Uganda (37.5)	Includes 10% Corporation tax.
Upper Volta (32)	
Uruguay (15)	On undistributed income in excess of 15% of net income. Also E.P.T. dependent on ratio of profits to capital.
U. S.A. (52)	Includes 22% surtax on profits over \$25,000.
Venezuela (5)	Plus surtax of 10%—45% (Profits over 28 million bolinares).
Viet Nam (24)	
Virgin Islands (Br.) (39.375)	
W. Samoa (40)	
Zanzibar (27.5)	On profits over £8,400 Sliding scale starting at 1s. in the £.

* Resident public company. Different rates for different types of company.

** From 1-1-61 extra tax of 5% for five years.

† These limits are increased for companies with capital over Eth. \$ 5 million.

§ Private limited companies; other legal entities—40%.

§§ Plus company tax of 15% of profits exceeding 6% of net worth.

(a) Public companies: reduced rate on first £25,000 of profits of a private company (5s. 5d.—plus 20% surcharge).

†† Including Super Profits tax. This tax will operate when the income of a company after deducting 10% of gross profits and the Income tax and Super tax payable at the existing rate exceeds 6 per cent of its capital and reserves. The rate of tax will be 50 per cent when "that income" is above 6 per cent but not above 10 per cent of the capital and reserves and 60 per cent on income above 10 per cent.

INDUSTRIAL IBCON CONSULTANTS

The industrial consultancy services offered by the group fall under the following headings:-

IN THE PLANT—

PLANT CAPACITY AND LAY-OUTS • PRODUCTION PLANNING AND CONTROL
STORES ORGANISATION • CONSUMABLE STORES CONTROL
RAW MATERIALS CONTROL • FUEL AND STEAM UTILISATION
TRANSPORTATION METHODS • MECHANICAL HANDLING
PRODUCT QUALITY CONTROL • OPERATIONAL RESEARCH
WORK STUDY • BUDGETARY CONTROLS
VALUATION OF PLANT & BUILDINGS
DESIGN AND ESTIMATES OF EXTENSIONS

ON LABOUR—

METHOD AND WORK STUDY • PRODUCTIVITY INDICES
TIMEKEEPING SYSTEMS • WAGE PAYMENT SYSTEMS
JOB EVALUATION • WAGE STRUCTURES
PERSONNEL RECORDS • LABOUR POLICIES
HUMAN RELATIONS • COMMUNICATION
REORIENTATION LECTURES • FOR LABOUR AND SUPERVISION

IN OFFICES—

MANAGEMENT ORGANISATION • EXECUTIVE LEVEL WORK
CLERICAL PROCEDURE • MANAGEMENT CONTROLS
WORK MEASUREMENT • BUDGET FORECASTS
LAYOUT, COMMUNICATIONS AND EQUIPMENT

AND

Old Wine in New Bottles

IN FINDING men for the vacancies caused by the resignations of Mr. Morarji Desai and Mr. Lal Bahadur Shastri, the Prime Minister has taken two decisions, one positive and the other negative, which must go a long way in raising the efficiency of the Government in the economic sphere. The positive decision is the choice of Mr. T. T. Krishnamachari for the portfolio of Finance.

There had been quite a good deal of entirely needless speculation about whom Mr. Nehru would choose to succeed Mr. Desai. Mr. Krishnamachari is obviously the man for the job. His agile and informed mind is needed to correct quickly the stagnation of the economy and reactivate it, particularly in the area of industrial expansion. It is true that Mr. Krishnamachari is apt to act in an unorthodox, and often unpredictable, manner and this is not altogether an asset in a Finance Minister whose primary purpose should be to inspire trust and confidence among the people in the stability and sanity of the Government's economic policies. From this point of view it is natural that there should be in some areas of the business community at least a feeling of anxious expectation regarding how he would conduct himself after his return to the Finance Ministry. But it is significant that this element of concern has not prevailed over the more general atmosphere of hopefulness which the news of his new appointment seems to have inspired in the industry and commerce of this country.

Mr. Krishnamachari himself may find it rather amusing to be regarded as a bull factor in the stock exchanges but it is possible that he has also been duly impressed by it. He has inherited, no doubt, a difficult legacy and the country will understand if it takes him time to get a measure of the problems he is up against. At the same time, nothing that needs to be done to relieve the pessimism in the capital market or stimulate investors' sentiments at home or abroad can be done too soon. This country's economic development is getting along not only on borrowed money but on borrowed time as well. A realistic and resilient policy of economic dynamism is therefore urgently needed. This is not to suggest that the new Finance Minister should take snap decisions, reversing existing policies or initiating radically new ones. But it will certainly be very helpful to the revival of economic activity if Mr. T. T. Krishnamachari would, as early as he conveniently could, take the country into his confidence on the broad lines of policy he proposes to follow for stepping up industrial production and capacity and the rate of economic growth generally.

In its own way the negative decision of Mr. Nehru in moving Mr. Nanda from the Planning Ministry to the Home Ministry could be as relevant to the better progress of the economy as the choice of Mr. Krishnamachari for the Finance Ministry. Mr. Nanda has been justly praised as a good man and true, but good intentions are proverbially known to lead to bad destinations. And there can be no doubt at all that, at least in recent years, as the problems of our economic development had been getting increasingly urgent and complex, Mr. Nanda's stewardship of the Planning Commission was becoming more and more a liability. For some time now he has been helplessly presiding over a vast bureaucratic administration which has certainly grown faster than any positive element in this country's economic growth and has thus been a standing violation of the dicta of efficiency and economy in administration that a poor country needs must observe in planning the use of its scarce resources.

Minister for Planning and as Deputy Chairman of the Planning Commission, Mr. Nanda has countenanced a philosophy of restrictionism, thanks to which it has become the habit with the so-called planning and development agencies of the Government to say "don't" rather than to say "do" where the economic expansion of the nation is concerned. It is possible that, in the goodness of his heart, Mr. Nanda loves the poor, but it is not good that a Minister for Planning should have love for poverty itself. At this critical stage of the nation's economic progress, when development programmes are being muddled and targets missed, a bold imagination and a creative outlook are clearly needed. And Mr. Nanda certainly is not the Minister to whom the country could have continued to look for them.

It is to be hoped that Mr. Nanda will do better in the Home Ministry than he has done in the Planning Commission. It is possible, of course, that the political importance of the Home Ministry may be somewhat less in the future. For one thing, to the extent the Kamaraj plan is effective in building up the status and morale of the party High Command and particularly such party institutions as the Parliamentary Board, the Prime Minister may turn more to Party leaders outside the Government than to his colleague in the Home Ministry for political consultations. Secondly, under such circumstances, it is also to be expected that Chief Ministers and other Ministers in the States may tend to look to their central party leadership rather than to the Union Home Minister for the services of mediation and co-ordination in inter-State matters. In this altered context the country could reasonably expect Mr. Nanda to function adequately as Home Minister.

Mr. Swaran Singh's new career will certainly be watched with sympathy. But there is no reason to take it for granted that he will master the problems of his new Ministry. The job which any Minister of Food and

Agriculture at the Centre will have to do is, above all, a tough, energetic and clear-headed exercise in administration. Mr. Swaran Singh has not shown so far that he is a particularly talented administrator. His most recent tenure, which was at the Railway Ministry, was too brief and uneventful for a judgment to be made. His earlier performance as Minister for Steel, Mines and Fuel could legitimately have been a matter for controversy. To what extent any failure on his part to summon vigour and organisational efficiency to the task of implementing the steel development programme of the second Plan had been responsible for the delay in the construction and commissioning of the new steel plants in the public sector is a matter which still remains to be objectively examined. It is to be hoped that the new Food and Agriculture Minister will take the very necessary step of getting himself a first class team of officials who could be depended upon to ensure that the vast finances provided for agricultural development are used in the States effectively and in strict relation to tangible results. The problem of the administration of agricultural development is really the problem of compelling the States, in the first instance, to take on complete and direct responsibility for the implementation of schemes and secondly, to supervise and co-ordinate from the Centre the working of those schemes in order to ensure that they are in fact being efficiently executed in terms of the public funds which are being committed to them. The Food and Agriculture portfolio is a job for a hard-working Minister who will also work his officers very hard indeed.

The three new appointments now announced in the Central Cabinet have inevitably left many loose ends. The future set-up of the Planning Commission, as of the Ministry of Economic and Defence Co-ordination, has been confronted with a large question mark. This apart, a very considerable merging or re-ordering of Ministries (or departments as among Ministries) will

KRISHNA AND HIS KINE

have to be done before the framing and execution of economic policies can assume a sufficiently integrated posture. The Prime Minister no doubt is giving his mind to this. He will probably take the relevant decisions in these respects simultaneously with effecting such additions to and such further elimination from the Ministerial strength at the various levels as he may

Back to the People

*Lizzy Borden took an axe,
And gave her Mother forty whacks;
When she saw what she had done
She gave her Father forty-one.*

THERE IS NO doubt that Mr. Nehru has committed a murderous assault on his family of Ministers, but it is rather amusing that a shock treatment, intended to shock Congressmen, seems to have shocked critics even more. Mr. C. Rajagopalachari, for instance, has evidently been reduced to a state of intellectual incoherence.

The Swatantra leader's outburst suggesting that the decision of the Prime Minister to relieve some of his colleagues of their portfolios so that they may devote themselves to party work has somehow entitled the President to dissolve Parliament and run the administration himself clearly shows that Mr. Rajagopalachari has at last begun to talk wholly in a language in which he could talk only with himself.

The Kamaraj plan is certainly not a perfect plan in the sense that no fault can be found in it. It has weaknesses and it runs risks. We certainly agree with Mr. Rajagopalachari's initial reaction that the plan is liable to invest Mr. Nehru with an absoluteness of personal authority which it is not easy to reconcile with the rights or requirements of a democratic society. We had expressed this feeling in a leading article in our issue of August 23, and now, after seeing the decisiveness with which Mr. Nehru has exercised the authority vested in him by the All-India Congress Committee of shifting Ministers to party work, we cannot but point out that not only has absolute authority been vested in Mr. Nehru but that he is evidently going to exercise that authority absolutely.

Mr. Rajagopalachari has tried to argue that it is "the President and not the Prime Minister that accepts resignations of Ministers". This, however, is not a contention of any substance. There is nothing in the Constitution — either in its written provisions or in its unwritten conventions — to show that there is with the President a privilege which can be held to detract in any manner from the Prime Minister's prerogative of choosing at all times who should be his colleagues in the government. It is not even necessary, strictly speaking, for the Prime Minister to consult the President in this matter. Whether on any particular occasion he does so or not is an act entirely within his discretion. But since, in the present case, Mr. Nehru has presumably acted in terms of the demands and requirements of his party, it would have been proper

consider necessary or desirable. Already steps have been taken to give Mr. Swaran Singh a certain authority over Community Development and Irrigation. The country can afford to wait for Mr. Nehru's further moves, now that he has shown that he is addressing himself seriously enough to the task of good and purposeful government.

for him to have consulted his senior colleagues in the party before he had made his decisions. Even here the AICC mandate itself does not require Mr. Nehru to consult his colleagues in the party, but it would have been more in keeping with the spirit of the mandate if, while reserving the right of ultimate decision to himself, the Prime Minister had discussed his intentions with other senior Congress leaders and taken them into his confidence to a greater extent than he has apparently done. The fact that he has not thought such consultations to be necessary must add an edge of disquiet to the general feeling of broad satisfaction with the determination and wholeheartedness Mr. Nehru has shown in putting the Kamaraj plan to work.

If the Kamaraj plan has a weakness it is that it is liable to underline the personal ascendancy and authority of Mr. Nehru as the One Leader of the Congress Party. Nevertheless, it is possible, paradoxically, for the plan to set in motion a sequence of forces and influences which may ultimately bring about the kind of collective leadership which is desirable for the future of the Congress Party and necessary for the security of this country's democracy. Whether the departure from the Central and State Governments of leading Congressmen would actually weaken the administration or the standards of Government remains to be seen. What, however, is at once evident is that their going back to important positions in the Congress organisation must undoubtedly strengthen the organisational wing of the Congress Party. So long as the Congress leaders concerned were holding office as Ministers they were not in a position openly to criticise Mr. Nehru or express their disagreements with him on matters of government policy or even on general public issues. Now they are freed from such restraint or constraint.

This is not to suggest that the Congress leaders retired from the Central or State Governments should, or are likely to, form a group of dissidents at the national level and work against Mr. Nehru as a person or as the Prime Minister. Such a development will certainly be most unhealthy because it will not only hurt the Congress Party but also the political stability of this country which is so directly dependent upon the Congress continuing to preserve its coherence in the difficult years ahead. What is considered both desirable and probable is that once the ex-Ministers are freed from the narrow discipline of office they may promote a collective leadership in the Congress Party which would serve to balance Mr. Nehru's personal ascendancy in

the present while preparing the ground for the smooth continuity of India's democratic political experience after Mr. Nehru. It has been a familiar criticism of the functioning of the Congress both as a political organisation and as a ruling party that, if the Congress has a mind at all, it is the mind of Mr. Nehru, which — so this complaint proceeds—is rather unfortunate since most of the time Mr. Nehru does not seem to know his mind at all. The biggest thing that is to be said in favour of the Kamaraj plan is that it is not impossible that it succeeds in giving the Congress a mind of its own.

Basically the Kamaraj plan is a plan to help Congress renew its friendship with the people of this country. We quite readily see why opponents of the Congress do not like this idea, but we just cannot understand what title they have to protest against this move, or, stranger still, presume to advise the Congress against it. The glory and greatness of the Congress traditionally has been that it is a party not of sections of the people, but of the people as a whole and in the mass. This tradition has unhappily become tarnished in recent years as a result of particular individuals or sections in the Congress organisation trying to establish special relations with particular parts of the great community of the Indian people. Thus there has been a right wing in the Congress and a left wing—with a centralist wing coming in between. There has also been talk or suspicion of various strata of Congress leadership having different affinities and different loyalties. We have been told that business interests, for instance, have good connections at certain points or levels of the Congress organisation. We have also been told that there are other areas in the Congress where opinion is reported to be specially sympathetic to what have been described as agricultural interests. It has been suggested, again, that the claims of organised labour have a special hold on sympathies at certain places in the party. It has also been claimed that there are similarly special areas in the Congress organisation to which other sectional interests, such as small traders, artisans or the urban middle class are supposed to have favoured access.

How much all or any of this is true or not is perhaps less important than the fact that the Congress organisation as a whole has certainly lost a great deal of

Failures in Fertilizers

THE MINISTER for Steel and Heavy Industries, answering questions in Parliament last week, indicated that the production of nitrogenous fertilizers was not likely to hit the third Plan target as there had been delays and difficulties in the implementation of schemes for new plants allowed to the private sector. Mr. C. Subramaniam said that of the eight firms to whom licences had been issued only three had shown some interest while five had surrendered their licences with no other private parties coming forward to take their place. This

the integrated personality which it once had as the common champion and principal spokesman of broad national interests and sentiments. This is essentially because the Congress, both as a political organisation and as a ruling party, has been steadily losing touch with the people at large. Its conscience and its character have been steadily drifting away from the circumstances in which the people of this country actually live and from their desires for the present and their aspirations for the future. It is because of this dismal divorce of the party from the people that the policies of governments at the Centre and in the States have lately taken such a turn as has alienated the support and sympathies of large and numerous sections of the people. As a measure of this estrangement we may point to the utterly mechanical manner in which fundamental changes in the people's habits and attitudes, as are contemplated in the Gold Control and Compulsory Savings policies, have been sought to be effected. Had the Congress kept its fingers on the pulse of the people it would certainly have exerted itself more than it had done to prepare public opinion in advance of such reforms as well as to carry public opinion with it in the actual implementation of those programmes. It is not an accident that the policies and measures of one single Central Budget should have brought so much unpopularity to the Congress in such wide areas of national life and opinion.

In the circumstances there is nothing criminal or sinful in the Congress trying to recapture public imagination and public support through the Kamaraj plan or otherwise. It does not lie in the mouth of those critics of the Congress who have always been complaining that the Congress has failed to give good government to argue now that the retention of the resigning Ministers has suddenly become essential to the proper administration of the country. It is, of course, true that the Kamaraj plan offers no guarantee that the Congress will succeed in getting restored to its pristine position as the great party of almost all our people. But it certainly does not make sense for opposition groups to pretend to be dismayed by the possibility of the Congress failing. It is a matter primarily for Congressmen to decide whether the chance of success is worth taking. Whether, in the event, the Congress fails or succeeds, it will always be to its credit that it has attempted in all earnestness to go back to the people.

was reported gleefully in *Patriot* with the accusatory headline "Private Sector Guilty". Actually this matter is rather more complicated than has been made to appear through over-simplification, deliberate or otherwise. In the first place, although it is true that the setting up of new fertilizer plants in the private sector has not proceeded according to schedule, it may not be right to say that all the expected shortfall in nitrogenous fertilizer production is to be attributed to this factor. Performance in the public sector also has fallen behind

targets and this too has to be taken into account in assessing the total situation in the planning and development of the nitrogenous fertilizer industry.

The Gorakhpur scheme, for instance, is now expected to be completed only in October, 1966, i.e., a few months after the end of the third Plan. The Namrup project again may not go into commercial production before the end of 1965. The Trombay project was expected to be commissioned in 1964, but actual production from this factory may be available only in the beginning of 1965. The Neyveli project, it is hoped, will go on stream in September-October, 1965. After the surrender of its licence by the private party to which a fertilizer plan to be located in Madhya Pradesh was originally allotted, this project has been shifted to the public sector. Korba has been tentatively selected for the location of this factory which will be coal-based and will have a capacity of 100,000 tons (N) in the form of urea as against a capacity of about half that amount envisaged by the original sponsors. The latest estimate places the cost of this project at Rs. 35.71 crores out of which the foreign exchange cost will be of the order of Rs. 13.56 crores. This scheme, now in the public sector, and delayed no doubt by the failure of the original licensee in the private sector to implement it, is not expected to fructify during the current Plan period.

This means, in effect, that most of the fertilizer expansion in the public sector during the third Plan is related to the fortunes of the plants at Sindri, Nangal, Alwaye (FACT), and Rourkela. Production at Sindri, Nangal and Alwaye is fortunately being maintained to schedule, although there is some misgiving regarding the current policy of over-stretching the capacity of the plants, especially at Sindri. Past experience should have taught the Government of India caution in this respect and it remains to be seen whether production at Sindri and Nangal could be taken up to and maintained at the annual rate of 110,000 tons (N) each in the last two years of the third Plan as is being planned. Some of the recommendations of the experts committee which had gone into the causes of deterioration in the Sindri plant in the years after 1958-59 have not yet been fully implemented. Supply of gypsum has improved but in respect of this basic raw material, Sindri still remains rather vulnerable. The problem of ensuring uninterrupted supply of coal of the required quality has not been solved by any means. As for Rourkela, it has not been possible to establish full production due to the non-availability of coke-oven gas in the required quality and quantity and shortage of electric power. In these circumstances, there is every likelihood of the installed capacity in the public sector falling well behind the additional target of 425,000 tons in terms of nitrogen (or 325,000 tons (N), excluding the capacity of the Madhya Pradesh project) set for it.

There is thus not much point in anybody trying to indulge in the pastime of throwing stones at the private sector as such. Even in the case of delays and failures in the private sector the Government's policies cannot

avoid their share of responsibility. To some extent, the lapsing of licences issued to the private sector is due to the wrong choice of parties. Had the Government exercised greater circumspection and judgment and assured itself that the would-be promoters had the required resources, organization and experience, the outcome might have been different. It must also be noted that in one case of delay, viz., the Durgapur fertilizer project, the sponsorship was not wholly by the private parties; the West Bengal Government has a 49 per cent stake. The Central Government is now being approached to shift this scheme to the public sector as negotiations for collaboration arrangements with a consortium of American firms which its present sponsors had undertaken have fallen through.

Indeed the difficulties and delays in securing foreign collaboration seem to have been the main stumbling block for the private sector. Two other private sector projects, one of which was to be sited at Mangalore and the other at Tuticorin, have also suffered for this reason. In the case of the Mangalore scheme, negotiations with Dutch firms having failed, collaboration is being sought from the United States. In the case of the Tuticorin scheme, negotiations with an American firm have been dragging on for some time now. Apart from the question of foreign collaboration, there have been other difficulties as well. The delay in respect of the Gujarat fertilizer project, for instance, is attributed to some modifications having been suggested in the pattern of production recently. Work on the Hanumangarh project is reported to have been held up because the arrangements for the supply of naphtha from the proposed Koyali refinery at reasonable prices have not been finalised yet. The question of transporting naphtha

Eastern Economist 20 Years Ago SEPTEMBER 3, 1943

The Public Accounts Committee at its meetings this week examined the accounts of the Railway, Posts and Telegraphs and Labour Departments. The main feature of the Railway accounts was the gradual dwindling of private invested capital which from Rs. 77 crores in 1924-25 has now come down to Rs. 22 crores. The Government investments in Railways now amount to Rs. 732 crores. The B.B. and C.I. and the Bengal-Assam Railways were acquired by the Government during 1941-42. The strategic railways which have been a heavy liability of the exchequer so far made profits for the first time during 1942-43. The depreciation fund stood at Rs. 55 crores at the end of 1941-42. An interesting point about the Posts and Telegraphs account was the success of the newly started airgraph service. About a million airgraph were handled by the Department every week. The Karachi and Ahmedabad Telephone Exchanges have also been acquired by the Government this year. The technical training scheme of the Labour Department cost the Government Rs. 60 lakhs during the first year. It is now intended to increase the number of trainees to 60,000 a year. An interesting fact revealed was that the total capital outlay on New Delhi so far amounts to Rs. 16.33 crores. The Committee has not yet concluded its work and will be meeting again in October.

September 6, 1963

from Koyali to Hanumangarh has also to be settled with the Railway Board.

The private sector's difficulties in the main, however, seem to be that of securing satisfactory financial and technical collaboration from abroad. If the Government really wants to promote a large private sector in the fertilizer industry, it is necessary that it should examine anew why these difficulties arise and how they can be dealt with. It is possible that the selection of the right parties, that is parties who have adequate standing, resources and organisation for negotiating collaboration with correspondingly resourceful and keen entrepreneurs abroad, should serve to ensure that the scheme is implemented efficiently and according to the time-table fixed for it. Secondly, it is equally important for the Ministry concerned to consider whether its own licensing and other procedures as well as the procedures of other connected Governmental agencies cannot be simplified and speeded up. At the recent seminar organised by the Federation of Indian Chambers of Commerce and Industry the Minister for Steel and Heavy Industries was frank enough to concede that too many restrictions and controls could frustrate many important and urgent industrial projects. It seems to us that nowhere is this risk greater than in the government procedures connected with the approval of foreign collaboration agreements. If the concerned official machinery could be made to function in a more business-like manner, it is possible that the climate in which collaboration negotiations have to be conducted will greatly improve.

The Minister in his replies to questions in the Rajya Sabha suggested that one reason why fertilizer schemes in the private sector were not coming up as proposed was that the promoters were discouraged by the fact that earnings and profits in this rigidly controlled industry were not attractive in relation to what could be obtained in other industries. Having appreciated this, it is necessary for the Government to deal with this problem constructively if there is to be a substantial development of fertilizer production in the private sector. In this context, the observations made in a recent report submitted to the World Bank by its team of experts who surveyed this country's economy are worth quoting: "The policy of controlling prices in key industries, while prices in less important industries have been left free, is particularly difficult to justify. It has had the effect in India of diverting capital away from the priority sectors where the need for expansion is the greatest. Thus the coal and cement industries have both experienced difficulties in attracting capital for development in recent years. Price controls probably have also had something to do with the reluctance of the private sector to exploit the opportunities of development in fertilizer production, notwithstanding the fact that the promoters have been assured by the Government that prices will be fixed on what is essentially a cost-plus basis....Prices once fixed are very difficult to alter, since vested interests become entrenched behind them. Nor can anyone simply have the knowledge and foresight needed to establish the right prices

or to change them promptly in response to new conditions. The cost-plus formula which is the normal basis for price fixation is singularly uncondusive to efficiency."

In the case of the fertilizer industry particularly, the Government's pricing policies are apt to be vitiated by the fact that it is generally assumed to be inevitable that fertilizers should be sold at heavily subsidized prices if the habit of using them is to spread among this country's generally indifferent, often ignorant, and for the most part indigent farmers. But, however difficult it may be, politically or otherwise, to adopt a rational pricing policy for the fertilizer industry, it is plain that this problem will have to be boldly faced. One possibility is to see whether the fertilizer industry should not be encouraged to enter the trade in fertilizers directly and extensively. According to present indications the total installed capacity for nitrogenous fertilizers is expected to be about 641,000 tons (N) while the expected production is of the order of 500,000 tons (N). These figures are substantially below the target for the third Plan which assumes a total capacity of 1.37 million tons (N) by 1965-66. Even a recent estimate which assumed that this target would not be reached, nevertheless expected that actual production would at least be 655,000 tons (N) in 1965-66. But the output, as has just been mentioned, is likely to be 150,000 tons (N) less than that figure. Demand in 1965-66, however, is likely to be between 750,000 and 800,000 tons (N).

The gap between demand and indigenous supplies has to be filled by means of imports which will necessarily have to be on a larger scale than has been provided for in the third Plan. It is suggested here that these imports should be channelled through the manufacturers of fertilizers in this country so that they could establish some kind of a common price which, while helping them to secure a reasonable level of earnings, will not at the same time, work to the serious disadvantage of the users of fertilizers. It might also be helpful to explore possibilities of manufacturers taking to the marketing of liquid fertilizers and mixed fertilizers operations. The fact that there is a large public sector in the fertilizer industry need not come in the way of an enlightened and progressive price policy. On the contrary, there will be a net national advantage if an economic price is fixed for fertilizers and their use there-by directed into the most productive channels. If any particular crop or any particular agricultural area or the proper thing would be for the financial burden to be borne on the budget for agricultural development programmes. It is to be hoped that merely because there have been delays and disappointments in the expansion of the fertilizer industry in the private sector due to reasons not all of which were or are under the control of the licensees, the Government will not adopt a defeatist attitude but will apply its mind constructively to the solution of problems which have cropped up in the course of the implementation of the expansion programme for this industry in the last few years.

EASTERN ECONOMIST

Highlights of the Week

MINISTERS IN MOTION

THE JUGGERNAUT of the Kamaraj plan keeps on rolling. On Saturday, Mr. Morarji Desai handed over charge of the Finance Ministry to Mr. T. T. Krishnamachari. On Sunday, Mr. Gulzari Lal Nanda took over the Ministry of Home Affairs from Mr. Lal Bahadur Shastri and Sardar Swaran Singh, Food and Agriculture from Mr. S. K. Patil. On the same day, Mr. Jagjivan Ram, Mr. Gopala Reddi and Dr. K. L. Shrimali relinquished their respective offices as Ministers of Transport and Communications, Information and Broadcasting and Education respectively.

The Prime Minister has started what would appear to be a series of regrouping and reallocation of Ministries and Departments. The Ministry of Economic and Defence Co-ordination which Mr. Krishnamachari was in charge of hitherto has been abolished. This is not because the co-ordination of economic affairs and defence activities has become superfluous. This particular portfolio was created primarily to accommodate Mr. Krishnamachari in the circumstances then prevailing. It is evidently the Prime Minister's intention that the comprehensive reorganisation of Ministries which he is now contemplating could enable co-ordination to be effected without the agency of a specific ministry for that purpose.

The Ministry of Transport and Communications has also been abolished. In its place a new Ministry of Transport has been constituted with Mr. Raj Bahadur, Minister of State, in temporary charge. This portfolio embraces Shipping, Ports, Roads, Civil Aviation and connected matters. The Posts and Telegraphs Department which had formed a part of the erstwhile Ministry of Transport and Communications has been constituted into an independent Department and has been placed temporarily in charge of the Law Minister, Mr. A. K. Sen. Similarly, the Supply and Technical Development Wings of the now defunct Ministry of Economic and Defence Co-ordination have also been constituted into independent Departments and placed in charge of Mr. Jaisukhlal Hathi, who was Minister of State in that Ministry and who continues to hold the same rank in the Government.

An interesting move of more than ordinary interest is the decision vesting Sardar Swaran Singh, as Minister of Food and Agriculture, with powers of "overall supervision" over the Ministry of Community Development and Co-operation in regard to its agricultural work and co-operatives in rural areas and over the Ministry of Irrigation and Power in matters relating to agriculture and irrigation. No permanent arrangements have so far been made for the Ministry of Planning or the Ministry of Labour and Employment both of which will remain temporarily with Mr. Nanda. The Ministry of Railways is similarly to be an additional responsibility for the time being of Sardar Swaran Singh, Minister of Food and Agriculture. The Minister of Scientific Research and Cultural Affairs, Mr. Humayun Kabir, will be temporarily in charge of the Ministry of Education as an additional portfolio, while Mr. Satya Narayan Sinha, Minister of Parliamentary Affairs, will be temporarily in charge of the Ministry of Information and Broadcasting.

EXPANDING STC

REPLYING TO a two-and-a-half hour debate in the Lok Sabha last week on the annual report of the State Trading Corporation for the year 1961-62, the Minister for International Trade, Mr. Manubhai Shah, not only stoutly defended the

growing operations of the STC, but also envisaged a large chunk of the country's foreign trade steadily coming within the purview of the public sector. He hinted that some more corporations on the pattern of the STC might be set up in the coming years to handle new commodities.

The expansion of the public sector in the country's foreign trade, Mr. Shah asserted, was "inescapable, inevitable and desirable" in the interest of stepping up exports. Individuals, he explained, had neither the wherewithal nor the experience to enter into long-term contracts for the supply to foreign countries of various items of export, especially bulk commodities. He cited the case of iron ore, exports of which are proposed to be increased to about 30/35 million tons a year. The Minister further said that, even in the capitalist countries, it was a growing practice that some 30 to 40 individuals came together to form a consortium for undertaking big jobs such as supply of equipment for setting up, say, a steel mill in another country.

State's Role

Referring to the criticisms voiced by some members that the STC was supplanting private export-import trade in various commodities and was charging unduly high profits, Mr. Shah said that the Corporation had exported goods which the private sector found it difficult to export and imported scarce commodities and saw to it that these were sold at reasonable prices. Mr. Shah opined that the expansion of the STC operations fitted into the Government's policy of carving out a dominant role for the State in the economic apparatus of the nation. He, however, conceded that the whole of export-import trade should not be nationalised merely on the ground that some people over-invoiced imports and under-invoiced exports.

Mr. Shah did not think that any change was called for in the constitution of the STC. He emphasized that it was desirable to have some flexibility in State trading. As the STC, formed under the Indian Companies Act and accountable to Parliament, had been successfully discharging its functions, he felt it was better to follow this example in future rather than form new corporations under special statutes.

Two other significant indications were given by Mr. Shah in his speech. While justifying the jute buffer stock operations of the STC on the ground that it must help the lowliest among the low in the country—jute-growers of Bihar, Assam and Bengal, he said, worked in the worst possible conditions—he stated that next year the Corporation would purchase about one million bales of jute. Last year these purchases had been limited to 60,000 tons. All the stocks of jute said to be of very low quantity, Mr. Shah added, would be sold out. The other disclosure made was about sugar exports. This year the Corporation would export 500,000 tons of sugar and next year 750,000 tons. The aim was that if production of sugar increased, one million tons should be exported. Mr. Shah further said that sugar exports had been effected at the best possible price.

Mr. Shah also revealed that during the first seven months of the current year exports had increased by Rs. 57 crores. He could not say whether this rate of progress

would be maintained. He, however, expressed the opinion that if exports went up by Rs. 40 to Rs. 50 crores every year, that should be a good achievement, considering the keen competition in the world markets. From a modest turnover of Rs. 9 crores in 1956-57, the STC's direct trade transactions were stated to have gone up to Rs. 80 crores in 1962-63. In 1961-62, they amounted to Rs. 77.4 crores, as against Rs. 64.7 crores in 1960-61. The Corporation continued to handle during this year the trade in mineral ores, particularly iron and manganese ores, non-ferrous metals, newsprint, fertilizers, caustic soda, soda ash, salt, art silk and yarn etc. Trading in groundnuts, groundnut oil, seedlac etc., were added to its activities in this year. The Corporation also endeavoured to promote the export of handloom fabric in new foreign markets. Its gross surplus for the year amounted to Rs. 6 crores and the net profit to Rs. 2.02 crores. A dividend of 10 per cent was paid on the equity capital, the balance being transferred to various reserves for development and expansion of business. In 1960-61, the net profit came to Rs. 1.44 crores.

BACKWARD CLASSES

IN HIS latest annual report, the Commissioner for Scheduled Castes and Scheduled Tribes, Mr. Anil K. Chanda, suggests that for ameliorating the lot of the weakest section of the Indian society, and more especially for the eradication of untouchability, legal provisions should be effectively utilized along with educative measures. In many respects Mr Chanda's report is a revelation of how vigorous action has failed to follow the precept.

It is a sad reflection on the working of Panchayats that Mr. Chanda has been constrained to call upon the Government to withhold grants to Panchayats in whose areas disabilities of scheduled caste persons persisted. Panchayats, he says, can be a very potent force in combating the evil of untouchability and their responsibility in the field should be increased. He further recommends that licences should be issued to hair-cutting saloons, restaurants, etc., only on the condition that they will put up notices at prominent places in their establishments stating that no discrimination against scheduled castes was practised there. He also suggests engraving on all public wells, whether old or new, inscriptions warning against stopping anybody from using these wells. Mr. Chanda's plea that the field staff of the Community Development Programme should be made responsible for reporting offences under the Untouchability Act, however, can be hardly supported. It will entail on them an onerous responsibility which will only hinder their work in the agricultural field to which their increasing attention is being sought to be diverted at the present juncture.

Spread of education and provision of land to the landless labourers, 42 per cent of whom belong to the scheduled castes and scheduled tribes, can obviously play a great role in improving the condition of these backward classes. In respect of the former, Mr. Chanda suggests that each State should evolve a method of distribution of scholarships so as to expeditiously disburse the scholarship money to the students belonging to the scheduled castes and scheduled tribes. He also recommends that students in these categories should be admitted to the reserved seats in technical institutes and schools without any reference to the marks obtained by the last candidate admitted to the general seats, provided they reach the minimum qualifying standard which he defines as 5 per cent marks less than the minimum marks prescribed for admission to such courses. He further

suggests that the States should raise the percentage of reservations for scheduled castes and scheduled tribes students in the general hostels at least to correspond to the percentage of their population in the respective States. In no case, of course, this should be less than 15 per cent.

The report urges that special attention should be given to the scheduled castes and scheduled tribes in schemes for settlement of landless labourers. Mr. Chanda has commended the Punjab legislation for provision of interest-free loans without any security to persons belonging to scheduled castes and scheduled tribes. He suggests that this policy should be followed in the other States as well. Development of cottage industries such as bamboo and cane-work, commended. The States may even give price preference in their purchases of the products from the training centres to be set up for scheduled castes and scheduled tribes. In the general development schemes, it is pleaded that adjustments should be constantly made so as to divert funds to programmes where there is scope for full use within a short period.

The performance of the housing schemes for backward classes is stated to have been quite poor. Energetic steps, it is recommended, should be undertaken to overcome the difficulties responsible for this poor performance.

NEPAL KING'S VISIT

THE WARM welcome extended to King Mahendra and Queen Ratna of Nepal on their last week's visit to New Delhi and the joint communique issued at the end of former's confabulations with the Union Government leaders indicate that the clouds of misunderstanding which last year threatened to bedevil the centuries-old cordial relations between the two countries have disappeared to a large extent. A significant role in this respect was played by the recent visits to Kathmandu of a former Indian Ambassador to Nepal, Mr. Bhagwan Sahai, the former Union Home Minister, Mr. Lal Bahadur Shastri, and the Chief of the Indian Army Staff, General J. N. Chaudhuri. This country's ready grant of transit facilities for Nepalese trade with Pakistan and its assurances of help in the building of Nepal's economy and strict non-interference in Nepal's long way in reassuring Kathmandu of this country's goodwill towards Nepal.

Broadly speaking, both India and Nepal have a similar outlook on world affairs and are engaged in the identical tasks of economic development. The defence of the two nations is also inextricably mingled with each other. Close friendliness and co-operation between them is, therefore, a mutual necessity. When President Radhakrishnan, in turn, visits Kathmandu in response to King Mahendra's invitation, the foundations of friendliness now being laid stone by stone would have gained further strength.

A Damning Document

From Our Parliamentary Correspondent

NEW DELHI: Tuesday:

ON MONDAY the Defence Minister, Mr. Y. B. Chavan, made his eagerly-awaited statement on the reverses suffered by our troops in the operations along our northern borders during the months of October-November, 1962. This statement was based on the report of the enquiry ordered by the Chief of Army Staff to find out what had gone wrong with (a) our training; (b) our equipment; (c) our system of command; (d) the physical fitness of our troops; and (e) the capacity of our commanders at all levels to influence the men under them. The Defence Minister declined to release the report itself on the ground that such a step would not be in the interests of national security.

Mr. Chavan emphasized more than once the point that the purpose of the enquiry was primarily to derive military lessons useful for the future. He stated that it was not the intention to undertake a witch-hunt into the culpabilities of those who were concerned with or took part in those operations. But it is doubtful that, in the light of the facts disclosed in the statement, either Parliament or the wider public will be inclined unreservedly to share with the Government this attitude of "charity for all and malice towards none". Even the broad assessment of the state of military unpreparedness disclosed by Mr. Chavan constitutes a damning indictment of the leadership, ministerial and other, in the Defence Ministry in the years preceding and on the eve of the Chinese aggression of last October. On the issue of the training of our troops, the finding of the enquiry was that the training did not have a slant for a war being launched by China. This meant that our troops had not the knowledge essential to counter Chinese tactics, their weapons and equipment or ways of warfare. The higher Commanders' concept of mountain warfare, in particular, was not equal to the demands made on them by the situation which developed in NEFA.

Logistic Deficiencies

Regarding equipment, the findings of the enquiry are even more adverse to those who, at the political and military levels, were responsible for this country's security in the face of the steadily developing Chinese threat over the years. It has been confirmed that there was an overall shortage of equipment both for training and during operation. A further difficulty was that even when equipment was available, the transport facilities were unequal to the task of moving the equipment to the forward formations. The enquiry has brought out gross logistic deficiencies, such as lack of properly built roads and shortage and bad maintenance of vehicles. Although the report states that our weapons compared favourably with those of the Chinese, automatic rifles would have helped in the cold climate.

On the system of command, the inquiry refers to departures from the accepted chain of command which it ascribes to haste and lack of adequate prior planning. It also blames in this respect the practice that has crept in in the higher armed formations of interfering in tactical details even to the extent of detailing troops for specified tasks. As regards the physical fitness of the troops committed to the front, the inquiry finds that the officers and men were not acclimatized to fight at the heights at which some of them were asked to stand. It also notes that there had been deterioration in standards of physical fitness among some middle-age-group officers.

Proceeding to the next question about the capacity of the

Commanders at the various levels, the report holds that there were shortcomings at the higher levels. It was found that some of the higher Commanders did not depend enough on the initiative of the lower Commanders, who alone could have the requisite knowledge of the terrain and local conditions of troops under them. Finally, the report makes out that the collection of intelligence in general was not satisfactory and that, as a result, the evaluation of intelligence might not have been accurate. A clear picture of the Chinese build-up was not made available and field formations were left with little guidance whether there were fresh enemy troops or old ones moving to new locations. Even such information about enemy troop movements which might have been collected and evaluated was not disseminated promptly as the means of communication with field formations were not fast enough. The report stresses that a major overhauling of the intelligence system is required. It also asks for improvement in the quality of General Staff work, particularly with reference to the depth of its prior planning in time. Much more attention will have to be given, than was done in the past, to staff work and procedures with regard to long-term operational planning, including logistics as well as to the problems of co-ordination between various Services Headquarters. To sum up, the conclusion is difficult to resist that the nation's defences and the capacity of its armed forces to guard our frontiers with China (which has been openly belligerent towards us for years before the aggression of October last) had been neglected in every major area of military preparedness. In the words of the Defence Minister's statement "the reverses that our armed forces admittedly suffered were due to a variety of causes and weaknesses." It is obvious that even such broad findings of the inquiry as have filtered through the Defence Minister's statement clearly indicate that there has been a serious and extensive failure of leadership, both at the ministerial level as well as at the level of the general staff, even during a period when China was not only already in occupation of a large slice of our territory in Ladakh, but was also advancing claims to other parts of our country along the frontiers in the north and north-east. In the circumstances the Defence Minister's plea that there could be no "witch-hunt" is hardly likely to commend itself either to Parliament or to the people of this country.

The Rajya Sabha had a discussion on the international situation on Monday; Mr. Nehru replied today. Mr. A. D. Mani (Independent) urged that there should be no further talks with Pakistan over Kashmir. He and Mr. A. B. Vajpayee, who spoke at a later stage of the debate, argued that this country should not continue to cling to the Colombo proposals indefinitely since China had refused to accept them in toto. Mr. Vajpayee opposed the suggestion that Sino-Indian border dispute might be referred to arbitration. Mr. Abdul Ghani (Independent) advocated the severance of diplomatic relations with Pakistan and China. The Prime Minister's reply to the debate was quite a lively performance. He had no difficulty in showing that Mr. A. D. Mani's suggestion that there should be a time-limit to India's acceptance of the Colombo proposals, was in fact pointless since so long as China had not accepted those proposals this country's freedom of action was in no way restricted. He reacted quite sharply to Mr. Ruthnaswamy's contention that we should be willing to accept assistance from friendly countries in the form of troops to repel the Chinese. Mr. Nehru said that, apart from the fact that this form of assistance was neither required nor would

September 6, 1963

be effective, it would be a sad day for this country if it were to depend upon others to defend its territory or independence. He underlined the fact that the defence of India was primarily the responsibility of the people of India themselves.

The Prime Minister was similarly firm and forthright with regard to Kashmir. He said that, apart from the fact that Kashmir was legally and constitutionally a part of India, it was not in the interest of the people of Kashmir or the people of India that that situation should be changed. He made it clear that the United States and the United Kingdom had not at all attempted to link their military assistance to this country with a settlement of the Kashmir issue. Dealing with the repression of Buddhists in Vietnam, Mr. Nehru assured the House that if the Buddhist countries convened a conference to discuss the matter, the Government of India would participate in it. Explaining the Government's position with regard to the Voice of America deal, the Prime Minister held that any attempt to implement the agreement as it stood would lead to enormous difficulties. He said that, in case the agreement could not be radically revised, the Government of India would try to do without the transmitter.

Question Hour

DURING THE debate held in the Rajya Sabha on the sugar position and the prospect for its improvement, Mr. A. M. Thomas, Deputy Food Minister, assured the House that the revised scheme of incentives to the sugar mills and cane growers would be announced in a few days and that appropriate measures would be taken to stop or reduce the diversion of cane to gur and khandsari from the sugar mills.

The motion was tabled by Mr. A. B. Vajpayee and members practically from all the parties or groups seemed to support his major points of criticisms. The central point which he made was the failure of the Government to evolve a dynamic sugar policy and this he attributed essentially to the uneconomic prices offered to the cane growers. The price factor, he asserted, was at the root of the diversion of cane to gur and khandsari. He urged that the cane price should be increased by a minimum of Rs. 2 per maund and the system of linking price with recovery of sugar should be abandoned. The other points made in criticism were that the cess on sugar cane was not properly and reasonably utilized by the State Governments and in future a strict policy must be observed to allocate the revenue from the cess to development activities, including particularly construction of roads to facilitate transport from sugar farms to the mills. Some of the participants in the debate pleaded for nationalisation of the sugar industry, while some others suggested that the Government should take over the uneconomic mills. None of them, however, could explain how government ownership or control should by itself improve the economies of the industry or any of its individual units. The rigid controls on the sugar industry came in for pointed attack. Here the remedy suggested was partial de-control of prices and distribution.

Mr. A. V. Thomas intervened in the debate and explained that the two major remedies which seemed essential to raise sugar production were additional incentives to the sugar mills as well as the cane growers and adequate cane supplies to the sugar industry. He emphasised that the aim of the Government's policy was to restore a rational balance between the production of sugar on the one hand and gur and khandsari on the other. To this end an excise duty would be imposed on gur and khandsari to reduce the fiscal advantage now enjoyed by them. The next day he announced in the Lok Sabha that a proposal for this levy had already been formulated and that the final decision would be taken soon. He admitted that the part of the proceeds of the sugar cane cess/

purchase tax now being spent on the development of sugar cane was inadequate. This was primarily due to the fact that the levy was collected and administered by the State Governments as part of the general revenue. Nevertheless, they were spending funds for intensive cultivation of sugar cane as a part of the package programme.

Coal

Higher Grades: Mr. O. V. Alagesan, Minister for Mines and Fuel, explained in the Lok Sabha that the aggregate requirements of coking coal (including blendable coal) for the metallurgical industries in the fourth Plan were placed at 62 million tonnes. Their production at the end of the third Plan was expected to reach 32 million tonnes and the washing capacity in terms of raw coal input, planned to be established during the period of the current Plan, is 24 million tonnes. Planning for additional production of high grade coal and for additional washing capacity in the fourth Plan was in progress.

Washeries: The Minister of Mines and Fuel stated in reply to a question on coal washeries that it was proposed to step up washing capacity in the Fourth Plan to wash practically all the coals necessary to fulfil the requirements of the steel plants. As regards the agencies through which the coal washeries were to be operated, he explained that, in so far as coal produced by the National Coal Development Corporation was concerned, the Corporation itself would set up the requisite washing capacity. As for coal produced in the private sector collieries, the question of the processing agencies would be determined when the private programmes for the production of coking coal during the fourth Plan were finalised.

Singareni: Mr. O. V. Alagesan stated in the Lower House that an agreement was reached between the Government of India and the Government of Andhra Pradesh that the existing pattern of the ownership of the equity capital of the existing Collieries Company in the ratio of 40:60 should be maintained unaltered. The authorised capital of the company was to be raised from the present Rs. 4 crores to Rs. 9 crores at the end of the third Plan in the light of the company's expansion programme. During the last two years of the third Plan, the Centre would advance a loan of Rs. 3 crores to Andhra Pradesh Government to enable it to subscribe its share of the additional equity capital.

New Deposits: The Minister of Mines and Fuel revealed in the Lok Sabha that the Geological Survey of India had established the existence of coal deposits in Singrauli coalfield in Madhya Pradesh after exhaustive investigations a few years ago. But, since then, discoveries of new coal deposits were made as suggested in the question on this point. The total coal reserves in Singrauli belt are estimated to be 4,000 million tonnes out of which the existence of 1,558 million tonnes has already been proved. A project report for the Singrauli coal mines with an annual production capacity of 3 million tonnes has been approved and the preliminaries are being expedited. Another project report for the production of 1.5 million tonnes a year from a second mine at Jhingurdah was under preparation.

Petro-Chemicals

Mr. O. V. Alagesan informed the Lower House that the French Petroleum Institutes had recommended the establishment of five regional petro-chemical complexes by stages to be completed by the end of the fourth Plan period. In regard to this proposal, the Institute has recommended that these units should be located in Bombay, Gujarat, South India, Barauni, and East India. The estimated cost of the five

complexes (excluding working capital, housing and petro-chemical utilisation equipment) is placed at Rs. 263 crores. The report was being examined by the Indian Government's technical experts.

The Government had formulated a scheme for the development of Marmagao Port (Goa) and had made specific recommendations in respect of the scheme to the Planning Commission. The total expenditure on the project is estimated at present at Rs. 20 crores. Out of this outlay, Rs. 8.5 crores will be spent during the third Plan period.

Explaining the position regarding the Port of Haldia, Mr. Raj Bahadur stressed that there was no question of any clash of interests arising between the future of Calcutta port and the future of Haldia port. The final decision on the pattern of the authority for the administration of Haldia would be taken after detailed studies are carried out on several important points.

Expenditure on Education

A statement was laid on the table of the Lok Sabha showing the trends in the expenditure incurred by the States on education and its proportion to the total budgetary expenditure. The trends are tabulated below:—

Percentage of Educational Budget to the Total Budget			
State	1960-61	1961-62	1962-63
Andhra Pradesh	20.2	19.2	21.4
Assam	16.8	21.6	23.1
Bihar	17.4	19.8	11.7
Gujarat	20.0	19.7	29.8
Jammu & Kashmir	14.3	17.0	11.6
Kerala	34.0	32.6	19.3
Madhya Pradesh	20.4	20.6	23.6
Madras	19.6	22.6	24.0
Maharashtra	20.6	19.1	17.9
Mysore	20.0	21.9	17.9
Orissa	11.0	11.8	15.2
Punjab	18.0	20.1	12.4
Rajasthan	21.7	24.6	27.7
Uttar Pradesh	13.4	14.6	14.1
West Bengal	15.3	17.9	19.5

Special Steels and Alloys

The Minister for Steel and Heavy Industries, Mr C. Subramaniam, explained briefly the prospect about increasing the production of special steels and alloys. He informed the Lok Sabha that Government had licensed an aggregate capacity of about 600,000 tonnes of special, stainless and alloy steels in the public as well as private sectors to date. The present production was about 53,000 tons per annum whose break-up was given as 29,000 tons of spring steel manufactured by six units and 24,000 tonnes of electrical sheets manufactured by TISCO.

The measures of expansion now under way are broadly as follows: The contract for the alloy steel plant at Durgapur in the public sector was likely to be concluded with a Japanese consortium in the very near future. Other units in the private sector were also likely to go into production by 1966-67. So far, Government had approved technical collaboration in respect of nine such units licensed for the manufacture of special steels and alloys. This licensing was exclusive of and in addition to the technical collaboration for the Central Alloy Steel Plant at Durgapur. In so far as the five units licensed for the manufacture of spring steels and alloy steel casting is concerned, foreign technical collaboration is not called for as indigenous skills are available.

Then there was the conversion programme of the Mysore Iron and Steel Ltd. into an alloy steel plant for which technical collaboration was arranged. This programme was expected to commence in the first quarter of 1964 and the ultimate

capacity of 77,000 tonnes of alloy steels was expected to be reached by 1966-67. The technical collaborators are Messrs Bohler Brothers of Austria. Credit is being negotiated from Austria and furthermore foreign exchange equivalent to Rs. 6.4 crores, which is required to meet the cost of the plant and equipment, is likely to be arranged under the West German credit. No investment has been made thus far in the conversion scheme. But an outlay of Rs. 4.5 crores has been incurred up to June 1963 for the expansion of mild steel. Its relevance in this context is that the facilities provided for mild steel expansion and extra foreign exchange investment from Austria and West Germany will be utilized for the manufacture of special steels.

Steel Targets

On the specific question as to whether the Steering Group for Iron and Steel had set up any targets for the fourth Plan, Mr. Subramaniam furnished the following information to the Lower House. He stated that the Steering Group had recommended a production target of 18 million tonnes of mild steel, 3 to 4 million tonnes of pig iron and 1 million tonnes of tool, alloy and special steels. So far as mild steel is concerned, the increased production is to be realised by the expansion of the existing plants and by establishing two new plants exclusive of Bokaro. The share of the private sector in the expansion will be 2 million tonnes. The detailed programme for tool, alloy and special steels is yet to be finalized.

"Nationalisation" of Audit

The Minister of Industry, Mr. Nityanand Kanungo, was questioned in the Lok Sabha about the Government's decision on the INTUC's demand for the "Nationalization of audit" made at its 14th annual session. In reply he stated that it was not at all clear as to what precisely was meant by "nationalisation of audit" in the INTUC's resolution. But he explained that if the demand was that the auditors of the companies should be appointed by the Government, this issue was very carefully considered by the Reviewing Committee appointed by the Government and the Institute of Chartered Accountants only a few years back. Government still adhered to its view that such a step was neither necessary nor desirable in the present stage of our developing economy. Section 233A of the Companies Act, 1956, provides for the appointment by the Government of a special auditor in certain circumstances after the normal audit by the statutory auditor. But the Government as well as the Institute of Chartered Accountants were of the firm view that the independence of auditors ought to be maintained and appropriate measures ought to be taken to preserve it. "Nationalisation of audit" was thus not contemplated by the Government.

Rural Credit

Mr. B. R. Bhagat, Deputy Minister of Finance, disclosed in the Lok Sabha that, after the introduction of the Gold Control Order, the annual average rural credit provided by the scheduled, non-scheduled and co-operative banks to farmers declined from Rs. 60 crores to Rs. 25 crores. But he explained that the Government was taking measures to improve, if not totally reverse, this trend. To this end, it had adopted a policy of liberalising the conditions under which credit was advanced by the medium and small banks which cater to the requirements of farmers. Likewise, advances against foodgrains were also being made on relaxed and liberalized terms.

Issue of Capital

The Finance Minister informed the Lok Sabha last week that during 1962-63 the total amount of capital which was authorized by the Government to be raised by commercial and industrial units was of the order of Rs. 408.2 crores. The

number of companies which required additional capital for the expansion of their present production capacity or business was 186 and the number of companies which were allowed permission for capital issue for new flotations was 131.

Fall in Coffee Production

The Minister of International Trade, replied in the affirmative to a question whether there was a decline in the production of coffee in the past two years. He stated that compared to the record production of 68,020 tonnes during the crop year 1961-62, the production of coffee during the crop years 1961-62 and 1962-63 showed a decrease of 22,200 tonnes and 14,000 tonnes respectively. The figure for 1962-63, however, does not show the final estimate. Explaining this steep fall, the Minister emphasised that the output in 1960-61 was abnormally high and, as such, it cannot be taken as representative of normal conditions. Unprecedented rains in 1961-62 and draught conditions in 1962-63 had their adverse repercussions on output. The Government was taking effective measures to raise coffee production, such as distribution of improved strains which are high-yielding and disease-resistant; tendering advice on control of pests and diseases; demonstrating intensive methods of cultivation and granting loans for intensive as well as extensive cultivation. In addition, Government was conducting trials to bring areas under coffee cultivation in Andhra Pradesh and the Andamans.

Bills

The Employees Provident Funds (Amendment) Bill, 1963, which was passed by the Rajya Sabha, was taken up for consideration by the Lok Sabha. This Bill contains some important amendments, the most vital among which relates to employees employed by or through contractors. The benefit of compulsory contributory provident fund was extended to this class of employees also in addition to those employed in factories and other establishments by the Employees Provident Funds Act, 1952. The definition of "employee" contained in this Act covered an employee employed by or through contractor, but there is no specific provision in this Act making it compulsory for the employer to contribute his share to the fund of this class of employees. In March 1962, the Supreme

Court gave a ruling that the provisions in regard to contract labour contained in the Employees Provident Funds Scheme, 1952, framed under this Act, were void for two reasons—there was no power conferred by the Act on the contractor to recover the amount of contribution from contract labour and there was no obligation on the contractor to pay to the employee of this class the employer's share of contribution. This ruling led to a strange situation resulting in discontent among contract labour which enjoyed the benefit of the Fund prior to March 1962. The lacuna is being removed by the amendment of the benefit of exemption from attachment of provident fund to certain employees whose provident fund is not now Central Board of Trustees to administer the Employees Provident Fund; empowering the Central, Deputy and Regional Provident Fund Commissioners to determine the provident fund dues and other charges recoverable from an establishment; authorising Provident Fund Inspectors to make searches and to seize documents etc., for the implementation of the Act and to provide for the transfer and acceptance of Provident Fund accumulations from the Employees Provident Fund to a recognized Provident Fund and vice-versa in cases where an employee leaves one fund and joins the other by change of his job.

The Major Port Trusts Bills was passed by the Lok Sabha for the purpose of constituting Boards of Trustees for the administration of three new major ports of Cochin, Kandla and Visakhapatnam. The provisions of this Bill will be applicable to the other major ports that may be set up or raised to this status in the future. For each of these major ports there will be a Board of Trustees whose Chairman will be appointed by the Central Government, while a Deputy Chairman may be appointed by it if necessary. The strength of the Board will consist of 22 members. Mr. Raj Bahadur, Minister for Shipping, rejected the demand made in an amendment that Members of Parliament should be included on the Boards of and not deliberative bodies. However, he accepted an amendment to the effect that the Boards should include at least two representatives of labour.

Getting the Best Out of It

(Facilities Utilisation Analysis)

By Brigadier K. PENNATHUR

WHAT ARE 'facilities' in the industrial sense? Facilities are resources which are pressed into service, at the cost of time and capital, in the pursuance of an industrial activity of providing goods or services to the society. These are in several forms: manpower, which comprises brain, brawn, skill and morale; materials—raw, semifinished and finished; machinery and equipment; space, plant and buildings; and auxiliary services like electricity, power, gas, telephones etc.

Whatever be our sphere of organising and controlling human effort directed to specific ends, we utilise some or more of these facilities. While some of us use them more effectively and to better purpose than others do, the basic fact is that all of us use them. There are Work Study specialists who subject the utilisation of facilities to the techniques of critical investigation and, through optimisation of utilisation, effect cost reduction and achievement-maximisation. Since the end products of reduction in cost and maximisation of achievements are our primary concern, it should be worth our while to analyse how facilities are utilised in varied spheres of human enterprise.

Barring the way to higher efficiency, effectiveness or productivity are many problems—some of which appear almost insurmountable. A successful executive, administrator or manager is one who can reorganise a problem and have the will to solve it and have the means with which to solve it. The last part can be easily overcome by using Work Study specialists to study the problems and make recommendations for their solution. But the first two aspects are right in our domain.

Sources of Waste

Among the many problems that beset us the least apparent and yet the most important one is that of Facilities Utilisation. It is here that the area of maximum cost reduction lies. We should, therefore, at least be aware of the various facets of this problem. The theme of this paper is to highlight some of the sources of waste in our utilisation of facilities so that it could bring about an awareness of the problem which could motivate us to determine to do something about them.

When we make use of the services of an individual, we aim at getting from him a certain amount of service the work content of which is generally correlated in terms of time or quantity and quality of achievement. Let us consider three hypothetical cases that of: a surgeon, a personal secretary and a machinist.

Against the contracted service, let us say in terms of time stipulation, the person 'serves' for eight hours in the day. It is not necessary, nor even feasible, that the person 'works' all the eight hours. A certain amount of relaxation is needed, in between spells of work, to avoid fatigue and to enable the individual to attend to his personal needs. If the summation of the various relaxation periods, spread out during the day, amounts to a hypothetical figure of one hour, then we should expect seven hours of work from the person. But, do we?

The surgeon does surgical work for three hours: He does administrative work, which does not require training as a surgeon, for two hours. The remaining time he spends in enforced idleness. The cause is simple: there is only one surgical theatre and it takes 87 minutes between two usages for cleaning up the theatre after the first usage and preparing it for the subsequent one. The surgeon, however, will

be quite content with a 20-minute break between two schedules. This is a case of under-utilisation of a surgeon, for no fault of his: the queue of patients is there; the surgeon is willing; but the 'make ready' and 'put away' activities in the theatre are the main bottleneck!

The itemisation of the secretary's daily service time is: 2½ hours of secretarial work; one hour of work for the executive, but not connected with the organisation; one hour of welfare work—like preparing and serving tea etc; the rest of the time in activities of relaxation. The reason is very simple—there is not enough work load for the secretary and probably for the boss too.

The machinist's sources of wasted time are: setting up and tooling at frequent intervals due to a constant variety in the type of jobs; waiting for work-piece to arrive from the previous process; breakdown in machinery; power failure etc.

Figure 1 below depicts a few samples of utilisation. Thus in many cases, the 'effective time' of work is grossly reduced due to various factors. Next, we must face the fact that 'effective time' is not necessarily 'effective work'. Mere application to a specified task for a specified time does not result in effective work. Two additional factors come into the picture: the 'method' of performance; and the knowledge, acumen, skill and dexterity of the performer. An inefficient method prescribed for the performance of a job supported by inept material, tools, equipment, might require 4 hours for the completion of a task. A better method might drastically reduce the time from 4 hours to 30 minutes. Again, a trained and correctly qualified person would take very much less time, task for task, than an untrained or semi-qualified person.

In piece rate systems of payment for work, the factor

FIGURE 1

BACK TO GRIHASTHASHRAM?

of 'method' is predominantly the cause of not maximising the achievement.

Figure 2 below shows how the working time need not necessarily produce corresponding work, giving the lie to our facile and innocent assumption that 'being at work' is the same as 'effectiveness at work'.

FIGURE 2

In the field of materials, utilisation assumes great magnitude because of the fact that the cost of materials also is around 60 per cent of the cost of the end-product! Direct factors affecting utilisation of material are: specifications of quality being much higher than required; persistence with materials in short supply rather than look out for cheaper but equally effective substitutes; more quantity being used because of faulty design; waste of material during processing due to bad process planning; waste due to defects etc.

Indirect factors are: capital locked up due to over-stocking and safety-cushion; expenditure on maintenance, care and preservation of stored items; waste due to deterioration; locking up of storage space; materials handling methods etc.

Figure 3 depicts the loss of 'value' of materials due to various causes.

In the case of space and buildings, the utilisation factor is rarely given the importance it is due. Firstly there is the bogey of 'cushion for expansion.' Thus a 100 per cent reserve in covered accommodation and 200-500 per cent reserve in open area is 'normal'! 'Norms', evolved after detailed surveys and studies are not to be our guides because our requirements are something special. Space and buildings are not consider-

FIGURE 3

ed scarce commodities in our country which probably accounts for our lavish outlook. But they will soon be. In central London, the space occupied by a waste paper basket could the same will be the case in our big towns too.

Even where there is an apparent justification for extra accommodation, an analysis may reveal that by suitable readjustments, the extra requirement could be eliminated or reduced. A pertinent example is a defence training establishment abroad. Because of the expansion in training activities, it was estimated that the present building would have to be extended at a cost of £500,000. An analysis of the existing set-up revealed the following percentages of utilisation:

	Per cent
(a) Class room	21
(b) Laboratories	41
(c) Auditorium	3
(d) Library	17
(e) Cinema hall	6

It was found, after a detailed readjustment in the schedules of training programmes, phasing of work in various courses in a rational manner and erecting a balanced multiple utilisation chart of various rooms and halls, that the existing accommodation could cope with not merely the immediate expansion but also a further expansion of 50 per cent! The necessity for building an extension was eliminated.

Some remarkable facts have been revealed by the study of utilisation of minor items such as lavatories, waiting rooms, linen cupboards, old-files-coffins etc. A study of office tables alone revealed that the size was seldom dictated by the necessity of utilisation but by the status of the officer.

In the above case, the utilisation was rated against a 7-hour day. There are examples, of schools, operation theatres, the utilisation had been rated against a 24-hour day and the acuteness of scarcity of accommodation overcome by achieving 87-92 per cent effective utilisation over a 24-hour day.

In the case of machinery the same question 'why only eight hours?' can be pertinently asked. Equipment and machinery are merely capital locked up—capital which does not earn any interest but, on the contrary, depreciates and, in some cases, at an alarming rate. The rate of return on the

capital is directly proportional to the factor of utilisation on a round-the-clock basis.

Factors responsible for under utilisation of equipment and machinery are: non-utilisation on a 24-hour-day basis; bad machine loading and scheduling resulting in 'idle' time; ineffective production control causing 'waiting' time; poor

production planning with frequent changes in 'types' of jobs leading to avoidable waste in retooling time; inefficient method, taking up excessive machine time; break-downs due to weak planned preventive-maintenance; absenteeism among operators etc.

Figure 4-A represents the futility of an 8-hour-day utilisation.

FIGURE 4A

FIGURE 4B

tion basis. Figure 4-B shows the relationship between effective work load and 'usage' time.

There are also cases of machinery and equipment whose utilisation is governed predominantly by work load. A few samples are illustrated in Figure 5 below.

And so on and so on and so on. The facts that could be

quoted would fill a book. The aim is not to make anyone look small but to bring about a recognition of the colossal waste that could be taking place in the utilisation of facilities in our own organisations. A broad pattern of the areas of waste has been traced. Only if we become aware that such problems do indeed exist can we gear ourselves up to the task of having them solved.

FIGURE 5

WINDOW ON THE WORLD

The Failure of Gaullism

From Our Special Correspondent
PARIS:

IT IS NO DOUBT too early to say that Gaullist foreign policy is bankrupt. The General still holds several strong cards; he could conceivably manage to pull many chestnuts out of the fire; and it would require fewer changes of course than he effected successfully in his Algerian policy to put a new face on his European policy such as to repair the defeats he has suffered to date. But all of that would be salvage work, disguised retreats, making the best of a bad situation. There is no doubt that his original design is ruined, for his lifetime at least: the "European Europe" that he envisaged building a new political unity and independence on its recovered economic power is in abeyance. It is even possible that such a Europe will never arise, that West Europe's failure to respond to the prospect de Gaulle outlined is definitive. That is to say, one can well imagine Russia and the USA developing their curious alliance to consolidate their superiority over all their clients and dependents, so that any attempt at building a third challenger was foiled—unless one day China can fill that role.

Cheerful Illusion

However distasteful this prospect may appear to some Europeans (both Britons and Continentals) who have a nostalgia for independence, one must take note of the fact that most of the nations of the world are not disturbed by it. On the contrary, they cheerfully embrace the position of dependence and cherish the hope (the illusion, perhaps) that in the shadow of the reconciled super-powers all the peoples will be able to devote themselves in peace to constructive tasks.

Still, one can never be too cautious about pronouncing the demise of the spirit of independence. However attractive subservience may appear, it seldom satisfies for long men who have the means to throw it off; it has happened before today that prophets of independence have died in disappointment but a later generation has revived their ambitions and realised them. The notion of an independent Europe is too plausible, too strongly suggested by the economic facts, to be quite dead even if de Gaulle has finally failed to secure support for it. And the illusions of a world living happily under fraternal American and Russian im-

perialisms are too evident for men to place long trust in them. The design of an independent Europe will surely be taken up again, and perhaps sooner than many think, so it is worth asking why it came to nothing in its Gaullist presentation.

Two reasons for this failure come to mind at once. The first was the General's unwillingness to let a united Europe take supranational form, that is to build it on the surrender of sovereignty by national states. The second was his effort to make West Germany, rather than Britain, France's partner in the work, on the grounds that the British were insufficiently independent of the Americans to co-operate loyally in the task of constructing a united Europe that would inevitably have galled the USA. In other words it is suggested that de Gaulle should have done either of two things (not a supranational unity). Either he should have let the original European-unity plans go ahead, with an elected parliament in Strasbourg and an embryo supranational government port of the Germans and of Benelux instead of frightening them with his outmoded nationalism. Or else he should have opened the doors of Europe to Britain, in which case he would have found a much more reliable partner in the truncated Germany reduced to impotent dependence on American protection.

It is obvious that by refusing both these courses, de Gaulle vastly complicated his own work and invited the failure that has overtaken him. It would have sufficed to pretend to enter on one or the other of them to expose the hypocrisy of his Benelux and German opponents who claim, with patent insincerity, to favour both a supranational Europe and British membership, when everyone knows that these are irreconcilable. As it was, de Gaulle managed only to arouse the opposition of the Americans (which was of course inevitable, European independence being what Senator McCarthy would have called an un-American activity by definition) and of the British and of the European-unity clan, he did nothing to mollify despite predictions to the contrary. In the face of this disparate coalition, his failure was unavoidable and it only remains, as we have said, for

de Gaulle to save what he can.

Among these various errors, some are greater than others. One may doubt, for instance, whether an independent Europe could really have arisen from the supranational fantasies of the European-unity visionaries. They imagine that de Gaulle vetoed their schemes because he was reluctant to surrender a jot of French sovereignty, that his nationalism was incompatible with genuine attachment to the cause of unity; and from there they have passed to the accusation that his idea of a united Europe was disguised French domination. The accusation is ridiculous and finds no support in the facts; it has served only American campaigns against European unification, which began as soon as Washington saw what was entailed. The real reason for Gaullist opposition to the supranational "ideal" was the perfectly sound argument that you do not start making an independent union by destroying the existing instruments of European power, which happen to be national governments. A headless Europe, where national capitals had handed over authority to tyro bureaucrats in Brussels, would be the plaything of Washington, who could dominate the insecure infant "super-state" much more effectively than it does the national governments today.

U.S. Hegemony

European-unity fanatics who cling to the super-state ideal have to admit that in reality it was only de Gaulle's restoration of the French state in 1958 that made possible such unification as has since been achieved. That is, the way toward European co-operation lay through bolstering the authority of national governments, not beheading them. But now they ask sadly why de Gaulle had to defy both the Americans and the unity party. They cannot see that this was one and the same task. To let the architects of a super-national authority have their way would have increased American domination of Europe, which could only be stemmed by strong national governments who agreed to collaborate in a European design, which is what de Gaulle invited them to. It is evident that once their baby super-state began to run into American opposition, as it was bound to do, the supernationalists in Brussels would have bowed like reeds in the wind, lacking all the historical strength of national states. This is so true that one can confidently forecast that if the USA succeeds, by means of its nuclear monopoly and its "free-trade" plans, in consolidating its hegemony over West Europe, it will lavishly encourage the formation of a puppet super-state in Brussels, this being the ideal instrument for its domination.

The other error, then, seems to have been the more

serious: the idea that there were fewer supporters for a European policy independent of the USA in Britain than in West Germany. The last few months have shown that the contrary is true. Few Britons delude themselves that their third seat at the super-powers' table is permanent, for they see that the aim of American policy must inevitably be to put Britain "back in the ranks" and that Britain alone, without the other Europeans, has no prospect of retaining her independence. Although infinitely more cautious about defying the Americans, the British are as attached to preserving their autonomy as the French. If the affair could be handled discreetly (without the open challenges that de Gaulle throws down in his Press conferences), Britain would no doubt collaborate in the sort of political union that the General outlined. At least, whenever it has been a question of doing something that asserted Europe's independence of America—whether it be in constructing a supersonic airliner or in projecting an independent satellite-communications network—it has been Britain that joined France.

The German Dinghy

West Germany in contrast, in whom de Gaulle placed so much hope in the treaty he signed with Adenauer, is entirely subservient to American policy and cannot help being so. If one is looking for the American "Trojan Horse" in Europe, for the colonial mentality, for the signs of the U.S. corporations' domination and for complete reliance on American protection, one must look in West Germany rather than in Britain. Anglo-French collaboration in a design to render a restored Europe free of outside direction would have been extremely difficult, but Franco-German collaboration in any such scheme would be—has already been proven to be—impossible. The Franco-German reconciliation is necessary for anything worthwhile in Europe (and it is essential for any effective American domination of the Continent too) but it is insufficient foundation for an independent Europe. This is beyond doubt the main reason for de Gaulle's failure. The Germans (not for any reason having to do with national character, of course, but simply because of their present exposed situation) are not candidates for a venture in independence. For centuries the Europeans have called Holland "the dinghy behind the British schooner" (a characterisation amply confirmed in the past year, incidentally), and some similar description must now be applied to West German relations with the USA. An Anglo-French Europe will be difficult to construct and might not resemble de Gaulle's ideal in some respects, but it is the only likely form of European independence. A Franco-German Europe has proven a vain imagining.

Flexible "Stop and Go"

By JOSSLEYN HENNESSY

LONDON:

THE O.E.C.D.'s newly published 1963 Report on the U.K. Economy has an important section on the Management of Demand in the U.K. which, if the Labour party were to win the next election would assume a certain quaint historic interest, as having lent the O.E.C.D.'s authority to encouraging a solution of the problems of rising prices and wages by techniques compatible with the maintenance of consumer's choice and a free market economy.

It is noteworthy that all economists, whether, like Professors F. W. Paish and L. Robbins, inclined to the Right, or, like Mr. J. K. Galbraith and Dr. T. Balogh, inclined to the Left, agree in their diagnosis of our troubles: namely, that modern "full employment" policies inevitably move into "over full employment", in which the pressure of demand is pushing up incomes faster than the maintainable rate of growth of output, so that more and more money chases the same volume of goods and services. They further agree that

this leads to the misallocation of resources by enabling inefficient firms to make (inflationary) profits, by causing firms to compete against each other for, and to hoard, scarce labour, and, not least, that by forcing up export prices and attracting in a flow of cheap foreign imports, it all ends in a balance of payments crisis. They agree that whereas, possibly, in the short run, inflation maintains full employment, it would in the long run certainly lead to massive unemployment by (a) pricing the nation's exports out of world markets and (b) discouraging the technical innovation that comes from competition. They agree that inflation can only be cured if the pressure of demand is kept below full productive capacity, so as to give a margin which, for the U.K. economy, Professor Paish, by empirical calculations (See his "Studies In An Inflationary Economy", Macmillan, 1962) puts at 5 per cent below total capacity, with 2 to 2½ per cent unemployed (i.e. between 500,000 and 625,000), although if structural unemployment could be eliminated and the percentage of

ployment made uniform throughout the country, the average level could be lower.

But on how to achieve this result, the Left and Right-inclined economists are in total disagreement.

Because the Labour party has been greatly influenced by Mr. Galbraith and Dr. Balogh, a great many people who had hitherto dismissed their views as wittily or dangerously eccentric began to study them afresh as Labour's chances of victory seemed to loom larger.

Mr. Galbraith would maintain the required margin of slack in the economy by taking workers out of production as the index approached the danger line of full capacity, compensating them with unemployment pay equal to their wages in order to avoid deflation, and controlling wage increases by authority in order to avoid wage-wage and wage-price spirals. Dr. Balogh, however, says that "anticipated maintenance of demand will rob unemployment of its terror and wage-bargains will continue as before in disregard of national needs." For Dr. Balogh, the root of the evil "obsession with consumer's choice". Public ownership both eliminates the motive for pushing production up to capacity and provides the means for an increase in collective consumption (education, health, etc.) without having to raise taxation, and the Labour party will have to stop soft-peddalling on nationalisation. Planning will get social priorities right and prevent waste of resources on the production of Cadillacs, luxury housing, and other goods of which Dr. Balogh disapproves.

Fiscal Controls

Professor Paish, on the other hand, whose views have influenced Conservative Chancellors, has a substantial number of economists of all political shades (e.g. Professors A. K. Cairncross, L. Robbins, T. Wilson, D. H. Robertson, etc.) with him in arguing that production can be kept within 5 per cent of capacity by controlling the volume of demand by monetary and fiscal measures. If you do that, they agree (with some qualifications) that you do not need a Wages Policy, or wage controls, because, if inflation is eliminated, wages will depend on the inter-action of supply and demand, and there will be no cost push inflation.

With one voice, the Left attacks such attempts to control demand as leading to the "Stop and Go" of the past few years, alternating periods of excessive price rises and excessive idle capacity, which interfere with industry's own planning, and lead to labour hoarding in anticipation of the next "Go", which defeats the objects of the policy. They also usually imply that the policy keeps production at 95 per cent of a static total of production.

To this, the proponents of the policy reply that just as the technique of public works and deficit budgeting had to be learned through trial and error and did not work effectively when first tried out, so the techniques of managing demand in conditions of full employment have had to be learned. First, the apparatus of statistical analysis required to recognise whether the point for putting on, or taking off, the brakes had been reached was deficient, so that the brake was put on too late, and therefore had to be applied more violently, and was taken off with equal crudeness. Finally, they point out that the statistics show that (a) the demand control policy has not prevented total capacity from rising, and (b) that capacity actually rises much faster in periods when demand is not pressing it all out.

The 1963 O.E.C.D. Report on the U.K., which has, on occasion in the past, been critical of U.K. policies, by implication rebukes those who have been criticising the government for not reflatting faster, and points to the merits of the present policy which, by better timed and gentler applications and removals of the brakes, avoids short lived phases of hectic increases in demand (as, e.g., in 1959 when consumer expenditure rose 10 per cent in 12 months and gross capital

formation rose by 18 per cent) followed by a phase of severe restriction. The O.E.C.D. praises the government's realisation that if management of demand is to be flexible, the government cannot delay fiscal changes until the budget but must take powers to vary taxes by administrative order, and concludes with the discreetly worded comment: "In the light of such considerations, it is difficult to quarrel with the judgment of the U.K. authorities."

In the event that a Labour government were to adopt a Galbraith-Balogh policy next year, it will be amusing to see whether the O.E.C.D. will manage a corresponding reversal of face and will find it difficult to quarrel with the abolition of consumer's choice, the inauguration of central planning, and a cheap money policy promoting inflation, repressed into black markets by a galaxy of controls.

Planning Commission in Melting Pot?

By Our Special Correspondent

NEW DELHI:

SPECULATIONS REGARDING further changes in the Central Cabinet continue unabated. It is considered likely that the Prime Minister would more or less complete the process of reorganisation within the first fortnight of this month, although the actual induction of the Congress President, Mr. Sanjivayya, into the Central Cabinet may have to be effected some time later. The names of Mr. K. P. Tripathi from Assam and Mr. Jetti from Mysore are frequently mentioned as possible additions to the ranks of Ministers at the Centre. It now appears to be the case that the possibility of Mr. Asoka Mehta joining the Planning Commission as its Deputy Chairman is negligible. It has been suggested that Mr. Mehta stood up for an autonomous body, a suggestion which has reportedly not found favour with the Prime Minister. Currently the expectation is that a Congressman with adequate political standing will probably be preferred. The larger question of the future set-up of the Planning Commission will have to be decided.

Lok Sabha has been discussing the extent of poverty in our country. This debate is provoked by Dr. Lohia's assertion that about 300 million persons in this land have to subsist on three annas per day or less. In this context an interesting study of the economic conditions of the tribal people in Madhya Pradesh, which the National Council of Applied Economic Research has just published, provides significant information. The Council's survey has disclosed the following estimates of average annual family income and expenditure in the tribal areas of Madhya Pradesh:

Area	Income (Rs.)	Expenditure (Rs.)
North-Eastern Zone	561	589
Eastern Zone	855	667
Western Zone	809	805
Central Zone	563	609
Southern Zone	669	718

From the more detailed figures given in this study, Bilaspur (West) in the Eastern Zone of the State reports the highest average family income of Rs. 1,132 per year, while Khargone in the Western Zone reports the highest average family expenditure of Rs. 1,165 per year. These levels are, of course, very much higher than the estimate of about Rs. 68 per year per person (or Rs. 340 per family of five) figuring in Dr. Lohia's assertion. The National Council's survey indeed shows that for one area, that is Raigarh in the North Eastern Zone, the average family income estimated at Rs. 316 per year was below Dr. Lohia's figures. But even in this case, the average family expenditure at Rs. 346 was above Dr. Lohia's estimate. Generally speaking, the tribal people fall into the poorest sections of the community. Even in their case Dr. Lohia's assumptions seem greatly to exaggerate the extent and intensity of poverty.

The Union Finance Ministry, it is understood, will shortly provide a further line of credit to the Refinance Corporation for Industry Ltd. This will be subject to reimbursement by the U.S. Agency for International Development. The Corporation at present has a line of credit from the Government of India (against reimbursement by USAID) to an amount not exceeding Rs. 26 crores. Of this, a sum of Rs. 18.50 crores has already been borrowed by it. The Cor-

poration expects to draw and utilize the entire amount of Rs. 26 crores earmarked for it before the end of the current financial year. By June 30, 1963, it has sanctioned refinance to the tune of Rs. 36.15 crores, out of which Rs. 20.64 crores have been disbursed. The 313 applications received for extending refinance facilities up to June-end involved a sum of Rs. 49.21 crores.

Addressing the Import and Export Promotion Advisory Councils in New Delhi this week, the Minister for International Trade, Mr. Manubhai Shah, indicated the possibility of effecting a slight liberalisation in the imports of raw materials, components and spare parts during the next six months. This, he said, had been made possible by increased availability of united external assistance and some improvement in the country's exports—exports in the first seven months of 1963 at Rs. 427 crores showed an increase of Rs. 56 crores over the figure for the corresponding period last year. Higher production of a number of items and the increased indigenous content in various others, he added, would also make available savings for diversion to other uses. He, however, stressed that the defence effort would naturally have the first priority on the available foreign exchange resources and any relief that could be given on industrial raw materials, components and spares must necessarily be confined to uses of high priority or against export promotion. The requirements of small-scale industries would also receive sympathetic consideration.

Export Incentives

Mr. Shah also made a number of other important pronouncements. He declared that the export incentive schemes which were in force today were not proposed to be modified in any way till the end of the third Plan. He assured the African countries that India did not aim at achieving self-sufficiency in raw cotton, which would shut out imports of this commodity from the African suppliers. All the existing contracts in this regard would be honoured and cotton imports from African countries would be continued. The possibilities of dovetailing some of the Indian exports to the development plans of the African nations might also be studied.

Another important announcement made by Mr. Shah was that an Export Credit and Guarantee Corporation on the lines of the Mathrani Committee's recommendations was likely to be set up before the end of the current year. Discussions are being held with the Reserve Bank in this regard. This new body would incorporate the functions of the Export Risks Insurance Corporation and also of the revolving Export and Import Stabilization Fund suggested to be established by the Mudaliar Committee to finance the additional imports of raw materials and components for export industries.

As regards the jute industry, Mr Shah indicated that a revolving fund might be placed at the disposal of the IJMA for import of jute cuttings from Pakistan. He favoured the setting up of captive power plants by the jute industry so that electricity supply to this important foreign exchange earner could be assured. Arrangements, he added, were also being made to the effect that electricity cuts in future should not affect the working of jute mills.

For stepping up exports of Indian films, a Film Export Corporation is to be set up on September 21, 1963. It will explore new markets in the foreign countries. Although the existing export trade in this line is not proposed to be dis-

September 6, 1963

September 6, 1963

turbed, gradual canalisation of film exports through this Corporation is not ruled out.

As regards the ferro-manganese industry, Mr. Shah indicated that a proposal was under consideration for according the same treatment to manganese ore supplies to this industry as is currently being given to manganese ore exports. Ferro-manganese is primarily an export item and its domestic consumption is only a fraction of its total output.

Free Trade Experiment

In respect of the recent demands made for establishing free trade zones at Haldia and Bombay ports, Mr. Shah stated that these proposals could be considered only if the experiment of setting up a free trade zone at Kandla proved successful. He, of course, called for realistic proposals from the quarters suggesting the setting up of free trade zones at Haldia and Bombay.

Mr. Shah further indicated that some cost reduction studies were proposed to be undertaken by the Ministry of International Trade and the Planning Commission as a measure to step up exports. A Madras State Export Promotion Corporation is also envisaged to be set up on the lines of the one established recently in Punjab. This Corporation will help in promoting the exports of decentralised industrial sector.

The two Advisory Councils on Import and Export Promotion are proposed to be reconstituted into a single Advisory Council for Foreign Trade so that the representatives of trade and commerce, exporters and importers, small-scale industries and small exporters, and medium and large-scale industries and export houses could discuss the inter-related problems in a more comprehensive and concrete manner. This Council is also likely to meet more often.

★★

The Minister for Shipping, Mr. Raj Bahadur, stated at the joint meeting of the Import and Export Promotion Councils that his Ministry had planned a number of steps to counteract the adverse effects on India's export trade of the recent 12.5 per cent increase ordered in its freight rates by the Karmahom Conference in utter disregard to the 7.5 per cent increase suggested by the Maritime Freights Commission. They cover both the short-term and the long-term periods.

The short-term plan envisages chartering of foreign ships and calling upon Indian shipowners outside the Conference to ply their vessels on tramp basis. The latter, it was disclosed, had already agreed to quote freight rates lower than the Conference rates.

As a long-term measure, it is proposed to develop the Indian merchant fleet in the direction of tramp vessels. Liberal loans, the Minister indicated, would be granted for acquisition of such ships, provided the shipping companies acquiring them adhered to the tramp trade and did not crave to join the Conference by the backdoor. Permitting of global licences to be issued to tramp trade for a period of one year in the first instance and renewable for longer periods is also contemplated so that these shipping companies can resort to cross trading, wherever necessary.

Mr. Raj Bahadur further stated that the Freight Investigation Bureau was being asked to approach the Conference to forthwith remove the discriminatory treatment accorded by it to shippers in India in the matter of deferred rebate. While in the U.K. and Europe, he added, the Conference allowed either 10 per cent deferred rebate or 9.5 per cent cash rebate at the option of the shippers, no such option was allowed to Indian shippers. There was no reason whatsoever, he opined, to compel Indian shippers to subscribe to the deferred rebate terms.

The Freight Investigation Bureau has also been asked to take up the following two questions with the Conference: (1) in cases of any dispute arising between the shippers and the shipowners, the Indian shippers should be afforded the facility of arbitration which is available to shippers in the U.K. and on the Continent; (2) the Conference must arrange for the grant of immediate dispensation (within 48 hours) wherever they are not in a position to provide shipping space. All other discrimination in freight rates practised by the Conference are also proposed to be examined by the F.I.B. and taken up with it for securing suitable adjustments.

For avoiding any arbitrary increase in the freight rates in future, Mr Raj Bahadur indicated, some legislative action might also be called for.

★★

Two "still born" projects are likely to be revived. The German Ambassador in India, who is at present on leave, is expected to hold discussions with Bayers in Germany to revive their interest in setting up the project for the manufacture of intermediates for dye-industry. A state-owned company, called the Hindustan Organic Chemicals, Limited, was incorporated some years ago, to undertake the manufacture of these intermediates. Side by side, the Government had licensed a number of units in private sector to manufacture several intermediates with the result that the German collaborators in the proposed undertaking. As indicated earlier, the Government is making every endeavour to revive this project.

Meanwhile licensing of new units in the private sector for some of the items proposed to be produced by the proposed undertaking have been postponed.

The heavy structural and vessel plate project, proposed to be located at Wardha, has similarly been lying in cold storage for want of foreign exchange. Originally these were proposed to be two units, one manufacturing heavy structurals and the other Vessel Plates. Davy Ashmore of the United Kingdom had prepared project reports for these two units. Subsequently it was decided to have one unit for the combined production of heavy structurals and vessel plates for which another project report, again by Davy Ashmore, was prepared. This was again put aside for want of foreign exchange. The revised thinking favours two units of which vessel plates plant is proposed to be commissioned in two stages. Davy Ashmore, for the third time has prepared a third project report for vessel plates. In its view, the first stage would not be an economic unit and suggestion has, therefore been made to take up the whole project simultaneously.

This view, prima facie, does not find much favour with the authorities here. Here again, the basic problem is that of finances and the project should go through, even of both the stages together, if foreign exchange were made available for it.

So far as heavy structurals are concerned, the thinking here favours the Austrian firm of VOST, which, it is believed, may be persuaded to participate financially in the project. Developments are expected.

★★

The Government has licensed a capacity of about 600,000 tons of alloy tools and special and stainless steels in the public and private sectors. The present production is about 53,000 tons per annum consisting mainly of 29,000 tons of spring steels by 6 units and 24,000 tons of electrical sheets which are being produced by TISCO. An ad-hoc committee has been set up to explore ways and means of starting production of low alloy steels in existing units with minimum further investment in foreign exchange. The conversion of Mysore Iron and Steel Limited into an alloy steel plant has also been approved and terms of technical collaboration settled. The conversion programme is expected to commence by the first quarter of 1964 and ultimate capacity of 77,000 tons of finished alloy steels is

A DEVIDAYAL In almost every Indian industry from automobiles to electronics, you will find a DEVIDAYAL tube at work—carrying, conducting, channellizing, transmitting—the power that turns the wheels. All for one, one for all!

"A solemn and public pledge," said Tata-Fison.

"To create!" said Ralli, thinking of fertilizers. "To grow healthy crops — ensure bumper harvests — feed India's millions."

"To destroy!" thundered Tata-Fison thinking of pesticides.

"We'll exterminate scurvy pests, villainous insects and strangling weeds."

"In short," they said together, "a public pledge to cover the field!"

Tata-Fison and Rallis have combined their separate marketing organisations into a single, unified service. For the future, all Tata-Fison products will be marketed by Rallis' Fertilizer and Pesticides Division. The merger will prove of immense benefit to the Indian farmer. For the first time, one integrated service will provide advice and products covering both crop growth and crop protection throughout the country...a notable contribution to the cause of agricultural progress.

5 PER CENT MADRAS STATE ELECTRICITY BOARD BONDS, 1975 FOR Rs. 400 LAKHS

PAYMENT OF INTEREST AND REPAYMENT OF PRINCIPAL, GUARANTEED BY THE GOVERNMENT OF MADRAS).

The bonds will be trustee securities under the Indian Trusts Act and also approved securities for the purposes of the Insurance Act and the Banking Companies Act.

ISSUE PRICE RS 99.75 PER CENT

REDEEMABLE AT PAR ON THE 23RD SEPTEMBER, 1975

Subscriptions will be received in cash or cheques from the 23rd September, 1963. But the lists will be closed as soon as the total subscriptions amount to approximately Rs. 400 lakhs and in any case not later than the close of business on the 28th September, 1963.

Applications will be received at all branches of the State Bank of India within the State of Madras and at the Bank of India at Madras, Bombay, Hyderabad, Calcutta, Delhi, Bangalore and Bangalore City.

Copies of the Notification announcing the terms of issue and application forms are available at all the receivements mentioned above, at all treasuries and sub-treasuries in the State of Madras and at all offices of the State Board.

likely to be reached by 1966-67. The contract for the alloy steel plant at Durgapur in the public sector is likely to be signed with a Japanese consortium very shortly. Other units in the private sector are also likely to go into production by 1968-77. Government have so far approved technical collaboration in respect of 9 such units licensed for the manufacture of alloy steels and special steels besides the technical collaboration for the central alloy steel plants of Durgapur. No technical collaboration is envisaged in respect of 5 units licensed for the manufacture of spring steels and alloy steels casting as the manufacture of these items does not require the application of skills not available in the country.

Due to the Emergency the entire woollen industry was geared for Defence Production and whatever stocks of wool tops were available were utilised for Defence requirements. It was not possible to give any quota of yarn for civilian production.

The woollen mills have since been permitted to utilise a part of their capacity for meeting civilian requirements and licences for the import of raw wool/wool tops have been issued to them.

The requirements of wool for the third Plan targets are :

Wool tops	32 million lbs.
Raw wool	33.7 million lbs.
Rags	14 million lbs.

The following additional quantities of wool will be required for Defence purposes at the present rate of demand.

Wool tops	13 million lbs.
Raw wool	18.5 million lbs.
Shoddy yarn	16 million lbs.

It has been agreed between the Japanese and Indian Governments that the foreign exchange cost of the Gorakhpur Fertilizer Project could be financed out of the Yen credits made available by Japan to India. Accordingly, the Fertilizer Corporation of India Limited who are in charge of the Project have recently awarded a contract to a consortium of Japanese manufacturers for the supply of plant and equipment.

It has now been agreed between the Government of India and the Government of Andhra that the existing pattern of participation between the Centre and the State, in the ratio

of 40:60 in the equity capital of the Singareni Collieries Company is to be raised from the existing Rs. 4 crores to Rs. 9 crores in the third Plan in view of the Company's expansion programme. The Central Government has agreed to advance a loan of Rs. 3 crores in the years 1964-65 and 1965-66 to the State Government to enable it to subscribe its share of the additional equity capital.

The rubber tyre manufacturers have represented to Government for an upward revision of prices of their products. The increase is sought on the ground of additional burden of customs/excise duties, freight and transport charges, Central sales tax, Emergency Risk Insurance, bank interest to cover additional excise financing and revised A.I.D. procedure.

The Commonwealth Economic Consultative Council will meet in London on September 24 and 25.

The meeting, which will be held at Marlborough House, will be attended by Commonwealth Finance Ministers, who will exchange views on economic matters of common concern, with particular reference to finance and development.

The value of foreign exchange approvals in principle for the import of capital equipment by the private sector since 1st April 1961 amounts to Rs. 400 crores.

The following will show the amount of sugarcane cess/purchase tax collected and the amount spent for the development of sugarcane during 1962-63 in various States :—

State	Sugarcane cess/ Purchase Tax collected (In Rs. Lakhs)	Amount spent for development (In Rs. Lakhs)
Uttar Pradesh	660.83	126.29
Bihar	124.48	30.87
Punjab	12.00	8.59
Maharashtra	160.76	30.56
Madhya Pradesh	0.59	3.07
Andhra Pradesh	130.18	40.27
Madras	20.92	14.36

It will be seen that the sugarcane cess, originally intended to improve the quality and yield of sugarcane is being largely used to finance ways and means expenditure.

Will He? Won't He?

From Our Correspondent

BOMBAY:

THE APPOINTMENT of Mr. T. T. Krishnamachari, in the place of Mr. Morarji Desai, as Finance Minister, is being interpreted in political circles as a concession to States' party leaders who have been agitating for a change in the Government's economic policies. TTK is well known for his pragmatic approach and it is generally expected that he will come out with a bold plan to improve the economic climate. Before long, the Compulsory Deposit Scheme may be scrapped or modified substantially, the Gold Control Order amended or withdrawn and the controversial SPT may be watered down if not totally abolished.

The share market greeted the appointment of the new Finance Minister with a modest rise in prices and it has maintained a steady uptrend since then. It is the hope of marketmen that TTK will help to revive confidence in the capital market so that the corporate sector may not encounter difficulties in securing the funds needed by it in financing expansion. Mr. G. D. Somani, President of the Indian Merchants' Chamber, remarked that "in him (TTK) we have a man of dynamism and imaginative drive and we expect him to take certain realis-

tic and effective measures to restore the confidence and stability in the capital market." Another section of industry, however, is not without its doubts. It is said that the series of imposts such as the wealth and expenditure taxes, which he (TTK) had levied during his previous regime as the Finance Minister, do not warrant any optimistic expectations. Probably the implementation of Prof. Kaldor's controversial tax recommendations by TTK is still very green in their memory.

Mr. H. V. R. Iengar, chairman of the National Productivity Council and former Governor of the Reserve Bank, told the ninth annual dinner meeting of the Bombay Management Association the other day that fresh thinking was needed for reshaping the economy so that it could regain the momentum of the first two Plan periods. In particular, he was thinking of the administrative machinery and, according to him, under the prevailing system of administration, even vital decisions were being delayed, despite the emergency caused by the Chinese aggression. Lack of prompt decision, he said, was at the bottom of the present deterioration.

The Chairman of the National Productivity Council sub-

jected his alert audience to a fairly extensive travelogue through Brazil, Mexico, Japan, and Spain just to provide an indication of what those countries have been able to achieve in more or less similar circumstances. Evidently, Mr. Iengar has become quite impressed with the progress made by Spain among all these countries, in recent years, and he has good reasons too for that, judging from the improvement made by that country in its rate of economic growth and balance of payments position. But he was quick enough to add that he was not suggesting that India too should, like Spain, resort to devaluation and demolition of all controls, a combination course that has been frequently and consistently advocated by at least one eminent economist in this country. However, Mr. Iengar was categorical about one thing. In the interest of speedy decision, to the lack of which he attributed almost all the economic ills to which we have become victims, he wanted the Government to liberalise or modify its approach to the wide network of controls. This is necessary, he exhorted, if we have to achieve the social objectives we have set unto ourselves.

★★

An investment programme of Rs. 3,545 crores and Rs. 1,710 crores, respectively has been recommended by the National Council of Applied Economic Research during the period 1961-76 to improve the economies of Maharashtra and Gujarat. If the investment targets are implemented, Maharashtra's income would go up from Rs. 1,245 crores (in 1960-61) to Rs. 3,026 crores (in 1976). The per capita income will rise from Rs. 315 to Rs. 557 in 15 years implying a growth rate of 6.1 per cent compared to an all-India average of 5.8 per cent.

Honeymooning with TTK

From Our Correspondent

CALCUTTA:

WHILE POLITICAL commentators are hard put to it to unravel the working of the Prime Minister's mind in accepting the resignation of six senior ministers in the Central Cabinet and appointing three from the remaining members to the key posts of Finance, Home and Food and Agriculture, the stock market seems to have had no doubts about what is intended to be done by the new Finance Minister. After the devastating performance of Mr. Morarji Desai in the last Central Budget, even the once dreaded Mr. T. T. Krishnamachari has become acceptable. Notwithstanding the reiteration of the Prime Minister that the ex-Ministers' policies were those of the Government also, the stock market fraternity finds no difficulty in concluding that a reversal of the controversial measures, to which Mr. Desai clung to the last, is in the offing. For, it is argued that since it has become clear for some time that Government is anxious to revitalise the capital market, the new Finance Minister will perforce have to examine anew the state of the capital market with a view to identifying the factors that are now choking it.

The recent steps initiated at the instance of Government such as asking the various financial institutions in the country to interest themselves actively in new issues have failed to enthuse investors, whose main concern is about the dividend paying capacity and the scope for expansion of the enterprises in which they will invest their funds. If the Government is sincere about fostering capital formation, then there is no way out but to scrap the SPT which is not only scaring away domestic investors but foreign investors as well. If he is convinced of its ill effects, as convinced he must be, then one can depend upon TTK boldly to opt for its abolition. This is all perhaps wishful thinking but then stock markets are always apt to invest in faith. Whether this new found enthusiasm for TTK will hold, time alone can show. It is, however,

According to the Council, the prosperity of Maharashtra is concentrated in Greater Bombay. The major portion of investment (Rs. 1,098 crores) would go to industries; power comes next with an investment of Rs. 629 crores; agriculture gets Rs. 613 crores. Maharashtra accounts for 9 per cent of the country's population and the proposed investment forms less than 8 per cent of the investment envisaged in the country during the 15-year period. The agricultural investment is expected to step up foodgrain output from 5.7 million tons to 12 million tons. While the State is expected to be self-sufficient in food in overall terms, it will continue even in 1976 to be deficit in wheat. After a careful review of the resources position of the State and the demands which would be made on the infra-structure in the process of development, the Council has proposed the investment of Rs. 1,789 crores for strengthening the social and economic overhead facilities.

According to the Council, Gujarat State should invest more in specialising commercial and cash crops than aiming at food self-sufficiency. With its new found oil and gas reserves and minerals and forest wealth, the State has immense potentialities of development. The investment proposed by the Council will enable Gujarat to achieve a 52 per cent increase in the net output of agriculture, a 170 per cent increase in industrial output and about 95 per cent increase in the tertiary output. A rough estimate of the Council shows that the output of cotton and tobacco will double and that of foodgrains increase by 118 per cent. Industrial activity accounts for a fifth of the State's income. Gujarat has the requisite material resources, capital and entrepreneurial abilities to push forward an ambitious industrial programme.

inconceivable that there will not be occasions in coming months that the new Finance Minister may not be doing what the stock market expects him to do.

It is perhaps a chance coincidence that the stock market people have found other factors to sustain their enthusiasm. These are generally said to be the Indonesian Foreign Minister's statement to the effect that the Chinese are not contemplating any further aggression on our borders, the growing indication of the LIC's interest in equities, good corporate news and the revival of investor interest in the stock market. Good corporate rate news such as the improved dividends paid by Bird-Heil-gers group of jute companies no doubt calls for a show of enthusiasm. The fact that during the past few days there has been some buying of cash scrips indicates that the investor too is influenced by current talks about a possible welcome change in Government policy pertaining to the private sector.

★★

The steady trend currently prevailing in the gunny market stems from revival of foreign interest in both the main categories of goods. Latterly, the US has made some sizable purchases of hessian and more is believed to be in the offing. The belief is that the long awaited revival of buying interest in hessian has started and will continue for some time. As been reported to have been concluded in recent days, some sizable business will be put through with a number of foreign countries in the days to come. The confidence that fresh orders will be secured stems from the fact that Pakistan will not be having much of its output available for some months. Purchases by Government of India are also expected to take care of a part of current output. Already the tour of the IJMA delegation of the USSR and East European countries has engendered optimism about increased sales to these countries.

In the meantime, the raw jute market is keeping fairly

steady despite increased arrivals. This is the time of the season when arrivals gather momentum and according to official indications preparations are well in hand to cope with the increased arrivals. The Jute Commissioner has allotted a purchase quota of 7.5 lakh bales, 7 lakh bales to IJMA mills and 50,000 bales to the rest of the industry. This is against 6.5 lakh bales stipulated for August. The Government is determined to ensure that the cultivator is not cheated out of his due share in the official minimum price. It has been indicated by the Minister for International Trade that in order to prevent the middlemen from appropriating the lion's share of the profit, the provision of DIR will be invoked when necessary. The jute mills too will have to share the responsibility with the State Trading Corporation which is to enter the market in a big way this season. Mr. Shah has revealed that on their part the mills will be required to carry jute equivalent to seven months' consumption as compared to three months' requirements as at present.

★★

Addressing a press conference in Calcutta last week, the Chairman of the LIC, Mr. B. K. Kaul, allayed fears that the LIC would be playing any part in the backdoor nationalisation of the private sector. However, it would make sure that the companies in which it invested were soundly managed. As for the investment policy, it continues to be the

same as laid down in the Insurance Act 1938 and elaborated by the Finance Minister in August 1958. The Corporation continues to discharge its duty in stabilising the stock market as will be evident from its large-scale purchases immediately after the commencement of the present emergency. Mr. Kaul recalled the policy statement of the then Finance Minister in 1958 in which he had said that the Corporation may, in the national interest, "sell during periods of boom and buy during periods of depression in order to even out the fluctuations in the stock market" and said that this continues to be one of the guide lines. The prime consideration, however, is the need to safeguard the interests of policyholders in investments. The complaint that the Corporation is not investing much funds in the private sector will not stand close scrutiny. In 1958 the LIC invested 16 per cent of its investible funds in the private sector. The proportion increased to 20 per cent in 1959 and after a temporary decline in 1960 to 18.1 per cent, it shot up in the next year to 29.2 per cent and for the 15-month period ended 31st March, 1963, the percentage has been lending active support to new floatations. During the 15 months period ended 31st March, 1963, the LIC's underwritings covered 58 new issues aggregating Rs. 19.53 totalling Rs. 20.56 crores, were placed in the market, resulting in an allotment for Rs. 20.19 crores.

Markets Turn Hopeful

From Our Correspondent

MADRAS:

THE CHANGES impending in the Madras Cabinet consequent on the decision of Mr. Kamaraj to give up his office, in pursuance of his plan, have not caused any excitement as it is now generally known that Mr. Bhaktavatsalam would become the Chief Minister and the new Cabinet would be sworn in on October 2. There may not even be new additions to the Cabinet, neither any large reallocation of portfolios.

There is, however, greater anxiety to know what will happen at the Centre as Mr. T. T. Krishnamachari has taken over as Finance Minister from Mr. Morarji Desai. There is naturally great satisfaction that it has again become possible for Mr. Krishnamachari to handle the finance portfolio, but it is realised that his task will be difficult and the reversal of some of the policies of his predecessor, which have come in for serious criticism, will not be easy of achievement. The changes in the Super Profits Tax, Compulsory Deposit Scheme and the Gold Control Order, have to be effected in such a way that there is no loss of face for the Government and the objectives are secured at the same time.

A rather optimistic feeling has been noticed in the stock markets in the past few days and a significant rise in the prices of many counters has been recorded in Madras, particularly as Bombay advices have been encouraging. As there are earlier precedents relating to the abolition of the Wealth Tax on companies and the Expenditure Tax, there is no reason why the Super Profits Tax and the Compulsory Deposit Scheme cannot be abolished and new schemes substituted in their place.

★★

The removal of the ban on exports of outsized goat skins by the Central Government has been welcomed by trade circles in Madras City. The imposition of the tax some time back, on the advice of the Leather Export Promotion Council was resented by a section of exporters because the sudden decision of the Government had an upsetting effect on the market and prices declined sharply. It was argued that exports of raw skins could be stopped only over a period and a slump in prices for raw qualities would have its adverse effect on finished products. As there were representations to the Government urging the removal of the ban and it was recognised

that prices had been unduly depressed, the Government agreed to lift the ban. It will be now possible for exporters to fulfill outstanding contracts. If Soviet purchases of pickled goat skins also prove to be satisfactory it can be expected that good prices would be secured on future exports.

★★

Indian coffee producers have been experiencing better trading conditions in the past two years after a bad patch when there was a huge crop and a heavy accumulation of Robusta grades. In the past two years, however, the crop has been only around 55,000 metric tons and with increasing internal consumption and large exports of Plantation grades, even the marketing of Robusta Coffee, which is not very popular within the country, has not been found difficult. In fact, Indian consumers are now obliged to use Robusta grades in increasing quantities on account of the shortage of Plantation varieties and methods have naturally been found to effect suitable blends. The country can do well with a much larger crop as exports have picked up in volume and coffee rate. The Chairman of the Indian Coffee Board referred to the fact, recently, that the industry had been able to complete its export quota under the International Coffee Agreement and that the Board had applied to the International Council seeking an upward revision of the quota of 21,350 metric tons. As a result of changes in the method of export sales and the provision of incentives coffee exports to quota countries have been satisfactory, Plantation varieties particularly Robusta grades also it has been possible to release larger quantities of these grades for export. The absorption by non-quota countries, particularly the East European bloc, has also been satisfactory. In fact, it has been claimed that Yugoslavia is the largest buyer of Indian coffee on the European continent. As Indian tea and coffee are likely to be absorbed in increasing quantities by the East European countries in the coming years and the E.C.M. group also might purchase larger quantities of Plantation products, it will not be surprising if total exports of coffee exceed 50 per cent of the total output. The yield of coffee crop should, therefore, be suitably increased, Plantation grades especially.

The moving fingerprints

SINCE THE Prime Minister has been remarkably successful in maintaining a high degree of secrecy lately about changes in the Government, very few of those who had been speculating both before and after the recent Cabinet reshuffle were really in a position to comment definitely on the 'why' or 'how' of things. Nevertheless, it would be broadly correct to say that neither Mr. G. L. Nanda nor Mr C. Subramaniam was considered at any stage for the Finance portfolio. There has certainly been a certain amount of lobbying by Mr. V. K. Krishna Menon against Mr. T. T. Krishnamachari, but this, if anything, could have only helped the latter.

There is lively talk of how acute the poverty of our masses is. If this very real problem of the poverty of our people is to be dealt with constructively at all, it is essential and urgent that there should be effective co-ordination of our economic policies to clearly realised long-term ends in terms of increased agricultural and industrial production. It is true, of course, that an increase in production that would ensure reasonable living conditions to the masses of our people cannot be secured within a few years. The process has necessarily to be spread over time but the point is that, if there is no intelligent and far-sighted direction of our economic affairs in the immediate present, the reduction of mass poverty will not be achieved ever. From this point of view the test that any Finance Minister must prepare himself to face is, whether by his policies and attitudes, he is succeeding in stimulating investment and production and assisting the economy in breaking through the stagnation that seems to be setting in. An uninterrupted increase in industrial production from year to year at a recurring annual rate of from 10 to 12 per cent is the minimum obligation which any Finance Minister who would assume the direction of our economic affairs should be prepared to accept. This is much more important than raising a little more revenue for the Government or securing a little more money from the Aid India Club.

It should be tempting to picture Mr. Mani Ram Bagri as a Sancho Panza to Dr. Lohia's Don Quixote, but then Master Sancho had a mind of his own and was capable of much healthy scepticism for the extravagances of his crazy master.

The analogy of the Boswellian allegiance to Dr. Johnson also does not seem to apply. I suspect that the canny Scot posed quite a bit, whereas there is nothing of the imposter at all in Mr. Bagri's dog-like devotion to his leader. I wonder whether there is not something frightening in the total identification which Mr. Bagri is evidently trying to achieve with his chief. It is not right that one human being should so single-mindedly be endeavouring to surrender his personality so completely to that of another. Dr. Lohia's certainly is a grave responsibility.

I must confess that I am fascinated by the subject of Dr. Lohia. In a rejoinder to Mr. Nanda, he has explained that the "three-anna-or-less-wallahs" who, according to him, number nearly 300 million, comprise agricultural workers, agriculturists holding two acres and below, Adivasis, artisans, widows and miscellaneous groups, such as sadhus. There is surely here what the statisticians would call the fallacy of double-counting. Widows in this context are not to be regarded as a class apart; nor are Adivasis. Again, why widows only? Why not also babes-in-arms, old men counting their days, blind persons and cripples and at least some politicians who, until they become Members of Parliament, were probably not earning even "three annas a day"?

I see that the Health Minister inaugurated last week a Family Welfare Counselling Bureau for the benefit of couples caught in marital disharmony. But is there not something faintly incongruous in the Delhi Family Planning Association interesting itself in the setting up of such institutions? Being (more or less) happily married myself, I am all for a movement to have more happy marriages. It is undoubtedly a good cause deserving well of all right-thinking men and, naturally, women. But since the Delhi Planning Association's primary purpose, I presume, is to assist in controlling the growth of population, I should like to know whether thought has been given to the possibility that the reduction in marital disharmony might conceivably lead to an increase in population. I am not suggesting that happy or harmonious marriages must necessarily lead to larger families, but the risk cannot be entirely ignored.

V. B.

Trade Winds

NEW SOURCES OF OIL

A NEW site has been selected at Tinali for a test well in Oil India's new concessions of 1,290 square miles in the Dum Duma area in Upper Assam. Drilling at Tinali is expected to commence in December, 1963 as soon as the approach road to the site is ready. The first well in the Dum Duma petroleum exploration licence area is located near Bogapani, where a ten-mile approach road at a cost of Rs. 8 lakhs is being constructed to carry equipment and machinery to the spot. While Bogapani is expected to be the first test well to be drilled in Oil India's new concession, Tinali could be taken up for drilling soon afterwards. These sites for exploratory wells have been selected as a result of the 223 line miles of seismic survey which was carried out between March and June, 1963, immediately after the grant of exploration licence for the Dum Duma area. This new area granted to Oil India Limited, which is owned half and half by the Government of India and the Burmah Oil Company is in addition to the 510 square miles of mining leases where it is already engaged in developing indigenous sources of crude oil and transporting it through 720 miles long Nahorkatiya-Gauhati-Barauni pipeline system to the refineries in North-East India.

VANASPATI PRICES REVISED

The Centre has revised the ceiling prices for Vanaspati with effect from August 23. The new prices apply to zones A (Maharashtra, Gujarat, M.P., Goa, Daman, Diu, Dadra and Nagar Haveli) and D (W. Bengal, Assam, Orissa, Bihar, Manipur, Tripura, Nagaland, NEFA, Andaman and Nicobar). The prices notified in a gazette extraordinary, include freight but exclude octroi, terminal tax and similar other local taxes and also sales tax. The price limits for zones B and C remain unchanged.

The following are the prices for zones A and D:

	Zone A		Zone D	
In tin con- tainers (net capacity in kg.)	Manufac- turers' price (in Rs.)	Retail price (in Rs.)	Manufac- turers' price (in Rs.)	Retail Price (in Rs.)
16.5	45.87	48.18	47.35	49.66
8.0	22.68	24.80	24.40	25.52
4.0	12.64	13.20	13.00	13.56
2.0	6.62	6.90	6.80	7.08
1.0	3.41	3.55	3.50	3.64
0.5	1.70	1.77	1.75	1.82
0.25	0.86	0.90	0.88	0.92

The price of loose vanaspati is Rs. 2.92 per kg. in Zone A and Rs. 3.01 in Zone D.

PAYMENT OF INCOME TAX

A discount of one per cent of income tax will be given to assesseees who file their returns of income and pay their tax dues before January 1 of the relevant assessment year, under a new Section 141A in the Income Tax Act, 1961. Assesseees who do not file their returns of income before January 1 of the relevant assessment year will, under the same Section, be liable to pay interest calculated at the rate of two per cent for the period of delay. This new Section 141A in the Income Tax Act, 1961, providing for the discount and penalty of interest, has been incorporated in the Finance Act, 1963. A press note issued by the Finance Ministry says, "the discount is admissible even in a case where no provisional or regular assessment to income-tax is made before the first day of January, if the assessee files his return of income

and pays the tax due on the basis of that return voluntarily before the said date (January 1). Instructions have been issued to the Income Tax Department for rendering necessary assistance to assesseees, on their request in calculating the amount of tax due on the basis of their returns of income".

GOATSKIN EXPORTS

Keeping in view the several representations made, the Union Government has decided to withdraw, with immediate effect, the recent restrictions imposed on the exports of raw goatskins of 36" and above sizes. These curbs were placed to develop tanning and finishing of raw skins so as to increase production, employment and export earnings, following the recommendations of the Leather Export Promotion Council. The press release issued recently says that "in view of the commitments already entered into by exporters for raw goatskins of large sizes and considering also the interests of exporters to develop and expand the tanning and finishing industry to enable the country to earn more foreign exchange through increased exports of finished skins, footwear, leather travel goods and other articles, above sizes are being withdrawn". It is also stated that policy of gradually increasing the production and export of finished and tanned skins compared with the export of raw goatskins.

MARKET RESEARCH

The Reserve Bank is to set up an overseas department to organise market research in various regions of the world for the purpose of export promotion. Economists will be attached to the department for each special region.

The RBI has also decided to reinforce its staff for research in markets abroad. It will secure the assistance of the foreign branches of Indian banks. The bank has already enlarged its programme of research studies on the commercial, economic and financial patterns developing in other countries, and it has been decided to undertake such studies on a continuing basis.

The recent studies made by the Bank on the South-east Asian and other markets have proved to be valuable, and the Board of Trade has suggested that the RBI should undertake such studies on a permanent basis.

FOREIGN CREDITS

The granting of £10 million (Rs. 13.33 crores) loan by Britain to India recently is to be welcomed on the score that it will help ease India's balance of payments difficulties. The loan will be used for the purchase of a wide range of manufactured goods from Britain. The loan agreements signed since the beginning of the third Plan bring Britain's contribution to £108.5 million (Rs. 144.67 crores) out of the total of £125 million (Rs. 166.67 crores) committed at the India Club meetings. Discussions are proceeding between the two Governments for the allocation of a balance of £16.5 million (Rs. 22 crores).

The Federal Republic of Germany has agreed to give an aid of \$100 million (nearly Rs. 48 crores) during the third year of the third five-year Plan. This amount represents an increase of \$35 million over the amount offered earlier. Upto the end of June, 1963, the Federal Republic of Germany had committed to provide development aid to a total value of DM 7,161 million (approximately Rs. 860 crores) — about Rs. 499 crores being the share of Asian countries. India benefits to

the extent of about Rs. 360 crores, i.e. nearly three-fourths of the entire aid being rendered to the developing countries of the entire aid of Rs. 360 crores, nearly Rs. 140 in Asia. Of this amount of Rs. 360 crores, nearly Rs. 140 crores had already been paid to India for carrying out schemes under the second five-year Plan. The Federal Republic's commitments to this country for the first three years of the third Plan amount to DM 1,850 million or about Rs. 220 crores.

The statement below shows rates of interest charged by different countries and institutions on loans offered at the end of the second Plan and interests now proposed to be charged for further loans during the third Plan.

Name of Country/ Institution	Interest Charged at the end of Second Plan	Interest charged/pro- posed to be charged for further loans dur- ing third Plan.
Austria	†	About 6%
Belgium	†	Not yet decided
Canada	4½%	*
Czechoslovakia	†	2½%
France	†	About 5½%
Germany	5½%	(Partly 3 % Partly 5½% Partly 5½%
I.B.R.D.	5½%	(**
Public Sector	6 %	(
Private Sector	†	½%
I.D.A.	†	***
Italy	5½% to 6%	5½%
Japan	†	Not yet announced
Netherlands	†	2½%
Poland	†	6%
Switzerland	†	3½% @
U.K	6-3/8%	2½%
U.S.S.R.	2½%	
U.S.A.		
EXIM	5½%	5½%
AID	..)	½%
DLF	5 %)	
Yugoslavia	†	3 %

- * Government's borrowing costs plus an administrative charge.
- ** For each I.B.R.D. loan interest will be determined in accordance with the normal practice. However, the present I.B.R.D. lending rate is 5½%.
- *** Rate of interest prevailing in the market plus Commission of less than 1%.
- @ The United Kingdom will make available loans totalling £30 million (\$84 million) repayable over 25 years, including a grace period of 7 years before repayments of principal begin. The United Kingdom Government has agreed to waive the interest payments during the grace period. Subsequently, the interest charged on the amount outstanding will be related to that at which the United Kingdom can borrow on the date of each drawing. The effect of this is that on the basis of current borrowing rates the interest charge may be something less than 3½ per cent over the whole period of the loan.
- † These countries did not extend any development loan to India in the second Plan.

MILK PLANT FOR KERALA

With the object of producing cheap milk and thereby to develop nutritional standards in Kerala State, a recombined milk plant is proposed to be established at Alleppey. The scheme envisages foreign assistance of Rs. 1.15 crore to meet

expenditure on laboratory and dairy equipment with an installation capacity of 20,000 litres of milk a day and the surplus of milk powder and butter oil over a period of five years. The project is reported to be under the consideration of the Norwegian Freedom from Hunger Campaign Committee for adoption.

Another scheme is the establishment of the Food Technology Training Centre at Mysore with the assistance of the Canadian Freedom from Hunger Campaign Committee. The Centre is intended to be utilised for demonstrating the methods of food processing and preservation adapted to local needs. Fifty model piggery units are proposed to be set up under another scheme. They will be located in suitable areas around big towns where bacon factories are being established or where such facilities already exist. The other action projects approved for implementation with foreign assistance include those for intensification of plant protection measures for achieving higher agricultural production, production of protein rich food through poultry, prevention of malnutrition and promotion of production and use of improved foods and improvement in the food of the general population, with particular reference to workers in industry.

EQUIPMENT FOR POWER STATIONS

Heavy Electricals (India) Limited have ordered hydro-electric equipment worth £300,000 for two power stations from Associated Electrical Industries. One order is for the Obra Power Station of the U.P. State Electricity Board for a 33,000-kW, 11,000-volt vertical waterwheel generator, together with the major component parts of a second and third machine. The second order is for the Punjab State Electricity Board and comprises a 15,000-kW, 11,000-volt generator, again with components for a second and third machine and the associated control gear for the Bassi Power House. These contracts raise the value of AEI's hydro-electric equipment on order from India to £4 million. The total rating of hydro-electric generators on order from the company's heavy plant division is now 7,24,000 kW.

IMPORTS OF TRACTORS

A plan is being finalized by the Union Agricultural Minister to ensure that the basic needs of modern farming are made available to the cultivator to the maximum extent. The doubling of the tractor imports from 1,800 to 3,600 and a Rs. 10 crore increase in the import of fertilizers next year are among the major measures to step up farm production. The import of fertilizers is to be increased from Rs. 25 crores to Rs. 35 crores in 1963-64. At the same time, renewed efforts have been made to encourage the use of compost manure. Poultry farming will be another item on which emphasis would be laid this year.

In addition to the original plan of importing 1,800 tractors from the U.S.S.R., it is now proposed to buy 500 more tractors during 1963-64 from Russia. One thousand and three hundred tractors are to be imported from Poland and Czechoslovakia and spare parts worth Rs. 50 lakhs this year.

COTTON EXPORTS

The Government of India has decided to release 2 lakh bales of Bengal Deshi cotton for export. No exports out of this quantity will be allowed under rupee payment arrangements. Out of this quota, 10,000 bales are earmarked for exports through co-operative societies in area growing such cotton. The balance will be licensed according to the terms and conditions laid down. The period of shipment will be from September 11, 1963 to August 31, 1964.

Company Affairs

TISCO

MR. J. R. D. TATA, Chairman of the Tata Iron and Steel Company Limited, informed shareholders at the Annual General Meeting held in Bombay that there was no point in a bonus issue unless the company could maintain the dividend on the increased capital. If, on the other hand, the company increased the dividend gradually, it would amount to the same thing. He also ruled out the possibility of a fresh capital issue by the company in the near future. During the five months of the current year, he stated the production had stabilised around an annual level of 1.5 million tonnes. By the end of the year, the company hoped to reach total production of 1.45 million tonnes, compared to 1.41 million tonnes last year. The company had also agreed at the Government's request to expand its capacity further provided it could be financed without undue strain on its resources. He said that the cost of expansion of one million tonnes capacity will be about Rs. 100 to Rs. 150 crores, out of which at least 50 per cent will have to come from abroad; a part of the balance will be met from internal resources, and a part by way of fresh issue of capital. The company could not get any foreign collaborator willing to invest in its alloy steel project on the Government's terms. Mr. Tata said that the alloy steel project was not likely to come up soon.

Regarding the decontrol of steel, he said that the matter was under a committee of the three main producers who would have to formulate their proposals. Regarding the target for steel production in 1971, Mr. Tata gave the opinion that the country would have to add nine million tonnes between now and by the end of the fourth Plan. Commenting on the Bokaro steel plant, he said that it would not affect the company either with regard to the availability of raw materials or in terms of production. The LIC's holdings in the company's share capital increased during the year from 298,000 to 403,767 shares, representing 11 per cent of the capital.

PARRYS CONFECTIONERY

At the Annual General Meeting of Parrys Confectionery Ltd., Mr. H. V. R. Iengar, Chairman, made a pointed reference to the Company's liability under the super profit tax which had been instrumental in reducing the net profit of the company for the year after tax to Rs. 3,88,903 — lower by Rs. 1.36 lakhs as compared with the preceding year. The sales of the company had listed a rise of 10 per cent over the preceding year to reach a new record level of Rs. 1.48 crores. In addition to the super profits tax, the increased cost of production especially in respect of raw materials, packing and wages was also responsible for wiping out the gains achieved through higher sales. Due to reduced profits and the anxiety of the company to conserve resources for the rehabilitation of its plant and machinery, the directors have proposed a reduction in the dividend to 16 per cent on the ordinary share capital absorbing Rs. 3,20,000 as against Rs. 4,17,000 last year.

The long-term progress of the company, the Chairman added, depended on the rehabilitation of plant and machinery and the cost of production which had continued to rise. Even the capacity of the company to earn more foreign exchange was limited by these two important factors. Since tastes continued to change in this consumer industry, the company has to experiment in new techniques of manufacture as well as in wrapping and packing the sweets. The company has not been able to make the advance necessary to compete with the sweets manufactured abroad and the basic limitation here is the licensing policy of the Government. Many of the raw materials such as gum arabic, menthol, tartaric acid and lecithin, etc., are all imported items and the licences made available are not sufficient to cope with the demand. Due to

the increases in customs and excise on cellophane, tin plate and aluminium foil, the wrapping and packing costs of the company had increased by about Rs. 3.5 lakhs on the same sales as last year.

DELHI CLOTH

The Delhi Cloth and General Mills Ltd., will enter the capital market on September 9, with a preference issue of Rs. 50 lakhs comprising 2 lakh, 9 per cent Fifth Redeemable Cumulative Preference Shares of Rs. 25 each at par. The subscription list will close on September 16 or earlier, but not before September 11. A sum of Rs. 10 per share is to be paid with application and Rs. 5 on allotment and the balance in two instalments later. The shares will be redeemable after June 30, 1975 and before June 30, 1980. The entire issue has been underwritten. The company proposes to set up two new plants, licences for which have already been received. At Kota will be located the PVC plant of 20 tons per day capacity with ancillary units for calcium carbonate, chlorine and caustic soda and rayon tyre cord plants for 4 million Kgs. per annum capacity. For the first project, the company has entered into a technical collaboration with Shin-etsu Chemical Industry Co., Ltd., Japan and Mitsui Co. Ltd., Japan. For the second units, the collaboration has been entered into with Chemtex Inc., U.S.A., and Beaunit Inc., U.S.A. Both the agreements have been approved by the Government.

ORIENT PAPER

The working results of Orient Paper Mills Ltd., for the year ended March 31, 1963 recorded an improvement in gross profit as well as in sales. The gross profit was Rs. 200.54 lakhs as against Rs. 198.14 lakhs in the previous year. Sales rose from Rs. 10.04 crores to Rs. 11.16 crores. The directors have proposed a dividend of Rs. 2 per share on 19,08,725 ordinary shares. In the previous year, a dividend of Rs. 2.25 per share was paid on 14,68,250 ordinary shares and a proportionate share of 56.25 nP. per share was declared for the new 4,40,475 ordinary shares. The directors have provided Rs. 60.45 lakhs for depreciation, Rs. 2.50 lakhs for development rebate reserve, Rs. 15 lakhs for general reserve and Rs. 3 lakhs for contingencies reserve. A sum of Rs. 70 lakhs has been transferred to deferred taxation reserve. The proposed dividends are to be paid out of the newly-created dividend reserve fund to which has been allocated a sum of Rs. 50,90,650. The directors have stated that the upward trend in the cost of raw materials, power and fuel and other expenses continued to persist during the year under report resulting in a further rise in the cost of production. The rates of excise and import duties, Central sales tax and other taxes were further increased; since the Government, the increased cost had to be borne by the company. The production of paper and board rose to 65,000 tonnes as against 62,000 tonnes in the previous year.

GWALIOR RAYON

The gross profit of Gwalior Rayon Ltd., for the year ended March 31, 1963 was lower at Rs. 3.90 crores as against Rs. 4.18 crores in the preceding year. The fall in profit was caused by the initial working expenses of the pulp factory (which went into production in January last), higher power and fuel costs, donation of Rs. 12.07 lakhs to the National Defence Fund and the excise duty on sulphuric acid. Higher. Shortage of coal forced the use of furnace oil which also increased fuel costs. An application of the company for raising the staple fibre capacity to 150 tons a day is pending with Government. The pulp plant at Birlakootam (Kerala State) started production in January and is expected to overcome teething troubles soon. The engineering divi-

sion of the company has manufactured rayon machinery with equipment and orders have been received from two rayon units.

HINDUSTHAN GAS

The Hindusthan Gas and Industries Ltd. has shown a lower gross profit at Rs. 15.39 lakhs for the year ended March 31, 1963 as against Rs. 16.80 lakhs in the previous year. The total sales, however, recorded a sizable increase from Rs. 70.38 lakhs to Rs. 94.72 lakhs in the year under report. The net profit, after providing for depreciation and development rebate reserve and necessary adjustments, was Rs. 4.89 lakhs compared to Rs. 4.51 lakhs in the preceding year. Depreciation was raised from Rs. 4.47 lakhs to Rs. 5.71 lakhs, general reserve from Rs. 1 lakh to Rs. 1.75 lakhs and development rebate reserve from Rs. 1.28 lakhs to Rs. 4.89 lakhs. No provision for taxation was made against Rs. 6.50 lakhs in the last year. The dividend on the ordinary shares has been maintained at Rs. 1.40 per share, less tax. The oxygen and acetylene plants have gone into production. Since the rate of dividend paid on the cumulative redeemable preference shares is now unrealistic, the board of directors has taken action to cancel the un-issued cumulative preference shares and to create an equal number of cumulative preference shares without fixing the rate of dividend which may be fixed in future as and when the said shares are issued.

SAKTHI PIPES

Sakthi Pipes Limited will enter the capital market shortly with a public issue of Rs. 54 lakhs. Its authorised capital is Rs. 1 crore and the issued capital is Rs. 90 lakhs. The promoters and their friends will subscribe Rs. 36 lakhs. The balance of Rs. 54 lakhs consisting of 36,000 equity shares of Rs. 100 each and 18,000, 9.3 per cent redeemable cumulative preference shares of Rs. 100 each is being offered to the public. The entire public issue is underwritten. The company will manufacture, in technical collaboration with Compagnie Generale des Conduites D' Eau of Belgium, 50,000 tons of centrifugal cast iron pressure pipes per annum. The total cost of the project is estimated at Rs. 1.71 crores. The foreign exchange component of the project is estimated at Rs. 64 lakhs which will be met by a loan from ICICI. The Madras Finance Corporation will provide rupee loan of Rs. 17 lakhs.

INDIA PAPER PULP

Satisfactory results have been reported by the India Paper Pulp Company Limited for the year ended March 31, 1963. A rise of Rs. 50 lakhs at Rs. 2.83 crores has been reported in respect of paper sales. Managing Agents' remuneration at Rs. 3.47 lakhs and depreciation at Rs. 13.86 lakhs have been provided. The profit, net of depreciation, was Rs. 40.63 lakhs as compared to Rs. 23.47 lakhs in the last year. The directors have recommended a final dividend of Re. 1 which along with the interim dividend of 50 nP. per share makes a total of Rs. 1.50 against Rs. 1.20 in the last year. The tax provision for the year was Rs. 22 lakhs out of which which Super Profits Tax accounted for Rs. 2.50 lakhs. Amongst the other allocations, Development Rebate received Rs. 2.85 lakhs and General Reserve Rs. 2.75 lakhs. The company has been permitted to expand its jute stick pulp plant. Its cost will be financed partly by a credit of Rs. 20 lakhs from ICICI and partly out of the company's own resources.

HUKUMCHAND JUTE

The working results of Hukumchand Jute Mills Ltd., for the year ended March 31, 1963, showed a higher profit at Rs. 87.89 lakhs (as against Rs. 27.19 lakhs for the preceding year) after providing Rs. 11.43 lakhs for depreciation. The sales also were higher at Rs. 6.44 crores against Rs. 6.15 crores in the last year. The directors have recommended the main-

tenance of the ordinary dividend at Rs. 2 per share (taxable). The various allocations proposed were: Development Reserve Rs. 3.06 lakhs, Contingency Reserve Rs. 57 lakhs and General Reserve Rs. 26.05 lakhs. No provision has been made for taxation, which will be appropriated from contingencies reserve when the liability is determined. The company has been licensed 75 looms out of which it has installed 47 so far. It has also received an industrial licence to set up a caustic soda and chlorine plant at Amlai, Madhya Pradesh.

METTUR CHEMICAL

The working results of The Mettur Chemical and Industrial Corporation Ltd., for the year ended March 31, 1963, showed a net profit of Rs. 29.82 lakhs after providing Rs. 16.33 lakhs for depreciation. A sum of Rs. 2.50 lakhs has been transferred to development rebate reserve, while the provision for income-tax is placed at Rs. 7.50 lakhs. On equity shares the dividend has been maintained at 12½ per cent per annum subject to tax. The caustic soda capacity unit was raised from 20 tons to 40 tons per day in the year under review. The unit is planning to expand its caustic soda capacity from 40 tons to 100 tons per day and to manufacture organic chemicals. During the year under review the industrial Finance Corporation of India sanctioned a foreign exchange loan of equivalent to Rs. 97.30 lakhs and rupee loan of Rs. 42.70 lakhs to cover the expansion. The company has received the sanction from the Controller of Capital Issues for issuing Rs. 60 lakhs worth of equity shares at par and Rs. 30 lakhs worth of preference share capital before 1964; it is programmed to make further issue of capital early in 1964.

ANGLO-INDIA JUTE

The sales of the Anglo-India Jute Mills Ltd., during the year ended March 31, 1963 rose to Rs. 8.63 crores as against Rs. 7.57 crores in the preceding year. The net profit, after providing Rs. 15.13 lakhs for depreciation but before taxation, was Rs. 73.58 lakhs as against Rs. 11.61 lakhs in the preceding year. The allocations were: Rs. 9.84 lakhs for general reserve, Rs. 9.54 lakhs for dividend reserve, Rs. 3 lakhs for contingency reserve, Rs. 38.13 lakhs for taxation reserve, Rs. 6.40 lakhs for development rebate reserve and Rs. 5.50 lakhs for investment rebate reserve. The ordinary dividend has been raised from 10 to 12 per cent, less tax.

SESHASAYEE PAPER

Commercial production of paper using imported wood pulp was started by Seshasayee Paper and Boards Ltd., in December, 1962. The total production till March, 1963, was 2,900 tons out of which 2,500 tons were sold for Rs. 37.47 lakhs. The working results for the four months show a loss of Rs. 4.5 lakhs which does not include proportionate depreciation "which when provided would amount to about Rs. 23 lakhs".

DIVIDENDS DECLARED

Ashoka Cement: The directors of Ashoka Cement Ltd., have proposed an equity dividend of 75 nP. per share for the year ended March 31, 1963.

Indian Rubber: Indian Rubber Regenerating Company proposes to pass over equity dividend for the year ended March 31, 1963.

Madras Machinitool: A maiden dividend of 5 per cent has been proposed by the directors of the Madras Machinitool Ltd. for the year ended March 31, 1963.

CAPITAL ISSUES

The Controller of Capital Issues has authorised seven companies to issue fresh capital amounting to Rs. 18.84 crores. Two are issuing bonus shares, one is issuing cumulative preference shares and the rest equities. The following are the details:

The African Trading Company Private Limited, Bombay,

has been granted consent to issue Rs. 20,000 bonus capital in shares of Rs. 100 each. The shares will be allotted in the proportion of one bonus share for every 15 shares held.

Oldham and Son (India) Limited, Madras, is to issue equity shares of the value of Rs. 2,50,000 as bonus shares in the proportion of one bonus share for every five shares held.

Sree Saraswathi Mills Limited, Madurai, is to issue capital of Rs. 15,88,520 divided into 1,09,402 equity shares of Rs. 10 each and 4,945 9.5 per cent (free of company's tax but subject to deduction of taxes at sources at the prescribed rates) and redeemable cumulative preference shares of Rs. 100 each for cash at par. Of these, 29,402 equity shares and 445 preference shares would be subscribed privately and the balance shares would be offered for public subscription by prospectus. The money is required for setting up a new spinning mill at Tiruttani.

The Canara Bank Limited, is issuing capital of Rs. 25 lakhs divided into 50,000 equity shares of Rs. 50 each, at a premium of Rs. 15 per share

Firth Sterling Steel Company of India Limited, Bombay, will issue capital of Rs. 50 lakhs in equity shares of Rs. 10 each. Of this amount shares of the value of Rs. 13 lakhs will be allotted to Firth Sterling Inc. of Pittsburgh, U.S.A., Rs. 10 lakhs for cash at par and the balance of Rs. 3 lakhs for consideration other than cash. The balance of Rs. 37 lakhs share capital would be issued for cash at par. Out of this amount, shares of the value of Rs. 20 lakhs will be offered to the public by prospectus. The money is to be utilised in the manufacture of high speed steels and high alloy constructional steels.

National Sugar Mills Limited, Calcutta, will issue Rs. 16 lakhs in equity shares of Rs. 10 each. This capital will be used for the expansion of factory premises.

In supersession of an earlier consent, **Fort Gloster Industries Limited, Calcutta** is to issue a total capital of Rs. 78,85,000. This comprises 41,500 equity shares of Rs. 100 each at a premium of Rs. 90 per share. Out of this 31,500 shares will be issued to the existing shareholders and 10,000 shares will be issued to the International Finance Corporation, Washington. The money is to be used for expansion in the manufacture of cables of various types.

LICENCES ISSUED

The following licences were issued under the Industries (Development and Regulation) Act, 1951, during the week ending August 24, 1963. The list contains the names and the addresses of the licensees, articles of manufacture and annual installed capacity.

SEMI-MANUFACTURES & MANUFACTURES

Devidayal Electromet, Tulsiram Gupta Mills, Estate, Reay Road, Bombay-10 (Kalyan in Thana Distt. Maharashtra) — 1,800 metric tons per annum of manganese metal and corresponding quantity of manganese dioxide etc.

COAL

Shri Sadananda Banerjee, New Bhagran Colliery, 'Nilochal', P.O. Sitarampur, Dist. Burdwan, (Salanpur Dist., Burdwan, West Bengal) — Coal 10,000 tonnes per annum.

ELECTRIC LAMPS

Bijlee Products (India) Private Ltd. 26, Dr. A. L. Nair Road, P.O. Box 4516, Byculla, Bombay-8 (Poona, Maharashtra) — Electric bulbs same, shifting from Bombay to Poona.

RAILWAY ROLLING STOCK

Ramchander Heeralall, 138, Canning Street, Calcutta, Proposed name: Shalimar Iron Works (West Bengal) — Axle

Guards 2,880 tons per annum.

MACHINE TOOLS

General Machinery Stores, Rajabhadur Compound, 24/BD, Hamam Street, Bombay-1 (Greater Bombay, Maharashtra) — Injection moulding machines, 108 Nos. per annum. Extruding machines 60 Nos. per annum. Mouldes 180 Nos. per annum.

HAND TOOLS, SMALL TOOLS

Factories Private Ltd., 55/115, Generalganj, Kanpur (Uttar Pradesh) — Turning tools with cemented carbide tips (excluding carbide tips) 1,20,000 pieces per annum.

MISCELLANEOUS CHEMICALS

Shri R. K. Tejura, Raja Bahadur Mansion 45, Tamarind Lane, Fort, Bombay-1, Proposed name: Eastern Air Products Ltd. (Bhopal, Madhya Pradesh) — Oxygen Gas 4,53,600 cu. metres per annum, Dissolved Acetylene 2,88,000 cu. metres per annum, Nitrogen Gas 14,40,000 cu. metres per annum.

Hastings Mills Ltd., 14, Netaji Subhas Road, Calcutta (West Bengal) — Wide Hessian (Carpet Backing cloth) 100 broad looms for producing 10,500 tonnes per annum.

ALCOHOL

Shri Madhavlal Narayanlal Pitie, C/o Shangrila Food Products Ltd., Great Social Building, 60, Sir Pheroazshah Mehta Road, Bombay-1 (Bihar) — Ethyl Alcohol 15,60,000 gallons per annum.

MALTED FOODS

Jagatjit Distilling and Allied Industries Ltd., P.O. Jagatjitnagar, Railway Station, Hamira (Jagatjit Nagar, Punjab) — Malted Milk Food 1,800 metric tonnes per annum.

VEGETABLE OILS

The Jai Hind Oils Mills Co., 387-89, Narasi Natha Street, Bombay-9 (Bhandup, Bombay, Maharashtra) — Cotton seed oil 20,000 tons in terms of cotton seed.

OPTICAL GLASS

National Instruments Ltd, Jadavpore, Calcutta-32 (Durgapur, West Bengal) — Ophthalmic Glass Blanks 300 tons per annum.

CHANGES IN NAMES

(Owner or Undertaking)

(During the week ending August 24, 1963)

From M/s. Asiatic Foundries, Patiala to M/s. Asea Works, Private Ltd., Patiala. From M/s. Universal Electric Co. (India) Ltd., Faridabad to M/s. American Universal Electric (India) Ltd., Faridabad. From M/s. Lekhray Manoharlal, Bombay to M/s. Lekhray Manoharlal Agrawal, Bombay. From Shri C. C. Desai, New Delhi to M/s. Galileo Instruments Ltd., New Delhi. From M/s. Sri Podma Textiles Manufacturing Co. Ltd., Kodur Post Cuddaph Distt. to M/s. Sree Padmavathi Mills Ltd., Kodur Post, Cuddaph Distt.

LICENCES REVOKED

(During the week ending August 24, 1963.)

M/s. The Kasturi Engineers Ltd., Coimbatore — Steel forgings. M/s. The Upper India Glass Works Ltd., P.O. Yamunanagar, Distt. Ambala — Hollow-ware, bottles. M/s. Union Paper and Board Mills Ltd., Calcutta — Writing, printing and wrapping paper and pulp.

Readers' Roundtable

THE STATE OF PLANNING

Sir,—I read the first two articles in the issue, dated the 9th August, with immense interest. I am particularly happy that you did not pull your punches in dealing with the Planning Commission. This sort of thing badly needed saying. As far as I know, no one else has been able to see through the Planning Commission's trick of trying to attribute the entire failure of the Plan to stagnant agriculture.

On page 245 when you refer to the "grossing up of dividends" I suppose you mean the Government of India's decision to abandon the practice of grossing up of dividends which meant an increased tax burden to the shareholder. This was done to compensate for the loss of revenue following the decision of the Government to reduce the tax on corporate profits. The net result was that companies were let off with slightly easier rates while the discontinuance of the practice of grossing up of dividends. Subsequently, however, the Finance Ministry increased the rate of corporate taxation as well, with the result that both the companies and the shareholders have come in for a heavier dose of taxation.

"SCRIBE"
Bombay.

ASSOCIATES AS DIRECTORS

Sir,—Under the Companies Act, 1956 as amended by the Amendment Act of 1960, in all cases of appointment of the associates of the managing agents as directors of their managed companies, whether such appointment is made by nomination under Section 377 or election by the general body of shareholders under Section 255 or by virtue of the power of appointment of additional directors vested in the Board under Section 260 or of filling casual vacancies under Section 262 or taking in alternate directors under Section 313, approval of such appointment by the Central Government under Section 360 is necessary; and failure to obtain such approval either before the date of the appointment or within three months next after that date will make the appointment invalid.

Sub-section (1) of Section 360 provides as follows:

"A contract between a company and its managing agent or an associate of the managing agent,—

- (a) for the sale, purchase or supply of any property, movable or immovable, or for the supply or rendering of any service other than that of managing agent; or

(b) for the underwriting of any shares or debentures to be issued or sold by the company; shall not be valid against the company—

(i) unless the contract has been approved by the company by a special resolution passed by it, and

(ii) where the contract is for the supply or rendering of any service other than that of managing agent, unless further the contract has been approved by the Central Government,

either before the date of the contract or at any time within three months next after that date."

The appointment of an associate of the managing agent as director being a contract for the rendering of service by him in the capacity of a director as distinct from service as managing agent, it is clear that such appointment comes within the scope of operation of the above Section and unless approval of the Central Government is obtained therefor as required herein, such appointment becomes invalid as against the company.

This aspect of the scope of the Section has apparently not been noticed so far either by the Central Government or by the Management of the companies concerned, with the result that the practice of appointing as directors, the partners and relatives of the partners of the managing agent, where the managing agent is a firm, and directors and the other officers of the managing agent where the managing agent is a body corporate, has been going on unchecked and now become very common and widespread; and in several, nay, very many cases, the majority or almost the whole of the Board of directors of companies managed by managing agents practically consist of associates of the managing agents, with the result that the ostentatious provisions of Section 368 which provide for the managing agents exercising their powers subject to the supervision, control and direction of the Board of directors have been set at naught, the position in actual fact being that the directors are under the control and direction of the managing agents.

If, the provisions of Section 360(1) are to be strictly enforced and Central Government approval required to be sought for appointment of the associates of managing agents as directors of their managed companies, there will be an effective check on the Board of Directors becoming subject to the control and direction of the managing agents.

BOOKS BRIEFLY

Joint Stock Companies in Perspective

Joint Stock Companies in India for 1958-59, Part II: Pages 1183; (supplemented by the Alphabetical Lists of Joint Stock Companies in India 1959-60 to 1961-62, pages 227+xxvii); Price Rs. 40 (both); Department of Company Law Administration, Ministry of Commerce and Industry, New Delhi.

A COMMENDABLE attempt has been made by the Research and Statistics Division of the Company Law Administration to piece together the information spread out in a number of publications and to present in two volumes an alphabetical list of the Joint Stock Companies at work as on March 1962. The publications running into about 1450 pages give authentic information relating to the date of registration, industrial

classification, capital position and addresses of registered offices of about 35,500 companies at work in the country.

The publications also contain a list of foreign companies doing business in India. This list gives such particulars as the date of their establishment of business in India, address of their principal place of business in India, and address in the country of their origin.

Besides meeting the pressing needs of chambers of commerce, joint stock companies and professional institutions, these publications will be of immense help to enterprising businessmen and to those interested in knowing about the companies functioning in the country and in particular as a source of ready reference about Corporate Sector.

COMPANY MEETINGS

THE JAIPUR UDYOG LIMITED

Speech of the Chairman, Shri S. P. Jain, at the Annual General Meeting of the shareholders of the Company at 12 noon on 21st August 1963, at Sawaimadhopur.

Gentlemen,

It gives me great pleasure to extend to you all a cordial welcome to the Annual General Meeting of the Company.

The Directors' Report and Statement of Accounts for the year ended 31st March, 1963 have been duly circulated and you must have noted the details of the working results with satisfaction.

As stated in the Directors' Report, production during the working year registered a substantial rise and has made an all time record for your Company. Production of clinker has risen from 6,69,675 tonnes to 7,67,250 tonnes and that of cement from 7,42,298 tonnes to 8,23,238 tonnes. Modifications and improvements made in sections of the plant such as feeding device and cooler system for the kilns have been large contributory factors to this striking rise in production. Some additional quantity of power made available by the State Electricity Board was helpful. In regard to despatches, as a consequence of improvement in the transport position mentioned by me in the last speech, substantial increase has been achieved making an all time record of 8,20,778 tonnes for the year from 7,34,139 tonnes in 1961-62.

The financial results also showed substantial improvement and the gross profit after providing for bonus to employees reached Rs. 1,30,76,745/- the highest level so far attained by the Company. The net profit after depreciation stood at Rs. 87,11,985 as against Rs. 65,02,100. The better financial results were largely due to the substantial increase in production. Although the price increase was applicable for the whole year, it was more than off-set by the heavy increases in costs mainly arising out of governmental action beyond the control of the industry.

The better working results have encouraged your Directors to propose an increased dividend at 10% against 8.36% in the previous year besides strengthening the finances of the Company by transfer of over Rs. 64 lakhs to Reserves. In view of profits determined by the Income-tax Officer as exempt from tax under Sections 84 and 101 of the Income-tax Act 1961 and Rule 20 of the Income-tax Rules 1962, Income-tax and Super-tax are not payable by the shareholders under Sections 85 and 101(2) of the Income-tax Act on the said dividends to the extent of Rs. 15,92,030. The proposed dividend of 10% on ordinary shares would amount to net payment of 87.52 nP. per ordinary share after deduction of Income-tax under Section 194 of the Income-tax Act 1961 on 4.16% dividend, the balance 5.84% dividend being exempt from tax. On this basis the shareholders would get a net dividend of 87.52 nP. per ordinary share.

In spite of the fact that there is general recognition of the importance and basic necessity of the development of the cement industry, the Government policy and action continued to be characterised by the same complacency as in the

previous years. Individual cement manufacturers and the industry as a whole have been representing to the Government from time to time about their difficulties and the continuing rise in costs mainly arising out of governmental action. But no tangible change in the governmental policy towards the industry has been witnessed. It is a matter for regret that the common objective of increasing production of an essential commodity like cement is not being fulfilled only for lack of a developmental price policy.

I can say with pride that the industry is pulling all its weight to improve production and despatches within its means. The impediments to expansion are no longer the foreign exchange scarcity and non-availability of plant and equipment because indigenous machinery manufacturers are promising delivery of complete plants by 1964 and 1965 providing firm commitments are given now. Orders are not forthcoming from licences because of low profitability and dearth of capital. It is only the non-availability of resources with the industry due to the price and tax policies of the Government that forms the impediment to development at present.

According to a Reserve Bank study, the cement industry could retain only 11.18% of the profits after tax against an average of 36.4% for industry as a whole in 1961-62. In spite of distributing 88.2% of the profits after tax, gross dividends worked out to only 6.9% of the profits after tax, gross is a matter entirely in the hands of the Government. If the production of cement is not going apace the requirements according to the anticipated targets, the blame should fall squarely on the Government policies affecting the industry.

The cement industry is a strategic one and it has to be helped to develop at an accelerated speed. Unless the Government follows an appropriate price policy that encourages expansion, the development of the industry cannot take place and the country will be faced with continuing scarcity in respect of an essential basic material as cement. In our developing economy and particularly with the emergency demand for cement will steadily mount. But the development of the industry is by no means showing any trend towards sufficiency to meet the need. Against the targeted capacity of 15 million tonnes the fulfilment of the existing proposals in different stages of execution will only lead to an attainment of 12.5 million tonnes capacity leaving a shortfall of nearly 3 million tonnes in the targeted capacity itself. Therefore, it is imperative that all the licensed schemes at present should be put into execution immediately if the Plan target is to be achieved within the Plan period as it takes about 3 years for a plant to go into production.

The Heavy Industries Minister Sri C. Subramaniam has announced a policy of cancelling licences on which no effective steps have been taken. It is desirable to have a clear idea as to the implementation of the schemes. But has the Minister gone deeply and carefully into the reasons for the

non-implementation of these licences? Sufficient appreciation of these basic reasons would have probably reflected a change in the Governmental attitude and policy in this respect. This fundamental problem has, therefore, to receive more earnest consideration at the hands of the Government leading to effective and prompt action.

In this light, the last price fixation has been disheartening. It reflected neither promptness nor perspective thinking. The increase granted with effect from 1st June, 1963 gave your Company Rs. 2.75 nP. per tonne. This price increase is totally inadequate in view of the heavy rise in costs that took place after the previous price fixation due to governmental action. Further rises in costs have also not been checked by any means. Unless a system of automatic escalation to cover the increases under the major heads like fuel, power, transport etc. arising out of governmental action is introduced by the Government, the industry will continue to face this problem of rising costs without adequate timely cover for same in the prices. Even after holding out definite assurance of providing for rise in costs due to their own action, Government failed to take timely action and when action was taken after considerable delay, the compensation was not sufficient and it was also not given retrospective effect with the result that the entire burden of enhanced costs due to governmental action had to be borne by the industry.

Another factor on which also the Government is not taking a realistic decision is in regard to the quarterly packing charges. The scheme of price fixation does not include any element to cover packing charges as the Government has been following a policy for fixing packing charges quarterly on a certain formula based on actual costs. Since October 1962 the Government formula envisages 50% use of old bags and the prices of old bags have been taken at 65% of the price of new bags. This 50% use of old bags is impossible as it requires 100% return of new bags. In spite of the best efforts of the industry, the average for 1962 has only been 34% use of the old bags. In view of the short supply of packing bags and consequent competition in the market the actual price of old bags has been as much as 85% of the price of new bags. There has thus been a considerable loss to the industry on account of packing charges also. This will continue till the Government adopts a realistic policy in this matter.

I would also like to point out here that transport costs on limestone from the quarries to your factory are increasing year by year due to the continuous increase in railway freight. As stated in the Directors' Report the railway freight has increased 70% since 1954. Cement factories like yours which are situated at a distance from the quarry site are at a disadvantage as the cost of transportation of raw materials from the quarry site to the factory is to be borne by the industry while the outward freight of cement is pooled. As long as individual prices were fixed on the basis of individual costs, this factor was immaterial. But when prices are fixed on the basis of average costs as is being done now, this becomes a burden on the units concerned. While locational disadvantages or advantages to the industry are nullified by the pooling of freight on cement, there should be a similar adjustment in the matter of freight on raw materials. In the case of your Works, the freight per tonne of limestone works out to Rs. 4.40 nP. This freight for a distance of 15 miles is exorbitant and inequitable especially in view of the bulk movement in block rakes of a raw material. Your Company had also a definite agreement with the then State Government at the time of the establishment of the factory that the concessional railway rates would be made available for the movement of the raw material and no terminal or short distance charges would be levied. This matter is still under

correspondence with the Railway authorities and it is hoped that the unfair and unjust situation would be remedied. The incidence of this freight on the cost of cement is Rs. 7 per tonne, which is an additional burden on your Company as compared to units at quarry site.

As I mentioned in my last speech, steps were taken for mechanisation of your quarries and installation of handling and other equipments at the Works. These should further contribute to efficiency and improve production. Your Company's application for import licence for balancing equipments is still pending with the Government for sanction. I had mentioned in my last speech that the grant of permission for such imports should be expeditiously given as the foreign exchange expenditure incurred would be more than compensated by the increase in the production of cement. Here again, a more practical approach on the part of the Government is warranted. May I express the hope that the experience, skill and the willingness of the industry to develop and make full utilisation of the capacity to satisfy the national demand for cement will meet with encouragement from the Government by appropriate policy and timely action.

I would, in conclusion, like to thank you all and on your behalf the workers and members of the staff at all levels for their continued co-operation.

NOTE: This does not purport to be a record of the proceedings of the annual general meeting.

An ideal drink for stomach disorders. This delicious and sparkling ginger beverage gives you the appetite to eat heartily and aids digestion. It helps you feel fine and fit.

PARRYS CONFECTIONERY LIMITED

STATEMENT BY THE CHAIRMAN, MR. H. V. R. IENGAR

The following statement has been circulated to Shareholders of Parrys Confectionery Limited by the Chairman, Mr. H. V. R. Iengar.

Since the last Annual General Meeting, Mr. G. N. Noel-Tod, one of the founder-Directors of the Company, and Mr. P. Hadfield, who joined the Board in July 1959, have resigned their appointments as Directors consequent upon their return, for permanent residence, to the U.K. Both of them have made valuable contributions to the development of the Company from its small beginnings in 1954, and I am sure you will wish to join with me in recording our appreciation of their services. I feel sure you will also welcome the new members of the Board, Mr. K. P. Ramsami, Mr. C. S. Narasimhan, and Mr. J. S. Prabhu.

The Report and Accounts for the year ended 31st March 1963 have been in your hands for the statutory period and, with your permission, I will take them as read.

In spite of the increase in sales of 10% to a new record of Rs. 1.48 crores, the net profit for the year, after taxation at Rs. 3,88,903, is Rs. 1.36 lakhs lower than that of last year.

The main reason for this reduction is the provision of Rs. 1,85,000 which it has been necessary to make for the Company's liability under the Super Profits Tax Act, although the increased costs of production, to which I referred in my speech last year, mainly in respect of raw materials, packing and wages, have all tended to off-set the gains achieved by a higher turnover.

It is not possible to say at present whether the Super Profits Tax will be abolished or further liberalised, although, in view of the effect of the tax on the capital market, there is a very strong case for its abolition. The tendency for costs of production to rise has, if anything, been accentuated by the additional indirect taxes levied in the 1963 Budget. Additionally, your Company is faced with the need to conserve resources for rehabilitation of its plant and machinery which will involve substantial expenditure over the next ten years.

It is in this context that your Directors have recommended a reduction in the quantum of dividend on the Ordinary Share Capital of the Company for the year under review, to a total of Rs. 3,20,000 (representing 18% on the Ordinary Share Capital) as against Rs. 4,70,000 last year. Whilst the reduction in dividend is regretted, it will be noted that it is more than accounted for by the Super Profits Tax liability and that the total dividend for the year still represents a very high proportion of the net profits, after taxation, for the year.

At the same time, your Directors have appropriated to reserve the bulk of the surplus brought forward from last year and of the net profit for the year, after provision for dividend, so as to obtain the maximum benefit under the Super Profits Tax Act in respect of the current and future years.

I am happy to say that a significant feature of the year's turnover was that a major portion of the Defence Forces' requirements of toffees, valued at over Rs. 8 lakhs, was supplied by your Company against tenders placed by

the Chief Director of Purchase and through the Canteen Stores Department.

The upward trend of sales in North India, to which I referred last year, was well maintained and approximately 40% of the increase in sales was in that area. This is an encouraging sign and it is hoped that in the not too distant future your Company's products will be as popular in North India as in the South.

Your Company, in common with the other units in the confectionery industry, faces two main difficulties, namely, rehabilitation of plant and machinery, and rising costs of production. The long-term progress depends largely on the Company's ability to obtain licences for import of machinery in order to maintain even the present rate of growth in the face of rising costs of production. The extent to which the industry can overcome these difficulties depends, in turn, upon the Government's licensing and fiscal policies.

In the matter of allocations of foreign exchange for imports, the confectionery industry is accorded a low priority, although the types of machinery needed by the industry are not manufactured in India. In a consumer line like confectionery, more than in any other field, trends and ideas keep changing fast and pose a continuous problem to the industry to keep pace with refinements in manufacture and packaging. You will have noted from the sales pattern over the years that the demand for wrapped sweets has been steadily rising. While this development has taken place, the industry, owing to import restrictions, has remained insulated from the advance western countries have made in packaging and is, today, finding itself ill-equipped to meet the changed situation. The imbalance is greatest between the sweet-making capacity and wrapping it in ways that will appeal to the consumer; and if the industry is to maintain its growth in the home market and, more especially, to play an effective role in developing exports, it must be assisted by grant of adequate licences for import of machinery required for modernization, rationalization, and replacement. Against this, the only remedy the Government has to offer is to exhort manufacturers to export, incurring heavy losses, and then allow only a nominal portion of the foreign exchange earned for import of machinery. This attempt to rehabilitate the industry through the medium of exports has proved ineffectual, costly, and uneconomic. I would, therefore, strongly urge the authorities to view the problem with sympathy and to accord a higher priority than at present to the confectionery industry in the matter of issuing licences for machinery imports.

It is well known that the confectionery industry in India has to pay a much higher price for sugar, glucose, and wrapping paper—the main raw materials—than its counterpart in other countries. Additionally, the industry is dependent on imports for many items of raw materials like gum arabic, menthol, tartaric acid and lecithin, and it is virtually impossible to cover its requirements with the limited import licences made available. This, in turn, forces the industry to buy part of its requirements from established importers at very high prices. While this unwholesome

September 6, 1963

EASTERN ECONOMIST

481

position persists, it has been further aggravated by the increase in Customs and Excise Duties on cellophane, tinplate, and aluminium foil. Due to the additional tax levies, our wrapping and packing costs will rise by no less than Rs. 3.5 lakhs on the same turnover as last year. The increase in Central Sales Tax and surcharge on freight introduced at the same time will account for a further Rs. 50,000/-. Added to this is the steady rise in our wage bill owing to the continuous upward movement of the Cost of Living Index.

Increased costs can, no doubt, be off-set to some extent by higher turnover and operating economies, but, clearly, there is a limit to this process of adjustment. In the long run, higher costs inevitably force the industry to increase its prices. As confectionery is a semi-luxury item, a steep increase will undoubtedly inhibit consumption and is, therefore, not in the interests of the industry. It also makes it virtually impossible for the industry to develop the export market.

It should cause no surprise, therefore, that our exports have so far been negligible in relation to the potential that exists. The quality of our product is not the obstacle. Except, perhaps, in the latest techniques of wrapping and packaging, we can offer a quality of sweet that can match the best available elsewhere. It is the wide disparity in the costs of production between the foreign and Indian manufacturer that stands in the way of our developing a large export market. The drawback of Customs Duty on imported raw materials and rebate of Excise Duty on sugar and other indigenous raw materials, together with the cash subsidy of 10% on the f.o.b. value of goods exported, still leaves the gap wide open. If a major break through is to be made in the export markets, I would urge the Government actively to consider a liberalisation of import policy in respect of machinery as well as of essential raw material.

In a growing economy, the demand for consumer goods is bound to rise, but the future prospects of the confectionery industry depend largely on the assistance it receives from Government to reduce the high cost of production and to set right the imbalances that affect its working today.

During the year under review, our relations with the staff and labour have been most cordial, and I take this opportunity to record our sincere appreciation of the excellent work done by them.

The above statement is not a report of the proceedings of the Annual General Meeting, which will be held on the 27th September 1963.

ORIENT PAPER MILLS LIMITED

Regd. Office: Brajrajnagar, Dist. Sambalpur (Orissa)

NOTICE is hereby given that the Annual General Meeting of the ORIENT PAPER MILLS LIMITED will be held at the registered office of the Company at Brajrajnagar in the district of Sambalpur (Orissa) on Friday, the 27th September, 1963 at 3-30 P.M. for the following purposes:

- To receive and consider the report of the directors and to adopt the audited accounts of the Company for the year ended 31st March, 1963.
- To declare dividends on Preference and Ordinary Shares.
- To elect directors in place of H.H. Maharaja Sir Sawai Man Singh Bahadur of Jaipur and Shri Shavax A. Lal who retire by rotation and are eligible for re-election.
- To appoint Auditors for the current year and to fix their remuneration.

AS SPECIAL BUSINESS

- To consider and if thought fit to pass with or without modification the following ordinary resolution:

"Resolved that (1) the letting out of the Company's factory situated at 111/1, Barrackpore Trunk Road, Calcutta to its wholly owned subsidiary, Orient General Industries Limited, be and is hereby approved and confirmed and (2) the directors of the Company be and they are authorised from time to time to vary, modify and/or abrogate any of the terms of the tenancy for the time being in force as the directors may consider proper."

CALCUTTA, the 14th August, 1963.

- N.B. (i) A member entitled to attend and vote is entitled to appoint a proxy to attend and vote instead of himself and a proxy need not be a member.
- (ii) The Share Registers and Transfer Books of the Company will remain closed from the 24th August to 9th September, 1963, both days inclusive.
- (iii) The dividends, when declared, will be payable to registered shareholders as on the 9th September, 1963, or to their mandatees on or after the 15th October, 1963.
- (iv) The Explanatory statement as required under Section 173 of the Companies Act, 1956, has been forwarded to the members of the Company along with the Notice of the Meeting.

RECORDS AND STATISTICS

Aluminium Industry

The Bombay Shareholders' Association has published a Paper prepared by its Study Group on "The Aluminium Industry in India". Following are the details:

The Aluminium industry has by now established itself as the paramount non-ferrous metal industry in India. It is on the threshold of the most spectacular expansion in its history. Special significance of aluminium due to its unique and remarkable properties is being increasingly realised with the growing tempo of all-round industrialisation during the third five-year Plan.

A development of special importance to India is the major technological breakthrough which is about to take place in the method of its production. This will mean a substantial reduction in capital cost for this highly capital-intensive industry.

Raw Materials

Aluminium is the only non-ferrous metal for which India has abundant supplies of the basic raw material, namely Bauxite deposits. Besides, the nature has been kind to the country in that these deposits are by and large evenly distributed all over the country. As a result, all the four regions of India have or will have aluminium smelters as shown below:

Smelter-Company	State
Aluminium Corporation	West Bengal.
Indian Aluminium	Kerala and Orissa.
Hindustan Aluminium	U. P. State.
Khataus	Maharashtra.
Madras Aluminium	Madras.

According to one estimate, India possesses bauxite deposit to the extent of 250 million tons of which 25 million tons have already been proved to be suitable for the manufacture of aluminium. The regional distribution of the bauxite deposits is as follows:

State	Million tons
1. Bihar: Ranchi Plateau	90
2. M.P.: Jabbalpore and Balghat Dists.	90
3. Maharashtra: Belgaum & Kolapur areas	30
4. Madras: Sherroy Mills	20
5. Kashmir	2
6. Rest of India	18
Total	250

These known reserves are expected to last at least for a century. However, there are limiting factors for the rapid development of aluminium in the country. First, areas of large deposits of bauxite are not always connected with rail or road. Secondly, aluminium smelting requires abundant supplies of power at cheap rates and the prospects of obtaining power at bauxite sites are in many cases, not bright. The latter need not be a handicap provided adequate transport facilities are available to move bauxite to the smelter sites where power is available in large quantities at relatively cheaper rates.

The Bihar and M.P. deposits contain the best and most concentrated bauxite. Madras bauxite is reported to contain a larger proportion of reactive silica content, which considerably affect production costs. The higher the silica content the larger the loss of alumina and consumption of soda ash during the process of purification. The contents of sand, clay or hard laterite covering the layer of bauxite also affects the

cost of production. The deposits of Maharashtra have been observed to contain these impurities in fairly large proportion.

Besides bauxite, the other chief raw materials or stores required for aluminium smelting are caustic soda, petroleum coke, soft pitch, cryolite, aluminium fluoride, and flourspar. Though the country is rapidly developing its production of caustic soda, the indigenous production, with the increasing claims on its domestic supplies from other industries is found to be inadequate to meet the demands of the aluminium industry. Besides the caustic soda industry is faced with the problem of surplus chlorine; and hence the capacity of caustic soda cannot be increased without finding alternative industrial uses of chlorine.

Soft pitch is available indigenously but cryolite, aluminium fluoride and flourspar have all to be imported. Cryolite is mostly imported from Greenland.

Aluminium is a power intensive industry, hence cheap electricity is a vital requirement for the industry. About 20 per cent of the cost of smelting is accounted for by electric power. As much as 25000 kWh electricity is required for each ton of aluminium required. An increase of 1 naya paise per kWh would inflate the cost of production of ingot by Rs. 220 per ton.

Production and Consumption

Planning has given a stimulus to the development of the industry, even though the first Plan target of 20,000 tons and the second Plan target of 30,000 tons (later revised to 25,000 tons) were not reached. The production in 1956-57 at 7,000 tons increased to 18,500 tons by the end of second five-year Plan. The production is expected to increase at a very fast rate when the number of new units under construction go into production. The monthly average production of aluminium ingots and fabricated goods for the last five years has been as follows:

Year	Pure Metal	Sheets and Circles	Aluminium Foils	(In tons)	
				Wires and Rods (Electric)	Rods and Sections
1958	982	1112	131	134	90
1959	1437	1317	163	358	103
1960	1514	1727	245	493	110
1961	1440	1605	274	580	121
1962	1560	1713	284	629	127

Production of aluminium and allied products has been consistently short of internal demand. The present demand is estimated to be more than 50,000 tons per annum. The demand has been met largely by imports as revealed by the following import statistics:

Year	Import in tons
1958	17,288
1959	15,091
1960	20,397
1961	22,153
1962	22,546

Properties and Uses

Until about ten years ago, the metal aluminium was sold mainly to the utensil manufacturers. As a result, consumption tended to fluctuate considerably, and the overall rise was never sharp. Now, the uses of the metal have been

greatly diversified, and it is mainly in the sector of newer uses that the demand has grown most rapidly.

These uses are based on the remarkable properties of aluminium. The most important of the properties are that it is light, strong, and an excellent conductor of heat and electricity. In addition, it resists corrosion better than most other metals in common use; and it can be beaten into thin sheets or foils which manage to retain remarkable strength.

The special properties have led to the increasing use of aluminium in place of iron and steel, copper, lead, zinc, tin etc., for various purposes in recent years. In the transport and building industries, aluminium sheets are used for fabricating aircraft frames, railway rolling stock, bus-bodies, pre-casting houses etc. Aluminium foil is used in place of fabricated houses etc. Aluminium foil is used in place of lead and tin as packing material for tea, cigarette etc. Aluminium powder paste is used in paint industry. The corrosion resisting properties of aluminium are utilised for the fabrication of plant equipment in the chemical industries. Increasing use is made of aluminium in the manufacture of domestic utensils in place of copper and brass.

The most promising use of aluminium is perhaps as an electrical conductor. The acute shortage of copper in the country has given a great impetus to the manufacture of A.C.S.R. (Aluminium Conductor, Steel reinforced) cables and other types of aluminium conductors.

Thus, aluminium can largely replace other non-ferrous metals like copper, lead and zinc, all of which are mainly imported. It is estimated that without the substitutive use of aluminium, annual demand of copper, lead and zinc by 1965-66 will be 17,000 tons, 55,000 tons and 150,000 tons respectively, which together would cost more than Rs. 800 million by way of foreign exchange at the current prices. Thus increased production of aluminium and its increasing use as substitute for other metal can help India to save considerable amount of foreign exchange.

Expansion in Third Plan

The Third Plan targets for the industry envisages fourfold increase in production and increase in capacity (installed) to 150,000 tons (revised from original target of 120,000 tons). This spectacular anticipated growth is but a true reflection of vital role of aluminium in the implementation of the engineering and heavy industries, power and transport programmes of the Plan.

Thus the targets are so set that they may take the Indian economy a considerable distance towards the stage of self-sustaining growth and these targets are expected to prepare the ground for more rapid development after 1966. The break up of 150,000 tons capacity is of the following demand-pattern.

Industry	Demand Pattern
Building & Construction	6,000
Transportation	20,000
Domestic Utensils	30,000
Electrical Industries	50,000
Food, Farming & Sugar Industries	5,000
Canning and Packing	10,000
Miscellaneous	9,000
Exports	20,000
Total	1,50,000

Simultaneously, with this increase in primary aluminium production, the semi-fabricating capacity will also be expanded considerably.

It is felt in some of the interested quarters that this revision of targets to 1.50 lakh tons is a premature step. Being a capital intensive industry, care must be taken to see that production is not too far advanced of demand. Dynamic growth can only be achieved if the industry's ability to supply is clearly demonstrated. For instance, demand of aluminium for elec-

trical industries estimated at 50,000 tons may emerge out ultimately to be an overestimate in view of the technical bottlenecks involved in the successful use of aluminium as the substitute for copper in the electric industry. Thus it should be kept in view that an excess capacity can militate against growth by reducing the attractiveness of investment in aluminium production.

To achieve the target fixed for the third five-year Plan, following expansions have been licensed, some of which are expected to complete the plant construction during the early fourth five-year Plan:

	(In Tons)		
	Present	Additional Licence	Total
Ingot			
Aluminium Corporation	2,500	5,000	7,500
Indian Aluminium Co. "Alwaye"	5,600	5,000	10,600
Indian Aluminium Co. "Hirakud"	10,000	10,000	20,000
Hindustan Aluminium	20,000*	30,000	50,000
Khataus	20,000*	30,000	50,000
Madras Aluminium	10,000*	—	10,000
Mysore State Project	—	30,000	30,000
Fabricated Goods			
Aluminium Corporation	2,500	2,860	5,360
Indian Aluminium: Belur	9,000	7,500	16,500
" " Venesta	3,200	—	3,200
Hindustan Aluminium	—	15,000	15,000
Mysore State Project	—	—	—

* Under construction or trial production.

The industry is highly capital intensive with higher percentage of foreign exchange. The success of the new companies' licences depends upon the availability of foreign exchange required to carry out the expansion, especially in view of the defence-oriented diversion of financial resources being implemented by the Government due to emergency requirements.

Future Prospects

Some notable developments in the international aluminium manufacture have taken place which may change the entire production process of aluminium. Some time back, one of the leading producers of aluminium in the world announced that they have under construction a plant for the production of aluminium by a basically new process. This plant, expected to be ready within two years will have a capacity of 6,000 to 8,000 tons of primary aluminium and will cost approximately \$4 million. Thus the capital cost for producing aluminium by the new process is about Rs. 2,500 per ton against Rs. 8,000 per ton under the existing process. This is of great significance to a capital intensive industry like the aluminium industry.

In view of these developments which may completely revolutionise aluminium production process all over the world within the next few years, it would be unwise to go ahead and invest large sums of money in plants which may become obsolete within the next few years. Moreover, we, in India can afford to wait for a few years before embarking on substantial expansion, considering that the current planned expansion will more than take care of the demand that is likely to arise by the end of the third five-year Plan. This will also enable the country to compete more effectively with the North American and European manufacturers and to build an industry which is based on the latest technological improvements, an important consideration for a developing country like ours.

Targets for 1965-66 are difficult to attain in view of the foreign exchange and raw material shortages, as well as diversion of financial resources due to emergency. Thus, from

the pattern of demand the market is likely to absorb the full supply that is possible to be generated in the circumstances. Thus, the individual aluminium units can expect to fare well in years to come, if they can curtail their costs reasonably and exploit the new developing markets of aluminium fruitfully.

Aluminium Industries Ltd.

Incorporation:—The Company was registered in 1946 at Kundara (Kerala).

Managing Agents:—Seshasayee Brothers, (Travancore) Private Ltd.

Works At:—Kundara (Kerala), Hirakud (Orissa), Hyderabad.

The Company has collaborated with Aluminium Laboratories Ltd., Montreal, Canada. The plant at Kundara was commissioned in 1950 with initial capacity of 1,500 tons of Aluminium conductors per annum. The present capacity of the plant is 9,000 tons of ACSR and other Aluminium conductors per year.

The Kundara works also includes a casting and rolling mill which was commissioned in 1955 and produces electric conductor grade aluminium rods with annual capacity of 2,400 tons. The plant for manufacturing insulated aluminium conductor was started in 1957, with capacity of 10 million core yds. p.a. The plant produces Alind all-weather and Alind ker-alite building wires and Alindal Vinyl all-purpose wire. There is also a small unit manufacturing full range of aluminium conductor accessories.

The works at Hirakud (Orissa) includes wire mill (Capacity 3,600 tons p.a.) and a rod mill (3,600 tons annual cap.). The wire mill was commissioned in January 1959, and the rod mill in February, 1960.

The latest addition to the company's manufacturing activities is wire mill in Hyderabad (Andhra Pradesh) to manufacture PVC covered aluminium housing wiring cables with capacity of 5 million core yards per annum.

The Company has plans to expand Rod rolling mill at Kundara.

Aluminium Corp. of India

Registration:—The Company was incorporated in Calcutta in 1937.

Managing Agents:—J. K. Industries Private Ltd.

Works:—At Jaykaynagar (District Burdwan).

Activities:—The company manufactures and deals in aluminium ingots and allied products. The chief products are virgin aluminium ingots, aluminium sheets, aluminium circles, aluminium extruded metal, aluminium chemicals etc. The Jaykaynagar factory at Asansol has annual capacity of 2,500 tons of aluminium ingots, which was commissioned in 1942; and produces aluminium of the purity necessary for Electrolyte reduction.

The expansion of the plant is being carried out to treble the present capacity. The first phase has been completed. Plant for the second phase has recently arrived. The entire project of expansion is expected to be completed by the end of 1964.

Hindustan Aluminium Corp. Ltd.

Incorporation:—The company was registered in 1958 in Calcutta.

Managing Agents:—Birla Gwalior Private Limited

Works:—At Renukoot (Mirzapur, U.P.).

The Company has been set up in collaboration with Henry J. Kaiser & Co. of Oakland, U.S.A., who have participated in the Company's capital to the extent of 160 lakhs. The smelter plant was commissioned into production in 1962, after a construction period of 18 months. The full capacity of 20,000 tons is expected to be reached by the end

of 1963.

The Company has obtained licence for putting up a Rolling Mill. Orders for plant and machinery of this Rs. 6 crores project have been placed, and the construction is expected to be completed by end of 1964.

The 20,000 tons smelter plant is to be expanded to the capacity of 50,000 tons.

The Company has also undertaken the installation of fabricating facilities for the manufacture of aluminium conductors, re-draw rods, rolled products and extrusion for a total capacity of 15,000 tons per annum.

Besides, the Company has applied to the Government for a licence to set up its own thermal power generating unit.

Indian Aluminium Co. Ltd.

Incorporation:—The Company was registered in 1937 as a private co. "Aluminium Producing Co. of India Ltd." which name was converted into the present name in 1944. The Company became a Public Ltd. Co. in 1945.

Registrars:—Andrew Yule & Co. Ltd.

Works:—

Bauxite Mines near Lahardaga (Bihar)

Alumina plant at Muri (Bihar)

Smelters at Hirakud (Orissa) & of Alupuram (Kerala)

Rolling Mills at Belur (W. Bengal)

Extrusion Plant at Alupuram (Kerala)

Powder and Paste Plant at Kalwa (Maharashtra)

The Company manufactures and deals in aluminium in its alloys and semifabricated products, namely, ingots, bars, chequered plates, circles, covered sheets corrugated sheets, extended sections, flat sheets, foilstock, grain foils, irrigation tubings, paste for paint-pigment, prefabricated houses, rods, slugs etc. The Company also produces and sells hydrated and calcined alumina, bauxite and carbon electrode paste. The Company is a distributor of Alcan Asia Limited.

The doubling of the Hirakud smelter, established in 1959 with initial capacity of 5,700 m.t. of ingots, was completed in 1961, simultaneously with the new extrusion press at Alupuram in the same year.

The expansion of Muri Aluminium Plant was completed in March, 1962 raising its capacity from 18,300 tons to 55,000 tons. In the same year Belur rolling mill was expanded to 16,800 tons.

The Company's plans are in full swing for expansion of Alupuram smelter to 10,850 tons expected to be completed in mid 1964.

Madras Aluminium Co. Ltd.

Incorporation:—The Company was incorporated at Coimbatore in 1960.

Managing Agents:—Messrs. Salcoa & Company, Coimbatore.

Works:—At Mettur.

The Company is to undertake manufacture of aluminium ingots and alloys, in technical collaboration of Messrs. Montecatini of Italy. The company has obtained mining rights of bauxite reserves in the Shevroy Hills, from "Shevroy Bauxite Products Company" by paying Rs. 14.25 lakhs for the said right.

The licensed capacity of the plant is 10,000 tons p.a. of which 7,000 tons will be ingots and 3,000 tons alloys. An additional licence for expansion of the plant to 20,000 tons capacity has been already granted to the Company.

A rolling mill is also to be set up as an adjunct to the Aluminium smelter.

The factory construction work is in progress. All contracts for major civil constructions have been entrusted to a leading contract company and the constructions are expected to be completed by December, 1963. The plant is expected to commence production during the later half of the year 1964.

Progress of Industrial Co-operatives: 1951-61

THE NUMBER of industrial co-operatives in India increased more than four-fold from 7,101 in 1951 to 33,266 in 1961. While their membership increased during the same period from 7.66 lakhs to 25.64 lakhs, the growth of their working capital was seven-fold — from Rs. 7.05 crores in 1951 to Rs. 53.80 crores in 1961. Industrial co-operatives have thus become the largest group of the co-operative movement after agricultural credit societies which occupy the first place. Co-operative societies of handloom weavers formed the most important group in the industrial sector. Over one-third of the industrial co-operatives were weavers' societies, responsible for over 50 per cent of the working capital and over 70 per cent of the sales in the industrial co-operative sector.

Special attention had been paid during the last few years to the Khadi and Village Industries field with the result that over 36 per cent of the industrial co-operatives were by 1961 in this sector. In some village industries a major portion of the effort of the Khadi and Village Industries Commission was directed towards co-operative development — 85 per cent in hand-pounding of paddy, 90 per cent in village oil industry and fully in palm gur industry. There were about 2000 co-operatives of traditional craftsmen producing artistic handicrafts. Efforts were also being made to encourage coir workers to form co-operatives, particularly in Kerala State.

In the small-scale field more than 700 co-operatives were operating in the engineering and sheet metal work field, over 100 co-operatives in the hosiery industry and 40 in the manufacture of chemical products. There were also co-operative societies manufacturing bricks and tiles, sports goods, fibre products, sericulture, salt, woodwork, garments and similar other products. Co-operatives of carpenters, blacksmiths, leather workers and other artisans were also in existence.

In certain areas the industrial co-operatives had also set up their own co-operative banks to meet the requirements of the societies as well as individual artisans. There were four such co-operative banks operating at the State level and seven at district levels. In Mysore and Saurashtra industrial credit societies had been developed. The weavers' and palm gur producing co-operatives had set up their own federal structure for sales and supplies at Central, State and all-India levels. District or State level federations had also been organised by co-operatives of oilmen, leather workers and workers in some other industries in one or two areas. Multi-industry federations had been set up in some States.

The owned funds of industrial co-operatives were Rs. 21.35 crores and their borrowings Rs. 32.45 crores in 1961. It is significant that the co-operative societies in industries other than weaving which had a low ratio of per-member paid up capital caught up with the weavers co-operatives by 1961, it being Rs. 38 in both cases. 30.08 per cent of the borrowings of the industrial co-operatives were from co-operative banks, 44.99 per cent from Government and 24.93 per cent from other sources. 32.81 per cent of the working capital of the societies was invested in stocks. The investment in raw materials was about half of that in the finished goods. Inability to sell the bulk of the goods produced by the societies and their members, has, however, remained as a drawback. The percentage of working capital invested in plant and equipment had steadily risen from 9.5 in 1951 to 14.91 in 1961. The fact that a large number of co-operatives were in traditional industries which were predominantly labour intensive was responsible for the investment at a low level. Societies in mechanised industries were, however, being organised and improved tools and equipment were being gradually introduced in traditional industries.

Red...Blue...Grey—colours play an important part in Mahabir's life!

WHEN MAHABIR SEES RED...

...he thinks of motor spirit! It's a natural reaction. Mahabir Routh is a general workman at Garhara depot. One of his many jobs is the loading of bulk petroleum products. The valves controlling the flow from tank to delivery vehicle are coloured—Red for motor spirit, light Blue for kerosine oil, Grey for high speed diesel oil and so on. Mahabir knows them all. In his seventeen years on the job, he has acquired skill and confidence. He follows instructions to the letter and does his work well.

HIS PROUDEST POSSESSIONS?

A generous moustache, two grandchild-

ren and his job. Mahabir's face softens perceptibly when he talks of his grandchildren. His favourite: a girl aged six. 'She is intelligent,' Mahabir says. He has already planned her education. Quiet and friendly, over the years he has won the trust of his co-workers.

TODAY, AS EVER, PEOPLE LIKE MAHABIR ARE WORKING FOR YOU

Mahabir and people like him—at all levels of responsibility—are Burmah-Shell. Today, as ever, they are hard at work... working to ensure that vital petroleum products, essential to India's growth and progress, are brought to you at the right place and time, in the right quantities.

Anatomy of Poverty

CURRENTLY THERE is a great deal of argument in this country about the arithmetic of the poverty of our people whereas an attempt to understand the anatomy of this poverty could perhaps have been more to the point. Current discussions have certainly served to emphasize the continuing prevalence of mass poverty in this country and the great and urgent need that there is for a more positive approach to our problems of economic development so that not merely poverty in the sense of penury or pauperism may be relieved but the standard of living of our people may be brought in step with the requirements of civilized life. But the discussions have not been equally fruitful in defining the broad principles along which that positive approach is to be made. If this problem is to be correctly understood and resolved it is even more necessary to discuss why our people are poor than to quarrel over how poor they are.

An answer to this question 'why' is, in its essential content, simple enough. Our people are poor because the capital and technical skills at the disposal of the nation are not adequate for the task of providing the goods and services which the 450 million people of this country need for a decent existence. It follows that the only solution is to build as rapidly as we can this capital and know-how into the nation's economy. Now it has been conceded more or less universally by all shades of opinion in this country that this task of building up of our capital and know-how will have to draw very heavily indeed on the resources of the industrially advanced nations of the world. This recognition is at the basis of our policy of seeking, securing and utilizing development assistance from the Governments of friendly countries. Unfortunately, this recognition has not extended to our attitudes towards foreign private capital. This is unfortunate because in the first place, external assistance on a government-to-government basis is not and cannot be sufficient for the demands of our development. Secondly, there is a limit to such assistance. This has become increasingly clear, especially in recent months and it will be an inexcusable act of wishful thinking on our part if we do not recognise that the peak of external assistance on an inter-government basis has probably been reached and passed.

It follows that we should give greater attention than we have done so far to the task of attracting foreign private capital to this country on a scale very much larger than has been realized hitherto. It has often been argued that foreign private capital can never be significantly important in the development of this country. The contention is that, in the first place, the exportable surpluses of capital are not sufficiently abundant and even if they are abundant they are unlikely to be keen on entering industrially backward areas of the world. There is, however, no firm warrant at all for such conclusions. Science and technology are taking giant strides in the world of today. This is increasing by leaps and bounds the efficiency and productivity of capital in the industrially advanced economies of the world. While this process certainly keeps on extending almost indefinitely the scope for domestic investments in advanced countries, it is also steadily adding to that part of the capital resources which can be released for investments outside the domestic economy.

The connected argument that the capital which may be available from industrialised countries for investment in backward but developing economies is not large is also not borne out by current experience. On the contrary, the limit, in fact, seems to be not the willingness or the ability of the capital exporting countries, but the opportunities and facilities

which countries importing capital are prepared to accord for industrial investments in their economies. In any case, while Governments and peoples of assisting countries are becoming less keen on providing public funds for development assistance abroad, they are becoming correspondingly more and more keen on stepping up the flow of private capital into the development of the assisted countries. This is a development which cannot be ignored by us. The economic climate and the investment climate we would create, particularly through the economic policies of our Government, should be such as to be broadly in alignment with the expectations of investors and entrepreneurs in the industrially advanced and capital exporting countries of the world. From this point of view it is becoming more and more irrelevant to try to justify our economic policies by referring them to our pieties and prejudices.

It is broadly true that if we follow a healthy economic policy in order to create a favourable investment climate for foreign capital, we would also be automatically providing a proper environment for the full and fruitful functioning of domestic capital and entrepreneurship. But at the same time, it may still be necessary to get over certain prejudices which have plagued our attitude to industrial development hitherto. In the first place, there has been far too much mistrust and in some areas of opinion an active animus against the growth of industrial undertakings. It is surely odd that in one and the same breath we demand industrial expansion but condemn individual firms or business houses which manage to expand. In the present circumstances of the country, the only true test of the public worth of private enterprise is that private enterprise should step up production and earn more thereby creating more capital for further expansion of industries and industrial production.

Threat to Textile Exports

FOR QUITE some time past, Lancashire cotton interests have been pressing their Government to do something to prevent what they describe as "price disruption" in the British domestic market for cotton textiles. Recently, a delegation of cotton industry leaders waited on the President of the Board of Trade to urge immediate action in this matter. From the statement made by the latter, the British Government seems to be impressed with the case made out by the Lancashire interests and, more, it even seems to share the views of the Lancashire interests on how to tackle the problem. Thus, the President of the Board of Trade is reported to have said: "I do not believe that the present state of affairs is satisfactory either for our own industry or for exporting countries whose needs to earn sterling I recognise as of the highest importance A reasonable measure of categorisation is desirable and justified to prevent price disruption in the home market for cotton textiles". This is precisely what Lancashire interests have been urging.

That the British Government is as good as its word is clear from the fact that the Board of Trade had already fixed quotas on arrivals from China of cotton

The Finance Minister, speaking in the Lok Sabha last week, pointed out that the paramount need of the day is that of stimulating the rate of growth of the economy. Proceeding, Mr. Krishnamachari said:

"The sizable claims of both defence and development cannot be met merely by diverting the existing resources from the private to the public sector or vice versa. What we need essentially is to enlarge the pool of available resources for stimulating the growth of the economy, so that the claims of defence and development are met in an environment of expansion.

The rate of growth of the economy as it is now organised has to depend to a very large extent on the performance of the private sector. It would, I think, be generally agreed that for a variety of reasons there has been a comparative set-back in the performance of the private sector both in industry and agriculture during the past two years. The issues that confront us, if we are to stimulate the growth of the economy, are many and range widely over the whole field of economic policy including policy in regard to controls, taxation, credit and the like but, as far as credit policy at any rate is concerned, the need at the present moment is to devise ways whereby our credit institutions can serve more adequately the needs of the economy at the present stage of development."

This candid and courageous assessment of the needs of the economic situation will no doubt confirm the initial confidence and hopefulness which have been generally inspired in business and financial circles by the assumption of the Finance Ministership by Mr. T. T. Krishnamachari. But, while recognising fully the key role which economic statesmanship and leadership in the Finance Ministry could play in accelerating the tempo of economic activity, we would like to point out that the task is not for the Finance Ministry alone, however strategic and significant the place of that Ministry may be in the machinery of Government. Here is a responsibility to which the Government as a whole as well as the Government in every one of its parts must address itself.

handkerchiefs and towels during the 17-month period from August, 1963 to December, 1964. Separate licences are now required for the import of these goods from China. Even before this, however, certain quotas had been in force for the imports of cotton or rayon yarn and thread and cloth from that country. It is significant that this action has been taken on the eve of the visit of the Indian delegation to the U.K.

Under her present agreement with the U.K., which is valid till 1965, India has voluntarily agreed to limit her shipments of cloth to the U.K. to 195 million sq. yards. The question of any modification of this agreement at this stage is, therefore, bound to raise difficulties. As it is, the export outlook for Indian textiles is by no means bright. Although there have been promises by developed countries that they would increase their imports of textiles from the less developed countries, in actual practice, the developed countries, even those like the E.C.M. countries which have an overwhelmingly favourable balance of trade with India, have not shown any eagerness to keep to such promises, as witness their half-hearted implementation of the pro-

visions of last year's Geneva Agreement. The United States, which took a prominent part in propagating the philosophy of aiding the underdeveloped countries, also is not prepared to increase her off-take of Indian cloth. On the other hand, the U.S. textile industry is reported to be unwilling even to maintain the level of America's intake of Indian cloth at the 1959-60 level of 32 million yards. In these circumstances, it would be interesting to watch what the Indian delegation to the forthcoming annual session of the International Federation of Cotton and Allied Textile Industries at Athens will be able to do to persuade the developed countries to liberalise their imports of Indian textiles.

But, when all is said and done, the fact remains that, unless our cotton mills are equipped with up-to-date

Input and Output in Agriculture

IN A SPIRITED defence of the agricultural policies of the Union Ministry of Food and Agriculture Mr. S. K. Patil stated in the Lok Sabha on August 20, 1963, that the progress made on the food front from 50 million tons in 1950-51 to 80 million tons in 1962-63 was not a sign of stagnation but was a sign of continuous growth. He claimed that an increase of more than 50 per cent in food production had been attained and that even a "bad year" for agriculture in 1962-63 had not reduced output below 80 million tons. While no one will deny that there has been an increase in output of foodgrains over the past 12 years, the difference lies in the degree of the rise.

The base-year figure of production is not comparable to the latest level of production for two reasons. In the first place, there were some non-reporting areas in 1950-51 whose production was not included in that year but which have been taken into account in subsequent years. The second important factor is that the method of estimation of production has changed in recent years from that of the inspection reports of the Patwari to the more scientific method of crop-cutting experiments. It is known that the crop-cutting experiments have invariably yielded higher estimates and a part of the present increase in food production is due to this new technique in estimation.

To analyse the performance of the agricultural sector, an attempt is made here to measure agricultural productivity in relation to investment. For this purpose, it would be best to correlate the estimates of agricultural income prepared by the National Income Unit of Central Statistical Organization and agricultural outlays in India's plans along with the farm investments made on personal account. The data on the investments made by agricultural families is not available beyond 1956-57. According to the estimates made by the National Council of Applied Economic Research annual farm investments on personal account between 1950-51

machines and are able to produce goods that can compete in the world markets both price-wise and quality-wise, our export ambitions are bound to remain as mere aspirations. The gap between the export target under the third Plan of 850 million yards per annum and our average annual (actual) exports during the past three years amply demonstrates that we have been falling behind our goal even quantitatively. It is high time, therefore, that both the Government and the textile industry in India applied their minds to the problems of the industry and did something concrete to revitalise the industry. If the Indian jute mill industry, which experienced similar periods of depression in the past, has been able to solve its problems remarkably in the past few years, there is no reason why the Indian cotton mill industry also should not be able to do likewise.

and 1956-57 were relatively constant. The figure was between Rs. 900 and Rs. 950 crores as is shown below:

Year	(Rs. Crores)
1950-51	947
1951-52	922
1952-53	914
1953-54	948
1954-55	945
1955-56	942
1956-57	927

Assuming that there was no significant change in personal investment in agriculture even after 1956-57, a relationship between inputs (agricultural outlays of the Government) in the farm sector and the resultant increase in production gives a measure of productivity of investment.

The value of agricultural production from 1950-51 to 1962-63 both at current prices and at 1948-49 prices and Plan outlays in agriculture are given in tables on the next page. It will be seen that the estimates of income at current prices tend to give a distorted picture. During the first five-year Plan the total, absolute increase in agricultural income over 1950-51 was negative at Rs. 440 crores. This may be explained by the performance of the agricultural sector during the five-year period. Agricultural production took a favourable turn from 1952-53 onwards which depressed agricultural prices and, hence, the monetary increase in agricultural income in three out of the five years was negative. An obvious interpretation of these figures is that investment made by the Government in the first five-year Plan (which was around Rs. 400 crores both by the Centre and the States combined), did not raise the money income of the farmers.

The picture in terms of constant 1948-49 prices, however, was different. The total increase in agricultural income at 1948-49 prices in the five years of the first Plan

over 1950-51 was Rs. 2,370 crores. Relating this monetary increase in production to investment of Rs. 400 crores (which, however, took place at current prices) by the Government, it is observed that capital-output ratio in this sector was 6:1 meaning every investment of a rupee in the farm sector yielded, in real terms, a rise of six rupees. The facts, as they are known, indicate that the increase in agricultural output was due to favourable monsoons and, hence, this highly favourable relation was not in any way a function of investment.

The agricultural scene took an unfavourable turn during the second five-year Plan. In the first two years of the Plan, that is 1956-57 and 1957-58, production was relatively stagnant and the outcome was an upward course of agricultural prices. It resulted in a sizable increase in agricultural income at current prices in the five years of the second Plan at Rs. 7,590 crores — again, not because of any rise in output, but because of the rise in prices. At constant prices, the real increase in the second Plan at Rs. 2,140 crores was lower than the increase during the first five-year Plan and was less than a third of the increase at current prices. The total Government investment in agriculture during the second Plan was Rs. 660 crores. It meant that every additional rupee which was invested by the State yielded an increase of Rs. 3.5 in real terms.

The picture in the first two years of the third Plan has been very dismal. In real terms, the increment in income over 1960-61 was negative at Rs. 60 crores. At current prices, it showed a marginal rise of Rs. 51 crores. It is estimated that the total agricultural outlay by the public sector during the first two years of the third Plan was around Rs. 350 crores showing that in these two years, every investment of a rupee brought an increase

VALUE OF AGRICULTURAL PRODUCTION
1950-51 — 1962-63

	Agricultural Income (Rs. crores) at current prices	Increment over 1950-51 or 1955-56	Agricultural Income (Rs. crores) at constant prices	Increment over 1950-51 or 1955-56
1950-51	4,890		4,340	
1951-52	5,020	+ 130	4,440	+ 100
1952-53	4,810	- 80	4,600	+ 260
1953-54	5,310	+ 420	4,980	+ 640
1954-55	4,350	- 540	5,030	+ 690
1955-56	4,520	- 370	5,020	+ 680
		- 440		+ 2,370
1956-57	5,520	+ 1,000	5,250	+ 230
1957-58	5,280	+ 760	5,010	- 10
1958-59	6,240	+ 1,720	5,560	+ 540
1959-60	6,250	+ 1,730	5,510	+ 490
1960-61	6,900	+ 2,330	5,910	+ 890
		+ 7,590		+ 2,140
1961-62	6,850	- 50	5,860	- 50
1962-63	7,001	+ 101	5,900*	- 10
		+ 51		- 60

* Estimated.

of only one-seventh of a rupee. Is there likely to be a more substantial increase in yield in later years because of these investments? The agricultural pundits believe that Indian agriculture has been dominated in the past by five-year cycles and that computations relating to the performance of the agricultural sector for two years are therefore not likely to yield meaningful results. Nevertheless it is reasonably clear from this broad analysis of Plan outlays and the volume and value of agricultural production that the performance of the agricultural sector, despite all the government directed investments, has been extremely erratic; money inputs have had no stable relation either to physical output or money value of product.

PLAN OUTLAYS ON AGRICULTURAL PRODUCTION
(Rs. Crores)

	Second Plan	Third Plan
Agricultural Production	98.10	226.07
Minor Irrigation	94.94	178.76
Soil Conservation	17.61	72.73
Co-operation	33.83	80.10
Community Development (Agricultural Programmes)	50.00	126.00
Major & Medium Irrigation	327.17	599.34
Total	666.65	1,281.00

- (a) Total agricultural investment by Government in the first Plan was about Rs. 400 crores.
(b) Total agricultural investment in 1961-62 and 1962-63 was about Rs. 350 crores.

Eastern Economist 20 Years Ago

SEPTEMBER 10, 1943

Elated at what they regard as the success which has attended their fiscal measures in recent months, Government has been egged on to further efforts. This time it is the small investor who has to be tackled, and it is the Provincial Governments which must set the machinery in working. A target of Rs. 100 crores has been fixed as the amount of small savings to be mobilized by the end of next March; in addition provincial tax measures are to be imposed to freeze surplus money. These include the amusement and sales taxes, court fees, stamp and excise duties and agricultural income-tax. The object of this second deflationary offensive is at once to set aside funds for post-war use by provinces and to provide the 'improvident' peasant with a 'nest egg' to lay hands on after the war. Even prior to this, some provinces, notably U.P. and Madras, have taken certain steps with this end in view. Now that these form part of a co-ordinated and country-wide campaign, it is opportune to review the state of provincial finances in the last four years with a view to examining how far it would permit of these large-scale offensives and to lay bare the inherent limitations of provincial fiscal policy in this respect. The question naturally can be considered in two parts: (1) Do the rural economic conditions today lend any strength to the scheme of mopping up Rs. 100 crores from the small saver in six months? and (2) Are there any sources of equitable and feasible taxation within the provincial sphere which have not been adequately tapped in the last four years?

Highlights of the Week

WHO IN S.-E. ASIA

IN HIS 15th annual report on WHO's contribution to health progress in South East Asia which Dr. C. Mani, Regional Director of the WHO presented to its Regional Committee now meeting in Bangkok, he makes the point that basic health services in the region should be developed on a top priority basis if the considerable success achieved by mass campaigns against malaria, yaws, leprosy and smallpox is to be consolidated. He notes that there has been a certain improvement in medical and nursing educational facilities in the Region; in India, for instance, the number of medical colleges has grown from 66 a year ago to 73 today. But it is still not possible to succeed in attaining a reasonable level of basic health services in the South East Asian Region without employing a vast number of auxiliaries to assist the qualified doctors as well as nurses. Urging a realistic ten-year programme for the training of medical auxiliaries, the Director says that any technical assistance required from WHO will certainly be forthcoming both for the initial planning as well as for the implementation of such schemes.

Meanwhile, the main emphasis in WHO's work in South East Asia continues to be on communicable diseases. The malaria eradication drive in the region, in which WHO has co-operated with national programmes, now affords protection to 545 million people out of a population at malaria risk of 600 million. Referring to tuberculosis control the report stresses that much greater resources should be provided as there are about 800 million active cases in the region. Experience from the projects assisted by WHO and UNICEF shows that gradual expansion of pilot projects to nation-wide programmes is feasible provided a strong organisation exists for the supervision of ambulatory treatment and funds are assured for adequate drug supplies.

The report refers to the commencement in this country of a national smallpox eradication programme towards the end of last year. This programme is the largest of its kind in the world and is certainly appropriate to India's requirements since out of about 40,000 cases and about 10,000 deaths notified in the South East Asia Region in 1962, the majority was from this land. The Indian programme tries to complete the "attack phase" within two years.

There was increased activity in the national leprosy, control campaigns in Burma, Indonesia and Thailand. In Nepal a WHO survey of the nature and extent of leprosy in Kathmandu valley disclosed that the incidence was of the order of 10 cases per 1,000 population. The report complains that a scarcity of doctors wishing to specialise in venereology is a limitation on the expansion of venereal disease control services in Burma, India and Indonesia. It notes with concern the wide prevalence of filarial infections in Burma, Ceylon, Indonesia, Thailand and throughout India, except in the north; about 64 million people are estimated to live in those parts of this country where transmission occurs. The report notes that although maternal and child health services have expanded, swelling populations, along with the acceleration of urbanisation and industrialisation, have brought into sharp focus inadequacies in those facilities, especially in the case of mothers and children in urban environments. It is proposed to recruit consultants to study this problem in a few major cities and to assist in preparing recommendations for further development of maternal and child health services.

The report takes rather a dim view of any large early

improvement with regard to sanitation and nutrition. Defective sanitation and malnutrition are still the two major causes of the very high morbidity that is characteristic of the Region. To widespread insanitation is linked the diarrhoeal diseases which the report describes as "one of the most formidable public health problems in the Region". A survey of water supply resources in Greater Calcutta which was started early in 1962 and is being financed by the United Nations Special Funds, the report hopefully suggests, could be the beginning of a determined effort to solve what is one of the most difficult urban water supply and sewerage problems in the world. The WHO is acting as the executing agency in this project. Advances in the field of nutrition and sanitation, however, have been slow and small, principally because of the financial barrier to any major breakthrough.

UNIT TRUSTS

A PROPOSAL for legislation to enable the setting up of Unit Trusts in this country was announced by Mr. Morarji Desai in his Budget speech last February. Mr. T. T. Krishnamachari, confirmed in the Lok Sabha last week that the matter was under consideration of the Government. The move has evoked considerable interest in financial circles and many parties have already come forward to start Unit Trusts. The need for legislation arises because Unit Trusts will have to be exempted from payment of income tax on their incomes since those incomes are derived as dividends from companies on which tax had already been paid at source. This apart, it is also necessary for the Law to lay down the form and manner in which Trust Deeds governing the operation of the funds of the Unit Trusts is to be drawn. In Britain the Trustee who administers the Trust Deed is usually a bank or an insurance company.

A point which the Government of India will have to decide is whether this practice should be followed here also or whether any particular institution such as the LIC or the Reserve Bank should be nominated for the position of legally authorised trustees. It is possible, of course, for the Government to have one or more Trusts for the entire country as a purely Government institution, but it would be much more desirable to let Unit Trusts be started as private investment institutions in accordance with such legal requirements as may be laid down. The investor should have the advantage of choosing among different Unit Trusts according to their different investment policies and relative efficiencies. This is certainly a field where competition is very much in the public interest, since investment is a business where the knowledge, judgment and expertise of the individual is an asset for which there is no substitute.

In view of the topical interest of the subject we reproduce below a pamphlet "A Plain Man's Guide to Unit Trusts" issued by the Association of Unit Trust Managers, London:

"The Right Way to Invest: Rather than put all of their savings on deposit at a fixed rate of interest, many people today want to invest in industry.

This means investing in stocks and shares. To the people who know little about it, and who fear the risks involved, the Stock Market is a forbidding world. For these people Unit Trusts provide an easy, convenient and, as far as it can be, safe way of investing in industry.

The soundest investment policy is to take the advice of well-informed experts and to use the money available to buy

the widest possible selection of stocks and shares.

The investor with limited means cannot easily by himself follow these rules of safe conduct.

However, as in other spheres of life, what a man finds difficult to achieve by himself, he can often bring about in co-operation with others. This in essence is all a Unit Trust is—a joint investment venture.

What Unit Trusts Are : A growing number of like-minded people have for years been daily adding their money together to make a large sum of capital to form a trust fund. This Fund is invested on their behalf in a carefully selected range of industrial companies, financial enterprises and commercial undertakings. The choice of the stocks and shares is made by the Managers of the Unit Trust, advised by leading investment experts. The list of investments is under continual review.

The operation of the trust fund is governed by a Trust Deed which is drawn up in accordance with requirements of the Board of Trade. There is a trustee—usually a well-known bank or insurance company—who holds the securities in which the money of the fund is invested and collects the dividends which these investments pay. The Trustee also ensures that the Managers of the Trust carry out their responsibilities to the unit holders in accordance with the Trust Deed.

Indirect Interest

When you buy units in a Unit Trust, you buy a proportion of the trust fund and, therefore, you have indirectly an interest in every share of every company in which the fund is invested. The dividends paid by the companies in which the trust has holdings form the income of the trust. In general, twice a year, after deduction of a small management fee for operating the trust, you will receive your share of the income in accordance with the size of your holdings. Because the dividends paid by the companies to the Trust are taxed at source, the income distributed to unit holders is net—i.e., income tax has already been deducted at the standard rate.

A Long-Term Investment : By buying units you cannot, of course, entirely escape the risks which apply to all investments in stocks and shares because the price of your units depends on the price of the securities in which the trust fund is invested. As the stock market value of these securities rises, so will the value of your units. If the securities fall in value, the price of your units will fall also. Likewise your income from a holding of units is governed by the dividends which the trust receives on the shares it holds. What you can escape, however, is the risk attached to investing in any particular share or small number of shares. And what you can expect is that through the guidance of investment advisers available to the Unit Trust in which you have chosen to invest, you will do better than an investor who merely follows his own inclination on every tip and hunch. One thing you should always remember, however, is that Unit Trusts are a medium or long term form of investment and can be relied upon to give satisfaction only if they are regarded as such.

Charges : The Managers and Trustees have, of course, to be remunerated for their services, and therefore charges are made for looking after your investments and for dealing with all the paper work involved. These charges, the level of which is controlled by the Board of Trade, are taken by way of an initial service charge, which is included in the price of the unit when you buy it, and an annual charge deducted

from the gross income or capital of the Trust in half yearly instalments.

Savings Schemes : Most Managers of Unit Trusts operate savings schemes in conjunction with the trusts which they manage. You can make periodical payments of small amounts to a savings account, and thereby accumulate capital for retirement, for children's education or for your family's financial future. Regular monthly investment eliminates the problem of when to buy.

How to Choose : Many Unit Trusts have different investment policies and no two have the same investment portfolio. Which one you choose depends on what you expect from your investment. Your bank manager, or a solicitor or a stockbroker can probably advise you as to which Unit Trust best suits your purposes.

To help investors distinguish between the investment objectives of Unit Trusts managed by its Members, the Association of Unit Trust Managers publishes a book (2/6d. post free) which gives details of each one.

Easy to Buy and Sell : On any working day you can write to, or telephone, the Manager of a Unit Trust belonging to this Association, and place your order to buy units at the offered price, or, if you prefer, you can ask a bank manager, solicitor or stockbroker to do the transaction for you—it will cost you no more. Offered prices are calculated to include all investment costs and the management's initial service charge. You can as easily sell your units back to the Manager at the bid price—although in this case, if you go through an agent, you can expect to pay him a commission for his services. The prices at which orders are carried out are those ruling when the order is received. These prices are printed daily in most national newspapers. Both the buying (offered) and the selling (bid) prices are calculated on the basis of the Stock Exchange values of the securities owned by the trust fund.

Some Terms Explained

Distribution/Accounting Period : This is the period in respect of which an income distribution is made. Most trusts have two distribution/accounting periods per year, each of six months. At the end of each accounting period the price of units is marked ex-distribution (xd).

XD : When these letters appear alongside the daily quotation of a unit it means that a purchaser of units will not receive the income distribution which the Managers are about to pay. On the other hand should a unit holder sell his units when they are marked "xd" he will receive his portion of the distribution of net income for the period just ended. Prices are quoted xd usually for a period of six weeks.

Income Distribution : This is equivalent to a dividend paid on shares. It is the amount of the net income of the trust distributed to unit holders in proportion to the size of their holdings. You may give instructions either to have the income distribution paid directly to yourself or, by agreement with the managers, to have it reinvested in units or to have it mandated to your account with, for example, a bank.

Distribution Dates : These are dates on which the income distribution is paid. They occur generally six weeks after the end of the accounting period.

Equalisation : When you buy units there will be included in the price a sum equivalent to the net income per unit accrued by the trust from the date of the last income distribution up to the time of your purchase. This amount will be returned to you as a tax free capital distribution on the occasion of

the first income distribution following the purchase.

Portfolio : This is the collective name given to the stocks and shares in which the trust fund is invested.

Gross Estimated Yield : Actual yield depends on the dividends paid by the companies in which the money of the trust is invested. The gross yield published by the Managers is their estimate of the return to be expected on a £100 investment over the next 12 months.

THE STATE OF THE PRESS

WITH TWO momentous events—the third general election and the Chinese invasion—taking place in 1962, a spurt in the number of periodicals and newspapers published in the country as well as in their circulation during this year could have been anticipated. The Press Registrar's report revealing a trebling of the rate of increase in their number from 3.5 per cent in 1961 to 10.9 per cent in 1962 and near doubling of the rate of growth in circulation from 4.7 per cent to 8.8 per cent, therefore, does not come as a surprise. In fact, as the Press Registrar himself records, the increase in the latter case would have been even of a higher magnitude but for the restrictions the Government had to clamp on the use of newsprint due to foreign exchange difficulties.

A pertinent point to be noted in this regard, however, is that most of the new additions to the daily press in 1962 were from district and small towns; as many as 33 new dailies made their maiden appearance during this year in regions where daily press was either non-existent or undeveloped. They were also successful in capturing appreciable new readership; their circulation rose by 11.7 per cent as compared to the previous year's figure. This surely is an indication of the fact that consciousness is growing in the suburban and rural areas about the happenings in the country and should augur well for democracy.

English Predominates

Language-wise, English newspapers commanded the highest circulation, followed by Hindi and Tamil papers. Particularly encouraging was the improvement in the circulation of Hindi papers. In 1961, the Hindi press had suffered a slight decline in circulation although the upward trend in the newspaper readership had continued during that year also. Gujarati papers are also stated to have done well in 1962; their circulation recorded an increase of 11.3 per cent as against 2.9 per cent in the previous year.

So far as periodicals are concerned, their number also showed sizable increase by 374, as against 281 in 1961. The specialised and technical journals shared well in this growth. The popularity of children's magazines was particularly impressive; eight such magazines were added during 1962 bringing their total to 114.

Another very significant fact brought out by the report is that while the Congress Party owned in 1962 as many as 25 papers, the Communist Party ran close to it owning 24 papers. These were the official party organs, declared and registered as such and did not include those which might reflect or advocate the views of particular political parties without any formal association. In respect of circulation, however, the papers belonging to the Communist Party commanded a lead over papers of the other political parties. This provides an eloquent testimony to the freedom the press in India enjoys.

Although the pattern of ownership disclosed in the Press Registrar's report indicates that individual ownership declined from 46.5 per cent in 1961 to 44.1 per cent in 1962, it can hardly be construed as accentuation of the tenden-

cies towards monopolistic hold on the Indian Press. The percentages of papers owned by societies and associations, joint stock companies, and firms and partners improved from 20.3, 7.4 and 7.6 in 1961 to 21.7, 8.1 and 8, respectively, in 1962. It is a pointer to the fact that the publication of newspapers today in India, as in the other countries, is becoming a big-size job, requiring pooling of resources by more than a few individuals. This inference is also corroborated by the finding of the Press Registrar that although the English and Hindi metropolitan papers (dailies published from Delhi, Calcutta, Bombay and Madras and these are the important links in the newspaper chains, groups and multiple units) showed an appreciable increase in their circulation, there was no significant rise in the percentage of their circulation outside the metropolitan towns.

The report also draws attention to two other—rather depressing—facts about the Indian press. One relates to the malpractices resorted to by some papers in exaggerating their claims of circulation. Surprise checks on the circulation of 172 daily papers, accounting for about 85 per cent of the total imports of newsprint in the country, disclosed wide discrepancies in the claims and actual circulation of as many as 105 papers. Of these, 68 papers accepted the lower figures assessed by the Press Registrar, but qualified their statements by adding that their circulation had come down only recently. The remaining 37 papers did not accept the Registrar's assessment but were at the same time unable to substantiate their claims by documentary evidence. These obviously were the papers belonging to the category which adopted rough and ready methods of keeping accounts. The reductions in the newsprint quotas effected by the Press Registrar resulted in a saving of Rs. 18 lakhs in foreign exchange. In the present-day conditions, when the country faces acute shortage of foreign exchange, the newspaper industry obviously has to subject itself to a voluntary code of discipline so that the legitimate requirements of all newspapers, old or new, can be met without jeopardising the larger interests of the country.

The other disconcerting fact brought out in the report is that the Indian newspapers in general have lagged behind in the introduction of modern printing, type-setting and processing equipment in their establishments. All the big papers had their own presses and rotary machines, but 13 medium-sized and 47 small papers had no press of their own. Modernisation of the Indian Press perforce has to be a slow process, taking into consideration the foreign exchange difficulties. But this process needs to be fostered to the extent possible.

TOURISM: NEW DEAL?

"WITH THE steady growth of international air travel, including round-the-world flights, foreign exchange earnings from tourism could easily be doubled, if not more than doubled, over the next five years if the Indian Government took the necessary steps. Few visible exports have potentially better prospects of growth". Thus observed the World Bank Team headed by Mr. Peter Wright, which submitted its report on the Indian economy to the Aid-India Consortium early this year, while commenting on the Government of India's estimate that the gross receipts from tourism were expected to rise from just over Rs. 20 crores a year at present to about Rs. 27 crores by 1965-66. It added: "India has to win tourist business in a highly competitive international market. The record of Air-India shows how well India can compete with other countries in this field if she tries, but so far little attempt has been made to cater specially to the needs of the foreign visitor, and opportunities for earning more foreign exchange from those who have come to the country have been thrown away". The Team listed three main factors which hindered

September 13, 1963:

the growth of tourist trade in this country. "Schemes for the development of the hotel industry, for the improvement of internal transport facilities and for the relaxation of restrictions on drinking", it pointed out, "have not been pressed forward with sufficient vigour".

Read against this background, many of the suggestions made by the Jha Committee on Tourism in its report submitted to the Union Government recently, can, at best, be styled as pedestrian. The most significant recommendation of this Committee is for setting up an undertaking in the public sector to handle activities of a commercial nature, e.g., hotel construction, provision of road transport facilities, production and sale of publicity material, entertainment for tourists, sale of imported articles on reasonable prices to tourists and arranging tours at all-inclusive rates. While this should meet the World Bank Team's such criticisms as the "Government (of India) has been reluctant to invest its own money in hotel construction unlike countries such as Greece and the United Arab Republic which have been much more successful in improving tourist amenities in recent years", the proposals made for fostering the development of the private hotel industry and for improvement of transport, apparently, are circumscribed by the anxieties caused by foreign exchange shortage. Private hoteliers and transport operators, according to the Jha Committee, should be released foreign exchange, as a sort of "positive incentive" against preventing leakage of it, in proportion to the amount of exchange earned by them.

The World Bank Team's observations implied much more than this. So far as the hotel industry was concerned, it had stated: "...Nor have private entrepreneurs been offered the special inducements and official support that are needed if they are to be persuaded to invest their capital in what is otherwise liable to be an unprofitable business—especially when there is little money to be made out of drinks, which elsewhere are usually the main source of the hotelier's income". Among the measures to improve transport facilities, the Team had suggested that if the Indian Airlines Corporation could not meet the tourists' requirements, "foreign operators could be allowed to operate services in conjunction with the major travel agencies." Further "car hire and bus services could also be improved and (their) rates lowered." The Jha Committee's suggestions assign a greater role in this respect to the public sector.

The Jha Committee, however, has done well in stressing the need for simplification of customs and immigration facilities, improving of the amenities at airports, speedy confirmation of LAC reservations, opening of more tourist offices overseas and concentration of resources to develop selected tourist centres on an integrated basis. Equally welcome are its suggestions in regard to relaxation for the tourists of restrictions on drinking. The Committee has recommended that facilities should be provided to enable foreign tourists to purchase,

carry or consume liquor with the minimum of formalities and that apart from the scheme of all-India liquor permits, provision be made in areas where there is partial prohibition, such as Delhi, to set apart a room in each hotel where both liquor and food can be served to foreigners and/or residents on all days, including "dry" days.

ALL-INDIA AGRICULTURAL SERVICE

At a two-day informal meeting of the State Agriculture Ministers, held in New Delhi last week, it was decided that an All-India Agricultural Service should be set up for removing the administrative backwardness of the Agricultural Departments in the States. Legislation for the formation of this service is hoped to be initiated during the next session of Parliament.

The creation of a full-fledged Indian Agricultural Service, capable of attracting the best talent to the service of science and practice of agriculture, it may be recalled, had been recommended by the Agricultural Administration Committee, popularly known as the Nalagarh Committee, set up by the Government of India in February, 1958, to undertake a detailed examination of the question of reorganisation of agricultural administration in the country. The Committee, in its report, had expressed concern over the low morale and frustration prevailing among the agricultural services in the States because they were treated as minor ones, and little attention was paid to build up stable departments manned by persons with adequate competence. The Committee had further stated that if the unit-area yields of agricultural crops and the total farm output had to be increased rapidly for fulfilling the needs of a growing population and an expanding industrial economy, it was necessary to remove administrative backwardness in the agricultural departments.

The formation of this service should go a long way in streamlining the agricultural administration, a process started recently. Since the officers manning this service will have a higher status than hitherto, they will be able to elicit better response from the agriculturists. They should also be in a better position to forge co-ordinating links among the various State Departments connected with agricultural development. Their transfers from one State to another should further help in the dissemination of the technological improvements being effected in different States. Instances have not been lacking in the past of such knowledge travelling from one State to another at not more than a snail's pace. There is the case-row), 'titan' and Nagpuri yoke, which can help in increasing unit-area yields, and have been very popular in Maharashtra, Gujarat, southern parts of Madhya Pradesh, western parts of Andhra Pradesh and northern parts of Mysore for centuries, having not found their way to the other parts of the country and even to the adjacent areas in Madras and Kerala.

BORDER STATE CHIEF MINISTER!

FROM THE PRESS GALLERY

Triumph of the Trio

By Our Parliamentary Correspondent

NEW DELHI: Tuesday

IT MAY BE said to the credit of the Ministerial trio who were recently moved to the key portfolios of Home, Finance and Food and Agriculture that they acquitted themselves remarkably well in important discussions in which they participated in Lok Sabha in the last few days. Mr. T. T. Krishnamachari who spoke on the LIC and later on the issue of the nationalisation of banking demonstrated that his grasp of the nation's basic economic programmes was as clear and firm as ever. He slid into a lively discussion of controversial problems with practised ease and through two pithy speeches succeeded in creating the impression that he would address himself to his task as Finance Minister with the vigour which the country has come to expect of him.

Sardar Swaran Singh was also a success when he made his first speech as Minister for Food and Agriculture in Lok Sabha on Monday. While it is true that his approach to the problems of his Ministry is still essentially that of a lay man who is anxious to learn, he did impress the House by his commonsense attitude and with a certain restraint which he had the good sense to exercise while holding out promises of future performance. But it was Mr. Nanda who provided the big surprise. Winding up the discussion on "the three-anna controversy" of Dr. Lohia, Mr. Nanda spoke unusually clearly-headedly and not only exposed the shallowness of the Lohia statistics effectively but, what was more important, managed to give a balanced picture of the achievements and disappointments in our record of economic development over recent years.

No Nationalisation

Intervening in the debate on a non-official motion, moved by Mrs. Subhadra Joshi (Congress), on nationalisation of banks, the Union Finance Minister, Mr. T. T. Krishnamachari, ruled out such a step on the ground that the direct and immediate gain from it to the Government in the form of an addition to its income could not be great. He stressed that what was required at the present juncture was to devise ways and means whereby credit institutions could serve more adequately the needs of the economy. The rate of growth of the economy as it was organised at present depended to a large extent on the performance of the private sector. Owing to a variety of reasons there had been a comparative set-back in its performance both in industry and agriculture during the past two years. The issue that confronted the Government, therefore, was how to stimulate the growth of the economy.

Disclosing the various steps the Government contemplated with this end in view, Mr. Krishnamachari made three important pronouncements. Firstly, he said, the question of placing further funds at the disposal of the Refinance Corporation for Industry was under consideration as it had disbursed or entered into commitments which would exhaust all the resources available to it. Secondly, the Government was thinking of enlarging considerably the scope of the Industrial Finance Corporation so as to convert it into a Development Bank with a broader capital base. The third important step proposed to be taken was the setting up of a Unit Trust which would provide a source for investment of savings of persons in the middle and lower-income groups without risks of

capital depreciation or capital erosion. This Trust, Mr. Krishnamachari expected, would be in a position to finance many new and and deserving enterprises.

Mr. Krishnamachari also pointed out that there was already a public sector in the Indian banking industry and this controlled 30 per cent of the working funds of the entire banking system. (The reference was to the State Bank of India and its subsidiaries whose total deposits amounted to Rs. 700 crores). From the practical point of view, he said, it would be useful and effective if the Government concentrated on extending further the area of operation of the banks which were already in the public sector.

Referring to the malpractices indulged in by some banking institutions in the private sector, the Finance Minister stated that there were other means of preventing them. He disclosed that the Government was examining whether further amendments to the Banking Companies Act were possible to check the control of banks for undesirable purposes by particular groups or persons. Similar was the Finance Minister's approach to the question of avoiding concentration of wealth and economic power. "For preventing the concentration of ownership in the private sector, we shall have to rely on other legislative or administrative measures", he said. "Our plans which aim at steady expansion of the public sector and at strengthening the less privileged classes of the society are also designed with this end in view", he added.

The motion was lost by 119 voting against and only 27 in favour.

TTK on LIC

The two-hour debate on the annual report of the Life Insurance Corporation of India for the year 1961 was noteworthy for the solid, often sparkling, contribution made to the discussion of the Corporation's broad as well as basic problems by the Finance Minister. The Minister's assurance that steps would be taken to settle claims more promptly was one of the major gains from the debate.

Mr. Krishnamachari gave a clear exposition of his views on the directions in which the LIC's investment policy should be evolved. The basic objective of its policy, he said, should obviously be to promote the socio-economic ends in our planned development. For this purpose it was essential that there should be a wide diversification of the investments of the LIC's funds. Giving a pointed reply to the suggestion that the funds should be invested more and more in Government securities to reach the level of something like 60 to 70 per cent of the portfolio, he reminded the House that the depreciation in the LIC's investments resulting from such a course must be counter-balanced by investments which would positively make for adequate appreciation. He urged that investments in loans for housing for low-income groups and in warehouse construction for agriculture would be highly desirable. But the actual pattern and changes in the investment portfolio, he emphasized, must be left to the Chairman and the Board of Directors.

The criticism of the monolithic structure of the LIC, the Finance Minister suggested, was valid but this was no time to reopen the question. The right policy, at this stage, would be to eliminate or minimise the drawbacks which sprang from monolithic organisation by seeing that reasonable initiative

is left with Branch Managers through a progressive delegation of powers.

The Minister did not agree with the suggestion that the lower mortality ratio should prompt a general reduction in the premia on the policies. This plea had some cogency with regard to non-participating policies. The better course was to distribute higher bonus. The potential field for the spread of life insurance was the country-side. But fluctuations in rural prosperity, influenced largely by the fluctuating fortunes of agriculture, lack of sufficient educative propaganda and the reluctance of insurance workers to face the risks and hardships of penetrating this area were responsible for the slow progress of insurance in the rural areas. Yet another field of more intensive sales of insurance policies was the newly emerging industrial townships which do not appear to have been sufficiently exploited. Enthusiasm of insurance workers was a powerful factor in this context and Mr. Krishnamachari stressed that the best way to provide incentive to them was to continue the system of linking their remuneration with the business procured. He disagreed with those who pleaded for fixed remuneration for them. He agreed with Mr. Singhvi, who initiated the debate, that there was a legitimate cause for concern about the rise in the lapse ratio from 6.6 per cent in 1960 to 7 per cent in 1961. Partly this was due to the excessive enthusiasm of the insurance workers; but there was something to be said about the control at the higher levels over adherence to sound practices in accepting policies.

Question Hour

THE DISCUSSION on the ninth annual reports of the Indian Airlines Corporation and Air-India for the year ended March 1962, in the Upper House was quite lively. It was initiated by Mr. Arjun Arora (Congress). The managements of both the airlines earned more than a word of appreciation for the general efficiency with which the services were operated. But the participants took sufficient care to focus attention on the drawbacks especially in the working of the Indian Airlines Corporation. The mover's complaint that the IAC was spending too much of its financial resources on the purchase of foreign aircraft when it could make savings by switching over to Indian-made planes was not, however, quite encouraging. Mr. Ahmed Mohiuddin, Deputy Minister for Civil Aviation, in his reply, said that AVRO 748's manufactured in the country would be purchased, depending on their availability. He declined to accept a plea for the reduction of air fares to Tripura and pointed out that the losses incurred by the IAC in the Assam sector were appreciable, although they were being progressively brought down — Rs. 26.50 lakhs in 1960-61, Rs. 23 lakhs in 1961-62 and Rs. 22.33 lakhs in 1962-63. The overall financial picture was improving. Up to 1958 the loss incurred was Rs. 5.9 crores approximately, after which the IAC started breaking even. But as against this loss, its contribution to the exchequer by way of payment of excise duty and sales tax ought to be taken into consideration. It more than cancelled out subsidy paid. What is significant is that in 1960-61 it earned a profit of Rs. 20 lakhs, as Mr. Raj Bahadur laid stress in the course of his speech. The question of agreement to settle the grievances of pilots was being negotiated and a solution acceptable to both the parties was expected to emerge very soon. But no uniform solution could be found by way of the complete absorption of the grounded pilots.

The tenor of the discussion on the working of Air-India showed unanimity in the judgment of the House on its operational and financial efficiency. It earned an operational profit of Rs. 77 lakhs in 1961-62 and of Rs. 117 lakhs in 1962-63. Mr. Raj Bahadur had no difficulty in disposing of two points of lesser importance that were raised in criticism of

Air-India's working. He explained to the House that in the highly competitive market of international aviation, publicity was of great importance and in the light of the traffic attracted by Air-India it was justified. He pointed out that expenditure of this Corporation on publicity was being reduced. From 6 per cent of the total expenditure in 1961-62 it was brought down to 5.3 per cent in 1962-63. He explained that purchase of spares and components in the United States through the agency of Tatas was to the advantage of Air-India. In any case it was an interim arrangement until a State agency could be set up. As it is the commission of 2.5 per cent paid to Tatas in this behalf was only 2.5 per cent on the average, which was the lowest in any part of the world.

MIG Manufacture

In the Lok Sabha the Minister of Defence Production, Mr. K. Raghuramiah, gave some broad facts about the project of manufacture of MIG-21's in India. This project envisages the establishment of two factories — one for air-frames in Maharashtra and the other for engines in Orissa. The Governments of the two States will take preliminary steps soon to expedite the work of civilian construction. But the major issue of real interest evinced by the House was centred in the agreement with the Soviet Union and the military aspects of the deal. Mr. Raghuramiah went only so far as to say that the manufacture of MIG's would start by about 1965. He made the general statement that the question of introducing some technical improvements in the MIG-21's to be manufactured in this country was under consideration between the two Governments concerned.

At this stage the Prime Minister had to make intervention and explain that the Government was not keen on maintaining strict secrecy on all the aspects of the agreement. But

T.T.K. assigns a big role for LIC in the economy

Mr. Al Foil Packs Dairy Products to Perfection

Aluminium Packaging keeps Dairy Products full-flavoured, fresh and uncontaminated right up to the consumer's table.

Al Foil completely seals out light which causes rancidity in butter; retains the moisture balance in butter, cheese and margarine and prevents 'freezer burn' when storage in the frigidaire is necessary. That's why dairy packagers choose Al Foil for product protection.

Specialized knowledge in diversified fields increases the value of McKee-WKE engineering to the Steel Industry of India

Almost one hundred percent of the work of the McKee organization for more than half a century has been designing and building facilities for recovering and processing the earth's underground resources—metallic and non-metallic ores, minerals, coal, aggregates, petroleum and chemicals.

Specialized knowledge gained in one field has frequently paid off in advanced production facilities for another. For example, thorough knowledge of blast-furnace practices and mining and ore beneficiation methods led to many improvements pioneered by

McKee in agglomerating, sintering and pelletizing plants. McKee Metals Division engineers recently drew upon the technical knowledge of our Petroleum & Chemicals Division specialists to aid in the design of highly efficient fuel-injection systems for blast furnaces which effected significant fuel economies. These are typical of many similar cases.

This unmatched fund of technical knowledge can be invaluable to India's steel industry. We will be glad to give you complete details of our mine-to-metal services. Your inquiry will receive a prompt response.

ARTHUR G. MCKEE & COMPANY

UNITED STATES: CLEVELAND • NEW YORK • CHICAGO • SAN FRANCISCO • HIBBING
ABROAD: LONDON • PARIS • TORONTO • MEXICO CITY • SAO PAULO • BUENOS AIRES
Represented in India by DR. B. S. GILANI 29 Jor Bagh, New Delhi 3

METALS DIVISION: Comprehensive engineering-contracting services for Blast Furnaces, Steel-Making Shops, Rolling Mills, Coke Ovens, Agglomerating, Sintering and Pelletizing Plants and related off-site facilities.

PETROLEUM & CHEMICALS DIVISION: Complete Refineries and individual Processing Units for all modern petroleum and petrochemical processes and for a wide range of organic and inorganic chemicals and chemical products.

WESTERN KNAPP ENGINEERING DIVISION: Plants and facilities for production of Non-Ferrous Metals, mining, preparation, handling, beneficiation and storage of Ores and Industrial Minerals, Coal and Aggregates.

Moscow was equally vitally concerned with the terms of the agreement and any disclosure of those conditions might cause embarrassment to it. One fact, however, was made clear beyond doubt. When the supplementaries were directed towards the MIG's to be imported from Russia, the Prime Minister categorically told the House that no conditions were imposed preventing India from using the MIG's for fighting purposes. Up to now, as the Minister of Defence Production stated, seven MIG's were received from Russia. So far seven pilots of the IAF had been given complete training in the Soviet Union on the MIG's. Besides, another batch of 12 pilots and 84 other ranks were undergoing training on the MIG's.

Sugar Export

Mr. A. M. Thomas, Deputy Minister of Food, stated that during this year it would not be necessary to subsidise the export of sugar. This was because international prices were ruling high. In the U.S. they were Rs. 632 per metric ton, in Canada Rs. 630, in Japan Rs. 700 and in Malaya Rs. 750. In India the cost of production was around Rs. 700 per metric ton. The Minister expressed the hope that next year India would export 300,000 tonnes of sugar.

Excise Revenue from Sugar

The Finance Minister gave details, statewide, of the excise duty on sugar received from the various States by the Central Government from 1947-48 to June 12, 1963. A specific question was put whether the excise duty received upto now during the current financial year was low and what was likely to be received during the rest of the period would be much lower than in the previous years. He qualified his reply by stating that while firm estimates cannot be made of the trends in the last three quarters of the current year on the basis of the collections of the first quarter, it might be that the total excise duty during 1963-64 would be lower than what was realized last year. The aggregate excise duty on sugar in the whole of India is tabulated below:

		(Rs. in crores)	
Year	Amount	Year	Amount
1947-48	4.43	1956-57	20.80
1948-49	6.31	1957-58	43.26
1949-50	7.10	1958-59	60.36
1950-51	6.58	1959-60	59.55
1951-52	8.49	1960-61	54.65

Fuels

Lubricants Plant: Mr. O. V. Alagesan, Minister of Mines and Fuel, informed the Lok Sabha that Government had finalized the project to set up a plant for lubricants in collaboration with Esso. A new Indian company will be established for the production of the lubricants and the plant will have a capacity of about 145,000 tons per year. Its cost is estimated to be Rs. 7.1 crores which is exclusive of the working capital. The Government of India and Esso will hold equal shares in the capital of this company.

Oil Research: The Minister of Mines and Fuel stated in the Lower House that the Training Research Wing of the Oil and Natural Gas Commission (Institute for Petroleum Exploration) had been established at Dehra Dun and had got off to a start with selected problems of applied research for investigation. The training classes are of three months' dura-

tion. A beginning was made in August 1963, for imparting training to Geophysicists, Well Site Geologists and Mud-Chemists. The Project Manager in-charge of the Wing is Prof. N. A. Kremenko who joined the Institute in December 1962. Six Indian experts and eight foreign experts are to be posted in this Institute. Procurement of equipment is under progress.

Manganese Ore: Mr. O. V. Alagesan disclosed in the Lok Sabha that there had been a small decline in the production of manganese ore in Bihar and Orissa in the first half of 1963 as compared to the same period of 1962. This was due to the stoppage of mining operations in some of the mines due to the non-renewal of their leases by the State Governments. Also, the depression in this industry had its adverse effect on output. But he emphasized that incentives were being provided for manganese export. These incentives were concessions on freights and permission to utilise 5 per cent of the foreign exchange earned by exporters for importing mining equipment and machinery for modernization. The foreign exchange entitlement was, of course, linked with cash sales. A Special Committee is studying the problems of this industry.

Mineral Industry in Goa

Mr. O. V. Alagesan gave the Lower House the broad particulars of measures for stimulating the mineral industry in Goa State which possesses potential resources. The Government of Goa, Daman and Diu had agreed to extend the Mines and Minerals (Regulation and Development) Act, 1957, for a systematic development of minerals on a scientific basis. The different sets of rules framed under this Act would also be applied to the Goa region. The Central Government had given its approval for a scheme to set up a palletisation plant in Goa for the iron ore situated there. It is already a widely publicised fact that the feasibility of establishing a steel plant in the Goa-Hospet region with a capacity of 1.5 million tons of steel ingots is under active investigation. The Government Mining Department in Goa is being thoroughly reorganized to cope with the new responsibilities. The Geological Survey of India is conducting an intensive survey in this region to assess the availability of various minerals. Power supply, roads and port facilities in Goa are being rationalized under a priority plan of development in this State.

Subsidy for Coal Shipping: The Minister of Mines and Fuel disclosed in the Lok Sabha that during the financial year 1962-63 subsidy to the tune of Rs. 3.56 crores was made by the Central Government as a measure to meet the higher cost of transport of coal by coastal shipping.

Compensation to Coal Industry: Replying to a series of questions about financial encouragement to the coal industry Mr. O. V. Alagesan stated in the Lok Sabha that it was Government's policy to provide financial aids and incentives, within reasonable limits, to the coal industry for its expansion and modernisation. The import duty on selected items of machinery and equipment has already been reduced. Government proposed to increase the development rebate admissible for the purpose of assessment of income-tax in respect of new plant or machinery for mining coal purchased between April 1, 1963 to March 31, 1966. The rate of the rebate is to be increased from 20 per cent as at present to 25 per cent of the cost of the machinery and equipment. The Income Tax Act would soon be amended for this purpose. The obligation to earmark 75 per cent of the development rebate for future expansion will apply to this industry as in the case of other beneficiaries of the rebate. The industry is pressing its claim for an increase in the price of coal on various grounds, particularly those of rising production costs; but so far Government has not accepted this request.

Produce or Perish

By R. G. HARDIKAR

HUMAN BEINGS fall into two distinctive groups, not as male and female, but as advanced or backward. The Bagias in Hazaribagh district in Bihar are good iron-smelters. Their products compare well with Sheffield steel. But the bellows they use are primitive. Those that use leather bellows belong to one caste; others who manipulate bellows made out of leaves to another. The fishing boats made on the east coast of Madras are good so far as their hydrodynamics is concerned. But when a boat capsizes it is buried on the beach nearby. It is believed to be possessed by the devil. To appease evil spirits and obtain better crops certain of our aboriginals sacrifice human beings even today. To them this is no murder. Increased productivity is the incentive.

Civilized persons adopt different methods. They rely on scientific technique, not on supernatural prowess for increased output, be it agricultural or industrial.

In the biological evolution, it was "survival of the fittest". In modern times it is mass production for mass consumption at progressively diminishing costs. "Produce or perish" is the war cry. It first began to be appreciated in the New World that high wages were not detrimental to economic progress. "Mr. Jones' employees are Mr. Smith's customers." High wages promote domestic consumption of manufactured goods. Automatic machinery and costly labour-saving equipment, on the other hand, lower production costs. Only, workers must put in optimum effort to make the enterprise a success. This realization ushered in healthier human relations all the world over. In progressively lowering production costs the management and personnel have identical interests in their undertaking. As the motive behind such a co-ordinated effort is both utilitarian and humanitarian the contemporary worker must function at maximum efficiency to give his best. The factory worker no longer deals with a proprietor blessed with any divine rights. Not profits but mass production for mass consumption is the new goal to be reached, by management and personnel jointly.

At the end of the first World War trade unions in Europe took to training their members so that employers would find hiring them gainful. The employees, on their part, looked upon such training as insurance against periodic unemployment which became a regular feature in most industries everywhere. Search for more and still more output during and after the last World War brought to light the pressing need for the employer to undertake training of his employees himself at his own cost. To train, it was soon discovered, was cheaper than not to train. Success in an enterprise could not be achieved merely by installing costly and intricate plant and equipment.

Just as the fighting forces in a modern war must know what they are fighting for so must the personnel in every concern realise what each one is striving after. Our industrial workers are not necessarily slovenly trouble-makers. They too have the universal urge to be respected by their neighbours. Will they not, therefore, whole-heartedly co-operate in the fulfilment of that universal human desire to see that their offspring have better times than they themselves have had or are having? True, our workers, especially after the end of the second World War, are wanting to earn more and more but work less and less for it. The responsibility of

educating them rests squarely and equally on managements and trade unions.

Our industrial personnel is recruited from three classes. Artisan, agricultural and never-did-well-at-school sons of white collar workers. Factories over 500 strong are generally multi-lingual. The personnel of larger ones even belongs to different religions and ethnic groups. The union leaders, however, seldom hail from these ranks. They are almost always rank outsiders, hunting for political careers. Often they are opportunists and have proved themselves turn-coats. Their deliberations and wrangles are for 'demands' or against 'exploitation'. The workers too are known to join a union only when they are in trouble, often an alleged theft, breach of safety rules or some other gross misconduct. Seldom does one hear of an attempt either on the part of the unions or on the part of the employers to tell the workers that those who eat least sleep most is true. But then the converse of the proposition is also equally true. Those who sleep most eat least. Naturally. Americans are known to slog hard. They eat more than most other nationals and wash it down with plenty of good milk. Nearer home, people from Punjab consume a lot of good milk. They work harder than others elsewhere in India. They have a higher standard of physical fitness too. The necessity of working hard was stressed very aptly by Mr. Khrushchev when he said that "labour productivity must always be one jump ahead of the growth of wages."

I can think of no country other than Switzerland which has benefited the most by hard work. Traditionally the Swiss are frugal craftsmen. It is by exporting the products of her small labour force that Switzerland has succeeded, even after the last war, in acquiring enough foreign exchange to attain an average standard of living which is perhaps the highest in the world today.

To my mind the best way to educate our factory staff is to tell them how their opposite numbers in other parts of the world live and work. Unlike in India, the Swiss factory hands are not given to gossiping. The Swiss work hard. "Work sweetens life", they say. The Swiss worker looks upon supervisory mate, a sirdar or a mukadam verily as a parasite. Nor does he ask for and depend on a helper to rig his tool box about. He does not want a semi-skilled practices are wasteful and injurious to his own interests. They betray class-consciousness. The Swiss industrial worker is a first rate artist with his file, be he an electrician, turner, machinist or even a cable jointer. During his spare moments he attends to his machine and tools; he does not while away time, waiting for a fresh job.

WINDOW ON THE WORLD

Home Truths for the US

By PAUL BAREAU

LONDON:

AT LAST the United States has come to realise that it might be possible to improve the international payments system which over the past few years has come to lean so heavily on the U.S. dollar. Gone is the connatent self-assurance with which President Kennedy told us just about a year ago by the device of the new 'relistar communications satellite that the dollar was "as good as gold." Gone, too, is the mood which, with a touch of arrogance, dismissed the initiative taken by Britain's Chancellor of the Exchequer, Mr. Maudling, to make some improvement in the International Monetary Fund mechanism.

Since that plan was rebuffed at the I.M.F. meeting last year a great deal has happened. To begin with, the U.S. balance of payments deficit which was scheduled to be removed and replaced by a surplus by 1964, has proved ominously resistant to the measures applied for its removal. Secondly, a number of supplementary defences have had to be erected to defend the dollar. Interest rates in the United States have been increased. The United States has swallowed the excessive dignity which has in the past prevented her from seeking assistance from the I.M.F. and has in fact established a standby credit of \$500 million. Last and by no means least, the basic principles of complete convertibility of the dollar and freedom of the American capital market have been slightly tampered with by the proposal to impose a selective tax on foreign issue in the New York market and on the purchase of foreign securities by American residents.

Changed Approach

Beyond these developments, and of much greater importance, has come a growing realisation in the United States that their duty to the world is not necessarily the same as that their duty to themselves. In the past Washington has tended their duty to themselves. In the past Washington has tended to argue, "let us solve our balance of payments problem and the world can only benefit from the consequent strengthening of the dollar." A very different sentiment emerged from the message on the balance of payments which President Kennedy sent recently to the United States Congress. In this he said that the United States was bent on solving its balance of payments problem but he added that the United States would also continue to study and discuss with other countries measures which might be taken for a further strengthening of the international monetary system over the longer ening of the international monetary system over the longer run; and he explained why adequate provision must now be made for the growth of international liquidity to finance expanding world trade: it was that "new sources of liquidity may well be needed because as we close our payments gap we will cut down our provision of dollars to the rest of the world."

These sentiments open up a new vista for the impending I.M.F. meeting. It now looks as though the fundamental problems of international payments and of the adequacy of international reserves will be considered. The attitude which international reserves will be considered. The attitude which will be taken up by the United States has been spelt out with some precision in the report on the U.S. balance of payments drawn up by the Brookings Institution of Washington. This is a semi-official organisation of the highest stand-

ing, which was wisely used for this purpose, precisely because it is not wholly official and because its suggestions can be regarded as a basis for discussion and not as the expression of official opinion. This report, having set out the ways by which the U.S. balance of payments deficit might be removed and tentatively given 1968 as the date by which this objective might be achieved, then went on to discuss what the repercussions of this might be for world liquidity and reserves, assuming other things to remain equal.

The reasoning is one which is by no means unfamiliar but which has previously failed to receive any serious official hearing in the United States. It is that the U.S. balance of payments deficit has over the past decade done a great deal of good by stealth. It has provided the rest of the world with dollars which have over this period constituted the truly dynamic element in the expansion of world reserves. The process may have been fraught with difficulties. Central banks have in recent times shown increasing reluctance about holding these dollars and not converting them into gold. All kinds of devices have had to be improvised, mutual credits, swap arrangements, and the like, in order to overcome this reluctance. But the fact remains that had it not been for this expansion of international reserves, the world over the past ten years would have been hard put to it to find the wherewithal, in terms of international liquidity, to finance international trade and the movement of capital.

Revamping IMF

If, therefore, this deficit disappears and is converted into a surplus, a contractionist force on world reserves will immediately become operative and the world may well meet a crisis of liquidity. That great truth has now dawned on official American consciousness and this, in its turn, has awakened interest in the improvement of the international payments system. The Brookings Institution makes two suggestions. The first is for a revamping of the I.M.F. or the establishment of a new international institution which would act as a genuine international central bank able to create or cancel international credit by its own operations. This would be following a trail which has been blazed by many authorities beginning with Lord Keynes's Clearing Union of 1943, the much later proposals sponsored by Professor Triffin and more recently the tentative plan that was put forward by Mr. Reginald Maudling.

A second proposal to be considered if the first fails, is that the currencies of the free world should be divided into two blocs, one of them centred around the two reserve currencies, dollars and sterling, and the other around the currencies of continental Europe. Within each bloc there would be exchange stability but as between the two a regime of flexible exchange rates. This would help to take the pressure off the reserve currencies by allowing them to depreciate in terms of those which now hold the main creditor position. But, it would undermine the whole I.M.F. system, remove what was left of the reserve functions of the dollar and sterling and thus call for some version of the first remedial formula, namely, a complete readjustment of the international payments system, including the I.M.F.

Since the debate on this issue will be reopened in earnest

at the I.M.F. meeting it is almost certain that we shall once again hear the familiar pleas for an increase in the world price of gold. This would increase liquidity, it would bring out of hoards a vast amount of gold which has in recent years been withheld from the central banks, and it would encourage additional production of gold and thus provide a sustained contribution to the growth of world reserves.

The case for a higher gold price has in the past been

persistently shot down by the United States with the argument that this would give undue and unmerited benefit to the Soviet Union. Now that the test ban treaty has been signed and the champagne glasses are clinking between Washington and Moscow, even this argument may have lost a little of its force,—though let it be added that another and even bigger beneficiary, South Africa, is now well and truly in the American dog-house.

Geneva Talks Resume

From Our Special Correspondent

PARIS:

ON SEPT. 18 in Geneva discussion will be resumed in the three sub-committees appointed by GATT at the end of June to clear the ground for the Kennedy Round, i.e. the tariff reductions between (in the first instance) the Common Market and the USA, as suggested in the Trade Expansion Act. The progress of these important negotiations has been overshadowed by the fortunes of the "chicken war": overshadowed in the public mind because the poultry opera is much simpler to follow, but overshadowed in the official mind too, because the terms of settlement in the fowlyard battle will decisively influence the atmosphere in which the Geneva talks are resumed. At the present moment, it appears that the chicken war is evolving toward an armistice; this will not be finally signed by Sept 18 but the parties will have ceased rattling the sabre of tariff reprisals, so conditions in Geneva should be more serene.

Compromise Solution

Writing before the event, one can say that the likely shot of the squabble about import duties on American chickens will be that West Germany's partners will convince her of the necessity to accept the solution all along proposed by the ECM Commission: a small reduction in those duties, which will then remain high enough to bring down US sales in the Common Market from last year's \$52.6 million but will not shut out American birds altogether. German poultry farmers are still saying that any such concession will be disastrous, but the Commission thinks that it will be possible to leave the Americans a modest share of the European poultry market without compromising the development of the local industry. In any event, the Americans will lose something of the quite abnormal gains they made in the European market in the last few years, and will demand compensation in other fields. This will give rise to a considerable amount of haggling. Washington said that, if duties stay where they are now, US losses would be \$46 million a year, whereas Brussels calculated that the loss would be \$19 million. Similar discrepancies will emerge in reckonings of the cost of whatever compromise formula is adopted. Even when a figure is settled upon, the Six will have to agree on the equivalent compensations to offer the USA. All this is very complicated and will take time, but we are a long way from the showdown that was looming up when Washington menaced to resort to tariff reprisals.

Nevertheless, it was the threat of reprisals that led the West Germans to surrender on this issue, and it is important to note this fact as the Geneva talks get going again. Tempers will be cooler next week on Lake Lemman than they would have been if two days before the meeting Washington had published an arbitrary list of punitive imposts on selected Common Market exports. But everyone will know that, though a head-on clash was avoided this time, the menace of ruthless

trade war is behind all the diplomatic formulas that will be exchanged in Geneva. The Americans might have the idea that, even when they have a very poor case (as over poultry), they can still have their way by thumping on the table and seeking to split the united front of the Six by means of penalty tariffs doled out according to how "co-operative" each capital shows itself. Indeed, those tactics worked in the chicken affair but one should note that in this case the ECM Commission was from the start in favour of concessions to the USA and that Bonn, the least capable of resisting American pressure, was the only capital opposed to them. Similar tactics would not necessarily work on an issue where the ECM Commission (which has confirmed itself as the conscience of the Six)

Mr. J. L. Bhatti, Minister in charge of the Department of Supply and the Department of Technical Development will be temporarily Minister in the Ministry of Labour and Employment.

TATA-FISON AND RALLIS — they "know-how"!

"Demonstrations," said Tata.

"You mean brass bands, flags, pretty girls?" Fison asked hopefully.

"Useful demonstrations," said Ralli, bringing him down to earth, "to show farmers how our fertilizers and pesticides grow better, healthier crops and protect them, too!"

Tata-Fison and Rallis have combined their separate marketing organisations into a single, unified service. For the future, all Tata-Fison products will be marketed by Rallis' Fertilizer and Pesticides Division. The merger will prove of immense benefit to the Indian farmer. For the first time, one integrated service will provide advice and products covering both crop growth and crop protection throughout the country...a notable contribution to the cause of agricultural progress.

TATA-FISON RALLIS COVER THE FIELD!

ISI
Certification
Mark is

A THIRD-PARTY GUARANTEE OF QUALITY

When you see the  Certification Mark on any article you buy, you can be sure of its quality and performance. For, the  Mark is affixed only on goods in the production of which appropriate materials have been used, the processes have been under strict control, and tests at various levels have been properly carried out, so that they conform to the requirements of the relevant Indian Standards.

Before granting a licence to a manufacturer to use the  Mark, the Institution makes a thorough inspection of the machinery and equipment at the factory, the manufacturing processes

and facilities for testing and satisfies itself completely about the capability of the factory for producing goods uniformly according to Indian Standards not only at the time of inspection but also continuously in the future.

During the operation of the licence, the Institution exercises a continuous control over the production inspection of the licensee, as the  Mark is a third-party guarantee of the quality of products.

As a consumer, exercise your right to get full value for your money by insisting on buying goods bearing the  Certification Mark.

advised governments to resist, and where Paris took the lead of the opposition.

That will be the case in many of the questions that the GATT sub-committees have to debate. Two of those groups have not even met yet, those concerned with agriculture and with non-tariff obstacles to trade (meaning disguised American protectionism). The one that has held meetings has made what diplomats call progress, i.e. made starker the points of total opposition. It is concerned with defining "notable disparities" in tariffs charged by the USA, on the one hand, and by the Common Market in its common external duty wall, on the other. It will be remembered that the Americans innocently suggested across-the-board cuts of 50 per cent in all tariffs. The Six agreed that this would serve as a general rule but pointed out that there were many cases where American duties were so much higher than European that it would not serve to halve both, but "special rules" would have to be applied to eliminate disparities. Specifically, the Six insisted on the circumstance that only one in a hundred of their common duties was higher than 30 per cent ad valorem, whereas 22 out of a hundred American duties were so. This disproportion would have to go before a simple halving of duties could be regarded as fair.

After first denying that there was any problem here, the Americans agreed that really outrageous discrepancies would have to be removed. They suggested that wherever their duty was more than one-and-four-fifths of the corresponding European tariff, the case should be declared one of "notable disparity" and some special rules worked out to deal with it. The Six have replied that this would still leave too much advantage on the American side; they are arguing that any

American duty that exceeds 40 or 50 per cent ad valorem (no matter what the corresponding European tariff may be) should be declared a special case, and moreover wherever an American tariff is one-and-one-third of the corresponding European duty this should be regarded as a notable disparity.

Limited Accord

That is as far as matters have gone, and you will agree that it is not very far — because not only cannot the experts settle on what constitutes a notable disparity, but they have not even discussed yet what should be done about such exaggerated differences where they plainly exist. That is, in a case where the European duty on a chemical product was 20 per cent and the American tariff on the same product was 80 per cent (and such cases exist), everyone would presumably consent that this is a special case where it will not do just to halve both duties, but there is no agreement about what "special rules" should then be applied. The Europeans have in mind that the US duty should be cut heavily, but supposing the American negotiators in Geneva thought so too they would have to convince their chemical industry — and Congress, which has empowered the President to make only concessions that are matched by equivalent concessions in Europe.

Discussion of these delicate questions will not be made any easier by the bearing of teeth that went on during the brief chicken war, but nor is it assisted by the contradictory evolution of the USA's external accounts: a growing payments deficit combined with a growing trade surplus in commerce with the Common Market. On the one hand, the disappointing results achieved by President Kennedy's July series of

Industry booms, employment grows, economy thrives — this is what J. K. aims for.

Much has materialised in the last 75 years of Progressive Development. The J. K. Organisation today employing well over 40,000 persons, consists of a countrywide network of industries, banking, insurance and other institutions, and in the service of the nation. The drive still continues and each of India's Five Year Plans have been an inspiration, a help and a guide to strengthen our service to the nation.

dollar-defence measures (especially after Canada had been exempted from the equalisation tax on loans) mean that more and more emphasis will have to be placed on increasing the trade surplus. Since the Geneva talks seem, from Washington, to be the readiest means of doing this, the Americans will be more determined than ever to force concessions from the Common Market.

On the other hand, the continued deterioration of their trade accounts with the USA must incline the Six to refuse such concessions because their trans-Atlantic deficit is beginning to assume alarming proportions even before they have agreed to lower duties on American goods. This deterioration has gathered pace since the Kennedy Plan was first mooted, and the latest figures, those for July, reveal that the Common Market's dollar deficit has increased further. The reason is not far to seek: wholesale prices have risen 6 per cent in several Common Market countries in the same period that they fell by one per cent in the USA.

The table opposite shows the average monthly deficit of the Common Market countries in their trade with the USA (in millions of dollars).

These are monthly figures; the annual deficit of the Six is obviously very large for the simple reason that they have increased their purchases in the USA by 30 per cent in three years while the Americans have bought only 6 per cent more in the Common Market. With figures like these in hand, it

should be easy for the Six to argue that the Americans have chosen an unsuitable moment to accuse them of protectionism and to present a tariff-reduction scheme of which the main object is to boost US sales in Europe "in return" for a negligible and uncertain increase in European sales in the USA. It should be easy, but the argument did not impress the Americans during the chicken war: a loss of \$30 million in poultry sales annually would have represented only one hundred-and-fiftieth part of US sales in Europe and only one-thirtieth of the Common Market's deficit, and yet we have seen with what determination the USA refused to accept the new poultry tariff. If their attitude is the same in Geneva, the talks that resume next week promise to be stormy.

Australian Budget: 1963-64

By HYLDA A. ROLFE

THE FEDERAL Budget brought down on August 13 provides some stimulus to the economy, but after a year of expansion coupled with a fair degree of stability, hopes for tax relief remain unfulfilled.

A major move was the increase of 1963-64 immigration target to 135,000, an increase of 10,000 over the target for last year. This should result in a net increase of some 100,000 new settlers, with special emphasis on attracting professional people and skilled tradesmen. In order to meet the resultant increased demand for public utilities, housing, education facilities, and transport, the Government borrowing programme is to be increased by £17 million to a record total of £272 million. Savings banks' contributions to housing will also be increased, by about £110 million this year, by raising from 30% to 35% the proportion of current balances of savings depositors which may be invested in housing.

Primary industry came in for some major concessions, in keeping with the Government's emphasis on the continuing importance of the rural sector in Australia's overseas trading. A bounty of superphosphate fertilizer at the rate of £3 per ton is a measure designed to improve productivity of farm lands and pastures; in addition to the existing 20% special depreciation allowance for primary producers on plant and structural improvements, the Budget proposed an investment allowance of 20% on new plant and equipment other than road vehicles. Thus, primary producers will be able to claim in the year in which eligible new plant and equipment is first installed, investment and depreciation allowances totalling 40% of the cost of the asset.

A further boost to the primary industry sector is an increase of £5 million in the capital of the Commonwealth Development Bank, which provides finance to assist primary production, or to establish or develop smaller industrial undertakings, in cases where it would not otherwise be

available on reasonable or appropriate terms.

Other major changes of the Budget were increases in some pensions; the removal of sales tax on all food for human consumption except confectionery, beverages and cordials; an increase of more than £30 million to £251.7 million in defence spending, and an increase of some £5 million in Government spending on special developmental projects, such as the Blowering Dam in New South Wales for irrigation in the Murrumbidgee Valley.

The Budget makes no change in company tax rates, but introduces a new, alternative basis for valuing trading stock and permits the deduction of certain small business expenses. Retention allowances on income (other than property income) of private companies are increased. Minimum taxable income was increased from £105 to £209 for individual taxpayers and non-profit companies.

Overall reaction to the Budget by the business community was mild. There was some disappointment at the omission of tax cuts on the personal and company levels, but generally it was felt that, in a year which is expected to show further improvements in employment and output generated by the activity of 1962-63, sweeping tax cuts were not warranted. The Budget was framed in a context of an 8% increase in gross national product in 1962-63 over the preceding year, and with some uncertainty concerning the possibilities of overseas loan raisings in terms of the proposed interest Equalization Tax on new issues of foreign securities recently announced by the U.S. Administration.

The Treasurer (Mr. Holt) sees the Budget as having a strong expansive effect through increased expenditure on goods and services, and through proportionally increased reliance on borrowings to finance these expenditures.

LISTENING POSTS

Jute Mission Succeeds

By Our Special Correspondent

NEW DELHI:

THE OFFICIAL delegation of the representatives of the jute industry led by Mr. M. P. Birla, which recently visited the Soviet Union and the East European countries to explore possibilities of promoting further our trade in jute goods in those parts of the world, seems to have returned in a hopeful mood. The hopefulness is warranted by the fact that the Soviet Union has offered to double its offtake of jute goods of various descriptions immediately and accommodate more of our jute goods export to the Soviet Union, which is now at an annual rate of about Rs. 7 crores, should be stepped up to Rs. 14 crores next year and up to Rs. 20 crores over the next four years.

As regards other East European countries, their interest in our jute manufactures was found to be quite active and large. It is believed that these countries will be willing to import jute goods on an increasing scale, once bilateral trade agreements, which are due to be renewed shortly, are completed. Incidentally, with Indo-Soviet trade having already reached a high level and promising to expand rapidly in the coming years, a great deal of interest is shown in business circles in this country in the question of setting up an Indo-Soviet Chamber of Trade which will enable Indian businessmen to study the Soviet market more continuously and extensively, besides helping representatives of both sides to build up trade contacts. It is believed that such a move, when initiated, will be looked upon with favour by the Soviet authorities.

To meet the shortage of pig iron, a seven-point plan has been drawn up. Included in this programme are the following:

The schemes of Andhra Pradesh, Punjab and Gujarat to set up pig iron plants; two large furnaces at Bhilai and Durgapur anticipating the fourth Plan steel expansion; small furnaces in the three steelworks using nut coke as fuel; imports; and diversion of some pig iron from spun pipe manufacture to general foundry use.

The current assessment of demand of pig iron is placed at 1.5 million tons. Availability is about a million tons. The National Council of Applied Economic Research recently estimated that the demand for pig iron in 1965-66 would be 2.1 million tons and would increase to 3.7 million tons in 1970-71.

The main producers of pig iron today are three, namely, Bhilai and Durgapur steel mills each producing 350,000 tons annually and Indian Iron at Burnpur having a capacity of about 250,000 tons. (Burnpur mainly feeds Kulti.) The relatively smaller producers are: Rourkela Steel Mill (about 80,000 tons last year); Mysore Steel Works (mainly used in own foundries); Barabil (25,000 tons); and Acme (15,000 tons). But by 1965-66, Rourkela will have no surplus pig iron for sale. Mysore is today self-sufficient, but when its steel expansion is complete in 1964, Mysore will become dependent on outside pig iron to the extent of about 50,000 - 55,000 tons to keep its foundries going. The prospects, therefore, are that if the demand estimates are right, India shall have a pig iron deficit of a million tons in 1965-66 and 2.7 million tons in 1970-71.

How to meet this demand is the problem. It should be conceded that parts of the 7-point programme, like the diversion of pig iron from spun pipe manufacture to general foundry use, setting up a large furnace in Bhilai in anticipation of the steel expansion programme, and imports, are, in every sense, short-term solutions.

For example, the large furnaces at Durgapur and Bhilai, when set up (by 1965-66, at best), can fill only part of the deficit for three years at most.

Import of relatively small tonnages — 100,000 - 200,000 — is certainly possible. But India cannot import a million tons or more because even if money were available it would be difficult to buy pig iron at a reasonable price.

The long-term solution clearly, therefore, is to plan additional production. With large reserves of iron ore and limestone, it will be unwise to import pig iron except as a temporary measure. Coal will no doubt be a problem. But it is a problem to be faced and solved. If Indian coal were not available, it will have to be imported. The following are the licensed or approved schemes the progress of which has been painfully slow:

The schemes licensed are: The expansion of the Barabil plant by 85,000 tons; Kamani Industrial Corporation, Udaipur; Birla Gwalior, Chanda; Kalinga Industries, Khammam; Andhra Cements in Andhra Pradesh.

Of the schemes, Orissa Industrial Development Corporation (formerly Kalingas) have placed orders for plant and equipment. For Kamanis, import has been cleared under the Yugoslav credit. The Birla Gwalior scheme is in trouble about the Lohara iron ore deposits which are under litigation. Even if this problem were resolved, there is no nut coke. In the case of Kalinga scheme at Khammam and the Andhra Cement scheme progress has been slow. Kalingas have been talking to Koppers for a long time. They have time till the end of August 1963 to submit firm proposals. In the case of Andhra Cements, negotiations are yet to begin. In the result, only two schemes (Barabil and Kamanis) with a total capacity of about 200,000 tons are likely to come up.

Besides the schemes licensed, there are a number of applications under consideration. These are:

Scheme	Capacity tons
1. Andhra Pradesh Industrial Development Corporation, Kothagudem	100,000
2. Dempo, Goa	100,000
3. Punjab Iron and Steel Works, Mohinder-garh	100,000
4. Vummidiars, Madras	20,000
5. V. Ramakrishna, Tiruvottiyur	20,000
6. Krishna Industrial Corporation, Howrah	50,000
7. Chowgule, Ratnagiri	240,000
8. Mysore	120,000

It is too early to say which of these will materialise. If coke imports are permitted, Chowgule and Dempo are near-certainties. So is Mysore, if 40,000 tons of coke were found. Vummidiars and V. Ramakrishna also might come up. Andhra and Punjab are only now beginning to show a certain degree of seriousness.

One has to accept the fact that Steel is as important as pig iron and therefore new locations for pig iron production have to be investigated. Recently the following locations were indicated: Visakhapatnam, Goa, Paradip, Bellary, Hospet, Bailadilla, Talcher, Rowghat and Bonai.

The Ministry of Mines and Fuel have recently estimated the availability of clean coal at 720-900 million tons. Even accepting the higher figure, the reserves, on a steel production target of 18 million tons, will last only 30 years. The steel

complex inland can be, at the end of the fifth Plan, 18-20 million tons. It is relatively more economic to use imported coals at coastal plants and stretch our own coal reserves for use in inland plants.

Production based on imported coal/coke is not necessarily uneconomic. The Japanese example is before us all.

Import of coal in the long-term, therefore, appears inevitable.

The possible locations are surveyed as under:

i. Visakhapatnam:

From a first look, it would seem that Visakhapatnam will not have enough water to sustain a large steel plant. But it may have for a pig iron plant. This will be based on Bailadilla ore.

ii. Paradip:

The port at Paradip is being developed to export 2 million tons of iron ore. It is a possible site for a small steelworks. Iron ore and limestone are available nearby. A plant at Paradip can be developed in two stages for pig iron production first and later for steelmaking. Even at the second stage, we can deliberately leave surplus iron capacity.

iii. Goa:

Goa can, it would seem, sustain a medium size steelworks. Land is a problem. But there might be sufficient land available for a small steelworks and a pig iron plant. The Dempo scheme is for 100,000 tons pig iron plant. This can be made larger and economic.

iv. Ratnagiri:

The Chowgule scheme for 240,000 tons can be revised to produce 300,000 tons or so.

v. Cuddalore:

An iron plant at Cuddalore can be based on Bellary-Hospet ores which flow out for export through the port.

vi. Barajamda:

The Barajamda area is the centre of numerous small iron ore mines. There is a slump in ore mining in the area. Coal can be brought in by wagons which now come empty.

vii. Rowghat:

The area is yet to be developed but the same conditions will apply as for Barajamda.

viii. Mohindergarh:

Demand-wise, this is an excellent location. But coke is the problem. Possibly this can be supplied from Durgapur.

Significant Factors

The further problem that arises is whether the new plants should be Government-owned or left to the private entrepreneur. Here, two factors have significance. The first is site; and the second, price. These are inter-linked.

To take size first. Government, in 1956 or 1957 with the Industrial Policy Resolution in view, restricted size of pig iron plants in the private sector to 15,000 tons. The size was later increased to 100,000 tons. Recently, in the case of Chowgule, the Government has accepted, in principle, an even larger size. It is now established that a large furnace, in every sense, will be more economic than a small one. In a planned economy, Government can always ensure that it has sufficient control over the production, the distribution and the price of the product. In this view, Government could permit the private entrepreneur, wherever he is willing to set up pig iron capacity irrespective of size.

The plea for putting up large merchant furnaces in preference to smaller ones is actuated by many reasons. Firstly, the product is cheaper. Secondly, small furnaces will have to be based on nut/pearl coke of which India have little or nothing to spare. The success of furnaces, small or big, will depend on sufficient additional coking capacity being provided.

ed. The large furnaces can have their own coke ovens. India can also consider the setting up of one or two large central coke oven plants for supply/sale of coke to furnaces, whether big as in Ratnagiri or small as in Mohindergarh. The Ministry of Mines and Fuel are already considering this problem.

The Prime Minister declared in the Lok Sabha early this week that the private oil refineries would not be allowed to expand if the public sector was in a position to fully meet the country's requirements of petroleum products. No departure was being effected in the oil policy pursued by the former Mines and Fuel Minister, Mr. K. D. Malaviya, he added.

This in no way contradicted the cautiously worded statement the Mines and Fuel Minister, Mr. O. V. Alagesan, made earlier on the issue. That apparently did not preclude all possibilities of allowing expansion in the private sector refineries of the Planning Commission and of the Indian Refineries Ltd., (which are seized of the problem in consultation with the Institute of Petroleum), in regard to surpluses/deficits in petroleum products that might arise in various regions up to 1966 and thereafter up to 1971. The whole question of augmenting the oil refining capacity in the country, through expanding the private refineries or establishing two new ones at Madras and Calcutta in the public sector with minority participation by some foreign oil companies, will be reviewed towards the end of this year in the light of the above mentioned studies.

The Government of India is planning to set up a limited liability company to construct, own and operate oil pipelines in India. The original idea was to include amongst its shareholders, Indian Railways and Public Sector refineries and the State-owned Indian Oil Company. The Government, however, has an open mind and may be persuaded to permit the three refineries and distribution companies in the private sector.

A beginning in the laying of pipelines has already been made. There is already a pipeline connecting Assam Oilfields with Nunmati refinery 260 miles and Barauni refinery 720 miles. Contracts were recently signed with the Italian firm, ENI for the construction of a dual — for crude and product — pipeline connecting Haldia, Calcutta with Barauni. By another contract it is proposed to construct a product pipeline connecting Barauni with Kanpur. There are proposals to connect by product pipeline Bombay with Poona, and Koyali with Ahmedabad and some other places in Gujarat. Similar net work of pipelines is envisaged in Kerala after Cochin refinery goes into production. As India is already manufacturing pipes at Rourkela Steel Mill, the main problem is that of planning and construction of pipelines. A decision is expected at an early date.

Incidentally, the original project estimates of Haldia-Barauni Pipeline were Rs. 29.07 crores. They were reduced to Rs. 26.42 crores. The final contract signed was for Rs. 11.33 crores or Rs. 17.74 crores less than the original estimates.

The Estimates Committee, earlier this year had recommended the amalgamation of Indian Refineries Limited and Government's distributing company, Indian Oil Company Limited, into one unit.

As a beginning, the Government has decided to have a common Chairman for both the organisations.

The former Chief Whip of the Congress Party, Sardar Jogindra Singh, has been the Chairman of Indian Refineries Limited. As a result of this reorganisation, he has resigned. The Chairman of the Indian Oil Company Limited, Mr. Gopal Krishna, it is expected, will become the common Chairman of both the organisations.

The new target dates for the commissioning of the Barauni

Refinery are now available. The first stage, comprising one million ton distillation capacity, the coke unit and the first stream of the kerosene refining unit is expected to be commissioned by April 1964. The second stage comprising the second million ton distillation capacity and second stream of the kerosene refining unit is expected to go into operation in June-July of 1964. The lubricating plant is expected to go on stream by August 1964.

The refinery, originally was to be completed progressively from the end of June 1963 to April 1964. Although one million ton capacity crude distillation unit is expected to be ready by the end of November 1962, it is not regarded advisable to commission the refinery till the kerosene unit was ready. It cannot be commissioned earlier than April 1964. The Government has had the bitter experience of Nunmati Refinery which was started in a hurry and where the kerosene unit has been the cause of major anxiety. It was started in May last but had to be shut down soon after. Its compressor has been giving non-stop trouble because its blades had been corroded and the behaviour of lubricant was unsatisfactory. At one stage the Government intended to consult independent oil companies, like Phillips Petroleum or Burmah Shell. Meanwhile a team of Rumanians has arrived and is examining the Plant.

Expansion of Nunmati Refinery

The Government of India, it will be recalled, has decided to expand Nunmati refinery up to 1.25 million tons and Barauni to 3 million tons.

So far the expansion of Nunmati refinery was concerned, it was suggested that the design work should be undertaken at Gauhati through a group of Rumanian specialists deputed to India to guide Indian engineers. Negotiations with Rumanians are in progress.

Apropos Barauni Refinery the USSR has already signed a protocol under which it will provide economic and technical assistance to India. The delivery of the Russian equipment and plant for the expansion scheme will commence in 1964 and should be completed by 1965 to enable the commissioning of the expanded unit complete by 1966.

The Government of the USSR has also agreed to finance a coke calcination project at Barauni out of the savings from the overall credit granted for Barauni refinery in 1959. The state-owned TIAJ promexport of Moscow has entered into an agreement with Indian Refineries Limited under which it will render technical assistance to the company in collecting the initial data for designing the plant.

Indian Refineries Limited, has entered into an agreement with Associated Industries of Assam for the supply of liquid sulphur dioxide to Gauhati and Barauni refineries, their combined rate of consumption being ten tons a day.

Phillips Petroleum which, in collaboration, among others

Capital Market Needs a Tonic

From Our Correspondent

BOMBAY:

A LEADING firm of finance and market experts, Messrs. Premchand Roychand and Sons, have, in their Annual Market Review, 1962, which has just been issued, described the outlook for the Indian economy as having "become uncertain" look for the Indian economy as having "become uncertain" and as being "fraught with disquieting possibilities". This view is strikingly brought out by the fact that the stock exchanges of this country seem to have stuck in a morass of depression and anxiety. It is a significant fact that whereas stock exchanges in other countries have been showing a constructive trend, the capital market here has been stubbornly bearish.

with Government, is putting up a two million ton refinery at Cochin, has asked the permission of the Government of India to start also a tanker company.

The Government of India has recently agreed to increase the ratio of foreign participation in the equity capital of a Shipping Company from 25 per cent to 40 per cent. No change however has been made in the requirements of the Shipping Act in respect of the composition of the managerial personnel of the company, which remain as under:

1. That, not less than three-fourths of the total number or Directors of the company shall be citizens of India;
2. That, the Chairman of the Board of Directors and the Managing Director, if any, shall also be the citizen of India, and
3. That, the Managing Agents, if any, of the company, likewise shall be citizens of India or in any case, where a company were the Managing Agent, such company shall also satisfy the prescribed requirements.

The main point under discussion, however, is in regard to cargo. Phillips Petroleum, it appears, will like to have a guarantee that all the crude imports of the Government of India would be entrusted to the proposed company. In practice, such a proposition is possible. By and large, the Government will like to import crude through a company flying the Indian flag. But the Government, in principle, is opposed to giving the guarantee, which Phillips Petroleum seeks since it is possible that its own Shipping Corporation may acquire tankers.

The United States Agency for International Development (USAID) has announced that it has \$51 million (Rs. 24 crores) available for loans to qualified businesses in India. The amount is available in rupees and is for use in India.

American firms operating in the countries receiving Public Law 480 supplies or local (Indian) firms having an affiliation with an American firm are eligible for these loans. Also eligible are entirely Indian owned firms with no American affiliation which are facilitating the disposal of American agricultural products such as local private warehouses storing grain or flour mills.

USAID also announced that Cooley loans are available in the following six countries of the Near East and South Asia: Iran (\$1.5 million), Israel (\$8.2 million), Pakistan (\$11.4 million), Syria (\$3.6 million), Turkey (\$16.5 million) and the United Arab Republic (\$27.2 million).

General inquiries about the Cooley programme should be addressed to the Private Enterprise Division, Agency for International Development Washington 25, D.C. Loan applications should be submitted to the appropriate regional bureau of AID, Washington. In India applications may also be submitted to the USAID Mission, Faridkot House, Lytton Road, New Delhi.

The following comparison of the variable index figures of New York, London and Bombay stock exchanges is quite revealing:

	Lowest touched during June 1962	September 1963
New York (Dow Jones) ..	535	730
London	87	103
Bombay (Reserve Bank) ..	189	161

The investors in India have suffered heavily and they shy at investing their savings any further in industrial ex-

September 13, 1963

pansion under the present conditions. As the Premchand Roychand Annual Market Review points out, the two unorthodox measures introduced in the last Budget, namely, the Compulsory Deposit Scheme and the Super Profits Tax have begun to result in a diversion of private savings away from the capital market. The Review also is apprehensive that the diversion of funds from the capital market to durable goods and commodities, a process encouraged also by the Gold Control measures, might accentuate the present inflation. It is pointed out that the real effect of the restrictions on gold may be known only after the current harvest season when the farmer may be discouraged from parting freely with his marketable surpluses. In a different way, however, the effect of these restrictions is being already reflected in a sharp decline in the annual average rural credit provided by the scheduled, non-scheduled, and co-operative banks to farmers. Since the introduction of gold control, off-take of this credit has fallen from Rs. 60 crores to Rs. 25 crores, as was disclosed the other day, in the Lok Sabha, by Mr. B. R. Bhagat, Deputy Minister in the Finance Ministry.

According to the Premchand Review, the most disquieting feature in the present situation is that the new issue market for even reputable business houses with attractive investment propositions has turned out to be extremely hesitant. The problem is not merely confined to raising resources for new issues thus, but to financing of working capital as well. According to them, there is today such a shortage of funds for working capital for trade and industries that many large business houses have started accepting long-term deposits from the public at fairly high rates of interest to meet their needs of current finance. It is not surprising, therefore, that commercial banks have become apprehensive of this new trend which does inhibit, to some extent, the rate of growth of bank deposits. This difficulty of finding resources, it is feared, will affect not only Indian investment but also foreign investment. For, so long as there is a lack of rupee resources to match foreign investment in India, foreign private capital may not be freely forthcoming. It is suggested that the only way in which the problem can be effectively tackled is to take such immediate action as would increase the liquidity of the banking system, augment resources for long-term industrial financing and infuse vigour in the capital market.

★★

The problems faced by the cotton textile industry in the sphere of export promotion were comprehensively reviewed by Mr. Neville N. Wadia when he addressed the ninth annual general meeting of the Cotton Textiles Export Promotion Council. There was a sharp setback in India's export performance of cotton textiles last year (1962). The exports declined from 574.3 million yards in 1961 to 508.3 million yards in 1962—a fall of 11.5 per cent. The price realisation was 79 nP. per yard in 1962 as against 80 nP. per yard in 1961. The foreign exchange earnings in 1962 therefore turned out to be Rs. 39.9 crores as against Rs. 46.1 crores in 1961. In an otherwise depressing export performance, India managed to increase her exports to Australia, USA, Canada, New Zealand and to some extent Eastern Europe.

In contrast, the trend of exports in the first part of 1963 was more encouraging. In the first six months of 1963, exports of cotton textiles amounted to 268.6 million yards compared to 244.5 million yards in the corresponding period of last year. It was encouraging to note that an increase in shipments to some of the traditional markets such as East Africa, Malaya and Singapore contributed to the rise. It is against this background that the various issues discussed by Mr. Wadia should be seen. Mr. Wadia deplored the rigid application of the 'market disruption' clause by some of the importing countries because it would stand in the way of India finding new markets. For instance, the USA has been taking measures to

restrict the Indian exports of twills and jeans on the ground that India had exceeded the quota during the twelve months ending June 30, 1961. Actually what had happened was that the USA imported less than 2 million yards during that period as against the annual consumption of over 800 million yards and it was difficult to understand how this could disrupt the American textile industry. 'If this is the spirit in which the Agreement is going to be operated', remarked Mr. Wadia, 'the chances of renewal at the end of the five years would be extremely slight and continuation would be totally unacceptable to industries like ours (those in India).'

Tariff Stability

Referring to the forthcoming discussions in London between Mr. Kasturbhai Lalbhai and the UK Cotton Board on the categorisation of exports, Mr. Wadia gave the assurance that Indian exporters had no intention of wasting the quota on very low priced goods if they can earn more by shipping higher qualities. He stressed the need to maintain stability of tariff rates in importing countries. As an example, Mr. Wadia cited the instance of Australia where the Tariff Board was scheduled to make an enquiry on the imports of cloth required for pillows and sheets. This was the fourth or fifth inquiry in the last ten years and this caused hardships to exporters and importers. The efforts to obtain larger quotas from France and West Germany and Austria met with success and in Western Europe, the Council decided to set up a Consortium of exporters to Western Europe who will co-operate in all fields of exports, including the textile industries in European countries. A bright spot in 1962 was an increase in the export of **made-up garments**. There appears to be tremendous scope for expansion in this particular field.

In the sphere of domestic matters, the main difficulty related to the ever-increasing cost of manufacture. The increase of **Rs. 125 per candy last year** in the ceiling prices of cotton now puts our raw material above world parity. In the problem. Dyes and chemicals too were expensive and in some States **extra taxes had been levied on electricity**. In all, Mr. Neville Wadia painted bright prospects for India's textile exports notwithstanding the spirit in which the Geneva Agreement on cotton textiles was sought to be operated by some of the importing countries and the growing monetary burden on domestic industry.

★★

Mr. Raj Bahadur, Union Minister for Shipping, inaugurated the first annual general meeting of the Western India Shippers' Association in Bombay. He referred to the system of deferred rebates, followed by the Conference Lines, and said that it operated as a dead weight on the neck of shippers and the latter were unable to extricate themselves for fear of losing large sums of money locked up with the Conference. Mr. Raj Bahadur assured shippers that every possible effort would be made by the Government to safeguard their interests.

According to the Minister, the problem of dependence on foreign shipping could be solved through the development of our own merchant fleet. The Government was considering increased facilities to companies to operate vessels as tramps on the condition that they would not join any liner services. The tramp and bulk carrier fleet comprised the weakest link in our merchant navy and recently certain steps had been taken to develop these, subject to the limitation of resources and foreign exchange. This would act incidentally as a check on the monopolistic hold of the Conferences. As a result of the development in recent years the share of our shipping in our total foreign trade had risen from 9 per cent earlier to over 12 per cent now; 30 per cent of the liner cargoes was

September 13, 1963

already being carried by our shipping, the figure having touched 50 per cent on certain routes. He defended the decision to raise the shipping target from 2 million tons fixed in 1947 to 4 million tons subsequently in view of the doubling up of the volume of trade from 20 million tons to 40 million tons. The Minister expressed confidence that the Western

Waiting for a TTK Deal

From Our Correspondent

CALCUTTA:

EXCEPT FOR profit taking at the higher levels, Lyons Range continues to be cheerful in the hope that Mr. T. T. Krishnamachari will soon initiate measures that will put the economy back on the road to accelerated progress. The economy back on the road to accelerated progress. The speeches he has made since he took over from Mr. Morarji Desai appear to confirm the belief that TTK is not likely to harp on his once familiar tone of the private sector being full of undesirables, at least for some time. Of course it was not expected that Government would concede to the demand for the nationalisation of banks but it should have been pleasant to the private sector to read Mr. Krishnamachari's statement in reply to the debate in Parliament last week. He has shown why nationalisation of banks is neither necessary nor feasible. He has utilised the occasion to indicate what the economy is stagnating and the "paramount need of the day is that of stimulating the rate of its growth". The Minister has pointed out that "the rate of growth of the economy as it is now organised has to depend to a very large extent on the performance of the private sector". It follows therefore that efforts are to be directed towards improving the performance of the private sector.

The hopeful mood of the stock exchange fraternity is also sustained by other factors besides what is expected of the Finance Minister in the direction of revitalising the capital market. Prospects of increasing maintenance imports have improved with the encouraging performance on the export front and there have been indications in the past few days, now that it has become almost certain that U.S. will not participate in the building of the Bokaro steel plant, that a larger quantum of the U.S. aid for the third year of the third Plan will be made available for maintenance imports. All this will go sizably to reduce the idle capacity in industry. The absence of adverse developments on the northern borders and the continued flow of encouraging corporate news in the shape of higher dividends and proposals for the issue of bonus shares are the other helpful factors in the investment situation. Even so, it is difficult to believe that equity values could scale new heights till such time that concrete evidence is available to show that steps are being taken to remove the obstacles that are stifling the economy.

★★

A steady trend continues to characterise trading in the gunny market notwithstanding the fact that there have not been many foreign enquiries during the past week. Of the two main sections, sacking is getting the bulk of the attention. Hessian too is steady but it would appear that such gain as has been possible is largely in sympathy with sacking. The outlook for hessian exports is rather obscure as its principal customers are yet to show sustained interest. On the other hand the heavy goods section is favoured for the better export performance expected of it. Already a number of foreign countries have placed orders with India and more orders are believed to be in the offing. It is clear that at least for some months to come foreign buyers have to come to India for their requirements during that period as Pakistan will not be able to fulfill any order which has a delivery date before the end of the current year. Much interest has also been aroused by a rumour that Pakistan has entered into an

India Shippers' Association would play an important role in the promotion of our foreign trade and in securing adequate protection and safeguards to serve the interests of exporters. He welcomed particularly the proposal of the Association to undertake a study of the freight structure and the export potentiality of individual commodities.

agreement with China for the supply of about one lakh tons of heavy goods to the latter country. It is argued that if Pakistan is to take up such a large commitment it will have little left to place on the free world markets. That will leave India to meet the requirements of other consumers. As it is, it is the current and prospective business that Indian sacking is likely to secure that seems to have entered into the calculations of the marketmen.

Over and above the foreign orders that may come their way, Indian mills have to meet the steadily increasing needs of the Indian Government which has been buying over the past several months sizable quantities of sacking. Far from being worried over the disposal of its sacking production even at the current full level of working, the industry may already be faced with the problem of meeting the demand for sacking in full. It is even said that before long the industry may have to take steps to increase its monthly output of heavy goods in preference to hessian. The raw jute market too is in good shape having been able to maintain prices at or around the minimum levels. This achievement of the market is attributed to the timely action taken by the Jute Commissioner in allotting progressively increasing compulsory purchase quotas to the mills right from the very commencement of the new jute season in July. It is said that this has greatly helped mop up the supplies as and when they arrive. Indications are that the compulsory quotas in coming months will be fixed so that mills offtake equals the arrivals.

Buffer Stock

Considering that jute production in the current season is expected to be large enough to leave a substantial surplus, there will be need for support from other agencies besides the jute mills especially since the next two or three months will be the peak period for raw jute arrivals. One of the agencies that may have to enter the market will be the Jute Buffer Stock Association. The JBSA has so far built up a stock of 6½ lakh bales of jute and the Vice-president of the association, Mr. R. H. Morrison, indicated at its first annual general meeting held in Calcutta last week that "it is the intention that this stock should be further augmented during the current season to give additional security for the future". Since its inception in November 1961 the JBSA has been supporting the market in a modest way and there is no gainsaying its usefulness as a stabilising factor. Though the stock held by it may appear to be small compared to the total quantity of jute that had to be satisfactorily accounted for last year, operating a buffer stock even on this modest scale is not an easy matter. This will be evident from the extent of credit that the JBSA has had to seek from the State Bank to finance its operations during the past twenty or twenty-one months. As at the 31st March this year the credit accommodation from the State Bank was of the order of Rs. 5½ crores and at present stands at over Rs. 8 crores. Earlier apprehensions about the JBSA becoming a useful agency have now yielded place to the optimism that while playing an important role in stabilising the jute market, the JBSA will also go a long way towards freeing the industry from the recurring anxiety as to the inadequacy of supplies of raw jute from one year to another. It goes to the credit to the jute industry that it has shown the way for other industries how to minimise

September 13, 1963

the uncertainty caused by the vagaries of the weather. Of course a scheme such as the JBSA operated by the industry itself cannot function without an organisation and attendant expenditure. Referring to the additional financial burden to the industry, Mr. Morrison, while giving an assurance, that efforts will be made to keep the costs down to the minimum has reminded the industry that the JBSA also ultimately serves the interests of the jute manufacturing industry itself in so far as it affords a measure of security against fluctuations in the supply of raw jute and hence it must be prepared to pay a price for such security. An important problem confronting the JBSA however remains unresolved yet and that is the evolving of a suitable arrangement for the turnover of the buffer stock. As stored jute deteriorates its "turnover" is "quite fundamental to the success of the buffer stock scheme" as otherwise mills will have to incur losses due to deterioration.

**

Addressing a press conference last week in Calcutta Mr. K. Agarwala, Chairman, Indian Foundry Association has referred to the extremely difficult position in which the foundry industry is placed today. Acute shortage of pig iron is prevailing for the past two years and the situation has further worsened this year as production in pig iron in the country continues to lag far behind demand. Even according to the revised estimate of the Iron and Steel Controller, the demand for pig iron is about 2 million tons, though the industry's estimate puts it at approximately 2.5 million tons. But the availability is not even half of the demand, having been placed only at 1.1 million tons. But the bulk of the available quantity is earmarked for specific purposes with the result that the commercial foundries are getting material only to the tune of about 10 to 12 per cent of their assessed capacity. It is not surprising to hear therefore that most of the foundries are on the verge of closing down. In fixing the entitlements, the Iron and Steel Control pays little attention to the type of work done by some of the foundries. An instance in point is the unenviable position in which foundries

executing the Railway Board's orders for cast iron sleepers are placed. The Railway Board is placing orders for sleepers on the basis of 100 per cent pig iron whereas the Iron and Steel Control is planning their indents only for 50 per cent of the material. It appears to be no one's concern now the foundries will execute the orders in time and avoid coming under the mischief of the damage clause.

It is inconceivable that at a time when higher and higher production is of the utmost importance, an industry of the importance of the foundry industry is made to keep for no fault of its own by far the major portion of its capacity idle. This industry serves a wide variety of industries and its inability to cater even to part of their needs will inevitably tell on their production too. In this view it is for the Government to ensure that the foundries do not suffer hardship faced by the industry. It is high time that the authorities bestowed serious attention to the critical position in the foundry industry and initiated expeditious remedial measures. There is need for affording the foundries relief in the near as well as the long term. Mr. Agarwala has suggested a number of steps for realising this objective. Re-assessment of the requirements of the special demands as well as the production trend should be made with a view to find out if more pig iron could be diverted to the commercial foundries. He also pointed out that one million tons of pig iron should be imported on an urgent basis to meet the present shortage. Mr. Agarwala has also suggested that steps should be taken even now to augment supplies of pig iron during the next plan period. In assessing the availability of their calculations a quantity of about 350,000 tons of pig iron from Bokaro. But this steel plant is yet to take a concrete shape and it is almost certain now that the U.S. is not to participate in its building, the plant will not be ready during the fourth Plan. Mr. Agarwala's suggestion that urgent steps to set up low shaft blast furnaces and not blast furnaces merits the serious attention of the authorities.

Break-Through in Transport?

From Our Correspondent

MADRAS :

GREATER ATTENTION is being paid in Madras State to the development of road and rail transport facilities. The opening of the small stretch of railway track between Virudhunagar and Aruppukottai in the Southern part of the State provided the opportunity for the Chief Minister to stress the need for larger railway expenditure on the opening of new routes and even the conversion of some sections of the metre gauge system into broad gauge. On account of the difficulty involved in transshipment of bulk and heavy cargo, the development of heavy industries has so far been concentrated in the Madras, Salem and Coimbatore areas. It is feared that there cannot be any dispersal of heavy industries in the Southern districts without direct access to selected centres through the broad gauge system. The Heavy Boiler Factory in Tiruchirapalli has no special disadvantage in this respect. But it is felt that there will have to be a new broad gauge line from Karur in Tiruchirapalli District to Tuticorin if the large limestone deposits available in the area have to be effectively exploited and other heavy engineering units also have to be promoted. In fact, there is a feeling in some quarters that even Neyveli should be connected to Salem by a broad gauge and through a reticulated track to Madras so that the facilities provided by the industrial belt in the Neyveli-Salem area can be effectively exploited. As at present planned the new metre gauge link will be extended from Aruppukottai to Manamadurai so that

the major port that is proposed to be constructed at Tuticorin can have a vast hinterland. It is not known what exactly will be the reaction of the Railway Board as the arrangements are still being made in terms of extending the metre gauge system and only between Bangalore and Salem the alignment of the track has been carried out in such a way that it can be converted into broad gauge when the need arises.

Some idea of the congestion in traffic can be had from the fact that additional passenger trains cannot be run in the existing metre gauge sections, without electrification or dieselisation, while it is feared that an additional train cannot be run between Madras and Calcutta even though there is the required volume of traffic because of other bottlenecks at various points. No doubt, a heavy doubling programme is being executed and the position might improve significantly by the end of next year. All the same, the existing Godavari railway bridge will not permit a free flow of traffic until the new bridge is completed by 1968. This bridge is a major venture and will have to be completed in several working seasons involving huge capital expenditure. There can, however, be free flow of traffic to the Northern side and upto the Godavari bridge. It is only to be expected that sectional working will be carried out in an intelligent manner and the needs of the Southern States will be more carefully looked into. There has naturally been a demand that the Mangalore-Hassan line should be completed as early as possible as with the dieselisation of certain sections of the metre gauge

September 13, 1963

system and the construction of the Mangalore Port there can be a big jump in exports of iron-ore and other minerals from this part of the country.

While it is not known when the work of construction on the Mangalore Port will gain momentum, there are now indications that the Tuticorin Port may be developed in a short period. Construction work of the new port at Hare island will be taken up shortly. The port will be connected to Tuticorin town by an embankment which will be protected by breakwaters and which can be used for both road and rail transport.

**

The development of lorry and bus services in the Southern States has taken place in an impressive manner in the past few years and there is keen competition between the railways and road transport operators for available freight traffic. The cost of operation has increased sharply in recent months on account of the stiff tax levied by the Madras Government and the imposition of heavy excise duties on petrol, diesel oil and various other items which are consumed by road transport operators. As it is not possible to operate the various services on a profitable basis, there has been an increase in freight rates. Also, it has been proposed by the State Transport Authority that bus charges should be revised and in order to prevent abuses ceilings should be fixed. It has been suggested that in urban areas, where there are town services, a fare not exceeding 30 nP can be charged for a distance of not less than 12 kilometres. The State Transport Authority can fix up rates of fares within the maximum rates having regard to the profitability of certain routes, condition of roads etc. The minimum charge will, however, be 10 nP for the first stage. With regard to mofussil service, 3 nP per one kilometre on routes in the plains can be levied and 5 nP per kilometre on ghat sections. Express State carriages can charge 50 nP over and above the rates for ordinary State carriages. It is expected that the new tariff rates, with any modification that might be proposed in the light of objections or suggestions from various quarters, will come into effect shortly. The inflationary impact of the last General Budget is, therefore, being felt in many directions.

**

In his presidential address, Mr U. K. Lakshman Gowda, at the 17th Annual General Meeting of the United Planters' Association of Southern India, stated that in 1947-48 the total earnings from all plantation and hill crops was Rs. 64.24 crores. In 1962-63 these crops earned Rs. 166.61 crores. In 1947 South India alone produced 44.5 million kgs. of tea, 16,054 tonnes of coffee and 16,712 tonnes of rubber. Last year Southern India's production was 82.2 million kgs. of tea, about 55,000 tonnes of coffee and 31,357 tonnes of rubber. Mr. Gowda pointed out that although South India has been able to produce from each acre 61 per cent more tea in 1960 than in 1950, cost of production per acre has increased by 140 per cent. Gross realisation from the sale of produce per acre increased by 113 per cent but most of it was absorbed by taxation and labour cost. The industry, Mr Gowda stressed, stands in need of vigorous rehabilitation programme which involves modernisation, removal of obsolescence and expansion of productive areas and processing facilities.

The industry is starved of finance through being taxed without allowing for self-generation of resources. Past reserves where they are free and liquid are now fully pressed into service as working capital and are not available for long term investment in development. Planting companies have suffered the greatest fall in profits after tax as a percentage of net worth since 1950. In 1961, the profit after tax as a percentage of net worth of 149 companies was 6.1 per cent against 10 per cent fall for all industries. The tea companies could only retain 2.9 per cent of the profit after tax, coffee

had to draw from the reserves to pay a minimum return and rubber could retain only 5.7 per cent as against 36.4 per cent for all industries covered by a recent Reserve Bank study of company performance. The industry needs a new deal if it is to play its leading role as the country's major earner.

Although plantations are supposed to enjoy an exemption from the ceiling provisions of the respective State Legislation, all that is achieved by the exemption is to protect the existing units from fragmentation. Future expansion or replacement of planting from exhausted soil is barred except for marginal extension. The Madras Land Reforms Act is an exception but even here the effect of applying the provisions of the Preservation of Private Forests Acts has had the same result as a restrictive ceiling. The proposed 17th amendment to the Constitution is designed primarily to protect some 122 Land Acts from judicial review. In the context of an expanding demand for plantation produce within the country and the importance of this industry to export promotion in the years to come, there is obvious contradiction in the application of ceiling legislation to plantations. This contradiction, Mr. Gowda urges, must be resolved without delay.

**

The expansion plans of Mysore Paper Mills are fast being implemented. The construction of buildings for housing the new plant and machinery is progressing according to schedule while it is expected that shipments of machinery from U.K. and West Germany will start arriving regularly after sometime. The arrangements concluded with the Commonwealth Development Finance Company and Industrial Credit and Investment Corporation for securing the necessary foreign exchange have been helpful and it is felt that an integrated plant having a capacity of 18,000 tons annually will be functioning by this time next year.

Another large paper mill at Erode, in Madras State, belonging to Seshasayee Paper and Boards Limited has been functioning for sometime past. This rupees seven-crore project has been constructed in a very short period in collaboration with Parsons and Whitemore of the U.S.A. The paper machines have been in operation since December last while the pulp making plant was commissioned into production recently. Paper is now being manufactured out of bamboo pulp from the company's own sources. It is expected that pulp from bagasse also will be manufactured later in the year when supplies of this raw material begin to be available from the Pugalur factory of Deccan Sugar and Abkhari Company Limited in the Parry group.

Other companies, too, have been progressing well and it is expected that, on account of the likelihood of a liberal policy being pursued with regard to imports of raw materials and components, the automobile and other engineering industries will be able to utilise their capacity more effectively. The automobile producers particularly are making serious efforts to raise the indigenous content in cars and trucks so that the allotted foreign exchange can be utilised to service a larger volume of production. Ashok Leyland has been making impressive progress latterly and it has been announced that additional capital of Rs. 55.25 lakhs will be raised in equity shares of Rs. 5 each at par. Out of this issue, the foreign participants, Leyland of U.K., will be taking up shares for Rs. 33.15 lakhs and a balance of Rs. 22.10 lakhs will be offered for subscription to the existing shareholders. Thus, all the existing shareholders will be given the opportunity to subscribe for the new shares in the proportion of one share for every nine shares held. The funds are required for implementing the programme of increasing the output of Comet truck chassis to 5,000 units annually. Besides, the capacity for manufacturing spare parts is to be increased appreciably. The output of industrial engines will be 1,200 units annually.

The moving finger writes

THAT THERE is a strong block of opinion among Congress M.P.s which favours profound changes in the Gold Control and the Compulsory Deposit policies and at least a minority opinion which demands their total abandonment has been made clear in the last few days through discussions first at the meeting of the Executive of the Congress Parliamentary Party last Saturday and later on, on Tuesday, at a general session of the party itself. It is no doubt true that some Congress M.P.s had felt that major decisions taken so recently should not be reversed except for compelling reasons—a point of view which the Prime Minister seems to share—but at the same time, Mr. Nehru seems to have been more or less persuaded that these measures as they stand at present are difficult to administer and are likely to have adverse political consequences for the ruling party.

As for the new Finance Minister, he has apparently adopted an attitude of the utmost circumspection which is certainly a most appropriate one. The problems (arising or likely to arise in the course of the implementation of these policies) are being examined by a committee of senior officials of the Finance Ministry with whom the Cabinet Secretary has been associated. While the findings of this Committee will assist the Finance Minister in making up his mind on the modifications, if any, which will have to be effected, he is likely, in the main, to be guided by the views not only of the Congress Parliamentary Party but also by the reactions of the State Governments, some of which do seem to hold very definite views on the wisdom of some aspects of the Gold Control and Compulsory Deposit measures.

★★

The Rajya Sabha had to adjourn for ten minutes on Wednesday last week because no Minister was present when the House met after the lunch recess. Mr. Humayun Kabir had to apologise to the Chair when the House resumed business because a Bill (for upgrading the College of Engineering Technology in Delhi to the status of an institution of national importance) which he was piloting happened to be under discussion at the time. The apology sounded rather odd. He said that there was some difference in the time showed by his watch and the Rajya Sabha clock. Whether this statement was offered as an excuse or intended as an explanation, it was clearly inadequate since no information was given on what was surely the relevant point, namely, which of the two timekeepers was showing the correct time.

Talking of erring clocks or watches, I must mention the New Delhi Town Hall clock which frequently disagrees with the Lok Sabha clock. Since the Lok Sabha and the Town Hall are more or less on the same longitude, I must conclude that both timekeepers cannot be right and Parliament being sovereign, I would readily concede that it must be the Town Hall clock which is failing in its duty—a verdict which would seem to apply also to Mr. Humayun Kabir's watch.

★★

It is not only in our bazars that the metric system of weights, measures and values seems to be causing confusion. A senior official in the Central Water and Power Commission, I understand, recently blundered sadly when he was confronted with a file relating to an application for a licence to import a certain number of metres of high-tension cables. Taking "metres" to mean "meters" this official reportedly wrote that the application should be rejected since electricity meters were being manufactured in this country. Fortunately, the mistake was corrected when a higher official to whom it was sent with

the noting that he might also see really did use his eyes and saw.

★★

Elsewhere in this issue Mr. Hardikar has pleaded eloquently for a new attitude to work in this country. In the course of his argument he has referred to the working habits of the German and the Swiss and while there is undoubtedly much substance in his plea that the Indian worker would do well to emulate his counterparts in the industrially advanced countries, I would like to share with my readers the following observations by the Institute of German Industry which purport to give the low-down on the German worker:

In recent years clichés and generalizations about whole groups of people or nations have been going out of fashion. Yet some stereotyped attitudes still persist—for a prime example, in regard to alleged national working habits.

Thus the Spaniard is popularly supposed when confronted with work to say "Manana"—that is, he'll do the job tomorrow; and the Italian is often said to be an expert at "dolce far niente"—the sweet art of doing nothing. Anybody who has travelled in the two Latin lands, however (or who has seen Italian and Spanish guest workers on the job in German factories) knows that the facts don't fit the stereotypes.

When it comes to Germans, the cliché is on the other foot: The Germans are popularly imagined to be almost fanatically hard workers. Germans seem content to let the label stick; they sometimes refer to themselves as "Arbeitstiere": work-horses. Is it so?

The figures are the answer. The average West German industrial worker now puts in some 300 fewer working hours per year than in 1950. Working time per worker has decreased by 15 per cent. Both shorter work weeks and longer vacations have contributed to this change.

International comparison shows that while the total per-capita working hours in W-Germany fell off 3 per cent from 1960 to 1962, last year the French, Belgians and Italians were remaining on the job longer than in 1960.

As for vacation, not long ago 12 working days off was the general allowance in Germany; but now the average vacation is 15 to 18 working days, with many collective-bargaining contracts granting much longer vacations. Quite a few branches of the economy provide for vacations of three weeks for older employees. Some vacations go as high as 30 working days.

Another version of the cliché about work habits is that in the sunny southern lands people spend much of the time celebrating fiesta. Yet in fact there is hardly a country anywhere with more nationally observed holidays than the Federal Republic of Germany. This year there are 12 such days off. The Italians have a few more holidays than that, but the Italian work week (44-48 hours) is longer than the W-German. But compared with the 12 individual days off (aside from vacations) in the German year, France has 5 (with some collective agreements providing for more), Holland 6 to 10, Great Britain 6 and the United States 7.

As a combined result of vacations and other days off, in 1963 many W-Germans will put in 234 days on the job for 131 free days. A nation many of whose residents call more than one day in three a holiday is not necessarily lazy—German productivity indicates the contrary—but neither is it exactly a community of "work-horses".

V.B.

Trade Winds

INDO-PAK TRADE AGREEMENT

THE RECENTLY signed Indo-Pakistan trade agreement makes a significant departure from the previous one as the payments will have to be made in sterling and not in rupees. The agreement will be valid for two years, but will be extended thereafter by one year if neither party gives notice of termination three months before the date of its expiry. At the time of signing the new agreement, India had a favourable balance of trade of Rs. 1.50 crores under the special rupee payment arrangement although the overall balance of trade was adverse. The special rupee payment arrangement was agreed upon in 1960 to bring about movement of certain commodities required by the two countries. The switchover to sterling now is because of the reason that the crop that was considered necessary to bring about the movement of certain commodities under the special rupee payment arrangement is no longer required, contacts having been established between exporters and importers in respect of these commodities. Since Pakistan imported more under the rupee payment agreement from India, the latter was able to accumulate Rs. 1.50 crores which will now be utilized for the purchase of fertilizers and industrial alcohol.

Pakistan's major imports have been chemicals, drugs and medicines, machinery of all kinds, iron and steel and manufactures thereof, coal, building materials, spices, glassware, art silk, cotton piecegoods, textiles manufactures, dyeing and tanning materials, etc. While the trade between the two countries was to the tune of nearly Rs. 35.52 crores in 1955-56, it declined to about Rs. 16 crores in 1959-60. From then onwards it had been picking up and reached Rs. 26 crores in 1962-63. The table below in this context is self-explanatory.

	(Rs. crores)				
	1955-56	1959-60	1960-61	1961-62	1962-63
India's					
Imports	27.11	8.59	14.01	13.86	16.66
Exports	8.41	7.24	10.26	9.55	9.45
Balance of Trade	-18.70	-1.35	-3.75	-4.31	-7.21

As in the previous agreement, the protocol attached to the new agreement provides for the supply by India of 1,35,000 tons of coal per month and 50,000 tons of stone boulders annually. Pakistan will export raw jute, including jute cuttings, and cotton according to India's requirements. Expansion of trade envisaged in the agreement is reflected in the large number of items included in the schedules of exportable goods from either country. India's export list includes industrial goods and machinery. All of India's exports to Pakistan including the traditional items such as coal are effected by the changes occurring in the economy of Pakistan. Pakistan's request for diversion from West Pakistan and an increase in the export quota of coal to East Pakistan is a case in point. The discovery of large deposits of natural gas has provided cheap source of power to West Pakistan, thus relieving the necessity of imported coal to this Wing. A substantial foreign investment in consumer industry has already occurred in West Pakistan and more is likely. This development indicates that practically speaking there is greater scope for export of con-

sumer goods to East Pakistan than to West Pakistan. It might be noted that substantial amounts of tied loans are being offered by Japan and the U.S.A. to Pakistan which restricts her freedom to import from sources other than the prescribed ones. The fall in India's exports of art silk and mixed fabrics to Pakistan is a direct consequence of increased imports from Japan under tied loans.

MICA MALADIES

The difficulties of the mica industry are more the result of the disorganised state of the trade than of any adverse conditions in overseas markets. This is the impression one gains from deliberations at the annual general meeting of the Mica Export Promotion Council held in Calcutta recently. There are good reasons why Indian mica should sell well overseas. Firstly, our mica is generally of a high quality and secondly, India has a near monopoly of this important mineral. With the rapid progress of the electronic industry all over the world the demand for natural mica is expanding and, as a matter of fact, our mica exports rose in 1962-63 to 34.4 million kg. from the previous level of 28.5 million kg. But earnings from exports have declined from Rs. 10.66 crores to Rs. 10.54 crores. The obvious conclusion is that the price realised for our mica has declined disastrously over the past year. The repercussions are already evident in the large number of closed mines—it is said that 30 per cent of the mines have gone out of operation. It is said that the ridiculously low prices paid to our mica is due to the fact that foreign buyers are able to take undue advantage of our exporters who because of lack of quality control measures are obliged to accept what the purchaser determines to be grade of their consignments. The remedy therefore lies in our hands and it is gratifying that, notwithstanding the apprehension about a fall in exports expressed by some quarters, the Central Government has accepted the majority plea of the industry for banning exports of mica on consignment basis. For this to yield the desired result, there should be evolved without loss of time a satisfactory system for quality control and pre-shipment inspection. It is equally important that exporters in their own collective interest should desist from unhealthy competition because such practices are partly responsible for depressing mica prices overseas.

STUDYING EXPORT TECHNIQUES

In order to study export techniques, a study team consisting of officials and non-officials sponsored by the National Productivity Council, left New Delhi last week on a tour of West Germany, U.S.A. and Japan. An important aspect that will be studied by the team is the institutional set-up in the countries it visits including the organisation of Government agencies in the country and abroad, the structure of trade and industrial organisations and individual trading houses. Other fields of study include the role of trade agreements in the promotion of trade, the development of export markets through market research, commercial publicity and commercial intelligence and fiscal and other promotional measures adopted for the encouragement of exports. The export orientation achieved in individual industries will be examined with special reference to their plans and programmes for export and export pricing. The study team will also examine the facilities available for export finance and credit insurance, the arrangements that exist for the processing of buyers' complaints and for the settlement of claims arising in the course of foreign trade and the organisation of free trade

zones and similar arrangements. The team proposes to make case studies of a few of their typical exporting industries.

The team consists of Dr. D. Banerjee, Director-Technical Adviser of National Rubber Manufacturers Ltd., Calcutta, (Leader); Shri B. S. Bhatnagar, Manager of Commercial & Industrial Exports Ltd., Bombay; Shri C. V. Mariwala, Managing Director of Bombay Oil Industries (P) Ltd., Bombay; Shri W. A. Wadud, Commodities Manager of Tata Oil Mills Company Ltd., Bombay; Dr. S. P. Chablani, Managing Director of Export Risks Insurance Corporation; Shri B. B. Gujral, Joint Chief Controller of Imports and Exports; Shri I. P. Gupta, Director of Incentives and Shri C. R. Krishnaswamy Rao Sahib, Joint Director (Export Promotion).

EXPORT OF ENGINEERING GOODS

To step up exports of engineering goods to East European countries, the Government of India has decided to sponsor a trade delegation as was done in the case of West European countries early this year. A spokesman of the Engineering Goods Export Promotion Council stated recently that export of engineering goods from the country had gone up after the council was formed in 1955 from about Rs. 4 crores annually to Rs. 8.5 crores in 1961 and to Rs. 10.50 crores in 1962. About Rs. 4.85 crores worth of goods were exported in six months ended June this year. The main items of exports from the Southern region, where an office was opened in December last, were centrifugal pumps, bicycle rims, stainless steel utensils, household utensils, steel furniture, hospital equipment and machine tools. Recently some of the manufacturing machinery was exported to Ceylon. Bicycle chains worth about Rs. 2,000 were exported to the United States as samples. Singapore, Malaya, Ceylon, East African and Persian Gulf countries, New Zealand and Canada, were the main importing countries.

SUPER PROFITS TAX RULES

The Central Board of Revenue has framed rules relating to super profits tax in exercise of the powers conferred on it by section 26 of the Super Profits Tax Act, 1963. These rules, named as the Super Profits Tax Rules, 1963, have been published in Part II, Section 3, sub-section (ii) of the Gazette of India Extraordinary dated August 23, 1963.

These rules, inter alia, prescribe the various statutory forms to be used in connection with proceedings under the Super Profits Tax Act, e.g., forms of return of chargeable profits, notice of provisional assessment, notice of demand, appeals to the Appellate Assistant Commissioner and Appellate Tribunal etc. The rules also prescribe the necessary modifications to various sections of the Income-tax Act, 1961 which have been applied to the super profits tax e.g., provisions relating to the power to call for information and evidence, issue of refunds, procedure for assessing non-residents through their agents, recovery of arrear tax dues, references to High Courts and appeals to the Supreme Court etc.

WORLD RICE PRODUCTION

The monthly rice report of the Commonwealth Economic Committee published recently, states that world production of rice in 1962-63 continued the upward trend that had been interrupted in the previous season and reached the record level of approximately 153 million tons of paddy. The crops in India and Pakistan were reduced, but output elsewhere in Asia particularly in the exporting countries was at a high level. Prospects for 1963-64 season are as yet uncertain. Drought appears to have been widespread during the earlier growth of the crops. Exports so far recorded in 1963 are

somewhat below the comparable figure for last year, although this is mainly the result of the rephasing of shipments from Thailand and the slower rates of export from Burma. Consignments from the United States are however, at a high level, and world trade in rice for the full year is expected to exceed that in 1962 despite the reduction so far recorded. Dealing with India, the publication says that reports early in June indicated that the rains missed many interior parts of India and the success of the autumn seeding campaign depended on increased rain. Arrivals of rice at Indian ports during the second quarter of 1962 totalled 2,40,000 tons, bringing the total for the first half of the year up to 3,55,100 tons — a rather higher figure than a year earlier. Most of the rice under the contract with Burma for 1,50,000 tons from the 1963 crop had been received by the end of June, while imports from the U.S. already exceeded those during the whole of 1962.

BHILAI STEEL FOR SUDAN

At a press conference recently in Raipur Mr. Inderjit Singh, General Manager of the Bhilai Steel Works stated that Bhilai had undertaken to supply 12,500 tons of rolled steel to Sudan. The General Manager pointed out that Bhilai was now in a position to produce quality steel. It successfully met recently two small orders of quality steel used for welding. India, he said, was importing twenty to thirty thousand tons of such steel. The steel works would certainly produce such steel if an order was placed with the management.

SEWING MACHINE FOR GERMANY

The Minister of International Trade, Mr. Manubhai Shah, stated in the Lok Sabha that an Indian firm (Jay Engineering) had concluded a contract with a West German firm for the export from India to West Germany of Usha Sewing machines at a rate of 1,500 machines per month or 18,000 machines during the financial year 1963-64; 2,000 machines per month or 24,000 machines during 1964-65 and 2,500 machines per month or 30,000 machines during 1965-66. Thus, during the three years of the duration of the contract, 72,000 Indian sewing machines would be exported to West Germany.

BRITAIN'S GOLD RESERVES

Britain's gold and convertible currency reserves fell by £7 million to £969 million at the end of August. The fall was mainly due to a £10 million payment to Germany in respect of bilateral debts arising from the winding up of the now defunct organisation for European Economic Co-operation, was wound up at the end of 1958, the whole of Britain's debt to Germany arising from trading transactions amounted to £95.7 million to be repaid over a period of 12½ years. Taking into account the annual payment towards the debt made in August, the reserves can be said to show a true gain of £3 million for the month. This is much the same as the position in August 1962, when there was a true gain of £4 million.

MAIZE IMPORT FROM U.S.

An agreement between India and the U.S. was signed recently providing for the import of about 110,000 tons of maize by India valued at Rs. 3.70 crores under P.L. 480. So far, the two countries have entered into aid agreements under P.L. 480 covering agricultural commodities valued at Rs. 1,161 crores. The consignment will be processed as starch for the textile and other industries. It will be paid for in rupees but the U.S. Government will make over to India 85 per cent of the sale proceeds to finance development projects.

One of the fastest growing general insurance companies in India MADRAS MOTOR & GENERAL INSURANCE COMPANY LIMITED

The stability of a general insurance company depends upon the continued patronage of its clients. The ability to expand the field of activities and serve new clients sets the pace of its growth.

The swift and steady growth of Madras Motor & General Insurance Company Limited indicates that it possesses both these qualities in ample measure.

Company Affairs

IISCO EXPANSION

SIR BIREN MOOKERJI, Chairman, the Indian Iron and Steel Company Ltd., stated at the forty-sixth annual general meeting of the company in Calcutta on September 3, 1963, that further progress had been made in regard to the expansion schemes of the company subsequent to his earlier statement (reported in Eastern Economist dated August 16, 1963, page 322). The Chasnalla Project being the key to the expansion scheme and involving substantial expenditure, the company had put forward to the Government two suggestions. The first asked the Government to agree to a deferment until after 1967 of further recoveries against the present loan balance of Rs. 4.61 crores. The second related to an increase in the company's borrowing limit from banks by way of cash credit on overdraft facilities against the security of stocks, stores and spares, over the current amount of Rs. 5 crores. The chairman further said that the Government had indicated its acceptance of these proposals and the company had now approached the World Bank. As soon as the consent of the World Bank was received, the company would push further the implementation of the scheme.

In the meanwhile, the consulting engineers were busy finalising planning details. The company had been assured by the World Bank that official appraisal of the first phase of expansion programme would be taken up as soon as the Chasnalla Project was submitted. In view of this assurance, the Directors of the company had decided to hasten the installation of the two re-heating furnaces which would cost around Rs. 66 lakhs. Previously it had been arranged that these furnaces would be put up along with phase I of the programme. The acceleration of the expansion programme in this way is also likely to hurry up phase II of the expansion programme. Sir Biren stressed the fact that the expansion programme would make a heavy call on the resources of the company and it was essential to conserve all its available resources so that the company might be able to play its role in the development of the steel industry in the country.

MYSORE PAPER

Addressing the twenty-eighth ordinary general meeting of Mysore Paper Mills Ltd. at Bangalore on September 5, 1963, Mr M. D. Shivananjappa, Chairman and Managing Director, drew attention to the rising cost of paper manufacture which necessitated an immediate revision in the facture which necessitated an immediate revision in the controlled prices of various varieties of paper. The last revision had taken place in June, 1962, and since then the emergency had "brought in new legislative measures" which had further added to the costs. He also stated that the industry had taken up the question of revision of prices with the Government of India and hoped that the Government would take a liberal view in this regard if the third five-year Plan target of 820,000 tons was to be achieved. He was of the opinion that only a price policy which ensured a reasonable and fair return on capital would act as an incentive for the implementation of expansion schemes.

The company had been able to show good working results despite the pressure of rising costs due to a judicious check on expenditure. The company did not attract Super Profits Tax because a large increase in equity capital had taken place recently consequent to a rights issue and reserves built over the years. During the current year a sum of Rs. 1,00,000 has been reserved for fluctuations in the value of stores and raw materials and another sum of Rs. 5,50,000 has been appropriated to rehabilitation reserve. The general reserve was raised to Rs. 36,00,000 for the year ended March 31, 1963, by the appropriation of Rs. 4,50,000

from the provision for repairs and replacements which is no longer required for that purpose. The company has declared a dividend of 12 per cent, subject to tax, absorbing Rs. 3,00,000 in case of fully paid shares and also a dividend of 12 per cent, subject to tax, on partly paid shares which would absorb Rs. 3,75,000. It had made arrangements to secure equipment necessary to raise production to 18,000 tonnes. Contracts have been signed with the suppliers of plant and machinery in Germany and the United Kingdom. For purposes of development finance, arrangements with the three lending institutions, namely, the Commonwealth Development Finance Co. Ltd., London, the Industrial Credit and Investment Corporation of India, Bombay, and the Industrial Finance Corporation, New Delhi, have been completed. From the Commonwealth Development Finance Co. Ltd a sum of £5,25,000 have been drawn. From the Financial Corporation of India, a sum of Rs. 55,00,000 in foreign currencies have been drawn for foreign purchases. For indigenous purchases and local expenditure, a sum of Rs. 35,00,000 has been drawn from the Industrial Finance Corporation of India.

KESORAM

The broad details of the auditor's statement of accounts for the year ended March 31, 1963 of Kesoram Industries and Cotton Mill Ltd., were discussed in "Eastern Economist" dated 23rd August, 1963 (page no. 374) on the basis of a preliminary report. The complete report of the directors to the shareholders has now been made available. The gross profit for the year under review was Rs. 2.01 crores. The allocations included Rs. 82.49 lakhs for depreciation, Rs. 39.21 lakhs for development rebate reserve, Rs. 8.00 lakhs for taxation, Rs. 8.39 lakhs for managing agents' commission and Rs. 29,676 as tax paid against old liabilities. Net profit after making all these provisions came to Rs. 59.91 lakhs to which were added (a) amount brought forward from previous year at Rs. 43,454 and (b) directors' commission provided in the past, now written back being disallowed by the Central Government at Rs. 1.92 lakhs. The net amount available for disposal was Rs. 62.27 lakhs.

The directors have recommended a transfer of Rs. 40 lakhs to dividend reserve and Rs. 22 lakhs to general reserve while a sum of Rs. 26,969 is proposed to be carried forward to the next year's accounts. The directors have also proposed for the consideration of the shareholders at the Annual General Meeting to be held on September 24, 1963 the payment of dividends (subject to deduction of tax) from the dividend reserve. The details of the dividend suggested are: (a) Cumulative Preference Shares at the rate of 10 per cent (gross) per annum, absorbing Rs. 2 lakhs, (b) Redeemable Cumulative Second Preference Shares at the rate of 7.85 per cent (gross) per annum, absorbing Rs. 7.84 lakhs and (c) Ordinary shares at the rate of 13 per cent (gross) absorbing Rs. 25.99 lakhs. Provision for dividend on ordinary shares, pending allotment, would absorb Rs. 738 only. The company is making an application to the Income-tax Department to determine the quantum of the profit of the year ended under review which is examined under Sections 85 and 101(2) of the Income-tax Act, 1961. If the decision of the department is received in time, the deduction of tax from the dividend recommended will be made accordingly.

The directors have also reported that the ceiling prices of cotton, the basic raw material for the textile industry, was raised by Rs. 125 per candy during the current season which did not receive any compensation by way of increase in cloth prices. The prices of other raw materials such as stores, dyes, chemicals, coal, power rates and packing items also increased, affecting adversely the economics of the industry. Other additional burdens on the industry were the Emergency Risks

Insurance premia and the increasing rates of Inter State Sales Tax. Again excise levies and customs duties in the case of a large number of commodities essential to the industry were also increased.

JAIPUR UDYOG

Mr. S. P. Jain, Chairman of Jaipur Udyog Ltd., brought into sharp focus the basic problem of the rising cost in cement manufacture at the annual general meeting of the shareholders on August 21, 1963 at Sawaimadhopur. He described the last price fixation which came into effect on June 1, 1963 as "disheartening"; Jaipur Udyog received a price increase of Rs. 2.75 per tonne which was inadequate in view of the rises in cost which had taken place since the previous fixation of price. He recommended an automatic escalation system whereby the rise in costs under the major heads such as fuel, power, transport, etc. was automatically communicated to the industry so that it might not be made to suffer for the Government's delayed actions. He rightly said that without an appropriate price policy, the development of industry would not take place and the problem of the continuing scarcity of cement would not be solved.

He also drew attention to the Government's unrealistic stand in making factories use 50 per cent of old bags. In the official fixation of prices, the old bags were priced at 65 per cent of the price of the new bags, but the manufacturers had to pay as much as 85 per cent of the price of new bags. Again, he highlighted the peculiar situation in which the Sawaimadhopur unit found itself in the matter of raw material transport. Whereas the distribution of cement is covered by the pooling of freight, there is no similar formula for freight on raw materials. Since the quarries of the factory were at a distance of 15 miles from the plant, the freight on limestone worked at Rs. 4.40 per tonne. Including other raw materials, the total incidence of freight on the cost of cement was Rs 7 per tonne. This was an additional cost which the Sawaimadhopur unit had to bear in relation to those units which were situated very near the quarries.

Disclosing the working results of the factory, Mr. Jain indicated that it had achieved an all-time record in production at 823,238 tonnes as compared to 742,298 tonnes in the previous year. This was reflected in the substantial rise in the net profit after depreciation which stood at Rs. 87.12 lakhs as against Rs. 65.02 lakhs in the last year. The Directors have therefore, proposed an increased dividend at 10 per cent against 8.30 per cent in the previous year. The proposed dividend, it is computed, will amount to a net payment of 8.752 per cent after deduction of income-tax on a part of the distributed profits.

BIRLA COTTON

The working results of the Birla Cotton Spinning & Weaving Mills Ltd., were discussed, on the basis of a preliminary report, in "Eastern Economist" dated August 30, 1963, on page 424. The Directors' report, now made available gives reasons for the decline in profits for the year ended March 31, 1963 and also gives the details regarding the construction of the new factories being set up at Kathua and Khurja. It is indicated that there was a further increase in the cost of production in the textile industry due to a rise in the price of cotton, stores, dyes and spare parts. Increase in dearness allowance also raised the bill for salaries and wages. The full impact of the levy on cotton consumption which was paid to the Indian Cotton Mills Federation (imposed towards the end of the previous year) was reflected in the accounts of the year under report. Again, a substantial compensation had to be paid to workers who left on their own accord under the Tribunal's Award. The Company added some more machines in the processing and finishing departments in its programme to rehabilitate them. The tent factory worked to full capacity

to meet the needs of the defence forces and also produced satisfactory results. The gunning and pressing factories at Maiout and Kesrisinghpur had also reported a good performance. The Chenab Textile Mills at Kathua was progressing very well and the erection of machinery was expected to commence very soon. According to present indications, the mill might go into production at the beginning of 1964. Steps have also been taken to acquire land for setting up a textile mill at Khurja; orders for plant and machinery have also been placed.

INDIAN CABLE

The annual report of the Indian Cable Company Limited for the year ended 31st March 1963 showed, after making provisions for depreciation and taxation, a net profit of Rs. 3.85 lakhs. Taking into account the balance brought forward from the previous year at Rs. 50.15 lakhs and transferring Rs. 19.56 lakhs from the "provision for retiring gratuities" and Rs. 10 lakhs from the "provision for taxation", the total sum available for distribution was Rs. 143.56 lakhs. The Directors have recommended a transfer of Rs. 3.45 lakhs to the "debenture redemption sinking fund", Rs. 45,000 to "development rebate reserve", Rs. 18 lakhs to "reserve for retiring gratuities", Rs. 5.00 lakhs to "reserve for replacement of fixed assets" and Rs. 60.50 lakhs to "general reserve", leaving a balance of Rs. 56.16 lakhs for disposal. The Directors have also proposed payment of a dividend on ordinary shares at Rs. 2.25 per share (subject to deduction of income-tax and super profits tax), absorbing Rs. 55.95 lakhs while the balance of Rs. 21,521 is proposed to be carried forward to the next year.

There has been an increase in the total sales of the company from Rs. 10.04 crores in the previous year to Rs. 10.48 crores in the year under report. There was also an improvement in the profit for the year after providing for depreciation at Rs. 1.57 crores compared to Rs. 1.38 crores in the previous year, but the increase was wiped out by the increased provision required for taxation, particularly as a result of the imposition of super profits tax. The company had filed a claim to the Central Board of Revenue for tax relief in respect of the profits of the Paper Insulated Power Cables Factory; the favourable decision of the Board enabled the release of Rs. 10 lakhs, indicated above, from the provision for taxation. The company is making earnest efforts to earn foreign exchange by exporting cables. In South-East Asia particularly, the company has a very high reputation. During the first half of the current year, the export figure for the whole of the past year had been exceeded. The volume of exports could be extended further if the company were in a position to accept foreign orders for paper insulated cables which are urgently needed in this country for priority requirements.

CAPITAL ISSUES

The Controller of Capital Issues has authorised eleven companies, including a State Government undertaking, to raise fresh capital amounting to Rs. 2.79 crores. Three companies are issuing bonus shares, three cumulative redeemable preference shares and the rest equities. The consent for all, except one, is valid for 12 months.

Burn and Company Limited, Calcutta, is to offer bonus shares of the value of Rs. 84 lakhs in 84,000 bonus shares of Rs. 100/- each in the ratio of one bonus share for every share held.

Jay Shree Tea and Industries Limited, Calcutta, is to raise capital of Rs. 21,86,666/-. These will be offered as 2,18,666 equity shares of Rs. 10/- each as fully paid-up bonus shares on capitalisation of reserves to a like extent.

National Planning and Construction Limited, Calcutta, is to issue 352 equity shares of Rs. 100/- each, as fully paid-

BUSINESS & SERVICE

The Bank receives deposits, gives advances against approved securities, purchases bills, sells drafts and telegraphic transfers and transacts all types of Foreign Exchange business. Through its internal net-work of branches and world-wide business arrangements it provides every kind of banking service.

S. T. SADASIVAN,
General Manager.

UCO 3

4¾ PER CENT MADRAS STATE ELECTRICITY BOARD BONDS, 1975 FOR Rs. 400 LAKHS

(PAYMENT OF INTEREST AND REPAYMENT OF PRINCIPAL, GUARANTEED BY THE GOVERNMENT OF MADRAS).

The bonds will be trustee securities under the Indian Trusts Act and also approved securities for the purposes of the Insurance Act and the Banking Companies Act.

ISSUE PRICE RS 99.75 PER CENT
REDEEMABLE AT PAR ON THE 23RD SEPTEMBER, 1975

Subscriptions will be received in cash or cheques from the 23rd September, 1963. But the lists will be closed without notice as soon as the total subscriptions amount to approximately Rs. 400 lakhs and in any case not later than the close of business on the 28th September, 1963.

Applications will be received at all branches of the State Bank of India within the State of Madras and at the State Bank of India at Madras, Bombay, Hyderabad, Calcutta, Delhi, Bangalore and Bangalore City.

Copies of the Notification announcing the terms of issue and application forms are available at all the receiving offices mentioned above, at all treasuries and sub-treasuries in the State of Madras and at all offices of the State Electricity Board.

up bonus shares on capitalisation of the company's reserves to the extent of Rs. 35,200/-.

Amar Dye-Chem. Limited, Bombay, is to issue capital of Rs. 30 lakhs, divided into 30,000 equity shares of Rs. 100/- each for cash at a premium of Rs. 5/- per share. The shares are to be issued to the existing share-holders in the proportion of one share for every three shares held. The proceeds are to be used for the company's expansion programme. The consent is valid till February 29, 1964.

The Premier Cable Company Limited, Delhi, is issuing capital of Rs. 70 lakhs (including Rs. 9,80,070 already issued and subscribed). These will be divided into 5,50,000 equity shares of Rs. 10/- each, and 15,000 cumulative redeemable preference shares of Rs. 100/- each carrying dividend at 9.3 per cent free of company's income-tax but subject to deduction of tax at source at the prescribed rates, for cash at par. The proceeds of the issue are required for financing the proposed manufacture of plastic insulated power cables.

Orissa Construction Corporation Limited, Bhubaneswar, a State Government undertaking, is raising capital of Rs. 10 lakhs in 1,000 equity shares of Rs. 1,000/- each. The money will be utilised for the construction of bridges on the State express way.

G.S. Mandi Dip Paper Private Limited, Bhopal, a company recently incorporated for the manufacture of paper, is to issue capital of Rs. 30 lakhs divided into 30,000 equity shares of Rs. 100/- each, for cash at par. The capital will be used for financing the proposed paper project.

Associated Pulp and Paper Mills Limited, Ahmedabad, is to raise further capital of Rs. 12,50,000/-. These will be divided into 12,500 cumulative redeemable preference shares of Rs. 100/- each for cash at par carrying dividend of Rs. 9.5 per share. These will be free of company's tax but subject to deduction of taxes at source. The capital is required for the acquisition of land and machinery etc.

Sundaram Textile Mills Limited, Madurai, is to issue capital of Rs. 10,00,000/-. This will be divided into 5,000 equity shares of Rs. 100/- each and 5,000 redeemable preference shares of Rs. 100/- each carrying a dividend of 9.5 per cent (free of company's tax but subject to deduction of taxes at source at prescribed rates) to be issued privately for cash at par. The proceeds are needed for the expansion of the existing textile mills.

Madras Motor and General Insurance Company Limited, is issuing capital of Rs. 10 lakhs in 10,000 equity shares of Rs. 100/- each. The proceeds are required for the purpose of expanding the business of the company.

South Indian Insurance Company Limited, Bombay, has been given consent to issue capital of Rs. 27,920/- in 2,792 equity shares of Rs. 10/- each. This will be allotted to New India Assurance Company Limited for cash at a premium of Rs. 14.75 per share. The object of the issue is to streamline and simplify the company's capital structure.

LICENCES ISSUED

The following licences were issued under the Industries (Development and Regulation) Act, 1951, during the week ending 31st August, 1963. The list contains the names and the addresses of the licensees, articles of manufacture and annual installed capacity.

IRON & STEEL CASTINGS AND FORGINGS

The Shalimar Works Ltd., 1, Foreshore Road, Shibpore, Howrah (West Bengal) — Ferrous castings (C.I. castings) - capacity to be assessed. Bhartiya Electric Steel Co. Ltd., 8, Swinhoe Street, Ballygunge, Calcutta (West Bengal) — Steel Ingots and steel castings 3,600 tons per annum.

COAL, LIGNITE, COKE

Bhowra Kankanee Collieries Ltd., 25, Brabourne Road, Calcutta-1 (P.O. Bhowri-Distt. Dhanbad, Bihar) — Coal & coke-

1,07,040 tonnes per annum. Bhowra Kankanee Collieries Ltd., 25, Brabourne Road, Calcutta-1 (P.O. Bansjora, Distt. Dhanbad, Bihar) — Coal and Coke - 1,86,200 tonnes per annum. Bhowra Kankanee Collieries Ltd., 25, Brabourne Road, Calcutta-1 (P.O. Kusunda Distt. Dhanbad, Bihar) — Coal and Coke - 1,10,000 tonnes per annum.

RADIO RECEIVERS

Harsh Engineering Industries, Nawalgarh House, Jaipur (Jaipur, Rajasthan) — Tubular papers capacitors 5 million Nos. per annum, Hermetically sealed paper capacitors 1 million Nos. per annum.

MACHINE TOOLS

Tak Machinery Ltd., Janambhoomi Bhavan, Ghona Street, Fort, Bombay-1 (Maharashtra) — Hydraulic Presses 60 Nos. per annum.

HAND TOOLS, SMALL TOOLS AND THE LIKE

New India Tool Mfg. Co. 48, Gariahat Road, Calcutta-19 (West Bengal) — (1) Reamers 24,000 pieces per annum, (2) Cutter and other precision small tools 3,000 pieces per annum, (3) Tool bits including carbide tipped tools 50,000 pieces per annum, (4) Twist Drills 10 lakhs pieces per annum.

SYNTHETIC RESINS & PLASTICS

Dr. Beck & Co. (India) Ltd., Bombay-Poona Rd., Pimpri, Poona (Maharashtra) — Synthetic resins of Phenolic, Alkyd, Polyester, Hydroxy Polyester, unsaturated Polyester etc. specially formulated for the electrical industry - 600 tonnes per annum.

DRUGS AND PHARMACEUTICALS

Sandoz (India) Ltd., 3, Wittet Road, Ballard Estate, Bombay-1 (Maharashtra) — Manufacture of active principles of podophyllum, Glycoside fraction 24,000 kgs. per annum, Aglycone fraction 30,000 kgs. per annum. Raptakas Bret & Co. Private Ltd., Annie Beasant Road, Worli, Bombay-18 (Thana, Maharashtra) — Catoxyl Gel 13,000 bottles of 360 ml. each per annum (shifting from Madras to Thana).

TEXTILES

Cheviot Mills Co. Ltd., 8, Clive Row, P.B. No. 150, Calcutta (West Bengal) — Wide Hessian (Carpet Backing cloth) 40 Broad looms for producing 4,200 tonnes per annum.

CHANGES IN NAMES

Owner or Undertaking

(During the week ending August 31, 1963)
From M/s. Devidayal Tube Industries Private Ltd., New Delhi to M/s. Devidayal Tube Industries Ltd., New Delhi.
From M/s. Kesoram Cotton Mills Ltd., New Delhi to M/s. Kesoram Industries and Cotton Mills Ltd., New Delhi.

LICENCES REVOKED

(During the week ending August 31, 1963)
M/s. Kalinga Industries Ltd., Calcutta — Pig iron. M/s. Walchandnagar Industries Ltd., Bombay — Solven extraction plants. M/s. D. C. Dhiman and Bros. Private Ltd., Calcutta — Railway wagons. M/s. Window Glass Ltd., Calcutta — Sheet glass.

EVEREST ADVERTISERS

Everest Advertising Private Limited has instituted a full term scholarship in advertising at the Bharatiya Vidya Bhavan's College of Journalism, Advertising and Printing. The scholarship will be given to a meritorious candidate deserving aid, who is unemployed and is interested in taking advertising as his career.

Everest Advertising was recently affiliated to world Marketers, U.S.A., as a Charter Member. World Marketers is a worldwide network of marketing-oriented advertising agencies and marketing research organisations.

1788
THE E.I.D.-PARRY GROUP
1963

THE HOUSE THAT THOMAS PARRY BUILT

Founded in 1788 as a small trading firm, Parrys have served the country well and truly for 175 years.

The remarkable progress made over one and three-quarter centuries has resulted in the E.I.D.-Parry Group of today, comprising nine companies of substance,—all making important contributions to the nation's economy.

The strong position it has achieved has given the Group courage and confidence to expand its resources to meet the country's diverse needs in fertilisers, sugar, confectionery, sanitaryware, acids, chemicals, light railway equipment, industrial and potable alcohol, etc.

Factors In Economic Development: By Professor A. K. Cairncross; Allen & Unwin; 35sh.

The British Economy In The 1950's: A symposium of seventeen essays; Oxf. Univ. Press; 50 sh.

Abstract of British Historical Statistics: By B. R. Mitchell and Phyllis Deane; Camb. Univ. Press; 52sh. 6d.

British Economic Growth 1688-1959: By Phyllis Deane and W. A. Cole; Camb. Univ. Press; 60sh.

American and British Technology In The 19th Century: By H. J. Habakkuk; Camb. Univ. Press; 32sh. 6d.

Reviewed by JOSSLEYN HENNESSY

THE U.K. worries because her postwar growth rate averages only 2.6 per cent p.a. Yet throughout the 19th century, when she led the world in industry, her growth rate averaged 2.75 per cent, i.e., only 1.5 per cent faster. Why then, worry?

As long as U.K. labour was content to take a more or less unvarying share of the cake, it did not matter so much that the cake grew more slowly than it could. Between 1860 and 1914, wages and salaries averaged 48.6 per cent, and profits 38.9 per cent of the cake, but in 1920-29, the share of wages rose to 59.7 per cent and profits fell to 33.7 per cent, while by 1950-59, wages were claiming 72.4 per cent and profits only 22.7 per cent. This transformation suggests that re-distribution of the existing cake not only in wages, but also in social benefits, can go no further, so that the only way to get bigger shares is to make the size of the cake grow faster. How?

Outstanding among the spate of recent books, which try to answer this question, are the studies which are reviewed here. One clear impression from pondering these authorities is that rising profits are essential to growth and that among the biggest obstacles to growth is the social disapproval that now surrounds "excessive" profit-making or, indeed, profit-making at all. The opposite of profit-making is subsistence-making. Before capitalism, agriculture was for subsistence, not for profit, as it still is in underdeveloped countries—and that is precisely why they are backward. Deane and Cole point out that long before the mid-eighteenth century saw the initiation of the Industrial Revolution, British agriculture was carried out for profit. The typical farmer was not a peasant toiling for his own subsistence.

Urge for Innovation

All these authorities emphasise that shortage of savings is rarely an impediment to growth: if there is an opportunity to make big profits, the capital will be forthcoming. What is important is an environment in which men gain experience in sizing up opportunities for profit. Thus, Cairncross says: "There has to be throughout the whole industrial system, a power to innovate, a built-in incentive to make further improvements, a linking of personal advantage with these improvements, and a readiness to look for opportunities of making them". Without the incentive of profits, growth cannot become self-sustaining.

Good as the U.K.'s average growth rate of 2.9 per cent p.a. was between 1800-1850, Habakkuk, looking at the rates achieved in Europe today, asks why it was not even faster. Among his several explanations is that although between 1819-1829, for example, handlooms fell from 240,000 to 225,000, the output per handloom rose by 30 per cent and the prices of their products fell, because the weavers, instead of moving into other employment, persisted in trying to compete with the factories. The weavers thus kept themselves on subsistence rates and, by causing the price of cloth to fall more rapidly, they lowered the profits of the factories and so reduced the ability, and the incentive, of the factory owners

Profits and Growth

to install more power looms. The lesson of this example is the importance for growth or encouraging the immediate adoption of new technologies. The slower the pace of adoption, the greater the possibility of resistance by the vested interests of capital and labour, the more long drawn out, and painful, the process of adaptation, the less economical the use of resources, and the slower the growth.

Habakkuk's observation that the U.K.'s slow growth rate in the 19th century affected the performance of her entrepreneurs applies equally today. Generals reveal their greatness not in peace but in war, and great entrepreneurs do not emerge in non-expanding industries. When profits are squeezed, risks are greater, initiative at a discount. Entrepreneurs are slower to try new methods, launch new products or start new firms. Because the market was growing slowly, risks were much greater in the U.K. than in Germany and the U.S.A., as was shown by the fate of those who showed enterprise in the electrical industry in the 1880's and came croppers as a result. On the other hand, when profit prospects favour expansion, British businessmen are as enterprising and successful as any in the world.

The authors of "The British Economy" argue that what the U.K. needs is an expanding, highly competitive, domestic market, because this encourages (a) the installation of productivity-raising equipment, dependent on large scale production, and (b) the search for additional profits in markets abroad.

Consumption-Oriented Economy

In the 19th century, growth sprang from the entrepreneur's drive for profits. He invested in new techniques because he saw the possibilities of new markets. Demand followed his investment. The economy was production-orientated. In today's welfare states, investment responds to rising demand following expansionary government policies: investment is cautious and non-speculative. The economy is consumption-oriented. In the 19th century, innovational investment, like the railways, lowered prices and created new buyers' markets, not only at home but abroad, and so helped the balance of payments. Today's entrepreneur shrinks from investment in innovations, which risk labour unrest from redundancy or restrictive practices. He prefers to play safe by merely increasing capacity in response to demand. Consumers, investors, and the government make rising demands on national product. Sellers' markets predominate. The incentives of capital and labour are blurred because rewards and penalties are not tied directly to economic performance. Expanded consumption rises as fast as output. Bang goes the balance of payments. Up goes bank rate to restrict demand and damp enterprise.

Of all the factors which caused growth in the 19th century—including industrialisation, education, free trade, capital accumulation, population growth—Cairncross goes so far as to assert that the only major one operative today is technical progress. Germany's postwar growth was launched by "profiteers" seizing every opportunity for technical change, which pushed exports out along with high rates of investment. Slow growth and balance of payment difficulties in the U.S.A. and the U.K. originate in protecting too many existing jobs, in postponing technical change, in too great reliance on domestic investment and on artificially stimulated domestic demand. At the moment, it looks as though Germany may be headed in the same direction. Erhard proposes but welfarism disposes.

The moral that seems to emerge from these authorities is that growth is fastest in an enterprising production-orientated economy, subject to rapid technological changes, fast rising productivity, and "excessive" dividends. Any comment from New Delhi's planners?

amazing LIQUID... makes **CONCRETE**
DUST-PROOF, WATERPROOF and
PERMANENTLY HARD

LILLINGTONS
hardcrete

Lillingtons **HARDCRETE**, exhaustively tested and used by builders throughout the world, has revolutionised construction technique by its unparalleled superiority over conventional waterproofing and hardening materials. Lillingtons Hardcrete Liquid ensures even penetration and effectiveness throughout the concrete. Setting time can be varied as required.

HARDCRETE

- Waterproofs.
- Gives permanent hardness.
- Dust-proofs—protects men and machinery against harmful dust.
- Increases crushing strength of concrete by 33 1/3%.
- Resists penetration of oils and chemicals.
- Sets to required time.

Available in 25 and 50 litre drums.

Readers' Roundtable

KAMARAJ PLAN

Sir, — The "Kamaraj Plan" of ministers taking up party work and its first instalment of implementation has created considerable interest. But it is doubtful whether the Plan would serve its objective.

The Plan overlooks the fact that the party has fallen considerably in public grace because of Governmental policies and action. A Government which can maintain a stable price level by giving up ideological planning in favour of realistic planning; ensure supply of adequate foodgrains and consumer goods at reasonable prices; provide a simple and fair administration which touches the life of the people at as few points as possible; disband monopolistic organisations like IAC and LIC which provide indifferent service to consumers; stop the growth of a wasteful and inefficient Public Sector; and create preconditions for steadily enlarging economic opportunities can command the support of the bulk of the people.

LIC FILMS

Sir,—I have just read in "Eastern Economist" of August 16 (p. 317) an interesting review of the special show of films held at the Rashtrapati Bhavan. I was glad that "The Moving Finger Writes" took note of this show.

It will interest you to know that all except four films have already been shown in over 5,000 theatres, through nearly 250 Mobile Vans—some belonging to the LIC and others to the Central and State Governments — as well as through a number of projection Units of the Corporation. Our programme envisages release of two to three shorts every year.

Your comments regarding the rural film are also interesting especially as this particular film has special background. It is not meant for theatre release and is to be shown only to the rural audiences under what is known as the "Integrated Publicity Programme" which enables the rural audiences to be reached through mobile vans of different authorities. In the rural areas, people like the story to unfold gradually. In fact, in small country theatres longer Indian feature films attract better audience than shorter ones and as there is hardly any consciousness about life insurance, we have taken to this technique which may not and need not appeal to the urban audiences.

We have been in touch with the manner in which commercial enterprises are doing their work and you may be surprised to learn that this particular film is having very favourable comments from these enterprises especially as it has background for rural approach which they have not tried. In fact, I am planning another documentary of the same length dealing with the use of child labour and lack of education particularly in the rural areas linking up with the harvest festivals of Pongal, Onam, Makara Sankranti etc. in the South.

I agree that a point has to be made pointedly but as we deal with different aspects you would have noticed that our approach varies and we cannot sell the idea of life insurance to these audiences by making a film star appear on the screen for a few minutes. I am sure, in view of the trouble you have taken to view the films and as your review is highly appreciated, this background will also give an idea as to why

we go in for different kinds of approaches. In publicity and promotional work, there can never be a single approach.

PAPER PLANT

Sir,—I would like to draw your kind attention to the matter appearing on page 361 (lines 13 and 14, right hand side column) of "Eastern Economist", dated August 23, 1963. The matter relating to Greater Mysore Rayon Grade Pulp and Paper Mills Ltd., has been erroneously reported by your special correspondent.

No doubt your interpretation will depend on the connotation you attach to the word "progress". The company, as I see it from my angle and could authoritatively testify to it, is making remarkable progress; more than what you could normally expect of rising concerns, especially in the difficult context of the emergency.

COMPANY MEETING

THE MYSORE PAPER MILLS, LIMITED

Bangalore-9

Speech delivered by Sri M. D. SHIVANANJAPPA, I.A.S., Chairman and Managing Director, The Mysore Paper Mills, Limited, at the Twenty-eighth Ordinary General Meeting of the Company held at Bangalore on Thursday the 5th September, 1963.

Ladies and Gentlemen,

I consider it a privilege and a pleasure to welcome you to the 28th Annual General Meeting of the Shareholders and to present the Report of the Directors and Accounts for the year ended 31st March, 1963, along with the Report of the Auditors of the Company thereon. These have been circulated already and have been with you for sometime and with your permission, I shall take them as read and proceed to refer to a few salient features of the year's operations.

It is a matter of great satisfaction for me to report that there has been an all round progress during the year under review; production of paper has increased by 212 tonnes over the previous year and the turnover has shown an increase by Rs. 3.69 lakhs over last year. Though the production and sales of paper and turnover have been slightly higher, yet the profits are slightly lower than the previous year and this is accounted for by higher working expenses. It has been reported to you previously that the Government of India had referred the question of paper prices to the Tariff Commission as early as 1958 and the Tariff Commission after elaborate investigation fixed prices which the Government of India accepted and announced in 1960. Prices recommended by the Tariff Commission and accepted by the Government of India were disappointing. The representatives of the Paper Industry made repeated representations to the Government of India for a suitable increase and it was only in June 1962 that the Government of India sanctioned a small increase. As stated in your Directors' Report, this increase is much too inadequate when compared with the increase in prices of raw materials, chemicals, coal and labour costs. Besides these increases, the emergency created by the Chinese invasion of our land has brought in new Legislative measures which have further added to our costs. The Paper Industry has taken up again the question of revision of prices with the Government of India and I am not without hope that the Government of India will not only afford immediate relief but also will see their way to set up suitable machinery to revise prices promptly at least to absorb such increases in costs over which the Industry has no control. In this context, it should be noted that under the third five-year Plan, the target of 8,20,000 tons is planned to be achieved by expanding the capacity of the existing Mills and by starting New Mills, large and small. I have no hesitation to say that it is only a price policy which would ensure a reasonable and fair return on capital that would act as an incentive for expeditious implementation of expansion scheme of the existing units and for starting new units. It is also to be remembered in this context, that India is still low down in the list of paper producing and consuming countries with low per capita consumption and nothing should be done to retard the growth of this Industry, so vital to the Nation.

Turning to the Balance Sheet, I have to say that depreciation on fixed assets calculated in accordance with the rates allowed for normal depreciation and extra shift allowance as per Income Tax Act amounting to Rs. 6,03,908 has been provided. A sum of Rs. 22,800 has been provided towards Deve-

lopment Rebate in accordance with the Finance Act. Provision of Rs. 6 lakhs has been made to meet the tax liability. Luckily, we do not attract Super Profit Tax because of large increase of equity capital by the recent Rights Issue and reserves built over the years.

Your Directors have considered it appropriate to transfer the following Reserves to the General Reserve:

Reserve for fluctuation in the value of Stores and Raw materials	Rs. 1,00,000
Rehabilitation Reserve	5,50,000

and have also decided to appropriate Rs. 4,50,000 available in provision for repairs and replacements which is no longer required to General Reserve Account, thus bringing the General Reserve to Rs. 36 lakhs.

In regard to distributable profits, as indicated in your Directors' Report, the net Profit for the year together with the balance of carry forward of Rs. 38,113 and Rs. 37,500 proposed to be drawn from Dividend Equalisation Reserve will amount to Rs. 6,90,100 which your Directors have proposed to appropriate as follows:

(i) To declare a dividend of 12 per cent subject to tax or at the rate of Rs. 1.20 (taxable) per Share of Rs. 10 fully paid absorbing	Rs. 3,00,000
(ii) To declare a dividend of 12 per cent subject to tax on partly paid Shares for proportionate period absorbing about	Rs. 3,75,000
(iii) To carry forward	Rs. 6,75,000
	Rs. 15,100

In making these proposals for distribution of surplus, your Directors have followed the sound policy of conserving Company's resources for development consistent with the interest of Shareholders and it is this consideration that weighed with your Directors to recommend declaration of 12 per cent dividend subject to tax absorbing Rs. 6.75 lakhs as against Rs. 5.5 lakhs last year, and I hope you will agree to this. I am glad to inform you that the Industrial Finance Corporation of India have communicated their approval to our declaration of 12 per cent dividend subject to tax in terms of the Agreement said before regarding mounting production costs on the one hand over which we have no control and controlled prices of finished products on the other, you will consider the working results of the year quite satisfactory and I should like to point out that the pleasing results now presented are mainly due to continued vigilance and prudence exercised by the Management in all directions.

I am happy to inform you that the Labour-Management relations continue to be cordial. The Five-Year Industrial Peace Agreement concluded between the Management and

labour in May 1958 expired in May 1963. All reasonable demands of Labour are sympathetically considered by your Directors. Your Directors have sanctioned financial relief involving an annual expenditure of Rs. 3 lakhs to staff and labour. Further bonus of three months' salary or wages and one more month's salary or wages as ex-gratia for having reached the highest production, have been sanctioned and disbursed to all our employees. It will be of interest for you to hear that a good number of our employees have become Shareholders of the Company by acquiring new Shares, thus identifying themselves with the interests of the Concern.

You will naturally expect me to say a word or two on the progress made in the implementation of the Scheme of expansion since we met last. I informed you last year about this time that arrangements had been completed to secure the complete range of equipments necessary to step up production to 18,000 tonnes and contracts concluded with the Suppliers of Plant and Machinery in Germany and United Kingdom. Messrs. J. M. Voith of Germany in execution of the Contract for supply of Pulp Plant have despatched practically the entire equipment and a portion thereof has already reached the factory site. Messrs. Escherwyss of Ravensburg, Germany and Messrs. Millspaugh of Sheffield, England, with whom orders have been placed for Paper Machine, Stock and Chemical Preparation Plant and other Paper Machine equipments respectively have despatched the entire set of equipments and 50 per cent have been received at the Factory and the balance is expected to reach Madras Port shortly. Likewise, Messrs. Masson Scott and Co., with whom orders have been placed for the Duplex Super Cutter, have arranged for the despatch and the shipment is expected early. Boiler and Steam Distribution equipments and also the Black Liquor Recovery Unit ordered with Messrs. Babcock and Wilcox have all been received at the Factory site. I am glad to inform you that the erection of the Boiler has already been taken up and the erection of Pulp Plant and Paper Plant is expected to be taken up sometime in October-November this year.

On the side of the development Finance, you had been told that all agreements and arrangements with the three Lending Institutions, The Commonwealth Development Finance Co., Ltd., London, the Industrial Credit and Investment Corporation of India, Bombay, and the Industrial Finance Corporation of India, New Delhi had been completed. We have drawn £5,25,000 (sterling) from the Commonwealth Development Finance Company Limited, and Rs. 55,00,000 (in foreign currencies) from the Industrial Credit and Investment Corporation of India to pay for foreign purchases and Rs. 35,00,000 from the Industrial Finance Corporation of India for purposes of indigenous purchases and local expenditure.

I would like to avail myself of this opportunity to thank you, the members present here and other members who are not present here today not only for the satisfactory response made in subscribing to the Rights Issues and payment of calls, but also for the continued support you have been extending to me all along.

Necessary funds have been secured for the expansion scheme. Thanks to our Suppliers, good progress has been made in the acquisition of equipments from abroad. The Civil Engineering Works at the Factory site have made satisfactory progress. Unless there be any unforeseen or insurmountable difficulties, I expect the New Plant to go into production before we meet next and to be able to present you with the Complimentary Letter Pads containing samples of paper turned out of our new Paper Machine.

Your Directors have contributed a sum of Rs. 25,000 to

the National Defence Fund, and I trust you will appreciate and accord approval to the same.

A Special Resolution to amend Article 96 of our Articles of Association is being placed before you suggesting an increase in the Sitting Fee to your Directors. For reasons stated in the Explanatory Note, annexed to the Notice convening this Meeting, I hope the proposal would meet with your whole-hearted approval, and with your permission, I shall seek the approval of the Central Government to this enhancement of Sitting Fee and consequent amendment in due course.

On behalf of the Company, it is my pleasant duty to express my thanks to the authorities of the Commonwealth Development Finance Company Ltd., London, the Industrial Credit and Investment Corporation of India, Bombay and the Industrial Finance Corporation of India, New Delhi, State Bank of Mysore, State Bank of India, and the Canara Banking Corporation Ltd., for their support and assistance in the implementation of the Development Plans.

I would also like to express on behalf of the Directors and Shareholders, our grateful thanks to the Central and State Governments for the continued interest they are evincing in the progress of the Mills.

I am very grateful to my colleagues on the Board for their whole-hearted support and valuable guidance.

I wish also to express on behalf of the Directors and my own warm appreciation of the willing and efficient co-operation of all our employees.

Ladies and Gentlemen, with these observations, I now move that the Directors' Report and Audited Balance Sheet and Profit and Loss Account for the year ended 31-3-1963 be "APPROVED AND ADOPTED".

Note: This does not purport to be a Report of the proceedings of the Shareholders' Meeting, a copy of which will be sent to the Shareholders separately.

Individual well-being is linked with national prosperity and only planned efforts can ensure both in the shortest possible time. And planning, for its success, largely depends on savings, individual as well as national.

Saving in the form of Bank Deposits provides resources for the National Plan.

RECORDS AND STATISTICS

Recommendations of Agricultural Team

A NUMBER of Central Teams on Agricultural Production Programmes comprising the representatives of the Ministries of Food and Agriculture, Community Development and Co-operation and the Planning Commission visited the States between 15th April and 10th June, 1963 and have submitted their Reports. The purpose of these visits by Central Teams was not so much to find out the shortfalls in specific areas but to locate the main bottlenecks and organisational deficiencies retarding agricultural progress and suggest lines along which the programmes for 1963-64 should be undertaken. The Reports submitted by the Central Teams call for specific action both by the Government of India and the individual State Governments. The Planning Commission have already considered the recommendations regarding foreign exchange allocation, adequate supply of scarce key materials, such as, iron and steel, cement, etc. and additional financial outlays for accelerating the programmes of agricultural production, minor irrigation and soil conservation, and have made the following recommendations to the concerned Ministries for further action:

Foreign Exchange

- (i) **Fertilisers:** Foreign exchange amounting to Rs. 35 crores should be made available for the import of nitrogenous fertilisers during 1964-65 (October-September). Also, care would be taken to see that the requirement of potassic fertilisers would be met in full.
- (ii) **Minor Irrigation:** Essential requirements amounting to Rs. 1.8 crores for the import of boring equipment should be met.
- (iii) **Plant Protection:** Requirements of the order of Rs. 3 crores for pesticides should be met in full through the Ministry of Commerce and Industry. Also, a sum of Rs. 30 lakhs for plant protection equipment might be provided during the current year.

Scarce Key Materials

- (i) The State Governments would be requested by the Ministry of Food and Agriculture to work out the requirements of cement and unrelaxed categories of iron and steel on the basis of the Plan targets and financial provisions and earmark a specific quota for meeting these requirements;
- (ii) The requirements of agricultural programmes would be given an absolute priority over the requirements for others and if there was any cut or shortfall in the State quota, it should not affect agricultural programmes;
- (iii) An additional allocation of 10,000 tons of B.P. sheets would be placed at the disposal of the Ministry of Food and Agriculture by the Department of Heavy Industries during the current year; and
- (iv) The possibility of allocating an additional quota of 6,000 tons of G.P. sheets and 2,000 tons of G.C. sheets would be examined by the Department of Heavy Industries.

Additional Outlays

The Central Teams have recommended an additional outlay of Rs. 18.65 crores — Rs. 14 crores for minor irrigation, Rs. 2.89 crores for agricultural production and Rs. 1.76 crores for soil conservation. It was agreed in the meeting of the Planning Commission held on July 19, 1963 that the position should be

reviewed State-wise in the light of the assessment of the resources position of each State. Final decision on this subject is likely to be taken very shortly. Necessary instructions for earmarking of Central assistance for agricultural programmes are also under consideration and likely to issue shortly.

The observations and recommendations made by the Teams in respect of each State have been forwarded to the State Governments with a request that these may be processed quickly and given effect to. The important recommendations on the major agricultural programmes are as follows:

(i) **Minor Irrigation:** The implementation of programmes concerning power pumps, well-sinking, distribution of pump sets, deep-boring of wells, installation of 'rahats' and construction of tubewells on co-operative basis as suitable to different States should be accelerated. Energisation of tubewells in Bihar, Gujarat, Orissa and West Bengal should be done expeditiously. Old tanks in Andhra Pradesh, Madras, Orissa and West Bengal should be restored on a priority basis. Larger allocation of finance as also of key materials like cement, and provision of electric power for irrigation should be made by the State Governments.

(ii) **Soil Conservation:** Facilities for training of soil conservation personnel in Andhra Pradesh, Madras, Kerala and Jammu & Kashmir should be expanded. Need for enactment of soil conservation legislation in Bihar and of consolidated soil conservation act in Andhra Pradesh has been stressed. Contour bunding with the help of bullock power should be done in Madhya Pradesh. Requisite organisation for soil conservation work should be built up in Kerala. Soil conservation programme should not be left to Panchayats and staff in Madras.

(iii) **Fertilisers:** Any existing restrictions on the consumption and sale of fertiliser in Andhra Pradesh and Mysore should be withdrawn. More depots should be opened for supply of fertilisers in Bihar, Madhya Pradesh, Mysore, Rajasthan, West Bengal and Jammu and Kashmir. Additional credit facilities should be made available in the States of Andhra Pradesh, Kerala and Orissa and the rate of interest charged to co-operatives lowered in Punjab. The off-season rebate of Rs. 2.5 per ton per month on fertilisers stocked in the non-manuring season allowed by the Central Government should be passed to the distributing agencies as an incentive for purchase and stocking of fertiliser in advance.

(iv) **Improved Seeds:** Speedy action should be taken by States for ensuring adequate production of foundation seeds, set up and, if necessary, by opening additional farms targeted to be established under the third Plan. Improved agricultural practices should be adopted on the Seed Farms set up by the State Governments. Incentives might be given to efficient farm managers and other workers. Good quality land may be selected for future expansion of farms. Improvements have been suggested in the administrative and technical structure as also the distribution arrangements for improved seeds.

(v) **Rural compost and green manures:** The progress so far made in green-manuring in the States of Mysore, Bihar and Orissa might be assessed through sample surveys. Green-manuring crops may be exempted from the payment of water charges in Telangana region in Andhra Pradesh.

Programmes of selling seed packets and mixing green-manure seeds with all dry crops for raising seeds may be undertaken in Andhra Pradesh, Madras and Assam. Organic

manure prepared by composting the loppings of perennial plants should be used on dry lands in Punjab, Madras and Andhra Pradesh. Subsidy may be given by the Government of Gujarat for construction of pucca floors in cattle sheds.

(vi) **Plant Protection:** Effective campaigns should be undertaken to popularise plant protection measures. The existing pest acts in Kerala, Madras, Punjab and Andhra Pradesh should be amended. Plant protection organisation in Orissa, Madhya Pradesh and Gujarat should be strengthened. Plan allocation for plant protection in Maharashtra, Madhya Pradesh and Uttar Pradesh should be increased.

(vii) **Improved agricultural practices:** The quality of fertiliser demonstrations should be improved in Mysore, West Bengal and Maharashtra. More field demonstrations may be conducted with fertilisers like urea and calcium ammonium nitrate in Kerala and Jammu and Kashmir. The results of fertiliser demonstrations should be widely publicised among the cultivators in various States. Greater attention to construction of field channels, ridging of fields, marketing and processing be given with a view to extending areas under double-cropping.

(viii) **Improved agricultural implements:** Demonstrations of improved implements, provision of free implements to cultivators, hire purchase arrangements for sale, repairs and even manufacture and trial in the popularisation of improved types of implements are some of the recommendations.

(ix) **Administrative arrangements for co-ordination:** Co-ordinating machinery which has been recently created at the

Canadian Economy in 1962

THE CANADIAN economy experienced a good year in 1962, measured in terms of output. Gross National Product increased eight per cent in value and six per cent in physical volume, and real output per person rose significantly for the first time since 1956. Most of the increase in volume of production occurred in the first half of the year and price increases were stronger in the latter part of the year due in part to the depreciation of the Canadian dollar. The rise in activity was well diffused in terms of geographic location and variety of employment, and a very good wheat crop provided additional strength in the fall of the year.

The major stimulus in 1962 came from two sources, a very substantial rise in merchandise exports for the second year in a row and a large increase in purchases of goods and services by the provincial and municipal governments. At mid-year the strain of the foreign exchange crisis reached a peak and there was a levelling-out in consumer expenditures which, in turn, created some uneasiness regarding the business outlook. By the fourth quarter, however, personal expenditures were again rising strongly, particularly outlays for automobiles and household appliances. Private investment for plant and equipment appeared to be on a modest rising trend after declining briefly in the early part of the year and the favourable balance in foreign merchandise trade was showing an impressive increase. At the same time, business inventories were sharply reduced following the rapid build-up during the summer months. In the fourth quarter of 1962, the Gross National Product reached the new record of \$41.2 billion, seasonally adjusted annual rate. This was a rise of seven per cent over the fourth quarter of 1961, calculated at market prices.

While the production records established in 1962 were impressive, the functioning of the economy was not as satisfactory in other important respects. In the government sector, a very considerable volume of deficit financing was required to cover expenditures. It has been estimated that outlays for goods and services by all levels of government exceeded revenue by some \$770 million in the calendar year 1962. More

Cabinet and Secretariat levels should function more effectively. District Agricultural Officers should be vested with larger authority and powers and should be able to get the programmes of agricultural development effectively implemented through the agency of Block Development Officers. The Extension Officer for Agriculture, Animal Husbandry, Co-operation, Panchayati Raj and other Departments allied to Agriculture should be under the respective District Agricultural Officers and control on them might be exercised by the latter through the Block Development Officers. The Village Level Workers should work under the Extension Officers of Agriculture and allied departments.

(x) **Cotton Development:** Package schemes for cotton in Madras and Punjab may be expanded. Some of the waste lands in Kerala may be reclaimed for growing sea-island cotton. Cultivation of cotton should be encouraged in newly irrigated areas in Punjab. The Rajasthan Government may examine the question of preparing a definite programme under the Bhakra Irrigation System. In Gujarat suitable areas should be listed out and detailed plans prepared for the intensification of cotton programmes.

(xi) **Oilseed Development:** The good results obtained in package programme in South Arcot District should be widely publicised. Groundnut production might be taken up in selected areas of Orissa. Detailed plans should be drawn for intensification of oilseeds programme in Gujarat. Larger number of package units for intensification of oilseeds production might be taken up in Maharashtra. Extensive use of superphosphate should be made in Maharashtra and Kerala.

recently, the Federal Government has reported that the Federal budgetary deficit was \$709 million in the fiscal year ended March 31, 1963.

The increase in employment was not as strong as the increase in the tempo of economic activity. The seasonally adjusted rate of unemployment as a percentage of the labour force, as measured by the sampling method of the Labour Force Survey, was six per cent in January 1962; it declined to 5.6 per cent in May and increased again to six per cent by December 1962. It should be noted, however, that the estimates of unemployment are based on a sample survey of households. Hence the results do not precisely measure the level of unemployment. In addition, the estimates as now constructed include as "unemployed", persons who are on temporary lay-off up to thirty days and who, therefore, may not be seeking employment.

In international transactions, the current account deficit in 1962 was approximately \$850 million. This was an improvement compared with the record of the six preceding years but the financing of the balance of payments deficit was still a heavy commitment for Canada and, of necessity, an important consideration in the formulation of economic policy. The improvement in the balance on merchandise trade, which resulted in a surplus of over \$150 million for the second year in a row, and the marked improvement in the tourist account were developments achieved in part as the result of the measures taken by the Government at mid-year to shore-up the foreign exchange reserves which had been subjected to very strong downward pressures. At that time, import surcharges ranging from 5 to 15 per cent were levied on a wide range of items which made up approximately two-thirds of Canada's imports. In addition, tax-free import allowances for Canadians returning from other countries were sharply reduced. Earlier, on May 2, the Canadian dollar had been fixed at the exchange rate of 92.5 U.S. cents bringing to an end the long period of a floating exchange rate and the decline in the value of the Canadian dollar which amounted to 12 per cent from its peak rate 31 months earlier.

Beyond Bokaro

THE ISSUE of US Government assistance to the Bokaro steel project has been allowed over a period to assume a significance which it does not really have. From this point of view, the statement made by Mr. C. Subramaniam, Minister for Steel and Heavy Industries, last week in Parliament had been drafted very well indeed, since it ought to help in restoring perspective. The Bokaro project is no doubt a major programme of development considering the investment that would be called for and the contribution that the plant should make to the industrialisation of the nation. But, at the same time, the question of US Government aid for this project cannot be permitted to become an obsession with us. As Mr. Subramaniam's statement points out, the President of the United States had fully backed this country's application for assistance. American public opinion, as reflected in the Congress, has however resisted this proposal. This apart, the question of American aid for Bokaro has to be viewed in the larger context of the vast assistance which that country has been providing for our development programmes over a long period of years. The Minister did well in emphasizing this aspect; he pointed out that, during the period 1959-63, the US has given us a total of nearly \$1.80 billion in assistance, both for the public and private sector projects. In the circumstances, when the Prime Minister recently wrote to the President of the United States offering to withdraw the Bokaro project from the list of schemes for which US assistance was being sought, he was clearly making a friendly gesture showing deep understanding of the generous co-operation with and basic support of this country's programmes of economic development which successive US Congresses and Administrations have been showing in the last 16 years.

Opposition in the US Congress to aid for Bokaro has been developing for a period and its recent decision to include in its foreign aid legislation a clause which, unless it undergoes further change, would shut out Bokaro for a year, cannot therefore have come as a surprise to any one in this country. Nevertheless, as supplementaries put to Mr. Subramaniam show, there seems to be a great deal of speculation regarding the 'whys' and 'wherefores' of the attitude adopted by the US Congress towards the Bokaro project. We, therefore, reproduce here extracts from an article in the issue dated September 9 of the *US News and World Report*, which seems to us to sum up frankly the workings of the US Congressional mind on the subject.

This article, which is captioned "Why Foreign Aid is in Trouble?", suggests that a mood is growing in the US Congress to bring foreign aid under control by cutting outlays and placing limits on dubious projects so that the burden on the American taxpayers may be eased. After referring to the main recommendations of the Clay Committee's report, the *US News and World Report* remarks that, looking around the world, more and more Congressmen are insisting that foreign aid has to be handled in hard-boiled terms as an investment and that many of them fail to see where the return justifies the continuance of foreign aid in past terms and in past volume. Proceeding, the article refers to this country and in particular to the Bokaro request for assistance and says:

"India offered an example that received much attention in Congress.

"Indian officials asked the US Government for help in building a big

new steel mill. Needed was a US commitment for about one billion dollars in loans.

"The mill was to be owned and operated by the Indian Government. Congress objected to that.

"Also a study revealed that ore to be processed would be low grade, coking coal would be inadequate, limestone and ore would involve a long haul, power would be short, and so would be trained personnel. Similar difficulties, it was pointed out, were causing all kinds of shortages and breakdowns in other steel mills built for India by foreigners. And the point was made that the Russian-built mill required only a loan of 136 million dollars from the Soviet Union, repayable in 12 years.

"These points, in themselves, raised a question in the minds of Congressmen of whether Americans should pour their hard-earned money into a project supposed to offset the showpiece value of the mill built by the Russians.

"Beyond the question of the steel mill, itself, was the feeling of many in Congress that the US is getting somewhat less out of its over-all aid to India than had been hoped for.

"Economically that country has made small gains, with the help of imported food, machinery and technical aid from America. Over the years, US aid to India has come to 3.5 billion dollars. Without that aid, it is widely agreed, India's population growth of seven to eight million people a year would have brought disaster. In last year's 'border war' between India and Red China, it was America that came to India's aid and is now bolstering its defences. That help stirred much resentment in neighbouring Pakistan—until then a firm ally of the US.

"Yet India continues to follow a 'neutralist' policy in foreign affairs. Suspicion of the US continues strong. Government planners who set India's economic course are building up costly State-owned industries at the expense of agriculture, power and transport."

It is possible that some of these observations may not make pleasant reading for many of us and it is indeed likely that the blocking by the US Congress of assistance to Bokaro may be attempted to be exploited in certain quarters in this country for creating feelings of disappointment and distress over Indo-American economic co-operation and friendly relations. While Mr. Subramaniam's statement should serve considerably to counter such propaganda, it is desirable to point out that prospects of financial and technical assistance from US sources for another steel mill in India have by no means been wiped out completely or finally. Apart from the possibility of US Congressional attitudes getting modified by about this time next year, it is obvious that, if this Government's intention is, as has

been stated by Mr. Subramaniam, to proceed with Bokaro project on the basis of global tenders and credits, there is scope obviously for American participation in some form or the other, at some stage or the other, to a greater or less extent in the construction of the plant. For one thing, since the Bokaro plant is planned to be a sophisticated unit producing flat products on a highly mechanized basis, it should be advantageous to get the American plant manufacturers to provide some of the more complex equipment such as, for instance, the rolling mills. We hope that the Minister for Steel and Heavy Industries is keeping this possibility in view and that intelligent thought is being given to the possibilities of American participation of this nature, if necessary, on the basis of private credits from American firms manufacturing or constructing steel plants.

Indeed, a more clear picture than has been provided in Mr. Subramaniam's statement of the real state of the Government's thinking on the subject of the Bokaro steel project seems to be called for. The Minister seems to have exaggerated the state of the Government's preparedness in respect of schemes alternative to the construction of the plant with US Government aid. He says that the Government in fact has been taking all the steps necessary for the project, short of placing orders for the equipment. This is like saying that the marriage has been arranged — only a groom is to be found. It should be understood very clearly that the

"Now, isn't silence golden?"

next big step in steel expansion will be a very difficult and complicated venture. Apart from the fact that there is already a current problem of considerably expanding, in fact roughly doubling, the capacities of the three plants already existing in the public sector, there has been much loose talk on behalf of the Government, to which Mr. Subramaniam himself has been contributing substantially, of a whole series of new State steel plants being started all over the country, in the north, the east, the south and the west. Simultaneously, there is also much brave talk of all these plants, particularly Bokaro, being built with local designing and constructional skills and local equipment to a great extent.

It is high time that the Government's mind on steel matters had been brought under some discipline. Mr. Subramaniam says that one of the reasons for deciding to explore sources other than the US Government for assistance to the Bokaro project is that the Government of India is keen on avoiding delay. We may tell him with reasonable conviction that any exaggerated reliance on the problematical availabilities of specialized engineering talent or steel plant equipment from domestic sources is bound not only to delay the construction of the plant but also create serious problems in such vital matters as the quality of the plant when finally constructed, proper co-ordination of the working of its constituent sections and the productivity of the pro-

ject as a whole. Already faith is evidently being placed to a greater degree than may be justified in the adequacy of domestic technical counselling. It would be a grievous mistake indeed if more realism and responsibility are not shown in thinking out the next stage in our steel development programme at this critical stage in its evolution.

Currently, there is some debate over the fourth Plan targets. While it is possible, as a recent study of the National Council of Applied Economic Research and other authoritative sources have indicated, that our estimated requirements of steel products may demand that the output of the domestic steel industry should be raised to 18 million tonnes of ingots in another seven years, we have also to ask ourselves very earnestly whether, considering the resources that may be available for steel development, it would not be both honest and prudent to fix our targets at a somewhat lower level. Mr. J. R. D. Tata and perhaps others seem to be of the view that a target of 15 million tonnes may be all that can be realised in practice by 1970-71. It would no doubt be an achievement if more ambitious planners could prove him wrong in the event, but it must certainly be said that an efficient steel development programme is not likely to be forthcoming so long as the complexity and the immensity of the task are not properly evaluated in time.

Detention During Emergency

THE CONFLICT of judicial pronouncements between different High Courts on the question of the validity of the detention of a citizen under the Defence of India Rules was set at rest by the judgment of the Supreme Court delivered recently in the appeals preferred by 26 detenus—nine from Punjab and 17 from Maharashtra—against the decisions of the Punjab and Bombay High Courts. This conflict arose out of the diametrically opposite rulings given by the Allahabad High Court on the one hand and the Bombay and Punjab High Courts on the other. In the appeals made to it by four detenus, the Allahabad High Court ordered their release on the ground that their detentions were invalid for various reasons and the detenus were competent to move the High Court under Section 491 (1) (b) of the Criminal Procedure Code. The Bombay and Punjab High Courts ruled that the detenus were incompetent to seek redress under Section 491 (1) (b) of the Cr.P.C. and they had indisputably no remedy available under the Constitution in view of the application of the provisions contained in Article 359. In dismissing the 26 appeals from Punjab and Maharashtra, the Supreme Court gave the final ruling that the order of detention issued by an Executive Government under the D.I.R. was not justiciable.

The contention raised by the applicants in the

Supreme Court was specifically based on the right of a detenu to move the High Court for redress against the infringement of his Fundamental Rights conferred by Part III of the Constitution. They contended that Sections 3 and 40 of the D.I.R. Act and Rule 30 under which they were detained were constitutionally invalid and, as such, could not be sustained. In rejecting this contention, the two High Courts gave the pronouncement that the President's order placing the Fundamental Rights under suspension under Article 359 of the Constitution created a bar against any legal remedy for the detenus and precluded them from moving the High Court under Section 491 (1) (b) of Cr.P.C. Article 359 deals with the situation of emergency and stipulates that when a Proclamation of Emergency issued by the President is in operation, the President may issue an order declaring the suspension of the right to move any court for the enforcement of all or certain specified rights conferred under Part III of the Constitution. The suspension of the remedy for the enforcement of the Fundamental Rights is to remain in operation during the duration of the Proclamation of Emergency or for a shorter period if so declared by him.

The reference to moving any court for the enforcement of the Fundamental Rights covers the two remedies with which a citizen is armed to seek redress.

Article 226 enables a citizen to move the High Court and under Article 32 he can move the Supreme Court to seek redress against the violation of any of his Fundamental Rights. These remedies, no doubt, constitute the supreme guarantee of the citizen's rights under Part III of the Constitution. But they can be held in abeyance during the duration of Emergency — a course which involves no violation of the Rule of Law on the universally accepted principle that such guarantees can be put out of operation in an emergency situation created by external aggression or, internally, by civil war. Article 359 of the Constitution empowers the President to put a blanket ban on the remedies to seek enforcement of Fundamental Rights. Its language is completely free from ambiguity and, therefore, its meaning and interpretation are quite plain and they do not admit of any multiplicity of interpretations. In plain terms, the rights are put under suspension and the remedy too is taken away during the duration of the Proclamation.

Nevertheless, the contention was raised on behalf of the detenus in the High Courts to assert their right under Section 491 (1) (b) of the Cr.P.C. to obtain a writ in the nature of *habeas corpus*. The Allahabad High Court accepted the plea of the four applicants, issued the writs of *habeas corpus* and set the detenus at liberty. The Bombay and Punjab High Courts, however, held the contrary view and ruled that the remedy normally open under Section 491 of the Cr.P.C. was also not available during the duration of the Proclamation of the Emergency. Which of the two views was correct? And can the position be maintained that the powers of suspension of the remedy to enforce Fundamental Rights, exercised by the President under Article 359, may be bypassed by invoking the remedy under Section 491 Cr.P.C.? In effect, can the contention be successfully made that Article 359 may be reduced virtually to an inoperative provision?

The majority of the six Judges of the Supreme Court held that Section 491 of the Cr.P.C. cannot be invoked by a detenu. But the remaining Judge on the Bench gave a dissenting judgment in which he expressed his disagreement with the view that the power of the High Court to issue a writ of *habeas corpus* under the Cr.P.C. was also held in abeyance. In fact, the real issue to be decided in the appeal to the Supreme Court boiled down to the determination of the question as to how far the bar created by the President's order issued under Article 359 operated also in regard to an application by a detenu under Section 491 of the Cr.P.C.

Mr. Justice Gajendragadkar, who delivered the judgment of the majority, dealt exhaustively with the full scope and effect of the President's order issued under Article 359. The most vital part of the judgment relates to the effect of the order on the remedy under the Cr.P.C. In view of the fact that the sus-

pension of the Fundamental Rights through suspension of the remedy for their enforcement as contained in Article 359 was beyond dispute, the majority judges approached the problem from the positive angle of determining the "substance" of the contention raised rather than the "form" in which the proceedings were moved. This was essential for making a decision whether the proceedings under the Cr.P.C. fell within the ambit of the President's order or not. Undoubtedly, Article 359 was comprehensive in its application inasmuch as it provides for a situation of emergency.

In so far as the form of the proceedings was concerned, there were two remedies open to a detenu—one, to move the High Court for the issue of a writ in the nature of *habeas corpus* under Article 226 or to move the Supreme Court for the same purpose under Article 32 and, the other, to move the High Court under Section 491 Cr. P.C. Mr. Justice Gajendragadkar emphatically stated the view of the majority that to keep the second remedy open for seeking redress at the hands of the High Court, while the first remedy was temporarily shut out, would be meaningless. It would be not only meaningless but would amount to a circumvention of Article 359 of the Constitution. In dealing with the question of the scope and full applicability of Article 359, Mr. Justice Gajendragadkar put the majority view succinctly thus: "It is clear that the content of the detenu's right to challenge the legality of his detention which was available to him under Section 491 prior to the Constitution has been enlarged

Eastern Economist 20 Years Ago
SEPTEMBER 17, 1943

Sir Chhotu Ram, Revenue Minister of the Punjab, in a statement says that "the belief that the purchasing power of the cultivator and the worker has seen an undue rise is a mere myth," and deprecates the present craze to "curtail the purchasing power of the masses". When so responsible a person as the Revenue Minister of the Punjab says at least with reference to his province that rural prosperity is at least wd feel bound to reaffirm our view that what is true of the Punjab is 'a fortiori' true of the rest of India. The Punjab, perhaps, is the only province which has been spared the privations of famine and where the peasantry, if not prosperous, is at least not starving; and yet the Government of India are putting through rigorous deflationary measures to tackle the small savers all over India on the basis of alleged rural prosperity. We do not deny that the small cultivators perhaps eat a little more or that the larger landholders are able to extinguish a part of their debts. But the least that the Government should do is to initiate a scientific random sample investigation to ascertain whether their assumption is well-founded. To embark on far-reaching fiscal measures on inadequate data and empirical prejudice is neither good Government nor sound economics.

by the Fundamental Rights guaranteed to the citizens by the Constitution, and so, whenever a detenu relies upon his Fundamental Rights even in support of his petition under Section 491 (1) (b) he is really enforcing the said rights and in that sense, the proceedings inevitably partake of the character of proceedings taken by the detenu for enforcing these rights, that is why the argument that Article 359 (1) and President's order do not apply to the proceedings under Section 491 (1) (b) cannot be sustained."

In the course of the arguments in the case, the point was made on behalf of the detenus that non-justiciability of the order of detention would put unrestrained powers in the hands of the Executive Governments without any check whatsoever on the abuse of their exercise. This, of course, was a political grievance as was explicitly pointed out on behalf of the

Export-Import Outlook

ADDRESSING the joint meeting of the Import Advisory Council and the Export Promotion Advisory Council recently, Mr. Manubhai Shah, Minister of International Trade, struck the right note when he said that we should not be satisfied with increases here and there in exports, but should rather try to tackle the problem on a more fundamental and lasting basis. Nevertheless, recent trends have been encouraging. Exports in 1962-63 which amounted to Rs. 710 crores registered an increase of Rs. 33 crores over the previous year. During the period April - July, 1963 the export earnings amounted to Rs. 240 crores as compared to Rs. 208 crores in the corresponding year of 1962. The increase in exports over the first seven months of the calendar year 1963 at Rs. 427 crores showed a rise of Rs. 56 crores compared to the first seven months of 1962. The Minister pointed out that this increase took place in spite of a buyers' market and continuous decline in commodity prices ranging between 5 to 10 per cent.

A commodity-wise analysis of export data indicates that the improvement witnessed during the period April - July, 1963 was due to gains registered in sugar, jute manufactures, non-essential vegetable oils, oil cakes, raw cotton, coffee, tobacco, leather, tanned or dressed. Sugar and jute manufactures between themselves were responsible for a total increase of Rs. 13.2 crores. Small gains were also registered in gums and resins, engineering goods, iron ores, fruits and vegetables other than cashew, woollen manufactures and fish.

So far as region-wise increase in exports is concerned, it will be noticed that next to America, Asia accounted for a major part of the increase. Exports to Africa during April - June were lower by Rs. one crore. The increase with the EEC countries during this period was only to the tune of Rs. one crore. East European countries, however, accounted for an increase

majority of the judges. Pressure of public opinion against excesses likely to be indulged in by the Executive is a remedy open to the citizens in a democracy and this pressure can be effectively exerted in the legislatures. The duration of the Emergency that has been proclaimed is uncertain, but it is likely to be prolonged in view of the cold war strategy which China has combined with her policy of open aggression. The entire trend of the use of the different powers under the DIR by the Executive Governments does not give cause for much real alarm of excesses and abuses. While the invocation of Article 359 cannot be revoked in the unpredictable outlook during the Emergency, there is certainly effective scope for a tacit understanding that the Executive would be responsive to the genuine grievances of the citizens against hardships or harassment likely to be caused by the suspension of their Fundamental Rights.

of Rs. 5 crores. The following table is illustrative in this connection :

(Value Rs. crores)			
Country	April-June 1962	April-June 1963	Net Increase or Decrease
East European countries (includes USSR)	21.5	26.5	+5.0
West Europe (includes UK)	44.8	50.0	+5.2
Asia	33.2	40.8	+7.6
Africa	10.2	9.3	-0.9
America	35.2	43.7	+8.5
Oceania	6.3	6.7	+0.4
TOTAL	151.2	177.0	25.8

Among East European countries, exports to the USSR were the highest i.e. by Rs. 3.5 crores mainly due to larger purchases of raw jute and jute bags, amounting to nearly Rs. 3 crores. Exports to the USSR were also higher in respect of hides and skins, raw tobacco, tea, castor oil, coffee, pepper and iron ore. Exports were also higher to Czechoslovakia and Yugoslavia by Rs. 2 crores and Rs. 1 crore respectively, but were lower in respect of Hungary and Poland by about Rs. 1 crore each. Our exports to the USSR are to be doubled to Rs. 115 crores per year and this doubling of exports is envisaged in the case of other East European countries as well. It will not do, however, to take these markets for granted. Our cotton textiles, for instance, are meeting with as stiff competition in these areas as elsewhere in world trade. The fact that our trade with Eastern Europe is being channelled through the State Trading Corporation has not been an unmixed blessing since the STC has been doing little by way of market research or for locating new markets in East Europe; by and large it has been content with processing the orders canvassed

by private parties. It is possible that the setting up of an Indo-Soviet Chamber of Trade and similar bodies for other East European countries might usefully enlarge opportunities and facilities for market studies and inter-change of visits and views on business matters.

A study of the direction of India's exports shows that her exports have encountered stiff resistance in Western Europe, excluding the United Kingdom. Although tariff on our tea has been done away with by the EEC countries, large parts of their protectionist citadel remain to be stormed. How far we will be able to annex concessions from these countries remains to be seen. The visits of our delegations which have now become more frequent have not produced results which might be described as fruitful to India. Selling some of the Indian products, particularly engineering goods, in Europe has been a difficult proposition and unless some linking up of our exports and imports is undertaken, as was referred to in the concluding part of the speech of the Minister of International Trade, the unfavourable gap in trade with some of the West European countries is not likely to be bridged. In fact, this link justifies Mr. Shah's move to combine the Advisory Councils into a single body. The logic of Mr. Shah's principles i.e. accent on increased production and productivity, modernization and technological innovation leading to reduction in cost, honesty in trade practices and imaginative sales promotion for exploring markets will, of course, have to be rigorously applied.

As far as the fifth—and admittedly short-term—principle of reduction in domestic consumption is concerned, it is definitely more debatable. Unless an increase in production is brought about, consumption curbs may not be of great help. It goes without saying that more incentives will be needed to sustain the increase in exports. Most of the incentives suggested by the Ramaswami Mudaliar Committee—the revolving fund for export-import stabilization, incentive licences and railway freight concessions, to mention some—await Government's approval and practical application. The need for a second look into the railway freight structure, a fervent plea for which was made by Mr. Bharat Ram, President, Federation of Indian Chambers of Commerce and Industry, at the Import and Export Advisory Council meeting, is no doubt urgent. There is much to be gained from improvements in the industrial apparatus connected with export promotion within the country. It is good that the Mathrani Committee recommendation for the Export Credit and Guarantee Corporation has been accepted by the Government of India. Import licences linked with export performance will need to be made more comprehensive. But a rigorous test of the provision of these or similar incentives will be adherence to quality standards. Parliament has passed an Act for quality control, but its real value will be determined by its relentless enforcement.

Along with export promotion, there is the need for cutting down imports of items of lesser priority, import substitution and increasing the production of goods, raw materials and components which continue to play a larger part in our import bill. It is heartening that a Committee has been appointed in the Planning Commission on "imports and import substitution". It will be the function of this Committee to keep a watch on continuous reduction or deletion of imports of such items which are indigenously produced or which could be substituted by indigenously available materials. During the year 1961-62, imports amounted to Rs. 1,107 crores. They were slightly lower by Rs. 26 crores at Rs. 1,081 crores in 1962-63, but they rose somewhat during the first four months of the financial year 1963-64 at Rs. 365.5 crores. An analysis of the import structure would reveal that while imports of industrial raw materials accounted for 65 per cent of our total imports, capital goods imports were 16 per cent, foodgrains 10.5 per cent and other consumer goods 8.5 per cent.

The shortage of imported raw materials, components and spare parts has been responsible for much of the slow pace of industrial growth in the country in the recent past. Some relief will, therefore, be felt at prospects of relaxation in import policy during the second half of the year. Mr. Manubhai Shah, however, has ruled out possibilities of substantial liberalization. It is gratifying, nevertheless, that even some slight liberalization in imports has been made possible by an increase in exports, expansion of domestic production of many items, whether components or finished goods. Additional help has come through the Aid India Club agreeing to provide more assistance in the form of untied loans.

The average index of industrial production for the first quarter of the calendar year was 156.2 with base 1956 equal to 100. This compares with 147.2 for the corresponding first three months of 1962 and the average of 149.6 for the calendar year as a whole. The rate of growth of industrial production during the first five months of this year was about 7.1 per cent. While an increase in domestic production in many items is to be appreciated, it is not correct to say that there was a steady growth in industrial production all round. Anyway it is a matter of satisfaction that increasing the indigenous content in our manufactured goods is being given considerable importance. The remedy for our ills lies in increased domestic production and for that necessary incentives will have to be provided. There is a close and positive relationship between the export of various commodities and the level of their domestic production; wherever an increase in exports has been recorded, it has come from increased production. So, unless a full-fledged drive is launched to encourage domestic production, attempts to cut down imports or increase exports will only be an exercise in futility.

Engineering, Yoga and Ballroom dancing... Engineer Jagtiani thrives on the combination!

6 a.m. Engineer Jagtiani pores over an engineering text, absorbed with the problems of stress. 7 a.m. Stress again—a particularly difficult yoga exercise! 8 p.m. Jagtiani and his wife execute a flawless reverse turn to a lively foxtrot... Engineer Jagtiani is a man of many parts, but engineering is his first love. 'Nothing to touch it,' he says. He should know. He has been with Burmah-Shell for thirteen years. His job: Divisional Engineer.

ROCK, WATER AND QUICK DECISIONS

Construction and maintenance of service stations, maintenance of oil depots—important links in the distribution system—and advice to customers on their oil storage plans are among Jagtiani's responsibilities. He assists in the planning of service stations, then brings the promise in a blueprint to

life. During construction, problems often arise which require intelligent, on-the-spot solutions. 'Start digging,' Jagtiani says, 'and anything can happen.' It often does. Hard rock at three feet... water at six! He takes it all in his stride.

TODAY, AS EVER, PEOPLE LIKE JAGTIANI ARE WORKING FOR YOU

Jagtiani belongs to a family of engineers. All four of his brothers are engineers and his 3 year old son already shows mechanical skill!

Jagtiani and people like him—at all levels of responsibility—are Burmah-Shell. Today, as ever, they are hard at work... working to ensure that vital petroleum products, essential to India's growth and progress, are brought to you at the right place and time, in the right quantities.

BURMAH-SHELL are People in the service of the People

Highlights of the Week

CENTRAL EXCISES

THE ASOKA Chanda Committee Report on the re-organisation of the Central Excises has made some far-reaching and well considered recommendations for maximising the yield with minimum of harassment to the tax-payer. This the Committee is confident could be achieved through streamlining and improving the administrative set-up. In regard to administration, the Committee says that "taxation policy is best formulated in the Economic Affairs Department of the Finance Ministry in association with other economic ministries. The Central Board of Revenue should cease to be a department of Government. It should be the chief revenue authority concentrating on efficient management of the collecting agencies but its views on the feasibility or otherwise of each levy should continue to be obtained."

There should be two Boards, one for direct taxes and the other for indirect taxes, each with its own independent Chairman.

The Board for indirect taxes, which may be called the Board of Central Excise and Customs, should sit as a Board to consider all aspects of technical, administrative and establishment work. The strength of the Board and distribution of work among its Members should be determined by the volume of work. The Chairman should be drawn from either Wing of the Service. Besides co-ordinating the work of the Board, he should be responsible for implementing taxation measures and evolve requisite techniques. He should report to Government the difficulties of administration so that remedial measures could be taken.

The data now used to formulate new proposals is neither up-to-date nor complete. It is also insufficient for consideration of excise levies. The Board of Central Excise and Customs should set up a tax research bureau to collect, collate, analyse and provide it with all relevant data. The Central Excise field force is best suited to collect the information required for the tax research bureau.

Departmental Reorganisation

The Directorate of Inspection should be reorganised to concern itself with investigation and study of major revenue and technical problems and not with the routine inspections. Its regional offices will then be unnecessary.

The Statistics and Intelligence Branch is hardly equipped to undertake any intelligent work. Little is gained by mechanical tabulation of the same statistical summaries which are also manually consolidated. It should be reorganised after a detailed study to be made by a committee of statistical experts. It should be equipped to build up fuller statistical information.

In regard to Parliamentary control, the Committee has made equally weighty recommendations. It says:

"Rates approved by Parliament are largely treated as ceiling rates and effective rates are introduced by notifications. This is an encroachment of the prerogative of Parliament which often has no information of the changes made. Neither total revenue foregone nor the revenue sacrificed in fostering growth of the small sector can be properly estimated. Revenue forecasts prove also incorrect and attract parliamentary and audit criticism. A scheme of subsidies should be considered as an alternative; if feasible, it would remove many of the drawbacks of the present procedure."

"As revenue estimates are framed on the basis of rates actually intended to be imposed by notification and there is time enough after the introduction of the Finance Bill to make necessary enquiries which could not be made earlier on considerations of secrecy, parliamentary approval should be

sought to rates to be finally imposed and not to rates which are subsequently treated as ceilings."

"With the power sought to vary the rates upwards also, the Indian provisions are now comparable to the UK scheme. The safeguards of the UK scheme should, therefore, be adopted to maintain parliamentary authority."

"Full and complete research should precede framing of taxation measures. The unusual power to vary statutory rates by notification should be sparingly used; changes, if any, in rates proposed in the Finance Bill should be incorporated in the Act itself. Other changes made by notification should be and large cover the whole range of taxed goods and should be brought before Parliament for ex-post facto approval."

"The law itself should provide for the status of a rule made when Parliament is not in session if it is later revoked when brought before Parliament. The question is important for regularising implementation during the intervening period."

Conditional Incentives

The Committee has suggested that the present system of excise levies with a bias on "ad volorem" rates and the practices of fiscal exemptions and concessions granted as economic stimuli should be scrapped. The Committee says:

"Incentives in different forms have been provided including preferential rate of, or exemptions from excise duties to give impetus to the growth of the village and small-scale industries. Two conditions should be fulfilled if small-scale industries are to make their full contribution to the national economy. Firstly, these industries should be largely complementary and not competitive with organised industries and, secondly, they must attempt at becoming self-reliant and self-supporting by adopting improved techniques and more efficient forms of organisation. In other words, reliance should not be on fiscal preferences."

"Generally speaking, low priced articles of high common consumption are best suited for excise levies, as also luxury articles. Capital goods, in view of their place in the economic development of the country, should be lightly taxed. Commodities with relatively small revenue potential are best left alone. Administration of levy in these commodities is expensive and also difficult."

"Increases in revenue attributable to new levies imposed in recent years have not been in proportion to the number of commodities added to the list."

"It is not prudent to keep down the cost of collection by resorting to relaxation of standard checks."

"The schemes for allowing drawbacks or sets-off of duty on raw materials and components used for making other excisable goods vary from commodity to commodity. They lead to a feeling of discrimination and do not always subserve the needs of internal economy or the export trade. A definite policy, even a philosophy should be evolved in taxing goods at different stages of manufacture."

"Articles with low revenue potential should be taxed only when they can be and are used as substitutes for other taxed articles. Levies that entail disproportionate costs of collection and on articles which are produced largely by small dispersed units should be avoided."

"The revenue from taxing fabrications of taxed basic materials could, sometimes, be raised more economically by increasing the rates of duty on the raw materials themselves."

"It is not possible to apply any one principle rigidly in

September 20, 1963

selecting commodities for taxation. The major consideration should, however, be that a levy does not create such administrative problems as largely defeat its purpose and that it does not create psychological complexes which retard production. It is best to explore the possibility of increasing yields by adjusting rates of established excises on goods already taxed before considering new levies."

CHILPIMA POWER HOUSE

THE INAUGURATION of the power house at Chilpima in Orissa State last week marked the completion of the second stage of the Hirakud Project. This second stage consists of provision of two units of 37.5 mw each at the Hirakud Dam power house and three units of 24 mw each at Chilpima power house. The total installed capacity of the Hirakud system has now been brought to 270 mw but the firm power available will be only about 120 mw at a 100 per cent load factor. The Hirakud power system is integrated with the thermal station of the Rourkela steel plant. It is proposed to integrate further these facilities with the Talcher thermal station which is expected to start functioning in 1965. Even after this integration the power system of Hirakud, Rourkela and Talcher would fall short of peaking capacity by more than 100 mw. It is therefore planned to install a few more units at Chilpima to provide additional peaking capacity. The requirements of power in Orissa State by the end of the third Plan would be 737 mw as against the prospective availability of about 319 mw. The gap between demand and supply would be widened still further by the end of the fourth Plan when the needs are expected to rise to 1,936 mw. It is obvious that the State Government will have to plan vigorously for the expansion of power facilities if the industrialisation of the State is to be fully realised. The Orissa Governor, who inaugurated the Chilpima power house, said that this problem was engaging the serious attention of the State Government.

MALAYSIA

TROUBLED AS its gestation has been, the new State of Malaysia, a Federation of four territories—Malaya, Singapore, Sarawak and Sabah (formerly British North Borneo)—inaugurated on September 16, has been caught up in post-natal complications, some of which may well prove serious and prolonged. While such internal disagreements or disharmonies as may linger among the federating units may reasonably be dismissed as not being quite unusual where conflicting interests have to be reconciled with or subordinated to a larger purpose—and the signing of the supplementary agreement relating to the question of the Federation covering issues which have developed among Malaya, Singapore and the United Kingdom since the signing of the Malaysia agreement in London in July last shows that these differences can be settled smoothly and by discussion—the open non-co-operation of the Governments of Indonesia and the Philippines with the new State has dimmed hopes that conflict and tension in the area would die down early.

While the Philippines and Indonesia have boycotted the inauguration of Malaysia, the former has deferred diplomatic recognition while the latter has bluntly stated that it will not recognise the new State. The Government of the Philippines is aggrieved because, according to it, territories in North Borneo which it claims as its have been included in the Federation. The Indonesian charge is rather a vague one that the Federation of Malaysia is likely to function as Britain's Trojan horse in South-East Asia. Indonesia is evidently in a truculent mood. The real reason could be that it represents the emergence of a strong new political entity which might contest Indonesia's influence in that part of the world. It remains to be seen whether Indonesian animosity would

extend to encouraging and supporting subversive movements in the jungles of Sarawak and Sabah, but the possibility cannot be discounted.

Meanwhile, the new State of Malaysia embarks on its high destiny with self-confidence and conscious of the goodwill and admiration it has already evoked in full measure from most countries of the world. In view of the clear UN verdict to the effect that an overwhelming majority of the people of the territories concerned has favoured the formation of the Federation, the new State may be relied upon to make a success of its daring attempt at creating an integrated community of the multi-racial population of the Federation. Malaysia has many things in its favour. It already enjoys the second highest per capita income in South-East Asia, its external reserves are comfortable and its industries are developing fast. Given political stability its economic progress could be spectacular since it is rich in natural resources, such as, rubber, tin, bauxite, iron ore and gold in Malaya and pepper, rubber, oil and antimony in Sarawak and timber in Sabah. The ten million people of the Federation not only have a heartening base of current prosperity to build on but may also look forward to a vastly richer future through the exploitation of potential resources, a good part of which is not only still untapped, but is even unexplored. Eut apart from the material attractions opened out to people of Malaysia by the inauguration of the Federation, the emergence of the new State also promises them democratic progress with greatly enhanced security against the ever-present Chinese communist threat.

As a mark of goodwill to the State, the Minister in the Ministry of External Affairs, Mrs. Laxmi Menon, has gone to Kuala Lumpur to represent this country in the celebrations of its inauguration and Mr. Nehru has expressed the wish that Malaysia will have a good start. In its Prime Minister, Tunku Abdul Rahman, Malaysia has a leader of vision, faith and courage who has done so much to bring about the Federation and who, despite the current distempers, has dared to express the hope that the process started by the setting up of the Federation would be completed by the bringing about of the association of Malaysia, Philippines and Indonesia in a larger entity of "Maphilindo".

LIC AND MORTGAGE BANKS

THE DEPUTY Minister for Finance, Mr. B. R. Bhagat, stated in the Rajya Sabha that up to 1962, the LIC had invested about Rs. 11 crores in debentures of land mortgage banks. In May, 1963, the LIC agreed to subscribe to 30 per cent of the debentures floated by each land mortgage bank during the terminal three years of the current Plan, subject to a maximum of Rs. 6 crores in each year for all the mortgage banks together, on the following terms and conditions:

- (i) The Reserve Bank of India would subscribe to 20 per cent of the issue, the State Bank of India to 10 per cent and Co-operatives and other sources should contribute the balance of 40 per cent;
- (ii) On the basis of the existing bank rate continuing at 4½ per cent, the rate of interest on the debentures should be 4½ per cent;
- (iii) the debentures should be for not longer than 15 years' duration with the issue price at 98; and
- (iv) the Life Insurance Corporation should be allowed underwriting commission of ½ per cent.

No issue of debentures has been made by any land mortgage bank in 1963. But the Andhra Pradesh Co-operative Central Land Mortgage Bank Ltd., issued a prospectus in 1963 for bonds of Rs. 1 crore. The LIC applied for Rs. 35 lakhs. of these bonds.

SEEING IN THE DARK

In the darkness of a fluoroscope, the "black light" of an ultra violet lamp throws invisible rays on rock samples brought to the surface from the bottom of an exploratory well. The samples may be "dry", bearing no indication of oil. But if even slight traces of oil are present, the samples will give off a fluorescent glow. From these and other tests geologists, chemists and other experienced oilmen can evaluate the prospects of the area where the search for more oil is under way.

Encouraging though they are, however, signs of petroleum in the cuttings of rocks penetrated by the drill do not always lead to the discovery of a profitable oil-field. Sometimes the indications come from rocks through which the oil has migrated to other regions, leaving only a stain and a smell behind.

Nature's way of hiding her mineral wealth is still a formidable challenge to prospectors everywhere.

Foreign Affairs in Lok Sabha

By Our Parliamentary Correspondent

NEW DELHI, Tuesday:

THE LOK SABHA debate on foreign affairs lasted for two days and ended with a reply from Mr. Nehru this evening. Few new points emerged out of the discussion but in the speech initiating the debate, Mr. Nehru devoted considerable time to speculating on the Sino-Soviet rift and its possible repercussions on the world and on India. The Prime Minister reiterated this country's stand that it continued to be willing to discuss a peaceful settlement of the differences with Peking should the latter accept the Colombo proposals in toto or agree to the Indian suggestion to refer the matter to the Hague Court or for arbitration by a mutually agreed arbitrator.

A dominant note struck during the discussion was one of concern over Pakistan's increasingly open antagonism and, graver still resort to hostilities along the Assam border. The Prime Minister pointed out that although this country was prepared to discuss Kashmir or any other point of difference with Pakistan, no useful purpose would be served unless and until Pakistan would retrace its policy of aligning with China on an anti-Indian programme. The Prime Minister noted improved relations with Nepal and expressed the view that a sound basis for co-operation and mutual understanding had been established between the two countries.

An interesting point brought out during the debate was that Mr. N. G. Ranga, leader of the Swatantra group in the Lok Sabha, did not share Mr. C. Rajagopalachari's views on Kashmir. Mr. Krishna Menon made one of the more effective speeches of the debate. He drove home the point that, with regard to Kashmir, India had undertaken no international obligations which it had not scrupulously honoured or which it was not willing to honour. More than one speaker expressed disappointment with the performance of our diplomatic missions abroad, particularly on the publicity side. Mr. Nehru made an attempt to meet this criticism but his arguments were not convincing. On the contrary, they betrayed the fact that he himself did not seem to be aware of the need for proper publicity or even what publicity was.

CDS Under Review

In a statement in response to a call-attention notice, the Finance Minister, Mr. T. T. Krishnamachari, clarified the Government's intentions regarding a reconsideration of the Compulsory Deposit Scheme. He indicated that there would probably be changes, but they would not be drastic. The Finance Minister said:

"The scheme itself falls into five parts. Two of these have been implemented, namely, one in regard to persons liable to payment of tax under the Income-Tax Act, and the other applicable to employees of certain categories earning salaries of Rs. 1,500 or more a year and who are not subject to income-tax.

"The other three parts relate (1) to persons liable to payment of land revenue, (2) to holders of immovable property in urban areas assessed to property tax, who are not liable to income-tax, and (3) to dealers whose annual turnover for purposes of State Sales Tax is Rs. 15,000 or more and who are not subject to income-tax.

"These three schemes have to be implemented in co-operation with the States. The benefit of the first of these three, namely deposits made by persons liable to payment of land revenue, would accrue entirely to the States.

"The Government of India has circulated these three

schemes to the State Governments for their comments. I have also written to the Chief Ministers a few days back drawing their attention to the letter addressed to their Chief Secretaries by the Secretary of Economic Affairs Department on the subject. Further steps in regard to these three parts of the scheme can be taken only after the full picture of the reactions of State Governments are known."

Sugar Debate

Among the problems debated in the Lok Sabha last week, the most important from an economic journalist's point of view was the sugar issue. With the Food and Agriculture Minister, Mr. Swaran Singh, having already announced the incentives which he wanted to provide for stepping up sugar output during the next crushing season to 3.3 million tonnes and the Rajya Sabha having earlier deliberated upon the sugar scarcity in the country, the discussion in the Lok Sabha, initiated by Mr. Kashi Nath Pandey (Congress), could be expected to be only a pedestrian one, as, in fact, it turned out to be. The criticism followed, by and large, the same old pattern as had been advocated frequently in times of sugar shortages—demand for nationalization of the sugar industry, the raising of the sugarcane price (now to Rs. 2 per maund), prompt payment by mills to cane suppliers, regulation of gur and khandasari production and desirability or futility of controls. The only new point made perhaps was by Mr. Prakash Vir Shastri (Independent) who wanted a Central machinery to be set up to administer the Cane Cess Fund.

The Minister's reply to the debate also was by no means illuminating. But he made two important announcements. Firstly, he proposed to investigate whether any organizational changes were required in the present pattern of sugar trade. He expressed his inability to spell out this proposal at any length "at this stage". The other decision announced by him was that exports of sugar during the next crushing season would not be increased beyond 300,000 tons for which contracts had already been made. Mr. Swaran Singh rejected the demand for an increase in the price of sugarcane to Rs. 2 per maund. He, however, added that in order to get the benefit of the rebates and concessions in excise duty on production additional to that in the 1961-62 season, sugar mills would be compelled to pass on some of these to the cane-grower. He promised to take up with the State Governments the issue of prompt payment by sugar mills to cane-growers as well as the problem of proper and full utilization of the cane cess.

Mr. Swaran Singh expressed the opinion that, technically or otherwise, there was no difficulty in raising sugar output to 3.3 million tonnes in the coming year. But even if production did not increase to beyond 3 million tonnes, the position "would not be gloomy".

Production Incentives

The following incentives had been announced by the Food and Agriculture Minister earlier for stepping up sugar production during the next crushing season:

(i) For encouraging the agriculturist to make available larger supplies of cane to the mill industry in areas where competition from gur and khandasari is intense, the mills will be authorised to pay a minimum price of Rs. 1.75 per maund or Rs. 4.69 per quintal. The price actually paid will be included in calculations of ex-factory prices. The maximum permissible deduction from the price paid at the factory gate for transport of cane by road will be 12 nP, as in the case of transport by rail, and the balance, subject to the existing maximum of 36 nP, shall be included in the ex-factory cost calculations.

September 20, 1963

This means an addition of 24 nP. per maund of cane to the price actually received by cultivators who supply cane through motor transport from a distance of from eight to 24 miles at the factory gate.

(ii) The mill industry is to be provided an incentive in the form of rebate in the basic excise duty on additional production as was the case in 1959-60 and 1960-61. The rebate will be calculated on 1961-62 output as the base and will amount to 50 per cent on additional production between July 1, 1963, and October 31, 1963, compared with the corresponding period of 1961, in respect of factories that commenced production during this period. A similar rebate will be available for the other factories which commenced production in November in relation to their output in November, 1961. In the normal season during November 1 or December 1, 1963, to March 31, 1964, or thereabout, the quantum of rebate in the excise duty on additional production will, however, be reduced to 20 per cent. On additional output during the remaining part of the season to June 30, 1964, factories will again be allowed rebate at the rate of 50 per cent.

No regulation of production of gur or khandsari is proposed. The users of "kolhus" are to be left completely out of the purview of the proposed measures. The Government will be promulgating a Sugarcane Control Order by virtue of which the State Governments would be authorised to regulate the utilisation, purchase and distribution of cane with the main idea of supplying it to factories and power crushers.

Question Hour

Bhadravati Steelworks: The Minister for Steel and Heavy Industries, Mr. C. Subramaniam, told the Lok Sabha last week that the Union Government had approved a scheme of the Mysore Iron and Steel Ltd., Bhadravati, for its conversion into a manufacturing unit capable of producing 77,000 tonnes of alloy and special steels per annum. The technical collaboration arrangement for the project had been concluded with Bohler Brothers of Austria. The foreign exchange cost of the plant and equipment to be installed under the scheme was estimated at Rs. 6.4 crores. It was proposed to arrange it under the West German credit. The approval of the West German authorities was awaited. The Minister also disclosed that no investment had so far been made specifically on the conversion scheme. An expenditure to the tune of Rs. 4.5 crores, however, had been incurred upto June, 1963, for implementing the mild steel expansion programme of the company. The facilities already provided for mild steel expansion together with the proposed extra investment would be utilized for the production of special steels.

Replying to some other questions, also put by Lok Sabha Members, Mr. Subramaniam yielded the following information in regard to steel output and pig iron.

Steel Production: Steel output at Bhilai, Durgapur and Rourkela during 1962-63 had been as follows: Bhilai 0.793 million tonnes (value at sale price: Rs. 41.97 crores); Durgapur 0.499 million tonnes (Rs. 24.70 crores); Rourkela 0.416 million tonnes (Rs. 32.16 crores). Of this, 315 tonnes were exported to Pakistan and 160 tonnes to Burma.

Pig Iron: A provision has been made in the trade agreement with the U.S.S.R. for the import of pig iron from that country in 1964, 1965 and 1966. Production of pig iron in India through low shaft furnace operations during 1962-63 amounted to 28,224 tonnes. Compared to the previous year, production in 1962-63 showed a decline to the tune of 1,360 tonnes. This was mainly due to a larger number of power failures.

Mr. Subramaniam and his Deputy, Mr. P. C. Sethi, gave the following information in regard to some of the heavy industries, in reply to questions in the two Houses of Parliament.

Heavy Machine Building Plant: Pilot production in certain departments of this plant is scheduled to commence by the end of the current calendar year. A sum of Rs. 17.50 crores had been invested in this project upto the end of July, 1963.

Heavy Pumps Factory: The Government had received a feasibility report prepared by a team of Soviet experts for setting up a factory to manufacture heavy pumps and compressors. The report had been considered by the Government and it has been decided to call for a detailed project report from Russian experts.

Agricultural Implements: Six firms have been so far given licences for the manufacture of agricultural tractors, including power tillers, and five for the manufacture of agricultural implements. The production of tractor-drawn farm implements (in numbers) since 1960 has been as follows: 1960—247; 1961—1,140; 1962—4,295 and 1963 (upto July)—1,860.

Fertilizers Output: There had been a "general lethargy" on the part of the private sector to enter the fertilizer field. The Government had to proceed now on the basis that the entire fertilizer production might have to be in the public sector. It was not possible to make up the shortfall in fertilizer production within the third Plan period.

Trombay Fertilizers: The Trombay Fertilizer Plant, currently under erection, is expected to go into production by August next year. The total c.i.f. cost of the machinery and equipment to be imported for the project is estimated at about Rs. 14 crores. Some of the equipment has already been received and the remaining is in various stages of fabrication or shipment.

Rourkela Fertilizers: It has not been possible as yet to establish full production at the Rourkela Fertilizer Factory owing to shortfalls in the availability of coke oven gas in quantity and quality, and of electric power. This fertilizer manufacturing unit was commissioned into production in November, 1962, with the rated capacity of 5,80,000 tonnes of calcium ammonium nitrate per annum (about 48,000 tonnes per month). The monthly production since November, 1962, has been as under:

November	1962	830	Tonnes
December	1962	8659	"
January	1963	9249	"
February	1963	9956	"
March	1963	11271	"
April	1963	8968	"
May	1963	1470	"
June	1963	5103	"
July	1963	15699	"
August	1963	17500	"

The very low production in May and June, 1963, was due to complete stoppage of coke oven gas for a period of five weeks, between May 4 and June 12, when the compressors in the steel plant, through which the coke oven gas was supplied to the fertilizer unit, went out of commission. The compressors have since been repaired and brought into working condition.

Aluminium: The Minister for Industries, Mr. Nityanand Kanungo, revealed in a written statement in the Lok Sabha that the National Industrial Development Corporation was not considering any proposal for setting up a big aluminium plant in the Jammu and Kashmir State. The Jammu and Kashmir Government, however, proposed to set up an aluminium plant in the Salal area of the Chenab valley and the NIDC would undertake a feasibility study of the project after the basic data required for the proposal had been collected by the Jammu and Kashmir Government. The question of foreign collaboration could be examined only after the feasibility

Setting up a new factory? Remember it is always advisable to ask for the services of experienced construction engineers. It pays in the long run in economy and efficiency. Come to Dodsal with your blue-print. Dodsal will study your basic requirements, construct the factory, set up the equipment and deliver the complete plant in record time. Dodsal are already working as construction engineers on turn-key jobs for a large number of organisations both in the public and the private sectors, putting up industrial plants, power stations and laying pipe lines for oil.

study had been completed and the details in regard to the capital, machinery, etc. had been worked out.

Textile Exports to USA: Exports of cotton piecegoods (mill-made) from India to the USA from 1961 onwards have been as follows: 1961—6.99 million yards; 1962—26.73 million yards and 1963 (January to June estimated)—25.80 million yards. The rise in exports in 1962 had been due to the fact that the USA had applied restraints on imports of cotton textiles from Japan and Hong Kong under the Short-term Agreement for Cotton Textiles of the GATT. The importers in the USA, therefore, looked to other countries like India. The second reason was that Japan had switched on from exports of grey goods to finished fabrics. Since India's bulk exports were in grey goods, India had obtained boost in her exports.

Tea Exports to ECM: The E. E. C. and the U.K. have reached an agreement for the suspension of the most-favoured-nation customs duties on tea (in packages of over 3 kgs.) with effect from January 1, 1964. It is certainly the intention of the Government of India to take full advantage of the establishment of the duty-free regime for tea in the ECM countries. The Tea Board is appointing a Senior Officer to work in Brussels. He will be leaving for that place shortly. His functions will be to intensify propaganda and sales promotion activities in the area.

Trade with Russia: Some of the new items introduced in the USSR, as a result of the Indian Exhibition held there recently, are: paper products, ready-made shirts, new varieties of woollen knitwear, nylon socks, cigarettes, cosmetics and soaps, finished semi-precious stones, new varieties of shoes, razor blades, sports goods, handkerchiefs, fruit juices, surgical beds, tooth brushes, etc. Considerable interest has also been shown by the Soviet buying organisations for insecticides, agricultural tractor attachments, textile machinery, piston rings, scientific and medical instruments, coir products, bicycles, motor cycles, scooters, art silk and terylene. Negotiations for actual contracts for the export of these from here are afoot. The Soviet organizations have also purchased additional quantities of handicrafts, shoes, tea, jute products, cashewnuts, woollen textiles and cotton fabrics. The business contracted for during the exhibition was worth Rs. 5 crores. Of this, business worth Rs. 1.20 crores had been conducted in new items and was in addition to the existing Trade Plan. This quota was specially negotiated to cover the foreign exchange expenditure on the exhibition. Negotiations for business worth Rs. 9 crores are being carried on. The present Trade Plan with the Soviet Union envisages that in the next three years, the level of India's exports to that country will go up from Rs. 35 crores to Rs. 110 crores.

Indian Investments Abroad: The Deputy Minister for Finance, Mrs. Tarakeshwari Sinha, told the Lok Sabha that the Union Government had permitted so far seven private Indian industrial houses to set up industrial units in foreign countries. Ceylon was one of the countries where these investments had been allowed to be made. The scheme here involved setting up of a sewing machines manufacturing plant. The total investments made abroad by the seven industrial houses amounted to about Rs. 99 lakhs. Replying to supplementaries, Mrs. Sinha said that reasonable precautions had been taken to ensure that the Indian capital thus invested was not confiscated and that investments permitted were in the shape of exports of machinery and technical know-how. India, she added, desired to participate, to the limited extent it could in the industrial development of the under-developed countries.

Indian Banks in Burma: In reply to another question, it was stated on behalf of the Ministry of Finance that all the five Indian banks which had branches in Burma had been allowed to repatriate to their head offices funds amounting to Rs. 5 lakhs in each case. As regards the other assets, the claims for compensation submitted by these banks were still pending before the Banking Business Nationalization Compen-

sation Commission, Burma.

Aid from UK: The Finance Minister, Mr. T. T. Krishnamachari, told the Lok Sabha that out of the £30 million aid indicated by the UK at the recent Consortium meeting, as much as 75 per cent was expected to be available without being linked to specific projects. The UK credit of £3.50 million for purchase of steel products was tied to purchases in that country.

Oil: Replying to a calling attention notice by ten Members of the Lok Sabha on expansion of private sector refineries, the Minister for Mines and Fuel, Mr. O. V. Alagesan, stated that the Union Government was awaiting the assessments of the Planning Commission and of the Indian Refineries Ltd., (in consultation with the Institute of Petroleum) in regard to surpluses/deficits in petroleum products that might arise in the various regions of the country up to 1966 and thereafter up to 1971. The whole question of augmenting the oil refining capacity in the country, through expansion of the private refineries, establishing of the two new ones at Madras and Calcutta in the public sector or through expansion of the public sector refineries already proposed to be set up, would be reviewed and decision taken after the results of the above-mentioned studies were available.

Intervening, the Prime Minister declared that the private oil refineries would not be allowed to expand if the public sector was in a position to fully meet the country's requirements of oil production. No departure was being effected in the oil policy pursued by the former Mines and Fuel Minister, Mr. K. D. Malaviya, he added.

New Gold Finds: Mr. Alagesan disclosed in the Lok Sabha that occurrences of gold had been reported at Bisanattam and Kalahatti in the Chittoor District and at Ramagiri in the Anantapur District of Andhra Pradesh. In the Bisanattam and Kalahatti fields, the gold content, however, was poor and the deposits were neither extensive nor otherwise promising. The Ramagiri goldfields were stated to be 152 metres wide and extended over about 18,288 metres from Jibuttil mines in the south to Kanapuram in the north. Detailed investigations of the deposits here had been undertaken. A realistic estimate of their quality and quantity could be made only after the investigations were completed.

Coal: Mr. Alagesan stated in the Rajya Sabha that a recent assessment had disclosed that production of coal had outstripped demand. It was expected that there would be no shortage of this commodity even during the remaining period of the current Plan. Certain important consumers were now carrying stocks equivalent to one month's consumption.

In reply to another question, Mr. Alagesan said that the NCDC had no proposal at present to develop the coal mines in Jammu and Kashmir. The drilling organization of the J. & K. Government, he added, had conducted drilling operations in Kalakot only. It had estimated that the coal reserves at Kalakot might be of the order of 6.94 million tons, besides an additional indicated reserves of 1.4 million tons.

Power Development: Replying to two questions in the Lok Sabha, the Minister for Power, Dr. K. L. Rao, stated that a team of Soviet experts was expected to arrive here shortly to settle the prices of equipment to be imported from the Soviet Union for the thermal power stations to be established in this country during the third Plan period. Technical discussions with the Soviet Union had already been completed and the equipment to be sent was now under manufacture in Russia. Of the power projects to be assisted by the Soviet Union, details had been finalized for the supply of equipment in respect of Neyveli Stage I, Korba Pathratu Thermal Stations, Bokaro Right Bank Plant, Mettur Tunnel and Hirakud Hydro-electric Scheme. Detailed project reports for Neyveli Stage II and the Obra Power Station had also been received. Their estimated cost would be Rs. 7.5 and Rs. 14.5 crores, respectively.

WINDOW ON THE WORLD

The European Inflation

From Our Special Correspondent

PARIS:

A REPORT published this week by the Organisation for Economic Co-operation and Development shows, with the customary delay between the collection and the publication of official statistics, the extent and the geographical spread of price-inflation in West Europe.

PERCENTAGE RISE IN RETAIL PRICES

	Between 1962 & 1963	Between 1959 & 1963
Denmark	7.2	18
Italy	6.1	13.7
Holland	5.6	11.9
France	5.3	16.3
West Germany	4.4	11.1
Britain	3	10.7
Sweden	3	12.5
Belgium	2.2	4.1
United States	1.2	4.6

These comparisons refer to prices at the start of the second quarter, but the Common Market Finance Ministers at their meeting here this week agreed that the same trend had continued through the spring and summer. Luxemburg, too, they pointed out is a victim of price-inflation comparable with Holland's; in Italy the rise has gathered pace and the advance of the cost of living over the past 12 months is today nearer 7.2 per cent than the 6.1 quoted above. In France also the situation has worsened somewhat, and the 12-month increase is now around 5.7 per cent. Like the OECD, the Six Finance Ministers concluded that price-inflation was a generalised phenomenon in West Europe, though its ravages are being better controlled in West Germany and Belgium.

Arbitrary Base

One must point out at once that no great significance should be attached to differences between the figures for each nation in the righthand column of the table above, unless they are very marked. Firstly, because the base year, 1959, is arbitrarily chosen; if one took 1957 or 1958 (i.e. before the French devaluation) the rise in French prices would seem very much larger than all the others. But even that would not be significant, because (and this is the second point), the rises are being measured in terms of national currencies, which have however varied in relation to the dollar or gold thanks to the upward revaluations of the West German and Dutch currencies and the devaluation of the French franc. If one translated prices into dollars at the official rates of exchange, it would emerge that Italian, West German and Dutch prices have soared, French prices have risen less than most, British prices less still and Belgian prices very little. (The Deutschmark and guilder were upvalued 5 per cent in March 1961, and the French franc was devalued 17.5 per cent in December 1958).

Such intricacies have to be borne in mind if one is to explain why, despite the large increase in French prices shown above, the Finance Minister could announce another month of balanced trade in August and a further rise in the gold and dollar reserves, by \$75 million in that month to the record total of \$4,290 million. Almost half French exports going to the other members of the Common Market, France retains some of the advantage of the massive 1958 devaluation in relation to Italy, West Germany and Holland, while losing part of it in the British market and possibly all of it in the

Belgian and US markets. So inflation measured in terms of the loss of purchasing power of the national money on the home market need not tally with the movement of export sales.

Marked Differences

Having made these corrections, there remain fairly marked differences between the increases in prices in the various countries, and these in turn suggest an explanation of wide-spread losses of purchasing power. The most obvious one is that countries which escaped the disastrous winter of 1962-63 in Europe, or which buy much of their food outside Europe (like Britain, Belgium and West Germany) have suffered much less from price increases in the past year than countries in this region which rely on their own farms (Denmark, Italy, Holland France—the top four in the left-hand column of the table). In other words, the rise in the cost of local food seems to be the main explanation of the price-rises in recent months. Combined with the general policy of boosting farmers' revenues to nearer those of city-dwellers, and the move to align Common Market agricultural prices (usually by levelling up, because no one will level down), a freezing winter and a non-existent summer have unleashed price inflation — which has been transmitted to the rest of the economy by the rigid system of linking many wages to index-numbers for the cost of living.

This does not mean that one may dismiss the whole affair as a meteorological accident, because the policies deliberately followed by most of these countries had put them in a situation where they were unnecessarily exposed to such accidents. For example, the French were so sure of having plenty of butter that they lately sold thousands of tons of it, at sacrifice prices, to Britain and Italy; when they discovered they would be short, they turned to Holland—notoriously a big butter exporter—to be told that the Dutch were hoping to buy butter in France because they had entered into export obligations they could no longer honour. The Dutch are frantically trying to cover what turned out to be bear sales.

Exactly the same story in wheat: after a 14 million-ton harvest in 1962, the French sold grain at half price to the Chinese, to free their siloes for the 1963 crop. But this crop has turned out to be only eight million tons, of which one third is heavily rain-damaged. So it will be necessary to import over a million tons, not only to meet French needs but to honour the commitments made to China! Needless to say, the Dutch and French taxpayers will have to foot the bill for the double loss involved in each of these operations: the subsidy for cheap export sales, and the higher prices to be paid for imports in a sellers' market.

Sequences of accidents like this are no longer "just accidents". They reveal, first of all, that under all the economic planning now in vogue in West Europe there is still a gamble on the weather, which modern men tend constantly to underestimate because of their optimism about being able to control so many things that defied their grandfathers. The price structure and, by ricochet, the course of economic expansion and social harmony can be called in question by a poor season. How much more true this is in countries with a more unstable climate, like India and China, does not need emphasis. Secondly, it shows the dangers of competitive dumping of farm surpluses by countries with a substantial peasant population, to the gain (in good times and bad) of their industrial

competitors who have few farmers and buy food on the international market (Britain, Belgium and to a somewhat smaller extent, West Germany).

Analysing the other factors in the European inflation, apart from the rise in food prices, the OECD experts note that it is a "cost-push" inflation and not a "demand-pull" inflation. In other words, they find no general excess of buying power over the volume of goods on offer; on the contrary, prices of manufactures are everywhere higher although output has advanced notably and freer imports have increased supply. The volume of wages is definitely not causing higher prices by stimulating demand, but is itself rising because of dearer food and services, thus raising manufacturers' costs. The point is important in deciding what counter-measures governments should take. The OECD report says explicitly, "Supply is easily matching internal demand, and the foreign trade accounts show a persistence (despite some deterioration in the past year) of the trade surplus. So it would seem difficult to connect the rise in prices with an excess of global demand, and in these circumstances resort to classic anti-inflation therapy is not to be recommended". No more are government budget deficits incriminated; budgets are balanced in West Europe and the most the experts can find to say is that the budgetary weapon should be used more flexibly: surpluses increasing in time of inflation and decreasing or disappearing in time of weaker demand. Since no government has yet succeeded in this "flexibility" (American attempts

have been unhappy because of the time-lag in the effects of budgetary measures), one must take this as a counsel of perfection.

The OECD finds it odd that manufacturers have so little trouble in passing on their higher costs in the shape of selling-price increases, and point out that this applies to all the European countries. The 60 per cent reduction in import duties inside the Common Market has had surprisingly little effect in stimulating price-competition, outside of a few sectors. Monopoly situations are not, in general, the explanation because here are still relatively few of them in Continental Europe, though tacit understandings inside employers' organisations often have much the same effects. The inefficiency of the retail circuits, still largely staffed by small shopkeepers, explains a certain part of the price increases; as a rule, wholesale prices have risen less than retail prices, the difference going into the shopkeepers' pockets. Finally, the OECD report dwells on the "psychological factor", which is also the main theme of a report on the French price-inflation published simultaneously by the National Statistical Institute. Both these sources insist that one of the causes of continued price-rises is that people are used to them: "Price stability does not seem normal to anybody, and there is no real inertia opposing price increases. No one is surprised by constant increases, but a decline in prices seems an extraordinary event". Various governments currently are drawing up price-stabilisation plans in West Europe but until they overcome this "inflationary psychology" one must be sceptical of their success.

American Labour Faces New Challenges

By GUY SIMS FITCH

WASHINGTON:

EACH YEAR, at this time, it has become the custom in the United States to eulogize the accomplishments of American Labour and its role in the national community. This annual observance of Labour Day, which falls on the first Monday in September, was somewhat restrained this year — a mood in keeping with the realization that events have thrust upon the American labour movement new problems and new challenges.

Among these are the intensified efforts to eradicate the vestiges of discrimination in labour union structures and operations, and to find meaningful ways of reconciling the established interests of union members, White and non-White, with the aspirations of American Negroes for greater status and opportunities in the nation's work force.

This is an obvious and pressing issue, one that the labour movement, which generally has been a leader in social and economic progress, faces in common with all elements of the American society in which it is an integral part.

Less obvious, perhaps, but no less urgent and pervasive as far as labour's institutional role in society is concerned, are emerging questions surrounding the conduct of labour-management relations in an era of growing automation and industrial and technological change. This affects both the labour movement's hard-won gains and its carefully nurtured and well-accepted influence as a free instrument of free men banding together for the common good.

Ever since its difficult, formative days of the 1930's, labour's remarkable progress in the United States has rested largely on the process of free collective bargaining. This

means the legally guaranteed right of unions, representing their members, to meet as equals with employers and work out contracts covering wages, working conditions, and such "fringe benefits" as vacations, pensions, insurance and medical care.

Much of the strength and success of the collective bargaining process has derived from its freedom, as befits a society in which personal liberty is a valued and safe-guarded heritage. Unions and employers have been able to pursue their legitimate if sometimes disparate ends, and to arrive at mutually satisfactory agreements, through procedures that have been essentially free of direct governmental intervention and control. This is a principle that all interested parties — labour, management, the public at large, and the Government itself—would like to see preserved.

There is every reason to believe that it will be preserved. This is said despite the vast socio-economic changes that inevitably are forcing alterations in bargaining concepts and procedures, and despite the fact that Congress, with the approval of President Kennedy, only a few weeks ago enacted an unprecedented law in effect under-writing compulsory arbitration of a labour-management dispute to avert a nationwide railroad strike.

It is significant that neither the President nor the Congress views this legislation as a precedent to future action. Typical is the reaction of Chairman Warren G. Magnuson of the Senate Commerce Committee that "we are not in the business of resolving controversies between management and labour."

What led the Government to act in this instance was the lack of any substantial or fruitful progress after three years

of drawn-out proceedings and negotiations between railroad unions and management, and the imminence of an off-postponed rail shutdown which, if it lasted for any length of time, could cause widespread injury to the health, economy and security of the nation.

The World Economy and IMF

THE ANNUAL Report of the International Monetary Fund for 1963 has presented an incisive analysis regarding the payments problems of the less developed countries. "The greater part of the day-to-day work of the Fund", says the Report, "is concerned with the problems of the less developed countries. These countries, practically all of which are predominantly exporters of primary products, are particularly likely to encounter difficulties in balancing their external transactions for reasons that are partly of internal and partly of external origin". The Report goes on to discuss the three main sources from which the difficulties of these countries emerge. In the first place, inflationary tendencies often connected with development programmes prevail in many of the countries. Secondly, relatively large short-term fluctuations take place in their foreign exchange receipts from exports and in capital movements and lastly, the rate of growth of export receipts, when compared with the growth of population, is relatively slow. Experience has shown that inflationary policies in these countries are likely to make more, rather than less, intractable many of the problems facing them. The impact of the inflationary tendencies on the economy is graphically described in the Report in these words:

Savings Reduced

"Inflation diminishes the volume of resources available for domestic investment. The community's saving is reduced, and a significant part of this saving is channelled to foreign rather than the domestic investment, while the flow of capital from abroad is discouraged. A substantial part of the reduced flow of resources for domestic investment is diverted to uses which are not of the highest social and economic priority, such as luxury housing and other luxury goods. The accumulation of large inventories is encouraged. Savings are diverted to channels where investment decisions are insufficiently guided by longer-term economic criteria. To reduce the foreign deficits, the authorities are tempted to resort to controls, which frequently protect uneconomic domestic production."

The Report has also analysed the instability of export earnings of primary exporting countries during the Fifties. The ratio of the prices of primary products to those of manufactured goods declined by more than 20 per cent in the period 1950-1960. As a natural corollary, the terms of trade of the high-income countries showed a marked improvement and the importing power of exports of this group rose most steeply than the volume of their exports. Almost all the major regions in the less developed group, except the Middle East, have been affected by the declining trend of the terms of trade. There are apprehensions that the development and extension of regional arrangements for foreign trade among industrial countries, both in manufactured and in agricultural products, may result in the reduction of the imports from the less developed countries.

World industrial production, excluding the countries in the Soviet area, was about 7 per cent higher than in 1961, whereas the rise from 1960 to 1961 had been 3.4 per cent. In both the years, the value of world trade was about five per cent higher than in the preceding year. In 1962, in contrast to experience in recent years, the increase in the value of exports of primary producing countries as a group almost kept pace with the manufacturing countries although declines in the prices of certain products adversely affected some countries.

In continental Europe and Japan, upward pressure on wages and prices continued during 1962. A considerable degree

Significantly, the two main issues at dispute between the carriers and the unions concern the composition of train crews and the right of management to eliminate obsolete jobs—both the result of important economic and technological advances in this key industry.

of price stability prevailed in the United States and Canada. The United Kingdom has an intermediate position. The balance of payments of the United States did not show any marked change, but these divergences "contributed to the trend toward broad adjustments in international payments positions especially among the industrial countries". The continued greater rise in wages than in productivity which reduced the profit margins gave a cause for concern in most European countries. These developments were considered a threat to long-run monetary stability. Increasing attention was given to the problem of formulating appropriate principles for determining wage increases in relation to increases in productivity and other relevant factors.

Discussing the role of domestic development in Europe on the world economy, the Fund stated: "As both balance of payments surpluses and the domestic pressures of demand in continental Europe decreased, the harmonizing of internal and external policy objectives became easier. The most pressing problem of these countries is to restrain excessive increases in wages and prices without losing momentum in economic growth. To achieve this objective, co-ordinated policies among the industrial countries are required to ensure that expansion of the world economy will not be jeopardized by domestic developments causing disturbances in international payments."

Except for the short-lived exchange crisis in Canada during the first half of 1962 and some speculation against sterling in the early months of 1963, international movements of short-term capital were moderate during 1962; the most serious instance of "disequilibrating movement" of short-term funds was the speculative flow of funds out of Canada occasioned by various uncertainties.

Bilateral Arrangements

Co-operation on monetary matters among the industrial countries was intensified in 1962, being reflected in an increasing volume of bilateral financial arrangements and in the creation of a co-operative scheme for stabilising the price of gold—the so-called gold pool—establishment by the United States and the United Kingdom and six countries in Continent Europe. The changes in basic positions from 1961 to 1962 were in the direction of greater equilibrium in world payments. The US deficit on the basic accounts increased somewhat from 1961 and 1962, but there was a further substantial reduction in the persistent surplus position of Continent Europe. The West German balance of payments on the basic accounts showed a small deficit. The balance of payments of Italy, another persistent major surplus country, weakened. The payments problems of the United States and the United Kingdom have continued. Effective international co-operation on monetary matters should facilitate the adjustments needed in surplus to the international payments system. It needs to be recalled that between 1961 and 1962 there was a certain improvement in the balance of payments of the less developed countries as a group; a moderate overall deficit in 1961 was reduced during 1962 and there was near balance in the second half of the year. "Many of the less developed countries" stated the Report, "live, in a sense, from hand to mouth in their international transactions. If their export and other receipts increase, their imports rather quickly adjust to a higher level. The reserves are often so low that, even allowing for their potential for drawing on the Fund and other sources of credit, they cannot afford to run large deficits even temporarily. The outstanding features of their combined balance of payments

have hitherto been a slow growth in their exports and an increasing flow of financial resources from the industrial countries, facilitating a somewhat higher growth in their imports."

The Fund has reported that the total of countries' reserves continued to increase from the end of 1958 to the end of 1962. The total increase over the four-year period was about \$5.4 billion or 9 per cent. Gold production is one of the factors that has added to aggregate monetary resources every year. In most post-war years, about \$500 to \$700 million worth of gold was added to the official holdings of the countries and international agencies, but the figure was smaller in 1960 and again in 1962 at about \$300 million. Liquidity claims on the United States have also shown a persistent tendency to rise by nearly \$1 billion a year on the average. In the autumn of 1962, the United States began to issue non-transferable obligations expressed in the currency of the purchaser, usually with a maturity period of 15 to 24 months. In so far as US deficits have been financed by other countries accumulating liquid resources in the US, these deficits have led to increases in the world total for international reserves. Analysing the reserves movements of certain groups of countries, the Report brings out the fact that while the reserves of the developing countries have since 1952 fluctuated around their present level of approximately \$12,000 million, the trade has expanded by about 40 per cent. On the other hand, the more developed countries participating in Funds' General Agreements to Borrow have experienced a net gain in their combined gold holdings of about \$500 million. If improvement or enlargement of credit facilities is needed, it may be more important and feasible to concentrate on the adaptation or enlargement of the existing multilateral arrangements through the Fund than to seek to establish supplementary or alternative arrangements outside.

Fostering Growth

The less developed countries have found sustained growth elusive. They have used certain expedients such as price controls, import restrictions, currency over-valuation, etc., which have intensified their problems. The Fund has suggested alternative measures for hastening growth in the economies of these countries. It is recommended that the less developed countries should do whatever lies in their power to increase the rate of growth of their export proceeds or to reduce their import requirements. Sustained efforts by individual countries to promote exports by enlarging the supplies and improving the quality of export commodities, keeping domestic demand under proper restraint and maintaining competitiveness have frequently produced considerable results. The industrial countries may, in their own interests, be expected

to follow policies directed towards the maintenance of high and stable levels of economic activity and employment. If all the countries pursue such active policies, the risk of serious balance of payments deficits facing any one of them should be small. However, the mere maintenance of over-all domestic demand by the industrial countries will not by itself suffice to maintain their demand for the products of the less developed countries. It is necessary also to remove those obstacles that exist at present to the import of both primary products and manufactured goods from the less developed countries, and to refrain from the imposition of further obstacles. There are many less developed countries where it would be highly economical to encourage export trade in certain types of manufactured and semi-manufactured goods. This would be in accordance with the principles of comparative cost and would also serve to diversify the export trade of the countries concerned, which in itself would tend to stabilise export receipts.

A new facility has been provided by the Fund in order to overcome temporary shortfalls in exports results. One of the ways which have been proposed to remedy and mitigate the effects of instability in export proceeds has been what is called "compensatory financing", namely, the provision of financial assistance, in the form of loans or otherwise, to the countries affected by shortfalls in receipts of exports. The Fund took a decision on January 27, 1963, to create a new compensatory financing facility to broaden the balance of payments support of member countries, particularly those primary product exporters that encounter payments difficulties produced by temporary shortfalls in receipts from exports. This new facility will not normally exceed 25 per cent of the members' quota.

As indicated earlier, the value of world trade rose by five per cent in 1962 over 1961. The exports of both manufacturing and primary producing countries expanded faster in the earlier than in the latter part of the year. The major factor in the growth of trade between manufacturing countries was the sharp rise in their exports to the United States, the value of which increased by nearly 17 per cent in 1962 over 1961. U.S. imports from primary producing countries rose by nearly 10 per cent from 1961 to 1962 while those of manufacturing countries in Western Europe rose by about 5 per cent. U.S. exports to primary producing countries, however, rose by 5 per cent while exports from EEC and EFTA countries declined by 4 per cent and 2 per cent respectively. For most primary products, prices moved within rather narrow limits in 1962. Prices of cocoa and tea averaged somewhat less in 1962 than in 1961. Cotton prices particularly those of extra-long-staple weakened in 1962.

LISTENING POSTS

The Patter of Many Feet

By Our Special Correspondent

NEW DELHI:

COUNTING FEET is sometimes more advantageous than counting heads. "Patriot" describing the presentation to the Speaker of the Lok Sabha of the Communist-organised "great petition of the people" called it a "historic" march of four lakhs of feet through Delhi streets. It is a mystery why the counting did not extend to toes. Had it done so, "Patriot" could have reached the resounding figure of two million.

Other reports were less generous in their arithmetic. "The Statesman", for instance, could spot only 75,000. Some others, not wanting to commit themselves, were rather vague. Thus, "The Hindustan Times" simply said that the demonstration was the biggest in the Capital in recent years. The Press Trust of India reported, again rather vaguely, that the numbers were more than 50,000, while according to the Delhi Police Control Room, the processionists numbered only about 30,000.

But what was important was not how many people exactly took part in the march, but whether the parade actually made any substantial impact on the public of the Capital. Here what the Communists expected to go off with a bang seems to have ended in a whimper. The people of Delhi were largely unmoved and if it was the intention of the march to work up pressure against the Government, even Mr. Dange cannot truthfully claim that the game had been worth the candle. A measure of his discomfiture may be had from the fact that he has confessed that he will have to try the trick again, come December. Meanwhile, if the Communists would permit themselves to become wiser and not simply sadder, the fiasco of the "historic" march should teach them that their chances of ending their isolation from the people by posing as the party of mass discontent are dim indeed.

There are two aspects to the statement made by Mr. C. Subramaniam in Parliament on the Bokaro steel project which require careful consideration. The Minister stated that the maximum indigenous equipment and talent would be made use of in commissioning the plant. Secondly, the rest of the equipment required would be obtained through global tenders from such countries as are willing to supply on long-term credit. Taking the second aspect of the problem first, the financing of the fourth Plan has also to be kept in view. The US Government had already made it clear that any aid for Bokaro would have to be a part of the overall credit to India. This also applies to the UK and West German Governments, which are expected to finance also the expansions of Durgapur and Rourkela Steel Mills respectively. In other words, the aid for Bokaro from these three major credit extending countries will have to be at the expense of some other project in the fourth Plan. This leaves France, Italy, Belgium, Austria and Japan in the field. In the case of most of them, it is export promotion credit that has so far been extended to India. India may get some equipment on credit from them, but only on terms which may make Bokaro even more costly than was estimated by the US Steel Mission. So far as the Soviet Union is concerned, the problem of aid to Bokaro bristles with many uncertainties and difficulties — political, financial and technical. In any case, it is certainly a long-drawn-out process to secure equipment for Bokaro on any global credit basis.

The first aspect of the problem is even more disturbing. It is no longer a secret that Messrs. Dastur and Company are being actively considered for appointment as Consultant to

this Rs. 500 crores project. The principal argument advanced in favour of this arrangement seems to be that Indians will never be able to acquire experience unless they are given the opportunity to make mistakes. Whether the complex and vital project of Bokaro should be chosen as the guinea-pig is a question to be seriously considered.

There is yet another aspect to this problem. The firm in question was appointed as Consultants for the Alloy Steel Project to be set up at Durgapur. Soon after its appointment, a Canadian firm, Atlas, was appointed as "Production Consultants". This episode may be repeated.

This should not be taken to mean that Indians should not be given a chance to learn. The better course might be to form a small consortium, including Dastur and Company. This will ensure smoother co-ordination for commissioning the plant and enable Dastur and Company to gain the necessary experience without excessive cost to the tax-payer and the steel-user.

The 13th report of the Public Accounts Committee, 1963-64, relating to the Appropriation Accounts (Railways) 1961-62, and Audit Report (Railways), 1963, under the Chairmanship of Mr. Mahavir Tyagi, M.P., brings out some of the gross irregularities in conducting the affairs of the Indian Railways, resulting in large losses. On budgeting and control over expenditure, the Committee has come to the conclusion that the progress of expenditure and liabilities incurred under the grants sanctioned by the Lok Sabha were not properly watched, and that this resulted in excessive supplementary demands and large savings at the end of the year.

The total value of stores with the Railways (including scrap in the case of certain railways) was valued at Rs. 85 crores in 1961-62 out of which about 8 per cent of stores

We record with deep regret the passing away of Mr. J. G. Gadkari, Senior Assistant Editor, "Eastern Economist", at Thana near Bombay, on the morning of Saturday, the 14th instant.

The late Mr. Gadkari joined the staff of this journal in 1945 and served it without interruption until his death. He rose to a high position in this organisation, functioning as its Acting Editor for some time during the last year. His last contribution for this journal appears as the second Leading Article in this issue. The late Mr. Gadkari was a scholarly writer with a high sense of responsibility and scrupulous regard for facts. His lawyer's training and background gave to his writings a persuasive quality which was further strengthened by the restraint with which he always used his pen. Gentle and unassuming, Mr. Gadkari was greatly respected in his profession and in his death "Eastern Economist" has suffered a great loss and his colleagues a valued friend and co-worker.

valued at Rs. 6.67 crores were declared "surplus". The ratio of surplus stores has been steadily increasing from 4 per cent in 1957-58 to 8 per cent in 1961-62. The explanation of the Financial Commissioner that a certain procedure was being followed in the disposal of the surplus stores did not carry conviction with the Committee. The rising percentage clearly indicated that the method outlined by the Financial Commissioner was not being followed by the Railway Administration as there could be no possible reason for the steady increase in the value of the surplus stores.

Again, there were losses due to negligence on the part of the Administration and also owing to certain avoidable expenditures. In one case, the losses were incurred due to irregular rejection of a tender with a lower quotation. Wasteful expenditure on old and defective earthmoving plant also came to the notice of the Committee. Heavy expenditure on stores and their eventual scrapping due to non-utilization caused losses running into lakhs of rupees. Losses were also encountered on account of damages and missing parts in wagons supplied to collieries. Various other kinds of irregularities such as undercharges and freight outstanding against firms, delay in recovery of railway dues and suspected fraudulent payment of stores bills, indicated the unsatisfactory state of accounts in the Railways. A case of fraud continued for ten years indicating, in the opinion of the Committee, deplorable lack of vigilance on the part of the Administration. Another case of leakage of revenue due to over-loading of wagons, in the absence of weighbridge facilities, was examined by the Committee in 1961-62. It was reported that the excess loading was as much as 6 to 7 tons per wagon in some cases. Negligence in this case cost the Railways heavily. The Committee has pointed out that the Railway staff could mark different scales of measurement in each wagon for loading various types of materials and insist on the consignees loading according to scale.

Dr. Raul Prebisch, Secretary-General of the UN Conference on Trade and Development, said here last Saturday that this Conference, opening in Geneva in March next, would be dealing with the fundamental issue of the widening trade gap between the developed and the developing countries. Since 1955, he added, there had been a serious tendency of the terms of trade going against the developing nations and this had to a very large extent cancelled out the advantages they derived from increased inflow of capital of any kind. If the rate of economic growth in the under-developed countries was to be stepped up, corrective measures had to be taken to arrest this tendency.

The most important issue to be discussed at the Trade and Development Conference, therefore, will be the evolving of a new form of international division of labour with a view to promoting exports of manufactured goods from the developing countries. The developing countries could not continue

EASTERN ECONOMIST

569

to be mere exporters of primary products which did not enjoy the advantages of manufactured goods, Mr. Prebisch asserted. With the idea of stepping up the export earning of the under-developed countries from primary goods, the Conference will, of course, be considering how best the present restrictions on their imports by the industrially advanced countries can be removed or relaxed. The developing countries are said to be receptive to this new line of thinking.

Another important issue that will come up for discussion before the Conference will be the fostering of trade with the socialist bloc where after initial sacrifices, levels of incomes and consumption have been going up rapidly. A related issue for consideration will be the institutional changes—strengthening of the GATT or its replacement by a new world trade organisation—that might be warranted. India, it is understood, favours the setting up of a new world organisation for promoting trade with the socialist countries. This is because of the fact that the trade of the socialist countries is not built on tariffs and cannot be brought within the purview of a mainly tariff negotiating machinery such as the GATT. She, however, would not like the new organisation to absorb the existing machinery of the GATT, which should continue with increased membership as a forum for tariff discussions. The new trade body may be entrusted with the task of looking after the larger problems of international trade and payments and with the changes in the economies of member-countries that might be required for keeping world trade continually expanding.

The Minister for International Trade, Mr. Manubhai Shah, who had been offered the chairmanship of the Conference is understood to have expressed his inability to accept it. The United Arab Republic's Trade Minister is now likely to be approached.

**

The President has issued an Order making certain amendments to the Government of India (Allocation of Business) Rules, 1961. The effect of this Order is that a new Department, namely the "Department of Co-ordination" has been created under the Ministry of Finance from September 1, 1963. From that date, the Ministry of Finance consists of four departments, namely, (1) Department of Economic Affairs, (2) Department of Expenditure, (3) Department of Revenue and (4) Department of Co-ordination.

The following matters will fall within the scope of the Department of Co-ordination: Statutory grants to States provided for in the Constitution and ad hoc grants and loans to them for financing their development schemes and other approved purposes; Local Taxation; State Finance; Capital Budget; Co-ordination in regard to important economic issues other than those handled by the Department of Economic Affairs; Planning and Development; Grants to the Indian Institute of Public Administration; Scrutiny of Central and State legislation having financial and economic implications.

Ministers and Their Critics

From Our Correspondent

BOMBAY:

NO-CONFIDENCE motions against the Congress Governments were pressed both in Gujarat and Maharashtra. All opposition members, including Mr Bhailalbhai Patel, the Swatantra leader who sponsored the no-confidence motion in Gujarat Assembly, paid glowing tributes to the regime of Dr Jivaraj Mehta which they were censuring. In the words of Mr Bhailalbhai "there is none in Gujarat who can match Dr Mehta. Even at this age he works very hard. Nobody can ever doubt his honesty and integrity." His only complaint, however, was that Dr Mehta was trying to shield his corrupt colleagues and party members. Any Government

which replaced the Jivaraj Government would not take the State further towards socialism but would be based on the cult of personality on the Russian pattern. The obvious reference was to the super-imposition of Mr. Morarji Desai's leadership on the organizational group of the Gujarat Congress, which was making a determined bid to oust Dr Jivaraj Mehta. The debate resulted in Dr Jivaraj Mehta winning a confidence vote by a handsome majority from the Assembly. He resigned his office within minutes of his winning the vote of confidence. His resignation "because of disagreement with the members of his party on a fundamental issue" was accepted by the Governor, who requested him and his Govern-

September 20, 1963

ment to continue till a new Government was formed.

'The fundamental issue' to which Dr Mehta referred was the position of the leader—whether he should act according to his own conscience and convictions or submit to the wishes of an outsider (Mr Morarji Desai). His difference with Mr Morarji Desai came to the fore with the 10-year rule controversy at the Bhavnagar Session of the Congress. The differences between the two actually date back, however, to the formation of Gujarat State in May 1960 but the rift widened until the showdown. Immediately after the resignation of Dr Mehta, the dissidents were understood to have contacted Mr Morarji Desai and sought his guidance in the selection of a new leader.

Extravagant Ministers

In contrast, the no-confidence motion against the Kannerwar Government in Maharashtra started on a tame note. The motion of no-confidence was sponsored jointly by all the opposition groups. Mr P. D. Rahangdale introducing the motion said that after the Chinese invasion people belonging to different parties forgot their differences and worked unitedly to help defence efforts. The people of Maharashtra, however, started losing confidence in the Government within a period of nine months. The Ministers and Deputy Ministers spent Rs. 90,000 by way of travelling and daily allowances within 3½ months of the Emergency. When people were told to tighten their belts, Ministers and their deputies did not economise. No efforts were made to hold the price line, hoarders, blackmarketers were not brought to book and the 'sugar muddle' only revealed the incompetence of the Administration. The Labour Department was blamed by Mr K. N. Dhulup for the 'unrest in the industries.' Its attitude towards workers was vindictive. The reactions of the Chief Minister, Mr Kannerwar, after the end of the civic strike contributed to the Government losing labour's sympathies. He charged the Government with complacency in the Krishna-Godavari water dispute. The Government had also failed to press the border dispute with Mysore. The Administration took no action against those who had misappropriated money in the co-operative societies. Mr Kannerwar, the Chief Minister, replying to the three-day debate said that the Opposition had failed to single out any instance during the last 305 days of his Ministry to warrant the censure motion. The Chief Minister's speech interspersed with lyrical quotations evoked frequent applause. The censure move was lost by 36 votes in its favour and 187 votes against it. The no-confidence motion moved in the Maharashtra Assembly was merely a link in the chain of such motions planned by opposition parties.

**

None of the irrigation and power projects in Maharashtra would suffer for lack of water in the third and fourth Plans. This was the assurance given by Dr. K. L. Rao, Union Minister for Power and Irrigation, when he visited Maharashtra a few days ago. The problem of distribution of the Krishna and the Godavari waters was not discussed at the talks. The matter was to be taken up with Dr. Rao after the current session of the Legislative Assembly. The State would have to face a shortfall of 25 TMC at the end of the third Plan. The State was allotted 400 TMC of water against the requirement of 380 TMC but the conversion of some of the projects

Although the Bombay short-term money market was ruling around 3 per cent, there was an easy tendency all-round. The current quantum of idle money in the City is placed around Rs. 7 crores. The call rate is expected to ease in the next few days notwithstanding the decline of Rs. 9 crores in the aggregate deposits of scheduled banks during the first week of September. There was heavy accumulation of funds in Calcutta where the call-rate was reported to have drifted to a new low level. It is expected that the rate would settle down around 2 per cent in Bombay soon. This in turn would lead to more investment in Treasury bills.

The reported willingness of the Finance Minister, Mr. T. T. Krishnamachari, to consider proposals for stimulating economic recovery has imparted a bullish fervour to the share market. In Bombay, the last day of the settlement witnessed renewed buying and hurried short-covering in selective scrips. Reports that the LIC had purchased large parcels of a few popular scrips contributed also to bullish sentiment. The bullish trend in the share market coupled with the easy conditions in the short-term money market was reflected in a fall in the 'badla' rate, for carry over of business from September 21 clearing to October 8 clearing, from 6.5 per cent to 5.9 per cent and the 'badla' index declined from 91 to 84. The current 'badla' rate was the lowest touched during the year.

**

The Reserve Bank of India released on September 10 the Report of its Central Board of Directors to the Government on the economic situation. The period of review relates to the year ended June 30, 1963. The Bank's income during the year under review amounted to Rs. 58.1 crores while the expenditure came to Rs. 11.6 crores. The net profit available for payment to the Central Government in terms of Section 47 of the Reserve Bank of India Act amounted to Rs. 44.5 crores as compared to Rs. 43.5 crores in 1961-62. The Reserve Bank highlighted the need to make every effort to maintain a reasonable degree of financial stability while reinforcing the measures for defence and development. According to the Report, agricultural production remained 'more or less static' in 1962-63 while industrial production picked up, especially after the Emergency. Available indicators point to a 'substantial increase' in aggregate demand. Government expenditures on consumption and investment increased by 30 per cent in 1962-63 and there was a sustained rise in investment by the private sector also in 1962. There was a rise of 4.6 per cent in wholesale prices in 1962-63 against a rise of 1.5 per cent in 1961-62 and 2.8 per cent in 1960-61. The Report adds: 'Position outlays of the private sector, increasing also the direct demand for food of the agricultural sector and reducing the marketable surplus. There were growing budgetary deficits in spite of an increase in tax revenues. The Report highlights the key role of agriculture in the Indian economy and indicates the future role of agricultural sector as a source of revenue. According to the Report, the performance of the Centre in the field of additional taxation had already exceeded the five-year target set in the third Plan. This is a considerable achievement and any further substantial expansion of tax receipts will only be feasible on the basis of an appreciable increase in production.'

September 20, 1963

increased dividends and bonus issues in the offing. Interest has also been stimulated by the possibility of a reduction in the idle capacity of industry now that prospects have improved for a larger quantum of maintenance imports. But at best these are only contributory influences. What is really at the back of the current enthusiasm is the expectation that Mr. T. T. Krishnamachari will soon initiate steps that will get the economy moving upward again.

**

The encouraging trend in export auctions in Calcutta for some weeks now tends to confirm the belief that India will be able to step up its exports of tea considerably this year. There is reason to believe that our export promotion measures are beginning to pay dividends. Efforts in this regard are to continue with increased vigour and the Tea Board is now concentrating on projecting the image of Indian tea in various overseas markets besides taking steps to cater to the changing tastes of consumers. This is evident from the proposal currently under consideration for the manufacture of instant tea.

In recent years consumers have been showing increasing interest in instant tea and as one of the major tea producers in the world it is but natural that India should take note of this preference. Instant tea will be a great help in popularising tea in European markets, where, thanks to the nil tariff which will become operative from the beginning of next year, the Tea Board will soon be embarking on a tea propaganda drive. During the current year the Board's activities will cover Australia and Brazil also. Thus conditions conducive to larger exports are being created. It is also expected that the USSR, already the third biggest consumer of Indian tea, will substantially increase its offtake under the new trade agreement between India and that country. According to Mr J. Mukherjee, Director of Tea Promotion, Tea Board, who had been to Moscow in connection with the Indian exhibition there, the USSR has agreed to purchase tea worth Rs 2.50 crores over and above the purchases to be made under the agreement.

Export Prospects Bright

While it is thus gratifying to note that prospects for expanding tea exports are quite bright, the trend of tea production is far from encouraging. One of the essential prerequisites to success in our export promotion endeavour is progressively increasing production. If we are to export more we must have more tea at our disposal. While it will be all right to curb domestic consumption so that we can export more, it will be neither practicable nor justifiable to peg it at a low level all the time. So the only answer to this problem is an increase in production. Unfortunately the record in this regard has been disappointing so far. In the current year in the first eight months output has been lagging behind the level touched even last year, itself a bad year for tea production. According to the Chairman of the Tea Board, the shortfall would be made up and the net result will be a sizeable increase in output. In his view the total Indian crop will be in the environs of 370 million kg. as against 327 million kg. last year. But going by the performance so far and the crop reports, it would appear that it is unlikely that in

the remaining four months the shortfall will be made up and a rise is recorded. Tea circles tend to believe that 1963 will be another disappointing year as far as tea production is concerned. Some go to the extent of averring that the 1963 crop will be smaller than the previous year's. The setback is attributed by the tea industry to the slow progress of new planting and replanting. While it is encouraging to find that Government is thinking in terms of providing fresh incentives to the tea industry for increasing production, the fact remains that additional quantities of tea cannot be produced overnight.

**

The gunny market is presently displaying a subdued trend in the absence of fresh foreign enquiries. Except for some business with Sudan early last week, no new orders have materialised. Operators are also reluctant to extend commitments in view of the IJMA decision to continue capacity working of mills up to the end of October. Meantime the statistical position of jute goods continues to be satisfactory. Production of jute goods during August amounted to 106,500 tonnes comprising 45,700 tonnes hessian, 42,700 tonnes sacking and 18,100 tonnes other goods. As compared to the previous month output has declined by 2,400 tonnes. This is due to the fact that mills in August worked for 208 hours while in July they worked for 216 hours. It will be seen that the emphasis in production is on hessian. Stocks of jute goods at the end of August show a small decline of 200 tonnes at 104,000 tonnes. A decline of 2,800 tonnes in sacking has been almost neutralised by an increase in the stocks of both hessian and other goods by 1,200 tonnes and 1,400 tonnes respectively. From the two sets of figures pertaining to stocks and production, it will be clear that the offtake during the month has been as much as the month's output.

As far as the raw jute market is concerned there has been a slight setback in prices as buyers are reluctant to extend commitments in view of the declining trend in goods prices. It is also possible that the increase in arrivals is influencing offtake. It is however believed, at least in official circles, that the absorption of the accelerated imports from the interior growing regions will not pose any serious problem as steps are already being taken to meet the situation. In the first place, the mills will be required to absorb progressively increasing quotas on a compulsory basis. Moreover the Jute Commissioner has now been given powers to direct mills to buy from particular markets with a view to relieving any temporary selling pressure that may develop in any region. The State Trading Corporation is also to enter the market in a big way while the Jute Buffer Stock Association is preparing to increase its absorption sizably. The JBSA will have no worry on the score of finance because it is reported that the State Bank of India has agreed to revise the credit level upward to Rs 15 crores as against the present level of Rs 10 crores. That substantial additional credit will be required by the JBSA will be evident from the fact that already the credit obtained by it from the State Bank has reached a level of Rs. 8 crores.

New Deal for Plantations?

From Our Correspondent

MADRAS:

THE OBSERVATIONS made by Mr. Manubhai Shah, Union Minister for International Trade, at the Seventieth annual meeting of the United Planters' Association of Southern India, were considered constructive though it is not yet clear how his suggestions will be implemented. It is comforting to note that the important part played by the various plantation industries in earning valuable foreign exchange for the country is now being more clearly realised. Particularly after the

invasion of the country by the Chinese in North-East India last November there has been greater anxiety to develop the potentialities of the different plantation industries in this part of the country. Indeed, there has been interested buying of scrips of many large-sized plantation companies in the past few weeks and the Board of Directors of at least one big plantation company has been reconstituted.

In Madras, Kerala and Mysore, besides tea, coffee and rubber, cardamom, lemon grass oil and other plantation pro-

ducts are grown on a large scale and the President of the UPASI justifiably pointed out that the plantation industries alone account for the largest net amount by way of foreign exchange and that they deserved to be encouraged to a greater extent than hitherto. Unlike other industries, it is not necessary in the case of tea or coffee estates to incur large expenditure on plant and machinery though it has been latterly emphasised that larger expenditure should be incurred on improving the quality of teas produced and replacing worn-out plant and machinery. For some time past South Indian estates have been more keen on producing higher grade teas by installing CTC machinery. There is also anxiety to increase the area under the crop and improve the yield per acre.

The loans given by the Indian Tea Board and the Indian Coffee Board have no doubt been welcome. But it is felt that the various industries cannot make desired progress unless wage costs could be kept down by increased productivity and the Government were not so keen on mobilizing tax revenues as they are now. In fact, it has been criticised that, in the case of estates which are producing commoner qualities of tea, the increase in the levy of a surcharge on excise duty and the withdrawal of the facility for draw-back of excise duty have to a great extent nullified the advantage arising on account of the abolition of the export duty. The industry must be given the necessary incentives in the shape of tax rebates for loss of income on account of replanting, apart from subsidies, as there is increasing competition from Ceylon, Kenya, China and other countries. Indian estate-owners should not be handicapped on account of higher working expenses.

Plantation Shares Booming

Mr. Manubhai Shah should be aware of the various problems confronting estate-owners in this part of the country though he said that the financial assistance given to the small estates and the subsidy to rubber growers, in order to push through the replantation programme, were liberal and compared favourably with the measures adopted in Malaya and elsewhere. He, however, recognized the need for granting incentives in respect of excess exports and concessions in excise duties on excess production. The incentives for additional exports would have to be in the nature of a tax rebate or facilities for the plantation producers to import certain products which can be sold at a profit within the country. In regard to increase in production the policy adopted towards the sugar industry might be copied with advantage though there will be some difficulty in evolving an equitable formula. But keen interest has been aroused by these statements and the Madras stock market has been more active than for sometime past. Plantation shares have been in great favour. The prospect of larger exports to the Soviet Union and other East European Communist countries are also encouraging while the Union Minister asserted that by 1965 the surpluses in many directions would have disappeared and a problem might arise where it would not be easily possible to meet the increase in demand. Even now the offtake of various plantation products accounts for around 25 per cent of the total exports. It may not be possible to improve the percentage with an expanding volume of trade, but in absolute terms the available foreign exchange earnings could be very much higher.

That there are possibilities of shortages developing or surpluses diminishing is amply proved by the experience of the rubber and coffee industries. Not long ago there was a shortage of rubber and quite a large amount is being spent at present on the imports of natural and synthetic rubber. It is now expected that there would be some displacement of imports with the stepping up of output by the new synthetic rubber plant at Bareilly. But there is such a large gap that it will be necessary to permit imports until such time as replantation programmes start yielding results. There are even proposals for promoting some more synthetic rubber units. From the short-term angle any addition to synthetic

rubber production will be extremely helpful but a larger production of natural rubber would be helpful in providing greater employment besides avoiding expenditure on plant and machinery needed for manufacturing synthetic rubber. The subsidy granted is now considered advantageous. But the rubber growers have to be induced to replant a larger acreage with some additional incentives as considerable ground has to be covered.

In regard to coffee, three years back it was feared that there would be a huge surplus and the industry would be bothered with the marketing of its output. But with a continuous increase in internal consumption and a good demand for Indian coffee in overseas markets the Indian consumer is not able to get his coffee in the required grades. The Coffee Board has been encouraging estate owners to increase the output of plantation grades and it is gratifying to note that, latterly, extension and replantation of acreage have been carried out with Arabica varieties. It has, therefore, been emphasised that apart from any incentives and concessions in excise duty that might be announced by Mr. Manubhai Shah the State Governments also should not adopt selfish policies and instead formulate the tax measures in such a way that the export effort is not impeded to any extent.

The reaction to the policy announced by the Central Government in regard to payment to cane growers and rebate in excise duty in respect of additional production in 1963-64 is not quite clear in this part of the country. The rebate in excise duty will no doubt be helpful. But it is felt that the basic year will not be quite favourable to the South Indian mills. In 1961-62, the output was maintained at a fairly high level and only in 1962-63 there was a drop in production on account of the diversion of supplies for conversion into jaggery. The crop also was smaller in size. But it has been announced that only in respect of excess production over 1961-62 the rebate in excise duty will be granted. Some mills in the South might benefit by the concession granted to them in respect of the additional output during the current special season. But the non-availability of cane is a limiting factor and some mills in Madras State and Mysore may not be even able to achieve the output recorded in the last season. The higher rebate given for additional output in November will not be helpful to factories in this part of the country though the smaller rebate available for late crushing may be useful. The only satisfactory feature relates to the reports that the standing crop is expected to be provide a record yield and with strict control over the movement of gur and titles to the mills. In any case, the importance of maximising output is generally recognized and with the new mills coming into full production during the next season, the Southern States may acquit themselves even more creditably than before.

The acute shortage of rice in Maharashtra, West Bengal and Assam has led to larger buying of this cereal from Madhya Pradesh and Andhra Pradesh which have surplus to export. The availability of rice in Madras State has been fairly satisfactory and in spite of an abnormal rise in prices in Calcutta and elsewhere, the consumer in this part of the country has had the benefit of fairly stable prices so far. But some developments in recent weeks have been disturbing. In order to level of prices in West Bengal and Maharashtra, the State Government has permitted exports against specific quotas on the them at procurement prices. The traders have found it profitable to accept this condition as the margin on exports is very attractive. The rush for buying coarse varieties of boiled rice has resulted in a slight firming up in prices in Andhra Pradesh and Madras and it is feared that if traders in Maharashtra also purchase fairly large quantities from Andhra, prices might move up further.

The moving finger writes

TO MR. NATH PAI, evidently, the sound of his voice is as the Music of the Spheres. His itch to talk in the House as often and for as long as possible is perhaps to be excused. Lacking Mr. Asoka Mehta's air of profundity but sharing his ambition to be taken seriously, Mr. Nath Pai has been attempting to make it a full time job of being an earnest member of the PSP. Unfortunately for him, he has come to Parliament at a time when his group has lost pride of parentage without discovering any pleasure in progeny. The PSP today is a party with a past which is not worth talking about and a future which is not worth troubling about. Hence, Mr. Nath Pai's passion to be noticed in the Lok Sabha. His tactics amuse but do not impress. He would say with exaggerated politeness that he did not want to interrupt the Chair or take the Floor out of turn, but that would only be a prelude to his starting off on one of his clever-clever lectures to the ruling party on cabbages and kings.

★★

As a specialist in raising points of order which are almost always pointless, Mr. Nath Pai is hard to beat. Last week, for instance, he tried to stage an altogether artificial discussion over what he described as the impropriety of Ministers making policy statements at their party meetings thus, ignoring the right of the House, when in session, to be informed first of the government decisions relating to important matters of public interest. Mr. Nath Pai, of course, had the facts wrong. In the first place, as both the Prime Minister and the Finance Minister explained, it was just not true that any statement about the Government's intentions relating to gold control was made at the meeting of the Congress Parliamentary Party as was alleged by some Members on the Opposition benches. In fact, gold control was not on the agenda of the meeting at all and if there had been any discussion among Congress MPs, it was necessarily of an informal and casual nature without any member of the Government participating in it. This apart, can the party system of parliamentary government work at all if it is insisted upon as a rigid principle that no member of the Government should ever give any indication of how the Government might respond to matters of public interest raised at meetings of the ruling party? In fact, it is not uncommon even for members of other political groups or parties to seek a meeting with the Prime Minister or other Ministers to discuss matters of public interest and then issue formal statements or otherwise supply information to the Press regarding the manner of ministerial response or the possibilities indicated of the way the Government is thinking or might act.

★★

In this context, the question was raised whether information regarding the proceedings of the meeting of the ruling party, indicating the Government's intention regarding policy matters, could be communicated to the Press. The issue surely is a pragmatic one. Where a large number of people take part in a discussion of public importance or public interest it is in the nature of human beings that what they have talked about should come to be published sooner or later. This apart, many MPs have a natural desire to cultivate the Press, and although strict instructions may be issued that there should be no leakage of the proceedings of a party meeting, it is common experience of journalists in the Capital that, before the evening is much older, half a dozen or more

MPs have been found willing to talk, even if each has his own version, with the result that quite often no two versions are found to agree.

In the circumstances, the only right and reasonable procedure to adopt is for an authorised spokesman to be instructed to brief the Press as precisely as possible and as informatively as may be necessary. Otherwise what happens is not that the proceedings are kept confidential but that misleading and often deliberately distorted versions manage to find their way into print.

★★

It is interesting that, in the first four months of the current financial year, small savings collections have amounted to Rs. 25.44 crores or about twice as much as the sum of Rs. 8.16 crores collected during the corresponding period last year. These collections are an all-time record for this period (April-July) since the movement started 20 years ago. The previous record was Rs. 16.63 crores in 1960-61. This year, in July alone, the net collections reached the level of Rs. 12.23 crores. I see that Mr. Manubhai Shah has lately been claiming more than once that the improvement in our export earnings is due to the promotional efforts of his Ministry. I suppose Mrs Tarakeswari Sinha may similarly want the credit for the improvement in small savings to go to her. After all she had done a lot of 'padayatra' for this purpose.

Seriously, it is gratifying to find that the better response from small savers has been prompted by the urge among our people to contribute their savings liberally to national defence. The appeal of the National Defence Certificates and Defence Deposit Certificates has largely been responsible for the record sales of small savings securities during April-July this year. Cumulative Time Deposit accounts are also proving popular, probably because they serve as an alternative to the scheme of Compulsory Deposits for non-income tax paying employed persons.

★★

The Reserve Bank of India is reportedly planning to set up an overseas organisation to conduct market research in various regions of the world for the purpose of export promotion. I should very much like to know how the Minister for International Trade feels about this proposal. I should be surprised indeed if Mr. Manubhai Shah takes kindly to it. I myself see no reason at all why the Reserve Bank of India should undertake an activity which is certainly not germane to its central banking functions. Apart from the fact that our Chancelleries abroad are supposed to look after commercial and trade matters, the various industries and trades are coming forward more and more to undertake market studies and research into consumer preferences for their products in foreign countries. In many cases the Government co-operates with such programmes. It is obvious that this tendency should be encouraged as much as possible. If any further special effort is necessary it must surely be the responsibility of the Ministry of International Trade to organise it. Already some steps have been, or are being, taken in this direction. It might merely mean a duplication of expenditure and establishment by the Reserve Bank of India to compete in this field. If its itch to research is indeed irresistible the Reserve Bank ought to find many other fields of study nearer home and more relevant to its own *raison d'être*.

V.B.

Trade Winds

U.N. CONFERENCE ON TRADE

THE UNITED Nations Conference on Trade and Development will be held in Geneva from March 23 to June 16, 1964. The conference will endeavour to adopt concrete measures to achieve the following goals: (a) creation of conditions for the expansion of trade between countries at a similar level of development, at different stages of development and having different systems of social and economic organisation; (b) progressive reduction and early elimination of all barriers and restrictions impeding the exports of the developing countries, without reciprocal concessions on their part; (c) increasing the volume of exports of the developing countries in primary products, both raw and processed, to the industrialised countries and stabilising prices at fair and remunerative levels; (d) expansion of the markets for exports of manufactures and semi-manufactures from the developing countries; (e) provision of more adequate financial resources at favourable terms, so as to enable the developing countries to increase their imports of capital goods and industrial raw materials essential for their economic development and better co-ordination of trade and aid policies; (f) improvement of the invisible trade of the developing countries particularly by reducing their payments for freight and insurance and the burden of their debt charges; (g) improvement of the institutional arrangements including, if necessary, the establishment of new machinery and methods to implement the decision of the conference.

These topics take into account the fundamental points relating to international problems of developing countries, which were enumerated by the General Assembly at its 17th session at which the Assembly authorised the holding of a trade conference. The Preparatory Committee will meet again in New York in February, 1964 to review the final arrangements for the conference, including possible modification of the provisional agenda. Dr. Prebisch, who has already exchanged views on the work of the conference with the officials in Argentina, Belgium, Brazil, France, Peru, United Kingdom, Uruguay, United States of America and the European Economic Community, was in New Delhi last week for consultations with the officials of the Government in regard to this conference.

RAIL CAPACITY

According to the preliminary information received in the Railway Board, railways loaded on an average 21,525 wagons daily on broad gauge last month. This represents an increase of 8 per cent over the loading in August, 1962. On the metre gauge average daily loading totalled 10,300 tons during the month. These figures are inclusive of the emergency traffic carried by the railways. In coal transport, railways met during the month the entire requirements of the steel plants as well as washeries and moved whatever was offered at the outlying coalfields. Besides, they loaded on an average 4077 wagons for other consumers against a target of 3816, exceeding it by more than 260 wagons a day. They could have moved even more if only the collieries were able to utilise the full allotment of wagons. In addition to detention of wagons and the fall in loading on Sundays and holidays, a number of wagons were returned empty by the collieries during the month. The impressive performance of the railways is also reflected in the clearance of outstanding registrations which stood at 14,000 in August as against 62,000 during the same period last year. Except Waltair in the

South and east of Siliguri in Assam, the entire 57,000 route kilometre railway network is now practically free from any quota restrictions on goods traffic. In fact, several zonal railways have been soliciting, through newspaper advertisements, demands for wagons from the trade and industry.

FOREIGN EXCHANGE FOR PORTS

The total foreign exchange requirement for the development of major ports during the third five-year Plan was about Rs. 56.35 crores. An amount of Rs. 33.48 crores had been obtained in the shape of foreign aid from World Bank loans (Rs. 2,230 lakhs), International Development Association Credit (Rs. 714 lakhs), West German Credit (Rs. 4 lakhs), Yen Credit (Rs. 22 lakhs), Colombo Plan (Rs. 4 lakhs), U.S. AID (Rs. 230 lakhs), United Kingdom Credit (Rs. 14 lakhs), Yugoslavia Credit (Rs. 40 lakhs), Dutch Commercial Credit (Rs. 90 lakhs). In addition, an amount of Rs. 1.57 crores had been released from the free resources of the Government of India. Negotiations were being carried on for World Bank assistance to the extent of Rs. 137 lakhs for Madras port and Yugoslav credit of Rs. 13.14 lakhs for Visakhapatnam port. It was proposed to negotiate with the World Bank for a loan of about Rs. 13 crores to cover the foreign exchange requirements of the Haldia Dock System. As regards the balance also, as far as possible, credit sources available from time to time, will be made use of.

COTTON IMPORTS FROM USA

India will import from the U.S. under P.L. 480 about 1,90,000 bales of cotton from September, 1963 to August, 1964. Imports from the U.S. which would be worth Rs. 11.38 crores, would be an addition to the normal imports from Egypt, Sudan, Kenya and Tanganyika. It was pointed out by Mr. Manubhai Shah, Minister of International Trade, in the Lok Sabha that it was the policy of the Government to build up buffer stocks of various commodities and cotton was one of them. Last year about 4.5 lakh bales of cotton was one imported under P.L. 480. A further 1,50,000 bales would be imported against last year's allocation. Imports under P.L. 480 varied from year to year and depended upon the allocation by the U.S. Government. There had been a fall of about 30 million yards in the export of cloth last year, but this was more than made up by the export of handloom cloth.

MINERAL PRODUCTION

According to the Indian Bureau of Mines, the total value of minerals produced in the country during May, 1963, rose to Rs. 19.2 crores from Rs. 18.17 crores during April this year. This, however, does not include the value of petroleum, minor minerals and minerals declared as proscribed substances under the Atomic Energy Act, 1948, produced during the month. Coal accounted for 66 per cent of the total value (Rs. 12.6 crores), followed by salt (Rs. 2.84 crores), iron ore (Rs. 0.45 crore), gold (Rs. 0.39 crore), manganese ore and copper ore (Rs. 0.18 crore). The metallic minerals contributed Rs. 2.14 crores—11 per cent of the total. The individual share of the ferrous and non-ferrous groups was 7.6 per cent and 3.6 per cent respectively.

The total output of iron ore during January-May this year was 6,184,000 tons, an increase of about 8 per cent as

protective finishes that

SHALIMAR SUPERLAC

SYNTHETIC ENAMEL
AND PLASTIC EMULSION

SHALIMAR PAINT

A MEMBER OF THE COURTAULDS GROUP

Shalimar Superlac Synthetic Enamel can be brushed, sprayed or dip-applied to almost any surface. It gives a hard, glossy finish and is ideally suited for all types of domestic and industrial use. Available in 38 inter-mixable colours.

Shalimar Superlac Plastic Emulsion comes in 28 fabulous shades. It is easy to apply, odourless and gives a flat finish.

Quick-drying and washable, both these Shalimar Paint specialities have high covering capacities and are particularly economical in use.

Freedom is in peril, defend it with all your might
—Jawaharlal Nehru

PLAN FOR SECURITY

The Five Year Plan is by no means an alternative to military effort. In fact, it is a part of it. We have to prepare ourselves in every field, military, scientific, economic, agricultural and industrial.

A nation which is economically strong and productive can meet any danger.

compared to the corresponding period last year. Orissa led in the production of iron ore accounting for 44 per cent of the total output producing 5,39,000 tons followed by Bihar 2,91,200 tons and Madhya Pradesh 1,99,000 tons.

PERMIT FOR TRANSPORT OF OIL

The Inter-State Transport Commission has advised all the State Governments to issue regular permits for distances not exceeding 300 miles for oil tankers and other vehicles specially designed for petroleum, oil and lubricants movement. To avoid difficulties in the matter of motor vehicle taxation, the Commission has also suggested that the permits should be issued on a parity basis with reference to the place of origin and destination of the vehicle in question. The Commission has also decided that there is justification for the issue of 162 regular permits, in all, to public carriers on the following routes : Gauhati-Calcutta; Ichhapura-Calcutta; Kanpur-Patna; Nagpur-Patna; Delhi-Patna; Amritsar-Bombay; Baroda-Delhi; Ahmedabad-Delhi; and Madras-Bombay.

POWER PLANT EXTENSIONS AT DURGAPUR

Power plant extensions at the Durgapur steelworks costing £1,450,000 are to be built by a British firm which is to spend half the cost of the contract value in India on material and equipment and civil engineering works. Messrs. Simon-Carves Ltd. of Stockport, Cheshire, a member of the British consortium which built the steel works has received an order from Hindustan Steel Limited for plant and equipment for the extensions. The firm will be responsible for the design, supply, erection and commissioning of installations and for the associated civil engineering works. The contract calls for two coal-fired boiler units, a turbo-alternator, turbo-blower, boiler feed pumps, coal and ash handling plants, water treatment plant, pipework, instruments and controls and other works to provide for the planned increase in the capacity of the steel works by 600,000 tons a year. The Durgapur work—built for the Government of India by ISCON, a consortium of 13 British firms, at a cost of £120,000,000—achieved full rated capacity at the end of last year. The original design called for a yearly steel output of one million tons. The plant is achieving more than this rated capacity in most departments. The new extensions which will cost a total of £22 million in foreign exchange, as well as substantial sums in rupees, will bring the yearly output of steel to 1,600,000 tons.

S.T.C. TO IMPORT CAUSTIC SODA

The State Trading Corporation has been asked to import 12,000 to 15,000 tons of caustic soda solid technical grade from USA under AID Loan No. 386-H-082. The Corporation has invited tenders from the USA which will close on 25th September, 1963. The material will have 96 per cent minimum Sodium Hydroxide content and the price quoted on FAS, FOB, C & F and CIB basis but will not include the commission payable to Indian agents as the same would be settled separately in Indian rupees.

U.S. WHEAT CROP

This year's U.S. wheat crop is estimated at 1,151 million bushels, slightly larger than last year. Both exports and domestic use of wheat are expected to increase. As a result, the U.S. carry-over stock of wheat is expected to be reduced for the third year. U.S. exports are expected to be helped by an increase in demand from Western Europe, where smaller crops are expected. Reviewing the outlook for the year that began July 1, the Agriculture Department said it expected prices to be firm during most of the year, averaging near the \$1.82 per bushel government support price. "However", it

added, "toward the end of the 1963-64 marketing year the approaching 1964 crop and its much lower price support rate will have a pronounced effect on the wheat economy". The support price is scheduled to fall to about \$1.25 per bushel, and will be available only for farmers complying with voluntary acreage allotments. The U.S., however, is prepared to take steps to prevent "dumping" of U.S. wheat on world markets if U.S. prices fall drastically. Under the international wheat agreement, the United States is committed to export wheat within a certain price range. For a typical key grade, it amounts to \$1.625 to \$2.025 a bushel.

\$ 100 MILLION BOND ISSUE

The World Bank has arranged the sale, entirely outside the United States, of a \$100 million issue of United States dollar bonds. The sale, at par, was made by private placement with central banks and other governmental institutions in 29 countries.

The new bonds known as the "Two-Year Bonds of 1963", bear interest of 4 per cent, payable semi-annually, with first payment due March 15, 1964. The issue was dated September 15, 1963 and matures September 15, 1965.

The countries where the new bonds were sold are :

Argentina	Finland	Iraq	Norway
Australia	France	Israel	Saudi Arabia
Austria	Germany	Japan	South Africa
Cambodia	Ghana	Kuwait	Spain
China	Iceland	Malaya	Switzerland
Denmark	India	Mexico	Thailand
El Salvador	Iran	Nigeria	Viet Nam
			Yugoslavia

Completion of the current transaction will not affect the total of the Bank's outstanding funded debt, as an equal amount of Two-Year 4 per cent Bonds, placed outside the United States in September 1961, matured on September 15, 1963. The total outstanding obligations of the Bank amount to about \$2.5 billion of which about \$1.9 billion is denominated in United States dollars and nearly \$620 million in Belgian francs, Canadian dollars, Deutsche marks, Italian lire, Netherlands guilders, sterling and Swiss francs.

Over 55 per cent of the Bank's outstanding debt is held by investors outside the United States. Included in the holdings of these investors, in addition to non-dollar obligations, are more than \$800 million of the dollar bonds and notes of the Bank, or about 43 per cent of its total United States dollar obligations.

BRNO TRADE FAIR

The BRNO International Trade Fair in Czechoslovakia has opened on September 8 and will close on September 22. Although India is not officially participating in it this year, more than two dozen businessmen and specialists are attending the Fair.

India could learn a great deal from the publicity organised for this Fair. The material distributed by the Czechoslovakian Embassy to Pressmen at New Delhi included a broadsheet containing the press comments on the last year's Fair. There were two dozen brochures explaining almost every aspect of the Fair. There were photographs of the exhibits, particularly of machines which are due to be exhibited. There were publicity stickups which could be used on envelopes. The Trade Fair held at New Delhi two years ago had not had a fraction of this publicity material.

Company Affairs

TITAGHUR PAPER

THE TITAGHUR Paper Mills Company Limited showed, for the year ended March 31, 1963, a net loss of Rs. 20,620 after providing for all charges and making a provision of Rs. 35.55 lakhs for depreciation. Taking into account the contribution to the National Defence Fund at Rs. 1.14 lakhs, the total net loss was raised to Rs. 1.34 lakhs. The transfer of Rs. 14.75 lakhs from the general reserve and the addition of the balance brought forward from the last year at Rs. 58,939, after deducting the net loss, brought the disposable profits to Rs. 14.00 lakhs. The directors have recommended 10.4 per cent per annum dividend on First Cumulative Preference Shares, 5.85 per cent per annum dividend on Second Cumulative Preference Shares, 13 per cent per annum dividend on Preferred Ordinary Shares and Re. one per ordinary share, all absorbing Rs. 13.85 lakhs. The balance of Rs. 15,112 is proposed to be carried forward.

In his annual statement, the Chairman, Mr. D. C. B. Pilkington, explained the plight of the industry in regard to the rises in the cost of raw materials and services which did not receive a fair response from the Government. The prices of paper fixed by the Government were as laid down by the Tariff Commission in 1958; an increase of 6nP. per kg. only was granted in June, 1962. According to the estimates by the mills, it has been found that the total increase in cost was of the order of 26 nP. per kg. including the additional imposts caused by the 1963 budget. He also drew attention to the various components which went to make the additional burden of 26 nP. per kg. in the cost of manufacture of paper. The first on the list was coal, whose price was increased on five occasions so as to make a total increase of Rs. 2.26 per tonne of coal. Freight went up by Rs. 1.50 per tonne. The increases in freight as well as in Central excise duty increased the prices of sodium sulphate, rosin, lime, etc. The compulsory insurance against Emergency Risks which was introduced on January 1, 1963, has also added to cost. In the case of the Titaghur mills, the costs of manufacture have also gone up because 40 per cent of the coal supplied to the mills was being delivered by road as against the earlier assurance that 80 per cent of the coal requirements of the mills would be delivered by rail and only 20 per cent would be delivered by road. This factor alone raised the cost by Rs. 15 per tonne of coal. The industry made a representation to the Government in this regard in June, 1963, which is still under consideration. Regarding the demand for paper in the market, Mr. Pilkington gave the view that during the next three or four years demand will outstrip supply. In such a situation, there seems to be no point in sending an export promotion tour by the representatives of the industry and the trade to the Middle East, Near East and Far East, firstly because the industry may not be able to provide sufficient volume of paper for export because of the general shortage of paper in the country and also because the high cost of the Indian paper may not yield any sizable slice of the international market.

HIND CYCLES

The working results of Hind Cycles Limited for the year ended March 31, 1963 showed a gross profit at Rs. 7.87 lakhs against Rs. 1.30 lakhs for the last year. The directors provided Rs. 6.21 lakhs for depreciation and Rs. 94,200 for development rebate. The company carried forward a loss of Rs. 7.06 lakhs. Even though the working results were better than the last year, the company had still to provide for depreciation for previous years, aggregating Rs. 11.45 lakhs and dividends amounting to Rs. 4.75 lakhs. The production of the company improved from 1,11,670 cycles to 1,28,086 cycles, though even this level was lower than the capacity of the plant.

DYER MEAKIN

Dyer Meakin Breweries Limited have reported a net profit of Rs. 45.99 lakhs for the year ended March 31, 1963, after providing for depreciation and taxation, as against Rs. 60.33 lakhs in the previous year. The sales showed a significant rise from Rs. 4.42 crores to Rs. 5.41 crores in the year under report. The increased sales of the company failed to push up the net profit in the same manner due to the fact that it had to pay Rs. 1.55 crores by way of excise duty as against Rs. 1.30 crores in the previous year. The allocation to depreciation was raised from Rs. 10.93 lakhs to Rs. 15.87 lakhs. Similarly, the allocation to taxation was raised from Rs. 47 lakhs to Rs. 62 lakhs including Rs. 11 lakhs for the Super Profits Tax. The allocation to dividend equalisation reserve was also increased from Rs. 2 lakhs to Rs. 10.31 lakhs. General reserve got a smaller amount at Rs. 30.36 lakhs as against Rs. 40 lakhs in the last year. Development rebate reserve also was allocated a slightly lower sum at Rs. 5.12 lakhs as against Rs. 5.93 lakhs in the preceding year. The dividend for the year under review was maintained at 18 per cent, less tax. The directors have reported considerable progress in the new brewery at Mohan Nagar which went into production at the end of the last year. The company's plan to set up a glass factory for the manufacture of glass containers has already reached an advanced stage.

JARDINE HENDERSON

The audited accounts of Jardine Henderson Limited for the year ended March 31, 1963 showed a profit of Rs. 41.88 lakhs. Taking into account the balance brought forward from the previous year at Rs. 4.50 lakhs and deducting the loss of Rs. 6,175 on realisation of investments and assets, the balance available for appropriation was Rs. 46.32 lakhs. Amongst the allocations were included the provision for taxation at Rs. 17.12 lakhs, the provision for general reserve at Rs. 12.68 lakhs and the development rebate reserve at Rs. 2,830; the net balance available for disposal was Rs. 16.50 lakhs. An interim dividend on the preference shares at the rate of 2½ per cent in respect of the year ended March 31, 1963 was paid by the directors on 30th November, 1962, absorbing Rs. 1.25 lakhs. A further interim dividend on the preference shares at the rate of 2½ per cent paid on May 3, 1963, absorbed Rs. 1.25 lakhs. The directors have recommended payment of dividends on the ordinary shares at the rate of 7 per cent absorbing Rs. 14 lakhs. Since the principal interest of the company was in Jute Mills, which had done extremely well in the year under report, the working results of the parent company also showed equally good results.

HINDUSTAN LEVER

Hindustan Lever Limited has obtained a loan of Rs. 60 lakhs in sterling from Unilever Limited. Early this year, it may be recalled, Hindustan Lever had obtained a loan of Rs. 20 lakhs from Unilever taking the total to Rs. 80 lakhs. It is hoped that the loan will be converted into a permanent investment in India before the due date. These loans are to be utilized for financing new projects and for modernising the existing plants. In addition to the milk products factory at Etah (Uttar Pradesh) and the plan to increase the capacity of the dehydrated vegetables plants at Ghaziabad and Etah—both of which are nearing completion—the new projects included the installation of an additional glycerine still, manufacture of nickel catalyst and an additional plant for the modern research laboratory and the setting up of a

LARSEN & TOUBRO

Caterpillar Overseas S. A. Geneva, a wholly owned subsidiary of Caterpillar Tractor Co., USA, entered into an agreement with Larsen & Toubro Ltd., on September 10, 1963

From India's first Carbon Black Plant at Durgapur

at Bombay to take up fifty per cent of the share capital in Tractor Engineers Ltd., hitherto a fully owned subsidiary of Larsen & Toubro. Another agreement between Caterpillar Tractor Co., and Tractor Engineers Ltd., was also signed which licensed the latter to manufacture parts of crawler tractors. The two agreements provided for technical and financial collaboration by Caterpillar and Larsen & Toubro in the manufacture of parts of crawler tractors in India of a quality comparable to the best in the world. Caterpillar Tractor Co. of Peoria, Illinois (USA) is one of the biggest manufacturers of tractors in the world. The size of the company may be gauged from the fact that its total sales in 1962 were \$827 million and it ranked 60th in the 100 top companies of the USA. During the current year, its sales are likely to approach \$1000 million and its rank will also rise amongst the top giant companies of the USA. Currently, Caterpillar accounts for half of all the earthmoving equipment in the United States.

In India, 40 per cent of the total earthmoving equipment is from the Caterpillar Co. The Tractor Engineers Ltd., will, in the first instance, manufacture not the complete tractor but a large number of fast-replacement components so as to help maintain India's fleet of crawler tractors in use for defence, irrigation and power and various industrial projects in good working order. When the unit goes into full production, it is likely to save foreign exchange for the country to the tune of Rs. 10 million. The share capital of Tractor Engineers Ltd., will be Rs. 60 lakhs out of which Rs. 30 lakhs will be contributed by Caterpillar Overseas SA; this amount will be utilised in importing new machine tools. Under the collaboration agreement, the company is authorised to export its products but it may not be feasible to export the tractor parts in view of the vast, domestic market.

MADRAS STATE ELECTRICITY BOARD

The Madras State Electricity Board has entered the market to raise a loan of the value of Rs. 4 crores. The loan will be redeemed at the end of twelve years and will carry interest at 4½ per cent per annum. The issue price is Rs. 99.75 for a bond of Rs. 100. The subscription list will open on September 23, 1963 and will be closed on September 28, 1963 or earlier. The Bonds are fully guaranteed by the Government of Madras in regard to repayment of both the principal and the interest. The interest will be remitted half yearly after deduction of income-tax to each registered holder. Book value of the assets of the Board on March 31, 1963 was of the order of Rs. 178 crores, including investments in Government securities towards depreciation and special reserves amounting to nearly Rs. 7 crores. The assets of the Board include seven hydro electric power stations at Pykara, Moyar, Mettur, Papanasam, Periyar, Kundah 1 & 2 and two thermal stations at Madras and Samayanallur (Madurai). The total length of the network of transmission and distribution lines spread over the entire State and carrying power to the remotest village in the State was about 50,000 miles.

ASHOKA CEMENTS

The working results of Ashoka Cements Limited for the year ended March 31, 1963, showed a surplus of Rs. 15.18 lakhs (before provision for depreciation) after meeting "all outgoings of operation and management" and Rs. 7.8 lakhs towards interest charges. The allocation to depreciation was Rs. 10.20 lakhs while no provision was made for taxation. Development rebate reserves got Rs. 1.96 lakhs while Rs. 4.20 lakhs were allocated to dividend reserve. The dividend for the year was maintained at the previous year's level of 70 nP. per share (taxtable). The production of cement for the year under review at 1.75 lakh tonnes showed a significant improvement over the previous year's level of 1.39 lakh tonnes. The increase in the price of cement by Rs. 2.75 per ton which was allowed by the Government on June 1, 1963 was totally inadequate, accord-

ing to the directors, to meet the heavy increases in cost of manufacture.

FERTILIZERS AND CHEMICALS

The working results of the Fertilizers and Chemicals Travancore Limited, for the 15-month period ended March 31, 1963, showed a drop in profit from Rs. 95.65 lakhs (1961) to Rs. 28.23 lakhs; the working results for the last year were for twelve months only. The provision for depreciation was enhanced from Rs. 33.76 lakhs in 1961 to Rs. 63.88 lakhs for the period under report. After making this allocation, the net loss to the company was of the order of Rs. 35.66 lakhs which was met by drawing from "the previous year's profits carried over" and the taxation reserves not required. The company completed its second stage of expansion which introduced the oil gasification process, replacing the uneconomic wood gasification plant. The unfavourable working results were primarily due to a severe setback in production during the year under report on account of many factors such as drastic power cuts, salinity in river water and shutdowns for the change-over from one process to another. The third stage of expansion has been taken up so as to increase its capacity to 70,000 tonnes of nitrogen and 33,500 tonnes of P2O5 per annum.

KIRLOSKAR OIL ENGINES

The audited accounts of Kirloskar Oil Engines Limited showed a profit at Rs. 89.85 lakhs for the year ended March 31, 1963 as against Rs. 77.59 lakhs during the previous year, after providing for depreciation, remuneration to managing

agents and the amount set apart for paying bonus to the employees of the company. Because of the Super Profits Tax, the provision for taxation had to be increased from Rs. 37 lakhs to Rs. 61 lakhs. The amount left for distribution, after providing for taxation, was reduced from Rs. 40.58 lakhs during the previous year to Rs. 28.85 lakhs, despite a higher profit during the year under report. The directors have recommended lowering of the dividend from 16 per cent to 12 per cent on equity shares so as to save resources for the expansion programmes. The demand for the products of the company has been fairly good and the company was making efforts to shorten the period of delivery to a minimum. Efforts were being made to improve the quality of output and efficiency and prompt after-sales-service. Exports also expanded during the year and the company sold its engines in a few more markets in North Africa and Latin America. The search for new markets continues.

DELHI CLOTH

The Delhi Cloth & General Mills Co., Ltd., entered the market on September 9 to raise Rs. 50 lakhs through 2 lakh 9 per cent Fifth Redeemable Cumulative Preference Shares of Rs. 25 each at par. The subscription list was closed on the evening of September 11, 1963 as the issue was over-subscribed.

SAKTHI PIPES

Sakthi Pipes Ltd., Pollachi, have announced that their subscription list for raising Rs. 90 lakhs (reported in "Eastern Economist" dated September 6, 1963) opens on September 14, 1963 and will close on September 28, 1963 or earlier as soon as subscriptions approximating to the amount offered for public subscription was received but not earlier than the 20th September.

DEVIDAYAL TUBE

Devidayal Tube Industries Ltd., the leading manufacturers of non-ferrous metal extrusion products in India, have declared an interim dividend of 7 per cent on the paid-up capital of Rs. 43,96,000 for their financial year ending 30th June, 1963.

CAPITAL ISSUES

The Controller of Capital Issues has authorised three companies to raise fresh capital amounting to more than Rs. 60.33 lakhs. One company will issue part of its capital as preference shares and another is issuing bonus shares. The third company is offering part of its capital for subscription by its foreign collaborator. The consent for all the issues is valid for 12 months.

Malur Durga Mills Ltd., will raise capital of Rs. 24,39,000. This will be divided into 19,393 equity shares of Rs. 100 each and 5,000 preference shares of Rs. 100 each to be issued for cash at par. Of this, shares of the value of Rs. 12.25 lakhs will be offered for public subscription. The proceeds are required for setting up a spinning mill at Malur in Mysore State for the manufacture of medium and fine counts of yarn.

Aluminium Corporation of India, Calcutta is to issue capital of Rs. 23,43,750. This will be divided into 2,34,375 equity shares of Rs. 10 each and on capitalisation of the company's general reserves to a like extent to be issued as bonus shares to the existing shareholders of the company.

Sundaram Clayton Ltd., Madras is to raise further capital of Rs. 12.50 lakhs. The amount is to be divided into 12,500 equity shares of Rs. 100 each to be subscribed privately for cash at par. Of this amount 49 per cent shares will be offered to its foreign collaborator against supply of plant and machinery. The proceeds will be utilised for the manufacture of air-brake equipment for commercial vehicles.

LICENCES ISSUED

The following licences were issued under the Industries (Development and Regulation) Act, 1951 — during the week ending 7th September, 1963. The list contains the names and

State of the Economy

Indian Economy: 1961-63 (Conditions and Prospects): National Council of Applied Economic Research, New Delhi; Pages 117; Price Rs. 6, \$1.80, Sh.12.

THIS IS the first in a series of Annual Reviews of economic and financial conditions in this country which the National Council of Applied Economic Research plans to bring out. The scheme of this publication is both descriptive and analytical. The Review gives a useful account of the major trends and developments during the last two years in agriculture, industry, foreign trade, price situation, money, banking and credit, budget and resources mobilisation, transport and power. This account is prefaced by a summary of the behaviour of the national economy in the two years surveyed. The last chapter attempts to indicate the outlook for the current year, that is 1963-64.

In the present volume considerable attention has been paid to problems of agricultural development. This is as it should be. The elements of a crash programme of short-term increase in production is discussed and although the formula suggested is not exactly new, this discussion serves the important purpose of emphasizing the urgency of practical and promptly productive steps in the agricultural field. Another subject on which also considerable light is shed is the mobilisation of resources for defence and development. The Central Budget for the current year is analyzed in a sympathetic manner and while it may readily be conceded that the Budget is a courageous attempt at providing for national security and for the development programmes of the third year of the third Plan, it seems to us that this review could also have taken note of, rather more critically than it has done, the obvious repercussions which some of the measures must necessarily have on the tempo of economic activity, particularly in the field of investment in industry. Rather surprisingly, the chapter on "Outlook for 1963-64" shows no awareness of the possibility that the tempo of industrial expansion may slacken as a result of some of the monetary and fiscal policies of the Government.

This is not to say that the study ignores either the fact that the annual growth rate of national income has come down in recent years or the supreme importance of an effort to reverse this tendency. The following passage is worth quoting:

"The decline in national income from an annual growth rate of 7.1 per cent in 1960-61 to 2.2 per cent in 1961-62 (in real terms) indicates a slackening in the tempo of economic development. Taking the growth of the national income at the close of 1962-63 at a little over seven per cent (i.e., 2.2 per cent in 1961-62 and five per cent in 1962-63 at constant prices), three-fourths of the Plan would still remain to be achieved with three-fifths of the time to do it in. In other words, the national income will have to rise at a much faster rate, viz., seven per cent in each of the following three years, to achieve the Plan target.

"A seven per cent cumulative rate of growth will clearly mean a higher rate of growth in each sector of the economy than has been achieved in the past two years. Broadly, the required cumulative rates may have to be of the order of five per cent in agriculture and allied activities, and 14 per cent in industry and six per cent in the tertiary sector. These annual rates are undoubtedly higher than those envisaged in the Plan, because the shortfalls in the growth of national income in the first two years of the third Plan are to be made up in the remaining parts of the Plan period. But it will require

Herculean efforts to achieve a seven per cent rate of growth, and it is unlikely that it will be achieved."

INTERNATIONAL LIQUIDITY

International Monetary Policy: By W. M. Scammell; Macmillan & Co., Ltd., London; Pp. 428; Price Sh.24.

AFTER THE problem of the post-war reconstruction a major issue that has come to be widely debated in recent years in the field of international economics is the problem of international liquidity. The Keynes Plan, the Triffin Plan and lately the Roosa Plan, are all attempts to grapple with it. Written mainly as a text book, the volume under review traces the developments in the international monetary policy since 1945, which by and large comprise attempts, through experiments in international monetary co-operation, to solve the problem of international liquidity.

Mr. Scammell has recorded the events and the process that led to the signing of the Brettons Woods Agreement, which gave birth to the International Bank for Reconstruction and Development and the International Monetary Fund. He has also touched upon the regional clearing systems, which were mainly devised to solve the problem of liquidity on a limited scale; notable among these systems are the Sterling Area, the European Payments Union and the European Monetary Agreement. Mr. Scammell has also taken care to include in this discussion the dollar payments problem, and the problem of the German surpluses.

While considering the issue of equilibrium in international payments, the author suggests that we are faced with two distinct sets of questions: Is the problem of short duration, governed by the movement of non-economic forces, or is it a function of basic economic forces extending over decades and engulfing a number of short-duration and non-economic problems? Proceeding Mr. Scammell concludes that it may not be prudent for the makers of international economic policy to place undue reliance on theoretical economic models. The author stresses the dynamic nature of the problems arising from the varying trade flows between given economic systems—some developing, some stagnating—over a period of time. He considers them in two categories—the short-run balance of payments problems and the long-term problems of the pattern of world trade—and discusses solutions in the light of the measures which are being taken for dealing with them. He shares the widely-held view about the inadequacy of the IMF to meet the challenge of the Sixties in a world confronted with developing economies, as distinct from the challenge of European reconstruction.

—C.L.D.

ECONOMIC DEVELOPMENT

Industrial India, Annual Number, 1963: Published by the All-India Manufacturers' Organisation, Bombay; Price Rs. 7.50. THIS SPECIAL number of Industrial India, the official organ of the All-India Manufacturer's Organisation, presents a wide-ranging discussion of various aspects of economic, particularly industrial, development. Mr. A. D. Shroff has a forthright article on the need for a new economic policy and Prof. Galbraith discusses frankly the nature of US aid policies. A useful feature of this publication is that there are a number of articles on specific subjects by contributors who have practical and concrete knowledge of their respective subjects. Thus Mr. Manubhai Shah writes on Export Promotion, Mr. C. R. Sundaram on Small-Scale Industries, Mr. B. N. Datar on Industrial Truce and Mr. M. S. Srinivasan on the Development of Financial Institutions.

CONCRETE
SURFACE
HARDENER
AND
DUST-PROOFER
...IN LIQUID FORM

LILLINGTONS
Surfacit

A surface dressing liquid, Lillingtons SURFACIT will render any concrete floor permanently hard and dust-free overnight—ready for use in the morning. Lillingtons SURFACIT possesses high penetrative power and gives long-lasting protection to existing concrete surfaces. Safeguard your plant, machinery and workers' health—through Lillingtons SURFACIT.

SURFACIT

- Most efficient concrete surface hardener—effective in depth and degree.
- Hygienic—minimises dust hazards to men and machines in factories, engineering works, printing shops, garages, aero-engine shops, etc.
- Can be easily applied by unskilled labour.
- Renders concrete surfaces resistant to chemicals and oils.

Available in 25 and 50 litre drums.

Cut down your lubricants Cut out your paper-work

Company executives can obtain a free copy of this booklet by writing on their official letterhead to their nearest Caltex Office.

Help your Purchase Officer to eliminate the stacks of paper that collect in his office...the unnecessary flood of Purchase Orders. When each department in a plant specifies a lubricant without reference to the purchases of other departments, there is bound to be duplication and waste.

The Caltex "Stop-Loss" programme can do away with this lubrication waste...can cut a great deal of Purchase Order paper-work.

Caltex "Stop-Loss" is a complete plan for organising lubrication on an efficient basis. There is no other programme like it.

It will be worth your while to find out specifically how Caltex "Stop-Loss" can help to ease the problems in your plant.

Help your operation to greater profit with the Caltex "Stop-Loss" programme.

COMPANY MEETING

THE TITAGHUR PAPER MILLS COMPANY LTD.

STATEMENT BY THE CHAIRMAN, MR D. C. B. PILKINGTON, O.B.E.

It had been hoped that the results for the year would show a substantial improvement over those of the previous year but, unfortunately, this has been limited to a reduction in the nett loss.

The reorganisation of the Company falls into two parts. Firstly, changes in management structure, economies in costs of production etc., and secondly, capital expenditure to eliminate bottlenecks and increase total production. Action under the first heading has been progressed actively but the results started to materialise some six months or so later than was anticipated. Under the second heading, planning for the capital expenditure programme has been virtually completed, a large part of the orders have been placed, and, in some cases, delivery has been received. Speaking generally, however, delivery periods for paper mill machinery are fairly lengthy to which has to be added the time required both for planning and erection so that speedy results cannot be obtained in this industry from any capital expenditure programme. Taking the above factors into account, I would estimate that 1963-64 will show a reasonable profit and, in fact, proforma profits up to July 1963 show a substantial improvement over the previous year. It will, however, in my view, not be until the 1964-65 financial year that the Company will resume its position as one of the leading profit earners in the Industry.

Increases in the costs of Raw Materials and Services in the Paper Industry continue unabated and apart from the increase in paper prices of 6 nP. per kilo which was granted in June 1962, the Industry continues to be governed by the prices laid down by the Tariff Commission in 1958. Sir Walter Michelmores mentioned last year that between 1958 and March 1962 the estimated total increase in costs in the Paper Industry was Rs. 160 per metric tonne or 16 nP. per kilo. Since March 1962 prices have shown a further increase, and with the 1963 Budget an estimated further increase of Rs. 100 per tonne or 10 nP. per kilo has been added to the Industry's costs. Therefore, since 1958, against a total increase in costs of Rs. 260 per tonne or 26 nP. per kilo, the Industry has been granted 6 nP. per kilo. Between June 1962 and June 1963 the cost of coal was increased on no fewer than five occasions resulting in a total increase of Rs. 2.26 nP. per tonne of coal. In addition, freight has also been increased by Rs. 1.50 nP. per tonne and the consequences of these increases on your Company's costs of production can well be imagined. Further, these increases in freight as well as increases in Central Excise Duty have affected the delivered Mill prices of Sodium Sulphate, Rosin, Lime etc., and added to this was the Compulsory Insurance against Emergency Risks which was introduced on January 1st, 1963. Further, although assurances were given that at least 80 per cent of our coal requirements would be delivered by rail, the actual figure for your Mills in West Bengal was only 60 per cent, so that 40 per cent of your coal supplies had to be delivered by road, the latter costing your Company approximately Rs. 18 per tonne extra. There has also been an increase in Provident Fund contributions from 6½ per cent to 8 per cent from January 1963. From the 1st of May 1963 the Government duty on consumption of electrical energy in West Bengal, whether purchased or generated, has been increased by .5 nP. per unit.

A representation has been made in June of this year by the Industry to Government for an increase in paper prices and it is hoped that the Industry's representation will be given sympathetic consideration.

COAL

As mentioned above, coal still had to be transported in

lorries to your Mills in West Bengal and although the position of rail wagons has been better than in the previous year, the supply of this essential commodity continues to be very difficult periodically, especially at the time of the movement of foodgrains. There has been an increase in supply of coal in B. O. X. rakes and if this could only be stepped up, as your mills are capable of taking these rakes, the position would be eased considerably. Increases in prices of coal and freight as previously mentioned put a tremendous burden on the paper industry owing to the high coal consumption per tonne of paper production. At No. 3 Mill coal is obtained from the adjacent National Coal Development Corporation Collieries at Talcher and while latterly supplies have improved, some difficulties regarding movement and quality were met. One colliery in particular has supplied coal with a very high ash content and very low calorific value with the result that the ratio of coal consumption per tonne of paper made has been unnecessarily high at this mill.

BAMBOO

It is pleasant to report that the wagon position for the movement of bamboo has been much better this year than previously and B.O.X. wagons which were intended for coal loading were also made available for bamboo loading to the mills in West Bengal. The question of handling bamboo in B.O.X. wagons is not quite as easy as that of coal but despite the difficulties we were glad to accept B.O.X. wagons in order to build up our stocks. Since the end of the year under review, wagon supplies have been very good with the result that at Titaghur and Kankinara we now have the largest stocks of bamboo that have been held by these Mills for some years. Stocks at No. 3 Mill have also been sufficient, having been built up by bamboo rafted down the Mahanadi River. A railway loop line at this mill will shortly be completed so that back-loading of bamboo can take place from this mill to the mills in West Bengal. As mentioned above, with the increase in freight prices, the cost of bamboo delivered at your mills in West Bengal has again shown an increase. During the year under review the mills at Titaghur and Kankinara used paddy straw and at Kankinara especially large-scale experiments with jute sticks and bagasse were made, the results of which have been most encouraging.

BAMBOO FOREST AREAS

Bamboo operations in our leased areas have been satisfactory with cutting and extraction almost up to the targets. Rafting of bamboo down the Mahanadi to No. 3 Mill reached a peak figure and our Forest Department's rafting operations are now fully organised. For the first time, in the year under review, over 25,000 tonnes of bamboo were rafted. It is hoped that with the experience gained this figure will be substantially increased in the current year.

As mentioned last year, however, the tendency of States to encourage paper mills by granting them leases in the State at the expense of outside mills still continues. Traditional areas of supply are no longer assured and State Forest Departments are demanding very high rates of royalty for long-term as well as short-term leases. The prospects of your Company getting future leases of bamboo in Bihar and Madhya Pradesh are bleak. Fortunately, your Company has been able to secure leases of four bamboo forest areas in Assam, through the District Council, but with the National Emergency, supplies from these areas are difficult and could dry up altogether should another Chinese attack take place. In addition, we have been successful in securing the lease of a small area in Orissa and negotiations are in progress for a further lease of an area in this State. The question of costs:

in the Bamboo Forest Areas continues to receive our closest attention.

MARKET

The market has continued to remain firm throughout the year and with the increased Government offtake of 9% and the continued increase in Civil demands, it would appear that there will be no surplus of paper in this country for at least the next 3 or 4 years.

Many of the licences granted by Government to small-scale manufacturers have had to be revoked and the overall production target for the Third Five-Year Plan is likely to fall well short of the estimated figure. In order to alleviate this shortage to some extent the Industry in their representation to Government for a price increase has also requested the Government to consider incentives for the production of lighter weight paper. The Government has also sponsored an Export Promotion Tour by representatives of the Industry and the Trade to the Middle East, Near East and Far East, but with the high costs of the Indian Paper Industry due to factors outside its control and the general shortage of paper in the country, it is difficult to envisage a substantial export market being built up.

The reorganisation of the selling side of the Company's organisation as referred to in last year's report has progressed satisfactorily and particular attention has been and is being given to Quality Control. With the introduction of Production Planning at the beginning of the year under review, greater liaison between the Mills and Sales Department has been achieved and we have been able to meet both seasonal and specific consumer demands in good time. Dislocation of supplies due to shortage of rail wagons hampered our efforts to some extent but this has now improved and with further developments in Quality Control and Production Planning, your Company is confident of giving even greater service to the Paper Trade in the coming year.

NO. 3 MILL—CHODWAR

This Mill has again made a loss but on a reduced scale so that one can say that the trend is in the right direction. Extremely high chemical costs together with numerous breakdowns in plant and machinery continued to be the main of many problems here. There are acute difficulties in rail movements to and from the Mill owing to the frequent restrictions imposed by the Railways and to this, of course, must be added the question of non-availability of wagons from time to time. On these occasions chemicals such as Caustic Soda, Chlorine and Lime have to be transported by road at prohibitive costs. It was our intention sometime ago to instal an Electrolytic Bleach Plant in order to reduce the cost and overcome the shortages of Chlorine and Caustic Soda which occur at this Mill but we were advised by Government that as a licence to produce these chemicals had already been granted to one party in Orissa, we would be able to obtain our requirements from this concern. To date, however, no substantial progress appears to have been made in this matter and our difficulties with chemicals continue. Chemical costs at this Mill are three times as high as those in No. 1 Mill. In addition the treatment of effluent at No. 3 Mill is an expensive process.

While the above presents a sorry picture, shareholders will be interested to learn that since January 1963 there has been a remarkable change in the attitude and working of the staff and labour at No. 3 Mill. Consequent upon the resignation of the then Manager, Dr. B. N. Sen, the Technical Superintendent was transferred to Choudwar as Manager and in a short space of time has achieved remarkable results. In April of this year, the mill produced over 900 tonnes for the first time in its history and in July 1963 has for the first time reached its present capacity, producing 1,026 tonnes.

The Training Scheme is also beginning to bear fruit under Dr. Sen's guidance and a Supervisory Development Course

for first-line Assistants has just been completed. Other levels of supervisors will also be developed and the staff are now working as a team.

Labour relations have improved, and should this trend continue, it is hoped that during the current year sufficient profits will be earned to provide for a greater part, if not all, of the depreciation on this Mill's assets. With the current cost and price structure it is, however, evident that a satisfactory profit will not be earned until the output is increased to the level of 18,000 tonnes per annum and it is, therefore, important that the capital expenditure programme to achieve this target should be pressed ahead as fast as possible—this being combined with every possible step to reduce the present high chemical cost.

NO. 2 MILL

One of the achievements of this year has been to restore No. 2 Mill to a profit-making basis but this occurred so late in the financial year that the Mill's net contribution to the annual results was a substantial loss. The main difficulties experienced were shortage of steam, high maintenance and repair costs in bringing machinery back into good condition and bottlenecks in washing capacity. The hard work put in at this mill over the past 18 months is now, however, beginning to show results and, at the present time, the mill is earning a reasonable profit, which it is hoped will steadily increase.

The efficiency of the Soda Recovery Plant has improved beyond expectation, while the new water tube boiler, which will shortly be commissioned, should end the steam shortage which has been a continuous problem at this mill for many years past. In July 1963, the mill finished over 2,000 tonnes of paper for the first time since April 1961, but this we feel sure is a figure that will be improved upon in the months to come.

The Training Scheme has also been put into effect here in order to produce better craft workers and programmes for other levels of management will shortly be introduced.

NO. 1 MILL

This mill has continued to work with reasonable efficiency and has contributed all the Company's profits.

REORGANISATION

Every period of major reorganisation and change is followed by a period of consolidation and the changes do not show complete results until the consolidation is complete. In his statement last year Sir Walter Michelmore mentioned that the entire Senior Management structure had been changed and new systems of modern management were being introduced. I have pleasure in informing you that this latter process continues and every attempt is being made to widen and extend it.

The post of Superintendent of Mills was created to co-ordinate the reorganisation at all three mills. This appears to have been successful and with better liaison between the Mills and Head Office the post became redundant and has been discontinued.

As mentioned previously, the Training Scheme is going ahead with the training of young men for future management positions. It is a matter of gratification that several of our own apprentices have been found to be most suitable potential for such training. Craft Training Schemes have been introduced at Nos. 1 and 2 Mills and a Supervisory Development Programme aimed at inculcating an interest in the principles of modern management and its application amongst our Supervisory Staff has been introduced at No. 3 Mill and will be extended to the other two Mills. The previous place schemes for Assistant Trainees and Operative Trainees have been formulated. Much still remains to be done and progress is slow but the results of what has been achieved to date are beginning to be apparent at No. 3 Mill.

Certain of the suggestions made by M/s. Urwick Orr and

Partners Limited aim at producing greater refinement and control in the production process. Based on these recommendations systems of Production Planning and Production Control are being gradually introduced. As mentioned before, greater co-operation and liaison between the Mills and Head Office have enabled us to keep stocks of paper at the Mills as low as possible in spite of the difficulties in obtaining rail transport.

The purchasing procedure is also being streamlined and quality control both in respect of material receipts as well as production is being introduced.

A Central Engineering Department has been set up with qualified Engineers and Technicians to handle the extensive work of expansion and renovations. This department is working under the Superintendent of Engineering Services.

Special emphasis has been given to the reorganisation of security staff and methods and this has resulted in vastly improved discipline.

The response to the reorganisation from our staff has been very encouraging and, as stated elsewhere, results are beginning to show themselves.

CAPITAL REORGANISATION

As mentioned last year, to provide funds for the Modernisation and Expansion programmes of the Mills and also to make the Capital structure more representative of its actual working capital, sanction was obtained from the Controller of Capital Issues and an issue has been made of Bonus and Rights Shares.

The Company's capital has thus been increased to Rs. 3,10,99,500 by the creation of an additional 16,80,720 'A' Ordinary (Equity) Shares. Of these additional shares, 560,240 were issued as Bonus Shares and the balance as a Rights Issue at a premium of Rs. 5/- per share. Thus Rs. 1,68,07,200 has been made available for the Modernisation and Expansion Schemes.

MODERNISATION AND EXPANSION

A great deal of work has been done during the year in planning how best to utilise the financial resources available for the modernisation and expansion of the Company's productive capacity. There is so much on which the available money could be spent that drawing up a scale of priorities between the three mills has required much time and thought. At long last our plans have now been finalised and the expected increase in production from the three mills will be in the neighbourhood of 20,000 metric tonnes per annum—in addition, there should be substantial benefits by way of reductions in cost and improved quality of paper. The primary objective in the overall scheme is the maximum utilisation of existing plant by remedying defects, eliminating bottlenecks and making necessary improvements and extensions.

At No. 1 Mill our objective is to increase the machine production to 106 tonnes per day. We have adequate crushing and digester capacity at this mill, the main bottleneck being in the washing capacity. We intend to remove this bottleneck and in addition introduce multistage bleaching to improve quality further, increase reeling capacity and improve the performance of the machines.

At No. 2 Mill a similar bottleneck in washing capacity exists. Apart from removing this by the installation of a 100-ton brown stockwasher, we intend to instal a multistage bleaching plant, additional centri-cleaners and also a modern continuous digester. Further, it is the intention to instal an additional papermaking machine for coated paper and this will be installed with the minimum of imported parts. An additional Roaster is also planned and the capacity of this mill will then be increased to over 100 tonnes per day. The installation of two additional banks of cells to the Electrolytic Bleach Plant has commenced having received the necessary expansion licence from the Government of India. As

previously stated a sixth Water-Tube Boiler has been erected and should be commissioned by the time this report is in your hands.

At No. 3 Mill, you are already aware that we hold an Industrial licence to manufacture 1,500 tons of paper and board per month. The first steps being taken to achieve this are to increase the washing, bleaching and recovery capacities. Additional stock washers, a multistage bleaching plant and an extra roaster are being installed. The 12th Digester is now in use and the cooking cycle which is much longer than at the other two mills will be reduced to permit sufficient digester capacity for the expansion. The Bentley & Jackson Papermaking Machine will be modified and modernised to run at increased speed and centri-cleaners and refiners will also be installed. Further modifications will also be made to No. 2 Machine to enable it to run at increased speed. In order to try and reduce the chemical costs we have applied for a licence to instal a plant for the manufacture of liquid alum and intend to reapply for a licence for a small E.B. plant. A scheme for reducing lime consumption is also under careful consideration.

LABOUR

As was reported briefly last year the Labour Relations Organisation in the Mills has been completely overhauled. Results of this reorganisation have been successful, the most important achievement being the vast improvement in the relations between employer and workers, although all mills are still subject to periodic disturbances and minor disputes.

Moving with current trends, Workers Identity Cards and revised Standing Orders have been introduced at Nos. 1 and 2 Mills. It is hoped that later this year a Central Time Keeping System can be brought into effect. The state of emergency declared in the country as a result of the Chinese aggression has had a beneficial effect towards the achievement of industrial peace and an increase in production. A large proportion of workers have responded to the Industrial Resolution by improving discipline and production. At No. 2 Mill in particular the workers have worked through one normal maintenance day every month and contributed part of their earnings for this extra day's work to the National Defence Fund.

At No. 3 Mill, an Emergency Production Committee has been formed and it is hoped that by the time this statement reaches the shareholders, similar committees will be in operation at the other two Mills. However, as a result of the Budget and the Compulsory Deposit Scheme the workers' zeal along these lines appears to be flagging.

The IBCON grading scheme which has been in force in Nos. 1 and 2 Mills expired on the 31st of March 1963 and the Government-sponsored National Productivity Centre have been requested, with the agreement of the workers' representatives, to draw up a new wage structure. It is our hope that the surplus workers as mentioned in the reports of M/s. Urwick Orr & Partners Limited will be absorbed by our expansion schemes and through natural wastage.

In conclusion, I would thank the staff and workers at the Mills and Head Office for their good work. The results for the year are certainly disappointing but we already have evidence of a substantial improvement in profitability since the closing of the accounts under review, and I feel confident that this is the beginning of the Company's return to its rightful place as a leader in the Indian Paper Industry.

NOTE: The above statement is not a report of the proceedings of the Annual General Meeting, which will be held on the 30th September, 1963.

CHARTERED BANK BUILDINGS
Calcutta-1.
2nd September, 1963.

RECORDS AND STATISTICS

Reserve Bank on Mobilisation of Resources

"THE ECONOMY," says the report of the Central Board of Directors of the Reserve Bank of India for the year ended June 30, 1963, "has now to adjust itself on a long-term basis to the needs of an enhanced defence budget and of continued development without which a large defence effort cannot be sustained." The report advocates a larger and more vigorous drive on the part of the State Governments to mobilise resources from the agricultural sector. It also points out that the use of the tax instrument in a purposive and persuasive manner has to be supported by a resilient monetary policy.

Control over the overall volume of credit operated according to the long and near-term requirements of the economy, the report suggests, has to be exercised through a combination of devices to regulate the cost and availability of credit and direct regulation of the volume of credit in sensitive sectors. Apart from the actions of the Central Bank a good deal depends upon the way in which the rest of the banking system itself responds to the needs of the situation. It is emphasized that efforts at deposit mobilisation have to be stepped up further. Innovations whether for this purpose or for the purpose of making the best possible use of available bank resources have to be tried. In the difficult times ahead, the role of the banking system, the report points out, will remain crucial.

Extracts from the report dealing with monetary and credit trends and policies, gold control and balance of payments are reproduced here:

Monetary and Credit Trends

The increased outlays in the public and private sectors led to a marked rise in money supply amounting to Rs. 315 crores during 1962-63 as against Rs. 217 crores in 1961-62, showing a rate of growth of 10.3 per cent as against 7.6 per cent in the previous year. While both components of money supply increased, the expansion in deposit money which comprises demand deposits with banks and 'other' deposits with the Reserve Bank of India, was larger (from Rs. 55 crores in 1961-62 to Rs. 131 crores in 1962-63) than in currency with the public (from Rs. 162 crores to Rs. 184 crores).

Net bank credit to Government, which comprises investments in Government securities by the Reserve Bank and other banks (excluding the investments of PL 480 and PL 665 funds) and ways and means advances adjusted for changes in Government's cash balances with the Bank, has been the most important factor affecting money supply during the year although its contribution was a little lower at Rs. 316 crores in 1962-63 as against Rs. 327 crores in the previous year. In both years, the bulk of the increased credit was made available by the Reserve Bank. Credit extended by banks to the private sector comprising both bank advances and holdings of private securities rose by a smaller amount of Rs. 144 crores in 1962-63 as against Rs. 161 crore in 1961-62. However, as

time deposits of the banks, adjusted for PL 480 and PL 665 deposits, increased by a much smaller magnitude as compared to the previous year—Rs. 76 crores in 1962-63 as against Rs. 204 crores in 1961-62—net bank credit to the private sector, which comprises banks' advances and holdings of private securities adjusted for time deposit, showed a large swing from a contraction of Rs. 43 crores in 1961-62 to an expansion of Rs. 68 crores. This exerted a substantial expansionary impact on money supply. The balance of payments which in the past few years had contributed to an increasing extent to a contraction of money supply also changed into an expansionary factor. As against a reduction of Rs. 107 crores in the net foreign exchange assets of the Reserve Bank in 1961-62, there was a rise of Rs. 7 crores in 1962-63, indicating a swing of Rs. 114 crores. While in 1961-62, a decline of Rs. 16 crores increase in foreign exchange liabilities was accompanied by a substantial drawal on the International Monetary Fund of Rs. 58.3 crores, the small rise in foreign exchange assets in 1962-63 was not offset by any significant increase in foreign exchange liabilities.

Banking Under Pressure

Although the expansion in bank credit over the year 1962-63 (July-June) was somewhat smaller than in the previous year, the banking system was under pressure in the early part of the year mainly as a result of the dislocation caused in the economy by the Chinese invasion. Following the declaration of the Emergency there was a slowing down of deposit growth which lasted till about the middle of March. Aggregate deposits excluding PL 480 and PL 665 funds, rose by only Rs. 68 crores during the period October 1962 to March 1963 as compared to Rs. 125 crores in the corresponding period of the previous year. Also the busy season of 1962-63 started with a somewhat more extended position for the banks than in the previous year as the slack season contraction had been much less in 1962 than in 1961. At the peak of the busy season in 1962-63, the expansion of bank credit at Rs. 216 crores was a little higher than in the 1961-62 busy season (Rs. 213 crores). The credit-deposit ratio excluding PL 480 and PL 665 funds, touched 80.1 per cent on April 12, 1963 as against 78.5 per cent touched in the previous busy season on May 4, 1962. Because of the set-back in the growth of deposits during the busy season and the spurt in seasonal credit demands, banks had to explore other avenues for raising resources. Their borrowings from the Reserve Bank reached a peak of Rs. 83 crores in the 1962-63 busy season, as against Rs. 66 crores in 1961-62 season. Banks had to liquidate a part of their investment portfolio; there was greater activity in the inter-bank call money market where the rates touched record levels of 6½ per cent to 6½ per cent and some banks also brought in sizable funds from abroad.

The set-back in deposit growth was, however, temporary. This is apparent from the trend of deposits since March. During the four months April-July 1963 aggregate deposits, excluding PL 480 and PL 665 funds, increased by Rs. 136 crores as against Rs. 125 crores during the corresponding period. An interesting development in the recent growth of deposits is a shift in favour of demand deposits. Over the year 1962-63, time deposits have shown an increase of only Rs. 68 crores as against Rs. 203 crores during the previous year while demand deposits have increased by Rs. 118 crores as against Rs. 58 crores. This reduces to some extent the cost to the banks of raising deposit resources and affords them some

relief in a situation where all other costs are on the increase.

The fact that the set-back in deposit growth in the last busy season was temporary does not mean that the banks can afford to slacken their efforts at deposit mobilisation. With rising money incomes and investment, the pressure of demand on liquid funds will grow 'pari passu' with that on real resources. It is essential therefore that the additional credit supplied by the banking system is backed by the genuine savings of the community in the form of bank deposits, as otherwise the existing pressure on the price level will be further accentuated. This is the basic consideration behind the concern that is felt by the Bank with regard to the high levels of credit-deposit ratio that have been prevalent in the recent past.

In terms of the recent amendments to the Banking Companies Act, banks have to maintain a higher over-all ratio of liquid assets to their demand and time liabilities, i.e., 28 per cent as against 20 per cent currently, as from September 1964. An intensive effort at deposit mobilisation will be necessary for the banks, especially those units which have been working with a highly extended position, in order to be able to fulfil the statutory requirement without at the same time starving demands for productive credit.

During May-July 1963, the first three months of the current slack season, bank credit contracted by Rs. 103 crores as against Rs. 42 crores in the corresponding period of the previous slack season. The faster pace of credit contraction together with the recent rate of deposit accretion has improved somewhat the liquidity position of banks.

Tight Money Policy

The pressure on prices and the slow pace of seasonal credit contraction during the 1962 slack season mentioned earlier led the Bank to tighten access to its accommodation by reducing the quota for borrowing at the Bank rate from 50 per cent of the average statutory reserves of each scheduled bank for the preceding quarter to 25 per cent. Borrowings in excess thereof up to 50 per cent of the average statutory reserves were to be at 1 per cent above the Bank rate, those in excess of 50 and up to 100 per cent of the average statutory reserves at 2 per cent above the Bank rate and those above 100 per cent at 2.5 per cent above the Bank rate.

The possibility of a further pressure on prices owing to the Emergency led to a more stringent policy of credit restraint. Accordingly, effective October 31, 1962, the Bank revised its system of lending rates, reducing the existing tiers to three, and for the first time regulated the availability of credit to banks by fixing a ceiling on such accommodation equal to a bank's average statutory reserves during the previous quarter. Borrowings up to 25 per cent of the statutory reserves were to be permitted at the Bank rate, viz., 4 per cent, another 25 per cent at 5 per cent and the balance at 6 per cent. Borrowings in excess of the basic quota were to be charged a higher rate which in effect was 6½ per cent. In order to ensure that the genuine needs of industry and trade were adequately met, the revised policy was operated with a large measure of flexibility. Appropriate permissible limits for borrowing were granted to applicant banks, after assessment of a bank's position and taking into account the needs of defence production, essential industries and exports. Banks were called upon to readjust their advances portfolio, to refuse advances which were likely to be used for purposes of hoarding and speculation, and to consider recalling in suitable cases advances against gold, shares and unsecured advances. The policy of granting preferential treatment in respect of Bank's lendings to certain special sectors like small-scale industries and co-operatives was continued.

As regards export finance, the Bank introduced in March

1963 the Export Bills Credit Scheme. The scheme widened the range of collateral for such borrowing, banks being permitted to borrow against their demand promissory notes and upon their declarations of holdings of usance export bills, and also cheapened the cost of borrowing slightly, since 'ad valorem' stamp duty charges are not payable on demand promissory notes. These advances were to be within the overall limits sanctioned to each bank. A special facility was, however, provided in respect of a bank's holdings of rupee export usance bills. Banks are entitled to borrow against declarations of their holdings of these bills at the Bank rate, over and above the overall permitted level of borrowing at this rate, provided they agree not to charge the exporters interest/discount/commission at a rate higher than 1½ per cent above the Bank rate.

Adjustments in Bank Rate

The steady increase in interest rates in the money and capital markets since October 1960 brought to the fore the question of adjusting the Bank rate in line with the prevailing pattern of interest rates. The last revision of the Bank rate was made in May 1957 when the rate was raised from 3½ per cent to 4 per cent. Effective from the close of business on January 2, 1963, the Bank rate was further raised by ½ per cent to 4½ per cent. Simultaneously, the system of lending rates was simplified into a two-tier system by merging the first two slabs. Banks were permitted to borrow in each quarter a sum equal to 50 per cent of their average statutory reserves during the previous quarter at the Bank rate and the remaining 50 per cent at 6 per cent; any borrowing beyond this level was to be charged a higher rate which was fixed at 6.5 per cent.

In the past two years or so, banks had progressively raised their lending rates, and the average rate of interest earned on advances by scheduled banks had risen from 5.6 per cent in 1959 to 6.4 per cent in the first half of 1962. In terms of the All-India Inter-Bank Agreement on the Minimum rate of Interest on Advances, banks which are signatories to the Agreement further stepped up their minimum advances rate from 6 to 6½ per cent, viz., 2 per cent above the Bank Rate, effective January 3, 1963. In April 1963 the State Bank, which previously had not increased its borrowing and lending rates, also raised its general advances rate by 1 per cent—though retaining rate of 5 per cent for advances against government securities—and its savings and fixed deposit rates by ½ per cent, thus bringing its interest rates on savings and fixed deposits on par with the maximum rates on deposits fixed under the Inter-Bank Agreement. The long-term lending agencies also raised their lending rates generally by ½ per cent in keeping with the increase in Bank rate.

In line with the general quantitative controls, selective credit controls were also tightened up. The exemption granted by the Bank in respect of advances against warehouse receipts covering paddy and rice and other foodgrains excluding wheat from the scope of selective credit controls resulted in a progressive rise in advances against warehouse receipts arising out of increasing use of the warehouses, set up by the Central and State Warehousing Corporations, by traders rather than by cultivators, and thus tended to nullify the effect of these controls. The Bank, therefore, issued two directives in January and March 1963, imposing for the first time a minimum margin of 25 per cent on advances against warehouse receipts covering stocks of paddy and rice and other foodgrains excluding wheat, as compared to 35 per cent for advances other than those against warehouse receipts. The directives also prescribed ceiling limits, commencing from January-February 1963 in respect of paddy and rice and from March-April 1963 in respect of other foodgrains, at the aggregate average level of advances in the corresponding period of 1962 inclusive of

advances against warehouse receipts. As, however, the inclusion of advances against warehouse receipts within the overall ceilings tended to produce a disproportionate contraction of these advances, the directives were partially modified on May 16, 1963. Ceilings have now been placed on banks' 'other' advances, i.e., other than those against warehouse receipts within the overall ceilings prescribed earlier, the balance being available for advances against warehouse receipts; also banks can make advances against warehouse receipts out of the limits fixed for other advances.

In view of the firmness in sugar prices arising from lower output in the 1962-63 season and the spurt in advances to traders, the Bank issued on April 27, 1963 a directive to scheduled banks, prescribing a minimum margin of 45 per cent on credit limits or advances granted to parties other than those manufacturing sugar and on those granted to parties manufacturing sugar in respect of stocks which have left the factory premises and on which excise duty has been paid.

As regards oilseeds, the ceiling limits fixed by the Bank for advances against groundnuts lapsed at the end of February 1963, and since then bank advances against groundnuts and other oilseeds are only subject to minimum margin requirements of 45 per cent and 40 per cent, respectively.

The impact of the various control measures in operation during the year was generally salutary. Net expansion in scheduled bank credit in the 1962-63 busy season was of the same magnitude (Rs. 203 crores) as in the previous busy season. Though credit expansion against seasonal commodities was somewhat larger in view of the substantial rise in the output of raw cotton, that against non-seasonal commodities was about the same as in the 1961-62 busy season while the rise in unsecured advances was smaller. Advances against shares, gold and gold ornaments came down in line with the advice given by the Bank. The progress of credit contraction in the 1963 slack season is also satisfactory. For 1962-63 as a whole, the net increase in scheduled bank credit was somewhat smaller, being 7.9 per cent as compared to 10.5 per cent in 1961-62. The modifications in the slab rate system, outlined earlier, generally exercised a restraining influence on scheduled banks' borrowings from the Reserve Bank. The highest weighted average rate on borrowings from the Bank was 5.8 per cent, as against 5.1 per cent during the busy season of 1961-62. The average cost of borrowing by banks from the Reserve Bank during January-June 1963 was 5.4 per cent as against 4.6 per cent during the corresponding half-year of 1962.

Restraint on Credit

The keynote of the Bank's credit policy has been to maintain both a general and selective restraint on credit and a pruning down of less essential demands through a combination of quantitative and qualitative measures. The appropriateness of this policy has to be judged in the context of insistent pressures on the supply of available real resources for defence and development. The shortage of real resources and the presence of bottlenecks in various sectors of the economy are factors which not only cannot be overcome by a liberal credit policy but may on the contrary be accentuated by excessive credit expansion. What is needed is so to regulate the supply of central bank credit that the monetary system subserves the overall objectives of economic policy, namely, to keep prices as stable as is reasonably possible without starving productive credit requirements. The cost at which credit can be obtained has also a role to play in this policy. An awareness that credit has its own cost can exercise a healthy influence on its use.

Flexibility is the essence of sound monetary policy. In the Indian economy flexibility is needed with reference to two considerations, the changing overall requirements of the economy and the strong seasonal pressures. The policy has to take into account both these in deciding the quantum of

credit to be made available and its cost. The slab system of lending evolved over the past three years represents, as it were, a compromise between the obligations of the Bank as the lender of last resort and its duties as the controller of credit. It is a flexible system permitting of modifications and such modifications have been made from time to time to suit the requirements of the situation.

The effectiveness of monetary policy depends to a considerable extent on the direction in which fiscal policy tends. Large deficit financing gives rise to an accrual of deposits in the banking system and enhances its potential for credit expansion. The large quantum of net bank credit to Government which is the overall measure of deficit financing witnessed during the last two years is significant in this context. The bold tax effort in the current year's budget, which aims in a purposive manner at alleviating the pressure of demand should result in a better control of the economy. The task of monetary policy would to that extent be rendered easier.

Gold Policy

A factor affecting the balance of payments of the country has been the continued smuggling of gold. Efforts made by the Government in the past to plug this leakage in foreign exchange receipts had brought only partial results. Government, therefore, decided to take further steps to deal with the situation. The first step was the passage in September 1962 of legislation bringing gold within the purview of the Industries (Development and Regulation) Act, 1951 which enabled the Central Government to take steps to regulate the production, supply and distribution of gold. This was followed by a ban on forward trading of gold effective from November 13, 1962. On January 9, 1963 the Government promulgated the Gold Control Rules providing 'inter alia' for the declaration of holdings of non-ornament gold, registration of dealers in gold, a ban on sale and purchase of gold except with permit and the prohibition of manufacture of ornaments of more than 14 carat purity. To administer the Gold Control Rules, a Gold Board was also established simultaneously. Following these developments, official trading came to a standstill but dealer-to-dealer transactions in declared gold commenced from February. As several types of cases of evasion came to light in the operation of the Gold Control Rules, Government amended the Rules towards the end of June 1963. The primary gold of a purity of more than 14 carat and provide for compulsory hall-marking of all primary gold produced by refineries, with effect from a date to be prescribed by the Board. These measures were primarily designed to curb smuggling effectively through regulation of transactions in gold inside the country. The measures were also intended to subserve the long-term objective of reducing the demand for gold in the country. In pursuance of this objective, the Reserve Bank advised the banks to recall in suitable cases advances against gold.

As a result of these measures, gold prices suffered a set-back; the price of the yellow metal which had touched an all-time peak of Rs. 129.90 per 10 grammes on August 29 receded to Rs. 115.75 on October 10. Subsequently, the quotation moved up by November 3 to Rs. 121.65 on continued high level of demand. Thereafter, as a cumulative result of the floatation of gold bonds and the ban on forward trading in gold, the quotation came down sharply to Rs. 86 on November 24, 1962. Due to the emergence of a strong consumer demand at such a low level, there was a recovery and the quotation touched Rs. 115.25 by December 18. It had receded once again to Rs. 102.75 by January 9, 1963 when the Gold Control Rules were announced and official trading came to a standstill until dealer-trend of dealer-to-dealer quotations was downward, falling from Rs. 102 on February 18 to Rs. 95 by February 28, but

with the increase in demand during the marriage season, the quotation moved up to Rs. 118 by May 9, but came down thereafter with the abatement of the demand to Rs. 112 by June 22.

Balance of Payments

The year opened with foreign exchange reserves under strain. During the year 1961-62 they had fallen by Rs. 41 crores despite a net drawing from the International Monetary Fund to the tune of Rs. 58 crores. The greatest amount of pressure was experienced in the quarter April-June 1962, immediately preceding the year 1962-63. A stand-by agreement for US \$100 million was, therefore, entered into and the equivalent of US \$25 million or Rs. 12 crores was drawn in July 1962. During 1962-63, however, not only was the drawing repaid but the reserves rose by Rs. 48 crores. There was thus a favourable swing of the order of Rs. 147 crores.

The main reason for this swing is the very much quicker pace of reimbursement receipts under the US Agency for International Development loans amounting to Rs. 90 crores as against Rs. 20 crores in 1961-62. The improvement in exports, partly attributable to transactions on account of Goa, Daman and Diu, was itself of the order of Rs. 35 crores. To some extent the favourable shift in the balance of payments is explained by the behaviour of banking capital which changed from an outflow of Rs. 9 crores in 1961-62 to an inflow of Rs. 10 crores in 1962-63.

The last full year for which balance of payments details are available is the financial year 1962-63. The discussion in the remaining paragraphs relating to the balance of payments is, therefore, based on these details. For this period, the position broadly was the same as stated above, though the figures relating to movement in reserves were somewhat different. During this financial year, foreign exchange reserves showed a fall of Rs. 2 crores as against a fall of Rs. 6 crores in the previous financial year. Allowing for net drawings of Rs. 58 crores from the International Monetary Fund in the financial year 1961-62 as against Rs. 12 crores in 1962-63, the pressure on the reserves in 1961-62 worked out to Rs. 64 crores and in 1962-63 to Rs. 14 crores. Various measures taken during the year, namely, the imposition of restrictions on foreign travel, the steps taken to check smuggling, the amendment of the Sea Customs Act and the introduction of Gold Control as well as larger receipts of aid not tied to specific projects, also seem to have made some contribution to the favourable outturn.

Deficit Widens

The deficit on current account, which includes merchandise transactions relating to Goa, Daman and Diu, since April 1962 widened further by Rs. 31 crores from Rs. 303 crores in 1961-62 to Rs. 334 crores. Export earnings improved over the year by Rs. 15 crores but the import bill increased by Rs. 88 crores, with the result that the trade gap widened from Rs. 334 crores to Rs. 407 crores. Receipts from official donations rose from Rs. 46 crores to Rs. 77 crores due to larger grants out of PL 480 funds, while payments on account of other invisible transactions declined from Rs. 15 crores to Rs. 4 crores.

The whole of the increase in export earnings during the financial year 1962-63 is accounted for by the inclusion of exports from Goa etc. (Rs. 16 crores) in total exports from this year. However, it appears that there was some real improvement during the second half of the year which more than offset the comparative stagnation of exports during the first half. Commodity-wise, the increase in export earnings was shared mainly by jute manufactures, vegetable oils and oilcakes, and metallic ores; but there were declines in the earnings from coffee, cotton raw and waste, tanned hides and

skins and cotton textiles. Exports to East European countries continued to increase, rising from Rs. 65 crores in 1961-62 to Rs. 86 crores in 1962-63, while exports to the rest of the world declined from Rs. 603 crores to Rs. 596 crores.

Total import payments of Rs. 1089 crores during the period under review were 9 per cent higher than in 1961-62 but somewhat lower than in 1960-61. Larger Government purchases were responsible for the whole of the increase over the year, private imports having in fact declined by Rs. 12 crores. Government imports of both developmental and non-developmental items recorded increases. On private account, all the categories of imports were held down by a tighter import policy. Pursuant to the Mudaliar Committee's recommendations, a larger proportion of licences were issued on an annual basis than hitherto. But for this, the policy in the year 1962-63 remained essentially restrictive and advantage was taken of increases in internal availabilities to effect cuts in quotas. The import policy for the year 1963-64, announced in April 1963, continued to be restrictive despite a moderate liberalisation for established importers by lifting the ban on about 80 items and the stepping up of foreign exchange allocation for small-scale industries.

Debt Servicing Burden

Higher receipts such as freight reimbursements in respect of PL 480 imports helped to reduce the net payments on account of invisible transactions. Investment income payments reflecting the growing foreign debt servicing burden continued to rise; but the payments on account of private donations, insurance, transportation and other miscellaneous services were lower, in part due to the various measures adopted since June 1962 to conserve the country's foreign exchange earnings.

The year also witnessed a sizable inflow of banking capital of Rs. 16 crores as against an outflow of Rs. 13 crores in the corresponding period of the previous year. The lower Bank rate in the UK coupled with the continued restraint of monetary policy in India and an unusually active busy season in 1962-63 brought about the favourable turn. The inflow mainly took the form of an increase in foreign currency liabilities of authorised dealers.

A number of changes were effected during the year in exchange control regulations. In December 1962, all Indian nationals holding shares/securities abroad were required to repatriate to India dividends, interest and sale/maturity proceeds of such shares and securities. Similarly, except in the case of accounts maintained prior to September 3, 1939 in non-sterling area currencies and July 8, 1947 in sterling area currencies, holders of foreign currency accounts were allowed to hold abroad balances up to £500 only. In February 1963, the general permission to travellers to carry Rs. 75 per person into or out of the country was withdrawn, though authorised money changers are allowed to sell foreign currency notes upto Rs. 40 per person to travellers and deck passengers to certain neighbouring countries; travellers to Ceylon and Pakistan are also allowed to take Indian or foreign currency notes upto Rs. 20 in value at a time. Foreign transit passengers are, however, allowed freely to convert rupee notes into foreign currency on production of evidence that the rupees were acquired by them by sale of foreign currency notes or travellers' cheques to authorised dealers or authorised money changers. Consequent on the extension of the Foreign Exchange Regulation Act, 1947, together with all rules and regulations thereunder, to Goa, Daman and Diu, all residents of these territories, other than foreign nationals temporarily resident, holding foreign currency balances abroad, other than balances in Burma, Pakistan and Ceylon, were required to declare them to the Exchange Control Department of the Bank before May 14, 1963. Persons who declared their balances before that date are allowed to retain half of such

balances to be utilised for approved purposes.

The various export promotion measures taken by India during the last few years, including the setting up of the Board of Trade in May 1962 appear to be bearing fruit gradually, though the average annual increase in exports necessary to attain the third Plan target yet remains to be achieved. During the year, a large number of items was freed from export control, the export duty on tea was abolished and freight concessions on 19 export items were announced. In addition, fiscal incentives in respect of a number of export commodities were announced and a provision of Rs. 3 crores was made in the 1963-64 budget for developing new markets. Similarly, credit facilities for exporters were further enlarged.

Nearly half (47 per cent) of India's exports still consists of the three traditional items, namely, tea, jute goods and cotton textiles; their share of the total exports was 52 per cent in the first Plan period. The scope for stepping up these traditional exports is limited for a number of reasons, such as increased competition from other developing countries, low elasticities of demand, trade barriers in the developed countries and increasingly protectionist policies of the developing ones. In addition, costs in these industries have also been on the upgrade. On the whole, their exports face an uphill task in foreign markets. Notwithstanding these difficulties, for an appreciable enlargement of exports in the near future reliance has still to be placed on a steady growth of traditional lines which form the sheet-anchor of the country's exports. Withal, a growing range of new export lines based on a diversifying productive structure will have increasingly to supplement the traditional lines.

Incentive Schemes

One of the important constituents of export promotion policy is the various incentive schemes. These schemes have proved to be of help in those cases where expanding output has enabled the industry to reduce its costs and to increase its exports. In some cases, however, the benefits of the schemes which succeeded initially in promoting exports have been eroded by rising costs. Export incentive schemes which seek to offset an adverse trend in the costs of production face heavy odds and may prove to be no more than temporary expedients to ensure a flow of exports that can only be sustained or improved by a direct attempt to hold the cost line. Such schemes will, nevertheless, continue to have a role in export promotion where they can alter the relative profitability of exports and domestic consumption in a context of rising domestic demand. The ultimate success of all export promotion devices depends on broad policies designed to increase output, restrain domestic consumption, raise efficiency and reduce costs of production and improve the quality of products.

At the same time, the industrialised countries have to extend their co-operation by liberalising progressively their trade policies with a view to promoting exports from developing countries, such as India. The benefits under GATT concessions under the "Dillon-Round" to countries like India have been only marginal. The prospects for a real expansion in the export trade of the under-developed countries now depend upon the results of the proposed "Kennedy-Round" which envisages 50 per cent across-the-board reductions in tariff rates on a number of industrial products, a nil tariff for some of the tropical products like tea, coffee and timber and the removal of non-tariff barriers.

Although the main source of strain on the balance of payments is the size of the import payments, it needs to be recognised that since the commencement of planning there has been considerable import substitution. In regard to iron and steel, the impact has been very pronounced; while total supplies have increased, the ratio of imports to total availability

has, at the same time, been halved. Tea and sugar machinery are two other items where the process of import substitution has been satisfactory. Thus it is clear that this is a field which has great possibilities, but it calls for a considerable measure of research, and adaptation to exploit it. The Emergency with its vast demands for all types of modern equipment for defence has given a new emphasis to this problem.

It has already been mentioned that foreign assistance was the major factor in the improvement recorded this year in the balance of payments. External assistance authorised to India in the form of loans, grants and P.L. 480 assistance amounted to Rs. 652 crores, including Rs. 16 crores from the East European countries, in 1962-63 (April-March) as compared to Rs. 425 crores during 1961-62 (April-March). The rate of utilisation also increased significantly and at Rs. 447 crores was higher by about 32 per cent than last year; this included Rs. 33 crores of the assistance extended by the Soviet Union and East European countries. An important reason why the pace of utilisation of foreign aid was quicker in 1962-63, as compared to previous years, was that the share of untied assistance especially from the U.S.A., had increased considerably. According to information available so far, additional assistance of the order of Rs. 143 crores has been authorised during April-June 1963. Moreover, the substantial increase in the quantum of aid authorised during the period was coupled with a softening of terms and conditions. A considerable portion of the loan assistance received during the year came from the U.S. and I.D.A. which carried only a small service charge of $\frac{1}{2}$ of 1 per cent and no interest payment and is repayable over a period of 40-50 years including a grace period of 10 years.

Consortium Aid

As noticed earlier, the bulk of the assistance authorised during the financial year 1962-63 was extended by the members of the Aid India Consortium. It will be recalled that the Consortium members had promised to make available the assistance of Rs. 1,125 crores for the first two years of India's third Plan; of this, Rs. 1,042 crores were authorised by the end of April 1963. At the eighth meeting of the Consortium held at Paris in June 1963, the members promised further assistance of the order of Rs. 436 crores for the third year of the Plan (1963-64) and at its subsequent meeting on August 7, 1963, the Consortium increased its total commitment for the year to Rs. 501 crores; this compares with the estimated requirement of Rs. 598 crores. It is encouraging to note that the Consortium members have recognised the need for a larger proportion of aid being made available in the form of non-project assistance with as much of the aid as possible in the form of grants or long-term loans at low rates of interest. While a larger component of untied aid is of help in securing raw materials in the cheapest markets and ensuring a fuller working of existing capacity and generally in the flexible adaptation of the investment programme, it places a greater responsibility on the Government, to utilise the untied aid for such augmentation of production as would be of help to the balance of payments situation.

Besides the assistance extended by the foreign governments and international institutions, efforts continued to be made to encourage the flow of private capital from abroad. Consents for issue of capital to non-residents, which broadly reflect the investment intentions, granted during 1962 were higher at Rs. 47 crores as against Rs. 34 crores and Rs. 19 crores in 1961 and 1960, respectively. The services of the Indian Investment Centre are being increasingly utilised by foreign as well as Indian entrepreneurs seeking foreign collaboration agreements. A Committee has also been set up by Government to evolve some definite guide lines for policies in regard to foreign collaboration agreements.

Task for TTK

DURING THE recent session of Parliament two themes dominated discussion. One, naturally, was the continuing Chinese aggression, made all the more menacing by the Peking-Pindi axis. The other, equally naturally, was the state of the nation's economy, especially the progress made in its agriculture and industry since the beginning of the third Plan and particularly after the emergency has emphasized the supreme importance of mobilizing national resources and building up the economic strength of the country which is the basis of its military strength.

There is, of course, an obvious nexus between the two themes. The only answer to the threatening postures of our hostile neighbours is increased defence preparedness; and defence preparedness, it is becoming increasingly evident, must result from a very rapid and large expansion of our industrial production and industrial facilities. There has been an attempt at some quarters to decry as a senseless slogan the exhortation to the nation to devote its energies and resources in full to both defence and development. The argument here is that, with agriculture stagnating, industry growing less slowly than before and population rising, it is unrealistic to plan ambitiously for both defence and development. This reasoning is rather difficult to follow. Is it the contention that because the economy is not expanding as fast as it should, attempts to correct this situation and step up the growth of the economy should be abandoned? On the contrary, is it not true that because of the very fact that our development effort has not been yielding adequate results, efforts should be made to improve its quality and vigour? Secondly, where is the inconsistency in asking for the maximizing of effort in defence and development alike? Has the country any choice at all? If defence preparedness is the supreme obligation — and it must be conceded that it is — can this responsibility be discharged without more vigorous development of the economy? In fact, amidst all the confused thinking there has been in the economic and defence fields in recent years, the only bright feature has been that, since the emergency, informed opinion has largely rallied to the idea that the maximization of defence and development is a programme which is one and indivisible and that it should be pursued as an integrated project. From this point of view, concern over external aggression and prospects of further hostilities and the consequent anxiety that defence preparedness should be rapidly promoted emerges logically from the anxiety over such weaknesses as there have been in the development effort in the last three years and indications that prevailing attitudes and policies are not conducive to a rapid development of the economy in its agriculture and industry.

The Lok Sabha had an excellent — even if rather odd — occasion for recording its anxiety over our inadequate and slackened economic development when the 'three-anna' controversy raised by Dr. Lohia succeeded in creating opportunities for a lively discussion of the quality and success of our development effort. While the fact that the country has made appreciable progress in the last 15 years in the fields of economic development and social welfare cannot be gainsaid, it is surely hard to deny either that the nation's capacity to defend itself effectively or provide the mass of the people with a reasonable living will not be assured unless and until the tempo of economic development generally and industrial expansion particularly is raised very considerably. This is a point over which there can really be no disagreement and the latest annual report of the Central Board of Directors of the Reserve Bank of India has surely made a very reasonable observation when it points out that "the economy has now to adjust itself on a long-term basis to the needs of an enhanced defence

budget and of continued development without which a large defence effort cannot be sustained."

The problem of this long-term adjustment in the sense of measures taken with a clear awareness of the implications of large-scale industrialisation and economic development in the long run is certainly the most challenging theme today for the Government in the economic sphere. Other issues, such as prices, however important in themselves, are clearly secondary in significance. As the Finance Minister very rightly pointed out in the Rajya Sabha last week what has most seriously gone wrong with our economy lately is that the tempo of economic activity has slackened. The increase in the price level is only a symptom of this basic malady. Mr. Krishnamachari indeed suggested in a weak moment that the Government could hold the price line through controls provided Parliament would authorise it to do so. But surely it is not what Parliament, supreme as it is as a law-making body, desires to dictate which is relevant to the price issue. The story of King Canute is a familiar one and even if both Houses of Parliament and all State Legislatures are to pass unanimous resolutions authorising the Government to freeze prices by controls, it is doubtful that the job can be done.

What is at issue is really not whether there is Parliamentary sanction for controls or not, or even whether public opinion wants controls or does not. What matters is: Can controls work efficiently in the sense that they will really be effective in the prevailing circumstances in preventing prices from rising? Mr. Krishnamachari himself gave the answer in the negative when he said that prices had been rising primarily because production was not keeping pace with demand. This demand he was careful to point out was not being boosted by monetary inflation but was a physical phenomenon in the sense that the supply of goods and services was just not moving in step with the needs of a growing population slowly and painfully emerging from a historic state of gross under-consumption. It follows that the only way that the price situation could be dealt with in the short period is to take steps which would lead as quickly as possible to a greater production of consumer goods. We have been taking the view in these columns that one of the important reasons for rising prices is that the growth of production of consumer goods industries has been seriously lagging behind the growth of general industrial production which itself has slackened. Sugar has certainly been a glaring example of how reduced production could boost prices, but it is by no means an isolated instance. Over the entire range of India's consumer goods industries there are today numerous cases where insufficient production is responsible for the pressures on the price line.

If an increase in production is the short-term answer to the current trend of rising prices, an increase in investment is the only real solution to the long-term adjustment

of the productive apparatus of the economy to the needs of defence and development of which the annual report of the Central Board of Directors of the Reserve Bank has spoken. The Finance Minister has indicated that he is conscious of the problem and some of his observations have been taken to mean that he would be moving in the direction of liberalising credit facilities through the banking system and availabilities of industrial finance through institutional lenders. While any step that we may take to facilitate the freer functioning of the economy would be welcome, it is doubtful that much can be achieved in terms of long-term needs unless the basic problem of stepping up the rate of investment is squarely faced. There is an unfortunate tendency to ignore the fact that so long as the rate of investment in this country remains as low as it is, no considerable expansion of the economy can be expected. While it is certainly not wrong to talk ambitiously about defence and development, it is definitely pathetic to imagine that there could be big defence and development in the absence of a dynamic and determined programme to increase the rate of investment in industry.

Mr. K. K. Birla, speaking recently to the Indian Chamber of Commerce and Industry, Calcutta, gave certain comparisons which are relevant in this context. He said that in the United States the new capital raised by corporations in the decade ending 1961 averaged about Rs. 5,900 crores per annum. In Japan this average was Rs. 445 crores and in the United Kingdom Rs. 437 crores. For our country the comparable figure, Mr. Birla said, was hardly Rs. 60 crores. Even this low rate of new capital investment in industry has declined since the emergency instead of being stimulated by the need for more urgent industrialisation. What would therefore matter is whether Government would be able to reverse this tendency and create conditions for a rapid and progressive rise in the rate of investment in industry. For some reason or other financial circles in the country have tended to assume that the new Finance Minister will be both willing and able to engineer this basic revolution in the economic and investment climate. It is very much to be hoped that their calculations are not ill-founded.

We are aware that, in a country of mass poverty, it is extremely difficult to step up the rate of savings and investment substantially. At the same time, unless this task is undertaken resolutely and competently, that mass poverty will remain. Not that efforts have not been made to increase or mobilise savings, but experience has shown us clearly that much of this effort has been either misconceived or misdirected. The annual report of the Board of Directors of the Reserve Bank points out that the five-year target of additional taxation fixed for the Centre in the third Plan has already been exceeded. It also adds that additional taxation in the Centre and the States in the current year is expected to raise the ratio of Central and States tax revenues to national income from 9.6 per cent at the end

of the second Plan to over 13 per cent and commends this as a "considerable" achievement. But this achievement has had the unfortunate effect of slowing down economic activity and the complication which the super profits tax and the compulsory deposit scheme have created is a warning that the transference anyhow of finances from individuals to the public fisc does not necessarily increase capital formation or improve economic activity.

It is therefore necessary that a new attitude should be brought to bear on the basic problem of mobilising resources both within the nation itself and from abroad for the purpose of stepping up very considerably the rate of investment of new capital in the expansion of industry. It has been suggested often enough that there ought to be a new deal, in fiscal terms, for individual incomes and savings as well as for corporate earnings. Great hope is being placed in the Finance Minister's pragmatism and dynamic outlook by many in this country and abroad who seem to be confident that new policies and new attitudes will soon be forthcoming. Here again we do not know how far this optimism is justified. After all, it cannot be ignored that, in his previous

Alternative Means of Corporate Finances

PERHAPS THE most crucial question that an entrepreneur often faces is the sources from which finance is to be raised for the growth and sustenance of corporate activity. An effort has been made by Mr. N. D. Joshi of the Company Law Administration to evolve a general concept of financial efficiency and trace the basic elements which determine the skilful management of company finances in such a way that the growth of the company, desirable from an overall economic view-point, is not starved for want of adequate supply of funds, with due regard to their costs and the terms and conditions under which they are obtained.

To achieve a full reward of financial efficiency, three necessary conditions have been laid down for raising funds. In the first place, the costs of all funds raised after due consideration should be equal to the returns earned on their use. Next, the pattern of costs of all funds should follow a specific sequence in the sense that it should be in the ascending order of trade finance, deposits, bank loans, debentures, preference capital and equity capital. The third condition is that, as far as possible, the proportion of equity capital in the total capital employed should be maximum and it is added that the more adventurous the company, the higher should be the percentage of equity capital. This is essentially on the basis that since it is equity capital that bears risks it should be employed to the maximum in bearing the strain of adventure.

Relying upon the data for 1955-60 extracted from balance sheets and profit and loss accounts of 271 of the biggest public limited companies which constitute nearly 56 per cent of the paid-up capital of all the public limited

companies, an attempt has been made to (a) examine the structure of relative costs of different types of funds used by the companies, (b) compare the costs of funds with the rate of returns and (c) find out how far their financial structure responded to the considerations of costs and returns during the period. The cost of funds to a company is the price it pays for their use, which may vary from year to year like the payment to equity shareholders. Returns, on the other hand, are calculated on tangible assets and on combined equity. It is added that in the case of small companies the returns of shareholders are inclusive of all types of income received by such group of people in the form of dividends, salary, commission, interest, etc. It appears that this latter concept is likely to cause an error because salary and commission is retained by the entrepreneur (if he receives dividends too) in return of his additional services which do not form a part of the company's capital.

tenure as Finance Minister, Mr. T. T. Krishnamachari himself was responsible for fiscal innovations, all of which did not have happy consequences for the capital market or the economy of the country. But, as has been said often enough lately, and as his own observations in Parliament testify, Mr. Krishnamachari seems willing at the present time to consider measures which will put new heart and new money into the industrial economy of the country and energise current production as well as investment in future expansion. In some ways it is not a good thing that basic economic policies could be initiated normally only once a year when the budget comes to be presented. Since these are not normal times it is perhaps possible for the Finance Minister to ignore this limitation and act sooner rather than later in revising existing fiscal measures which have been demonstrated to be obstructive of the growth of investment in industry. The reform of both personal and corporate taxation in order to stimulate savings and investment having become imperative, there is really no reason why this urgent task should not be taken up promptly or that the Finance Minister should wait for February. There is no magic in any month.

The analysis indicates that "the overall pattern of costs of funds of 271 companies studied here for each year for the five-year period between 1955-56 to 1959-60 generally satisfies the standard of financial efficiency, namely that the relative pattern of costs of different types of finances should be in accordance with attendant risk and conditions attached to them". It is further pointed out that the companies earning very low rates of return have failed to maintain the correct pattern of costs according to terms and conditions under which different types of funds are supplied. The brunt was borne in these cases by equity and preference shareholders. It seems that in the case of companies earning a return of six per cent or more on combined

equity, proper sequence of returns was noticed so that ordinary shareholders were paid more than preference shareholders who, in turn, were paid more than debenture holders. In case of sugar, automobiles, cotton and electricity industries, where earnings were more than eight per cent, it is indicated that payment to ordinary shareholders was less than the overall interest rate paid on loan capital. Such cases of divergence from norm have to be studied in larger details and one cannot agree with the author's conclusion that by doing that the interests of the shareholders were neglected.

An attempt has been made to assess the effect of age-pattern of companies on the cost of finances. The analysis shows that the highest percentage of ordinary dividends was recorded by companies registered in the period 1930-39 and the lowest percentage was recorded by those registered in 1954-55. Preference dividend was less than debenture interest for companies floated during 1948-53, while the debenture interest was less than interest on other loans for the same age group of companies. Preference dividend was less than interest on loan capital for companies registered up to 1960 and during 1930-53.

Other interesting trends regarding the costs of finances during 1955-60 that emerge in this study are that dividends to ordinary shareholders went up during these five years by 3.02 per cent in case of these 271 companies, while interest on the loan as a whole rose by 1.39 per cent and preference dividend and debenture interest rose by 0.21 per cent and 0.04 per cent respectively. It is further observed that during these years the preference dividend dropped in case of trading companies, remained constant in managing agency group, chemicals, plantations, electricity, cement, rayon, shipping, coal, cigarettes, oil, cotton, miscellaneous industrial companies and increased in other industries like sugar, paper, automobiles, jute. During these years the cost of debenture went up in the case of engineering cotton, paper, cement and jute companies and remained the same in other industries. Dividend to ordinary shareholders went up in all industries, excepting shipping and plantation companies, the rise being highest in case of rayon companies of 11 per cent followed by coal companies of 9 per cent.

In an effort to determine the break-even point where costs of different types of finances are equal to the rates of returns, the data has been analysed to determine the yields on various types of funds employed. It appears that more than half of the companies studied here earned a rate of return above five per cent on tangible assets and on combined equity. The break-even point where costs of finances of different types were equal to the rates of return happened to be around six per cent approximately. The break-even point of companies belonging to fast-growing industries such as paper, cement, automobiles etc. are higher than those of companies belonging to other industries showing thereby that fast growing companies can afford

to pay comparatively higher cost of finances.

The study also throws some light on the manner in which the financial pattern of big companies has changed during these years. One of its indications is that relative importance of equity finance declined during these years in paper, sugar, electricity, managing agency, cement, shipping, coal, cigarettes, oil, rayons, cotton and jute companies. In some industries like engineering, automobiles, plantations, chemicals, trading, the share of equity capital actually increased. It is also stated that oil, shipping, coal and cigarette companies on the whole did not attempt to raise their equity capital although these companies undertook considerable expansion and financed such expansion out of other sources. It may be pointed out that in the first instance the period of five years is not enough to arrive at such a conclusion. It is not necessary that every company should correspond its expansion with the increase of equity capital. Moreover, there are peculiar conditions in every industry that determine the source of finance that has to be tapped. Such conclusions, therefore, should not have been stated in a derogatory tone. In fact it is clearly indicated that the sheer size of finance required for growth seems to have compelled these companies to go in for other sources like bank loans, and perhaps the need for more short-term finances required by some of them deflated the percentage of equity capital. It is further stated that in some industries, such as oil, a substantial part of the profits was ploughed back in the business with the result that there was a considerable increase in the net worth of these companies.

Towards the end of the study data has been examined in details regarding the companies that earned very high rates of return on tangible assets according to the yardsticks of financing efficiency. The top 16 companies earning above ten per cent rate of return on tangible assets did satisfy these yardsticks in the sense that the relative costs of different types of finances did correspond to the terms and conditions and the costs of non-equity funds were less than the return on tangible assets. Apparently all other companies could not have followed the underlying conditions of financial efficiency. The author believes that non-compliance with these conditions restricts the supply of risk capital. To substantiate his point he indicates that during these years bank deposits have increased by Rs. 828 crores while equity capital of non-Government corporate sector increased by Rs. 166 crores. "This shows that the pool of risk capital has not been augmented proportionately to the augmentation of the pool of total savings". This at least is faulty logic. It is hard to believe that anyone would expect a major part of the newly created money to flow into the hands of those who put it as risk capital. Bank deposits, on the other hand, reflect a general rise in buying capacity with the people, and have got to be much larger than the newly created risk capital.

Concealed Taxation?

THE REPORTED decision of the Government of Maharashtra to introduce, in the current session of the legislature, the Bombay City (Inami and Special) Tenures Abolition Bill, 1963, in the guise of a land reform measure, is unfortunate. The provisions of the Bill leave no doubt in one's mind that it is a taxation measure, pure and simple, intended to augment the revenues of the State Exchequer. Instead of achieving the objectives of land reform as envisaged by the Planning Commission in the third five-year Plan, the proposed bill, if enacted, is likely to lead to exploitation, result in social injustice and gravely imperil the economic and financial structure of the city of Bombay.

It is not clear why the bill has been suddenly revived after having been shelved once in 1957 and, again, in 1959. Except for a few minor changes, the bill that is due to come up for consideration is practically the same. Consequently the criticisms levelled against the original bill in 1957 and the subsequently revived bill in 1959 hold good today.

The object of the proposed legislation is "to abolish Inami tenure and certain special land tenures in the city of Bombay". It may be noted here that the tenures that would be affected by the bill are mostly situated in the industrial and residential areas of the city and are covered, to a substantial extent, by industrial structures and residential buildings both for industrial and non-industrial workers. The rents of these in most cases have been either subsidised by the employers or frozen at the pre-war level under the Rent Control Act. This apart, the tenures in the city of Bombay, an essentially urban area, are fundamentally different from tenures obtaining elsewhere in the city. Moreover, these properties having been long in existence — some of them from pre-British days — interests in them have changed hands several times. There are, moreover, small holders who are entirely dependent on the income of the property on these tenures for their livelihood. A substantial portion of the tenure lands in the city — 6,842 acres — falls under the category of "redeemed land", i.e., a special tenure land in respect of which the cess, assessment or, as the case may be, rent has been redeemed long ago. And, on the lands so redeemed several industrial and commercial undertakings and banks have been set up.

It is not merely the proposed abolition of this type of tenures in the city of Bombay that is objectionable but also the proposed arbitrary basis of assessment and the proposed reduction of the period of grace from 50 years in the earlier bills to 20 years. To mention one instance, if the proposed bill is enacted as law, a textile mill, which according to present assessment, has to pay Rs. 25, will be called upon to pay Rs. 11,200, during the first five years, and this amount will steadily rise in subsequent quinquenniums to Rs. 1,12,000 at the end of 20 years. There must be hundreds of cases of this kind and the irony of it is that, when purchasing the lands, the parties were under the impression that, inasmuch as the lands had been redeemed, they would

remain virtually as free-hold lands.

The bill will not only hit the well-to-do sections but also a considerable number of tenants occupying buildings constructed on the tenure lands. As a result of the proposed steep increase in assessment consequent on the abolition of tenures, these tenants will have to pay higher rents. This apart, the bill would lead to a sharp depreciation in land values with all their attendant repercussions. For example, the credit structure of business and industry in the city will be adversely affected, because it is on the basis of the prevailing values that banks and others have extended credit to the parties concerned. It is pertinent to point out here, in parenthesis, that, although the levy of full assessment is to be in gradual stages, for purposes of affording credit, the creditors will only take into account the incidence of the final assessment.

The Maharashtra Government could certainly have been more frank about its intentions in bringing forward such a bill. It is obvious — although this is not implicit in the statement of objects and reasons — that the measure has been conceived purely as a revenue-raising device. It has been estimated that the State Exchequer will benefit to the extent of about Rs. 6 to 7 crores per annum. But, to an almost corresponding extent, it should be noted, the Central revenues will suffer. For the assessment would be a deductible item for purposes of income-tax. This is an aspect which the Central Government cannot afford to ignore. As at present, being urban in nature, the lands in Bombay city are a fruitful source of revenue to the Centre by way of income-tax, wealth tax, gift tax and estate duty. As a result of the proposed legislation and the consequent heavy assessment, the values of these lands are bound to suffer depreciation, both as to capital valuation and as to income potential, which will, in turn, result in affecting revenue payable to the Centre. In short, the proposed bill is not likely to tap any additional source of revenue; instead, it is feared, it will only divert the existing revenues from the Central Government to the State Government.

What should occasion much concern is the fact that the textile industry bids fair to be the worst hit by the proposed bill. The likely addition to the already existing burdens on this industry will place it in a very unfavourable position *vis-a-vis* the cotton mill industry in the other centres of the country. This is something which the Maharashtra Government does not appear to have taken into account. It is to be hoped, therefore, that the authorities would drop the bill altogether. They should, in any case, give serious thought to the representation of the Bombay mill-owners that the bill should revert to the basis of assessment as laid down in clause 18 of the 1959 version, exclude from the scope of the legislation the redeemed lands (nearly 280 acres out of the 440 acres of land, the tenures in respect of which are proposed to be abolished, belong to cotton mills) and provide for adequate compensation for lands, the tenures of which are sought to be abolished.

Highlights of the Week

POLITICAL & POPULAR

THE NEW Finance Minister announced in Parliament on Saturday his eagerly awaited decisions on the revision of the Gold Control and Compulsory Deposit measures. The Compulsory Deposit scheme has been virtually scrapped except to the extent that income-tax payers will continue to have the option to discharge a part of their tax liabilities by making a refundable interest-bearing deposit as provided for in the budget. Those parts of the Compulsory Deposit Scheme which relate to land revenue payers, urban immovable property holders and sales tax payers, which have not yet come into force have been given up. Salaried workers who are not in the income tax paying category (and to whom the scheme has already been applied) will have their deposits refunded with interest with the least possible delay.

The result is that there is no longer anything "compulsory" about the Compulsory Deposit Scheme. On the contrary, in the form in which it will remain it will be a concession granted to income tax payers on whom the tax has been increased in the current year's budget. These decisions have been taken in the light of the views expressed by State Governments and on a consideration of the administrative difficulties inherent in the extension of the scheme to land revenue payers, urban immovable property holders and sales tax payers. In the budget estimates it was anticipated that the total collections under the complete scheme might amount to between Rs. 65 and 70 crores, out of which the Centre might retain Rs. 40 crores, releasing the balance to the States. As a result of the changes now announced, the entire proceeds which will be from income tax payers, will go to the Centre. In the Budget the amount thus accruing has been estimated at Rs. 12 crores, but the present estimate is nearer Rs. 8 crores.

Minor Revision

In the case of Gold Control the revision has been far less drastic. The policy itself has, in fact, been reiterated in its essentials, but a considerable concession has been granted permitting the conversion of the existing gold ornaments in excess of a purity of 14 ct into ornaments of like purity. The main purpose of this relaxation of the Gold Control rules is stated to be to provide licensed self-employed goldsmiths with some employment pending the long-term process of their rehabilitation. The implication is that ultimately this concession may be withdrawn when the problem of rehabilitating unemployed goldsmiths has been accomplished. The Finance Minister also announced that a Gold Controller would be appointed in the Department of Revenue of the Ministry of Finance to take charge of matters of gold policy and administration. This implies that the Gold Control Board may be wound up and that the Central Excise Department will cease to be responsible for enforcement. Mr. Krishnamachari indicated that the Government would be bringing up before Parliament at a very early date a bill which would take the place of the present Gold Control Rules issued in the form of amendments to the Defence of India Rules.

Incidentally, answering a short notice question in the Lok Sabha last Saturday, the Finance Minister disclosed that about 42.97 million grammes of non-ornament gold valued at approximately Rs. 23 crores at international prices had been declared under the Gold Control rules by dealers, refiners, institutions and individuals. He said that the Government had not made any assessment of the total quantity of non-monetary gold in all forms held in this country, but an article published in the April, 1958 issue of the Reserve Bank of India Bulletin estimated this quantity at about 3266 million

grammes, the value of which at the international price would be about Rs. 1,750 crores. The Finance Minister added that this estimate was not based on any precise data. The following is the text of his statement:

"I had indicated in reply to questions in this House that I would make a statement before the House rose on Gold Control and the Compulsory Deposit Schemes.

Basic Objective

"My distinguished predecessor had on more than one occasion outlined in this House the basic objectives of Government's gold policy. While there can be no denying the important role that gold continues to play in the social outlook and habits of people, we cannot minimise its effects in the form of a drain on our resources in foreign exchange and otherwise. The basic features of the gold policy initiated by my distinguished predecessor were aimed at a curtailment of the facilities to market gold, particularly in its primary forms, so that the smuggler who got past the Customs point did not feel free to dispose of the gold openly and without challenge, and secondly at reducing the demand for gold by stopping the production of gold ornaments of a higher purity than 14 carat. Government feel that both these objectives are basically sound and justified by considerations of national interests. There can be no going back on them. Nevertheless, the many problems which have been thrown up in the administration of the gold control in its present form had to be reviewed. We had also to consider whether and to what extent changes were necessary, even if they be of a transitional character, to alleviate hardship to the class of people, who have been working on gold as a means of livelihood, having at the same time due regard to the sentiments of the people, who as I have said before, have a great deal of attachment to gold and gold ornaments.

"On the problem of those working on gold we have to consider firstly the self-employed goldsmiths and secondly those employed by the bigger goldsmiths and jewellers. While we have a programme of rehabilitation of the self-employed goldsmiths, we had recognised that the fringe of the problem has been barely touched, and it would take much more than the amount of money we have allotted for this purpose so far as well as a great deal of time, before we can successfully rehabilitate most of them. While we propose to proceed with this task of rehabilitation of goldsmiths, who depend purely on the manufacture of gold ornaments for their livelihood, we cannot do all that has to be done in a day.

Conditional Facility

"Government have, therefore, decided to grant licences to self-employed goldsmiths on a nominal fee and to permit them on certain conditions to convert existing gold ornaments in excess of a purity of 14 carat into ornaments of like purity. This will restore to them the facility to carry on what was their main avocation. Out-workers i.e., those goldsmiths who worked on gold in their own houses to execute orders received from licensed dealers, will be permitted to handle limited stocks of primary gold upto 14 carat. Government hope that these measures will facilitate the continuance in the long-term process of rehabilitation.

"I would emphasise that these relaxations do not involve any change in the Government's basic long-term policy to discourage the use of gold generally and the production of gold jewellery of high purity. If any one wants new ornaments to be made from primary gold he can only get 14 carat ornaments to whichever source of supply he turns. There will be no sale or display by dealers of jewellery of a purity exceeding 14 carat. The facility to convert existing ornaments into new ornaments of purity above 14 carat is necessarily a limited one and intended to benefit those who

MANSFIELD TYRES

HI-BAR AND MULTI-MILER **(MRF)** TRUCK AND BUS TYRES

MADRAS RUBBER FACTORY LIMITED

(IN COLLABORATION WITH MANSFIELD TIRE & RUBBER COMPANY, U.S.A. —

50 YEARS' TYRE-BUILDING EXPERIENCE)

4¾ Per Cent

ANDHRA PRADESH STATE ELECTRICITY BOARD BONDS, 1975

For Rs. 350 LAKHS

Payment of interest and repayment of principal guaranteed by the
Government of Andhra Pradesh.

The bonds will be trustee securities under the Indian Trusts Act and also
approved securities for the purposes of the Insurance Act and the Banking
Companies Act.

ISSUE PRICE Rs. 99.50 Per Cent

Redeemable at par on the 26th September, 1975.

Subscriptions will be received in cash or cheques from the 26th September,
1963. But the lists will be closed without notice as soon as the total subscriptions
amount to approximately Rs. 350 lakhs and in any case not later than the close of
business on the 1st October, 1963.

Applications will be received at (a) the branches of the State Bank of Hyder-
abad within the State of Andhra Pradesh, wherever they exist and at Bombay and
Madras, (b) the branches of the State Bank of India at Delhi, Calcutta and Banga-
lore and at places within the State of Andhra Pradesh, wherever the branches of the
State Bank of Hyderabad do not exist, and (c) the Government sub-treasuries in the
State of Andhra Pradesh at places not covered by items (a) and (b).

Copies of the Notification announcing the terms of issue and application forms
are available at all the receiving offices mentioned above, at all treasuries and sub-
treasuries in the State of Andhra Pradesh and at all offices of the State Electricity
Board.

possess such ornaments and want them to be re-shaped, and
to enable the self-employed goldsmiths to continue to earn
a living for the time being.

"Apart from these changes to which I have just referred,
Government propose to make certain changes in the
administrative set-up in order to make enforcement more
effective. The present rules provided for the establishment of
a Board to advise Government and to be in over-all charge of
the implementation of policy. The responsibility for enforce-
ment of these rules is, however, entrusted to the Central
Excise Department. After a careful examination of the mat-
ter, Government have come to the conclusion that bifurcation
of responsibility for policy making and for implementation
is not wise. Government, therefore, have decided to centra-
lise the administration by appointing a Gold Control
Administrator, located in the Department of Revenue, who
will be in charge of matters of gold policy and administration
and who will seek the assistance of States administrations in
this task.

"When the Gold Control Rules were originally framed, it
was considered that the most convenient method was to issue
them in the form of amendments to the Defence of India
Rules. Considering the application of these rules to a very
large section of the community, both in regard to the use
of gold in industry and in regard to the use of gold as orna-
ments, Government feel that these rules should be replaced
by a statute, subject of course to the approval of the Parlia-
ment. Government, therefore, intend to bring up before
Parliament at a very early date a bill which might cover
both the short-term and the long-term objectives of Govern-
ment's gold policy.

Compulsory Deposit Scheme

"I now turn to the other matter which has been exercis-
ing the minds of the members of Parliament during the
session, namely, the Compulsory Deposit Scheme. As the
House is aware, three out of the five schemes contemplated
under the Compulsory Deposit Scheme Act, 1963, namely
those relating to land-revenue payers, urban immovable pro-
perty holders and sales tax payers, have not yet been brought
into effect. These schemes have to be implemented through
the States and local authorities concerned and draft schemes
were referred for their comments to State Governments. The
replies received have indicated numerous practical difficulties,
notably in the case of land-revenue payers. Not only the rates
at which tax on land is levied, but also the periods, methods
and agencies of collection vary widely from State to State.
In regard to the two other schemes also, it has been
represented that collection would pose difficulties. In many
cases, the municipal authorities do not impose any urban
property tax and would thus have no ready basis for col-
lecting compulsory deposits. The States have also complained
that the sales tax payers scheme would impose additional
burdens on their already hard-pressed sales tax authorities.
Besides, the out-turn from these two subsidiary schemes is
expected to be comparatively small.

"Quite apart from the administrative problems, there
were indications that many State Governments were far
from happy about the idea that an additional levy, even
though it was in the form of savings rather than tax, be
imposed upon land owners and the relatively lower income
urban groups. Since the main beneficiaries of the Compulsory
Deposit Scheme were the State Governments themselves and
the entire collection from the land revenue paying class would
have gone to them, the Government of India felt that it was but
fair to ask the State Governments to express their considered
opinion once again on the scheme as a whole. Accordingly, I
wrote to the Chief Ministers of all the States asking them
for their opinion as to whether these three schemes should
be implemented, modified or given up. The replies I have
received from them show that almost all of them are in
favour of abandoning the scheme for the land revenue payers

and most of them would prefer to see the schemes for the
urban property owners and sales tax payers also given up.
Some Chief Ministers have drawn pointed attention to the
fact that the levy of a compulsory deposit on land owners in
particular and the urban population generally would affect
the contribution to voluntary savings, a consideration which
we cannot ignore.

"In the light of these comments, the Government of
India have made a review of the Compulsory Deposit Scheme
as a whole. It is important to ensure equity of sacrifice
between people who belong, broadly speaking, to the same
income groups or to the same economic levels. We cannot
exempt the land revenue payers from this scheme without
giving relief to salaried workers as well.

"The Government of India have, therefore, decided that
schemes in respect of land revenue payers, urban immovable
property holders and sales tax payers, which have not yet
come into force, should be given up. As regards salaried
workers who are not in the income-tax paying category,
Government feel that similar relief should, in equity, be given
to them. Arrangements will be made to refund the deposits that
have already been made with interest with the least possible
delay. Income-tax payers, however, stand on a different foot-
ing. So far as they are concerned, the rate of income-tax on
them has gone up and they have the option to pay a part of
the increase in the shape of a contribution to the Compulsory
Deposit Scheme. A mere withdrawal of this scheme might
mean a greater hardship to them, because in lieu of a refund-
able deposit they would have to make an outright payment
in the shape of a tax. The scheme for income-tax payers will,
therefore, continue. I trust these changes will have the sup-
port of the House.

"The decisions which I have just announced would mean
a substantial loss of resources. Government, however, hope
that the loss would be more than made up by an increase in
voluntary savings. The House will be glad to know that dur-
ing the first 5 months of the current financial year, small
savings collections have been at a record figure of Rs. 31
crores, which is more than double the collections in the cor-
responding period last year. Government propose to intensify
their efforts for the collection of small savings and they trust
that State Governments who receive two-thirds of the col-
lection from small savings will also join in this effort with
renewed vigour."

WAGES IN JUTE INDUSTRY

THE CENTRAL Wage Board for the Jute Industry in its
report submitted to the Central Government a few day ago
and laid on the table of the Lok Sabha last week, has recom-
mended a general increase in the emoluments of all categories
of labour and clerical staff working in mill premises, linking
of their dearness allowance to the Working Class Consumer
Price Index and introduction of a standardised bonus scheme.
They will apply to all the jute mills now in existence, includ-
ing the spinning units, and also those that might be started
hereafter. Following are the more important recommenda-
tions of the Board:

No contract labour should be employed in connection
with the manual work in the jute mills. Even when contract
labour is employed, the principal employer should be liable
for payment of wages to the contract labour and it should
be the principal employer's responsibility to see that all laws
relating to labour are fully implemented.

The total minimum wage in the jute mills in West Bengal
at the working class consumer price index number of 425 for
Calcutta with the base year 1939 as 100 should be Rs. 81 per
month. It should consist of (1) Basic Wage, (2) Wage Board
Increment, and (3) Variable Dearness Allowance.

The existing eight basic wage groups in the jute mills in
West Bengal should be reduced into the following three groups:
(a) Basic wages of all workers within the existing wage groups

I to IV, i.e., Rs. 34.67, Rs. 35.75, Rs. 36.84 and Rs. 37.92 should be equated and fixed at Rs. 40.17; (b) Basic wages of workers within the wage groups of V to VII, i.e., Rs. 39.00, Rs. 40.09 and Rs. 41.17 should be equated and fixed at Rs. 41.17; (c) Basic wages of workers in the wage group VIII, i.e., of workers who are now at Rs. 42.25 and above, will be more or less the same, i.e., Rs. 42.25 and above.

The rate for the double (pair) loom weavers should be 80 per cent, instead of the present 75 per cent of the basic wages on the production of the two looms.

In addition to the basic wages, all categories of workers (except the clerical staff whose case has been dealt with separately) should be paid an increase of Rs. 8.33 per month inclusive of the interim relief of Rs. 3.42 per month. This increase should be shown as a separate item "Wage Board Increment", in case of all categories of workers. The Wage Board Increment should be treated as a part of the basic wage for all purposes like bonus, provident fund, etc.

Dearness Allowance

The present dearness allowance of Rs. 32.50 should be considered as the dearness allowance fixed at the working class consumer price index number of 425 for Calcutta with base year 1939 as 100. The dearness allowance should be a variable dearness allowance and the rate of increase or decrease should be 20 nP. per point rise or fall in the average working class consumer price index number for Calcutta. The dearness allowance should be revised every six months in the months of February and August on the basis of the average consumer price index number of previous half years — July to December and January to June, respectively.

The wages fixed by the Board whether time rates or piece rates, are on the basis of a 48 hour week. If for any reason the working hours in a week are less than the normal 48 hours, the wages of the workers should be calculated in the following manner: (i) The dearness allowance should not be reduced whatever may be the number of working hours; (ii) the basic wages also should not be reduced if the working hours in a week are not less than 45; (iii) when the working hours are less than 45 in a week, the basic wages fixed on the basis of 48 hours' week may be reduced proportionately. The conditions laid down in clauses (ii) and (iii) should apply only to the time-rated workers.

All categories of workers (except the clerical staff) in jute mills outside West Bengal should be paid Rs. 8.33 per month inclusive of the interim relief of Rs. 3.42, as "Wage Board Increment".

The rate of dearness allowance of all categories of workers including the clerical staff in Sri Hurdutroy, Rameshwara, Katihar and Raigarh jute mills should be the same as recommended for the jute mills in West Bengal. Fluctuation in the rate of dearness allowance in these mills in future should also be governed by the working class consumer price index number for Calcutta in the same manner as recommended for mills in West Bengal.

The rate of dearness allowance of all categories of workers including the clerical staff for Nellimarla and Chitavalsah jute mills, Arun Jute Rope and Twine Co. and Hindustan General Produce Co. should be fixed at Rs. 36.63 per month at the average working class consumer price index number of 479 for Vishakapatnam for the last 6 months of 1962 with the base year 1935-36 = 100. Further variation in the dearness allowance will be governed by the general formula with Visakhapatnam, index taken into consideration. Similar arrangements have been suggested for the jute mills workers in U.P. and Eluru area.

The piece rates in Sri Hurdutroy, Rameshwara Katihar, Raigarh, Nellimarla and Chitavalsah jute mills should be the same as the standardised piece rates applicable to the jute mills in West Bengal. In Raigarh Jute Mill, however, the

standardised piece rates in jute mills in West Bengal will be applied in a phased manner.

The employers in J.K., Maheshwari Devi, Mahabir, Sri Krishna and Shree Bajrang jute mills should fix the time rated wages of different categories of workers on the basis of the new minimum wage fixed by the Board maintaining the differential now in existence. In the case of piece rated workers, the piece rates should be so adjusted that the minimum earning operative is able to earn not less than the minimum wage recommended by the Board on the basis of the existing work loads and other existing conditions. Other piece rates should be fixed by keeping the present differentials intact. All operatives, both time rated and piece rated, should get the "Wage Board Increment" and dearness allowance. The intention of the Board is that the total pay packet of all workers should increase by at least Rs. 4.91 per month (in addition to the interim relief). In the case of a dispute between the employers and the workers about the wage rates and/or piece rates, as revised by the employers, the State Government concerned should take necessary steps to settle it.

The amount of expected earnings for the various piece rated occupations should also be reckoned as the minimum (fall-back) wages in the case of Sri Hurdutroy, Rameshwara, Katihar and Raigarh and Mellimarla and Chitavalsah jute mills for a month of 298 hours provided the workers do not adopt 'go-slow' methods. In Shree Bajrang jute mills the employers should work out the amount of expected earnings for the various categories of piece rated workers working with diligence and efficiency and be considered as minimum (fall-back) wages for a month of 208 hours provided the workers do not adopt 'go-slow' methods.

A standardised scheme of bonus is recommended for all mills in the country. But if bonus at a higher rate is payable or practice that award, agreement or practice should continue to remain in force and bonus would be payable thereunder and not under the recommendations of the Board.

Basis for Bonus

The bonus for the year 1963 is payable on the basis of the basic wages drawn by the workers in the year 1962, the Bengal should be calculated either according to the basic wages drawn by the workers in each mill in 1962 or by assuming whichever is higher. In future years the bonus will be paid according to the wages drawn in the preceding year.

Age of retirement of men workers should be 58 years and of women workers 55 years. It will, however, be open but this should be without prejudice to the right of workers to claim gratuity.

The Board has come to the conclusion that there was no need of granting night shift allowance. But it has recommended that any existing practice in this connection favourable to the workers should not be disturbed.

The new wage structure recommended by the Board should come into effect from 1st July, 1963, and its recommendations should remain effective upto 31st December, 1967.

After the Government accepts and publishes the recommendations, the payment of wages, etc., at the new rates should start as early as possible and in any case not later than the wages for the week ending 2nd November, 1963 (payable in the following week). The difference in emoluments between the new and old wages, etc., from 1st July till the date from which the new wage structure is actually introduced should be paid on or before 23rd November, 1963.

Problems of Indian Poverty

By K. SANTHANAM

IT IS COMMON experience that a person is his own worst advocate. The desire of Dr. Lohia to focus national attention on the problem of poverty during the no-confidence motion in Lok Sabha was altogether commendable. Unfortunately, the entire subject was side-tracked by his fantastic assertion that 270 million of people in this country were having a per capita income of three annas per day. Even if that were the truth, it would not have meant much. As Mr. Gulzarilal Nanda stated in his reply, "that a very large mass of the people of this country are steeped in poverty is not in question".

Probably, what Dr. Lohia wanted to say was that the per capita income of these people had not increased as a result of the three Plans. Even that of course would have been palpably false. No one can question the correctness of Mr. Nanda's statement that the estimated average per capita expenditure for 60 per cent of the population counting from the bottom was 7.5 annas a day. Nor is there any doubt that for the vast majority of the population living conditions have improved. Still, if Dr. Lohia had been more careful, he could have formulated the issue of Indian poverty in terms which it would have been difficult for the Government spokesman not to concede.

Fundamental Mistake

I feel that one of the fundamental mistakes of our planning is to assume that poverty is a general condition almost similar to all sections of the people except in the degree of its incidence. On the basis of this assumption, it is natural to conclude that, if the national income of India can grow at a reasonable rate, employment opportunities expand and social services develop, poverty will be lightened at least proportionately to all sections, though social justice would require that the distribution of the increased national income should be in inverse proportion to the per capita income of the various sections. It is now more or less generally accepted that the tendency has been in the opposite direction and that the more prosperous sections of the people have benefited more from planning than the less fortunate classes. Yet it is generally assumed that even though the poorer sections may not have benefited as much as they should, there are none whose conditions have not improved to a significant extent.

I think that this method of approach is not satisfactory. Indian poverty is not a single problem. In my view it consists of many problems, each of which requires a distinct evaluation and separate treatment. Though this is true of both urban and rural poverty, I propose to confine myself in this article

to the condition of the rural masses. The problems of these masses can be stated as follows:

- (1) Is there any section of the population which has not benefited at all by the total increase of national income as a result of planning, and therefore unlikely to be benefited by future plans unless the character of these plans is radically altered? What is its proportion to the total population and what are the changes that are necessary to improve that condition?
- (2) What is the proportion of population which, though it may have been benefited to some extent by planning is still living below the margin of subsistence, that is to say, does not get more than two-thirds of the minimum food, and half the minimum clothing that it should have? Why have 15 years of planning been unable to raise this section above the subsistence level and what changes should be made in the plans so that its standard of living may be improved as speedily as possible?
- (3) What is the proportion of the people who, though above the subsistence level, are still below the poverty line, i.e. whose incomes are just enough for their essential necessities, and leave no margin for any cultural or social activity?
- (4) What is the proportion of the rural population which can be said to be above the poverty line and what is the proportion of the increase in the total rural income which is appropriated by this class?

I do not claim to have adequate material to give correct replies to all these questions. But from the official publications of the Planning Commission and the National Sample Surveys, it is possible to give some tentative answers which may find general acceptance.

From the figures quoted on page 392 of "Eastern Economist" of August 30, 1963 we find that 14.89 per cent of the rural population have got a monthly per capita expenditure of less than Rs. 8. In Indian conditions, it is better to think in terms of families rather than individuals. Assuming the average family to consist of five persons, this means that 15 per cent of rural families have an income of less than Rs. 40 per month, or Rs. 480 per year. I do not think it is a bad guess to suggest that out of this 15 per cent, 10 per cent are likely to have an annual income of about Rs. 300 per year. This class will consist of families whose bread-winners are dead, disabled, or sick. It may also consist of families of landless agricultural labourers in areas where rainfall is scanty and, therefore, there is little scope for work, or in

September 27, 1963

those areas where population is so dense that a large number is compelled to be idle for the greater part of the year. It is difficult to imagine how improved agriculture, increased industrialisation or the expansion of social services can benefit this destitute class. I am convinced that only a system of direct poor relief is likely to benefit them. Assuming that the total number of rural families is 70 million, the number of these destitute families may be of the order of seven million, and if an annual relief of Rs. 100 per family can be given in the form of grain and clothes, it will cost Rs. 70 crores a year. Undoubtedly, this will be a severe burden on our public finances, but denial of such relief means an inexcusable and heartless neglect of people who live in a perpetual state of deprivation.

Nearly 70 per cent of the rural population have a per capita income of less than Rs. 15 per month. Deducting the 10 per cent of destitutes, 60 per cent of the rural families get an annual income of less than Rs. 900. From the National Sample Survey Report No. 74 on Land Holdings I find that 71.23 per cent of land holdings are less than five acres out of which 10 per cent have no land at all. In this connection, it should be remembered that the irrigated area is about 20 per cent of the total cultivated area. Therefore, the income of this 60 per cent of families who are living below the subsistence level has to come out of five acres of dry land or one acre of irrigated land. It is hardly likely that this class has benefited considerably from efforts to improve agricultural implements. As it operates only 15 per cent of the cultivated land, its benefit is also likely to be of the same order. This class must have benefited also by the promotion of Khadi and village industries. It is stated in this year's August issue of the "Khadi World", the official publication of the Khadi and Village Industries Commission, that by the end of 1961-62 opportunities for employment were created for 1.5 million part-time spinners, and in other village industries for an additional 170,000.

Drop in the Ocean

It is no exaggeration to say that out of over 40 million families in this class, the provision of part-time work for 1.7 million, likely to give an additional income for a family of Rs. 100 per year, is a mere drop in the ocean. It may also be conceded that this class has benefited by the spread of elementary education, particularly where the children are provided with mid-day meals. Perhaps, the one step which can benefit most this class is to provide mid-day meals, free clothing and books to the children. Extension of public works in the rural areas and provision of employment when there is no work in the field are likely to assist this class. But as Plan expenditure on these items has been a small fraction of the total, it will not be wrong to conclude that this class has not benefited proportionately in the increase of national income.

Poverty is a relative term and any line which may be drawn separating the poor and the well-to-do is bound to be rather arbitrary. Still I do not think that there will be serious objection to considering that families with a per capita income of less than Re. 1 per day are below the poverty line. This will mean an income of Rs. 1800 per annum for a family of five persons, and any rural investigator will be able to demonstrate that with this income no family will be able to do anything more than feed or clothe itself. This class consists of 20 per cent of the rural families with holdings between five and 15 dry acres and one to three irrigated acres. This class has undoubtedly benefited by all the measures taken to improve agriculture, but much of this benefit has probably been neutralised by fluctuations in prices and loss of harvest due to drought or floods. It is imperative that steps should be taken to stabilise prices and provide crop insurance if the progress of this class is to be sustained. This class ope-

rates 40 per cent of the cultivated land.

To borrow the striking caption of the cover page of "Eastern Economist" of September 13, the anatomy of rural poverty is there as follows:

Destitutes — 10 per cent or seven million families; Below subsistence level — 60 per cent or 42 million families; Below the poverty line — 20 per cent or 14 million families; Above poverty line — 10 per cent or seven million families.

I have no basis for any estimate of the share of each of the last three classes in the total increase of income of rural India. But as the top 10 per cent operates on 45 per cent, the next 20 per cent on 40 per cent, and the third 60 per cent only 15 per cent of the cultivated area, their benefits also are likely to be in the same proportion. The bottom 10 per cent has not benefited at all. Social justice requires that conscious steps should be taken to assist the disinherited and weak sectors and secure a more equitable redistribution of increasing prosperity.

Eastern Economist 20 Years Ago SEPTEMBER 24, 1943

Engrossed as he is in devising so-called anti-inflationary measures the Finance Member apparently has little time or inclination to look ahead and examine the impact of high taxation on industrial development in the future. That the weight of taxation is extremely heavy and burdensome and will have adverse effects on enterprise and initiative in the future cannot be denied by anyone. Even those students of economics, who often institute comparison between India and Great Britain and U.S.A. in respect of the incidence of taxation without sufficient regard to the difference in their industrial and economic development will now concede that India compares favourably both as to the proportion which total tax revenue bears to total expenditure and that which direct taxation bears to indirect. As has been pointed out recently by the Governor of the Reserve Bank of India, "the proportion of tax revenue to total expenditure during 1942-43 was 50 per cent in U.K., 55 per cent in India; around these figures in other Empire countries and 26 per cent in U.S.A. Of taxation again the increase in direct taxation has been far greater than in the total has undergone significant increase in many countries. In the U.K. this proportion has increased from 56 per cent to 64 per cent between the pre-war and 1942-43, while revenue increased from 24 to 61 per cent. In Canada the percentage of direct to total taxation has increased from 37 to 64 per cent and in U.S.A. from 50 to 73 per cent". The country bears the high taxation at present with fortitude recognizing the inexorable demands of the war, but the response minimized is all the greater. One of the serious defects in our fiscal policy in the past has been a lack of balance between our fiscal development and economic development. An up-to-date and twentieth century tax system has been sought to be built upon a nineteenth century economic structure and on a scheme of public and social expenditure which is antediluvian and an anachronism. It has resulted in burdens without compensations, in taxation being merely restrictive and in all-balanced expenditure. There is perhaps no other country where the scale of beneficent public expenditure is so low, as revealed by conditions of literacy, health, sanitation and medical aid.

Mr. Chavan has Arrived

By Our Parliamentary Correspondent

NEW DELHI, Tuesday:

BEFORE THE Lok Sabha adjourned "sine die" last Saturday, the Defence Minister, Mr. Yashwant Rao Chavan, replying to a two-day debate on the NEFA reverses, had made a speech which confirmed the impression created by him earlier while speaking on the same subject in the Rajya Sabha that the Defence Ministry is now led by a Minister who can be relied upon to give it political leadership of the highest integrity and competence.

Mr. Chavan's two speeches in Parliament last week were indeed the biggest thing that has happened to boost the morale of the people after the sad days of October-November — barring, of course, the exit of Mr. Krishna Menon from the Defence Ministry. There has been for some time now a whispering campaign that Mr. Chavan has not been as effective as he should be and that he is perhaps not equal to the challenge of administering such a complex portfolio as Defence. Such doubts must now disperse and disappear. It is clear that the present Defence Minister has been unostentatiously going about his duty of getting a firm grasp of the difficult problems of his charge and charting his own strategy and tactics for the proper discharge of his responsibilities.

In handling the debates in the two Houses, Mr. Chavan clearly demonstrated that he was master in his own house. It is often said that the Defence Minister is not an impressive debater, that he lacks the oratory of Mr. Patil, the virtuosity of Mr. Menon or the assurance of Mr. T. T. Krishnamachari. But Mr. Chavan does know his business and while he relies more on the soft word that turneth away wrath, he showed last week that he could be deadly when he wanted to. The way he disposed of Mr. A. D. Mani in the Upper House and that precious pair, Mr. Frank Anthony and Mr. Nath Rai, in the Lower House was a treat. Lately, Mr. Frank Anthony has been scaling new heights in Parliamentary irresponsibility, while Mr. Nath Rai is settling down more and more into a pattern of political conduct which it is not unfair to describe as a state of juvenile delinquency. If Mr. Frank Anthony had been reduced to a rag doll after Mr. Chavan had exposed the hollowness of his manufactured bitterness, Mr. Nath Rai fared even worse. More in sadness than in anger the Defence Minister rebuked him for spreading demoralisation among the people through indulgence in such extravagant charges as that every secretariat in the Government has a pro-Chinese Communist cell — and after that even the usually irrepressible Mr. Nath Rai looked like a drowned, very dead, kitten.

The discussions on these occasions in the two Houses were perhaps the best debating performances of the Monsoon session. They certainly elicited an unusually large number of impressive individual contributions. Mr. A. B. Vajpayee (Jan Sangh) and Mr. M. N. Govindan Nair (Communist) in the Rajya Sabha and in the Lok Sabha Mr. Prakash Vir Shastri, Mr. Indrajit Gupta and Mr. K. C. Pant, among others, made notable contributions. An interesting feature of the debates in the two Houses was that the Communists joined others in criticising the Government for its military unpreparedness on the eve of the Chinese attack. Equally interesting was the clear division in attitudes between the Communists on the one hand and non-Communist Opposition groups on the other where apportionment of responsibility was concerned. While Mr. Prakash Vir Shastri, Mr. Frank Anthony and Mr. Nath Rai held the former Defence Minister to be the villain of the piece, Mr. Indrajit Gupta suggested

that the blame should rest mainly on the military chiefs or rather on one particular General. The dominant impression left by speeches of the critics was that it was in the public interest that the Government should not shirk the issue of individual responsibility. In the circumstances, it was all the more to the credit of Mr. Chavan that, through his conciliatory and tactful speeches in the two Houses he very nearly, if not quite, succeeded in persuading Parliament that no useful purpose would be served by attempting to court-marshal a General here or impeach a Minister there. His clear and categorical assertion that there had been no political interference with the actual conduct of the military operations and his assurance that the Government had not withheld from Parliament any material in the report of the inquiry into the NEFA reverses which might support a contrary view were certainly reassuring.

In constructive terms, the debates on the NEFA reverses seem to have succeeded in imparting a new realism to the conduct of this country's defence policy. Mr. Chavan assured the two Houses that greater attention would be paid to the testing of the battle qualities of commanding officers, evolving a more satisfactory pattern of relationships between jawans and officers, the principle of merit in the making of promotions and the establishment of an efficient and adequate organisation for military intelligence. The Defence Minister pointed out that while the Government would continue to invite and accept offers of military equipment from all and assistance from friendly sources abroad, the policy would be to build up defence production within the country as rapidly as and to the greatest extent possible. Mr. Chavan, however, admitted that progress in this field would necessarily be determined by the state of the nation's individual and technological capabilities. Significantly, the Defence Minister served notice that the nation ought not to be unduly surprised if his Ministry was not able to spend all the money allotted to it in the Central budget this year.

The Seventeenth Amendment

After a seven-hour debate, the Lok Sabha last week, referred the controversial Constitution (Seventeenth Amendment) Bill to a Joint Select Committee of the two Houses of Parliament. The Swatantra Party's motion for circulating the Bill for eliciting public opinion was lost by 189 votes to 29. This led to a protest walk-out by the members of the Swatantra Party and Akali Dal.

The impressive array of voting in favour of the Law Minister, Mr. A. K. Sen's motion to refer the Bill to a Joint Select Committee, however, did not mean that there was unreserved or uncritical backing for it. The debate all through was very acrimonious. Mr. Sen too could proceed with his reply only amidst frequent interruptions from all sections of the House, not excluding the Congress benches or even the Communist members who generously supported the measure. The Swatantra Party objected to the very principle of the Bill. The Praja Socialist and the DMK members lent only qualified support. They wanted an assurance that no harm would be done by this amendment of the Constitution to small peasant proprietors and that adequate compensation would be paid for the land acquired.

The Bill seeks to redefine the expression "estate" in Article 31A of the Constitution by including within its scope lands held under the ryotwari settlements and also other lands in respect of which provisions had normally been made in land reform enactments. It further seeks to amend the Nineth

September 27, 1963

Schedule by including in it 144 State enactments relating to land reforms, with a view to removing any uncertainty or doubt that might arise in regard to their validity.

The Law Minister, in his reply to the debate, endeavoured to impress upon the House that by incorporating this amendment in the Constitution, the Government did not intend to deprive the tiller of his land. It was meant to confer on him proprietorship rights by taking away excess land from those who never cultivated it themselves. Mr Sen contended that the whole object of this legislation was to make the peasant the core of the country's agricultural life.

The Rajya Sabha, subsequently also agreed to the motion for its reference to the Joint Select Committee. The debate in this House too was quite acrimonious and critical. Explaining the Jan Sangh point of view, Mr V. K. Chordia said that there could be no two opinions that the tiller of the land should be given the ownership of it. If, however, proprietary rights were ended by nominal compensation and a new type of zamindari was created in the garb of co-operative societies, it had to be resisted. The Swatantra Party declined to associate itself with the Select Committee.

Committee for Public Sector

Just before the House adjourned, the Minister of Industry, Mr. Nityanand Kanungo, moved in the Lok Sabha two motions to provide for the setting up of a 15-member Committee of the two Houses of Parliament—ten from the Lok Sabha and five from the Rajya Sabha—to scrutinise the working of the public sector undertakings. Discussion on the motions will take place during the next session.

The functions of the proposed Committee will be: (i) to examine the reports and accounts of the public sector undertakings; (ii) to examine the reports of the Comptroller and Auditor-General on these enterprises; (iii) to scrutinise, in the context of the autonomy and efficiency of the public sector undertakings, whether their affairs are being managed in accordance with sound business principles and prudent commercial practices; and (iv) such other functions as are vested in the Public Accounts Committee and the Estimates Committee of Parliament in relation to these concerns. It has, however, been stipulated that the Committee shall not examine and investigate matters of major Government policy, as distinct from business or commercial functions of the public sector undertakings, and also those relating to day-to-day administration.

The members of the Committee will hold office for a period of five years. One-fifth of the members will retire every year by rotation. They will be those who would have been the longest in office since their last election. Lots will be drawn to determine who amongst the Members who were elected on the same day, should retire.

The Committee's jurisdiction will extend to seven public sector undertakings — (a) the Damodar Valley Corporation; (b) the Industrial Finance Corporation; (c) the Indian Airlines Corporation; (d) Air-India; (e) the Life Insurance Corporation of India; (f) the Central Warehousing Corporation and (g) the Oil and Natural Gas Commission — set up under Central Acts and to those established under the Companies Act and whose reports are placed before the Parliament. It will also cover the following four undertakings administered by the Defence Ministry: (a) Hindustan Aircraft Ltd., (b) Bharat Electronics Ltd., (c) Mazagaon Docks, and (d) Garden Reach Workshop.

Management Reorganisation

The Minister for Steel and Heavy Industries, Mr. C. Subramaniam, detailed in the Lok Sabha last week steps for reorganising the management of the public sector undertakings under the charge of his Ministry. To begin with, these important changes are being made in the managements of the Durga-

pur steelworks and the Sindri fertilizer factory. The reorganisation programme has been designed in the light of the industrial management practices in multi-plant organisations in other countries and is aimed at placing a larger measure of operating authority at the plant level and minimizing the need of scrutiny by the Ministry or by the Headquarters at Hindustan Steel and the Fertilizer Corporation of India in the day-to-day operations of these plants.

The authority to appoint, promote and discharge persons within the plant organisations at Durgapur and Sindri is to be handed over to the General Managers. They will, in return, delegate appropriate sub-responsibilities to the heads of the units under them. The General Managers will remain responsible to their Boards of Directors and to the Chief Executives for the efficient operation of their plants.

The plant managements at Durgapur and Sindri are also to be given authorities to decide within the ambit of their budgets, how many senior or junior posts they should have. They will be free to recognize merit by promoting employees from one grade to another or by giving advance increments. Specialized bonus schemes may also be introduced in these two plants on the advice of their managements.

The second important change being made is that the responsibility of timely purchases of replacements and stores will be that of the General Managers and their Purchase Departments who will have the authority, if necessary, to override the Financial Advisers' advice. This is being done to ensure uninterrupted production. The idea is not to side-track the Finance Officers of the plants, but to control their powers in the interest of efficient functioning of the undertakings.

A new office is also to be established at the two plants. It will be known as that of Commercial Manager or Commercial Superintendent. One of the important functions of this officer will be to provide a good liaison between sales and production so that production can be undertaken efficiently for satisfying the needs of the consumers.

Specialised Talent

Mr. Subramaniam was convinced that in many of the public sector undertakings there was need to bring in more specialized and experienced talent to the office of the Personnel Manager. He also considered it essential to define the staff and service functions of the Personnel Managers as also the Financial Advisers and Chief Accounts Officers; their role, he said, should be to tender advice to the General Managers and not to hinder working of the plants by considering themselves as administrators of personnel and financial rules and regulations.

Mr Subramaniam was of the opinion that excessive manpower adds to costs in many of the public sector plants, particularly the Sindri unit. In the steel and fertilizer industries, he added, labour employed per ton of product was several times more than in the comparable operations abroad. One of the causes of this over-manning, he pointed out, was excessive leave and absenteeism. There was need to tighten up the procedures in this regard. To give the General Managers specialized legal advice, particularly at Sindri, an experienced labour lawyer might be employed, said Mr. Subramaniam. This was intended to relieve the management of its uncertainties in labour law interpretation and for handling competently claims and litigations should they arise.

In regard to the Auditor-General's role in auditing public sector undertakings, Mr. Subramaniam stated: "The Auditor-General of India, under our Companies Act has the authority to designate chartered accountants, giving them such special instructions as he sees fit to carry out the work of auditing our public sector enterprises. He has long since designated an approved list of chartered public accountants. They are presently auditing our public sector enterprises. In addition,

September 27, 1963

the Auditor-General has his staff located at the plants to go into matters which chartered accountants in this and other countries do not deal with. I would personally have very much preferred that at Durgapur and Sindri these auditors could be withdrawn and the audit confined to the examination by the chartered accountants as in other countries which also have public sector plants. Till, however, this can be done, it is the intention that a separate officer be nominated in each plant to deal with whatever audit queries may be received and to leave the General Manager and his operating staff free to devote their entire time to the efficient running of their units."

Car Prices

Replying to a half-an-hour discussion raised by Mr. Sinhasan Singh (Congress) who complained that the prices of cars manufactured in the country were higher than world prices, Mr. Subramaniam expressed the opinion that as long as the production in the car manufacturing units in this country was not raised to the economic level—which according to some was 100,000 vehicles per annum and according to some others 60,000 vehicles — there was no possibility of their production costs coming down to levels comparable to those in other countries. There was also the fact that the cost of indigenous components was high. Due to a low priority being accorded to the manufacture of cars, their production had gone down further recently. In July and August this year, no Ambassador car could be produced owing to paucity of matching imported components (production, of course, was expected to start this month as some foreign exchange had been allocated). The indigenous content of this car is expected to be raised to 90 per cent by the end of the current year from the present level of 80 per cent. Car manufacturers had asked for increase in prices on the ground that the cost of production had gone up. A cost examination was completed recently and the matter is under the consideration of the Government. In deciding how much increase should be allowed in the price of cars, the Government, Mr. Subramaniam said, would take into account the higher cost of procuring indigenous components, compared to their cost elsewhere. He also said that manufacturers' applications for the expansion of capacity would be considered after they had stepped up the indigenous content to 90 per cent. This, it was expected, would be by 1964.

Gauhati Refinery

In a detailed statement he made on the working of the Gauhati Refinery, the Minister for Mines and Fuel, Mr. O. V. Alagesan, stated in the Lok Sabha that the damaged kerosene refining unit of this undertaking had now been repaired and recommissioned. Since the second week of August last, the refinery had been operating to its full or nearly full designed capacity which was 2,250 tons per day. He assured the House that the refinery would henceforward operate satisfactorily and its products would be available according to the optimum expectations.

Mr. Alagesan also told the House that since early September, the Railways had made special efforts to meet the full wagon requirements of the refinery. The despatches had now increased to 66 wagons per day; during the first two weeks of this month over 20,000 tonnes of products had been despatched. This represented a substantial improvement over the movements in the previous month.

The Minister confirmed that the trouble in the kerosene refining unit had been caused by the difficulty of maintaining the water content of SO₂ within the permissible limit of 0.08 per cent. The water content, he added, had been varying from 0.06 to 0.25 per cent. The reason for this seemed to be the malfunctioning of the fractionating column (drying column) which was intended to separate the water from

SO₂. The high water content had contributed to excessive corrosion of the steam re-boilers in the kerosene unit which, after consequential rupture had further increased the water content, causing more corrosion. Similarly, the inter-coolers and the compressors in the kerosene unit had been badly corroded and the working of the compressors adversely affected. With the assistance of the Rumanian experts, under the leadership of the Deputy Minister for Oil of the Rumanian Government, the kerosene unit had now been completely overhauled. The Rumanians had also arranged for the supply, at their cost, of the replacement parts and spares needed. The Minister expressed warm appreciation of the co-operation which the Government of Rumania had extended in this matter.

Question Hour

Manufacture of MIGs: The Minister for Defence Production, Mr. K. Raghuramiah, giving further information on the manufacture of MIG aircraft, revealed in the Rajya Sabha last week that the project report on the scheme was in the final stages of completion. The two factories under this project were to be set up at Koraput in Orissa and Nasik in Maharashtra respectively. Detailed survey and demarcation of the two sites, the Minister added, had been completed and acquisition proceedings were under way. The State Governments, which would act as the agents of the Government of India for civil construction work, had mobilized their engineering departments for the job. The detailed estimates of the first phase of construction programmes of the two plants had been completed and were under administrative approval. Construction work would begin as soon as the tendering was over. A technical training school had been started at Nasik on August 16 and the training scheme for the Koraput factory was being finalized. A limited company in the public sector under the name Aeronautics (India) Ltd., had been formed to implement the project. Both factories were expected to be commissioned in 1965. Replying to another question on this subject on a subsequent day, Mr. Raghuramiah further stated that the MIGs to be manufactured in India would be of the improved type.

New Air Force 'Drome: The Minister for Defence, Mr. Y. B. Chavan, stated in the Rajya Sabha that an alternative site had been selected at Hindan, near Ghaziabad for an airfield for the exclusive use of the Indian Air Force, and that construction work would be taken in hand shortly. After the Hindan project was completed, the Air Force would use the Palam airport for certain limited purposes such as the needs of Communication Squadron (including the V.I.P. Squadron) and transport units.

Aircraft Maintenance: The Deputy Minister for Civil Aviation, Mr. Ahmed Mohiuddin, replying to a short notice question in the Lok Sabha, denied that there had been any deterioration in the maintenance of the IAC aircraft. During the period January-August this year, the IAC viscounts had reported engine trouble on five occasions and fire warnings thrice. The figures for the corresponding period in 1962 were one and three, respectively. All the three fire warnings this year had been false and were due to some wrong contacts in electric communication. The manufacturers were contacted and they had suggested certain modifications which were carried out in all the existing viscounts. Fire-fighting equipment at the Indian airports, the Minister added, were being augmented.

In reply to more questions on civil aviation, Mr. Mohiuddin gave the following information:

New Air Service. The IAC's plan to operate the Calcutta-Bhubneshwar air service upto Visakhapatnam with a Fokker Friendship as part of the next winter schedule may have to

September 27, 1963

be reviewed as a sequel to the loss of one of its viscounts recently.

Helicopter Service: The Government of India has under examination the economies of operating a Helicopter service between Calcutta and Dum Dum.

Caravelle Aircraft: Three Caravelle jet aircraft will be delivered to the Indian Airlines Corporation between November and January next. They will cost Rs. 5.71 crores.

Investment in Public Sector Steel Plants: The Minister for Steel and Heavy Industries, Mr. C. Subramaniam, disclosed in the Rajya Sabha that an investment to the tune of Rs. 698.12 crores had been made upto March 31, 1963, in the three public sector steel plants — Rs. 224.78 crores in Bhilai, Rs. 271.38 crores in Rourkela and Rs. 201.96 crores in Durgapur. Providing for depreciation and interest on loans up to that date, the Hindustan Steel Ltd. (which operates the three public sector steel plants) was estimated to have suffered a loss of Rs. 61.55 crores.

Mr. Subramaniam gave the following further information in regard to steel:

Steel Equalisation Fund: The balance in the Iron and Steel Equalisation Fund on January 31, 1961, was Rs. 40.56 crores. A sum of Rs. 74.24 crores was credited to this Fund between February, 1961, and July, 1963. Out of this, a sum of Rs. 51.97 crores was spent on account of subsidy on imports, payment to the main producers on account of increase in retention prices in the past periods, adjustments of freight with producers and re-rollers, charges on TCA steel, etc. This left a balance of Rs. 62.83 crores at the end of July this year.

Arrears with Steel Importers: Against the provisional amount of Rs. 49.14 crores claimed by the Iron and Steel Controller from the importers, a sum of Rs. 37.25 crores had been realized upto July 31, 1963. The balance of claims amounted to Rs. 11.89 crores. This does not take into account the counter-claim of importers on account of transport charges and subsidy payment. These are to be set off against the gross amount due. The delay in the finalization and realization of the amount due from the importers is due to such factors as delay in the delivery of materials for want of adequate financial arrangements on the part of the consignees, delay in the production of consignees' receipts, etc.

State Steel Costs: The works cost of steel ingots in all the three public sector steel plants, has come down between October, 1962, and May, 1963. The decline in the case of Rourkela and Bhilai has been only marginal. But in the case of Durgapur it has been of the order of 15.9 per cent. Durgapur at present has the lowest works cost for ingots.

Blast Furnaces: The Government of India proposes to license additional pig iron manufacturing capacity both in the public and the private sectors. The question of installation of a number of large and small blast furnaces is under study and firm decisions will be taken shortly. It is proposed to set up another blast furnace at Bhilai Steelworks in anticipation of the fourth Plan expansion programme.

The following information was given by Mr. Subramaniam in respect of some heavy industries.

Small Tractors: Of the three firms which had been licensed in 1960 for the manufacture of small tractors/power tillers, licences of two have been revoked because they had not made any progress in implementing their schemes. In view of the great demand for small tractors/power tillers, one more firm has been licensed in May, 1963, for the manufacture of power tillers. Schemes of two more firms have also been approved in principle. No import of small tractors or power tillers had been allowed so far. A proposal to import power tillers, however, is currently under consideration. There are no separate targets laid down under the third

Plan for the manufacture of small tractors and power tillers. The overall target for tractor manufacture by the end of 1965-66 is 10,000 numbers per annum.

The Minister for Agriculture, Dr. Ram Subhag Singh, in reply to another question, disclosed in the Rajya Sabha that 1,800 tractors were proposed to be purchased from the Communist countries—the Soviet Union, Poland, Czechoslovakia and Rumania—with a view to stepping up farm production. He hoped that in three or four years' time, India would be self-sufficient in tractors. At present 2,200 tractors were manufactured in the country annually.

Machine Tools: In a statement laid on the table of the Rajya Sabha, along with HMT's annual report for 1962-63, it was disclosed by the Minister for Steel and Heavy Industries that Hindustan Machine Tools Ltd., was planning to set up a fifth machine tools factory at Hyderabad. It already had two factories at Bangalore and expected to commission a third one at Pinjore (Punjab) in November this year. A fourth factory was being established by it at Kalamassery, near Ernakulam. The capital cost of each of the new factories was estimated at Rs. 7.75 crores out of which the foreign exchange component would be about Rs. 2 crores. The capital costs of the new units would be met entirely from the internal resources of HMT.

Successful Working

Hindustan Machine Tools earned a net profit (before levy of taxes) of Rs. 2.15 crores in 1962-63 as against Rs. 1.27 crores in the previous year. It declared a dividend of 10 per cent in the third successive year and attained the target capacity of 2,000 machine tools per annum with a monthly production rate of 165 machines from November, 1962, onwards.

HMT Watch Plant: The watch manufacturing unit of Hindustan Machine Tools will attain a level of 84 per cent to the remaining 16 per cent of "critical items," an assessment will be made later whether they can be manufactured here. The plant will be attaining a manufacturing capacity of 360,000 watches per annum in 1967-68. Adequate arrangements are being made for the sale and servicing of HMT watches.

Coking Coal: Mr. Alagesan told the Rajya Sabha that the known reserves of coking coal in India were about 2,800 million tons—approximately 5.6 per cent of the total proved reserves of coal, both coking and non-coking. Reserves of more than 5.6 per cent. The Government, he further said, were aware of the limited reserves of superior grade coal and had adopted the following measures with a view to ensuring their conservation: (i) stowing in coal mines; (ii) washing of inferior grade coal, particularly coking coal, with a view to improving the quality so that the direct consumption of superior grade coal could be reduced; (3) protective measures for safety of coal mines and in particular for removing the threat of danger to collieries from fires and floods and regulation of methods of working in coal mines; (4) classification of coal under various grades, to enable allocation of superior grades to only those categories of consumers who required these essentially; (5) blending of weakly coking coal in the mixture for coke oven plants in order to reduce correspondingly the consumption of good coking coal; and (6) conducting studies in development of technological improvements in the use of coke in steel plants.

Replying to another question, also in the Rajya Sabha, Mr. Alagesan admitted that stocks of Grade III coal had been of late increasing at the pithead; currently there were about three months' stocks at the pitheads.

EASTERN ECONOMIST

617

"There's a word for service," said Tata.

"Impeccable...smooth...prompt," suggested Fison.

"No, no," said Tata.

"Quiet...personal...careful," offered Ralli.

"Got it!" said Tata, a gleam in his eye.
"Integrated!"

Fison and Ralli agreed. Tata had a way with words.

Together they said, "We offer the farmer an integrated service. The finest range of fertilizers and pesticides in India. And what's more, we advise him on their use."

"A comprehensive service," said Ralli.

"A complete service," said Fison.

"An integrated service," said Tata.

Tata-Fison and Rallis have combined their separate marketing organisations into a single, unified service. For the future, all Tata-Fison products will be marketed by Rallis' Fertilizer and Pesticides Division. The merger will prove of immense benefit to the Indian farmer. For the first time, one integrated service will provide advice and products covering both crop growth and crop protection throughout the country...a notable contribution to the cause of agricultural progress.

WINDOW ON THE WORLD

Finance Ministers Meet

From Our Special Correspondent

PARIS:

WHEN THE finance ministers assemble at the end of this month for the annual sessions of the IMF and the World Bank, they will no doubt exchange congratulations on their management of international monetary affairs. Finance ministers, more even than other politicians, are given to self-congratulation. It is an occupational disease with them, for their position requires that they exude confidence and complacency: living between the twin dangers of deflation and inflation, they are expected in the former case to inspire confidence among hesitant business men and, in the latter case, to discourage speculators by a show of confidence in a depreciating currency. For Stafford Cripps, the pound was perfectly sound right up to the day of devaluation and for Harding prosperity was assured right up to the day of the big crash. So when the clan foregathers, as this month in Washington, one cannot look for sessions of self-criticism.

Yet, amid the paeans of self-praise, there would be room for expressions of astonishment at the curious state of Western monetary affairs. The world's most powerful economy is losing blood at the rate of \$3,000 million a year and has been doing so since 1958 despite periodic assurances that the haemorrhage was about to dry up—and throughout it all, resources have been underemployed, notably human resources. (The millions of unemployed, apart from constituting an economic scandal, explain the revolt of the Negroes.) To the north, Canada has achieved the same feat of defying the economic textbooks by combining unemployment with an external deficit and, on this side of the water, Britain has done even worse by running together substantial unemployment, a precarious payments balance and rising prices. As if to demonstrate that every absurdity has two extremes, the Common Market countries have achieved the contrary (and contradictory) combination of overfull employment, inflation and massive payments surpluses. The economics primers say that the countries with millions out of work should have the payments surplus, and those with inflation and overfull employment should have the payments deficit; but the finance ministers have "changed all that."

Classic Treatment

Still, we should be grateful to them for not reading their primers too closely (though this sort of literature is even now popular in Basle, at the headquarters of the Bank for International Settlements.) Because if they had, they might have come to the conclusion that the classic treatment for the U.S. deficit was a stern deflation, and that the classic remedy for the Common Market's runaway prices was, similarly, a ruthless deflation. In that event, we would be headed for a slump of (at least) the proportions of 1930. Indeed, there are people in the USA and others in Continental Europe urging just such courses for each nation's predicament, presumably without seeing the catastrophic consequences that would flow from their advice being heeded simultaneously on both sides of the Atlantic.

How far we are from that may be seen by comparing the policies currently followed in the USA, to right the payments deficit, and in France, to correct the price-inflation. In neither case is there resort to measures that would damage the other

party by a competition in deflation. Washington proposes tax reductions to stimulate business and investment at home, while Paris carefully abstains from raising bank rate lest funds be attracted across the ocean, to the further embarrassment of the dollar. Exactly for such reasons, of course, theorists can claim that both policies are doomed to remain ineffectual: because they shrink from deflation, the USA will not succeed in stopping the outflow of gold and France will not master her price-inflation. One would prefer to reserve judgment; the carefully blended series of measures taken in each country will require time to have effect and meanwhile we have avoided the worst of both worlds, a coincidence of two deflations each decided upon for different reasons.

The fact stands that the malady has not been attacked at the root: capital is flowing out of the United States to accumulate idly in the reserves of France and West Germany. In the country whose gains have been by far the largest, France, this inrush of dollars has led to the creation of an equivalent volume of francs (minus the pre-payment of international debt) which is the main culprit of the secular inflationary trend, apart from the accidents referred to here last week. At the same time, because a proportion of these swollen reserves is left in the bank accounts in New York, they are, to that extent, still supporting the American credit structure although theoretically "lost" by the Americans to the French. It is difficult to decide how important is this fact that the same sums of dollars are being counted twice over, so that they lie at the base of two credit pyramids, but the inflationary impact of the flow of dollars into the Common Market is not to be denied.

The Two Remedies

There would be two ways (if we may state the obvious) of dealing with this situation: to stop the dollars going from the USA to the Common Market, or else, once they had arrived, to put them back in international circulation again. To take the first: this obstruction could be either (in fact or a discouragement to their arriving in West Europe. Minor steps of both sorts have been taken. As to the hindrance to their leaving the States, this is what Washington is aiming at with its equalisation tax on foreign loans floated in New York and its 15 per cent surcharge on U.S. purchase of foreign stock. But this is notoriously inadequate because, apart from the exclusion of Canadian borrowing from the tax (and Canadians are the biggest borrowers in New York, the measure does not cover direct investment by American corporations in the Common Market. Yet this is the biggest single item in the payments deficit. As for the discouragement to their arriving in Europe, even less has been done. France last month forbade her banks to borrow abroad on acceptable terms (thus shutting out some floating capital) but she has not succeeded in getting her partners in the Common Market to discuss restraint on U.S. direct investment. In the name of liberalism and non-discrimination, the pro-American European refusal to consider the one step that could best assist the USA's payments balance (and their own inflation).

To take the second: the Common Market is not putting back into circulation the dollars it is accumulating, because its financial markets are inefficient and expensive. It is in Paris and Frankfurt that Canada, Japan and the World Bank should be borrowing the money now collected in New York, to the

detriment of the dollar's health. But the small size and high cost of loans in those European centres mean that borrowers will prefer to pay the equalisation tax in New York, where they can raise their money at one swoop and at a price that is still competitive. So funds will, in all probability, continue to quit the USA and to get stuck in Europe's sluggish financial mechanism. Reform and concentration of Continental financial markets would be a long task, but one does not see even a beginning being made in that direction. Other means of putting back into international currency the funds that France and West Germany do not know what to do with are similarly neglected, or inadequately explored. Such means would be the granting of untied loans to certain developing countries on a large scale, or the conversion of gold reserves into stockpiles of raw materials. It is here, incidentally, that we find the only genuine problem of "international liquidities"—not their absolute size but their velocity of circulation.

One cannot predict what will go on in the wings of the international monetary assembly this month (it is usually more important than what is said in public) but it is quite unlikely that anything will be done towards finding solutions at this fundamental level. We cannot deny the finance ministers the satisfaction of congratulating themselves on having avoided disastrous measures, on having discouraged speculation against the major currencies and on having shown themselves more thoughtful of other nations' troubles in seeking to repair their own. But they are left with their real problem, the flight of capital from underemployed economies to countries strug-

gling with inflation.

There exists the hope, explicitly stated by American leaders, that this paradox will be removed "by natural means" given time. Tax reductions, the maintenance of cheap money and various other stimulants to investment will decide U.S. capital to stay at home, once the wages and prices spiral in the Common Market makes that region less attractive to the giant corporations. For the medium-term future, this seems excessively optimistic. That half of the hypothesis that lies within Washington's power, the stimulation of investment opportunities at home, is surely well founded, but the other half is less so: one cannot see, that is, the Europeans letting their prices and wages get so far out of line that this region ceases to interest American investors—especially when these latter take account of the common external tariff which is more easily jumped by investments in Europe than by exports from the USA. Eventually, a closing of the gap between European and American prices and costs is, no doubt, a certainty but given the room for expansion in the Common Market this fact could leave Europe a more profitable site for investment for as much as a generation to come. Besides, the measures just taken by the French Government show that the Europeans will not sit idle while prices soar; similar steps will surely be taken in Italy before long, and to the extent that they succeed, the solution "by natural means" is postponed. Before such means begin to correct the anomalies in current capital movements, the Western finance ministers will be obliged to tackle the problem directly. If it is not this month, it must be later.

The Battle of Washington

By PAUL BAREAU

LONDON:

THE LINES of battle are being drawn for the great debate which will take place at the annual meeting of the International Monetary Fund to be held this year in Washington. The main issue stands out clearly: it is the adequacy of international reserves and of the mechanism for controlling their size.

On the one hand are ranged the traditionalists who believe that there is a sufficiency of world reserves and that the root trouble in the present international monetary situation is to be found in the persistent deficits that are being run by certain countries and notably by the United States. These deficits, they argue, could be cured by appropriate deflationary measures. To maintain them by the tricks of central banking co-operation and by the extension of international credit will merely ensure that the deficit countries will export their inflation to the surplus countries.

On the other hand there is the more forward looking and expansionist school of thought which holds that the rate of growth in the world economy is being held back by the inadequacy of international reserves; that the available amount of gold and international credit is inadequate to meet temporary balances of payments deficits. Those who argue thus contend that countries which are running temporary deficits in their balances of payments are given neither the time nor the means to correct them by the appropriate expansionist remedies and are, therefore, compelled in self defence to resort to restrictionist measures. These will affect them and in course of time infect others.

This, in many respects, is a replica of the familiar conflict on domestic economic policy. On the one hand are the

fundamentalists who argue that the rigid discipline of a monetary standard such as gold should be heeded, even to the extent of drastic deflation and creating unemployment. There are those, on the other hand, who argue that mankind was not made to serve any monetary standard but that monetary standards are there to further the interests of humanity. In this domestic context the debate has lost much of its fury; the fundamentalists are few and far between. But in the context of international monetary affairs, the fundamentalist school is still highly respected.

Denouncing the Myth

At the IMF meeting in Washington it will be expounded very forcibly by representatives of a number of Western European countries, including France and Germany. It will probably have a spokesman in the new Managing Director of the International Monetary Fund, the ex-Deputy Governor of the Bank of France, M. Paul-Pierre Schweitzer, who has just succeeded the late Mr. Per Jacobsson. In an interview which he gave before leaving Europe he indicated that one of the first "myths" he intended to denounce was the alleged inadequacy of international liquidity. He argued that there could be no such inadequacy since no one had ever heard of a commercial transaction which could not be financed for lack of credit facilities.

This argument holds a basic confusion. It is true that international trade is financed by credit facilities offered in the main by commercial banks and that these have so far proved adequate to satisfy the needs of creditworthy traders selling to equally creditworthy buyers. International reserves held by monetary authorities do not enter directly into the circulation of commercial credit. But there is a fundamental relation between the volume of world trade and the volume of international liquidity, this is because the greater the amount of world trade the greater will be the tendency for individual

September 27, 1963

countries' balance of payments to drift into temporary disequilibrium. This tendency is being accentuated today by the move to ever greater convertibility of currencies and, therefore, by the greater ease with which short term capital flows from one market to another. It is, therefore, possible to argue that though world liquidity has nothing to do directly with the financing of international trade, the desirable expansion of world trade requires a greater volume of international reserves than exists today. M. Schweitzer's argument, that because no commercial transactions have ever been held back by lack of credit there is therefore an adequate supply of international liquidity, is a non-sequitur which it is astonishing to have to attribute to a citizen of France, that nation of logicians.

Book of Revelation

The expansionist view in the Washington debate will this year be expounded by the United States delegation who will be using as the basis of their argument a new "Book of Revelation" namely the report of the Brookings Institution on the United States balance of payments in 1968. This is a remarkable document the importance of which is to be found in the policy recommendations that are made after a lengthy and highly questionable estimate of what the US balance of payments will be in 1968.

This report commissioned by President Kennedy finds grave faults with the existing international monetary system, and suggests the creation of a new mechanism that would

provide adequate international liquidity. This, says the report, could best be achieved if industrial countries committed themselves to hold a substantial proportion of their reserves in an international institution, with creditor countries accumulating credits and debtor countries incurring overdrafts expressed in an international unit of account. The report admits that this would mean that the major countries of the free world would have to relinquish part of their freedom to choose the form in which their international reserve is held, but it sees little alternative to this. At present Western European countries are accumulating dollars in order to support the dollar and avoid destroying what is in effect an international dollar standard. But the readiness to accumulate dollars is becoming more reluctant and, argues this report, "there is a strong case for replacing this stopgap co-operation with more solid institutional arrangements."

This attitude is a very far cry from the rigid, closed minds with which the United States representatives at the IMF meeting a year ago shot down Mr. Reginald Maudling's suggestions for improving the international monetary system in the very direction indicated by the Brookings Report. This year the US and UK will probably be found arguing on the same side of the table and in favour of a more liberal and entrenched phalanx of conservatives most of them speaking with the accents of the Common Market countries. It will certainly be a lively debate. It may even be momentous.

LISTENING POSTS

This Matter of Ministers

By Our Special Correspondent

NEW DELHI:

THE POINT of interest in political speculations in the Capital now naturally is what further changes the Prime Minister might be proposing to make in the composition of the Government or the structure of the various Ministries. It is now being assumed, more or less generally, that there will be two more Cabinet Ministers and that one of them will be Mr. Sanjivayya. The other name most often mentioned is that of Mr. Chagla. It is considered that the Prime Minister may not be in a hurry to make these additional appointments, but it is suggested that he cannot delay much longer the discharges and releases he is credited with wanting to effect among the existing Ministers below the Cabinet level. It is not a very agreeable task to retail here the names which figure in speculations in this connection. But it can be said that political opinion in the Capital will be surprised, agreeably or otherwise, if the pruning, when it comes, is not drastic.

★★

Mr. Asoka Mehta's appointment as Deputy Chairman of the Planning Commission has had a mixed reception. There is a danger that, with Dr. V. K. R. V. Rao already there, the Planning Commission may be turned into a mere talking shop. If Mr. Mehta wants to make a reputation it will be his first task to reconstitute the Planning Commission into a compact body concerned only with guiding policy-making. Over a period of years the Planning Commission has been permitted to deteriorate into a ubiquitous busybody poking its nose into details of day-to-day administration or departmental execution of policies and programmes. That the Planning Commission needs to be eased of deadwood is not open to doubt. Mr. T. N. Singh and Mr. Shriman Narayan are political light weights with no particular administrative or technical competence. It must always be a mystery why they were brought in at all. It is becoming increasingly scandalous that they could manage to go on. As for Mr. C. L. Trivedi, there is sufficient reason to relieve him on the ground of age, while a point in favour of Prof. Thacker's departure, which must surely be effected now, is that it is unlikely to make much difference if only because he has got into the habit of spending more of his time outside India serving world science than inside India attending to his chores at the Planning Commission or elsewhere.

★★

The appointment of Mr. H. C. Dasappa as a Cabinet Minister was widely expected and has been generally welcomed. If there is any criticism at all it is that he should have been given this opportunity earlier. But thanks to Mr. K. C. Reddi's stubborn over-staying taken with the unfortunate fact that Ministerships are still influenced by considerations of regional representation, Mr. Dasappa's entry into the Central Cabinet had been postponed until he is nearly 70. Nevertheless until not very long ago, as Chairman of the Estimates Committee, Mr. Dasappa did demonstrate that he had a vigorous mind and could work hard and it may reasonably be expected that he will address himself energetically to the responsibilities of the Railway portfolio. There is a general, but wrong, impression that the Railway Ministry has, so to say, settled down and that all that is needed is to keep it in its course. Actually, any Railway Minister who takes himself seriously must make up his mind to face some very important challenges. Recently, "Eastern Economist" published a series of articles to show that there is great need for an imaginative and informed revolution in the operational, organisational, and financial aspects of Railway administra-

tion. It is to be hoped that Mr. Dasappa will bring an open mind and a crusading zeal to bear on the task that has been entrusted to him.

The promotion of Mr. B. R. Bhagat as Minister of State in charge of Planning, is also a popular decision. He has certainly earned an opportunity for the display of his competence in a wider field than before, and although the Prime Minister is reported to have described his function as that of the Planning Commission's Public Relations Officer in Parliament, it is possible that he may in due course be able to play a more substantial role. That he was one of the more intelligent, hard-working and informed Deputy Ministers had been generally accepted and his further progress will be watched with friendly interest.

★★

According to the Government's present policy, the moratorium on the nationalisation of goods transport will continue till the end of the third Plan period.

In a number of States, the buses of the nationalised road transport undertakings also carry, apart from the passengers and their luggage, small freight consignments or what may be called 'unaccompanied parcels'. This practice is followed by State transport undertakings in Andhra Pradesh, Bihar, Gujarat, Kerala, Maharashtra, Mysore, Uttar Pradesh, Himachal Pradesh. In Madhya Pradesh, only newspaper bundles and news packets and in Madras (Kanya Kumari Branch of the Department) newspaper parcels and post mail bags are carried by buses as unaccompanied parcels. In Rajasthan, between Abu Road and Mt. Abu, where there are no alternative transport arrangements for the carriage of light packages, small parcels of vegetables and edibles are accepted at owners' risk and despatched in the daily goods service which the Rajasthan State Roadways operates over the route under the Railway Goods Out-Agency contract. The Roadways uses the passenger-cum-truck vehicles and, in case the quantity of goods demands it, a full-fledged truck is also used to carry the entire load.

Varying Standards

The type of traffic carried as unaccompanied parcels varies from State to State. In Andhra Pradesh, the services carry medicines and perishable articles. The Bihar State Road Transport Corporation carries fresh vegetables, fruits, canisters of milk, bundles of newspapers, saplings and baskets of fish. In Gujarat, the types of traffic carried under the Parcel Transport Scheme include commodities like silk goods, furs, vegetables, eggs, fish, fruits, ice, hides and leather; general merchandise, furniture within permissible size and weight, rubber tyres for cars and trucks, empty cans, etc. The State Transport Department of Kerala also carries all types of goods and articles which emit obnoxious smell. The Maharashtra State Road Transport Corporation carries milk cans. The Mysore State Road Transport Corporation carries articles of the different types which are generally required by the public. The Uttar Pradesh Government Roadways carries articles of small parcels, including fresh vegetables, fruits and poultry etc. In Himachal Pradesh, goods of all types, especially fruits and vegetables etc., are carried.

The freight rates for the unaccompanied parcels are not uniform. In Andhra Pradesh the charges range from 25 naye Paise per maund or part thereof for journey upto 16 miles (8 stages) to 100 naye Paise per maund or a part thereof for

journey over 96 miles (48 stages). In Bihar, the charges are 3 pies per 10 seers per stage or part thereof. In Gujarat, the rates charged range from 3 pies per maund mile or one anna per stage per maund to Rs. 1½ (one stage is equal to four miles). In addition to the freight charges, there is also a surcharge ranging from two annas to six annas according to value of freight and distance. In Kerala the rates are according to weight ranging from 13 kgs. to 102 kgs. and distances ranging from 10 to 250 miles. The rates of 13 kgs. for 10 miles distance is 31 naye Paise and for 250 miles it is 150 naye Paise. The rates of 102 kgs. for 10 miles distance is 87 naye Paise and for 250 miles distance it is 525 naye Paise.

As regards the maximum weight of package accepted for carriage as unaccompanied parcels, the Andhra Pradesh Corporation buses carry a maximum total weight of 12 maunds. In Gujarat, parcels weighing upto a maximum weight of 1½ maunds are carried. In case of parcels containing handloom goods, the limit has been relaxed to 1 maund 25 seers. The size of the parcel is also restricted to 3'x2.5'x2' or 15 cubic feet in volume. The Kerala State Transport Department has not fixed any minimum weight limit for the parcels. The maximum weight of newspaper parcel carried by the Madras State Transport Department in their Kanya Kumari Branch is 112 lbs. at a time and the maximum weight of each post mail bag is within one maund. The maximum weight of a single parcel carried by the Maharashtra State Road Transport Corporation is about 55 kgs. The maximum weight and size to each parcel that can be transported by the Mysore State Road Transport Corporation, is 1½ maund and 3'x2½'x2', respectively. It has been stated that the Rajasthan State Roadways carried packages having maximum weight of one maund in its bus-cum-truck vehicles operating between Abu Road and Mt. Abu. The maximum weight of a package carried by Uttar Pradesh Government Roadways buses is one and a half maunds. In Himachal Pradesh the maximum weight upto which packages are accepted is normally upto three maunds.

No special permits are generally required for enabling the carriage of unaccompanied goods parcels by the buses of the State Road Transport Undertakings. However, in Andhra Pradesh permits for the carriage of unaccompanied luggage are issued on the execution of an indemnity bond and in Maharashtra the regional transport authorities have been authorised to prescribe conditions to be attached to the permits, subject to which goods may be carried.

★★

In its 15th report, presented to Parliament last week, the Public Accounts Committee has urged upon the Central Government the necessity of taking "vigorous steps" for reorganising the Damodar Valley Corporation and, in the process, reappraising its functions in the field of thermal power generation. The latter reappraisal, the Committee says, is required in view of the rapid industrialisation occurring in the areas served by the DVC. A thorough investigation into the possibilities of exploiting the existing resources of the Corporation for the generation of additional hydro-electric power has also been suggested so that at least the original modest target of 250 MW of power could be achieved.

The PAC has also expressed grave concern at the continued shortfalls in the utilisation of the DVC's irrigation potential, which not only has jeopardised its financial interests, but also undermined one of the avowed objects for which it was set up. Considering that the barrage was opened nearly eight years ago, the Committee is perturbed over the inordinate delay that has occurred in taking up the execution of water courses and field channels. The scaling down of the targets for the kharif and rabi irrigation from the DVC system to 0.87 million acres and 55,000 acres, respectively, from the original targets of 1.03 million acres and 300,000 acres, has also been criticized by the PAC. The Com-

mittee feels that in the large interests of increasing agricultural production and promoting welfare of the people, due attention should be paid by the Corporation to the future irrigation requirements of the area. It suggests that the Corporation might examine whether any reduction in the water rates could yield more revenue.

The Committee has also expressed great concern at the non-utilization by the DVC of gas in its power plant and the delay in the opening of its navigational canal to traffic. Non-utilization of gas is estimated to have resulted in a loss of about Rs. 10 lakhs per annum, while quite a good deal of loss of revenue has been occasioned by the delay in the opening of the navigational canal to traffic. The Committee hopes that the Corporation will be in a position to adjust its power plants to utilise both coal and gas by October, 1963, and the charges for the supply of gas would be settled soon. Similar optimism has been expressed about the resolving of the various problems with the West Bengal Government in regard to the opening of the navigational canal to traffic.

Fishery Scheme

The Committee also regrets that the fishery scheme started by the DVC ten years ago has not yielded satisfactory results. It says that there was little justification in the Corporation continuing to run the fisheries when it had to attend to more important functions and could not deal effectively with the problem of poaching. The Committee suggests that the question of transferring the fisheries to the respective State Governments on royalty basis should be examined.

Some irregularities have also been pointed out by the PAC in the 1961-62 accounts of the DVC. Pertinent reference is made to the heavy amount of Rs. 1.81 crores outstanding on March 31, 1962, under "Sundry Debtors for Current Supplied". The expenditure of Rs. 5.38 lakhs incurred on investigations in regard to the underground power scheme at Konar has also been held excessive in view of the intractable nature of this expense. Among the other criticisms of the DVC's working by the PAC, mention may be made of the purchase of a diesel engine and spare parts by the Corporation's mechanized earthenmoving division at a cost of Rs. 51,000 and these having never been put to use, and departure from the normal procedure in not referring to the consulting engineers MAN's tender for the supply of turbines of specific sizes and designs.

★★

The allotment of foreign exchange for private imports of components, raw materials, spare parts, and essential consumer goods other than steel and petroleum products, was reduced by 5.5 per cent between April-September 1962 and October 1962—March 1963. The allotment for April-September 1963 was at virtually the same level as in October 1962—March 1963.

The exchange allotment for licensing of raw materials and components to small-scale industrial units on actual user basis was reduced by 10 per cent between April—September 1962—October 1962—March 1963. The allotment for April-September 1963 was at the same level as in April-September 1962.

The allotment of exchange for the licensing of raw materials and components to large-scale engineering and chemical units as actual users was reduced by 7 per cent between April-September 1962 and October 1962—March 1963, and was restored to the April—September 1962 level in April—September 1963.

Some large-scale industries making items of high priority from the points of view of defence, export promotion or essential civil consumption, such as jeeps, trucks, tyres, dry batteries and drugs and medicines were allowed to import raw materials without cuts.

Certain industries in the small-scale sector such as those manufacturing machine tools cutting tools, drugs, pesticides, industrial plastic goods, industrial glass products, industrial

September 27, 1963

since the Jute Buffer Stock Association is also to lift more, thanks to the decision of the State Bank to increase the credit limit to Rs. 15 crores, jute growers may not have to worry about this year's large crop becoming a drag on the market.

**

Though Mr Sankardas Banerji, Finance Minister, West Bengal, has told the annual meeting of the Indian Roads and Transport Development Association that it would be idle to expect spectacular results in road development in the State owing to the limited resources at the Government's disposal, the progress achieved so far is by no means insignificant. As against only 1,181 miles of road, there are now 5,000 miles of completed roads. There are plans to construct roads linking the coal fields with the Trunk Roads at a cost of Rs. 10 crores. During the present emergency a good job of work has been done by the State Government in improving roads in North Bengal. Mr. B. P. Poddar has drawn pointed attention to the need for expediting road development plans in the north-eastern States. Transport to and from Assam still depends to a large extent on river transport which has proved to be undependable owing to the possibility of strikes as happened at the height of the emergency last year.

The Gamble in the Monsoon

From Our Correspondent

MADRAS:

THE FAILURE of the South-West monsoon has given cause for considerable concern to the Madras State Government. Even though it has been claimed by the meteorological authorities that the earlier deficit in rainfall has been made up in August-September, the catchment areas of the main rivers have not benefited to a great extent and the shortage of water in many of the reservoirs is very low for this time of the year. Indeed, in Periyar, Papanasam, Manimuthar and some of the reservoirs in the Nilgiris the levels are so low that it will be necessary to resort to turn cultivation. It is even feared that the hydro-power stations in the Nilgiris would have to be worked to a greater extent than Periyar and Papanasam if water in these two projects is to be conserved and the needs of cultivators have to be met even though on a reduced basis. The Mettur reservoir also has not filled up to the desired extent and the inflow at the present moment is only half the irrigation discharge. The emptying of the lake early this year in order to expedite the work of construction on the Mettur Tunnel Scheme has no doubt been partly responsible for the present situation. The position is such that the cultivators in the delta areas cannot think of sowing a paddy crop which will require water over a period of six months unless, after the harvest of the current Kuruvai crop, there was an early onset of the North-East monsoon and the reservoir level increased significantly.

For the time being, it has been decided that the Kundah and Mukoorthi reservoirs should be utilised fully for power generation and that the whole position should be reviewed later in the year. There is need, however, for pursuing a cautious policy as the situation might get out of control early in the next year. Fortunately, on the power side, the position may not be very critical if the North-East monsoon proves to be reasonably satisfactory and the irrigation needs can be met in such a way that the cultivation programme is not seriously affected. It is anticipated that the fourth thermal unit at Neyveli will be commissioned in November and the fifth unit by March next. While it is reasonably certain that the fourth unit will be commissioned within the next three months, in regard to the fifth set it will be necessary to secure some parts from the USSR for completing erection because the other units have been commissioned with the stocks of spare on hand and the parts belonging to the last unit. Every effort is being made to complete the first stage of the project before the end of the current financial year. If these facts

If one goes by the example of the developed countries, the case for the development of roadways is indeed strong in our country. In the UK road transport carries roughly two-thirds of the goods, but in India the proportion is only one-seventh. The road mileage in India per square mile is 0.25 as against 3.25 in the UK. The immense leeway that is to be made in roads development in India will also be brought out clearly by the fact that only 14 per cent of the total road mileage is either blacktopped or concreted. Mr. Poddar has pointed out that judging by current norms road transport will not be able to carry all the load expected to account for during the third Plan. Out of the anticipated third Plan load of 342 million tons, road transport is expected to carry as much as 70 million tons. But according to Mr. Poddar, carriage by road will hardly exceed 23 million tons. Currently the transport situation does not seem to cause much worry because the railways are well able to carry whatever load is offering. This is because for the past two years industrial production has been stagnating. Now that steps are under way to re-energise the economy, it may well be that the transport position may before long begin to assume its usual character—shortage and bottlenecks.

prove to be successful, the Madras State grid can depend on the availability of an additional 100 mW. of power from a secured source. This will be greatly helpful in getting over the difficult period next year though Mr. R. Venkataraman has been pointing out that consumption of electricity has been regularly on the increase and that the additions to generating capacity whether by the State Electricity Board or by the Neyveli Corporation are being outstripped by the increased demands for power. The Madras State Electricity Board also expects to commission some more units in the Kundah and Periyar projects. But water availability is absolutely necessary for utilizing this new capacity. The dependence on the monsoon even with the successful harnessing of rivers for irrigation and power generation has thus been forcefully brought out.

**

In Kerala too the position is not very comfortable as the reservoirs in that State have also not filled up to expectations. A difficult situation is apprehended early next year. Even otherwise, it is felt that at least 25 mW. of power should be secured from the Madras State. In its present predicament the latter is unable to give any definite assurance. But the request from the neighbouring State is being carefully examined.

Meantime, the Madras engineers have been exploring the possibility of securing supplies of water from some of the west-flowing rivers in Kerala in order to irrigate the arid tracts in Madurai and Ramanathapuram districts. The engineers of both States are having meetings and it is being examined to what extent surplus resources exist in some of the west flowing rivers and the needs of the backward areas of the two districts on the other side of the Western Ghats can be met. There is naturally an apprehension in Kerala that the State's needs should not be overlooked. But there is also some difference of opinion about assessment of water surpluses. Actually, the Home Minister of Kerala State has indicated that there is no surplus in the tributary of Periyar river which can help Ramanathapuram district. But the possibility of utilizing the waters of two other rivers in the same area are being explored. As the Madras Government have been successful in getting a share of the Siruvani waters for meeting the requirements of the Coimbatore area and concluded a satisfactory arrangement in the Parambikulam project, it is hoped that some supplies of water could be secured to irrigate areas in the Ramanathapuram and Madurai districts.

EASTERN ECONOMIST

629

The moving finger writes

I FOR one do not see what useful purpose the Finance Minister hoped to serve by displaying reluctance to disclose the name of the individual concerned after it had been stated in the Lok Sabha that "a Central Minister" had been allowed to keep a small foreign currency account consistent with the rules framed on the subject. Mr. Krishnamachari's invoking the legal safeguard that protects the privacy of a client's relations with his banker was, of course, beside the point for it had been conceded that the Government was, in fact, in possession of the information through the simple process of the holder himself having declared the account as the law stipulates. To that extent the client's relations with his banker had already ceased to be confidential. The only issue that remained was whether Parliament had a right to the information which the Government had already had. The convention in this matter surely is that Parliament, broadly speaking, should have access to information of public interest unless the Government could seek privilege or protection on demonstrably reasonable and legitimate grounds. Apart from all these considerations, in this particular case it was clearly to the advantage of the Government itself and of the Central Ministers collectively as well as individually, that the Minister concerned should be identified. As the transaction has been a wholly legitimate one, there is no reason at all why the Minister himself or the Government on his behalf (or for its own sake) should have hesitated or been reluctant to reveal his identity. It must be added, of course, that Mr. Nehru who was the "Central Minister" in question had himself been most ready and willing that the Lok Sabha should be given the information that was sought.

While on this question of the Prime Minister's small foreign currency account, I might perhaps pass on a story (that I heard some time ago) which shows Mr. Nehru in a very human light. It appears that when the matter of releasing the foreign exchange required for the education of one of his grandsons came up before the Reserve Bank, the question whether any special treatment should be given to this application was reportedly referred to the then Finance Minister, Mr. Morarji Desai. The story goes that Mr. Desai drew Mr. Nehru's attention to the fact that under the rules no foreign exchange could be sanctioned in this case. It seems then that the Prime Minister suggested that perhaps the small foreign currency account he had could be used for the purpose, but Mr. Desai rightly pointed out that the rules did not permit that procedure—all of which goes to show that the Prime Minister of the country could be as innocent as any ordinary mortal of the subtleties and intricacies of the foreign exchange regulations. Perhaps I should complete the story by adding that some other way, wholly legitimate and consistent with the rules, was found for the education expenses abroad of Mr. Nehru's grandson.

**

I am not surprised that the Home Minister reacted violently to the allegation of Mr. Dayabhai Patel in the Rajya Sabha that Mr. Nanda was in the habit of carrying with him hot food over a live coal brazier while travelling on IAC planes. This was a serious charge to make and I am glad that Mr. Nanda neither lost time nor minced words in refuting the accusation. At the same time, I must add that safety regulations on IAC planes do quite often seem to be treated in a cavalier fashion not only by the passen-

gers but also by the crew. I myself had the unpleasant experience of witnessing last year three such grave breaches of safety rules within a period of six months and, in fairness to Ministers, I must point out that it is not necessary that one should be a Minister to be able to cock a snook at the IAC safety regulations.

Thus, to go back to the incidents I have just referred to, there was the case of a Delhi businessman who was allowed during an IAC Viscount flight from here to Karachi to spend most of the journey in the cockpit and even remain there while the plane was landing at Karachi airport. The second case was that of the wife of an official of the All India Radio who was permitted to travel from Patna to Delhi on an IAC Heron flight with a large dog by her side and even allowed to visit the cockpit along with her pet while the plane was air-borne. The third episode was that of one of the air hostesses on a Viscount flight from Bombay to Delhi who very obligingly helped a passenger to light his cigarette after the no-smoking signal had gone up and the plane was preparing to land at Palam.

The worst of my story, however, is still to come. These incidents were brought to the notice of the management of the IAC in a formal report which I made to them. The net result was that after quite some weeks one of their officials was sent to me to explain how difficult it was for the management to take any disciplinary action against offending crew since unionism was very strong and could strike back. Over a cup of coffee, which he graciously accepted, this IAC official also pleaded with me that although the facts reported by me were found to be substantially correct, it would be fine if I did not insist on pursuing the matter further since the pilot concerned in one of the incidents mentioned by me already had "black marks" against him and that he would, therefore, be in serious trouble if any further misdemeanour were to be brought home to him. It did not occur to this worthy official of the IAC that a pilot who is permitted in this manner to accumulate "black marks" in virtual immunity is a menace to the life of those who would travel by IAC. It is needless to say that I did not agree with his arguments, but that does not seem to have mattered much. I in any case just do not know what action, if any, has been taken at all.

**

It is fine that, in the same week in which Air-India's Maharaja was mauled in Parliament by clumsy, puritanical claws, the company has been able to report a very creditable operational and financial year in 1962-63. The proof of the pudding is in the eating and I for one should imagine that those who are tempted to pass amateurish judgment on Air-India's publicity ought to give some thought to the significance of the fact that Air-India has been able to work at a profit at a time when the international civil aviation industry as a whole is deep in the red. I am not suggesting that the Maharaja's sales talk is always stuff for the family breakfast table, but it must surely be conceded that, by and large, he is a very pleasant and persuasive fellow and is working damned hard to his country's profit in a magnificently successful attempt to give the lie to the traditional complaint that Maharajas are parasites. Seriously, advertising and sales promotion are jobs for the expert and it is not out of place to remind the Maharaja's detractors that a cobbler should stick to his last.

COTTON BUFFER?

THE COTTON situation in the country and the factors affecting production and marketing of cotton were discussed with Members of Parliament from cotton growing States at a meeting held recently under the chairmanship of the Minister of Food and Agriculture, Sardar Swaran Singh. On the question of the supervisory and survey system which are intended to prevent adulteration of cotton and to ensure orderly marketing of the commodity, some Members were critical of the working of the system while others felt that in the present context there was no need for its continuance. The Minister for International Trade explained the background to the various control measures in operation and indicated that the compulsory survey and supervisory systems had been introduced at a time when cotton prices were about to pierce the ceiling. They had been continuing during the last three seasons with suitable modifications. He, however, promised to review these measures and withdraw them in cases where the prices ruled between the floor and the ceiling.

It was pointed out at the meeting that prices of cotton in this country were higher than those of comparable staple lengths and varieties of cotton in the rest of the world. The Minister for Food and Agriculture informed the Members that action would have to be taken on two fronts, i.e., increasing the yield per acre, reducing the cost of marketing and streamlining the cost structure for the farmer. The Government of India is studying the question of setting up a buffer stock agency for raw cotton on the lines of one already in operation for raw jute. The proposed agency will enter the market to buy cotton stocks as and when the prices fall below the ceiling by more than Rs. 100 per candy. A buffer stock of one million to 1½ million bales is considered adequate. A portion of the imported cotton could also be held by the buffer stock agency.

After the partition of India we found ourselves heavily deficit in cotton. Special efforts were made to increase production and the statement below regarding production from the year 1950-51 onwards will indicate the increase in production of cotton year by year:

Year.	Area in acre- age under cotton culti- vation. (Thousand acres)	Internal Produc- tion. (Bales)	Internal Consump- tion. (Bales)	Import of foreign cotton. (Bales)	Exports of Indian cotton. (Bales)
(1)	(2)	(3)	(4)	(5)	(6)
1950-51	14,556	29,71,000	37,22,000	11,05,000	1,76,000
1951-52	16,198	31,33,000	41,66,000	10,83,000	2,00,000
1952-53	15,693	31,31,000	45,61,000	8,49,000	3,09,000
1953-54	17,182	39,65,000	47,07,000	7,19,000	1,34,000
1954-55	18,684	42,27,000	48,68,000	6,30,000	3,19,000
1955-56	19,978	40,01,000	50,74,000	6,08,000	6,12,000
1956-57	19,893	47,35,000	53,33,000	5,67,000	2,99,000
1957-58	19,996	47,39,000	50,99,000	5,66,000	2,92,000
1958-59	19,926	46,86,000	52,35,000	4,55,000	4,01,000
1959-60	19,252	36,78,000	52,04,000	6,85,000	1,59,000
1960-61	18,971	53,90,000	54,10,000	10,60,000	2,99,000
1961-62	18,710	45,00,000	57,31,000	9,69,000	3,20,000
1962-63	18,800	56,00,000	57,50,000	7,00,000	3,25,000
(Estimated)					
1963-64	18,800	57,00,000	58,25,000	7,00,000	3,25,000
(Estimated)					

N.B.—In addition Khadi production also consumes some bales of cotton per annum.

Three aspects clearly come out. (1) That the variation in annual production when the area under cotton has been between 19 and 20 million acres is as high as 26 lakh bales i.e. the variation is between an annual crop of 31 lakh bales and 57 lakh bales. (2) The consumption shows a steady rise, the present consumption being about 57 lakh bales. With exports of low staple Bengal Deshi of about 3 to 3.5 lakh bales per annum, the minimum quantity of annual production required to satisfy the current levels of consumption of cotton (and which is steadily rising) would be round about 61 to 62 lakh bales per annum. (3) India continues to be net deficit in cotton.

As much as 87½% of cotton grown is a dry crop. Only 12½% area is under assured irrigation. Seasonal variations therefore account for fluctuations in yield. Although the yield per acre has gone up from about 80 lbs. per acre to over 100 lbs. per acre, the yield is about the lowest in the world, the US average yield being 300 to 400 lbs. per acre. Due to wide fluctuations of crop in India which is due to low agricultural productivity and large dependence on weather conditions because of little assured irrigated crop etc., even in recent years the annual crop has fluctuated between 37 lakh bales in 1959-60 and 57 lakh bales (estimated) in 1963-64 making it very difficult for the cotton policy to be worked very effectively.

Prices Pierce Ceiling

The system of floor and ceiling prices for cotton operates for a number of years. The floor price continued at Rs. 495 per candy for the standard quality Moglai Jarila for ten-year period from 1951 to 1961 but this was raised by Rs. 105 in the year 1961-62 and another Rs. 100 in the current year, the floor price now being Rs. 700 per candy. The ceiling prices have been continuously raised from Rs. 550 to Rs. 947 per candy. Last year the ceiling prices were raised by Rs. 125 per candy to Rs. 947 per candy. In recent years prices are ruling nearer the ceilings sometimes piercing them. For the longer staple variety of cotton, the price rise in ceilings given was proportionately higher.

Import is being kept to the minimum required to make good the deficit between total consumption, taking into account our exports of 3 to 3½ lakh bales of very low staple Bengal Deshi Cotton, and the internal production of cotton. Imports have varied from 4 lakh bales in 1958-59 to 11 lakh bales in 1950-51 as per the annual deficit from year to year, the average imports being 6 to 7 lakh bales per year.

As and when we produce more cotton indigenously, less would be the requirements of imported cotton in the overall balance. There are, however, some factors which may also be kept in mind regarding imports. Our trade pattern with countries particularly in Africa, namely, Egypt, Sudan, Nyasaland, Tanganyika, Uganda and East African territories is such that they depend very much on India to purchase substantial quantities of cotton from them (for the last two decades or so it has been around 4 lakh bales).

If this pattern is disturbed our exports to these countries (as well as our relations with these countries) will also be seriously affected. The cottons imported from these areas are mostly of the longer staple variety of which we are in short supply and for which there is internal demand for finer fabrics like sarees and dhotis. Historically speaking since the last two decades and more, we have over 120 mills already in existence spinning higher medium and fine qualities for dhotis and sarees etc. With larger growth inside the country,

September 27, 1963

it would be possible to adjust the import-export pattern of cotton by continuing to import longer staple cottons from countries particularly in Africa and exporting any surpluses of our lower staple varieties which are in demand in the world. The overall cotton position is such that there is no reason to suppose that this pattern cannot be maintained. It would be beneficial to grow more and more cotton and import some larger staple from friendly African countries and export our lower staple of cottons which have a world-wide demand.

The imports of cotton are now confined broadly to the categories of staple length 1.1/16" and above. Cotton production in India of these staple lengths is still small.

Our imports are also phased over the year as a whole whether under normal marketing or under PL 480 from U.S.A. and the receipts are of a monthly order of about 50 thousand bales, depending on our requirements.

PATENT LAW REFORM

CIBA, prominent in the drugs and pharmaceuticals industry has come out with its views on the proposal for abrogation of patents. The company feels that this will have international implications and will act as a strong disincentive to foreign investment. The CIBA statement points out that the Patent System stimulates technical progress in many ways. It encourages research and inventions; it induces an inventor to disclose his discoveries instead of keeping them a trade secret; it offers reward for the considerable expense of developing inventions to the stage at which they are commercially practicable. It also provides an inducement to the investment of capital in new lines of production which would not be profitable if many competing manufacturers embarked on them simultaneously. If India should now decide to abrogate patents, be it chemical, pharmaceutical, food or industrial,

there will be justified anger and criticism.

One of the major criticisms that had been levelled against the Patent System is that the majority of patents are held by foreigners. It is argued that this militates against the advance of Indian industry. But a large proportion of patents are in fact held by foreigners even in the industrially advanced countries as will readily be seen from the following figures.

	Average annual number of Patents granted during the years 1930 to 1937	Number granted to foreigners	Percentage granted to foreigners
Canada ..	9,269	8,368	90.3
Holland ..	2,674	2,164	80.9
Norway ..	1,428	1,031	72.2
Denmark ..	1,590	1,056	66.4
Switzerland ..	7,307	4,066	55.6
Great Britain ..	18,417	9,522	51.7
France ..	20,025	9,994	49.9

The Patent System has led to a marked development of the pharmaceutical industry resulting in better products, cheaper medical treatment and greatly improved standards of health. The abrogation of patents in the pharmaceuticals will give a death-blow to this industry. The Indian pharmaceutical industry has now reached the stage of development when its own inventions and processes will need to be safeguarded. New institutions devoted to research have recently started functioning in India both in the public and private sectors. The

ORISSA STATE ELECTRICITY BOARD BONDS 1975

FOR Rs. 200 LACS

(Payment of interest and repayment of principal guaranteed by the Government of Orissa)

The bonds will be trustee securities under the Indian Trusts Act and also approved securities for the purpose of the Insurance Act and the Banking Companies Act.

ISSUE PRICE - Rs. 99.50 PERCENT REDEEMABLE AT PAR ON THE 11th OCTOBER 1975. INTEREST PAYABLE IN CASH EVERY HALF YEAR.

Subscriptions will be received in cash or by cheque, at the offices of the State Bank of India at Calcutta, Bombay, Madras, New Delhi and at their branch offices in Orissa from the 7th October, 1963 to 10th October, 1963, both days inclusive. Subscription may however be closed earlier without notice if the total amount is subscribed.

Copies of loan prospectus and application forms are available at (i) all the offices of the State Bank of India mentioned above, (ii) offices of all the District Collectors in Orissa and (iii) all the Offices of the Orissa State Electricity Board.

HYDERABAD LOANS

The outstanding balances of the 4 per cent Hyderabad State Development Loan 1963 and the 2½ per cent Hyderabad Loan 1953-63 (H.E.H. the Nizam's Government 2½ OS Rupee Loan 1363-73 Fasli) issued in terms of the former Government of Hyderabad, Finance Department, Notifications Nos. 10/PD/53 and 30 dated October 21, 1953 and September 26, 1943 are repayable at par on October 15, 1963 and October 16, 1963 respectively and no interest will accrue thereon from these dates. To facilitate discharge of the loans on the due dates, the holders may tender their securities on and from October 1, 1963 at the Public Debt Office, Treasury or Branch of the State Bank of India or its Subsidiary Banks at which they are encased/registered for payment of interest. Full details of the procedure for obtaining the discharge value may be obtained on application from any of the above offices.

SUGAR MILLS IN THE SOUTH

In view of the increased per acre yield of cane in the South and its higher sucrose content, it has been agreed in principle by the Food and Agriculture Minister, Mr. Swaran Singh, that preference should be given in future to the Southern region in granting licences for sugar factories. The suggestion was made, at a meeting of the Board's Executive, which discussed the Government's sugar policy recently. The Minister for International Trade, Mr. Manubhai Shah, also agreed in principle with the suggestion.

TARIFFS ON TEA

An arrangement between Britain and the European Economic Community (EEC) for the simultaneous suspension of tariffs on tea and tropical hardwoods was signed in Brussels on 10th September. Under the terms of arrangement, the suspension takes effect on January 1, 1964 and will last until December 31, 1965. The arrangement benefits Commonwealth countries which now export these products to Britain and the Six, because from January 1, 1964 they will be able to sell these products to countries of the Six without the barrier of any tariff. The President of the Board of Trade, Mr. Frederick Errol, announced on July 31, 1963 that British duties suspended under the arrangement would affect tea, mate (a kind of tea) and all hardwoods except oak, ash, birch, maple, elm, sycamore, walnut, aspen, poplar, beech, Spanish chestnut, jarrah and karri.

INDUSTRIES IN MAHARASHTRA

At the 29th annual general meeting of the Mahratta Chamber of Commerce and Industries, Mr. S. L. Kirloskar, dwelt at length on some of the problems connected with industrialisation in Maharashtra State. Pointing to the crisis in the powerloom industry, he said that when the entire question of powerloom industry was under the examination of Asoka Mehta Committee, it was surprising that the excise authorities had started seizure of powerloom cloth. A fact finding committee on powerlooms in the State had moreover come to the conclusion that the increase in the excise levies on the cloth produced on powerlooms was not justified and had resulted either in the total closure or sealing of looms.

Referring to the power needs of Maharashtra, Mr. Kirloskar said that the Electric Power Survey Committee appointed by the Government of India has estimated the load forecast for the third five-year Plan for Maharashtra at 1201 mW. To provide firm generating capacity against this load and allowing 15 per cent standby on the installed capacity, the State's

installed capacity has to be of the order of 1,400 mW. The CWPC and the Planning Commission have now two schemes of thermal power stations under their active consideration—one of 300 mW. in the Nasik area and the other of 60 mW. at Gangakhed in Marathwada area. It is essential that these schemes should be sanctioned immediately.

AID FROM U.S.S.R.

An agreement for setting up a coal washery at Kathara in Bihar was signed recently between the National Coal Development Corporation, a Central Government undertaking, and the Soviet supplying organisation, "TJAZHPROMEXPORT". Under the agreement, the Soviet Organisation would supply equipments, technical aid and other materials valued at Rs. 2.047 crores out of the Indo-Soviet rouble credit agreement signed in February, 1961. The coal washery will have a capacity of 30 lakh tons of raw blendable coking coal per annum.

Equipped with modern machinery and equipment, the washery will use advanced technological processes and techniques. The coal cleaned at the Washery will be supplied to the steel plants and the rest to thermal power stations. Under the contract, the Soviet specialists would be deputed to India for rendering technical assistance to the NCDC in the erection, adjustment and commissioning of the washery. The Soviet Union had also extended assistance to India in setting up certain other coal mining establishments. These include two coal mines in Korba area of Madhya Pradesh with an aggregate annual capacity of 1.7 million tons, a quarry in Korba with an initial capacity of 1 million tons which would later expand to 2 million tons and the establishment of the central electrical and mechanical workshop at the Korba coalfields for repairing a variety of coal mining equipment.

PLAN FOR PARADIP PORT

According to the Japanese Technical Mission Survey the total reserves of iron ore in the Daitari area are over 55 million tons. The Mission examined the plans of the State Governments for mining and transportation of this ore by truck-trailers through an expressway, now under construction, for the export of 2 million tons of iron ore per annum commencing from the end of 1965. The Mission has made detailed technical suggestions on these aspects as well as on port construction programme both in the first stage and the ultimate phase. While the first stage visualises an export of 2 million tons of iron ore from the Daitari area, the Mission has recommended the early construction of a railway line from Paradip to Banspani in order to enable the exploitation and export of not only the iron ore of Daitari but of the high grade ore in the Nayagarh area of North Orissa. For the ultimate development of Paradip port it has suggested ten berths for miscellaneous cargo in addition to five berths for ore handling and has visualised the gradual development of various industries centring in the port such as machine repairing, ship building, food processing, oil refining, etc. The Mission has also dealt in its report with the mechanisation of farming, manufacture of agricultural implements, the development of fisheries, of small enterprises, electrical power and town planning of the new harbour city at Paradip.

PRICE SUPPORT FOR JUTE

Questions relating to the production, prices and marketing of jute were discussed recently at a meeting of Members of Parliament from jute growing States with the Union Minister for Food and Agriculture. There was general agreement that the jute industry should have an assured supply of raw material so that production is maintained unhampered at levels required to meet the demand for the manufactured goods. Some

September 27, 1963

capital of Rs. 7.16 lakhs has been reserved for the technical collaborators, the Jost's Engineering Company. The balance of Rs. 6.86 lakhs is being offered for public subscription.

The company has been licensed to manufacture several models of drilling machines with a capacity of 1,200 machines per year. The factory is to be located at Ambattur, Madras, and the plant is likely to go into production by March, 1964, and reach full production capacity in a year.

SELECTED SATGRAM

Selected Satgram Ltd. proposes to issue 10,000 redeemable cumulative preference shares (9.5 per cent) and 20,000 ordinary shares, both of Rs. 100 each. These shares will be offered to the existing shareholders and to the public simultaneously. The original proposal was to issue equity shares worth Rs. 30 lakhs to the existing shareholders as rights issue. But it has now been decided to issue this capital of Rs. 30 lakhs in 20,000 ordinary shares and 10,000 preference shares both to the existing shareholders and the public. It has already applied for permission to modify the earlier proposal.

The present authorised capital of the company is Rs. 2 crores comprising 100,000 ordinary shares and 100,000 unclassified shares of Rs. 100 each. It is now proposed to create preference shares out of the unclassified shares. The additional capital will be utilized to finance to company's expansion programme. It has already acquired a new colliery and started a new pit sinking at new Satnagar colliery. Steps have also been taken for the expansion of collieries during the third Plan period. The Managing Agents have arranged for a medium-term loan of Rs. 50 lakhs from the Refinance Corporation for Industry which will partially meet the expenditure on expansion.

S. B. JOSHI

S.B. Joshi and Co., Ltd., will enter the capital market with a public issue of Rs. 19.36 lakhs divided into 1,93,575 equity shares of Rs. 10 each. The subscription list opens on September 26 and will close on October 8 or earlier, but not before October 4. The entire issue has been underwritten. The company has an authorised capital of Rs. 1 crore and will raise its paid-up capital from Rs. 10.64 lakhs to Rs. 30 lakhs. The proceeds of the present issue will be utilized for financing the company's expansion programme. Besides extending its construction activities the company will undertake the first stage of the factory for steel fabrication and the manufacture of industrial equipment such as winches, grabs and cranes. In steel fabrication the emphasis will be on steel bridges and the use of standard economical steel components for factories and other buildings. The capital outlay on the first stage of the expansion programme is estimated at Rs. 39 lakhs, which will be met partly by the present issue and partly by borrowings. The full expansion scheme which is expected to be completed in six years is likely to involve an outlay of Rs. 128 lakhs.

RAYMON ENGINEERING

The Directors of Raymon Engineering Works Ltd. propose to raise the company's authorised capital to Rs. 3 crores by the creation of further 21,51,700 equity shares of Rs. 100 each. The present authorised capital is Rs. 1 crore, divided into 20,000 redeemable preference shares of Rs. 10 each and 8,00,000 equity shares of Rs. 10 each. These shares were issued in 1960. Out of the total redeemable preference shares, only 4,830 shares were subscribed. The Directors now propose to cancel the 15,170 unsubscribed preference shares thereby reducing the authorised capital to Rs. 84.43 lakhs. This dimi-

nished capital will be increased now to Rs. 3 crores by the equity issue.

The company has made substantial progress during the year to March 31, 1963. The installation of machinery and equipment and also the commissioning of the forge, pressed steel and smithy shops have been completed. Negotiations are also proceeding to secure foreign financial participation for the installation of the plant to manufacture spirally-welded pipes for oil, gas, water, sewerages etc., of larger diameter. In this respect the company has been granted the manufacturing licence for such a plant with an annual capacity of 45,000 tons.

KHATAU'S HIGHER PROFIT

Khatau Makanji Spinning and Weaving Company Ltd. has proposed an equity dividend of Rs. 8 per share for the year ended June 30, 1963, against Rs. 16 for the previous year. The total distribution has, however, been maintained at about Rs. 9.58 lakhs, the capital serviced during the year amounting to Rs. 1.19 crores against Rs. 59.85 lakhs in the previous year as a result of the bonus issue in the ratio of one new share for every share held. Its performance for the year has substantially improved with the gross profit rising from Rs. 74.02 lakhs to Rs. 93.72 lakhs. The sales increased from Rs. 5.83 crores to Rs. 6.48 crores. The number of spindles in the company's mills has increased during the year from 103,840 to 108,504 and a further addition is expected in the current year. It may be pointed out that the company's capital has increased from Rs. 20 lakhs to Rs. 1.50 crores including preference shares worth Rs. 30 lakhs as a result of a series of bonus issues. A sum of Rs. 19.50 lakhs has been set apart for depreciation, Rs. 45.95 lakhs for taxation, Rs. 2.84 lakhs towards development rebate reserve and Rs. 11.25 lakhs towards development reserve. The proposed equity shares and preference dividend will absorb Rs. 11 lakhs. The company has also set apart Rs. 7 lakhs for special reserve created for SPT.

J. K. RAYON

The preliminary report issued by the J. K. Cotton Spinning and Weaving Mills Company Ltd., for 1962 showed a sizable decline in sales from Rs. 5.17 crores to Rs. 4.83 crores due to the prolonged strike in the rayon unit which lasted for about three months. Gross profit also registered a steep fall from Rs. 73.39 lakhs to Rs. 28.94 lakhs. After providing Rs. 69,748 only. A dividend on the preference shares has been recommended by the directors while no dividend is recommended for the ordinary shares.

WINDOW GLASS

The directors' report for the second year ended March 31, 1963 stated that the estimates of cost had to be revised because of certain additions and modifications in the machinery and buildings. The company is expected to commence production within three months. The Industrial Finance Corporation of India sanctioned a loan of Rs. 25 lakhs to the company. A sum of Rs. 10 lakhs was given in March and another sum of Rs. 12 lakhs in June last. The balance is expected to be received shortly.

MALABAR SPINNING

The Malabar Spinning and Weaving Company Ltd., working under Government management, has shown a net profit of Rs. 61,891 for the year ended December 31, 1962. The company has been working at a profit for the last three years and the directors have proposed redemption of the

September 27, 1963

mortgage executed in favour of the Kerala State Government after paying the amount invested by the Government for the working of the Mills. The National Industrial Development Corporation Ltd. has consented to give financial assistance for rehabilitation and modernisation of the mills. The directors have made an application for financial assistance to the tune of Rs. 20 lakhs.

PYROTENAX

A loss of Rs. 28,296 for the first year ended December 31, 1962 has been reported by the Pyrotenax India Ltd., which was incorporated on July 7, 1962. The company has entered into two agreements with Pyrotenax Ltd., U.K., for the supply of technical know-how and information for the manufacture of mineral insulated metal sheathed electric cables and also for the supply of plant, machinery and equipment.

PROJECTS FOR ORISSA

The following statement giving details of heavy engineering projects for Orissa was placed in the Lok Sabha last week. The items of manufacture and annual installed capacity are given against the name of each firm.

Units for which licences/letter of intent to grant licences have been issued:

(1) M/s. Industrial Development Corporation of Orissa Ltd. Spun Pipes—12,000 tons, C. I. Specials—2,520 tons. (2) M/s. Orissa Industries Ltd., Cuttack, Steel castings—4,800 tons. (3) M/s. Daga & Co. (P) Ltd., Calcutta, Steel castings—3,000 tons. (4) M/s. Precision Machine Tools (P) Ltd., Balasore, (a) Guillotine Plate Shearing machine—72 Nos. (b) Universal Punching and Shearing machine—72 Nos., (c) Plate binding machine—36 Nos., (d) Angle & Section binding machine—120 Nos., (e) Radial drilling machine—72 Nos., (f) Forging hammers—72 Nos., (g) Pneumatic moulding machine—72 Nos., (h) Pendulum Swing Frame Grinder—20 Nos., (i) Industrial knives—Worth Rs. 6 lakhs. (5) M/s. Orissa Cement Ltd., Rajganpur. Box type railway wagon—32 Nos.

Applications for issue of industrial licences, under consideration.

(1) M/s. Industrial Development Corporation of Orissa Ltd.—Power Tillers. (2) M/s. Jaypore Sugar Co. Ltd.—Cement Plants & Heavy Structurals. (3) M/s. Utkal Machinery Ltd.—Presses.

AGRICULTURAL TRACTORS

The following firms are licensed under the Industries (Development and Regulation) Act, 1951, for the manufacture of agricultural tractors. The figures indicate annual installed capacity in numbers.

(1) M/s. Eicher Tractor Corporation of India Private Ltd., New Delhi—2,000. (2) M/s. Tractors & Farm Equipment Ltd., Madras—3,500. (3) M/s. Tractors & Bulldozers Private Ltd., Bombay—2,000. (4) M/s. Mahindra & Mahindra Ltd., Bombay—3,500. Of these, the first three are in production and their current ex-factory prices are: Eicher—Rs. 11,000; Zetor—Rs. 14,850; Ferguson—Rs. 15,750. The fourth firm is likely to go into production in 1964. In addition, the following firms are licensed under the Industries Act, for manufacture of power-tillers, sometimes called small tractors. (1) M/s. East Asiatic Co. (India) Private Ltd., Bombay—24,000 Nos., (2) M/s. Krishi Engines (P) Ltd., Hyderabad—3,000 Nos. None of these firms has started production as yet.

CAPITAL ISSUES

Fifteen companies have been authorized to raise fresh capital of Rs. 22.14 crores. The consent is valid for 12 months.

Sidhpur Mills Company Limited, Gujarat, is to issue bonus shares of the value of Rs. 10 lakhs. These will be allotted to the existing equity shareholders of the company in the ratio of one bonus share for every two equity shares held.

Hindustan National Glass Manufacturing Company Limited, Calcutta, is to issue bonus shares of the value of Rs. 8,30,000 on capitalization of its reserves. The bonus shares will be issued in the ratio of one bonus share for every five shares held.

Anglo India Jute Mills Company Limited, will also issue bonus shares of the value of Rs. 9,84,200 on capitalization of its reserves. They will be issued in the ratio of one bonus share for every five shares held.

Orissa Mining Corporation, Bhubaneswar, an undertaking of the Government of Orissa, is to raise capital of Rs. 50 lakhs in 50,000 equity shares of Rs. 100 each. The shares will be entirely subscribed by the Government of Orissa.

Durgapur Projects Limited, a Government of West Bengal undertaking, is to issue capital of Rs. 15 crores divided into 1,50,000 equity shares of Rs. 1,000 each to be subscribed entirely by the Government of West Bengal. Excepting one share, which will be issued for cash, all the other shares will be issued against transfer of asset to the company.

Isaac Holdens (India) Limited, Calcutta, will raise capital of Rs. 30 lakhs in equity shares of Rs. 10 at par.

Pressed Steel Tank Company of India Limited, a new company incorporated in West Bengal, is to raise capital of Rs. 110 lakhs divided into equity shares of the value of Rs. 80 lakhs and preference shares of the value of Rs. 30 lakhs. The capital is required for the setting up a factory at Faridabad for the manufacture of cylinders, both high and low pressure type.

Bhaskar Textile Mills Limited, Calcutta, is to raise further capital of Rs. 5 lakhs in 50,000 equity shares of Rs. 10 each for cash at par.

Shah Malleable Castings Limited, Bombay, will issue capital of Rs. 30 lakhs. These will be in equity shares of Rs. 10 each to be issued for cash at par. Of these shares, Rs. 14 lakhs will be subscribed by non-resident Indians in Kenya in sterling and the amount utilized in the import of plant and machinery. Shares of the value of Rs 11 lakhs will be offered to the public by prospectus.

Sylvania & Laxman Company Limited, New Delhi, will issue capital of Rs 80 lakhs. These will be divided into 8,00,000 equity shares of Rs 10 each to be issued for cash at par. Out of these, 3,60,000 equity shares of the value of Rs 36 lakhs would be offered to the U.S. collaborators Sylvania Electric Products and/or their nominees for cash at par. Shares of the value of Rs 24 lakhs would be offered to public for cash at par by prospectus.

Saurashtra Ceramics Limited will raise capital of Rs 30 lakhs—Rs 25 lakhs equity and Rs 5 lakhs preference—in supersession of previous consent for Rs 20 lakhs. Of these, the entire preference shares and equity shares of the value of Rs 14 lakhs will be offered to the public for cash at par.

S. F. Products India Limited, Calcutta, is to raise capital of Rs. 12 lakhs in 12,000 equity shares of Rs. 100 each. The capital is required for the manufacture of fans and blowers in collaboration with a Swedish firm who will subscribe to 69 per cent of the capital.

Mahindra Ugine Steel Company Limited, Bombay, a new company, will raise capital of Rs 3 crores at par. This will be

divided into Rs 2.5 crores in equity shares of Rs 10 each and Rs 50 lakhs in 9.3 per cent cumulative preference shares of Rs 100 each. Out of this, equity shares of the value of Rs 41.50 lakhs will be offered to Messrs. Ugine, France, Rs. 40 lakhs to International Finance Corporation, Washington and Rs 107 lakhs and the entire preference shares of Rs 50 lakhs will be offered to the public by prospectus.

Sree Vallappa Textiles Limited, Salem, will raise capital of Rs 25 lakhs. This will be divided into 19,000 equity shares of Rs 100 each and 6,000 cumulative redeemable preference shares of Rs 100 each, carrying a dividend of 9.3 per cent free of company's income-tax but subject to deduction of tax at source. All the shares are to be issued for cash at par. Of the above, equity shares of the value of Rs 10 lakhs and preference shares of the value of Rs 5 lakhs will be offered to the public by prospectus.

The Ganesh Flour Mills Company Limited, Delhi a public company, will issue debentures of the value of Rs 14 lakhs bearing interest at the rate of 7 per cent per annum and repayable after 10-12 years, for cash at par.

LICENCES ISSUED

The following licences were issued under the Industries (Development and Regulation) Act, 1951—during the week ending 14th September, 1963. The list contains the names and full addresses of the licensees along with the articles of manufacture and annual installed capacity.

NON-FERROUS METALS

Ferro Alloy Corporation Ltd., Post Box No. 99, Shree Ram Bhawan, Tumsar (Garavidi, P.O. Shriramnagar Dist. Shrikakulam, Andhra Pradesh)—Manganese metal 1800 metric tons per annum; manganese dioxide 1,800 metric tons per annum.

ELECTRICAL FANS

American Refrigerator Company Ltd., 13/C, Russel Street, Calcutta-16 (West Bengal)—Industrial Blowers such as: (a) General ventilating (b) Fuse or high temperature Fans (c) Roof Exhausters (d) Air conditioning & heating (e) Dust or Material Handling (f) Chemical Fume Exhausters (g) Axial Aerofoil Fans and so on 6,000 pieces.

AUTOMOBILES

Steel Work Ltd., G. S. Road, Gauhati (Assam)—Trailers of various types including Jeep trailers—within the existing capacity of 564 trailers per annum licensed for Tinsukhia factory. **Mahindra Owen Ltd.**, Galeway Building, Apollo Bunder, Bombay-1 (Maharashtra)—Oscillating axles of 16 ton and 20 ton payloads—600 Nos.

TEXTILE MACHINERY

Shri S. Devaraj, 'Saraj,' Tatabad, Coimbatore-12. Proposed name: Sovereign Engineers Private Ltd., (Sulur, Palladam Taluk, Distt. Coimbatore, Madras) (1) Fluted Rollers 600 frames (3600 lines) (2) Spindles 2,40,000 pieces (3) Rings 2,40,000 pieces. **Textile Machinery Corporation Ltd.**, P. O. Balgharia (Balgharia, 24, Parganas, West Bengal)—Texmaco-Zinser Ring spinning and doubling Frames upto 600 Nos. **Shri K. S. Jankiram** 20/B Second Line Beach Madras-1. Proposed name: Madras Spindle Co. Ltd., (Madras, Madras State)—Spindles 3,74,000 pieces, Rings 2,70,000 pieces, Fluted Rollers for 240 Ring Frames (1440 lines). **Swastik Textile Trading Co. Pvt. Ltd.**, Motilal Hirabhai Market, Railwaypura Post, Ahmedabad-2 (Amraiwadi, Ahmedabad, Gujarat)—(1) Felt Calendar Combination 3 units. (2) Openwidth, Roll off securing and

crapening machine 5 units. (3) De-Twisting and opening machines 4 units.

INORGANIC HEAVY CHEMICALS

Travancore Cochin Chemicals Ltd., Udyogamandal (Elloor Udyogamandal, Kerala)—Liquid chlorine 9,900 tonnes, Hydrochloric Acid 100% 19,800 tonnes. **National Peroxide Ltd.**, Neville House, Graham Road, Ballard Estate, Bombay (Thana, Bombay, Maharashtra)—Hydrogen Peroxide (100% strength) 2,000 tons.

ORGANIC HEAVY CHEMICALS

Union Carbide India Ltd., 1 & 3 Brabourne Road, P.O. Box No. 2170, Calcutta (Trombay, Maharashtra) Acetylene Black 2,000,000 lbs.

DRUGS & PHARMACEUTICALS

Hind Chemicals Ltd., M/336, Rail Bazar, Post Box No. 227, Kanpur (Uttar Pradesh). Digoxin and other Digitatis Glycosides, 6 kgs.

VEGETABLE OILS & VANASPATHI

Hindustan Lever Ltd., Scindia House, Ballard Estate, Bombay-1. (Shamnagar, 24 Parganas, West Bengal). Vanaspati 115 tons per day (after effecting Substantial Expansion).

CHANGE IN NAME (Owner of Undertaking)

(During the week ending 14th September, 1963.)

From **Shri S. R. Sengotiah**, Tirupur to **M/s. Neela Spinning Mills Private Ltd.**, Tirupur.

LICENCES REVOKED

(During the week ending 14th September, 1963.)

M/s. Tata Iron and Steel Co. Ltd., Bombay-1. Ferrosilican and Ferro-chrome. **M/s. Garden Reach Workshops Ltd.**, Calcutta-24. Steam package boilers.

GOLD ORDER CHANGETH

Moisture seepage causes incalculable damage to your buildings. Impermo-treated walls will have no leakage, seepage or absorption of moisture through capillary action. Impermo is durable, economical ... just 2% of Impermo ensures 100% waterproofing. Can be stored in good condition indefinitely.

Available in 1 kg cartons for your convenience in mixing with a bag of 50 kg cement.

BOOKS BRIEFLY

Not by Bread Alone

The Rich Nations and the Poor Nations: By Barbara Ward; Hamish Hamilton, London, October 1962; Pp. 148; 12s. 6d.

BARBARA WARD, no stranger to India, needs little introduction and there is a common theme that runs through her advocacies made repeatedly in her "Policy for the West", "India and the West" and the present volume. The second of these books is a collection of lectures given at Sapru House, and the volume under review, a series of talks broadcast in Canada. She writes with a fine and profound concern for the future of the West — the Atlantic community as she calls it in this booklet. She is quite right to assert that the notion of equality as a burning faith was an artefact exclusively of the North Atlantic Community but it does seem rather odd that she should go to John Lilburne for its origin. Is it not inconsiderate and ideological in reverse to ignore the French revolution altogether? Surely she has not taken Irving Babbitt's strictures on Rousseau to heart!

If she is proud of her tradition and its achievements, she is deeply sensible of its Christian message for the future. "What can freedom be said to mean when the nations ... have so little awareness of its wider moral dimensions? Am I free if my brother is bound by hopeless poverty and ignorance?" The United States is carrying more than its fair share of the burden in helping to defend the free world and in bringing capital and the blessings of science massively to bear upon the scarce resources of its over-populated, under-developed regions. To supplement this, Mrs. Ward argues, each member of the Atlantic Community ought therefore to contribute one per cent of its national income—the agreed minimum—towards this capital fund, and it behoves Western Germany, the recipient of more than just treatment after Hitler and of plentiful Marshall funds besides, to do even more. She feels that this is not merely good works but an underpinning of a world-wide pattern of consumption which can only be beneficial to the West ultimately. India, by whose achievements Mrs. Ward is not unimpressed, should have an annual aid of £300 million guaranteed to her in foreign exchange.

Partisan Analysis

Her exposition of the mechanics of contemporary economic development in under-developed regions is rather more controversial. It is incidentally a resume of the more extended argument found in "India and the West". A very able analysis incorporating many commonplaces from the academic thought of the West, it is nevertheless a partisan one. Innocuous as it seems, one is unable to accept the familiar argument that the growth of British power in India was the unintended result of the East India Company's attempts to secure stable conditions for trade. People in those days simply did not feel this detachment about territory which subsumes the wisdom of two twentieth-century world wars. It is hard moreover to believe that all that Clive, Warren Hastings and Wellesley did was merely to protect the spice and cloth trade. Undoubtedly, there was no grand design of Empire in the minds of the grasping factors whose keen appetite was whetted by the forbidden private trade; but if they had come here with an express 19th-century Imperialist brief, they would not have acted very differently although they would have felt a little more righteous and glossy about it all after Burke's apologies and Macaulay's exhortations.

For some time now, economists have been able to see and

explicate the classical development of Britain, France, the United States and the more compressed and heterodox growth to economic maturity of the Soviet Union through a single analysis. Britain, for instance, went through the primitive phase of capital accumulation when the public conscience was not so tender about grinding the faces of the poor and when markets were as wide as the navigable world itself (not just the new nation-state 'pace' Mrs. Ward). The Puritans rekindled the light of the Bible (Max Weber showed it was timely) and with the fervour so aroused, insisted with high-minded austerity that each one must generate his share of the unconsumed surplus that was necessary for economic growth out of feudal servitude. Like a happy childhood, this was innocence of growth. Planning was for those less well-born and the surpluses in Russia which today come mostly from profits of State undertakings and sales tax had in the first instance to be obtained through State-enforced consumer austerity. Mrs. Ward notes that even in Japan which decided to grow up the classical way, the State started the undertakings and sold them as going concerns to influential families. She is thus not opposed to planning and controls at all and observes without any cold war passions that steel mills such as Bhilai (and one may add Bokaro) are just beyond the means of private enterprise at the present stage. In fact she congratulates the Planning Commission for "giving Indian private enterprise the best decade in its history" and speaks approvingly of its desire to occupy "commanding heights of the economy". With sociological insight she notes that caste prejudices have prevented the social ascendancy, of any duration, of the merchant class which is so necessary for economic growth; that the entrepreneurs in India and the under-developed world generally have not been as enterprising as the textbook pioneers; that, lusting after the status symbols of a fading aristocracy, they

Individual well-being is linked with national prosperity and only planned efforts can ensure both in the shortest possible time. And planning, for its success, largely depends on savings, individual as well as national.

Saving in the form of Bank Deposits provides resources for the National Plan.

United Bank of India Limited

HEAD OFFICE: 4, CLIVE GHAT STREET, CALCUTTA-1
with branches all over India and East Pakistan,
and correspondents in all important trade centres
the world over.

offers complete banking service

use their new wealth to affect old forms of privilege much to the detriment of the economy.

Man does not live by bread alone, reminds Mrs. Ward. Literature achieved this insight long ago, bringing both Communism and the free market into focus within a single perspective. At the height of the left-wing commitment in the thirties, Cyril Conolly, sullen and cynical with a Latin urbanity, wrote that Communism was no more than muscular Christianity. Michael Oakeshott, Laski's successor in the London School of Economics, describes Communism, and all rational ideologies generally, as "an abridgement of (Western) experience". Marx and Engels were the greatest cribs of all. For the present state of affairs in free societies, he blames Bentham (how reassured the middle class was by his "greatest good of the greatest number"! The phrase and the world became a miracle harmonising the diverse pursuits of private gain. Nevertheless Bentham served to discipline the new class emerging into society). To Oakeshott, it was the early Christians who opened the floodgates. For him not even the stable Middle Ages with its firm world-view when people roamed Europe without passports and without a thought of economic development, for the demand, schismatic by implication, for equality in the name of God had already begun. Sceptical people such as these two have seen "the setting in of the rot" culminating in frightful things like planning as a continuous trend in history. To tell the truth, State-ism as a mode of cultural and economic aspiration began when Fredrick the Great asked the disaffected and fugitive Voltaire to his court in order to enrich his Kingdom's culture. Germany, a late-comer on the European scene, longed for a cultural identity and it was a tacitly concerted longing. Hegel incandesced as if on behalf of a whole aspiring nation, but his classical respectability would have

been outraged at the mention of economic planning and he would certainly not have recovered from Rostow's "take-off". The German Romantic movement, mere thoroughgoing than any other, was full of inchoate longings. It would, however, be reductionist and it would be turning a Freudian hypothesis — which is only a mode of viewing — into a whole truth to argue that the anguish of a Heine or a Wagner represented seemingly without a cause the urge to economic betterment, but that element was undeniably present in all nationalism. For culture, which so angered Goering, does help to distance the "sordid" objectives of day-to-day economics and even to shimmer with a sable Christian virtue like dying light caught for a few celestial moments in black marble, was a desperate prayer that a whole eternity be compressed into a German moment. Dostoevski knew all the secrets of the heart aching with private or public anguish and a hero of his carried about with him "a bit of Russia in his heart". The Grand Inquisitor never left bread out of account.

If Mrs. Ward's book is allusive and full of overtones, it is because she writes within the longest and most viable tradition known to history. To us it is European rather than North Atlantic. In conclusion, Mrs. Ward's is a noble Liberal-Christian thesis and she has taken over Karl Popper's more secular "open society" into her plan for the under-developed world the condition of which she sees as a moral challenge to the North Atlantic Community; but like all liberal resolutions, it must be judged strictly by performance. That Mrs. Ward's intentions have to be vindicated by the performance of others cannot detract from the merit or the sincerity of her case.

C. L. N.

Readers' Roundtable

BOKARO STEEL PLANT

Sir, — Considerable time and energy of the Government are being spent over the proposed Bokaro steel plant. Production of steel is supposed to be an indicator of the economic strength of a country. In totalitarian communist countries, a large percentage of the steel produced goes to the building up of a War Machine. In democratic countries, a large percentage goes for the production of consumer goods such as bicycles, electric irons and sewing machines, etc. In a communist economy, investment in a heavy industry such as steel is made possible by extracting surplus from agriculture and neglecting consumer goods industries. In democratic societies, heavy industries evolve when agriculture is put on a sound basis and the prosperity of farmers creates the demand for consumer goods which in turn makes possible the evolution of heavy industry.

It is necessary to examine whether, in the present Indian context, the Government should set up the fourth steel plant involving investment of scarce resources. A number of basic amenities are lacking so far as the bulk of the people is concerned. For instance, recently the Madhya Pradesh Planning and Development Minister pointed out that out of 70,000 villages, the Government had been able to provide drinking water supply only to 10,000. There are still villages where people have to trek as far as 14 miles every day for drinking water. The Prime Minister had also stated in a speech in March 1962, "The thought of it is irritating that people cannot

get good water yet. In some places they have to go miles to fetch their water. Greater importance could be attached to the common basic necessities of human life which everybody in India should have."

It is equally important to note that investment in agriculture and consumer goods industries yields greater and quicker returns (that is, increases national income) and provides larger employment than in heavy industries. According to Prof. P. C. Mahalanobis, investment of one crore of rupees results as follows:

Sector	Output	Employment created
Agriculture	Rs. 57 lakhs	4,000
Consumer goods Industries	Rs. 33 lakhs	1,150
Heavy Industries	Rs. 19 lakhs	500

The question, therefore, is should planning mean the setting up of heavy industries without relevance to the technological level of the country, cost considerations and the problems of poverty and unemployment, or should planning be conceived in terms of basic amenities and human welfare? I shall be grateful to your readers for guidance on this subject.

Bombay.

CHAIRMAN'S STATEMENT

Alind's Seventeenth Annual General Meeting

'An interesting, and in some ways, a challenging year'

MR. S. NARAYANASWAMY REVIEWS ACTIVITIES

Disturbing effect of SPT* Enhanced rolling and
conductor capacity* Improved metal position*
Tax impact on dividend* Productivity Team's
Report on cable Industry*

ADDRESSING THE SEVENTEENTH ANNUAL GENERAL MEETING HELD AT THE REGISTERED OFFICE, KUNDARA, ON 23RD SEPTEMBER, 1963, MR. S. NARAYANASWAMY SAID:

Before discussing domestic affairs, I would like to dwell briefly on the posture of public affairs. Since we met last, China has chosen to violate our northern frontiers in an effort to enforce her fantastic and historically unsustainable claim to her Himalayan territory, about which she has carried on an acrimonious debate with India for some years now. The Government of India have since proclaimed a state of emergency in the country. This has not unnaturally resulted in distracting attention of Government and the people and in the deployment of our energies from our more constructive preoccupation — with economic development. Government have expressed their resolve not to allow the state of emergency to interfere with implementation of the Plan despite some slight re-ordering of priorities rendered inevitable by the exigencies of Defence. Industry and trade have shown practical appreciation of the necessities of a changed political situation, created by the unexpected bellicosity of China — by placing their resources and productive machinery at the disposal of Government.

In the effort to mobilize resources for Defence, the Central Government have introduced certain taxation and savings measures. These, however, have tended perceptibly to slow down the tempo of development activity and to dishearten wage earners at all levels. The Super Profits Tax, which concerns the Corporate Sector exclusively, has had the disturbing effect of slowing down capital formation to a degree that must cause grave concern to all those that believe in the development of free enterprise and indeed to the Planning Commissioners who have made copious allotments of industrial capacity to the Private Sector. The latter cannot hope to play its allotted role without mobilizing the resources of the people through healthy capital formation. The accentuated rigours of Corporate Taxation have had the unwholesome effect of deflecting savings to channels that offer immediate and less uncertain returns, while being far less productive of added industrial capacity to the country. If as is frequently claimed, the country has to pay homage at the twin altars of Defence and Development, the resourcefulness of our tax experts must be harnessed in declogging the choked conduits of capital formation by total substitution of the Super Profits Tax by an alternative impost. The concept of progressive taxation of the Corporate Sector seems strangely contra-indicated for an economy that is developing from infancy to adolescence. It is my hope that recent changes of personnel at the highest level will lead to rethinking on this subject and intrepid action.

LOWER SALES, HIGHER PROFITS

1962-63 has been an interesting and in some ways a challenging year for ALIND. We have reported a contraction in

sales by about Rs. 44 lakhs or about 7 per cent over the previous year; but our taxable profits have been higher at Rs. 55.40 lakhs against Rs. 41.37 lakhs in 1961-62. This is contrary to the general trend in company performances during the year, where larger sales have been followed by reduced profits — this being in major part explained by increased cost of raw material, higher wages, fuel costs, power and other operational factors. The higher profits of ALIND for the year create the impression of uniformly higher profitability of working in every line of production which I am reluctant to dispel.

In an age when wide awake shareholders insist on being told as to how a company happened to fare better no less than how it happened to fare worse, when those alternations of fortune do occur, it is perhaps just as well to take you into confidence and say that the Company's programme of effective diversification of its production lines over the last few years has been vindicated as is presently reflected in the overall gainfulness of the year's operations. I may add that this policy of diversification continues to be implemented with zest by the management as is evident from the programme outlined in the report.

WIDENED SPHERE OF ACTIVITIES

The covered conductor capacity at Kundara is being stepped up and the enhanced capacity will be in full commission before the end of the calendar year. The Hyderabad covered conductor unit will also go into production in the last quarter of the year.

While the civil works connected with the erection of the plant for manufacture of "SOLIDAL" or low voltage plastic-insulated underground aluminium cables are under way, there has been some delay caused by delayed issue of import licences, in the placement of final orders with machinery manufacturers abroad. It is however expected that the Solidal plant will go into steam by August 1964.

The Company having received a licence for the expansion of its rolling capacity at Kundara, arrangements are being made to secure a second Properzi unit for continuous rolling of metal. This will bring the number of Properzi units operated by the Company to three including the one working at Hirakud. Arrangements have just been completed for obtaining the required foreign exchange through the Industrial Credit and Investment Corporation of India who have kindly offered us a loan in foreign currency for the purpose. With the completion of this programme, ALIND would have graduated with honours into the rank of comprehensive cable manufacturers, without losing its primacy of place as a producer of bare high tension conductors. I would like you to join me in congratulating the Managing Agents and top executives of the Company for their prudent but intrepid planning which has helped

the Company to widen the sphere of its activities with a minimum of additional capital.

SPT IMPACT ON DISTRIBUTABLE PROFITS

I now come to the somewhat less colourful aspects of the Report and Accounts. I presume several shareholders have smacked their tongues out of a sense of deprivation on seeing a sum of Rs. 39.50 lakhs being carried to tax provision. This provision includes a sum of Rs. 9 lakhs provided to meet Super Profits Tax demands. This somewhat copious but inevitable provision has compelled your Board to reduce the dividend for the first time in the Company's history. That the Company had to salt away in tax provision over 263 per cent of what is being distributed to shareholders as dividend may dishearten shareholders somewhat, but that is a measure of the impact of SPT on distributable profits of a Company, which in the past has sought to achieve a fair balance between distribution and ploughing back, a fact to which the Tariff Commission bore handsome testimony the other day.

BETTER METAL POSITION

The position as to aluminium metal has shown great improvement with the commissioning of Hindustan Aluminium Company's plant at Rihand. It is a matter of no small gratification to the management that dependence on external sources and allocation of metal through DLF and similar sources has to an extent been reduced. The Company has a modest share in the export trade in cables and is happy to report that such export has been economic. There is however no reason to expect a large off-take of Indian manufactures owing to competitive prices offered by manufacturers in world markets.

PURPOSEFUL REPORT OF PRODUCTIVITY TEAM

I should avail of this opportunity to dwell briefly on the Report and Recommendations of the Cable Industry Team of

the Indian Productivity Council published recently. It is a matter of satisfaction to us that the Team of which our General Manager, Mr. V. G. G. Nayar, was the leader, has produced a purposeful and practical Report. Among the recommendations made are: elimination of conflicting grades of wire in manufacture and sale and adhering to certain recognised grades only; insistence on conformity to rigid specifications in electric cables and where small producers are in the line an arrangement for joint or pooled testing facilities to establish their conformity to ISI standards; creation of manufacturing capacity for fittings and accessories for aluminium cables, particularly because of the switchover from copper to aluminium metal in cable manufacture in India; the need for excise relief on PVC and plastic material used in the Cable industry in order to maintain parity with the end price of imported raw materials used as alternatives. It is my hope this Report will receive the attention it deserves and be acted upon by both Government and Cable manufacturers, big and small.

Before I conclude I would request shareholders to bear with us in what I have reason to hope is a transitional phase in distributions. Having regard to the projects under implementation and those under examination, there is reason to look forward with confidence to the future. In this blue print of gainful expansions, the shareholder as resource provider will be restored his rightful place.

I want to tender the thanks of your Board of Directors and of you all to the Managing Agents, administrative and technical staff and all ranks of workers for the fine work they have put in during the year.

N.B.—This does not purport to be a record of the proceedings of the Annual General Meeting.

CHAIRMAN'S SPEECH

THE METTUR CHEMICAL & INDUSTRIAL CORPORATION LTD.

Caustic Soda production touches a new high

Dr. P. S. LOKANATHAN REVIEWS ACTIVITIES

Addressing the twenty-sixth Annual General Meeting of the Company held at Mettur Dam R.S. on 11th September 1963, Dr. P. S. Lokanathan, Chairman, said:

I have great pleasure in extending to you a cordial welcome to the Twentysixth Annual General Meeting of your Company.

At the outset I wish to express my deep sense of sorrow at the passing away of Sri K. K. Raman, Managing Director of our Managing Agents and an Ex-Officio Director of this Company on 29th October, 1962. He was largely responsible for the position this Company enjoys today as a premier producer of basic chemicals in South India and it is a matter of grief to us that he has not lived to see the fruition of the expansion programmes which he conceived with courage and vision.

I should also refer to the great loss sustained by the Board in the death of Sri M. S. M. M. Meyyappa Chettiar, who was a Director of the Company for about 10 years and took active interest in its affairs.

During 1962-63, sales at over Rs. 2 crores as against Rs. 1.5 crores in the previous year constituted a record. Caustic soda production at 10,380 tons was the highest reached so far and would have been still higher but for power shortage during June and July 1962. We are continuing to maintain and even exceed in some instances the figures of satisfactory production already reached.

Thanks to our having sustained satisfactory production, the net profits have shown a gratifying increase of about Rs. 10 lakhs over the previous year, thus making it possible for

us to maintain the normal dividend of 12½ per cent on the increased paid-up capital.

Shareholders will be glad to notice that the Income-Tax authorities have determined the appropriate proportion of the final dividend at about 50 per cent on which tax is not payable by this Company, under the provision of Sec. 85 and Sec. 101 of the Income-Tax Act, 1961.

Shareholders would also have noted with interest from the Directors Report, the satisfactory progress made in the execution of the expansion scheme of the Company. I am very happy to state that all details relating to the grant of a combined foreign exchange and rupee loan of Rs. 1.40 crores by the Industrial Finance Corporation of India have now been finalised and we are about to start availing the loan facilities shortly. This will be the fifth and the biggest loan granted to us by the Industrial Finance Corporation of India. I will be failing in my duty if I do not convey our most grateful thanks for the excellent co-operation and support we have invariably received from the Industrial Finance Corporation of India in the context of all our expansion schemes. The assistance we are receiving in the present instance is particularly valuable not only for the reason that the present scheme is larger than all the previous ones, but also for the reason that the major part of our foreign exchange requirements are being met by this loan. We look forward to the continuance of the fruitful support from the Industrial

ance Corporation of India in the years to come.

I would also like to express our thanks and appreciation to the State Bank of India for the excellent co-operation and facilities extended to us by them.

Our negotiations for the manufacture of Organic Chemicals have made very good progress. As a result of the visit of Sri R. V. Ramani to the U.S., a scheme of technical collaboration with a leading chemical manufacturer in the U.S. has been finalised and submitted to the Government of India for their approval. This collaboration would cover the manufacture of four new organic chlorine compounds.

We have already taken possession of a part of the land for the location of the No. 2 factory and civil works are about to commence. A major part of the shipments of Cell Plant and Chlorine Drying Plant have already arrived at Mettur.

Orders for equipment for the further expansion of caustic soda capacity from 40 to 60 tons per day with Hooker cells in the No. 1 factory have already been placed and it is hoped to commission this extra capacity in early 1964. The erection of the third Stable Bleaching Powder Plant is in an advanced stage and the plant will be commissioned before the end of this year.

The increase in the tempo of expenditure connected with the expansion schemes makes it necessary for us to make the further issue of Rs. 60 lakhs face value equity shares at par as well as Rs. 30 lakhs of preference shares, in such a way as to receive application moneys in January 1964. I expect that shareholders will receive intimation of this issue towards the end of the year.

The Government of India were good enough to grant us an increase in price for bleaching powder in August 1962, consequent on the imposition of a Central Excise duty on chlorine and the levy of customs/excise duty and cess on packing sheets, which resulted in increased costs of production. Costs are, however, continuing to rise due to reasons beyond our control, — reasons such as the introduction of the Emergency Risks Insurance Scheme. It is my earnest hope that representations which have been made by the Alkali Manufacturers Association of India in this connection will receive the sympathetic consideration of the Government of India.

Excise duty on vegetable oils was abolished under the Budget proposals for the current year and this duty was transferred to vanaspathi and refined oil. Vanaspathi Price Control was also introduced effective from March 1, 1963. Thanks to the efforts of the Vanaspathi Manufacturers' Association the system of price fixation has been modified on a basis more acceptable to the manufacturers.

While the low level of water in the Hydro-Electric Reservoirs and the delay in the setting in of the monsoon again caused serious power shortages in the State, it was a matter of satisfaction to us that no cut in power supply was imposed on continuous process industries like ours engaged in the production of essential commodities. This was an extremely helpful concession extended by the State Government and I wish to convey my thanks to them for this gesture. This has helped us to maintain supplies of our chemicals for such essential purposes as Defence, Public Health and Sanitation at normal levels. In this context I should again like to emphasise the urgent necessity to develop thermal and atomic power resources in this part of the country in order to supplement our hydro-electric power resources, so that the wheels of industry may turn continuously and purposefully.

We have offered certain increases in emoluments by way of wages and dearness allowance to the Staff and Labour and this is under discussion with the concerned Unions and the Labour Department. It is hoped that the matter will be settled to the satisfaction of all concerned very soon.

COMPANY MEETING

THE IMPERIAL TOBACCO COMPANY OF INDIA LIMITED

Speech of the Chairman, Mr. F. A. Collett, at the Fifty-second Annual General Meeting of the Company on 26th September, 1963.

The year under review saw the beginning of the National Emergency with its manifold impact on all aspects of national life. The burden on industry generally of the consequential financial measures introduced in March has been great, but the tobacco industry is affected more heavily than most. In our case there was not only additional income taxation, which involved a further charge of Rs. 20 lakhs after the year's trading had been completed, but also the substantial rise in the level of Excise. This rise affects our business in several ways. Not only do the inevitable increases in selling prices restrict consumption and make the maintenance of adequate profit margins more difficult but the Company's working capital requirements are also increased because of the large amounts of excise and duty included in the stocks of manufactured goods.

I concluded my Speech to you last year with the words "I am confident that taking all foreseeable factors into account we shall be able to maintain our present rate of dividend during the current year after making adequate appropriations to reserves". Obviously we could not foresee the present National Emergency. The trading profits of your Company for the year fully justified my confidence, but the impact of the national financial measures on your Company, and in particular the increased working capital requirements, have obliged your Board with regret to recommend a reduction of the final dividend to 3 per cent, making a total of 8 per cent for the year as against 9 per cent last year.

The need for additional working capital is emphasised by the Company's cash position. Until very recently your Company has been in the position of being able to finance its business without resort to borrowing, but you will see from the Accounts that at 31st March last the Company was dependent on bank finance, albeit for a comparatively small amount.

Whilst the deterioration in the Company's liquidity is in part due to the purchases of our requirements of flue cured leaf tobacco at an earlier date than usual, the most important factor is the very much larger amount tied up in Excise on stocks on hand, due not so much to larger physical stocks as to the higher rate of excise applicable to those stocks as a result of the further increased rates announced in this year's Budget.

As this factor is so important, I think perhaps it would be appropriate if I deal with it in more detail.

Tobacco Excise Duty, with its attendant Special and Additional Excise Duties, is payable at the time that the leaf tobacco is taken into use in the factory, while the much heavier Cigarette Excise Duty (with its attendant Special and Additional Excise Duties) is payable when the finished cigarettes leave the factory.

The cigarettes are then despatched throughout the length and breadth of the country to the many distribution points which we maintain in order to give the ultimate consumer the sales service that he rightly expects. As cigarettes are, particularly during the monsoon, a perishable commodity, it is very much in our interests, and that of the consumer, that the period between the manufacture of the cigarettes and their consumption is reduced to a minimum.

Our Marketing and Traffic departments are constantly and persistently trying to reduce this transit period, and have indeed met with a deal of success. Nevertheless, despite our best endeavours, and with despatches from five factories in

different parts of the country, we have not been able to reduce it below an average of three to four weeks, and we are not therefore reimbursed for our outlay on Excise during this time.

With successive increases in the rates of Excise this outlay has been steadily mounting: and the 1963 Budget increased it by as much as Rs. 67 lakhs on approximately the same volume of cigarettes, with the result that we now have perforce some Rs. 2 crores of unremunerative capital permanently tied up at any one time in Excise.

I think that it is generally accepted that Excise is intended to be a tax on the consumer, and not on the manufacturer who is taxed by Corporation Tax and Super Profits Tax, not to mention the Excise element in the price paid for raw materials. It is not therefore reasonable to ask the shareholders for new capital to finance this outlay as there is no return on it at all. We have so far been fortunate in that our Bankers have been able to grant us overdraft facilities to enable us to carry this burden.

However, as is well known, in this stage of the country's development Bank funds are not unlimited, and are required for the finance of new development to broaden the base of the economy. We are therefore making representations to Government to allow the industry some credit on their excise payments as is done in many countries, in order that these funds may be put to a more useful purpose than at present, and can only hope for a successful outcome.

The cigarette trade is one of the largest producers of Excise revenue in the country, and consequently our policies are to a very large extent dominated by this impost. The effect of successive increases in excise rates over the last two years has been, and still is, far reaching, particularly as although Government revenue has continued to rise fairly steadily, the volume of business has not.

For the five years until the 1962 Budget there had been a steady increase in volume of some 10% per annum. As a result of that Budget the volume last year was virtually stagnant; and although it is more difficult than ever to forecast the effect of the 1963 Budget it seems highly likely that this year will see a regression in volume, though not in Government revenue, for the first time for several years. In fact, rising costs coupled with annual increases in Excise rates have forced our lowest prices up to a figure which many consumers can no longer afford to pay.

In these circumstances after this year's Budget, your Board was faced with two alternative courses: either to pass on the whole of the increased Excise rates to the consumer, thus accentuating the anticipated fall in volume of sales with the consequent laying off of labour in the factories, or, taking the long-term view that this is a temporary setback brought about as a by-product of the National Emergency, to absorb a large part of the Excise increase, thereby restricting price increases to the minimum, particularly in the lower price categories.

We have chosen the latter course because we considered it to be in the best long-term interests of the Company. This must inevitably result in considerably decreased profits for the current year.

In the developing stage of the country periodical increases in Excise rates are probably inevitable; but in the cigarette trade an Excise change means a complete overhaul of the entire business, particularly for a Company such as ours which sells cigarettes over the entire price range from Rs. 1.40 to 12 nP

for ten. Thus when the increases come regularly every year it is extremely difficult to maintain a consistent long-term policy, and considerable fluctuations in profits seem inevitable.

In our opinion Tobacco and Cigarette Excise rates have for the time being at least reached the maximum that the consumer can afford to pay, and the trade needs a period of stability: further increases in Excise must clearly be reflected by equivalent increases in prices to consumers, which in present economic circumstances can only result in further decline in volume of sale.

I mentioned to you last year the progress that we were making towards increased productivity through training and this objective has assumed even greater importance under present-day conditions. If volume, and therefore profits, are to remain stagnant or diminish due to the tax burden, any further development must come from greater productivity and greater efficiency. For this reason an intensification of our training programmes is being undertaken and our administrative procedures are being closely re-examined.

The urgent need for effective training, both of our Managers and Labour, has been recognised now for several years and during the past year the momentum in both directions has been stepped up. Wherever possible the fullest advantage has been taken of training opportunities offered overseas for Managers at the senior as well as the intermediate levels, and in this connection two senior Managers have attended sessions at the Administrative Staff College, Henley-on-Thames, in the U.K., and seven of our intermediate Management completed courses at the Training Centre run by our Associates in the U.K. in the recent past. In addition a further seven men have completed other forms of technical training in the U.K. and Australia.

This has not only helped our key personnel to keep up to date with latest developments and techniques but has also assisted us in equipping a larger number of our Indian national

staff to take over responsibilities previously held by foreigners in furtherance of the Indianization policy. At home six of our senior Managers were accommodated on courses at the Administrative Staff College at Hyderabad in the past year and two men attended fulltime Management Courses run by the Calcutta Management Association and Indian Institute of Personnel Management. Our own residential Training Centre in Calcutta is being utilized to the full in training Managers at all levels in general management techniques, as well as in imparting a greater awareness of the commercial aspect of their jobs as Managers. Altogether approximately 100 members of the Company's Management have completed courses at this Training Centre during the past twelve months.

The Executive Development Programme is also directed towards the particular objective of more intensive training of labour in which a large number of our Managers are now actively engaged. Our Labour Training programmes are being vigorously carried out in all the Company's branches with two objectives—first to increase the efficiency of operatives and secondly to improve the supervisory and leadership skills of the higher echelons of labour. By these means greater productivity is our aim, and the enthusiasm with which our Labour Training programmes have been received by the labour themselves has also helped to improve our Management's relationships with the work force.

I would like to close with a word about the future and little as I like to end my Speech on a depressing note, the very steep increases in Excise duties imposed by the 1963 Finance Act represent a substantially increased burden for your Company, and our trade has undoubtedly suffered severely. I can only forecast, therefore, that in the current year we must expect profits to show a marked decrease.

N.B.:—THIS DOES NOT PURPORT TO BE A RECORD OF THE PROCEEDINGS OF THE ANNUAL GENERAL MEETING.

THE UNITED COMMERCIAL BANK LTD

Head Office: 2, India Exchange Place, Calcutta

G. D. BIRLA
CHAIRMAN

AUTHORISED CAPITAL	..	..	..	Rs.	8,00,00,000

With Branches in all important cities and towns in India, Pakistan, Malaya, Singapore, United Kingdom and Hong Kong and Agency Arrangements throughout the world, the Bank is fully equipped to give best service in India and abroad.

S. T. SADASIVAN,
General Manager.

RECORDS AND STATISTICS

Reorganisation of Central Excises

THE GOVERNMENT of India appointed in November 1960 a Committee headed by Mr. A. K. Chanda to examine in general the organisational and administrative set-up of the Central Excise Department and advise Government on such reorganisation as may be necessary for achieving maximum efficiency at minimum cost and further to recommend the steps to be taken wherever necessary for the rationalisation of the Central Excise Act and Rules and Procedures. The Committee has released its Report and we reproduce below a summary of their findings and recommendations:

Incentives in different forms have been provided including preferential rate of, or exemptions from, excise duties to give impetus to the growth of the village and small-scale industries. Two conditions should be fulfilled if small-scale industries are to make their full contribution to the national economy. Firstly, these industries should be largely complementary and not competitive with organised industries and, secondly, they must attempt at becoming self-reliant and self-supporting by adopting improved techniques and more efficient forms of organisation. In other words, reliance should not be on fiscal preferences.

Fiscal preference as an instrument of national planning and development is not new and has been used to protect developing indigenous industries. Excise levies are also being used to subserve this purpose. Differential rates of duty and exemptions have, however, in certain cases, led to fragmentation to avoid payment of duty.

Maximising Exports

Excise duties have been used to conserve foreign exchange and to reduce domestic consumption for maximising exports. Other objectives have also influenced the evolution of the tariff.

The tariff has also been used as a measure of economic assistance to individual units and to whole industries in times of distress. The use of differential excise levies selectively as an economic regulator has not always fulfilled the purpose intended; in some cases it has produced a contrary effect. It has also placed on the revenue administration responsibilities inappropriate to its main function.

Generally speaking, low priced articles of high common consumption are best suited for excise levies, as also luxury articles. Capital goods, in view of their place in the economic development of the country, should be lightly taxed. Commodities with relatively small revenue potential are best left alone. Administration of levy in these commodities is expensive and also difficult.

Increases in revenue attributable to new levies imposed in recent years have not been in proportion to the number of commodities added to the list.

It is not prudent to keep down the cost of collection by resorting to relaxation of standard checks.

The schemes for allowing drawbacks or sets-off of duty on raw materials and components used for making other excisable goods vary from commodity to commodity. They lead to a feeling of discrimination and do not always subserve the needs of internal economy or the export trade. A definite policy, even a philosophy should be evolved in taxing goods at different stages of manufacture.

Articles with low revenue potential should be taxed only

when they can be and are used as substitutes for other taxed articles. Levies that entail disproportionate costs of collection and on articles which are produced largely by small dispersed units should be avoided.

The revenue from taxing fabrications of taxed basic materials could, sometimes, be raised more economically by increasing the rates of duty on the raw materials themselves.

It is not possible to apply any one principle rigidly in selecting commodities for taxation. The major consideration should, however, be that a levy does not create such administrative problems as largely defeat its purpose and it does not create psychological complexes which retard production. It is best to explore the possibility of increasing yields by adjusting rates of established excises on goods already taxed before considering new levies.

Pattern of Levy and Control

Each major industry has its distinctive features and its own pattern of production and distribution. It must necessarily have rules suited to its needs. It is not possible to bring all commodities under a common code.

Abatement of duty on losses due to dryage and wastage of tobacco, though reasonable in itself, is a major source of friction between excise officers and assesseees.

Apprehensions expressed when the consolidating Act was passed in 1944 that consolidation of statutes for dissimilar goods will create complication have materialised. These are sought to be met by frequent amendments and adoption of principles which are applicable to some but not to all. There is thus complaint of discrimination. Relaxation of rules or checks is not the solution to the problem.

The normal scheme of excise control cannot be applied to many commodities. The scheme devised primarily for a few basic commodities is no longer suitable for the large range of goods now subjected to levy. A rationalisation of the law is necessary.

Central Excises and Salt Act

The Act should be made comprehensive to include all substantive provisions of law; procedural matters should be covered by subsidiary legislation.

Rates approved by Parliament are largely treated as ceiling rates and effective rates are introduced by notifications. This is an encroachment of the prerogative of Parliament which often has no information of the changes made. Neither total revenue foregone nor the revenue sacrificed in fostering growth of the small sector can be properly estimated. Revenue forecasts prove also incorrect and attract parliamentary and audit criticism. A scheme of subsidies should be considered as an alternative; if feasible, it would remove many of the drawbacks of the present procedure.

As revenue estimates are framed on the basis of rates actually intended to be imposed by notification and there is time enough after the introduction of the Finance Bill to make necessary enquiries which could not be made earlier on considerations of secrecy, parliamentary approval should be sought to rates to be finally imposed and not to rates which are subsequently treated as ceilings.

With the power sought to vary the rates upwards also,

the Indian provisions are now comparable to the UK scheme. The safeguards of the UK scheme should, therefore, be adopted to maintain parliamentary authority.

Full and complete research should precede framing of taxation measures. The unusual power to vary statutory rates by notification should be sparingly used; changes, if any, in rates proposed in the Finance Bill should be incorporated in the Act itself. Other changes made by notification should be and large cover the whole range of taxed goods and should be brought before Parliament for ex post facto approval.

Provisions and references to salt in the Act and Rules should be deleted.

Anomalies arising out of definitions, particularly of the term "Manufacturer", should be removed.

Tariff values should be determined with circumspection; the apparent conflict in the provisions relating to valuation and fixation of tariff values should be removed.

Provision should be made for determination of assessable value of taxable components of a manufactured article.

The law itself should provide for the status of a rule made when Parliament is not in session if it is later revoked when brought before Parliament. The question is important for regularising implementation during the intervening period.

(i) Courts of law should notify the excise officer of impending disposal of excisable goods under their control.

(ii) Infringement of licensing provisions should be brought within the ambit of departmental adjudication.

(iii) The ceiling for penalties should be realistic; it should be up to three times the value of goods involved.

(iv) Central Excise officers empowered to summon persons for conducting enquiries should have the authority to impound the documents required and to impose penalties if the summons are disregarded.

(v) The law should provide that a Central Excise officer seizing excisable goods should, on demand, give the owner the reasons therefor.

(vi) Provision should be made for review of original decisions.

The present arrangement of taxable items under different groups in the Schedule to the Act is unnecessary and should be discontinued.

The Rules

A common set of rules to regulate storage of excisable goods in the manufacturer's store-room and in bonded warehouses should be prescribed.

Common provisions of all compounded levy schemes should be consolidated.

Rules regulating refund on export should similarly be revised and consolidated; inoperative or out-moded provisions should be deleted.

Rules relating to exemptions and remissions of duty should be made more specific to conform more fully to the provisions of the Act. Delegation of powers to subordinate officers should be reviewed, rationalized and enlarged.

A period of limitation should be incorporated in Rule 10A. A common set of rules should be drawn up to regulate returns of excisable goods for reprocessing.

Failure to comply with supplemental instruction should entail penalties.

There is no up-to-date compendium of the rules and the rates of duty in force. A revised edition of the Central Excise Tariff should be published every half year as on 1st May and 1st December.

There is no uniformity in notifying procedural instruc-

tions to the Sections affected. The demand for a periodical bulletin of rules, notifications, interpretations, and instructions for public use is legitimate. Such a publication is also necessary for the excise officers. Supplemental instructions should be issued in printed sheets of a standard format.

Levy and Collection of Duty

It is not possible to be dogmatic on the question of the basis of levy for every commodity. Though specific rates lead to difficulties, especially for the small sectors of industry, their definiteness outweighs many of the disadvantages. Purely from the point of view of simplicity of administration, they are to be preferred to ad valorem rates. The present system does not lead to equitable results even when ad valorem rates are prescribed.

The administrative set up of the Central Excise Department is not suited for the proper administration of ad valorem duties. This is proved by the adoption, in a number of cases, of expedients to convert ad valorem to wholly or partially specific rates.

Constitutional, legal and economic objections to the present concept of assessable value for levy of duty ad valorem deserve consideration. The customs legislation which formed the prototype for administration of ad valorem excise duties has now itself been revised.

The tariff as now designed gives anomalous results for certain values of taxable tobacco products as it is arranged in slabs of values. This anomaly should be removed.

Specific rates are obviously feasible in those cases where the present tariff provides both for specific and ad valorem rates but as alternatives.

Specific duties should be prescribed where ad valorem levies are administered through specific rates fixed by exemption notifications.

Where specific rates of duty cannot be evolved, tariff values for goods chargeable ad valorem should be fixed after proper enquiry.

Determination of assessable value on cost of production plus a fixed margin is not practicable.

Determination of assessable value on list price less fixed deductions is of limited application.

Assessable value should correspond to ex-factory price less excise duty, without reference to any particular market. For this purpose, transactions in which there is no special relationship between the manufacturer and the purchaser should be distinguished from those in which there is such relationship.

In direct sales, assessment should be on invoice value, less duty and other post-clearance charges.

For transactions involving special arrangements between producer and buyer, rules should specify inclusions and exclusions to be made uniformly to arrive at the assessable value.

Payment of Duty

There should be no reversion to the system of post-payment of duty; its prepayment should continue.

Procedures for payment should be simplified by consolidating assessment forms into three basic documents.

One current account for all duties payable by a manufacturer for all products produced in the same factory should be authorised.

Departmental Treasuries should be set up in major centres of concentration of excise work.

The scheme for payment by cheque should be made more attractive by liberalising procedural restrictions and accept-

ance of a single cheque for all clearances made from a factory in the course of a day.

Payment of licence fee should continue through revenue stamps. Use of stamps for payment of other dues is not feasible.

Facilities for bonded storage of excisable goods in main marketing centres should be allowed in selected cases on recovery of extra costs incurred as supervision fees. The principle in selection should be to allow bonded storage for goods whose production is regionally concentrated and which are assessable at specific rates.

Structure of Control

A single multipurpose licence should be issued to cover all manufacturing operations at the same factory. Similarly, a single licence should be sufficient for wholesale purchase and warehousing of manufactured tobacco.

Brokers and Commission Agents not possessing or stocking unmanufactured tobacco need not be licensed.

Categories of licence fees should be fewer. The fee for a licence to manufacture more than one commodity might be made a multiple of a single manufacturing licence.

All manufacturing and major warehousing licences should be renewed triennially.

Renewal of licences should be staggered over the year instead of being concentrated in the months of November and December each year.

The penal fee for failure to renew licences in time should be substantially enhanced.

Powers of Inspectors to issue and renew licences in certain cases are adequate but Superintendents should be made the licensing authority for all other licences. Manufacturing licences or those where a transfer of ownership or premises is involved should be approved and renewed by Superintendents.

Licensing provisions should be made more stringent as a deterrent to revenue misdemeanours.

The utility of bonds for securing safety of revenue is limited. The work involved in their execution, acceptance, custody, etc. is not commensurate with the revenue collected.

Audit type of control should be extended to all public sector undertakings, and in the private sector to those whose products are normally assessable at uniform specific rates and/or whose book keeping is adequate for checking production and delivery. Licensee's own statutory auditors may also be appointed Government Auditors.

The standard procedure of control should be simplified; deliveries may be permitted without excise officers' counter-signature of gate passes, subject to surprise checks.

The procedures for routine verification and check of intake and utilisation of raw materials should be reviewed with a view to eliminating avoidable checks. Manufacturer's own accounts of raw materials supported by purchase vouchers should generally be accepted in lieu of officially prescribed accounts.

Revenue control should be ensured by periodical and systematic analysis of manufacturers' own accounts. Proper procedures should be formulated for this scrutiny. When results of such checks warrant, a deeper probe should be made.

Schemes of sampling of process materials and of physical attendance of excise officers should be reviewed to eliminate all those checks which do not contribute to the substance of revenue control.

Separate production and store-room entry books entail

duplication and should be amalgamated wherever possible. Forms of account, where prescribed, should take account of different characteristics of excisable goods. Where a manufacturer's own accounts are adequate for proper excise control, they should be accepted in lieu of officially prescribed accounts.

Routine test checks of daily production and packing should be made at the filling or packing stage in surprise visits. Tolerances should be authorised to conform to those commonly current in the trade or permitted by legislation such as the Merchandise Marks Act.

Quantities of excisable goods taken for chemical analysis should be the minimum necessary. Re-tests should be conducted on duplicate or triplicate of the same sample. Test results should be speedily communicated to the assessee. Re-tests in better equipped institutions should generally be permitted.

While some notice of removal of excisable goods is necessary, loading for clearance need not await the arrival of the excise officer.

Routine opening and verification of contents of packages at the time of delivery is unnecessary. The power to make such checks should be retained but exercised only in cases of well founded doubt.

Assessment disputes should initially be settled by the Superintendent, whose order should be appealable. The limitation for rectifying short levies is adequate. Resort to provisional assessments is to be deprecated.

Excise officer's counter-signature of gate pass should be dispensed with. Producers' own despatch invoice, etc., if it gives the information required, should be accepted in lieu of gate pass.

Existing formalities attendant on removal of samples are unduly detailed and rigid; a more liberal attitude would not endanger revenue.

Sector officers should be authorised to permit overtime clearances subject to subsequent approval by the Range Officer.

A common set of basic rules will obviate the need for frequent changes in compounded levy schemes.

Compounded levy schemes do not solve the problem of ensuring adequate revenue control where the small sector forms a large proportion of manufacturers. A better alternative would be to recast the tariff.

Multipurpose Excise Levies

Although relief from multiple levies is afforded selectively, there is neither uniformity in the pattern nor is there any evident or expressly stated principle in these reliefs.

The scheme recently introduced for giving credit of duty borne on specified components and raw materials used for manufacture of specified excisable goods entails additional documentation and leads to distortion of revenue accounts without meeting the general grievance as it is limited in scope.

The variegated pattern of selective ad hoc reliefs leads to contradictions and accentuates discrimination.

It is impracticable to achieve a single point levy uniformly.

Collection of duty on raw materials and components on delivery from the producing factory blocks up working capital of manufacturers using them for production of other excisable goods. Some relief is called for. It should be provided by permitting transfer of duty liability with the goods, the duty being collected along with that leviable on the final product. Similar relief should be provided for goods to be refined or reprocessed. Costs of administration of this relief should be

recovered as supervision fee. This will facilitate also the determination of ad hoc rates of refund on export.

A detailed study should be made of the administration of Added Value Tax System (TVA) in France and certain other countries to explore the possibility of introducing it in India in future.

Fiscal Preference

The tariff is riddled with preferences, privileges and exemptions. Their administration creates practical difficulties. It is doubtful also if their benefits always reach the persons for whom they are intended.

Increase in rates of duty has accounted for the largest contribution to increased revenue and extension of excise coverage the smallest.

The small increase in revenue relatively to a much larger excise coverage has stretched the administrative machinery; gaps between work-load and resources are bridged by ad hoc adjustments.

Schemes of fiscal preferences, besides reducing revenue potential, lead to fragmentation of larger units. Scope for malpractices and collusive frauds increases. The need then arises for greater administrative vigilance and more detailed schemes of surveillance over the free and preferred sectors. These in effect become paper controls. Idle capacity also increases and the role which the Plan assigns to small scale industry is defeated.

Fiscal concessions to units in the organised sector of industries are neither necessary nor beneficial.

Commodities of which the major part of the production is not concentrated in the organised sector units are administratively unsuitable for taxation.

Revenue foregone by schemes of fiscal preferences cannot readily be computed. Without reckoning the effects of limiting production in 1961-62 it may have been of the order of Rs. 80 crores with reference to tariff rates and Rs. 20 crores with reference to effective rates.

Fiscal preferences are largely ineffective in their promotional effect, firstly, because they come in dribbles with each assessment, and secondly, because the distributive trade depresses the purchase price corresponding to the quantum of duty preference and eventually appropriates most of the benefit to itself. This has been particularly noticeable in vegetable non-essential oils and matches.

Rate concessions should be substituted by cash bounties paid periodically. Assessment in all sectors would then be simpler as uniform rates could be applied. Units in the preferred sector may claim and receive the bounty periodically with reference to their past production. This will not involve extra work. Revenue security will improve and amounts incurred to assist the small scale sector will be known.

The principles and scales of subsidy for different classes of manufacturers should be determined after open enquiry by a body like the Tariff Commission which should also review the working of the schemes periodically.

Periodical cash bounties will ensure that fiscal aid reaches those for whom it is intended and that it takes a more effective and tangible form. Possible initial hardship for small scale manufacturers should receive due consideration when evolving principles and scales of subsidy.

Refund of Exports

Many provisions of the present multiplicity of production cannot be fully understood or applied. They also hamper exports as the full burden of excise duty is neither removed nor is it practicable to do so. Refunds are not always admissible of duty borne by raw materials and components and even where they are allowed, no abatements are given for wastages in manufacture.

There is no rationale in a bond not being allowed to cover

exports merely because the port of export is changed.

Different procedures govern payment of refunds which are made partly by the Central Excise and partly by the Customs Departments.

There is excessive documentation and repeated verification of the same manufacturing formulae where ad hoc rates of Customs and Excise drawbacks are authorised.

Whenever an excise officer supervises goods made ready for export, checks for customs purposes should also be entrusted to him. Goods may then be allowed to be shipped under his certificates or seals without routine opening in the docks at the time of shipment.

Procedures should be devised so that full refund of the total amounts is paid promptly after shipment.

Common procedures, applicable to all goods and all exporters, should be devised and consolidated to ensure that goods exported are relieved of the total customs and excise duty burden. Formal notifications that refund will be payable on export of specified goods are avoidable. This should be restricted to instances where special conditions become necessary.

The actual exporter should be entitled to refund on goods exported and executive restraints against this should be revoked.

Ad hoc rates of rebate on account of Customs and Central Excise duties should be fixed for as wide a range of goods as possible on broad estimates of the incidence of all such duties borne at every stage, including the duty borne by packaging materials. It is essential that the exporter should know the quantum of rebate which will accrue on the goods he exports. Subsequent procedures can thereafter be simplified.

The special procedure now restricted to specified ports should become the normal procedure.

Other refunds should also be speeded up. Verification of original payment may be made with excise records and refunds paid by cheques.

Adjudication, Appeals, etc.

Decline in incidence of detection of excise offences may be due to slackness resulting from inadequacy of manpower for enforcing the standard pattern of control. New techniques have, therefore, to be evolved.

An efficient enforcement and investigation agency should be created. Selected officers should be trained in modern methods of investigation.

Rewards for detection are small; diligence and initiative should be better rewarded.

Graduates with legal qualifications should be employed in cadre posts at Collectorate Headquarters for briefing counsel in law suits.

Powers of adjudication of officers should be substantially enhanced. The Deputy Collector should have the same powers of original decision as the Collector.

Appellate powers of officers require no change, but to expedite decisions, the Collector and his Deputies should hear appeals also on their tours.

If a licensee holds adequate excisable goods to cover penalty and duty, his appeal should be heard without pre-payment of the dues.

While the present appellate channels may continue, the final stage of the revision application should be abandoned; instead, an Appellate Tribunal which would go both into the facts of the case as well as points of law should be set up. The Tribunal should have one member of status and experience comparable to that of a serving or retired High Court Judge and one or two members with working experience of technical excise work. The Tribunal should not be subordinate to the Chief Excise Authority, but there is no objection to its being within the Ministry of Finance.

(To be continued)

REVENUE FROM COMMODITIES TAXED: 1954-55-1961-62

(Rs. Lakhs)

Dear Defence Minister...

YOUR TWO fine speeches in Parliament in the closing week of the Monsoon Session on the NEFA reverses and the state of our defence preparedness have justly been acclaimed by the nation for their candour, realism and sincerity. That they have added considerably to your reputation as a political leader of the first rank is indeed most gratifying. But what is certainly more important is that they have given our people an assurance that in the Defence Ministry today there is adequate awareness of the tremendous effort that would be needed to cope with the threat to this nation's security created by the Peking-Pindi axis.

We admire you, in particular, for the utter honesty of your public pronouncements on the state of our military preparedness. In Rajya Sabha you took the nation fully and rightly into your confidence when you spoke on this subject as follows :

"I shall try to be rather more realistic (on the state of our military preparedness). Somebody asked me just now whether our production is commensurate with our requirements. Let me tell you very frankly that it is not. If you expect the Minister merely to have the production required for war consumption within a few months, it is not possible. Your defence preparedness cannot be separated from your economic base, from your economic capacity, your economic capabilities, your technological capabilities, your scientific development and other connected matters."

We are sure that you are fully alive to the important implications of these observations. In a report on the steps taken in the last few months in the area of defence preparedness, you had informed Parliament of the progress which had been made. You said that of the six new Divisions proposed to be raised, three had already been raised while the remaining three were in the process of being constituted according to a planned time-schedule. Pointing out that the raising of these Divisions had meant large scale recruitment of officers and other ranks, you indicated that nearly 5,000 officers would have been commissioned since the emergency and by the end of last month. You also suggested that by the beginning of this year the number of officers commissioned would have exceeded 8,000.

On the important issue of equipment you explained that the question was not merely one of providing equipment to new raisings, but of equipping the entire army with modern weapons, ammunition and other requirements, such as, clothing, blankets and boots. After referring to the invaluable aid received from friendly countries in the form of arms, ammunition and other defence stores, you also dealt with the progress that was being made in developing indigenous production. The disclosure that the production of semi-automatic rifles has been perfected at the Ishapore rifle factory and that this basic weapon is now being produced in quantity was certainly most encouraging. The nation was also informed that work on the establishment of six new Ordnance factories with the assistance of friendly countries was progressing satisfactorily. You gave then the welcome information that work on the setting up of plants for the manufacture of MIG aircraft was being expedited. Summing up, you said that to support the expanded armed forces the Defence Ministry had undertaken a programme of modernization and expansion of defence industries and creation of new production potential.

You will readily agree, however, that in spite of such progress as has been made in the last ten months, the present state of our military preparedness is still nowhere being an effective deterrent to a major offensive by a big military power. It is certainly true that our fighting forces

October 4, 1963

will be able in the event of hostilities, to give a much better account of themselves in strategy and actual combat than was the case in the sad months of October-November last. But in the larger sense of defence preparedness which embraces the economic capabilities which you have mentioned you will readily agree that we have still a long way to go. The speeches you delivered in the two Houses referred to the possibility that the Defence Ministry may not be able to utilise all the financial provisions made in the Central Budget this year. While it is quite true that it is not always possible to ensure that every rupee appropriated for defence or any other purpose is actually spent, you will surely see that it would be an admission of the Government's failure to implement substantially the physical programmes considered essential for the security of the country if the bulk of the money allowed for defence is not spent properly and within the time prescribed. It is true that there has been a tradition of appropriations being surrendered year after year. While it is possible to allow some latitude in this matter in normal times, this question has to be viewed much more seriously when the enemy is actually active on our frontiers and is known to be steadily building up its striking power.

The entire people of this country, the rich and the poor alike, have shown that they are willing to make all the financial and other sacrifices that may be necessary for the timely strengthening of the nation's security. The Government's response cannot therefore be any the less complete. We could readily concede, of course, that defence preparedness cannot be created overnight, but the compelling fact is that the enemy unfortunately does not strike only when we are ready. The nation must be expected to apply very stern standards indeed in assuring whether within the time at the Government's disposal everything that is possible is being done to step up our defence capabilities. It is true again that the availability of essential external assistance may determine to a substantial extent the tempo of our defence effort. But it is the business of the Government of India, as it is the business of any government similarly circumstanced, to obtain this assistance through all the political and diplomatic means open to it. When a nation's security is threatened, the only test that it may be expected to apply to those who are responsible for its defences is that they deliver the goods.

It is, as you pointed out, quite true that defence preparedness is conditioned by the nation's economic capabilities. It is, therefore, pertinent to ask whether enough is being done for the expansion and reinforcement of these capabilities. In your statement you have given a more or less encouraging picture of what is being done in limited areas of defence production in the government sector. But you have made only a very brief and cursory reference to what is being done in the private sector of the economy to build our de-

fence potential. It would be a disturbing conclusion indeed if we have to infer that you have not said much because not much has been done.

In the context of the demands which modern warfare is bound to make on the economy of a nation, there is no room for making any rigid distinction between defence industries and other industries. The requirements of training, equipping and fielding the fighting forces are so comprehensive that higher levels of capacity and output have to be built up in almost every industry, although the extent to which individual industries may be important or relevant for the purpose may certainly vary. From this point of view it must be a matter of grave concern for those who are responsible for defence preparedness that the growth of industrial activity has not only not been stepped up but has evidently slackened since the emergency. It is true that there was some quibbling over the phrase 'industrial or economic stagnation' at the meeting of the Central Advisory Council of Industries last week. Mr. Kanungo, Mr. Manubhai Shah and Dr. V. K. R. V. Rao seemed to be able to draw immense consolation from the fact that industrial output was not declining. It seemed to be their view that, as industrial output was advancing at about seven or eight per cent per annum, it could not be said that the economy was stagnating. But the material point is that the rate at which industrial production is growing is not being maintained, but is declining. In the third Plan, an average annual increase of 11.1 per cent in industrial production has been envisaged. It is now conceded even in the Planning Commission that the actual average may only be 10.1 per cent. It is possible that even this expectation is too optimistic. When the tempo of industrial activity declines in the present nobody can confidently say how much further this tempo will not deteriorate in the coming years if corrective action is not taken in time and a return to a progressively higher rate is not secured soon enough.

This is one of the reasons why we ought to be concerned over the tendency of the rate of increase in industrial production to slow down. Another reason is that if an annual average increase of 11.1 per cent was considered satisfactory for the third Plan period before the emergency had arisen, it ought to be obvious even to Members of the Planning Commission and Ministers of the Central Government that a much higher rate of industrial growth is absolutely necessary if the financial and physical resources for the building up of defence are to be forthcoming in sufficient measure. It follows that a substantially increased rate of industrial growth, say, about 14 per cent per annum, instead of the 8.9 per cent recorded in 1962-63, has become an essential and inseparable obligation of our defence preparedness. It is encouraging to note that the Planning Commission believes that in respect of a number of important industries, such as railway rolling stock, jeeps and

October 4, 1963

station wagons, road rollers, agricultural implements and machinery, electric transformers and motors, electric cables, caustic, soda, sulphur drugs, DDT, rubber manufactures, power alcohol and ferro-manganese, third Plan targets of capacity and production are likely to be hit. But it is disturbing too that the Planning Commission itself expects shortfalls in several crucial sectors, such as pig iron, finished steel, steel castings and steel forgings, machine tools, fertilizers, paper, newsprint and cement. It is learnt that the mid-term appraisal of the performance of the third Plan which is now in progress in the Planning Commission is leading to the conclusion that the implementation of a number of industrial projects has been impeded largely by delays in finalising schemes and arranging foreign aid and collaboration and that as a result the fourth Plan would start at a somewhat lower base than originally contemplated.

The Planning Commission wisely suggests that greater effort consequently would be required over the next six or seven years if this lag has to be made good and the basic objective of achieving a self-sustaining economy by the fifth Plan is to be fulfilled. Now while this is one way of looking at the situation we certainly do not have the assurance that the Chinese will respect this somewhat leisurely schedule of the Planning Commission. It is surely an abdication of responsibility to be talking, in the face of the emergency, of the inevitability of the fourth Plan starting at a somewhat lower base than originally contemplated. There are after all still two and a half years to go before the third Plan ends and the public certainly has no evidence to prove that a more energetic effort in removing the obstructions to industrial expansion cannot considerably raise the tempo of industrial activity in the coming years. If, as the Planning Commission concedes, delays and difficulties in securing foreign collaboration have been an important explanation for the slackening of economic expansion, is it not plain that Government policies and procedures should be revised to reduce those delays and difficulties? And yet it has taken nearly a year since the emergency and the meeting last week of the Central Advisory Council of Industries for the Government to appoint what is described as a high-powered committee "to examine the operation of the controls applicable to the establishment of additional industrial capacity under the Industries (Development and Regulation) Act, the import of capital goods, the issue of capital and foreign investment and collaboration and to suggest changes of procedure to reduce delays". A strange aspect to this affair is that a committee with similar functions was supposed to have been set up following the seminar on industrial undertakings held by the Federation of Indian Chambers of Commerce and Industry last August. That the proposal is now being resurrected and given effect to is certainly no testimony to the Government's concern over delayed industrial expansion.

We must, therefore, emphasize that, while it is a

fair enough argument that defence preparedness cannot be achieved without a sufficient industrial base and that this industrial base cannot be built overnight, we have got to insist on the fact that the Government is in the present circumstances under a compelling obligation for taking all the measures necessary to hasten the expansion of the industrial capacity of the nation. This insistence is all the more necessary because, particularly since the emergency, so many actions have been taken in the various areas of Government policy which have not only not improved the climate for industrial expansion, but have on the contrary spoilt it further. We have to refer here particularly to two important developments; the first lies in the area of fiscal policy where entirely unnecessary tax innovations have had the effect of rendering the domestic capital market dry and foreign collaborators shy. If there is a proper scheme of economic priorities in terms of the needs of the emergency, the Government cannot but realise that the appropriate corrective action in the fiscal field has to be taken sooner rather than later—and yet it appears to be the case that Government thinking continues to be limited in terms of normal annual exercises in Budget making. The next Budget is still some five months away and five months is not an inconsiderable period in the gestation of an industrial project which in favourable circumstances

Eastern Economist 20 Years Ago

OCTOBER 1, 1943

Judging from the available figures of yields of important cereals we find that there is a stagnation, if not steady deterioration in the production of crops. But we have noted above that the irrigated area has been steadily increasing. We have already noted that the area of land which was sown more than once has increased both absolutely and relatively. There was some increase in the imports of manures and the use of improved varieties of seeds by the agriculturists. But the proportion of the area benefited by these two factors is relatively small in the case of food crops. Still these three factors must produce a cumulative effect on the trend of production.

Statistical analysis of the average yield per acre of rice, wheat and cotton in the period 1900-32 shows that the yield has not shown any improvement since the beginning of the century. In the case of all the three crops, the trend lines, taken as a whole, indicate a downward tendency in the yield per acre. The average yields of subsequent years do not show any different trend. There are no reasons to assume that things are better in other crops except perhaps in sugarcane and jute where the acreage under improved varieties is higher. Considering these different facts, we have come to this conclusion that either the data of average yields are incorrect or the condition of land not affected by these improvements is deteriorating to a greater extent to off-set these improvements.

should not take more than two years, except in the case of projects of extraordinary complexity.

The other consideration to which we would like to point is that, in war or emergency, when speed is the essence of performance, governments the world over have historically learnt to act faster than in more normal times. Is it not surprising that in this country, since the emergency, the functioning of the administration should actually have slowed down? It is now admitted that decisions are being delayed even more than was usually the case. To some extent this has been because, after the last general elections, the Prime Minister had failed to evolve a rational pattern of portfolios and inter-ministerial or inter-departmental relations. The recurring conflict of jurisdictions and the chronic confusion in responsibilities had resulted in paralysing not only initiative but even normal activity in government offices.

This situation has been aggravated in recent weeks by the manner in which the Prime Minister has chosen to implement the Kamaraj Plan. Mr. S. K. Patil was perhaps not exaggerating when he suggested last week that government activity seemed to have come to a standstill in the States and possibly at the Centre. It is certainly odd that the Prime Minister should not have attempted to avoid extensive dislocation of and disruption in government business at a time when the Government is presumably engaged round the clock in building up the defence effort as well as a comprehensive economic base for that effort. There can be little

Agricultural Incomes

IT IS AN interesting exercise to measure how the fruit of planning gets distributed among the various States. The National Council of Applied Economic Research published the findings of its first effort in this field some time ago in one of its occasional papers entitled "Inter-District and Inter-State Income Differentials, 1955-56". This was discussed in *Eastern Economist* of August 2, 1963. The Council has now released its report on "Agricultural Income by States, 1960-61" which extends the story to the end of the second Plan, but only in the agricultural sector.

The estimates of the Council relate to all the major States including Jammu & Kashmir, Delhi and Himachal Pradesh. The Union territories of Manipur, Tripura, Andaman and Nicobar Islands, Laccadive, Minicoy and Amindivi Islands and Nagaland, covering only one per cent of the gross area sown of the country, are excluded. The total net value of agricultural output for all the States (after adjusting for the non-included States) has been estimated at Rs. 6,272 crores as against the official estimate of Rs. 6,000 crores. This small difference is ascribed to "the adoption of different methods of estimation of by-products and various items of input" by the Council. Broadly, it has corroborated the official estimate of a

question that the sense of urgency which informed the Government and the people in the wake of the Chinese aggression has now largely disappeared. It is because appreciation of the importance of immediate effort has grown faint that there could be persons in high positions of responsibility in government who could permit themselves to be complacent towards the faltering of the industrial effort or the failure of policy to keep up a progressive improvement in the rate of industrial expansion.

We are aware that the responsibility for energising the economy for defence purposes spills over a far wider area than that of the Defence Ministry. If we have nevertheless thought it useful to urge upon you the economic and industrial aspect of defence preparedness, it is primarily because you yourself have so clearly and publicly enunciated the vital truth that the country cannot be strengthened in the military field unless simultaneously its economic potential is rapidly and considerably promoted. In the early days of the emergency attention was rightly paid first to the task of procuring urgently needed supplies from anywhere. Now, in terms of a planned programme of defence preparedness, it is necessary to achieve an effective co-ordination of the pace of industrial development with the requirements of defence. It is a sobering thought that at the present time, the entire effective heavy engineering capacity existing in the country is probably not equal to that of one major plant in any industrially advanced country.

rise of 52.7 per cent in agricultural income for the whole country between 1955-56 and 1960-61.

Table I below compares the agricultural incomes.

States	1955-56 (1)	1960-61 (2)	Percentage change of (2) over (1)
Andhra Pradesh	378.8	467.7	+23.5
Assam	148.4	217.5	+46.6
Bihar	372.5	446.2	+19.8
Gujarat	208.8	333.5	+59.7
Kerala	173.8	249.9	+43.8
Madhya Pradesh	364.3	483.5	+32.7
Madras	315.8	491.8	+55.7
Maharashtra	327.5	618.0	+88.7
Mysore	224.3	360.4	+60.7
Orissa	165.8	275.8	+66.3
Punjab	236.7	391.0	+65.2
Rajasthan	202.2	255.5	+26.4
Uttar Pradesh	565.3	1,039.6	+83.9
West Bengal	265.8	513.4	+93.2

of the major States in 1955-56 and 1960-61, showing that West Bengal, Maharashtra, Uttar Pradesh, Orissa, Punjab, Mysore, Madras and Gujarat had rates of increase above the all-India average. The States which have put up poor performances were Bihar, Andhra Pradesh, Rajasthan, Madhya Pradesh, Kerala and Assam. While broadly the last column in the table does show the percentage increase in agricultural income between the years under review, in certain cases it tends to exaggerate the degree of gain or loss. This may be illustrated with reference to Uttar Pradesh which, according to these figures, ranked the second best, the first position being occupied by West Bengal. In 1955-56, Uttar Pradesh had a setback in agricultural production, and the total volume of output was far below the normal output of the State; 1960-61 was a moderately good year for the State and, therefore, the gain depicted in this comparison tends to be unreal. The increase of 84 per cent in agricultural income in this State where more than 70 per cent of the people live on agriculture should have placed the per capita income of the State at least above the level of all-India average. As was indicated in an article in the 20th anniversary number of *Eastern Economist*, the per capita income of the State in 1960-61 was 11 per cent below the all-India average. The same is likely to be true of some of the other States as well. For a realistic appraisal of the growth in the States, it is necessary that the Council should attempt to estimate income figures year-by-year instead of between two arbitrary end-points which may not be truly indicative of the trend. This may not be very difficult in view of the fact that the more arduous tasks of outlining the method of estimation and the defining of the various concepts have been completed by it.

In its earlier publication mentioned at the outset, the Council had come to the conclusion that "in a number of instances the per capita income is relatively small for those States which are predominantly agricultural". Agriculture cannot be as productive as industry but, as the present study has revealed, even in agriculture, the levels of productivity vary violently. Table II alongside, for example, gives the ranking of the States according to the net value of agricultural output per acre. It puts Kerala at the top of the list followed by Assam, West Bengal, Madras, Jammu and Kashmir and Uttar Pradesh. Rajasthan is at the bottom of the list with the index of productivity of land at about one-sixth of the index in Kerala. In another index of productivity per worker (see Table III, p. 660) the same conclusion is re-inforced. Kerala once again is at the head of the best with net output per worker at Rs. 1159 as against Rs. 343 in Rajasthan and Rs. 214 in Himachal Pradesh. The question that immediately crops up is why Kerala with such high indices of productivity both in relation to land and worker is having the same per capita income as Rajasthan. The explanation lies in pressure of population resulting in a high ratio of non-

working force. In 1961, the total population of Kerala was 13.5 millions out of which 9.2 millions (68 per cent of the total) were non-workers as against the all-India average at 57 per cent and Rajasthan's average at 50.6 per cent.

While estimating the State-wise agricultural incomes, the Council also derived the input-output coefficients so as to measure the profitability of agriculture in the different States. The average all-India index of profitability (see Table IV) was 14.2, implying that, on the average gross agricultural output valued at Rs. 7 needed an input of one rupee by way of seeds, fertilizers etc. In this measure, Assam led the rest of India because of the plantations which do not need, by way of input, every year as much as other crops. Himachal Pradesh, Mysore, Andhra Pradesh, Madras, Uttar Pradesh and Rajasthan show that inputs needed in their agricultural sectors are higher than the all-India average.

TABLE II.
RANKING OF STATES ACCORDING TO NET
VALUE OF AGRICULTURAL OUTPUT
PER ACRE (1960-61)

States	Net value of output per acre (Rs.)	Index (All States= 100.0)
Kerala	445.44	277.3
Assam	347.78	216.5
West Bengal	313.21	195.0
Madras	282.87	176.1
Jammu and Kashmir	231.11	143.9
Orissa	180.80	112.5
Uttar Pradesh	167.09	104.0
Delhi	164.73	102.5
Bihar	161.53	100.5
ALL STATES	160.61	100.0
Andhra Pradesh	156.65	97.5
Punjab	155.55	96.8
Mysore	137.94	86.3
Gujarat	136.77	85.1
Himachal Pradesh	136.04	84.7
Maharashtra	132.08	82.2
Madhya Pradesh	106.10	66.0
Rajasthan	71.34	44.4

age; in other words, agriculture is less profitable in these States than in Assam, Bengal, Gujarat, Punjab, etc.

Attention has been drawn repeatedly in these columns to the exaggerated claims made by the Union Ministry of Food and Agriculture regarding the total

TABLE III.

STATE-WISE ESTIMATES OF NET OUTPUT
PER WORKER IN 1960-61

States	Net output per worker (Rs.)	Index (All States=100.0)
Kerala	1,159	243.0
Punjab	861	180.5
West Bengal	824	172.7
Delhi	800	167.7
Assam	620	130.0

increase in agricultural production since the beginning of the planning era. The error was introduced while changing over from the traditional methods of crop estimation to the new technique of crop-cutting experiments. In the estimates of income reviewed in this article, there were still some crops which had not adopted the new methods. The yield of small millets (at 2.0 million tonnes in 1960-61) was estimated to the extent of 13.9 per cent only by the crop-cutting experiments. The corresponding percentages for sugar cane,

tobacco and potatoes were 23.2, 18.4 and 28.3 respectively. Wheat, rice, jowar, bajra, maize, barley and gram were estimated by the new methods to the extent of more than 90 per cent. These percentages were lower in 1955-56 and a part of the increase witnessed in 1960-61 in Table I is due to this change in method.

The broad conclusion to be derived from this study is that the regional differences in this country are very wide. Both land productivity and labour productivity are governed by many factors all of which are not under human control. The new statistical information thrown up in regional income studies can be used in planning future development projects but "regional and national development are essentially two different facts of a common objective" and, therefore, the regional angle should not be over-emphasised.

TABLE IV.

STATE-WISE ESTIMATES OF INPUT-OUTPUT
CO-EFFICIENT IN AGRICULTURE SECTOR (1960-61)

States	Input as per cent- age of gross output	Index (All States=100.0)

Highlights of the Week

DEFENCE PREPAREDNESS

BY FAR the most heartening news about defence preparations so far has been last Tuesday's announcement that the Ishapur Rifle Factory, near Calcutta, is expected to start turning out semi-automatic rifles at its target capacity of 2,500 units a month, in about ninety days' time. One of the main reasons of the Indian Army's inferiority in NEFA last year was its being equipped with ordinary bolt action rifles which in range and frequency of fire were far less effective than the Tokarev M1940 Russian-type semi-automatics used by Chinese troops. Equipping the Indian Army with semi-automatic rifles should place it on an equal footing with the enemy forces.

The performance of the Ishapur semi-automatic is said to have been "completely satisfactory"; in quality, it is claimed to be second to none in the world. The production of such a modern weapon at an old plant—set up before World War I—is, indeed, creditable. Another significant fact about the Ishapur semi-automatic is that it, along with the ammunition required, has been produced entirely from indigenous materials. This rifle has certain advantages in mountainous regions; it can be operated without much loss of energy.

The preparations for air exercises, proposed to be held in November under the auspices of the Indian Air Force and in collaboration with the United States, Britain and Australia, are stated to be progressing well. A fighter squadron each from the United States and Britain and a few Canberras from Australia are expected to arrive in New Delhi shortly. The U.S. squadron will consist of F100s and the British squadron of Javelines. Most of the supplies of radar equipment from the United States have already been effected. These air exercises, which will last for about three weeks, are intended to give training to the Indian Air Force personnel in modern air defence. The foreign aircraft will return to their respective bases after the exercises are over.

GREEN SIGNAL FOR STEEL

HAVING ACCEPTED the Steel Steering Group's recommendation of raising steel output to 18 million tonnes in terms of ingots by 1970-71, for which an installed capacity to the tune of 20-21 million tonnes will have to be established, the Planning Commission last week gave the green signal for work to be initiated on this expansion programme. A high-level committee, consisting of Mr. T. Swaminathan, Secretary, Supplies and Technical Development, Mr. N. N. Wanchoo, Secretary, Steel Department and Mr. N. Subramaniam, Additional Secretary, Heavy Industries, was set up to ascertain the position of raw materials and availability of equipment from indigenous sources. The committee will particularly look into this question in regard to the two new steel plants proposed to be put up in the Hospet-Visakhapatnam and Goa regions.

The Steering Group on Steel, it may be recalled, had suggested the 20-21 million tonnes ingots installed capacity target for the fourth Plan in view of the fact that the demand for this vital commodity had been outstripping supplies by a fairly wide margin. It was of the opinion that the proposed target was not beyond reach. The expansion of the existing steel plants—IISCO's and TISCO's in the private sector and Bhilai, Durgapur and Rourkela in the public sector—would by 1970-71 yield a capacity to the tune of 13.65 million tonnes. Another three million tonnes capacity could be expected to be established by then at Bokaro—a third Plan project spilling over to the fourth one. If, therefore, two new steel plants with a capacity of 1.5-2 million tonnes could be set up under the fourth Plan, there would not be any difficulty in slightly-more-

than-doubling the third Plan-end installed capacity for steel in the subsequent five years.

So far as the new steel plants are concerned, the first task which the Committee has been asked to attend to is the selection of sites for them. Once this is done, it is claimed, all the other plans can be worked out more smoothly and with confidence. This presumes that these plants will not require foreign technical collaboration. No clear indication, of course, is available on this point. There is need to clarify this issue first. Further, it is hoped, political considerations will not be allowed to bias selection of sites. In matters such as these, the advice of technical experts requires to be given the utmost weightage; the sites chosen should be those which are the most suitable from the economic point of view.

COMMITTEE ON CONTROLS

THE ONE positive result of the last week's meeting of the Central Advisory Council of Industries has been the setting up of a 10-member committee to examine the operation of controls applicable to the establishment of additional industrial licensing capacity under the Industries (Development and Regulation) Act, the import of capital goods, the issue of capital and foreign investment and collaboration, and to suggest changes in procedure to reduce delays. The Committee is headed by Mr. T. Swaminathan, Secretary, Department of Supply and Technical Development. Its other members are Mr. Bharat Ram, Mr. A. R. Foster, Mr. Lakshmi Pat Singhania, Mr. A. M. M. Murugappa Chettiar, Mr. T. Chentsal Rao, Mr. N. C. Srivastava, Mr. P. Govindan Nair, Mr. V. K. Ramaswami and Mr. K. J. George. The latter four members, along with the Chairman, are Government officials, while the former five represent trade and industry. Mr. George will be the Secretary of the Committee.

The need for setting up such a committee has been long felt by industry and perhaps the Government itself. In the recent past, even Government spokesmen have in fact been expressing themselves in favour of its appointment. This has obviously been due to the crippling effects which controls and procedural delays have had on the industrial development of the country. The most depressing indication of this has been that even during emergency, the tempo of industrial development has failed to pick up by any substantial degree.

The case for removal of unnecessary controls and simplification of procedure could have hardly been summed up better than in the following paragraph from the World Bank Mission's report submitted to the Aid-India Club early this year. The Mission stated: "The activities of industry in India are minutely controlled and supervised by the Government in a manner which is destructive to enterprise and efficiency. Public undertakings are subject to much the same controls as private enterprise. In some respects, indeed, they are more hedged around because of their accountability to Parliament for the public funds entrusted to them. An overworked civil service, which must stick to the rules and avoid mistakes, should not be expected to take what are essentially management decisions. Yet in the last resort, it is the Ministries of the Central Government and their subordinate agencies which decide in important cases how large a firm should be, whether or not it should be allowed to expand, what price it should charge for its products, what its wages and salary scales should be, where it should obtain its products, what foreign exchange it should spend, whether it should go to the market for a loan, sometimes even who should be its directors. If Indian industry is to operate efficiently, some way must be found of eliminating at least the major of these detailed checks and controls

October 4, 1963

and of decentralising the process of economic decision. The machinery of Government in India is simply not designed to carry out the tasks that are now being imposed upon it, and every year it comes closer to breaking down altogether under the strain."

The taking of decisions on which controls should go and how procedural details should be simplified, is, of course, not going to be an easy task. It will be only prudent if the Committee is guided in its deliberations by the criterion that if any control is to be retained, it must be on positive evidence in its favour. Even if elimination of certain controls entails some justifiable risks, the Committee, it is hoped, will not feel any inhibition in recommending their abolition. A lead has already been given in an allied field by the Minister for Steel and Heavy Industries. While reorganizing the management patterns of Durgapur Steelworks and the Sindri Fertilizer Factory recently, he has subordinated financial control to the exigencies of the situation.

A very significant point to be noted about the terms of reference of the Committee is that they do not contain any mention about price controls. The Committee, however, will do well to look into this issue as well. It has a vital bearing on many of the other controls on industry. Price controls have tended to introduce in the Indian economic system an undesirable rigidity just at a time when patterns of costs, production and demand are changing rapidly and continuous adaptation is required. The strengthening of the planning machinery and improvement of economic statistics are two other important matters which this Committee needs to attend to. The Committee will submit interim reports as and when necessary. It shall complete its work in six months.

ADMINISTRATIVE REFORMS

AMONG THE many judicious and sweeping reforms recommended by the Rajasthan Administrative Reforms Committee the most crucial one obviously is the suggestion for appointing an Ombudsman or a Commissioner to inquire into complaints against high government officials and Ministers. There is, of course, no novelty about this suggestion; such offices have been in existence for quite some time now at least in three foreign countries — Sweden, Denmark and New Zealand — and the following of this precept in India has been often urged by various persons included among whom is a Judge of the Supreme Court. But there can be little doubt that this important recommendation of the RARC will receive country-wide attention now.

With a view to insulating this office against undue pressures—political, regional, caste etc.—the Committee has suggested that the incumbent should be appointed for a term of three years (renewable further for a similar period in special cases) by the President on the recommendation of the Chief Justice of India and that he should be of the status of the Chief Justice of a High Court. A further safeguard is proposed in the suggestion that an Ombudsman when appointed, should not be removable unless a two-thirds majority of the State's legislature votes for such a step. An Ombudsman shall be responsible to the State legislature and will be required to keep a vigil over executive actions and investigate cases in which the action taken by government agencies is considered to be either illegal, unjust or arbitrary. He is not to supplant the judicial set-up in the State and, therefore, is not to be requested to go into any matter that lies within the purview of the law courts. He, of course, will have the right to reopen court cases already decided if he comes to possess evidence which, if taken into consideration, might have, in his opinion, led the Court to a different conclusion. For the successful discharge of his duties, the Ombudsman shall have access to all official documents. Lest he should be inundated

with frivolous complaints, legal action has been suggested against complainants if their allegations were found to be lacking in evidence or mala fide motives were established.

The Committee describes the Cabinet as the fountain-head of all administrative actions and is of the opinion that it will be presumptuous to expect good administration if regional, communal and caste considerations or the factions among the legislators were given free play in ministry-making. It also impresses the need for imparting sincerity of purpose, integrity and competence at the ministerial level. That is the one way of inspiring confidence in the public about administrative efficiency. On this also depends to a great extent the successful functioning of an Ombudsman. The Committee favours small cabinets with scientific distribution of portfolios and work among Ministers and Secretaries. It calls for greater delegation of power and discretion to departmental heads so as to enable them to take the initiative and act in an effective manner. While there should be supervision, control and direction by a Minister, suggests the Committee, he should refrain from interfering with the exercise of delegated authority by those under him.

So far as developmental activities are concerned, the Committee recommends the setting up of a planning body at the State level. This body will not only tender advice on these activities but will also be required to keep a watch on their effective implementation. For avoiding procedural delays, the Committee suggests the adoption of cell and group systems. Heavy reduction in the secretariat staff is also recommended; so also radical changes in the method of recruitment and training of government personnel.

The Committee lays great emphasis on ascertaining by the Government of public grievances. It suggests preparing of a note of such grievances every quarter for the benefit of the Cabinet and giving of publicity to the action taken on them. Special powers have been recommended for District Collectors for inquiring into complaints against any government agency at their level. It is further pleaded that there should be respect and courtesy for people's representatives and circumstances should administrative principles be sacrificed or tampered with.

NEW ANTIBIOTIC

PIMPRI HAS added another feather to its cap. It has introduced in the market a new antibiotic called Hamycin. After extensive trials in four prominent Indian hospitals and some foreign ones, this new drug in the Penicillin family has been found to be very effective against oral thrush and a large number of fungal infections of the skin, nails and scalp, including dandruff. It is claimed to be 70 per cent more powerful and still about 50 per cent cheaper. The credit for the discovery of Hamycin goes to a band of research scientists of Hindustan Antibiotics Ltd., under the leadership of Dr. M. J. Thirumalachar.

Currently this antibiotic is being produced in small quantities in the existing penicillin and streptomycin plants of the Pimpri factory. It is hoped to meet the entire domestic requirements from this existing capacity. Some exports are also being negotiated. The foreign exchange thus earned will help in setting up a Rs. 30 lakhs new plant for the manufacture of this drug. The plant will have a capacity of 50 kgs. of Hamycin per annum. Licensing of others for the manufacture of Hamycin is not envisaged. Licences, however, may be granted to some, both in India and outside, for making formulations from it.

Pimpri also hopes to put on the market soon two other

October 4, 1963

EASTERN ECONOMIST

antibiotics developed here—Dermostatin and Octacillin. Dermostatin is at present undergoing clinical trials in foreign countries. Octacillin has gone through such trials on a fairly large scale at Pimpri itself. Octacillin, it is claimed, will revolutionise penicillin therapy for it would be orally administered. Work is also stated to be at an advanced stage for developing an anti-tumour antibiotic. Chlortetracycline of Pimpri manufacture is expected in the market in the next few months. It will be available at a much lower price than the prevailing one. There is as well a programme to start manufacture of Vitamin C here.

Another noteworthy feature of Pimpri's working in the recent past has been a steady reduction in its production costs. The costs of manufacturing various antibiotics here are said to have gone down to 52 to 78 per cent compared to the costs in 1958-59. The total production has been exceeding the stipulated targets since 1957-58. Sales too have been steadily going up. In 1962-63, they amounted to Rs. 4.30 crores, as against Rs. 3.55 crores in the previous year. Despite these encouraging facts, however, the gross profit last year showed a slight decline from Rs. 140.47 lakhs to Rs. 139.60 lakhs. This was attributed to emergency risk insurance expenses, additional discount that had to be made available on UNICEF supplies, payment of some customs duties (this, however, has been appealed against) and provision of subsidy on production of streptomycin at the new plant set up for the purpose. The Pimpri factory was awarded Silver Shield and Copper Plate last year on being adjudged as the best among the public sector undertakings for outstanding performance in 1961-62.

\$ FOR FERTILIZERS

A U.S. LOAN totalling Rs. 21.2 crores was announced last week for Coromandel Fertilizers Ltd., a new company organised by an Indian-American consortium, which has been licensed by the Government to erect the plant. The plant will produce 3,65,000 tons of ammonia phosphate and 16,500 tons of urea annually. It is expected that the construction

of this plant would save about Rs. 10 crores of foreign exchange annually. The U.S. Government is financing the entire cost of another huge fertilizer factory under construction at Trombay by the Fertilizer Corporation of India. The U.S. loans for that project, which will go into production in 1964, total Rs. 27.7 crores.

Coromandel Fertilizers Ltd., has been organised by East India Distilleries and Sugar Factories Ltd., of Madras, the California Chemical Company, a wholly owned subsidiary of Standard Oil of California, and International Minerals and Chemicals Corporation from Illinois. The two American firms will invest \$5.5 million in foreign exchange (the equivalent of Rs. 2.6 crores) in the shares of Coromandel Fertilizers Ltd., and both companies will bring to the project extensive and successful experience in operating a number of fertilizer factories in the United States. The U.S. Government foreign exchange loan will be channelled through the U.S. Export-Import Bank which has authorised a loan of \$27 million (Rs. 12.9 crores) to the new company. The U.S. Agency for International Development will extend a loan of Rs. 8.35 crores, under the Cooley amendment programme, from the sale proceeds of agricultural commodities supplied to India under U.S. Public Law 480. The remainder of the financing, Rs. 4.57 crores will come from East India Distilleries and the Indian public, who will own a majority of the new company.

The refinery operated at Visakhapatnam by Caltex will provide to the Coromandel Fertilizer plant the primary raw material supply of naphtha. The factory is expected to go into production within 29 months of the commencement of work. When it reaches full production it will supply more than a third of the estimated fertilizer consumption of Andhra Pradesh and also meet a small part of the requirements of Mysore, Madras, Orissa and Madhya Pradesh. Parry and Co. Ltd., one of India's largest distributors of fertilizers, a subsidiary of East India Distilleries, have been appointed the principal selling agents of Coromandel.

"HAVE YOU ANY SUGGESTIONS?"

Development: Philosophy & Principles

By CHESTER BOWLES

AS I SEE it there is a whole series of principles that we have been gradually evolving, or some of us have evolved, which I think are of basic importance to a successful developing nation. First, I think, is to know what you are trying to build. What is the development for? This is a very obvious question, however, that very often gets overlooked. What kind of a society do you want? The second point, I think, is something we are all rapidly learning and that is to have a little less faith in "isms" and clichés that involve capitalism, communism, socialism and the rest. I get very mixed up reading stories about American political life and who stands where sometimes.

I come to India expecting to get very straightened out and I go to the Lok Sabha, I read the newspapers and I am even more confused here. I'm very troubled as to just what is a leftist, for instance, since I have gotten to India. I meet leftists that I'm told are very dangerous characters and very radical people and I find myself getting into terrible arguments with them over land reform. They say you mustn't touch land ownership because this is something that you must never deal with. What is wrong with having five or six hundred acres of land? So I find myself arguing for the poor tenant farmer. I wonder whether this makes me a leftist or what it makes me but it often leaves me very mixed up. So, I think, it is very important to get all the clichés out of our mind and to really face up to the really pragmatic problems with which we have to deal.

Motives for Progress

There is also a third principle that seems to be very important. That is the need for adequate motivation in development. What does the individual get of it? What is he working for? What are you asking him to do? Why should he work harder? What are you offering him to really make him put his heart into this development work? Then, of course, the fourth point is a need for adequate resources with which to move ahead, to build the country. This, of course, is very important, not only capital resources, but technical resources and the rest. And there's the question of management—able management not only in the public sector but the private sector and all sectors working in the economy.

And last I would put the very special importance of the rural areas, which I find that the longer I work at the question of development the higher I find this priority seems to me to belong. Now, let's take these and discuss them, one by one.

What are we talking about when we talk about the objectives of development? It seems very clear to me that what we should be talking about is the building of a free nation, a nation not trying to ape some other nation, trying to be like some foreign government but rather a nation working through its own traditions, within the framework of its own culture, drawing from its own experience, to give its people expanding opportunities, opportunities for growth, opportunities for education, for good health, with great emphasis, the maximum emphasis you can give on the dignity of the individual citizen. It seems to me that whatever effort the American people put into development of other countries, the development that you put into your own efforts here, should respond to that basic objective. I don't think the United States with its aid programme is going to necessarily make friends or influence people or gain support for our ideas, but we are going to gain out of it. I think it is very, very important to us Americans if it all succeeds, a world

Text of talk by the American Ambassador, before the Research Scholars Association at the University of Madras, on September 11.

of nations which are free, which are independent, which feel proud of what they have done, proud of the fact that they are Indians, Bolivians, or Peruvians or whatever they may be and feeling very happy and confident of what they have created in their own country.

Now, moving on to the question of these various "isms," I would suggest that capitalism in its old form, communism in any form I know it, national socialism, in the forms you hear about it involving what is called democratic socialism. I think you can pick any one of these things apart and demonstrate that it probably won't work very well.

Certainly, no country is seriously considering going back to the old Adam Smith capitalism where you have a driving force of private energy unharnessed by government in any way, just working purely from the basis of the market with the public and people sort of figured as just ingredients in the general process of development with very little emphasis on their dignity, their opportunity or what happens to them. This, of course, endured through the industrial revolution. This is what Karl Marx denounced. It seems to me that Karl Marx in denouncing it denounced rather accurately but failed to foresee some of the developments that some capitalistic countries would go through as it began to develop socially responsible governments that developed along quite different lines.

Incentive System

But it seems to me that communism too is just about as irrelevant as the old form of capitalism. It seems to me whenever I see the Communist countries beginning to do well in some field they borrow the incentive system. Years ago the Russians, for instance, began to bring the incentive system into their whole industrial approach to programmes. And the incentive system plays a very real role today in the Soviet industrial system.

I do not think the Russians are going to do very well in agriculture until they begin to take this into account. They've left it out, it seems to me, much too much. The result is that in agriculture they are often very bogged down. I don't think that Karl Marx, if he came back to this world today, would find many things in Russia he would really recognise. I know Lenin wouldn't. I'm sure that if Lenin looked around the world today he would be very surprised old theory, had to own vast colonies in order to survive, are all giving up their colonies at a very rapid rate and prospering.

Indeed, the only country that shows any signs of clinging to colonies is Portugal, which has the lowest per capita income in Europe. I wonder what Lenin would make of that? So I think you can pick Adam Smith capitalism or either Marx-Lenin communism pretty much to pieces as going concerns.

Socialism has a great appeal to all of us—democratic socialism. Everybody owning everything—it sounds like a wonderful democratic idea. I think the difficulties are that

when you develop this beyond a certain point, your government gets so bogged down it simply cannot have the load of administration. It just gets much too big for it.

This is particularly true in a democratic government because if the government has to make too many decisions it finds itself in all kinds of problems. Every time it makes a mistake, a group of people arise in the national parliament to point out the grievous errors made by the government. As a result, industrially, a country operating that way does not often dare take the risks that are important.

You are never going to build a dynamic society without risks. In a totalitarian society, you can operate with risks. You just figure your risks, you go ahead and take them and it works to a degree. You may lose all thought of human dignity in the process, but it will produce rockets, satellites, railroad trains or whatever you want. The individual doesn't do too well in it. Similarly in a private industry operation, again the risk can be taken. They are taken by private firms and when things don't work out too well, why you just dismiss the whole thing as none of the government's business.

A little while ago in America we had a car called the Edsel, back, I think in 1955 or so. Millions and millions of dollars went into producing the Edsel. It was produced by the Ford Motor Company. It cost about 300 million dollars and unfortunately nobody bought any. The Edsel didn't do very well. I've often thought what would happen if the Democratic Party or the Republican Party had produced the Edsel. I'm sure it would have lost the next election without the slightest doubt. Fortunately everybody was able to say the Ford Company made a bad mistake and what was all there was to it.

Mixed Economy

So what I am really getting at is that the system which only makes any sense to me is a very pragmatic one where you take these issues as they come. You're going to have some state ownership, some private ownership, because you have to. The private sector is never going to build your power plants or railroads or all the steel you need. So you have to let government to do that job. But still you try to think of leaving the doors open wherever you can. This leaves most parts of your economy to an enlightened socially responsible private sector. You get a balance of the two. You work pragmatically to find out where you can get management resources, money resources, put them together with national plans, to get an expanding, developing economy.

All of this will not work, as I suggested before, unless something good happens to people in the process of growth. This is something, I think, we have very often overlooked. We don't think that a growing national product, an increasing per capita income, in itself provides you with a happy society. And I think all of you will agree that there is no evidence of that whatsoever.

The rising per capita income or gross national product is vitally important but often has nothing to do or very little to do with political stability and a feeling of a good society to which people are proud and happy to belong. For instance, if you take the nations of Latin America, and list them in order of their per capita income, you will find that that list has nothing in common with another list that you might put together involving those countries in order of their political stability. The two lists simply do not fit. For instance, Cuba in the days of Batista, before Castro took it over, had the third highest per capita income in Latin America. By all standards this was not a poor country judged by per capita income. Just so, Venezuela today has a per capita income of over one thousand dollars. This is more than of Netherlands and Austria. Yet you see in Venezuela enormous differences between rich and poor, you see vast areas of the

mountainsides and valleys where people are living in a very very low standard of living—bitter people—people full of hatred—and cross the valley you will see a little group of people sitting on mountainsides with great, beautiful homes, living in great luxury. And here you've got this enormous rising per capita income with such differences between rich and poor, that often you get a highly explosive and very embittered society. I might add that President Betancourt of Venezuela is probably doing as much as any one man in the whole history of his country to put an end to these conditions and to bring about a better distribution of wealth. But unless you have a good distribution of wealth, along with all your high per capita income, you are not going to get a very good society, you are not going to get political stability, in any lasting sense of the word.

So I have seen many examples of this and I am sure you have too. I remember in 1958 I received a letter from a friend of mine, who is an engineer working in Baghdad, in Iraq, and he was very excited there about all that was going on in Baghdad. They were harnessing the rivers of the Tigris, Euphrates, new industrial plants are being built up, many of the oil revenues are being ploughed back into the development of Iraq and as he wrote me, "This is a dynamic exciting thing to be a part of. This country is going ahead by leaps and bounds."

The same time I had a letter from another friend of mine, who is an Indian, who had worked in Hyderabad, and he was working in the rural areas of Iraq, and although he was answering the first correspondent, although he didn't know him, he wrote me a letter which I received the same week. He said, "We understand out here that in Baghdad everything is going ahead very rapidly, that they are damming the Tigris, damming the Euphrates, everything is moving ahead in a very dynamic way. But there is no way in the world that you'd ever know it where I live, which is where most of the people live, because nothing has happened to them." He said, "Yes, something is happening to them." "In the old days," he said, "the landlords and the money-lenders used to come riding out on horseback, and very poor horses at that, but now they all come out riding in Buick automobiles. But they still collect the same old rent and same old interest."

Iraq Explodes

And I wrote an article, predicting that Iraq was about to explode, based on these two letters and I neglected to send the article to the "New York Times," which had agreed to print it quickly enough, so the explosion came just before my article arrived and it never saw the light of day, which teaches me a lesson. In any event there is a lesson in this, increasing per capita incomes, unless they are broadly shared, unless there is a general feeling of belonging and growth on the part of the people, just is not going to give you a happy result.

There is nothing soothing about a fertilizer factory or steel mill, there is nothing that makes life easier or particularly happier. It's a step toward a stronger society and a very important one. However, as you take the young man living in some village far, far away from the town and suddenly decides to move and work in that plant, they leave behind a familiar village, familiar circumstances, a family which gives them a sense of security, great poverty, perhaps, but at least some sense of belonging. They go into that town or city, and there they find a job, they get a bicycle, they begin to get some belongings of their own, but they live in a slum area, they have perhaps no opportunities for growth in community existence, they lose their sense of security, and they may be far more volatile, far less happy, far less secure, than they were in the first place.

So if you are going to build the factories, and build them you must, this all must relate back to the way people live, to the schools, to clinics, to clearing away slums, to giving people

October 4, 1963

a sense of participation and belonging in the cities or urban areas, wherever they may live and if you don't get that sort of growth, that kind of inner relationship, you're never going to get a happy society, I don't care how high your per capita income will go.

The next point of course relates to resources themselves. So many countries that we have worked with have shown far too little care, and far too little interest, in really using their own resources. And this one place where I think my government has gone wrong over the past years, but I think we have pretty well corrected it. We have given money to some countries and bolstered some countries which were really unwilling to help themselves. I don't want to name names, because it always gets you in difficulties, but I certainly can offer you some examples in a theoretical sense. Better life for their people, I knew many countries where we will put 50-75 million dollars in as an investment to try to help them build a better life for their people, only to have the same amount of money or an equivalent amount go out the back door for deposit in some Swiss bank or New York or London bank for safekeeping. And we're putting money in one place that's going out the other. And you go to this particular nation, and you say "Why don't you get a grip on your foreign exchange? Why should we put money in the front door when your wealthy people take it out the back?" And they say, "We believe in the private system of enterprise, don't you?" And well, if carrying that far, I must say I don't. I must say I greatly admire the efforts that you people make right here to see that your foreign exchange goes for very useful purposes.

Tight Grip

I stopped in one country on the way out here from the United States, a country which has a slightly lower per capita income than India, but a country which probably has four or five times as many automobiles per hundred thousand people as you have here in India, where the schools look pretty good, the housing looks by and large perhaps little better than it does on the average here in India. Now why was it, it looked as though that society was a little better off, when actually the statistics show their per capita income is a little less. The reason is that that country had no import controls, it had no income tax and as a result the foreign exchange was moving into automobiles, the show of luxury, people were putting it into housing and the rest, or houses for relatively few. At the same time the railroads in this country were practically falling apart, and I was told that they were operating in many of their manufacturing operations at one-third capacity, because all of the money that was flowing to automobiles should have been going to parts, raw materials, and all the rest, which would make that a going society. You have a grip on your resources. Some people think the grip is a little too tight sometimes. But in any event you have a grip on it, you've got the courage to do this and you are never going to succeed unless you do this and India has done it, and a handful of other countries have also done it. But many countries we deal with, for instance in Latin America, have no income tax whatsoever and we go down there and press them to get an income tax and then they call us a lot of radicals. We have had an income tax since 1910. And we see nothing radical about a progressive income tax. It was put through by a Republican administration of 50-odd years ago in the United States yet this in many parts of Latin America is considered very radical, very dangerous, and may just have been thought of in Moscow. The chance is it may well have been thought of in Washington, and we may have been trying very hard to get people to act on it.

And so you try, first of all, of course, to expect a nation and India is certainly living up to this expectation, to do a good job of using her own resources. You then usually find that this isn't adequate particularly in a democracy because while totalitarian society you can refuse people consumer

goods, you can refuse them motivation of working for a bicycle or whatever it may be and say there are going to be no consumer goods, we are going to squeeze everybody very tightly, and add on very heavy taxes and you may be able to get out of a very developing society under totalitarianism 18 to 20 per cent of the gross national product saved and plowed back into the economy.

When I came to India in 1951, India was saving only about 6 per cent of her gross national product. In other words, she was consuming 94 per cent of all she produced. I think one of the most remarkable things you've done in these last years is to raise that 6 per cent to something I've heard estimated all the way from 10 to 13 per cent but in any event it's probably double what it was some years ago.

Heavy Taxation

And this is how you are harnessing your energies and your resources to plough them back into the development of your country. You have taxed your people very heavily, some people think, some outsiders feel that you have done it perhaps to a point where it will not give you very much more in the way of benefits. I once asked one of your Finance Ministers some years ago who said that India believes in taxing her people for development. I said but how do you know that you are taxing them too hard. He said, when they start tipping the trolleys cars and buses over in Calcutta, we think we have gone a little bit too far, and then we bring the taxes down slightly.

Well, that's fairly tough operation, and I admire it, but I think you can sometimes take away some of the motivations that make people work. Because in a free society, people must have something to work for, they must have a feeling of getting something out of their daily work or their weekly work looking forward always to just a little bit more. I remember talking to the Prince in Phnom Penh, Cambodia, about a year and a half ago, I was very impressed with the fact that Cambodia, a very rich country, with plenty of sunshine, and plenty of rain all year round, only produces one crop of rice per year. I said, what in the world is wrong, why don't you produce more rice? He said, well you see, we have no bicycle plant here in Cambodia, if only we had a bicycle plant, then we'd easily have two crops of rice, and I saw what he meant. Because the average farm family there the rice they need themselves, they could raise all nearby Mekong river, and fruit on the trees and they could live pretty well, they had a fairly decent basic life. It was very small, but there was not much else to do until they saw a chance to move ahead, but if you had offered those people to expand their standard of living, then he was saying they would move ahead. They would work harder — you'd get that extra rice. Your economy would begin to get the dynamic to make motivation, tend to give people the drive and push to make the move forward towards greater development goals.

Soviet Record

I don't think you can grind it out of people, I don't think you can do it in a totalitarian society. Take a look at the Soviet record in agriculture. We have in America 9 per cent of all of our people involved in agriculture, just 9 per cent and one out of every eleven families and yet they produce as you know plenty of food for the United States and much food for the rest of the world. Indeed there is one shipload of wheat leaving every single day, on the average, from the United States for India and we do this of course with many other countries as well.

In the Soviet Union 41 per cent of the people work in the rural areas. They produce plenty of food for Russia, but the point is it takes 41 per cent of the people to do it. Now, my guess is you are going to see changes there the next few

October 4, 1963

years because I think they are very conscious of this and as they begin to get opportunity to offer people incentives, you are going to see people working harder, producing more, and this problem may be on its way to getting solved.

I think this is one problem or one opportunity that exists in this whole arms testing situation. I think the pressure on the Soviet economy to release resources, provide more consumer goods for the Russian people, is probably very great. I think it is going to become greater. They have promised the people a much better life. They haven't been able to deliver that to anywhere near the extent that they hoped. They can't deliver it as long as the arms race continues.

Therefore, I think there may be signs in the future. I'm not sure, but I'm hopeful, that the Soviet will approach the disarmament problem with a greater sense of realism. If so, we can all get some of the load off our backs. Because when you start offering the Russian peasants a chance to own a washing machine, a chance to have a little better house and buy a car perhaps, or a motorcycle, then they're going to put in those extra hours of work and you're going to see production going up, and fewer people will be required to make Soviet agriculture move ahead.

Agriculture Basic to Development

Now another point, I think, of very great importance which I referred to indirectly is a very great vital necessity for the rural areas really coming alive. And this I find as I go around the world is one that people very easily forget. As I see every country's success is based primarily basically on agriculture. If our agriculture had not been so efficient in the United States, we never would have become the industrial power we are. We are successful industrially because we solved our agricultural problems, and freed enormous numbers of workers, for work in the factories, building houses, construction and the rest.

I think this is brought home particularly as we look at Japan, where two things have occurred. Because the Japanese rural society has been very dynamic and very prosperous and because the people there worked so hard and produced so much, there is extraordinary political stability throughout the Japanese rural countryside, where something like half the people of Japan are still employed. But the second factor is that because they work hard, because they do pretty well, because they have fairly good incomes now, enormous outlet for the goods produced in the factories of Tokyo, Yokohama, and other Japanese cities.

If 80 per cent of your people, which is often the rural sector of an underdeveloped country, are not in the money economy, then you cannot get industry started on any expanding base.

This just isn't possible, because all you are selling to is the 15 or 20 per cent of the people who are in the money economy. Now I think the Japanese example is an interesting one to pause over particularly interesting for an American because we had some part in it. As the military governor of Japan immediately following the war, General MacArthur, who I don't think would ever consider himself a great economic liberal but nevertheless saw this problem very clearly, is the man responsible really, in one major sense, for the revitalisation of the rural areas of Japan. And I think if you ask most Japanese students, they would tell you that this was true. After the war, General MacArthur was concerned, and properly concerned, as to how the war had started. Who started it — what were the groups in Japan which created the war psychology that led to the invasion of China, South-East Asia, and the attack on the Americans at Pearl Harbour?

And, after studying this with many political scientists for some time, they came to the conclusion that it was the land-

lords of the rural areas, who owned most of the land — indeed only 30 per cent of the people living in the rural areas of Japan owned any land whatsoever. The rest was all taken care of by tenant farmers, working on a very, very small and very bad basis of income. So, he started to break up these great estates — these great feudal estates, and see if he couldn't give every family in Japan a small bit of land of their own.

He brought over economists from the United States and they went to work on a programme. Today, as a result, 94 per cent of all the rural families of Japan own and till their own soil. The farms are very small — they average 3.2 acres each — but on those 3.2 acres each they have the highest production of any nation in the world per acre, substantially higher than the United States where the farming is largely done by great machinery. People forget that the machinery does not bring us a greater output per acre. What it does is bring a large output per acre with a very low labour cost or labour increment. The farm machinery we use is merely a labour-saving device. Actually you could go through an American wheat field, after the harvest, and an Indian village or Chinese village could find enough food to feed the people for a week, on the food that is left behind, after those great monster harvesting machines walk through those fields. The whole idea is to hold down your labour costs, your use of labour, to free labour for work in the urban areas, in construction, and manufacturing, and the rest.

Japanese Example

In any event, in the early stages, the Japanese family went to work on their 3.2 average acres, and worked very hard. They didn't engage in farming. It was more gardening, just as many Indian farmers garden and farm. They had plenty of money for fertilizer because there were loans immediately available to them. They could borrow money at low rates of interest. They could get good equipment, adequate fertilizer, and good seeds. They had extension work programmes, so they could call any time they wanted, and a good extension worker would come in to advise them if they wanted. There were roads to take their goods to market and there were co-operatives to cut down the cost of distribution. All of this combined to give the Japanese farmer an opportunity to move ahead.

Little factories have gone up and there were jobs, not for 12 months, but most of the year. Farmers had a chance after their crop was in to work in a little fish factory or a little canning factory to pick up some cash. Seventy per cent of all Japanese farmers now have an additional source of income over and beyond their farm. Now this has brought forth another item and that is, as they have got these extra jobs in little manufacturing plants, they have also begun to bring in small units of machinery, not like our American machinery, but small units that cost may be 700 to 1,200 rupees, small operating gasoline, motor-driven one-man plows and the rest.

This has freed more of their time so they could spend more of their time in industrial work. Now what is the result of all of this?

The Japanese farmer is extremely well off. Seventy per cent of them have television sets. All of them are now electrified. The farms are electrified. I have been in many dozens of farm homes in Japan and you will find electric toasters, electric washing machines, and all the rest. This has been made possible by the fact they now have purchasing power that they can use to work out their problems. This has been a difficult situation in Japan.

It would be far more difficult in many ways in other places because in Japan you have almost total literacy. The people are almost fully literate and this gives them a great

October 4, 1963

advantage in moving ahead in the revolutionary way they did move ahead. But they have now a ceiling of seven acres per family. No man or no family can own more than seven acres. Chiang Kai-shek introduced some similar reforms in Formosa. If he had introduced them on the mainland of China he would still be there and you might not have this problem up there now in the NEFA and Assam and the rest of your country. But he didn't introduce these reforms on the mainland.

Source of Stability

Your rural areas are a source of great stability. There are so many people there but only if the people feel a sense of belonging, of participation of growth. The more they can be taught and encouraged to build their own schools, roads, clinics, to pull and work together, the more drive that comes in to it, the more sense of personal participation there is. If a family at the end of a week is able to look back and say here is what we have done this week, working together, you get this dynamic quality. But if it is sort of a trickle down business from the top, it does not come out that way.

I have seen villages where there is a very fine school built by the state, or the government or some outsiders and I have seen people criticize it. I have gone to other communities where the people have built their own school. And a sense of pride and excitement is very great.

I was in a middle eastern country just a year ago and I was shown with great pride a whole area that had been opened up in the rural areas. They were bringing people from the capital city suburbs out there for farming. They brought them into almost model communities. There is a home built of concrete, with a bathroom in it. There was a little barn next door with oxen and buffalo. There was a clinic down the street and a school on the corner — an ideal set up. Were the people contented. Not one bit. I never saw an angrier lot of people than those people because they had been told they could borrow money to get their fertilizer and they would have to pay back in the fall. But when the fall came they didn't want to pay for the fertilizer. So there was practically a revolution going on when I was there.

One man lost his buffalo. The buffalo died. He was demanding another buffalo. But they said, "You forgot to feed your buffalo," and he said, "What does that matter? The state owes me another buffalo." Because the people had never participated in building this community it didn't belong to them. It wasn't part of them. I think you can only work this whole basis of rural development by feeding the whole human initiative into the stream. In any event these are some of the principles I think evolve. Now I might state briefly some of the experience of the U.S. Government in working with them. We've done some things well on economic development and we've done some things poorly. We've had some successes and we've made some mistakes. This is inevitable. It's a whole new subject. We didn't know anything about it. We had to learn as we went along. Our first experience was in Europe, where everything was falling apart. The cities were half destroyed and we went in after the war to try to build them up, and to try to put the factories back together again. But this was an enormous job and a very expensive task, costing billions of dollars. But it was easy in one sense. The management skills were there. The labour skills were there. The knowledge of how to operate the machine and the factories was there.

The system was there. So when you put the material goods back into being, Europe picked up and, of course, went on its way. As we looked at the other developing nations, we also saw that we had an obligation and responsibility and

opportunity to try to do something there that would help nations such as India and other nations of Africa and Latin America gradually to ease their way out of the poverty of the past.

Our first effort was through Point Four technical assistance. This was a great effort we made. It worked pretty well. It is still working well. We still have a lot of it going on. We soon found, however, that capital investment had to come that you had to give capital investment, you had to give loans, you had to find ways of moving capital funds out there to get the growth and development. I think it is at this point that we made several mistakes, one of which was not to set standards for how we distribute this money. Too much of it, I think, in the old days — I don't think this is true now anywhere near the degree that it was — was given sometimes more on a political than an economic basis.

Self-Help Essential

We still have to do some of this. There are some political situations we just can't ignore. But by and large we are now trying to work with standards. The standards involve questions we ask each country that gets aid. Is its planning competent? Is it taxing itself well? What is it doing towards land reform? Does it have good engineering on its projects? Is it willing to work hard to bring about its own future improvements? Those nations are not very many. There are probably not more than six or eight or ten in all the world we deal with that fit into the category. India would be one of those at the head of the list. And your neighbour, Pakistan, would also be right at the head of the list. They do a very competent job there of economic planning, taxation and so on. Israel, of course, has done such a remarkable job, it no longer requires aid. Tunisia is doing very well. So is Colombia. So is Nigeria. So is the island of Taiwan.

There are probably 10 or 12 countries whose planning is really up to scratch. We are trying to give those nations priority treatment as far as our resources will allow. Then there is a second group of nations which do some things well. Maybe their tax system is pretty good. Maybe their planning isn't so good. Maybe they have good land reform programmes, but poor urban programmes. We try to help in those nations on a selective basis wherever we find programmes and projects that really deserve help and assistance. India is one of the few nations to which we give what we call non-had a little American flag on it so you say America did this. But the money flows right into your own stream of foreign exchange to pay for minerals and steel and parts and all is the most important kind of money you can have but also it is a tribute to you; we give it to you without it being tied to a project because we have sufficient confidence in what you're doing to feel that this is justified.

Now the third group is nations that are not ready for massive aid, not ready for this big leap ahead in growth, haven't got their planning in order, and are not really knowing how to go at it. Here we try very hard to get them to plan better. The World Bank, the UN, and other organizations get into it and try to see if they can't get their plants moving along and get them thinking in positive terms. Only when those plans begin to evolve, does the money follow for investment.

Now I don't know for how long or to what extent American aid will continue. I certainly think it's going to be needed.

McKee-WKE engineers can bring sound, practical mine-to-metal

experience to bear on India's steel plant projects

The two photos above illustrate the diversity of McKee-WKE mine-to-metal services in the ferrous and non-ferrous metals fields. The modern 15,000-ton-per-day copper concentrator at top was designed and built by the WKE Division. Among its other projects the WKE Division is now working on the Indian Government's first copper producing facilities. The WKE staff is providing engineering services for the mine, ore concentrator, smelter and refinery located at Khetri. This project, when completed, will be India's largest producer of copper. The small photo shows the

entry end of a 120-inch, 4-high plate mill for which the McKee Metals Division supplied engineering-contracting services including the installation of machinery and equipment.

While these plants are far too large to be called commonplace, they are by no means unusual undertakings for the McKee-WKE staff. We frequently have a number of equally large plants in process simultaneously in widely separated world locations. The McKee organization has the scope and resources to design and construct comparable projects of any size in India.

ARTHUR G. MCKEE & COMPANY

UNITED STATES: CLEVELAND • NEW YORK • CHICAGO • SAN FRANCISCO • HIBBING

ABROAD: LONDON • PARIS • TORONTO • MEXICO CITY • SAO PAULO • BUENOS AIRES

Represented in India by DR. B. S. GILANI 29 Jor Bagh, New Delhi 3

METALS DIVISION: Comprehensive engineering-contracting services for Blast Furnaces, Steel-Making Shops, Rolling Mills, Coke Ovens, Agglomerating, Sintering and Pelletizing Plants and related off-site facilities.

PETROLEUM & CHEMICALS DIVISION: Complete Refineries and individual Processing Units for all modern petroleum and petrochemical processes and for a wide range of organic and inorganic chemicals and chemical products.

WESTERN KNAPP ENGINEERING DIVISION: Plants and facilities for production of Non-Ferrous Metals, mining, preparation, handling, beneficiation and storage of Ores and Industrial Minerals, Coal and Aggregates.

THE DYNAMIC MAKERS OF PULP & PAPER MACHINERY

TATA-JOHNSON LIMITED, are the leaders in the country in designing and supplying top quality equipment for the Pulp & Paper Industry.

STANDARD EQUIPMENT :

Stock Pumps - Hot Liquor Pumps - Chippers - Chip Screens
Chest Agitators - High Speed Refiners - Jordan Refiners - Jönsson
Screens - Black Liquor Filters - Hydrapulpers - Vacuum Pumps
Controllers. These and similar equipment are all supplied against
Rupee Payment.

TAILOR MADE PLANTS :

Continuous Digester Plants - Batch Digester Plants - Blow Tanks
and Blow Heat Recovery Plants - Brown Stock Washing Plants
Bleach Plants - Black Liquor Evaporator Plants - Paper Mills.
The above type of plants are supplied with the highest indigenous
content.

TATA-JOHNSON LIMITED, JAMSHEDPUR-10
BRANCH OFFICES : CALCUTTA • BOMBAY • NEW DELHI

for the next 20 to 30 years without any doubt. There are, however, a lot of problems back home. We have also dams that many of our people would like to build. And we have many construction projects that we would like to see. Those of you who have been to America know that America is far from being perfect. We have plenty of slums in our country. Plenty of things are wrong. Plenty of things that should be rebuilt, that are waiting for investment in capital. There are always a certain group of rather isolationist-minded Americans who point to these things and say why don't we take care of Kentucky before we take care of Madras.

Steady Progress

Well, we have been doing this for 15 years and where is the millenium, they say. Why isn't everything straightened out? Why do these problems still exist? We thought we were going to have it all fixed by now. Well, the fault here is over-promising people. I think that much too frequently in the past — I don't think it is true today — we have told the American people this was a temporary effort and you would get all kinds of miracle results out of it that you aren't going to get. This is a long, hard, tough planning programme. It is going to take years. You are going to pull your per capita income up in this country bit by bit, tediously, laboriously, and, I think, successfully. It is not going to happen overnight and there are no miracle formulas for it. And the American people, I think, will understand this. I have travelled all over my country. I have talked much the way I am talking now. They understand it back home if they get the direct, clear word as to what you are trying to do. The trouble is all too frequently they have not been told the full story. We have tried to get the foreign aid programme through one more year and then we will worry about next year. But if we had done a better informational job from 1948 to 1960 I think by now you would have much more support for the programme at home. As it is, we get the money every year, but we are always a little nervous at this time because there is always such opposition.

In any event, we in the United States have very mixed views on all of this. We are often very confused. Americans talk in very conservative tones. If the Americans acted the way they talked, America would never have much more liberally than she speaks. She is basically pragmatic and we have always been pragmatic. We had a land reform programme 100 years ago this May when 160 acres was given to every single American or foreign family that would agree to till the land. You could come from Sweden or Germany or Britain or anywhere else and there was 160 acres. What you had to do was build a farm, build fences, and prove you were trying to farm it and you got your 160 acres.

There was a Homestead Act of 1863. As I said, the income-tax programme started 60 years ago, we put in monopoly legislation 65 years ago. Many countries, I think, including your own, do not yet have the kind of monopoly legislation we have. Go, read our Sherman Act and you will see a piece of legislation we passed in 1890 forbidding great firms and great corporations to go into agreement to hold prices above a competitive level. You can go to prison in the United States, you can be heavily fined if you make an agreement with a competitor for arranging a price to the detriment of the consumer or the government.

In any event looking at India, in terms of what I've said, it is clear to me here that a great many things have been accomplished and the obvious point, a great deal is also left to be accomplished. Coming here as a newcomer, or as old friend visiting, you see two completely different Indias. One is all the problems, all the poverty, all the troubles and difficulties. There are 70 million more people here than when I was here before to share it all. And this is one basic difficulty

that you see right away. Then you look closer and you see the extraordinary things that have occurred since 1953. For instance, according to all the records of the Planning Commission and others, your industrial production now is more than double what it was when I was here in 1953, your electric power output is three times what it was in 1953, it will be doubled within the period of 1961-66. You have more than twice as many children in school. You had a hundred million cases of malaria a year in 1953, I am now told it is below 2 million cases. You have taken your hard roads and added something like 50 per cent. You have gone a long way towards building a rolling stock of your railroads. These are great achievements. You have four times as many engineering students and technical students in the universities.

Worthy Achievement

These are achievements, and they are very worthwhile ones. Put them, however, besides the problems that remain and obviously you get the feeling of a tremendous lot to be done. And I think it is important we all look the situation very squarely in the eye, and realize how really rough and difficult it is going to be. There are a lot of us around the world, Indians, Americans, and other people of other nations, who feel very strongly about matters such as human dignity and poverty and the opportunity for people to have a good doctor when their child is sick, a teacher for their child, a chance for growth and the rest. We all take it very seriously. We want desperately to see that something is done about it. We want to see that capital flows in those countries that are able to help themselves and technical help flows to those who need it, and in the sharing of all that there is a sense of great excitement. I have noticed sometimes that many Indians go to American universities to study and then stay there. There are 3,500 Indian professors now in American universities. But they are more than equalled by the number of young Americans who would like to come to India and work here with you, in the development of your own society. This is a very exciting adventure, starting with what you've had just since 1947 and building a nation that is moving ahead with a sense of confidence, a growing sense of cohesion, against tremendous odds. And yet I think that we are all honest in realizing that the pace is going to be slow, and sometimes you wonder if you can ever get through the vast mass of apathy, indifference, illiteracy, ignorance and prejudice and all the rest that stands in the way.

However, I believe very deeply that somehow it all is going to succeed — that you are going to build a world of free nations, independent nations, each proud of their own national heritage, each growing within the framework of their own cultures and religions, each putting something together worth defending, worth dying for, worth working for. I think nations are going to come to work more and more closely with each other. I think the awesomeness of nuclear weapons may well mean that they are never used, and we are shocked and shattered by the consequences that some kind of international arrangements which will make war something that gradually recedes into the background will be made. Let us hope so, because the stakes are so very large.

No generation ever tackled anything remotely what we are tackling. No people anywhere, India, America or anywhere else, were ever up against a challenge of this dimension, because technology, as it has developed now, has suddenly made almost everything theoretically possible. The questions now are whether we can put the human drive and skill and dedication together to make that technology really produce. I have a feeling that one of the greatest testing places all over the world is right here in India. I am very happy to be back here working with you, for I think a very great experiment, perhaps the world's greatest experiment, is taking place here.

WINDOW ON THE WORLD

The Troika of International Finance

(WORLD BANK, I.F.C. AND I.D.A.)

THE WORLD BANK and its affiliates (I.F.C. and I.D.A.) made new commitments during 1962-63 amounting to \$727 million in loans, investments and credits as against \$1,037 million in the preceding year for the development of the economies of the member countries. Actual disbursements were \$692 million only. Commitments made for the Indian Union alone were nearly \$209 million with the largest share provided by I.D.A. at \$178 million. The World Bank lent \$30 million to I.C.I.C.L. and I.F.C. committed \$898,000 to Precision Bearing India Ltd. for the establishment of a unit in Baroda to manufacture "anti-friction ball and roller bearings". The total assistance provided to this country by all the three agencies at the end of the current fiscal year was about \$1,281 million; the World Bank lent \$876 million followed by I.D.A. at \$300 million and I.F.C. at \$4.8 million. India is expected to lean heavily in the coming years on I.D.A. whose terms of repayment are exceedingly favourable in relation to those of the World Bank and the I.F.C.

In its annual report released on September 30, 1963, the Bank made special reference to a proposal for a system of arbitration of disputes between Governments and investors which "holds great promise as a means of improving the international investment climate". Says the Report: "It is a proposal to establish facilities, linked in some way to the Bank itself, which would be available to foreign investors and host governments wishing to bring investment disputes to conciliation or arbitration. It is an essential feature of the proposal that resort to these facilities would be entirely voluntary. They would be brought into use only when both the government concerned and the foreign investor had consented. But once this consent had been given, the parties would be bound to carry out their undertaking and, in the case of arbitration, to abide by the award."

World Bank

The eighteenth annual report of the International Bank for Reconstruction and Development for 1962-63 indicated a drop in value of loans from \$882.3 million in 1961-62 to \$498.65 million in the year under reference. Despite the decline in the total of funds lent, there was no fall in the number of loans actually made. The drop in the volume of loans did not indicate any long-term downward trend and was caused by fluctuation between years due to "accidents of the calendar, whereby large loans just before or after the end of June widely affected the total for a fiscal year". The 28 loans sanctioned during the year under report took the total number of loans made by the Bank to 349 and the total money lent to \$6,983 million, net of cancellations and refundings. Among the borrowers were four new countries, namely, Cyprus, Morocco, Singapore and Swaziland; the total number of borrowing countries was thus raised to 64. The largest share of new loans was granted to Asia and the Middle East at \$179 million. The Western Hemisphere borrowed \$126 million, Europe \$111 million and Africa \$33 million.

Purpose-wise classification of the loans (see Table I) showed that the transportation loans were of the highest value at \$190 million. The four railroad loans to Colombia, Pakistan and Peru totalled \$66 million. Highway lending accounted for \$110 million in four loans to Israel, Thailand, Uruguay and Yugoslavia. The remaining transportation loan was of

\$13.5 million to Nigeria for improvement of the Port of Lagos. For electric power, ten loans were made during the year totalling \$124 million; the projects were situated in Colombia, Cyprus, El Salvador, Finland, Panama, the Philippines, Singapore, Swaziland, Thailand and Yugoslavia. The loans for industrialization were five in number and were valued at \$110 million to Colombia, India, Morocco, Pakistan and the Philippines. Four loans (value \$80 million) were given to Industrial Development Banks in India, Morocco, Pakistan and the Philippines. Four loans totalling \$24 million were made to assist irrigation projects in Mexico, Nicaragua and Thailand.

The cumulative total of the Bank's loans, net of cancellations and refundings, rose to \$6,983.2 million (see Table II) out of which \$5,425 million had been disbursed by June 30, 1963. \$2,261 million had been repaid to the Bank or sold to other investors. The total of loans — effective and non-effective — held by the Bank, net of exchange adjustments, on June 30, 1963, stood at \$4,712 million, \$47 million more than the year before. The Bank's net earnings at \$83 million were a new record which raised the Bank reserves to a total of \$813 million. All payments of principal and interest due during the year were received.

The Bank disbursed \$620 million during the year under

TATA-FISON AND RALLIS — they "know-how"!

"Demonstrations," said Tata.

"You mean brass bands, flags, pretty girls?" Fison asked hopefully.

"Useful demonstrations," said Ralli, bringing him down to earth, "to show farmers how our fertilizers and pesticides grow better, healthier crops and protect them, too!"

Tata-Fison and Rallis have combined their separate marketing organisations into a single, unified service. For the future, all Tata-Fison products will be marketed by Rallis' Fertilizer and Pesticides Division. The merger will prove of immense benefit to the Indian farmer. For the first time, one integrated service will provide advice and products covering both crop growth and crop protection throughout the country...a notable contribution to the cause of agricultural progress.

TATA-FISON RALLIS COVER THE FIELD!

This year it's Khajuraho... and Cashier Seshadri has every right to look pleased!

Three years ago, it struck P. G. Seshadri that he had seen hardly anything of his country. He decided to do something about it. ... This year he will complete the final leg of his tour! He's fifty-three, looks ten years younger, and has won the veterans' race at the Burmah-Shell meet for six years running. He has received three long service emblems and his interests include amateur dramatics, social welfare, sports, travel and photography.

... TO THE LAST NAYA PAISA

He signs/endorses some 700 receipt or payment documents every day. Chief Cashier with Burmah-Shell, Madras, Seshadri is in charge of the Cash Section consisting of fifteen men. His section receives money amounting to several lakhs every day and is responsible for making day to day payments. What is

his most important task? "Balancing the books," he says, "is of the utmost importance. The accounts must tally each day to the last naya paisa." They always do!

TODAY, AS EVER, PEOPLE LIKE SESHADRI ARE WORKING FOR YOU

Seshadri doesn't just have hobbies. He is good at them. One of his photographs won a second prize in a company competition. Liked and respected by his colleagues, Seshadri can look back with satisfaction on a happy, fruitful career.

Seshadri and people like him—at all levels of responsibility—are Burmah-Shell. Today, as ever, they are hard at work... working to ensure that vital petroleum products essential to India's growth and progress are brought to you at the right place and time, in the right quantities.

BURMAH-SHELL are People in the service of the People

report as compared to \$485 million in the previous year. The loans made by the Bank resulted in wide dispersal of the funds as the borrowers place their orders on the basis of international competition. The sales of Bank loans to other investors totalled \$273 million and the cumulative figure of sales of loans exceeded \$1,600 million. Borrowings during the fiscal year amounted to \$124 million; the maturing issues and redemptions totalled \$126 million, reducing the outstanding fund by \$2 million. The Bank was in a liquid position and had no need to raise new money in world's capital markets.

The Bank has provided technical assistance to a large number of countries in preparing projects and programmes up to the stage where they are ready for financing. In India consultants engaged by the Bank are studying ways to solve the coal transport problem in the short and long-term. Similar teams for various other projects are currently working in Ecuador, Iran, Nigeria, Republic of China and India. The entire cost to the Bank of these studies is estimated at \$2,750,000. The local costs in each case are provided by the Governments concerned.

The report has indicated that meetings were arranged by

the Bank with groups of capital-exporting nations interested in co-ordinating assistance to particular developing countries. During the year, the countries which were the subject of such meetings were India, Pakistan, Colombia, Nigeria and Tunisia.

Among the technical assistance services provided by the Bank to its member countries, an important element is the Economic Development Institute — the Bank's "Staff College" in economic development for senior officials of less developed countries. The Institute has now expanded its work and is able to provide courses "in more subjects, to more students and in more languages than ever before." The Institute has prepared courses to be conducted in French and Spanish, including special courses on the techniques of appraising development projects. The Bank took two initiatives in the sphere of education during the current year. The first related to the sponsoring of a new International Institute for educational planning to undertake research and training; this was done in collaboration with the United Nations Educational, Scientific and Cultural Organization. The Institute is situated in Paris and has been receiving support from the French Government and the Ford Foundation. The other project related to the organization of an expert study for

October 4, 1963

recommending "improvements in the standards and procedures for the design and construction of schools in Tunisia".

The membership of the Bank increased by ten during the year and rose to the total of 85. The increase was due to the entry of new countries of Africa; the names of the entrants were Ivory Coast, Jamaica, Kuwait, Niger, Senegal, Sierra Leone, Somalia, Tanganyika, Togo, and Upper Volta. The subscribed capital of the Bank increased from \$20,485 million to \$20,730 million.

Bank Aid to India

The total value of loans provided to India was \$876.11 million at the end of the fiscal year 1962-63, consisting of 13 loans to the Railways, five for power projects, five to ICICI for promoting industry, four to steel mills, two for coal mining and one each for agriculture and multipurpose projects. The rate of interest charged was between four and six per cent. The first loan of \$34 million was sanctioned on August 18, 1949, to the Indian Railways maturing in 1964, at the lowest rate of interest of four per cent. The loan of \$32.5 million to the Tata Iron and Steel Company Ltd. on November 20, 1957, and a loan of \$50.0 million to the Railways on July 19, 1959 at the highest rate of interest were of 6 per cent. It may be stated that most of the loans during the year under review were sanctioned at 5½ per cent. Changes in market conditions after September, 1962, reduced the rate to 5½ per cent which rate prevailed till the close of the current year. Complete details in regard to the loans to this country are provided in Table III. Special mention needs to be made here of the sanction of a loan of \$30 million to the Industrial Credit and Investment Corporation of India on June 5, 1963. While the date of maturity has not been fixed, it needs to be recorded that this was the fifth loan granted by the World Bank to this organisation. Total lending to ICICI by the Bank now comes to \$90 million, all in foreign exchange in order to finance the industrial projects. ICICI was organized in 1955 with the assistance of the Bank, and "it has so far approved financial assistance for 200 industrial projects involving 183 firms for a total sum of \$127 million." The industries which have profited by the loans of the ICICI are iron and steel, chemical, electrical, mechanical, paper and pulp, shipping, food processing, textiles, metal products, glass, cement and other building materials. It is estimated that the ICICI has been instrumental in mobilising total capital investments (domestic and foreign) in India equivalent to about \$650 million or nearly five times its own investment. Interest charged on the new loan will be at the Bank's current rate. The Bank and the ICICI will draw an amortization schedule for repayment of the loan which will be in semi-annual instalments and the final repayment of the entire loan will not be later than December 1, 1978.

IDA: Liberal Lender

IDA was set up three years ago "to promote economic development, increase productivity and, thus, raise standard of living in the less developed areas of the world". It is an affiliate of the World Bank and finances "carefully selected and prepared development projects" in the developing countries all over the world. The financial resources of this body are separate from those of the Bank. The most important aspect of the operations of this body is that it provides capital on much more liberal terms of repayment than any other international organization. The loans provided by the IDA make it possible for the less developed countries "whose ability to make good use of capital exceeds their capacity to service loans extended on conventional terms". The Indian Union also falls in this category.

All the credits provided by the IDA are repayable in

foreign exchange over 50 years, free of interest. There is also a 10-year period of grace following which 1 per cent per annum is repayable over the next 10 years and 3 per cent in each of the final thirty years. A service charge of ¼ per cent per annum is payable "on amounts withdrawn and outstanding" so as to meet the administrative costs.

During the third year of its operations (1962-63) the total value of new credits amounted to \$260 million. Only \$101 million were provided in the first year and \$134 million in the second year. The member-countries have made an initial subscription to IDA equivalent to \$765 million in freely convertible funds. These commitments are to be paid over a five-year period, that is, the funds are to be made available by the members within the first five years' operations of the IDA. Sweden has increased the subscription by \$10 million, thus raising the total available to \$775 million. On June 30, 1963, \$495 million had been committed leaving a balance of \$280 million. The net balance available for further commitments is less than even the figure of \$280 million, because negotiations are going on to make available to Pakistan a sum of \$102.5 million; another lending \$15 million to India will be included in 1963-64. Since repayment of these credits is not likely to begin in the near future, the resources of the IDA will have to be replenished by fresh commitments by the members.

Table IV provides details in regard to 13 projects for which a loan of \$300 million was provided to India by the IDA between 1961 and 1963. During the year under report, six new projects received sanctions; brief details of these projects are given below:

1. **Purna Project:** A credit of \$13 million was provided on July 13, 1962, to complete the irrigation project for supplying 1,52,000 acres in the Purna River Valley in the State of Maharashtra and to provide 15,000 kW hydro-electric power station. The project includes the construction of two dams on the Purna River, a 50-mile main canal and about 250 miles of distribution channels with associated works. In schemes of this type, the Government of India finances 60 per cent of the cost. The IDA credit will be a part of this contribution to the State of Maharashtra which will be in the form of interest-bearing advances repayable in 7 to 15 annual instalments at 4 per cent per annum, with the usual grace period.

2. **Koyna Project:** A credit of \$17.5 million was provided by the IDA on August 8, 1962, in order to complete this project. Earlier in 1959 the World Bank had provided a loan of \$18.7 million which assisted in the construction of the first stage of the Koyna hydro-electric project to provide an installed capacity of 2,40,000 kW. The new loan will finance the second stage of the project so as to increase its installed capacity to 5,80,000 kW. When the second stage of the project is completed, it will prove to be one of the largest hydro-electric undertakings in India.

3. **Port of Bombay:** A loan of \$18 million was provided on September 14, 1962, so as to expand facilities at the Port of Bombay both for cargo and passenger traffic. The expansion of the Port had become urgent because cargo traffic through Bombay had almost doubled in the past decade. Passenger traffic had also increased significantly. Included in the expansion programme are the construction of "four additional deep-water berths at Alexandra Dock; a new ferry wharf adjacent to Prince's Dock; an extension of Ballard Pier so as to provide an additional berth and a new building to accommodate passenger and cargo traffic." The other details of the programme include dredging of the main harbour channel, new floating craft including a new drag-suction

NOTES: IISCO—Indian Iron & Steel Company Ltd. TGPC—Tata Group of Power Industries. ICICI—Industrial Credit & Investment Corporation of India. TISCO—Tata Iron & Steel Company Ltd. A-I—Air-India International. CPC—Calcutta Port Commissioners. TPM—Trustees of the Port of Madras.

- (1) Loans made (a) to the member or (b) to a political sub-division or a public or private enterprise in the territories of the member with the member's guarantee.
- (2) Agreements in the total amount of \$296,350,000 providing for these loans have been signed, but the loans do not become effective and disbursements thereunder do not start until the borrowers and guarantors, if any, take certain action and furnish certain documents to the Bank.
- (3) The Bank has entered into agreements to sell the below listed portions of loans which are not yet effective: The list gives the borrower (guarantor), the year signed and the principal amount agreed to be sold: CVC & Chidral (Colombia), 1963, \$400,000; Ferrocarriles Nacionales (Colombia), 1963, \$790,000; Acerias Paz del Rio, S.A. (Colombia), 1963, \$325,000; Electricity Authority of Cyprus (Cyprus), 1963, \$1,185,000; Comision del Rio Lempa (El Salvador), 1963, \$395,000; Indian Iron & Steel Co., Ltd., (India), 1961, \$400,000; Nicaragua, 1963, \$135,000; Peruvian Corporation Ltd. (Peru), 1963, \$497,000; Swaziland (United Kingdom), 1963, \$85,000; Thailand, 1963, \$895,000; Uruguay, 1962, \$365,000; Yugoslav Investment Bank (Yugoslavia), 1963, \$209,000; Total \$5,972,000. The total of both effective and non-effective loans sold or agreed to be sold is the equivalent of \$1,605,315,492.
- (4) This includes amounts which, according to information available to the Bank, have been prepaid prior to maturity.
- (5) The interest rate on these loans was not fixed at the time the loans were signed; interest will be applied to each portion of the loans at the Bank's current rate when such portion is committed for a specific project.

dredge, two grab dredges, seven tugs, four harbour launches and one salvage-cum-water boat."

4. **The Indian Post and Telegraphs Department:** A loan of \$42 million was provided on September 14, 1962, to expand and improve telephone and telegraph services. This country has only "1.2 telephones per 1,000 inhabitants, compared with an average of 5 per 1,000 for Asia, 47 for the entire world and 300 to 400 in the developed countries." The third five-year Plan aimed at increasing telephone subscriber sets from 4,61,000 to 7,61,000 between 1961 and 1965. The capacity of the central exchanges was proposed to be raised from 4,12,600 to 7,58,100 lines during the five-year period. The loan will be used for building new telegraph offices, installing telecommunications equipment operating at the international speed and considerably expanding the teleprinter services.

5. **The Indian Railways** received a credit of \$67.5 million on March 22, 1963, to finance "imports of track materials, components and equipment to build locomotives and rolling stock in India." It will also be used to finance imports needed for the electrification programme and various other items required to increase carrying capacity."

6. **Kothagudem Project:** A loan of \$20 million provided on May 24, 1963, will help the construction of a 1,20,000 kw thermo-electric power station near Kothagudem in Andhra

Pradesh. The loan will also be used to build a reservoir to supply cooling water and a 150-mile transmission line to connect with other power facilities.

International Finance Corporation

Founded in July, 1956, I.F.C. is an international financial institution with an authorised capital of \$100 million. During the year 1962-63, the total membership of the Corporation increased by ten countries to a total of 73 with the subscribed capital of \$98,198,000. As compared to the World Bank and the IDA, IFC is an investing rather than a lending institution. In 1962-63, according to the seventh annual report of the Corporation eleven new commitments totalling \$18 million were made for the financing of private enterprises in ten countries including two standby commitments amounting to \$5.1 million. Also, the Corporation joined with the World Bank in assisting industrial development financing companies in Morocco, Pakistan and the Philippines. The Bank made long-term loans to the companies, while the IFC purchased capital shares. The IFC has also invested in the newly established development institution in Spain without the World Bank's participation. Proposals were under consideration to assist development finance companies in Finland, Malaya, Nigeria, Thailand, Turkey and Venezuela.

At the end of the fiscal year 1962-63, the Corporation had invested in 59 enterprises in 24 countries. In the year under

1. In these cases, certain legal formalities must be completed and other conditions fulfilled before funds may be withdrawn on account of the investment or before disbursements are required for commitments underwritten.

* The Corporation has agreed to sell \$260,000 of this investment.

The Erhard Era

From Our Special Correspondent

PARIS:

THE ERHARD era opens for West Germany in the middle of October, when the aged Dr Adenauer hands over, with every sign of regret and reluctance, the chancellorship to his eternal Dauphin, Dr Ludwig Erhard. Yet one hears it asked whether the real Erhard era does not lie in the past rather than in the future. That is to say, the principles of the "social market economy" have found a more thoroughgoing application in the last 15 years than they will be able to find in the more difficult years ahead. Erhardism worked in the period when the professor occupied a subordinate position but, by one of those ironies of fate not unknown in politics, he may find on acceding to the supreme power that he is obliged to practise another policy.

sponsor is Norma-Hoffmann Bearings Corporation which is providing assistance in planning and construction of the plant. It will also provide an eight-man management and production staff during the initial period of operations. The originator of the project is, as mentioned above, K. P. Joshi & Company of Bombay. The third sponsor is East Asiatic Company (India) Private Ltd. of Bombay which is a subsidiary of the East Asiatic Company Ltd. of Denmark. The total cost of the project is estimated at \$4,800,000, out of which \$2,200,000 will be the share capital. Norma-Hoffmann Bearings Corporation will take up shares of the new company to the extent of \$630,000, East Asiatic to the extent of \$240,000 and K. P. Joshi and Co. to the extent of \$160,000. The total investment being made by the Corporation is \$898,000—\$378,000 in shares and \$520,000 in the form of a loan repayable over a ten-year period. A part of the IFC investment is being taken up by the Irving Trust Company of New York. The new company is being assisted by the Industrial Credit and Investment Corporation of India Ltd, the proceeds of the public offerings managed by the ICICI of shares in the new company and also by loans from the United States Agency for International Development.

For example, Alfred Frisch recalls in a recent article that Dr Erhard's doctrine has, by good chance, never been seriously tested "because he benefitted throughout all his ministerial career, except for a very brief period, from a remarkable economic expansion that allowed Germany to wipe out unemployment and absorb quickly millions of refugees." Thus, he never had to choose between full employment, sound money and free competition, the three things that his social philosophy claims to be able to reconcile. Frisch is sceptical about the chances of Chancellor Erhard encountering equally favourable conditions, whereupon he would have to resolve a "conflict of conscience" and if he chose the wrong solution "the whole system could collapse lamentably." This author claims, too, that such doubts are widespread in West Germany where, in

October 4, 1963

spite of the professor's opposition, "the idea of economic planning is gradually making its way."

Similar thoughts are expressed by the Wirtschaftsbank of Zurich which says in a recent bulletin, "Whoever has followed closely in the last few months Press commentaries on the economy in West Germany has been struck by the more and more frequent doubts aroused by the development of that economy. There are those who fear that the 'social market economy' no longer corresponds to the tendencies of the moment.... These doubts rest on the following facts: the progressive modification of the economic climate, the complete exhaustion of manpower reserves, the full utilisation of production capacities... Since the end of the war, the economy has been able to give free rein to its indefatigable will to expansion, but henceforth the room for movement is becoming so small that the dynamic elements are starting to clash. It is difficult to deny that we find ourselves on the eve of a decisive turning-point in postwar economic development... Will the 'social market economy' be successful in the future? It is sure that if a turning-point has arrived and if the economy takes the direction it seems to be heading for, the free-competition system will be placed under much greater strain than it has known up to now. The temptation will be greater to restrict competition, and business itself will want the State (it will bring pressure on it for this purpose) to intervene more often."

Erhardism May Bend

In short, Chancellor Erhard will be under pressure to break with some of the policies of Minister Erhard, much as President de Gaulle has had to break with General de Gaulle, while Premier Debre had purely and simply to disown Senator Debre. It is not suggested that West Germany is headed for any kind of grave economic crisis; there is no sign of that. It is suspected, rather, that the reconciliation of social security and business freedom, which is the basis of the Erhardian economic philosophy, will hereafter be considerably more difficult, and in particular that dogmatic liberalism will have to compromise with democratic planning, as it has done already in virtually every other West European country.

Now, assuming all this to be true, I think one may be confident that Chancellor Erhard will not have as much trouble adjusting to the new situation as some of his friends and adversaries imagine. The reason for this confidence is that his economic management, in practice, has seldom tallied exactly with his economic doctrine, in theory. This point is usually made with polemical intent: the professor is accused of insincerity or hypocrisy, preaching one thing and practising something rather different and less "liberal." That is not the intention here; so far as one can show that Minister Erhard has never applied unsullied Erhardism, as described in his own writings, this is grounds for congratulating him and for expecting that he will be capable of the suppleness that Germany's new situation requires.

Examples are legion. There still exist some price-controls in the Federal Republic after half a generation of Erhardism, and in general the economy is bound up in a network of regulations and controls quite comparable to those existing elsewhere in Europe. A German economist has written, "It is important to note that this country has a solid infrastructure of regulations... The German economic and social system is equivocal. One might even wonder whether the dogmatic affirmation of economic liberty is not an indispensable antidote to an excessively authoritarian regulation." The same point is made more acidly by foreign observers who have asked whether the passionate attachment to a super-liberalism that out-Americans the Americans is not the sign of a bad conscience about the plentiful controls in the German economy. If one wished to come to specific cases, it is easy to cite things like the subsidies for German ports that help them meet Rotterdam's

competition, or the public funds poured into the Lufthansa airline.

More generally, one must note that a large part of German production is exported (31 to 46 per cent for the big chemical firms, for instance), and that the State plays an active role in this trade by way of outright financing, guarantees and commercial policy. A senior German official could say publicly lately that no German capital-goods firm could call itself private enterprise because the State is its partner at every point. In investments in developing countries, too, the State has taken all the initiative, private firms venturing nothing without governmental leadership and support. Nor has Minister Erhard ever applied his liberal doctrine to the letter as regards cartels, which are banned in theory but there are so many exceptions (some of them dubious, from the point of view of the public interest) that the situation does not differ from that elsewhere in Europe. Specialisation pacts are of course as common as anywhere, but Dr Erhard has blessed more than one price-fixing cartel and market-splitting arrangement where this seemed needful for the health of an industrial sector. German energy policy, further, is as rich in contradictions as anywhere in Europe and has as little to do with liberal dogmas. Coal and oil are protected, and progressive developments like atomic energy have been restrained to safeguard investments in older forms of fuel.

Farm Politics

In agriculture, the distance between liberal doctrine and German practice is too great to need emphasis, and the Six seldom meet in Brussels without someone pointing out the blank contradiction between Dr Erhard's super-liberalism and his super-protection of German farmers. The standard German retort is that farming brings in human and social interests (more frankly, electoral considerations) that cannot be sacrificed, and this is of course the same reason as governments have always given for their retreats from economic liberalism in any sphere. Lastly, even while maintaining his doctrinaire condemnation of planning, Dr Erhard has suffered to be attempted this year for the first time an economic budget for the whole country—not just a budget of public revenues and expenditures, but a forecast of the nation's business such as planners begin with.

The contradiction between such facts as these and pure Erhardian theory is not particularly shocking. Nor is it evidence of bad faith, because on all these questions and many others Dr Erhard could fairly claim that he has tried to preserve as much liberalism as was compatible with political and social necessities. He will no doubt continue to do so as the situation becomes less favourable to his economic theories. That is, his practice may become less "orthodox" but he will always prefer the more liberal of two solutions where both are consistent with full employment and social security. But supposing there is an ineluctable need to choose between business freedom and full employment? Few Germans, even among his critics, doubt that in that case Chancellor Erhard would prefer full employment. Frisch, who is rather cynical about Erhardism, has said, "In that case, professor Erhard and his collaborators would probably try to take the most liberal measures they could, resisting the temptation of government intervention and control, but nevertheless they would fight to the end in defence of full employment. It is certain that their liberal principles will never stand against the demand for full employment and social security." There seems to be ample warrant for this forecast in the record of Erhardism to date, which has never been as old-fashioned and "liberal" as it is made to sound. And the compromises with his "principles" that a politician will accept when he is in a post of secondary importance are nothing alongside the retreats from orthodoxy that he will make when he has the supreme and final responsibility for his country's welfare—and his party's

Japan to Help with Bokaro?

By Our Special Correspondent

NEW DELHI:

THE STATEMENT in Madras by Mr. Takashi Nayto, Chairman of the Japanese House of Representatives' five-man delegation, now touring the country, that Japan has offered to set up the projected steel plant at Bokaro, is the first authoritative public indication of that country's interest in this scheme. But it has been known for some time that discussions have been going on at an informal level between the Government of India and the Japanese steel and heavy engineering industries. The talk seems to be concerned mainly with the first stage of the Bokaro project, namely, the construction of the plant up to and including the blast furnace stage. One of the proposals under examination is that the foreign exchange cost would be financed by the export of iron ore or pig iron to Japan. The Japanese preference seems to be for the ore, but on the Indian Government side, the desire reportedly is that the Japanese should agree to receive at least part of the payment in the form of pig iron.

Among other possibilities which are being considered in this connection are that the European Coal and Steel Community may perhaps be approached to take up some part of the Bokaro project, possibly in association with the United Kingdom or the United States.

★★

The Finance Ministry's intention with regard to the promoting of a Unit Trust to serve small investors seems to be that banks and other appropriate financial institutions should form a consortium for setting up and running the proposed unit trust. This project runs contrary to the practice in Britain where Unit Trusts are a competitive business and there is no restriction on their establishment provided the regulations laid down for their constitution and proper running are observed. The British model gives the investor a choice between competing Unit Trusts; he is enabled to choose, on the basis of their respective investment policies and performances, which among the several Trusts he would give his custom to. Under the Government of India's scheme, however, he will not have this choice since there will be only one Unit Trust functioning in the field. The absence of competition might also mean that there would be no standards of comparison or relative efficiency which could be applied to the working of the Unit Trust.

★★

The first meeting of the Board of Directors of the Cochin refinery, held on September 27 and 28 at Ernakulam, is understood to have approved Ambalamukal as the site for the project. Ambalamukal will be linked to the main road to Ernakulam and Kottayam by a 100-foot long feeder at Tripanithura. A 7½ miles pipeline is to be laid from Ernakulam Channel to the refinery site to pump crude oil straight from the tankers to the refinery and the refined products to the tankers in the port. A combined broad and metre gauge railway line is also planned from Tripanithura to Ambalamukal to link the refinery with the Cochin Port.

The Board of Directors, it is further learnt, reaffirmed the resolve expressed in the refinery agreement that the project should be commissioned by the end of 1965. Considering the difficulties which the project authorities were encountering in their liaison work with the Union Ministry of Mines and Fuel, the Board is believed to have approved the appointment of a high-powered liaison officer whose main function would be expediting matters so as to enable the refinery to go on stream as per schedule.

The Union Minister for Mines and Fuel, Mr O. V. Alage-

san, who inaugurated the Board's meeting, is reported to have stated that the agreement on the Cochin refinery had led to a perceptible change in the attitude of the managements of the three existing private sector refineries in this country. He felt that they were now prepared to enter into partnership with the Government for construction of further oil refineries in India. Mr Alagesan called upon Burmah-Shell, ESSO and Caltex managements that they should give up their 1951 agreements which "looked absolutely out of place in the present context." These agreements, he added, were already inoperative in certain parts and with whatever safeguards that might be necessary and provided for, it should not be difficult for them to abrogate these voluntarily.

Mr Alagesan reiterated the Government's decision that two new refineries — one at Madras and the other at Calcutta — should be set up by 1967 and 1968, respectively. Considering the regional demand pattern, he opined that a refinery somewhere in North India might also be necessary. These new refineries, along with the existing ones, Mr Alagesan said, should help in meeting the country's requirements of about 17 million tons of oil and oil products at the end of the third Plan and also a part of the requirements of the fourth Plan which were estimated at 27 to 30 million tons.

Talking about the development of the petro-chemical industry, Mr Alagesan stated that petro-chemical complexes had to grow around every one of the refineries, since they had a great potentiality to enrich the economic life of the country. The Government, he said, was already thinking of setting up a huge petro-chemical complex along with the Gujarat refinery. Most of it was envisaged to be developed in the public sector. But the private sector could also have a part to play in its development.

Mr Alagesan wanted the Oil and Natural Gas Commission to proceed a little faster in exploring for oil in the country so that dependence on foreign crude should end. He favoured the ONGC undertaking exploration work abroad as well. In this connection, he said, the Government was considering co-operation with the Iranian Government in a suitable manner in exploring for oil in that country — both offshore and on-shore. He revealed that a high level delegation would proceed to Iran in the second half of October for holding negotiations with the authorities there for arriving at some working arrangements both for import of crude as well as exploration for oil.

★★

The Planning Group on Fertilizers has divided itself into two sub-groups, one to plan the production of fertilizers and the other of fertilizer-making plant and equipment. According to present indications, a target of two million tons of Nitrogen is being suggested for the fourth Plan. The Group is examining various sites for five or six fertilizer plants to be commissioned by 1971. The sites suggested are Rihand for a coal-based plant, the Madras region, based on imported naphtha and Goa, also based on imported naphtha. There are four alternatives for the Eastern region, namely, Barauni, Haldia, Durgapur and Sindri, the former three being on gases or naphtha.

Hanumangarh was selected for a fertilizer plant in Rajasthan during the current Plan period. The group will have in addition Jai Samudram near Udaipur. It is explained that for the economics of this plant, a formula to determine the cost of Naphtha for Koyali in Gujarat has been evolved. So also the railway freight. Jai Samudram will have the additional advantage of having a zinc smelter in its proximity, this

October 4, 1963

facility will make sulphuric acid available to the project.

The group in charge of plant and equipment will, among other things, consider the requirements of petroleum refining and petro-chemical industry, which require similar equipment.

Another committee with Dr. Kalelkar has been set up to re-appraise the need for a second Forge and Foundry Plant. A Committee had recommended some two years ago the setting up of a second Forge and Foundry Plant. Since then new developments have endorsed this recommendation.

All these committees it is expected, will make their reports by November this year.

**

The State Electricity Boards of Uttar Pradesh and Punjab and the Delhi Electric Supply Undertaking have agreed to inter-connect the Punjab-Delhi-U.P. power systems and construct the necessary transmission lines which will link the three systems.

It has been estimated that, by interlinking the Delhi and Punjab systems alone, there would be a saving of Rs. 9.65 crores in capital outlay and Rs. 1.46 crores in annual running charges. Under the integrated operation of Delhi and Punjab systems, it would be possible to increase the firm capacity of the systems by about 100 MW at the commissioning of the fifth unit at Bhakra Right Bank Power House. In addition, a substantial portion of the secondary power available in the Punjab system can be profitably utilised by the Delhi Thermal system.

An extra high tension interconnection between the Punjab-Delhi and U.P. systems will be achieved by constructing a 220 kv line from Moradnagar to Delhi 'C' station. This will also be interconnected with Punjab system by constructing a 220 kv line from Faridabad. Another 66 kv single-circuit link will be established between Ghaziabad and Shahdara to enable exchange of power under emergency conditions during the interim period. The Punjab State Electricity Board has started planning their inter-connection with Delhi. The U.P. Board has prepared a project report for the work, and construction is expected to start shortly.

**

The Planning Commission is understood to have agreed with the Union Minister for Works, Housing and Rehabilitation that pending the setting up of the Central Housing Board, Rs. 10 crores earmarked for it in the third Plan should be utilised for directly financing housing projects in States. This is because even if it is eventually decided to set up the Board, it might take two years before an Act by the Parliament is passed and necessary machinery set up. The additional funds would help considerably because following the emergency, allocations for Housing had been drastically reduced.

It has also been agreed that the functions and the role of the proposed Board should be further discussed between the officers of the Commission and the Ministry. Once the ideas on the Board's field of activity were formulated, the proposal would be discussed with the State Governments.

The Planning Commission, it appears, considers Central Housing Board essential for utilising it as "an instrument for planned housing." Over 7.6 million houses would have to be built during the next decade to meet the current requirements in urban areas alone. Such a big problem, it is argued, could not be solved through the financial resources of the Government alone. Institutional arrangements were, therefore, necessary for providing finance to enable large number of persons to build for themselves.

Another argument given in favour of the Board was that the existence of such an institution would ensure that the funds meant for housing do not lapse and are not diverted to other projects. The funds provided by Government along with those raised from the market could be "revolved"

to enable the maximum output of housing.

**

A Permanent Committee has been set up recently in the Ministry of Mines and Fuel for co-ordinating the planning of coal washeries and power stations so as to ensure the maximum utilisation of washery middlings. Besides the Mines and Fuel Ministry, the Ministries of Railways, Irrigation & Power and the Planning Commission are represented on this Committee.

The use of washery middlings for power generation is preferred to the use of straight low grade coal because they have a fixed consistency in the matter of ash content. They started to be utilised for generation of electric power towards the latter half of the second Plan and by 1961-62, their use for this purpose had grown to 0.9 million tons at Bokaro, 0.6 million tons at Durgapur (D.V.C.) and 0.27 million tons at Durgapur (coke oven) power stations. By the end of 1965-66, the Chandrapura Power station of the D.V.C. and the Pathratu, Barauni, Bandel and Calcutta thermal stations are also expected to start using washery middlings. Then the combined requirements of the eight middlings using thermal stations will be of the order of 5.22 million tons per annum.

This, however, does not mean that the entire middlings that come out of the washeries already in existence of those being set up would be fully utilised by the thermal power stations. The excess supply of middlings over the demand for them from power stations is anticipated to be as follows during the next five years: 1963-64 — 0.97 million tons; 1964-65 — 0.81 million tons; 1965-66 — 2.11 million tons and 1967-68 — 0.89 million tons.

All the future central power stations to be set up in West Bengal, Bihar, Madhya Pradesh, Maharashtra, Andhra Pradesh and Orissa, it has been decided, should be capable of using washery middlings.

**

The Government of India has set up a second State Trading Corporation. It is called the Minerals and Metals Trading Corporation of India Limited. As the name should suggest, this Corporation will be handling export of iron ore, manganese ore and other minerals and import of non-ferrous and other metals. It started functioning from October 1.

The new Corporation has been created primarily by separating the divisions concerning minerals and metals from the existing State Trading Corporation.

Incorporated as a limited company under the Indian Companies Act, 1956, the MMTC will have a subscribed capital of Rs. 2 crores. All its shares, except two, will be held by the President of India. The remaining two shares will be held by senior officers of the Union Government. They will be nominated by the President.

Mr Govind Narain, S.T.C.'s Chairman, has been named as the Chairman of the M.M.T.C. His place in the S.T.C. will be taken by Mr B. P. Patel, Adviser, Programme Administration of the Planning Commission.

The M.M.T.C. will draw and implement all the plans for the export of minerals and ores and co-ordinate the work with all the other authorities concerned in order to realise export targets fixed in these respects, through a unanimous and synchronised development of mining, transport capacity, port handling arrangements and other facilities.

**

Although in the course of the three five-year Plans about Rs. 75 crores have been spent on the various rural water supply programmes, it is estimated by the Government of India that about three-times as much more funds will have to be spent in the coming years before all the rural areas are provided with minimum water supply facilities. The Central Ministry of Health has in hand a programme of rapid surveys on the collection of data through special investigation divisions in the States and a Special Rural Water Supply

October 4, 1963

ordination Committee and a Drinking Water Board. This, it is expected, should help the Government to assess the dimensions of the problem within about a year and provide them with the data for preparing detailed engineering projects.

**

Mr Asoka Mehta has been appointed as the Deputy Chairman of the Planning Commission.

He will assume charge of the office on his return from abroad, which will be in about 2 months' time.

During this period Mr C. M. Trivedi, the senior member of the Commission, will act as Deputy Chairman.

Mr G. L. Nanda, the former Deputy Chairman, will continue to be a Member of the Commission.

The Prime Minister has also invited Mr B. R. Bhagat, Minister for Planning, to be a Member of the Commission.

Discussions on the utilisation of the \$65 million yen credit granted to India by Japan began in Tokyo this week. The talks will cover the continuation of assistance for the fertiliser project at Durgapur and Gorakhpur and allocation of aid money for some new projects including a steel alloy plant in the private sector and for certain maintenance imports from Japan. Terms of the credit will also be finalised. The talks are likely to last about two weeks.

The \$65 million yen credit was indicated by Japan at the

God Damned for Dam Disaster

From Our Correspondent

BOMBAY:

THE MAHARASHTRA Government announced the acceptance of most of the findings of the Naik Commission on the Panshet and Khadakvasla dam disasters. The Commission, according to the Government, observed that the breach of the dams on July 12, 1961 'was an act of God.' The civil authorities were 'unprepared for the situation caused by the dam burst and the rescue arrangements proved utterly inadequate. Neither the advancing of the date of completion of the dam by one year nor any negligence in the construction or maintenance (of the dam) were responsible for the mishap. The Government in its resolution observed that it would be taking disciplinary action against those officers who were guilty of inefficiency or misconduct in the performance of their duties. The findings showed that warnings were not given to the people in Poona about the imminent danger of the breach of dams. The All India Radio was not instructed to broadcast the news of the dam failure.

**

The Bombay Municipal Corporation Act is proposed to be amended to levy a new octroi duty on goods entering into Greater Bombay for consumption, use or sale. The Bill provides for varying the maximum rates specified in the schedule from time to time. A wide range of consumer goods ranging from grains to soaps and blades, structural materials like cement and iron and the various types of vehicles are sought to be brought under the new impost. The total number of items on which the levy is proposed comes to 60 as against 40 now subjected to town duty. Trade circles in Bombay expressed grave concern about the levy. This is because they were demanding the abolition of town duty whereas the new proposal tries to impose fresh burdens. The prices of all the 60 enumerated articles in the schedule are expected to go up and the ultimate sufferer would be the consumer in the process.

Price-wise, no reaction was noticed in the Bombay commodity markets but traders apprehend that the extension of duty to items like coffee, animals, cutlery, perfumery, paper etc. would disrupt trading in the city. Substantial increase

recent meetings of the Aid India Consortium in Paris and Washington.

The newly appointed Vice-Chairman of the Oil and Natural Gas Commission, Mr. P. R. Nayak, is leaving for Iran with a team of experts on October 15 to secure concessions for oil exploration in Iran. Side by side, intensified efforts are being made to secure untied foreign exchange, which may be used for oil exploration.

**

A number of World Bank teams are expected to come out from October onwards to study projects for which aid could be made available to India. As usual there will be a team for the survey of railway development. In addition, there will be teams to study projects in the fields of irrigation, roadways and power generation, for which the Bank has been giving aid to India.

**

A high-level team from the British Coal Board is arriving here on October 8, to have discussions with the Government and the Coal Industry. It will be headed by Mr Shepherd.

An Indian Mission led by the Joint Secretary in the Ministry of Mines and Fuel had been to Belgium and England earlier this year, primarily to purchase coal-mining machinery.

in vanaspati duty would affect the production in mofussil centres heavily depending upon Bombay as outlet. Mr. G. D. Somani, President of the Indian Merchants' Chamber, said that the new levy would bring about a rise in prices of goods meant for individual consumption and use in industries. There was hardly any justification for the Government to empower itself to vary the rates. He appealed to the Government not to hasten with the passage of the Bill, but give an opportunity to the interests concerned to express their point of view so that the Bill in its final form may not adversely affect the trade and industry of the city. The position of industries exporting the goods overseas is not clear in the Bill. Unless such industries are exempted, the competitive position of industries situated in Greater Bombay would be adversely affected.

**

A Bill seeking to regulate the promotion of the construction and the sale and transfer of flats on ownership basis was introduced in the Maharashtra Assembly by the Housing Minister, Mr Taleyarkhan. The aim of the Bill is to remove the evils in the system of acquiring housing. According to the Minister, nearly 14,000 flats had been constructed under the ownership flat system in Bombay in the last 10 years. As the system grew popular due to the increasing demand for housing, a heavy profit bias on the part of the promoters developed and they began to charge fantastic prices even for small flats. A redeeming feature of the Bill was the provision to ensure that the builder handed over the flat, complete in all respects, to the purchasers on the due date; if he failed to do so, he would not only have to refund the money to the purchaser but pay 9 per cent interest on it. The Bill was welcomed by all sections since it constituted the first attempt to put a stop to the abuses arising from the ownership flat schemes in the city.

The 15th meeting of the All India Farmers' Council scheduled to be held at Ahmedabad from October 2 to 4 will now be held from November 5 to 7. Farmer members of the Council from all parts of the country are expected to participate in the meeting. A Seminar on "Ways and Means to step up agricultural production to meet the demands imposed

October 4, 1963

by the National Emergency" will be held along with the Council Meeting. An exhibition on "Agriculture in Emergency" will also be organised with the active co-operation of the Department of Agriculture, Government of Gujarat.

**

A 'Home' for Indians settled abroad who visit the country has just been completed in Bombay. It will be opened by President Radhakrishnan during his visit to Bombay. The six-storeyed structure is situated in Backbay Reclamation and has been sponsored by the Brihad Bharatiya Samaj, an organization which promotes the interests of Indians abroad. The House will carry research into Indian emigration as well as its other functions. There will be a hostel for students from abroad studying in India and scholarships will be awarded. A transit camp will provide accommodation for Indian travellers going or returning from abroad. The auditorium can seat 800 persons and will be rented out for social and cultural functions. The research centre will conduct a survey of five million Indians in more than 40 countries. The Samaj hopes to have similar buildings erected at Madras, Delhi and other centres in course of time. The scheme is the idea of Mr. S. K. Patil, the former Food Minister, who is also the Chairman of the Samaj.

**

The Forward Markets' Commission celebrated the tenth anniversary. Mr. P. C. Bhattacharyya, the Governor of the Reserve Bank, released a special monthly Bulletin brought out to mark the occasion. Mr. Manubhai Shah, Minister of International Trade, inaugurating the fourth conference of presidents and Government-nominated directors of associations statutorily recognised by the Forward Markets Commission, observed that the farmer got a 'raw deal' in our country. This was because of social practices and lack of consciousness. Hedging was primarily designed to protect the farmer. He urged forward operators not to depress the prices 'through vicious propaganda.' The crops were overestimated at the time of harvest while another estimate was produced at the time of sale. No economic revolution was possible without a system of price support, adequate buffer stocks and hedging facilities. For instance, in Japan the Government supported the prices of as many as 94 items. The 'jute grower' in India was the 'most hard hit grower in the world' and got a meagre return. Powerful interests had colluded to hammer down the prices. Areas growing cotton were more prosperous because of the fairly good price cotton fetched.

Mr. Shah conceded that the price of Indian cotton was about the highest in the world but said that high costs arising out of low productivity were built-in factors in any under-developed country. He appealed to the trade to give the

Centre in Default?

From Our Correspondent

CALCUTTA:

DOUBTS ABOUT West Bengal being able to fulfil its third Plan targets have grown following a meeting last week of the State Cabinet to make an appraisal of the progress of the Plan. This is because according to the State Finance Minister, West Bengal's financial position is passing through a difficult phase, mainly because of the failure of the Centre to release the agreed quantum of funds so far in the plan period. It may be recalled that West Bengal has drawn up a third Plan of Rs. 293 crores though originally a plan of Rs. 341 crores had been envisaged. Even the final plan of Rs. 293 crores is higher by Rs. 43 crores of the Plan indicated by the Planning Commission which fixed a central assistance of Rs. 160 crores and assessed State resources at Rs. 90 crores. But on the State indicating that it can raise its resources to Rs. 133 crores, the Planning Commission approved a Plan of Rs. 293 crores.

co-operatives a proper place. There was no 'hiatus' between the co-operative and the private farmer. The Forward Markets Commission was exhorted to create a climate for price support programmes, particularly jute, and for policies which were pro-agriculturist and pro-co-operative. Although India was the largest producer of many seeds, Indian vegetable oil prices were the highest in the world. The tropical Indian seeds were unique in quality and had a good market abroad. He said that the oilseeds crop had remained stationary. Research should be conducted into improving the productivity. In spite of a near monopoly in black pepper, India got low prices for its products abroad. The associations concerned were requested by the Minister to suggest ways and means of remedying the situation.

Price Stabilisation

Mr. A. S. Naik, Chairman of the Commission, claimed that the Commission had always endeavoured to stabilise prices. During 1962-63, nearly 32 per cent of the country's exports (Rs. 694 crores) were accounted for by commodities in which forward trading was regulated. The scope for increasing the exports was considerable and it was imperative that the prices were not allowed to rise because of irresponsible trading. Often, a sharp rise in forward prices had resulted in a rise in ready prices while the converse was rare. Forward trading in the country was still suspected as a field for speculators. The Commission had decided to take strong action against unscrupulous speculators. Many members of the recognised associations were found guilty of irregularity counts of such traders.

**

The Bombay Stock Exchange put up a remarkable performance. There was an atmosphere of cheerfulness and the market has been brought about by a change in the psychology following the amendment of the Gold Control Rules and the Compulsory Deposit Scheme and by hopes that every effort will be made to stipulate the capital market. A notable feature of the bullish trend during the last six weeks is that the improvement has been slow and cautious, though, in the latest week, it gathered considerable momentum. The bullish support, although confined to certain selective leading counters, has been backed by a sizable investment demand also as witnessed in the substantial rise in several cash counter in Bombay, Calcutta and Madras. Several shares in the cleared list were picked up by investors at low levels, with the result that there was a scarcity of stocks in the market and at every purchase investors had to pay a higher price. The recovery from the year's low has been of the order of 9.5 per cent during the past 1½ months.

Explaining the position in regard to disbursement of Central assistance, Mr. Sankardas Banerji has revealed that for the first three years the State has received only a total of Rs. 68 crores. In his Budget speech in February last, Mr. Banerji had said that Central assistance received in 1961-62 amounted to Rs. 21.03 crores while Rs. 26.40 crores was promised for 1962-63 and a like sum for 1963-64. It is clear now that even the promised quantum of assistance has not been forthcoming. According to Mr. Banerji the State could expect Rs. 35 crores in 1964-65 and Rs. 40 crores during the last year of the Plan. All this will add up to only Rs. 143 crores for the entire third Plan period though the Central assistance agreed upon is of the order of Rs. 160 crores. Though Central assistance has been coming in a trickle, so to speak, the State Government has not slowed down its development works with the result that it has already spent about Rs. 80 crores out of its resources

October 4, 1963

of Rs. 133 crores. The very fact that the State has agreed to raise Rs. 133 crores as against the Planning Commission's assessment of its resources of Rs. 90 crores is a clear indication that it has made strenuous efforts at mobilising internal resources. It will therefore be idle to expect it to fill up the large shortfall of Rs. 17 crores in Central assistance.

**

The reported indication given by Mr. O. V. Alagesan, Minister for Mines and Fuel, at a recent meeting of the Congress Parliamentary Party's Standing Committee on Mines and Fuel to the effect that one of the three refineries proposed and Fuel to the effect that one of the fourth Plan will be located at Haldia, to be set up during the fourth Plan will become an has aroused the hope that this satellite port will become an industrial complex comparable to Durgapur. For more reasons than one, the development of Haldia as an auxiliary to the port of Calcutta is a necessity that brooks no delay. In the first place, Haldia's function is to minimise the strain on the Calcutta port which is being choked by the progressive silting of the Hooghly. Further deterioration in the available depth of the river is being kept in check only by the spending of large sums for dredging. Even so the fact remains that payable load of ships operating to and from the Calcutta port has been declining steadily over the past few years thereby adding to the cost of shipping. The World Bank has also stressed the need for establishing a satellite port at Haldia to handle food-grains, coal and iron ore. In the opinion of the Bank, Haldia should be at least in partial operation by the end of the third Plan.

Another Durgapur

In consultation with the Calcutta Metropolitan Planning Organisation, the Calcutta Port Commissioners have drawn up a scheme for developing approximately 25 square miles around Haldia to accommodate docks, rail and marshalling yards, housing for employees and other facilities. Experts consider that Haldia will also be ideal for supporting an industrial complex, as big as Durgapur, if not bigger. Speaking at a recent meeting of the Society for International Development Dr. S. N. Sen, formerly of the State Trading Corporation, has pointed out that a variety of industries including a steel plant and refinery can be set up at Haldia. The non-availability of raw materials should not be considered as a serious bar to setting up a steel plant at a particular place which is otherwise well suited. In this connection Dr. Sen cited the case of Japan, UK and USA which are leading in steel production despite deficiencies in one or more raw materials. In the case of Haldia, he has maintained, transport costs will be minimum because of the factory's proximity to the port and high-grade iron ore can be brought from the neighbouring State of Orissa by inland water transport by developing the inter-State canals. This will have the added advantage of aiding the development of Orissa also. With the setting up of a refinery, Dr. Sen opined, rolling of heavy plates could be cheaply done using the gas from the refinery. Other industries suggested by Dr. Sen, are a fertilizer factory based on the byproducts of the steel mill and an electronics industry.

**

In common with other stock exchanges in the country, Lyons Range continues to be buoyant on the hope that Mr. T. T. Krishnamachari will before long give good tidings for the investor.

It is believed that the Government is studying the impact of the SPT on the corporate sector, but it is not expected that its repeal is round the corner. It is quite on the cards, however, that it will be quietly replaced by a suitable increase in the corporate tax in the next Budget. Hopes and thoughts such as these are now sustaining the bullish fervour in the stock market. But it will be wrong to suppose that the current mood is one of unbridled enthusiasm for equities. Al-though there has been in recent days increased interest in the cash section, it is as yet essentially a speculative market. That lingering doubts continue to govern the outlook has again and

again been demonstrated by the not-infrequent profit realising operations. It is however not to be denied that such operations have been well absorbed but it only proves that the bulls are strong. The fact that the present buoyancy is as yet built on hopes which may or may not materialise is not ignored by the more sober section of marketmen who have begun to express concern at the rather quick rise in equity values in the past few days.

**

Sacking prices in the Calcutta jute goods market gained sizable ground towards the close of last week following renewed support. Interest was sparked off by reports of fresh orders from Australia but it would appear that the expectation of more orders from a number of foreign buyers was the sustaining influence. Another sizable buyer is expected to be the Government of India. As for foreign orders, the belief is that at least for some months to come, supplies have perforce to come from India only, in view of the fact that Pakistani order books are full for the next few months. It is not improbable that already traders in Calcutta are getting ready to book orders from Russia and East European countries. It has been revealed that the recent jute delegation headed by Mr. M. P. Birla has brought extremely good news to the Indian industry.

Speaking in Calcutta last week-end the Jute Commissioner, Mr. G. C. L. Joneja, said that the delegation had found that a number of markets in these countries would be able to absorb sizable quantities of Indian jute manufactures as well as jute. The Commissioner further revealed that large quantities of jute goods from India would soon be placed on these markets. He however made it clear that while proper propaganda may bring in business from these new regions, the fact remained that these markets could be retained and expanded only if our goods were able to maintain good quality while our traders strictly conformed to the mutually agreed terms and conditions of business. Dispelling the impression held in some quarters that business with Russia and East European countries would not require the adherence to strict standards as to quality, the Jute Commissioner pointed out that the Russian markets were as sensitive as the US markets. As an export industry catering to some of the most sophisticated markets, the jute goods industry should be extra careful about maintenance of proper quality of its products. It is true that by and large the industry's record has been quite good but the fact remains that now and then there are complaints. Recently there have been complaints from Australia about some consignments. It is therefore gratifying that the IJMA will have soon its own scheme for voluntary quality control and one can be sure that Government will have no occasion to enforce its own scheme of quality control.

Steady Trend

Referring to the raw jute situation, the Jute Commissioner said that a steady trend had been maintained last month and similar conditions might be expected to continue. During October the jute industry will be required to lift a total of 9.2 lakh bales, 8.5 lakh bales by IJMA mills and 70,000 bales by other mills, as against 7.5 lakh bales in September, under the scheme of compulsory purchase quota. This is in conformity with the expectation that the mills quota will be closely related to the rate of raw jute arrivals. The Jute Commissioner pointed out that if arrivals during October proved to be heavier than expected the JBSA would be asked to lift 2 lakh bales. Now that the State Trading Corporation had made available to the jute growing States a sum of Rs. 1.70 crores, jute co-operatives would not be long in starting operations. The fund now provided by the STC however does not represent the ceiling limit. As a matter of fact the State Governments will be able to draw almost unlimitedly for the specific purpose of enabling the co-operatives to buy all the jute that is on offer. As it has been noted in this column more than once, it is as yet too early to conclude that success of the Govern-

October 4, 1963

ment's policy of ensuring a reasonable price to the cultivator is assured. That there is many a slip between the cup and lip may still be true as far as the jute cultivator is concerned. That the task to which Government has addressed itself is not

Cement Muddle Serious

From Our Correspondent

MADRAS:

THERE HAS been an acute scarcity of cement for quite a long time, particularly after the declaration of emergency. The demand on account of the Government's projects and defence services increased so sharply that in the absence of any corresponding increase in production, the allocation for civilian consumption had to be drastically reduced. In Madras State and elsewhere, there was complete control over distribution and even small purchases for urgent repairs had to be obtained only through permits. This caused great annoyance to consumers besides delay in construction and essential repairs.

There is a feeling that the Government had allocated for themselves a large share of production and that there would be need for relaxation of restrictions before long as the Government departments were not lifting their quotas for some time. With a reduced offtake during the monsoon on Government account, particularly in Andhra Pradesh, there has been an accumulation of stocks in the past three months. It has been actually complained by the cement units in Andhra that there silos are full of cement and it has been found obligatory to suspend grinding of clinker on account of the lack of storage capacity. Even clinker storage is proving to be a problem and it has been represented to the authorities concerned that the restrictions on distribution should be relaxed as there was a large unsatisfied civilian demand. In Madras also the various units have no arrears of delivery and permits for civilian consumption are immediately handled as one unit in Ramanathapuram District has expanded its capacity by 350 tons daily and another unit in Salem district will shortly be commissioned into production. The supply position is expected to improve considerably. It has, therefore, been suggested that the stockists should be given partial freedom to dispose of cement in the manner obtaining sometime back. The stockists had then freedom to sell 20 per cent of their receipts to small consumers without restriction. In any case, reduced offtake on Government account should not result in reduced production on account of a needless accumulation of stocks.

Advantage was taken of the presence of the President, Dr. S. Radhakrishnan, to lay the foundation-stone for a large milk plant to be erected at Sathamangalam, near Madurai. This plant is being constructed under the auspices of UNICEF and with the assistance provided by New Zealand. This will be the ninth large milk plant to be assisted by UNICEF in this country and the value of contribution is \$100,000. The pasteurisation plant with an initial capacity of 50,000 litres daily will be installed under this scheme through the Madurai City Co-operative Milk Supply Union. It is expected to be commissioned by the end of next year. The Milk supply union, which has been run on a co-operative basis, has a chain of 274 feeder societies located around Madurai City within a radius of 30 miles and will be taking care of the distribution and collection of milk. The object of the new scheme is to increase the quantity available to the various families and provide the necessary facilities for cattle-owners. A milk processing plant will be established at Sathamangalam.

The Madras Government is also keen on starting a factory for the manufacture of baby food which will be located near Ootacamund. It is only in recent years that the efforts to start units for manufacturing milk powder and baby foods have been thought of seriously and several units have come

easy has been confirmed by the report of the Jute Marketing Committee which is reported to have impressed on Government that the measures so far got ready may not be adequate to meet the situation when arrivals reach the peak period.

into being in Maharashtra, East Punjab and Uttar Pradesh. In Madras, a project has been under consideration for some time though the problem of milk availability posed some difficulty. It is now expected that the details of the scheme would be worked out and an announcement made after the State's Industries Minister, who is now on a tour in the USA, returns to this country.

Efforts to increase the output of chemical fertilizers through the establishment of large-sized units in the private sector did not fructify earlier because of the prolonged negotiations with foreign interests and the difficulty in securing foreign exchange and the unprofitable character of the investment. The new tax measures also had a discouraging effect on foreign investment. But it has now been announced that the project of EID-Parry to establish a large sized unit at Visakhapatnam in collaboration with foreign interests will take shape before long. The US Ambassador in India has stated that the US Government would be giving development loans amounting to Rs. 21.2 crores to the Coramandel Fertilizers Limited, the Indian company formed by EID-Parry in collaboration with the American participants, California Chemical Company. This fertilizer plant will have a capacity for producing 365,000 tons of ammonium phosphate and 165,000 tons of urea annually. The EID-Parry will be subscribing to some extent the issued capital of the new company while it will be handling the large quantities of fertilizers that will be produced, as selling agents.

Negotiations are also going on for establishing another fertilizer plant at Kothagudem though no definite details are yet available. In regard to the Mangalore project it was reported that the Dutch interests were not keen on pursuing their proposals. It is now, however, expected that Tata-Fison and Rallis may succeed in enlisting U.S. assistance for this project as well though considerable preliminary work has yet to be completed. The benefit of the new schemes will rally be derived only after some years. Large quantities of urea can be expected to be achieved only when the Neyveli fertilizer project is completed, which may be sometime in 1965.

The growing importance of Madras City as a manufacturer of automobiles and components and parts was again emphasized when Mr. C. Subramaniam inaugurated the new factory and administrative buildings of Rane (Madras) Limited during the week-end. In the past six years, Rane (Madras) Limited has been successfully manufacturing tie-rod ends and clutch discs. Its associate company is also producing engine-increased further and it is gratifying to note that the indigenous content is as high as 98 per cent in the case of tie-rod ends. The Managing Director of the company has announced that there is a programme for producing moulded brake-linings and clutch facings in collaboration with British interests. There is also another scheme for manufacturing laminated springs which are in short supply.

Expectations of fresh incentives have been responsible for the greater activity in the Stock Market in Madras. Advances from Bombay and Calcutta have been very encouraging. But the rise in prices in Madras has not been so spectacular as in other centres. There is, however, a noticeable reserve on the part of sellers with plantings continuing to be in great favour. Select industrials also have been marked higher with Mettur Chemicals, Ashok Leyland, Madura Mills, Travancore Rayons and others being quoted significantly higher.

October 4, 1963

The moving fingerprints

THERE IS surely a contagion in the political air. It is not only the Congress which seems to be going through a crisis of conscience. In the Communist Party, Mr. A. K. Gopalan is preparing to clash with Mr. Dange, while there is much ado in the P.S.P. over Mr. Asoka Mehta taking up a job with the Government of India. Only the Swatantra Party seems to be immune and this is for the reason that every leader, and presumably every member, of the Swatantra Party has been given complete 'swatantra' to think as he would or act as he likes. Rajaji and Mr. Ranga have agreed to disagree on Kashmir; Rajaji and Mr. K. M. Munshi have agreed to disagree on the language issue; and Rajaji and Mr. Minoo Masani have agreed to disagree on Mr. Morarji Desai. Evidently a party like that can hardly have any trouble on the score of unity.

Going back to Mr. Asoka Mehta, I really do not see what the fuss is all about. I do not think that a party which could not manage to secure to its leader a seat in Parliament has any claim at all on his loyalty. After all nobody is in the political game for the fun of it. I do not see why Mr. Asoka Mehta alone should be expected to continue to be content with having the worst of both worlds. So far as the Planning Commission is concerned, I just do not know whether Mr. Asoka Mehta's draftsmanship will be an improvement on Mr. Tarlok Singh's; neither would I pretend to predict how long the new Deputy Chairman will be able to pull on with his colleague, Dr. V. K. R. V. Rao, without each accusing the other of unfair trade practices in competitive demagoguery.

I must say that I have more than sneaking admiration for Mr. Daniel Walcott. A modern State anywhere in the world, when it is not a menace to the individual, is certainly a most intolerable nuisance. And I cannot but applaud any person who manages to make the Leviathan look silly. In Karachi, the gloating President of the Trans-Atlantic Airlines Corporation is reported to have said many uncomplimentary things about our bureaucrats, politicians, magistrates and judges, the Indian Air Force and even about the Indian Press. But I for one can forgive him easily. It is not often that the mere individual gets a chance to call the bluff of Authority and when one succeeds in doing so, one is certainly entitled to brag about it. In any case, no right-thinking person would deny that Mr. Walcott is basically a fine chap. Anybody who, the moment he decides that he has had enough of red-tape and routine, could jump into a jeep, drive to the nearest airport, get into any handy aircraft and take off into the wide open skies, has me for his friend and well wisher. And, when you think of it, it was not at all necessary that Mr. Walcott should have come here all the way from the United States merely to expose our Government to ridicule. This particular instance of external aid was redundant.

In the local cinema theatres and, I presume, in theatres all over the country, the Government of India, unassisted, has been making a complete fool of itself during the last few days. Although it was announced last Saturday that the Compulsory Deposit Scheme was being given up in respect of all except income-tax payers, a Films Division short entitled "Save and Serve," dealing largely with the working of

the Scheme in respect of employees not paying income tax was (and perhaps is) still being screened to the accompaniment of irreverent commentary from amused cinemagoers. Surely it should not have been impossible for the Ministry of Information and Broadcasting to arrange for the withdrawal of the film within, say, 24 hours. It is a pity that the quality and standards of the functioning of the Government have been allowed to deteriorate to such an extent that there seems to be no longer any pride anywhere in doing things properly or not doing things improperly.

I am not at all sure that the Home Minister and the Minister for Information and Broadcasting acted right in letting themselves be bullied by Messrs. Mahavir Tyagi and company into withdrawing the Indian News Review short of the Communist sponsored "people's petition" march to Parliament. I wish some one in authority would care to explain why the Government has acted the way it has done. Mr. Mahavir Tyagi's own reasoning seems to me to be quite faulty. He argues that since the Films Division is a Government department, it should not be instrumental in giving publicity to anti-Government demonstrations. But the function of the Indian News Review surely is to present the highlights in the news. If an event or a situation is news-worthy, it should obviously be dealt with on that basis. If Mr. Tyagi's dictum that the Government is strictly applied, it will be reduced to presenting only the President unveiling statues, the Prime Minister making speeches, Ministers laying foundation stones and Post Offices selling Premium Prize Bonds. I am not concerned here with the rights and wrongs of the Communist march, but I do think that if interference of this kind is encouraged, the working of organisations such as the Films Division, already by no means conspicuous for initiative or enterprise, is bound to be reduced to a clerical exercise in keeping on the right side of the bosses.

Even as new brooms go, Delhi's new Chief Commissioner is thrashing about most lustily. His measures to discipline traffic laws have indeed been so sweeping that I still do not know what hit me. In less hectic times, it used to take me about seven minutes of leisurely and uneventful driving to do the short distance from where I live to where I work. Now it takes about twice as long in a whole series of nerve-racking "stop and go" and the choice for me is either to keep shuttling between the second gear and the third or consent philosophically to do the entire journey on the second. But this must not be taken to mean that I am complaining. I know that the Chief Commissioner means well and I imagine that some good will come out of it all ultimately. Meanwhile, I am second to none in my admiration for the dedicated manner in which he is launching campaigns against the Capital's many ills. I am told that road surfaces, badly scarred by the monsoon, are to be mended very promptly, in fact, before the next monsoon arrives. And I also learn that something will be done about Delhi's chaotic housing and the abominable state of sanitation in the old city and the suburbs. Mr. Dharma Vira, in other words, is truly a warrior in a holy war of his making. I wish him success.

V.B.

BIRD'S SILLIMANITE

BRICKS AND BLOCKS

Standard Sillimanite Bricks are now available ex-stock, and Sillimanite Wedges, Arches and Blocks (including cement kiln blocks) within 4 to 6 weeks—an excellent reason why you should use only Bird's Sillimanite products. Remember, they have the unsurpassed quality only Kumardhubi—the largest refractory unit in the East—can offer.

For your immediate requirements:

KUMARDHUBI FIRECLAY & SILICA WORKS LIMITED

Managing Agents: BIRD & CO. (PRIVATE) LTD., Chartered Bank Buildings, Calcutta-1

Works: Kumardhubi, Dist. Dhanbad, Bihar.

KFS is but one of the many progressive divisions of the Bird-Hellgers Group. The Group, with its varied industrial activities, plays a significant role in the country's economy.

62/KFS-6

Trade Winds

COMMONWEALTH TRADE

COMMONWEALTH TRADE was revised last month at the meeting of the Commonwealth Economic Consultative Council. One of the problems that came up for discussion was the vulnerability of producers of primary commodities and their adverse balance of trade. The Council considered the proposal for undertaking a systematic study of world economic trends in general and those of underdeveloped Commonwealth countries in particular in the context of their development plans. The Council also discussed problems of aid for development. It reviewed the preparations made since their last meeting in May for the 'Kennedy round' of trade negotiations and other steps which were being taken in the General Agreement on Tariff and Trade (GATT) to reduce or eliminate barriers to international trade in primary products, agricultural commodities and manufactures.

EXPORT OF IRON AND STEEL GOODS

To ensure that only manufactured articles and not merely pig iron or steel with a little processing are exported, the Government of India have prescribed certain floor prices for the iron articles and for articles made of steel. The following revised floor prices would be effective immediately: articles predominantly made out of pig iron Rs. 350 per ton; articles predominantly made out of bars and rods Rs. 445 per ton; articles predominantly made out of structurals Rs. 490 per ton; articles predominantly made out of black sheets Rs. 680 per ton; articles predominantly made out of galvanised sheets Rs. 800 per ton; articles predominantly made out of skelp Rs. 565 per ton; articles predominantly made out of plates Rs. 600 per ton; articles predominantly made out of wire (H.B.) Rs. 740 per ton and articles predominantly made out of wire (galvanised) Rs. 870 per ton.

TRANSPORT OF FERTILIZERS

With a view to accelerating despatches of fertilizers from ports and indigenous factories, the Government of India had decided in May this year to reimburse the actual charges for transporting chemical fertilizers by road by the consignees upto a distance of 250 kms from places where stocks are held on behalf of the Government of India. The Government of India have now decided that this limit of 250 kms. may be extended to 500 kms. The above concession can be availed of by the State Governments and distributors of fertilizers for plantation crops such as tea, coffee and rubber.

DURGAPUR STEEL EXPANSION

Greaves Cotton & Crompton Parkinson Ltd., has announced the receipt of a "turnkey" contract valued at Rs. 1.5 crores from Hindustan Steel Ltd. for the Electrical Power Distribution System of the 1.6 million ton expansion programme of Durgapur Steel Plant. This contract covers the supply, erection and commissioning of the complete power distribution system, including transformers, high & low voltage switchgear and all cabling etc. A large element of the supply is being made by the Company's Indian factories, leaders in the manufacture of electrical power distribution equipment in India.

INDUDYOG PORTABLE CRANES

The Indudyog Company Private Limited manufacturing cranes and material handling equipment has made rapid progress over the last few years. While the total sales of the company in 1962 were Rs. 4,23,638, by the end of 1963, they are expected to be over Rs. 6,00,000. Upto September 1963, the sales were Rs. 3,93,933. The company is negotiating with the Government for getting an acre of land in the industrial

estate area, Okhla, and is changing over from small-scale to medium-scale industry. The company has plans to export portable cranes to U.A.R., Czechoslovakia and Poland. One of the directors of the company is already on tour in these areas to find out the possibilities of export of cranes manufactured by the company. The latest crane model "STC" of the company with hand operated winches is ideal in many locations where power is not available. This crane can be supplied with electric winches also. Portable Floor Cranes, Portable Floor Stackers, Pillar Jib Cranes 360 degree Swing, Skip Hoists, Roller and Belt Conveyors and various types of Warehouse Trolleys are specialities of Indudyog Company.

ENGINEERS' STEEL FILES

The Government of India have accepted the Tariff Commission's recommendation that protection to the engineers' steel files industry need not be continued beyond December 31, 1963. The Government have also taken note of certain other ancillary recommendations of the Commission for suitable action to the extent possible. Attention of Messrs. Harbanslal Malhotra & Sons, steel file manufacturers and producers of grinding wheels, has also been drawn to some of the recommendations in the Government resolution.

AUTOMOBILE SPARK PLUG INDUSTRY

The recommendation of the Tariff Commission that protection to the automobile spark plug industry should be continued for a further period of two years upto December 31, 1965 at a reduced rate of protective duty, has been accepted by the Government of India. In a resolution the Government have taken note of certain other ancillary recommendations of the Tariff Commission for suitable action to the extent possible. The attention of the spark plug and aluminium manufacturers has also been drawn to some of the recommendations in the Government resolution.

I.M.F. SUSPENDS AID TO INDONESIA

The \$50 million aid by credit arrangement concluded last July with Indonesia has been suspended by the International Monetary Fund. The Indonesian Government has been told that until the intentions of Indonesia towards Britain and Malaysia become clearer, the U.S.A. is "reserving judgment on the feasibility of the multi-nation effort to contribute to the Indonesian stabilisation programme". Indonesia's standby arrangement with the International Monetary Fund was intended to give financial support to a programme of economic stabilisation, most of which the Indonesian Government has already put into effect. The Indonesian authorities have introduced a revision of exchange rates and have taken steps to prevent undue monetary expansion and strengthen the balance of payments. Indonesia's quota in the Fund is \$165 million, of which \$29.2 million has been paid in gold. The country's net drawings on the Fund at present amount to \$82.5 million.

COKING COAL NEEDS

The working group on coal has estimated that coking coal requirements by 1970-71 would be 58 million tons. This estimate includes the requirements of merchants cokeries put at five million tons. The total has been arrived at on the basis of an output target of 18 million tons of ingot steel and four million tons of pig iron. The bulk of the supply is expected from NCDC.

Record of coal production during the current Plan is far from satisfactory. A shortfall of nine million tonnes is expected. Poor performance of the public sector is stated to be the main cause of this shortfall. For instance, NCDC is expected to produce only 24 million tonnes by 1965-66 against

the target of 31 million tonnes. According to an assessment made by a committee set up by Coal Council of India, reserves of coking coal are 2,500 million tons. The committee is carrying out a survey to estimate reserves both quantitatively and qualitatively on international standards. The present requirements of coking coal, both for steel plants and for merchant cokeries, are roughly about 14 million tons per annum. These requirements, it is claimed are being met in full.

HIGHER EXPORTS IN AUGUST

The steadily rising trend in exports was kept up last month also when goods worth Rs. 66 crores were exported as against Rs. 61 crores in August 1962 — a rise of Rs. 5 crores.

The total exports in the period January to August, 1963 were worth Rs. 493 crores as compared to export worth Rs. 432 crores in the first eight months of 1962, thus registering an increase of Rs. 61 crores.

LIGNITE RESERVES IN GUJARAT

Lignite reserves with varying thickness have been located in Kutch and Broach Districts of Gujarat State, the Deputy Minister for Industries, Mr. Devendra Desai told the State Assembly recently. Drilling carried in ten places in Kutch has shown that the thickness of lignite reserve there was about 5.45 metres. In Broach District, the thickness was estimated to be about two metres. The Geological Department is pursuing vigorously the survey work in both the Districts.

POLISH COLLABORATION

Two contracts were recently signed between the National Coal Development Corporation and CEKOP, a foreign trade agency of Poland specialising in the export of complete industrial plants for a provisional design for the construction of the coal mine "Monidish" in the Jharia coal basin as well as for services of Polish specialists to sink shafts at this mine. There are at present 70 Polish specialists in the Jharia coal basin. A coal washery with a working capacity of about 3 million tons of coal per year is being constructed in Gidi on the basis of Polish installations. A factory of machines and mining installations which will produce about 80,000 tons of mining machines per year is also being constructed in India.

SALE OF GOLD

The price of gold has fallen in London following the sale of gold by the U.S.S.R. on the continent. Normally, the U.S.S.R. sells gold valued at \$150 million per year. She is proposing to sell gold in great quantities in the next few months to pay for the huge stocks of Canadian and Australian wheat she has contracted to buy. The U.S.S.R. is seeking 112 million bushels of wheat, 40 million bushels of corn and 42 million bushels of oats from the U.S.A. If the deal goes through, it is expected the U.S.S.R. will unload more gold in the European market.

WORLD STEEL OUTPUT

In spite of lower figures for some countries of Western Europe and for Japan, world steel production in 1962 reached a new record level of 368 million tons, according to the annual review of the steel committee of the United Nations Economic Commission for Europe. The increase can be attributed almost entirely to the continued growth of production in the

Soviet Union, Eastern Europe, the United States, and certain developing countries.

The report notes a disequilibrium in Western Europe, the United States and Japan between over-all economic expansion and the demand for finished steel products. This led first to surplus production capacity, then to increased competition internationally and finally to curtailment of investment in new plant. Among the causes, the report mentions changes in the structure of economic growth from steel-intensive to less steel-intensive industries. The commission secretariat, with the help of an expert group, is preparing a study dealing with the situation that has arisen in recent years through the advances made by materials such as aluminium, plastics, cardboard and fibre-board, and asbestos-cement.

AVOIDANCE OF DOUBLE TAXATION

A comprehensive agreement for the avoidance of double taxation of income between India and the Republic of Austria was signed recently. The agreement will come into force after it has been ratified by both the Governments and a notification has been issued by the Central Government. The Agreement was negotiated at Vienna in October 1962, when an Indian Tax Delegation headed by Mr V. V. Chari, Additional Secretary, Ministry of Finance, visited Austria at the invitation of the Austrian Government.

India has concluded similar agreements with Ceylon, Pakistan, Sweden, Norway, the Federal Republic of Germany, Japan, Finland and Denmark and a limited agreement relating to Swiss Air with Switzerland.

MEMBERSHIP OF FUND, BANK, IDA

Trinidad and Tobago have become members of the International Monetary Fund and International Bank for Reconstruction and Development (World Bank). Dahomey became a member of the International Development Association. The quota of Trinidad and Tobago in the International Monetary Fund is \$20 million and its subscription to the capital stock of the International Bank is 267 shares with a total par value of \$26.7 million. Dahomey's subscription to IDA is \$500,000. Membership in the three organisations and the total quotas of the Fund and total subscriptions of the Bank are as follows:

Fund	No. of Members	Total
Bank	94	\$ 15,341,750,000
IDA	93	\$ 20,836,500,000
	79	\$ 970,250,000

PRODUCTION OF INDUSTRIAL FIBRES

According to a report published by the Commonwealth Economic Committee, world production of chief industrial fibres in 1961-62 season at some 45,900 million lbs. represented 6 per cent rise over the previous season's total. Natural and man-made fibres increased in much the same proportions. The increase in the output of the former to about 38,100 lbs. was almost entirely the result of a one-third rise in jute production, while in the case of man-made fibres (which reached 7,800 million lbs. in 1961) the growth was largely in the newer non-cellulosics. Preliminary information for 1962-63 indicates that on balance output of industrial fibres will rise further in the season. Cotton and the man-made fibres will increase quite markedly and silk production may rise slightly, but hemp output is unlikely to change much and jute will fall somewhat from the high level of the 1961-62 season due to lower acreages in India and Pakistan. Among wool producers, only New Zealand is expected to show any significant rise and the world clip is estimated to be slightly lower than in 1961-62.

Company Affairs

IMPERIAL TOBACCO: PRESSURE OF EXCISE

THE INCREASE in excise duty on tobacco, raw and manufactured, has caused considerable dislocation in the working of the Imperial Tobacco Company as was revealed by Mr F. A. Collett, its Chairman, while addressing the annual general meeting held recently. This rise, he pointed out, has not only caused increases in selling prices which restrict consumption and make the maintenance of adequate profit margins more difficult, the company also has to manage the increased requirements of working capital through bank borrowings. The deterioration in the company's liquidity, the Chairman added, was in part due to the purchases of the requirements of flue-cured leaf tobacco at an earlier date than usual. But the most important factor has been the larger amount tied up in excise on stocks on hand, due not so much to larger physical stocks as to the higher rate of excise applicable to these stocks. He elaborated the point by saying that cigarette being a perishable commodity, it was always the effort of the company to reduce the period between manufacture and consumption, but in spite of its best endeavours, the company has not been able to reduce it below an average of three to four weeks. A significant point raised by the Chairman was that excise duty was intended to be a tax on the consumer, consequently the shareholders should not be expected to bear the expenses which go into the raising of new capital to finance the outlay in the form of additional working capital. He added that nearly Rs 2 crores of unremunerative capital was permanently tied up at any one time in the form of excise duty. The company has, therefore, made representations to the Government to allow the industry some credit on their excise payments as was being done in many other countries in order that these funds might be put to a more useful purpose.

Mr Collett indicated that the company has borne a part of the additional excise duty thereby restricting price increases to the minimum, particularly in the lower price categories. In an effort to retain their level of profits, greater attention was also being paid to productivity and efficiency. The training programme was being intensified and administrative procedures were being closely re-examined. The company has taken advantage of training facilities which were available to its staff at the Administrative Staff College, Henley-on-Thames in the U.K., Administrative Staff College at Hyderabad, management courses run by the Calcutta Management Association and Indian Institute of Personnel Management. Its own residential training centre in Calcutta was also being utilised to the full in training managers at all levels.

INDIA CEMENTS: HIGHER COSTS

It appears that the cement industry, with its selling prices determined by the Government, is finding it hard to bear the burden of higher costs resulting from various recent fiscal and other measures. Mr Suryanarayana, Chairman of India Cements Ltd., while addressing the shareholders at the recent annual general meeting referred to the various items of costs like railway freight, surcharge on power, which had increased considerably. The scheme of Emergency Risks Insurance alone, he added, had cost the Company something like Rs. 1.54 lakhs. In reply to various representations the Government did agree to increase the retention price, but this increase of Rs. 3.75 per ton means only Rs. 2.75 per ton to the producers because the balance of Re. 1 is to be made over to the State Trading Corporation for meeting the increased freight rates suffered by the Corporation in connec-

tion with the distribution of cement. The Chairman rightly pointed out that the increase accounted fell short of industry's expectations. It is quite relevant to indicate that the industry has been forced to bear the increased costs brought out mainly by Government collections progressively from 1961 while the Government has given effect to the revised retention price only from June 1, 1963. Moreover, the retention price raised by Rs. 2.75 per ton will further be reduced by 25 nP. per ton in the sense that the State Trading Corporation has, with effect from June 1, 1963, reduced the selling commission of the selling agents from Rs. 1.50 per ton to Rs. 1.25 per ton.

The Chairman made a reference to the commissioning of the Sankari plant which was scheduled to go into production by the middle of this year but was delayed because the ships carrying the machinery were held up for six to eight weeks due to the freezing of various ports of embarkation. The construction work, he indicated, has been progressing rapidly and the operations will commence by the end of October this year. With the commissioning of the Sankari unit, the annual production for the company will be seven lakh tons and the project for doubling up of the Sankari plant has also been taken up. While the company has been making these efforts to increase its capacity, its actual production suffered on account of factors beyond the control of the management. Its first kiln was shut down for major repairs for a period of nearly 54 days and its new 750-ton kiln also had to be shut down very frequently which resulted in great loss of production and heavy repair costs. The production during the year consequently was 4,49,149 tons of cement as against 4,57,116 tons in the previous year. Consequently, profits also decreased and the directors had to recommend a lower dividend on the equity capital for the current year. It may, however, be indicated that this dividend was paid on a larger capital structure.

INDIAN OIL: GOOD SHOW

Mr. P. A. Gopalakrishnan, Chairman, Indian Oil Company, Ltd., addressing the fourth annual general meeting held in Bombay recently, informed the shareholders that the sales effected during 1962-63 had trebled as compared to the previous year. The company sold 629,639 kilolitres of oil products and 11,498 metric tons of petroleum coke during the year under review as compared to 211,033 kilolitres of oil in 1961-62. Consequently it recorded a net profit of Rs. 59.61 lakhs and it has been able to wipe out an accumulated loss of Rs. 16.85 lakhs. The Indian Oil Company, which started with two oil products, has now a variety of fourteen items to sell which include high speed diesel, superior kerosene, aviation turbine fuel, etc. The company has already saved Rs. 7.78 crores in foreign exchange in 1962-63 as against Rs. 4.57 crores in 1961-62, by making rupee payments for oil products.

The Chairman referred to the operational cost of products per kilolitre which has declined to Rs. 30.16 per kilolitre in 1961-62 as against Rs. 31.68 per kilolitre last year and Rs. 35.16 per kilolitre the year before. He added that it would have been Rs. 25.82 per kilolitre if certain abnormal expenses relating to previous year had not been met in 1962-63 and if the costs had not increased on account of emergency, and related causes. The Company has increased its storage space from 131,600 kilolitres last year to 309,380 kilolitres on March 21, 1963. The number of depots has also increased from 14 at the end of the last year to 63 and the number of consumer and dealer pumps has increased substantially from 84 to 379

in 1962-63. This in a way is a measure of the company's creditable performance. He informed the shareholders that Indian Oil Company had become the sole distributors to India for Mobil Premium grade lubricants. Two blending plants which were expected to go into production in 1964 were being set up by the Indian Oil Company Blending Ltd., a 50:50 partnership between the Indian Oil Company and Mobil Petroleum.

ALIND'S PROGRESS

In spite of reduced figures of sale proceeds, Aluminium Industries recorded a higher profit of Rs. 55.40 lakhs during 1962-63 as against Rs. 41.37 lakhs a year before. This apparently is contrary to the general trend in a company's performance. But, as Mr. S. Narayanswami, Chairman of the company indicated, while addressing the annual general meeting held recently, this impressive record was the result of the company's programme of effective diversification of its production lines over the last four years. This year's operations, therefore, vindicated the gainfulness of a continued process of expansion and diversification. The Chairman indicated that this process is being carried further and he informed the shareholders that the covered conductor capacity at Kundara is being stepped up and the enhanced capacity will be in full commission before the end of the calendar year. The Hyderabad covered conductor unit will also go into production in the last quarter of the year. The unit which will manufacture solidol or low-voltage plastic insulated underground aluminium cables is also progressing and is expected to be commissioned by August, 1964. The company has also received a licence for the expansion of its rolling capacity at Kundara while arrangements are being made to secure a second Properzi unit for continuous rolling of metal. This will bring the number of Properzi units operated by the company to three including the one working at Hirakud. With the completion of this expansion programme, Alind would rank as a major comprehensive cable manufacturer while retaining its primary place as a producer of high-tension conductors.

The Chairman made a reference to the availability of aluminium metal which, he believed, has greatly improved with the commissioning of the Hindustan Aluminium Company's plant at Hirakud. "It is a matter of no small gratification," he pointed out, "that dependence on external sources and allocation of metal through D.L.F. and similar sources has to an extent been reduced." He also referred to the impact of the Super Profits Tax on distributed profits which had compelled the board of directors to reduce the dividend for the first time in the company's history. He pointed out that a huge sum of Rs. 39.50 lakhs was being carried to tax provision which included a sum of Rs. 9 lakhs provided to meet SPT demands. This somewhat copious but inevitable provision has disturbed the balance between distribution and ploughing-back for which the Tariff Commission bore handsome testimony as far as this company was concerned. He assured the shareholders that in view of the projects under implementation, there was sufficient reason to look forward with confidence to the future when their interests would be guarded properly.

FERTILIZERS AND CHEMICALS

Considerable advancement in technology was achieved by the Fertilizers and Chemicals Travancore Ltd., during the year ended March 31, 1963 as was revealed by Mr. T. S. Joseph, Chairman, while addressing the annual general meeting held recently. The company introduced for the first time in India a new technique for the production of synthesis gas required for ammonia manufacture. Secondly, it also

replaced the wood gasification plant by an oil gasification plant which was installed as a part of the second stage of its expansion programme. The Chairman, however, pointed out that these technological improvements were not able to achieve much for the company in terms of output because the supply of electric power had not been enough. Against the total requirement of 31,000 KW. the Kerala State Electricity Board has been supplying only 23,000 KW. Another development which affected its output adversely was the sudden incidence of salinity in the Periyar river waters during the summer months of 1962. This resulted in a further loss and together with power cuts it meant a loss of over 4,000 tonnes of ammonia. The Chairman, however, was confident that the company would soon be able to recover from the damage caused by these adverse developments and hoped that the Electricity Board will shortly be able to honour its commitments in full.

He referred to its third stage of expansion programme for which it invited the Government of India to participate in the equity share capital. Shares worth Rs. 3.5 crores have been taken by the Government which makes the latter a majority holder of shares. The third stage of expansion involves the installation of a number of major plants. Apart from the oil gasification plant, it includes the installation of a tonnage oxygen plant, apart from various other units. When the third stage of expansion is completed, the company will have an annual capacity of about 75,000 tonnes of nitrogen, 33,500 tonnes of potash and the ultimate products will be 200,000 tonnes of ammonium sulphate, 135,000 tonnes of ammonium phosphate and 25,000 tonnes of ammonium chloride.

The Chairman informed the shareholders that the company has also been engaged in negotiations with Messrs. Davy Ashmore Ltd., of U.K., a leading firm engaged in manufacture of industrial plants and equipment, for establishing a joint venture to fabricate pressure vessels and specialised steel capital outlay of Rs. 75 lakhs, the balance being proposed to be found by loans to be negotiated with organisations like Industrial Finance Corporation, Industrial Credit and Development Corporation. On a single-shift working this capacity of 450 tons of grade I mild steel; 1900 tons of grade II and 600 tons of grade III stainless steel. The capacity envisaged is 1,440 tons of simple stainless steel and 720 tons of complex stainless steel. The company is negotiating the formation of a joint venture with Power Gas Corporation of U.K. for establishing an engineering and contracting organization capable of planning, designing and erecting fertilizer, chemical, petro-chemical and oil refining plants.

INDIA STEAMSHIP

Mr. A. Ramaswamy Mudaliar, Chairman, India Steamship Co. Ltd., addressing the annual general meeting held recently pointed out that it was the failure of Indian Lines to secure an increase in freight rates which resulted in a loss of nearly Rs. 30 lakhs in the working of the company. The company's fleet, he indicated, has been operating on the India-U.K.-Continent route and the Baltic Sea and Black Sea routes where freight rates have not been increased in route of the ocean going vessels of Lines had had the freight rate increased at least once and in most cases more than once since 1961. He was of the opinion that even if a 10 per cent increase had been allowed, which the Indian Lines had sought in the East-West trade, the Company would have been able to avoid the losses. He further pointed out that

while no increase in the freight rates had been allowed the increase in coal charges, dock levies and stevedoring rates have been substantial both in India and abroad. Some other factors like time taken in berthing vessels at the port of Bombay, weather conditions and labour strike had further caused a loss of 541 days by the Conference ships of the fleet. One saving grace has been that in spite of a decrease in freight earnings as compared to last year, owing to a degree of rationalisation there has been a corresponding decrease in expenditure. The number of ports at which the vessels called was 736 in the total voyages as against 947 in the previous year. The average duration of a round voyage was 126 days as compared to 129 days in 1962. There have also been serious attempts at reducing the expenditure on dock and engineering stores.

The Chairman expressed his agreement with the policy of the Government that export promotion should not be hindered by unreasonable freight rates. He was, however, of the opinion that attempts should be made to balance two apparently antagonistic factors: lower freight rates which maximise exports and higher freight rates which increase the earnings of the Lines. He indicated that the case of what was called the sensitive commodities from the export angle, should be taken up by the Government in consultation with the Conference and freight rates for other commodities should be allowed to be raised.

AHMEDABAD ELECTRIC ISSUE

The Ahmedabad Electricity Company Ltd., has received the sanction to issue a third series of debentures of the value of Rs. 2 crores. These are expected to be issued before the end of the current year. The board of directors intend to revise the company's tariffs upwards in view of the progressive increase in its tax liability. It has, therefore, served notices on the authorities intimating its intention to apply revised tariffs with effect from November 16 this year. The board has been also thinking of the diversification of the company's activities. Its present licence will expire in 1967. In case the licence is not renewed, it will become necessary to take up other industrial activities. Though the board has not yet taken any decision on the particular field of activity or the items to be manufactured, the possibilities are being considered for which negotiations are being conducted. The Chairman, it is reported, hopes to report some progress about this to the shareholders at the next annual general meeting.

FERTILIZER CORPORATION

The net profit earned by Fertilizer Corporation of India during 1962-63 registered a sizable increase of more than Rs. 14 crores over that of the previous year and the Corporation's operating factories at Sindri and Nangal recorded a substantial increase in production.

The profit before providing for depreciation and interest on loan from Government of India amounted to Rs. 7,27,97,389 during 1962-63. Out of this amount, Rs. 5,07,74,883 was provided for depreciation and Rs. 83,81,553 was utilized towards payment of interest on loan from Government of India. This left a balance of Rs. 1,36,40,953. After adding Rs. 1,89,680 carried over from the previous year's profit, the net profit amounted to Rs. 1,38,30,633 as compared with Rs. 13,89,680 during the previous year. Out of this net profit, Rs. 1,23,00,000 was appropriated to the Development Rebate Reserve. The balance of Rs. 15,30,633 was carried forward. In view of the financial needs of the Corporation's new projects under construction, the available surplus is being utilized for financing these projects.

The management of the fertilizer plant at Rourkela, a substantial part of which was designed, engineered, procured

and built by the Corporation for Hindustan Steel, has been transferred to the Corporation from April 1, 1963.

The Corporation's new projects—Trombay in Maharashtra, Namrup in Assam, Gorakhpur in U.P. and Korba in Madhya Pradesh—are in various stages of development. According to present indications, the Trombay Plant is expected to start production of ammonia and urea in August 1964 and nitrophosphate by the end of 1964 or the beginning of 1965. The Namrup factory is expected to go into production by the end of 1965 while the Gorakhpur project will be completed in all respects in 1966.

The Korba plant (Madhya Pradesh) will be the first complete fertilizer production unit of the Corporation to be designed, engineered and built by the Corporation's Planning and Development Division. Only necessary process know-hows for coal gasification and ammonia and urea synthesis will be purchased from specialist foreign firms. The Korba plant thus stands out as an important milestone in the growing field of fertilizer technology in India.

PANIPAT WOOLLENS

The Panipat Woollen and General Mills Company Limited is entering the market to raise Rs. 40 lakhs. The issue will open on October 9 and will close on October 16 or earlier at the discretion of the directors but not before October 11, 1963. The present issue is made up of 3,00,000 equity shares of Rs. 10 each and 10,000 cumulative redeemable preference shares (9.3 per cent) of Rs. 100 each. Out of this issue, 1,22,653 equity shares of Rs. 10 each have been allotted to the existing shareholders on right basis. Another 60,307 equity shares of Rs. 10 each have been allotted to friends and relatives of directors. In addition to these equity shares, 109 cumulative redeemable preference shares (9.3 per cent) of Rs. 100 each have also been allotted to existing shareholders on right basis. The issue for public subscription is made up of 1,17,040 equity shares of Rs. 10 each at par and 9,891 cumulative preference shares (9.3 per cent) of Rs. 10 each. The entire issue has been under-written. The authorised capital of the company is Rs. 1 crore and issued, subscribed and paid-up capital is Rs. 13,80,580. Fresh capital is being raised to expand the present capacity of the company which at the moment has concentrated on the production of woollen goods. Having established itself in the production of a variety of woollens, it has now turned its attention to the manufacture of cotton goods. A beginning is being made with the installation of 12,000 spindles. Land has already been purchased for the cotton spinning unit and other ancillary purposes and for future extension of cotton mills by installing more spindles and cotton waste plant. The building is already been purchased for the cotton spinning unit and other ancillary purposes and for future extension of cotton mills by installing more spindles and cotton waste plant. The building is already under construction and the required plant and machinery have been ordered. With the extension of the company's activities in the field of cotton goods manufacture, it is certain to show higher profitability and the shareholders can hope for positively better results. With these prospects in view, the issue is likely to receive a good response in the market.

CAPITAL ISSUES

Seven companies have been authorized to raise fresh capital of Rs. 5.42 crores. The consent is valid for 12 months.

Voltas Limited, Bombay has been authorised to issue debenture capital of Rs. 1 crore. The capital is divided into 7 per cent mortgage debenture of Rs. 1,000 each and will be offered to the public for cash at par.

Shree Bhawani Cotton Mills Limited, Calcutta is to issue capital of Rs. 10 lakhs in equity shares of Rs. 10 each for cash at par.

Protein Products of India Limited will issue Rs. 70 lakhs

equity capital in shares of Rs. 10 each at par. All the shares will be issued for cash except shares of the value of Rs. 7 lakhs which will be allotted in consideration of technical services etc. to Compagnie Rouselet of France. The French firm will also be allotted shares of the value of Rs. 2 lakhs for cash. Shares of the value of Rs. 41 lakhs will be offered to the public by prospectus.

Andhra Sugars Limited, Tanuku, will raise further capital of Rs. 10 lakhs divided into 100,000 equity shares of Rs. 10 each for cash at a premium of Rs. 3 per share to the public.

Cibatul Limited will issue Rs. 1 crore capital divided into 100,000 equity shares of Rs. 100 each, for cash at par. The entire issue will be offered to the existing shareholders of the company.

Heavy Electricals (India) Ltd., Bhopal, a Central Government undertaking, is raising further capital of Rs. 2.45 crores, divided into 24,500 equity shares of Rs. 1,000 each for cash at par.

The Mysore Spg. & Mfg. Co. Ltd., Bombay is to issue capital not exceeding Rs. 743,500 in equity shares of Rs. 50 each by capitalising the company's reserve to a like extent in the proportion of one share for every eight equity shares held.

LICENCES ISSUED

The following licences were issued under the Industries (Development and Regulation) Act, 1951—during the week ending 1st September, 1963. The list contains the names and full addresses of the licensees along with the articles of manufacture and annual installed capacity.

IRON & STEEL CASTINGS AND FORGINGS:

Shri C. R. Das Gupta, 6, Nandi Street, Calcutta-29 (West Bengal). Steel forgings 9,000 tons. Heavy structurals 3,000 tons.

COAL:

Shri Dwarka Prasad Agarwalla, Chandore Colliery, P.O. Jharia, Distt. Dhanbad (Mouza Chandore, P.O., Jharia, Distt. Dhanbad, Bihar). Coal 15,000 tonnes. Pure Samla Coal Co. Pvt. Ltd., 108, Stephen House (6th floor) 4, Dalhousie Square East, Calcutta (P.O. Nutandanga, Distt. Burdwan, West Bengal). Coal 72,000 tonnes.

INTERNATIONAL COMBUSTION ENGINES:

Hindustan Motors Ltd., P.O. Uttarpara, Distt. Hooghly, (West Bengal). Automotive Diesel Engines, 15,000 Nos. (including 3,000 petrol engines). **Premier Automobiles Ltd.**, Construction House, Ballard Estate, Bombay-1 (Maharashtra). Automotive Diesel Engines (including, Meadows Diesel and petrol engines) 15,000 Nos. **Simpson & Co. Ltd.**, 202-203, Mount Road, Madras-2 (Madras). Automotive Diesel Engines 6,000 Nos. **Jyoti Ltd.**, P.O. Chemical Industries, Baroda-3 (Gujarat). (1) Secondary relays for protection against over current short circuits etc.—3,600 Nos. (2) Primary relays for protection against over current & short circuits—1,200 Nos. (3) Relays, control devices and indicating devices such as over voltage relays, time relays, differential relays, signal relays, special purpose relays, synchroscopes, directional relays etc. 960 Nos. (4) Current and voltage regulators—600 Nos.

ELECTRICAL EQUIPMENT:

Geep Flash Light Industries Ltd., 28, South Road, Allahabad-1 (Uttar Pradesh) Lamp caps for miniature bulbs 10 millions Nos.

ELECTRICAL CABLES:

Express Cables Pvt. Ltd., 16 Roy Lane, Calcutta-7, (Bihar State). A.C.S.R. & A.A. Conductors 2,000 tons. **Shri Ramesh Chandra G. Shah**, C/o M/s. Lalubhai Amichand, 225/27, Tardeo Road, Bombay-7. Proposed name: M/s. Bombay Conductors and Electricals Pvt. Ltd. (Ahmedabad Distt., Gujarat). A.C.S.R. & A.A. Conductors. 2,000 tons.

Nandram Narayandas, Sweet Cottage, Gwallor, (Madhya Pradesh). A.C.S.R. and A.A. Conductors. 2,000 tons.

ELECTRONIC EQUIPMENT:

The Gandhi Electric Industries Private Ltd., 94, Meadows Street, Fort, Bombay-1 (Maharashtra). (1) Photo Electric equipments—500 Nos. (2) Transistorised phase failure—250 Nos. (3) Automatic lighting control units—100 Nos. (4) Electronic Adjustable speed—100 Nos. (5) Grinder load control equipment — 100 Nos. (6) Process Timber — 250 Nos. The English Electric Company of India Ltd., 35, Golf Links, Post Box No. 174, New Delhi, (Madras). Electronic Test equipment—360—600 units.

AUTOMOBILES:

Simpson & Co. Ltd., 202/203, Mount Road, Madras-2. Proposed name: M/s. Chassis Frame India Ltd. (Madras). Pressings for automobiles. 12,000 Tonnes (Metric). **Simpson and Co. Ltd.**, 202/203, Mount Road, Madras-2 (Madras). Commercial Vehicles chassis in the 3-5, tonnes payload range 12,000 Nos.

TRANSPORTATION:

Voltas Ltd., 19, Graham Road, Ballard Estate, Post Box 1198, Bombay-1, (Maharashtra). (1) Fork Lift Trucks (Petrol/Diesel driven)—200 Nos. (2) Fork Lift Trucks (Electrically driven)—300 Nos. (3) Handlift and Pallet Trucks—15,000 Nos. (4) Spares for the above Rs. 5 lakhs worth. **Shri S. Ghose**, 11, Government Place East Calcutta-1. (Calcutta, West Bengal). Pallet Trucks (Electrically operated of 1000 kgs. to 4000 kgs.) capacity Rider and non-rider types 300 Nos.

CONVEYING EQUIPMENT:

Dynacraft machine Co. Private Ltd., Juhu Lane, Andheri, Bombay-58, (Jogeshwari, Bombay, Maharashtra). Conveying equipment—Rs. 40 lakhs worth.

MACHINE TOOLS:

Khalsa Foundry (Regd.) Kashmir Road, Batala (Punjab). Horizontal, Vertical and Universal Milling machines—36 Nos. Tool and cutter grinding machines—24 Nos. **R. S. Machine Tool Corporation**, 435, Jissore Road, Calcutta-28 (West Bengal). Milling machines and Accessories—120 sets. **Extrusion Processes Private Ltd.**, Rambaugh, Ghodbunder Road, Malad, Bombay-54 (Maharashtra). Impact extrusion Presses—36 Nos. Trimming and Finishing machines—36 Nos.

EARTH MOVING MACHINE:

Kirloskar Pneumatic Co. Ltd., Hadapsar Industrial Estate, Poona-1 (Maharashtra). Power Transmission Equipment (Torgue Convertors)—2,400 Nos.

COTTON:

Raghuvanshi Mills Ltd., 11-12, Haines Road, Bombay-13 (Maharashtra). 6,788 spindles for the manufacture of cotton yarn.

JUTE:

Anglo-India Jute Mills Co. Ltd., Post Box No. 189, 31, Netaji Subhas Road, Calcutta (West Bengal). 100 looms for the manufacture of mixed fabrics containing jute and cotton/rayon.

BOOKS BRIEFLY

The Hunger for Power

First Annual Electric Power Survey of India: Published by the Central Electricity Authority; July, 1963; Copies from Manager of Publications, Delhi; Price Rs. 5.00.

Reviewed by **R. P. AIYER**

WHEN ONE seeks to sell a product, there is need for an appraisal of the nature of the market. This doctrine, however, has not been very relevant in determining the target of installed capacity for power plant during the first decade of our planning. The situation during this period has been one of demand outstripping available capacity. Nevertheless, it was recognised in 1955 that a systematic power load survey should be undertaken so as to provide valuable data for location of new industries. From then on continuous stress was laid on the importance of load surveys on a year-wise basis. Much useful work has been done by the Central Water and Power Commission since 1955 and in 1957 the Commission had completed preliminary load survey of all the States. These load surveys indicated that the power demand on an all-India basis would double up every five years until at least the end of the fourth five-year Plan.

Load survey to be realistic has to be a continuous process and this responsibility is vested on the Load Survey Directorate of the Central Water and Power Commission. Nevertheless, for some time past, it has been thought that there should be a second look on the load survey pattern to arrive at a more realistic assessment of the rate and structure of load growth in the various regions of the country.

This led the Government of India setting up in December 1962 an Electric Power Survey Committee which was charged with the task of making recommendations regarding the future pattern of power development and distribution in the country.

The Committee's Report now made available provides a broad picture of the power requirements of the country up to 1970-71 as expressed by yearly gross margins, Power-Systemwise and Statewise.

The survey covers the entire Public Utility Industry, operated by Statutory Corporations like the Damodar Valley Corporation, the State Electricity Boards and the Licensees' Undertakings.

Interlinking of the country's Power Systems is now an accepted policy and therefore until this process is completed, the gross margin requirement, expressed as a percentage of peak load, may vary from as high as 30 to 40 per cent for isolated systems to as low as 15 to 20 per cent for large fully integrated and fully co-ordinated regional Grids such as are being planned to be established in the future.

On the basis of this premise the scheduled capability in terms of Maximum Demand is expected to rise from 2226 MW in 1955-56 to 16025 MW in 1970-71. During the same period the peak load is expected to rise from 1683 MW in 1955-56 to 17,681 MW in 1970-71 with a minus Gross Margin in 1970-71 of the order of 1656 MW.

The survey has demarcated the country into seven regions as follows: Western Ghat — Kerala, Madras, Mysore

and South Andhra; Eastern Ghat — North Andhra, South Orissa, East Maharashtra and Central & Southern Madhya Pradesh; Satpura — Gujarat, Central and Western Maharashtra, Western Madhya Pradesh and extreme South Rajasthan; Western Himalayan — Jammu & Kashmir, Himachal Pradesh, Punjab, Delhi and Rajasthan; Central Himalayan — Uttar Pradesh and North Madhya Pradesh; Eastern Himalayan — Bihar, West Bengal, JVC & North Orissa; and Assam — Assam, Manipur, Tripura, NEFA and Nagaland.

The region-wise power situation in terms of scheduled capability related to peak load demands would indicate a gross margin of the order of—1656 MW in 1970-71 for the seven regions indicated above

Non-utility Power Stations are not covered in the survey. The capability of these undertakings will decrease from 964

SUMMARY OF BASIC FINDINGS OF SURVEY Energy Requirements (All-India): 1955-56 — 1970-71 (Public Utilities Only)

Year	Capability (MW)	Peak Load (MW)	Gross Margin (MW)	Energy Requirements (Mil. KWH)
1955-56	2,226	1,683	543	8,270
1960-61	3,880	3,312	568	16,385
1961-62	4,393	3,794	599	20,676
1962-63	5,056	4,236	820	23,710
1963-64	6,126	5,315	811	29,165
1964-65	7,880	6,479	1,401	35,054
1965-66	10,953	8,264	2,689	44,916
1970-71	16,025	17,681	—1,656	95,148

Capability is defined as the maximum kilowatt output ability of the systems at the time of system peak load with all power sources available with no allowance for outages and with sufficient kilowatt hours available to supply the energy requirements of the system. Thus capability must provide for scheduled maintenance, emergency outage, and system operating requirements in addition to the estimated load and any unforeseen load.

Peak Load is the maximum simultaneous ultimate customer demand which occurs during the fiscal years as measured by actual deliveries at bulk power sources. The peak load, therefore, includes time losses but no auxiliary power requirements.

Gross Margin represents the difference between capability and peak load as defined above.

MW. in 1961-62 to 811 MW. in 1970-71 and the demand will also likewise come down from 566 MW. in 1961-62 to 480 MW. in 1970-71.

Does the Committee's 1st Annual Electric Power Survey of India conducted by experts reflect a position which is very much different from the load picture presented by the various Power Systems and co-ordinated by the Central Water and Power Commission? Presumably not, but nevertheless the second opinion which the load survey now presents may perhaps give further evidence of the need for the country's power programme being sustained at levels which should at least keep up with the demand in the various regions of the country.

Ultimately the issue is not so much as whether or not a given demand for power is evident or not, but how much of the country's resources could be diverted for power development. In this context the determining factor will of course be the overall resources, and from the scale of power planning which is now evident there is no doubt that the authorities are giving due regard to the necessity for adequate allotment of resources for development in this vital sector.

Electric power surveys are common features in industrially advanced countries like the United States and Japan where primarily these surveys are conducted to enable electrical plant manufacturing industries to co-ordinate their programme so as to dovetail with the needs of the Public Utility Systems. The First Annual Electric Power Survey of India has also made an attempt in this direction although for some years heavy units of electrical power plant would still have to be imported from overseas.

COTTON INDUSTRY

The Indian Cotton Textile Industry, 1962-63 Annual: Editor M. P. Gandhi; Published by M. P. Gandhi & Co., Nanabhy Mansion, Sir Pherozshah Mehta Road, Fort Bombay; Price Rs. 6/-; Pages 152.

The Indian Cotton Textile Industry Annual, 1962-63, as usual discusses the principal problems pertaining to cultivation, export, consumption, prices of raw cotton and futures trading, etc. The statistics given in the section "Cotton Industry at a Glance" and in Appendix 'A', provide an authoritative character to this Annual. Interesting details regarding the allotment of cotton spindles and automatic looms are provided in the chapter "Other Developments" (Expansion of Textile Industry). In the decentralized sector — handlooms and powerlooms — is given the progress made in the reversion of handlooms into powerlooms upto the end of December, 1961. International textile situation and compulsory exports of cotton textiles have been dealt with in greater details. The annual should be useful to students of commerce studying the subject as part of the B.Com. and textile technological course in the various universities of India.

INDIAN ECONOMY

Indian Economics Year Book (1963): Raj Narain Gupta; Kitab Mahal, Allahabad; Pp. 356; Price Rs. 3.00.

The book under review is running its fifth edition which is perhaps enough proof, if proof is needed, of its usefulness and as the Indian economy assumes new dimensions the usefulness of such a book is bound to be increasingly realised.

The book has much to commend itself to those who have often to look up for figures and facts relating to Indian economy. The book is concise without being sketchy.

CORRECT IDEOLOGY

Correct Thinking and Standard Ideology: L. N. Bhatt, 14A/86, W.E.A., Karol Bagh, New Delhi; Pages 144. Price Rs. 4.00.

In the words of the author, one of the main purposes of the book is to bring to the notice of the nations of the world the fact that the ideologies at present current in the world cannot all be correct — only one or at most two of them can be so — and also the necessity for their forging by mutual discussion a correct ideology for general acceptance

Readers' Roundtable WORK-STUDY

Sir,—Brig. Pennathur's article on 'Getting the Best Out of It' in the issue of Eastern Economist of September 6, does provide a hint for a 'facilities utilization analysis' to tackle the acute shortages in our scientific and technical personnel, scarce materials like cement, steel, etc., and living space in the big cities. It is common knowledge that the scientific and technical talent at present is quite under-utilized, rather in some cases not at all effectively utilized. Even worse is the case with scarce materials; substitutes can replace them to a much greater extent than is actually the case. Worst is the case with living space. Being quite unrelated to what one actually requires in so many of the big bungalows a number of rooms remain vacant all the year round. Besides, the covered area of our class rooms, laboratories, auditoriums, libraries and cinema halls can also make available much valuable space if their wholtime effective utilization is ensured. Work Study experts such as Brig. Pennathur can help much in overcoming these shortages.

ACTIVITIES — EXISTING & PROPOSED

The Company was incorporated in 1947 and has established itself as a manufacturer of a wide range of woollen goods. New Woollen and Worsted Spinning Handloom and Powerloom Weaving, Dyeing and Finishing, and Hosiery Departments were added thereafter, with the result that about the year 1959, the Company came to occupy not only the position of one of the largest suppliers of woollen goods for Defence requirements but catered also for civilian needs of good quality suiting cloth, Tush and other shawls and knitting wools etc. under the popular trade name of "Pantex". The Company started in 1960 the manufacture and supply of the much-needed tentage for the Army. The Company has also started the export of goods to various countries. The Company is also manufacturing woollen cloth for industrial purposes. The sales of the Company reached Rs. 2.48 crores in the year ended 31-3-1963. Having declared a dividend of 12 per cent per annum for 3 consecutive years the Company is declaring the dividend at 12 per cent again for the fourth time in succession for the year ended 31-3-1963, in spite of the Super Profits Tax and other enhanced taxes.

Having established itself in the supply of woollen goods, the Company has now turned its attention to the manufacture of cotton goods. The beginning is being made with the installation of 12,000 spindles. Land measuring about 35 acres has been purchased for the Cotton Spinning Unit and other ancillary purposes and for future extension of Cotton Mills by installing more spindles and cotton-waste plant. The required plant and machinery have been ordered. The building is already under construction. With the working of the cotton unit, the profits of the Company are expected to show a further increase. The Directors consider that the prospects of and payment of dividend on Preference Shares, should be such that the Company should, in the absence of any unforeseen circumstances, be in a position to pay reasonable dividends on its equity shares.

Steps to solidarity

CORPORATION MEETING

INDUSTRIAL FINANCE CORPORATION OF INDIA

Speech delivered by Shri K. P. Mathrani, I.C.S., Chairman, Industrial Finance Corporation of India, at the Fifteenth Annual General Meeting of the Corporation held on the 30th September, 1963.

DURING THE fifteen years of its existence, the Industrial Finance Corporation of India has sanctioned gross financial assistance of the order of Rs. 202.7 crores to various industries. During the same period assistance of the order of Rs. 102.57 crores had been disbursed or made available. Projects of a total order of Rs. 433 crores, that is roughly 30 per cent of the total net investment in the organised industries in the private sector since Independence, are estimated to have been helped to fruition through this I.F.C. assistance. Consistent with its very considerable role in promoting the industrialisation of the nation, the Industrial Finance Corporation has been enlarging the range and content of its activities and is assuming the part and function of a development bank and not merely a lending institution. These and other striking facts about the progress of the Industrial Finance Corporation have been brought out in the Fifteenth Annual Report which is for the year ended the 30th June, 1963 and in the speech delivered by the Chairman, Mr. K. P. Mathrani, at the 15th Annual General Meeting held on the 30th September, 1963.

Following is the text of the Chairman's speech: Gentlemen,

I have great pleasure in welcoming you to this Annual General Meeting of the shareholders of the Corporation and placing before you the Fifteenth Annual Report of the Board of Directors and the Accounts of the Corporation for the year ended the 30th June, 1963. Printed copies of the Report have been circulated to the shareholders and I shall, with your permission, take the Report as read.

2. With the close of the year, the Corporation completed the fifteenth year of its service to Indian industry. As the shareholders are aware, the Corporation was established on the 1st July, 1948, i.e. during the very first year of our Independence. The activities of the Corporation, therefore, reflect to some extent, the results of the efforts since Independence to establish a sound industrial base for developing the economy of the country, particularly in the private sector. Starting from a modest beginning, the activities of the Corporation have progressively increased both in scope and in magnitude. Apart from rupee loans, which still constitute the major of its operations, the Corporation now sanctions loans in foreign currencies, gives guarantees in respect of deferred payments and foreign loans and has, in addition, during the last few years, ventured forth into promotional activities, such as underwriting of public issues in the form of equity and preference shares and debentures and also direct subscription to such issues. The Corporation has thus gradually been assuming the role and functions of a development bank and not merely a lending institution.

3. In order to project these widening activities of the Corporation, the form of presentation of the Annual Report has been suitably altered to give a complete picture of the total financial assistance approved and disbursed by the Corporation instead of confining the statistics only to the loans sanctioned, as has been the practice in the past. The appendices, therefore, contain combined statistics of all forms of assistance. Another notable feature of this year's Report is that statistics in the appendices to the Report have been prepared on the basis of net sanctions, i.e. exclusive of the figures

relating to the facilities approved by the Corporation which were subsequently not availed of by the applicant concerns or were cancelled or withdrawn by the Corporation for various reasons.

4. During the 15 years of its existence, the Corporation has sanctioned gross financial assistance of the order of Rs. 202.7 crores. The net amount of the financial facilities approved during this period, after accounting for cancellations and withdrawals aggregating Rs. 38.37 crores, totalled Rs. 164.33 crores, made up of rupee loans of Rs. 118.39 crores, foreign currency loans of Rs. 9.29 crores, underwritings and direct subscriptions of Rs. 9.48 crores and guarantees to the extent of Rs. 27.17 crores. As against the facilities sanctioned, assistance of the order of Rs. 102.57 crores had been disbursed or made available till the 30th June 1963 and the assistance outstanding on that date, after accounting for repayments, aggregated Rs. 78.92 crores.

5. While the figures of total assistance rendered by the Corporation are impressive enough, they do not tell the whole tale. Even more noteworthy is the total cost of the projects which have come to fruition because of I.F.C. assistance; this is estimated at Rs. 433 crores i.e. roughly 30 per cent of the total net investment in the organised industries in the private sector since Independence. Viewed in this light, I.F.C. may be said to have played not an insignificant part in developing the industrial economy of the country in the private sector. With the contribution it has already made, the experience it has gained and the reserves it has built up, the Corporation now stands poised to assume larger and more positive responsibilities envisaged by the Finance Minister in his statement in Parliament on the 6th September, 1963.

6. Turning to the year under review, it has been a particularly satisfactory one in every respect—from the point of view of the variety and magnitude of the assistance sanctioned and disbursed, the working results, the areas and regions assisted and the clientele served and the nature of industries financed. During the year the Corporation sanctioned financial facilities of the order of Rs. 40.14 crores made up of loans aggregating Rs. 22.61 crores, underwriting and direct subscriptions amounting to Rs. 5.19 crores and guarantees of deferred payments and foreign loans totalling Rs. 12.34 crores. The assistance disbursed or made available during the year was of the order of Rs. 22.43 crores, out of which the cash out-goings amounted to Rs. 18.1 crores. The figures of both the sanctions and disbursements are the highest in any one year since the inception of the Corporation, being almost twice the corresponding figures of the previous year.

7. Our gross income for the year was Rs. 394.72 lacs which shows an increase of Rs. 90.54 lacs i.e. almost 30 per cent over the previous year's figure. The gross profit of Rs. 167.26 lakhs for the year, subject to provision for taxation, is higher than that of the previous year by about Rs. 37 lacs. After providing a sum of Rs. 84.95 lakhs towards taxation, including Rs. 5.76 lakhs towards super-tax for the years ended the 30th June, 1962 and the 30th June, 1963, the net profit for the year comes to Rs. 82.67 lakhs. These results could be regarded as satisfactory and satisfying.

8. Out of the current year's profits a sum of Rs. 30 lakhs has been transferred to the General Reserve Fund which now

stands at Rs. 166.08 lakhs. In addition Rs. 17.60 lakhs have been appropriated to the Special Reserve Fund under Section 36(1) (viii) of the Income-tax Act, 1961. We have further transferred a sum of Rs. 15.82 lakhs to the Special Reserve Fund under Super Profits Tax Act, 1963. With these appropriations, the reserves now total Rs. 3 crores as against the paid-up capital of Rs. 7 crores.

9. The Corporation did not have to make any further provisions towards the reserve for bad and doubtful debts, the balance in which now stands at Rs. 14.47 lakhs. The existing provision relates largely to three very old accounts, action in regard to which is in progress. It is hoped that the bulk of these will be cleared or regularised during the course of the current year. Apart from these, our borrowers have, with rare exceptions, been prompt and punctual in the payment of our dues. Some of the old arrears of principal have been cleared and the percentage of defaults in the repayment of the instalments of principal has come down further from 1.24 per cent to 0.87 per cent. It is a matter of some satisfaction that one of the concerns which was in arrears for some time past has now been leased out to enable liquidation of the account in an orderly manner.

10. I am glad to inform you that as envisaged in my last year's Speech, the balance of Rs. 18 lakhs in respect of the subvention availed of by the Corporation from Government for paying the minimum guaranteed dividend was repaid during the year and thus the statutory liability in this regard stands completely discharged. A provision of Rs. 19.25 lakhs has been made in this year's accounts towards the payment of guaranteed dividend at 2½ per cent per annum in respect of the original issue of share capital of Rs. 5 crores and 4 per cent per annum in respect of the additional issue of Rs. 2 crores made in March 1962. I am conscious of the fact that the present position in regard to the dividend in respect of the first issue is somewhat anomalous and I hope that a satisfactory solution of this problem will be found when amendments are made to the I.F.C. Act.

11. As I have mentioned earlier, the promotional nature of I.F.C.'s activities has been progressively increasing in the last few years. During the year under review, we approved 18 proposals for underwriting of an aggregate amount of Rs. 3.37 crores — Rs. 1.52 crores in respect of equity shares, Rs. 17 lakhs for preference shares and Rs. 1.68 crores in regard to debentures. In a number of cases, the Corporation has sanctioned underwriting facilities in conjunction with loans as also other facilities for substantial amounts. A notable underwriting undertaken by us during the year was in respect of the 6½ per cent debenture stock 1968-77 of the Oil India Ltd., where we acted jointly with a consortium consisting of the Life Insurance Corporation of India, the State Bank of India and its subsidiaries, the Industrial Credit and Investment Corporation of India Ltd., and certain leading commercial banks, companies and share brokers. The Corporation underwrote the stock to the extent of Rs. 1.68 crores and in addition subscribed directly to the extent of Rs. 1.82 crores.

12. As you are, no doubt, aware, the Corporation did not enter underwriting business till December 1956 after it had acquired adequate experience of other activities and had also built up some reserves. Since then, we have progressively increased our operations in this field and have up-to-date given net sanctions in 42 cases to the extent of Rs. 7.66 crores. During this period 28 issues involving a commitment on our part of Rs. 6.25 crores were actually placed on the market and shares and debentures worth Rs. 4.51 crores devolved on the Corporation as a result of these operations. The proportion of the shares and debentures which have devolved on the Corporation as a result of its underwriting commitments is

no doubt, quite large, but, as you will appreciate, this is due mainly, to the condition of the capital market. The projects assisted by us are, however, basically sound and viable and we have every reason to hope that after they have gone into production they will give us adequate return.

13. The depressed state of the market, particularly during the last few months, is obviously, a matter of concern to us and as you will have seen from the press reports, this question has been a subject of consultation between the Central Government, the Reserve Bank of India and the institutions concerned. It is our feeling that this is a temporary phase which need not hold up the industrial development of the country. We propose to continue to play our part in the Plan targets in respect of industrial development in collaboration with other sister institutions. We shall, naturally, review our policy in this regard from time to time in the light of the conditions that may develop.

14. Whereas the bulk of our lending operations continue to be in rupees, the number of sub-loans in foreign currencies has been on the increase. Up to the 30th June, 1963, the Corporation had approved sub-loans in foreign currencies for a net amount equivalent to Rs. 9.29 crores. Out of the two loans of 30 million dollars sanctioned to the Corporation by the Agency for International Development (AID) of the United States of America, the Corporation had committed itself to a sum of \$14.85 million (Rs. 7.07 crores). We have a number of pending applications as also enquiries with us and we therefore propose approaching the AID through Government for a further allocation. We are also committed to a sum of DM 12.25 million (Rs. 1.5 crores) out of the two DM lines of credit aggregating DM 40 million. The demands made on us for sub-loans from the West German credits are particularly numerous and we hope that these credits will be further supplemented in the near future.

15. During the year under review the Corporation was also sanctioned a line of credit from the Banque Francaise du Commerce Extérieur, Paris (commonly known as BFCE) to the extent of 50 million Francs for financing the import of capital goods mainly from France and the relative protocol was signed in October 1962. A sum of 6.67 million Francs out of this credit has already been committed. A beginning in the sanction of sub-loans in Japanese Yen equivalent to U.S. \$0.25 million out of the amount allocated to us by the Central Government last year has also been made during the year.

16. With the above additions in foreign currency resources, the Corporation hopes to meet the foreign exchange requirements of its borrowers on a larger scale. However, in view of the fact that except for the West German credit, other credits are tied to purchases in the respective countries, the gap in our resources of a substantial line of credit in convertible currencies remains to be bridged. I hope that with the good offices of the Central Government this vital need of the Corporation will be met in the larger interests of the Indian industry.

17. Apart from the quantum of assistance rendered by the Corporation during the year, its distribution is of some importance. For some years past, sugar industry has been the largest single recipient of our assistance. During the last year, however, the position has changed and non-ferrous metal industry — principally aluminium — was sanctioned the largest quantum of assistance, namely 16.8 per cent followed by textiles (15.2 per cent), sugar (15.1 per cent) and basic chemicals (10.9 per cent). While considering requests for assistance we have shown particular sympathy to projects enjoying high priority which will help to fill the vital gaps in

the industrial economy of the country. Accordingly, we agreed to assist a small project for the manufacture of glass-lined equipment for use in chemical industry, a scheme for the manufacture of tyre bead wires, a project for the manufacture of malleable iron pipes and fittings, a unit for the manufacture of gelatine, a scheme for the manufacture of injection moulding machines and moulds and an alloy steel project of the capacity of 25,000 tons per year. In most of these cases, the parties have been able to secure dependable foreign collaboration and know-how.

18. The distribution of our assistance according to States has also shown a departure from the pattern obtaining in the previous year. While in the past Maharashtra led the list of our beneficiaries, during the current year that distinction goes to Madras State which was sanctioned 29.4 per cent of the total assistance followed by Maharashtra, Assam and Mysore. Uttar Pradesh, Orissa and Punjab have also claimed a sizable proportion of our sanctions during the year. Thus, in consonance with the Government directive, a larger proportion of our assistance is being availed of by the less developed parts of the country.

19. As in the past, the Corporation has paid particular attention to industrial co-operatives. The net financial assistance approved by the Corporation upto the 30th June, 1963 to this sector of industrial economy amounted to Rs. 36.86 crores representing about 22 per cent of the total sanctions by the Corporation. This assistance has been sanctioned to fifty sugar factories, three spinning mills and one unit engaged in the extraction of vegetable oil. These co-operatives, I am glad to say, have been meeting their obligations to the Corporation in time.

20. An interesting feature of the operations of the Corporation during the recent years has been the progressively smaller number of requests which have been finally turned down. During the year under review apart from one request for underwriting, no application was finally rejected by the Corporation. Credit for this goes partly to the entrepreneurs who have been bestowing greater care to the preparation of their projects and have been furnishing the information and data required by the Corporation for processing the requests. But this also reflects the constructive approach of the Corporation in considering these requests. Very few of the applications received by us are complete in all details and much work on them is necessary before they are considered acceptable. During the course of our examination it has been our aim to help the prospective entrepreneurs suitably to modify their schemes, where necessary, so to make them financially and technically viable. This has been facilitated by the setting up of a technical organisation within the Corporation and by our utilising the services of the Technological Consultancy Bureau of the National Industrial Development Corporation Ltd. The parties are thus assured of sound financial and technical advice and are in a position to revamp their schemes to the mutual advantage of themselves and the Corporation. This may sometimes give rise to complaints of delays. We have, however, found that the time spent in careful examination at that stage leads to more expeditious completion of the projects and their successful operation in the long run.

21. At the last Annual General Meeting I informed the shareholders that the Corporation had entered the market for the issue of bonds for Rs. 6 crores at 4½ per cent per annum at an issue price of Rs. 99.50. The issue was fully subscribed. I take this opportunity of thanking the shareholders and other investors for their support in making the issue a success. The Corporation has also, since the 1st January, 1963, taken over the management of the bonds which hitherto was entrusted to the Reserve Bank of India.

22. It might be of interest to you to know that the total amount of disbursements so far in cash in respect of loans sanctioned and shares and debentures subscribed to or taken up by the Corporation as a part of its underwriting commitments aggregated Rs. 87.79 crores. These have been financed to the extent of Rs. 22.62 crores out of the repayments of loans to the Corporation, Rs. 24.75 crores from borrowings from the Central Government, Rs. 28.24 crores from borrowings from the market by issue of bonds, Rs. 2.18 crores from the foreign credits and the balance of Rs. 10 crores from the paid-up capital and reserves. It will thus be seen that disbursements have been financed from the internal resources (including share capital) of the Corporation to the extent of about 37 per cent and from borrowings from the market to the extent of 32 per cent; the balance of about 31 per cent coming from Government and foreign loans.

23. Until last year the Corporation used to levy a small premium for premature repayment of loans by the borrower concerns whether from the accumulated profits or from additional share capital or from other sources. This policy has been reconsidered and with a view to encouraging the borrowers to repay our loans from their internal resources, the levy of premium in such cases has been completely withdrawn. Further the payment of premium in respect of premature repayments made from other sources has also been suspended for a period of two years with effect from the 1st July, 1963. The system of

levy of commitment charges has also been rationalised. Until recently commitment charges were recovered for late execution of mortgage documents and for non-drawal of loan amount according to schedule. A deposit for ensuring the utilisation of the facility sanctioned was also required. These have been replaced by a single commitment charge levied at 1 per cent on the amount of loan not availed of, calculated from the date of acceptance of terms and conditions by the borrower concerns. The revised basis for the levy of commitment charge is in line with the practice followed by other long-term lending institutions.

24. We have continued to act in close collaboration with sister institutions such as the Life Insurance Corporation of India, the Industrial Credit and Investment Corporation of India Ltd. and the State Bank of India and have financed some of the bigger projects in partnership with them. In respect of one project, we have worked jointly with the International Finance Corporation, Washington and the Industrial Credit and Investment Corporation of India Ltd. to assist in the setting of an alloy steel plant. Our association with commercial banks has also become closer. Such joint collaboration with other institutions and banks helps not only in bringing to fruition large projects which are essential for the economy of the country, but also in the exchange of ideas and the sharing of risks. I am grateful to these institutions and banks for the co-operation and consideration they are showing to us at every stage.

25. Our relations with various Chambers of Commerce and our borrower concerns continue to be cordial. We deeply appreciate the constructive suggestions that they have made from time to time for improving our service to our bene-

ficiaries.

26. Our practice of appointing non-officials on the Boards of our borrower concerns has proved fruitful and we have benefited much from their advice and assistance. I take this opportunity to thank them on behalf of the Board of Directors for the keen interest they have taken in their work. I should also like to convey our thanks to the members of our Advisory Committees for the able and objective assistance they have given to the Corporation.

27. Our appreciation and thanks are due to the United States of America Agency for International Development with whom our relations have been very cordial. We are also grateful to Kreditanstalt Fur Wiederaufbau and to the Banque Francaise du Commerce Extérieur for the consideration they have shown us.

28. Before concluding I should like to express my sincere thanks to my colleagues on the Board for their valuable co-operation and wise counsels. In particular, I should like to make a reference to Shri S. P. Virmani and Shri K. S. Sundara Rajan, who ceased to be Directors of the Board and to Shri M. Ct. Muthiah, Shri V. P. Varde and Shri C. C. Desai who are retiring this year. Their sound advice and active participation in the affairs of the Corporation has been of great value. Lastly, I record with pleasure the appreciation and thanks of the Board of Directors as well my own to the General Manager and the entire staff of the Corporation for the loyal and devoted work on their part during the year.

NOTE: This does not purport to be a record of the proceedings of the Annual General Meeting.

THE INDIA CEMENTS LIMITED MADRAS-2

Speech delivered by Sri P. Suryanarayana at the Seventeenth Annual General Meeting of the Company held on Thursday, the 19th September 1963

Ladies and Gentlemen:

On behalf of the management and on my own behalf, I extend to you all a cordial welcome to the Seventeenth Annual General Meeting of your Company and place before you the Annual Accounts of the Company for the year ended the 31st March, 1963, and the Directors' report and the Auditors' Report thereon. Printed copies of these have been circulated to all the members and with your kind permission, I will take them as read.

The year under review has been over-shadowed by the threat of war due to the unprovoked aggression by the Chinese on our frontiers. The entire industrial activity of the country had consequently been geared to a war-footing, laying aside for the moment, the planned industrial policy of the Government under the current Third Five-Year Plan. Needless to say, the cement industry has not lagged behind in its contribution to the defence efforts. The industry has, as its measure of contribution, maximised production and has tried to meet the full requirements of this vital commodity for the national effort to defend our country. The Government is now faced with the responsibility of defending the country against any possible future Chinese aggression, in addition to pressing on with its plans for economic development and rapid industrialisation. The defence of India requires colossal sums of money and it is the duty of every one by to contribute their maximum to this cause. The Private Sector has not been hesitant to respond generously to the Govern-

ment's appeal for donations to the National Defence Fund. I am very glad to inform you that all the cement manufacturers in the country have together contributed a sum of Rs. 25 lakhs to the National Defence Fund. Your Company has contributed a sum of Rs. 2 lakhs, while our workers and staff have contributed a sum of Rs. 13,305 to the National Defence Fund.

The emergency has, in its wake, forced the Government to impose new taxes and additional levies on a number of items required by the industry and people in general with a view to raise additional revenue to meet the grave situation. One of the proposals seriously affecting the Corporate Sector is the Super Profits Tax. This new tax, in spite of amendments, has had a disturbing effect on the financial markets and also on capital formation. It is hoped that Government will realise the serious repercussions of this levy on the Corporate Sector and avoid the resulting damage to industry.

Another additional burden cast on industry is the scheme of Emergency Risks Insurance, which has been in effect since the beginning of this year. Under this scheme, it is obligatory to take out insurance in respect of every factory and the goods produced therein. THE RATE was originally fixed at 25 nP. per Rs. 100 in the case of factories and 15 nP. per Rs. 100 in the case of goods. Subsequently, this has been reduced to 11.25 nP. and 7.5 nP. per Rs. 100. Your Company has had to expend on this item a sum of Rs. 75,795 for the first quarter and in all a sum of Rs. 1,53,887 to date. It is hoped

that this measure will only be a temporary one during the continuance of the emergency.

Now, coming to our own affairs, as already stated in the Directors' Report, there was a tremendous loss of production during the year under review due to reasons beyond the control of the management. The first kiln was shut down for major repairs for a period of nearly 54 days and the new 750 tons kiln had to be shut down on and off very frequently, necessitating great loss of production and also heavy repair charges. I am glad to report that the difficulties have, however, been overcome and the performance of the kilns so far during this year is quite satisfactory and upto the rated capacity.

I would like to refer to the commissioning of the Sankari Plant. The project has proceeded according to schedule except for a slight set back in the time fixed for the commencement of production. We had originally anticipated going into production by the middle of this year. But owing to causes entirely beyond our control, I am afraid, it will be possible to commence production only in October. In spite of prompt shipments by the foreign suppliers, the ships carrying the machinery were held up for nearly six to eight weeks due to the freezing of the seas at the ports of embarkation due to an unprecedented winter in Europe, delaying our original plans to commence operations by the middle of this year.

In addition, the supply of indigenous items of machinery were also greatly delayed by the local suppliers following the national emergency. But I can assure you that every effort is now being made to complete construction and commission the plant as early as possible. Since all the machinery has now arrived at site and the construction work is progressing fast, there should be no reason why we should not commence operations at Sankari by the end of October.

With the commissioning of the Sankari Unit, our annual production will be seven lakh tonnes of cement, an increase of nearly 40 per cent over our present production. The project for doubling up the Sankari plant has also been taken up.

The country's production of cement is still far below the targets set by the Planning Commission. As I mentioned to you earlier, the emergency has given an impetus to greater production which if kept up, may yield the desired results of fulfilling the Plan targets.

The country's foreign exchange position continues to be difficult with no prospects of exports increasing in the light of increasing consumption for our own needs and defence purposes.

Your Company has during the year under review produced 4,49,149 tonnes of cement as against 4,57,116 tonnes produced in the previous year. The fall in production as compared to the previous year was due to stoppage as already stated, of one of the kilns for effecting major repairs for nearly 54 days and also the frequent shut down of the big kiln.

The statement of accounts has been in your hands for quite sometime. The profit, before deduction of depreciation and the Managing Agents' commission has decreased by Rs. 6,12,038 as compared with the previous year.

The production of clinker, cement and sales were lower at 4,37,965 tonnes, 4,49,149 tonnes and 4,49,740 tonnes respectively.

Mention has been made in the Directors' Report regarding coal subsidy. I do not wish to add anything besides saying that we are pursuing our representations to the Government, asking for the fixation of the subsidy on the basis of actual expenses incurred in getting the coal by sea-cum-rail route.

The fall in production which has resulted in lower profits has reluctantly forced your Directors to recommend a lower dividend on the equity capital for the current year. Members

will of course take into account that this dividend has to be paid on a larger capital structure.

As I mentioned to you on the last occasion, there has been a steady increase in the pits' mouth cost of coal, railway freight on movement of all goods, surcharge on power and on other heads since 1st November, 1961, when the Government of India fixed the retention price for cement. Representations were made to the Government, drawing its attention to the increased cost and requesting them to enhance the retention price. Our representations have at last borne fruit and the Government of India have recently announced an increase of Rs. 3.75 per tonne. Out of this, only Rs. 2.75 nP. per tonne will go to the producers, the balance of Re. 1 being made over to the State Trading Corporation for meeting the increased freight rates suffered by the Corporation in connection with the distribution of cement. The increase now granted falls short of the industry's expectations. It would be relevant to point out that while the industry has been forced to bear the increased costs brought out mainly by governmental actions progressively from 1961, the Government have given effect to the revised retention price only from 1st June, 1963. Although the Government have raised the retention price by Rs. 2.75 per tonne, the actual price accruing to the producers will be less by a further 25 nP. per tonne in that the State Trading Corporation have with effect from the 1st June, 1963, reduced the selling commission from Rs. 1.50 per tonne to Rs. 1.25 per tonne.

The present increase is supposed to have taken into account the premium payable by the industry towards the Emergency Risks Insurance, though the industry wanted an extra margin on this account. What is disheartening about Government's decision is that the increase in price is to be only on a prospective basis.

Mention was made in the previous reports of the Directors in regard to the Company's arrangements with the Cement Marketing Company of India Limited for marketing of the cement produced by your Company. The agreement expired on the 15th September this year. The arrangements with the Cement Marketing Co. of India Limited have worked exceedingly satisfactorily over the period of five years of the agreement.

However, in view of the fact that your Company's production will reach about a million tonnes with the completion of the Sankari expansion scheme, the management feel that your company should develop its own sales organisation and for this reason, your Directors have had to take the decision that the agreement with the Cement Marketing Company of India Limited be allowed to lapse and the company itself take over the distribution of the cement.

In this connection, the management wish to place on record their appreciation and sincere thanks to the Cement Marketing Company of India Limited, who have handled the marketing of our cement for the last five years extremely well.

I am glad to inform you that the working of the Sankar Institute of Polytechnic has been very satisfactory. The classes are now conducted in the new buildings which were occupied in June 1962. The Junior School started in 1962 has also been doing well. Both the Institutes continue to render great service to the children of the employees of the Company.

The relations with labour at the factory and the staff at the head office continues to be cordial as usual. I take this opportunity, once again, both on my behalf and on your behalf to tender our thanks to all the employees of the Company for their unstinted co-operation and hard work during the year. The Company looks forward to their continued services and cooperation in the years ahead.

I thank you all, gentlemen, for giving me a patient hearing. N.B.: This does not purport to be a report of the proceedings.

CHAIRMAN'S STATEMENT

INDIANOIL'S FOURTH ANNUAL GENERAL MEETING

"BOUND TO BECOME AN OIL GIANT IN THE COUNTRY"

Mr. P. A. Gopalkrishnan, ICS, Reviews Activities

Addressing the fourth Annual General Meeting held at the Registered Office in Bombay on September 25, 1963, Mr. Gopalkrishnan said:

The Balance Sheet and Profit and Loss Statement are in front of you for your ratification. You will see that the Indian Oil Company has made a profit of Rs. 59.61 lakhs after making provision for payment of tax in 1962-63 over an equity capital of Rs. 322.25 lakhs. This gives a net return of 18.5 per cent and a net profit per kilolitre of Rs. 9.3. With this amount of Rs. 59.61 lakhs, it is proposed to wipe off accumulated losses of Rs. 16.85 lakhs, make provision for development reserve of Rs. 43.44 lakhs and carry forward a small balance. The net profit would have been over Rs. 90 lakhs if we had received agreement to receive the following amounts from Government or other parties:

- (i) Rs. 10 lakhs and odd which was realised by Government as C & F duty which was really not due.
- (ii) Rs. 14 lakhs and odd from Government on account of abnormal bridging expenses, emergency risks insurance, demurrage etc.
- (iii) Rs. 3 lakhs and odd from Government on account of unrecovered freight in Nunmati Supply Area.
- (iv) Rs. 4 lakhs and odd from other oil companies on account of Central Sales Tax which the IOC has paid on behalf of other companies.

The Indian Oil Company is pursuing these cases. Besides, the Company has paid Rs. 10.79 crores as Customs Duty, Rs. 6.67 crores as Excise Duty and Rs. 1.04 crores as Sales Tax, making a total of Rs. 18.50 crores (Rs. 4.24 crores received from other oil companies). The total amount by way of these three duties paid by the Indian Oil Company from its very inception is Rs. 22.39 crores.

SALES TREBLED

The quantity of product sold in 1961-62 was 322 kilolitres per person employed at the end of March 1962. The quantity of product sold in 1962-63 was 482 kilolitres per person employed at the end of March 1963.

Sales have almost trebled in 1962-63 compared with the previous year. They amounted to 629,639 kilolitres, plus 16,764 kilogrammes of greases and 11,498 metric tons of Petroleum Coke as compared to 211,033 kilolitres (plus nil kilogrammes

of greases and nil metric tons of Petroleum Coke) in 1961-62. Starting with two oil products, the Indian Oil Company now sells fourteen products viz., High Speed Diesel, Superior Kerosene, Inferior Kerosene, Aviation Turbine Fuel, Furnace Oil, Tea Drier Oil, Light Diesel Oil, Transformer Oil, Axle Oil, Lubricants of different sorts, Iomex, Motor Spirit, Greases and Petroleum Coke.

Technical advice is now available for giving advice to industrialists and others in the use of proper lube oils and fuel oils. A full-fledged lubrication department has been set up with officers in all branches for the purpose.

BLENDING PLANTS

Under a series of agreements with Mobil Petroleum, the IOC have become the sole distributors in India for Mobil Premium Grade Lubricants and two blending plants are being set up by the Indian Oil Blending Limited of which the Chairman of the IOC is the Chairman and the IOC and Mobil hold equal shares. The Blending Plants are expected to go into production in 1964 thus leading to saving in foreign exchange. The IOC has already saved Rs. 7.78 crores in foreign exchange in 1962-63 as against Rs. 4.57 crores in 1961-62 by making rupee payments for the oil products from communist countries and avoiding payment in foreign currency.

STORAGES

The storage space of the IOC at port and main installations has increased nearly two and a half times during the year under review. The company has also established a large number of inland depots and retail outlets to promote its sales and service to the consumer.

The times are difficult. While the Government is ready to collect Customs Duty and Excise Duty as the products are withdrawn for despatch, they are not prompt in paying the bills. Various rules come into play such as Supply Orders, Inspection Notes and Consignees' Receipts. In result the amount outstanding at the end of August 1963 is over Rs. 8 crores. Out of this over Rs. 4 crores is outstanding on account of DGS and D bills alone and about Rs. 4 crores with the State Government and other State Undertakings. Since the Indian Oil Company caters to the needs of almost all Government Departments and State Undertakings, the burden on the Company is terrific. It has to carry big over-drafts and Rs. 2 lakhs per month becomes the interest charged alone. On the

one side there is a ceiling price fixed by Damle Committee on certain assumptions and on the other there are terrific outstanding bills owing to Government Rules and Regulations. The burden on the Company is very much and working capital requirements have gone up. So in the current year, the rate of profit on the equity capital is likely to go down, particularly because of the increase in duty on all kinds of products.

OPERATIONAL COST

The next important item is the operational cost per kilolitre of product sold. Excluding sales to Hindustan Organizers, which are made from tankers direct, the operational cost in 1960-61 was Rs. 35.16 per kilolitre. In 1961-62, it was Rs. 31.68 per kilolitre. In 1962-63, it was Rs. 30.16 per kilolitre. It would have been Rs. 25.82 per kilolitre if certain abnormal expenses pertaining to previous years had not been met in 1962-63 and if the expenses had not increased as a result of the emergency and other causes.

Almost all the oil products sold by Indian Oil Company as well as by other companies are used both in the rural areas and urban areas. The tax paid to the Government comes from the pockets of the entire population. Many middle men get profits out of the business. So do the oil companies which employ quite a number of persons. Therefore the oil industry is very important to the people as well as the Government.

CHAIRMAN'S STATEMENT

THE FERTILISERS AND CHEMICALS, TRAVANCORE LTD.

Mr. T. A. Joseph Reviews Activities

Addressing the Nineteenth Annual General Meeting held at the Registered Office, Udyogamandal, on 30th September, 1963, Mr. T. A. Joseph said:

You will notice that the financial year of the Company has been changed. This became necessary to fall in line with that of other public sector companies. The accounts circulated to you relate, therefore, to a period of fifteen months, i.e. from 1st January, 1962 to 31st March, 1963.

The period under review has witnessed two major events in the history of the Company. They are—the introduction for the first time in India of a new technology for the production of synthesis gas required for Ammonia manufacture and the closure of the wood gasification plant, which has been serving the Company from its inception. The Oil Gasification Plant installed as a part of the Second Stage of the Expansion Programme of the Company, has introduced a new technology, by which raw light naphtha is utilised for producing hydrogen by the partial oxidation process. The Plant, which has been commissioned in the last quarter of 1962, has a capacity to produce sufficient hydrogen to make 80 tonnes of Ammonia a day. With the introduction of this new process, the Company has closed down the firewood gasification plant. It was mainly on considerations of economy that the wood gasification plant has been closed down, although it had served the Company usefully for 17 years and has fulfilled a very useful purpose in the field of fertiliser development in India.

While we have made a remarkable advancement in technology and have been able to raise our production capacity considerably, the factory has been facing severe set-backs in achieving the production target. Ever since the Electrolytic Hydrogen Plant was commissioned in 1960, the Kerala State Electricity Board has not been able to supply the Company

WORLD REFINING CAPACITY

The oil industry is about a hundred years old and many international giants have risen, particularly in the United States. In 1950, North America had about two-thirds of the world's refining capacity. Now it is less than half. Refining capacity is increasing in consuming countries, the sources of supply supplying only crude oil and there is a frantic and systematic search for crude in almost all countries. The world's refining capacity is very nearly 1,200 million tons. Russia exports 40 million tons of oil and oil products per year. So you can imagine the size of the international oil industry. Compared to it, the Indian Oil Industry is very small and the business of the Indian Oil Company is much smaller. Barauni Refinery is expected to go on stream in March or April 1964 and Koyali and Cochín Refineries are expected to go into production by March 1965 and June 1966 respectively. The ultimate capacity of the four Public Sector Refineries is 9.75 million tons and when the Indian Oil Company begins to distribute the production of these refineries it is bound to become one of the oil giants in the country.

Finally, I wish to point out that this young Indian Oil Company has started off well and has made a profit for the first time in 1962-63, which is creditable. I thank you for your co-operation and advice and thank all those officers and staff in the Company, who have worked hard to make the year successful.

N.B.: This does not purport to be a record of the proceedings of the Annual General Meeting.

the full requirements of power required for operating that Plant. As against a total requirement of 31,000 KW the Electricity Board has been supplying only 23,200 KW. Thus, even under normal conditions, the factory could have achieved only approximately 75 per cent of its production capacity, provided power supply to that extent was regular. But during the period, the Company had to face very severe power-cuts indeed. In 1962 there was a power-cut commencing from the 1st of March to the 10th of May. During 1963 the cut started earlier than usual and it was much more drastic. From 1st February, 1963, the factory could work only at 50 per cent production, because of the power-cut. This cut went on till the end of June. In between there was a period of about 3 weeks when Ammonia production was almost nil.

Another unforeseen development that completely upset the production programme of the year was the sudden incidence of salinity in the Periyar river waters during the summer months of 1962. This resulted in a further substantial reduction in the Company's production, as several of the important Plants had to be kept idle for fear of being permanently damaged by saline water.

The power-cuts and salinity in the Periyar waters alone accounted for a loss of production of over 4,000 tonnes of ammonia. On top of this there was the planned closure of the wood gasification plant to facilitate the inter-connections of the new Oil Gasification Plant and the commissioning of the latter. This however, was only in the normal course of things; but it was unfortunate that the loss of production consequent on this change over also fell in a year when we

had to face great difficulties on account of power-cuts and salinity.

The factors which I have just described have been responsible for the poor financial results during the period under review. As you have seen from the Statement of Accounts, these adverse factors have resulted in a loss of nearly Rs. 36 lakhs. This loss, however, has been covered in full by drawing from the previous profits carried over and the taxation reserves which are not required. You will notice, however, that we have provided Rs. 63.88 lakhs for depreciation as against Rs. 38.75 lakhs in 1962. A surplus of Rs. 3.85 lakhs has been carried over to the next year.

In view of the foregoing your Directors have not been in a position to recommend any dividend this year.

In the normal course the Company should be expected to derive from this year the benefits arising out of the increased capacity consequent on the installation of the Oil Gasification Plant. But as I stated earlier the current financial year itself has started with a drastic power-cut which kept on till the end of June. Even after the restoration of power supply the Company has not been given its full requirements. We are still working on a 75 per cent load as the Electricity Board is yet to make available the shortage of 7,600 KW. Besides, the rainfall this year has been very much below par so far, and it remains to be seen whether our Hydro-electric sources would be able to keep up their normal supply level after the monsoons are over. I do hope that with the commissioning of the Panniar Project towards the end of this year, the Electricity Board will be pleased to honour its commitments to us in full.

As I mentioned to you last year, we had invited the Government of India to participate in the equity share capital of the Company and to give us the necessary loans to finance the third stage of our expansion programme. Shares worth Rs. 3.5 crores have been taken by the Government of India as on 1st July this year. Thus, the Government of India now holds a majority of shares in the Company. Certain consequential amendments to the Articles of Association have been proposed and placed before you at this meeting.

The second stage of expansion was completed well in time and formally inaugurated on the 8th December 1962. The plant has had the usual teething troubles, but has been performing quite satisfactorily since then. I am glad to inform you that the Company has been able to complete the second stage of expansion according to the sanctioned estimate therefor.

The third stage of expansion, of which I had given an indication last year, is well under way. This expansion involves the installation of a number of major plants, the important ones being an Oil Gasification Plant and a Tonnage Oxygen Plant, which together will produce sufficient gases to make about 150 tonnes of ammonia a day, a 150-tonne ammonia synthesis plant, a phosphoric acid plant of 100 tonnes P₂O₅ capacity, a 450 tonnes sulphuric acid plant, a 300 tonne ammonium phosphate plant, a 300 tonne ammonium sulphate plant and a 50 tonne ammonium chloride plant. Although the target date for the completion of the third stage is 1965-66, the Company expects to complete the programme well ahead of that date.

When the third stage of expansion is completed, the Company will have a capacity of about 70,000 tons of nitrogen and 33,500 tons of P₂O₅ per annum, the ultimate products being 200,000 tons of ammonium sulphate, 135,000 tons of ammonium phosphate and 25,000 tons of ammonium chloride.

Superphosphate capacity will continue at the present level of 44,000 tons. In addition, the NPK mixture capacity will go up to 350,000 tons per annum.

The Company is now engaged in planning the utilisation of some more of its by-products. The Company has already obtained a licence for the production of dry ice. In addition investigations for the utilisation of waste gases of the Superphosphate and Phosphoric Acid Plants are in progress.

The Company is now engaged in planning its programme of activities for the fourth Plan period. Having regard to the experience of FACT and the planning and designing organisation the Company has already built up for its expanding activities, I am glad to say that the Government of India have decided to assign a very important role to the Company in the field of building up additional capacity for fertiliser production in the country. The Government of India have now asked FACT to plan, design and construct at least three complete fertiliser plants before the end of the fourth Plan period. The Government of India have also indicated that allocation of further units will be considered if the Company has more capacity. I need not tell you that the magnitude of the task involved is immense as the total outlay on the three complete fertiliser projects will be of the order of Rs. 100 crores. The Company is, therefore, taking the necessary preliminary steps to equip itself to undertake the task assigned to it by the Government of India.

In addition, the Company has also been engaged in negotiations with Messrs. Davy Ashmore Limited of U.K., a leading firm engaged in the manufacture of industrial plants and equipment for establishing a joint venture to fabricate pressure vessels and specialised steel work. A scheme drawn up for this purpose has been submitted to the Government of India. According to the schedules drawn up, this unit which is likely to be established in an area adjacent to FACT will go into production in the beginning of the fourth Plan period. The Company is also negotiating the formation of a joint venture with Power-Gas Corporation of UK for establishing an Engineering and Contracting Organisation capable of planning, designing and erecting fertiliser, chemical, petro-chemical and oil refining plants.

The Company has been rendering suitable assistance in the form of technical advice and consultancy services to other units coming up in Kerala. At present the Company is providing the necessary consultancy services to Mannam Co-operative Sugar Mills Private Limited.

To take care of the additional responsibilities and work that will be devolving on the Company on account of its expansion of activities, we have taken steps to augment the strength of the Company's technical personnel. Technical training facilities have been increased. We have at present 33 engineers including diploma holders and 70 university graduates under training in addition to 62 artisans. With a view to strengthening our middle management and to developing future managers, we have introduced a system of recruitment, training and absorption of executives. The first group recruited under the scheme has started the training on the 1st of August.

On the sales and marketing side, I am glad to inform you that the Company has made very good progress during the period. As a result of the programmes like fertiliser festivals introduced by the Company, fertiliser consciousness has grown considerably among the farmers of Kerala. Consequently, the Company has been able to raise its sales in Kerala from Rs. 11 lakhs in 1958 to Rs. 114 lakhs in 1962-63, the figure for 1961 being Rs. 68 lakhs. Although the progress has been

good, we still believe, that the fertiliser consumption in Kerala should increase several times more, before we can say that the State is taking reasonable advantage of the facilities available. The Company is, therefore, working according to a long term plan, with a view to achieving a sale of about Rs. 6 crores worth of fertilisers in Kerala State alone. The Company has also extended its programme of intensive campaign to the neighbouring districts of Madras State. The results have been very encouraging.

While the Company has been going ahead with a rapid expansion programme, our neighbours have also been expanding. New units are coming into our area. Instances are, a Zinc Smelter, a Cement factory based on the calcium carbonate sludge released by our Company, an Oxygen Acetylene unit using our surplus oxygen and an Ossein Plant. All these require considerable quantities of water. During the summer months the flow in the Periyar river has been so low that salinity has been creeping up to a dangerous extent. From a statement made by the Kerala Minister for Electricity a few weeks ago, we have learnt that when the Idikki Power project is completed, the water used for generating power in that project would be dropped into the Muvattupuzha river and as a result the water position in Periyar would be very much worse. This is certainly a matter of great concern. I would take this opportunity to stress that the urgent need now is to augment the availability of water in the Periyar

river and hence it will be suicidal to divert any more of its water to other river basins. The construction of the Idikki Power project should, I feel, be re-designed in a manner that would prevent Periyar waters being diverted elsewhere. If the logistics of Idikki dictate the need to drop the tail waters to the Muvattupuzha river, it is vital that the project also provide for re-diverting the water used by it back into the Periyar river by means of an inter-communication canal between the Muvattupuzha and the Periyar rivers. If such a step is not contemplated now itself, the completion of the Idikki project will place the present industries in the Periyar basin, in a very unfortunate position indeed. The numerous Lift Irrigation Schemes in the Periyar basin would share a similar fate resulting in a substantial drop in rice production in the area.

Management labour relations continued to be cordial during the period. The Work Study and Job Evaluation work is progressing satisfactorily.

I would like to take this opportunity to express our deep appreciation of the excellent work that is being done by the executives and workers of the Company.

I now move that the Directors' Report and the Audited Statement of Accounts for the financial year 1962-63, namely for the period 1-1-1962 to 31-3-1963 be adopted.

N.B.: This does not purport to be a report of the proceedings of the General Meeting.

INDIA STEAMSHIP COMPANY LIMITED

Address delivered by Sir A. Ramaswami Mudaliar, K.C.S.I., D.C.L. (Oxon), Chairman, India Steamship Co. Ltd. at the Annual General Meeting of the Shareholders of the Company, on the 30th September, 1963.

Gentlemen,

The Audit Accounts and Directors' Report for the period ending March, 1963, has been in your possession for some time and with your permission, I shall take them as read.

Before dealing with the Directors' Report and the Audited Accounts, I think it would be appropriate that I place before you frankly the course of events during the last two years regarding the financial position of the Lines operating on the India-U.K.-Continent routes and associate routes. It is no satisfaction to me to present a Balance Sheet showing for the fourth year in succession, a substantial loss, and shareholders have a right to know why these losses have been incurred during this period.

In 1961, the Conference Lines engaged in this Trade came to the conclusion that an increase in freight rates both in the Eastward and Westward direction was necessary if they should earn a reasonable margin of profit on their operations. Elaborate calculations were made of the Balance Sheets of various Lines by Auditors specially appointed for the purpose and based on their findings, a Delegation of the Conference Lines visited Pakistan and India, to get the approval of both Governments to a formula that they had devised, for making what they considered to be legitimate profits for the operating Lines. The Delegation found, when they met the Pakistan Authorities, that they were considering the proposals of a proposed foreign shipping company, which would cater to the entire Pakistan shipping, from and to Pakistan ports, East and West, cargo, both ways, at a lower freight than the Conference was on this route, at a lower freight than the Conference was prepared to offer. The Conference Delegation, after consulting the two Indian Lines, and with their approval, decided to visit Pakistan and come to the best arrangements so that the Conference Lines may continue to operate for the Pakistan Trade. The agreement they came to, instead of raising

the freight rates, reduced the rates substantially on some of the commodities, notably Jute and Gunnies, moving from Pakistan. They further agreed that till the end of 1962, they would not increase any freight rates from East to West. The Delegation then met the Indian Government and came to an agreement with the Government, whereby, as a corollary to the agreement with the Pakistan Government, they agreed not to raise any freights till the end of 1962. They further agreed with both Governments that there would be six months' notice given by the Conference on the 1st January, 1963, indicating the freight increase they would desire to make, the period of six months being utilised, for negotiations with Shippers and consultation with Government. As you would see, the final result of all these negotiations and agreements, was that the Conference which wanted a freight increase to be made in 1961, agreed in effect to no freight increase in the East to West Trade till the 1st July, 1963. The Conference had already increased the West to East freight by 10 per cent on the 1st October, 1961.

I stated, that to meet the so called threat of competition from a new shipping company which was going to use tramp shipping, the Conference reduced the freight rate on Jute from Pakistan, from sh. 173, (the rate which prevailed from 1958 to 1961) to sh. 160. The rate in 1957, when the last increase was made was sh. 187. It was quite obvious to the Conference that the freight rates on Gunny exported from India should be in parity with the Pakistan jute rates. There was, therefore, a similar reduction in the exports from India, which meant a rate of sh. 173/6 per 1,000 kilos of gunnies, against sh. 187 in 1961. I do not want to go into the comparative figures of other commodities, common to the export trade of India and Pakistan, which had to be kept at parity in the trade of each country. In effect therefore, the Delegation which felt that the Lines were incurring a loss on the existing freight rates in 1961, had to content themselves for nearly

two years with the same rates in most cases and at even reduced freight rates in others, before coming up for a revision in freight rates to either of the Governments. The threat of the proposed shipping company, as it happened, and some of us felt that it was bound to happen, was no real threat, for the simple reason, that ships on charter or tramp ships, cannot serve the trade as effectively and carry cargo from and to as many destinations as the Conference, which has about fifteen to twenty Member Lines operating in this trade, each Member with several ships.

It has been generally agreed by shippers and Government ultimately, that an increase in the freight East to West was justified. Both the Shippers and the Maritime Freight Commission have acknowledged that a freight increase East to West was indicated, if the Lines engaged in this Trade were to function and continue to offer to Shippers an adequate service. It is unfortunate that there has not been an agreement on the rate of increase that would be justified. It may be pointed out that during 1960, 1961 and 1962, every Conference of Lines engaged in other overseas trade, increased the freight rate and some of the Conferences have increased it twice during these three years. The Indian Lines had suggested an increase of 10 per cent in the East to West trade, but the Conference fixed an increase of 12½ per cent on the ground that the increase proposed will result only in an effective 10 per cent increase or even somewhat less, because of the non-increase or slightly lower increase in commodities, which have been termed sensitive commodities, whose exports may be affected by freight increases. The question of sensitive commodities and how they should be dealt with is a matter still to be discussed with the Authorities, by the Conference, and I hope as a result of the discussions, a more cordial atmosphere will prevail between the Conference and the Governments concerned.

I have stated, that the last increase in freight rates was in 1957. Comparing the rates then prevailing with the rates now announced, it would be found that in many cases, the rates are only slightly higher than they were at that time. While I am equally anxious that the export trade should be promoted and that our foreign exchange earnings should meet some portion of the present gap in foreign exchange, I would venture to suggest that the price factor and the profit factor of some at least of the export items, should be carefully evaluated before either an increase in freight, or a decrease in the rate proposed, is finally advocated and adopted.

It is with this background that I would like to deal with the results of your Company during the year under review. The Directors' Report discloses that there has been a loss of about Rs. 30 lakhs in the working of your fleet. I would only like to point out that even if a 10 per cent increase had been allowed in the East to West Trade, during that year, the loss would have been avoided.

I have heard it suggested that while other shipping companies are showing a profit, your company is showing a loss. The fleet of your Company is operating on the India-UK-Continent route and the Baltic Sea and Black Sea routes, with a small number of calls to South American ports. It is in this route that the freight rates from East to West was not increased from 1957 to 1961 by the Conference, and has further not been allowed to increase for nearly two years by arrangements with Governments. It is the result of the voyage earnings of Lines in these routes alone, that should be compared to get an exact perspective of the functioning of the companies concerned. Many companies have other routes, in which the large number of ships they have, ply. Some of them have large investments of reserves, the income from which is also appropriated towards profits. As I have already stated, every

other route of the ocean going vessels of Lines, had had the freight rate increased at least once and in some cases more than once, since 1961. I hope these factors will be appreciated in the unenviable task of indulging in comparisons.

The Directors' Report shows that the freight earned during the year was Rs. 8,00,21,725 as against Rs. 8,97,26,920 in the previous year. The decrease in freight is to a large extent compensated by a corresponding decrease of 53 lakhs in port expenses and other charges generally included under this heading.

During the year, the total number of Liner voyages completed, was 48 as against 54 in the previous year.

While there was no increase in the freight rates from India in the routes followed by your vessels, the increase in port charges, dock levies and stevedoring rates, have been substantial, both in India and abroad. There has also been unusual delays in the time taken to berth vessels at these ports, notably at the port of Bombay. Weather conditions and labour strikes, have increased the delay in some ports more than in the previous year. These factors account for a loss of 541 days by the various ships of your fleet. Another unforeseen and unaccountable delay was sustained in one of the ports of the Baltic Sea, when at the time of the Small Pox scare in Western Europe, a seaman on one of our vessels was suspected to be affected by this disease. It turned out that

THE CALCUTTA ELECTRIC SUPPLY CORPORATION LIMITED

(Incorporated in England)

NOTICE is hereby given that the Board of Directors of this Company have decided to recommend to stockholders at the forthcoming Annual General Meeting that a Final Dividend for the year ended 31st March 1963 on the Company's Ordinary Stock at the rate of £4 per cent net (Tax applicable at 7s. 9d. in the £) be paid on the 28th October, 1963 to those stockholders whose names are registered in the Company's Stock Register on the 14th October, 1963.

Applications for transfers received in this office before 12 O'clock noon on Monday, the 14th October, 1963, will, if otherwise satisfactory, be registered at that date for the purpose of participation in the above Dividend.

BY ORDER OF THE BOARD
D. P. M. KANGA
AGENT

VICTORIA HOUSE,
Calcutta, 28th September, 1963.

the suspicion was baseless, but the Port Authorities quarantined the ship for 36 days, involving substantial loss in earnings.

In spite of decrease in freight earnings as compared to last year, owing to a rationalisation, there has been a corresponding decrease in expenditure. The number of ports at which your vessels called was 736 in the Liner voyages, as against 947 in the previous year. The average duration of a round voyage was 126 days as compared to 129 days in 1962. There has been a serious attempt at reducing the expenditure on deck and engineering stores but victualling expenses have gone up slightly in sympathy with the rising costs.

The average age of the fleet of your company was nine years in March 1963, and the fleet is in good condition thanks to the attention which has been paid to maintenance.

I referred earlier, to the fact that even with the increases proposed by the Conference, there is only a very slight increase in actual freights over those prevailing in 1957, for several of the commodities. Even so, I am in complete agreement with the policy of the Government of India, that Export Promotion should not be hindered by unreasonable freight rates. It is the same policy which has been adopted by countries anxious to promote their exports and thereby minimise their dependence on foreign exchange. Though National Lines of some of these countries have been compensated in various other ways for their loss in earnings. I would, however, point out that the Indian Lines taken together, are themselves earners of very considerable foreign exchange, particularly if their share in the India-UK-Continent trade is taken into consideration. The Government of India is naturally anxious to expand Indian tonnage, particularly tramp tonnage, thereby avoiding over-dependence on foreign carriers. It is, therefore, really a matter of balancing two apparently antagonistic factors, but I believe that the balance can be struck if the varying factors are taken into consideration in their proper perspective.

I would have greatly wished that the Maritime Freight Commission had consulted the Indian Lines in particular, at some stage before they gave their final decision as to what they considered was a fair increase in freight rates from East to West, to the Continent of Europe. As I have already stated, the consideration of what are called sensitive commodities from the export angle, will be taken up by the Government in consultation with the Conference. I believe that representatives of Indian Shipping Lines in this Trade, will be in a position, from their local knowledge of facts, to assist the Government in coming to fair conclusions.

When referring to this subject of export, I stated last year "It is to be emphasized that as against the small voice of Indian shipping companies, the loud and uncontrolled menacing voice of some shippers of comparatively small exports sometimes prevails." I expressed the hope that the shareholders of shipping companies will join with the management in impressing on the public the need for fair play as between Indian shipping companies and Latin exporters and importers.

THE FUTURE

Shipping is an unpredictable industry—its factors, some of them are outside the control of the Management of Shipping companies. Even so, I express the hope that we have come to the end of deficit Balance Sheets.

The share of the Indian companies in the import and export trade of the United Kingdom is every year increasing by one per cent. The determined efforts made by the Government to increase exports are beginning to have effect in the volume of trade that is moving both to West Europe and to East Europe.

Recently there has been an improvement in the berthing facilities in some of the Indian ports, and what is more im-

portant, the drafts of the River Hooghly, which have the biggest influence in the carriage of cargo to and from the port of Calcutta, have been improved.

The determined effort of the Government to carry through the industrial development that has been planned, affords opportunity for larger import of goods from abroad.

These are factors which may to a certain extent dispel the gloom that shareholders of shipping companies may feel.

THANKS

We are grateful to the Minister of Shipping for his continued interest in Indian Shipping and for his helpful advice from time to time. The Officers of the Ministry of Shipping, the Director General and his Deputies and Assistants in particular, have helped Indian companies and their advice has benefited the management of these companies. We look to their sympathetic guidance in days of difficulty. I am certain that being in charge of the welfare of Indian Shipping, they will, while having regard to the foreign exchange position, also have equal concern about earnings and requirements of Indian Shipping.

TRIBUTE

It is no conventional language that I shall be using when I offer my hearty thanks on behalf of the Board and myself to the Officers and Staff both afloat and ashore, for the devoted services they have rendered during the year.

I should also like to express my thanks to the Shippers, Brokers and Forwarding Agents, for their firm support to us and for the confidence they have reposed in us and in the quality of our shipping service.

N.B. : This does not purport to be a report of the proceedings of the General Meeting.

RECORDS AND STATISTICS

Reorganisation of Central Excises

(Continued from Previous Issue)

TAXATION policy is best formulated in the Economic Affairs Department of the Finance Ministry in association with other economic ministries. The Central Board of Revenue should cease to be a department of Government. It should be the chief revenue authority concentrating on efficient management of the collecting agencies but its views on the feasibility or otherwise of each levy should continue to be obtained.

There has been no rationale in fixing the strength and status of Members of the Board from time to time. There should be an objective assessment of workload and responsibility to determine both the number of Members and their Chairman's status.

There should be two Boards, one for direct taxes and the other for indirect taxes, each with its own independent Chairman.

The Board for indirect taxes, which may be called the Board of Central Excise and Customs, should sit as a Board to consider all aspects of technical, administrative and establishment work. The strength of the Board and distribution of work among its Members should be determined by the volume of work. The Chairman should be drawn from either Wing of the Service. Besides co-ordinating the work of the Board, he should be the Finance Minister's adviser on indirect taxes. The Board should be responsible for implementing taxation measures and evolve requisite techniques. It should report to Government the difficulties of administration so that remedial measures could be taken.

The data now used to formulate new proposals is neither up to date nor complete. It is also insufficient for consideration of excise levies. The Board of Central Excise and Customs should set up a tax research bureau to collect, collate, analyse and provide it with all relevant material and data. The Central Excise field force is best suited to collect the information required for the tax research bureau.

The Directorate of Inspection should be reorganized to concern itself with investigation and study of major revenue and technical problems and not with the routine inspections. Its regional offices will then be unnecessary.

The Statistics and Intelligence Branch is hardly equipped to undertake any intelligence work. Little is gained by mechanical tabulation of the same statistical summaries which are also manually consolidated. It should be reorganized after a detailed study to be made by a committee of statistical experts. It should be equipped to build up fuller statistical information.

If articles to be taxed are properly defined, there should be little room for technical chemists in the day to day administration of excise levies. The principal function of Regional and the Control Laboratories should be of carrying out analysis where duty liability depends upon the chemical composition of an article. Their needs in equipment and personnel should be reviewed in this light.

Field Organisation

The Multiple Officer Range Scheme has evoked widespread criticism from official and non-official witnesses alike. The main objectives of the scheme have not been achieved; the gravamen of criticism is:

- the Deputy Superintendent in charge of the Multiple Officer Range is unable to inspect his charge objectively;
- evidence is not conclusive that yields of tobacco have increased following introduction of the scheme;
- delays are greater and there is lack of continuity of supervision;
- an extra rung in the hierarchy is introduced and the responsibility has become difficult;

(e) despite travelling longer distance licensees cannot readily find the proper officer and complaints of delays are frequent.

Concentration of staff farther from areas where work arises increases risks of smuggling and evasion. Frequent rotation has created a feeling that the administration lacks faith in its men and has affected morale besides reducing scope for specialization.

There is greater loss of time in travelling and more expenses. Rotation of officers dislocates family life besides causing other difficulties where accommodation is provided by factories. There is mutual bickering and rancour and the control of the Deputy Superintendent is ineffective.

Multiple Officer Range Scheme may be suitable for areas of concentration of industry but it is not so where production units are dispersed. Periods of rotation should be reduced to a minimum of one year to provide for continuity and specialization.

The primary revenue unit should be a sector with workload manageable by an Inspector, and an adequate number of sectors should cover the whole country. The general pattern, except in areas of concentration, should be single officer sectors manned by Inspectors. The utility of Sub-Inspectors is extremely limited.

Supervisory Hierarchy

Too many tiers of supervision and lack of adequate delegation delays resolution of difficulties. Both should be remedied. Compact groups of sectors and Multiple Officer Ranges should form a Range in charge of a Class II Superintendent whose office duties should be drastically curtailed. He should essentially be an inspecting and supervising officer. There is neither room nor need for a non-gazetted Supervisory Officer between the Sector Officer and the Superintendent. Range should not be offices of record but each Range should have one or more additional Inspectors for enforcement, etc. work. There is no justification for retaining two classes of Superintendents. Control over Ranges should vest in Class I officers in charge of Divisions with adequate powers to shoulder responsibility and take decisions.

The Divisional office should have three branches, each in charge of a Class II Superintendent for administration, technical including statistical and intelligence control, and adjudication work respectively.

Jurisdiction of Collectorates should be based on all relevant considerations, the purpose being to make them as far as possible comparable. Collectorates comprising portions of two States should be avoided.

Collectors should be assisted at their headquarters by two Deputies so that they are not tied down to their desks.

Integration of customs and excise work outside major ports may continue but service conditions of officers engaged in customs work whether they are of Customs or Central Excise Departments should be made comparable. There is not much scope for the merger of customs and central excise administration or for integration of their Class II and Class III cadres.

Collectors, Deputy Collectors and Assistant Collectors should be redesignated Commissioners, Deputy Commissioners and Assistant Commissioners respectively.

Ministerial and executive cadres should continue to be separate.

A large proportion of Lower Division Clerks actually undertake Upper Division Clerks' work. Adjustments should be made in the strength of Lower Division Clerks who should be em-

ployed only on routine duties as envisaged by the Second Pay Commission.

There should be a common grade of Office Superintendent for all Collectorates. The numbers required should be determined on the strength of the establishment in each office.

Deputy Superintendents (Ministerial) and Head Clerks in supervisory charges of sections in offices should be replaced by a common grade of Deputy Office Superintendent. Their number should depend upon the number of sections in which an office is organized — each of the three branches in Divisional offices should be in charge of a Deputy Office Superintendent. In Ranges an Upper Division Clerk should be the clerk in charge with a charge allowance.

Ministerial cadres in the Directorates and the Statistics and Intelligence Branch should be merged in those of the office of Chief Central Excise Authority. Present anomalies in career prospects and emoluments should be removed.

Cost of Collection

Commodity-wise costs cannot be worked out under the present system of accounting. While employment of recognised techniques of cost accounting should enable determination both of commodity-wise costs as well as their comparative costs in different Collectorates, the true position of real comparative costs may be obscured by a number of factors. Steps should be taken to develop a fully integrated system of cost control. Costing must be based on basic documents prepared at the time of assessment. Overheads not relatable to any particular excise should be allocated empirically. Costs of Chief Central Excise Authority and its ancillary offices at New Delhi need not be allocated to Collectorates for purposes of comparison. Present cost of collection of excise duties is not unreasonable and is comparable to that of the other two main sources of revenue, though compared to costs of collection of indirect taxes, in some other countries, it is still high.

Textile Fabrics and Yarn

The separate levy of yarn consumed in manufacture of cotton fabrics in composite mills and powerloom units larger than 49 looms, should be converted into fabric duty. There is no agreement on replacing physical-cum-accounts method of control by the audit type of control. Duty may be charged on samples but the procedure should be simplified. There should be closer and early consultation between representatives of industry and excise officers competent to settle procedural details and clear doubts whenever a new duty is levied. Production has increased but the average incidence of duty on cotton fabrics of the compounded levy sector has been falling. Revenue sacrifice in compounding is estimated at Rs. 6 crores annually on the basis of 1961 rates of production. Licensed powerloom units rose from 279 in 1955 to over 26,000 in May, 1962. Neither reduction of looms per unit to constitute the free sector nor raising the compounded levy rates is likely to improve revenue. The benefit of the revenue sacrificed often goes to city financiers instead of powerloom owners. Anti-fragmentation measures have not succeeded. Fragmentation has resulted in the costs of administration sometimes exceeding the revenue collection. Schemes to relate the compounded levy to actual or potential production and grading it according to sizes of units will both entail excessive costs and perpetuate the tendency towards fragmentation. Cotton powerloom fabrics should not again be exempted from the duty. Duty from powerloom cotton fabrics should be derived by a levy on yarn delivered from spinning mills and excise control over powerlooms abandoned with economy in administrative costs. The exemption for coarser yarns delivered in hanks should be revoked. All handloom fabrics will then again bear a modicum of tax. If protection for them is to continue, this could either be done by refund of yarn duty to handloom

cooperatives or by increasing the rate of handloom cess, preferably the former. Relief to different sections of powerloom industry may, if found necessary, be given as subsidy.

The monthly exemption slab for independent processing units should be replaced by a scheme of subsidy, the amount of subsidy rising as the quantities processed increase above a floor and upto a ceiling, after which there should be no subsidy.

The revenue from the second stage levy of processing duty on rayon and artificial silk fabrics, should be derived through revised rates of yarn duty. This will reduce administrative costs and also remove the grievance that, unlike cotton fabric processors, artificial silk processors do not have an exemption slab. There should be no exemption slabs for them.

Conversion of the two stage levy on woollen fabrics into a duty on yarn is not feasible.

Avoidable documentation in completion of assessment memoranda and deduction for discounts, 'flag' allowances and the like should be eliminated.

Duty on yarn wasted in processing and milling should be taken into account when fixing rates of refund on export of fabrics.

Remnants of pieces used for cutting samples should be allowed to be delivered on recovery of duty.

Tobacco

The excise systems of other countries give no guidance for remodelling our Scheme. A scheme of assessing duty on cured produce, the liability being discharged by the first buyer but without subsequent control on the tobacco, is not feasible. If the off-take for cigarette production was higher and a tax on manufactured biris administratively feasible, it would be possible to raise all revenue from these manufactured products and leave raw tobacco untaxed. But that is impracticable. There is no workable alternative to the present system of classification for assessment, but the large gap between lower and higher rates is an incentive to misuse of lower rated tobacco. Complaints of this are widespread though statistical study does not indicate any large scale increase in production of whole-leaf varieties. The quality of Indian tobacco should be improved but not through compulsory grading or tariff preferences. There should be stricter restrictions, as in other countries, on collection of bottom, withered, etc. leaves and ratoon. A flat rate of duty is desirable, but as a differential between tobacco for biri and for other uses has been maintained over a long period, a sudden change may upset the equilibrium. The gap between the two rates should be gradually reduced so that a flat rate can ultimately be introduced. Control over production of tobacco should be stricter.

The grower's entry book may be abolished and the curer's entry book restricted to professional curers only. To help curers, some such agency as the Central Warehousing Corporation should set up public bonded warehouses for cured tobacco and make advances on stocks deposited. A specified period adequate for the actual needs of the trade should be fixed for the storage of tobacco warehouses in bond. There should be no extensions and the period fixed should be uniformly enforced. Revision of rates of duty to allow for losses due to dryage and withdrawal of the concession to condone such losses is to react adversely on the producer. But such condonation should be limited to losses on account of natural dryage during period to be fixed for each major variety, taking into account the time taken by freshly cured tobacco to lose its surplus moisture. Thereafter, no claims for losses should be entertained. Condoning losses in curer's premises should be regularised by law.

In re-arranging jurisdictions care should be taken to see that primary revenue officers are able to realise the arrears and, in any case, to check any further rise in arrears. A

mandatory penalty should apply to amounts remaining unpaid. There is no need to demand interest, but curers may be allowed to pay arrears in instalments. Amounts in arrears may be re-assessed on rate enhancements only where tobacco physically exists. Revising other demands where tobacco has already gone into consumption, is for practical purposes of no value. The law to enforce recovery of arrears is adequate. State administrations should realise that a part of the arrear is actually State revenue. There should be reliance on the normal organization to realise arrears and not on employment of special squads. Administration will become simpler and certain grievances of cigarette manufacturers will be met if the two stage levy, first on tobacco and then on cigarettes, could be replaced by a single levy on cigarettes, but a specific tariff with reference to weight of tobacco in cigarettes does not appear practicable.

There is considerable evasion of cigar and cheroot duty and more and more cigars pass for non-taxable than could genuinely be marketed within the tax-free slab having regard to prevailing price, wage, etc. levels. The collection being small, the duty should either be abolished or replaced by a flat specific levy related to weight of cigars and cheroots. Excise labels for cigars lose all meaning when a free slab exists and may be continued only if the free slab is abolished.

Sugar

Either the methods prescribed for testing sugar samples should be replaced by those which will not be open to objection on technical grounds or the earlier definition of excisable sugar should be restored. Documentation and sampling for excise purposes and physical checks are excessive and should be reduced. Departmental chemists should only analyse samples in disputed cases and not become technical consultants or judges of operational efficiency. The scheme of technical control and scrutiny of process accounts should be modified accordingly. Audit type of control should largely replace the present system of physical control. The incidence of duty borne by khandsari sugar produced under compounded levy is much lower than under the notified rates which are themselves low. The production of khandsari sugar by sulphitation process is organized in small factories. The sugar they produce is also often indistinguishable from sugar made in vacuum pan factories. The rate of duty on sulphitation processed khandsari sugar should, therefore, be brought nearer the normal rate. This would be justified in itself and would also largely compensate for the loss of revenue by exempting ordinary khandsari sugar from the duty.

Matches

A simple levy has become extremely complex through successive changes in categorisation of factories and rates of preference applicable to individual producers. Despite a duty preference for factories in the organized sector since 1961, their total production declined. Changes in gross benefits from rate concessions have led to lowering of output of 'B' category factories, some of whom have closed down or fragmented into 'C' category factories whose numbers and output have shown a phenomenal increase. Restriction on licensing of more than one factory belonging to members of the same undivided Hindu family is commonly circumvented and also complained of as discriminatory. Both this and the rule requiring approval of labels have in effect become dead letters and serve no useful purpose.

The existing rate preferences are an incentive to fragment into smaller units or restrict output. The effective tariff should be recast to encourage consolidation and growth. Revised duty differentials have not benefited those for whom they were intended, the labour engaged in small factories or the consumer. The objective of telescopic rates to encourage manufacturers to grow has not been achieved. The duty preference is largely passing into the distributive channels. There is no justification to distinguish between the present 'B' and 'C' category factories for tariff purposes. The criterion of the use of mechanical power may be an adequate one to distinguish factories in the organised from those in the smaller sector, ignoring such use of mechanical aids as, for instance, in grinding chemicals, cutting labels, etc. There should be no preferential slab for manufacturers in the organised sector. There should be a common preferential rate for all manufacturers in the small sector. Aid to individual manufacturers in the latter sector should then be given through cash subsidies, the amount of subsidy increasing as production rises. This will provide incentive to consolidation and growth. Banderolling is preferred by all but as there is scope for substantial economy by eliminating banderolling, an alternative should be explored. Rules relating to certificates specifying the price at which manufacturers may buy banderols need revision. The Departmental Treasury at Sivakasi should be supplied banderols directly from the Security Press. Mar-useful purpose. Uniform retail price cannot be ensured without statutory price control and uniformity in other taxes levied on matches.

Tea

Warehousing of tea stored in Calcutta and Cochin pending auction will relieve the financial burden on producing tea

estates. Excise duty may be recovered on delivery from warehouses after auction. Where estates deliver tea directly to buyers, duty may continue to be recovered at the time of removal from the producing factory. The suggestion to accept post-dated cheques on account of excise duty cannot be endorsed. Tea cess levied on quantities of tea exported may be spread over the entire production and collected in the same way and along with excise duty to facilitate recovery and also lower the cost of tea exported.

Consumption of loose tea which does not bear the package tea duty is increasing. Levy of package duty puts a premium on unhygienic storage and handling of loose tea. The saving of package tea duty is largely appropriated by the distributive channels. The overall duty burden bears more heavily on the rural consumer than on hotels, restaurants, etc. who can order tea in large packs and avoid the package duty. Revenue will improve considerably and the rural consumer also benefit if to the zonal rate was added, in substitution of the package duty, a common rate applicable to all tea going into internal consumption. Warehousing of tea in auction markets will facilitate this and reduce administrative costs. Zonal rates should be fixed taking into account, besides the average selling price, the cost of production also. There is scope for reducing physical checks and excise accounts to eliminate those that are of little value or involve duplication. Powers of officers to supervise destruction should be liberalised to meet day-to-day needs of production. There is no need for a bond for tea waste which is 'ab initio' exempted from the duty. Central and State levies on tea can only be combined into a single stage recovery if constitutional difficulties and the objections of the States can be overcome.

Paper

The complaint that dissimilar varieties are grouped under the tariff at common rates of levy and that the same varieties are at times classified differently at different paper mills is not without substance. The present scheme leads to the grievance that officers usually assess at the highest of several rates applicable. Grouping of varieties for tariff purposes should be on the basis of verifiable physical characteristics. The number of categories could be reduced from the present four to two. The higher rate may apply to varieties identifiable by physical characteristics, e.g. tissue other than cigarette tissue, blotting, toilet, cheque or art paper. The lower rate may include all other varieties. The rate preference for newsprint is liable to abuse, the detection and prevention of which is difficult. A common rate of duty may apply to all newsprint howsoever used, the mechanical woodpulp content being made the criterion to distinguish newsprint from other varieties of paper. Enquiries which are made at the instance of the Ministry of Commerce and Industry to determine whether a variety of paper is provisionally recognised as hand-made before it is exempted from duty may be entrusted to Excise officers. As all boards are assessable at any one of two basic rates of duty, a more broad based tariff description will facilitate administration. The existing procedure prescribes the same physical checks at successive stages in the packing room, store room and at the time of clearance. The scheme should be simplified and all test checks conducted mainly in packing room, checking in subsequent stages being confined to such cases where there is reason to suspect substitution.

Soap

The output of the power operated sector has steadily increased after the levy of duty but there have been only minor improvements in the output of the taxable non-power operated sector. The free slab in power operated sectors accounts for four per cent of its total duty liability. The free and pre-to five per cent of its total duty liability. The revenue foregone in exemption slab in power operated sector is about Rs 10 lakhs annually; the annual revenue from the non-power operated

sector is Rs. 14 lakhs. About 150 power operated factories yield nearly 94 per cent of the total revenue from soap. 350 factories in the non-power operated sector contribute the balance of 6 per cent. Another 1400 non-power operated factories are under excise control but as they pay little revenue, the excise effort in surveillance over them is unproductive revenue. The non-power operated sector may be exempted from the duty; the revenue loss should be offset by abolition of the exempted slab for the power operated sector and recasting the tariff. This will reduce costs without a major disturbance to the economy of the industry. All household and laundry soap should be chargeable at a common rate. As rates of duty for all other soaps are the same, the tariff can be rationalised into two rates, one for household and laundry soaps and another for all others. Criteria such as the size of containers, alkalies used, design of labels, etc. for eligibility to exemption should be reviewed and simplified.

Soap stock should be taxable. If delivered for further processing into power operated soap, it should be treated like other excisable components and raw materials; all other deliveries should be subjected to the duty. Correlation of raw material with production is incomplete if it is confined to consumption of vegetable non-essential oils only.

Footwear

Nouned and executive exemptions have stultified the purpose of extension of the levy to footwear parts. Recovery of duty on excisable footwear parts is contingent on the fact whether they are made into footwear in the same or in any other footwear factory in the excluded sector. Duty should be levied on all footwear and footwear parts produced with the aid of power.

Electric Batteries

Administration of ad valorem levy has presented more than the usual difficulties in assessment of batteries used by certain manufacturers. Changing the basis of levy to a specific rate with reference to the weight or other criteria of batteries should be explored. Flat deduction from published list prices for assessment of batteries is not favoured by the industry. On administrative considerations, battery plates produced by five-worker factories whose output of battery is still exempt, should also be exempted.

Electric Wires and Cables

Preference in valuation for assessment is an incentive to production of non-standard cables. Sub-standard electric cables are hardly in the national interest. Simplification through tariff values for assessment is defeated by the fixation of values and preferences. Duty cannot be calculated in terms even of whole naye Paise. Revenue to be derived from cables can be realised more simply and cheaply by suitable revision of the rates of duty for electrolytic copper and conductor grade aluminium, or taxing rods drawn from such metals, and insulating materials. Such decisions as charging insulating tapes if the weight of cotton fabrics in them exceeds 40%, and on insulation enamels made from taxed imported resins, should be revoked. While not contributing any appreciable revenue, they create administrative difficulties and enlarge the area of conflict.

Patents & Proprietary Medicine

Instead of the intrinsic quality or the therapeutic value of a drug, the format, design, colour or colours, borders, background effect of the label under which it is marketed, determining its liability to duty is irrational. There is also a large discretion to the assessing officer, giving rise to uncertainty which is not healthy for the trade. If the intention is to siphon off a part of the extra profit, this cannot be achieved by charging the duty ad valorem. From the practical point of view, the entire range of pharmaceutical products should be brought under excise levy with selective exemptions, restricted to specified essential life saving drugs. The institution of the loan licensees should be reviewed specially as purity of drugs is so vital to

the well being of the community. Excise administration will be simplified if loan licensees were abolished.

The limits for quantities permitted to be replaced free of duty or delivered as samples free of duty should be reviewed from time to time to conform to the normal practice in the trade. Audit type of control is not feasible with a preponderance of small scale manufacturers, but it could be introduced for well organized laboratories with fully documented accounts only if the whole range of medicine is made excisable.

Coffee

Although the Coffee Board markets the bulk of the crop, it is neither advisable nor feasible to entrust excise administration to it. All coffee could be subjected to a common rate of duty. It is inadvisable to convert the basis of levy to ad valorem to help inferior or low priced grades. Facilities of bulking and garbling coffee should be allowed to all exporters. In view of the importance of the industry and its revenue potential a research foundation should be instituted to secure improved yields and quality of Indian coffee.

Hydrochloric and nitric acids made without the use of power by small manufacturer using duty paid sulphuric acid may be exempted outright as revenue is small and it is not possible to ensure compliance of all the conditions now prescribed.

Films

The suggested substitution of the excise duty on exposed cinematograph films by an increased rate of duty on raw film is likely to bear harder on those producers who take fewer than 14 or 15 copies of each film but will lighten the burden on producers who take larger number of copies. In view of the altered balance between import and excise duties under the Finance Bill of 1963, the matter may be further examined.

Vegetable Oil

Although more oil was produced in successive years by a

larger number of millers and the exempted and preferred sectors had been reduced in size, the revenue declined instead of improving. The share of the small sector in the total output rose in successive years and that of the organized sector declined. The incidence of duty borne by oil produced in the organized sector averaged Rs. 100 per tonne; the incidence on the small scale sector's oil fell from about Rs. 81.60 in 1959-60 to about Rs. 40.60 per tonne in 1961-62. The scheme of duty preferences induced larger units to fragment. Anti-fragmentation measures did not succeed. Compounding led to swelling the profits of the exporters and the benefit of lower incidence in compounding did not accrue to the millers. A more marked distortion occurred in the production pattern of castor oil. Abolition of the exempted sector in March, 1959, was expected to yield about Rs. 4 crores additional revenue, but actual revenue collections fell by about Rs. 3.5 crores over the preceding year. The revenue actually forgone may have even been higher. Fragmentation and growth of numbers of small millers affected also the solvent extraction plants and export trade in oil-cake. As the number of factors which affects the production capacity of the same equipment is large, there is no method of arriving at a fair average production capacity for each equipment for crushing of oilseed. For constitutional and other reasons compounding cannot be made compulsory.

Deriving the total revenue from vegetable non-essential oils by enhanced rates for other excisable goods made with oils as raw material might upset the balance and lead to other complications. A commodity in which half the production is distributed in the small scale sector is not a very suitable article for levy of duty. Government appear to have arrived broadly at the same conclusion as the duty has been exempted but a study of this levy gives an interesting insight into practical and economic effects which an excise duty can have.

(Concluded)

Tourist Traffic in India

A DETAILED analysis of the trends of foreign tourist arrivals in India shows that the decline in tourist arrivals of 3.9 per cent in 1962 as against the figures for 1961, has not been wholly due to the emergency. A region-wise examination shows that 38 per cent of the fall from Europe, 19 per cent from Africa and 22 per cent from East Asia have occurred after the declaration of the emergency, which did not affect the tourist traffic from South America. Western Europe as a whole sent more tourists to India than other areas, foreign tourists from this region accounting for 28.1 per cent in 1962 as against 26 to 27.4 per cent in the previous years. While France and Germany have recorded increase in 1962, for the first time, there has been a small fall in the total number of tourists from this region, especially in regard to tourists from Italy, the Netherlands, Portugal, Sweden and the U.K. The tourists from U.K., however, retained their second place, constituting 16 per cent of the total number of tourists to India, which is about the same proportion they have been maintaining for a number of years. Tourists from Africa for the first time showed a fall in 1962. The fall has been due largely to the decline in the number of tourists from Kenya (from 11,420 to 9,141). The other countries in the region have in fact shown some increases. Tourist arrivals from West Asia, on the other hand, showed an increase in 1962, the rise since 1967 being just nearing two-fold.

Out of the 80 countries from which tourists come to India, 37 showed a total rise of 6,324 in 1962 as against a fall of 11,768 tourists from 43 countries. The high spending category of tourists showed a rise from 82,038 in 1961 to 83,318 in 1962. The number of North American tourists (35,075 in 1962) has registered a sharp increase, being double of the figure of 1957, the tourists from the U.S.A. being the largest nationality in 1962 forming 24.7 per cent of the total

tourists coming to India. The increase in the number of tourists from South America since 1957 has been three-fold, having risen from 536 in 1957 to 1593 in 1962.

The number of pleasure tourists who visited India in the last quarter of 1962 rose from 17,928 in 1961 to 18,932 in 1962. The tourists passing through India on their way to some of the neighbouring countries, also increased from 12,040 in 1961 to 13,930 in 1962. Even in the case of nationalities which have shown sizable fall in the total number of tourists, the pleasure tourists have registered an increase. In the case of U.S.A. the pleasure tourists recorded an increase of 5.6 per cent.

The figures of foreign students and those connected with educational institutions in U.S.A. and Western Europe, who visited India during July and August which are bad months for the tourist traffic generally, also showed an increase. The corresponding figures from America and Western Europe were 1,766 in 1962 as against 1,379 in 1960 and 1,189 in 1962 as against 1,008 in 1960 respectively.

Airborne tourist traffic has been on the increase from all regions except Eastern Europe, the increase being at the cost of arrivals by sea and by land. The proportion of tourists arriving by air in 1962 reached the figure of 67 per cent as against 63.3 per cent in 1961.

The number of tourists disembarking at Palam and Safdarjung has shown a spectacular increase from 21,046 in 1960 to 31,650 in 1962. The increases in the case of Dum Dum and Santa Cruz have been much less. An examination of the data available seems to indicate that there is a good desire on the part of the tourists to make Delhi as the first point of arrival rather than Calcutta or even Bombay.

Towards Tokyo

THE FUND-BANK meetings in Washington last week were clearly an exercise in preparing the ground for the more important next annual session in Tokyo when the Bretton Woods twins would have got out of their teens and are expected to celebrate their coming of age with bold words and even bolder actions. The Fund, particularly, is expected to assume increasingly adult responsibilities. No international institution, however conservative in its leadership, could resist for long global winds of change and fears, chiefly British, that the new Managing Director of the Fund, M. Pierre-Paul Schweitzer, could prove a too worthy successor to Dr. Per Jacobsson in the practice of monetary orthodoxy have not been wholly borne out. Although the annual report of the IMF had deprecated rather ominously the cry of world finance being insufficient to cope with the rising demands of world trade, the Managing Director's speech shows a reasonably receptive attitude of mind.

M. Schweitzer was in fact quite apologetic in his admission that a whole series of arrangements outside the Fund had been found necessary in recent years in providing the means of financing deficits and preserving the exchange rates. He conceded the important role played by the inter-central bank credits which helped to defend sterling in 1961 and the more extensive and formalized network of swap arrangements established over the last two years by the United States with as many as ten industrial countries and with the Bank for International Settlements for an aggregate value of \$1,550 million. It may perhaps be not unfair to the Managing Director of the Fund to suggest that a possible apprehension that such arrangements outside the Fund might in due course become the main instrument through which international liquidity might be sought to be expanded could have been one reason why he has now pledged the Fund to intensive studies of means of enabling it to play a more effective role in the provision of liquidity. M. Schweitzer has promised that the results of the study would be ready for Tokyo, but he has also made it more or less clear that no startling conclusions are to be expected.

The Fund's line of thinking, at any rate for the present, seems to be in the direction of exploring the question of increase in quotas and possible changes in the Articles of Agreement. Limited thus as the Fund's approach is, it is unlikely to satisfy substantially expectations such as those nursed by the British in terms of Mr. Maudling's ill-fated "mutual currency account" proposal of a year ago. Rather more radical ideas for increasing international liquidity may be expected from the inquiry which the ten leading industrial countries, which subscribe to the \$6,000 million International Monetary Fund borrowing scheme, are planning to initiate. This group, which has come to be known as the "Paris Club", proposes to investigate future world liquidity requirements in terms broader than those with which the IMF will necessarily have to concern itself. This group, for instance, may discuss matters such as the gold ratio policies of the major Central banks; one view which has been in the air in this direction is that arrangements should be made for directing the newly mined and Russian gold to low-ratio countries desiring to raise their ratios.

It remains to be seen whether the labours of the "Paris Club" assist directly or indirectly in strengthening the demand made in some quarters that the IMF should evolve into a credit-creating institution and thereby become in due course what is described as "a real international Central bank" rather than just a club of national Central bankers. Much will depend, of course, on American attitudes which, in the eyes of the protagonists of change, have lately become less dogmatic. France, which, as a major creditor nation, can play an influential role in these discussions, is also

October 11, 1963

reportedly responsive at present to notions of reform. The French Minister of Finance, M. Giscard de'Estaing, has expressed dissatisfaction with the existing monetary system on several grounds. He has pointed out that, when the Central banks accumulate holdings of the currencies of other countries, there is no "automatic machinery" for a prompt return to equilibrium. There is, he further complains, a lack of reciprocity in that the reserve currency countries, when they move from deficit into surplus, might not be willing to accumulate the currencies of their new debtors. Pleading for a more equitable relationship between debtor and creditor nations and a fairer distribution of risks and burdens, he argues that the present system, whereby some countries keep almost all the reserves in gold and others hold large amounts of foreign currencies, is far from satisfactory. In these circumstances, however tentative or narrowly technical M. Schweitzer's own ideas of change in the structure or machinery of the Fund may be, it is likely that by this time next year the IMF may well arrive at Tokyo, still unwilling perhaps to adventure, but reconciled to being receptive.

Although this country has had to ask for access to the Fund's resources more than once, there is still a feeling that problems such as international liquidity and international good behaviour in the currency sphere, which constitute the main responsibilities of the Fund, are of rather remote interest to countries other than the economically advanced members of the IMF. This is perhaps a wrong impression because the Fund has always performed a role, not at all negligible, as a mentor of morals and manners in international commerce, a subject which is of concern to all countries of the world. In giving advice in these matters the Fund has generally tried to appreciate the special difficulties of less developed countries. In its latest annual report, the Fund has shared the fears of these countries that common market groupings of industrially advanced nations, unless accompanied by liberal attitudes to world trade, are likely to affect adversely the export trades of the nations which are left out. M. Schweitzer notes that the payment position of the less developed countries in 1962 was somewhat more favourable than in the previous year, thanks to higher export earnings.

IFC: Fine and Fifteen

REVIEWING THE evolution and functioning of the Industrial Finance Corporation of India, particularly its progress in recent years, its Chairman claimed recently that it "now stands poised to assume larger and more positive responsibilities envisaged by the Finance Minister in his statement in Parliament." Mr. K. P. Mathrani was rather modest because it can fairly be said of the IFC that it has, to some extent, anticipated Mr. Krishnamachari's plans for converting it into a development bank. The activities of the Corporation have been steadily spreading over an area wider than

But he warns that basic uncertainties persist. Imports of primary products have not kept pace with the growth of national income or of manufacturing production in industrial countries; moreover, export receipts of the less developed countries have been adversely affected by a worsening of their terms of trade. These are two of the difficulties for the easing of which a number of countries over a large part of the world would certainly be relying very considerably on the discussions of the world trade conference which is to be held next March, preceding the Kennedy round of talks at the GATT meeting in the following May.

Meanwhile the deprecatory references in the Fund's annual report to bilateral trade pacts, barter deals or special payment arrangements are likely to be received with mixed feelings in countries which have found it necessary to resort to such devices in order to promote exports or finance essential imports. It is a common assumption but a wrong one that such special agreements are peculiar to trade with Communist countries. India, for instance, has had to enter into transactions of this class with the United States for marketing her manganese ore and with Japan for marketing her iron ore. The point is that, over the greater part of world trade, commerce just does not find it possible to flow smoothly or without special aid and comfort. It follows that the Fund's stricture that bilateral trade pacts tend to encourage stagnation of commerce or depress levels of world trade may perhaps be true in the long term and on the condition that the channels of multilateral trade are themselves being cleaned up by enlightened international action; but, in the short period, they may not necessarily have a restrictive effect. On the contrary, they may stimulate commerce even spectacularly in the present as has been demonstrated through this country's trade agreements with the Soviet Union. World commerce, in other words, cannot be liberalised through sermons on the virtues of multilateral trade. It would be more to the point if powerful trading areas, such as the United States and the ECM would constructively react to suggestions that they should make unilateral trade and tariff concessions in the distressed areas of world trade when the less developed countries are struggling hard to find normally expanding markets for their exports at economic prices.

its original and principal jurisdiction of institutional lending. Apart from the fact that the IFC has been giving not only rupee loans but also loans in foreign currency, its activities have included, for some time now, the giving of guarantees in respect of deferred payments and foreign loans and the underwriting of public issues in the form of equity and preference shares and debentures.

It is well to recognise, however, that the secondary activities of the IFC are necessarily subject to limitations.

October 11, 1963

This is so, for instance, with regard to sub-loans in foreign currencies. Till June 30 this year, the total funds guaranteed in this manner are Rs. 9.29 crores. Considering the overall shortage of foreign exchange, it may be conceded that this assistance should have been valuable. Nevertheless, in extent, it is still marginal to the main lending operations of the IFC which are in rupees. Another reason why the IFC has not been able to do more in this direction evidently is that the available resources of foreign currencies are scarce.

The IFC got its funds from the U.S. Agency for International Development, the West German and the Japanese inter-governmental credits and, more recently, a line of credit from the Banque Francaise du Commerce Extérieur. A point worth noting is that the IFC seems to have been rather slow in utilising these resources. Thus, although it has been sanctioned in all \$30 million by the U.S.A.I.D., it has committed in the form of sub-loans only \$14.85 million out of that amount. In the case of the West German credits again, only DM 12.25 million have so far been utilised out of a total of DM 45 million. It has been suggested that the fact that most of the foreign credits are tied to purchases from the lending country has interfered with their prompt utilisation.

This, however, is not a sufficient explanation. The German credits, in any case, are not tied, but here too there is a considerable amount which the IFC has not yet found possible to disburse to its clientele. This apart, the practice of the lending countries tying their credits to their supplies is a factor with which borrowers have got to come to terms. The Corporation has approached the AID for a further allocation. It is also applying to the Central Government for more resources in foreign exchange. While these moves merit sympathetic response, it is simultaneously necessary to study whether the IFC is not being excessively conservative in the engagement of the foreign credits already placed at its disposal.

In the interesting, but difficult, field of underwriting operations, the IFC, as its Chairman has emphasized, is rather a raw practitioner. It was in December, 1956, that the Corporation first ventured into this business. But since then it has been stepping up its commitments and has so far given net sanctions in 42 cases to the extent of Rs. 7.66 crores. During this period, 28 issues, involving commitments, on the Corporation's part, of Rs. 6.25 crores were actually placed on the market, resulting in shares and debentures worth Rs. 4.51 crores

devolving on the Corporation as a result of these operations. The Chairman has conceded that the proportion of the shares and debentures which the Corporation has thus been left to nurse is quite large, but he has explained that this is due mainly to the condition of the capital market. This is an assessment which may perhaps have to be scrutinized further.

The resources of the Corporation are not unlimited and the first charge on them, undoubtedly, is the requirements of its normal lending operations. While a certain enthusiasm for promotional activities is certainly to be admired, it is at the same time proper to sound a note of caution against the Corporation committing its scarce resources unduly to secondary purposes. Recently it was reported that, as one of the measures for reviving the capital market, the IFC was being asked to do more underwriting business in association with the LIC and the ICICI. It is possible that, as Mr. Mathrani suggests, the depressed state of the capital market is a temporary phase, but it is also not unlikely that the depression may not really lift until fiscal and other economic policies are liberalised by the Central Government. So long as there is no clear indication that such a revision will be effected, institutions, such as the IFC, must necessarily exercise a wise restraint on their generous impulses for supporting the capital market.

So far as the central area of its activities is concerned, the IFC is certainly doing solid and even spectacular work. During the 15 years of its existence the Corpora-

tion has sanctioned in all Rs. 164 crores as loan assistance and in the same period it has disbursed actually about Rs. 103 crores. It has been estimated that the total cost of the projects which have come to fruition because of IFC assistance is of the order of Rs. 433 crores, that is, roughly 30 per cent of the total net investment in the organised industries in the private sector since Independence.

A principle which governs the Corporation's lending policies is that the industrial priorities written into the five-year Plans should be respected and honoured. The Corporation has always claimed that it has tried to do this. But, rather surprisingly, the sugar industry, which cannot, by any means, be described as having been given a high priority rating in the five-year Plans, had been the largest single recipient of IFC assistance for some years past. It is not suggested here that there may not be a perfectly sound explanation why this was so, but it is certainly a matter for gratification that the industry-wise pattern of IFC lending is now apparently becoming diversified. New growth industries, such as aluminium and basic chemicals, are becoming more prominent in the IFC portfolio.

In the matter of the regional pattern of IFC lending, again, there seems to be a shift to the advantage of what may be regarded as the less-developed parts of the country. The distribution of IFC assistance, however, is essentially a matter of the credit-worthiness of the

projects for which the loans are sought and the competence with which the financial and technical data are assembled and presented to the Corporation. It certainly takes two to make a loan and the borrower's obligations are no less compelling than the lender's.

As the dimensions of IFC financing expand from year to year, it is most agreeable to witness a simultaneous improvement in its technical efficiency. Although relatively young in years, the IFC is already old in its reputation as a sound institutional lender. This reputation continues to grow — a fact which the excellent form of presentation of its 15th annual report makes it easier to appreciate. It is no small credit to the IFC that even in the tricky field of financing industrial cooperatives, it has been remarkably successful in adhering to sound banking principles. Although the net financial assistance provided to industrial co-operatives has aggregated to the large amount of

Air-India Takes Off

AIR-INDIA has bettered its record of earnings of any year in the past by netting in an operating profit of as much as Rs. 3.45 crores for the financial year 1962-63. Thus a decade after the nationalisation of this service, Air-India has entered its "take-off" stage, as its General Manager, Mr. B. R. Patel, claimed, while releasing the tenth annual report of the Company recently. This is indeed gratifying in the context of the record of international air transport organisations generally. It is common knowledge that competition in this field has been steadily growing. This is clearly reflected in the earnings figures available for the previous year of some of the major air-lines of the world, such as B.O.A.C., K.L.M., Alitalia, Sabrins, Lufthansa and TWA. Every one of these has failed to show profits, which only goes to show how formidable a task it is to extract profits in this difficult field today, notwithstanding the higher fares (consequent on the high operational costs) and the enormous addition to seating capacity (made possible by the introduction of Boeings). For there are several factors inhibiting the growth of air travel, not all of which are amenable to the control of air-lines.

Primarily, the ability to maintain or increase profitability depends on the load factor, and this has become specially difficult since the rise in traffic is still lagging behind existing capacities. But there are a number of other factors besides, some peculiar to one or more airlines. To take Air-India, for instance, there have been our own Government restrictions on foreign travel, the Chinese aggression on our borders, the Cuban crisis, the introduction of the U.K. Immigrants Act and, last but not least, the U.S. Government's "Fly American" policy. It is against this background that the working of Air-India has to be evaluated.

It is a fair measure of the feeling of confidence that Air-India has today that it should want to throw its weight on the side of those aviation companies which have been urging the lowering of fares. In case fares

Rs. 36.86 crores, representing about 22 per cent of the total sanctions, the Chairman was able to say that this class of borrowers had been meeting its obligations to the Corporation in time.

The larger picture of bad and doubtful debts generally is also quite satisfactory. The Corporation, in fact, did not have to make any further provision during the year ended June 30, 1963, towards the relevant reserve and the Chairman has been able to report that the percentage of defaults in the repayment of instalments of principal has come down further from 1.24 per cent to 0.87 per cent. It is a small matter, but it is nevertheless a significant indication of the IFC's solid progress that the subvention availed of by the Corporation from the Government for paying the minimum guaranteed dividend in the early years has now been wholly paid back. Solvency may not be a heroic quality, but it is a necessary virtue for any financial institution.

were to be lowered, how will Air-India fare? With its lowest operating cost, according to Mr. Patel, Air-India could well absorb the initial impact of lower fares and benefit from the resulting expansion of the market. With its plan to add to its existing fleet of six Boeings a new Boeing every year until 1970, Air-India should also have a relatively bigger fleet than now to be better able to compete with other leading air-lines on equal terms.

According to the annual report, Air-India succeeded in increasing its traffic (scheduled services) in 1962-63 by 21.2 per cent over the previous year. Significantly, the increase in capacity was only 16.7 per cent, which indicates a reversal of the erstwhile trend resulting in over-capacity. Its overall load factor too increased from 43.7 per cent in 1961-62 to 45.3 per cent in 1962-63. Operating revenues rose from Rs. 21.57 crores in 1961-62 to Rs. 24.53 crores in the year under review. Although even operating expenses, excluding interest on loans, showed a slight increase from Rs. 20.80 crores in the previous year to Rs. 21.07 crores in 1962-63, it is noteworthy that Air-India could manage successfully to reduce its operating costs to a level where its break-even factor (on the basis of present fares and rates) is about 40 per cent, probably the lowest in the world.

By reason of this stimulating record, it is only fair that Air-India should have decided to pay to the Government a dividend at the rate of five per cent on its equity capital of Rs. 13.41 crores. There is a Government loan capital as well of a like amount, but Air-India need not pay interest on this till October, 1966. As regards the borrowed loans from the U.S. commercial banks and the World Bank of \$20.41 million, Air-India has already repaid with interest more than half of the loan and hopes to pay back the rest of the loan also by 1966. If Air-India were to maintain the same efficiency and the present rate of progress, it will not be very long before it is well and truly air-borne.

"A WOODEN BOWL

The first order is only half as important as the second order.

Therefore exporters must maintain a very high standard of business in order to make long term profits and uphold the country's prestige—particularly as new competitors with highly industrialised countries.

The export market can be a source of continuous earning power—if quality goods, prompt service, competitive prices and service facilities are provided.

Export is a Sacred Trust

Highlights of the Week

IMPORT POLICY

IF THE TRADE was pleasantly surprised at the announcement of the import policy for the second half of the current financial year a fortnight earlier than was expected, it has been disappointed at the mere maintenance of the import quotas of the established importers and Consumers' Co-operative Societies at the first six months' level. The Minister for International Trade, Mr. Manubhai Shah, speaking at the joint meeting of the Import and Export Promotion Advisory Councils last month, seemed to encourage expectations that, as a result of the encouraging export performance this year and slightly more than one-third of the aid promised by the Aid-India Club being available in the form of untied loans, some liberalisation of the import policy might take place. Second thoughts on the part of the Ministries of International Trade and Finance and an upward revision of defence requirements appear to have been responsible for belying these hopes of the trade.

The continuance of a cautious policy with regard to exports by established importers and Consumers' Co-operative Societies have apparently been prompted by fears that the current uptrend in exports may not be maintained during the rest of the 1963-64 financial year. Doubts have again cropped up that the Rs. 745 crores target set for exports this year may not be realised owing to the shortages that have developed in such exportable commodities as sugar, cashewnuts, groundnuts and steel scrap.

This, however, does not rule out all possibilities of a slightly higher level of imports in the aggregate during the six-month period October, 1963—March, 1964. The import policy in regard to actual users, who account for nearly 33 per cent of the country's imports today, is yet to be announced. In view of the greater assistance made available by the Aid-India Club for maintenance imports, it may be expected that the actual users' imports may be somewhat liberalised. Relaxation in their case is indicated in the interest of fuller utilization of industrial capacities.

KASHMIR

IN HIS farewell address to the State Legislature on the eve of tendering resignation under the Kamaraj Plan from the Prime Ministership of Jammu and Kashmir, Bakshi Ghulam Mohammad last week announced two important changes which his party proposed to effect in the Jammu and Kashmir Constitution during the Budget session early next year. One of these changes envisages redesignation of the "Head of the State" and of the leader of the Government there as Governor and Chief Minister respectively, instead of Sadr-i-Riyasat and Prime Minister as is the case at present. The second one proposes that Members of Parliament from Jammu and Kashmir, instead of being elected indirectly by the State Legislature and nominated by the Union Government should be directly elected by the electorate.

The significance of these changes lies in the fact that they will take the process of complete integration of Jammu and Kashmir with the Indian Union an important step further. It is not yet known, however, whether the change in the designation of Sadr-i-Riyasat to Governor will also mean a change in the procedure of the nomination of the incumbent to this office. At present, the Head of the State in Jammu and Kashmir is elected by the State Legislature and then nominated by the President. Governors in the other constituent States of the Union are chosen by the President.

Once these changes are effected, the process of integration of the Jammu and Kashmir State with India would have been virtually completed for all practical purposes. Full integration, however, can take place only when the Article

370 of the Indian Constitution, which provides a special status to this State vis-a-vis the other States, because of its peculiar conditions, is abrogated. That day may not be now far as this provision has already been diluted to a very great extent. Since 1954, when the accession of Jammu and Kashmir to India was ratified by the State Legislature, a number of measures have been taken by the State Government voluntarily with the ultimate objective of fully integrating this territory with the Union. The most important among these are: (1) the extension of the jurisdiction of the Supreme Court, the Indian Election Commission and the Comptroller and Auditor-General to the State; (2) the abolition of the permit system of entry into and exit from the State; (3) the removal of the customs barrier between India and Jammu and Kashmir; and (4) integration of Jammu and Kashmir Administrative and Police Services with the two all-India Services, though to a limited extent. Relaxation has also been effected in the matter of acquisition of landed property in Jammu and Kashmir by non-Kashmiris. Although non-Kashmiris are even now not permitted to acquire land in the State, industrialists and businessmen from outside have been allowed to establish industries and trading institutions on lands held on lease. The emotional integration of the residents of Kashmir with their fellow-citizens in the rest of India is also proposed to be fostered through the gradual integration of the National Conference with the Congress Party. The first step in this direction was taken recently when Bakshi Ghulam Mohammad became a member of the latter while retaining presidentship of the former.

IN FINE FLIGHT

THE HINDUSTAN Aircraft Ltd., Bangalore, has been asked by the Government to step up substantially the production of HF-24 — India's first supersonic aircraft. The step presumably has been taken in view of the emergency. In the initial stages, a certain number of these supersonics will be fitted with Orpheus-703 engines to be supplied by Bristol Siddley. Later on, they will be developed for higher performance, using more powerful engines. Plans for producing these aircraft have already been taken on hand. A large number of jigs, tools and fixtures for them have been made.

HAL's programme for the manufacture of helicopters is also stated to be progressing well. It has submitted two project reports to the Government in this connection. Clearance of these is expected soon. Another project on which the company is working is the production of basic jet trainer aircraft. The prototype of this aircraft will be ready for flight trials early next year.

Last week, the HAL turned out the 100th Orpheus-701 engine which powers the Gnat transonic jet fighters. A large number of light four-seater "Krishaks" have also been produced by the company. The IAF has approved this multi-purpose aircraft used for short distance air travel, air observation duties and for pest control and agricultural spraying. Some orders have also been received for the supply of "Krishaks" to the I.A.F.

Reports from Kanpur suggest that the AVRO Project of the Aircraft Manufacturing Depot is also making satisfactory progress. Three AVRO-748s of Series I have already been manufactured and the last one of this series is nearing completion. After this, A.M.D. will be taking up the manufacture of Series II AVROs. They will be powered by the Rolls-Royce Dart-7 engines. No further manufacture of AVROs Series I is contemplated.

The HAL is stated to have saved a sum of Rs. 8 crores in foreign exchange during 1962-63. In this year the com-

October 11, 1963

pany improved its net profit as well sales turnover. The net profit amounted to Rs. 94.4 lakhs, as against Rs. 73.09 lakhs in the previous year and the sales Rs. 10.75 crores, as against Rs. 2.61 crores.

TAXES ON TRANSPORT

THE LONG and persistent clamour by the inter-State road transport operators for replacing the present multiple levies on them by a single-point tax may soon bear fruit. The Union Ministry of Transport has set up a nine-member Study Group for going into this question. The Group is headed by Mr. N. P. Mathur, Chairman of the Inter-State Transport Commission. Its other members are: Mr. K. L. Luthra, Director (Transport) Planning Commission; Mr. S. Q. Rizvi, Transport Commissioner, Bihar; Mr. Devi Sahai, Transport Commissioner, Madhya Pradesh; Mr. J. C. Agarwal, Deputy Secretary to the Maharashtra Government; Mr. D. N. Handa, Director of Transport, Rajasthan; Mr. Kehar Singh, Transport Commissioner, Uttar Pradesh; Mr. G. C. Mallik, Deputy Secretary to the West Bengal Government; and Mr. K. Srinivasan, Deputy Secretary, Union Ministry of Transport. Mr. Srinivasan has been named the convener of the Study Group.

Multiplicity of taxes on inter-State road transport and lack of uniformity in their quantum has not only been retarding the growth of road transport in India but also affecting its efficient operation. Now that attempts are to be made under the fourth Plan to foster the development of all the transport services in the country on a closely co-ordinated basis, inter-State road transport development assumes heightened significance. In fact, the tentative proposals put forth by the Planning Commission to the State Governments in connection with transport development programmes in the next Plan contain specific reference to this fact. For roads and railways development, the country is to be divided into eight regions: (1) Madras and Andhra Pradesh; (2) Mysore and Kerala; (3) Maharashtra and Gujarat; (4) West Bengal, South Bihar and Orissa; (5) Uttar Pradesh and North Bihar; (6) Punjab, Himachal Pradesh and Jammu and Kashmir; (7) Rajasthan and Madhya Pradesh; and (8) Assam, NEFA, Manipur and Tripura. This apparently assumes extension of inter-State road traffic. Simplification and integration of the various taxes on road transport should go a long way in fostering its rapid growth.

All the moves for replacement of the multiple taxes on road transport by a single-point tax have been hitherto objected to by the State Governments on the plea of maintaining flexibility in their taxation revenues. The States where the incidence of taxation on road transport is comparatively higher, have also been fearing that a single-point tax may operate to their disadvantage. To assuage these fears, the Study Group has been asked to suggest a scheme for the levy of a single-point tax on inter-State road transport keeping in view that its recommendations do not adversely affect the revenues of the States. The Study Group is to examine thoroughly the procedures for the assessment and collection of motor vehicles tax and goods and passenger taxes on inter-State road routes before suggesting a reasonable basis or formula for the division of the proceeds of the proposed single-point tax among the States. It is expected to submit its report within six months.

FOREIGN TRAVEL

ALTHOUGH THE improvement in the foreign exchange situation as a result of somewhat higher export earnings and substantial assistance made available by the Aid-India Club for maintenance imports has not yet helped in relaxing the import policy, the Reserve Bank of India has slightly liberalised release of foreign exchange for travel abroad. Three concessions have been announced by the Bank last week-end and

further reliefs are not ruled out. The concessions now granted are:

(1) If invitations with offer of full hospitality are received by residents in India from foreign Governments or reputable international agencies for promotion of cultural, educational, scientific and professional interests, a limited number of such invitees will henceforth be allowed to go abroad and a limited amount of foreign exchange will be given to them for meeting incidental expenses. They will also be allowed to extend their stay for a period not exceeding one week, but without release of any additional foreign exchange.

(2) Some relaxation has also been made in the case of persons proceeding abroad for non-technical studies. Hitherto, such persons were released foreign exchange only if they had secured admission in any of the limited number of the listed foreign universities. The number of approved universities to which students desirous of going abroad for study in non-technical subjects can seek admission has been enlarged. They, however, shall be allowed to go in for such studies, and for this purpose foreign exchange will be released to them, provided they satisfy some minimum educational qualifications.

(3) The third concession is for newspapers. Hitherto, foreign exchange was released only to correspondents of news agencies who went abroad to cover important international events. Now, this facility will be as well available to correspondents of newspapers of standing provided the journalists sent are permanent employees and have been working in the paper (sending them abroad) for at least two years. Applications for release of foreign exchange from free-lance journalists intending to go abroad for professional purposes will also be considered.

VITAL STATISTICS

THE WORLD's population, according to the 1962 Demographic Yearbook, issued by the United Nations on September 30, 1963, was approximately 3,069 million in mid-1961, recording an increase of 61 million over 1960 which was equivalent to three times the population of Argentina or one-third of the population of the USA. In the eleven-year period 1950-61, the population of the world increased by about 560 million which is larger than the total population of India. The Asian contribution to this increase was 60 per cent—a net addition of 337 million people. The average annual rate of increase was 1.8 per cent during 1950-61, though the rate of increase during the later part of this period was in excess of this, reaching 2.0 per cent between 1960 and 1961.

The population of Ghana increased at an annual average rate of 4.1 per cent between its 1948 and 1960 censuses. In Venezuela, the inter-censal rate of increase between 1950 and 1961 was 4 per cent per annum. Average annual rates of increase of 3.1 to 3.4 per cent were recorded between the censuses taken during the period 1955-62 and the last previous census in Albania, Brazil, China (Taiwan), Kenya, Mexico, the Philippines and Thailand. Higher rates of rise were recorded in smaller areas: the increase in the population of Israel at 8.2 per cent per annum was attributable to high rates of immigration. Although the rate of 2.0 per cent in India may not seem particularly high when compared with the rates of 3.0 per cent and over found in the above mentioned countries, the average yearly net addition of 7 to 8 million persons which this rate represents is a sizable proportion of the yearly increase of the population of the world. High rates such as these and those of the 36 other countries where average yearly inter-censal growth rates of between 2.0 and 2.9 per cent were found, illustrated the general acceleration in the rate of population growth in the world during the past decade.

There were 23 persons for each square kilometre of land in the world in 1961 as against 18 per square kilometre ten

October 11, 1963

One of the fastest growing general insurance companies in India

MADRAS MOTOR & GENERAL INSURANCE COMPANY LIMITED

The stability of a general insurance company depends upon the continued patronage of its clients. The ability to expand the field of activities and serve new clients sets the pace of its growth.

The swift and steady growth of Madras Motor & General Insurance Company Limited indicates that it possesses both these qualities in ample measure.

years ago. The most densely populated region in the world was Central Europe, where there were 138 persons for each square kilometre; South Central Asia followed with 112 persons. At the other extreme was Oceania which had only 2 persons per square kilometre. The Netherlands was the most densely populated of the major countries of the world with 346 persons per square kilometre; next in order were England and Wales (306), Belgium (301), and Japan (254). Much greater densities occurred in certain "city states", ranging from 2,273 in the Holy See to 14,667 in Monaco. Island areas of high density included Malta and its neighbouring Island of Gozo where there were 1,041 persons per square kilometre, the Channel Islands with 559, Bermuda with 845 and Barbados with 588. Australia, Greenland, Libya, Mongolia and South West Africa had not more than one person for each square kilometre.

Birth and Death Rates

The world birth rate was estimated to be 36 per 1,000 population while the death rate was estimated at 18 per 1,000. The highest estimated regional birth rate (47 per 1,000 population) and the highest estimated death rate (26 per 1,000 population) were found in tropical and southern Africa. The lowest birth rate at 18 per 1,000 population was found in Northern and Western Europe. Ivory Coast had the highest birth rate at 56.1 per 1,000 population. The lowest recorded birth rates were 10.6 in West Berlin, 11.8 in Norfolk Island and 13.8 in the Isle of Man. Sweden's birth rate at 13.9 was the lowest amongst the major countries of the world. Ivory Coast reported 33.3 deaths per 1,000 population. The lowest death rates were those of Iceland (7.0) and the USSR (7.2). Infant mortality rates continued their downward trend but they were still high in many areas. Estimated rates for Gabon and Togo were 160 and 120 per 1,000 live-births respectively. The infant mortality rate of Chile was 116.2 per 1,000 live-births. The lowest recorded rates were those of the Netherlands at 15.4 and Sweden at 15.5.

The longest expectation of life was estimated to be in Sweden, the Netherlands, Norway and France where baby girls could expect to live for almost 75 years. Baby girls in England and Wales, Denmark, Israel and the USA had expectation of life at 74 years while those in Czechoslovakia could look forward to a life of slightly over 73 years and those of New Zealand exactly 73 years. There were 16 other countries where the expectation of life for girls at birth was 70 years or more. The greatest expectation for baby boys was estimated to be over 71 years in the Netherlands, Norway and Sweden, implying that the baby boys could not be expected to live as long as the baby girls. As against 26 countries where girls could expect to live at least 70 years there were only 5 countries where the expectation for baby boys was over 70 years. In the Netherlands, Sweden and Norway as stated above, the expectation of life for baby boys was slightly over 71 years and in Israel and Denmark somewhat over 70 years.

The Sex-Ratio

There were more females than males in some of the countries of Europe and North America and in the USSR while countries of Asia and Oceania had more males than females. Males tended to outnumber females at the younger ages but were outnumbered by them at old ages, substantiating the well-known fact that more males were born than females but the females generally had lower death rates at all ages so that proportionally more of them survived to the older ages than did the males.

According to the information received at the United Na-

tions Headquarters, 239 national population censuses were likely to be completed between 1955 and 1964 covering about 67 per cent of the world's inhabitants. A large majority of these censuses had already been taken and the data on total population for approximately 66 per cent of the world's population had already been obtained.

Tokyo was the largest city in the world followed by New York. The October 1960 census of Japan showed that the population of 23 Wards (KU) of Tokyo city was 8.3 million. By October 1961 it had increased to 8.5 million. The April 1960 census of the United States showed a population of 7.8 million in New York. The third largest city was Shanghai, with a population of 6.9 million. Other cities with a population of over 3 million were Moscow (6,262,000), Bombay (4,306,404), Peking (4,001,000), Chicago (3,550,404), Cairo (3,348,000), Rio de Janeiro (3,223,408), Tientsin (3,220,000), London (3,195,114), Sao Paulo (3,164,804), Osaka (3,085,000) and Leningrad (3,036,000). Many countries of the world contained no large cities at all. In fact, 40 per cent of the 190 countries reporting on city populations had no city with as many as 100,000 population. This was particularly so in Africa where 36 out of 53 reporting countries or territories fell into this group.

North America had the highest proportion of urban population, namely 65 per cent; Europe was next with 58 per cent, followed by Oceania with 56 per cent. The USSR and S. America had 48 per cent while Africa and Asia had 25 and 24 per cent respectively. There appear to be regional differences in the relative proportions of the male population and the female population living in urban areas. In African and Asian countries, in general, a greater proportion of the male population as compared with the female lived in these areas. In Europe and North America, the situation was reverse and the females were more urbanised than the males. It might be a reflection of the differing roles of women in the economic life of countries in various stages of economic development.

Households in Asia and Oceania

Large households were relatively more common in countries of Asia and Oceania than in other regions. The average household in American Samoa contained 7.6 persons while in the Pacific Islands the average size was 6.4 persons and in the Fiji Islands it was 6.3 persons. Of the remaining countries where households average 5.4 or more persons, seven [Bahrain, China (Taiwan), the Republic of Korea, the Philippines, Thailand, Turkey and Sarawak] were in Asia and one (Albania) was in Europe. At the other extreme was Christmas Island with 3,000 inhabitants having the average size of the household at 2.3 persons. The Demographic Yearbook has made available household details in regard to only 20 per cent of the world's population because in other cases such information was not available at all. It may be stated that the size of the household was not equivalent to the size of the family because even a private household might contain more than one "family" of persons related by blood or marriage or might be based on family plus one or more unrelated persons. All reporting countries had some households of 10 or more persons, but the range in average size for countries indicated that households in the countries of the Americas (average 3.2 to 4.9 persons) were generally smaller than those in Asia (average 4.8 to 5.7 persons). European households were still smaller with country averages of between 2.8 and 4.1 persons except for Albania where the average was 5.5. In the six African countries for which such data were available, between 3.1 and 4.4 persons lived in a household on the average, though it could not be considered representative of the continent.

What is Wrong with Our Universities?

By T. M. RAO

IN A COURSE on "Problems of Economic Development," Professor Segal developed his lectures mainly as a critique of David McClelland's "The Achieving Society" and Hirschman's "The Strategy for Economic Development." This was followed by seminar-type discussion of the five year plans and development programmes of different countries such as India, Greece, Puerto Rico and Nigeria. In another course, "Banking and Finance in Developing Countries," Professor Schlesinger organized the whole course as a series of presentations by the students of the problems of selected countries. The one who talked the least during the whole semester was the Professor himself. Teaching methods such as these would, no doubt, seem unorthodox in India, where teachers are obliged to "prepare" students for the university examinations and where the prescribed syllabus is generally outdated by fifteen to twenty years.

At any of the graduate schools in the United States, one semester of intensive accounting course would not only give you a thorough grounding in the fundamentals of the art but put you abreast of the modern developments in accounting theory, such as the recent controversies in the field of depreciation, the debate on "LIFO" and "NIFO" in the area of inventory valuation and such like. The emphasis in the study of the subject is not merely to learn the techniques of accounting; rather it is to use it as a tool for appraising organizational performance. This is, of course, in direct contrast to the Indian scene, where two years' study of the subject will not take you farther than the mechanics of preparation of financial statements.

Now, let us take a look at the Graduate School Bulletin of Columbia University under the Department of Mathematics. Some of the many courses listed are Linear Algebra, Mathematical Logic, Topology, Complex Variables and Functional Analysis. Even an undergraduate, if he is so interested, could study some of these topics in advanced mathematics. In contrast, most Indian universities not only do not offer these courses, but restrict students to a syllabus set in narrow limits.

Credit Hours

If you take the undergraduate's programme of study, he has to do a certain number of credit hours (a credit hour equals an hour's lecture per week) in his major subject of study, as well as in English language and Composition. A large number of credit hours are electives, which means that you can choose other subjects of study such as Anthropology, Economics or History of Art. Even where the undergraduate is preparing for a degree in engineering, he has opportunity to acquaint himself with other branches of knowledge. There is, of course, no reason why an engineer should be ignorant of economics, behavioural sciences and even of art.

Typical of the lack of progress in educational methods in India is the curriculum in the engineering colleges. There is too much of subjects like Building Materials, Building Construction, surveying and workshop and not enough of Mathematics, Structural Theory and Fluid Dynamics. Courses in Steel and Reinforced Concrete have not been revised in the last quarter of a century. Subjects such as Railways, Docks and Harbours, Geology, and Estimating which are purely descriptive, continue to occupy a great deal of the student's time. No wonder, then, that the engineering colleges are far behind in the teaching of theory particularly of Structures, Applied Mechanics, etc. This is also one of the reasons why

so many bright students who join the engineering colleges get disillusioned quickly with their studies.

The picture in the United States is completely different. An undergraduate does not waste his time doing surveying and workshop practicals. Instead, he bites into Mathematics, Physics, Electro-Magnetic Theory and Theory of Structures. Because of the system of electives, he could choose specialization, if he were doing Civil Engineering, in Structural Engineering or Construction or Sanitary Engineering.

Engineering schools in the United States have come to believe that engineering science and education cannot be divorced from the fundamental disciplines of mathematics and physics and that the best training that the schools could give a student is to train him to be a scientist rather than a mere technician. The philosophy guiding the educationists in India would seem to be just the opposite.

Contribution of Business Schools

A significant contribution in the field of education has come from the Graduate Schools of Business Administration in the United States. By combining study of the basic disciplines such as Economics, Finance and Statistics with business subjects like Management, Marketing and Human Resources, the schools have enriched both fields of knowledge. The majority of the teaching faculty who come straight from the business world bring a touch of realism to the discussions in the classroom. They also help to take back to the business practices the high standards of knowledge installed in the academic world.

The most significant thing, however, is the contribution of the business school graduates to the success of the modern industrial corporation. The modern corporation not only needs technical and financial abilities but what is more important, the managerial skills. A well-known commentator went so far as to claim that the relative lag of the British economy could be traced to the absence of Business Schools in Britain and the high prestige attached there to the study of classics and liberal arts. This may not be a rash statement when viewed in the context of the United States where the plentiful supply of managerial talent has been equally matched by the unprecedented growth of the economy. Here, no doubt, is a lesson for the planners and educationists in India.

One should, of course, start with the question "Why has education in India become so stagnant?" Not that we have not tinkered with our educational programmes. But, it has not touched the two basic issues in our educational system. And unless something is done concerning them, it is unlikely that education in our country will break out of its morass.

The first issue is the examination system. The universities in India are nothing more than examination boards. The concern of the students, as well as the teachers, is to prepare for the final examinations. In such an atmosphere, learning and knowledge take the back seat. Cramming and the ability to answer examination questions become all important. Because of the system of outside examiners, very often the question papers make a mockery of what is learnt in the class room.

Earlier in this article, I listed some novel methods of teaching economics in American Universities. What is taught in the class room concerns the most pertinent questions that are being raised in the outside world. There is opportunity

to study current theory as also the freedom to question and criticize it. This is possible because the professor is not restricted to the narrow confines of a syllabus nor is he unduly preoccupied with the idea of "preparing" the students to face an "anonymous" examiner. At the end of the course, he will, of course, set his own examination. But he does not have to wait until he gives the final test to know how his students are faring. During the course of the semester, he has many ways of finding it out. First, there is student participation in class discussions of the subject. Second, there are term papers (a term not commonly known in Indian universities) which you have to prepare and submit. In addition, there are frequent quizzes to see that you are devoting your time to studies. All this keeps the student continuously busy throughout the term. But remember the accent is always on learning and understanding the subject rather than preparing for a final examination.

There is one particular advantage in this type of education. And, that is you have freedom to criticize the prevailing doctrine and advance your own views. In fact, you may disagree with your professor and say why you think he is wrong. Textbook is not the god at which students pay obeisance. It is merely a tool in your understanding of the subject. How refreshingly different is this approach when compared with the slavish acceptance of "received doctrine" and textbook theories as in India!

Now, to come back to the question posed earlier: "Why is the system of university examinations incompatible with genuine educational progress?" The answer is simple. In so far as the attention of the students and teachers alike is riveted on the final examinations, the freedom to experiment with different study methods comes to be severely abridged. Secondly, so long as there is a system of common examinations for a number of colleges put together, the syllabuses would of necessity be outdated because everyone must be agreed before hand on the specific limits within which question papers would be set.

Inadequate Organization

The second fundamental problem concerns the whole apparatus of university administration in India. As the universities have evolved up to now, they are nothing more than examining bodies. If you take the employee strength in the university administration, it would not be wrong to assume that over seventy-five per cent of the number are engaged, in one form or another, in setting examinations and publishing the results. The overwhelming concern of the principal officers of the university, including the Vice-Chancellor and the Registrar, is the conduct of university examinations. Is there any wonder, then, that the universities in India have made so little progress?

The problem becomes clear when you look at the scene in the United States. Here the universities have grown into gigantic institutions of higher learning. Universities like Harvard, Princeton and Stanford, to name only a few, run on hundred million dollar annual budgets each. They attract some of the best minds of our generation to serve on their faculties. They have long ceased to be the mere playgrounds of the undergraduate; rather their predominant concern is with graduate study and research. The number and variety of courses offered at these universities is truly phenomenal. Alongside there is significant contribution to fundamental research in most branches of knowledge. The number of students working for doctoral degrees runs into hundreds at each of these institutions.

How did the American universities make such phenomenal progress over the last 15 to 20 years? The causes may be discovered principally in the university organization itself. If you look at the administrative organization, you will find that apart from the President of the university there are the Chancellor who is nominally in charge of the educational programmes, several Vice-Presidents including a Vice-President for University Development and a Vice-President for Business Management, and the Registrar. Besides, there is a Dean for each of the colleges and graduate schools within the university, who is wholly responsible for the administration of his school within, of course, the limits set by the university budget.

It has been said that a typical university President spends only about a third of his time on academic matters. For most of the remainder he is supposed to be raising funds for the university. This may be considered a trivial function, but if you see the close connection between university development on the one hand and its financial resources on the other, it would soon be evident that finances are perhaps the most pressing need of a growing university. Seeing the vast endowments supporting the American Universities (Harvard is reputed to have an endowment valued at \$300-400 million) and their financial independence, it would soon become clear that the university President plays a very important role.

Vice-Chancellor's Role

Now, who in the administrative organization of an Indian University is charged with the responsibility for university development? Who, in particular, is concerned with raising the financial resources of the university? The answer simply is none, because the Vice-Chancellor who is burdened with administrative detail, does not have the time necessary to think and offer effective leadership. Secondly, as the government is considered the supplier of funds, the universities end up being as poor as the government itself.

One is tempted to ask: "Why does not the Vice-Chancellor go about actively to raise funds for the university from private sources particularly when there is a great need for expansion in university education?" The answer, of course, lies in the fact that our universities have lost their dynamism and have become as antiquated as the apparatus of the government itself.

The only way that the universities can be revitalized is to organize them under fresh charters. In the United States there is a Board of Trustees (sometimes called Board of Overseers) to oversee the affairs of the university. Apart from wealthy financiers, there are on these Boards men distinguished in diverse fields, and who as a collective body are able to provide dynamic leadership in education. The presence of Dr. Saranoff, Board Chairman of RCA or Thomas Watson, Jr. of IBM, has not only helped to broaden the outlook of the universities but has helped to alert them to the developments in the outside world of commerce and industry. The result is that universities have been able to keep in step with the explosive advance of technology particularly in such areas as computer science and space exploration. The burst of new ideas in the behavioural sciences has been equally impressive.

One of the main functions of the Board of Trustees is the selection of the university President. It is well known that a nationwide search for talent and ability goes on before the Trustees make their final choice. When the Trustees of New York University selected James M. Hester as the eleventh President, they were not deterred by the comparative youth

HONEYWELL INSTRUMENTATION at Nirlon Synthetic Fibres & Chemicals Ltd.

The critical processes in the manufacture of nylon require critical control of variables such as temperature, pressure, flow, level, speed, etc. They call for instruments that are accurate, reliable, and fast enough to deliver the precise integrated control needed.

That is why Nirlon Synthetic Fibres & Chemicals Ltd. selected Honeywell instrumentation for their new plant at Bombay.

With Honeywell automatic control, you can improve quality, increase production and reduce costs per unit, make better use of manpower, improve operating techniques, and increase profits.

Have Blue Star custom-fit a Honeywell control system to your specific requirements.

The custom-designed Honeywell Control Cubicle for Spinning Machine No. 2

Vinyl Graphic Cubicle for V.K. Tube Polymerisation

BLUE STAR Comprehensive Service Includes:

- Expert assistance in selection of instrumentation
- Engineering, installation and start-up
- Prompt, competent after-sales service
- Tuition-free training for your instrument engineers at Blue Star-Honeywell Education Centre, Bombay

GLOBAL SUPPLY SOURCES
Depending upon the currency available to you, you can obtain Honeywell instruments from any of their plants in U.S.A., U.K., Europe and Japan.

Sold and serviced in India exclusively by

Honeywell

H First in Control
since 1959

of the man (he was just thirty-eight at that time); rather they were willing to bestow their trust on a young man who would broaden the financial resources of the university and at the same time raise its academic standards.

The Trustees do not, of course, interfere with the day-to-day administration of the university which is vested entirely in the hands of the President and his aides. While the Chancellor with the assistance of the Deans provides the leadership in formulating educational programmes, the several Vice-Presidents look after the various aspects of the university administration. This leaves the President with enough time to provide the necessary leadership in the field of university education.

The aspects of university development are worth mentioning here. One is the large number of extension courses offered to the public. A citizen interested in Greek Drama can enjoy a series of lectures on the subject by well-known professors. Alongside of humanities, there are a variety of scientific subjects offered such as Statistical Analysis and modern developments in Physical Theory. Extension courses of this kind help to spread knowledge and build a wider community of well-informed citizens.

The other is the institution of summer sessions. In a six-week summer session is compressed a whole semester's course work. For those who want to cut short the length of their studies, summer sessions offer a great advantage. This is the time when there is a great deal of exchange of visiting profes-

sors between different campuses. This is also the time when professors from Mid-West and Pacific Coast come to make their debut at the universities in New York and New England.

Strangely, in India the educational process grinds to a halt with the arrival of summer. Of course, the summer weather is not particularly conducive to serious study in many parts of the country. The difficulty could be obviated by arranging morning classes. But this is not the real reason, of course. In the summer the huge examination machinery is set to work. This is the most important part of the university's work and the raison d'être for its existence. Thousands of students are kept anxiously waiting for their results while anonymous examiners and tabulators juggle their marks and decide their fates. And the consequence is that the whole educational process must wait.

In a developing economy, education must be in the forefront. The nation's schools and colleges must be the sources from which a continuous stream of educated young men come forth to fill the needs of the economy. In a rapidly industrializing society, the accent will, of course, be on engineers, scientists, doctors and the like. But the picture that emerges from India is one of tremendous waste of educational effort. This primarily stems from the outmoded curricula and the antiquated examination system.

Unless there is a new ferment in India's educational systems, it is unlikely that the universities will make a significant contribution to the economic development of the country.

Mr. Sen hopes for normal rice production this season — Report

WINDOW ON THE WORLD

Development as a Business

By ASHOK DESAI

OXFORD:

THE ANNUAL report of the World Bank is a bit sensational: the volume of loans granted by the World Bank and its associates has dropped 30 per cent in the last year, and the Bank's own loans have halved. The Bank is at pains to emphasize that this reflects no trend, but gives reasons which do suggest one. The first is that some countries have been successful in floating loans in Western money markets; the second is that some countries have been "nearing the limit of the amounts they can afford to borrow on the Bank's terms of interest and repayment" though their need for external finance remains high. The first refers principally to Japan; the second refers to a growing number of countries, including India.

Japan's success in foreign capital markets is partly due to her record of rapid and sustained economic expansion—to the widespread confidence in the prospects of investment there which it generates. But this is not what distinguishes Japan from countries that cannot borrow, for many have fairly creditable records and prospects of expansion, and there are generally promising industries even in the more sluggish countries. Nor is Japan the only country which, so to say, guarantees free passage to foreign finance and its profits; nationalisation of foreign enterprises or threats of it and restrictions on repatriation are still rare enough to score newspaper headlines. What distinguishes Japan is the foreign confidence in its guarantee—confidence based on Japan's steadily improving payments position in the last decade, which has made the prospect of restrictions on repatriation of capital or profits virtually unthinkable. This sets Japan apart from most of the developing countries, including the ones which are ceasing to qualify for World Bank loans. And the factor which prevents the latter from borrowing in Western capital markets is the same as what now limits their capacity to borrow from the World Bank—a weak balance of payments position and a continued prospect of it.

International Finance

The fact that countries which were most in need of international finance were also least able to borrow it on money markets was increasingly recognised in the fifties; the World Bank under Camille Gutt played a crucial role in its recognition and in filling the gap between these countries' needs and the available resources. It would be curious if it were to go out of this business for virtually the same reason as international financiers.

There is, however, no intention to go out of business; rather, the Bank seems to be in two minds about the next step. Its dilemma arises thus: if a country is to be able to borrow from the Bank it must be able to service a steadily growing debt; that is, its exchange earnings from exports and foreign aid must exceed its imports by a steadily rising amount. The tendency in developing countries is often the opposite. Since most of them have little industrial capacity, virtually any step of economic improvement, be it building an electricity works or putting more fertilisers into agriculture, increases imports. Further, the collection of taxes is difficult in an economy where farmers and traders predominate, so any increase in public expenditure, whether on investment, extension of civil services or expenditure on social overheads, tends to create or increase budget deficits. This, together with growing urbanisation, increases the de-

mand for consumer goods and tends to generate inflationary pressure and weaken the balance of payments. There is, therefore, continuous pressure on foreign exchange resources, which the burden of service charges only serves to aggravate.

There are four alternatives open to the Bank in these circumstances. First, it can stop lending to countries in payments difficulties: this is what it is doing to some extent at present. Second, it can reduce service charges by lengthening the period of repayment and reducing interest rates. This is the line it has hitherto favoured. There were institutional difficulties in following it, since the World Bank likes to be thought of as a hard-headed business concern and likes to think of itself that way. But it solved the problem by splitting its personality and handing over the softer procedures to its offshoot, the International Development Association. The IDA has been giving interest-free loans repayable over 50 years, in the borrower's currency if necessary; consequently, the volume of its loans has leapt up from \$101 million and \$134 million in its first two years to \$260 million in the third. Already it is nearing the limit of its funds—\$775 million—and seeking their extension through an increase in members' subscriptions. How far this trend

Eastern Economist 20 Years Ago

OCTOBER 8, 1943

No less than twelve resolutions were adopted at the three-day meeting of the Central Advisory Board of Public Health, but there was a distinct feeling of dissatisfaction among the members that though the Board has been in existence for over five years and made important recommendations, the Governments concerned have yet to give effect to a large number of them. The Committee discussed at some length the report of the Committee appointed to investigate the question of food adulteration in India. In addition to making detailed suggestions for the prosecution and punishment of offenders guilty of food adulteration the Committee has recommended that under existing conditions the creation of a cadre of analysts in each province and State will alone meet the situation. The Committee has also suggested that advantage should be taken of the provisions of Section 103 of the Government of India Act, 1935, under which Provincial Legislatures can request that the Central Legislature should pass an Act for the control of food production, distribution and sale. Lately, the Committee has taken care to observe: "While the provision of adequate legal powers is essential for a continuous improvement in the community's food supply, it will be equally necessary to supplement legal measures by administrative action which will be satisfactory in quality. The promotion of co-operatives for the larger production of essential foodstuffs and for reducing the cost of their distribution to the public is a matter for serious consideration by Provincial and State Governments."

can continue obviously depends on the Bank and the principal member countries; but if the IDA eventually takes up the major part of the World Bank's business and increases in subscriptions become automatic, there might be a far-reaching transformation of the Bank from an investment bank running the business of investing in financially pukka projects to an instrument for channeling international aid into investment in developing countries. This is, however, a remote and uncertain possibility yet.

Third, the practice of receiving service charges in the borrower's currency as the IDA is authorised to do might find further extension. However, the currency would be useful to the Bank only if some other borrower wanted it; e.g., if the first borrower produced investment goods for the needs of the second. This would involve planning production in borrowing countries in such a way that they could meet each other's investment needs. This brings us to the fourth alternative—influencing the economic policies of borrowing countries.

The Labour Party's Problems

By JOSSLEYN HENNESSY

LONDON:

UNANIMOUSLY, from Left to Right, the British press believes that the Labour party's display of unity and choice of topics at its Scarborough conference has enhanced its "image" in the country.

How is it that this party which, only a year ago, was tearing itself apart, between moderate radicals on the right and traditional Socialists on the left, has apparently achieved such internal amity? Clearly it is the continuing lead given to Labour by the public opinion polls in recent months which have persuaded the party that it is on the threshold of victory providing that it does not arouse the distrust of the electors by appearing so divided as to be incapable of a coherent policy.

Many observers believe that the electors were satisfied enough with Conservative policies, and that Labour would have remained in the wilderness, had not Selwyn Lloyd sought to counter the 1961 balance of payments crisis and restore competitiveness to UK export prices by launching a Wages Pause, which hit civil servants, and other middle class wage earners, who constitute the floating vote which keeps Labour out or puts it in. Economic observers agree that the UK's current strong balance of payments trend and record exports sales are Mr. Selwyn Lloyd's harvest, while the rising growth rate is the now emerging result of the Conservative investment policies of 1950-80. The 1964 general election may largely depend on how far the Conservatives succeed in getting across to the electors the somewhat sophisticated economic arguments involved and how far Labour succeeds in the simpler task of building up its counter-picture of "twelve wasted years" in which allegedly nothing was accomplished under Tory rule.

Nationalisation Fear

The Labour leaders appear to have grasped at last, what the German Socialists realised several years ago, that the bulk of the electors fear nationalisation and all the old doctrinaire Socialist slogans. They are, therefore, seeking to reassure the voters that Labour is a progressive rather than a "public control" party. This attempt is reasonable and legitimate, but it is clear from listening to the conversations of rank and file members at Scarborough that a substantial section remain orthodox Socialists by conviction, and refrain from voicing their disapproval of their leaders' line, only because they understandably do not wish to rock the boat now that a favourable wind is filling its sails. The leaders have

Here the Bank might try to influence either fiscal and monetary policies or structural policies. Hitherto it has generally thought of the former. As I said above, these tend to be such as to worsen the balance of payments and can often be blamed; and the Bank has a preference for financial as opposed to physical measures. It is difficult to say whether the Bank has actively thought of influencing the structural policies of its borrowers so as to improve their payments position—of encouraging the growth of industries producing import substitutes or exports, including exports of investment goods to subsequent borrowers. The public pronouncements of the Bank betray little; on the other hand, the detailed economic studies of member countries that the Bank has published often point out industries fit to be developed, from which it would not require much imagination to look for industries whose development would ease the balance of payments. Anyway, this is a direction in which the Bank's thinking and policy have furthest scope for evolution.

skilfully avoided controversy by forcibly sweeping nationalisation, defence, nuclear disarmament, foreign policy, and future relations with the European Economic Community under the carpet, and by leaving the definition and mechanics of a Wages Policy wrapped in rosy but vague generalities.

Assuming a Labour victory, the question arises how far Labour's sensible and realistic leadership will be able to assert itself over the traditionalists (a) in the rank and file, and (b) in the trade unions, Labour's strongest single sector of support.

Emotional Subjects

One possibility is that in order to push constructive policies through, the leaders will have to make concessions on such emotional subjects as housing and rent control. On this point the "Economist" represented a widespread non-political viewpoint when it said "No part of Labour's domestic policy is more dangerous than its present vague commitment to re-introduce rent controls, to impede redevelopment by crazily nationalising the freehold of building sites as soon as somebody is efficient enough to start rebuilding on them, to treat the developer who provides this social necessity of new housing space as a pariah who must never get the full market price. The policy would be bound to intensify housing scarcity..."

As for the trade unions, partly because they are the heirs of the world's oldest trades union movement, partly because their thinking is still dominated by the inter-war depression (and therefore concerned with unemployment and deflation instead of over-full employment and inflation), and partly because they will not pay modern salaries to their officials and are therefore over-staffed with second rate thinkers, the unions are the strongest representatives of the Luddites — those who favour preserving old craft techniques against modernisation — for whom Harold Wilson proclaimed at Scarborough, amidst cheers, that there was no room in a Socialist party. It is, however, one thing to applaud the ideal at a euphoristic party conference; it is another to practise it on the factory floor. This is a basic problem which faces whatever party is in power. Hitherto, the Conservatives' headache has been to try to contract or eliminate thickets of traditional industries, now obsolete or in need of root and branch modernisation, such as textiles, shipping, coal mining, and the railways. The rearguard action to bolster them by subsidies or other protective measures, has come, and continued even at

the Labour conference to come from the unions concerned, which for reasons of history are among the oldest and most powerful.

Labour's leaders are under no illusions about this difficulty, which was doubtless among the considerations which led the deputy leader, George Brown, to warn that the achievement of Labour's targets must be a matter of several years, probably spreading over to a second general election.

It is worth noting that the Conservatives have helped to force Labour's traditional preoccupations into the background, because Conservative policies have brought the problems of modernisation, scientific research, and wages policy into the foreground. It may be that, under Mr. Wilson's realistic

Dominance in World Trade

From Our Special Correspondent

PARIS:

SHIFTS AND changes in world trade channels are constant, and there is no country that enjoys a permanently privileged position, safe from challenge, in any major market abroad. True, there are some small nations that are the commercial satellites of some big partner, but if we define a major market as one importing at least \$1,000 million worth of foreign goods each year, there are only two that depend on one other country for over two-thirds of their supplies. They are the immediate neighbours of the USA, namely Canada and Mexico. The fact that a country buys much or most of its imports from one other nation does not signify economic dependence, unless it also sells a good part of its exports to that same country. By that criterion, there are still two countries that are substantial traders and yet do most of their import and export trade with one other nation: Canada and Mexico again, in their relation with the USA.

No nation in Europe enjoys this dominant position in regard to another country. Neither Britain, nor Germany nor France supplies over half of any country's imports. There are cases where Britain and France buy over half a country's exports (sometimes almost all its exports) but these are small countries formerly belonging to their respective empires, which represent a modest market for British and French exports. The only instance of economic domination, approaching U.S. trade relations with Canada and Mexico, is British commerce with New Zealand. Britain takes 51 per cent of New Zealand's exports and supplies 45 percent of its imports. This case is unique in West Europe's foreign trade, and even then one must note that New Zealand is not a major market as we have defined it (i.e. its imports in all are worth less than \$1,000 million a year). If we extend the definition of major traders to include nations that buy at least \$500 million abroad each year, West Europe still has no other trade dependencies besides New Zealand, but the USA has two more: Colombia and the Philippines, buying half their exports and supplying half their imports.

These calculations are prepared by the Common Market trade experts on the basis of 1961 and 1962 commerce. They would seem to be essential for any discussion of "dominant situations" in foreign trade, a subject often debated loosely without regard to the facts. In reckoning the Common Market's influence in world trade, for example, it is necessary to know that West Germany is not the major supplier of any significant importer outside Europe and even within Europe it nowhere succeeds in supplying over a third of any country's imports except in neighbouring Austria; moreover West Germany is not the dominant client for any exporter of raw materials. France, on the contrary, is the dominant

leadership, Labour, because of its link with the unions, can solve these problems more easily. If so, good luck to them!

Nevertheless, as the "Sunday Times" pointed out, one should not assume that the Conservative momentum cannot be restored. If one takes Mr. Wilson as setting a high standard of party leader, the Conservative cabinet is full of antagonists of equal calibre, while Labour's shadow cabinet is not. Butler, Hailsham, and Maudling, are obvious, but Lord Home, Edward Heath, Iain Macleod, Edward Boyle, and Keith Joseph are all of prime ministerial calibre. The government also has the advantage of a strongly reviving economy. And how its annual party conference (due when this report appears in print) handles itself may make a big difference for—or against—Conservative fortunes.

client of a whole string of small exporters of commodities, all recent members of its empire, but the French role in export trade is much more modest: France does not have the number one place among the suppliers of any country buying more than \$500 million abroad annually. There is no nation, then, that is dependent on a member of the Common Market in its external commerce to the extent that a handful of nations are dependent on the USA.

Two tables will show the dominant situations (or something approaching that) in world trade, one for the exports of the three biggest exporting countries (the USA, West Germany and Britain), and one for the three biggest importers of commodities (the USA, Britain and France).

Percentage (within brackets) of each country's total imports bought from:

USA	West Germany	Britain
1. Countries importing over \$1,000 million from abroad annually		
Britain (11)	Italy (17)	Argentina (12)
W. Germany (14)	France (18)	South Africa (29)
Spain (20)	Norway (18)	Australia (31)
India (21)	Belgium (19)	
Brazil (35)	Finland (20)	
Japan (36)	Denmark (22)	
Venezuela (59)	Sweden (22)	
Canada (69)	Holland (23)	
Mexico (70)	Switzerland (32)	
	Austria (42)	
2. Countries importing between \$500 and \$1,000 million from abroad yearly		
Iran (19)	Yugoslavia (19)	Nigeria (38)
Egypt (19)	Portugal (37)	New Zealand (45)
Greece (20)		
Pakistan (25)		
Israel (33)		
Chile (40)		
Philippines (47)		
Colombia (52)		

The export table, then, shows that the USA plays an important role as a supplier to a fairly large group of countries but this role only becomes dominant in the former colony, the Philippines, and in the Western hemisphere (and even then Argentina escapes, making Britain her first supplier). Britain, on the contrary, has this important role as a supplier in surprisingly few countries that import on any

large scale; apart from Nigeria, they are only the white Dominions of the southern hemisphere. For the rest, British exports are widely scattered, and former imperial connections have left little mark in the shape of dominant or privileged situations in trade. West Germany, in contrast, is of the first importance to most Continental nations as a supplier, in part because of her membership of the Common Market, in part because of traditional links with her neighbours. For memory, the value of total exports in the average recent year was \$21,400 million for the USA, \$13,000 million for West Germany and \$10,500 million for Britain.

Turning to the import table, one takes the percentage of each country's commodity exports that were bought by the USA, Britain and France. West Germany drops out because her purchases are scattered around the globe and she is not a major customer for any nation. France takes her place, because she is still the major market for the goods of her former colonies. These figures concern commodities, and not total exports, because no exporter of manufactures relies to any large extent on any one foreign customer, i.e. industrialisation removes the danger of dependence on a single client, a situation that must still be accepted by countries that export mainly or only commodities. Even where the above table shows that, say, Canada or Mexico are important markets for American exports (or Austria for West German exports), it is obvious that such markets absorb only a moderate proportion of total exports from the USA (or West Germany), and an even smaller proportion of total output.

The table alongside reveals that there are still a large number of countries that rely on one client to pick up at least half of their exports. The list is very short where Britain is that client, for British purchases (like West German) are very scattered, and again we can say that the imperial connection has left little mark; apart from New Zealand, the countries concerned are very tiny possessions. The list is much

longer where France is the dominant client, but this reflects the recent liberation of these States (all small in population apart from Algeria) from direct French tutelage. In any case, the commerce in question is evolving rapidly as these territories get the benefits of association with the Common Market. Mostly, these countries sell over half their goods to France because France still offers them guaranteed minimum prices higher than world prices, but this arrangement is destined not to endure. The only important instances of commercial dependence, in sum, relate to the U.S. connection with countries in the Western hemisphere, and it is only there that one finds countries that rely on one big nation to buy most of their exports and supply most of their imports.

Percentage (in brackets) of each country's total exports bought by:

USA	France	Britain
Guatemala (53)	French Guiana (52)	New Zealand (51)
Liberia (53)	Togoland (52)	Barbados (52)
Philippines (54)	Madagascar (54)	Br. Honduras (54)
Costa Rica (58)	Tunisia (55)	Sierra Leone (79)
Canada (59)	Central African Republic (57)	Mauritius (80)
Colombia (60)	Comoro Islands (58)	
Ecuador (61)	Equator (61)	Cameroons (59)
Dominican Rep. (62)	Dominican Rep. (62)	Gabon (60)
Honduras (64)	Niger (62)	
Mexico (73)	Dahomey (70)	
Surinam (76)	New Caledonia (77)	
Bahamas (93)	Algeria (81)	
Panama (94)	Guadaloupe (83)	
	Reunion (85)	
	Senegal (86)	
	Martinique (90)	

Future of Ghana's Industry

By MADAN M. SAULDIÉ

ADDRESSING the press at Accra sometime ago, Mr Imoru Egala, Ghana's Minister for Industries, disclosed that the preliminary results of the recent industrial census in Ghana showed that more than 100,000 industries of all sizes flourished in the country. He added that "from all over the world Ghana's industrial and general investment policies have made her an attractive proposition." It was, he said, the Government's prime concern "to ensure that easy credit from both East and West did not lead the country into establishing ill-considered projects, and that the terms were favourable to Ghana at all points."

This note of warning is significant because Ghana's terms have never been favourable. Even after her independence in 1957, she has not been able to correct the imbalance of her foreign trade and as lately as 1961, the unfavourable factors amounted to 23 per cent. She had been exporting raw materials at cheaper rates in exchange for manufactured goods imported at much higher rates. This has resulted in a perpetually unequal exchange and deterioration of her export earnings.

At the time of independence there were hardly any industries and cocoa production was the mainstay of the country's economy. The country behind Dr Kwame Nkrumah thus had to face a double challenge: one, of diversifying the economy and the second, of processing her own raw materials. The process generated by a £75 million (raised to £108 million) ten-year (later reduced to 8 years) Development Plan launched in 1949 was carried ahead through an Interim Consolidation Plan despite the difficulties in forecasting future trends in cocoa prices, coupled with trade recession in the United States and Europe. The Plan was designed "to cover the completion

of any first Development Plan projects left unfinished, to sustain employment, to provide for reasonable expenditure in the regions and to consolidate the development work already carried out under the First Plan."

The 5-year Second Development Plan which came into operation in July 1959, envisaged a total expenditure of £242 million for general development and an additional £100 million for exploiting the country's hydro-electric potential. While the previous plans laid emphasis on communication, public works, education and general services only, the second Plan stressed the need for increased production and planned expenditure on agriculture, natural resources, industry and trade, although communications and education continued to claim the lion's share of the total outlay.

Having thus built an infra-structure for economic growth, through educational and health programmes, the country undertook to processing her own raw materials and within a span of six years, she was processing her timber through a vast furniture industry with genuine hopes that by the Plan-end, the exports of unprocessed lumber would be reduced to 'minor proportions.' The paper industry is also expanding and by 1970 it is expected to be turning out at least 25,000 tons of paper and paperwood per year. Palm oil is being processed into soap, bauxite into aluminium and hides into footwear and leather goods. A factory processing cocoa beans is springing up soon which would enable more than half of cocoa being exported in the form of cocoa products by 1970. In short, the country is preparing to manufacture within the country all that was being imported in exchange for raw materials. That done, it would not be difficult for Ghana to become in her own dreams "a predominantly industrial trading country" and re-

place consumer goods industries by medium and heavy manufacturing ones. Much also depends on what the 7-year Plan, to be launched towards the close of this year or the beginning of the next, achieves for Ghana.

But it can be expected that by the time Ghana takes to heavy industrialization, she would have tapped at least three essentials of industrial growth—power, chemicals and steel. To meet her power requirements, Ghana finds rich prospects in the \$392 million Volta River Project which when completed would not only provide hydro-electric power but also serve as an all-purpose scheme affecting the economy as a whole. The power when fed to an aluminium smelter at Tema would utilize much of the bauxite deposits concentrated round the city.

In addition, the artificial lake created for the project would help inland transport and navigation, fishing industry and provide irrigation to heavy water-using crops. The construction of Tema Harbour and Tema New Township to be built from Ghana's own resources and estimated to cost £30 million, forms a key part of the whole project.

The work on the 240-feet high Akosombo Dam—a part of the project—has already started and is progressing speedily.

The availability of large quantities of salt might put the chemical industry in motion. Petro-chemical industry would also go up as soon as Tema refinery, expected to refine more than one million metric tons of crude oil in the first year of its working, goes into operation.

Then comes the third essential: steel. By next year, it is expected that Ghana would be producing 30,000 tons of steel from scrap at a small steel plant. The large steel plant to be built at a cost of £1,700,000 and which would lay the foundation of a potential steel base in Ghana, would utilize the ores extracted from Shiene area.

Heavy Industry

Three essentials thus mustered up, Ghana would embark upon heavy industrialization and mass production. The 7-year Plan with a total outlay of £840 million, more than half (£425 million) of which has been allocated for the production of capital goods, might take the former British colony a decisive step forward. By 1970, Plan-end, it is hoped that national production will rise by 38 per cent.

In building up an industrial Ghana, the role of private investment cannot be over-emphasised. Ghana will have to attract and encourage the establishment of new industries both in the private sector as well as in the joint private-Government sector. To that end an Industrial Development and Investment Division has been set up in the President's Secretariat. The Government's policy towards private investment has already been explained more than once. In 1958 Dr Nkrumah in a statement to the National Assembly (Parliament) rightly emphasized that the Government was determined "to expand the industrial capacity of the country and that private capital and technical know-how would be most welcome." This assurance was repeated in his speech to the Assembly in March and again in October 1959, when he declared that the Government aimed (in the spirit of the Indian National Congress' Avadi Resolution) at evolving a "socialist pattern of society."

The Ghana Government has, of late, been making vast concessions to the private sector. The legislation now provides for the refund of customs import duty on raw materials used in the approved local industries. The Pioneer Company Relief scheme, which originally consisted of exemption from tax on profits of pioneer industries for a period of five years, now provides for the extension of tax holiday until the initial capital has been fully recovered. To cap it all, positive help is being given to industrialists in the acquisition of land for their projects — and developing it by providing water, power etc.

up to June 1963, there were 72 privately-owned factories

in Ghana as against 11 State-owned ones. Eight State-owned factories are under construction and plans are afoot for building up another 15. Important private overseas and local industrial investments include a 20-year old Swiss brewery, Pioneer Tobacco Company (a subsidiary of the British-American Tobacco Company), British Tyre Equipment and Reconditioning Company, Coco-Cola, (followed by Pepsi-Cola), a Lebanese bakery, a French industrial gas producing plant, a Canadian roofing sheet factory, Imperial Chemical Industries' pharmaceutical plant and a British vehicle assembly plant. Local private undertakings are generally engaged in the manufacture of prefabricating concrete buildings and structural element, metal production, products of reconstituted milk and cream, aluminium utensils etc. Cottage and village industries may also receive stimulus by the Government's plan to establish village industrial halls to be used by craftsmen such as goldsmiths, basket and kenti-weavers and wood carvers whose products would be marketed by the National Trading Corporation.

But notably enough, all the above listed bigger industries were set up long before independence and not a single of them produced capital goods. Even after independence, private capital has not been forth-coming as hopefully as could be expected partly, because of Dr Nkrumah's proclaimed leftist leanings and partly, due to the Africanisation policies—Africans now occupy all but 0.6 per cent of the positions in the top grades. This has kept most of the managerial genius and technical know-how off her industries. It is time greater incentives were given to the private industrialists and their interests guaranteed so that the pace of industrialisation is not slowed and the rising trends in Ghana's per capita income is maintained. According to the U.N. sources, Ghana enjoys the highest average per capita income of \$245 a year as compared to \$110 for West Africa as a whole, \$65 for East and Central Africa and \$130 for North Africa.

"Current" Circulates a Canard

By Our Special Correspondent

NEW DELHI:

THE PRIME Minister at his Press Conference on Wednesday dismissed brusquely a report in the "Current" last week that, at his instance, the Government was preparing the ground for the nationalisation of commercial banking. Mr. Nehru's denial only confirms what has been known to be the fact among informed circles, that there has been no change at all in the Government's policies on this issue as affirmed on two occasions in the last session of Parliament, first by Mr. Morarji Desai and subsequently by Mr. T. T. Krishnamachari each, in turn, speaking as the Finance Minister of the day.

The demand for nationalisation of banks has been pressed off and on, chiefly by the Communists but also by a section of Congressmen. In fact, in the last Monsoon Session, an unofficial resolution in the Lok Sabha, asking for the nationalisation of banks, was moved by a Congress MP who, however, withdrew it after Mr. Krishnamachari had explained that the nationalisation of banking was not necessary either for developing the economy of the nation or as a means of promoting what are described as social objectives. The Finance Minister further pointed out that, apart from the fact that the Government of India, through the Reserve Bank, could already act effectively to regulate banking on sound lines, it was always open to the Government to consider such other regulatory measures as might be necessary to reinforce its authority over the functioning of the banking system. It appears that this continues to be the position of the Government in this issue and in the circumstances much surprise is expressed here at the irresponsible manner in which reports are fabricated and circulated in a matter where it is so clearly necessary to preserve public confidence. A section of the Press, specialising in sensationalism, has no doubt got into the habit of indulging in personal attacks and character assassination. This is bad enough. But when these tactics are carried to a point where false fears can be spread in sensitive areas of the economy, great harm could clearly be done to public interest in the widest sense of the term. Incidentally, while it is conceded that reports appearing in a certain section of the Press are usually not taken seriously even by its regular readers, it is still thought to be rather surprising that the Finance Ministry has not considered it necessary to contradict promptly such wild charges as those built into the "Current" story which alleges, in part, that the LIC has been instructed to buy the shares of certain banks as an exercise in the nationalisation of the banking industry through the back door.

It was an alert, but completely relaxed Mr. Nehru who met the Press this week. The Prime Minister seems to have shed lately much of the burden of his years. He was in great good humour and this was so obvious even as he came to in that the questions (and questioners) were encouraged to become promptly aggressive. On the Kairon affair, especially, the Prime Minister was subjected to something like a searching cross-examination and at one point he was even advised that, in the circumstances of the case, he should at least have kept "mum" over the supposed virtues of Punjab's Chief Minister. Mr. Nehru, however, not only took all this in the good part, but also held more than his own often with the help of a gay witticism here or a deft turn of phrase there. For instance, in the matter of the VOA deal, which incidentally seems to be neither on nor completely off, Mr. Nehru slyly got on the right side of critical Pressmen with a disarming confession that "mistakes do happen in the best regulated families".

From the point of view of hard news, the Press Conference was not very productive. Mr. Nehru is far too old hand at the game to be provoked or persuaded into giving away information as such. But it was certainly useful to have the Prime Minister's clarification of the position with regard to the so-called "second list" of releases of Ministers for Party work. Mr. Nehru explained that he himself had never mentioned any second or third list. All that he had said, while announcing the famous drafting of the dozen, was that he might have some further suggestions to make in due course. He denied that it was his intention to imply that there were to be more departures of Ministers from the Central or State Governments in pursuance of the Kamaraj plan.

It all boils down to this. While the Prime Minister may not be sending out more Ministers from the Centre in the name of the Kamaraj plan, it does not necessarily mean that there will not be any more changes in personnel or portfolios. On the contrary, the Prime Minister clearly said that the allocation of portfolios at present is of a temporary nature in certain cases and that more permanent arrangements will, therefore, have to be made. Again, that there would be some new appointments to the Cabinet is being generally taken for granted. Finally, although the Kamaraj axe may have been put away in the woodshed, it is still not only possible but more than likely that some weeding out will be done among Ministers of State and Deputy Ministers. Action taken in this regard will, of course, be distinct from action taken earlier in terms of the Kamaraj plan. Incidentally, even with regard to the Kamaraj plan, the Prime Minister seems to have given away the show when he said laughingly that perhaps part of the reason for the names of Mr. Gopala Reddi and Dr. Shrimali being included in the list of the six Central Ministers chosen for Party work was that he (Mr. Nehru) had a feeling that six was a satisfactory number, while less than six might be too few. Did I imagine a mischievous twinkle in the Prime Minister's eyes when he said this?

At the end of his Press Conference, Mr. Nehru read out a statement which he disclosed that the Finance Minister had requested him to release at the Press Conference. This statement was on a Government decision to grant 'ad hoc' increases in pensions drawn by retired government employees who are entitled to that benefit. Pressmen were rather intrigued why Mr. T. T. Krishnamachari had chosen this rather unusual procedure for publishing this decision. But there is no doubt at all that this announcement is of more than ordinary social significance. Retired government pensioners have been agitating for a long time against having been left unprotected against the abnormal increase, continuously over the years, in the cost of living. That the present Finance Minister, so soon after taking office, has responded to this call of distress, which is bound to be welcomed, especially among the lower middle-class, is a proof of the Government's awareness of and sympathy with the hard-pressed sections of the community who have to keep stretching their fixed incomes to meet the rising cost of living. Although the increases are necessarily in the form of small amounts, the extent of relief they could bring to the mass of the pensioners who are from the low-salaried class could be relatively significant.

The Planning Commission is likely to place before the country, by November-end, a broad idea of the objectives and tentative targets of the fourth Plan. Currently, as many as 26 Working Groups, consisting of the representatives of the

Planning Commission and various economic Ministries, are engaged on this problem in the larger context of development during the 15-year period to 1981. They are expected to submit their preliminary reports in three or four weeks' time. Some of the particular aspects of development being studied by these Working Groups are the internal and external resources, food policy, industrialisation, international trade, family planning, scientific research and labour and employment. Since increased emphasis is now being placed on advance action in regard to some fourth Plan projects, the Working Groups will be indicating the important schemes which should be taken up in 1966-67 and 1967-68.

Tentatively, the Planning Commission is understood to have suggested to the State Governments that the basic objective of the fourth Plan will continue to be to accelerate the growth of agriculture and industry. Suitable provision, of course, will be made for the development of transport, fuel, power and education. A new element in the planning policy being brought in is the devising of measures to obviate foreign exchange difficulties. Rectification of the balance of payments position is to be an over-riding consideration in the drawing up of the fourth Plan industrial programmes. For this purpose, not only will savings have to be stepped up, but there will also have to be significant improvement in the construction and management of industrial enterprises

★★

Meanwhile, the mid-term appraisal of the implementation of current Plan is said to have revealed that as a result of increase in prices, the outlay on the Plan programmes is likely to go up by nearly Rs. 600 crores. The two sectors of the economy worst affected by escalation in prices and adjustments necessitated by the emergency are industries and transport and communications. Some of the third Plan projects, it is feared, will have to spill over into the next Plan because of this increase in the cost of executing them and owing to the delays that have occurred in arranging necessary foreign exchange.

For giving a boost to agricultural production next year, the Planning Commission is stated to have addressed recently a circular to State Governments in which it has reiterated the need for expeditiously streamlining the administrative machinery. The attention of the States has been drawn to the fact that in several cases where large investments have been made, the benefits remain to be realised. The States have been advised to earmark as top priority in their 1964-65 Plans, the resources required for the completion of the agricultural projects under execution. They have also been urged to concentrate on areas selected for intensive cultivation of cotton, oilseeds, rice, millets and other crops. Concerted drive has been called for in matters of plant protection, multiplication of seeds, utilization of irrigation facilities and local manures and distribution of fertilizers and credit.

★★

The National Iranian Oil Company has sharply reacted to Mr. P. R. Nayak's projected visit to Iran and the publicity given to it in India and abroad. It has made it clear, in a formal statement, that no arrangements are being considered for possible grant of oil rights to India outside the framework of Iran's competitive bidding procedure and requirements.

The statement says: "Indian reports of the planned visit of the Oil and Natural Gas Commission's representative to Iran had apparently given rise to such question in industry circles with the result that some companies had inquired whether they also might submit offers before National Iranian Oil Company declares District one acreage formally open for bids next year. The purpose of the Indian Government's representative's projected visit to Iran is to discuss oil matters in general. The National Iranian Oil Company will adhere

very rigidly to its well established procedure with respect to bidding in District one."

The Indian Government, it is explained here, is under no illusion, so far as District one is concerned. But there might be other areas in Iran which could be a subject matter for negotiations. Then again, India is also anxious to make long-term arrangements for importing crude. Prima facie, the present reserves in Assam are not adequate for feeding the expanded Barauni refinery in Bihar. The construction of the Haldia-Barauni crude pipeline is a pointer to this assumption. The existing three refineries in the private sector and the proposed Phillips refinery at Cochin have been allowed to import crude from their own sources. The plan of the Indian Government to import crude through the Oil and Natural Gas Commission however will enable Government to know the geography of crude imports, its discounts and impact of such discounts on the prices and products if any.

★★

The Government of India have issued a new Rule — 125B under the Defence of India Act — assuming specific powers to regulate supplies of cane in areas reserved for the factories. This is in pursuance of the statement made by the Union Minister of Food and Agriculture in Parliament on September 6, 1963, on measures for augmenting sugar production in 1963-64. He had emphasised the need for ensuring adequate supplies of sugarcane to sugar factories in order to achieve a sugar production of 33 lakh tons and indicated the nature of regulatory measures for the purpose.

The Rule empowers the Central Government to reserve areas where sugarcane is grown for its purchase by factories, after taking into account the crushing capacity of the factory, the availability of sugarcane and the need for production of sugar. It authorises the Central Government to require sugarcane-growers in the reserved area to deliver a specified portion of their production of sugarcane to the sugar factory and the factory in turn to accept and crush that sugarcane.

The Rule also provides for restrictions on animal-drawn crushers not owned by sugarcane-growers, power crushers and khandsari units operating in areas reserved for sugar factories in the matter of licensing or purchasing sugarcane or sugarcane juice for manufacture of gur, shakkar, jaggery, rab or khandsari sugar etc. The units found to be operating without a valid licence are liable to seizure and being rendered inoperative by sealing or otherwise, i.e., by removal of vital parts. They would also be liable to forfeiture in addition to any other penalty which may be imposed.

Powers to require persons engaged in the production, manufacture, supply or distribution, trade or commerce in sugarcane, sugarcane juice, sugar, gur, shakkar, jaggery, rab or khandsari sugar, to maintain and produce for inspection such books, accounts and records as may be required relating to their business and to furnish any required information, have also been provided for.

The powers under the Rule are being delegated to State Governments, who have been requested to give effect to the measures immediately according to the needs of the situation in their States.

★★

The President has given assent to the Constitution (Fifteenth Amendment) Bill, 1963 and the Constitution (Sixteenth Amendment) Bill, 1963. These Bills were passed by the Parliament early this year and have since been ratified by the requisite number of the State Legislatures as required by the proviso to Article 368 of the Constitution of India.

The Constitution (Fifteenth Amendment), Bill seeks to raise the retirement age of High Court judges from 60 to 62. It also empowers the various High Courts to hear cases against the Union Government. Hitherto only the Punjab

High Court had this jurisdiction. Another feature of this Bill is that now the government servants will have only one opportunity for appeal against two so far available.

The Constitution (Sixteenth Amendment) Bill seeks to enable the Parliament to make laws providing penalty for any person questioning the sovereignty and integrity of the Indian Union. Under its terms, a person shall not be qualified to be chosen to fill a seat in Parliament or in the legislature of a State unless, 'inter alia', he makes or subscribes before a person authorised by the Election Commission an oath or affirmation that he will bear true faith and allegiance to the Constitution and will uphold the sovereignty and integrity of India. The Election Commission has authorised every Returning Officer as the person before whom such oath or affirmation is to be made.

★★

The question of implementing the principle of 'single point taxation' in respect of transport vehicles plying on inter-State routes, under regular or temporary permits, has been under the consideration of Government. The Transport Development Council, at its last meeting held in April, 1963, recommended the appointment of a study team, consisting of representatives of the Central Government and a few State Governments, to examine the relevant issues. A part-time study Group with Mr. N. P. Mathur, as its Chairman, has now been appointed. It will examine the procedure for the assessment and collection of motor vehicles tax, goods tax and passenger tax in regard to vehicles operating on inter-State routes in different States and recommend a simple and uniform procedure in order to eliminate inconvenience and delay to inter-State transport, without adversely affecting the revenues of the different States concerned. It will also recommend a reasonable basis, or formula, for the division of the proceeds of the three taxes from inter-State transport among the different States concerned. The study group is expected to report within six months.

★★

The Government of India must express its "grave disappointment" at the short-sighted attitude of the India/UK-Continent Conference which had imposed a 12½ per cent increase in freight rates and "consider themselves free to take whatever steps are required to protect the legitimate interests of Indian trade", said Mr. G. Venkateswara Ayyar, Chairman of the Consultative Committee of Shipping Interests in Overseas Trade. Mr. Ayyar, Secretary, Union Ministry of Transport, was addressing the Committee's eleventh meeting here during the week.

Mr. Ayyar disclosed that the Conferences and Shipping companies serving trade from Calcutta and East Coast of India to US North Atlantic ports, US Pacific Ports and Canada had also announced a 10 per cent general increase in freight rates effective from October 11, 1963. This, he said, was a second increase within a short period of two years, the freight rates in these trades having been increased in January, 1962.

During the course of examination of various complaints received by the Freight Investigation Bureau, according to Mr. Ayyar, it had been observed that shippers in India were placed at a disadvantage vis-a-vis exporters from other countries in regard to freight rates, payment of rebates etc. In many cases, freight rates from India were very high compared to the freight rates from other countries. The shippers in UK-Continent were allowed an option of either 10 per cent deferred rebate or 9½ per cent cash rebate, but no such option was allowed to shippers in India. This discriminatory treatment resulted in large amounts of shippers' money being locked up unnecessarily.

★★

The Consultative Committee decided that all items of discrimination and disparity in freights should be taken up

again by the Freights Investigation Bureau with the Conferences concerned directly as well as through the Indian Shipping Companies who are members of the Conferences concerned. The Committee was apprised of specific instances of discrimination in freight rates for several commodities including coffee, aluminium sulphate and decorticated mattress type fibre, as shipped from Indian ports and foreign ports similarly situated. The attention of the Conference was also invited to a wide disparity between freight rates for the same commodity from different ports in India to the same destination.

The Committee also noted the additional charge of \$4 per ton levied on shipments from US north Atlantic ports to Cochin, Madras, Vishakhapatnam, Kandla and Gujarat ports. The Committee decided that the Indian Shipping Companies who are members of the Conferences concerned should pursue this question further and try to persuade the Conferences to abolish the additional levies.

The Committee was informed that even though the local representatives of the India-U.K. Continent Conference had been posted in India, complaints from shippers were still being received regarding difficulties experienced in getting timely shipping space, particularly from Madras, Cochin, Vishakhapatnam and Tuticorin. Shipping interests were requested to take necessary steps to ensure that India's export trade to UK Continent was adequately and fully covered and whenever they were not in a position to provide shipping space they should grant immediately dispensation within 48 hours to enable the shippers to make alternative arrangement without losing their accumulated deferred rebate with the Conference. Mr. A. Ramaswamy Mudaliar on behalf of the Conference stated that difficulties regarding shipping space were being gradually resolved and he hoped that these would disappear soon. This complaint, he added, would not in any case figure at the next year's meeting of the Committee.

Earlier, the Committee considered various aspects of the working of Bombay, Calcutta, Madras, Tuticorin, Kandla, Vishakhapatnam, Cochin and Marmugao ports.

★★

Side by side, the trade representatives of Germany, Italy and Japan were discussing whether they should lodge a protest against what they alleged "Flag Discrimination" recently started by India. According to a Gazette notification of the Government of Goa, there will be three freight rates for the export of iron ore from that enclave. The floor price of 5.25 dollars per metric tons will be allowed to a dealer exporting cent per cent of his ore in foreign bottoms. He will be given 0.15 dollar rebate if he were to ship 20 to 30 per cent of his ore in Indian ships. This rebate will be increased to 1.20 dollars if he were to export 50 per cent of his ore in Indian ships. The following seven shipping companies are scheduled Indian companies which are eligible for the carriage of iron ore for the purpose of earning rebate: Shipping Corporation of India, Indian Steamship Company of Calcutta, Scindia Steamship Company, Abjee Lines and Surrindra Overseas, Great Eastern Shipping Corporation, Jayanti Shipping Company and Thakur Shipping Company. The notification issued from Goa lays down that the concessions will be available to persons who undertake to make the first offer to ship 20 to 30 per cent or 50 per cent as the case may be of the ore agreed to be sold to the shipping companies "at world competitive freight rates prevailing at the time of chartering or freight fixtures." The Gazette notification has a slight variation. It says "at international freight rates prevailing at the time of the shipping."

The Government has finally approved of the Russian Project Report on Heavy Electrical Equipment Plant to be installed at Hardwar. The Plant, when in full production will manufacture 1.5 million kw. of turbo generators, complete with

steam turbos of 50,000 to 200,000 kwt and 1.2 million kwt of hydro electric turbine of 10,000 to 100,000 kwt in addition to heavy and medium size A.C. and D.C. electric motors with total capacity of 1,500 kwt and starting and control apparatus for completing the turbo generator and hydro-electric turbines. For its speedy completion, the Government has agreed to import 75 per cent of the plant and equipment from Russia.

The following ten study groups have been set up in the Ministry of Heavy Industries to work out plans for machine making industries for the fourth Plan.

Electrical Power Equipment: Equipment required for electrical power generation, transmission and distribution, including thermal boilers, and heavy electrical equipment for electrical power utilisation, including large motors and electrical traction equipment.

Transport Equipment: Rail and road transport equipment, including railway rolling stock and commercial motor vehicles.

Steel and Metallurgical Industries Equipment: Equipment for steel plant and other heavy equipment for metallurgical industries.

Mining and Drilling Equipment: Mining, drilling and other equipment for coal, mineral ore and oil industries, including beneficiation of ores, and coal preparation and washing.

Fertiliser and Chemical Equipment: Equipment for fertilizer, petroleum refining, petro-chemical and other heavy chemical industries.

Machine Tools: Machine tools, including hand tools, small tools and heavy machine tools; welding equipment; pressing equipment; and furnaces.

Industrial Machinery: Equipment for cement, paper, sugar and other industries.

Textile Machinery: Equipment for cotton, jute, woollen, silk and artificial fibre industries.

With Apologies to God

From Our Correspondent

BOMBAY:

THE CHIEF Minister, Mr. Kannamwar, made a statement on the last day of the Monsoon session of the Maharashtra Assembly on the Naik Commission Report (on the Panshet Dam disaster). He admitted in the Assembly that the Commission had not stated in the Report that the disaster was due to an 'act of God.' It has been pointed out to the Government that the word 'no' occurring at a significant portion of the Report was an error. An official corrigendum was to be issued incorporating the correction. According to the Chief Minister, 'it is correct to say that the Commission has not said so in so many words in the Report.' What the Government intended to convey was that it had concluded that 'such was the purport of the report.' To remove the misimpression, the Government proposes to issue another corrigendum deleting the words 'and agrees with the Commission.' Replying to a supplementary question, the Chief Minister said that the report was printed actually five or six months ago. A copy was immediately passed on to Mr. Naik. He informed the Chief Secretary on the evening of September 23 about the mistake, that is, after it was presented to the Assembly. Whatever might be the explanation, it is obvious that the Maharashtra Government bungled the issue in presenting the case to the Assembly. It deserves congratulations for admitting and rectifying the errors.

According to Mr. Shriman Narayan, Member of the Planning Commission, the emphasis in the fourth five-year

Structurals: Structural, cranes, sluice gates and related items.

Engineering Industries: Items common to various industries such as castings and forgings, pipes and tubes, gears, ball and roller bearings etc.

The Study Groups have been asked, in their respective spheres to make (a) an estimate of the requirements of equipment having regard to the production programmes and investment in the sectors requiring such equipment envisaged during the fourth and fifth Plans, in so far as they are relevant to the establishment of capacity for the manufacture of such equipment during the fourth Plan, and (b) recommend the capacity and production targets for 1970-71, for each category of equipment, by type and by range, to the extent indigenous manufacture is considered feasible and desirable.

A Trade Delegation from Czechoslovakia has arrived here for preliminary negotiations on a new long-term trade agreement with India.

Mr. F. Hamouz, Minister of Foreign Trade of Czechoslovakia, who will be arriving in India in the latter half of October, will hold talks with Mr. Manubhai Shah, Minister of International Trade, for concluding the terms of the five-year trade agreement which is likely to be signed by them.

The trade between India and Czechoslovakia is expected to be of the order of Rs. 12 crores each way in 1963. As a result of the negotiations, it is likely to be doubled by the end of 1966.

Henley Cables India, Limited, which will shortly be producing in India quality AEI cables, has received an industrial expansion licence for the manufacture of winding wires and copper strips, at its factory at Poona. This plant is already producing rubber and thermoplastic cables for domestic and industrial use, multicore telecommunication cables and flexible cables and cords.

vided Rs. 85 crores of additional funds for State agricultural plans. The States had also been told that 'money need not be the limit for agricultural development.' It has been decided to import the necessary fertilisers to meet agricultural needs because of the production shortfall in indigenous production. Mr. Narayan furnished these details while he was addressing the Planning Forum of the Poddar College of Commerce & Economics, Matunga.

The new import policy had a mixed reception in Bombay. The established importers have been disappointed by the maintenance of the status quo because they had expected increased import quotas in view of an improvement in the foreign exchange position. The actual users had however welcomed the new policy since the benefits would be passed on to them. Some industrialists expressed the feeling that the Government should have considered at least the suggestions put forth by them for restricting or prohibiting the import of a number of items, the indigenous production of which is sufficient to meet the demand. The industrialists, in general, welcomed the decision not to liberalise imports by established importers. By pegging the imports of the actual users to meet their requirements of imported raw materials. Since the actual users are granted licences for the import of industrial raw materials only, the prices of consumer goods imported by the established trade would harden. The exporters are confused about the position of the export promotion schemes in the absence of any specific reference in the policy. Established importers are critical of the Government's failure to take note of a number of suggestions for liberalisation of imports submitted by them. Government, according to them, could have atleast allowed a token quota for the items which are essential but not manufactured in India. It should be noted here that the established traders had been subjected to a pruning of their quotas during the successive periods.

There is a likelihood of 'Bengal Deshi' being included in the barter agreement against import of stockpile of American long staple cotton. Trade and industrial circles consider this an unwise step. It has been pointed out to the Ministry of International Trade that any attempt to barter away Bengal Deshi in exchange for extra long staple cotton lying with the US Commodity Credit Corporation would be injurious to India's interests. While the stockpile cotton has been in American warehouses for more than ten years, the fancy premia fetched by the higher counts of yarns, particularly in

South, it was stated, were mainly responsible for the keen mill demand for extra long staple cotton, however old the stock might be. Barter deals are not normally struck for traditional items of export. It is relevant to note that the Government had actually rejected a trade proposal some years ago to export jute against the import of Syrian cotton on the ground that a readily salable commodity should not be shipped for anything other than foreign exchange. Bengal Deshi brings in foreign exchange to the tune of about Rs. 10 crores per annum. The export performance in the 1962-63 season was particularly encouraging. India was able to ship 330,000 bales valued around Rs. 12 crores. In spite of the fact that Japan continues to be the major buyer of Bengal Deshi, latterly America has been showing keen interest in this type of cotton. Under the latest quota, about 3,500 bales of Bengal Deshi have been sold to the USA. The total imports of Bengal Deshi into America during 1962-63 season were placed around 14,176 bales. The conclusion of a barter deal besides disrupting the present trade channels would ultimately reduce the foreign exchange earnings on India's export of Deshi cotton by weaning away some of the traditional buyers. So far there has not been a single instance of the Bengal Deshi figuring in a barter deal and it is to be hoped that wiser counsels will prevail with the Government.

The Gujarat Chamber of Commerce held its annual meeting on October 4. The President, Mr. Chandrakant Jagbhaiwala, welcomed the pragmatic approach adopted by the Union Finance Minister in fiscal matters and hoped that the Government would take steps to re-activate the capital market from the state of paralysis. The country had remained behind the targets of food production in respect of steel, fertilisers, sugar, cement etc. There had been a substantial shortfall in the utilisation of foreign aid particularly when the country was in the grip of foreign exchange shortage. The stagnation in capital market, rising price level, increasing cost structure, unutilised industrial capacity, slackening in the face of agricultural and industrial production, deteriorating employment situation and stringency in money market called for immediate attention.

Mr. Chandrakant Jagbhaiwala emphasized the urgency of ensuring better working of the public sector and said that the present performance had been very much behind schedule. He also expressed concern at the idle capacity in industries such as automobiles, bicycles, aluminium foil, steel ingots casting, soap etc. and believed that this anomaly needed correction.

Scraping the Barrel

CALCUTTA:

WHILE IT has been accepted on all hands that the supply position of rice in West Bengal will continue to be rather tight till the new crop (aman paddy estimated at four million tons) becomes available from December, the Chief Minister's blunt statement that the Government was not in a position to supply rice to more than 85 lakhs people through fair price shops did come as a shock. From the figures given by him, it would appear that half of the population of the State will have no alternative but to depend on the free market for its rice requirements unless of course, as the Chief Minister has advised, they take to wheat and potatoes, both of which are in abundant supply. The present excessive pressure on fair price shops has developed from the fact that the free market price of rice has been rapidly going up in the course of the past few weeks. In the meantime the number of cardholders

has enormously increased consequent on the Government's decision to make available sugar only to cardholders. Since cardholders can also take rice along with their sugar quota, with the sharp rise in the open market price of rice, almost all of them have started drawing their rice quota as well from the fair price shops. According to the Chief Minister nearly 90 per cent of the State's population of 370 lakhs have taken out ration cards and it is not surprising that the scheme of regulated rice supply has reached near-breaking point. The difficult situation in West Bengal has prompted the Centre to announce a fresh allotment of 10,000 tons to the State. This will afford some relief but the position will not markedly improve because the minimum requirements during the next two months are put at 40,000 tons. The hope that some supplies from Orissa will be available on trade account has receded because of the damage caused to parts of that State

The moving finger writes

IT IS ALL rather confusing. Mr. S. K. Patil wants Mr. Atulya Ghosh to be the next Congress President; Mr. Ghosh reportedly would cast his vote in favour of Mr. Lal Bahadur Shastri, and in case Mr. Shastri is unwilling to embrace the honour, Atulya Babu's vote, presumably, will go to Mr. Kamaraj. Mr. Kamaraj, it appears, would rather that Shastriji consents. In this game of musical chairs in reverse, the two odd men out seem to be Mr. S. K. Patil himself and Mr. Morarji Desai. If anything at all is clear it is that no Congress leader has so far indicated, either overtly or covertly, his choice for the one or the other as President.

But, of course, it is all too early yet and much water is bound to flow down the Jamuna before the image of Mr. Sanjivayya's successor takes shape. There is, of course, in every potential Congress President's breast an earnest desire to avoid an unseemly contest or even controversy — the snag is that the other fellow, unfortunately, may not agree to stand down. For the people the prospects are irritating rather than exciting. Considering that Congress politics and Congress administration are so thoroughly mixed up, the ordinary man — either as taxpayer or as citizen — is unlikely to enthuse over possibilities of prolonged confusion, if not chaos, in the affairs of the ruling party.

From a common sense point of view, the next Congress Presidentship ought to be confined to one of the "Kamaraj dozen" sent out of Government for undertaking high organisational responsibilities. Among the dozen, preference should naturally be shown to the top men in the Congress hierarchy. This should leave the stage to Mr. Morarji Desai and Mr. Lal Bahadur Shastri, with Mr. Kamaraj and Mr. Patil possibly in the wings. Since Mr. Shastri himself is generally assumed to be not only not keen on the Presidentship but is actually showing considerable reluctance towards being drafted, I just do not see why there should be any objection anywhere in the Congress Party to Mr. Desai being unanimously invited to become the next Congress President — provided, of course, Mr. Desai himself is not unwilling to function in that capacity. It is greatly to his credit that in the difficulties following the implementation of the Kamaraj plan, Mr. Desai has not only behaved with great personal dignity but has also shown himself to be in every way not only a wise leader but also a true soldier of the Congress.

★★

I must say that I have no sympathy for Mrs. Sucheta Kripalani. She became Chief Minister of U.P. through what are clearly false pretences and it is surely a reflection on her intelligence that it has taken her so long to realise that she has not become the leader of the Congress Party in the U.P. legislature in her own right. For her to complain at this stage of being dictated to in the selection of her colleagues is not merely naive but foolish. Surely she ought to have found out earlier that she had been made a cat's-paw and if she does not want to get too badly burnt, she had better take the only sensible as well as decent course open to her, which is to resign her Chief Ministership. Poor, unfortunate, U.P. has been mis-governed far too long by weak and divided administrations and its people have been made to pay grievously for this through lost opportunities of economic and social progress. It would be a continuing betrayal of the

interests of the people of that State if, in the name of the Kamaraj plan, ministry-makers and ministry-breakers were to be permitted perpetually to try to run and thereby ruin the administration from behind the scenes.

★★

The leader of the Dravida Kazhagam, Mr. E. V. Ramaswami, or EVR as he is widely known, was recently weighed by his followers against the required kilogrammes of onions. That this humble vegetable was chosen for the ceremonial, instead of gold or silver, might only have been partly due to the state of the DK coffers. Onion is stated to be EVR's favourite vegetable. One reason may be that onion is taboo to an orthodox Brahmin and since EVR is the fiercest and most durable of professional Brahmin-baiters, it is possible that he might have concluded that it was his moral duty to exalt the onion which Brahminism has condemned as lowly.

In the South there are two varieties of onions. In addition to the milder, big-sized kind, which is the sort commonly found in the North, but which is described as "videshi" onion in the South, there is also in those parts a local variety which is smaller, harder and much more pungent. EVR's favourite onion, no doubt, is this "swadeshi" stuff. If and when EVR's dream of a separate Dravidian State comes true, it will no doubt be the first act of high policy of the new State to ban the production, import, traffic in, or use in any form of "videshi" onion, while making the daily eating of the local variety compulsory for all citizens, Brahmins being required to eat double the ration.

★★

Miss Christine Keeler, as "The Economist" suggests, may have gone from British politics, but she has not yet departed definitely from the front pages of some of our national dailies. The blow-by-blow account of the Ward trial was splashed on the front pages of our papers with the tongue-in-the-cheek justification that the case had important political and social overtones and was, therefore, a matter of legitimate public interest. No such explanation can be pleaded in support of the exuberant reporting of the sordid story of Miss Keeler's (far from) private life with the black or white trash of suburban London which is being unfolded in her present trial for perjury. And yet, day after day, we find the press here unwilling to let go even the seamiest shred of pornographic piffle that could be scavenged from the proceedings of the court.

★★

Talking of "The Economist", there is a paragraph in its issue of September 28 on 'Indian Exchange Control' in which it is rightly suggested that investigation of suspected cases of under-invoicing should not be conducted in such a manner as to make foreign enterprise lose confidence in the fairness of this country's administration. This note quotes from an article written on similar lines in this journal ("Ordeal by Slander", 'Eastern Economist', August 9, 1963). My purpose in mentioning this is that, while quoting, "The Economist" does not refer to this journal by name but describes it as "one Indian newspaper". Apart from the fact that this is rather slovenly writing, I should have thought that, if a source is worth quoting, especially with approbation, as was the case on this occasion, it is worth being properly acknowledged as well.

V.B.

Trade Winds

RUSSIAN GOLD SALES

IN THE LAST week of September, the price of gold declined sharply in the London bullion market because of sales by the Soviet Union on the Continent. The lowest rate recorded was \$35.06 per ounce as against the Central Banks' gold pool price of \$35.07 to \$35.08 per ounce. For four months, the London Market had ruled between \$35.10—\$35.12 per ounce primarily because of the measures taken by the U.S. to stem the tide of deteriorating balance of payments and also attempts at increasing international liquidity.

It was in 1953 that the U.S.S.R. started sales of gold which during the last five years have ranged in value above or around \$200 million per annum. The table below shows that in 1961 Soviet sales were estimated around \$275 million which dropped to \$200 million in 1962:

SOVIET SALES OF GOLD (In millions of U.S. dollars)				
1958	...	...	...	210
1959	...	...	...	255
1960	...	...	...	200
1961	...	...	...	275
1962	...	...	...	200

No precise estimates are available as to how much gold has been unloaded by the Russians on the Continent (which will ultimately find its way to London — the most organised bullion market in the world) but it is believed that the volume is likely to be larger than in 1962 in view of the failure of Soviet agriculture in the current year and its anxiety to buy wheat from the U.S.A., Canada and Australia. There are reports that the U.S.S.R. has already bought wheat from Canada and Australia valued at \$600 million. The Russians have also asked for wheat from the U.S.A. to the value of around \$250 million.

It may be recalled that in October, 1960, there was a great upheaval in the gold markets of the world when the price of the yellow metal in the London market had reached \$40 per ounce. An agreement was then reached among the Federal Reserve Bank of New York and the Central Banks of Belgium, France, Federal Republic of Germany, Italy, the Netherlands, Switzerland and the U.K. to set up what is now popularly known as "the gold pool", which considered methods by which effective monetary control, with particular reference to the price of gold, may be maintained. The Russian unloading of gold on the Continent at four times the normal annual sales is likely to lower the price appreciably. In the absence of Russian sales, the tendency of the gold price has been to firm up on demand from industry, art and private hoarders; the pool has endeavoured so far to restrain an undue rise in gold prices.

The latest Annual Report of the International Monetary Fund has estimated that the total increase in the amount of gold available to the world (outside the Communist bloc) in 1962 was of the order of \$1,500 million, out of which production accounted for \$1,300 million and Russian sales for \$200 million. A large share of this supply made its way into private hoardings in certain countries where political and economic uncertainties existed and it was this continuous demand which had kept up the price of gold.

The Gold Control Rules promulgated in this country early this year had brought down the price of gold from Rs. 130 to Rs. 100 per 10 grams but the changes in the rules announced by the Finance Minister in the Lok Sabha on September 21 (and reported in "Eastern Economist" on September 27, 1963, on page 608) revived the demand for gold, leading to an immediate rise in price to Rs. 105 per 10 grams. According to the new rules, re-making of existing jewellery

of more than 14-carat purity is allowed but no sanction has been given for the making of new ornaments of more than 14-carat purity from primary gold. Currently, the price of gold ranges between Rs. 103 to Rs. 104 per 10 grams and the rise of Rs. 3 to 4 carries the uneasy implication that some goldsmiths might have created demand for primary gold by indulging in transactions in violation of the new Rules.

US LOANS FOR POWER PROJECTS

The Governments of India and the United States have concluded agreements providing for American loans totalling Rs. 24 crores to the Bandel, Cambay and Birsinghpur power projects. The three thermal power stations will add 665,000 kilowatts to India's installed power generating capacity.

These rupee loans have been made from the sale proceeds of U.S. agricultural commodities supplied to India under Public Law 480. The United States is financing the entire cost of the three projects. Earlier agreements have provided for loans totalling \$80 million (Rs. 38.1 crores) to meet the foreign exchange costs.

The Bandel power station is being constructed a short distance from Calcutta. Its four turbine generators will produce a total of 355,000 kW. The expansion and establishment of chemical, heavy and light manufacturing industries and rail-at Bandel. Power will also be supplied to a large number of irrigation pump sets. The 250,000 kW Cambay thermal power station will play an important role in stimulating the industrialization of Gujarat. In the initial stage the boilers will use pulverized coal, but provision is being made for future conversion to oil firing. The Birsinghpur project provides for the construction of a 60,000 kW power station at Madhya Pradesh, a region of abundant natural resources.

TRADE WITH EUROPE

The Indian Council of World Affairs recently sponsored a study of the latest economic and political institutional developments in the European Economic Community. The team, which was headed by Mr. G. L. Mehta and included Mr. H. M. Patel and Mrs. Dharma Kumar, was also asked to recommend the lines on which the further study of the impact of the Common Market on India should be conducted.

The team met a wide range of individuals and organisations connected with the EEC, the European Coal and Steel Community and the Commission of Euratom, in addition to meeting officials in London and Washington. According to its study, the problem of India's trade with the Community has two aspects; in the short run the possibilities of reducing tariff quotas, internal taxes, etc., must be studied. In the long run, and of India itself, may be more important in bringing about changes in the quantum and pattern of trade. The team discussed both these aspects with the Commission and with other interested parties; several useful points were made on individual commodities, though, of course, a systematic study of demand and supply conditions is necessary.

On textiles the team found that in many countries, and particularly in Italy and Germany the necessity for specialising in the higher types and leaving the cheaper varieties to the underdeveloped countries, was being widely recognized. "In Germany, the Government is clearly prepared for a fall in the production of textile industries, though this will naturally have to be handled with care in order to avoid sudden unemployment, or losses to the investors. While the supply of at least certain types of textiles in some countries of the Six may fall, the consumption will rise, particularly in the poorer countries of the Community where the demand for textiles still has not reached saturation point. For instance,

the team was told that in Italy the consumption of textiles is likely to rise at the rate of 5 per cent per annum. While these are hopeful factors, the continuation of restrictions on textiles and of competition from other areas, particularly Japan, must also be borne in mind. Also, the pattern of consumption may alter in favour of the finer varieties. As the GATT officials stressed, it is very important for India to work out exactly what types of textiles can be sold and what is the tolerable level of duty on each type. If the problem is broken up in this way, it would sound much more manageable than if the underdeveloped countries appear to menace the whole of the textile industry in Europe or to demand nil tariffs on all textiles.

Cup That Cheers

The demand for tea and coffee is also likely to rise as income increases. The German agricultural Ministry felt that the demand for both these commodities is likely to rise in Germany. But the very high internal duties on tea and coffee may keep the demand down. It is argued that tea in Germany is used mainly by the well-to-do, and even if the duty is taken off, the consumption would not increase very much. On the other hand, the revenue on tea is small, since the total consumption is still small, and could therefore be easily removed. But the Finance Ministry assert that they cannot remove the duty on tea without also removing the duty on coffee, and the latter step is impossible for revenue reasons. The abolition of duties on tea is also opposed by French coffee interests and German beer interests.

Also, the distribution system involving importers, packers, wholesalers and retailers raises the prices unduly and prevents the quantum of tea exports from rising. To some extent rationalisation of the system has been impeded by the differential duty on packaged tea; packaged tea pays a duty of 23 per cent as against 18 per cent on unpackaged tea. (And even when the duty on unpackaged tea is suspended, a 5 per cent duty will be levied on packaged tea).

The big question for Indian tea exports now is how they will be affected if import duties are suspended both in the Community and in the United Kingdom, as is now proposed. The Indian Tea Association representatives fear that the mutual lowering of barriers will, on balance, be dangerous to India. Consumption in the UK cannot increase much more, and the removal of the Commonwealth preference may divert some trade to other suppliers, such as Argentina, or even China; last year non-Commonwealth tea accounted for 8 per cent of total intake, but this share will increase. And in the Community, consumption of tea may not rise unless the internal duties are reduced. On principle, however, the team cannot object to any measure which removes discrimination between underdeveloped countries.

Outlook for Oilseeds

The growth of production of oilseeds in the Associated Overseas States is not likely to be very large. In fact a Commission official felt that some of these countries might even be persuaded to move from oilseeds to other crops, since the Commission was anxious that they should diversify their pattern of production. But the common agricultural policy on oils, which still has to be worked out, will undoubtedly discriminate in favour of producers in the Community and the AOS. The Six have agreed in GATT to make allowances for the interests of developing States, but they want special studies to be made, so that tropical fats can be encouraged, rather than temperate fats. Another problem is the discrimination against processed oils in favour of oilseeds. A member of the Commission himself pointed out that since the duty on processed oils was 15 per cent on the entire commodity, this amounted to a protection of 84 per cent for the oil crush-

ing industry. This is clearly excessive and India should press for the removal of this difference.

Jute textiles appear to be one of the very few commodities where India is very highly competitive; representatives of the Indian Jute Mills' Association in London felt that Indian jute could compete successfully with Common Market output even if the common external tariff of 18½ were applied. Here it is the import quotas in the various countries that are important. At present the Community imports around 16,000 to 17,000 tons of jute textiles per annum. The French have proposed to the Commission that quotas for jute imports should be 8,000 tons per annum for the Community as a whole. The team were informed that this proposal is unpopular with the other countries, but that nevertheless they are unlikely to dispute this point with the French.

The Germans have reinstated their industries after the War but with old machinery, while the Belgians developed their industry because they have some raw jute in the Congo. Even so, India's exports could increase. Not only the representatives of the Indian Jute Mills' Association but the GATT official too asserted that sales of jute goods, both in the UK and on the Continent, need not fall for the next ten years. In fact sales could be raised somewhat, if prices could be kept at a reasonable level. The monopolistic practices of jute associations, both in the UK and on the Continent, not merely keep Indian goods out but reduce the total demand for jute in the long run, since the high prices encourage consumers to use substitutes. Incidentally, officials in the Commission pointed out that it was difficult to get Pakistan and India to agree on a common jute policy.

Prospects for Ores

Mineral ores form one of India's main exports to the Community; unfortunately, in the long term the demand for some of these ores may not increase. The ECSC has invested 5 million dollars in prospecting for ore in Africa, and the Associated Overseas States are likely to grow in importance as suppliers of ores to the Community since there are good deposits in Guinea and other countries which have not been opened up as yet. The High Authority also felt that the demand for manganese ore as a whole would go down for technical reasons.

GATT representatives felt that there might be some possibilities for exports of crude steel by India. India should explore the possibilities of exporting crude steel to be finished in Europe.

India should also study the possibility of increasing exports of goods required in development projects in the Associated Overseas Territories, since the rate of investment in these areas is to be stepped up significantly.

During the British negotiations the Community had agreed to suspend or reduce, temporarily at least, duties on some of India's main exports, such as heavy jute goods, coir mats, and East India kips; on tropical goods such as cashew nuts, spices, sandalwood and lemon grass oil; and on handloom products and certain sports goods. The Indian Government has recently sent an aide memoire to the Commission asking that these concessions should be reconsidered as soon as possible in order to revive India's flagging export to the Community. The Commission is examining the memorandum and is expected to subject a detailed study to the Council. The Permanent Representatives will also examine the memorandum in general terms and then send it to a sub-committee. If the Permanent Representatives agree to the memorandum, it will automatically be passed when it is put to the Council. From the talks the team had with the Permanent Representatives of the Six in Brussels, it appeared that most of the Governments were favourable to the Indian memorandum in general.

There may however be some difficulties in obtaining a

October 11, 1963

comprehensive trade agreement soon, since the Commission is otherwise preoccupied. And even if a satisfactory comprehensive trade agreement is secured, this is only a preliminary step in the struggle to increase export earnings. It is essential to improve the supply of most of India's export commodities and to improve India's sales efforts in the Community. The weakness of India's export promotion measures was pointed out time after time in the Community. The team was frequently asked if the lowering of trade barriers would really make a significant difference, since even in those countries of the Six where tariffs are low, India's exports are not high; this is obviously a point worth examining in detail. The team was told that Germany gives aid in improving sales techniques; it was suggested that India should avail herself of such assistance. And apart from selling harder, India must produce more, including such agricultural commodities as oilseeds, since duties on tropical primary products will be small.

PATENTS AND PRICES

High prices of drugs and medicines, according to reports, is the primary reason for the amendment of the Patents Act, a Bill for which purpose is being drafted at present. The Development Council on Drugs and Pharmaceuticals had had this matter examined by two special committees, including one technical committee. Their report says:

"Though no detailed survey of actual prices of drugs in this country as compared to the relative prices in international market is made, it is a fact that indigenous prices of drugs are very high as compared to international prices. There are a number of factors contributing to this difference in prices but since these factors do not affect the cost of all the drugs to the same extent, it is difficult or rather impossible to arrive at a reasonably accurate figure of percentage difference that could be taken as applicable to all drugs. The price and cost structure of each drug will need to be separately examined and compared with respective figures in international market for arriving at a reliable conclusion whether the prices in India are justified on the basis of prevailing circumstances. Such data would also enable consideration of possible measures that can be recommended for bringing about a reduction in prices of indigenous drugs.

The factors which make up the cost of a drug can be grouped as under:

- (a) Cost of raw materials.
- (b) Manufacturing expenses including direct overheads.
- (c) Cost of plant as reflected in interest in block capital and depreciation.
- (d) General overheads and marketing expenses.
- (e) Interest on working capital.

One revealing fact that emerges from the examination of the raw materials usage is that the so-called indigenously manufactured drugs are in reality substantially dependent on imported intermediates and raw materials, and to the extent of this dependence, the cost of the finished drug includes the incidence of duty on the imported materials. The proportion and cost of imported materials that go into the cost of different indigenously manufactured drugs vary considerably but an attempt is made here to assess on a rough basis the extent to which the incidence of duty on raw materials could be expected to effect the price of the finished drug.

Cost of Materials

Depending on the scale of production, it is estimated that cost of raw materials would contribute between 60 per cent and 90 per cent of the total cost of a drug. For the present purpose, a figure of 70 per cent is taken. Also it has been observed from the raw materials figures that, on an average, the imported raw materials cost constitutes about 75 per cent of the total raw materials cost. On this basis, the incidence of duty on imported materials would contribute to the final cost of the drug to the extent of 15 per cent. If the imported components were to be only to the extent of 50 per

cent instead of 75 per cent, the relative figure would be 10 per cent. In other words, in a drug costing, say, Rs. 100 per unit, the contribution due to duty on raw materials would be Rs. 10 if the cost of imported raw materials were 50 per cent of the total raw materials cost, and Rs. 15 if it were 75 per cent.

Indigenous raw materials also being more expensive than in international market, account has to be taken of the reflection of additional cost in the final cost of the drug.

It can therefore be concluded that, if the prices of Indian raw materials were in level with international prices, and provided there was no duty on the imported raw materials, and assuming that all other costs were comparable, the cost of the drug would come down from Rs. 100 to Rs. 72.5. In other words, in the given circumstances, the cost of the indigenous drug would be higher by about 37 per cent. This figure would be proportionately lower where the cost of imported raw materials is more than 50 per cent of the total cost of raw materials.

High Overheads

It has been stated that cost of plant and equipment is about 35 per cent higher in India than in Europe and also that the overheads are high because the sale of production paratively poor productivity often offsets this advantage. In the above calculations, the committee have allowed 30 per cent of the total cost to cover all the remaining factors, and if it is assumed that the effect of these factors is to make drugs about 35 per cent more expensive in India as compared to Europe, than the contribution in the total cost of the drug would amount to 35 per cent of Rs. 30 namely, about 10.5 per cent. Taking this into account, it can be calculated that the cost of drug manufactured in India would be about 61 per cent more than the cost of drug in the European market. This figure is only approximately indicative of how much more expensive the indigenous drugs should be compared to the cost of drugs in Europe, in the stated circumstances. The actual figure in respect of each drug will, of course, be different to the extent that the influence of the factors mentioned above varies from the assumptions made.

It will therefore be safe to assume that in the case of drugs which are not exported to India at subsidized prices and where the efficiency of the process adopted in India is reasonably comparable to that abroad, a 60 per cent margin over the c.i.f. price should cover all the legitimate factors that increase the cost of production of a drug in this country. If the increase in selling price of a drug manufactured in India is substantially more than 60 per cent of its c.i.f. value it will need to be investigated whether the higher price is due to:

- (i) the drug being exported to India at subsidized prices;
- (ii) the efficiency of the process adopted abroad being much better than that adopted in India;
- (iii) the profits made by the local firms being substantially higher.

An examination by a cost accountant would reveal in such cases the exact state of affairs. The sub-committee would therefore recommend such an examination being undertaken when the local selling prices of drugs are 60 per cent higher than their c.i.f. prices. The Government should appoint a cost accountant to work with the Chairman and the Secretary of the Council.

MAN-MADE FIBRES

At the 24th Annual General Meeting of the Art and Art Silk Mills' Association, Ltd., held recently in Bombay, Mr. D. N. Shroff reviewed the trends obtaining in man-made fibre industry as well as in the world during the year ended September, 1963.

Referring to world production, Mr. Shroff observed that

October 11, 1963

in 1962 man-made fibre production has established an all-time record on world scale; the total production of man-made fibre was about 4 million metric tonnes, an increase of more than 10 per cent, higher than for the two previous years when the rate of increase amounted to 6 per cent. and 5 per cent. respectively. The output of man-made fibre has thus formed a quarter of the world supply in textile fibres in the year under review. Mr. Shroff said this increase in fabrics production was made possible, mainly, by a commensurate rise in man-made fibre production.

Conditions in the man-made fibre industry in India, too, confirmed to world trends. The production of viscose and acetate filament yarn recorded a further rise in the year 1962, thus bettering the entire record output of 1961. The rise in the output was of the order of 4.157 million kgs. from 23.408 million kgs. in 1961 to 27.625 million in 1962, i.e., an increase of 17.71 per cent. over the previous year's production. As regards the output of rayon fabrics there was a decline. In 1961, the production was 422.256 million metres whereas in 1962 it was 387.307 million metres—a decline of 8.99 per cent. over the 1961 production level. The fall in production of fabrics after a period of steady increase in the last four years, according to Mr. Shroff, was because of disruption in the working conditions occasioned by strikes in the weaving sector, the Chinese aggression, high prices and even shortage of yarn during the early part of the year.

Later, addressing the Ninth Annual General Meeting of the Silk and Rayon Textile Export Promotion Council, Mr. Shroff stated that the exports of rayon and synthetic fabrics during 1962-63 amounted to 77.8 million metres valued at Rs. 8.46 crores which showed an improvement of 10.7 per cent over the previous year and also surpassed the target of Rs. 6 crores set by the Council. Mr. Shroff observed that considering the various handicaps, such as non-issue of import licences in Morocco, ban on textile imports in Iran, trade restrictions in Ceylon, etc.—all of which are important markets for Indian fabrics—the export performance was no less gratifying.

INDO-SOVIET TRADE

The arrival recently of the 5,000th Soviet tractor to be delivered to this country highlights the fact that the Soviet tractors, models DT-14B, DT-28 and Belarus, have gained great popularity on our farms. Soviet tractors constitute about 20% of the total number of agricultural tractors working in this country.

Tractors are one of the items of the new five-year Trade Agreement covering the period of 1964 to 1968, signed in Moscow last June. After the conclusion of the first trade agreement in 1953 during the period of 1955-1962 the goods agreement between the USSR and India has increased more turnover between the USSR and India has increased more than ten-fold. As a result of the successful fulfilment of the three-year Trade Agreement in regard to the contingents of goods for mutual deliveries for the period of 1961-1963, the goods for mutual deliveries for the period of 1961-1963, the goods turnover between the USSR and India in 1963 will constitute approximately Rs. 100 crores (without deliveries of complete plants under credits). Under the new (third in succession) five-year Soviet-Indian Trade Agreement the goods turnover between the two countries will reach Rs. 200 crores (400 million roubles) by 1966. In other words, it will exceed the present level by more than two times.

The bulk of imports of Soviet goods under the Trade Agreement is machinery and equipment (55 per cent) including power equipment for the thermal power station in Patratu (Bihar) with the capacity of 400,000 kwts., for the hydro-electric power stations in city of 400,000 kwts. and in Balimela (Orissa) with the capacity of 360,000 kwts., building machinery including cranes, excavators, bulldozers, scrapers and also geological exploring and

drilling equipment, metal cutting machine-tools and other machinery. The remaining 45% of the value of the Soviet merchandise include pig iron, ferrous metal rolled stock, non-ferrous metals, oil products, chemical goods, paper and other goods.

The share of Indian industrial goods in the total Indian export to the USSR will constitute 50% (jute, cotton and woollen fabrics, leather footwear, handicrafts, coir goods etc.) The new items of Indian export to the USSR are bananas, oil cake, ground nuts, insecticides, razor blades, goods of engineering industry, etc. India exports to the USSR about 22% of its export of coffee, 20% of black pepper, 19% of castor oil, 12% of cashew nuts, 10% of shellac and 7% of tea.

The purchases of Indian goods are being increased by the USSR from year to year according to the steady increase in imports from the Soviet Union by India.

At the Indian exhibition held in Moscow this summer, the Soviet Foreign Trade Organization bought the samples of the new export goods of India worth Rs. 1.5 crores. About two million Soviet people visited this exhibition.

SUCCESS WITH SUGARBEET

Experiments conducted at the Indian Institute of Sugarcane Research at Lucknow have shown that Sugarbeet, which is a crop of the temperate areas, can be successfully cultivated in North India. Yields obtained at the Institute were of the order of from 15 to 20 tonnes per acre, and sugar content ranged from 14 to 17 per cent. There were indications that by employing improved techniques, the yield of roots can be increased to 25 tonnes per acre.

BRNO FAIR

More than 600 exhibitors from 44 countries from all parts of the world participated in the International Trade Fair, Brno (Sept. 8-22, 1963), which was visited by 30,000 persons from abroad. This year for the first time Burma, Ghana, Iran, Greece and Venezuela had official expositions at the Pavilion of Nations. India did not participate due to emergency conditions and necessity of saving foreign exchange, but a number of Indian delegations visited the Fair to participate in symposia and enter into business deals.

Trade negotiations took place particularly in the course of the second week of the Fair. A number of important contracts had been concluded between the foreign exhibitors themselves, about which it was difficult to collect data. The results achieved by the participating Czechoslovak Foreign Trade Corporations (14 of them exhibited 7,000 items) are claimed to have surpassed their own expectations.

ANUGA 1963

Anuga, the International Exhibition of Fine Foods and Provisions in Cologne from 21st to 29th September 1963 was marked by heavy international competition resulting from the participation of nearly all the food exporting countries. The further increase in the number of trade visitors out of the total number of visitors entailed successful to very successful business results of the German and foreign exhibitors. In all 244,300 trade visitors and other interested persons from 66 countries visited the exhibition at which 2,476 firms and organisations from 45 countries were represented in 14 halls covering an area of more than 140,000 sq. yds. At 11,820 the number of foreign visitors was 28% greater than at the last Anuga in 1961. Most of the visitors came from the EEC countries of Holland, Belgium and France; next in line were the EFTA countries Switzerland, Austria, Denmark, Sweden and Great Britain followed on the visitors' list by Finland, Italy, Norway and the USA.

Company Affairs

ELECTRIC CONSTRUCTION

ELECTRIC CONSTRUCTION and Equipment Company Limited entered the capital market with an offer of Rs. 12.50 lakhs comprising 12,497 (9.3 per cent taxable) redeemable cumulative preference shares of Rs. 100 each. The subscription list opened on October 7 to close on October 12. The company has an authorised capital of Rs. 3 crores consisting of 50,000 preference shares of Rs. 100 each and 25,00,000 equity shares of Rs. 10 each. The issued capital is Rs. 76.43 lakhs and the subscribed and paid-up capital is Rs. 64.11 lakhs. The company is engaged in the production of power and distribution transformers, electrical motors, starters and iron clad switches. The annual turn-over is around Rs. 2 crores. A new unit commenced production in November 1962 and it has another unit at Visakhapatnam which produces transformers, switchgears and lamps worth Rs. 66 lakhs. It intends to expand its transformer manufacturing capacity. The company has also set up a plant in Andhra Pradesh in technical collaboration with Veb Zahler-Und Apparatewerke, Berlin. The licensed capacity of this unit is 60,000 single phase meiers and 18,000 poly phase meters per annum. The production is expected to commence in the next few months. The proceeds of the issue will be utilized for financing the development of the above-mentioned transformer and switch-gear factory at Visakhapatnam.

ATUL PRODUCTS

The Board of Directors of Atul Products has decided to extend the period for receiving applications in respect of new right shares issued by the company up to October 31, subject to a condition that in addition to the application money of Rs. 50 per share an interest at the rate of 9 per cent per annum on Rs. 25 (payable on capital account) should be payable by the applicants for the period from October 1, 1963, to the date of actual payment.

BOMBAY DYEING

The request of the shareholders of the Bombay Dyeing and Manufacturing Co. Ltd. for participation in the capital structure of the chemical companies promoted by Nowrosjee Wadia and Sons (Private) Ltd., the managing agents of the company, has been conceded by the latter. It is now proposed to offer the shares of Herdillia Chemicals Ltd. on a firm allotment basis to shareholders of Bombay Dyeing. Herdillia Chemicals Ltd. was formed recently in collaboration with the Distillers Company Ltd., London, and Hercules Power Company, Wilmington, U.S.A., for the manufacture of petrochemicals. The company's authorised capital is Rs. 10 crores in shares of Rs. 10 each of which Rs. 4.40 crores will be issued. The foreign collaborator will subscribe for shares of the value of Rs. 1.80 crores. Out of the balance, shares of the value of Rs. 1.32 crores will be allotted to the promoters, their friends and associates and the balance will be offered to the public. It is proposed to issue, out of equity shares reserved for promoters, directors and their friends, one share of Herdillia Chemicals for every two shares held by the shareholders of Bombay Dyeing as on August 22, 1963. The allotment is subject to the condition that shares will not be transferable for a period of one year from the date of allotment.

MAFATLAL'S ISSUE

The directors of the Mafatlal Fine Spinning and Manufacturing Company Ltd. propose to increase the capital of the company by issue of 29,000 equity shares of Rs. 100 each, at a premium of Rs. 235 per share, so that each share will be priced at Rs. 375. This will fetch a sum of Rs. 108.75 lakhs which together with the company's existing resources will

meet the rupee finance required for a new project for the manufacture of fluorine chemicals. Navin Fluorine Chemicals Ltd., one of the companies of Mafatlal Group, has obtained a licence for the manufacture of synthetic cryolite, aluminium fluoride and sodium fluoride. Out of the 29,000 shares, 14,500 equity share for every four existing equity shares held and the balance of 14,500 shares will be made available for public subscription through a prospectus. The company is applying for Government sanction and will soon seek the shareholders' approval too.

NATIONAL AND GRINDLAYS

National and Grindlays Bank Ltd. celebrated its centenary on September 30, when the main component of this banking group completed its 100 years. The bank was registered on September 29, 1863, in Calcutta by a small group of British and Indian merchants under the name of the Calcutta City Banking Corporation which was changed to the National Bank of India early in 1864. It was this bank around which the latter alliances have grown. Starting from that year the titution was able to provide banking services for larger numbers. On December 31, 1864, the bank's total assets amounted to £328,736; today, they are more than £277 millions. In the first year of operation there were slightly more than 300 shareholders; at the end of 1962 the number was approximately 6,500. In contrast to the dozen or so members of the staff with which the Calcutta City Banking Corporation opened its doors in 1863, National and Grindlays today gives employment to nearly 10 thousand employees of all grades in 165 branches operating in a dozen countries and is official banker to four Governments. This is one measure of the progress which National and Grindlays is able to record on the historic occasion of its centenary.

BAJAJ AUTO

The directors of Bajaj Auto Ltd. stated in their annual report for the year ended March 31, 1963, that the company has been granted a licence to expand its manufacturing capacity from 6,000 scooters to 12,000 scooters per shift and to 18,000 scooters on double shift basis. The Government has sanctioned in principle import licence for capital goods of the value of nearly Rs. 49.65 lakhs and has directed the company to apply for the foreign exchange loan to the IFC or to the ICICI to cover the imports. The company has made an application to the ICICI for a loan of Rs. 70 lakhs of which the foreign exchange components will be about Rs. 50 lakhs. It is stated that every effort is being made to maintain the turnover and profit margin while the indigenous component is raised from the present level of 63 per cent to 85 per cent in the next eighteen months. Gross profit for the year under review amounted to Rs. 26.87 lakhs out of which a sum of Rs. 8.56 lakhs was provided for depreciation, Rs. 7.40 lakhs for development rebate reserve and Rs. 3.86 lakhs for taxes. The directors have recommended a dividend of Rs. 10 per every fully paid ordinary share of Rs. 100 and a dividend of Rs. 7 per every partly paid-up ordinary share of Rs. 100, which will absorb a sum of Rs. 5.20 lakhs.

STANDARD MOTORS

Mr. K. Gopalakrishna, chairman of Standard Motor Products of India Ltd. expressed considerable optimism with regard to the future of the company while addressing the annual general meeting held recently. The company has a plan to manufacture car bodies and will gradually achieve self-sufficiency to the extent of 85 to 90 per cent as far as foreign exchange is concerned. In a way, within the limits of the available foreign exchange, it will be able to increase its

production capacity. This development programme is likely to be completed by the end of 1964. To finance this expansion, the company proposes to issue fresh capital of Rs. 25 lakhs and the balance will be raised by way of loans. The chairman indicated that the manufacture of the four-door version of the Herald has been postponed due to extra cost involved and will be taken up when the press plant is installed and the prices are revised. The company has applied to the Government to revise the price of its car and allow a reasonable margin on the capital employed.

SOUTHERN STRUCTURALS

During the half year to June 1963, the Southern Structurals Ltd. earned profit of Rs. 9.48 lakhs, subject to taxation, after providing Rs. 2.32 lakhs for depreciation and Rs. 79,000 for development rebate reserve. The profit has been earned on turn-over of Rs. 98.19 lakhs, of which, the proceeds of the railways wagons account for Rs. 42.66 lakhs and those of structural contracts for Rs. 55.53 lakhs. The company expects a much larger turn-over in the coming months. In addition to the recent diversification in the company's activity covering railway wagons, steel structures, welded works etc., it is lately undertaking the building of cranes. It is at present engaged in building 15 units for the Madras Port Trust on behalf of Krupp-Ardelt of West Germany. The company has decided that the manufacture of wagon component should be advanced to the extent possible immediately. The wagon building programme has been kept fairly close to the estimates end on the structural side the company's capacity can reach a target of 9,000 tons per annum. The construction of the Avadi Heavy Vehicles factory has been making good progress, and this Rs. 108-lakh contract is likely to be completed before the end of the year.

TRAVANCORE TITANIUM

Travancore Titanium Products Ltd. proposes to increase its daily production of titanium dioxide from 10 to 18 tonnes. Titanium dioxide is mainly used as a colouring agent in the production of paints, textiles, soaps and rubber. Inaugurating the expansion programme recently, Mr. V. V. Giri, Governor of Kerala, stated that the State had the richest reserves of ilmenite, base material for production of titanium dioxide. The Governor stated that even under the expansion programme the production will be only 7,000 tons of titanium dioxide per annum which is far short of the country's requirements. The Kerala Government holds 73 per cent of the shares of the Travancore Titanium Products Ltd.

SHIPPING CORPORATION

The State-owned Shipping Corporation of India has made a net profit of Rs. 1.32 crores during the financial year 1962-63, as against Rs. 1.07 crores made in the previous year. According to the annual report of the Corporation released last week, cargo carried during the year under review improved further from 8.69 lakh tons in 1961-62 to 11.89 lakh tons. Over the same period gross earnings rose from Rs. 7.88 crores to Rs. 10.43 crores. In addition to the existing fleet of 29 vessels of 2.20 lakh grt, the Corporation expects to more than double its gross tonnage during the next four years. Already, orders for six cargo vessels have been placed with Hindustan Shipyard and orders for six more cargo vessels will be finalised soon. The Corporation has also placed orders for four cargo vessels of 11,600 dwt each for overseas trade to be built in Poland and one motor tanker of 33,600 dwt is already under construction in Japan which will be delivered in April next year. It is chartered for Caltex (India) for a period of ten years.

The Corporation has also plans to acquire two more super-tankers of 45,000 dwt and 53,000 dwt. The first one, which

EASTERN ECONOMIST

757

is expected to be delivered in October 1965 will be chartered for British Petroleum for Bombay-Persian Gulf route. According to Mr. C. P. Srivastava, the Managing Director of the Corporation, all the proposed expansion programmes which are subject to the Government approval would involve investment of about Rs. 30 crores to be spent over the next 8 to 9 years. The Corporation, he said, is confident of raising its own resources of about Rs. 20 crores and the balance would have to be met from a loan from Shipping Development Fund. Mr. Srivastava said that there were also plans to acquire some special carriers of 13,000 tons each from Yugoslavia.

HINDUSTAN ANTIBIOTICS

Hindustan Antibiotics Ltd., engaged in the manufacture of some vital drugs, has presented a rather encouraging record for the year 1962-63. There was a gross surplus before taxation of Rs. 139.6 lakhs which was nearly the same as during the previous year and consequently, it has declared a dividend of 6.25 per cent. The directors indicate that it has ploughed back during the last two years a sum of Rs. 1.7 crores from its own earnings for expansion and development. The company has exceeded its previous year's production by over 10 per cent and its output of vialled products was 40 per cent higher. The sales reached a new peak of Rs. 430 lakhs, which was the result of improved processing techniques and additions to the plant. The research laboratories of the company have continued their work on newer antibiotics and the year under review saw Streptomycin and Dihydrostreptomycin for the first time and recently it has set up a plant for the production of Hamycin, a new antifungal antibiotic at a cost of Rs. 30 lakhs. It has also set aside a sum of Rs. 8.5 lakhs to promote exports of these items.

BHARAT ELECTRONICS

Bharat Electronics Limited during its working for the year ended March, 1963 has shown better results in respect of production, sales and profits. The production target of Rs. 275 lakhs planned for the year was surpassed and production of the value of Rs. 302.74 lakhs was achieved as against Rs. 243.12 lakhs of the previous year. The sales realisation has increased by over 112 lakhs from Rs. 248.50 lakhs in the previous year to Rs. 360.65 lakhs during the year under review. It has shown a net profit of Rs. 46.86 lakhs after making a provision of Rs. 27.51 lakhs towards depreciation of assets and Rs. 5.44 lakhs for the gratuity scheme. During the year over 40 different types of electronic equipment were in production. The production of semi-conductors namely transistors and diodes also commenced. The production of radio receiving valves, ceramic and mica capacitors and piezo electric crystals were stepped up.

ALUMINIUM CORPORATION

While addressing the 25th annual general meeting of the Aluminium Corporation of India Ltd., Mr. Lakshmi Pat Singhania, its chairman, announced a Silver Jubilee gift in the form of bonus shares to be issued shortly to the existing holders of ordinary shares in the ratio of one bonus share for every four ordinary shares held. The consent of the Controller of Capital Issues has been obtained. The Silver Jubilee year has also seen the near-completion of the expansion programme. The new smelter started functioning from June, 1962, and has reached its full production capacity. The extension of the alumina plant is likely to be in full operation by the end of the year. Trials have already started on the extrusion plant which is expected to be in full operation within a month or two. The full benefit of these extensions and new products will, however, be available to the company only during the next financial year. The year 1962 has been of considerable importance to the industry as a whole. The chairman informed the shareholders that the production of

metals has jumped from 16,382 metric tonnes in 1961 to 35,313 metric tonnes in 1962 because of new plants and extensions of the existing plants coming into operation. He believed that consumption of the metal at the end of the third five-year Plan would be about 120,000 tons or even higher in view of the non-availability of other non-ferrous metals in the country. To meet this increasing demand, he exhorted that power, which is an important element in the production of aluminium, should be made available from bulk generating stations at suitable rates.

ARUNA SUGARS ISSUE

Aruna Sugars Ltd., Madras, propose to enter the capital market shortly with a public issue of Rs. 40 lakhs. The authorised capital is Rs. 2 crores and the issued capital is Rs. 85 lakhs. The present issue is for Rs. 55.63 lakhs. Of this promoters and their friends will take up Rs. 15.63 lakhs and the balance of Rs. 40 lakhs is being offered for public subscription in the form of 300,000 equity shares of Rs. 10 each and 10 000 cumulative preference shares (9.5 per cent) of Rs. 100 each. The entire issue has been underwritten. The company is setting up a sugar factory at Pennadam in the South Arcot district with a crushing capacity of 1,250 tons a day to be raised later to 1500 tons a day. The capital outlay on this project is expected to be at Rs. 168 lakhs. The factory is to go into production early in 1965.

INDIAN RAYON'S EXPANSION

Mr. Morarji J. Vaidya, chairman of the Indian Rayon Corporation Ltd., indicated in his statement accompanying the annual report that the company has completed the first phase of its programme with the recent commencement of production of rayon yarn at the rate of five tons per day. The company has been taking steps to attain its full licensed capacity of 10 tons of rayon filament yarn and 15 tons of sodium sulphate in addition to the present installed capacity of 25 tons of sulphuric acid and five tons of carbon disulphide. Orders have been placed in the USA for a plant capable of manufacturing 15 tons of rayon grade pulp from cotton linters. The US Export-Import Bank has sanctioned a loan of \$4.7 million for this purpose. The company has secured almost all licences necessary for its plans to manufacture helical spiral mould pipes. The idea of entrusting this project to a subsidiary company has now been given up and the company is considering alternative schemes. The Government has not yet taken any decision on the company's proposal to set up a staple fibre unit with the production capacity of 25 tons per day but the issue may be decided in the near future.

CAPITAL ISSUES

A Central Government undertaking, which is being set up, is among the five companies which have been authorized to raise capital aggregating Rs. 4.02 crores, says a Press Note.

Of the others, two are issuing part of their capital to their foreign collaborators, one of which will offer a further part to an Indian company. Two companies are offering a share of their capital for subscription by the public and two are partly issuing preference shares.

The consent of the Controller of Capital Issues is valid for 12 months in all cases.

The Minerals and Metals Trading Corporation of India Ltd., New Delhi (Proposed), a Central Government undertaking, has been given consent to issue capital of Rs. 2 crores divided into 200,000 equity shares of Rs. 100 each for cash at par to be issued privately. With this capital, a corporation will be established to organize and undertake the exports and

imports of minerals, ores and concentrates, metals, etc.

Shakti Insulated Wires Private Ltd., Bombay, has been granted consent to issue capital of Rs. 17 lakhs. Of this, Rs. 12 lakhs will be in equity shares of Rs. 100 each, Rs. 5,000 in 9.3 per cent cumulative redeemable preference shares of Rs. 100 each for cash at par. The new capital will be used for manufacturing cotton and paper covered, superenamelled and bare and bright annealed copper wires and strips.

B. R. Loiya Textiles Ltd., Nagpur, is raising fresh capital of Rs. 40 lakhs divided into 35,000 equity shares of Rs. 100 each and 5,000, 9.5 per cent cumulative redeemable preference shares of Rs. 100 each. All the shares will be issued for cash at par. Out of these shares the entire preference shares and equity shares of the value of Rs. 17.5 lakhs will be issued to the public by prospectus. The money is needed for manufacturing cotton yarn.

Frick India Ltd., Delhi, is to issue Rs. 25 lakhs in equity shares of Rs. 10 each at par. Of this capital, Rs. 12.75 lakhs will be subscribed by Frick Company, USA, and used for the purchase of plant and machinery. Shares of the value of Rs. 6,24,930 will be offered to the public for subscription and the balance to be subscribed privately for cash at par. The money will be used for the manufacture of industrial refrigeration machinery.

Mahindra Owen Ltd., Bombay, is to issue capital of Rs. 20,95,000 in equity shares of Rs. 100 each at par. Of this amount, shares of the value of Rs. 10,68,400 will be issued for cash to Mahindra and Mahindra Ltd., and Rs. 10,26,000 to Rubery Owen and Company Ltd., U.K. for consideration other than cash against the supply of plant and machinery. The money will be utilized to manufacture trailers of various types, axles and automotive parts.

LICENCES ISSUED

The following licences were issued under the Industries (Development and Regulation) Act, 1951 — during the week ending 28th September, 1963. The list contains the names and the addresses of the licensees, articles of manufacture and annual installed capacity.

IRON & STEEL CASTINGS

The Indian Smelting and Refining Co. Ltd., Industry House, 159, Churchgate Reclamation, Bombay-1 (Thana, Maharashtra) — Malleable iron castings (same capacity as, licensed earlier), change of location from Bhandup to Thana. National Rubber Manufacturers Ltd., Leslie House, 19, Chowringhee, Calcutta-13 (West Bengal) — Railway draft gears 3,300 Nos.

NON - FERROUS METALS

Kamani Engineering Corporation Ltd., Agra Road, Kurli
(North) Bombay-70 (Maharashtra) — "Zinc Ingots" (Sec-
dary Metals) 600 metric tons.

ELECTRICAL EQUIPMENT

Gandhi Electric Industries Private Ltd., 94, Meadows Street, Fort, Bombay (Maharashtra) — High voltage transformers up to 100 K.V. 50 Nos., Ignition transformers 120 Nos., Technical cottage transformers 60 Nos., Neon trans-

MEDICAL AND SURGICAL APPLIANCES

National Instruments Ltd., Jadavpur, Calcutta-32 (West Bengal) — Dial gauges 700 Nos., Sphygmomanometers 100 Nos.

INORGANIC HEAVY CHEMICALS

Premier Fertilisers Ltd., 150A, Mount Road, Madras-2 (Cuddalore, Madras) — Synthetic cryolite 540 tonnes. The Durga-

October 11, 1963

pur Projects Ltd., 10, Middleton Row, Calcutta-16 (Durgapur, Distt. Burdwan, West Bengal) — Alum 4,125 tonnes.

ORGANIC HEAVY CHEMICALS

Excel Industries Private Ltd., 184-87, Ghodbunder Rd.,
Jogeshwari, Bombay-60 (Maharashtra) — Oxalic acid 500
tonnes.

COTTON TEXTILES

COTTON TEXTILES

Kohinoor Mills Co. Ltd., Killick House, Home Street, Fort Bombay-1 (Dadar, Bombay, Maharashtra)—500 automatic looms for manufacture of cotton textiles. Davangere Cotton Mills Ltd., Davangere (Mysore) — 500 automatic looms for the manufacture of cotton textiles. Lakshmi Mills Co. Ltd., Avanashi Road, Pappanaickenpalayam, Coimbatore - 1 (Madras) — 500 automatic looms for the manufacture of cotton textiles. Birla Cotton Spinning and Weaving Mills Ltd., P.O. Birla Lines, Delhi-6 (Khurja, Uttar Pradesh) — 500 automatic looms for manufacture of cotton textiles. Madura Mills Co. Ltd., Madurai (Aladiyoor Village, Ambasamundram, Madras) — 500 automatic looms for manufacture of cotton textiles. Standard Mills Co. Ltd., Mafatal House, Backbay Reclamation, Bombay-1 (Dewas, Madhya Pradesh) — 500 automatic looms for manufacture of cotton textiles. Premier Mills (CBE) Ltd., Pulankinar P.O. Udumalpet, Coimbatore Distt. (Madras) — 500 automatic looms for manufacture of cotton textiles. Palani Andavar Mills Ltd., Udumalpet, Coimbatore District, (Madras) — 500 automatic looms for manufacture of cotton textiles. Kothari Textiles Ltd., Oriental Buildings, Armenian Street, Madras-1 (Singanallur, Madras) — 500 automatic looms for manufacture of cotton textiles. Shree Ram Mills Ltd., Ferguson Road, Parel, Bombay-18 (Maharashtra) — 100 automatic looms for the manufacture of cotton cloth. Kishin Chand and Co. (India) 55/57, Empire Building, Fort, Bombay-1, Proposed name: Kisco Mills (Maharashtra) — 48 automatic looms for the manufacture of cotton corduroy and velveteen. M.G. Corporation, 31, Forbes Street, Fort, Bombay (Khandwa, Madhya Pradesh) — 500 automatic looms for manufacture of cotton textiles. Shree Katteri Textiles Private Ltd., 422, Mettupalayam Road, R.S. Puram P.O., Coimbatore-2 (Veerapandy Village Tehsil Coimbatore District, Madras) — 12,000 spindles for the manufacture of cotton yarn. Jaya Shree Textiles and Industries Ltd., P.O. Rishra Distt. Hooghly, (West Bengal) — 16 Tape looms for the manufacture of cotton webbing. Premasukhdass Trilokibhushan, P.O. Sirsa, District Hissar, (Punjab) — 12,000 spindles for the manufacture of cotton yarn.

PORTLAND CEMENT

PORTLAND CEMENT
Kalyanpur Lime and Cement Works Ltd., 2 and 3, Clive
Row, Calcutta-1 (Banjari, Bihar) — Portland Cement 200,000
tonnes.

BOOKS BRIEFLY

Where Planning Pauses

The Bengal Peasant From Time To Time: By Tara Krishna Basu; Asia Publishing House; Rs. 14.

Democracy, Decentralisation And Development: By Henry Maddick; Asia Publishing House; Rs. 20.

The Strategy For Agricultural Development And Other Essays On Planning: By S. R. Sen; Asia Publishing House; Rs. 16.

Reviewed by **JOSSLEYN HENNESSY**

AN ECONOMIST concerned with agricultural or other planning in a developing country, or an administrator anxious to implement plans, will find sound sense in the excellent books of Dr. S. R. Sen, of the Indian Planning Commission, and of Mr. Maddick, who visited many developing countries to study field agencies at work. But to read Mr. Basu is to see Dr. Sen and Mr. Maddick in startling new perspective.

Mr. Basu, a delightful writer as well as an experienced sociologist, spent a year in Kanchanpur, a village which, although only 66 miles from Calcutta, is sociologically and economically in what would correspond to the Anglo-Saxon period in England. Development in England began in the Middle Ages because the town depended on the agricultural surpluses of the countryside; there was commerce and exchange of ideas and inhabitants between the pioneering enterprise of middle class traders and small manufacturers, and the rural dwellers, who provided slowly growing complementary markets for city products. Out of this cross-fertilisation there emerged, in the course of the centuries, the industrial revolution. By contrast, in Anglo-Saxon times, there were no towns and no entrepreneurs; there were only self-sufficient, subsistence level villages—like those of India today. Of India's population of 440 millions, 83 per cent (375 millions) live in 558,000 villages. Periodical drought apart, they grow enough food for themselves. India only needs food imports because the bulk of the peasants see no reason why they should grow a surplus to feed the cities.

Dr. Sen and Mr. Maddick seek ways whereby India's 558,000 villages can be dragged, in a decade or two, across a thousand years into India's planned, socialist, embryonic industrial economy. But to Mr. Basu's villagers, the emissaries of the world of Dr. Sen and Mr. Maddick—administrators, community developers, educationists—are as incomprehensible, and as to be feared, as Martians. Unfortunate that the villagers are, West and East are united against them. The casual Western observer is horrified by caste, which he rejects as inegalitarian, and by untouchability, which he condemns as serfdom. Sensitive after a century of Western criticism of their social structure, India's westernised political leaders make no effort to understand it, and they deceive themselves, and re-assure the purveyors of Western aid, by asserting that caste is crumbling under the impact of democracy. Mr. Basu shows that

the impact is superficial, and that, contrary to Western belief, the villagers do not see caste as a menace, but as giving them status—exactly what the British worker is seeking when he insists in "differentials". Caste and the institution of the joint family together constitutes an all-embracing system of social security adapted to the needs of a poor country. Nobody suggests that the system is perfect, but Dr. Sen and Mr. Maddick agree that evolution can come only by decentralisation of authority, and by enlisting the villager's active participation through Adam Smith's principle of self-interest.

Under the Plan, the whole trend is towards centralisation. The delays, corruptions, and large-scale waste of money at the Hirakud dam, for example, arose from the attempt to build it from Delhi. Dr. Sen insists that the provision of "wide-spread economic opportunities" and "ladders for advancement" are "essential" for progress. In India's traditional civilisation, with its communal resistance to any individual who, by adopting modern methods, threatens to become richer than his neighbours, the pioneer needs special encouragement. Instead, private enterprise is controlled more closely than in any country outside the Iron Curtain. The government controls capital issues (although this is not important now because the last budget's super taxes have, to the government's naive surprise and dismay, killed the capital market), exports, and foreign exchange transactions. The government licenses the setting up, extension, or change of location, of an enterprise, or even its mere production of a new article. It can prescribe prices, methods, volumes of production, channels of distribution, can prohibit an enterprise from reducing its output or capacity, can remove executives and put in its own appointees, without compensation. These controls are hard on medium and small enterprises, many of which are efficient low-cost producers, but their managers do not understand the law's intricacies and are easily over-awed by authority. On the other hand, the controls shield existing enterprises against competition from new entrants and have created controlled sellers' markets.

India suffers from her planners' obsession with physical investment. If the millions hitherto lavished on spectacular prestige projects had been spent on measures designed to protect the enterprising individual, to encourage the further spread of an exchange in place of a barter and subsistence economy, and to spread education, primary and technical, they could have helped to create the conditions pre-requisite for a speedier crumbling of caste and other barriers to the multiplication of wealth. As it is, direction from the top keeps alive the villagers' traditional ambivalent attitude towards government: helplessly, they fear and distrust Authority, and Mr. Basu lists examples of how all castes unite to gress, remain on paper.

Readers' Roundtable

STC AT LARGE

Sir, — It is reported that the State Trading Corporation will enter into the manufacturing field shortly. This calls for a review of the activities of this organisation which has come in for much criticism not only at the hands of the trade but also Parliament.

STC was originally established in 1956 even without obtaining Parliamentary sanction. Its monopoly dealings are a matter of concern. For instance, it is the sole distributor of cement in India and earns a commission of 60 nP. per tonne although it is described as a fifth wheel, the actual distributing work being done by established distribution agencies of cement manufacturers.

Several instances of profiteering by STC have also come

to light. The Estimates Committee of Parliament has adversely commented on STC's profiteering in cement. A recent memorandum of the Bengal National Chamber of Commerce and Industry has pointed out that STC's margin of profits on betelnuts is 187.5 per cent and in coconut oil 340 per cent.

The Government does not allow diversification to private companies although such diversification is in the interest of the nation in that production of wealth would go up and employment would increase. It is, therefore, surprising that a trading corporation of the State is allowed to enter into the manufacturing field.

The time has come for a thorough policy review of the State Trading Corporation's activities.

Bombay.

One Purchase Officer with a headache cut his inventory down from 30 products to only 8!

The Caltex "Stop-Loss" plan was the headache antidote... When each department in a plant specifies a lubricant it wants without reference to the purchases of other departments, there is bound to be a lot of waste and costly over-lapping. The Caltex "Stop-Loss" programme helps to eliminate this waste of lubrication by effectively reducing the total plant lubricant inventory. Caltex "Stop-Loss" is a complete plan for organising lubrication on an efficient basis. There is no other programme like it.

Find out today how Caltex "Stop-Loss" can specifically stop the problem in your plant. Help your operation to greater profit with the Caltex "Stop-Loss" Programme.

RECORDS AND STATISTICS

Banking in 1962: A Statistical Profile

AMONG THE several publications brought by the Reserve Bank each year, the Statistical Tables Relating to Banks in India contains information essential for policy making in commercial banks. The publication released this year on September 28 has several useful tables. It gives particulars of centres with deposits where more than two banks are operating. It is possible to find out from these statistics the deposit potential of each important town where more than two banks are operating. Similarly, the details on Indian banks' offices abroad and the correspondents would be found useful by the public especially those with overseas connections. A co-ordinated and full picture of the banking system can be formulated from the statistics made available in the Statistical Tables.

A regrettable feature of the publication is the enormous delay in its release. The balance sheets of banks for the year 1962 were released as early as March/April, 1963 and within another three months the position relating to 1963 will be out. Any publication which appears with considerable delay loses its utility and becomes a document of historical interest. It is essential for the Reserve Bank to realise that it should cut short the delay to the absolute minimum in such important publications.

Perhaps the most striking finding from an analysis of the balance sheets is the significant increase in the owned funds (capital plus reserves) of the Indian scheduled banks. In 1962, the owned funds increased by Rs. 8.6 crores in contrast to an increase of Rs. 2.7 crores in 1961. Even banks with reserves equivalent to deposits strengthened the capital structure in 1962 and 1961 to attain the 6 per cent ratio between owned funds and deposits prescribed by the Reserve Bank. In spite of such an endeavour, the capital base of all scheduled banks remained without any change (at 4 per cent). In the case of banks with total deposits above Rs. 5 crores but below Rs. 25 crores the ratio came down from 6 to 5 per cent. This occurred mainly because of the substantial increase in deposits during the year 1962. In 1963, there was a further substantial increase in deposits and it is possible that the equity/deposit ratio would show a fall instead of a rise.

Doubled Growth

The rise in deposits of scheduled bank deposits in 1962 amounted to Rs. 213.3 crores or more than double the increase (Rs. 95.5 crores) in 1961. The rise in bank credit was also higher at Rs. 162.5 crores than the increase of Rs. 103.4 crores in 1961. The credit/deposit ratio for all scheduled banks remained however unchanged at the close of 1962 at 70 per cent. In the case of non-scheduled banks it went down from 64 per cent in 1961 to 57 per cent in 1962. Investments in Government securities of scheduled banks, other than the State Bank of India, recorded an increase of Rs. 43 crores in 1962 as compared to a smaller increase of Rs. 17 crores in 1961; the investments on State Bank recorded an increase of Rs. 26.8 crores in 1962 as compared to a fall of Rs. 69.8 crores in 1961. It is necessary to note in this connection that the fall in 1961 was more apparent than real because it was due to the phased transfer of the PL480 and 665 deposits to the Reserve Bank of India.

The non-scheduled banks registered a further decline in deposits and loans mainly due to liquidation of some banks

and amalgamation of weaker units with bigger banks.

Among the foreign banks, the National and Grindlays Bank showed the maximum increase (Rs. 6.8 crores) in deposits and in number of offices (11) in 1962. The deposits of Chartered Bank went down (Rs. 2.4 crores) while the number of its offices remained the same at 10. The foreign banks, with few exceptions, reveal a static picture.

The co-operative banks showed sizable progress.

The Postal Savings Banks disclosed that the average outstanding balances at the end of 1962 amounted to Rs. 466.5 crores as compared to Rs. 431.4 crores at the end of 1961. The number of deposit accounts went up during 1962 by 2.7 lakhs to 94.8 lakhs. The average balance held by the depositor went up from Rs. 468 to Rs. 492 between end-1961 and end-1962. This shows that the savings bank accounts are gaining in popularity. This growth is attributable not only to the increase in number of post offices during the year but also to the stepping up of the rate of interest from 2½ per cent to 3 per cent.

Earnings Rise

According to the Statistical Tables, the earnings of scheduled banks recorded a further rise in 1962. This reflected an increase in the level of advances and investments. In respect of Indian scheduled banks, earnings from loans and advances went up by Rs. 10.8 crores (to Rs. 67.4 crores) in 1962 on the top of an identical increase in 1961. Total current operating earnings increased by Rs. 16.9 crores (to Rs. 120.2 crores) in 1962 in contrast to a rise of Rs. 10.9 crores in 1961. The current operating expenses recorded an equivalent rise (Rs. 16.7 crores) in 1962 as against Rs. 4.6 crores in 1961. It is interesting to note that the increase in expenditure exactly matched the rise in income and is indicative of the clever window dressing carried out by the bank managements during the year 1962. The interest paid on deposits went up by Rs. 8.2 crores due to the higher level of interest payments. This did not reflect any rise in interest rates as such because they were pegged by bank managements at the 1958 level through the Inter Bank Agreement but a higher level of deposits. The establishment expenses appreciated by Rs. 6 crores to Rs. 37 crores in 1962 and represented the implementation of higher emoluments recommended by the Desai Award. The profits of scheduled banks showed a nominal decline (Rs. 11 lakhs) in 1962 to Rs. 23.4 crores as compared to an increase of Rs. 6.1 crores in 1961. In 1961 also, the profits amounted to Rs. 23.5 crores — almost the same level as in 1962. This is again due to adjustment of profits by various banks. As a ratio of current operating earnings, the balance of profit showed a decline from 22.7 per cent to 19.5 per cent as compared to a rise from 18.9 per cent to 22.7 per cent in 1961.

The operating earnings of foreign banks showed an increase of Rs. 1.5 crores in 1962 in contrast to a rise of Rs. 2.3 crores in 1961. Such earnings in 1962 amounted to Rs. 21.8 crores. Thus they accounted for a sixth of the operating earnings of the Indian scheduled banks. The rise in current operating expenses in 1962 absorbed the rise in earnings in case of foreign banks also with the result that they showed the same level of profits (Rs. 4.7 crores) in 1962 as in 1961. The establishment expenses in the foreign banks went up by the negligible amount of Rs. 37 lakhs in spite of the opening of 11 new offices by the National and Grindlays Bank. This is

Individual well-being is linked with national prosperity and only planned efforts can ensure both in the shortest possible time. And planning, for its success, largely depends on savings, individual as well as national. Saving in the form of Bank Deposits provides resources for the National Plan.

United Bank of India Limited

HEAD OFFICE: 4, CLIVE GHAT STREET, CALCUTTA-1
with branches all over India and East Pakistan,
and correspondents in all important trade centres
the world over.

offers complete banking service

not surprising in view of the fact that the salaries in foreign banks are much better than those paid in Indian scheduled banks and the impact of the Desai Award must have been in consequence less severe.

Branch Banking

The number of offices of scheduled banks in the Indian Union increased in 1962 by 216 (to 4604) as compared to a rise of 246 in 1961 and 220 in 1960. In the first half of 1963, they increased by 160 offices. The number of offices of non-scheduled banks, as in the preceding year, continued to show a decline. The increase in the number of State Bank offices

in 1962 was only 56—in the preceding year the rise was 46—due to the 'slow down' policy adopted by the State Bank of India to digest the earlier progress. The major contribution to the expansion in branch network, therefore, came from banks operating in the private sector in 1962. According to the population Census in 1961, a third (1500) offices of scheduled banks were located in places with population less than 25,000. That means, the rest of two thirds were concentrated in places with population above 25,000. Non-scheduled and co-operative banks had 304 offices and 1383 offices in places with population less than 25,000 thus constituting 54 per cent and 64 per cent of the total number of offices operating in these areas.

TTK Thinks Aloud

THE A.I.R. announcer who at 8-30 p.m. on Friday last week asked listeners to stand by for an "important" broadcast by the Union Minister of Finance was not misleading them, although Mr. T. T. Krishnamachari, as it transpired, did not have any dramatic decisions to announce. His broadcast, however, was nonetheless significant. In fact, its importance was all the greater because it marked what was probably the first occasion when a Minister holding one of the most important portfolios in the Central Government found it desirable to go to the people and share with them his thoughts on how best he could discharge his vast and difficult responsibilities. From another point of view too the Finance Minister's broadcast was a landmark because it gave welcome evidence that the right to and responsibility of decision-making in the area of economic development will no longer continue to be dissipated among the amorphous mass of the Planning Commission, but is being restored to where it belongs, namely, the Council of Ministers at the Centre.

We have already noted that Mr. T. T. Krishnamachari had no specific decisions to announce, at any rate none which was altogether new. The proposals for the establishment of a unit trust or the enlargement of the functions of the Industrial Finance Corporation had been mentioned by him earlier. He had also given an indication on previous occasions that he was considering with the Reserve Bank the measures that might be taken to enlarge the availability of bank credit for productive purposes and it was only to be expected that this contemplated liberal and positive credit policy would be launched at about this time when the banking system should be getting ready to meet the requirements of the busy season. On the question of prices again, Mr. Krishnamachari had already expressed himself in Parliament during the last session on more or less the same lines as he did last Friday. Then, as subsequently, he had agreed with a section of opinion which is in favour of more intervention by the Government in the working of the normal trade channels. But on both occasions he has said that the regulation of distribution by the State cannot be successful without the active support and co-operation of the people and he had reiterated his belief that the discipline which went with the concept of the policy of the maintenance of stable prices can only be enforced by the Government if it has the strong backing of public opinion. There was, therefore, nothing that was exactly new that he had to say regarding the Government's intentions in terms of definite policies or decisions in the economic field, except that — and this is an important exception —, in the extremely sensitive and significant field of fiscal and related policies, he was able to give on Friday last an assurance that he would review those policies with reference both to the immediate needs of the economy as well as the requirements of growth and social justice in the years to come.

This part of the Finance Minister's broadcast will certainly be examined with great interest and expectation not only in the business world but also in a wider world where informed opinion is rightly conscious that any improvement in the living conditions of the people, any possibility of more employment, or any hope of more production is decisively dependent on more resources being mobilised and directed into industrial investment and industrial expansion. Mr. Krishnamachari, through a rather colourful and controversial political career, has always had his

critics, but even his worst detractors have never doubted his comprehension of economic forces or his instinctively dynamic outlook. He has always enjoyed a reputation not only for knowing his own mind, but also for knowing what he is talking about. That he is knowledgeable in both those senses is apparent from the following statesmanlike passage in his broadcast:

"There is reason to apprehend that the ability of the private sector to raise internal or market resources for substantial expansion of investment in the basic sectors of industries may not come up to the expectations in the Plan. It is often said that this situation is the result of pricing or fiscal policies. If that were so, it will be necessary to inquire whether these policies need modification, bearing in mind the legitimate requirements of both the public and the private sectors. If the present situation reflects inadequacy of resources in the aggregate for the tasks that we have set out to achieve, this fact too shall have to be taken into account in framing our future policies."

Surely nothing can be fairer than this. The Finance Minister has dared to look economic realities in the face. He has not tried to run away from the fact that the rate of increase in industrial production, notably of consumer goods industries, has been slackening, nor has he shied from the truth that it is the paramount need of the day to revive and stimulate economic growth. More important still, he has had the courage to see and state that the Government's fiscal and other related policies may have had something to do with the slowing down of the economy and that they will, therefore, have to be reconsidered if the economy is to be helped to grow faster.

While it is true that an ounce of performance is worth more than a ton of promise, informed opinion is sensible enough to realise that the Finance Minister

Truth and the Planning Commission

WE HOPE we are not flattering ourselves or the Prime Minister when we claim to have noticed a healthy change of tone in his recent pronouncements on the way this part or that of the Government has been functioning. There was a time when Mr. Nehru seemed disposed to claim that the Government of India, as run by him in the name of the Congress, if not in the name of Avadi, was a case of all being for the best in the best of all possible worlds. It had become a habit with him to rush to the defence of the Government of India and all its works at the slightest criticism or complaint from any quarter of any aspect of its working. But lately we have come to sense a greater receptivity and a larger responsiveness on his part to public feelings about the lapses and failings of the Administration and its agencies.

It is certainly an unusual thing for the Prime Mi-

nister should necessarily be free to choose the time and the manner of carrying out his intentions of reform of Government policies. Especially as Mr. Krishnamachari is not the man to let "I would" wait upon "I could", the intention, in his case, may be taken as nine-tenths of implementation. What remains is how precisely he is going to carry out the process of stimulating investment and industrial expansion, of the paramount need for which he has declared himself to be fully convinced.

Finally, tribute must be paid to the high statesmanlike quality of the grand conception of the Finance Minister's statement. Somewhere in his speech he has asked that there should be less wishful thinking. He himself has wrought manfully to this end by attempting to destroy the superstition that the objective of a socialist pattern of society or a programme of planned economic development is in some mysterious sense inconsistent with seeking to stimulate and reward individual initiative and enterprise or provide a proper economic climate for the growth of industry and the revival of investment activity in the private sector. Mr. Krishnamachari has pointed out that the concept of positive socialism essentially means that, while there should be an enlargement of opportunities for all, the weaker and vulnerable sections of the community have a special entitlement to some measures of social security as well as special facilities for individual betterment. He has also explained that, while the needs and aspirations of every section of the community will have to be met, this could be done only if it is accepted that, in the field of financial and economic policy, the Government's clear purpose must be, first and foremost, the realisation of rapid economic growth. This is a daring test for the Finance Minister to formulate for himself but we are confident that he has sufficient daring too to go through with it. We wish him success and pledge him support by results.

nister to have said, for instance, that our national science laboratories are not paragons of their kind. In the worst days of the solar cooker he would not only refuse to admit that anything could be wrong with the manner in which scientific research was attempted to be run in this country, but he made no serious attempt even to find out whether there was any justification for the doubts and fears that were being expressed. But a few days ago, while inaugurating the 50th session of the Indian Science Congress, he spoke against the national waste involved in the mismanagement of scientific research by the Government in a way more vehement than the fiercest critics of our national scientific laboratories had ever adopted. Although he spoke with a formal politeness of the "creditable work" the laboratories are supposed to have done, "especially during the emergency", he left his hearers in no doubt that he was profoundly dissatisfied with what he called

"the governmental way of working" of scientific institutions. He said that, although the national laboratories had done some useful work, all was not well with their working; they had been functioning for ten or 15 years but still important posts had remained vacant for years. All this made good listening, but the unfortunate part of it all is that, having thus unburdened himself, the Prime Minister is likely to forget all about it with the result that the same old state of affairs will go on and on.

It is to be hoped that, at least in the case of the Planning Commission, of the functioning of which too he has been speaking critically on recent occasions, the Prime Minister's public agreement with the wide dissatisfaction felt about the constitution and working of that body would have set in motion influences and trends which would result in the necessary reform. On the same occasion when he delivered himself of the strictures against the science laboratories, Mr. Nehru also referred to the Planning Commission as another agency of the Government where the departmental pattern of working had led to the enthronement of obstruction and stagnation as the twin principles of all governmental activity. On an earlier occasion, while introducing to the Planning Commission its Deputy Chairman-designate, Mr. Asoka Mehta, the Prime Minister reportedly deplored the fact that the Planning Commission had come to lose its dynamism and expressed the hope that Mr. Asoka Mehta would be able to mend matters in this respect. Quite understandably, this observation seems to have created some heart-burning.

It would be natural, for instance, for Mr. Gulzarilal Nanda, who certainly has been a dedicated Deputy Chairman of the Planning Commission all these years, to be told now that he has had to be succeeded by somebody else in order that the Planning Commission might become once again dynamic. It is obvious, however, that the Prime Minister himself would not agree to or like such an interpretation being given to his remarks. That is perhaps the reason why at his press conference last week he was anxious to counter the impression that he had been criticizing the value of the work done by the Planning Commission. Mr. Nehru was at pains to make it clear that he was not critical of the work of the Planning Commission but rather the procedures it employed. More and more things were being referred to it by the ministries. Planning itself was a difficult job in all circumstances and it became peculiarly difficult in a federal state such as ours since it involved discussions at various levels. He thus tried to make it out that what he had in mind was to point out the weaknesses in procedures and functioning. The Planning Commission, he said, tended to follow the bureaucratic routine which necessarily delayed work.

The Prime Minister undoubtedly was right in em-

phasizing the procedural aspect. It is conceivable that, with better organisation, considerable administrative simplification, higher standards of competence in individual officials and the right kind of leadership which imparts a sense of urgency to its working, the Planning Commission may evolve into a more satisfactory agency. But it would be an over-simplification of the problem to say that what has gone wrong with the Planning Commission is only its procedure. On the contrary, it is possible to argue that mainly at the technical level the Planning Commission has been doing an exceedingly fine job. It has been claimed with some justification that it has succeeded in setting up from scratch a national apparatus of economic and social planning which could be a useful model to other developing countries. What is really important, however, is not how well or how badly the Planning Commission has done its work in a narrowly technical or organisational sense. Undoubtedly it has created an institution where none existed before for the framing of Planning concepts and policies. And, on the whole, it has done this job in a responsible and informed manner, sedulously collecting data and analysing and making meaning out of them.

What would be more to the point, therefore, is to quit quarrelling with its procedures merely but ask some basic questions about the place it has been permitted to assume in the actual working of the Government in

Eastern Economist 20 Years Ago

OCTOBER 15, 1943

I understand that an Ordinance is shortly to be issued—probably the last of Lord Linlithgow's Ordinances—which provides for the prevention of hoarding and profiteering. It is intended to set up machinery throughout the country for regulation of prices and sales. Under the Ordinance the Central Government will have the power to fix the maximum quantity which any dealer or producer can keep or sell to any one person and also fix the maximum price or rate which may be charged. There are also restrictions on the quantity which any particular person can keep in his possession. The Ordinance is intended to cover all articles other than foodgrains, but provision is made in the Ordinance for notifying the article or class of article which will be controlled in this manner. As this is the first all-India attempt to prevent hoarding and profiteering and regulate civil supplies, its working will be watched with interest. A separate Controller-General in the Civil Supplies Department will be in charge of this measure.

the economic sphere. To the extent Mr. Nehru's dissatisfaction was confined to procedures, he was finding fault only with the symptoms, or at the worst, the secondary complications. The primary malaise is something different. It is the concentration of political and economic power without responsibility in an authority which in its basic structure and personnel has been singularly unfitted to exercise it properly. Through a process of default the Planning Commission has been allowed to convert itself from an advisory body expected to operate at a broad or even remote policy-making level into a semi-political, semi-governmental busy-body, interfering with the Central Ministries and State Governments in the making and administration of detailed policies.

The Prime Minister blamed the federal character of our Constitution for some of the burdens and obligations with which the Planning Commission finds itself encumbered, but it is the very process which the Planning Commission has deliberately adopted for its own evolution which has amplified and, in some cases, even created these burdens. Thanks to the role which the Planning Commission has assumed as an arbiter in all development matters, the sense of responsibility which State Governments must feel in such areas as Agriculture, Education and Health has been steadily whittled down to the point of virtual disappearance. The Planning Commission in one sense is the victim of centralisation of functions and concentration of authority; but it has also been the conscious architect of that concentration and centralisation alike. Today there is general recognition that development expenditure in agriculture has been largely unproductive. There is also national concern about the deterioration in educational standards. While education has spectacularly progressed in quantity, it seems to have deteriorated sharply in quality. It cannot, of course, be claimed that the failure either in education or in agriculture can be attributed to any one factor, but an important part of that responsibility must certainly belong in a state of affairs in which the sense of accountability of State Governments has been eroded through the steady aggrandisement of initiative and decision-making by the Planning Commission acting as the sole custodian of the nation's interests in development.

The answer to the Prime Minister's complaint that the federal character of the Constitution has slowed down the working of the Planning Commission simply is that it is not the federal character itself, but the lack of respect for the federal character and the process of constant violation of that character which is the root cause of the trouble. We do not know how much dynamism Mr. Asoka Mehta will be able to bring with him, but it is clear that unless an attempt is made by Mr. Mehta or somebody else to face honestly the need for a tremendous decentralization and delegation of responsibility,

which would make State Governments directly and largely responsible for development in considerable areas of economic and social planning, the plea of the federal character of the Constitution is bound to recur like King Charles' head whenever the inadequacies of the Planning Commission come to be discussed. It has been suggested that the Planning Commission should quit occupying the entire Yojana Bhavan on Parliament Street, New Delhi, and that it should move high-powered high-level advisory groups to State capitals where a flexible liaison could be maintained between the State administrations and the Central agencies without the former becoming irresponsibly dependent and the latter becoming obstructively overbearing. Whether this particular treatment is the answer to the problem or not is a matter to be examined, but what is not in doubt at all is that a point has been reached where the main reason why so little is being done at the State level in many parts of the country in vital areas of development is because the Planning Commission seems to have not only discouraged State responsibility but seems to have fostered the idea that even if State Governments might be blamed occasionally when things did go wrong, it would normally be not expected of them that they should do things right.

With the Central Ministries too the Planning Commission seems to have evolved a pattern of relationship which is the enemy of positive and constructive activity. The Prime Minister's Chairmanship of the Planning Commission has not infrequently been criticized as an undesirable arrangement. There is certainly one important argument against it. The Prime Minister's Chairmanship has given the Planning Commission a prestige and an appearance of over-riding authority and omnipotence which have been exploited in a way which has been more improper than proper. As a result, over the years, the Central Ministries have been gradually losing their legitimate rights to discretion and judgment in matters which are within their clear jurisdiction. This trend has been encouraged by the unfortunate tendency among Ministers and Ministries to resolve their disagreements by an appeal to the Planning Commission as mediator. The Planning Commission, like the monkey in the story of the quarrelling cats, has undoubtedly benefited in the process, especially because, apart from ideological clashes, there has been so much personal rivalry and personal antagonism among Ministers that the encouragement to the Planning Commission to concern itself with the everyday conduct of the Government has been enormous.

In fact, the Planning Commission should, in the circumstances, be justified in claiming to be surprised at its own moderation. Again and again, in instances without number where decisions on details of administrative action could and should have been taken through discussions among the Ministries concerned, it has been

a constant practice to invite the Planning Commission to resolve disputes or pronounce verdicts. In fairness to the Planning Commission it must, therefore, be said that if the Central Ministries or some Central Ministers now feel that the Planning Commission has tended to be ubiquitous in the interest it has been showing in detailed decisions, they have largely themselves to blame. One result is that today the Central Ministries are so bemused that in many cases they seem to have got into the habit of referring to the Planning Commission for orders matters with which that body could have no conceivable concern at all.

It is possible that this unfortunate state of affairs can be effectively remedied only if the advisory status of the Planning Commission is emphasized through some such spectacular step as the formal relinquishment by the Prime Minister of its Chairmanship. It may also be necessary that other Ministers too should cease to be regular members of the Planning Commission, while retaining the opportunity to attend meetings of the Commission as invitees. It is, of course, true that the position of the Finance Minister is a peculiar one in that co-ordination of economic policies is as much a function of his portfolio as it may be an obligation falling within the advisory jurisdiction of the Planning Commission. Some formula should certainly be found to accommodate this situation. But it may be pointed out, for the time being, that the Finance Minister could cease to be concerned with most of the work of the Planning Commission if that work itself is so defined and delimited that it is purely advisory and is strictly limited to the broad formulation of the general concepts of Planning and the Plans.

We have said that the association of the Prime Minister with the Planning Commission as its Chairman has given that body an excessive authority which is not for it to use and which it has used improperly rather than properly. But, while it has been over-weighted at the top, it has also been distressingly anaemic in the limbs. The presence of too many weak and unqualified people has always been a serious defect in the membership of the Planning Commission. This is one of the reasons why despite the excellent technical work done at certain levels in its secretariat, the Planning Commission has not been able to command in the country esteem for its competence and trust for its leadership to an extent which might otherwise have belonged to it. It is a clear mistake to treat a body of this kind as a convenient dumping ground for retired civil servants or rejected politicians. Youth may not always be pleaded as a virtue but age after a point must certainly be demonstrably meritorious. The title of a vague political background is even less sound as a claim for positions which must necessarily go to those who have the special aptitudes and training for the jobs they will have to do. It has been an unhappy experience

in this country that in the selection of the members of the Planning Commission from time to time sound principles of recruitment have been more often disregarded than respected. This is because, from the very beginning, the Prime Minister particularly seems to have had no clear conception of the kind of Planning Commission the country must have.

It is to be hoped that, at this critical stage in the progress of the third Plan and in the economic affairs of the nation, a bold approach will be made to reconstitute the Planning Commission into an effective working group of fresh and active minds, positive in their practical attitude to economic development and with a sense of urgency about industrializing the country and improving the living conditions of its people. Although the Prime Minister himself may like to have it that his criticism of the Planning Commission relates only to its procedures, the public is bound to draw its own conclusions from the fact that the timing of his critical observations has coincided with the recognition, both within the Government and outside, of the truth that the implementation of the third Plan has been unsatisfactory in many important areas of development and that as a result, the national economy is tending to stagnate just at a time when it has become more important than ever that there should be more agricultural production and more industrial activity, not merely for the prosperity of the people but for their very security.

"It will receive the attention of the authorities as soon as Lucknow Power Crisis ends."

Highlights of the Week

TTK ON HIS TASK

THE FINANCE Minister, in a broadcast to the nation on October 11, pledged himself to an economic and financial policy which would "serve first and foremost the requirements of rapid growth."

The following is the text of Mr. T. T. Krishnamachari's talk:

"It is now nearly six weeks that I assumed my present responsibility in the Union Cabinet. Financial and economic policy directly affects every citizen of the country. To discharge my responsibility adequately, I must enter into the needs and aspirations of every section of the community. Equally, I must tell you what I think of the economic realities that confront us as a nation and as individuals. Only so can we create an environment of mutual responsiveness between the people and the Government. It is in that spirit that I propose to share with you a few of my ideas on the current state of the economy.

"Most of us in this country are now agreed on the basic objectives of social and economic policy. They can best be summed up shortly 'Socialism,' and 'Planned development' towards that end. Planning for growth, for more food and fertilisers, for more schools and hospitals, for more steel and other materials of essential production—this is the only way in which we can lift the burden of poverty and want. Financial and economic policy has to serve first and foremost the requirements of rapid growth. At the same time, the way in which we seek to achieve this growth must not be inconsistent with the equally vital objective of achieving a socialist pattern of society.

Socialism and Enterprise

"The word 'Socialism' has come to mean 'all things to all men.' In fact, it is rapidly on the way to being debased. To me, however, socialism is real and positive. Its main accent is on performance as distinguished from privilege, on the enlargement of opportunities to all, irrespective of class, caste, inheritance, social status and the like. To some socialism appears to be synonymous with restraining the individual from exercising his initiative. To me, however, socialism, far from curbing the individual, seeks to stimulate and reward individual initiative and enterprise. But this enterprise has to be in the social interest rather than in the direction of promoting dynastic and monopolistic tendencies. Positive socialism of this kind cannot be achieved by mediaeval thinking. There must be a readiness to accept desirable social and institutional changes and to subject all our value judgments to the test of reason, science and social purpose. All these different ingredients that I have mentioned, namely, reward for work and merit, acceptance of change dictated by rational and scientific considerations as well as care and concern for the weak and the needy are essential in a positive and dynamic concept of socialism which seeks to create a society with hope for all and want and fear for none.

"We have a long way to go even to approach this idea. More than sixteen years ago, on the eve of our Independence, our Prime Minister recalled that the ambition of the greatest man of our generation was to wipe every tear from every eye in India. But even Jawaharlal Nehru, with all the support he can command from the people, cannot banish poverty and want in a decade or two. But however difficult the task, it must be pursued steadily with determination and mutual goodwill.

"Right now, the picture that our economy presents is

hardly one of adequate growth. Over the first two Plan periods we achieved a compound rate of growth of about 3.5 per cent per year. This was at least more than the rate of growth of the population. But during the last two years, the rate of growth has been even lower than before and we are hardly keeping pace with the growth of population. To some extent, this might have been due to bad weather conditions which have affected agricultural production. But there has also been a slackening of the rate of increase in industrial production—notably of consumer goods industries. These point to what is the paramount need of the day, namely, to stimulate economic growth all round.

Optimistic Assumptions

"To a certain extent, we would be justified in expecting that the economy will turn the corner on its own momentum since the setback in the past has not been of a basic nature. The crop prospects this year, for example, are good and the capital market is showing glimmerings of a revival. In the industrial field, new capacity will come into being as a result of past investments and there has lately been or is likely soon to be a significant improvement in regard to supplies of basic materials or facilities such as power, transport, raw cotton and raw jute as well as steel and fertilisers. Some of the measures we have recently taken, such as the grant of additional assistance to the States for accelerating programmes of agricultural and power development, larger foreign exchange allotment for import of fertilisers and the like should produce results in time.

"While we may expect some improvement in regard to production in the coming months, it is, I think, clearly necessary to take further measures to quicken the process of expansion. The demand for credit, for example, in the coming busy season must be adequately met. While fortunately, the banking system is in a better position to do so now than last year, they might still need support and assistance from the Reserve Bank. I have been in touch with the Reserve Bank and I am happy to say that the Reserve Bank proposes to pursue a liberal and positive policy designed to meet credit demands for all productive purposes though the Reserve Bank cannot be expected to relinquish its vigilance over speculative and other unhealthy tendencies. We should remember, however, that in our monetary structure, unhealthy tendencies are encouraged not merely or even primarily by bank credit. There is, in our system, a considerable amount of unaccounted money which is used essentially for speculative transactions and more especially in commodities. In devising suitable instruments of monetary control we cannot lose sight of this major factor.

"Apart from credit requirements, the problem of industrial growth in the short run is one of availability of materials and components. As I have already said, internal availabilities in this regard should show an improvement in the coming months. As regards imported components and materials, we have been able to bring about some improvement as a result of greater availability of non-project assistance from friendly foreign countries and the upward trend in our exports. Nevertheless I am not in a position to hold out any promise of significant liberalisation of imports in the near future, since our underlying reserves and payments position continues to remain difficult. What is more, the requirements of defence would also continue to impinge on our balance of payments till such time as defence production gathers substantial momentum. Altogether, therefore, it is only by vigorous import substitution and promotion of exports that we could

hope to increase substantially the availability of materials and components required for our industries.

"Looking a little beyond the immediate requirement of credit or materials, the rate of growth of industrial production could not be raised on a sustained basis without a significant revival of investment activity. It is my hope that some of the measures we are proposing to take such as the establishment of a unit trust and the enlargement of the functions of the Industrial Finance Corporation would help in this direction. There is reason to apprehend that the ability of the private sector to raise internal or market resources for substantial expansion of investment in the basic sectors of industries may not come up to the expectations in the Plan. It is often said that this situation is the result of pricing or fiscal policies. If that were so, it will be necessary to inquire whether these policies need modification bearing in mind the legitimate requirements of both the public and the private sectors. If the present situation reflects inadequacy of resources in the aggregate for the tasks that we have set out to achieve, this fact too shall have to be taken into account in framing our future policies. It is my intention to review the present fiscal and related policies with reference both to the immediate needs of the economy as well as the requirements of growth and social justice in the years to come.

Prices Problem

"Perhaps the problem that concerns you all most at the moment is the problem of rising prices. There is no doubt about the fact that a steadily rising price level which deprives thousands of families of a part of their livelihood is not in conformity with the concept of socialism that I outlined a few moments back. It is not unlikely that, with the prospect of a better crop, the price situation in the coming months may not continue to cause much concern. But I think I am right in saying that by and large, this question of a need for a stable price policy will remain with us for years to come as it has indeed been with us with minor interruptions for at least the past two decades. If this were so, we should, I think, consider a number of consequential questions seriously. Most of us would agree that price policy for essential consumer goods must reconcile the opposing interests of producers and consumers. The producers must get a fair price, both as a reward for their labour and as an incentive for increasing production. At the same time, consumers must not be required to pay excessive prices out of line with their incomes. But how can we reconcile these two interests without reducing, in some way, the role and the profits of the middlemen? There is a widespread feeling that with decline in competition, the margin of profit in distribution has increased in recent years. But if this margin is to be reduced, it cannot be done without a measure of regulation or intervention by the State in the machinery of distribution. And such regulation can be successful only with the active support and co-operation of the people. I think all of us should also ask ourselves whether reasonable stability of prices should be assured to all sections of the people irrespective of their incomes or whether it should be assured only to the more vulnerable sections of the community. I do not propose to answer these questions or to lay down tonight the policy of the Government in this regard. I hope that you, as citizens, would give thought to these questions so that the element of wishful thinking that has dogged us for long in this area of price policy is progressively reduced by an enlightened public opinion as, after all, the discipline that goes with the concept of the policy of maintenance of stable prices can only be enforced by a strong backing of public opinion.

"I have spoken to you about the need for stimulating growth and about price policy. But I am not, repeat not, one of those who believe that we should put on the shelf our as-

pirations for social justice till such time as we achieve a satisfactory rate of growth on a continuing basis. It shall be our endeavour in the months ahead to explore some practical avenues for expanding the scope of social security for at least some sections of our people as also for enlarging opportunities for the talented who lack the means to develop their talents to the fullest. As we open up new horizons of hope by a positive policy of growth, we must also narrow the confines of fear for increasing numbers of our people. And let us hope that, with determination and mutual goodwill, we shall succeed in enhancing social justice without sacrificing economic progress."

STATE CABINETS

SEVEN STATE Cabinets have been re-constituted during the past one month; six as a sequel to the Chief Ministers relinquishing office under the Kamaraj Plan and the seventh one, on account of the leader losing the support of his party legislators. The expectation that the re-organisation of the State Cabinets under the Kamaraj Plan would be a painless process, befitting the spirit of the Plan, however, has been belied. Keen contests and a good amount of behind-the-scene manoeuvres have marred the outward unanimity on new leaders' election in practically all the States. Even in Madras where no contest for leadership was anticipated, the election of the new Chief Minister could not be a unanimous one.

Three other points need to be noted in regard to the reconstitution of these State Cabinets. In four cases, the new leaders have been the nominees of the outgoing Chief Ministers—Mr. Shamsuddin in Jammu and Kashmir, Mrs. Sucheta Kripalani in Uttar Pradesh, Mr. Biren Mitra in Orissa and Mr. Bhaktavatsalam in Madras. In Gujarat, Dr. Jivraj Mehta, who lost the confidence of his party legislators, yielded place to Mr. Bhalwantrao Mehta. In Bihar and Madhya Pradesh, the leadership has been wrested by dissidents—Mr. K. B. Sahay and Mr. D. P. Mishra, respectively.

Contrary to the Congress High Command's decision to have homogeneous Cabinets, the new set-ups in all the cases can hardly be said to be so. The case of Uttar Pradesh is a unique one in this respect. The comparatively free-hand allowed to the other new Chief Ministers in the formation of their Cabinets has been denied to Mrs. Kripalani. It will not be an exaggeration to say that in Uttar Pradesh today there are two Chief Ministers instead of one; if Mr. Kamalapati Tripathi adopts an adamant attitude, a new ministerial crisis in the State should not be ruled out.

The Congress High Command appears to have also followed a weak-kneed policy in regard to the strength of the State Cabinets. As a rule, the new State Cabinets were to be of smaller sizes than the previous ones and were to consist of not more than 20 members. In pursuance of this ruling, the strength of the Bihar and Madhya Pradesh Cabinets was reduced from 29 and 23 to 20 members each. The new Cabinets in Madras, Kashmir and Gujarat also are slightly smaller in size, with 8, 11 and 14 members, respectively. But the strength of the Orissa Cabinet has been maintained at fourteen. The case of Uttar Pradesh again has been a singular one; although the strength of the Uttar Pradesh Cabinet has been reduced from 34 to 21, the ceiling of 20 members has not been adhered to. The strength of the State Cabinets where no reorganisation has been done has also not been reduced except in the case of West Bengal. In Maharashtra, the Chief Minister, Mr. Kanamwar, continues to head a Cabinet considerably larger in size. He is also reported to be not amenable to reducing it unless the High Command specially desires so. Taking into consideration the fact that small and compact cabinets do not

suffer from any disadvantage in administration, as has been made abundantly clear in Madras and Punjab, it is wondered if the ceiling of 20 members for a State Cabinet is also not on the high side. More so during the current emergency.

WHITLEY COUNCILS FOR INDIA

THE UNION Government has decided to set up for its employees a machinery for joint consultation and compulsory arbitration. The adoption of such a course had been suggested by the Second Pay Commission over four years ago. The scheme envisages establishment, on a non-statutory basis, of three Councils at the national, departmental and regional office levels. These Councils are to be modelled on the pattern of Whitley Councils in Britain. Although the right to go on strike is not being taken away from the Government employees in principle, as was contemplated by late Pandit Pant after their strike in 1960, they are required to abjure strikes if they want to have any benefit under the new arrangement.

The scheme covers all the regular civil employees of the Central Government, industrial and non-industrial, except Class I, Class II services other than the Central Secretariat Service and other comparable services whose duties are mainly ministerial, and the managerial, administrative and supervisory staff in industrial establishments. The Police and Railway Protection Force are also being excluded from its purview.

The National Council will consist of upto 25 official members nominated by the Government and upto 60 members nominated by recognised associations of employees according to the rules framed for the purpose. The Cabinet Secretary will be the Chairman of this Council. The staff side will elect its own leader. Both the sides will have their own secretaries. The Departmental and the Regional Office Councils will also be similarly constituted. A Departmental Council will have 5 to 10 members on the official side and 20 to 30 members on the staff side. The strength of Regional Office Councils will depend on the size of the staff concerned. In view of the special nature of the staff problems on the railways, subject to the observation of the provisions of the scheme, detailed arrangements will be worked out for the setting up of regional/zonal and office councils which will take into account the arrangements already in existence. No person who is not an employee or an honourably retired employee of the Central Government can be a member of a joint council. The representatives of the staff associations will serve the three Councils for a term of three years. But there will be no bar on their renomination.

The National Council will deal with matters of general application, such as minimum remuneration, dearness allowance and pay of certain common categories of employees—office clerks, peons and lower grade workshop staff. Matters relating to categories of staff common to two or more departments and not grouped together under one Departmental Council will also be looked into by it. The National Council will have two Standing Committees—one for the non-industrial staff and the other for industrial staff. The Departmental Councils will deal with matters concerning the staff employed in a particular department, unless these are matters which by virtue of their common concern to the staff of other departments fall within purview of the National Council.

The Councils may concern themselves with all matters relating to conditions of service and work, welfare of employees and improvement of efficiency and standards of work. In regard to recruitment, promotion and discipline, consultation will be limited to matters of general principles. Individual cases will not be considered. The joint councils are not intended to supplant the facilities provided to employees to make individual representations or to associations of employees to make representations concerning their constituent

services and the like. They will only supplement these facilities.

In the interest of expediting work, the official representatives will be required to settle matters in the meetings of the Councils themselves; they will not reserve them for decision by the Government. Agreements thus reached will become operative, subject, of course, to the final authority of the Cabinet. It is, however, not intended that such agreements would require Cabinet approval as a normal practice. Matters once disposed of by a Council shall not come before it again at least for the next twelve months, unless for any special reason the Chairman decides otherwise.

Compulsory Arbitration

Only the most important and the most intractable of the disagreements between the official and employees' representatives on questions of pay and allowances, weekly working hours and leave for particular classes or grades of employees can be referred to compulsory arbitration. Full consideration of each issue will, however, first take place in the Council concerned. The Government reserves the right to refuse to refer any dispute to arbitration if it is of the opinion that such a reference will not be in public interest. But as a safeguard against misuse of this power, provision has been made that in all such cases, reasons will have to be recorded by the Government in writing and placed before both the Houses of Parliament.

The disputes referred to arbitration will be heard by a Board of Arbitration to be set up each time contingency arises. It will have three members—an independent Chairman to be nominated by the Union Labour Minister and one member each to be selected from two panels of five names to be submitted by the official and the staff sides. The recommendations of the Board will be binding both on the Government and the employees, subject to the overriding authority of Parliament. The Government, however, may recommend to Parliament modifications of an award of the Board of Arbitration if it is of the opinion that the award needs modifications on grounds affecting national economy or social justice. Specific reasons will have to be assigned for this and placed before Parliament in writing. Orders made by Government on the recommendations of the Board of Arbitration and after approval by the Parliament shall remain in force for a period of five years, unless modified by mutual agreement between the staff and the Government.

In determining a dispute, the Board of Arbitration shall generally be guided by such general principles contained in any report of a commission appointed by the Government as are relevant to the dispute and have been accepted by the Government. Matters determined by the Government in accordance with the recommendations of a commission will not be subject to arbitration for a period of five years.

RAJ COMMITTEE'S REPORT

THE Raj Committee on Steel Control, in its final report submitted to the Government last week, confirms, in the main, the suggestions it had made in the interim report early this year, but goes a step further at least in one respect. The mechanism it has recommended for the fixation of producers' prices for various categories of steel takes away this matter from the purview of the Tariff Commission which could bring to bear upon its deliberations a good measure of objectivity. Whether this will be a step in the right direction, only time can show. If adopted, this course can surely be expected to raise similar claims from a number of other important industries. Otherwise, the recommendations of the Committee make a good deal of sense.

The Committee suggests that the producers' prices for steel should be fixed by the Government on the recommendations of a Joint Steel Plant Committee to be set up with the Iron

ONE LOG, TWO MILES LONG

It is not possible to see more than a few feet down a well, but there are scientific devices which can produce for the oil explorer a complete photographic chart of the inside of a well, all the way from surface to bottom. When interpreted, such charts, or logs as they are called, indicate the variation in the physical properties of underground rock formations penetrated by the drill, thus helping the scientist to locate levels where maximum

production may be expected and giving him other information about the nature of the various strata. Other logging instruments make use of electrodes, gamma rays and radioactivity measuring devices to record the characteristics of the earth's crust.

Looking into the earth in this way calls for highly specialised equipment and skilled men to operate it.

and Steel Controller as the Chairman and the General Managers of the various steelworks, or their nominees, as members. This it considers necessary for imparting some measure of flexibility in the retention prices so that the production capacity could be geared to turning out an optimum product-mix. The Committee feels that a fuller provision needs to be made for plant replacement at current or prospective costs and this should be done without a uniform upgrading of the prices of all categories of steel. Increases should be granted only in the prices of the scarcer categories and the more-difficult-to-roll sections. A shift of this kind in the relative price structure, the Committee opines, is imperatively required in the prevailing circumstances. A reduction in the number of sections which the steel plants are called upon to roll, has been favoured by the Committee.

Free Market

The Committee recommends a free market in steel after the control on first-sale prices which it desires should be subject to periodical adjustments in the light of demand conditions. When market prices are such as to justify an increase in the first-sale controlled prices but the latter are already high enough to more than cover producers' costs and requirements of replacement and expansion, action is suggested to be taken by the Government to adjust the sale prices realized by producers through imposition of excise duties or other fiscal devices.

The joint plant body has also been assigned a crucial role in the planning of steel production. For this purpose, all the indents for steel supplies are to be routed through it—a function at present performed by the Iron and Steel Controller. On the basis of the indents received by it, the joint plant body will be required to establish principles and general conventions in allocation of indents between plants, taking into account the need for specialization among the plants, the importance of ensuring economic rolling tonnage, the need to reduce the time-lag between the receipt of indents and the despatch of supplies and the necessity of avoiding long leads in transport.

For simplification of distribution controls, the Committee suggests that all steel demands should be divided into three categories: (A) overriding priority demands; (B) priority demands and (C) non-priority demands. 'A' class demands, it suggests, should consist of only defence needs. 'B' class demands should cover the requirements of basic industries, namely, coal, steel, oil, heavy machinery, heavy electrical equipment, fertilizer, agricultural equipment and machinery, shipbuilding, transport and communications and irrigation and power. All other demands should be treated as 'C' class demands. The general criterion for fixing priorities should be the end-use of the supplies demanded. Once the demand for steel of a project or production unit is accorded priority, all categories and sections required by that project or unit should get the same priority grading. To make this system of priorities effective, it has been recommended that the task of following each priority indent upto the point of final delivery should be one of the main functions of the Iron and Steel Controller. In matters of price, however, no concession is to be given to the priority demands. The price charged in each case is to be governed by the same considerations as for others. If some price advantage is called for, it should be provided in the form of "drawbacks." Anyone requiring steel, the Committee suggests, should be free to place indents directly on the producers and receive supplies at producers' price. Sale and resale transactions after first deliveries should not be sought to be controlled except in the case of priority deliveries for which the condition of allotment should be that there will be no resale. In this system, no rationale is left for maintaining the distinction between the

"controlled" and "registered" stockists or between the "recognized" and "unrecognized" traders.

For meeting the special needs of re-rollers and small-scale industry, the Committee, besides suggesting special arrangements, recommends that the Government should hold a small proportion of the non-priority supplies as stocks of its own. Building up of stockyards in various parts of the country has been advocated also for ironing out of excessive fluctuations in prices, especially in areas where transport difficulties or inadequacy of resources by the steel users tend to vitiate regularity in demand. Supplies to the stockyards are recommended to be given the same priority as for the 'B' category demands. The sale prices at the stockyards would be the producers' prices plus a small margin to cover operating expenses. Fixation of a limit on the maximum amount that can be purchased by any customer from a stockyard at any one time is favoured for avoiding cornering of stocks by a few. Some of these stockyards may be built up by the main plants; others by Government or Government agencies and still others by private parties requisitioned or commissioned by the Government.

In the new scheme of things suggested by the Raj Committee, the Steel Equalisation Fund goes as its primary function was to adjust the loss on imports by the accruals to it of the difference between the controlled sale prices of steel and the retention prices. The Raj Committee has made some forthright recommendations in regard to steel imports. It has suggested that steel imports, when found absolutely unavoidable, should be effected through official agencies; the practice of allowing imports by established importers should be discontinued. The system of barter imports of steel by private parties has also been recommended to be stopped forthwith. Raising of import duties to levels high enough has been suggested for wiping out the differences between the landed costs of steel and the prevailing internal market prices.

Freight Equalisation

The Committee has expressed misgivings about the usefulness of the present policy of freight equalisation. It feels that this policy encourages unnecessary cross-movements of steel without necessarily promoting socio-political equity. But no change has been suggested in the current practice, pending a more thorough examination of the whole question of regional development in the light of transport and other costs. It has been recommended that the Joint Plant Committee might include in the first-sale price a freight element to be realized on all despatches of steel and operate a clearing arrangements whereby every plant receives the excess of freight paid over freight realized and pays out the excess of freight realized over freight paid.

The net result of its recommendations, the Committee opines, should be an optimum production of various categories of steel and mopping up of the unduly large profits of the middlemen for the benefit of the steel plants and the State Exchequer. Free market in steel after the first sale at producers' prices, according to the Committee, should not lead to increase in the prices of steel products as at present there is only negligible (if at all) difference in the prices of such products whether made out of the steel supplies secured at controlled rates or at a high premium in the open market.

The Government decisions on the Raj Committee's report will be taken after another Committee, that of producers, set up in July last, reports on this matter. This report is expected any day. The assessment of demands for various categories of steel from a long-term point of view will have to be made by the Union Ministry of Steel through other means. Market studies may be undertaken for this purpose. The Raj Committee, however, is silent on this issue.

The Mischief of SPT

By SAGATTARIUS

EVER SINCE Mr. T. T. Krishnamachari assumed charge of the Union Finance Ministry, there has been speculation whether there would be any radical change in the Super Profits Tax especially as he was known to have expressed the view that measures should be adopted to stimulate the economy and end the stagnant phase that has been in evidence for some time past. The announcement of changes in the Gold Control Rules and the virtual scrapping of the Compulsory Deposit Scheme, except that portion relating to incometax payers, also encouraged the feeling that corporate taxation might be lightened and there might even be streamlining of indirect taxes. Surprisingly, however, beyond the emphasis on the need to rationalize interest rates and liberalize credit facilities, with an enlargement of the activities of the Industrial Finance Corporation, Industrial Credit and Investment Corporation and the Refinance Corporation for Industry, there has so far been no serious discussion in Parliament or outside by legislators about the urgency of modifying the Super Profits Tax and affording such other incentives as would encourage the inflow of foreign capital and enliven the capital market.

The proposals to liberalise lending restrictions by the Reserve Bank during the forthcoming busy season and the conversion of the Industrial Finance Corporation into a full-fledged development bank, along with additional rediscounting facilities provided by the Refinance Corporation, will no doubt take care of a slack in the capital market for a short period. But even with liberal assistance from the statutory finance corporations there will be need for large support from the investing public and enthusiastic collaboration from foreign interests if the tempo of industrial development, noticeable until recently, is to be sustained.

Risk Needs Reward

The importance of a lively capital market and reasonable profitability of investment will be recognised if it is remembered that in the last boom in new company floatations there was an aggregate investment in different industries of a volume which has not been likened in earlier booms. Also, the character of floatations was entirely different and there was no hollowness about the new ventures. Indeed, the benefits of many new schemes are now being derived and the industrial economy is getting more integrated in nature. Unfortunately, this process has not been allowed to continue with the levy of heavy indirect and direct taxes early this year. There was no doubt some uncertainty about the future outlook following the declaration of Emergency. The fears of a disruption of the Indian economy on account of the Chinese threat have, however, considerably receded and it is now felt that industrialists, both foreign and Indian, would be prepared to embark on new ventures if only there was a measure of reassurance that fresh investment would be profitable and the small investors who have been growing in large numbers would be rewarded more adequately for the risks taken by them in placing their hard earned savings in industrial securities.

It has not been adequately realised that the indirect taxes themselves have resulted in a reduced margin of profit and that on the balance of earnings, after providing for depreciation and development rebate, the provision towards direct taxes, including SPT, has had a regressive effect. Even with the concessions granted by Mr. Morarji Desai before the new levy took its final shape the net incidence has worked out to anything between 60 to 80 per cent of disposable profits in

many cases and the introduction of the principle of progression in corporate taxation has penalised unduly the small investors. It has been asserted in the vigorous representations from the committees of the principal stock exchanges, shareholders' associations and industrial organisations that the incidence of SPT would prove to be severe and the yield would be very much more than the estimate of Rs. 20 crores. This tax has, therefore, to be modified radically.

There is unmistakable evidence to indicate that a continuance of this tax in its present form will be highly inequitable in its incidence and as a result it would be difficult to maintain the tempo of industrial development in the private sector at the rate of 1960-62. Many companies have been obliged to cut drastically dividend payments and even postpone the implementation of expansion schemes on account of the fear that the required additional capital could not be raised on the basis outlined by the Government. Even though the additional profits earned by the various industries were due to a larger turnover following a larger outlay the benefit of the increased earning capacity has been derived solely by the Exchequer. In some cases, even the additional depreciation charges and development rebate could not be fully provided without reducing the usual allocations to other reserves because of the large appropriations towards taxation. This is hardly a state of affairs which can ensure sustained industrial growth.

Unscientific Levy

The analogy of World War II, when the Excess Profits Tax completely immobilised excess profits, is not in any sense correct as larger profits were made on the same volume of production in many cases. Besides, the deposits were refundable apart from some portion of the tax being returned to the assessee. The most severe incidence worked out to 50 per cent of "excess" profits which were computed on what should be called, in the light of recent developments, on a rational basis. The Excess Profits Tax was more scientific as for purposes of determining excess profits and there were also adjustments in the standard profits in respect of changes in any sense. It has uneven incidence even in respect of earnings of companies which have similar capital-absence of facility for rebate in respect of Super Profits Tax paid by companies has caused considerable hardship to the small shareholders. The force of the above arguments will be clearly brought out by an analysis of the working results of 101 companies belonging to different industries and which have published their accounts after the last Finance Act was passed.

It is clearly borne out by the experience of these companies that even to pay the same dividends, distributed prior to the imposition of SPT, there will have to be an increase in earning capacity by at least 30 per cent. This would be possible only if there were large additions to fixed assets which would obviously be impossible in the prevailing circumstances. Also, it is needless to say that there would be no desire to invest large sums additionally only to prevent a reduction in disposable profits.

These 101 companies have a fairly creditable record for efficient conduct of their business. There was an increase in sales in 1962-63 to Rs. 682.13 crores from Rs. 616.39 crores in 1961-62. There was also a slightly more than proportionate in-

crease in earnings, before depreciation and taxation, to Rs. 95.26 crores from Rs. 81.70 crores previously. The increase in earnings by Rs. 13.56 crores, however, did not in any way benefit these companies as what all could be retained in business related only to the additional provisions towards development rebate and depreciation. It should be said that even these appropriations could not be fully found without disturbing allocations to other reserves. The actual provision towards depreciation and development rebate was higher at Rs. 26.10 crores against Rs. 23.74 crores. The net profit, before taxation, was, therefore, higher by only Rs. 11.20 crores at Rs. 67.16 crores. The charge on account of taxation, however, increased by Rs. 11.50 crores to Rs. 32.10 crores leaving disposable profits of Rs. 13.06 crores against Rs. 13.36 crores. There was actually an increase in the proportion of taxation to net earnings to 56.5 per cent from 47.6 per cent. That is, additionally 18.5 per cent had to be set aside towards taxation which gives a measure of the increase in the average burden of taxation on account of SPT. (If this is any guide, the yield from SPT in a full year could be easily Rs. 40 crores).

Notwithstanding the heavy incidence of taxation a sincere effort was made by many companies to transfer to reserves amounts at least on the previous scale. But this was found difficult of achievement by some groups and there has been actually a decline in the sums transferred to reserves to Rs. 9.98 crores from Rs. 10.39 crores. If the transfers from reserves were adjusted, the net addition to reserves were further lower at Rs. 8.18 crores against Rs. 8.97 crores. If it had been decided by the Directors of the different companies to maintain at least the dividends on equity capital on the previous basis the quantum of profits ploughed back would have to be even more severely affected. Again, the amount of Rs. 20.35 crores distributed by way of equity and preference dividends against Rs. 21.14 crores in 1961-62 does not give exactly an idea of the hardships endured by the shareholders. A larger capital was ranking for dividend purposes in many cases and the shares had been issued at a good

premium in a number of instances. The cut in dividends on equity capital in the case of as many as 50 companies, nearly 50 per cent of the sample under reference demonstrates clearly the fact that, even with an increase in earnings, it has been necessary to reduce dividends severely with the consequent adverse effect on share values and morale. The rate of capital formation in the corporate sector has considerably slowed down. It has also to be pointed out that the dividends could be barely maintained by 27 companies at the cost of transfers to reserves while out of the 24 higher dividend declarations as many as 9 related to the jute group which has no special significance for the reasons already explained. In respect of others dividend increases have been nominal in the majority of cases even with large profits. It would not be possible for the ambitious companies to continue their good work without a good measure of support from the shareholders and without the ability to enter into fresh commitments and to discharge obligations on a basis acceptable to the investors and lenders.

Declining Profit

From a closer analysis it will be found that, even with an increase in sales, the proportion of gross profits to the former has tended to decline and the companies were in the awkward position of having to pay larger amounts by way of taxation, even where earnings were lower. This is borne out by the experience of cotton mills, chemicals and cement units. It would not be incorrect to say that the increase in the proportion of gross profits to sales for the group as a whole to 14.11 per cent from 13.20 per cent has been due to the better experience of only the engineering, jute and miscellaneous groups, the latter particularly. The gross earnings of 27 cotton textile mills for 1962-63, therefore, declined to Rs. 20.73 crores from Rs. 21.75 crores in the previous year. There was no doubt an increase in sales to Rs. 141.02 crores from Rs. 134.65 crores. But even allowing for a slight inflation in the value of sales on account of the levy of heavy excise duties, the costs of production were generally higher and profit

margins were reduced. It was necessary, however, to set aside a larger sum of Rs. 8.13 crores against Rs. 7.44 crores towards depreciation and development rebate. On the reduced earnings of Rs. 12.55 crores against Rs. 14.31 crores, after making these provisions, taxation, including Super Profits Tax, claimed nearly 50 per cent against 47.1 per cent previously. The dividend payments had, therefore, to be reduced to Rs. 4.79 crores from Rs. 5.20 crores and the net transfers to reserves amounted to only Rs. 32 lakhs against the fairly large sum of Rs. 2.81 crores. This is indeed an unsatisfactory position.

Likewise, the cement industry, whose selling prices are also controlled and which has not been compensated fully to the extent of the increase in costs under the escalatory clause, has found it virtually impossible to plough back sizable amounts to reserves. There is naturally unwillingness to undertake expansion plans in a big way. Six cement units included in the sample had an increase in sales to Rs. 23.84 crores in 1962-63 from Rs. 19.90 crores in the previous year. But there was only a marginal increase in the gross profits to Rs. 4.78 crores from Rs. 4.27 crores. The charge on account of depreciation and development rebate was higher at Rs. 1.50 crores against Rs. 1.41 crores while taxation claimed as much as Rs. 1.80 crores against Rs. 1.13 crores. The net transfers to reserves amounted to only Rs. 33 lakhs against Rs. 47 lakhs in spite of the fact that the dividend amount was lower at Rs. 1.10 crores against Rs. 1.21 crores. It is noteworthy that the increased profits were earned on a larger capital outlay though it may be admitted that there was also a higher level of production with a better utilisation of capacity.

The engineering group has no doubt done very well there being an increase in sales on account of 24 units to Rs. 237.01 crores from Rs. 205.88 crores during the two years under reference. There was also a significant increase in gross earnings to Rs. 34.30 crores from Rs. 29.22 crores. The provision for taxation in 1962-63 has absorbed more than the increase in earnings with the result that the increased allocation to depreciation and development rebate reserves had to be made at the expense of transfers to other reserves apart from a reduction in dividends paid to shareholders. Thus, the charge on account of depreciation and development rebate was higher

at Rs. 9.64 crores against Rs. 8.41 crores while taxation claimed as much as Rs. 15.30 crores against Rs. 10.16 crores working out to over 62 per cent of profit after depreciation and development rebate against 48.8 per cent in 1961-62. The net transfers to various reserves could be only Rs. 2.91 crores against Rs. 3.45 crores in spite of the fact that the shareholders received the smaller sum of Rs. 6.84 crores against Rs. 7.06 crores. There was a significant increase in the gross block to Rs. 135 crores from Rs. 117 crores which clearly shows that the increase in earnings has come about mainly on account of increased capital expenditure and no benefit has been derived by either the companies or the shareholders out of this additional investment.

Radical Modification

Even in respect of the miscellaneous group which has done excellently with an increase in sales of 26 companies to Rs. 219.10 crores from Rs. 198.35 crores and gross profits to Rs. 26.73 crores from Rs. 22.77 crores, the dividends distribution have had to be reduced to Rs. 5.92 crores from Rs. 6.54 crores with taxation accounting for nearly the whole of the increase in profits to Rs. 12.30 crores from Rs. 8.50 crores. If the net transfers to reserves were higher at Rs. 3.61 crores against Rs. 2.34 crores, it was partly due to a smaller provision of Rs. 4.33 crores against Rs. 4.64 crores on account of depreciation and development rebate. The experience of shareholders in any particular group has not, therefore, been satisfactory. As already explained, there was an increase in the dividends distributed by jute mills generally due to the fact that the earlier payments were mainly nominal. There is, therefore, an unanswerable case for a radical modification or the abolition of the Super Profits Tax. If the Exchequer has to be protected against loss of revenue while removing the inequities of the new levy there can be a straight surcharge on income tax and super tax paid by the companies in order to yield the estimated sum of Rs. 20 crores. By making a reasonable gesture the Finance Minister would even ensure larger revenues over a period with an enlargement of the industrial base following the revival of confidence and a continuous boom in new floatations. As considerable damage has already been done, the decision to lighten the burden of direct taxes on corporate profits cannot be delayed for long.

WINDOW ON THE WORLD

Good Advice from Friends

By R. V. MURTHY

WASHINGTON:

TO AN OBSERVER from India of the proceedings of the joint sessions of the Boards of Governors of the World Bank, the IMF, the IFC and the IDA and the several press conferences and press briefings that followed, the most gratifying impression was neither the large assemblage of the world's bankers and financiers nor the elaborate arrangements made for them at Sheraton Park — impressive though these undoubtedly were — but the almost complete unanimity of approach to the question of international liquidity or rather to both the long-term and the short-term manifestations ("international imbalance", as President Kennedy would have it) thereof. While the opening address of the President of the World Bank, Mr. George D. Woods, and the Managing Director of the IMF, Mr. Pierre-Paul Schweitzer, set the pace, as it were, the statements of one Governor after another of the participating countries served to underline the urgency of the problems that still press in on the world and the readiness to explore new ways by which these Brettonwood institutions and their offshoots can more effectively meet these problems. Although these speeches highlighted "the vital role" of these institutions "in the continuing quest for finance and economic stability among the nations of the world", they represented — and continue to represent — the precise problems of India today and the proper solution to them.

'New Dimensions'

I do not think that anyone, not excluding an Indian, could have presented India's case more graphically and point to the directions in which a solution of these problems might lie — a feeling only further reinforced by the unqualified welcome and support extended by Messrs. L. K. Jha and Bhattacharya to the bold proposals of Mr. Woods in his brilliant address to the Board of Governors. All the developing countries, and India particularly, are bound to benefit by the response to Mr. Woods' call for addition of "new dimensions" both to the World Bank's lending and technical assistance activities and Mr. Schweitzer's plea for further widening the wide spectrum of the existing liquidity arrangements, especially if these were to proceed along the lines urged by India's representatives. Mr. Jha was quite right when he confessed to the difficulty of trying to add to the suggestions of Mr. Woods. Considering all this, as also the certain prospect of the balance of payments problems of the less developed countries continuing to be with us for quite some time, as was stressed by Mr. Bhattacharya, one hopes the authorities in India would take particular note of Mr. Woods' suggestions. In this connection, it is important to bear in mind the reactions of aid-giving countries, whether expressed overtly or covertly. Whereas these countries are prepared to continue to assist India and other developing countries, it would be prudent to anticipate a gradual deduction in the quantum of such assistance as well as to recognise the fact that they are also keen on ensuring that their assistance is utilised effectively and expeditiously (as witness the concern of the World Bank and the IMF chiefs to study the causes for delayed utilisation with a view to eliminating them, wherever practicable) and without being hampered unduly by the profitless pursuit of ideological dogmas.

Mr. Woods regretted the discouragingly slow rate of pro-

gress in many underdeveloped countries and referred to the three problems contributing to this which call for special attention, namely "the policy problem". There will be hardly any opposition to the World Bank Chief's plea either for a far-reaching diversification of the production and exports of the developing countries or for a closer look into the disturbing factor of the unfavourable structure of the debt of many of these countries, so as to reorient the terms upon which development assistance is given. As regards his solution of the policy problem, however, there is likely to be criticism from some expected quarters, but this should not deter a pragmatic approach to the question.

While considering the exhortation of Mr. Woods, developing countries such as ours should take note of the daring shift he has proposed from "proven ground" to "less familiar terrain". As far as India is concerned, every one of the World Bank President's suggestions, such as those for more credit for agricultural projects, for financing of education (for the first time the Bank's resources are proposed to be used in this way), for increasing both the duration and the interest-free guarantee period of loans and for providing facilities for arbitration and conciliation of international investment disputes, seems to have been specifically tailored to her needs and, if she is to avail herself of all these, she cannot afford to ignore the sage counsel of a known friend of India such as Mr Woods. So as to make sure that the effectiveness of this counsel is not affected in the least, I quote below what he had to say on the important place that needs to be assigned to the private sector:

Outdated Facts

"It is not the business of the Bank, nor of its President, to tell the developing nations within the Bank's membership that they must accept private capital from abroad as a partner in their development efforts or what kind of price it is reasonable for them to pay in order to achieve such a partnership. Those are issues which our members, as sovereign nations, must decide for themselves. Whatever decisions they make, the Bank, as a non-political international organisation, must and does accept without reservation. For my part, however, I believe that, to a great extent, the attitudes of many of the less developed countries toward foreign private investment are based on the outdated past rather than on present facts. And I am convinced that those of our members who adopt as their national policy a welcome for international investment — and that means, to mince no words about it, giving foreign investors a fair opportunity to make attractive profits — will achieve their development objectives more rapidly than those who do not. For a country which is known to be hospitable to private investment will have access over the years to a much larger and more stable pool of capital than its neighbour which relies solely on government-to-government aid. It will have access, too, to a much larger pool of industrial personnel — managerial, administrative and technical — and to a much larger mass of scientific and technological information than it could possibly acquire in any other way. Most important of all, its economy will be stimulated and invigorated by the many different contacts, at many different levels, which a hospitable investment climate will make possible between enterprises and individuals within its own borders and those within the borders

of the industrialised countries. None of these advantages is likely to be fully available to any nation whose government, however well-motivated and however well-administered, decides to relegate the private sector to a subordinate role".

Toward Higher ECM Steel Tariffs

From Our Special Correspondent

PARIS:

WHEN GENERALISED price-rises in steel in the USA coincide with plans to increase tariff protection for steel in Continental Europe someone is surely mistaken about the outlook for the Western steel industry. The American and Continental steelmakers cannot both be right. The former, whose prices are already far above those of Europe and Japan, think that in a year when 20 million motor vehicles will be turned out, the demand for steel is strong enough to stand further price-increases. The Continentals, on the contrary, point to continuing deterioration of prices, under the influence of foreign dumping, and consider that West Europe needs more protection. Indeed, European steel tariffs would have been raised by now were it not that several Common Market capitals are reluctant to prejudice the Kennedy Round of tariff negotiations by a demonstration of protectionism. The French Government, at a meeting of the Coal and Steel Community, has just brushed aside these hesitations and presented an ultimatum: if the Six do not do something to protect their market from steel imports by the end of the year, France will take unilateral measures.

This ultimatum is not addressed to the High Authority in Luxembourg, for the Coal and Steel Community, unlike the Common Market, has no joint external trade policy or common external tariff; so the Luxembourg Authority is not responsible for the failure to raise tariffs before this. There is simply an informal agreement among the Six Governments to harmonise their steel import duties, and in practice this has meant aligning them on the lowest in the region, those of Benelux. This has entailed notable tariff disarmament by Italy and France, and since there has been much dumping of steel by Japan, the Communist bloc and (last year) by Britain, those two countries are regretting their liberalism. They are threatening now to take back their freedom of action; unilateral increase of protective tariffs would be consistent with the letter of the treaty. Rome and Paris would prefer to see a Community decision, rather than to be obliged to act separately. They hope that in coming weeks the High Authority in Luxembourg will recommend to all the Six capitals an increase in import duties.

Indisposing Washington

The Continental steelmakers (who do not share their Governments' qualms about indisposing Washington by a display of protectionism at this inauspicious moment) hope so too, because the need to match cut-price offers by importers is weighing heavily on their selling prices. It is not that alarmingly large quantities are being imported, but the mere quotation of a lower price in a buyers' market, such as the highly competitive European steel market is today, depresses all rates. A recommendation in favour of higher duties from Luxembourg, in answer to Paris's ultimatum, would suit the industry in general. The West German Government would probably accept it, risking displeasing Washington provided it could shelter behind the High Authority; only the Dutch Government would strongly oppose the move.

So an increase in Continental steel duties seems fairly

It is for those at the helm of affairs in our country to decide whether or not they care to avail themselves of the advantages eloquently catalogued by Mr. Woods and benefit thereby.

certain before the year is out. It will have to be generalised, because if France alone raised her duties, there would have to be introduced a complicated system of "certificates of origin" to ensure that cheap Japanese steel was not being imported into Belgium, for example, to be forwarded to France at the lower intra-Community tariff. The amount by which European tariffs will be raised will be subject to negotiation, but the French, who have decided after much hesitation to lead the move, have in mind to raise tariffs moderately, leaving them still lower than British import duties. For the average European tariff is today far below that of most other steel-producing countries, and indeed this discrepancy is the reason the Continental steelmen have a good conscience in demanding an increase in protection. The average duty on steel imports into the Common Market is five to six per cent, against 10 per cent in the USA, 15 per cent in Japan and 15-16 per cent in Britain.

Anomalous Difference

This wide difference is anomalous in an increasingly integrated world steel market, and of course it explains why the Common Market has felt the draught first: excesses from many sources have been dumped here, over the low tariff barrier. They could not so easily be dumped in Britain or the USA, and the Common Market was incapable of retaliating even when producers in those countries were the authors of the dumping. Besides, we have referred only to straight-out tariff protection, but there are various other non-tariff obstacles to exporting steel to, for example, the USA. One of them, much used by the American steel industry of late, is simply to allege that foreigners are dumping in the USA, whereupon all imports are suspended while a lengthy official enquiry is held into the allegation. It may well turn out (it has several times) that the charge of dumping is unfounded, but meantime steel importers' business has been totally disrupted for months because supplies from abroad are frozen till the enquiry is completed. Irritated steel consumers take the precaution of ordering American steel next time.

Thus we have a first explanation of the different sentiment about the steel outlook on the two sides of the Atlantic. Solidly protected, by tariffs twice as high as those of the Common Market as well as by non-tariff obstacles, the American producers feel confident they can exploit the upturn in demand by raising their prices. Indeed, in the past year they have raised prices of 55 per cent of steel products by 3.5 per cent and the increase promises to become general. The mills have to resort to this gradual method of raising prices, almost by stealth, to avoid President Kennedy's wrath, for they have not forgotten their clash with him in April 1962 when he forbade them to increase their prices and had three firms prosecuted for violating the anti-trust laws by concerting a price-rise.

So far the US steel industry has got consumers to accept these increases, for its utilisation of installed capacity has risen from 58 to 60 per cent in the same period. One may doubt however if the industry is acting wisely, because a general rise in steel prices now could well jeopardise the hesitant expansion in American business, as well as pricing American

steel right out of foreign markets. These are points that President Kennedy will no doubt make if he decides to prohibit the stealthy rise in steel prices as he did the avowed rise last year; it is believed that he will intervene if the increases come to affect three-quarters of total steel products.

If the American estimate of the steel outlook, then, is over-confident and largely founded on the assurance of solid tariff protection, the gloomier Continental view is equally questionable. Specifically, one is obliged to ask whether it is Common Market steel that is to be protected or Common Market coal; in other words, the proposed increase in tariffs on steel imports might not be necessary if the mills were not being forced to pay fancy prices for domestic coal. There are two ways in which they are led to do this. In West Germany, because of vertical integration, the steel companies exploit their own coalmines and this unprofitable investment is a burden on their profits (especially now that petro-chemicals are reducing the value of coal by-products). In France, the mills do not own coalmines because they are nationalised, but this has the same effect.

Thus in France and Germany at least, and to a lesser extent in Belgium and Luxemburg, the inability to compete with cheap imports, which has led to the demand for higher tariffs, is the result of the luxury of supporting an inefficient coal mining industry. If asked to choose between higher tariffs on steel imports and lower or nil tariffs on coal imports, one

The UK in 1963 A.D. (After Denning)

By JOSSLEYN HENNESSY

LONDON:

IF LAST SPRING was BC (Before Christine), last month the UK entered a new era AD (After Denning). What this will bring economically is already discernible. The indicators show that both industrial output and exports are flowing at levels never attained before. While prices in Europe surge upwards, UK prices remain stable. Wage increases have been modest. Export prices are extremely competitive—as some recent spectacular foreign orders in shipbuilding and other industries have demonstrated. All is set for the achievement of the National Economic Development Council's targets for the five years ending in 1966.

What is ironical is that if Neddy's targets are attained, Neddy will have had nothing to do with it. For Neddy's plans are still plans. Its prediction that the UK is capable of growing at 4 per cent p.a. is simply an extrapolation of trends that were in motion before Neddy existed. The long investment campaign between 1951 and 1961, in the course of which UK fixed investments rose by 80 per cent (at constant prices), is now bearing fine fruits in faster growth. This is the result of the Conservative government's modernisation policies.

The Conservatives won popularity in the 1950s because they abolished controls, dropped Labour's inflationary cheap money policy, and began to use fiscal and monetary measures vigorously. Many people forget, however, that before Labour left office it had already begun to abandon its restrictive and inflationary policies. Had Labour won in 1951, it would have cashed in on them. As it was, the Conservatives were able to develop them and to exploit them electorally. If Labour wins the next election it will be ironical that it will be cashing in on the results of Conservative policies.

Labour has led the attack on Conservative "Stop and Go" — an electorally catching but economically inaccurate term. But Labour's leaders have been studying post-war economic policies in other European countries and it has been born in on them that those countries with the best growth records have been active in using the whole battery of fiscal

suspects that the French steel-mills would choose the second. Not that Governments can take a lighthearted view of the contraction of the local coal industry: there are a hundred miners sitting at the bottom of a condemned marginal pit in northern France in protest against the perfectly rational decision to shut it down, and one remembers the prolonged stay-down strike in Decazeville when its mines were to be closed last year and the rioting in the Belgian Borinage the year before that. So, at the risk of compounding one error with another, the Common Market Governments will no doubt choose to increase their steel tariffs rather than hasten the closure of uneconomic coalmines.

Some co-ordination of steel investments would be as useful to the Common Market steel industries as increased tariff protection. Behind the anxiety to maintain selling prices lies the fear that profits will not be adequate to finance the vast investment programmes that all the steel companies have under way. The total capacity that will result from these investments is excessive, in the short term at least, in comparison with likely domestic demand and exports. But each company sticks to its plans for fear of being outdistanced by the others. A co-ordination of expansion plans by the High Authority, leading to agreement to space out investments over a longer period, would lessen competitive anxiety and reduce apprehension about foreign dumping as effectively as tariff increases.

and monetary measures. Basically the object of these policies is to create conditions in which enterprising firms can make good profits which enable them to pay high wages, in competitive markets which compel them to seek efficiency and keep costs and prices down. Although Labour economists shrink from saying so in public, they will freely admit off the record that they believe that the lesson of Europe's experience is that you do not end shortages by imposing controls and allocating scarce resources centrally, or stop prices from rising by subsidising those commodities which affect the cost of living index. Experience of price controls has been that if firms cannot make adequate profits on a price controlled item, they switch manufacture to an uncontrolled item, thus often allocating scarce resources to products to which planners would give lower priorities.

Planning is now fashionable in the UK and the French model is held up to us. Personally, after several talks with France's No. 1 planner, M. Masse, I do not doubt the value of planning in France's particular circumstances. The French have a tradition, dating from Napoleon I and earlier, of central control and collaboration between civil servants and business. Also France has until recently been self-sufficient to a far greater extent than the UK, did not have a world banking position to look after, and could afford to watch less closely her balance of payments. Nevertheless as Mr. Enoch Powell, Minister of Health and an outstanding economist, pointed out recently, retail prices in the UK's unplanned economy have fallen again, and prices in the past two years have risen only at the rate of 1 per cent p.a., whereas prices in planned France have already risen 5 per cent this year, and this, following big increases last year, has led the government to strong measures of the Stop and Go variety. "I doubt," said Mr. Powell, "that we shall be told that French inflation is the result of French planning and be asked to imitate that."

It is too early to dogmatise about the political repercussions of the Denning report. Its suggestions of lack of co-ordination in handling security cannot help the Conservatives. Yet I doubt that they will help Labour either. Not security scandals but growth, education, the economy — these are

what win or lose elections. The man in the street is sick of the flurry of character assassinations, which Lord Denning's wide ranging investigation has revealed to be baseless. When taken together with steadily improving economic indicators, it would not be surprising if Labour's fulminations over Vassal and the innocent Mr. Galbraith, and over Keeler and the undignified Mr. Profumo, did not boomerang against them. Officially Labour has taken the line that it was solely concerned with security, but there have been attempts to exploit the scandals indirectly by generalised statements. For example, recently Mr. Harold Wilson accused the Prime Minister of having "debauched Britain's public life" and talked of a "devaluation of public standards". A retort to this by Mr. Anthony Barber MP, Financial Secretary to the Treasury, received widespread approving comment. "Who," asked Mr. Barber, "is Mr. Wilson to talk of public standards? Was it not he who by subtle innuendo, and in the guise of public duty,

caused a mammoth enquiry into an alleged Bank rate leak which proved to be utterly without foundation? Was it not Mr. Wilson who remained a member of Mr. Gaitskell's Shadow Cabinet, although he was in fundamental disagreement with Mr. Gaitskell's policies?"

One of Mr. Wilson's complaints seems to be that the UK has advanced materially during the years of Conservative government. He talks as though moral depravity inevitably accompanies material well-being. Can it really be that he thinks that his hints of the need for a return to austerity will win votes? After all, it was the trade unions' rejection of Sir Stafford Cripps' austerity policies which led to their collapse. The political picture is confused for the moment but, the Denning report out of the way, it should become clearer as hints of scandals in high places yield to the serious facts of life.

THE BRIDGE OVER THE BRAHMAPUTRA

By day and by night, with deafening roar and rattle, goods and passenger trains hurtle across the new Brahmaputra Bridge, connecting Amingaon and Pandu. When on 7th June 1963, Prime Minister Nehru formally opened the Saraighat Bridge, wholly Indian in design and execution, it marked the culmination of a plan first thought of in 1910.

Work commenced in November 1958, and it took Rs. 10.6 crores and nearly four years of round-the-clock effort to throw the bridge across the mighty and turbulent Brahmaputra.

When the first goods train travelled over the bridge on 31st October 1962, it heralded a new era in the fast-developing economy of north-eastern India. For the first time, an all-rail-cum-road link was established between the tea gardens and the oilfields of Assam and the rest of the country.

No less than 4.2 million cubic feet of concrete, 40,000 tons of cement and 14,000 tons of steel were used to build the 10-span, two-tier bridge with a roadway on top and rail tracks below. Of about 11,000 tons of vital mild and high tensile steel required to build the girders of the bridge, about 60 per cent came from the steel works at Jamshedpur. This is yet another example of Tata Steel in the service of the nation.

Swiss Credit

By Our Special Correspondent

NEW DELHI:

BY AN agreement signed in July, 1960, the Government of the Swiss Confederation had agreed to facilitate the opening of transfer credits to the extent of 100 million Swiss francs (about Rs. 10.9 crores) for payments to suppliers in Switzerland for capital goods required for India's development programmes. The amount of credit was subsequently raised to 110 million Swiss francs (about Rs. 11.99 crores).

It has been agreed that the first instalment of 60 million Swiss francs (about Rs. 6.6 crores) will be used for financing: part of Upper Sileru Project (Rs. 2.00 crores), circuit breakers and switchgear required for power transmission schemes (Rs. 0.80 crores), machinery for modernisation and expansion of textile industry (Rs. 0.80 crores), turbo alternator sets for sugar industry (Rs. 0.60 crores), printing machinery (Rs. 0.40 crores), capital goods and equipment required for private sector industry (Rs. 2.00 crores).

Under the second instalment of the Swiss credit, the following items are being financed:-

	Allocation (Rs. crores)
1. Upper Sileru Project ..	1.10
2. Machine tools equipment for Heavy Electrical (India) Ltd., Bhopal, for manufacture of heavy electrical plant equipment ..	0.20
3. Ropeways for transportation of coal ..	0.04
4. Logging and forestry equipment ..	0.11
5. Travancore-Cochin Chemicals Hydro-Sulphite plant ..	0.30
6. Textile machinery ..	1.00
7. Capital goods for private sector industries ..	1.20
	3.95

A contract for the delivery of oil exploration and drilling equipment was signed here during the week between oil and Natural Gas Commission and VJO Technoexport, the supply organisation of the U.S.S.R.

Under the contract, the Technoexport would supply drilling rigs, pipes and production, transport and geophysical equipment etc. valued at about Rs. 80 million. The contract has been signed in pursuance of the Indo-Soviet Agreements of June, 1960 and February, 1961. This equipment will be used by the Oil and Natural Gas Commission for exploration and production of oil in various parts of India.

A Trade Delegation from Czechoslovakia, led by Mr. V. Rudolf, Deputy Chief of the Asian Department, Czech Ministry of Foreign Trade has arrived in New Delhi. It will hold preliminary negotiations for a new trade agreement between Czechoslovakia and India. Mr. F. Hamouz, Minister of Foreign Trade of Czechoslovakia is expected to arrive here in the latter half of this month. The trade between the two countries, which is expected to be of the order of Rs. 12 crores each way in the current year, is likely to be doubled by the end of 1966 as a result of these trade negotiations. Major items of export from India to Czechoslovakia are iron ore, jute products, spices, coffee, mica, manganese ore and de-oiled

cakes. Imports from that country include machine tools, capital goods, power equipment, steel products, and chemicals.

Europe's shipbuilders, plagued by excess capacities, lack of orders and fierce international competition, are now considering a common scheme to avert an all-out crisis. The programme, which would resemble an international cartel, calls, in effect, for a reduction of capacities and a common price level for new shipbuilding. It was initiated by Adolf Westphal, chairman of the Association of German Shipyards and director of the Kieler Howaldtswerke yards (of Kiel) who urged a "voluntary restraint on bids and an adaptation of yard capacities to the requirements of ship-owners."

In 1962, the world's shipyards produced 8.27 million GRT, or 2.6 per cent more than in the previous year. This was the first increase in four years, but shipbuilders in Germany, Great Britain or Denmark, for instance, had no part in this increase and their production declined as a result of fewer orders. Their main complaint was that world shipbuilding capacity was quickly outgrowing the demand for new tonnage; "dumping" and "excessive" government subsidies granted in some countries had made sound competitive conditions illusory. Deliveries of new ships totalled 1,882 units last year, 91 fewer than in 1961 but comprising more tonnage. Nearly half of the tonnage produced in 1962 originated in the world's three leading shipbuilding countries—Japan, Great Britain and Germany. Japan was the only one of the three to increase tonnage built and also to record a remarkable export boom. Great Britain and Germany, by contrast, suffered severe setbacks: production there dropped by 386,000 and 71,000 GRT respectively. Japanese shipbuilders completed nearly 2.2 million GRT in 1962, more than Great Britain and Germany together. Their exports totalled well over one million tons.

The technical services of the Ministry of Defence, in associations with the engineers of Hyderabad Allwyn, have successfully solved the problem of speeding up the process of body-building for general service (GS) military trucks. The conventional methods make it necessary for body-building to be undertaken in the works of the various body-builders. This involves delays and difficulties. Besides the movement of chassis to the workshops of various body-builders, the inspection of body-building at site often poses awkward problems. Under the new technique, conceived by Maj.-Gen. W. T. Wilson, Director of Ordnance Services, it is no longer the case that bodies can be assembled and mounted only in the body-builders' workshops. What may be described as a "kitable" body has been evolved. It can be mass produced, transported easily in CKD condition to various ordnance depots which hold the chassis and assembled quickly on to the chassis by depot personnel.

The design for these all-metal kitable bodies is derived from a truck body designed on similar principles by Allwyn for civilian use, the basic design has been suitably adopted for military requirements. Prototypes were built, intensively tested and after the design was approved for final production, public tenders were invited and the initial contract for 2,000 kits by Allwyn to the defence services and the assembly of bodies therefrom at the Central Vehicle Depot, Delhi Cantt., was celebrated last week at a pleasant function at which the Defence Minister, Mr. Y. B. Chavan, was present. The Min-

EEC 919 B EVEREST

ister for Supply, Mr. Jaisukhlal Hathi, who spoke on the occasion, described the history of the project and said that, thanks to the new technique of kitable bodies, the delivery of GS military trucks to the armed forces could be considerably accelerated. He also pointed out that this achievement was a good example of the fruitful collaboration between the technical services of the Ministry of Defence and engineering facilities in the private sector. A cheque for Rs. 51,000 was presented to Mr. Chavan for the National Defence Fund, on behalf of the Hyderabad Allwyn Metal Works Limited.

The technique embodied in the kitable body represents a new concept in military general service truck body design. Since the bodies and cabs are despatched CKD, they can be packed flat and as many as 10 complete kits can be loaded in a railway wagon. Allwyn have produced in a short period of two months elaborate jigs and tools for each component to ensure perfect interchangeability. Equally elaborate jigs and fixtures ensure accurate and interchangeable sub-assemblies. The final assembly is almost entirely held together by bolts and nuts and a few rivets and tack-welds. Consequently, little equipment or skill is needed in assembling. The ordnance depots are setting up assembly lines with the assistance of Allwyn engineers and will soon start rolling out completed vehicles at a fast rate. This type of cab and body enables replacement of damaged components by substitution with standardised components.

★★

On the basis of several surveys conducted recently by its Research Programme Committee, the Planning Commission has reached the conclusion that many gaps have been left in the implementation of the land reform measures in most of the States. The main defects found are: (1) slow completion of tenancy records; (2) excessive rents realized by landlords in a number of States and lack of uniformity in rents charged and (3) spurious transactions in land in excess of the ceilings fixed.

So far as tenancy deals are concerned, it has been noticed that in six States—Andhra Pradesh, Assam, Kerala, Madras Mysore and Orissa—land records do not contain any information about tenants and share-croppers. In some others, they are incomplete. Many leases are entered into orally with the result that tenants cannot easily prove their title. Most of the States have not ever taken advantage of the Planning Commission's offer to meet 50 per cent expenditure on preparation of these records. The Commission is stated to be anxious that up-to-date tenancy records should be prepared expeditiously. It favours association of non-officials commanding public confidence, with this task as the official agencies may not in many cases know who owns the land and who cultivates it.

About charging of rents, it has been revealed by the Research Programme Committee's surveys that there is a wide disparity in the practices prevalent in different States. In Gujarat, Maharashtra and Rajasthan, the maximum rent charged by the landlords from the tenants currently is one sixth of the produce. In Assam, Orissa and Union Territories, it is one-fourth of the produce or less. In Punjab, it is one-third. In Madras, it varies between 33-1/3 and 40 per cent. In Andhra Pradesh, Jammu & Kashmir and West Bengal, it is 50 per cent of the produce. The Commission is of the view that rents should be steadily reduced to about one-fifth of the produce and that they should be computed in cash. The system of paying rent by way of share in produce, it is felt, is difficult to enforce.

About disposal of land in excess of ceilings fixed, it has come to the notice of the Planning Commission that transfers

have taken place in recent years which have defeated the very aims of land legislation. In one State—Punjab—even after ten years of planning, legislation has not been enacted to fix ceilings on land holdings. In West Bengal, the law passed has yet to be enforced. In several States, including Andhra Pradesh and Mysore, there are no provisions to prevent spurious transfers. In Madhya Pradesh and Orissa, owners of surplus lands are allowed to sell them to persons in prescribed categories. The Planning Commission wants the State Governments to take, at an early date, steps to ensure that the laws on ceilings are effectively implemented and the lacunae in the legislation in this respect are plugged soon.

The National Development Council, which is meeting here next month, is expected to bestow some thought on these issues.

★★

The Union Minister for Steel, Mr C. Subramaniam, revealed at a Press conference here last week that many countries had shown interest in the Bokaro project. He, however, did not further elaborate his statement. An assessment, the Minister added, was being made of how much of the equipment required for the Bokaro plant would be available from indigenous sources. After this is done, global tenders would be invited for machinery to be imported. Efforts will be made to secure credits from the countries which successfully tender for these supplies. The tenders are expected to be issued in about six months. In regard to the two steel plants proposed to be set up in the Visakhapatnam and Goa areas, Mr Subramaniam stated that preliminary investigations had been entrusted to Dastur & Company. On receipt of the reports by the year-end, the Government would have further consultations with foreign experts, if necessary.

The Government has received all round support to the Norwegian proposal for the establishment of an industrial estate for the manufacture of marine diesel engines for fishing craft. The proposal envisages not only the manufacture of engines but also of other fishing equipment, such as winches, fishing gears, propellers as also for training of technicians. According to the Planning Commission a capacity to manufacture 72,000 diesel engines was needed to produce 66,000 engines by 1966. The present licensed capacity for diesel engines is 78,135 as under:

Madras	..	..	..	..	6,610
Punjab	..	..	..	..	5,004
Maharashtra	..	..	..	..	53,290
Gujarat	..	..	..	..	9,475
West Bengal	..	..	..	..	3,000
Uttar Pradesh	..	..	..	..	756
TOTAL	..	..	..	..	78,135

In addition, a scheme of Alcock Ashdown of Bombay was recently approved to create a capacity of 6,000 diesel engines per year.

The Central Board of Revenue has published regulations to govern the import of goods by members of foreign diplomatic missions entitled to "diplomatic immunity". Under the regulations the head of the diplomatic mission concerned or his duly authorised officer shall have to certify that the goods were meant for official use in the mission or for the personal use of a privileged person or for the use of any member of his family and that they would not be sold or

otherwise disposed of in India without obtaining prior concurrence of the Central Board of Revenue and without payment of customs duty, if any payable thereon. There is a schedule attached to the regulations requiring the importer to state the number and date of Bill of Lading, detailed dis-

Cotton Textile Exports to UK

From Our Correspondent

BOMBAY :

MR RAMNATH A. PODDAR, Chairman of the Indian Cotton Mills' Federation has just returned to Bombay from an extensive foreign trip in connection with the annual conference of the International Federation of Cotton and Allied Textile Industries at Athens. He took part also in the negotiations with the U.K. textile interests about the regulation of the export of cotton cloth and yarn from India. He revealed that agreement was reached on the categorization of exports of yarn from India to the U.K. Certain outstanding problems relating to Indian exports of finished cloth and made-up goods still remained to be settled. The meetings between U.K. and India became necessary, Mr. Poddar added, following the insistent demand by the cotton industry of that country for the introduction of some measure of categorization of the Indian export quota of 195 million sq. yards of cloth and 11.5 million lb of yarn. In face of the difficulties experienced by the Lancashire industry, the British delegation which was led by Mr Frank Rostron, Chairman of the Cotton Board, showed deep consciousness of India's need for earning foreign exchange through the export of cotton cloth and yarn to the U.K. This awareness was reflected, according to Mr R. A. Poddar, in the delegation's efforts to meet the Indian point of view. The deliberations of the annual conference of the International Federation of Cotton and Allied Textile Industries were dominated by the theme of regulating the international trade in cotton textiles. There was a tendency on the part of some of the delegates of the developed countries to show opposition to an increase in the exports of the developing countries. The Indian delegation presented to the conference its viewpoint as to how it was possible for the developed countries to absorb exports from the developing countries to their mutual benefit. A few of the developed countries, particularly, the United Kingdom, gave some support to India's stand by suggesting that the Western countries could take 10 to 20 per cent of their domestic requirements from the product of the developing countries as a help to them to earn vital foreign exchange.

★★

In view of the anticipated record U.S. cotton crop, in the coming year, which is estimated at over 14 million bales in spite of a reduced acreage, enough cotton would be available for import by India. According to Mr G. A. W. Schilling of the U.S. Department of Agriculture, yields in America are expected to be at an all-time high. With a carryover stock of more than 11 million bales, plenty of American cotton would be available for export. U.S. exports are estimated around 5 million bales during the coming crop year and domestic consumption would be nearly 9 million bales. India is expected to obtain a large part of the cotton under the barter programme—for items like manganese ore, mica and bauxite. Cotton under this programme is expected to begin moving within the next month or two.

★★

It has been revealed by the Maharashtra Government that the experimental cultivation in some places of the Sea Island Andrews Cotton, one of the best long-staple varieties, had been successful and its cultivation on a large-scale could be undertaken in Maharashtra. Now Andrews Cotton worth Rs 20 crores was being imported every year and Kerala, Mysore and Assam were growing this variety. The Minister for

agriculture, Mr D. S. Desai, observed that the acreage under Deviraj cotton, a variety of long-staple cotton in Maharashtra had risen by 50 per cent in one year—from 1.50 lakh acres in 1962-63 to 2.25 lakh acres in 1963-64. This had been made possible because of a drive carried out to persuade the farmers to go in for this variety and thus help to minimise the import. Production this year is expected to be of the order of 1,80,000 bales against 1,42,000 bales last year. The total acreage to be brought under Deviraj Cotton in the State during the third Plan is 3 lakh acres. If the Union Government assured a higher price for the growers during the next two years, he was confident that the State would certainly exceed the target.

★★

The pattern of income distribution in India 'is more or less similar' to that in some of the developed countries and is more even than that in some of the under-developed countries. This was the conclusion arrived at by a study published in the September 1963 issue of the Reserve Bank Bulletin. The pattern of income distribution in urban areas seems to be more uneven in India than in some of the developed countries. The trend seems to have been towards an increase in the degree of inequality in income distribution. As in some of the developed and under-developed countries, the pattern of distribution of income is more even in the rural sector than in the urban sector. The system of direct taxes is more effective in reducing the degree of inequality in income distribution in the developed countries than in the under-developed countries. The concentration of personal and disposable income in the rural and urban sectors was also given. The finding is that the disparity between the concentration ratios of personal and disposable income is much wider in the developed than in the under-developed countries. The top decile accounts for 28 per cent of personal income and the bottom decile for only 3 per cent. The top 5 per cent of the households accounts for 20 per cent of personal income. The distribution pattern of household income is more or less similar to that of personal income. Direct taxes seem to affect only the top 5 per cent.

★★

Mr G. L. Mehta, Chairman of the Indian Investment Centre, appealed that foreign collaboration should neither become a 'craze' with Indian industrialists nor should it be a 'symbol' for any venture. He decried the tendency of Indian industrialists to depend upon the collaborators for running the show and said that success of any joint venture depended upon the Indian entrepreneur as much as on his foreign partner. Mr Mehta expressed this opinion at a reception given by the All-India Manufacturers' Organization to honour him, Mr R. S. Bhatt, Executive Director and Mr Gopala Menon, Resident Director of the Centre in New York. Mr Bhatt and Mr Menon attended several receptions in the last few days. Mr G. L. Mehta also cautioned that the confidence generated among the foreign investors counted very much in attracting foreign investments further than any propaganda carried out by the Investment Centre or any other agency. Mr Menon explaining the efforts so far made by the Centre in furthering the flow of American private capital into India said that the present generally favourable climate in the USA was bound to improve in the future. The Kennedy Administration had come out fully behind India to tell their investors that 'a

great giant is waking up' and India presented tremendous opportunities for American industrialists to go in. 'Haphazard handling' of negotiations often left the American parties in confusion. It was in that context that he had advised the Indian industrialists to utilize the assistance of the IIC in Indian industrialists to flood information to the same stead of different parties flooding information to the same American party. When entrepreneurs forwarded proposals to the IIC, they should be exhaustive in furnishing information like capital structure, raw materials, capacity and production targets. American businessmen were 'hard boiled' and liked to get 'hard facts.'

★★

At the Tariff Commission's public inquiry into the cost structure of preserved fruit and vegetable industry and the need for subsidy on tins for open top sanitary (O.T.S.) cans, held recently in Bombay, the Commission's Chairman Mr K. R. P. Aiyangar, underlined the significant role that the preserved fruit and vegetable industry has to play in the country's economy since it conserves valuable food material which might otherwise go waste and also supplies important articles of consumption for our defence forces. Export markets also offer greater scope for further exploitation. However, he said, that a wider market can be developed and retained only by reducing the cost of production for which there was ample scope.

The industry, which was protected from 1948 to 1957 has shown considerable development during recent years. The number of units licensed under the Fruit Products Order (1955) to manufacture preserved fruits and vegetables, increased from 720 in 1957 to 929 in 1962. In 1961, there were only 82 large-scale units whose annual ex-factory sale value exceeded Rs 1 lakh and the rest were small-scale and cottage scale units.

The total production of fruit and vegetable products increased from 25,986 tonnes valued at Rs 316.36 lakhs in 1957 to 47,373 tonnes valued at Rs 632.30 lakhs in 1961, thus recording an increase of 82 per cent over the four years. During this period the rise in the case of production of vinegars, tomato products and sauces, fruit beverages and canned vegetables was as high as 159 to 522 per cent.

In 1961, aerated fruit beverages, canned vegetables, fruit beverages and pickles together accounted for 62 per cent of the total production. The second Plan had fixed a target of production for this industry at the end of 1960-61 at 50,000 tons. The actual production at the end of 1960 was 40,000

Durgapur Canal

From Our Correspondent

CALCUTTA :

MORE THAN four years behind schedule, the 85-mile long DVC navigation canal connecting Durgapur with Calcutta was formally opened for traffic last week. This canal has been built at a cost of nearly Rs. 5 crores and is designed to carry a gross traffic of 2 million tons of cargo. Originally it was intended to be opened in July 1959 but the collapse of a regulator in the September 1959 floods blasted all hopes of the navigation facilities being made available at an early date. It took the DVC nearly three years to reconstruct the regulator and since July last year hopes revived of the canal becoming navigable in the not distant future. The whole project however has been a dismal story of slipshod planning, ad hoc decisions and lack of coordination between the diverse authorities connected with the construction and maintenance of the canal. At one time it was feared that the canal will prove to be a costly failure because of the difference in water levels at particular points. Finally when everything seemed to be shaping well, it was revealed that the canal could not

tons, i.e., about 20 per cent below the target. The third Plan has fixed a target of 1,00,000 tons by the end of 1965-66.

Reviewing the growth of can fabricating industry, Mr Aiyangar stated, that the present capacity to manufacture O.T.S. cans stood at 150 million per year on single shift basis. The production of such cans has increased from 13.44 million in 1958-59 to 32.15 million in 1962-63. The consumption of tinplate which is mainly imported for the manufacture of subsidized cans, increased from 1,134 tonnes in 1958-59 to 2,420 tonnes in 1962-63. Since the introduction of the tinplate subsidy scheme in June 1958 the number of subsidy holders has increased from 32 in 1958-59 to 159 in 1962-63, and Government incurred during the five-year period an expenditure of about Rs 45 lakhs, i.e., less than Rs 10 lakhs a year on account of subsidy.

★★

Mr. Viren J. Shah, Chairman of the Steel Re-rolling Mills Association of India, has welcomed the Raj Committee Report on Steel. He has said that the suggestion to set up a steel plant specially for making billets for re-rollers is encouraging. Since controls are recommended to be removed, the suggestion to set up a Joint Plant Committee has been welcomed by him. One of the glaring omissions, he said, is that the Committee has not recommended representation of the re-rolling industry on the Joint Plant Committee. This industry consumes more than 25 per cent of steel (in the form of billets) produced in India. It is also responsible for about 25 per cent of finished steel produced in the country. It was wrong, he said, to leave out such an important segment of the industry from representation on the Committee. The recommendations to authorize the main producers to raise the price of billets, if accepted, would be severely harmful to the re-rolling industry. It is likely that the recommendation regarding distribution of billets will create complications. The suggestions of establishing freight equalization for re-rollers and maintenance of the status quo in the case of the main producers appears to be grossly unjust to the re-rolling industry. Mr Shah stated that it was not clear from the report whether re-rollers would be called upon to pay deposits on billets they get from the main producers, but if that was the intention, the Government should not accept that recommendation since re-rollers were themselves steel producers, though of secondary type. The recommendation that there should be no import entitlement for exports of scrap should be implemented promptly.

serve both irrigation and navigation adequately. Only on the West Bengal Government agreeing to substantially reduce the targets for rabi irrigation (from the original target of 3 lakh acres to 55,000 acres) a solution to the problem of inadequacy of water could be found. According to the DVC, there are six factors that should be satisfactorily tackled in order that the canal is put into actual use. They are: (a) possible inadequacy of water for navigation after meeting rabi irrigation needs, (b) setting up distinct organisations for moving traffic upto the loading points and for moving traffic in vessels along the canal, (c) provision of mechanical loading and unloading equipment, (d) round-the-year navigation of Hooghly, (e) amendment of the law to make licence and registration fees leviable and (f) subsidy for making up the deficits. The most important requirement is adequate water supply and that has been ensured with the agreement of the West Bengal Government to restrict rabi irrigation target. The other important problem is the fourth in the above list and the DVC representative has informed the Public Accounts Committee

A further tribute to our leadership in India has been given by Hindustan Steel through the award of the contract for supply, erection and commissioning of the Electrical Power Distribution equipment for their expansion at Durgapur. We, at GCCP, are proud to be associated with the engineers of H.S.L. in shouldering the responsibility for the electrification of this gigantic project.

THE LARGEST ELECTRICAL "TURNKEY" CONTRACT AWARDED TO AN INDIAN COMPANY

GREAVES COTTON & CROMPTON PARKINSON LIMITED

of Parliament that the round-the-year navigation of Hooghly is not very much of a problem since Hooghly is navigable all the year round by craft of the particular type used in the canal. There is, however, the question of silting of the tail-end of the canal. The PAC has been told that an order for a dredger has been placed and its delivery is expected in 1964. Now that the canal has been opened to traffic, the strain on the overworked road and rail systems may be expected to be relieved somewhat. It is however to be noted that the opening of the canal has only generated subdued optimism. This is understandable because of the following observations of the Public Accounts Committee: "The committee feel concerned at the delay in establishing the causes of the collapse of the bridge, which took place in September 1959. They trust that the finalisation of the findings of the expert committee will not be further delayed. They would like to know the action taken to fix the responsibility for the collapse of the bridge on the basis of the findings of the expert committee and the remedial measures applied to other similar structures."

★★

Although Mr P. C. Sen, the Chief Minister, has been often speaking on the food situation in the State during the past few days, he has not been able to give any good news to those who still prefer to eat rice. He has however been all along consistent in his stand that the shortfall in the supply of rice is so big that it is impossible to meet the demand beyond a particular point. There are about 12 million people who are demanding rice but the Government could make firm arrangements to meet the rice needs of only 8.5 million people. The proper thing to do is for the rest of the population now demanding rice to take to wheat. He has tried to emphasise again and again that there is no food shortage. Only rice is in short supply and the remedy is to substitute wheat for rice and there will not be any difficulty because wheat is in plentiful supply. But there are people who seem to think that when demand for wheat increases, the Government will come up against fresh difficulties in ensuring supplies. It is also felt that Government has failed to take expeditious steps to arrest the spurt in rice prices. Over the past few days rice prices have shot up with certain varieties selling at as much as Rs. 50 a maund. The Chief Minister who said the other day that wholesale prices were declining however admitted that the change for the better had not been reflected in the retail level. It is pointed out that the State Government is unnecessarily complicating a situation which is no doubt difficult but temporary. It is generally expected that the rice supply will markedly improve in about two months' time with the arrival of the new crop. Fortunately, the coming crop in West Bengal is said to be quite good and according to the Chief Minister of Orissa that State also expects to harvest a bumper crop. So it is argued that the proper thing for the State Government to do is not to urge people to change their food habits overnight—the wisdom of the step to ask people in this State to consume more wheat is not questioned: but it is a measure that has got to be accomplished steadily over a period—but to try to get over the temporary scarcity period by making up the shortfall from supplies from the Centre and surplus States such as Andhra. In this regard the suggestion of the committee of the Bengal National Chamber of Commerce and Industry reflects the general view on this ticklish question. It points out that a total of 80,000 tons appear to be available from the two States of Orissa and Andhra and if only the West Bengal takes energetic steps to persuade these two Governments to liberalise their despatches, there will be a favourable effect on rice prices in West Bengal.

★★

Prospects for close cooperation of UK's National Coal Board with the Indian coal industry as a whole in its deve-

lopment plans have considerably brightened since the brief visit to this country recently of Lord Robens, Chairman of the NCB which is presently assisting the NCDC in the development of deep shaft mines. In the course of his discussions with the private sector coal industry in Calcutta, Lord Robens indicated the readiness of NCB to train Indian personnel either in England or in India itself with a view to enabling this country to achieve its targets in the coming plan periods. He has however pointed out that India's plan to raise 350 million tons of coal by 1980 is impracticable. According to him it would be physically beyond the capacity of the country to attain such a big target while financial stringency will also constitute another serious obstacle. He said that to reach the present coal production level of 200 million tons, the UK had to invest nearly £ 1000 million since 1947. As pointed out by Lord Robens himself, talks of automation in the coal industry in our country may not be relevant in the present context of the huge employment but what he has said on the subject nevertheless deserves careful consideration. Automation in the coal industry in England is a must because it has to compete with the cheaper American coal and oil. Automation has enabled the NCB to reduce an estimated labour force of 2,500 to a mere 250 in a particular mine.

★★

If Lyons Range has been reassured by the Finance Minister's broadcast to the nation last Friday evening, it has yet to display its enthusiasm. For in last Saturday's trading, prices continued to hover around previous levels which were not the best touched recently. Perhaps this is because, concrete evidence of the Government's new found anxiety to stimulate the allround economic growth seems to be still in the offing only. He has however promised to initiate early steps to meet the credit demands for all productive purposes. There are passages in his speech which indicate that the difficulties of the private sector in increasing production will receive sympathetic consideration. But it is generally believed that liberalisation of credit will come soon enough but fiscal changes, if any, will not be announced before the next budget. So there is a tendency to await the shape of things to come before extending commitments. The undertone however continues to be fully steady and this partly stems from encouraging news from the corporate front. As far as Lyons Range is concerned, the resumption of aggressive bullish fervour has a deterrent in the proximity of the long Pujā holidays. The reluctance of operators to push up prices any further may also stem from the none too improbable contingency of the authorities frowning upon any unbridled speculative fervour.

★★

Although the jute goods market continues to display a steady undertone, prices have been moving both ways under alternate bouts of buying and selling. The market is still sustained largely by the expectation of further fresh orders especially for sacking in view of the reported trade deal of Pakistan with China for the supply of about one lakh tons of sacking. With Pakistan thus committed to supply China a sizable quantity of jute goods, she will not be a serious competitor to India for at least some months to come. In the meantime, the fact that stocks of jute goods at the end of September with IJMA mills have increased despite a fall in output has been a damper. Though it is explained that the rise in stocks is partly due to the congestion in Calcutta port in September, the development has nevertheless served as a reminder of the setback suffered by sacking exports over the past few years. It is relevant to note in this connection the observations made recently by Mr C. L. Bajoria, former chairman of the Indian Jute Mills Association in the course of his comments on the recommendations of the Srivatsava Committee. He has expressed surprise that the committee

which was set up to suggest ways and means of increasing export of jute goods from India has totally ignored the threat posed by the fast growing Pakistani industry. In his view continued failure to counter Pakistani competition will result in losing for our industry the entire sacking market abroad and a shrinkage of hessian market as well.

★★

The Indian Chamber of Commerce, Calcutta, have forwarded their views on utilization of foreign aid to the Rao Committee stating that the rate of utilization could be hastened "by appropriate physical measures and streamlining of Government machinery." An important cause for the slow utilisation of foreign loans and aid is the difficulty experienced by entrepreneurs in getting together the requisite rupee finance to match the external assistance. To remedy this situation, measures need to be adopted to revitalize the capital market. Risk capital is not forthcoming currently because growth prospects of companies have become unattractive due to the taxation policy. A liberalization of equity-debt ratio in the proportion of 1:2 is also necessary so that the entrepreneurs may be able to obtain loan finance if sufficient equity capital is not available. The Reserve Bank's restrictive credit policy has greatly reduced the commercial banks' advances against shares, making the capital market still more difficult. The Chamber strongly feels that such restrictive policies need to be reviewed so as to provide encouragement

Accent on Coffee Exports

From Our Correspondent

MADRAS :

INDIAN COFFEE is getting into the headlines. The success of the export drive in the last three years has encouraged the Indian Coffee Board to approach the International Coffee Council for increasing our export quota to the rather handsome figure of 50,000 metric tons from the present quota of 21,305 metric tons. With a slump in prices sometime back in world markets and the apathy shown by estates owners for building up an export trade, so long as internal sales were remunerative, there was no problem of marketing. However, it was feared in 1960-61 that the problem would relate to the disposal of a large crop especially as internal consumption was not expanding at the anticipated rate. There was a record crop of 66,000 metric tons in this year and the problem related for a time in several years to its marketing. It was even felt that, without a sizable export trade, the industry could not think of increasing the size of the crop. Even though there was an accumulation of stocks at the end of 1960-61 season and prices slumped, later developments have come about in a rather unexpected manner. Either because of the recent emphasis on growing more Arabica coffee or unfavourable weather conditions, the coffee crop has been fluctuating between only 57,000 and 60,000 metric tons in the last three years. The quantum of exports has tended to increase and plantation grades particularly could be disposed of without difficulty though prices were not considered remunerative enough and internal sales were more profitable. But the Government have been advising the coffee growers to step up exports and utilise Robusta grades for internal consumption as far as possible. In the absence of easy availability of plantation grades and Peaberry, Robusta has been used in larger quantities after being blended with Arabica varieties.

The position is now such that the industry cannot hope to increase exports without restricting consumption. This position is in direct contrast with the situation that obtained three years ago. The Indian Coffee Board was successful in signing an international agreement last year and a quota of 21,305 metric tons was allotted, as stated earlier. A higher quota could not be secured because average exports were rather low, the drive

for a sufficient flow of rupee finance for increasing participation in industrial ventures with foreign collaboration

Another factor retarding the growth of foreign collaboration is the highly controlled character of the economy and the administrative set up. The procedure for Government's examination of proposals involving foreign collaboration is lengthy and cumbersome. The various stages through which a proposal has to pass take a long time with the result that a project needs nearly four to five years for coming to fruition. The entire process of sanctioning the schemes needs to be streamlined. It has been suggested by the Chamber that a single committee should be empowered to examine and decide on every aspect of foreign collaboration proposals so that all delay is eliminated. Mention has also been made by the Chamber of the uneconomic price policy, inadequate return on capital, difficulties in sanctioning royalty agreements and the taxation structures as a whole as factors responsible for a decline in the number of foreign collaborations. Foreign collaborators generally like to know beforehand how much tax they will have to pay and the terms of the collaboration are usually finalized after taking into account the tax payable. It is desirable, therefore, that in the case of joint ventures the C.B.R. should have a system of clarifying what will be the tax position under any proposed scheme of foreign collaboration.

for maximizing foreign exchange earnings being intensified only latterly. But over and above exports against the quota, our estate-owners have been developing the trade with non-quota countries like the U.S.S.R., East European communist bloc and neighbouring markets like Ceylon, Iran etc. The offtake by these countries has been quite satisfactory in recent months and it is now estimated that total exports will be over 30,000 metric tons in the current year. As internal consumption has been between 32,000 metric tons and 35,000 metric tons it is felt that the marginal shortage can have upsetting effect especially if the present trend in internal consumption proves to be more pronounced. The current season's crop is estimated at around 60,000 tons and with good blossoms the next crop may be larger.

But if Mr Manubhai Shah's move for raising the export quota to 50,000 metric tons proves to be successful even partially and we are allowed to export up to this limit in stages, it might happen that, even in a short period, the total of exports would amount to 40,000 metric tons. As the coffee habit has been latterly spreading fast in different parts of the country it has become necessary to think in terms of a policy which would ensure the same rate of increase in output as was witnessed in the 'fifties. During that period there was a more than doubling of the yield of the crop on account of better methods of cultivation and the extension of acreage. Even now it is said that the estates can undertake a programme of fresh planting besides raising the yield from existing acreage. It is no doubt anticipated that, within a five-year period, there will be an increase in the yield of the crop to 80,000 metric tons in the normal course. But it would be necessary to have even accelerated progress if simultaneously with an increase in exports internal consumption also is to be allowed to grow in an uninhibited manner. The Coffee Board has a special responsibility in this regard as, apart from additional foreign exchange earnings of Rs. 10 crores on account of the stepping up of exports, the needs of the internal market should be met freely. The Union Minister for International Trade has asserted that, notwithstanding the vagaries of the monsoon and the difficulties involved in coffee cultivation, the yield of the crop could be significantly raised by adopting better methods and applying

larger doses of fertilizers. While there should be no problem of marketing a larger crop under the changed circumstances, the assurance has also been given by the Minister that the growers should be guaranteed a minimum price if ever there happened to be a slump in the market. The coffee industry is, therefore, on the eve of a new era of expansion.

★★

It had been hoped sometime back that the South Arcot District in Madras State, which is the home of lignite now being used intensively for generation of power, would also come to the rescue of this region by leading to the find of reserves of non-ferrous metal ores. The Geological Survey of India has been exploring this region for some time past and it was suggested that there might be reserves of copper, lead and zinc which could be commercially exploited. The size of the reserves was not known then. It has now been stated that about 8 lakh tons of ore reserves have been located. Even though this quantity cannot be considered large in any sense the content of metals in the ore is high enough to warrant commercial exploitation. Copper will necessarily have to be refined in conjunction with other metals like lead and zinc. The share of copper is no doubt low at one per cent of the ore that might be milled but the yield, however, will be fairly large as the aggregate proportion is as much as 10 per cent. It may be said that even the fullest use of reserves, not more than 60,000 to 80,000 tons of different metals can be refined. However, since the Indian Copper Corporation in Bihar has not been producing more than 5,000 to 6,000 tons annually, a medium-sized project, without involving heavy capital expenditure, can be started. It might happen that when mining operations are begun, additional reserves are located. Private parties will be allowed to undertake the exploitation of these new reserves. But the Indian Bureau of Mines might take up the task itself if no entrepreneur volunteers to take up the work.

★★

The broadcast speech by the Union Finance Minister had been eagerly awaited by industrialists and stock brokers in Madras City. Even though there was reason to believe that Mr. T. T. Krishnamachari would make a constructive speech there was no disposition to anticipate his pronouncement. The Finance Minister could not naturally make any definite announcements as he was still examining the impact of credit and tax policies and any major decision could not be taken without having discussions in Parliament. It is now, however, expected that there would be a liberalization of credit restrictions and that no serious difficulties would be experienced during the next busy season in meeting requirements of industry and trade. The reaction in business circles here to the observation made by Mr. T. T. Krishnamachari has been quite favourable and somehow there is a feeling in knowledgeable quarters that, besides easier credit availability, there would be changes in direct and indirect taxes. The corporate sector may probably be helped to proceed with the expansion plans with liberal outside assistance apart from definite inducements for promoting capital formation within the sector. The Super Profits Tax might be modified or even abolished though it is not known whether an announcement to this effect would be made during the winter session. But it is felt that corporate bodies will get greater relief than individual income-tax assesses and many of the pending schemes for developing new industries would be finalised in a short period.

It is apprehended, however, that some measures might be adopted to mop up unaccounted money though it is not clear how this problem would be tackled. If speculation in commodities could be effectively checked and tax evaded sums could be legalised somehow, many of the present difficulties relating to availability of funds could be got over while violent fluctuations in the commodity markets due to speculation can be avoided. The stock market, however, has not had the opportunity to digest the observations of the Finance Minister. The trend of

prices even earlier was inclined to be steadier and on account of the reserve of sellers no large business could be put through. With favourable advices from Bombay and Calcutta select scrips in Madras were pushed higher. Planting shares too improved further and the general undertone was inclined to be hopeful. There may not be any increase in activity as there is already a holiday feeling in evidence in Calcutta while business will be brisk in Bombay only after the Moorat session on October 17. All the same, there is a feeling that stock markets have turned the corner and with a positive relief in taxes prices might be marked further higher in the coming weeks.

★★

The 22nd meeting of the Central Board of Trustees which administers the Employees' Provident Fund, was held at Madras on October 7, 1963, under the chairmanship of Mr. N. N. Chatterjee, Joint Secretary, Ministry of Labour and Employment, Government of India. The Board discussed the question of setting up of a 'Death Relief Fund' under the Employees' Provident Fund so as to ensure a minimum payment to the nominees/heirs of the deceased members of the Fund. It also considered re-introduction of the facility of grant of advance from provident fund for meeting medical expenses in certain types of illness. The annual report on the working of the Employees' Provident Fund Scheme for 1962-63, was also an item on the agenda. At the end of June, 1963, about 23,300 factories and other establishments were covered under the Employees' Provident Funds Act and the benefit of contributory provident fund was being enjoyed by about 36.66 lakhs of workers. The Employees' Provident Funds Act, 1952, which was initially applied to six industries, now applies to 81 industries and classes of establishments.

DARE HOUSE at PARRY'S CORNER

Soon after he had founded his business in 1788, THOMAS PARRY acquired a site for his office and godowns at the corner of Esplanade and First Line Beach, strategically situated, as close as it was then possible to approach Fort St. George. It was not long before this corner became known as Parry's Corner, which name it bears to this day.

On January 1, 1819, PARRY took into partnership JOHN WILLIAM DARE—"not only a fine businessman but also a great character." DARE HOUSE, the Head Office of the E.I.D.—PARRY GROUP is named after him.

One-hundred and twenty-five years have passed since JOHN DARE'S death in 1838. Eventful years of steady progress for PARRYS!

The E.I.D.—PARRY GROUP of today consists of E.I.D.—PARRY LTD., PARRY & CO., LTD.

and a number of subsidiary and associated concerns, in all nine companies of substance, contributing to the country's economy through the manufacture of sugar, confectionery, fertilisers, light railway equipment, industrial and potable alcohol, acids, chemicals, carbonic acid gas, sanitaryware, etc.

The GROUP provides employment to more than 10,000 people. The strong position it has achieved today gives it courage and confidence further to increase and broaden its activities to keep pace with the country's Five-Year Plans.

Oil and Karnatic Music... Sales Service Manager Chari is in harmony with both

He has a wealth of information at his fingertips, an active, facile brain, a quick winning smile... And among his fellow officers in the Sales Department at Burmah-Shell's General Manager's Office, Chari is known as the man with the answer. How was this done in 1953? And why was that decided? Chari knows. How will this be done in 1973? Check with Chari. He always helps. But if Sales isn't your interest and Karnatic music is, once again, ask Chari. He is sure to know.

'WOULD BE LOST WITHOUT HIM'

The Sales Manager says, 'I would be lost without him.' He'll write you a contract or quote you a price, produce statistics or analyse a trend, with speed and obvious pleasure. He has en-

joyed his work for 31 years and looks forward to another three years of it.

TODAY, AS EVER, PEOPLE LIKE CHARI ARE WORKING FOR YOU
Chari has never been known to flinch before a mass of figures, or duck an argument on Karnatic music! His only daughter has won the President's Prize for vocal Karnatic music and holds a Government scholarship. 'Like father, like daughter,' Chari says chuckling.

Chari and people like him—at all levels of responsibility—are to ensure that vital petroleum products, essential to India's growth and progress, are brought to you at the right place and time, in the right quantities.

BURMAH-SHELL are People in the service of the People

The moving finger writes

WE WERE listening to a musical recital by Madurai Mani last Friday on the Madras station of the All India Radio when the programme was interrupted for the Finance Minister's broadcast to the nation. One of us, a rather ardent fan of Madurai Mani, was more than slightly annoyed and his irritation became all the greater on finding that Mr. T. T. Krishnamachari had no sensational announcement to make. Since he also happened to be a journalist, he went on to complain why the Finance Minister should not have chosen the medium of a Press conference to release his statement. His argument was that a Press conference would also have had the additional advantage of giving the Press an opportunity to put questions on matters arising from the statement.

I, however, am inclined to disagree. Even on the purely aesthetic plane, the broadcast was an enjoyable performance. The shrillness that is sometimes noticeable in Mr. Krishnamachari's voice when he uses the mike was happily completely absent. He spoke in a very soft, well-modulated, almost musical voice which sent my teen-aged daughter into something like an ecstasy. The script of course helped a lot and the fact that he himself had drafted it is a credit to Mr. Krishnamachari. Except in parts, it was in tidy and telling sentences while, for the most part, the language, allowing for the necessary use of technical words or phrases, was simple and direct. But it was in the mode of his delivery that Mr. Krishnamachari scored most strikingly. He spoke in a manner which was intimate, personal, giving the listener the impression that he was not only talking to him personally but was also greatly caring how it all went down.

I have no doubt that Mr. Krishnamachari has done a wise thing in electing for this kind of personal diplomacy in the matter of public relations for his colourful and controversial portfolio. In fact, I would strongly recommend that the radio should be used more and more by leaders of Government for communicating with the people and taking them into confidence on the working of the Administration in important areas of public welfare. I am aware that as one belonging to the Press, I am not exactly promoting the interests of my guild when I plead the rival claims of broadcasting, but I am convinced that since the AIR is a Government undertaking, the Government should at least get more out of it than it seems now to be doing.

★★

The selection of Mr. Kamaraj for the Congress Presidency has been described as "unanimous". But, given current tensions in the party hierarchy, "unanimity" in a matter of this kind is just not possible in the true sense of the term. It would be more accurate perhaps to say that Mr. Kamaraj was chosen "without dissent". That Mr. Kamaraj himself would have dearly loved to be excused is not in doubt. If, in the event, he has acquiesced, it is clearly because this is the only decision which, in the present state of party affairs, would have avoided an eruption, perhaps violent, but certainly disconcerting, of personal rivalries and factionalism at the level of the national leadership. And so, for the time being, the explosive issue of "the next man" or even "the second man" seems to have been shelved, although politicians practising astrology, even if not astrologers practising politics, have apparently begun moving already to the conclusion that from the manner in which the question of Mr. Sanjivayya's successor has been

settled, certain aspirants have definitely lost ground—perhaps irretrievably.

★★

I never doubted for a moment that Mr. S. K. Patil would manage to get away with it. Those who would normally have been inclined to make an issue of his Calcutta speech were not on as firm ground as might have been generally assumed — and they knew that they were not. Man, it is said, is a political animal and, in that sense, at any rate, Mr. S. K. Patil is the Perfect Man. There was just enough home-truth in his Calcutta homily to compel his would-be critics to decide to lump it all on the excellent principle that discretion was the better part of valour. It is surely significant that the Prime Minister found it wise and convenient, when an opportunity was offered to him at his last Press conference, to declare with great vigour that he was not thinking, nor had he ever thought, in terms of a "second or third list" of what may be described as "Kamaraj resignations". It will be recalled that one of the points made by Mr. S. K. Patil in his Calcutta speech was that the implementation of the Kamaraj Plan should not be done in a manner which caused confusion within the Congress Party over motives or resulted in the dislocation of the functioning of the Government through prolonged uncertainties about the future of individual Ministers or their portfolios.

In the circumstances, I am inclined to conclude that this particular Patil episode has, on the whole, ended well for all concerned—and I am not forgetting the Press, which, predictably, has been blamed for misreporting the Calcutta speech. This is not the first time — nor will it be the last — that politicians who find that they may perhaps have let their loquacity get the better of their instinct for self-preservation have exploited the alleged weakness of the Press for attempting to take a public man's foot and thrust it into his mouth. But the Press manages to survive — even as Mr. Patil does; the public has come to understand only too well that it is the professional privilege, even if it may not be the divine right, of politicians in tight corners to accuse the Press of hearing one thing and reporting another. Finally, I see that I have said "this particular Patil episode". Surely, no one would believe that Mr. Patil is now cured for good of the habit of saying things which, if embarrassing to himself, are usually even more embarrassing to others.

★★

It is a bracing experience to meet the Minister for Supply and discuss with him how things are going on in the direction of provisioning the Defence Services. It is rather difficult to draw Mr. Hathi out on the subject of his Ministry's performance. I am convinced, however, that much good work is being done in a silent way in organizing the production, procurement and distribution of provisions and equipment required by the Armed Forces. Indeed, I was able to wring out of Mr. Hathi the reassuring information that in the matter of supplies, such as clothing, footwear and tents, not only have the Armed Forces been adequately equipped but stocks have also been built up to take care of future needs. Mr. Hathi hinted that his organisation was no longer confining itself to new procurement but was also undertaking larger responsibilities such as assistance to suppliers in obtaining raw materials and other facilities for their manufacturing programmes. Mr. Hathi is also emphasizing the development aspect of his Inspection organisation by asking his inspection staff to extend technical advice wherever needed.

V.B.

tomers to buy his product. Here the buying habits of the people can provide a helpful guide. Mail order selling, door-to-door canvassing and the appointment of wholesalers, retailers, etc. need to be handled imaginatively. Mr. Bell advised that the highest percentage of possible outlets must be sought if sales were to be smooth and speedy. The fourth important element in the marketing mechanism was split by him into two parts. The first part related to "concentration" in the sense that the consumer must not be confused by being asked to assimilate too much at once. If a product had a number of selling points, only one should be stressed in the first instance. The example of the London manufacturer of shirts who pushed his sales by concentrating on white shirts proved the efficacy of "concentration." The second was "domination" of the market; in case the manufacturer had limited resources, he must "dominate" a small area instead of frittering his strength over a wide area.

POWER PROJECTS

Five new power schemes, which will yield results in the beginning of the fourth Plan, have been sanctioned by the Union Ministry of Irrigation and Power. The schemes have been sanctioned in advance to ensure that there is no imbalance in the demand and supply of power in the beginning of the next Plan. Consisting of nine units in all, they will generate a total of 7,15,000 KW power.

The power stations sanctioned include:

Dhuvaran thermal station extension	)	Gujarat	2 x 125 MW = 250 MW
Harduaganj thermal station extension	)	U.P.	2 x 60 MW = 120 MW
Kodayar hydro electric station	)	Madras	1 x 30 MW = 75 MW 1 x 45 MW
Durgapur Coke Oven thermal station extension.	)	West Bengal	1 x 150 MW = 150 MW
Kothagudam thermal station extension	)	Andhra Pradesh	2 x 60 MW = 120 MW

FOREIGN CAPITAL

In an address delivered on September 16, 1963, at the 13th International Management Conference held in New York, Mr. H. K. S. Lindsay, Managing Director, Metal Box Company of India Ltd., explained in detail the role of foreign enterprises in developing economies with particular reference to India. He said that in India "there had been no turning back from the welcome extended to foreign capital after Independence." On the basis of his 15 years' experience in India, he asserted that "the developing nations will increasingly judge private foreign investment not merely in terms of financial costs and benefits but by its broader contribution to the economy," which depended on the quality of management which the overseas investor brought into the enterprise. The application of sound management principles in an unfamiliar environment required both flexibility and imagination of a higher order; that was a challenge which international management must prepare itself to meet if it desired to take the best out of its investments in the developing economies of the world. Speaking of the prospects for further investment in this country, he expressed the opinion that the economy offered splendid opportunities for further investment and that the market was almost unlimited. The recent budget had no doubt increased the incidence of taxation, but the modifications made in the Super Profits Tax to favour new enterprises and the incomes

received by non-residents, showed that the Government were keen to encourage foreign investment. A fact which needed to be borne in mind was that "many of the industries were highly protected against competitive imports which both reduced risks and enhanced profits."

TANKER 'DESHBANDU'

The 33,500-ton tanker "Deshbandu" belonging to the Indian Shipping Corporation was launched at Hitachi Enoshima Yard on October 5 by the Indian Ambassador in Japan, Mr. Lalji Mehrotra, in the presence of the President and Managing Director of the Hitachi Company and a selected gathering. "Deshbandu" is the first tanker acquired in Japan by the Shipping Corporation.

BANK TAKE-OVER

The assets and liabilities of the Coimbatore Sri Kannikaparameshwari Bank Ltd., Coimbatore, have been taken over by the Canara Industrial & Banking Syndicate, Ltd. with effect from October 3, 1963. Started in 1927, the Coimbatore Sri Kannikaparameshwari Bank had one office at Coimbatore. With the merger of Sri Kannikaparameshwari Bank, 15th to be taken over, the Syndicate Bank will have two offices at Coimbatore.

DELEGATION TO GERMANY

The Government of India has announced the inclusion of Dr. D. P. Antia, Director, Union Carbide India Ltd., as a member of the Indian Goodwill Mission to Germany. The other three members of the delegation are Mrs. Sharda Mukherjee, member of Parliament, Mr. H. C. Mahindra of Mahindra and Mahindra and Mr. A. M. M. Arunachalam of T. I. Cycles of Madras. The members of the delegation will attend the opening of the Berlin Industries Fair, and visit important industrial centres in Germany. The delegation will stay in Germany for two weeks and will be the state guests of the Berlin Senate and the West German Government.

ALUMINIUM PRICES

Aluminium Limited has announced that with effect from October 2, 1963, its basic price for Primary Aluminium Ingot in world markets has been increased by one-half cent per pound to U.S. cents twenty-three per pound CIF main ports.

THE CALCUTTA ELECTRIC SUPPLY CORPORATION LIMITED

(Incorporated in England)

Notice is hereby given that the Board of Directors of this Company have declared payment of an Interim Dividend on the Company's Preference Stock for the year ending 31st March, 1964 at the rate of £2-14-8.16/49d. per cent less Income Tax at 7s. 9d. in the pound equal to £1-13-6d. per cent. Payment will be made on 15th November, 1963 to those stockholders whose names are registered in the Company's Stock Register on 28th October, 1963.

Applications for transfers received in this Office before 12 O'clock noon on Monday, the 28th October, 1963, will, if otherwise satisfactory, be registered at that date for the purpose of participation in the above dividend.

BY ORDER OF THE BOARD,

D. P. M. KANGA,
Agent.

VICTORIA HOUSE,
CALCUTTA, the 10th October, 1963.

High Abrasion Furnace Black

Use Philblack O to help overcome such obstacles as cracking and excessive wear in tyre treads... to reduce dangerous static electricity in tyres and industrial belting. To give mechanical rubber goods the qualities they need to overcome toughest service conditions, and, in general, give your rubber compounds exceptionally good physical properties... use Philblack O.

PHILBLACK O is now made at our Durgapur Plant.

Let any or all the types of Philblack work for you.

Company Affairs

HYDERABAD ALLWYN

THE HYDERABAD Allwyn Metal Works Limited has recorded handsome results for the year to April 30, 1963. With sales rising from Rs. 2.77 crores to Rs. 3.54 crores, the net profit increased substantially from Rs. 5.30 lakhs to Rs. 17.23 lakhs. The directors have proposed to maintain a dividend at 10 per cent on increased capital. Subscribed and paid-up capital at the end of the previous year amounted to Rs. 43.00 lakhs which was increased to Rs. 120.49 lakhs by the end of the year under review. The dividend is to be paid out of the dividend reserves to which a sum of Rs. 12.05 lakhs has been transferred. Allocations include Rs. 14.63 lakhs for depreciation, Rs. 2.61 lakhs for managing agents' commission, Rs. 5 lakhs for deferred taxation reserve and Rs. 2.65 lakhs for general reserve. During the year under review the company's expansion proceeded satisfactorily and the programme was almost completed. The addition to plant and machinery during the year was to the extent of Rs. 54.28 lakhs. The company made arrangements on a priority basis to manufacture and supply some defence requirements without, however, affecting the production of its normal items.

SARAN ENGINEERING

The Saran Engineering Company Limited proposes to undertake the manufacture of pneumatic hammers in collaboration with Beche and Grohs of West Germany. The company has applied to the Government for industrial licence for this purpose. During the year ended March 31, 1963, the company earned a net profit of Rs. 2.14 lakhs. This is after providing Rs. 3.00 lakhs for taxation and Rs. 1.09 lakhs for depreciation. The profit for the year under review was lower than the previous year, consequently the gross equity dividend has been reduced from 12½ per cent to 10 per cent, absorbing Rs. 60,000. A sum of Rs. 1.50 lakhs has been separated towards rehabilitation reserve and Rs. 25,000 towards general reserve. The decline in profit is attributed to the keen competition from engineering firms recently established, high cost of raw materials and production of items on which the margin of profit is comparatively low. Current year's working is expected to be considerably satisfactory.

T. MANEKLAL'S BONUS ISSUE

The directors of T. Maneklal Manufacturing Company Limited have recommended a cut in the equity dividend from Rs. 27 to Rs. 6 per fully-paid share of Rs. 100 each and a pro rata dividend on partly-paid shares. They have however, proposed to issue bonus shares in the ratio of one for every five shares held, both fully-paid and partly-paid, subject to the sanctions of the Controller of Capital Issues, by capitalising Rs. 5.98 lakhs from the general reserve. The working of the company during the year ended May 31, 1963 resulted in a gross profit of Rs. 19.22 lakhs. Sales increased from Rs. 112.10 lakhs last year to Rs. 136.90 lakhs during the year under review. A sum of Rs. 5.16 lakhs was provided for depreciation, Rs. 2.12 lakhs for development rebate and Rs. 11.21 lakhs for taxation including Rs. 2.51 lakhs for the super profits tax. The directors have provided a further sum of Rs. 4 lakhs for super profits tax for the earlier year.

The company has received an industrial licence for the manufacture of Artos patented float dryer, Artos hot-flue with Artos nozzle and patented relax drive, Artos-Avetema steam ager for continuous dyeing range, merceriser, stenters, soapers, pneumatic mangles, fibre machine and jiggers. Some time ago it received licences for the manufacture of 300 automatic looms per annum for silk, rayons, nylon and staple fibre mixtures. The collaboration proposal with a foreign firm is

pending with the Government. The company has undertaken the fabrication of rubber lined vessels and plants for chemical industries. The annual capacity is equivalent to Rs. 14 lakhs in value. For larger and heavy duty units the installation of special machine tools is awaited. The construction of the building for the rubber and ebonite rollers plant has commenced at Hyderabad and the manufacture of rubber ebonite rollers, rubber lining of vessels and hard rubber drums is expected to commence shortly. For the rubber blankets plant with an annual capacity of 30,000 square metres, negotiations for foreign collaboration are being finalised. The production of fibre machine is expected during the current year. Licence for imports of components from Benninger Engineering Company Ltd., Switzerland, has been received and orders have been placed.

JUBILEE MILLS

The directors of Jubilee Mills Limited have proposed the issue of bonus shares in the ratio of one share for every two held, subject to the sanction of the Government. They have also proposed an equity dividend of Rs. 4.50 per share for the year ended June 30, 1963 against a dividend of Rs. 5 and a bonus of Rs. 2 per share during the previous year. The company has recorded better results for the year with its gross profit amounting to Rs. 27.86 lakhs against Rs. 22.80 lakhs for the previous year. The higher profit is a sequel to an increase in realisations from Rs. 68.57 lakhs to Rs. 85.37 lakhs. A sum of Rs. 4.46 lakhs has been transferred towards depreciation, Rs. 1.50 lakhs towards development rebate reserve and Rs. 2.03 lakhs towards managing agents' remuneration and Rs. 11.40 lakhs towards taxation. The directors have set apart Rs. 6.40 lakhs for general reserve out of which the proposed dividend will be paid. Special reserve for super-profits tax absorbs Rs. 2 lakhs. The proposal to issue bonus shares will result in the creation of 50,000 new equity shares by capitalising a sum of Rs. 5 lakhs from the amount standing to the credit of company's reserve No. 2.

FIBRE GLASS ISSUE

Fibre Glass Pilkington Limited will enter the capital market shortly with an offer of Rs. 45 lakhs in 4,50,000 equity shares of Rs. 10 each. The company has been promoted by Fibre Glass Ltd., of U.K. and Bombay Company (Private) Limited. It proposes to manufacture glass fibres and glass fibre products. The issued capital will be Rs. 1.20 crores of which Fibre Glass Limited, U.K., has agreed to take up shares worth Rs. 60 lakhs. An allocation of shares worth Rs. 15.00 lakhs will be for consideration other than cash. The Bombay Company (Private) Ltd., will take up shares worth Rs. 4.88 lakhs and the directors, their friends and associates worth Rs. 10.20 lakhs. The offer for public subscription, therefore, amounts to equity shares worth Rs. 45 lakhs. The total cost of the project has been calculated to be around Rs. 114.02 lakhs to be met partly by this present issue and partly by bank borrowings. Fibre Glass Limited, U.K. has agreed to act as the technical consultants and has assigned to the company certain patents. An arrangement has also been made to assign a proof patent to the company from Corning Fibre Glass Corporation, U.S.A., one of the important manufacturers of glass fibres in the U.S. The plant will be located at Thana, near Bombay. The raw materials required are available indigenously. The imports will constitute a very small percentage of the total raw materials and may be limited to chemicals. Orders for plant and machinery have been placed and the shipment is expected to arrive within the next twelve months. The annual capacity of the proposed plant at Thana will be about 1,100 tons of glass fibre and glass fibre products,

October 18, 1963

a level which is likely to be reached within three years of commissioning of the plant. The company has also secured licences to manufacture glass wool, glass textile fibres and glass staple tissues. This will involve the construction of two additional glass wool plants, one each in West Bengal and Madras.

JOHN FOWLERS ISSUE

John Fowlers India Limited is expected to offer shortly for public subscription an equity capital of Rs. 10.67 lakhs. The company has an authorised capital of Rs. 50 lakhs, made up of 5,00,000 equity shares of Rs. 10 each. The issued and subscribed capital is Rs. 4.03 lakhs. It proposes to issue a further capital of Rs. 15.97 lakhs in 1,59,700 shares of Rs. 10 each. Out of this, 3,950 shares will be allotted to Stream-Line Filters Limited, U.K. as part consideration for technical collaboration, 29,050 shares are reserved for Vokes Group Ltd., and/or Stream-Line Filters and 20,000 shares for Vokes Group Ltd. The balance of 1,06,700 shares will be offered for public subscription. The company was formed to acquire the business of John Fowler and Company (India) Ltd., which was importing spare parts into India and servicing road rollers and diesel locomotives supplied by John Fowler and Company (Leeds) Ltd. Following the restrictions on imports, the company had to undertake manufacturing activities. It entered into the collaboration agreements with Vokes Limited for the manufacture of filters and elements for mobile and stationary internal combustion engines and industrial filters. It has negotiated with Stream-Line Filters Ltd., a subsidiary of Vokes, for the manufacture of lubricating and insulating oil, aviation oil and fuel filters. It has also obtained a licence for the manufacture of tobacco processing machinery. The plant for the manufacture of new items will be located in Bangalore. The construction of the factory has already commenced. The present capital requirements of the company will be met by the public issue and by the allotment of 20,000 shares to Vokes Group Limited.

SANDVIK ASIA

Mr Nawal S. Phatarphekar, who presided at the third annual general meeting of the Sandvik Asia Limited in the absence of the Chairman, Mr Wilhelm Haglund, indicated that despite the impediments in the way of the new company, particularly by way of power interruptions and non-availability of raw materials in sufficient quantities, it has recorded satisfactory performance. Its sales increased from Rs. 7.60 lakhs during the previous year to Rs. 65.60 lakhs during the year under review. It has also built up development reserve and depreciation provision to the tune of nearly Rs. 21 lakhs. He pointed out that the company's three plants, rock drill steels plant, tungsten carbide blanks plant and tungsten carbide power plant are all in production. A new line of production, tungsten carbide tipped tools, has also commenced and stocks of tools are being built up with a view to commencing commercial sales. Outlining the prospects of the company in the financial year 1963-64, he indicated that the sales between April 1, 1963 and September 20, 1963 have been of the order of Rs. 44.35 lakhs against Rs. 24.00 lakhs during the corresponding period last year. He indicated that the technical collaborators, Sandviken Jernverks Aktiebolag, Sweden extended 'splendid co-operation' in resolving all the numerous technical problems and helped it to attain the present satisfactory result.

CAPITAL ISSUES

Ten companies have been authorised to raise capital totalling Rs. 11.33 crores. The consent of the Controller of Capital Issues is valid for 12 months.

Hardcastle and Waud Manufacturing Private Limited, Bombay, has been authorised to issue bonus capital of Rs. 4

lakhs (in equity shares of Rs. 100 each). It will be offered to the existing equity shareholders of the company in the ratio of one bonus share for every three equity shares held, on capitalization of the company's reserves to a like extent.

Cochin Refineries Limited, Kerala, to be floated for refining crude petroleum, in collaboration with Phillips Petroleum Company, U.S., is to issue capital of Rs. 7 crores divided into 7,00,000 equity shares of Rs. 100 each, for cash at par. Out of this issue, shares of the value of Rs. 3.57 crores will be offered to the Government of India, Rs. 1.75 crores to the U.S. collaborators, Rs. 14 lakhs to Duncan Brother & Company, Calcutta, and Rs. 84 lakhs to the public by prospectus. The remaining shares of the value of Rs. 70 lakhs are to be offered to parties to be nominated by the Government of India.

The Minerals and Metals Trading Corporation of India Limited, New Delhi (Proposed), a Central Government undertaking, will raise capital of Rs. 2 crores divided into 2,00,000 equity shares of Rs. 100 each for cash at par to be issued privately.

Bharat Bijlee Limited, Bombay, is to issue further capital of Rs. 60 lakhs for cash at par consisting of Rs. 30 lakhs in equity shares of Rs. 100 each and Rs. 30 lakhs in 9.3 per cent cumulative redeemable preference shares of Rs. 100 each.

Andhra Foundry and Machine Company Limited, will issue capital of Rs. 55 lakhs divided into 4,00,000 equity shares of Rs. 10 each and 15,000 9.3 per cent cumulative redeemable preference shares of Rs. 100 each for cash at par. Of this, equity shares of the value of Rs. 10 lakhs would be subscribed by the promoters and directors of the company.

Tractor Engineers Limited, Bombay, is issuing further capital of Rs. 50 lakhs divided into 5,000 equity shares of Rs. 1,000 each for cash at par. The issue would be subscribed as to Rs. 30 lakhs by Caterpillar Tractor Company of the U.S. and Rs. 20 lakhs by Larsen Toubro Limited, Bombay.

U.P. State Industrial Corporation Limited is to issue Rs. 25 lakhs equity capital in shares of Rs. 100 each for cash at par, to be subscribed entirely by the U.P. Government.

Mahindra Owen Limited, Bombay, will raise Rs. 20,95,000 in equity shares of Rs. 100 each at par, of which shares of the value of Rs. 10,68,400 will be issued for cash to Mahindra and Mahindra Limited and Rs. 10,26,600 to Rubery Owen and Company Limited, U.K. for consideration other than cash against the supply of plant and machinery.

Kerala State Small Industries Corporation Limited, Trivandrum, a State Government undertaking, is to issue capital of Rs. 8 lakhs divided into 8,000 equity shares of Rs. 100 each to be issued for cash at par.

The Indian Motion Pictures Export Corporation Limited, Bombay, will issue capital of Rs. 10 lakhs in equity shares of Rs. 100 each for cash at par.

LICENCES ISSUED

The following licences were issued under the Industries (Development and Regulation) Act, 1951 during the week ending 5th October, 1963. The list contains the names and the addresses of the licensees, articles of manufacture and annual installed capacity.

BOOKS BRIEFLY

Old Wine in New Bottles

Price Theory: By W. J. L. Ryan; Macmillan, London; Price 16 Sh.

Reviewed by DR. B. M. BHATIA

THOUGH A considerable change in emphasis has recently taken place in economic analysis, price theory still continues to form a major part of courses in Economic Theory at the universities. The book under review is, therefore, a welcome addition to textbooks on Economic Theory for use in the universities.

The book is divided into 12 chapters. The first four chapters discuss the theory of price determination under conditions of perfect competition, and the next three, "the determination of relative prices of productive services" or what is traditionally included in the theory of distribution. Chapter VIII takes the reader from Partial Equilibrium to the Walrasian General Equilibrium. The next three chapters discuss the pricing of products and services under conditions of 'imperfect' and 'Monopolistic' competition. Chapter XII discusses briefly a number of miscellaneous problems, left over from the first eleven chapters, such as "the choice of a sale-plan by a multiproduct firm," and the actual method of 'fixing selling prices of their products by firms. In this connection a brief description is given of the two alternative techniques of analysis — namely mathematical programming and the theory of game.

The analysis in the first eight chapters closely follows Marshall's analysis in Books V and VI of his 'Principles'. According to the author these chapters "are largely a translation (of Alfred Marshall's Principles of Economics) into a different idiom" (p.260). But the change of idiom is very important from the point of view of the student. Mr. Ryan builds up his theory of demand on Hicksian Indifference Curves and his analysis of supply side on average and marginal cost curves. He makes generous use of Hick's and Joan Robinson's "geometry" as well as some mathematics because "it is convenient for us to do so; it is also fashionable".

To the present reviewer who himself has taught Economic Theory at the University level for quarter of a century, the chief appeal of the book lies in the way the author presents the subject. As the author himself points out with characteristic academic humility: "I do not think that there is anything that is original in the contents of this book, but there may be some originality in the form in which they are presented." In the latter there is not some but lot of originality.

Probably to keep the size of the book within limits, the author ignores even important concepts, which it is necessary even for a beginner in the subject to be familiar with. For example, in the first chapter devoted to analysis of demand he does not even mention the word "utility" much less give Marshallian analysis of the theory of demand before giving indifference curve analysis. Similarly, he bases his supply and cost curves on the modern law of variable proportion and completely ignores the classical law of diminishing returns. The cost curve of a firm under perfect competition is said to include no profits because "when these conditions (of perfect and pure competition) obtain, profits tend towards zero, as long run adjustments are effected" (p.308). All Economists do not subscribe to this view. It would have been far better if the author had given the traditional view in these matters, at least in the footnotes.

All the same, Mr. Ryan has written an excellent introduc-

tion to Price Theory and he is to be congratulated on this useful production.

TRIBAL UPLIFT

Socio-Economic Survey of Primitive Tribes in Madhya Pradesh: National Council of Applied Economic Research, New Delhi, 1963; Price Rs. 15.00.

IN ITS survey of the socio-economic conditions of the primitive tribes of Madhya Pradesh, the Council has shown that development of land and agriculture alone would not be adequate for the rehabilitation of 4.8 million tribals in the State. Agricultural land available within the State was insufficient to serve the needs of even half the tribal population. The Council has therefore recommended top priority for a programme of industrialization and extension of communication facilities to the interior of the tribal areas.

The recommendations of the Council obviously fall within the broad framework of the national policy for tribal areas and tribal communities. The policy is to integrate the tribal communities within the body politic of the nation. The nature of the economic problem of the State's sizable tribal population is fundamentally not very different from that of the other backward societies in that the vicious circle of low income and lack of thrift is ubiquitous. The differences, if any, largely arise from the relative insularity in which tribal society had lived through the ages.

Roughly, the survey says, a fifth of the tribals are landless labourers whose economic distress is the most stringent. As against the average State per capita income of Rs. 260 the figure for the tribal populations in the eastern parts of the State is Rs. 171, Rs. 162 in the western zone, and Rs. 134, Rs. 112 and Rs. 104 respectively in the Southern, Northeastern and Central zones. In terms of per capita daily income the most prosperous zone would thus have an average of 50 nP. and the poorest 29 nP. There is considerable variation in the income level within each zone.

STEPPING OUT
TO TOMORROW

Day by day, month by month,
the face of India changes fast.
Mighty steel penstocks guide the
rushing river waters to turn the
turbines to produce electric power.
Massive generators, dotted across the
country, send this power vibrating along
wires to turn the wheels of industry. Electric
lamps are switched on in village homes. Long lines
of steel pipes girdle vast stretches of land, carrying
water to thirsty villages and liquid gold to refineries.
Automatic signals guide rolling wheels along a
criss-cross of steel tracks. Radio waves race across
the skies to help mighty Jet planes land on our soil
with their precious cargo. And thus a nation steps
out to tomorrow.

As electrical and mechanical
contractors and maintenance specialists on
behalf of leading West German manu-
facturers, we too are contributing our
bit towards building a new India.

THE GWALIOR RAYON SILK MFG. (WVG.) CO., LTD. Birlanagar - Gwalior.

Available in Delhi at:

SYLCO, 11-E, Conn. Place; ORIENTAL TEXTILE CORPORATION, Madras Hotel Block, Conn. Circus; BHAGIRATHMAL & SONS, Opp. Bank of India, Ch. Chowk and other Leading Stores.

Distributors in Delhi: SHIVLAL KANHAYALAL, Katra Nawab, Ch. Chowk; HAZURA-SINGH MANOHARSINGH, Katra Rathi, Nai Sarak; RUGGANMAL PURANCHAND, Katra Chohan, Ch. Chowk; RAKESH & RAJESH CO., Katra Rathi, Nai Sarak; ANAND SILK STORE, Katra Subhash, Ch. Chowk.

ALL HANDS TO WORK

Your job is vital to victory. India demands all hands to work — and work more for increased production to strengthen our fighting forces, to build up the nation's resources and striking power on all fronts

At foundry and lathe, machine shop and giant industrial plant, shall all hands strive the harder to raise productivity, boost output. Let vital supplies flow in an unending stream to the front line as well as for the nation's domestic needs.

WORK RESOLUTELY

for Greater Production, Stronger Defence

Lest We Forget

FOR A NEWLY independent nation we seem to be accumulating National Days rather fast. October 20, however, must be, in a rare sense, a Day of Dedication for all of us. On this day last year, the Chinese communists taught us the very valuable lesson that freedom was not less easy to keep than to win. This week the nation celebrated on Sunday its first National Solidarity Day in demonstration that this lesson has been well learnt. The Prime Minister has spoken of the shattering of many illusions. Some, however, still seem to linger. That we as a people value our independence and the territorial integrity of our nation has been affirmed clearly enough in the agonizing months following the Chinese invasion, but it still remains to be proved equally clearly that we are going about this job of the defence of our values and ourselves in the most effective manner possible.

It is true that, as Mr. Nehru said, we have been building up our defence strength steadily over the past year, but, as the Defence Minister realistically pointed out not very long ago, there is still a great deal to be done before our country may be deemed to be militarily capable of dealing effectively with a major offensive on the part of a powerful country as fully geared to the purposes of war as China has been for a long time now. That our Jawans, as individuals, are cool of head and brave of heart on the battle front, is happily wholly true. But it is also true that in the encounters of last October and November they were poorly equipped and armed, inadequately trained and, by and large, incompetently led. There was considerable — and very useful — discussion in the last session of Parliament of what was being done to remedy these weaknesses discovered at such great cost to our national prestige and national morale. The assurances which have been forthcoming from the Government on this point have been, on the whole, encouraging, but as Mr. Chavan himself would only too readily admit, how well in fact our defence preparedness is being pursued can in the last resort be shown only through the dread arbitrament of war. While we must surely hope that means will be found for the restoration of an honourable and enduring peace along our country's ravaged frontiers, October 20 must always remain a hard reminder to us not to be complacent or too trusting, and above all, not to entertain again the particular illusion that our own desire for friendship and peaceful co-existence should necessarily be reciprocated by our neighbours whose inner compulsions might be quite different.

In describing October 20 as National Solidarity Day, the idea evidently has been to emphasise the important fact that it is in our national unity more than anywhere else must be found the most trustworthy guarantee of our national security. In the wake of the Chinese invasion there has been heart-warming upsurge of oneness in the hearts and thoughts of our people. But it would be unsafe to ignore the fact that there is a very considerable element of mass emotion in this response. The task for statesmanship consequently has been to give a concrete character to this emotive reaction and to release its energies into constructive channels which would feed our national will and capacity to resist aggression and persevere in the pursuit of our way of life. That this task has been earnestly and valiantly attempted none in the wide world may properly question. But how much has been actually accomplished is a matter which undoubtedly needs to be anxiously considered.

In certain directions the progress of course has been commendable. The numerical strength of our Armed Forces, in the officer and other ranks, is being steadily built up. The Defence Minister has given us his word that the bitter lessons of the NEFA campaign are being kept in mind and that the training of the troops is being planned and executed on the lines

which have been indicated as necessary. He has also said that the higher echelons of command are being toughened up and that every care is being taken to ensure the highest level of competence in the areas of strategic studies and planning. We may, therefore, reasonably assume that, along with quantity, the quality aspect of the military build-up is also being taken care of.

Elsewhere too there has clearly been progress. The organisation of Supplies is getting into stride and the provisioning and equipment of the Armed Forces are being undertaken in satisfactory compliance with current demands as well as in careful anticipation of future requirements. The resources of military transport are similarly being expanded and even in the critical areas of small arms and ammunition, programmes of manufacture have apparently been organised to overcome the tragic deficiencies disclosed last October. Thanks to the co-operation of friendly foreign countries, the manufacture of high-speed military aircraft as well as the training of IAF personnel in strategic manoeuvres and the handling of advanced types of aircraft are proceeding apace. All this shows that the country's will to defend itself is being backed in a very tangible manner by specific programmes instituted in those areas of Defence preparedness which are directly relevant to possible threats to the nation's security, particularly in the immediate future, but also in the long period

It should be obvious, however, that direct Defence preparedness is only a part of a more comprehensive national preparedness for roughing it out in this deceptive and dangerous world. As has been promptly recognised by the Prime Minister and other leaders of the Government after the Chinese invasion of last October, the capacity of this country to defend itself will be determined in a very critical sense by the larger capacity of its economy, particularly the industrial part of it. This is true not merely in the narrow context that most of the materials for Defence in terms of modern warfare will necessarily have to come out of factories, particularly sophisticated industrial plants. Even more important is the fact that, unless in a poor country such as ours, the economy is visibly expanding, steadily providing more employment and a better livelihood to the impoverished millions, it will not be possible really to create and sustain a psychology of national confidence, national enthusiasm and national dedication to national interests. While it is certainly necessary to coin slogans to crystallise, capture and propagate essential national moods, it must be admitted that national solidarity so vital to national security cannot be achieved through political speeches or propaganda. On the contrary, democratic politics being what they are, especially in a country such as ours which is new to the manners and morals of Parliamentary government, sooner or later there is bound to arise a temptation in the hearts of politicians and political

parties to agitate against one another even in the very name of national solidarity.

That this is so has become quite evident through recent trends in our political and public affairs. The Congress no doubt has been making a commendable bid to put its house in order, but some of the actions perpetrated in the name of this cleansing process have themselves come to be criticised as sheer opportunism. As for other political parties, the P.S.P. has evidently given up all pretensions to serious political activity. Angered by the desertion of its leadership, humiliated by the cavalier treatment meted out to it by the Lohia Socialists, and rendered witless by the disappearance from the Government of easy targets, such as Mr. V. K. Krishna Menon and Mr. K. D. Malaviya, the P.S.P. has now been reduced to an annoying distraction on the political stage. The Swatantra Party, on the contrary, has lately been showing much activity, but rather epileptic in character. In its almost insane hatred of the present leadership of the Congress, it now seems to have reached a mental state where it would evidently be prepared to bury the country with the Congress. How else are we to interpret its unashamed support and sympathy, in the present circumstances of the country, to disruptionist agitations such as the one which the DMK is contemplating? As for the Communists, the Gopalan episode cannot really hide the brute fact that

Eastern Economist 20 Years Ago
OCTOBER 22, 1943

With a view to studying the conditions of poverty in the City of Madras, a survey was started in 1937 and completed in about a year's time. As the whole of the City could not be surveyed, one municipal division, namely, Purasawalkam, was taken up and about 2,500 families were studied. The method of enquiry was that adopted by Mr. Rowntree in his study of New York: that is a house-to-house enquiry of all families whose income was less than Rs. 50

The following table gives the total income of each of the six groups as well as the total number of families and the total number of persons.

Income Groups	Total Income Rs. a. p.	Number of families.	Number of persons.
1. (Rs. 10 and below 10)	4,387 2 0		
2. (Rs. 10-15)	6,134 9 0	803	2,975
3. (Rs. 15-20)	7,352 15 0	445	1,889
4. (Rs. 20-25)	6,843 6 8	393	1,766
5. (Rs. 25-30)	7,028 8 0	289	1,359
6. (Rs. 30 and above)	12,060 8 9	244	1,261
		298	1,663

The total income of 803 families in the lowest income group (or about 33 per cent of the families investigated) consisting of 946 men, 1,019 women and 1,010 children is as seen in table above Rs. 4,387-2-0. This works out rightly at Rs. 1-12-5 per adult per month or a little over 11 pies a day. (A child is taken as half an adult). One wonders whether it is possible for anyone to subsist on such income. Perhaps, it is not as incredible as it sounds.

their party is as eager and alert as ever to find its opportunities in the nation's difficulties.

In such a context it may be unsafe to depend unduly on intelligent political management to preserve the psychology of national solidarity. It has therefore become all the more necessary to release an alternative, purposeful and positive influence among the people in order that the national will to national security may be safeguarded and strengthened. This alternative means will necessarily have to be found in the economic sphere through a dynamic programme of vigorous economic expansion. In this way it is possible not only to speed up the building of our Defence effort but also to create a clear and firm impression in the minds of our people that this country, worth defending always, is becoming more and more a country worthy of its people's sweat, toil and tears in its defence. Every unemployed person who gets employment, every man, woman or child who had hitherto to make do with one meal a day, but may hereafter hope to get two meals, is worth more than all our pledges of national solidarity.

It is true that the immediate past has not been very encouraging; industrial activity has not been expanding as fast as it had done in the earlier years; industrial

Erosion of Wealth

A CRUCIAL sentence in the Finance Minister's broadcast to the nation on October 11 was: "To me, socialism far from curbing the individual, seeks to stimulate and reward individual initiative and enterprise". The practical effect of such direct taxes as wealth tax, gift tax, expenditure tax, etc., which he levied in 1957-58 was to punish, rather than reward, individual initiative. This is brought out by the latest statistics in regard to these taxes which were published in *Eastern Economist* last week on pages 819-826. It may be stated that the expenditure tax was discontinued in April 1962 and the wealth tax on companies in April 1960; hence they do not form a part of this analysis.

Table I below gives the yield from wealth tax from 1957-58 to 1963-64 (budget) which totalled Rs. 63.23 crores for all these years; the maximum wealth tax realised in any single year was Rs. 12.11 crores in 1959-60. The anticipated rise of Rs. 40 lakhs in revenue from

expansion has apparently become halting and uncertain; important industrial programmes are not being pursued or fulfilled according to schedule. All this is no doubt disquieting. But, as the Finance Minister explained a few days ago, it is not as if the position cannot be retrieved. Basically our economy has great potentialities and it is not impossible to persuade it to recapture its elan. Much of our current disappointments and difficulties is a product of Man's mistakes. They must consequently be capable of being corrected by Man's wisdom. Some time ago there was a hot dispute about the extent of poverty that is prevalent in our country, but it has not been, nor can it be, disputed that our people, undoubtedly poor now, need not continue to be poor. There is today in every section of the community a desire for economic progress. This surely must be a powerful catalyst. The ingredients are there — a large potential in natural and human resources. Sixteen years ago in the first flush of its independence, this country made to itself a promise that it would use those resources well and wisely. This promise, unfortunately, has not been always fully kept. But even through the lapses both knowledge and experience have been gained. On this occasion, on the first anniversary of Red China's open challenge to our existence as an independent nation, it is proper that we should recall that promise and resolve to carry it out better.

wealth tax in 1963-64 is due to the withdrawal of the exemption limit upto Rs. 25,000 allowed for jewellery in Section 5 of the Wealth Tax Act for the purpose of computing the net wealth of assessees. In his budget speech, the Finance Minister had justified this measure in these words: "At a time when we have launched on a new gold policy to reduce the glamour for gold, an exemption for jewellery in wealth would be inappropriate".

Table II (p.834) sets out the demands from individual assessees in 1960-61 and 1961-62. It shows that the bulk of the assessments in 1960-61 at 94.2 per cent and in 1961-62 at 94.1 per cent, to be precise, were in the net wealth brackets of Rs. 2 to 12 lakhs. Nearly 40 per cent of the assessees were in the lowest range of Rs. 2 to 3 lakhs. The assessees with net wealth of more than Rs. 12 lakhs were hardly 6 per cent of the total number of assessees.

The wealth tax demands at Rs. 7.3 crores in 1960-61 and Rs. 7.5 crores in 1961-62 had the maximum impact on assessees commanding net wealth at more than Rs. 12 lakhs. In 1960-61, the percentage of the number of such assessees to the total was only 5.8 but the percentage of wealth tax demanded of them was 52.0 of the total. Similarly, in 1961-62, the assessees having net wealth above Rs. 12 lakhs were 5.9 per cent of the total but the tax demanded of them was 46.7 per cent of the total. Special attention is invited to the top three classes of assessees having net wealth above Rs. 50 lakhs; in all the groups, the number of assessees has declined. Their

collective strength has dropped from 105 in 1960-61 to 91 in 1961-62. They constituted only 0.5 per cent of the total number of assesseees in 1960-61 and only 0.4 per cent of the total number of assesseees in 1961-62. The wealth tax demanded of them at Rs. 1.7 crores in 1960-61 was 23.3 per cent of the total; in 1961-62, the wealth tax demanded of them was Rs. 1.1 crores at 14.7 per cent of the total. This is a clear pointer to the fact that the wealth tax is fast reducing the number of wealth-tax assesseees in the group above Rs. 50 lakhs and that very soon this class of assesseees is likely to vanish. Moreover, the additional surcharge rising progressively from 4 per cent to 10 per cent on the incomes after tax in the last budget coupled with the wealth tax is hastening the erosion of wealth in this country.

Table III below illustrates this point. It shows that there is no incentive to work if one has net wealth of Rs. 25 lakhs and an annual income of Rs. 1,00,000. The assumption of 4 per cent return on taxable net wealth is justified on the ground that all the companies (in which capital might be invested) do not pay dividend every year and a part of the wealth must be locked up in buildings and jewellery. With net wealth of Rs. 50 lakhs, there is positive disincentive of Rs. 53,575 which rises to Rs. 1,54,675 at the Rs. 100 lakhs level of net wealth.

TABLE III

Net Wealth	Assumed Income*	Income-tax **	Wealth Tax	Total Tax
(1)	(2)	(3)	(4)	5=(3)+(4)
25 lakhs	1,00,000	64,815	38,000	1,02,815
50 lakhs	2,00,000	1,53,075	1,00,500	2,53,575
75 lakhs	3,00,000	2,41,375	1,63,000	4,04,375
100 lakhs	4,00,000	3,29,675	2,25,000	5,54,675

* 4 per cent rate of return.

** Including surcharge.

The total wealth tax demands on Hindu undivided families in 1960-61 were valued at Rs. 94.5 lakhs which increased to Rs. 115.30 lakhs in 1961-62. The number of assessments under this category rose from 2,138 in 1960-61 to 2,345 in 1961-62 because of the "persistent tendency" of the Hindu undivided families to increase from year to year. Even in the case of the income-

tax paying Hindu undivided families there has been an increase due to certain tax advantages to be derived in breaking one undivided Hindu family into several Hindu undivided families.

The total tax demands relating to gift tax in 1961-62 were not more than Rs. 1.15 crores from individuals, Hindu undivided families, firms and other associations of persons. The largest category of the assesseees was "individuals"; the others were relatively few in number (see page 821 of *Eastern Economist* dated October 18, 1963). At the time when this tax was levied, it was thought that people might avoid payment of wealth tax by making free gifts to relations and friends. The figures of gifts and gift tax show that there is no attempt on the part of the people to distribute their wealth through gifts in a liberal manner and where-ever people feel the urge to give gifts, they do so irrespective of the tax. The largest number of donors, amongst the "individuals", were in the lowest range of taxable gifts i.e. Rs. 50,000 and below. There were, in fact, no taxable gifts in 1961-62 (with the exception of a solitary company) which were in value more than Rs. 20,00,000. The burden of the tax, as indicated above, fell mostly on individuals. Like the Hindu undivided families in the case of the wealth-tax, the total number of assesseees under the gift tax has been on the increase; as against 5,608 cases in 1960-61, the number rose in 1961-62 to 6,648 (and the tax demands increased from Rs. 99.9 lakhs to Rs. 115.5 lakhs).

The estate duty demands also recorded a rise in 1961-62 over 1960-61. As against the total estate duty demanded in 1960-61 at Rs. 2.82 crores, it was Rs. 4.23 crores in 1961-62 because of the yield from two cases (in the highest value of property class at more than a crore of rupees) amounting to Rs. 75.5 lakhs. The largest number of cases at 1001 out of a total of 3044 in 1961-62 was in the property range between Rs. 50,000 and Rs. 1,00,000. The number of cases with the property value below Rs. 50,000 was as small as 161 in 1961-62 as against 452 in 1960-61. The sizable rise in revenue demands was because of the two stray cases in the highest property value class indicated above.

TABLE II

Range of Net Wealth (Rs. Lakhs)	No. of Assessments	1960-61		1961-62

NOTE: Figures in brackets are percentages to total.

Highlights of the Week

TRANSPORT IN THIRD PLAN

THE TOTAL cost of implementing the third Plan transport and communication programmes is now expected to go up to Rs. 2,070 crores from Rs. 1,486 crores provided in the Plan and Rs. 1,630 crores, the original estimate of this cost. The increase, however, has been mainly occasioned by a number of additions made to the original development proposals. The more important among these are the strengthening of the transport and communication systems in the border and mining areas. The cost of transport schemes is expected to go up from the original estimate of Rs. 1,475.5 crores, against which a provision had been made to the tune of Rs. 1,351 crores, to Rs. 1,907 crores. The cost of communication programmes is likely to increase from the original estimate of Rs 154.4 crores and the Plan provision of Rs. 135 crores to Rs 163 crores.

The whole of Rs 2,070 crores estimated outlay, however, is not expected to be incurred during the third Plan period. The maximum expenditure anticipated is around Rs. 1,997 crores. This should suggest that some of third Plan transport and communication development schemes will have to spill over to the fourth Plan. The two sectors which are expected to fully incur the revised costs of their programmes are railways (Rs. 1,196 crores—excluding the expenditure met from the Depreciation Reserve Fund of the railways and the expenditure of inventories) and posts and telegraphs (Rs. 85.4 crores). Expenditure on the development of ports (Rs. 131.2 crores) may also be nearly 100 per cent of the revised estimated cost (Rs. 131.8 crores). Significant shortfalls in expenditure are anticipated in respect of roads, tourism and civil aviation development plans. Against the Rs. 470.8 crores, Rs. 7.7 crores and Rs. 55.8 crores revised costs of these programmes, the actual expenditure anticipated is Rs. 424.1 crores, Rs. 4.8 crores and Rs. 47.5 crores, respectively.

The present development programmes of the railways provide for creation of a capacity adequate for carrying 260 million tons of originating traffic as against 245 million tons estimated earlier. Owing to shortfalls anticipated in the production of steel, coal and cement industries, the originating traffic in the last year of the Plan, however, is not likely to be more than 241 million tons. The railways, thus, will start the fourth Plan with a certain amount of advantage. The revised rolling stock programme provides for acquisition of 2,070 locomotives and 150,464 wagons (in terms of four-wheelers), as against 1948 locomotives and 117,144 wagons originally provided for. The electrification programme is also being speeded up; about 2,400 route kilometres are now proposed to be electrified as against the original proposals of electrifying 1,760 kilometres. The programme of doubling the lines has been stepped up from the 2,560 kilometres target to 3,548 kilometres. The plan for laying new lines now includes the construction of a broad-gauge link to Assam. Otherwise, no major changes have been made in the original provision of laying 2,400 kilometres of new lines, including 320 kilometres of lines connected with coal development and 632 kilometres with movement of iron ore.

As regards development of roads, the original target of increasing, under the third Plan, road kilometrage from about 230,400 to 270,400 is to be stepped up by about 1,140 kilometres mainly on account of developing the main arterial routes. The number of new bridges to be constructed under the Central Plan has also increased from 60 to 85. Missing links have to be provided on an additional 480 kilometres. The other additions in the road transport development programmes have been for improving the existing facilities. The Centre is envisaged to play a greater role in this respect in view of the need

to develop roads in the border areas.

As regards shipping, with the third Plan original target of increasing the total tonnage from 857,000 GRT by a gross addition of 375,000 GRT or a net addition of 181,000 GRT after allowing for replacements, having been practically achieved during the very first year of the Plan, the gross five-year target has now been increased. Ships aggregating 607,000 GRT have already been acquired or ordered. It has now been decided that further offers for acquisition of ships on suitable terms may be considered on merits, bearing in mind, of course, the need to keep commitments for future repayment of foreign exchange within reasonable limits.

The ports development programme, which originally envisaged increasing the capacity of the major Indian ports from 37 million tons in 1960-61 to 49 million tons in 1965-66 through completion of the works initiated in the second Plan period and starting of work on three new all-weather ports at Haldia, Tuticorin and Mangalore, has now been expanded to include the development of Paradip Port. There has been no major change in the development programmes for civil aviation. As regards development of communications, it is now expected that as many as 320,000 new telephone connections might be made available during the current Plan, as against the original estimate of 300,000 connections. Opening of new exchanges may also go up from the initial estimate of 1,200 to 1,290. Provision has also now been made for increasing the capacity to manufacture tele-communication cables and cross-bar equipment.

MORE FUNDS FOR AGRICULTURE

THE UNION MINISTRY of Food and Agriculture has decided to make additional allocations of funds to the States for stepping up farm output during the current financial year. The total amount sanctioned is Rs. 19.15 crores. Though belated—already half of the year is out—the step is welcome in view of the lag in agricultural production witnessed during 1961-62 and 1962-63. These allocations are partly to be made available as additional Central assistance and partly as accelerated aid. The latter will be adjusted against assistance to be given by the Centre during the terminal two years of the Plan.

As could be expected, the new allocations are to be utilized for measures yielding quick results—minor irrigation programmes, intensive agricultural production schemes and soil conservation. Over three-fourths of this expenditure—Rs 14.86 crores—has been earmarked for minor irrigation. A sum of Rs. 2.56 crores will be spent on intensive agricultural production programmes and the remainder Rs. 1.73 crores on soil conservation schemes.

In selecting new minor irrigation programmes, the States have been asked to give preference to schemes which can be undertaken and completed expeditiously. These include boring and deepening of the existing wells, installation of pump sets and restoration of tanks. It may be recalled in this connection that a decision was taken recently by the Union Government to make available adequate quantities of steel and cement for agricultural purposes and at appropriate times. The State Governments have also been advised to expedite the utilization of the irrigation potential already created. Particular attention is to be paid in this regard to areas selected for intensive cultivation of various cash and food crops.

Under the agricultural production programmes, the additional allocations are to be used for meeting in a fuller manner the requirements of the districts selected for intensive cultivation of rice, millets, pulses, cotton, oilseeds, sugarcane, fruits and vegetables, poultry and cattle development, the latter

particularly in areas around dairy projects. They can also be utilized for plant protection measures. For starting any new soil conservation schemes also, the stress is to be on the selected intensive cultivation areas.

The Union Ministry has done well in making the additional assistance conditional on the full utilization of the outlay already sanctioned for agricultural development. There should also not be any diversion of these funds for any other purpose—a complaint often heard in the recent past. If the level of outlay now arrived at is not reached in a particular State, the assistance drawn by that State from the Centre would correspondingly diminish. The State-wise break-up of the new allocations is: Andhra Pradesh Rs. 3.23 crores; Bihar Rs. 2.20 crores; Kerala Rs. 0.65 crores; Madhya Pradesh Rs. 3.00 crores; Madras Rs. 0.9 crore; Maharashtra Rs. 1.00 crore; Mysore Rs. 2.50 crores; Orissa Rs. 1.15 crores; Punjab Rs. 0.90 crore; Rajasthan Rs. 1.40 crores; Uttar Pradesh Rs. 1.00 crore; and West Bengal Rs. 1.22 crores. No additional funds have been made available to Jammu and Kashmir, Gujarat and Assam.

EEC TARIFF CUTS

THE EUROPEAN Economic Community has decided to unilaterally suspend, with effect from January 1, 1964, in whole or in part, tariffs on various commodities imported by it from India. The commodities on which tariffs have been completely withdrawn are cashewnuts, chillies and chillies powder, unground cardamum, unground coriander, ginger, tobacco-seed oil, bleached shellac, mango chutney, ginger preserved and conserved, curry paste and powder, and cricket and polo requisites. A seven per cent suspension has been announced in tariff on castor oil. Tariffs on handloom textiles, reports from Brussels suggest, may also be withdrawn provided a new tariff position can be opened which satisfactorily distinguishes them from mill-made cloth. The tariff withdrawals or cuts announced are for a period of two years.

Coming soon after the suspension of the EEC tariff on tea, the new concessions have been welcomed in Delhi. The Government of India, it is learnt, considers these as marking the beginning of a favourable treatment that needs to be accorded by the European Economic Community to exports of less developed countries of both primary products and manufactured goods. India has been stressing for larger outlets for the less developed countries in the expanding Community of the Six. She is of the view that a new form of international division of labour is necessary in the changing circumstances of the world. Under this, simple manufactures from the developing countries should have greater access to the markets of the developed ones by virtue of the latter concentrating on sophisticated manufactures.

The satisfaction in New Delhi over the tariff concessions announced, of course, cannot be said to be complete as no cuts have been offered in tariffs in certain other important commodities for which slight relaxations had been proposed during Britain's negotiations with the EEC last year. These commodities include kips, coir mats and matings and heavy jute goods. It is also not yet clear whether the national tariffs will also be suspended on the new commodities simultaneously with the withdrawal of the Community tariffs on them.

REGIONAL CO-OPERATION

THE NORTHERN Zonal Council, at its two-day meeting at Chandigarh last week, took two important decisions which, if implemented, should open new vistas for regional co-operation. The first decision was in respect of introducing uniform rates of sales tax in the States comprising the Northern Zone. A Committee was appointed to go into this question and report before March next. Diversity in the rates of sales taxes in different States has been one of the major complaints of the business community and it has been urged that sales taxes

should be substituted by additional excise duties on as many commodities as possible. But this proposal has not found favour with the State Governments for the reason that it would have taken out from their sphere a very flexible source of revenue. Introduction of uniform rates of sales taxes on regional basis should be a via-media between the two extremes.

The second important decision taken was the introduction of common training programmes for various administrative services in these States. It was decided to set up three common institutions for revenue, police and accountancy training. The revenue training institution is to be located in Rajasthan, the police training institution in Punjab and the accountancy training institution in Jammu & Kashmir. A similar step in regard to post-graduate training and research in various fields of education, particularly in medicine and engineering, was also favoured. The Chairman of the University Grants Commission, Dr. D. S. Kothari, is to be requested to assist in the suitable distribution of such institutions in various parts of this zone.

The economic development of the Northern Zone States on a co-ordinated basis is proposed to be taken a step further by the development of fisheries in the Gobindsagar Reservoir at Bhakra as a joint venture of the Dam authorities and the Himachal Pradesh Government.

TOURISM

PROBABLY, the most important effect of the last week's Nainital Conference of the Tourist Development Council will be to accelerate the growth of the hotel industry in this country. The Conference pointed out that in order to increase the hotel-bed capacity, new hotels will have to be built both in the public and the private sectors and that positive incentives need to be given to private hoteliers. Particular importance was attached by the Conference to increasing hotel accommodation in the four metropolitan cities—Delhi, Bombay, Madras and Calcutta.

The Conference recommended to the State Governments to earmark suitable plots of land at reasonable prices for hotel construction. The Central Ministries concerned were urged to make available adequate quotas of cement and other building materials. Special attention was advocated to be paid to proper designing of new hotels. To this end, it was suggested that the Department of Tourism should be consulted by the loan-giving agencies of the State Governments, such as the State Finance Corporations, in the same manner in which the Industrial Finance Corporation at the Centre was already doing. The Conference endorsed the recommendations of the Hotel Classification Committee and felt that adequate machinery should be set up for reviewing classification periodically.

The recommendations of the Jha Committee on Tourism were also considered at the Conference, though not in any great detail. This was presumably due to the fact that the State Governments wanted more time to study these proposals. It was agreed that both the State and Central Governments should simultaneously give careful thought to the Jha Committee's suggestions so that decisions could be taken on them within the next three months.

The Council felt that the air-conditioned tourist coaches, introduced recently in some States, whether on inter-State routes or for city sight-seeing, should be exclusively earmarked for use by tourists. The need to foster home tourism was also stressed. Concern was expressed at the slow utilization of the funds allocated under the third Plan for development of tourism. As against a total provision of Rs. 7.7 crores for this purpose, the expenditure likely to be incurred in the first three years will be not more than Rs. 2.2 crores. Another Rs. 2.6 crores are anticipated to be spent in 1964-65 and 1965-66. The shortfall, therefore, may be to the tune of Rs. 2.9 crores. The Tourist Department can hardly congratulate itself on this performance.

The Money Talks

By PAUL BAREAU

"LIQUIDITY" HAS been the most widely used but also a much abused word in the discussions at the I.M.F. meeting in Washington. The Chancellor of the Exchequer felt it incumbent on him to dispel some of the misunderstandings. Discussion of liquidity did not, he said, concern the means of financing international trade. That is done through commercial channels and it is probable that no genuine commercial transaction undertaken between solvent partners has ever been stopped in its tracks for lack of commercial credit. What has been discussed in Washington has been the adequacy of reserves. These do not finance trade but they have a direct link with the volume of world trade and the movements of capital between one country and another, because the greater these transactions the more likely is it that balances of payments will get temporarily out of the equilibrium.

Mr. Maudling expounded the expansionist case for increasing international liquidity but he also recognised the dangers into which this might lead. The primary purpose of a more generous supply of reserves is to give time for individual countries to make adjustments in their balance of payments without sharp changes in the volume of their imports or in the growth of domestic demand. There were nods of approval at this argument; but the nods became far more widespread and assertive when he went on to argue that the availability of liquid resources should not be such as to promote or encourage countries to tolerate the continuance of basically unsound domestic policies and unbalanced external positions.

"The basic dilemma is clear. If adequate resources are not available, automatically or nearly automatically, their usefulness in times of trouble, may be problematic; but to the extent to which they are automatically available may represent a temptation to refrain from the necessary corrections of policy. This, I believe, lies at the core of our problems."

Balanced Compromise

Indeed, it does, and this juxtaposition summarises the basic conflict of views in the great debate on this subject. The debate was not concluded. In the best tradition of these discussions, the matter has been remitted to a committee—in fact to two committees—one set up by the International Monetary Fund, the other consisting of the deputy finance ministers of the ten countries in the so-called "Paris Club." The latter will be the really effective working party. The chairman will be Mr. Roosa of the U.S. Treasury but the place of meeting will be Paris—a nicely balanced compromise in the continuing contest between the Anglo-Saxons and the Europeans, of which there have been many other echoes during the Washington meeting.

There has been a strange and impressive transformation since last year. The Anglo-Saxons now stand firmly together. The United States have swung completely round to the view that effective action will have to be taken to improve the international monetary system, particularly as they are determined to right the balance of payments deficit and thus to staunch the flow of dollars which over the past decade has helped to build up the reserves of the rest of the world.

There is, however, one thing that has remained completely unchanged in the American attitude towards the problem of liquidity. It is the intolerance, verging on contempt, that meets any suggestion that the problem be solved by increasing the price of gold. This was made more abundantly clear than ever when President Kennedy opened the annual meetings of the Bank and Fund. "We are determined" he said, "to do whatever

must be done to protect the dollar as a convertible currency at its present fixed rate. We are determined—in your interest as well as ours—to maintain the firm relationship of gold and the dollar at the present price of \$35 an ounce; and I assure you that we will." That last sentence uttered with all the emphasis of the President's flat Bostonian accent, could not have carried more conviction.

It is particularly unfortunate for the higher gold price school that Soviet Russia should have been compelled to choose this very juncture to sell gold in the world markets on a larger scale than ever before. This and the reasons for it have caused another debate in Washington, whose acrimony has deafened the comparatively mild tones of the speeches delivered at the Bank and Fund meetings. This is the debate on Capitol Hill about the pros and cons of selling wheat, and government wheat at that, to the communists. The outcome is a foregone conclusion. The wheat will be sold and the deal will yield considerable mutual benefits. It will reduce a deteriorating stockpile of grain in the United States; it will get more gold into international circulation.

Quest for Solution

These operations promise a momentous addition to world liquidity. They are not, however, a permanent solution of that problem. That solution remains the quest of the two study groups and, in particular, of that which will be meeting in Paris. Very few people expect this particular committee to have a smooth run and to have reached ready made solutions by the time the Fund governors meet again in Tokyo a year hence. It will, however, be prodded into quick action. Mr. Maudling urged in his speech that the problem should be studied as a matter of urgency. He trotted out again his own runner, the "mutual currency account" which was so effectively nobbled by the United States last year. There are other possibilities, including increases of Fund quotas, an enlargement of the borrowing scheme and more flexibility in the use of the Fund's resources.

What may help the labours of this committee is the prospect of an appreciable improvement in the dollar position over the next twelve months. The measures being taken to stem the flow of capital from the United States are likely to take effect. Congress is in earnest about cutting unnecessary or marginal aid. Some measure of inflation in Europe will bring uncovenanted benefits to the United States. Sales of Russian gold which may well continue for a time will also stem the loss of gold from U.S. reserves and may even reverse this movement. Twelve months from now it may be the European countries and not the United States that will need the help of increased liquidity. That possibility may make the course of the Paris committee run rather more smoothly than the somewhat grudging attitude of some of the delegates in Washington would suggest.

Scarcely less important than the talks about the future of the international monetary system were the indications given by Mr. George Woods, the new President of the World Bank, of the need for new vistas for that institution. The World Bank is not running out of funds, but it is running out of borrowers who can afford the commercial terms on which it insists. The Bank, said Mr Woods, will now have to be much more ready than before to venture on less familiar terrain, and he specified agriculture, secondary industries and education as objectives which the substantial resources of the Bank might be called upon to serve. If, however, this link with new types of projects is to be established the terms will have to be made easier.

October 25, 1963

Proposals have already been made for a longer period of grace before interest payments begin and an increase in the length of loans beyond the present normal maximum of 25 years. Progress on these lines will inevitably erase the frontier between the sphere of activity of the World Bank and that of its youngest affiliate, the International Development Association. IDA, in contrast to its parent, is running out of funds and not of borrowers or "recipients" as they should perhaps be called. It has been argued here that the Bank should not invade IDA's territory but divert some of its spare cash to its affiliate. A step in this direction may have been taken with the announcement that the World Bank's net income will no longer be put

automatically into its reserves but be treated as part of the Bank's resources available for lending.

This extension of the Bank's activities fits into the main theme of the IMF meeting: the contraction and ultimate disappearance of the US deficit and the consequent need to amend the international machinery for providing international reserves. The more the burden of foreign aid and investment in the less developed countries can be shifted to these international institutions and therefore placed on truly collective shoulders, the better the prospect of easing the U.S. balance of payments.

WINDOW ON THE WORLD

Lower Taxes Mean Greater Revenue

By R. V. MURTHY

WASHINGTON :

THE 100th Anniversary of the National Currency Act, observed by the American Bankers' Association (A.B.A.) last week, was the occasion for a solemn reiteration of the desire of both the administration and the banking industry in America—that is the term rightly used to describe banking here—for a vigorous and growing economy to ensure continued national growth and stability. Contrary to the view held about commercial banking in our country which frequently leads to the demand for nationalization of banking in certain quarters, President Kennedy feels that commercial banks benefit the American people and the Government in numerous ways—as “multi-functional lenders serving the needs of many and diverse borrowers despite the shifting demands placed upon money and credit by the nature of our economy. Of equal importance is the role of commercial banks as the primary force through which the impact of credit and monetary policies are transmitted to the economy.” I suggest that it is eminently worthwhile for some of our slogan-happy politicians to read and re-read these words.

Identical Stand

It is significant that the 100th Anniversary of the National Currency Act was celebrated by the banking industry which availed itself of the occasion of the 89th Annual Convention of the A.B.A. for the purpose. Notably, to mark the official opening, the A.B.A. sponsored a symposium on economic growth. No less significant was the association of officialdom with the event. No only did President Kennedy send his greetings but Secretary Dillon attended and addressed the Convention. But the most striking thing to me was the almost identical stand taken by both the spokesmen of the banking industry and the American government on the presently much-debated question here of tax reduction and economy in government expenditure. Recognizing the need for tax reduction, the A.B.A. had adopted a resolution a year before itself in which it had stated that tax reduction would foster incentive and job-producing investment. But in advancing this thesis, the A.B.A. pleaded for four safeguards, viz. 1) “that the cut be tailored to provide for sustained economic expansion, rather than simply provide a one-shot boost to the economy; in other words, that the reduction should be both substantial and permanent; 2) that the reductions should be implemented within the bounds of fiscal prudence, in other words, government spending over a protracted period should be strictly controlled; 3) that the shift to lower taxes should be spread over more than one year; and 4) that the implementation of the programme must be accompanied by a willingness to employ maximum flexibility in the use of debt management and monetary policy, including a willingness to reply on market forces for the determination of long-term rates of interest.”

This stand was also reiterated by a spokesman of the A.B.A.—Dr. Walker—before the House Ways and Means Committee in March last. Later events seem to demonstrate that the Association's efforts in influencing public economic policy have been bearing fruit. How far has this gone should be obvious from the remarks made by Douglas Dillon, Secretary of the U.S. Treasury, at the Convention. This apart, Mr. Dillon's remarks are of especial interest to us in India, where to advo-

cate tax reduction as a means to raise revenues and augment employment would be to invite immediate scorn. For having urged tax reduction, Mr. Dillon did not take the bankers to task, but gratefully acknowledged their services to the nation and complimented them on having endorsed tax cut as one of the prime prerequisites for reaching balance in international payments. Describing Mr. Kennedy's tax proposals as “the most important domestic economic measure in fifteen years,” Mr. Dillon noted that tax reduction had the enthusiastic support of labour as well. It is a tribute to the pragmatism of the American people that all sections recognize that “only by revising our outmoded tax structure and relaxing its grip upon incentives and growth, can we move decisively towards both internal and external strengthening of our economy.”

Secretary Dillon touched on the question of the initial impact of tax reduction at a time when the country is experiencing larger budget deficits and to remove the anxiety arising therefrom in certain quarters, chose to deal with the subject at some length. I am reproducing the relevant extracts of this part of his speech by reason of its relevance to the Indian economy today. By generating greater economic activity, he said, the tax cut would increase Government revenues and to drive home his point recalled what happened after the sharp tax cuts in 1954 and in 1924. Within two years of the cut in 1954, the U.S. Secretary said, revenues exceeded pre-tax cut levels; so it was in 1924, when, to quote the then Treasury Secretary Andrew Mellon, “in spite of the very sweeping reductions...we will collect in 1925 more money at lower rates than we collected in 1923 at higher rates.” In short, after a brief transitional period, lower taxes mean greater revenue not less. It was the experience in the twenties and it was so in the fifties too. “And it will be so after we adopt this year's tax bill,” added Mr. Dillon.

Expenditure Control

The most remarkable feature of U.S. tax policy is not this reduction in tax rates alone, but also the intensified programme of expenditure control, which happens in fact to be an integral part of the tax bill. So it has been said that “the tax bill represents a major decision to rely upon greater ‘private’ spending rather than greater ‘government’ spending as the prime factor in our economic growth.”

One other noteworthy point that Mr. Dillon made and one that applies to us in India also is that “deficits need not be inflationary when there is persistent unemployment and excess capacity.” Both these features exist in our country too and it is perhaps worthwhile for our Government, if only because of so many similarities in the situation, to bring out the Kennedy tax programme boldly in India also and watch the results. How heartening would many an Indian feel if the Union Finance Minister perorated as follows:

“We cannot, therefore, let anything restrain us from adopting the tax reduction bill this year. We cannot burden down with restrictions the very measure that will free our economy from the burdens of a restrictive tax system—we cannot dally until it is too late over a measure that we urgently need now. Our productive potential is unparalleled. The tax bill will give us the expanding economy and heightened incentives that will enable us to capitalize on that potential and

achieve the still greater gains in output and productivity that we can—and must—have. With its enactment, and only with its enactment, can we look forward with confidence to solving our problems of unemployment, unutilized capacity, and budgetary and balance of payments deficits."

This requires courage and imagination, qualities that the new Finance Minister certainly does not lack.

★★

There is nothing unusual if, as has been reported in the American Press, the more serious business of the Sheraton-Park sessions of the World Bank and the I. M. F. was transacted off-stage rather than at the formal sessions. Nor is it any new discovery that the proceedings were "a striking blend of politics and economics". This is bound to be so, especially as the world's problems today are more economic than political. But to read more politics than economics into the proposed study of the monetary system by the non-socialist world's ten industrial nations is clearly to overstrain one's imagination. And yet, strangely enough, one comes across more than one instance of such exercise. The staff reporter of "The Washington Post", for example, has sought to establish such a thesis. According to him, the very fact that the ten are making their own study rather than leaving it to the I. M. F. reflects an implicit political decision. While the wisdom of letting any decision that will eventually affect all the members of the Bretton Woods institutions to only a small number is questionable, it is to say the least uncharitable to remark that "the world's wealthy nations do not want the less affluent countries to have a voice in their deliberations, ... that they do not intend that the poor should have a free access to any new arrangements that the rich pose" and

Ravages of Rent Control

From Our Special Correspondent

PARIS:

SINCE THE devaluation of 1958, the retail price index in this city has risen 24 per cent. If the country's export prices had risen by anything like that amount, all the effects of the devaluation would have been wiped out and the franc would be back where it was. In fact, wholesale prices have risen 15.5 per cent, which is already considerable, but this coincided with notable, though smaller, price-rises elsewhere in the Common Market (which now buys almost half French exports). So the franc has retained a diminishing margin of advantage, enough to explain the constant increase in exports—which is dogged, however, by an even faster increase in imports, with the result that the trade surplus has all but vanished. This fortunate period is obviously drawing to a close, and if French prices continue to outpace other European prices, there is white water ahead. The London "Times" recently wondered wishfully whether the French economic expansion, which it described as the main single political factor in European affairs in recent years, had not passed its peak. There is no sign of that anywhere except in the retail price index: industry is booming, employment full, business confidence intact and the nation's accounts, both internal and external, are in rigid balance. But the persistence of an apparently ineradicable pressure on prices certainly entitles one to wonder whether there is not some secret fault under these symptoms of prosperity that must inevitably break the main-spring of expansion.

Hence various attempts to "X-ray" the price index, to discover the origins of a price-inflation that is not due, as was the inflation of the 1950's, to budget deficits and tariff protec-

so on. It is somewhat surprising that such a view should emanate from the Press in the rich countries and not from that in the poorer countries. There have been rumours that the spokesman of one of the poor countries did express such a view, in very broad terms. By and large, from what one could gather from Press briefings, it would seem, the poorer countries have not reacted to the proposed study by the ten in this way.

Although the ten have yet to make this study, it is becoming already apparent that decisions will be anything but unanimous. Here the reasoning of "The Washington Post" corresponds is unassailable. Probably it is here too that decisions will be influenced more by political considerations than by purely economic considerations. But that is more because of the political differences between France and America and because the French leaders are determined to miss no opportunity of twitting the Americans.

★★

It is hard to find a parallel to the silent tributes paid to the memory of the Father of the Nation in America on October 2, 1963. On that day, Emperor Haile Salasie placed a pure silver wreath at the pedestal of Abraham Lincoln at the Lincoln Memorial. Nothing could be more touching than this tribute by a representative of the people of Africa to the great American President who fought so valiantly to abolish slavery on the birthday anniversary of Mahatma Gandhi who fought so gallantly to do away with untouchability. It might all have been a fortuitous coincidence, but I have reasons to believe that Emperor Haile Salasie deliberately chose October 2 for laying the wreath at the Lincoln Memorial.

tion. A number of factors have been isolated by different analysts: the payments surplus, price supports for agriculture (which raise the cost of food) and self-financing of ambitious industrial expansion (which prevents companies lowering the prices of manufactures as much as higher productivity would permit). While admitting the relevance of these, and other factors, one can still highlight a development that is quite peculiar to the French price index and explains a good part of the effort to repair the ravages of half a century of absurd rent controls by means of a gradual return to a free market in housing. To the extent that this can be shown to be a major element in the rise in the prices index, one can argue that the soaring cost of living is not due to some persistent vice but is part of the costs of the restoration of liberalism that began in December 1958.

Rents indeed stand out in any breakdown of the price index: they have spiralled no less than 82 per cent since the monetary reform; the nearest approach to that rate of increase "weightage" in the price index, rents are thus immediately responsible for a rise of almost 1 per cent a year. Since the are geared to it by a fixed differential) depends on the price index, the rise in rents has indirect repercussions on many other prices: in the first instance, on the prices of services which consist almost wholly of wage-costs. It is probably true in the increased cost of living.

Why should they have soared 82 per cent in just over four

years? This was no accident but a matter of deliberate policy. Rent controls had been in force in France since August 1914 when rents were frozen to protect soldiers and evacuees. The freeze was said to be "for three months," but it was renewed every quarter until 1918 and then hardened into regular law. By that time the French people were well launched on one of the most incredible stories of organised folly that economic history can offer. Briefly, they turned themselves into a nation of slum dwellers by wiping out the landlords and prohibiting new building. For, as the franc depreciated, the 1914 money-rents (periodically increased by ludicrously small percentages) became worth less and less, so that not only would no one build but no one could even afford to maintain existing accommodation which soon began to fall into ruins.

By 1948, landlords (of course, almost none existed by then: there were just working people who clung on to inherited real estate) were receiving only one-fifth of the income, in terms of buying power, that landlords had been getting in 1913. Whereas the bourgeois used to pay, between 1860 and 1913, from 15 to 20 percent of their income in rent, by 1950's Parisians were paying only 2 percent. The national average was a mere 5 per cent of income for rent, by far the lowest in the Western world. Everyone knew that this was madness, because the results were too plain to miss: the index for new housing starts in Paris fell from 100 in 1913 to just five in 1946, and loss of old housing more than counterbalanced these feeble additions. Meanwhile another war came to flatten more housing; in the two struggles on French soil in this century 2.25 million dwellings out of a total of around 12 million were destroyed or battered. A rising population (and especially a rising urban population, as the drift to the cities got under way) had to subdivide this contracting pool of accommodation, with consequences in terms of squalor that are easily imagined. But the rent-control demagogues (who include every government without the courage to face the outcry of irresponsible politicians) seemed determined to take France right to the end of line and demonstrate for all time the absurdity of price-controlling supplies right out of existence.

Nefarious Controls

This was the inheritance of the monetary reformers in 1958. There was a housing shortage of several million dwellings, and the prospect of a shortage of several million more accumulating in the coming 20 years. Two million apartments were officially classified as grossly overcrowded; 35 percent of rural buildings and 20 percent of urban dwellings were fit to be bulldozed at once; out of 1.2 million lodgings in Paris 84 percent dated from before 1914 (that is, from before the introduction of rent controls), 270,000 had no running water, 70,000 no electricity, almost a million neither bath nor shower and 620,000 had no individual toilet. In short, the nefariousness of controls had been conclusively proven and the question was how to get back to a free market in housing where it would be worthwhile building to meet demand.

A first move had been made in 1948, when it was ruled that housing constructed after that date would be uncontrolled. As landlords began to re-appear, there were thus two housing markets: a controlled one constituted by pre-1948 (largely pre-1914 in fact) accommodation, and a free one of new (and naturally in large part luxury) flats. The aim was then to decree gradual rises in controlled prices until they came into line with the free prices; they would never equal them, given the difference in age of the constructions, but they would come into relation with them so that a unified market was restored. This process of increasing controlled rents began in earnest just over four years ago; hence the 82 percent jump in the "rent" entry in the cost of living index number.

It was, needless to say, impossible to restore free rents at

one swoop, as was done in various other fields where subsidies were abolished, because almost 50 years of rent control had created a situation where cruel hardship would have resulted from a massive dose of liberalism. Some estimate that it will require 20 years of solid building effort, under the regime of free prices for new housing, before there is near enough to go around, so that controls may be scrapped entirely. Such guesses are hazardous because it is a regular consequence of controls that they artificially disguise the real volume of supply; i.e. goods, in this case houses, are held off the market (e.g. under-occupied) because it is not profitable to offer them to users. As rents become more reasonable, supply could increase faster than now seems plausible. The Government's objective is to coax tenants into parting with more than five per cent of their revenues for rent, until they approach the 15 percent that is now the West European average. This should be somewhat easier in a period of rising incomes: between now and 1980 French revenues per head should double so rents could be multiplied by six and thus come into line with other European rents. (Instead of paying five francs out of 100 francs for rent, the tenant would pay 30 francs out of 200.)

This is eminently reasonable policy and looks to be the only way to undo the damage of a generation of controls which had led to the scandalous paradox of Europe's most prosperous nation being its worst housed. Yet as rent becomes a more

"Rs. 15 crores more will be spent by the Union Food Ministry in the States on minor irrigation."

significant item in the family budget, increases in rent will have more evident effects on the cost of living index and hence, indirectly, on many other prices and on the value of the franc. This is one form of price-inflation that the French will have to bear with, while seeking to limit its effects on the value

Battle Over Profits in the UK

By JOSSLEYN HENNESSY

LONDON:

PARTY CONFERENCES come amidst a fanfare of polemics and party leaders go leaving a cloud of speculation, but the hard facts of the economy go on for ever.

A new poll shows that business confidence has returned to the boom height of mid-1959, exports have attained record levels, and the economy is achieving Neddy's 4 percent growth rate. As European wages and costs rise, the U.K. is reaping the harvest of the unfortunate Mr Selwyn Lloyd's pay pause. The Stock Exchange index is also at a record high because profits are soaring. And, curiously enough, this is the fly in the ointment. A prominent trades union leader recently declared that the workers would not accept sacrifices in pay in order to fill the pockets of employers. So whatever party wins the elections, wages trouble probably lies ahead, especially as the terms of reference of the National Incomes Commission lay it down that NIC is required to have regard to the Government's pledge that if any undue growth in the aggregate of profits should result from restraint in earned incomes, that growth should itself be restrained by fiscal or other means.

Uncertain Profits

In a widely publicised memorandum to the Government, the Federation of British Industries points out that whereas wages are costs of production, profits are that—if anything—which remains after all costs have been paid. Wages are paid by contract, which must be honoured whatever the profit or loss, and they are, incidentally, extremely resistant to any reduction. Once agreed, wages and salaries are fixed at a given minimum. Profits, alas, have no minimum—they are uncertain. In an efficient economy the points of economic growth or shrinkage are first shown by changes in profits, and only subsequently by changes in other incomes. Above all, profits in most instances—the nationalized industries being the most conspicuous exceptions—are earned in competitive conditions. Wages are settled by bargaining. It is, indeed, because trade unions have succeeded in limiting competition in the labour market that it is possible for wages to run ahead of productivity; against this, profits cannot for long exceed the measure of the risk-taking and the value to the economy of the enterprise of which they are the reward.

The F.B.I. stresses that if, therefore, direct restraining action on wages, but not normally on profits, may often be justified, this is not because in their view a national incomes policy is a medicine for workers but not for investors.

On the contrary, the F.B.I. insists that indirect measures producing an economic climate in which profits can be high only where efficiency is high are likely to restrain aggregate profits far more than any practicable direct measures can restrain wages. The F.B.I. therefore urges that the aim of government policy should be to favour high wage-earnings based on competitive wage rates, and high profits based on competitive profit margins. High profits, earned by efficiency, are the foundation of high wages and job security.

The F.B.I. challenges NIC's directive that dividend restraint is needed on the grounds that profits in the hands of shareholders are inflationary, but that ploughed back, or

of the currency, as for example by encouraging lower prices for manufactures as far as increased productivity allows. It is, at all events, worth drawing attention to a case of persistent and apparently insidious price rises actually due to sound economic policy.

skimmed off in taxes, they are not. Even if this were true, there are still two objections to dividend restriction.

First, the share of dividends in the total of personal incomes is far smaller than that of wages. In 1961, wages (adjusted for stock appreciation and capital conservation) were £2,521 m. or 17.1 percent of wages and salaries. Dividends and interest payments totalled £1,316 m. or 8.9 percent of wages and salaries.

Secondly, dividend limitation harms the economy by thwarting the function of the capital market, which is to prize; it is inequitable between companies because it does not allow a desirable reward when new capital produces good results or when companies fight their way out of difficult control of current expenditure; it weakens the penalties for between good and mediocre companies weakens the investor's incentive to promote expansion by investing with care. Profits and dividends must be high enough to attract funds from investors if the economy is to prosper. This applies not only to domestic but to foreign capital. If the U.K. wants level of profits cannot be determined by what may be thought cult to decide how far any rise in aggregate profits is due to wage restraint.

Cost-Plus Pricing

The chief methods of limiting aggregate profits have hitherto been: control of prices, control of profit margins, and manipulation of profits tax, either by a general increase, or by a special increase on profits which exceed some given "norm".

The control of prices and profit margins means either cost-plus pricing, which puts a premium on inefficiency, or it prevents the accumulation or attraction of capital for expansion or improvement.

A general increase in profits reduces profits after tax, but hits all firms alike, whether efficient or inefficient, whether their markets are relatively sheltered or not, and whether their profits have risen from wage restraint or not. A discriminatory increase against profits above some norm not only has the same defects but also raises difficulties in deciding what norm is equitable.

In short, the F.B.I. believes that profits should be controlled by the economic climate created by anti-inflationary fiscal and monetary policies, in combination with international competition in exports, and with liberal imports.

So far NIC has one victory to its credit. The impact of its reports on public opinion ended last month in a three-year agreement to hold pay increases within 3½ percent annually. Neddy and NIC are too young to warrant judgement on their contributions to growth, but by promoting of cost-push inflation. The real battle will come next year if, as is likely under the present favourable economic trend, profits continue to soar.

LISTENING POSTS

Ministries in Motion

By Our Special Correspondent

NEW DELHI:

WHILE IT is generally believed that Mr. M. C. Chagla will be given the portfolio of Education, it is rumoured that his own preference was more in the direction of responsibilities relating to Commerce and Industry. The Prime Minister, it is believed, found it difficult however to accommodate him in this matter. As for Mr. Sanjivayya, it is highly likely, but not yet quite certain, that his portfolio would be Labour and Employment. It appears that Mr. G. L. Nanda, who is credited with the desire to retain some kind of overlordship in that area, is not quite pleased at the prospect of a full-fledged Cabinet Minister being put in charge of it. At the present time, Mr. Jaisukhlal Hathi, as a Minister of State, has care of Labour and Employment, an arrangement which is probably more to the liking of the Home Minister. Mr. Hathi, however, seems to be a much wanted man. It is being said, for instance, that Mr. T. T. Krishnamachari would like to have him in the Finance Ministry. Another possibility named in this connection is Mr. R. M. Hajarnavis, Minister of State in the Ministry of Home Affairs.

It is true, of course, that these and other prospective movements of ministerial personnel would be determined to a considerable extent by the recasting of portfolios which the Prime Minister is considering. One readjustment has already been made with the abolition of the Department of Company Law Administration in the Ministry of Industry and the transfer of its responsibilities to the Department of Revenue in the Ministry of Finance. Mr. D. L. Mazumdar, who had been presiding over that now defunct department as its Secretary has gone on leave and will presumably have to be accommodated in some other suitable position when he rejoins duty. It is also possible that the Department of Supply and Technical Development, which is presently under Mr. Hathi, may lose its identity in a larger Ministry when the re-patterning of portfolios is effected.

★★

The Minister of Shipping is making an all out effort to build a second Shipyard at Cochin. Following his visit to Japan, a Japanese consortium, including Mitsubishi and Company has submitted a comprehensive proposal for technical and financial collaboration in the setting up of the project. The Japanese proposal, it is believed, envisages a total outlay of Rs. 22 crores with a foreign exchange component of about Rs. 4.5 crores.

While the Government of India would reportedly like this project to be commissioned by 1966, a year earlier than is suggested by the Japanese collaborators, some criticism is heard of the enthusiasm which is being shown for this relatively low priority project in the face of over-capacities, lack of orders and fierce competition, which are plaguing the European shipyard.

Last year, German shipyards obtained new orders for not more than 200,000 GRT. Orders for another 144,000 GRT were cancelled during the same period for a variety of reasons. The Danish company Burmeister and Wain AS, of Copenhagen, one of Europe's largest shipyards and machine building firms, has said it had not been able to book a single order for new buildings in 1962. Even if new orders could be obtained this year, some of its 8,000 workers may have to be dismissed, the management announced. In Sweden, it is generally admitted that a large part of the shipbuilding orders received in recent months were won only at prices entailing

losses for the yards involved. In the U.K. about 25 shipyards reported earlier this year that they had no orders on hand for the construction of new vessels.

Japan is the only country, which has increased tonnage built and has recorded an export boom. The success of the Japanese is explained by a number of factors. Above all, they offer new ships at prices considerably below world market levels. According to a French shipbuilding journal, spokesmen of the Japanese shipyard Hamesaki and Co., of Osaka, freely admitted that their yard had booked new orders at prices below production costs—at the expense, evidently, of their subsidy-granting Government.

Next to low prices, the Japanese lay claim to high quality. Their emphasis is on up-to-date technical innovations and, as of late, on automation. One Japanese shipyard, for instance, has built a 10,000 ton freighter so extensively equipped with electronic gear that it will require a crew of not more than 20. Normally, between 40 and 50 officers and men crew a conventional ship of that size.

An engineer of the Mitsubishi Shipbuilding Company explained: "The 10,000-ton automatic freighter will cost about \$4.2 million, as against a price of \$3.3 million for a non-automatic vessel of that category. Operational costs for the more modern vessel, however, will be substantially lower and, in time, make up the price difference."

Such serious competition coming from the Far East has already affected European shipbuilders to the extent that workers have had to be dismissed, work shifts reduced and dividends cut or suspended.

★★

The mid-term appraisal of the implementation of the third Plan health programmes has revealed that the outlay of Rs. 342 crores provided in the Plan for this purpose may not be actually spent. The expenditure in 1961-62 amounted to Rs. 57.98 crores and in 1962-63 Rs. 71.45 crores. The budget provision for the current financial year is Rs. 64.74 crores. The expenditure likely to be incurred during the two terminal years of the Plan is estimated at Rs. 140.83 crores. Actual expenditure during the five years to 1965-66, therefore, is expected to fall short of the Plan outlay by about Rs. 7.00 crores.

This, however, does not imply that the physical targets in respect of some important health schemes will not be achieved. In the case of three crucial programmes—new medical colleges to be opened, the number of doctors and nurses to be trained and the number of hospital beds to be provided—the targets are expected to be even exceeded.

The number of medical colleges is stated to have gone up from 57 in 1960-61 to 71 in 1962-63. Against the Plan target of having 75 medical colleges in the country at the end of 1965-66, the number of such colleges in now expected to go up to 80. The Plan target of providing 2,45,100 beds in hospitals is likely to be exceeded by a small margin. By 1962-63, as many as 2,01,860 beds had been provided. The number of doctors available at the end of 1965-66 is now estimated to be 85,000 as against 81,000 envisaged in the Plan. As against 32,200 trained nurses at the end of the second Plan, the number of nurses at the end of the current Plan is expected to go up to 45,000.

In regard to family planning, the progress, however, has not been satisfying. It is likely that more funds will be made available for this purpose in 1964-65 and 1965-66.

The progress in the sphere of water supply and drainage

also is not considered to be adequate. This is attributed to serious short supply of drilling equipment, cement, pipes and other materials. The Central Government has sponsored a scheme for investigation of rural water supply position in each State. A Drinking Water Supply Board had also been set up to accelerate the implementation of water supply plans.

Two important proposals are understood to be under the consideration of the Government of India in regard to technical education. The first is to set up a Central pool of technical teachers from which critical shortages of such teachers in various State engineering colleges and polytechnics would be met. The need for establishing such a pool arises due to the fact that some States have found it difficult to implement the scheme of revision of salaries of technical teachers recommended by the All-India Council of Technical Education. In many State engineering institutions, the shortage of qualified teachers is said to be extremely acute; only 40 to 50 per cent of the teachers employed are qualified.

The second proposal envisages setting up of another Central agency for arranging ready supplies of indigenous technical equipment and for investigating the possibilities of procuring items of equipment with foreign exchange component from East European countries and Japan. The need for establishing this agency has arisen owing to the meagre allotment of foreign exchange that has been possible in the recent past for import of technical equipment. As against an estimate of Rs. 14 crores foreign exchange spending for this purpose, including Rs. 3.5 crores to be received under foreign aid, during the five years to 1965-66, the actual allocation in 1961-62 and 1962-63 has been only of the order of about Rs. 1.00 crore. This naturally has created many difficulties for the engineering institutions.

The setting up of these two agencies should go some way in helping to raise the falling standards of technical education in this country.

Due to the current emergency, facilities for technical education are proposed to be expanded so as to increase the number of annual admissions for diploma and degree courses from the original third Plan targets of 37,391 and 19,137 to 47,546 and 23,130, respectively.

Screening for practical training in engineering abroad of seventy-five persons, recently done in New Delhi, disclosed some glaring shortcomings of Indian candidates. There were as many as eight hundred applications from which three hundred were selected for interview. The broad intake was thirty from amongst private sector factory workers, fifteen from public sector factory workers and thirty from teachers already engaged in teaching in India's technical institutions. As could be expected, the general standard of education and general knowledge of factory workers was below expectations. The teachers in many cases were drafted straight from the Universities and had had no practical training or experience. What would they do in a highly sophisticated factory in Europe could easily be imagined. This aspect of the problem of training needs reappraisal by the Government.

The Union Health Ministry's second mile-stone is a proposal for a public sector factory for rubber contraceptives, the first one being the proposed amendment to Patents Law. It is explained that family planning was not going well, largely because of inadequate supply of contraceptives or their below the standard quality.

There are at least seven applications in the field, not only to manufacture rubber contraceptives but also other pharmaceutical items. There may be a surplus capacity for this item in the country. Why a public sector project is suggested is not easily explained. Opposition is gaining strength.

So far as the amending Bill to Patents Law is concerned, in addition to the Federation of Indian Chambers of Commerce, the Governments of the U.S.A., the U.K., Germany,

Denmark and Switzerland have lodged strong protests against the proposal.

World Bank assistance is envisaged here in developing automobile industry and its components, industrial equipment and construction equipment. Loans of the order of thirty million dollars each are under negotiations. They will, of course be subject to proper appraisal of these three sectors of industrial development by the World Bank teams.

A team is shortly going to Austria to negotiate terms of collaboration with Voist, which has indicated the possibility of financial participation in the Heavy Structural project. The revised thinking, so far as vessel plate project is concerned, is to have more than one unit. This is largely due to the increased demand for its products required for fertilizer plants, chemical and petro-chemical industries. Meanwhile, according to reports, the Davy Ashmore power-gas group of Britain will collaborate with Fertilizers and Chemi-

AT PINJORE -A MONUMENT TO VISION, COURAGE AND DYNAMISM

VISION—of the Government of India to plan for the manufacture of machine tools in the Public Sector to meet the industrial needs for "Machines that make machines". **COURAGE**—to go into the manufacture of machine tools against the opinion of experts who considered the project economically unsound and doubted the ability of the Indian worker to acquire the necessary skill. **DYNAMISM**—of the workers and management of HMT whose resolution and hard work made such an unparalleled success of the two machine tool factories and the high precision watch factory at Jalahalli, and their continued determination to gift the nation a new factory every year.

On the 23rd October 1963 the Prime Minister opened another HMT Factory, a Public Sector project at Pinjore, the third in a series of ten machine tool factories planned as a part of the HMT complex to be completed by 1970.

Cut down your lubricants Cut out your paper-work

Company executives can obtain a free copy of this booklet by writing on their official letterhead to their nearest Caltex Office.

Help your Purchase Officer to eliminate the stacks of paper that collect in his office...the unnecessary flood of Purchase Orders. When each department in a plant specifies a lubricant without reference to the purchases of other departments, there is bound to be duplication and waste.

The Caltex "Stop-Loss" programme can do away with this lubrication waste...can cut a great deal of Purchase Order paper-work.

Caltex "Stop-Loss" is a complete plan for organising lubrication on an efficient basis. There is no other programme like it.

It will be worth your while to find out specifically how Caltex "Stop-Loss" can help to ease the problems in your plant.

Help your operation to greater profit with the Caltex "Stop-Loss" programme.

Good News for the Homeless

From Our Correspondent

BOMBAY :

NEARLY 40 PER CENT of the married working population of Bombay City are forced to remain as bachelors due to shortage of housing accommodation. The Maharashtra Government appears to be seriously bent at last upon solving the acute housing shortage in the City. According to an announcement made by the Chief Minister, Mr. Kannamwar, 'after 15 years from now, no one would live on the pavement nor would there be any slum-dwellers.' This would be a veritable Noah's Ark to the homeless. In order to make the fond dream a reality, the Chief Minister has appealed to the public to 'make a determined effort' to help accomplish the 'houses for the millions' scheme. He assured the public that the suggestions would be taken into consideration before implementing the schemes for housing the city's millions. It is relevant to recall that Bombay's population was increasing by leaps and bounds. Twenty years hence, it was expected to exceed the five million mark. In Bombay, the heart of Maharashtra, an estimated three lakhs of people lived in the slums. Hundreds of slums are raising ugly heads every day in new areas. A number of middle class and lower middle class people are leading a very miserable life. Unless a 'careful phasing' was done now, 'things are going to be difficult at a later stage.' A beginning in this direction was made on October 9 when the Mayor of Bombay accompanied by the Ministers for Revenue and Housing, the Municipal Commissioner etc. inspected the lands in Greater Bombay on both sides of the Western highway available for undertaking the construction programme. The places proposed for intensive development were Ghatkopar, Mulund, Bhandup, Bandra, Oshivara, Kandivli, Marole and the Aerodrome fringe. At all these places, 280 acres of land was proposed to be developed at a cost of about Rs. 12 million which would provide plots for 7,000 families to start with. The scheme envisaged provision for developed plots with requisite common water and sanitary arrangements. Each plot would measure 25 feet by 40 feet. The work of development would be executed by the Maharashtra Housing Board. The ancillary services like roads, street lights etc. would be provided by the Corporation 'if possible.' The Chief Minister would not leave anything to be desired for executing the project. It was also proposed to build night shelters for pavement dwellers and for those who come to the city from the mofussil areas to market their produce such as vegetables. They would be provided with accommodation for overnight stay at nominal fee. If the grand schemes envisaged in respect of housing fructify, there is no doubt that the housing shortage in the city would totally disappear. Among the various State Governments, the Maharashtra Housing Board has a proud record. The problem could be solved provided there is mutual co-operation and sympathy of all concerned—the Union and State Governments, the Bombay Municipal Corporation, industrialists and the general public.

★ ★
The Commissioner of Income-tax, West Bengal, Mr F. H. Wallibhoy, came to Bombay on a short visit. He took the opportunity to address the Rotary Club of Bombay. According to him, the residents of Bombay and Calcutta the two most industrialised cities of India, paid nearly two-thirds of the

Rs. 395 crores collected as income-tax last year. Among the other interesting facts disclosed by him were that the average annual income of doctors and lawyers was Rs. 10,000 as compared with the income of Rs. 40,000 to Rs. 50,000 of film artistes. The tax evasion was not confined to those in the high-income bracket. It was equally widespread among petty shopkeepers and merchants. The new Finance Minister, Mr. Krishnamachari, can be expected to check the serious problem of tax evasion. It is a herculean task to plug the leakages in the case of small shop-keepers; many of them do not maintain any account books and there is no way of knowing their actual income.

★ ★
Mr. Anil K. Chanda, the former Comptroller and Auditor General, came all the way to Bombay to address a meeting of the Forum of Free Enterprise. He chose the appropriate, subject 'Economy in Public Expenditure'. He revealed that the Planning Commission which was originally conceived to be 'a technical advisory board' has developed into another government. It had an annual budget of Rs. 1 crore, 500 officers and departments which corresponded to the Ministries. It had been encroaching on all Government departments and had disturbed the Federal-State relations. He deplored, in particular, the wastage of public funds by Ministers, the frequent break-up of Ministries, the subsequent amalgamation for the convenience of the appointees and the growth rate of the posts of secretaries which was higher than the phenomenal growth of the population of India. He criticised the wrong priority given to prohibition over the policy of free and compulsory education and the wastage of funds in the propagation of 'khadi'. As a panacea he advocated the reversion of the role of Planning Commission into a compact 'technical advisory body' and retrenchment of the present mushroom growth. Every project of public importance should be carefully conceived, properly planned and economically executed. It is interesting to note that the Prime Minister himself expressed sorrow at the way the Planning Commission was working. Is not the Prime Minister, who is the Chairman of the Commission incidentally, responsible for the present state of affairs? It is to be hoped that the injection of new blood into the Commission would make that Body more useful and less fussy than before.

★ ★
A scheme for the training of sailors to be employed in the saloon section of Indian ships is under contemplation. Indian saloon crews are rated very high all over the world. But the authorities feel that proper education and instruction in modern cuisine and service could improve their efficiency and bearing. In the West, only trained hands are recruited for the saloon service. India is yet to ratify the International Maritime Convention relating to the training of saloon department seamen. As an experimental measure, the scheme will be in operation for three years. The training ship, the "Dufferin" has been chosen for the training of galley and non-galley saloon crews from January next. Twelve from the first and 16 from the second categories would be trained annually. The galley class includes chefs and cooks and the non-galley class comprises cabin and stable stewards. So far, there have been no training faci-

lities for saloon seamen. Both the deck and engine crewmen are covered by the training of ship personnel. The Government of India is keen on extending the training scheme to cover all Indian saloon crewmen in due course.

★★

In spite of the earlier statement of the Chief Minister, Mr. Kannamwar, that there was no likelihood of a reduction in the State Cabinet, knowledgeable circles believe that the Maharashtra Government has to fall in line with the cabinets in the rest of the States. Mr. Kannamwar's earlier statement rested on the belief that the pruning under the 'Kamaraj Plan' applied only to those States which elected new leaders. The belief proved short-lived when he was summoned to Delhi to discuss with the Congress High Command the reduction in the strength of the Cabinet. Since important leaders were away from the Capital, Mr. Kannamwar had to utilise his visit not for discussing the subject of future strength of Maharashtra Cabinet but other pressing matters like the border dispute with Mysore. The question of establishing a separate press advisory council, it was revealed,

Nigger in the Coal Pile

From Our Correspondent

CALCUTTA :

IT IS HARDLY surprising that the fact that coal production in the country is progressing at the anticipated level has not evoked much enthusiasm either from the producers or the consumers. For producers are worried over the accumulation of pithead stocks while consumers complain they have often to accept lower quality coal paying the price for good quality. For a casual observer of the coal situation, however, everything may appear to be quite satisfactory. Unlike in some basic sectors of the national economy, coal production is progressing apace according to schedule. Output in April-August, 1963 has totalled 27.73 million tonnes as compared to 24.79 million tonnes during the corresponding period of the previous year. It is quite on the cards therefore that the production target fixed for 1963-64 will be reached in time. In marked contrast to the frequent complaints about coal shortage one used to hear only a year ago, all consumers today appear to be well satisfied with their coal stock position.

There has also been considerable improvement in the transport situation in that the Railways have lifted a total of 60.2 million tons in 1962-63 as compared with only 49.7 million tons carried in the previous year. It would appear that the railways are poised for carrying even bigger loads of coal in the current and subsequent years considering the very satisfactory progress of their development programmes and the increased allotment they have got for capital outlay. But the fact of the matter is that there is something radically wrong with the coal situation as it obtains today. Producers apprehend that the demand for coal will not come to the level assumed in the third Plan but will be considerably less. Consequently some of them argue that there is need for revising the coal production target downward. Equally strongly it is argued by some others that it will be an extremely foolish step to interfere with the present tempo of production because any slackening now will result in shortage if not in the next one or two years, definitely in the early years of the fourth Plan. The truth however seems to lie between these two contentions when a grade-wise analysis of coal production is made. Such an examination will show that the rise in production has been solely ac-

was discussed with the Centre and also the subject of allocating an additional newsprint quota to the State.

★★

The new Samvat year 2020 bids fair to open on a brighter note than the previous one for the Stock Exchanges in India. There has been a marked rise in prices over the year, 2019, which has enabled the investors to recoup a sizeable part of the losses suffered in the previous year. The share prices during the year, for instance, recorded a rise of nearly 5 per cent in refreshing contrast to the decline of 12 per cent in the year 2018. The rise in prices from the year's low was around 13 per cent. It is true that the Emergency is still on. But the chances of a major Chinese aggression seem to have faded in the context of fresh developments on the international front. This factor coupled with official assurances that every effort would be made to increase the pace of growth of economy has infused confidence among the investors. It is with this type of optimism that 'Dalal Street' has been entering the new year. All the major industrial shares in the year's gains although the engineering section has been most prominent.

counted for by lower grade coal while the production of high grade coal has even declined.

The situation has been aptly put by Mr. D. C. Driver, in his presidential address to the eighteenth annual general meeting of the Coal Consumers Association of India, at Calcutta last week. There has been no doubt an improvement in overall output but the same cannot be said of quality. We have the anomaly that "there is more low grade coal than we can use and less good quality coal than we need." Mr. Driver has pointed out that while for the year ended March 1963 the output of coal totalled 64 million tonnes as compared with previous year's figure of 55 million tonnes, there is serious imbalance in regard to quality. While low grade coal has surpassed its target, there has been a serious decline in good coal, the production of which for Selected A has declined from 7.6 million tonnes in 1960 to 6.9 million tonnes in 1962 and that for Selected B has come down from 10 million tonnes in 1960 to 7.8 million tonnes in 1962. According to Mr. Driver, washing of low grade coal into high grade by-product of the washing process, are hard to sell. Already coming into being, the quantity will further increase. If the washing of ordinary non-coking coal is also undertaken, the supply of middlings will reach unmanageable proportions. The result of unchecked output of low quality coal and their washing will not only pose a serious problem of the disposal of middlings but will go to inflate the cost of fuel of industries having to buy the washed coal because there will be no chance for offsetting the cost of washing by the profitable disposal of middlings.

Mr. Driver has also shown that a reduction in the output of low grade coal also seems to be indicated by the diminishing trend of demand for this category of coal from the industry. In the first place, the rate of increase in new industrial units has relatively declined in recent years. In recent years, mainly on account of the uncertainty in regard to coal supply during earlier years, many industries have changed over at least partially to oil. The offtake of coal by the railways will be progressively lowered owing to the plans

for dieselisation and electrification. The problem of raising the production of good coal cannot, therefore, be ignored for long without bringing about serious dislocation to industries using such coal. In the coming years the demand for coking coal will increase with the expansion of the steel industry. It has been contended that the present pricing policy of Government has been a serious obstacle in the way of expansion of quality coal output. Under the present dispensation, producers have little incentive to place emphasis on quality because the price differential between low grade coal and good coal is so little that it is not profitable to undertake costly deep mining for good quality coal. Another drawback of the present price formula is that even consumers who can use low and medium coal are inclined to indent for good quality coal because of the almost negligible price difference, thereby increasing the already heavy pressure on the limited supply of good quality coal. The remedy it is pointed out lies in widening the price gap between low and good quality coals so that only consumers who actually cannot do without good coal indent for it. A higher price for good coal will also give an incentive for producers to invest in deep mining machinery in the assurance that their increased efforts and investments will be suitably rewarded.

★★

Equity prices on Lyons Range are depicting a firm trend notwithstanding the proximity of the long Puja vacation. The fact that there are fewer uncertainties in the investment situation now than a few months ago has greatly contributed to the strengthening of the bullish fervour. Initially marketmen especially in Calcutta appeared to be a little disturbed over certain passages in Mr. Krishnamachari's recent broadcast but sentiment soon revived in sympathy with Dalal Street where the speech has been generally well received. Liberalisation of credit is believed to be the next step that the Finance Minister will finalise in the course of the next few weeks. It is not however any particular point in the speech

but the general tone and tenor of it that seems to have impressed operators.

★★

Despite the elaborate arrangements made by the authorities, the raw jute market has tended to be somewhat weak. In contrast to the steadiness till a few days ago, there are now reports of sellers selling their stocks even below the minimum prices. Perhaps those who have concluded such sales are exceptionally needy people but this does not alter the fact that there is no agency offering them the minimum price. Storage space appears to be the main difficulty everywhere, in country centres as well in the mills. Although mills have been given a fairly big quota for the current month, their offtake has remained so far rather poor. That arrivals have been proved to be larger than anticipated is shown by the announcement of a quota of 1.5 lakh bales by the Jute Commissioner to be absorbed by the Jute Buffer Stock Association. It would appear that in view of the unusually heavy arrivals this month, the rate of absorption of jute by other agencies operating in the field will have to be considerably increased if the objective of ensuring a reasonable return to the grower is to be realised.

Meantime, conditions in the jute goods market have considerably quietened largely because of a sharp decline in the price of sackings. The fact that stocks at the end of September have increased despite a fall in production during the month may be one of the reasons. Orders have been below expectations, especially from the Government of India. Another bearish influence appears to be the loss of a Sudanese order to Pakistan. At a time when the trade was under the impression that Pakistan would not be entering world markets for some time to come especially in view of its contract with China to execute a large order for sacking, this had come as a surprise. The industry and trade is rather concerned over the continued indifference of the Government of India to the growing Pakistani competition to our sacking markets.

Dearer Rice in Southern States

From Our Correspondent

MADRAS :

THE CRISIS in the rice situation in West Bengal is having its effects felt in the Southern Zone. Thanks to a fairly large harvest, prices in Andhra Pradesh, Madras and the other two neighbouring States remained stable until recently. Indeed, till June this year, it was complained in Madras particularly that prices were ruling even below the levels that prevailed during the corresponding period last year and that the policy of procurement by the State Government was operating adversely against the interests of growers. As the millers were asked to surrender stipulated quantities at the prices fixed for procurement purposes and there would be a loss to the miller when large purchases were made at higher prices, the policy of regulated buying by the middlemen kept down prices especially as the yield of the crop in the different parts of the State was satisfactory. The position in Andhra also was encouraging and prices did not rise until a few weeks back the Chief Minister of the State agreed to allow exports of rice to West Bengal and Maharashtra against quotas on the understanding that an equal quantity of rice was surrendered to the State Government at the procurement prices. In the Tanjore District in Madras State, it was even complained for a time that prices for the Kuruvai crop were low and uneconomic because of the absence of any large off-take from Kerala dealers, the requirements of Karala being satisfied by Andhra to a great

extent. Also, after the merger of Goa there has been a decline in smuggling to Pakistan, and in the past two years prices have been remarkably steady.

When there is an acute shortage in one part of the country, it cannot be insisted that the consumers in other regions should be protected against an undue rise in prices. But right from the beginning the shortage of rice in West Bengal has been underestimated and there was a sense of complacency on account of the comfortable position in the Southern States. It was also felt that the situation could be easily managed with the issue of stocks by the Centre and large sales of wheat. But the calculations of the authorities have gone wrong though there was ample warning in the shape of the crop failure in Orissa and the large diversion of acreage for jute cultivation in West Bengal. This diversion of acreage by itself could not be said to have created a difficult situation in West Bengal as the new crop rice, which will come into the markets in the next few weeks, will be more than generally expected and it was the ban imposed by the Orissa Government that has complicated the situation. When adequate supplies are not available in the Zone, prices cannot be kept in check without larger imports from abroad or arrivals from the neighbouring areas. As there is a net deficit in regard to the cereal in the whole country and as considerable saving in foreign exchange had been effected on account of growing of a large jute crop,

it should have been decided by the Government to import larger quantities of rice from abroad or at least quicken the shipments that would have been brought in at a later date.

The failure of the Central and State Governments to assess the situation correctly has led to a needless rise in prices in Andhra, Madras and elsewhere and consumers in this region are also being obliged to pay atleast 12½ per cent more than what they did sometime back. It was argued by the Andhra Pradesh Government that there was no justification for an increase in prices of the qualities consumed in Andhra, Madras or Mysore. The exports to West Bengal consisted only of inferior varieties of rice, particularly boiled categories, which are not used by consumers in Madras particularly. With the remunerative sales to West Bengal, however, prices for boiled rice in Andhra shot up which had a sympathetic effect on other varieties as well. At the same time, the millers found it advantageous to convert existing paddy into boiled rice and realise higher prices. This has resulted in a fall in despatches of raw rice to Madras as Maharashtra also purchased finer qualities of raw rice to some extent. The opportunity to push up prices was exploited by the rice dealers.

With the lifting of the ban by the Orissa Government on despatches of rice to West Bengal and the diversion of ships carrying rice from South Vietnam and Thailand to West Bengal, it is expected that the situation will improve especially as retail prices have also been fixed at Rs. 35 per maund. Large hoarded stocks have come into the open market and the situation in West Bengal is getting under control. It is not expected, however, that there will be a decline in prices in the Southern Zone for sometime as the new crop is just being marketed and high price at the time of harvest does not augur well for the consumer in the coming months. If the situation is to be controlled, it is emphasised that the State Governments should effect sales of rice at controlled prices through fair price shops so that prices can be pushed back to the old levels. When there is an unexpected shortfall in the yield and the production of the cash crops at the same time has been satisfactory it would not be incorrect to import larger quantities of rice especially when corresponding adjustments in shipments of wheat can always be effected.

★★

Some concern has been expressed over the recommendation of the Development Council for Paper, Pulp and Allied Industries recently that the Government should not grant licences for paper mills which undertake to manufacture paper and boards based principally on bagasse as raw material. Though this decision may not have any adverse effects on units which have already been licensed and which are also operating on the basis of bagasse as raw material and only during the week a fresh letter of intent has been granted by the Central Government to an Andhra industrialist for starting a paper mill in Bodhan area in Andhra Pradesh, it is felt that the ban on issue of fresh licences may affect the progress of the industry in this part of the country. The Development Council would seem to be worried about the delay in the completion of projects based on bagasse on account of the difficulties experienced by the sugar mills in releasing supplies of bagasse in absence of proper arrangements for supply of coal or fuel oil. The boilers firing bagasse as fuel have also to be changed in order to use coal or fuel oil as the case may be. But this is a procedural change-over which is to be carried out efficiently if the paper industry is to be enabled to progress rapidly in this part of the country. Actually in the case of Seshasayee Paper and Boards Limited it is expected that the oil-

fired boilers will be functioning shortly at Pugalur and the sugar mill at this place belonging to the Parry Group will start supplying bagasse to the paper mill at Erode for conversion into pulp. The Mandya National Paper Mills in Mysore is operating satisfactorily on bagasse supplied by the Mysore Sugar Co. and this new unit has a programme of doubling its capacity. A few days back a loan of Rs. 40 lakhs was granted out of the Cooley funds for carrying out this expansion. This mill is operating in co-operation with American interests and after the completion of the expansion schemes it is estimated that the output will be 70 tons daily. The new paper mill at Bodhan will derive its supplies of bagasse from the two large sugar mills in the same area and it is expected that coal will be utilised in place of bagasse and there may not be any serious problem as supplies could be derived from Singareni. This project has been in contemplation for a long time and the licence could not probably be refused especially as the State Government was anxious to have a large paper plant promoted by Andhra industrialists.

There are some more schemes under contemplation in this part of the country and it is understood that the Central Government is worried about the use of large foreign exchange for imports of fuel oil in place of a raw material which is entirely a by-product. But in the absence of bamboo supplies, the use of bagasse on a large scale for the manufacture of paper not to speak of newsprint, cannot be avoided and a formula will have to be devised for the alternative fuels to be made available to the sugar mills on the lines of the cement industry. The coal situation is very much easier and the problem relates only to transport. The new paper mills may be located in areas which can be reached more easily by the sea-cum-rail route for purposes of coal despatch.

A few days back, the Development Council had a meeting at Bellagola for considering the schemes to be implemented during the fourth Plan. It is apprehended that there would be a considerable shortfall in production at the end of the Plan period and a huge effort would have to be made in the next few years if a serious shortage of paper and boards is to be avoided. Even though licences have been granted on a large scale and the capacity would be as much as 11 lakh tons, after all the schemes fructified, it is not expected that the actual production will be more than 5.8 lakh tons in 1965-66 against the target of 7 lakh tons and an installed capacity of 8 lakh tons. The target for the fourth Plan has been fixed at 1.2 million tons which may mean that there will have to be a virtual doubling of capacity in a short period.

As even with the use of bagasse a serious shortage of raw material is apprehended, the Development Council is reported to have recommended the cultivation of fast growing trees on a plantation scale in order to have adequate supplies for pulp manufacture. Besides raw material shortage, there is also the question of securing plant and machinery in time and in adequate volume.

The arrangements for the manufacture of paper-making machinery within the country have no doubt been helpful, but it has been emphasised that larger allotment in foreign exchange should be made in order to import such machinery as cannot be had from indigenous sources. While the indication that a sum of Rs. 2 crores has been allotted for this purpose is to be welcomed, there should be no hesitation in issuing import licences where it is clear that the earlier start of a mill would result in the displacement of costly imports of paper and boards which would otherwise have to be effected. A significant increase in output in a short period can obviously be brought about only with the expansion of

the capacity of the existing mills. These schemes will cost less and yield quicker results. The whole situation will have, therefore, to be carefully watched and the necessary facilities provided.

It has also been pointed out that the stagnation in the industry is partly due to the price and taxation policy adopted by the Government and the new units particularly have been operating on an unremunerative basis. It has been complained that while a premium is charged for certain varieties by the trade, the mills themselves do not derive any tangible benefit. It is understood that representations have been made to the Government for a fresh revision of fair selling prices. It is expected that there will be an increase in prices for lighter varieties of paper while a further increase in selling prices for other varieties might be granted after consultations with expert bodies. The consumer will naturally be penalised in the bargain, but the industry may be given relief in the shape of a revision in indirect taxes on intermediate products if the authorities do not want any increase as such in selling prices.

★★

The Stock Market in Madras has been fairly active following encouraging advices from Calcutta and Bombay. Business has been restricted owing to the paucity of sellers. It must be said, however, that prices have not risen to the same extent as in other two centres. There is a desire to await fresh developments. It is generally expected that after the meeting of the Central Board of Directors of the Reserve Bank, there will be an early announcement relating to the rationalization of interest rates. The presence of the Union Finance Minister in the City during this period is considered significant.

The moving fingerprints

THE PRIME MINISTER broadcast on October 19, calling upon our people to celebrate the National Solidarity Day which fell on the 20th. It was Mr. Nehru again who, on the following day, administered the National Solidarity Day pledge to a mass gathering at the Willingdon Pavilion. The broadcast to the Armed Forces that evening was also made by him. I am disposed to agree broadly with such of us as might feel that we cannot have too much of Mr. Nehru on occasions like this. Nevertheless, I cannot help asking the question whether it would not have been more proper had the President been asked to make the broadcasts. Mr. Nehru, when all is said and done, is a leader of a political party which happens for the time being to be the ruling party. Since the very essence of national solidarity is that this concept should be rescued from the exigencies and expediencies of party politics, I for one find it rather inappropriate that a particular political leader—however eminent and however widely admired and respected he may be—should virtually have been made the sole symbol of a national celebration of this kind. Incidentally, it may be pointed out that it is the President who is the Supreme Commander of the Armed Forces and to whom certainly should have gone the right and privilege of making the National Solidarity Day broadcast to the Defence Services.

Most of last week I was in Andhra Pradesh visiting some of the industrial centres and plants in that part of the country. This State is, in terms both absolute and relative, definitely underdeveloped industrially. Such industrial progress as it has made in recent years has been due principally to the fact that some important industrial undertakings, which were being run under State auspices but were not being run too well, had been handed over to private enterprise. The experiment has been brilliantly successful and the result is that industrial undertakings which were more or less at a dead end have acquired not only a new lease of life but have become vigorous enterprises making good use of installed capacities as well as planning boldly and imaginatively for their modernisation and expansion.

Nevertheless, it still remains true that Andhra Pradesh has yet to tap in any significant manner its vast industrial potential. I understand that the State Government is becoming increasingly aware of its obligations in this respect and I gather that the State's five-year plans will hereafter attend more and more to the requirements of industrialisation of this region. Currently, much of the resources, Central or State, which are being poured into development in this area, are being absorbed in river projects and agricultural programmes. While it is certainly true that Andhra's agriculture should not by any means be neglected there is a growing feeling in the State that the region cannot achieve a satisfactory rate of economic growth if industry is not provided with more nourishment than it has been receiving. Perhaps a satisfactory solution of the problems presented here could be found through the State Government adopting a more positive policy for attracting capital and enterprise to Andhra Pradesh. By these means the State Government should be able to reduce its own direct financial commitments for the industrialization of the region.

Sydenham College, Bombay, which completed its fifty years on October 22, and is celebrating its Golden Jubilee, is certainly a landmark in the progress of higher education in the nation. Launched as a modest commerce college with an honorary principal, four part-time lecturers and about a

hundred students, it has now grown into a veritable university of commercial education with fifty eminent teachers and about 1,300 students on its rolls. Among its other distinctions, it is the only educational institution in the country which has been teaching Actuarial Science for the last 35 years. The College at present provides instructions up to Ph.D. degree and the authorities have decided to start a research centre for research in the Humanities, Commerce and Economics.
