trust only genuine spare parts

No problems ! No worries
Problems always arise if you neglect your Jeep. It works hard and long for you and may at times need certain replacements. Factory approved spare parts guarantee a new life and maintain the excellent performance with minimum upkeep. Rely with confidence on genuine spare parts —only with them will you get complete satisfaction.

T.T.K.'S APPROACH TO PLANNING

THE Union Finance Minister, Mr. T. T. Krishnamachari, who has been thinking aloud on current economic problems and raising posers regarding them in a manner calculated to provoke public thinking and discussion, has had two very recent occasions for displaying his freshness of approach to economic growth. The first such occasion was on 16th December 1963, when, at the end of an unusual pre-budget statement on the economic situation, he announced the decontrol of 16 industrial commodities (*vide* second leading article in our issue of 21st December 1963). In that statement, incidentally, the accent was more on short-term than on long-term problems. But on the more recent occasion, when he delivered the inaugural address at the Indian Economic Conference held at Bombay on 25th December 1963, the basic and longer-term aspects of planning and growth claimed his greater attention. It is noteworthy that the Lok Sabha statement and the inaugural address, both of which raised a series of practical issues for public discussion, have also roused hopes in the public mind that T.T.K. might strive hard to bring about a pragmatic reorientation of economic policies, albeit within the ideological framework of democratic socialism.

As planning is a continuous process and the third Plan must be followed by the fourth, T.T.K. did well, in particular, to pose the following relevant questions, for some of which he also sought to provide, by implication or otherwise, practical answers in his inaugural address at the Bombay conference of economists:

(1) Is the fourth Plan going to be a translation, in more detailed terms, of the broad projections that we have been giving in the earlier Plans? Or, do we need to look again, re-examine those projections and perhaps shift our sights or perspectives or both?

(2) Do our strategy of development—involving heavy effort on basic industry—and our scales of priority determination continue to be correct or do they need a fresh look?

(3) Is our balance between consumption and investment, while politically wise, economically the optimum?

(4) On the institutional side, are we making the best use of productive energy whether in the Centre or the States and in the public and private sectors?

(5) Are we doing enough to generate the resources—human, physical and economic—for the targets that we deliberate?

(6) Are we in fact moving towards a new momentum in economic effort and an expanding environment for production or are we moving into a situation of excessive control and complicated institutionalisation?

Since T.T.K. is firmly convinced that "the strategy and methods (of planning) hitherto followed are basically correct" and that the fundamental approach and investment priorities in our Plans are inherently sound and thus deserve to be continued, his call for a "ruthless re-examination of our methods of implementation of the Plan targets so as to rectify our mistakes and shortcomings" is to be strictly understood as referring to the *process of implementation*. It involves no contradiction in T.T.K.'s stand on the *planning strategy* as such. Surely, one can envisage more practical, and less doctrinal, ways of Plan implementation without prejudice to the basic framework of a Plan. Even if one has reservations about the soundness and wisdom of the basic Plan strategy, one should find no difficulty in recognising the flexible and pragmatic approach of T.T.K. to the broad technique of implementation. His general emphasis "on both advance and consolidation" and his recognition of the need for devoting more attention in the initial period of the fourth Plan to the problems of consolidation and of securing substantially larger outputs from the inputs already made are unexceptionable, for they are entirely relevant to the question of efficient and effective fulfilment of Plan targets.

Likewise, in the given "income-oriented" Plan which is designed to effect a relatively greater increase in saving and investment than in current consumption, T.T.K.'s ideas pertaining to possible readjustments in investment as between sub-sectors of development seem to be practical and realistic. For instance, his twin plea for the further development of metallurgical industries so as to produce a variety of capital goods and intermediate products and for a relatively larger emphasis on chemical industries, especially those based on the petro-chemical complex, is perfectly sound, for these industries can not only bring down the foreign exchange needs of future growth but are also crucial to higher levels of performance in agriculture and consumption industries. Practical ways of readjusting import-saving and export-earning investments have also been indicated by T.T.K. That import substitution, like export earning, should not ignore the cost aspect is his view. It is difficult to disagree with this view, for, if both import-saving and export-earning investments are judiciously effected in the light of the comparative cost advantages of end-products, they are more likely to have the most favourable impact on the overall balance of payments position than the present thin resource allocations over a wide front on the import and export sides alike. In other words, T.T.K.'s idea would involve a concentrated effort in selected industries so as to reduce potential imports quickly and efficiently, even if this implies continued reliance on imports in certain other directions. On the export side, too, his idea would involve a concentrated effort on lines that promise the best results in terms of cost advantages and availability of markets. Surely, both planners and industry can find a lot of food for thought in T.T.K.'s plea for selective and concentrated effort in the import and export fields.

Another field in which investments and methods of implementation can be suitably readjusted and modified without prejudice to the basic framework of Plan priorities is that of irrigation and power development. It is well known that irrigation development in particular has not taken place according to schedule and that power projects have been frequently delayed in execution. Inter-State rivalries and the increasingly difficult financial position of State Governments would seem to justify the course suggested by T.T.K. The suggestion here is that the Centre should shoulder more direct responsibility for irrigation and power development. It is T.T.K.'s expectation that such a change in the area of responsibility would produce the additional good that the economics of a project might receive greater consideration as against sentimental and parochial support that often goes with such a project. All this is realistic, but the difficulty lies in persuading the States to surrender their responsibility.

By far the most sensible of T.T.K.'s observations are at the end of his address at the economic conference. Although he is of the opinion that no radical change in the policy of giving to the public sector "a dominant position in basic industrial development" is called

for, he has nevertheless recognised the need for a change in the approach to the distribution of responsibility between that sector and the private sector. The required change, in his emphatic view, should be "in the direction of devising new ways of co-operation between the two sectors and in determining their complementary character, so that the national economy as a whole could grow fast." There is no elaboration of this idea in T.T.K.'s address. It would be most interesting to watch for concrete developments in this regard. But there can be no doubt that his emphasis on "complementarity" and "co-operation," both of which are positive and constructive in the context of India's mixed economy, would be strenuously contested by doctrinaire leftists in the Congress, including his leader.

The last point in T.T.K.'s address relates to foreign private investment. It is, indeed, a forthright stand that he has taken on this issue. His view is that "the stage has come when we would be justified in opening the doors even wider to private foreign investment as long as the burden that such investment might put on our balance of payments in future is not disproportionate to its contribution to our economic growth." He has also made the telling point that there is no reason to fear the domination of private foreign investment in most of the vital areas where "the vigilant presence of the public sector" has by now been established. Some of these vital areas are oil prospecting and refining, fertiliser production, petro-chemicals, non-ferrous metallurgy, sections of engineering industry, power generation and coal mining. In all these areas, it should be possible to encourage private foreign investment, if T.T.K. succeeds in devising new ways of determining the complementary character of the public and private sectors either within the existing framework of the Industrial Policy Resolution of 1956 or by modifying it in the needed direction. It is, perhaps, too much to read such things into his observations on the role of the two sectors and on the need for opening the doors even wider to private foreign investment. It is, however, to be hoped that T.T.K. will preserve in his dynamic approach —dynamic in the sense of changing the methods of implementing the Plan in accordance with the changing circumstances.

MONETARY POLICY

IN his presidential address to the forty-sixth annual conference of the Indian Economic Association held at Bombay last week, Prof. S. K. Basu of Calcutta University chose for special comment the issues pertaining to monetary policy. After touching on the post-war theoretical innovations relating to monetary policy over which a lively debate has been going on in recent years, Prof. Basu extended his support to a relatively high interest rate structure. This plea, which also found general support from the other economists who participated in the conference, is fully in accord with what Commerce itself has been emphasising repeatedly for quite some time now. Indeed, at no time was such discipline so urgent as now, for the forces of inflation are gathering momentum, following defence orders, industrial expansion, a soft home market and generous labour awards. No one will say that the monetary authorities are not conscious of the urgency, but only they are not prepared to follow a dear money policy through a straight increase in the Bank rate which continues to be pegged at the low level of 4½ per cent since the beginning of last year. The rate, it is common knowledge, is completely out of alignment not only with the rate of interest charged by banks to trade and industry (about 8 to 8½ per cent) but also with those offered by first class industrial concerns on their debentures.

Prof. Basu was quite justified in his criticism of the Reserve Bank's policy of introducing the Bank rate weapon through the back-door, either through the raising of stamp duties (this was done way back in 1957-58 when T.T.K. was Finance Minister) or by introducing a quota and a slab rate system of lending rates and requesting banks to raise their lending rates and then formalising the rise in the structure of interest rates by increasing the Bank rate. By not including the Bank rate weapon in its package deal approach to the problem of credit control, the Reserve Bank has been weakening the effects of its monetary policy. One of the main reasons why selective credit control has not yielded the results expected is, as Prof. Basu said, that it was not, at least in the earlier stages, buttressed by general control measures, a practice which has been contrary to that adopted in other countries.

The one stock argument advanced against the policy of high interest rates is that it will inflate the cost of public borrowing. There is not much force in this argument, inasmuch as the bulk of the gilt-edged securities is held by the Reserve Bank and the Government departments themselves, so that the increase in service charge will be only fictional. Prof. Basu did well to draw attention to this important aspect. Nor is the argument that high interest rates would have a disquieting effect on small industries valid, for, apart from Prof. Basu's solution to this problem—namely, there are various ways of giving special relief to such industries—the fact remains that small industries have always had to pay a relatively higher cost for credit.

Even supposing that the policy of high interest rates suffers from certain drawbacks, its advantages to the economy as a whole will more than counterbalance the disadvantages. The advantages were impressively highlighted by Prof. Basu as follows:

"In a capital-scarce economy, the maintenance of a low and stable interest rate policy is likely to hamper, rather than stimulate, economic growth and capital formation. A relatively high interest rate structure will help in economising the use of capital and bring about a desirable change in the allocation of resources. In certain circumstances, low interest rates . . may tend to encourage substitution of capital for labour and provide an incentive to wastage, rather than economy of scarce capital resources. They may also tend to stimulate unhealthy practices in company financing by placing too much reliance on loan capital, rather than on equity, as is already being witnessed in India. Post-war Japan offers a good example of a country achieving a high rate of economic growth and capital formation with a high interest rate structure."

To follow a dear money policy would be tantamount to hitting two birds with one stone. In the first place, dear money will help combat the danger of inflation, especially at a time when a heavy increase in money supply is inevitable. Secondly, a dear money policy, coupled with suitable fiscal incentives, will increase the propensity to save, thereby permitting greater investment and higher production. What is more, the policy will prompt the banking community to offer competitive interest rates for attracting deposits away from non-banking financial institutions and commercial houses which are said to be paying as high as 8-9 per cent on deposits collected from the public. It is, of course, assumed here that the ceilings on rates of interest payable on deposits, under inter-bank agreement, will be linked to the Bank rate and that the agreement itself will operate in a flexible manner.

The problems posed by the non-banking financial institutions and industrial houses which compete with banks in providing credit as well as in accepting deposits received detailed attention at the hands of Prof. Basu. He enlightened the audience on the theoretical approaches made in other countries (such as the U.S. and the U.K.) which have similar problems and himself appeared to have been carried away by them. He wanted the central banking institution to extend its controls to non-banking institutions also and warmly endorsed the powers conferred on the Reserve Bank under the latest amendments to banking laws. He neither questioned the veracity of an unverified unofficial estimate of time deposits diverted to business houses, nor went into the practicability and cost of enforcing such controls on non-banking companies. This is a very disappointing omission in Prof. Basu's address.

In the context of the straightforward employment of the general weapon of Bank rate, there is much to commend in the plea of Prof. Basu that the possibilities of a selective use of the discount rate policy may be explored by the monetary authorities. Preferential discount rates, for instance, could be charged by the Reserve Bank for certain categories of paper such as export bills and industrial papers with a view to diverting the flow of credit into desired channels, as is being done in several European countries. The Indian tier system of quotas and lending rates is no doubt based on a formula which relates the penal rates to the amount of borrowing made by a bank in excess of a certain percentage of its statutory reserves subject to an overall ceiling. But the system which Prof. Basu has suggested has a positive value, in that it will relate the penal or preferential rate to the type of collateral paper. It is true that a beginning has already been made by the Reserve Bank in this direction, especially in regard to export finance, but the practice deserves wider application. One other suggestion of his in this connection concerns the technique of import pre-deposit requirements. This technique, which has been adopted in many foreign countries, it is claimed, has not only selective but also quantitative effects upon the cost and availability of credit. It is a moot point whether India should adopt this technique, for the great bulk of India's imports consists of essential raw materials, components and capital goods. The cost of these imports will go up, if this technique is followed, thereby aggravating the high cost character of our economy.

The distinguished economist from Calcutta also chose for special comment the issue pertaining to the exchange rate of the rupee. Ruling out a straight devaluation of the rupee, he advocated a policy of multiple exchange rates for both exports and imports through a well planned differential tariff policy as a desirable alternative. In support of his plea, he observed:

"The advantages of a multiple exchange rate policy over straight devaluation are obvious. While the effect of devaluation would be pervasive, multiple exchange rates can be selective and discriminatory. They will also avoid, first, the difficulties inherent in quantitative restrictions which are created by the possibilities of windfall profits to importers who are able to secure licences and, secondly, the danger of corrupt and inefficient allocation of foreign exchange. Under multiple exchange rate system, the allotment of foreign exchange is also, no doubt, a function of administrative judgment, for the responsibility of classifying imports into preferred and non-preferred, essential and non-essential categories still rests with the officials. But multiple exchange rates being in the nature of cost restrictions, the price mechanism operates as a safety valve, while quantitative restrictions like prohibition of non-essential imports pay no heed to the price mechanism."

The anxiety of Prof. Basu over the persistent strains in the balance of payments position is, of course, understandable. But a system of multiple exchange rates suggested by him, in whatever manner it is introduced, constitutes, as in the case of devaluation, a remedy which is worse than the disease. It is bound to inflate the import bill, while, in the case of exports, its effect will only be of a short-term nature. For, sooner or later, the other countries competing with India for foreign markets may—in fact, will—adopt retaliatory measures to counteract the effects of India's manipulation of its exchange rate. Moreover, such a system has been tried in several countries and found wanting; in fact, the Latin American countries which had tried them for a long time in the post-war period lost more than they had gained. It is also pertinent to add here that multiple exchange rates have been tried mostly by dictatorships, including that of Herr Hitler in pre-war Germany, to bolster themselves up in power. Indeed, even their moderate success can be ensured only through an authoritarian regime. Since there are no extraordinary circumstances favouring its adoption, it would be difficult, indeed, to secure the consent of the I.M.F. which, as is well known, is totally opposed to policies of multiple and discriminatory currency practices. As for the G.A.T.T., Prof. Basu has stated that discriminatory taxes and subsidies could be so cloaked as not to arouse its opposition. It is a pity that he thinks that India can fool the G.A.T.T. this way.

That apart, discriminatory taxes and subsidies are at best only palliatives and palliatives cannot be relied upon as a means for securing a sustained expansion of exports. They will only shield the defects in Indian economy and the economic policies of the Congress Government. Clearly, in putting forward such a dubious solution, Prof. Basu has only sought to perpetuate, albeit indirectly, India's high-cost economy, whereas the stress ought to have been on the improvement of the country's export capacity through maximum production of quality goods at an economic cost. Instead of advocating multiple exchange rates, we wish Prof. Basu had cared to find out the causes of economic disequilibrium in the country and advocated straightforward remedies that would yield enduring results, though they might be painful in the initial stages of application. It is amazing that Prof. Basu, who was realistic enough to appreciate the merits of dear money policy, should have succumbed to the temptation of commending solutions that are being rapidly abandoned as being worthless by those who have tried them and the adoption of which will seriously undermine India's credit abroad. This country will go down in the estimation of not only Western democracies but also the Soviet bloc, if it follows his advice. What is more, there will be a serious setback to the inflow of foreign private capital.

LONDON LETTER

THE RISING TIDE

(From Our Own Correspondent)

LONDON, 28th December 1963

THE change of Administration has already proved to have had a much deeper political and economic significance than was at first suspected. It came hard on the heels of the annual political conferences of the parties, conferences in which the Labour Party hoisted a new flag of "modernisation in industry" and showed how increased output could pay for the country's social programmes. The Conservative Party was not to be outdone, "Modernity" was their keynote too and, apart from the new Prime Minister, it was the forward-looking men of the party—men like Maudling at the Treasury and Heath at the Board of Trade—who held the leading positions. When the Prime Minister went on his own private election tour, he not only jumped on the band-wagon of modernity but staggered his colleagues with the ease with which he promised money-wise all things to all men.

Now the Chancellor of the Exchequer has published a quinquennial estimate of public spending—by both Central and Local Government—that puts the seal on the rising tide of expenditure. Government is to spend *pro rata* with the estimated rise in national output over the next five years; that is, between the current year and 1967, public spending is to rise by about 20 per cent, that is, at a rate of approximately 4 per cent per annum; all this in *real* terms.

How different is this from what has happened in the past? Five years ago in 1958, public spending in the U.K. totalled £7,400 million and five years before that £6,100 million. But prices have risen 9 per cent in the past five years and had risen 18 per cent in the five previous years. In terms of *today's* prices, public spending has risen from £8,000 million in 1953 and £8,100 million in 1958 to £10,900 million in 1963.

Thus, the first five years of Conservative administration were true to tradition—the tradition of a party which claimed to keep public expenditure and taxes down. Incidentally, they also witnessed an 18 per cent inflation, but that presumably was not a matter of policy.

But the second five-year period of the Conservative Government saw a *one-third* rise in public spending—a rate of increase much above the rise in national output, a rate which saw Government taking a much larger share of the national cake. What had happened to the traditional policy of conservatism? It had been caught in the pressure for more defence, more education, more social services. There *was* no coherent policy—every department was out for itself, ploughing its own path towards its own general goals of "improvement."

So the plan for the next five years (it is *not* a five-year plan, merely a Treasury estimate of the trend of Government expenditure) is, relatively speaking, an orderly approach to the financial policy of the future, keeping this in line with *current* policies and current estimates of national output. But two things are certain to happen to this plan: in the first place actual annual estimates are going to exceed this as various pressures push up spending here and there, pressures which could only be resisted by a Government bound on retrenchment. Neither a successor Conservative administration nor yet a Labour one is looking for such retrenchment. The second certain happening is some degree of inflation. If the general cost of goods and services rises by no more than 10 per cent in the next five years, the nation will have cause to feel well satisfied, especially if they are five years of active business.

Thus, in the end, the next five years may see as big a rise in Government spending in real terms as did the last five—whatever Government is in power. The significant thing is that, as a result of the recent change in administration, the new Premier's electioneering and the whole trend of the Administration's policies, the Government and the Conservative Party are set on a new course, a course not so very different—except in the political philosophy which dominates it—from that of its Opposition.

The priorities are roads, education and housing. A Labour Government would have the same, with the additional emphasis on a Ministry of Science or of Scientific Development. And, of course, there remain fundamental differences between the ways in which Conservatives and Labour would seek to implement their policies. For all that, the two parties are more and more approximating to the American system. They are a tremendous way from that yet, but the great differences of financial policy, the differences of how much of the national product should be spent by Government on behalf of all and how much should people spend for themselves, these differences have now been eroded away. Large and growing Government expenditure is now an accepted policy of both the major political parties.

MARKET GOSSIP

Democratic Socialism: An Election Stunt

ONE fails to understand the necessity for redefining the Congress Party's brand of socialism or for reiterating its faith in that philosophy. All that has been well known not only in India but throughout the world. In addition, Prime Minister Nehru himself has been swearing by democratic socialism almost every week, if not every day. Indeed, he has been doing this so often that, nowadays, one scarcely comes across any new points in his speeches. Most of his speeches have become stereotyped and stale. This is also true to a considerable extent about the speeches of most of the Congress leaders. And yet why are they trying to define socialism in concrete terms now with a lot of fan fare? The answer is simple. The Congress Party wishes to stay in power for as long a period as possible. It is paving the way for the next election propaganda.

The vast majority of people are poor but they have votes. Naturally, the Congress Party wants to sound sweet to the poor masses by promising to squeeze the well-to-do people a little more. Jealousy is a human weakness. The Congress Party wants to play upon this weakness. But, in doing so, it is exposing the country still further to the danger of communism. It is no secret that there are many communists in the Congress in the disguise of democratic socialists. They are, once again, bestirring themselves to capture power as quickly as possible, or at least to get control of the party when Mr. Nehru gives up the leadership or disappears from the scene. For them, the Kamaraj Plan has been a boon. They have already been defying party discipline by insisting upon complete nationalisation of banking and other key sectors, even though Mr. Nehru has stated times without number that he does not favour such a step.

The Congress Party is misleading the public when it says that there is concentration of economic power in a few hands in the private sector. What this party wants to do is to concentrate both political power and economic power in its hands. The big industrialists in the private sector are hardly a power nowadays, as witness their inability to prevent the drastic amendments to the Company Law and Banking Laws that were carried out in December last. Their effective influence over the Congress Party is very little, even though they continue to provide it with the bulk of the resources required to win the elections. Actually, the big industrialists, barring a few exceptions, are quite submissive to this Party.

The Congress Party has not been successful in bringing about the rapid economic growth which it had promised. This failure reflects partly its inability to administer this vast country efficiently and partly the defects in its economic policies. If, for instance, people are not having more food, more clothing, more housing, better education and cheaper cost of living, surely the blame cannot be laid at the doors of businessmen; it has not been due to any concentration of economic power. Who, for instance, prevented expansion and modernisation of cotton mill industry, the only one that could produce cloth at an economic price? Where are the Ambar Charkas now? Where are the handlooms to protect which the mill sector was subjected to a ceiling? Who was responsible for allowing crores of rupees to go down the drain through prohibition? Who gave a long lease of life to bootlegging? Who worked the Sindri Fertiliser plant virtually to death and how many crores have been spent on its rehabilitation? How many crores of foreign exchange have been lost by the grievous delay in permitting expansion of petroleum refineries and the establishment of petro-chemical industries? Why is there such a great underutilisation of irrigation potential created at a cost of several crores of rupees and who is responsible for it? Who prevented the tuning up of the administrative machinery in the Centre and States in order to improve its efficiency to the required level?

One can go on expanding this list of omissions and commissions. Suffice it to say that it is not the Birlas or Tatas, or Thapars or Singhanias, but the Congress Party that is responsible for the poor rate of economic growth. That is the blunt truth. And now this Party is trying to find scapegoats in the business community, in the so-called concentration of economic power and in the middlemen, not all of whom are functionless intermediaries. In other words, the objective behind the resolution on democratic socialism drafted by the Congress Working Committee and released to the Press on New Year's Eve is to throw the blame on others for its own miserable failures.

Neither nationalisation of banks, nor the placing of a ceiling on urban incomes and urban property, nor an increase in the incidence of capital gains tax will lead to a narrowing down of the gap between the rich and the poor. On the contrary, it will only delay the attainment of genuine socialism, as the rate of economic growth will continue to remain poor in such circumstances. There will be more tax evasion, inflation in share values, redistribution of urban property among family members, a setback to saving habit and encouragement to spendthriftness and speculation. One day, these evils may become so strong as to trigger a bloody revolution by the exasperated masses. No political party, not even the Congress Party, can hope to bring about sustained social contentment and stability through paper socialism of the type which it has been preaching since 1931 and practising since 1951.

Some in market circles are happy that Mr. T. T. Krishnamachari has been successful in preventing the inclusion of nationalisation of banks in the Working Committee's draft resolution on democratic socialism. But what did his fair-looking Deputy Minister, Mrs. Tarakeswari Sinha, say in Parliament last week? She said, in effect, "no nationalisation now, but at a more opportune time later." She did not say "no nationalisation for ever." So the sword of Damocles has, again, been left hanging over the banks.

The most significant addition made by the Congress Working Committee to the draft circulated at the Jaipur Session of the A.-I.C.C. in November last is the following:

". . . other steps will also have to be taken so that the distance between the bottom and the top rungs is reduced in a striking manner in a reasonable period of time. These steps will be in the sphere of both policy and organisation.

"It is necessary to bring about a limitation of incomes and property in private hands. This limitation should apply specially in respect of inherited wealth and urban property. The State should secure a large share of capital gains and appropriate a much larger proportion of unearned income than is being done at present.

"The Government should place itself in a position, more effectively than is the case now, to direct the means of credit and investible resources of the country along the lines of national priorities and our social purposes. At present, small entrepreneurs and new-comers are placed under a serious disadvantage in respect of availability of financial resources. There is also need for further steps for the removal of abuses and malpractices in financial institutions."

The second paragraph in the above quotation has queered the pitch for T.T.K. If he were to implement this directive in his next budget, he would cause a serious disappointment to investors and the capital market. If he failed to do so, he would be unpopular with his party. It would, therefore, be a fair inference to conclude that the resolution places T.T.K. in a dilemma.

Frantic Bid To Check Price Rise

An unusually firm stand on the question of setting up of consumer stores for workers by industrial establishments marked the speech of Mr. G. L. Nanda, Union Minister for Home Affairs and Labour, at the meeting of the Standing Labour Committee held at New Delhi on 27th December 1963. Mr. Nanda said that all industrial establishments employing 300 workers or more should set up their own consumer stores by the end of February 1964. He warned that failure to do so would compel the Government to resort to legislation to achieve the objective. The Government, he added, would not hesitate to promulgate an ordinance to force employers to set up consumer co-operative or fair-price shops, if need be. Mr. Nanda wanted these consumer stores, which could be subsequently converted into co-operatives, to cater to at least 50 per cent of the ordinary working class family and also to extend credit facilities to workers. He brushed aside the objections raised by employers to the provision of credit facilities and pointed out that it would be in the interests of employers themselves to set up consumer stores where workers could buy their requirements at reasonable rates.

Mr. Nanda also strongly favoured the linking of dearness allowance with the cost of living index by all employers. At present, the practice of linking dearness allowance directly to the cost of living index is prevalent only in certain industries. Obviously, the Minister wants this system to be adopted more widely so that rise in price would be compensated by an automatic increase in allowances. But will the linking of dearness allowance to consumer price index and the establishment of consumer stores constitute a lasting solution to the real problem which is shortage of goods and services and their high costs and prices? This in turn is the result of the wrong policies followed by the Government whose cumulative effects are now manifesting themselves in the form of shortages and mounting costs. This, coupled with administrative laxity and inefficiency, has produced the present unpleasant situation of inflationary rise in prices of essential commodities.

The Government's obligation in respect of the Industrial Truce Resolution was to keep prices under check. Having failed to do this, it is now left with no alternative but to hustle employers into doing something about it, notwithstanding even genuine difficulties that they might have. Finance and supplies are two problems employers will have to face in opening consumer stores. Even if the money is found, the question of getting adequate quantities of goods at controlled rates is not easy, unless, of course, the Government takes special responsibility for such supply. Whatever the difficulties, the idea of consumer stores for workers is a commendable one and considering the Government's record in regard to holding the price line, it seems to be perhaps the only way employers can ensure that workers get goods at reason-

COMMITTEES IN INDIA

HOW THEY WORK AND HOW THEY SHOULD

(By A Special Correspondent)

THE abnormal delay on the part of the Mahalanobis Committee to submit its report has attracted considerable attention. It is necessary to point out that this is not the only committee that has failed to complete its work in time. In fact, there is hardly any important committee set up under official auspices, which has finished its job within the time originally allotted to it. Almost invariably every official committee asks for extension of time.

The Import and Export Policy Committee, for example, was set up on 30th March 1961 and it was asked to submit its report by the end of July in the same year but it was able to do so only in March 1962. The Central Excise Reorganisation Committee, appointed on the 2nd November 1960, was called upon to submit its report by 31st October 1961, but its report was finalised in March 1963. The Committee to suggest ways and means of increasing the export of jute manufactures was constituted in March 1962 and it was required to submit its findings within a period of three months. But its report was signed only in January 1963 and published several months later. Similar instances can be multiplied.

It should be said in fairness to the committees that, in some cases, delay occurs due to factors beyond their control. Sometimes the personnel of the committee is changed owing to the resignation, transfer or death of some member; or entirely new problems may come up in the course of investigation, which call for more time. But even allowing for such factors, it cannot be denied that official committees in India do take much longer time than what is actually necessary or justifiable.

Delay is not the only shortcoming of official committees. Sometimes the committees do not take the trouble to do their job as thoroughly as they should. As a result, their reports are rather sketchy. As an example of this, we may mention the report of the Committee on Fair Trading Practices. This Committee was set up in June 1962 by the Board of Trade with ten members including eminent industrialists, economists and officials. But the Committee did not appear to have considered the problem seriously.

"At the outset," said this Committee's report, "we would like to say that, in the short time in which the Committee was asked to submit its report, it was not possible either to meet the representatives of industry, trade and consumers or to study the problems referred to it in great detail." One wonders what prevented this Committee from asking for extension of time so as to enable it to examine the problem in all its aspects. As it was, its report was very brief and hardly did justice to the subject.

Similarly, the Jute Committee failed to assess properly the threat posed to the Indian jute industry from the jute industry of Pakistan—a point on which the Indian Jute Mills Association has strongly criticised the Committee's report. We may also cite in this connection the failure of the Export-Import Policy Committee to review the working of the export promotion councils and commodity boards. This Committee had asked in its questionnaire to what extent export promotion councils and similar bodies had succeeded in diversifying our export trade, but its report is silent on this aspect.

If committees are to serve a useful purpose, Government should see to it that the personnel is carefully chosen. The members should not only be competent in their field but they should be able to devote some time to the work of the committee on which they are called upon to serve. Committees should be required to complete their work in a reasonable time. And Government should also be prepared to show greater respect to the recommendations of the committees. It is, of course, neither possible nor desirable for the Government to accept the recommendations in all cases but rejection should be the exception rather than the rule. Where it is not possible to accept the recommendations, the Government may explain the reasons for the same, so that the public can better appreciate the official point of view.

It is also important to emphasise that committees should be set up only when there is a genuine need for them, that is, when a problem has to be examined carefully and objectively in all its aspects so as to enable the Government to come to a right decision. There should be no attempt to constitute committees merely to serve as a pretext for postponing or abandoning certain schemes and projects. A glaring instance, where Government set up committees which served no useful purpose, is provided by the project for the manufacture of cheap cars.

For over two years, this question was examined by more than one committee and the Government and Parliament took so much interest in it that an impression was created that the manufacture of cheap cars was the most urgent task confronting the country! Ultimately, however, the project was abandoned. The Union Minister for Steel and Heavy Industries explained that the scheme could not be implemented because priority should be "definitely and overwhelmingly in favour of the manufacture of commercial vehicles which provide the base for the transport of goods and for public passenger transport." The Minister added: "The immediate implementation of the project will involve not only money resources —of which we are short enough, in all conscience, especially in terms of foreign exchange— but also physical resources like building materials, steel, power and transport. These are all in short supply and I do not see that we can expend any of these on what is, after all, not a project meriting high priority in our present situation."

Surely, it did not require the services of committees with technical experts to come to the above conclusion!

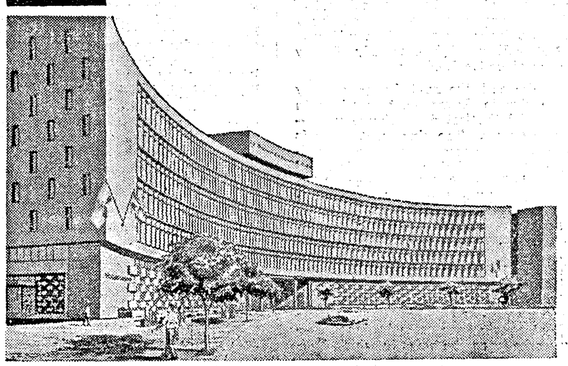
*

In an article in its issue of 7th December 1963 the *Economist* of London made a critical study of the working of official committees in England and its observations are by no means irrelevant to the practice followed in India. "Committees," said the journal, "have too often been asked to make up the Government's mind on what it should decide itself. Committees have often been asked the wrong questions, and given the wrong membership. Their best and most radical recommendations are often fated to be pigeonholed, or ignored. Worst, committees of outside inquiries have been used to thrust into temporary obscurity matters on which a straight answer from the Government would be politically inconvenient. There is a further, purely political, criticism. It seems the height of folly for a Government to appoint a committee of reasonable men to tell it to do what all reasonable men already know it ought to do. At the very least, the Government thus deprives itself of the credit for deciding to do these things."

ASP/LIC-SP-42A

Overlooking the Arabian Sea at Bombay stands a gigantic new building. It's named 'Yogakshema'—a Sanskrit word connoting 'welfare'—a very apt name for the headquarters of the LIC, which the Prime Minister, Shri Jawaharlal Nehru opens on Thursday, December 26, 1963. We hope the LIC policyholders everywhere will share our joy on this occasion. Because 'Yogakshema' is more than a very handsome six-storey edifice—it's a statement of trust by the Corporation in the future of life insurance in India. And it is the measure of stability of an institution which guards the future of many millions.

LIC—YOUR COMPANION IN PROGRESS



IS WHAT'S GOOD FOR MONEY GOOD FOR STOCKS?

By Questor

THERE seems to be little doubt that the U.S. Federal Reserve Board's control over credit granted for stock market dealing is going to increase. This is the likely outcome of the regulations proposed to the U.S. Congress in the spring by the Securities and Exchange Commission *for eliminating various abuses* in the over-the-counter market.

The power to exercise a specific control over stock market credit was first granted to the Fed as a result of the 1929 collapse and has not been dropped, like other specific controls, with the return of "normal" conditions—it is something not found in many countries outside the U.S. The reason, no doubt, is that stock markets in most other centres are smaller, their importance to the economy less marked, and the use of credit to support their operations less organised.

But even in the U.S., though the power to vary margin requirements exists and is not infrequently exercised—it has been exercised 15 times since 1945, the last time in November—nobody claims that its effect can be predicted at all precisely. The amount of credit in use for financing security purchases at any time is not known. The actual use a borrower makes of his credit will always escape official statisticians. And the permitted exemptions from the margin regulations are so generous—all loans, including foreign loans, other than from brokers and banks—that the effect of an increase in margin requirements is bound to be blunt.

That, perhaps, is why the Fed has chosen to alter margin requirements fairly infrequently and then by fairly large amounts. The change, like a change in the British Bank Rate, is intended to have a generalised impact on market psychology rather than to produce a precise effect. And the result is that there is little agreement among experts, even of the most general kind, about the consequences of a change. It appears that an increase in margin requirements is more effective at checking a boom than a reduction is in stimulating one. It appears, too, that an increase has more effect on the price of glamour stocks than on that of blue-chips. But both these generalisations could have been deduced, without much risk of error, from what is known about the consequences of all credit restrictions.

It may well be, once the extent of the Fed's control over stock market credit becomes greater, that it may be able to exercise its powers more subtly, with smaller and more frequent changes in margin requirements. It will not be easy, since few lenders care to ask many questions when the security is sound; it may well be necessary to attack the assumption that margin trading is normal by making the average requirement considerably higher. But the point is that any experience the Fed acquires in the flexible use of this selective monetary control will be of considerable value to central banks in other countries. As national stock markets develop in size and importance, and as the connection between the investment climate and the general business situation becomes closer, other governments too will come to regard the influencing of security prices as part of their economic responsibility.

Let me take London, which has a well-developed stock market, as an example of what I mean. The London market in official debt is large and efficient, and official bodies of one sort and another are constantly operating in it: the Bank of England, therefore, has long regarded it as part of its function to preserve an "orderly market" in government paper—not usually attempting, unless pushed, to work against the established trend, but trying hard to smooth out irregular and potentially disturbing fluctuations. This smoothing out habit shades off imperceptibly, in modern conditions, into an open-market policy based on definite aims in the field of interest rates and institutional liquidity.

Whether this kind of intervention is right or wrong, I do not pretend to judge; but it has been going on for a good many years and is generally accepted. If intervention is acceptable in one market, why not in another? And, since the behaviour of industrial stock prices is often much more important to the economy than the course of bond yields, why not intervene when it seems economically necessary to nudge the market in a desirable direction?

The idea, no doubt, will seem startling and unpleasant to many people. But it cannot be turned down on the sentimental grounds that the stock market is the preserve of the little man and the bond market the haunt of large institutional investors. If it is permissible to intervene in one—as most governments do where there is a large national debt to be managed—the idea of intervening in the other cannot be dismissed out of hand. A much more real difficulty is that governments in capitalist countries do not normally hold, and would not be permitted to hold, the large portfolio of investments in private industry needed if intervention in the stock market is to be possible.

But attitudes change. The U.S. Administration, for example, soon found ways and means of acquiring foreign currencies when it decided that intervention in the exchange markets was necessary. And, if a Labour government takes office in Britain this year, we may be in a position to add to the experience gained by the Fed. State shareholding in private industry, both to exercise economic pressure and to back a national scheme of graduated pensions, is part of the Labour Party's policy. Nobody has yet suggested that these holdings should be used for market operations, and most people—the Bank of England above all—would resent the suggestion. But, in the long run, it seems to me, the very fact that a Government holds large quantities of stocks is likely to make some sort of market intervention inevitable.

Wider Still and Wider

It may be a little other-wordly, at a time when the future of the European Community is hanging desperately in the balance, to spend time on the prospect for complete financial integration inside it. But the European Commission has already achieved a good deal by patient other-worldliness; and the article by M. Claude Segré in the current number of *Moorgate & Wall Street* (a review jointly sponsored by Philip Hill from London's Moorgate and Harriman Ripley from Wall Street) is of interest to everyone concerned with the possibility of widening the international capital market. It demonstrates that the difficulties involved are of a sort which are unlikely to be overcome without a will towards political union which even the Six are finding it troublesome to maintain.

So far as the letter of the law is concerned, the Commission has little to grumble about. "Provisions already in force," according to M. Segré, "are sufficient to permit all the operations essential for the day-to-day functioning of the Common Market"; and Article 67 of the Rome Treaty demands the removal of restrictions on capital movements only to "the degree necessary to ensure the proper functioning of the Common Market." Why, then, the worry? Because the mere removal of restrictions is not in itself sufficient to create the free market in capital which is necessary to support freedom of trade, freedom of establishment for manufacturers and the free movement of labour.

It is true that all restrictions have not yet been removed. Since the directive of 1960, the Six have virtually removed those on the movement inside the Community of direct investment, personal capital, transactions in securities, and trade credit. But the control of short-term capital movements and of foreign capital issues is still left to the discretion of national governments; and this, as M. Segré indignantly points out, is not so much because of balance of payments considerations as because of national economic interests. So far as short-term movements are concerned, circumstances have largely taken the place of decision. The emergence of an international money market in Euro-currencies, together with the experience that "leads and lags" in commercial payments can constitute a major speculative operation, have in effect side-stepped the reluctance of some European governments to abandon control over purely financial movements of short-term capital.

But the market in long-term capital is still restricted directly or indirectly. And since this restriction is not made for balance of payments reasons—the European market in existing securities is now extremely free—it must rest on arbitrary institutional factors and the equally arbitrary (in the view of the European Commission) habits of national governments. M. Segré draws up a long list of friction-producing customs. They range from conscious discrimination against foreigners on blatantly nationalistic grounds to the quotation requirements of different stock exchanges. The predominant demands of state finance, the prejudice against foreign investments long written into the constitutions of financial institutions, legal requirements about mortgages and other forms of security, the prevalence of self-financing, the inadequacy of company accounts, the jungle of national tax law and the failure of double-taxation agreements—all these deter the foreign investor, institutional or private.

"None of the above elements," Mr. Segré writes, "positively prevents international financial transactions, but they considerably increase the 'margin of indifference,' that is to say, the minimum advantage that an investment or issuing operation abroad must offer compared with a similar operation on the home market before it appears worthwhile." And all these elements, I would add, increase the discretion of a particular government to tailor the international flow of capital to its national advantage even when formal restrictions have been abandoned.

M. Segré, as an internationalist so far as the Six are concerned, is determined to demonstrate that a concerted effort to break down institutional barriers to the free movement of capital would be to the advantage of the Community as a whole. I do not doubt it. But the difficulties involved in appealing to the spirit of the Treaty of Rome rather than to its actual provisions are apparent in some of the suggestions he makes. For the long term, he reckons that the logical aim is complete monetary union, as suggested in M. Marjolin's Action Programme published earlier this year. The only comment that needs to be passed on this excellent document—and it's a sad one—is that no government or central bank in the Six has yet shown the slightest practical interest in it.

For the short-term, M. Segré commends the loans denominated in a "European unit of account" which Belgian banks have been issuing and the proposal that various tranches of a major issue should be simultaneously placed in several national markets, each denominated in the local currency, by an international consortium of banks. But the "unit of account" seems to be a dying duck—partly because of the risk to the issuer, partly because central banks mistake it for a gold clause, partly because it is horribly complicated.

And the consortium idea, which has a much better chance of success, was put forward by Herr Abs of the Deutsche Bank, who dislikes M. Marjolin's idea of monetary union inside the Community and believes that the leading European financial institutions have a responsibility to keep a bridge open to the world outside.

I have the feeling that the positive action needed to oil the international movement of capital can best be initiated, now that the orthodox barriers are down, by financial institutions themselves. And there is no obvious reason why it should be easier to initiate inside the European Community than on a wider scale.

SMALL SAVINGS IN MAHARASHTRA

IT is well-known that the State of Maharashtra has been in the vanguard of the country's small savings movement. In the last 12½ years it has contributed an aggregate of Rs. 180 crores by way of net collections of small savings. Although the State's population represents only 10 per cent of the all-India population, its small savings contribution has amounted to as much as 30 per cent of the country's total collections. What is more, Maharashtra has consistently exceeded its own annual targets in this field by 125 to 150 per cent. In the current fiscal year, for instance, Greater Bombay alone has collected, four months ahead of schedule, a record amount of Rs. 15.0 crores (net), as compared with the year's target of Rs. 14.0 crores. Incidentally, Greater Bombay's actual contribution in the first eight months of 1963-64 represents a fourth of the all-India collections of Rs. 61 crores (net) in the same period; this is at once an index of the region's industrial prosperity which has made such a high rate of small savings by the working and middle classes possible. This performance, it is expected, will be bettered in the next three months when, according to the confident estimate of Mr. Homi J. H. Taleyarkhan, State Minister for Small Savings, the additional collections would come to Rs. 6.0 crores. In all likelihood, therefore, Greater Bombay's net collections in the current year might aggregate Rs. 21.0 crores. It is presumably by taking into account the trend of collections in Greater Bombay and in the State as a whole in the first three years of the current Plan that Mr. Taleyarkhan has just forecast an aggregate collection of nearly Rs. 100 crores in the State for the entire Plan period. If his estimate materialises, as it is most likely to do, it would mean that about a fourth of the State's third Plan outlay of Rs. 390 crores will have been financed from this source. And that will be no mean achievement in a country where only three or four out of every 100 persons are savers.

How has Maharashtra achieved its pre-eminent position in small savings collections? First and foremost is the energetic and missionary drive of the Minister for Small Savings and the Directorate of Small Savings. In this connection, the Union Finance Minister Mr. T. T. Krishnamachari himself who inaugurated the Small Savings Seminar at Bombay on 25th December 1963, rightly described Mr. Taleyarkhan as a "missionary" in the cause of small savings. Secondly, in the last few years the small savings movement has spread so rapidly to the rural areas that they now contribute nearly as much small savings as the urban areas do. Thirdly, regular savers in the State are now 10 lakhs, as compared with five lakhs a few years back. These savers are in 5,000 groups and 5,000 bachat grams, with 100 per cent coverage of the earning population. And, lastly, there are at present 20,000 official and non-official agents for small savings collections in the State.

These facts and figures convey an eloquent idea of the tremendous organisational efforts that has gone into the small savings movement over the years. No wonder, therefore, the Union Finance Minister was full of admiration for the small savings organisation in Maharashtra. In fact, he seemed to think so highly of its performance and potentialities that he indicated the possibility of small savings agents being asked to take up propaganda work on behalf of the Unit Trust. After all, the Unit Trust would supplement the small savings movement. It might thus be easier for the small savings organisation to get the small investors to take interest in the Unit Trust, of which much is expected.

FARM RESPONSE TO PRICE AND NON-PRICE FACTORS

The highly theoretical presidential address delivered by Dr. B. N. Ganguli at the All-India Agricultural Economics Conference held at Bombay on 25th December 1963 was not without some practical importance, for it dealt with the trend of agricultural development in India with special reference to the operation of the price mechanism. How farm output has responded to prices (regulated or unregulated) came in for analysis in Dr. Ganguli's address, and this is relevant to a discussion of the agricultural price policy. It is well known that sugarcane, for instance, has been subjected to minimum price regulation on the basis of a high minimum which has become traditional. The prices of rice and wheat have been kept down by a number of regulatory measures, and maximum and minimum prices are fixed for cotton. There is a minimum price for jute, but *gur*, *jowar* and groundnuts are more or less unregulated or there is less continuous regulation. The different ways in which these crops have responded to prices would seem to suggest that the price factor alone is not of decisive importance in agricultural production.

Dr. Ganguli has observed, in this connection, that "it is not entirely convincing to say that output has increased because of relative price stability." Groundnut prices have had a very high co-efficient (20.3) of variation; yet its annual rate of increase of output has been only 4.6 per cent, on the average, as against 4.2 per cent in the case of non-food crops, in general. On the other hand, the annual rate of increase of output of cotton—a controlled commodity, the price of which has been kept down by regulatory measures—is as high as 6.6 per cent. In the Punjab, for instance, it has been shown by a research study that, while price alone was the important factor in the determination of the acreage under maize and sugarcane, irrigation capacity was more important than price for cotton, *bajra* and irrigated wheat and yield more important in the case of rice. Dr. Ganguli seems to think that it is irrigation capacity, rather than the price factor, that explains the recent increases in both the area and yield of wheat and cotton in India as a whole. Similarly, the yield factor seems to have been more important than price in the case of rice, for this commodity has registered the highest annual increase (2.5 per cent) of productivity in the last decade. Farm response cannot thus be explained wholly in terms of prices. On the other hand, it "would seem to depend on the constellation of price and non-price factors which act and re-act on one another through an intricate chain of relations."

Dr. Ganguli's analysis is significant precisely for its synoptic view of the operation of price and non-price factors. He has shown how the output of foodgrains is linked in a chain of mutual causation with the output of non-food crops, prices of input and consumer goods purchased by farmers, prices of non-food crops and food-crops and the level of self-consumption. Likewise, the output of non-food crops is linked with the aforesaid factors other than self-consumption which is either non-existent or insignificant in the case of commercial crops. Two significant factors in the situation, of course, are (i) the parity, that is, the ratio between the prices received and the prices paid by farmers and (ii) the inter-crop price parity. Any disequilibrium in these parities may have adverse reactions on agricultural development in the long run. But self-consumption, marketed surplus, and de-stocking and re-stocking operations of farmers are also of importance. Unless all these factors are systematically studied in their intricate inter-relationships, *ad hoc* price fixing and regulation may have unintended consequences. Experience to date in this field does not lend itself to any valid generalisation. It goes to the credit of Dr. Ganguli that he has questioned the thesis that whatever has happened by way of agricultural development has happened only because of the State's price policy. So long as there are several non-price factors which have influenced the direction of India's agricultural development, the entire question would need to be more carefully studied. That is a task for applied research in agricultural economics.

L.I.C.'S "OWN-YOUR-HOME" SCHEME

The L.I.C. has just announced a scheme for helping its policyholders to have their own homes. Called "own-your-home" scheme, this step is claimed to be yet another service the L.I.C. renders to its policyholders. Stated simply, the scheme is this: The L.I.C. will advance loans to its policholders for the construction or purchase of new houses on the strength of the policies which should be assigned to the Corporation as a pre-condition of grant of loan. The amount of the loan would be about 90 per cent of the sum assured, subject to a maximum of one lakh of rupees and a minimum of Rs. 10,000. However, in the case of approved housing schemes or when the loan is for the purpose of constructing extensions to an existing house, the minimum limit will be reduced to Rs. 7,500. The actual amount of loan to an individual within the maximum indicated above will be determined by the category to which he belongs, there being only two such categories: (1) policyholders who are in employment and can satisfy the L.I.C. about the stability of their employment and (2) other policyholders. In the first category, loans will be computed on a slab system, the percentage being 85 (of the value of the property) for the lowest slab which will gradually decline to 70 per cent in the highest slab. For those in the second category, the maximum limit will be two-thirds of the value of the property. The higher percentage for small loans is designed to ensure that the more modest borrowers, who would normally stand

Eating SATHE Chocs
you'll surely get
The speed of a Boeing Jet,
To dispose of
miles and miles
Of boring office files!

SATHE BISCUIT & CHOCOLATE CO. ETD., POONA 2.

in need of greater financial assistance, get a larger quantum of loan.

Policies to be eligible for the loan will have to be of the approved type, for instance, endowment assurance policies whereunder the term is not longer than the repayment term fixed under the loan. Such policies will have to be maintained in force at all times. Loans may be repaid out of the proceeds of life insurance policy/policies assigned to the Corporation but repayment of the loan can be made either partly or fully by instalments in multiples of Rs. 500. The rate of interest payable has been fixed at 7½ per cent. But this is subject to an attractive rebate of one per cent per annum for punctual payment. Interest is payable monthly.

Under the scheme, loans against policies will be granted only for the construction of new houses, or carrying out extension to existing houses or for the purchase of recently constructed houses in good condition. Loans, however, will not be available for buying ownership flats, in a commercial or co-operative housing scheme, obviously because the ownership flat-holder does not have any title over the land and building in which he owns a flat. In effect, this condition, namely, that loans will not be available for buying ownership flats, makes the scheme of little value in cities like Bombay and Calcutta where housing shortage, in its most acute form, exists. The scheme is likely to benefit policyholders in small towns where land values are not very high and where it may be possible to construct houses at a cost not exceeding Rs. one lakh, the maximum amount that one can borrow under the scheme. The scheme will not make any significant impact on the housing shortage in most cities where it is acute. The L.I.C. should, therefore, examine whether it can devise a method by which the problem of the weak legal status of ownership flats, which makes loans for purchase of ownership flats risky, could be got over. Unless this is done, thousands of its policyholders will not be able to avail themselves of this facility.

CHEMICAL INDUSTRY

The point that the chemical industry should devote more attention to research was stressed by Mr. Asoka Mehta, Deputy Chairman of the Planning Commission, in his inaugural address at the silver jubilee celebrations of the Indian Chemical Manufacturers Association held the other day at Bombay. He added that the industry's real dynamism lay in its capacity to make science and technology augment and alter the resources provided by nature. He realised, of course, that it was necessary to secure foreign know-how at the present stage of development. But he did not consider it advisable to depend wholly on processes developed by foreign countries for all time to come. His suggestion was that the industry must establish closer links for fruitful exchanges with the National Laboratories by using the processes developed in them, besides referring to them their problems and possibilities. He also advised the industry to organise its own research facilities on a co-operative basis.

Mr. Mehta's emphasis on research is certainly timely in the context of rapid development and expansion taking place in the field of chemical industry. The Development Wing of the Planning Commission, it may be noted here, has envisaged an investment of as much as Rs. 1,600 crores in the fourth Plan, as against an estimated investment of about Rs. 650 crores in the third Plan. The fourth Plan is also likely to ensure a breakthrough in the vast field of petro-chemicals. Among the products that have already recorded rapid strides in production are basic chemicals, such as caustic soda, soda ash, calcium carbide, industrial gases, acids and fertilisers, organic chemicals and a host of other products, including vitamins, sulpha drugs, dyestuffs, insecticides and explosives. Several new products have, of late, been added to the list of manufactures within the country, which include, among others, synthetic rubber, vitamin C, streptomycin, hamycin, ammonium phosphate fertiliser, reactive dyes, potassium permanganate, formaldehyde and carbon black. As Mr. J. H. Doshi, President of the Association observed, the base of the industry is widening all the time.

These encouraging trends, however, should be viewed against the background of several heavy odds facing the industry. In the first place, there is the high cost structure of the industry. Analysing this phenomenon, Mr. Doshi, President of the Association, referred to the fact that the ratio between output and investment is low in India. A sample survey of the member-firms of the I.C.M. Association conducted recently, covering 79 firms, has substantiated this trend. They together accounted for the employment of 140,000 workers. Their total output was only Rs. 273 crores, whereas their total investment was still higher at Rs. 315 crores. Thus, the output is not even equal to the amount of investment. This is in contrast to the trend in the developed countries, where the chemical industry's output represents two to five times its investment. The low ratio of output in the country, according to Mr. Doshi, was due to the higher cost of plant installation and the low proportion of utilisation of plant capacity, besides low labour productivity.

Mr. Doshi was of the opinion that excise duties also contributed to the enhancement of the cost of production. Explaining this point, he observed:

" .... While it may be conceded that excise is an essential means of collecting revenue, it is open to question whether it is a wise policy to extend the net to cover basic chemicals, accessories and finished products all at the same time. A glaring instance is the incidence of excise duties at various stages in the manufacture of dyestuffs. Basic raw materials like acids and alkalis used in their manufacture attract excise duties. Even carbon dioxide manufactured and used for captive consumption is not spared and is subject to 50 per cent duty. The end-product is further subjected to an excise duty as high as 16⅔ per cent *ad valorem*. These are raw materials of textile industry where again the excise is levied. It is this system of multiple levies which progressively inflates the cost of production as it becomes compounded at each stage of manufacture. Similar conditions apply to plastic industry also, with the result that they have shown a slow-down in consumption causing an idle capacity. These are by no means isolated examples. What is more embarrassing is that there is a great deal of attention on any price changes of products but none at all on a basic contributory factor, namely, the insatiable appetite for funds of the Exchequer."

Another important reason for the high cost structure of the industry is the defective licensing policies, with little or no attention given to the economies of plant size. Referring to this issue, Mr. Asoka Mehta justified the role assigned to small units in the industry. Bigger units, he conceded, offered economies of size, but they required large capital outlay, which could be managed only by a few business houses. "Apart from the question of monopolies, the activisation of our economy," he said, "required wider spread of entrepreneurship in the country." According to him, in the fields of primary and basic chemicals, the utmost attention should be paid to economies of scale. But, he added, in further conversion and processing, small units should be favoured, "as they would spread entrepreneurship, help to diversify the economy in many regions and provide more employment." These are usual arguments in support of the small units, which leave unanswered their impact on the cost structure. As Mr. Doshi pointed out, fragmented and small units would keep chemical prices much higher than those in world markets, and reduce their competitive capacity. Mr. Doshi did not, however, rule out the usefulness of the small units in the chemical industry. Only, he urged that their role should be properly defined and planned in a manner that would not act as a constant drag on the economy.

SINGARENI COLLIERIES

The revised third Plan production target for the Singareni Collieries Company, Ltd. in the public sector is 6.1 million tonnes per annum, as against the original target of 5.6 million tonnes. That represents exactly a sixth of the entire public-sector target of 36.6 million tonnes, so that the share of the National Coal Development Corporation is 30.5 million tonnes. These targets seem to have been fixed rather unrealistically, for, as the recent mid-term appraisal of the third Plan has estimated, the likely achievement of the N.C.D.C. collieries in 1965-66 would be no more than 24.0 million tonnes and that of the Singareni collieries just 4.1 million tonnes. Incidentally, the private sector is expected to produce as much as 61.7 million tonnes in the last year of the Plan, as compared with its target of 61.5 million tonnes. The contrast between the lagging performance of the public sector in coal industry and the steady progress of production according to schedule in the private sector is thus quite sharp and patent.

As far as the Singareni Collieries Company, Ltd. is concerned, its expansion project is not likely to be completed by the end of the third Plan. While the Company achieved its 1962-63 production target of 3.2 million tonnes fully and is expected to exceed its 1963-64 target of 3.5 million tonnes by 100,000 tonnes, it will not be able to achieve its 1964-65 target of 4.3 million tonnes fully even in 1965-66. But it is surprising that there is a reference to this poor rate of growth only in the mid-term appraisal but not in the address delivered by Mr. M. P. Pai, I.C.S., Chairman, in his address at the annual general meeting of the Company on 23rd December 1963. It is, however, possible to draw the inference from his address that the progress of the expansion project has been slow, for he has himself stated that the Company has been finding it difficult to procure the necessary foreign exchange for the purpose of importing equipment. Incidentally, the Company's third Plan capital outlay of Rs. 28 crores has a foreign exchange component of about Rs. 8.4 crores. Even maintenance of production at the current level seems to be difficult at Singareni. The Chairman has complained, in this connection, that there is difficulty in procuring essential spares required for maintenance of the plant and equipment due to inadequate foreign exchange allotment.

BANKING LAWS (MISCELLANEOUS PROVISIONS) ACT, 1963

A SURVEY OF THE LATEST CHANGES

NOW that the heat and light generated by the easy but exciting passage of the Banking Laws (Miscellaneous Provisions) Act is cooling off, one can settle down to a review of the actual and practical changes that have occurred. Most of the important controversial provisions of the Act have been widely commented and are fairly known, but, in the glare of publicity, a few of the minor, though useful, changes have escaped the notice they deserve.

This is an omnibus Act, which amends three other Acts, two of them substantially, and grants many overriding powers of a judicial nature to the Reserve Bank of India and the Government of India; the Act is, after all, not as simple as its title suggests. Moreover, although the Government could avoid a reference to the select committee by telling the Lok Sabha that the Act involved no complicated technical points requiring a detailed scrutiny, it could not conceal the fact that the Act does involve a wholly different structure of and unprecedented operational controls over the banking and financial systems of the country. It is no consolation to be told that the powers will not be used, unless necessary or that they will not be abused, for the power to determine what constitutes "necessity" and "abuse" are also in the hands of the same authority that will wield the more substantial powers.

Non-banking Institutions

The bulk of the substantial amendments to the Reserve Bank of India Act are included in a new chapter containing provisions relating to the non-banking institutions receiving deposits and the financial institutions. The terms are very widely defined. "Non-banking institutions" cover all companies under the Companies Act, 1956, all firms under the Indian Partnership Act, 1932 with partners' capital in excess of one lakh of rupees, and all statutory corporations; and "financial institutions" are those non-banking institutions the business of which it is to finance hire purchase, trade, commerce, industry or agriculture, or to deal with all types of stocks, shares, securities or hire purchase transactions. The net is cast so wide as to cover almost every type and description of financial activity in the country: the financial institutions, for example, are so defined as to include public sector institutions like the Industrial Finance Corporation, State Financial Corporations, Industrial Credit and Investment Corporation of India and many others, though it is not clear whether L.I.C. will also be included or not.

As a result of the latest amendments, the Reserve Bank now possesses three types of powers over the entire range of *non-banking* and *financial* institutions:

(a) Power to call for detailed *returns* relating to or in connection with the receipt of deposits by the non-banking institutions or regarding the business of the financial institutions. The details to be supplied by the former include the purpose and period of deposits, rates of interest and other terms and conditions governing the deposits, while the latter must furnish data on their capital and reserves, assets and liabilities, investments and advances including the names of the borrowers, in addition to the other conditions governing their advances.

(b) Power to *inspect* any such institution and their books and accounts for the purpose of verifying the correctness or completeness of the information furnished or for the purpose of obtaining such information.

(c) Power *to give directions* to such institutions either generally or to any one of them or a group of them regarding the *receipt of deposits* by the non-banking institutions or the *conduct of business* by the financial institutions.

Penal Provisions

In addition, the Reserve Bank is empowered to regulate or prohibit the issue of a prospectus or advertisement soliciting deposits of money from the public, to determine whether any amount described as "borrowing" is or is not a deposit and to examine any director, manager, officer or employee on oath and to administer an oath accordingly. The penal provisions provide that offences under the Act are punishable with imprisonment upto three years or with fine or with both, in addition to the power of the Reserve Bank to prohibit acceptance of deposits by non-banking institutions.

The only safeguards against the executive or judicial powers of the Reserve Bank under these provisions are that the Bank will be guided by "*public interest*" in dealing with the non-banking institutions, and would have "*due regard*" to the responsibilities and objects of the financial institutions and to the effects of their business on money and capital markets. But even here, the Bank itself is the sole authority to determine what constitutes the public interest and whether due regard has been paid to the relevant factors.

An Unexpected Ally

The declared purpose of the Government in regulating the acceptance of deposits and grant of advances by non-banking and financial institutions in the above manner is to ensure more effective supervision of the monetary and credit system by the Reserve Bank, by bringing them within the orbit of credit control measures in the organised money market. Apart from enforcing the discipline of the money market on the recalcitrant elements, what appears to be at the back of the Government's mind in bringing these measures is its newly-found concern for the existence of "unaccounted money" used to finance trading in goods, commodities and durables. For both these purposes, the Government seems to be eager to prevent diversion of deposits away from the banking system: the bankers have, of course, been glad to find an unexpected ally in the Government.

The first few clauses of the amendments to the Reserve Bank of India Act, introducing a couple of procedural changes, end the redundant system of currency accounts that has been in existence for almost 100 years. Formerly, the Government and now the Reserve Bank maintain detailed accounts and statistics of the notes in circulation in order to ascertain the notes due to be written off. According to Section 34 of the Reserve Bank of India Act, which copies the earlier Paper Currency Acts, notes which have not been presented for payment within 40 years of their issue are deemed to have been lost or to have gone out of circulation. The volume of such notes was fairly large in view of the great preference for cash in our country; their writing off reduced the Bank's (or Government's) liabilities, and became a source of immediate gain to them, by enabling them to acquire or resume assets held against the notes written off. In the longer run, however, the gain was only nominal and could be wiped away to the extent that such notes, which are subsequently presented for payment, have to be honoured. Moreover, the cost and effort involved in maintaining the detailed accounts was far out of proportion to the gains available. Wisely therefore, the system of maintaining detailed accounts of currency in circulation and the procedure of writing of notes outstanding for more than 40 years is being discontinued.

The Relic of a Bygone Age

Similarly, the provisions providing for maintenance of a certain minimum level of rupee coins (which technically include Government of India one rupee notes also) in the assets held against the bank notes in circulation are also being dropped. With the vast expansion in the amount of notes and in the economic functions and responsibilities of the Government, these requirements were formal only and served no real purpose. It makes no difference whether the Reserve Bank Governor's promise to pay is *backed* by the Government Securities signed by the Governor himself on behalf of the President or by the metalic rupee coins or by the one rupee notes signed by the Finance Secretary: in fact, the entire theory of the need for maintaining reserves as backing for the note circulation is the relic of a bygone age.

The amendments to the Banking Companies Act enhance and extend the powers of the Reserve Bank over the commercial banks so as to provide for stricter supervision of the operations and working of the banking system; there are at least five amendments which introduce fundamental changes in the structure and organisation of banking, though there are many others which are only clarificatory in nature and are intended to bring out more clearly the intention underlying certain provisions of the Act.

The voting rights of an individual shareholder of any banking company, which are now restricted to *five* per cent of the total voting rights of all the shareholders of the company, will in future be restricted to *one* per cent. Grant of unsecured loans and advances to directors or to firms, private companies or individuals in whom they are interested as guarantors or otherwise are at present prohibited under Section 20 of the Banking Companies Act: the prohibition is now extended to both public and private companies in which the Chairman of the bank is also interested as Chairman, managing director, managing agent, or director or partner of the managing agent. Unsecured advances to such companies against Government supply bills, *bona fide* bills of exchange or trust-receipts are, however, exempted from the prohibition.

The present Section 21 of the Act already empowers the Bank, in public interest, to determine banks' policies in relation to their advances, and to issue directives to them regarding the purposes, margins and the rates of interest governing such advances. The amended Section 21 requires the Reserve Bank to take into account the interests of depositors also, and enables it to give to any bank, additional directions regarding the maximum amount of advances that may be granted to, or guarantees that may be given on behalf of, any one company, firm or individual, having regard to the capital structure, assets structure and the deposits of the bank concerned. The directions will also apply to the other terms and conditions on which the advances or guarantees may be given.

Additional Control

A new Part IIA containing three sections, 36AA, 36AB and 36AC gives the Reserve Bank considerable additional control over the banks and their managements. These new provisions replace sub-sections (3), (4) and (5) of Section 10 of the Act, which, among other things, enabled the Reserve Bank to remove from office, a Chairman or director or manager or chief executive officer, *if he had contravened the provisions of any law* in circumstances which made it undesirable for him to continue to be associated with the bank concerned or detrimental to the interests of its depositors. Under the new provisions, the Reserve Bank could order the removal of any person associated with a bank, if it is necessary for securing the proper management of the bank concerned, or if it is in the interests of the public or depositors, *whether that person has violated any law or not.* The only safeguards against the abuse of this vast power are that the reasons for removal must be recorded in writing, that a reasonable opportunity must be given to the affected person to make a representation to the Reserve Bank, and that an appeal could be made to the Central Government, the decision of which shall be final. One of the safeguards is, however, vitiated by the Reserve Bank's power to suspend the person concerned pending the consideration of his representation. Further the Reserve Bank could appoint a suitable person to fill the vacancy caused by the removal of the director or chief executive officer or other officer or employee of a bank. The Reserve Bank could also appoint additional directors on the Board of a bank, their number being not more than five or one-third of the prescribed strength of the Board, whichever is less. Such persons or directors shall hold office during the *pleasure* of the Reserve Bank, but for not more than three years, shall *not incur any obligation or liability* for their actions and ommissions in good faith and in the execution of their duties, and shall not be required to hold any qualification-shares. No such removal shall entitle any person to any compensation notwithstanding any law or contract, and all such appointments shall take effect notwithstanding anything contrary contained in any law or instrument.

Clarificatory Amendments

Among the minor and clarificatory amendments to the Banking Companies Act, one extends the prohibition against the use of words 'bank,' 'banker' or 'banking' to firms, individuals or groups of individuals also: another makes it clear that the appointment of a chief executive officer cannot in any event be for a period in excess of five years at a time, and that no renewal could be allowed two years before it is due: still another provides that no loan due from a director or his friends could be written off without the permission of the Reserve Bank. This is intended to plug a loophole revealed by the Palai affair.

The detailed annual return of unclaimed deposits not operated for ten years or more which the banks were submitting so far to the

Thermocole®

GETS AROUND PIPES AT GLAXO

The pipes at the GLAXO Fine Chemical Factory live through the most exacting conditions with a sense of security. No wonder. THERMOCOLE protects them against temperature variation and moisture—the scourge of all low-temperature piping.

There are many organisations in India that know and use THERMOCOLE for vessel and pipe insulation and GLAXO is one of them.

THERMOCOLE is foamed polystyrene—the lightest rigid insulating material in the Industry. It has a very low thermal conductivity and is resistant to moisture. Available in handy, close-fitting sections, THERMOCOLE is the ideal material for pipe insulation.

The Trade Name—THERMOCOLE is your guarantee of Quality for Expanded Polystyrene

IC 34-496

ANNOUNCEMENT REGARDING THE PROPOSED ISSUE OF CAPITAL

This is only an announcement and not a Prospectus and persons interested are requested to apply for a copy of the Prospectus for full details.

BHARAT FORGE COMPANY LIMITED

Registered Office: **13, ELPHINSTONE ROAD, KIRKEE, POONA-3**

EXISTING AND PROPOSED ACTIVITIES

Bharat Forge Company Limited plans to erect a Modern Drop and Upset Forge Plant capable of producing 6,000 tons of forgings per annum on a single-shift operation and 16,800 (Nos.) finished crankshafts per year.

Included in the project, in addition to Modern Drop and Upset Forging Equipment, will be a completely equipped Die Shop, heat treat facilities and up-to-date equipment for Quality Control.

Complete facilities for the machining, heat treatment, grinding and inspection of Drop Forged Crankshafts will enable the Company to produce these items from the billet to the completed crank.

The Company will produce a complete line of forgings and finished crankshafts in a variety of ferrous and non-ferrous metals for the rapidly developing manufacturing industries of India.

The Company has concluded collaboration agreement with The Steel Improvement and Forge Company, Ohio, U.S.A., for providing the necessary technical assistance and services. The Company has secured the necessary Foreign Exchange Loan and import licences.

LOCATION OF THE INDUSTRY

The Company has purchased from the Government of Maharashtra 61 acres and 34-8 gunthas of land in Mundhwa, within 3½ miles from Poona City, to locate the Industry.

THE FIRST 25 YEARS OF NYLON

WILL IT FIGHT OFF ITS RIVALS?

"MIRACLE fibre": This was how nylon was first described over twenty-five years ago —on 27th October 1938—when E. I. du Pont de Nemours and Company of the U.S announced its discovery to the general public. The appellation is quite apt and nylon continues to be a really miracle fibre, notwithstanding the advent of several new synthetic fibres. The properties offered by nylon are unmatched and the uses to which it is put are unlimited. Indeed, the past two and a half decades have brought almost universal acceptance of nylon both as a synthetic fibre and as an engineering plastic. Perhaps no other product in the chronicles of the chemical industry is said to have justified, even in the year of its twenty-fifth anniversary, new investments as heavy as those required in all its previous history. The story of nylon's progress through many stages of hard-won development, embodying great technical leaps as well as staggering financial risks, is impressively presented by the Du Pont Company in a brochure specially published on the occasion of the twenty-fifth anniversary of the Company's public announcement of nylon.

Besides tracing some of the stepping stones to nylon's success, the booklet suggests that some of the more significant chapters in the history of this fibre are yet to be written. In particular, attention is drawn to two important factors which have prompted nylon's present modernisation and expansion programme. One is the heightened competition within the industry. In addition to Du Pont, several other producers now make nylon. And many new fibres and plastics aim at nylon applications. Nylon facilities, it is stressed, must incorporate the latest technology if they are to compete successfully. The second factor is the steadily expanding world economy. With economic growth come new markets and enlarged opportunities for products that can fill definite needs. In this pattern of growth, nylon expects to prove its continued usefulness; it foresees a lively 25 years ahead.

The one measure of continued acceptance of nylon—and of the increased competition for nylon customers—is, according to the Du Pont booklet, the proliferation of production facilities around the world. As of 1963, some 112 producers of yarns and fibres owned more than 120 plants in 38 countries, including plants projected or under construction. The location of the nylon plants is indicated below:

Country	*No. of plants*
U.S.A.	13
Argentina and Italy	8 each
W. Germany, Japan and Brazil	7 „
India	6
United Kingdom	5
Spain, France and E. Germany	4 each
Mexico	3
Venezuela, Uruguay, U.S.S.R., Czechoslovakia, Turkey, Mainland China, South Korea and Australia	2 each
Canada, Colombia, Peru, Chile, Portugal, Norway, Sweden, Netherlands, Belgium, Luxembourg, Poland, Hungary, Rumania, Greece, Israel, U.A.R. and Taiwan ..	1 each

The above list, it must be added here, gives only a broad idea of the position of nylon manufacturing facilities. Just because one country has more nylon plants than another, it does not mean that the former is a bigger producer than the latter. For instance, Britain has fewer plants than India. But the fact is that India's production of nylon is only a fraction of that of the U.K. and what little India manufactures is based on imported raw materials.

Du Pont's booklet has not furnished data relating to the actual production of nylon in the different countries excepting the U.S. In the U.S., the total nylon fibre output, which was less than 50,000 lbs. prior to 1940, gradually rose and touched about 250 million lbs. in 1956. It was, however, after this year that the increase in production was spectacular, the quantity actually produced in the calendar year 1962 being as much as 600 million lbs.

Nylon is used most extensively in a number of fields. The majority of tennis racquets today are strung with braided nylon. Nylon has practically replaced raw silk in military parachutes. This fibre is largely used in making lightweight combat clothing, mosquito netting, hammocks, tents, camouflage netting and cloth, socks, ladies' and men's wear, tyre cord and several industrial products. A special bulked continuous filament nylon yarn is used for carpeting. Industrial, non-apparel uses have multiplied from the very start and, every year, nylon seems to find a foothold in a new and promising fibre or plastics application. Tyre yarn is especially revealing of nylon's utility. Although it costs more per lb. than rayon, its greater strength has made nylon the chosen fibre in over 70 per cent of replacement passenger tyres and in more than 72 per cent of replacement tyres for trucks and buses. Meanwhile, further improvements in nylon tyre cord are being made. A new low-flat-spotting type may soon make heavy inroads in the original equipment market long dominated by rayon. Nylon has also found a wide variety of uses in recreational materials.

The manifold uses to which nylon is put have been the result of persistent and continuous research. Equally significant results from research have been the other popular fibres for the consumer market. The legacy of nylon involved financial and technical carryover. Just as rayon earnings helped subsidise early research and development costs for nylon, earnings from nylon helped underwrite development for 'Orlon' ($25 million) and 'Dacron' ($80 million) before these fibres went into full production. The details in respect of these fibres, as well as of "Lycra," are given below:

Orlon: This is an acrylic fibre spun from polyacrylonitrile. Earning wide acceptance in carpeting, blankets, sweaters and other knitwear, it serves both as a supplement to nylon fibres and as a vigorous competitor.

Dacron: This polyester fibre is produced from a polymer based on polyethylene terephthalate. It has widest use in shirts and suits (where nylon is less adaptable), curtains and drapes and as a fibre-fill for comforters, pillows and upholstery. In clothing, Dacron has been particularly successful in blends with rayon, cotton and wool.

Lycra: This spandex fibre is the result of highly complex chemistry involving polyurethanes. It is lighter, more elastic and more durable than rubber. It is already the choice fibre for swimsuits, girdles and other figure-hugging feminine finery. Lycra both supplements and competes with nylon for brassieres and other intimate fashion uses.

The impact of nylon, especially on the U.S. market, was "immediate and overwhelming." This was because of the fact that the new fibre offered certain vital properties which the other fibres did not offer. At the time when nylon made its debut, the position in respect of the traditional textile fibres as described by Du Pont's booklet was this: "Silk was expensive but not very durable; linen crushed easily; wool was scratchy and water-shy; cotton was serviceable but not easily translated into high fashion. One relatively recent innovation, rayon, was economical, but there were severe limits to its strength and durability."

The economic success of nylon shared by thousands of business firms also means the livelihood, in varying degrees, for nearly 1.5 million American working people and their dependents. More than 19,000 persons, it is stated, are engaged directly in the manufacture of nylon and over 730,000 in the making of various kinds of apparel with nylon as the sole or basic fibre. Another 150,000 work in tire-cord processing or making of rugs and house furnishings, including upholstery. More than 500,000 persons work for retail stores which sell clothing, with part of it made from nylon.

Nylon has so far resisted every attempt to make it obsolete. Actually, it is proving more useful than at any time in its 25-year commercial history. This is evident from the fact that nylon production has been expanding at a vigorous average annual rate of more than 14 per cent.

What are the reasons for nylon's outstanding durability as a glamour product in the highly competitive fibres industry? The answer given to this question in the Du Pont booklet is as follows:

"For one thing, the combination of strength, toughness and elasticity is still unmatched, even by such highly useful and popular fibres as 'Orlon' and 'Dacron.' Most important of all, however, have been the persistent and successful efforts of scientists to adapt the original molecule to other forms and structures. A new form, sold under the trade-mark 'Antron,' illustrates this kind of improvement. The conventional nylon fibre had a hard, slick surface which made it ideal for stockings, lingerie, and many industrial uses. But these characteristics also made it less attractive in most dress materials, in skirts and in sweaters. The newer form, however, has a softer, bulkier feel, and is winning nylon many new customers in fields where formerly it had proved only moderately useful. Similarly, the new bulked continuous filament nylon makes possible many new and exciting designs in carpeting. As a result, nylon carpets in 1962 recorded a 41 per cent gain over 1961, and by 1963 were accounting for nearly 40 per cent of all carpet fibre used. Stretch nylon yarns are recording spectacular gains. Their popularity in ski wear has spread to all forms of casual clothing. In addition, stretch nylon began to appear in men's suiting in 1963, as blends with wool and 'Dacron' polyester fibre. Another factor in nylon's history for the next 25 years which should be of great interest to the consumer is the fierce fight for markets among a growing number

BUSINESS ASSOCIATIONS

NEED FOR A PHILOSOPHY

By V. I. Chacko

IN Independent India business associations have proliferated in number and they cover almost all kinds of businesses including trade, industry, planting and agriculture. They range from nothing more than printed letterheads to complex organisations, with a vast variety of industrial or trade groups and interests within their fold and performing many functions of importance to its membership.

Voluntary organisations have been formed with social, religious, professional and economic objectives. There are several thousands of these bodies, registered and unregistered. Here we are only concerned with organisations with economic objectives like chambers of commerce, industrial, planting and agricultural associations. Some of these associations date back to a century or more and are nationally known. Some of these have exercised great influence on the Government's economic policies in the past and wish to believe that they still do so. They surely do exercise considerable influence over their own membership and regulate their internal affairs over a wider field than at any time in the past.

Whatever their influence over public policy, some of the nationally known associations have increasingly become aware of the role they should play beyond the strict business interests of their membership. Voluntary organisations are power centres and many of the matters on which they may decide as of internal and domestic concern are not necessarily matters without public effect.

Little Literature

There is very little of literature on industrial or business associations in this country, about their structure, functions, standing, objectives, interests and systems of operation. At the outer edges are the paper associations. They appear to represent certain interests during a crisis faced by them and disappear as soon as their limited purposes are achieved or the crisis blows over. There are those small and parochial associations which are maintained alive by an occasional meeting, spasmodic activities and the interest of a few individuals who find such bodies convenient for their own purpose. The larger chambers of commerce and industrial associations with paid and permanent secretariats keep a wary eye on all matters affecting their membership, maintain the flow of information from and to the membership, help in studying problems affecting them and making representations on their behalf.

Some of the leading organisations go far beyond these familiar chores. These organisations at the national level have increasingly tended to deal with public policy in relation to business, have organised research and systematic inquiry into economic policies of the Government and give voice to business views on broad industrial policy. They have tended to establish points of lively contact between the policy-makers in the Government and the industry and to express in public the business point of view.

Since economic policy was concerned primarily with development under Government control and Central planning, business associations were caught in an unending stream of legislations, executive decisions, sanctions and restrictions which immediately affected their members. Associations, as power centres, were of relevance only to their own membership once the Government began to assume power monopoly over economic and social policies. Association policy was no longer a matter subject to an independent and comprehensive understanding of the integrated totality of the purpose of policy, but what was expedient and circumspect. Its own inherent limitation that the membership was not concerned with anything more than what affected them in the carrying on of their business in the accustomed manner, made things worse. Voluntary associations as power centres were, to the broad stream of public opinion, self-seeking and inward-looking.

So long as a parliamentary system of democracy exists in India, together with its attributes of civil liberties and freedom of speech, it becomes effective and meaningful only if private enterprise and the opportunities for self-employment also exist. In place of a monopoly of State power, private enterprise provides the countervailing force of dispersed economic power with the necessary freedom for the majority of the population from dependence on the State for livelihood.

New Role

There are many thoughtful men in the country who feel that, with Central planning, enormous concentration of power in the hands of the Government over social and economic activity, wholesale dependence of individual businesses on the patronage and systems of permits and licences, there is very little of freedom left with the business community to act as effective centres of the countervailing powers of a pluralist society. If we can get away from an argument on the perfect distribution of powers for maintaining a system of checks and balances and accept that powers have begun to flow into Government hands by an exercise of the very instrument of popular democracy, businessmen will find a more fruitful area for creative discussion.

It is certainly the belief of many businessmen that their organisations are only concerned with the protection of their business interests and for the regulation of their internal relations. But few can now afford to believe that public policy and political objectives have no lasting and decisive effect on business and businessmen. The efforts of business organisations to protect the interests of their members from the consequence of such policies bring their activities, if not directly in conflict with State policies and objectives, at least at some dissonance with such policies. Associations now recognise that an intelligent and responsive understanding of the interests of the community at large is essential to their successful functioning.

Wider Responsibility

Any voluntary association of a business interest must take decisions which have social and economic impact on people not covered by the association's membership. What justifies such exercise of power and who should control it and make it acceptable to the people affected? How could it act with responsibility to the community? How could it protect its own interests if the community believes that business associations are only concerned with the interest of their membership? This obvious conflict cannot be resolved, unless associations assume a wider responsibility than what their articles and memoranda of association have laid down or would strictly allow.

Large-scale business associations in India have most of their time and talent devoted to the everyday problem of functioning business in industry, commerce or agriculture. Its membership is in constant need of advice, help and guidance and, within the framework of existing practice and the law, they have to be guided through or protected from the rigours and dangers of the exercise of State power. Since that power cannot be challenged or questioned, associations have tended to seek mitigation from the effect of such power exercise by placating and flattering the wielders of that power and in some cases by feeble and sporadic efforts at educating them. The last function has taken several forms, the most enlightened being a study of public policy for their impact on industry and trade. But associations have unfortunately stopped short of a critical examination of their own objectives and policies, with the result that distrust of the intentions of private enterprise frustrates public appreciation of all efforts at an objective study of Government's economic policies by such associations.

Why Keep Out of Politics?

Business associations have always refrained from any action which might be construed as politically inspired and, by this excessive caution, have rendered themselves incapable of studying or understanding the political climate in which they operate. Voluntary association of industrialists and businessmen encounter their most serious shortcomings in their adjustment towards the political climate for which industrial bodies have done little or no original work in India. The fact that social and economic decisions proceed from a certain politically-accepted framework of reference are not always readily recognised by these associations. Their preoccupation with the consequences of those decisions as apply to their membership's interests invariably lead them to deal with the symptoms and not with the causes of their problems. Over a period of time, their effectiveness must inevitably decline. In fact, private enterprise has no effective defence against the accusation that it is only interested in its own limited self-interest and not in that of the community at large and the mist of distrust so completely envelops it that the true image of private enterprise cannot be seen. Whereas private enterprise has taken just pride in its initiative, drive, creativeness and efficiency, it has failed to convey that its efforts are in the interest of the welfare and progress of the community.

Modern Governments are increasingly tending towards taking into their hands all the levers of community organisation and action. In a country such as ours this process of power concentration provides a dangerous situation in which despotic powers can be assumed in the name of the ignorant, the incurious and the indifferent masses who rely so much on the Government for their protection and welfare. What could be a more convenient means of destroying private enterprise than by projecting them as the exploiters of the innocents from whom the Government is out to protect them. Democracy cannot survive in our country, unless informed and responsible decisions are taken on matters which affect the community the majority of whom are helpless against the exercise of power whether by the State or from dispersed centres of power like unions, industrial and agricultural associations and chambers of commerce.

A changing society is not a threat but an opportunity to businessmen who are attuned to a higher objective than an exclusive concern for personal gain. In fact, enlightened businessmen accept this proposition. Their principal preoccupation however happens to be the unending problem of dealing with the frustrating, confusing, time-consuming and wearying processes of Government controls and regulations. Their associations are primarily intended to guide them through such deeps and shallows as the flood of Government directive and control operations present. It is here that some clear thinking on the part of business organisations has become necessary. Individual businessmen, however enlightened, cannot make a difference to the popular impression about private enterprise when individual beliefs and practices differ so widely. To keep the sights of the business community on the higher objectives which do not figure at every meeting of the committee should essentially be a function of the professional association men. Indian business associations are witnessing the rise of an efficient, articulate body of professional men who man their secretariats. Their experience is deep and wide in the problems of associations, but there are among them men equipped to understand and appreciate the broader setting of public interests and aspirations and who can find a synthesis between the interests of business and the larger community. As stipendiaries, their influence over their committees and the general membership varies very considerably and provides no assured basis for exercising any great influence over business thinking beyond their everyday problems.

Fear Mentality Must Go

Much of what has been said here might lead one to conclude that the problem is one of public relations. While good public relations would keep associations alive to policies that secure public goodwill and acceptance, the main question here is one of public responsibility on the part of private enterprise beyond the call of ordinary decent conduct. The two essentials for the rise of a new philosophy by which to conduct business affairs would be a rise of men with vision within industrial and trade associations and a common approach by the different business organisations in the country. Though political backing may differ in complexion, trade unions are better placed than employers' organisations in the matter of adjustment to political forces. They are closer to the levers of political power and their leaders are full-time stipendiaries of their unions and individually committed to the changes. In employers' organisations, the power rests within the membership and, as businessmen individually, they are not directly involved with the broader issues which condition the functioning of their businesses and collectively they are incapable of a common viewpoint on such remote and possibly controversial issues.

Business associations require a new approach to the world of politics, an intelligent, informed and responsible view of the political climate instead of getting paralysed with fright and confusion at the thought of political involvement in business discussions. Associations must be guided by a new philosophy which takes public interest as the standard guide-posts for business policy.

THE MADRAS ALUMINIUM COMPANY LIMITED

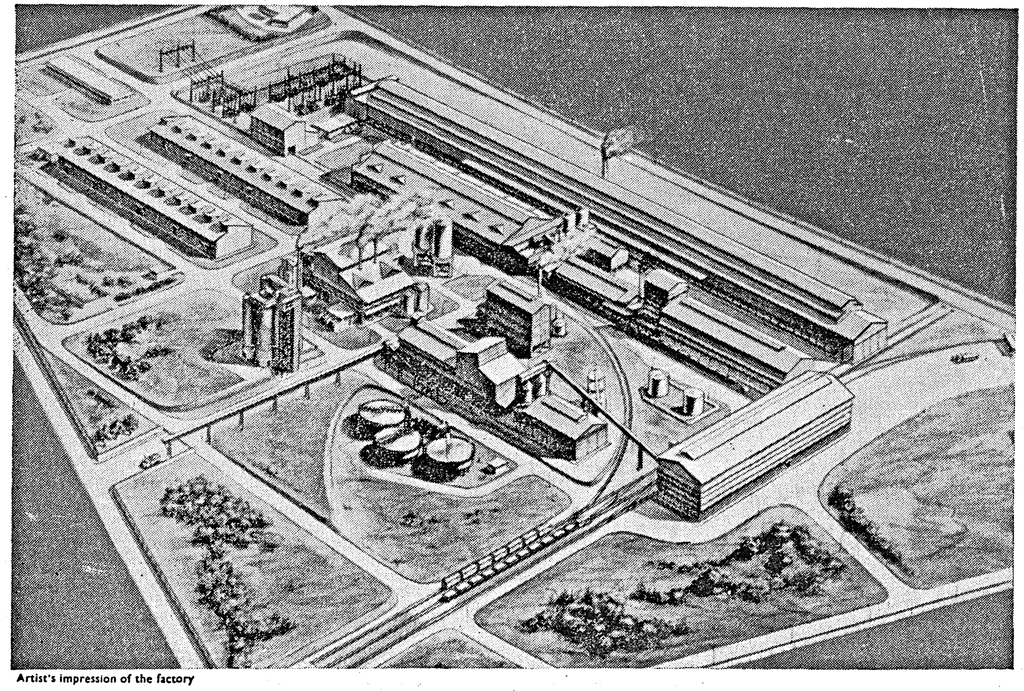
announce the installation of the

ELECTROLYTIC POT

at Mettur, Salem District
on the 29th December, 1963
in the distinguished presence of

HON'BLE SRI R. VENKATARAMAN
MINISTER FOR INDUSTRIES, MADRAS

PRODUCTION OF ALLOYS & INGOTS TO COMMENCE BY THE SECOND HALF OF 1964



Artist's impression of the factory

Technical Collaborators:
M/S MONTECATINI of ITALY
Authorised Capital : Rs. 10 crores
Issued Capital : Rs. 6 crores

Foreign loan arrangements with
M/S. MEDIOBANCA of ITALY

Raw material—"BAUXITE" ore from company's mines at Sheveroy Hills, Yercaud, Salem District.

TO PRODUCE ANNUALLY 10,000 tonnes comprising of

ALUMINIUM ALLOYS & INGOTS	:	2,500 tonnes
ALUMINIUM RODS	:	3,000 tonnes
ALUMINIUM EXTRUSIONS	:	1,000 tonnes
ALUMINIUM ROLLED PRODUCTS	:	3,500 tonnes

FDS-MA-171

DEVELOPMENT OF TECHNICAL KNOW-HOW

SUGGESTIONS FOR ACCELERATED AND INTEGRATED PROGRESS

By Dr. Surendra C. Dholakia

EVER since we nationally adopted a policy of economic progress through industrialisation, we have been expanding the volume and complexity of technological effort in order to achieve progressively higher levels of production of goods and services. And so we are advancing from one Plan to another into industrial and economic activities of increasing diversity and greater complexity. In such circumstances, availability and application of technical know-how assumes vital significance.

While materials in their primary crude form have been potentially available for centuries, their utilisation has been stepped up only as and when the necessity to support and protect human subsistence and welfare has kept on mounting. Thus, necessity and human genius may be termed the parents of invention, that is, know-how. In our country, the only positive way of meeting such a heavy backlog of social and personal needs of the society is to press into service the modern technical know-how.

Anatomy of Technical Know-how

Development and accumulation of know-how, however, is a slow, painful and relatively expensive process. Such a development has also to go through certain stages to retain a mature and self-sustaining dynamism. In order to appreciate the all-pervading nature of technical know, it would be advisable to follow the various stages of interaction between materials and know-how ending up in a consumable product. These stages are:

1. Consumable product may either be imported for further transport and distribution in the country or may be produced indigenously.

2. Production results from the interaction between process know-how and intermediate raw materials.

3. Intermediate raw materials are obtained through process know-how and primary materials.

4. Process know-how is composed of plant know-how and operating know-how.

5. Operating know-how involves academic aspects including research and training in fundamentals for the particular technology and development of operating skill and efficiency techniques.

6. Plant know-how includes the materials for fabrication of the plant, fabrication and construction know-how and design know-how for the plant and machinery.

7. Production of materials used in the fabrication of the plant requires the application of process know-how with respect to other primary raw materials. This process know-how is developed along the lines already mentioned.

8. Know-how involved in the physical construction of the plant and machinery is based on the development of human skill and training in certain workshop techniques so as to achieve the characteristics and specifications required by the design know-how. This is achieved by proper intensive training of the qualified personnel under the expert supervision and guidance.

9. Design know-how is the most vital part of the technical know-how complex and is built up partly by integration of available operating and design data and partly by experiments on pilot scale. A thorough background of the academic aspects of the technology involved is absolutely essential.

Stages of Application

A national plan of development, therefore, basically implies a well-thought-out programme of making various degrees of technical know-how available from indigenous talent. The emphasis in the beginning would progressively shift from purchasing know-how plus materials from abroad to gradual replacing imported materials with indigenous ones and development of technical know-how locally for each corresponding stage of such substitution. Such a stage-wise development of technical know-how may cover the following aspects:

(a) Survey of needs and available means for satisfaction at national and international level.

(b) Arrangement for supply of the consumable materials and articles including know-how and materials, terms of payment, and national costs involved therein.

(c) Item-wise development of projects for utilisation of indigenous materials—termed "project design."

(d) Process design.

(e) Product design.

(f) Equipment design.

(g) Engineering design.

(h) Erection and start-up know-how.

(i) Efficient production and maintenance.

(j) Factory management.

(k) Research, development, and accumulation of further know-how.

The above stages may be illustrated by a reference to the development of the industries of steel and fertilisers in the country during the last few years. Although we have been making these products indigenously, we have to import large quantities to meet the balance of our requirements. In order to save time involved in the development of various stages of know-how described above, we first continued to import consumable articles. Secondly, we tried to investigate indigenous material resources available for their production in the country. Thirdly, we developed projects in detail in order to study the economics of the same. Fourthly, we decided to put up manufacturing units in the country by importing necessary plant and equipment, thereby importing the design know-how, as well as know-how for start-up and production. Ultimately, we realised that the materials which are used in the manufacture of this plant and machinery should also be made in the country in order to let the indigenous technical know-how grow to maturity, which was the ultimate step for complete and integrated development of technical know-how in these particular fields. This process is still continuing, and is far from complete even in these two fields, but we are positively on the right track.

Know-how Costs

Considerable sums of national savings have been spent abroad simply because of non-availability of various degrees of know-how within the country. The accompanying table indicates approximate amounts spent on the know-how factor since 1951. In this table, the know-how costs have been classified as direct, indirect and built-in costs. These costs which are payable explicitly for purchase and availability of know-how (whether design, or operating or any other) are termed "direct costs." Under the "indirect costs" may be included such amounts as may have to be spent in order to make arrangements for direct know-how to be feasible and practicable. Cost of travelling and maintaining the expert personnel, engineering and supervisory services which should be paid to the know-how group in order that the plant is erected according to their requirements, etc., are part of indirect costs. At any particular stage of technology, there is a built-in item of know-how which is brought in as a part of the imported plant and equipment and some process materials which may be termed "built-in know-how." Whenever a machinery is imported, the country is paying not only for the basic constructional material and manufacturing labour used in its production but also for the know-how involved in its design and quality production. Thus, the know-how costs are not separately stated, but are included in the cost of equipment and hence have been so termed. Additionally, there is a concealed element of know-how costs in the profits accruing to the supplier firm, in view of the fact that considerable specialisation and monopoly in the field of heavy plant and machinery exists and hence competition is not sufficiently widespread to force down the level of profits. These figures, though only approximate, do indicate the range of financial expenses involved for technical know-how imported in various forms.

Pace of Indigenous Progress

The figures as such need not be grudged against if we take certain aspects of the situation into account. Technological development in the country remained, more or less, at a stagnant level for several decades, while the other countries kept on advancing technology by intensive application of science to industry all the time. Our social and personal needs for materials and consumable articles have also continued to grow during this period of stagnant technology. It takes several years before the stage of ultimate know-how picks up indigenous roots. Thus, the only immediate way of attempting to approach the progressively rising level of needs was to apply ready-made technological know-how from whatever sources available in order to make up for the lost time. We have already stimulated the stagnant indigenous technology by injecting modern technical know-how at various levels in our industrial set-up. The question, however, remains whether the present pace of improvement in the level of indigenous technical know-how could be considered in step with our advancing needs and whether it is really the best effort the country can make at the present time.

Outlay on Know-how factor since 1951

(In crores of rupees)

Plan	Total Plan investment	Investment in organised industries	Approximate Know-how costs			
			Direct	Indirect	Built-in	Total
First	2,000	400	6	4	10	20
Second	4,800	1,600	24	16	40	80
Third	10,000	2,400	36	24	60	120
Fourth	18,000	5,000	75	50	125	250

The transition from academic and operational level of know-how to the design level is a relatively long and complex process. At the same time, unless the ultimate level of know-how for design and construction of manufacturing equipment and processes is acquired, the true benefits obtainable from technological revolution would remain only marginal. It is only when this stage in technical know-how is developed indigenously that the country can be said to have developed technological maturity and would be in a position to channel certain proportion of its economic, technological and academic efforts into research and development for continued technological achievements. This alone can be the bedrock of continuing social revolution based on technological development and a wholesome remedy for meeting our expanding needs.

Suggestions for Speeding Up

How, then, can this advancement towards technological maturity be speeded up? The problem is to be handled at all levels of technical know-how together. Beginning with the academic level, our teaching institutions should employ intensive methods of training and impart the most modern knowledge available in the subjects. The laboratories should be well equipped for the purpose. However, these are no substitutes for the quality of the teaching staff. Ultimately, it is the mental make-up and professional experience of the individual teacher that will provide an organic link between the student at the academic level, the equipment, experimentation and modern industrial practice.

At the operating level, considerable experience is normally accumulated in any plant organisation. Such an experience has to be systematically collected, interpreted, and pooled for further development and application. As the experience in the operation of a plant grows, certain technological factors at academic level tend to acquire practical significance. It is one thing to maintain a mass of figures at a plant just for statistical purposes and to calculate broad economic results. It is, however, an entirely different matter to develop that mental discipline to watch for such data and operational features which would be helpful in jumping over to the stage of ultimate know-how. This is possible if the plant personnel are recruited on the basis of merit only and are provided with necessary in-plant training and offered freedom of action and proper incentives so as to stimulate their active participation in the jumping-over process.

Integration of Experience

Pooling of such experience on an industry-wise basis should then be the next step. The engineers and technologists experienced in all the aspects of each industry should be provided ample opportunity for exchanging their experience regarding problems and their remedies. While it may be true in general that, in a competitive industrial field, the plant personnel should be advised to keep their experience within the plant and should not pass it on to the competing producers, some method should also be found whereby the exchange of experience continues to take place in the interest of all concerned. Such a task may be undertaken by the industry-wise associations of technologists through seminars, technical journals and publications, plant visits and research projects. It should be said that the demand for goods in this country is likely to lead the supply for the next few years and, hence, given efficient management and sound technological practice, all the manufacturers are likely to have an assured market for their products. In such circumstances, pooling of technological experience would only lead to the increased level of efficiency and national self-reliance for all the plants in the country. This would pave the path for the firsthand development of specialised know-how indigenously.

Exchange of Personnel

Exchange of personnel from one plant to another and from one industry to another and also from one sector to another need not be taken in bad light. Ambitions and aspirations of individuals with drive and initiative should be taken into account while deciding recruitment and personnel policies. A technologist should be considered within his normal rights if he hopes for a more challenging job with possibilities of further professional and economic advancement. Not all our plant organisations are run along objective and scientific lines and some well-deserved technicians may get stuck up at places from which they wish to be delivered in order to develop their potentialities fully. Rate of growth of professional talent is faster if an engineer gets an opportunity to widen his horizons of experience in both intensity and diversity. No undue impediments need be put in such a process of exchange of personnel. The plea that there is shortage of trained people and that the employers should, therefore, treat their own as virtual slaves is untenable when one bears in mind that it is lack of objective management and foresight which is primarily responsible for this shortage. Promotion of technical personnel to managerial positions should also be encouraged. Industrial management and project administration are new professions vitally required in a developing economy. The old ideas which treat technical and managerial functions as separate watertight spheres and which only believe in placing premium on age and time-seniority in preference to youthful merit and initiative should be discarded once for all. These factors have been neglected hitherto in the public and private sectors and have cost us dearly in retarding the healthy growth of indigenous technical know-how.

Standardisation and Practical Training

One of the means of expediting the development of indigenous know-how is standardisation of processes, plant and equipment and scale of operation. We are already aware of the efficient processes and machinery of economic size operating in other areas of the world. We have also the benefit of perspective planning, by which our requirements for the future may be reasonably estimated and availability of indigenous raw materials for various major products may be assessed. We should, therefore, select those processes and equipment and scales of operation which would be within our financial and operational means and would produce the desired products at a reasonable cost. This does not imply that we should restrict ourselves only to the specific processes and equipment and thus deny ourselves the advantages of competitive processes and diversity in equipment design. Probably, the techno-economic circumstances in the different parts of the country would lead us to adopt different processes and equipment. At the same time, we need not adopt processes and equipment which have not been successfully tried out elsewhere. We have neither time nor the means to make technological experiments on a commercial scale. We should rather take advantage of the technology already available and spend whatever additional means available for further development to keep abreast in each field.

Development of human skill and intensive practical training are other aspects which should be attended to in order that the specifications drawn up by the designers are adequately realised in practice during the fabrication of plant and equipment. This would suggest a social change in attitude of young workers towards the relatively new types of jobs and working conditions. All facilities, such as easy accessibility to a nearby technical training institute, post-training employment facilities, part-time training facilities, career guidance and aptitude tests, financial assistance and incentives for good work, should be planned on a country-wide basis. It is needless to mention that investment in this field is potentially highly productive.

Design Know-how: Consultants and Entrepreneurs

The ultimate know-how stage is reached when the services of the designers for plants and processes and technical consultants are available widely in the country on a competitive basis. Such a profession would develop when the entrepreneurship would become further widespread and fresh groups of the enterprising people with initiative and foresight would be eager to undertake calculated risks involved in setting up new industries. This would develop a demand for designers and consultants which could be met from the senior experienced and qualified personnel from the industry and the research institutions. Even at this level, the collaboration with some experienced organisations from abroad could be of help. Such a new profession would naturally require certain safeguards and incentives. It is frequently mentioned that adequate use is not being made of the indigenous know-how already available in some fields. Some of the reasons which may have led to this situation are the following:

1. An industrialist would prefer to reduce the element of risk as far as possible by selecting an experienced firm from abroad rather than a new consultant within the country. He is already facing several risks in regard to his project and his tendency to minimise the same could be understood.

2. The speed of implementing the project is also determined by the experience of the consultancy firm and the industrialist is anxious to put up his project without undue loss of time in order to keep down the cost of the scheme and also to secure substantial markets before competitors enter the field.

3. Sometimes the financing arrangements, particularly with respect to foreign exchange, would encourage industrialists to seek foreign collaboration from a particular source.

4. Highly specialised nature of a project in some cases gives no option to the promoter in regard to the selection of the consultants.

5. At times the industrialist is not able to locate the right kind of personnel for design and consultancy services in the country who may command his confidence and may be willing to offer services on terms suited to him.

6. An industrialist may also feel that his secrets regarding the project may pass on to other prospective competitors through an Indian consultant, thus partly nullifying the advantages he expected to derive by being the pioneer in a particular field.

7. Certain factors like fabrication of plant and machinery, special constructional materials, workshop techniques and tools, credit facilities, delivery periods, availability of controlled materials, performance guarantees regarding output, efficiency and life of machinery may not be indigenously resolved to the satisfaction of the industrialist. This may make implementation of the project more difficult even after the services of an Indian designer or a consultant are secured. The industrialist may, therefore, decide to proceed with a foreign consultant and foreign suppliers of machinery in the overall interest of the project.

If it is desired to develop technical know-how indigenously soon enough, positive steps should be taken to meet the above-mentioned apprehensions in the mind of a prospective industrialist. This would best be done by the Indian designers and consultants who should adopt a liberal and more exacting attitude as regards their terms and quality of the service rendered and should continue their pioneering efforts to co-ordinate the industrialists, the suppliers of plant and materials and the authorities so as to build up confidence in their ability and integrity. Industrialists should also realise that, sometime, somewhere, someone has to be the first to design, construct and operate a new project in the country and they should, therefore, make an all-out effort to avail themselves of the services available indigenously, whenever practical.

Contracts for Know-how and Training

It is also observed that some of the contracts for supply of know-how and machinery from abroad cover training of Indian technologists in operating techniques only. In this way, none from the Indian side is associated at the design stage and thus no first-hand experience for design of plants, processes and projects is available to the Indian promoters even after payment of the know-how fees. It should also be stated that the opportunity of training Indian engineers abroad is not fully utilised by some Indian promoters partly because of their anxiety to avoid expenses of training due to lack of foresight and partly because of difficulties of foreign exchange. It would be more productive if arrangements to train the Indian engineers even in the up-to-date methods of design and to associate them in all techno-economic processing and decision-making stages right from the inception of a project were included in all contracts with the companies abroad. It should also be impressed upon the Indian promoters that it is in their own interest to get their engineers thoroughly trained in the factories abroad for sufficiently long periods and that any expenses on this account are bound to prove highly productive in due course. The Government, too, should encourage these practices by proper co-operation and vigilance.

Conclusion

It can be seen from the above discussion that development and application of technical know-how in all aspects is highly imperative in the country. The structure of technical know-how in relation to industrial development as a whole has been looked into and the limitations placed on its development indigenously have been brought out. Various suggestions have been made in order to bring about its development in an integrated and expeditious manner. We have to consider modern large-scale operating methods and continuous processing equipment which are available to us at the payment of a price from abroad. We have also to produce our goods and services at reasonable prices and of standardised quality in order not only to offer them to the masses with meagre incomes but also to meet competition in international export markets. We have also to recognise the urgency imposed upon us by the rate of growth of population and its material needs. The country should, therefore, take up the challenge by expediting the development of technical know-how indigenously so that we can really achieve a "snowball" stage so vital to our very existence and sustained progress.

FIRST I.D.A. CREDIT FOR TANGANYIKA

The International Development Association, an affiliate of the World Bank, has extended a development credit equivalent to $4.6 million to Tanganyika to help the Government to enlarge the secondary school system. This is the first financial operation by the World Bank group in Tanganyika since the country became independent in 1961. The credit will help finance the construction and equipment of two new schools and the extension and equipment of 53 others, providing in all nearly 6,900 additional places for students.

The expansion of secondary schools is vital to the economic development of Tanganyika. There is an urgent and increasing demand for secondary school graduates both for direct employment and for further training in the administrative and professional fields, private and public. The need is all the more pressing as expatriate civil service officials depart. In five years, Tanganyika will need to have trained and available twice the present number employed in such careers as teaching and engineering, as well as a wide range of technicians in other fields. There is little chance, however, that enough qualified people will be available to fill all the vacancies even after completion of the programme now being financed.

The Government programme to expand the secondary school system was started in July 1962 and is scheduled for completion in June 1967. As a result of the programme, the number of places for students will be increased to 24,300. Several countries are helping to provide qualified teachers for the schools. The two new schools to be built with I.D.A. assistance will be Government boarding schools; the 53 schools to be enlarged include 12 Government and 27 voluntary agency boarding schools, and 8 Government and 6 voluntary agency day schools. Tanganyika's population is scattered and boarding facilities for secondary schools are necessary to enable pupils to attend regularly. The voluntary agency schools, which are operated and staffed by various religious organisations in Tanganyika, have traditionally played an important role in the country's educational and social development.

The I.D.A. credit is for a term of 50 years. Repayment of the principal will begin on 15th November 1973. Thereafter, 1 per cent of the principal will be repayable annually for 10 years and 3 per cent will be repayable annually for the final 30 years. The credit is free of interest, but a service charge of ¾ per cent per annum of the amount withdrawn and outstanding will be made to meet I.D.A.'s administrative costs.

CO-OPERATIVE FARMING SOCIETIES

About 2,053 co-operative farming societies are now functioning in the country, 1,049 in pilot areas and the rest in non-pilot areas. About 41,000 farmers have pooled a little over 260,000 acres of land to form farm co-operatives. Uttar Pradesh has 288 societies in the pilot areas, the largest for any State. As for non-pilot societies, Maharashtra leads with 291. Nine farming societies, six in pilot and three in non-pilot areas, have been formed in the Union territory of Delhi. Manipur has 18 societies, 12 in pilot and six in non-pilot areas.

The Union Government has been giving several incentives to popularise co-operative farming. A co-operative farming society is eligible for a total assistance of about Rs. 12,000 towards share capital, managerial expenses, etc. Central assistance to co-operative farming societies, in both pilot and non-pilot areas, is outside the State plan ceilings. The State Governments have also been advised by the Centre to make available to co-operative farming societies loans and subsidies on a preferential basis from the Community Development and other departmental budgets. The central co-operative banks will meet the short-term requirements of the farm co-operatives. To enable the recovery of loans granted by central banks, the co-operative farms are required to give an undertaking to sell their agricultural produce through co-operative marketing societies.

ECONOMY AND GROWING NUMBERS

ASIAN MEETING SURVEYS THE BURDEN

By Our New Delhi Correspondent

THREE facts emerged clearly from the Asian population conference held in New Delhi under the auspices of the United Nations Economic Commission for Asia and the Far East: first, all of Asia except Japan has to live and grow with the burden of a heavy population drag for many years to come; secondly, the Japanese method of family planning through a national practice of abortions does not fit in with concepts acceptable to the rest of Asia; thirdly, apart from the horror of abortion, there are not many inhibitions in most parts of Asia which stand in the way of initiating family planning campaigns.

The fact that a conference on population could be held reflected the lack of pressing inhibitions in Asia; even today such a conference cannot be convened in some parts of the world like Latin America which are under the dominating influence of the Roman Catholic Church.

The Russians did not go on record as being opposed to family planning in Asia, but at the same time pointed out that the ardent advocates of family planning were propounding absurdities if they thought that birth control would be able to bring about quicker development prospects in the near future—a decade or two. The Russians projected the "impossible hypothesis" of a total suspension of all human births in the region, say, for the next two decades, as an exercise in argument. They were disgusted at the continuing popularity of "the Malthusian gibberish." Even if no babies are born for 20 years, the demand for employment for those already there and growing up would proceed at the same pace as now in the coming two decades. In other words, the approach of the Russians was: Asia's development planners should not take cover under the plea of population explosion for their failures to plan properly and to make the best possible use of the available manpower.

The final report of the conference recorded that there was widespread acceptance in Asia of the need for "responsible parenthood and limitation of families." At the same time, the least that economic development planners and politicians could do was to lay more emphasis on food production programmes to see to it that the growing number of people were provided at least with food.

As usual, the E.C.A.F.E. Secretariat working paper contained a complete statistical record. The E.C.A.F.E. region's population was placed at around 1,700 million now, against the total world count of 3,000 million people. That meant 54 per cent of the world's population was in one-sixth of the land area of the world. Average density in the E.C.A.F.E. region was 71 persons per square kilometre, thrice the world average. On the basis of arable area, the E.C.A.F.E. region's average density of more than 400 people per square kilometre was double the world average. The actual total of the E.C.A.F.E. region's population in 1960 was 1,608.7 million and the projections were a total of 2,000 million by 1970 and 2,440 million by 1980.

Between 1950 and 1960 the annual average increase in population in the E.C.A.F.E. region was 1.8 per cent, as compared with one per cent in the three preceding decades. In the 40 years, 1920 to 1960, the E.C.A.F.E. region's population increased from 1,000 million to 1,600 million. Of this increase, 44 per cent was in the last decade. There was no special increase in fertility and the increase came about as a result of social welfare and public health measures adopted by the various countries which had become free after the war. Excluding Hong Kong and Singapore, which in effect are city states, the highest population density of 250 per square kilometre or more were in Taiwan, South Korea and Japan. Mainland China has a population density of about the same as the region's average, 71 per square km., but India has a density twice the region's average.

On the basis of average density for land area, Japan comes after the Netherlands, Belgium and Taiwan. But if only the inhabitable arable area is taken into account, Japan comes out the most densely populated in the world—with a density of 1,535 persons per square km. of arable land. Following Japan are North Vietnam (1,262), South Korea (1,225) and Taiwan (1,220).

At the bottom of the population growth graph is Japan which had an annual increase of 1.6 per cent in the decade of the fifties. Currently, the rate has been brought down further to one per cent for the past three years since the national census of October 1960. At the top of the graph, is tiny Brunei with more than six per cent annual population growth. A growth rate of more than three per cent was reported from Taiwan, the Philippines, Thailand, Malaysia, Cambodia and Laos.

China's population growth rate was 1.6 per cent annual, India's 1.9 per cent and Pakistan's 2.1 per cent. The average annual growth rate for Mainland China in the sixties is placed at 3.3 per cent, and in the seventies at 2.8 per cent, projecting a Chinese population of 778 million in 1970 and 915 million in 1980. For India the projections are an increase annually of 2.3 per cent in the sixties and 2.6 per cent in the seventies, giving a projection of 541 million people in 1970 and 661 million in 1980.

Brunei has the largest number of people in the dependant age group of below 15 years or above 60 years, 110 for every 100 in the working age group. India has 82 dependant age group people for every 100 in the working age group; of these 72 are below 15. The comparable figure for Japan is 64, including 49 below 15 years. But these comparisons are somewhat irrelevant because a large number of the people in the working group in India do not have proper employment and wages.

There were two aspects in studying which the conference delegates took particular interest, the Japanese method of population control, and the special problems of Indonesia which has a very uneven pattern of population distribution within the islands in the Republic. Indonesia's present population is placed at 100 million. The 1961 census had counted 97 million people in Indonesia. Of these nearly 63 million or 65 per cent were concentrated on Java which comprises less than seven per cent of the area of Indonesia. Kalimentan, which has 28 per cent of the area, has four per cent of the total population and Sumatra, which covers a quarter of the area, has 16 per cent of the population. The Indonesian Government has an official policy of transmigration to other islands to relieve the pressure on Java but this has not met with much success so far.

The Japanese method of population control has been successful *entirely because of the* widespread practice of abortion. The Eugenic Protection Law, in force for the past fifteen years, permits abortion if pregnancy will affect the health of the mother or if another baby will bring economic hardship for the parents. In effect it means anybody, married or *unmarried*, can have an abortion operation done legally. There are more than 12,000 doctors who make a living entirely from abortions. They do not have to report the names and addresses of the patients but only report to the authorities on the total abortions done in a month. Reporting a lower number is common because it means paying less taxes.

The tally of abortions officially counted in Japan is around 13 million and the estimates of those not registered are another six million. There have been more abortions than births in the past decade. An annual rate of a million abortions on the official count was reached in 1953 and it stayed at that level since then. Soon after giving legal sanction for abortions, the Japanese Cabinet started having second thoughts on the matter. Half-heartedly the Japanese Government and family planning experts started playing up the ill-effects of abortion on the health of the mother and advocating greater use of physical and chemical contraceptives. But contraceptive appliances have not proved foolproof. Sterilisation operations have also not become popular. One semi-official estimate is that three out of ten women undergoing abortion suffer injuries. At the same time, some economists in Japan talk of an optimum population of 30 to 40 million against the present 96 million. The present Japanese Prime Minister, Mr. Ikeda, is against abortion and the craze for contraception. He is not overawed by an increase in population.

Home Minister Gulzarilal Nanda has ruled out abortion for India. If India were to adopt abortions on the Japanese scale, it would mean ten million abortions a year.

While the conference delegates did not exhibit any inhibitions on the part of their Government, all-out support by many Governments to family planning is still a distant dream in several parts of Asia. Burma was not present at the Delhi conference and some people in authority in Rangoon have told this correspondent that they felt Burma suffered from underpopulation. When this writer questioned the late Marshal Sarit of Thailand, he was still in two minds about official promotion of family planning campaigns. Family planning campaigns in Pakistan, India and South Korea are not extensive enough to make any mark on the birth rate for two decades or so.

TUBE INVESTMENTS OF INDIA LIMITED

CHAIRMAN'S REVIEW

SPEAKING at the Fourteenth Annual General Meeting of the Shareholders held on 18th December, 1963 at the Registered Office of the Company at 52/53, Jehangir Street, Madras, the Chairman, Sir A. Ramaswami Mudaliar, K.C.S.I., D.C.L. (Oxon), said :

GENTLEMEN,

Let me extend to you a cordial welcome to the fourteenth annual general meeting of the shareholders of Tube Investments of India Limited. The Directors' report, the audited balance-sheet as at, and the profit and loss account for the year ended 31st July 1963, have been in your hands for some time and with your permission I shall take them as read.

The Directors' report deals with the many problems that have faced the Company during the year under review. The production of cycles, which was our original objective and which still remains one of the main purposes of this Company, has fallen in number and has been ten per cent less than in the previous year. The fall in production is due to causes which are fairly familiar to industrialists particularly in this part of the country.

Tubes of the requisite type are obviously essential for cycle manufacture, and the Company, therefore, established a tube mill at the appropriate time, but the short production of tubes, the causes of which will be referred to later, has affected the production of cycles. To this was added a severe cut imposed by the Government of India in the value of import licences issued to the Company. Essential consumable stores, mostly chemicals, nickel, etc., could not be had in sufficient quantities. Above all, the almost complete cut in the supply of electricity by the Madras State Electricity Board, extending over a period of two weeks, led to the closure of the factory and entailed, consequently, the failure to reach the planned targets for cycles and spare parts.

Demand Growing

I referred to the fall in the production of tubes. The cold roll mill installed in 1962, started production in March of that year with hardly any teething troubles, so long as imported skelp and strips were used. During the year the Company had to use steel from the Rourkela factory and was glad of the availability of indigenous products for the purpose, but unfortunately experience showed that the supplies were not of the requisite quality and specifications. The defect in the skelp supplied often became manifest only after the steel had been processed and naturally resulted in the processed article being also discarded with considerable financial loss to the Company. The demand for our tubes and cold rolled steel strips has been steadily growing and the Company has under consideration a scheme for a substantial increase in our present capacity of cold rolled steel strips. Some of the details relating to the scheme are now under discussion with Government and our collaborators.

The costs of production have been increasing fast due to various causes. The last budget has added very considerably to the costs of the end products in most industries. While realising the need for meeting the needs of the Defence requirements, consequent on Chinese aggression, and desiring to play its part without reserve, industry may be allowed to point out that some of these tax burdens may considerably add to the costs of manufacture without compensating advantages to Governments. The increase in the import duty on plant and machinery, the enhancement of inter-State sales tax, the increase in the import duty on essential raw materials, not readily available, are some of the tax burdens, which one may venture to suggest, deserve a second and more thorough examination by the top authorities concerned.

Metal Sections

The Directors' report refers to the fact that in spite of all the setbacks, preparations have been made including selection of personnel for the special training required, and the erection of buildings to install the plants and machinery of this unit, but Government orders for capital goods licence have not yet been received.

Ti Diamond Chain Limited

The factory has made good progress. The production suffered only due to shortage of raw material and the power cut already referred to. The cycle chains manufactured in this factory have been of such quality that they have been exported in considerable quantity to Nottingham and more exports are in contemplation. The production of industrial chains, it is hoped, will be commenced early in the new calendar year.

Ti Miller Limited

As the Directors' report mentions, the factory building has been completely constructed and most of the plant and machinery has been installed. The production of dynamo lamps is now expected to commence early in the new year.

In spite of the handicaps which have been mentioned above, the operating costs are fairly satisfactory, but those in charge of management must feel a sense of frustration when on the one hand they are asked to have a productivity drive and show results and on the other hand for causes beyond their control, production falls even below normal. I feel bound to emphasise this point as the difficulties experienced at the present day are not confined to any particular industry or industries but are general and are the result of the complexities of the controls in operation which in their turn lead to unconscionable administrative delays. The obstacles in the way of establishment, maintenance and development of industries catering to the needs of the country, and even of the export trade, are legion and these, I believe, are also realised and even appreciated by persons in authority but remedial measures have been tardy and haphazard. It is to be sincerely hoped that steps will be taken to remove, in the coming year, in good measure, the causes which hamper industrial productivity and development.

I should like to record my deep thanks for and appreciation of the ready help and advice that the Company has continued to receive from our Associates, Messrs. Tube Investments Limited, of the United Kingdom, and other companies in their group. The foreign collaborators of our subsidiary companies have also continued to help us with their best advice and have placed their latest know-how at the disposal of our factories without reserve. We are also grateful to the Government of India and the Government of Madras for their interest in the development of this Company and the facilities they have extended and the advice that they have given in its expansion programme. If in spite of their desire to help, either raw materials or the supply of electricity had to be cut, some at least of the blame must be attributed to nature.

We continued to have cordial relations with our factory workers and office staff both at the factory and head office and I have great pleasure in acknowledging with thanks the co-operation they have extended to us and their enthusiastic support in the successful working of the Company.

Note : *This does not purport to be a record of the proceedings at the Annual General Meeting.*

WORLD NICKEL CONSUMPTION REACHES NEW HIGH IN 1963

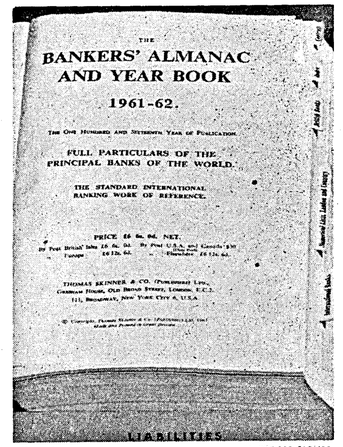
Free world consumption of nickel in 1963 established a new record high of 525 million pounds, or approximately 50 million pounds over 1962 and almost 20 million pounds above the previous record high reached in 1961, according to Mr. Henry S. Wingate, Chairman of the International Nickel Company of Canada, Limited. Most of the countries of the free world shared in this year's increase over 1962, with the United States, Japan and the Common Market countries registering the greatest gains.

The nickel industry is continuing its strong efforts to broaden the markets for nickel, for, despite the record high consumption attained in 1963, the current nickel-producing capacity in the free world, exclusive of Cuba, is still substantially in excess of consumption.

Commenting optimistically on the future, Mr. Wingate has predicted that the free world's consumption of nickel in 1964 would be higher than the record reached in 1963, and that the years further ahead would show solid growth in nickel consumption.

With effect from the 1st inst., all cupro-nickel one anna, copper double pice and copper and bronze single pice coins have ceased to be legal tender. These coins will, however, continue to be accepted for the next six months, that is, upto the end of June 1964 at all offices of the Reserve Bank of India, all agency banks of the Reserve Bank conducting government business and all treasuries and sub-treasuries in payment of dues as well as for exchange. During this period, these coins will also be accepted at all railway and post and telegraph offices, but only in payment of dues, such as in payment for railway tickets, booking of goods by railways, for postage stamps and other postal stationery, radio licence fee, etc. Thereafter these coins will continue to be accepted at the seven offices of the Issue Department of the Reserve Bank of India at Bombay, Calcutta, Madras, Kanpur, New Delhi, Bangalore and Nagpur.

The irrigation potential created in the country up to March 1962 was 12,912,000 acres and the utilisation of this potential in 1962-63 was 10,599,000 acres. The potential created upto March 1963 was 14,267,000 acres; the unutilised potential being 2,257,000 acres. The utilisation in any year must be compared with the potential created one year earlier as the crops could be grown and water utilised only after the potential was first created.



A GREAT BANK?

How do you judge the world's great banks? Deposits are one way. The Mitsubishi Bank's deposits of well over eight hundred billion yen* tell part of the story. For the rest, speak to the world bankers who respect Mitsubishi and the business leaders who prefer to deal with it. The Mitsubishi Bank can make your dealing with Japan easier and faster.

CHAIRMAN'S SPEECH:

GENERAL TYRES LIMITED

MARKETING COMMENCED—PLANS FOR EXPANSION SCHEME

THE following is the speech delivered by Dr. Ramaswami Mudaliar, Chairman, General Tyres Limited, at the Third Annual General Meeting of the Shareholders of the Company on 20th December 1963, at Leslie House, 19, Chowringhee, Calcutta 16.

LADIES AND GENTLEMEN,

It gives me great pleasure to extend to you a hearty welcome to the third annual general meeting of your Company. You have already received the Directors' report and Audited accounts for the year ended 30th June 1963 and with your permission I shall take them as read.

The working of the Company in course of the year under review resulted in a loss of Rs. 1,82,615 on account of expenses incurred during the period of construction and your Directors have recommended that the amount be carried forward.

Construction of Plant

Construction of buildings at the factory site has since been completed. The factory layout and buildings would not only take care of production to the full extent of the initial capacity of 1,80,000 Nos. each of tyres and tubes per annum but also provide adequate scope for future expansion. Imported plant and machinery of the latest and most advanced type representing a c.i.f. value of about Rs. 75 lakhs have been received and installation thereof has since been completed along with matching indigenous equipments and electric installations.

Your Company's plant could not be commissioned early this year as stated by me in my last year's speech. Trial production was delayed by a few months and commenced in July this year due to the unavoidable delay in getting power, building materials and some raw materials all of which are common though disquieting features of new industrial projects in our country.

The specifications for the tyres and tubes of your Company have been finalised on the basis of the special road and climatic conditions in India. The products of the trial output that were put to a complete series of extensive and rigorous tests in the laboratory as well as on roads have turned out very satisfactory. At present production is confined to the more popular types and sizes for cars and trucks. I am glad to be able to tell you that the tyres and tubes of your Company have since been introduced to the market through the all-India sales set-up of the Managing Agents.

The Tyre Industry

The automobile tyre and tube industry in India continued to maintain satisfactory progress during the year under review, the index of production of rubber manufactures including tyres and tubes in July 1963 being 204.6 as against 173.9 for the corresponding month of 1962. Actual production of automobile tyres and tubes during the twelve months from July 1962 to June 1963 amounted to 17.98 lakh Nos. and 18.60 lakh Nos. respectively and the output for the whole of 1963 is expected to be about 21 lakh Nos. each of tyres and tubes.

According to current estimates, the demand for automobile tyres and tubes is expected to go up from 22.50 lakh Nos. each in 1962-63 to about 34 lakh Nos. each at the end of the third Five-year Plan period. Out of 12 units licensed by the Government of India with a total annual capacity of 51.45 lakh sets of tyres and tubes, eight tyre factories, including that of your Company with an aggregate licenced capacity of 39.45 lakh sets are in production while the remaining four units having a licensed capacity of 12 lakh sets are likely to go into production at a later stage.

I am sure I am voicing the feeling of the tyre industry as a whole when I say that it is rather perturbed over the continuous rise in the cost of important raw materials consumed by the industry particularly as a result of the heavy tax burden imposed by the 1963 budget. Apart from the impact of the budget, raw material costs will further increase due to the prices of indigenous items like synthetic rubber, carbon black, rayon fabric, tube valves, etc. being substantially higher than those of their imported counterparts. Very recently the Government of India have announced their decision to abolish price control on sixteen commodities including tyres and tubes, natural rubber and rayon yarn. The implications thereof are being considered by your Directors.

Expansion Project

You will have noticed from the Directors' report that your Company have already received an industrial licence from the Government of India to effect substantial expansion of its installed capacity and that after completion of the said expansion scheme the total capacity of the Company's factory would cover 3 lakh Nos. each of tyres and tubes and 6 lakh kgs. of Camel Back per annum. The existing technical link-up with Messrs. Technoexport Foreign Trade Corporation, which has worked satisfactorily since its inception will also cover this expansion project. Consent of the Controller of Capital Issues has been received for the issue of 8,00,000 equity shares of Rs. 10 each for cash at par to finance the said scheme for the present. Your Directors propose to proceed in due course with the rights issue of equity shares in the ratio of one new equity share for every existing equity share held in accordance with the terms and conditions of the consent letter. As per present estimates the substantial expansion is likely to be completed within the third Plan period.

The Collaborators

His Excellency Mr. F. Hamouz, Minister for Foreign Trade, Czechoslovak Socialist Republic, laid the Company under a deep debt of gratitude by visiting the factory at Kankinara on 1st November 1963 and spending there the major part of the day. In fact this was the only industrial unit in the private sector visited by Mr. Hamouz inspite of his numerous preoccupations during his brief stay in Calcutta. The visit is testimony to the great importance attached by the Czechoslovak Government to and the keen interest taken by them in our project which emphasises fruitful collaboration between Czechoslovakia and India. On that occasion Mr. Hamouz expressed satisfaction at the progress of your Company's project and assured your Company of all possible help from his Government, particularly in respect of the second stage expansion scheme and also stated that his Government may explore possibilities of large-scale export of your Company's products to Czechoslovakia and countries. The long-term trade and payments agreement (to be effective from January 1964) recently concluded between the Governments of Czecholovakia and India providing for substantial increase in the export of manufactured goods from India to Czechoslovakia and the 50-million dollar credit offered by Czechoslovakia to this country have opened up possibilities for further economic collaboration between the two great countries for implementation of various projects included in our third and fourth Five-year Plans, of which the factory of your Company represents one.

Before concluding, I would like to record the appreciation of the Directors of the co-operation and assistance received from the technical collaborators, Messrs. Technoexport Foreign Trade Corporation, Czechoslovakia, and of the loyal and devoted efforts of the officers and staff of the Company throughout the year under review.

Blocks of rubber no bigger than bricks are solving vexing and expensive maintenance problems in rugged *mining, industrial and agricultural operations* throughout South Africa. Better known as industrial fenders, and produced by the Goodyear Tyre and Rubber Co. (S.A.) (Pty.) Limited, South Africa, the virtually indestructible natural rubber blocks are positioned to take up the terrific initial shock caused when two ore-laden mine cars clang together or when the damp body of a tilt unloaded hopper car returns against its frame. It is claimed that a "tub-busting" problem of broken frames and damaged axles has been reduced by 75 per cent. In South Africa, the use of 3-in.-and 3½-in.-square fendering on mine tubs has now become, in fact, standard mining practice. Three-inch square fendering has been used successfully to replace broken steel springs in cane trucks.

After breaking several axles of his springless quarry stone trailers, a quarry operator is said to have solved the problem of this severe impact damage by placing 3½-in.-square fendering between the trailer chassis and the body, taking up the shock.

BASIS OF COMPUTATION OF EXCISE DUTY NEEDS TO BE CHANGED

CHAIRMAN, MR. Z. R. IRANI'S SPEECH AT ANNUAL MEETING

A PLEA for a change in the basis of computation of excise duty on manufactured articles was made by Mr. Z. R. Irani, Chairman of Spencer and Co., Ltd., Madras, in his speech at the Sixty-sixth Annual General Meeting of the shareholders held at Madras on Friday, 20th December, 1963. In Mr. Irani's opinion, a levy at a flat rate would be simpler and easier to collect than the present system of calculating the levy on the basis of the highest ruling wholesale price. The following is the full text of Mr. Irani's speech :

Another year sees us together for our annual meeting and I welcome you all. We meet in a more secure atmosphere than on the previous occasion, but the necessity for vigilance is no less and, as time goes on, more and more will be demanded of us and, accordingly, it will be our duty to meet our obligations as best we can.

The accounts have been in your hands for the prescribed period and I now propose enlarging on some points that may be of interest. In a business with such varied activities as ours, there must be expected fluctuations in the profits of certain sections. If the trend is upwards, then this satisfactory position is analysed and the fullest advantage taken of our findings. If the trend is downwards, then it behoves us to examine the causes and remedy them if within our power so to do. For comparison, our profits this year were derived as follows : wholesale and retail sections 19 per cent, drugs and pharmaceuticals 27 per cent, hotels and catering 17 per cent, refrigeration and air conditioning 13 per cent, house furnishing 9 per cent, aerated waters 4 per cent, tea 6 per cent, cigars 2 per cent, and sundries 3 per cent.

Overheads Increase

There has been a decrease in the contribution from wholesale and retail sections and this is due partly to the limited availability of some important indigenous commodities, partly to the restricted import of liquor and partly to a further contraction in profit margins. There is a cure for the first two reasons, but the third is a trend which will remain with us for a long time to come. As a matter of fact, our gross profit percentage, when compared with that of the previous financial year came down by 1 per cent, though it was offset, to a large extent, by the increase in turnover. On the other hand, overheads are unavoidably on the increase and the only answer to the problem of advancing earnings is to swell turnover and this is constantly being pursued. So far in the current financial year, turnover is slightly higher, but you will understand that this in itself does not spell a corresponding increase in net results.

Cost-consciousness

I have said it before and I will reiterate the statement that we are predominantly a trading concern. Our category of business is as important to the economy of the country as that of the producer, be it heavy industry, the class of commodities known as consumer goods or raw foodstuffs, for the simple reason that the final disposition of everything produced is the actual user and an organisation to effect this is essential. The frequent exhortations of Ministers and officials to maintain the price line is therefore of concern to us in that it impinges on the welfare of the people. Our practice in arriving at the selling price of a commodity is, in essence, to calculate its comprehensive cost and for our services add a margin representing a fair gross profit. I have from time to time advised you that these margins have been shrinking over the past few years in order to hold the price line, so far as is possible, for the benefit of our many customers and to secure volume of business. We, therefore, consider ourselves extremely cost-conscious, but the misfortune is that the average trader does not work on that principle. It is the principle of supply and demand that governs the prices he fixes and thus he is to be considered a speculator rather than a trader. Here we have the root of an unstable economy which is unwholesome, to say the least, and which can only be eradicated by a process of rethinking involving a deeper sense of civic responsibility. I am against the imposition of controls by Government, except as a last resort, but should that be unavoidable, then they should not only be realistic but also such as to promote and not curb or leave scars on the economy and furthermore wilful infringements should be severely penalised.

Excise Duty on Manufactures

I wish to touch on the subject of excise duties levied on certain manufactured articles. I regard such duties as a necessary form of indirect taxation but I am not enamoured with the method of their computation. Why is it necessary to compute this on the highest ruling wholesale price instead of a simpler expedient ? Wholesale prices vary according to the reputation and uptake of the buyer, this being a world-wide practice, especially in countries where there is intensive production and extensive buying. Excise duty is a tax ex-manufactory. Would it not therefore be simpler and less vexatiously but more efficaciously collected by a levy at a flat rate—for instance, in the case of refrigerators and domestic air conditioners, on the basis of cubic capacity and horse-power, respectively ?

There is a move afoot to change the existing procedure of licensing of industries whereby each State sponsors and sanctions industries within its jurisdiction. Such a step will only lead to chaotic planning and unhealthy competition for the simple reason that their desire to possess key industries will blind States from consideration of all-important factors as, for example, relationship of factory site to the source of raw material and to potential markets. Such and other factors are basic in any scheme with a view to producing at the lowest cost possible. It goes without saying, then, that licensing of industries must be controlled by a central organisation which has at its command the broad picture of production costs and targets.

Higher Labour Cost

The increased cost of living has necessitated our having to meet demands for an increase in dearness allowance to workers and this will undoubtedly add to our operating costs. In 1961, the provident fund of workers in our drug factory, bakery and hotel establishments was taken over by the State under the Employees' Provident Funds Act. Since then all our workers have been brought within the scope of the Act. This means that, as provident fund contributions are made on the basis of both basic salary and dearness allowance, in addition to which a gratuity is also payable to workmen, as defined by the Industrial Disputes Act, the cost of providing retiring benefits has risen. I am confident that labour will appreciate these measures and co-operate to their utmost with the management.

Your Directors would like to place on record their warmest appreciation of the services rendered by the senior executives, staff and workers, and I am glad to say that during the year they have received their continued loyalty and support.

The balance-sheet as at 30th June 1963 was approved and adopted. A further and final dividend of 12 per cent, less tax, on the ordinary shares as recommended by the Directors was declared, making in all a total dividend of 18 per cent less tax for the year.

Note :—*This does not purport to be a record of the proceedings at the Annual General Meeting which will be sent separately to shareholders.*

At their Head Office in Bombay, and main Branch Offices at Calcutta, Madras, Indore, Bangalore, Hyderabad, New Delhi (54, Janpath, New Delhi) and Ahmedabad.

EXISTING AND PROPOSED ACTIVITIES AND LOCATION

The Company's business consists of sale and distribution of a variety of products in the engineering, chemical and pharmaceutical industries such as : agricultural, earthmoving, mining, air conditioning and refrigeration, textile machinery, machine tools, electrical and mechanical equipment as well as chemicals, pharmaceuticals and consumer products. The Company's manufacturing activities are at present carried on in its factory at Chinchpokli, Bombay, and cover air conditioning and refrigeration equipment (including window units), mining, electrical and agricultural equipment. As the space available in the factory does not permit of expansion in the manufacture of these products or the addition of other products, the Company proposes to set up in Thana, Bombay, an up-to-date factory to manufacture a wide range of air conditioning and refrigeration equipment, mining equipment, materials handling equipment, electrical equipment and few others for which the Company is negotiating for collaboration with leading manufacturers abroad.

DATE OF THE OPENING AND CLOSING OF THE SUBSCRIPTION LIST

The Subscription list will open at the commencement of banking hours on Thursday, the 9th January 1964, and will close at the close of banking hours on Wednesday, the 15th January 1964, or earlier at the discretion of the Directors but not before the close of banking hours on Monday, the 13th January 1964.

COPIES OF THE PROSPECTUS AND THE APPLICATION FORMS WILL BE AVAILABLE FROM THE BANKERS TO THE ISSUE, THE UNDERWRITERS, AUTHORISED BROKERS AND FROM THE COMPANY'S REGISTERED OFFICE.

LABOUR IN DEMOCRATIC SOCIALISM

A THEORETICIAN'S DISAPPOINTING PERORATION

TO those who had hoped that the Presidential address of Dr. Radhakamal Mukerjee at the Sixth All-India Labour Economics Conference, held at Bombay on 25th December, 1963, would contain an objective analysis of labour problems and their economic implications, as well as practical suggestions for solving these problems, the hour-long peroration of the learned professor must have come as a great disappointment. For most of what Dr. Mukerjee said was calculated to create the impression that workers were a neglected and exploited lot and that, unless they were made the focus of all planning, it would not be possible to usher in democratic socialism. In his enthusiasm to canvass sympathy for workers, Dr. Mukerjee has sought to paint a picture of industrial workers and their status which does not have even a faint resemblance to actuality. Pointing out that the Five-year Plan envisages the worker as "the principal instrument in the fulfilment of the targets of the Plan and in the achievement of economic progress generally," the President said that, in "reality he (the worker) enjoys today not the status of the architect or master-builder of the Plan but of a goaded, harassed and discontented errand boy." Dr. Mukerjee may receive applause from workers for this rhetorical flourish, but those who know the actual state of affairs in the labour field and are aware of the role workers and their representatives play in the formulation and implementation of labour and other policies affecting workers would surely not subscribe to this view.

The same exaggerated concern for workers' welfare, without regard to practical realities, marks this distinguished Professor's approach to the question of wages. He wants a National Minimum Wages Act to be enacted immediately which would serve as an incentive to fair labour standards in various States and industries. The Act should, according to his plan, lay down a general national minimum based on the assessment of the essential requirements of the industrial workers' family belonging to the lowest paid group. The President of the Conference was "amazed" that the Indian Labour Conference, held at New Delhi in 1957, while laying down that the minimum wage should be need-based, calculated the minimum human requirements on a basis substantially lower than the current internationally adopted norms. He said that Dr. Aykroyd gave a wrong lead in fixing the minimum food requirements at 2,600 calories, which, in his opinion, was inadequate. Dr. Mukerjee recalled that he had suggested long back that, for calculating minimum wage, a norm of 3,000 calories per day, 45 yards of clothing per annum and 100 square feet of living space per capita for a family of 3.4 adults or 4 persons should be adopted and that several minimum-wage decisions had been given on this basis. In view of this, he thought that the acceptance of the criteria of the minimum needs of the Indian worker on the basis of the norms laid down by the Indian Labour Conference, would be a "retrograde step."

Capacity to Pay Ignored

None would have objected to Dr. Mukerjee's calculation, if the problem was merely one of determining a respectable, need-based minimum wage, so that, once agreement on this issue was reached, all workers could be paid that minimum. But, unfortunately, the real problem is the incapacity of the industry, nay, of the country, to pay a need-based minimum wage. The Indian Labour Conference itself recognised this and that is why, instead of insisting that a need-based minimum wage should be paid by all industries, it laid down certain norms (food: 2,700 calories; clothing 18 yards, per capita) as a "guide" for all wage-fixing authorities.

Having fixed the national minimum and safeguarding the health and productive efficiency of different grades of workers, wage policy should, Dr. Mukerjee recommended, be delinked from a purely monetary approach. The present policy of holding money wages down in a period of rising prices is, in his opinion, incompatible with democratic socialism for at least two major reasons. First, the industrial working class can neither safeguard the standard of living nor have any interest in any plan for improved industrial output. Secondly, the employers earn higher profit in the redistribution process associated with an inflationary situation. The present imbalance between wages, profits and prices, he went on to say, was highly detrimental to the working class as well as to the consumers in general. Quoting figures in support of his contention, Dr. Mukerjee said that, between 1939 and 1956, the cost of living had increased by more than four times (413 as compared with 100 in 1939), while the improvement in real wages was negligible. Both production and productivity showed an improvement during the same period, 163 and 112 respectively, but the rise in profit was phenomenal, about four times (377). Looking from a different perspective, the national income improved by 19.20 per cent between 1950-57 and the net production of factory industries by 73 per cent during the same period. But the average earnings of workers in perennial factories improved by only 27.63 per cent. From these data, the President of the Conference drew the conclusion that wages had not increased in proportion to production and productivity.

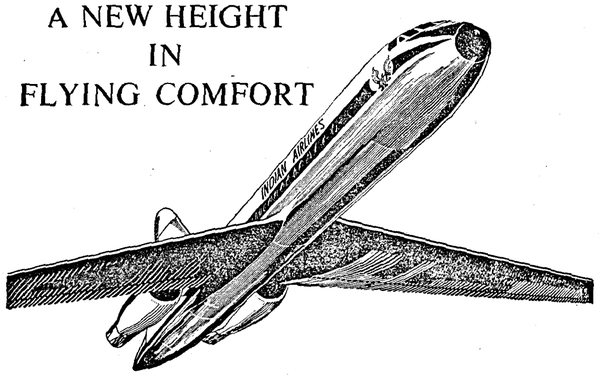
Compulsory Bonus!

It is in this context that he advocated bonus as some kind of a compensatory payment to workers. Bonus, Dr. Mukerjee opined, should comprise an increasing proportion of wages. He suggested a tentative formula for payment of bonus in industries making profit. Twelve and a half per cent of the net profits, he maintained, should be regarded as the basic minimum to be distributed to the workers of an industrial establishment "on the basis of the principle of social justice." How this figure was arrived at and how such an amorphous and elusive concept as social justice could be given a precise quantitative definition are two questions for which the learned professor provided no answer. Dr. Mukerjee went a step further and said that bonus should be made, by legislation, part and parcel of the workers' earnings whenever such earnings fell below the living wage level. Both social justice and the peace and welfare of a country fast accelerating its pace of industrialisation demanded this, he added. It is amazing that Dr. Mukerjee had not cared to examine the practical implications of his suggestion. Is he suggesting that bonus should be paid whether or not there is profit? If there is no profit in a particular year wherefrom should bonus be paid? He may be tempted to retort by asking: Are not dividends paid to shareholders out of reserves built up from the profits of previous years? This, however, is not fair reasoning, for, if no dividend is paid for any particular year, the capital remains unremunerated, whereas workers get at least their wages.

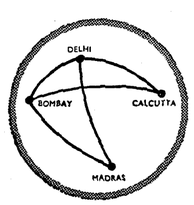
Wage-fixing Machinery

The President of the Conference expressed dissatisfaction with the existing machinery for bonus and wage fixation. Wage and bonus fixation, in his opinion, should be taken away from adjudicators, tribunals or from Government and be entrusted to voluntary wage councils on State and all-India levels. The major objectives of these Councils should be (1) formulation of norms for the determination of wages and bonus, (2) fixation of workloads and norms, (3) standardisation of wage rates for each industry and co-ordination in the wage structure in other industries, (4) fixation of a national minimum wage, (5) establishment of inter-regional parity in wage levels, etc. He also wants full opportunities for collective bargaining and the development of strong and effective trade unions and consequently views with disfavour the State assuming larger and larger responsibility for decisions affecting wages, industrial peace and labour welfare. What Dr. Mukerjee obviously advocates is that, after having ensured a need-based minimum wage to workers and having made provision for cheap rations, clothing, education, medical aid and housing, workers should be left free to bargain for still higher wages and better conditions of service. Moreover, facilities should be created for co-determination and worker participation in management. Nowhere in his speech he stressed the obligations of workers, as distinguished from their rights, with which he seems to be obsessed. Nor did he consider the financial aspects of his proposals and the ability of the country, with its vast unemployment and underemployment, to meet the cost. It is this one-sided approach and lack of balance and perspective that vitiate the entire speech of the President and render it an unrealistic piece.

INTRODUCING
A NEW HEIGHT
IN
FLYING COMFORT



THE IAC CARAVELLE



- Powered by two Rolls-Royce Avon jets each with 12,000 lbs thrust.
- Cruising speed of 510 m.p.h. at up to 35,000 feet height, well above uncomfortable weather.
- Radar equipped, pressurised and air-conditioned.
- Engines mounted at the rear to throw the noise and fury behind you for the smoothest, quietest flight.
- Spacious cabin accommodating 84 passengers in comfortable reclining seats.
- Three hostesses and a steward in attendance.

INDIAN AIRLINES

IAC-1812

ANNOUNCEMENT

This is not a Prospectus but only an announcement of a proposed issue of Debentures. Interested persons may obtain copies of the Prospectus from the Company's Registered Office and the Bankers, Underwriters and Brokers of the issue.

KESORAM INDUSTRIES AND COTTON MILLS LIMITED

(Incorporated on the 18th day of October, 1919 under the Indian Companies Act, 1913)

Registered Office: **15, INDIA EXCHANGE PLACE, CALCUTTA-1.**

A. EXISTING AND PROPOSED ACTIVITIES :

The Company is engaged in the business of manufacturing various types of cotton textile goods. The Company has also established two Filament Viscose Rayon Yarn Plants (known as Kesoram Rayon Unit No. I and Kesoram Rayon Unit No. II) and a Transparent Paper Plant.

The Company has now decided to implement its Cast Iron Spun Pipe Project with an installed capacity (on double-shift working) for the manufacture of 30,000 tons of Cast Iron Spun Pipes ranging from 3" to 12" nominal bore and fittings per annum. The construction work in respect of this Project has already commenced and it is expected that by the end of 1964 it will go into production.

The Company has entered into agreements with M/s. GHW-Gesellschaft Fuer Huettenwerksanlagen, M.B.H. of West Germany for the supply of plant and machinery, drawings, instructions, standards and specifications, etc. for installation of a complete plant of the said Cast Iron Spun Pipe Project and delegating skilled staff for supervision of erection, commencement of operation and fulfilment of guaranteed performance as well as for training the Company's basic staff for the purpose. Besides, a tripartite agreement on technical collaboration has also been entered into between the Company, the said M/s. GHW-Gesellschaft Fuer Huettenwerksanlagen, M.B.H. and M/s. Buderus' Sche Eisenwerke of West Germany under which the foreign collaborators have, inter alia, agreed to render all technical know-how for production and process control, technical consulting services and all research development to the Company.

B. LOCATION OF THE INDUSTRY :

The Textile Unit of the Company is situate at 42, Garden Reach Road, Calcutta-24, and its Filament Viscose Rayon Yarn Plants and Transparent Paper Plant are situate at Tribeni, District Hooghly.

The Company's Cast Iron Spun Pipe Project is located at Bansberia, District Hooghly.

C. BOARD OF DIRECTORS :

1. SHRI BASANT KUMAR BIRLA (ex-officio), "Basant Vihar," 18, Gurusaday Road, Calcutta-19.—*Merchant.*
2. SHRI PRABHU DAYAL HIMATSINGKA, 11, Queens Park, Ballygunge, *Calcutta.—Solicitor.*
3. SHRI RAM KUMAR BHUWALKA, 38-C, Garcha 1st Lane, Ballygunge, Calcutta-19.—*Merchant.*
4. SHRI MAHALI RAM SONTHALIA, 503, Keyatala Road, C.I.T. Scheme, Ballygunge, Calcutta-19.—*Merchant.*
5. SHRI HIRALALL SOMANY, 13, Gurusaday Road, Ballygunge, *Calcutta-19.—Merchant.*
6. SHRI KRISHNA GOPAL MAHESHWARI (ex-officio), Maheshwari House, 36, Nepean Sea Road, Bombay-6.—*Business.*

D. AUDITORS :

MESSRS. PRICE WATERHOUSE, PEAT & CO., Chartered Accountants, B4, Gillander House, *Calcutta-1.*

E. SOLICITORS TO THE ISSUE :

MESSRS. ORR, DIGNAM & CO., 29, Netaji Subhas Road, Calcutta-1.

F. MANAGING AGENTS :

BIRLA BROTHERS PRIVATE LTD., 15, India Exchange Place, Calcutta-1.

G. SHARE CAPITAL:

(a) **Authorised Capital:**

Rs. 5,00,00,000 divided into—

(i) 20,000 10% Cumulative Preference Shares of Rs. 100 each,

(ii) 1,40,000 7.85% Redeemable Cumulative Second Preference Shares of Rs. 100 each (redeemable at par on 31st March, 1967), and

(iii) 34,00,000 Ordinary Shares of Rs. 10 each.

(b) **Issued, Subscribed and Paid Up Capital:**

Rs. 3,19,92,590 divided into—

(i) 20,000 10% Cumulative Preference Shares of Rs. 100 each,

(ii) (a) 99,844 7.85% Redeemable Cumulative Second Preference Shares of Rs. 100 each (redeemable at par on 31st March, 1967),

(b) 156 7.85% Redeemable Cumulative Second Preference Shares of Rs. 100 each aforesaid, with a partly paid-up capital of Rs. 8,190 forfeited by the Company, and

(iii) (a) 19,99,566 Ordinary Shares of Rs. 10 each,

(b) 434 Ordinary Shares of Rs. 10 each in respect of which Application money has been received but allotments are pending.

H. PROPOSED ISSUE OF DEBENTURES TO THE PUBLIC:

Rs. 1,75,00,000 Registered Debentures (1975-78), divided into 17,500 Debentures of Rs. 1,000 each, bearing interest at the rate of 7% per annum, at par, payable in full on application.

I. OPENING AND CLOSING OF THE SUBSCRIPTION LIST :

The Subscription List will open at the commencement of banking hours on the 9th January, 1964 and will close at the close of banking hours on the 18th January, 1964 or earlier at the discretion of the Directors, but not before the close of banking hours on the 11th January, 1964.

J. Application Forms along with copies of the Prospectus may be had from the Registered Office of the Company or from the Bankers/Underwriters/Brokers, whose names and addresses are given below.

(a) BANKERS :

1. State Bank of India, 3, Strand Road, Calcutta.
2. The United Commercial Bank Ltd., 2, India Exchange Place, Calcutta-1.
3. The Central Bank of India Ltd., 33, Netaji Subhas Road, Calcutta-1.
4. Canara Bank Ltd., 71, Canning Street, Calcutta-1.
5. The American Express Company, Inc., 21, Old Court House Street, Calcutta-1.

(b) UNDERWRITERS:

1. Life Insurance Corporation of India, 'Jeevan-Kendra,' Jamshedji Tata Road, Bombay-1.
2. Messrs. Harkisondass Lukhmidass, Stock Exchange Building, 5th Floor, Apollo Street, Fort, Bombay-1.
3. Messrs. G. M. Pyne, Allahabad Bank Buildings, 14, India Exchange Place, Calcutta-1.
4. The Central Bank of India Ltd., Mahatma Gandhi Road, Fort, Bombay-1.
5. The United Commercial Bank Ltd., 2, India Exchange Place, Calcutta-1.
6. West Bengal Financial Corporation, 23, Rajendra Nath Mukherjee Road, Calcutta-1.
7. The Oriental Fire and General Insurance Company, Ltd., Oriental Buildings, Mahatma Gandhi Road, Bombay-1.
8. Messrs. Batlivala & Karani, Union Bank Building, Dalal Street, Fort, Bombay.
9. Messrs. Maconochie & Co., Mercantile Bank Buildings, Madras-1.
10. Canara Bank Ltd., 71, Canning Street, Calcutta-1.
11. Messrs. Jhawar & Co., 7, Lyons Range, Calcutta-1.
12. Messrs. Murarka Brothers, 7, Lyons Range, Calcutta-1.

(c) BROKERS :

1. Messrs. G. M. Pyne, Allahabad Bank Buidings, 14, India Exchange Place, Calcutta-1.
2. Messrs. Place, Siddons & Gough (Private) Ltd., 6, Lyons Range, Calcutta-1.
3. Messrs. Jhawar & Co., 7, Lyons Range, Calcutta-1.
4. Messrs. Murarka Brothers, 7, Lyons Range, Calcutta-1.
5. Messrs. Kishanchand Jhunjhunwala, 7, Lyons Range, Calcutta-1.
6. Messrs. Harkisondass Lukhmidass, Stock Exchange Building, 5th Floor, Apollo Street, Fort, Bombay-1.
7. Messrs. Batlivala & Karani, Union Bank Building, Dalal Street, Fort, Bombay-1.
8. Messrs. Lewis & Jones, Bank of Baroda Building, Apollo Street, Fort, Bombay-1.
9. Messrs. A. B. Pandit & Co., 32, Apollo Street, Fort, Bombay-1.
10. Messrs. Navalchand T. Shah & Co., 15, Union Bank Building, Dalal Street, Fort, Bombay-1.
11. Messrs. P. Roy Company, 3/8, M. M. Road, JN. Panchkuin Road, New Delhi-1.
12. Messrs. Harbans Singh Mehta & Co., 33, Regal Building, Parliament Street, New Delhi-1.
13. Messrs. M. R. Dhawan & Co., 4/8, Asaf Ali Road, New Delhi-1.
14. Messrs. Maconochie & Co., Mercantile Bank Buildings, Madras-1.
15. Messrs. Kothari & Sons, Oriental Buildings, Armenian Street, Madras-1.
16. Messrs. M. Nanjappaiah Jahgirdar, 181, Cavalry Road, Bangalore-1.

(d) HEAD OFFICES OR MAIN OFFICES OF THE BANKERS AT :

Ahmedabad, Amritsar, Bangalore City, Baroda, Bombay, Calcutta, Cochin, Darjeeling, Delhi, Ernakulam, Gauhati, Goa, Hyderabad, Indore, Jamshedpur, Kanpur, Madras, Nagpur, New Delhi, Poona, Simla, Srinagar, Surat, Tuticorin.

By Order of the Board,
M. L. BAGRODIA,
Secretary.

CALCUTTA,
Dated 28th December, 1963.

J. K. STEEL LIMITED

INADEQUATE SUPPLY OF RAW MATERIALS HITS PRODUCTION

SPEECH OF CHAIRMAN, MR. LAKSHMIPAT SINGHANIA

ADDRESSING the shareholders of J.K. Steel Ltd. at their Tenth Annual General Meeting held at Calcutta on Monday, 30th December 1963, Mr. Lakshmipat Singhania, Chairman of the Company, pointed out how lack of co-ordination of Government policies resulted in avoidable delays in production. Citing the Company's own experience, the Chairman said that ever since the plant for the manufacture of cold rolled strips and box strappings was set up, it was consistently starved of raw material, namely, hot rolled strip, the supply of which had been of the order of only 25 per cent of the requirements. Mr. Singhania rightly questioned the advisability of creating capacity for production without adequate planning for supply of essential raw materials.

The following is the full text of Mr. Singhania's speech:

GENTLEMEN,

I have great pleasure in welcoming you to the tenth annual general meeting of the Company. The annual report and accounts for the year ended 30th June 1963, have already been circulated and the Directors, in their report to the shareholders, have dealt with the salient features of the Company's working during the year.

Working of the Year

The sales during this year reached a peak of Rs. 1.76 crores, as compared to last year's figure of Rs. 1.14 crores. The profits are also higher in this year and the Directors have recommended an increased dividend of 15 per cent. The year under review has been a very difficult one for India, overshadowed by the Chinese aggression, which brought in more strain on our foreign exchange resources, necessitating further curbs on available foreign exchange to the industry in general. Your Company also suffered on this account with shortage of imported raw materials, stores and spares. Super Profit Tax was introduced and Emergency Risk Insurance was levied. Further, during the year Calcutta area suffered from a serious shortage of power, necessitating restriction in and staggering of power supply as well as frequent load sheddings, with the result that some of the day shifts of your factory had to be transferred to work during night. The cost of material, labour and services also increased substantially during this period. All these resulted in loss of production and increased costs. Viewed in this background, the results of this year should be considered as satisfactory. The profits could have been still better had the Government fixed the retention price of jute baling hoops for the year under review for which the Company has claimed an increase.

The Company Completes Ten Years

The Company has completed ten years of working. During this decade, there has been gratifying increase in the size and activities of the Company. The gross block, which stood at about Rs. 12 lakhs at the beginning of the decade, stands at Rs. 98 lakhs at the end of this year. Sales have risen approximately Rs. 30 lakhs to Rs. 176 lakhs. When the Company commenced production, it employed about 175 persons and today it is employing more than 725. Apart from providing such substantial employment opportunities in the State, the Company employed and trained over 650 East Bengal refugees, a good number of whom are still in our employ, while others, after their training, have engaged themselves in other gainful employments. The total employment potential, thus created, is appreciable taking into account the fact that for every direct employment there are nine indirect employments. The average earning of an employee has reached Rs. 2,200 per annum.

The Company, which started with the manufacture of jute baling hoops only, now also manufactures cold rolled strips, box strappings and steel wire ropes. In addition, the manufacture of electric hoists and chain pulley blocks is to commence very shortly, factory for which is already complete. All of these new lines of production, adopted by the Company, are of pioneering nature. These items, which are very much needed for the country's requirement, were imported at the cost of enormous foreign exchange. We can derive satisfaction from the fact that manufacture of these new items by us has so far saved for the country approximately Rs. 2 crores worth of foreign exchange. Apart from these new items, the Company's initial product, namely, jute baling hoops, which is an important ancillary to the jute industry, being used for packing the entire jute goods production in the country, has continued to serve the country well by earning foreign exchange through exports. It may be added that in spite of very high increase in cost of materials, labour and taxation, there has been comparatively very little increase in the selling price of the hoops and the Company has been working at low margins of profit in order to make available these hoops to the jute industry at prices, which are comparatively very much lower than those of other similar rolled products.

Distribution of Earnings

The total earnings of the Company, during the last ten years, have been distributed as follows:

62.41 per cent ...	on materials and stores
8.57 per cent ...	to employees
7.63 per cent ...	to Government taxes and duties
9.94 per cent ...	on depreciation, administrative expenses and interest on borrowings
6.77 per cent ...	for funds ploughed back in the industry itself
2.89 per cent ...	as dividends
1.79 per cent ...	to management.

It will be seen that the shareholders only received 2.89 per cent of the earnings of the Company. The total taxes and excise duty paid directly by the Company during these years amounted to Rs. 74 lakhs and the Company ploughed back as much as Rs. 66 lakhs for expansion of the Company's activities and for the manufacture of new articles.

It will be clear from the above that an industry of this kind is a national institution providing greater employment, creating and contributing to the wealth of national economy and making the country self-sufficient in respect of essential manufactured goods for which the nation had to depend on imports from other countries.

Expansion

The Company is going ahead with its various expansion programmes, though the progress was very much affected on account of various handicaps. The plant for the manufacture of electric hoists and chain pulley blocks has been installed, but the production could not be started as yet on account of non-availability of import licences for essential raw materials and components, though these represented a very small percentage. It is unfortunate that this scheme, which is once again of pioneering nature, has taken more than five years for completion on account of unnecessary, wasteful and avoidable delays in the Government machinery in respect of industrial licensing, approval of collaboration agreement, issue of import licences for capital goods and raw materials and components, etc. If this plant could have started even two years before, the country would have saved foreign exchange to the tune of Rs. 1 crore by now. It is high time that definite steps are taken to remove these impediments in the speedy growth of the industry in the country.

Our project for doubling up the capacity of steel wire ropes plant was similarly delayed. On account of non-availability of foreign exchange the Company had to go to the Industrial Credit and Investment Corporation of India Ltd. for a foreign exchange loan. I am happy to report that the I.C.I.C.I. Ltd. have agreed to sanction the necessary foreign exchange loan. Orders for the machinery have already been placed and it is now expected that the expansion shall come into effect in a year's time.

Other schemes of the Company are also receiving the Company's full attention. Meanwhile, the Company has obtained industrial licences for (1) doubling the capacity of the plant for the manufacture of cold rolled strips, and (2) manufacture of electric overhead travelling cranes.

Last year, I had dealt with in detail the difficulties that we had been facing in regard to raw material supply. I regret to inform that the problem continued without showing any sign of improvement this year also. Supply of billets for the manufacture of jute baling hoops—which is directly linked with the export of jute goods—continues to be far from satisfactory. The actual average monthly receipts of billets during the year were 750 tons or 62 per cent of the so-called "entitlement" fixed by the iron and steel control—a figure supposed to represent the minimum supply that can be realistically made in a situation of short supply of billets in the country. It will be recalled that this figure of "entitlement" in itself is 60 per cent of our original quota of 2,000 tons to which we were entitled during 1960-61. Thus the actual receipts are nearly 37 per cent of our original quota and a process of progressive reduction in raw material supply seems to be in operation. Even this inadequate quantity was received by us in a most irregular manner and in many months the actual receipts were not more than 25 per cent of the "entitlement," due to which we had to encounter many a time slowing down of production and threats of imminent closure of the works. In fact, we had to shut down the operations for nearly 1½ months during October-November, 1962, on account of shortage of billets. This naturally resulted in short supply of jute baling hoops to the jute industry. The fact that this industry is supposed to enjoy a certain amount of priority in regard to supply of billets further raises the question of efficacy of control of production and distribution of steel.

Supply of Hot Rolled Strip

Similarly the position in regard to the supply of hot rolled strip, which is the raw material for the manufacture of cold rolled strips and box strappings, did not show any sign of improvement—rather deteriorated during the year. Ever since the plant has been set up, it has been starving for raw material, supply of which has been of the order of 25 per cent. The indigenous supply of hot rolled strip was very much inadequate to meet the requirements and the position was further accentuated on account of the inability of the Rourkela plant to supply hot rolled strips in slit widths, which it was supposed to do two years back. Import of raw materials was not allowed, whereas import of cold rolled strips continued in one form or other. The Company is capable of manufacturing various types of cold rolled strips and box strappings, but the Company has been deprived of savings in foreign exchange of nearly Rs. 1½ crores because of the failure on the part of Government to supply raw materials to such an important plant and utilise its capacity. One wonders at the advisability of creating capacity for production without adequate planning for supply of essential raw materials for the same.

The Minister for Steel, Mines and Heavy Engineering has himself acknowledged that there is a great shortage in the country of flat steel products and the shortage is likely to continue for some time to come. The flat products, which include strips, serve as basic raw material for many engineering industries and it is therefore necessary that, till indigenous production of such flat products comes up, arrangements should be made to import hot rolled strips and sheets rather than cold rolled strips or other finished products.

Personnel and Productivity

Under the existing conditions of industrial development in the country every effort should be directed towards increased production. Taking into account that we have to export more and more with a view to earning foreign exchange, it will also be necessary to modernise our productive methods and reduce costs. Unfortunately, the tendency on the part of the labour leaders is not to enthuse into the workers this sense of emergency. During the year under review, even though there had been no conflict with the labour in general, yet the tendency of slow-down and indiscipline had been manifest. In spite of the fact that a number of channels have been devised, through which the demands of the workmen could be settled, the general tendency has been to bypass these channels and take the law in hand. This attitude has only resulted in a lower productivity, which is a great loss to the country.

On account of the rapid industrial development taking place in the country, a vacuum has been created for technical and administrative hands. Unfortunately, imparting training in specialised jobs has become more difficult on account of frequent changes that such personnel now make in this situation of shortage of their supply over demand. I think, it is in the national interest to ensure that we not only educate more technical hands, but also train specialists in specified jobs. It should be recognised that specialisation can only be acquired by continuity of experience in a particular line. It is also necessary that the educational system is moulded to suit the pattern of new employment opportunities that exist or are being created.

Export

Another point which I may touch is in regard to making available raw materials for export of finished goods. We have been endeavouring for sometime past to export jute baling hoops. However, it has not been possible for us to do so, on account of two factors, (1) non-availability of raw material, i.e. billets, and (2) non-availability of any export incentive either in the shape of concessional price of raw materials or otherwise. We have been pleading with the Government to help us in establishing this export line, but we have not been successful so far. We are, however, continuing in our attempts.

Raj Committee Report

As you are all aware, the Government of India constituted a Committee to enquire into the system of planning and distribution of steel. This Committee, known as the Raj Committee, has submitted its report in October, 1963. The Committee has made far-reaching recommendations, some of which can be called bold in as much as that they favour decontrol to a large extent. While basically I am always in favour of decontrol, the problem connected with decontrol in times of extreme shortage in the availability of steel against demand, both as raw material and finished product, has to be reckoned with. I hope Government will take suitable action on the report in due course, after taking into consideration all the pros and cons of the subject.

Conclusion

Gentlemen, any industrial undertaking in India today is no longer a concern only of the shareholders, management or of the labour directly engaged in the undertaking. It subserves the overall economy of the country trying to expand as fast as possible. The economy, no doubt, has grown over the past decade of planning, but during the first two years and even in the current year of the third Plan, the rate of growth has slowed down. Those of us in business have been pointing to this stagnation for sometime past and I am happy that the Government is also getting more and more cognisant of the realities.

One thing that I would like to stress is that economic well-being can be achieved really only by greater production. Therefore, to my mind the question "who does it faster and better" is more important today than "who should do it." After all, economic success is more important than anything else and this should not be affected by policies based on doctrinaire considerations. Economic policies would have to be such as to promote initiative and capital formation.

Further, greater stress is to be laid on increased efficiency and hard work by everyone. It is only through greater productivity and higher efficiency that we can really hope to achieve our aims.

Gentlemen, on your behalf I must express my appreciation of the good work done by all sections of the employees. Our thanks are also due to the Managing Agents for their very valuable services and to our esteemed customers for their continued co-operation.

IDEA OF HELICOPTER SERVICE IN BIG CITIES

PRACTICAL DIFFICULTIES HIGHLIGHTED

By Our Aviation Correspondent

ALL who travel fairly constantly by air will probably agree that much of the charm—and value—of air travel is dissipated by the quite disproportionate time of any air journey which is spent on the ground. Some part of that time, of course, is spent in the processing of passengers and their baggage and, in the case of international flights, in passing through Customs and other formalities. The greater part of the 'ground time', however, is usually spent in surface transport negotiating traffic-congested roads to and from airports.

The discrepancy between flight and ground time, needless to say, is most marked on very short-haul routes between most European and American cities—London/Paris is a typical example. Nevertheless, even over the comparatively long distances of India's trunk routes, the disparity, if less, is still noticeable. From Bombay to Delhi, for example, the flight time by Viscount is usually about 2 hours and 40 minutes against a total journey time of five hours. And when, from February next, Caravelles begin to operate the trunk services, the proportion of ground to flight time will, of course, be accentuated.

Scope Plenty

Viewed in this light, a recent suggestion by the Minister for Transport and Communications has much to commend it. The Minister, in fact, mooted the idea of a helicopter service between the Calcutta Maidan and Dum Dum Airport, and he invited private enterprise to take the matter in hand. Since air travellers from Calcutta currently complain that it takes as long to reach Dum Dum from Tollygunge as it does to fly to Bombay by jet, there seems to be plenty of scope in the idea.

Nor, it appears, has private enterprise been slow in taking up the challenge. A private company in Calcutta has expressed, we are told, its willingness to operate such a service and has actually presented a plan to the Civil Aviation Department. Such details of the plan as have been disclosed indicate a service operated by by Russian M-14 helicopters with accommodation for 16 passengers. With three such helicopters, the company estimate that, operating for nine hours daily, the service could carry up to 800 passengers per day. The flight between the Maidan and Dum Dum will be a matter of about ten minutes, and the fare proposed is said to be Rs. 20 for the single journey.

Is it Practicable?

Fired, perhaps, by this example, a private company in Bombay has also presented a plan to connect Santa Cruz Airport with Bombay city by helicopter. No specific type has been mentioned but an American helicopter—possibly the Sikorsky S-61, a 25 seat vehicle—has been indicated. Both these proposals are of great interest—but are they entirely practicable? This is an issue on which opinions are likely to differ and, if one's personal opinion lacks enthusiasm, that does not indicate a lack of sympathy with the projects. Nor, of course, is one necessarily right.

There is, of course, little practical difficulty in operating helicopter services of this nature on, shall we say, a casual or *ad hoc* basis. But to be financially successful, and of benefit to the public, such services must be established on a more or less permanent basis. In that case, certain requirements must be fulfilled. First and foremost, there is the question of heliports. While, at first glance, the Maidan in Calcutta may seem to be ideal for the purpose, there are a number of possible objections.

An Important Question

The Maidan, after all, is a public park. Should the citizens—and particularly those who are never likely to enjoy the facilities of air travel—be deprived of any part of the amenities which parks are established to provide? In cities in Europe and America, that question has been summarily answered with a very emphatic negative. It is true that helicopters require a small alighting area—but the needs of a heliport do not stop there. For a service run on a regular basis, there would have to be facilities for passengers—a waiting-room at least, a restaurant perhaps. There would have to be ticket offices, a Control Room, roads, car and vehicle parks, and, possibly, facilities for customs, police, and medical authorities. In all, as these services develop, the actual area required would probably extend to six or more acres.

And there is, too, the very important question of noise, because the helicopter is nothing if not noisy. The problem of noise, in fact, has been the biggest single obstacle that would-be operators have had to surmount. The Maidan is surrounded by hotels, offices, and a residential district. Will the residents be prepared to suffer helicopter noise for nine hours daily and every day of the year? If so, they must be more long-suffering than the residents of most cities in Europe and the United States.

So far, one has dealt solely with the Calcutta plan. Assuming, however, that the Bombay plan envisages the use of the Oval, or some central spot in Bombay, exactly the same objections arise—indeed, possibly in a greater degree. The Oval, for instance, is completely surrounded by offices and residential flats. What is more, apart from Colaba—which is mainly a Defence area—one finds it difficult, off hand, to name any open piece of ground, close to the heart of the city, which is naturally suitable for a heliport. It might be necessary, in fact, to build a heliport on a platform erected over existing buildings—an immensely expensive undertaking.

An Expensive Luxury

Finally, we come to the question of economics. This, of course, is mainly a matter for the promoters. It may be of interest, however, to outline what one conceives to be the principal economic difficulties. The distance from the Maidan to Dum Dum Airport is some sixteen miles. The fare proposed—or so one has been given to understand—is Rs. 20 for the single journey. In other words, the fare is about Rs. 1.25 per mile—or more than four times the cost of an air ticket on conventional services. Furthermore, most airlines provide a free coach service to and from the airport. The helicopter service, therefore, is an expensive luxury. Those who are prepared to pay Rs. 20, over and above the cost of an airline ticket, one argues, must value their time and comfort fairly highly.

How many people, then, would be prepared to avail themselves of the service? We have two possible guides. I.A.C. estimates an average of 1,000 passengers into and out of Dum Dum daily. There are, in addition, passengers travelling on international services which call at Dum Dum—say, about 200 on daily average. Thus the helicopter service has a potential of 1,200 passengers per day. Now, on similar helicopter services operated by British European Airways from London Airport to the West End of London, less than 5 per cent of passengers make use of the facility. Let us, however, stretch a point and assume that 10 per cent of passengers arriving at and departing from Dum Dum use the helicopter service. Carrying about 120 passengers per day, can the company concerned make the service pay? And what one has written of Calcutta applies, in greater or lesser degree, to Bombay. It is not, one is inclined to think, a particularly golden prospect.

PLASTIC LOCOMOTIVE

The world's first plastic locomotive, it is reported, will make its bow at the six international engineering fair in Brno next September. It will be manufactured by the V.I. Lenin (Skoda) Works in Plzen, and will be in test operation on Czechoslovakia's main line for most of 1964. Routine production is expected to start in 1965.

Czechoslovakia began making electric locomotives only six years ago. Today this country is Europe's foremost exporter of AC locomotives. While Skoda turned out 81 electric locomotives in 1959, the year the last steam locomotives was produced, it will soon reach 350 and then 450 units per year. It was this expansion which spurred the creation of the ivory coloured streamlined plastic model, weighing 123 tons and powered by six 850 kilowatt AC motors, now being tested.

Skoda decided it was high time to introduce something new in the way of locomotive styling, and they called in Otakar Diblik, the industrial artist who made his name as a member of the team that designed the curvaceous rear-engine air-cooled Tatra 603 sedan.

A.C.C.'S PROFIT-MARGIN LOWER

DIVIDEND NOT FULLY COVERED BY NET PROFIT

THANKS to the continuing pressure of costs, the Government's inflexible and unrealistic price policy and a faulty packing charge formula, the Associated Cement Companies Ltd. (Managing Agents: Messrs. Cement Agencies Ltd., Bombay) has had again to dip into reserves—deeper this time than during the preceding year—to maintain the dividend at 12 per cent per annum, subject to deduction of tax, for the year ended 31st July 1963. The total production in India and Pakistan had, of course, increased from 40.52 lakh tonnes to 41.45 lakh tonnes and despatches from 39.81 lakh tonnes to 41.91 lakh tonnes and this swelled the turnover by Rs. 2.30 crores to Rs. 36.67 crores. This increase in the sale of products is naturally reflected in an increase of Rs. 40.69 lakhs to Rs. 15.14 crores in the cost of materials and stores consumed but it is the staff and other expenses which have expanded out of all proportion, the former from Rs. 574.43 lakhs to Rs. 654.09 lakhs—partly because of the inclusion of additional bonus of Rs. 41 lakhs for the six years ended 31st July 1962—and the latter from Rs. 690.16 lakhs to Rs. 770.48 lakhs. As a result, the 1.3 per cent rise to 94.4 per cent in the utilisation of rated capacities has been of little avail and the gross profit has declined by Rs. 5.05 lakhs to Rs. 782.97 lakhs. In terms of profit-margin (ratio of gross profit to turnover) the drop is from 22.9 per cent to 21.4 per cent.

With the decrease in the gross profit, the provision for the Managing Agents' commission has gone down from Rs. 35.73 lakhs to Rs. 33.42 lakhs, while that for depreciation has been lowered from Rs. 257.41 lakhs to Rs. 242.77 lakhs. The provision for taxation, however, has shot up by Rs. 25.62 lakhs to Rs. 298.45 lakhs largely because of the inclusion of the estimated liability of Rs. 19.69 lakhs for S.P.T. The decline in net profit is, therefore, relatively larger, being Rs. 13.72 lakhs to Rs. 208.33 lakhs. The maintenance of dividend absorbs Rs. 228.90 lakhs, so that the net profit falls short by Rs. 20.57 lakhs, as compared with a deficiency of only Rs. 6.85 lakhs in the previous year. This shortfall has been made good by withdrawals from reserves.

The working results of the Company for each of the past four years are set forth in the comparative table below:

(In lakhs of rupees)

	For the year ended 31st July			
	1963	1962	1961	1960
Sale of products	36,66.83	34,36.69	30,04.39	27,08.69‡

High	159.00	185.00	172.00	162.50
Low	137.00	145.50	143.25	137.50

In spite of the poor rate of return on capital employed and the gradual erosion of reserves, the Company, it is encouraging to find, has continued to perform its duty of expanding its capacity and production of the various types of cement. This will be evident from the following summary of the relevant portions of the Directors' report:

The production of special cements, such as Silvicrete, slag cement, oil well cement, hydrophobic cement, etc., was stepped up during the year under report. The production and sale of slag cement at Chaibasa, in particular, showed a sizable improvement and sales amounted to 1.07 lakh tonnes as against 0.47 lakh tonnes in the previous year. Although there was some improvement in the transport of granulated slag from Jamshedpur to Chaibasa, the problem is by no means satisfactorily solved yet. It is expected that there will be a further improvement in the manufacture and sale of slag cement which has been very well received by the market. The output of firebricks at the Katni works was, however, only marginally higher than last year but the manufacture of other A.C.C. products made steady progress.

At Mancherial works, production during the year improved considerably over that of the previous year, but is still below the rated capacity of the factory. This is primarily due to continued restriction in power supplied by the Andhra Electricity Board. Very recently, however, a part of the power cut was restored. At Bhupendra works, due to rapidly depleting limestone reserves, it was difficult to keep the plant running at full capacity. In order to conserve the available limestone reserves, the Central and Punjab Governments were approached to permit the Company to transfer one of the four kiln units from Bhupendra to Madukkarai works.

The plant at Madukkarai works is being extended by 1.2 lakh tonnes. Simultaneously, in order to improve both the quality and quantity of the available raw materials, a flotation plant will also be installed. The entire installation is expected to be ready in 1967. Progress on the extension of the Dwarka works has been well maintained. At Kymore works all the buildings and structures for the white cement plant have been constructed and the kiln and other machinery are now under erection. The plant is expected to go into commission early in 1964.

The work on the Jamul factory is making progress. All the buildings and structures including the housing colony have been completed and the erection of the kiln is now in progress. The first unit is expected to be ready and taken into commission by the end of 1964 and further extension to include the manufacture of slag cement will be completed about six months later. The Company has signed an agreement with Hindustan Steel Ltd. for the supply of granulated slag from Bhilai to this factory. The material will be used for intergrinding with clinker produced at the factory and will thus help to increase considerably the productive capacity of the plant. Construction of the new factory at Porbandar is proceeding and work on the factory buildings structures and residential colony is making good progress. Manufacture of cement will be by the dry process and the plant will be similar to that being erected at Jamul.

Progress of the engineering works project at Shahabad has been satisfactory. The machine shops and fabrication shops went into production as per schedule. Steady progress on construction of the grey iron foundry is being maintained. It is expected to go into production early in 1964. Efforts are also being made to enlarge the scope of the engineering activity at Shahabad by including new line of manufacture in technical collaboration with Hitachi Ltd. of Japan.

As regards the factories in Pakistan, fresh negotiations have commenced for their disposal and a letter of intent has been signed with certain promoters. The actual sale will be subject, of course, to the approval of the Governments of India and Pakistan. Meanwhile, the Directors have decided to obtain the authority of shareholders at their forthcoming annual meeting.

At the last annual general meeting the shareholders had sanctioned the proposed investment by the Company in 12,000 equity shares of Rs. 100 each at par (out of 60,000 equity shares of Rs. 100 each to be issued at par) of Tata-Robins-Fraser, Limited, a public company promoted in collaboration with Hewitt-Robins Incorporated, U.S.A., Fraser and Chalmers Engineering Works of General Electric Company, Limited, U.K., and the Tata Iron and Steel Company, Limited, for the purpose of manufacturing materials handling and processing equipment and for undertaking turnkey contracts for designing and erection of conveyor systems and the like. As required by Section 372 of the Companies Act, 1956, approval of the Central Government has been obtained to this investment. The new company which was incorporated on 20th November 1962, has offered to the company 12,000 equity shares of Rs. 100 each on payment of Rs. 50 per share and accordingly the company has invested Rs. 6 lakhs.

In spite of successive withdrawals from reserves during the past few years for dividend disbursement, the financial position of the Company still continues to the strong, though, of late, it has been subject to some strains following the continued expansion of activities. The share capital, the whole of which is only in equity shares of Rs. 100 each, stands unchanged at Rs. 19.07 crores. It is supported by Rs. 10.49 crores in reserves, excluding Rs. 2.29 crores which is to be utilised for payment of dividend for 1962-63. Against these "own" funds of Rs. 29.56 crores, the written down value of fixed assets alone amounts to Rs. 28.49 crores while the gross block is stands at Rs. 45.37 crores including additions of approximately Rs. 2 crores made during the year. Borrowings have also increased from Rs. 7.05 crores to Rs. 11.15 crores and current liabilities and provisions from Rs. 13.56 crores to Rs. 15.10 crores. The outside interest thus aggregates Rs. 26.25 crores or Rs. 2.60 crores more than the total, at Rs. 23.65 crores, of current assets, loans and advances. Investments, mainly in shares of subsidiaries or associated companies, are placed at Rs. 3.66 crores.

The Rs. 100 fully paid ordinary shares of the Company are currently quoted at Rs. 157.25 cum-div. which, on an ex-div. basis, fetches a yield of about 5.7 per cent per annum on fresh investment.

PROFIT OF PANYAM CEMENTS DECLINES

DIVIDEND PASSED OVER

THE story as narrated by the Panyam Cements and Minerals Industries Ltd. (Managing Agents: Messrs. Panyam Industrial Agencies Pvt. Ltd., Cement Nagar) in respect of the year ended 31st August 1963 is in no way different from that narrated by other cement producers and reviewed in this journal from time to time. On the one side there has been an increase in the production of clinker from 66,009 tonnes to 71,770 tonnes and of cement from 65,604 tonnes to 77,038 tonnes, the turnover increasing by more than 10 per cent from Rs. 60.02 lakhs to Rs. 67.81 lakhs following the rise in cement despatches from 65,656 tonnes to 76,219 tonnes. But, on the other side, consequent on the decrease of Rs. 3.87 lakhs to Rs. 14.04 lakhs in gross profit, the profit margin (ratio of gross profit to sales) has declined sharply from 29.8 per cent to 20.7 per cent. The reasons for this deterioration in profit margin have been chiefly two, namely, increase in cost of production due to Governmental action and a faulty packing charge formula imposed on the industry as will be evident from the following extract from the Directors' report.

"The improvement on the production side has not, however, reflected itself in better working results, namely, due to the substantial increase in costs on account of higher prices of coal, increases in railway freight, royalty on limestone, etc., all due to Governmental action, which the Government had assured the industry to compensate as per the escalation clause. In fact, from 1st November 1961 such increases were up to Rs. 4.22 per tonne, while subsequent increases from the beginning of 1963 in royalty, electricity tariffs, provident fund contributions, sales tax, and the imposition of Emergency Risk Insurance have further stepped up the actual costs to Rs. 5.16 per tonne as on 31st May 1963 over and above the retention price. Had this increase been conceded, it would have meant for us an income of about Rs. 4 lakhs. But, unfortunately, the Government granted an increase of Rs. 2.50 per tonne only (excluding 25 nP per tonne for reduction in selling agency commission) from 1st June 1963. Thus the compensation received from such an inadequate increase in price conceded for three months (June to August 1963) has resulted in Rs. 48,000 only. The packing charges fixed by the Government from quarter to quarter, too, have always been falling short of the actuals for the procurement and rise of the required percentage of new and serviceable second hand jute gunnies."

The decrease in gross profit has resulted in lowering the provision for the Managing Agents' commission from Rs. 83,000 to Rs. 49,000, while that for depreciation has gone down from Rs. 9.27 lakhs to Rs. 8.84 lakhs, as a result of the decline in the value of depreciable block. But this saving has been very nearly absorbed by the provision which has become necessary for the first time, as all previous losses have been fully recouped. On making these essential provisions, there has remained a net profit of Rs. 4.05 lakhs, as against Rs. 7.81 lakhs a year before. Adding to this the amount brought forward from the preceding accounting period and Rs. 14,949 as the excess provisions written back and write off Rs. 61,286 as share capital issue expenses, the Directors have transferred Rs. 1.55 lakh to reserves and have proposed the payment from the balance of the preference dividend for the year, amounting to Rs. 2.33 lakhs. No dividend on the ordinary shares has been recommended, as against eight per cent distributed in the previous year. A sum of Rs. 1,340 is being carried forward, as against the Rs. 30,304 brought in.

The following comparative table clearly brings out the vissicitudes in the Company's fortunes during the past four years:

(In lakhs of rupees)

	For the year ended 31st August			
	1963	1962	1961	1960

SYNOPSES OF COMPANY REPORTS

Baroda Rayon Corporation Ltd.

(*Managing Agents:* Messrs. Gaekwad Chinai & Co. Private Ltd., Udhna (Surat).)

Fifth Annual General Meeting—1st February 1964.

Working Results:

	For the year ended 30th September (In thousand rupees)	
	1963	1962
Sales—yarn and waste	1,35,54	Nil
,, —others	1,57	Nil
Closing stock	43,64	Nil
Other income	1,28	64
Loss	40*	38*
Credit balance brought forward	3,73	4,11
Excess tax provision transferred	19	Nil
Total available balance	3,93	4,11
Appropriations:		
To adjustment of loss for the year	40	38
To provision for depreciation	1,49	Nil
Credit balance carried forward	2,03	3,73

Market value of ordinary shares (in rupees):	1963	1962	1961
High	127.00	161.00	171.00
Low	87.00	111.00	119.00

* Loss after providing Rs. 50,000 for Managing Agents' remuneration (Rs. 37,500 for the previous year).

Extracts from the Directors' report: Inauguration: Dr. S. Radhakrishnan, President of India, formally inaugurated the *Rayon Plant* on 23rd December, 1962. The occasion was marked by the presence of the then Chief Minister of Gujarat State, Dr. Jivraj N. Mehta and a number of other distinguished invitees.

Progress: The auxiliary plants, viz. *Sulphuric Acid, Carbon-de-Sulphide* and *Power Plants* were put into commission at the beginning of October, 1962. The *Anhydrous Sodium Sulphate Plant* has been recently put into successful operation. The teething troubles experienced by the *Power Plant* were finally overcome by the end of June, 1963 and this plant has since been working satisfactorily.

Production and Sales: The output of the Rayon Plant was 1,420 M. Tonnes of *Rayon Yarn* of various deniers (corresponding to 1,519 M. Tonnes of *Rayon Yarn* of 120 deniers) during the year. The Plant attained its rated capacity of 6.25 M. Tonnes per day on 100 denier basis at the end of June, 1963. The products of the Company have been progressively achieving the desired quality and are now most acceptable to the weavers throughout the country.

In the initial period the Company experienced high turnover of labour and teething trouble in the Power Plant, resulting in irregular production. Considering these factors among others, the Company was permitted to sell its production of yarn in the open market.

The Government of India has directed the Tariff Commission to go into the cost structure of various Rayon Units and to recommend the fixation of fair prices. This Company has submitted to the Tariff Commission that, being a high cost unit, it cannot afford to give away a substantial part of its production under Distribution Control Order at the rate fixed by the Textile Commissioner and has urged the Commission to recommend higher prices for the new high cost units than for the existing units.

As the erection of the plant and machinery and the construction of civil engineering works were completed during the year under report, the total expenditure of Rs. 54,88,204 incurred during the period of erection till the date of starting up of the production has now been capitalised and allocated to various heads of accounts, on the basis of the certificate received from the Architects of the Company. This, however, is subject to further adjustments, when final bills of the contractors in respect of the civil engineering work are received.

Expansion: The Company has already received an industrial licence to increase its production capacity of rayon yarn by 1½ tons on the basis of 100 deniers. The import licence for importing the additional machinery required to implement this expansion is awaited. The Company's application for an industrial licence for putting up a plant to manufacture 20 tons of *Staple Fibre* per day is pending with the Government.

As stated in the last Report, necessary steps have been taken to convert the boilers from coal firing to oil firing. The licence to import the oil firing equipments is expected to be received shortly.

Accounts in brief as at 30th September 1963 are as under :—

Liabilities	Rs.	Assets	Rs.
Capital*	4,75,79,300	Gross block	8,58,04,748
Reserves and surplus	8,33,094	—Depreciation	1,49,332

* The dividend for 1963 will be paid out of the dividend reserve.

Extracts from the Directors' report: During the year under review the factory crushed 1,44,339 tonnes (38,67,174 mds.) against 1,51,958 tonnes (40,71,315 mds.) of sugarcane in the previous year. The working days were less at 161 days as compared to 186 days in the previous year. The average recovery was however, better at 10.38 per cent. against 9.64 per cent. in the previous year. The crushing was lower due to restriction imposed by the Government on sugar production of last season as also due to inadequate rains and diversion of cane to gur and khandsari. During the current season a crushing of about 1,30,600 tonnes (35 lac mds.) of sugarcane is expected.

Accounts in brief as at 30th June 1963 are as under :—

Liabilities	Rs.	Assets	Rs.
Capital*	15,00,000	Gross block	56,65,330

Trichy Steel Rolling Mills Ltd.

(*Managing Agents:* Messrs. Sree Sankar & Co., Madurai.)

Second Annual General Meeting—Held on 30th December 1963.

Extracts from the Directors' report for the period from 1st September 1962 to 30th September 1963 :— During the period under reference all the expenses have been charged to capital account and the Company has earned a net income of Rs. 5,480. The Directors recommend to appropriate the same as follows: To provision for taxation Rs. 2,740 and to preliminary expenses Rs. 2,740.

General: The construction of the Mill buildings and the erection of the plant and machinery has been completed and the trial production has since commenced. The Directors hope that the Mill will reach the full licenced capacity of 50 tonnes per day very shortly.

Accounts in brief as at 30th September 1963 are as under :—

Liabilities	Rs.	Assets	Rs.
Capital*	37,00,000	Gross block	37,51,978

Market value of ordinary shares (in rupees):	1963	1962	1961
High	16.00	15.00	16.62
Low	11.25	12.00	11.50

* The dividends for 1963 will be paid out of the dividend reserve.

Extracts from the Directors' report: During the year under review the crushing of sugarcane was very much lower at 57,608 tonnes (15,43,463 mds.) against 1,16,668 tonnes (31,23,078 mds.) in the previous year. The factory worked for 108 days against 216 days in the previous year. The average recovery was, however, slightly higher at 9.94 per cent. as against 9.58 per cent. in the previous year. The crushing was abnormally low as a result of the acreage under sugarcane in the area having gone down due to cut in sugar production of last season announced by the Government of India and lower yield of sugarcane per acre owing to early start of rain. During the current season a crushing of about 68,000 tonnes (18 lac mds.) of sugarcane is expected.

Accounts in brief as at 30th June 1963 are as under :—

Liabilities	Rs.	Assets	Rs.
Capital*	20,00,000	Gross block	26,70,91
Reserves and surplus	22,15,515	—Depreciation	18,53,168
Other liabilities	37,76,165	Net block	8,16,746
		Current assets	53,77,761
		Investments	14,44,770
		Cash	3,51,403
	Rs. 79,91,680		Rs. 79,91,680

* Paid-up capital consists of 1,50,000 ordinary shares of Rs. 10 each 5,000—5 per cent. cumulative redeemable preference shares of Rs. 100 each.

MARKET GOSSIP

(Concluded from page 3)

able prices. In fact, this approach is better than the alternative of paying higher dearness allowance to compensate for the rise in price, because the latter system itself is inflationary.

India To Have A Terylene Plant

I.C.I., the world-famous British firm, will shortly manufacture polyester fibre in India. Polyester fibre, known and marketed in this country under the trade name "Terylene", is an outstandingly good apparel fibre which has strongly entrenched itself in the field of clothing manufacture in India in an incredibly short time. Fabrics made from polyster fibre are strong, crease- and stretch-resistant, quick-drying, rotproof and durable—qualities which make Terylene really cheap, in spite of its apparently high price compared with fabrics made of natural fibres. It blends well with natural fibres such as cotton and wool in the manufacture of lightweight materials suitable for warmer climates. Terylene is being increasingly used by the Indian textile industry for the manufacture of high quality fabrics for shirts, suits, dresses, socks, ties and other items of apparel. By virtue of its strength and resistance to many chemicals, polyester fibre also finds some important industrial uses.

At present, Terylene goods are manufactured by Indian mills out of imported polyester yarn. Although the processing conditions and techniques are different in respect of polyester fibre, well-equipped cotton and woollen mills are able to handle polyester fibre without difficulty once they are acquainted with the correct processing conditions. In order to ensure that mills are properly advised in this matter, I.C.I. (India) Private Ltd., the Indian subsidiary which markets Terylene in India, has set up a Technical Service Department for the purpose. This Department is also responsible for quality control to ensure that fabrics that do not conform to certain minimum standards are not produced.

The manufacture of polyester fibre in India now proposed by I.C.I. will obviate the need for imports of yarn and provide a strong base for building up an export market for polyester fabrics. A limited quantity of Terylene fabrics is already being exported. This could be greatly expanded into an important source of foreign exchange earnings for the country when the present plan for the manufacture of polyester fibre comes to fruition. I.C.I. has already formed a new company, called Chemicals and Fibres of India Ltd., C.A.F.I. for short, for undertaking the manufacture of synthetic fibres, plastics, dyestuffs and other chemical products. C.A.F.I.'s first venture will be manufacture of polyester staple fibre which will be known under the trade name 'Terene'. The plant is being built with the technical assistance of the Fibres Division of I.C.I., Ltd., U.K. The estimated capital outlay on the plant and equipment is Rs. 585 lakhs, of which Rs. 250 lakhs will be equity capital, two-fifths of which will be offered to Indian investors and the balance will be held by I.C.I. The Company will enter the capital market shortly.

Notices

ASHOK LEYLAND LIMITED
ENNORE, MADRAS-57

NOTICE

NOTICE IS HEREBY GIVEN THAT THE Fifteenth Annual General Meeting of the Company will be held at the Registered Office of the Company at Ennore, Madras-57, on Monday the 27th January, 1964, at 2-00 p.m., to transact the business, particulars of which have been given in the Notice along with the explanatory statement, being posted individually to the Shareholders of the Company.

The Share Transfer Books of the Company will be closed from 10th January 1964 to 27th January 1964, both days inclusive.

By Order of the Board,
For ASHOK LEYLAND LIMITED,
A. E. L. COLLINS,
Managing Director.

ENNORE, MADRAS.
25th November 1963.

Note: A member entitled to attend and vote at the meeting is entitled to appoint a Proxy to attend and vote instead of himself and the Proxy need not be a Member.

THE CHAMPDANY JUTE COMPANY LIMITED

NOTICE IS HEREBY GIVEN THAT AN Extraordinary General Meeting of the Members of the Champdany Jute Company, Ltd., will be held at the Registered Office of the Company, 2, Netaji Subhas Road, Calcutta, at 11-45 a.m. on 21st January, 1964, to consider, and if thought fit, to pass the following Special Resolution:

"That Mr. A. N. Sircar be and is hereby appointed a Director of the Company."

By Order of the Board,
JAMES FINLAY & CO., LIMITED
Managing Agents.

2, NETAJI SUBHAS ROAD,
CALCUTTA.
10th December, 1963.

Notes:

(1) A member entitled to attend and vote at the meeting is entitled to appoint a proxy to attend and vote instead of himself, and the proxy need not be a member.

(2) An Explanatory Statement under Section 173 of the Companies Act, 1956, is being forwarded to the Members.

SHAW WALLACE AND COMPANY LIMITED

DIVIDEND ON PREFERENCE SHARES

THE DIRECTORS HAVE DECLARED A Second Interim Dividend on the Company's Preference Shares for the year ending 31st December, 1963 at the rate of 2.4975 per share (i.e. Rs. 3 per share increased in accordance with the provisions of the Preference Shares (Regulation of Dividends) Act, 1960 less Income Tax at the Company's rate of 25 per cent). This dividend will be paid to Members whose names appear in the Company's Preference Share Register on 15th January, 1964 or their mandatees, subject to deduction of tax under Section 194 of the Income Tax Act.

The Preference Share Transfer Register of the Company will be closed from 4th to 15th January, 1964, both days inclusive.

By Order of the Board
D. A. HOUGHTON,
Calcutta Director and Secretary.

Registered Office:
4, BANKSHALL STREET,
CALCUTTA 1.
27th December, 1963.

ASSOCIATED BATTERY MAKERS (EASTERN) LIMITED

NOTICE TO SHAREHOLDERS

THE ACCOUNTS OF THE COMPANY FOR the year ended 31st August, 1963 exhibit a net profit, after allowing for depreciation, of Rs. 54 lakhs before tax. After providing for taxation and reserves, and bringing in the balance from the last account, the amount available is Rs. 18 lakhs.

The Board of Directors has resolved to recommend to the shareholders at the forthcoming Annual General Meeting that a dividend for the full year on the issued capital of Rs. 118 lakhs be declared at the rate of 15 per cent subject to tax.

By Order of the Board,
H. M. COX,
Secretary.

Registered Office:
BARLOW HOUSE,
59C, CHOWRINGHEE ROAD,
CALCUTTA-20.
17th December, 1963.

47, Velacheri Road, Madras-32

NOTICE

NOTICE IS HEREBY GIVEN THAT AN Extraordinary General Meeting of the shareholders of the Company will be held at the Registered Office on Friday the 10th January 1964 at 4 p.m., to transact the businesses, particulars of which have already been posted to the members individually.

By Order of the Board,
IYER & CO. PRIVATE LIMITED,
Managing Agents.

MADRAS,
Dated: 24th December, 1963.

Note: A member entitled to attend and vote at the meeting is entitled to appoint a proxy to attend and vote instead of himself. A proxy need not be a member of the Company.

BANKING

(*Concluded from page* 8)

Reserve Bank of India has been discontinued as it was not worth the time and labour involved, in view of the insignificant amount of such deposits. Section 34A of the Act, preventing disclosure of information regarding secret reserves of banks has been made applicable to all the banks. The duty to furnish information to the Reserve Bank inspectors has been cast even on bank employees who may not be classified as officers.

The amendments to Sections 44A and 45 of the Banking Companies Act have been proposed as a result of practical difficulties faced in giving effect to schemes of voluntary or compulsory amalgamations of banks. Desirable schemes of mergers have often been prevented or at any rate delayed by interested parties demanding a proof that all the legal formalities and requirements in connection with the amalgamations have been complied with. It is now clear that an order or a certified copy of the Reserve Bank's order sanctioning a scheme of voluntary amalgamation and of the Government's order reconstructing or amalgamating a bank shall be conclusive evidence that the prescribed procedure has in all cases been followed and that the reconstruction or amalgamation is in order and valid. Amendment to Section 44B of the Act ensures that the Reserve Bank's approval is obtained before a High Court sanctions any modifications to a scheme of compromise or arrangement with creditors, originally certified by the Reserve Bank as being in order and reasonable.

The Amendments to Section 45F of the Act provide that the entries in the documents or certified copies of documents shall be admitted as evidence in all legal proceedings (and not only in proceedings by or against a banking company) and against all officers and employees (and not only against directors). The amended section will apply to *all* banking companies that are wound up.

The amendments to Sections 45S and 45T are concerned with the liquidation procedure. Some of the officers of the State Governments, who are already authorised under the present Act to take charge of the properties and assets of the banking companies in liquidation on behalf of the liquidators concerned, have now been empowered to sell the properties locally on behalf of the liquidators, who have also been empowered to issue the necessary certificates to the State Government officers.

The amendment to the State Bank of India (Subsidiary Banks) Act 1959 brings down the voting rights of the individual shareholders of any subsidiary of the State Bank on par with the voting rights of the shareholders of other banking companies.

How does the Reserve Bank feel about the additional powers thrust upon it? The Governor has already given an assurance to the bankers that these powers will be exercised only if it is necessary to do so in the interests of the public and the depositors. That goes without saying: but the real snag, as already pointed out, is that the Reserve Bank is itself the sole judge of the "necessity and interest." Moreover, although the Governor felt that quick-acting devices and effective powers were necessary to enable the Reserve Bank of India to act in good time, it has no where been demonstarted that the powers were not enough to enable it to act quickly and effectively. As regards the powers acquired over the non-banking institutions, the Governor flatly declared that *at present* the Bank had no intention of exercising any control over them: that would be considered only after the Bank has been able to complete its information of the nature of the problems it is expected to solve!

In any case, under the weight of these vast and sweeping powers over the entire range of banking, non-banking and financial institutions, the Reserve Bank must find itself in a very uncomfortable and unenviable position, for it will no longer be able to avoid its responsibilities, as it did in the Palai affair. It must now be busy finding officers and employees of the calibre required to enable it to live up to the new challenges it will have to face in the years to come.

TEXTILES

(*Concluded from Page* 11)

of fibre producers. Some of these are large manufacturers with strong research organisations. They too will be working steadily to improve nylon, or to find an ultimate successor."

Whatever be the scale of expansion and development in the nylon industry elsewhere, Du Pont of the U.S. continues to hold its position of leadership in the production and sale of nylon. This Company not only supports research on an increasing scale but also continually re-examines every phase of production to find ways to insure high quality and hold costs down. As part of such a programme, Du Pont has taken on hand the implementation of a programme which seems to ensure a "thoroughgoing modernisation of every phase of nylon manufacture." The programme entails heavy capital outlay which is said to approximate the original costs of the Company's four major nylon fibre facilities. Nevertheless, the Du Pont Company emphasises that competition in the years ahead will require the finest production plant that the present knowledge of the art of making nylon can create. Considering the frantic efforts of scientists to develop a fibre that will not merely perform most of nylon's functions but perform them better, the future of nylon will naturally depend on whether this fibre will be so improved and modified as to fight off all rivals and even perform new tasks.

COMPANY MATTERS

(*Concluded from page* 26)

unpaid amounts on the preference and ordinary shares issued in the preceding year and this has raised its issued share capital to Rs. 99.53 lakhs from Rs. 83.40 lakhs a year. Of this, Rs. 24.99 lakhs are in three series of preference shares and the balance in equity shares of Rs. 100 each. The reserve position has bettered slightly and aggregates Rs. 14.74 lakhs. As against these own funds of Rs. 114.26 lakhs, outside interest amounts to Rs. 98.32 lakhs, comprising Rs. 81.50 lakhs in borrowings (of these Rs. 72 lakhs from the Industrial Credit and Investment Corporation of India) and Rs. 16.82 lakhs as current liabilities and provisions. On the assets side, the net block has come down from Rs. 75.40 lakhs to Rs. 71.34 lakhs, but, as the value of capital work-in-progress has risen sharply from Rs. 4.06 lakhs to Rs. 75.79 lakhs, the total net block is higher at Rs. 147.12 lakhs, as against Rs. 79.46 lakhs as at the beginning of the year.

BLUE-PRINT FOR SOCIALISM

THE Congress Party is becoming a victim of its own slogans and propaganda in favour of socialism. This is the outstanding impression that one gets of the lively debate at Bhubaneshwar this week on "democratic socialism," the new slogan for the old goal, displacing the hitherto familiar phrase "socialist pattern of society" coined at the Avadi session. The counsel of caution given by the new President, Mr. Kamaraj, and such elders as Mr. Lal Bahadur Shastri, Mr. S. K. Patil, Mr. Morarji Desai and Mr. T. T. Krishnamachari went unheeded by the younger generation and the old radicals. The Government of India, the Planning Commission and the High Command were severely criticised by the latter group for the slow pace of economic growth in recent years and clearly warned that, unless democratic socialism was spelt out and a programme of action with specific time limits was drawn and announced, the masses would revolt against the Party. Admittedly, the extreme leftist elements in the Party want to capture power or at least to get the Party committed to State capitalism during the lifetime of Prime Minister Nehru. They realise that the sands are running out and that they must assert themselves quickly. It is with this object they have been vehemently criticising and ridiculing the elders who have been in power all these days by recounting their failures and attributing such failures to the inadequate dose of socialism injected into the economy. Some may be inclined to dismiss this conclusion as cynical. If that is so, the alternative inference is that the rank and file of the Party are sadly disillusioned and disappointed with the performance of their leaders. This is much worse, especially as the remedies suggested by them for quickening the pace of economic progress and improving the living standards of the masses disclose a doctrinaire bent of mind influenced by obsolete theories and dogmas. If their remedies were adopted, democracy would soon become a sham in India and the poor would be poorer still, for it is the poverty, and not wealth, that would be redistributed.

The record of leftists in the Congress Party has been such as not to command unquestioned faith in their honesty and sincerity of purpose. Active behind the scenes in their camp is Mr. Krishna Menon, the notorious author of the jeep scandal and a leader who brought the country to the verge of a military disaster. Then there are the highly vocal Mr. K. D. Malaviya, who had to leave the Cabinet under a cloud, and Mr. B. Patnaik, the erstwhile Chief Minister of Orissa, who too is believed to have been connected with some of Mr. Malaviya's discreditable actions. If only Prime Minister Nehru had cared to lift the veil that hides the many sins of omission of these three leaders, their pretence of being good, democratic socialists would have been exposed long ago. But, unfortunately, for reasons best known to himself, Mr. Nehru has always shielded them, thereby enabling them to preach extremist doctrinaire socialism today. It is only in this country that ministers who had to retire from their posts under disgrace can pose as the champions of masses and underdogs. The irony of it all is that they want nationalisation of banks, which, to be successful, requires a high degree of integrity and honesty. Are these sterling qualities present to the degree required in the party-in-power and in the administrative machinery? This is by no means an impertinent question, what with the candid admission of corruption in high places by the former Congress President and the Union Home Minister, among others, and their continuing search for an effective remedy for this chronic malady. It is astonishing that, when there is so much corruption in the country and when the hands of the public sector are more than full, with the administrative machinery groaning under maximum strain, top leaders, who are aware of all these defects, should advocate nationalisation of banks, sugar, textile, plantation, and cement industries. Either they have become irresponsible or they are deliberately forcing the country along the path that will take it to economic and political chaos and let in the communist forces. It will be useful to remember, in this connection, that the present strength of the leftist forces in the Congress Party is itself due (*a*) to its advocacy of doctrinaire socialist policies such as State trading and State-ownership of industries and (b) to constant harping on such catchwords as concentration of economic power in a few hands and monopoly capitalism. If leaders like Mr. Nehru, Mr. Lal Bahadur Shastri and Mr. T. T. Krishnamachari had refrained from indulging in these slogans and faced the facts squarely right from the beginning, there would have probably been fewer opportunities for the type of criticism and demands made by *the leftists in the Bhubaneshwar session of the* Congress this week.

The case for nationalisation of banks presented by Mr. Patnaik was quite misleading. He said five business houses controlled the banking industry which had only Rs. 38 crores of share capital and Rs. 1,480 crores of depositors' money. These five houses, he added, controlled 1,600 industrial units, through interlocking of finance. Put this way, the whole thing may sound fantastic to laymen. But the fact is that all over the free world the paid-up capital of banking system is only a small fraction of deposits. It will be so, for that is the feature of banking business. Bank shares are widely held, but the controlling interest has to be in a few hands if there is to be order, discipline, continuity of policies and sound management. A bank cannot be run in the same way as a political party or a government; if it is run that way, it will not exist for a day and the funds of depositors will be in jeopardy. It is incorrect to suggest that banks have been using their deposits to finance mostly the industries and trade belonging to their directors. Moreover, banks are under the control of the Reserve Bank and those in the private sector have to compete with the Government-owned State Bank of India and its subsidiaries which together account for over a third of the commercial banking sector. That no significant practical advantage will accrue to the public by nationalising the joint-stock commercial banks has been demonstrated time and again. And yet a section of politicians keeps on demanding nationalisation, in order to fulfil their political ambitions.

Mr. T. T. Krishnamachari has firmly declined to accord a high priority to nationalisation of banks, on the ground that the objectives of those in favour of nationalisation can be effectively served under the latest amendments to Banking Laws. These amendments, as readers are aware, will enable the Government to reduce the voting rights of shareholders, to dismiss or appoint executives and directors of a bank without let or hindrance and, to control and direct the provision of credit, so that the Government enjoys all the benefits of nationalisation without having to pay compensation to shareholders and without any of the responsibilities that go with ownership. It is, however, not known to what extent he has been successful in postponing the evil day, because the leftist leaders assert that the new blue-print on socialism implies total nationalisation. It looks as though they will not rest content until their goal is reached. In the bargain with them, the rightists will continue to yield ground to them, as they have already done in the banking, general insurance and corporate sectors. Mr. Krishnamachari's own order of priority for implementing the blue-print holds promise of further restrictions on trade and industry. One does not know what new measures he will initiate to check tax evasion and to catch the black market money. In all these cases, it is the honest businessmen that are inconvenienced most.

The Bhubaneshwar session of the Congress Party was concerned more with ideology than with the burning problems of the day. Take the price problem, for instance. It was left to Mr. T. T. Krishnamachari to remind the delegates that the price line was getting out of control and that effective steps must be taken to bring down the prices first. The Congress Party's approach to this problem is one of confusion; it is a case of one trying to catch the bull by the tail instead of by the horns. The price line will remain stable if supplies are increased through higher production. Instead of concentrating its attention on this basic problem, the Party is bent upon devising methods for eliminating the middlemen in the false belief that they are the real mischief-mongers. It is true that, when uncontrolled, middlemen exaggerate the effects of shortfalls in production on prices. By removing them from the scene, it may be possible to minimise the exaggerated rise in prices. But the assumption here is that the State can provide an alternative chain that will link the producer with the consumer and function more efficiently and honestly than the middlemen. That assumption, however, is unwarranted in the light of experience since independence. The poor progress made by the *co-operative marketing societies and the* prevalence of corruption in the co-operative movement as a whole are there for all to see. Worse will be the position, if crops happen to be larger than expected and shortages disappear. In such a situation, the growers will suffer more than the consumers. The specific mention in the so-called blue-print on democratic socialism that rice mills should be progressively nationalised betrays the absence of realism and existence of shallow thinking among the policy-makers in the Congress. One wishes they had taken the advice of Mr. S. K. Patil, who, as the Union Minister for Food and Agriculture, had studied this problem thoroughly and from the angle of feasibility. It is sheer nonsense to think that, in times of shortages, only rice millers exploit the consumers by pushing up prices and that everything will be fine once the State ousts them out of their business. The growers themselves do the mischief by withholding the crops. Again, after the rice *moves out of millers, there is room for* interfering with its flow to consumers. There are also several ways in which the real cost to them can be increased.

Even if one were to concede, for argument's sake, that nationalisation of rice mills would solve the problem to a considerable extent, the

question whether it would be a practicable proposition remains to be answered. On this issue, Mr. Patil made some pertinent points in his speech at Bhubaneshwar, though they fell on deaf ears, as witness the unanimous adoption of the resolution on democratic socialism without even changing a comma. Mr. Patil said there were 43,000 rice mills in the country, employing some 500,000 persons. The Government could certainly find the money to pay compensation to the millers for taking over their factories, as it can create money. But the real problem would be to find the necessary personnel who would be honest and efficient in managing these mills. As Mr. Patil rightly remarked, *the 500,000 workers in these mills* would not become paragons of virtue overnight. His warning that, *if the Government took the* risk of managing the rice mills and failed to arrange the proper distribution of products, the farmers and consumers alike would be punished is no exaggeration. His further remark that, by taking on the role of middlemen, the Government would become the donkey which should be prepared for the flogging, too, is sheer commonsense. In having failed to listen to this sane advice of a realist, the Congress Party has sowed one more seed of uncertainty in rural areas. The rice millers will now become shy of investing more in their business; they may not care to modernise their plant and machinery or expand their capacity. The more honest ones among them may be tempted to dispose of their mills while the going is good and the mills will pass into the hands of only those who have the guts to face the uncertainty and/or have no scruples. *Another result may be a slackening* in the expansion of rice milling capacity which in turn will adversely affect the interests of agriculturists. Is this socialism? No, it is either bankruptcy of thought or political hypocrisy or a blend of both.

IRRIGATION AND POWER

OF the several ingredients of the *infrastructure* for which the public sector has assumed the major responsibility in India, irrigation and power are by far the most important, the one being basic to agricultural development and the other to industrial growth. It is well known that the accent in planning has all along been more on agricultural and industrial progress with the aid of relatively cheap water and electricity than on the economic viability of irrigation and power projects and the economics of pricing these public sector services. But, considering that such projects have already absorbed enormous capital outlays and that they will call for bigger expenditure in the years to come, the need seems to have arisen for examining whether they could not be made remunerative enough to provide a good part of the resources required for the future expansion of irrigation and power facilities. In this context, the Union Finance Minister's recent suggestion *at Bombay that the Centre should shoulder* more direct responsibility for irrigation and power *development deserves to be actively* pursued, if the economic aspects of a project are to receive greater consideration as against sentimental and parochial support that often goes with such a project.

The shortfalls experienced in irrigation and power targets in the first decade of planning have only underlined the need for taking a fresh look at the economics of the relevant projects. One may recall, in this connection, that several projects were slowed down, postponed or dropped altogether for lack of sufficient resources, with the result that the original targets were not achieved. It was originally envisaged in the second Plan that irrigation, for instance, would be available for an additional area of 21 million acres (12 million acres under major and medium projects and 9 million acres under minor works), so as to take the net irrigated area in the country to 88.0 million acres in 1960-61 (the last year of the second Plan), as compared with the base level of 51.5 million acres in 1950-51 (the year immediately preceding the first year of the first Plan). The actual capital expenditure incurred on irrigation during the decade aggregated Rs. 910 crores (Rs. 730 crores on major and medium projects and Rs. 180 crores on minor works). But, in spite of this huge expenditure, the aggregate net irrigated area rose from 51.5 million acres in 1950-51 to only 60.2 million acres in 1960-61 (*vide* Classification of Area and Irrigated Area, 1960-61, on page 343 of the Annual Number 1963 of *Agricultural Situation in India*). This aggregate, incidentally, is very much less than even the reduced figure of 70.0 million acres estimated for 1960-61 in the third Plan's review of ten years of planning, let alone the original estimate of 88.0 million acres for that year in the second Plan.

It would thus appear that, whatever be the official claim in regard to the additional irrigation potential that has been created, in terms of actual utilisation in the fields, the additional area benefited has come to only 8.7 million acres (60.2 *minus* 51.5) during the first decade of planning. Of this additional area, 4.5 million acres were irrigated by Government canals (major and medium projects) and 4.2 million acres by minor works like tanks and wells. The additional area irrigated by tanks and wells was in fact 5.4 million acres, for there was a net reduction in the area irrigated by private canals and other sources to the tune of 1.2 million acres. The long and short of the whole thing is that, while the huge outlay of Rs. 730 crores on major and medium irrigation has *benefited only 4.5 million acres*, an outlay of just Rs. 180 crores on minor irrigation has sufficed to benefit an area of as much as 5.4 million acres. In other words, while the capital cost of major and medium irrigation has come to about Rs. 1,600 per acre (of course, this figure may be expected to decrease progressively to Rs. 1,200 with the progressive increase in utilisation from the current 75 per cent of the earlier projects to 100 per cent), that of minor irrigation has represented no more than Rs. 333 per acre. At these rates, the proposed third Plan outlays of Rs. 650 crores on major and medium irrigation and about Rs. 200 crores on minor irrigation may be reasonably expected to bring the aggregate net irrigated area to about 70.3 million acres only in 1965-66, as compared with 60.2 million acres in 1960-61.

If 80 per cent utilisation is assumed, as Dr. K. L. Rao, Union Minister for Irrigation and Power, has done in his presidential address at the Irrigation and Power Ministers' Conference held at New Delhi on the 3rd instant, the additional potential of 23.2 million acres proposed to be created under the third Plan would benefit as much as 18.4 million acres. But that much addition, bringing the net irrigated area to the level of 78.6 million acres in 1965-66, cannot be validly assumed, for the rate of utilisation is bound to be much lower than the figure of 80 *per cent in the earlier years of new irrigation* projects initiated in the third Plan period. Whatever be the rate of utilisation, *there can* be no questioning the need for completing almost all the *committed* projects during the fourth Plan period. According to Dr. Rao, this task itself would involve an aggregate outlay of Rs. 800 crores. As the costs of projects have been going up, the planners would do well not to include any new major and medium projects in the fourth Plan. The additional resources (whatever they be) demanded by Dr. Rao for some new major and medium projects could as well be allotted to minor irrigation which is any day more economical and capable of yielding quicker benefits than major irrigation. At the same time, the beneficiaries of major and medium projects should be made to contribute more than they do at present towards the running costs of such projects through higher water rates and also, wherever possible, *towards a part of their capital costs.* Unless they foot a part of the capital bill, it would be patently uneconomic to maintain a high level of investment in major irrigation from which they stand to benefit ultimately. It is unfortunate that several State Ministers of Irrigation have refused to commit themselves to this course. But the fact that the Ministers' Conference has led to the appointment of a committee for examining the question of additional resources for irrigation through betterment or other levies may yet mean something, if only the leaders of State Governments can summon some courage in dealing with the increasingly prosperous agriculturists.

As for the power programme, the total investment upto the end of the second Plan was about Rs. 1,020 crores (of which State-owned public utilities accounted for Rs. 790 crores), as compared with Rs. 190 crores (of which less than half was in the public sector) in 1950-51. The additional outlay of Rs. 830 crores during the first decade of planning was made up of Rs. 720 crores in State-owned utilities, Rs. 70 crores in company-owned utilities and Rs. 40 crores in self-generating industrial establishments. The aggregate addition to the 1950-51 generating capacity of 2.30 million kw., over the ten-year period, was only 3.40 million kw., as against the target (combined first and second Plans) of 4.88 million kw. The capital cost of that much additional capacity actually installed has worked out to about Rs. 2,400 per kw. This rate may be on the high side, as some of the power projects on which outlays had been effected have spilled over into the third Plan. But, as against this must be set the likelihood that some of the third Plan projects, too, would spill over into the fourth Plan. So much so, that the rate of Rs. 2,400 per kw. may be validly assumed for the third Plan period. At this rate, the revised aggregate outlay of Rs. 1,130 crores for the stated purpose of installing an additional capacity of 7.0 million kw. may *actually* suffice for an additional capacity of 4.6-4.7 million kw. only.

Perhaps, at the most, the likely achievement may come to 5.3 million kw. on the basis of a reduced rate of Rs. 2,100 per kw. And that would mean an aggregate installed capacity of no more than 11.0 million kw. in 1965-66, as against the 12.5 million kw. estimated in the recent mid-term appraisal of the third Plan. As Dr. K. L. Rao himself has confirmed, the *aggregate installed capacity at the commencement* of the New Year (that is, 1964) is just 7.1 million kw., representing an increase of only 1.4 million kw. over 2¾ years of the Plan. Even considering that the phasing of benefits has itself visualised relatively larger additions to capacity only in the last two years of the Plan, the likelihood of achieving 12.5 million kw. in 1965-66 would have to be ruled out. Incidentally, the most likely achievement of 11.0 million kw. in 1965-66 would involve a cumulative shortfall of 3.2 million kw. in the combined target for the first three Plan periods. No wonder, therefore, that industrial production is expected to range round the relatively moderate rate of 7.5 per cent per annum over the third Plan period. The biggest single factor responsible for the continuing under-utilisation of industrial capacity is indubitably the shortfall in power supply.

It may still be possible to expedite the tempo of power development, if additional re*sources can be mobilised for the purpose.* This is particularly necessary, for the resource *requirement of the third Plan projects* seems to have been underestimated. The most effective way of generating the required additional resources would be to increase the electric power rates so as to get a return of at least 10 per cent on the capital base. This has been strongly recommended in the recent report of the World Bank Mission. It is the Mission's view that the policy of low power rates is no longer a stimulus to "growing investment and larger production," for many industrialists have recognised of late that the ready availability of power is much more important than its price. What is worse, according to the Mission, this policy "does make difficult the accumulation of funds for the further expansion of generating capacity which is so urgently needed." As the Mission's illustrative calculations have it, increasing the average power rate to, say, Re. 0.116 per kw.h. would mean an additional profit of about Rs. 500 crores for the entire third Plan period. Dr. K. L. Rao, too, has appropriately referred to the need for raising the rates, albeit in the context of the resources for the fourth Plan power programme. But the State Ministers have evinced no enthusiasm for this proposal too. In fact, they have opposed the idea on the ground that it would retard industrial progress in their States. Here, again, the appointment of a committee for examining the question of additional resources for Electricity Boards through an upward revision of power tariffs may ultimately lead to something or nothing.

What is difficult to understand, in this connection, is the shortsighted opposition of sections of industry to any suggestion of an increase in the price of power (which has all along been subsidised in a way to further industrial development). It is well known that the costliest kilowatt of electricity is that which is not readily available for maintaining industrial production at the optimum level. Moreover, any upward revision in the power tariffs of State Electricity Boards should be logically applied to those of the company-owned utilities, and that would improve their finances. If the electricity industry in the private sector is benefited that way and if, at the same time, it is permitted to expand its generating capacity in all possible ways, it would be in a position to raise more resources, both internally and by attracting fresh capital from the market, so as to make good at least a part of the expected *shortfall in the third Plan's target of generat*ing capacity. There is no reason why the proposal mooted by the Union Minister for Irrigation and Power should wait for implementation during the fourth Plan period. The need for additional resources for power development in the current Plan itself is there for all to see. It should be met here and now.

MARKET GOSSIP

Indian Cotton Prices

AN elementary fact that too often tends to be ignored in the avalanche of official exhortations and policies for holding the price line is that the price of any product or service is a function of cost and a reflection of the supply position. It, therefore, follows logically that, in order to bring down prices, *costs of production must be reduced* and supply increased. Unless this is done, nothing can stop prices from rising even in a controlled market. The cure for rising prices is, therefore, apparently simple—cost reduction and higher production—though it may be difficult to administer it in practice. Measures that enhance cost and restrict production are inconsistent with the policy of holding the price line. It is, perhaps, this simple logic that has prompted the Committee of Experts (headed by Dr. S. K. Muranjan), appointed by the Ministry of International Trade early last year, to suggest that, in view of the prevailing high price of raw cotton, measures should be taken to stabilise cotton prices. Extensive extracts from the Committee's report in respect of cotton textiles have appeared in a section of the Press. It is not clear from these extracts whether the Committee investigated the other elements in the cost structure of the cotton textile industry, that is, other than raw materials, and if so what other suggestions it has made. So far as cotton is concerned, the Committee is reported to have pointed out that one of the main reasons for the continuing high price of cloth is the high price of cotton. It has found that Indian cotton prices are very much higher than world prices. An economic and stable price for raw cotton, in its opinion, is of crucial importance to the competitive success of Indian cotton textiles in foreign markets.

The Committee feels, and rightly so, that, as a producer of coarse and medium varieties of cotton, India has or should have an advantage over its competitors, who depend on imports for raw materials, both from the standpoint of domestic consumption and exports of yarn and cloth produced from these cottons. The extent of the advantage would depend in an appreciable measure on the prices of these varieties as compared with the prices of cotton abroad. It is, therefore, important, according to the Committee, to examine whether the floor and ceiling prices fixed for cotton are reasonable. It is but proper and inevitable, the Committee maintains, that prices of comparable cottons in India and abroad should rule at the same level when a free market, however regulated, exists.

Proceeding from this basic assumption, the Committee makes a comparative study of the prices of American and equivalent Indian cottons. It points out that the American middling one inch cotton, for which the U.S. Government declares support prices, has its nearest counterpart in Indian Cambodia B cotton which has an identical staple, namely, one inch. The American support price for middling 1 inch cotton works out to Rs. 1,240-Rs. 1,250 per candy of 784 lbs., as compared with the floor and ceiling prices of Rs. 911 and Rs. 1,325 per candy for Cambodia B. It will thus be seen that the Indian ceiling price is higher than the American support price. It may be noted here that, in view of the shortage of cotton existing in this country, the ceiling prices more often than not turn out to be the actual market prices. Indeed, sometimes they even rule above the ceilings also as has been the experience in the last few seasons.

The bulk of mill consumption of Indian cotton, about 73.5 per cent, is accounted for by cotton having a staple length of less than 28/32". Cotton with staple length one inch and above forms only 10 to 11 per cent of total mill consumption. Yet, the Committee points out, the average of ceiling prices of the major 26 varieties of cotton, with staple lengths ranging from 25/28" to 1", weighed by their respective share in mill consumption during 1962-63, is as high as Rs. 1,127 per candy. This has led the Committee to the conclusion that, unless the ceilings fixed for the medium staples are unduly high, the weighted average could not amount to such a high figure as Rs. 1,127, as against the ceiling price of Rs. 1,325 per candy for the comparatively longer staple Cambodia B cotton.

In the opinion of the Committee, there is further reason to believe that the floor and ceiling prices of Indian cotton are higher relatively to the prices of American cotton. Thus, it points out, one of the most inferior Indian varieties, Mogiai Jarilla 25/32", has a staple length one point lower than the shortest staple American cotton (26/38"). The longest staple Indian cotton Cambodia A has a staple length of 1.1/32" which is very much lower than the best American cotton 1.8/32". Yet floor prices for these two Indian cottons are allowed a difference of Rs. 463, as against the American minimum price difference of Rs. 229.5 per candy only. This is even more true of ceilings, says the Committee. Jarilla and Cambodia have ceilings which differ by as much as Rs. 528, whereas the difference between the highest prices of the shortest and longest staple American cottons is only Rs. 50.4.

Even when the disparity between the floor and ceiling prices is compared with that between the ruling minimum and maximum market prices in the U.S., it is found, according to the Committee, that the trading margins allowed in this country are high. Floor and ceiling prices (average), with such wide disparity as Rs. 747 and Rs. 1,127, have become necessary, because, unlike in the U.S. where the C.C.C. stocks and price supports act as a cushion, a forward market has been allowed to exist in this country without any stabilising agency entrusted with the responsibility of holding the price line in the interest of the consumer and exports. The Committee concedes that the cotton situation in the U.S. and India are basically different, with the haunting fear of unwanted surplus in the former country and the danger of shortages and prices piercing the ceilings in the latter. Even so, in the interest of domestic price policies and exports, the need for a reasonable and stable price for raw material cannot be overlooked. Whether a forward market in cotton has any healthy function to perform in the context of persistent shortages and continuous upward pressure on prices is quite a separate matter, opines the Committee. But it presumes that the present basis of the hedge contract, namely, Moglai Jarilla 25/32" staple, which is an inferior and non-representative variety, has much to do with inflating both the floor and ceiling prices of cotton.

That Indian cotton prices are above world parity is a fact well known to mills in India for quite some time now. And the high price of cotton has been one of the significant factors that have contributed to the high domestic and export price of cloth, because raw cotton accounts for more than 50 per cent of the cost of production of cloth. Instead of trying to bring down cotton prices, official policy has been pegging cotton prices at higher and higher levels under pressure from growers, or more correctly, from the self-appointed champions of growers' interest. The Government has succumbed to this pressure partly because of political expediency and partly influenced by the hope that high price will bring forth higher production. This hope has not materialised and the resultant situation of high prices and persistent shortage, along with high taxation and restriction on mill production, has undermined the export trade in cotton textiles. It is to be hoped that the Committee's report and the suggestions contained therein would induce some rethinking on cotton price policy and lead to an eventual readjustment of cotton prices to more reasonable levels.

"Musco": An Attractive Long-term Issue

Due to open for subscription on Tuesday next (14th January) is the Rs. 1.57-crore public issue of Mahindra Ugine Steel Company Limited (Musco for short), an enterprise launched jointly by Messrs. Mahindra and Mahindra Limited and the Societe Inde-Ugine of France for the manufacture of alloy and special constructional steel. The issue, which has been fully underwritten, consists of Rs. 1.07 crore in equity shares (of Rs. 10 each) and Rs. 50 lakhs in preference shares (9.3 per cent cumulative redeemable shares of Rs. 100 each). The public issue of Rs. 1.57 crore will meet roughly one-fourth of the aggregate estimated capital outlay of Rs. 6.50 crores, including a foreign exchange component of Rs. 2.6 crores. The balance of Rs. 4.93 crores will be met by a loan-cum-investment of Rs. 1.50 crore (investment proper is Rs. 40 lakhs) from the International Finance Corporation, a foreign exchange loan of Rs. 65 lakhs from the I.C.I.C.I., a rupee loan of Rs. 1.50 crore from the I.F.C. of India, deferred payment facilities amounting to Rs 25 lakhs, a direct investment of Rs. 40 lakhs by the French firm, and Rs. 63 lakhs from the House of Mahindras and its associated companies, staff and shareholders. Details of the issue are given on pages 50 and 51 of *Commerce*. A perusal of these details will clearly indicate how attractive this issue is from the point of view of investors. It is true that investors will have to wait for a few years before getting a return, as the promoters of the project themselves say that their factory, proposed to be built at Khopoli, about sixty-five miles from Bombay, will commence operation only by the middle of 1966 and go into full production a year later. But such waiting will doubtless be amply rewarded, considering that the project is a sound and well-conceived one, with great growth potential. Some of the highly attractive features of the project are as follows:

1. The products of the factory, namely, chromium, nickel, manganese, molybdenum and vanadium alloy construction steels will have a ready market. For so vast is the demand for these steels which are widely used in the manufacture of aircraft, locomotives, automobiles and machinery parts where higher strength and elastic properties, coupled with higher ductility, are required. They also form one of the essential raw materials for the armament and defence-oriented industries. The estimated annual demand for constructional steels is put at 100,000 tons by 1965-66 and double this quantity by 1970-71. The annual licensed capacity of the Musco's plant is 25,000 tons of ingot steel or about 18,000 tons in terms of finished steel.

2. One can reasonably expect economic operation of the factory with special emphasis on quality. For the construction and operating phases of the project will have comprehensive engineering and technical services and know-how rendered by Ugine of France which has more than fifty years' experience in the manufacture of construction steel. The French firm enjoys a world-wide reputation for the quality of their products.

3. The factory will have easy accessibility by road and rail, besides being close to the industrial consuming centres. What is more, it is assured of adequate power and water supplies.

4. Plentiful supplies of melting scrap, the most important raw material for the production of alloy and special steel by electric furnace, are available. As for other items, some are indigenously obtainable, while some need to be imported till such time as indigenous capacity is developed.

5. The Company is in the hands of a competent Board of Directors, including Mr. Harish Mahindra (Chairman), Mr. H. V. R. Iengar, Mr. Madan Mohan Mangaldas, Mr. Keshub Mahindra, and the Maharaja of Jaipur.

6. The Company will have tax benefits such as a tax holiday for the first five years, development rebate, and concessions in super-tax on dividends and S.P.T.

7. The distribution of the Company's products will be in the hands of Mahindra and Mahindra Ltd. (the sole selling agents) which, as is well known, has long experience in steel trade.

So much about the investment merits of the Musco project. One cannot, however, envisage the profit-margin of this Company, for much will depend on the fiscal and pricing policies of the Government at the time the Company goes into production. But there is no doubt that the project is of considerable importance for the economy of the country as a whole. The production will help meet a part of the growing demand for alloy constructional steels that India cannot afford to import because of the shortage of foreign currencies. The annual turnover of the Company's output, when normal production is attained, is expected to be of the order of Rs. 4 crores which is certainly not an insignificant figure in terms of the foreign exchange savings to the country.

Chemicals And Fibres' Capital Issue

One of the notable companies to enter the capital market in the new year is the Chemicals and Fibres of India Ltd. (C.A.F.I.). The Company, which was formed in 1961 to undertake the manufacture of synthetic fibres, plastics, dyestuffs and other chemical products, has offered 625,000 equity shares of Rs. 10 each for public subscription. The list will open on 20th January 1964 and close on the 25th or earlier but not in any case earlier than 22nd January. The mode of payment is Rs. 2.50 per share on application and Rs. 7.50 per share on allotment. Application must be for a minimum of 50 shares of multiples thereof.

The authorised capital of the Company is Rs. 10 crores in 10,000,000 equity shares of Rs. 10 each. The issued capital is Rs. 2.50 crores; of this, the Imperial Chemical Industries Ltd. of Britain, the parent company, will contribute Rs. 1.50 crore or 60 per cent of the capital in pound sterling which will be used to pay for the plant, equipment and design charges. The Life Insurance Corporation of India takes up Rs. 12.50 lakhs. The Directors and employees of the Company have agreed to take up Rs. 25 lakhs. The balance of Rs. 62.50 lakhs represents the present offer to the public. The issue has not been underwritten in the strict sense of the term, but the Imperial Chemical Industries (India) Private Ltd. has agreed to take up, without any commission, any of the shares not subscribed by the public. The Company has a seven-member Board of Directors, with Mr. A. R. Foster, Chairman and Managing Director of I.C.I. (India) Private Ltd., as Chairman. There are two Indian Directors on the Board, namely, Mr. Neville Wadia and Mr. N. R. Pillai.

The capital outlay on the project, including the cost of land, buildings, plant, equipment, machinery, etc., is estimated at Rs. 5.85 crores which will be met by the equity capital of Rs. 2.50 crores, a loan from the Life Insurance Corporation of India of the order of Rs. 1.50 crore and borrowings aggregating Rs. 1.85 crore from the British Bank of the Middle East. The first plant will be for manufacturing polyester staple fibre for which there is a great and growing demand in the country. At present, import of polyester fibre manufactured by I.C.I. of Britain and marketed under the name "Terylene," is severely restricted and therefore locally manufactured polyester fibre is expected to find a ready and expanding market in the country. A much larger demand than the present licensed capacity of the Company of 4.5 million lbs. is said to be in existence in the country and plans for a substantial increase in capacity have already been formulated. Technical assistance is being provided by the parent company. Construction of the plant is now well under way at the Company's 220-acre site at Thana, near Bombay, and production is expected to commence in the first half of 1965. Investors in this issue may not, therefore, have to wait for long to get a return on their capital, if everything goes well according to schedule.

Ambika Silk's Silver Jubilee

On the occasion of the Ambika Silk Mills' Silver Jubilee, the management can certainly look back with justifiable pride and look forward with considerable confidence. We say "justifiable pride" because the Company has, during the twentyfive-year period of its existence—it was incorporated on 11th January 1939—not only expanded but also diversified production of art silk, nylon and terylene fabrics. Such expansion and diversification have been achieved through (a) increase in the number of looms from 200 to 300, (b) installation of latest type machinery (including warp knitting looms), and (c) establishment of an efficient printing department. The progress is fully reflected in the highly encouraging results of the Company for the past few years. Between 1939 and 1953, the share capital of the Company has risen from less than Rs. 3 lakhs to Rs. 25 lakhs, sales and processing service charges from Rs. 1.21 lakh to Rs. 2.21 crores and gross profit from just Rs. 22,702 to as much as Rs. 31.35 lakhs (for the year 1962). The gross block of the Company as at the end of 1962 stood at Rs. 50.46 lakhs, as against Rs. 4.70 lakhs in 1939. The shareholders of the Company have benefited greatly from the progressively rising rate of dividend which for the year 1962 was 20 per cent (subject to tax), as against 4 per cent distributed for the year 1941.

TREND OF SHARES

OPERATORS CAUTIOUS

(From Our Own Correspondent)

BOMBAY, 9th January

THE Stock Exchange greeted the New Year in an atmosphere of hesitancy and uncertainty. Caution was the keynote of trading, as the market had not fully recovered from the shocks administered on Tuesday, 31st December 1963, by the Congress Working Committee's draft resolution which, *inter alia*, envisaged a ceiling on income, inherited wealth and urban property and a larger share for the State in capital gains and unearned income. Apprehensions that this resolution would be adopted in the Congress session at Bhubaneshwar caused nervousness in the bull camp during the holidays and provoked long liquidation at throw-away prices in the kerb dealings. The losses would have been heavier but for a sudden change in the market sentiment on the concluding day of the account on Friday last. Although a landslide in prices was averted, confidence was by no means restored. It is needless to emphasise that the new uncertainties would nullify the good effects of certain recent moves of the Finance Minister such as the decontrol of 16 commodities.

Fears of nationalisation of banks was another factor which undermined the sentiment and frightened genuine investors out of the market. This resulted in some selling pressure in bank shares and adversely affected the insurance section also.

The only question on which attention continued to be focussed was this: What concrete steps would be taken by the Government to implement the objectives of democratic socialism? Marketmen soon realised that an answer to this question could be found only in the budget for 1964-65 due to be presented on 29th February next.

In refreshing contrast to past experience, some aggressive buying was in evidence on the last day of the last settlement. Undeterred by the prevailing uncertainties, leading operators lent effective support to the speculative favourites such as Tata Steel, Century, National Rayon and Tata Engineering. In doing this, they were encouraged by the growing belief that the Government would hesitate to take any drastic steps which would have the effect of retarding the pace of industrial development. The improved sentiment was also attributed to a substantial increase in the output of steel registered by T.I.S.Co. and I.I.S.Co. during the past month and reports of revival of U.S. investors' interest in the Indian market.

From the technical point of view, it would appear that market has become healthier, as the marginal bulls have been weeded out in the recent nervousness engendered by the trend of discussions on the Congress resolution. This was amply reflected by the encouraging behaviour of the market since the beginning of this week with a few shares like National Rayon and T.E.L.Co. and Tata Chemicals hoisting fresh peaks.

In unofficial dealings late on Tuesday, however, anxiety over the Prime Minister's health caused a jitter and values suffered a small jolt only to recover fully in Wednesday's official session on reassuring reports that, after feeling very tired and weak, the Prime Minister was quite cheerful and in good spirits. Again, after the close of the market on that day, values receded in kerb trading following unfounded adverse rumours about Prime Minister's health. On Thursday, the markets opened higher due to short-covering by the overnight speculators, as the rumours turned out to be false. A part of the resultant gains were, however, wiped out towards the close, as there was no follow-up buying and operators preferred to keep their commitments light. The Finance Minister's determined opposition to the leftists' demand at the Bhubaneshwar session of the Congress Party for nationalisation of banks and certain other industries also helped the stock exchanges to close on a steady note. As compared with the closing rates for 1963, the list as of Thursday this week shows a sprinkling of modest losses and gains.

* * * *

Scripwise, National Rayon, T.E.L.Co. and Tata Chemical were particularly outstanding during the week under review, inasmuch as all the three of them scaled new peaks of Rs. 439.50, Rs. 306 and Rs. 19.72 during the week. Among the favourites, Steels were conspicuously firm on continued speculative support aided by the substantial improvement in the output figures of steel for the past month. Tata Ordinary were lifted up higher to Rs. 147.50 and India Iron to Rs. 25.10, as against Rs. 144.50 and Rs. 24.88 last week. Century and Kohinoor were likewise pushed up at one stage to Rs. 694 and Rs. 343 before receding to Rs. 681 and Rs. 339.50 at the end of the week, as against Rs. 665.50 and Rs. 330.50, respectively, a week before. Indian Dyestuff and Colour-Chem, however, recorded losses of Rs. 5 and Rs. 7.50 to finish at Rs. 332.50 and Rs. 352.50 after advancing in the mid-week to Rs. 347.50 and Rs. 356.25. The cash list presented a more or less dull appearance, as investible funds were being conserved for participation in a spate of new issues entering the capital market in the current month. Popular favourites like Baroda Rayon, South India Viscose, Synthetics and Chemicals, Kirloskar Cummins, Associated Bearing and Sandvik Asea eased on disinvestment selling.

* * * *

Reports from Bombay were mainly responsible for maintaining a steady trend on the Calcutta Stock Exchange during the week. Trading was, however, dull and featureless and share values, after registering a general decline on Monday, staged a moderate recovery as the week progressed. Selected speculative counters regained considerable ground under the leadership of India Iron and Hind Motors, Orient Paper, India Aluminium, Guest Keen William and Texmaco followed suit and recorded welcome gains over the week. In the cash section, selected jute and miscellaneous industrials such as Angelo, Imperial Tobacco, J. K. Synthetics, Aluminium Corporation, Indian Carbon, Alkali, Goodyear and Universal Cables attracted attention and showed a hardening trend. After remaining sluggish for sometime, Teas met with selective support.

* * * *

Trading on the Madras Stock Exchange was dull and unexciting. There was a slackening of buying inquiries and business was restricted only to the popular scrips. A redeeming feature was the steadiness of planting shares, which met with moderate absorption but only at lower rates. Selected textiles such as Madura and Travancore Rayons showed to advantage on some demand reflecting a revival of confidence on the part of investors. In contrast to this, South India Viscose were a soft feature under the weight of special selling. Enquiries for Mettur Chemicals, Ashok Leyland and Aluminium Industries were meagre and made no significant impact on their value.

ANOTHER VENTURE OF ANDHRA SUGAR

The Andhra Sugars Ltd. has announced the launching of a new venture to set up three plants for producing annually 9,900 tons of caustic soda, 6,330 tons of chlorine and 2,600 tons of hydrochloric acid. The combined outlay on these plants is estimated at Rs. 214.17 lakhs. The major part of the outlay is proposed to be met by a loan (of Rs. 140 lakhs) from the Industrial Finance Corporation, deferred payments (Rs. 28.75 lakhs), and internal resources (Rs. 32.42 lakhs), so that the amount raised by way of public issue will be only Rs. 13 lakhs in 100,000 equity shares of Rs. 10 each at a premium of Rs. 3; the issue will open for subscription on the 20th inst.

Although the I.F.C. loan is sizable and entails heavy interest payments, the Company has preferred it to larger public issue apparently because of two considerations. One is that the Company may be hopeful of repaying the I.F.C. loan at the earliest so as to obviate payment of heavy interest charges. It is already operating a sugar factory with a daily cane-crushing capacity of 1,250 tons, as well as sulphuric acid, industrial alcohol, and acetic acid and acetic anhydride plants. The gross income earned by the Company during the year ended September 1962 amounted to Rs. 2.81 crores and the profit-margin (ratio of gross profit to sales) was 20 per cent, the rate of dividend distributed being 16 per cent. The second consideration seems to be that the Company wants the benefit of expansion schemes to be enjoyed more by existing shareholders than by new investors. It may be noted here that the managing agents and friends of Andhra Sugar are holding nearly 70 per cent of the total capital of Rs. 69.97 lakhs (as of 30th September 1962).

Whatever the considerations, in view of good growth prospects and capital appreciation and also of the fact that the amount of public issue is small, the public response to the issue will doubtless be highly encouraging.

DENA BANK DOES WELL

As usual, Dena Bank is the first among the Bombay banks to announce the results of its working during the year ended December 1963. The results are quite gratifying, in that they show an improvement of Rs. 2.51 lakhs to Rs. 26.60 lakhs in net profit after providing for taxation but before making provision for bonus to staff. The improvement may no doubt appear small, but it must be remembered that, in the year 1962, the Bank had suffered a setback of Rs. 5.57 lakhs in profit. The rise in profit should also be judged against the background of larger interest payment on deposits—the total of deposits went up from Rs. 51 crores to Rs. 59 crores—enhanced salaries for staff, and additional expenditure incurred on the establishment of 17 new branches, bringing the total to 129 branches. The aggregate advances made available by the Bank to its clients spurted from Rs. 31.74 crores to Rs. 38.75 crores and working funds from Rs. 55.34 crores to Rs. 65.00 crores.

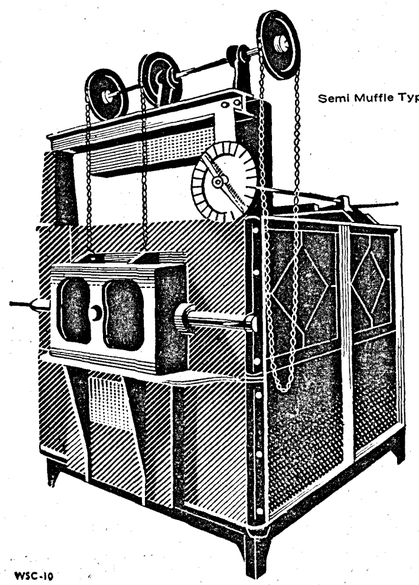
The profit of Rs. 26.60 lakhs, together with the Rs. 3.19 lakhs brought in from the previous year, gives a total of Rs. 29.79 lakhs available for distribution. The proposed dividend, including the final 3 per cent, is higher at 12 per cent, as against 11 per cent a year before. As the enhanced dividend is on a higher capital base for the whole year, the amount required for making it is larger at Rs. 12.00 lakhs, as against Rs. 6.90 lakhs a year before. The bonus to staff also takes up a bigger amount, namely, Rs. 6.00 lakhs, as against Rs. 4.50 lakhs. Consequently, the amount transferred to reserve funds is lower by Rs. 13 lakhs at Rs. 10 lakhs.

UNITED BANK PAYS MORE

The United Bank of India, too, has proposed the payment of a higher dividend (subject to tax) of 7½ per cent for the year 1963, as against 6 per cent distributed in 1962. This has been rendered possible by a handsome increase in net profit (after providing for taxation and bonus) from Rs. 21.20 lakhs to Rs. 26.39 lakhs. Of this profit, dividends alone will absorb Rs. 20.20 lakhs, the sum allocated to statutory reserves being Rs. 5.30 lakhs; the corresponding figures for 1962 are Rs. 16.08 lakhs and Rs. 4.26 lakhs, respectively. The net accretion to the deposit portfolio of the Bank was larger in 1963 than in 1962, being Rs. 7 crores, as against Rs. 5 crores; the total deposits at the end of 1963 stood at Rs. 72 crores.

WELLMAN INCANDESCENT STANDARD OIL FIRED FURNACES

- Made in India by Wellman Incandescent India Ltd
- For forging, reheating & heat treatment
- Available in standard sizes or tailored to customers' specifications
- Accurate temperature control
- Low operation and maintenance cost
- Rapid attainment of working temperature
- Working temperatures ranging from 250°C—1350°C *depending on type of furnace*



Semi Muffle Type Furnace.

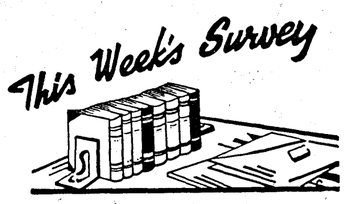
UNDERSTAND

the problem
Development and Defence go together. The more you produce in farms and factories the more you add to the strength of the country.

WORK RESOLUTELY FOR STRONGER DEFENCE

DAVP 17



REPORT ON CO-OPERATIVE ADMINISTRATION

THE co-operative movement, which used to be mainly concerned with credit, has become so much diversified in recent years that it now covers several other fields of economic activity like joint farming, agricultural processing and marketing, sale of consumer goods, industrial production, housing and insurance. Thanks to such diversification, the responsibilities of the co-operative administration have become increasingly complex and difficult. That the Co-operative Departments in the States would need to be streamlined and strengthened for discharging their manifold administrative responsibilities has been recognised for some time now. But concrete measures towards this end are yet to be taken. It is in this context that the recommendations of the Committee on Co-operative Administration (Chairman: Mr. Vaikunth Lal Mehta), which was appointed in April 1963 in pursuance of a decision taken at the Lucknow Conference of State Ministers of Co-operation held in February 1963, strike one as quite timely. Whether these recommendations, just published in summary form, are also realistic and practical can only be broadly inferred, in the absence of the full report.

The Press summary, while referring to the Committee's recommendations for strengthening the staff of the Co-operative Departments so as to enable them to discharge their diverse promotional, as distinct from supervisory, responsibilities more efficiently, has highlighted the Committee's view that "any increase in the size of the Co-operative Departments should not lead to any interference in the day-to-day working of co-operative institutions, such as would adversely affect their freedom and autonomy." The expanded set up, recommended by the Committee in this connection, would have the Registrar in the elevated rank of a Commissioner, assisted by six functional advisers or joint registrars for audit, banking and credit, co-operative marketing and processing of agricultural produce, industrial co-operatives, co-operative farming and consumers' co-operative stores. At the divisional and district levels, too, there are to be full-fledged officers to represent the Co-operative Department. It may be conceded, as Sir Malcolm Darling had stated in his report on certain aspects of the co-operative movement in India (1957), that special staff would be needed to enable the large areas, which are co-operatively undeveloped, to keep pace with the Plan. Given thus the need for strengthening the co-operative staff and the even greater need for vigilant supervision and efficient, as also continuous, audit of various types of societies, it may not be possible entirely to avoid departmental interference in the day-to-day affairs of co-operative institutions. Perhaps, it would be easier to avoid needless administrative interference, if one key recommendation made by the Committee can be implemented expeditiously. This recommendation is to the effect that the primary credit societies, which are now subjected to departmental supervision in some States and to the institutional supervision of central financing agencies in some others, should come to be supervised by central banks uniformly in all the States and that the supervision of all other co-operative societies should be transferred to appropriate federal co-operative agencies. This salutary approach is, incidentally, in conformity with the following view of the Rural Credit Survey Committee:

> "Supervision of primary societies should be invariably regarded as the legitimate function of the financing banks. They are well fitted for this role because of the intimate relations which may be expected to exist between them and the societies. Besides, as financiers of the societies, they have to safeguard their own interests and ensure the soundness of the operations of the societies. . . ."

This approach would involve, in the case of non-credit societies, too, the formation of federal co-operative bodies wherever they are not in existence and the transfer to them of some of the statutory powers of the Registrar of Co-operative Societies. Until such systematic arrangements are made within the co-operative sector itself, it goes without saying that supervision should continue to be the direct responsibility of the Co-operative Departments. The required amendments to the Co-operative Societies Act, it is needless to add, should not, however, be unduly delayed, if the co-operative movement is to be freed from excessive bureaucratic control and interference. Likewise, there is need for ensuring that extraneous forces, political or other, do not influence the working of co-operatives which are essentially business organisations. It is good that the Committee, while recognising this need, has particularly questioned the wisdom of any move to transfer to *panchayats* some of the powers in respect of co-operatives. It has done so on the ground that any such transfer of powers would impede progress towards the transfer of authority to federal co-operative agencies which alone could make the movement self-disciplined and self-regulatory. The Committee's view, incidentally, is broadly in line with the approach of the Damle Committee on Co-operative Policy (1959) which had pleaded for a clear demarcation of functions between the *panchayats* and the co-operatives for the simple reason that "the *panchayat* is primarily an administrative body which comprises all the people in the village and has revenue resources and tax powers, while the village co-operative is essentially a business organisation whose resources are largely based on contractual obligations." As a business organisation, it is only fair and appropriate that the co-operative society should be subjected to the business supervision of federal co-operative agencies and not to the supervision of *panchayats* with their inevitable local feuds and politics.

STATE FINANCIAL CORPORATIONS

What role do the State Financial Corporations play in the country's economy? Has the progress made by them in the past few years been satisfactory? Are there any special factors that are hampering the efficient working of the Corporations? And what should be done to ensure a quick expansion of the range and volume of their activities? For the answers to these posers, one has only to peruse the brief but forthright speech delivered by Mr. P. C. Bhattacharyya, Governor of the Reserve Bank of India, while inaugurating the tenth conference of the representatives of State Financial Corporations at Bangalore last week-end. The points made by him certainly deserve the urgent consideration of the Corporations, if they "are to make a real impact on the process of industrialisation that is going on in the country. These Corporations, by the way, are considered to be "the most important instruments" for accelerating the pace of development of small- and medium-scale industries.

The State Financial Corporations, it will be recalled, have been functioning for various periods in different States since 1953. Ten years may be a short period to judge whether the Corporations have fulfilled the objectives for which they were set up, especially because of the teething troubles experienced by them and the dislocation caused by the reorganisation of States. But even after fully allowing for these troubles, the progress made so far has been rather slow. Candidly enough, Mr. Bhattacharyya said: "We cannot feel entirely satisfied, particularly *when what has been done is viewed against what needs to be done.* This has been a matter of concern to all of us for some time." He attributed the poor progress to four major impediments. They are: (1) Lack of adequate resources; (2) absence of suitable climate for undertaking underwriting business; (3) excessive caution owing to inability to build up adequate reserves; and (4) implications of the scheme of guaranteed dividends as applicable to the Corporations. The lack of foreign exchange resources of their own has also limited, according to Mr. Bhattacharyya, their business. The fact that a considerable part of the business of small-scale units is being handled by the National Small Industries Corporation, which has been supplying machinery on hire purchase, has been another factor responsible for the unimpressive progress of the State Financial Corporations.

The aforesaid factors, we are told, have been dealt with by the Working Group set up by the Reserve Bank—the report of the Group has still not been released to the public—and the Group has offered various suggestions, short-term and long-term, for improvement. Assuming that these suggestions are practical, they deserve to be implemented energetically and that without much delay. In particular, there is the urgent need for strengthening the resources position of the Corporations. Mr. Bhattacharyya felt that certain further measures of positive assistance should be accorded to the Corporations, but he did not spell out clearly what these measures were. The grant of such assistance can certainly be obviated if the Corporations themselves take steps to acquire more resources by, say, strengthening the capital base and tapping the source of deposits from the public. Meanwhile, the improvement in the resources of the Refinance Corporation for Industry and the establishment of the proposed Development Bank will doubtless help the flow of funds to the Corporations.

A mere increase in the resources of Corporations is, of course, of no avail. What is more important is the utilisation of these resources wisely and profitably. Unless definite steps are taken to augment the business of the Corporations, their subvention liability to the State Governments—the total of this liability now stands at Rs. 1.62 crore—would, as Mr. Bhattacharyya warned, continue to grow, mortgaging their future profits. The lending operations of the Corporations must be of a judicious nature, for, otherwise, the Corporations will incur heavy losses as a result of payment defaults. The working results of some Corporations for the year 1962-63 reveal a number of defaults. Naturally enough, Mr. Bhattacharyya was prompted to urge maintenance of close contacts with borrowers after the disbursal of loans.

A noticeable feature of development banks abroad is the relatively greater freedom enjoyed by their managements in deciding upon the nature of securities which borrowers must furnish for term loans. Recalling this, the Reserve Bank Governor stated that it was now appropriate to examine whether, in India also, the existing provisions of the statute governing the State Financial Corporations are not unduly restrictive. If there are any such restrictions, they must be relaxed forthwith. It is, however, necessary to mention that this step should not lead to the employment of resources in risky ventures, thereby jeopardising the safety of funds belonging to the State and the public. Mr. Bhattacharyya did well, indeed, to emphasise this important aspect.

ROLE OF TECHNOLOGISTS

A technologist, as distinct from a scientist or a laboratory researcher, is one who plays a crucial role in the practical (commercial) exploitation of the results of scientific and industrial research. Especially in the current technological revolution associated with the growth of nuclear energy, complex chemicals, electronics, plastics and other science-based industries, he plays an even more significant role by integrating science with industry. Technologists as a class, particularly in a developing economy like India's, are also expected to act as innovators in relation to industrial development by (1) adapting engineering processes and practices to the country's resources and requirements, (ii) extending technical know-how gained in a particular branch to allied fields and (iii) applying the processes developed in laboratories for commercial manufacture. It would be interesting to examine whether technologists in India have acquitted themselves creditably so far in the discharge of these three functions. Most revealing in this context is the 12th Pandya Memorial Lecture delivered by Mr. G. L. Mehta, Chairman, Industrial Credit and Investment Corporation of India, at the Annual Convention of the Indian Institute of Metals held on the 3rd instant.

While dealing first with the adaptation of processes and use of raw materials to suit Indian conditions, Mr. Mehta has driven home the point that it is the responsibility of technologists to improvise and fabricate machinery in India and use indigenous raw material so as to curtail capital goods and raw material imports. But, according to Mr. Mehta, Indian technologists, working even in well-established fields, are still not actively engaged in the development work of adapting and perfecting new processes aimed at conservation of resources. Three telling examples of little or no technological progress are to be found in the following passage of Mr. Mehta's lecture:

> "Our paper industry is still dependent on bamboo as raw material which would sooner or later be inadequate to meet the increasing demand for paper, and yet insignificant development work seems to have been done in regard to the use of bagasse for the purpose. Our rayon industry has now come of age, but we have yet to develop the technology for making rayon grade pulp which is at present imported. We are still importing large quantities of zinc required for galvanising certain steel products, while its substitution by the process of aluminising remains only a vague idea."

Extension of know-how from the established fields to new ones should also be increasingly possible. For instance, the experience gained by Indian technologists in steel plants should be of use in establishing independent pig iron plants and in developing the technology for producing alloy steel. Again, the technical know-how gained in the fairly well-established dyestuff and plastics industries should be of use in the development of intermediates. Likewise, welding techniques learnt during the establishment of a large number of plants should make it possible for us to take up fabrication of process plants ourselves. That not much technological progress has been made in such fields is clear from Mr. Mehta's emphasis on the possibilities for the extension of know-how over a wider field of industry. In so far as adoption of laboratory research for commercial production is concerned, it is a painful fact that the industrial fruits of research work in the National Laboratories have been slow to materialise. Here, again, it is expected of the technologists to bridge the gap between laboratory results and their commercial exploitation. A practical suggestion made by Mr. Mehta, in this connection, is that technologists working in industries should also be associated with the research institutions in order to ensure the commercial orientation of industrial research. Indian technologists have thus before them *some unique opportunities for creative endeavour.*

RURAL SAVINGS AND DEBTS

Some revealing light on the pattern and trend of debts, borrowings, assets and investments in the rural household sector is thrown by a survey conducted by the Reserve Bank of India last year. The main findings of the survey have been published in the latest (December 1963) issue of the *Reserve Bank of India Bulletin.* The survey was carried out in an overall sample of 2,057 villages, spread over all the States, and covered the period July 1961 to June 1962. It was found that nearly three-fourths of the rural households were cultivators, the proportion varying from 59 per cent in the Punjab to 91 per cent in Jammu and Kashmir. Cultivators were predominant in the States of Bihar, Madhya Pradesh, Rajasthan, Kerala, Uttar Pradesh and Jammu and Kashmir while non-cultivators accounted for a sizable portion of the rural community in Madras, Andhra Pradesh, Gujarat, West Bengal and the Punjab.

The average value of recorded assets per rural household ranged from Rs. 3,115 in Assam to Rs. 10,482 in the Punjab, the all-India average per rural household being Rs. 5,358. The average value of assets owned by non-cultivators, at Rs. 1,678 per household for all India, was much lower than that of cultivators, namely, Rs. 6,696 per household. The explanation for this disparity, which was particularly marked in Kerala and Maharashtra, is that artisans and other low income groups formed a large proportion of the non-cultivating households.

The survey also revealed that quite a large proportion of households, nearly 62 per cent of the total, to be precise, reported outstanding loans in cash at the end of June 1962. The proportion was more than 50 per cent in all States except Assam and Orissa. In Mysore, Rajasthan, Madras and the Punjab the proportion exceeded 70 per cent. The average debt per reporting household was about Rs. 654 for all rural households. Rs. 719 for cultivator households and Rs. 429 for non-cultivator households. Debts per acre of cultivated holdings exceeded Rs. 100 in Madras, Kerala, Andhra Pradesh and Bihar. Measured as percentage of the value of total assets, the incidence of debt was less than 5 per cent in Assam, Orissa, Jammu and Kashmir and Kerala. In Madras, Rajasthan, Mysore and Andhra Pradesh, this proportion exceeded 9 per cent.

Nearly 50 per cent of the rural households reported borrowings during the year under survey. State-wise, the proportion was relatively low in Assam and Orissa, being only 20 per cent. The proportion was highest in Rajasthan where it exceeded 70 per cent. In other States, the proportion varied between 40 and 60 per cent. The average amount borrowed per rural household was about Rs. 180, the averages for cultivators and non-cultivators being Rs. 205 and Rs. 111, respectively. Repayments averaged about Rs. 90 per household, that is, about half the amount borrowed. The proportion of repayments to borrowings was around the all-India figure in most of the States.

Fixed capital formation in farm business, non-farm business and housing was estimated at Rs. 50 per rural household. Farm business and house construction together accounted for the major part of the fixed capital formation; the former contributing Rs. 24 and the latter Rs. 22 per household. Fixed capital formation in non-farm business was negligible at Rs. 4 per rural household. Among individual States, fixed capital formation per rural household was comparatively low, ranging from Rs. 25 to Rs. 30 in the States of West Bengal, Bihar, Madhya Pradesh, Orissa and Assam, while, in all other States, it was above Rs. 40. Fixed capital formation in farm business was comparatively high in Gujarat, Madras, Mysore and Maharashtra but very low in West Bengal, Bihar and Madhya Pradesh, while capital formation in house construction was more important in the Punjab, Rajasthan, Kerala and Jammu and Kashmir.

The foregoing account covers, as already mentioned, only some of the more important findings of the survey. The mass of statistical data thrown up by the investigations have yet to be tabulated and it is therefore difficult to interpret the causes of and relationship between the changes in the debts and assets position recorded by the survey. A comparison with earlier estimates is also not possible, because *the required adjustments for differences in* concepts, definition, coverage, etc. are not possible. However, when the tabulation and analysis of the data are completed, a fuller and clearer picture of rural debts, savings and investments would emerge.

LABOUR RELATIONS IN ROURKELA

Despite frequent labour troubles, which are attributed to non-observance of labour laws, and which have contributed substantially to the unsatisfactory performance of the Rourkela steel plant, the management of the plant has in the past vehemently denied that there is anything seriously wrong with labour-management relations in the plant or in the treatment of workers. The management has in fact been very touchy about criticism that labour laws are not being strictly observed in the plant and has tried to create the impression that such criticisms are deliberately made by interested parties to discredit the "fair image of the public sector." The claims of the management have, however, failed to carry conviction, as they have not been borne out by actual experience. Labour troubles in the plant have been too frequent to justify the conclusion that the situation is as favourable as the management wants one to believe. In this context, the report that Mr. W. Solveen, a high official of the W. German Economics Ministry, will shortly be coming to India to make an on-the spot study of the labour situation in the steel plant is significant. It is not known whether Mr. Solveen has been asked by the plant's management to make the study or whether he is being sent by the W. German Government itself in view of its close association with, and stake in the success of, the Rourkela plant. According to one report from Bonn, Mr. Solveen's study has been sponsored by the W. German Government, because of its anxiety to see that normal labour relations are restored and the plant's working improves. In any case, the fact that such a study has been found necessary or desirable speaks volumes for the actual situation prevailing in the plant. Mr. Solveen, who has made a thorough study of the plant and the causes of its unsatisfactory performance during his three earlier visits to this country, should be able to assess the shortcomings in personnel policies that have caused frequent troubles and to suggest suitable reforms in this regard. Their implementation would, of course, rest with the management. This it can do only if it sheds its self-righteous attitude and honestly ask itself whether it is or is not really at fault. If the boot is on the other leg, that is, if labour leaders are responsible for inciting workers to resort to go-slow tactics and other undesirable practices, the blame should be fixed squarely on them and suitable action taken. In any case, the country cannot afford the working efficiency of such a vital unit as the Rourkela steel plant to be impaired on any account.

DELHI LETTER

DEFENCE PLANS GET BOGGED DOWN

SOME NEW NAVAL AND AIR FORCE FORAYS

From Our Special Correspondent

NEW DELHI, *7th January*

PLANS to strengthen the defence potential are also getting bogged down, like the Five-year economic development Plans. Nearly fifteen months after the massive Chinese attack on the North-East Frontier, there is still considerable groping about by Indian defence officials in a maze of plans for indigenous armaments manufacture. American and British promises in this field are by no means unlimited and some Western diplomats—fortunately not all of them—are developing a feeling of exasperation over the inability of the Indian administration to absorb at a fast pace the military aid already provided. Existing ordnance factories have done a commendable job in abandoning coffee percolators and in increasing production of military hardware and branching out into new items like automatic weapons. But a beginning has yet to be made with the six new ordnance factories which are planned to be set up. Equipment for the first of these new factories is expected to arrive from the United States in six months and it is hoped that the plant will be commissioned by the end of the year. This means that, despite all sense of urgency about a defence plant, the gap between the date on which a decision was taken to build the plant and the day on which the plant will begin production is two years! The plan for the six ordnance factories is quite feasible within a few years. The British are expected to help with the second ordnance plant and the third may also go up with American assistance.

The Indian arms shopping list, prepared by the Defence Ministry in the flash of danger following the Chinese attack, has long ago been dismissed by Washington as too ambitious. Apart from the unwillingness of the West to provide massive military assistance within the rules of non-alignment still in force in Delhi, there is the question of Indian administrative capacity to make use of aid. Not that the Americans or the British are ready to pour in a flood of aid. The annual American military supplies are expected to be pegged at Rs. 30 crores in the absence of further Chinese military action. It is possible the United States will be able to supply much of the equipment India wants from surplus stores. This will make the purchases cheaper too. Assistance from other Western sources may also be around an annual Rs. 30 crores. Britain, it is said, will have to fabricate hardware specially. This may mean delays but the equipment will be fresh from the factory.

Talks with Russians

Western allies agree with the Indian thesis that it will be excellent to persuade the Russians to continue to invest in aid for Indian defence against the Chinese threat. The West, having expressed unwillingness to provide supersonic fighters for the Air Force, the Russian supplies of and promises to help in the manufacture of MIG-21 crafts is welcome. Here again, the project plans are moving slowly. The Russians supplied six MIG planes last year, of which two have been lost in a crash a few days ago. Six more MIGs are to come this year. One reason for the delay in the setting up of plants to make MIGs is the Indian desire to make a plane more advanced than the MIG-21, so that the craft which may come out of the Indian factories are not totally obsolete when they are produced. Aeronautics (India) Limited has been formed with an initial capital of Rs. 25 crores to run the Nasik air frame factory and the engine factory at Koraput in Orissa. A third plant is to be built in Hyderabad to make the essential accessories for MIGs like electronic equipment and missiles. Details of this project are under discussion. Defence and Finance Ministry officials are expected to go to Moscow soon to discuss some remaining details of the Nasik and Koraput projects. There are whispers about difficulties over the financial arrangements. If the experience of Soviet dealings in military aid to other non-communist countries is any indication, the Russian terms of loans for military use will be much harsher than the terms of loans for economic development. Take, for instance, the Indonesian experience. Both the period of repayment and the rates of interest could be hard. In the case of Britain, the military assistance is a gift. The Americans are said to offer liberal terms—thirty to forty years—for repayment with virtually no interest. As in the case of economic aid, the Russians will accept 'rupee payment' which means exports of selected commodities. The Americans are also said not to insist on repayment in dollars; one way out is to create counterpart rupee funds which may again be lent back to the Indian Government for semi-military uses like building strategic roads.

Apart from the creation of more mountain divisions and modernisation of the armaments used by the army, another aspect of defence development is the conversion of the Indian Air Force into an all-jet fighting arm. More training facilities for this will be provided by Britain and the United States. The Indian Air Force has a fleet of Dakotas for transport work and the other planes in use include MIG-21s, Hawker Hunters, Mysteres, Ouragons, GNATs, Vampires, Canberras, Caribous, C-119 planes and Soviet-made turbo-transport. The helicopter fleet also has a variety, including the French Alouettes which are to be manufactured in the country.

Aircraft Manufacture

The origins of the Indian aircraft manufacturing industry go back to 1940, when, in collaboration with the Mysore Government, the late Mr. Walchand Hirachand established the Hindustan Aircraft Factory. HAL has played a significant part in the defence build-up.

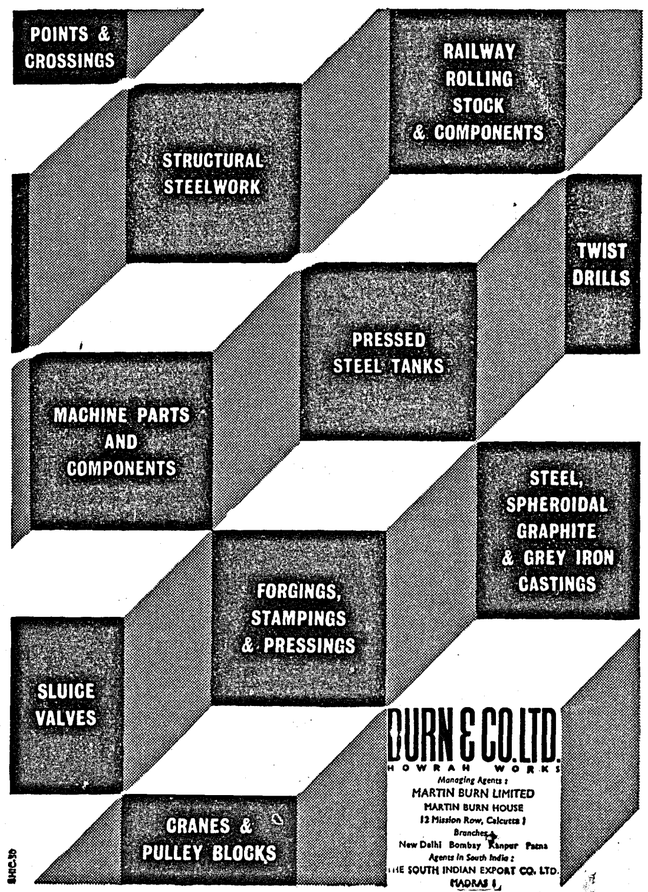
Although started by a private entrepreneur, from the very beginning the factory had been under the control of the Defence Department. First, HAL launched a programme to make Curtiss-Hawk fighters, Vulteee bombers and Harlow trainers under licence. But, when the Second World War spread, the Government converted HAL into a base for overhaul of engines and planes used in the Far Eastern war sector. HAL did a commendable job in this field, and, when the country became free, HAL initially devoted itself into converting damaged aircraft into airworthy planes. Then, under licence, HAL began making Percival Prentice trainers for the Indian Air Force. HAL also assembled about one hundred Tiger Moths by 1951. In 1947-48 HAL had begun experimentation in designing its own plane and the result was the HT-2 trainer aircraft to replace the Tiger Moth. Numerous HT-2 planes were made and supplied to the Air Force, Navy, and flying clubs and some were also sold abroad. In 1950, HAL struck out into the jet field, taking a licence from De Havilland to make Vampire jet fighters. HAL made about 280 Vampires for the Air Force. In 1952, HAL separated its manufacturing and overhauling wings and set up a branch unit in Barrackpore to undertake the repair work.

In Supersonic Set

India joined the supersonic set in 1961, when HAL successfully test-flew the HF-24, a supersonic jet fighter designed and built in Bangalore. (The design team was led by a German employed by HAL.) While prototypes have been made and tested and a production range is understood be under way, HAL has still not broken the back of the problem of finding a suitable engine for the Mark II version of HF-24, which will be faster. The HAL break-through made India the first Asian country to make its own supersonic jet plane.

Simultaneously with the work on HF-24, HAL started manufacturing the GNAT transsonic lightweight jet fighter under licence from a British firm. For powering the GNATs and the HF-24, HAL has a contract with Bristol Siddley permitting it to make Orpheus engines but the advanced development of Orpheus engines was given up by the British and has resulted in problems for HAL. Suggestions for use of a Soviet engine on HF-24 were abandoned, because the Soviet engines were too heavy to be fitted into the HF-24 design.

(*Continued on next page*)



LONDON LETTER

PAYMENTS POSITION

(From Our Own Correspondent)

LONDON, *4th January*

THE year-end has brought both the formal results of the balance of payments to the end of the third quarter of 1963 and the latest movements right up to the end of December in the United Kingdom gold reserves.

On the first, there has turned out to have been—as long anticipated—an overall deficit on the current balance as against surpluses in each of the three preceding quarters. On the other hand, the deficit was not as great as that in the third quarter of 1962 and, since the third quarter is always payments-wise the worst of the four, the figures just published are in effect reassuring rather than the reverse. The following table shows the United Kingdom's imports and exports and the visible balance of trade over each of the past four quarters:

(In million £s)

	Imports f.o.b.	*Exports f.o.b.*	*Balance*
4th quarter 1962 ...	1,031	1,031	*nil*
1st quarter 1963 ...	1,037	1,051	+14
2nd quarter 1963 ...	1,064	1,083	+19
3rd quarter 1963 ...	1,075	1,014	−61

Against the adverse visible balance of £61 million for the third quarter of this year, that for the third quarter of 1962 was almost the same at £57 million. The country's *invisible* income for the three quarters of this year were respectively: £63 million, £49 million and £33 million—the latter representing a *rise* of £13 million on the invisibles for the corresponding quarter of 1962. Thus, taking all the figures together, the final current balance for the first three quarters of this year were respectively: favourable £77 million, favourable £68 million and the third quarter adverse £28 million (against adverse balance of £37 million the previous year).

The biggest factor causing the drop in invisibles is that in the third quarter there is very heavy outgoing tourist expenditure. But if these figures are corrected for seasonal factor, then the current balances—instead of those given above—are, for the three quarters respectively: £70 million; £23 million and £15 million—all *favourable*—a total favourable balance for the year to date of £108 million.

A comparison of the seasonally adjusted figures with the unadjusted figures shows that there is something in hand for the fourth quarter, which a year ago threw up a favourable current balance of £22 million. There is nothing yet in these figures, therefore, to upset the forecast of a favourable balance at the year-end of the order of £100 million even allowing for the steady growth in imports during the quarter just ended.

Capital Movements

Capital movements, however, during the third quarter ran unfavourably to this country: there was a net outflow of £34 million, mainly due to a big drop in investment into the United Kingdom by overseas residents. Thus, as an offset against the trading balance, there has been in the first three quarters of the year to date a net capital outflow of £95 million, as against a net capital outflow of £31 million for the corresponding period of 1962. However, there is more than one way of regarding capital outflows: the traditional purist way is that a "good neighbour" country ought to export in capital whatever it gains on its current balance. By this criterion the United Kingdom has this year been an exemplary "good neighbour."

The history of the gold reserves this year is reasonably encouraging even though the year ends, as a result of the annual heavy payments to U.S.A. and Canada on the old Lend-Lease accounts, at just under £950 million. But the true history of the reserves is that, although in a sense the February/March speculation was against the pound, the reserves have climbed steadily by nearly £100 million to the year-end. The special payments that have been made in the course of the year have been:

1. repaying £89 million to the European Central Banks for their help given during the February/March drain;

2. repaying £13 million on the old European Payments Union account;

3. the annual repayment to U.S.A./Canada of £66 million.

If we ignore the last one because it is an annual payment, the other two items still account for just over £100 million. Basically, therefore, the reason why the reserves today stand at just under £950 million is because of the special hot money outflow in February/March which has not yet been fully recovered. As for the month of December itself, the payments to North American countries of £66 million were offset by special receipts from West Germany (to feed an account here for arms purchases). Finally, there was gain on current movement of £9 million, reducing the overall December drop to about £40 million.

If one questions why the reserves have been moving up in the past nine months of the year, while the balance of monetary movements as between the current and capital transactions over the year as a whole appears to have been stationary, the answer seems to lie in the improvement in the balances of the sterling area countrise with the non-sterling world, for we know that in the first nine months of this year they built up their balances in this country by some £180 million.

The good showing of the reserves this month (that is, after allowing for this special American payment) has, of course, helped to strengthen the general position of sterling and until it is clearly seen that current and capital movements are steadily against the country—which nothing in the figures above yet indicates—there is no reason to expect other than mild fluctuations in the exchange.

DELHI LETTER

(*Concluded from previous page*)

Along with the development of the fighter planes, HAL also worked on light aircraft and came up with the Pushpak in 1958. The Pushpak is a trainer aircraft suitable for flying clubs. Then came the four-seater Krishak, useful for short hops, pest control and insecticide spraying and observation work. Under way now at Bangalore is a two-seater jet trainer, provisionally called HJT-16, powered by a Viper turbo-jet engine. Under contract with Rolls Royce, HAL is making Dart engines and engine parts useful for Viscounts, Fokker Friendships and the Avro-748 which is being manufactured at the Aircraft Manufacturing Depot in Kanpur. Initially under the direct control of the Air Force, the Kanpur plant is now a public sector undertaking run by the Defence Ministry.

The Navy's air arm is today confined to the Garuda air station in Cochin and the only aircraft carrier, I.N.S. "Vikrant" now equipped with Sehawk jet fighters. More of them are soon arriving from Britain. A decision has now been taken to build the second naval air station in Goa. The Navy still lacks a submarine wing. The decision to establish a naval air station in the Andamans outpost is also significant. Besides the Chinese threat, there has been the rapid growth of the Indonesian naval striking force with East European help. However, the Indonesian build-up is not even whispered about as one of the reasons for the build-up of a garrison on the Andamans which is closer to Indonesia and Malaysia than to the Indian coast.

TATA-JOHNSON LIMITED ★ JAMSHEDPUR ★

THE DYNAMIC MAKERS OF

PULP & PAPER MACHINERY

TATA-JOHNSON LIMITED, are the leaders in the country in designing and supplying top quality equipment for the Pulp & Paper Industry.

STANDARD EQUIPMENT:

Stock Pumps - Hot Liquor Pumps - Chippers - Chip Screens Chest Agitators - High Speed Refiners - Jordan Refiners - Jönsson Screens - Black Liquor Filters - Pulpers - Vacuum Pumps Controllers. These and similar equipment are all supplied against Rupee Payment.

TAILOR MADE PLANTS:

Continuous Digester Plants - Batch Digester Plants - Blow Tanks and Blow Heat Recovery Plants - Brown Stock Washing Plants Bleach Plants - Black Liquor Evaporator Plants - Paper Mills.

The above type of plants are supplied with the highest indigenous content.

We are only manufacturing modern equipment as per our experienced collaborators' designs.

WILL THE STERLING AREA BOW OUT?

By Questor

REFORMING the international monetary system is a bone of contention usually discussed in relation to the dollar, the difficulties which have been caused by the persistence of a large U.S. payments deficit and, paradoxically, the even greater difficulties which may arise when this deficit is finally eliminated. But the problem of sterling is, in its way, even more serious.

Sterling plays a double part in the system: it is held as a reserve currency by the countries which form part of the sterling area and it is employed by many others as a currency in which to settle commercial transactions. Net balances of about $6,900 million are held in London by sterling area countries and of about $1,500 million by others.

Since the British reserve of gold and convertible currencies amounts to only some $2,800 million, the existence of these short-term foreign balances places a considerable restraint on economic policy: the British Treasury pointed out recently that it would not be desirable to adopt policies which might lead to any considerable increase in the size of foreign balances of sterling.

But the balances held by non-sterling countries are now probably no larger than the minimum needed for working convenience. They have been built up in the past few months even though interest rates in London are no longer relatively attractive. It is the balance held by other sterling countries, which were once regarded as the lesser threat to stability, which now present the greater problem.

The traditional assumption is that the sterling area is a largely self-contained unit made up of two complementary halves. Britain buys raw materials and foodstuffs from other sterling countries; they buy manufactures from Britain. Britain invests long-term capital in other sterling countries; they keep their liquid funds in London and the gold reserve serves as a common pool of foreign exchange for the whole area. But the traditional assumption has been breaking down for some time past.

In the first place, the pattern of trade has been changing, in two ways. Raw materials have come to represent a lower proportion of Britain's total imports while the more developed sterling countries have been trying to build up their exports of manufactures. At the same time, as a result of the erosion of Commonwealth Preference, other countries have been making more and more headway into Commonwealth markets. The two halves of the sterling area neither interlock so neatly nor are as dependent upon one another as was once the case.

In the second place, the trade of other sterling countries has grown more rapidly than that of Britain. In 1962, for example, for the first time, their combined imports and exports with the non-sterling world were larger than Britain's and the gap seems to have widened during 1963. The result is that the behaviour of the central gold reserve is now more likely to be affected by the current balance of payments of other sterling countries than by Britain's own.

In the third place, the massive injection of foreign capital on which the outer sterling area relies to balance its accounts is no longer coming predominantly from Britain. In the first three-quarters of 1963 the inflow of long-term capital from Britain amounted to $344 million, the inflow from non-sterling countries (much of it in the form of tied aid) to $1,190 million.

It is understandable, when other sterling countries no longer do more than a third of their trade or obtain more than a third of their long-term capital imports from Britain, that the area no longer functions as it used to do. And, in fact, sterling countries have been building up reserves outside London for some time past. In 1961, 1962 and apparently in 1963, only about half their total surplus of foreign exchange was invested in London and went to increase the sterling area reserve.

A good part of the difference is explained by the fact that South Africa has been in handsome surplus and believes, as a major gold-producing country, in keeping its reserve in gold. But the same tendency has been at work elsewhere. It seems reasonable to assume that more and more sterling countries will wish in the future to hold gold of their own or to hold liquid assets in centres other than London.

This is reasonable enough from their point of view. It is even reasonable from Britain's point of view—though it may raise the problem of how to run down smoothly the business of a bank which has always borrowed short and lent long. But, from the general point of view, it means that sterling may not be able much longer to economise the gold needs of a large part of the world as effectively as it has done in the past.

It may be, of course, that the European Community will become politically integrated as fast as the sterling area dissolves and that the creation of a common European currency will make possible an even greater economy of gold. It would be more prudent to assume that a fresh strain is likely to be imposed on the international monetary system and that vigorous international action is needed to meet it.

DEMAND GROWTH FOR CARS IN U.K.

That the number of motor vehicles in Britain will continue its headlong advance during the next 20 years and beyond is a basic assumption of the report entitled "Traffic in Towns" recently submitted by a working group of engineers, architects, and traffic experts appointed by the Minister of Transport in 1961. Projecting past trends and taking account of recent experience in the U.S.A., the working group believes that the number of motor vehicles will rise from 10½ million at present (only 7½ million five years ago) to 18 million by 1970, 27 million by 1980 and perhaps 40 million by the year 2010. Because of the prevailing passion for car-ownership, the proportion of cars in the total will steadily increase. Their number will rise from 6½ million at present to 12 million by 1970, 19 million by 1980 and 30 million—three-quarters of the total—by 2010.

These forecasts take account of the estimated increase in the population of Great Britain to 74 million by 2010. They imply that there will then be 540 motor vehicles for every thousand people; and that there will be 405 passenger cars per thousand, or 1.3 cars per family on average. Around the year 2,000, the number of vehicles per thousand of the population will be stabilised, on the assumption that most of the people who want cars will by then have been able to secure them. Thus, the growth curve will have flattened out by then.

All such long-range forecast are, of course, highly speculative, says the *Petroleum Press Service*. The Committee is not unmindful of the fact; but it regards an increase to 25 million vehicles (including 17½ million cars, or an average of one per family) as virtually certain, assuming that the growth of the population has been correctly forecast.

An agreement has been signed by the Burmah Oil Co. of Britain with the Government of Burma covering outstanding questions arising from the transfer to Government ownership of the interests in Burma of Burmah Oil Co., Indo-Burma Petroleum Co., and British Burmah Petroleum Co. The Government of Burma has paid to Burmah Oil, on behalf of the three companies, a sum of £2,419,487, being the balance of the agreed price of the companies' holdings in Burmah Oil Co. (1954), and the marketing interests of Burmah Oil Co. (Burma Trading) and of Indo-Burma Petroleum Co.

The latest production plans of Soviet Union foresee an increase in the output of crude oil from 205 million tons in 1963 to 222 million in 1964 and 240 million tons in 1965. Most of the increase is to come from the Volga region, the North Caucasus, and from new oil regions in the Ukraine. Also, gas production in 1965 is expected to be 40 per cent higher than last year, and the share of oil and gas in total energy production is to rise from 48 per cent in 1963 to 53 per cent in 1965. It is planned to lay in 1964 and 1965 a total of 8,500 kms. trunk pipelines for the transport of gas, and 5,500 kms. for the transport of oil.

Gently flows the quiet river

THE STATE BANK OF INDIA

INDIA'S LEADING BANK

SISTA'S-SB-81A

THE ANDHRA SUGARS LIMITED, TANUKU

(INCORPORATED ON THE 11TH DAY OF AUGUST 1947)

THIS IS ONLY AN ANNOUNCEMENT AND NOT A PROSPECTUS

Consent of the Central Government has been obtained for this issue

A copy of the Prospectus for the issue of 1,00,000 Equity Shares has been delivered to the Registrar of Companies, Andhra Pradesh, Hyderabad, for registration as required by Section 60 of the Companies Act, 1956.

The Company's Preference and Equity Shares are at present being officially quoted on the Madras Stock Exchange. Application will be made to the Madras Stock Exchange for permission to deal in and for an official quotation of the present issue of Equity Shares of the Company.

The subscription list in respect of this issue of 1,00,000 Equity Shares of Rs. 10 at Rs. 3 premium will open at the commencement of working hours on 20th January 1964 and will close at the close of working hours on 25th January 1964 or later at the discretion of the Directors but not earlier than close of business on 22nd January 1964.

SHARE CAPITAL

AUTHORISED CAPITAL:		Rs.
30,000 9.3% Cumulative Redeemable Preference Shares of Rs. 100 each		30,00,000
7,00,000 Equity Shares of Rs. 10 each		70,00,000
	Total Rs.	1,00,00,000
ISSUED CAPITAL:		
30,000 9.3% Cumulative Redeemable Preference Shares of Rs. 100 each		30,00,000
5,00,000 Equity Shares of Rs. 10 each		50,00,000
	Total Rs.	80,00,000
SUBSCRIBED AND PAID-UP CAPITAL:		
30,000 9.3% Cumulative Redeemable Preference Shares of Rs. 100 each		30,00,000
4,99,667 Equity Shares of Rs. 10 each		49,96,670
	Total Rs.	79,96,670

PRESENT ISSUE

1,00,000 Equity Shares of Rs. 10 each are offered to the public at a premium of Rs. 3 per share	Rs. 10,00,000

Pursuant to the provisions of Section 81 of the Companies Act, 1956, the Company in general meeting has, by a special resolution, authorised the present issue of 1,00,000 Equity Shares to the public. A premium of Rs. 3 per share has been fixed by the Controller of Capital Issues for this issue.

This fresh issue of 1,00,000 Equity Shares of Rs. 10 each will rank *pari passu* with the existing equity shares in all respects except for the dividend to be declared for the year 30th September 1963 and in case of dividend for which they will be entitled to from out of the profits of the accounting year 1963-64 *pro rata* to the paid-up capital from the date of the allotment on the application money and from the dates of payment of the allotment and call monies respectively will be paid.

APPLICATION AND SUBSCRIPTIONS AND TERMS OF PAYMENT

Applications for 1,00,000 Equity Shares offered for public subscription must be for a minimum of 50 Equity Shares or multiples of 50 shares. The share money including premium is payable as given below :

(1) On application at Rs. 2.50 per share and the premium amount of Rs. 3 per share.

(2) Within one month from the date of allotment Rs. 2.50 per share and the balance of Rs. 5 in two equal instalments of Rs. 2.50 each as and when called for by the Directors.

BOARD OF DIRECTORS

(1) SRI MULLAPUDI TIMMARAJU (*Chairman*), Tanuku.
(2) SRI MULLAPUDI HARISCHANDRA PRASAD, M.L.A., Tanuku.
(3) SRI VEGESANA KANAKA DURGA VENKATA SATYANARAYANARAJU, Panduvva.
(4) SRI JAVVADI LAKSHMAIAH, Penugonda.
(5) SRI M. A. KRISHNAMACHARI, Madras.
(6) SRI NIDADAVOLU SURENDRANATH CHOWDARY, Tanuku.
(7) SRI BOLLA BULLI RAMAIAH, Tanuku.
(8) SRI NUTHAKKI BHANU PRASAD, Hyderabad.

MANAGING AGENTS

MESSRS. RANGA RAO & COMPANY, Tanuku.

SECRETARY

SRI K. ANJANEYULU.

REGISTERED OFFICE

VENKATARAYAPURAM, MANDAPAKA LIMITS, TANUKU (West Godavari District).

BANKERS

1. STATE BANK OF INDIA, Tanuku.
2. THE CENTRAL BANK OF INDIA LTD., Tanuku.
3. THE ANDHRA BANK LTD., Tanuku.
4. BANK OF BARODA LTD., Madras.

AUDITORS

M/s. BRAHMAYYA & COMPANY, Vijayawada.

UNDERWRITERS

M/s. P. R. Subramanyam of Bombay and M/s. Somayajulu & Co., of Madras have jointly and severally underwritten the entire issue of 1,00,000 Equity Shares at Rs. 3 premium for an underwriting commission of 2½ per cent on the face value of the shares.

OFFICIAL BROKERS

1. M/s. P. R. Subramanyam, 70-A, Stock Exchange Building, Apollo Street, Fort, Bombay-1.
2. M/s. Somayajulu & Co., 337, Thambuchetty Street, Andhra Insurance Building, Madras-1.
3. M/s. P. R. Subramanyam, "Shree Siva," 24, Fourth Street, Benson Cross Road, Bangalore-6.

EXISTING AND PROPOSED ACTIVITIES

The Company operates at present (a) Sugar Factory with a cane crushing capacity of 1,250 tons per day, (b) Sulphuric Acid Plant of 50 tons per day, (c) Superphosphate Plant of 150 tons per day, (d) Industrial Alcohol Plant of 3,000 gallons per day, and (e) Acetic Acid and Acetic Anhydride Plant of 8 tons per day.

The Company is now setting up at Kovvur

(1) Caustic Soda Plant of 9,900 tons per annum.
(2) Chlorine Plant of 6,330 tons per annum, and
(3) Hydrochloric Acid Plant of 2,600 tons per annum.

The total cost of the entire new project is estimated at Rs. 2,14,17,000 and this will be met by borrowings from Industrial Finance Corporation of India for Rs. 1,40,00,000, deferred payments for Rs. 28,75,000 and balance from Internal resources and the present issue of Rs. 10 lakhs at 30 per cent premium, i.e. Rs. 13 lakhs.

The Caustic Soda and Chlorine Plants are already under erection and are expected to go into production in 1964.

Other information regarding Dividends, etc. will be available from the Prospectus.

Application forms and Prospectus copies can be had from the Registered Office of the Company, Bankers and Official Brokers and Underwriters.

Moisture seepage causes incalculable damage to your buildings. Impermo-treated walls will have no leakage, seepage or absorption of moisture through capillary action. Impermo is durable, economical ... just 2% of Impermo ensures 100% waterproofing. Can be stored in good condition indefinitely.

Available in 1 kg cartons for your convenience in mixing with a bag of 50 kg cement.

INTERNATIONAL MONETARY SYSTEM

ADEQUACY OF LIQUIDITY AND EFFORTS TO COUNTER IMBALANCES IMPERATIVE

By Pierre-Paul Schweitzer

Managing Director, International Monetary Fund

[Has the present international monetary system the potential to provide an expanding volume of international liquidity in a manner acceptable to the countries concerned? The answer to this poser, broadly speaking, may be in the affirmative, considering that the series of measures devised already or proposed to be taken later will help meet the liquidity needs that may emerge in the long run. But there is no denying the fact that these measures alone will not be sufficient, for there is the imperative need for continuous efforts to make the world monetary system strong enough to counter any imbalances or crises that may develop and flexible enough to meet the growing requirements of world trade and economic development. This need was most forcefully emphasised by Mr. Pierre-Paul Schweitzer, the new Managing Director of the International Monetary Fund, in his address before the U.N. Economic and Social Council at New York on 19th December 1963. In view of the considerable importance attached to the subject, we reproduce on these pages the text of his address.—ED.]

LET me begin by summarising the main financial and economic developments in the world as they have appeared to us in the Fund. 1962 was a year of generally favourable developments and this trend on the whole has continued in 1963. In both years, economic activity has expanded in most industrial countries; this year the cyclical upswing that began in the United States about three years ago has accelerated, there was a revival in activity in the United Kingdom, and most other countries continued to increase output under conditions of very high levels of employment. As one might expect, the continued upward trend in some of these countries has had its effect on wages and prices, especially in Western Europe and, in some of these countries, increasing inflationary pressures have recently called for corrective action. In contrast, there has been continued relative stability in costs and prices in the United States and the United Kingdom. On the whole, there has been progress toward a better equilibrium in world payments during the last two years. However, capital movements among the industrial countries have at times caused strains during both years. In the United States, large outflows of capital earlier this year have recently induced the United States to intensify its programme of action to reduce its overall payments deficit. I shall revert to these matters later. I would just say at this point that the payments imbalance of the United States, even though calling for continued vigilance, on the whole appears to be approaching manageable proportions.

It is also encouraging that international financial trends among the developing countries as a group have improved somewhat during the last two years. The downward movement in the prices of primary products has been reversed and the value of exports of the primary producing countries has recently risen at least at the same rate as world trade. Nevertheless, it must be recognised that the majority of these countries still face considerable difficulties in carrying through their policies of economic growth and in achieving a reasonable balance in their international transactions.

Smooth Operation

In general, then, the international financial scene has been calm. Among industrial countries, there has been further progress in monetary co-operation, and the monetary system as a whole has operated smoothly. At this time of relative monetary calm internationally, the world's monetary authorities have considered it particularly appropriate and timely to take stock of their collective resources and facilities and to consider whether anything needs to be done to strengthen them. It is in this context that the current studies of liquidity originate, to which the I.M.F. is directing considerable attention and to which I shall later refer in greater detail.

Among the most significant developments in the Fund during the last year was the substantial increase in its membership. In 1963, twenty countries have joined—all but two of them in Africa. They are: Algeria, Burundi, Cameroon, Central African Republic, Chad, Congo (Brazzaville), Congo (Leopoldville), Dahomey, Gabon, Guinea, Ivory Coast, Jamaica, Malagasy Republic, Mali, Mauritania, Niger, Rwanda, Trinidad and Tobago, Uganda and Upper Volta. In addition, we have received an application for membership from Kenya, which gained its independence last week. The Fund now has 102 members—almost three times as many as it had when it started operating in March 1946.

With this latest increase in membership, quotas in the Fund now amount to more than the equivalent of $15.5 billion, and about two thirds of this is available in the form of gold and the currencies of the major industrial countries which are most frequently used in international trade and payments. In addition, the Fund, to counter any undue strain on the international monetary system, can borrow the equivalent of a further $6 billion in the currencies of ten industrial countries in accordance with the terms of the General Arrangements to Borrow. The resources of the Fund, furthermore, because of their revolving character, are continually being reconstituted and can thus be directed to those situations where they are most needed any particular time. Thus the actual and potential resources available to the Fund, amounting as they do to something like one-quarter of the total gold and foreign exchange reserves of member countries, provide a most powerful defence against the harmful repercussions of disequilibria in international payments.

Almost all the new members that have joined the Fund during the last few years are newly-independent countries. Most of them are facing difficult problems in organising their monetary, fiscal and exchange systems so as to provide a solid basis for their economic growth. Over the years, the fund has provided technical assistance to its members both in the course of its regular rounds of consultations and by the assignment of Fund staff members as resident advisors. But the addition of so many new members, many of them as yet without sufficient trained personnel and all of them aspiring to a rapid rate of economic development, has posed a new challenge.

Technical Assistance

The Fund is, therefore, substantially expanding its capacity to render technical assistance to its members. We are doing this in two ways. First, we are organising a fiscal affairs group, which we expect in due course to develop into a fully-fledged department of the Fund. Experts recruited for this new activity will be experienced in most aspects of fiscal affairs, including tax policy, tax systems, tax administration, budgeting and other aspects of the control of revenues and expenditures. We expect this group will examine the experience of various countries in the fiscal field and build up a store of comparative data, participate in missions sent out by the Fund, provide fiscal advisors to members on their request, and share in the Fund's training programme. In organising this facility, we have been very conscious of the excellent work on fiscal affairs which has been carried out over the years by the United Nations itself, and we have explored frankly with U.N. officials the areas of possible overlap in the operations of the two programmes. While we have little experience as yet, I am confident that we will find no difficulties arising between our two organisations in this field that cannot be resolved through the close and helpful working relations which have long existed between us.

The second new service is in the central banking field, where we are working out arrangements by which members of the Fund wishing to establish central banks or to improve or strengthen the existing ones may come to the Fund for technical advice. In providing this service, the Fund, in addition to the use of its own personnel, will turn principally to one or another of the established central banks to borrow officials with appropriate experience who might be sent to the requesting country to give advice or to serve there temporarily in official positions. Experts recruited by the Fund in the latter category will be responsible only to the country for which they work, even though their salaries will generally be paid by the Fund. In our opinion, there is a growing need for this type of technical service and we think we can fill the need in the way I have described. In one case where there is a special and urgent need, that of Congo (Leopoldville), the Fund has gone further than envisaged in the programme by agreeing to recruit, at the Fund's expense, qualified senior technicians who can take executive responsibility not only in central banking matters but also in such fields as exchange and import control and fiscal administration. Let me also mention that, in view of the need of the many newly-independent members, the Fund is considering ways to improve and expand the usefulness of its Training Programme for officials for member countries. In particular, we are at present setting up a training programme in French, in addition to the existing one in English, as a service especially to the many of our new members coming from French speaking areas in Africa.

Compensatory Financing

In his speech here last April, Mr. Jacobsson explained the policy that was adopted in February of this year for giving special financial assistance, in addition to that available under the Fund's normal policies, to those countries that face payments difficulties created by sharp decreases in the value of their exports. As he indicated then, this assistance becomes available to a member when the Fund is satisfied that the shortfall is temporary and largely caused by circumstances beyond the member's control. The member in turn must indicate that it is willing to co-operate with the Fund in finding appropriate solutions to its balance of payments difficulties, where these are required. Where these conditions are satisfied, a country can be assured that its request for a compensatory drawing will be met in amounts normally up to 25 per cent of its quota. Furthermore, this facility will not reduce the amount of assistance available under general Fund policies, as the Fund is prepared to permit its holdings of a member's currency to exceed what has hitherto been the limit of 200 per cent of its quota, when this is necessary to facilitate its policies on compensatory financing. Such financial assistance also possesses the same revolving character as that made available under the Fund's general drawing policies.

We have been pleased to note that the Fund's policy on compensatory financing has been well received both by member countries and by international bodies, in particular the United Nations Commission on International Commodity Trade. So far, the new facility has been used by Brazil and the United Arab Republic, the former drawing $60 million and the latter $16 million. These amounts represented an estimate of the export shortfall experienced, which was, in both cases, smaller than 25 per cent of the quota. The United Arab Republic transaction brought the Fund's holdings of that country's currency to 215 per cent of quota—the first time in the Fund's history that the 200 per cent limit had been exceeded. The fact that only two countries have, so far, applied for a compensatory drawing is, I believe, largely attributable to the generally favourable trend during the past year in export receipts of primary producing countries.

The Compensatory Financing Decision also provides that sympathetic consideration will be given to requests for quota adjustments from countries exporting primary products, especially those with smaller quotas, in order to make these more appropriate in the light of export fluctuations and other relevant criteria. Increases in the quotas for such countries will, of course, increase the financial assistance which the Fund can give them in accordance with its policies. Under this provision, increases have recently been agreed to for El Salvador, Honduras, and the Syrian Arab Republic, which raise the quotas of these countries by an average of more than 50 per cent. Other applications for quota increases are presently under consideration in the Fund.

Standby Arrangements

In part because of the comparatively favourable developments in the payments positions of many primary producing countries, Fund transactions have been smaller in amount so far in 1963 than during the last few years. Total drawings by 15 countries have so far amounted to $330 million. Repurchases have been of about the same magnitude, so that the total amount of outstanding drawings has remained between $1.6 billion and $1.7 billion. Amounts available to member countries under outstanding standby arrangements have increased this year, however, by almost $200 million, and now total about $1.75 billion. These stand-by arrangements, all but two of which have been concluded with developing countries, provide for frequent contacts between the members and the Fund which are, I believe, of great value both to the Fund and to the member.

The two largest stand-bys are with the two main reserve centres. The equivalent of $1 billion is at the disposal of the United Kingdom under a stand-by arrangement which that country concluded in August for one year. This was a precautionary measure taken by the U.K. authorities against the possible short-term impact on the payments position of their programme of expansion without inflation. In July, the Fund also granted a stand-by arrangement to the United States, for an amount equivalent to $500 million. This was the first time that the United States had availed itself of the financing facilities of the Fund. During the first decade of the Fund's operations, drawings on the Fund were made overwhelmingly in U.S. dollars, so that the United States was the only country that had extended large credits to other countries through the Fund.

Broader Use of Currencies

With the introduction of convertibility in a number of European countries at the end of 1958, and the accompanying increased strength of these countries' currencies relative to the U.S. dollar, a broader use of currencies became appropriate in Fund operations. In the past few years the Fund has encouraged countries using Fund resources to draw currencies other than dollars. At the same time, repurchases to the Fund have been made primarily in U.S. dollars, thereby gradually eliminating the earlier large creditor position of the United States in the Fund. During 1962, for instance, repayments to the Fund in U.S. dollars exceeded drawings by $610 million; to that extent the Fund assisted in the financing of the balance of payments deficit of the United States. This illustrates the way in which the Fund is developing its policies to make better use of the currencies available to it.

At the beginning of 1963, the Fund's holdings of U.S. dollars were approaching 75 per cent of quota, a level beyond which they cannot, under the Articles of Agreement, be accepted in repurchase. This threatened to cause inconvenience to a number of countries who keep their international reserves mainly in U.S. dollars and who have repurchase obligations to the Fund. The stand-by arrangement of the United States was chiefly intended to resolve this problem. The United States can use this facility to draw the currencies of other members that can be accepted by the Fund in repurchase. It will then sell such currencies for dollars at par to other countries which need to make repurchases to the Fund.

The Fund's stand-by arrangements with the two major reserve centres not only demonstrate the Fund's ability to assist all its members, large or small, but also that even its largest members are prepared to use it. They are also an indication that we are gradually overcoming the feeling which prevails in some countries that use of the Fund's resources is to be regarded as a sign of serious weakness or crisis for the currency of the country availing itself of Fund assistance.

U.S. Position

The deficit in the U.S. balance of payments will, no doubt, for some time remain a key factor on the international financial scene. It may, therefore, be useful to view the most recent developments against their historical background. The balance of payments problem of the United States became apparent in 1958, but had its origin much earlier. In fact, the U.S. balance of payments had already moved into deficit in 1950. In general, however, U.S. deficits were moderate until the late 1950's, and the resulting increase in the international reserves of other countries was welcomed both in the United States and elsewhere as a necessary part of the post-war economic adjustment, toward which so much of the U.S. economic policy had been directed. The weakening in the U.S. payments position had been concealed in the mid-1950's by the effect of the Suez crisis and other temporary factors. By 1958, however, it became evident that there was a radical change in the pattern of the earlier years. In that year, the United States began to run large and persistent deficits in its balance of payments while most industrial countries were accumulating surpluses, many of them substantial ones.

The payments disequilibrium among the industrial countries that became apparent in 1958 was reflected in other aspects of economic and financial relationships. Those countries that had large surpluses were also generally experiencing a much more rapid economic growth than the United States. Their exports were rising rapidly. This increase in exports stimulated economic growth directly; it also strengthened the payments positions of these countries so that they were not inhibited by balance of payments considerations from carrying out their economic policies. With their more rapid growth and expanding markets, these countries also offered attractive investment opportunities, and the resulting flow of capital from the United States to these countries added to the international balance of payments problem.

There are now signs that the disequilibrium among the industrial countries has lessened substantially. Costs and prices have remained remarkably stable in the United States, while, in the major surplus countries, they have risen sharply in the course of the last two or three years as production has pressed against the limits of capacity. The appreciation of the German mark and the Netherlands guilder in 1961 also helped in this adjustment process. The balance of payments surpluses of the main industrial countries have been eliminated or reduced. These persistent surpluses had been concentrated in Continental Europe. Of the countries in this area, only France remained in a strong surplus position at the end of 1962. During the first half of 1963, the French overall position remained very strong, although the surplus on current account was reduced, but, since mid-1963, the rise in its reserves has levelled off somewhat. Italy, which still had a substantial surplus during most of 1962, is at present running a sizable deficit. On the other hand, the balance of payments of the Federal Republic of Germany has again moved into overall surplus, although the current account remained in deficit through the third quarter of this year. This adjustment has coincided with continued expansion in world industrial production and, in the process, the growth rates in the industrial countries have become more nearly equal. Since 1961, industrial production in the United States, aided by a cyclical upswing, has risen more rapidly than in the Common Market area.

Developments in U.K.

Another encouraging sign of reduced international imbalance is found in recent economic developments in the United Kingdom, the other major reserve centre. While that country has tended to be in balance of payments equilibrium over the long run, its international reserves have been subject to pressure from time to time, and its economic growth has for many years been rather sluggish. In 1963, however, the United Kingdom has experienced a more rapid increase in production than for the past several years, coinciding with considerable stability in its balance of payments. One of the most important factors contributing to this increase in production has been increased competitiveness due to a slower rise in domestic prices and costs than in many countries in Continental Europe.

These various encouraging factors in the present world payments situation do not mean that further efforts will not be required to reduce the continuing imbalance to tolerable dimensions. The United States has made it clear that it will pursue energetically a programme aimed at reducing its deficit while maintaining a vogorous domestic economy with stable cost and price levels. This is all the more necessary because it is unlikely that the rise in costs and prices in Europe will be allowed to continue long at anything like its recent pace.

Primary Producing Countries

Another most welcome feature of international monetary developments in the past year has been the tendency for a number of primary producing countries to achieve surpluses in their balances of payments. This has been caused largely by a rise in exports due chiefly to increases in basic commodity prices. In the course of 1962, the downward movement in the price of basic commodities, which had persisted for several years, was reversed and recovery has continued this year. In the first half of 1963, exports of primary producing countries were about 7 per cent higher than a year earlier and they were apparently rising at least as rapidly as world trade. This favourable development is tempered by the fact that, while there has been an improvement in the level of export proceeds, there does not appear to have been any increase in the inflow of financial resources from the industrial countries. This is a field in which clearly much still needs to be done.

Over a period of years, the export performance of the primary producing countries has been sluggish when compared with the trend in the exports of industrial countries. Between 1958 and 1962, trade among the industrial countries rose by over 50 per cent, whereas their imports from primary producing countries rose by only 20 per cent. Primary producers' exports have not kept pace with the rise in industrial production in the industrial countries, in part because of the rapidly rising use of synthetic materials, but also in part because of the trade barriers which are maintained by many countries, against both primary products and manufactured goods. A liberal attitude by industrial countries toward imports from the less developed countries should be given full emphasis in current international deliberations on trade policy. Many less developed countries are becoming increasingly well equipped for the production of manufactures, and fuller access to export markets for such goods would greatly facilitate the diversification and expansion of exports which ought to be an important aspect of the economic growth of the developing countries. They should not be denied the opportunity to use their competitive advantages in any markets in the world. Both the problem of access to markets and that of maintaining the level of prices of primary products at an equitable level will properly occupy the attention of the G.A.T.T. and the United Nations Conference on Trade and Development. At the same time, the efforts of the developed countries to extend economic aid to the less developed ones and to improve the terms on which it is offered, need to be intensified. In addition, both groups of countries should give high importance to policies that stimulate the flow of private long-term capital.

Role of I.M.F.

The Fund's role in this vital process of economic growth and the expansion of world trade and the flow of resources needs to be better understood. The resources that a country can obtain from the Fund are a supplement to its reserves. They are not a direct contribution to development financing. Designed to deal with temporary swings in the balance of payments, drawings are repayable, at the latest, within three to five years. However, access to Fund financing enables members to adjust their payments positions less abruptly, and in a more orderly manner, than they could otherwise do. This helps to prevent wasteful disruption in programmes for economic development and is in itself a contribution to the process of economic growth. Moreover, the Fund, in its day-to-day activities—in its advice to member-countries in the course of regular consultations and its technical assistance missions—makes an important contribution to the developing countries' efforts to achieve the financial conditions necessary for their economic growth.

Essential for all efforts to promote the advancement of the less developed countries is an international climate of prosperity and growing world trade. In this respect, the record since 1945 has so far been more encouraging than that of any comparable period in modern history. Throughout the post-war period, business recessions in the industrial countries have generally been mild and short-lived, and restrictions on international trade have been widely reduced; the volume of world trade has doubled since 1950. Responsibility for the continuation of this favourable climate rests primarily with the major industrial countries, and with the international organisations that are entrusted with important tasks in the economic field.

I believe we may all take much encouragement from the increasing international co-operation on economic problems which has developed both among countries and through international organisations. In the particular field of the Fund's responsibility, there have been decisive advances in co-operation on monetary and exchange problems, both to deal with crises or threatened crises in international payments and to reduce underlying disequilibria through co-ordination of economic policies. It has become recognised that, in the vital area of financial and monetary policy, each country should consider the interest of the world at large and not only those of its own economy, and that all major issues call for co-ordinated action rather than action by each country in isolation.

A Major Question

One of the major questions that is now under active consideration is whether the present international monetary system is strong

(Continued on page 61)

STATE BANK OF INDIA ACT TO BE AMENDED

SALIENT FEATURES OF PROPOSED CHANGES

THE proposed amendments to the State Bank of India Act are intended (i) to improve the quality of its services and increase the efficiency of its business by creating a larger number of local head offices and by increasing their autonomy, particularly in so far as the powers to grant loans and advances are concerned, and (ii) to extend and enhance the Government's control over the management of the Bank by increasing the official and nominated element in the composition of both the Central Board and the local boards. Incidentally, the amending Bill also extends the period of State Bank's term loans up to ten years and makes provision for limiting the accumulations in the Integration and Development Fund at any time to a sum of Rs. 5 crores.

The amending Bill is the outcome of practical difficulties experienced by the monolithic organisation of the State Bank of India in dealing with the staff, administrative and business problems of almost 1,600 branch offices and over 40,000 employees (including the branches and employees of the seven subsidiaries) from a single central office. Although the existing organisation of the Bank provides for four local head offices, their powers have so far been confined to the routine recruitment and establishment matters and to the payment of staff salaries and bills. During recent years, the two managing directors of the Bank must have found it increasingly difficult and physically impossible to maintain a *personal* liaison with the fast increasing number of branch agents and, through them, with the customers of the Bank scattered throughout the country.

The other reason which must have prompted the Government to decentralise the powers and functions is the Finance Minister's declared intention to extend the area of the State Bank's operations. With its existing organisation, the Bank had reached the limits of its expansion, and the increasing business was already telling upon the speed and accuracy of its functioning. The proposed decentralisation would bring welcome relief to the executives, officers and men of the Bank's central office and would provide greater scope and initiative to the talents and abilities at the local head offices. No doubt, the reorganisation would involve additional staff at the local head offices, but they would more than justify the additional expenditure involved, if they are able to initiate efforts towards achieving an efficient service organisation.

Handicaps

Inadequacy of staff, accommodation and lack of powers have made the working of the State Bank branches a difficult task for its executives and customers. There have been complaints of inordinate delays on the Government Receipts and Payments Counters at the State Bank of India branches throughout the country and of poor quality of service to the business community. One often hears reports of procedural and operational delays, insufficient (or lack of) appreciation of the needs and requirements of depositors and borrowers and a total disregard of the customers' conveniences, in general. To a large extent, the decentralisation of business and administrative matters in the local head offices will enable the latter to devise ways and means of ending this state of affairs at the branches. Larger staff and wider discretionary powers to the local head offices would help cut down procedural delays and enable quick decisions to be taken for augmenting staff or accommodation in time to cut down operational delays. The local head offices would, however, need to instil a greater sense of discipline and purpose in the staff at the branches and to provide more leisure and freedom from routine duties to branch agents, if they are to be enabled to devote themselves to the problem of winning and retaining customers for the State Bank and to lessen the ordeals of the public who has to deal with Government's receipts or payments; branch agents who are tied to their desks throughout the day (and even some part of the night) are obviously unable to do so.

The four local head offices at present cater to the four circles in which the branches of the State Bank are divided for the purpose of accounting. The immediate needs of the Bank could be met by the creation of two or three additional local head offices and corresponding circles and by reallocating the jurisdiction of the four existing local head offices. But from the long-term point of view, it would be advisable to plan for an independent local head office in each of the States, in line with the Reserve Bank's plan for a branch in each of the State capitals. The Bengal and the Bombay Circles, with more than 200 branches under each, are in need of urgent relief.

The local boards will now be required to exercise all powers and perform all functions and duties of the State Bank in relation to the specified business that may be carried on or transacted by the State Bank under the provisions of Sections 32 and 33 of the State Bank of India Act.

The jurisdiction of the local boards will cover the banking and remittance business of any Government in India, as the agent of the Reserve Bank, or undertaking and transacting any other business which the Reserve Bank may from time to time entrust to the State Bank. The question of settling terms and conditions of agency or of appointing sub-agents will, of course, be dealt with by the Central Board.

The local boards will also be authorised to carry on or transact the business of advancing and lending of moneys upon the security of trustee stocks and securities, debentures, etc., issued by public authorities, goods or documents of title to goods, eligible bills of exchange and promissory notes, and to accept, as *additional collateral* security, fully paid shares or immovable property or documents of title to them. Where, however, the security consists of debentures of limited companies, or of shares and debentures of statutory corporations, or of hypothecated goods or book debts and assets of hire-purchase companies, the approval or directions of the Central Board will still be required.

The local boards will further be allowed to deal with the sale or realisation of any security or property, negotiable instruments, remittance business, buying and selling of gold and silver, acceptance and conduct of deposit accounts, agency business on commission term, executor and trustee business, granting letters of credit and advancing or lending money for the purpose of averting or facilitating winding up of a company or a society or to grant loans to courts of wards.

Finance for Housing

In addition to these traditional powers of the Bank, the local boards will be empowered to advance money for housing purposes as agents of or in participation with any Government or Corporation. Their powers to grant advances to any staff co-operative housing society or to grant term loans to industries will, however, be circumscribed by the directions issued and the general policy laid down by the Central Board of the Bank.

Moreover, the local boards will also exercise such other powers and functions as may be conferred on or assigned to them by the Central Board.

After all this delegation, the powers retained by the Central Board of the State Bank of India relate to such matters as unsecured advances (with the approval of the Central Government) to any national or foreign Government, investment of the funds of the Bank, agency arrangements with co-operative institutions, underwriting of stocks, shares, debentures etc., borrowings by the Bank for the purposes of its business, or acquisition of subsidiaries, etc. It is apparent that these are all matters which require central direction and decision and as such cannot be delegated to regional boards. The powers now delegated to the local boards are in addition to such powers regarding staff and establishment matters as were already being exercised by them.

Composition of the Boards

The second major amendment proposed by the amending Bill increases the Government's powers to appoint members of the Central Board and local boards of the Bank. After reorganisation, the local boards will consist, in addition to those directors of the Central Board who are also members of the local boards, of eight members (instead of four at present) out of which six (instead of three at present) will be nominated by the Central Government, one will be elected by the shareholders and the remaining one will be filled by the Secretary and Treasurer, by virtue of his office. As the Chairman of the State Bank cannot possibly attend all the meetings of all the local boards, the Governor of the Reserve Bank of India will appoint one of the members of the local board as the President.

Under the revised constitution, the Central Board of the State Bank of India will consist of a Chairman and Vice-Chairman (to be appointed by the Central Government in consultation with the Reserve Bank and after considering the recommendations of the Central Board of the State Bank), two Managing Directors (to be appointed by the Central Board of the Bank with the approval of the Central Government), one representative each of the Reserve Bank and the Central Government, the Presidents of all local boards who shall become directors of the Central Board by virtue of their office, not less than two and not more than four directors to be elected by shareholders other than the Reserve Bank (instead of the six directors appointed by them at present), and not less than two and not more than six directors to be nominated by the Central Government (in place of eight directors who are appointed at present).

It will thus be noticed that a marked change has sought to be made in the composition of the local boards as well as the Central Board of the Bank. The reasons that have prompted the Government to increase the official or nominated element in the directorships are not clear, but it is a fair guess that this is not an isolated move: it is a part of the Government's wider policy of moving from price and distribution controls over the economy towards increased ownership and management control over both the public and private sectors of the economy.

Medium-term Loans

Another important amendment to the State Bank of India Act seeks to permit the Bank to grant term loans to industrial or commercial units or groups as may be specified by the Central Board, for periods up to ten years (instead of the present seven years). The wisdom of this amendment will be apparent if one appreciates the various difficulties faced by new industries in growing to maturity. The seven-year period imposed the strain of repayment just a little too soon, and this welcome amendment would provide the much needed breathing space to India's nascent industries. The progress made by the Bank in the provision of medium-term loans and in furnishing deferred payments guarantees for acquiring plant and machinery has, however, been modest: as at the end of 1962, term loans were just over Rs. 4½ crores out of total advances of the State Bank amounting to over Rs. 270 crores. It is to be hoped that the proposed liberalisation in the period of the term loans will give a greater fillip to the Bank's term loans.

The Integration and Development Fund, to which the dividends declared by the Bank and payable to the Reserve Bank on the latter's compulsory minimum holding of 55 per cent are credited, is intended to finance the development activities of the Bank, particularly the losses incurred by it and its subsidiaries on their new branches. The balance in the Fund at the end of 1962 was a little over Rs. 3 crores: over the years, more than Rs. 82 lakhs were utilised from the Fund. The amount of the Fund is now considered adequate and it is no longer necessary to continue further automatic contributions to it. It is, therefore, proposed to limit the total amount of the Fund to Rs. 5 crores.

These changes do not touch or affect the State Bank's subsidiaries in any manner. There is a school of thought which feels that the maintenance of the separate facade of subsidiaries without any real freedom to them is meaningless and raises several difficult problems of administration and business. It would have served, in its view, a real need if the opportunity provided by the present amending Bill had been utilised to bring about a complete merger of the subsidiaries with the State Bank of India. This, however, is a short-sighted view, for decentralisation of power, however small and limited, does help in ensuring provision of efficient service to borrowers and depositors alike.

TEXTILE INDUSTRY IN GOOD SHAPE

HIGHER PROFIT-MARGINS EXPECTED

From Our Special Correspondent

MANCHESTER, 31*st December*

ALTHOUGH trading conditions during the half-year to the end of September were far from satisfactory, mainly because of the wide disparity between the cost of home-produced cotton textiles and import prices, the Directors of Fine Spinners and Doublers, one of the big Lancashire combines, announced in a statement that future prospects were brighter than for some time. The Directors are declaring an interim dividend of 5 per cent and, in addition, a special tax-free distribution of 6*d.* per unit on realised capital profits arising from the sale of property and investments.

MANCHESTER LETTER

"Since September, the seasonal upsurge in trade has been sufficient to ensure high activity in the mills until well into 1964," added the statement. "Although much of this new business shows little improvement in margins, there are definite signs of a more realistic approach to the pricing problem." The trade was accepting that, as duty-free imports of yarn and cloth from low-cost countries had been contained at a level representing 30 per cent of the home market, prices within this sector could have no relation to prices within the remaining 70 per cent. "There are now encouraging signs that determined efforts to make worthwhile the trade left available to us are meeting with some success and, for this reason, it can be said that future prospects are brighter than for some time," said the statement.

In the U.S.A., the Company's subsidiary, the Delta and Pine Land Company, had had an excellent growing season, the cotton crop being particularly successful, with the yield per acre an all-time record. There was every reason to believe that the Company's cotton planting seed would again meet with a steady demand, so that the final result from the subsidiary at the year-end should prove to be very satisfactory.

Conditions in the French cotton industry were far more stable than in Lancashire, providing a good framework in which reorganisation plans could be pressed forward. As a result, the improvement in earnings of the Company's French mills continues.

Union Discussions Adjourned

After a 1½-hour meeting in Manchester, union leaders of nearly 150,000 Lancashire cotton workers decided to adjourn discussions about new pay, hours and holiday arrangements within the industry. The Executive Committees of the eight unions involved will discuss the matter, and then a further full union meeting will be held in January.

The meeting followed a call from the Bolton Cardroom Workers for a new look to be taken at the present wages and hours structure in the cotton trade. Mr. Lewis Wright, the Chairman of the meeting, said that no firm decision had been taken, but he hoped that, following further talks, some "formulated policy" might emerge.

New £1-million Mill

A new £1,000,000 cotton mill capable of producing 10 million yards of cloth a year is to be built in Northern Nigeria with top management and weaving machinery from Lancashire. Mr. Edward A. Seroussi, Managing Director of Nortex (Nigeria) Ltd., signed a contract with British Northrop, the Lancashire machinery manufacturers, for the supply of 250 automatic looms for the new mill at Gusau in Northern Nigeria. To be run by Zamfara Textile Industries Ltd. and partly financed by Northern Nigeria Investments Ltd., an associate of the Commonwealth Development Corporation, the mill is expected to be in operation by October next year, employing about 1,000 workers.

Mr. Alan D. Ashley, Managing Director of a Manchester executive selection firm, is to advise the Company on the selection of 17 textile technicians from Britain. They will be offered: salaries of about £3,500 to about £1,750; free £4,000-bungalows with air-conditioning; and every 18 months a three-month holiday with pay to Britain. This will also include free air transport for the technicians and their families. Explained Mr. Seroussi: "We have come to Lancashire, because we believe that the technicians and management here are the best in the world for know-how. British textile machinery manufacturers are first-class for service."

"Buy Textiles" Advice

In view of the traditional diffidence with which the Stock Exchange approaches the textile share market, it is rare indeed for advice to be given to investors to support such issues. Even those stockbroking firms which have their finger on the textile pulse are often chary of stating categorically that prospects are bright.

Recent developments, not solely concerned with the sharp expansion in activity during the last month or two, however, have prompted a Manchester firm of brokers who regularly attend the meetings of textile firms and who can be relied upon to have a sure grasp of the situation, to give unqualified advice to their clients suggesting that a selection of textile shares at today's prices may well prove a good long-term investment. The trade, it contends, can hope for greater stability in the future, thus reducing the risk element implied in the present high yields. In some cases at least, there is the prospect of restoration of dividend cuts and, in all cases, a better industrial future should lead ultimately to growth in profits and dividends.

While this is the summing-up of an independent observer, the report goes into considerable detail in gauging the outlook and draws comfort from the major developments which have occurred in the structure of the industry in the past few years, and particularly in recent months. The recovery from the last slump has been slow and long delayed, says the writer, but the new conditions developing in the structure of the industry have encouraged greater readiness to undertake forward commitments. Order books in general now present a sufficiently healthy state to allow thoughts to turn towards higher margins.

Long War of Attrition

Dealing with the generalisation so frequently made about the textile industry that the average level of management ability is extremely low, the report springs to Lancashire's support in declaring these allegations are not completely satisfactory as a working rule. "It is by no means certain," it continues, "that the average level of innate ability in management in textiles is significantly lower than that to be found in other industries. If, indeed, the average level is lower, it may fairly be attributed to the long war of attrition which the industry has been fighting in the face of continuous and cumulatively difficult commercial conditions."

Coupled with prospects of more categorisation and control of imports, a continuous reduction is taking place in the number of firms and the amount of capital equipment which is producing textiles within this country. The significance of the various bids made by the man-made fibre producers extends beyond their immediate effects on individual companies. Such changes have already created a more dynamic atmosphere in the industry and, although restlessness may not be entirely favourable in stimulating buying power, the idea of merger and amalgamation, says the report, becomes much more a day-to-day possibility.

EXTRA LONG-STAPLE COTTON

RESURGENCE OF DEMAND LEADS TO BETTER BALANCE BETWEEN SUPPLY AND DISTRIBUTION

THE extra long-staple cotton situation during the 1962-63 world cotton season, which ended on 31st July 1963, was doubtless more favourable than that for some time in the past. This is the main conclusion reached by the International Cotton Advisory Committee, Washington, in its annual survey of the supply and demand position of this type of cotton which has a staple length of more than 1⅛". During the 1962-63 season, according to the Committee, new records were set for supply and demand and the statistical situation at the end of the calendar year 1963 was strong. The record supply was due to the fact that, despite a reduction in total acreage, thanks to reduced plantings in the United Arab Republic, one of the major producers of extra long-staple cotton, production reached an all-time record of 2.1 million bales of 478 lbs. each, as against 1.8 million bales during 1961-62. The explanation for this spurt in world production lies in the marked improvement in overall average yield which, at 484 lbs. per acre, was 73 lbs. more than in the previous season. In fact, the average yield per acre in the U.A.R., at 567 lbs., approached double the 1961-62 figure of 300 lbs. and was higher than that in any previous season. Record or near-record yields were also realised in the U.S. and Peru and in the smaller producing countries as a group. In contrast, the yield per acre in Sudan was markedly lower than the 1961-62 figure which was a record, although it was higher than in any other recent season.

Higher production, coupled with larger carryover stock of 878,000 bales, as compared with 765,000 bales in the previous season, made for a total supply of close to three million bales, 2.79 million bales to be precise, during 1962-63. The main increase in supply occurred in the U.A.R., but supply in each of the other major producing countries was also noticeably higher.

The most remarkable feature of the extra long-staple cotton situation last season was the resurgence of demand. Consequently, total disappearance, as represented by indigenous consumption in producing countries and exports, exceeded even the 1959-60 record. At 2.1 million bales, comprising exports of 1.9 million bales and indigenous consumption by producing countries, aggregating 205,000 bales, disappearance during the season (1962-63) exceeded production by a small margin. This resulted in a modest decline in stocks from 878,000 bales at the beginning of the season to 812,000 bales at the end of it. In absolute terms, however, stocks of this magnitude are higher than in any previous season except the last. This situation, in the opinion of the I.C.A.C., should be considered in the context of the marked increase in demand and the limited availability for export of extra long-staple cotton until the new crop comes to the market. The following table gives a country-wise break-down of supply and disappearance of extra long-staple cotton during the period 1960-61 to 1963-64:

('000 bales of 478 lbs. each)

	1963-64	1962-63	1961-62	1960-61
Supply : stocks on 1st August :

The higher supply during 1962-63 season imparted some easiness to prices of extra long-staple cotton which ruled well below the 1961-62 levels. The table below indicates the trend of prices during the decade ended 1962-63:

(Cents per pound)

Season and month	C.I.F. Liverpool (Dudley Winder)			El Paso/ Phoenix
	Egyptian Karnak F.G.	Sudan Sakel G 5 S	Peruvian Pima No. 1	U.S.A. Grade 2 1⅛"
1953-54	55.06	..	47.56	71.79
1954-55	60.05	53.54	50.95	64.43
1955-56	64.65	54.41	53.49	59.35
1956-57	72.11	69.33	63.61	67.20
1957-58	49.57	48.51	49.19	64.40
1958-59	35.70	34.59	35.76	58.14
1959-60	44.77	41.62	43.73	57.07

1961-62	43.28	38.00	41.38	61.12
1962-63	41.03	36.89	38.54	57.07
1963-64 :				
August	42.35	37.70	38.55	57.71
September	42.92	37.66	39.54	56.36
October	43.61	38.50	39.14	56.63

As regards the outlook for the current season, that is, 1963-64, the Committee observes that the salient factors in the supply of extra long-staple cotton during the season are the reduced carryover stocks and lower production prospects. Total supply during 1963-64 is tentatively estimated at 2.8 million bales, as compared with nearly three million bales during the last season. The large unknown factor in the estimate is the actual production in Sudan which is difficult to assess precisely at present. It is, however, assumed that a normal yield will be produced on an acreage stabilised near last season's level. The 1963-64 supply thus appears quite large in relation to consumption requirements. Free world consumption of extra long-staple cotton during 1962-63 aggregated nearly 1.3 million bales, as against 1.17 million bales in the previous year. Consumption prospects for the current season are uncertain at present. The following comments of the Committee are, however, significant in this context.

Outlook for the near future will be affected by various factors. The continuing heavy demand for extra long-staples, even after allowing for some rebuilding of stocks, would seem to indicate the possibility of a further increase in consumption in certain countries. There is reason to believe that the favourable relationship between the prices of extra long-staples and those of other cottons during the 1962-63 season offered an inducement in some countries to substitute extra long-staples for other cottons in certain end-uses. However, during the last few months, extra long-staple cotton prices have tended upwards while the reverse is generally true for other cottons. If this trend continues this might exert a limiting influence on consumption. On the other hand, if the price situation is favourable, the extra long-staples might be expected to share in any upward movement in cotton consumption generally.

A vital consideration in the future trend of consumption of extra long-staples will be the competition from the man-made fibres but in view of the rather volatile situation prevailing here it is difficult to appraise what effect this will have in the short run. However, it is apparent that the trend of total consumption and of extra long-staples in the United Kingdom have been downward for several years and apparently many other countries in Western Europe are finding it increasingly difficult to maintain the output of the fine sections of the industry. By contrast, with the not-so-favourable outlook in Western Europe, the trend in consumption of extra long-staples in India and Japan should continue to rise. In summary, it would appear that consumption of extra long-staples during the present season will, in all probability, show little change from the 1962-63 level.

As regards trade, the Committee opines that the export outlook for extra long-staples in 1963-64 will be more or less favourable. This opinion is, however, based on two assumptions. First, no radical change will occur in the pattern of trade in extra long-staple cotton, especially in respect of trade with Communist countries which now absorb about 40 per cent of the world export of extra long-staple cotton. Secondly, extra long-staple cotton will share, to some extent at least, in any upward trend in world cotton consumption. Already, the Committee points out, there is evidence that exports would increase in 1963-64—the tendency of prices to firm up. But this very factor, namely, the firm trend of prices, the Committee hastens to add, might tend to limit expansion of exports and consumption.

BIRD'S CENTENARY YEAR

MINERALS IN MULTI-MILLION TONNES FOR STEEL

India's rising steel production demands an increasing supply of raw materials. To help meet this demand, the total minerals output of the Bird-Heilgers Group has increased in the last five years from just under 4 million tonnes to over 7 million tonnes per year. The Group is among the biggest mining organisations in the world—and still growing— producing coal, iron ore, limestone, manganese and dolomite.

Deploying the skills acquired over a hundred years, the Bird-Heilgers Group is making important contributions to the economy . . . through planned diversification and expansion.

JUTE INDUSTRY'S FIBRE NEEDS RISING

HIGHER YIELDS OF QUALITY JUTE ESSENTIAL

BY the end of the fourth Plan—that is, 1965 66—the jute industry in India will be requiring not less than eight million bales of raw jute and two million bales of mesta. This is the estimate that has emerged from the studies made by the Working Group on commercial crops set up in the Union Ministry of Food and Agriculture. As compared with the actual output in the 1962-63 season (July-June), the estimated requirements represent an increase of 2.63 million bales in the case of raw jute and 480,000 bales in that of mesta. The increase, especially in regard to raw jute, may appear to be significant, but it is not at all difficult of achievement, provided, of course, sustained efforts are made to augment the productivity of jute lands, both quantitatively and qualitatively. The need for sustained efforts has to be specially stressed because of the lack of much progress actually achieved so far, despite the loud talk of intensive development of jute cultivation. Here are the relevant figures:

	Area ('000 hectares)	Production ('000 bales)	Per-acre yield (bales per hectare)
Raw Jute			
1950-51	564	3,283	5.82
1955-56	696	4,108	5.03
1960-61	619	4,030	6.51
1961-62	923	6,347	6.88
1962-63	848	5,367	6.33
Percentage rise in 1962-63 over 1950-51	50	63	9
Mesta			
1952-53	194	682	3.51
1955-56	231	1,159	5.02
1960-61	279	1,131	4.05
1961-62	318	1,692	4.36
1962-63	318	1,522	4.37
Percentage rise in 1962-63 over 1952-53	79	123	24

One bale=400 lbs.

A look at the above table will reveal that whatever rise in the production of raw jute that has taken place during the last few years has been due largely to the expansion of area under jute, the improvement in per-hectare yield being negligible. The all-India average yield of raw jute obtained in the 1962-63 season was no more than 6.33 bales which is much less than that (7.38 bales) obtained in East Pakistan. Actually, in 1960-61, the average yield in East Pakistan was as high as 9.16 bales. Only about eight or nine districts out of a total of 73 districts growing jute in India, we are told, have a per-hectare yield exceeding 7.41 bales, as against the overall average of 6.33 bales for the country. With such low productivity, it would, as Dr. Ram Subhag Singh, Union Minister for Agriculture, clearly warned while addressing the annual general meeting of the Indian Central Jute Committee held at Calcutta on Thursday last week, be extremely difficult for Indian jute goods to stand up to serious competition that is developing in the world market. Increased production of jute goods through rise in productivity instead of through additional acreage, Dr. Singh rightly pointed out, was necessary to enlarge the country's share of the expanding world demand for jute goods, as well as to meet the rising domestic consumption. Incidentally, it may be noted that the jute industry is an export industry—almost three-fourths of its production is sold abroad—and that raw jute accounts for well over half of the industry's production costs.

Jute Development Board

To the extent per-hectare yields are raised, the cost of raw jute can be reduced. Such a reduction is imperative in the context of enhancing the competitive capacity of Indian jute goods in world markets *vis-a-vis* not merely Pakistan jute goods but also other substitute packing materials (such as paper, cotton and plastic bags) and bulk handling. Incidentally, an increase in the productivity of jute lands will release a large part of acreage for the cultivation of rice, the production of which is lagging behind the country's growing needs. Dr. Singh certainly struck a note of realism when he declared: "We cannot afford to continue to put more land under jute." It is because of the deficiencies in promotional effort at the level of the State Governments concerned that the Srivastava Committee has urged the establishment of a Jute Development Board which would co-ordinate the activities of the State Agriculture Departments. The suggestion is, indeed, a very pertinent one and must be implemented without much delay.

With judicious application of good seeds, fertilisers and improved cultural practices, it is possible to step up the per-hectare yield of jute to a significant extent. There are quite a few instances of growers in West Bengal, Assam and Tripura having obtained 14-15 bales per hectare. Similar yields can be secured in most of the areas if a vigorous drive is launched to intensify cultivation. Viewed thus, it is, indeed, gratifying to be assured by Dr. Singh that the suggestions of the Working Group "would be fully implemented" during the remaining two years of the third Plan and in the fourth Plan period. Stating that there were no basically limiting factors such as soil and environment, he observed:

"What is necessary is to improve the administrative machinery and to ensure that all the inputs required by the jute growers are made available to him in time and at reasonable cost by using all the incentives and subsidies which the Central and State Governments have agreed to place at his disposal. It has been recognised that, unless the quality of jute is improved, it would be difficult for India to compete with other jute-growing countries which have more congenial natural conditions for the production of high quality jute and are fast developing a modern jute goods industry, India lost some ground in the market for gunnies and may similarly lose some customers in hessian and other jute products in which she holds a monopoly at present, unless the quality of fibre is improved."

Retting Facilities

The quality of raw jute depends largely on the availability of retting facilities. It is true that the jute retting scheme was started several years ago, but it does not, as Dr. Singh himself frankly admitted, seem to have had the desired impact on the quality of raw jute, thanks to the difficulties involved in having small individual retting tanks. In view of these difficulties, a comprehensive scheme for establishing bigger tanks linked to irrigation canals, tube wells, etc., was recently drawn up by a sub-committee of the Central Jute Committee and a sum of Rs. 3 crores was also made available by the Government of India to the jute growing States as loans free of interest for the first three years. It is disquieting to hear from Dr. Singh that there has so far been no response to his scheme from any State Government. Dr. Singh did well to urge the State representatives present at the meeting to give serious consideration to it and formulate proposals without further loss of time for the excavation of retting tanks, particularly in those areas where there is acute scarcity of water at the time of retting of jute crop and, consequently, the quality of fibre is poor.

Simultaneously with efforts to augment productivity of jute lands, there is the urgent need for removing many anomalies that exist in the present system of grading and quality classification of jute fibre. This is important if the cultivators are to be assured of a proper price. A high-level technical committee, according to Dr. Singh, has been set up recently to work out a new regional basis for proper grading and classification. The report of this committee is expected to be ready soon, but the question is whether the Government will take an early decision on it.

Improved Seeds

Whether for raising the output of raw jute from a given area of land or for improving the quality of fibre grown, improved seeds play a notable part. It was just as well, that Dr. Singh made a pointed reference to this aspect. He said:

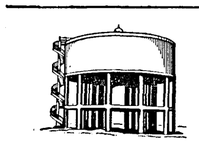
"Under the third Plan, seed multiplication schemes were sanctioned for each of the jute-growing States. However, the progress made under these schemes does not justify the assumption made earlier that the jute area will be saturated with some of the latest improved strains within the foreseeable future. The Government has been advised that those areas which are growing jute at present concentrate attention on fibre production for which they are more suitable and that the seed production programme be taken up in dry areas of the country where the yield of seed per acre will be higher and the quality of seeds also superior. A scheme of this nature is being formulated and it is proposed to be implemented in the States of U.P. and Rajasthan through the National Seeds Corporation. This step would eventually lead to the solution of jute seed problem and would make it possible for taking full advantage of the very good work which has been done in developing new varieties of superior quality and better yielding capacity."

Besides ensuring the necessary wherewithal to cultivators for producing a larger quantity of quality fibre from a given area of land, it is essential that the cultivators get an economic price for his product. Such a price is in the interest as much of the cultivators as of the jute industry itself. There have been complaints from several quarters that the jute growers are not getting prices to which they are entitled. These complaints, as Dr. Singh rightly said, must be removed, so that the farmers respond in full measure to the appeal to produce more fibre of better quality per acre. Needless to say that, in this context, proper regulation of jute markets requires utmost attention.

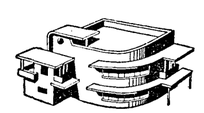
ACCOPROOF

—ACC's CEMENT WATERPROOFING ADDITIVE—

SOLVES YOUR WATERPROOFING PROBLEMS !



Reservoirs and water-tanks



Wall renderings and roofs

Water-supply conduits

Reservoirs, water supply conduits, swimming pools—any water-retaining structure can be made water-tight by using ACCOPROOF with cement. When mixed with cement before it is stirred in with the aggregate, ACCOPROOF makes stronger and denser concrete and reduces the capillary absorption of moisture. Damp-proof courses, wall-renderings and roofs require the use of ACCOPROOF to increase their resistance to moisture movement.

ACCOPROOF is readily available from

THE CEMENT MARKETING COMPANY OF INDIA LTD.

PROGRESS OF AUTOMOBILE INDUSTRY

THIRD PLAN TARGETS WILL NOT BE ATTAINED

THE automobile industry in India is one of those newer and younger industries which owe their origin to planning. It will be recalled that in 1953 the Government of India formulated its policy for the development of an indigenous automobile industry—a policy which decreed the termination of the activities of those assemblers who did not submit proper manufacturing programmes and which made the market for automobiles available to those units that had a genuine programme for progressive manufacture. At the same time, protection was granted to the industry. Subsequently in 1956, following the Tariff Commission's inquiry, protection was extended for a period of ten years. In 1957, faced with a difficult foreign exchange situation, the Government rationalised the types and makes of vehicles to be developed to three passenger cars (Standard, Fiat '1100' and Hindustan) three medium trucks of 3 to 5 tons (Dodge, Mercedes-Benz and Bedford) one heavy truck of 5 tons and above (Leyland Comet, Tiger-Titan), one light truck (one-ton Dodge) and one jeep. Perkins P6 and Meadows engines, suitable as original equipment for Dodge and Bedford trucks, were also licensed for manufacture.

In the last ten years the main automobile industry has made much progress, as will be seen from (i) the progressive increase of investment, (ii) the sustained rise in production, and (iii) the gradual reduction in the import content. As for the first indicator, it is noteworthy that the investment, which stood at no more than Rs. 3.0 crores in 1953, rose to Rs. 6.4 crores in 1956, to Rs. 16.8 crores by the end of 1959, to Rs. 26.7 crores at the end of 1961 and to over Rs. 35.0 crores by the middle of 1963. Secondly, the annual output of jeeps, cars and commercial vehicles rose from 32,137 in 1957 to 56,967 in 1962, the aggregate for the six-year period coming to 256,904. The rate of output in the first six months of 1963, however, was slowed down mostly because of the emergency restrictions placed on car production for the purpose of maintaining the level of truck manufacture for defence purposes. The actual output of jeeps, cars and trucks in the January-June 1963 period was only 24,777, representing an annual rate of just under 50,000 for the whole of 1963, as compared with about 57,000 in 1962. The aggregate output of diesel engines in the 6½-year period from 1957 to the end of June 1963 was 48,092. Thirdly, the industry's progress towards indigenous content may be noted in the following percentage figures:

	As in 1956	End of 1961
Willys Jeep	45	68
Hindustan	50	75
Standard	20	44
Fiat	30	49
Dodge—1-ton	30	38
Dodge—3-5 tons	48	76
Bedford	—	54
Mercedes-Benz	45	67
Leyland Comet	35	52

In 1962 the indigenous content was further raised overall by 9 per cent. If the industry's goal of reaching an indigenous content of 85 to 90 per cent by 1964-65 comes to be attained, it will be something remarkable, considering that, out of the 5,000-and-odd components and parts of an automobile, only 35 to 40 per cent can be made by the main manufacturers themselves, while 30 to 35 per cent and 25 to 35 per cent have to come from the automobile ancillary manufacturers and general engineering industries, respectively.

Ancillary Industry

The automobile ancillary industries, which meet the requirements of the vehicle manufacturers for original components and also the spare parts needs of the fleet of vehicles on the roads, have also progressed rapidly since 1955 when their total production of items (excluding tyres, tubes and batteries) was no more than Rs. 45 lakhs. In 1961, the output of the ancillary sector was valued at Rs. 12.5 crores and in 1962 at Rs. 18.0 crores. As for tyres and tubes for the automobile industry, their production, too, has gone up since 1955. The output of tyres increased from 8.8 lakhs in 1955 to 15.6 lakhs in 1961, while that of tubes from 7.9 lakhs to 14.8 lakhs. In the sub-sector covering the manufacture of motor cycles, scooters and three-wheelers, the total output increased from 18,298 in 1960 to 25,852 in 1962.

In spite of all this progress in the automobile and ancillary industries and of the expansion plans under way for truck manufacture, the third Plan production targets of 60,000 commercial vehicles and 60,000 motor cycles and scooters may not be achieved. In fact, the Planning Commission's recent mid-term appraisal of the Plan has itself forecast a likely achievement of only 54,000 commercial vehicles and 45,000 motor vehicles and scooters in 1965-66. But, considering that the level of output of jeeps was as high as 7,597 and that of cars 23,326 in 1962, it should not be too difficult to reach the targets of 10,000 jeeps and 30,000 cars in 1965-66, if foreign exchange allocations do not fall short of the industry's minimum requirements. But the Planning Commission's recent mid-term appraisal has given no such hope, for, according to it, the likely output of cars in 1965-66 would be about 25,000 only.

Current Shortage of Vehicles

Let alone the production targets for 1965-66. What is currently disquieting is that, in spite of the industry's progress so far, there is a serious shortage of motor vehicles and of spare parts for their maintenance. How serious this shortage is and how it can be possibly remedied have been succinctly dealt with in the presidential address of Mr. A. E. L. Collins at the annual meeting of the Association of the Indian Automobile Manufacturers held at New Delhi on the 3rd instant. The relevant passage from the address is quoted below:

"The rate of our progress, however, remains primarily dependent on the amount of foreign exchange which can be made available for the import of plant and machinery required for the expansion of outputs and of those components and raw materials which are not yet available from Indian sources. It is a great problem because the demand for cars, commercial vehicles, motor-cycles, etc. has increased more rapidly than their indigenous content. Consequently, the total amount of foreign exchange required to sustain the industry has increased, in spite of the reduction in the foreign exchange required per vehicle. At the same time, the demand for spare parts for the maintenance of vehicles in service has continuously increased.

"Today, therefore, there is a serious shortage of motor vehicles and of spare parts for their maintenance in a roadworthy condition; and this has resulted in the usual unhealthy state of a market in which demand greatly exceeds supply. It poses a tremendous problem not only to our industry but also to Government. It is unlikely that the production targets of the third Plan can be achieved in full. It is certain that the success of the fourth Plan will, to a great degree, be dependent on the road transportation of an enormous volume of persons and goods, necessitating an increase in the production of motor vehicles which may be well in excess of twice the third Plan targets. We must inevitably, therefore, face the necessity to undertake formidable expansion projects; and, notwithstanding the achievement of satisfactory indigenous contents, for some time to come our industry will require allotments of foreign exchange which will represent a severe strain on the country's resources. The obvious solutions to this particular problem are such increases in indigenous content as will bring the total foreign exchange requirements to a manageable level or the export of such a volume of the industry's products as will earn the foreign exchange necessary to sustain it.

"With regard to the former of the two solutions which have been suggested, most vehicle manufacturers will, within a comparatively short space of time, have established facilities which will enable them to manufacture all those components which are normally produced in automobile factories. But the achievement of indigenous content in excess of 90 per cent will be dependent on the availability in India of raw materials, part fabricated components, such as forgings, castings and pressings and finished components purchased from ancillary manufacturers such as carburettors, electrical equipment, brake gear, etc. which have to be purchased by vehicle manufacturers. Great strides have been and will continue to be made in the establishment of ancillary industries. However, until alloy steels, special tools, forgings, castings and the great variety of what to the vehicle manufacturer can all be classified as his raw materials are available, the ideal of 100 per cent indigenous content will remain unattainable."

But the Government's insistence on the attainment of 100 per cent indigenous content in the next few years seems to ignore two aspects—one pertaining to quality and the other to cost. That quality runs the risk of deteriorating further and that costs will go up may be foreseen, for the present hectic drive towards optimum or 100 per cent indigenous content ignores realities. Mr. Collins has, therefore, done well to point out the practical difficulties in the way of attaining 100 per cent indigenous content. The two points of criticism in Prime Minister Nehru's inaugural address at the meeting of the Association, namely, that (i) the automobile industry, with its sheltered market, is indifferent to the general complaint about the "poor quality" of vehicles, and (ii) the cost of production and thus the price of cars have not gone down in spite of the progressive increase in indigenous content, do not seem to be wholly valid. As far as the "poor quality" and high cost factors are concerned, both the unrealistically rapid pace of indigenous content and the relatively uneconomic scale of operations in the industry are to blame. As far as the "high selling prices" of cars are concerned, Mr. Collins himself has argued why the ability of the industry to reduce prices is limited:

"Our Association is gravely concerned regarding the high level of selling prices of motor vehicles. To raise revenues to meet the cost of its development projects, Government must necessarily impose taxes and duties appropriately; and to the extent that road transport can be considered capable of contributing, it must bear its share of such impositions. Nevertheless, if the numbers of transport vehicles necessary to ensure the carriage of commodities and persons at a level to meet the requirements of the country are to be purchased, particularly by private operators then careful consideration must be given to the question of retail prices.

"In future planning, therefore, it will be essential that on the basis of minimum ex-factory prices, exclusive of import and excise duties, at which it may be practicable to produce motor vehicles, the quantum of duty added will be such that there will be sufficient purchasing power, and sufficient credit and hire purchase facilities, to ensure that the number of cars, commercial vehicles, jeeps, motor cycles and other vehicles operating in the country shall be adequate to meet its requirements. Our Association would not wish to appear presumptuous in referring to this question, which may be considered a Governmental prerogative: and we are well aware that it must be engaging the careful consideration of the Planning Commission and of the Ministries concerned with the manufacture and operation of motor vehicles. But it is perhaps appropriate for us to emphasise that the extent to which our members can expect to contribute to the desirable reduction of retail prices must, for some time to come, be very limited; and that fiscal policy is likely to have a greater impact on prices than attempts to reduce manufacturing costs."

In these circumstances of high costs and high prices and of the large unsatisfied demand for vehicles in the domestic market itself, any suggestion of automobile exports would seem to be of only academic importance. Mr. Nehru's reference to this matter and Mr. Collins' examination of its possibility in certain circumstances have, therefore, no relevance to the Indian situation in the near future.

NEW PUBLICATIONS

Theory of Money. By W. T. Newlyn. Published by Clarendon Press, Oxford. Pages: 166, Price: 18s. net.

THE theory of money is a subject which has current interest and, in this book, Mr. W. T. Newlyn examines the ways in which monetary policy affects the economy. The Radcliffe Committee of England submitted an exhaustive analysis of the monetary system in England and, according to the author, the analysis of the Committee requires "careful interpretation" if it is not to mislead. The author has restricted his scope to an analysis only of those structural relationships which it is essential to understand in order to see how the theory operates in practice. The subject is dealt with in twelve broad chapters which deal with various aspects of money supply, the influence of rate of interest, how the concepts of liquidity influence monetary policy and finally makes some assessment of the scope of monetary policy. Taking the Keynesian theory of money, he has tried to integrate the much broader concepts of liquidity which "have, for sometime, been lurking uneasily on the periphery of the subject." The author concludes that the monetary measures can make a contribution which, though small, is significant in itself in restraining demand but can do little more than facilitate the operation of non-monetary measures in stimulating demand.

He has taken the following three as the objectives of the monetary policy, namely, full employment, avoidance of inflation and external equilibrium. With reference to these he considers the effect of the following measures which are open to the authorities, namely, the manipulation of supply of money, the manipulation of maturity of Government debt, conversion of market expectations and the manipulation of the Bank Rate. The most effective single monetary measure is the manipulation of money supply. But both because of the fiscal limitations and because a sharp contraction of any large magnitude might produce a liquidity crisis, the use of this measure is likely to be confined within limits which makes it slow to operate. He considers that a deliberate policy of raising interest rates runs into the debt management limitation which stems from the fact that the monetary authorities, being responsible for managing the Government's credit, are reluctant deliberately to drive down the value of securities. All the above policy measures involve a change in the rate of interest and in the interest incentive affecting expenditure. Having regard to the limitations on both the manipulation of the supply of money and the manipulation of interest rates, monetary policy can only be regarded as a fine adjustment to be used in conjunction with other measures of economic policy.

The assessment of the scope for monetary policy has been concerned throughout more with restrictions than with expansion. The author deals with the overall conclusion of the Radcliffe Committee on the scope of monetary policy. "Monetary measures are aimed at the level of demand, but by their nature they are incapable by themselves of having an effect sufficiently prompt and far-reaching for the purpose, unless applied with a vigour that itself creates a major emergency. They are not so much a policy in themselves as a part of one general economic policy which includes, among its instruments, fiscal and monetary measures and direct physical controls.

Written in a lucid style, the publication is a valuable contribution to the library on monetary economics.

The World Bank. By James Morris. Published by Faber and Faber, London. Pages: 192. Price: 25s. net.

The World Bank or the International Bank for Reconstruction and Development is well known by now as the most successful of the great international bodies created after the Second World War. "With its vast resources, its empirical methods, its sometimes patronising self-confidence and its immense range of activities, the Bank has established itself as the principal fermenter of the continuing industrial revolution—the chief single agency by which the backward nations of the earth are trying to hoist themselves into equality." Any discussion about a Bank would ordinarily be dry as one has to deal with it without passion or sympathy, but Mr. James Morris has attempted to present to the layman an interesting book wherein he indicates that, though the Bank's policies, methods and even intentions have been different, it has succeeded by adopting one common denominator, the conviction that change is usually for the best, despite first appearances, and that all nations must come in the end to 'Huddersfield.'

Mr. James Morris, who has many popular books to his credit, was commissioned by the ex-President, Mr. Eugene Black, to paint a picture of the Bank. Choosing five different corners of the earth in which the Bank's money is playing a role, the author takes us to see the developments in Ethiopia, Siam, Southern Italy, Colombia and the Indus Basin. Ethiopia has been only a tiresome honeymoon. The Ethiopians scarcely need to change but angrily want to. The Siamese must but scarcely feel the urge. The differences between the two Italies are remarkable. In regard to Colombia it is observed that, though it is a confused, even a sick country today, she has some seeds of dignity in her and, in their germination, one may perhaps see the future of South America. The negotiations in regard to the Indus Basin development lasted just a little less than nine years, "perhaps the longest gestation any international agreement has ever had to endure." During the discussions, it is indicated that "the Indians quoted *force majeure*, the Pakistanis quoted the old principle that in riparian disputes the existing uses of water must be sacroscant, and only additional uses are open to agreement—by which they meant that, if might was on the other side, right was all on theirs. So tricky and ticklish did the negotiations become that the Bank took to dealing with each side separately one at a time." Mr. James Morris regards the agreement a landmark in the history of development diplomacy and reckons it as the most flamboyant of the feathers in the World Bank's normally sombre Hamburg. The enterprises underwritten by the Bank are varied: the port of Bangkok was dredged; the city of Baghdad was freed from floods, the Cacua Valley in Colombia was electrified, the Northern Rhodesian railways were overhauled, the Icelandic radio transmitter was rehoused, the Ethopian telephone system was reorganised, the Ceylonese established an institute of scientific research, etc.

Till recently there had been a fear that countries had reached a saturation point in the matter of absorption of loans from the World Bank, particularly with its affiliate, the International Development Association. The I.D.A. is gentler in its stipulations and can put money into things not commercially profitable, like education, charge no interest and adopt the "gradual payments" system. But Mr. James Morris rightly sees the World Bank "as the seed of something greater still." The World Bank in 1956 did not have a reputation which was reassuring but today "the Bank is nothing if not respectable, and the very fact that it considers a State ripe for a loan is a kind of gilt-edged testimonial. It abandoned its duties of reconstruction and devoted all its energies to development." The institution is a bank—"a proper bank, run by professional bankers, lending money at rates of interest not extortinate but scarcely open-handed, expecting to see a profit on its cash and on the projects it financed, raising its own funds largely by the selling of bonds in the open market." Mr. Eugene Black guided it for over a decade. While in 1950 a floatation by the Bank was a sorry failure, today it is scarcely less in demand than those of the most successful corporations. Mr. Black's stature enormously increased during his tenure of the presidency, as one "whose loyalties went beyond flag-waggings and parochial slogans." He developed the institution to no idealist zeal but only to steady sensible standards—money well used, money paid back. It is an apt remark: "I don't always agree with him but at least he is consistent."

The book is well written, giving an insight into efforts for economic development, which will be useful to the professional as well as the general reader. Mr. Eugene Black during his tenure of office built up the philosophy of "Development Diplomacy." As a catalyst agency, the World Bank has played an important role in the world technical revolution, though it may be marginal. In this regard the author portrays the effective role of Eugene Black.

BOMBAY CHAMBER OF COMMERCE

The report of the Bombay Chamber of Commerce and Industry for the year ended 1962, published recently, is much more than a mere recitation of the annual proceedings of the Chamber, for it contains a wealth of information pertaining to trade and industry. It provides a "bird's-eye view" of almost all the important legislative enactments of the Central Government, as also of the Government of Maharashtra. For instance, it has reproduced, in brief, the Apprentices Act 1961, the budgets of the Central Government and the State Government for the year 1963-64 and the Defence of India Act and Rules. There is also a resume of the meetings of the Direct Taxes Advisory Committee, the constitution of Export Inspection Advisory Council, the amendments to Factories Act, the deliberations of the 20th Indian Labour Conference and the trade agreements during 1962. Besides, a short account of the Workers' Education Scheme, a summary of the Mudaliar Committee on Import and Export Policy and the Government's resolution thereon has also been included. The Chamber's replies to the Bonus Commission's questionnaire and the report of the Committee on Free Trade Zones form part of the report under review. A unique feature is that the report's table of contents has been arranged alphabetically so that it may also serve as an index to the subjects covered therein. There are some statistical tables, the most informative of which is one on the import and export trade of India from 1883 to 1962. In short, the Chamber's report touches upon all the important aspects of, and developments in, the fields of commerce, industry and finance.

Cylinder Dryer for Fabrics

A combination of convection and contact in a new cylinder machine for the accelerated drying of fabrics results in a reduction in floor space and capital cost. Manufactured by Weston-Evans and Co. Ltd., Avanti Works, Manchester Road, Clifton, near Manchester, England, the machine's narrow cylinders—30 in. in diameter—are said to be more effective than the usual large-diameter, thick-walled, air-laden cylinders, with their lower surface temperature and lower contact pressure. Full compensation for fabric shrinkage and control of tension are possible, since the fabric in contact with the small cylinders is sub-divided into controllable sections, with automatic speed adjustment between each. The machine consists of several drying units, the number depending on the required output. Hot air and steam used in the drying are re-circulated via ducts. When the fabric is light and its moisture content is high, the makers claim, one convection accelerator unit serving one drying cylinder is equivalent to four drying cylinders used without the convection unit.

NEW PRODUCTS AND PROCESSES

Deionisation of Sugarcane Juice

SUGAR content in the Indian sugarcane is rather low compared to other countries. Further, because of the presence of non-sugars, appreciable amount of molasses is produced and the full recovery of sugar from sugarcane juice cannot be effected. With an annual production target of 3.3 million tons of sugar, it is estimated that about 1.2 million tons of molasses containing about 4.2 lakh tons of irrecoverable sugar will be produced. Thus it will be seen that over 11 per cent of total sugar is lost through molasses. Sugarcane juice (from sulphitation process) as sent for concentration and crystallisation contains about 1 per cent ash. This high ash content is one of the responsible factors for high production of molasses. Any reduction in the mineral matter in the juice will reduce production of molasses, increasing thereby sugar recovery.

Laboratory investigations revealed that the ash content in the juice could be considerably reduced by removing mineral impurities from the juice by means of ion exchange process and that the recovery of sugar can be increased by 8-10 per cent. With a view to establish the practical possibilities from these laboratory results and to collect economic and technical data for commercial application of the process in the Indian sugar industry, a project was set up at National Sugar Institute, Kanpur, by National Research Development Corporation of India. Pilot plant studies have been made with clarified (sulphitation) cane juice and conditions for optimum deionisation have been established in the pilot plant.

Clarified cane juice, cooled to a temperature of 15-18°C was passed through beds of suitable cation and anion exchange resins whereby most of the mineral and colouring matters were removed and almost a water-white or pale yellow juice is obtained. This juice gives an increased yield of 8-10 per cent (over the usual) of superior grade sugar and an edible syrup. Different techniques of juice deionisation were studied. Also different types of resins were tried to determine their capacity for the purification of juice and regeneration efficiency so as to select the most useful combination. These studies established the superiority of the mixed bed technique for treatment of cane juice. A pair of cation and anion exchangers most suitable for demineralisation of clarified juice was selected. After exhaustion cation exchange resin was regenerated with dilute hydrochloric or sulphuric acid and the anion exchange resin was regenerated with dilute ammonia. Other alkalies like soda ash or caustic soda could also be used for regeneration of anion exchange resin. The activities of the resins are found to be good for several thousand cycles.

Besides the extra recovery of sugar of superior grade, there are other economic benefits accruing from the above process. Molasses obtained after the ion exchange treatment process have edible characteristics and can be placed in the market at a low price for such purpose. Another benefit of great importance is the elimination of periodical shut-downs for cleaning scales and incrustations deposited on heating surfaces, because the scale forming substances are removed during the deionisation process. A continuous non-stop operation for very long time can therefore be expected. Over and above these direct advantages the process it is said will yield extra sugar without any increase in the acreage for sugarcane, and the final molasses obtained being edible, can be expected to relieve direct pressure on sugar by replacing it in many fields of its application.

Automatic Textile Sizing Process

Automatic and accurate control of the sizing process in textile manufacture—a major research project of the world's textile industries for many years—has now been accomplished. A system developed at the Shirley Institute, 52-56 Market Street, Manchester, England, the headquarters of textile research in Britain, is applicable not only to textiles but to any industry in which materials have to be impregnated or coated with a fluid substance. Sizing in the textile context means the addition of an adhesive lubricant—usually a solution of starch and tallow—to the warp yarn so that it can be woven without breaking. Conventional practice is to run the warp sheet through a bath of hot sizing paste and to remove the excess by mangling. The operator of the "slashing" or sizing machine can only judge the amount of size added by the "feel" of the yarn as it passes from the mangle to drying cylinders. Lack of a precise control system has resulted in many difficulties in the weaving stages. The system which has now been perfected at the Shirley Institute provides the complete answer to all problems associated with size application. It provides the method for delivering additive sizing ingredients at any desired rate automatically and with an accuracy of plus or minus 0.2 per cent. In so doing it automatically compensates for all variable conditions, mechanical and otherwise, which cannot be standardised in normal practice. Basic principle of the Shirley size box system is a metering control and a pump governed by infinitely variable gears. To cover the full range of modern and foreseeable requirements in sizing (different yarns require varying percentages of size), the gearbox has a speed-ratio range spanned in logarithmic steps so small that the controller can be set to within one-fiftieth of any percentage of size.

KOLHAPUR SUGAR MILLS LIMITED

FURTHER EXPANSION OF CAPACITY CONTEMPLATED

CHAIRMAN, MR. RAMNIWAS R. RUIA, URGES PRICE REVISION

THE Kolhapur Sugar Mills Limited has requested the Government of India to permit a further expansion of daily cane-crushing capacity from 2,600 metric tonnes to 3,000 metric tonnes. This was disclosed by the Chairman of the Company, Mr. Ramniwas R. Ruia, in the course of his speech at the Thirtieth Annual General Meeting of the Company held at Bombay on Friday, 27th December 1963. Such expansion, Mr. Ruia said, would be in the interest not only of the Company but also of the agricultural economy in the neighbourhood, since the factory was situated in a very concentrated cane area. Reviewing the working results of the Company, he alluded to the various increases in cost elements since the last report of the Tariff Commission and urged the Government to examine the cost structure of the sugar industry afresh. Referring in particular to the cane price policy, he warned that sugar was an agro-industrial problem and that making raw material dearer would make Indian sugar dearer for the consumer and also less competitive in world markets. The very basis of a balanced policy, he declared, lay in the improvement of per-acre yields of quality cane by adopting an intensive programme of development.

The following is the full text of Mr. Ramniwas Ruia's speech:

GENTLEMEN,

It is my great pleasure to welcome you here and to be in your midst this afternoon at the thirtieth annual general meeting of the Mills.

Before I proceed with the business of the meeting, I desire to refer to three very sad events which have recently occurred, events of international and national significance, which have, cast a deep shadow in the mind. I refer to the brutal assassination of the late President of the United States, John Fitzgerald Kennedy, who, by his dynamism, had ushered a new era in international affairs, had sought to find a common ground of understanding between the East and the West. He was an apostle of peace and equality of human beings—a second Abraham Lincoln, who had the courage to bring the noble philosophy into practice. His invaluable help to us in our emergency further endeared him to all of us.

Death has taken a heavy toll in the most tragic and accidental deaths of five of our very experienced top Generals. It is a grievous loss to our Defence Services and particularly so in this hour of national emergency, regarding which we feel very deeply.

The third sad happening was the sudden demise of our late Chief Minister, Shri Dadasaheb Kannamwar, who died in harness. He was a man of the masses possessed courage and judgment in dealing with men and things.

Gentlemen, in expressing the feelings of sorrow, I am sure, I am voicing your feelings also.

(At the suggestion of the Chairman, the assembly remained standing in silence for a couple of minutes to express their heartfelt condolences and deep respect for the memory of the departed.)

The New Chief Minister

The late Shri Dadasaheb Kannamwar has been ably succeeded by his trusted colleague, Shri Vasantraoji Naik, who brings in his new post considerable experience of public life in Vidarbha and also in the larger Maharashtra and wide experience as administrator, along with a rich record of legislation in the sphere of land reforms. He has widely travelled and had an opportunity of visiting China and Japan as a delegate of the International Rice Commission. His unanimous election as leader and Chief Minister is an evidence of the trust which his colleagues and the public have in his talents and ability. We all wish him a brilliant future as Chief Minister and prosperity to our State with him at the helm of affairs.

Now, coming to the business of the meeting, the accounts for the period ended 30th June 1963, along with the report of the Directors for the statutory period, have already been in your hands and, with your permission, I shall take them as read.

The production of sugar of 380,231 quintal bags during the year under report, as compared with 269,890 bags of the last year, has been an all-time record for the factory. Our production stands as the highest in Maharashtra and second in the whole of India. The average recovery was 12.47 per cent, as compared with 12.45 per cent of the preceding year.

The production of alcohol in our distillery was augmented to 1,250,000 gallons, as against 731,580 gallons of the previous year. The molasses allotted from the neighbouring factories by the Government of Maharashtra was fully utilised. The new and the old plants together are well on the way to achieve an annual production of two million gallons with a daily production of 7,000 gallons, and your management has already approached the Central Government with a request to grant us increase in production capacity to that extent. This will necessitate a supply of 35,000 metric tonnes of molasses and the distillery can easily utilise the molasses of all the neighbouring factories in the district. While on this point, I would like to express our sense of thankfulness to the Industries Commissioner of the Government of Maharashtra and to the managements of the Panchaganga, Warana and the Bhogawati factories for their valued co-operation.

Expansion and Modernisation

Gentlemen, while reviewing for you the progress of the Mills, naturally, my mind goes back some twenty years when the Mills were only a 400-ton unit producing about 50 to 60 thousand bags and the distillery producing only about 500 to 600 gallons per day and about 100,000 gallons annually. The capacity now has increased almost to eight to ten times and both the plants have been modernised. Further, the Mills have taken up new projects of alcohol-based chemical industries. It has, however, to be borne in mind that the block capital investment of Rs. 3.5 crores, necessary for this development, has been built without the shareholders being called upon to contribute, which I am sure, you will appreciate. Your management has been pursuing the wise policy and healthy practice of ploughing back profits so necessary for capital formation and needed for expansion. I must, however, observe that, due to the heavy tax burden, rise in cost of stores and the wage Bill, formation of capital is becoming increasingly difficult and, I am afraid, is reflected in the comparatively slow pace of industrial expansion in 1962-63.

To speak of the financial working results, I might observe that, though our working results are as good as can be expected, the incidence of the Super Profits Tax, which amounts to Rs. 2,73,315, War Risk Insurance and other taxes reduces profits for distribution. Added to that is the rise in the cost of stores, and the wage bill due to the full implementation of the recommendations of the Wage Board. None of these factors were taken into account when the Tariff Board framed the cost structure of sugar. I, therefore, think that Government will be well advised to examine the cost structure afresh.

Cane Price Policy

Gentlemen, as regards return to the cultivator, none will be happier than myself if the the cultivation of sugarcane is made a more lucrative occupation to the farmer than what it is at present. But, in order to make the cultivation of sugarcane more profitable to the farmer, a long-range policy of cane development is necessary. The overall yield per acre in our country is the lowest in the world. The sugar content is also poor. Merely fixing higher cane price may be expedient as a temporary measure, but that is not enough. Sugar is an agro-industrial problem and making the raw material dearer will make our sugar dearer for the consumer and also less competitive in the foreign market, as it was two years back. The very basis of a balanced policy lies in improving the per-acre yield and improving the quality by adopting an intensive programme of development which, I am happy to note, the Mills have been following. We provide irrigation, finance, manures, seed, etc., and technical guidance and our Development Department is manned by twelve agricultural graduates along with the necessary field staff and the number of cultivators deriving the benefits is 5,706 today.

While on the question of development, I may refer to the huge amount of Rs. 87,24,000 paid by us, so far, by way of cane cess and purchase tax together, levied by the State Government for development work. Provision of roads in the area of operation for facilitating and cheapening transport of sugarcane forms a major part of the development work. A few years back, the Maharashtra Government had prepared a tentative scheme to construct roads in the areas of factories in the Kolhapur district. Certain amounts were also proposed to be spent in the area of each factory. In the meanwhile, the *Zilla Parishads* began functioning and the work of constructing roads in the factory areas appears to have been shelved. I would most earnestly urge the *Zilla Parishad* to take up the work which is of utmost importance for our cultivator-suppliers and for the industry as well. I would also request the State Government that, while apportioning grants to the *Zilla Parishad*, certain specific amounts, in proportion to the amounts contributed and the present contributions by factories, should be earmarked for the purpose of roads for each factory area. Speaking about our Mills, an additional crossing in the upper reach of the Panchaganga will shorten distances of transport of cane from the other bank of the river and save cost on transport.

Sugarcane Farms

You are aware of the Maharashtra Agricultural Land (Ceiling on Holdings) Act, 1961, by which the State Farming Corporation has taken possession of our surplus lands (1,134 acres), along with staff, on 1st of August 1963. Negotiations regarding the taking over of the agricultural machinery and valuation of structures, etc., are on the way. Our irrigation project will remain with us and we shall have to supply the facility to the Corporation on terms and conditions to be mutually agreed. Recently, however, Article 28 of the above Act has been declared invalid by the Bombay High Court as being repugnant to the Constitution and the Government have preferred an appeal to the Supreme Court. The matter being *sub judice*, I need not say anything more.

The third Plan target of production of sugar is placed at 40 lakh metric tonnes and the all-India target for the present year is 33 lakh metric tonnes. The Maharashtra State has been allotted a target of 6.5 lakh metric tonnes. The sub-allocation for us is 42,000 metric tonnes. This means, a higher production of approximately 40,000 quintal bags over the production of the last year. It appears somewhat strange that, though there are nearly 180 factories in the country, no proper and comprehensive planning, taking into account the interests of the cultivator, producer and consumer, has been so far there. A balanced long-term policy allocating zones of cane supply also is needed. I appreciate that there may be various difficulties which Government may have to tackle. But in any plan, certain difficulties will always be there and they will have to be faced and overcome.

Exports

Happily today, our country has gained a fairly important position in the international market as exporter of sugar, thanks to the far-sighted policy of the former Food Minister. Sugar is now an important earner of exchange. The prices in the international market have also shot up and this is just the opportunity for ourselves to stabilise our position as exporter. The present short supply all the world over has stimulated the production of sugar in countries like Australia which have been very watchful in securing markets in America and Japan. Widening of export and meeting the higher domestic consumption should be the guiding pivots of the future development of our sugar industry.

You are aware that our factory has achieved a crushing capacity of 2,500 to 2,600 metric tonnes per day, as against the licensed capacity of 1,700 metric tonnes. You will join with me in appreciating this achievement of nearly 50 per cent increase in the crushing capacity. Looking to this, your management has requested the Centre to grant us expansion to 3,000 metric tonnes per day. The factory stands in a very concentrated cane-area and a further expansion of this factory will not only be in our interest but also in the interest of the agricultural economy in the neighbourhood.

Now coming to the new chemical projects, particularly, acetic acid, I may say that the progress has been somewhat slow and the start-up has been delayed for one technical reason or another, the most important factor being the delay in getting power. However, every effort is being made to expedite the start-up of the plant early. All the important plant has been erected and some indigenous material is expected to be received soon. The laboratory building is complete and the progress of the butanol building is satisfactory. In the context of the alcohol-based industries, I may acquaint members that the Government has granted us licences for the manufacture of ethyl acetate (900 metric tonnes), carbon dioxide (5,400 metric tonnes) and dry ice (3,600 metric tonnes) and preliminary enquiries about plant and machinery are in progress.

Current Working

Gentlemen, you would like me to offer a few remarks in a general way on the current working since the end of our official year.

You are aware that, due to the abnormal shortage in the overall production of sugar in the country during the year under report and the commitments for export, there is paucity of sugar for meeting the rising domestic consumption. Government had, therefore, to resort to regulation of price, movement and distribution control by issuing the Sugar Control Order in April, in addition to the controlled releases which were already there. I would like to say that the demand for sugar has been acute for the first time and not only we, but also all factories in the country find their godowns empty. Though from the factories' angle, this is a good feature, but, looking to the country's requirements, this appears a bit alarming, because we are in the process of consuming all our past surplus and, unless production goes up substantially, the problem from the consumers' angle in the months to come will be rather acute. The present trend of production in the country also does not give a very rosy picture. As far as our Mills are concerned, I understand that it will be difficult to reach anywhere near the target of 42,000 metric tonnes fixed for us and even the production of last year may not be achieved, in view of the prevailing high prices of the *gur* market and the diversion of cane for *gur*.

Sugar Prices

You are aware that in the Government policy of granting licences for new sugar factories, the co-operative sector is favoured by the Government. In my opinion, mixed economy, working together for mutual advantage as in Australia, may be good for the country. It is, however, the duty of the Government to see that factories in the so-called private sector are not placed at a disadvantage by the public sector. I have also to observe that, as compared with the price of cane fixed at Rs. 54.10 nP per metric tonne for the last season on the basis of recovery, the final price now fixed for our Mills is Rs. 61.80 nP per metric tonne. This price was first revised on 18th of November and the second upward revision came during the last week. As a result of the first revision, the price of sugar also was increased. It is, however, feared, judging from the Press report, that sugar price is not likely to be again revised. Moreover, the revision of cane price has to be given effect to retrospectively from 1st of November 1963. This places the industry in a rather awkward situation in realising the amount of difference in price of the sugar already delivered under Government orders which may sometimes be difficult. In this context, I may also refer to the idea of giving cane price fixed, ex-field, which policy some co-operative factories have adopted. This is likely to increase the cost of production and I understand the Government of Maharashtra are not unaware of this and they are trying with the Centre to get transport charges included in the cost.

Similarly, with regard to the question of rebate in excise duty as an incentive for higher production, the recent ruling of Government, to include Maharashtra along with Madras, Mysore and Kerala will adversely affect the amount of rebate to which the mills in this part of the country should have been entitled. This question, I hope, will be taken up energetically by the Deccan Sugar Factories Association.

Gentlemen, you have noticed how the productivity and efficiency of our industry have been looked after by the management very assiduously. The management have been equally keen about the physical, the mental and the cultural progress of the employees and they have liberally encouraged the two institutions which cater for the physical and cultural progress, I mean, the *Kolhapur Sugar Mills Gymkhana* and *Jeevan Kalyan*.

Among the activities of the Gymkhana, cricket, badminton and tennis and indoor games like table tennis and bridge, may be mentioned for the outstanding merit our players have shown by winning local and outside championships.

The *Jeevan Kalyan* observed the *Ganesh Festival* with the same enthusiasm and on the same scale and in keeping with the high traditions. Likewise, the Annual Number possesses a variety of articles of high literary merit in both English and Marathi. Shri Madhavraoji Bagal's contribution on *Art and Artists of Kolhapur*, also published separately in book form, deserves special mention.

I take this opportunity to thank my colleagues on the Board of Directors who have all along given me their guidance, advice and support. I am equally thankful to you all for your keen interest in the affairs of the Company.

As Chairman of the Company, I desire to express my feelings of thankfulness to the cultivator-suppliers with whom our relations have always been very cordial, and of whose invaluable co-operation the management are very sensible.

Finally, I desire to record our warm appreciation of the very efficient and devoted work of our General Manager, Shri M. B. Lohia, who has that rare gift of imaginative dynamism combined with a keen sense of reality. I may also mention the loyal and earnest co-operation of the Deputy General Manager, Shri S. D. Patil, and other colleague officers and for the never-failing and hearty co-operation of the staff and workers in the discharge of their duties.

With these words, I now beg to propose that the balance-sheet and profit and loss account for the year 1962-63 be approved and adopted.

'TERYLENE'

Polyester ICI Fibre

suits men who matter

Only 'Terylene' can give you suits which are outstanding. Blending splendidly with wool, 'Terylene' makes suits that combine crease resistance with comfort, good looks with durability; they keep you smart the whole day through, and require minimum care.

MUSCO MAHINDRA UGINE STEEL COMPANY LIMITED

(Incorporated on the 19th day of December, 1962 under the Companies Act, 1956).

Registered Office: **Gateway Building, Apollo Bunder, Bombay-1**

SHARE CAPITAL

AUTHORISED CAPITAL :

	Rs.
40,00,000 Equity shares of Rs. 10 each	4,00,00,000
1,00,000 Preference shares of Rs. 100 each	1,00,00,000
	5,00,00,000

A. ISSUED CAPITAL :

4,30,000 Equity shares of Rs. 10 each	43,00,000

B. SUBSCRIBED AND PAID-UP CAPITAL:

		Subscribed Rs.	Paid up Rs.
(1)	8 equity shares of Rs. 10 each, fully paid in cash, subscribed for at par by the signatories to the memorandum	80	80
(2)	15,000 equity shares of Rs. 10 each at par credited as fully paid-up, allotted to Mahindra and Mahindra Limited for consideration other than cash	1,50,000	1,50,000
(3)	15,000 equity shares of Rs. 10 each at par credited as fully paid-up, allotted to Societe D'Electro-Chimie D'Electro Metallurgie Et Des Acieries Electriques D'Ugine for consideration other than cash	1,50,000	1,50,000
(4)	1,99,992 equity shares of Rs. 10 each, on which Rs. 5 have been paid-up, subscribed for in cash at par by Mahindra and Mahindra Limited	19,99,920	9,99,960
(5)	2,00,000 equity shares of Rs. 10 each on which Rs. 5 have been paid-up, subscribed for in cash at par by Societe Inde Ugine, a subsidiary of Societe D'Electro-Chimie D'Electro Metallurgie Et Des Acieries Electriques D'Ugine	20,00,000	10,00,000
	Rs.	43,00,000	23,00,040

C. PRESENT ISSUE: Rs.

(1) 20,70,000 equity shares of Rs. 10 each at par	2,07,00,000
(2) 50,000 Redeemable 9.3% Cumulative preference shares of Rs. 100 each at par free of Company's tax but subject to deduction of taxes at source at the prescribed rates	50,00,000
Rs.	2,57,00,000

D. OUT OF THE PRESENT ISSUE:

(1) 2,00,008 equity shares of Rs. 10 each have been agreed to be subscribed for in cash at par by Mahindra and Mahindra Limited	20,00,080
(2) 2,00,000 equity shares of Rs. 10 each have been agreed to be subscribed for in cash at par by Societe Inde Ugine	20,00,000
(3) 1,99,992 equity shares of Rs. 10 each have been agreed to be subscribed for in cash at par by Mahindra & Mahindra Ltd. if in the first instance they are not taken up by the staff of Mahindra & Mahindra Ltd., and of their associated companies ; and shareholders of Mahindra & Mahindra Ltd.	19,99,920
Rs.	60,00,000

E. SHARES RESERVED FOR ALLOTMENT TO INTERNATIONAL FINANCE CORPORATION, WASHINGTON

4,00,000 equity shares of Rs. 10 each are reserved for allotment to International Finance Corporation, Washington, for cash at par in terms of the Investment Agreement	40,00,000

(This is governed by a separate consent order No. R. 75-CCI/63 by the Controller of Capital Issues dated the 18th September 1963).

F. NOW OFFERED AT PAR FOR PUBLIC SUBSCRIPTION FOR CASH :

(1) 10,70,000 equity shares of Rs. 10 each	1,07,00,000
(2) 50,000 redeemable 9.3% cumulative preference shares of Rs. 100 each free of Company's income tax but subject to deduction of taxes at source at the prescribed rates	50,00,000
Rs.	1,57,00,000

LOCATION OF THE INDUSTRY

The Company's factory is to be established on a site measuring about 150 acres near the Railway Station at Khopoli, about 65 miles from Bombay in the State of Maharashtra. Karjat-Khopoli Broad Gauge line runs alongside the site. Power will be available from the Tata Hydro-Electric grid and the Company has received confirmation from Tata Hydro-Electric Power Supply Company that the Company's power requirements will be met in full by the time the plant goes into production. *Patalganga tailrace, originating* from Tata Hydro-Electric Power Station, flows very near the site and will provide adequate water for the plant.

EXISTING AND PROPOSED ACTIVITIES

Mahindra Ugine Steel Company Limited is establishing an up-to-date and modern plant for manufacture of Alloy Constructional Steel and Case-Hardening Steel, with an annual capacity of 25,000 tons of ingot steel or 18,000 tons of finished steel. The manufacturing programme of the Company covers a wide range of chromium, nickel manganese, molybdenum and vanedium alloy steels.

The manufacturing facilities will, *inter alia*, include modern electric arc furnace, forging press, rolling mill, re-heating furnaces and heat treatment furnaces. The products to be manufactured will include billets, rounds, flats, squares etc., in sizes and sections related to current consumption and future growth trend.

The Company's products will find applications in aircraft construction, locomotives, automobiles and machinery parts where higher strength and elastic properties coupled with higher ductility are required.

The Company has entered into collaboration agreements with Societe d'Electro-Chimie d'Electro Metallurgie et des Acieries Electriques d'Ugine of France for providing comprehensive technical assistance and services both during the construction and operating phases of the project.

The Company has secured the necessary foreign exchange loans-cum-investments and deferred payment facilities to cover the foreign exchange cost of capital plant and equipment.

DATES OF OPENING AND CLOSING OF SUBSCRIPTION LIST

The Subscription List will open at the commencement of banking hours on the 14th January, 1964 and will close at the close of banking hours on the 24th January, 1964 or sooner as the Directors may decide but in no case will the List close before the close of banking hours on the 17th January, 1964.

ANDHRA PRADESH INDUSTRIAL DEVELOPMENT CORP. LTD.

SPEECH OF CHAIRMAN, MR. A. V. BHANOJI ROW

"ENTERPRISE MUST BE KEPT FREE AND UNFETTERED"

THE Second Annual Meeting of the Andhra Pradesh Industrial Development Corporation Ltd. was held at Hyderabad on 6th December 1963. Addressing the meeting, Mr. A. V. Bhanoji Row, Chairman of the Corporation, made the very pertinent point that, for rapid industrial development, it was necessary that enterprise should be left free and unfettered with minimum controls and that the technical personnel available be mobilised and put to best use. He outlined the varied activities of the Corporation and regretted that its eagerness to help was not matched by its resources. He, however, assured that the Corporation was making all possible efforts to raise additional resources and to render assistance on a larger scale than at present.

The following is the full text of Mr. A. V. Bhanoji Row's speech:

GENTLEMEN,

I have great pleasure in welcoming you to the second annual general meeting of the shareholders of this Corporation.

The annual accounts and the directors' report for the period ended 31st March 1963 have been placed before you. I am glad to inform you that the Comptroller and Auditor General of India has stated that he has no comments to offer on our accounts for the period. With your permission, I shall take the annual accounts and Directors' report as read.

Andhra Pradesh has been a predominantly agricultural State. While one cannot minimise the importance of agriculture in promoting and assisting economic growth, it cannot also be gainsaid that industrialisation is equally necessary for progress. Both industry and agriculture are, therefore, necessary for the economic progress of the State. After all, the essentials of progressive agriculture are better implements, more and better fertilisers, insecticides and pesticides and of course better seeds. Except the last item, all the others are the products of industrial development. In the present emphasis on agriculture, it should not, therefore, be forgotten that it is equally necessary to pay attention to industrial development, even though this may be directed towards assisting in agricultural output.

Decade of Development

Although there has been a strong tradition of agriculture in Andhra Pradesh, widespread industrial development is a comparatively new phenomenon. At one time, the plea for rapid industrial growth was made on the basis of balanced regional development, but it is becoming increasingly known that our prospects of industrialisation are based on more substantial grounds of sound raw material base, both mineral and agricultural, and increasing availability of water, transport and power facilities. It is said that, in India, we are now passing through the decade of development. I would say that Andhra Pradesh is now at the beginning of a decade of rapid industrialisation.

One of the requisites for the rapid industrial development in any State is to create a separate cadre of officers for industries, so that they could function continuously in any industrial undertaking or in Industries Department in which they are posted. These officers can also be sent for further training in their respective fields, if required, either in this country or outside. By doing so, continuity of implementation of policies, programmes and plans can be ensured. The specialised knowledge of these officers acquired during their service could be put to the best use and advantage for the undertakings or offices for which they are posted. But now what is happening is that these officers are constantly shifted from one assignment to another unrelated to their fields of activity at short intervals, with the result that the implementation of programmes is being retarded. For these reasons, it is essential that the Industries Department should have a special cadre of officers.

Enterprise

For rapid industrial development, it is necessary that 'Enterprise' should be left free and unfettered with minimum controls and that the technical personnel available should be mobilised and put to best use. Two countries in the world, that is, West Germany and Japan have followed the above policies and developed their industries from utter destruction to prosperity after the Second World War and they have become most prosperous nations in the world.

When this Corporation was set up about three years ago, the broad purpose was to assist in the rapid industrial growth of the State. Over a period of time, we have evolved a pattern of activities which are calculated to provide the fillip to further growth. Many other States also have established similar Corporations. In the field of financial assistance to new industries that are being established in the State, I may say that, with the comparatively meagre resources at our disposal, we have done fairly well. The total assistance we have rendered so far in various forms is broadly as follows:

	Rs. in lakhs
1. Underwriting of share capital ...	113.50
2. Investment in share capital ...	4.00
3. Guarantees for deferred payments	468.00
Total ...	585.50

We have recently taken a further decision to assist the spinning mills in the State. We may, therefore, claim that nearly every large-scale industry that has been promoted in the State has had some form of assistance from this Corporation. I hope we will be in a position not only to maintain this record but also to improve upon it in the future and catch up with other industrially developed States in the country.

Joint Ventures

One special feature of our activities which is not normally found in other similar institutions but which I am sure will come to be increasingly followed, is our direct promotion of certain selected industries. Without casting any aspersions on anyone, I may say that the general level of industrial activity in the State has been low in comparison with some other States like Maharashtra, West Bengal, Madras and the Punjab. There were several reasons for this and I do not propose to go into them on this occasion. The fact, however, remains and we, therefore, considered that the Corporation could itself perform the initial functions of promoters in the promotion of industries, by applying for industrial licences, negotiating for foreign collaboration and financial participation and welcoming private capital in the formation of joint ventures for certain selected industries.

We have so far obtained clearances from the Government of India for the promotion of a ball bearings factory, a high tension and low tension insulator factory, an integrated glass factory and a pig iron project in the State. In the case of the ball bearings project, we have negotiated the terms of the foreign collaboration with a reputed Japanese firm, Messrs. Koyo Seiko Company Ltd., for the manufacture of all kinds of bearings, including the heavy journal bearings for Indian railways. The formal approval of the collaboration agreement and the clearance for foreign exchange are awaited from the Government of India. We have in the meanwhile acquired the necessary land for this project. We are now considering certain offers of participation from Indian parties for the formation of the new company to manage this project. In the case of the insulators and glass projects, negotiations with foreign collaborators are in progress, and we expect shortly to finalise these also. In the meanwhile, steps are also being taken to form new companies along with private capital participation. A preliminary feasibility report for pig iron project has just been received and is under our examination now. We expect rapid progress hereafter in this project also.

Development Area Scheme

Another new item of activity which we have recently taken on is the implementation of the Development Area Scheme, which is intended to help the growth of industry by providing developed industrial sites with all facilities to be given to private industrialists desirous of setting up large-scale industries in the State. We have selected about 1 000 acres in Maula Ali and Sanathnagar areas, close to Hyderabad, for this purpose. Acquisition of these sites is in progress now.

A Corporation such as ours with varied activities has necessarily to depend on funds directly from Government or from other sources with the support and backing of Government. As I have said before, we are now in the decade of development and, with the increasing availability of various facilities, we have already found considerable interest being shown by various industrialists in promoting new industries in the State. The present political stability in the State and the progressive attitude of the Government are also happy auguries for rapid industrial growth. It is but proper that these industrialists look up to the various financing institutions in the country and particularly to our Corporation for assistance in the promotion of new ventures such as fertiliser factories. Our eagerness to help is, unfortunately, not matched by our resources.

Loan from Government

Sometime back, the Sub-Committee on Development of Andhra Pradesh Regional Committee decided to sanction a loan of Rs. 5 crores from out of the resources of Telangana region. This loan will carry interest of 4½ per cent and it should be repaid in 20 instalments and it has to be utilised by the Corporation for the direct promotion of industries in Telangana region of the State. As first instalment of this loan, the Committee had decided to allot a sum of about Rs. 1 crore to the Corporation. We have accordingly addressed the State Government to release this loan of Rs. 1 crore, in the first instance. Now that some of the industries taken up for promotion by the Corporation are being established in Telangana region, I hope that this loan of Rs. 5 crores will be made available by Government to the Corporation at an early date.

We are making all possible efforts to raise additional resources and we are confident that, with the sympathetic support of the State Government, we will very soon be in a position to render assistance on a larger scale than at present.

I wish to take this opportunity to thank the Managing Director, General Manager and the other officers and the staff of the Corporation for their loyal and enthusiastic work in promoting our activities.

INDIA'S EXPORTS TO UNITED STATES

NON-TRADITIONAL ITEMS FARING WELL

THE increase in the export of non-traditional items from India to the U.S.A. has been an encouraging feature in our foreign trade in recent years. The value of such exports so far has been relatively small but a good beginning has been made and, with more vigorous efforts, it will be possible to achieve significant success in course of time. Some of the new Indian items now being exported to the U.S. are handicrafts, engineering goods, sugar, medical and pharmaceutical products, floor-coverings and footwear. The table below shows the trend in the export of some non-traditional goods from India to the U.S.

(Value in '000 rupees)

	1960-61	1961-62	1962-63
Art works	1,15,65	93,38	1,09,92
Sewing machines household		1,55	4,93
Iron and steel	4,29,58	5,06,43	65,54
Floor coverings	91,24	98,96	1,08,68
Footwear	16,75	20,89	34,60
Medicinal and pharmaceutical products ..	7,86	5,37	4,64
Sugar	..	10,87,95	3,90,10

Among handicrafts, the more important are carpets, druggets and floor coverings, ceramics, toys and dolls, fabrics, coir products, jewellery, including precious and semi-precious stones, metalware, miscellaneous goods like artwares, ivory and horn products, etc.

Market for Handicrafts

In 1962, the import of handicrafts into the United States from all over the world declined to $291 million from $303 million in 1961. However, the import of handicraft goods from India into the U.S. rose from $8 million to over $10 million in the same period. The items which recorded an increase in exports were carpets, druggets and floor coverings, jewellery and coir products. The export of other items like metalware, fabrics and miscellaneous handicrafts sharply declined. The trend in the U.S. import of handicrafts from India is as follows:

(In thousand dollars)

	1960	1961	1962
Carpets, druggets and floor coverings	2,033.40	2,014.50	2,494.80
Jewellery	1,919.30	2,497.20	3,942.10
Coir and other fibres and their products	1,545.10	1,575.60	2,257.10
Metalware	1,061.90	1,572.20	1,493.40
Fabrics	138.40	588.50	299.20
Dolls and toys	4.70	4.40	4.50
Ceramics	10.60	4.80	4.90
Miscellaneous handicrafts such as ivory and horn products, papier mache, fancy leather goods, paintings, sculpture and artwork	129.40	129.70	88.50
Total U.S. imports of handicrafts from India	7,742.80	8,386.90	10,584.80
Total U.S. imports of handicrafts from *all* countries	292,450.00	303,650.00	291,700.00

The prospects for increasing the export of Indian handicrafts are bright, provided adequate care is taken to maintain first class quality and to adjust to the changing tastes of the consumers in the United States. Our competitors in handicrafts are mainly Japan and Hong Kong. In certain items like fibre products and carpets, the competition is chiefly from the Netherlands, Mexico and Iraq. Some of these countries have better advantages than India in respect of lower freight rate, more efficient labour and better sales techniques. Even so, there is great scope for increasing our exports. The Commercial Section of the Indian Embassy in the U.S. has observed that Indian designs are mostly conventional with the usual elephants, gods and goddesses. These are too ornate and embellished for the tastes of American purchasers. It has been, therefore, suggested that, while the motif may remain Indian, there should be greater variety and originality in conception and design combined with utility.

Engineering Exports

So far as engineering goods are concerned, Indian businessmen as well as our Consulate-General in New York and San Francisco have recently been making intensive efforts to export these goods, but there has not been much success. Apart from sewing machines, the other engineering goods have not been able to make headway. In 1961-62 we exported 2.800 sewing machines which rose to 8,803 in 1962-63. Although this increase is gratifying, it is insignificant, as compared with the total import of sewing machines into the U.S. from various countries. In 1962 the value of sewing machines of different types imported into the U.S. was $40 million—$5 million more than that of the previous year.

Japan is the most important supplier of sewing machines to the U.S., the bulk of her supplies consisting of household types valued at over $10 but not over $75 apiece. Japan is reported to have made arrangements with some large department store chains in the U.S. and she produces these machines under the brand names suggested by these stores. India also can sell more sewing machines to the U.S. after making a better study of the requirements of housewives in that country.

Among other engineering goods, cast iron soil pipes have a good market but there are various difficulties. The U.S. itself produces these pipes in huge quantities and our competitors like France and Australia have already firmly established themselves in the U.S. market. Nevertheless, if our costs of production can be brought down, it may be possible to increase our export to some extent. The total import of engineering goods into the U.S. reached a record figure of nearly $5 billion in 1962, as against $3.3 billion in 1961. The difficulties in increasing our exports are formidable indeed. Even so, by proper efforts, it should be possible to increase the export of our non-traditional items, especially engineering goods, to a far higher level than at present.

NANGAL FERTILISER FACTORY

The performance of the Nangal Fertiliser and Heavy Water Factory belonging to the State-owned Fertiliser Corporation of India is quite encouraging. The factory is expected to reach the production target set for the year 1963-64. The annual rated capacity of the factory is placed at 380,000 tonnes of fertiliser and production in 1963-64 is likely to come very near this capacity. During the first nine months of the current year, the factory produced as much as 280,435 tonnes of fertiliser (calcium ammonium nitrate). It will be recalled that the output in 1961-62 was 200,790 tonnes, as against the target of 200,000 tonnes, and 284,322 tonnes in 1962-63, as against the target of 280,000 tonnes. The fact that a high rate of production was achieved even during the first two years of the factory's working gives an idea of its efficiency.

The Heavy Water Plant, which was commissioned in August 1962, exceeded its production target during 1962-63. The output during that year was 5,250 kgs., as against the target of 4,000 kgs. The target for the year 1963-64 is 11,500 kgs. of heavy water, against which production during the first nine months amounted to 8,740 kgs. The designed capacity of the plant, assuming most favourable conditions of concentration of distillate hydrogen, is 14,000 kgs. per annum, but it is normally expected to yield only about 12,000 kgs. a year.

MANUFACTURE OF PRINTING MACHINERY

The panel appointed by the Government of India for assessing the requirements of printing machinery has assessed the demand by the end of 1965-66 as follows:

Proof presses: 300 precision cylinder proof presses and 1,000 letter press proof presses.

Platen presses: 3,000 treadle type end power-operated type presses.

Flat bed machines: 600 single revolution stop cylinder type machines and 300 two-revolution type machines.

Rotary presses: 20.

Offset machines (single colour): 600.

In addition to the printing machines listed above, the panel has assessed the requirements of ancillary machines as follows: 550 guillotines, 1,700 wire stitching machines, 200 board shearing machines, 300 folding machines, 200 perforating machines and 200 book sewing machines. The requirements by 1970-71 for various types of machines would be still greater.

The Government is anxious that the manufacture of printing machinery should be developed within the country as rapidly as possible. With this object in view, it would welcome any well-drawn schemes, preferably in collaboration with reputed foreign manufacturers of printing machinery. The industry at present is not covered by the Industries (Development and Regulations) Act, 1951. As such, no permission is necessary for undertaking the manufacture of printing machinery. The Government's approval, however, is necessary for the import of capital equipment and collaboration arrangements.

The annual demand for printing machinery in the country by 1965-66 is estimated at over Rs. 7 crores. The demand is expected to rise to about Rs. 12 crores per annum by 1970-71.

PREMIER AUTOMOBILES' SALES AND PROFIT RECEDE

DIVIDEND PASSED OVER

THE year ended 30th June 1963 has, indeed, proved to be an unfortunate one in the life of the Premier Automobiles Ltd. (Managing Agents: Messrs. Aero-Auto Ltd., Bombay). Owing to the reduction of 30 per cent in the foreign exchange allocation for import of Fiat components, the number of passenger cars produced fell by 2,790 and, though the Company was called upon to execute some defence orders for trucks, the actual output of these vehicles was "rather" disorganised, due chiefly to the Defence Ministry's policy of self-sufficiency in the matter of production. It was with great effort, therefore, that production could be reorganised, but, even then, the number of vehicles sold could register a less than ten per cent increase over the previous year. To make matters worse, the cost of production went up as a result of several factors such as imposition of various levies by the Government, the rising prices of materials, particularly of indigenously manufactured components, overheads, interest charges, levy of Emergency Risk Insurance, and enhancement of sales tax, excise and import duties with no corresponding escalation in the price of either cars or trucks. Consequently, the profit margins (ratio of gross profit to turnover) were reduced to 5.9 per cent from 7.6 per cent earlier.

How the aforesaid factors have affected the sales realisation and the profit—particularly the latter—will be evident from a scrutiny of the comparative table given below:

(In lakhs of rupees)

	For the year ended 30th June			
	1963	1962	1961	1960
Sale proceeds	20,11.64	21,47.62	22,73.87	20,94.88
Other income	16.83	12.74	14.60	12.47
Closing stocks of ifinished goods	199.66	217.01	191.63	163.90
Raw materials and stores consumed	14,81.83	16,09.10	17,80.58	16,43.53
Salaries, wages and benefits	276.74	266.49	222.64	189.15
Other expenses	133.74	146.47	119.12	93.95
Gross profit	118.81	163.68	193.86	153.88

Market price of ordinary shares (in rupees):	1963	1962	1961	1960
High	117.00	160.00 CR	185.00	191.50
Low	95.00	92.00 XR	151.00	136.00

Note:—All dividends are subject to deduction of tax.

The turnover, it will be noted, has declined by a little over nine per cent from Rs. 21.48 crores to Rs. 20.12 crores, but the gross profit has decreased by well over one-fourth its previous figure of Rs. 163.68 lakhs to Rs. 118.81 lakhs, despite a rise in other income and a welcome reduction in closing stocks. In view of the drop in gross profit, the Managing Agents have agreed, with a certain proviso, to forgo their commission of Rs. 3.91 lakhs for the year. No provision has, therefore, been made for this amount in the accounts. The provision for depreciation, however, has been raised slightly from Rs. 60.37 lakhs to Rs. 63.47 lakhs but that for taxation is less by as much as Rs. 29.85 lakhs at Rs. 19.15 lakhs, owing partly to lower taxable profit and partly to higher transfer to the development rebate reserve. As a result of this substantial saving, the decrease in net profit is only Rs. 11.35 lakhs to Rs. 36.19 lakhs, the lowest level touched during the past few years. Adding to this the amount brought forward from the previous year and the Rs. 2.05 lakhs withdrawn from past provisions, the Directors have written off from the amount available a sum of Rs. 10.90 lakhs as expenses and claims pertaining to previous years, including Rs. 7.03 lakhs as bonus for the year 1959-60. The credit to the statutory development rebate reserve has been stepped up from Rs. 8.00 lakhs to Rs. 13.75 lakhs, while Rs. 15 lakhs (as against nil), have been transferred to the general reserve. The dividend has unfortunately been passed over as against seven per cent subject to deduction of tax paid for the preceding year. The carry forward is Rs. 40,487, as against the Rs. 1.82 lakh brought in.

During the year under review, the Company sold 4,350 cars and 5,712 trucks, as against 7,193 cars and 5,324 trucks in the previous year. The restricted output of cars, as stated earlier, was due partly to the reduction in the foreign exchange allocation for Fiat components and partly to the need, particularly since the advent of the emergency, to step up the production of commercial vehicles to meet defence requirements. It is obvious, therefore, that the output of cars can increase within the given capacity only if the indigenous manufacture of components goes up with a corresponding reduction in the reliance on imports. Viewed thus, the statement of the Chairman, Mr. Lalchand Hirachand, that the production of components and parts is progressing well and that more and more parts are being manufactured indigenously is certainly heartening. The Company now manufactures all major parts for the rear axles for the Fiat cars and expects to reach 85 to 90 per cent indigenous content when its sheet metal plant starts operation. The construction of the press plant buildings and the erection of presses are progressing; they are expected to be completed soon. It is hoped that the first phase of production will be commenced by the first quarter of 1964 and the second phase by the middle of this year when stamping will be produced.

As for the manufacture of diesel engines under the agreement with Messrs. Henry Meadows Ltd. of England, the Company has received a part of the machinery and equipment ordered and is making four to five engines per day. But when all the machinery and equipment are received and installed, the output will go up to ten engines per day. At present, the Company is also manufacturing "Airtemp" air-conditioners in its factory. In order to meet the growing demand for these, it is now considered necessary to start a separate subsidiary Company to undertake this activity in collaboration with the Chrysler Corporation of the U.S.A. Negotiations are in progress on the terms and conditions regarding capital, etc.

Time and again, the automobile industry had emphasised the need for a larger volume of production with a view to reducing the prices of vehicles. The target of automobile production in the country also demanded an immediate revision, particularly in the context of the emergency so as to meet the increased defence requirements. With this view in mind, several automobile manufacturers of whom this Company is one, submitted to the Government their expansion programmes. The Chairman informed the shareholders that the Government has now approved of the Company's programme for expanding the truck manufacturing capacity to 15,000 per annum and also for the manufacture of Chrysler Cummins diesel engines at the rate of 15,000 per annum. The Government's sanction for the expansion project for Fiat cars is, however, yet awaited.

The Company made during the year a further call of Rs. 10 on the 187,237 ordinary shares of Rs. 100 each issued in April 1962 and this has raised its subscribed share capital (made up only of ordinary shares of Rs. 100 each) to Rs. 6.38 crores which enjoys a backing of Rs. 1.83 crore in reserves and surplus. Side by side with this increase in "own" funds, borrowings have also risen sharply from Rs. 5.23 crores to Rs. 8.91 crores, due mainly to the loan of Rs. 2.12 crores availed of from foreign financial institutions. These are in addition to current liabilities and provisions aggregating Rs. 2.52 crores. As a result of additions worth Rs. 1.78 crore, the block account, too, has gone up to Rs. 9.22 crores, while the written down value of fixed assets is placed at Rs. 4.81 crores. This besides, unallocated capital expenditure on new projects is Rs. 1.64 crore. Investments are carried in the books at a cost of Rs. 13.51 lakhs and current assets, loans and advances altogether amount to Rs. 13.05 crores.

Coming to the prospects for current year, the Chairman states in his report to shareholders that, as at 30th November 1963, the Company had sold 1,660 cars, 2,522 trucks and Rs. 74.36 lakhs worth of spare parts, as against 2,271 cars, 1,909 trucks and spare parts valued at Rs. 66.22 lakhs in the corresponding period of 1962-63. Moreover, the Company has secured orders from the Government of India for supply of trucks to the defence department. It is expected, the Chairman adds, that the production of these vehicles will be "substantially" stepped up from April 1964 and it may take a little longer to raise the output of Fiat cars to, say, 650 a month from the present average of 300 per month.

KIRLOSKAR BROTHERS FARES WELL

PROFIT-MARGIN, HOWEVER, SAME

THE working results of Kirloskar Brothers Ltd. (Managing Agency: Messrs. Kirloskar Son and Company, Kirloskarwadi) for the year ended 31st July 1963 are very good. For, notwithstanding the keen competition experienced by the Company's products, turnover has expanded further by about Rs. 90 lakhs, or 23 per cent, to Rs. 477.81 lakhs and the gross profit has risen more than proportionately from Rs. 48.95 lakhs to Rs. 60.64 lakhs. In terms of profit margin (ratio of gross profit to sales), however, there is hardly any improvement—the actual margin having remained stagnant at 12.7 per cent. But it has to be remembered that manufacturing costs have also gone up during the year, owing to increase in the prices of raw materials and rise in expenses. Staff expenses, for example, have risen from Rs. 40.66 lakhs to Rs. 49.85 lakhs and other expenses are higher by Rs. 5.18 lakhs at Rs. 40.23 lakhs. Material costs of goods sold are also higher at Rs. 334.06 lakhs, as against Rs. 268.20 lakhs, but this increase is due entirely to enlarged production.

The increase in gross profit has hardly affected the Managing Agents' commission which has gone up only marginally from Rs. 3.18 lakhs to Rs. 3.76 lakhs. Not there has been an appreciable increase in the provision for depreciation which is larger by Rs. 1.58 lakh at Rs. 13.96 lakhs. Considering that new assets worth Rs. 37.37 lakhs were acquired during the year and that the full year's depreciation became chargeable on assets valued at Rs. 61.13 lakhs added in the previous year, this small increase in the provision for depreciation may appear incongruous. The reason, however, is that there has been a change in the mode of charging depreciation during the year from the equal instalment basis followed hitherto to the written down value method allowed under the Income-tax Act. It is also for this reason and also for the fact that the provision for taxation is higher by only Rs. 4.61 lakhs at Rs. 18.13 lakhs that there has been only a slight increase in the provision for Managing Agents' commission. On making these essential provisions, the resulting net profit is Rs. 24.79 lakhs, as against Rs. 19.87 lakhs a year ago. From this the Directors have transferred Rs. 18.64 lakhs to various reserves and set aside a further sum of Rs. 36,246 for payment of dividend on nine per cent preference shares proportionately for the period between the day of allotment and 31st July 1963. The ordinary dividend has once again been maintained at 10 per cent subject to deduction of tax, but, since it is also payable proportionately on the new equity shares issued during the year, the actual amount to be distributed is higher at Rs. 6.10 lakhs, as against Rs. 5.78 lakhs for the year before and Rs. 4.31 lakhs for 1960-61. The carry forward is Rs. 19,491, as against the Rs. 12,309 brought in.

The steady progress achieved by the Company during the past four years is amply reflected in the following table:

(In lakhs of rupees)

	For the year ended 31st July			
	1963	1962	1961	1960
Sales (gross)	477.81	387.87	315.67	235.13
Other income	6.97	5.29	3.42	3.00
Material cost of goods sold	334.06	268.20	208.38	144.88
Staff expenses	49.85	40.66	38.38	33.61
Other expenses	40.23	35.05	35.28	26.77
Gross profit	60.64	48.95	37.05	32.87
Managing Agents' commission	3.76	3.18	2.54	2.60
Provision for—				
Depreciation	13.96	12.38	9.27	7.82
Taxation	18.13	13.52	11.28	11.06
Net profit	24.79	19.87	13.96	11.39
Excess provisions written back	0.39	0.04	0.09	0.10
To reserves	18.64	14.12	9.76	7.46
Dividends—				
Preference	0.36	..	..	..
Ordinary	6.10 (10%)	5.78 (10%)	4.31 (10%)	4.03 (10%)
Carry forward	0.19	0.12	0.11	0.12
Market price of ordinary shares (in rupees):	1963	1962	1961	1960
High	42.50	60.00	62.00	75.00
Low	37.00	44.00	37.00 XR	61.00

It will be seen from the above table that there has been a continuous upward trend in the sale as well as gross profit, both of which have nearly doubled over the four-year period. Even though the dividend rate has remained unchanged at Rs. 2.50 per share subject to tax, owing to the increase in the number of ordinary shares, the actual distribution has risen from Rs. 4.03 lakhs to Rs. 6.10 lakhs or roughly 50 per cent. On the whole, the dividend payout policy has been conservative, since, out of a total net profit of about Rs. 70 lakhs, only Rs. 20.22 lakhs or less than one-third have gone

* Dividends for 1963 is to be paid out of the dividend reserve.

Extracts from the Directors' report: During the year under review the crushing of sugarcane was very much lower at 1,24,343 tonnes (33,31,432 mds.) against 1,97,540 tonnes (52,92,567 mds.) in the previous year. The factory worked for 114 days against 192 days in the previous year. The average recovery was, however, higher at 9.92 per cent. against 9.02 per cent. in the previous year. The crushing was abnormally low as a result of the acreage under sugarcane in the area having gone down due to cut in sugar production of last season announced by the Government of India. During the current season a crushing of about 1.12 lac tonnes (30 lac mds.) of sugarcane is expected.

The Government of India have fixed a target of 33 lac tonnes of sugar production during the current season. With that end in view the Government have increased the price payable by sugar factories for sugarcane. Besides this, rebate in basic excise duty on additional production during the current season over the production during the season 1961-62 has been granted. The rebate will be 50 per cent. of the basic excise duty on additional production during November, 1963 and April, 1964 and subsequent months and 20 per cent. on production during December, 1963 to March, 1964 compared with the production during the corresponding periods of season 1961-62. The Company's factory is likely to get a very little benefit of the rebate on this account.

This year different prices of sugarcane have been fixed for different areas in the country. In the case of this Company's factory the price of sugarcane payable during the current season has been fixed at Rs. 4.82 per quintal as against Rs. 4.38 during the preceding season. The price of sugar has been fixed at Rs. 113.75 per quintal against Rs. 108.50 (raised to Rs. 111.20 from 19-7-1963) of the preceding season. The price of sugar fixed is not adequate keeping in view the increased price of sugarcane and the increase in the costs of production.

Accounts in brief as at 30th June 1963 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	18,54,610	Gross block	61,13,988

* Upto 27th December 1963.

Extracts from the Directors' report: Working: The Directors feel that the working results of the Company for the year ended 30th June 1963, have been satisfactory. The Coffee produced by the Company has been valued at Rs. 2.10 per point.

Crop	Estimated for 1962-63	Realised for 1962-63	Estimated for 1963-64
Arabica	211 tonnes	174 tonnes	180 tonnes
Robusta	382 tonnes	3254 tonnes	330 tonnes
Pepper	24 candies	52 candies	27 candies
Orange	20 to 25 lorry loads	30 lorry loads	20 lorry loads

The average cost of coffee per kilo stood at Re. 1.48 as against Re. 1.68 during the previous year.

General: The coffee crop realised for the year was about 500 tons as against 468 tons realised for the previous year and the points awarded for coffee submitted to the Coffee Pool for the year was 5,81,955 as against 5,76,959 points awarded originally plus 4,41,839 bonus points awarded for the previous year. The reduction in basic points awarded for the various grades of coffee cont.nues for the year. It is expected that for the current year's crop also bonus points may be awarded. The Wage Board appointed by the Government of India for Coffee Industry has awarded an interim increase in wages at 3 nP per day for men and 2 nP per day for women and adolescents and Rs. 9 per month to the staff of Coffee Estates with effect from 10th August 1962.

The estates of the Company are being maintained in a very good condition.

Accounts in brief as at 30th June 1963 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	12,07,833	Gross block	22,60,026
Debentures	3,81,000	—Depreciation	3,45,437

		Current assets	19,54,902
		Investments	2,58,856
		Cash	39,429
	Rs. 41,77,376		Rs. 41,77,376

* Paid-up capital consists of 6,50,080 ordinary shares of Rs. 2 each. Of this 1,50,080 ordinary shares are allotted as fully paid-up bonus shares.

Sitalpore Sugar Works Ltd.

(*Managing Directors:* Mr. R. N. Datta and Mr. D. P. Ghosh, Calcutta.)

Thirty-first Annual General Meeting—Held on 30th December 1963.

Extracts from the Directors' report for the year ended 30th June 1963: The result for the period shows a net loss of Rs. 7,18,697 (Loss of Rs. 6,97,343 for 1962) after providing only half the normal depreciation on factory building, plant and machinery and full normal depreciation on other assets due to uneconomic crush and short duration.

The causes attributing to adverse result being the impact of Wage Board award, low recovery from cane and very meagre quantity of cane supply which has increased the Company's over-head expense to a large extent.

The normal seasonal requirement for the existing capacity of the plant is 30 lakh maunds of cane in a season; against this there was a supply of 8 lakh maunds only. Thus the crushing season was as short as 50 days. This shortfall was mainly due to the announcement for 10 per cent cut in cane supply and diversion of cane for *gur* which fetched higher price.

Control was imposed on 17th April 1963, and price fixed at Rs. 108.50 per quintal for D-29, which was too low in comparison to the cost of production. However the price was increased to Rs. 111.20 subsequently from 19th June 1963, by which time a substantial quantity of the stock of sugar was already sold at the previous rate.

Prospect for the current year is not considered bright as there has been a shrinkage in cane acreage and some of the cane has been diverted for *gur* manufacture. The Directors, however, expect a better supply for 1964-65 season as cane has been priced at a higher rate this year.

The Company has almost completed the development programme for increasing the capacity of the plant and it is expected that before the beginning of 1964-65 season, the factory will have an increased capacity and as such will be able to crush more cane in a shorter period which will help in bringing down the cost of production.

Accounts in brief as at 30th June 1963 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	10,02,115	Gross block	38,57,935

Low	70.00	75.00	65.00

Extracts from the Directors' report: The year under review was a critical one for the Textile Industry which had to face many odds. The Chinese aggression in October 1962 caused a severe dislocation in cloth trade and a state of emergency was declared by the Central Government. Due to heavy indirect taxation resorted to by the Central Government, the cost of living went up thereby increasing the dear food allowance. The position of Indian Cotton, which constitutes a major item in the cost of production of cloth and yarn, was very difficult, the prices ruling considerably higher than in the previous year. There was also increase in several of the items that go into the cost of manufacture. The cost of dyes, chemicals and stores had gone up. There was increase in power tariff, in the rates of Inter State Sales Tax, in customs and excise duties on a number of items consumed by the Industry and in transport charges also. The Contribution to the Employees State Insurance had to be paid at double the rate i.e., 2½ per cent. The State of Emergency declared brought about an additional burden of Emergency Risks Insurance from 1st January 1963, not only on buildings, plant and machinery but on goods also such as raw materials, stores, finished products etc., whether in godowns or in transit. All these factors cumulatively, pushed up the cost of production while the prices of cloth continued to be regulated in accordance with the price fixation formula, voluntarily accepted by the Textile Industry as an *ad-hoc* and temporary measure as far back as September 1960. The export trade was none too happy due to increased competition from other exporting countries.

All these factors contributed to pull down the gross profits to a low level despite the best efforts that had been put forth. Due to meagre gross profits earned, the statutory depreciation of Rs. 4,15,304 could not be provided for in full and only a sum of Rs. 2,90,304 was provided for, leaving in arrears the balance of Rs. 1,25,000.

On an application made by the Company, the Central Government was pleased to accord sanction to increase the installed capacity of spindleage by another 3,520 spindles so as to make a total of 27,936 spindles. In the circumstances the 3 *New Ring Frames* of UT3E *High Draft System* originally ordered out for replacement of 10 old *Ring Frames*, were diverted with the permission of the Textile Commissioner, for expansion purposes. The 3 *New Ring Frames* of a total of 1,320 spindles so far received have already been erected and put into commission.

With a view to finance the above said expansion and modernisation schemes, the Andhra Pradesh State Financial Corporation was approached for a long term loan. The Corporation has sanctioned a loan of Rs. 7,74,000 on the security of a mortgage on the fixed assets of the Company and steps are being taken to finalise the transaction.

The Company has been executing orders for supply of cotton fabrics for Defence purposes. Cloth worth about Rs. 5,00,000 has already been supplied and cloth worth about Rs. 8,00,000 is being manufactured and supplied under another order.

Accounts in brief as at 30th June 1963 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	18,00,000	Gross block	1,03,98,274
Reserves and surplus	12,09,073	—Depreciation	51,64,929
Debentures	9,46,000		
Other liabilities	49,43,787	Net block	52,33,345
		Current assets	35,97,122
		Investments	40,535
		Cash	18,858
	Rs. 88,98,860		Rs. 88,98,860

* Paid-up capital consists of 18,000 equity shares of Rs. 100 each fully paid up in cash.

COMPANY MATTERS

(*Concluded from previous page*)

to shareholders, while the balance has been ploughed back into business. The reserve position as at 31st December 1963 stands at Rs. 142.69 lakhs, excluding Rs. 6.10 lakhs earmarked for the payment of ordinary dividend if approved of by shareholders. Against this, the share capital aggregates Rs. 83.21 lakhs only, of which Rs. 15 lakhs are in preference shares. The expansion and diversification of current activity undertaken a few years earlier have also resulted in increasing the borrowing from Rs. 93.95 lakhs to Rs. 111.50 lakhs, while current liabilities and provisions are higher by Rs. 15.11 lakhs at Rs. 116.93 lakhs. On the assets side, owing to the addition of new assets worth about Rs. 38.46 lakhs (including building and construction valued at Rs. 1.09 lakh), the gross block has expanded to Rs. 220.50 lakhs. On deducting therefrom Rs. 88.90 lakhs as the depreciation accumulated to date, it yields a net block of Rs. 131.60 lakhs. Investments mainly in associated companies are carried in the books at Rs. 26.04 lakhs, besides current assets, loans and advances altogether amounting to Rs. 302.79 lakhs.

The Company's branch factory at Dewas was formally inaugurated on 22nd December 1963 and has now attained its full production. Production of vertical turret lathes with partially imported components is also likely to commence shortly. An agreement has been signed with the Tecumseh Products Company of the U.S.A. for manufacture in India of hermetically sealed compressors units required by the manufacturers of refrigerators and air-conditioners. Tecumseh Products Company is the world's largest manufacturer of such compressors and its products are on the most advanced design. The Directors hope that these products will be well received in the Indian market.

The Rs. 25 paid 'old' ordinary shares of the Company are currently quoted at Rs. 42.50 *cum div.* On an *ex-div.* price, the net yield per annum works out to about 4.3 per cent.

NEWS IN BRIEF

THE budget session of Parliament is expected to begin on 10th February 1964.

India exported tea worth Rs. 131 crores during the year 1963, representing a rise of Rs. 7 crores as compared with the previous year.

The Nepa Mills produced a total of 30,361 tonnes of newsprint during the calendar year 1963. This quantity exceeds the rated capacity of the Mills by 361 tonnes.

The Employees' State Insurance Scheme has been extended to Palghat in Kerala State from 28th December 1963. As a result, 2,000 more factory workers will benefit under the Scheme.

A nine-member Vigilance Committee has been constituted for the Union Territory of Delhi to suggest adequate measures for the control and elimination of corruption. The Chief Commissioner of Delhi is the Chairman of the Committee.

The Minerals and Metals Trading Corporation of India expects to export annually 16 million tons of iron ore, including 6 million tons from Goa, by the end of the third Plan, the total foreign exchange earnings therefrom being estimated at Rs. 70 crores.

The Indian Lac Cess Committee has placed the final estimate of the *Katki* lac production in 1964 at 4,722 tonnes, as against the preliminary estimate of 6,793 tonnes. The quality actually produced during 1963 was 6,532 tonnes.

The first sugar factory in the co-operative sector in Kerala, built at a cost of Rs. 125 lakhs at Pandalam, will be commissioned on the 13th inst. The factory has a daily cane crushing capacity of 1,000 tons of sugarcane.

The Union Government has banned exports of mica on consignment basis with effect from the 1st of next month. Export of mica scrap and waste will, however, be allowed on merits by the Chief Controller of Imports and Exports at New Delhi.

Air-India proposes to effect this year sweeping fare reductions on the North Atlantic route. This move is a sequel to the decision of B.O.A.C. and other big airlines to cut the London-New York economy fare by £36 to £142.10. Air-India is to operate a daily London-New York service from 1st April next.

India's exports during the first eight months of the current financial year 1963-64 amounted to Rs. 512 crores, as compared with Rs. 455 crores in the corresponding period of 1962-63. The exports during November 1963 touched the record level of Rs. 73.7 crores, as against Rs. 64.2 crores in November 1962.

The first U.A.R.-Indian shipping agreement was signed at Cairo on the 3rd inst. between the Governments of the two countries. The agreement envisages the establishment of a regular maritime service between the two countries. It is valid for five years and provides for "most favoured treatment" of the two countries' ships at the U.A.R. and Indian ports and for the equal sharing of the shipping traffic.

The First National City Bank has introduced with effect from the 2nd inst. a novel cheque book facility for the savings bank account holder. The name of each saving bank account holder will be printed on every cheque. The other important facilities include two withdrawals a week by cheque, the ceiling on the amount of weekly withdrawal being Rs. 1,000 or a fourth of the balance, whichever is more, without notice, and sending of quarterly statement of accounts to clients, thus eliminating the conventional pass book. Clients will be given a booklet for maintaining a personal record of deposits and withdrawals.

The National Coal Development Corporation has a programme of opening 14 deep shaft mines which will ensure a total annual output of 25 million tonnes. Nine mines, each accounting for an annual output of two million tonnes, are proposed to be located in the Central Jharia coal field in Bihar. Poland is expected to provide assistance for these mines. The total outlay is put at Rs. 15 crores. Three mines together accounting for an annual output of 2.25 million tonnes are to be opened in the Bokaro coalfield with the assistance from Britain. The remaining two mines will be at Disengarh in West Bengal and they will have a production capacity of 1.50 million tonnes each.

The Government of India has announced f.o.b. floor prices for mica exports. The prices, which range from 50 nP to Rs. 17 per lb. depending on the variety of mica, will take effect from the beginning of next month. The floor price is fixed at Rs. 17 for book form splitting quality No. 4, Rs. 13 for book form quality No. 5, Rs. 11.50 for No. 4 loose splittings (dusted or undusted) exported from Calcutta port and Rs. 11 from Madras port, Rs. 8 for No. 5 loose splittings (dusted or undusted), 75 nP for loose splittings other than cheap loose and 50 nP for No. 6 cheap loose splittings.

• • • •

From Abroad

The Government of Switzerland has abolished the import duty on tea with effect from the 5th inst.

The Ceylon Petroleum Corporation has taken over all the 525 petrol filling stations owned by Shell, Caltex and Esso in that country with effect from 29th December 1963.

Textiles and clothings emerge as one of the three most important growth sectors in the international trade during 1962, according to the annual report of G.A.T.T. The others are chemicals and passenger cars. Trade in all types of yarns and fabrics reached a total of about $8,000 million, 5 per cent more than in 1961, while clothing accounted for $1,500 million, a rise of 12 per cent.

President Johnson has signed the $3,000 million Foreign Aid Bill which was passed by the U.S. Senate on 30th December 1963. The Bill also authorises extension of the Government-backed credit for private sales of wheat to the Soviet Union and Eastern Europe.

The Government of Turkey has published a decree under which the exporters of all manufactured goods will be able to claim "a drawback" of all taxes, import duties and other treasury charges included in the cost price of their exports. The decree refers specifically to all kinds of textiles, yarns, clothing and hosiery; a wide variety of other manufactures is expected to be added in the near future.

The Indonesian President has signed two bills which give the status of contractors to Shell, Stanvac and Caltex. The Companies have agreed to give the Indonesian Government 60 per cent of their profits *plus* a total bonus of $45 million. The Shell and Stanvac, as well as the Caltex which does not do any marketing business in Indonesia, have been allowed to continue their production and export business over the next 20 years but as Government contractors.

A liberal import trade policy for the shipping period ending June 1964 has been announced by the Pakistan Government. The major items of iron and steel group (iron billets and tinplate) can now be imported from any source. Previously, imports were allowed only against licences issued under the U.S. A.I.D. financial assistance. Further, as a measure of improving the export performance, the rate of export bonus has been increased from 10 to 15 per cent in the case of cotton yarn and 30 to 40 per cent in respect of other textiles.

The International Coffee Agreement is now in full force, following its ratification by the Governments of the U.S. and Madagascar, according to the U.N. European office. The Agreement required ratification by exporting countries representing 80 per cent of world exports and importing countries representing 80 per cent of imports. The quota adjustment, the setting of price differentials and the promotion of consumption have now become the responsibility of the International Coffee Council established under the Agreement.

The U.S. Justice Department, which recently began the investigation of the case of the missing soyabean oil, has come across another "big commodities scandal." Many European grain importers are reported to have attempted to defraud the U.S. Government. An inquiry by the House Appropriations Committee revealed that over half of about a million tons of feed grains, which were to have been supplied to Austria under the foreign aid programme, were diverted to countries such as West Germany, East Germany and Britain and were sold at premium prices. These diversions took place between 1959 and 1962. None of these countries was eligible to receive American commodities under the foreign aid programme. It is said that the companies concerned earned a profit amounting to $3-5 million.

PERSONAL

MR. Haakon Nord has been appointed Ambassador of Norway to India.

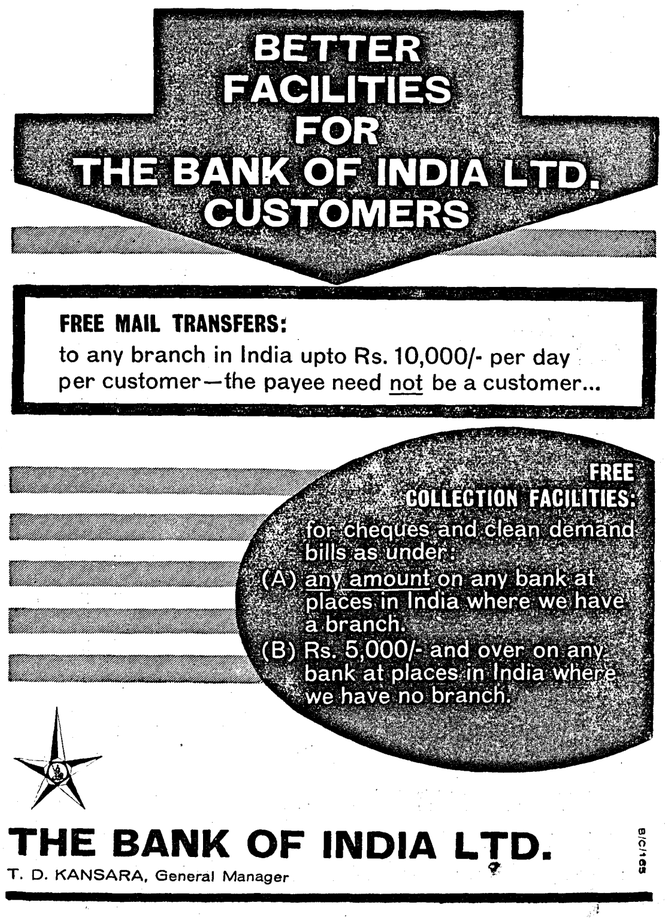
Sir Giles Guthrie has taken over charge as the full-time Chairman of British Overseas Airways Corporation.

Mr. R. V. Sheth has been appointed Secretary of the Bombay Oilseeds and Oils Exchange Ltd., Bombay.

Mr. Raghunath Rao, Assistant Director-General, International Labour Office, is retiring in February next. He will be succeeded by Mr. Hafiz Abdul Majid of Pakistan.

Mr. S. S. Khera, Cabinet Secretary, has been appointed Chairman of the Board of Directors of the Aeronautics (India) Ltd., a State-owned concern which was floated and registered in August last for the manufacture of MIGs and other types of aircraft.

Mr. J. S. Raj, Deputy General Manager of the Industrial Credit and Investment Corporation of India Ltd., has left for Nigeria to take up the post of General Manager of the Nigerian Industrial Development Bank being set up there. In view of the initial problems of setting up a new organisation in that country, the World Bank and the I.F.C. requested the Corporation to spare the services of Mr. Raj during the early stages of the new Bank's development. The Corporation has agreed to lend his services for a short period.



THIS ANNOUNCEMENT IS NOT A PROSPECTUS. PERSONS INTERESTED IN FULL DETAILS ARE REQUESTED TO OBTAIN COPIES OF THE PROSPECTUS WHICH ARE AVAILABLE FROM THE REGISTERED OFFICE OF THE COMPANY OR FROM THE OFFICES OF THE COMPANY'S REGISTRARS, BROKERS AND THE BANKERS TO THE ISSUE.

CHEMICALS AND FIBRES OF INDIA LIMITED

(INCORPORATED ON 29TH MARCH, 1961, UNDER THE COMPANIES ACT, 1956)

NAME OF THE COMPANY AND THE ADDRESS OF THE REGISTERED OFFICE :

Chemicals and Fibres of India Limited, Crescent House, 19, Wittet Road, Ballard Estate, Bombay-1.

EXISTING AND PROPOSED ACTIVITIES :

The Company will manufacture in India polyester staple fibre for which the demand in India is already established.

The polyester staple fibre which is manufactured and sold in Britain under the registered trade mark "Terylene" will be manufactured in India and sold under the registered trade mark "Terene". Polyester staple fibre is used by itself and in blends with other fibres and can be made into a wide range of fabrics such as suitings, trouserings, dress goods and shirts. Locally manufactured polyester fibre will also be used in a number of industrial applications. Import of "Terylene" is at present severely restricted.

Imperial Chemical Industries Limited, London, are the technical collaborators.

LOCATION OF THE INDUSTRY

The factory to manufacture polyester fibre will be erected at a site in the Trans-Thana Creek Industrial Area which has been provided for the Company by the Maharashtra Industrial Development Corporation. This site is suitable in all respects for the purposes of the Company ; it is connected by road to Thana which in turn is directly linked to Bombay by rail.

BOARD OF DIRECTORS

USHA SPINNING AND WEAVING MILLS LIMITED

PRICE STAMPING ON COTTON CLOTH SHOULD BE DISCONTINUED

SPEECH OF CHAIRMAN, MR. BABUBHAI M. CHINAI, AT ANNUAL MEETING

IN his speech at the Second Annual General Meeting of the Usha Spinning and Weaving Mills Ltd., held at New Delhi on Wednesday, 18th December, 1963, Mr. Babubhai M. Chinai, Chairman, has endorsed the view that the system of stamping prices on cloth, which is an integral part of the three-year-old scheme of voluntary price control, has not served the desired purpose and that it should, therefore, be scrapped. Price stamping, in Mr. Chinai's opinion, has led to a certain amount of distortion in the pattern of production which is not in the ultimate interest of the consumer. It has also caused difficulties to mills and come in the way of building a healthy relationship between manufacturers and distributors. Mr. Chinai has expressed the hope that the ten-man committee, appointed for examining the procedure and methods of stamping prices, would not confine itself to the procedural aspects of price stamping but would examine objectively the merits and demerits of the scheme itself. The following is the full text of Mr. Chinai's speech:

FRIENDS,

I have great pleasure in welcoming you all to this second annual general meeting of the Company. The report of the Directors and the statement of accounts for the period ended 30th June 1963 have been with you for some time. I shall, with your permission, take them as read.

I am happy to say that your Company is making good progress. At a time when the capital market was not particularly attracted to investment in new textile units, it is a matter for satisfaction that our flotation was a great success. As you know, on 17th March 1963 production of the Company's mill at Badarpur was inaugurated by Sardar Pratap Singh Kairon, Chief Minister of Punjab. Regular production started from April 1963 with 12,000 spindles. The Company will thus be making its contribution to the industrial development of the State of Punjab which has already made rapid industrial development during the last few years due to the impetus and encouragement given by the Government of Punjab to new industrial enterprises.

Up-to-date Machinery

Latest and up-to-date machinery has been installed in your mill. A significant feature of our production planning is that the mill can switch over to the manufacture of a variety of special kinds of yarn and also yarn of special application to military and defence requirements. We had certain difficulties in the beginning after the installation of the machinery, particularly lack of adequate supply of electric power. They have now been tided over and the mill is now working three shifts a day. I will now deal with certain points in the balance sheet and the profit and loss account. During the period under review, the Company has sustained a loss of Rs. 3,55,484.99 after providing for depreciation of Rs. 2,16,100.56 on building, plant and machinery, electrical equipment, etc. During the period under review, the Company completed only three months of trial production. The Company has acquired capital assets worth Rs. 68,18,160.28 comprising land, building, machinery and other assets thereby providing a good foundation for further expansion and development.

Expansion Programme

The Government of India has been kind enough to grant us an expansion licence No. L/23(1)/296/62 TEX(B) dated 6th April 1962 for further 13,000 spindles. The Government of India, after due and careful consideration, has decided to increase the spindle capacity of small units to 25,000 spindles to make the units economical and reduce overhead expenses. On a study of the comparative working results of units with 12,000 spindles and 25,000 spindles, it is found that the expected return on investment on the basis of current values is 57 per cent in a unit of 25,000 spindles as compared to 30 per cent in a unit having only 12,000 spindles. Moreover, the basic production cost is expected to be much lower in a unit functioning with 25,000 spindles. However, the main advantage is derived from the sales angle, as increased quantity of hosiery yarn and doubled yarn, which can fetch higher prices, can be produced in a 25,000 spindles unit. As per estimates, it enables an operating profit of 17.3 nP per lb. on 12,000 spindles, as against 37.8 nP on the 25,000 spindles unit. The installation of the additional 13,000 spindles in pursuance of the industrial licence granted to us will lead to great economy in overhead expenses and, I think, an early implementation of the proposal is very necessary. Your Company has already taken adequate steps for the implementation of the expansion programme. The capital outlay for the proposed expansion is expected to be about Rs. 106 lakhs. We have applied for loan and other facilities from the Industrial Finance Corporation of India. It is also necessary to raise part of the finance by recourse to a further issue of capital of Rs. 35 lakhs. An application for the purpose has been made to the Controller of Capital Issues and necessary consent for the issue has since been received. Orders have already been placed with indigenous machinery manufacturers and also foreign machinery suppliers for the supply of necessary plant and machinery for the expansion programme.

I am happy to say that your Company has already acquired land comprising about 23,000 square yards for the construction of a labour colony and the Punjab State Government has been approached for necessary assistance for the construction of 96 double-room tenements and 128 single-room tenements. Your Company is expecting early sanction for the construction of the labour colony.

Rise in Cotton Acreage

The cotton textile industry occupies an important place both from the point of view of meeting the growing requirements of an essential consumer item as also for augmenting our foreign exchange earnings. However, the inadequate and uncertain supply of cotton continues to be the industry's major problem. The average area under cotton cultivation increased from 12.16 million acres between 1947 and 1951 to 19.50 million acres or by 60 per cent between 1956 and 1961. Though the area under cotton cultivation in India is the highest in the world, we have not yet attained self-sufficiency in this essential raw material. The reason is the low yield per acre. While the yield of cotton per acre varies from 207 to 455 lbs. in other cotton growing countries of the world, it is a mere 100 lbs. in India. Government should, therefore, take necessary steps to increase the yield and augment cotton production.

Price Stamping

It has been my view that the scheme of stamping of prices on cotton fabrics, which is an integral part of the three-year-old system of voluntary regulation of cloth prices, has not served the purpose envisaged for it. It is known that price stamping has led to a certain amount of distortion in the pattern of production which is not in the ultimate interest of the buyers. It has caused difficulties to the mills also and has stood in the way of building a healthy relationship between them and the distributive channels. In this context, I welcome the appointment of a ten-man committee to examine the procedure and methods of stamping prices. I would like to express the hope that the committee will not go merely into the procedural aspects of the matter but also look into the merits of the proposal itself, and consider dispassionately the removal of price stamping. In my view, in the circumstances prevailing in the country today, removal of price stamping will be in the larger interests of the consumers.

Economic Growth

I am happy to note that the Union Finance Minister intends to review the present fiscal and related policies of the Government with a view to stimulating economic growth. The too frequent changes in fiscal policies are having its adverse effects on the economy. The imposition of the Super Profit Tax is an additional burden which is bound to retard industrial production. Further, the increase in excise duties, customs duties, corporate taxes and surcharges in addition to the rising costs of all materials, stores, spare parts, wages, etc., has contributed to the increase in production costs. The Government's pricing policy without any consideration being given to the increased production costs inevitably effects the profitability of the Company.

Some measures have already been taken for liberalising credit facilities to help augment industrial production and development. Further steps need to be taken by enlarging the functions of the Industrial Finance Corporation and by liberalising credit facilities. Repayment schemes should also be conceived more imaginatively so that no undue strain is involved in servicing loans during the period of development. I hope that before long Government will take suitable measures including necessary changes in the Super Profit Tax and other fiscal levies and bring about a wholesome climate for capital formation and industrial growth. In fine, I am glad to inform you that your mill's production has steadily gone up from an average of 2,067 kg. in April, 1963 to an average of 5,797 kg. in November, 1963. During certain periods in November, production reached a high figure of 6,174 kg. which is more than the usual maximum production which could be expected of a unit of the same capacity. Your mill is producing 50 per cent of the yarn in cones and 50 per cent in hanks. The quality of the yarn is found to be good. Daily market reports show that the yarn produced by the mill compares very favourably with many of the established mills in Northern India.

The Company has planned to implement the following programme during 1964.

(a) Expansion of existing spindleage by another 7½ per cent without any increase in capital except for minor additions of 3 more Ping frames.

(b) To diversify the production of 75 per cent in cones for which comparative return is much higher than the hank yarn.

(c) To diversify the balance production to doubled yarn and other special yarn which is fetching comparatively higher price in the market. The Company intends to spend about Rs. 7 lakhs on its balancing programme for which necessary financial arrangements are being finalised.

Thanking you.

Note: *This does not purport to be a record of the proceedings of the Annual General Meeting.*

TREND OF MARKETS

CALL RATE 5 PER CENT

(From Our Own Correspondent)

BOMBAY, *8th January*

The short-term money market has continued to rule firm since we reported last on 18th December 1963. Demand for funds has been well maintained, but borrowers are finding no difficulty whatever in obtaining their requirements, since the supply of funds available is adequate. Only, they have to pay a high rate of interest, namely, 5 per cent, below which lenders refuse to part with money (both fresh and renewals). Conditions at Calcutta have been persistently tight, the inter-bank call rate now being 5 per cent, as against 3½-3¾ per cent three weeks before.

The 91-day Government of India Treasury Bills, the tenders for which opened on Tuesday the 7th inst., elicited limited support. The total amount offered was no more than Rs. 2 crores which was also the amount invited and accepted. The average rate of accepted tenders continued unchanged at Rs. 2.315 per cent per annum. The Intermediate Treasury Bills fared no better. The amount of Bills actually sold from 30th December to 4th January was just Rs. 23.75 lakhs.

India's foreign assets improved by Rs. 22 lakhs to Rs. 105.79 crores during the week ended 3rd January, the improvement was in contrast to the drop of Rs. 1.64 crore which occurred in the previous week. It was entirely under balances held abroad which stood at Rs. 8.33 crores. The foreign securities held in the Issue Department of the Reserve Bank were unchanged at Rs. 97.46 crores. Deposits of scheduled banks with the Reserve Bank increased by Rs. 4.19 crores to Rs. 85.14 crores. At the same time, their borrowings rose by Rs. 18.71 crores to Rs. 26.79 crores, including Rs. 8.71 crores (a rise of Rs. 5.55 crores) against usance bills. Notes in circulation spurted by Rs. 29.46 crores to Rs. 2,369.18 crores.

There was a sharp rise of Rs. 24.28 crores (to Rs. 1,574.86 crores) in the total credit made available by the scheduled banks to their clients during the week ended 27th December. Deposits, too, rose but by only Rs. 16.58 crores to Rs. 2,405.64 crores. The banks had, therefore, to resort to borrowings from the Reserve Bank, the total outstanding of these was Rs. 7.74 crores, of which those against usance bills alone accounted for Rs. 3.18 crores, a rise of Rs. 1.14 crore. They had also to sell a part of their investments which receded by Rs. 11.19 crores to Rs. 709.20 crores.

Listless conditions prevailed in the Gilt-edged market. Barring select short-dated loans in which some strong business was put through, the volume of transaction was very much limited, with narrow fluctuations in prices. Indeed, the quotations for most of the Central and State loans were maintained at their previous levels.

In the foreign exchange market, the banks' selling and buying rates for U.S. dollars declined by 25 nP each to Rs. 478.25 and Rs. 475 per $100, respectively. In New York, the pound sterling strengthened *vis-a-vis* the dollar, the spot rate advancing by 0.210 cent to 279.860-279.890 cents and the three months' forward by 0.110 cent to 279.640-279.670 cents.

* * * *

The total cash contributions brought into the Central account of the National Defence Fund at New Delhi till the close of business on 31st December 1963 amounted to Rs. 57.88 crores. Of this sum, Rs. 28 lakhs came from Britain and Rs. 62 lakhs from other countries. In addition, contributions in gold and gold ornaments amounted to 2,277,109 grammes, approximately equivalent to 195,292 tolas.

SILVER RISES AGAIN

(From Our Own Correspondent)

BOMBAY, *8th January*

A fresh peak of Rs. 252.50 per kilogram was touched by silver today, as against the closing of Rs. 248 three weeks ago. The persistent firmness was engendered by the move of some dealers to corner sizable stocks. Hopes of larger demand during the ensuing marriage season also fanned the bullish fervour. The upward trend is expected to continue for some time to come unless there are fresh large-scale arrivals. The actual daily arrivals are currently of the order of just 10 bars, whereas the rate of offtake is higher.

In Sympathy with silver and on the likelihood of better demand, fourteen-carat gold also edged forward from Rs. 59 on 18th December (the last date covered by our previous report) to Rs. 60.25 per 10 grams today. Primary gold was unofficially quoted at Rs. 103. Sovereign was unchanged throughout at Rs. 85.

The world price of gold in the London market softened slightly from $35.07⅞ per ounce three weeks ago to $35.07 today. Ready gold declined over the same period by 2½*d.* to 250s. 7¾*d.* Ready and forward silver were unaltered at 111⅜*d.* and 111½*d.*, respectively. Silver at New York, too, was unaltered at 129.3 cents. Silver is now freely available from the U.S. Treasury at 129.29 cents an ounce, a level which was reached in the New York market in September last and has been held since. Speculative positions, according to Messrs. Samuel Montagu and Co., London, have all been liquidated and the inventories, which had been increased in anticipation of price rises, have now been reduced to more normal levels. These positions are estimated to have fed about 40 million oz. into world markets during the calendar year 1963. The total demands upon the U.S. Treasury silver stocks for both industrial and coinage purposes in 1964 are expected to approach 150 million oz.

The aggregate free world output of gold in 1963 is estimated at about 39 million oz. worth approximately $1,400 million, representing a rise of five per cent as compared with 1962 and 60 per cent above the output in 1953. Estimates of Russia's annual gold output vary widely from $350 million to $600 million and those of gold reserves from $4,000 million to $10,000 million. These figures are given in the January *Monthly Letter* of the First National City Bank. Posing the question whether there is enough gold, the *Monthly Letter* observes:

"With better distribution of monetary gold stocks between the United States and other major nations, the gold problem today focuses on the adequacy of new gold supplies to meet the needs of an expanding and increasingly complex world economy. Over the past fifteen years, official gold stocks have increased by 1.3 per cent annually out of new output and Russian sales. The slow growth in gold reserves is the consequence of the large and sustained private demand for gold, itself a sign of fears and suspicions about the world's major currencies. Reserves in the form of currencies are easier to supply and, as a matter of fact, constitute a growing portion of monetary reserves, though gold still represents some three-fifths of the total. As the gold standard has gradually evolved into the gold exchange standard, holdings of dollars and sterling in international reserves have provided a means of economising on gold. There must be enough reserves to provide time for needed readjustments in balances of payments among nations, but not so much as to breed worldwide inflation. There is, of course, no way to turn the clock back and restore the gold standard. By the same token, however, there is no practical possibility of cutting loose from gold altogether.

"The crux of the international liquidity problem is that some nations are reluctant to accept other nations' currencies in lieu of gold. Recognition of this will help improve the understanding, in the searching re-examination of our international monetary system now under way, that the problem cannot be resolved by creating Esperanto units of account by some international body. It must be resolved by protecting real values of currencies and enhancing respect for credit instruments as substitutes for gold."

The following table shows the trend of prices during the week under review:

	8-1-1964 (closing)	High	Low	31-12-1963 (closing)
SILVER	Rs.	Rs.	Rs.	Rs.
Ready (996 fine) ..	252.50	252.50	250.00	250.50
GOLD				
Ready (14 carat) ..	60.25	60.50	60.00	60.00
Sovereign ..	85.00*	—	—	85.00*
London—				
Gold ..	250s. 7¾*d.*	250s. 9½*d.*	250s. 7¾*d.*	250s. 10*d.*
Silver Ready ..	111⅜*d.*	—	—	111⅜*d.*
Silver Forward ..	111½*d.*	—	—	111½*d.*
New York—				
Silver	129.3 cents	—	—	129.3 cents

*As on 24-6-1963.

N.B.—The quotation for gold is per 10 grams (about 0.85 tola) and that for silver is per kilogram (85.73 tolas). London and New York quotations are per ounce.

COTTON FUTURES FIRM

(From Our Own Correspondent)

BOMBAY, *8th January*

The cotton futures market ruled distinctly firm during the three-week period under review. The firmness, in the context of a fairly comfortable stock position and the promising outlook for the new crop, is largely attributed to two main factors. First, there is growing apprehension that import of any sizable quantity of U.S. cotton under P.L. 480 is difficult during the current season. The failure to secure as yet the 300,000 bales of American cotton which India is supposed to receive under the Indo-U.S. manganese-cotton barter deal concluded in April last is pointed out as an instance of the bleak prospects for imports of U.S. cotton. Second, spot prices, especially of Gujarat varieties, have been ruling firm. This has imparted considerable strength to futures. Although the crop prospects continue to be bright, in spite of some adverse developments in weather during November, a critical month for cotton, the expansion of mill capacity now going on is expected to increase the demand for cotton so that, even if the crop turns out to be as good as last season's, the surplus would not be as large as earlier anticipated. This consideration, coupled with fairly good demand from abroad for Bengal *Deshi*, induced good support for the Jarilla March contract in the futures market. Consequently, the contract steadily firmed up from Rs. 721 per three quintals on 18th December to a peak of Rs. 738.75 on the 6th inst. Profit-taking attracted by the high level and some fresh selling induced by easier advices from the terminal markets, especially Punjab, resulted in a decline in prices and the contract closed lower at Rs. 754.50 today, a net gain of Rs. 13.50 over the period. The undertone, however, remains generally firm.

Trading in Jarilla May 1964 contract commenced on 24th December. The contract opened on a subdued note at Rs. 725.25 per three quintals, that is, Rs. 6.25 below the March contract and, after declining steadily to touch Rs. 718 on the 2nd inst., firmed up in sympathy with the March contract to Rs. 728.50 on Monday, the 6th inst. The finish was, however, Rs. 3.50 lower.

In the spot section, mill buying is at present limited on account of the high prices and the expectation of a fall in rates. Such popular varieties as Co2, Buri Digvijay, 197/3, Kalyan and Wagad, however, continue to elicit inquiries. But mills are reluctant to buy at the prevailing prices. Export demand for Bengal *Deshi* continues to be fairly good. If the present interest were to persist, the shippers' share of the last quota for 200,000 bales of Bengal *Deshi* would be absorbed before long. Sales registered for export as at the end of December aggregated 102,000 bales. As regards foreign cotton, mills showed interest in ready lots of almost all foreign varieties. The following are the latest available quotations—in rupees per candy of 784 lbs.—from the spot market at Sewri:

Bengal *Deshi* 750; L.147 1,205; Co2 1,200; Digvijay 1,275; Jaydhar 950.

Crop prospects continue to be good. A leading cotton firm, namely, Patels and Volkarts, has summed up new crop position as at the end of November as follows:

"Although we had rather unseasonal weather developments during November in some parts of the country, the crop on the whole continued progressing satisfactorily. Some setbacks here and there were made good by improved crop prospects elsewhere. Total production estimates remain unchanged and prospects are still for an excellent crop, both quantity and particularly quality-wise.

In the North (Punjab, U.P., Rajasthan), harvesting was in full swing. By end of November practically the whole Bengal *Deshi* crop was picked, and only about 30 per cent of the P/American crop remained to be collected from the fields. A few rainy days interfered with the crop movement, but fortunately did not cause any significant damage. Arrivals reached some 15,000 bales per day at the end of the month, with the Bengal Deshi crop movement at its peak and P/American arrivals rapidly increasing. Quality-wise, the picture is very satisfactory and, particularly, the P/American 320F crop is far better than last year's.

"Crop accounts from the central belt (Madhya Pradesh, Maharashtra) were mixed. The whole of Madhya Pradesh came in for further, rather unseasonally late, rains which were, however, of short duration and followed by clear weather; the net result will be a late but good crop. In the CP/Berar tracts of Maharashtra, weather was unsettled towards the end of November, but fortunately no rains fell; whilst production estimates for 197/3 had to be scaled down, those for Buris could correspondingly be increased and overall prospects continued good. Only in the Gaorani circle of Maharashtra did the crop come in for a severe setback due to a plant disease which reportedly spread throughout this circle and must have been bred during the excessively wet spell earlier in the season; here crop estimates had to be pruned down quite considerably. Harvesting throughout these areas was in full swing by end of November, with arrivals gradually increasing to some 20,000 bales per day.

"The West Coast (Gujerat, including Saurashtra) recorded fairly heavy rains towards the end of November, accompanied by gusty winds, which caused some shedding of bolls. It was at one time feared that the crop suffered quite some damage, but as it cleared up, prospects for a good crop, particularly in Saurashtra, revived again. Due to these rains, the crop development has, however, been somewhat delayed and arrivals will start later than previously expected.

"In the South (Mysore/Andhra/Madras), crop reports continued rather mixed. The main crops in the Western-Comptah circle did not fare too well because of inclement weather conditions, but there was still time and opportunity for making up some of the setbacks. Further South, beneficial rains were received just when they were most needed. As per end of November, the following arrivals were recorded as compared with these at the same time during the previous two seasons:

	(In bales of 400 lbs./180 kgs.)		
Areas	1963-64	1962-63	1961-62
North	367,000	252,000	370,000
Central Belt ...	425,000	219,000	160,000
West Coast ...	7,000	—	3,000
South	34,000	31,000	22,000
Elsewhere ...	—	—	—
	833,000	502,000	555,000

GROUNDNUTS FORGE AHEAD

(From Our Own Correspondent)

BOMBAY, *8th January*

The three weeks that this report covers (from 19th December to 8th January) witnessed a hectic rise in the groundnut futures, the April contract jumping up by Rs. 13.38 to Rs. 229.50 and the January contract by Rs. 5.88 to Rs. 225.00. The rise followed frantic buying by bulls who feared an acute scarcity of supplies in the not too distant future. The fears stemmed from the slow pace of arrivals in the wake of heavy demand from crushers and *vanaspati* manufacturers. The reported brisk export business in groundnut oil also imparted strength to the market, with the result that the spot prices of groundnut and groundnut oil registered a notable rise. The swift advance in forward rates has perturbed the authorities. The State's Minister for Civil Supplies, it is reported, discussed the issue with the Chairman of the Forward Markets Commission recently. The Chairman, however, was understood to have stated that the existing forward rates, though they were higher than those prevailing some weeks ago, were fairly lower than the prescribed ceilings. Discounting the belief that speculators had cornered stocks, the Chairman assured the Minister that his commission would not hesitate to take appropriate steps if the situation so warranted.

There were no developments worth reporting in the castorseeds section. The March contract picked up 25 nP to Rs. 165.50. Ready Madras was fully steady at Rs. 32.62 and Kanpur at Rs. 31.62. Oil B.S.S. gathered 15 nP to Rs. 14.40 and commercial 5 nP to Rs. 13.70.

Linseed met with good support. March contract advanced by 62 nP to Rs. 37.12 and June contract by 50 nP to Rs. 37.94. Bold ready gained 10 nP to Rs. 37.62. Linseed oil, however, declined by 30 nP to Rs. 15.40.

Cottonseed April contract elicited large enquiries and rose by Rs. 2.50 to Rs. 100. But the January contract was a shade lower at Rs. 99.75.

The following table shows the closing prices of oilseeds and oils on Wednesday 8th January as compared with those of two previous weeks:

	8-1-1964	31-12-1963	24-12-1963
Groundnuts	Rs.	Rs.	Rs.
January 1964 contract	223.00	223.37	223.37
April 1964 contract	229.50	228.50	230.00
Nizam bold	45.75	45.75	45.75
Khandesh quality	46.25	46.25	46.37
Oil ex-mill	18.00	17.90	18.10
Oil Ldy. Receipts	17.85	17.75	17.85
Castorseed			
March 1964 contract	165.50	165.50	166.75
June 1964 contract	168.00	168.25	169.60
Ready Madras	32.62	32.87	33.00
Ready Kanpur	31.62	32.00	32.00
Oil B.S.S.	14.40	14.30	14.40
Oil commercial	13.70	13.70	13.90
Linseed			
March 1964 contract	37.12	36.94	37.25
June 1964 contract	37.94	37.87	38.12
Bold ready	37.62	37.50	38.00
Linseed oil	15.40	15.40	15.80
Cottonseed			
January 1964 contract	—	94.50	98.50
April 1964 contract	100.00	100.00	101.50

N.B.—All quotations for futures contracts are per 250 kilograms except linseeds for which rates are per 50 kilograms. Spot quotations of seeds are per 50 kilograms and oil per 10 kilograms.

FREIGHT ON PEPPER RAISED

(Messrs. Parekh and Co.)

BOMBAY, 8th *January*

Malabar black pepper (garbled) moved narrowly between Rs. 272.50 and Rs. 282.50 during the month of December, in view of poor inquiries from New York where spot remained dull at $0.32, as grinders were out of the field and in sympathy with Singapore where market ruled flat at $(M) 105 with poor overseas demand. At the beginning of New Year, however, the market appeared to have turned the corner and garbled edged forward to Rs. 282.50 during the week, as New York started nibbling by buying ready and forward shipment. Dealers in New York paid for Ready shipment of Malabar pepper $0.31½ and $0.32 and for February-March shipment $0.32½. In Singapore also, black pepper improved from $(M) 105 to $(M) 112½, despite poor foreign demand, as all hopes of early settlement of the present political differences between Indonesia and Malaysia faded and border situation in the North Borneo deteriorated. New York spot, after rising to $0.34, came down to $0.33½, as demand from grinders remained poor. Most of the sellers there, however, turned bullish, as Lampong remained unquoted from both Singapore and Indonesia. They were not pressing in view of the comparatively poor stock position. Speculative elements which were until now sitting on the fence appeared to have started taking interest.

Despite the augmenting of new arrivals, all the coastal markets in Malabar remained steady, as most of the dealers and exporters there were buying in anticipation of early broadening of enquiries both from the U.S.A. and Europe. Most of the foreign buyers are said to be in favour of buying Malabar pepper, as there is no certainty regarding the shipment of Lampong or Sarawak pepper should the situation worsen.

Acute inflation in Indonesia and poor crop of Lampong are supporting factors. The position in Sarawak is confusing and the despatches of white and black Sarawak pepper to Singapore are very much reduced.

The important events of the week are the increase in the freight on pepper from India to New York from $55 to $65 and the establishment of a pilot plant for making white pepper from black in Kerala.

The estimate of new crop of Malabar black pepper remained unchanged between 28,000 tons and 29,000 tons. The export of Malabar pepper during the seasonal year 1962-63 amounted to 19,000 tons, as against 23,000 tons in the previous season.

Prices on the Cochin ring hardened from Rs. 282 to Rs. 287 for January. February delivery remained, on enquiries, with a premium of Rs. 6 to Rs. 7. In Bombay ring, *Maha* delivery, after touching the lowest at Rs. 308, improved to Rs. 318 but came down again to Rs. 314, while *Chaitra* rallied from Rs. 317 to Rs. 326.

Ungarbled developed improved tone and was on demand at Rs. 272.50 the lowest being Rs. 262.50.

The future of pepper appears to be promising, as all the unfavourable factors that were keeping the market down till now are now discounted at the present level of price, particularly in view of the uncertain political situation in Malaysia and lower stock position in Singapore, Sarawak and Indonesia.

There are reports that most of the direct shipments of Lampong from Indonesian ports were detailed for regarbling, as they were not fully to *Asta* standard. There are chances of seeing some firework in the world's pepper market should the situation between Malaysia and Indonesia worsen into a shooting war.

GOOD C.T.C. TEAS STRONG

(From Our Own Correspondent)

CALCUTTA, 7th *January*

The improvement in sentiment in the last export auctions held here followed increased demand. The intervening holidays meant early arrangements for meeting commitments. Meanwhile, tea shipments to the United Kingdom have continued to be heavy. Exports as a whole this season have been higher than last year, although the North Indian crop up to the end of November 1963 amounting to 548.2 million lbs. was 18.2 million lbs. lower than the crop for the comparative period of 1962.

Production in North India in December was insignificant, in view of the heralding of cold weather much earlier than usual. The year's shortfall in crop will, therefore, not be less than 18 million lbs. at any rate. This feature, despite increase in exports, makes the 1963-64 season a disappointing period for tea gardens. This is reflected in the poor interest shown by investors in tea garden shares. While the average prices realised at auctions this season have been lower as compared with the last season, costs of production have risen appreciably.

The keen competition shown by other producing countries in export markets is keeping down prices and preventing gardens from equalising marginal revenue to marginal cost. India is the largest tea producing country in the world, and it should be a matter of concern that Ceylon has made an earnest bid to lessen the gap between its and Indian output. Up to the end of October, Ceylonese production aggregated 411 million lbs., thus representing a rise of 16 million lbs. over the first ten months of 1962. Ceylon is striving hard to attain the target of 500 million lbs.

While the overall exports from India have risen this year, it is a matter of concern that shipments to some of India's traditional markets have fallen. The Sudan, Iran, Turkey, and the U.A.R. have taken less tea than last year, whereas the U.K., the U.S.S.R. and East European countries have bought more. Significant success is reported in attempts in Turkey to grow tea. Already 40,000 acres of land in that country have been brought under tea, and the fact that Turkey has imported less tea from India this year shows that it is able to supply more against internal needs.

In accordance with the arrangements already made with the European Economic Community, the U.K. has announced suspension of import duties on tea and certain other prodocts for a period of two years commencing from 1st January 1964. It was stated that, if the forthcoming negotiations with the G.A.T.T. did not succeed, Britain could reimpose the duties at any time after 31st December 1965. Switzerland and Canada have also announced a similar withdrawal of duties. India is hoping to increase exports to the E.C.M. countries and the Indian Tea Board has already set up a promotional centre at Brussels. At the same time, it should be noted that, now that the non-Commonwealth producing countries would also be able to ship tea to the U.K. freely, competition for the U.K. market would be keener.

In the last internal sales, dusts on offer aggregated 31,208 packages. A fall in demand towards the close of sales was in evidence. Orthodox teas were very steady. "Teas for price" were also in good demand, but legg-cut teas eased. Good C.T.Cs were also a strong feature, and the smaller and brighter categories were preferred. Medium C.T.Cs, however, eased. The quotations per 1 kg. inclusive of excise duty were: good Assam C.T.C. dust Rs. 5.70 to Rs. 6.30; medium Assam C.T.C. dust Rs. 5.05 to Rs. 5.25; legg-cut dust Rs. 4.80 to Rs. 5.00; medium Assam dust Rs. 4.70 to Rs. 5.00; and plain orthodox dust Rs. 4.50 to Rs. 4.70.

At the last export sale, offerings amounted to 48,873 packages. There was good general demand. Whole leaf grades improved. The few tippy teas were also steadier. In Darjeelings, the improved types met with better inquiries, but other kinds eased. In C.T.Cs, the better liquoring kinds were higher, and B.Ps were steady, while similar fannings eased. Secondary grades were in good demand. Legg-cut teas eased by 10 nP. Plain orthodox teas were a fully strong market, but fannings eased. Medium orthodox teas were irregular, but the more useful and better liquoring kinds recorded a definite dearer trend. The quotations per 1 kg. inclusive of excise duty were: Best Assam C.T.C. fannings Rs. 5.60 to Rs. 6.20; best Assam C.T.C. B.P Rs. 5.70 to Rs. 6.40; clean plain pekoe Rs. 5.00 to Rs. 5.40; medium Assam C.T.C. B.P. Rs. 5.10 to Rs. 5.50; medium Assam C.T.C. fannings Rs. 5.00 to Rs. 5.30; plain fannings Rs. 4.50 to Rs. 4.60; and plain B.P. Rs. 4.50 to Rs. 4.65.

TANNED SKINS FIRM

(From Our Own Correspondent)

MADRAS, 6th *January*

Though the New Year has dawned, importers overseas have not bestirred themselves and got into a buying mood. Export trading has been very small during the last two weeks and prices have ruled firm in all sections.

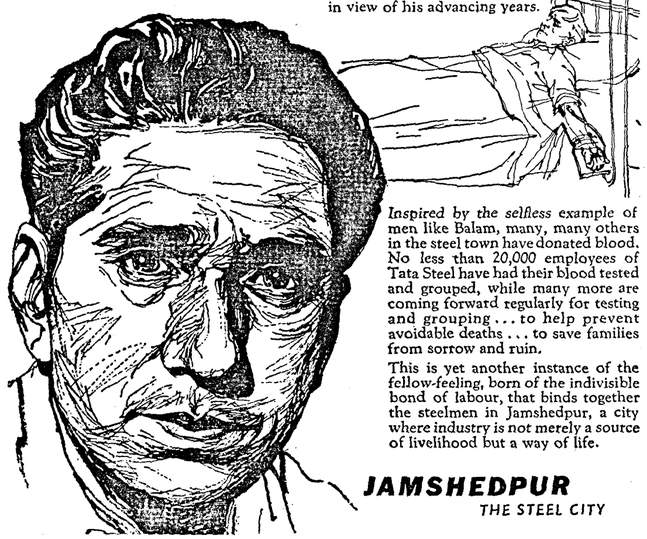
Arrivals of stocks from the tanneries have been on the usual scale and clearance slow. Inland demand for low grade kips has been moderate. Export demand was for cowcalf light weights which have been in poor supply. Inquiries for cow hides, buff hides and calf for shipment were negligible, as importers in U.K., Continent and U.S.A. have been lethargic. It is hoped that regular trading will commence by the middle of this month.

Tanned skins market ruled firm. Tanners have been trying to obtain increased prices for goat skins—top marks—but buyers have declined to meet sellers' ideas. Tanners have not been able to buy raw stocks at economic prices so far, but hope to do so, in view of the Government reducing the export quota of shippers of raw skins by 5 per cent from the 1st inst. Prime and semi-prime sheep skins remained steady; and middle class sheep lower selections in light weights were in good demand and higher prices were paid by the importers on the Continent.

His blood has saved many lives

Way back in 1935, at Jamshedpur's Main Hospital, a man lay dying. Only a transfusion of blood could save him. In those days, most people thought that blood donation permanently damaged health. But a young man came forward and voluntarily gave his blood to sustain the ebbing life. Between 1935 and 1955, the same man freely gave his blood no less than 40 times—on an average twice a year—for victims of industrial accidents, to save men critically ill.

This extraordinary man is T. S. Balam, a typist with Tata Steel at Jamshedpur, a happy, healthy family man of 50. Although he still wants to donate blood, doctors decline his offer in view of his advancing years.



Inspired by the selfless example of men like Balam, many, many others in the steel town have donated blood. No less than 20,000 employees of Tata Steel have had their blood tested and grouped, while many more are coming forward regularly for testing and grouping ... to help prevent avoidable deaths ... to save families from sorrow and ruin.

This is yet another instance of the fellow-feeling, born of the indivisible bond of labour, that binds together the steelmen in Jamshedpur, a city where industry is not merely a source of livelihood but a way of life.

JAMSHEDPUR
THE STEEL CITY

GIVE FREELY TO THE NATIONAL DEFENCE FUND

The Tata Iron and Steel Company Limited

IWTTN 1254

The following are the ruling prices—in rupees per lb.—for all-round parcels in the local market:

Tanned cow hides 8/8½ lbs. average Rs. 2.20 to Rs. 2.25, cowcalf 1½/2 Rs. 3.80 to Rs. 4.00, buff hides 12/14 Re. 1.85 to Re. 1.95 and buffcalf 1½/2 Rs. 3.50 to Rs. 3.60.

FANNING TEAS EASIER

[Messrs. Forbes, Ewart and Figgis (Private) Ltd.]

COCHIN, 2nd *January*

A total of 952,000 kgs. was offered in tea sale No. 53 held here on 30th December 1963. A few Nilgiri invoices were improved in quality, while mediums showed little change from last week. The market opened to good demand which continued throughout the sale. There was good support for plain and low medium brokens which were fully firm to occasionally dearer. Similar fannings, however, inclined easier. Medium brokens were irregularly steady, but, here again, fannings came to an easier market. Good mediums evoked useful support and sold at around last rates. Highgrowns elicited irregular support and generally realised lower rates than last. Black leaf descriptions were a strong feature of the sale. C.T.C. descriptions were sold readily and prices for these were quoted steady, but unorthodox types inclined easier. Whole leaf grades and tippy teas were slightly lower.

The quotations per kg. were:

	1963	1962
	Rs.	Rs.
Low mediums	4.20-4.50	4.10-4.50
Mediums	4.40-4.70	4.55-4.90
Good mediums	4.80-5.45	4.95-5.35
Nilgiri B.O.P.	4.50-8.20	5.20-8.05

The average price realised in sale No. 53 was Rs. 4.47 per kilo, as against Rs. 4.49 a week ago and Rs. 4.77 in the corresponding sale last year.

A total of 396,000 kg. was offered in sale No. 'A', held today., There was less demand than in previous weeks and prices on average declined by about 10 nP. Highgrowns and unorthodox teas, however, met with firm support and generally sold at about last rates. Medium teas declined by 10 to 15 nP. There was strong enquiry for clean black grainy grades which were firm and occasionally dearer. Residuals were the weakest feature of the sale and often up to 20 nP easier.

The average price realised in dust sale No. 'A' was Rs. 4.38 a kilo, as against Rs. 4.45 a week ago and Rs. 4.28 in the corresponding sale last year.

Colombo: There was good demand. Best liquoring highgrowns were 10 to 20 cents easier, but others were steady. Better liquoring mediums advanced by 10 to 15 cents, while others were sold at around last rates. Lowgrowns were firm. Owing to a general clerical strike, next week's sale has been postponed.

London: In Monday's sale, there was strong demand. C.T.Cs were dearer by 1d. to 2d. Orthodox descriptions and Dooars were irregular and sold at around last rates.

Ceylon and South Indians: Offerings in Tuesday's sale amounted to 23,550 packages, of which 7,607 packages were from South India. Best liquoring Ceylons were firm, but others were easier. Teas from South India were steady at last week's levels.

As we go to press, Messrs. Forbes, Ewart and Figgis (Private) Ltd. wire as follows:

"*Sale No.* 1: 962,000 kgs. offered. Good general demand. Low mediums and mediums steady. Good mediums firm. Highgrowns better demand with quality. Unorthodox stronger. All clean and blackleaf fannings dearer."

SUGAR SAGS

(From Our Own Correspondent)

HAPUR, 6th *January*

Sugar in the open market registered a sagging trend during the fortnight under review, thanks to the improved supply position. The sugar factories in west U.P. are reported to be drawing normal cane supplies, barring a few which are now facing dearth of supplies and are made to work in restricted hours. The State Government is reported to be taking steps to achieve the production target of 1.5 million tons, but trade circles are of the opinion that the target is beyond reach. Sugar prices in the open market ranged between Rs. 155 to Rs. 160 per quintal, as against the controlled prices of Rs. 118 to Rs. 124.

New *khandsari* attracted good buying support from stockists of Punjab and Rajasthan in expectations of early despatches on export permits. Production is still mounting and *khandsari* producers in some centres in the Muzaffarnagar area were purchasing cane upto Rs. 5.75 a quintal, as against the Rs. 5.04 to Rs. 5.34 a quintal paid by factories. *Khandsari* stayed steady and was now quoted at: *desi* inferior Rs. 105 to Rs. 120; medium Rs. 130 to Rs. 140; superior Rs. 140 to Rs. 152.50; *boora* Rs. 150 to Rs. 160 per quintal.

Ready *gur* during the fortnight was influenced mainly by the receipt of import permits. In the earlier part of the fortnight under review, ready *gur* was subdued and eased upto Rs. 3 a quintal, as import permits for the month of December had been exhausted, but, on receipt of import permits against January quota, prices recorded gains and the week's despatches aggregated forty wagon loads mostly to Gujarat. Arrivals during the week were hampered due to rains and cloudy weather. The major part of the arrivals here as well as in the mofussil markets was readily lifted and stocks with the trade were still meagre. Half of the cane crop is reported to have been used in sugar, *khandsari* and *gur* manufacture. Preparation of land for the next cane sowings has commenced and actual sowings would commence by the end of the month. Prices of *gur* were: superior Rs. 67.50; *dara* Rs. 65 to Rs. 66.25; *balti* Rs. 71.50 to Rs. 72.50; *shakker* Rs. 72.34 to Rs. 77.70 a quintal.

INTERNATIONAL MONETARY SYSTEM

(Concluded from page 41)

enough to counter any imbalances or crises that might develop and flexible enough to meet the growing needs of world trade and economic development. In particular, the question has been raised whether the system has the potential to provide an expanding volume of international liquidity in a manner acceptable to the countries concerned.

The question of international liquidity has been under close study in the Fund for many years. A report on this question was given to the Economic and Social Council, at its request, in 1953. In 1958, a report, *International Reserves and Liquidity*, was presented to the annual meeting of the Board of Governors at which a general increase of Fund quotas was recommended and carried out the following year. At the 1961 annual meeting of the Board of Governors, Mr. Jacobsson presented a plan for supplementing the Fund's resources through borrowing which, after prolonged negotiation, evolved into the General Arrangements to Borrow, which came into force just over a year ago. This year's Annual Report of the Executive Directors, now before you, has paid considerable attention to the subject of international liquidity, and it was also actively discussed at the meeting of the Board of Governors in October. I think it is fair to say that the consensus of that meeting was that there was not at present a general shortage of liquidity, but that the long-run adequacy of liquidity deserved serious examination. The Fund is, therefore, intensifying its study of international liquidity, including the functioning of the international monetary system and the role of the Fund in this system. In working on these problems, it is our intention to bear in mind the many and diverse interests of all our members, old and new, developed and developing, all of whom have a fundamental common interest in maintaining and strengthening an effective world monetary order. The ten industrial countries that are the potential lenders to the Fund under the General Arrangements to Borrow are also studying the question of international liquidity. Close liaison has been established between the Fund and this group to assure effective co-operation and co-ordination between the two studies.

I believe that it cannot but be a source of added strength to the world economy that these questions of the adequacy of liquidity in the longer run are now being carefully studied. At the same time, however, that we devise measures to meet the liquidity needs that may emerge in the longer run, we should continue efforts to counter the pressures to which the international monetary system is exposed now. In this connection, we can note with great satisfaction the much closer and more effective co-operation among central banks and treasuries that has been built up in the last few years. The collective defences thus provided have been able to counter, with increasing effectiveness, the pressures to which the exchange markets were subjected.

However, there is one major aspect of the international financial situation which confronts us in the immediate future. I have mentioned that the authorities in the United States and in all other major countries are agreed that payments equilibrium must be established. The adjustments necessary for this purpose will, however, take time, not least because the United States must, in the light of its key role in the world economy, take into particular account the wide repercussions of its actions on the rest of the world. During this time, the remaining deficit must be financed. Fortunately the resources available for this are, indeed, very substantial. First, the United States holds over $15 billion in gold and has stated that this great reserve will be used to defend the parity of the dollar. It was particularly helpful in this connection that the Chairman of the Board of Governors of the Federal Reserve System recently restated in clear terms that the effective use of the gold stock to meet international obligations need not be hampered by the prescribed minimum reserve of gold against liabilities of the reserve banks. Secondly, the United States has large drawing facilities in the International Monetary Fund of which the stand-by arrangement to which I have already referred is only a small fraction. Thirdly, the United States can continue to count on the fact that many countries are prepared to take a considerable part of any balance of payments surpluses in the form of claims on the United States. Impressive support for the dollar is, therefore, available, while the United States is achieving a reasonable equilibrium in its payments position. The gradual realisation that this is so has for some time been contributing increasing strength and confidence to the international monetary system.

PASSPORTS TO WORLD TRADE

Three Banks have merged. Separately, they have large assets, a fine tradition and a wealth of experience. United, they offer a comprehensive service in all matters affecting business between India and any part of the world. Their advice and help are your surest "passports" to profitable trade with those areas.

FOREIGN TRADE OF INDIA

(In lakhs of rupees)

Particulars	Six months ended Sept. 1963	1962	April to March* (Twelve months) 1962-63	1961-62
Exports	366,26	320,46	686,35	655,17
Re-exports	1,73	4,43	7,34	5,17
Total Exports	367,99	324,89	693,69	660,34
Imports	554,93	564,13	1,077,09	1,090,06
Overall Balance of Trade	—186,94	—239,24	—383,40	—429,72
Exports—Items:				
Tea	52,55	55,28	129,19	122,26
Coffee	4,60	4,11	7,61	9,02
Sugar	18,68	9,15	18,04	15,34
Jute yarns and manufactures	81,77	75,66	156,17	144,78
Cotton yarns and manufactures	25,19	23,86	52,13	53,31
Metalliferous ores and metal scrap	23,21	13,89	31,75	36,56
Cotton, raw and waste	8,04	9,22	17,07	20,35
Petroleum Products	2,89	1,71	4,13	3,48
Vegetable Oils	8,99	5,23	13,17	5,32
Fruits and vegetables	14,74	12,13	26,90	25,35
Tobacco—Raw	16,85	12,19	18,37	14,97
Mica	4,44	5 50	10,36	9,66
Wool and other animal hair	2,40	3,46	6,64	9,19
Gums, resins and lac	3,92	3,55	7,28	6,64
Spices	6,05	6 14	13,87	7,51
Hides and skins, raw	5,04	4,95	11,01	8,79
Cashew kernels	11,18	9,29	19,36	18,17
Pepper (black)	2,37	2,94	6,57	8,08
Manganese ore	3,72	4,14	9,86	10,42
Iron and steel scrap	2,56	84	1,99	6,25
Iron ore and concentrates	16,16	8,12	19,32	17,41
Sewing machines	14	18	48	44
Electric fans	35	29	93	67
Groundnut oil	5,09	2,25	7,33	1,03
Castor oil	3,16	2,43	4,29	4,00
Defatted groundnut meal	12,69	10,47	26,52	13,96
Country-wise Exports—				
Australia	8,90	9,74	18,82	15,85
Burma	2,35	2,45	5,13	5,24
Canada	12,47	11,91	22,42	17,58

ABBREVIATIONS. N—Nominal. (J) Income-tax free. * Loans held entirely by the Trustees. † Erstwhile State Transport
A—Held by Government of India. B—Taken up by State Bank of India. C—Held by Commissioners. D—Domestic Loan not marketable
††Rate of Interest reduced from 6 to 3 per cent with effect from 1st June 1944. ‡ Rate of Interest reduced from 4½ to 4 per cent with effect from 1st April 1955
‡—Interest free for first 12 years. †—Interest free for first 7 years. E—Ex Eleven Instalments but inclusive of accrued interest.
M—At the option of the Government after three months' notice. K—On September 1956 or later at the option of the Government after three months' notice
T—Liability taken over by Madhya Pradesh. @ Total amount invested in Gold Bonds up to 18th February 1963.

STOCK & SHARE QUOTATIONS

Abbreviations :—D.—Deferred shares. P. O.—Preferred Ordinary shares. Y.—Accounts published yearly. H.—Accounts published half-yearly. P.—Company has Preference shares. T.—Company has Debentures. N.—Nominal quotations. x.d.—Ex. Dividend. c.d.—Cum. Dividend. I.—Interim Dividend. CR.—Cum. Right. XR.—Ex. Right.

Shares :—If a company has different classes of shares—as for example : 'A' shares and 'B' shares—these are indicated by the same letters 'A' and 'B' under the columns 'Paid-up Ordinary Capital' and 'Paid-up' per share.

Accounts :—Figures in the Accounts Closed column represent the months or the year in which the respective companies close their accounts, 6 and 12, for instance, indicate the months of June and December, respectively. Reserves include general and other reserves and all other funds which a company may have excluding depreciation fund, reserves for tax liability and provident fund. Block represents actual cost of land, buildings, machinery and all other items on which depreciation is allowed less sales, if any, and stands for the gross figures except where otherwise indicated.

Dividends :—Dividends for completed years are shown as amount per share per annum, but where quoted for portion of a year they represent the proportionate dividend for that period. In the case of those companies which close their accounts yearly dividends shown are for their financial year.

MARKET GOSSIP

(*Concluded from page 31*)

With the notable progress achieved so far, the Ambika Silk Mills is today well poised to develop *further in the years to come.* Well could Mr. Ravindra Maganlal, Chairman of the Company, claim, in his speech at the Silver Jubilee celebrations held at Bombay on Wednesday this week, that the future of the Company was bright, with prospects of continued expansion and prosperity. Reassuring, indeed, is his statement that the management would always endeavour to ensure a fair return on capital consistent with the building up of the Company's internal strength and to give the consumers the quality fabrics produced from the latest in man-made fibres at a reasonable price.

Bharat Forge Company

Steel forgings are extensively used in industry, particularly in the automobile, coal mining, earthmoving equipment, electrical and petroleum industries. Quite a large part of the requirements of forgings is currently being met by imports, since domestic production is sufficient to meet no more than two-fifths of the total demand. Presently, the demand is placed at 100,000 tons and this is expected to double by the end of the third Plan (1965-66). Most of the present forging units are integral parts of main workshops which themselves consume the forged parts, leaving only small quantities for supply to other industries on commercial basis. Further, it is stated that there is at *present no forge shop that can manufacture finished* forgings on mass scale solely for commercial purposes. It is these factors that invest the project of the newly formed Bharat Forge Company Ltd. with great importance. The project (to be located at Poona) envisages production of 6,000 tons of carbon and alloy steel forgings (on single-shift basis) weighing upto 450 lbs. apiece and 16,800 finished crankshafts for automobile and other engines. The crankshaft machine shop, the promoters claim, will be the first of its kind in India to supply finished crankshafts on a commercial basis. The value of expected total turnover after the plant goes into full operation will be over Rs. 5 crores.

Considering that the project belongs to the heavy engineering group, it is no wonder that the capital cost is very high: Rs. 4.71 crores. Barring Rs. 78 lakhs already subscribed and agreed to be subscribed and Rs. 152 lakhs to be raised by way of a public issue, the entire balance of Rs. 2.41 crores is proposed to be met in the form of loans (Rs. 186 lakhs from the U.S. Ex-Imp Bank and Rs. 55 lakhs from banks and other sources). The Company has secured the technical collaboration of the well-known Steel Improvement and Forge Company of Cleveland (U.S.A.), having more than 40 years' experience in the manufacture of commercial steel, non-ferrous and other forgings for automative, aircraft, railway and other industries in the U.S., Canada and South America. The collaborators will furnish to the Indian Company all technical data and advice. It has also undertaken to buy the machinery for the new project, supervise its erection here, and send American technicians to erect and run the plant for five years, simultaneously training Indian technicians. They have already sent an experienced engineer as technical adviser.

The Board of Directors of the Company is presided over by Mr. S. L. Kirloskar. The other Directors are Messrs. Charat Ram, N. S. Shodhan, Pratap Bhogilal, Bahubali Gulabchand, N. M. Gurjar, Charles H. Smith, N. L. Kalyani and the Maharaja of Kolhapur.

INDIA AND THE WEST

IT is, indeed, India's good fortune that there are in Britain and other Western countries quite a number of highly responsible persons who continue to take keen interest in its economic development. They include not merely politicians, businessmen and industrialists but also leading economists and financial commentators. Opinions, of course, vary on the ways and means of helping India in its task of improving speedily and effectively the woefully low living standards of its teeming millions, a task which, as it has been appropriately described, is almost half the problem of alleviating world need. But there seems to be unanimity of views at least on two important measures of assistance. One is that the economically advanced countries should intensify their efforts to extend aid on a much larger scale and to improve the terms in favour of India on which it is offered. The other is that these countries should adopt a more liberal attitude towards imports from India. Both these aspects have been impressively highlighted by Mr. Douglas Jay of Britain in the course of a special article contributed exclusively to *Commerce* (*vide* page 76). The observations of Mr. Jay are of special significance not so much because he is one of the most influential members of the British Parliament and one who will in all probability become the Board of Trade President in the event of Labour Party winning the next General Elections but because of the highly sensible and practical suggestions he has offered to foster India's economic relations with Britain, in particular, and the industrially advanced countries of the free world, in general.

The main thesis of Mr. Douglas Jay is *that the economically advanced countries can* help India much more effectively by buying its exports freely than by merely lending or giving money. India is becoming increasingly well equipped for the production of manufactured goods, and fuller access to export markets for such goods would greatly facilitate *the diversification and expansion of exports* which, as the new Managing Director of the International Monetary Fund, Mr. Pierre-Paul Schweitzer, has very rightly pointed out, ought to be an important aspect of the economic growth of the developing countries. For how else could India be expected to pay for the *increased imports of a wide range of capital* goods so vitally necessary for speeding up industrial growth? It should not be denied the opportunity to use its competitive advantages in any markets in the world. Although India has raised this problem of access to markets on so many occasions in the past, it has not been of much avail, as witness the persistently low pace at which exports are rising. It is, therefore, just as well that Mr. Douglas Jay has emphasised that his own country should take the lead in both urging and practising this policy. Britain, incidentally, is the head of the Commonwealth, of which India too is a member and its share in the aggregate trade of India is quite sizable: about 22 per cent of exports and 16 per cent of imports.

Taking the example of cotton textiles, a staple earner of foreign exchange for India, Mr. Douglas Jay has indicated how the problem of access to markets in developed countries can be tackled. Britain, we are told, takes about 38 per cent of its textile consumption from abroad, whereas the U.S barely five per cent and the Common Market less than two per cent. Quite bluntly, Mr. Jay says: "The Common Market countries are, as usual, the worst—narrow, protectionist, selfish and insular." At the G.A.T.T. Textile Conference at Geneva in 1962, the U.S. and other industrial countries had pledged themselves to buy more textiles from Asia. Recalling this pledge, Mr. Jay observes that the progress made so far is very little. He could actually have said that the progress is negative, as evidenced by the use of escape clause of the G.A.T.T. long-term textile agreement by the U.S. and some other countries for curtailing imports and the continuance of quota restrictions in others. Mr. Jay must, therefore, be heartily thanked for having urged Britain to take the lead in breaking this deadlock. It must, he avers, inform the Common Market and the U.S. that, unless they step up generously their purchases of Indian textiles before some given date, Britain will have to cease buying textiles from them and buy more from India.

The warning that Mr. Jay wants Britain to give to the U.S. and the Continent is pertinent indeed. But the question is: Will the textile millowners and traders in Britain not object to heavier imports of cotton goods from India? Even if there is a slight increase in imports at any time, these interests raise a hue and cry. Notwithstanding the voluntary ceiling agreement between the cotton industries of the two countries, there is a powerful section of Lancashire mill interests which continues to raise the bogey of competition from import's of low-cost cotton goods and urge for official intervention to curtail such imports. The British Government has not been able to fight these pressure tactics partly for political considerations and partly for fear of unemployment in textile industries. Although it has not itself clamped down any controls by way of either quota restrictions or levy of import duty, it has played an active part in bringing about the voluntary agreement between the cotton textile industries of both the countries.

Being a politician, besides an eminent economist in his own right, Mr. Douglas Jay is fully aware of the understandable anxieties of British textile industrialists and workers. But he is not one of those who say that nothing can be done. In fact, he has suggested a way out which need not be regarded as impracticable, a solution to which this journal drew attention on an *earlier occasion* (*vide* pages 142-43 of *Commerce* dated 27th July 1963). It is this: The British Government should redouble its efforts to steer new industries and employment into the Lancashire and Dundee areas, so that the British textile industries can gradually adapt themselves without causing unemployment on a *mass scale. It can reasonably* ask the workers to change over to new industries, but what it cannot ask them to do is to suffer prolonged unemployment. Mr. Jay's answer to the question as to how both Britain and India can reach a bargain acceptable to both sides is as follows:

"Suppose the Indian Government were to guarantee to buy, over a period of years, the aircraft, motor vehicles, ships or machine tools produced by a new plant erected in the British textile areas; then Britain could in return reasonably undertake, over the same period of years, to widen the import quotas for Indian textiles. This would economically benefit both sides; would cause no unemployment; and would correspond with economic realities, since each country would be concentrating on the products it was best fitted to manufacture. Certainly, any such scheme would be difficult to organise in practice. But *I do not believe it would be impossible*, given goodwill and intelligence on both sides. Indeed, this is precisely the sort of planned co-operation to which we ought to be directing our minds."

Mr. Jay's suggestion, though it is addressed primarily to Britain, holds equally valid in the case of all other developed countries which have been taking interest in India's economic growth. One must not confuse oneself by *thinking* that what Mr. Jay is advocating is a mere barter. This will be clear, if one reads the whole article of Mr. Jay. It is only one of the series of valuable suggestions made by him. It will not, however, be wrong to say that Mr. Jay wants the principle of international division of labour to be liberally applied by the developed countries in favour of developing countries. He has tried to show that this can and ought to be done to the mutual benefit of both. It is precisely this aspect of world trade and payments that has unfortunately been relegated to the background in favour of the monetary problems and so-called liquidity difficulties of the world's richest and most developed nations. That the trade (and aid) problems of development of underdeveloped countries is equally important and urgent has been most forcefully brought out by Mr. Neil McInnes in a comprehensive article on pages 36 and 38 of our 1963 Annual Number published last week. He observes:

"It would be dishonest to put resolution of Western payments problems before the urgent question of stimulating aid for development and of increasing the developing nations' exports. What is more, this could become an alibi for never doing anything really helpful about development, because one does not have to be a sceptic by temperament to entertain serious doubts about the West ever 'solving' its monetary difficulties to everyone's satisfaction. . . . In general, the trade and aid problems of development are relegated to the background, while advanced nations settle their own commercial and financial differences. More urgent than taking sides in such disputes, e.g., for the Anglo-Americans against the Common Market, is the need to protest against this order of priorities which entails neglecting questions that concern all huma-

nity for questions that concern only a dozen nations at most and which will take years or decades to settle if ever they are settled."

Not that the problems of the industrially advanced countries are of no concern at all to India and other developing countries, for both the groups have a fundamental common interest in maintaining and strengthening an effective world monetary order. Only, the developed countries, in their anxiety to settle their own problems, should not belittle the urgency of helping the underdeveloped countries by way of trade. The major element in help, as Sir Roy Harrod, another eminent economist of Britain, has stressed (*vide* his article in the 1963 Annual Number of *Commerce*), consists in hospitality to the exports of developing countries. "It is a paradox," to quote him, "that some countries seem more willing to provide gifts or soft loans to developing countries than to allow the produce of those countries access to their own markets." It is as much in the interest of developing countries as in that of advanced countries themselves that the former should not be excluded from the markets of the latter by import restrictions, tariffs, etc. Surely, the problem of providing trading facilities to the developing countries in world markets requires greater Governmental attention and action in the developed countries. At no time before was this need so urgent as it is today.

So much for what the West should do for India. But there is a lot that India itself must do, if the suggestions made by leaders like Mr. Douglas Jay and Sir Roy Harrod are to be of any avail. It must work in close cooperation with Britain and other countries that wish to widen the role of the International Monetary Fund. Besides, it must initiate and vigorously implement measures designed to improve the efficiency of India's export industries. It must not allow its imaginary fears of concentration of economic power in a few hands and monopolies in the private sector to stand in the way of fulfilling this essential task. It is a pity that, at this juncture, some eminent economists in this country should put forward proposals that are likely to undermine the ability of India to compete in world markets. They too are so obsessed with the ideological need for decentralising means of producing consumer goods and distributing economic power that they seem to be oblivious of the more urgent and practical need of economic viability on the export front. What is the point in asking the developed countries to open up their markets for India's simple manufactures, if we continue to indulge in dogmas that have no relevance today and do not learn from our mistakes of the early 'fifties in regard to consumer goods industries? Surely, we cannot expect the developed countries to pay for our follies also.

PRIVATE SECTOR IN INDUSTRY

THE private sector in agriculture, mining and industry, transport and commerce, housing and services has always been predominant in India's mixed economy. It continues to be so up till now, the spectacular growth of the public sector (represented by the Central, State and local Governments) since 1948-49 notwithstanding. The relevant statistical magnitudes in the national accounts show, for instance, that the contribution of the private sector to net domestic product (at current prices) increased absolutely from Rs. 8,030 crores in 1948-49 to Rs. 13,060 crores in 1961-62, though, as a percentage of domestic product, it did fall from 92.6 in the former year to 88.9 in the latter. While the net output of the public sector (covering both enterprises and administration) increased, at the same time, from Rs. 640 crores to Rs. 1,630 crores, the increase, as a percentage of domestic product, was from 7.4 to only 11.1. If the net output of Government enterprises, as distinct from administration, is considered separately, the relevant increase was from 2.8 per cent of net domestic product in 1948-49 to just 4.2 per cent in 1961-62. It is seen from the national expenditure data, too, that the share of the public sector by way of current and capital expenditures has continued to represent a relatively small proportion of net national expenditure at market price. The percentage figures, in this connection, are 9.4 for 1948-49 and 14.7 for 1961-62. The major role played by the private sector, whether in terms of its contribution to net domestic product or in terms of its share in national expenditure, should thus be clear.

While this overall picture emerging from national income data may be very flattering to the private sector, it should not be forgotten that, since the advent of planning, public policy has been oriented to a relatively faster expansion of the public sector. It is, in this context, that a comparison of Government capital expenditure and private sector investment during the first decade of planning from 1951-52 to 1960-61 would seem to be quite relevant. The figures show that gross capital formation on Government account was as much as Rs. 5,800 crores during the period, whereas, in the vastly bigger private sector, the aggregate investment during the same period was no more than Rs. 4,900 crores at the most liberal estimate. A break-up of the private sector investment, incidentally, shows that agriculture accounted for Rs. 800 crores, power for Rs. 90 crores, transport for Rs. 210 crores, mining and industry (including small industry) for Rs. 1,400 crores (exclusive of about Rs. 200 crores being the outlay on modernisation and replacement), housing and other construction for Rs. 1,700 crores, and miscellaneous fields for Rs. 700 crores. In this break-up, the figure pertaining to mining and industry alone is relatively more significant in the context of the controversy that has centred on the relative roles of the two sectors —public and private. Here the comparative investment figures pertaining to the two sectors show that, with its aggregate capital outlay of Rs. 1,400 crores, the private sector had somewhat excelled the public sector outlay of about Rs. 1,200 crores on mining and industry.

Let us suppose, for the nonce, that the projected third Plan outlays on mining and industry in both the sectors would fully materialise. The consolidated picture covering 15 years of planning would then show an aggregate public sector investment of Rs. 2,850 crores in mining and industry, as against Rs. 2,825 crores (exclusive of Rs. 150 crores for modernisation and replacement) of private sector investment. It would thus appear that the private sector and the public sector are equal (that is, fifty-fifty) contributors to fresh investment in mining and industry in the 15-year period of planning. Whether this position would continue undisturbed in the fourth and fifth Plan periods is the question. That it *should* continue at least at this fifty-fifty level, if not at a level more favourable to the private sector, is a reasonable expectation, but one cannot be certain that it would actually be so, for the Congress Party's statement on democracy and socialism clearly says that the public sector must grow progressively in large-scale industries, particularly in the field of heavy and basic industries, which are all capital-intensive. Besides, the stress is on co-operation so far as processing industries are concerned and, as the bulk of the resources of industrial co-operatives (as, for instance, sugar and cotton spinning) is provided by the State, the co-operative sector belongs more to the public sector than to the private sector. Further, the new Congress President has urged that the State Governments should be permitted and encouraged to set up medium-size consumer goods industries also.

There is, however, no denying the fact that the private industrial sector's achievements in terms of output, employment, creation and diversified manufacture have been vastly more impressive than those of the public sector. On this ground alone, the private sector industries can lay claim to the allocation of a dominant share in the task of industrialising the country and to the encouragement necessary for fulfilling it. The Federation of Indian Chambers of Commerce and Industry has done well, in this connection, to bring out a brochure on the contribution of private sector industries during the Plans. This publication is quite timely, for the Congress Party's statement on democratic socialism has raised the doubt whether pragmatic considerations would prevail with the powers-that-be in their approach to industrial growth. Since there is much that remains to be done in the industrial field, it is but necessary that the public should be persuaded to place greater faith in the future of private industries in the light of their past performance. A broad idea of that performance can be had from the following highlights of the private industrial sector's achievements as described in the Federation's brochure:

1. The output of private organised industries and mining nearly doubled during the first decade of planning and is expected to go up further by nearly 60 per cent, according to the third Plan targets. The physical achievements so far could easily have been greater if the several persistent shortages of foreign exchange, power, transport and raw materials had not stood in the way of optimum utilisation of installed capacities.

2. Nearly 95 per cent of the output of organised industries was in the private sector in 1960-61 and their contribution to national income went up from 5.8 per cent in 1950-51 to 10.5 per cent in 1960-61. The contribution of small enterprises to national income went up by 24 per cent during the last decade.

3. Private enterprise in India is responsible for the development of a very wide range of manufacturing industries covering many consumer and producer goods. A nucleus of machine building industry covering machinery and equipment for textile, sugar, tea processing, cement, paper and printing industries, industrial boilers, etc., was also formed mainly by private enterprise, and the output of machinery in the private sector increased by 2.2 times during the first decade of planning.

4. A major part of the resources for development of private industries was provided from their internal resources. Undistributed profits and surpluses of private industrial enterprises financed 62 per cent of the total investment in the first Plan and 47 per cent in the second Plan. During the third Plan also, the contribution of internal resources of industry for financing industrial development in the private sector is expected to be 48 per cent.

5. Private industries contributed almost the whole of the total income-tax revenue (inclusive of super-tax and surcharge) accruing to the Central Exchequer from industries, which came to a total of Rs. 788 crores during the first decade of planning. Net contribution on account of excise duty, largely from private industries, was about Rs. 2,020 crores during the same period. In addition, there was the contribution of private industries to State finances by way of electricity duty, general and motor spirit sales tax and other State levies.

6. Additional employment in private organised industries was one million during the first decade of planning. In the small-scale sector, a good deal of progressive and self-reliant leadership was in evidence, suggesting a dynamic potential of efficient small-scale enterprises.

7. Out of every rupee spent by private organised industry, about 16 nP are spent by public limited companies and about 10 nP by private limited companies on salaries, wages and employees' welfare expenses, as against a share of dividend income of 3 nP per rupee for public limited companies and about 2 nP per rupee for private limited companies.

The first of the aforesaid findings is most impressive when viewed against the background of the contribution of the public sector in mining and industry. The Federation's brochure has provided, in this connection, a comparative picture of the growth of output in as many groups of industries as possible in the two sectors. The period covered is from 1950-51 (the year preceding the first year of the first Plan) to 1965-66 (the last year of the third Plan). It may be noted that the 1965-66 figures are only targets. Since in both the sectors there are going to be shortfalls in the achievement of production targets under the third Plan, the comparison provided in the brochure may be deemed broadly valid. The following figures, gleaned from the brochure, will tell their own story:

Output of Organised Industry and Mining

(In crores of rupees)

	1950-51		1960-61		1965-66	
	Public sector	Private sector	Public sector	Private sector	Public sector	Private sector
Base metals and products ..	..	90	57	214	318	444
Transport equipment	7	43	31	176	40	380
Machinery	..	37	4	82	58	363
Electrical equipment	..	16	2	81	70	192
Chemicals and pharmaceuticals.	1	70	22	134	143	387
Mining and oil ..	..	96	17	132	106	189
Non-metallic minerals ..	3	64	15	261	106	344
Rubber and leather products ..	..	78	..	170	..	271
Paper, wood and products ..	..	29	2	70	4	138
Textiles	..	750	..	1,102	..	1,374
Food products	..	262	..	625	..	851
Total ..	11	1,535	150	3,047	845	4,933

It can be worked out from the above figures that the public sector's output will represent only about a seventh of the aggregate output of organised manufacturing and mining industries alone by the end of the third Plan. Even if the public sector investment in these industries comes to be stepped up in the fourth and fifth Plan periods at a phenomenal rate, that sector may still neither surpass nor even catch up with the private sector in terms of output, provided its growth in size and variety is not retarded as a matter of State policy.

MARKET GOSSIP

A Tame End

THE Bhubaneshwar session of the Congress Party had a tame end. Mr. K. D. Malaviya and his company of radical socialists did not follow up their fiery speeches, demanding, among other things, immediate nationalisation of banks and foodgrains trade, by insisting that their amendments to the Working Committee's resolution on democratic socialism be put to vote. Instead, they quietly withdrew them and did not even vote against the original resolution. Apparently, they must have sensed that the majority of delegates was not with them. It is significant that, just before the adoption of the aforesaid resolution by the A.I.C.C., Mr. Malaviya lost the contest for a seat on the new Working Committee of the Congress Party for the current year.

Equally significant was the tone of moderation and restraint that characterised the presidential address of Mr. Kamaraj. While solidly supporting the thesis of democratic socialism, Mr. Kamaraj favoured a practical approach to the realisation of this goal, an approach that would not lead to class conflict. He felt that there could be no inherent conflict between socialism and democracy and hoped that the Congress Party would be able to dispel the popular belief that, in a socialist State, men lose their natural freedom. His speech, however, was not free from some suggestions of dubious value. The proposal that State Governments should establish and run medium-size consumer goods industries was one of them. He, too, subscribes to the fallacy that there is a vast concentration of economic power in a few hands. Hence such suggestions as also the proposal that a monopolies commission be appointed on the British model. There could be no objection to this proposal, provided encouragement to, and the treatment of, the private sector were also on the British model. In fact, this journal had preferred the appointment of such a commission to the numerous restrictive clauses in the Company Law, the appointment of tribunals under the latest amendment to the Company Law, and the punitive features of the fiscal policy, all of which have been introduced on the plea that they are necessary for preventing concentration of economic power.

Although nationalisation of banking and foodgrains trade has been denied the high priority demanded by the radical leftists, the Congress Party is committed to it in principle. Mr. Lal Bahadur Shastri amply acknowledged this point in his reply to the debate on democratic socialism, though he emphatically stressed that the realities of the situation must always be taken into account before translating a principle into action. He also gave the assurance that, through the Congress Parliamentary Committee and its counterparts in State Legislatures, the High Command would keep a close watch over the Government at both the Centre and the States in order to ensure that the Party's socialist programmes were faithfully implemented.

Not Exactly Bullish

The implications of the aforesaid assurances of Mr. Shastri at Bhubaneshwar to the share markets are not exactly pleasant. They do not mean any improvement in the scope for bullish fervour. On the contrary, one has to be cautious; one may take a risk with one's savings, but not with borrowed funds. It would be unwise to pitch too high one's expectation of tax reliefs in the forthcoming budget. The Congress Party has persuaded itself to believe strongly that something more effective must be done in the fiscal sphere to reduce economic disparity in the country. As to what this "something effective" is will, perhaps, be known in the coming budget itself. Another uncertain factor is the determination of Mr. T. T. Krishnamachari to get an account of the "unaccounted money." Many in market circles are wondering as to how the Finance Minister will tackle this rather ancient problem. Some share-brokers, however, are inclined to think that whatever he does in this direction will ultimately have a bullish effect on stock exchanges, as the unearthed money will seek an outlet in shares, particularly equities. This reasoning doubtless sounds plausible. It may not, however, work out that way, if the measures adopted by the Finance Minister to reach his goal turn out to be of an expropriatory nature. It will be pertinent to recall here that, contrary to the common belief, the steps taken by the Government to cure the people of the gold habit did not have a sustained bullish impact on equities.

Martins Bank Chief On Interest Rates

The reflections of Sir John N. Nicholson, Chairman of Martins Bank Ltd., London, on interest rates should provide some food for thought to those monetary diehards in India who still cling to the outmoded Keynesian doctrine of cheap money. Although Sir John's observations, made in the course of his annual statement circulated to the shareholders of the Bank, refer to conditions in Britain, they have relevance to India because banks in this country too face much the same problem as those in Britain, namely, fast-growing demand for advances and increasing competition for deposits among banks themselves, on the one hand, and from institutions outside the banking field, on the other. The relevant portion of Sir John's statement is quoted below:

"Though the trend of bank advances has shown a pronounced upward tendency during the year, our banking system still has scope for lending to sound borrowers. That situation may not continue indefinitely. The Government's deficit financing of their proposed extensive schemes of public expenditure should considerably increase the total deposits of the banks (though there is little sign of this as yet) and thus enable the banks to provide finance for those who require it; but deposits increased from this source alone may not prove sufficient and, moreover, if we are to expand our business, we must not be content to rely on them solely. We also face—and cannot ignore—the steadily growing demand for deposits from an ever-widening circle of competitors outside the banking field. It has for long been our view as a bank that this competition could become serious, but during the time of credit restriction, and since, while ample funds for all reasonable requirements were still available, it would obviously have been most unprofitable to alter our long-established interest rate pattern. *When we begin to find ourselves unable to provide the funds for our customers' borrowing needs, we must go into the market and bid for them, even though the net result may be a general rise in rates of interest to be charged. In this context, money is itself a commodity which is subject to market influences—and yet, in spite of this, the rate of interest charged by the Clearing Banks for their advances is in general obviously below that of the free market.* Since our deposits are not keeping pace with the growth of our economy, it is clear that sooner rather than later we shall have to become competitors in the open market if we are to play our full part."

The portion italicised is the most significant part of the statement because it reflects the real function of interest rates and indicates the solution to the banks' problem. This is a view with which we heartily concur. What Sir John's advice amounts to is this: offer higher interest rates to attract more deposits and charge more on advances, even if this means a general rise in interest rates. This view, of course, assumes that banks are free to compete in the open market for deposits by offering terms which are relatively as attractive as those given by non-banking institutions and not bound, as they are in this country, by agreements limiting the rate of interest payable on deposits. And as long as banks in this country operate under this limitation, they would be fighting a losing battle against non-banking institutions in the struggle for deposits. And the increasing diversion of deposits away from the banking system is not a healthy development, because it will, by enlarging that part of the monetary system outside the control of the Reserve Bank, contribute to the rigidity of the monetary system itself. The answer to the problem does not lie in trying to control the interest rates in the non-banking sector through a flat.

Devidayal Cable's Fresh Issue

A substantial manufacturer of winding wires and cables, Devidayal Cable Industries Ltd., Bombay (with aggregate assets of about Rs. 60 lakhs, as of December 1963) has been in the field for the past nine years—as private limited company from 1955 to October 1963 and as a public company since November 1963. Its aggregate sales, mainly of winding wires for use in the manufacture of transformers, motors, chokes, metres, etc., has risen from a modest Rs. 6 lakhs in 1955 to Rs. 1.25 crore (estimated) in 1963. Working with the latest type of equipment for continuous extrusion and vulcanising, the Company's factory at Thana near Bombay has been manufacturing house wiring cables, too, since 1961. The output of cables represents only a third of the Company's entire production. In view of the large prospective demand for winding wires, the Company has been licensed for substantial expansion both for the production of super-enamelled, paper-controlled and cotton-covered wires and strips and for the establishment of new lines of production, such as steel and alloy steel wires and glass insulated wires. It is for raising a part of the finance required for this expansion project that the Company has just proposed to enter the capital market on 27th January next. The expansion project, incidentally, will involve an aggregate outlay of about Rs. 97.0 lakhs by way of both fixed and working capital, of which Rs. 53.5 lakhs will be raised in loans from bankers, Rs. 6.0 lakhs met from retained earnings and other reserves, and Rs. 37.5 lakhs raised in fresh equity and preference capital.

With an authorised capital of Rs. 1.25 crore, the Company has at present an issued, subscribed and paid-up capital of Rs. 23.10 lakhs (Rs. 21.60 lakhs in equity shares of Rs. 10 each and Rs. 1.50 lakh in redeemable cumulative preference shares of Rs. 10 each). The present issue is for Rs. 37.5 lakhs (Rs. 2.5 lakhs in equity shares allotted to the Directors and their friends, Rs. 25.0 lakhs in equity shares offered to the public at par for subscription in cash and Rs. 10.0 lakhs in 9½ per cent redeemable cumulative preference shares, free of company's tax but subject to deduction at source at the prescribed rates). The total issue now being offered for public subscription is Rs. 35.0 lakhs and has been fully underwritten. The subscription list will open on 27th January 1964 and will close on 6th February 1964 or earlier at the discretion of the Directors, but in any case not earlier than 29th January 1964.

The Company expects a sales turnover of Rs. 2.3 crores per annum after the expansion project is completed. It has an expanding market for both winding wires and cables. Its profit-making capacity may be rated fairly high, considering that it has paid equity dividends since 1958 and that its profit (subject to development rebate and taxation) for 1963 is expected to be Rs. 10 lakhs, as compared with Rs. 3.5 lakhs for 1958. Mr. Harikishandas T. Aggarwal, Chairman of the Company's Board of Directors, is hopeful that the profit from 1964 onwards would be adequate to enable the Company to pay the fixed dividend on preference shares, to make a reasonable transfer to reserves and to declare a reasonable dividend on equity shares. The hope seems to be quite justified in the light of the Company's past experience and in view of the tax exemption available for a part of the share capital and reserves to be employed by the Company for its substantial expansion.

Glasstek—A New Tata Enterprise

A new Company that is likely to enter the capital market shortly is Glasstek, a joint venture of the Investment Corporation of India (a Tata concern) and the Pfaudler Permutit Inc. of the U.S.A., the world's largest manufacturer of glassed-steel process equipment with an annual sales turnover of $62 million, having subsidiaries and manufacturing plants in four Continents. The Company proposes to establish a factory at Chinchwad, near Poona, for the manufacture of glassed-steel and alloy process equipment as well as Ionac water and waste treatment equipment and chemicals. The authorised capital of Glasstek will be Rs. one crore. The initial issued capital will be Rs. 60 lakhs, of which 50 per cent will be owned by the Pfaudler Permutit Inc. and 25 per cent by the Investment Corporation of India; the remaining 25 per cent will be offered to the public.

Glassed-steel is very much in demand by the fast-growing chemical, pharmaceutical and allied industries in the country. Its distinguishing quality is corrosion-resistance and pliability. In fact, it is said that few materials can be made economically into such wide variety of sizes and forms for handling so many types of corrosive materials as glassed-steel. At present, glassed-steel equipment is not manufactured in this country, the demand is met entirely from imports. Indigenous manufacture of glassed-steel process equipment will not only obviate the need for imports but will also ensure speedy delivery at lower cost. Customer-servicing will also improve because parts and personnel will be available locally for the maintenance of the equipment.

The Company has already secured a manufacturing licence for the various items it intends to manufacture. Although the capacity proposed to be installed is not known, the total outlay on the project envisaged is Rs. 94 lakhs.

Asian Cables Corporation

The Asian Cables Corporation is going ahead with its second stage of manufacturing power cables, magnet (enamelled) wires and covered strips in collaboration with the Phelps Dodge Enfield International Corporation of the U.S., according to the Company's new General Manager, Mr. T. S. Sitapati. If everything goes well, the implementation of the whole project will have been completed by the end of March next year. The project envisages an annual production of 800 miles of paper-insulated cables, 200 miles of P.V.C. cables, 1,200 tons of enamelled wires and 500 tons (to be raised to 1,000 tons later) of paper-covered strips. The total estimated outlay is Rs. 255 lakhs. A sum of Rs. 100 lakhs has already been raised by way of a rights issue. The American collaborator has contributed Rs. 55 lakhs by way of equity capital. The balance of Rs. 100 lakhs is being met from out of a foreign exchange loan of Rs. 50 lakhs from the I.C.I.C.I., a loan of Rs. 12 lakhs from the I.F.C. of India and Rs. 38 lakhs from other borrowings.

The Company is at present producing only rubber and P.V.C. cables, the licensed annual capacity on two-shift basis being 30 million core yards and 15 million core yards, respectively. Currently, only one shift is being worked, because of temporary slackness of demand, teething difficulties and delay in the issue of I.S.I. certificate marks. The capacity is, however, expected to be fully utilised in about three or four months when the total annual production in terms of value would be of the order of Rs. 2 crores. Meanwhile, efforts are being made to switch over from copper to aluminium cables, wherever possible.

Bharat Steel Tubes

Yet another company to enter the capital market in the new year is the Bharat Steel Tubes Ltd., New Delhi. The Company, which was first established as a private limited company in November 1959 and converted into a public limited concern in August 1962, has offered for public subscription at par 429,000 equity shares of Rs. 10 each and 30,000 9.3 per cent cumulative redeemable preference shares of Rs. 100 each. The subscription list opens on the 28th inst. and closes on 7th February 1964 or earlier but not before the 30th inst. Details of the capital structure and the extent of participation by the foreign collaborating company (Abbey Etna Machine Company of the U.S.) are given in the Company's announcement published on page 106 of this issue. Suffice it to add here that the issue is fully underwritten by the Life Insurance Corporation of India and six other underwriters, including the Government of Punjab —the State where the Company's factory is to be located. The Company has already acquired a 130-acre site at Ganaur, 35 miles from Delhi. It will produce steel tubes and pipes, both galvanised and black, of ⅜" to 5" diameter required for carrying water, gas, steam oil and petroleum. The demand for these pipes is large and growing, in view of the hydro-electric projects under execution and the development of the oil and petroleum industries. The Company has secured, as already noted, the financial and technical collaboration of the Abbey Etna Machine Company of the U.S.A. which will provide one million dollars in the form of equity capital, besides technical know-how and services at all stages of the project. The required foreign exchange loan and licence for importing equipments have already been secured. The Company has a nine-member Board of Directors, with Mr. N. Dandekar, I.C.S. (Retd.) as Chairman.

BRITAIN'S ROLE IN INDIA'S DEVELOPMENT

GOOD SCOPE FOR EXPANSION

By Douglas Jay, M.P.

THE wish is, I believe, very strong in Britain among almost all schools of thought to expand trade massively between Britain and India and, if possible, to increase aid at the same time. Relations between the two countries have, perhaps, never been more friendly, particularly after the prompt military help promised to India by Britain after the Chinese attack at the end of 1962. Realisation is also very widespread among the British public that standards of living are so deplorably low in the Indian sub-continent, as compared with the West, that there are strong moral grounds for Britain giving all the assistance possible to India's third Five-year Plan and its probable successors. One of the most powerful strands in British opposition little over a year ago to joining the Common Market on the terms proposed by Mr. Edward Heath and Mr. Harold Macmillan was the fear that it would harm India.

One welcome result, however, of the Common Market controversy in Britain has been a much wider understanding of the fact that advanced countries can much more effectively help developing countries by buying their exports freely than by merely lending or giving money. Economically advanced countries all over the world ought, in my view, to buy as freely as possible the produce of less developed countries; and Britain ought to take the lead in both urging and practising this policy. In any economy in a sane world, it is, of course, wholly in the interest of *both* sides to the bargain that the richer countries should buy the exports of the poorer on an ever-expanding scale.

Trade Between Both

These are sentiments and aims which most informed people in both Britain and India would no doubt readily accept in general terms. But, when we look at the actual scale of trade between the two countries, it is absurdly small, particularly in view of the long economic ties between them, and Britain's special responsibility for India arising out of the past. India's total exports of about £500 million a year are grossly inadequate to pay for her imports of £800 million a year; and her imports of £800 million a year are themselves far too small for a developing country with so huge a population. But even out of these totals, India is only importing a little over £150 million a year from the U.K., and exporting rather less to the U.K. These seem to be ridiculously small figures of trade between countries of 450 million and 50 million, respectively, and also too small in relation to the U.K.'s total imports and exports of about £4,000 million a year each way. The U.K.'s aid to India of only about £30 million is also surprisingly small, compared with the total aid India is receiving of about £400 million a year and the U.S. contribution of about £200 million. Britain's aid is, of course, limited by two factors; first the rival needs of many developing Commonwealth countries throughout Africa and Asia and the West Indies; and, secondly, Britain's own balance of payments difficulties, and shortage of gold reserves.

What is the reason for the trade between the two countries being on such a plainly inadequate scale? In general, there is really little doubt about the answer. India cannot sell more to Britain, because quota obstacles are put in the way of the goods India can most easily export. And India cannot buy more from Britain simply because she has not the foreign exchange. It is an unhappy accident that, apart from the great primary raw materials like tea, cotton and raw jute which India still sells in big quantities to the U.K., the manufactured goods which she is already able to produce and export happen to compete with British industries heavily concentrated in certain geographical areas. If cotton and jute manufacture were not both concentrated in the Lancashire and Dundee districts respectively, it would be far easier for Britain to step up its purchase of Indian goods. Fortunately, leather goods—which India is also well-fitted to export—do not raise the same issues quite so acutely.

Britain, of course, here has a far better record than the United States or the Common Market countries. The U.K. now takes about 38 per cent of its textile consumption from abroad, the U.S. barely 5 per cent, and the Common Market less than 2 per cent. Thus, British policy towards the developing countries, though not good enough in my view, has nevertheless been far more liberal than that of the other industrial nations. The Common Market countries are, as usual, the worst—narrow, protectionist, selfish and insular. In these circumstances, it is extremely difficult to expect Lancashire to accept even greater pressure from imports when other countries are clearly not doing anything like their share in helping the less developed countries.

So far very little progress has followed from the G.A.T.T. conference at Geneva in 1962, at which the U.S. and other industrial countries pledged themselves to buy more textiles from Asia. I believe that, in order to break the deadlock, Britain ought to inform the Common Market and U.S. that, unless they agreed to step up generously their purchases of Indian textiles before some given date, Britain will have to cease buying textiles from the U.S. and Common Market. This should lead to an increase in India's exports either to the other countries or to the U.K., since, if we in Britain are forced to cut our purchases from the Common Market and the U.S., we shall be better able to buy more from India.

Some Concrete Suggestions

Secondly, I believe the U.K. Government ought to redouble its efforts to steer new industries and employment into the Lancashire and Dundee areas, so that the British textile industries can gradually adapt themselves without unemployment being caused on a mass scale. You can reasonably ask Lancashire and Dundee workers to change over to new industries. What you cannot ask them to do is to suffer prolonged unemployment. Here it seems to me that India itself might be able to help to reach a bargain acceptable to both sides. Suppose the Indian Government were to guarantee to buy over a period of years the aircraft, motor vehicles, ships or machine tools produced by a new plant erected in the British textile areas; then, in return, Britain could reasonably undertake over the same period of years to widen the import quotas for Indian textiles. This would economically benefit both sides; would cause no unemployment; and would correspond with economic realities, since each country would be concentrating on the products it was best fitted to manufacture. Certainly, any such scheme would be difficult to organise in practice. But I do not believe it would be impossible, given goodwill and intelligence on both sides. Indeed this is precisely the sort of planned co-operation to which we ought to be directing our minds.

Britain's exports to India, however, have somehow to be increased as well as India's exports to Britain. Here the difficulty is not any lack of wish by India to buy British capital goods, but rather shortage of foreign exchange. It seems to me, therefore, that, despite all the export credit schemes already in force, a British Government must make up its mind on the following question: Is the U.K. prepared to liberalise its credit terms on a really generous scale? Or are we going to lose the greater part of potential export trade to India to the U.S., Germany, Japan and others? Here, I agree with the recent British Federation of Industries report on India's economic problem that Britain ought to take the plunge and stake its future on extending far more generous export credit schemes for India and the other poorer countries.

The motive which quite naturally leads any prudent British Government to hesitate before doing this is the fear that, if exports are simply given away, and not paid for, then the U.K.'s balance of payments will be undermined—and perhaps sterling endangered, to the injury of all Commonwealth countries. I believe we can find an answer to this. Though the whole subject of export credits is vastly complex, the main lines of policy should, I suggest, be as follows:

Apart from some direct gifts of aid, and the contributions of the international agencies, the export of capital goods for development from Britain to India should normally be financed by loans not gifts. This is surely likely to be more satisfactory to both sides. The lender will have some assurance that the whole proceeding is not hopelessly uneconomic and likely to end in fiasco. The borrower will feel that he is not receiving charity, but entering into a mutually beneficial enterprise. He will also have an incentive to use the money productively and carefully.

But, again in general, the periods of such loans should in my view be long; and the rate of interest should be low, but not negligible. It is perfectly clear that, if India borrows further large amounts at 6 per cent for five or ten years, her balance of payments will become unmanageable before her economy has developed anywhere near the self-sustaining stage. But, despite the current difficulties and delays in India's present Five-year Plan, I do not despair of her economy becoming viable in thirty, forty or fifty years' time. More rapid swings in relative economic fortunes than this have occurred between the U.K., Germany, the U.S. and France in the past twenty-five years. By the year 2000, India might be a surplus country, if she discovered oil and natural gas in really massive quantities, she might win through sooner. Therefore, it seems to me that loans on a thirty to forty-year basis are a reasonable proposition for both sides. They offer India a real chance of earning the service on the loan, and Britain a chance of getting something over a long period in payment for her exports.

So with rates of interest. The present rates on some loans and credits (not all of course) of five and six per cent seem to be an intolerable burden for India with her present living standards and at her present stage of development. On the other hand, rates as low as ¼ to ½ per cent seem to me going too far the other way, apart from exceptional projects not intended to yield an economic return. They amount to near-charity from the lender and must put a burden on his future balance of payments, and they exert only a negligible incentive on the borrower to use the money productively.

Should British loans to India be tied or untied? I think the answer must be *both*. From India's point of view, clearly the more untied loans the better. From the British point of view, the principle should, I suggest, be this: Give all the untied loans and grants which the U.K. economy can afford without danger. Then, over and above this, offer tied loans wherever Britain has surplus capacity for producing goods which India needs. Such a scheme for £15 million of "surplus capacity" loans has recently been adopted by the present British Government under pressure from the Labour Opposition. But so far we have, I believe, only scratched the surface of these possibilities, and should push this idea very hard indeed from now onwards.

World Liquidity

Finally, let us remember that the limiting factor on what Britain—and indeed the U.S.—can do today is the shortage of gold and international financial reserves. An inadequacy of world reserves, due to a faulty monetary mechanism, is without doubt holding back the use of productive capacity in both the richer and the poorer countries. The right solution in principle is for the International Monetary Fund to be given the power to create more international credit in some form, and lend it through the World Bank and its family of agencies to the less developed countries for them to spend on goods they need from their more advanced neighbours.

This would break the deadlock all round, expand trade both ways, throw no burden on anyone's balance of payments, and speed up development and the real rise in living standards in India and the other poorer countries. It would be wholly to the benefit of all of us, and the real key to success in India's struggle to achieve a self-sustaining role. So both the British and Indian Governments, and the rest of the Commonwealth, ought to put their whole strength co operatively behind the plans now being worked out for more generous "world liquidity" and a strengthened I.M.F. Where our interests thus coincide, let us wholeheartedly work together.

DR. A. N. KHOSLA'S POWER-FULL DREAM

QUICK-MARCH ORDERS IN BACKWARD ORISSA

By K. Krishna Moorthy

INDIAN State Governors, by and large, are figureheads of State, decorative additions to the furniture in Raj Bhavans. The job has also been generally the preserve of political pensioners from the Congress Party—for a veteran who loses his hold in his home State in internecine faction strife or in general elections. The Governor of Orissa State, Dr. A. N. Khosla, engineer and planner, is an exception to the general rule of Governors. He fits in well with the new mood in backward Orissa introduced when Biju Patnaik led the Congress back to a decisive election victory in 1961. The mood prevails in Orissa although Mr. Patnaik applied for relinquishing office under the Kamaraj law of renunciation; Mr. Patnaik continues to dominate the affairs of State sitting in his room in the Secretariat as the Chairman of the State Planning Board.

For most officials in Orissa, the Governor, Dr. Khosla, is the "old man" who busies himself with putting his finger into development projects and dreaming up new concepts of economic development. Dr. Khosla's biggest contribution to Orissa's development ideas is a dream document for harnessing the river system in the State and for producing power also from big thermal installations which will be integrated with the hydro complex. Dr. Khosla has been associated with Orissa power plans for more than two decades. As Chairman of the then Waterways, Irrigation and Navigation Commission, Dr. Khosla in 1945 first put out his plans to harness the Mahanadi. The only project to come to fruition from among those plans was the Hirakud dam across the Mahanadi, completed in 1957. Dr. Khosla has revised his original power plans for Orissa and now produced a bigger perspective plan which aims at harnessing the Mahanadi river system at various stages.

Twin Spectres

Orissa State has an abundance of water resources whose seasonal shift is wide. Orissa, comprising five per cent of the area of the Indian Union, has within its 60,000 square miles area one-tenth of the nation's water wealth. The total run-off of the rivers in Orissa is an annual 121.26 million acre feet, about two-thirds of the Indus system's flow. The Mahanadi system, consisting of the Mahanadi, the Brahmani and the Bitarani, contribute 101.61 million acre feet a year. The seasonal variations in the Mahanadi system range from a maximum flood discharge of 2.8 million cusecs to a minimum of 100 cusecs!

The twin spectres of Orissa have been flood and drought, alternating with disastrous frequency. In a drought in 1865-66 nearly a million people are estimated to have perished in Cuttack district alone. This was followed by a big flood. In 1961 the floods caused severe damage and relief operations cost the Government an initial Rs. 6 crores. In the following year, damage to kharif crops from drought was placed at Rs. 60 crores.

The Khosla Plan can be divided broadly into two sections, the thermal part and the hydro part covering generation of power, irrigation and navigation canals and a new seaport. As Dr. Khosla explained to this correspondent at the Raj Bhavan in Bhubaneswar, the hydro part of the plans will cost a total of a little less than Rs. 950 crores. The end products of these projects will be complete flood control on Orissa's treacherous rivers; installation of more than eight million kilowatts of generating capacity; irrigation facilities for more than eight million acres of cropped area; about 1,000 miles of navigational canals connecting Visakhapatnam and Haldia and the Rourkela steel plant and the iron ore and coal belt to Paradeep port and Chilka lake; 1.2 million acres of reservoir for fish cultivation and other things; and a potential fresh water harbour of about 150 square miles, in the western part of Chilka lake with about 36 miles of fresh water canal up to 50 feet deep with a perennial discharge equal to or more than the winter discharge of the Hooghly on which Calcutta lies.

The river valley projects and the thermal projects could be designed to produce together more than 18 million kilowatts at the end of a 25-year period. Dr. Khosla's calculations are that the hydro-electric part of the river valley projects will cost a little over Rs. 600 crores and the thermal part another Rs. 600 crores. Including the flood control, irrigation and navigation projects, the total cost of the hydro projects is placed by Dr. Khosla at more than Rs. 900 crores. Or, in other words, something around Rs. 1,500 crores for the integrated scheme, to be spread over 25 years.

Dr. Khosla has made a comparison of his estimates for the Orissa complex with the cost of the Tennessee Valley Authority which has 31 hydro-electric dams and ten steam plants producing 12 million kilowatts, of which eight million kilowatts are steam-based. The T.V.A. cost around Rs. 840 crores and Dr. Khosla's estimates are about Rs. 1,200 crores for producing more than 18 million kilowatts in Orissa. The T.V.A. has brought direct benefits to seven American States in an area of 80,000 square miles. Dr. Khosla says that his scheme will do all that T.V.A. has done and more—in the irrigation field—and help Orissa, Andhra, Bengal, Bihar and Madhya Pradesh States.

Dr. Khosla envisages an investment of Rs. 250 crores in these power and irrigation projects spread over the years to 1973. At that stage, he says, the sale of power and other income will provide sufficient returns—he calculates a net annual Rs. 40 crores—for re-investment on the later stages of the integrated scheme. Dr. Khosla also thinks that an expenditure of Rs. 250 crores on these projects by 1973 will be within the technical and managerial capacity of Orissa.

The first step in the extension of the power plans in Orissa was taken on 5th January when Prime Minister Nehru laid the foundation-stone for the Tikkerpara dam and the Talcher thermal plant which is aided by the United States.

Fresh Water Port

The Governor's plan for a port in Chilka lake also has interesting aspects. The flow of water from the canal falling into Chilka will be sufficient, according to Dr. Khosla, to make the channel self-flushing, once dredged to between 40 and 50 feet depth. The soil dredged out could be used to build a 400 to 500 feet embankment on which railway lines can be laid and other port facilities provided.

Whether Dr. Khosla's calculations will be financially as simple as he visualises remains to be seen. According to one Delhi observer, Dr. Khosla has a record of consistent underestimation of financial costs of projects.

Orissa's first Five-year Plan outlay was originally estimated at Rs. 74.5 crores but the actual expenditure was Rs. 68 crores, of which the Centre took the burden of spending Rs. 60 crores. In the second Plan, against the original outlay of Rs. 100 crores Rs. 84 crores were spent and, of this amount, the Centre picked up the bills for nearly Rs. 66 crores. For the third Plan the original outlay was Rs. 160 crores, with a Central promise to provide nearly Rs. 129 crores. But now the Orissa State's third Plan has been revised to Rs. 220 crores. The actual expenditure on the Orissa plan was Rs. 23.77 crores in 1961-62 and Rs. 33.61 crores in 1962-63. The original provision in 1963-64 was Rs. 32.56 crores but the anticipated outlay has gone up to Rs. 46.70 crores. For the fourth year of the third Plan, in discussions with the Planning Commission last month, an outlay of more than Rs. 63 crores was agreed upon. Orissa State has exhibited greater vigour than many other States in canvassing its projects. For example, although Dr. P. C. Sen brought a huge delegation from West Bengal, he was unable to explain many of his plans to the satisfaction of the Planning Commission. The Orissa delegation, on the other hand, was well-equipped with arguments, many of which appear to have convinced the planners into agreeing to steadily increasing outlays.

Paradeep Project

Some officials in Delhi also talk of the 'political banditry' by Orissa's leaders in development projects. The Paradeep port project was resisted by the Planning Commission as well as the Transport Ministry which claimed that a major port was in its domain. Biju Patnaik went ahead and started work on the Paradeep project and has now forced Planning Commission approval for spending nearly Rs. 12 crores on the port project during the third Plan. The biggest arguments for Paradeep are the three B's in Calcutta—bars, bores and bends. The port of Calcutta is being suffocated by silt. The quick march in development projects in Orissa, including Paradeep, is entirely the result of the dynamic approach of Biju Patnaik.

A port at Paradeep has been talked about for 15 years and the Japanese have been interested in it since the early fifties. The Japanese, in the middle of 1963, submitted to the Ministry of International Trade a scheme for the integrated development of mines, railways, roads, ports and industries in Orissa State. The Japanese had earlier conducted several tests on possibilities in Paradeep. Both the Japanese and French engineers suggested estuary ports but Indian engineers and the British consulting firm of Render, Palmer and Tritton ultimately chose a lagoon harbour. Model experiments were conducted at the Poona research station of the Water and Power Commission.

A road has been constructed from the port site to the quarries 100 miles away and a total of 600,000 tons of stone and boulders are being carried to raise the breakwaters. The lagoon harbour will be formed by dredging into the shore—about 200 million cubic feet or 11 million tons of soil have to be dredged out. Ten thousand people are already at work on the port construction.

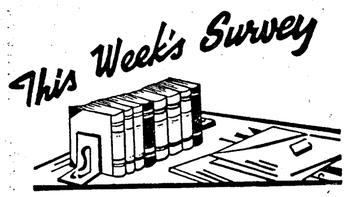
From the mines 100 miles away, iron ore will initially be brought to Paradeep by trailer trucks speeding on an expressway. A railway line will come later when more distant mines are developed.

The total cost of the project may be around Rs. 40 crores and Paradeep will become the deepest port on the Bay of Bengal, capable of handling 60,000-ton ore carriers and 100,000-ton tankers. The first stage, to cost Rs. 18 crores, is to be finished in 1966 when the iron ore berth will be capable of handling two million tons of iron ore. In the first stage, half a million tons of general cargo also could be handled every year. By 1970-71 the aim is to make the port capable of handling five million tons of ore and one million tons of other cargo. In the final stage, there are to be three ore berths and nineteen general cargo berths, capable of handling ten million tons of iron ore. That will be about ten years from now.

The report of the National Council of Applied Economic Research on the development of Paradeep, released in December, says: "The end cost of delivery of ore from the mining area to the port of Paradeep can be the lowest for any port on the east coast, and with one or two exceptions such as Goa, in the country as well."

The Central Government has decided to participate in the forthcoming British Columbia International Trade Fair scheduled to be held at Vancouver (Canada) from 13th to 23rd May next. This Fair offers an opportunity and effective media to Indian exporters and industrialists for publicising their merchandise not only in the province of British Columbia but in the entire region of West Canada. This market, which has not yet been tapped, offers a special advantage in the existence of a large and prosperous Indian community there whose co-operation will be of great help in introducing new products from India to that region. Besides, the complete removal, earlier this year, of the surcharges on the import of a large variety of goods in that area makes India's entry into this market easier. The intending participants are expected to forward a list of exhibits which they wish to send to the Director of Exhibitions, Ministry of International Trade, Udyog Bhavan, Maulana Azad Road, New Delhi, by 19th February, 1964 mentioning the quantity and value of their goods and area likely to be required for their display. Approximate gross and net weight and volume of the packages containing the goods have also to be mentioned. The exhibits will then have to be delivered to the Government's forwarding and shipping agents, namely, Messrs. Mackinnon Mackenzie and Co. Pvt. Ltd., Ballard Estate, Bombay, by the end of next month.

The expansion of the Bhadravati Iron and Steel Works in Mysore State is making good progress. The rolling mill building has been completed. And while erection of the rolling mill itself was started, erection of the steel structure for the oxygen generating plant is nearing completion. The construction of the steelworks bay is now in full swing. Installations to be incorporated under the expansion scheme of the Indian Iron and Steel works include a complete LD and electric steel-making plant, a 500-ton mixer, the necessary crane installations and auxiliary equipment. The existing rolling mill will be extended to include a three-high blooming stand and a three-high finishing mill. The annual rolling capacity will thus be increased by 85,000 tons. At the structural steelwork plant, the entire structural steelwork for the plant is being manufactured locally by Indian personnel according to drawings and instructions supplied by DEMAG Ag. of Duisburg, Germany.



FOR SPEEDIER INDUSTRIAL LICENSING

IN his Lok Sabha statement of 16th December 1963, it will be recalled, the Union Finance Minister, Mr. T. T. Krishnamachari, announced the first step towards liberalisation of industrial licensing policies and procedures. The Government's decision involved (i) the raising of the exemption limit for licensing under the Industries (Development and Regulation) Act from Rs. 10 lakhs to Rs. 25 lakhs and (ii) the consequential raising of the exemption limit for purposes of capital issues control from Rs. 10 lakhs to Rs. 25 lakhs. (This exemption is not applicable to issue of bonus shares.) It was then clarified by the Finance Minister that the relaxation was intended to simplify and expedite the licensing procedures and to give a special fillip to the setting up of industries with indigenous equipment and using indigenous raw materials. T.T.K. had also indicated in his statement that further measures of liberalisation, if any, should await the report of the Committee which had been appointed to examine the licensing procedures in regard to industrial capacity, import of capital goods, issue of capital, and so on. It is, indeed gratifying to find that this Committee (with Mr. T. Swaminathan, I.C.S., as Chairman and with leading industrialists like Mr. Bharat Ram, Mr. A. R. Foster, Mr. Lakshmipat Singhania and Mr. A. M. M. Murugappa Chettiar and some other representatives of businessmen as members) has drawn up an interim report within less than four months from the date of its appointment in September last. And it is even more heartening to know that the Government has promptly accepted its main recommendations.

The first of these recommendations is calculated to ensure a speedy procedure for according clearance in principle to the establishment of industrial capacity. The new procedure would involve the issue of a "letter of intent" to an industrialist within about a month from the date of receipt of an application from him for starting an industry. As the purpose of the "letter of intent" is to indicate that the Government would be prepared to consider favourably the proposal put forward by the industrialist, the issue of this letter will enable him to negotiate more confidently with foreigners for collaboration or for the supply of capital goods. But, if within a specified period of six to twelve months, depending on the nature of the industry, the party does not submit all the remaining applications in respect of foreign collaboration, capital issue, etc., the "letter of intent" would automatically be deemed to have become inoperative. There is no doubt that the recommended procedure would reduce greatly the usual time lag between the date of application for an industrial licence and the date of actual licensing. The issue of a "letter of intent" within a month of the receipt of application would, by eliminating the uncertainty on the score of licensing, greatly assist the entrepreneur in his arrangements for foreign collaboration, import of capital equipment and issue of capital. The Government has, therefore, done well to accept the relevant recommendation of the Committee.

But neither the prompt issue of a "letter of intent" by the Government nor the submission, within six to twelve months, of other related applications by the party concerned would automatically mean that the actual approval of foreign collaboration terms, issue of import licences and issue of capital would be free from further procedural delays. It is precisely to minimise such delays that the Committee has made its second recommendation. This is intended to ensure the speedy processing of all applications relating to some key industries. The new procedure would involve expeditious and simultaneous consideration of *all* further clearances by the appropriate sub-committee of the Licensing Committee. Incidentally, the key industries, to which this procedure is to be applied in the interest of speedy establishment of additional capacity for the promotion of self-sustaining industrial growth, are: Pig-iron, alloy steel, ferro-chrome and other ferro-alloys except ferro-manganese and ferro-silicon, malleable iron castings, steel castings, steel forgings, structurals (heavy), industrial machinery, cranes, machine tools including small tools, dies, jigs and fixtures, automobile ancillaries, coated abrasives, electric winding wires, fertilisers, sulphuric acid, caustic soda and soda ash, rubber chemicals, petrochemicals, including synthetic rubber pesticides, paper and paper board, cement and pulp (cellulosic). In cases where adequate capacity has already been licensed, only expeditious approvals would have to be given to the relevant applications. It is good that the Government has accepted the Committee's second recommendation too. But it should not be forgotten that speedier licensing procedures, by themselves, would not bring about faster industrial growth in the absence of a favourable climate in other respects, too, especially in regard to raising capital. The State Governments also must streamline their procedures for making available water, land and power.

LAKDAWALA COMMITTEE REPORT

The three-man expert committee (Chairman: Professor D. T. Lakdawala of the University of Bombay) appointed by the Government of Maharashtra in August 1963 to examine the question of readjustment of the existing consumer price index series of Bombay and to consider the method of linking it with the proposed new series, with 1960 as base year, submitted its report on the 7th inst. Disclosing this at a Press conference held in the City this week, Mr. N. M. Tidke, the State's Labour Minister, said that the Government proposes to hold consultations with organisations of employers and trade unions this week before taking a decision on the report. While the Government's move to consult employers and workers, the two parties that will be directly affected by the decision, is welcome, it is surprising that the Government has not made available copies of the report even to the Press. Even at the Press conference, held last Saturday to announce the news, only a few conclusions and recommendations of the Committee were disclosed. The brief Press note issued by the Government in this connection is also not any more enlightening, as it has not given even a fairly good, let alone a fair, summary of the report or of its conclusions. All that has been published by the Government so far is the following terse announcement:

"In the opinion of the Committee, any revision of the existing series for periods prior to 1960 has to be ruled out. The Committee has not also considered it appropriate to take into account the changes in consumption pattern in respect of few items as that would have disturbed the weights of other items. The Committee has, therefore, stuck to the fixed basket up to 1960 as far as possible and has corrected the current index series for the calendar year of 1960.

Various points were raised by the employers' and workers' organisations before the Committee and they included grievances in respect of repetition of prices of certain items over a long period, failure of the compilation to take into account the quality changes in certain items of consumption, non-representative character of some of the items that have been priced and substitutions made in some of the items of consumption. After careful consideration of these points, the Committee came to the conclusion that the existing series require adjustment in respect of price indices of only four items, namely, ghee, ready-made tea, house rent and clothing group. The price indices of these items were, therefore, corrected by the Committee and on such corrections, the average general index figure for the year 1960, which was at 420, worked out to be 449, that is, 29 points more.

"As regards the problem of linking the current series with the new series, after considering the various submissions made to them, the Committee came to the conclusion that the new series should be linked to the current revised series at 1960 only by a simple ratio linking and that the linking factor should be 4.49. In doing so, the Committee took into consideration the factor that the period of the Family Budget Enquiry on which the proposed new series is based is different from the base period for the proposed series and felt that no readjustment is necessary in the new series on account of this factor."

It is, therefore, not surprising that there has been singular lack of comment and reaction about a report whose outcome is likely to affect the pay packets of lakhs of wage earners in the City and the wage bill of hundreds of employers. Responsible trade union leaders preferred to remain silent in anticipation of fuller details, while the more vocal and militant among them, knowing little about the exact recommendations, not to speak of the logic and reasoning behind them, attacked the Committee on the ground that workers were not represented on it. The fact is that this particular Committee was not supposed to be a tripartite committee but a technical committee, composed of experts, to decide a technical issue, namely, linking of the present series of consumer price index numbers, readjusted if necessary, with the new series. It was, of course, open to the Committee to ascertain the views of employers' and workers' representatives on the question and this the Committee did before framing its report and recommendations.

One fails to understand why the Government rushed to announce the recommendations of the Committee even before making arrangements to release copies of the report at least to the Press. Is it because the report indicated the possibility of higher D.A. for workers as a result of the increase by 29 points in the general index figure for 1960, worked out by the Committee on the basis of the readjustment made in respect of the four items? Or is it because the Government wanted the linking factor to be finalised quickly so that the switch-over to the new series could be accomplished as soon as possible? Whatever the reason, the failure to make available a fuller account of the Committee's recommendation is deplorable, especially because the Government wants to make a decision on the report forthwith, after consultation with representatives of employers and workers. It is pertinent to ask, in this connection, whether the Government does not want any public discussion of the report but is satisfied with ascertaining the views of representatives of employers and workers only. It is true that these represent the two parties directly affected by the decision. But there is a third party, that admirable, long-suffering, normally meek and generally silent group of men and women—the consumers—on whom are always inflicted the wounds of labour-management conflict, because they ultimately foot the bill of higher D.A. and higher prices. Should they not have a say in the matter, unless, of course, the Government arrogates to itself the exclusive right to speak for, and defend the interests of, consumers?

PRESIDENT JOHNSON'S MESSAGE TO CONGRESS

The Johnson Administration in the United States is committed to the continuation of the former Kennedy Administration's policies. What is more, it is determined to get the pending legislative programme enacted by the Congress by summer, presumably with an eye on the presidential election later this year. The Kennedy image can stand the new Administration in good stead and yield results at the hustings if the Kennedy programme is substantially implemented in time. That seems to explain the anxiety of President Johnson, who, in his State of the Union Message delivered before a joint session of the U.S. Congress last week, has called for prompt action on the legislative programme and made a fervent plea for getting the job done. Much is expected of this year's session of the Congress—at least President Johnson expects much from it—and the Civil Rights Bill, the Tax Reduction Bill and the forthcoming Budget with its programmes relating to health, housing, education, transportation and foreign aid will demand its more or less simultaneous attention. If that august body had been stung to the quick by President Johnson's twitting remark—"Last year's Congressional session was the longest in peacetime history. With that foundation, let us work together to make this year's session the best in history"—all would be well and both the United States and the world might stand to benefit a great deal from the fulfilment of the Kennedy programme.

The new President may well find the Congress more co-operative than it was in the last session, for he has promised to do what the Congress would like most to be done. Thus, he is for a substantial reduction in federal expenditures and in federal deficit without a corresponding reduction in the federal support for social services. This is how the President has highlighted the essential features of his Administration's forthcoming Budget for the fiscal year 1964-65:

"The Budget will cut our deficit in half, from $10 billion to $4.9 billion.... It will call for a substantial reduction in federal employment, a feat accomplished only once before in the last ten years. While maintaining the full strength of our combat defences, it will call for the lowest number of civilian personnel in the Department of Defence since 1950. It will call for total expenditures of $97.9 billion—compared to $98.4 billion for the current year, a reduction of more than $500 million. It will call for new obligational authority of $103.8 billion—a reduction of more than $4 billion below last year's request of $107.9 billion.

"But it is not a standstill budget—for America cannot afford to stand still. Our population is growing. Our economy is more complex. Our people's needs are expanding. By closing down obsolete military installations—by curtailing less urgent programmes—by cutting back where cutting back is wise—by insisting on a dollar's worth for a dollar spent—I am able to recommend in this reduced Budget the most federal support in history for education, for health, for retraining the unemployed, and for helping the economically and physically handicapped."

With its promise of frugality, efficient spending and reduced deficit, the Budget may persuade the Congress more easily than any other economic argument to adopt the pending tax Bill which envisages a phased cut of $11 billion in personal and corporate taxes. Quite apart from the twin consideration that the American taxpayer surely deserves the cut and the American economy strongly demands it, what commends it most at the present time is that "the new budget clearly allows it," as President Johnson has emphasised. First of February next has been laid down as a tentative deadline for the enactment of the tax Bill, for, according to the President, every month of delay will dilute its benefits in 1964 for consumption, investment and employment.

President Johnson's message is quite as significant for the world, in general, as for the United States, in particular. Some noteworthy steps that are being taken by his Administration and some promises made by it are in the best interests of world peace and security, ultimate disarmament and world prosperity. The proposed cut in the output of enriched uranium by 25 per cent and the proposed closure of four plutonium piles and non-essential military installations clearly show that the present U.S. Administration does not seek an excess of military power that could be provocative as well as wasteful. The President's assurance to make increased use of food as an instrument of peace, to preserve the present gold value of the dollar, to expand world trade and to continue the aid programmes should be deemed no less heartening, especially to the underdeveloped parts of the world.

SMOKING AND HEALTH

To the mass of statistical evidence on the hazards to health on account of cigarette smoking, of which the report of the British Royal College of Surgeons, published in 1962, was the most authoritative contribution so far, has now been added the findings of the special committee appointed by Dr. Luther L. Terry, the Surgeon General of the U.S. The Committee, which was asked to study the effect of smoking on health, has given, in a 150,000-word report published this week, the finding that cigarette smoking is causally related to lung cancer in men. The data for women, though less extensive, point in the same direction. The main conclusions of the report are:

1. Cigarette smoking is a health hazard of sufficient importance in the U.S. to warrant appropriate remedial action.

2. It is causally related to lung cancer in men and in women it points in the same direction. The risk of developing lung cancer increases with the duration of smoking and with the number of cigarettes smoked per day and is diminished by discontinuing smoking. Risk of developing lung cancer for pipe and cigar smokers is greater than for non-smokers but much less than for cigarette smokers. The relationship of pipe smoking to cancer of the lip appears to be established.

3. Cigarette smoking is the most important cause of chronic bronchitis. A relationship exists between pulmonary emphysema and cigarette smoking, but it has not been established that the relationship is causal. For the bulk of the population, cigarette smoking is a much more important cause of chronic broncho-pulmonary disease than atmospheric pollution or occupational exposures. Cigarette smoking does not appear to cause asthma.

4. Male cigarette smokers have a high death rate from coronary artery disease than non-smoking males, but it is not clear whether the relationship has causal significance.

5. Women who smoke cigarettes during pregnancy tend to have children of lower weight at birth. It is not known whether this decrease in birth weight has any influence on the biological fitness of the new-born child.

The Committee comprised nine eminent doctors and one professor, with Dr. Terry as Chairman. It took 14 months to prepare the report which runs into 387 pages. The principal source of evidence was the seven studies conducted in the field since 1951. A total of 1,123,000 persons were covered by these studies of whom 37,391 men died during the studies. Deaths due to lung cancer in the U.S. in 1962 aggregated 41,000, as compared with less than 3,000 in 1930. This extraordinary rise in the death rate, according to the Committee, has not been recorded for cancer of any other part of the body. The Committee also noted that observations of thousands of patients and autopsy studies of smokers and non-smokers showed that many kinds of damage to body functions and to organ cells and tissues occurred more frequently and severely in smokers.

Announcing the findings of the Committee at a Press conference at Washington this week, Dr. Terry said that the Government would take prompt action to determine what remedial measures the public health services should take. He, however, declined to say whether the Committee's report constituted the official policy of the U.S. Public Health Service. Although Dr. Terry did not indicate what remedial action would be taken, tobacco manufacturers in the U.S. expect that, in view of the unequivocal condemnation of cigarette smoking by the Committee, some action would be taken by the Government. These are likely to be (1) broader educational campaign against smoking by the Public Health Service, (2) new labelling rules, and (3) possibly, some regulation of, if not restriction on, cigarette advertising. Already several Bills have been tabled in the Congress, which require, among other things, cigarette packets to be marked to show nicotine and tar content or to carry a printed warning that cigarette smoking is a health hazard. More Bills are expected to be tabled, though the chances of their passage are regarded slim. Meanwhile, the three major U.S. broadcasting network have announced that they will review their policies regarding tobacco advertising in the light of the report. One radio station in Concord, California, has, in fact, promptly banned cigarette advertising even though it is one of the three main sources of revenue to the station.

A drop in cigarette sales is also anticipated, though the possibility of a permanent decline is ruled out. As had happened when the report of the Royal College of Surgeons was published, sales, after falling initially, are expected to rise again. Thus, in 1963 cigarette consumption in the U.S. rose by three per cent to reach a total of 523,000 million, as compared with a rise of only one per cent in 1962, the year in which the British report was published. *Per capita* consumption, which had declined slightly in 1962, recovered last year to more than 4,000 cigarettes or 200 packs (of twenty cigarettes each). Similarly, *per capita* consumption of cigarettes dropped in 1953 and 1950, following the report of the American Cancer Society, but, thereafter, it rose consistently year after year until 1962. There are, according to one estimate, 70 million smokers in the U.S. out of a total population of 180 million. No wonder tobacco manufacture and distribution is a multi-million dollar business, with annual sales of cigarettes alone being of the order of $2,000 million and an advertising budget of $200 million. Taxes on tobacco, running into a few billions of dollars, constitute an important source of revenue to the Government.

LONDON LETTER

PRICES OR PROFITS?

(From Our Own Correspondent)

LONDON, 11*th January*

AS the idea gains ground that non-inflationary expansion of an economy depends upon some sort of incomes policy, so the debate turns on which way could be used to control the non-wage, non-salary, incomes. Profits, after all, are not the same as wages: they are residual and subject to greater fluctuation than any other item in the make-up of costs (that is, selling prices). To control them is to make risk-bearing less attractive and so damp down that initiative which is the mainspring of economic expansion. About the most effective and least damaging control is through the taxation of profits and a system of differential taxation of profits has for many years been part of the British fiscal system—but with the object simply of exploiting a source of revenue rather than of assisting an incomes policy.

This week "Neddy" (National Economic Development Council) met to consider recommendations from the staff side that management had a function of responsibility in opposing price and cost inflation, and that it should recognise this responsibility and take steps to implement it. The "Neddy" economists were saying that it is easier to control prices than profits and it was not so damaging—it need not be damaging at all—to initiative. But a control over prices does, by definition, give a control over profits, since profits are the residual item in prices. Moreover, the public have an immediate interest and benefit from a control over prices. Nearly everyone understands nowadays that wage increases become only nominal instead of real if price increases follow and that control over prices can keep down the demand for higher wages.

The representatives of management accepted the general recommendations of "Neddy" and the Chancellor of the Exchequer thereupon asked for a joint declaration by employers and unions that (*a*) unjustified price increases were not to be made and (*b*) that inflationary wage increases would not be sought. The unions felt a trap and would not agree—deferring the problem to next month's meeting. And the Chancellor is visibly annoyed.

But, by avoiding one trap, the unions may not avoid another, for, if the economy shows increasing signs of strain, the Chancellor may take restrictive measures before the election and blame the unions for having to do so. Some cynics have suggested that the unions should accept the declaration and agree that excessive wage increases are as bad as excessive price increases, pointing out that that still permits higher-than-average increases for workers whose wages are lower than average, or who ought to be paid more to recruit more labour, or whose efficiency deserves it! Unfortunately, unions are mainly run by simple men not given to devious thinking or to taking advantage of the breadth of meaning of words and they are not likely to take the cynics' advice.

The Chancellor is, therefore, faced with doing nothing for a month (and perhaps longer) and to blame the unions, if need be, or to take some sort of action to implement the "Neddy" recommendation as endorsed by the employers. Since "Neddy" can only be a recommending body, action must always lie with Government and the responsibilities of Government do not lessen, because the governed cannot always make up their minds on what advice to offer. There is, therefore, substantial opinion already that the Government should take steps to avoid excessive price increases and, therefore, strengthen its position, if it had to resist certain wage increases.

In this country, there is still substantial resale price maintenance and the current report of the Registrar of Restrictive Trading Agreements shows that pricing arrangements cover wide areas of British selling. To make competition real, resale price maintenance should be scrapped—made illegal—to allow sellers to pass on the benefits of their economies to the public. If the Chancellor were to make plain that all attempts to combine, to agree, or to penalise non-agreers, on prices would incur his severe displeasure to be followed by whatever legislation was necessary, a great blow would have been struck for keeping down prices.

Next, the Government has already got "Neddy" to recommend on the state of the economy; it has "Nicky" to consider the effect of wage increases; why should it not set up a price review commission to consider the justification for particular price increases? The Chancellor could then use legislative machinery to prevent certain price rises being effective while a case was under review and to cause them to be abandoned altogether if the Commission ruled against them. This action could be effective in the case of the great utilities, such as power, steel and constructional materials and other commodities (e.g. flour) having a big influence on the economy.

This would not be difficult machinery to operate, though it would show that the Government meant business in the matter of an incomes policy. But one must admit that, in practice, nothing is likely to be done till the next meeting of "Neddy" and, if there are differences still, may be not then.

A NEW NUCLEAR RESEARCH PROJECT

The U.K. Atomic Energy Authority has notified its intention to participate in the new three-year research programme of the O.E.C.D's European Nuclear Energy Agency's Halden Reactor Project which began on the 1st inst. The other participants in the new programme, which will have a budget of $3.6 million, are the Norwegian Institute for Atomenergi (owner of the Halden reactor), the Danish and Finnish Atomic Energy Commissions, Reactor Centrum Nederland, A/B Atomenergi of Sweden, and the Swiss Government. The Austrian and the Atomic Energy Commission will be associated through the secondment of personnel. The new programme will be devoted mainly to long-term testing of fuel elements, including burn-up studies, experimental investigations of the chemistry of boiling water reactors, and further development of instrumentation for the measurement and control of the physical conditions in high specific power fuel elements of an operating power reactor. The Halden Project is one of the joint undertakings of the O.E.C.D.'s European Nuclear Energy Agency and was set up in June 1958 under a three-year agreement to carry out a joint programme of research and development on the boiling heavy water reactor concept.

The British week in Germany for promotion of exports of U.K. consumer goods, sponsored jointly by the Board of Trade and the Export Council for Europe, will be declared open at Dusseldorf on 23rd May next by Mr. Edward Heath, Secretary of State for Industry.

WHAT TO DO WITH GOLD?

By Questor

ONE result of recurrent uncertainty about the strength of the pound or the dollar is that an unduly small proportion of the world's newly-mined gold finds its way into the vaults of central banks. During 1962, for example, they obtained only about a third of new production, and over the past ten years private holders of gold—speculators, hoarders and investors in *objets d'art*—have absorbed an amount equivalent to twice the official reserve of the sterling area. The total amount of gold locked up in private hands is not known with any certainty, but it may well be as much as one-third of the world's official reserves.

Should an attempt be made to plug this leak? The U.S., until the establishment of the central bankers' gold pool, was often critical of the existence of a free gold market in London. The Italian central bank suggested last year that the existence of the market was frustrating the efforts of central banks to economise on the use of gold by co-operative action. But the attempts made by Governments of gold-hoarding countries (notably India and France) to discourage the habit have not so far been particularly successful; and, while the private demand for gold persists, there is little doubt that the closing of the London market would be rapidly followed by the growth of an alternative market in Zurich perhaps, or Johannesburg.

The fact that the market is in London does at least enable central banks to exercise some control over its behaviour. The gold pool, administered by the Bank of England, has succeeded in keeping the price of gold extremely stable. Last year, for example, private demand fluctuated considerably. It rose strongly on several occasions, when the failure of the Brussels negotiations led to pressure on sterling and again in the summer when the possibility that Congress might turn down the interest equalisation tax produced a spate of devaluation rumours. It fell short of supply in the autumn, when Russia was selling gold on an unprecedented scale. Yet the market price of gold fluctuated only between the narrow limits of $35.05 and $35.12 an ounce throughout the year. This ability to manage the market may be useful in 1964, when elections are to be held both in Britain and the U.S.

Moreover, it seems likely—the figures are not yet available—that central banks were able to add more to their reserves of gold during 1963 than in the previous year. To that extent, the case for trying to cut off supplies from the private hoarder is less strong than it may have seemed twelve months ago.

But the fact is that any improvement in official reserves has been due not so much to a decrease in hoarding demand as to an increase in the supply of gold coming to market. On the one hand, South African sales rose further during 1963. On the other hand, Russia—which needed to finance large purchases of grains and other foodstuffs—sold more gold to the West than ever before. It is suggested that the amount involved may have been more than 400 tons (say, $500 million worth), more than half of it in the month of September alone.

The size of Russia's gold production and reserve is a matter of guesswork. But the Central Intelligence Agency of the U.S. has just published its guess that output is worth only $175 million a year. This is less than half the figure guessed in the past by the U.S. Bureau of Mines. Its size, and the C.I.A. estimate that gold production costs in Russia are twice the world price, seems to square well with reports that Russian planners and politicians have been at odds for some time past about the desirability of devoting more resources to gold output. But, if this figure is right, Russia has been selling more than she produces and running down her accumulated reserve of gold for six years past.

Where the reserve has fallen to now, it would be interesting to know; the C.I.A. guess of something under $2,000 million must be reckoned as even more tentative than its guess about output, and may even be connected with U.S. attempts to persuade European countries not to allow long-term credits to Russia. But it certainly looks less likely now than has sometimes been suggested in the past that Russia's need to buy from the West will help to solve the West's financial problems. The increase in liquidity to be expected from this source must now be scaled down sharply. Last year's sales, in particular, must be regarded as quite exceptionally large.

Moreover, if the C.I.A. estimates about Russian production costs are to be taken seriously, the U.S. now has an even stronger reason than before for keeping the price of gold pegged at $35 an ounce. While the price is pegged at this level, world production will continue to rise relatively slowly. If the supply of international liquidity is to support a steady growth in trade, central banks must get as much of the increase in production as possible: so if Russian sales are relatively small in 1964 and private demand relatively high, it is possible that we shall hear renewed demands for the closing of free gold markets.

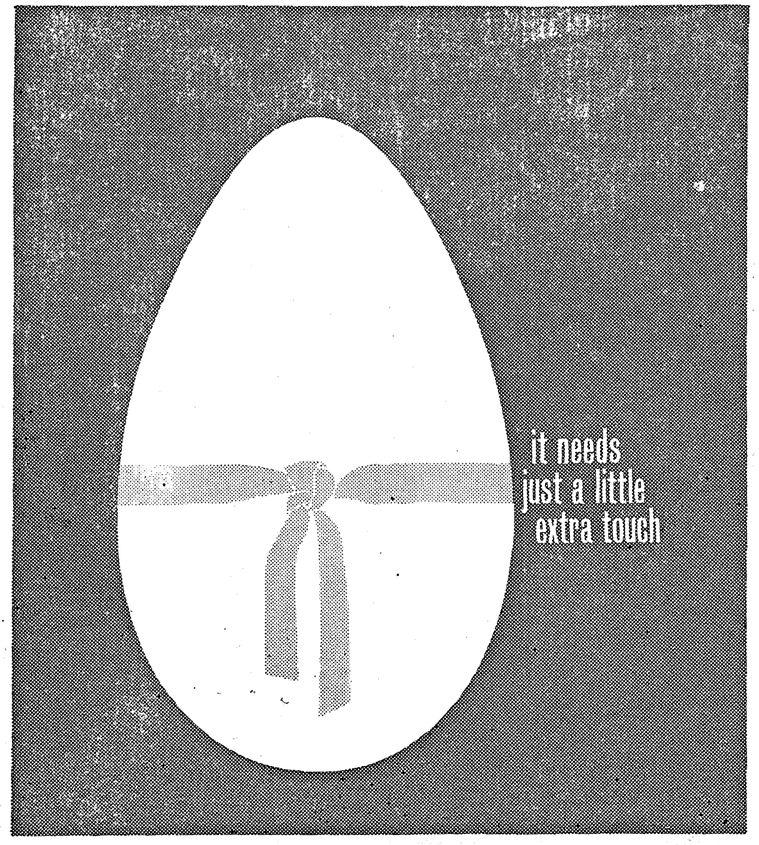
Until the U.S. payments deficit is eliminated and the dollar out of trouble, however, it might be extremely dangerous to take steps likely to produce a black market price of gold well above the U.S. official price. It would be much more sensible to reform the monetary system in such a way as to make the amount of gold already available go a long way further.

GIANT CUBAN ORDER FOR LEYLAND

The Government of Cuba has signed a big contract with the Leyland Motor Corporation, U.K., worth nearly £4 million, for the supply of 400 buses together with spare parts during the next twelve months. The buses will be used for urban passenger transport in the city of Havana and are part of a Cuban Government plan to standardise on Leyland buses throughout the whole country. This plan may mean orders for a further 1,000 buses later.

Commenting on this latest Cuban order, Mr. Donald Stokes, Managing Director of the Leyland Motor Corporation, said: "This order is one of the largest we have ever received, and has been won against intense foreign competition. We have had salesmen in Cuba for the past six months who have secured the contract against tenders from companies in France, Germany, Japan, Spain and Czechoslovakia."

This is the third bus order which Leyland has received from Cuba since the war—the first was in 1949 for 620 buses and the second in 1959 for 200. The bus concerned in the new order is the Leyland-M.C.W. Olympic single-deck model of integral construction which is designed and built specifically for export by Leyland and Metropolitan-Cammell-Weymann Ltd. It is 36 ft. in length and seats 45 passengers.



TO MAKE IT MORE ATTRACTIVE

With a little care taken for attractive presentation of your rayon and synthetic fabrics, you have made a lasting impression on the overseas buyer. And if you service your export trade with maximum efficiency, you have made your business too. Attractive presentation of samples and fabrics creates confidence in *you... brings in repeat orders.*

Your reputation abroad rests on:
★ Supplies as per samples
★ Attractive presentation
★ Strong and seaworthy packing
★ Shipments in time
Build your exports on a long-term basis

CLEAR UNDERSTANDING OF PROBLEMS LACKING

JUDGED by whatever criterion, be it the length of maturities of loans, the valuation of primary assets of borrowers, the appraisal of the value of collaterals supporting credits, or even the purpose of advances and the margin requirements, the commercial banks in India have been following, generally speaking, the highest credit standards and prudent, sensible and careful credit policies. These elements, which determine the 'eligibility' standards of the banks (or of any other credit or lending institution, for that matter), constitute the broad fabric of the *quality* of credit. Defined in a single phrase, the quality of credit means the basic *ability* of the borrower to liquidate the loan in good times as well as in bad. The capacity of the same borrower under different circumstances and of different borrowers under similar circumstances may be different, and it is apparent that there could be a wide variety of situations depending upon the various possible combinations of borrowers and circumstances. It is the basic function of banks to evaluate these various combinations and to examine the nature and character of borrowers, the circumstances in which they are placed as well as the circumstances in which they *could* find themselves, if something goes wrong. The Indian banking system as a whole has an excellent record of evolving the highest standards of eligibility and following sound loan procedures and practices.

Reserve Bank's Comment

Fifteen years of efforts of the Reserve Bank inspectorate have made no mean contribution to this achievement, but it would be a mistake to suppose that regulatory inspections, which are in the nature of an examination and evaluation of what has been done and left undone, and which has left broad discretion to the banks regarding their operations, could by themselves achieve the positive result of improving the tone and quality of the assets structure. Bankers have also been willing partners in this process and have made efforts and taken initiative to ensure that the highest credit standards are prescribed and followed and the best quality is achieved and maintained. It is not without reason or justification that the Reserve Bank of India paid a tribute to the banking system not only for the "notable contribution" it has made to the economic development of the country in spite of the difficulties which it has had to face, but also for the "continuous process of organisational improvements" in the tone and quality of the operations. Even at the end of 1960, during which public confidence in banks was slightly shaken following the failures of Palai Central and Laxmi Bank, the Reserve Bank could say that "such weaknesses as have been shown are dimensionally of little significance," and express its confidence in the banking system by remarking that it can "look forward successfully to meet the challenge" of the third Plan.

It is in this context of the quality of bank credit that the growing demands of politicians, belonging to the Congress as well as the Opposition parties, for the supply of bank credit to farmers, smaller entrepreneurs, villagers and other vulnerable sections of the community have to be examined. To the general complaint that joint-stock banks do not provide finance to these classes of borrowers, the bankers' general answer is that they are not creditworthy. This, of course, is evading the issue, for that precisely is the complaint against the banks. Bank finance is freely available to creditworthy borrowers who do satisfy the minimum standards of eligibility prescribed by the bankers—there is nothing peculiar about it. The question in developing countries, it is argued, is to liberalise the eligibility standards, increase the element of risk and provide finance to such borrowers who do not strictly satisfy all the standard tests, in order to enable them to build up their economic strength and improve their creditworthiness up to the standard insisted by the banks. The emphasis, in short, is on the purposive use of bank credit.

A Risk

The purposive use of bank credit, involving, as it does liberalisation of eligibility and credit standards, carries with it, the risk of deterioration in the quality of credit. Far from assisting the vulnerable and weaker sections of the community, such a deterioration could bring the banks into financial difficulties, besides also jeopardising the development plans of the country by giving a setback to the efforts of the banks to mobilise savings of the community and by damaging the fabric of confidence of depositors in their banks. If a large credit portfolio is built up by banks on unsound loan practices and if the quality of their assets consists largely of weak and poor securities on the margin, a subsequent collapse of the entire credit structure would simply place another obstacle in the path of our economic expansion.

It is widely being argued that bank advances to farmers for agricultural production should be based not upon the assets which he is able to furnish (for he has none, and even when he has, it is unacceptable to the bankers according to conventional standards), but upon the *productive potential* that he possesses. It is readily conceded that all credit must take into account the lender's assessment of the borrower's creditworthiness, but what is insisted upon is that creditworthiness should largely mean and be based upon the productive potential of the borrower.

In a way, this is the actual position. No good banker relies upon the security alone, even when he takes it. All bank managers look to the character, integrity and ability of the customer and look upon his business as a "going concern," for they know it well, that the borrower's capacity to repay depends upon the profitability of his business: Security is the safety net—the final resort in case of unforeseen difficulty—but an essential element. It is not the only factor, but it is not unimportant. A banker has no wish to be involved into extended procedures for enforcing a security, or exercising his legal rights over it. No banker takes recourse to such forceful tactics until he has exhausted all the gentler methods of request or persuasion, for he knows that realising a security is always an unpleasant and troublesome way out and the result is often unsatisfactory to both the parties. In many cases, all this unpleasantness is not at all necessary, because a good banker scrutinises the *purpose* of the loan carefully and makes sure that the borrower utilises it in ways which themselves generate the *means* for repayment. Nevertheless, curious and unexpected circumstances do arise and it is always necessary to retain the freedom of action and the ultimate source on which to rely.

Real Objection

The real objection of joint-stock banks to providing farm credit is, therefore, not what they say it is: bankers' reluctance cannot be on the grounds that farmers have no eligible or acceptable assets, because in fact, a substantial portion of their advances is unsecured, and every banker will testify that there are many unsecured advances which cause far less anxiety than some of the secured ones. Again, the bankers' objection cannot be against basing their valuation of the creditworthiness of the farmer on his productive potential, for that is what they actually do, in case of most of the industrial and trade borrowers, even when they take a security. Their reluctance is in fact due to the element of *uncertainty* in the results of agricultural operations. The bankers' estimate of the productive potential may be all right, the farmer may be honest and hardworking, and may apply the loan for the purpose of raising the crop: but there is no guarantee that the right type of fertilisers will be available at reasonable prices and at the appropriate time, and that the monsoon will just be satisfactory. Nor is there any insurance against crop failures and unforeseen or untimely loss of cattle.

Moreover, with the age-old technique *still* being followed by the farmers, there is the constant danger that the productive potential may not be actually realised. It is because of these uncertainties that joint-stock banks have largely avoided farm advances and that the co-operative credit system is saddled with an excessive proportion of overdues and heavy bad debts. In spite of official patronage, concessional finance and many other encouragements and support, the co-operative movement has hardly been able to face these odds: if joint-stock banks, with their relatively heavier overheads as compared with co-operative banks, involve themselves into similar predicaments, it is easy to visualise the adverse effects upon their resource mobilisation. The blame for this state of affairs, if it is to be apportioned, lies entirely with the Government, which has failed to transform agriculture into a commercial proposition, in spite of crores of rupees of taxpayers' money utilised on irrigation projects, rural development projects, costly fertiliser factories and the national extension services.

The first move towards interesting the commercial banks in farm credit must, therefore, come from the Government: if it fails to make agriculture a viable and prosperous industry, it is futile to exhort joint-stock banks to lower their credit standards for lending to farmers, for the Reserve Bank will be the first to object to such deterioration in the quality of credit. A task which is unequal to the abilities of the Government (with all the taxpayers' money and the power to create money at will) could hardly be a suitable field for the banks to stake the depositors' money held by them in trust. The fact that even the State Bank of India, which is charged with the task of tackling the problem of rural-credit, has hardly been able to assist the farmers beyond making token advances to co-operative and warehousing institutions, should be enough to convince the enthusiasts that the solution of our agricultural stagnation does not lie in forcing the banks to lower their standards of credit, but in improving the character of agriculture and raising the capacity of the farmers to face the banks on a commercial footing. The incentives provided by the availability of refinance from the Agricultural Refinance Corporation could hardly solve the problem on the necessary scale, for the banks will still have to bear the impact of risk and uncertainty in farm lending.

An Important Difference

The case is, however, different when we examine the bankers' reluctance to handle a large number of small accounts: the uncertainties of lending to small manufacturers, small entrepreneurs and businessmen are far less than those of lending to agriculturists, and are of a different character. The Reserve Bank and the National Small Industries Corporation have evolved imaginative schemes of guarantees for bank advances to small industries. Here a distinction can be made between liberalisation in the procedures for grant of advances to them and deterioration in the quality of credit. If the experience of the 'Pilot' scheme of the State Bank of India during the last eight years in supplying *co-ordinated* finance to small-scale industries is shared widely with the other banks, some useful lessons can be learnt and applied by the latter in practice.

The real difficulty in dealing with a large number of small advances is administrative; as the short-lived but costly experiment with the compulsory deposits scheme showed conclusively, commercial banks in the private sector are hardly equipped to deal with a bulk of small businesses. Some rethinking and reorganisation are necessary in this field.

The principles and problems governing credit to agriculturists and the small-scale industries are thus different and both should not be clubbed together as is being done today by many a politician. They require careful thought and analysis. The politicians lump them together, obviously because banks do not interest themselves substantially in both these fields. The result has been that the critics have missed the real issues, and have failed to suggest appropriate solutions for each problem. The initiative in one case rests with the Government, while in the other it is with the banks. Let none blame the other for its own failures, and let us hope that, in the wider interests of the nation, each will live up to its own responsibilities.

SYNDICATE BANK LTD.

The name of the Canara Industrial and Banking Syndicate Limited has been changed to the Syndicate Bank Limited with effect from the 1st of this month. The Registered Office of the Bank has been shifted to Manipal, a small town about three miles from Udipi (South Kanara District, Mysore State). The administrative office of the Bank, however, will continue to function for the present at Mukund Nivas, Udipi. This also will move to Manipal shortly. The change in name will not affect any rights or obligations of the Bank or render defective legal proceedings by or against the Bank. Any such proceedings will be continued under the new name. The existing share certificates of the Bank with the share-holders will continue to be quite valid and it is not necessary to get the new name of the Bank endorsed immediately on the share certificates or deposit receipts, pass books, cheque books or other documents with the public. Whenever, in the ordinary course, those documents are received by the Bank (say, for endorsement of payments of share money or for transfers), the new name of the Bank will be impressed or endorsed on the documents. No fresh account opening forms or resolutions, etc., will be necessary, in view of the change in name.

STATE BANK OF HYDERABAD

THERE was a handsome rise of Rs. 21.71 lakhs to Rs. 171.02 lakhs in the gross earnings of the State Bank of Hyderabad (General Manager: Mr. Satya Dev, Hyderabad) during the year ended December 1963 as compared with the previous year. If, however, allowance is made for the enhanced subsidy (Rs. 5.16 lakhs, as against Rs. 2.31 lakhs) received from the State Bank of India for the losses incurred by the Bank's new offices, the rise in earnings comes to only Rs. 18.86 lakhs. The bulk of this rise, as is only to be expected, was accounted for by banking business proper, the earnings from which increased by Rs. 18.67 lakhs to Rs. 164.79 lakhs, other income (excluding the aforesaid subvention) increasing by Rs. 0.19 lakh to Rs. 1.07 lakh. Quite a large part of the additional earnings, however, was eaten up by heavier interest payments (+Rs. 7.82 lakhs), staff and other expenses (+Rs. 12.23 lakhs), and depreciation (+Rs. 0.09 lakh). The provision for taxation has not been disclosed, but there is no doubt that it must be larger, in view of the higher assessable profit. Even so, the net profit for the year 1963 is better by Rs. 1.57 lakh at Rs. 12.23 lakhs. The improvement in profit is notable, especially because it is in contrast to the setback of Rs. 1.53 lakh suffered in 1962. The Directors of the Bank could, of course, have raised the dividend a little, instead of maintaining it again at 6 per cent., subject to tax. But they have preferred to be cautious and transferred larger sums to reserves (Rs. 3.00 lakhs, as against Rs. 2.50 lakhs) and other funds (Rs. 1.75 lakh, as against Rs. 1.28 lakh). Provision for bonus to staff has also been enhanced by Rs. 50,000 to Rs. 4.50 lakhs.

Notable among the changes in the Bank's balance-sheet over the year is a substantial rise of Rs. 4.81 crores to Rs. 31.34 crores in deposits. Loans and advances, on the other hand, are lower by Rs. 1.15 crore at Rs. 15.03 crores. Consequently, the credit ratio has recorded a marked fall from 61.0 per cent. to 47.9 per cent. For the same reason, borrowings from other banks are *nil*. The entire growth in deposits has been used to strengthen the cash position and the ratio of cash to deposits has more than doubled, from 11.3 per cent. to 25.2 per cent. Investments are only fractionally better, which, in the context of the jump in the size of deposits, has meant a lower ratio of investments to deposits. Apparently, the seasonal demand for bank credit had not significantly asserted itself on the resources of this Bank before the year-end. It may have done so since then.

The progress made by the Bank since 1960 is depicted in the table below:

(In lakhs of rupees)

	1963	1962	1961	1960
Interest and discount earned ..	132.14	116.89	92.35	76.30
Commission, exchange and brokerage earned	32.65	29.23	27.27	22.97
Other income	6.23	3.19	2.50	2.10

Investments	35.3	30.2	35.8	48.3†
Cash	25.2	11.3	14.9	8.3

* Provision for taxation undisclosed.
† Only on unencumbered portion.

The developmental activities of the Bank during the year 1963 included the establishment of twelve new branches, raising the total number of branches to 94, besides three pay or sub-offices. The total limits sanctioned against the security of warehouse receipts rose from Rs. 49.41 lakhs to Rs. 51.93 lakhs; four additional warehouses were built within the Bank's area of operation. The needs of small-scale industries continued to receive special attention, the limits actually sanctioned rising from Rs. 81.14 lakhs to Rs. 111.45 lakhs, though the amount of credit utilised was only Rs. 54.16 lakhs, as against Rs. 37.55 lakhs. The Bank also continued to transact the Government cash business and agency functions. As of today, the Bank is handling Government cash business at 59 centres and holds currency chests of the Reserve Bank's Issue Department at 67 centres (including two sub-chests). The aggregate remittancee issued and encashed during 1963 under the R.B.I.'s remittance facilities scheme amounted to Rs. 109.14 crores and Rs. 17.31 crores, respectively. The corresponding figures in respect of co-operative institutions were Rs. 36.84 crores and Rs. 25.55 crores. Further, the Bank continued to act as the Registrar of the Andhra Pradesh State Electricity Board.

WORKING RESULTS OF FIVE BANKS

Five more banks have announced their working results for the year ended December 1963. They are the Bank of India, the Punjab National, the Bank of Baroda, the Indian Bank and the Bank of Maharashtra. The results of all these Banks show an improvement in net profit, the actual rise ranging from Rs. 13.46 lakhs in the case of the Bank of India to Rs. 57,000 in respect of the Bank of Maharashtra. The Bank of Baroda and the Indian Bank have stepped up the rate of dividend, the former from 16 to 18 per cent. and the latter from 14 to 15 per cent. (including bonus). The dividend proposed by the Bank of Baroda for the year 1963 is on higher capital. The additional capital issued in 1962 ranks for dividend in respect of the whole of 1963, while it received a proportionate distribution of final dividend in 1962. The Punjab National and the Bank of Maharashtra have maintained the dividend at the previous year's level of 20 per cent. and 9 per cent., respectively. The additional capital of Rs. 10 lakhs issued by the latter Bank during the year 1963 also ranks for *pro rata* distribution. If the Bank of India has reduced the dividend from 20 to 18 per cent, it is apparently because of the Directors' proposal to issue, subject to official consent, 40,500 fully paid bonus shares of the face value of Rs. 50 each; the issue will be in the proportion of one bonus share for every 20 existing shares whether ordinary shares and/or 'A' ordinary shares held by a member on a date to be prescribed later. Including the proposed issue, the paid-up capital of the Bank will increase to Rs. 425.25 lakhs. Moreover, the dividend of 18 per cent. proposed for 1963 is payable on the higher capital of Rs. 4.05 crores, whereas, in 1962, the interim 8 per cent. was on Rs. 3.00 crores and the final 12 per cent on Rs. 4.05 crores.

The salient features of the Banks' working results during the years 1962-63 are given in the following table:

(In lakhs of rupees)

Name of Banks	Profit*	Amount brought in	Transfer to reserves	Dividend‡	Amount carried forward
Bank of India:					
1962	111.54	29.16	22.50	72.60	45.60
1963	125.00	18.10	25.00	72.90	40.20
Punjab National:					
1962	113.83	10.38	25.00	40.00	15.21
1963	126.47	15.21	50.00	40.00	3.18
Bank of Baroda:					
1962	63.19	3.03	12.75	27.30	26.17
1963	75.00	3.47	15.50	36.00	26.97
Indian Bank:					
1962	15.25	1.49	3.10	12.20	1.44
1963	17.00	1.44	3.40	13.26	5.18
Bank of Maharashtra:					
1962	8.43	4.35	4.50	3.89	0.46
1963	9.00	0.46	4.00	3.89	0.46

* After providing for taxation but before making provision for bonus to staff.
† Subject to tax deduction.
‡ Including payment of bonus to staff.
§ Excluding bonus to staff and charities.

It will be noted that the transfers to published reserves are larger in the case of the first four banks included in the table, while they are a shade lower in the case of the fifth.

Details regarding deposits, advances, etc. (as at the end of 1963) are not available in respect of the Bank of India and the Punjab National, but it can be confidently said that both have registered a notable improvement in the year under review. The aggregate deposits of the Indian Bank have gone up over the year 1963 from Rs. 44.04 crores to Rs. 49.83 crores. The deposits of the Bank of Baroda are said to have risen by 22 per cent. in 1963; 33 new branches were opened by the Bank. As for the Bank of Maharashtra, deposits have increased by Rs. 4.69 crores to Rs. 29.45 crores, advances by Rs. 2.8 crores to Rs. 14.67 crores and investments by Rs. 3.9 crores to Rs. 13.43 crores.

COST STRUCTURE OF COTTON MILLS

MURANJAN COMMITTEE'S FINDINGS

IN our Market Gossip columns last week, we made a reference to the views of the Muranjan Committee on cotton prices, basing ourselves on extracts appearing in a section of the daily Press. We had stated then that it was not clear from those extracts whether the Committee had investigated the other elements in the cost structure of cotton textile industry. Inquiries made since then reveal that the Committee, appointed by the Union Government towards the close of November 1962, has done so and that it submitted the first part of its report concerning raw material cost as early as at the end of March 1963 and the second part concerning conversion (or manufacturing) cost early in July 1963. The Government, however, has still not released either part of the report to the public. Apparently the Government has held it back pending its decision on the revision of cloth and yarn prices. It may be recalled that, besides the findings and suggestions of the Muranjan Committee, the Tariff Commission, too, studied the problem and submitted its report well over a year ago, in December 1962, to be precise. The delay in taking a decision on this important issue is deplorable considering that the cotton mill industry is today caught between severe cost inflation, on the one side, and virtual pegging of selling prices, on the other. The Committee of the Indian Cotton Mills Federation, at its meeting held in Bombay recently, reviewed the cost structure of the industry especially since the introduction of the voluntary price regulation scheme and the freezing of textile prices since January 1961. The review revealed the following trends:

While the cloth prices have remained virtually the same during the last three years, there has been an all-round increase in the manufacturing costs following the rise in the cost of materials required for the production of textiles. The wage bill of the industry has also gone up substantially. Besides the increase in the basic wages, there has been a rise in the dear food allowance and in the employers' contribution to the provident Fund and Employees' State Insurance. Recently, the Industrial Court awarded five days' casual leave and seven days' privilege leave to the workers of the Bombay cotton mills. In the result, the growing disparity between costs and prices is causing grave apprehension to the industry.

Modernisation Element

The cotton mill industry, or, for that matter, any other industry, cannot be expected to sell its products indefinitely at prices below the actual cost of making them. Indeed, the prices must not only be sufficient to cover adequately the rise in different costs but also ensure a reasonable margin of profit. Further, the prices must provide for suitable rehabilitation or modernisation allowance. The need for such an allowance arises from the fact that the machinery and equipment installed in a large number of mills are old and worn-out and, unless they are replaced, the productivity will continue to be poor. Since the financial position of the vast majority of cotton mills is none too satisfactory and considering that the outlay on rehabilitation is pretty heavy, the Muranjan Committee has done well, indeed, to urge that the new cloth prices now being considered on the recommendations of the Tariff Commission should be so fixed as to include an element of the price specifically for modernisation or rehabilitation. The Committee is reported to have observed:

"....Price fixation which does not admit of provisions to stimulate efficiency and reduce costs imperils development. It should be so devised that the stimulus for elimination (of highly uneconomic units), replacement or amalgamation is not removed. If the element of rehabilitation or modernisation is provided for at the time of price fixation, it is necessary to ensure that this element is used purposefully and effectively to raise the efficiency of the industry as a whole. If the return on employed capital is deemed adequate to cover all legitimate requirements of return on investment, a special element for rehabilitation or modernisation can only be regarded as a sacrifice by the consumer in favour not only of any individual unit but of the industry as a whole."

The Muranjan Committee is quite right when it says that it might not be conducive to the efficiency of the industry if inefficient units are permitted to collect and use the element of price (for modernisation or rehabilitation) for themselves. For any further expenditure on such units would be a mere waste of financial and real resources. The Committee has accordingly suggested that the funds accruing from the modernisation element in the case of mills with unsatisfactory working results should be used on units which give promise of reaching the efficiency of the average level. "Such a collective and selective approach," to quote the Committee, "may not be compatible with a purely competitive economy, but it must be regarded as an ordinary incident of planned economy." This approach, incidentally, marks a welcome departure from the system of fixing prices on one condition regarded as basic, namely, that the existing units, irrespective of their level of efficiency, must be kept in production. The Committee has divided the mills to be dealt with into the following two categories:

Units that can be reconstructed with some investment of capital or change of management, etc., and

units that have to be liquidated as legal entities but the assets and equipments of which are capable of further use either in the textile or in some other industry.

Reconstruction Corporation

The Muranjan Committee has recommended the establishment of a special body, known as the Reconstruction Corporation, to liquidate the latter category of mills and assist the former category to improve their position. Both the courses should be considered inevitable in any scheme of cutting down the production costs of cotton textiles as a whole. The proposed Corporation, it is emphasised, would have to function with adequate capital and personnel working on two separate sets of reconstruction and liquidation. The Committee has, therefore, suggested the imposition of a special cess on the textile industry. It is further suggested that the funds accruing from modernisation element in price in the case of mills with highly unsatisfactory working results should be credited to the Corporation.

The proposal for the levy of a general cess on the industry is not sound. Apart from the unjustified additional burden that will fall on the mills which have persistently striven hard to improve their efficiency with a view to producing larger quantities of quality textiles at an economic cost, the impact on consumer prices will be severe. The grant of a special rehabilitation allowance in price, together with more liberal loans from the Government-sponsored financial institutions and other measures of assistance, may be quite sufficient. In the case of units which are highly uneconomic and inefficient, the Government can directly order their liquidation or amalgamation with bigger units. The managements of such units will not suffer any heavy loss, as they can doubtless get a lot of money by disposing of their machinery, buildings and lands.

Production Control?

The Muranjan Committee has alluded to the raw cotton buying policy of mills and says: "The freedom to buy cotton anywhere and to adopt or claim to have adopted any particular 'cotton mix' lies at the root of one of the most serious malpractices or abuses on the part of mill managements. The purchase price at which cotton is passed on in the accounts of textile mills betrays too often a suspicious look about them." This abuse, in the opinion of the Committee, could be eliminated if the Government were to compel the mills to standardise their production of yarn or fabrics within the prescribed limits and, in the case of purely spinning mills, standardisation of yarn should be fixed mill-wise.

In effect, the Muranjan Committee has advocated detailed production control which, to say the least, is highly unjustified, with disquieting effects. It would be clearly wrong to deny the mills the freedom to produce whatever type of goods the domestic and overseas buyers want, though no one will dispute the need for prohibiting production of sub-standard textiles. Any denial of such freedom is bound to curtail the production of higher quality cloth to suit the changing tastes of consumers. The abuses to which the Muranjan Committee refers can be minimised, if not completely eliminated, if appropriate conditions are created for the prevalence of inter-mill competition. The causes of corruption lie in a defective textile policy designed to protect uneconomic units in the decentralised sector. It is this policy that needs to be changed.

I am an income tax payer

Why should I open a Cumulative Time Deposit Account?

1. BECAUSE you earn income tax rebate on the deposits. If your earned income is Rs. 20,000 a year, by opening 10 or 15-year Cumulative Time Deposit accounts in your name or in the name of your wife, children or other dependents of Rs. 300 per month, you reduce your income-tax liability by Rs. 598 per year.

2. BECAUSE you get tax free interest on your deposits. You get tax free compound interest of 3·8% per annum, equivalent to 5·4% taxable compound interest at current rates of taxation on 10 year accounts and of 4·3% per annum, equivalent to 6·1% taxable on 15 year accounts.

TRADING RESULTS OF COTTON MILLS

PROFITS TOUCH LOW LEVELS

From Our Special Correspondent

MANCHESTER, *7th January*

PROFITS announced by British cotton companies in 1963 were at their lowest level since 1959, before the industry's big reorganisation scheme took effect. Total earnings, after tax, of 67 companies owning more than 250 mills were £4,027,191, as compared with £7,234,961 for the same firms in 1962. In the previous year, 70 firms made profits of nearly £12 million. The fall in earnings reflected dull trading in 1962 and the early part of last year when the mills were frequently working short time. In the final quarter of 1963, big buying of textiles resulted in a sharp upsurge in order lists and many firms are now fully engaged for most of the current year. Profits are expected to rise accordingly, although margins are still narrow.

MANCHESTER LETTER

According to an independent analysis of trading results of cotton companies (prepared by Frederick W. Tattersall Ltd., of Manchester), aggregate net earnings announced by 15 leading spinning and weaving combines and their subsidiaries amounted to £2,033,952, as compared with £3,494,469 in 1962. The average profit was £139,597 per group, as against £232,965, and the average dividend paid was 8.09 per cent, as against 11.97 per cent.

Average profits announced by 22 independent spinning mills during 1963 were £6,053, as against £25,475 for the same units in 1962. The average dividend distributed was 10.39 per cent, as against 15.65 per cent. Average profits of 15 firms combining spinning and weaving was £67,829 per company, as compared with £134,982 for the same firms in 1962. The average dividend was 10.19 per cent, as against 14.05 per cent.

Credit balances accumulated by the 22 spinning firms now total £3,762,274, an average of £171,012. Those combining spinning and weaving carried forward an aggregate of £3,037,480, an average of £202,499. Total net earnings of 15 firms mainly dealing with the weaving of cloth announced in 1963 were £782,630, as against £1,155,308 in the previous year. Average profit was £52,175, as against £77,021, and dividends averaged 8.06 per cent as against 10.07 per cent.

Overseas Trade in November

Assessment of 1963 in terms of exports and imports must await the completion of the annual accounts prepared by the Board of Trade. In the meantime, the eleven-month figures show no pronounced change from conditions prevailing earlier in the year. Both shipments abroad during November and the arrivals from foreign sources were on a similar basis to previous months.

By the end of November, earnings from exports of cotton goods had exceeded £40 million, a reduction of about £2,750,000 on the previous year. The cost of imports of similar materials had increased by some £3 million to nearly £56,500,000. Without a sudden deterioration in the situation in December, it appears that the joint totals of exports of cotton and man-made fibre fabrics last year will, for the first time for more than a decade, exceed the quantity of goods exported in the previous 12 months.

Big Man-made Fibre Gains

Producers of purely cotton fabrics can scarcely congratulate themselves on this feat as the eleven-month volume was still almost 13 million yards lower than in 1962. Makers of man-made fibre cloth, however, gained a lot of ground, achieving not far short of a 50 per cent increase on exports. Cotton cloth shipments to the end of November were 203,858,000 square yards, as against 216,647,000 square yards, while those in the man-made fibre sector were 72,040,000 square yards, as against 50,099,000 square yards.

Much the same situation arose in the spinning section where cotton yarn and thread exports fell from 20,118,000 lbs. to 18,803,000 lbs. but man-made fibre yarn shipments advanced again after their big rise in 1962. The eleven-month total was 74,910,000 lbs., as against 62,716,000 lbs. in the same period of the previous year and 48,575,000 lbs. in 1961.

Larger Imports

Turning to imports, the figures to the end of November show that larger supplies of all types of goods entered this country, apart from man-made fibre cloth. Arrivals of cotton yarn and thread increased from 29,672,000 lbs. to 33,541,000 lbs.; cotton grey cloth imports from 406,220,000 square yards to 446,098,000 square yards; finished cotton cloth from 131,729,000 square yards to 139,981,000 square yards and man-made fibre yarn imports rose steeply from 5,579,000 lbs. to 14,350,000 lbs. The single exception to the trend was man-made fibre cloth, where purchases from abroad were reduced from 62,601,000 square yards to 58,351,000 square yards.

Within the cloth imports total, India remained well ahead as a grey cloth supplier, sending 167,469,000 square yards, as against 140,144,000 square yards. Other countries to increase their shipments to Britain were Pakistan, from 36,444,000 square yards to 50,821,000 square yards; Canada from 6,309,000 square yards to 11,188,000 square yards; Portugal from 14,304,000 square yards to 25,839,000 square yards and China from 20,259,000 square yards to 33,464,000 square yards.

Reductions in grey cloth imports were recorded during the eleven months from Hong Kong at 80,491,000 square yards, as against 93,511,000 square yards; France at 6,069,000 square yards, as against 11,515,000 square yards; Spain at 5,728,000 square yards, as against 12,927,000 square yards, and Japan at 13,570,000 square yards, as against 24,611,000 square yards.

The only notable changes in purchases by British importers of finished cotton cloth were bigger takings from India at 14,667,000 square yards, as against 8,351,000 square yards and from Portugal at 10,527,000 square yards, as against 4,178,000 square yards.

A Good Guide

Confirmation of the general tone of reports from the industry during the past few weeks came in the interim statement issued by the Directors of Fine Spinners and Doublers just before the year-end. This official summary of the position always provides a good guide to the affairs of the spinning trade in the second half of each year, particularly when linked to the survey given by the Chairman of the Lancashire Cotton Corporation which follows within a few weeks.

"Since September, the seasonal upsurge in trade has been sufficient to ensure high activity in the mills until well into 1964," said the Fine Spinners' report. "Although much of this new business shows little improvement in margins, there are definite signs of a more realistic approach to the pricing problem."

Imports from low-cost countries, it is pointed out, have now apparently been contained at a level of about 30 per cent of the home market. Prices within this sector, it is suggested, have no relation to those within the remaining 70 per cent. On the assumption that determined efforts have been and will be directed towards maintaining prices at a reasonable level, the Board of Fine Spinners are able to predict that future prospects are brighter than for some time.

Outside the United Kingdom this group has extensive interests, most of which seem to be progressing well. The American cotton plantation has had an excellent growing season, with all-time record yields. Reorganisation of the French mills is being pressed forward, resulting in a continued improvement in earnings from this source.

SOUND APPRECIATION IN A 5% DEPOSIT ACCOUNT

LOMBARD BANKING LIMITED offers real financial stability and an interest rate of 5%—the maximum safe and sure rate for your money to earn. No U.K. Income Tax will be deducted; your money grows all the time, and is completely unaffected by economic conditions. Withdrawals can easily be made, subject to the terms you arrange. To earn 5% per annum the minimum initial deposit is £100, the minimum period of deposit and notice of withdrawal is six months. Your Deposit with Lombard Banking Limited is supported by paid up capital and reserves in excess of £12,000,000. Write now to the General Manager for further particulars and your copy of "Deposit Account" Booklet No. AO 91.

TRENDS IN BRITISH TEXTILE INDUSTRY

MERGERS GAIN MOMENTUM—PRODUCTIVITY IMPROVES—EXPORTS PICK UP

By Arthur Tattersall

IN any notes which future historians make about conditions in the Lancashire cotton industry in 1963 the year may well be regarded as the one in which its structure began to show a remarkable change. Four years before, the Government-sponsored reorganisation scheme had set in motion a comprehensive scrapping programme, to be followed by equally extensive re-equipment plans. The past 12 months has seen a fresh outbreak of amalgamations in which the giant man-made fibre producers have taken a leading part. The movement began at the beginning of May when it was announced that the English Sewing Cotton Company (E.S.C.) had made a bid for Tootal Ltd., thus linking two organisations which were already predominantly "vertical" in structure.

Taken by itself, this development would have attracted considerable attention in textile circles, but the important aspect of the venture was the fact that financial aid to effect the merger had been given jointly by Courtaulds and Imperial Chemical Industries, two of the largest combines in Britain, both with a considerable stake in the textile trade, who themselves had been locked in an abortive takeover struggle only a few months previously.

It was abundantly clear at the outset that the E.S.C./Tootal link was only the beginning of the chapter so far as the man-made fibre producers were concerned. Jointly they expressed belief in verticalisation and their readiness to put a fraction of their far-from-inconsiderable finances at the disposal of other companies which contemplated expansionist policies, but lacked the capital for large-scale efforts.

In the meantime, both these determined leaders in their sphere have reached out in different directions to strengthen their position in textiles as a whole. In this way, they can provide outlets for their production and keep a firm grip on all processes through to the finished article.

Swift Changes

Merely to enumerate the deals subsequently arranged hardly gives an adequate picture of the swiftly changing scene, but it is safe enough to predict that similar developments will occur in the years ahead, unless unforeseen events hamper this trend.

Courtaulds, for example, has taken a minority interest in Carrington and Dewhurst, the big man-made fibre spinning and weaving group; it has absorbed Bairnswear and Foister, Clay and Ward, thus branching out into the hosiery and knitwear industries; it has consolidated its controllling interest in Morton Sundour Fabrics and taken over three small private companies involved in processing, trimming manufacture, etc. In the fashion field, the well-known house of Susan Small has been brought within the Courtaulds fold and within the past few weeks two new bids have been announced—one for the old-established James Nelson group, which not only spins and weaves but also produces rayon yarn—and the other for the well-known Midlands knitwear firm of Meridian.

Upto the beginning of November, I.C.I. had kept relatively quiet, but a sudden fresh incursion into the textile field by the offer of financial aid and a minority interest in Viyella International set all the old rumours circulating once more. This was followed by an arrangement to take a similar interest as Courtaulds in Carrington and Dewhurst, so that speculation rose sharply as to whether these two all-powerful companies in their particular field were, in fact, collaborating or competing for what must appear to them as the textile pygmies.

It is still too early to give a definite answer on this point, but there can be no illusions about the general trend, which, once more, moves towards the big battalions in industry. This has been accentuated by the quick use made by Viyella of the loan offer by I.C.I. to absorb the British Van Heusen Corporation—another instance of two big groups with extensive vertical organisations joining forces to strengthen their position in the field.

Some commentators have described the latest phase as the "insatiable appetite" of the man-made fibre producers for textile companies. There have been forecasts that the outcome will be an industry consisting of four or five huge concerns, rather on the lines of the United States where the giants dominate cloth production, surrounded by several thousand satellites.

On a lower level in the financial sense was Viyella's earlier takeover of John Binns, the Yorkshire spinning and weaving firm, and the absorption by Vantona of a number of companies, particularly in the candlewick trade, which now form a compact grouping in a particular section and offer the advantage of expert specialisation. Such developments are a natural corollary of events going on in high places and have the effect of stabilising the trade, which should eventually be to the benefit of the market as a whole.

In contrast to these exponents of the theme of verticalisation and throughput from the earliest stage of the fibre to the made-up garment, there are still many supporters of consolidation by the more traditional methods of horizontal operation. Nothing further has been heard of the widely-canvassed rumours circulating some months ago about the links which were said to be being forged between the major producers in the spinning section, but moves along these lines cannot be ruled out as the general readjustment continues.

Case for Categorisation

One of the most vital factors to emerge from the long-drawn-out arguments over the import situation was the eventual acceptance by the Government of the industry's case for categorisation to be introduced. The President of the Board of Trade made it abundantly clear during a visit to Manchester in June that no revision of the current arrangements establishing ceilings on arrivals from Commonwealth countries was contemplated until their expiration at the end of 1965.

At that time, he brushed aside the trade's contention that limits should be imposed on imports of individual types of cloth on the lines of the systems already operating in other countries and regarded as part of the structure of the long-term agreement which had been ratified by more than a score of nations under the G.A.T.T. "umbrella." Subsequent pressure in high places and the strong tone adopted by several negotiators resulted in an admission only a few weeks later that the system was justified. The Government promised support for Lancashire's case when talks with India's trade leaders started in the autumn.

This was a turning point indeed, being as significant a move as that which launched the reorganisation scheme. It marked a change in policy for which Lancashire had long been pressing and ended the crisis of confidence which had held back customers from making their needs known for the best part of two years.

Subsequently, the broadening of demand came as a natural result of the change of mood, but there were extensive undertones which equally affected the market. Better productivity in the mills was a major influence in this respect. Widely quoted and re-quoted has been the figure of a 15 per cent rise in output per head as compared with four years back and to an industry so prone to criticism as cotton, an achievement of this side has been a formidable aid in stimulating confidence.

Immediate repercussions from the re-equipment scheme could not be envisaged. Installation of new plant requires careful timing and balanced production in the different processes before it can be fully effective. Only since the beginning of 1963 have the advantages become clear cut and still more gains can be forecast in the years ahead.. Meanwhile, the progress made has given an incentive to every section of the trade to put its house in order; the more intelligent and far-sighted firms have gone a long way towards achieving this object.

At the beginning of May 1963, a sudden decision to concede a second wage advance in a short time to spinning and weaving workers was announced; from July a flat rate increase of 5*s.* 9*d.* a week was given. Hopes that the subsequent rise in overheads and prices might encourage a buying movement in the early summer were not fulfilled, but business during the holiday season was on a rather broader basis than often happens at that time of the year. Throughout this period orders were placed which provided producers with only a very narrow margin of profit and complaints about this state of affairs were persistent.

Time to Buy

In September, however, customers made up their minds that the time had come to buy. The statistical position was much as it had been 12 months previously—only more so. Stocks had been allowed to decline to extremely low levels and, though yet another disappointing summer from the weather aspect had been experienced, clearances had gathered some momentum. The necessity for replenishments reached a pitch where follow-on orders were placed on a more extensive scale than at any time since the hectic days of 1959-60.

Still a major influence was the relatively low price level ruling. Imports, larger than in 1962 but well below the previous year's peak, had a depressing effect on bids and buyers were not prepared to raise their quotations until supply shortages began to appear. By that time many of the mills had secured contracts which meant that delivery could not be offered until the early months of 1964 and the underlying strength of the market had undergone a very considerable change.

Quite apart from the fundamental aspect of categorisation of imports, the control over arrivals of foreign goods became tighter during the period. An agreement was reached with Portugal (a country which had been described, not without reason, as liable to become "the Hong Kong of Europe") under which shipments to the United Kingdom will in future be subject to a ceiling roughly equivalent to actual imports during the 12 months to the end of August, 1963.

Contact was also made with the Spanish cotton industry with the object of introducing a measure of categorisation; talks took place with Indian trade leaders on the same important topic. Although some opposition to the idea was expressed by Hong Kong, the wheels have been set in motion to regulate the flow of arrivals and the position is at least stabilised for the moment.

During the first half of 1963, yarn production showed very little change as compared with the same period in 1962, the respective figures being 310,570,000 lbs., as against 318,050,000 lbs. The quantity of cloth woven, however, was nearly 60 million yards lower than in the first half of last year at 809,250,000 yards.

Yarn output in 1963 was running at above the comparable level in 1962 each month since April. Production of cloth per working day in August was higher than in the same month last year, being the first time for over two years that production had exceeded the rate recorded in the same month of the previous year. These gains were achieved with a labour force in spinning and weaving some 12,000 fewer than a year previously.

Exports of cotton goods were slightly lower than in the comparable period of 1962, but a sharp revival in overseas trading took place in man-made fibre yarn and cloth. In consequence, for the first time for more than a decade, the joint totals of exports of cotton and man-made fibre goods for the first nine months of the year were in excess of the previous year's level. The margin was indeed narrow but, coupled with other more favourable factors, this represents a base from which further progress might be achieved.

The tables on the next page indicate the latest position of exports, imports, employment and production compared with recent years.

Raw Cotton Prices and Supplies

Changing conditions in raw cotton markets are just as much a sign of the times in textiles as the developments taking place in many other sectors. There is no point in reiterating the importance once attributed to such events as American crop estimates and the sudden variations in demand which had a direct bearing on the offtake in yarn and cloth. Times have certainly changed in this respect.

There could have been no more obvious example of this transformation in the raw cotton scene than the complete absence of reaction to the two official reports on the progress of the American crop issued in October and November. The first of these showed that the yield per acre had spurted significantly to a new all-time record of 500 lbs. and that the probable production would be virtually unchanged as compared with the previous season's harvest.

A rise of some 500,000 bales in the supplies anticipated a month previously and the fact that the crop has been grown on an area some 2 million acres smaller than last year were notable factors, but the markets took them in their stride without price changes of any magnitude.

Very Big Yields

The November estimate consolidated the position by adding yet another 500,000 bales to the probable production and raising the average yield to 516 lb. per acre. This lifts the harvesting outlook into a very different category as it represents an increase of 50 lb. per acre above the previous peak in 1958-59.

Modernisation of agricultural methods can be expected to create new situations of this kind, but it remains to be seen what action will be taken by the authorities in Washington to restore some kind of equilibrium in the face of changing conditions. The legislative system at the moment is based on control of acreage to avoid the accumulation of surpluses, so that considerable readjustment will be necessary if yields persist at this high level.

Outside the United States, however, latest production trends show that the overall output may be reduced by about 500,000 bales as compared with last season. Smaller supplies are likely from Mexico and the Middle East, but should be offset by larger crops in the Communist bloc countries. A major influence in the past few weeks has been recognition that the quantity of cotton likely to be available in Egypt and the Sudan will be smaller than anticipated and supply shortages have already been predicted.

Spot rates for raw cotton in the markets of the world showed a little more animation than in recent years, although the tendency was for sudden movements to be followed by several weeks of stability. Official values seemed to lag behind trade trends to a far greater extent than in the past.

At the beginning of 1963, one-inch middling American cotton on the spot in Liverpool was quoted at 24.00*d.*, there being a limited rise to 24.15*d.* in January, and a subsequent decline to 23.75*d.* by the end of June. A steady downward movement developed during August and September, until the low point of 22.90*d.* was reached. Slightly firmer rates prevailed in the last two months of the year, the latest figure being 23.20*d.*

In the Liverpool market for Sudan cotton, there were lengthy periods when no changes took place in quotations. The Sakel C6 variety, which opened the year at 28.90*d.*, was reduced to 27.90*d.* in January, and remained unchanged thereafter until October. Subsequently, a rising undertone developed and the latest quotation is 29.10*d.*

Fully Competitive

Results from modernised spinning mills are exceedingly promising and it is no idle boast that the best of British firms can now stand comparison with any others in the world. Naturally, the introduction of costly new machinery, especially in the ancillary processes, is an expensive item and in the circumstances it becomes all the more essential that reasonable profits should be earned to cover depreciation and make allowances for future re-equipment. The absence of adequate margins has therefore provided employers with severe problems, but the brighter mood lately encountered should go part of the way to rectifying this situation.

When the buying movement developed in September, the call for supplies extended over most types of yarn, though the trend still favoured the medium and lower qualities rather than some of the finer numbers. As usually happens, however, when pressure for supplies mounts, the offtake shows a broadening tendency and, in due course, most of the descriptions produced in Lancashire mills came in for sustained attention.

Growing imports again provided a disconcerting aspect and added to the difficulties of spinners. Not only were direct arrivals larger than in the past, but the rivalry from foreign cloth producers caused a reduction in the demand for domestic yarns. In this connection, the volume of doubled cotton yarn entering British ports from abroad still had an important bearing on the situation at home.

Total imports from all sources were bigger than in the same period of 1962.

Exports of cotton yarn and thread dwindled during August and September and at the end of nine months of 1963 were some 500,000 lbs. smaller than in the corresponding period of the previous year. Some progress was made in shipping these goods to Continental markets, but a further reduction in supplies sent to Australia and New Zealand was noted. A little more demand was encountered for the Irish Republic.

The ever-widening gap between shipments of cotton yarn and thread and comparable exports of man-made fibre yarns was further emphasised during the first nine months of this year. Trade in cotton yarns and thread was barely 15,600,000 lbs., but man-made fibre yarn shipments exceeded 60 million lbs., being 10 million lbs. higher than in the same period of 1962. Exports of man-made fibre yarns were spread over a number of markets. Australia, the Soviet Union, Sweden and Switzerland each absorbed more than 4 million lbs., with good support from China, South Africa, the Irish Republic and India.

Cotton Weaving

In the weaving section of the industry, the turnover was in a few hands, until the general broadening of demand developed after the holiday season came to an end. The call for supplies varied substantially between individual branches and some manufacturers were not without useful orders for the whole of the year. Gathering animation in the autumn provided a much stronger basis from which weavers could operate and in the past few weeks the turnover has shown a very marked expansion.

Most firms, as a result, are now in a much more favourable position than for some years back and the length of order lists is sufficient to keep machinery well engaged for at least a similar period in the future. Like their counterparts in spinning, however, weaving employers have grumbled incessantly about their inability to secure adequate terms on which new business can be fixed up. Only very recently have contracts been arranged which offer more than barely acceptable remuneration.

So far this year purchases from abroad have been well in excess of the totals taken from foreign producers in 1962, though some curtailment of imports has been noticeable in the last two or three months. To the end of September, the volume of arrivals of grey and finished cotton cloth was 473,160,000 square yards, against 427,144,000 square yards in the same period last year. The major increase has been in grey cloth, but the quantity of made-up cotton garments reaching British ports has also broadened perceptibly.

In the face of these sustained thrusts from overseas and in particular the disruptive price element, local manufacturers have found progress far from easy. A regular call for follow-on contracts has been encountered from week to week, but it has only been in the closing stages of the year that anything approaching large-scale purchasing has been experienced. Fair quantities of routine constructions, ranging over dress-wear, linings and furnishings have moved off steadily, while, in the industrial sector, operations have continued in many different styles, from the finest speciality products to heavy materials.

In the nine months to the end of September, shipments of cotton cloth to overseas markets amounted to 168,750,000 square yards against 177,218,000 square yards in the same period of 1962. Impressive figures of exports were achieved by makers of man-made fibre cloth, the quantity sent abroad in the first nine months of the year being 57,021,000 square yards against 40,070,000 square yards in the corresponding period last year.

In cotton goods, South Africa took first place in absorbing cloth supplies, the quantity of 23,475,000 yards being 2 million yards more than in 1962, while the Irish Republic and Nigeria also accepted more goods. Shipments to Australia were reduced by over 4 million yards to 19,055,000 square yards. A sharp setback in trade with Rhodesia and Nyasaland was also encountered, this year's total being 9,984,000 square yards against 14,085,000 square yards.

New Zealand took first place as importer of British man-made fibre cloth this year, absorbing 5,098,000 square yards in the first nine months of 1963. Exports to the Irish Republic exceeded 4 million yards, as did those to South Africa, while useful support came from Sweden, Hong Kong and Rhodesia and Nyasaland.

Non-stop Operation

A major item of interest in relation to labour matters has been the application submitted to the Cardroom Workers' Amalgamation for permission to run a mill on a non-stop basis. Carefully worked-out schedules, comprising 5 shifts and allowing week-end workers a long break, were put forward and received consideration, not only by the chief union involved, but by all the other cotton unions.

The idea was treated as a principle, as it was regarded in the form of a test case which might well be duplicated in other directions if the system was successfully adopted. Opposition to the scheme was voiced by some union officials and the outcome was a rejection of the arrangement.

The trade union leaders phrased their comment carefully, indicating the passing of a resolution that they were not agreeable to the running of mill machinery "outside the terms of the present five-day week agreement." This was taken to mean that the particular application had been refused and that others would meet with similar opposition. In view of the fact that the individual workers at the mill concerned were apparently ready to operate the rather unusual hours, particularly as they would mean a shorter working week and more pay, the end may not yet have been heard of the matter.

Exports—A Lost Habit?

The fact that the almost continual downward slide in exports of cotton and man-made fibre fabrics has been halted this year gave slight encouragement to those traders who believe that rock bottom has been touched, and that a reversal of this trend can be anticipated. The obstacles are legion, but are not insuperable. Many firms have lost the habit of seeking export business, despite Lancashire's proud record of the past.

Six missions have crossed the Channel to probe the possibility of regaining some of the business formerly done with European countries, most of which have similar living standards to Britain. Continental styling has made great headway in this country, to the detriment of our own manufacturers, while many shippers have barely scratched the surface of the numerous outlets in Europe.

The breakdown of the Common Market talks was a setback in many ways, but there is much to be said for getting a foothold across the Channel in the event of future changes of policy. A resumption of negotiations for Britain's entry into a customs union in Europe should not catch textile traders unawares.

The immediate outlook for both the cotton and man-made fibres industries in Lancashire remains encouraging. Sufficient momentum has been built up and forward buying has developed on such a lively basis that most firms are assured of sustained activity throughout the next six months at least.

DATA ON U.K. TEXTILE INDUSTRY

(Sq. yds. in thousands)

	Exports		Imports	
	Cotton	Rayon, etc.	Cotton	Rayon, etc.
1938	1,386,235	31,176	52,000	24,000

SUGAR PRODUCTION PROSPECTS

ACTUAL OUTPUT THIS SEASON MAY BE FAR SHORT OF THE 3.3-MILLION-TON TARGET

TWO and a half months have elapsed since the current sugar season officially began—on 1st November, to be precise. This is no doubt too short a period to say categorically as to what would be the total sugar production in the whole season. Even so, the reports of crushing operations of mills that have come from different parts of India do enable one to assess the overall performance of the industry to some extent. The quantity of sugar produced in the first two months of the season (that is, November and December 1963) is said to be about 840,000 metric tons, as against the actual output of 635,000 tons in the corresponding months of the 1962-63 season. The extent of rise is of the order of 32 per cent. On this basis, the aggregate production for the whole season may be estimated at no more than 2.85 million tons, as against the 2.15 million tons actually produced in 1962-63. One section puts the figure at as low as 2.60 million tons. It is, of course, possible that production during January, February and March will be at a higher pace than in November and December. If regard be had to this consideration, the total production in the whole of 1963-64 season may be a bit more than 2.85 million tons. Even so, the prospects of sugar production target of 3.3 million tons (fixed for 1963-64) being hit successfully are rather dim. Indeed, there is no exaggeration whatever in the statement of Mr. Neville N. Wadia, Chairman of the Belapur Company Limited, that the eventual sugar production would fall far short of the set target. Speaking at the annual meeting of the Company at Bombay on Friday the 10th inst., Mr. Wadia alluded to the joint-stock sugar mills in Maharashtra State and observed:

"In Maharashtra alone, the objective is 650,000 tonnes, but most joint-stock factories find themselves short of the required quantity of cane to produce the amount of sugar which the private sector will have to make as its contribution to the target set by the State Government."

Sugarcane Supplies

Similar is the experience of sugar mills situated in other States. It is true that the cane prices payable by mills have been raised steeply and the controlled selling prices of sugar, too, have been enhanced. And it may also be true that the cane crop position this season is much better than in the previous season. Why then are the sugar mills finding it difficult to secure the required quantities of cane? The answer to the poser is not far to seek. Diversion of cane supplies to *gur* and *khandsari* manufacture continues to be on a large scale, thanks to the persistently high prices commanded by them. Apparently the official restrictions on the production of these sugar substitutes are not being, and cannot be, effectively enforced. If anything, the restrictions themselves have imparted a bullish fervour to *gur* and *khandsari* markets.

The question naturally arises as to what should be done. In his speech, Mr. Wadia suggested the imposition of an excise duty on *gur*, which at present is entirely free of duty, or some form of zoning to ensure that all cane grown within a fixed factory area goes to the factory in the zone for being converted into white sugar. The imposition of excise duty on *gur* does not seem to be a feasible proposition, as it will not be easy to collect it from the large number of small producers scattered over a wide area. But the other part of Mr. Wadia's suggestion, namely, zoning of factory areas, is quite possible, provided the State Governments have the political courage to compel cane growers to supply their produce to the factories and ruthlessly stamp out illicit conversion of cane into *gur*. The fact of the matter is that a Government which is ever ready to compel and coerce the most efficient manufacturers of sugar, namely, the sugar millowners, has not the guts to act in that manner, so far as *gur* manufacturers are concerned, even though it is fully aware that recovery of sugar from cane under this process is only 70 per cent of that in the factory. It is significant, in this connection, that the zoning committee within the Maharashtra State Sugarcane Committee, though it was appointed several weeks ago, has still not been able to produce a workable scheme. Stating that the future of the sugar industry was highly uncertain, Mr. Wadia expressed his confidence that, with a more realistic and bold approach from both Central and State Governments, the uncertainties could be removed and the sugar industry put on a more stable and sound base. Surely, it is such an approach that is wanted most, and not introduction of controls from time to time to take care of temporary difficulties.

Meaningless Exhortation

One of the uncertainties that continue to face the sugar industry pertains to lack of regular, adequate cane supplies. Dame Nature does, of course, play an important part in influencing the size of the cane crop harvested in any particular season. Even so it is not at all difficult to ensure the requisite supplies to sugar mills which, after all, consume only a third of the aggregate annual cane yield. It is sheer commonsense that no sugar mill will curtail its operations any time if it is able to secure the quantity of cane it needs at an economic price, for, to the extent the duration of its working is lengthened, its earnings will correspondingly increase, assuming that other things remain unaltered. Viewed thus, the exhortation made by Mr. K. G. Rajwade, Chairman of the Development Council for Sugar Industry, at the sixteenth meeting of the Council held at Etikoppaka (Andhra Pradesh) on the 10th inst., that "the sugar industry should adopt a more rational and patriotic attitude" is meaningless. All this is mere rhetoric and sentiment rather than substance and reason. This conclusion is further strengthened from the following passage of Mr. Rajwade as reported in a section of the daily Press:

"I appeal to the sugar industry to increase sugar production in such a way as to ensure a guaranteed level of availability of sugar for consumption in the country. The present time is the most crucial and testing period for the sugar industry. If, in spite of all the measures taken by the Government which has cost the country Rs. 20 crores in subsidies to growers, rebates to the industry, etc., the production does not increase and the industry fails to achieve the targets, serious consideration will have to be given to the question of reorganising the industry itself, so that a certain minimum level of production is attained and maintained over the next few years. The industry should think of the days when it suffered from the handicap of a surplus and clamoured for exports. The Government then came to the rescue of the industry with large subsidies. Now that there is a scarcity, the industry's co-operation and, if necessary, sacrifice is essential. The country has a fortuitous time when it can earn large amounts of valuable foreign exchange through increased sugar exports. The industry is not, however, inclined to produce more, unless promises are made and advantages held out."

By implication, what Mr. Rajwade means is that the sugar industry is deliberately trying not to produce more sugar. This assessment is, to say the least, wrong and uncharitable. Mr. Rajwade ought to know that, since higher production results in lower unit cost of output and higher profit, every mill will naturally endeavour its best to maintain maximum output. Did the industry not produce in the 1960-61 season (last year of second Plan) 3.03 million tonnes of sugar, a quantity which was well above the Plan target of 2.25 million tons? If the industry could not produce more than 2.15 million tons in 1962-63, was it not because of insufficient cane supplies, following large-scale diversion to *gur-khandsari* production and the reduction in the size of the crop itself? Even before the crushing season began, it was abundantly clear that there would be keen competition for the available cane supplies, but neither the Centre nor the State Governments did anything to ensure the requisite supplies to sugar mills and that notwithstanding a clear warning from the interests concerned. This journal itself had drawn the attention of the Government to this aspect. What was Mr. Rajwade doing then? Did he warn his Ministers and urge them to initiate timely measures? Instead of being candid enough to admit the Government's lethargy, he now seeks to put the blame for the shortfall in sugar output entirely on the industry and talks not like a responsible official but like a political demagogue. He holds out, by implication, a vague threat that, if the industry does not step up its production even at a financial loss, it would be subjected to some drastic reorganisation. He conveniently forgets, in issuing this threat, the Government's own responsibility for the mess in which the sugar industry often finds itself. If anything goes wrong with a controlled industry in a planned economy, the Government is more responsible for it than the industrialists concerned, for the latter, with their hands tied by bureaucratic controls, do not have the freedom to exercise their initiative and ingenuity.

The need for augmenting sugar output is paramount from the point of view of rising demand for both domestic consumption and export. The working sub-group of the Development Council, in its draft report which was considered at the meeting last week, has estimated the aggregate domestic demand to rise to three million tons by 1965-66 (the end of third Plan) and to four million tons by 1970-71 (end of fourth Plan). The consumption of *gur* and *khandsari* by 1970-71 is expected to reach 6.75 million tons and 480,000 tons, respectively. Taking exports into account, the total requirements of sugarcane are put at 135 million tons. Although this target represents an increase of as much as 41 million tons as compared with the 94 million tons actually harvested in the past season (1962-63), it should not be difficult of achievement. The lands devoted to sugarcane crop in several parts of the country can certainly be made to give larger yields of superior quality cane, provided the State Agricultural Departments apply themselves wholeheartedly to help the cultivators through provision of better irrigation facilities, distribution of quality seeds and supply of fertilisers. The State Governments do collect every year crores of rupees by way of cane purchase tax and they must utilise a substantial part of the proceeds, if not the whole of them, for cane development work.

EXPANSION OF SUGAR INDUSTRY

The implementation of the expansion schemes of the existing mills does not seem to be progressing quite satisfactorily. Thus, according to a recent official review prepared for the benefit of the Development Council for Sugar Industry, of the 120 mills licensed for expansion during the second and third Plan periods, only 49 units have completed their schemes. Such poor progress is not surprising, in view of the foreign exchange shortage, favouritism shown to co-operative sugar factories and official red-tapism, not to speak of the difficulties in raising sufficient rupee resources.

Including the additional capacity of one million tons (in terms of white sugar output) licensed so far partly by way of setting up new mills and partly by expansion of existing units, the total licensed capacity as of today comes to 3.36 million tons. Of this total, a capacity of 160,000 tons is likely to remain infructuous. Three factories have gone into production since the commencement of the current sugar season and four more are expected to begin functioning before the season ends (on 31st October 1964), the total additional capacity installed being at least 180,000 tons.

The Government of India has decided to license another 500,000 tons capacity, so as to raise the aggregate capacity to 3.7 million tons by the end of the current Plan. Proposals for licensing are expected to be finalised shortly. It is understood that a fourfold criteria may govern the future licensing of sugar mills: recovery percentage, absence of competition for available cane supplies from the *gur* industry, condition of cane development and preference for co-operative sectors. Present indications are that, out of the additional annual capacity of 500,000 tons, the share of the co-operative sector alone will be 350,000 tons, of which expansion of existing co-operative units accounts for 200,000 tons and establishment of new co-operative units for 150,000 tons. The corporate sector's share is put at 150,000 tons, the whole of which is meant for the expansion of existing units. This is only as it should be considering that the expansion of existing units always entails much less capital outlay than the setting up of new mills.

As against the Government of India's aforesaid decision to license an additional capacity of only 500,000 tons, the applications actually received are said to cover a total capacity of 1.9 million tons—1.1 million tons in the co-operative sector and 800,000 tons in the private sector. Out of this, the official screening committee, which is expected to complete its work by the end of this month, is believed to have already approved of applications for licensing the expansion of 19 co-operative mills with a total capacity of 200,000 tons.

ISI Certification Mark is

A THIRD-PARTY GUARANTEE OF QUALITY

When you see the ISI Certification Mark on any article you buy, you can be sure of its quality and performance. For, the ISI Mark is affixed only on goods in the production of which appropriate materials have been used, the processes have been under strict control, and tests at various levels have been properly carried out, so that they conform to the requirements of the relevant Indian Standards.

Before granting a licence to a manufacturer to use the ISI Mark, the Institution makes a thorough inspection of the machinery and equipment at the factory, the manufacturing processes and facilities for testing and satisfies itself completely about the capability of the factory for producing goods uniformly according to Indian Standards not only at the time of inspection but also continuously in the future.

During the operation of the licence, the Institution exercises a continuous control over the production inspection of the licencee, as the ISI Mark is a third-party guarantee of the quality of products.

As a consumer, exercise your right to get full value for your money by insisting on buying goods bearing the ISI Certification Mark.

CANADA'S ECONOMIC ADVANCE STEADY

SIGNIFICANT EXPANSIONARY TRENDS IN OPERATION

By Hon. Mitchell Sharp
MINISTER OF TRADE AND COMMERCE

FOR Canada 1963 has been a year of steady economic advance. While the performance of the economy is still less than adequate, improvement has been general and significant progress has been made toward overcoming our main economic difficulties. Unemployment is lower, industrial slack has been partially absorbed and the imbalance in our external account and reliance on foreign borrowing have been reduced.

It appears that Canada's Gross National Product has increased by six per cent between 1962 and 1963 and total output in real terms by more than four per cent. A record grain crop has contributed to this advance but non-farm output also is up by about four per cent. This growth has increased the earnings of all major income groups. Total personal income is up by six per cent and *per capita* real income has advanced to a new high.

Total employment in Canada has been more than two per cent higher on average in 1963 than in the previous year and unemployment has been four per cent lower. This margin of improvement has widened toward the end of the year. In November 226,000 more persons were employed than a year ago, an increase of 3.6 per cent, and 39,000 fewer persons were without jobs. After adjustment for usual seasonal variation, jobless persons now comprise 5.1 per cent of the labour force, the lowest figure in more than six years.

Influences contributing to sustained expansion in 1963 include strong international demand giving rise to sharply rising exports, increased business outlays for plant and equipment and an unusually strong market for consumer durable goods. In the latter part of the year an upsurge in new house-building, along with the emergence of large market outlets for Canada's record wheat crop, gave new stimulus to the economy.

Industrial Growth

In 1963 as in the previous year Canada's industrial growth has been spearheaded in large part by the strong advance in secondary manufacturing. Motor vehicles produced in Canada exceeded 600,000 units this year after reaching the half-million mark for the first time in 1962. This has led to sharply higher levels of output in the automotive parts and rubber industries. Steel ingot production is up year-over-year by 14 per cent to a total annual output of more than eight million tons, double the level of a decade ago. The agricultural implement industry has had a notable resurgence, as have a number of other machinery producers. Other secondary industries to achieve substantial gains this year include textiles, clothing, electrical apparatus and a number of chemicals.

Among Canada's major industrial materials, notable production increases have been achieved in iron ore, aluminium, lumber, kraft pulp and plywood. Higher sales of copper and nickel were accompanied by a reduction of excess stocks and some decline in operating levels. The newsprint industry, though hampered by the early year newspaper strikes in the United States has, nevertheless, recovered to its previous high level of annual production and sales. Good progress has been made in the development of market outlets for sulphur which, along with potash, have assumed importance in Canada's export trade. Oil and natural gas have advanced in line with demand growth in available markets. Electric power generation has attained a new high level whereas coal output has averaged a little higher in 1963 than in the preceding year.

Total industrial production has increased by five per cent between 1962 and 1963, bringing the cumulative advance for the last three years to 16 per cent. This gain is the result not only of growing demand but also of increased penetration by Canadian producers into both the domestic and foreign markets.

The generally improved competitiveness of Canadian producers is reflected also in Canada's trade and balance of payments position. Exports this year have increased much more than imports. This has resulted in an upward shift of $275 million in the merchandise trade balance in the first ten months of the year, while further substantial gains are anticipated in ensuing months due to unusually heavy grain shipments. Most of the improvement in the trade balance this year reflects the further increase in Canada's surplus with overseas countries, particularly Britain. Canada's deficit with the United States is down moderately but still amounts to $450 million in the 10-month period.

Exports Higher

Exports within each of the major commodity groups are higher this year. Most notable in this respect is the continuing rapid expansion in sales abroad of secondary manufactured products reflecting new and growing markets in many parts of the world for a wide range of machinery and equipment items and consumer products. Exports of capital goods under long-term financing arrangements, mainly to less-developed countries, are of growing importance in this trade.

In non-merchandise transactions, Canada's tourist account has shown continued improvement—from a deficit of more than $200 million in 1960 and $50 million last year to what promises to be at least an even balance this year. There is, however, no evidence of significant or continuing improvement in other current account items which means that the deficit on all current non-merchandise transactions remains close to $1 billion annually. Consequently, even with the improved balances in commodity trade and tourism, Canada still has a large imbalance in current transactions as a whole which in the 12-month period ending September 1963 (the latest figures available) amounted to $542 million.

Nevertheless, the chances of a further increase in the surplus on merchandise trade appear good. The existing strong trend of exports has been reinforced by large sales of wheat to Mainland China, the U.S.S.R. and other Eastern European countries. These greatly increased shipments to Communist countries together with the heavy movement to traditional customers is expected to raise wheat exports in the current crop year to 550 million bushels, about 150 million bushels above the previous annual record. Also of major significance is the atmosphere of sustained expansion which presently characterises Canda's principal foreign markets. In the United States the expectation is widespread that the current up-trend of activity will continue in 1964. Following several years of slow advance, Britain is now experiencing a considerable economic resurgence. In Japan also growth trends have strengthened following a brief slow-down last year. Economic activity in Western Europe continues on an upward course accompanied, nevertheless, by inflationary pressures in some countries. Strengthening now under way in a number of international commodity markets will add to the buying power in underdeveloped areas which rely heavily upon exports of raw materials and food. While Canadian export prices, on average, are at about the same level now as a year ago, there are indications of firming in the prices of a number of export commodities.

These conditions suggest the likelihood of a quite substantial increase in Canada's exports in 1964 which would be the fourth consecutive year of strong advance.

Outlook for 1964

Significant expansionary forces are also apparent within the domestic economy. While the return to more normal weather conditions in 1964 would entail a year-to-year decline in grain output, the additional spending power generated by this year's record production and exports will be source of new stimulus in the economy as a whole for some time. In the West there is a new optimism associated with the disappearance of conditions of burdensome oversupply in Canada's grain growing industry and the expectation that high level of exports will continue at least through the next two crop years.

Preliminary indications of capital spending plans for 1964 suggest that this year's rate of advance in business outlays on plant and equipment will be fully maintained. Significant increases in capital programmes are indicated in manufacturing, electric power and transportation. In housing the large carryover of unfinished houses virtually assures a high volume of house-building next year even in the event of some decline in starts from this year's high level. The trend of public construction will be influenced by the advanced stage of the technical school building programme but some continuing increase in total outlays is, nevertheless, indicated. In short, there is every indication that total private and public capital spending will be higher in 1964 than in 1963.

While it would be hazardous to try to assess the future trend of consumer spending on durable goods, nevertheless, the continuing growth of incomes should provide firm underpinning to the consumer market generally.

All in all demand prospects appear good in both home and foreign markets. Strong overall demand means increased production, more jobs and higher incomes. Such conditions could be short-lived, however, unless they are accompanied by the kind of initiatives which will ensure a continued strengthening in our position in both home and foreign markets. In Canada's open economy, mounting prosperity can all too readily bring a resurgence of imports and strain in our balance of payments. Such an eventuality will be avoided only by pressing forward in our efforts to expand existing markets and develop new ones wherever there are opportunities for economic production. From this point of view, Canada supports and looks forward to participation in next year's important round of trade and tariff negotiations.

Continued competitive ascendancy in traditional export lines is, of course, tremendously important to our national well-being. However, this in itself is not enough. Even in the best of circumstances, proceeds from the sale of our major food and industrial material exports are not likely to be adequate, in the longer run, to meet the ever-mounting foreign exchange requirements of a prosperous Canada. No lasting solution to our balance of payments and related problems is likely to be achieved except through the further substantial broadening and filling out of Canada's industrial structure on a competitive basis.

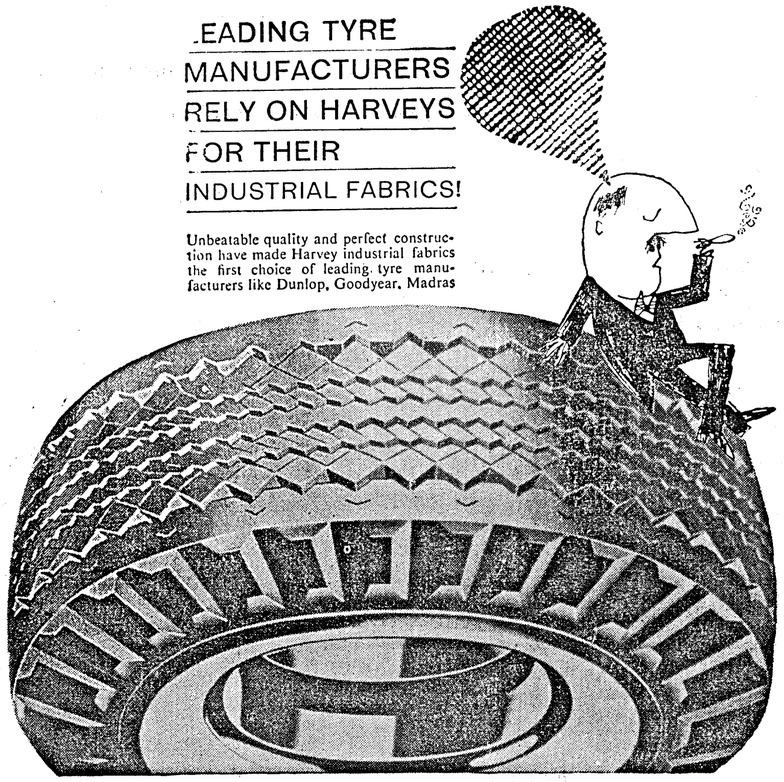
International Competitiveness

Canada's current account deficit has been reduced from a high of $1.5 billion in 1959 to scarcely more than one-third of this amount in the 12 months ending September 1963. The promising outlook for exports in the ensuing year might seem to bring us within sight of balancing our external accounts for the first time in a decade. In the interim, however, imports also are rising and further progress in reducing Canada's reliance on net foreign borrowing might yet prove ephemeral unless we are able to sustain our present momentum towards broader participation in both home and foreign markets. With the more limited availability of foreign capital following upon recent taxation proposals in the United States, this is no time to risk a reversal in our external payments position. This is why it is so important to press ahead with the task of filling existing gaps in our industrial structure.

International competitiveness has a special significance in Canada's present economic circumstances. It should, however, be remembered that internationally-oriented industries make up the lesser part of the total structure of industry and cannot, therefore, be expected to provide all or even most, of the new employment opportunities necessary to absorb a growing labour force. Moreover, productivity is improving especially rapidly in this segment of industry which means that substantial increases in production can be achieved with relatively little additional employment. Export and import-competing industries can make their most vital contribution to the national well-being by giving sufficient viability to our external financial position to support adequate growth in the economy at large. Growth in domestically-oriented sectors of the economy, where most of Canada's labour force is employed, can proceed in a sound and healthy fashion only if the economy is made free of vulnerability to balance of payments strain. This is why the further strengthening in our external payments position is so important at this time. All-out economic growth is not only fostered by, but is also conditional upon, a strong external financial position.

LEADING TYRE MANUFACTURERS RELY ON HARVEYS FOR THEIR INDUSTRIAL FABRICS!

Unbeatable quality and perfect construction have made Harvey industrial fabrics the first choice of leading tyre manufacturers like Dunlop, Goodyear, Madras Rubber Factory, etc. Today Harveys supply them, and countless other major industries, with a variety of essential fabrics from Tyre Cords and Jacket Ducks to Canvases.



Harveys step up their industrial fabric production!

The installation of additional new high-speed looms and up-to-date precision machinery—among the world's most modern—now enables Harveys to accept many more orders of varied character. Harveys can produce almost anything you require in industrial fabrics. They have the men, machines and know-how to manufacture material to the most rigid specifications. And relentless quality control throughout the manufacturing process makes Harvey industrial fabrics equal to the world's best.

EXISTING AND PROPOSED ACTIVITIES

The Company has been engaged in the manufacture and sale of winding wires, viz. super enamelled wires, paper covered wires, cotton covered wires and strips, since January 1953. Since 1955 the Company has expanded its activities several fold and in 1961 the factory for the manufacture of winding wires and strips was shifted to Pokhran Valley, Thana, and a cable manufacturing unit was added. The Company is marketing its cables under the I.S.I. mark. The Company has been granted industrial licences for the expansion of its installed capacities in respect of super enamelled wires and strips and paper covered wires and strips. The Company has also been granted industrial licences which they have now decided to implement in respect of :

(1) manufacture of steel and alloy steel wires (mild steel galvanized, black hard bright wire, high tensile wire, etc.) up to an installed capacity of 5,000 tons per annum with the technical assistance of Messrs. Barron & Crowther (Export) S.A. U.K. and

(2) manufacture of glass insulated wires.

LOCATION OF THE FACTORY

The factory is located at Pokhran Valley, near Thana, 22 miles from Bombay, in Maharashtra State, on a freehold plot of land.

DATE OF OPENING AND CLOSING OF SUBSCRIPTION LIST

The subscription list will open at the commencement of banking hours on 27th January 1964 and will close at the close of banking hours on 6th February 1964, or earlier as soon as the subscription approximating to the amount offered has been received, but in any case not earlier than the close of banking hours on 29th January 1964.

Application forms along with copies of Prospectus can be had from the Registered Office of the Company and at the offices of the Underwriters, Bankers and authorised Brokers.

U.P. LETTER

CONSUMERS FACE GREAT HARDSHIPS

PLAN FOR THE EASTERN DISTRICTS

From Our Special Correspondent

LUCKNOW, 15*th January*

ALTHOUGH the indices of wholesale food prices for the country, after having registered an unprecedented rise in 1963, showed a seasonal decline at the end of the year, the prices of food articles, both wholesale and retail, in all U.P. markets have continued to rise. In most of the U.P. markets eatable wheat, rice and pulses are available only at the rate of 1½ seers, 1¼ seers and 1¼ seers per rupee, respectively. The prices of milk, vegetables, ghee and other food articles have also increased. It would not be wrong to say that the rise in the retail food prices in the different U.P. markets between January 1963 and January 1964 has been of the order of 30 to 50 per cent. The consumers have suffered unbearable hardship because of the ever-rising food prices. The prices at which the fair-price shops and consumers' co-operative stores are expected to sell cereals, pulses, sugar and other food articles are, of course, lower but these shops and stores are unable to supply the people's demand for the simple reason that they do not always have the necessary stocks.

Defective Policies

The worst feature of the situation is that part of the scarcity of both food articles and other commodities is due to defective Government policies and a suitable change in these policies would improve matters. The distribution of wheat, rice and sugar is defective not only in rural areas but also in the urban areas. Even in the cities and big towns, for example, the consumers are not able to get even the limited amount of one kilo per head per month, in spite of the fact that the Central Government has increased U.P.'s quota of factory sugar from 20,000 tons to 21,503 tons per month. In the case of cement, an artificial scarcity has been created because of the State Government's order to all District Supply Officers to earmark 75 per cent of the cement quota for the Planning Department so that irrigation and agricultural programmes in rural areas might be properly implemented. Out of the remaining quota of 25 per cent, top priority has been given to departmental and Government construction work and to demand for repairs to people's houses.

The consequence is that cement for new construction activity by the people is almost non-available. The people would probably have suffered less because of these hardships if they had known that the available supply of cement was being utilised properly. But the block development officers who are responsible for the utilisation of the 75 per cent of the cement quota in the districts are not able to make proper use of the available supplies which are either used for construction work which could be done as well by motar or the cement bags pass into the black market. This explains the paradoxical position that, whereas cement is not available in the open market, any quantity could be bought at Rs. 15 per bag from the black market.

The most unfortunate aspect of the developing food crisis in U.P. is that the Government appears to be oblivious of it and has no programme to meet it. The U.P. Food and Civil Supplies Minister, Mr. Jagmohan Singh Negi, while admitting that food prices in U.P. had increased, told a Press conference that the U.P. Government had adequate buffer stocks of wheat and rice to be able to prevent prices from rising unduly and that the number of fair-price shops in the State has been considerably increased to cope with the situation. But since the buffer stocks and fair-price shops have not succeeded in checking the rising prices so far, the people are not convinced of their doing so in future. The situation cries out for some definite measures to solve the problem of rising prices in the immediate future and to prevent its recurrence so as to protect the consumers from undergoing unbearable hardships.

Another Sugar Inquiry

The U.P. Government is setting up a high-power committee to examine the working of the sugar, *gur* and *khandsari* industries and to devise ways and means of increasing sugar production in the State. But what is needed is not a fresh inquiry but some definite action. In fact, all aspects of the problem should by now be quite clear to the Government and the proposed committee could hardly find out anything new. Sugar production in U.P. had declined from 14½ lakh tons in 1960-61 to 8½ lakh tons in 1962-63 and the Government has already fixed the target of output for 1963-64 at 15 lakh tons. In fact, the report of the U.P. Sugar Advisory Committee, which also was a high-power committee, is already before the Government. The problem of sugar production would be solved if the Government were to take action on the recommendations of the Sugar Advisory Committee. It has recommended that the Government should provide, through the agency of the State Industrial Corporation and the National Industries Development Corporation, loans to the sugar industry in U.P. to the tune of Rs. 5 crores for purposes of modernisation and renovation of plant and machinery. Unless this capital is made available to the U.P. sugar industry, it is difficult to see how sugar production in U.P. could be increased while maintaining quality and prices at competitive levels. The Committee has also recommended that an intensive programme of sugarcane cultivation should be undertaken in the mill's gate areas and no new licences for power crushers should be issued within ten miles of the gates of sugar factories and within a radius of three miles of the out centres—where sugar factories purchase their sugarcane in addition to purchasing it at the factory gate—if the amount of sugarcane purchased at such centres is more than five lakh tons.

The Committee has not neglected the *gur* and *khandsari* industries and has suggested their fuller development in areas which are taken out of the factory's reserved areas in the wake of intensive development of the mills' gate areas. One of the most important recommendations of the Committee is that the U.P. Government should approach the Government of India for fixing the minimum sugarcane prices each year in advance of the sowing season and for fixing the yearly target of sugar production for the entire country with the State-wise break-up several years in advance. It is difficult to see as to what new light the U.P. Government hopes to get from the new inquiry committee. If action were taken on the recommendations of the Sugar Advisory Committee, much valuable time and considerable public money would be saved and quick results produced.

Development of Eastern U.P.

The joint study team of the Planning Commission and the U.P. Government, under the chairmanship of Mr. B. P. Patel, has produced a comprehensive seven-year plan for the development of the eastern districts of U.P. on the basis of a type-study of four districts in the eastern region, namely, Deoria, Azamgarh, Jaunpur and Ghaziabad. The Plan would cost nearly Rs. 84 crores, of which Rs. 10 crores would be needed in the remaining two years of the third Plan. One of the most difficult problems would be to provide the necessary finances as the U.P. Government is already finding it difficult to implement their third Plan and would not be able to find either the money or real resources to the extent of Rs. 10 crores for the eastern districts in addition to what they are already spending on them.

As was only to be expected, the study team found that the *per capita* outlay on the development of the eastern districts of U.P. at Rs. 14 in the first Plan, Rs. 26½ in the second Plan and Rs. 50 in the third Plan, after taking into account the team's recommendations, was not only much less than for the entire country taken together but was also less than for the other regions of U.P. But it was somewhat unexpected that the study team emphasised the development of agriculture and not of industry and agriculture on a balanced basis because, without the development of industry, it would not be possible either to increase the *per capita* income fairly rapidly or to provide employment opportunities to a rapidly increasing population. It is, however, true that the economy of the eastern districts of U.P. is predominantly agricultural and a fuller development of agriculture—for which the team has recommended not only that 75 per cent of the cultivated areas in place of 50 per cent at present should be brought under irrigation but that double-cropping, use of fertilisers, better seed and co-operative credit should be more fully developed—would provide higher incomes to the population already employed in agriculture. Moreover, the team's recommendation that the economy's infrastructure, chiefly the sources of irrigation, power supply, transport and communications should be more fully developed, would prepare the base for future industrialisation of this region.

FORWARD MARKETS BULLETIN
(Monthly)
Published by Forward Markets Commission
Government of India, Bombay

REGULAR FEATURES

- A 'General Review' presenting an assessment of trading conditions in the futures markets during the month
- Special articles on technical aspect of forward trading
- Extensive information relating to developments in futures markets
- Detailed commodity market reviews
- Comprehensive and up-to-date statistical supplement relating to crop estimates, production and consumption trends, price movements, trading against futures contracts, etc.
- About 200 pages in print in crown ¼ size
- Attractive get-up

Annual subscription		Single copy	
In India ..	Rs. 24.00	In India ..	Rs. 2.50
Abroad ..	Rs. 40.00	Abroad ..	Rs. 4.00

THE MAJOR EVENT IN THE ENGINEERING CALENDAR

Don't miss it!—the outstanding engineering exhibition of the year... Don't miss it!—your finest opportunity to see and compare, under one roof in London's vast Olympia, the newest products of the world's leading makers of machine tools and allied equipment... Don't miss it!—the chance of talking over your own production problems with the world's most experienced production engineers.

It's a show of immense interest and value to everyone concerned in fast, accurate, economical production—a *live* show in every sense of the word! All the machines will be powered and many will be working on actual production runs.

Exhibits include:—
Metal cutting machine tools
Metal forming machine tools
Engineers' small tools
Gauges and measuring equipment
Testing equipment
Electronic control gear
Power hammers
Woodworking machinery

Why not combine your visit to the exhibition with a holiday in Britain? And see London at its gayest—at the peak of the London 'Season'!
So make your plans and get your travel agent to reserve your hotel accommodation *without delay.*

INTERNATIONAL MACHINE TOOL EXHIBITION 1964

Olympia
London, England
June 25 — July 9
(Sundays excepted)

● *For further Information regarding the Exhibition, please write to the address below.*

THE BELAPUR COMPANY LIMITED

TAX BURDEN ON SUGAR INDUSTRY STUPENDOUS

SPEECH OF CHAIRMAN, MR. NEVILLE N. WADIA

On a turnover of Rs. 3.66 crores during the year ended September 1963, the Belapur Company Limited paid a total tax of as much as Rs. 1.21 crore. Recalling these figures at the Forty-fourth Annual General Meeting of the Company held at Bombay on Friday, 10th January 1964, Mr. Neville N. Wadia, Chairman, stated that one could get an idea of the stupendous tax burden the sugar industry had to shoulder in one form or another. Apropos the 3.3 million-tonne output target fixed for the current season, Mr. Wadia felt that the eventual sugar production would fall far short of the net target. In Maharashtra alone, most joint-stock factories found themselves short of the required quantity of cane to produce the quantity of sugar which the private sector would have to make as its contribution to the 650,000-tonne target fixed by the State Government.

The following is the full text of Mr. Neville Wadia's speech:

GENTLEMEN,

I welcome you all once again to the annual general meeting of the Company and, as usual, I will try to review for you the workings of the Company during the year and the prospects for the current year.

As you will have seen from the printed accounts and report which you have no doubt all studied, the Company has had quite a successful year and the results, I think you will agree, can be considered satisfactory. The very heavy burden of taxation, however, rather spoils the picture from the shareholders' point of view and I will again refer to this in more detail in a few minutes.

The quantity of cane harvested on our estates was just over 167,000 tonnes which is very slightly less than the previous year, but the quantity of cane purchased from outside sources was substantially higher at 73,000 tonnes, as against the previous year's figure of 37,000 tonnes.

Sugar Produced

The quantity of cane actually crushed at Harigaon was almost 188,000 tonnes, as against 184,600 tonnes the year before, and nearly 53,000 tonnes were sent over to Gangapur to be crushed on behalf of the Company at the subsidiary Company's factory. The sugar produced out of these quantities of cane was 234 963 bags at Harigaon and 65,436 bags at Gangapur, making a total of 300,399 bags.

Owing to heavier demands in the internal markets and requisitions for export abroad, the average monthly releases by the Central Government were larger than usual and this accounts for the comparatively small stock remaining in the godowns at the close of the financial year. These circumstances also account for the large increase in revenue from sales.

Cane Shortage

Those of you who were present at the annual general meeting just twelve months ago will recall that I concluded my address to shareholders on a somewhat pessimistic note. I had in mind at that time the approach of a difficult period of sugarcane shortage, the heavy taxation which the year 1962-63 would have to bear and the possible loss of our farms under the Land Ceilings Act. Actually the period of cane shortage did not arrive early enough to affect us very much during the year, but it is with us now and it is certain that the total cane we crushed at Harigaon and Gangapur will be less during the current season. This is because *gur* manufacture is more remunerative to the cane grower, despite higher prices offered for cane by the sugar factories, and also because of a drive by co-operative units to increase their membership.

The direct taxation which the Company has had to provide for in the accounts for 1962-63 amounts to the staggering figure of Rs. 59,09,011. This, of course, includes Rs. 24,28,000 agricultural income-tax for two previous years and Super Profits Tax of Rs. 1,10,230 for 1961-62. To this must be added Rs. 87,02,476 of excise duty and cane purchase tax paid during the year. When one contemplates that, as compared with a turnover of Rs. 3,65,82,730 in 1962-63, the total tax amounted to Rs. 1,20,73,257, one gets an idea of the stupendous burden the sugar industry has to carry by way of taxes in one form or another.

Sugarcane Farms

As regards our farms, you will have seen from the press that the writ petition which was filed against the State Government in connection with the Land Ceilings Act was heard in the Maharashtra High Court during September and October 1963 and, as a result of the judgment, Section 28 of the Act was struck down. Both the parties, that is, the State Government and ourselves, have obtained leave to appeal to the Supreme Court and the matter is still *sub judice*. So I do not want to say anything at this stage which might in any way be construed as contempt of Court. The section which was struck down by the High Court is the one which provided for the taking over of sugarcane farms by a State-owned corporation. Until the case is finalised, we shall continue to carry on the cultivation of sugarcane on our farms, as before, and it is because I do not anticipate any decision during the current season that I feel the results this year should again be satisfactory.

Gangapur Mills

But I am afraid I cannot hold out such hopes for our subsidiary company, Gangapur Sugar Mills Ltd. Their accounts for the year ended 30th June 1963 are published in your printed balance-sheet and you will see that they had a better year. The cane they crushed was of good quality and they were able to obtain a recovery of 12.10 per cent which is the best they have so far achieved. They were able to show a profit of about Rs. 1 lakh after charging full depreciation for the year, but there are still large arrears of depreciation for previous years and also arrears of development rebate. So it cannot be said that the Company is yet on a sound basis. Unfortunately, the current year for them is not likely to show a continuance of the progress. There is a very acute shortage of cane in their area and, although we have done our best to persuade those cultivators who have cane for sale, to supply it to us, by offering them higher rates, we have not been wholly successful, with the result that the crushing season at Gangapur this year is likely to be very short.

I regret also that I am not able to report any progress in the matter of irrigation schemes to enable cane to be grown in the vicinity of the Gangapur factory. A few months ago, the State Government showed some interest in financing such a project to utilise the Godavari river waters, but these things take time to develop and, as far as I know, there has not yet been any definite decision to go ahead. Also quite recently, a suggestion was made that the Gangapur factory be turned into a co-operative unit. Without making any commitment, we agreed to consider any schemes which might be placed before us and which might appear to be beneficial to all concerned, but, up to now, nothing in the way of a definite proposal has come forward.

As you probably know, the Central Government has this year set the target of sugar

REPORT OF THE AUDITORS

To THE STATE BANK OF INDIA:

We, the undersigned Auditors of the State Bank of Hyderabad, appointed under Section 41 (1) of the State Bank of India (Subsidiary Banks) Act, 1959, report on the Balance Sheet and Accounts of the Bank as at the 31st December, 1963.

We have examined the above Balance Sheet of the State Bank of Hyderabad as at the 31st December, 1963, and the Profit and Loss Account for the year ended upon that date with the Accounts and Vouchers relating thereto of Head Office and with the Returns submitted and certified by the Branch Managers, which Returns have been incorporated in the above Balance Sheet and Accounts, and report:

(i) that, in our opinion the Balance Sheet is a full and fair one, containing all the necessary particulars and properly drawn up so as to exhibit a true and correct view of the affairs of the Bank, according to the best of our information and the explanations given to us and as shown by the Books of the Bank;

(ii) that, where we have called for any explanation or information such explanation and information have been given to us and have been satisfactory;

(iii) that, the transactions of the Bank which have come to our notice have been within the powers of the Bank;

(iv) that, the Returns received from the Branches of the Bank have been found adequate for the purpose of our audit;

(v) that, the Profit and Loss Account shows a true balance of profit for the year covered by such Account;

(vi) that, in our opinion the Balance Sheet and the Profit and Loss Account are drawn up in conformity with the law; and

(vii) that, in our opinion Books of Account have been kept by the Bank as required by law.

S. B. BILLIMORIA & CO.,
Chartered Accountants.

HYDERABAD (A.P.),
Dated 8th January, 1964.

TRAINING STEEL WORKERS IN U.K.

INDUSTRY'S OWN MACHINERY HAS FARED WELL

THE British Government recently framed certain proposals for the future of industrial training. One of these envisages the establishment of Training Boards for the leading industries. In this connection, the British Iron and Steel Federation, which has welcomed the prospect of the establishment of an Iron and Steel Training Board, has highlighted the coincidental nature of the Government's proposals and those which the industry itself has followed over the last fifteen years. Thanks to the co-operative action taken by the steel companies on a national and on a regional basis through the medium of the Federation, there is now in existence a voluntary machinery for training which can be further developed under the ægis of the new organisation. The Federation is conscious that much remains to be done and that the progress achieved by the voluntary machinery for training needs to be more widely applied. The industry's experience todate in the field of training would seem to suggest that the right foundations have been laid and the right principles followed. As the growing iron and steel industry in India would have to grapple with this gigantic problem of technical training, it might usefully study the working of the training organisation within the British steel industry. Luckily, in this context, an authoritative account of that training machinery is available in a brochure, just published by the British Iron and Steel Federation.

The brochure notes at the outset that training is recognised throughout the British iron and steel industry as an essential part of efficient management. Apart from the need to train new recruits, there is the need to train staff for promotion, to keep the work force up-to-date with modern practices and also to retrain existing workers to operate the new processes that are being introduced. Training today is thus more than just a narrow instruction in the execution of the job in hand, for it offers the individual, of whatever grade, the chance of acquiring maximum competence, a clear understanding of his role in his organisation and an opportunity for advancement. In view of this wider concept of training, the industry as a whole has looked to the Federation for the provision of services that would be uneconomic if every company were to provide for itself. Since the establishment of the Federation's Training Committee in 1948, company directors, managers and senior education and training officers have brought their executive experience and specialist knowledge to the formulation of advice at the national level. Such advice has been regularly carried to the steelworks through seven area training committees covering the major steelmaking areas.

Area Committees

Six of these area committees, incidentally, have full-time training officers whose function is to be at hand with advice and guidance even in regard to the planning of full-scale schemes at the request of individual companies, to organise co-operative training schemes and to help the development of training itself. The director of a small company concerned about the recruitment and training of young operatives, the departmental manager planning a series of talks, the office manager wanting to discuss the problems of communication within a large staff, an education officer contemplating a company course for young managers, a sales manager needing to provide some initial instruction for new salesmen—all can call on their area training office for help and advice. The area training staff spend some time in the works to find out what is wanted, put to the management such recruitment and training schemes as will meet the need and, if these are approved, remain at hand to help implement them, working with the local education authorities and the youth employment service. The committee's work can also extend beyond national boundaries; in recent years it has organised the training of some 400 key personnel for the Durgapur steelworks in India. It will be recalled here that the Indian students had each an average of six months' training at one of 16 British steelworks after a series of 14 induction courses run jointly with the British Council.

Further details about the "training for skill" are to be found in the brochure. To deal first with the training of operatives. Half the 22,000 workers under the age of 21 in the industry are said to be junior operatives, and almost all large companies provide introductory courses for such operatives, *putting a strong emphasis on safe working at this early stage.* In their first year, junior operatives usually move from one department to another, gathering experience. Many companies have first-year training schemes that include periods of study at the local college and several give instruction in a company training workshop. After their first year, continuous shift-working makes it difficult for junior operatives to be released for study courses without interfering with production, but ways round this difficulty have been devised by a number of firms so that they can complete these two or three-year studies and get the City and Guilds of London Institute Iron and Steel Operatives Certificates. But, with the advance of technology, the need for more highly qualified production workers is constantly arising. To meet this need, too, the City and Guilds of London Institute is considering a proposal of the B.I.S.F. Central Training Committee for an advanced certificate for operatives, to be awarded after a further year of part-time study. The new course will give men destined for senior jobs an understanding of some of the scientific background to production processes. The first examination, in this connection, is expected to be held in 1965. At the same time, men well-versed in the skills required for older processes need re-training as new methods of producing or shaping steel are introduced. Companies are, therefore, introducing planned re-training schemes that bring together teams of operatives, as well as the foremen and engineers upon whom the main burden of instruction in new plant must fall. Modern teaching methods, coupled with experience in existing plant elsewhere, are used to effect a smooth transition. Since so much operative training is on the job, co-operative training schemes, in which several companies participate, have also come into vogue, though their growth has been rather slow. Such schemes, for instance, are operating in the West Riding and North Derbyshire and the Lancashire areas for training young forge workers and rolling mill operatives from small companies. These schemes call on the administrative services of the B.I.S.F. Area Training Staff.

Apprenticeship

Teaching craftsmen their trade through apprenticeship, which is the oldest systematised training in industry, has been dealt with next in the brochure. This system of apprenticeship is now on the threshold of change. The current trend is to provide fully-equipped training workshops and use modern teaching methods. This has led the industry to believe that the training of a fitter, turner, bricklayer, electrician, carpenter, plumber or painter could be completed in other than the usual five years. The industry's aim is an overall change in the pattern that might involve a shortening of the standard term of apprenticeship for most crafts and even a possible lengthening for some specialised crafts. That the length of apprenticeship for each trade should be reassessed is also one of the recommendations of the B.I.S.F. Training Committee. The Committee has urged the abolition of the present maximum age limit for entry into apprenticeship, as also the introduction of practical tests to establish standards of basic skill which must be reached before the apprenticeship is complete, and a widening of the range of skills taught in each trade. Changes, in this connection, would have to be gradual and subject to consultation with craft unions. Already, at the national level, companies and craft unions are in touch through a joint advisory committee on which sit six representatives of the B.I.S.F. Training Committee and six members of craft unions. At least one major company has by now negotiated changes in the apprenticeship for its electricians, mechanical engineers and painters.

The varied duties of a technician lie between the scientific work of the technologist and the skilled operations of the craftsman. A technician, incidentally, has been defined as a man who must have sufficient understanding of technical practices to undertake their application and control without needing the more advanced scientific knowledge that the technologist possesses. Technicians are required for process control, inspection, laboratory work, maintenance, planning and drawing offices. Many more will be needed as the industry advances technologically. In order that they might receive an adequate training for carrying out the increasing number of tasks that call for them—tasks that can free technologists from duties which do not require their educational level—the B.I.S.F. Training Committee has begun a detailed study of the jobs technicians do and the training that these require. One result of this study todate is the recommendation that technicians in laboratories and quality control departments should take the new three-year course for the City and Guilds of London Institute Metallurgical Technicians Certificate.

Future Technologists

The need for well-qualified and practical technologists to control the complex processes in a modern steelworks is growing. Colleges offering diploma courses in, for example, engineering or metallurgy, are attracting students from steelmaking areas all over Britain. One of these colleges, through liaison with the B.I.S.F., has taken special account of the industry's needs, by including in the syllabus more industrial metallurgy, lubrication, refractories and other subjects than is common with engineering courses. In its turn, the industry co-operates with the colleges by providing lectures in special subjects and by giving practical experience to staff. Training in the work is based on personal tuition by experienced members of staff working to a syllabus drawn up by the particular department. Trainees usually receive instruction in some form of engineering —mechanical, structural or electrical—or in one of the branches of laboratory work, metallurgy or fuel technology, and even in production administration and blast furnace burden development.

On the administrative and managerial side, too, the steel industry in Britain has been operating training programmes for (i) clerical workers. (ii) foremen or supervisors and (iii) managers. As for the first, several large companies have developed three to five-year training programmes that take clerical workers through all departments, and the industry is also looking to the new Certificate in Office Studies to introduce more secondary modern school-leavers to office work. In regard to supervisory skills, training within companies is supplemented by attendance at outside courses. The B.I.S.F. Area Committees keep under review the changing needs in foremanship training and adjust their provisions accordingly. Area courses for foremen are also run by the Area Training Organisation on behalf of companies. In management training, the established practice is in-company training, supplemented by outside courses of instruction. The term "manager" today includes more than the heads of production departments. Some of the biggest steel companies run residential courses for their managers or make use of some of the residential conferences run by Area Training Committees. Many steel companies nominate present or future managers for one of the two-month residential courses held at the B.I.S.F. Management College. Since the college was established in 1957, as many as 940 managers from 85 companies have attended courses there.

From the foregoing account of training facilities in the British steel industry two noteworthy conclusions emerge. One is the remarkable catalytic role played by the British Iron and Steel Federation which guides and organises training in co-operation with the industry. And the other is the pooling of experience and the exchange of ideas that take place through the medium of the Federation's Central and Area Training Committees. The systematic way in which the Federation and the industry have voluntarily organised and operated the diverse training programmes is worthy of emulation in this country.

ALL-WEATHER PORT AT RATNAGIRI

Work on the Rs. 2-crore scheme for the development of Ratnagiri (in Maharashtra coast) as an all-weather port is to commence shortly. The foundation stone of the 1,500-foot harbour wall to be built into Mirya Bay will be laid on the 20th inst. by Mr. Raj Bahadur, Union Minister for Shipping. The project is expected to be completed in three years' time. When completed, Ratnagiri will rank as the second all-weather port in Maharashtra, Bombay being the only one at present. It will, however, continue to be a minor port.

The decision to develop Ratnagiri as an all-weather port had been delayed due partly to some technical reasons and partly to a futile public controversy over the choice. But the Government of Maharashtra has at last made a firm choice, which has been welcomed widely because Ratnagiri has a vast hinterland, rich in agricultural and mineral resources. Besides its proximity to the iron mines, it has always had its importance as an intermediate port.

To begin with, a sum of Rs. 50 lakhs has been provided by the Union Government for expenditure on the Ratnagiri project in the coming year, while the State Government has allocated Rs. 20 lakhs as its share.

NEW PRODUCTS AND PROCESSES

Reversible Washing-line Holder

A DUTCH firm has brought out a washing-line holder that is said to be especially suitable for use on flat balconies. The frame of the holder consists of two seamless drawn steel tubes and two clamps, which can be attached to a wooden or metal balcony railing. The tubes are 70 c.m. long, with a wall thickness of 2 m.m. and a diameter of 19 m.m. The clamps consist of two profiled plates that are passed around the balcony rail and can be secured with four bolts and wing-nuts. An alternative design is used for fixing the holder to a stone balcony. On the top plate of each clamp a trough-shaped steel keyway is welded, in which the end of one of the tubes if fixed, again by wing-nut and bolt. Turning on its axis (i.e. the bolt), the tube can then describe an arc of about 150°. Thanks to this design feature, the wash, which in dry weather hangs outside the balcony, can, when it starts to rain, be placed under cover by flipping the frame inwards. The wash will then normally be sheltered by upstairs balconies. Welded at six points along the tubes are metal eyelets to which the washing lines are attached. By sliding the clamps apart along the railing the six washing lines can be stretched between the two tubes. If the tubes are three metres apart, the washing line has an effective length of 18 metres. If the spacing is greater, a third tube should be mounted between the first two. The entire washing-line holder is galvanised to prevent it from rusting. The holder weighs a little over 1½ kg. and patents are pending on it.

Capless Fountain Pen

A major fountain pen manufacturing company in Tokyo, Japan, has on sale a unique "capless" fountain pen claimed to be the first of its kind in the world. The novel fountain pen incorporates a unique contrivance. When the body of the pen is turned, the end opens automatically and the pen point protrudes, ready for use. Because it is sealed in when not in use, the pen can be clipped to a pocket without any fear of the ink leaking. Foreign manufacturers are said to have tried without success to produce this type of capless fountain pen. The Japanese manufacturer, however, completed the pen in four years by using special metal alloys and techniques. The manufacturer has acquired 40 domestic patents on the novel pen while applications for patents have been filed with the United States, Britain, France, West Germany, Italy, India and Brazil.

Special Light Domes

A Dutch firm has started marketing a light dome (lantern light) which gives maximum diffusion without loss of light. The dome, which is made of plastic (methyl methacrylate), is provided over its entire surface with circular micro-diffusers about 15 m.m. in diameter, which allow all sunlight to pass and at the same time completely disperse it. Where these domes are used, in the rooms below there is no trouble from direct rays of sunlight, local heat, reflexes or cast shadows. The dome is fabricated with a profiled rim so that where a double wall is desired two domes can easily be fitted one on top of the other. With the aid of corrosion-resistant aluminium clips the dome can be securely clamped on to any kind of base frame. Using this method of fastening there is no need for holes to be made for screws, thus precluding the possibility of leakages. Expansion and contraction can take place unimpeded. A double dome, where used, is secured in the same manner. Although the domes can be fitted on to any type of frame, special lightweight base frames can also be supplied that are fully finished on the inside and, moreover, insulated. Frames are also made to cater for circular domes over square roof openings. These light domes, on which patents are pending and which are the outcome of numerous tests conducted jointly with the Technical and Physics Department of the T.N.O. (Organisation for Applied Physical Research), come in five sizes, namely, two circular versions with diameters of 86 c.m. and 116 c.m., respectively, and three rectangular ones measuring 86 c.m. square, 86 x 116 c.m. and 116 c.m. square.

Cutting Coke Consumption in Blast Furnace

Dr. Istvan Péntek and his associates at the Firing Techniques Research Institute in Miskolc, Hungary, have been engaged for a considerable length of time on a problem of world-wide interest: how to replace expensive coke, traditionally used in blast furnaces during the production of pig-iron, by some other suitable fuel and reducing the amount required. Liquid or gaseous hydrocarbons, natural gas or oil could more economically be used and be more efficient if they could be mass produced. Specialists have unanimously agreed that a suitable solution would be to considerably increase the temperature of the blast in the furnaces. However, neither the construction nor the refractory material used in ordinary hot-blast processes have proved suitable for this, as they are bound to deteriorate under the increased thermal strain. Dr. Péntek's team has, however, succeeded in developing a new type of hot-blast plant construction which can be fired on an industrial scale with enriched fuel, without the necessity of using special refractory materials. This enables cheap natural gas, available in large quantities to be used and leads to a reduction of the amount of coke required. One of the hot-blast devices at the No. 2 Blast Furnace at Diósgyór has recently been rebuilt to this new design. The equipment has been in regular operation for the past month and has proved to be completely successful. Coke consumption in the blast furnace was reduced by more than the estimated ten per cent. In addition, the new equipment has the advantage of being simply and easily erected, and the expenditure is recovered within two months through economical operation.

Flame-resistant Cable

Cable with flame resistant qualities, capable of withstanding a standard flame test of 1093° C., is being produced by an Irish firm, Wandleside Warren Wire Company Ltd., Dunmurry, Belfast, N. Ireland. It is also resistant to heat and corrosion. The cable has been developed particularly for use in aircraft, on circuits where lower temperature cables are unsuitable, and for industrial use where heat, corrosion and flame are problems. The makers say an example of the cable's industrial use is in steel works. The cable can be supplied with copper conductors, or with special conductors, for use as thermocouple compensating cable. It can be made up in multi-core form. The secret of cable's particularly high flame and heat resistant qualities is in insulation, which consists of a combination of various materials, including glass and P.T.F.E., and in the method of manufacture. The new cable is lighter in weight, has a smaller diameter and is rated at a higher operating voltage than comparable cases, say the firm.

Ultrasonic Bonding of Fabrics

A technique which could elliminate conventional sewing in many manufacturing operations has been developed in Britain. It is designed for the bonding of man-made fibres, woven and non-woven fabrics, plastics and most structures of a predominantly fibrous composition. Basis of the development are the effects that result from the use of intense high frequency vibrations, when applied to materials, causing them to inter-weave, interlock or amalgamate with each other. When a number of layers of fabric are activated ultrasonically under a given pressure loading, they bond together so intimately that in tearing them apart the parent fabric can rupture before the treated zone. Microscopic examination shows that the bonded structure has become an integrated whole and there is no appreciable change in the nature of the bonded material. The effects of the process on differing materials, such as paper to plastic, are complex but the manufacturers claim that regardless of the precise physics in creating these unions, the resulting bond is as durable and stable as the parent materials. Man-made fibres such as nylon and terylene can be bonded with little or no embrittlement of the structure of the fabrics. With certain cloths a "threadless stitcher" or ultrasonic "sewing machine" can be used. The type of equipment varies considerably from one application to another, depending on the type of material, thickness and physical characteristics but essentially employs an ultrasonic probe operating in conjunction with a rotary or claw feed device, under carefully controlled pressure.

Wrapping Machine

A semi-automatic machine which applies heat-sealed wraps of polythene, polypropylene, P.V.C., or other suitable film to products of various shapes and sizes at rates up to 600 an hour, is being manufactured by a British firm. The manufacturers, Industrial Developments (Packaging) Ltd., Turnstill Street, Burnley, Lancashire, England, say it has special applications for textile, stationery, toy, fancy goods and confectionery manufacturers who are faced with the problems of swiftly wrapping products of various sizes and shapes. A quick adjustment of height and width enables it to handle any article up to 8 in. high, 20 in. wide and 30 in. long, while greater height can be obtained by permanent alteration to the sealing frame mounting.

Metal Recovery

A new range of portable and semi-portable magnetic metal recovery plants, designed to meet the needs of companies engaged in metal recovery operations on steelworks slag heaps, foundry and works waste heaps, is being produced by a British firm, Brimag (Industrial Magnets) Ltd., Stratford Road, Shirley, Solihull, Worwickshire, England. The unit is a self-contained electro-magnetic separator and screening plant designed for handling metal bearing slag, foundry or works waste at a feed rate up to 350 tons an hour. The function of the machine is to accept material fed into a hopper by a dragline excavator, face shovel, or similar earth mover, and then to feed the vibratory in a controlled and evenly distributed burden, over an electro-magnetic divertor drum. The waste material is discharged by a conveyor at the front of the machine and the magnetic material diverted into a vibratory grading and cleaning screen. This discharges magnetic scrap on to one conveyor and magnetic fines on to another. Both these conveyors are fitted into the side of the machine.

Cork Remover

A French firm—De Poncins and Cie, Paris 15—has invented a sensational cork remover using compressed CO_2 to pop out corks instantly and effortlessly. The keen-pointed needle is plunged through the cork, a short burst of CO_2 and the cork is automatically blown out undamaged and without affecting the wine. A real boon to restaurants, hotels, bars, cafes, etc., this device is indestructible and guaranteed for one year against defects. Cartridges are replaceable and provide 100 openings.

PHILBLACK*

Fast Extrusion Furnace Black

For excellent extrusion and calendering use Philblack A in your recipes. Philblack A rates A-1 for smooth, glossy surface...and for delightfully easy processing! Philblack A stocks are also noted for their smooth, easy extrusion characteristics and true-to-the-die accuracy. To impart a soft, satiny finish and pleasant, rubbery 'feel' to your moulded products...use Philblack A.

PHILBLACK A is now made at our Durgapur Plant.

Let any or all the types of Philblack work for you.

PHILBLACK G General Purpose Furnace Black.

PHILBLACK A Fast Extrusion Furnace Black.

PHILBLACK O High Abrasion Furnace Black.

PHILBLACK I Intermediate Super Abrasion Furnace Black.

NAB-PB-949

INTERNATIONAL MARKETING

POINT OF VIEW OF A U.S. BUSINESS MANAGER

By Robert Sackman

VICE-PRESIDENT, AMPEX CORPORATION, REDWOOD CITY, CALIFORNIA

[Mr. Sackman was the leader of the five-man team of senior U.S. industrial executives which conducted a series of seminars on international marketing in Calcutta, Madras, Bombay and New Delhi in November last. His views on the subject are, therefore, worthy of close study.—ED.]

MANY American businessmen have developed during the past few years a new international orientation and export consciousness. Until recently, we have been, for the most part, "inwardly oriented"; that is, the domestic market was regarded as the primary one and international markets were considered merely additional areas for sales of the same products. In the last 15 years, however, many of our businessmen have come to look at the world as their market place.

From ancient days, international trade has been one of the leading forces in shaping the destiny of nations. It is, perhaps, no exaggeration to say that on the expansion of this instrument of communication and physical exchange the fate of the world may hinge. In fact, one of our largest firms has incorporated this idea in its motto, "World Peace through World Trade."

However, world trade, like world peace, must be worked at—it does not just happen. In management, academic, government and labour circles in the United States, world trade has been receiving much study.

I would like to discuss in some detail six management principles which I think are fundamental to any business that has committed itself to enter world markets. While these principles are applicable to domestic business as well, each has a special importance in international business.

1. The company and its management must have a total market or customer orientation, international in scope.

2. The company must make an investment in new product development through controlled Research and Development programmes, particularly in products designed for world markets.

3. Continuing programmes for cost reduction, quality control, and new manufacturing methods and techniques must go hand-in-hand with new product development.

4. Managers are a company's most valuable asset. The time and money must be invested to select and train them.

5. Systematic planning must be provided to knit together all elements of the business, domestic and international.

6. Once a commitment has been made to international export, the company and all levels of its management must think and act as an international enterprise, if the company is to succeed in world trade.

Now, let us take each of these principles in turn.

What do we mean by "total market or customer orientation"? Modern marketing has caused us to change from the old philosophy of "sell what we can make" to that of "make what we can sell." In the field of international trade, the Japanese have done an outstanding job in following this principle. Since World War II, they have made a major effort to study and understand customer needs in the U.S. market, which they picked as a prime one. Through this study, they determined, for example, that the small battery-operated, transistor radio filled a customer need that had not been recognised by many of our manufacturers of similar products. The result is history: a classical case of the "make what we can sell" theory. The Japanese now have a substantial share of the market for all transistor type radios sold in the United States.

The second principle which I have stressed is management's willingness to "make an investment in new product development through controlled research and development, particularly in products designed for world markets." All too many companies, in making the transition from "inward," or domestic, orientation to an "outward," or international, orientation, do not face the fact that they now must compete with companies world-wide who are likewise making a determined effort to advance the state of the art, develop new products, find new applications for existing products and thus gain a foothold in new markets and increase participation in old ones. I speak here from the point of view of a company whose products are of high technological content. To be successful in these world markets, a company cannot sit by passively while market conditions change and competition introduces more advanced products, and then try to react to these by emergency counter-measures.

A chief characteristic of an industrial economy, particularly one which is in a rapid state of growth, is change. To do business successfully at home or overseas, a company must be a leader in change. By providing the basic ingredient, research and development, to produce new products, a company is, in effect, changing the shape of the market, rather than running the risk of having to react to market conditions changed by others with a product the market will not buy.

The next management principle is that of "continuing programmes for cost reduction, quality control and new manufacturing techniques must go hand-in-hand with new product development." When any company, whether in India or the United States, makes the decision to leave its relatively sheltered domestic market, it finds itself in the arena of world-wide competition, with the customer now looking for the product that will give him the features he wants at the lowest cost and best quality, wherever it may be obtained. In the case of technical products particularly, we have found that low cost labour, in and by itself, is not the answer; but, rather, it is consideration of the total of all costs—overhead and direct—plus the great factor of productivity, that tell the story. Innovation in manufacturing methods and techniques, tooling and automated production, plus an efficient and economic overhead structure, are the keys to cost competition in world markets.

U.S. industry has had to make several major changes in its manufacturing methods because of its experience during World War II. From 1939 to 1945, most of our industry operated on the basis of what we have called "cost plus fixed fee contracts," issued by the Government. That is, the Government paid all operating costs, plus a 4-10 per cent fee on total cost—in effect, a guaranteed profit. Under these conditions, the cost of manufacture became secondary. Our total efficiency was low; manpower was added at all levels.

At the war's end and as a result of this lack of cost consciousness, U.S. industry found itself in a dangerously uncompetitive condition. If found it could no longer keep excessive manpower, both overhead and direct, added during the war years, and still be competitive in the world market. Twelve to eighteen months of reorganisation and readjustment at all levels were needed to bring industry back to an economic and competitive level.

The second change occurred in the early 1950's, when the new plants and methods of Europe and Japan began to export products of high quality and technical calibre into the U.S. market and other world markets at very competitive prices. Here, again, innovation in manufacturing methodology took place—the use of data processing computers for production and inventory control cut inventories and improved manufacturing cycle time. A new field of value analysis came into being, and more companies developed standards systems, all to the end of obtaining for the customer a better product at lower cost, profitable to the company but competitive in world markets. In not every case were companies successful, but many were.

I believe that opportunities exist for India to be a contender for leadership in quality and low cost manufacture in many product markets.

The next point I made earlier was that managers are the company's most valuable asset, and we must invest the time and money properly to select and train them. The equity in your managers is not shown on your books. They are not added up as values of X rupees. They are, however, more valuable than the total remaining resources of the business. Thus, a company should be prepared to invest substantial amounts of time and money in the development of management personnel. Particularly in growth companies, it is an ever-present challenge.

Many companies in the United States, ourselves included, have an extensive college hiring programme, and we pay all or part of the undergraduate or graduate training of engineers and business specialists. We also select promising young students from our secondary schools for technician training, give them a combination of schooling and on-the-job training.

Last, but not least, our middle and top management are encouraged to participate in management seminars; to attend courses in their own fields and, in some cases, to go back to the university for specialised courses. It is my own personal belief that one of the most important jobs I have as a manager is to coach, train, and guide the people who work for me. All too often, when faced with the daily problems of running a business, we forget that we must give the younger man an opportunity to learn to manage by managing. Let him make mistakes, and make this a part of his training programme.

A matter of particular urgency in the area of management development was highlighted by Dr. Homi Bhabha, Director of the Indian Atomic Energy Laboratories, in a recent interview in the United States. Dr. Bhabha stated: "One of the most serious manpower problems is the lack of managers who have the technical background to direct laboratories, factories...." The president of my own company shares this view and has frequently emphasised that no manager of the future can afford to be technologically illiterate. This does not mean that he must be a scientist or engineer, but he must have some understanding of the disciplines in which his company is working.

The fifth principle I have mentioned is systematic planning to knit together all the elements of the business, domestic and international. I believe that the single most important function of the manager of an enterprise is to plan—to look ahead. No one else in the firm can really have the responsibility for charting the course. No one else has as many facts upon which to base decisions, to determine realistic goals and the best methods of achieving them. For, in addition to broad policy planning, there must be planning in regard to market, product, manufacturing, research and development, personnel, facilities, and finances, too.

This job of total planning cannot be done without considering the international phases of a company's business. As a matter of fact, the domestic division manager must have the responsibility for participating in the planning of the international operations. Just as an obvious type of example, when a research and development programme for a new product is started, the characteristics which are required in the international market place are taken into account with those of the domestic. If they are not—and this has happened at times—it is a costly process to re-tool and re-design a special product or a modification of the domestic product for the international field.

The sixth and last management principle, and one that I think sums up the whole, is that, once a commitment has been made to international export, the company at all levels of its management must think and act as an international enterprise. I mentioned earlier that a major change had taken place in our industry over the past 15 or 20 years. It has recognised the fact that it cannot serve international markets simply by tacking on to its domestic structure an organisation known as an "export operation" without making the other necessary changes in the thinking and philosophy of everyone, from the president on down to the factory supervisor. All must be made to see clearly the potential of the international market. The managers must be made to travel overseas and visit with overseas customers, to convince themselves of the tremendous potential for their product in the overseas market and the potential profit that would reflect back on the division if the international operation could be properly served.

This type of planning and leadership will convert a group of men from separate camps of domestic and international managers within the same company to a unified group dedicated to the fact that it is in their company's and their country's interest to become a truly international organisation.

CELLULOSE ACETATE INDUSTRY

EAST ANGLIA PLASTICS' INTEGRATED PROJECT

A SIGNIFICANT step towards the establishment of an integrated acetate industry in India was taken when the foundation-stone of the cellulose acetate factory of East Anglia Plastics (India) Ltd. was laid on the 13th inst. by Mr. Lal Bahadur Shastri at Visakhapatnam, in Andhra Pradesh. The cellulose acetate project of the Company will be a completely integrated unit designed to produce a whole range of chemicals, plastics and textiles from such indigenously available raw materials as cotton linters and alcohol. The unit will also produce, in intermediate stages, cotton-wool, cotton for explosives, acetic acid for rubber and plasticizers industries, acetic anhydride for aspirin manufacture and acetylated products, besides the ultimate product of acetate flake which finds many uses in the manufacture of moulding granules, plastics, X-ray, photographic films, lacquers, and for producing filament for man-made silk industries and staple fibre for woollen industry.

The nucleus of the integrated project of the Company is the small factory at Jessore Road near Calcutta which produces cellulose acetate moulding powder and P.V.C. compounds out of imported raw materials. This factory has an installed capacity of 2,000 tons per annum but actual production has been much less, thanks to fortign exchange shortage which has placed a limit on imports of raw materials. It is to overcome this limitation that the Company proposes to produce the raw materials within the country itself by integrating the compounding scheme with the manufacture of C.A. flakes. The Company has succeeded in securing the technical collaboration of an internationally reputed group of industries in the flakes project. According to the terms of the collaboration agreement, the fee for the collaborator is to be paid in fully paid-up shares of the Company; no separate royalty is payable. The project consists of five independent plants. These are: (1) bleaching plant, (2) acetic acid plant, (3) acetic anhydride plant, (4) acetylin plant, and (5) acetic acid recovery plant. The principal plants and equipment will be imported through the foreign collaborator on deferred payment basis under a French credit, the repayment of which has been guaranteed by the State Government of Andhra Pradesh. The plant will have a capacity of 10 tons of cellulose acetate a day.

Demand and Production

The significance of this venture of East Anglia Plastics (India) Ltd. can be appreciated only if it is viewed against the background of the rising demand for cellulose acetate plastics and filaments in the country. The consumption requirements of cellulosic plastics at the end of the third Plan is estimated to reach 7,000 tonnes per annum. At present, the country does not produce any cellulose, while the demand is only partly met by imports which aggregate about only 2,000 tonnes of cellulose acetate. In view of the foreign exchange shortage, much larger imports to meet the rising demand is clearly out of the question. Hence the need for manufacturing cellulose acetate within the country itself. Cotton linters and power alcohol being available in plenty in this country, by virtue of its position as one of the largest producers of cotton and sugar in the world, conditions are said to be ideal for the development of cellulose acetate industry in India. Its slow growth so far is attributed by some to lack of technical "know-how" about acetate industry which has been surrounded by a veil of secrecy. Consequently, acctate rayon and thermoplastic industries have not developed as much as, say, viscose rayon industry. One of the great disadvantages of the latter, however, is that rayon grade wood pulp, the principal raw material, is not abundantly available. In this respect, acetate industry has a great advantage in that its main raw material, namely, cotton linters and power alcohol, can be found within the country. The only disadvantage in depending upon cotton linters and power alcohol is the absence of stability in their production. As readers are aware, the output of both cotton and sugar varies widely, as it depends, among others, on the trend of monsoon and other weather conditions. The experience of some of the other chemical industries based on power alcohol has not been happy, their progress having been erratic. It would be interesting to know what steps the East Anglia Plastics proposes to take to overcome this defect and ensure a steady flow of its basic raw materials at stable prices. It is true that the main object in locating the factory in proximity to the Caltex Oil Refinery is to facilitate the future extension of the Company's activities by linking it to the petrochemical industrial complex that is expected to come up there. But that will take time, being more or less a long-range project.

From the point of view of demand for cellulosic plastics, there is, of course, tremendous scope for the industry. The varieties of products cellulose acetate industry can produce and the numerous uses of cellulose acetate make it an important industry for any rapidly developing country. This industry, it may be noted here, has attained a high degree of development not only in the U.S., the U.K., France and Germany but also in Japan, Italy, Hong Kong, South America and Mexico. At one stage, when many varieties of synthetic man-made fibres and other plastics appeared in the market, the future of acetate was considered not bright. But it has now been proved beyond doubt that acetate, by virtue of its unique characteristics such as resiliency, toughness, high impact strength, colourability and immunity from fire hazard, is highly suitable for use in yarn, plastics, film and lacquer.

Varied Uses of Cellulose Acetate

This versatility of cellulose acetate was clearly brought out by Mr. D. N. Mitra, a Director of East Anglia Plastics (India) Ltd., in his welcome address at the foundation-stone-laying ceremony. Characterising the modern age as the age of plastics and cellulose acetate as a very important member of the plastics family, Mr. Mitra outlined the numerous uses of cellulose acetate in the following words:

"One cannot fail to appreciate its versatility when one realises how often during his daily life one uses cellulose acetate end-products. As you begin your day, brushing your teeth, combing your hair, you use cellulose acetate. Your garments, be it silk, worsted fibre or wool, probably are spun from cellulose acetate in one form or the other. As you steer your car, hold your tool handles, use your pen, dictate your talk to record on a tape, smoke your filter-tip cigarette or breathe the filtered air in your air-conditioned room, you perhaps cannot think of any other plastid material than cellulose acetate which is more suitable for the manufacture of automobile steering wheels, tool handles, fountain pens, tapes, cigarette or air filters. When you click your camera or watch a film-show you appreciate in the back of your mind the versatility of this plastic, which is safe and not inflammable.

"As your wife goes for shopping for toys or household articles or other materials in beautiful and attractive transparent packages she cannot avoid buying cellulose acetate products. A modern housewife lives with cellulose acetate perhaps throughout the day with her spectacles, sun-glasses, the knitting needles, kitchen whisks and mixers, hair driers and vacuum cleaners.

"Even when you retire to bed, switch off your bed-room lamp and put away your eye-glasses, the lamp shade and filter-end of your burning cigarettes quietly remind of acetate and you wonder how often during the day you have made use of cellulose acetate either as plastics, film, filters, yarn or lacquer."

In his address on the occasion, Mr. Lal Bahadur Shastri conceded that India could not afford to lag behind other countries in plastic production for long as plastics were needed for use not only in consumer industries but also in engineering and construction industries. It is, however, necessary to ensure, as Mr. Shastri emphasised, that the goods produced both for domestic consumption and exports are of high quality and reasonable price, especially because of the keen competition in the field of plastics from Japan and Hong Kong which are offering quality goods at low prices. Exports of plastic goods from India were valued at Rs. 76 lakhs in 1961-62 and Rs. one crore in 1962-63. The export target for 1963-64 is two and a half times this figure, Rs. 2.50 crores, to be precise. Good quality and competitive price hold the key to success in achieving this target.

The management of East Anglia Plastics deserves to be congratulated on its venture in setting up an integrated project for the manufacture of cellulose acetate in the country. When the project is completed and production starts the country can be truly said to have a cellulose acetate industry, capable of producing both the raw materials and the finished product from them.

How does this help Defence?

Prompt disposal of work—leading to speedier implementation of Plan schemes—producing more resources for Development, more supplies and equipment for Defence.

Your job is vital to Defence

MONTHLY ECONOMIC REVIEW OF U.K.

REFLATION IN RIGHT DOSE YIELDS SATISFACTORY RESULTS

NEW YEAR PROSPECTS REASONABLY GOOD

By W. T. C. King

EDITOR, *THE BANKER, LONDON*

BRITAIN'S economy at the end of 1963 was in very different shape from what it was at the beginning. The winter of 1962-63 marked the bottom of the economic cycle when abnormally severe weather sharply reinforced other forces that were putting a brake on economic activity.

Even before that aggravating influence, the check to expansion had given place to an actual decline in the fourth quarter of 1962. The seasonally corrected index of industrial production dipped to an average of 115 from its third-quarter peak of 116 (1958=100), and even the total national output (which is much less susceptible to fluctuation than industrial production alone) declined fractionally for the second successive quarter to £5,531 million at 1958 prices, as compared with the second-quarter peak of £5,611 million.

In consequence, by the mid-September count in 1962 the number of persons registered as unemployed in Great Britain had risen to 566,000 or 177,000 more than at the corresponding date in 1961 and the ratio of unemployed to the labour force had risen to 2.5 per cent. The exceptional severities of the weather in the next two months carried the total to a new post-war peak (apart from the extraordinary fuel-crisis dislocation of 1947) of 878,000 and the ratio to 3.9 per cent. Yet, by the last count in 1963, the total of unemployed had been brought down to just under 460,000, showing a net decline of more than 100,000 over the 12 months and the ratio was down to two per cent.

Industrial Production

That is, one important measure of the change in economic climate that has taken place in 1963; but the movement in some other indicators has been at least as striking. The latest available index of industrial production relates to the month of October. Even so, the seasonally corrected figure at the new peak of 122 was already showing an advance of nine points from its lowest 1962 level and of 13 points from the weather-distorted index of January 1963. If month-to-month variations are smoothed by taking a three-month average, the latest available figure shows an advance at an annual rate of fully six-and-a-half per cent as compared with the average for the fourth quarter of 1962.

In order to observe this rate of advance in perspective, it needs to be remembered that the level of industrial production for the final quarter of 1962 (which happened also to be the same as the average for the whole of that year) was less than two-and-a-half per cent above the average for the year 1960. The driving force behind this rather striking swing into re-expansion was unquestionably the series of deliberate measures of reflation introduced by the Government and monetary authorities progressively from about the middle of 1962 onwards.

By the end of that year there were differences of opinion among public commentators about whether further reflationary steps would be needed in 1963, but, early in the year, virtually everyone agreed that more would have to be done and the debate shifted to the problem of scale—with some highly respected unofficial commentators advocating very large injections.

Indeed in the event, the Budget of last April did give tax reliefs on an unprecedented scale (if measured in terms of money values), but considerably smaller reliefs than the most enthusiastic *pundits* had thought necessary. Some of these observers actually predicted that what had been done would only just about suffice to prevent a further rise in unemployment if seasonal fluctuations and the readjustments after the abnormal winter were excluded.

This calculation was based in part on the assumption that the degree of under-utilisation of the employed labour force by the fourth quarter of 1962 (the extent of this could be roughly deduced from the smallness of rise in output over a two-year period in which capacity had been mounting steadily) would permit a substantial rise in output with only a small intake of labour. In the event, as has been shown, unemployment fell much more rapidly than had been expected. This may mean that employers have on average been content to retain a considerable margin of slack in utilisation of the employed labour force, so that the scope for further expansion of output from existing capacity may be larger than might appear from the level to which the ratio of unemployment has fallen.

On the other hand, it is important to remember that the average ratio for Great Britain conceals wide variations between the several regions. Whereas in Scotland and the northern region, the ratio is still over four per cent, in London and the south-east and in the Midlands it is down to only 1.2-1.3 per cent, which must be very close to the effective limits of full employment. If such ratios are sustainable without undue strain, it is only on the basis that mobility of workers from regions of higher unemployment is sufficient to provide a safety valve.

Overstrain Avoided

In retrospect, it is plain that the scale of reflation was fully adequate to achieve the chosen aim—namely, to take up the slack in productive capacity as quickly and considerably as was feasible without running the risk of developing such a momentum of demand as would force the economy into a new crisis of overstrain.

In fact, the rate of expansion of output has reached virtually the best expectations; and anything faster might have been dangerous. Even as it is, the climate of expansion, the general confidence that it will continue, and the tightening of conditions in the labour market have had their repercussions in wage bargaining.

By far the most considerable source of doubt at the moment is whether the next round of wage increases can be kept, on an average, from going much beyond the Chancellor's target average of three to three-and-a-half per cent per annum. Several important settlements have recently been reached on the basis of around five per cent—though in some instances this has been equivalent to a considerably lower annual rate—and the big question now is whether these can be clearly established as justifiable special cases and thus prevented from being a dangerous precedent in the general run of negotiations.

Aside from this danger, the prospect for the coming year looks reasonably favourable. An important characteristic of the reflationary process up to date is that it has not been substantially based, as was the upturn of 1959, on any boom in spending on consumption, nor has there been any such massive injection of consumer credit as occurred four years ago.

On this occasion, the upturn in aggregate demand came first from the investment outlays of the public sector and from exports and these were flanked by a moderate growth in consumption. It seems probable that, in 1964, all the principal sectors of demand will be expanding simultaneously, though the rate of growth in public sector investment should slacken.

Industrial Investment

At the same time, fixed industrial investment by the private sector is expected soon to turn upwards again, after its declining trend since the third quarter of 1961; and at some stage during the year total demands on productive resources seem bound to be swollen by an increase in the flow of supplies into stocks, including work in progress.

Contrary to expectations, the latest quarterly estimates of industry's stocks suggested that, in the third quarter of 1963, after allowing for seasonal factors, there was an actual de-stocking—to the extent of £67,000,000 (at 1958 prices)—the first perceptible movement of this kind since the second quarter of 1958. If stock-building demands proved to be large and if the other sectors of demand were all expanding as considerably as has been estimated, it would not be surprising if some braking action became necessary before the end of the year.

The National Institute of Economic and Social Research, an unofficial but highly expert body of economists, estimated a few weeks ago that, by the end of 1964, the ratio of unemployment, seasonally adjusted, was likely to be down to 1.6 or 1.7 per cent, which many people (but not the Institute) would regard as close to, if not beyond, the safety limit. And this estimate was framed at a time when it was assumed that the upturn in stock-building had already begun.

There is no general expectation, yet, however, of any return to major restraints. But both the Prime Minister and the Chancellor of the Exchequer have emphasised that, in view of the scale of the programmes of public-sector expenditure, there is not likely to be scope for "general or substantial" reductions in taxation.

Meanwhile, there is reasonable ground for hoping that the expansionary trend will not this time have to be slowed up prematurely because of a threat to sterling or to the balance of payments. Over the past year, exports have risen somewhat faster than imports, and, although in the latest months this relationship has been reversed, Britain's balance of payments as a whole has remained in a reasonably healthy state, and the future prospects for exports are regarded as good.

The seasonally corrected quarterly estimates show that the current account was still in small surplus by the third quarter of 1963—at £15,000,000, as compared with £23,000,000 in the second quarter and £70,000,000 in the first. The unadjusted figures for the nine months showed a surplus of £117,000,000, which was actually more than sufficient to cover the estimated net outgoings of long-term capital account. (These, at £95,000,000, were running at a substantially smaller rate than was usual a few years ago.)

This heartening performance, combined with the rising earnings of the overseas Sterling Area, explains why the central gold and dollar reserves of the Sterling Area have continued their upward trend (special transactions apart) in spite of the fact that the relative levels of international interest rates no longer favour a flow of short-term funds towards London. Stock-building demands for imports, or changes in international influences, may yet cause pressure on sterling; but, so long as the underlying state of the balance of payments remains healthy, it will be reasonable to meet any such pressure by drafts on the reserves or on Britain's large international credit facilities without immediate recourse to major measures of domestic restraint.

THE BELAPUR COMPANY LIMITED

(*Concluded from page 97*)

production for the country at 33 lakh tonnes, which is 50 per cent higher than the production during the past year. With a view to reaching this target, sugarcane prices have been increased from time to time during the past few months and the controlled selling prices of sugar have also been enhanced twice during the past nine months in the hope that more cane will be attracted to the factories, but, from reports coming in from various parts of the country, it would appear that the eventual sugar production will fall far short of the set target. In Maharashtra alone, the objective is 6.5 lakh tonnes, but most joint stock factories find themselves short of the required quantity of cane to produce the amount of sugar which the private sector will have to make as its contribution to the target set by the State Government. It is, therefore, clear that the remedy will have to be sought in some other direction, as, for instance, an excise duty on *gur* which at present is entirely free of duty, or some form of zoning to ensure that all cane within a fixed factory area goes to that factory for sugar manufacture. A Zoning Committee within the State Sugarcane Committee is in fact already in existence, but, upto now, that Committee has not been able to produce a workable scheme.

There is, therefore, much uncertainty in the future of the industry, but I am sure that, with a more realistic and bold approach from both Central and State Governments, those uncertainties can be ironed out and the sugar industry put on to a more stable and sound base, so as to avoid, as far as possible, the necessity for having to make changes and introduce controls from time to time to take care of temporary difficulties.

GREAT EASTERN SHIPPING FARES WELL

SUBSTANTIAL EXPANSION OF FLEET PROPOSED

THERE is only one way to describe the working results of the Great Eastern Shipping Company Ltd. (Managing Agents: Messrs. A. H. Bhiwandiwala & Co. (Bombay) Pvt. Ltd., Bombay) for the year ended 30th June 1963, and it is that these are excellent. Operating earnings by way of freight and charter hire, which had advanced by Rs. 40.61 lakhs to Rs. 326.48 lakhs during the previous year, have spurted by as much as Rs. 126.42 lakhs to reach what may be called a record level of Rs. 452.90 lakhs, while other income, including the profit on sale of assets, is higher by Rs. 7.39 lakhs at Rs. 24.25 lakhs. Total income during the year has thus marked a rise of about 37 per cent over its previous level. Since as against this the increase in total expenses is of the order of 38 per cent only, that is, from Rs. 268.42 lakhs to Rs. 350.14 lakhs, the profit-margin (ratio of gross profit to operating earnings) has widened by about five points to 28 per cent. This has resulted in raising the gross profit to Rs. 127.01 lakhs from Rs. 74.92 lakhs a year ago. But this has inevitably invited a higher provision of Rs. 5.07 lakhs as against Rs. 1.05 lakh for Managing Agents' commission and of Rs. 64.70 lakhs, as against Rs. 61.55 lakhs, for depreciation. No provision for taxation has been made for the third year in a row, for reasons set forth in the following extract from the Directors' report:

"In view of accelerated depreciation on ships claimed for income-tax purposes in the past years, the depreciation to be claimed for income-tax purposes during the year under report would be lower than that provided in the books of accounts. The taxes paid in foreign countries would also be disallowed expenditure for Indian income-tax purposes. The assessable profit would, therefore, be higher than the profit as for our books of account. Your Directors, therefore, consider that the profit and loss accounts for the financial year must be debited with a development rebate reserve of Rs. 51.75 lakhs (Rs. 16 lakhs for the previous year) for the purpose of availing the benefit of the development rebate allowed for income-tax purposes in respect of the profits for the year under report. As such, there would be no tax liability."

After making the essential provisions as noted above, what has remained as net profit is Rs. 57.24 lakhs which compares very favourably with Rs. 12.32 lakhs for the year before. Adding to this the amount brought forward from the previous year, a sum of Rs. 58.29 lakhs has become available for appropriation. Out of this Rs. 51.75 lakhs have been credited to the statutory development rebate reserve as stated earlier and a sum of Rs. 5.25 lakhs have been transferred to the general reserve. The dividend has been passed over and the balance of Rs. 1.29 lakh is being carried forward as against Rs. 1.05 lakh brought in.

The rapid progress achieved by the Company, particularly since 1961 when it suffered a setback in profit, is clearly brought out by the following comparative figures:

(In lakhs of rupees)

	For the year ended 30th June			
	1963	1962	1961	1960
Operating earnings	452.90	326.48	285.87	336.52

Low	11.40	11.24	12.76	15.20

* Fully subject to deduction of tax.
† Of this only 2 per cent. was subject to deduction of tax.

In order to compensate the shareholders for the loss of dividend, the Directors had originally proposed the capitalisation of Rs. 25 lakhs standing to the credit of the capital redemption reserve account and Rs. 5 lakhs from the general reserve No. 2, representing the untaxed profits set aside in the past, for the purpose of issuing bonus shares in the proportion of one fully paid equity share of Rs. 10 for every two fully paid equity shares of Rs. 10 held. They had also recommended that proportionate benefit may be made available to the holders of partly paid shares by capitalising a further Rs. 15 lakhs out of the sum lying in the general reserve No. 2 and applying the same for crediting partly paid equity shares with an amount of Rs. 2.50 per share so as to increase the amount paid-up on every partly-paid equity share of the nominal value of Rs. 10 from Rs. 5 to Rs. 7.50 per share. The Government, however, was not agreeable to this proposal. After discussions with the Controller of Capital Issues, the Directors have modified the earlier proposal as follows:

One bonus share of Rs. 10 each for every three fully-paid equity shares of Rs. 10 each and one fully-paid bonus share of Rs. 10 each for every six partly-paid equity shares of the nominal value of Rs. 10 each on which only Rs. 5 have been called up.

Besides the Directors have decided to make the final call of Rs. 5 on the partly paid shares; this call is payable by 1st February 1964.

The financial position of the Company as at 30th June, 1963 may now be briefly summarised. The paid up capital is unchanged at Rs. 90 lakhs, all in equity shares of Rs. 10 each, half fully paid and half paid to the extent of Rs. 5 per share only. It is supported by reserves aggregating Rs. 272.93 lakhs so that the equity per share works out to more than Rs. 40 against nominal value of Rs. 10. Secured loans have advanced from Rs. 626.94 lakhs to Rs. 682.82 lakhs and so have current liabilities and provisions from Rs. 110.33 lakhs to Rs. 142.75 lakhs. With additions worth Rs. 23.82 lakhs during the year, the gross block has gone up to Rs. 1,034.30 lakhs and, on deducting therefrom Rs. 349.50 lakhs as depreciation provided so far, the net block works out to Rs. 684.90 lakhs. Investments, mainly in debentures of Madurai Mills Company, are carried in the books at a cost of Rs. 20.82 lakhs, while current assets, loans and advances total Rs. 497.89 lakhs. Receipts on account of incomplete voyages as at the date of the balance-sheet are shown at Rs. 28.36 lakhs, as against an expenditure of Rs. 13.25 lakhs.

As at the date of balance-sheet, the fleet of the Company consisted of 15 vessels, with a gross registered tonnage of 95,872 and deadweight tonnage of 138,255. Before the close of the financial year, the Directors decided to add five to seven ships to the Company's fleet. They now report the acquisition of five ships at an approximate cost of £1.3 million or Rs. 1.75 crore. Out of these two have already been delivered and the remaining three were expected to be delivered soon. With the acquisition of these five ships and discarding of one old ship, the gross registered tonnage has risen to 127,918 and the deadweight tonnage to 183,839. It is expected that, on the basis of the present freight rate level, this acquisition of five ships will bring about an increase of about Rs. 1.5 crore in the freight-earning potential of the Company. The Company has also placed an order, subject to the approval of the Government of India, with the Japanese shipyard for building a bulk carrier of 36,000 tons with an option to build another at an approximate cost of Rs. 2 crores each. These ships are proposed to be utilised for carriage of such bulk cargoes as ore and foodgrains.

The impact of the expansion already effected after the end of the year under report and to be achieved by the building of two bulk carriers will be reflected in the working of the Company as under:

(*a*) Since the two vessels have already been delivered and the remaining three vessels will be delivered by December 1963, their operation will reflect itself partially in the working of the current year and fully in the financial year 1964-65.

(*b*) If the Company is able to achieve the contemplated expansion by building two bulk carriers which are expected to be delivered to it in the second half of 1965 and 1966 their operation will influence its financial results from 1965-66 onwards.

As regards the prospects for the current year, the Directors have reported to the shareholders as follows:

"The recent rise in the international freight market has coincided with the seasonal rise that takes place during winter months when Europe requires additional fuel. It is, however, felt that the recent improvement in the freight market is more than seasonal and more lasting. This hope is based on the requirements of the two major powers, Russia and China, for contemplated movement of foodgrains from U.S.A., Australia and Canada. Since the Company has already executed or made commitments for fairly major expansion, it can hope to benefit, provided improvement in the international freight market lasts for some time."

"The coastal freight structure is again being reviewed by the Government. It is hoped that action taken by the Government as a result of this review will impart stability to coastal shipping and also provide for self-regulating adjustment of the level of coastal freight rates to the level of the operating costs for the future."

OIL INDIA LIMITED

Oil India Limited has declared an interim dividend of Rs. 40 per share (of Rs. 1,000 each) for the year 1963. The authorised capital of Oil India is Rs. 50 crores. The subscribed capital of Rs. 28 crores is held in equal proportions by the Government of India and the Burmah Oil Company, the two partners in the concern. A debenture issue of Rs. 30 crores was raised to meet the rupee cost of the Company's pipeline project. The foreign exchange cost of the project was provided by the Burmah Oil Company and this amount, approximating to £10 million, was later converted into medium- and long-term loans through a debenture raised by the Burmah Oil Company in London and loans from financial institutions in London under B.O.C.'s guarantee. The U.K. Government also advanced a loan of £3 million for this project.

There were limitations imposed upon actual production and sales of crude oil during the year 1963 due to unavoidable delays in the completion of the Barauni refinery, but the Company's operations during the year 1963 were otherwise satisfactory according to plan. Sales of crude oil during the year to the Gauhati refinery and also to the Assam Oil Company refinery at Digboi amounted to a total of approximately 750,000 tonnes.

During the year, 29 wells were drilled, as against the target of 30 wells, bringing the total number of wells completed to 171, of which 132 wells are successful producers of oil and gas, 22 await further testing and 17 have proved dry. It is said that the number of wells drilled during the year would have been more but for the difficulties encountered towards the end of the year in the acquisition of land for drilling sites. New techniques such as directional drilling and dual completion were applied for the first time in India, and the field potential was brought to three million tons production per annum. When this quantity of crude oil is refined, products of a foreign exchange value of over Rs. 35 crores, it is claimed, need no longer be imported. Its 720-mile-long Nahorkatiya-Gauhati-Barauni pipeline, technically one of the most modern and automatic of its kind in the whole world, was completed throughout its entire length early in 1963. The crude conditioning plant at Duliajan especially designed to make it possible to transport the waxy Nahorkatiya crude at cold weather underground temperatures in Assam was also completed at a capital cost of approximately Rs. 1.6 crore.

Oil India also undertook exploration and test drilling in its exploration licence area, granted in January 1963, under a Rs. 2-crore programme which will continue in 1964 and 1965. In the first working season March-June 1963, a seismic survey covered 220 line miles and, for the next working season from September 1963 to June 1964, nearly 700 line miles are expected to be covered. The test well at Tinali has reached a depth of 12,586 ft. and the second test well spudded in at Bogapani on 21st December is already 3,000 ft. deep.

KESAR SUGAR'S PROFIT DOWN

NEW CHEMICAL COMPANY TO BE FLOATED

DURING the year ended 31st July 1963, the sale proceeds and the gross profit of the Kesar Sugar Works Ltd. (Chairman: Mr. Tulsidas Kilachand, Bombay) have shown divergent trends. The turnover had expanded handsomely from Rs. 229.71 lakhs to Rs. 291.00 lakhs or over 26 per cent but the gross profit has declined, though moderately, from Rs. 15.51 lakhs to Rs. 14.69 lakhs in spite of a rise of Rs. 3.35 lakhs in other income. The improvement in sales has, of course, been due to the heavy reduction in the stocks of sugar as is evidenced by the decrease of about Rs. 70 lakhs to Rs. 89.22 lakhs in the value of closing stocks while the deterioration in profit-margin (ratio of gross profit to sale proceeds) from 6.7 per cent to five per cent has been due principally to a poor crushing season as will be seen subsequently. In addition to the drop in gross profit, essential provisions too have increased, for depreciation from Rs. 4.28 lakhs to Rs. 4.38 lakhs and for taxation from Rs. 5.25 lakhs to Rs. 6 lakhs, so that the result in net profit is lower by Rs. 1.67 lakh at Rs. 4.31 lakhs. Nevertheless, the ordinary dividend has been maintained once again at 20 per cent, subject to deduction of tax, but since it is also payable proportionately on the new partly paid shares the total amount to be disbursed is Rs. 4.63 lakhs against Rs. 4.50 lakhs for the preceding two years.

The working results of the Company for the past four years are presented synoptically in the following comparative table:

(In lakhs of rupees)

	For the year ended 31st July			
	1963	1962	1961	1960
Sale proceeds (gross)	291.00	229.71	224.97	191.28

* On Rs. 50 paid shares.
† On Rs. 40 paid shares
Note :—All dividends are subject to deduction of tax.

Owing to unsatisfactory weather conditions and the diversion of sugarcane to *khandsari* and *gur* manufacture, there was a substantial drop in cane supplies during the year under report and the factory could crush only 1,792,463 quintals of cane in 161 days as against 2,372,933 quintals in 206 days during the previous season. Consequently, sugar production declined heavily from 230,202 quintals to 176,950 quintals even though the recovery was better, being 9.87 per cent as against 9.70 per cent in the preceding season. As for the distillery, the production and offtake of alcohol improved further during the year being the highest on record so far. This was mainly because the synthetic rubber factory at Bareilly commenced lifting alcohol from January 1963 onwards. As there is now sufficient demand for alcohol for internal consumption as well as for export, the Government has dispensed with the scheme of compulsory admixture of alcohol with petrol. Though the demand seems now to be assured, the non-availability of molasses in large enough quantities may come in the way of further increase in production. The business of the subsidiary, Distillers' Trading Corporation Ltd., also showed good progress during the year. The Company has now assigned its export contract to the subsidiary which would carry on the business throughout the year. The prospects of exports for the current year, however, are not certain. At the chemical factory, various efforts made to improve the working resulted in increasing the sale of chemicals but profit showed little improvement, owing to continued disparity between rising costs of manufacture and the selling prices of chemicals manufactured by the factory.

As regards the scheme for the manufacture of sodium hydrosulphite and allied chemicals at Baheri in technical and financial collaboration with A.C.C. (Brotherhood) Ltd., it was decided, as desired by the Government of India, to float a new company for undertaking the said project. A new company has accordingly been registered under the name Kesar Chemical Ltd. with an authorised capital of Rs. 2.50 crores of which equity shares of Rs. 80 lakhs are to be issued presently. The Directors propose to invest Rs. 20 lakhs in the equity capital of this new company and to move the necessary resolution seeking the shareholders' sanction at the forthcoming annual general meeting.

It will be recalled that, during the preceding year, the unissued 35,000 equity shares of Rs. 100 each of the Company were subdivided into 70,000 shares of Rs. 50 each and that, of these, 18,000 shares were offered to the equity shareholders of the Company in the proportion of two new shares for every five shares held. During the year under report, a sum of Rs. 25 per share only was paid-up on these and this has raised the equity share capital of the Company as at 31st July 1963 to Rs. 26.95 lakhs while the preference share capital has remained unchanged at Rs. 15.00 lakhs. The total paid-up share capital thus totals Rs. 41.95 lakhs and has a backing of Rs. 22.69 lakhs in reserves and surplus. As against these own funds of Rs. 64.64 lakhs, borrowings amount to as much as Rs. 135.12 lakhs besides current liabilities and provisions aggregating Rs. 73.30 lakhs.

On the assets side, the net block is worth Rs. 43.70 lakhs and has been obtained by reducing a gross block of Rs. 108.17 lakhs by Rs. 68.46 lakhs which is the aggregate amount of depreciation earned to date. Investment, chiefly in the ordinary shares of Synthetics and Chemicals Ltd., an associate company, have a book value of Rs. 86.85 lakhs while current assets, loans and advances stand at Rs. 142.51 lakhs in the aggregate.

As regards the prospects for the current year, this is what the Directors have to state:

"The sugar production in the country had declined from 29.70 lakh tons in the year 1960-61 to 27 lakh tons in 1961-62 and declined further to a very low level of 22.50 lakh tons last year and even with a carry forward of 10 lakh tons this seemed hardly adequate to meet the increasing domestic consumption and export commitments. For the current season, the Government have fixed the production target of 33 lakh tons and for this purpose have taken various incentive measures such as increasing the price of sugarcane and sugar and allowing excise rebates on excess production, etc. These measures alone are not likely to achieve the object and the Government must make strenuous efforts to see that the factories obtain adequate supplies of cane and that the price of sugar is made remunerative."

The Rs. 50 fully paid ordinary shares of the Company are currently quoted at Rs. 112 *cum-div*. The net return, on an *ex-div*. price, works out to about 6.7 per cent per annum.

The Government of India has approved in principle the project of Messrs. Lekhraj Devraj and Sons of Bombay for manufacturing 3,000 metric tonnes of link chains on single-shift basis. A public limited company, under the name Eldee Link Chains Limited, is being formed for implementing the project. The capital outlay is put at Rs. 75 lakhs.

Mr. Al Foil Packs Dairy Products to Perfection

Aluminium Packaging keeps Dairy Products full-flavoured, fresh and uncontaminated right up to the consumer's table.

Al Foil completely seals out light which causes rancidity in butter; retains the moisture balance in butter, cheese and margarine and prevents 'freezer burn' when storage in the frigidaire is necessary. That's why dairy packagers choose Al Foil for product protection.

" " ordinary	Nil	3,72
Carry forward	1	1

* Includes Rs. 1,75,000 for previous year.
† Includes arrears of preference dividends for earlier years.
‡ Only Rs. 133.

Extracts from the Directors' report: While the overall results are the highest ever achieved by the Company, the Directors regret that they can only recommend the payment of the dividend on the preference share capital because of the need to reduce as quickly as possible the rather large overdraft with the State Bank of India, Calcutta. It has to be reported that some progress has been made in the negotiations to hand over the Pakistan Branch to a Pakistan Company in exchange for shares. The Directors will, of course, be requesting, in due course, the approval of the shareholders to the proposed sale of the Branch.

India: Rosa Sugar Factory: It was a most disappointing season and the factory crushed 61,301 tonnes of cane against 116,000 tonnes in the previous year. There was, of course, a substantial drop in the quantity of cane crushed in 1962-63 by most sugar factories but Rosa was particularly badly hit by the activities of the *gur* and *khandsari* operators. While the Government did eventually agree to an increase in the controlled selling price for Rosa Sugar Factory, this decision came too late to prevent a heavy loss being incurred by the factory. It is difficult to assess with any accuracy what the prospects are for the current season but the factory has made an early start and as a consequence of steps taken by the Government the crush may be in the neighbourhood of 93,000 tonnes. First impressions are that the quality of cane is as good as last year although with the possibility of a longer crushing season the overall rate of recovery will probably be less than last year.

Distilleries: The sale of case liquor showed an improvement over the previous year and this is reflected in the net profits of the units. Due to the shortage of supplies of molasses to *West Bengal*, Rosol Distillery was not able to produce as much commercial spirit as previously. While this difficulty continued during the early part of the current financial year steps have now been taken to procure sufficient supplies. The Company has placed a new *Whisky* on the market.

Pakistan: Darsana Sugar Factory: This Unit had its most successful sugar season from the financial point of view and was able to crush 161,675 tonnes. The crush ended on 12th *May* 1963 and as a consequence of the long season and the inferior quality of the cane the recovery was 8.77 per cent. While it cannot be expected that the results of the current year will be as good, it is likely that the financial results should prove to be satisfactory.

Distillery: The profit of this Unit was more than maintained and while there are difficulties in obtaining imported materials required for production the current year should show a reasonable return of profit.

Accounts in brief as at 30th June 1963 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	40,00,000	Gross block	1,63,32,127
Debentures	20,41,211	—Depreciation	1,21,38,966
Reserves and surplus	65,23,161		
Other liabilities	1,85,69,708	Net block	42,43,161
		Other assets	5,58,567
		Current assets	2,48,55,637
		Investments	90,419
		Cash	3,85,117
	Rs. 3,01,34,100		Rs. 3,01,34,100

* Paid-up capital consists of 3,20,000 ordinary shares of Rs. 10 each and 8,000—6½ per cent cumulative redeemable preference shares of Rs. 100 each.

Globe Auto Electricals Ltd.

(*Chairman*: Mr. Nyalchand Mulchand Sheth, Bombay.)

Second Annual General Meeting—18th February 1964.

Extracts from the Directors' report for the year ended 30th September 1963: The working of the Company during the year under report, after providing Rs. 49,658 (Rs. 12,596 in 1962) for depreciation, has resulted in a net loss of Rs. 1,28,302. Adding thereto a carried forward loss of Rs. 34,911 from last years' account and an income-tax payment of Rs. 12,285 pertaining to the same, the accounts show a total loss of Rs. 1,75,498 which the Directors recommend to be carried forward.

Further Issue of Capital—Autolite Project: In addition to the capital requirements of Rs. 30 lakhs for Marelli Project already raised last year, the additional capital needs of Rs. 45,75,000 for *Autolite Project* have been satisfactorily raised during the year under report as follows: Rs. 10,00,000 Right shares of Rs. 100 each at par—(i) Rs. 6,00,000 subscribed by existing shareholders. (ii) Rs. 2,00,000 subscribed by The Industrial Credit and Investment Corporation of India Ltd. and (iii) Rs. 2,00,000 subscribed by Industrial Finance Corporation of India. Rs.15,75,000 equity participation by The Electric Autolite Company (15,750 shares of Rs. 100 each at par) as per Collaboration Agreement entered into with them; Rs. 15,00,000 rupee loan from *Industrial Finance Corporation* of India and Rs. 5,00,000 Bank cash credit arrangement. The Company's total financial requirements of Rs. 75,75,000 for both Marelli and Autolite Projects have thus been satisfactorily arranged.

The Directors have so far allotted to The *Electrical Autolite Company 11,775 equity* shares of Rs. 100 each at par for consideration otherwise than in cash against initial disclosure fee and supply of machinery already received. The outstanding 3,975 equity shares will likewise be allotted to them for consideration otherwise than in cash in terms of the Collaboration Agreement.

Progress of Marelli Project: The production of *Marelli items* has now been stabilised and the Company has started making supplies to the vehicle manufacturers against annual contracts entered into with them. In this connection, the visit of Dr. Orefici, Managing Executive of Messrs. Magneti Marelli, was found helpful and timely. The two experts deputed to India by Messrs. Magneti Marelli did a satisfactory job in training the Companies' personnel and in stabilising quality of the products.

Progress of Autolite Project: The construction of buildings and the erection of machinery for the *Autolite Project* are practically complete. The trial production of the *Alternators, Starting Motor* and *D.C. Generator* has already commenced and the quality of the products turned out has been found upto the mark. The production of all the *Autolite items is expected to be stabilised during* the next few months. Meanwhile, the Company has already negotiated annual contracts for the same.

The Directors have to report that both Marelli and Autolite Projects are making satisfactory progress after overcoming teething troubles and unforeseen difficulties. The task has been considerably facilitated by the timely receipt of import licences for raw materials and components from Government.

Mr. J. J. Bohmrich, President, Prestolite International Corporation and Special Director of the Company, came to Bombay in the first week of November 1963. He visited the factory at Mulund and expressed satisfaction at the progress achieved.

Accounts in brief as at 30th September 1963 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	41,68,450	Gross block	20,63,810
Other liabilities	14,08,536	—Depreciation	62,254
		Net block	20,01,556

" " equity	1,57† (15%)	75 (21.44%)
Carry forward	43	25

* Includes Rs. 35,000 for super profits tax.
† Includes Rs. 1,04,901 being dividend at the rate of 15 per cent. on 34,997 equity right shares.

Extracts from the Directors' report: *Sales*: Inspite of competition in the market and falling prices, the total sales during the year amounted to Rs. 76,26,912-53 which is more than the sales of the previous year by Rs. 3,26,492-68. The Company has started exporting its products and during the current year, it has been able to export substantial quantity of tiles. The Company is endeavouring to export sanitaryware and tiles in larger quantities.

New Work: During the accounting year, an amount of Rs. 762,797-11 has been spent for new buildings, furnaces, plants and machineries in various factories of the Company.

Expansion Project: Due to delay in the grant of the required import licences for the expansion projects of *Sanitaryware* and *Glazed Tiles*, it is regretted, much progress in the Company's expansion projects could not be made during the year. However, now the import licences are received and the work of implementing the expansion projects for *Sanitarywares* and *Glazed Tiles* will be speeded up. It is hoped that the Company will be able to complete its expansion programmes by the end of the next year. Regarding the *Glazed Tiles* expansion project the Company was awaiting the necessary import licence which is now received and it is hoped to complete the expansion programme for *Glazed Tiles* also by the end of next year.

Accounts in brief as at 31st July 1963 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	21,72,415	Gross block	1,05,25,903
Reserves and surplus	23,27,466	—Depreciation	57,38,031
Other liabilities	52,22,618	Net block	47,87,872
		Current assets	29,17,183
		Investments	10,47,710
		Cash	9,69,714
	Rs. 97,22,479		Rs. 97,22,479

* Paid-up capital consists of 10,000—6 per cent. free of income-tax cumulative first preference shares of Rs. 25 each; 28,000—4 per cent. free of income-tax cumulative second preference shares of Rs. 25 each and 43,746 equity shares of Rs. 25 each. Application moneys received on new issue of equity shares amount to Rs. 3,765.

FRESH CAPITAL ISSUES

The Controller of Capital Issues has authorised eight companies to raise fresh capital aggregating more than Rs. 8.51 crores. Of these, five are issuing capital exceeding Rs. 1 crore each. The issue of one company is on a rights basis and another is issuing bonus shares. Two are issuing preference shares partly. Three companies involve foreign collaboration and, in one, a State Government will hold 51 per cent of the share capital. One company is offering part of its new capital to the public through prospectus. There is a bank issuing equity capital. The consent for all these issues is valid for 12 months. Here are the details:

Bayer (India) Limited, Bombay: It will raise capital of Rs. 261 lakhs in equity shares of Rs. 100 each, for cash at par. Out of this, 146,160 shares may be offered to Farben Fabriken Bayer A.G. of West Germany. Of the balance, such number of shares as would qualify the shares to be listed on recognised stock exchanges would be offered to the public by prospectus. The proceeds will be utilised for the manufacture of insecticides and *various pharmaceutical items.*

Durgapur Chemicals Limited, Calcutta: It is proposed to raise capital of Rs. 2 crores in 20,00,000 equity shares of Rs. 10 each partly for cash and partly for consideration other than cash. The capital is required for the establishment of a factory at Durgapur for the manufacture of caustic soda, chlorine, phenol and bye-products. The total capital cost of the scheme is estimated at Rs. 650 lakhs. The Government of West Bengal will participate in the share capital of the Company to the extent of 51 per cent.

Metal Box Company of India Limited: This company will issue 1,610,000 equity shares of Rs. 10 each for cash at a premium of Rs. 2.50 nP per share to be issued to the existing shareholders in the ratio of one right share for every share held. The capital is required for the conversion of existing loans of Rs. 124 lakhs obtained from Metal Box Company Overseas Limited (London) into shares in connection with the Company's expansion programme which has already been completed.

Delhi Cloth and General Mills Company Limited, Delhi: It will issue Rs. 110 lakhs capital (inclusive of the premium amount of Rs. 10 lakhs) in 200,000 equity shares of Rs. 25 each, for cash at a premium of Rs. 5 per share to be offered to the existing shareholders of the Company and 200,000 9.3 per cent redeemable, cumulative preference shares of Rs. 25 each for cash at par to be offered to the public. The money will be used for meeting the increase in the cost of its two projects for manufacture of P.V.C. and rayon tyre cord.

Saru Engineering Corporation Limited, Uttar Pradesh: It will issue Rs. 1 crore capital, divided into 320,000 equity shares of Rs. 25 each, and 20,000 9.5 per cent (free of company's tax but subject to deduction of tax at source at the prescribed rates) redeemable, preference shares of Rs. 100 each. All the shares will be issued for cash at par, except equity shares of the value of Rs. 1 lakh which will be for consideration other than cash. Out of the capital consented, equity shares of the value of Rs. 55 lakhs and the entire preference shares will be offered to the public by prospectus.

Punjab and Sind Bank Limited, Dehra Dun: This is raising further capital of Rs. 10 lakhs divided into 20,000 equity shares of Rs. 50 each.

Usha Martin Black (Wire Ropes) Limited, Calcutta: It will issue capital of Rs. 5 lakhs in 50,000 equity shares of Rs. 10 each at a premium of Rs. 2 per share to the Commonwealth Development Finance Company Limited, London, towards meeting cost of capital equipments. The Company is also obtaining a loan of Rs. 20 lakhs from the C.D.F.C. for the same purpose.

Bajaj Tempo Limited, Bombay: This Company will issue Rs. 486,450 in equity shares of Rs. 10 each to be allotted as bonus shares to the existing shareholders of the Company in the ratio of one bonus share for every two equity shares held. The shares will be issued on capitalisation of Company's reserves to a like extent.

ANNOUNCEMENT REGARDING THE PROPOSED ISSUE OF CAPITAL.

This is only an announcement and not a Prospectus and persons interested are requested to apply for a copy of the Prospectus for full details.

BHARAT STEEL TUBES LIMITED

(Incorporated as a Private Limited Company on 20-11-1959 under the Companies Act 1956 and converted into a Public Limited Company on 29-8-1962)

Registered Office: **14-15/F, Connaught Place, New Delhi-1**

EXISTING AND PROPOSED ACTIVITIES OF THE COMPANY

The Company was incorporated with the objects stated in the Memorandum of Association and with the immediate object of setting up a factory for the manufacture of Steel Tubes and Pipes, both galvanised and black, within the size range of ⅜" to 6" diameter for the flow of gas, water, steam, oil and petroleum, with an annual installed capacity of 36,000 tons per shift.

The Company, besides producing Steel Tubes and Pipes to I.S.I. specifications, will also produce to certain specifications laid down by A.P.I. (American Petroleum Institute) to contribute towards the speedy execution of projects in the country, where pipe lines are required for various purposes.

The Company has concluded Financial and Technical Collaboration Agreement with Messrs. Abbey Etna Machine Company, Perrysburg, Ohio, U.S.A. for providing U.S. Dollars one million in the form of equity capital, besides technical know-how and services at all stages of the project. The Company has secured the necessary foreign exchange loan and import clearance, required for the purpose.

LOCATION OF THE INDUSTRY

The Company has acquired, through the Government of Punjab, approximately 130 acres of land in Ganaur (near Railway Station) in the State of Punjab, about 35 miles from Delhi, to locate the industry.

MANAGING DIRECTOR

Under an Agreement with the Company, Mr. Raunaq Singh was appointed the Managing Director of the Company for a period of five years commencing from 29th August, 1962. His appointment has been approved by the Central Government by its letter No. 1 (420)-C.I./62 dated 12.3.1963.

The Agreement provides for payment to Mr. Raunaq Singh, during the tenure of his office a remuneration of 5 per cent commission on the net profit of the Company for each financial year, inclusive of the perquisite of free furnished accommodation and a car to be placed at his disposal for the business of the Company, with the reservation that the total remuneration drawn by him by way of commission on net profit and the remuneration from Messrs. Raunaq & Company Private Limited, Delhi, as the Managing Director of that Company should not exceed Rupees 1,20,000 per annum, but in the absence of or inadequacy of profits he shall be entitled to draw Rs. 7,500 per annum as minimum remuneration plus the money value of the perquisite of a car and free furnished accommodation. The minimum remuneration shall be increased to Rs. 30,000 per annum when the effective capital of the Company exceeds Rupees Sixty lacs.

Mr. Raunaq Singh has been in this Steel Tubes Trade for the last 25 years and he is the Managing Director of Messrs. Raunaq & Company Private Limited, Delhi, which has a long standing and has a name in the pipe market in this country. This Company has a network of offices in Calcutta, Bombay and Delhi.

NEWS IN BRIEF

AIR-INDIA has reduced its fare on the Bombay-New York route from $1,989.50 to $1,856.30 for first class round trip and from $1,191.30 to $1,127.90 for the economy class round trip with effect from 1st April next.

The Government of India, on the recommendation of the Forward Markets Commission, has granted recognition to the Pepper and Ginger Merchants Association, Bombay, to conduct forward trading in black pepper for a further period of three years.

The Indian Council of Medical Research has drawn up a Rs. 10-crore programme of medical research during the fourth Plan. The programme lays special stress on the need for augmenting the research potential in the existing research institutions.

The Gujarat Agriculture Department has decided to introduce during the current calendar year hot weather cultivation of groundnuts in about 6,000 acres where irrigation facilities are available. Such cultivation is expected to give a per-acre yield of 1,200 to 2,000 lbs.

The aggregate exports of cashew kernel during the year 1963 amounted to 2.33 million cases (of 50 lbs. each) valued at Rs. 8.21 crores, as against 2.05 million cases valued at Rs. 7.25 crores in 1962. The U.S. continues to be the largest buyer with 1.28 cases, followed by Russia and East Germany with 400,000 cases and 150,000 cases, respectively.

The subjects "textiles," "handloom industry" and "jute" which were hitherto under the Ministry of International Trade, and the subject "cement" under the Ministry of Steel, Mines and Heavy Engineering (Department) of Heavy Engineering) have been transferred to the Ministry of Industry with effect from the 8th inst.

The Central Government has decided to license additional capacity for the manufacture of agricultural tractors. Preference will be given to schemes for production in the lower h.p. ranges. A recent study has revealed that, since some of the licensed units have not made satisfactory headway, there exists a gap between demand and installed capacity, thereby necessitating imports of built-up tractors from rupee payment countries.

The pisciculture earnings of the *panchayats* in Orissa increased from about Rs. 1.8 lakh in 1960-61 to nearly Rs. 5.9 lakhs in 1962-63. This income constituted about 22 per cent of the total income from non-tax sources of the *panchayats* in the Estate. The area under fish cultivation also increased from about 5,500 acres in 1961-62 to well over 13,500 acres in 1962-63. During the third Plan, a provision of Rs. 40 lakhs has been made for giving assistance to the *panchayats* for the development of pisciculture in this State.

The Union Government is to set up, with the help of the United Nations Special Fund, a Central Soil Mechanics and Material Testing Laboratory. The U.N. Special Fund has sanctioned Rs. 16.2 lakhs and the Centre will bear an expenditure of Rs. 19.7 lakhs. The Laboratory will be attached to the Central Water and Power Commission. It will carry out intensive scientific investigations of river development and flood control projects, delineation of areas that can be commanded by irrigation canals, and examination of construction material to locate available rock and earth quantities required for the construction of dams.

The 26th meeting of the Indian Central Tobacco Committee is scheduled to be held at Madras on the 20th inst. under the chairmanship of Mr. A. D. Pandit, Special Secretary to the Union Ministry of Food and Agriculture. It will consider, *inter alia*, the recommendations of the various sub-committees, review the progress made on research work done at the Committee's Institute, as well as exploratory trials on exportable types of tobacco in new areas, and results of research to be released for adopting by farmers, and examine a scheme for training cultivators in growing exportable types of tobacco.

Members of the employees' provident fund are likely to be granted "unemployment relief advance" from their provident funds on being retrenched from service. This question, along with other subjects, was discussed by the Central Board of Trustees, Employees' Provident Fund at their 23rd meeting held at New Delhi on Monday this week. The Board fixed the rate of interest at 4½ per cent to be credited to the subscribers' accounts for the year 1964-65. At the end of October 1963, over 24,100 establishments were covered under the Employees' Provident Funds Act, 1952, and the benefits of contributory provident fund were being enjoyed by over 3.7 million workers. About Rs. 465 crores had been collected by way of provident fund contributions, of which over Rs. 231 crores were invested in Government securities. Till the end of September 1963, about Rs. 137 crores had been refunded to members on account of final settlement, advances, etc.

From Abroad

Gold output in South Africa touched a new peak of 27.43 million ounces during the year 1963, as compared with 25 million ounces in 1962 and 22.9 million ounces in 1961.

The rate of unemployment in the U.S. declined to 5.5 per cent in December 1963 from 5.9 per cent in the previous month, though the number of adult men unemployed was higher.

The U.S. Government has recently issued licences for the sale of a further $104 million worth of American wheat to the Soviet Union and other Communist bloc countries. This sale brings the total value of American wheat shipments to $300 million.

Production of paper in Norway reached the all-time high of 900,000 tons during the year 1963, an increase of 10 per cent over the 1961 record. Exports also touched a record of 580,000 tons, while domestic consumption was of the order of 310,000 tons. Western Europe continued to be the biggest buyer.

The Governments of Indonesia and Pakistan have signed an agreement under which Pakistan will supply cotton yarn worth one million U.S. dollars. The delivery will be made during the first six months of this year. The payment by Indonesia will be 65 per cent in the form of raw cotton acquired by it under U.S. P.L. 480 and the balance in dollar currency.

The Fibres Division of the Imperial Chemical Industries (U.K.) has released for commercial use a new synthetic staple fibre which can be processed on conventional equipment for hard fibres. The fibre, known as Type R polypropelene staple, can be used in its own or in intimate blends with normal sisal fibres. Some ropes made from it are already available and a much wider range of products is expected to be on the market soon. Like sisal, the new fibre has a cross-sectional diameter of 0.005 inch and a staple length of 40 inches, but, unlike sisal, it is crimped along its length to improve cohesion and assist in processing. The new staple fibre is expected to make a tremendous impact on the rope, twine and cordage trades.

An agreement has been reached between the representatives of the Norwegian authorities and the private credit institutions on measures to restrict credit expansion during the current year. The agreement closely resembles similar deals concluded between the two parties in previous years, but it indicates that credit will be even tighter than previous year. Accordingly, the commercial banks are to be allowed to increase their outstanding loans by only 400 million kroner (£20 million) during the year, a rise of 5-6 per cent as compared with the permitted increase of 6-7 per cent during 1963. At the close of 1964, the outstanding loans granted by these banks should not exceed 7.5 million kroner (£375 million) and the savings banks' outstanding loans 7,000 million kroner (£350 million). The agreement also stresses the need for still tighter curbs on all forms of consumer credit, particularly personal loans and loans to finance hire purchase buying. In granting loans this year, the private credit institutions have been urged to favour applications for housing loans, loans for regional development projects, and schemes to make Norwegian firms more competitive, as well as export projects.

PERSONAL

MR. Radhakrishna R. Ruia, a Director of Ramnarain Sons Pvt. Ltd., has been elected Chairman of the Millowners Association, Bombay, for the year 1964-65.

Mr. T. S. Sitapati, formerly Technical and Commercial Manager, National Insulated Cable Company, has joined the Asian Cables Corporation Ltd. as its General Manager.

Lord Normanbrook, formerly British Secretary to the Cabinet and Head of the Home Civil Service, will join the Board of British Overseas Airways Corporation sometime in June next.

Mr. P. L. Tandon, Chairman of Hindustan Lever Ltd., has been nominated a Director of the Central Board of the Reserve Bank of India, with effect from 15th January 1964.

Mr. Dhirajlal Maganlal, senior partner of Messrs. Dhirajlal Maganlal Purshottamdas, and Mr. P. A. Narielwala, a Director of Messrs. Tata Sons Ltd., have been elected President and Vice-President, respectively, of the Indian Merchants Chamber for the year 1964.

The Earl of Cromer, Governor of the Bank of England, will be arriving in New Delhi on 5th February. During his 15-day visit to this country, he will have discussions with the Finance Minister, Deputy Chairman of the Planning Commission and heads of banking concerns.

Mr. R. L. Mehta, till recently Joint Secretary in the Union Ministry of Labour and Employment, has been given the special assignment of implementing labour laws in the public sector undertakings. He will hold the rank of Additional Secretary.

BHARAT STEEL TUBES LIMITED—*Continued*

DATE OF THE OPENING AND CLOSING OF THE SUBSCRIPTION LIST

The subscription list will open, both in respect of Equity as well as Preference Shares at the commencement of Banking hours on the 28th January, 1964, and will close at the close of the Banking hours on the 7th February, 1964. The Directors at their discretion may close the subscription lists both in respect of Equity as well as Preference Shares earlier, but not before the close of the Banking hours on the 30th January, 1964.

Application forms along with copies of the Prospectus can be had from the Registered Office of the Company or from the Underwriters, Bankers and Brokers whose names and address are given below:

TREND OF MARKETS

MONEY TIGHT

(From Our Own Correspondent)

BOMBAY, 15*th January*

Demand for credit in the short-term money market was well sustained throughout the week under review. Since, however, the supply of funds available was sufficient to meet this demand, inter-bank call rate continued unchanged at the high level of 5 per cent. There was a slight expansion in turnover. Conditions at Calcutta, however, tightened further, the call rate rising from 5 to 5½ per cent; some business was put through even at 5¾ per cent.

The prevailing tightness of money is reflected in the

poor response to Government of India Treasury Bills,

sharp rise of Rs. 43.31 crores to Rs. 2,412.49 crores in notes in circulation during the week ended 10th January,

increase of Rs. 4.52 crores to Rs. 31.32 crores in loans and advances obtained by scheduled banks from the Reserve Bank in the same week, and

fall of Rs. 6.42 crores to Rs. 78.72 crores in deposits of scheduled banks with the Reserve Bank.

The total amount offered against tenders for the 91-day Government of India Treasury Bills which opened on Tuesday the 14th inst. was Rs. 2 crores, just equivalent to the amount invited (and also accepted). The average rate of accepted tenders was unaltered at Rs. 2.315 per cent per annum. The Intermediate Treasury Bills evoked very poor demand, the Bills actually sold from the 8th to 11th inst. aggregating no more than Rs. 15 lakhs, as against Rs. 23.75 lakhs a week before and Rs. 210.00 lakhs two weeks before.

A further rise of Rs. 96 lakhs to Rs. 106.75 crores in the foreign assets of India was voted in the week ended 10th January. The whole of this rise was under balances held abroad which stood at Rs. 9.25 crores, as against Rs. 8.33 crores. The foreign securities held in the Issue Department of the Reserve Bank continued unchanged at Rs. 97.46 crores. Loans and advances to scheduled banks, as already mentioned, went up by Rs. 4.32 crores, the bulk of the increase (+Rs. 3.84 crores) being accounted for by those against usance bills.

The pressure of demand for bank credit persisted during the week ended 4th January, according to the statement of position of scheduled banks for this week. The total of credit actually made available spurted by Rs. 45.35 crores to Rs. 1,620.21 crores. The rise was so appreciable that the improvement of Rs. 3.31 crores to Rs. 2,408.95 crores in deposits was too insufficient to meet the enlarged demand from their clients, so that the banks were compelled to approach the lender of last resort (that is the Reserve Bank) for accommodation. The total borrowings from that source jumped up by Rs. 12.41 crores to Rs. 20.15 crores, of which the share of those against usance bills alone was Rs. 11.73 crores, a rise of Rs. 8.55 crores. The scheduled banks were also compelled again to sell a part of their investments. The aggregate investments stood lower by Rs. 12.41 crores at Rs. 696.78 crores.

There was no development worth reporting in the Gilt-edged market. In view of the tight money conditions, fresh buying support in both Central and State loans was lacking. Turnover, as a consequence, was restricted, with values remaining practically unchanged.

In the foreign exchange market, the banks' selling and buying rates for U.S. dollars were unaltered at Rs. 478.25 and Rs. 475 per $100, respectively. In New York, spot sterling-dollar rate was quoted at 279.860-279.890 cents, same as last week, while the three months' forward gained 0.030 cent to 279.670-279.700 cents.

14-CARAT GOLD IN DEMAND

(From Our Own Correspondent)

BOMBAY, 15*th January*

Fourteen-carat gold forged ahead from Rs. 60.25 to Rs. 63 per 10 grams during the week under review. The rise followed renewed hopes of enlarged offtake during the coming marriage season. Primary gold was unofficially quoted higher at Rs. 109 per 10 grams, as against Rs. 103 a week before. Sovereign was fully maintained at Rs. 85.

On persistent buying support, ready silver advanced further from Rs. 252.50 to Rs. 254 per kilogram. The rise would have been more marked but for larger arrival. The actual average arrivals during the week were 13 bars, as against 10 bars in the previous week.

The world price of gold in the London market improved slightly from $35.07⅞ to $35.08 per ounce. Ready gold picked up ½*d.* to 250*s.* 6*d.* Both ready and forward silver were unchanged at 111¾*d.* and 111¼*d.*, respectively, as also silver in New York at 129.3 cents.

No trading took place in the local bullion market on the 9th inst. as a mark of protest against the Gold Control Rules in response to the call made by the All-India Sarafs Association. This day was also observed as a "Black Day." The Greater Bombay Jewellers' and Bullion Dealers Association held a public meeting on the same day to protest against the proposed Gold Control Bill. Several persons who spoke at the meeting made a scathing attack on the Bill. Mr. N. Dandekar, who presided over the meeting, declared that the Bill was highly unjustified and should be withdrawn. Mr. Morarji Vaidya feared that gold control would breed bribery and corruption on an increasing scale. Mr. P. Gopalkrishnayya described how the Government had lost a revenue of about Rs. 30 crores a year by way of income-tax, sales tax, etc., and how the Government had to spend about Rs. 20 crores towards the rehabilitation of the unemployed goldsmiths. Mr. B. S. Mahajan, President of the Association, criticised the Government's attempt to have the Bill passed into law during the emergency so as to claim immunity under Article 358 of the Constitution and to avoid a challenge to the Bill under Article 19. He also warned that the *implications of some of the new* provisions would be very serious.

The Government of India has sanctioned the setting up of 18 gold refineries in Andhra Pradesh for the supply of 14-carat gold to self-employed goldsmiths. The refineries will all be in the private sector.

The following table shows the trend of prices during the week under review:

	15-1-1964 (closing)	High	Low	8-1-1964 (closing)
	Rs.	Rs.	Rs.	Rs.
SILVER				
Ready (996 fine) ..	254.00	254.00	252.00	252.50
GOLD				
Ready (14 carat) ..	63.00	63.25	61.00	60.25
Sovereign	85.00*	—	—	85.00*
London—				
Gold ..	250*s.* 8*d.*	250*s.* 8*d.*	250*s.* 6½*d.*	250*s.* 7½*d.*
Silver Ready ..	111¾*d.*	—	—	111¾*d.*
Silver Forward ..	111¾*d.*	—	—	111¾*d.*
New York—				
Silver	129.3 cents	—	—	129.3 cents

* As on 24-6-1963.

N.B.—The quotation for gold is per 10 grams (about 0.85 tola) and that for silver is per kilogram (85.73 tolas). London and New York quotations are per ounce.

FURTHER RISE IN COTTON

(From Our Own Correspondent)

BOMBAY, 15*th January*

The firmness witnessed in the cotton futures market last week gathered momentum during the week under review. The apprehension that imports of American P.L. 480 cotton under the Indo-U.S. manganese-cotton barter deal would be delayed till April next and the growing firmness of spot prices initiated a buying movement which led to a rally in futures. The possibility of tenders against the maturing Jarilla March contract being smaller than expected, in view of the widening disparity between spot and futures prices, also fanned the bullish fervour. Under pressure of large-scale bull support and short-covering the Jarilla March contract spurted from the week's opening rate of Rs. 738.50 (per three quintals) to a peak of Rs. 745.75 yesterday) before receding to Rs. 739.50 at the close today, the net gain over the week being Re. 1. The May contract too rose in sympathy from Rs. 727 to Rs. 731 but finished lower today at Rs. 727.50.

In the spot market at Sewri, several mills were regular buyers of such long staple varieties as Co2, L.147, and Digvijay early in the week. Prices of Gujarat varieties in particular, showed a tendency to harden almost daily, thanks to the reluctance of co-operative societies to sell cotton except at a premium, on the one hand and good mill demand on the other. Demand tended to fall off towards the close of the week but prices continued to rule firm. Export demand for Bengal *Deshi* was well maintained and prices ruled firm. Export sales registered to-date against the quota of 200,000 bales is estimated at around 140,000 bales.

Following reports that U.S. cotton under the barter deal would not be available until April, attention of mills turned to other foreign cotton varieties, especially Sudan and East African. Operators noted the announcement of the Government of Sudan that there would be no change in the export duty on Sudan cotton during the 1963-64 season and that the policy of marketing the crop through weekly auctions would be continued during the current season also. This should set at rest rumours that were current locally that the export duty on Sudan cotton was likely to be revised. The U.A.R. Government has also announced that no new changes will be introduced in the system of marketing of Egyptian cotton in the current season. The reported sale by the Uganda Lint Marketing Board of 20,000 bales of cotton to China and the possibility of sale of another 80,000 bales induced fears among mills in India that they would find it difficult to secure supplies at reasonable prices. This led to a hardening of prices of ready lots of East African cotton available locally. As regards U.S. cotton, mills seem to be of the opinion that unless the Government negotiates a fresh agreement for import of U.S. cotton under P.L. 480, India might be forced to buy inferior cotton at higher prices later in the season.

The following are the latest available quotations—in rupees per candy of 784 lbs.—from the spot market at Sewri:

Bengal *Deshi* 765; Ganganagar 820; Nagar C02 1,725-1,750; Hubli Jaydhar 930; L.147 1,220.

YARNS LISTLESS

(From Our Own Correspondent)

BOMBAY, 15*th January*

The yarn market presented a dull appearance during the week under review due to lack of up-country demand. There was no inquiry for art silk yarn from upcountry operators as well as the local mills. National Rayon 150D suffered a loss of 25 nP over the week while 120D sagged by 31 nP to Rs. 11.55. S.I. viscose 120D, however, gained 22 nP to Rs. 14.52. S.I. viscose 180D changed hands at Rs. 12.91.

In the staple fibre section, mill buying was restricted. The operators were hesitant to enter into fresh commitments either way.

Spot Century (40 x 2) fell by 7 nP to Rs. 9.90. Kohinoor was dull at the last week's level of Rs. 10.32.

The cotton yarn section was devoid of interest. 80s Mahindras lost a rupee to Rs. 92. 10s Modern was neglected at Rs. 20.62, and 20s Parkash at Rs. 23.62. But 40s City put on 25 nP to Rs. 37.

The following table gives the prices of rayon staple fibre and cotton yarns, today, as compared with those prevailing a week ago:

	15-1-1964	8-1-1964
	Rs.	Rs.
Art silk yarn (per kg.)—		
National Rayon 120D	11.55	11.81
Century 75D	18.30	18.41
S. I. Viscose 150D	14.52	14.30
Staple fibre yarn (40 x 2)—		
Kohinoor (per kg.)	10.32	10.32
Century	9.90	9.97
Cotton yarn (per bundle of 10 lbs.)—		
10s Modern	20.62	20.62
20s Parkash	23.62	23.62
60s Finlay	—	76.00
80s Mahindra	92.00	93.00

OILSEEDS DULL

(From Our Own Correspondent)

BOMBAY, 15*th January*

Dull conditions prevailed in the oilseeds market during the week under review. Trading in groundnuts futures was confined mainly to adjustments of open positions in the maturing contract. Most of the open positions were squared up in accordance with the understanding reached between bulls and bears. Since the bears sought to cover up their short-sales, the carry-forward charges declined markedly. Today's closing date for the January contract was Rs. 226.87, as against Rs. 225 on Wednesday last week. The April contract picked up 50 nP to Rs. 230. Spot rates moved narrowly in the absence of any special development.

Castorseeds ruled easy. Buyers were scarce, thanks to poor demand from crushers and dull export enquiries for castor oil. Turnover was greatly restricted, with rates remaining practically unchanged, that is at last week's levels.

Linseeds were listless, excepting for oil which on special support went up by 30 nP to Rs. 15.70.

Cottonseeds were subjected to selling. The April contract declined by a rupee to Rs. 99.

The following table shows the closing prices of oilseeds and oils on Wednesday 15th January as compared with those of two previous weeks:

	15-1-1964	8-1-1964	31-12-1963
	Rs.	Rs.	Rs.
Groundnuts			
January 1964 contract	226.87	223.00	223.37
April 1964 contract	230.00	229.50	228.50
Nizam bold	45.75	45.75	45.75
Khandesh quality	46.75	46.25	46.25
Oil ex-mill	17.90	18.00	17.90
Oil Bly. Receipts	17.75	17.85	17.75
Castorseed			
March 1964 contract	165.25	165.50	165.50
June 1964 contract	168.25	168.00	168.25
Ready Madras	32.75	32.62	32.87
Ready Kanpur	31.62	31.62	32.00
Oil B.S.S.	14.40	14.40	14.30
Oil commercial	13.70	13.70	13.70
Linseed			
March 1964 contract	37.06	37.12	36.94
June 1964 contract	37.87	37.94	37.87
Bold ready	37.62½	37.62	37.50
Linseed oil	15.70	15.40	15.40
Cottonseed			
January 1964 contract	—	—	94.50
April 1964 contract	99.00	100.00	100.00

N.B.—All quotations for future contracts are per 250 kilograms except linseeds for which rates are per 50 kilograms. Spot quotations of seeds are per 50 kilograms and oil per 10 kilograms.

PEPPER STEADY

(Messrs. Parekh and Co.)

BOMBAY, 15*th January*

Malabar black pepper remained steady during the week, with prices fluctuating within a narrow range. Garbled was steadier under support from exporters and commission houses who were stock-piling in anticipation of foreign enquiries. Garbled moved between Rs. 277.50 and Rs. 281.50. January delivery was steady at Rs. 286, after touching Rs. 290, while February was quoted at Rs. 293, the highest being Rs. 298. Spot in New York was quoted at $0.33, whereas fair quantities were sold to grinders by the dealers at $0.32½ on ex-dock basis. New York is reported bidding Malabar at $0.32 for ready shipment. Dealers there buy once or twice a week and then withdraw and try to sell to grinders either afloat or ready or almost or the same parity of replacement from India, their profit being saving in interest and warehouse charges only. They do this with a view to remaining in touch with Indian market as Singapore, after confrontation, has become a dead market to them. Quotations from Indonesia remain erratic and differ from one seller to the other. The soft feature of the Malabar market is stockpiling by exporters, inasmuch as, if the foreign buyers do not materialise in time and New York continues to persist its "hand to mouth" buying policy, the market may go down even after the seasonal pressure is over. In short, the future of the Indian market depends on the timely and continuous foreign inquiries from New York.

Singapore remained steady at $112½ for black and at $(M)145 for white with poor inquiries. There are reports that Singapore is inquiring for buying Malabar hollow berries. On the Bombay Exchange, *Maha* delivery moved between Rs. 318 and Rs. 314 and *Chaitra* between Rs. 328 and Rs. 324.

Ready pepper is quoted at Rs. 152.

The weekly noteworthy features were the grant of the recognition in respect of the forward

trading in black pepper to the Pepper and Ginger Merchants' Association, Bombay, for a further period of three years and the Sukarno-Macapagal talk on Malaysia at Manila. There are reports that President Sukarno is proposing to Manila the development of Cebu of Phillipines as "free port" for the use of Indonesian export.

The future of the world's pepper market depends on the buying policy of the U.S., because bulk buyings by Russia and East European countries do not make so much impression on the trade as the buying of New York which is sending bids to buy to various merchants and not confining their buying to small group of merchants as done by Russia and other East European countries. Russia, after buying in the previous months, is now reported to have withdrawn. Other East European countries are reported to be negotiating small parcels.

NILGIRI TEAS IMPROVE

(Messrs. Forbes, Ewart and Figgis Pvt. Ltd.)

COCHIN, 9*th January*

A large quantity of approximately 1,000,000 kg. came under the hammer in tea sale No. 1 held here on Tuesday the 7th inst. Nilgiri quality was generally improved, but mediums were only a little brighter. There was strong general demand throughout the sale. The better Nilgiri invoices with improved quality were sold at enhanced rates, but lesser kinds tended to be irregular and were sometimes easier. All mediums and low-growns were well supported selling at firm to dearer rates, particularly fannings grades. Black leaf descriptions were a strong feature of the sale. Whole leaf grades were better supported, especially O.Ps which were strong. Tippy teas received useful support. Unorthodox types shared in the general upward trend of the market and were sold well, particularly the cleaner sorts.

The quotations (per kg.) were:

	1964	1963
	Rs.	Rs.
Low mediums	4.30-4.60	4.20-4.85
Mediums	4.60-4.85	4.85-5.20
Good mediums	4.90-5.70	5.20-5.85
Nilgiri B.O.P.	4.75-8.10	5.60-8.70

The average price realised in sale No. 1 was Rs. 4.56 per kilo, as against Rs. 4.47 a week ago and Rs. 4.91 in the corresponding sale last year.

In dust sale No. 1 held today, 332,000 kgs. were offered. There was good general demand. All medium categories evoked useful support, though prices for these were quoted barely steady. Residual kinds, however, were sold at rates below last with some withdrawals. Highgrowns elicited good support and often registered advances in price. Clean black grainy descriptions were a strong feature of the sale. Unorthodox descriptions received useful inquiry, particularly C.T.Cs which were dearer.

The average price realised in dust sale No. 1 was Rs. 4.42 per kilo, as against Rs. 4.38 a week ago and Rs. 4.33 in the corresponding sale last year.

Colombo: There was no sale this week, owing to the general electrical strike.

London: *North Indian and other growths*: In Monday's auction, there was fair demand with Assam C.T.Cs generally lower, but Dooars remained about steady.

Ceylon and South Indians: In Tuesday's sale, better liquoring types were firm to dearer, but others came in to an irregular and occasionally easier market.

As we go to press, Messrs. Forbes, Ewart and Figgis Private Ltd., wire us as follows:

"*Sale No.* 2: 699,000 kgs. offered. Good demand. Low mediums firm. Mediums upto 15 nP dearer. Good mediums steady. Highgrowns dearer with quality. Unorthodox irregular, sometimes little easier. Clean black fannings stronger."

WHEAT AND RICE HARDEN

(From Our Own Correspondent)

HAPUR, 13*th January*

Foodgrains moved both ways during the week. While wheat and rice registered a hardening trend, coarse grains were subdued, thanks to better *rabi* crop prospects following recent rains. The Union and State Governments are anxious to check this rising trend in grain prices and more fair price shops are being opened and sales through such shops are increasing. Stock position with the Government, however, is reported to be sound.

Wheat hardened by 50 nP per quintal during the week on brisk local and outside buying support. Average quality was now placed at Rs. 54.25 to Rs. 56.50 and farm produce at Rs. 57 to Rs. 60 per quintal. Local wheat stocks ran down to 3,000 quintals. Rice, however, improved slightly during the week due to small arrivals of new crop produce and demand, too, was slack at higher levels. Local stocks left with trade were also reported to be nominal. Week-end prices were:—Rice *basmati* superior Rs. 93.77 to Rs. 95.45; *sela basmati* Rs. 91.09 to Rs. 93.77; *nainpuri* Rs. 64.30; *ramajwayan* Rs. 77.70; *raimunia* Rs. 83.38; and *gadda* Rs. 61.62 per quintal.

Gram, however, eased by 67 nP per quintal during the week on easy Punjab advices and good crop prospects. Stockists were said to be anxious sellers. Punjab quality gram was now transacted at Rs. 50.91 and local produce at Rs. 50.25 per quintal. Maize declined by a further 50 nP to Re. 1 per quintal on selling pressure by stockists, the actual prices ranging between Rs. 37.50 and Rs. 38.75 per quintal according to quality. Week's arrivals, however, were small around 5,000 maunds and local maize stocks were now put around 19,000 quintals. Barley and *bejhar* stayed steady on good demand in the face of small stocks and prices stood at Rs. 39 to Rs. 40 for barley and at Rs. 40.50 to Rs. 41.50 for *bejhar*. *Juwar* and *guwar* sought higher levels, due to poor supply position. Prices were quoted between Rs. 46.89 to Rs. 48.23 and Rs. 48.23 to Rs. 48.90 per quintal respectively. *Bajra* and *methi* ruled quiet.

Subdued conditions prevailed in the pulses market during the week on better crop prospects. Peas declined by Re. 1.75 to Rs. 2.50 per quintal according to quality on slack demand and poor outside buying enquiry. Peas *dara* was now quoted at Rs. 46.50 to Rs. 47.50 and white farm between at Rs. 48 to Rs. 49 per quintal. Peas *dal* also eased to Rs. 50.50 per quintal. *Arhar* also declined by upto Rs. 3 per quintal on poor buying and prices now ranged between Rs. 57 and Rs. 59.50 for average quality and between Rs. 61.62 and Rs. 63.63 for superior quality. *Urd* and *moong* ruled quiet on slack demand at Rs. 61.62-Rs. 68.32 for *urd* and at Rs. 72.34-Rs. 77.70 for *moong*. *Masoor* and other *dal* were listless. Week-end prices were: *Arhar dal* Rs. 71 to Rs. 81; *urd dal* Rs. 83.03; *moong dal* Rs. 75.74; *masoor* Rs. 58.94 to Rs. 64.30; *masoor dal* Rs. 75.50; and gram *dal* Rs. 58.94.

"KHANDSARI" RECEDES

(From Our Own Correspondent)

HAPUR, 13*th January*

Sugar in the open market continued to rule subdued, thanks to diversion of demand to new *khandsari*, and prices ranged between Rs. 155 and Rs. 158 a quintal. However, through rationshops, sugar supplies continued to be restricted at the controlled prices of Rs. 120 to Rs. 126 per quintal. Sugar factories in West U.P. were reported to be facing shortage of cane supplies and, if the situation does not improve soon, the sugar season might end earlier and, in U.P., sugar product on figure would be around 1.2 million tons, as against the target of 1.5 million tons fixed for the State. In the Muzaffarnagar area, too, sugar factories were facing dearth of cane and it was gathered that the prices of sugarcane payable to cultivators had to be revised upwards in order to face competition with *khandsari* units.

Khandsari eased further during the week by Rs. 5 to Rs. 8 a quintal on poor buying support in the face of increased new arrivals in the markets. *Khandsari* units were reported to be purchasing cane upto Rs. 5.50 per quintal in the Muzaffarnagar region, as against the Rs. 5.04 to Rs. 5.34 paid by factories. Some units in the Hapur area have reverted to the manufacture of *gur*, thanks to the marked increase in the prices of the commodity in the past few weeks. Week-end prices of *khandsari* here were: moist inferior Rs. 100 to Rs. 115; medium Rs. 120 to Rs. 130; superior Rs. 131 to Rs. 148; *boora* Rs. 155 to Rs. 160 a quintal.

Ready *gur* firmed up during the week following brisk buying support of *balti* quality which is being received in Hapur markets only and prices touched new heights after the imposition of ban on its movement. The Central Government, however, rushed any fresh permits to Hapur and *balti* quality ran down steeply upto Rs. 10 a quintal today. The week's exports during the week, however, aggregated 70 wagonloads. New permits against January quota are now being received at Muzaffarnagar where *gur* prices are on the increase. Daily arrivals of *gur* here as well as in *mofussil* areas have improved substantially due to increase in *gur* prices. Week-end prices of *gur* here were:—superior Rs. 62.50 to Rs. 63.50; average Rs. 61; *balti* Rs. 64; *shakker* Rs. 72.34 to Rs. 77.70 a quintal.

Ready *gur* in the Muzaffarnagar continued to record a steadier trend on receipt of import permits from Gujarat. Week-end prices of 40 kilogram were:—*Chaku* Rs. 26 to Rs. 28.62; *pansera* Rs. 25.50 to Rs. 26; *laddoo* Rs. 27.50.

TANNED SKINS FIRM

(From Our Own Correspondent)

MADRAS, 13*th January*

Trading in kips has been small during the week. Importers of E.I. tanned cow hides are offering low prices for F.A.Q. marks and a small volume of business has been booked. This has to some extent affected the price structure of better standards. Export trading is negligible and the tone is weak. There is limited interest in cow calf light weight fourths selection and moderate call from the U.K. for standard marks in buffcalf.

In the tanned skins section, prices ruled firm. There is good demand for goat skins 11/12 lbs. and upwards. The tanners' efforts to obtain increased prices have not met with success. As regards sheep skins, the market overseas is similar to last week; but in the local bazaar, sellers have put up prices, following the strength in the raw centres.

The next German tanned skins public sales take place on the 20th instant when 83,100 goat and 2,300 sheep skins will be available for sale.

Shipments during the month of December 1963 were: 1,221 bales tanned cow hides, 172 cowcalf, 10 buff hides, 314 buffcalf, 350 goat and 420 sheep skins to the U.K. ports; 21 cow hides, 5 cowcalf, 2 buff hides, 58 buffcalf, 858 goat, 548 sheep skins, and 1,406 cases chrome and pickled goat skins to the Continental ports; 20 buff hides, 107 buffcalf, 385 goat and 5 pickled goat skins to the U.S.A. ports; 7 goat and 320 sheep skins to Japan.

SURVEY

(*Concluded from page* 79)

The reaction of tobacco manufacturers, as expressed by Mr. George Allen, President of the American Tobacco Institute, is that the report is "not the final chapter" of the story and that further research is necessary. In view of the mounting volume of evidence against smoking, tobacco manufacturers will, however, be forced to devote more funds to research on new methods of filtration so as to develop "safe" cigarettes. So far, the tobacco industry has spent only a negligible sum (placed at no more than $7 million in the past 10 years) on research study of diseases that may be caused by smoking. Introduction of filters is an attempt to reduce the hazards of smoking. But the efficiency of filters has not been proved and the Terry Committee itself was of the view that there was as yet not enough evidence to make a judgment whether filter cigarettes were safe.

Repercussions of the report under review are not confined to the U.S. In Britain, the British Medical Association greeted the report as confirming, with very much more detail, the findings of the Royal College of Surgeons on smoking in 1962. It warned the addicts to stop the habit, or cut it down drastically, or face the grave risks indicated by the U.S. report. A renewed bid to remove cigarette advertising from television in Britain was hinted at by Mr. Noel-Baker, Labour M.P. and Chairman of the Advertising Inquiry Council, in his comment on the report. In Japan, the Monopolies Corporation, the only agency that can produce or sell tobacco in the country, is reported to be considering what action needs to be taken in the light of the report. Even in Bombay cigarette sales are said to have dropped following the publication of the report in the U.S.

Although no one will claim that the Terry Committee has said the last word on the subject, sufficient evidence has been marshalled to prove not only the hazards to health of smoking but also to establish a casual relationship between lung cancer and smoking. Those who ignore the warning of these eminent doctors, on the ground that there are still some gaps in the knowledge so far available, will do so at their own peril.

India is an important producer and exporter of raw tobacco. Any setback to smoking habit is bound to affect adversely the fortunes of tobacco growers. Farsighted farmers, as well as farmers who have regard for the safety of human lives, will doubtless switch over to other crops which are wholesome and equally rewarding.

LINTAS' SILVER JUBILEE

Lintas Limited, Bombay, was set up as an advertising agency on 2nd January 1939. The agency then consisted of 23 persons and it leaned heavily on Lintas, London. Even press bookings were made there. There was only one artist. Mr. P. L. Tandon, a 'founder' of Lintas, recalls that "a new professionalism, a new jargon, a new vitality" arrived with the birth of the agency. Before Lintas, he says, the Lever operation was selling and advertising. "Now it became marketing based on a proper integrated concept." In Madras, where he was Lintas Branch Representative in 1939, Mr. R. Ramaswami coped manfully with what he calls "a panel of pundits." They helped him with translation of advertising copy into the South Indian languages. Today Lintas handles work involving nearly 150,000 words of Indian language copy. It is all written centrally in Bombay.

Mr. P. L. Tandon and Mr. R. Ramaswami, the two members of the first batch of Lintas, are today the Chairman and Vice-Chairman, respectively, of Hindustan Lever Ltd.

To meet the marketing needs of their clients in those early days of advertising in India when the advertisers were handicapped by the dearth of medium of communication, Lintas grappled with many unfamiliar problems. Mr. P. L. Tandon undertook the first ever scientific survey of the Indian press. The project started in 1939 and it was completed in 1940.

The agency's post-war expansion got really under way in 1947. A Client Service Organisation was set up with full-fledged Accounts Executives handling billings that totalled Rs. 18 lakhs in 1947 and Rs. 65 lakhs in 1952. The staff increased to 114. Lintas Marketing Research unit also began to function.

Lintas development has been geared to the needs of the marketing operations in which it participates. Apart from growth in size (and it has grown), apart from elaboration of more services and departments (and this has been notable), the most important development has been in its people. They have added an understanding of markets to pure advertising expertise. They are now more intimately a part of the general marketing picture.

Lintas Bombay's Silver Jubilee celebrations in January 1964 grow memorable from the presence of Mr. S. R. Green, Director of Unilever's Marketing Division in charge of Lintas World Co-ordination. Silver jubilees are moments built on the past that point to the future. It is in this spirit that the 128 people of Lintas Bombay gather as a generation passes.

MISCELLANEOUS STATISTICAL INFORMATION

Reserve Bank of India

DELHI LETTER

OIL AND STEEL CONCEPTS CHANGING

I.A.C. WORLD'S LARGEST DOMESTIC AIRLINE

From Our Special Correspondent

New Delhi, 14th January

THE concept of seeking primacy in the oil sector for the public sector even at the cost of delays in development—a policy which was dear to the heart of ex-Minister K. D. Malaviya—now appears to be yielding, albeit very gradually, place to a more pragmatic approach. Not that the public sector plans are being downgraded to a subsidiary status, but the private firms may now have a fair chance. The projects in the public sector at Koyali, Barauni and Cochin and the current plans for the Madras and Haldia refineries will be pursued with vigour, to be completed by the middle of the fourth Plan. A top-level meeting, attended by the Union Finance Minister, Mr. T. T. Krishnamachari, was held on the 13th inst., at which perspective programmes for the oil sector were considered. Those who participated are said to have agreed with expert projections that, at the end of the fourth Five-year Plan, that is, by 1971, the national needs of petroleum products will be between 27 and 28 million tonnes and that to meet this demand, the refinery capacity will have to be 30 million tonnes. The needs by the end of the third Plan may be around 17 million tonnes of products.

Mr. Malaviya had advocated a policy of first creating refining capacity for the public sector so that it would achieve a dominating position. As things stand, during the third Plan period, the expansion will be only in the public sector. The Digboi refinery of the Assam Oil Company, India's oldest plant, has little scope for expansion. A decision is now expected to be taken to permit the Bombay and Visakhapatnam refineries to expand early in the fourth Plan period. The Government now appears to be willing to agree more readily with oil companies' estimates of rapid growth in demand for petroleum products. Mr. Malaviya is said to have deliberately sought to dismiss oil firms' estimates as too high so as to add weight to his policy of denying scope for the firms to expand.

The Oil and Natural Gas Commission has been having talks with the Kuwait National Petroleum Company whose delegation arrived in Delhi on Saturday. The talks are in continuation of discussions initiated when an Indian delegation visited Kuwait in October. The Indian Government is seeking imports of crude from Kuwait for the Madras public sector refinery and exploring possibilities for imports to feed the proposed refinery at Haldia.

Steel Projects

Is there a big conflict between Steel Minister Subramaniam's perspective plan for Steel and Finance Minister Krishnamachari's emphasis on a selective approach during the fourth Plan? There are loud whispers in the capital over a growing clash of opinion between the Steel and Finance Ministers. The differences are reported to include their personal assessment of the ability of Indian experts to design and build the Bokaro plant on their own. The Finance Minister's view appears to be that it will be difficult to canvass foreign assistance for the Bokaro project, if the Steel Ministry goes entirely on Indian consultants' plans and advice.

Immediately after the refusal of U.S. Congress of the late President Kennedy's request for American aid to underwrite Bokaro, Mr. Subramaniam had made the thunderous declaration of doing it largely on our own. There were different strategies under discussion then. One was to start work on the project, call for international tenders for various types of machinery and leave it to the successful foreign tenders to negotiate with their Governments for the necessary foreign aid guarantees. Second thoughts have led to abandoning this method, partly for fear of chaos in building the Bokaro plant, as this piecemeal ordering may lead to difficulties in co-ordinating the plant construction stage by stage.

The original hope of indigenous fabrication of a large quantity of machinery, expressed by Mr. Subramaniam, is receding into a distant aspiration long after the early stages of Bokaro are ready. The Heavy Engineering Corporation can make a limited contribution to the building of steel plants in the fourth Plan period. As for private fabricators who may be able to make some steel plant equipment, an assessment of the capacities available will take many months. A detailed study of the quality performances of the private fabricators will have to be made even after the various firms spell out what they can make. According to one expert, such a survey will take about two years. The Heavy Engineering Corporation itself is in no position to give an accurate estimate of what it will be able to deliver in the next five years.

The Steel Ministry's rethinking rules out as impossible the Steering Group's perspective targets of 18 million tonnes of ingots and four million tonnes of pig iron by the end of the fourth Plan. As it is, by 1968, the ingot production will be a little less than seven million tonnes. From that level to 18 million tonnes by 1971? The dreams have to be cut down to size.

The present position is as follows: Foreign aid prospects and equipment manufacture possibilities for Bokaro have to be worked out carefully, but the priority will be for Bokaro. The two other projected public sector steel plants—in Goa and Salem—will take a back seat. Only in Bhilai is the first expansion programme going ahead smoothly. Bhilai's ultimate expansion to 3.5 million tonnes capacity may not face many hurdles. In Durgapur and Rourkela, the foreign collaborators are reported to be willing to discuss further expansion in the fourth Plan only after the current expansion programmes go forward smoothly. As for the Tata and Indian Iron plants, World Bank aid may be available for expansion.

Special Steels

The selective approach calls for the rapid creation of facilities to make special steels. Here, two sizable projects are under way, although the start of work on them was considerably delayed. The Bhadravathi conversion is being done with the assistance of Austrians and Germans. Its ultimate capacity will be 77,000 tons of tool, die and construction steel for the railways and the automobile industry; delivery of products at this rate will be around 1967, if there are no new snags.

Work on the Durgapur special steels plant, with Japanese technical and financial collaboration, is being speeded up. Rourkela expansion will provide about half a lakh tonnes of electrical steel and ordnance factories may contribute another half a lakh tonnes. Fifteen private firms licensed to make special steels have a total capacity of around two lakh tonnes. By the end of the fourth Plan, one estimate is that the country will need up to a million tonnes of special steels. The reasons for the withdrawal of the licence for a special steel plant given to Tatas have not been explained clearly by the Steel Minister. The original programme for a special steel plant under the Defence Ministry in Kanpur has been given up. A search is being made by the Government for Soviet assistance in this field. Nothing is likely to emerge in the form of additional Soviet aid in the third Plan period; the Government will have to try to include this special steel plant in projects with Soviet help in the fourth Plan.

Indian Airline

The new General Manager of the Indian Airlines Corporation, Mr. Jehangir S. Parakh, who was confirmed in his post early this month, is the first airline employee to be appointed to the top executive post in the I.A.C. He had 'non-official' antecedents, having been on the accounts side in the Deccan Airways at the time of nationalisation in August 1953. The I.A.C. initially had a full time Chairman, Mr. B. C. Mukharji. His successor as Chairman was Mr. Shankar Prasad, during whose term Air Vice Marshal Lal was appointed General Manager. The I.A.C. then continued to have Mr. Prasad as part-time Chairman. Mr. S. Mullick, who succeeded Air Vice-Marshal Lal as General Manager, also came from administrative officials' cadre. Since the past year, the I.A.C. has a non-official, Mr. Satish Chandra, as part-time Chairman.

In 1962-63, the I.A.C.'s profits rose to Rs. 20.91 lakhs from Rs. 7.88 lakhs in the previous accounting year and the new General Manager says that, in 1964-65, with the introduction of new and faster planes, the Corporation will be able to make a profit of around Rs. 75 lakhs or more. From February, the I.A.C. will be flying three Caravelles to connect the four major cities. Except between Calcutta and Madras, there will be a daily flight each way between Bombay, Calcutta, Delhi and Madras. Additionally, there will be a daily Viscount service plus the night services taking mail and passengers and converging on Nagpur to swap men and mail.

Apart from the three Caravelles—the I.A.C. has asked the Government to provide it with the fourth Caravelle by the end of the year—there will be twelve Viscounts, ten Fokker Friendships, three Skymasters and three dozen Dakotas in operation. The Heron fleet has been disposed of. Of the fourteen Viscounts the I.A.C. bought, one was lost in a crash last year and another was scrapped after an accident in Colombo earlier.

The Viscounts will also start flying Bombay-Hyderabad, Bombay-Bangalore and touch Coimbatore too. More Viscounts will go into the hard-pressed Assam sector. From the short hop runs like Delhi-Agra-Banaras-Calcutta, the Friendships will go more into the feeder services. But the replacement of Dakotas will take several years.

The I.A.C. claims that its unduplicated route mileage of 26,000 makes it a bigger domestic airline in terms of mileage than any in the world, except in the Soviet Union. The biggest American home airline, the United Airlines, has an unduplicated route mileage of 18,000, according to an I.A.C. official. The I.A.C. also becomes the first domestic airline in Asia to use its own jet craft. Pakistan flies Boeings between Dacca and Karachi but that flight is not strictly domestic.

The Transport Ministry has at last also yielded to the pressure of higher Cabinet counsels to tone down its opposition to the Avro which is being made by the Aircraft Manufacturing Depot in Kanpur. The I.A.C. has now agreed to try out this aircraft for its suitability without placing too much emphasis on the economic aspects in comparison with, say, the Fokker Friendships. When the Series II Avro comes out of the factory in a few months, the I.A.C. will give it a trial as a freighter in Assam. The Avro it may be noted, has a great advantage in its ability to take off from short and rough airstrips.

TREND OF SHARES

DULL AND LISTLESS

(From Our Own Correspondent)

Bombay, 16th *January*

THE stock markets spent another week worrying about the future. Dull and listless conditions prevailed throughout. Business was patchy and fluctuations, except in a few pivotal counters, were narrow. With barely six weeks to go for the presentation of the Union budget for 1964-65, there was naturally little inclination to extend the commitments.

During the week, the main source of worry was reports of disturbed conditions in certain parts of Calcutta and it's suburbs on Friday which forced the authorities to call in the military on Saturday to assist in maintaining law and order. These ugly developments provoked nervous selling in an unwilling market and depressed prices over a wide front.

The sixty-eighth session of the Indian National Congress, which concluded on Friday, put the seal of approval on its socialist programme and policy, declaring the national objective as "the establishment of a Socialist State based on parliamentary democracy" and indicated the direction in which the Congress Party and the Government should move in the pursuance of the socialist goal. The Congress President, in his address, stressed the need for reducing the inequalities in income through taxation and followed this up with the declaration at a public meeting in Madras on Tuesday that concentration of wealth in a few hands would lead to frustration and revolution among the people and endanger democracy itself. Echoing this sentiment a day later at Indore, Mr. V. K. Krishna Menon averred that concentration of wealth and economic power in a few hands would not only disrupt community life but also destroy the nation. He, therefore, urged that economic imbalance must be removed without delay.

On the economic front, the news was certainly encouraging and such as to inspire confidence. The clamour of the left wing in the Congress for nationalisation of banks will not be heard for some time, as the question has been ruled out.

A further concession was announced by the Finance Minister in regard to licensing of industries, inasmuch as henceforth no licence need be obtained except in a few specified industries for substantial expansion of the existing industries provided the fixed assets do not exceed Rs. 25 lakhs after expansion.

The Union Government's decision to issue expeditiously "letters of intent" and to evolve a special procedure for the speedy processing of all applications for industrial licences relating to certain key industries was welcomed by industrial circles as a pointer to the Government's determination of making the economy more forward.

On top of this, in a public lecture delivered in the capital last week, Mr. Ashok Mehta, though an ardent socialist, underlined the value of profit-motive as a spur to investment and increased production.

But all these favourable factors, as also the trend of higher profits earned by the banks in 1933 which should have normally served to act as morale booster, fell flat on the market, as it has become more sensitive to adverse factors. The only consolation is that selling pressure was not heavy, because of the tight grip of a few bull operators having stout hearts and long purse; these bulls refused to be scared of their wits by the unfavourable developments referred to earlier in this review.

In the prevailing circumstances, the cautious mood of both operators and investors is understandable, as there is a growing feeling that whatever changes the Union Government intends to make in pursuance of Bhubaneshwar Congress Resolution are likely to be reflected in the budget to be presented to Parliament on 29th February. The dividend outlook, too, does not suggest a significant change for the better in the context of the recommendation to limit the unearned income. The most optimistic view that the operators can take is that the economic situation might not deteriorate further, in view of the Government's emphasis on stimulating investment activity and through it industrial production in the private sector.

Scripwise, equities received consistent but small setbacks throughout the week under review and the entire list, with the solitary exception of Voltas, was dotted with moderate losses over the week. The main bearish factor was the outbreak of communal disturbances in Calcutta and its suburbs and the calling of the military to maintain law and order in the City. On Tuesday, there was some improvement in Tata Steel Ordinary which were bid up to Rs. 148.50 on renewed hopes of an imminent increase in the retention prices of steel. Likewise, Century regained speculative favour on revival of rumours and at one stage were in keen request upto Rs. 688 before winding up the week at the unchanged rate of Rs. 681. The announcement of a two for five rights issue in Voltas, coupled with the encouraging performance for 1962-63, was greeted with a rise in the scrip to Rs. 269 on Wednesday but the improvement proved short-lived in line with the general soft tendency. The closing rate on Thursday was a shade lower at Rs. 264, reflecting a nominal gain of Re. 1 over the week. The worst affected counters were Scindia and Tata Chemical both suffering losses of 68 nP and 44 nP at Rs. 13.56 and Rs. 18.60, respectively. Elsewhere, Hindustan Motor and T.E.L.Co. provided weak features on stray bull liquidation.

DR. RAO'S BLUEPRINT FOR SOCIALISM

THE Congress Party's preoccupation with definition of socialism even while a state of emergency is on has led to an increase in the production of plans for ushering in socialism. In the process, more paper and ink, both scarce commodities, are being wasted. Dr. V. K. R. V. Rao, who had the foresight to jump into the socialist wagon long before his colleagues in the teaching profession had realised the necessity for it as a means of advancing their interests and who has quite a few firsts to his credit, seems to have been the first among the fraternity of distinguished professors to prepare a blueprint for implementing "democratic socialism." His is really a blueprint, in contrast to the rather irregular and confusing outline drawn up by the Congress Party at Bhubaneshwar. Unlike the Congressmen known for their verbosity and inconsistencies, Dr. Rao has evidently to care for his reputation as a trained thinker and disciplined writer. The 2,000-word blueprint on socialism, which he is reported to have submitted to the Planning Commission, certainly does credit to these qualities of his. He is said to have focussed attention on five major points, obviously to prevent rambling by the policy-makers.

The first goal of the Congress Party under its new socialist outlook is to prevent concentration of economic power in a few hands. Warmly endorsing this stand, Dr. Rao proposes the following steps to reach the goal:

1. Limit the size of private enterprises.

2. Regulate levels of consumption by fixing a ceiling.

3. Oust the big business from the ownership of newspapers, including weeklies and other periodicals, and place all the media that seek to mould public opinion in the hands of trusts.

4. Regulate recruitment of staff for the private sector through Government machinery.

5. Give preferential treatment to the vulnerable sections of society in order to ensure equality of opportunities to them.

It is not clear whether Dr. Rao wants his first suggestion to be applied with retrospective effect or only to the enterprises that are established after his scheme is put into operation. If it is not applied to existing concerns, it will mean that the concentration of economic power in a few hands that is alleged to have already taken place will continue. If it is applied, it will mean chaos in economic activity and retardation of the pace of economic growth. If what Dr. Rao is after pertains only to the new units to be established, he has to prove that there are enough entrepreneurs who can do the job efficiently and expeditiously. It is pertinent to remind him, in this connection, that, in its anxiety to avoid concentration of economic power, the Union Government gave licences for several new projects to new entrepreneurs, many of whom, as was discovered later on, could not bring them to fruition. Quite a few of them surrendered their licences and a number of them were forced to give them up. The result has been a slowing down of economic progress and emergence of imbalance in the industrial structure. Some of the projects, as, for instance, aluminium, fertilisers, and petro-chemicals, have now been allotted to the public sector at State levels and it remains to be seen how quickly and economically the State Governments will establish and administer them. Resort to this solution will have to be made increasingly, as the supply of experienced entrepreneurial skill in this country is by no means plentiful. The outcome will be more and more of State capitalism and a mixed economy with a diminishing role for the private sector in industrialisation and marketing. Power will then be concentrated in the hands of a few politicians and the country will succumb by stages to some form of authoritarianism. Merit will yield place to sycophancy. Efficiency, enterprise and integrity will be at a discount.

Being a sensible economist, Dr. Rao realises that imposition of a limit on the size of private enterprises will impair the economic efficiency of units in certain industrial sectors and the country will lose the benefits of large-scale mass production methods. He has, therefore, hastened to qualify his suggestion by adding that "nothing should be done that will come in the way of maximising production and productivity." But how is this condition to be observed? Dr. Rao does not appear to have answered this query. An obvious answer is that all those industries where economies of scale can be realised must only be in the public sector—an answer which is consistent with his basic thesis. This means that all large-scale industries and economic activities, including banking, insurance, shipping and other services, must be in the public sector. By implication, therefore, Dr. Rao wants State capitalism on a massive scale; he is only using such words as democratic socialism and mixed economy as a facade for State capitalism, so that the private sector might not get frightened by his proposals. He is, however, honest enough to admit that a mixed economy and a socialist society of his concept cannot co-exist for long, as there is an inherent contradiction between them and, therefore, emphasises the urgent need for resolving it by framing and implementing a "deliberate and well-conceived policy." Otherwise, he fears that the "socialist ideal" itself might get destroyed. So for Dr. Rao the socialist ideal is more important than rapid economic growth. And he sees no contradiction between a socialist society of his concept and parliamentary system of democracy.

As a sop to private sector apparently, he is said to have added a rider to his five point scheme, the rider being this: "As socialism does not mean just the sharing of poverty, special care must be taken to see that regulatory measures suggested for private enterprises do not hamper either production, or efficiency, or the free flow of foreign capital and technical assistance." This is a striking essay in contradiction, for it is hard to see how this qualification can be fulfilled in actual practice without detriment to his main solution discussed in the foregoing paragraphs. The learned professor will do well to explain how he would implement his policy subject to this condition, if he were in charge of the Government. The contradiction becomes more apparent if the fourth point in the list given at the outset is taken into consideration, namely, Government control over recruitment of personnel required by the private sector. The reference here is obviously to managerial and technical personnel who are in short supply. No efficient and honest foreign private investor will come forward to invest in this country under such a condition.

Basically, this proposition is undemocratic and unconstitutional, for it implies physical control of a section of labour market. It may be argued that the Government has already powers to regulate the appointment of executives in the corporate sector, that the salaries and other emoluments of chief executives such as managing directors and paid directors have to be approved by the Company Law Department of the Government, and that there could be no harm in extending this control to a larger and wider section of executives in the private sector. This argument is tantamount to saying that one wrong step justifies another. Moreover, this solution will not be conducive to promotion of efficiency, enterprise and sense of res-

...contrary to the ...ard, diligent work. ...untries, the prin... ...results is coming ...of the type advocated ...d to drive away even ...gn countries. Dr. Rao ...thinks that considera... ...mpts the managerial per... ...ientists and engineers to ...rivate sector in preference ...or. There are also other con... ...e most important being greater ...dom of action and quicker pro... ...ne are actually averse to Govern... ...rice, for, among other things, there ...m and the task of implementing con... ...s a thankless and risky one. In an ad... ...tration charged with the responsibility of ...king a variety of economic controls, there ...always a danger of even honest officers getting caught under some charge or other, especially if they are conscientious and enterprising. Not all can be so fortunate as Dr. Rao has been to get positions in Government where the task is to tender advice without any responsibility for implementing it.

What goods does Dr. Rao have in mind the consumption of which is to be regulated through a ceiling? They cannot be essentials of life, for the masses do not have enough money for buying even the bare minimum. Nor is there an unlimited supply of these goods. If what bothers him are the luxuries and the conventional or professional necessities, a ceiling is already in operation, albeit indirectly, through a high level of indirect taxation and prohibitive prices induced by a keen shortage of supplies even in relation to the minimum demand for them. Evidently, these limitations do not satisfy our distinguished professor of economics, because he believes that the type of life led by businessmen and the upper sections of middle class excites the envy of the have-nots and fears that it may spark a revolution. If the powers-that-be share this fear of Dr. Rao, the better thing to do would be to abolish all upper classes in railways, to restrict the use of automobiles only to the defence personnel, ministers and aged persons as well as invalids who can afford, to close down the manufacture of such luxuries as air conditioners, refrigerators and cooking ranges; and to play effectively the role of a kill-joy. This solution is infinitely better than the one advocated by Dr. Rao, as it will minimise, if not eradicate, the evils of corruption, black-marketing and the growth of unaccounted money. Austerity of the type which Dr. Rao has in mind could not be practised by Gandhiji's followers even when he was alive. But it could probably be enforced by a Stalinist-type regime.

It has been a favourite pastime of some politicians, not merely communists but also socialists and Congressmen, to attack the Indian Press as being a handmaid of money bags and to demand that newspapers should not be owned or controlled by them. More and more politicians have begun to indulge in this fashion and it is not surprising that Dr. Rao (who has for long been regarded more as a politician than as an objective economist) too has joined their ranks. The objectivity of the vast majority of the Indian Press, the logic of its criticisms and the efficiency of its news services are often a thorn in the flesh of politicians who are eager to push this country into the quagmire of State capitalism of a communist type in the name of egalitarianism. Their irritation is understandable. Implicit in their suggestion for bringing the newspaper ownership under trusts is the allegation that the editors are the stooges of capitalists, that they have no convictions of their own and that they have no courage to express them. There is, however, no substance in this allegation, nor in the implied assumption that, once the newspapers are brought under independent (?) trusts, they will all become the supporters of socialist policies now being propagated by the Congress Party. Further, those who advocate the idea of trusts forget that, under the latest amendments to the Company Law, trusts can be controlled and influenced by the Government. If newspapers are to be efficient in fulfilling their roles, they have to be large-scale business enterprises, requiring an enormous amount of risk capital and competent leadership. If they are owned by trusts, there is no certainty that these prerequisites will be forthcoming in an adequate measure and that the gaps, if any, will not be filled by some undesirable elements. The Congress Party is rich in money and can establish its own chain of newspapers to propagate its ideals, instead of resorting to dubious solutions of the type incorporated in Dr. Rao's blueprint for socialism.

STATE OF THE U.S. ECONOMY

IT is still true to say that, notwithstanding the emergence of Western Europe as a strong economic bloc and the increasing participation of Soviet Russia in world trade, the economic prosperity of the world as a whole is closely linked to that of the United States. For so wide and far-reaching are the repercussions of the U.S. actions, economic as well as political, on the rest of the world. The U.S. holds nearly two-fifths (about $16,000 million worth) of the aggregate free world gold stock and one-third ($5,235 million) of the total I.M.F. gold tranche positions, the two major elements of international liquidity, and accounts for approximately one-sixth of the total world trade. And no other country has extended economic and technical assistance to the developing countries on such a colossal scale as the U.S. Take, for instance, India. Out of the total aid received by this country since the era of planning began in April 1951, the share of the U.S. alone is more than half. Incidentally, the U.S. supplies India nearly one-third of its import requirements and buys roughly one-fifth of its export wares, both being in terms of value. Viewed thus, a sound, healthy and expanding American economy is of the utmost significance to the world, in general, and India and other developing countries, in particular. It is, therefore, greatly reassuring to hear President Johnson declare, in his first economic report sent to the Congress this week along with the 1964-65 budget message, that he and his Administration would endeavour their best to promote maximum employment, production and purchasing power within the framework of free competitive enterprise.

There is ample evidence in President Johnson's report to show that the economic progress made by the U.S. during the year 1963 and the two years preceding it has been impressive and sustained and, what is more, non-inflationary. The gross national product (that is, the total output of goods and services) rose by 5.4 per cent to $585 billion in 1963, as compared with 1962; actually in the last quarter of 1963, the G.N.P. passed the all-time peak of $600 billion. Industrial production went up by 5.1 per cent, personal *per capita* income (before taxes) by 4.7 per cent to $2,500 and corporate profits by 10.5 per cent to over $50 billion before taxes and $25 billion after taxes. The after-tax income of individuals exceeded $400 billion. Residential construction passed $25 billion and civilian employment $70 million. Simultaneously, price stability has been maintained for the sixth consecutive year.

FIVE KEYS TO EARNING POWER

1. *Education*: Poverty and ignorance go hand in hand. We must upgrade the education of all our youth, both to advance human well-being and to speed the nation's economic growth. But, most vitally and with Federal support, we must upgrade the education of the children of the poor, so that they need not follow their parents in poverty.

2. *Health*: We must speed and intensify our efforts to make good health more accessible to the poor.

3. *Skills and jobs*: We need to help both young adults and older workers acquire marketable skills.

4. *Community and area rehabilitation*: Concerted community action, with new Federal assistance, can break the dismal and vicious cycle found in too many of our rural and urban areas. The Area Development Act must be renewed and improved and rural communities must be helped to find new economic strength.

5. *Equal opportunity*: Even beyond civil rights legislation, the fight to end discrimination requires constructive action by all Governments and citizens to make sure—in practice as well as in principle—that all Americans have equal opportunities for education, good health, jobs and decent housing.

—PRESIDENT JOHNSON

While the record of U.S. economic growth is thus striking and heartening, there are nevertheless certain disquieting trends which continue to tarnish the performance of American economy. Among them, three stand out most prominently, namely, unemployment, idle capacity in industry and balance of payments deficit. About 5½ per cent of the American labour force, we are told, is still idle even after a year-to-year advance of $30 billion in G.N.P. Taking into account the inevitable annual additions to workers who seek employment, at least two million jobs are needed today to get rid of what President Johnson aptly described as stubborn excess unemployment. Another two million jobs are needed each year to offset the labour-saving effects of rising productivity. All in all, it is said, 75 million jobs will soon be needed. Operating rates in manufacturing industries still average only 87 per cent of capacity, as against the 92 per cent rate preferred by business managers. The high unemployment rate and existence of idle capacity in industry have resulted in heavy wasting potential (men, machines and materials) of the order of $30 billion annually. There is then the persisting balance of payments deficit, as a result of which gold outflows continue, though the rate of actual outflow is now less than what it was in the previous years.

These disturbing trends must be corrected forthwith in the interest not merely of the U.S. but of the world in general. It was to this task that the late Mr. Kennedy had addressed himself and one should be happy indeed to learn that President Johnson would continue the dynamic policies initiated by Mr. Kennedy. This is what President Johnson says in his economic report:

"If we are to master these problems, we must, above all, enact the Tax Bill. Not in one or two or three months but now. Not in diluted but in strengthened form, with an immediate drop from an 18 per cent to a 14 per cent withholding rate."

The Tax Bill, it will be recalled, envisages a phased cut of $11 billion in personal and corporate taxes. Considering that such a cut will give a powerful boost to the domestic economy, there is no doubt that the U.S. Congress will be realistic enough to approve the Bill without much delay. As a result of tax reduction, the gross national product of the U.S. is expected to rise by as much as $38 billion to $623 billion in the current calendar year. The estimate of $623 billion is said to be substantially higher than what could be expected in the absence of prompt enactment of the tax legislation. Since the expectations of a tax reduction have already been incorporated in the forward planning of many business firms, the effect on the economy of any failure to pass the legislation swiftly, as President Johnson has clearly warned, might be deeply disturbing. How powerful will be the full effect of tax reduction on the American economy has been impressively brought out by him thus:

"As the tax reduction takes full effect, its stimulus to private consumption and investment will shrink the $30-billion gap between the nation's actual and potential output and provide approximately two million additional jobs for the unemployed and the new workers entering the labour force. As economic activity expands and personal and business incomes increase, Federal revenues will also rise. The higher revenues, combined with continuing pressure for economy and efficiency in Federal expenditure programmes, should hasten the achievement of a balanced budget in an economy of full prosperity."

To the extent the American economy receives stimulus from the proposed tax cut, the other countries too will be greatly benefited, especially the underdeveloped countries, in the form of more liberal economic assistance and larger inflow of private capital investments. The early enactment of the tax cut legislation will, by enhancing the competitive capacity of American firms in world markets, reduce the deficit in the U.S. balance of payments which, as is well known, remains a key factor on the international financial scene. A significant improvement in the U.S. balance of payments position is also of considerable importance to India and other developing countries in that it may lead to a relaxation in the condition attached to the A.I.D. loans and grants under which over 80 per cent of these must be spent on the goods and services produced in the U.S.

Be that as it may, there are two sentences in President Johnson's economic report which deserve notice. They are: "Our development assistance effort must and will be more sharply focussed and vigorously administered. We shall encourage others to share more of its burden and seek a larger role for private investment." These observations, it is possible, may give one an impression that the quantum of direct Government assistance to the developing countries will be reduced and that more restrictions will be imposed on its utilisation. Such misgivings are, however, unwarranted. For President Johnson has clearly urged the continuance of a strong development assistance programme—this, he says, is "vital to the pursuit of peace and stability in the free world"—and fervently called for reduced trade barriers. These are the things that are most urgently needed today in the struggle of developing countries for attaining and ensuring decent living standards.

MARKET GOSSIP

Stock Exchanges Cautious

BOTH investors and speculators are keeping out of stock exchanges, due to a number of uncertainties. There are not many who are now sanguine about the Central budget for 1964-65 being a bullish one. Some who are close to Delhi feel that this pessimism is unwarranted, but faith in the optimism of this minority is lacking. The most popular guess is that, while S.P.T. will be abolished, the Finance Minister will take back the concession in some form or other. The tax revenues are buoyant and normally one could have justifiably expected some relief in both direct and indirect taxation. Bhubaneshwar and the Centre's promise to increase its contribution to State budgets have, however, engendered caution.

Corporate results published since the beginning of 1964 are encouraging. Profits of almost all banks have shown a perceptible improvement. A couple of them have even increased their dividends and the others have maintained them on a higher capital. Among the industrial concerns, Voltas, Indian Oxygen and Associated Battery Makers have done well, though they have only maintained the dividend. The impression that one gets from the statements of accounts and directors' reports about the outlook is favourable. Nevertheless, equities in general are lower than those at which they began the year. A possible explanation for this state of affairs is the fact that, in the current year, profit-margins may be adversely affected by a heavier wage bill. The award of the Bonus Commission seems to be unfavourable to shareholders, as the lion's share of the net profit has been earmarked for workers. The revision of cost of living indices, as well as the continued rise in cost of living, implies heavier dearness allowance. The time is up for the Wage Board for plantations to submit its report. It will be unrealistic to think that the Board will let the employers off lightly.

The increase in wage bill is unlikely to be neutralised by a fall in the cost of raw materials or power. On the contrary, all available indications are that the cost inflation will persist. An increase in the cost of electricity to industrial consumers is being actively considered. Similarly, the manufacturers of coal, steel, cement and paper have been pressing the Government to permit a rise in their ex-factory prices. Inflation is going to be the biggest worry of all in the coming months of the year.

A redeeming feature of share markets is the absence of any substantial selling pressure. This is due, to a large extent, to the hope that somehow things will turn out better. The fact that the Government is sponsoring a unit trust has strengthened this hope, as it has created the impression that, however much the politicians may talk of nationalisation and a further strong dose of socialism, the Government has a stake in popularising investments in equities. Again, experience in the past has shown that undue pessimism about the prospects for equities, especially when a boom is absent, has invariably proved unprofitable. In any case, there seems to be no sense of alarm among the leaders of business community. They have been taking the discussions in Bhubaneshwar and the drastic amendments in the banking and company laws quietly.

Boom In Coffee Abroad

Among the world commodity markets, it is not only sugar that has been moving up, but also coffee. In the London market, for instance, Uganda spot is now quoted in the neighbourhood of 335s. a cwt., an increase of 20s. over a week; a year ago, the price realised was less than half of it, 159s. 6d. to be precise. In the U.S., Santos No. 4 is standing at about 47 cents per lb., equivalent to some 380s. per cwt., as against 275s. per cwt. (approximate) this time last year. The main reason for the upward trend in the price of this popular beverage in the Western world—even in the U.K., the traditional tea drinking country, coffee habit is rapidly growing, especially among the younger generation—is a shortage of floating stocks of high grade coffee and the fear of scarcity in the coming months, owing to a big fall in the estimates of Brazilian coffee crop for the 1964-65 season, from over 20 million bags in 1963-64 to less than 10 million bags. The coming into existence of the International Coffee Agreement following its ratification by the U.S. (which accounts for more than half the world consumption of coffee—24.5 million bags a year out of a total of 46.9 million bags) last week has also contributed to the better tone of the market. Discussing the prospects for coffee, the *Economist*, London, writes:

"Coffee prices have soared under the impact of the series of natural disasters during 1963. These virtually eliminated some Caribean crops and Brazil—where the 'normal' production of about 18 million bags equals over one-third of world consumption and recent heavy crops have equalled more than one-half—is estimated to have as little as 9.5 million bags in prospect in 1964-65, while the effects of last year's disasters may still be felt in some reduction of its 1965-66 crop. Brazilian stocks are heavy but ageing, so that purely numerical calculations are little guide to true reserves of high-grade coffee.

"With annual world consumption creeping up and expected to reach 50 million bags in a year or two, there is thus a real fear of physical shortage of 'quality' coffees. Quota increases are to be sought again by the United States when the Executive Board of the International Coffee Organisation (I.C.O.) meets later this month to prepare for the March meeting of the full Council. An increase of a million bags a year was refused at the Council's last meeting. Such increases, more likely to be agreed this time, would ease supplies and, temporarily, prices too; but they would still leave unsolved the other problem that underlies the present imbalance of the coffee market. Some 16 per cent of U.S. roastings and around half of the U.K.'s 1.2 million bags a year now find their way into soluble ('instant') coffees.

"Stocks of coffee in consumer countries, which were kept low while supplies were heavy and prices weak, have now been rebuilt to equal the high post-war levels. So the present climb in prices can be expected to meet with resistance that will cause setbacks from time to time—certainly at the end of this month if the United States has its way on quotas. But any real change in trend must await a recovery in Brazilian output and a change in the basic quotas, neither of which will happen overnight."

If India is to avail itself of the benefit of this boom in world coffee markets, it must seek and obtain a bigger quota than the 20,000 tons that have been allotted to it under the International Coffee Agreement. There is no reason why it should not be granted a larger quota, especially as the shortage is precisely in the varieties which it is in a position to offer. It is to be hoped that the Union Ministry of International Trade will take up the matter with the Executive Board of I.C.O. in London without any delay.

Urban Credit Co-operatives

Whereas the commercial banks cater primarily to the credit requirements of industry and trade, the non-agricultural credit institutions, comprising urban co-operative banks, employees credit societies and others which serve the needs of particular professions, such as weavers and fishermen, perform two important functions. One is to encourage thrift among their members and the other is to provide credit facilities to individuals on a scale that is normally considered uneconomic by the commercial banks. The past few years have witnessed a notable expansion of this sector of the urban economy. Thus, between 1951 and 1962 (the latest year for which data are available), the number of societies has gone up from 7,300 to 12,300, membership from 2.18 million to 5.00 million, working capital from Rs. 57 crores to Rs. 165 crores and loans advanced from Rs. 47 crores to Rs. 162 crores. About a third of the urban population, it is claimed, is today covered by the non-agricultural credit societies and, by the end of the fourth Plan (1970-71), about half the urban population will have been covered.

The progress made by the non-agricultural credit societies is thus notable. Also notable is the financial strength and independence of these societies, as witness the fact that the deposits gathered by them (Rs. 103 crores as of 1961-62) form 62 per cent of their working capital. But the way in which several of these societies are actually working leaves much to be desired. It was, therefore, just as well that the Union Ministry of Community Development and Co-operation constituted, in May last year, a Study Group (Chairman: Mr. V. P. Varde) to suggest measures to ensure the sound and speedy growth of this sector. The Group has since submitted its report, a summary of which was released to the Press last week-end.

The Study Group has done well to deplore the organisation of urban banks on commercial basis. And it is quite realistic in urging that the lending policy of the banks should be production-oriented and related to the repaying capacity of the borrower rather than security. Only, the criteria mentioned should be scrupulously observed. Repaying capacity, for instance, is a vague term and the managements of societies must take care to check the capacity of borrowers to repay thoroughly, lest they should be burdened with a heavy load of bad debts. Loans for small-scale industry and housing, it is suggested, should increasingly be given. In order that the urban banks may not suffer losses by advancing to small industries, the Group has recommended the inclusion of these banks in the scheme for guaranteeing bank loans. No one can take exception to this recommendation, as well as to the plea that the central financing co-operative agencies should provide the urban banks adequate loans and overdraft facilities. But the Group's suggestion pertaining to State contribution to share capital on matching basis is irrational. Where, after all, is the need for such contribution when the urban banks themselves are collecting sizable deposits, as noted above?

As for employees' co-operative societies, the Group wants every organisation employing more than fifty persons to have one such society. This is a good suggestion worthy of implementation. Surely, the employers can provide, as has been suggested by the Group, working capital loan of upto Rs. 15,000 repayable in ten years, besides managerial subsidy or staff on loan for about three years initially. Care, however, must be taken to see that the employee-members of the societies do not make it a habit to borrow from these societies for all and sundry purposes.

Bajaj Tempo To Expand

Encouraged by its own past performance and by the excellent demand that exists for light trucks (three-wheelers and four-wheelers), Bajaj Tempo Ltd. has decided to undertake a large-scale expansion programme estimated to

ANTI-GRAFT DRIVE

(From Our Special Correspondent)

ALTHOUGH he has been meeting the Prime Minister and having consultations with him almost daily, the responsibility of being the No. 1 in full operation in the Centre has been thrust upon Mr. Gulzarilal Nanda temporarily. According to Mr. Nanda—in conversation with foreign correspondents last week-end—Mr. Nehru has been wanting to be up and about as early as he can, but all his party friends have been advising the Prime Minister to take it easy. Mr. Nanda says that a radical reorganisation of the Cabinet will be completed before Parliament reassembles in the third week of February for the Budget session. While the Prime Minister remains available for consultations from his sick bed, foreign as well as domestic affairs have pressed upon Mr. Nanda. At Calcutta, the Home Minister took quick and firm steps to control the communal troubles. The riotous aftermath of the theft of the Prophet's hair in Kashmir and the breakdown of the administration in that State as well as the Bengal rioting had international Indo-Pakistani overtones which again have had to be dealt with largely by Mr. Nanda without ready advice from senior colleagues who have been Kamaraj-planned into the party wilderness.

In the Planning Commission, Mr. Nanda, with all the Gandhian sincerity at his command, had earned a reputation for long-winding dissertations and little else. It must be said in his defence that, in all those years, he did not have the administrative apparatus under him to implement his ideas, his job was to be a shadow of Mr. Nehru in the planners' brains trust. In the few months he has been in the Home Ministry, Mr. Nanda is beginning to prove himself capable of quick decisions and firm implementation, as was seen in Calcutta. Amid all these preoccupations with quasi-international and law and order problems, the Home Minister has found time to work out in great detail a programme for administrative reorganisation and suppression of corruption.

Move No. 1 in the anti-corruption drive is the appointment, announced last evening, of Mr. Nittor Srinivasa Rau, retired Chief Justice of the Mysore High Court, as the Chairman of the Central Vigilance Commission. The appointment will be for six years and the judge will be barred from accepting any other Government post afterwards. The judicial chief of the Commission will have independent authority to take up cases on his own, without anybody standing in the way. No doubt, he will operate within the ambit of restrictions imposed by constitutional procedures and not through emergency laws.

Move No. 2 is action to reduce administrative delays which have become the major cause of corruption. Mr. Nanda divides into two broad categories the corrupt practices in the permit *raj* that the country is—bribes being offered for getting what are normally due to the applicants for some permit, licence or concession, and bribes for undue favours to which the applicants are not entitled under the normal course of licensing or other orders. The first category of bribes, Mr. Nanda explains, has become widespread because of the administrative delays of which some are contrived at to induce bribe-giving—deliberate delaying tactics to earn cash. The businessman parts with money to get what may be his normal due to avoid waste of time which again is waste of money and profit for the industrialist. Nobody has yet suggested a *satyagraha* by some industrialist laying claim to a Gandhian business pedigree. Mr. Nanda does not promise a *ram raj* which would brook no delays, but offers to act within the administrative framework by putting the screw on officials. He is calling a series of meetings of senior officials to speed up administrative procedures. There will be someone high enough in the official hierarchy who will also be easily accessible, to deal with grievances about delays. This again will naturally have to suffer a red-tape treatment because the complainants will have to be screened first. As for the other set of corrupters in search of special favours, the weapon is the big stick and the Home Minister holds out the threat of deterrent punishment in which the bribe-giver will be penalised as much or more than the official caught taking illegal gratification. The meeting between industrialists and the Home Minister last week was something of a comic interlude in which both sides accepted the charges of widespread corruption and made a mutual promise to mend ways. The Home Minister hopes to have his anti-corruption machinery in swing by the time the new financial year begins.

Food Trading

Apart from the resolutions adopted at the Bhubaneshwar session of the Congress—which prescribes no deadline for various socialist measures—there are practical considerations which are leading to an elaborate reassessment of the policy on trading in foodgrains. The re-thinking is taking the administration away from the policies of Mr. S. K. Patil which ended State trading. The Calcutta rice crisis caught the administration on the wrong foot and the traders were found, by and large, unmanageable. Food Ministry officials are thanking their and Mr. Swaran Singh's lucky stars that a situation similar to that in Calcutta did not emerge in North India in the past few weeks. Wheat stocks in the North Indian grain markets are said to be a tenth of what they were at this time a year ago and one reason for the small stocks is the huge export to Bengal during the rice crisis. The Government claims to have averted a grain crisis in the northern zone by unloading large quantities of wheat through hundreds of fair-price shops. In Delhi itself, about two hundred new fair-price shops have been opened, bringing their total number to more than four hundred and fifty.

TREND OF SHARES

PRE-BUDGET APATHY

(From Our Own Correspondent)

BOMBAY, *22nd January*

SHARE markets were again on the defensive last week, with both bulls and bears disinclined to be aggressive. A growing decline in the volume of business and a continuation of the sustained downward drift were the main features of the trading. The mood was one of caution and the professional operators were not inclined to enlarge their commitments. The bulk of the business was of a jobbing nature with an increasing tendency to book quick profits at small upturns. The phenomenon could be attributed as much to the pre-budget apathy as to the continuance of mixed news from the corporate front. Judged by the mood of the market, it appears fairly certain that equities will drift aimlessly to progressively lower levels, until the budgetary uncertainties which have cast their shadows on the market are out of the way.

On the economic front, the news bag contained quite a few encouraging features. The reports that the Union Government is taking steps to provide adequate and cheap credit for export purposes as recommended by the Study Group on export finance and the recommendations of the Secretaries' Committee in regard to decontrol of steel failed to create a durable impression.

On the contrary, the reactionary trend which developed on Friday gathered fresh momentum under the unfavourable impact of the reported recommendations of the Bonus Commission whose report was signed on Saturday. The Commission is reported to be of the view that a return of seven per cent on paid-up capital and four per cent on reserves should be adequate and that a minimum bonus of four per cent and a maximum of 20 per cent of annual wages (including dearness allowance) should be paid. Marketmen also found something to worry in the Lakdawala Committee's findings that the cost of living index in Maharashtra will have to be revised upwards.

The uncertainties regarding Cabinet reshuffle were set at rest by the official announcement of Mr. Lal Bahadur Shastri and Mr. D. Sanjiviah as Ministers of the Union Cabinet.

As the Central budget was only five weeks away, speculation was rife about the new budget proposals. While the overall tax structure for the new financial year is not expected to undergo any radical change, feeling is gaining ground that Mr. T. T. Krishnamachari would grant some relief to the corporate sector at least in the matter of Super Profits Tax in order to enliven the capital markets. Since the level of expenditure is likely to show a further rise next year, marketmen believe that the Union Finance Minister might rely more on indirect taxes. Moreover he may have to find the ways and means of implementing the socialist policies of the Congress. It is also feared that there cannot be any significant change in the dividend outlook for the corporate sector in the context of the recommendations to limit unearned income.

Scripwise, all the speculative counters, excepting A.C.C., Scindia and Telco wound up the week with on-balance losses in varied degrees. The rot began since the end-of-account session on Friday when fears of higher contango charges provoked tired bull liquidation and in its wake prices declined along the entire list. A weak tendency developed on Monday, following the bearish implications of the Bonus Commission's report, which suggested a larger distribution of profits to labour. Several equities took a downward plunge which brought them down to the depressed levels registered on 2nd January as a sequel to Congress resolution on democratic socialism. A feeble attempt at recovery on the following days proved abortive in the absence of any follow-up support even at lower levels. During the course of the week, Tata Steel were marked down to Rs. 144.50, Indian Iron to Rs. 24.84, Century to Rs. 664, Bombay Dyeing to Rs. 61.40, Kohinoor to Rs. 330.50, National Rayon to Rs. 418, Telco to Rs. 290, and Hind Motor to Rs. 18.84. At these levels, some replacement support was in evidence which averted a further decline. The closing rates on Thursday were a trifle better: Tata Steel Rs. 145, Indian Iron Rs. 24.88, Century Rs. 673.50, Bombay Dyeing Rs. 62, Kohinoor Rs. 333.00, National Rayon Rs. 419, Telco Rs. 292, Hind Motor Rs. 18.88. The most pronounced fall was in Standard which closed at the worst level of Rs. 777 against Thursday's close of Rs. 822. The only shares which had an improved finish were Scindia and A.C.C.

In the cash section, the general drooping tendency was once again in evidence not because of any perceptible selling pressure but due to paucity of inquiries. Mafatlal Fine were marked down in the last two sessions by Rs. 120 to Rs. 600 on disinvestment selling, following the offer to the public of 14,500 equity shares of Rs. 100 each at a premium of Rs. 275 per share.

MARKET GOSSIP

(Concluded from previous page)

cost about Rs. 180 lakhs. The programme envisages (a) an increase in the production capacity of three-wheelers from 1,000 to 2,500 vehicles a year and (b) manufacture of 1,500 four-wheelers annually. The bulk of the estimated outlay of Rs. 180 lakhs is proposed to be met from borrowings (Rs. 92.77 lakhs, including Rs. 50 lakhs from the I.F.C. of India), reserves (Rs. 7.37 lakhs), present capital (Rs. 14.59 lakhs), contribution to equity capital by the foreign collaborating firm (Rs. 17.77 lakhs) and offer of shares to existing shareholders (Rs. 18.50 lakhs). The balance of Rs. 29 lakhs will be offered to the public. The issue will open for subscription on the 10th of next month.

The public response to the issue of Bajaj Tempo will doubtless be encouraging. For the Company's products are assured of a ready market. Further, the experience which the Company has already had and the services of some technicians made available by the German collaborators may be expected to ensure quality production at economic costs. What is more, the Company is already paying handsome dividends, the rate of dividend actually paid for the year 1962-63 being 20 per cent. The Company, it will be recalled, commenced manufacturing activities only in May 1959.

Guest, Keen, Williams' Debentures

The well-known firm of Guest, Keen, Williams Limited is offering to the public Rs. 1.5 crore worth of debentures—1973-78 (of Rs. 1,000 each at par) carrying interest at 7 per cent taxable. The proceeds from the issue will be utilised for financing the Company's development plans, the most important of which pertains to the expansion of steel making and rolling capacity for the manufacture of special steels. The subscription list will open on 3rd February. The whole of the issue has been underwritten by the Life Insurance Corporation, the I.C.I.C.I. and four sharebroker houses. The Company has chosen the issue of further debentures—there are already outstanding Rs. 139.75 lakhs worth of 6½ per cent stock 1966-71—apparently because its subscribed capital is quite large, being no less than Rs. 632.18 lakhs.

Notice

STRUCTURAL ENGINEERING WORKS LIMITED

NOTICE

NOTICE IS HEREBY GIVEN THAT THE Twentieth Annual General Meeting of the above Company will be held at 4.30 p.m. on Wednesday the 29th January, 1964 at the Registered Office of the Company to receive and adopt the Directors' Report and Audited Accounts for the year ended 30th June, 1963, to declare dividends, to appoint Directors in place of Mr. A. M. Kapadia and Mr. I. N. Bhagat who retire by rotation and to appoint Auditors for the current year.

U.S. MAMMOTH BUDGET

THE mammoth budget of the U.S. Government for the fiscal year beginning on 1st July next, which President Johnson presented to the Congress on Tuesday this week, cannot be described more aptly than what President Johnson himself called "a budget of economy and progress." It is a budget of economy, because it envisages, for the first time in the past nine years, a reduction of $500 million to $97,900 million in the total administrative expenditure, in spite of an appreciable increase of $4,600 million to $93,000 million in administrative receipts. The resulting budget deficit is, therefore, small, being $4,900 million, as against $10,000 million (estimate) for the current fiscal year (1963-64) and $6,200 million for 1962-63. The reduction in deficit certainly marks an important step towards "the achievement of a balanced budget in a full-employment, full-prosperity economy." And the budget is a budget of progress in that it continues to provide ample funds for a multitude of programmes, domestic and foreign, aimed at peace and plenty for all. The key paragraph in President Johnson's budget message is worth recording here:

"This budget safeguards the peace by providing for the further strengthening of the most formidable defence establishment the world has ever known; it recommends continued military assistance to those nations menaced by Communist aggression, direct and indirect; it includes economic assistance to those nations which are willing to take the steps necessary to guard their freedom and independence through economic self-help; it provides the funds necessary to advance our mastery of space, toward the achievement of a manned lunar landing in this decade; it provides for the sound management and development of our natural and agricultural resources; and in its recommendations relating to education, housing, manpower training, health, and employment opportunities for youth, it provides more funds than ever before in our history for the fuller development of our nation's most important resource—its people. Moreover, this budget makes provision for the initiation of a new and major effort to break the vicious circle of chronic poverty, which denies to millions of our fellow citizens a just participation in the benefits of life in our country. We owe to every young person in America a fair start in life—and this means that we must attack those deficiencies in education—training, and health, and job opportunities by which the fetters of poverty are passed on from parents to children. The attack on poverty must rely on local initiative and leadership and the resources of the local, State, and Federal Governments must be mobilised to support these efforts."

The administrative budget expenditure of $97,900 million estimated for the coming fiscal year covers only regular Government programmes financed out of Treasury revenues and does not include the outlay of $29,400 million on trust fund transactions and other special projects having their own sources of revenue (such as the Highway Trust Fund and the Social Security System). Adding these two figures and subtracting $4,600 million (that would otherwise be counted twice), the total Government outlay, or the total cash payments to the public as it is called, comes to $122,700 million, which is the same as that for the fiscal year 1963-64. More than two-fifths ($55,200 million to be precise) of this aggregate outlay is accounted for by national defence and nearly one-fourth (24 per cent of the total) by social security payments, as well as other trust fund transactions. The balance represents the combined share of international relations (2 per cent), interest charges on Federal Government debt (7 per cent), space research (4 per cent or $6,731 million), agricultural programmes (4 per cent), veterans benefits (4 per cent) and other programmes, including natural resources, commerce, transportation, housing, health, labour, community development, federal aid for education and general Government (11 per cent). Of the money needed to finance these payments, 40 per cent will come from individual income taxes, 21 per cent from corporation income taxes, 14 per cent from employment taxes paid into trust funds that finance workers' benefits, 23 per cent from other taxes and 2 per cent from public borrowings.

The President's budget estimates tell only a part of the story about Governmental spending in the U.S., for they exclude the funds spent by State and local Governments. In 1962, the most recent year for which complete figures are available, general expenditure by these Governments amounted to $59,000 million, the comparable figure for the Federal Government being $89,000 million. While the Federal Government spends most heavily for national defence, the State and local Governments put the bulk of their money into schools, highways, hospitals and public welfare programmes.

To India and other developing countries, President Johnson's budget message is certainly gratifying. In this message, the President has echoed his distinguished predecessor, Mr. Kennedy's emphasis that the U.S. should use a part of its great resources and technical knowledge to promote in the emerging nations hope and orderly progress, replacing misery, hostility and violence. "The 1965 request," to quote him again, "reflects the successes we have had in reducing the dependence of some nations upon the low-cost aid loans made by the Agency for International Development; by 1965, a number of countries will have turned to other sources and types of loans more consistent with their increasing economic strength." It is also a matter for great satisfaction to the developing countries that President Johnson has laid considerable emphasis on the reduction in trade barriers, as this step would bring about an increase in their exports and help an increasing number of these countries to become self-supporting. Declaring that the 30-year campaign of the U.S. to reduce barriers to world trade and the intensified pursuit of that goal signalled by the passage of the Trade Expansion Act of 1962 would reach a climax in 1964, he said: "For most poorer countries, full self-support is still some distance off. We must help them find a path to development through freedom and freedom through development." These are, indeed, noble sentiments and it is to be hoped that they would permeate the deliberations and actions of the U.S. Congress as well as of the other industrially advanced countries, especially the members of the European Economic Community.

TECHNICAL TALENT FOR PUBLIC SECTOR

The problem of attracting and retaining qualified personnel, especially technical personnel, which the industrial and commercial undertakings in the public sector are already facing, will increase in magnitude and complexity as the public sector expands, as it doubtless will. For, in the free market for labour, which exists in this country, those establishments, which offer better terms and opportunities for advancement, will obviously attract better talent. Public sector undertakings will, therefore, have to compete more keenly with the private sector units if they want to attract first class technical and managerial talent. Since most of the public sector undertakings are concerned with highly complex and specialised technical operations, it would be a dangerously shortsighted policy to select second-rate personnel to be put in charge of plants costing crores of rupees. So far, no serious attempt seems to have been made to evolve a system of remuneration that will attract and retain talent in the public sector undertakings. The system obtaining in most of them is at best a modified version of the pay scales applicable to the civil service. The result has been not altogether happy, because public sector undertakings are finding it increasingly difficult to get suitable technical personnel of the required quality. In fact, there is even a flight of first class talent from the public to the private sector which offers more attractive terms and greater scope for quick promotion.

In view of this position, the Industries Ministry of the Union Government did well to initiate an independent study of the problem, the causes and solutions for it. The study was made by Dr. H. K. Paranjape of the Indian Institute of Public Administration, New Delhi. For the purposes of the study, data were specially collected from 27 enterprises in both public and private sectors. The study points out that the existing imbalance between the demand for and supply of experienced engineers, especially those with certain kinds of specialised experience, has created difficulties for all industrial undertakings whether in the private or public sector. However, new public sector undertakings have a special problem to face, in that they have to attract at least a minimum number of qualified and experienced persons at the initial stages. The study has, therefore, suggested that public sector undertakings should pay higher salaries to technical personnel. One of the findings of the study is that remuneration in public sector undertakings is generally related to the pay scales prevalent in Government services and grant of higher pay at a comparatively young age is objected to even in the case of scarce talent. There is, the study points out, a virtual ceiling on remuneration at Rs. 3,000 though, in the case of foreigners and a few persons specially obtained from the private sector under special agreement, higher remuneration is permitted. The result is that competent and experienced persons are not attracted to new undertakings and those who possess valuable experience tend to get lost to the public sector.

It is true, the study points out, that public sector undertakings are treating their employees fairly; but then, it adds, the large and better managed companies in the private sector also do so, though there are many private companies which are much worse than public sector undertakings in their treatment of workers. This distinction is, however, irrelevant to personnel selection, because the public sector undertakings, if they were to secure talent, have to compete not with the badly managed companies in the private sector but with the well-managed ones. Given a mixed economy and the reluctance of the Government directly to control the remuneration paid by private sector undertakings, there is no alternative to public sector undertakings but to provide comparable remuneration. The report adds that the idea that salaries in the public sector undertakings should be similar to those paid in Government services should be firmly rejected and that a business-like approach to remuneration should be adopted. The study emphasises that, in an economy where rapid industrial growth is taking place, some migration of personnel is not only not harmful but to some extent desirable. But public sector undertakings, which lose a large number of their personnel or fail to attract sufficient number of young men of talent, are bound to suffer.

The study has also made certain specific recommendations regarding the lower and upper limit of salary and the channels for promotion. Thus, it is suggested that a fresh engineering graduate should get a starting salary of Rs. 500 per month and that the top most salary in large public undertakings should be placed somewhere around Rs. 5,000 per month. As regards promotion, it is suggested that opportunities for rising to top positions should be equally open to all categories of personnel and that technical personnel should not be made to feel that they are handicapped because of their being engineers and technicians. One of the significant findings of the study is that bureaucratic attitude on the part of top-managers, many of whom are civil servants, has been a source of considerable dissatisfaction among the younger technical officers.

The author of the study examined the feasibility of creating a common cadre of technical personnel for all public sector undertakings. His conclusion is that a common cadre will not be desirable, though some kind of a co-operative endeavour may be necessary for small enterprises in the public sector. He has, however, stressed the need for observance of certain uniform principles regarding remuneration in all public sector undertakings. In order to ensure uniformity, the establishment of a pay research unit is proposed for conducting surveys and advising public sector units about suitable standards of remuneration for different types of jobs.

The most important point that emerges from the study is that personnel policies in public sector undertakings, including the level of remuneration, cannot be pursued in isolation but has to take cognisance of the trend of salary and other benefits offered in the private sector. It is, in other words, idle to think that an industrial undertaking in the public sector could be managed in the same way as a Government department. If the Government wants (and it certainly does) public sector undertakings to function as efficiently as the units in the private sector, it should be prepared to adopt those policies which have contributed to the latter's efficiency. This is as much true of personnel as of other aspects of management.

D.I.R. AND CANE SUPPLIES

The Union Food and Agriculture Minister's statement at Lucknow the other day that the Defence of India Rules would not henceforth be resorted to for inducing the cultivators to supply cane to the sugar mills in reserved areas is rather surprising. It may be that administrative action for cane regulation has already been taken and a stage reached where it would be possible to deal with the problem under normal laws. But the withdrawal of D.I.R. for cane supply will definitely take away even the element of paper compulsion and further worsen the situation of sugar production, especially in Uttar Pradesh. The crushing operations of sugar mills are not so encouraging as one would wish. The actual output of sugar up to the 7th of this month, according to Mr. A. M. Thomas, Union Minister of State for Food, was no more than 912,000 metric tons, as against the 755,000 tons produced in the corresponding period of 1962-63. The rise in output is thus of the order of 21 per cent, whereas the production target of 3.30 million tons fixed to be achieved in the current season represents an increase of over 50 per cent as compared with the actual output of 2.15 million tons in 1962-63. Whatever it is, one wonders whether it is advisable to withdraw the application of D.I.R. for cane supplies during the peak period of the crushing season and that when the sugar mills continue to experience difficulties in obtaining their requirements of cane. It is strange that, while the Government is prepared to compel cereal growers to deliver a part of their crop at fixed prices, it is unwilling to follow this method so far as sugarcane is concerned. Commenting on the withdrawal of D.I.R., a spokesman of the U.P. sugar industry is reported to have said:

"The situation will worsen further. The stumbling blocks created by cane growers have already made it impossible for the factories to reach the State's production target of 1.5 million tons. The Government has already admitted that it would be possible to produce only 1.2 million tons. In the present circumstances, the maximum the State can achieve is 1.05 million tons. . . . On the basis of present trends, ten to fifteen sugar factories will conclude their operations before the end of next month for want of cane."

Similar seems to be the position obtaining in Bihar State. "Five sugar mills in North Bihar," to quote a report, "are facing closure owing to the diversion of sugarcane to *gur*. A large number of *gur* manufacturers have migrated from U.P. to North Bihar. They have made bulk purchases of standing cane crop, thereby depriving the sugar mills of their normal supply."

Mr. Swaran Singh has, of course, done well to brush aside the political pressure brought upon him for removing the ban on inter-State movement of *gur*. But the point is that, in spite of such a ban, mills in certain areas, as Mr. Swaran Singh himself has admitted, are facing acute competition from *gur* and *khandsari*. One of the factors—a predominant factor indeed—that has inspired such competition pertains to the increasing use of *gur* for illicit distillation which, as is well known, has turned to be a flourishing cottage industry in several places, thanks to prohibition. Mr. Swaran Singh is, therefore, sadly mistaken if he thinks that the present problem of cane supply to sugar factories has been met by raising the cane price to Rs. 2 per maund in areas of keen competition for cane supplies. If the authorities are really anxious to ensure maximum sugar production, they must accept the imperative need for completely banning *gur-khandsari* production in and around sugar factory areas. There is no escape from this.

On the question of cane price, Mr. Swaran Singh also stated at Lucknow that there was no scope for a further increase in price and that the sugar mills were free to give from their own resources a cane price of more than Rs. 2 per maund in the interest of keeping up sugar production. This statement implies that any additional price will not be taken into account at all for the purpose of fixing ex-factory sugar prices. Does Mr. Swaran Singh believe that the sugar mills have the means to pay a higher price for cane? The present price of Rs. 2 per maund is itself high in all conscience. It is the sugar consumer that is being mercilessly squeezed out to whet the appetite of the politically-led cane growers, as well as of the exchequer.

SEVEN MORE BANKS ANNOUNCE THEIR RESULTS

Since we went to press last week, seven more banks have announced their working results for the year ended December 1963. They are the State Bank of India (the biggest commercial bank in India though it is in the public sector), the Central Bank of India (the biggest commercial bank in the private sector), the United Commercial, the Union Bank, the Indian Overseas, the Canara Bank and the Syndicate Bank (formerly known as the Canara Industrial and Banking Syndicate Ltd.). The results of all these banks, as those of others reviewed briefly in our earlier issues, also show an improvement in net profit. The improvement must be attributed to expansion of banking business, as is reflected in the upward trend of advances. If the rise in net profits for the year 1963 as compared with the previous year has not been more marked, it is because of the fact that the increase in gross earnings of banks has been neutralised greatly by heavier interest payments, staff and other expenses, and taxation. The table below gives the exact amount of net profits earned by the aforesaid seven banks during the years 1962 and 1963, as well as dividend absorption, transfer to reserves and amounts brought in and carried forward:

(In lakhs of rupees)

Name of bank	Profit*	Amount brought in	Transfer to reserves	Dividends	Amount carried forward
State Bank of India:					
1962	269.25	50.41	55.00	129.37	45.67
1963	274.82	45.67	55.00	129.37	35.51
Central Bank:					
1962	179.06	23.37	38.71	63.00	0.93
1963	189.26	0.93	40.00†	63.28	0.91
United Commercial:					
1962	73.33	2.07	28.00	24.56	0.19
1963	76.43	0.19	17.00	33.60	0.76
Union Bank:					
1962	22.07	1.45	6.00	6.06	1.40
1963	27.38	1.40	6.00	11.40	10.88‡
Indian Overseas:					
1962	20.00	2.23	6.75	10.20	2.03
1963	24.93	2.03	4.00	13.19	1.02
Canara Bank:					
1962	15.44§	0.47	5.50	8.20	0.53
1963	24.00§	0.53	N.A.	15.00	N.A.
Syndicate Bank:					
1962	18.33	0.35	6.50	8.40	0.78
1963	26.00	0.78	9.00	8.40	4.38‖

* After providing for taxation (figures not disclosed) but before providing for bonus to staff.
† Excluding Rs. 39 lakhs transferred to special reserve.
‡ Subject to payment of bonus to staff.
§ After providing for bonus to staff.
‖ Subject to other appropriations not disclosed.
N.A.—Not available.

Dividends (subject to tax) have been maintained at the previous year's levels in the case of all banks, except the Indian Overseas which has stepped it up from 12 per cent to 14 per cent; the actual rate (per cent) of dividend proposed for the year 1963 is: State Bank of India 23, Central Bank 20, United Commercial 112, Union Bank 11.4, Syndicate Bank 20 and Canara Bank 15. The dividends in the case of United Commercial, Union Bank and Canara Bank are on higher capital. Besides maintaining dividend on higher capital, the Directors of the United Commercial have also proposed to issue, subject to the approval of the Controller of Capital Issues, bonus shares in the ratio of one share (of Rs. 50) for every 14 shares held by capitalising a part of the premium on shares. The new shares of the Union Bank, which qualified for dividend for only three months in 1962, are now entitled to a full year's dividend. The amount transferred to reserves is larger in the case of Central Bank and Syndicate Bank, but smaller in respect of United Commercial and Indian Overseas, while it is unchanged in the case of State Bank of India and Union Bank. The allocation to reserves made by the Canara Bank is not known. Bonus to staff accounts for quite a bit of the profits earned. The actual amount set aside for this purpose—in lakhs of rupees—for the year 1963, the figures in brackets relating to 1962, is: State Bank 82 (72); Central Bank 70 (65); United Commercial 19 (16.5); Indian Overseas 6 (4); Syndicate Bank 5 (3). The amount of bonus payable by the Union Bank and Canara Bank is not known; in the previous year, their bonus had absorbed Rs. 7.66 lakhs and Rs. 5.14 lakhs, respectively.

In the preliminary statement of results, the deposits of the Indian Overseas Bank, as on 31st December 1963, are shown at Rs. 41.50 crores, as against Rs. 37.13 crores a year before. The corresponding figures for the Syndicate Bank and Canara Bank are Rs. 45.11 crores (Rs. 32.65 crores a year before) and Rs. 72 crores (Rs. 59 crores), respectively.

I.F.C. INVESTMENT IN NIGERIA

The International Finance Corporation has agreed to join a group of leading Japanese cotton textile firms and two Nigerian development institutions in establishing a new cotton textile company in Nigeria. The new company, called the Arewa Textiles Ltd., will construct and operate an integrated cotton textile mill at Kaduna in Northern Nigeria. The cost of the project is estimated at £N 1.6 million ($4.48 million), of which the I.F.C. is providing finance, in the form of loan and share capital, amounting to £N 250,000 ($700,000). The Barclays Overseas Development Corporation of London (a subsidiary of Barclays D.C.O.) and Handelsfinanz of Zurich are participating in I.F.Cs loans. The I.F.Cs investment is in the form of capital shares to the tune of £N 117,000 and loans aggregating £N 133,000. Of the amount to be lent, £N 87,000 will be in the form of a secured loan, repayable in ten equal annual instalments beginning in 1967, and £N 46,000 will be in the form of a convertible loan, repayable in five equal annual instalments beginning in 1969. The new plant will have 10,000 spindles, 400 looms and appropriate bleaching facilities. Using Nigerian cotton as a raw material, it will help in the growth of an industry which has a natural base for development in Nigeria. When in full production, the plant will provide employment for some 750 Nigerians. This is the first investment that the I.F.C. has announced in Nigeria, and it is the first operation in which the I.F.C. will be associated with a group of Japanese industrial companies.

LONDON LETTER

SATISFACTORY TRADE FIGURES

WILL BANK RATE BE RAISED?

(From Our Own Correspondent)

LONDON, 18*th January*

WE now have the trade figures for December before us and therefore those for all 1963. *Both imports* and exports jumped to *record* levels in December: even on a seasonally adjusted basis imports hit a new high at £443 *million* and exports and re-exports a new high at £373 *million—which also shows* a record high *trade* gap of £70 million.

For the year 1963 as a *whole, imports* totalled £4,825 million (a 7 per cent rise on the *1962 total)* and *exports* and re-exports reached £4,230 *million (also a 7 per cent* rise on the year). The crude trade gap is, therefore, a little under £600 million but, when the imports, which *are shown above on* a c.i.f. *basis, are* corrected to f.o.b.—same as exports—the *gap* is narrowed to about £100 million. Thus, pending final estimates for the invisibles, there is no reason to alter *recent forecasts that the year will* end up with a *favourable* balance of the order of £100 million.

The first comment on these figures is that imports have not risen as much as they might, *given the upsurge in the* economy, even though they are 2 per cent over the *annual* N.E.D.C. target. Admittedly, in the last quarter, imports rose 13 per cent, but they rose 14 per cent in the last quarter of 1960 at *the same* stage in the trade cycle of four years ago.

The second point is that the average monthly trade gap has been growing: from £36 million per month in the first quarter, £47 million in the second and £53 *million* in the third, to over £60 million in the final quarter. But again, for a boom year, it could have been *worse.*

The question as to why it has not been worse brings us to the third point, which is the encouraging export performance. The last peak month was August and *since then exports* have, relatively speaking, been dropping away. Thus, their rise to a new December peak—on a seasonally adjusted *basis*—shows that the momentum of increase has not been lost. Moreover, past dragging in exports has been to the sterling area where raw material prospects are now better and *with them the chance of* more export expansion; and recent expansion has been to North America where trade prospects remain exceptionally good.

Even so the steadily rising strain on balance *of payments is something of which account must* be taken and, if the strain is not to increase, the first question asked is what monetary action the *authorities might* take. Apart from the balance of payments, *they must be noting the* rise in both industrial investment above the *forecasts* and the higher personal spending. Midway through last year the forecast was that capital investment in industry in 1964 would be little different from that in 1963; now, *six months later,* the Board of Trade is forecasting a rise of 8 per cent. The distributive and service industries are expected to go up from the original 5 per cent estimate by 10 per cent; so taking *all business investment,* whereas the original guess was under 5 per cent, it now looks as if 10 per cent will be nearer the mark and in terms of money this might be £100 million more investment. Even these figures are well below the level of investment for 1962, but the investment boom of that year marked the end of *the previous cycle.* The present indications are that investment in 1965 will be even higher than in 1964.

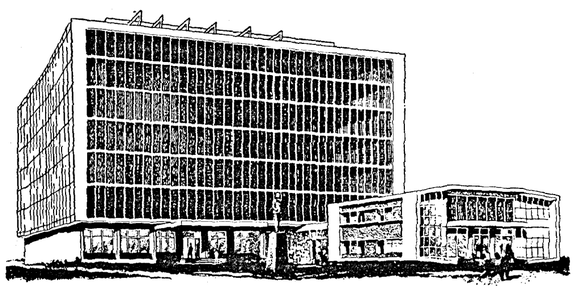
As for consumer spending, the latest figures only relate to the third quarter which was up on *the second quarter by* the very high margin of 2½ per cent. Present indications are that 1963 consumer spending was 3½ per cent up on *the previous* year—and, of course, the rate is steadily rising.

Over the past quarter short-term interest rates have risen 0.3 per cent and long-term rates 0.4 per cent, but neither of these rates *are quite as high* (especially the short rates) as they were in the *early spring of last year.* Superficially, therefore—Bank rate having been unchanged over this period—there seems no *reason* to suppose that Bank rate might be *raised (the gap between it and other* rates being less wide than last *March).*

The anxiety to avoid a repetition of stop-go *policies, however, makes everyone concerned* strain to look ahead as much as possible in order to use gentle brakes and stimuli. Thus, the current query is whether Bank rate should *not be raised as* a warning. What about the effect on international *money flows? There is* now a two-tier Bank rate, brought into operation when the Bank rate was last lowered to enable hot money to continue earning competi*tive interest. This would hardly work in* reverse, for, if all money *rates were rising,* overseas funds would come in to take advantage of this. And at present the margins be*tween British* and U.S. interest rates (and also in other *competitive centres)* are not such as to encourage a British move upwards. *If the* U.S. economy does go on boosting and money rates there rise, then the British rate is likely *to follow automatically.*

But, apart from the technical reasons concerned with the economy, there are political *reasons to consider and, though the* Governor of the Bank is not directly *concerned with* these, his master in Whitehall is. If the election is not too long delayed, then Bank rate could go up soon after it (whoever was in power), but, *if it is unduly postponed,* technical reasons could force the Chancellor's hand. Indeed, the Chancellor must be increasingly faced with a conflict between his political and *national interests. The* former dictate giving the economy a free *rein till after an election,* the latter might demand a gentle application of the brakes very soon. His is not an enviable position in which to be and it will get worse as time goes on and as the economy continues to expand.

Enduring symbol of stability and service



THE INDIAN OVERSEAS BANK'S
New, Fully Airconditioned
Administrative Building at
Mount Road, Madras 2
was opened on 13th January, 1964
by the Hon'ble Shri C Subramaniam
MINISTER FOR STEEL, MINES AND HEAVY ENGINEERING, GOVT. OF INDIA.

Functional, spacious and modern, the new I.O.B. Building is a picture of streamlined efficiency. It is truly a symbol of the Bank's basic soundness, geared to your service and progress.

Twentysix years have rolled by since the Bank's inception. Built on the firm foundation of your confidence, I.O.B. today is among the leaders in banking, offering comprehensive service in India and abroad. I.O.B. faces the *future with enthusiasm,* inspired by the challenge of finding newer and better ways of serving those who need a progressive bank with a modern outlook.

THE INDIAN OVERSEAS BANK LIMITED

Central Office: Madras. *Over 80 branches spread over India.* Overseas offices in Bangkok, Colombo, Hong Kong, Ipoh, Klang, Kuala Lumpur, Malacca, Penang, Singapore. *Correspondents in commercial centres the world over.*

COMPETITION IN BANKING—YES OR NO?

By Questor

LAST April, in the City of London, Martins Bank held a banquet to celebrate its 400th *anniversary.* The chief guest and speaker was the Governor of the Bank of England, and he suggested to the assembled bankers that they should compete more vigorously to serve *the needs of the twentieth century.*

Their deposits, he pointed out, had been rising much less rapidly than the national income. Rather than rely passively on the *Government* to increase their resources by deficit budgeting, they should seek themselves to increase them by adopting more flexible interest rates and by attracting the custom of *the ordinary wage-earner.*

The bankers were first surprised and then annoyed. They have certainly been growing less rapidly than other deposit-taking institutions, but this is because they have been the main victim during the past 25 years of formal and informal Government restrictions on credit. Their interest rate structure certainly *tends to be rigid, but this is because* rigidity suited the convenience of the monetary authorities in the past and was assumed still to do so.

They have been trying hard to attract new, *small accounts,* despite the fact that they are relatively unprofitable to operate. If *they have* been trying hard only recently, it is because they have only recently been given freedom to *act as commercial rather than semi-official* organisations and are not sure how long this freedom will last.

The bankers, in short, felt that they had been unfairly used. They have been brooding privately on this unfair usage ever since, and only now, when the annual chairmen's statements are being published, are they making an *open rejoinder. Some of their comebacks* are no more than good debating points: they suggest, for example, that the Government will prevent the banks from making use of any hard-earned increase in lendable resources whenever it seems convenient, or that the slow growth of deposits is a result of restrictions and has been accompanied by a higher velocity of circulation.

Some, again, are a bid for active co-operation from the authorities. The compulsory liquidity ratio, they point out, *is still ex*tremely high by international standards, and the fact that the Government charges a stamp duty on cheques increases the cost of banking services to the wage-earner.

But the more thoughtful of them have concentrated on the implications of the proposal that they should make the interest rate structure more flexible and *attempt to attract* deposits which are at present going elsewhere. And they make some strong points.

In the first place, the only domestic source of funds which can increase bank deposits directly is the Government itself. But, if the banks were to succeed in attracting money out of the various National Savings media or in offering *companies* a rate competitive with that available on Treasury Bills, the Government would be forced to retaliate. The *status quo* would be restored inevitably, but at the cost of an unnecessary and possibly damaging rise in interest rates.

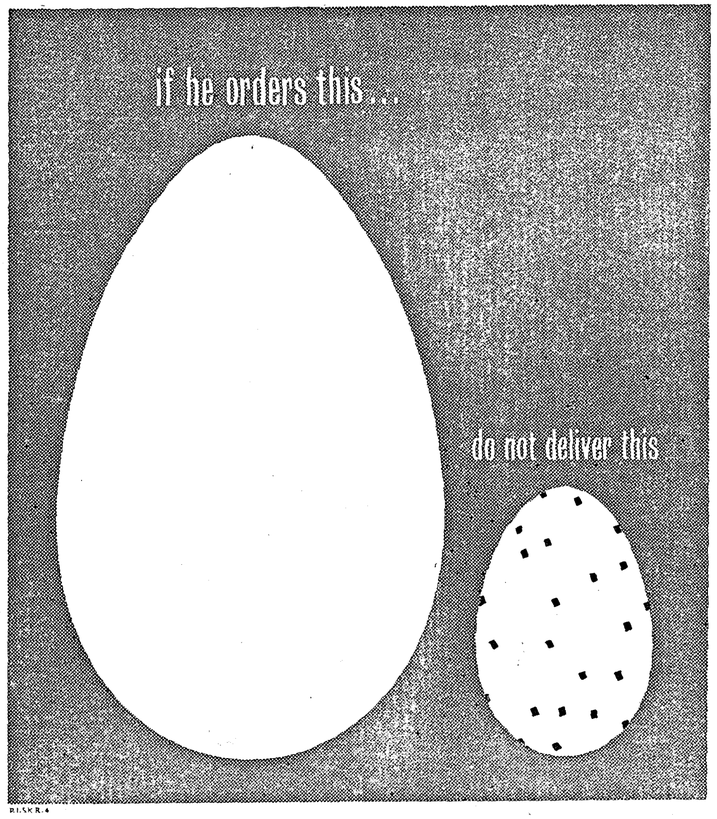
In the second place, whether the banks increased their deposits directly by competing with the *Government* or forced the Government to increase them indirectly by competing with other institutions and reducing the velocity of circulation, they could do so only by *offering* higher interest rates. This increase would apply not only to new deposits but to a considerable slice of existing deposits. Their costs would therefore rise, and they would be forced to increase the rate charged on advances; this would imply not only a tendency to devote a larger part of their funds to speculative *projects which can afford* to pay high rates, but a widening in the gap between the rate charged to small borrowers and that *charged* to large. Not only would interest rates generally tend to rise as a result of competition, in short, but the big depositor and the big borrower would tend to gain at the expense *of the small.*

It is not certain which of these two arguments—one basically economic, one social—carried more weight, but it appears that the Treasury was sufficiently impressed by the conjunction to hint that it would not approve of competition along the lines recommended by *the Bank of England. The bank chairmen,* therefore, both those who have seemed to favour competition and those who have expressed reservations, are consciously arguing a theoretical rather than a practical case. But it may well become more practical in the future than it is at present, and it presents a question *of general interest—is free competition, which* is generally assumed to produce the best results in other sectors of a developed economy, to be allowed between large financial institutions?

History has forced most countries to answer "no." The risks involved in full-scale competition—notably bankruptcies and concentration—affect too many people and are too close to the *health of the whole economy* to be tolerated. Banks, and the interest *rates* they charge, have been carefully regulated for a long time past; and nowadays, when the *national dangers which* first led to regulation are less urgent, the *need for international co*operation in financial affairs is better recognised.

But if the banks are to be *discouraged from* competing in price and are expected to adopt a "responsible" line in their lending operations, how are they to be prevented from ossifying? In the *first place, I suggest, Governments need*ing to impose formal or informal restrictions on the granting of credit should see to it that these are imposed on all deposit-taking institutions, and *not only* on the largest: it is in the general interest that new *institutions should* spring up with changing circumstances, but they should not be given a free run of the field.

And, secondly, there is plenty of room for the banks to compete with one another in the services they provide—especially to wage-earners *who do not yet use them. The British* banks, for example, are moving slowly through advertisement and automation to attract a larger public: as soon as one of them is ready to go out bald-headed, the others will be forced to follow.



Your business integrity alone will ensure better *returns.* Keeping to promised quality is vital in *your export* dealings. Letting down the overseas buyer is letting down your business. Your delivery of rayon and synthetic fabrics should be as per sample.
Correct and prompt delivery creates confidence in you... brings in repeat orders.

Your reputation abroad rests on:
★ *Supplies as per samples*
★ Attractive presentation
★ Strong and seaworthy packing
★ Shipments in time
Build your exports on a long-term basis

ROURKELA'S CHRONIC AILMENTS

SEARCH FOR COMPETENT DOCTORS

By K. Krishna Moorthy

THE Steel City of Rourkela is flanked by the Koel and Brahmini rivers; the confluence of these rivers is only a few miles from the City. Near this *sangam*, legend has it, Ved Vyas sat and composed the Mahabharata. Now another epic is being composed here again—the travails of bringing about close co-operation between Indians and Germans for industrial progress and the search for competent leaders to co-ordinate this constructive endeavour.

The epic began in 1948, when the Indian Government indicated its intention to set up a steel plant with an annual capacity of 500,000 tons. In 1953, two well-known German firms, Krupp and Demag, signed a consultation contract with the Indian Government and, in January 1955, they submitted a project report. The plan for a million-ton plant had by then been conceived by Delhi and, in February 1956, the new project report was approved by the Indian Government. Construction work on the plant began in October 1956. In March 1961, the wide strip mill, the last big section of the steel works, was inaugurated. Nearly three years have passed, but the enterprise has still been unable to shed the sicknesses it acquired partly in the very first stages of its conception.

Crop of General Managers

On 2nd December last, Mr. Walter Scheel, German Minister for Economic Co-operation, launched the work on the expansion of the plant to 1.8 million tonnes under the terms agreed to in April. A fortnight later, Dr. Peters, who was the General Superintendent of the Works for 28 months, left. A few days later, Mr. S. T. Raja, who had been General Manager of the Rourkela plant for exactly two years, was out. Delhi has announced the name of Mr. A. N. Banerjee as Mr. Raja's successor. Mr. Banerjee is not completely new to steel, having been Iron and Steel Controller and Deputy General Manager at Durgapur. Whatever the deficiencies in Rourkela's steel production programme, it has raised a large crop of general managers. Mr. Banerjee has the distinction of being the seventh General Manager. While expansion work has begun, it will be months before the new General Manager and the new General Superintendent, the two key-men at the plant, are able to come to grips with the problems affecting the steelworks. The Deputy General Manager, an I.A.S. officer, has just about finished his running-in period at the plant and he is there to some extent as the State Government's watchdog.

As soon as he became Steel Minister in the middle of 1962, Mr. C. Subramaniam announced that one of his early tasks would be to try and cure the sick child that Rourkela had become. After the Chinese attack, the Rourkela plant assumed more importance than ever before as the supplier of flat products essential for the defence industries. But Mr. Subramaniam, who experimented with a scheme of decentralisation of control of steel plants, has yet been unable to find the doctors competent enough to cure Rourkela.

Capital Outlay

Rourkela's limp has placed it way behind Bhilai and Durgapur in many respects. It has a congenital origin in the Indian steel organisation directly dealing with numerous firms in West Germany. In the case of Bhilai and Durgapur, the Soviet Government and the British consortium of firms had been turn-key contractors, presenting a co-ordinated approach right from the beginning. Rourkela was the first in the matter of planning, erection and completion, but Bhilai raced ahead in the matter of production and has maintained its record in 1962 and 1963. The first million-ton stage of the Rourkela plant cost Rs. 234 crores, as compared with a little less than Rs. 200 crores at Bhilai and Durgapur. But the capital cost is not strictly comparable, as the Rourkela plant is meant for producing steel products of higher value. According to Rourkela accountants, there will be 50 to 75 per cent more money in the sale of Rourkela products as compared with the sales of Bhilai and Durgapur products. Until Bokaro comes into being Rourkela has no competitor in the country.

The Rourkela management says that the works cost per ton of ingot is about the same in all the public and private sector plants but this correspondent was unable to obtain the exact figures from the Rourkela authorities. The Rourkela financial authorities say that the T.I.S.Co investment cost per ton of steel is Rs. 1,300. The capital investment in Rourkela is Rs. 2,340 per ton capacity and the expansion may bring it down to Rs. 2,000. The expansion to 1.8 million tonnes is now estimated to cost Rs. 130 crores. The maximum expansion possible at Rourkela is 2.5 million tonnes.

A Race-horse

In flat products essential to the defence industries, Rourkela will play an important role for many years. Dr. Erhard described the Rourkela plant as a race-horse. The horses at Bhilai and Durgapur, which did not lay claim to high pedigree, are running more smoothly. Why has the Rourkela race-horse been stumbling?

One reason is the organisational failure on the Indian side from the very beginning in co-ordination. The Germans failed to organise a central agency and the Indian organisation did not come to the standard of performance which the Soviet and British suppliers were able to provide through their own centralised systems. The Soviet insistence on detail was exacting; the British also managed their co-ordinating tasks well. As for the Germans, they either assumed a high level of performance on the part of the Indians—a confidence misplaced—or they were indifferent to the problems. They did not start with anything more than commercial motives; when international comparisons started emerging, the whole thing came as a rude shock for German industry.

There are plenty of arguments on both sides. A new series of mutual recriminations cropped up even at this late stage over whom to blame for the spare parts muddle which is ruining the performance of the plant. According to German experts at Rourkela, the German steel works back home carry a stock of ten per cent of plant as spare stores. Because of the trans-Oceanic distances involved in supplies to Rourkela, the spare-parts stocking, according to the Germans, should have been 20 per cent of plant. Despite detailed studies, even the last bulk orders for spare parts was defective, as Mr. Peters emphasised in his farewell report.

Caste System!

The Germans, the Russians and the British have all been dealing with similar sets of Indians at the construction stage and after the plants went into production. Only the British have had the edge in the language of communication. Both the Russians and the British appear to have made sufficient allowance for the calibre of Indian technical and managerial personnel and made adjustments, while the Germans perhaps cry wolf at the slightest provocation. The Germans are mad at Indians who do not go mad over machinery breakdowns; the philosophically indifferent approach of some Indian counterparts to engineering problems gets on the nerves of Germans. The Indian B.Es sneer at the "fitters and the foremen" who come out as experts, because some of the good German steel men may not have a degree to their credit. Their attitude stems from the Indian academic caste system.

Why was Mr. Raja Retired?

The absence of a continuing thread of managerial leadership at Rourkela is another major problem. The command performance of six General Managers in eight years has placed the plant under a shadow of constant uncertainty. Mr. S. T. Raja, the last General Manager, earned praise for his "vigorous management" from Mr. Solveen, Secretary to the German Ministry of Economic Affairs. The Germans are also known to have expressed a wish that Mr. Raja be retained as General Manager in the crucial initial stages of expansion work. For his performance at the Hindustan Antibiotic Factory at Pimpri, Mr. Raja was honoured with a *Padma Shri*. But Mr. Raja is now being sent "underground" to raise coal in the nationalised coal sector.

In the politics of personalities, did Mr. Raja become disqualified for Rourkela leadership, because he was, to an extent, acceptable to the Germans who saw some merit in him? Mr. Raja had drawn on his head a hornet's nest of labour unrest. Absenteeism at Rourkela—as high as 25 per cent—had broken the heart of German as well as Indian engineers. Added to this was a series of labour disputes and work stoppages as a result of the in-fighting among five registered labour unions, of which not one has been recognised. Each one of the unions naturally tries to outdo the other in the race for the title of militancy necessary to swell the membership rolls. Orissa State officials complain of the contemptuous disregard the former Rourkela General Manager had for the views of the State Government on the brittle labour situation. State Ministers and officials have felt that the Rourkela management was creating law and order situations which would be difficult for the State Government to solve.

With the Central Government also, there was, perhaps, a feeling that the erstwhile Rourkela manager was talking too much about other steel plants like Bhilai. One inference is that such talks was partly inspired by the Germans. I have heard Rourkela management talk of the danger in running steel plants above rated capacity as is being consistently done at Bhilai. Rated capacity is not an absolute equation and obviously the Russians rate things differently. But there is plausibility in the alleged danger, as witness what happened to the fertiliser plant at Sindri a couple of years ago.

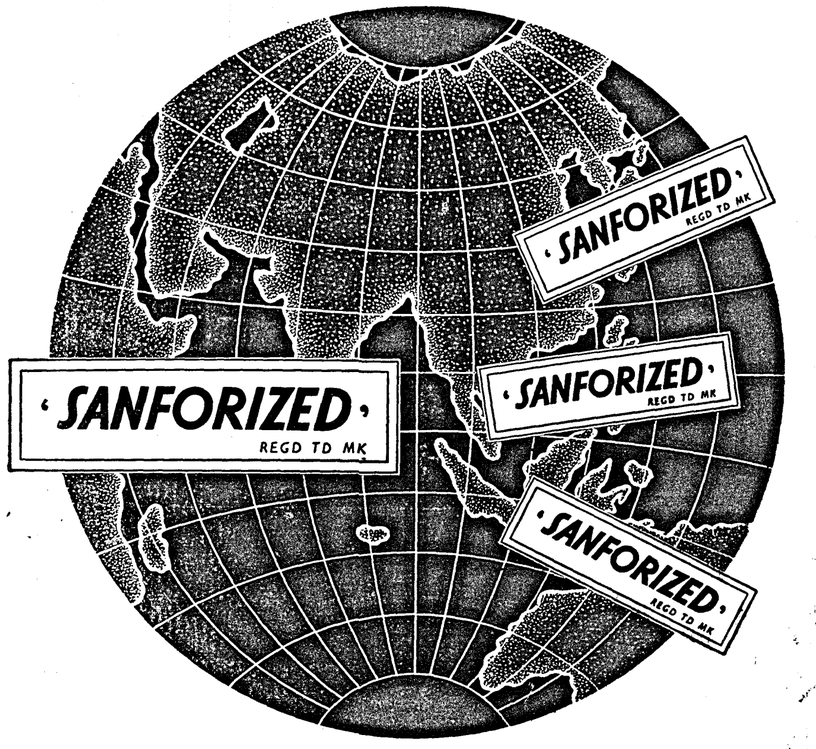
German Annoyance

Under the new arrangements with the Germans, more than 250 technicians are to be available to rectify the flaws in Rourkela. The largest number of Germans at the plant at one time for maintenance and operations was two hundred and fifty; now there are about 230 Germans at Rourkela. There were 1,100 Germans in all employed during the first stage of construction. It is doubtful whether the Germans have been able to provide experts in all the sections where they assessed they would be needed. It is also doubtful whether the Indian side has given the Germans as much freedom as was envisaged in recent agreements. The Germans, according to some, have not been forceful enough to exercise the powers supposedly conferred on the technical team.

After the appointment of a Briton as the General Manager at Durgapur, the Germans have been cut up more than ever before. The annoyance was already extensive over the denial of a seat for the Germans among the steel planning brains-trust groups in the country. The Americans, while discussing Bokaro, insisted on a free hand for ten years and this was acceded to by Delhi in principle. The British and Russians have the final word on many things at Durgapur and Bhilai. The Germans feel they have been left in the lurch. They are not impressed by the argument that, apart from being a Briton, the new Durgapur General Manager was considered to be the best man available for the job.

The Germans still have to present their "best man." There is a failure of communication between Indians and Germans at Rourkela as well as in Delhi. The Indian official prejudices against the private sector are carried over naturally into the international field and the Indian Government has a pronounced reluctance to deal intimately and directly with German industry. The Germans also lack a personality like, say, Sir Norman Kipping to speak for all German industry from a position of prestige equal to that of a Minister.

Apart from the flow of money, men and materials from Germany, Rourkela today needs technical and general managers who will be assured full support by both Delhi and Bonn to have an uninterrupted innings of several years. Once the competent men have been picked for the two jobs and paid adequately to resist corrupt practices, there is no reason why Bonn and Delhi should not back them to the hilt, instead of treating a succession of general managers as apprentices to be tried out and sent out periodically.



HOW THE LABEL 'SANFORIZED' CAN HELP TO STEP UP TEXTILE EXPORTS

Indian textiles are a major earner of foreign exchange; the export of cotton cloth in 1961-'62 added Rs. 48.39 crores to the nation's coffers. Exports will expand still further as new foreign markets are being tapped. Only textiles that are competitive in quality as well as price can hold their own in tough world markets. Indian mills are producing increasingly better quality cloth and the label 'Sanforized' is helping them to do so. The trademark is an international word denoting a uniform standard of shrinkage control. Millions of consumers in 49 countries look for the label 'Sanforized'. It is known and trusted on every continent. Such a label, recognised the world over as synonymous with quality, can help to increase exports of India's cotton fabrics, and enable them to earn more and more foreign exchange.

Issued by Cluett, Peabody & Co., Inc. (Incorporated in the U.S.A. with limited liability) proprietors of the registered trademark 'SANFORIZED'. The trademark proprietors use the trademark 'SANFORIZED', or permit its use by authorised registered users, only in respect of tested fabric which meets the trademark proprietors' strict requirements as to residual shrinkage.

For information: 'Sanforized' Service, 95, Marine Drive, Bombay 2.

FERRO ALLOYS CORPORATION LIMITED

Largest Ferro-manganese Plant

Manufacturing standard grade High Carbon FERRO-MANGANESE

Also

Manufacturing standard grade SILICO-MANGANESE and FERRO-SILICON.

Sufficient capacity to meet requirements of all Steel Plants, Mills and Foundries.

Local and Export enquiries for ready and forward deliveries solicited.

MANAGING AGENTS:

SARAF MOR & COMPANY PRIVATE LIMITED

Factory: Shreeramnagar (Srikakulam Dist.) Andhra Pradesh

Head Office: Shreeram Bhavan, Tumsar (Maharashtra)

Bear the Burden of Defence and Development Cheerfully

PARTNERS IN PROGRESS

WORLD BANK GROUP IN ASIA, AFRICA AND THE AMERICAS

IN almost two decades of its existence, the objectives, functions, role and effectiveness of the International Bank for Reconstruction and Development have been changing, both in emphasis and strategy. From the urgent problems of reconstruction in the already advanced industrial areas of the Western Europe in the immediate post-war years, its efforts have been directed mainly towards aiding the economic development of countries in Asia, Africa and the Americas. This is only one of the reasons, however, why the activities of the World Bank group of institutions in Europe and other advanced countries of the world like Australia have been excluded from this review of their partnership in the progress of the developing world. The other, more cogent reason is that the more important of their activities in advanced countries concern borrowings in their capital markets. The World Bank has issued and sold bonds in Austria, Belgium, Canada, Germany, Italy, Netherlands, Switzerland and the United Kingdom in the respective currencies of those countries: in addition, various issues of American dollar bonds have been sold in more than 40 countries, as well as in the United States itself.

The Bank had made more than 350 loans totalling over $7,000 million for financing 800 projects in 64 countries by June 1963: the emphasis has been less on the utilisation of official resources consisting of the member-Governments' subscriptions, than on facilitating the movement and activating the channels of international private capital investment. More than half of the loans disbursed by the Bank have come from sources other than Government subscriptions.

Two affiliates of the World Bank, the International Finance Corporation (established in 1956) and the International Development Association (established in 1960) have also largely contributed to the widening horizons of the World Bank group. The I.F.C. is an investment institution, designed to supplement the activities of the Bank, by encouraging the growth of productive *private* enterprise in the less developed countries. The I.F.C. seeks to create investment opportunities and to stimulate the flow of private capital by bringing together domestic and foreign investors as well as experienced management. While the Bank grants loans, the I.F.C. makes investments in the share capitals of enterprises or underwrites new issues. The I.F.C. does not invest in Government-owned or operated industries: more than that, it does not insist, like the World Bank, on Government guarantee of repayment. In fact, under the new regime and leadership, the World Bank itself proposes to liberalise its operations and procedures by dispensing with the guarantee of the Government of the borrower's country.

The I.D.A. adds to the investible international funds of the World Bank, but its terms are less onerous than the conventional terms of the Bank. The developing countries' need for and ability to make use of development capital have increased faster than their ability to service the capital on conventional terms, and the I.D.A. was intended to bridge the gap between the needs and abilities. In fact, the I.D.A. divides its member-countries into two parts—countries who are contributors and countries who are eligible to receive credits.

While the World Bank has 90 member-countries, the I.F.C. has 73 and I.D.A. 76 members: the scale of assistance rendered by the affiliates is modest: against more than 350 *loans* to 64 countries totalling over $7,000 million made by the Bank, the I.F.C. is committed to *invest* $80 million in 59 enterprises in 24 countries and the I.D.A. has extended 40 development *credits* totalling more than $500 million to 18 countries. The importance of I.F.C. and I.D.A. lies, not in the quantity of their contribution, but in the quality of their assistance.

Having analysed the changing strategy of the World Bank group, we may now review their activities in the three continents. The accompanying table shows the position at a glance:

World Bank Loans and I.D.A. Credits to Asia, Africa and the Americas Classified by Purpose

Purpose	No. of loans and credits			Amount in million dollars		
	Asia	Africa	Americas	Asia	Africa	Americas
Electric power	31	9	50	568	252	960
Transportation	41	24	46	1,130	515	596
Rail-roads	21	14	8	682	274	145
Roads	6	7	34	269	104	425
Ports and waterways	12	2	4	159	87	26
Aircraft	1	..	..	6	..	..
Pipelines	1	1	..	14	50	..
Telecommunication	1	2	2	42	4	22
Agriculture	20	5	20	177	72	88
Industry	32	5	7	574	120	52
Water-supply	3	..	1	96	..	3
General development	1	2	..	75	40	..
School construction	..	1	..	..	5	..
Total	129	48	126	2,662	1,008	1,721

Twenty-three countries in Asia and Africa each and twenty in the Americas (in addition to U.S.A. and Canada) are members of the World Bank and I.D.A. The total commitments in the three areas by the two institutions amount to $2,662 million distributed among 16 countries in Asia, $1,721 million distributed among 19 countries of the Americas and $1,008 million distributed among 19 countries of Africa. The World Bank has given one-third of its total loans throughout the World to Asia, one-fourth to Americas and one-seventh to Africa, that is, more than 70 per cent to the three continents: of the balance, $1,600 million have been lent to Europe and $400 million to Australia. The I.D.A. has lent to Asia more than 70 per cent of its total lending throughout the world, 14 per cent to Americas and 7 per cent to Africa. This gives an indication (1) of the stakes that the World Bank group has built up in the large developing tracts and teeming millions of Asia; (2) of the comprehensive and continuing story of the part played by the group in Americas; and (3) of its developing relationship in Africa.

The World Bank group of financing institutions have mainly directed their efforts towards helping member-nations to build the foundations of economic growth. Approximately, one third of Bank loans and one-eighth of I.D.A. credits are for electric power and have helped to finance the addition of over 20 million kilowatts to world's generating capacity. Another one-third of the Bank loans and one-half of I.D.A. credits are for transport improvement throughout the world—railways, highways, airways, waterways and pipelines. The remaining third of Bank loans and two-thirds of I.D.A. credits have been for agriculture, especially irrigation: for industry, especially steel production, for telecommunications, drinking water supplies, school construction and for general development. But this classification by categories provides only a broad guidance, for the purpose of transport loans has often been to open up new farming areas or improve agricultural marketing: electric power loans often help improvement of telecommunications, give a stimulus to industrial growth and help to irrigate farmlands or protect them from the ravages of floods.

Both the World Bank and I.D.A. have concentrated on lending for the development of basic services: electric power and transportation have accounted for over 90 per cent of loans and credits in Americas, over 75 per cent in Africa and over 60 per cent in Asia. In large parts of the developing world, inadequate transport and insufficient power act as obstacles to economic progress: hence this emphasis on building up the foundations of economic development.

Transportation

Loans for *railways* not only take up the lion's share of lending for transportation in Asia and Africa, but they also make up by far the biggest proportion: the World Bank has, for example, lent more for the development of Indian railways than for any other single enterprise anywhere in the world. They help to raise the capacity of Indian railways to meet the growing challenges of the Five-year Plans. In Burma, Senegal, Mali, Upper Volta, Ivory Coast, Congo and Kenya, Tanganyika, Uganda, Rhodesias and South Africa, they help to pay for locomotives, rolling stock, bridge construction materials and other equipment required to rehabilitate and modernise the railway systems. In Korea, the World Bank group pays for the services of consultants to assist in modernising railway accounting! In Thailand, the Bank and its affiliates help the replacement of railway workshops destroyed by war, while in Japan, the Bank has been financing a new high-speed rail link to relieve congestion in the world's most heavily industrialised region. In Pakistan, it is the track and repair facilities and signalling and other equipment that have received attention, while in Sudan the help has been for new railway equipment and for the construction of 400-mile long railway extensions. In order to open up remote but fertile North-east Nigeria, the Bank is financing construction of a 400-mile-long new line. In the Americas, Brazil, Columbia, Mexico and Peru are rehabilitating or modernising 2,500 miles of railroads with the help of World Bank assistance.

Improved *road* transportation has played a key role in the recent economic development of many American countries. New roads have opened up millions of additional acres for commercial cultivation: they have lowered the transport costs and brought producers closer to the markets. Bank loans have supplied foreign exchange for transportation projects in a *chain* of 17 countries stretching from Mexico to Argentina and in Haiti also: I.D.A. credits are, in addition, financing major highway programmes in seven countries. More than 30,000 miles of roads are being built in the Americas. Though lending for roads has played a relatively smaller part in Asia and Africa, they are already financing an express highway in Japan, a comprehensive highway development programme in Thailand, Iran and Israel and improvements to the National Highways system in India. In Ethiopia, Congo and Kenya, new motorable roads are being built and improved.

The Bank has financed erection of *pipelines*—altogether a different kind of transport link—in Pakistan and Algeria: a 350-mile pipeline for bringing natural gas from the newly discovered Sui fields to Karachi, and a 400-mile oil pipeline between Sahara oilfields and the Mediterranean port Bougie. Introduction of jet *air* transportation in India has also been financed by the Bank.

Building new ocean ports in Israel and Equador and a new lake port in Ethiopia, transformation of an old Peruvian port into one of the most modern in the Western hemisphere, deepening and widening of the Suez Canal, improvement of a number of inland river ports in East Pakistan and Congo, and dredging and other improvements or reconstruction and modernisation of ports in India, West Pakistan, Burma and Thailand are among the main features of World Bank group financing for *port* development.

Severe shortage of electric *power* is a major barrier to economic growth in all the three continents. Forty-nine power loans by the World Bank or I.D.A. in 14 countries of Americas have helped to generate more than 8.3 million kilowatts of additional electricity, which has approximately doubled the generating capacity. Ten countries of Asia have borrowed to finance 18 major dams and hydro-electric stations, 12 thermo-electric stations, many thousands of miles of transmission lines and extensive distribution facilities. When all the projects are complete, they will add more than 4 million kilowatts to the total generating capacity. Bank loans for power development are also helping a number of a major schemes in Rhodesias, South Africa, Ghana, Algeria, Uganda and Swaziland.

Agricultural Loans

Agriculture provides livelihood to more people than any other activity in the three continents. Many of the transport and power loans have helped improve agriculture: in addition, the Bank has made loans directly for agriculture in ten countries or territories of Americas to assist irrigation projects or to finance import of equipment to mechanise methods of cultivation. Improved communications in rural Africa are helping in expanding agricultural and livestock products: direct loans for irrigation and other agricultural improvements have also been made. In India, Iran, Japan, Lebanon and Thailand, agriculture shares through irrigation and flood control, in the benefits of multi-purpose projects. Bank loans for agriculture, moreover, have helped to increase food production in India through reclamation of lands from weed-infested and jungle areas, and in Pakistan from waterlogged and salty areas. Drilling for deep irrigation wells and other drainage schemes, and irrigation projects are being financed in many areas; loans have also financed import of cattle in Japan and equipment and machinery for land settlement and clearing new farms in Pakistan.

Industrial Loans

Much of the lending for *industry* in Asia has been used to finance the expansion of iron and steel industries of India and Japan, though machines and machine tools in Japan and coal raising in India have received attention. Two of the largest industrial loans in Africa have been for mining projects that are helping to transform the economic prospects of Gabon, Congo and Mauritania. Bank loans are helping expansion of output of potash and other mineral salts in Israel and construction of a paper mill in Pakistan. I.D.A. credits are financing establishment of industrial estates designed to encourage the development of small-scale industry in India and Pakistan.

In the Americas, Bank assistance for power and transport has been an important factor for rapid industrial growth, which itself has largely been financed by private capital. Bank's direct lending has been for the projects of particular importance to the economies: loans for Chile's new paper and pulp mills permit fuller utilisation of forest resources and new export industry, and modernisation of coal mining will lead to self-sufficiency in coal; a cement plant is being financed in Peru for the development of the North-West.

Apart from these loans for particular private projects, the World Bank group has been providing loans and credits to development financing institutions, which—the development banks—help to stimulate private industry by financing and otherwise aiding existing industries and setting up new ones. The Development Bank of Ethiopia was, in fact, organised by the World Bank itself.

Improvement of water-supply to capital cities of Jordan and Nicaragua, construction of secondary and technical schools in Tunisia, modernisation of telegraph and telephone systems of India, Uruguay, Brazil and Ethiopia and the works under the Indo-Pak settlement over the use of the waters of the Indus river and its tributaries are some of the other purposes which Bank loans and I.D.A. credits are financing.

Other Activities

Financial assistance for economic development is not the only or even the main part of Bank efforts in the three continents. Technical assistance has become an increasingly important source of assistance for the development programmes of member-countries.

In Africa, advice and assistance have been given to a number of countries. Bank-sponsored missions have carried out comprehensive economic surveys, to serve as a basis for drawing up a long-range development programme. The Bank has also supplied a number of executives to African countries for carrying out development measures. To broaden its knowledge of the newly independent African countries and their knowledge of it, the Bank appointed a special representative for Africa in 1961, and has set up a department for African studies.

In the Americas, the World Bank's engineers and financial experts regularly visit countries, investigating not only the existing projects but also proposals for new projects. The Bank's resident representatives have assisted in the preparation and implementation of general development policies. The Bank has also sent special missions to conduct broad economic surveys, to study specific problems and to advise Governments on measures to promote economic development.

In Asia, general survey missions of the Bank have made comprehensive economic surveys of Ceylon, Iraq, Jordan, Malaya, Syria and Thailand. Another mission reported on the economic implications of Malaysia. Bank missions have kept in close touch with the economic growth and problems of India and Pakistan and a resident representative is stationed in both. Most important contributions of the Bank to these two countries is the organisation of Aid-India and Aid-Pakistan Clubs which concert the efforts of capital-exporting

MAN-MADE FIBRE INDUSTRY IN THE U.S.

SCOPE FOR EXPANSION OF CONSUMPTION CONSIDERABLE

[Man-made fibres play a very prominent part in the textile economy of the U.S. which, it is common knowledge, is one of the largest producers of these fibres in the world. How remarkable has been the growth of this industry and how vast is the scope for their future development constituted the main theme of a special paper which Mr. Robert C. Jackson, Vice-President of the American Textile Manufacturers' Institute, read at the last annual meeting of the International Federation of Cotton and Allied Textile Industries held at Athens. An adaptation of Mr. Jackson's paper is published on this page for the benefit of the textile industry in India where, too, the man-made fibre industry is making rapid strides. The table accompanying the article is compiled from the figures given by the Textile Organon and the U.S. Department of Agriculture—Ed.]

THE man-made fibre producers and the man-made fibre textile mill products industry are *two distinct and separate groups.* The relationship is that of supplier and customer enjoying a common bond of interest in the consumer product. The good terms of this relationship have contributed to the large measure of success enjoyed by this segment of the *textile industry.*

Many changes have taken place in the structure of the industry in the United States in recent years. The nature of these changes makes it difficult to report on a fibre or even a family of fibres except on the basis of mill consumption. While it is true that we continue to have many mills devoted either by choice or economics to a single fibre, this fact does not hold today with the greater portion of our total production. Modern machinery and technological advances and innovations have made it possible for management to choose almost at will among the fibres. Advances in market research, changes in consumer preferences, improvements in quality and properties of fibres, and, by no means least of all, the fluctuations of pricing are a few of the many standards on which mill management might decide to use this or that fibre or combination of fibres.

The state of the man-made fibres textile industry in the United States is relatively good. A vibrant new industry has claimed its place in our economy and, in so doing, it has accepted its responsibilities to industry, to the Government and to the consuming public. It has been responsible for significant changes in the material conditions of life for untold millions of people. It has offered satisfaction to human needs in ways that never existed before the discovery and subsequent adaptations of these fibres.

Happy Marriage of Fibres

There are many students of the subject who think that the era of the battle of the fibres is drawing to a quiet close. The battles of the past—not unlike the temperamental frustrations of a normal courtship of strong-willed boys and girls—are inevitably resulting in a happy marriage of the fibres. The full realisation and acceptance of this union obviously is contributing to the profitable satisfaction of the fibre producers, the manufacturers, the retailers and the consumers.

The United States continues to enjoy the highest per capita rate of fibre consumption in the world. This rate of consumption, however, has not kept pace with the rate of population growth during the past decade. We find many reasons to which this strange fact may be attributed. None of them are peculiar to our country and none of them are conclusive, but, in combination, we are sorely aware of the end result. We know of the losses to such non-textile products as paper and plastics. We are conscious, too, of the trend of people everywhere toward the informal way of living, the desire and the need for lighter weight and more informal clothes. By the same token, we know that the acceptability of these lighter weight fabrics is, in itself, a tribute to the ingenuity of the textile industry. With much less weight and bulk, we are providing an ever lighter piece of goods in combination with superior strength, hand and drape. Even so, we know that rapidly improving technology in man-made fibres has helped make these changes both possible and acceptable.

In the twenty-year period beginning with 1950, it is anticipated that per capita consumption of all fibres in the United States will have dropped from 40 to 36 lbs. Of this total, and if current trend continues, cotton might be expected to decline from 27 lbs. to 21 lbs. and wool could suffer a slight loss from three and a half to three lbs. By the same time, 1970, man-made fibres likely will show an increase from slightly over nine lbs. to at least twelve lbs.

Again, if current trends can be relied upon, man-made fibres may be expected to show a greater share of the total volume of all fibres consumed. While the volume of natural fibre consumption will continue to increase, the rate of increase may well decline. Obviously, an import factor in recent trends, and certainly a factor to be considered in the future, is the price structure of the natural fibres, particularly cotton. Should cotton become available to American textile mills at the same price it is sold on the world market, there most certainly would be an improvement in cotton's competitive position relative to man-made fibres, especially rayon.

No Limit in Sight

From our vantage point, we believe that a combination of related circumstances contributes to the growing acceptance of consumer goods made from these fibres. In the case of the natural and vegetable fibres, we think of just one fibre in each instance. Man-mades embrace an entire family and there is no limit in sight on the ultimate number involved. While the family is classified as man-made, the individual members are as different from each other as cotton and wool or hemp and silk. Yet it is the variety of quality and performance among the entire group that creates interest in, and demand for, these textile fibres.

We doubt that there has been any more dramatic impact by any fibre than the resurgence of rayon within the past year. A pure product of research, this "grandfather" of the new family of fibres continues as the dominant man-made fibre in the world. From the first recorded suggestion, in 1964, that silk might be man-made by a scientific process to the first public showing of rayon fabric at the Paris Exposition of 1889; to the building of a plant at Marcus Hook, Pennsylvania, in 1910; and to that day in 1924 when the industry agreed to the word "rayon" as a generic term for all synthetic yarns made from a cellulose base, this fibre has led the fight for survival and recognition for the family to follow. It has been said that the production of rayon and acetate in the United States alone could encircle the globe 45 times every minute of every day of the year.

High-wet-modulus Rayons

The advent of the high-wet-modulus rayons has brought an entirely new range of interest in mixes of 50 per cent modified rayon and 50 per cent carded cotton. Many of our manufacturers feel that these new blends offer cleaner staple fibre, improved spinning and weaving efficiency, improved yarn quality, and improved appearance over carded cotton. This rayon gives higher lustre, more luxurious hand, and greater colour depth and clarity to dyed or printed fabrics.

The development of trilobal filament yarns —polyamides and polyesters—has provided a silky hand and high lustre which has not only caught on in woven fabrics but has found a big welcome in tricot fabrics. Improved properties in the acrylics have sparked new interest among texturisers, knitters, weavers and designers who like the worsted-like hand and appearance in bulky sweaters, pile linings, suitings (with 50 per cent polyester) and in floor coverings where its use is showing steady growth.

Perhaps more than any other recent development, the offering of stretch fabrics has truly captured the mind and the imagination of designers and consumers. These fabrics are moving fast in so many end uses that an up-to-the-minute report is impossible. Man-made fibres enjoy the commanding lead in this area which was set initially by polyamide in the mid '50s. The significant development of spandex core yarns with spun yarn covers may very well prove to be one of the outstanding textile achievements of the current year.

Acceptance of Blends

This brings us now to the impact created on our industry through the forthright acceptance of blends. Of course, blends are not new either in concept or production. What is new is the rush of consumers and retailers to buy, and of the mills to spin and weave the fabulous properties that research and industry have fashioned into fabrics not even dreamed of a few years ago. Fundamentally, we are concerned with the impact of blends on the textile mill products industry. Here we see new concepts emerging in the thinking of management officials.

We have been confirmed cotton textile manufacturers moving heavily into these blends. Some of these represent large production facilities and have long been wedded to cotton as their only raw material. Others are experimenting and will move into the field, if they sense the opportunity for "trading up" and improving their earning position through the new blends.

There is so much to talk about the giant strides of the man-mades in texturising, bonding, laminating and non-wovens, or the many new developments in the use of the thermoplastic qualities of the existing yarns. But we simply say again that the joint efforts of fibre producers, weavers and knitters continue to stagger the imagination with the future they predict for man-made fibres.

Two Significant Steps

In the United States, we are presently taking two steps of a statistical nature which we believe hold some significance for others also. Our Government, on 1st September 1963, instituted a new system for reporting deliveries of man-made fibres and their products into the United States. These reports will give us a record of the true nature of these fibres and goods. We will know whether the fibres in the fabrics are filament, spun or mixed. Under each of these groups, we will know the generic fibre content. The system is new and it is easily expandable. It is designed to encompass the future additions to the family of man-made fibres. On 1st January 1964, our Government instituted a new report on domestic production. Like the import report, domestic production will be geared to yarn type and generic fibre. We will have a far more accurate statistical picture of the changes taking place in the production of the industry. Provision has been made for blends which cannot now be positively pin-pointed in our current reports. We would encourage close observation of these two reports by this Committee for Man-Made Fibres. We would hope that some date in the not too distant future will see the inauguration of a means of statistical reporting with a common base which would be accepted and understood by manufacturers of all nations.

The Future

Rather than try to predict the future for man-made fibres, we would more appropriately pay respects to the forebears of our hosts and recall the ancient Greek saying, "the future is hidden in the lap of the gods." Surely, the future for these magnificent fibres from the test tubes is 'hidden' but only because that future is so bright that its true place is beyond our comprehension. These fibres long ago passed the point of imitating nature. They are no longer 'substitutes' for cotton, wool or silk. Today they are the new raw materials of the ancient textile industry in their own right.

It goes without saying that we in the man-made fibre segment of the textile manufacturing industry have the greatest appreciation for the value of the natural fibres, and for their continuing need. At the same time, it is now completely clear that they do not, and will not in the future, completely dominate the textile fibre picture. In the future, based on the realities of today's world of textile fibres, we feel that one of the great contributions our industry can make to the consuming public is to encourage the maximum contribution of all the fibres to each other.

Man-made Fibres in U.S.

(In million lbs.)

	1962	1961	1960	1950
Total world production	8,604	7,778	7,303	3,706
Of which: U.S.	2,431	1,981	1,882	1,405

SUSTAINED ACTIVITY IN TEXTILE TRADE

SALES RISE MARKEDLY—ORDER BOOKS LENGTHEN

From Our Special Correspondent

MANCHESTER, 14th January

MANCHESTER LETTER

WEEK by week the statistical evidence mounts up to support the trade assessments of the past few months which have described the gradual emergence of the industry in Lancashire from a period of "just ticking over" to a phase of sustained activity. Latest to report on the current position is the Cotton Board, whose quarterly review attributes the recovery in part to the prolonged running down of stocks. The survey records a big expansion in sales, marked lengthening of order books, and a reduction of stocks of finished products, but only a very marginal improvement in prices.

The fall in stocks of cloth held by weavers, converters and grey cloth importers is now estimated at 63 million square yards in the 12 months to the end of September last. Retail clothing sales took a marked turn for the better from July onwards, the review adds. In the third quarter last year, they were about 6 per cent greater than in the same period of 1962.

Higher Productivity

Most of the other information contained in the quarterly analysis of the industry has already been released. Yarn productivity in November was 2½ per cent up on the 1962 rate and the best figure for any month since November 1961. In cloth, the improvement was 3 per cent in October as compared with the same month a year previously.

Once more figures for machine activity show a declining quantity of plant in place, but the more effective use of spindles and looms from those available. In the third quarter last year, total ring equivalent spindles amounted to 6,510,000, of which 5,700,000 were running. These figures compare with an average of 8,690,000 spindles in place in 1961 when 7,950,000 spindles were operating and 15,260,000 spindles in 1959, of which 10,320,000 were at work. The latest machine activity returns for the third quarter of 1963 are the best since the 1961 average, being 67.6 per cent of capacity, there being a steady rise so far in each quarter last year.

Although two-shift working in spinning mills showed a reduction of 60,000 spindles to 1,400,000 in the third quarter, there was a slight movement towards more three-shift working. This reached a new high level at 400,000 spindles; the volume of plant operating either two or three shifts was fractionally higher than in the second quarter.

Cloth Output Gains

Much the same picture emerges from the weaving section where machine activity improved, despite the smaller labour force and the reduction in the number of looms running. Output of both cotton and man-made fibre cloth in the third quarter last year was higher than in the similar period of 1962, but the number of looms running in the Lancashire area fell from 117,800 to 106,700. The rate of weaving machine activity increased from 84.7 per cent to 86.5 per cent. This was again the highest level since the average for 1961, as in the case of spinning.

One rather surprising fact is the decline in the number of fully automatic looms in place in running mills. In the third quarter last year, these aggregated 42,300 out of 123,400 available looms. In the same period of 1962, 43,000 automatics were in place out of a total of 139,100, but, in the subsequent 12 months, the number has gradually fallen.

Profits—A Comparison

Delving a little deeper into the sectional variations disclosed within the broad outline of profits announced by cotton companies last year, it is possible to pursue a theme which has been apparent in the past—that the industry's earning power is now dominated by the fortunes of the combines. This is noticeably so as a result of the marked elimination of single-unit spinning firms since the reorganisation scheme was launched.

The tables below indicate the profit-earning capacity of the different branches during recent years. They should be read in conjunction with our annual figures for the spinning trade published last week at the time of our regular analysis of trading results:

	Companies	Average profit per company	Yearly average dividend
		£	Per cent
Combines			
1951	11	701,526	10 00
1952	12	524,004	17.42
1953	12	384,180	11.94
1954	12	431,028	12 58
1955	14	383,213	14 09
1956	14	324,904	13.25
1957	14	354,010	12 72
1958	14	336,716	10.70
1959	14	320,254	9 73
1960	14	375,525	12.48
1961	14	470,700	14.82
1962	14	250,317	12 83
1963	15	139,597	8.09
Spinner-Weavers			
1951	17	194,428	23.03
1952	17	177,045	19.84
1953	21	74,047	17.06
1954	17	82,200	16.32
1955	20	60,701	13.06
1956	18	50,233	12 53
1957	19	89,197	10 80
1958	19	71,504	10.74
1959	20	57,736	10.18
1960	17	112,844	14.17
1961	16	171,868	17 51
1962	16	146,148	13.60
1963	25	67,829	10.19
Weavers			
1951	21	120,404	31.79
1952	21	70,857	21.09
1953	28	40,821	21.21
1954	28	34,120	15.08
1955	27	42,235	13.80
1956	24	24,000	9.81
1957	24	21,320	8.27
1958	23	25,015	9.07
1959	22	10,073	6.84
1960	20	47,102	9.66
1961	17	52,512	13 11
1962	17	70,073	11.54
1963	15	52,175	8.06

In every section, the gap between the figures recorded in the post-war peak of 1951 and the current returns is very substantial. The spinner-weavers made a bold bid to regain past fortunes in 1961, but conditions affecting other firms have been relatively disappointing in a number of years since the beginning of the 1950's.

The position of the combines last year was in fact the poorest in more than a decade, apart from 1959; only in two years were lower figures produced by those firms which combined spinning and weaving. In contrast, the weaving sector returned profits well above the average for the decade, although dividend payments were roughly in line with the distribution made by the major groups.

Revival at Hand?

Many estimates are now being made about the returns which can be expected in the course of 1964. Observers who have noted the long order books and apparently prosperous state of a number of companies are suggesting a revival in earning power. Those closer to the industry, although ever prone to take a cautious line, are not entirely convinced that finances will be quite as flourishing as the professional onlookers seem to think.

There is no need to withdraw our prediction that an improvement will be recorded. That seems obvious in the light of current circumstances, but whether the gains will be such as to merit the use of the much abused term "boom" depends largely on future control over imports and the ability of the industry itself to regulate its affairs on a truly economic basis.

NEW NON-IRON COTTON FIBRE

After two years of research, a leading Austrian textile concern in the Province of Vorarlberg has succeeded in arriving at a process which permits the production of a cotton fibre with permanent non-iron properties, which is now being marketed in textiles under a registered trade name. The chemical process applied results in a change of the fibre's molecular structure to the effect that the wet crease recovery test shows an index of 170 degrees, as compared with 138 degrees in the previously produced non-iron cotton fibres and 32 degrees in the untreated cotton fibre. The textiles manufactured from the new fibre are boiling-proof and have a chale-test resistance of 92 per cent, as against 100 per cent found in the natural fibre and 60 per cent in the previous form of treatment, so that their durability is considerably increased in comparison with the earlier types of non-iron textiles.

PASSPORTS TO WORLD TRADE

Three Banks have merged. Separately, they have large assets, a fine tradition and a wealth of experience. United, they offer a comprehensive service in — all matters affecting business between India and any part of the world. Their advice and help are your surest "passports" to profitable trade with those areas.

WORLD COTTON STOCKS RISING TO REACH A POST-WAR RECORD

IMBALANCE LIKELY TO PERSIST

THE most striking feature of the world cotton situation during the 1962-63 season, which ended on 31st July 1963, was the return of a pronounced imbalance between production and consumption. This situation, according to the latest monthly review (December 1963) of the International Cotton Advisory Committee, Washington, was brought about by a record level of production, aggregating nearly 49 million bales, including production in communist countries, and a decline in consumption to 45.9 million bales—the lowest level since 1958-59. The combined effect of these two developments was to increase carryover stocks at the end of the season to a record 22.8 million bales, that is 3.2 million bales more than a year ago and sufficient to meet six months' global consumption requirements. The U.S. accounted for the major part of the increase in stocks. At 11.2 million bales, stocks at the end of the season in that country was 3.4 million bales more than at the end of the previous season. Stocks in net importing countries also increased by 400,000 bales to 5.9 million bales, though the carryover in net exporting countries (other than the U.S.) and in the communist bloc countries declined by 300,000 bales each to 3.5 million bales and 2.2 million bales, respectively. Nearly all major textile manufacturing countries in Western Europe reduced their stocks last season while there was a substantial rebuilding of stocks in India and some increase in Japan.

This increase in stocks, coinciding with another good world cotton crop during the current (1963-64) season, point to continuance of the last season's imbalance in supply and demand, unless, of course, consumption rises sharply to absorb the surplus. This is quite unlikely. The increase in production, it may be noted here, is solely accounted for by the U.S., where, according to the December crop forecast of the Department of Agriculture, the 1963-64 output would be up by 600,000 bales at 15.5 million bales, as compared with 14.9 million bales last season. This increase in estimated production, despite a marked reduction in planted acreage, is attributed to a record yield per acre of 524 lbs. which is 58 lbs. higher than the previous record of 466 lbs. An acre of land in the U.S., therefore, now produces one bale (of 478 lbs.) and 46 lbs. of cotton per acre, as compared with less than 100 lbs. in India.

With a marked increase in carryover and a larger crop, supply in the U.S. during the 1963-64 season is placed at a level four million bales higher than during the last season. Utilisation of cotton is also expected to increase significantly during the current season but not sufficiently enough to offset the increase in supply. Current indications, therefore, are that there will be a further marked addition to the carryover stocks in that country at the end of the current season, bringing stocks to a record 13 million bales. This means that, in the relatively short period of only three years, stocks in the U.S. will have increased by some six million bales from 7.2 million bales in 1961-62 to 13 million bales at the end of the 1963-64 season. If stock position outside the U.S. remains more or less unchanged, carryover at the end of the current season would aggregate 25 million bales—the highest level reached since the Second World War.

In the free world outside the U.S., production during the current season is expected to decline substantially in Mexico, U.A.R., Spain and Turkey, while in Central American countries, Greece and North Brazil it is expected to increase. The total output in the free world outside the U.S. will, on present reckoning, be fractionally lower at 21.2 million bales, as compared with 21.9 million bales during last season. A slight increase in production from 12.1 million bales to 12.5 million bales is expected in communist countries. Global supply during the 1963-64 season is currently estimated at 72 million bales, as compared with 68.5 million bales in 1962-63. The accompanying table indicates the estimated world supply during the current season as compared with that in the previous two seasons.

The most important element in the other aspect of the cotton situation, namely, distribution, is consumption. It is too early to say what exactly will be the actual level of consumption in the U.S. and other important consuming centres of cotton in the free world. The general impression, however, is that consumption in the current season should show a modest increase by comparison with the last season. On the basis of early returns, the present cycle appears to have passed the low point in the U.S., in several West European countries and in Japan. Raw cotton supplies have been augmented in India by the marked increase in carryover stocks and another good crop is expected during the current season. Whether this would be sufficient to meet the consumption requirements would depend on the expansion in demand by mills as a result of the expansion in spinning and weaving capacity now going on.

One of the factors that will have a direct bearing on the level of mill consumption of cotton in the U.S. will be the price of cotton. In an effort to eliminate the so-called "price advantage" enjoyed by foreign mills in the purchase of U.S. cotton, the U.S. House of Representatives recently passed the Cooley Cotton Bill. Under this Bill, payment in kind would be made to persons other than producers to reduce the cost of raw cotton to domestic mills. The Secretary of Agriculture would have discretionary powers to determine the rate of such payments. Also included in the Bill is a provision to enable a reduction in support price from its current level of approximately 32.50 cents per lb. to 29 cents per lb. for basic Middling one inch within the next three years. The Bill, even if it is passed by the Senate (there can be no certainty about this), is unlikely to have any effect on cotton prices and, through lower price, on consumption of cotton, in the current season.

On the basis of the present estimates of stocks and production and taking into account the prospects for consumption, export availabilities in the free world outside the U.S. are expected to be about one million bales less than during last season and exports of cotton from this area are likely to be less during the current season. Export availability in the free world outside the U.S. is estimated at 10 million bales. Virtually all of this cotton is expected to be exported. Taking into account the reduction in export availabilities in other countries and the prospective increase in world consumption, the official estimate for exports of U.S. cotton during the current season is around 5 million, as compared with 3.4 million bales in 1962-63, thus reversing the declining trend of exports witnessed in the past three seasons, which brought down exports from the U.S. from 7.1 million bales in 1959-60 to 3.4 million bales last season.

WORLD CRUDE OIL PRODUCTION

SHARP RISES RECORDED IN MIDDLE EAST, RUSSIA AND LIBYA

FOLLOWING the record rise of 95 million metric tons in 1962, the world's crude oil producers last year achieved another sharp increase in output, of the order of 90 million metric tons. Production in all countries thus reached the impressive figure of 1,304 million metric tons, as compared with 1,214 million tons in the preceding year, and 1,119 million in 1961. In fact, world production has virtually doubled over the past ten years, going up from 655 million tons in 1953, and last year's increase—amounting to over seven per cent—was slightly above the average annual percentage rate of growth during the 1953-63 decade.

Last year's experience confirms the assessment made in these columns a year ago, that annual increases of some 90 million tons must now be considered as normal. As was also pointed out last year, such vast increases in production make it imperative for the oil industry to provide for corresponding expansions in its facilities for oil refining, transport and distribution. Indeed, no other industrial activity in the world involves continuous new investment on such a scale.

Taking the free world alone, production increased last year by some 70 million tons, or 7 per cent. As usual, the steepest rises occurred in the Eastern Hemisphere whose output now accounts for over two-fifths of the free world's total. In particular, the massive production of the Middle Eastern countries rose in 1963 by another 31 million tons, while Libya's output shot up from 3½ to 21 million tons. In the Western Hemisphere, the main increases occurred in North America, with U.S. output rising by some 13 million tons, and Canadian output by some 3 million tons. Within the Communist world, the Soviet Union itself was once again responsible for most of the steep rise which added some 20 million tons to the production of the area.

Western Hemisphere

The U.S.A. is still by far the largest producing country, but internal demand is now growing slowly and, notwithstanding the local restrictions on imports, her share in world production has fallen dramatically, from over half in 1950 to one-third in 1960, and now to 28.6 per cent in 1963. Last year's increase in volume was equivalent to close on about 3½ per cent, which is relatively high by recent U.S. standards but amounted to only about half the average rate for the free world as a whole. For 1964, the I.P.A.A. forecasts an increase of only about 1.5 per cent in crude oil production, alongside somewhat larger increases in the output of natural gas liquids (3.4 per cent) and in imports (2.7 per cent).

In Canada, production over the past few years has been increasing more rapidly than in any other major producing country of the Western Hemisphere, but the annual rate of growth has been declining—from 15 per cent in 1961 to 11 per cent in 1962 and 9 per cent in 1963. Moreover, the Alberta Conservation Board now assumes a much more modest increase in the foreseeable future, amounting to about one-third during the whole of 1963-70. Nearly 25 million tons, or over two-thirds, of last year's output, came from Alberta where, however, the present productive capacity is estimated to be as high as 50 million tons annually, not including the large potential capacity of the as yet undeveloped oil sands of Athabasca.

Venezuela continues to be the world's largest oil exporter, but expansion there is hampered by high costs. In 1962, there was nevertheless a sharp rise in production, mainly due to requirements of heavy Venezuelan crudes in Europe, and, consequently, the average annual rate of increase for the years 1959-62 nearly reached the Government's target of 4 per cent. Last year's performance, however, was disappointing, with a further rise of 1.4 per cent only.

Mexican production continues to rise, though in an unspectacular manner, while conditions in Colombia have greatly improved with the recent start of operations in newly developed fields. Production in Argentina and Trinidad, however, was barely maintained last year, and the outlook in Argentina in particular is uncertain, in view of the Government's recent cancellation of the drilling, exploration and development contracts with foreign oil companies.

The phenomenal increase in the Middle East continues, mainly in response to the still rapidly rising demand in Europe. Last year's output, estimated at 343.9 million tons, amounted to nearly half the free world's total production outside the U.S.A.; Kuwait alone produced as much oil as was produced in the whole of the Middle East as recently as in 1951. The rate of increase in 1963 amounted to about 10 per cent—the same as in 1962—and the increase in terms of volume is one of the highest on record.

Kuwait and Saudi Arabia consolidated their leading position within the area by increasing their output, in each case by 5-6 million tons, and Saudi Arabia's production capacity will shortly be further increased by over 6 million tons (125,000 b/d) when Aramco's ninth field, at Manifa, is taken into operation. At the same time, production in the Kuwait/Saudi Arabia Neutral Zone expanded by over 3 million tons, chiefly through the expansion from the Japanese-controlled offshore field.

Production in Iran is now rising even more rapidly than in Kuwait and Saudi Arabia, the increase in 1963 being as high as 7½ million tons. Of last year's record output of some 73 million tons, all but about 1.2 million came from the Consortium, but E.N.I. and Pan American will both shortly complete their preparations for large-scale offshore production. The Consortium's operations last year included the commissioning of three new production units—one at Gach Saran and two at the new Ahwaz field.

In Iraq, the downfall of the Kassem regime was followed last year by an upsurge in oil production. After being virtually unchanged the year before, overall production went up in 1963 by over 6 million tons, reaching about 55½ million tons. More oil is now flowing through the Northern pipeline system, but an even more significant change is the reversal of the downward trend in the Southern fields, as a result of the lower cargo dues and port charges at Fao. Production in the South went down from 12½ million tons in 1959 to about 9 million in 1962, but last year's output again equalled the 1959 record, and towards the end of the year it was actually equivalent to some 16 million tons annually.

Elsewhere in the Middle East, the development of the E.N.I.-controlled fields brought about a further sharp rise in Egypt, and the Trucial Coast sheikhdom of Abu Dhabi, where regular production started in mid-1962, has now attained a production rate of over 3 million tons annually. At present, all the sheikhdom's oil comes from the Umm Shaif offshore field, but I.P.C's onshore field at Murban has now reached the stage of commercial production, with an export potential as high as 6 million tons a year.

• • • •

The world's most spectacular current development in the realm of production, however, is the emergence of Africa as a major source of crude. Production in Algeria, started in 1958, went up to 20½ million tons in 1962 and has now reached an annual rate of 24 million tons. No further increase is attainable with the present pipeline facilities, but the capacity of the Edjélé-La Skirra line will shortly be raised by another 3 million tons annually, and there are plans for a new trunk line from Hassi Messaoud to Arzew, with an initial capacity of 8.9 million tons.

In the course of last year, Algeria has been overtaken as an oil producer by neighbouring Libya, whose producing/exporting career began as recently as October 1961. Moreover, the two Libyan pipeline systems already completed give scope for a further expansion of output, and a third system—from the new Hofra field to the Gulf of Sirte—will be completed by the end of this year, with an initial capacity (later to be doubled) of about 8 million tons annually.

There are also three firmly established oil-producing regions in Equatorial Africa—in Nigeria, in Angola, and in the ex-French countries of Gabon and Congo. In Angola, last year witnessed a substantial increase in production from the new Tobias field, and Nigerian output is moving steadily up, towards the goal of 5 million tons set for 1965.

Europe and the Far East

Production in Western Europe rose last year by 1,000,000 tons, reaching over 18 million tons. However, the long-term future of the area's leading producer—Western Germany—is in doubt as State support is being gradually withdrawn. The decline in Austrian production which started in 1956, has now been reversed, and the more recent decline in Italy—chiefly Sicily—may be reversed in the near future, as crude from the Gela field will soon be used in the new adjacent refinery and petrochemical plant.

There was very little change last year either in Indonesia, or in the Far Eastern area as a whole. The output of the Seria field in Brunei has, however, fallen from around 5.4 million tons annually in 1955-59 to barely 3.5 million tons now. The first Australian field, at Moonie in Queensland, will probably start commercial production early in the new year.

In the Soviet Union, crude oil production developed last year broadly in accordance with

(Continued on page 132)

SUGAR AS FOREIGN EXCHANGE EARNER

HIGH WORLD PRICES HELP INDIA BUILD UP EXPORTS

SUGAR is now earning for India quite a bit of foreign exchange. The total value of sugar exports in the current financial year is expected to be of the order of Rs. 30 crores, out of the aggregate estimated exports of Rs. 780 crores. Indeed, almost one-sixth of the anticipated improvement of Rs. 86 crores in overall exports as compared with the previous year (1961-62) will be accounted for by sugar alone. Sugar has thus emerged as one of the staple earners of foreign exchange, a position that ought to be preserved in the years to come. It is, therefore, somewhat disconcerting to learn from the reported assessment of export prospects as made by the experts of the Union Ministry of International Trade that the actual sugar exports in the next financial year (that is, 1964-65) may not exceed Rs. 15 crores, as against the estimated Rs. 30 crores for 1963-64.

The above assessment is based on the ground that the country is already committed to export 300,000 tons of sugar during 1964-65 and, judging by the current trend of production, more sugar may not be available for export. This, however, is not the way one should look at the problem of sugar exports. It is true that the domestic demand for white sugar is rising persistently, but the installed capacity of sugar industry, too, is expanding, following the additional capacity licensed by the Government partly through setting up of new mills and partly through the expansion of existing units (*vide* reference on page 88 of the last issue of *Commerce*). And whatever capacity that is put up can certainly be utilised fully, provided the sugar industry is assured of adequate cane supplies. India does grow every year much more cane than what is actually needed by the sugar industry and it should not at all be difficult to ensure the requisite supplies to the mills, provided energetic steps are taken to see that there is no large-scale diversion of cane supplies to the production of *gur* and *khandsari* which is really a wasteful exploitation of raw material. Sugarcane production itself can be augmented if the State Agricultural Departments play their part properly. Although attention to these aspects have been drawn repeatedly, they have to be stressed again, particularly in the present context of the supreme urgency for earning as much foreign exchange as possible through sugar exports, especially as the prospects for this trade are very bright, thanks to the buoyancy of the world sugar market, a buoyancy that is expected to persist for sometime to come. Surely, the present is the most opportune time for India both to consolidate its existing markets and to explore new markets.

The continuing buoyancy of world sugar market is reflected in the sustaining high level of prices. Raw sugar in London is currently ruling at £88 per ton (c.i.f. London), which, though well below the peak of £105 touched early in November 1963, is more than twice the rate of £40½ prevailing a year ago. A further rise in prices, with a peak in the late spring of over £100 per ton, is confidently expected by the sugar dealers in London. Even when allowance is made for a possible decline in price due to unexpected developments, there is room for warranting the assumption that the price may not go below £75 (Rs. 1,000) per ton. At this price, India can undoubtedly export sugar at a profit without any subsidy payable by the Government of India to meet any loss on exports.

Sugar as India's Foreign Exchange Earner

(In crores of rupees)

	1963-64 (estimate)	1962-63	1961-62
Total exports of all commodities.. ..	780.00	693.69	660.34
Of which sugar ..	30.00	17.01	14.55
Percentage share of sugar in the total	3.9	2.4	2.2
Quantity of sugar exported (000 metric tons)	—	418	285

—Not known. Actual exports in the first half of the year (April-October) was 363,864 metric tons valued at Rs. 18.86 crores.

World market conditions are highly in favour of India as a seller of sugar. In the first place, there are, it is said, fewer second-hand cargoes of sugar in the hands of speculative interests still waiting to find buyers and to depress prices. Secondly, the U.S. refiners are expected to enter the market to buy sizable quantities of sugar, in view of the inability of the Administration to ensure for them sufficient supplies. And, finally, the aggregate world sugar production of 54.32 million tons in the current season, which began on 1st September 1963, is expected to fall short of the estimated consumption of 55.77 million tons by over a million tons.

That the supply-demand position in the current year would continue to be tight was clearly envisaged by the International Sugar Council at its last meeting held at London early in November last. The Press *communique* issued by the Council then, it will be recalled, had said:

"The Council adopted the Statistical Committee's first estimate of the net import requirements of the free market for 1964 amounting to 1,143,000 metric tons (raw value) and noted that the import requirements of the United States of America from foreign sources were estimated at 3,540,000 metric tons, making a total for the requirements of the world market of 14,970,000 metric tons. The Council considered this estimate against the first forecast of supplies available for world destinations in 1964 and noted that requirements would again be considerably in excess of supplies."

The gap between world sugar production and consumption widened considerably from 3.31 million tons in 1961-62 to 5.35 million tons in 1962-63. While the deficits in Asia and Europe increased, the surpluses in North, Central and South America continued to decrease. The situation in Oceania, however, shows a considerable improvement, the actual output being well above consumption. Africa turned from a deficit to a surplus one, though the actual surplus in 1962-63 was negligible.

World sugar consumption has continued to expand since the past few years, due to population increases, rise in purchasing power, and opening up of large new areas of consumption in underdeveloped countries. Thus, between 1953-54 and 1962-63, the actual consumption, according to the estimate prepared by Messrs. F. O. Licht, a well-known firm of sugar dealers in London, has gone up by an average of over six per cent per annum (the total net increase is 21.16 million tons), while actual output has risen by 5.27 per cent (the total net increase is 17.70 million tons). Since population experts forecast even quicker increase in population and considering that the standard of living will improve with further technological development, as also because of the refinements in taste standards in underdeveloped countries, the tempo of increase in consumption will doubtless continue to rise. Messrs. F. O. Licht have calculated that, on the basis of an annual increase of five per cent, world sugar consumption will reach 91.4 million tons by 1972-73 or 35.3 million tons more than in 1962-63. As against this rise, world sugar production (also at a yearly rate of increase of five per cent) will be of the order of 83.5 million tons. The anticipated shortfall is thus 7.9 million tons. An increase in production at the yearly rate of five per cent is thus regarded as insufficient. These figures indicate how promising is the future for the world trade in sugar with "tremendously good marketing potentiality for the product in the next decade." If the expanding requirements of world sugar are to be satisfied fully, it is necessary to step up the sugarbeet and sugarcane acreage, improve per-acre yields, expand the capacity of existing sugar mills and refineries, and install new plants.

As for the areas where expansion of production capacity may occur, Messrs. Licht see tremendous possibilities in some Asiatic and African countries. According to them, India offers boundless production possibilities, and developments in Australia and South Africa will also be of considerable importance. Taiwan can easily double its production if the prices offer an appropriate incentive. The position in respect of other areas is as follows:

South America: Sugarcane cultivation possibilities are unlimited.

Central America: Development will be decided in the near future by production in Cuba which, in turn, will depend on whether the present Government there is able to check the present recession.

U.S.A.: The home-grown cane and beet sugar production has been steadily rising since the lifting of Government restrictions and there is enough land in the country to meet the increased internal demand for sugar. But much will depend on the Administration's sugar policy and on the question whether large quantities of sugar will continue to be imported in order to meet internal requirements or whether the domestic industry will be allowed to cater more for these requirements.

Europe: The sugar policies of European countries have so far been oriented towards meeting the domestic needs, since exporting sugar is normally a losing business for these countries, though the situation has changed with the prices ruling high (8 to 10 cents per lb.) in the international market. But developments there will certainly not be a decisive factor for sugar supply for the rest of the world.

Soviet Russia is one of the world's biggest producers of sugar. Details of its production programme for the coming years are not available. The target fixed to be achieved in 1963 was 5.90 million tons, but the actual output is estimated at no more than 5.15 million tons of white sugar (or 6.55 million tons raw value); the estimate is based on a total beet crop of 35 million tons and an average yield of 10.61 tons per hectare. Russia, it may be noted here, has been buying the major portion of Cuba's sugar production since the U.S. Government imposed a ban on Cuban imports. In view of the tight supply position in Russia and because of the serious shortfall in output (placed at just 3.5 million tons) in Cuba, due to the damage caused by the hurricane "Flora," the quantity of Cuban sugar left for Communist China and the world market is expected to be less than a million tons. This development, together with the marked reduction in stocks in the exporting countries and the emergence of the tendency to build-up of stocks in importing countries, strengthen the prospects of a high level of world sugar prices for sometime to come. This opportunity should certainly be availed of in full by India.

Sugar: Continental-wise Position

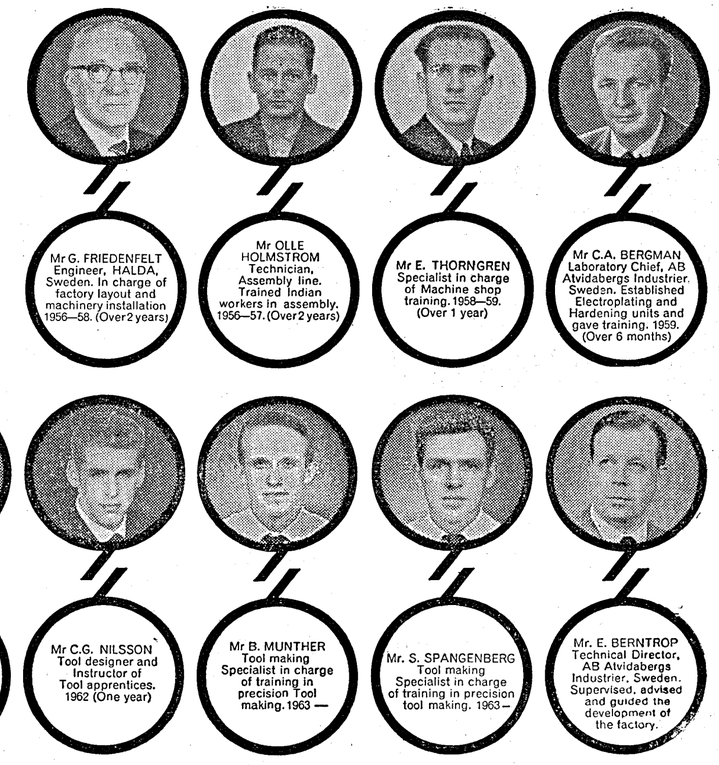
CO-OPERATIVE SUGAR MILLS

Four more co-operative sugar factories have gone into production during the current season, bringing the total number of co-operative sugar factories working to 45. Of these, two are located at Takli and Kumbhi-Kasari in Maharashtra and one each at Batala in Punjab and Aska in Orissa. Each of these factories has an installed cane-crushing capacity of 1,000 tons per day.

The Union Ministry of Community Development and Co-operation has recommended the applications of five existing co-operative sugar factories for expansion of their capacity and eight proposals for the establishment of new co-operative sugar factories. With a view to ensuring the production of 3.3 million tons, the target set for the current year, the Government has already announced a number of incentives, namely, increase in cane price, rebate in basic excise duty and transport charges, increase in the ex-factory price of sugar and measure for stoppage of diversion of cane in the factory zones for the manufacture of *gur* and *khandsari*.

HALDA'S HIGH QUALITY AND PRECISION ARE NO ACCIDENT!



PHOTOMECH-3553

HALDA

FACIT's Technical Chiefs, Engineers and Specialists working relentlessly for years in close collaboration with Indian engineers and technicians have helped Rayala to manufacture and place on the Indian market a quality typewriter—HALDA. Every stage of progress was marked by thorough and careful planning, expert experienced supervision, intensive and continuous training and education of Indian workers and technicians, and high standards of quality-control.
HALDA is indeed a triumphant combination of supreme technical skill and world-renowned Swedish steel. HALDA's unique quality, precision construction and dependable performance are by no means an accident!

STAGNATION IN AUTOMOBILE ANCILLARY INDUSTRY

RAW MATERIAL SHORTAGE ACUTE

IT is well known that the motor vehicle is an assembled product of as many as 5,000 and odd components, most of which are produced by manufacturers functioning independently of the automobile plant. About 30 to 35 per cent of these components usually come from the automobile ancillary manufacturers, while 25 to 35 per cent come from the general engineering industries. Taking the ancillary industry alone here, it is noteworthy that its output of original components needed by the vehicle manufacturers in India and of spare parts needed by the fleet of vehicles on the roads has increased from Rs. 45 lakhs in 1955 to Rs. 18 crores in 1962. In addition, the output of tyres has gone up from 8.8 lakhs in 1955 to 15.6 lakhs in 1961 and that of tubes from 7.9 lakhs to 14.8 lakhs. In the context of the drive under way for raising the indigenous content of motor vehicles to 90 per cent in the next one or two years, the need for quickening the pace of development of the ancillary industry has arisen. This aspect has been emphasised time and again by the Government and the ancillary industry itself has shared the Government's anxiety in this regard. But the industry is conscious of the fact that it has not come up to the Government's expectations. Its inability to leap forward, according to Mr. Pranlal Patel who addressed the fourth annual general meeting of the All-India Automobile and Ancillary Industries Association held at Madras on the 19th instant, has been due to some built-in resistances.

Present Position

What is the present state of the industry? As Mr. Pranlal Patel has stated, the overall production (Rs. 20 crores) of automobile components in 1963 did not represent any significant increase over the 1962 level. This was in sharp contrast to the performance of the industry in the years immediately preceding. In 1961, for instance, the industry had recorded an increase in production of 39 per cent over 1960. The performance was much more impressive in 1962 when the industry registered a production increase of 60 per cent over the 1961 level. There is thus no doubt that there is currently stagnation in what should be a rapidly growing industry with a ready market for its products. The Association's own assessment is that while, on the one hand, production facilities in terms of equipment installed in the industry are rapidly expanding, raw material bottlenecks, on the other, continue to inhibit their optimum utilisation. According to a recent survey by the Association, installed capacity in the industry is grossly underutilised and the incidence of idle capacity in some cases is as high as 50 per cent.

What is even more deplorable is that this underutilisation of capacity continues while shortages of those very items, which the installed equipment is intended to produce, continue to persist. It may be recalled, in this connection, that the World Bank Mission's recent report has given the finding that "stocks of spare parts and accessories in the motor vehicle industry are totally inadequate in relation to the number of vehicles now on the roads (or immobilised for repair)." This situation can be relieved by augmenting indigenous production, provided adequate supplies of raw materials and components (both indigenous and imported) can be made available. Otherwise, the acute raw material shortage would continue not only to slow down production but also to upset seriously the industry's economics.

Import Content of Ancillaries

The President of the Automobile and Ancillary Industries Association has drawn pointed attention to the fact that most of the components and sub-assemblies manufactured by the industry are either processed wholly out of imported materials or have a substantial element of import content in them. Mr. Patel has, therefore, made the following cogent plea for a more liberal allocation of foreign exchange:

"Our efforts to raise production are being frustrated by the inadequate supply of raw materials which are not available in the country and have necessarily to be imported. In a rapidly growing industry like ours, consumption of raw materials will be continuously on the increase. Thus, our requirements of alloy steels of various specifications, non-ferrous metals and chemicals, all of which are imported at present, are steadily rising, with the growing volume of production. Nonetheless, foreign exchange releases to us continue to be pegged down to levels which have long since ceased to reflect our actual needs. *Ad hoc* releases of foreign exchange will no longer suffice. Considering the growth of the industry, particularly in the last three years, and the very significant contribution it is making today towards import substitution, the time has come to consider the industry's claim to its rightful share of scarce resources like foreign exchange on the basis of a rational order of predetermined priorities.

"Indigenous raw materials like pig iron and steel are by no means easy to acquire, as their distribution is governed by numerous priorities on which defence and operational priorities have been superimposed after the proclamation of the national emergency. While there is a great shortage of pig iron, supplies of which are now being actually rationed, supplies of sheets from Rourkela have failed to materialise. To quote an instance, the manufacturers of scooters, motor cycles and three-wheelers, who placed trial indents with Hindustan Steel, Rourkela, for sheets at the beginning of last year, have now been told that, in the absence of priority, their orders cannot be executed.

"The industry's requirement of foreign exchange this year on purely maintenance account is in the neighbourhood of Rs. 10 crores. This is mainly on raw material account as our component imports are comparatively small. This is a very conservative estimate and, judged in relation to the very significant contribution the industry is making towards import saving both in vehicle production and maintenance, the requirement is modest indeed."

Government's Approach

The Union Minister for Steel, Mines and Heavy Engineering, Mr. C. Subramaniam, whose speech was read at the Madras meeting of the Association, admitted that there was a shortage of essential raw materials. But he expressed surprise at the fact that, in spite of a fourfold increase in the foreign exchange released to the ancillary items during the last four years, production had been more or less stagnant in 1963, as compared with the previous year. The Minister pointed out that, in the current financial year, the foreign exchange allocation to the industry was to the tune of Rs. 10 crores. It was his view that, with that much allocation, it should be possible for the industry to produce over Rs. 30 crores' worth of goods in 1964-65. The long and short of the Minister's reply was a 'no' to the industry's demand for more foreign exchange. In the circumstances, what can the industry do? If it is not to reconcile itself to the prevailing situation of idle capacity, it should make a diligent effort to find indigenous substitutes and sources of supply, without detriment to the quality of parts made by them. At the same time, the Government also would do well to determine the industry's share in foreign exchange resources on a more rational basis of priorities, as suggested by Mr. Pranlal Patel, and not on an *ad-hoc* basis which is of dubious value. On balance, it would appear that, if production of both original equipment for the automobile industry and of spare parts for the transport fleet on the roads is to be stepped up greatly, the ancillary industry's plea for a larger and more stable level of foreign exchange allocation deserves to be fully considered by the authorities.

Price Control?

The Minister's threat to extend price control to automobile ancillaries "in order to check wasteful methods of production, inefficiency and profiteering" is no answer to the problem for two reasons. For one thing, price control would be a retrograde step at a time, when several industrial commodities have been rightly decontrolled and the need for liberalising other controls has been recognised by the Finance Minister, Mr. T. T. Krishnamachari, himself. For another, inefficiency in production, if there is any, must be largely due to the inadequacy of imported raw materials and the relatively poor quality of indigenous materials. But it should be remembered, at the same time, that manufacturers of vehicles, the prices of which are subject to Government approval, have been asking for higher prices to meet the higher cost of indigenous components. If vehicle prices are not to be raised further, the ancillary industry must do its best to quote reasonable prices for the components manufactured by it. But here the industry is unfortunately in a vicious circle, for, unless it has adequate raw materials for utilising its capacity fully, it may not be in a position to reduce the costs of production.

JAYANTI SHIPPING COMPANY

The Jayanti Shipping Company has recently acquired a bulk carrier, called *Kanishka Jayanti*. This is the sixth of eight such vessels being built for the Company by the well-known shipbuilders, Mitsubishi Shipbuilding and Engineering Company of Japan. Two more carriers of the same class, of 33,250 d.w.t. each, are expected to be delivered during mid-1964.

The bulk carrier just acquired has an overall length of 600 feet and breadth of about 90 feet. When fully loaded, it can carry about 32,000 tons of ore, has a draft of about 33 feet and is equipped with the most modern navigational devices, including radar and a special equipment called 'Loadicator.' The loadicator will indicate the exact load distribution in different holds and thus help in the navigational stability of the vessel.

The Jayanti Shipping Company's total tonnage, incidentally, works out now to approximately 365,000 d.w.t., including the recently added bulk carrier, which is roughly one-fifth of the total tonnage on Indian registry.

Including the *Kanishka*, Jayanti's fleet now comprises six bulk carriers of average 33,265 d.w.t. each, one tanker of 33,015 d.w.t. and a dozen cargo vessels of average 10,614 d.w.t. each, making a total of 19 vessels. The Company is expected to acquire one more oil tanker (super-size, of 54,000 d.w.t.), two more bulk carriers (of 33,250 d.w.t. each) and three combined oil-*cum*-ore carriers (of 21,000 d.w.t. each) during the year 1964.

COCHIN REFINERY'S PUBLIC ISSUE

The Cochin Refineries Ltd. is a mixed, that is, public-*cum*-private enterprise. The Central Government's share in its Rs. 7-crore equity capital will be 51 per cent, while Phillips Petroleum Company, Duncan Brothers and Company Ltd. and the Kerala Government will have 25 per cent, 2 per cent and 7 per cent, respectively. The remaining 15 per cent (representing Rs. 1.04 crore) is to be issued to the public for subscription. It is reported, in this connection, that the share list of the Company will be opened for public subscription early next month. This public issue will consist of 104,000 equity shares of Rs. 100 each. While no underwriting of the shares is contemplated, Phillips Petroleum has offered to take up any shortfall in the subscription.

According to the Managing Director of the Company, Mr. John W. Loy, the entire project will cost Rs. 22.8 crores. Nearly all the financing, excluding equity capital, would be covered by medium and long-term U.S. loans arranged by Phillips. The refinery, he claimed at New Delhi last week, would be in a position to go on stream in the fall of 1965 and reach its full capacity by the end of that year.

TATA-MERCEDES TRUCKS

The expansion project of T.E.L.Co. for the manufacture of trucks is making steady progress. According to Mr. Walter Hitzinger, representative of the German collaborating firm, who spoke at a Press conference at New Delhi on the 17th instant, T.E.L.Co. would begin manufacturing 2,000 Tata-Mercedes trucks per month within the next two years, as compared with the present 1,000 per month. He disclosed further that from July this year the Company was likely to manufacture 1,500 trucks per month, possibly with 90 per cent indigenous content.

WORLD CRUDE OIL PRODUCTION

(*Concluded from page* 129)

the annual plan, reaching about 205 million tons, or 19 million tons more than in 1962. The country is thus favourably placed to reach, if not exceed, the goal of 240 million tons set for 1965, the last year of the current seven-year plan. Beyond that, the U.S.S.R. is committed to strive towards an output of 390 million tons in 1970, and about 700 million tons in 1980.

The world's proved reserves of crude oil today are taken to be equivalent to 37 years' production at the 1962 rate. But, unless the figure is revised, they will only be equivalent to about 34 years' production at the 1963 rate while, according to Mr. M. R. Bridgeman's calculation, they amount to a mere 15 years' production if measured by the probable output of the year 1980. Mr. Bridgeman's conclusion—that we are in need of a sustained world-wide search effort—is, indeed, powerfully supported by the production estimates now available for the year just passed.—*By Special Arrangement with Petroleum Press Service.*

NEW PRODUCTS AND PROCESSES

New Pack for Export Cheese

AUSTRALIAN cheeses are now being shipped to Britain and Europe in newly designed boxes made of timber and hardboard. The box was developed in conjunction with the Dairy Research Section of Australia's Commonwealth Scientific and Industrial Research Organisation. It is constructed with timber ends and sides and the bottom of 3/16th in. standard hardboard. The internal dimensions are held to close tolerances because the most important aspect of the box is the pressure exerted on the cheese itself, which is packed in a plastic bag. The pieces of hardboard in the bottom of the box are planed smooth to remove the possibility of dust particles entering the cheese. Drop tests in the form of two foot drops on to concrete, have shown that they stand up to the normal rigours of transport. The boxes are now being used commercially for export shipments by the Producers' Distributing Co-operative Society, Queensland.

"Epistop"—An Australian Adhesive

An Australian-made adhesive, "Epistop," will bond wood to concrete, iron to bricks and stone, glass to steel and rubber to ceramic or metal, or any structural materials. The manufacturers, Indelab Pty. Ltd., rather than compile a detailed list of what materials the adhesive will bond, simply point out that the only material to which it will *not* bond is polythene. The adhesive, which contains fibreglass and is known as an epoxy, also has a wide use as a filling compound. It hardens in 2 hours. Epoxies have nothing in common with the more conventional adhesives. They are not glues, but thermosetting plastics, which, when mixed with a curing agent, undergo a chemical reaction. In the reaction, the chemical structure of the epoxy changes and its molecules link with the molecules of the materials being bonded. The result is a "weld" often stronger than the material it bonds. Other advantages of epoxies are that, when heated, the bond will not melt and flow and is not effected by immersion in acids, alkalis, water or solvents.

"Safety" Belts for Car Seats

Safety is "built in" at each stage of manufacture of car seat belts which have won significant export markets for an Australian firm. Tudor Accessories (Aust.) Ltd. of Adelaide, produces a range of car safety belts to the stringent specifications of the Standards Association of Australia. The belts are made in several styles—lap strap (a single belt around the abdomen), diagonal type (across one shoulder), combination lap and diagonal belt, and full harness (lap strap and belts over both shoulders). Safety specifications are concerned with two aspects. The first, obviously, is that all parts of the belt—webbing, stitching, buckle, connections—must be capable of withstanding very great force. The second is that the buckle, under pressure, can be released quickly and easily, even by a child or a person injured or suffering shock. The Standards Association of Australia specifies that a belt must withstand a 4,000 lb. strength test in a static test rig. This and the testing conditions are identical with the relevant British Standard (B.S.S. 3254). In Australia, after investigations by the Standards Association, it was decided to make the release specification even more exacting than the 45 lb. specified in B.S.S. 3254. A figure of 25 lb. was laid down as the maximum which could be safely accepted for a belt carrying a 250 lb. load. The firm has been closely connected with the testing of safety belts ever since it began making them. It built the test rig used by one of the Standards Association testing authorities, the Royal Melbourne Institute of Technology. Tudor factory tests about one belt in 500. It claims this is probably a higher proportion than that of any other quantity manufacturer in the world. It uses I.C.I. terylene woven into webbing in Australia. Terylene thread is used for stitching. To maintain strength of joins, machining must follow a specific design. In Tudor belts, there must be just seven stitches to the inch, no more and no less. General Motors-Holden's Pty. Ltd., Ford Australia Ltd., Rootes Australia and Australian Motor Industries (Standard) have all chosen Tudor belts for fitting to their vehicles.

World's Largest Yankee Cylinder

The world's largest Yankee cylinder is to be manufactured by Karlstads Mekanis a Werkstad (K.M.W.), the Swedish heavy engineering company, for the Ingerois cardboard mill at Ikeroinen, Southern Finland. It will have a diameter of 6,000 mm, length of 5,170 mm and is designed for a speed of 300 m. per minute. The 120-ton unit, with a surface of 93 sq.m. will be cast in April. After grinding, finishing and final assembly it will be ready for shipment in January 1965. K.M.W. has manufactured a number of big Yankee cylinders over the years. The latest was a 5,100 mm diameter cylinder for the K.M.W.-built paper machine for the Munksjö paper mill in Sweden.

Structure of Proton

A unique method of investigating elastic scattering of protons on protons at energies of 1,000 MEV and above has been suggested by Soviet scientists, Victor Kopylov-Svlridov and Vladimir Nikitin. The scientists have found a way to measure with high accuracy even the small angles at which high energy protons scatter. This enabled them to carry out experiments which might play a big role in the studies of the structure of elementary particles. A report on their experiments was presented to the 15th session of the Scientific Council of the Dubna Joint Nuclear Research Institute by Academician Vladimir Veksler, Director of the Institute's laboratory of high-energies. The essence of the new method applied in Dubna for the first time is that the elastic scattering process is studied through determining the characteristics of the recoil protons which were in a state of rest before the collision. The experimenters placed a one-micron target into a hydrogen-filled chamber of the proton-sychrotron. Such accelerating conditions were selected under which the same proton passed through the target thousands of times. Thereby, the effectiveness of the accelerated beam of protons increased by as many times. This, in turn, increased the intensity of the beam of recoil protons which were knocked out of the target. Collisions of two protons occurred at great distances—so that the bombarding particle and the proton at rest interacter by their "stratospheres," to use Academician Veksler's metaphor. The Dubna research workers have registered 22,000 cases of the appearance of recoil protons. The scattering characteristics in these experiments have been measured with great accuracy. Using different methods of mathematical processing, physicists obtained data warranting definite conclusions concerning the proton structure. The experiments in Dubna are continuing.

Identifying Rail Wagons

A system for identifying moving railway wagons has been announced by International General Electric, overseas marketing division of U.S. General Electric. It consists of a pattern of piezoelectric elements to be mounted under the truck and serve as a "fingerprint," a pick-up unit mounted between the rails having no moving parts and suitable for encasing in concrete if required, and a scanning, decoding and output device near the pick-up head. When the wagon enters the field of the pick-up unit a signal from the fingerprint unit or "Dezignator" is received by pick-up device antennae. Impulses are transmitted to the decoder and punched on tape. The system is claimed to permit railways to locate any wagon immediately, quickly switch incoming trucks to the proper sidings and notify customers without delay.

New Face for Screw

The changing face of the simple screw, universal medium for fastening any two things together has just been demonstrated in London. Developed by Phillips, in collaboration with the British firm of G.K.N. Screws and Fasteners Ltd., the world's biggest manufacturers in this field, the main feature in the new recess head type screw, named "Pozidriv," is its vertical driving face which can be speedily located by the driver without danger of misalignment. The new head is claimed to eliminate the tendency of the driver to "cam-out" or be forced from the screw head during fixing. Other material advantages based on extensive tests in the U.S. and in Britain are productivity gains in the order of eight per cent on assembly work. The new screw can make a significant contribution to cost saving in mass assembly industries.

Flame-resistant Adhesive

Samples of a new range of non-inflammable adhesives developed by a British firm, Plus Products, 1-68 Queensway, Team Valley, Gateshead, County Durham, after two years of intensive research have been sent for evaluation to many parts of the world. Main application is in foam rubber, automobile and upholstry industries where adhesives are rapidly replacing welding and stitching methods. An official of the company said that although the new product was slightly more expensive than inflammable equivalents, it could in fact prove more economical because of its better surface spread. The new solution was heavier and could give an increased spread of 10 to 20 per cent over similar products. Other advantages are short drying time, good ageing properties and flexibility. In some cases it can be used by application to one surface only of the two being joined.

New Process for Corrosion Protection

A method of applying paint coatings by electro-deposition has been introduced into the production plant of a British factory. The coating technique, said to give greatly improved corrosion protection, is expected to find wide application in the car industry and general industrial field. The system has been developed jointly by two British companies, Imperial Chemical Industries Ltd., London, and Pressed Steel Ltd., Cowley, and is believed to be the first technique of electro-deposition of paint to be used on a production line in Britain. It is now being used at works where an ammonia-stabilised water-borne paint is priming car petrol tanks. Experimental plant for applying the process to car bodies and to a small-parts line is also in operation at the same company. The process is essentially a dipping one, in which an electric current is passed between the work piece and another electrode. The resultant coating consists of a high viscosity coagulated film which adheres strongly to the steel surface even before stoving. Only the resin and pigment are deposited (the water being excluded by electro-osmosis), which eliminates the possibility of runs or sags. The voltages necessary to achieve a satisfactory film are below 100 volts DC. Deposition can take within a period of one minute and drain-off is claimed to be very rapid. Other advantages claimed for the new technique are: fully automatic operation including the facility of controlling film thickness, full utilisation of paint, good coverage of sharp edges without film recession, penetration into welded seams and effective and irreversible coverage of partially screened areas such as the interior surfaces of box sections.

Changeable Bed

A bed that can be changed from single to double in five seconds without lifting and without changing mattresses, manufactured by Price Brothers and Co. Ltd., Wellington, Somerset, is said to be the answer to one of the hotel industry's problems—the loss of trade when a couple have to be turned away because the only vacant room is a single one. In its single form, it looks like a 3 ft. modern bed. But the foam-filled divan base is in two sections, one fixed and one moveable, rather like the leaves of an extensible table. When pulled, the moveable section runs out on casters for 18 in., making a gap into which the mattress drops. The sections are stepped, with "tongues" that run under the mattress for a close and level fit. In this double form, the bed is 4 ft. 6 in. For ease of storing and transport, the legs, head board and foot board of the bed are detachable, and the whole packs into a relatively small space.

Ni-Hard Iron

Successful commercial development of a nickel-chromium cast white iron combining superior resistance to both abrasion and corrosion has been announced by The International Nickel Company, Inc. Designated Ni-Hard iron, type 4, it is a patented high-alloy modification of the Ni-Hard family of abrasion-resisting irons which has been in industrial service for many years. Ni-Hard iron, type 4, however, offers improved mechanical properties and greater resistance to corrosion over the established Ni-Hard iron, type 1, it is claimed. By virtue of its alloy content, the type 4 iron possesses a matrix structure, in the mold-cooled condition, which is similar to that of a heat treated steel. It is expected to find major service in pumps and other equipment handling abrasive solids in water. Also, extensive use is predicted for Ni-Hard iron, type 4, in applications such as metal-working rolls, mill liners, grinding balls, pulveriser rings and roll heads. In-service tests have shown that Ni-Hard, type 4, iron impellers in centrifugal pumps handling ore and tailings have lasted upto twice as long as those made of competitive abrasion-resisting materials. Grinding rings of type 4 iron in a ring-roll type pulveriser, used for dry-grinding cement clinker, had an average life of more than 4,000 hours. Reports from International Nickel's Research Laboratory, where the iron was developed, indicate that the type 4 iron can be melted in either a cupola or electric furnace and is quite fluid and readily castable. For most applications the only treatment required is stress relieving for four hours at 400 to 450°F, although a more extensive heat treatment may be used for applications where higher strength and hardness are desired. Ni-Hard iron, type 4, is composed of 3.0 to 3.6 per cent total carbon; 1.5 to 2.0 per cent silicon; .40 to .70 per cent manganese; 5.5 to 6.5 per cent nickel; 7.0 to 10 per cent chromium; balance iron. Ni-Hard is a registered trademark of The International Nickel Co. Inc., for a family of abrasion-resisting cast irons. Ni-Hard irons, including type 4, are produced by authorised foundries licensed by International Nickel.

Weaving Steel

Skilled master weaver operates a special hand-built loom producing ultra-fine wire cloth. The wire cloth, woven in Pall Corporation's plants at Lurgan, Northern Ireland, and Shannon, Eire, is furnace-sintered and manufactured into precision filters and other equipment for aerospace and industrial uses. The finest grades of this stainless steel mesh may contain as much as 3½ miles of finer-than-human-hair wire per square foot. Pall filters manufactured from these materials are used aboard virtually all military and civil aircraft, including the Boeing 707 and in most space vehicles. They protect hydraulic, pneumatic, fuel and lube systems from microscopic contaminants which could damage or jam sensitive, close-tolerance pumps and valves and thus precipitate a catastrophic failure.

PUBLIC ACCOUNTABILITY OF PRIVATE CORPORATE SECTOR—I

PHILOSOPHY OF INDIAN COMPANY LAW

(Contributed)

THE expanding frontiers of the private corporate sector and the stirrings of a new consciousness among the public about the obligations of the private corporate sector towards the society have added a new dimension to the discussion of the role of private corporate sector in an economy which is free from the trappings of centralised direction and control as is noticed in the countries that boast themselves to be "socialist democracies." The discussion of this new dimension is particularly of vital significance to developing countries like India, where the goals of a welfare economy and an egalitarian society in which opportunities to share the fruits of developing economy are to be thrown open to all sections of the society have been specifically defined in the directive principles in the Constitution and as such are of the nature of a permanent obligation cast on the present as well as future governments of the country. While in the developing countries including ours, a discussion of public accountability of private corporate sector is still almost unknown, in the more industrially advanced countries of the West it has come to be most avidly discussed in academic circles and among the intelligentia, as a natural corollary to the acceptance of the concept of public interest *vis-a-vis* the private corporate sector. But even there, the discussion on the application of the test of public accountability to private corporate sector and the ways of doing it, is very largely confused. This confusion largely arises from the general line of thinking that the public sector and the nationalised industries alone are to function in 'public interest' and as such it is necessary to subject them only to the test of public accountability. It is proposed to discuss in this article the need to apply the test of public accountability to the private sector after statistically showing that the frontiers of the private corporate enterprise have so vastly expanded that, apart from the shareholders and creditors, the public have also come to have a stake in its functioning.

Expanding Frontiers

For a proper appreciation of the expanding frontiers of the private corporate sector in our country, it may be emphasised that, at present, our country is passing through a very crucial phase of industrial revolution which started with Independence in 1947 and gained momentum with the launching of the First Five-year Plan in 1951. During the current phase of industrial revolution, the industrial base of the country has vastly been diversified. In fact, it can be said that the country has taken big strides to get nearer to the take-off stage.

In the next few Five-year Plans, which will ultimately lead the country to that stage, the corporate sector has a big role to play. Already, the corporate sector in our country accounts for more than 90 per cent of industrial production computed on the basis of factory output. Also ninety per cent ownership of the productive capital of factories in the major industries is vested in the joint-stock companies. The share of the corporate sector in the net domestic product at factor cost for the non-Government sector is reckoned around 15 per cent. This proportion for the trade and industry in the non-Government sector comes to over 66 per cent. The total invested capital of the entire corporate sector aggregated approximately Rs. 2,200 crores and their total assets over two times that figure. Excluding the capital invested in the Government companies incorporated under the provisions of the Companies Act which comes to about Rs. 800 crores, the total paid-up capital of the private corporate sector, which comprises approximately 25,400 companies, is at present estimated at around Rs. 1,400 crores.

These figures indeed look very large in comparison with the number of companies at work at the beginning of the century when there were only 1,340 of them and their paid-up capital added upto Rs. 35 crores only. If we go still earlier into the nineteenth century to its eighties when the corporate sector in our country had taken firm roots after a lapse of some three decades since the passing of the first Companies Act in 1850, we find that there were only about 500 companies at work in the country with a total paid-up capital of about Rs. 16 crores. It is not only that the number and paid-up capital at work in the country have increased over the last 100 years—in fact much of this expansion took place after the outbreak of the Second World War—but also that, within the corporate sector, the number of big-sized companies has gone up phenomenally. Excluding the private railways, banks, insurance and other financial companies, the total number of companies having a paid-up capital of Rs. 50 lakhs and more was only 6 on the eve of the First World War and the number of such companies increased to about 50 by 1930-31. As against this, the number of big companies was reported to be 461 in 1960-61 to be exact. Since then, the number of such companies has further gone up to around 500. The paid-up capital of the 461 large-sized companies amounted to Rs. 1,212 crores in a total of Rs. 1,814 crores for the entire corporate sector. Out of the 461 companies, 39 were the Government companies with a total paid-up capital of Rs. 539 crores, whereas the remaining 422 were non-Government companies, having a total paid-up capital of Rs. 673 crores. It is thus seen that the total number of non-Government joint stock companies having a paid-up capital of Rs. 50 lakhs and more accounted for nearly ·53 per cent of the total paid-up capital of the entire private corporate sector.

Small and Big Co-exist

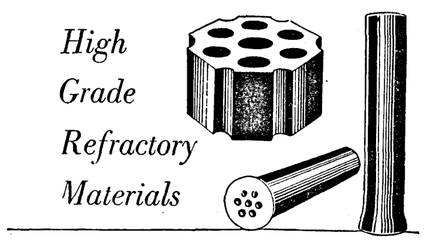
This concentration of capital invested in a small number of fair and large-sized companies in the private corporate sector is not to be regarded as either alarming or disconcerting, as the growth of these companies has in no way impeded the formation or growth of small and medium-sized companies in our country. It is seen that, in almost every industrial group, about 90 per cent of the companies are incorporated every year with such small authorised capital base as Rs. 10 lakhs or less. Notwithstanding this continued overwhelming flotation of small-sized companies in the private corporate sector, the number of large-sized flotation with an authorised capital base of Rs. 1 crore or more has steadily increased from 28 in 1956-57 to over 70 in 1961-62, after establishing a record of 89 in 1960-61. In all during the period 1956-57 to 1961-62, 272 big-sized companies had been formed with an authorised capital of Rs. one crore and more each, of which 236 were in the private corporate sector and their authorised capital accounted for about 44 per cent of the total authorised capital of all the companies formed in the 'private sector' during the same period.

The foregoing figures thus clearly bring out that both the small and big companies coexist in the private sector without the latter affecting the chances of survival and growth of the former. To draw an analogy from the U.K. and the U.S., it may be mentioned here, that, in those countries, the growth and presence of a large number of giant-sized companies is construed not necessarily a harmful phenomenon, provided they function as independent competitive units not belonging to any closely connected industrial or business hegemonies, with no secret understandings collusively entered into between them in regard to the evolution of common price policies and of sharing markets which might prejudicially affect the interests of the consumers and generally speaking go against the public interest.

The wide horizons embraced by the totality of the corporate bodies and the commanding heights touched by the leaders of the private corporate sector have, however, come to catch the imagination of the various sections of the society; private corporate sector will continue to remain a focal point of discussion in future as its size expands further under the coming Five-year Plans. To the present volume of investment in the private corporate sector, another Rs. 1,850 crores are expected to be added during the third Plan. The proposed addition works out to as much as 46 per cent of the total private sector investment and 18 per cent of the total planned outlay and investment of the third Plan. Alongside the public sector's growth, the future of the private sector so far its growth is concerned continues to be bright. But the actual conditions and climate for its functioning would very much depend on how the corporate management, which is estimated to comprise 70,000 directors at the minimal level, conduct the business of corporate bodies under it not merely in furtherance of the interests of shareholders and for the safety of the monies lent by the creditors but by keeping the workers in the enterprises satisfied by giving them a 'fair wage' and a share in the profits and by playing fair to the public as consumers by giving them a share in the fruits of higher productivity. That is to say, the private sector enterprises and their management have to function under a new socio-economic philosophy for business which is the philosophy of public interest, not under the traditional one of looking after the interests of shareholders and creditors only.

Not A Mere Law

In law, the new socio-economic philosophy has yet to get recognition in its full implications and in explicit terms. In comparison with the provisions of Companies Act elsewhere in the English speaking world, the company law in our country, as spoken of by official circles, is more than a mere law and order measure which adjudicates between the rights of different parties—



High Grade Refractory Materials

Blast Furnace Bricks, Chequer Bricks, Tuyeres, Ladle Refractories, Glass Tank Blocks and Pot Mixtures; Burnite Air-setting Refractory Cements, Detric 'Detred' Tiles for industrial furnaces and Unifil Insulating Products for cold storage and industrial furnaces. Also superior quality Stone Ware Pipes and Specials, Acid-resisting Wares, Vitri Chlorinators, Chemical Stone Ware, etc.

shareholders, creditors and management by majority. It is said to be an instrument for effecting socio-economic policies of the Government in regard to the dispersal of concentration of economic power, reduction of inequalities in income and wealth, democratisation of company management and subjugation of private motives that govern the working of the corporate bodies to the larger interests of the society. Thus, some half a dozen sections in our company law speak of 'public interest' in explicit terms. The scheme of the substantive Companies Act of 1956, and certain changes or innovations contemplated under the latest Amendment Act of 1963 such as the setting up of a high powered tribunal to look into the conduct of company directors and remove them from their positions if found guilty of fraud, misfeasance and grave misdoings aim at making company management and directors as responsible company managements and directors.

This move to make company management and directors behave and acquit themselves as responsible leaders of the corporate sector is one big trot towards the goal of taking the companies out of their traditional grooves and changing their complexion into that of responsible companies, the touchstone of which is 'public interest,' which has to be broadly viewed in present times to be roughly synonymous with 'general welfare' of a pluralistic society. Here, while considering the concept of public interest, it is also to be realised that the 'value element' of public interest is relativistic.

Change in Ideas

Apart from this conceptual consideration of the term 'public interest,' the understanding of which is very essential for the discussion of public accountability of private corporate sector, one more thing that deserves mention is that, in modern times, company managements have to, in a positive and deliberate manner, shape corporate policies and pursue them in consonance with the prevailing concept of public interest, whereas, in the past, when the *laissez faire philosophy* was dominant throughout the world, it was not the company managements' behaviour but the force of classical competition that made the joint-stock companies serve the 'public interest.' Even in those days, the justification for protecting property rights in private enterprise used to be that they served the public interest. It was believed that, by protecting the enterpriser in the profits he could make, he was induced to risk his capital in productive enterprise and to manage his enterprise economically, so as to increase his profits. And, while the economical management induced the enterpriser to maximise his profits, the classical competition exercised a control over the profits and at the same time also removed the uneconomic and inefficient ones from the field. Public interest was thus served by private enterprises. It was also then believed that the classical competition compelled enterprisers to serve public interest in four ways, namely, that the price was brought in reasonable relationship to costs, that benefits to labour arising from production were reasonably related to their respective contribution to production, that, as nearly as possible, optimum use of resources was made, so that no more of resources was used than was necessary for the end product and the combination of resources was used which involved the least cost and that technology was improved so as to reduce the costs, improve products and introduce new products.

However, in the twentieth century, a radical change has occurred in the corporate sphere. Joint-stock companies have become collective enterprises. In the big ones among them, a single management interrelates the capital of many thousands of investors, labour of many thousands of workers and the wants of many thousands of consumers. Companies have put on an appearance of a 'community system' or they look like a "microcosm of society as a whole." Unlike the olden days, when ownership and control of enterprise was united in the hands of an entrepreneur or a small group of enterpreneurs, now, as a result of widespread dispersal of share ownership, the shareholders have come to be removed from a position of direct control over the corporate enterprise to a remote point of control and the control now rested with persons who owned only a small portion of the share capital. These managerial oligarchies, who control enormous resources, naturally have to look to the claims of workers and consumers. The emergence of big corporate giants has, to a certain extent, made the market mechanism inoperative and conditions of perfect competition of the classical type have been replaced by those of imperfect competition. These changes in the economic scene and the emergence of a strong feeling among the public for a fair deal and fair treatment, together with the growth of powerful trade unions, have had tremendous repercussions on the corporate bodies and their management, and have made the application of test of public accountability to them a matter of urgent necessity.

(To be continued)

CONSENT FOR CAPITAL ISSUES IN 1963

During the calendar year 1963, as many as 418 companies were given consent for capital issues, involving an aggregate amount of Rs. 544.31 crores, as against 447 companies covering a total of Rs. 381.5 crores in the previous year. Of these 418 companies, 359 were non-Government companies covering Rs. 237.57 crores and 59 Government companies covering Rs. 306.75 crores. The details of the issues relating to non-Government and Government companies, respectively, are as follows:

(In crores of rupees)

Initial 85.000 non-Government and 41.90 Government: further issues 41.08 and 187.33; bonus 10.75 and 0.11 debentures 15.39 and nil; loans, etc., 85.35 and 77.41 and the total 237.57 and 306.75.

The Central Bank of India Limited.
(At their branches at Ahmedabad and Indore.)

EXISTING AND PROPOSED ACTIVITIES
The principal business of the Company consists of manufacture, distribution and sale of special steels, steel bars and bright sections, bolts, nuts, rivets, railway permanent way material, railway wagon parts, railway signal fittings, steel sleepers, scaffold fittings, wood screws, metal thread screws, cotter pins, safety pins, tungsten carbide tipped tools and steel grinding media. The Company also has an Agency Section importing and selling a wide range of mechanical and electrical products of well-known overseas manufacturers.

The Company has development plans, the principal among which is the proposed expansion of steel making and rolling capacity for the manufacture of special steels for which necessary industrial licences have been obtained from the Government of India.

LOCATION
The Company has manufacturing works at Calcutta and Bhandup near Bombay. The Calcutta Works are situated in Howrah, West Bengal and the Bhandup Works, approximately 18 miles from Bombay, on the main Agra Road.

DATE OF OPENING AND CLOSING OF SUBSCRIPTION LIST
The Subscription List will open at the commencement of the Banking hours on the 3rd February, 1964 and will close at the close of Banking hours on the 12th February, 1964 or earlier, according to the discretion of the Directors of the Company, but not earlier than the close of Banking hours on the 5th February, 1964.

COPIES OF THE PROSPECTUS AND THE APPLICATION FORMS WILL BE AVAILABLE FROM THE BANKERS AND THE BROKERS NAMED IN THIS ANNOUNCEMENT.

FIRST DECADE OF EMPLOYEES' PROVIDENT FUND SCHEME

RECOVERY OF ARREARS BIGGEST PROBLEM

THE scheme of compulsory contributory provident fund, framed under the Employees' Provident Funds Act, 1952, completed ten years at the end of the fiscal year 1962-63. The scheme made steady progress during the decade, with each successive year bringing within its compass more and more workers in an increasing number of industries and conferring on them more and more benefits in addition to the schemes primary function of providing for the old age of members and for their dependents. Beginning with only six major industries in 1952, the scheme, according to the annual report for 1962-63 of the Employees Provident Fund Organisation, embraced as many as 71 at the end of March 1963, covering 22,413 establishments and 3.52 million subscribers, as against 17,416 establishments and 3.15 million subscribers as at the end of the previous year. Out of this, 1,350 establishments covering 1,269,340 workers, were "exempted establishments"—that is, establishments having their own provident fund schemes, the benefits under which were not less favourable than those under the statutory scheme and which were managed by the companies themselves. The scheme was extended to an additional 11 industries since March 1963, bringing the total number of industries covered at the end of the year to 82. The table at the end of the page indicates the progress of coverage at a glance.

The Employees Provident Fund Act, it may be noted, now applies to establishments in the covered industries employing 20 or more persons, unless of course the establishments are registered under the *Co-operative Societies* Act and works without the aid of power, in which case the minimum limit is 50. Originally, the Act was also not applicable to establishments owned by the Government or local authority. Since May 1958, however, this distinction has also been removed.

Rate of Contribution Enhanced

The rate of contribution by members, as is well known, was originally fixed at 6¼ per cent of basic wages, retaining allowance, if any, and dearness allowance, including cash value of food concessions, if any. Section 6 of the Act, fixing the rate of contribution, was, however, amended in 1962 in order to vest the Government with general powers to apply and enhance the rate of contribution from 6¼ per cent to 8 per cent in any industry or class of establishments covered under the Act by a notification, after making such inquiry as it deemed fit. In exercise of this power, the Government raised, with effect from 1st January 1963, the statutory minimum rate of provident fund contribution to 8 per cent in respect of factories employing 50 or more persons in six industries, namely, (1) cigarettes, (2) electrical, mechanical or general engineering products, (3) iron and steel, (4) paper other than hand-made paper and (5) cement. In the case of cement, it may be noted here, the enhanced rate was applicable with effect from 1st April 1963 only. Later, that is, with effect from 1st November 1963, the higher rate was made applicable to 18 more industries, namely, (1) textiles (made wholly or in part of artificial silk and wool, (2) matches, (3) edible oils and fats other than *vanaspati*, (4) rubber and rubber products, (5) electricity, (6) tea, (7) printing, (8) glass, (9) stone-ware pipes, (10) sanitary wares, (11) electrical porcelain insulators of high and low tension, (12) refractories, (13) tiles, (14) heavy and fine chemicals, (15) indigo, (16) non-edible vegetable and animal oils and fats, (17) mineral oil refining industry and (18) newspaper establishments.

It has also been provided that a worker can increase his contribution to 8⅓ per cent of his wages if his employer agrees but the employer's contribution will remain at the specified rate. This ceiling, that is, the ceiling on employees' contribution is likely to be raised further. The report under reference discloses that, during the year 1962-63, about 40,171 members contributed voluntarily at the higher rate.

Investments

Total contributions received in cash from unexempted establishments, during the year, inclusive of past accumulations, amounted to Rs. 28.60 crores, as against Rs. 25.04 crores in the previous year. In addition, past accumulations contributed in the shape of securities aggregating Rs. 4.15 crores were also received from covered establishments which had previously their own provident fund scheme. A sum of Rs. 26.04 crores were invested in Central Government securities in respect of unexempted establishments. Interest realised on investments during 1962-63 amounted to Rs. 4.33 crores. The pattern of investment is 20 per cent in 12-year National Defence Certificates and Defence Deposits and 80 per cent in other Government of India Securities, including National Defence Bonds. This pattern is expected to yield a little over 4 per cent per annum in respect of future investments. In line with this expectation, the rate of interest on provident fund contributions was raised to 4 per cent for the year 1963-64, as compared with 3.75 per cent paid since 1957-58. The Central Board of Trustees hope that a further increase would be possible in the near future. This hope has materialised for the Board has since announced that the rate of interest for 1964-65 would be 4½ per cent.

Recovery of Arrears

The recovery of arrears of provident fund contributions from employers is by far the biggest problem facing the Employees Provident Fund Organisation. An idea of the magnitude of the problem can be had from the fact that, at the end of the year, 2,144 cases relating to recovery of arrears were pending before law courts and 2,020 cases were pending with State Governments for sanction. Total number of prosecutions launched from the beginning of the scheme till the end of the year under review, was 6,693 of which 4,549 cases were disposed of. Out of these, as many as 2,852 resulted in convictions. In August 1963, the problem of recover of arrears and default was discussed at a conference of Regional Provident Fund Commissioners, presided over by the Central Provident Fund Commissioner. It was suggested at this conference that the Act should be amended so as to provide for: (1) first priority for the recovery of arrears of provident fund dues over all debts or its inclusion among the secured debts, (2) imposition of a minimum fine in the case of non-payment of dues, (3) imposition of minimum fine or continued non-payment of dues after convictions, and (4) fixation of a minimum period of compulsory imprisonment for subsequent defaults. These and other recommendations of the conference are said to be under the consideration of the Central Government.

In order to speed up the rate of recovery of arrears, the Employees Provident Fund Act was amended recently to empower the Central, Deputy and Regional Commissioners to determine the provident fund dues and other charges recoverable from an establishment and to confer on Provident Fund Inspectors powers to search and seize papers and other evidences for the proper implementation of the Act.

Higher Damages from Employers

In order to discourage persistent defaults, the State Governments were empowered to realise from the defaulting employers damages up to 25 per cent of the arrears. Till recently, the usual rate of damages charged was only 6¼ per cent per annum and this low rate constituted an indirect incentive for the irresponsible employers to defer payment. For this reason, it has been suggested to State Governments to levy damages according to a progressively increasing scale of damages, beginning from 2 per cent for first default of a duration of one month or less, increasing to a maximum of 25 per cent for the sixth default, or for a period of more than five months. Almost all State Governments have agreed to levy damages according to this scale and the rest are expected to follow suit. The levy of increased damages is said to have resulted in better recovery, though the full impact is expected to be felt during 1963-64 only. Damages received during 1962-63 on delayed contributions amounted to Rs. 7.77 lakhs.

The need for prompt settlement of claims of out-going members can be hardly overemphasised. The Employees Provident Fund Organisation claims, in its report, that every effort is being made to see that most of the claims are settled within 10 to 15 days. The delay that occurs is said to be due, in most cases, to the late submission of returns by employers or due to the receipt of claims not correctly filled up. As prompt payment of claims is the final objective and most important function of the regional offices of the Employees Provident Fund Organisation, the following steps were taken during the year in order to speed up settlement of claims:

(i) Employers were requested to submit necessary forms immediately after the date of retirement of a subscriber. Inspectors on their visits checked this important point and guided the establishments suitably;

(ii) The statement of contributions sent by the employer was particularly scrutinised to check

PROGRESS OF PROVIDENT-FUND SCHEME AT A GLANCE

if an individual had ceased to be a member;

(iii) Inspectors on their visits paid particular attention to the filling up of nomination forms;

(iv) Wherever possible, *interim* payments of the subscribers share were made; and

(v) The Regional Commissioners carried out a periodical review of outstanding cases.

A sum of Rs. 6.57 crores was paid in respect of 134,000 claims during the year, as against Rs. 5.29 crores in respect of 113,000 claims in the previous year. The different categories of claims paid were as under:

	Claims	*Rs. in lakhs*
Superannuation	8,779	81.92
Retrenchment	31,354	158.86
Dismissal	2,679	10.72
Resignation and termination of service	69,599	236.00
Migration	975	5.44
Permanent invalidation	8,562	60.48
Death	8,377	50.35

Total claims settled in just over a decade amounted to Rs. 26.40 crores, involving about 676,000 claims.

One of the facilities available to members of the Fund is that they can get non-refundable advances from the Fund for specific purposes under certain conditions. These purposes are (1) payment of premia on life insurance policy, (2) construction or purchase of a house or a plot of land for a house, (3) buying shares of consumers' co-operative stores and (4) exigencies like temporary closure of an establishment of more than 30 days. Advances made for these purposes during the year amounted to Rs. 91.61 lakhs, of which no less than Rs. 27.61 lakhs were for payment of insurance premia and Rs. 64 lakhs for construction or purchase of houses.

Clarifications

Some important clarifications in respect of claims settlement coverage of the Act etc. were issued by the Government. These are worth recording here:

(*a*) The provident fund accounts of the members of the Fund may be settled immediately, by payment of both the employee's and employer's shares of contributions in full together with interest thereon, as may be admissible in case of those members who cease to subscribe to the Fund as a result of the establishment in which they are employed going out of the purview of the Act in accordance with the provisions of section 16(1)(*a*) thereof.

(*b*) Reservists who are employed in various establishments covered under the Act may be paid non-refundable advances to the extent of their own share of contributions together with interest thereon when they are called back by the Army authorities.

(*c*) Exemption has been granted under section 16(2) of the Act to such classes of establishments owned or controlled by charitable institutions as are working exclusively for the benefit of their employees, from the operation of the Act for a further period of 5 years. (This notification has come into force with effect from 13th August 1960).

(*d*) The manufacture of tamarind seed powder cannot be deemed to fall within the scope of the scheduled industries 'starch,' 'heavy chemicals' or 'flour milling.'

(*e*) In view of doubts in certain quarters it has further been clarified that:

(i) Railway booking agencies are not covered under the Employees' Provident Funds Act under the scheduled head 'trading and commercial establishments.'

(ii) Guar gum does not fall under the scheduled head 'starch' or 'heavy and fine chemicals' for the purposes of Employees' Provident Funds Act.

(iii) The manufacture of boot polish does not fall under the scheduled industry 'heavy and fine chemicals.'

(iv) Staple fibre yarn manufactured from staple fibre comes under the scheduled head 'textiles' under the Employees' Provident Funds Act.

(v) The manufacture of staple fibre does not come under the head 'textiles.'

(vi) The wages earned by the members by working on Sundays and other holidays (intended to be contributed towards National Defence Fund) will not be liable for provident fund deductions.

(vii) The Employees' Provident Funds Act does not apply to 'cotton ginning and pressing' factories.

Supreme Court's Decisions

The Supreme Court also delivered some judgments clarifying the applicability of the Act to certain industries. The following decisions are important from the point of view of employers and workers:

Different High Courts had expressed divergent views regarding the question whether the composite factories, that is, factories partly engaged in a scheduled industry and partly in a non-scheduled industry should be brought within the purview of the Act and the scheme as a whole or only in respect of that part which is engaged in scheduled activities. This controversy has been set at rest by the Supreme Court's judgment delivered in the cases of Regional Provident Fund Commissioner, Bombay *vs.* (1) Shri Krishna Metal Manufacturing Company, and (2) Oudh Sugar Mills Limited, wherein it has been laid down that the definition of 'factory' as given in the Employees' Provident Funds Act cannot necessarily mean a factory *exclusively* engaged in the particular industry specified in Schedule 1 and that the words 'engaged in any industry specified in Schedule I' used in Section 1(3)(*a*) of the Act would mean primarily engaged in any such industry; and if a factory is engaged in 2 or more connected industrial activities, one of which is primary and the others are purely subsidiary, feeding or incidental, then it is the primary activity which should determine the character of the factory. In case the factory is engaged in two or more industrial activities which are independent, then all such activities are primary and any one of these activities would determine the character of the factory. This view has again been confirmed by the Supreme Court in its recent decision in the case of Associated Industries *vs.* Regional Commissioner, Kerala.

The Supreme Court recently held that the typical production bonus in force in Bridge and Roof Company (India) Ltd. is excluded from the definition of 'basic wages' and is, therefore, not liable for provident fund deductions. While delivering the judgment in this case, and the case of the Jay Engineering Works Limited, the Supreme Court observed that a typical production bonus scheme has only one base or standard and the worker is not bound to produce more than the base or standard; time wages are guaranteed up to that base or standard and any payment for production above that base or standard, whatever the name of this payment is production bonus. The peculiar feature of the production bonus scheme in force in the Jay Engineering Works is that it has got two bases, namely, (i) the quota, and (ii) the norm, the quota being much lower than the norm. The workmen are expected to give the 'norm' as the minimum production and if there is any deliberate deviation therefrom they are liable to be charged with misconduct in the shape of go-slow and may be dismissed for such misconduct. It has accordingly been held that the portion of the payment which is made for production above the 'norm' would be production bonus and would be covered by the judgment of the Court but that portion of payment which is made for production up to the quota as well as for production between the 'quota' and the 'norm' is basic wage within the meaning of that term in the Act. It will be seen that the base or standard of the typical production bonus scheme corresponds to the norm of the peculiar production bonus scheme of the Jay Engineering Works Limited. Thus each case of production bonus will now have to be examined on the basis of the principles enunciated by the Supreme Court.

Contract Labour

The employees employed by or through a contractor are covered under the definition of 'employee' given in the Act. But there was no specific provision in the Act making the employer responsible for complying with the provisions of the Act in relation to the employees of a contractor. The Supreme Court decided in March 1962, that the provisions made in this regard in the Employees Provident Funds Scheme, 1952 were unconstitutional and void mainly for the following reasons:

(*a*) That there is no provision enabling the employer to recover the amount of contributions from the employees employed by or through a contractor, and

(*b*) that there is no obligation on the contractor to pay to the employer the amount paid by the employer on account of employees of the contractor.

As a result of this decision, the provident fund benefits since then were available only to the employees employed directly by the employer and not to those employed through a contractor. This situation led to discontent amongst the workers employed by or through a contractor who had been enjoying provident fund benefits under the scheme prior to March 1962. Very recently (in September 1963), the Act has been amended, extending the benefits to the employees employed by or through a contractor as well, and enabling the employer to recover the contributions from the contractor.

While the existing work is being consolidated and the administrative machinery is being streamlined, the Employees Provident Fund Organisation, the annual report claims, is going ahead with planning for the future also. As many as 27 more industries and classes of establishments with an estimated prospective membership of about 270,000, have already been surveyed with a view to ascertaining their capacity to bear the burden of provident contributions. As the application of the scheme to smaller units and the problem of recovery of arrears present difficulties, the Organisation would do well to gear up and streamline the administrative machinery at both the Centre and in States before coverage of the Act is extended to more and more industries. In other words, the emphasis should now be on consolidation rather than expansion.

PRIVATE SECTOR AND PUBLIC RELATIONS

SERIOUS OMISSIONS IN FEDERATION'S STUDY

(*By A Special Correspondent*)

ON the eve of the Bhubaneshwar session of the Congress, the Federation of Indian Chambers of Commerce and Industry brought out a brochure, explaining the contribution of the private sector to the development of the Indian economy during the first decade of planning. This is, indeed, a commendable effort to inform the public about the achievements of the private sector in the different fields of economic activity.

The brochure has given copious statistics, indicating the investment made by the private sector in agriculture, power, transport, large and small industries, housing and in other spheres; the sources from which the funds were obtained; and the extent to which production has been increased in various industries.

An attempt has also been made to show how the private sector helps to augment the revenues to the Exchequer in the form of direct taxes and indirect taxes and State taxes like electricity duty, sales tax, etc.

The data presented in the brochure are undoubtedly useful and interesting, but there are many significant and serious omissions. It is, of course, not possible within a small brochure to deal in detail with every aspect relating to the achievement of the private sector but at least the more important ones ought to have been mentioned.

For example, there is not a word in the brochure about the contribution made by the private sector industries towards the earning of foreign exchange. This is, after all, one of the most valuable ways in which the private sector has been serving the economy. In fact, one main reason why the large-scale industries should be actively encouraged is that they can contribute substantially to the earning of foreign exchange.

World trade is becoming increasingly competitive and the advanced countries are taking the fullest advantage of the latest developments in the field of science and technology by modernising their equipment. Therefore, if Indian goods are to compete successfully in foreign markets, it is necessary that our industries should be given all facilities for expansion, for diversification and for modernisation.

Similarly, the Federation could have usefully pointed out to what extent industrialisation during the last ten years has helped to displace imports. If this fact had been brought out with suitable statistics, it could have created a very good impression.

It is stated that between 1956-60 no fewer than 188 new items of manufactures were taken up by the private sector of which 106 were engineering and 82 belonged to chemicals and other industries. But no details are given about these new industries or about the extent to which they have contributed to the earning or saving of foreign exchange.

Another serious omission is about prices. The country is interested not merely in increasing production but in making goods and services available at reasonable prices which the consumer can afford. As Mr. T.T. Krishnamachari, the Union Finance Minister, pointed out at Bhubaneshwar, the continuous rise in prices is one of the most difficult and important problems confronting the Government at present.

The Federation could have dealt with this matter and explained how the prices have risen due to factors beyond industry's control. It could have shown how the various levies in the field of direct and indirect taxation have resulted in price increases of essential commodities and caused distress to the people. The Federation itself set up, soon after the proclamation of the Emergency in October 1962, vigilance committees in different zones for keeping a watch on price trends. But it is not known to what extent these efforts have actually succeeded.

The Federation has described the limitations that have hindered the progress of the private sector, such as industrial policy, administrative delays, shortage of foreign exchange, and scarcity of transport and power. But, surprisingly, no mention is made of the fiscal policy which has also contributed to the

(*Continued on page* 145)

INDIAN OXYGEN LIMITED

CHAIRMAN, MR. N. DANDEKAR'S STATEMENT

SEVERAL NEW PROJECTS TO BE LAUNCHED

THE following is the statement circulated by Mr. N. Dandekar, Chairman, Indian Oxygen Limited, to the Members of the Company with the annual report for the year 1963:

It is a pleasure and a privilege for me to have the opportunity of addressing you for the first time as Chairman of your Company since my appointment on 1st April 1963.

The year under review began with a short, sharp but undeclared war with China, which ended as abruptly as it began. While it exposed large and unexpected areas of unpreparedness on our side in weapons, transport, equipment and communications, it also disclosed to a surprising and welcome degree the underlying unity and resolve among the people at large, throughout the country, to resist the unprovoked aggression by every means and at whatever cost. In this context, the task for industry was to mobilise the national material resources without avoidable delay and to place at the disposal of our Government and our Armed Forces everything they needed to resist aggression. In this effort, your Company has played its part to the best of its ability and resources.

Profits, Taxation and Dividend

The result of the year's operations, before taxation but after providing depreciation of Rs. 59,66,478 (previous year Rs. 49,83,816), was a profit of Rs. 1,40,40,263, as against Rs. 1,35,49,369 last year. Compared to a sales advance from Rs. 8.88 crores to Rs. 10.21 crores, the profit increase was indeed small. Considering, however, the substantial increase in depreciation, coupled with the severely curtailed production at the Electrode Factory where activity was inhibited by acute shortage of core wire, and the general rise in costs resulting partly from the national emergency and partly out of inflation and the impact of the Finance Act, 1963, the trading results may be regarded as satisfactory.

The tax provision for the year, including Rs. 9,00,000 for Super Profits Tax, amounts to Rs. 69,33,996, leaving a net profit of Rs. 71,06,257 as against Rs. 60,82,869 in the previous year. Out of this, a sum of Rs. 19,00,000 (previous year Rs. 6,50,000) has been transferred to the development rebate reserve; this includes a further provision of Rs. 6,00,000 for the previous year. After adding Rs. 17,61,389 brought forward from the previous year and transferring Rs. 32,069 to the fixed assets replacement reserve, almost the whole of the balance amounting to Rs. 69,00,000 has been transferred to general reserve, as against only Rs. 10,00,000 so transferred last year.

After careful consideration of the Company's present and prospective resource position, and all other relevant circumstances including, in particular, the increasing burden of taxation in the context of the continuing situation of national emergency, your Directors have decided to recommend that the rate of dividend (subject to deduction of tax) should be maintained at 12 per cent. If this recommendation is accepted the dividend will be paid out of general reserve.

Sales

Sales for the year totalled Rs. 10.21 crores, an increase of 15 per cent over the last year's figure of Rs. 8.88 crores. In view of the difficulties your Company had to encounter during the year under review, this was indeed very satisfactory. Acute shortage of core wire persisted almost throughout the year, severely curtailing the output of electrodes at our factory at Khardah near Calcutta. It is a matter of great regret that, despite the continuance of the national emergency, timely attention was not given by the authorities to ensure the availability of core wire, with the result that electrode production in the country suffered a very severe setback and caused considerable inconvenience to the engineering industry. There was also occasional failure of power which interrupted production activities at several of our factories, notably at the Electrode Factory, and also at Asansol and Madras.

Oxygen and dissolved acetylene sales showed considerable increases and the sales of gas-user equipment, electric welding equipment and medical products also improved substantially.

Capital expenditure incurred during the year was financed largely out of the Company's internal resources and amounted to Rs. 85,50,601 covering a number of projects throughout the country.

I am glad to report that the agreement with the British Oxygen Company Limited for a sterling loan of £500,000, to which reference was made by my predecessor in his statement last year, has now been finalised; and it has also received the approval of the Government of India. With the support of this foreign exchange loan, the Company is now in a position to take in hand a major expansion programme covering a number of projects to which I shall refer in some detail in the paragraphs which follow. This expansion programme is expected to cost about Rs. 6 crores, spread over four years. It has been estimated that, after taking into account the internal resources which will be generated over that period and the loan of £500,000, the Company will require additional rupee finance of about Rs. 2 crores for the expansion programme. I am glad to report that, subject to the consent of the Controller of Capital Issues, arrangements have been made with the Punjab National Bank Limited, to provide us with this amount by way of medium-term loan secured by the pledge of debenture-stock.

Development and Expansion

In his statement last year, my predecessor had mentioned that the second 400M³ oxygen plant was under erection at Bombay. That plant went into commercial production in May.

The buildings for the new factory at Hyderabad are in an advanced stage of construction. The dissolved acetylene plant is expected to go into production there within the next two months and the oxygen plant by July 1964.

Construction of the Loxite factory at Ranchi is expected to be completed early in 1964. Production activities were discontinued at the Burnpur Loxite factory in January 1963 and taken up partly (in a temporary structure) at the Ranchi site and partly at Bermo.

Keeping in view the general trend of demand for your Company's products in the near-future, we have drawn up a programme of substantial development and expansion for the four years ending 30th September 1967. Several new projects have been proposed covering additional facilities for production and distribution of gases, production of user equipment and electrodes, and also for manufacture of plants. Our schemes include, of course, plans for reorganisation and modernisation of existing factories also.

Industrial Gases

In the field of industrial gases, the new projects include the installation of an argon purification plant at Bombay (for which an industrial licence has already been received), two 400M³ liquid oxygen plants one each at Calcutta and Madras, and many new installations at customers' works in various parts of the country.

An industrial licence has been obtained for the manufacture of welding and cutting equipment at our new factory for which land has been acquired at Taratala Road, Calcutta. Construction work will begin soon and it is hoped that the project will be completed by the end of 1966. It is intended ultimately to shift the activities of the present Equipment factory at Beliaghatta, Calcutta, also to the new factory.

In the sphere of electrode production, the Company has been granted an industrial licence for substantial expansion at Khardah factory as also for a new Electrode factory at Madras. The work of expansion at Khardah will commence soon; and as regards the industrial licence for the proposed Madras factory, clarification is awaited from the Government on certain points. Meanwhile, the land required for the Madras factory has already been acquired and it is hoped that it will be possible to commence construction work during the second quarter of 1964.

Mention was made last year of the Company's intention to undertake the manufacture of plant and machinery for producing and using gases. Your Company's application for an industrial licence for the manufacture of air separation plants and associated cryogenic equipment is now under the consideration of the Government.

Each manufacturing venture, whether for gas-producing plants, electrodes or equipment, will take the country one further step towards self-sufficiency for these essential products besides effecting valuable saving in foreign exchange. We hope, therefore, that the urgency and desirability of the projects outlined above will bring forth from the authorities concerned support and co-operation in full measure.

Competition

The pressing demands for industrial oxygen and dissolved acetylene thrown up by the national emergency were brought to your notice last year. I record with satisfaction that, in spite of insufficiency of cylinders, the Government demands on us for additional supply of gases were on the whole satisfactorily met and, despite the shortage of core wire, our contractual obligation to Government for the supply of electrodes was fulfilled, although inevitably in both cases often at the cost of non-Government customers. It is hoped that the inadequacy of oxygen and dissolved acetylene supplies in the country, and also of electrodes, which already existed and was highlighted in the difficult initial days of the national emergency and which still persists, will persuade the Government to adopt a more practical policy of industrial licensing of new manufacturing units for these vital products. While the Government continues to be influenced by illusory fears concerning a supposed monopoly situation in these fields, your Company accepts the necessity for, and the fact of, competition. But it is only natural to hope that, in view of your Company's resources, experience and stature in this field, as also in recognition of the quality of the services it has provided over the years, the Company's expansion schemes will not be held in check by the Government's restrictive policies.

I am glad to say that the Company has been entrusted with the management and operation of the tonnage oxygen plant, the first in the private sector, put up by the Tata Iron and Steel Company Limited, at Jamshedpur. This arrangement with Tatas is in pursuance of the power taken by your Company under one of the new object clauses adopted at a meeting of the shareholders held on 27th September 1962, and since approved by the Calcutta High Court.

We have also been approached by other producers of industrial gases to render them assistance *inter alia* by way of technical advice on their plant and factory. In three cases, we have already agreed to render such assistance. All this goes to emphasise that we are not in the least averse to the emergence of genuine competitors. Indeed, we hope that our standing and experience will, by helping others, foster a happy spirit of co-operation and healthy competition among the producers of industrial gases in this country.

Prospects

From what I have said above, it will be evident that I entertain a feeling of confidence and restrained optimism about the future prospects for the Company. We are about to enter upon a period of fairly heavy capital expenditure with full confidence and faith in the future of our country. It is a faith shared by the British Oxygen Company Limited also; in this connection, we had the privilege of a visit in November this year by their Vice-Chairman, Lord Reith, who toured India extensively and visited five of your Company's factories in different parts of the country. But, while investment of such magnitude as we have in view implies favourable long-term prospects, both as regards profits and growth generally, the short-term prospect must necessarily be viewed somewhat more conservatively because of the increasing debt and interest load until the new investments become fully productive.

Management and Personnel

On his retirement from India, Sir John Brown relinquished on 31st March 1963 the office which as Chairman of your Company he had occupied since 11th June 1958. Under his distinguished stewardship, there have been remarkable developments of your Company's undertaking and the ground has been prepared for further expansion in future. I offer Sir John Brown our sincere thanks for his services to the Company and I also extend to him our warm wishes for further success in his new life in England.

Mr. P. C. Kavanagh, who had been the Company's Assistant Managing Director since 1st June 1959, also vacated his office on 31st March 1963. Mr. Kavanagh left us in order to take up a position with the British Oxygen Company Limited. Mr. Kavanagh's association with the Company extended over a period of more than fourteen years and I take this opportunity of wishing him success in the years to come.

Mr. S. K. Sinha, one of your Directors since 26th October 1956, will retire at the annual general meeting; and though eligible for re-election, he has, on personal grounds, decided not to seek it. In Mr. Sinha's retirement the Company will suffer a distinct loss. I thank him for his services to the Company, and would like him to know that he carries with him our sincere good wishes for the future.

House Journal

In the Chairman's statement on the 27th annual report and accounts, mention was made of the publication of a house journal called *Oxygen News*. The employees' reaction to this mode of communication was so encouraging that *Oxygen News* commenced monthly publication in January 1963. This house journal is fast becoming an effective medium of self-expression for the employees, as also a secure channel of communication between the management and the employees.

I take this opportunity of recording with pride the contributions made individually by members of the Company's staff in furthering the national effort during the emergency. In particular I would mention the warm and generous response to the appeals for contributions both to the National Defence Fund and the Blood Bank. Sixteen employees were called up for active service, while their colleagues, working in factories and elsewhere, were also contributing towards the defence efforts.

Note: *This does not purport to be a record of the proceedings of the Annual General Meeting.*

THE CENTRAL BANK OF INDIA, LIMITED

Profit for the Year 1963

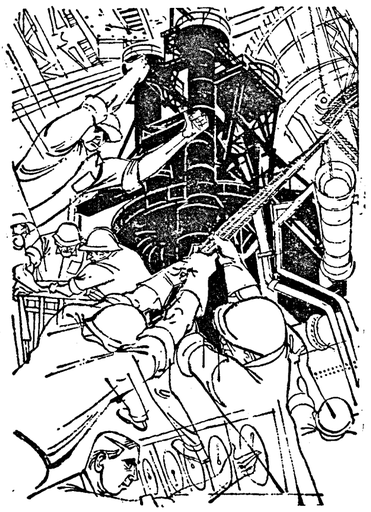
The net profit of The Central Bank of India, Ltd., for the year ended 31st December 1963, subject to audit and after providing for taxation, amounts to Rs. 1,89,26,426.88 (previous year Rs. 1,79,95,826.83), which, together with the sum of Rs. 93,249.88 (previous year Rs. 23,36,733.88) brought forward from the previous year's account, amounts to Rs. 1,90,19,676.76, which the Directors have disposed of as follows :—

	Rs.
An *ad-interim* dividend paid at the rate of Rs. 2.40 per share, subject to tax (i.e. Rs. 1.68 net) for the half-year ended 30th June 1963..	30,28,166.40
Amount transferred to Reserve Fund	40,00,000.00
Amount transferred to Special Reserve	39,00,000.00
Amount transferred to Staff Gratuity Fund	10,00,000.00
Amount provided for Bonus to Staff	70,00,000.00
To Carry Forward to next year's account	91,510.36
	Rs. 1,90,19,676.76

The Directors propose to recommend to the Shareholders the payment of Dividend as follows :—

	Rs.
To pay the balance of final dividend for 1962 and interim dividend for 1963 to the former shareholders of the Jodhpur Commercial Bank Ltd., to whom the shares of the Central Bank have been or remain to be allotted	12,641.37
To pay a Final Dividend for the half-year ended 31st December 1963 at the rate of Rs. 2.60 per share, subject to tax (i.e. Rs. 1.82 net), making in all 14 per cent for the whole year	32,87,401.00
	Rs. 33,00,042.37

a challenge well met



On the 3rd January, this year, the 'E' blast furnace at the Jamshedpur steel works was blown out for relining and enlarging. It was a big job involving 2,100 tonnes of refractories, 1,700 metres of piping, 7,600 metres of electric cables and 1,100 tonnes of steelwork and castings.

When the original schedule was halved from 180 days to 90, many thought it to be impossible. But a team of Tata Steel engineers, technicians and workers took up the challenge and completed the operation in 84 days, 6 days ahead of the drastically revised schedule.

The 'E' blast furnace, with an original capacity of 315 tons a day, was bought second-hand from the U.S.A. 45 years ago. Its rated capacity has now been stepped up to 660 tonnes of pig iron a day without sinter burden, or to 725 tonnes with sinter and sized iron ore.

The record-breaking achievement is another demonstration of efficient team-work, technical know-how and sustained efforts to attain greater productivity with the minimum outlay that characterize a city like Jamshedpur, where industry is not merely a source of livelihood but a way of life.

EXPORT PROSPECTS FOR ELECTRIC MOTORS

COST STRUCTURE AND PRICES DEEMED COMPETITIVE

By S. K. Srivastava

AN increase of 175 per cent in the export of engineering products from India during the last six years must be regarded as a significant rate of growth. In 1956, the value of our engineering exports totalled Rs. 4 crores; in 1962, it rose to about Rs. 11 crores. Electric fan and parts, diesel engine and parts, railway accessories, sewing machine and parts, steel sections, cast iron products, aircraft parts, aluminium ware, etc., constitute the bulk of our engineering exports. But the emergence of electric motors in the export list is a distinct achievement.

India is endeavouring through successive Plans to bring about by rapid industrialisation the "take-off" phase in its economy and achieve the process of "self-sustaining" growth. For a fast developing economy, the requirement of capital goods is colossal and ever-increasing. Among capital goods, the electric motor being the nerve-centre of all industrial activity has a great demand in all countries, whether developed or developing. India's annual import of electric motors is thus around Rs. 3 crores. Compared to 1960-61, the value of import has slightly fallen recently from over Rs. 3 crores in that year to Rs. 2.6 crores in 1961-62 and Rs. 2.9 crores in 1962-63. The slight fall in import and the emergence of export of electric motors are clearly due to the substantial increases in domestic production in recent years.

Although electric motors were first manufactured in India before the Second World War, in 1951 the output was only 24,000 (No.). Under the successive Plans, the level of production has steadily risen every year and the industry has made remarkable progress. Installed capacity increased from 152,400 h.p. in 1951 to 339,600 h.p. by 1956. By the end of 1960, it rose to 602,400 h.p. The present annual rated capacity of 1,124,600 h.p. is nearly double that of 1960. The production of electric motors was 60,000 in 1956. In 1951, it rose to 135,600. Last year, the output was 152,400. Thus, with the advent of national planning, domestic production of electric motors during 1951-62 increased by more than six times.

Capacity and Production

The Indian electric motor industry has today 27 large-scale units located in Madras (11), West Bengal (6), Maharashtra (5), Punjab (2) and one each in Mysore, Gujarat and Andhra Pradesh. Besides, there are 74 small-scale units with a capacity of 266,000 h.p. Their combined production reached the second Plan target of about one million h.p. By the end of the third Plan (1965-66), the demand of electric motors upto 300 h.p. is estimated at 2.5 million h.p. Additional capacity required for the purpose has, therefore, been licensed. Some of the new units are expected to manufacture special types of motors like flameproof motors and high horse-power motors ranging upto 500 h.p.

Having regard to the recent expansion and the large-scale development programme before the industry, a gradual reduction in the volume of imports of electric motors and steady increases in their export in future may reasonably be visualised. The export figures for the last three years are shown below:

Year	Export of electric motors: Quantity (No.)	Value Rs.
1960-61	70	24,073
1961-62	100	62,042
1962-63	115	1,39,850

The Indian electric motor has been exported to East Pakistan, Afghanistan, West Germany, Ceylon and Aden. But, as already observed, the export of electric motors has only just emerged. Its present magnitude is not of much immediate consequence. What really matters or concerns us is the prospect of export and our ability to raise high the present level. It must be remembered that there is a close connection between the level of export and the competitive position of industry. The lower the unit cost of production, the stronger is the competitive position, and consequently the larger is the export possibility. This brings us to the fundamental question of production cost and prices.

Data relating to the cost of production are available from the *Annual Survey of Industries* (*A.S.I.*) reports on which are issued by the Central Statistical Organisation (Industrial Statistics Wing), Calcutta. The *A.S.I.* commenced from the year 1959; for former *Census of Indian Manufactures* did not give separate data on electric motors. The *A.S.I.* data are at present available for two years only, namely, 1959 and 1960. The available data however relate to the entire output of the industry and not to each of the products—major or minor—manufactured by it. As our interest is to study the unit cost of production, it is necessary to estimate the industry's gross output in terms of its major product, namely, the electric motor. This has been done in Table I below. The various elements of cost have been studied in Table II and the unit cost of production of electric motor has also been worked out therein.

TABLE I—*Estimate of Physical Output*

Item	Year 1959	Year 1960
Major product (Electric motor)		
*Quantity (No.)	75,667	110,285
Value (Rs.)	4,17,02,505	5,36,23,233
Other products (including work done)		
Value (Rs.)	2,75,68,136	3,61,41,098
†Major product equivalent (No.)	50,032	74,364
Gross output 1+2		
Quantity (No.)	125,699	184,649
Value (Rs.)	6,92,70,641	8,97,64,331
Ex-factory sale price of electric motors (Rs.)	551	486

* The production of electric motors shown in this table differs with that quoted earlier, as the two production series are taken from different sources and their coverage is not identical.
† The value of other products converted at the rate of the major product yields the equivalent of the latter.

TABLE II—*Manufacturing Costs (in Rs.)*

Item	Year 1959	Year 1960
Value at factory of fuels, lubricants, electricity, etc. consumed		
Amount	9,14,178	8,94,850
Unit cost	7.27	4.84
Value at factory of raw materials, chemicals, packing materials, etc. consumed		
Amount	4,18,90,044	5,49,30,903
Unit cost	333.25	297.49
Work done by others		
Amount	8,84,401	21,51,454
Unit cost	7.03	11.65
Depreciation		
Amount	13,88,510	22,06,404
Unit cost	11.04	11.94
Total input		
Amount	4,50,77,133	6,01,83,611
Unit cost	358.59	325.92
Salaries, wages and benefits paid to employees		
Amount	1,30,51,131	1,47,16,658
Unit cost	103.82	79.70
Total manufacturing cost		
Amount	5,81,28,264	7,49,00,269
Unit cost	462.41	405.62

N.B.—1. The unit cost has been worked out by dividing the respective amount of cost by the physical output.
2. The amounts of the individual input items do not add up to the total value of input which is adjusted for the difference in the opening and closing stocks of semi-finished products, and finished products used for further manufacture during the year.

Findings of Data

The following salient features of cost and prices in the Indian electric motor industry may be observed from the data analysed in Tables I and II:—

(1) The industry is cost-conscious. Compared to 1959, the cost per unit of output in 1960 shows appreciable decreases. The reduction in cost is brought about by the fall in the value of materials consumed and the decrease in the amount of wages, salaries, etc. spent per unit of production. The former declined by Rs. 35.7 and the latter by Rs. 24.1 on every electric motor produced in 1960. Together they resulted in the reduction of total cost by Rs. 56.8 which is not insignificant in a single year.

(2) The decrease in cost is a measure of rationalisation and efficient management achieved by the industry. As the scale of production has risen, the level of technological efficiency has advanced and the economies secured in larger measure. The process should continue.

(3) The little increase in the value of work done by other concerns for industry is due to the growth of sub-contracting activity and is to be regarded as a welcome feature. It is prevalent in all industrially developed countries and is a recognised part of the modern industrial complex.

(4) With a fall in the unit cost of production, the reduction made in the ex-factory selling price is more significant, that is, Rs. 65.0, as against Rs. 56.7 in the cost.

Data for later years not being available, it is not possible to indicate precisely the extent of further reduction in production cost and prices that might have been achieved by the industry during the last two years. But the fact that export has shown appreciable rise in these two years suggests further gain in the competitive position of the industry, and if this process of steady reduction in cost and consequently in price is continued, sizable increases in export and substantial foreign exchange earnings thereby are a clear possibility in the near future.

Competitive Prices

A comparison of the prices of Indian electric motors with the prevailing prices in other countries would no doubt give us a clearer picture of the competitive position of our industry. But such price data are not readily available. In their absence, however, some idea of the position can be had by comparing the readily available import, export and ex-factory prices of electric motors in India. It is, of course, true that the import price being c.i.f and the export price f.o.b., they are not strictly comparable between themselves or with the ex-factory price. It is also true that prices of electric motors vary according to their capacity and make, and the likely differences in their composition in the export, import or domestic production would vitiate the price comparison. But their relative differences, by and large, can still be meaningful, as we shall see presently.

The relevant price data are as under:

	Average prices Rs.
Ex-factory	486
Export	1,216
Import	1,990

The prices may now be analysed as under:

(1) The price structure appears quite logical. The ex-factory price should be the lowest and it is so.

(2) The higher import price may be explained by the elements of insurance, freight, duties, etc., on the one hand, and by the difference in quality, on the other.

(3) The export price is reasonably below the import price and appears competitive. The difference between the export price and the ex-factory price is not insignificant so that the possibility of a reduction in the former might be explored with a view to boosting export.

As an incentive to export, a drawback of customs duty or Central excise duty paid on materials used in the manufacture of electric motors is allowed by the Government. Besides, there is a 50 per cent reduction in the normal tariff rates for the transport of electric motors from certain producing centres to the ports by goods train for export. Further export promotion measures would be helpful. In so far as the industry is still partly dependent on imported supplies of insulating materials, copper wire and strips and aluminium ingots, it would be necessary to ensure their adequate supplies either by liberalised imports or by augmenting indigenous sources so that the industry's future development is not interrupted at any stage. Quality product is a "must" today. This can be hardly over-emphasised. The specifications laid down by the Indian Standards Institution for electric motors should be scrupulously followed by the manufacturers.

A recent market survey for electric motors in Iran, published in the May issue of the *Journal of Industry and Trade* (pp. 841-42), has concluded that "Indian manufacturers have a good chance to enter the market, if they can offer competitive price and quality." The Engineering Export Promotion Council's trade delegation to West European countries last year has also reported market opportunities for electric motors in those countries. More market surveys and official and non-official visits to the foreign countries, particularly Asian and African, should be undertaken and trade contacts established.

Thus, with a large-scale development programme in hand, and prospects of further increases in domestic production, with a reasonably competitive structure of cost and prices and possibility of further reduction and gain in strength thereby, with the various export promotion measures, and with the quality of product assured, the emergence of electric motors in India's export list of engineering products has come to stay and is sure to move up. And one day (not in the distant future), it seems, it is certain to occupy one of the top positions in the export list of India's engineering goods, provided, of course, efforts are continued in that direction. And why should not the efforts continue when both the industry and the Government are determined to boost exports?

INDIAN OXYGEN'S RESULTS ENCOURAGING

DIVIDEND SAME—RESERVES STRENGTHENED

IT is probably for the first time in its career as the leading producer and supplier of industrial gases and allied equipment in the country that the turnover of the Indian Oxygen Ltd. (Chairman: Mr. N. Dandekar) has crossed the Rs. 10-crore mark to stand at Rs. 10.21 crores for the year ended 30th September 1963, or some 15 per cent higher than the 1961-62 figure of Rs. 8.88 crores. This improvement is, indeed, impressive but has been achieved, it is pertinent to note, not without difficulties. The acute shortage of core wires which had interfered with production during the preceding year persisted almost throughout the year under report and severely curtailed the output of electrodes at the factory at Khardah. Besides this, there were occasional failures of power which interrupted production activity at several of the Company's factories, notably at Asansol and Madras. The supply of cylinders also was insufficient. If despite these handicaps, the turnover expanded it was because of the considerable increase in sales of oxygen and dissolved acetylene and the substantial improvement in sales of gas-user equipment, electric welding equipment and medical products. In consonance with the growth in sale proceeds, the gross profit too has advanced from Rs. 185.34 lakhs to Rs. 200.07 lakhs but the profit-margin (ratio of gross profit to sale proceeds) has actually declined from 20.9 per cent to 19.7 per cent because of the severely curtailed production of electrodes coupled with the general rise in costs resulting partly from the national emergency and partly from the inflationary impact of the last budget.

Apart from the decline in profit-margin, there has been an increase in essential provisions as well, that for depreciation having risen from Rs. 49.84 lakhs to Rs. 59.67 lakhs and for taxation on the year's profit from Rs. 58.17 lakhs to Rs. 69.34 lakhs. Since, however, an extra provision of Rs. 16.50 lakhs had had to be made last year on the issue of bonus shares and for additional tax in respect of prior years, total provision for taxation for the year under report shows a fall of Rs. 5.33 lakhs. The net profit is, therefore, higher at Rs. 71.06 lakhs against Rs. 60.83 lakhs but is still a shade below the level of Rs. 71.30 lakhs achieved in 1960-61 on a turnover which was a third less than that of the year under report. A notable feature of the year's result is that the plough back has been raised from Rs. 17.60 lakhs to Rs. 44.64 lakhs partly because of the higher disposable profit and partly because a substantial portion of the amount brought forward from the previous year has also been credited to reserve.

Working results of the Company for the past four years are presented synoptically in the following comparative table:

(In lakhs of rupees)

	For the year ended 30th September 1963	1962	1961	1960
Sale proceeds	1020.68	887.67	756.58	645.52
Other income	2.57	3.13	1.05	2.29
Materials and stores consumed..	400.31	353.05	299.37	242.11
Staff expenses	191.84	166.42	143.33	127.00
Other expenses	231.03	186.39	163.32	130.35
Gross profit	200.07	185.34	152.61	138.95
Provision for—				
Depreciation	59.67	49.84	44.96	37.11
Taxation	69.34	74.67	36.25	38.86
Net profit	71.06	60.83	71.30	62.98
Refunds and write backs			10.50	4.23
To reserves	44.64	17.60	38.52	33.16
Dividend	43.68	43.68	39.00	30.00
	(12%)	(12%)	(15%)	(15%)
Carry forward	0.35	17.61	18.07	13.78
Market price of ordinary shares (in rupees):	1963	1962	1961	1960
High	31.00	50.12	42.00	45.00
Low	24.44	30.75	34.37	27.87

The development and expansion plans initiated a few years ago were continued during the year. The second 400 cubic metre oxygen plant which was under erection at Bombay, went into commercial production in May. The buildings for the new factory at Hyderabad are in advanced stage of construction. The dissolved acetylene plant there is expected to go into production within next two months and the oxygen plant by July of this year. Construction of the Loxite factory at Ranchi is expected to be completed early in 1964. Production activities were discontinued at the Burnpur Loxite factory in January 1963 and taken up partly in a temporary structure at the Ranchi site and partly at Bermo.

Keeping in view the general upward trend of demand for its products, the Company has drawn up a programme of substantial development and expansion for the four years ending 30th September 1967. Several new projects have been proposed covering additional facilities for production and distribution of gases, production of user equipment and electrodes, and also for manufacture of plants. The schemes include, of course, plans for reorganisation and modernisation of existing factories also.

In the field of industrial gases, the new projects include the installation of an argon purification plant at Bombay (for which an industrial licence has already been received), two 400 M^3 liquid oxygen plants one each at Calcutta and Madras, and many new installations at customers' works in various parts of the country.

An industrial licence has been obtained for the manufacture of welding and cutting equipment at the new factory for which land has been acquired at Taratala Road, Calcutta. Construction work will begin soon and it is hoped that the project will be completed by the end of 1966. In the sphere of electrode production, the Company has been granted an industrial licence for substantial expansion at Khardah factory as also for a new electrode factory at Madras.

The expansion programme are expected to cost the Company about Rs. six crores, spread over four years. It will be recalled that, in his last year's statement, the Chairman had informed the shareholders that the parent Company, the British Oxygen Company Ltd., had agreed, in principle, to make further advance by way of loans up to the total of £500,000. This agreement has now been finalised and it has also received the approval of the Government of India. It is, however, estimated that, after taking into account this loan and the internal resources that will be generated over the period of four years, the Company will still require additional rupee finance of about Rs. two crores for the completion of its expansion programme. The Chairman has informed the shareholders that, subject to the consent of the Controller of Capital Issues, arrangements have been made with the Punjab National Bank Ltd. to provide the Company with this amount by way of medium-term loan secured by the pledge of debentures.

The expansion programmes are expected to capital of the Company during the year which accordingly continues to stand at Rs. 364 lakhs made up entirely of equity shares of Rs. 10 each. This is supported by reserve aggregating Rs. 169 lakhs. Borrowings have also increased from Rs. 227.46 lakhs to Rs. 244.64 lakhs, while current liabilities and provisions have advanced to Rs. 432.98 lakhs from Rs. 375.72 lakhs a year ago. New assets worth Rs. 116.80 lakhs were acquired during the year as a result of which the gross block has gone up to Rs. 906.16 lakhs. On deducting therefrom Rs. 391.56 lakhs as the depreciation earned to date, a net block of Rs. 514.56 lakhs is obtained. Inclusive of Rs. 65.75 lakhs as the cost of capital projects in progress, the total net block stands at Rs. 580.31 lakhs. Current assets, investments and loans and advances all amount to Rs. 633 lakhs.

As regards future prospects, this is what the Chairman has to say:

"From what I have said above it will be evident that I entertain a feeling of confidence and restrained optimism about the future prospects for the Company. We are about to enter upon a period of fairly heavy capital expenditure with full confidence and faith in the future of our country. It is a faith shared by the British Oxygen Company Limited also; in this connection we had the privilege of a visit in November this year by their Vice-Chairman, Lord Reith, who toured India extensively and visited five of your Company's factories in different parts of the country. But while investment of such magnitude as we have in view implies favourable long-term prospects, both as regards profits and growth generally, the short-term prospect must necessarily be viewed somewhat more conservatively, because of the increasing debt and interest load until the new investments become fully productive."

The ten-rupee ordinary shares of the Company are currently quoted at Rs. 26.12 *cum-div.*, at which rate the yield works out to 3.3 per cent per annum net.

ASHOK LEYLAND

PROFIT LOWER—DIVIDEND CUT

IT is really difficult to dispute the fact that the performance of Ashok Leyland Ltd. (Chairman: Dr. A. Ramaswami Mudaliar, Madras) during the year ended 30th September 1963 is disheartening. Although the demand for the Company's products continued greatly to exceed supply, the turnover has come down from Rs. 13.12 crores to Rs. 10.99 crores, or by 16.3 per cent, owing to the disappointingly low output of chassis. If, despite this heavy decline in turnover, the gross profit shows only a moderate deterioration of Rs. 3.76 lakhs to Rs. 114.61 lakhs, it is chiefly because of the substantial rise in closing stocks of vehicles and finished components from Rs. 101.25 lakhs to Rs. 183.29 lakhs. This statement is substantiated by the fact that staff and other expenses have combined to increase from Rs. 126.62 lakhs to Rs. 145.37 lakhs and, though the excise duty paid and the cost of materials, spare parts and stores, etc., consumed have together declined in absolute terms by Rs. 153.69 lakhs to Rs. 928.38 lakhs, their proportion to the turnover has actually risen by more than two points to 84.5 per cent.

In the matter of net profit, again, there is only a marginal reduction from Rs. 55.91 lakhs to Rs. 51.52 lakhs, because, whereas the provision for depreciation has been stepped up slightly from Rs. 40.46 lakhs to Rs. 41.64 lakhs, that for taxation is a shade lower at Rs. 21.45 lakhs against Rs. 22 lakhs for the year before. There is thus little change in the total of essential provisions. But here also the downward movement has been artificially arrested by bringing about a change in the mode of calculating depreciation. From its inception, the Company has been providing depreciation in accordance with the diminishing balance method. To fall in line with modern practice, the Directors have decided that it would be advantageous to change over to the straight line method of depreciation fund allotment with effect from 1st October 1962. Had the Company adhered to the original method of charging depreciation against the gross profit the provision would have been as high as Rs. 52.17 lakhs or Rs. 10.53 lakhs more than the amount provided for now and the net profit in that case would have been correspondingly lower.

After adding to the disclosed net profit for the year Rs. 0.58 lakh brought forward from the previous accounting period, the Directors have set aside Rs. 5.50 lakhs (as against Rs. five lakhs last year) as provision for bonus to staff, and credited Rs. 14 lakhs to the development rebate reserve (against Rs. 16.42 lakhs last year). Transfer to the general reserve, which had received Rs. 5.41 lakhs a year ago, has altogether been suspended. The ordinary dividend has been pruned to seven per cent per annum from eight per cent per annum paid for the previous four years in succession. But since it is payable on a larger number of shares than previously the actual distribution amounts to Rs. 32.07 lakhs against Rs. 29.39 lakhs.

It must, however, be noted that the Company was not the only one whose working results were adversely affected during the preceding year, as this was the general fate suffered by all automobile manufacturers in the country; nor was the setback something of its own creation. As has been pointed out by the Directors in the statement to shareholders, the low output of chassis during the year was the combined result of the following difficulties:

i. Delay in the issue of import licences in October 1962 and curtailment of the Company's foreign exchange allotment caused serious material shortages which led to the loss of 58 working days during the year.

ii. 12 working days were lost during June/July due to the imposition of an 80 per cent power cut, thus bringing the total lost working days to 70.

iii. In some cases during the year, initial supplies of material from indigenous sources, following their deletion from import, proved unsatisfactory; and, until improvements could be effected, production was adversely affected.

The above difficulties notwithstanding, a satisfactory rate of output was achieved by the year-end and, as far as can be foreseen, it will be maintained and increased progressively during the current year.

The fluctuations in the fortunes of the Company during the past four years due to

Transfer to depreciation	1,20	1,39
,, ,, provision for taxation	1,95	3,46
,, ,, ,, super profits tax	72*	Nil
Net profit	72	2,40
Transfer from general reserve	23	Nil
Excess provisions and receipts relating to previous years	1	14
Appropriations:		
Transfer to development rebate reserve	9	8
,, plant replacement reserve	Nil	1,00
Proposed dividends (taxable): preference	28	28
,, ,, ordinary	75	1,20
	(5%)	(8%)
Carry forward	†	17

Market value of ordinary shares (in rupees):	1963	1962	1961
High	9.54	10.00	10.00
Low	8.98	9.44	9.90

* Includes Rs. 67,700 for super profits tax for the previous year.
† Only Rs. 64.

Extracts from the Directors' report: The increase in the cost of electricity and the compulsory insurance against Emergency risk added further burdens to the already rising manufacturing cost. While these influences have resulted in a reduction in the profitability of the Company's operations, it would still have been possible to pay a reasonable dividend on the equity shares but for the fact that the Company has to meet a substantial liability for Super Profits Tax in respect of the operations of an earlier year. In view of that, the Directors feel justified in drawing on the reserves to a small extent in order to make the dividend on the equity shares up to 5 per cent.

The building for the expansion of the Mill by 6,000 spindles is completed. The preparatory machinery has been despatched by the manufacturers and some of it is ready at the site. The delivery of the ring frames, however, is not expected to commence until January 1964 and, therefore, the additional capacity may not be commissioned until about the middle of 1964.

Accounts in brief as at 30th June 1963 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	19,55,120	Gross block	30,08,930
Reserves and surplus	3,90,827	—Depreciation	21,36,341
Other liabilities	15,76,887		
		Net block	8,72,589
		Block-in-progress	2,81,316
		Current assets	25,99,210
		Investments	54,657
		Cash	1,21,062
	Rs. 39,28,834		Rs. 39,28,834

* Paid-up capital consists of 4,306—5 per cent. tax-free cumulative preference shares of Rs. 100 each and 1,50,000 ordinary shares of Rs. 10 each. Amount paid up on shares forfeited is Rs. 24,520.

Champarun Sugar Co., Ltd.

(*Secretaries and Treasurers*: The British India Corporation Ltd., Kanpur.)

Fifty-eighth Annual General Meeting—Held on 30th December 1963.

Extracts from the Directors' report for the year ended 30th June 1963:

Sales of sugar and molasses amounted to Rs. 2.29 crores against Rs. 2.44 crores in the previous year. The results for the year including items relating to previous year and provisions no longer required show a surplus of Rs. 3,67,461. After deducting depreciation amounting to Rs. 2,12,301 (Rs. 2,27,043 for 1962) and development rebate reserve of Rs. 98,711 (Rs. 27,820 for 1962) there is left a credit balance of Rs. 56,449. This amount is adjusted against the debit balance brought forward from the previous year of Rs. 9,07,232, thus leaving a loss of Rs. 8,50,783 to be carried forward.

On account of unfavourable conditions the working results of the Company have not been very satisfactory and only a marginal profit has been made in respect of the year under review. The crushing season had been unusually short being of 103 days duration (192 days previous year) at Barrah factory and 90 days as against 201 at Chanpatia factory. This was directly attributable to shrinkage of cane acreage and consequent short supply of sugarcane for crushing. The trading results have further been adversely affected owing to frequent mechanical breakdowns at Barrah factory, which is capable of producing good quality sugar.

Operations: The comparative figures of the last two seasons for cane crushed and extractions obtained, are as under:—

	Barrah Factory		Chanpatia Factory	
	1962-63	1961-62	1962-63	1961-62
Cane crushed (qtls.)	7,28,634	13,97,500	6,23,071	14,58,129
Recovery (%)	9 48	8.66	10 35	9.08

In order to tide over the mechanical shortcomings and to achieve more efficiency, steps have already been taken to implement, as referred to in the last report, within the Company's financial limitations, the first phase of the rehabilitation programme recommended by the Company's Technical Adviser, Mr. Gundu Rao, who has since joined the Organisation. The working is, therefore, expected to be better in the present season, provided adequate cane supply is forthcoming.

Raw Sugar: As stated in the last Directors' Report, Chanpatia factory was to be fully engaged in the manufacture of raw sugar and the entire quantity was to be exported on behalf of the factory. The export agency division of the Indian Sugar Mills Association, however, accepted a quantity of 2,500 tonnes of sugar to be supplied by the Chanpatia factory and suggested that the rest might be offered on behalf of other associate sister factories. Accordingly, the remaining quantity of sugar was supplied either on behalf of Barrah factory of this Company or against the export quotas of Marhowrah and Gauri factories of Cawnpore Sugar Works, Limited.

Cane Prices: The Government of India, in pursuance of their policy of linking cane prices for season 1963-64 to the recovery obtained in the last season have, by a notification dated 21st October, 1963, prescribed the cane prices to be paid by the sugar factories. The cane prices per maund for the Company's factories are:—

	1963-64	1962-63
Barrah	Rs. 1.75	Rs. 1.53
Chanpatia	Rs. 1.83	Rs. 1.57

The corresponding increase in sugar prices announced by the Government of India is highly unremunerative. The factories in East U.P. and North Bihar are very much perturbed and agitated over this issue and are pressing for the fixation of prices in a more realistic manner.

Accounts in brief as at 30th June 1963 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	18,00,000	Gross block	03,21,057
Reserves†	47 01,301	—Depreciation	63,53,290
Other liabilities	72,83,614		
		Net block	29,67,771
		Block-in-progress	3,142
		Current assets	1,07,66,804
		Investments	30,000
		Cash	1,00,598
	Rs. 1,38,74,915		Rs. 1,38,74,915

* Paid-up capital consists of 1,80,000 ordinary shares of Rs. 10 each.
† Reserves shown after deducting the debit balance of Rs. 8,50,783 in the profit and loss account.

Kelvin Jute Co., Ltd.

(*Managing Agents*: Messrs. McLeod & Co., Ltd., Calcutta.)

Annual General Meeting—31st January 1964.

Market value of ordinary shares (in rupees):	1963	1962	1961
High	204.00	213.00	177.00
Low	165.00	173.00	130.00

Extracts from the Directors' report: During the year, the hours of work remained constant but the number of looms in operation varied with the purchase of loom hours by the Company and the reduction in the sealed loomage by the Indian Jute Mills Association from 9 per cent to 5 per cent on 2nd July, 1962. As from the 23rd December, 1962, the sealing of looms was discontinued. Over the year under review the loomage was increased at various dates from 376 to 457 in double shift which resulted in working an additional average of 188 looms on a single shift basis, over and above, the registered complement of 703 looms giving an all time record production for the Company. Due to power cuts, working hours had repeatedly to be adjusted but despite this only 1,018 loom hours were lost due to sudden load-shedding. Workers wages, however, were not affected.

Modernisation of the preparing/spinning and weaving sections continued throughout the year. The Company has taken a lease of premises from the Waverley Jute Mills Co. Ltd., thereby increasing the loomage from 48 to 155 for the manufacture of *Jute Carpet Backing* during the period under review. This loomage worked in trible shift 7 days per week and at the date of this report 160 looms have been working. Initially the yarn supply for these looms was made from the Main Mill at Kelvin Jute Mills but subsequently *Batching, Preparing, Spinning* and other ancillary machinery has been installed and now the *Carpet Backing Section* is independent for yarn supplies. The cost of installing the machinery and looms in the broad loom section was met partly from the Company's own resources and also by arranging additional overdrafts from the State Bank of India.

Another bumper crop led to an abundant supply of raw jute and in order to support the raw jute market the Company's Mill continued to make purchases on buffer stock account and also statutory quotas issued by the Jute Commissioner. The Company was thus obliged to hold very large stocks resulting in considerable financial strain.

Trading conditions were favourable throughout the year with the general price level for goods, particularly *Hessian*, well able to absorb the operational minimum price for raw material. Foreign demand has since slackened and the outlook for the current year, however, is not expected to be so satisfactory as a result of lower prices for goods and increases in workers wages by implementing the recommendations of the Jute Wage Board.

Relations with labour remained cordial throughout the year. The Apprentices Act, 1961 has been implemented and amendments to the Maternity Benefit Act and the Provident Fund Act have given more beneficial conditions to certain employees.

Accounts in brief as at 31st May 1963 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	38,00,000	Gross block	2,51,06,312
Reserves and surplus	73,56,736	—Depreciation	1,23,43,904
Other liabilities	2,18,16,884		
		Net block	1,27,62,408
		Current assets	1,86,15,298
		Investments	8,00,050
		Cash	6,75,054
	Rs. 3,29,73,620		Rs. 3,29,73,620

* Paid-up capital consists of 10,000—7 per cent. cumulative preference shares of Rs. 100 each and 28,000 ordinary shares of Rs. 100 each. Of the above shares 14,000 ordinary shares are allotted as fully paid up by way of bonus shares of which 7,000 ordinary shares are issued by capitalisation of reserves and 7,000 ordinary shares from share premium account.

Balrampur Sugar Co., Ltd.

(*Registered Office*: Calcutta.)

Thirty-first Annual General Meeting—Held on 21st December 1963.

Working Results:

	For the year ended 30th June (In thousand rupees)	
	1963	1962
Sales—sugar and molasses	1,18,81	1,10,82
Stock-in-trade	8,27	56,56
Gross profit (+) or loss (—)	—1,69*	+2,81
Transfer to depreciation	1,70	1,76

	(Nil)	(1%)
Carry forward credit or debit	—1,53†	16

* Loss after providing for depreciation. Loss carried forward after taking into account provision for taxation for earlier years.

Extracts from the Directors' report: The duration of season during the year under review was the shortest during the last eight years with 73 days as against 145 days in the previous year. This was due to shortage of cane availability which was 5,42,410 quintals only as compared to 11,00,436 quintals during last year. The reasons attributed to this are mainly due to curtailment in the cane area by the cane growers and diversion of cane to *gur*. The recovery was, however, 9.99 as against 9.71 per cent in the preceding season.

The scarcity of cane was not only confined to the Company's Factory but during the current year there had been a very steep fall in the availability of cane throughout India. Total cane crushed in the country was 2,16,00,000 tonnes as against 2,79,36,700 tonnes in the preceding season and consequently the sugar production fell from 27,30,419 tonnes (1961-62) to 21,50,000 tonnes (1962-63).

On account of low production of sugar, the Government imposed control on the 17th April, 1963 over the sale and distribution of sugar. The controlled price as fixed by the Government is much lower than the cost of production which has gone up on account of low crushing due to short-availability of cane and higher cost of stores and other charges. This is reflected in the accounts presented for the year.

This year the Company's factory produced 39,608 quintals of raw sugar which was exported through the Indian Sugar Mills Association (Export Agency Division).

The future for the coming season does not seem to be bright as far as the availability of cane is concerned. Although the Government have increased the sugarcane prices by 0.18 nP per maund over last year's prices, *khandsari* and *gur* prices have gone up and there being no restriction over its production and/or price, manufacturers of these commodities offer much higher prices to cane growers and consequently supplies to sugar factories suffer.

Accounts in brief as at 30th June 1963 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	14,00,000	Gross block	30,01,002
Reserves*	0,32,007	—Depreciation	23,99,157
Other liabilities	19,83,303		
		Net block	15 05,535
		Block in progress	1,63,006
		Current assets	25,37,046
		Investments	15,000
		Cash	21,121
	Rs. 43,15,310		Rs. 43,15,310

* Paid-up capital consists of 5,60,000 fully shares of Rs. 2.50 each fully paid up in cash.

Notice

RALLIS INDIA LIMITED

NOTICE OF CLOSURE OF TRANSFER BOOKS

NOTICE IS HEREBY GIVEN THAT THE Transfer Books of the Company will be closed from 7th February 1964 to 24th February, 1964, both days inclusive.

By Order of the Board,
KENNETH SHEPPARD,
Secretary.

16, HARE STREET,
CALCUTTA,
30*th December* 1963.

NEWS IN BRIEF

THE Board of Trade is scheduled to meet at Calcutta on the first of next month. The implementation of the various export promotion schemes will come up for review at the meeting.

The final report of the Wage Board for Tea Plantation Workers is expected to be released within the next two months, according to Mr. G. Ramanujam, Vice-president of the I.N.T.U.C.

A Rs. one-crore factory for the manufacture of baby tractors is proposed to be set up by the Omsum Engineering Company of Bangalore in collaboration with a Japanese firm. It will be located at Malur and produce 3,000 units of Fuji hand tractors a year.

The production capacity of the State-owned superphosphate factory at Sindri is expected to be raised from 25,000 tons to 50,000 tons during the third Plan period. Similarly, the capacity of the high-tension insulator factory at Ranchi will be stepped up from 2,400 tons to 4,800 tons.

Following the removal of price control on staple fibre and the withdrawal of the voluntary price control scheme in respect of viscose yarn, the Union Government has directed the Tariff Commission not to continue its inquiry into the quest on of fixing fair prices for man-made fibres and yarns.

An Indian trade centre, the first foreign institution of its kind in Nigeria, has been opened at Lagos. The centre, besides acting as an information centre, will also provide trade and industrial intelligence on India to Nigerians and transmit to India data on current Nigerian economical trends. It will mount every three months a different display to illustrate aspects of Indian industrialisation.

Exports of specified grades of cardamoms are allowed to all permissible destination up to the end of August next and licences will be given freely but subject to ceilings and floor prices. Exports of cardamoms in all forms other than specified grades will also be allowed freely to all permissible destinations against shipping documents. And as a measure of promoting exports of cardamoms, it has been decided to waive the licence fee.

A study team with Mr. I. N. Bongirwar, Maharashtra's Registrar of Co-operative Societies, as Chairman, has been constituted by the Union Ministry of Community Development and Co-operation to examine the working of general insurance co-operative societies and to recommend the future line of their development. The team has been asked to indicate promotional steps and future programmes for the organisation and working of co-operatives in the general insurance sector. It is likely to submit its report in about three months time.

The Agricultural Production Board has directed its Committee of Secretaries to examine the question of stabilising the price structure of agricultural commodities. The Committee has been asked to submit its report at the next meeting of the Board on 19th February next. The Committee consists of the Secretaries to the Union Ministries of Food, Agriculture, Community Development, Economic Affairs and of the Planning Commission. Meanwhile, the Board has decided to continue Central financial assistance for intensive cultivation of cotton and oilseeds and to extend it to include wheat and rice also.

The Governments of India and Afghanistan signed at New Delhi on Tuesday this week an arrangement involving an annual trade of around Rs. 10-11 crores. Under the arrangement, India will supply traditional goods such as textiles, tea, spices, engineering goods, electrical equipment and apparatus, and hardware in exchange for dry and fresh fruits, asafoetida, cumin seeds, medicinal herbs, etc. Payments in respect of cotton and wool exported by Afghanistan and those in respect of a specified list of non-traditional goods exported by India will be paid in free foreign exchange. Although the arrangement is for one year, it will automatically be extended for the second and third years.

The members of the Kuwait oil delegation held the final round of talks with Mr. P. A. Gopalkrishnan, Chairman of the Indian Oil Company Ltd., at Bombay last week. In New Delhi, the delegation met the Union Minister for Petroleum and Chemicals, Prof. Humayun Kabir, and Minister of State, Mr. O. V. Alagesan. The delegation told Mr. Gopalkrishnan that the Kuwait National Petroleum Company had decided to set up a refinery with Governmental assistance from Kuwait. The Kuwait Government holds 60 per cent shares in the Kuwait National Petroleum Company, while the remaining 40 per cent has been subscribed by the public. The Kuwait refinery is scheduled to go on stream sometime in the middle of 1966. Among the subjects discussed with the Chairman of the I.O.C. were the possibilities of importing middle distillates produced by the refinery into India to be marketed by the Indian Oil Company. They also revealed that an economist would soon arrive in India to collect information about matters pertaining to oil industry in India, including the pattern of demand and facilities available at the major ports for importing refined products into India.

From Abroad

Britain's exports and imports both touched during the year 1963 new peaks of £4,229 million and £4,825 million, respectively.

Sweden's State budget for the fiscal year 1964-65 shows a formal operating surplus of Kr. 80 million. Total revenues are estimated at Kr. 22,050 million and expenditure at Kr. 21,970 million.

Under a trade protocol signed between the Governments of Soviet Union and Guinea, Russia will supply motor cars, refrigerators, oil products and sewing machines to Guinea in exchange for coffee and fruits.

Nigeria has formally asked the European Economic Community for negotiations on an association agreement with the Common Market. Nigeria's main aim is to secure access to the European market for its exports of cocoa, palm oil and palm kernels and groundnuts.

The U.S. Department of Commerce has authorised the sale of $7.5 million worth of rice to Russia, the first substantial quantity of this grain involved in the current deals between the two countries. The authorisation also covers $15.5 million worth of wheat, bringing the total proposed wheat sale to $286 million.

The Government of Yugoslavia has decided to abolish all customs duties on coffee, tea and some other agricultural products imported from tropical countries. The decision is in line with the Government's policy (as a temporary member of the G.A.T.T.) of removing duties on agricultural products of developing countries.

China will export to Cuba rice, soya beans, edible oils, canned meat, cotton, fabrics, paper, rolled steel, machinery, chemical products, medicines and other goods and import in return raw sugar, nickel ingots, tobacco and copper concentrates. A trade protocol to this effect covering the year 1964 has been signed between the Governments of the two countries.

Tea prices in West Germany are about to drop by 2.35 to 3 DM per kilo, following the Government decree abolishing customs duty for unpacked tea and reducing the levy to 5 per cent for packages below three kilos. West Germany consumes 8.5 million kilos of tea each year, nearly 90 per cent of which comes from India and Ceylon.

A new home is being built every minute of the year in West Germany. Last year, 525,000 dwellings were completed, the rate of construction being maintained steadily during the last 15 years. From 1949 up to the end of 1963, 7.30 million new homes were built. They represent more than 40 per cent of the present total of 17 million housing units in the country, including West Berlin.

PERSONAL

MR. Justice Nittor Srinivasa Rau, retired Chief Justice of the Mysore High Court, has been appointed Chairman of the Central Vigilance Commission.

Mr. J. M. A. H. Luns, Minister for Foreign Affairs of the Netherlands, has been elected Chairman of the Council of the O.E.C.D. at Ministerial level for 1964.

Dr. N. Das, till recently Director-General of the Employers' Federation of India at Bombay, has been appointed Adviser-*cum*-Vice-President of the Hindustan Motors Ltd. He will take up his new assignment on 1st March next.

Mr. M. S. Ram, a former Director of India Supply Mission at Washington and currently attached to the Union Ministry of Irrigation and Power, has been appointed General Manager of Trombay fertiliser project, under the Fertiliser Corporation of India.

Mr. J. O. Hitchcock, Managing Director of the International Nickel Company (Mond) Ltd., London, will be visiting India in the first half of February to acquaint himself with the latest developments in the iron and steel industry, as well as with the projects on special steels. Mr. Hitchcock will be arriving in Bombay on 2nd February next.

Mr. A. N. Banerji, former Iron and Steel Controller, has taken over charge as the General Manager of the Rourkela steel plant *vice* Mr. S. T. Raja who has been appointed Chairman of the National Coal Development Corporation. Mr. Raja succeeds Mr. R. C. Dutt who will take over as the Additional Secretary, Company Law Administration, in the Union Finance Ministry.

enjoy unique JAL service on your next flight to LONDON and other gay cities of Europe

Leave Calcutta Sunday or Thursday evening (2220 hours) aboard a luxurious JAL DC-8 Jet. (Also by connection at Karachi.) Arrive in Rome for breakfast; London for lunch. Visit Cairo and Frankfurt along the way. Or, fly JAL's morning service east through Bangkok and Hong Kong to Tokyo, where JAL's trans-Pacific jets leave daily for the U.S.A. Either way, JAL's wonderful hospitality will make your flight truly enjoyable.

MONEY TIGHTER

(From Our Own Correspondent)

BOMBAY, 22*nd January*

Tighter conditions prevailed in the short-term money market during the week under review. There was persistently high demand for credit—a common feature at this time of the busy season—while the supply of funds actually available was less. Indeed, borrowers found it difficult to obtain their requirements in full. Some banks had to approach the Reserve Bank for temporary accommodation. Consequently, the inter-bank call rate moved up to a high level of 5¼ per cent for both fresh money and renewals, as against 5 per cent a week before. Even at this rate lenders were scarce. Some are said to have paid no less than 5¾ per cent. Similar was the position at Calcutta, the call rate jumping up from 5-5¼ per cent to 5¾ per cent with borrowers over.

The rate of interest for short-term deposits remained unchanged at the ceilings prescribed under the inter-bank agreement. For purposes of ready reference, the ceilings are quoted below:

(*a*) Category I (banks with deposits above Rs. 50 crores and exchange banks) 3 to 30 days (inclusive) 3 per cent, 31 to 60 days (inclusive) 3½ per cent, 61 to 90 days (inclusive) 3½ per cent, 91 days and over but less than 12 months 3¾ per cent, 12 months 4 per cent.

(*b*) Category II (banks with deposits of more than Rs. 10 crores but upto and including Rs. 50 crores) ¼ per cent higher than the rates for Category I.

(*c*) Category III (banks with deposits of more than Rs. 10 crores but upto and including Rs. 25 crores) ¼ per cent higher than the rates for Category I.

In view of the stringency in the money market, the response to the 91-day Government of India Treasury Bills, tenders for which opened on Tuesday the 21st inst., continued to be poor. The total amount offered was just equivalent to that invited and also accepted, namely, Rs. 2 crores. The average rate of accepted tenders was slightly higher at Rs. 2.325 per cent per annum, as against Rs. 2.315 per cent. The response to the Intermediate Treasury Bills was also poor, the Bills actually sold from the 15th to 18th inst. being no more than Rs. 43 lakhs, as against Rs. 15 lakhs a week before.

India's foreign assets improved by a further Rs. 2.95 crores to Rs. 109.70 crores during the week ended 17th January, the entire improvement having been accounted for by balances held abroad which stood at Rs. 12.24 crores. There was no change in the foreign securities (Rs. 97.46 crores) held in the Issue Department of the Reserve Bank. Deposits of scheduled banks with the Reserve Bank rose by Rs. 4.02 crores to Rs. 82.74 crores. Loans and advances to scheduled banks, too, increased by Rs. 96.45 lakhs to Rs. 32.23 crores. Notes in circulation showed an increase of only Rs. 2.38 crores to Rs. 2,414.87 crores.

There was a further rise of Rs. 19.31 crores to Rs. 1,639.52 crores in the total credit made available by scheduled banks to their clients during the week ended 10th January. Since, at the same time, deposits declined by Rs. 2.04 crores to Rs. 2,406.91 crores, borrowings from the Reserve Bank went up by Rs. 11.20 crores to Rs. 31.35 crores. Of this total, those against usance bills accounted for Rs. 14.17 crores, an increase of Rs. 2.44 crores. Investments showed a rise of Rs. 9.18 crores to Rs. 696.78 crores.

The sale of 4½ per cent 1973 Central loan has been suspended by the Reserve Bank with effect from the 15th inst. The suspension is apparently because of the proximity of the half-yearly interest which falls due today (22nd January). The Bank was offering this loan before at Rs. 100. Despite the suspension of its sale, the loan was available at Rs. 100. The gilt-edged market dull, with poor institutional support. Turnover was limited.

In the foreign exchange market, the banks' selling rate for U.S. dollars advanced by 25 nP to Rs. 478.50 per $100, while their buying rate was unchanged at Rs. 475. In New York, the pound sterling eased a little *vis-a-vis* the dollar, the spot rate declining by 0.040 cent to 279.820-279.850 cents and the three months' forward by 0.060 cent to 279.610-279.640 cents.

SILVER SPURTS AGAIN

(From Our Own Correspondent)

BOMBAY, 22*nd January*

Ready silver touched a fresh peak of Rs. 258 per kilogram on Friday the 17th inst., a rise of Rs. 4 in just two days; the closing rate on Wednesday last week was Rs. 254. Although the metal stood a shade lower at Rs. 275.50 today, the undertone was distinctly firm. Buying support was well sustained, thanks to bullish advices from Madhya Pradesh, Gujarat and Rajasthan sides. With low level of floating stocks—estimated at a mere 400 bars—and with prospects of high demand during the ensuing marriage season, it was feared that an acute scarcity of supplies would be felt. Some parties were reported to have attempted to corner whatever stocks they could get. The daily average offtake was about 30 bars, whereas actual arrivals were no more than 15 bars.

In sympathy with silver and following continued demand from ornament manufacturers, 14-carat gold also moved up from Rs. 63 to Rs. 65.25 per 10 grams. In the wake of reduced contraband supplies, pure gold advanced by Rs. 2 to Rs. 111.50. Sovereign was fully maintained at Rs. 85.

The world price of gold in the London market picked up ¼ cents to $35.08¾ per fine ounce. Ready gold spurted by 1¼d. to 250s. 9¼d. Ready and forward silver, however, were firm, the former at 111¾*d.* and the latter at 111¼*d.* Silver in New York was also firm at 129.3 cents.

The following table shows the trend of prices during the week under review:

	22-1-1964 (closing)	High	Low	15-1-1964 (closing)
	Rs.	Rs.	Rs.	Rs.
SILVER Ready (996 fine) ..	257.50	258.00	256.00	254.00
GOLD Ready (14 carat) ..	65 25	65.25	63.75	63.00
Sovereign	85.00*	—	—	85.00*
London—				
Gold ..	250s. 9¼d.	250s. 9¼d.	250s. 8¼d.	250s. 8*d.*
Silver Ready ..	111¼*d.*	—	—	111¾*d.*
Silver Forward ..	111¼*d.*	—	—	111¾*d.*
New York—				
Silver	129.3 cents	—	—	129.3 cents

* As on 24-6-1963.

N.B.—The quotation for gold is per 10 grams (about 0.35 tola) and that for silver is per kilogram (35.73 tolas). London and New York quotations are per ounce.

COTTON FUTURES FORGE AHEAD

(From Our Own Correspondent)

BOMBAY, 22*nd January*

Cotton futures, which started the week on an easy note induced by profit-taking and fresh selling on fears of compulsory requisitioning in Gujarat, firmed up in subsequent sessions. The firmness was engendered by speculative support following adverse weather conditions in Gujarat and Punjab and the possibility of damage to the crop. The report that the Gujarat Government was opposed to the move for compulsory requisitioning of cotton and the sealing of certain cotton areas in the State in order to arrest the spiralling trend of prices, especially of Digvijay varieties, bullishly affected the markets. Rumours that the announcement of a second export quota for Bengal *Deshi* was imminent also affected sentiment. Large-scale speculative buying and spot house support induced by these considerations led to a rally in futures. The Jarilla March 1964 contract forged ahead from the week's opening of Rs. 737 (per three quintals) to touch a peak of Rs. 751.75 today, the highest level reached so far and Rs. 12.25 above the last week's closing of Rs. 739.50, before winding up the session fractionally lower. The *May* contract firmed up in sympathy from Rs. 726.25 on the 16th inst. to Rs. 734.50 today.

The trend of the cotton futures prices during the week is indicated below:

(In rupees per three quintals)

	15-1-64	*High*	*Low*	22-1-64
Jarilla March ...	739.50	749.50	737	750.50
Jarilla May ...	727.50	733.25	726	734.50

In the spot market at Sewri, trading continued to be characterised by restricted mill demands, thanks to the prevailing high prices. Most mills were inclined to defer purchases, pending a fall in prices. Needy mills, however, picked up moderate quantities of popular varieties such as CO2, L.147, Digvijay 197/3 and Kalyan. The Gujarat Government is reported to have been advised by the Centre to keep a watch over the upward trend in prices of Gujarat cotton. The latter is said to be concerned over the persistent tendency of prices of Gujarat cotton, especially the Digvijay variety, to harden and is understood to have suggested that, if prices do not come down to a reasonable level, compulsory requisitioning should be resorted to. The Gujarat Government, it is said, has denied that prices have risen unduly or that there is hoarding of stocks. The firmness of cotton prices currently witnessed in the State is attributed to keen mill demand on apprehension that there would be shortage of long staple cotton on account of delay in getting P.L.480 cotton from the U.S.

Talks of the possibility of another export quota for Bengal *Deshi* activised the export section. There were renewed inquiries for Bengal *Deshi*, the prices of which tended to harden as a consequence. Meanwhile, export sales registered against the last quota for 200,000 bales of Bengal *Deshi* aggregated 154,000 bales as on 20th January 1964. Moderate mill demand for foreign cotton was reported. Higher grade Sudan, Egyptian and U.S. cotton attracted the attention of mills. Only a limited volume of actual business was, however, put through.

The following are the ruling prices—in rupees per candy of 784 lbs.—from the spot market at Sewri:

Wagad 885; Kalyan 940, CO2 1,340; L.147 1,200; Gadag Laxmi 960; Sudan G5S 1,430; Pima 1,735.

ART SILK YARNS DEPRESSED

(From Our Own Correspondent)

BOMBAY, 22*nd January*

The yarn market continued to rule subdued owing to slackness in demand. Art silk yarns were depressed on account of poor offtake by mills, while supplies were reported to be plentiful. Prices, as a result, fell further. Even at lower levels, traders were hesitant to lend support. Staple fibre yarns were dull in the absence of any encouraging development. Cotton yarns elicited only selective demand. The finer counts tended to move up on reports that there was paucity of supplies.

In the art silk yarn section, Bright South India Viscose 120D fell by 22 nP to Rs. 14.30 and Bright Century 100D by 25 nP to Rs. 13.75. Bright National Rayon 150D was dull at Rs. 10.89. While *National Rayon* 120D, however, gained 2 nP to Rs. 11.57.

Among staple fibre yarns, spot Kohinoor (40×2) dropped 64 nP to Rs. 9.68. City was neglected at Rs. 9.61. But Century met with special support and moved up from Rs. 9.90 to Rs. 9.99 today.

In the cotton yarn section, ten counts Navsari, 32s Madura and 40s City were dull, with rates maintained at last week's level. The exception was 40s City which put on 25 nP to Rs. 37 and 80s Mahindra which gathered 25 nP to Rs. 92.50.

The following table gives the prices of rayon staple fibre and cotton yarns, today, as compared with those prevailing a week ago:

	22-1-1964	15-1-1964
	Rs.	Rs.
Art silk yarn (per kg.)—		
National Rayon 120D	11.57	11.57
Century 75D	18.21	18.39
S. I. Viscose 150D	12.91	12.91
Staple fibre yarn (40 × 2)—		
Kohinoor (per kg.)	9.68	10.32
Century	1.99	9.90
Cotton yarn (per bundle of 10 lbs.)—		
10s Navsari	19.50	19.50
20s Parkash	23.62	23.62
32s Madura	32.50	32.50
40s City	36.75	37.00
60s Finlay	—	—
80s Mahindra	92.50	92.00

OILSEEDS ADVANCE

(From Our Own Correspondent)

BOMBAY, 22*nd January*

A distinctly firm trend was in evidence in the oilseeds market during the week under review. Groundnut futures staged an impressive rally, following excellent advices from upcountry markets and increase in spot prices which induced large-scale short-covering. Small arrivals, too, imparted strength. Castorseeds also met with good buying support induced by reports that the recent cold spell had affected the standing crop in the North Gujarat area. In sympathy, linseeds and cottonseeds tended to move up.

The groundnut *January* contract shot up from Rs. 226.87 to Rs. 230.50. Some operators who had commitments in this contract were said to be busy shifting their interest in the distant (April) contract which, as a consequence, rose by Re. 1.75 to Rs. 231.75. Nizam bold ready spurted by Re. 1.12 to Rs. 46.87 and Khandesh quality by Re. 1.37 to Rs. 47.62. Groundnut oil ex-mill hardened by 50 nP to Rs. 18.40 and railway receipts by 45nP to Rs. 18.20. The reported cancellation of an order for exports of 6,000 tons of groundnut oil to the U.K. did not have much effect.

In the castorseeds section, March contract advanced from Rs. 165.25 to Rs. 167.62 and June position from Rs. 168.25 to Rs. 169.50. Ready Madras gathered 50 nP to Rs. 33.25. Kanpur picked up 63 nP to Rs. 32.25. B.S.S. rose by 30 nP to Rs. 14.70 *and commercial by 20 nP to Rs. 13.90.*

Linseed March contract increased from Rs. 37.06 to Rs. 37.19 before finishing at Rs. 36.94. June contract gained 7 nP to Rs. 37.94. Bold ready strengthened by 38 nP to Rs. 38. Oil, however, softened a little to Rs. 15.60.

Cottonseed April contract was bid at Rs. 100, as against Rs. 99.

The following table shows the closing prices of oilseeds and oils on Wednesday 22nd January as compared with those of two previous weeks:

	22-1-1964	15-1-1964	8-1-1964
	Rs.	Rs.	Rs.
Groundnuts			
January 1964 contract	230 50	226 87	223 00
April 1964 contract	231 75	230 00	229 50
Nizam bold	46 87	45 75	45 75
Khandesh quality	47 62	46 25	46 25
Oil ex-mill	18 40	17 90	18 00
Oil Rly. Receipts	18 20	17 75	17 85
Castorseed			
March 1964 contract	167 62	165 25	165 50
June 1964 contract	169 50	168 25	168 00
Ready Madras	33 25	32 75	32 62
Ready Kanpur	32 25	31 62	31 62
Oil B.S.S.	14 70	14 40	14 40
Oil commercial	13.90	13.70	13.70
Linseed			
March 1964 contract	38 94	37 06	37 12
June 1964 contract	37 94	37 87	37 94
Bold ready	38 00	37 62	37 62
Linseed oil	15.60	15.70	15.40
Cottonseed			
January 1964 contract	98 00	—	—
April 1964 contract	100.00	99.00	100.00

N.B.—All quotations for futures contracts are per 250 kilograms except linseeds for which rates are per 50 kilograms. Spot quotations of seeds are per 50 kilograms and oil per 10 kilograms.

MEDIUM TEAS FIRM

(Messrs. Forbes, Ewart and Figgis Private Ltd.)

COCHIN, 16*th January*

Offerings in tea sale No. 2 held here on the 14th inst. amounted to 699,000 kgs. Quality from the Nilgiri district showed a further seasonal improvement, while medium categories were generally brighter. The market met with good demand. There was useful inquiry for low mediums which were sold at firm rates. Mediums, particularly the brighter types, were well competed for and registered advances up to 15 nP. Good mediums were also well supported and sold around last rates. Highgrowns, meeting better support, were sold at dearer rates where quality showed improvement. There was better support for fannings than brokens. Clean black leaf descriptions, particularly fannings, were a strong feature. Unorthodox descriptions evoked irregular support. C.T.C. brokens were easier, but fannings were firm. *Orange pekoes were fully firm, while flowery* pekoes came to a lower market.

The quotations (per kg.) were as follows:

	1964	1963
	Rs.	Rs.
Low mediums	4.35-4.65	4.15-4.75
Mediums	4.70-4.95	4.75-5.10
Good mediums	5.00-5.70	5.20-5.80
Nilgiri B.O.P.	5.00-8.90	5.60-8.30

The average price realised in sale No. 2 was Rs. 4.67 per kg., as against Rs. 4.56 a week ago and Rs. 4.89 in the corresponding sale last year.

A total of 303,000 kgs. was offered in dust sale No. 2 held today. There was strong general demand. Highgrowns were sold well at enhanced rates. Medium dusts of all descriptions were generally firm to dearer. Clean black grainy descriptions were the strongest feature of the sale and some good prices were paid. Unorthodox dusts generally followed the dearer trend of the market.

The average price realised in dust sale No. 2 was Rs. 4.50 per kilo, as against Rs. 4.42 a week ago and Rs. 4.18 in the corresponding sale last year.

Colombo: There was again no sale this week on account of the general strike which has now been resolved, and the sale will be held next week.

London: North Indian and other growths: In Monday's auction, there was somewhat less demand, with C.T.C's registering declines in price, while Dooars were slightly easier. Orthodox descriptions were about steady.

Ceylon and South Indians: In Tuesday's sale, 24,468 packages were offered, of which 7,710 packages were from South India. There was strong general demand for both Ceylon and South Indian teas. Prices were generally dearer for most descriptions.

As we go to press, Messrs. Forbes, Ewart and Figgis Private Ltd. wire as follows:

"*Sale No.* 3: 492,000 kgs. offered. Strong general demand. Low mediums fully firm. Mediums and good mediums strong and dearer. Highgrowns dearer. Unorthodox fully firm."

RICE ARRIVALS POOR

(From Our Own Correspondent)

HAPUR, 20*th January*

Wheat was quietly subdued and the rising tendency seemed to have halted, thanks to the measures taken by the Government, including large-scale sales of wheat through fair-price shops and wheat flour freely. But some coarse grains, including gram and maize turned steadier on good buying support in the face of dwindling stocks. Apart from draught conditions in East U.P. and scanty winter rains in West U.P., heavy frost all over Northern India during the week was reported to have adversely affected the standing *rabi* crops.

Wheat at Hapur was quoted around the previous week's level of Rs. 54.50 to Rs. 56 per quintal for average quality and Rs. 58 to Rs. 60 for better farm produce. Local stocks had fast declined, but wheat flour was being sold freely. Arrivals out of the stocks retained by cultivators were reaching the market albeit in small quantities.

Rice also maintained the last week's level, as arrivals were meagre and local stocks, too, were not sound. Rice *basmati* was quoted towards the week-end at Rs. 94 to Rs. 96.45, *sela* at Rs. 91.09 to Rs. 94, *mainpuri* at Rs. 82.96, *ramajiwayan* at Rs. 76.36, *raimunia* at Rs. 79.04 and *gadda* at Rs. 60.95 a quintal.

Among coarse grains, grams improved fractionally to Rs. 49 to Rs. 50.84 a quintal and local stocks declined to 7,800 quintals. Maize was steadier, as it was in good demand for seasonal consumption and prices stood at Rs. 37 to Rs. 38.75 a quintal. *Bajra* also attracted consumer support and sought higher levels at Rs. 45 to Rs. 47.75 a quintal. *Barley* and *bejhar* were in poor demand. While *juwar* was listless for want of support, *guwar* was in some demand. Week-end prices (in Rs. per 40 kilogram) were: *Barley* 39 to 40; *bejhar* 40 to 41; *juwar* 47 to 48.25; *guwar* 46 to 47.75.

Peas and *arhar* turned steady during the week, as standing crops were adversely affected due to heavy frost. Stocks left with the trade, too, were very small. *Urd* and *moong* arrivals being poor and seasonal demand being fairly heavy, prices were held steady. Other pulses were steady in sympathy with *peas* and *arhar*. Week-end prices (in Rs. per 40 kilogram) were: Peas *dara* 45 to 46.50; *farm* 48 to 50; peas *dal* 50.62; *arhar* 58 to 63.63; *arhar dal* 80.38; *moong* 71 to 76; *moong dal* 82.06; *massor* 60 to 64; *massor dal* 75.02; *urd* 61.63 to 68.32; *urd dal* 80.38; and gram *dal* 59.

SUGAR DRIFTS LOWER

(From Our Own Correspondent)

HAPUR, 20*th January*

Sugar in the open market fell to Rs. 155 to Rs. 158 per quintal, as against the previous week's level of Rs. 160. Although the supply position continued to be restricted, a part of the demand was being met by *khandsari* the prices of which ran down appreciably during last two weeks. The current season's production of 913,000 tons upto 7th January is the highest for the corresponding period in recent years, but the season's total output is not expected to be substantially higher than last year. Many factories in the West U.P. are already facing cane shortage and the season is expected to be over before long. The Union Government has refused to increase cane prices further as well as to lift the ban on the inter-State movement of *gur* and *khandsari*. Sugar in Muzaffarnagar was also depressed in the absence of buying urges and, in the open market, sugar was now quoted at 158 a quintal.

Khandsari eased appreciably during the week and the fall was influenced by the U.P. Government's proposal to control distribution of *khandsari* also. Fall in prices was to the extent of Rs. 8 a quintal, as the stockists were anxious sellers and support from Punjab and Rajasthan stockists was lacking. *Khandsari* production is being done with vigour in Muzaffarnagar area where the producing units are lifting cane by paying a price of upto Rs. 5.80 a quintal, as against the Rs. 5.36 a quintal paid by factories. Week-end prices were: Inferior Rs. 95 to Rs. 105; medium Rs. 110 to Rs. 120; superior Rs. 125 to Rs. 135; crystal Rs. 135; *boora* Rs. 147.

Ready *gur* drifted lower sharply, as the Union Government has refused to grant any export permits to Hapur. *Balti* quality, which is a speciality at Hapur and is much in request from Gujarat, and ran down by Rs. 5 a quintal. Pansera superior was done at Rs. 25 average at Rs. 24.50, *balti* at Rs. 25 and *shakker* at Rs. 26 a quintal. Over two-third of the cane crop is finished and a major part of the rest would be used for seed purposes. Daily arrivals were small at an average of 3,500 maunds and offtake was only under previous commitments. In the Muzaffarnagar market, *gur* drifted lower in the week-end following the Government's announcement that restrictions on inter-State movement of *gur* would not be withdrawn.

According to the Indian Sugar Mills Association, the total sugar production in the month of December 1963 was about 510,000 metric tons, as against 459,000 tons in the same month in 1962. This brings the total production for the first two months of the season 1963-64 to 755,000 tons, as against 634,000 tons in the corresponding period of the last season. The offtake of sugar from factories during the month of December 1963, including 11,500 tons despatched for exports, was 218,000 tons, as against 230,000 tons (including 12,000 tons despatched for export). The total despatches during first two months of the 1963-64 season were 381,000 tons (including 19,000 tons despatched for exports), as against 456,000 tons (including 30,000 tons despatched for exports) in the same period last season. The total closing stock of sugar with the factories as on 31st December 1963 was 524,000 tons, as against 1,181,000 tons a year before.

• • • •

The Controller of Foodgrains Distribution, Greater Bombay, has promulgated an order fixing the maximum wholesale and retail prices for sugar candy, lissa sugar and *bura* (crushed) sugar in Greater Bombay. Under the new order which came into effect on the 21st inst., no person who is a wholesale or retail dealer can sell or agree to sell or otherwise dispose off or agree to deliver sugar candy, lissa sugar and bura (crushed) sugar at a price in excess of the maximum wholesale or retail price fixed under it. The prices fixed for the three categories of sugar are:

	Wholesale Price (Rs. per bag of 50 kg.)	*Retail Price* (Rs. per kg.)
Sugar candy		
Fulkali	38.40	2.03
Jodkhada	36.40	1.99
Kani	33.40	1.93
Lissa sugar	96.70*	1.57
Bura (crushed) sugar ...	133.75†	1.47

*Per bag of 70 kg. †Per bag of 100 kg.

KIPS DULL

(From Our Own Correspondent)

MADRAS, 20*th January*

Business in E. I. kips continued to be dull with stray inquiries for lower ends in lights and mediums. Cow calf market remained quiet. Inquiries for buff calf were fair but at lower prices.

Tanned goat skins remained steady to firm. In tanned sheep skins, while best middle classes and market types advanced locally, prime and semi-prime ruled steadier.

BANKING

(Concluded from page 124)

countries. Direct technical assistance grants to help in planning projects or programmes have also been made by the Bank.

Above all, the Economic Development Institute of the Bank provides training to the officials of its members and helps in improving the quality of economic management in developing countries.

The purpose of the International Finance Corporation, as already seen, is to promote the industrial development of less-developed regions by means of investments in productive private enterprises. I.F.C. has been particularly active in Americas, where over two-thirds of its investment commitments have been made. Thirty-eighth enterprises distributed in 11 countries of the Americas, varying from steel and paper mills to petro-chemicals, fertilisers, and transport and construction equipment have received $56 million which has helped to generate new investments totalling $374 million. In four Asian countries, nine enterprises, including textiles, steel rolling, cement, pumps and ball bearings, have received $13 million, which has financed new investment to the scale of $60 million. Commitments have also been made to invest $8 million in nine enterprises in Africa.

The story of the World Bank group in the three continents is a continuing one: new resources are being raised, new outlets are being sought. New dimension is being given to the problems of development throughout the world.

PRIVATE SECTOR AND PUBLIC RELATIONS

(Concluded from page 137)

stagnation in industrial development in recent years.

Coming on the eve of the Central Budget, the Federation might have pointed out how the impact of various taxes, particularly those which were imposed last February, has affected confidence and discouraged capital formation. It could have made some useful suggestions to the Union Finance Minister for his consideration in formulating his next budget.

The brochure states that the private sector continues to dominate the economy. It points out that nearly 95 per cent of the output of organised industries is in the private sector. A statement of this type is likely to encourage the radical elements in the Congress and outside to persist in their demand for the immediate nationalisation of various industries. The Federation could have refuted the argument that industrialisation has resulted in the concentration of power and explained how India's biggest industrial units are mere toys in comparison with their counterparts in the U.S., the U.K., West Germany and elsewhere.

In conclusion, it must be emphasised that a mere statistical approach is not going to be of much help in changing public opinion in favour of private enterprise. Statistics are, no doubt, useful but they should be employed skilfully and imaginatively to counter the persistent propaganda deliberately carried on against the private sector by interested persons. Valuable as the present brochure is, its usefulness could have been greatly enhanced if it had been made more comprehensive by touching on points relating to import saving, export promotion, prices, fiscal policy, etc., briefly discussed in this article.

COMPANY MATTERS

(Concluded from page 141)

one reason or another are clearly brought out in the following comparative table:

(In lakhs of rupees)

	For the year ended 30th September		For nine months ended 30th Sept.	For the year ended 31st Dec.
	1963	1962	1961	1960
Sale proceeds (gross)	10,98.54	13,12.48	811.93	832.67
Other income ..	7.68	10.28	9.01	6.70

Low	7.10	7.43	7.87	6.80

Note:—All dividends are subject to deduction of tax.

During the year, the balance of Rs. 2.50 per share on the partly paid 3,445,134 equity shares were called up and this has raised the share capital of the Company as at 30th September 1963 to Rs. 497.11 lakhs. This is supplemented by Rs. 81.61 lakhs in reserves and surplus. But against this rise of about a crore of rupees in 'own' funds, outside interest has advanced much faster. Secured loans which had increased by a mere Rs. 26.74 lakhs to Rs. 195.06 lakhs a year ago have now spurted to Rs. 267.52 lakhs while current liabilities and provisions are up from Rs. 195.31 lakhs to Rs. 218.89 lakhs. Luckily both these put together are more than fully covered by current assets, loans and advances, which, as on the date of the balance-sheet, aggregate no less than Rs. 538.41 lakhs. Besides, there are investments worth Rs. 25.35 lakhs at cost, chiefly in Ennore Foundries Ltd. —a company in the same group. Inclusive of the additions worth Rs. 98.80 lakhs made during the year, the gross block has now risen to Rs. 599.72 lakhs, or about Rs. 21 lakhs higher than the own funds, but has been written down through the depreciation account to Rs. 438.46 lakhs. Adding to it Rs. 62.90 lakhs being the cost of capital work-in-progress, the total of net block works out to Rs. 501.37 lakhs.

The Rs. 5 fully paid ordinary shares of the Company are currently quoted at Rs. 7.05 *cum-div.* and fetch a net return of 3.6 per cent per annum on fresh investment.

ABBREVIATIONS. N—Nominal. (*f*) Income-tax free. * Loans held entirely by the Trustees. ‡ Ex-Jay State Transport Loan. † Ex-Elsewhere Loan not marketable.
A—Held by Government of India. B—Taken up by State Bank of India. C—Held by Commissioners. D—Ex-Sterling Loan not marketable.
†Rate of Interest reduced from 6 to 5 per cent with effect from 1st June 1944. ‡ Rate of Interest reduced from 6½ to 4 per cent with effect from 1st April 1932.
‡—Interest free for first 15 years. †—Interest free for first 7 years. ‡—Ex-Eleven Instalments but inclusive of accrued interest.
M—At the option of the Government after three months' notice. §—On September 1966 or later at the option of the Government after three months' notice.
T—Liability taken over by Madhya Pradesh. @ Total amount invested in Gold Bonds up to 18th February 1963.

STOCK & SHARE QUOTATIONS

Abbreviations :—B.—Deferred shares. P. O.—Preferred Ordinary shares. Y.—Accounts published yearly. H.—Accounts published half-yearly. P.—Company has Preference shares. T.—Company has Debentures. N.—Nominal quotations. x.d.—Ex. Dividend. c.d.—Cum. Dividend. I.—Interim Dividend. C.R.—Cum. Right. X.R.—Ex. Right.

Shares :—If a company has different classes of shares—as for example : 'A' shares and 'B' shares—these are indicated by the same letters 'A' and 'B' under the columns 'Paid-up Ordinary Capital' and 'Paid-up' per share.

Accounts :—Figures in the Accounts Closed column represent the months or the year in which the respective companies close their accounts, 6 and 12, for instance, indicate the months of June and December, respectively. Reserves include general and other reserves and all other funds which a company may have excluding depreciation fund, reserves for tax liability and provident fund. Block represents actual cost of land, buildings, machinery and all other items on which depreciation is allowed less sales, if any, and stands for the gross figures except where otherwise indicated.

Dividends :—Dividends for completed years are shown as amount per share per annum, but where quoted for portion of a year they represent the proportionate dividend for that period. In the case of those companies which close their accounts yearly dividends shown are for their financial year.

RETHINKING ON SUGAR POLICY URGENT

THE supply position of sugar in India is by no means comfortable. The prospects are that, in the coming months, consumers will have to suffer more than they did last year. There is increasing evidence that the Government's calculations regarding production may not fructify. It is true that production upto 22nd January 1964 has been 100,000 tons more than that in the corresponding period of the 1960-61 season when there was a record high output of about 3,000,000 tons. But this does not automatically warrant the conclusion of the officials of the Union Food Ministry that the remaining months of the 1963-64 (that is, the current) season will witness the same rate of production (let alone a higher rate) as in the 1960-61 season. For the availability of sugarcane to sugar factories is rapidly shrinking, due to the combined effect of keen competition from *gur* and *khandsari* producers and failure of sugarcane crop to come up to the levels expected earlier. In many parts of India, factories are, therefore, faced with the prospect of earlier closure of crushing operations. It is possible that, by March end, crushing will be virtually over in almost all parts of the country.

When the production target of 3.30 million *tons of sugar* was fixed for the current season, the assumption was that sugarcane crop would be at least 104 million tons, that is, the level reached in the 1960-61 season. But current estimates are that the crop is much less than this total. At the same time, *gur* prices have been twice as high as those prevailing in the comparable period of 1960-61. This is true of *khandsari* too. So the brown sugar producers have been at a great advantage over white sugar producers whose capacity to compete with the former is limited by the price control on their product. The latest estimate of white sugar production for the current season as a whole, made by Mr. G. M. Modi, Chairman of Indian Sugar Mills Association, is no more than 2.53 million tons, a shortfall of 770,000 tons, as compared with the target of 3.30 million *tons. Even if some allowance* is made for possible underestimation by Mr. Mody, it now looks as though the output may not exceed 2.65 million tons, as against a minimum requirement of 2.80 million tons for both domestic consumption (on the basis of existing controls and restraints) and export of 300,000 tons already committed to. Really speaking, if there is to be some elbow room and a modest surplus to be carried forward, production should be not less than three million tons.

This being the real state of affairs, the Government must act quickly and do all that is possible to increase the flow of sugarcane to the factories and to extend the crushing season. The solution put forward by the I.S.M.A. this week, though by no means ideal, seems to be a practicable one, capable of meeting the current situation in a better manner than the measures taken so far. The Government is not prepared to compel sugarcane growers in the areas of sugar factories to deliver all their crop to factories. Nor is it willing to enforce compulsory closure of *gur* and *khandsari* units in these regions. So the only thing to do is to permit the sugar factories to pay whatever prices they like for sugarcane and to raise their selling prices for sugar accordingly. Since, however, complete decontrol is not a feasible proposition from the political point of view, the I.S.M.A. has been realistic enough to suggest that only that quantity of sugar which is in excess of production achieved in the past season (this amounted to 2.16 million tons) should be allowed to be sold at whatever prices the factories can realise in the open market. There may be room for bargaining about the quantum of production that should be subject to price control, but, once the principle of "selective control," to borrow Mr. Modi's description, is accepted, the issue can be settled to the satisfaction of both the industry and the Government. But the authorities must make up their mind expeditiously, for, with the crushing season rapidly advancing towards its end, even a week's delay will reduce the extent of increase in production that can be secured under the proposed scheme.

The incentive given by the Government to producers of white sugar at the commencement of the season in the form of a 50 per cent rebate of excise duty on production in excess of that in 1961-62 has not been of much avail to the majority of factories. For the output in the base year was about 2.80 million tons, a level the attainment of which itself is extremely doubtful as shown earlier. The incentive scheme would have been of some help had the Government agreed to the industry's proposal that 1962-63 should be taken as the base. It is to be hoped that the Government will not make a similar mistake in regard to the present suggestion of the industry. If the industry is charged with the responsibility of supplying 2.2 million tons at controlled prices, leaving the rest of production to be sold at free market prices, the gain may be substantial; according to Mr. Modi's reckoning, production can be expected to touch at least 2.8 million tons. If bulk consumers such as confectioners, sweetmeat-makers and hotels are left to get their requirements of sugar in the free market, a supply of 2.2 million tons should suffice to take care of the needs of households and individuals at controlled prices. So the hardship to consumers will not be as much as one may imagine. In any case, at present, the prices paid by consumers for *gur* and *khandsari* are nearly as much as those for white sugar. These two varieties of brown sugar account for about 60 to 65 per cent of total sugar consumption in the country, the market for them being provided by the rural areas and the low income group in urban centres.

In other words, the bulk of the people who need and deserve the benefit of controlled prices is not receiving it. Accordingly, there is not much substance in the contention that the poor will suffer most if the suggestion for selective control is accepted and implemented. On the contrary, the country will be richer, as conversion of sugarcane into white sugar is undoubtedly the most economic way of utilising this edible crop.

The two-price scheme discussed here does not mean that exports of sugar will become uneconomical. World prices of white sugar are now so high and the prospect of their staying at current levels for some time to come is so bright that it should be possible to export not only 300,000 tons but even something more. Only, full remission of excise duty and sugarcane cess may be necessary at the worst. The immediate objective should be to secure as high a level of sugar production as possible this season itself. The next objective should, of course, be to evolve a long-term policy for sugar that will replace the policy of expediency and short-term solutions (controls followed by decontrols and *vice versa*) that have characterised the growth of sugar industry all these years. But this is a subject which is outside the scope of the present article and needs separate treatment.

FULL FREEDOM FOR JUTE MILLS

FOR jute mills in India, Saturday, 1st February 1964 is a red-letter day in their history. It marks their return to full freedom. From that day, they can work as long, and as many looms, as they like, the only limiting factors being the Factories Act and the length of their order books. The quarter century old Working Time Agreement, which has been governing the operations of Indian jute industry, has been scrapped with effect from that day. Significantly enough, the Indian Jute Mills Association (I.J.M.A.) announced this important decision on the eve of the fifteenth Republic Day. The Agreement, it will be recalled, was instituted by the Association way back in 1938—it was actually enforced with effect from 26th September of that year—as a means to reg

1962, the I.J.M.A. has consistently followed the policy of maximum production, so much so that the entire installed capacity of the industry has been fully utilised, thanks to the plentiful supplies of raw jute and excellent offtake of jute goods for both domestic consumption and export. The total average loom hours actually worked in the calendar year 1963 was as high as 2,458, as against 2,432 in 1962 and 2,099 in 1961. The average would have been higher still but for shortage of spinning capacity and restricted supply of power.

The I.J.M.A.'s Working Time Agreement was severely criticised by the Srivastava Committee on the score that it was basically restrictionist in outlook and that it operated to protect inefficient units. But the criticism had clearly ignored the realities of the situation. It is no doubt true that, as a result of the Agreement, one-eighth of the jute industry's weaving capacity remained unutilised during the last twenty-five years, excepting since January 1962 when the industry, as already stated, has been allowed to operate to the full installed capacity. But there is no denying the fact that the Agreement did serve a much useful twofold purpose: to avoid cut-throat competition among I.J.M.A. member-mills and to maintain a constant strict vigilance on any unplanned growth of production capacity in individual units. What would have happened if the Agreement had not been there during the period immediately after the devaluation of the Indian rupee (in September 1949) when the jute industry was threatened with a total cessation of raw jute supplies from Pakistan and again during the raw jute famine years of 1959 and 1960? If only the Srivastava Committee had cared to examine this question, it would have found that, but for the Agreement, the conditions in the jute industry would have been depressing to a degree, with a most severe impact especially on the marginal, financially weaker mills.

In any case, the fact that the Government did not compel the industry to give up the Working Time Agreement all these years, though it had the power to do so, is evidence enough that it too was a party to it. It would be interesting to know what would have been the recommendation of the Srivastava Committee had it gone into this question a few years ago when the industry was in the doldrums. In fact, there had been many a Government committee on jute industry before and, to the best of our recollection, none of them had condemned the Agreement as unworthy of being continued. It is also necessary to recall here that the public exchequer has benefited more from the restrictive features of the Agreement than the jute mills themselves, because, but for the stabilising influence imparted by it, the Government would not have been able to collect the hundreds of crores which it did from the industry by way of export duties, before it was compelled to abolish them by the keen competition offered by the young and energetic jute industry in Pakistan and the growth of a variety of substitutes for jute goods. All this shows that the Srivastava Committee was gifted with short memory and hindsight.

It is sheer commonsense that the rate of output in any industry in a given period of time is influenced essentially—one can as well say wholly—by two factors, one, availability of adequate supply of the right types of raw materials and, two, level of demand for its products. Both these factors are important especially in the case of the jute industry which, as readers are aware, is largely at the mercy of Dame Nature—it is Dame Nature that determines the size of the jute crop harvested in a season—and, what is more, its fortunes are linked very closely to the conditions obtaining in the world jute goods markets. It may be worth mentioning here that, out of every hundred tons of jute goods produced by the industry, as many as 80 tons are exported abroad. Which industry, after all, will deliberately curtail its production operations if it is assured of adequate supplies of raw materials at an economic price and of ready market for its products? The Srivastava Committee and all others who have unreservedly criticised the I.J.M.A.'s Working Time Agreement ought to have known that the jute industry is fully aware that, to the extent production is stepped up, the unit cost of output will be lower and the margin of profit better. There were, of course, occasions in the past when the I.J.M.A. had to be prodded by the Government and a section of the Press (including this journal) to work the Agreement in a flexible manner and to devote more time and resources to improve their efficiency, to evolve new uses for jute goods and to do market research.

The argument that the Working Time Agreement was restrictionist in outlook is, therefore, an exaggeration. This is also true of the contention that the Agreement was choking enterprise and initiative by virtually putting a premium on inefficiency. The Srivastava Committee has itself admitted that the jute industry has modernised itself almost 90 per cent up to the spinning stage, rationalised its operations by amalgamating uneconomic units and diversified its production by increasing its output of specialities from about 30,000 tons to 150,000 tons a year. This admission itself clearly disproves the Committee's allegation that the Agreement had checked the growth of the bigger, better-managed and economically more viable mills, so that they may not affect the working of the relatively weak and inefficient units. It must, however, be recognised that all this outcome was not spontaneous. It was due partly to the changeover from a sellers' market to a buyers' market in the latter half of 'fifties and partly to constructive criticisms from those who took an interest in the welfare of jute industry. In all these matters, one has to balance the disadvantages against the advantages before pronouncing the final verdict. It would be incorrect to contend that the Agreement was always operated in a perfect manner and that it had no ill-effects at all of the type described by the Srivastava Committee. Equally incorrect it would be to deny the benefits conferred by the Agreement. What is important is that, on balance, the Agreement has been beneficial to the country.

All this is no doubt past history now that the Agreement itself has been completely and quite rightly abandoned. Even so, this discussion is not irrelevant, lest the jute industry should stand condemned before the public. The industry certainly needs public sympathy

Jute Goods As Foreign Exchange Earner
(In crores of rupees)

and active Government assistance in its struggle to face boldly and successfully the serious challenge posed by (a) the rapidly expanding jute industry in Pakistan, (b) the competition from substitute packaging materials (especially paper and plastic bags), and (c) the increasing resort to bulk handling methods in transportation and storage of foodgrains, sugar and other similar produce. How keen is the competition offered by the Pakistan jute industry will be evident from the statistics relating to actual exports of sacking from India and Pakistan in recent years. Between 1957 and 1963, the share of Pakistan in the combined shipments of the two countries has jumped up from 12 per cent to about 38 per cent, while that of India has gone down from 88 per cent to 62 per cent. Competition from Pakistan in the hessian markets too is tending to be keener and keener every day. While it is unfortunate that the Srivastava Committee failed to take note of this vital aspect, it is gratifying to find that the Export Study Group on Jute Manufactures (Chairman: Mr. G. C. L. Joneja, Jute Commissioner) has drawn special attention to it. The Study Group has impressively highlighted the six distinct advantages which the Pakistan jute industry enjoys over its Indian counterpart. They are:

1. Pakistan possesses the most modern machinery, with higher productive capacity per man.

2. Pakistan has abundant good quality raw jute. The industry gets jute of superior quality at lower prices. The use of good quality jute gives a better quality of product. Pakistan has fixed its minimum raw jute prices at rates which are about Rs. 6 per maund below that for the comparable Indian variety. Stock operations are at 10 per cent below even the minimum prices. The incidence of freight from the cultivator's fields to the mills is less than a third of that in India. The Pakistan industry is also protected by an export duty on raw jute. The overall advantage enjoyed by Pakistan in the price of jute and cuttings amounts to about Rs. 168 per ton.

3. Pakistan has got abundant supply of cheap labour which only needs to be trained. The efficiency of the Pakistan worker is gradually increasing with experience.

4. Pakistan's industry is not required to spend as much as modernisation as the Indian industry.

5. Pakistan's industry sells a part of its production at present to the internal market at high prices. The benefit so accruing is used to subsidise export prices.

6. Pakistan's industry enjoys the benefit of export bonus, the impact of which is about Rs. 180 per ton on hessian and Rs. 120 per ton on sacking.

The Study Group has not merely presented the picture of Pakistan's cost advantages over Indian jute goods. It has also enumerated the advantages of India over Pakistan in regard to power charges, supply and prices of stores, efficiency of workers and benefits of research, but has come to the conclusion that most of these advantages are of a temporary nature and will gradually disappear in the years to come with the progress of jute industry in Pakistan. Besides, it has strongly urged the adoption of immediate measures "to work out a suitable solution to the problem" and to set up an appropriate machinery for dealing with it. One wonders whether the Group itself could not have indicated, in clear cut terms, the steps the Government and the industry should take. All that it has stated is this and the whole of it is pertinent as far as a general statement can go:

"The picture of Pakistan's cost advantage over Indian jute goods in the export markets makes the necessity of an all-round productivity drive vitally important to meet the challenge, although it is appreciated that only a part of the deficit can be met by cost reduction through higher productivity. It is necessary for the Indian industry to diversify its production and take to more and more sophisticated manufactures. In this connection, the role of research and market development is of vital importance."

Against the background of keen competition from Pakistan, it is indeed encouraging to hear about the propects of enlarged buying from Soviet Russia and East European countries. According to the I.J.M.A. delegation which visited these countries some time last year, jute goods exports to Russia could be raised from the present level of Rs. 8 crores to Rs. 30 crores by 1967 and those to East Europe from Rs. 3 crores to Rs. 5 crores. Equally encouraging is the report that the demand for jute goods for industrial uses in West Germany would continue, despite the inroads of substitutes. Encouraging, too, is the news that burlap continues to enjoy wide popularity in the U.S. which bought a record total of 915 million yards in 1963, as against 878 million yards in 1962. The U.S., incidentally, is the biggest customer for Indian jute goods, accounting as it does for one-third of the total Indian exports.

Now is the time, therefore, for the Indian jute industry not only to consolidate its present markets but also to establish new markets. It is appropriate to refer here to the recent Pacific Coast regional meeting of the Textile Bag Manufacturers Association at Las Vegas (Nevada) whereat it was said that Pakistan jute goods were sometimes better in quality and cheaper in price than the Indian goods. The main defects in Indian burlap to which attention was drawn at the meeting were: wrong and uneven weaving, mouldy cloth, splash marks, leopard spots, narrow width, more short bolt ends, and shortage in measurement. It is surprising that such avoidable defects should exist even today. They must be removed forthwith. There is an urgent need for improvement in quality and proper pre-shipment inspection. No less urgent is the need for constant research in the ever changing user habits, in discovering new uses and in developing methods to sustain the buyers' interest in jute goods in the face of competition from substitutes. Given this vigilance and adequate, regular supplies of raw jute at reasonable prices, the Indian industry will, there is no doubt, compete effectively for its share of expanding world trade in jute goods.

MARKET GOSSIP

Cotton Control Returns

THE expected has happened in regard to cotton supply. The soaring prices of the commodity during the past few weeks have at last awakened the authorities. The Textile Commissioner's order of 27th January, stopping movement of cotton from the Digvijay tracts of Gujarat to outside the growing districts, marks the first official intervention of the season. The action has been defended on the ground that prices of Digvijay 'A' cotton have pierced the ceilings and have caused a similar rise in those of other varieties. If such conditions were to prevail in other varieties of cotton, the Textile Commissioner has warned, in his Press note published on page 183, that a similar action would be taken in respect of those areas where they are grown. He has also threatened random requisitioning of cotton at the ceiling rate based on the survey result of the Appeal Committee. There are reports that the authorities are likely to intervene in all those areas where cotton is still to be marketed. The bulk of the crop in the Punjab, Madhya Pradesh, Maharashtra, Rajasthan, U.P., parts of Andhra and Mysore has already reached the market, while arrivals from Gujarat will commence next month and the Southern crop will move in last. In addition, the Textile Commissioner has also limited mill buying of Digvijay 'A' cotton this season to 75 per cent of consumption of such cotton last season and called upon mills to settle out contracts for purchases in excess of this quantity immediately.

Better late than never is the remark one would offer on the official action. But in doing so, one might be accused of being charitable. For, barely two months ago, the official thinking was seriously inclined in favour of raising a buffer stock of cotton by making purchases if and when cotton prices declined by about Rs. 100 a candy below the ceiling rates. That was when prices had ruled easy on expectations of a bumper crop of about 5.9 million bales. The constant talk of building up an official buffer stock actually prevented any important setback in prices. Since then, and especially during the past three weeks, the outlook for cotton, particularly for the popular varieties, has changed radically owing to the two successive cold waves in a fortnight, the intensity of which was very severe and the duration quite long especially in Gujarat. The indigenous crop, more reasonably placed at 5.70 million bales in December last, is now estimated at 5.60 million bales. The Textile Commissioner's office needs no telling that the Gujarat crop, maturing around this time of the season, is always exposed to the risks of the cold weather. But, instead of being cautious, a quality all the more necessary this season because of the limited scope for imports, it not only quietly acquiesced in the official talk of building up a buffer stock at a time when the size of the total crop was anybody's guess but also failed to act promptly the moment the price trend became definitely upward. Now the Textile Commissioner conveniently blames speculators for the rise in prices of good varieties of cotton of about Rs. 50 per candy above the ceiling rates. He could have easily prevented this rise, if his experts had been vigilant.

The tragic fact of the cotton situation in this country has all the while been that official actions have very little to do with demand and supply and have been more often than not motivated by political considerations. The emphasis has been not on insuring the farmer against damage to the crop and loss of his cattle, nor on helping him to raise the yield through greater use of fertilisers and manures, improved seed, etc., but on giving him incentives by way of higher ceilings. The reaction of the Gujarat Government to the Textile Commissioner's action also speaks of its anxiety to be popular with cotton growers and disregard for the less vocal consumers.

Official sources and the textile industry think that the supply situation is not as tight as is feared by traders. Even if it is so, imports will have to be larger than the quantity considered sufficient before the cold wave. According to reliable estimates, 700,000 bales of foreign cotton will be available this season, including some 300,000 bales out of the quotas licensed last season. The Textile Commissioner is expected to visit Washington soon and will negotiate with the authorities there for a fresh authorisation of 500,000 bales of cotton under P.L. 480 and press for a minimum of at least 300,000 bales. The success of his mission can prove really comforting.

Income Distribution: An Interesting Study

Three notable conclusions emerge from the study of the analysis of income distribution as made by the Tax Research Unit of the Union Finance Ministry: the analysis covers a nine-year period from 1953-54 (third year of the first Plan) and 1961-62 (first year of the third Plan). One is that the share of lower and middle income groups (with taxable annual incomes above Rs. 5,000 but not exceeding Rs. 25,000) in the aggregate income of all individual assessees has gone up from 60 per cent in 1953-54 to about 70 per cent in 1961-62, while that of persons with annual incomes of over Rs. 25,000 has declined from 40 per cent to 30 per cent. This trend is the result of the relatively higher rate of rise in the total incomes of the former group—these have actually doubled from Rs. 250 crores to Rs. 500 crores—than in the case of the latter group the total incomes of which have risen by only 50 per cent from Rs. 160 crores to Rs. 240 crores. The pattern of shift in incomes has, however, remained broadly the same for all categories of assessees, that is, for both salary and non-salary earners. Secondly, there has been a reduction in income concentration among individuals, the actual reduction being 12.3 per cent in respect of incomes before tax and 10.7 per cent in respect of those after tax. Thirdly, the income disparity itself has narrowed down, albeit slightly. It is particularly significant, says the Tax Research Unit, that income-tax and public expenditure have brought about a 30 per cent reduction in income concentration. The actual co-efficient of concentration, the value of which is represented as ranging from zero to one, is found to have come down from 0.44 to 0.31.

The improvement in the incomes of lower groups of tax assessees should be attributed primarily to increased employment opportunities following the implementation of the innumerable development schemes under the Five-year Plans. One has to concede also the fact that there has been, as the Research Unit itself rightly points out, some increase in the mobility of persons from lower to higher income brackets. This has resulted from the provision of extended and improved facilities of education and technical training, as well as from competition for experienced personnel among the growing number of employers.

Since the analysis covers only individual incomes assessable to income-tax, a comparison of the incidence of income-tax on the different income groups is specially relevant. Such a comparison reveals that, alongside of a decline in incidence for the lowest income-tax paying groups over the nine years ended 1961-62, there has been a fall in the proportion of disposable income of the higher income groups. The tax changes have, therefore, brought about a positive reduction in the post-tax income concentration during the above period. The study also shows that, for all individuals coming within the income groups below Rs. 40,000 annually, there has been an increase in the pre-tax incomes, the increase in the case of those coming within the Rs. 5,001-Rs. 10,000 group being higher than for others. Conversely, there has been a decrease in the relative shares of income of persons having incomes above Rs. 1 lakh. The same pattern of distribution is noticed in regard to changes in the relative shares of post-tax incomes also.

The aforesaid broad conclusions have been reinforced by the income-tax statistics compiled by the Central Board of Revenue. The statistics bring out the fact that, between 1956-57 and 1961-62, the number of assessees in the annual income group not exceeding Rs. 15,000 has risen from 422,328 to 820,441 and the total assessed income from Rs. 295 crores to Rs. 512 crores, whereas, in the case of persons with incomes above Rs. 2 lakhs, the number of assessees has declined from 650 to 543 and total taxable income from Rs. 27 crores to Rs. 20 crores. It is, of course, true that the findings of these studies cover only individuals assessable to income-tax and these individuals together account for no more than 4 per cent of the country's total working population and that the agricultural incomes, which do not attract Central income-tax, are not included. Even so, the trend is clear. And it is that income disparities are definitely getting reduced and that the rich are not getting richer as is frequently alleged by communists and fellow-travellers.

Century's Diversification Plan

The Century Spinning and Manufacturing Company Ltd., which has shown, under the able management of Birlas, commendable enterprise in expanding the range of activities in the field of textiles first by taking up manufacture of rayon yarn and then tyre-cord, has now drawn up an ambitious plan for diversification of its activities. Some of the new lines proposed are closely related to its main business and therefore designed to help it emerge as a well-integrated modern unit. Some others, however, are only distantly related, if at all. Thus, it proposes to manufacture synthetic rubber and rubber products, rayon pulp and other cellulose products, plastics and photographic goods and also generate and distribute gas and power. The additional activities, the Directors claim, arise out of the Company's existing business and are cognate, ancillary or supplementary thereto. They think it is desirable and beneficial for the Company to undertake these activities, because, by doing so, it will attain its main purpose of carrying on its business more economically as well as efficiently. Although the outlay on the new schemes is not disclosed, it can be expected to run into some crores of rupees. In this connection, the Directors state that the Company has and can command sufficient resources for financing the diversification of its business.

Since the Company is already manufacturing tyre-cord, in proposing to produce synthetic rubber and rubber products it will be only turning its attention to the other raw materials used in the manufacture of tyres and tubes. The proposal for manufacturing rayon pulp and other cellulose products arises from the fact that the Company is already manufacturing quality rayon, the most important raw material for which is wood pulp. According to the Directors, a right step would be that the Company should have its own plantations. Linked to this is the scheme for manufacturing photographic goods, including raw films, the basic raw material for which is cellulose. As regards plastics, the Company proposes to manufacture polymers required for producing synthetic fibres. The Company is interested in the development of synthetic fibre industry and is exploring the possibilities of obtaining the basic raw materials which can be had either from the feed-stock of naphtha or steam cracking units or alternatively obtained by coal distillation. The proposal to generate and distribute gas and power stems from this. The Company is said to have explored in Vidarbha coal deposits suitable for setting up a low temperature carbonisation plant which can yield, as by-product, coke, surplus coal gas and relatively greater amounts of other products such as road tar, spirit, phenols and cresols.

For accommodating these additional activities, the objects clause of the Company's memorandum is sought to be amended by a special resolution to be placed before shareholders for approval at their extraordinary general meeting called on the 21st inst. Two other resolutions, one for the re-appointment of the Managing Agents, Messrs. Birla Gwalior (Private) Ltd., for a period of ten years with effect from 1st July 1964, and the other for approving contracts entered into by their associates, Lucky Trading Company Ltd., will also be tabled at the meeting.

The Company's plan for diversification as described above is a bold one, in keeping with the enterprising spirit of the Birla House. It is also in consonance with the type of integration and expansion of activities undertaken by the industrial giants in Western Europe and the U.S. in the last few years. But it remains to be seen whether the Government of India will accord its sanction to the plan. The fact that the Directors have not hesitated to take the public into confidence, notwithstanding the Congress Party's growing stress on the need for preventing concentration of economic power and Dr. V. K. R. V. Rao's serious suggestion for placing a ceiling on the size of enterprises in the private sector, reflects their faith in the merits of their scheme and robust optimism in the future of private enterprise. Here is a typical example of a pioneering entrepreneur who believes in action; obviously, Birlas have immense faith in the Gita, wherein it is said, to the effect, do your duty without fear and reward will follow. Good luck to them!

Gwalior Rayon's New Acquisition

The Gwalior Rayon Silk Manufacturing (Weaving) Company Ltd. has decided to acquire the Punjab Cloth Mills Ltd., an associate of the Company's Managing Agents, which has a textile mill at Bhiwan (Hissar) in East Punjab. The proposed take-over is deemed essential in the Company's interests, as it will promote the use and consumption of staple fibre at a time when indigenous production of staple fibre has increased and cotton is in short supply. Besides, for the Company's weaving division, special yarns with staple fibre as the basic raw material are required for the manufacture of suitings and other products. Apart from helping the Company in making experiments in spinning staple fibre, the textile mill will also enable it to make special yarns for use in its weaving division and also for sale to the art silk industry. It would thus be possible to stimulate the Company's sales which at present are becoming difficult. Even independently of this object, the mill, as it is, can be a profitable proposition under the Company's management. It may be pointed out here that the Company had applied for a licence for setting up a spinning mill, but has so far not got it. In the meantime, it has negotiated the purchase of a running mill in the Punjab.

The mill consists of 18,000 spindles and 286 looms. It has already got a licence for another 9,000 spindles. If the Company can obtain a licence for additional 15,000 spindles, it can have at its disposal 42,000 spindles. The Directors understand that the Government is inclined to let the Company have this additional spindleage. The purchase price agreed upon is Rs. 33.02 lakhs, comprising Rs. 7.02 lakhs, being the value of land and buildings, and Rs. 26 lakhs, being the value of plant and machinery, motor vehicles, furniture and fittings, etc. The Company will first pay Rs. 8 lakhs and acquire the mill's premises, plant and stocks. The balance of the purchase price will be paid on completion of the sale.

Twentieth Anniversary of I.M.F.

In July next, the International Monetary Fund—I.M.F. for short—will be celebrating its twentieth anniversary. On that occasion, the Fund could surely take legitimate pride for its untiring efforts to achieve the high ideal of a multilateral system of world trade and payments at fixed exchange rates. Although the Fund is less than twenty years old—it was conceived at the Bretton-woods Conference in July 1944 and legally established in December 1945—it is mature enough to engage itself actively in a varied programme of service to its members. Not only have the membership and financial resources of the Fund registered a marked expansion but its role and responsibility in the functioning of the international monetary system have also increased quite significantly. When the Fund began functioning, it had only 29 members with quotas aggregating $7,000 million. Today, it has 102 members with quotas aggregating $15,560 million, supplemented by a $6,000-million borrowing arrangement with ten developed member-countries. As of 31st December 1963, forty-eight members have drawn in all an equivalent of $7,100 million from the Fund in 14 currencies and the repayments have reduced the amount outstanding to $1,700 million.

Besides making available stand-by credits to member-countries faced with tight balance of payments position, the Fund has also been providing facilities for consultation, research and technical assistance. In order to meet increasing requests for technical aid, the Fund announced, in 1963, that efforts would be made along several lines to develop its advisory capacity. A fiscal affairs group with experience in tax policy, tax

LONDON LETTER

BANKING FOR BANKERS

GROWING PAINS OF BECOMING MODERN

(From Our Own Correspondent)

LONDON, 25th *January*

THE chairmen of the great joint-stock banks, finding that the pronouncements of official bodies on the state of the economy, have overtaken theirs in value and timeliness, have drawn the proper conclusions and decided to devote their annual reviews this year to the broad subject of banking. Thus we have had dissertations on the principles of banking; the correctness or otherwise of the 28-30 per cent liquidity ratio against deposits (the Chairman of Martins spoke for them all when he said that 25 per cent should be sufficient and pointed out that, in the U.S. the limit is only 18 per cent on current accounts and 5 per cent on time-deposits); the proportion of deposits held in investments and the proportion held in advances. The end-year balance sheets reveal total deposits of the eleven clearing banks of the U.K. at some £8,300 million, with net deposits (that is after eliminating cheques, etc., in course of collection between banks) some £600 million less. This figure has grown gradually, but not spectacularly, over the past ten years. But what concerns all the banks is that the rate of growth has, in this period, fallen so far behind that of the national income, that is, that of the economy as a whole. On the comparison produced by the Lloyd's Bank, bank deposits have only increased by one-fourth the rate of growth of the gross national income.

Undoubtedly, the banks have felt they were somehow failing to meet the needs of the community and have turned their minds to the question as how to swell their deposits and so their profitable lending. In the last five years, one great change has already taken place: they have swung an increasing share of their assets from investments to advances. The latter have now reached nearly 50 per cent of a bank's assets, while investments have dropped to 15 per cent.

But the banks are not satisfied with this increase in earnings. They are painfully aware that even the charges they make on current accounts (which most customers resent anyway) do not pay for running those accounts and in this year's speeches it is claimed that the cost of current accounts is even greater than the cost of deposit accounts on which, of course, an interest rate of 2 per cent (with Bank Rate at 4 per cent) is being paid. If this is so, then no wonder they are worried.

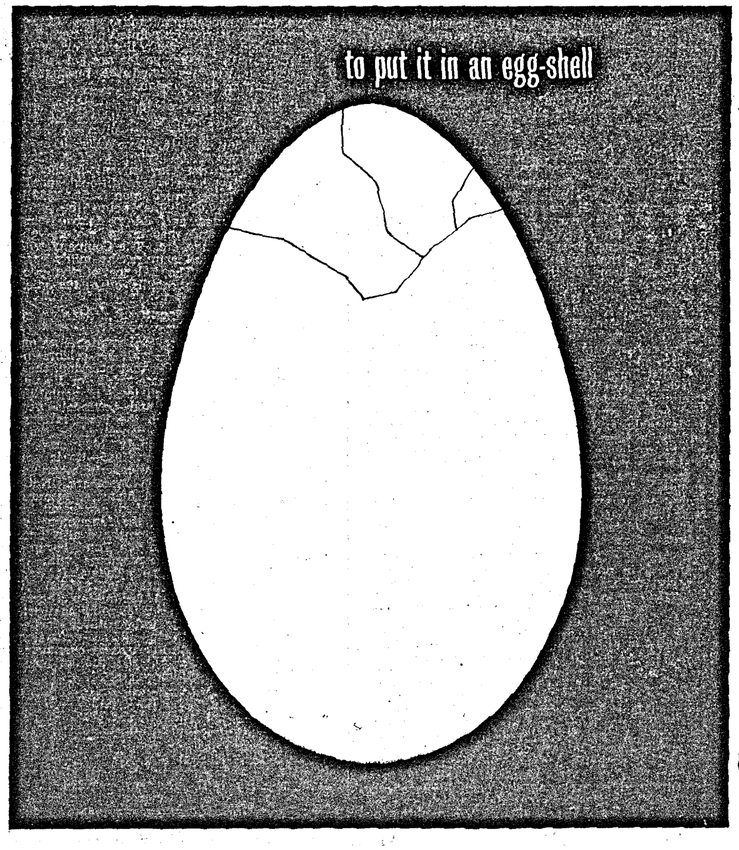
The banks have been told to compete for deposits. They have been doing some collective thinking on this problem and some tentative conclusions are beginning to emerge. First of all, current accounts are costly: and when the Chairman of Barclays claims that his bank's current accounts have risen by 7 per cent per annum over the past four years (the total is now 2,600,000 accounts, with nearly half as many deposit accounts and Barclays' grand total of deposits has now topped the £2,000 million-mark, the highest of any bank outside the U.S.A.) his pride is mixed with concern that this vast total is not paying its way.

Next, since to raise charges is so highly unpopular, the banks are wondering whether they must not expand the total of their deposit accounts by offering higher rates of interest—and in turn they would have to charge more on their loans.

In recent years, many short-term lenders have decided that the deposit rates offered by banks are uncompetitive and have put their money straight into Treasury Bills or loans to finance companies or to local authorities. These last three classes of borrowers have, as a result, not used the services of banks. This whole section of borrowing and lending has bypassed the banks. The tentative answer appears to be to offer higher rates of interest on large time-deposits—the sort of sums that are otherwise lent directly. Here there is room for competition between the banks, but they clearly do not relish bidding for large deposits in the same way as they have to bid for Treasury Bills. On the other hand, they will be reluctant to have to charge more on accommodation, but they seem to have decided to face that one, and one of the spokesmen has pointed out that, even with the prospective increase, the cost of bank accommodation in the U.K. would be lower than elsewhere in the world.

What the banks are not keen on doing is changing the nature of the business they like to finance, even though they could charge more on that different business. Thus, they do not seem inclined to go in for business involving more risk or longer time, charging a higher price. However this may not be an inflexible view, so far as the time element is concerned, for Lloyd's have pointed out that their ideas began changing in 1947, when they decided to help finance medium-term export business in large capital goods—involving credit being outstanding for a few years instead of a few months. But Barclay's have uttered a warning about assuming that more time deposits means that it is prudent to increase investment in long-dated advances: time deposits can become very hot indeed (they can hardly expect over a month's notice and even though for an appropriate increase in the price the term might be three months such terms would be of little help when the balancing investment was for a term of years).

The conclusion from all this is that at the moment the big British bankers are in no wise prepared to relinquish their innate caution; they are bothered about getting the increased current accounts for which they are all busily advertising with only higher costs to show for their pains; they want to go for the banking business that is at present bypassing them and to angle for the big deposits by offering better bait; and they reluctantly envisage making the general borrower pay more as a result. But, of those who have uttered so far, none has yet grasped the thought that banking in the U.K. might even turn slightly in directions familiar to most foreign banks and compete in fields where the time element is a little longer and may be the risk slightly greater. Is this because the authorities behind them, the Bank of England and the Treasury, would not be prepared to extend the rediscounting and other help a central banking authority can give? If so, the joint-stock banks have given no hint of complaint. Maybe they have not yet realised they are experiencing the growing pains of banking in the modern world!



BI-SKR-3

POOR PACKING MEANS SO MUCH GONE WASTE

Are there any cracks in your packing of rayon & synthetic fabrics? Check on it before shipment. Packing can make or mar your business reputation. Adhere to the packing specifications laid down for exporting these fabrics.

Strong and seaworthy packing creates confidence in you and your fabrics ... brings in repeat orders.

Your reputation abroad rests on:
* *Supplies as per samples*
* Attractive presentation
* Strong and seaworthy packing
* Shipments in time

The parade of freedom that never ends....

Fourteen years ago she watched the first Republic Day Parade, in her arms her baby son. The years have passed. Once again she watches the march past. Beside her stands her fourteen year-old boy, symbol in his eager youth of the young India he is part of. ☐ In those fourteen years for mother, for son, and for millions like them the world has changed. They have learnt new needs, achieved new fulfilments, accepted the new responsibilities of Freedom. ☐ Year by year has grown the ever-deepening awareness of a national unity, an integration reaching through and beyond the division of locality and language. ☐ The Parade of Freedom is a living symbol of national oneness. This Parade must never end...

"MASTER PLAN" FOR IRON ORE EXPORTS

IRON ore ranks today as the fifth largest earner of foreign exchange for India, after jute goods, tea, cotton textiles and sugar. And it might not be surprising at all if iron ore were to emerge as *the* largest foreign exchange earner in the next few years, assuming, of course, that the "Master Plan" for iron ore exports evolved by the Union Government is implemented successfully. This Plan envisages a total annual exports of 30 million metric tons by 1970, valued at Rs. 120 crores (at the current average price of about Rs. 40 per ton). The Plan is an integrated one embracing as it does development of mines, expansion of transport capacity, improvement of port handling facilities and gradual acquisition of ore-carrier fleet. The total outlay on the whole scheme is expected to be no less than Rs. 330 crores, as against the earlier estimate of Rs. 250-300 crores. This is also in addition to the cost of schemes included in the third Plan. Considering that the outlay is pretty heavy and, what is more, the foreign exchange component is quite sizable (as much as Rs. 70 crores), utmost attention is naturally being given by the Government of India to the question of financing the Master Plan. And it is gratifying, indeed, that the World Bank is taking a keen interest in the Plan. The Bank has deputed to India two experts (Mr. Peter Wright and Mr. Pentanalli) to help the Government implement the Plan. The two experts held detailed discussions with the Planning Commission and the Union Finance Minister last week-end. The discussions, it is gathered from press reports, centred round the extent of investigation of iron ore deposits, scale of investment, facilities for prospecting operations, long-term prospects for exports, and port facilities. Presumably on the basis of the assessment made by its experts, the World Bank will announce the grant of a loan to finance a part of the outlay on the Master Plan.

In view of the comprehensive nature of the Master Plan for iron ore exports, the reported move of the Government of India to set up a separate organisation for ensuring complete integration in planning, follow-up and appraisal of progress is commendable. Equally commendable is the decision of the Mineral Ores Export Advisory Committee (Chairman: Mr. G. L. Bansal, Secretary-General, Federation of Indian Chambers of Commerce and Industry) to ask the iron ore mineowners to prepare their plans for the mechanisation of mines, indicating the investment they are prepared to make and also the minimum quantity of ore they would like to lift every year. Mechanisation of mines is imperative for bringing down production costs. The need for a reduction in costs is all the greater in the context of the buyers' market that has emerged in the iron ore trade, as witness the steady and continuous fall in prices. The average price realised from the export sale of one ton of iron ore during the first seven months of the current financial year (1963-64) was less than Rs. 40—it was lower still at Rs. 35 in the month of October 1963—as against over Rs. 53 realised in the corresponding period of 1962-63. India had to export thrice the quantity (4.91 million tons, as against 1.82 million tons) to earn double the foreign exchange (Rs. 19.44 crores, as against Rs. 9.74 crores).

It is thus obvious that, if the exports of Indian iron ore are to be safeguarded in a competitive market, there is the vital need for improving the operational efficiency of mines and for ensuring quicker and economic transport of ore first from the mines to ports and then from the ports to destinations to which the ore is sold. What is wanted, therefore, is energetic implementation of the Master Plan referred to above. Given such implementation, one need not be sceptical at all about the possibility of the 30-million-ton export target being hit by 1970, even though the target represents a rise of as much as 20 million tons as compared with the current rate of shipments.

Since the Master Plan for iron ore exports is of long-term character, it is appropriate that due attention is paid to the question of the form in which the exports are to be effected. some are inclined to feel that India should export pig iron and not iron ore. The suggestion is a perfectly valid one in theory. It is any day better to export a semi-processed raw material than the crude raw material, as it will provide greater scope for employment and yield a larger amount of foreign exchange, both of which the country needs badly. But India is not in a position to muster enough capital and technicians to increase its pig-iron making capacity even to meet its domestic requirements, let alone the needs of export markets. The suggestion, therefore, is not a practicable one, however desirable it may be. Further, manufacture of steel in most of the industrially advanced countries in the West, as well as in Japan, is a highly automatised process from ore to finished products, so that the problem arises as to how the pig iron supplied by India could be fit into this process. But it should be possible for India to try and succeed in the next alternative, namely, to sinter the iron ore and export it in the form of pellets. This method of promoting India's exports has three distinct advantages. In the first place, the sintering process will provide employment to a large number of persons. Secondly, a lot of shipping space which is otherwise wasted in carrying a lot of waste material along with iron ore proper can be saved. And, finally, the foreign exchange earnings will improve, because of the value added in the process of converting the ore into pellets. The authorities in India would, therefore, be well advised to consider the merit of this suggestion and explore the possibilities of implementing it in co-operation with the principal buyers of Indian iron ore. It is quite likely that, considering the high cost of their domestic labour, if not the difficulty of obtaining enough workers, the importing countries themselves would welcome the idea.

INDIAN LEATHER FAIR

The leather and allied trades, the Central Leather Research Institute and the Indian Leather Technologists Association must all be complimented on their spirit of co-operation in sponsoring the Indian Leather Fair which was inaugurated at Madras on Monday this week by Mr. Manubhai Shah, Union Minister for International Trade. Organised for the first time in the history of Indian leather industry, the Fair provides an excellent opportunity to producers and exporters to exchange ideas, discuss problems of mutual interest and acquaint themselves with the latest techniques of production as well as to assess the changes in consumer tastes and preferences. The Fair also helps the exporting interests to come in contact with foreign buyers who visit the Fair. Such exchange of information and ideas are of considerable importance in the renewed efforts now being made to promote exports. Hides and skins (raw and tanned), by the way, constitute a staple earner of foreign exchange for India, the total value of exports actually effected in the calendar year 1963 being as much as Rs. 40 crores, representing one-twentieth of the estimated aggregate exports of Rs. 770 crores in that year. Appropriately enough, Mr. Manubhai Shah described the leather industry as "the *prima donna*" of the export industries.

Vast scope exists for stepping up the exports of leather and leather manufactures. The world demand for these goods has risen substantially in recent years and all available indications point to a further rapid rise in demand in the next few years. The U.K. continues to be the most important traditional market for Indian tanned goods. The other important markets are the U.S., France, Italy, West Germany, Switzerland, the Netherlands, Belgium, Sweden and Denmark. That exports of hides and skins have improved markedly from Rs. 32 crores in 1961 to Rs. 40 crores in 1963 is, of course, quite gratifying. But the proportion of finished goods in the total exports in 1963 is negligible, being no more than Rs. 4.5 crores. Apparently, the Government's policy of discouraging exports of raw hides and skins has still not had the desired effect. In the scheme of export promotion, due attention ought to be paid to exports of finished goods, instead of raw goods. For such exports fetch larger foreign exchange, not to speak of the additional employment provided in the process of converting raw hides and skins to finished goods. Tanned skins, we are told, for instance, earn 25 per cent more per unit of raw material than raw skins. Mr. Manubhai Shah did well, therefore, to urge the leather industry and trade to augment exports of finished goods to at least Rs. 20 crores in 1964.

Of special significance to exports are the three assurances which Mr. Shah held out in his speech. First, the Union Government would pursue a "steady" policy in regard to exports of hides and skins and there would be no sudden changes in it. It is the lack of such a policy that often disrupts the export trade. Needless to say that the foreign buyers must always be sure of a continuous flow of hides and skins. Secondly, assistance for export promotion would be made available from the Marketing Development Fund created by the Government. Thirdly, the Government would be ready to release foreign exchange for the import of machinery and equipment required for modernising the industry, besides seeking the assistance of developed countries for the purpose.

Never was the need for modernising the tanning and finished leather manufacturing industry so pressing as it is today. The industry, it is common knowledge, continues to be run predominantly on traditional lines, adopting the same old patterns and methods without imbibing the rapid changes in science and technology that have taken place in the highly industrialised countries. The result is low productivity in respect of both output and quality. The reason for this state of affairs, as Mr. A. Nagappa Chettiar, Chairman of the Indian Leather Fair's Executive Committee, has rightly averred, is the lack of opportunities to contact and observe the up-to-date scientific methods of production. It is not, he says, feasible for most producers in India to travel wide and study the changing pattern of requirements of overseas buyers every year. "A sense of self-satisfaction," to quote him, "seems to prevail and they appear to rest content so long as the normal exports continue." Mr. Nagappa Chettiar certainly strikes a note of realism when he says that, in the highly competitive world, the leather industry, if it is to progress and thrive, must adjust and reorient its production and offer what is best and what is needed most. The Leather Fair, it is to be hoped, will help foster the development of quality-consciousness which is one of the essential prerequisites for successful export promotion. It is also to be hoped that the Fair would be an annual feature and run on business lines to promote the growth of trade and industry and not as a form of evening entertainment as most fairs in this country invariably turn out to be.

U.K. TO FOSTER COMPETITION IN RETAIL TRADE

Britain's Secretary of State for Industry, Trade and Regional Development, Mr. Edward Heath, has promised to produce in a few weeks' time a Bill aimed at making the system of Resale Price Maintenance (R.P.M. for short) illegal. Under this system, a manufacturer can fix the retail price of his product and make sure that retailers stick to that price. At present, the British law permits this arrangement and manufacturers can, and often do, enforce it by going to a court. The proposed Bill will, however, provide the right to seek exemption before a judicial tribunal within probably about six months of its becoming law. During the period between the application and the settlement of the case one way or other by the tribunal (which will probably be a branch of the Restrictive Trade Practices Court), goods which are the subject of an exemption appeal will continue to be protected by R.P.M. This means that, after the grace period of six months, there will be a further period of exemption from the new law for the goods before the tribunal while their cases are being heard. This further period, the Board of Trade seems to think, may be up to two or three years. The end of R.P.M. may not, therefore, come soon. But Mr. Heath seems to be assuming that trade associations rather than individual manufacturers will be the main applicants for exemption and that the tribunal will be able to lay down expeditiously precedents for categories of manufacturer and also demonstrate case by case the kind that it will not exempt, thus weeding out pleas for individual goods in advance. Sweden, incidentally, set about the same problem in the same way 11 years ago. When the manufacturers had finished stating their cases, just two articles were allowed to enjoy the benefit of R.P.M., namely, books and newspapers.

Making a statement to the House of Commons on 15th January on the Government's decision to abolish R.P.M., Mr. Heath said: "The Government believes that this practice is in general incompatible with the objective of encouraging effective competition and keeping down costs and prices. It has reached the conclusion that R.P.M. should be presumed to be against public interest, unless, in any particular case, it is proved to the contrary to the satisfaction of a judicial tribunal." Mr. Heath's statement covered not only R.P.M. but also the Government's approach to mergers, monopolies and restrictive trade practices. But on these other topics the Government does not propose a Bill this session. Instead, it will produce a White Paper on these much discussed topics in about a month amplifying the broad outlines given to the House by the Secretary on strengthening and enlarging the Monopolies Commission in order to enable it to work in groups and refer to the Government practices considered to be contrary to the public interest.

After he made his statement, Mr. Heath faced a number of critical comments on the Government's decision to end R.P.M. at a private meeting of the Tory backbenchers' Trade and Industry Committee. Many of the 100 Conservative M.Ps present were worried about two points: the effect of the abolition of R.P.M. on the small individual shopkeeper, and the timing of the proposed legislation so close to the General Election. But the general feeling was that all the criticism had come from the "reactionary" wing of the Party. Labour M.Ps, favouring all throughout the end of restrictive trade practices, were inclined to support the Government's action. The reaction of the British Press has generally been favourable. Many of the newspapers have appreciated the Government's boldness in coming forward with this measure which is bound to be unpopular with thousands of retailers, the majority of whom are supporters of the Conservative Party and have already been hurt by the rapid growth of large department stores, called super markets in American parlance.

Many manufacturers, the wholesale trade and associations speaking for small shopkeepers (who still command nearly half of Britain's £9,000 million a year retail sales) have been shocked by the Government's proposals to end the system of fixed prices. They contend that R.P.M. disciplines dealers, helps them give good service to customers and protects small retailers and manufacturers by preventing big retailers from starting a rate war by cutting prices. They also believe that it is justified where after-sales service is needed (especially in such consumer durables as kitchen equipment, washing machines, T.V. sets and refrigerators) and argue that standards would decline and the user's safety might be endangered after its abolition. In fact, there was an immediate wave of price cutting after Mr. Heath's statement, though it is less noticeable now. While many manufacturers affected by the price cutting, including even Cadburys who are committed to preserving the maximum number of small confectioners, have refrained from prosecuting the retailers for breaking the R.P.M. agreement, General Electric and Prestige have threatened legal action against them. It may be noted here that large retailers, including the super market groups, who will be able to use their considerable buying power to undercut and outsell the small trader, have been delighted at the Government's proposals. They have, in fact, been outselling the small trader for quite some time by giving discounts in various ways. The small shopkeepers have been trying hard to retain the goodwill of their customers by improving their efficiency by rendering personalised service and by giving the regular buyers occasional gifts in kind, invariably food parcels.

But what is now proposed by the British Government is something more serious than the competitive undercutting indulged in by the big stores, a competition frowned upon by the manufacturers themselves when it tended to go too far. No wonder then that the 480,000 small shopkeepers themselves are expected to lead the fight against the removal of R.P.M. Among the trades where this price practice has been in force for long, they dominate with as much as 90 per cent share of the business done. Mainly, these trades are confectionery, tobacconist, newsagent and ironmongery. Their share of the furniture and soft furnishings business also is substantial, being 75 per cent. In the book trade, they handle 70 per cent. In some other trades also, where there is not much R.P.M., like women's and children's clothes, small retailers have held their own even in the face of rivalry from super markets.

There is, however, another school of thought, according to which there is not much evidence that R.P.M. is essential to keep the small man alive. The Federation of British Industries, for instance, feels that the effect of abandonment of R.P.M. on prices is unlikely to be nearly as great as many commentators seem to think. The attitude of National Association of British Manufacturers is, however, a little cautious and conservative. It is not totally opposed to the abolition of R.P.M. for it is prepared to concede that, in some articles, it will lead to healthy competition with favourable results for consumers, but it feels that R.P.M. is necessary for certain manufactured goods. Nevertheless, the consensus of opinion among British commentators is that, while the manufacturers who turn out to be last-ditch defenders of the principle may number a few, quite a number of them would like to see the practice go and that the majority might reconcile themselves to the change by reorganising their pattern of distribution and marketing. They are further of the view that, among the distributors and retailers, those who are opposed to the change might be more important in numbers but not in the share of trade.

The end of R.P.M. could very well mean unfettered competition and extension of rationalisation in the distributive trades. It could have some interesting side-effects upon certain marketing services that have in some degree been substitutes for price competition, such as certain kinds of consumer advertising, co-operative trading, and the latest surrogate, trading stamps. The classical concept of free competition, with the consumer as the king, could then have some real meaning.

In India, of today, there is no such problem in retail marketing as in Britain, though the system of fixed retail prices prevails for such items as radios and other electrical goods, chocolates, toilet articles, packed foods, etc. Where there is competition for custom, special discounts can be obtained. But the scope for competition is very, very limited, on account of scarcity of supply of almost all types of consumer durables, articles of conventional and professional necessities, toilet and beauty products, and packed foods, soft beverages and chocolates. In the U.K. (as well as in other Western countries), however, there is a surfeit of all types of consumer goods, resulting in a strong buyers' market. Besides, in most urban centres in India, the chances for new entrants in the retail trade are scarce, if not *nil*, for want of accommodation for opening shops as well as because of non-availability of goods. One has to pay a heavy premium to get either of the facilities. The problem in India is, therefore, the reverse of that in Britain. The preoccupation of the State here is to prevent blackmarketing and fleecing of consumers as a result of acute shortages.

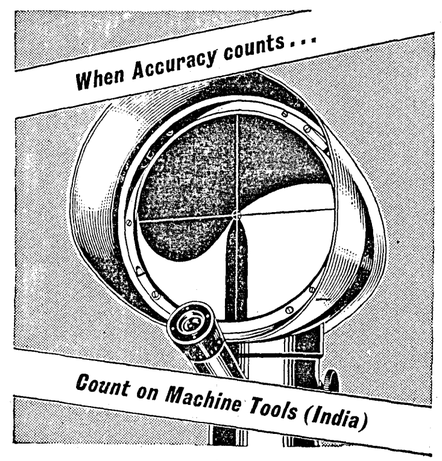
There is, of course, a lot of talk in India currently about concentration of economic power in a few hands and private monopolies. Much of it is political propaganda, designed to win the votes of ignorant masses and to sidetrack their attention from the Government's failures to keep the rosy promises made under the five-year development plans. But that apart, its approach to these so-called evils of private enterprise is different from that in the U.K. Here the solutions proposed are State capitalism and/or State controls, co-operative marketing and State ownership of marketing channels for certain types of goods, especially foodgrains. There, in the U.K., the move is to enhance the forces of free market competition. What is more important, where the State finds it necessary to permit a certain amount of restraint on excessive competition through the system of R.P.M., the issue is to be judged by a judicial tribunal and not by bureaucrats as is invariably the case under the socialist dispensation obtaining in this country.

COLOMBO PLAN REVIEW

The latest annual report of the Consultative Committee of the Colombo Plan, that covering the year 1962-63 (July-June), reviews the economic progress made in the South and South-East Asian countries during the year and assesses the possibilities for progress in the years ahead. Its summing up is that, "while economic progress has been possible and rising national income serves as a tribute to the efforts of these countries, there is a general feeling that performance can and must be improved." The task for the future, it says, seems clearly to find the ways and means of accelerating the rate of economic progress. The report records that almost $13,820 million worth of external assistance has been directed to the countries of South and South-East Asia since the inception of the Plan up to the end of June 1963. In 1962-63 alone, external assistance amounting to $1,820 million came to the receiving countries.

Reviewing the economic trends in India, the Colombo Plan Consultative Committee observes:

"Mobilisation of resources has now to be carried out with a view not merely to pressing ahead with planned development but also to enabling India to build an adequate defence. The outlook for the coming years will no doubt depend on the rate at which production can be increased and foreign assistance secured for the import of fixed capital as well as materials and components required to maintain full capacity production in Indian industries. . . . While there is every likelihood of an improvement in supplies, the pressure of demand is likely to increase as spending on defence and development gathers further momentum. Although Government revenues have shown a sizable increase since the beginning of the current fiscal year—an increase sufficient to nearly offset the increase in Government outlays—the prospect of a renewed pressure of demand is not unlikely. It is clear, therefore, that concerted efforts will be necessary to increase savings in order to maintain a reasonable degree of stability in the economy consistent with the need to stimulate growth."



We offer British, American and continental Automatic Production Machinery, standard Machine Tools and Cutting Tools, also Wimet Indoloy Tungsten Carbide Tools and products made in India to I S O British and DIN specifications. Our offices listed below will welcome your enquiries.

BUSINESS NEWS FROM EUROPE

RUSSIA'S THREAT TO EUROPE'S SHIPPING

VALUABLE DATA ON STERLING AREA

By Our Special Correspondent

REPORTS of plans to increase the Soviet merchant fleet fourfold backed by increases in the tonnages of other Communist countries, *are seriously worrying West European shipping interests.* Last year, Russia moved up three places—from 11th to eighth—in the world shipping league, increasing her fleet by 750,000 tons to 5.4 million gross tons. This tonnage is still not large for her population size, but she has plans to make herself the world's second largest shipping nation by 1980.

The target is 10 million tons of shipping by 1970 and 21 million tons by 1980, which would give Russia a working tonnage slightly behind that of *Britain's present fleet.* In order to achieve this, Russian yards are now working at such full stretch that orders for ships have had to be contracted out to the Western world. Last year, major orders were placed, among others, in Britain (three dredgers), France (three ships) and Japan (eight ships in one order, £50 million *worth of tonnage in another).*

For Europe, *the consequences of this huge* expansion are that over-capacity (which at last shows signs of receding after seven years) may again be intensified and the existing patterns of international shipping freights *may be disrupted.* There is also the probability that, with much new Communist capacity afloat, trade will be *carried increasingly in the ships of the nations* conducting it, to the growing exclusion of third-country charter traffic.

This is a particular problem for Britain, since much of its merchant fleet has been built on the premise that it will carry goods anywhere for anyone. America has already made inroads into this principle by stipulating that foreign aid—*and even some commercial transactions* such as the wheat-for Russia deal should be carried substantially in United States flag ships.

The extent of the coming threat can be *seen from the rise in freight turnover carried* by Russian ships. In 1950, they carried 39,700 million ton-kilometres. By 1961, this had risen to *131,500 million and by 1962 to 173,000 million* ton-kilometres.

Difficulties Loom for Sterling Area

Recent developments in international trade *suggest that the sterling area may be heading* for difficulties (*vide* page 38 of *Commerce* dated 11th January, 1964).

Holdings of sterling by the overseas sterling area at the end of June, 1963, were the highest *at £2,763 million (7,736 million U.S. dollars)* since 1959. When British claims on the rest of the sterling area are taken into account, this *left net balances* in London of £2,407 million (6,740 million dollars).

The sterling area finances approximately one-third of the world's trade. But the proportion of its exports to, and imports from, Britain, long the *main prop of this trade,* has been declining appreciably. In 1963, the overseas sterling area (all the area except Britain) imported 49 per cent of its goods from Britain; by 1962, the percentage had fallen to 31. While the total value of its imports from Britain went up slightly from £1,217 million (3,407 million dollars) to £1,360 million (3,848 million dollars) imports from the rest of the world more than doubled from £1,253 million (3,508 million dollars) to £2,970 million (8,316 million dollars).

The same trend shows in the overseas sterling area's exports to Britain. In 1953, these comprised 48 per cent of the overseas area's total exports; by 1962, the proportion had fallen to 36 per cent. *While the value of exports to Britain* rose slightly from £1,333 million (3,732 million dollars) to £1,405 million (3,934 million dollars) exports to the rest of the world rose from £1,435 million (4,018 million dollars) to £2,473 million (6,924 million dollars).

This trend has been aggravated by a change in the balance between exports and imports: *in the past, British and overseas sterling area* exports and imports have been complementary. Britain has imported foodstuffs and raw materials from the area while exporting ready-made goods to it. Such a movement meant that there was no great strain on sterling balances. When Britain's imports from the overseas sterling area rose, the supplying nations could use the funds accumulating as a result of more trade to strengthen their own currencies.

The situation was a convenient one for Britain: the sterling balances held in London provided a small but useful source of liquid funds to help in the conduct of the London international financial market. But since 1959, the overseas sterling area has been buying more manufactured goods, and more from outside the sterling area.

This is partly the result of a loss by Britain of export competitiveness as her prices have risen. But it is also due to the whittling away of privileges given to British goods—the narrowing of import duty preferences in Commonwealth markets and the ending of trade discrimination there against the Japanese and the Americans. Partly, too, it is due to the substitution of the United States for Britain as a provider of capital. Britain's traditional role of assistance in, for instance, India and Pakistan has been very much taken over by America and, since the United States ties a large proportion of its aid to its own goods, American influence is to that extent replacing British. Up to about 1950, the overseas sterling area received about half its capital from Britain. By the early 1960s, this proportion had fallen to about one-third.

A further disconcerting trend concerns changes in the reserves of the rest of the sterling area. When it has been in deficit with the rest of the world in recent years, it has run down sterling balances to cover the deficit; when in surplus it has built up locally held gold reserves instead of converting into sterling and helping the sterling area's gold and dollar reserves. Had the overall surpluses of the rest of the area been converted into sterling, the gold reserves of the area as a whole, would, it has been estimated, now be standing at over £1,300 million, higher than at any point since the end of the war.

Furniture Trade: Hopes and Fears

After two or three lean years, culminating in the disastrous winter of 1962-63, European furniture producers believe that 1964 will see *them back on the road to expansion.* The biggest problem facing many of them at the moment is that orders have temporarily outstripped productive capacity. They now hope that the two big trade fairs opening in London on 27th January and Cologne a day later, will give them a clearer idea of whether the boom will last throughout the year. The short-term future is bright; it is doubts about the longer term that the manufacturers would like settled.

This is particularly true of continental Europe, where there has been some price instability in the industry during the last two or three years. *In spite of this,* intra-European trade in furniture has risen appreciably and one of the better auguries for the future is the way in which the progressive reduction of trade barriers in the Common Market has helped to stimulate trade among the Six. Between 1958 and the end of 1962, for instance, Belgian exports to the rest of the Common Market rose tenfold, from £0.4 million (1.1 million dollars) to £4.4 million (12.3 million dollars). And, by the end of the first half of 1963, exports were running at an annual rate of £7.36 million (20.6 million dollars), 55 per cent over 1962. West Germany, Europe's *largest furniture trader,* has shown a similar trend. Total exports between 1958 and 1962 rose by 105 per cent from £5.5 million (15.4 million dollars) to £11.3 million (31.6 million dollars). In the same period, exports to the rest of the Six rose by 109 per cent from £3.48 million (9.7 million dollars) to £7.18 million (20.1 million dollars).

In spite of relatively higher tariff barriers, countries outside the Common Market have also shown encouraging results in selling to the Six. British exports to the Six in the same period have risen by 385 per cent, from £0.2 million (0.56 million dollars) to £0.97 million (2.7 million dollars) and Swedish exports by 67 per cent from £0.68 million (1.9 million dollars) to £1.15 million (3.2 million dollars). Belgium, after West Germany and France, the next largest trader, has boosted her output by making cheap credit available to producers. But exports have been *helped by the gradual abolition of quotas* and licences and rapidly increasing productivity per worker. If 1956 is taken as the base year, output per man had risen 63 per cent by the end of June, 1963.

Germany also reached record levels by the end of 1962, production having touched £355 million (994 million dollars). But early in 1963 *there was a decline of about 10 per cent,* the first setback the industry has had for some years. However, in the last quarter of the year, estimates show that the trade is once more on a rising curve. In the first nine months of 1963, France took most German exports, followed by Switzerland, the Netherlands, Belgium and Austria.

Factors common to most of Europe seem to indicate that, even if the trade is precariously poised at the moment, its long-term trend is in fact a rising one. Increasing affluence makes faster turnover more likely. Thirty to 40 years ago, a family bought a suite of furniture soon after marriage and expected it to *last through married life. Now, the family* buys on average at least one more, sometimes two. There is also increasing quality and design, with the Scandinavians leading the way and the Italians following rapidly. There has also been an increase in the quality of subsidiary furniture—for the bathroom, the kitchen and *the garden. Finally,* there is likely to be increased competition from Eastern Europe (already a big timber exporter) as trade planners there realise that furniture is an exportable commodity.

In the past, furniture producers have held back from exporting, thinking that national styles do not make for easy selling abroad. *The Yugoslavs and other Eastern Europeans* are already proving them wrong. With increasing manufacture of cheaper furniture in the East bloc, there is likely to be an increase in sales pressure *on non-Communist countries.*

Finland: Outlook Clouded

After the inflation and stagnation of production which gripped Finland most of last year, the outlook for 1964 is now viewed too happily in Helsinki. The boom years of 1959-61 *are unlikely to return: all that Finnish econo*mists expect for is that this year the country will start to move forward again.

Industrial productivity is expected to rise by some 4 per cent, about the same as in 1963 but well below the 10 per cent of the previous two years. A rise in productivity late last year enabled gross national product to go up by 2.5 *per cent, but this was well below the 6 per* cent average for the four previous years.

Key to the future is the ability of the Government to control prices; which rose 4.5 per cent last year. This was followed at the turn of the year by a six-month freeze on the prices of food, textiles and some other consumer goods and building materials. If prices cannot be kept *in check, higher taxation is likely.* A lack of investment finance has held back the efforts of the key forest industry to increase productivity. Forest products bring in about 75 per cent of Finland's *foreign earnings.* A surge at the end of the year resulted in the total value of all forest product exports being about 8 per cent higher in 1963 and exports of paper and pulp up by some 10 per cent.

Exports of all goods and services in 1963 were estimated to be £375 million (1,150 million dollars), about 4 per cent above 1962, which resulted *in the trade gap being reduced from* £44 million (124 million dollars) to £17 million (47 million dollars). A number of foreign loans were received, a large one being floated in New York, the first there since 1934, and new net long-term borrowing abroad is expected to have amounted to nearly £30 million (80 million dollars).

RECORD BRITISH AID FOR OVERSEAS COUNTRIES

Britain's total aid programme had doubled in size between 1957-58 and 1961-62 and Britain's ability to maintain and increase the size of her programme *depended on the soundness of the* domestic economy. This was stated by Britain's Minister of State at the Board of Trade, Mr. Edward du Cann, during the third reading of the Export Guarantees Bill in the House of Commons last week. Mr. du Cann said that the British economy was so sound now that the amount of aid being given during 1963, and in the pipeline, was a record. The total of Government expenditure overseas was currently running at nearly £500,000,000 a year. Private investment overseas amounted to another £300,000,000 a year. This was a very substantial charge on Britain's balance of payments.

ECONOMIC AID—FRENCH OR AMERICAN STYLE?

By Questor

MOST rich countries nowadays supply some kind of aid to those which are poorer than themselves. Their motives are not always clear as crystal. Governments conventionally regard the instinct of charity as the prerogative of private persons and organisations. The expenditure of public money has to be justified in terms of political, or military, or economic advantage, however faraway and imprecisely defined. Much of it, therefore, is wasted by politicians, soldiers and economists.

The U.S. got into the habit of spending large sums on foreign aid when the need was more pressing than an analysis of motives. Habit was reinforced by the various pressure-groups it bred, which were able to use the cold war against communism as a universal pass-key. But now, when the deficit on foreign payments has brought the U.S. to face the fact that its spending capacity is limited, Congress is beginning to interfere with the Administration's discretion to spend the appropriation as it pleases as well as with the size of the sum itself.

This year's cut in the appropriation is certainly large—a cut of about one-third against an average of about 20 per cent. We know that it will have little immediate effect, because the U.S. Administration, which regards the aid programme as an essential part of its foreign policy, has taken good care to keep a comfortable reserve of unspent appropriations from past years in hand. But Congress has simultaneously taken care to circumscribe the use of this reserve. Military aid to Africa is not to exceed $25 million; no military aid is to be given to Latin America except in special circumstances; aid of any kind is to be supplied to Indonesia only when the U.S. national interest is immediately concerned; aid must be suspended whenever a Government—as the Government of Argentina did in 1963—repudiates a contract; and so on.

Congress, moreover, has now expressed a clear view about two of the chief issues raised by all aid programmes. The first of these is the extent to which aid, supplied and received by Governments, should be used to assist private enterprise at home and abroad. In fourteen separate amendments, Congress is seeking to increase the proportion and a special advisory committee has been appointed to report by the end of 1964.

The second is the extent to which Government aid should be provided through international agencies on a multilateral rather than a bilateral basis. Multilateral aid is undoubtedly more efficient in getting value for money, but prevents the immediate donor from attaching political or economic strings to his gift. The Senate came down in favour of more multilateralisation, the House heavily against.

It is interesting to compare the U.S. debate about aid with that which has been started in France by the recent report of a Government-appointed commission of inquiry. The question is of interest there, because of the end of the Algerian war, the improvement in the French balance of foreign payments, and perhaps because of General de Gaulle's wish to cut an independent dash in the world. France has always spent a great deal on aid—more than any other member of the O.E.C.D. in relation to national income—but the lion's share has gone until recently to Algeria and other ex-members of the colonial empire; military and similar prestige expenditure in territories outside Algeria has been costing even more than economic aid. The time has now come for a fresh look.

The French commission, starting logically from the beginning, decides that foreign investment (as distinct from aid) is economically inferior to investment at home and is an expensive way of stimulating exports. It comes down in favour of it on the ground that the West has an interest, not so much in combating Communist infiltration as in preventing the development of a hungry and hostile poor half of the world.

And it admits that there are national advantages to be gained as well. It suggest that the high French ratio of aid to national income should be kept up (which means, on the optimistic assumptions of the economic planners, doubling the amount between 1961 and 1975) and it makes various general suggestions about its use. In particular, it suggests that France should devote a decreasing proportion of its aid to the ex-empire, that she pay attention to the efficiency of recipient Governments rather than to their political leanings, and that she should channel a larger part of her total aid through multilateral (i.e. European) institutions. The whole emphasis, moreover, is on State aid, rather than on State aid as a means of helping private concerns.

I cannot claim that Britain's present motives about aid are clearer than those of the U.S. or of France; most of the British thinking about the subject is distorted by old assumptions, some political and some economic, about the nature of the Commonwealth and the working of the sterling area. But it is possible that British politicians and officials, with a long tradition pressing on them, take the broad *view more instinctively than those of some other* countries. And I think that most of them, once the sterling area finally collapses, would agree that multilateral action is best.

The highest possible proportion of that aid which is not military support, or dumping of surpluses, or export promotion should be channelled through bodies like the I.D.A., which are staffed by *impartial experts in development.* The free flow of private investment capital should be encouraged by the establishment of an international insurance scheme—the World Bank would have done it two years ago if there had been enough support. The rich, as the French commission pointed out, have a common interest in preventing the emergence of a hostile poor.

STEEL PRODUCTION IN U.K.

Production of steel in Britain showed a marked rise in 1963, and the demand for British steel products in world markets rose to a record level. Total production of steel in 1963 was 22,520,000 tons, which is 10 per cent. higher than in 1962 and somewhat above the total for 1961, though still below the peak of 24,305,000 tons achieved in 1960.

Capacity utilisation in the steel industry in 1963 is estimated to have averaged 79 per cent and the rate improved progressively in the course of the year. Weekly production in December (at 519,300 tons) actually reached the highest level ever recorded.

Direct exports of steel in 1963 are estimated to have been at a record level—some 9 per cent more than in 1962 and about 4 per cent. more than the previous peak of 4,200,000 million tons in 1961.

BANKING REFORM IN SWEDEN

NEED FOR FRESH COMPREHENSIVE STUDY FELT

SWEDISH banking consists of many paradoxes: though the bulk of commercial banking is restricted to five leading banks who control 80 per cent of deposits and act more or less *oligopolistically* in relation to each other, they face competition from other credit institutions like savings banks, postal-giro and rural credit institutions. Although these specialised institutions fulfil different functions, there is, nevertheless, considerable overlapping, particularly in the competition for deposits and in providing means of payments or transfers. While, on the one hand, the Swedish banking system has reached a degree of maturity and displays a high level of efficiency, the policies and methods of the central bank (*Riksbank*) and the Government, on the other, have failed to create conditions in which banks could play a useful role and function normally. Though the Riksbank has enforced various restrictive measures and *ad hoc* controls on top of a series of directives and requests to counter recurring *inflationary pressures*, it has failed to evolve an adequate technique of central banking control. The limits imposed on the banking system by legal restrictions and administrative controls are the source of the main weakness of the system, yet, within these limits, the banks have largely maintained flexibility in their policies and have been adaptable to changing environments.

The 1955 Act

The Swedish Banking Companies Act, 1955 has largely become an anachronism within eight years of its operation, because of the predominant but misplaced emphasis that it lays upon the protection of the interests of depositors. Security of deposits is the fundamental element in any system of banking, but danger to depositors through imprudent policies or unscrupulous managements is very remote now-a-days. The 1955 Act has undergone so many amendments and revisions that it already looks like a "patchwork of legislation," as a result of limited changes on various aspects that have so far taken place. Many of the changes have been the result of the initiative taken by the Swedish Banks' Association. The banking quarters now feel that a time has come for a radical reform of the stipulations of the Act dealing with the business operations of the banks, and a general review of the principles for the management of banking business.

In Sweden, the tradition of legal supervision and control of the banking system is long and old. Extensive new and detailed legal restrictions were introduced by the Banking Companies Act of 1933 and many of the restrictions already in force under the old Act of 1911 were rigorously tightened. In 1955, a revision of bank legislation was undertaken as a result of the recommendations of an expert committee which had laboured for six years to complete its report; but the committee was not required to review the *entire* complex of important problems concerning the ways and forms for the operation of the banks' activities. The committee reported only on certain specific aspects of banking, like the banks' right to receive deposits, their duty to maintain adequate cash reserves and their right to grant term-loans and unsecured advances. In view of the structural changes in the banking system and the rest of the economy which have occurred since 1933, a general review of bank legislation would have been of vital importance: since this was not done, the inadequacy of the Swedish Banking Companies Act, 1955 has been evident in recent years. In the paragraphs that follow we shall draw a broad outline of the problems and inadequacies of the existing provisions and of the desirable solutions. In doing so, we have relied on a comprehensive article on the subject by Mr. Lars Fogelklou in the latest *Quarterly Review* of Skandinaviska Banken.

Restrictions on Term Loans

The most important provisions of the 1955 Act are concerned with the scope of banks' lending operations, capital requirements and liquidity ratios.

The foremost restriction on the scope of banks' lending operations is the emphasis on the short-term loans. Prior to the legislation of 1955, the articles of association of all commercial banks contained a compulsory stipulation to the effect that loans could be granted for a maximum period of only six months, with certain important exceptions. The 1955 Act not only gave a legal recognition to this condition, but also relaxed it somewhat by allowing overdrafts up to one year and term loans up to ten years subject to a maximum of 150,000 kronor on each loan so long as the total of such loans did not exceed 20 per cent of banks' capital funds. Even before this relaxation, there was in actual practice a frequent tacit understanding that the short-term credits would be successively renewed, and many such credits have in fact remained outstanding for long periods. Many borrowers have used these short-term loans for the extension of their fixed capital on a medium- or long-term basis. As the Swedish people rarely relish to invest their funds in equities but prefer to entrust them to credit institutions, industrial development might have been seriously hampered had it not been for the banks' help in extending the fixed capital loans, though in violation of the spirit of the laws.

The Swedish Banks' Association has in recent years recommended further twofold relaxations in the restrictions on term loans: the first of these pertains to 'loans to premium payers' under the rules governing the administration of the General Pension Fund; it has been accepted, in view of the special nature of loans. The other relates to long-term export credits; the Government has responded to this part of suggestion by establishing (in 1962) a special institution for export credits, *Svensk Exportkredit*.

The main justification behind the peculiarly stringent restrictions on the grant of term-loans in Sweden, unlike in the neighbouring Scandinavian countries, is apparently to guarantee the liquidity and solvency of the banking system, but the arguments are not very convincing. Even if the banks were liberally allowed to grant term-loans, they would certainly be selective and ensure sufficient security and safety for bank funds. Perhaps, the objection is against the principle of borrowing short and lending long. Sound banking, to the Swedes means, as to many others, lending largely on a short-term basis.

Security for Loans

The most prevalent and popular form of lending in Sweden is loans or advances against a note of hand, that is, the demand pronote. But the loans and advances *must* be secured by some type of collateral of which the most common are mortgages on buildings, plant and machinery, bonds, shares, personal guarantees and in certain cases merchandise. The banking legislation provides that loans may not be granted, unless satisfactory security is furnished. To the three exceptions to this rule, namely, loans to all classes of banks and public authorities, short-term loans to businesses for business purposes and discounted bills of exchange, etc., a fourth was specially added by the 1955 Act: unsecured loans to small businesses up to a maximum amount of 75,000 kronor in each case, provided that the total amount of these loans did not exceed 10 per cent of the banks' capital funds. Within the same proviso, a further relaxation allowing unsecured loans up to 5,000 kronor to businesses other than small ones, was made in 1960. In 1962, again at the initiative of the Swedish Banks' Association, the limit was further raised to 15,000 kronor.

In spite of these relaxations and exceptions, the possibilities for unsecured loans are still limited: even while introducing the Midland Bank type of 'personal loans' under which no security is required, the Swedish banks themselves arrange for some type of collateral in the form of credit insurance in order to comply with the law. The peculiar restrictions on unsecured loans by Swedish banks, unlike the position in other European countries, are of particular relevance to us in India at a time when several restrictions on unsecured loans to certain companies or firms have been introduced by the recent Banking Laws (Miscellaneous Provisions) Act, 1963. Bankers' experience not only in India but throughout the world is that many unsecured loans are far more safe and give much less trouble than some of the secured ones. In practice, the restrictions on unsecured loans have proved to be an obstacle to the banks' meeting reasonable requests for bank credit. It is a welcome sign that the Swedish Banks' Association is asking for a reconsideration of the 'strange legal requirement of security' for an ordinary short-term bank loan, although our own Indian Banks' Association has been satisfied with securing a couple of exceptions in the Banking Laws (Miscellaneous Provisions) Act before it was passed.

Shares and Debentures

As compared with the position in Holland, Switzerland, Norway, Denmark and Finland, the stipulations of the Swedish Banking Companies Act regarding banks' right to acquire shares or debentures are extremely restrictive. The reason for these prohibitions is that shareholding is supposed to imply a risk of unwise speculation—a risk alien to the nature of banking. In practice, however, a bank's inability to acquire shares or debentures for short period investments or to guarantee or underwrite new issues has meant considerable hardships to small enterprises who do not have adequate resources of their own or who cannot wait till favourable opportunities in the capital market are available. Moreover, the Swedish Banks' Association has maintained that there are weighty reasons—both economic and practical—in favour of giving the banks the right to acquire debentures at least to a limited extent. Debenture loan is a very convenient form of loan, and an important source of finance for industry.

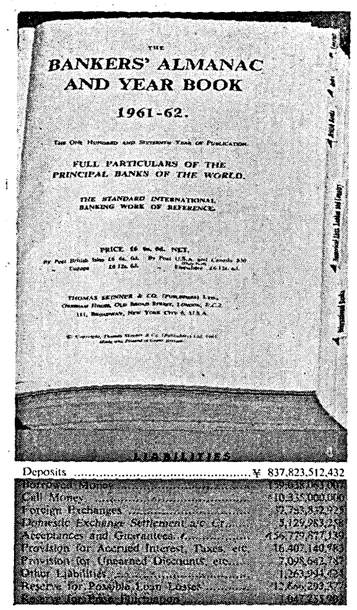
According to the view of the Swedish Banks' Association, small industries will find it particularly difficult to obtain finance without the help of bank guarantee or underwriting, especially when business conditions are less favourable. The Association has, therefore, suggested that Swedish banks may be allowed to acquire shares up to the total value of 50 per cent of their capital funds and debentures up to 15 per cent of their capital funds. Among the new and worthwhile innovations suggested, are two new types of securities representing something in between the debentures and shares, namely, loans against participating debentures and convertible debentures. For obviating the difficulties of small businesses in obtaining risk capital, it has also suggested that special issuing houses and holding companies may be established and banks may be allowed to acquire and hold shares in them in the same way as they have been permitted to acquire shares in the case of other specialised institutions like *Industikredit* and *Exportkredit*.

Right to Receive Deposits

The Swedish Banking Companies Act 1955 prescribes the principle that a bank must observe a certain relationship between capital and reserves, on the one hand, and between the capital funds and deposits, on the other. If capital funds do not exceed 5 million kronor, deposits must not exceed 25 million kronor: If the capital funds are more, a very complicated formula prescribes the maximum level of deposits. Some relaxations in the formula have been allowed at the instance of the Banks' Association, but several problems still remain: for example, the question whether debenture capital borrowed by banks is to be considered as deposits or loan capital is still to be settled finally. There are further restrictions on the maximum amount permitted on a single savings bank account and on the branch expansion programmes of the banks which in many ways limit their efforts at deposit mobilisation.

The Banking Structure

At present, the structure of Swedish banking is more complex than in England, because, in addition to the postal-giro and the postal cheque service, there is a heterogeneous group of banking and mortgage institutions. Some of the problems relating to banking operations and management are already being considered by the *Credit Institution Committee* set up a year ago to define the areas of activity of the various credit institutions. There is, however, a strong case for appointing another high-powered committee, with broad terms of reference, for undertaking a comprehensive review of every phase of banking activity and legislation in Sweden. Apart from outlining the directions in which relaxations are necessary, such a committee will also have to face the specific task of assessing the impact of the developments in the gradually maturing Common Market and speedily integrating European Capital Market upon Swedish banking. Such a review by any expert committee is, however, a long-term affair: meanwhile, the Swedish bankers are waiting and wondering how far their immediate problems will be solved by the authorities.



A GREAT BANK?

How do you judge the world's great banks? Deposits are one way. The Mitsubishi Bank's deposits of well over eight hundred billion yen* tell part of the story. For the rest, speak to the world bankers who respect Mitsubishi and the business leaders who prefer to deal with it. The Mitsubishi Bank can make your dealing with Japan easier and faster.

IN STEP WITH TOMORROW

New processed foods, new pharmaceuticals, and many more new products are coming on the Indian market every day. They create new packaging problems ■ At Poysha, one of the leading tin container makers in the country, they are always geared to meet the requirements of their customers. In 1961 they pioneered the manufacture of 5½ oz juice cans. Soon these will be lithographed too. Next on the agenda is a much wider expansion of the range of packaging material. What is more, plans are ready for the setting up of subsidiary factories in the heart of the fruit and vegetable growing areas to help the canners with quick and economical canning facilities. Poysha are indeed always in step with tomorrow.

PUBLIC ACCOUNTABILITY OF PRIVATE CORPORATE SECTOR—II

WHY NOT APPOINT SUPERVISORY BOARDS?

(Contributed)

THE grounds for applying the test of public accountability to private sector enterprises are stronger than those commonly cited in the case of public sector enterprises. Firstly, the control over public sector enterprises through public accountability is advocated to see that those enterprises do act and function in public interest. In fact, the public sector enterprises are from the very start public-interest oriented. In the case of private sector enterprises, it is all the more necessary to see that they do not do things that might be against public interest. Secondly, the private sector enterprises are in a big way responsible for the success of the national economy as a whole and in our country for the success of the Five-year Plans. Also, they are expected to maintain the country's ability to compete in the world markets. Thirdly, in a country where capital and technical resources are limited, it is important to see that they are most efficiently and desirably used. Such use of the resources is not automatically assured by leaving the private enterprise to operate on the basis of maximisation of profits. Fourthly, private enterprises in a free society do influence the character of the society. One of the ways of influencing the character of the society is by contributing to the political parties and thereby moulding the character of laws of the land. Fifthly, public accountability is necessary in the case of private sector enterprises to see more closely and precisely to what extent private appropriation of wealth diverges from the accepted goal of reduction of gap between the various sections of the society and to suggest ways of effecting harmony between those classes.

It may be mentioned here that there are other alternative controls also, but, in comparison to public accountability, they have either become blunt with the passage of time or are found to be less effective to achieve the desired results in a pluralistic society. One kind of control is the economic control by markets. The efficacy of this control is gone. The second kind of control is the existence of countervailing power which means organised resistance to corporate management policies. This control, according to the past experience, could not be organised on a wide front and has, therefore, proved to be inadequate. At best, countervailing power could be developed on the labour front and it secured benefits for the labour only whereas the interests of the consumers could not be safeguarded. A third type of control is the control by the rule of law, which, in democratic societies, could not be pushed beyond a certain stage.

Welfare of Society

The acceptance of concept of public interest by the State for operating industrial enterprises was easy, as, in democratic societies, Government's existence and stability very much depended on its record of work for the general welfare of the society. In the private corporate sector, the acceptance seems to be confined to certain enlighted corporate management circles only. In the western world, the chairmen and presidents of big companies have started looking beyond the frontiers of shareholders and creditors to consumers and public while formulating the business policies. But this realisation, however, has not yet quite clearly resulted in the dawning of a realisation of public accountability of private sector enterprises. It is seen today that the public sector is subjected to the test of public accountability in a number of ways and to a considerable detail, whereas only to a very small extent has the private sector been made accountable.

By far the most important argument used for prescribing a very strict test of public accountability for the public sector enterprises is that the public sector industries, being bereft of profit motive, their efficiency has to be judged in some other effective manner. Then there are other arguments also, namely, that the attainment of targets set for the public enterprises, the attainment of national objectives, the regulation of undue powers of managers of monopolistic public enterprises, etc., justify the application of test of public accountability. Among the methods employed for securing public accountability of public enterprises, one is that, in some cases, public sector enterprises are governed by special statutes, rules and regulations which act as automatic means of controlling their policy decisions. These statutes also specifically lay down the controls to be exercised by the Government and by the *Ministers. They are* also required by law and often by directives given to them by the Government to disseminate adequate information by preparing full and factual annual reports and accounts, organising efficient public relations departments, issuing informative literature on major policies of production, expansion, labour relations, etc. Also they are subjected to control by Parliament in several ways, namely, through Parliament questions, debates and resolutions, examination by Public Accounts Committee and Estimates Committee and inquiries by special committees of Parliament. Apart from these, financial transactions and working of the public sector enterprises are subjected to close scrutiny and audit by the Comptroller and Auditor-General. In regard to the last-named control, there are certain express provisions provided for under the Companies Act, 1956 in our country. Provisions of Section 619 place the Government companies under the jurisdiction of the Comptroller and Auditor-General for its audit and those of Section 619A cast an obligation on the Central Government to place the annual reports of Central Government Companies before Parliament and on the State Governments to place such reports before their respective State legislatures.

"Numbing Effects"

As against the foregoing array of diverse methods subjecting the public sector enterprises to public accountability which sometimes cause "numbing effects" on them, the corporate bodies in the private sector are made primarily accountable to their shareholders and to the public in a limited way. In the first place, the Companies Act contains certain provisions which ensure that companies are set up on an honest basis. These regulations relate to the preparation of memorandum and articles of association and prospectus in which a series of disclosures which might help the investors to make investment decisions are required to be made. Another set of provisions under the Act requires the companies to hold annual general meetings and present annual accounts and report to their shareholders. Annual accounts and a number of other documents are also required to be filed with the Registrars of Companies under the provisions of the Act for inspection by the public and for scrutiny by the Government. The companies are also required to keep certain registers containing the list of shareholders, details of the shareholdings and other particulars of financial interests of directors, etc., in their registered offices for inspection by the shareholders and creditors. The provisions of Company Law in our country also require the passing of special resolution by shareholders and approval of the Government in regard to a number of matters such as inter-company investments and loans beyond certain stipulated limits, appointment of managerial personnel, their remuneration and contracts entered into by the companies with their managerial personnel and their associates, etc. The provisions of the Act also, under certain circumstances, confer powers on the Government to get the affairs of the companies investigated by inspectors. Thus, the scope of public accountability in the case of private sector enterprises stops with the foregoing few provisions contained in the Companies Act.

In reality the foregoing requirements under the Companies Act do not ensure adequate public accountability of the private sector enterprises. Broadly speaking, any scheme of public accountability of the private sector enterprises should deal with three matters. In the first place, fraudulent and dishonest practices and oppression of minority rights have to be investigated and checked. Secondly, the scandalous waste of which chances cannot completely be ruled out in the private sector is to be prevented. Thirdly, policy decisions of the private sector need to be brought out in the open so that it could be seen that they in no way militate against the goals set and accepted by the society. For looking into each of the foregoing things, different ways of public accountability are to be evolved and, in evolving these, one has to see that they do not inhibit the smooth and successful working of joint-stock companies concerned and that they also do not discriminate between the two sectors, namely, the private and public sectors. In fact, as far as possible, the various devices of public accountability should apply equally to the public and private sector industrial organisations.

In order to secure control over the activities mentioned, one effective way of subjecting the private sector enterprises to public accountability would be to require them to publish information on their working in a very detailed and comprehensive manner. Over the span of last one hundred years or so, the scope of annual accounts of companies has very considerably widened. In the beginning, when business enterprises were one-man ventures or joint ventures promoted by a small group of people, annual accounts were a matter of 'mere historical record.' But, as the number of shareholders increased and the companies acquired the character of 'public companies' in law, as loans and advances came to be sought by these companies from financial institutions and banks and as wider appeals made to the public for large amounts of share capital, annual accounts became an 'instrument of accountability' and a 'public address' rather than a 'solilogy' and an 'aide-memoire.' In the nineteenth century, the legal injunction to disclose the financial working of companies in the form of profit and loss account and balance-sheet under the Company Law was regarded as "sheer legislative interference with the benevolent workings of *laissez-faire*."

Wider Economic Interest

In the present times, when the companies have become powerful engines of economic progress, the functions of disclosure in accounts are not merely restricted to the prevention of fraudulent and other abuses of financial stewardship and the exercise of shareholders' control "as compacts between particular boards of directors and their shareholders." The wider economic interest of society demands "disclosure, because a free economy operates through spontaneous attraction of resources to points of highest productivity" and for this process to work "the provision of finance is crucial. Social economy in real resources demands that finance is channelled to uses where the rate of return is high and away from uses where it is not." This point has very cogently been put forward by Professor Baxter of the London University who submitted for the consideration of the Jenkins Committee that "if the economy is to work efficiently, the decisions regarding the fruitful uses of resources by the individuals" must be based on adequate information. Investors should have available the fullest and clearest data on the working of the various sectors guided by such data, they will put new resources into the sectors where likely returns are the highest—thus helping to give the consumer what he wants and to reduce abnormally high profits rates to the competitive level.

The society that fails to provide itself with the best available information is wasting resources and keeping its income needlessly low; when applied to such a society, the main economic argument for freedom becomes hollow since most people concerned would probably be better off in material things if they abandoned private enterprise and entrusted new investment to state planners with dictatorial powers to extract information. Considering these imperatives, the annual accounts and other sources of information of the companies should among other details required under the law, disclose financial connections of companies with other firms, past and present levels of production, employment and investment, reveal the background of policy decisions relating to production, employment and pricing. The details of management structure, formal agreements made with directors, various other bodies, etc., should also be disclosed.

Another way of securing public accountability would be that some means of questioning and reviewing the working of companies should be established. Already for the public sector undertakings, a number of parliamentary bodies such as the public accounts committee, estimates committee, standing committee of parliament are there which periodically or even continually conduct the examination of the work of these enterprises. Certain expert quarters in the West which favour the idea of public accountability of private sector

MANPOWER SHORTAGE IN COTTON MILLS

TRADE UNIONS TO PRESS FOR BETTER TERMS

From Our Special Correspondent

MANCHESTER, *21st January*

AFTER simmering just below the surface for some considerable time as a controversial issue, the future of resale price maintenance, with all its implications, has suddenly flashed into the limelight. From a purely political standpoint, the Government's decision to introduce legislation, aimed at ending the system, is, at the very least, courageous, as such a step was bound to produce strong reactions from many sources.

MANCHESTER LETTER

Some commentators have suggested that the proposals offer too many loopholes and the possibility of delays confusing the issue may undermine its effectiveness, but the stand which is to be taken against price-fixing must have very substantial repercussions on the economic scene. The attitude displayed is nevertheless well in line with earlier legislation drawn up with the object of curtailing restrictive practices and curbing the powers of monopolies.

One of the complaints raised about the way in which the previous cases of alleged restriction have been tackled was the slow rate of progress achieved, the lengthy hearings and the long wait for a decision which inevitably caused a lack of confidence in the industry under review. If the present legislation succeeds, it is to be hoped that more effective measures will be adopted to investigate the appeals which are likely to be put forward by many interested parties.

Five Years Back

Although the cotton industry's direct acquaintance with such events dates back for some five years, the experience is still sharp enough in many memories to bring recollections of the confusion then caused by the eventual abandonment of the Yarn Spinners' and the Cotton Yarn Doublers' Agreements. Before that, it had been the turn of members of the textile finishing trade to fact the tribunal probing alleged pricing arrangements on behalf of the Monopolies Commission.

In each case, the schemes then in force were regarded as being against the public interest and their sponsors were given the opportunity to withdraw the arrangements. Only in two instances among the many so far heard has the Restrictive Practices Court failed to find against the organisers of the practices which were being surveyed. There must obviously be numerous ways of creating defensive mechanism to sustain a particular industry or service against those who threaten to undermine its foundations. Equally, there will be two points of view as to whether such steps are justified.

The opponents of these schemes strongly contend that they bolster up the inefficient and smother initiative; supporters are just as convinced that they offer traders who have an important stake in an industry the chance to make reasonable profits and keep their machinery up-to-date and competitive. Although the agreements in cotton yarn spinning and doubling have long since ceased to exist, it is as well to remember that they consisted not of price-fixing pure and simple but of a minimum margin arrangement under which competitive prices could still be quoted. The margin, and not the final selling rate, was the subject of the pacts.

Leadership, the Answer?

Some local significance can be found in the current outbreak of dissention over the proposed new legislation. Many influential individuals and companies within the cotton textile industry still feel strongly that margins should be maintained to eliminate weak selling in time of strain.

Behind-the-scenes moves have been taking place in an attempt to secure official sanction for some system of recommended price levels which would not cut across the five-year-old verdict of the Restrictive Practices Court. In view of the latest developments, it seems very unlikely that the Board of Trade in its present mood would countenance any scheme of this kind. Price leadership on a completely informal basis is the only possible alternative. Such an operation could be carried out more easily now that the industry consists of a smaller number of units. It may, indeed, encourage more mergers provided they do not approach the "monopoly" standard.

As often happens, two items of news affecting the trade coincided last week, both of which raised fundamental issues concerning wages and working conditions which caused considerable misgivings about the future. On the one hand, the spinning and weaving trade unions decided to go ahead with their approach to the employers for better terms, while a report from Oldham disclosed that one of the largest mills in the area was discontinuing shift working.

Taking the second point first, the attitude of the operatives at the Lily Mill at Shaw in reverting to single day-shift operation in two of the three ring rooms highlights the difficulty experienced by the management in securing enough women to work the shift which runs from 2 p.m. to 10 p.m. Opposition to the afternoon-evening shift from housewives can be attributed to a number of causes, not least the alternative employment offered by other firms in the area, both textile and non-textile, which do not involve evening work.

The social consequences of the shift system have always been a drawback, but, if a streamlined industry is to operate successfully in these highly competitive days, there seems to be little alternative but to use the expensive machinery now installed to the best possible advantage. In theory at least, the costs of production must be kept at the lowest possible level and it is difficult to see how the latest plant can be economically worked on a single day shift.

The labour situation in the industry as a whole has undergone a pronounced change in the past few months. Although the position varies from district to district, there are constant reports of a shortage of manpower, particularly in specialist occupations within the mills. Fortunately, too, so far this year, the weather has not caused the usual rate of absenteeism which is always liable to hamper productivity during the winter months. This factor has lately become even more vital now that the redeployment of labour means that the numbers employed in particular processes have been reduced to a minimum.

These important aspects of the current state of trade are sure to be raised by the employers at forthcoming meetings with the unions when the whole question of future labour relationships in the industry comes up for consideration. It is not yet clear whether the leaders of the operatives are planning to put a detailed scheme before the millowners, but they are aiming at a comprehensive system of improving working conditions as a whole.

The official statement issued by the executive committees of the various unions said that the whole question of wages, holidays, hours of work and redundancy had been considered. The meeting expressed dissatisfaction with the method of forcing wage increases and other improvements in time of good trading and the difficulties experienced when trade was not buoyant. A decision was made to approach the employers for talks about the possibility of "programming" increases over a period of a few years "to establish some stability and to avoid disputes."

(Concluded from previous page)

have suggested the establishment of Supervisory Boards for each of the basic industries like the Iron and Steel, Coal, Oil and Gas, etc., and a General Supervisory Board for big companies in other industrial fields. These Boards should, apart from looking into the financial working of basic industries and big companies, evaluate their general planning, supply and production capacities, price policies and also see how their policies fit in with the Government's policies at the national plane. These Boards should, however, not undertake lengthy internal probing and inquiries which might become a burden on the industries and companies, but should consider reports and accounts published by them, take oral evidence etc. Further, the boards should do the assessment periodically, say, once in three years or so in various industries and groups of companies. The setting up supervisory boards as suggested above should not meet with opposition from the private sector, as the public sector enterprises are already being investigated by a number of parliamentary committees.

Thus, the foregoing two important suggestions would go a long way to make the public accountability of private sector enterprises really effective as they would satisfy the main aims of public accountability, namely, that public accountability opens major decisions to informed criticism and that it increases the influence of public interest on management decisions and widens the criteria by which industrial organisations are to be judged beyond the traditional economic or commercial tests.

LAKSHMI MACHINE WORKS LIMITED

(INCORPORATED IN INDIA ON 14TH SEPTEMBER, 1962 AS A PUBLIC LIMITED COMPANY UNDER THE COMPANIES ACT, 1956)

Registered Office : **348, AVANASHI ROAD, PAPPANAICKENPALAYAM, COIMBATORE-1.**

SHARE CAPITAL

AUTHORISED CAPITAL

	Rs.
3,00,000 Equity shares of Rs. 100 each	3,00,00,000
50,000 9% Cumulative Preference shares of Rs. 100 each	50,00,000
Rs.	3,50,00,000

ISSUED CAPITAL: *Present Issue*—

	Rs.
2,50,000 Equity shares of Rs. 100 each	2,50,00,000

SUBSCRIBED CAPITAL

1,00,000 Equity shares of Rs. 100 each Subscribed by Promoters, Directors, their Friends and relatives.	1,00,00,000

AGREED TO BE SUBSCRIBED:

	Rs.
1. Reserved for allotment to Messrs. Rieter Machine Works Ltd., Technical Collaborators of the Company, for the supply of Know-how, Plans and Layout, and for supplies of machine tools upto 12% of the Issued Capital	30,00,000
2. 20,000 Equity shares of Rs. 100 each reserved for allotment to International Finance Corporation, Washington	20,00,000
3. **Now Offered to the Public for** subscription at par in cash, in terms of this Prospectus—1,00,000 Equity shares of Rs. 100 each	1,00,00,000
Total Issued Capital .. Rs.	2,50,00,000

TERMS OF PAYMENT

The share moneys are payable as follows :—On application Rs. 25 per share : On allotment Rs. 25 per share within 45 days of the date of allotment. The balance of Rs. 50 per share in two calls of Rs. 25 each per share as and when the Directors call.

Application for shares :—Application for Equity shares must be made for a minimum of 5 shares or multiples of 5 shares and must be made in the form attached to the Prospectus.

PROPOSED ACTIVITIES

To manufacture complete Blowroom Lines, Carding Engines, Lap Formers, Ribbon Lap Machines, High Speed Combers, High Speed Draw Frames, Speed Frames, Ring Spinning Frames, Double Apron Drafting Arrangements, and manufacture of the complete range of spinning machinery, accessories and Spare Parts to spin cotton and staple fibre yarns and allied kindred materials or products of the same design as those of M/s. Rieter Machine Works Ltd., Winterthur, Switzerland.

TECHNICAL COLLABORATION

The Company will embark on the manufacture of textile spinning machinery of all description in collaboration with the world-renowned Swiss Firm of textile machinery manufacturers namely, M/s. RIETER MACHINE WORKS LTD., WINTERTHUR, SWITZERLAND. The collaboration Agreement is valid up to 31-3-1975.

LAKSHMI MACHINE WORKS LIMITED—(*Continued*)

BUSINESS PROSPECTS OF THE COMPANY

While a number of established units are producing textile machinery and are straining at the leash to meet the country's requirements, the demands are far from being met. Experience of existing manufacturing units has proved that specialised skill and meticulous training make all the difference in securing a proper output and maintaining quality in production. With the foreign collaboration of such a veteran among textile machinery manufacturers as RIETER MACHINE WORKS LTD., WINTERTHUR, SWITZERLAND, the Company can ensure the highest efficiency in output, the incorporation of the latest refinements in textile machine making, and the maintenance of quality. The Company hopes to place on the market textile machines of the same standard and quality as Rieters are themselves producing over the years, the first stage of production to commence in the latter half of 1964. It is expected that based on the present estimates, the Company will make sufficient profits to enable a fair dividend to be paid to the shareholders of the Company after meeting other obligations.

LOAN CAPITAL

The Industrial Credit and Investment Corporation of India Ltd., have agreed in principle to grant a loan to the Company in foreign currencies equivalent to U.S. $840,000 (about Rs. 40 lakhs) and a rupee loan of Rs. 15 lakhs. The International Finance Corporation, Washington, has also agreed in principle to grant a foreign exchange loan of U.S. $960,000 and they will also participate in our equity capital (in foreign exchange) for a sum of Rs. 20 lakhs. Scheduled banks have agreed to advance a block loan of Rs. 65 lakhs. All these loans will be secured by a legal mortgage ranking *pari passu* for all the institutions. The repayment will be in sixteen half-yearly instalments ending in 1975.

LOCATION OF THE FACTORY

The factory will be located at Periyanaickenpalayam, about 11 miles from Coimbatore on the Coimbatore-Mettupalayam Railway route near the Railway Station. There will be a railway siding and easy access by roads. The Company has already purchased 111 acres 74½ cents of land. Adequate supply of water and power have been ensured.

PROGRESS MADE

Import licences for machine tools, component parts and raw materials have been obtained for Rs. 37,80,587/- Essentiality Certificates also for the same for a total value of Rs. 34,86,247/- have been received and necessary applications have been made for getting the import licences. Model machines from M/s. Rieter Machine Works Ltd., have been ordered and these will be got shortly. Indigenous machineries for the first stage of the project have also been ordered for. Building constructions are expected to be ready by April 1964 and the first stage of production is anticipated to commence in the latter half of 1964.

DATES OF OPENING AND CLOSING OF SUBSCRIPTION LIST

The subscription list will open at 10 a.m. on *Monday, 3rd February*, 1964 and will close at 5 p.m. on Wednesday, 19th February, 1964 or earlier at the discretion of the Directors as soon as subscriptions approximating to the amount issued hereunder to the public have been received but not earlier than 5 p.m. on Thursday, 6th February 1964.

FRESH LIGHT ON AIR ACCIDENTS

SAFETY AIDS IN SOUTH-EAST ASIA INADEQUATE

By Our Aviation Correspondent

THE subject of air safety has occupied, of late, an increasing amount of space in the aeronautical press. This is not because of any *deterioration in the accident rate.* Indeed, in spite of a sudden spate of serious accidents towards the close of the year, provisional figures indicate that the rate for 1963 was a slight improvement on that for 1962. The cause of present concern is, rather, the increasing number of accidents—and, if that sounds contradictory, an explanation of how the accident rate is computed will serve, perhaps, to clarify the issue.

As at present calculated, then, the rate is based on the annual number of fatalities related to the annual total of passenger-miles *operated. The present rate, for example,* is a shade under one fatality for every 100 million passenger-miles. Thus, despite the fact that the number of accidents tends to increase every year, owing to the continuous expansion of air transport, the accident rate has actually improved over the last two years. Now, however welcome in itself, the picture of air transport safety which this presents is not altogether reliable. An added disadvantage stems from the impression that the standard of safety is constantly improving. This could lead, in certain quarters, to a quite unwarranted sense of satisfaction. It may be of interest to examine these two charges more closely.

Complacency

Leaving for a moment the question of accident rate presentation, let us deal with the possibility of complacency. One does not imply that this actually exists. So long, however, as it can be demonstrated that the accident rate is improving, a tendency to inaction, to rest on the oars as, it were, is bound to exist. And this, in fact, has been encouraged by some statisticians who have certainly conveyed the impression that, statistically speaking, accidents are bound to increase as air transport expands. This is a dangerous attitude.

At a recent conference in London, convened by the United Kingdom Air Safety Committee, amongst the papers read was one which contained this significant passage:

"It is not the absolute level of risk which counts, but the image of risk in the public mind. A five or tenfold improvement (in the accident rate) in the next decade or so appears to be necessary. In other words, it is not enough that the accident rate be maintained, or even slightly improved. Only a very substantial reduction in the number of accidents will suffice. And, if that reduction is not forthcoming, the image of risk in the public mind is going to assume very ugly proportions indeed."

Method of Calculation

Let us now turn to the actual presentation of the accident rate. While, on the face of it, the present method of calculation may appear to be as good as any other in comparing the relative safety of air transport *vis-a-vis* those of other means of public transport, it does tend to depict the safety of air travel in an unduly favourable light. The air transport industry carried, in 1962, close on 140 million passengers. That figure increases annually. It is estimated, moreover, that the average distance travelled by each passenger is about 600 miles. The quite astronomical number of passenger-miles which this represents, therefore, itself tends to distort the picture. More to the point, however, the picture itself does not reveal the true facts of the situation.

What are the facts? At a meeting in Athens, organised by the Flight Safety Foundation of New York, an exhaustive study was made of all jetliner accidents during the past five years. This clearly showed that an overwhelming proportion of these accidents occurred during two phases of flight—take-off and descent. Of these two phases of flight, moreover, descent accounted for twice as many accidents as did take-off. It was also remarked that, whereas three-quarters of the world total of airliner flights took place in the North American Continent and Europe, yet, of the thirteen accidents which involved air traffic control or ground aids, only two occurred in those areas. The inference drawn was to the effect that, in greater or lesser degree, the remaining areas lack adequate ground aids.

An Interesting Study

These conclusions are now reinforced by an interesting study of airline accidents in 1962 made by a Mr. Peter Clegg and published in *The Aeroplane and Commercial Aviation News.* For the purpose of his study, the author divides the world into seven regions. These are: (1) North America, (2) Australasia, the Far East, and the Pacific, (3) Europe and North Africa, (4) Africa exclusive of the North, (5) South and South East Asia, (6) Central and South America, and (7) the Middle East. He then summarises the accident statistics of 1962 in a series of tables. Thus, he tabulates, by regions, the number of accidents, the number of fatalities, the number of departures, and, as a ratio, the number of flights involving fatalities against the total number of flights. Finally, he tabulates, again by regions, the average number of flights per fatality.

Mr. Clegg's object is to demonstrate that the accident rate, to be of any value, should be based not on the number of passenger-miles flown, but on the number of flights made. "The normal airline passenger," he says, "will have little, if any, idea of the distance he has flown or is likely to fly in his lifetime. But he would probably be very interested to know how many times he can expect to board an aircraft before—according to the laws of probability—he meets with a fatal accident." In tabulating the results by regions, Mr. Clegg aims to show how very widely the risks involved vary from region to region. Finally, he claims that any so-called average accident rate is quite misleading. "The measure of safety prevalent in 1962," he points out, "is largely accounted for by the safety of North American and Australasian operations."

Space precludes any detailed account of the results of Mr. Clegg's study. It must suffice to mention his three principal conclusions. These are: firstly, that flights in North America and Europe total 4,861,700 or more than four times the number of flights—1,114,200—in all the other five regions put together; secondly, the ratio of flights involving fatalities to world total flights shows that North America, Australasia, and Europe—in that order—come out conspicuously better than the remaining four regions. In the case of Australasia, for example, the ratio is 1 : 414,800 as compared with 1 : 33,500 in the case of South East Asia. Finally, in an assessment of safety by regions, South and South East Asia comes out the worst of the seven regions.

Mr. Clegg, in fact, gives us an entirely new picture not only of the comparative safety of air travel, but, more specifically, of where the principal dangers lie. His views and conclusions are not necessarily, of course, the last word on the subject. They do, however, make a great deal of sense—that is undeniable. They merit, one suggests, the close attention of all those concerned with the provision of airports, communications, ground aids, facilities, and services generally—and particularly in the countries of South and South East Asia of which India is one. It is not enough for our national airlines to hold well merited reputations for safety. The same high standards must be applied to the organisation on which, in the final analysis, the safe conduct of air operations so heavily depends.

AIR-INDIA TO BUY ONE MORE BOEING

Air India is contemplating to buy one more Boeing 707, according to Mr. B. R. Patel, its General Manager. Including this, which is expected to be delivered in March 1965, Air-India will have in all eight Boeings. With the purchase of the eighth Boeing frequencies on some of Air India's routes will be increased to cater to the increased traffic on the system. The Corporation is looking forward to the addition of one large jet practically every year to the fleet until such time as the supersonics come into commercial use. With the arrival of Air-India's new Pratt and Whitney powered Boeing 707 320B, Air-India will introduce the eighth service from Bombay to London in August this year. This will be departing from India in the morning and reaching London in the evening on Saturday and will leave London on Sunday afternoon and arrive in India on Monday morning. The Corporation will also step up the frequency of India-Moscow service to two and extend its Sydney service to Nandi, Fiji.

PASSPORTS TO WORLD TRADE

Three Banks have merged. Separately, they have large assets, a fine tradition and a wealth of experience. United, they offer a comprehensive service in *all matters affecting* business between India and any part of the world. Their advice and help are your surest "passports" to profitable trade with those areas.

NEW PRODUCTS AND PROCESSES

Multiple Solar Cells

THE concept of power from sunlight comes closer to commercial reality with the development in Britain of multiple solar cells which have virtually unlimited life and can withstand extreme climatic conditions. The solar cell system for converting daylight into electric current for storage in secondary batteries became generally known when it was used to provide power for electronic equipment in satellites. The cell, developed by Ferranti Ltd. of Lancashire in Britain, is claimed to be the first efficient and economic device for doing the same job in remote land or sea situations at considerably less cost than conventional systems. The new system is based on a large-area silicon photovoltaic cell unit known as type MS40. It is composed of four individual cells connected in parallel to a common heat sink. An integral moulded cylindrical lens encapsulation increases the effective solar radiation collection area. This, together with other design features, gives a solar spectrum conversion efficiency of about 8 per cent at ground level. A trial assembly of the MS 40 modules has just been shipped to the Persian Gulf where it will be used to power off-shore oil drilling. Others are being used to provide light for marine buoys and other navigational aids. Cost of power when using the new cell is one penny per watt hour—based on capital cost of the equipment spread over five years. Compared with conventional power generation systems using commercial fuels and requiring frequent maintenance, running costs of the solar power system are said to be negligible. Other uses envisaged for the solar power system are rural telecommunications, telemetry systems, unattended weather stations, solar powered clocks and repeater stations.

Dual Purpose Fork Truck

The slow process of goods selection, using ladders or portable platforms between widely spaced racks at varying heights in warehouses, is eliminated by the use of a dual purpose fork truck manufactured by Conveyancer Fork Trucks Ltd., Warrington, England. It can also be used as an order-picking machine as well as a conventional reach fork truck. The operator can travel the entire length of storage racking, driving either forward or reverse, adjusting the height of the platform enabling him to select items of stock for miscellaneous order requirements, which are stacked on a standard pallet carried in front of the driver. When order picking is completed the platform is lowered and the truck is driven away and the load deposited in the conventional manner.

Plastic Jacket for Pipe Insulation

A new type of plastic jacket for insulating pipes before use underground has been developed in Britain by Anchor Insulating Co. Ltd., London. Intended for pipes that are to carry water, oil, grain, or other substances needing a constant temperature, the jacket is applied in two stages. First a waterproof polythene outer layer is wrapped loosely around the pipe. Foam polyurethane able to withstand temperatures between minus 50°F. and 240°F. is then injected into the cavity between polythene and pipe. When the pipes are laid they are joined by an oversize polythene sleeve into which polyurethane is injected from mobile equipment. The makers of the jacket claim that by removing the need for brick or concrete pipe ducts the system reduces installation costs. They also supply pre-insulated pipes to any specification.

Odourless Cooking

A griddle and a deep fryer now being produced in Britain by the Flavourfare Ltd., Hamshire, are said to be the only ones with built-in extractor systems that remove all fumes and cooking smells. An extractor fan is enclosed in the stainless-steel body below the infra-red griddle plate. It draws fumes down behind the cooking area, over a precipitator that removes the grease, and expels them at the bottom through a pipe that can be led, low down and out of sight, to a wall vent, or connected to an existing ventilation duct.

New Switch Point

The switch construction department of an important Australian steel mill has recently manufactured and exported longest switch point with a branch-off curve radius of 1,600 m., the most favourable for Central Europe. The advantage of the new construction, designed in accordance with the latest technological findings, is the fact that the train can travel on the branch-off curve—without cant—at a maximum speed of 125 km/h. The new design makes it possible to do without considerable speed reductions at junctions or when running through stations. Some railway administrations already use switches admitted for a maximum speed of 125 km/h, however they have an even bigger branch-off curve radius, a fact causing considerable difficulties especially within the range of railway stations. The enterprise exports about 3,000 to 5,000 tons of switch points per year.

New Grinding Wheel

A diamond grinding wheel on which a layer of fine diamond grit lies parallel to a layer of coarse diamond grit is claimed to give a 10 to 15 per cent cutting power improvement as compared with conventional diamond wheels. Made by the De Vries and Son (Diamond) Tools Ltd., London, it is developed specifically for sharpening tungsten carbide tools, but it can also be used in optical and other industries where smooth surface finishes are required. The two layers of diamond grit are side by side on the face of the wheel and, when the coarse and fine grits alternately contact the material, the average penetration is greater than that achieved with a uniform grit size.

Air-conditioning for Spinning Frames

Spinning requires very carefully controlled conditions of heat and humidity, and the more the output of spinning frames is stepped up, the more air is required for the air-conditioning of the premises containing them. With a view to avoiding wastage and enabling the operatives to work in a normal atmosphere, a big Swiss firm recently produced an individual system of air-conditioning which combines the suction of the roves and the necessary humidification, and above all air-conditions the space inside the frames, and consequently the feed thread. The air circulates in a closed circuit. Thanks to this new solution, the humidification effect is the maximum where most needed, that is, inside the frames.

Air Mixing Device for 'Jets'

A British development of considerable value in the testing of jet aircraft engines is an air mixing device for a "cell" in which the engines are tested under varying simulated flight conditions. It replaces a number of complex systems previously used to achieve the same result. The new unit is a sphere of titanium stabilised stainless steel and is about 14 ft. in diameter. Its function is to feed air to the test "cell" at varying ranges of temperatures and pressures and to act as an anchor point for the 24 in. and 36 in. bore pipework associated with the system.

Compact Ground Prospecting Instrument

A lightweight electromagnetic ground prospecting instrument has been developed by the ABEM company, Stockholm. The instrument, called the Minigun, was subjected to extensive field tests in Canada during the past year and is now being marketed. The single-frequency equipment features two self-contained units connected to each other by a length of cable that serves the double purposes of measuring tape and electrical voltage reference. The total weight, including the feeding cable, is only 9.75 kg. The minigun measures three parameters at the receiver unit—in-phase component, out-of-phase component, and dip of the electromagnetic field at the receiver staff. This staff, a coil wound on a ferrite core, forms an integral part of the compensator-amplifier. Component readings are obtained directly in per cent of the normal field strength for any transmitter-receiver separation up to 40 metres, while readings of the dip of the electromagnetic field can be obtained up to a separation of 90 metres without the use of a feeding cable connection. The minigun is powered by standard dry batteries. The latest electronic techniques are used, including a transistorised printed circuit on a plug-in card for the amplifier. The Company since 1961 a member of the Atlas Copco group of companies, is a pioneer in the development of electromagnetic ground prospecting equipment and also undertakes complete geophysical contract service with air-borne, ground and underwater surveys.

New Step Ladder

A company Handelsonderneming van't Hof, Belvédèrelaan 9, Nunspeet (Holland) has produced a step ladder with pivoting steps for use in the house, in shops or in stores. So long as the ladder is in the folded position the steps are parallel to the oprights; when it is pulled out, they are brought by a lever into a horizontal position. The step ladder is made entirely of metal, the steps too. It comes in 3-, 4-, 5- and 6-steps versions, all the steps folding away neatly when the ladder is closed. The steps are 14 cm. wide and provided with aluminium treads with anti-slip honeycomb surfaces. When closed, the step ladder is only 7 cm. wide. The ladder with three steps is 122 cm. long: length increases by 22 cm. for each successive step. Thanks to a special design feature, the ladder is not unsteady on uneven floors (with differences of up to 8 mm. in level). Even if not properly put up, the ladder is prevented from shooting open by a special catch fitted underneath the top step.

Summary Of Chairman, Mr. T. S. Sundaram's Address

THE following is a summary of the address to shareholders by Mr. T. S. Sundaram, Chairman of the Company, dealing with the Company's working for the year ended 31st August 1963. The Annual General Meeting of the Company was held on 20th January 1964 at 4.00 p.m. at Cement Nagar.

I have great pleasure in welcoming you all to this the eighth annual general meeting of the Company.

Before dealing with the accounts for the year ended 31st August 1963, I should like to refer to the gloom that overtook the world by the assassination of President Kennedy, who had striven hard for the improvement of international relations during the tenure of his office.

We met last year under the cloud of Chinese aggression, which created a spontaneous upsurge of patriotic effort, unequalled at any time in the history of our country. Even now, this aggression on the borders still continues, although the actual fighting has stopped. We should, therefore, be ready to renew our pledge not to rest until the aggression is driven out of our soil. We should be glad, therefore, of our Government's determination to develop adequate military forces to resist aggression from Communist China and their associates. At the same time, our Government have recognised that economic development should not be allowed to suffer through an excessive application, as is due, of the resources for our rearmament programme.

Appraisal of Third Plan

As you all know, the recent mid-term appraisal of the third Five-year Plan, which has been discussed threadbare since over a month in Parliament, as also outside, has disclosed an increased feeling of dissatisfaction and frustration. Whilst the Hon'ble Ministers and their associates were inclined to throw the blame, for this shortfall, on the private sector, the majority opinion of the Press, industrialists and other well-wishers of the country has been that the targets drawn up have been somewhat optimistic and that the situation has been further aggravated by the procedural delays in obtaining foreign exchange resources in the early period of the Plan. More than all, as the Hon'ble Planning Minister himself confessed in Parliament, even in more favourable circumstances, the period of gestation of some projects and/or in some industries should have been longer than what the planners had visualised at the time of the formulation of their Plans, with particular reference to power shortages and the inability of the respective State Governments to keep pace with the growing industrial needs, besides the increased emphasis attached to rural electrification.

Opportunity to Think

Whatever be the outcome of this reappraisal and the consequent action that our Government and the Planners may decide to take, this has given one and all the opportunity to pause and think as to whether our planning targets have been realistic and whether, instead of maximum growth at a point of time, the development policy should have been actually the maximum rate of growth over a period as a whole, commensurate with the other attendant circumstances, such as the investment climate and opportunities, taxation policies at the Centre and States, power supply position, availability of capital goods and foreign exchange with particular reference to their imports, spares and so on.

According to the recent survey, it has been revealed that roughly, two out of five companies in the private sector had to prune their dividends; whilst, one increased and two others, with great difficulty, maintained their previous rates, mostly by ploughing back their reserves. Despite the recently promulgated regulations drastically curbing the beneficial amenities offered by commercial banks and the more stringent conditions to Company Law regulations, the attitude of the present Central Finance Minister, particularly his bold action in abolishing price controls for certain industrial goods and raising the exemption limit for industrial licensing and for capital issues for industries, justifies our hope of a more realistic approach from him to our economic maladies, which alone would ensure capital resources for industrial expansion and investment in productive enterprises. It is, therefore, fervently hoped that the Finance Minister, besides, strengthening the institutional framework of commercial finance resources, would also consider the much needed changes in the fiscal and taxation policies.

Cement Industry

Speaking of our portland cement industry in particular, unless due encouragement is given, the Plan target, both as regards installed capacity and production, cannot be fulfilled and there would be a substantial shortfall. Owing to the heavy capital costs for new projects, as also for the substantial expansion of existing units—it may be mentioned in this context that indigenous supplies of capital goods are 30 to 50 per cent higher in costs than imported makes —most of the industrial licences have been shelved. This is the case even with the contemplated State ventures which have not passed the proposal stage, even after two years.

The need of the hour, to achieve higher installed capacity, would, therefore, be for the Government to review the position dispassionately, without any reference to their being the largest consumers of cement in the country, having thus a direct interest in keeping the cement prices from soaring. The surveys published in the Reserve Bank *Bulletins* in the past two years clearly confirm the facts that (1) the level of profitability in the industry has been lower, compared to the average of all industries during the last three years of the second Plan; (2) the scale of profits and of reserve accumulation in the industry has been inadequate in relation to its very heavy capital requirements; (3) the shift in the structure of cost has gone in favour of employees, raw materials, manufacturing expenses and tax provisions, as against entrepreneurs, dividends and profit retention; and (4) the general attitude to labour by the Central and State Governments has been in preference of bigger labour complement for a given workload, than what is obtained in Western countries, particularly in U.S.A. where it is less than one-tenth in man-hours per tonne of cement output, although our per capita consumption, which is usually taken as an index of progress in a country, is far below that of the advanced countries in the world, at 40 lbs. as against 600 lbs. in U.S.A. and 660 lbs. in Sweden. Unless, therefore, the Central Government is activated by genuine motives for the rigorous rehabilitation of the industry, no substantial results can be envisaged, even when, as the ruling party are now visualising, such basic industries are taken over and run in the public sector.

In the report of the Directors submitted to all the shareholders, full explanation was given as to the unfortunate circumstances which, in spite of the best production results achieved during the year, could not reflect in better working results and profits; mainly due to the substantial increases in costs of production and refusal of the Central Government to accord due compensation as per the escalator clause. In fact, whilst the increase in actual cost was Rs. 5-16 per tonne as on 31st May 1963, it was Rs. 5-24 on 31st October 1963. But the actual compensation conceded by the Government from 1st June 1963 is only Rs. 2.50 per tonne, excluding the reduction of 25 nP per tonne in the selling agency commission. Thus, there is a shortfall of Rs. 2-74 per tonne.

High Rate of Production

The equity of State policies have been, as a great poet expressed, "He that with his hand the vessel made, will surely not in after wrath destroy." But, unfortunately, in the case of our unit, such equitable considerations have not prevailed with the Central Government; and we are one of the four high cost units in the country, that have been totally denied the concessions of the incentive scheme, although we have been producing about 105 per cent of the rated capacity ever since we started production, five years back.

The erection of machinery for the expansion unit is in full swing and we expect the new unit to go into production within the next two or three months, as soon as the additional generator at the T.B. Hydel Station, Hospet, commences generating power. Delayed deliveries of machinery ordered from indigenous suppliers, arising partly by the delays in shipment of essential components from abroad, but mostly owing to the non-availability of plates, etc., from Rourkela, for the manufacture of kilns and the necessity, therefore, for importing these also, have been responsible, in a large measure, for the postponement of production of the expansion unit by nearly one year.

Labour

I desire to take the opportunity of conveying my appreciation to all ranks of labour and staff for their strenuous and efficient co-operation in achieving the production results during the year and for the quick work that is being done in regard to the erection of the expansion unit. My observations will be incomplete if I do not make a special mention of the devotion and great earnestness that our top officers and departmental heads brought to bear on their responsibilities.

I would also like to take the opportunity to record our appreciation and thanks to the Industrial Credit and Investment Corporation of India Ltd., and the Bank of Baroda Ltd., with reference to the capital loans granted for the substantial expansion of our unit. Thanks are also specially due to our Managing Agents for enabling the Company to achieve record production during the year and to the A.C.C. Organisation for their continuous and quick erection work that is in progress.

I now have the pleasure to move that the Directors' report and audited accounts for the year ended 31st August 1963 with the auditors' report thereon, be adopted.

Note:—*The above is not a document purporting to be a report of the proceedings of the Annual General Meeting.*

VOLUNTARY ARBITRATION

NEED FOR CAUTION AND RIGHT DIRECTION

By Dr. R. M. Goil

MUCH interest has lately been shown in the matter of voluntary arbitration of industrial disputes in India. Its widespread use is being advocated, especially at the Governmental level, with renewed emphasis, as a method of fostering cordial industrial relations and stepping up production. Its comparative merits over the existing method of adjudication are being reiterated. It offers, it is being said, a simple, informal, and prompt method of settling disputes, as against adjudication which involves time-consuming litigation, gives rise to feelings of resentment among the parties, undermines mutual faith and, therefore, whittles down the quality of adjustment necessary to settle industrial disputes.

The recognition of theoretical superiority of voluntary arbitration, however, is not new. As early as 1956, Mr. Khandubhai Desai, the then Labour Minister, replying to a debate on Industrial Disputes (Amendment and Miscellaneous Provisions) Bill, commented on the famous 'Giri Approach' (which supported voluntary arbitration) and said that he had always felt that voluntary agreement to refer questions to arbitration was the best solution. On practical considerations, however, he felt that complete *laissez-faire* was out of date and the society cannot allow workers or managements to follow the law of the jungle. Therefore, as a last resort, he supported the Government's power to refer disputes to adjudication. Furthermore, it was pointed out that, even though compulsory adjudication was being retained on the statute book, the Government would endeavour to encourage voluntary arbitration as far as possible.

Similar faith in the desirability of voluntary arbitration has been incorporated in the Code of Discipline framed about five years ago and in the Industrial Truce Resolution over a year back. The tripartite nature of both these measures and their acceptance by all the major employers' and workers' organisations further reinforced the ideal of voluntary arbitration.

Having accepted the "ideal" of voluntary arbitration, however, the parties do not seem to be unanimous about the translation of the ideal into practice on a large-scale. The trade unions and the Government seem all for it, as against the rather cautious attitude of the employers towards it. The speeches and discussions at the two-day seminar on voluntary arbitration in New Delhi in November 1963, sponsored jointly by the All-India Organisation of Industrial Employers and the Employers' Federation of India (*vide Commerce* dated 7th December 1963) are indicative of this cautious approach.

It may be of interest, therefore, to consider whether the present industrial relations climate in the country provides us with an opportune time for a widespread adoption of voluntary arbitration and whether the necessary pre-conditions for such an adoption exist, and to offer some suggestions.

Difficulties Ahead

Odds seem to be very much against a significant improvement in the general industrial relations climate in the country in the near future. Despite the Industrial Truce Resolution adopted by the central organisations of employers and workers in November 1962 and despite the continued "emergency" which prompted its adoption, several strains and stresses have lately been experienced on our labour front both in the private and public sectors. The erstwhile Union Labour Minister Mr. G. L. Nanda also referred to such "signs of tension" at a recent conference of personnel and welfare officers organised by the National Institute of Labour Management, Bombay. Unresolved controversies with regard to bonus and neutralisation of constantly rising cost of living are already causing concern in several industrial and other employments. The situation with regard to work stoppages caused by industrial disputes has, of late, also not been promising. The progress of the scheme of workers' participation in management has been very halting. And reports of the failure of Industrial Truce Resolution have even appeared in the Press.

Difficult situations from the point of view of labour-management relations in several Indian industries may further be expected due to the continued necessity for a faster growth of the country's economy which carries with it a latent threat of inflation and a laggard race between cost of living and wages. More production and better production will further call for an accelerated pace of technological improvement and rationalisation and the consequent retrenchment and re-adjustment of at least a part of the labour force are likely to further sharpen the tensions, especially in an economy already replete with chronic unemployment.

Mutual negotiations culminating in voluntary arbitration will certainly help in the improvement of this climate and will pave the way for a spirit of genuine co-operation between labour and management. The realisation of this objective of genuine co-operation, however, does not depend so much on voluntary arbitration (the culminating step) as on what precedes it. In fact, it will not be far from the truth if it is said that voluntary arbitration is more a "result" of good industrial relations and mutual confidence and understanding between the parties rather than a "cause" of it. The extent to which the parties practice voluntary arbitration is, in other words, an index of the extent to which they rely on themselves and to which they refuse to accept any outside interference except when they themselves seek it.

Pre-conditions

For, after all, voluntary arbitration is nothing but voluntary reference of a controversial issue to some disinterested person or persons to obtain a "decision" when the parties have tried and failed to arrive at an understanding themselves. Reference of any dispute to such arbitration, therefore, presupposes the existence of an adequate grievance and a negotiating machinery and the capacity and willingness of the parties effectively to utilise it. Widespread effective use of mutual grievance and negotiation machinery, it may be hoped, will itself lead to a widespread reliance in voluntary arbitration. And powerful, united, and responsible labour movement, enlightened management, and an atmosphere of mutual trust and confidence are the essential pre-conditions for the former. So long as, therefore, there are rifts within the labour ranks even at the plant level, so long as union leadership finds it difficult to accept boldly and implement hard decisions, so long as the Code of Discipline and the Truce Resolution continue to be violated, and so long as there is an atmosphere of mutual distrust, simple insistence on voluntary arbitration will not mean a real difference. Use of voluntary arbitration should, and automatically will, be phased along with progress in these areas. Government's policy of encouraging collective bargaining, of inducing comprehensive agreements between the parties, of recognising a single "representative" union, of instituting formal grievance procedures in the undertakings, and of spreading facilities for workers' and union leaders' education, and the gradual spread of the idea of human relations in industry will all contribute significantly to progress in these areas and, through it, to voluntary arbitration.

Thus, the correct approach lies not in coercion (that is how the employers seem to be feeling about it) but in encouragement; not in demanding voluntary arbitration but in creating an atmosphere in which it will "voluntarily" evolve itself. Certain guidelines may, no doubt, be suggested for such an evolution.

Binding Award

Arbitration may be voluntary or compulsory both in the matter of referring a dispute to it and in accepting its award. When we talk of voluntary arbitration in India, we mean only voluntary reference of the disputes to it. Once a matter is voluntarily referred to arbitration, its award is binding on the parties (as it is in the U.S. and several other Western countries) and not non-binding (as it is largely in the U.K.). It is also in this sense (voluntary arbitration with binding award) that the term has been used in the Industrial Disputes (Amendment and Miscellaneous Provisions) Act, 1956. And that is also how it should be. For not much useful purpose will be served if the parties, having failed to arrive at a settlement by themselves, agree to refer some dispute to a third party for "decision" but refuse to abide by the "decision" of that party. Granting of legal status to arbitration awards (as is conceived in a recent Bill to amend the Industrial Disputes Act, 1947) is, therefore, a step in the right direction.

This, however, should not mean a complete denial "to the parties to the dispute the chance for any further reference to courts of law" in the matter. Grounds such as that any one of the parties does not represent the majority, that the arbitrators have gone beyond the terms of reference, and that the issue under dispute was not arbitrable under some existing contract should certainly be legitimate grounds for either party to go to the court against the arbitration award. A definite time limit, however, ought to be provided for making an appeal against the award.

'Contract' and/or 'Grievance' Arbitration

Arbitration may be either an extension of grievance machinery or of negotiating machinery or of both. In an industry or firm where collective bargaining is well established and there are regular contracts or agreements between the employers and the workers with regard to the latter's wages, hours, and other conditions, arbitration can be used to settle both kinds of disputes: (a) disputes involving "interests" or economic disputes, and (b) disputes involving "rights" or interpretative disputes. While arbitration in the first kind of disputes is called "contract arbitration," it is called "grievance arbitration" in the second. In the first, the matters under dispute are those that are relevant for negotiating a contract such as wages, hours, holidays, workers' share in profits, etc. In the second, the disputes are only over rights that flow from existing agreements. When, for example, a dispute is over the content of the Standing Orders in a firm, it is a dispute of "interests." Once the Standing Orders have been framed and agreed upon, any difference of opinion about their application in a particular case will be a dispute of "rights" or of interpretation. The parties have to be clear in their minds if they are willing to submit both kinds of disputes to arbitration or only the latter type of disputes. In the U.S., for instance, arbitration is largely limited to the "rights" issues; "interests" issues are only to be bargained between the parties. Most collective contracts, there, contain a no-strike clause and a formal grievance procedure with voluntary arbitration as its last step.

Attempts may be made in India first to popularise voluntary arbitration in the limited sphere of 'grievance arbitration,' i.e., for the settlement of those 'rights' disputes that flow from contracts wherever they exist. Such contracts must provide for a formal grievance procedure culminating in voluntary arbitration. Where no formal contracts exist between the parties, such matters will be those that normally constitute a grievance under the Model Grievance Procedure adopted by the Sub-Committee of the Indian Labour Conference on Workers' Participation in Management and Discipline in Industry in 1958. These matters are: "complaints affecting one or more individual workers in respect of their wage payments, overtime, leave, transfer, promotion, seniority, work assignment, working conditions, and interpretation of service agreements, dismissals and discharges." Most such disputes will be regarding such routine matters over which Labour Court (not Industrial Tribunal) will have its jurisdiction, should it be decided that they be referred to adjudication under the existing law. As for 'contract arbitration' it is better to advance slowly and cautiously.

Constitution

Whether there should be a single arbitrator or a board, who should appoint and pay the arbitrators, whether the appointment should be *ad hoc* or permanent, and the like may be raised as relevant questions. Since we are talking of voluntary arbitration, the final answers to such questions will ultimately depend upon how the parties feel about them. In general, it may be said that single-man arbitration may satisfy the requirements in cases of 'grievance arbitration.' Such single arbitrators may also be named by the parties on a permanent basis, subject, of course, to provisions of periodic change should it be demanded by either party. Payment for the services of such arbitrators and any other costs involved in it should be shared by the parties both to act as a check against an indiscriminate use of arbitration and to ensure independence of the arbitrators from any kind of influence from within (any of the parties) or without.

In matters of 'contract arbitration,' on the other hand, a board of arbitration constituted

(*Continued on page* 177)

INDIA, WORLD TRADE TALKS AND E.C.M.

PROSPECTS OF BETTER EXPORT OPPORTUNITIES IMPROVE

THE outcome of the Board of Trade meeting that will be held at Calcutta today (1st February) is awaited with more than ordinary interest, for, at this meeting, the Board is expected to decide on the broad approach which India should adopt at the forthcoming two world trade conferences, namely, United Nations Conference on Trade and Development and the Kennedy round of multilateral negotiations. The U.N. Conference is due to begin at Geneva on 23rd March and the Kennedy round on 4th May. The former is intended to be the highlight of the U.N. Development Decade and owes its origin to a decision taken at the General Assembly in December 1962. The Conference will deal mainly with trade problems concerning the developing countries. The Kennedy round will be held under the auspices of the G.A.T.T. The procedure to be followed in the Kennedy round will be laid down by the Trade Negotiations Committee set up by the G.A.T.T. Ministers at their meeting held at May 1963. This Committee is expected to meet at Geneva in the second week of this month and, on the basis of the reports presented by its various sub-committees, it will prepare its own report and submit it to the G.A.T.T. Contracting Parties when they meet at Geneva on the 24th inst. This meeting, which will be attended by Ministers' deputies and last about three weeks, will also deal with other G.A.T.T. business.

India and other developing countries are eagerly looking forward to the aforesaid world trade conferences as a means for improving their exports to the developed countries. The hopes of the successful outcome of these conferences have revived greatly of late, especially after the European Economic Community got over the worst crisis in its short period of existence (of five or six years) on 23rd December last when the Council of Ministers reached accord on farm policy and Kennedy round. The atmosphere that prevailed both before the Council met at Brussels and during the deliberations of the meeting, it will be recalled, was one of tension and confusion. Indeed, it looked as though the fate of the E.E.C. itself was at stake, because of the sharp divergence in the stand taken by France and West Germany, the two most powerful members of the Common Market. President de Gaulle of France had threatened to destroy the Common Market unless the other members agreed to implement a common agricultural policy before the end of 1963, whereas West Germany wanted a package deal for settling together the questions of agricultural policy and the joint E.C.M. approach to the Kennedy round of trade for liberalising tariffs.

Compromise Package Deal

Happily, however, the Council of Ministers accepted the compromise package deal on the next steps in the Common Market's agricultural policy and on the Community's position in the Kennedy round of trade negotiations. The salient features of this deal are as follows:

Cereals: By 15th April 1964, the Council will fix cereal prices for the 1964-65 marketing year on the basis of the Commission's proposals.

Dairy produce, beef and veal: The common policy comes into operation on 1st April 1964.

Rice: The common policy comes into operation on 1st July 1964.

Fats: By 1st June 1964, the Commission is to put forward a draft regulation based on principles laid down by the Council. The latter must come to a decision by 1st November 1964.

In addition, the Commission must submit draft basic regulations concerning the sugar market and a proposal for Community rules regarding quality wines produced in certain areas. The Council must also take decisions on four proposals by the Commission on the alignment of health regulations (concerning intra-Community trade in fresh meat, cattle and pigs, fresh poultrymeat and meat products) and on the proposal for the harmonisation of legislation on cocoa and chocolate.

Under Article 6 of Regulation No. 19 of Rome Treaty, target prices of cereals are required to be brought gradually into line during the transition period and fixed by the Council before 1st July every year. The E.E.C. Commission has put before the Council a proposal to effect this alignment in a single operation during the 1964-65 marketing year. The "cereal" component of the levy on processed products (such as flour, groats, meal, malt and starch) has been revised in step with the progress towards a common level of cereal prices. The other component (that is, protection for the processing industry) will be cut again by 2/15 on 1st July 1964, reaching a total reduction of two-fifths. The intra-Community levies on pigment, eggs and poultry are also being gradually reduced. The part of the levy resulting from the effects on feeding costs of the difference in feed-grain prices has been reduced in step with the alignment of cereal prices. The component representing protection for the industry should be cut by a further 2/15 on 1st July. On the same date, that part of the levy on imports from non-member countries which maintains Community preference will be raised from one to four per cent. Before the end of June, the Council has to draw up Community rules for the operation of markets and commercial transactions in respect of fruits and vegetables. It may be noted here that, with effect from 1st January 1964, quantitative restrictions and measures with equivalent effect imposed on class one products have been abolished in intra-Community trade and the member-States have ceased to rely on Article 44 of the Treaty (governing minimum prices).

The contribution of the Agricultural Guidance and Guarantee Fund to expenditure on refunds and market intervention will be increased from one-sixth to one half of total expenditure for 1964-65. The Fund derives 80 per cent of its total revenue from the member-States' contributions and 20 per cent in proportion to the net imports of each member-State.

Internal Market

There is no deadline for customs disarmament in 1964; the next reduction in internal customs duties is scheduled for 1st January 1965. The Commission has, however, a great variety of tasks ahead of it in the internal market. Broadly, these cover the following:

1. Establishment of a true customs union, elimination of charges with effect equivalent to customs duties, elaboration of common rules to ensure the uniform application of the common customs tariff and the free movement of goods, the quest for Community solutions to quota problems. These are in addition to the work of administering the tariff resulting from the numerous changes in rates for various items.

2. Abolition of quantitative restrictions maintained by measures with effect equivalent to quotas or by technical regulations liable to hamper trade. The relaxation of Government monopolies also comes under this head.

3. Preparation of the directives provided for in the general programmes for the liberalisation of establishment and services and to studies dealing with the structure of industrial sectors.

It is intended to set up three semi-permanent panels of experts to draw up general customs regulations (suspension or abolition of duties), to determine the method of calculating customs value and to draw up explanatory notes for the application of the common external tariff. The customs aspects of negotiations under the Trade Expansion Act, which began in 1963, will be actively pursued in 1964. It consists of detailed studies to determine the impact of customs duties on the various products and the semi-tariff and non-tariff obstacles encountered in the principal sectors. The Commission's programme of work relating to liberalisation of establishment and services covers the two years 1964 and 1965. Some thirty directives are expected to be issued during this time, dealing with public contracts, wholesale trade, occupations serving industry and transport, banks and other financial establishments, journalists, architects, agriculture, retail trade, accountants, food industries, engineering, mining and quarrying, and manufacturing.

In the course of 1964, the E.E.C. Council will examine the five proposals governing transport which the Commission submitted towards the close of May last year. They are: (*a*) regulation establishing a rate bracket system for goods transport by road, rail and inland waterway; (*b*) regulation on the institution and operation of a Community quota for road haulage; (*c*) directive on the standardisation of procedures for issuing licences for road haulage; (*d*) decision on the harmonisation of certain provisions affecting competition in road, rail and inland waterway transport; and (*e*) decision on the organisation of a survey on infrastructure costs in road, rail and inland waterway transport. These proposals are already being studied by the Economic and Social Committee and the European Parliament, both of which are to render formal opinions during the first three months of this year. The Council itself will then be able to consider these texts. If the Council adopts them by the end of the year, this will constitute a basis for the common transport policy. The Commission's proposals relate to the most important aspects of transport policy, that is, free movement of transport services, organisation of the market and harmonisation of competitive conditions. Moreover, the initial proposals will be supplemented later in the year by others dealing with passenger transport, removal of double taxation on road vehicles and co-ordination of infrastructure investments. The application of the common policy to traffic on the Rhine will have to be settled at the same time. The Commission will shortly submit a memorandum in the Council on this matter to assist the Council in taking its decisions. By 30th June, the Commission will put forward a proposal for applying the rules of competition to road, rail and inland waterway transport.

Harmonisation of Taxes

The E.E.C. Commission's agenda for the current year (1964) also includes the subject relating to the elimination of tax frontiers which, it is said, is most essential for economic union. On the 16th and 17th of last month (January), there was for the first time an exchange of views at Brussels between the Commission of the European Economic Community and members of a Parliamentary Committee concerning the harmonisation of taxes in the Common Market. In his opening remarks, Mr. von der Groeben recalled that all attempts to achieve better international division of labour by reducing customs duties, removing other obstacles to trade and introducing currency convertibility could have no lasting success as long as other action by Governments materially influenced trade between States. The abolition of tax frontiers, he said, was an essential prerequisite for a European internal market. With this in mind, the Commission, at the end of 1962, had submitted the draft of a directive on the harmonisation of turnover taxes. Now that the Economic and Social Committee and the European Parliament have given their agreement to the Commission's proposal, the harmonisation of these taxes has entered on a decisive phase. As a bill for the introduction of an added-value tax has also been tabled in the German Bundestag, the Commission welcomed direct discussion with the members of the Finance Committee at this juncture. It expected that the German bill would soon be passed and that this would provide a strong stimulus to turnover tax harmonisation in the E.E.C.; conversely, the Bundestag was justified in expecting a rapid decision on the Commission's draft directive by the E.C.C. Council of Ministers. The members of the Bundestag Finance Committee evinced particular interest in the aims, importance and technical preparation of the harmonisation of turnover tax and in the state of progress of the Commission's work on consumer taxes, direct taxes on enterprises, international double taxation and capital transactions taxes.

The Finance Minister of the Six are meeting at Rome this month to discuss the introduction of the added-value tax and the harmonisation of consumer taxes and other direct taxes. The discussions will centre round the report submitted by the Standing Committee of the heads of revenue departments on how the common added-value tax system proposed by the Commission may be applied and what effects it would produce. In the light of the discussions at this meeting, the Council will consider the course of action in the spring.

Associated States

Meanwhile, there has been some delay in the enforcement of the new convention with the associated African States and Madagascar. The convention, which had been scheduled to come into force on 1st January 1964, has been held up as a result of the delay in the fulfilment of the requisite condition that the instruments of ratification by the six member-States and at least 15 associated States, as well as the instrument notifying the conclusion of the convention by the E.E.C., should be deposited. The condition is likely to be fulfilled in the beginning of spring. Pending this, the provisional arrangements which were to lapse on 31st December last have been extended. The Commission has decided to ask the Council also to extend until the convention comes into force the measures intended: (*a*) to eliminate customs duties and charges with equivalent effect in accordance with the system in force on 31st December 1962; (*b*) to maintain reciprocal import quotas at the level fixed for 1962, subject to arrangements that may be made by the E.E.C. under the common agricultural policy; (*c*) to take into consideration, in the framework of the common agricultural policy, the interests of the associated States as regards products similar to or competing with European products; and (*d*) to maintain the situation concerning freedom of establishment resulting from the application of the Treaty upto the end of December 1962.

It may be interesting to note, in this connection, that some of the Commonwealth countries in Africa have also sought the E.E.C.'s permission to become associate members. These are Kenya, Tanganyika, Uganda and Nigeria, which have a total population of 55 million. This move has, however, caused considerable misgivings not only among the African States that are already enjoying the benefits of associate membership but also among Latin American countries.

Whatever developments that take place in the European Common Market are always of much significance to India which has close trade relations with this region. Out of the aggregate Rs. 635 crores worth of imports from all countries in the first seven months of the current financial year 1963-64, the combined share of the six Common Market countries alone comes to over Rs. 77 crores, representing more than 12 per cent of the total imports. The C.M. countries constitute an important source from which India obtains a wide range of capital goods. But the imports of C.M. countries from India continue to be on a small scale, their combined share in the total exports from India being just 7 per cent (Rs. 31 crores) out of the total of Rs. 437 crores in the first seven months of 1963-64. Consequently, India continues to have sizable adverse trade balance with the C.M. countries. Hence India's plea to these countries to reduce trade barriers that are at present hampering its export trade in their markets. It is just as well that the Union Ministry of International Trade is reported to be directing its attention to the task of using fully the opportunities made available as a result of the E.E.C.'s decision to suspend the tariff on tea and hard wood and their expected decision to grant similar suspension in respect of spices and cashew. It is, of course, gratifying to learn that the Government of India continues to press for the widening of the C.M. countries' gates for Indian goods. But this alone is not sufficient. The Government must follow realistic economic and fiscal policies, so that the Indian exporting interests will be able to compete effectively in E.E.C. markets.

COMMERCIAL ARBITRATION IN E.C.A.F.E. AREA

Professor Pieter Sanders, an internationally known Dutch lawyer, who recently visited several Asian countries at the request of the United Nations Economic Commission for Asia and the Far East (E.C.A.F.E.), investigated the present conditions of commercial arbitration, both national and international, in certain parts of the region. In the seven countries he visited—Iran, Pakistan, India, Ceylon, Malaysia, the Philippines and Thailand—Professor Sanders entered into contact with Government officials from the ministries of commerce and foreign affairs, as well as with chambers of commerce and other organisations and individuals active in commercial arbitration. In all these countries, he found a steadily growing interest in commercial arbitration as a procedure for the settlement of disputes arising from trade contracts.

One of the purposes of Professor Sander's visit was to discuss with Governments and national commercial arbitration organisations the advantages of acceding to the United Nations Arbitration Convention of 1958 on the enforcement of foreign arbitral awards. Only a few of the countries of the E.C.A.F.E. region have ratified this convention. The convention facilitates recognition and execution of awards made abroad.

With the growth of international trade between countries of the region, and between them and those of other regions, further development of international commercial arbitration may be expected. The E.C.A.F.E. has set up a commercial arbitration centre within its international trade division. It organised a conference on commercial arbitration in Bangkok in 1962 and is planning to hold another early in 1965.

LABOUR

(*Concluded from page 175*)

on an *ad hoc* basis may be preferred. These boards may be constituted either with or without the co-operation of the Government. Provision may be made for the statutory constitution of such boards on the lines of Section 11 of the M.P. Industrial Relations Act, 1960, which provides for nomination by the Government of equal number of arbitrators from the lists submitted by the union and the employer concerned. Such a board is chaired by a person mutually agreed upon by the parties or, in its absence, by a member or chairman of the Industrial Tribunal as nominated by the Government. In both the cases, i.e., when the board is formed either independently by the parties or under Government auspices, its size should not normally exceed three (a chairman and one member nominated by each party). The cost of each member on such board should be borne by the respective parties and that of the chairman jointly by both.

The Central and State Governments should draw up and maintain panels of persons considered suitable for appointment as arbitrators which should include a cross-section of qualified neutral experts. The parties may not, however, be bound to select arbitrators only from such panels.

Normally, the persons appointed as arbitrators should be well versed with the problems connected with the disputed matter. Nevertheless, for very technical matters assistance of assessors might be taken if the parties and the arbitrators so desire.

A code of conduct for the arbitrators should be drawn up on a tripartite basis, preferably by the Indian Labour Conference, which should spell out in detail some guiding lines for the actual conduct of arbitration, as it is only the quality of arbitration in the beginning that can ensure its popularity in future. It is necessary that arbitration proceedings are conducted in an informal manner and, as far as possible, without the help of legal practioners; that there is proper recording of the evidences and other relevant material; and that the arbitrators confine themselves only to specific matters under reference.

Objectives

One very important decision shall have to be taken by the parties at the time of drawing up such a code. It is whether the arbitrators, while giving their awards, are to be considered only with the limited and immediate objective of bringing peace between the parties directly involved or are to take into account the larger interests of the industry and the community. It does not seem possible that, in the present circumstances of development planning, our arbitrators can ignore these larger interests, especially in 'contract arbitration.' Even in a country like the U.S., where free collective bargaining largely regulates labour-management relations, Secretary of labour under the Kennedy Administration, Mr. Goldberg, had to uphold the right of the Administration (Government) "to assert and define the national interest" wherever it was likely to be affected by collective bargaining. He held that "collective bargaining should be responsive to the public interest" and "that Government mediators, in addition to assisting in keeping the peace, should provide guidelines to the parties to insure that the settlements reached took into consideration the interests of the parties as well as the public."

To conclude, a slow and steady march towards voluntary arbitration should be preferred to a rather hasty changeover. Let 'grievance arbitration' be widely established in the first instance and 'contract arbitration' will itself get popular as the necessary pre-conditions—strong and united unions, general social and economic improvement, education, a liberal outlook of the parties, and collective bargaining—are developed. Let us retain the 'voluntary' nature of voluntary arbitration. Encouragement, not coercion, will bear good fruit. Let us, at the same time take all possible measures, including permissive legislation, to ensure its development on sound lines wherever the parties come forward to give this 'ideal' a trial. This alone can ensure lasting sustenance to the move once it gets going on any significant scale.

TELEGRAMS ARE DELIVERED QUICKER BY TELEPHONE

Send your telegrams addressed to the TELEPHONE NUMBER* of the addressee.

BANNERJEE
*TF 31670
NEW DELHI

The message will be telephoned to him as soon as it reaches the telegraph office. It will save all delay involved in manual delivery.

It may also be cheaper—the telephone number, including the prefix 'TF,' is charged for as only one word.

This facility is available wherever there is a local phone service.

A copy of the message will be sent the same day by the first postal delivery.

RECEIVE YOUR TELEGRAM BY 'PHONE

In some cities you can get telegrams by 'phone even if the sender has not given your 'phone number. Register your 'phone number with the telegraph office.

SETBACK FOR STRUCTURAL ENGINEERING

EXPANSION SCHEMES DELAYED

COMPETITION and other extraneous factors have affected the results of the Structural Engineering Works Ltd. (Managing Agents: Messrs. Bhagat and Sons (Private) Ltd., Bombay) for the second year in succession, namely, the year ended 30th June 1963. Realisation from the sale of products and work done has declined by Rs. 10.22 lakhs to Rs. 129.73 lakhs and the gross profit has shed a further Rs. 4.39 lakhs to Rs. 13.96 lakhs. As a result of this decrease in profit, the provision for Managing Agents' commission has been lowered from Rs. 1.23 lakh to Rs. 50,000 and that for taxation from Rs. 5.40 lakhs to Rs. 1.87 lakh.

The provision for depreciation is, however, slightly higher at Rs. 6.15 lakhs, as against Rs. 6.01 lakhs a year before, but since this rise has been more than fully absorbed by the substantial saving in other essential provisions, the net profit has receded only marginally from Rs. 5.71 lakhs to Rs. 5.44 lakhs.

To this is to be added Rs. 3,713 brought forward, Rs. 21,295 written back from past provisions and Rs. 1.35 lakh withdrawn from reserves to get Rs. 7.04 lakhs as the amount available for distribution. Out of this, the Directors have credited Rs. 70,000 to the development rebate reserve and set aside Rs. 2.21 lakhs for the payment of the preference dividend for the year. The rate of ordinary dividend has been lowered by two points to six per cent, subject to deduction of tax. Since, however, it is also payable proportionately on the 45,000 new shares allotted on or after 1st July 1962, it absorbs a larger amount of Rs. 4.06 lakhs, as against Rs. 3.51 lakhs in the previous year. The carry forward is Rs. 5,683.

The Company's results for the past four years are set forth in the following comparative table:

(In lakhs of rupees)

	For the year ended 30th June			
	1963	1962	1961	1960
Sales and work done	129.73	139.95	145.16	94.46

	(6%)	(8%)	(13%)	(12%)
Carry forward	0.06	0.04	0.09	0.12
Market price of ordinary shares (in rupees):	1963	1962	1961	1960
High	110.00	182.00	235.00	350.00
Low	92.00	121.25 XR	167.50 XR	225.00

During the year under review, the Company issued 45,000 new equity shares of Rs. 100 each on which Rs. 75 per share were called up during the year. This has raised the share capital to Rs. 103.68 lakhs, of which Rs. 78.68 lakhs are in ordinary shares, but the reserves have decreased by Rs. 4.16 lakhs to Rs. 46.76 lakhs. Borrowings have risen from Rs. 133.75 lakhs to Rs. 136.26 lakhs and so also current liabilities and provisions from Rs. 71.81 lakhs to Rs. 75.73 lakhs. But the total indebtedness to outsiders of Rs. 211.99 lakhs is more than adequately covered by current assets, investments and loans and advances aggregating Rs. 259.51 lakhs. The gross block has risen by Rs. 5.96 lakhs to Rs. 128.89 lakhs, but, as the accumulated amount of depreciation is higher by Rs. 6.07 lakhs at Rs. 60.80 lakhs, the net block works out to Rs. 68.09 lakhs, as against Rs. 68.20 lakhs a year ago. Besides, projects-in-progress are valued at Rs. 34.77 lakhs.

To some extent profits during the year were affected by the considerable strain on the finances as well as the working of the Company imposed by its expansion programme inasmuch as the new schemes of expansion, undertaken with foreign collaborations, could not be completed and the progress thereof was seriously hampered by the delay in completing the Company's financial arrangements with its bankers. In order to finance the expansion the Company, it will be recalled, was carrying on negotiations with its bankers for a substantial increase in the existing overdraft facilities and for a medium-term loan. It had also applied to the Industrial Credit and Investment Corporation of India Ltd. for a loan of Rs. 60 lakhs to meet the capital outlay for the Cochran boiler and other projects. Owing chiefly, as the Directors inform the shareholders, to the serious repercussions of the last budget, it took nearly a year and a half to complete these arrangements.

Further, the work relating to the duct line project of the Bombay Municipal Corporation and certain other jobs had to be held up for considerable time on account of the prevailing emergency, while work at the Dhamangaon factory was affected by power supply. Considerable difficulties were also experienced in obtaining materials, like electrodes which are so essential for the Company's business. Also, owing to difficulties beyond the control of the management, the work of laying pipes at Calcutta could not progress as expected. The Calcutta factory has now been switched over to other structural work necessitating the maintenance of large stocks of steel. All this imposed a heavy burden on the Company's finances. Furthermore, there was keen competition in the structural steel fabricating industry and, whilst accepting work at reduced rates, the Company had to expend more towards the cost of labour owing to revision of wage scales, etc. Thus, its working continued to be affected by a downward trend in prices and an upward trend in the cost of labour and materials.

As for the prospects for the current year, the Directors state that the question of expediting the progress of work on the new schemes of expansion, namely, manufacturer of prestressed concrete pipes, Cochran boilers, penstock, transmission towers and reinforced concrete pipes for the duct line project of the Bombay Municipal Corporation, has been engaging the attention of the Directors. It is, however, to be added that further progress will naturally depend upon and be subject to national emergency and other difficulties which may obstruct the same but which cannot be foreseen at this particular stage.

The Rs. 100 paid shares of the Company are currently quoted at Rs. 95.00 *cum-div.* and fetch a net yield of 4.6 per cent per annum on an *ex-div.* price.

NEW SPINNING MILL AT KHANDWA

The foundation-stone of Nimar Textile Mills at Khandwa in the State of Madhya Pradesh was laid on the 20th inst. by one of the Directors, Mr. Mangaldas D. Vora. This is the first spinning mill at Khandwa. Its capacity is 25,000 spindles. Khandwa has been chosen for the location of the mill, as it is a rich cotton growing centre with adequate power and water facilities. It is 43 miles from Burhanpur, which is the ready consuming market for the cotton yarn, required for handlooms and powerlooms. It is expected that the mill will go into production by the end of 1964. Loan arrangements have been made with I.F.C. of India and the underwriting arrangements are being completed.

The Board of Directors include well-known businessmen and industrialists. The Company proposes to enter the capital market very shortly.

ASSOCIATED BATTERY'S NET PROFIT LOWER

DIVIDEND, HOWEVER, SAME

SUPER Profits Tax, claiming as much as Rs. 9.60 lakhs including Rs. 4.70 lakhs on account of the previous year, is responsible for the setback in the net profit of the Associated Battery Makers (Eastern) Ltd. (Managing Director: Mr. H. R. Gregson, Calcutta) from Rs. 21.67 lakhs to Rs. 15.70 lakhs for the year ended 31st August 1963. The total tax burden for the year at Rs. 38 lakhs, as against Rs. 29.10 lakhs for the previous year, is higher roughly to the same extent as the estimated S.P.T. liability for the two years. Dividend on the 10-rupee ordinary shares has, however, been maintained at 15 per cent per annum, subject to tax, because (i) the overall results have been encouraging, with sales showing an improvement of 12 per cent from Rs. 227.58 lakhs to Rs. 254.98 lakhs and gross profit of 6 per cent from Rs. 60.82 lakhs to Rs. 64.87 lakhs, and (ii) the amount brought in from the previous year, at Rs. 7.18 lakhs, is quite substantial. It is because of this large surplus profit available from the previous year, as against which only Rs. 7,978 have now been carried forward as the undistributed surplus, that the dividend, absorbing Rs. 17.70 lakhs, has been fully covered without any depletion of reserves. The amount conserved by transfers to reserves out of the profit for the year under review is a shade lower at Rs. 4.92 lakhs, as against the net figure of Rs. 5.04 lakhs last year.

The following table compares the Company's progress in the past four years:

(In lakhs of rupees)

	For the year ended 31st August			
	1963	1962	1961	1960
Sales	254.98	227.58	218.14	206.23
Income from other sources	4.13	4.51	1.69	5.99
Materials, stores and spares consumed	118.58	105.92	103.73	97.62
Expenses and charges	76.67	65.35	63.06	54.73
Gross profit	64.87	60.82	53.04	59.86
Provision for—				
Depreciation	11.17	10.05	7.47	7.79
Taxation	38.00	29.10	21.58	23.77

Withdrawals from reserves and provisions	..	1.64	1.13	1.05
Transfer to reserves	4.92	0.68	7.91	5.70
Dividend	17.70 (15%)	17.70 (15%)	17.70 (15%)	19.50 (25%)
Carry forward	0.08	7.18	8.24	8.75
Market value of equity shares (in rupees):	1963	1962	1961	1960
High	30.25	40.12	40.12	41.75
Low	22.37	29.50	33.50	33.37

The Managing Director, Mr. H. R. Gregson, has made four important points about the Company's working in his statement for the year. First, the satisfactory progress during the year has been due to heavy and essential Defence orders and excellent demand for the products from automotive machinery manufacturers for whom the Company has been the principal supplier of the *Exide* initial equipment batteries. But the Defence demand caused dislocation of the normal production and led to the doubling of the output of the wide range of special Defence batteries and also to the introduction of new types of special batteries. Further, the Defence demand and the requirements of the automotive machinery manufacturers made it difficult for the Company to meet adequately the other healthy demands for *Exide* and *Dagenite*. However, efforts are being continued to increase output to meet these overall requirements. Secondly, exports of storage batteries which the Company first started in the year 1958-59 have improved and the Company has a good export order book, thanks to some success from the tours of its representatives in overseas markets. The third point made by Mr. Gregson is about the prices of raw materials and development of suitable grades of the various plastic and rubber raw materials in the country. This point is to be read in continuation with the second point, for Mr. Gregson says: "We are marketing our products at prices (excluding excise duty) directly comparable to those prevailing in Europe, but, if a manufacturer has to pay twice as much for a raw material as competitors in Europe, Japan and other countries then the adverse effect of this on exports is very apparent." The vexed question of raw materials continues to be a problem, although the Company has endeavoured to improve matters, for example, through its lead recovery plant which, during the year under review, made a major contribution to its lead requirement and produced a quarter of its total net requirements. Lastly, the current

(Continued in previous column)

(Concluded from next column)

year's prospects are said to be good. The year has started on a satisfactory note and order position is encouraging. Plans for improving production to meet what should continue to be a strong general demand are under way.

The Company's financial position is sound. The paid-up capital of Rs. 118 lakhs is backed with reserves and surplus amounting to Rs. 98.43 lakhs. Borrowings (unsecured loans) have gone up from Rs. 4.61 lakhs to Rs. 7.86 lakhs and so have current liabilities and provisions from Rs. 45.65 lakhs to Rs. 64.68 lakhs. The total indebtedness to outsiders aggregates Rs. 72.54 lakhs which is less than a third of the total of current assets, book debts and investments amounting to Rs. 234.35 lakhs. The gross block of the value of Rs. 131.11 lakhs (Rs. 118.83 lakhs a year before) has been well written down to Rs. 54.08 lakhs and is shown, with capital goods in transit, at Rs. 54.62 lakhs.

The Rs. 10 fully paid ordinary shares of the Company are currently quoted at Rs. 25.75 *cum-div.* and offer a net yield of 4.2 per cent per annum.

248 Pages

These pages of **COMMERCE ANNUAL NUMBER 1963** contain as many as 46 feature articles on a wide variety of subjects of topical importance contributed by eminent economists, administrators, businessmen and experts. The subjects covered include planning and development, agriculture, industry, trade, banking, finance, taxation, labour, transport, and economic trends in Britain, West Germany and the U.S. The Number contains also our customary comprehensive reviews of trends in the different sectors of the Indian economy, besides all the major markets. Here are the exact **CONTENTS** of the Annual Number:

SYNOPSES OF COMPANY REPORTS

Tulsipur Sugar Co., Ltd.

(*Secretary*: Mr. M. P. Jhunjhunwala, Calcutta.)

Fourth Annual General Meeting—Held on 30th December 1963.

Working Results:

	For the year ended 30th June (In thousand rupees)	
	1963	1962
Sales—sugar, molasses and bagasse	1,22,32	1,54,06
Closing stock of sugar and molasses	20,85	60,07
Gross loss (—)	—2,63*	—47*
To depreciation	2,63	2,64
Net loss(—)	—2,63*	—47*
Excess provisions for tax and other credit adjustments	13	24
Credit balance brought forward	Nil	20
Total available balance	13	44
Appropriations:		
To excise duty short recovered	Nil	6
„ cane price claim short realised written off	1,13	Nil
„ cane purchase tax on an export quota sugar recoverable—written off	5	Nil
„ dividends	Nil	Nil
„ adjustment of loss	13	44
Net debit balance carried forward	—3,76	—3

* Loss after providing for depreciation.

Extracts from the Directors' report: As indicated in the Directors' report for the previous year, the loss has been caused by circumstances under which the Company had been struggling for some time. There has been considerable outlay towards expansion through borrowings. As a result, the Company had to provide a great deal of depreciation and interest, for several years.

During the period, the Company's factory was required to supply 30,556 quintals of sugar to the Export Agency Division for export outside the country which reduced the Company's realisations by Rs. 2.80 lakhs. Had the quantity been paid for at market rate, the net result for the year's working would have shown a small surplus. However, the directors are still hoping to receive a sizable amount in the shape of final payment from the Export Agency Division.

Working: The factory commenced crushing on 9th December, 1962 and could continue only upto 6th March, 1963. Shortage in supply of cane resulted in a reduced total crush of 80,020 M. tons as against 1,38,831 M. tons in the previous season. The factory worked for 88 days as against 175 days in the previous season. Overall crushing was smooth and booked a recovery of 10.14 per cent as against 9.72 per cent in the previous season.

Accounts in brief as at 30th June 1963 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	14,00,070	Gross block	48,97,688
Reserves	12,78,314	—Depreciation	22,98,956

Low	117.50	152.00	91.50

* Loss after providing for depreciation.
† For two years 1962-63 and 1961-62.

Extracts from the Directors' report: As far as the Company's Howrah Works are concerned the Directors regret that in spite of their best efforts they were unable to get the accounts thereof duly audited. As members are aware the Howrah Works were closed from 15th November, 1961 and were re-opened on the 24th August, 1963 in a phased programme ending on the 16th November, 1963. Due to the closure of over 21 months and the total absence of the old staff attending to accounts and other senior executives which did not rejoin the Howrah Works on re-opening, the management was handicapped in carrying out this work.

The sales invoiced by the Company have increased from Rs. 1,64,26,382 in 1961-62 to Rs. 2,24,50,113 in this year. Whereas the sales of transformers have been reduced due to the fact that the Company's Howrah Works were closed throughout the year, production and sales of *Conductors* and *Motors* have increased. Sales of imported *Brown Boveri* material have already started and are expanding satisfactorily. As a result of these increased activities, stocks have also gone up to a certain extent.

The offer for the purchase by the Company of the land and factory including residential quarters at Faridabad has been accepted by the Government of India on reasonable terms of payment and the necessary agreements are under execution.

The Company has also initiated the purchase of approximately 40 acres of fresh land near the railway station of Faridabad. Sale deeds for about 30 acres have already been executed and for the remaining plots, for which the sale deeds will be executed shortly, deposits have been made to land owners. At Baroda the Company is at the same time purchasing land for a new plant near Makarpura Railway Station.

Industrial Licences: The Rolling Mill at Faridabad Works has made good progress and went into regular production in May 1963. The new Conductor Factory at Ghaziabad has also started production in July 1963.

The industrial licence for Baroda Works has been extended to cover the manufacture of *Air Blast Circuit Breakers* for *Electric Locomotives*. For the assembly of these breakers as well as for the manufacture of *Control Panels* a new shed has been erected near the existing plant in Baroda. In the same shed a training centre for the workers will be opened soon.

The Company's collaborators have prepared a project report for the establishment of a new plant on the land under acquisition at Makarpura/Baroda. According to this project, the Company will undertake initially the manufacture of *High Tension Air Blast Circuit Breakers* up to 220 kV., the complete manufacture of *Breakers for Railways, Tap Changers, etc.* Other items covered by the industrial licence will follow in a phased manner.

Howrah Works: The negotiations which were going on with the workers of the Company's Howrah Factory for a considerable time proved successful and a settlement was arrived at with a large majority of the workers. Consequently, the Howrah Works were re-opened on 24th August 1963 and production has been resumed. In view of this settlement, separate representation has been granted by the Hon. Tribunal and accordingly a joint petition for compromise has been filed.

As stated in the Directors' report of the Hindustan Conductors Ltd. the object and the purpose of the said subsidiary company is being fulfilled by this Company and hence the said subsidiary Company is not functioning. It has therefore been decided by the Board of Directors to dispose off 4,993 equity shares of Rs. 100 each (Rs. 5 per share paid up) being its entire shareholding to Mr. D. D. Desai, one of the Directors of this Company, at Rs. 25,000.

Accounts in brief as at 30th April 1963 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	1,40,00,000	Gross block	79,23,681
Reserves and surplus	1,64,104	—Depreciation	28,47,228

	(9%)	(9%)
Carry forward	76	1,40

* On the increased ordinary capital of Rs. 55 lakhs.
† On a paid-up capital of Rs. 50 lakhs.

Extracts from the Directors' report: There has been an increase both in production and in sales of *Bonded* and *Coated Abrasive* products. The net increase in sales amounts to over Rs. 16 lakhs. However, the profit after provision for taxation is considerably lower. The main reason for this is the very onerous burden of taxation which the Company has had to bear. In addition to the normal provision for Income-tax and Corporation tax, the Company has had to provide for Super Profits Tax in respect of the earnings of the year under report as well as that of the year ended 31st August 1962. It is sincerely hoped that the levy of Super Profits Tax will be removed altogether or at least substantially modified so as not to be such a heavy burden on the industry.

In the Directors' report for last year, mention was made that the Industrial Credit and Investment Corporation of India Limited had agreed to extend a line of foreign exchange credit of upto Rs. 17.5 lakhs to finance the import content in the Bonded Expansion project of this Company. Utilisation of funds thereof has commenced. The main building extensions are complete and several items of machinery have already been received and the rest are expected shortly. This increased capacity will be available for utilisation towards the end of the financial year ending August, 1964.

Construction work of the *Aluminium Oxide Plant* is proceeding apace at Edapally near Cochin and some shipments of machinery have been received. Work has also commenced at Port Okha in respect of the *Calcined Bauxite* installation and the *Rotary kiln* has been shipped from abroad towards the end of December 1963. In addition to these schemes, the Company has plans for the manufacture of 750 tons per annum of *Super Refractories* for which a very good demand has been indicated. It is expected to receive an industrial licence for this purpose from the Government of India shortly.

To meet part of the capital expenditure in respect of the *Aluminium Oxide Plant*, the issue of 20,000 shares of Rs. 100 each at a premium of Rs. 25 per share as required by the Controller of Capital Issues, has been made during the year under report and a sum of Rs. 50 (Rs. 25 towards the premium and Rs. 25 towards share capital) per share has been received by the Company on these newly issued shares. Subsequently, the Board of Directors of the Company have called up a further sum of Rs. 50 per share on these 20,000 shares and this sum is expected to be paid up by the end of December 1963.

For additional finance to meet the cost of the various schemes, the Board of Directors approached the Industrial Credit and Investment Corporation of India Limited and are pleased to report that the Industrial Credit and Investment Corporation of India Limited has expressed their willingness to extend another loan of Rs. 75 lakhs (Rs. 65 lakhs in rupees and Rs. 10 lakhs in foreign currency). It is expected that this Company will be able to obtain and utilise this loan in the near future and implement its various plans of expansion and new projects by the end of 1964.

Accounts in brief as at 31st August 1963 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	55,00,000	Gross block	1,05,80,858
Reserves and surplus	45,00,000	—Depreciation	51,21,109
Other liabilities	88,00,942		
		Net block	54,68,749
		Goodwill and trade marks	1,017
		Current assets	1,29,21,076
		Investments	98,392
		Cash	3,12,708
	Rs. 1,88,01,942		Rs. 1,88,01,942

* Paid-up capital consists of 50,000 ordinary shares of Rs. 100 each and 20,000 ordinary shares of Rs. 100 each—Rs. 25 per share called and paid up.

Stanes Amalgamated Estates Ltd.

(*Managing Agents*: Messrs. T. Stanes & Co., Ltd., Coimbatore.)

Seventeenth Annual General Meeting—Held on 17th December 1963.

Working Results:

	For the year ended 30th June (In thousand rupees)	
	1963	1962
Sales—tea, green leaf and other produce	17,70	16,28
„ —coffee	2,48	2,01
Closing stock—tea and coffee	2,85	1,29
Gross profit	4,51*	6,21
To donations	5	3
„ Managing Agents' remuneration	34	57
Transfer to depreciation	95	88
Net profit	3,17	4,73
Excess tax provision no longer required	2	32
Appropriations:		
To provision for taxation	1,50	2,52†
Transfer to reserves	63	1,01
To dividends (taxable) ordinary	1,08 (12%)	1,35 (15%)
Carry forward	18	21

Market value of ordinary shares (in rupees):	1963	1962	1961
High	15.60	15.92	16.65
Low	13.71	14.55	14.78

* After providing Rs. 7,000 for bonus to staff.
† Includes Rs. 6,373 being additional wealth-tax paid for assessment years 1957-58, 1958-59 and 1959-60.

Extracts from the Directors' report: *Crop*: *Tea*: The output of black tea for the year from the Company's own leaf was almost up to the level of the previous year's record, with 4,08,265 kgs. and, in addition, 23,461 kgs. from bought leaf. The previous year's figures were 4,10,516 and 13,085 kgs. respectively.

The production of green leaf, at 3,26,160 kgs. was 33,701 kgs. down compared with the 1961-62 record. The average sale price exclusive of excise duty was Rs. 4.51 per kg. as against Rs. 4.44 per kg. last year, and for green leaf Rs. 0.72 per kg. against Rs. 0.65 last year.

Coffee: The crop harvested amounted to 44,856 tonnes, approximately 6 tonnes in excess of the blossom estimate. The crop has been valued at the same price as last year Rs. 2.20 per point. This crop was not big enough to make the running of the coffee economical, with the result that the Company incurred a loss of Rs. 34,465 compared with a profit of Rs. 64,134 the previous year. With 2.43 hectares replanted in Station Selections during the year, the Company's estates maintaining 13 hectares of immature coffee as a charge under cultivation expenses. In continuation of the decision to replant Kotada mixed Tea and Coffee areas in tea, 2 hectares of moribund old coffee has been uprooted for planting in tea. A further 2 hectares of similar old coffee has been uprooted and planted with guatemala grass to rehabilitate the soil before planting in tea at a later date. The current year's crop is estimated at 44 tonnes.

Progress Report and Crops Harvested:

Year	Gross profit	Net profit after taxation	Tea crop	Coffee crop
	Rs.	Rs.	Kgs.	Tonnes
1960-61	2,33,053	1,05,053	3,53,419	24

NEWS IN BRIEF

THE National Shipping Board has appointed a Committee to consider the feasibility of a round-the-coast cargo service, aimed at linking almost all the small ports clothing the country's vast coastline.

Britain is currently spending at a rate between Rs. 200 and Rs. 250 crores a year on Governmental aid to the developing countries or 1¼ per cent of Britain's national income, besides Rs. 180 crores a year on technical assistance, according to the British High Commissioner in India.

A Rs. 15-crore newsprint factory is proposed to be set up in the private sector in the Punjab in collaboration with a Canadian firm. The factory, which is expected to go into production by 1968, will manufacture about 16,000 tonnes per annum.

The first thermal power station in the Jammu and Kashmir State, located at Kalakot 75 miles from Jammu, is expected to be commissioned some time next year. The station is being built in collaboration with Yugoslavia. It will have a capacity of 22.5 MW. per annum.

The Chief Minister of Gujarat has indicated the State's readiness to accept the offer of arbitration for settling the controversy between Gujarat and the Oil and Natural Gas Commission on the pricing of gas to be supplied to the State's power houses and industrial units.

A team headed by Mr. N. N. Wanchoo, Secretary, Department of Iron and Steel, will leave for Japan in the middle of this month on a three-week tour of that country to study the working of steel industry there with particular reference to its capital structure and advanced techniques of steel making.

The State Trading Corporation has signed an agreement with Messrs. Abitibi of Canada, under which it will import 25,000 tonnes of newsprint valued at about Rs. 1.5 crore from Canada during 1964-65. India imports approximately 90,000 tonnes of newsprint and sheets every year from the Soviet Union, Canada, Scandinavian countries and Poland.

The refining capacity of the Gujarat refinery now under construction will be expanded from two million tonnes to three million tonnes before the end of the third Plan, according to a spokesman of the Oil and Natural Gas Commission. The Commission is vigorously stepping up its exploration activities all over the country in order to meet the growing demand for petrol.

The Government of India has set up a 14-member Central Planning Group, with Mr. M. C. Chagla, Union Minister for Education, as Chairman, to prepare the broad outline of a perspective plan of educational development in India to cover the next 15 years (1966-81) and, against its *background, to work out a detailed programme* for inclusion in the fourth Plan (1966-71).

The cotton mills' production in December 1963 is provisionally placed at 81 million kgs. of cotton yarn and 390 million metres of cloth, as compared with 74 million kgs. of yarn and 377 million metres of cloth in the same month of 1962. At the end of the month, the composite mills held 113,000 metric bales of cloth as unsold and 165,000 metric bales as sold but unlifted.

The budget session of Parliament will commence on the 10th inst. The Railway Budget will be presented on the 11th inst. and discussion on it will commence on the 19th inst. The general budget will be introduced on the 29th inst. and discussions on it will commence on 2nd March next. The Lok Sabha will take up the demands for grants of various Ministries between 10th March to 14th April next.

The Maharashtra Government has decided to appoint a committee for carrying out a traffic survey of ports in the State and for preparing a master plan for their development. The Committee will be asked to study the cargo and passenger traffic potential in all ports in the light of various industrial and other developments proposed for the coastal belt and make some specific recommendations regarding the pattern of development.

As many as 96 co-operatives have made necessary arrangements for procurement of jute in 89 secondary markets and nearly 300 feeder centres in the jute growing States of Assam, West Bengal, Bihar, Orissa, Tripura, Uttar Pradesh and Andhra Pradesh, under the price support scheme. They are reported to have purchased up to the end of December 120,000 maunds of jute valued at about Rs. 36 lakhs, on the price support basis and 250,000 maunds valued at Rs. 75 lakhs on commercial basis as part of their normal business activity.

The Iron and Steel Controller has notified that 2,000 tons of stainless steel sheets of gauges suitable for utensil making are to be imported through the Minerals and Metals Trading Corporation of India, New Delhi, against their exports. The Directors of Industries of State Governments will be allotted bulk quotas for their States. Allocations to individual units will be made by them. The manufacturers of stainless steel utensils may submit their indents direct to the Director of Industries of the respective States before the end of this month (February).

The prospectors of the Atomic Energy Department have discovered a rich deposit of high grade uranium ore in Bhatin area in Bihar State. The deposit will help in the setting up of another uranium ore mill in that area, besides the existing one at Jaduguda. The existing mill, which is the principal source of uranium presently in India, will yield raw material for the production of requisite quantity of atomic fuel for India's first atomic power station at Tarapore in Maharashtra. The target of extraction of 1,000 tonnes of uranium per day is expected to be achieved when the Bhatin mine is worked.

One of the largest Hungarian foreign trading enterprises, the Complex, recently signed a contract to supply two 25 MVA synchrocompensators at a cost of Rs. 20 lakhs for the Hirakud Dam project. The synchrocompensators are manufactured by the Ganz Works in Budapest, one of the largest and oldest factories for power-generating and electrical gear in Europe. The two synchrocompensators are of the latest hydrogen-cooled type. After installation, the electricity-losses of the Hirakud-Rourkela grid will be significantly reduced. They are expected to be delivered in 1965.

The Union Ministry of Community Development and Co-operation has drawn up a scheme for the award of prizes and incentives to the best co-operative institutions as well as individuals who have an outstanding achievement to their credit in furtherance of the co-operative movement. Under the scheme, the best model society in every district which has a consistently good record of performance for a period of years, might be selected by the district co-operative banks or the district co-operative unions for award of rolling shields or trophies every year. Small cash prizes may also be awarded to a few societies which have been functioning on sound lines or have shown outstanding results.

The Union Ministry of International Trade has made arrangements for the import of machine tools from Czechoslovakia, Hungary, Poland and East Germany for delivery in 1964 for actual users in both scheduled and non-scheduled sectors. The actual users are required to submit their applications for import licences in the prescribed form and manner to the Development Officer (Tools), Directorate-General of Technical Development. Applications for licences for import of machine tools under the capital goods licensing scheme from actual users may also be made under the normal procedure, with a copy of the application sent to the Development Officer (Tools).

The Union Minister of Shipping, Mr. Raj Bahadur, discussed several shipping problems with the representatives of shipowners at Bombay last week. The Minister expressed satisfaction at the working results of the shipping companies and was hopeful that the Indian tonnage, which at present stood at about 1.2 million g.r.t., would reach the figure of 1.6 million g.r.t. and might possibly go upto 2 million g.r.t. by the end of the current Plan.

* * * *

From Abroad

Britain will pay to the International Development Association an additional £34.5 million in three equal instalments, in November 1965, 1966 and 1967. The House of Commons has given its consent to this contribution.

The Pakistan International Airlines is placing orders for three Trident jet airliners worth about £6 million with the de Havilland division of the Hawker Siddeley in Britain. These airliners are powered by three aft-mounted Rolls-Royce Spey 25 engines; they are likely to be delivered in the summer of 1965.

Production of staple fibre in Britain touched a record of 388.90 million lbs. in 1963, as compared with the 336.29 million lbs. produced in 1962 and 305.66 million lbs. in 1961. The filament yarn production was 330.29 million lbs., as against 290.85 million and 261.97 million lbs., respectively.

International price levels for newsprint are expected to collapse because of a build-up of a large surplus by 1965, according to the F.A.O.'s report on pulp and paper prospects in Eastern Europe. By 1965, Western Europe alone is expected to have a potential export surplus of 2.8 million tons of paper and paperboard.

The U.S. Senate Banking and Finance Committee has voted in favour of a $11,500-million cut in U.S. income-taxes. The cut, if approved by Congress, would be the biggest income-tax cut in that country. The tax cut Bill was approved by the House of Representatives on 25th September 1963.

The total world production of natural rubber during the first eleven months of 1963 amounted to 1.87 million tons and consumption aggregated 2.03 million tons. The consumption figure includes gross imports of 287,500 tons into the Soviet Union and 95,000 tons into China. The production of synthetic rubber during the same period was 2.2 million tons and consumption 2.14 million tons.

The U.S. Agriculture Department's first estimate of world rice crop (excluding the communist Asia) in the 1963-64 season puts the total yield at 154.3 million tonnes, a record level, as compared with the 150.4 million tonnes actually produced in 1962-63. The acreage under rice cultivation is estimated at 215 million acres in 1963-64, as against 219 million acres in the previous year.

The International Air Transport Association has just approved a world-wide air-freight consolidating programme. The programme, subject to ratification by the Governments of the member-countries concerned, is expected to be put into effect on 1st April next. It will encourage the orderly promotion and sale of air-freight and establish uniform standards of business practice.

As the largest car makers, the Fiat of Italy is reported to be studying the ways and means of warding off air poisoning by exhaust gases. It has already put into shape an ingenious device whereby exhaust gases are channelled into the aspiration system and burned in the engine's cylinders. This device keeps the inside of the engine's bottom slightly depressed, so that at no stage of operation can any exhaust gas puff into the air, while at worst a mild washing may occur by outside air leaking in. It has been approved by U.S. authorities and all Fiat cars shipped to America are provided with it. The Fiat will extend this application gradually to all its cars.

Production of paper and paperboard in Sweden rose by over 10 per cent to about 2.26 million tons in 1963. The capacity of the Swedish mills at the end of the year was about 2.90 million. Most of the production increase during 1963 was accounted for by paperboard, particularly kraftliner (up from 425,000 to 535,000 tons). The output of kraft paper rose from 636,000 to 703,000 tons, while newsprint showed a small rise of 11,000 tons to 640,000 tons. Deliveries during the year included 1.65 million tons for export and 935,000 tons for the home market. Of the total exports, nearly 80 per cent went to Europe, including 48 per cent to E.E.C. and 28 per cent to E.F.T.A. countries. The remaining 20 per cent is absorbed by a large number of countries on all continents.

Permits granted to Swedish companies for direct investments abroad aggregated Kr.391 million in 1963, as compared with Kr.430 million in 1962. Of this total, only 45 per cent was utilised during the year (which is probably due to the fact that most of them were granted during the latter half of 1962). For the first time, applications for investments in E.F.T.A. countries have exceeded those for E.E.C. which dropped by 50 per cent in value. A sharp decline was also registered for investments in the U.S. However, a major increase was noted in Sweden (from Kr.322 million in 1962 to Kr.754 million in 1963). Practically the entire amount is earmarked for investments in already existing companies and includes a comparatively small number of large projects. A particularly large increase is registered for U.S. investments in Sweden and also investments from the E.F.T.A. countries.

Labour position in Britain improved greatly during the year 1963. By the end of the year, the demand for labour was rising rapidly. In the autumn, the number of workers temporarily laid off fell to a very low level, and the absorption of the July school leavers into the labour force became very rapid in the last eight weeks or so of the year. The number of unemployed in Britain during December 1963 was 460,000 some 100,000 less than in December 1962, and represented about 2 per cent of the labour force. Some further decline in numbers seeking work is expected in 1964.

PERSONAL

MR. Lal Bahadur Shastri was sworn in as a Cabinet Minister without portfolio on 24th January.

Mr. D. Sanjivayya, the erstwhile Congress President, was sworn in as the Union Minister for Labour and Employment.

Mr. J. L. Hathi, who was looking after the labour portfolio until recently, has now been designated Minister of Supply and Technical Development.

Mr. Carl T. Rowan, U.S. Ambassador to Finland, will be nominated by President Johnson as the new Director of U.S. Information Agency, in the place of Mr. Edward R. Murrow who has resigned because of ill health.

Mr. D. S. Joshi, Secretary, Union Ministry of International Trade, left for New York to participate in the final meeting of the Preparatory Committee of the World Trade and Development Conference.

Prof. M. S. Thacker, Member, Planning Commission, has been appointed a member of the U.N. Advisory Committee on the Application of Science and Technology to Development. He will attend the Committee's first session commencing at New York on the 25th inst.

Notices

RESERVE BANK OF INDIA
CENTRAL RECRUITMENT BOARD
BOMBAY

APPLICATIONS ARE INVITED FOR THE following posts in the Agricultural Credit Department of the Reserve Bank of India:—

(A) POSTS AND SCALES OF PAY:

(i) **Rural Credit Officers:—**

Rs. 430-430-55-815 EB 55-925-60-1,045.

(ii) **Economic Assistants:—**

(a) *At higher pay centres—*

Rs. 255-15-270-16-398-21-419 EB 21-482-22-570.

(b) *At centres other than higher pay centres—*

Rs. 230-10-240-15-270-16-382 EB 16-398-21-503-22-525.

Note: Candidates possessing exceptionally good qualifications and experience of value to the Bank may be given a higher starting pay in the prescribed scales.

In addition to pay, the selected candidates will be eligible to draw local pay, dearness and house rent allowances at rates prescribed from time to time. Local pay is not admissible to category (ii).

(B) QUALIFICATIONS:

(i) **Rural Credit Officers: Applicants should**

(*a*) posses very high academic qualifications of Indian or foreign Universities (preferably post-graduates) in Economics, Co-operation, Sociology or other social sciences and posses degrees which are either first class or high second class. Special study or knowledge of Rural Economics or Rural Sociology will be an additional qualification, *and*

(b) have a minimum of five years' experience in a co-operative department/institution or commercial bank out of which not less than three years should be in a responsible position.

(ii) **Economic Assistants: Applicants should** possess high second class Master's degree or a first class Bachelor's degree in Economics or Commerce of an Indian or foreign University. Specialised study in Rural Sociology will be an additional qualification. Due weightage will be given to the successful completion of the training courses conducted under the auspices of the Committee for Co-operative training, and/or experience gained in a co-operative department/institution or a commercial bank.

Note: Experience in Community development, small-scale and cottage industries, marketing, training and publicity, etc. will be given due weightage and knowledge of more than one regional language will be an additional qualification.

(C) AGE LIMITS AS ON 1st FEBRUARY 1964:

(i) **Rural Credit Officers:** Candidates should not ordinarily be over 30 years of age but the age limit may be extended upto 35 years in the case of candidates with exceptionally good qualifications and/or experience of value to the Bank.

(ii) **Economic Assistants:** Between 18 and 24 years.

The maximum age limit is relaxable but not beyond 30 years in the case of:—

(*a*) candidates possessing special qualifications and experience of value to the Bank;

(*b*) ex-employees of banking institutions whose services had to be terminated for reasons of economy or as a result of the banks going into liquidation;

(*c*) personal retrenched from Government offices after at least one year's service applying through Employment Exchanges; and

(*d*) candidates belonging to the Scheduled Castes or Scheduled Tribes.

2. Applicants for the posts of Rural Credit Officers must remit with their application a fee of Rs. 7.50 and those for the posts of Economic Assistants a fee of Rs. 2.00 by cheque or bank draft on a *Scheduled Bank* payable at Bombay or by Postal Order drawn in favour of Reserve Bank of India, Bombay. *The application fee is in no case refundable.* In the case of candidates belonging to Scheduled Castes/Tribes, the fee will be reduced to one-fourth.

3. Applications in the candidate's own handwriting in the prescribed forms obtainable from the Reserve Bank's offices at Bombay, Calcutta, Kanpur, New Delhi, Nagpur, Madras, Bangalore, Hyderabad, Trivandrum, Lucknow, Patna and Jaipur accompained by copies (originals should not be sent) of certificates regarding age and educational qualifications, statements of marks secured in the Graduate and Post-graduate degree examinations and two testimonials should be forwarded to the Secretary, Central Recruitment Board, Reserve Bank of India, Central Office, Post Box No. 406, Bombay No. 1, so as to reach him on or before the 22*nd February* 1964.

4. Candidates already in service will be required to produce a proper discharge certificate from their employers in the event of their being selected at the time of their appointment in the Bank's service.

5. Candidates belonging to Scheduled Castes/Scheduled Tribes should mention this fact prominently in their applications and also enclose a copy of a certificate to that effect from a competent authority.

6. Candidates must be prepared to serve in any office of the Bank in India and to undertake tours when required.

7. Selected candidates will have to appear for interview/s before the Selection Board at any of the Bank's offices.

8. Appointments will be subject to candidates being found medically fit for service in the Bank by the Bank's Medical Officer.

9. If any candidate desires to have his application acknowledged, he should send it by "Registered Post—Acknowledgement Due." Apart from those who may be specially called, interviews will not be granted to candidates nor will the Bank enter into correspondence with them.

10. Canvassing in any form will be regarded as disqualification.

THE RAMNUGGER CANE AND SUGAR COMPANY, LIMITED

NOTICE

NOTICE IS HEREBY GIVEN THAT THE Twenty-seventh Ordinary General Meeting of the Shareholders of the Ramnugger Cane and Sugar Company, Ltd. will be held at the Registered Office of the Company, 7, Wellesley Place, Calcutta, on Wednesday, the 26th February, 1964, at 12 noon, to transact the following business:—

Individual Notices to Shareholders will also be sent on 1st February 1964.

By Order of the Board,
H. P. DHANUKA,
Director.

CALCUTTA, 28*th January* 1964.

TREND OF MARKETS

MONEY STRINGENT

(From Our Own Correspondent)

BOMBAY, 29*th January*

The short-term money market continued to rule firm during the week under review, though conditions tended to improve slightly later in the week, following inflow of some funds. Demand for credit was well sustained and it was not easy for borrowers to obtain their requirements fully. The inter-bank call money rate for both renewals and fresh money was maintained at the high level of 5½ per cent. Interest rates for short-term deposits remained unchanged at the ceilings prescribed under the Inter-bank Agreement. Conditions at Calcutta continued to be stringent throughout the week, the call rate standing at 5½ per cent, same as last week.

Thanks to the persistent stringency in the money market, the 91-day Government of India Treasury Bills, tenders for which opened on Tuesday 28th January, evoked poor response. The total amount offered was no more than Rs. 2 crores which was just equivalent to that invited. The whole of it was accepted. The average rate of accepted tenders remained unaltered at Rs. 2.325 per cent per annum. Strangely enough, the response to Intermediate Treasury Bills was better than last week. The Bills actually sold from 22nd to 25th January amounted to Rs. 250 lakhs, as against Rs. 43 lakhs a week before and Rs. 15 lakhs two weeks before.

There was a handsome improvement of Rs. 2.02 crores to Rs. 111.72 crores in India's foreign assets during the week ended 24th January. The improvement occurred despite the fall of Rs. 2.98 crores to Rs. 9.26 crores in balances held abroad, for this fall was more than made good by the rise of Rs. 5 crores to Rs. 102.46 crores in the foreign securities held in the Issue Department of the Reserve Bank. Deposits of scheduled banks with the Reserve Bank receded by Rs. 4.13 crores to Rs. 78.60 crores. At the same time, their borrowings from the Reserve Bank, too, declined by about Rs. 3 crores to Rs. 29.29 crores, of which total of those against usance bills accounted for Rs. 9.84 crores, a drop of Rs. 1.95 crore over the week. Notes in circulation decreased by Rs. 17.69 crores to Rs. 2,397.18 crores.

The total credit made available by scheduled banks to their clients expanded by a further sum of Rs. 13.37 crores to Rs. 1,652.89 crores during the week ended 17th January. With this expansion, the net rise in credit since the beginning of the current busy season on 1st November 1963 comes to Rs. 183.94 crores, as against Rs. 72.64 crores in the corresponding period of the 1962-63 busy season. Alongside of the increase in bank credit in the aforesaid week, the deposits of banks also spurted by Rs. 18.47 crores to Rs. 2,425.38 crores. Even so, the outstanding borrowings from the Reserve Bank were pretty heavy, being Rs. 32.04 crores (a rise of Rs. 69 lakhs), including Rs. 12.20 crores (a fall of Rs. 2.50 crores over the week) in those against usance bills. Investments were a shade lower at Rs. 687.08 crores.

Trading in the Gilt-edged market was a dull and drab affair. Institutional support was lacking. The volume of transactions put through was thin, with values moving narrowly. Most of the Central and State loans were held at the last week's levels. The 6½ per cent 1977 Gold Bonds softened by 25 nP to Rs. 117.75 at which level they give a redemption yield of 4.77 per cent.

In the foreign exchange market, the banks' buying rate for U.S. dollars rose by 25 nP to Rs. 475.25 per $100, whereas their selling rate was unchanged at Rs. 478.50. In New York, the pound sterling ruled easier *vis-a-vis* the dollar, the spot rate declining by 0.050 cent to 279.770-279.800 cents and the three months' forward by 0.060 cent to 279.550-279.580 cents.

FURTHER RISE IN COTTON

(From Our Own Correspondent)

BOMBAY, 29*th January*

Cotton futures rose further this week, in spite of the Textile Commissioner's announcement on Monday (27th January) of the imposition of ban on the movement of cotton from Districts of Gujarat to outside those areas. Curiously enough, the ban, which constitutes the first official intervention during the current season, was construed by speculators to emphasise the feared shortage of supplies. In fact, as is explained by the Textile Commissioner in the Press note published below, the ban has been imposed because of the sharp rise in the price of Digvijay 'A' cotton, which, unless checked in time, might prove infectious. All the same, the futures contracts rose to new high levels on short-covering, speculative buying and absence of selling. The report on Saturday that steps were being taken to import 300,000 bales of U.S. cotton under P.L. 480 imparted some easiness to the futures market. The easiness, however, proved short-lived, thanks to emergence of fresh speculative support. Firm spot advices and reports of damage to the crop in Gujarat due to the cold wave continued to affect the sentiment. The March contract advanced during the week from Rs. 750.50 to Rs. 761.50 and closed Rs. 9.75 higher over the week at Rs. 760.25. The May contract attracted speculative buying from yesterday, with the result that its discount over the March delivery narrowed down from Rs. 17.75 to Rs. 12.25.

The week's trend in the futures prices is indicated below:

(In rupees per three quintals)

	22-1-64	*High*	*Low*	29-1-64
Jarilla March ...	750.50	761.50	750.50	760.25
Jarilla May ...	734.50	749.00	734.50	748.00

Announcing the imposition of ban on the movement of cotton from outside Gujarat Districts, the Textile Commissioner, in his Press note, describes how the Government of India has viewed with concern the increasing prices of many varieties of indigenous cotton which have gone beyond the statutory ceiling prices mainly because of the operation of speculative elements in the market. Recalling that the ceiling prices were increased during the last season by Rs. 125 per candy and that the revised ceiling prices were generally considered adequate to give sufficient incentive for increased production of cotton, the Textile Commissioner observes that, since, next to food, the price of cloth is an important factor entering into the cost of living index, it is in the public interest that cotton, which forms the major component of the cost of cloth and yarn, should not go beyond the ceiling prices fixed by the Government, particularly when such prices are considered to be "incentive oriented" and are, in fact, much above the international prices ruling for corresponding staple lengths.

In view of the increase in prices beyond the ceilings, especially in the case of Digvijay 'A' cotton, the leadership of which has been followed by certain other varieties also, the Textile Commissioner states that he has banned the movement of cotton in ginned or pressed form from any of the Districts of Surat, Broach, Baroda, Panch Mahal, Sabarkantha and Kaira of the Gujarat State excluding the talukas of Cambay and Petlad to places outside those Districts except in accordance with a special permission issued by the Textile Commissioner or any officer authorised by him. Mills desirous of transporting cotton from the above places may apply in writing to the Textile Commissioner, Bombay, giving full details. This restriction will not, however, apply to cotton parcels of weights not exceeding 15 kilograms for samples and domestic purposes. In this connection, the official Press note says:

"If such conditions prevail in respect of other cotton, similar action will be taken in respect of those areas which grow such cottons as and when necessary. Requisitioning of cotton at the ceiling rate based on the survey result of the Textile Commissioner's Appeal Committee will be commenced at random as and when necessary. In the implementation of the above measures, the Textile Commissioner will hold consultations, whenever necessary, with an advisory panel consisting of Mr. Dayalji G. Patel and Mr. Mooljibhai Bhatt, representatives of cotton growers, and Mr. Keshavlal Premchand Shah."

The Textile Commissioner has issued a further notification prescribing that the quantity of Digvijay 'A' cotton which a manufacturer may buy during the season commencing from 1st September 1963 shall not be more than 75 per cent of his consumption of such cotton during the cotton season 1962-63. If a mill has made forward purchases of this cotton in excess of the above limit, it should, it is pointed out, settle the contract for such excess quantity immediately under advice to the Textile Commissioner. Incidentally, it has been clearly stated that, if the situation does not improve after taking these measures, the Textile Commissioner may consider introducing further control measures such as varietal quota and compulsory survey.

There were no sellers of Digvijay cotton in the Sewri spot market after the Textile Commissioner issued the above order. Most mills were inclined to defer purchases, pending a general fall in prices following the official intervention. Some business was, however, reported in selected lots of CO2, L147 and 197/3.

The following were the spot prices—in rupees per candy of 784 lbs.—of some of the varieties:

Arvi L147 1,270; Amravati 1,237, Chopda 1,085, Digras 1,200 and Malkapur 1,170.

In the export section, registerations of Bengal *Deshi* were fast nearing the current quota's ceiling of 190,000 bales, and traders viewed with optimism prospects for an additional quota. The quantity licensed for import and actual arrivals into the country in the period from 1st September 1963 to 10th January 1964 amounted to 338,455 bales and 165,465 bales, respectively.

OILSEEDS SHOOT UP

(From Our Own Correspondent)

BOMBAY, 29*th January*

Both oilseeds and oils ruled buoyant during the week under review, with values shooting up to impressively high levels. The buoyancy followed hectic buying by bulls and heavy covering by shorts, thanks to tight supply position in the wake of steadily expanding demand. The groundnut section in particular depicted a distinctly firm trend, the January contract touching yesterday the ceiling of Rs. 236 per 250 kg. prescribed by the Forward Markets Commission; on Wednesday last week, it stood at Rs. 230.50. Trading in this contract was suspended. Today the contract was nominally quoted at the same level, that is, Rs. 236. The April contract forged ahead in the course of the week from Rs. 231.75 to Rs. 236.50, before finishing today at Rs. 236, a level that is just Rs. 5 below the revised enhanced ceiling of Rs. 241 fixed for this contract. The bullish fervour was fanned principally by fears of a possible acute scarcity of supplies developing in the next few weeks. The fears stemmed from:

(*a*) reported damage to the crop caused by the recent cold spell in Gujarat and other parts of Northern India;

(*b*) poor arrivals; the average daily arrivals were no more than 2,500 bags of groundnuts and 200 tons of oil, as against the normal rate of 10,000 bags and 500 tons, respectively; and

(*c*) good export business in groundnut oil with deals actually put through covering about 50,000 tons.

It is precisely for these reasons that crushers and *vanaspati* manufacturers were said to be buying on a large scale, while the stockists and cultivators were holding on to their stocks in anticipation of a further rise in prices. No wonder then that the spot prices, too, recorded a hardening trend. Groundnuts Nizam bold jumped up by Re. 1.75 to Rs. 48.62. Khandesh quality spurted by a like amount to Rs. 49.37. Oil ex-mill put on 85 nP to Rs. 19.25. Railway receipt strengthened by 75 nP to Rs. 18.95.

Castorseeds features were also buoyant during the week on reports of considerable damage done by the cold spell in North Gujarat to the standing crop. The report that the Brazilian crop had been affected by rains also imparted strength. The March 1964 contract moved up from Rs. 167.62 to Rs. 172.50, yesterday, the peak touched since business in this contract commenced on 19th November 1963. The closing today was a shade lower at Rs. 171.75. June contract went up in sympathy and touched Rs. 173.50 before finishing at Rs. 173. Ready Madras and Kanpur gathered a rupee each to Rs. 34.25 and Rs. 33.25, respectively. Oil B.S.S. hardened by 25 nP to Rs. 14.95. Oil commercial changed hands at Rs. 14.30, as against Rs. 13.90 last week-end.

Linseeds ruled strong following firmness of mustard seeds in North Indian markets. The March 1964 contract gained 37 nP to Rs. 37.31. June contract increased by 56 nP to Rs. 38.50. Linseed oil was done at Rs. 15.30.

In sympathy with the general trend of the market and on bullish advices from the cotton market, cottonseeds, too, tended to move up. The April 1964 contract recorded a rise of Rs. 2, today's closing being Rs. 102.

The following table shows the closing prices of oilseeds and oils on Wednesday 29th January as compared with those of two previous weeks:

	29-1-1964	22-1-1964	15-1-1964
	Rs.	Rs.	Rs.
Groundnuts			
January 1964 contract	236.00	230.50	226.87
April 1964 contract	236.00	231.75	230.00
Nizam bold	48.62	46.87	45.75
Khandesh quality	49.37	47.62	46.75
Oil ex-mill	19.25	18.40	17.90
Oil Rly. Receipts	18.95	18.20	17.75
Castorseed

SILVER SOARS

(From Our Own Correspondent)

BOMBAY, 29*th January*

Silver soared this week by more than ten points to Rs. 268 per kilo, which is a new all-time peak. The rise was caused by excellent offtake and poor stock position. At 30 bars, the daily average offtake almost doubled arrivals. Local stocks were extremely limited at about 400 bars, as the tendency of certain parties to corner the available supplies continued. The price opened one point higher at Rs. 258.50 and gradually improved to Rs. 262 by Saturday. Yesterday, it shot up to Rs. 267 and rose further to Rs. 268 at close today.

Gold was also firmer. The 14-carat variety met with steady demand from ornament manufacturers and recorded a handsome gain of Rs. 4.25 to Rs. 69.25 over the week. As against Rs. 111.50 last week, pure gold was unofficially bid up to Rs. 120 this week, before settling down to around Rs. 118. Sovereign moved up from Rs. 85 to Rs. 88.

The international price of gold in London was fractionally higher at $35.08¼, as compared with $35.08¼ last week. The ready rate gained from 250s. 9¼*d.* to 250s. 9½*d.*, after easing initially to 250s. 8½*d.* Silver in New York and London continued firm at last levels.

The following table shows the trend of prices during the week under review:

	29-1-1964 (closing)	High	Low	22-1-1964 (closing)
	Rs.	Rs.	Rs.	Rs.
SILVER				
Ready (999fine) ..	268.00	268.00	256.50	257.50
GOLD				
Ready (14 carat) ..	69.50	69.50	66.00	65.25
Sovereign	85.00*	—	—	85.00*
London—				
Gold	250*s.* 9½*d.*	250*s.* 9½*d.*	250*s.* 8½*d.*	250*s.* 9½*d.*
Silver Ready ..	111½*d.*	—	—	111½*d.*
Silver Forward ..	111½*d.*	—	—	111½*d.*
New York—				
Silver	129.3 cents	—	—	129.3 cents

* As on 24-6-1963.

N.B.—The quotation for gold is per 10 grams (about 0.85 tola and that for silver is per kilogram (85.73 tolas). London and New York quotations are per ounce.

BLACK PEPPER QUIET

(Messrs. Parekh and Co.)

BOMBAY, 28*th January*

Malabar black pepper ruled quiet this week, with slow erosion in prices in the absence of foreign enquiries and owing to pressure of arrivals. Arrivals have proved much more than the demand, and stocks are accumulating in the godowns of commission agents. Ready ungarbled was on sale at Rs. 266. Garbled was quiet at Rs. 269. The February delivery moved sluggishly between

Rs. 278 and Rs. 281. March was quoted at a premium of Rs. 6. Ready, in Bombay, was quoted at Rs. 150 per 50 kg. The *Mahu* delivery dropped to Rs. 302 on liquidation. The *Chaitra* delivery eased to Rs. 313. Singapore was fairly steady at $ (M) 112¼, as the arrivals from Sarawak were diminishing. Spot, in New York, came down from $0.33¼ to $0.32¼ as grinders remained out of the market on expectation of lower prices. It is reported that offers for Malabar at $0.31½ remained unaccepted. Indonesia was a sporadic seller both in Europe and the U.S.A. Exporters there were reported quoting at $0.31½ per lb. *c.i.f.* New York without success. Malabar was offered at progressively lower price for testing the New York buyers.

The noteworthy factor for the market was the official declaration of "cease fire" both by Indonesia and Malaysia following the good offices of Mr. Robert Kennedy. Settlement of the political dispute between Indonesia and Malaysia is likely to affect the world pepper market. The *Mahu* delivery, in Bombay, went off the board at Rs. 303.

TEAS DEARER

(Messrs. Forbes, Ewart and Figgis Private Ltd.)

COCHIN, *23rd January*

A smaller quantity of approximately 500,000 kg. came under the hammer in tea sale No. 3 held here on Tuesday, 21st January. A useful selection of Nilgiri teas was on offer and mediums were generally brighter. The market met with strong and active demand. Best Nilgiri brokens were sold at around last rates, but their fannings were often dearer. The lesser Nilgiris were higher where quality was improved, but similar fannings came to a lower market following less competition. Good mediums were sold well and were firm to dearer, particularly where quality was improved. There was strong inquiry for medium and low medium brokens which tended to move up, especially the brighter kinds, while fannings in these categories advanced but to a lesser extent. Black leaf descriptions were again a strong feature of the sale and were sold well. Whole leaf grades and unorthodox types followed the general upward trend of the market. Tippy teas were easier.

Quotations (per kg.) were:

	1964	1963
	Rs.	Rs.
Low mediums	4.45-4.85	4.30-4.80
Mediums	4.90-5.15	4.80-5.10
Good mediums	5.20-5.80	5.20-5.90
Nilgiri B.O.P.	5.20-8.75	5.75-10.90

The average price realised in sale No. 3 was Rs. 4.93 per kilo, as against Rs. 4.67 a week ago and Rs. 5.28 in the corresponding sale last year.

Offerings in dust sale No. 3 held today amounted to 253,000 kg. The market opened strong and active which continued throughout the sale. All medium categories were well competed for and were sold at firm to dearer rates. There was useful inquiry for highgrowns and these were also fully firm to dearer. Residual kinds, meeting useful demand, were sold at around last rates. Clean black grainy descriptions were a strong feature of the sale. Unorthodox descriptions shared in the general trend of the market.

The average price realised in dust sale No. 3 was Rs. 4.52 per kilo, as against Rs. 4.50 a week ago and Rs. 4.15 in the corresponding sale last year.

Colombo: There was active demand. Broken grades were better, particularly brighter liquoring kinds. Lowgrowns were also better, though best liquoring fannings were slightly easier.

London: North Indian and Other Growths: The market was fairly active on Monday with prices ruling steady on last rates. Bright liquoring Africans were often dearer by 1d. to 3d.

Ceylon and South Indians: 26,513 packages were offered in Tuesday's sale, of which 8,496 packages came from South India. There was good general demand and prices tended dearer.

As we go to press, Messrs. Forbes, Ewart and Figgis Private Ltd., wire as follows:

Sale No. 4: 468,000 kgs. offered. Strong general demand. Low mediums and mediums 5 to 10 nP dearer. Good mediums 10 nP to 20 nP dearer. Others fully firm. Highgrowns strong and dearer. Unorthodox stronger.

GOOD DEMAND FOR TEA

(From Our Own Correspondent)

CALCUTTA, *28th January*

Although good general demand was a feature of both the export as well as internal tea sales held here last week, it is generally expected that demand is unlikely to broaden. For, most of the overseas markets, which usually buy from India, have already taken substantial quantities. Despite the shortfall in the North Indian crop in 1963, exports to the United Kingdom rose impressively. It should also be noted that tea stocks in the U.K. increased to 160 million lbs. in the week ended 17th January from 154.60 million lbs. in the previous week.

What is now remaining to be marketed is mostly the cheaper varieties, for which foreign demand is usually poor. Domestic demand also is not heavy at this time in view of the expensive credit. Also, since supplies exceed demand, internal stockists are cautious. At the same time, it is unlikely that overseas buyers would be in a hurry to enter the market this year. They have built up a good stock position, and can stay out of the market for some time. Nothing can be known about the quantity the U.S.S.R. would lift from India this year. Last year, Russian support to the Calcutta tea market was lively, but now Communist countries have been reported to be growing more tea. In the present situation, the trade is worried about the difficulties that might be caused by overproduction. Although world production last year equalled consumption, it was clear that producing countries were vying with one another to increase their output. The F.A.O.'s forecast of a glut in supplies by 1964-65 would, therefore, appear to be based on a correct assessment.

The North Indian tea output in December 1963 was higher at 14.25 million lbs. as compared to 9.96 million lbs. in December 1962. Total output in 1963, at 562.44 million lbs., showed, however, a decline of 13.95 million lbs. as compared to 1962. The loss in the North Indian output was partly made good by the rise of 7.8 million lbs. in the South Indian production which totalled 178.8 million lbs. up to the end of November 1963. The Calcutta Tea Traders Association recently stated that, although the present statistical position was good, the future outlook was uncertain.

In the last export sales held here, offerings totalled 68,101 chests, which met with good general demand. Darjeelings were a strong feature, and prices recorded a hardening tendency. Whole leaf grades were firm, but tippy teas eased. Plain orthodox teas met with support, and the more useful grades, particularly fannings, were higher. Medium orthodox B.O.Ps eased, but the brighter teas were fully firm. C.T.Cs were accorded useful support, with B.Ps being firm. Prices of the brighter liquoring teas gained, but legg-cut teas eased up to 10 nP. The prices per one kg., inclusive of excise duty, were: Best Assam C.T.C. fannings Rs. 5.60 to Rs. 7.00, best Assam C.T.C. B.P. Rs. 5.70 to Rs. 6.20, medium Assam C.T.C. fannings Rs. 5.00 to Rs. 5.30, medium Assam C.T.C. B.P. Rs. 5.20 to Rs. 5.60, clean plain pekoe Rs. 5.10 to Rs. 5.40, plain fannings Rs. 4.50 to Rs. 4.65 and plain B.P. Rs. 4.50 to Rs. 4.65.

Dusts on offer at the last internal sales held here totalled 31,166 packages. Demand was good and gathered momentum as the sale progressed. Flavoury Darjeelings were fully steady. C.T.Cs opened easier by 10 nP to 15 nP, but as the sale progressed, the loss was not only made good, a small gain was also recorded. Good C.T.Cs were favoured by buyers. Plain orthodox teas eased, and, among Assams, the better liquoring teas were steady. Legg-cut teas were firm, but the fibrous kinds occassionally eased. The quotations per one kg., inclusive of excise duty, were: Good Assam C.T.C. dust Rs. 6.00 to Rs. 6.60, medium Assam C.T.C. dust Rs 5.10 to Rs. 5.30, legg-cut dust Rs. 4.90 to Rs. 5.05, medium Assam dust Rs 4.70 to Rs. 5.00 and plain orthodox dust Rs. 4.50 to Rs. 4.70.

JUTE GOODS HARDEN

(From Our Own Correspondent)

CALCUTTA, *28th January*

With good business reported in both hessian and sacking constructions, prices of jute goods recorded an uptrend during the week under review. The daily arrivals having declined further, fibre prices were fully firm at around the minimum levels.

The trade noted with satisfaction that the West German Government proposed freeing jute goods from import control from July next. India at present exports about 15,000 tonnes of jute goods to West Germany, and the trade is hopeful that this quantity can be increased at least threefold within the next two years. Sharing in this optimism, Mr. Theodor Schwartz, Vice-President, Import and Export Division of the West German Bags and Canvas Importers' Association, who was at Calcutta last week, said that the Indian mills should study the requirements in West Germany. For he said that West German buyers, since they experienced difficulties in securing timely supplies from Pakistan, looked to India to meet their increasing needs of the packaging material.

Although the stocks which the U.S. built-up in 1962 in the wake of the Chinese invasion of India enabled U.S. buyers to accord support to the Calcutta market only sparingly in 1963, the total offtake from India by that country exceeded that of 1962. This is attributed to the marked increase in economic activities in the U.S. in the last year. Both farms and industrial output touched high levels and these required more bags. Packing for industrial uses, too, recorded a significant increase. The high burlap stocks assured price stability and, with increased output, Indian mills were also able to maintain a steady supply. The outlook for increased exports to the U.S. this year is considered bright among the trade here. Although the average monthly consumption in the U.S. in 1963 was higher than in 1962, December consumption was only 75 million yards, as compared with 77 million yards in the previous month. At the end of December 1963, stocks aggregated 294 million yards, against 281 million yards in the previous month. At the December rate of consumption, the stocks represented about 3.9 months' requirements.
