THE Expert Committee on the Consumers Price Index Numbers for Industrial Workers, Bombay (commonly known as the Lakdawala Committee after the name of its Chairman, Professor D. T. Lakdawala) has recently submitted its second report to the Government of Maharashtra. This report is noteworthy for the clarification and reconsideration of some points contained in the Committee's first report, submitted on 7th January 1964. It has recommended certain procedural changes in compilation of the consumers price index. While releasing the report to the Press on the 17th instant, the Labour Minister of Maharashtra, Mr. N. M. Tidke, promised to ascertain the views of labour and employers' organisations regarding the proposed changes before taking final decisions thereon.

The consumers price index for Bombay is based on the results of the family budget enquiry conducted in 1932-33. The weighting pattern, based on this enquiry, was kept unchanged for over thirty years. On the recommendation of the Conference of Central and State Statisticians held in 1953, the Government of India conducted in 1958-59 fresh family budget enquiries on a uniform basis in important industrial centres in India, including Bombay. The new index numbers based on these enquiries are being worked out by the Labour Bureau of the Central Government.

The question of replacing the existing series, it will be recalled, was also engaging the attention of the State Government at the same time and, in December 1958, the Government appointed a Committee, under the chairmanship of Professor Lakdawala, to examine "whether the expenditure pattern of the working class in Bombay City has undergone such a change as to necessitate the introduction of a fresh interim series of consumers price index in place of the existing series and, if so, to advise how the interim series should be correlated with the existing series." The Committee was also asked to examine "whether, if a fresh series is not to be introduced, any *ad hoc* changes should be made in respect of the various items of expenditure contained in the existing series of the weights attached to them." The Committee, which submitted its report in July 1959, recommended that, in view of the significant change in the expenditure pattern of working class in Bombay City, it would be advisable to introduce a fresh interim series of consumers price index numbers (based on the rapid family budget enquiry) in place of the existing series based on the 1932-33 enquiry. The Committee did not, therefore, consider the question of any *ad hoc* changes to be made in the existing series. The Government, however, took no action on these recommendations and the series continued to be worked out on the old basis.

First Report's Findings

In June 1963, however, labour organisations made representations to the Government, pointing out the various defects in the existing series. They argued that, before the new series, based on the 1958-59 family budget enquiry was introduced, the defects in the existing series should be removed first and the new series should be linked only with the revised current series. As a result, in August 1963, the Government appointed the Expert Committee on the Consumers Price Index Numbers for Industrial Workers, again under the chairmanship of Dr. Lakdawala, to examine the necessity for readjustment in the existing consumers price index series for the City of Bombay, and if so, to suggest what readjustment should be made; and to consider the method of linking of the proposed series with the existing series, readjusted if necessary. The Committee, which submitted its report to the Government of Maharashtra on 7th January 1964, ruled out any revision of the existing series for periods prior to 1960. It also did not consider it appropriate to take into account the changes in consumption pattern of a few items as that would have disturbed the weights of other items. Thus, as far as possible, the Committee stuck to the fixed basket up to 1960. After considering the various viewpoints, the Committee decided that the existing series required readjustment in respect of price indices of ghee, ready-made tea, house rent and clothing group. After making the necessary corrections in these items, it revised the average general index for 1960, which was originally 420, upwards to 449. As regards linking, the Committee recommended that the new series should be linked to the current revised series at 1960 only by a simple ratio linking, and that the linking factor should be 449. The State Government implemented the recommendation of the Committee relating to the readjustment of the current consumer price index series. But, in view of the unanimous stand of employers and employees, that the introduction of new series and linking it with the current series from 1960 should be undertaken only after full details regarding the 1958-59 family budget surveys were made available to them, the Government deferred, for the time being, action in this matter.

As sufficient data relating to some points raised by employers and employees were not available for 1960, the Committee could not consider them. These points, relating to (*a*) the proportion of consumption of Government and other rice, (*b*) the change in the mode of purchases of food articles by the workmen, (*c*) retail prices of cloth items, and (*d*) unit of quantity utilised by the Committee in readjusting the current index figure of ghee, were referred back to the Committee for consideration. The second report, submitted by the Committee on 14th August, 1964, deals with these four points.

Before drawing up this second report, the Committee invited the organisations of employers and employees to submit their views. Whereas all the five labour organisations, which were invited, submitted their views in writing or orally, of the eight employers' organisations invited for this purpose, three organisations did not take any part in the enquiry. Such an attitude on the part of the employers' organisations has unfortunately created the impression (right or wrong) that their case is weak. The views of employees and employers organisations and the recommendations of the Committee on the four issues, are summarised in the following paragraphs:

Proportion of Government Rice

The employers organisations pointed out that the ratio of 1 : 3 laid down by the Asoka Mehta Committee in 1958 and adopted by the Government Labour Office for collecting the prices of Government-supplied rice and free market rice was not correct. The Millowners' Association submitted data, showing that during 1962 and 1963 this ratio was 2:3. The Association also pointed out that, according to the 1958-59 family budget survey, the working class did not consume 'Patni' at all and, in fact, it was not available in the market, and that it was a variety of rice and as such should not be considered separately and that its weight should be amalgamated or distributed with the weights of other cereals. On the other hand, labour organisations based their argument mainly on the "fixed basket" theory and pleaded that a variety of private rice had already been fixed for the price collection and it was also available in the market. Since the primary purpose of constructing a series of consumers price index number was to measure the effect of changes over time in the expenses incurred for maintaining an unchanged consumption level, no weightage, they continued, should be attached to Government rice. The Committee, however, felt that rice could not be covered by the "fixed basket" theory as there were other factors involved in measuring the consumer price index for this commodity. As the Committee has observed, "it is true that, once the variety of commodity for price collection is fixed, there should be generally no tampering with it, and it should only be changed when it is no longer available. In this particular case, however, the 1933-34 variety of rice, Burma rice, is no longer available and has been already substituted. It is not clear to us that the substituted variety is closer to the original variety than some varieties of Government rice. Government's entering into the rice trade is a matter of policy. Under the circumstances, it would be wrong if we fail to attach due importance to Government rice as revealed by 1963 offtake prices."

After examining the available data and arguments, the Committee has recommended that the item 'rice' should be treated as one commodity and its weight should be divided between the Government rice and free market rice in the proportion of actual consumption, to

BIG CUT IN TITAGHUR PAPER'S DIVIDEND

MAIN HANDICAPS ARE COST-PRICE SQUEEZE AND DELAY IN MODERNISATION

FOR shareholders of the Titaghur Paper Mills Company Ltd. [Managing Agents: Messrs. F. W. Heilgers and Company (Private) Ltd., Calcutta] the prospects are certainly not rosy. During the year ended 31st March 1964, their Company has no doubt earned a higher gross profit of Rs. 61.08 lakhs, as compared with Rs. 34.82 lakhs in the previous year out of net sales (that is, excluding excise duty paid) which have increased from Rs. 874.41 lakhs to Rs. 959.05 lakhs and realised, for the first time in three years, a net profit, which is a fairly decent amount of Rs. 13.65 lakhs, as against net losses of Rs. 1.34 lakh and Rs. 11.38 lakhs in the previous two years. But the return to equity shareholders, who had faithfully taken up the new issue offered at the ratio of one-for-three at a premium of Rs. 5 per share (of Rs. 10 fully paid) soon after they received one bonus share for two shares on 1st April 1962, is a mere 2.5 per cent per annum, as against 10 per cent for the previous two years and 20 per cent per annum for the year 1960-61. What is more, as in the previous two years, both the preference and equity dividends are to be paid from reserves, though, at the same time, the Directors have been able to carry to reserves the entire net profit, as against nothing in the preceding three years, so that there has been a net addition to them this year.

On top of getting a meagre return after putting in more funds, the shareholders are told that the Company's modernisation and expansion programme, for which these funds are being utilised, and on which depends largely the Company's return to a position of producing satisfactory financial results, is unlikely to bear fruit until the year 1965-66. According to Mr. D. C. B. Pilkington, Chairman of the Company, delays in the delivery of plant and equipment have impeded the expected progress in implementation of this programme. It is this slow progress, combined with accentuation of the cost-price squeeze under which the paper industry has been groaning since 1960, that has affected the Company's results for the year under review. It must be noted here that, whereas costs have shot up by Rs. 270 per tonne since 1960, selling prices have been allowed to be raised only once by Rs. 60 per tonne.

The Company's progress in the past four years is compared in the table below:

(In lakhs of rupees)

	For the year ended 31st March			
	1964	1963	1962	1961
Sales, less excise duty paid	959.05	874.41	857.43	825.53

Low	11.81	15.12	20.75 X.R.	35.69	38.25

Production during the year under review had increased by 4 per cent, the aggregate being 57,822 tonnes, as against 55,425 tonnes a year before. But, as in the previous year, only No. I Mill has contributed to the Company's profit. The No. 2 Mill has shown some improvement, but the No. 3 Mill has continued to run at a loss. New machines for improving quality of the paper produced have been installed in all the three mills. Additional machines will raise No. 1 Mill's capacity to 100 tonnes a day by 1965. It is possible to achieve an average production of around 70 tonnes per day in No. 2 Mill and, with the new machines expected to be installed in the next two years, the capacity will rise further. The No. 3 Mill has a capacity of 40-45 tonnes per day but this rate cannot be reached until ancillary equipment is installed. These increases in production capacity are part of the modernisation programme designed to reduce costs and improve quality of the paper. Since the close of the year, economies in expenditure of roughly Rs. 8 lakhs have been effected. But it is pertinent to note that the reversal by the Supreme Court of the lower Court's award in the issue of profit-sharing bonus to the labour has cost the Company Rs. 11.30 lakhs during the year under review. Further, if the uncompensated increase in costs during the past four years had not occurred, the profit for the year under review would have been higher. Successful completion of the modernisation programme at an early date is thus of vital significance for the Company.

In this connection, readers' attention is invited to the following extract from the Chairman's latest annual statement to shareholders:

"The paper industry is one in which major technological advances have occurred in recent years, resulting in substantially lower costs of production as regards chemicals, labour and in many other directions. Modern mills in this country with an economic daily output can still make reasonable profits, despite the steady increase in costs. Although the Company's total output is large by this country's standards, it is derived from three mills, only one of which has a truly economic output while much of the plant and machinery is not of the latest design.

"The Directors are well aware of this situation and, for this reason, in late 1962, embarked on a modernisation and expansion programme, designed to increase production at all three mills, while, at the same time, reducing costs and improving quality. The main frustration of this year has been that, to-date, virtually no benefit has been derived from this programme. In line with Government's policy, virtually all orders have had to be placed with indigenous manufacturers of paper mill machinery. Deliveries quoted are between 14 and 18 months to which has to be added, around four months for planning, going out to tender, and placing orders *plus* three to four months for erection and commissioning. In most cases, manufacturers are behind schedule in making actual delivery, usually due to circumstances outside their control. The net outcome is that it takes up to three years to derive any benefit from a planned programme of expansion and modernisation and it will not be until 1965 that the Company sees any real results from the scheme now in progress. In the meantime, interest charges have increased, following advance payments to manufacturers."

The Company's paid-up share capital of Rs. 310.80 lakhs, including Rs. 30.87 lakhs in preference and preferred shares, is backed by Rs. 319.56 lakhs in reserves and surplus. The excess of current assets, book debts and investments aggregating Rs. 600.50 lakhs over the total of short-term indebtedness of Rs. 368.66 lakhs comprising borrowings of Rs. 70.65 lakhs (excluding 5.5 per cent 1966-70 debentures of Rs. 100 lakhs) and current liabilities and provisions shown at Rs. 298.01 lakhs works out to Rs. 231.84 lakhs. The gross block carried in the books at Rs. 10.71 crores, as against Rs. 10.24 crores a year before, has been written down to a net value of Rs. 4.68 crores and, including capital work-in-progress, is shown at Rs. 4.99 crores.

The net yield on the Rs. 10 fully paid ordinary shares of the Company at their current market value of Rs. 12.37 *cum-div.* works out to 1.6 per cent per annum.

VOLTAS'S NEW VENTURE

A new factory for the manufacture of electrical switchgear and controlgear is being set up at Thana by Tata-Merlin and Gerin Limited, a new company which has been promoted by Voltas Limited jointly with the well-known firm of Etablissements Merlin and Gerin of Grenoble, France, and Tata Sons Private Limited. The factory will manufacture under Merlin Gerin's licence various types of switchgear and allied power distribution equipment, including the Solenarc high tension air-break circuit breakers, isolators upto 380 kV, Interrupters, current and potential transformers, switchboards and control panels and a complete range of LT air-break circuit breakers. The manufacture of relays and measuring instruments is also planned. Production is expected to start at the end of 1965.

Tata-Merlin and Gerin Limited has an authorised capital of Rs. 2.5 crores. In the first stage, its issued capital will be Rs. 70 lakhs, of which about 45 per cent will be issued to the public. The balance will be taken up by the three promoters, Merlin Gerin capitalising a part of the fees and royalties payable to them.

The Company's foreign collaborators, Messrs. Merlin and Gerin S.A. of Grenoble, France, are one of the leading manufacturers of electrical equipment in Europe. They have over 40 years' experience in the manufacture of switchgear, power and instrument transformers, prefabricated switchboards and special equipment for mines, ships and railways.

Although switchgear and controlgear are already under progressive manufacture in India, the output of these items is far below the present demand and the country has been importing switchgear and allied equipment worth about Rs. 11 crores a year.

DAWN MILLS' DIVIDEND WELL COVERED

HOSIERY LINE THE MAIN PROP

DUE chiefly to the further advancement in the realisation from the sale of hosiery from Rs. 39.47 lakhs to Rs. 50.91 lakhs—though not unassisted by a marginal improvement in sales of yarn and waste—the Dawn Mills Company Ltd. (Managing Agents: Messrs. Ruia Industries Pvt. Ltd., Bombay) has been able to report fairly satisfactory working results for the year ended 31st March 1964. There is an increase in the combined turnover of yarn, hosiery and waste of about 10 per cent, from Rs. 228.02 lakhs to Rs. 247.87 lakhs, while both other income and closing stocks are usefully higher than those a year ago. As a result, the gross profit has gone up from Rs. 31.11 lakhs to Rs. 38.07 lakhs. Cost of raw materials and stores consumed and other expenses have continued to rise rather disproportionately—the former from Rs. 107.12 lakhs to Rs. 127 lakhs and the latter by as much as Rs. 18.05 lakhs to Rs. 95.05 lakhs.

The major portion of the increase in the gross profit has, however, been absorbed by the rise in essential provisions. Thus, the provision for Managing Agents' commission has gone up from Rs. 2.39 lakhs to Rs. 2.81 lakhs, that for depreciation from Rs. 4.59 lakhs to Rs. 7.65 lakhs and for taxation from Rs. 14.50 lakhs to Rs. 17.99 lakhs. The net profit at Rs. 11.62 lakhs is, of course, higher but only by a mere Rs. 2 lakhs. Out of this profit, the Directors have credited Rs. 3.22 lakhs, as against Rs. 4.89 lakhs last year, to reserves and have maintained the dividend, for the fourth year in succession, at Rs. 15 per share of Rs. 50 each, or 30 per cent per annum, subject to deduction of tax. The apparent drop in the plough-back is due to the fact that the amount brought forward in 1962-63 from the preceding year (1961-62) was Rs. 3.68 lakhs as against only Rs. 2,149 brought in in 1963-64. The dividend claims Rs. 8.40 lakhs as before and is well covered by the net profit for the year under review.

The working results of the Company for each of the past four years are presented synoptically in the comparative table below:

(In lakhs of rupees)

	For the year ended 31st March			
	1964	1963	1962	1961
Sales	247.87	228.02	201.19	190.48
Other income	4.44	1.51	0.97	0.88
Closing stocks	40.59	32.78	47.08	39.80
Raw materials and stores consumed	127.00	107.12	99.94	94.86
Other expenses	95.05	77.00	69.68	65.16
Gross profit	38.07	31.11	40.32	31.29
Managing Agents' remuneration	2.81	2.39	3.09	2.57
Provision for—				
Depreciation	7.65	4.59	4.39	4.74
Taxation	17.99	14.50	17.00	11.50
Net profit	11.62	9.63	15.84	12.48
To reserves	3.22	4.89	5.88	1.16
Dividend	8.40 (30%)	8.40 (30%)	8.40 (30%)	8.40 (30%)
Carry forward	0.02	0.02	3.68	2.07
Market price of ordinary shares (in rupees):	**1964**	**1963**	**1962**	**1961**
High	171	161	182	155
Low	149	124	150	111

During the year under report, the Company expended Rs. 9.50 lakhs in acquiring new assets and, of these, more than half, or Rs. 4.90 lakhs to be exact, was spent on additions to plant and machinery. These included automatic socks machines, interlock and knitting machines, hank dyeing machines, roller grinding machines and other electrical accessories. Extension of the bleach house which was in progress at the time of the last annual general meeting was also completed during the year. As a result, the block account as at 31st March last has risen to Rs. 130.56 lakhs. On this, the total amount of depreciation earned and provided for to date is Rs. 85.06 lakhs, so that the net block works out to Rs. 45.50 lakhs or about a third of its original value. Of the Company's investment of Rs. 4.60 lakhs at book value, investments worth Rs. 3.59 lakhs are in quoted scrips and these have a market value of as much as Rs. 11.98 lakhs. Current assets, loans and advances together amount to Rs. 171.59 lakhs. On the liabilities side, the Company's own funds stand improved at Rs. 71.53 lakhs, of which Rs. 28 lakhs are in ordinary shares of Rs. 50 each fully paid-up, and the balance, that is Rs. 43.53 lakhs, in reserves and surplus. As against this, outside finance is Rs. 150.16 lakhs, including Rs. 8.40 lakhs for the proposed dividend. It will thus be noted that the Company's financial position is quite sound.

The Rs. 50 fully paid ordinary shares of the Company are currently quoted at Rs. 165.50 *cum-div.* and offer a net yield of 7.8 per cent per annum.

BRADBURY STILL STRUGGLING

PROFIT INADEQUATE

THE Bradbury Mills Ltd. (Managing Agents: Messrs. M. Ramnarain Private Ltd., Bombay) has reported disappointing results for the year ended 31st March 1964. The turnover has increased by Rs. 12.25 lakhs to Rs. 236.19 lakhs, but the gross profit is practically the same, in fact, a little lower, at Rs. 12.76 lakhs, as against Rs. 12.94 lakhs for the preceding year. The ratio of gross profit to sales (profit-margin) which has always been uncommonly low and which had dropped by four points to 5.8 per cent in 1962-63, has, therefore, lost further ground and stands reduced at 5.4 per cent. After meeting essential provisions, the profit is so low that, for the second year in succession, the Company has had to withdraw from the reserves to maintain the dividend on equity capital. Although this deterioration is disappointing, it was not altogether unexpected. For, at the last annual general meeting itself, the Chairman, Mr. Ramniwas R. Ruia, had stated that the working results for the year under review till then were more or less the same as those for 1962-63 and that the mills' working continued to be affected by the lack of bleaching and dyeing facilities. This has now been confirmed by the Directors who state:

"Owing to rising costs of manufacture and no corresponding increase in realisation, the working has not shown better results. Moreover, the Company has at present no processing plant of its own and has, therefore, to get its processing work done by outside agencies. During the year under report, there have been heavy increases in the processing charges which the Company has had to pay, ranging between 60 and 75 per cent for yarn and 125 and 150 per cent for cloth. The Company has, therefore, to sell more of grey and unbleached varieties of cloth. This has also adversely affected the margin of profit. The Company expects to have its own modern processing plant by March or April 1965. Till the processing plant is received and erected, the Company will have to continue to depend for its processing on outside agencies."

Although, in consonance with the decrease in gross profit, the provisions for the Managing Agents' commission and taxation have declined —the former from Rs. 0.82 lakh to Rs. 0.73 lakh and the latter from Rs. 3.75 lakhs to Rs. 3.50 lakhs—that for depreciation is actually higher by Rs. 0.76 lakh at Rs. 5.34 lakhs. The resultant net profit is, therefore, a shade lower at Rs. 3.19 lakhs, as against Rs. 3.89 lakhs for 1962-63. The ordinary dividend, once again, remains unchanged at Rs. 15 per share or 30 per cent subject to deduction of tax.

The following comparative table clearly brings out the steady decline in the Company's earning potential, particularly during the past three years:

(In lakhs of rupees)

	For the year ended 31st March			
	1964	1963	1962	1961
Sale proceeds	236.19	223.94	212.95	196.15
Other income	8.09	9.96	3.36	2.67
Closing stocks	67.30	68.15	62.93	52.09
Raw material and stores consumed	115.69	113.70	107.78	91.58
Other expenses	114.98	112.47	98.66	89.93
Gross profit	12.76	12.94	20.71	17.31
Managing Agents' remuneration	0.73	0.82	1.48	1.21
Provision for—				
Depreciation	5.34	4.58	4.72	4.51
Taxation	3.50	3.75	4.50	5.00
Net profit	3.19	3.89	10.01	6.59
Withdrawal from reserves	1.94	..	..	..
To reserves	0.66	1.08	4.96	1.70
Dividends—				
Preference	1.47	1.47	1.47	1.65
Ordinary	3.00 (30%)	3.00 (30%)	3.00 (30%)	2.50 (25%)
Carry forward	0.24	0.21	1.96	1.36
Market price of ordinary shares (in rupees):	**1964**	**1963**	**1962**	**1961**
High	168	158	215	155
Low	145	140	155	114

There has been no change during the year under review in the paid-up share capital of the Company which stands at Rs. 24.85 lakhs, with Rs. 14.75 lakhs in preference shares of Rs. 50 each and the balance in ordinary shares of a like face value. This is supported by reserves aggregating Rs. 38.17 lakhs, excluding the amount required for dividend disbursement. Although there has been some reduction in borrowings, secured and unsecured loans still continue to be as heavy as Rs. 82.37 lakhs, besides current liabilities and provisions standing at Rs. 40.83 lakhs. On the assets side, the net block is shown at Rs. 30.72 lakhs; this has been arrived at by reducing the gross block of Rs. 102.82 lakhs by the accumulated amount of depreciation of Rs. 72.10 lakhs. Current assets, investments and loans and advances at Rs. 155.52 lakhs more than adequately cover the liabilities.

The Rs. 50 fully paid ordinary shares of the Company are currently available at Rs. 162 *cum-div.* and offer a net yield of about eight per cent per annum.

ALUCOIN'S RESULTS ENCOURAGING

DIVIDEND ENHANCED

THERE has been an all round improvement in the working of the Aluminium Corporation of India Limited (Managing Agents: Messrs. J. K. Industries Private Limited, Calcutta) during the year ended 31st March 1964. The net sale proceeds (that is, net of excise duty paid) have recorded an increase of 46 per cent, from Rs. 213.67 lakhs last year to Rs. 311.47 lakhs in 1964. Gross profit has gone up from Rs. 47.81 lakhs for 1963-64 to Rs. 62.91 lakhs for the year under review, an increase of about 24 per cent. The profit-margin (ratio of gross profit to sales), which had suffered a decline from 26 per cent in 1961-62 to 22.4 per cent in 1962-63, has, however, declined further to 20.2 per cent, apparently because costs rose further, while the selling prices for ingots declined due to a slackness in the demand for them caused by inadequate fabrication facilities in the country. The provision for depreciation has claimed Rs. 23.70 lakhs which is about one and half times the amount set apart last year, namely, Rs. 16.20 lakhs. No provision for taxation has been made, presumably because none is due on account of availability of development rebate and other concessions. The net profit is, therefore, technically Rs. 38.12 lakhs, up by about Rs. 8 lakhs over 1962-63. The dividend has been stepped up from 5 per cent to 9 per cent, but it is still below the 12 per cent per annum paid for the years preceding 1962-63, albeit on a somewhat smaller capital.

The following table gives a comparative picture of the Company's progress during the last four years:

(In lakhs of rupees)

	For the year ended 31st March			
	1964	1963	1962	1961

* Without provision for taxation.
† Subject to deduction of income-tax.

It will be observed that the directors have utilised only a small portion of the profit for payment of dividend (both preference and ordinary) and that great bulk of the profit has been conserved. Of the sum of Rs. 25.71 lakhs added to reserves, the share of development rebate reserve is Rs. 12.71 lakhs, the balance of Rs. 13 lakhs being the addition to general reserve. This is only as it should be, for the Company's own resources (paid-up capital at Rs. 157.19 lakhs plus reserves at Rs. 243.79 lakhs, of which the bulk, that is, Rs. 173.82 lakhs, is capital reserves not available for distribution to shareholders) are small in relation to its net block account at Rs. 778.41 lakhs (gross block: Rs. 939.83 lakhs). The total liabilities are heavy at Rs. 541.32 lakhs, of which Rs. 199.95 lakhs represent secured loans. As against these, the current assets are no more than Rs. 162.81 lakhs. In other words, the major portion of the expansion of the Company's production capacity has been financed by borrowed funds.

The Directors have, therefore, decided to reduce the borrowings at least to some extent by raising the paid-up capital. Accordingly, they will soon issue additional capital of the order of Rs. 42.81 lakhs, of which Rs. 25 lakhs will be in cumulative redeemable preference shares of Rs. 100 each, carrying dividend at 9.3 per cent free of company's tax, but subject to deduction of tax at source at the prevailing rates. The balance of Rs. 17.81 lakhs will be in ordinary shares of Rs. 10 each at par. Both will be offered to the existing ordinary shareholders in the first instance in the proportion of one preference for 47 ordinary and one ordinary for 7 ordinary. There should be no difficulty in remunerating the capital increased thus, for the Company's expansion programme, making its plant an integrated one, has been completed. The new additions to alumina plant, which have trebled its capacity, were commissioned in April 1964 and are in full production. The new melting shop facilities and extrusion plant commissioned during the year has practically attained full production. The cable plant for manufacture of A.C.S.R. and A.A.C. (Conductors) and new rolling mills have also been commissioned. The foil plant is still under completion and is expected to be started shortly.

The Chairman of the Company is optimistic about the future.

The Rs. 10 ordinary shares of the Company are quoted at present at Rs. 12.50 *cum-div.* and give a net yield of 5.7 per cent per annum.

HIGHER SELLING PRICES HELP N.I.C.CO.

DIVIDEND RAISED SLIGHTLY

THE results of the National Insulated Cable Company of India Ltd. [Managing Agents: Messrs. Associated Industrial Development Co. (Private) Ltd., Calcutta] for the year ended 31st March 1964 compare favourably with those for the previous year. Sales show a notable rise of more than Rs. 49 lakhs from Rs. 401.09 lakhs to Rs. 450.26 lakhs, as against the increase of Rs. 10 lakhs from Rs. 390.61 lakhs to Rs. 401.09 lakhs in the previous year. Gross profit has staged a sharp recovery of Rs. 40.80 lakhs to Rs. 117.45 lakhs, thus reversing the downward trend noticed in the preceding two years. The improvement in net profit is, of course, comparatively small, being Rs. 15.23 lakhs to Rs. 39.23 lakhs, but this is because of heavier tax liability; the actual tax provision has shot up from Rs. 38.90 lakhs to Rs. 61.25 lakhs. The net profit is sufficient, even after transferring a big sum of Rs. 10.37 lakhs to reserves, as against Rs. 1.75 lakh a year before, to permit restoration of a part of the seven-point cut imposed last year in the dividend rate on the 10-rupee ordinary shares in the previous year; the rate of dividend proposed for 1963-64 is 20 per cent per annum, as against the 18 per cent distributed in 1962-63.

An increase in the selling prices of the Company's products since 1st October 1963 and concentration on the production of more remunerative types of cables are the principal factors explaining the year's much improved results. Selling prices were raised because the cost of raw materials increased substantially. At the same time, however, the Company obtained the benefit of the old stocks of raw materials purchased earlier at lower prices. Besides, the fabrication work done for other parties has also helped the Company in securing better trading position. But the Directors have warned that, although the year's results are encouraging, the higher cost of raw materials will be reflected in the working of the current and subsequent years and it might be difficult to maintain the last year's higher profit ratio.

The following comparative table gives an idea of the progress made by the Company during the last four years:

(In lakhs of rupees)

	For the year ended 31st March			
	1964	1963	1962	1961
Sale proceeds	450.26	401.09	390.61	467.52

Low	21.75	21.75	22.50	28.75	25.62

The Company's paid-up share capital, unchanged at Rs. 135 lakhs, is backed by Rs. 131.84 lakhs in reserves and surplus. Borrowings of Rs. 112.57 lakhs comprise Rs. 10 lakhs in 6 per cent debentures and Rs. 102.57 lakhs in bank loans. These bank loans and current liabilities and provisions bring the total short-term indebtedness to Rs. 277.73 lakhs, as against which current assets, book debts and investments aggregate Rs. 469.41 lakhs. The gross block of Rs. 168.75 lakhs (Rs. 164.18 lakhs a year before) has been written down to Rs. 85.15 lakhs.

Currently quoted at Rs. 25.50 *cum-div.*, the Rs. 10 fully paid ordinary shares of the Company offer a net yield of 6.6 per cent per annum.

SYNOPSES OF COMPANY REPORTS

Mysore Chemical Manufactures, Ltd.

(Chairman and Managing Director: Mr. S. Ramanathan, Bangalore.)

Twenty-sixth Annual General Meeting—30th September 1964.

Working Results:

* Dividends—payment out of the dividend reserve.
† Upto 18th September 1964.

Extracts from the Directors' report: There was good demand for the Company's products during the year under report and the entire production of *Copper Sulphate* was sold out. The total sales have considerably improved to Rs. 41,45,584 as against Rs. 32,95,355 in the previous year. The margin of profit was low owing to increased cost of production.

The factory at Belagula producing *Sulphate of Alumina* and *Alum* has not contributed to the profits this year also.

Accounts in brief as at 31st March 1964 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	12,00,000	Gross block	13,72,190
Reserves and surplus	7,21,025	—Depreciation	8,00,475

Low	4.00	4.24

* Loss after providing for depreciation.
† Including the loss of Rs. 1,55,990 brought forward from 1962 accounts.
‡ Upto 20th September 1964.

Extracts from the Directors' report: It has been decided to spread out the incidence of depreciation evenly under the straightline method as is stipulated under Section 205(2)(b) of the Companies Act, 1956. Depreciation previously provided in excess on this basis amounting to Rs. 2,72,494 has been written back and transferred to general reserve.

Production during the year was affected due to labour strike lasting nearly 1½ months. The same had its impact on the working results which otherwise would have been still more encouraging. The Directors are glad that it has been possible for them to recommend payment of maiden dividend. Development rebate reserve as required under the Income-tax Act has been provided fully including for the previous years.

During the report year, the Company has made considerable headway with the manufacture of cranes. The standardisations effected should ensure economic production and larger turnover.

The Lister engines since produced have been found satisfactory with the tests carried at the Company's factory. The same are now being put in the market. An industrial licence for the manufacture of industrial and marine diesel engines has also been recently received from the Government and the various aspects of this project are under necessary examination.

The working of the Company's building machinery division has been satisfactory. Despite increasing competition, the Company has been able to expand its sales of concrete mixers and concrete vibrators. The quality of your product is well received. The Agency turnover has also been satisfactory contributing to profit.

The Company has been successful in negotiating with a State Government for supply and installation of an iron ore handling plant for a value of approximately Rs. 293 lakhs in conjunction with a foreign company.

With the Calcutta Port Authorities completing their work on the land allotted to this Company at Taratalla Road, the construction of the new factory has commenced. It is unfortunate that there was delay in availability of suitable land to the Company for reasons beyond its control. It is, however, expected that with the new factory coming into operation in due course the activities of the Company will considerably expand.

Accounts in brief as at 31st March 1964 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	57,47,755	Gross block	26,17,042

* Subject to taxation estimated at Rs. 33.50 lakhs.
† Dividend—Payment out of the dividend reserve.
‡ High and low upto 11th September 1964.

Extracts from the Directors' report: Consequent upon the re-introduction of triple shift depreciation allowance, the provision for depreciation has increased from Rs. 61,92,948 in the previous year to Rs. 76,72,187 in the year under review.

Except for a small decline in the production of paper and boards, the general level of production was maintained during the year.

	Production		
	1961-62	1962-63	1963-64
Paper and boards (tonnes)	46,565	52,243	49,919
Cement (tonnes)	2,67,885	3,19,656	3,17,991
Clinker (tonnes)	2,85,860	2,91,347	2,88,524
Asbestos cement (tonnes)	17,770	19,092	19,546
Sugar (season) (quintal)	11,611	5,713	5,600
Vanaspati (tonnes)	9,795	11,270	11,321
Caustic soda (tonnes)	5,575	5,643	5,991

The fall in the year's profit is mainly due to an increase in depreciation provision, settlement of raw sugar claim, increase in the cost of power and fuel and general rise in the cost of production without increase in selling prices.

Paper and Boards: With prices pegged still at the old unremunerative level and the Government not taking any action during the last two years, the profits in the paper industry have tended to shrink and this Company could be no exception. Coal prices including railway freight registered a rise by 8.5 per cent during the last 18 months. The cost of main raw materials also has continued to increase and the Bihar Government is still charging exorbitantly high royalty rates for bamboos. The incidence of rising costs has been partly absorbed by improved efficiency and continued efforts to improve and modernise the plant and machinery.

A satin white plant to improve the quality of coating and an additional coating plant both fabricated in this Company's workshop have been installed during the year under report. Equipments to increase bleaching capacity have been installed and production of unbleached pulp has been eliminated. The I.C.I.C.I. has sanctioned a loan of Rs. 15 lakhs in foreign exchange for modernisation of the Soda Recovery Plant towards increasing both its capacity and efficiency. The application for import licence is pending with the Government for sanction.

Vulcanised Fibre: The vulcanised fibre plant continued to operate below capacity due to the inadequacy of imported base paper. Although exchange is not being allowed for import of base paper, finished vulcanised fibre sheets are being imported at considerably higher expenditure of foreign exchange.

Cement: The price was increased by Re. 1.25 per tonne only as late as July 1964. This increase has not been given retrospective effect to cover the increased cost of production that had already taken place. The industry through the Cement Manufacturers' Association continues to press its case for increase in the retention price of cement to compensate the rises in costs due to governmental actions.

Asbestos Cement: There has been a small increase in production of asbestos cement products. The unit has got sufficient capacity to increase production and there is also considerable pent up demand for the product. If imported asbestos fibre is available regularly and adequately, production could be further pushed up to meet the needs of the consumers.

Sugar: Although there was a 32 per cent increase in the production of sugar in Bihar over that of the previous year, the position of sugar industry in South Bihar is otherwise as it has registered a decline of 30 per cent in 1963-64 over the previous season. At the Company's plant the production remained the same as last year. Due to uneconomic price of sugar fixed for South Bihar factories, this Company's factory, in common with others in the region, has been suffering heavy losses. The average duration of all the factories in South Bihar region was only 37 days and the average recovery 9.65 per cent. The Union Government revised price of sugar from Rs. 122 to Rs. 134 per quintal with effect from 22nd May 1964 as against the fair ex-factory price of Rs. 146.12 calculated by I.S.M.A. based on Tariff Commission Schedule. But by the time the revision of prices came, major portion of the sugar production had already been despatched at the previous lower prices.

The cane availability in the area is expected to be higher by 50 per cent. If the diversion of cane to *Gur* is effectively checked, the production of the Company's sugar factory can be increased by even more than 50 per cent.

Vanaspati: The *Vanaspati* prices were under regulation by the Government throughout the year. Due to severe competition, the industry sold *Vanaspati* at prices lower than the fair prices allowed by the Government.

Due to failure of Mustard-Rape crop, the edible oil supply has become scarce. Groundnut oil is not available in the eastern region and the Company's factory has to depend on other States for its requirements. Movement restrictions have been imposed by U.P. and Gujarat Governments and the Company's factory will have to close down till the arrival of new crop in November.

In view of scarcity of groundnut oil, the Government have decided to import one lakh tonnes of soyabean oil from the U.S.A. under P.L. 480 for manufacture of *Vanaspati*.

Accounts in brief as on 31st March 1964 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	6,04,77,070	Gross block	16,37,20,662

† For the years ended 31st March 1958, 1959, 1960 and 1961.

Extracts from the Directors' report: With the termination of the Indian Jute Mills Association's Working Time Agreement with effect from the 1st February 1964, suitable modifications have been made in the working arrangements whereby the Company's looms are being operated at the Dalhousie Jute Mills. There is now a total of 294 looms being worked on double shift on this Company's account by the Dalhousie Jute Company Ltd.

The foundry section of the Company is operating successfully and has made a valuable contribution to the Company's profits. This section is handling the castings requirement of the Group Mills as well as those of certain other industrial undertakings in the same organisation. The quality of the castings produced is very satisfactory and several outside firms have approached the Company for supplies. In view of this, it is proposed to increase the capacity of the foundry to 200 tons per month.

Accounts in brief as at 31st March 1964 are as under:—

Liabilities	Rs.	Assets	Rs.

‖ Upto 11th September 1964.

Extracts from the Directors' report: During the year, three technicians, who were sent to France for 3 months' training, have returned with rich experience. The Directors are hopeful that future mechanisation and expansion programme which the Company has embarked upon, will have now smooth sailing.

The negotiations for getting the foreign exchange loan to enable the Company to import machineries for the expansion of the plant capacity by 25 million cells have materialised and the I.C.I.C.I. has undertaken to loan Rs. 9.44 lakhs approximately to the Company in foreign currency. Necessary steps are now being taken to place the orders for these capital equipments. But in view of the late deliveries indicated by the suppliers, it is expected that these machineries will not be commissioned before this financial year ends.

With a view to develop dry batteries of flat type of construction, the Company had applied for increasing the plant capacity. After detailed and laborious discussion, Government has now sanctioned by granting industrial licence to manufacture 35 million cells of this type of batteries, thus the full capacity of the factory, when this expansion project is completed, will be 100 million cells.

Accounts in brief as at 31st March 1964 are as under:

Liabilities	Rs.	Assets	Rs.
Capital*	28,91,580	Gross block	46,26,827
Reserves and surplus	18,28,347	—Depreciation	28,54,752
Other liabilities	37,83,863		
		Net block	17,72,075
		Current assets	62,10,298
		Investments	2,04,859
		Cash	3,16,558
	Rs. 85,03,790		Rs. 85,03,790

* Paid-up capital consists of 34,825 ordinary (equity) shares of Rs. 50 each; 15,000 ordinary (equity) shares of Rs. 50 each—partly paid up at Rs. 10 per share and 19,947—7.14 per cent. taxable cumulative redeemable first preference shares of Rs. 50 each. The amount paid up on shares forfeited is:—Rs. 1,490 on ordinary shares and Rs. 1,490 on preference shares.

Jaipur Udyog Ltd.

(Managing Agents: Messrs. Sahu Jain Ltd., Calcutta.)

Annual General Meeting—30th September 1964.

Working Results:

	For the year ended 31st March (In thousand rupees)	
	1964	1963
Cement sales	9,57,17	8,82,85
Closing stock	6,83	35,88

† Payment of dividends out of the dividend reserve.
‡ High and low upto 11th September 1964.

Extracts from the Directors' report: Production and despatches have been as under:

	Production		
	Clinker Tonnes	Cement Tonnes	Despatches Tonnes
1961-62	6,69,675	7,42,298	7,34,189
1962-63	8,23,238	8,20,778	8,20,778
1963-64	8,28,900	8,40,368	8,40,368

The production of clinker could not be maintained at last year's level because of the Government not granting necessary import licences for components and spare parts essential for maintenance. Unsatisfactory supply of power from Chambal Hydel Project also affected production.

The cement price has been increased by Re. 1.25 per tonne only from July 1964. The increase has not been given restrospective effect to cover the increases in the cost of production that had already taken place. The industry through the Cement Manufacturers' Association continues to press its case for increase in the retention price of cement to compensate the rises in costs due to governmental actions.

The packaging charges fixed by the Government continue to be inadequate to cover the actual expenses incurred in packing cement. There has been considerable loss on account of the unrealistic computation of packing charges.

A traxcavator, two Diamond Core Drills, one Wagon Drill, an Air compressor, etc., have been received and are expected to add to the mechanisation of the Quarries. Installation of Limestone Breaker at the Quarries with Screening Plant is nearing completion. Further steps are also being taken towards mechanisation of the Quarries.

Accounts in brief as at 31st March 1964 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	3,25,00,000	Gross block	9,04,06,214

Receipts relating to previous year	Nil	2
Provision written back	Nil	1,12
Appropriations:		
Transfer to development rebate reserve	54	1,96
,, ,, general reserve	1,00	Nil
,, ,, dividend reserve	Nil	4,20
Proposed dividend (taxable) equity	4,20	4,20*
	(7%)	(7%)
Carry forward	52	11
Market value of equity shares (in rupees):	1964†	1963
High	7.25	7.87
Low	6.37	6.81

* Dividend for 1963 was paid out of the dividend reserve.
† High and low upto 11th September 1964.

Extracts from the Directors' report: Consequent upon the re-introduction of tripple shift depreciation allowance, the provision for depreciation has increased from Rs. 10,19,632 in the previous year to Rs. 13,29,707 in the year under review.

Production and despatches have been as under:—

	Production		
	Clinker Tonnes	Cement Tonnes	Despatches Tonnes
1961-62	1,33,695	1,38,597	1,37,504
1962-63	1,62,036	1,74,851	1,75,504
1963-64	1,59,963	1,67,036	1,66,218

As in the previous years, frequent D.V.C. trippings have continued to hamper production. The Bihar State Electricity Board and the D.V.C. authorities have not yet been able to improve the power position. The production was also affected by the labour strike for 7 days in September 1963. Even after the strike was called off, it took some time to attain normal level of production.

The working results during the year have improved despite increases in costs mainly due to better working of the Foundry Division of the Company.

As mentioned in the last report, the Government had increased the retention price of cement by Rs. 2.75 per tonne from 1st June 1963, which was totally inadequate in view of the heavy rise in costs under various heads. The cost of production has been continuously on the increase even thereafter consequent upon governmental actions. No corresponding increase in the retention price of cement was, however, given during the financial year. The price was increased by Re. 1.25 per tonne only, as late as July 1964. This increase has not been given retrospective effect to cover the increased cost of production that had already taken place. The industry through the Cement Manufacturers' Association continues to press its case for increase in the retention price of cement to compensate the rises in costs under various heads.

The Raw Mill that is under installation at a cost of Rs. 23 lakhs would augment the slurry grinding capacity of the Company.

Accounts in brief as at 31st March 1964 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	59,00,843	Gross block	2,04,26,686
Reserves and surplus	14,91,628	—Depreciation	56,03,746
Other liabilities	1,63,91,031		
		Net block	1,48,22,940
		Machinery-in-stock	5,79,101
		Current assets	82,57,031
		Investments	12,100
		Cash	2,03,140
	Rs. 2,38,74,402		Rs. 2,38,74,402

* Paid-up capital consists of 6,00,000 equity shares of Rs. 10 each. Calls unpaid amount to Rs. 9,157.

Sir Isaac Newton held that gravity is a force, whereas Einstein regarded it as a property of space, which he believed was curved. But they had one thing in common. Both the Law of Gravitation and the Theory of Relativity were put down on papers for the consumption of knowledge-hungry world.

The world's first paper was made by the wasp for nesting purposes. The Egyptians manufactured Paper by cutting strips from the stem of the Papyrus plant-moistening them and laying them flat.

In modern India, J. K. Paper Mills produce all quality high grade writing and printing paper.

THE RAGHUVANSHI MILLS LIMITED

CHAIRMAN, MR. RAVINDRA MAGANLAL'S SPEECH

FREQUENT CHANGES IN TAXATION DEPLORED

SPEAKING at the Thirty-fifth Annual General Meeting of the Raghuvanshi Mills Limited. held at Bombay on Monday, 21st September 1964, Mr. Ravindra Maganlal, Chairman of the Company, severely criticised the frequent changes in tax structure and the consequent unsettling effects on investors. He wanted a declaration from the Government to the effect that the changes in future would not worsen the situation any more. Such a declaration, in his opinion, would act as a catalyst of the climate of investment. Referring to exports he emphasised that the time had come when stress should be on quality rather than quantity. Alluding to the Central Government's decision on the Bonus Commission's recommendations, he observed that, although the Commission had failed to distinguish the industries and regions for the purpose of bonus, its findings deserved a fair trial by both the industry and the labour.

The following is the full text of Mr. Ravindra Maganlal's speech :

GENTLEMEN,

I have great pleasure in extending to you a very cordial welcome to this thirty-fifth annual general meeting of your Company. I thank you all for attending the same.

Nehru's Death

The guiding star that ruled the destiny of the nation for one and a half decade is now no more since May 27, 1964. The light that he kindled and the posts that he illuminated will, however, guide the nation for years to come. The nation, nay, the world at large, has become poorer with the passing away of the saintly statesman like Jawaharlal Nehru. Gandhiji got us the freedom, but it was Nehru who consolidated it. We owe him a debt which we can rarely repay. Let his soul have eternal peace!

Shastri's Stewardship

Though our beloved Prime Minister did not name his successor, his faith in people and democracy was never misplaced. The country has well demonstrated this in unanimously electing Mr. Lal Bahadur Shastri as the new guardian and custodian of the country. It is too early for us to assess the achievements of the new regime; yet, the start by it is really praiseworthy. We all wish him success in his leadership.

Accounts

The Directors' report and the audited accounts for the year 1963-64 have been in your hands for quite some time and I believe I have your permission to take them as read. You will observe from the accounts that our sales have gone up by about Rs. 18 lakhs; the profit has risen by Rs. 8 lakhs, that is, in terms of percentages, the sales have gone up by 8 per cent with a remarkable rise of 30 per cent in the profits. Talking in terms of ratios, compared to last year, our gross profit to sales ratio percentage has gone up from 12.35 to 14.44. This is indeed an encouraging state of affairs, particularly in view of the fact that there is an avalanche of inflation all round and the consequent upward sloping cost curve of all inputs.

The profit has gone up during the year under review, yet, there is an apparent paradox of smaller available surplus. It is because of the fact that the provision made for the national exchequer has to be stepped up from Rs. 10.75 lakhs to Rs. 15.36 lakhs, that is, taxation claims 68 per cent of the net profits of the Company.

Additional Spindles

In my last speech I had announced the receipt of the industrial licence for installation of 6,788 spindles. Since then the industry has been granted general permission to raise their installed capacity by 10 per cent. This will lead our installed capacity to 44,000 spindles. Orders have already been placed to reach this installed capacity, and I hope to pronounce still better results in the years to come when all these spindles are installed.

Cotton Supplies

The supply position of indigenous cotton has been quite satisfactory throughout the year. The consumption of domestic varieties has also gone up from 45 to 54 lakh bales. The cotton prices have moved between the floor and ceiling except in case of Digvijay. Though the current crop expectations are 62 lakh bales, there is no reason to be complacent in the matter. Our yield per acre is the lowest in the world and the quality that is grown demands much of improvement. With regard to foreign cotton, import and consequent supplies still remain a formidable problem. It is gratifying to note that the Indian Cotton Mills' Federation is aware of this aspect and is attempting to do its utmost. Yet, it must be admitted that our yearly cotton import bill of Rs. 60 crores on the import of finer varieties of cotton cannot be stopped unless we accelerate the research programme in indigenously producing long-staple cotton.

Price Line and Inflation

Occasional bouts of inflation are not new to us since we had some form of inflation or the other since 1939, but the current inflationary trend which started from the beginning of the current year has remained unabated. Prices have been rising continuously at the rate of 18 per cent, something unusual and alarming that has happened in the last quarter century. This has consequently been reflected in the cost of living indices.

It is true that the prices of foodstuffs and eatables have gone up disproportionately compared with manufactured articles, but the inevitable will surely follow in case of manufactured articles also since the cost of all inputs and labour have gone up. One of the reasons of the rising inflationary trends is that though our gross national product has gone up by 9.6 per cent, the money supply has increased by 28.5 per cent. This steadily widening gap between the two is essentially a prime mover of inflationary prices. The vicious circle of price-wage chase will never end unless a purposive and positive price policy is evolved.

Bonus Commission

The Central Government's decision on the Bonus Commission's recommendations is remarkably practicable and purposive, signifying a balanced cut through. Though there has been good deal of compromise, it is regrettable the basic incongruencies are not yet remedied. The Bonus Commission itself has defined bonus as a share of the employee in the prosperity of the concern he serves. But the burden of minimum bonus inflicted on the marginal and loss making concerns will indeed be a contradiction in terms. The Bonus Commission has failed to distinguish the industries and regions for the purposes of bonus. Yet, it really deserves a fair trial by the industries as well as the labour.

Exports

Time and again stress has been laid on exports. The increasing import bill has got to be matched with the export earnings. In the presence of unsurmountable handicaps experienced by the domestic exporter, the fourth Plan export target of Rs. 5,100 crores will need the introduction of the export elements in all the fourth Plan targets. A portion of the projected fourth Plan targets will have to be specifically reserved by fiscal and other means to achieve the targeted exports during the fourth Plan.

Our emphasis so far on the export front has been of a quantitative nature. Now is, however, the time to consider the qualitative aspects of the export items and have larger per unit realisations. It is heartening to note that vigorous export drives are being carried out by the Government, and it is granting appropriate relief on export sales and profits. The establishment of Import-Export Stabilisation Fund is a step in right earnest and direction.

Taxation

We have by now learnt to live with the heavy incidence of taxation. Fulfilment of planned objectives undoubtedly calls for sacrifices from all and we have to bear the burden with a smiling face. What is disturbing, however, is the frequent changes in tax structures and the consequent unsettling effects on the investors. These well justified apprehensions have polluted the investment climate. We need not go too far away in searching this situation as the stock exchanges of the country very well reflect this atmosphere. Let there be a declaration from the ruling Government that the changes in future on this front will not worsen the situation any more. This will act as a catalyst of the climate of investment.

Powerloom Sector

The handloom and the powerloom now proposed to be treated as one sector will perhaps be the largest single small-scale industry in the world and ought to be encouraged in the interest

(*Continued on page 567*)

NEVER COMPARE...

It is always frustrating! So it is when you compare metric weights and measures with obsolete units like seer or viss. You will only waste your time and often lose in the transaction.

NEWS IN BRIEF

THE gross arrears of income-tax as on 31st March 1964 amounted to Rs. 290 crores, the total effective arrears being Rs. 170 crores.

The project capital outlay on the manufacture of petrochemical intermediates during the fourth Plan period is estimated at Rs. 300 crores.

A proposal to set up a heavy water plant with a capacity of 200 tonnes per annum is under the active consideration of the Union Government. The proposed plant will help sustain the nuclear power programme envisaged for the coming year.

The draft outline of the fourth Plan is expected to be published by March-April 1965. Members of Parliament have already met in five groups to consider the programmes in various sectors relating to the fourth Plan.

The coal production pattern is being adjusted to demand in order to prevent the existing imbalance partly due to an unforeseen increase in the output of lower grades, according to Mr. Sanjiva Reddy, Union Minister for Steel and Mines.

The expansion of the Bhilai steel plant from one million tons to 2.5 million tons (ingot steel) is scheduled to be completed by the end of the third Plan at an estimated cost of Rs. 177 crores, including a foreign exchange component of Rs. 68 crores.

The Mysore Iron and Steel Works Corporation (Bhadravati) has decided to pay a bonus of three months' wages to all its 10,000 workers. The total bonus payment is estimated at Rs. 20 lakhs, representing two-sevenths of the aggregate profit of Rs. 70 lakhs earned last year.

A new coin in the denomination of three-paise will be issued early next month. The metal composition of the new coin is aluminium with 3.5 to 4 per cent magnesium. This alloy is being introduced for the first time in the country. It will be hexagonal in shape with rounded corners and weighs 1.25 grams.

The change-over to metric system in all spheres is estimated to have cost the Union and State Governments, industries, trade and the public as much as Rs. 12 crores, according to a survey conducted by the Directorate of Weights and Measures. A large part (about Rs. 3 crores) of the expenditure has been on the replacement of weights and measures.

Ninety Central Acts, enacted between 1954 and 1961, are sought to be repealed, mostly in their entirety, under a Bill just introduced in the Rajya Sabha. The Bill also provides for amendments to 17 existing enactments. The Bill is a periodical measure by which Acts which have ceased to be in force, or have become obsolete or unnecessary are repeated.

The Indian Chemical Manufacturers Association has instituted two awards for the best industrial units in the chemical industry. The Sir P. C. Ray award will be presented to the "best industrial unit developed by indigenous endeavour in the chemical industry" and the I.C.M.A. award for "outstanding example of forward development of technology in the chemical industry for the first time in India." Industrial units in both the public and private sectors are eligible for the awards.

Exports of both unmanufactured and manufactured tobacco from India increased appreciably during the first quarter of the current financial year. The actual exports of unmanufactured tobacco aggregated over Rs. 10 crores (24.4 million kg.), representing increase of about Rs. 1.8 crore over the corresponding period of 1963. The exports of manufactured tobacco in the same period were higher at over Rs. 4.4 crores as against Rs. 1.6 crore, a year before.

A Bill seeking to effect compulsory amalgamation of small and uneconomic collieries in the country is expected to be introduced in the Budget session of Parliament. A draft Bill is already under the scrutiny of the Law Ministry. Compulsory amalgamation has been found necessary because of the failure of the voluntary amalgamation scheme. The Colliery Voluntary Amalgamation Committee had received only 298 proposals by the end of last month, of which 50 had been approved for amalgamation.

A magnesium plant with an annual production capacity of 250 tonnes will be put up shortly at Jamshedpur by the National Metallurgical Laboratory in collaboration with the Central Design and Engineering Unit of the Council of Scientific and Industrial Research. The plant, which is likely to cost Rs. 50 lakhs, is expected to go into production in about two years' time. It will meet the country's total requirement of magnesium needed for the manufacture of alloys and strategic material for defence purposes.

The Bhilai Steel Plant has been working at full rated capacity and the Durgapur Steel Plant has more or less reached this stage, according to the Union Minister of Steel and Mines. However, the Rourkela steel plant is lagging behind slightly but is expected to reach full rated capacity soon. Incidentally, there is some surplus staff in the public sector steel plants. The position is being reviewed with a view to determining the exact extent of overstaffing.

The steel prices announced by the Joint Plant Committee is applicable only to supplies made by the main producers direct. This was disclosed by Mr. Sanjiva Reddy, in the Lok Sabha last week. To these base prices, some extras for size and quality as well as sales tax have to be added. In the case of supplies received through stockists, the stockists' remuneration had to be added and in the case of re-roller products, the freight element also had to be added. The prices ruling in the market would therefore be generally somewhat higher than the J.P.C. prices. On the whole, the supply position of the decontrolled categories continued to be easy and prices are not appreciably higher and, therefore, the aim of decontrol has not failed.

• • • •

From Abroad

Production of flue-cured tobacco in the main producing countries outside China is expected to show a small decline this year despite the record output of 310-320 million lbs. in southern and north-western Rhodesia. The decline will be accounted for by North America.

The total production of coarsegrains in the U.S. during 1964 is estiated at 139 million tons, 17 million tons less than the actual output in 1963. The sorghum crop is expected to be lower by 15 per cent, maize by 11 per cent, oats by 9 per cent and barley by 3 per cent.

Industrial production in the U.S. touched a new record during the month of August 1964, the Federal Reserve Board's index (1957-59=100) for that month standing at as high as 133.5, as against 132.7 in July and 125.4 in August 1963. The high level of production was due to the usual recovery in steel production, increase in car assemblies and enhanced output of household goods.

A new alloy called Incramet 800 has been developed by the International Copper Research Association. By using this new alloy for moulds, glass products, it is claimed, will have finer surface finishes with more exact limits and the rate of products will itself be faster. It has a potential world market as a glass mould material for about 100,000 tons a year.

Industrial production in Britain rose slightly in July. The index (1958=100) for all industries, on a seasonally adjusted basis, is provisionally estimated at 127, one point higher than the June figure. The rise follows a pause in the first half of 1964, during which there was no change in the general level of production.

The Governmment of Ceylon has published details of its programme for the "Ceylonisation" of trade designed eventually to place the whole of the country's import business in the hands of Government agencies or Ceylon nationals. The programme will be implemented with effect from the beginning of next year. The "effective capital" of private trading companies operating in Ceylon will have to be cent per cent Ceylonese-owned, if the companies are not to suffer any discrimination. In addition, rules of employment will be made stringent. The regulation affecting public companies include a provision stipulating that 51 per cent of share capital must be held by Ceylonese nationals and the shares must be quoted on the Colombo Stock Exchange. A majority of the company directors must be Ceylonese and no director of a "Ceylonese" trading company will be permitted to retain interests in any national company engaged in export or import trade. Measures will also be taken to reserve trade in individual commodities for the proposed State Trading Organisation and other Government agencies.

PERSONAL

MR. W. H. Armstrong has been elected Chairman of the Mundakayam Planters' Association for the year 1964-65.

Mr. Pierre Paul Schweitzer, Managing Director of the International Monetary Fund, is arriving in Bombay, on the 28th inst.

Mr. R. S. Bhatt, Chairman of the Unit Trust of India, has been nominated by the Central Government as a member of the Governing Body of the Indian Investment Centre.

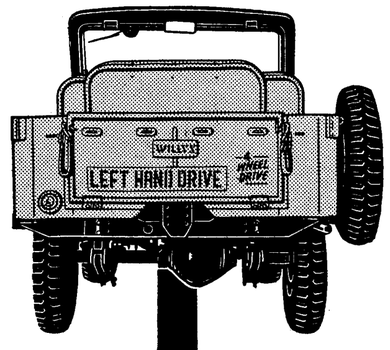
Mr. R. L. Tuli, General Manager of the Punjab National Bank Ltd. and the President of the Institute of Office Management, left last week on a trip to Europe, the U.K., the U.S.A. and Japan.

Mr. Keshub Mahindra and Mr. M. A. Chidambaram have been elected President and Vice-President, respectively, of the Association of the Indian Automobiles Manufacturers for the current year.

Mr. Harold Leslie Manning, a British cotton expert, arrived in New Delhi on the 18th inst. from London to advise the Union Ministry of Food and Agriculture on the research and development aspects of long-staple cotton cultivation.

Mr. K. B. Somanna has been appointed Managing Director of the Consolidated Coffee Estates (1943) Ltd., *vice* Mr. K. Narayanaswamy, I.A.S., whose services have been recalled by the Mysore Government.

Mr. G. K. Devrajulu, Managing Director of the South India Viscose Ltd., is the Chairman of the newly reconstituted Development Council for art silk industry. Mr. D. H. Vora, Deputy Director in the office of the Textile Commissioner, will act as the Secretary to the Council.



PARTICULAR SERVICING FOR PARTICULAR PEOPLE

It means more life, more mileage if your Jeep is serviced by Jeep Dealers. It is oiled, cleaned, tuned and adjusted by people who know each nut and bolt of the Jeep. They have been trained to give you factory specialised servicing. There are over a 100 dealers spread throughout the country with a complete range of equipment.

TREND OF MARKETS

MONEY DISTINCTLY EASY

(From Our Own Correspondent)

BOMBAY, 23rd *September*

The short-term money market ruled distinctly easy during the week under review. The supply position of money was very comfortable and whatever demand that emerged was met fully. Indeed, there was a sizable surplus of funds. The inter-bank call rate, as a consequence, continued to drift downward. The actual rate for both renewals and fresh money today was as low as one per cent, whereas, on Wednesday last week, the former was quoted at 2 per cent and the latter fetched 2½ per cent. Calcutta also reported easy conditions, the call rate there declining from 1½-1¾ per cent to 1-1½ per cent.

Thanks to the comfortable money situation, Intermediate Treasury Bills elicited renewed support. The Bills actually sold from the 16th to 19th inst. aggregated Rs. 7.98 crores, as against Rs. 2.45 crores a week before and Rs. 1.29 crore two weeks before. The response to the 91-day Government of India Treasury Bills, tenders for which opened on Tuesday the 22nd inst., however, was limited, though the total amount offered (Rs. 2.10 crores) was higher than that (Rs. 2 crores) invited and accepted. The average rate of accepted tenders was slightly higher at Rs. 2.399 per cent, as against Rs. 2.386 per cent.

The easy money trend is reflected in (*a*) the decline of Rs. 31.55 crores to Rs. 2,389.82 crores in notes in circulation, (*b*) a fall of Rs. 1.11 crore to Rs. 92.95 lakhs in loans and advances granted by the Reserve Bank to scheduled banks, and (*c*) an increase of Rs. 7.60 crores to Rs. 106.50 lakhs in the deposits of these banks with the Reserve Bank during the week ended 18th September. In the same week, the foreign exchange reserves of India improved by Rs. 2.35 crores to Rs. 98.87 crores, the improvement being entirely in balances held abroad which rose from Rs. 11.06 crores to Rs. 13.41 crores. The foreign securities held in the Issue Department of the Reserve Bank continued unchanged at Rs. 85.46 crores.

There was a fall of Rs. 4.08 crores to Rs. 1,731.71 crores in the total credit made available by scheduled banks to their clients during the week ended 11th September. Since this fall was accompanied by an increase of Rs. 3.33 crores to Rs. 2,660.09 crores in deposits, borrowings from the Reserve Bank receded by Rs. 2.88 crores to Rs. 1.95 crore, those against usance bills alone declining by Rs. 2.21 crores to Rs. 20 lakhs. Investments fell by Rs. 29.17 crores to Rs. 761.99 crores, while total cash rose by Rs. 6.82 crores to Rs. 160.98 crores.

The Gilt-edged market ruled subdued for lack of fresh support. Among Central loans, 3¾ per cent 1974 encountered selling and declined by 40 paise to Rs. 96.35. 3 per cent 1986 eased by 20 paise to Rs. 63.50, 4 per cent 1973 by 10 paise to Rs. 98.70 and 4 per cent 1972 by 5 paise to Rs. 98.75. State loans were all unchanged at last week's levels excepting the 4¾ per cent 1976 Andhra Pradesh and Orissa loans both of which eased by 25 paise to Rs. 97.25.

The market has taken note of reports suggesting the flotation of a Rs. 6-crore loan by the Bombay Municipal Corporation. The proposed loan, it is said, will be issued at par and bear interest at 4¾ per cent. It will be repayable in 1976. The market has also taken note of the Andhra Pradesh State Electricity Board's move to float a loan of Rs. 4 crores, carrying 5 per cent interest and redeemable at par twelve years later. The list for this issue is due to open on the 19th of next month. The proceeds of the loan will be utilised to meet a part of the Board's Rs. 17-crore capital programme for the current year.

In the foreign exchange market, the banks' buying and selling rates for U.S. dollars remained unchanged at Rs. 477.50 and Rs. 481 per $100, respectively. In New York, the pound sterling firmed up a little *vis-a-vis* the dollar; the spot rate and the three months' forward improved by 0.030 cent each to 278.340 - 278.370 cents and 277.820 - 277.850 cents, respectively.

SILVER EASY, GOLD FIRM

(From Our Own Correspondent)

BOMBAY, 23rd *September*

While silver was easy owing to poor demand and better arrivals, gold ruled distinctly firm during the week under review. The firmness of gold was due to limited arrivals and strong up-country demand in view of the nearness of *Dassara* and *Diwali* festivals. The reports of continued acquisition of hoarded gold by the Government and the renewed bid of authorities to check smuggling also imparted strength. The buying support that ensued lifted up prices of gold. Indeed, the prices prevailing today were the highest for some weeks now. Traders expected that prices would pick up still further in the next few weeks.

Fourteen-carat gold began the week a rupee higher at Rs. 67.50 and spurted to Rs. 71.25 today. Pure gold, in unofficial trading, forged ahead from Rs. 109 to Rs. 124-125. Sovereign was quoted higher at Rs. 93, as against Rs. 91.

Silver was quite firm early in the week, the quotation advancing from Rs. 256 to Rs. 257.50. It, however, declined swiftly on increased arrivals to Rs. 254 on the 22nd inst. But for some scattered support today, the closing rate would have been lower than Rs. 255.50. The weekly average arrivals and offtake of the metal were 23 and 7 bars, respectively.

The international price for gold in the London market was higher at $35.09, as against $35.08¾ last week. The sterling price rose by ¼*d.* to 252*s.* 1¼*d.* Ready and forward silver gained ¼*d.* each to 112¼*d.* and 112⅝*d.*, respectively. Silver in New York, however, continued unchanged at 129.3 cents.

Since the introduction of the Gold Control Order a marked fall has resulted in the export of gold jewellery. It is 30 per cent in the case of jewellery, and 50 per cent in stone-studded ornaments. Even the number of exporters, according to the Association of Registered Manufacturers and Exporters of Gold Jewellery, has come down 35 to a mere four. Some of the factors accounting for this decline are the high cost of making, inadequate equipment and the insistence of constant supervision by Government officials. The export trade turnover, which was Rs. 1 crore prior to the Gold Control Order, is now only a few lakhs of rupees. The traditional buyers of India's ornaments are countries in West Asia. It is now hard to regain the markets as European manufacturers, especially Italy and Germany are dumping comparatively cheap ornaments.

While the exporters point out the Gold Control Order as the cause for the fall in exports, the authorities assert that the exporters did not take advantage of the schemes sponsored by the Department of International Trade to boost export of jewellery.

The Government of Maharashtra has permitted goldsmiths to utilise the loans given to them upto Rs. 1,000 each, under the State Aid to Industries Rules, as their share capital towards the industrial co-operative society. However, the membership of such society should be limited to goldsmiths affected by the Gold Control Order and goldsmiths who are members of the society should work in the society as workers.

The following table shows the trend of prices during the week under review:

	23-9-64 (closing)	High	Low	16-9-64 (closing)
SILVER	Rs.	Rs.	Rs.	Rs.
Ready (996 fine) ..	255.50	257.50	254.00	256.00
GOLD				
Ready (14-carat) ..	71 25	71.25	67.50	66.50
Sovereign ..	93.00*	—	—	91.00*
London—				
Gold	252*s.*1½*d.*	252*s.*2½*d.*	252*s.*1½*d.*	252*s.*1½*d.*
Silver Ready ..	112½*d.*	—	—	112*d.*
Silver Forward ..	112⅝*d.*	—	—	112¼*d.*
New York—				
Silver	129.3 cents	—	—	129.3 cents

N.B.—The quotation for gold is per 10 grams (about 0.85 tola) and that for silver is per kilogram (85.73 tolas). London and New York quotations are per ounce. * Unofficial rate.

COTTON QUIETLY STEADY

(From Our Own Correspondent)

BOMBAY, 23rd *September*

Quietly steady conditions prevailed in the futures section of the cotton market on account of favourable weather reports from all the cotton growing areas. Price fluctuations were narrow and the turnover less than moderate. After ruling distinctly quiet during the earlier sessions of the week, futures staged a recovery on Monday, the 21st instant, following sustained short-covering, influenced by excessive rains and apprehensions about possible damage to crops in Berar, Khandesh and Saurashtra. But the recovery could not be maintained because of selling at higher levels, induced by reports that the overall crop position continued to be satisfactory.

The Jarilla March 1965 contract, which closed last week at Rs. 728.25 per candy (of 784 lbs.), opened the week lower by 25 paise at Rs. 728 and, after touching a low of Rs. 725.75 on the opening day itself (Thursday, the 18th inst.) recovered to Rs. 729.75 on Monday but finished the week at Rs. 728.25, without any loss or gain over the week.

Moderate activity was reported during the week in the spot market at Sewri. Some leading mills have been evincing interest in new crop Digvijay, Khandesh and Berar cotton. Ready lots of Laxmi, Co2 and 197/3 were in good demand from needy mills. The following are the latest available quotations in respect of certain popular varieties:

Akola Rs. 910, Bhagalkot Laxmi Rs. 1,020, Digvijay New Rs. 1,220, Ganganagar Rs. 790, Hubli Laxmi Rs. 1,040, Nagar Co2 Rs. 1,150, Rajpipla Rs. 1,110 and Viranagar Rs. 900.

In the foreign section, there were reports that the Uganda Lint Marketing Board had suspended the auctions till 6th October 1964. It is understood that the Uganda cotton crop will now turn to be around 400,000 bales, as against 475,000 bales estimated earlier. Incidentally, it may be mentioned here that Dr. H. L. Manning of Uganda is on a visit to this country to advise the Indian Government on the development aspects of cultivating long-staple cotton. Dr. Manning's visit to this country has been arranged under the Colombo Plan.

As regards Bengal *deshi* variety, there has been a slight improvement in the demand for export. Sales have picked up with registrations standing at 45 000 bales as of 22nd September. The current rate for the December delivery contract is at Rs. 737, a gain of four points over the week.

Provisional data pertaining to exports of raw cotton in the whole of 1963-64 season are now available. They show that exports were smaller at 266.709 bales (of 180 kgs. net) as against 335.612 bales in the 1962-63 season. Japan's share in the total is a little over 200.000 bales. The Continent took some 29.000 bales, the U.S. 18,500 bales and Hong Kong 10,000 bales.

An important event of the week was the 90th half-yearly meeting of the Indian Central Cotton Committee to which a detailed reference is made elsewhere in this issue. It may, however, be added that the Agricultural Extension Sub-Committee of I.C.C.C. has given its approval to the release of five new improved cotton strains, namely, AK 235, AK 277 and Y.1 in Maharashtra, ISC 67 in Gujarat and 14/2 in Mysore. The farmers in Gujarat had, it will be recalled, sought the intervention of the East India Cotton Association last season to persuade the mills, through the Textile Commissioner, to lift ISC 67 cotton, which is a long-staple variety with a staple length of 1-3/32" and above. At present it is priced at about Rs. 1,600 per candy, as against the comparable African cotton available at not less than Rs. 1,800 per candy. It is felt that there is no justification in mills' reluctance to make use of this cotton in the place of foreign growths on which foreign exchange has to be spent. There are reports in the market that the Textile Commissioner is likely to advise the mills in this regard.

KIPS QUIET

(From Our Own Correspondent)

MADRAS, 21*st September*

There was no appreciable change in the kip market and importers were not willing to pay increased prices. Demand for cowhides inferior grades was negligible. There were a few enquiries for new season buffcalf from U.K. and light weight cowcalf skins, and cowhides.

It has been reported that a fair volume of business in tanned goat and sheep skins was booked during the Paris Leather Fair, at reduced prices. The local market is steady for the present. There were enquiries for suede selections for export to the Italian ports, at increased prices. Demand for tanned goat 5½/6 lbs. and 8/9 lbs. and for middle class sheep lower selections from importers on the Continent was insistent. Prices in the raw centres ruled steady.

The next German tanned skins public auctions will take place on the 28th inst. when 206,800 goat skins and 28,700 sheep skins will be available for sale. The next London auctions will take place on 19th October 1964. Consignors have not been happy over the results of these periodical auctions this year and, it is high time that the E.I. tanners regulate their mode of buying raw stocks to feed their factories.

ART SILK YARNS DECLINE

(From Our Own Correspondent)

BOMBAY, 23rd *September*

Distinctly easy conditions prevailed in the yarn market during the week under review. The upward trend of art silk yarns witnessed last week proved short-lived, as prices started declining again this week, thanks to comfortable supply position following large-scale sales by spinners. Traders were inclined to discount any possibility of an immediate recovery in prices. Actually, they expected the downward trend of prices to persist at least in the next few weeks. It was reported that heavy stocks were lying unsold with mills. One mill was said to be offering 150 deniers at Rs. 10.36 per kg. (f.o.r. rate including a sale tax of 20 paise), as against the currently ruling rate of Rs. 10.87. In spite of such an attractive offer, traders were not very much enthusiastic to buy. In sympathy with art silk yarns and due to poor demand from Surat weavers, staple fibre yarns ruled distinctly easy. Cotton yarns were dull with minor price fluctuations.

Among art silk yarns, National Rayon 150D shed 6 P to Rs. 10.87. 120D declined by 13 P to Rs. 11.55. South India Viscose 120D lost 16 P to Rs. 12.91. Bright century 75D receded from Rs. 18.57 last week to Rs. 18.15 today.

In the staple fibre yarn (2 x 34 French count) section, Kohinoor dropped 7 P to Rs. 9.83. City eased by 11 P to Rs. 9.35. Premier lost 6 P to Rs. 9.22. Sitalaxmi was a shade lower at Rs. 9.53. Vasanta decreased by 9 P to Rs. 9.06 and Premier by 11 P to Rs. 9.79.

Activity in the cotton yarn section was considerably restricted. 34s Vasanta fell by 75 P to Rs. 37.75. 68s Minerva declined by 50 P to Rs. 85.50. Others were neglected at last week's levels.

The following table gives the prices of rayon staple fibre and cotton yarns, today, as compared with those prevailing a week ago:

	23-9-1964	16-9-1964
Art silk yarn (per kg.)—	Rs.	Rs.
National Rayon 120D	11 55	11.68
Century 75D	18 15	18.57
S. I. Viscose 120D	12.91	13.07
Staple fibre yarn-34 x 2 French Count (per kg.)		
Kohinoor	9.83	9.90
Premier	9.79	9.90
City	9.35	9.46
Cotton yarn - French Count (Rs. per 5 kg.)		
8s Podar	21.00	21.00
17s Modern	28 50	28.50
22s Madura	32 00	32.00
34s Madura	43 00	43 00
52s Pioneer	68 75	68 75
68s Finlay	106.70	106.70

SPURT IN LINSEED

(From Our Own Correspondent)

BOMBAY, 23rd *September*

There seems to be no point in discussing the trends in oils and oilseeds in terms of prices which have lost both their meaning and perspective, thanks to the shortsighted policy of the Gujarat and Uttar Pradesh Governments in banning exports of oils and oilseeds from their States. It is difficult to say how far the imposition of export ban on foodgrains and other commodities is guided by political or retaliatory considerations, but the net result of these has been the same

artificial rigging up of prices at the receiving end. So far as oilseeds and oils are concerned, Maharashtra depends for them on Gujarat—Saurashtra to be precise—for a major portion of its requirements, but, with the ban in force, the main supply base is cut off. Naturally, prices in Bombay are ruling at record high levels.

Linseed stole the limelight during the week under review, the spot material touching a record high of Rs. 52.50 today. Linseed oil also touched a new high of Rs. 22.10. In futures, the March contract advanced from Rs. 39.66 to Rs. 40.31. The city had virtually no stocks of oil and what little was there had been held by a few dealers who were keeping it in anticipation of yet higher prices. Perhaps they will achieve their objective in view of the fact that no more oil can come from Uttar Pradesh, the main source of supply. In Bombay, linseed oil is used mainly by the paint industry and, under the present scarcity conditions, it should not be difficult for dealers who are lucky to possess stocks to dictate their own terms. Normally linseed oil, which commands little export business, should not fetch these prices, but, then, there is just no oil. Moreover, the other members of the oil group are shooting up.

The story of groundnuts and groundnut oil is sufficiently well known to warrant any repetition. Groundnut oil ex-mill was quoted in Bombay at Rs. 32.75. Although it was slightly down on the record level of Rs. 33 touched last week, the level was still pretty high. The trend in distant positions was also getting firm, with October mentioned at the time of writing around Rs. 24.75, November at Rs. 20.10 and December at Rs. 19.50. Among seeds, Spot Madras was done at Rs 78, Upper Madras at Rs. 77.25, Latur at Rs. 76 and Sangli at Rs. 75. Traders were reluctant to quote prices for distant positions, as, in view of the uncertain situation, they did not have the courage to commit themselves for the future. Stocks of groundnut oil in the city were said to be virtually nil. The State Government was making arrangements to sell groundnut oil to consumers through fair price shops in Bombay at a reasonable price, but how far this will offer a long-term solution to the problem of scarcity is a question difficult to answer.

Market men say that arrivals of new crop from areas other than Gujarat like Khandesh from within Maharashtra and Davangere in Mysore should help in checking the prices from going up. It is said that the new crop has begun to move in these areas and that it might take a fortnight for its effect to be felt. However, the volume of these arrivals may not be such as to effect a reversal in the trend. The market has not given up hope of the Gujarat Government removing the ban on new crop movements. It is said that farmers there are reluctant to harvest the crop due to price uncertainties. There are also reports that oil is finding its way underground over there, as the price fixed by the State Government is considered very much low in relation to the price it might probably fetch were the market an open one.

It was thought that the commencement of forward deals in groundnuts new crop might help the market find more reasonable levels, but hopes have been shattered on account of the inability of the Forward Markets Commission and the Oilseeds Exchange to find a common ground with regard to terms and conditions. It is said that a meeting of the representatives of the two organisations held during the week under review ended without arriving at an agreement. Reports indicate that the gap between them is rather wide and, therefore, difficult of being bridged unless one of the parties is prepared to compromise on details. The main hitch is said to be regarding margins. It appears that the Association was prepared for margins at a level of Rs. 275, but the Government insisted that they should be imposed at Rs. 250. Further, the F.M.C. is understood to have suggested that the rate of margin should be 20 per cent during non-delivery period and 50 per cent during delivery period. The trade did not seem to like this either.

The anxiety of the Government to keep prices within reasonable limits is appreciated, but knowledgeable circles feel that the level of Rs. 250 is rather too low and that the contract would be unworkable, as the spot rate is around Rs. 375 to Rs. 400 per 50 kg. The level of margins and spot prices, they insist, should bear some reasonable relationship to each other. The experience is still fresh in market's memory. Both castor and linseeds September contracts went untraded for a long time due to unrealistic ceilings. It now appears that the question of new crop trading has been put into cold storage for the time being. And trading in futures cannot start unless the Gujarat Government removes the ban.

Castorseeds and cottonseeds were both firm with castor March quoted at Rs. 178.75 and cottonseeds January at Rs. 102.75. The trend in these was induced more by the conditions in groundnuts rather than by any intrinsic merit in themselves. Market men were saying that there was absolutely no justification for the high prices of cottonseeds, particularly in view of the satisfactory weather reports from cotton growing tracts and the good crop of cotton that is likely to be harvested during the current season.

Groundnut extractions were dull. With most of the solvent extraction plants closed or in the process of closing down, there could not be much of an activity in this section. Supplies were short and demand, too, was small. Hence the market tended to be easy. Extractions September was quoted at Rs. 436, October at Rs. 431, November at Rs. 405 and December at Rs. 392. Expellers were also quiet. Ready expellers were mentioned at Rs. 500, October at Rs. 485, November at Rs. 430 and December at Rs. 425. The United Kingdom was the only customer in the market, but demand was limited. Advices from there were easy with September-October at £39, November at £37-2-6 and December £36-2-6.

Communist countries were out of the field and market sources thought that it would take some more time for demand to revive. The undertone was quiet.

The following table shows the closing prices of oilseeds and oils as on 23rd September as compared with those of the two previous weeks:

	23-9-1964	16-9-1964	8-9-1964
Groundnuts	Rs.	Rs	Rs.
Nisam bold	75.50	75.50	67.50
Khandesh quality	77.50	78.00	69.00
Oil ex-mill	32.75	32.00	29.10
Oil Rly. Receipt	30.50	31.00	28.80
Castorseed			
September 1964 contract.. ..	188.00	183.00	183.00
March 1965	178.75	177.37	175.62
Ready Madras	39.37	40.00	39.25
Ready Kanpur	38.37	39.00	38.12
Oil B.S.S.	18.30	18.25	17.90
Oil commercial	17.45	17.50	17.25
Linseed			
September 1964 contract.. ..	44.97	44.94	44.94

January 1965 contract	102.75	102.00	98.75

N.B.—All quotations for futures contracts are per 250 kilograms except linseeds for which rates are per 50 kilograms. Spot quotations of seeds are per 50 kilograms and oil per 10 kilograms.

SUGAR STEADY

(From Our Own Correspondent)

HAPUR, 21*st September*

Steadier trend was witnessed in crystal sugar during the week under review, as sugar supplies to bulk consumers were further curtailed and prices improved to Rs. 175-177 a quintal in the market. At the fair price shops, the commodity was available at Rs. 136. The new sugar policy for the season which is to commence on 1st November is expected to be announced shortly. Thanks to a bumper cane crop and overall increase in acreage upto 7.5 per cent, it is hoped that sugar production in the coming season would be 33 lakh tons as against the total production this season of 26 lakh tons.

Desi khandsari continued to be firm during the week under review, as bulk quantities were being lifted against permits received from the consuming States of the Punjab and also east U.P. prices improved by Rs. 5 a quintal in unofficial dealings to Rs. 130-160. Trading circles were urging the State Government to lift the controls on *khandsari* movements, so that the remaining stocks which were reported to be heavy may be wiped off by the time the new production commences sometime in November. *Khandsari* stocks in the Muzaffarnagar market were around 70,000 quintals.

Ready *gur* was steady in the local market on buying support from the consuming States such as Gujarat. Dry stocks with trade have been exhausted and the little dry-wet and wet stocks were being readily lifted even at higher prices. Traders were of the opinion that due to the prevailing high prices of the commodity with dearth of stocks, the new *gur* production season would start shortly by the end of this month. They were perturbed on the news that Government was again thinking in terms of banning *gur* trade, and a new policy would be announced shortly. Week-end quotations (in rupees per 40 kilogram) were: *pansera* dry nominally quoted at 42, dry-wet 34 to 35, wet 30 to 31 and *shakker* 42 to 45.

Gur and *shakker* recorded sharp gains during the week in the Muzaffarnagar market on brisk enquiries from the Punjab coupled with acute paucity of dry stocks. Prices in all sections improved and were quoted in the week-end at (in rupees per 40 kilogram):—*chaku* dry 47-48, wet 37-40, *laddoo* 42-45 and *khurpapar* upto 48. *Shakker* touched a new high upto Rs. 50 per 40 kilogram.

FOODGRAINS ADVANCE

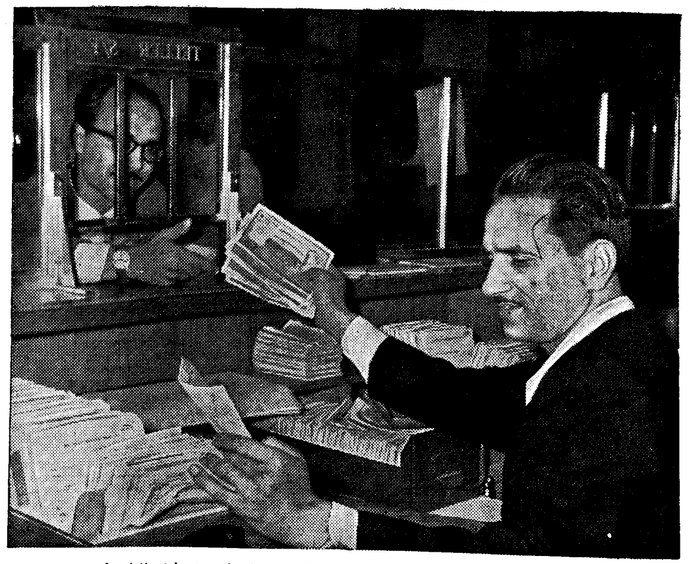
(From Our Own Correspondent)

HAPUR, 21*st September*

Bullish trend continued unabated in foodgrain prices and prices have touched all time new high level. Paucity of stocks meagre arrivals and brisk local and east U.P. purchases were main influencing factors. Ration shops were faced with deficit food supplies and even one kg. a unit per week is not available. The U.P. Government opines that Union Government is not supplying adequate imported grains to feed ration shops. The U.P. Government has now decided to build a buffer stock of *kharif* and *rabi* crops to the tune of at least eight lakh tons and for this purpose a compulsory levy would be imposed for both the crops.

Wheat prices advanced by Rs. 5 to Rs. 7 per quintal, according to quality, during the week to touch a new peak on east U.P. buying support and purchases by local consumers. The average quality was quoted between Rs. 95 to Rs. 97.50 and farm produce between Rs. 97.50 to Rs. 101.50 per quintal, while the corresponding prices last year were much lower at Rs. 44.21 to Rs. 48.75 and in 1962, Rs. 39.85 to Rs. 44.22 per quintal. Arrivals were very poor and stocks were meagre. Rice prices shot up by Rs. 2.50 to Rs. 6 per quintal,

Cashed in a Minute!



And that is precisely what we mean. It takes no longer than a minute to cash your cheque at any PNB office with the Teller System.

The streamlined Teller System eliminates tokens, queues, all tedious and unnecessary waiting and delay

PNB was the first bank to have introduced the Teller System as far back as 1954. Today, PNB has 90 branches operating this system and plans to introduce this on-the-spot service in 60 more branches throughout the country.

PNB—*the People to Bank on*

THE PUNJAB NATIONAL BANK LTD.

The Oldest Name in Modern Indian Banking

TWTPNB: 3027 C

according to quality, because of tight supply position due to poor stocks. The condition of the standing paddy crop was reported to be good and market was anticipating a bumper rice output this year. Week-end prices here were: Rice *basmati* superior Rs. 129.50 to Rs. 132, *sela* Rs. 125 to Rs. 128, *mainpuri* Rs. 109.85, *ramajwayan* Rs. 112.50, *raimunia* Rs. 112.50 to Rs. 115 and *gadda* Rs. 109.85 per quintal.

Gram prices rose sharply by Rs. 10 per quintal, because of good demand and paucity of stocks. The commodity was quoted at Rs. 90 to Rs. 95 per quintal as against Rs. 40.50 in the corresponding period last year, and Rs. 43.21 in 1962. New maize moved up by Rs. 4 per quintal as arrivals were still poor and prices ranged between Rs. 70 to Rs. 71.80 on brisk consumers support. Barley and *bejhar* were quoted higher in sympathy with other grains. Stocks were also reported poor. Barley was quoted at Rs. 77.50 to Rs. 80 and *bejhar* between Rs. 78 to Rs. 80 per quintal. The prices of *juwar* and *guwar* were steady while other coarse grains prices were steadier as stocks were negligible. Week-end prices were:—*Juwar* Rs. 63 to Rs. 65, *guwar* Rs. 63 to Rs. 64, *bajra* Rs. 68 to Rs. 71, *methi* Rs. 65 to Rs. 67.50, and oats Rs. 75 per quintal.

The pulses market indicated a mixed trend, while peas and *arhar* recorded good gains. *Urd* and *moong* drifted lower on increased arrivals. Peas advanced sharply by Rs. 7.50 to Rs. 10 because of tight supply position and was quoted between Rs. 82.50 to Rs. 87.50 per quintal as against Rs. 37.50 per quintal in the corresponding period last year, and Rs. 31.96 per quintal in 1962. Peas *dal* prices also improved to Rs. 82.50 per quintal. *Arhar* and its *dal* prices also ruled firm due to meagre stocks in face of good buying support and prices of *arhar* now ranged between Rs. 84 and Rs. 87.50 per quintal. *Urd* and *moong* prices, however, drifted lower under pressure of arrivals from outside. *Masoor* prices, however, were steadier and other *dal* prices also ruled firm. Week-end prices were:—*Arhar dal* Rs. 108 to Rs. 115, *urd* Rs. 58.94 to Rs. 66.98, *urd dal* Rs. 85.74, *moong* Rs. 101.81 to Rs. 107.17, *moong dal* Rs. 115 to Rs. 117.50, *masoor* Rs. 80.38 to Rs. 85.75, *masoor dal* Rs. 96.45 and gram *dal* Rs. 99.13 per quintal.

* * * *

PROSPECTS FOR WORLD WHEAT PRODUCTION

The present outlook for 1964 world wheat production indicates a record or near-record harvest. Production, in Northern Hemisphere countries promises to be the largest on record. Although it is too early for a reliable measure of Southern Hemisphere harvests, which will not be underway until November, conditions to date have been mainly favourable in the principal producing countries.

If, as now seems likely, the prior wheat record of 8.7 billion bushels (a bushel=80 lbs.) in 1962 is exceeded, the largest factor in the increase will be the gain in North America; production is up in each of the three principal producers of the area. The total for Western Europe, though large, is estimated to be moderately below the record achieved there in 1962. The Soviet Union may also be below its 1962 figure. Indicated differences in other continents are of minor significance.

A near-record outturn in *North America* this year does not mean larger surpluses for export. Following the heavy export movement from the United States and Canada during 1963-64, supplies are somewhat smaller in both countries for the current marketing season. U.S. supplies for 1964-65 are estimated at 2,190 million bushels, 148 million below supplies a year earlier, despite a production increase of 147 million bushels. Canada's supply is lower because of reductions from the high 1963 level in both production and carryover. Mexico reports a record outturn and plans to export about 18 million bushels.

World import demand is expected to be well below the high 1963-64 level, with larger production over most of Western Europe and in Japan playing a part, as well as reduced needs expected to follow better harvests in the Soviet Union and Mainland China.

Present estimates indicate that *Western Europe's* total production this year may be second only to the 1962 record. Good crops are reported everywhere, except on the Iberian Peninsula; there, production is somewhat smaller than last year in both Spain and Portugal.

A slightly smaller crop than last year is expected in *Eastern Europe*, mainly because of a reduction in Yugoslavia. Early season forecasts of a record crop in that country were not realised as a heat wave in late June, followed by heavy rains, delayed harvesting and lowered conditions of the crop.

The outlook is for an average crop in the *Soviet Union*, following the poor outturn of 1963. The area for harvest is estimated larger than last year and yield prospects for spring wheat in the "New Lands" area are much better.

Yields were disastrously low in this area last year, because of prolonged drought. Moisture supplies have been unusually good this year, but a late start this spring makes the crop vulnerable if the growing season should be cut short.

Conditions in *Asia* vary widely, with better conditions than last year in some parts offset by poorer conditions in others. The crop in Turkey is reported smaller than in 1963 while other Near East countries report better crops. Japan's production approaches average after last year's failure. Conditions appear generally better in Mainland China, in contrast with reduced outturns in India and Pakistan.

Total production in *Africa* is expected to be less than last year mainly because of a sharp reduction in Algeria from last year's bumper crop. Some reduction is also reported for Tunisia, but larger harvests in Egypt and Morocco more than offset that decrease.

The outlook for the growing wheat crop in Southern Hemisphere countries is generally promising. Seeding took place under favourable conditions in most parts and increased acreage is reported in Argentina and Australia, the largest wheat producers. Growing conditions up to November will govern final outturns.

TEA DUSTS LACK SUPPORT

(From Our Own Correspondent)

CALCUTTA, 22*nd September*

Although tea offerings, which are larger this year in view of the increased crop, continue to be absorbed, prices are yet below last year's levels. This has been so because buyers are assured of regular supplies, and the increased nature of offerings week after week is an index of the good supply position this year. The decline in U.K.'s stocks of tea shows that overseas support can only increase in the weeks ahead. Including the figure for the last month, North Indian output so far this year amounts to 148.59 million kgs. showing a rise of 11.15 million kgs. as compared with the corresponding period of last year. Last month, output was only 101 million lbs., as against 105.2 million lbs. in August 1963. Such being the productive performance in the best month of the year, it is now doubted if this year's output would touch the 1961's peak level.

Dusts on offer during last week's internal sales aggregated 34,538 packages. The good general demand in evidence at the opening petered out as the sale progressed and losses were recorded. Thus bright liquoring Assam orthodox teas eased towards the close by up to 30 paise. Plain orthodox teas eased, but the recession was only slight. Legg-cut teas were in good form. Medium C.T.Cs dropped by more than 20 paise, with the selected lines being firm at quoted rates. Good C.T.Cs were readily absorbed at firm rates. The quotations per 1 kg. inclusive of excise duty were: good Assam C.T.C. dust Rs. 6.20 to Rs. 6.50, medium Assam C.T.C. dust Rs. 5.30 to Rs. 5.60, legg-cut dust Rs. 5.00 to Rs. 5.40, medium Assam dust Rs. 4.90 to Rs. 5.50, and plain orthodox dust Rs. 4.20 to Rs. 4.60.

RAW JUTE RECEDES

(From Our Own Correspondent)

CALCUTTA, 22*nd September*

Following the very satisfactory increase in arrivals and firm expectations of the crop conforming to earlier estimate, fibre prices dropped further during the week under review. The decline was about Rs. 2.50 a maund. On the other hand, jute goods were maintained at the higher levels, the earlier fall in heavy goods proving only temporary. The capacity of Pakistan mills, it is stated, has been fully covered with overseas orders up to March next, and as such more export orders on Indian mills are anticipated in the coming few months. It is also encouraging to note that the Indian delegation to the current session of the U.N.'s Food and Agricultural Organisation at Rome would seek the Organisation's assistance so that India, Pakistan and Thailand could come to an understanding and thus avoid competition detrimental to the interests of the jute industry generally. The trade here, noting this proposal with enthusiasm, feels that a conference between the representatives of the jute industry in India and Pakistan would be very much appropriate in order that each other's problems could be better understood. Attempts should also be made to remove the apprehension in Pakistan that, without resorting to competition of the kind now being offered by Pakistan mills in overseas markets, Pakistan would not be able to market all its output at reasonable prices. The removal of this apprehension should enable the Pakistan mills to desist from offering unfair competition, which is harmful as far as the long-term interests of the jute industry is concerned.

It is also a good development that domestic offtake of heavy goods has been rising gradually in recent months. Sacking despatched by mills for internal consumption in August aggregated as much as 26,200 tonnes, which represented an increase of 6,900 tonnes as compared with the previous month and of 7,800 tonnes as compared with August 1963. Hessian at 4,700 tonnes showed a rise of 600 tonnes, while all other constructions at 3,400 tonnes suffered a loss of 400 tonnes. In the result, the total of all constructions despatched for consumption within the country at 34,300 tonnes showed a rise of 7,100 tonnes. On the other hand, despatches for export abroad in August 1964 at 80,600 tonnes showed the insignificant decline of 100 tonnes. While sacking and carpet backing cloth increased from 19,000 tonnes and 7,000 tonnes to 22,700 tonnes and 7,100 tonnes, respectively, hessian and miscellaneous goods fell from 44,700 tonnes and 10,000 tonnes to 42,800 tonnes and 8,000 tonnes, respectively. The overall increase in despatches in August thus amounted to 7,000 tonnes, despite the fall of 6,200 tonnes to 111,500 tonnes in output in the same month. Output of hessian fell by 2,100 tonnes to 47,000 tonnes, of sacking by 1,300 tonnes to 45,100 tonnes, of carpet backing cloth by 100 tonnes to 8,100 tonnes, and of miscellaneous constructions by 2,700 tonnes to 11,300 tonnes. The increase in demand, coupled with the fall in production, was a factor which imparted liveliness to jute goods during the week.

The news of increase in burlap consumption in the United States during August 1964 was also a factor that helped sentiment. At 81 million yards, the increase as compared with the previous month was 17.4 million yards. In August 1963, consumption was only 69.5 million yards. U.S. burlap stocks at the end of August 1964 declined to 281 million yards from 300.1 million yards in the previous month. The total U.S. consumption this year was 580.9 million yards, as against 601.6 million yards in the same period last year, the monthly average being 72.61 million yards and 75.2 million yards, respectively. It is to be hoped that the U.S.A. continues to consume more and more hessian and that the shortfall of the earlier months is made good. It is also encouraging to note that, this week in the New York Burlap market, conditions became steadier, with the 40" 7½ oz. hessian gaining from 9.25 cents a yard to 9.40 cents and the 10 oz. hessian from 12.35 cents a yard to 12.40 cents.

Now that fibre prices have fallen very satisfactorily as a result of the series of steps taken by the Jute Commissioner, including the issue of maximum weekly purchase quotas on mills, an early announcement raising the minimum purchase prices by at least Rs. 5 a maund is looked forward. During this week, arrivals averaged about 125,000 maunds a day and the need for cash among cultivators for the forthcoming *Poojas* should lead to further increase in the quantity offered. During the week, Assam bottoms eased from Rs. 39.00 a maund to Rs. 37.50, daissee bottoms from Rs. 40.50 to Rs. 38.50, and northern bottoms from Rs. 38.50 to Rs. 36.50. For the current week ending on the 25th, the Jute Commissioner has a maximum quota of 150,000 bales. The increase in the quantity as compared with previous two weeks in accord with the extent of daily arrivals.

On Tuesday last, the news of increased consumption of burlap in the U.S.A. and the fall in output in mills in India last month checked the downtrend in ready goods originating from selling pressure in the hedge market. Thus, despite the fall to Rs. 141.75 and Rs. 50.15 from Rs. 142.10 and Rs. 50.25, both ready B. twills and hessian 40" 10 oz. were firm. At this stage, a buying spree developed in the futures market, to take up ready B. twills and hessian 40" 10 oz. to Rs. 114.15 and Rs. 50.20 on Wednesday. Bulls availed this opportunity to book profits on Thursday, and this took down B. twills to Rs. 142.50 and hessian 40" 10 oz. to Rs. 50. Government interest in B. twills was a feature on Friday and this pushed up ready B. twills to Rs. 143.25 with hessian 40" 10 oz. remaining unchanged at Rs. 50. Over the week-end, some business was done and this led to raise the prices to Rs. 143.75 and Rs. 50.10 respectively. There was good covering business in ready goods yesterday, and B. twills, though unchanged at Rs. 143.75, were firm. Hessian 40" 10 oz. was, however, fractionally lower at Rs. 49.80.

METALS FIRM

(From Our Own Correspondent)

CALCUTTA, 22*nd September*

While resistance on the part of buyers checked the uptrend for some time in the local metal market during the week under review, the quotations on the London Metal Exchange, the New York Commodity Exchange and the Far Eastern metal markets continued to advance. In London, spot copper wire-bars rose to quote as high as £445 a ton, as against £398 early in the week. The 3-months' quotation moved up from £356 to £388. Spot cathodes and spot fire-refined metal closed higher on balance at £430 and £345, respectively, as against the opening rates of £385 and £325.

The uptrend was attributed to bear-covering. The fact that prices are rising every week is causing concern. Since the beginning of this year, production of copper in several mines in the world has increased, but the steady rise in prices gives the impression that the rise in consumption has far outstripped the rise in supply. The question as to how long the prices would continue to rise is difficult to be answered, but it appears that only clearer indications of a fall in demand on substitution would bring down prices to a reasonable level. The quotation for utensil copper scrap eased from Rs. 675 per 100 kgs. to Rs. 670.

Even if world shortage of metals eased, the possibility of any improvement in India depends upon the country's ability to raise exports to the same level of imports. With the need for more and more capital goods, it is difficult to expect that India's imports could be financed from export earnings alone. In this context, there is a strong case for India to quicken the pace of the shift to aluminium from copper in as many uses as possible, and it is interesting to note that Mr. Himachand K. Shah, in his address from the chair to the annual meeting of the All-India Non-ferrous Metal Industries Association in Bombay, urged the provision of all facilities to brass utensil makers to change to aluminium. Note has also been taken by the trade here of the earnest plea made by Mr. Shah to restore the recent cut in the import entitlement on exports. He stated that exports of non-ferrous metals products at present earned for the country foreign exchange to the tune of Rs. 2.40 crores, which could be raised, he thought, by incentives and the provision of more raw materials.

On the L.M.E., spot tin opened at £1,400 a ton and steadily rose to £1,452½. The low level of warehouse stocks, coupled with the rise in Penang markets, pushed up sentiment. Increased Indonesian-Malaysian bitterness and the discussions in the Security Council were also factors that aided the steady uptrend. In Calcutta, tin was unchanged but firm at Rs. 3,300 per 100 kgs. Lead and zinc were also firm at Rs. 312 and Rs. 365, respectively. Spot lead on the L.M.E. gained to £115 from £110½, while spot zinc eased from £124½ to £122½. The fall in zinc should be attributed to the anxiety of producers to make zinc available to users at a reasonable price, in view of the apprehension of substitution.

Measured in terms of the number of automobiles produced per thousand population, West Germany ranks first (44 units per 1,000 persons), followed by the U.S. (40) and France (32). The U.S. accounts for the biggest share in the total world production, the actual share being 46.3 per cent followed by West Germany (14.6 per cent), Britain (9.7 per cent), France (9.2 per cent) and Italy (6.7 per cent).

LABOUR

(Concluded from page 557)

be determined every six months. For the current period, the ratio of 1 : 1 has been recommended. For the compilation of rice index, the Committee has recommended that the year ended May 1964 should be taken as the base period for determining the base price and initial weights, and the index so arrived at should be linked to the current index by the usual procedure—the linking factor being 7.43. For the purpose of price collection, all the varieties of Government supplied rice and two varieties of free market rice have been recommended.

The Millowners' Association represented that the employers were running a large number of grain-shops on no-profit-no-loss basis for selling fifteen major articles of consumption in different varieties at reasonable prices, which were sometimes lower than the current market prices. The prices were fixed once a month by the Association itself and all the mills were required to adhere to these prices during the month. The Association submitted that, if due weightage was given to these factory grain-shops in the index series, it had "no objection to stock in these shops all the articles of consumption which figure in the index series and go to the extent of considering the sale of these articles at subsidised rates." The employees' organisations, however, argued that most of the factories were not having any grain-shops and, even in the case of those which were having, only a very small percentage of workers of these factories were taking advantage of these shops as these shops were not selling all the items of consumption and were situated at considerable distances from the workers' houses. It was, therefore, stressed that these shops were not eligible for being considered for the purpose of price collection.

On the basis of the figures supplied by the Millowners' Association, the Committee has estimated that only six per cent of the factory workers took advantage of the employers' shops. Moreover, the rice sales of these shops have already been covered as they sell only Government rice covered under the recommendations above. Thus the Committee's finding is that the impact of these shops was not substantial. It has, therefore, opined that, unless a much larger number of employees make their purchases from mill grain-shops, there is no reason to depart from the practice followed now.

Although a number of varieties of cloth had gone out of production, their prices continued to be repeated for more than a decade. In its report submitted on 7th January 1964, the Committee pointed out that, "while such price repetitions might be legitimate for a short period, their peristence for over a decade is indefensible. The procedure followed had the effect of pegging cloth group prices at a lower level. ... There is no doubt that, if the chosen cloth varieties in *dhotis, saris* and shirting had continued to be available, they would have shown some price rise." After considering the various points, the Committee recommended in its last report that the total cloth price index in the current consumers price index number should be replaced by the all-India wholesale price index number of cotton manufactures.

This method was, however, not acceptable to employers' and employees' organisations which wanted that equivalent varieties should be selected and substituted in place of the old varieties. But the lists of substitutes supplied by them were so much at variance with each other that it was difficult to come to an agreed decision. The Committee also found it difficult to fix any substitutes which would satisfy the conditions of being popular and continuously available for some time. Under these limitations, the Committee felt that the only way out was to fix broad varieties for different items in the clothing group and to collect prices of all the sub-varieties within each variety. The advantages of this method are that the chances of an accidental or deliberate distortion would be greatly reduced as it would be based on the whole price range of the variety rather than one fixed sub-variety, and the problem of substitution, which crops up when one specified variety goes out of market, will not arise. However, it is a hitherto untried method and the Committee has recommended that, before it is put into practice, the Commissioner of Labour should study its details and implications. In the meantime, the Committee has recommended that there is no alternative but to continue the method suggested in its earlier report.

Since December 1951, Dalda had been substituted for ghee in the consumer price index number, on the plea that ghee prices could not be collected as 'pure' ghee became difficult to identify. The Committee, however, did not consider this procedure proper and sustainable and, in its last report, recommended the reversal of the substitution. However, in calculating the ghee price index, through oversight, the Committee compared the price per pound in 1950 to that per seer in 1960. The Committee, which was asked to clarify the position, has now admitted this mistake and rectified it, bringing down the food group index for 1960 by five points.

All these are technical points, the Committee was highly competent to consider them. There can thus be no argument about its decisions. Moreover, as hinted by Mr. N. M. Tidke, Labour Minister, its recommendations are not likely to make any substantial change in the consumers price index number. Still, it would have been proper if the Committee had included one mill grain-shop in the 24 shops from where prices are presently collected. As these mill shops cater to six per cent of the workers, such an inclusion would have been quite appropriate and it would have also been very easy to collect the prices from these shops. It is not being suggested that such an inclusion would have led to any substantial change in the consumers price index. But it would have certainly made the index more fully scientific and impartial and encouraged the employers to start more such shops and increase the supply of articles of consumption in the already established shops.

It may be in order to point out here that a statistical organisation is useful only when it supplies correct information with the minimum possible time lag. It is now more than a decade since the Conference of Central and State Statisticians held in October 1953, recommended fresh family budget enquiries in the country. Five years were spent in implementing that recommendation. Now, for the past five years the Labour Bureau of the Government of India has been working out the new index series. Though the responsibility for this delay does not lie entirely with the Government statisticians who are hindered at every stage by administrative red-tape in matters like sanctioning the necessary funds for such enquiries, one cannot help remarking that it should have been possible to finalise the matter in a much shorter period than the ten years actually taken for the entire operation.

THE RAGHUVANSHI MILLS LIMITED

(Concluded from page 562)

of cloth consumers and because of its decentralised character. In my last year's speech, I had stated how the textile industry of India should be shaped, namely, spinning as a basic industry, composite mills, and decentralised weaving sector. Any proposal which ensures prosperity and progress to all sectors of this industry without in any way harming the interest of any of them, both from short-term and long-term view, ought to be accepted without any hesitation. I have no doubt that the Asoka Mehta report on the Powerloom Enquiry Committee which very well serves this end will be adopted by the Government.

Before I conclude, I would like to thank all my colleagues on the Board who rendered unflinching co-operation throughout this year.

I am happy to say that your Company could receive unsparing co-operation from the members of technical and administrative staff throughout the year. On the labour front we had a peaceful working. It is the endeavour of the management to create in every employee a sense of pride in being a part of our organisation. I take this opportunity of thanking them all on your behalf.

Gentlemen, now I propose that the report of the Directors and balance-sheet together with the profit and loss account for the year ended 31st March 1964 as audited and certified by the Company's Auditors be and is hereby approved and adopted.

Note: *This does not purport to be a report of the proceedings of the Annual General Meeting.*

(Concluded from next column)

25 per cent. Gammon India declared 12 per cent and the shares at Rs. 14.62 offer a yield of around 8.25 per cent on fresh investment. However, it is difficult for the cash section to maintain its position at a time when speculatives happen to be weak. Other shares which were active during the week were: Bajaj Auto at Rs. 120 (as against Rs. 119), Citric at Rs. 69 (as against Rs. 68), Sandvik at Rs. 175, Associated Bearings at Rs. 104, Borosil at Rs. 12.40 and Lynx at Rs. 6.60. Synthetics and Chemicals declined by four points to Rs. 76 but these shares seemed to lack strength.

TREND OF SHARES

BULL LIQUIDATION

(From Our Own Correspondent)

BOMBAY, 24*th September*

IT was a very bad week for Dalal Street for equities were persistently hammered down by nervous bull liquidation and selective bear pressure. The undertone at the close was extremely weak and the list showed generally sizable losses on balance. The tendency for the volume of business to decline at lower levels in the early part of the week had led to the belief that there was yet nothing to panic about, but trading today did show that the turnover was fairly good at declines.

The decline was more pronounced in some of the market leaders like Tata Steel, Indian Iron, Century, Standard, Telco and National Rayon and it was but natural that, having been in the forefront during the upward move, they should have led the decline. Tata Steel fell from Rs. 158.75 to Rs. 157 and Indian Iron closed lower at Rs. 26.55, as against Rs 27. Telco eased from Rs. 272.50 to Rs. 267. Century lost more than 13 points at Rs. 615, Standard was down from Rs. 641 to Rs. 633, and National Rayon lost nine points at the week's closing level of Rs. 356. Hindustan Motors and Scindia were among those which came in for severe hammering. Dyestuff lost as many as seven points to be quoted at Rs. 289. A.C.C. were among the few exceptions which in an otherwise weak market not only maintained a firm tone but closed the week with a moderate rise.

Factorwise, sentiment was induced by the Finance Minister's policy statement which indicated that the Government would go ahead with its defence and development plans. The statement came as a big damper on the market which, rightly or wrongly, was expecting a significant departure from the present fiscal and economic policies helpful to it. Further, the market was disappointed by the restrictions regarding blank transfers. The likelihood of a further tightening of control over the corporate sector through necessary changes in the Companies Act, too, acted as a deterrent to fresh speculative buying. Developments in Kashmir also caused considerable uneasiness. The last but not the least, the arrest of some leading members of the foodgrain trade and the feeling of frustration it left behind in Vadgadi had its effect on the share market. The cumulative result of these was nervousness and a setback in both prices and morale.

More important than the quantum of the decline was the way in which the support levels of many a pivotal scrip were damaged by the decline during the week under review. The comparable levels were the highs touched on 4th August when Tata Ordinary was at Rs. 156.75, but the lowest (touched today) for the week was Rs. 156.50. Similarly, Century tumbled to a low of Rs. 614, as against the 4th August high of Rs. 622, Standard to Rs. 624 from Rs. 644, Hindustan Motors to Rs 17.84 from Rs. 18.32 and National Rayon to Rs. 354.50 from Rs. 372.50. How far below the levels are from the 22nd September peaks is evident from the fact that Tata Ordinaries had touched Rs. 162.25 on that day, Century Rs. 640.50, Standard Rs. 682, National Rayon Rs. 383 and Hindustan Motors Rs. 19.28. The decline from the 22nd September levels has been steep and almost non-stop and, coupled with the piercing of known support levels of 7th July and 4th August. It gives rise to the feeling that the secondary reaction was having its full play. And if the market were to pierce the next support levels, then the major uptrend of the market might itself come in for trouble.

Steels were distinctly weak. With all factors discounted and nothing worthwhile coming up in the near future, public interest in these shares should naturally be limited and this explained the tendency on the part of speculators to liquidate their holdings. Calcutta interests were more eager to get rid of their long positions in Indian Iron. The situation in textiles continues to be uncertain. Both domestic and export sales are dull and the Government is yet to announce its price policy for cloth. There was some flutter in Bombay Dyeing, following rumours of a change in management, but, despite the Chairman's denial of anything like that, the shares suffered a sizable setback—from Rs. 60.90 to Rs. 59.60. Conditions in the man-made fibres were anything but encouraging to rayon interests and it was rather too much to expect one to support these shares in the face of reports that spinners were eager to enter into new contracts for yarn at a discount on the current market rates. Baroda Rayon eased from Rs. 72 to Rs. 68.50 and South India Viscose was shaded at Rs. 116. Indian Rayon, however, maintained a steadier tone at Rs. 58, but they had declined enough earlier. Tyre shares were weak and the optimistic account of the Chairman of Premier Tyres at the annual meeting was evidently lost on the market which was set for a decline and the shares closed a shade easier. Ceat suffered even more. Other members of the group also weakened. Paper shares were unwanted, with Sirpur declining from Rs. 12.08 to Rs. 11.92, but it is difficult to foresee any support worth the name for papers so long as the market continues to be in its present state when distributors have to forego part of their commission to get rid of stocks.

Electricity shares continued to maintain a steady tone and this was something to note in a weak market. Investment support to these shares was sustained by hopes of a likely rise in the permissible return. Among shippings, Scindia was down from Rs. 16.40 to Rs. 15.92. Sugars were generally weak with Belapur losing four points to Rs. 223 and Maharashtra two points to Rs. 139. Phaltan and Walchandnagar suffered fractional losses. Cash shares were generally sluggish although a few of them came out with good corporate results. T. Manekial raised the dividend to

STOCK & SHARE QUOTATIONS

Abbreviations :—D.—Deferred shares. P. O.—Preferred Ordinary shares. Y.—Accounts published yearly. H.—Accounts published half-yearly. P.—Company has Preference shares. T.—Company has Debentures. N.—Nominal quotations. x.d.—Ex. Dividend. c.d.—Cum. Dividend. I.—Interim Dividend. C.R.—Cum. Right. XR.—Ex. Right.

Shares :—If a company has different classes of shares—as for example : 'A' shares and 'B' shares—these are indicated by the same letters 'A' and 'B' under the columns 'Paid-up Ordinary Capital' and 'Paid-up' per share.

Accounts :— Figures in the Accounts Closed column represent the months or the year in which the respective companies close their accounts, 6 and 12, for instance, indicate the months of June and December, respectively. Reserves include general and other reserves and all other funds which a company may have excluding depreciation fund, reserves for tax liability and provident fund. Block represents actual cost of land, buildings, machinery and all other items on which depreciation is allowed less sales, if any, and stands for the gross figures except where otherwise indicated.

Dividends :—Dividends for completed years are shown as amount per share per annum, but where quoted for portion of a year they represent the proportionate dividend for that period. In the case of those companies which close their accounts yearly dividends shown are for their financial year.

William Blake.

VOL. CIX. No. 2789 BOMBAY, 3rd OCTOBER 1964 PRICE Rs. 2

DEAR MONEY AND CREDIT SQUEEZE

THE emphasis on credit restraint set well before the Emergency and in evidence throughout the period since then, except for a Bank Rate weapon in India had long been carried a step further by the Reserve Bank's announcement late in the evening of 25th September 1964 of a higher Bank Rate and a modified mechanism of credit control, which would result in tighter money and dearer interest rates in the coming months. These measures, along with the directives on the revision and reordering of interest rates on bank deposits, are designed to bring about greater realism in the entire structure of interest rates in the organised banking sector.

The five per cent Bank Rate which came into effect on 26th September 1964 is the highest so far in India since the formation of the Reserve Bank in April 1935. With the Reserve Bank's concern on the price situation, expressed repeatedly in a series of its recent reports, and with its preference for realistic fiscal and monetary policies as well as for an orderly structure of interest rate, the rise in Bank Rate was not unexpected, though its timing was a surprise to the capital market. As in the past, the increase in Bank Rate has only been by one-half of one per cent. This is not surprising, for the authorities in this country have never believed in wielding this monetary weapon aggressively. Circumstances today certainly warrant a much higher Bank Rate than the five per cent in force now. But, in this respect, the Reserve Bank's action has always been belated and half-hearted.

The previous half per cent rise in January 1963 in the Bank Rate to 4½ per cent was officially described as a measure intended to bring it in line with the prevailing pattern of interest rates in the money and capital markets, a pattern set in 1960 by the differential lending rates for central bank borrowing. This time, too, the rise in the Bank Rate could be regarded as only an adjustment to the existing pattern of rates, because the effective rate of borrowing by the Central Government on its long-term loans had gone up earlier from 4.50 to 4.75 per cent and the average rate of central banking credit to scheduled banks in the last busy season was a little over 5½ per cent. The explanation given by the Reserve Bank for putting up the Bank Rate is, however, its "growing concern with regard to the current price situation." At best, its present action is only symbolic of its concern, because a 15 per cent rise in prices over the year reflects a serious imbalance between the growth of money incomes and that of real resources and output.

Even apart from this gap between aggregate supply and aggregate demand, a contraction of Rs. 130 crores in bank credit between 24th April and 18th September 1964 in the current slack season has clearly been inadequate, particularly in relation to the unprecedented expansion of Rs. 377 crores in credit that had taken place in the preceding busy season. In view of the revised liquidity requirements coming on top of the already high credit level (as witness the 69 per cent credit ratio even in mid-September), the resources position of banks is much less comfortable this year than it was this time last year with a credit ratio of 66 per cent. The current series of measures, headed by the increase in Bank Rate, are, therefore, intended to put up the red signal to banks. This signal means that, rather than relying upon resources traditionally provided by the Reserve Bank, they should try to meet the genuine credit requirements of their customers within the framework of a policy of restraint and that they should intensify their efforts at mobilising the savings of the people.

The reluctance to make effective use of the Bank Rate weapon in India had long been justified on the ground that the money market was neither organised enough nor sensitive enough to respond to the changes in interest rates. It used to be further argued that the rates of interest on bank deposits and advances were not linked to the Bank Rate. All this, however, was only a lame excuse, for the real reason was partly the desire to keep down the cost of borrowing by the Government and partly the socialist ideology under which it was considered undesirable to pay higher rates of interest on the savings of the public. Increases in the Bank Rate were effected only as a last resort and under acute pressure of circumstances. It may be recalled here that the Rate remained at three per cent right from November 1935, when it was lowered from 3½ per cent, up to November 1951, that is, throughout the war, post-war and early post-independence years. It was stepped up by half per cent to 3½ per cent in the beginning of the First Plan and later from 3½ per cent to 4 per cent in May 1957, that is, early in the second year of the second Plan. The era of planning thus saw a gradual shift from cheap money to dear money and, on each occasion, the intention behind raising the Bank Rate was to strengthen the credit restraints, necessitated by the strains and stresses in the economy due either to world forces or to development expenditures. As already mentioned, the rise in the Bank Rate in January 1963 was in a class by itself, but the latest rise is a continuation of the earlier trend. It is the mounting inflationary pressures that have again forced the hands of the Reserve Bank, whose Governor was till recently opposed to any rise in the Bank Rate.

It must, however, be said to the credit of the monetary authorities (these include the Union Finance Ministry also) that the increase in Bank Rate this time is not merely a reflection of the renewed faith in the value of sound monetary management: it also represents a lead to the commercial bankers to reconsider their interest rate policies and problems. It may be noted here that the banks have failed to take serious notice of the Reserve Bank Governor's advice a month ago that the pattern of interest rates on deposits under the Inter-Bank Agreement was unrealistic and that it did not provide sufficient incentive to attract more deposits into the banking system. The higher Bank Rate is further intended to induce economy in the use of credit and to provide incentive to save rather than to spend. Contrary to common belief, the higher Bank Rate would have a perceptible impact on borrowers who are outside the banking sector also, for the effect of dear money on them is more prompt and telling than that of cheap money. This would be more so, as the rise in the Bank Rate is being followed by restrictions on the ability of banks to create credit, with a clear emphasis upon credit for only genuine and productive purposes as against speculative and hoarding purposes.

The differential rates of interest payable by scheduled banks on their borrowings from the Reserve Bank of India based upon quotas fixed with reference to the statutory reserves of the scheduled banks, first introduced in 1960, have now been abandoned after four years of experimentation, involving no less than eight changes. The erstwhile scheme consisted of (i) a basic quota for borrowings equivalent to 100 per cent of the average statutory reserves of banks (except during the short interlude of liberalisation between 30th October 1963 and 12th March 1964, when it was 150 per cent), which could be availed of at rates of interest varying between the Bank Rate (lower limit) and 6 per cent (upper limit) and (ii) a special quota (in addition to the basic quota) borrowings under which attracted a penal rate of 6.5 per cent; it was in the nature of a discretionary quota allowed only after a review of the merits of individual cases. Further, within the basic quota, additional borrowings were permitted at Bank Rate against the banks (*a*) lendings to small-scale industries and co-operatives. (*b*) holdings of eligible usance export bills drawn in Indian rupees, and (*c*) lendings to collieries guaranteed under the Guaranteed Scheme. Till March 1963, these additional borrowings at Bank Rate were allowed by effecting a corresponding reduction in the quota at 6 per cent, but, thereafter, the additional quotas on these special lendings were really an addition to the basic quota, thus providing an incentive to the banks to take greater interest in the development of the specified fields.

This scheme, which came to be known as a system of *quotas* and slab rates, had its limitations and failed to impose any effective control on the extent of scheduled bank borrowings which touched an all-time peak of Rs. 107 crores in March 1964. Moreover, a major change in the system of liquidity has also taken place. In view of this, the Reserve Bank has discontinued the system of quotas for the scheduled bank borrowings from it and introduced a new one this week. According to it, a new kind of differential interest rates has been put into operation. The cost of borrowing from the Reserve Bank will now rise progressively, depending upon the level of credit extended by banks in relation to their own resources. The Reserve Bank desires to operate the restraint by increasing the cost of central bank accommodation without enforcing any formal ceiling on the amounts that can be borrowed. But it has fixed a ceiling at 9 per cent per annum on the rate of interest that can be charged for bank advances by the larger Ind

foreign banks. In effect, therefore, the Bank has indirectly put a practical limit on the maximum cost which the banks will be prepared to pay on their borrowings from the Reserve Bank. There is, however, no ceiling on the lending rates of the smaller scheduled banks having deposits less than Rs. 50 crores.

The amounts which the banks will be allowed to borrow from the Reserve Bank at various rates of interest under the new scheme are related to what is called their "net liquidity position." The net liquidity position as now defined means the "total of a bank's cash, balances with the Reserve Bank and other notified banks (including the State Bank of India), and balances in current accounts with other banks, and investments only in Government securities, *less* its total borrowings from the Reserve Bank and the State Bank, as a proportion of its aggregate demand and time liabilities," as reported every Friday under Section 42 of the Reserve Bank of India Act. This net liquidity is different from the definition of liquidity adopted for the purpose of the statutory requirements of "liquidity ratio" under the Banking Companies Act, according to which the liquid assets consist of cash, balances with the Reserve Bank, State Bank and other notified banks and unencumbered approved securities. But, as the borrowings from the Reserve Bank and/or the State Bank have to be excluded for arriving at the net liquidity position, the ratio of net liquidity to aggregate liabilities will fall more rapidly in the busy season than the statutory liquidity ratio, for a good part of the borrowings is usually against usance bills.

A bank will be allowed to borrow unlimited amounts from the Reserve Bank at Bank Rate, that is, at 5 per cent per annum, as long as the net liquidity position as explained above is at or above 28 per cent. But for every one percentage point fall in this position, the rate of interest to be charged on the *entire* amount of that bank's borrowings will go up by half per cent. It will be noticed that one of the fundamental differences in this new scheme of differential interest rates, as compared with the old scheme, is the abolition of the *slab* system: under the old arrangement, a quota of the amount that can be borrowed at each slab of interest rates was fixed, and the mere fact that a bank borrowed some amounts at a higher rate did not affect the cost of its borrowings under the preceding slab or slabs. Under the new system now, every decline in net liquidity position beyond one per cent will push up the rate of interest not only on the further borrowings, but also on the amounts already borrowed earlier at a lower rate. All this would mean that the limit beyond which it would not be profitable for banks to borrow from the Reserve Bank would be reached much sooner and that, although in theory, there is no limit imposed on the availability of central bank accommodation, there will always be a ceiling in practice.

As a further measure of tightening the central bank accommodation, the schemes for additional special quotas at Bank Rate in respect of advances to the small-scale and the co-operative sectors and to the coal industry will be discontinued. The only concession that now remains pertains to borrowings from the central bank under the Rupee Export Bill scheme against a bank's holdings of rupee export bills, provided that the rate charged by the borrowing bank to its customers is not more than 1½ per cent above the Bank Rate.

The Reserve Bank has repeatedly been emphasising the need to increase the pace of deposits mobilisation: its gentle hints on an appropriate and scientific interest rates structure were, however, not heeded by the bankers and they are now faced with a Reserve Bank directive fixing rates of interest for very short-term periods upto three months, in addition to a specific indication of its mind regarding the base from which rates of interest for deposits beyond three months should be calculated. Under the pattern in vogue hitherto, banks have been paying as much as 3 per cent on three days' notice money and only four per cent for 365 days' money. When the Bhabha Committee of the Indian Banks' Association considered revision and rationalisation of interest rates, it suggested a rate of 2½ per cent on three days' notice money for a minimum period of 15 days, with the option to raise the rate up to 3 per cent in the busy season. This was not acceptable to the majority of bankers. Even the milder proposal of the Exchange bankers to raise the period of notice to seven days as it existed before the Reserve Bank's directive on interest rates in 1960 was not acceptable to the bankers. The Reserve Bank has now directed that interest on deposits up to 14 days shall be on the same basis as on current accounts, that is, *nil*. For 15 days' to 45 days' deposits, the maximum interest rate prescribed is 1.25 per cent per annum. For deposits repayable between 46 and 90 days, the rate prescribed is 2.50 per cent per annum, in place of the existing rates of 3½ per cent for deposits falling due between one month and two months and 3½ per cent between two and three months. The contention of the Reserve Bank of India that banks were paying too much for money in this category which would in any case have remained with the banking system is supported both by logic and facts, which even the banks would have noticed, if their deliberations had not been influenced by inter-bank jealousies and politics.

It is clear that the new credit control mechanism and the directives on interest rates payable on short-term deposits, together with the withdrawal of the general permission given to banks to bring short-term funds from abroad, imply that the banks must make serious efforts to increase their deposits from the public. The Reserve Bank cannot now be accused of saying vague and general things in platitudinous terms: for it has unambiguously indicated that, in its opinion, the structure of interest rates for term deposits should be based on a minimum rate of 4 per cent per annum for deposits of 91 days, with adequate spreads for deposits of longer terms. Here is an opportunity again for the bankers to pick up the gentle but firm hint from the Reserve Bank, but, if they fail to do so, they will not then be able to blame it for the consequences of their failure.

FIGHT AGAINST CORRUPTION

It was the widespread public belief that there was "something rotten in the State of Denmark"—that corruption was prevalent in an acute form, particularly in the political, administrative and business sectors of the country—that touched the sensitive soul of Mr. Gulzarilal Nanda, Union Home Minister, to the quick and led him to give a solemn undertaking to the nation just ten months ago. The Minister's public pledge, given on 30th November 1963, was to the effect that he would give up his high office if, within a period of two years from that date, he failed "to produce a striking impression and to make a substantial difference in regard to the prevalence of corruption" in the Central sphere in which he acted. In giving this pledge, Mr. Nanda had also been influenced to some extent by the "disturbing" findings of the Committee on Prevention of Corruption, headed by Mr. K. Santhanam. The Home Minister thus seemed to have taken, at that time, an extremely grave view of the "corruption" situation. But he has since adopted a sober and more balanced view, as will be evident from the pointed remarks he made in his broadcast talk of 7th May last:

> "Our people are prone to exaggeration of their own faults. Very often the picture of corruption is overdrawn. There are many Government servants whose careers are free from any taint of corruption, applying even the strictest test. It is also true that not every businessman has recourse to dishonest ways. And it is demoralising for the nation that, because of the lapses of a few, sweeping statements should be made about persons in political life generally."

Still the ministerial pledge is too solemn to be forgotten, and Mr. Nanda has done well to try to redeem it in part by taking a series of steps. He has, to begin with, set up a Central Vigilance Commission in pursuance of a recommendation made by the Santhanam Committee. The Commission's principal function is to ensure that complaints of corruption or lack of integrity on the part of public servants are attended to promptly and effectively and that the offenders are brought to book without fear or favour. Much is rightly expected of this Commission, for its independent character is calculated to make it a powerful force for the eradication of corruption in the public services. But, whether this expectation will materialise within a year or two is doubtful, for, by its very nature, the process of eradication of corruption is bound to be a tedious and protracted one.

Another step taken by the Home Minister in recent months is the constitution of a Department of Administrative Reforms. This Department is expected, in due course, to help cut down avoidable delays in all branches of administration. The idea here is that a reformed administration, which can function with greater speed and efficiency, especially in matters pertaining to permits and licences, contracts and payments, grants and loans, and so on, would be less susceptible to corruption. Here, again, no spectacular results can be expected within a short period, for the innumerable administrative divisions and departments which have a "vested interest" in the maintenance of controls and regulations will not be easily persuaded to divest themselves of even the less important or superfluous powers of direction and regulation. However, it will be interesting to watch whether and how the reforms, if any, proposed by this Department for speeding up administrative procedures in all other Government departments are going to be implemented by the latter.

The Sanyukta Sadachar Samiti, sponsored by Mr. Nanda in May last, as "a purely non-official and non-political body," represents another significant step, in that it is intended to bring to the notice of the vigilance machinery of the Government "reliable" information about "the techniques, ways and locations chosen for corrupt dealings." The direct sources of the Vigilance Department and the material gathered by the Samiti, according to Mr. Nanda, should together ensure coverage of almost the entire field of corruption. This voluntary organisation, which has been unfairly criticised by some because of its association with Mr. Nanda's name, is yet to make its impact on the situation, both in terms of assistance to the Government for eradicating corruption and of development of moral and social sanctions for counteracting corrupt tendencies and dishonest dealings.

All these steps are doubtless in the right direction. But their preventive aspects are of relatively long-term significance. It is the punitive aspect of the anti-corruption drive that is most crucial from the relatively short-term point of view, for deterrent punishment for offences involving corruption is bound to reduce the future incidence of such offences. Considered from this point of view, some of the stringent provisions of the Anti-Corruption Laws (Amendment) Bill, introduced in the Lok Sabha last week, would seem to be necessary. For instance, there is the provision for making the possession, by a public servant, of disproportionate assets — disproportionate to his known emoluments—"a substantive offence" unless, of course, he can validly explain their origin or acquisition. The provision relating to inspection of bankers' books in cases of suspected concealment of assets is equally stringent. The purpose here is to give more powers to the police officer (of the rank of a Superintendent of Police), investigating a case of suspected corruption, to inspect any bankers' books insofar as they relate to the accounts of the person suspected to have committed the offence, or any other person suspected to be holding money on behalf of such person. Another related provision authorises possible attachment of money or other property believed to have been obtained by the commission of offences under Section 5 of the Prevention of Corruption Act, 1947. The redefinition of "public servant" so as to cover certain additional categories of persons, such as persons performing adjudicatory functions under any law, liquidators, receivers and commissioners, is another noteworthy feature of the Bill.

The bribe-giver, too, will come in for stern treatment, for the relevant provision in the Bill makes "habitually corrupting public servants" a criminal offence. Another salutary provision is intended to safeguard the interests and reputation of honest public servants who may be maliciously defamed by disappointed applicants for contracts or licences. In such cases, "defamation by spoken words" is to be treated as an offence and public prosecution against the offender can be launched even without obtaining the consent of the "public servant" who has been defamed. It would thus appear that the Bill is designed as much to bring to book the corrupt officials and thereby deter others from possible corruption as to protect the honest and innocent officials against defamation or unsubstantiated allegations and to deal more sternly and effectively with the insidious breed of bribe-givers. But the Bill, which is intended to eradicate administrative corruption in pursuance of the recommendations of the Santhanam Committee, is incomplete, in that the political master of the public servant is yet to be dealt with. It is when Mr. Nanda comes to deal with the corrupt politician's role in administrative corruption that he will know what he is up against and where he stands.

MARKET GOSSIP

More On Bank Rate

THE Bank Rate has been raised from 4½ per cent to 5 per cent. The system of providing central bank credit to member-banks has been so modified that both the volume and cost of such credit would be adversely affected. In view of the prevailing low level of liquid assets with the majority of banks excluding the State Bank of India and its subsidiaries, their ability to borrow from the Reserve Bank in the coming busy season will be far less than in the last busy season. The average cost of such borrowings also will be more. The banks must, therefore, necessarily charge more on their loans and advances. Indeed, they must have already raised their minimum lending rate from 6½ per cent to 7 per cent.

What does this mean? It means that every user of bank credit must work harder and more efficiently, cut down waste, give up overstocking of raw materials, and sell his finished goods as quickly as possible. It does not mean that he should pass on the increase in his interest charges to consumers. Again, he should cut down his borrowings to the maximum extent possible and increase his own resources by building up reserves and raising additional capital, preferably equity capital.

The Reserve Bank has undoubtedly done the right thing in pushing up the Bank Rate and the cost of bank credit. But, if this policy is to yield satisfactory results, the fiscal policy of the Government must also undergo a change. Otherwise mere adjustments in monetary policy will be self-defeating.

What are the lines on which the fiscal policy should be changed? In the first place, the incidence of taxation should be reduced, in order to encourage more savings and their investment in equities. Without this reform, the corporate sector cannot minimise its dependence on bank credit. In the second place, expenditure by the public sector must be drastically curtailed. This should not be impossible, if the Central and State Governments have the necessary will power and realise that, unless they do so, economic difficulties confronting the country will multiply fast and the value of money will go down further. At present, one regrets to find that the public sector is only paying lip sympathy to economy in expenditure and no serious attempts are being made to prune the expenditure drastically. And, thirdly, the Government should expedite its efforts at securing full production from all its industrial and other commercial undertakings.

There are also two directions in which the Government should move. One is a tightening of the wage policy. It must display sufficient political courage in evolving and enforcing a policy which relates the worker's remuneration to his production performance. The other is to enhance the reward for small savings, in keeping with the increase in interest rates.

The last mentioned suggestion will also serve the purpose of inducing banks to pay appropriate rates of interest on term deposits. The Inter-bank Agreement on deposit rates has not been sufficiently flexible and operated with imagination. The banks have been using it more as an instrument to protect their costs than as one meant for attracting more deposits. One thing which this Agreement has definitely done is generation of wrong ideas about the role of interest rates. Even today there are bankers—and some of them are holding high places as representatives of the banking system as a whole—who feel that time deposits with banks are not savings and that it is a sheer waste to increase the rates of interest on deposits. The Reserve Bank has already realised that it is useless to wait for banks to amend the Inter-bank Agreement realistically.

On 31st August last, the Governor of the Reserve Bank told bankers in all seriousness that the changes made by them in deposit rates were inadequate and unscientific. He was right, for, after a mountain of labour lasting over several months, all that was produced was a mouse. What is more, none of the bankers cared and the Committee of the Indian Banks' Association had literally kept quiet on the Governor's advice, as if it was of no consequence. In fact, shortly after his address at the Bankers' Dinner, almost all the top bankers went abroad and there was hardly anyone in the country to take the lead.

The Reserve Bank, which has already scientifically fixed the rates of interest on deposits for short periods up to 90 days, should take the initiative and determine the rates of interest for other term deposits also, if the Committee of the Indian Banks' Association fails to do so within a month. It must be borne in mind, in this connection, that, by reducing the rates of interest on call deposits and very short-term deposits, the Reserve Bank has actually saved a lot on interest charges for the banks, while, at the same time, it has helped them to charge more on advances. It would surely not be in consonance with the objectives of the latest changes in monetary policy, if the banks take too long to make up their minds about utilising a part of this gain for attracting more time deposits.

There are two ways in which the Reserve Bank can act, if the banks fail to realise their responsibility. One is to give a directive to all banks as it has done now in the case of very short-term deposits. The other is to ask the State Bank of India and its subsidiaries to take the lead by stepping up the rates of interest on deposits on 91 days and over. As the State Bank of India is not a signatory to the Inter-bank Agreement, it is free to act independently of this Agreement.

The right rates of interest on term deposits would, in our opinion, be 4½ per cent for six months, 5 per cent for one year, 5½ per cent for two years and 6 per cent for three years. It is unnecessary for banks to quote for a period in excess of three years. These rates would, in the long run, turn out to be cheaper for the banks and help reduce their dependence on the costly and irksome central bank credit.

An impression has been sought to be created by some that the new scheme for providing central bank credit has been so designed as to be more favourable to the State Bank of India and its subsidiaries than to the commercial banks in the private sector. This is not a correct interpretation. There is very little of P.L. 480 investments with the State Bank now. Accordingly, the higher liquidity of that Bank is the outcome of devoting a relatively lower proportion of its resources to loans, advances, overdrafts and cash credits and bills purchased and discounted. This is true of its subsidiaries also. The banks in the private sector, however, have been devoting a larger proportion of the resources to providing credit for trade and industry and a relatively smaller proportion to investments in Government securities. Generally speaking, the ratio of liquid assets to deposit liabilities is higher by 10 to 11 per cent in the case of the State Bank of India than the comparable figure of its confreres in the private sector. Surely, one cannot have the cake and eat it too.

There seems to be a doubt among some banks whether the rates of interest prescribed by the Reserve Bank for call money and very short-term deposits are applicable to the inter-bank borrowings as well. This doubt is unwarranted, because inter-bank call money is on an entirely different footing from the deposits taken from the public. The purpose and spirit behind the directives on interest rates is to encourage deposit mobilisation from the public. It is, therefore, absurd to think that the inter-bank call money is covered by these directives.

There is, however, another doubt which is quite warranted. This relates to the investments of banks in Government securities for purpose of calculating the net liquidity ratio. In its *communique*, the Reserve Bank has used the words "investments in Government securities." The question is whether these include approved securities also. Some say that they do not, as the wording is quite clear and not capable of any other interpretation. The issue, we understand, has already been taken up with the Reserve Bank and a clarification is awaited. Meanwhile, it is unnecessary to add that, if approved securities are not included for the purpose of calculating the net liquidity position, the room for borrowings from the Reserve Bank at Bank Rate will be narrower than otherwise, because investments in approved securities constitute a substantial amount in the banks' portfolio of Gilt-edged securities as a whole. Surely, there is no reason why approved securities also should not be included for this purpose, as they are all securities with the interest and principal guaranteed by either the State Governments or the Central Government. Any attempt to differentiate between the two would be a case of splitting hairs and deal a severe blow to the borrowing capacity of Local authorities, electricity boards and other State-owned institutions.

The increase in Bank Rate has not had any pronounced effect on either equities or Gilt-edged securities. As there was a substantial short position in shares on the eve of the Reserve Bank's announcement, the event came as a Godsend for the bears to book their profits conveniently; hence the quick recovery after the initial setback and subsequent steadiness of equities. As for the Gilt-edged, it is not a free market, since it is propped up by statutory compulsions on institutional investors and provident funds in regard to the disposition of their funds.

One final point. Usually, changes in the Bank Rate are effected in the evening of Wednesdays. This time the change was made on a Friday evening. It is a statutory obligation on the Reserve Bank to announce the Bank Rate on the notice board by 5 p.m. every Wednesday. Although the present change in the Bank Rate is the fifth one since the Bank was established, this is the first change to be effected on a day other than the traditional Wednesday.

State Bank Acts

Since writing the above, the State Bank of India has issued an announcement enhancing its deposit rates with effect from 1st October. While following the Reserve Bank's directive in regard to very short-term deposits, the State Bank, which was hitherto observing the schedule of rates under the Inter-bank Agreement, has decided to pay 4 per cent for 91-day deposits as suggested by the Reserve Bank and 4½ per cent for six months and above, 5 per cent for 12 months and over, 5¼ per cent for 24 months and over, 5½ per cent for three years to five years and 6 per cent for five years and over. Under the Inter-bank Agreement, six months deposits get only 3½ per cent, one-year deposits only 4¼ per cent, two-year deposits 4½ per cent, three-year deposits 4¾ per cent, followed by a ¼ per cent more for the addition of a year to the usance of deposits, subject to a maximum of 6 per cent for deposits of seven years and over. Now that the State Bank of India has acted promptly, the other banks will have to follow suit, if they are not to lose their deposits to the public sector banks.

Sweating For Nothing

That there is confused thinking in official circles about the cotton textile situation is clearly borne out by the statement on mill cloth production and price control which Mr. Manubhai Shah, Union Minister for Commerce, made in the Lok Sabha on Monday this week. In one breath Mr. Shah admitted that "there is *sufficient* quantity of cloth in the market, the pipeline in the wholesale and retail trade is *quite full*, and the stocks with mills are *adequate*" (all italics ours). In another he said that the Government had decided on the scheme of partial control "with a view to ensuring an adequate supply of good cloth of popular varieties at reasonable prices for common mass consumption." If, as Mr. Shah says, the supply position of cloth is comfortable, one would ask: Why then controls, even partial? Indeed, the present state of supply of and demand for cloth seems to be propitious for complete decontrol. Actually, there is at present a completely "free" market in cloth. Cloth is available in plenty everywhere, and no one hears any complaint from consumers about either non-availability of cloth or difficulty in obtaining supplies in required quantities. The Government could have allowed the present position to continue for some more time and, in the meantime, permitted mills to expand their weaving capacity through installation of automatic looms. No one need argue elaborately to prove that, if attention is concentrated on increased production, distribution will take care of itself. Anyway, ignoring all this, the Government has firmly decided on a scheme of partial control on mill cloth, obviously because a section of politicians has been shouting from house-tops that mills are exploiting consumers. In the past one year, prices of cloth have doubtless gone up, but the increase has only been modest as compared with the other articles of consumption.

Now that the Government has made up its mind to "protect" the interests of consumers, we wish it success in its new experiment. It is only to be hoped that the scheme will be implemented properly, so that the following three purposes which Mr. Shah mentioned in his statement will be served:

One, adequate supply of good cloth of popular varieties at reasonable prices is ensured for common mass consumption.

Two, there will be a reduction of about five to eight per cent in the prices of most of the controlled categories, as compared with the prices prevailing under the industry's voluntary price scheme; only in a few old varieties of controlled categories, the prices of which continue at pre-1961 level and which constitute less than five per cent of the controlled cloth, the new prices are expected to rise by 7 to 8 per cent.

Three, the controlled varieties of cloth will be produced "in more than adequate quantities to meet the requirements of all."

The scheme of partial control announced now differs from that recommended by the Cotton Textile Consultative Board in three important respects. In the first place, the percentage share of the total mill cloth production (excluding sales for exports and defence requirements) coming under production and price control with effect from 15th October is fixed higher at 45, as against 40 per cent suggested by the Board. Secondly, the scheme will cover only four categories of mill-made piecegoods, namely, *dhotis*, *saris*, longcloth and shirting (drill may be included later), whereas the scheme recommended by the Board covered a cross-section of the entire production. Thirdly, a special incentive has been given to the mills to produce more for export and defence. Thus, for every 10 per cent (of total production) of sales made by any mill for export and defence, credit will be given at the rate of 2 per cent which can be sold in the free market. No such incentive had been envisaged by the Board. All these changes appear to have been for the better.

The prices of the controlled varieties of cloth will be fixed on the basis of formulæ prescribed by the Government for working out the cost of cotton, the conversion charges for spinning and weaving, and the processing charges for bleaching, dyeing, printing, mercerising, etc. The prices so determined will be stamped on the pieces of cloth as ex-mill prices. The retail prices, the excise duty, the category and the description of cloth, as well as the tex-mark of the mill, will also be stamped separately. In calculating the retail price, a margin of 18 per cent over the ex-mill price (excluding excise duty) will be allowed. In addition, the controlled categories will bear the words "controlled cloth." All these details will be printed in red colour. No mill will be allowed to produce the controlled varieties in the non-controlled sector. Nor will any mill be permitted to print the words *dhotis*, *saris*, longcloth and shirting on any non-controlled varieties.

All mills have been asked to begin producing and price stamping from 7th October onwards and complete the switch-over by 15th October after which date all controlled varieties will have to be produced and price-stamped as per control orders. But the Government has still not made available to the mills the multipliers for fixing prices of controlled varieties. It is, therefore, doubtful whether the mills will be able to complete the switch-over by 15th October. This will be much more so, if the multipliers turn out to be complicated, as is feared by the industry. Indeed, it looks as though the hope of Mr. Manubhai Shah that "controlled cloth will become available in the market in appreciable quantities early in November" (that is, Diwali days) will not materialise.

Be that as it may, in order to ensure the effective implementation of the control scheme, the Government of India proposes to set up a Textile Control Advisory Committee (with Mr. V. P. Naik, Chief Minister of Maharashtra, as Chairman) and a Central Consumers Vigilance Com-

DELHI LETTER

SHASTRI BEATS A RETREAT?

EXPERT EXERCISES ON FOURTH PLAN SIZE

From Our Special Correspondent

NEW DELHI, *29th September*

THE Prime Minister, Mr. Lal Bahadur Shastri, appears to have beaten a retreat from his efforts to curtail the size of the fourth Five-year Plan outlay. This conclusion emerges from the detailed discussions among members of the Planning Commission and the Ministers in the Union Cabinet in the past three or four days. Yesterday, the Union Cabinet deferred giving its final assessment of the desired size of the fourth Plan and sent back various memoranda to Yojana Bhavan for redrafting and presentation to another Cabinet meeting after Mr. Shastri returns from Cairo on 12th October. At the end of next month, the Central-Cabinet-approved papers on the fourth Plan will be presented to the delayed meeting of the National Development Council.

According to one source, the Prime Minister is reported to have been worried over the increasing tempo of the controversy over the fourth Plan—too much of it for his comfort, particularly because of his lack of grip over the details of planned development programmes. The Prime Minister's initial pronouncements on planned development, no doubt, were basically political in that he tried to think aloud on what the layman wanted and what to do to alleviate the frustration and discontentment among the people. In closed meetings, the Prime Minister often finds it difficult to follow the technicalities—whether they involve fertilisers or the many varieties of cloth—he himself is used to wearing a simple *dhoti* and *kurta* all his adult life. In his career as Union Minister, Mr. Shastri scored in his political position as Home Minister and did not make much impact in the other Ministries which had to deal with technical questions. One expert reduced Mr. Shastri's plan concepts to an absurd equation: reduce investment but at the same time maintain a quick growth rate—the reduction in outlay being dictated by the fact of inflation getting out of administrative control. The Prime Minister will certainly pursue his well-intentioned aim of going in for projects which will yield quick results and at the same time he, as well as the planners, is convinced that great scope exists for saving through better project implementation. But the Prime Minister and his advisers could not come up with specific suggestions on where and how the big cuts in investment can be made. Meanwhile, the process of formulating the fourth Plan was getting delayed. At a certain stage, the Prime Minister must have decided to put a stop to the drift. Mr. Shastri may also have realised that the momentum of planned development and the increasing expectations generated by Plan promises added up to certain inescapable minima in outlay. When faced with the details of sectoral development, Yojana Bhavan appears to have convinced the Prime Minister that heavy cutbacks in investment were not possible, unless the Prime Minister was willing to go for a lower growth rate in the fourth Plan than is politically feasible to project (*vide* Delhi Letter on page 396 of *Commerce* dated 5th September).

T.T.K.'s Upper Hand

Union Ministers are agreed on a minimum five per cent annual rate of growth in agriculture and 12 per cent growth in industrial production as the minimum aspirations for the next Plan period. Whether it is Rs. 21,000 crores, or Rs. 22,500 crores or Rs. 24,000 crores that is to be fixed as the outlay target, investments in agriculture and industry are to be maintained at a high level. The figure most popular this week with the planners for agricultural investment in the fourth Plan is around Rs. 3,400 crores, of which more than Rs. 2,700 crores are sought to be in the public sector. For industry, the total allocation is mentioned at between Rs. 5,700 crores and Rs. 6,200 crores against an original proposal of Rs. 7,000 crores. The allocation for private sector industries may not be more than Rs. 2,000 crores. The three sets of possible fourth Plan outlay now being studied are all in excess of the estimates of resources of a maximum Rs. 20,000 crores.

Mr. Krishnamachari is again in a commanding position, with the Prime Minister being described as almost an on-looker because of his weak grasp of fiscal and technical details of the problems of development. In Parliament, Mr. Shastri has been shy of discussing economics—leaving it to Mr. Krishnamachari. According to one report, the Finance Minister has been responsible for restraining the Prime Minister from pressing forward with an approach which may have resulted in a reversal of the modern attitudes to planning and development built up in the past few years. It was only in the preparation of the second Plan that a concerted approach to planning emerged. The third Plan performance shows that the experts at Yojana Bhavan did not take into sufficient account the resources position. Or, to put it the other way, the politicians were not willing to squeeze the people harder to raise the resources which may be necessary to fulfil the third Plan targets. The biggest problem, however, will be in foreign exchange resources. During the fourth Plan, as Mr. Krishnamachari has repeatedly stated, foreign exchange may be harder to come by if the targets are too ambitious. One interpretation of the change of mood in the Union Cabinet over the next Plan size is that the recent conversations with the Russians have shown that there is more hope now for greater flow of Soviet financial and technical assistance for heavy projects during the fourth Plan. All the same, the bulk of foreign assistance has to come as a result of World Bank persuasions of the participants in the aid-India consortium meetings.

Secretarial Confusion

In several high places in the Union administration, problems have emerged as a result of simultaneous changes of the Ministers in charge and senior Secretaries. The Indian Civil Service is credited by its members with having the capacity to switch from one job to another and, of course, it is true that the changes do not affect the salary or other facilities for the civil service men. In the Food and Agriculture Ministry, the change of Minister and change of Secretary took place in quick succession, with the result that there were two novices learning the business at Krishi Bhavan. In the Petroleum and Chemicals Ministry, the exit of Mr. Malaviya was also followed by big changes in the senior officials in charge, with the result that some of the expertise gathered in dealing with complicated international oil problems were lost, to the disadvantage of the Government.

In the Planning Commission, too, administrative changes have affected the relations between the Cabinet and Yojana Bhavan. It will soon be a year since Mr. Asoka Mehta joined the Planning Commission as Deputy Chairman. Mr. G. L. Nanda was the first Deputy Chairman of the Commission and returned to the post after Mr. V. T. Krishnamachari had a long innings on the job. Mr. V. T. Krishnamachari brought much administrative cohesion to the work at Yojana Bhavan. Mr. Nanda's appointment to the Home Ministry in August last year was followed by the posting of a junior Minister, Mr. Bhagat, to be in charge of Planning and by Mr. Mehta's take-over of the Deputy Chairmanship. Mr. Mehta started with declarations on the need to reform the working of the Planning Commission and he has done much public relations work in defending some planning concepts, but Mr. Mehta's ideas on Yojana Bhavan shake-up as well as Mr. Shastri's ideas on the subject are still hanging in the air. While Mr. Nehru, Mr. Shastri and Mr. Mehta all talked of ending some of the "executive functions" of the Planning Commission no one seems to have located these extra activities which should be ended. There has been talk that the Planning Commission should refrain from a detailed examination of individual projects from States or Ministries but only frame the general outline. If this is done, the Centre may have to create another mechanism to regulate the Plan activities of the States. While the National Development Council acts as the top Plan policy group, in the federal set-up there will continue to be need for a co-ordination executive. Mr. Krishnamachari's advocacy has been for more Central projects which will automatically lead to co-ordination at the Central Ministerial level.

India and the United Arab Republic on 28th September signed an agreement for collaboration to develop supersonic aircraft capable of flying at twice the speed of sound. The project is to marry the HF-24 aircraft (Marut—designed at Bangalore with the help of German designers employed by the Indian Defence Ministry) with an engine which has been developed in Cairo, also with the help of Germans. The U.A.R. engine may take another two years to be developed for Match II performance. An Anglo-American team which visited the Hindustan Aircraft factory earlier this year had recommended the adaptation of a Rolls Royce engine for the HF-24 to make it capable of Match II performance. This suggestion is now being pushed to the background and the biggest effort will be to produce the HF 24 Match II version with U.A.R. collaboration. One reason for the apathy towards the Rolls Royce engine seems to be the high cost of development and adaptation, placed at more than Rs. 5 crores. The deal is not just Afro-Asian politics.

Under the five-year defence programme, Mr. Chavan is initiating steps to reorganise and speed the ordnance production programme also. The American offer of help for ordnance factories came immediately after the Chinese attack in October 1962 and it is only nearly two years later that the first plant under that offer has gone into production. Mr. Chavan will formally inaugurate the plant on 15th October. The book value of the factory is said to be about Rs. 2 crores, because the factory was 'moth-balled' after the last war by the Americans who went in for more modern arms factories. The new ordnance plant will be capable of meeting most of the immediate needs in ammunition for the automatic and semi-automatic weapons being made near Calcutta, where production has been increased. Although it is two years since the ammunition plant was offered by the Americans, the Indian Defence Ministry makes a valid point that, once work on the plant erection began and the equipment started arriving, only eight months were needed to build the factory and bring it on production. Five other ordnance plants are among projects which the Defence Ministry wants to pursue soon.

The Governments of India and the United Arab Republic have exchanged letters providing for economic, industrial and technical collaboration. Agreement has been reached on the scope existing for collaboration in the setting up of industrial projects and undertaking construction of highways, bridges, transport and communication systems. Agreement has also been reached on the trade plan between the two countries for the years 1965-66 and 1966-67. Under this plan, a total trade turnover of about Rs. 45 crores—Rs. 22.50 crores each way—is envisaged for the current year.

Notices

MARTIN BURN LIMITED

NOTICE IS HEREBY GIVEN THAT THE Register of Members and Share Transfer Books for Preference Shares in the Company will remain closed from the 7th October to 9th October 1964, both days inclusive, for the purpose of payment of Preference Dividend for the half-year ending 30th September, 1964, on or after the 9th October, 1964, to those Preference Shareholders whose names appear on the Company's Register of Members on the 9th October, 1964, or to their mandatees.

By Order of the Board,
L. K. SEN CHOWDHRY,
Secretary.

Registered Office:
12, MISSION ROW,
CALCUTTA 1.
24th September, 1964.

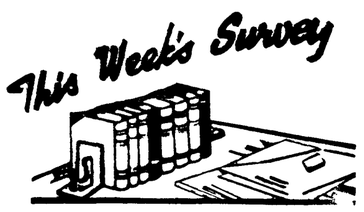
DALMIA CEMENT (BHARAT) LIMITED

Registered Office:
DALMIAPURAM (Madras State)

A GENERAL MEETING OF THE SHAREholders of the Company will be held at Dalmiapuram, the Registered Office of the Company, on 30th October, 1964, at 11 a.m. Notices of the Meeting setting out the Agenda and Explanatory Statement on the special business to be transacted thereat have been sent to the shareholders by post.

By Order of the Board,
S. C. AGGARWAL,
Secretary

Dated: *24th September*, 1964.



FOOD ADULTERATION

ANY trader or hotelier who indulges in adulteration of food for the sake of some immediate gain may be either giving the consumer less than his money's worth or even endangering his health. A strictly enforceable measure to protect the consumer against that harmful and deceitful practice of anti-social elements in hotel and distributive trades and to mete out deterrent punishment to the latter has always been thought of as an absolute necessity in the conditions of rampant food adulteration in this country. But, unfortunately, the Prevention of Food Adulteration Act, 1954 has not succeeded in eliminating or drastically curbing this malpractice. In fact, this has become an even more widespread menace in the present conditions of food scarcity. It is in this context that the Prevention of Food Adulteration (Amendment) Bill, 1963, on which a Joint Committee of Parliament has just reported, may be welcomed as a useful measure —useful from the point of view of plugging loopholes in the original Act and of strengthening the inspection and enforcement machinery.

The amending Bill is noteworthy for the improvements made in some of the provisions of the original Act and for the insertion of some new clauses therein. One of the objects, as laid down in the original Act, is to prevent food adulteration "with a view to preventing the outbreak or spread of infectious diseases." This limited object becomes a wider object in the amending Bill, thanks to the substitution of the words within inverted commas by the new words "in the interest of public health." An improved clause provides for the appointment of "public analysts" by the Central Government or a State Government to bring it in line with the appointment of "food inspectors" by either Government. The proviso here is that no person who has any financial interest in the manufacture, import or sale of any article of food shall be appointed to be a "public analyst" or a "food inspector." The food inspector, incidentally, will be deemed to be a "public servant" within the meaning of Section 21 of the Indian Penal Code. A new clause makes it obligatory on the part of manufacturers, distributors and dealers of articles of food to give a warranty, in writing, about the nature and quality of the articles sold to the vendors. Every vendor will also be required, where necessary, to disclose to the food inspector the name, address and other particulars of the person from whom he purchased the article of food.

As for punishments for offences under the Act, the amending Bill provides uniformly for a minimum sentence of imprisonment for not less than six months and of fine of not less than one thousand rupees, and a maximum sentence of imprisonment for a term of six years, for all offences. The more important offences possible —some of a technical nature and some others of a serious kind—are listed below:

1. Importing into India or manufacturing for sale, or storing, selling or distributing any article of food which is adulterated or misbranded, or the sale of which is prohibited by the Food (Health) authority in the interest of public health.

2. Preventing a food inspector from taking a sample as authorised by the Act.

3. Possession, by a manufacturer of an article of food, any material which may be employed for the purposee of adulteration.

4. Giving the vendor a false warranty in writing of any article of food sold to him.

5. Tampering of any article of food kept in the safe custody of a person under sub-section (4) of Section 10 of the Act and adulterating it with poisonous or other injurious ingredient and selling it.

The Joint Committee has also proposed an entirely new clause to plug a certain loophole in the original Act. This clause is intended to have a check at all levels, so that, during the trial of an offence against the vendor of an article of food, the manufacturer, distributor or dealer of such article could also be impleaded. The idea here is that, if the court is satisfied on the evidence adduced before it that the manufacturer, distributor or dealer is also involved in the vendor's offence, the court may proceed against that manufacturer, distributor or dealer. Another salutary provision is to the effect that, if any person convicted of an offence under the Act commits a like offence afterwards, the court shall also have the power to order the cancellation of the licence, if any, granted to him under the Act.

All these are doubtless stringent provisions for enforcing the law and preventing food adulteration. But the provision for appointment of "public analysts" and "food inspectors" by Central and State Governments, involving as it does dual responsibility, may cause some confusion in the field of enforcement. As, however, the power to appoint food inspectors is now in the Concurrent List and the Centre cannot, therefore, take over the entire responsibility for dealing with the problem of food adulteration without amending the Constitution, there should be perfect Centre-State co-ordination and co-operation in this field so as to neutralise the confusion, if any, of dual responsibility. In the ultimate analysis, whether the enforcement is done by the Central Government or the State Government or by both together, it is as much a question of integrity and incorruptibility on the part of public analysts and food inspectors as of vigilant public opinion. If the consuming public and the enforcement machinery act in unison, it should not be too difficult to weed out the "black sheep" from the ranks of dealers and vendors of articles of food.

PLASTICS INDUSTRY

The plastics industry in India can legitimately feel proud of its achievements in recent years. The total production of plastics raw materials, which was no more than 700 tons in 1955, jumped up to 12,745 tons in 1961 and further to 25,000 tons in 1963. Such a striking expansion of output has resulted in a considerable saving of foreign exchange that would otherwise have been spent on imports. The actual imports have declined from Rs. 7.77 crores in 1961-62 to Rs. 6.48 crores in 1962-63 and Rs. 4.71 crores in 1963-64. What is more, the industry is also earning quite a bit of foreign exchange through exports. In 1963-64, the industry exported Rs. 2.64 crores worth of plastics goods (as against a bare Rs. 83 lakhs in 1961-62) and is confident of achieving a target of Rs. 5 crores by 1965-66.

The appreciable rise in the production of plastics raw materials has followed the notable expansion in installed capacity, though the progress has been far behind that envisaged in the third Plan document. The total capacity (annual) that has actually been created so far amounts to nearly 33,000 tons, as against the third Plan target of 74,000 tons fixed to be achieved by 1965-66. In other words, the gap remaining to be covered between now and end-March 1966 is as wide as 41,000 tons. Provided sufficient encouragement and assistance are forthcoming from the Central and State Governments, it may not be difficult, according to Mr. Shantilal I. Parekh, Vice-President of the All-India Plastics Manufacturers' Association, to achieve the target within the stipulated period. The exact nature of assistance the industry needs was spelt out clearly by Mr. Kantikumar R. Podar in his welcome speech at the seventeenth All-India Plastics Manufacturers' Conference held at Bombay on Tuesday this week. Four specific suggestions were put forward by him. One, the Government should arrange to supply adequate quantities of alcohol for the production of polyethylene. Two, a flexible policy must be adopted in so far as imports of the latest types of plastics machinery are concerned. Three, the excise duty on the entire range of plastics must be reduced from the present exorbitant rate of 24 per cent to a reasonable level. And, finally, the drastic restrictions imposed by the Bombay Municipal Corporation on the manufacture, trading and storage of plastics should be relaxed suitably.

The plea of the plastics industry for sufficient encouragement is unexceptionable. The industry is endeavouring its best to meet the rising domestic demand for plastics goods and also to export abroad. The estimated domestic requirements in 1970-71 are put at about 275,000 tons. On this basis and bearing in mind the need for an adequate export surplus, the Plastics Panel of the Planning Commission is believed to have suggested a capacity target of 400,000 tons during the fourth Plan period. The successful achievement of this target is, however, possible only if, as Mr. Podar rightly stated, the petrochemical industry is developed in the country, for it is only petrochemicals that can regularly offer the raw materials required by the industry in adequate quantity of the right quality and at an economic price. Experience has shown that the supply of industrial alcohol produced from molasses is irregular and vary expensive, besides being in short supply almost invariably. Almost all industries based on industrial alcohol are working below their rated capacity.

It is not the quantum of output alone that is important; equally important is the quality of the plastics goods. Although the quality is generally good, there is still vast room for further improvemeent. Mr. Radhakrishna R. Ruia, who presided over the Conference, did well, therefore, to urge the need for a well-equipped and well-staffed research institute for this rapidly developing industry. The provision of adequate facilities for the training of technicians was also an urgent necessity. Proper research work and training of technicians, together with modernisation of productive equipment and a concerted drive to augment productivity, as Mr. Ruia aptly said, will go a long way towards attaining the twin-goal of better quality and lower costs.

NATIONAL PRODUCTIVITY COUNCIL

The conference of the National Productivity Council Foreign Programme Participants and Productivity Institutions, held in Bombay on 28th and 29th September 1964, served to highlight the importance of the excellent work being done by the N.P.C. The main idea behind the establishment of N.P.C. was "to stimulate productivity consciousness in the country and to provide services with a view to maximising the utilisation of available resources of men, machines, materials and power; to wage war against waste; to help secure for the people of the country a better and higher standard of living." With this end in view, the N.P.C. collects and makes available information about procedures and techniques of productivity and organises and conducts training programmes in this subject. It has also organised an Advisory Service to facilitate the introduction of productivity techniques in industries and, in order to assist the industries to adopt techniques of better management and operational efficiency, it has decided to offer a Productivity Survey and Implementation Service. In view of the importance of agriculture in the national economy and very poor agricultural productivity in the country, the N.P.C. is now considering the various aspects of securing an improvement in the productivity of this sector. The importance of agriculture to the economy of the country is obvious to all. As a source of a variety of raw materials and food, greater efficiency in agricultural production means a significant improvement in the health and strength of the economy. But there are at least sixty million farmers, if not more, in this country. Will it be possible for the Productivity Council to reach even a fraction of them? Would it not be better for the Council to concentrate its energies on industry where there remains still a lot to be done in spreading productivity consciousness? These are questions on which the Council would do well to reflect before venturing into the problems of productivity in agriculture.

Among the various other activities, the N.P.C. offers foreign fellowships and sends abroad study groups to equip the individuals concerned with the productivity know-how in foreign countries. The purpose of sending these people abroad, as described in the brochure distributed at the Conference, is that they may not only use the knowledge gained abroad for their own self-development and that of their organisations, but may also impart this knowledge to others through participation in the various activities of N.P.C., the Local Productivity Councils (there are at present 46 such organisations in the country) and other institutions and associations concerned with productivity. Whereas attempts have been made to ensure fulfilment of these objectives, some difficulties have been experienced in implementing this programme. These figured in this week's Conference. Lack of adequate finance is the most important hindrance in the achievement of the aims of productivity councils in India. As pointed out by Mr. M. N. Unni Nayar, Regional Director of the N.P.C., it is comparatively more easy to get grants for the construction of buildings than for staff and staff training. Dr. P. S. Lokanathan, Chairman of the N.P.C. also referred to this point and said that the threatened cut down of the U.S.A.I.D. programmes might have adverse effects on the activities of the N.P.C.

Some important suggestions were made at the Conference to expand the activities of the Council and to make them more effective. Dr. Lokanathan pointed out that the reason for the low productivity in India was the tendency of the people to be content with superficial education and training. The aim should be to reach the depth of knowledge and understanding. In this connection he stressed that, though the productivity techniques were important as tools, the emphasis should be on productivity education, for a clear understanding of the subject would enable the adaptability of the tools to the changing times. Another point made by him was that, as the problems varied from industry to industry, each industry should have a productivity council and each industrial unit a productivity cell. Alluding to the utilisation of the know-how gained by the participants in N.P.C.-sponsored training programmes abroad, Dr. Lokanathan pointed out that, as in many cases the participants were not the top people in industries, they were not in a position to implement the new ideas gained by them. This is a very important point, for the ideas gathered by them go waste, since they do not invariably succeed in carrying the top managements with them for implementing them. If this waste is to be avoided, the outlook of top managements should undergo a change. They should give the participants in productivity studies sufficient encouragement and freedom to put their knowledge to work. Mr. N. K. Bhojwani, Executive Director of the Council, pointed out that there was need for the transfer of knowledge from one industry to another and added that the economic opportunities in the country were so wide that this parting of secrets would do no harm to any industry. In view of the very low productivity in the country in almost every field of economic activity, the need for strengthening the productivity movement cannot be exaggerated. Whereas much will depend on the availability of funds from the quantitative point of view, a lot can be achieved qualitatively, if the various institutions and industries co-operate with the Council and among themselves.

DISPERSAL OF INDUSTRIES IN MAHARASHTRA

The excessive concentration of industries in the Bombay-Poona region has been engaging the Maharashtra Government's attention for some time now. In this region, Bombay City and its suburbs, in particular, continue to attract entrepreneurs because of their locational advantages, thus adding to the existing congestion, transport bottlenecks and unhindered expansion of slums. This premier industrial city, incidentally, accounts for about 60 per cent of the total employment and about 40 to 50 per cent of the total industrial production of the State. Besides the fact that the city's population has doubled during the last 15 years or so, its ill-planned industrial concentration has, in fact, brought about a decline in the living standards of that population.

In order to bring about decentralisation and an even distribution of industries all over the State, the Government of Maharashtra, it will be recalled, set up in 1962 the Maharashtra Industrial Development Corporation. This body develops industrial plots by providing facilities for water supply, roads, electric power and drainage and also helps in providing other amenities such as technical training facilities, medical facilities, warehouses, banks and police stations, as and when required. During the last two years, the Corporation has done commendable work and has taken up for development 17 industrial areas all over the State. But it has been found from actual experience that, despite all the efforts made and the amenities provided, the response from industrialists for starting new industries in the underdeveloped areas of the State has not been quite encouraging. There are reports that entrepreneurs are willing to pay very exorbitant land prices in order to remain in the already crowded suburbs of Bombay City. This has led to the further problem of soaring land values which, in turn, has created an acute housing problem. The reasons for this tendency are not far to seek. The amenities and facilities available in Bombay City and suburbs, as well as in the Poona region, far outweigh the cheapness of land and other help offered by the State Government for establishing industries in the underdeveloped regions.

It is against this background that the announcement last week by the Maharashtra State Minister of Industry, Mr. S. G. Barve, regarding a package of incentives offered to the prospective industrialists willing to establish industries beyond the Bombay-Thana complex and Poona-Pimpri-Chinchwad region, should be viewed. Speaking to pressmen, the Minister declared, *inter alia*, that with a view to giving an impetus to the spread of industries in the undeveloped areas of the State and also to reduce the concentration of industries in the Bombay-Poona areas, it was considered necessary that some direct incentives should be offered to new industries. The proposed new incentives are:

1. Applications for industrial licences will be supported by the State Government.

2. Government will give 75 per cent towards the cost of preparation of a feasibility study done through an approved agency.

3. Government may favourably consider guaranteeing loans to be raised by new industries.

4. The State Electricity Board will offer a rebate on the electricity tariffs for all new industries.

5. Government will give a cash refund of the sales tax paid by the industry on raw materials purchased by it, as also on finished products.

6. Government will provide services of skilled personnel to new industries by working a second shift in local technical high schools and in the shape of free use of equipment and provision for establishment expenses.

7. Raw materials, capital equipment and building material imported within the limits of local authorities by industries will be exempted from the payment of octroi duty.

8. In order to ensure regular and prompt supplies of building materials like cement, iron and steel for the expeditious completion of construction programme, the Government will create a revolving fund of such materials.

9. Industries, which have to pay 25 per cent of the cost of housing under the industrial housing scheme, will be subsidised to the extent of 10 per cent of their share to be paid to the Housing Board.

10. To help new industries in marketing their products, the Government will reserve for them 33 per cent of the Government purchases through the Central Stores Purchasing Organisation at the lowest price tendered in open tender.

11. The industries which lift water from public water sources will be exempted from the payment of royalties thereon, if they are required to pay the same.

12. Industries will be exempted from the payment of non-agricultural assessment on the land allotted to or taken up by them.

These incentives, it should be noted, are over and above the present scheme of Government participation in joint ventures. The incentives offered will remain in force for a period of 13 years from the date of licensing or registration, as the case may be, except in the case of electricity tariff where the incentive will be for eight years.

These incentives, it should be noted, are Maharashtra Government is no doubt praiseworthy. But, while these may be sufficient to attract entrepreneurs to new areas in the State, there is the doubt whether these entrepreneurs would be able to attract technicians and skilled workmen to such areas in the absence of assured facilities for their housing, medical care and community life and for the education of their children. Such incentives for technicians may be as necessary as the proposed incentives for intending entrepreneurs.

HOW INDIAN STATES FARE IN INDUSTRIAL PRODUCTION

NEED FOR MORE PROMPT PUBLICATION OF DATA

By A Special Correspondent

THERE has been in recent years a commendable improvement in the publication of statistical information relating to industrial production in India; and credit for this should go largely to the Central Statistical Organisation. Production figures are now available more promptly than before. The coverage also is now much wider.

Apart from traditional industries, production statistics of many new industries are now issued. These industries include beer and ale, fibre board, argon gas, nitrous oxide, sodium aluminate, potassium permanganate, nickel sulphate, acetic anhydride, acetone, ethyl acetate, yeast, hydroquinone, sodium hydrosulphite, sodium thiosulphate, P.V.C. resins, synthetic stones, art silk fabrics, penicillin, vitamin A, mopeds, clinical thermometers, water meters and zip fasteners.

The publication of monthly production figures State-wise was started towards the end of 1958. In the beginning, only ten industries were covered. Subsequently, this coverage was extended from time to time and, at present, it includes 74 industries, the important among them being salt, cotton textiles, sugar, steel, coal, iron ore, tea, wheat flour, cigarettes, paper and paper boards, sulphuric acid, superphosphates, ammonium sulphate, soap, copper sheets, machine tools (graded), fans, radio receivers, rubber footwear, razor blades, steel castings, diesel engines, sewing machines, automobiles and railway wagons.

Many Useful Purposes

The publication of State-wise figures serves many useful purposes. In the first place, it helps to have a clear picture about the industrial development of India from the regional angle. Facts about the location of major industries like coal, steel, cotton textiles, etc., are well known, but the relevant data about the new industries are not. Not many, for instance, are aware that the largest number of radio receivers and portable room air conditioners are made in Maharashtra or that West Bengal is the biggest producer of crockery. Secondly, State-wise figures help to locate readily the areas where production shows a downward trend, so that appropriate remedial measures can be adopted. A brief analysis of the trend in the production of some important industries State-wise is given in the following paragraphs.

Coal production in India increased from 62 million metric tons in 1962 to nearly 67 million metric tons in 1963. Most States recorded an increase in production, the notable exception being Assam where there was a fall from 795,507 metric tons in 1962 to 763,450 metric tons.

The production of sugar in India declined from 2,705,932 metric tons in 1961-62 to 2,159,744 metric tons in 1962-63. The fall was mainly in Uttar Pradesh from 1,201,850 metric tons to 852,182 metric tons and in Bihar from 355,732 metric tons to 171,744 metric tons. But in some States, sugar production actually increased. Maharashtra, for instance, produced 534,153 metric tons in 1962-63 against 497,112 metric tons in the previous year and Madhya Pradesh 34,436 metric tons against 30,688 metric tons.

Cloth production in the country as a whole fell from 4,560 million metres in 1962 to 4,423 million metres in 1963. The decline occurred mostly in the major producing areas like Maharashtra, Gujarat, Uttar Pradesh and Madhya Pradesh. In Maharashtra, the output dropped from 1,658 million metres to 1,602 million metres, in Gujarat from 1,318 million metres to 1,293 million metres, in Uttar Pradesh from 331 million metres to 297 million metres, and in Madhya Pradesh from 387 million metres to 372 million metres in 1963. But in many other States, cloth production was higher in 1963 as compared with the previous year. In Delhi, for instance, production improved from 151 million metres in 1962 to 158 million metres in 1963, in Orissa from 35 million metres to 39 million metres, in the Punjab from 65 million metres to 68 million metres, and in Rajasthan from 53 million metres to 56 million metres.

The production of paper and paper board in the country rose sharply from 387,637 metric tons in 1962 to 464,614 metric tons in 1963. This increase was shared by all States. In West Bengal, the output went up from 94,563 metric tons to 98,205 metric tons, in Uttar Pradesh from 25,039 metric tons to 29,402 metric tons, in Orissa from 73,272 metric tons to 91,349 metric tons, in the Punjab from 37,725 metric tons to 40,571 metric tons, in Maharashtra from 24,354 metric tons to 28,536 metric tons, in Andhra Pradesh from 24,922 metric tons to 37,624 metric tons, in Mysore from 38,551 metric tons to 47,920 metric tons and in other States (including Bihar, Madhya Pradesh, Gujarat and Kerala) from 69,211 metric tons to 91,007 metric tons.

As regards cement, most States recorded a higher production in 1963 as compared with the previous year. In Andhra, the increase was from 799,726 metric tons to 944,691 metric tons, in Bihar from 1,503,951 metric tons to 1,563,086 metric tons, in Gujarat from 1,099,080 metric tons to 1,225,328 metric tons and in Madras from 1,271,404 metric tons to 1,281,192 metric tons. Other States like Madhya Pradesh, Uttar Pradesh, Punjab and Rajasthan also produced more. But, in Orissa, there was a decline from 380,376 metric tons to 353,291 metric tons and in Kerala from 54,655 metric tons to 52,410 metric tons. The total cement production in the country was 9,354,803 metric tons against 8,586,323 metric tons in 1962.

The paint industry is concentrated in Maharashtra and West Bengal. India's total production of paints, enamels and varnishes was 69,218 metric tons in 1963 against 64,833 metric tons in 1962. In Maharashtra, the production rose from 26,953 metric tons in 1962 to 30,711 metric tons in the next year, but, in West Bengal, there was only a negligible increase from 32,728 metric tons to 32,733 metric tons. In Madras, the increase was from 2,104 metric tons to 2,240 metric tons in 1963.

Engineering

Engineering industries are concentrated mainly in West Bengal and Maharashtra; and the statistics show that these two States account for the bulk of the production. In 1963, India produced 1,143,172 electric fans, of which the share of West Bengal was 990,504 and of Maharashtra 147,097. The Punjab produced 2,915 and all the other States together 2,656. For sewing machines only the production in West Bengal is indicated separately and that of all other States is shown together. In 1963, production of sewing machines in the country was 337,295 of which West Bengal's share was 265,804 and that of other States 71,491. In diesel engines (stationary type), Maharashtra dominates, accounting for 43,517 out of the total production of 55,644. West Bengal's share was only 712 and that of Uttar Pradesh 543. Gujarat, Madras and Punjab produced 3,375, 3,983 and 3,514 respectively.

In the production of railway wagons, West Bengal leads, its share in 1963 being 14,371 out of the total production of 18,958. Maharashtra produced, 1,481 wagons and other States 3,106. As regards automobiles, while Maharashtra produced 19,365 in 1963 and Madras 6,072, the other States together accounted for 26,860.

The production of complete bicycles in India rose from 1,115,910 in 1962 to 1,183,529 in 1963. West Bengal was the only State where there was a fall in production from 245,661 to 228,556. In other States, the output was higher. In the Punjab the increase was from 365,250 to 448,328, in Uttar Pradesh from 30,900 to 31,945 and in other States, including Maharashtra, Bihar, Madras and Assam, from 427,236 to 474,700.

Broad Lessons

This brief analysis leads to certain broad conclusions. In the first place, there is need to accelerate the industrialisation of the comparatively less developed States like Assam, Orissa, Andhra Pradesh, Kerala and Rajasthan.

Second, State-wise statistics should be given for a much larger number of industries than at present.

Third, production figures should be issued more promptly. For 1964, for instance, State-wise statistics are available, at the time of writing, only upto February and only in a few cases.

Fourth, while publishing statistics, a brief explanation may be given where there is a steep fall in production, giving the reason therefor. Sometimes the output declines due to labour trouble, shortage of raw material, want of demand or other causes. The annual report of the Union Ministry gives the explanation for the shortfall in production in important industries but it does not make any regional analysis. It will be more helpful if the reasons for the decline in production are analysed periodically, say, once in three months, so that there will be a better understanding of the trends in industrial production and progress.

TECHNICAL EDUCATION

The past decade has witnessed a large expansion in the field of technical education in India. A stage has now been reached when the institutions should be consolidated and standards improved. With this end in view, the Central Working Group on Technical Education, appointed by the Union Government, has recommended various steps to be taken. These include, *inter alia*, (1) the concentration of a major part of the resources and efforts in the fourth plan on the training of teachers, improvement of courses, supply of equipment and institutional materials, post-graduate courses; (2) the setting up of four regional institutes for the training of teachers for polytechnics and the expansion of teachers training programme for engineering colleges; (3) the awarding of merit-cum-means scholarships to at least 25 per cent students; (4) revising the standards and contents of diploma courses in engineering and technology so as to reorient the courses towards industry; and (5) the setting up of a Central Organisation for research into various aspects of technical education.

Meanwhile, the team of Soviet experts, which visited India recently under the auspices of the U.N.E.S.C.O. to study the existing system of science education in the country, has also submitted its report. The team has precisely defined the aims and objectives of science education, including mathematics at the school stage, and made the following recommendations:

Improvement of syllabi, incorporating modern developments; introduction of general science teaching upto class V and separate disciplines like biology, physics and chemistry from class IV onwards instead of from class IX as at present; special arrangements for talented pupils; development and production of prototypes of science equipments; teacher training through correspondence and in-service training centres; a concentrated research programme in science education and increase in the enrolment of pupils in the science classes.

ANNOUNCEMENT

Subsequent to the merger of De Twentsche Bank N.V. with the Nederlandsche Handel-Maatschappij, N.V., the business carried on in India since 1920 by the

NEDERLANDSCHE HANDEL MAATSCHAPPIJ, N.V.

(Netherlands Trading Society)

will be continued as from 3rd October, 1964 under the new style of the combined venture:

ALGEMENE BANK NEDERLAND N.V.

(General Bank of the Netherlands)

Head Office at **Amsterdam.**

Bombay Branch at: 14, Veer Nariman Road, Fort.

Calcutta Branch at: 18A, Brabourne Road.

CULTURE BUT NOT CASH FOR L. AMERICA

By Questor

LONDON, *26th September*

GENERAL de Gaulle's spectacular tour of Latin America—it was preceded by a visit to Mexico last April—is primarily intended as a demonstration that France is a major power with world-wide interests ranging from the Americas to South-east Asia. It will probably have some political effect. The General is a colourful, almost heroic figure. His readiness to stand up to the U.S. will command considerable sympathy in Latin America; and there is undoubtedly a strong feeling of cultural affinity between Latin America and France.

But those who are trying to pull that Continent up by its own bootstraps are more interested in cash than in culture, and the amount which France can afford to contribute is tiny by U.S. standards. A few export credits, a certain amount of technical assistance may well earn a disproportionate amount of goodwill, but, in economic terms, they are a drop in the ocean.

Matters would be different, of course, if the General were in the position he would like to occupy, that of being able to speak for Europe as a whole. A united Europe would certainly be able to make an important economic as well as political impression on the situation in Latin America. But one reason for the General's excursion may well be the fact that his attempt to unite Europe under French leadership as a counterweight to the U.S. is making very little headway.

The Latin Americans have themselves formed a free trade area, in circumstances much less favourable than those which exist in Europe, and are already running up against the inevitable conflict between the good of the whole and the national self-interest of individual members. General de Gaulle would be able to explain to them, if he chose, how this same conflict is playing havoc with the development of the European Economic Community.

The men who decided, immediately after the last war, to inaugurate a new period in European history by working towards union, were quite clear in their minds that their ultimate goal was full political union: economic union, to be encouraged in the first place by the establishment of a customs union, was only a first step in that direction.

The customs union, thanks to a period of rapid economic growth, has developed extremely well, and internal tariffs between the Six will be, by the end of this year, down to only 30 per cent—perhaps even to 20 per cent—of their original size. There has also been a good deal of progress in promoting the free movement of labour, and to a smaller extent of capital, from one member to another.

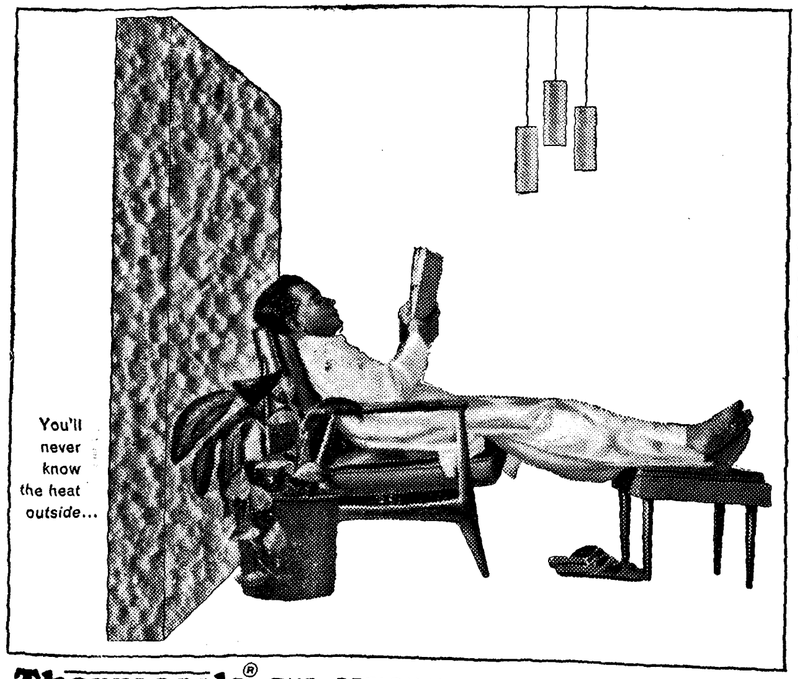
But this progress has helped the Community as a whole without really hurting any individual member of it. Now that the decisions which hurt are coming up, progress is becoming a good deal slower. There is a head-on conflict, for example, between Germany and France on the question of a common price for cereals. Germany is a high-cost producer interested in placating its peasant proprietors and importing cheaply from North America, while France is ambitious to become the supplier of wheat to the whole Community. There is another conflict—exacerbated by some recent British deals—about the question of trade on long-term credit with Russia, which Germany regards as a key diplomatic bargaining counter.

The European Commission is having very little success in its attempts to bang agreement out of member-Governments and is hopefully waiting for 1966 when decisions will no longer have to be reached unanimously but by by a majority. Given the present atmosphere, however, it is unlikely that, even in 1966, a majority would attempt to impose an unwelcome decision on a matter of importance: the minority might simply refuse to obey the rules. The fact is that the Six have been gradually losing their original impulse towards union, and there is no doubt that one reason for this is the highly nationalistic policies of General de Gaulle. He has made no secret of the fact that he has no interest in pooling sovereignty and his concern with the European Community is mainly that it should serve French advantage.

The rest, under this pressure, are gradually realising that idealism may be out-of-date. Germany, under Dr. Erhard, is refusing to honour the spirit of the alliance struck between General de Gaulle and Dr. Adenauer; Italy, in a financial emergency went to the U.S. and Britain for help; Holland and Belgium, the strongest theoretical advocates of European unity, are now very worried indeed.

The General put good Europeans on the spot at the beginning of the year by proposing that a step should now be made towards political union. The Dutch and the Belgians want this in theory and realise that some dramatic step is needed to prevent the Community's momentum towards union from disappearing. But they have always held that, if there is not to be a formal federation—which is quite out of the question at present—they can risk exposing themselves to French and German pressures in a loose political union only if Britain is also a member. The trouble is that de Gaulle's France will never agree to Britain joining and that Britain's Labour Party, which has an even chance of winning the approaching election, is not at present interested in the idea of European union.

If a compromise can be found, it will probably be on the lines of informal consultation between ministers of the Six about foreign policy and defence but with no agreement signed for three years—a long enough breathing space perhaps, for the position to become clearer than it is at present. There is no doubt at the moment that the General is breaking up one pattern of European union without succeeding in imposing his own pattern on his neighbours. He has none but discouraging lessons in economics to teach the planners of Latin America.



Thermocole® keeps your room so cool!

THERMOCOLE is foamed polystyrene: The lightest rigid insulation material. Its closed cells provide an effective barrier against heat, noise and moisture.

THERMOCOLE is versatile. It is ideal for insulating roofs, walls and floors in all kinds of buildings. One inch of THERMOCOLE insulates better than four feet of concrete!

THERMOCOLE false ceilings are very attractive. It is excellent for fabricating light-weight insulating partitions and doors.

THERMOCOLE is feather-light, yet strong, durable and easy to work with. It cuts structure and labour costs. Efficiency with economy—that's the insulation THERMOCOLE provides.

CHANGING PATTERN OF CORPORATE FINANCING

PRESENT SOCIALIST BRAND HINDERS RAPID GROWTH

By George Carvelho

ONE of the paradoxes of the Indian economic situation is that, although everyone agrees that the depressed state of the capital market is a serious drag on economic growth and that something should be done to improve the investment climate, no effective action to this end has yet been taken. What is more, the tax changes introduced in the last Budget, which were intended to transform the investment outlook and revive the stock market, have misfired. This has given rise to wild charges that big operators are deliberately keeping share prices down by manipulation, with a view to extracting further fiscal concessions. In the meantime, the market continues to flounder in the depths of depression, response to new issues is poor and, as Mr. G. L. Mehta put it, underwriters find themselves playing the part of undertakers, performing the obsequies and providing a resting place for issues that have flopped.

At the root of this impasse lies a divergence of opinion as to the organisational pattern of industrial finance appropriate to a developing economy such as this. So far as can be deduced from his pronouncements as well as from his tax measures, the Finance Minister has very definite views on this matter. The new pattern which he visualises involves a radical transformation of the whole institutional framework of corporate finance.

The starting point of this line of thought is that the average investor in the shares of companies needs to be protected from stock market speculators who are in a position to rig prices to suit their own interests and also from unscrupulous company managements. He dismisses as untenable the claim of the stock exchange to be a barometer of the economic situation. Rampant speculation makes it, he would no doubt say, a distorting mirror rather than one that gives a true reflection. Moreover, the average shareholder is too ignorant 'and apathetic to keep a vigilant watch over the affairs of the companies whose shares he holds, with the result that his interests go by default. Moreover, the shareholders' desire for high dividends and substantial capital appreciation are tainted by capitalist greed and should not be encouraged in a regime of democratic socialism. Yet the needs of economic development require private saving on the widest possible scale and the channelling of such savings into productive investment, both in the public and private sectors.

New Pattern

Thus, the ideal of a shareholders' democracy, in the sense in which it is gaining strength in Western Europe and America, would be regarded as inappropriate to Indian conditions. The new pattern which the Finance Minister would like to develop, instead, has the advantage of simplicity and also that it does not involve any radical change in the institutional and organisational structure. Companies and shareholders would remain, so would stock exchanges, but these would be only the outer facade; behind them the inspiration and directing force of the whole system would be socialist and not capitalist.

The essence of the new pattern is that the State should replace the private investor as the major source of corporate capital. Industrial financing institutions including the new Industrial Development Bank, would stand ready to provide loans as well as equity through direct subscription and underwriting. The debt equity ratio will readily be relaxed, if this is necessary to accommodate increased borrowing from these institutions. Already the Life Insurance Corporation holds some Rs. 125 crores of capital, spread over about a thousand companies and the scale of its investment operations will keep on rising through the continuous accrual of new investible funds. To this is now added the Unit Trust of India, which could, in course of time, become another important instrument of State control over the corporate sector.

Under the new pattern, resources that would have formed private saving are to be diverted to the State by a system of personal direct taxation without parallel in other parts of the world. This is supplemented by a resort to compulsory saving currently in the form of annuity deposits. To the argument that all this leaves the private investor with little or no saving capacity, specially in a time of rapidly rising prices, the Finance Minister remains unmoved, for, as he sees it, this amounts simply to replacing private by public saving and investment, a change which every good socialist will welcome.

Growing State Control

Such private saving as remains in spite of all this, he would like to see flow into the Unit Trust of India and the Life Insurance Corporation. These have, from his point of view, the advantage that though the savings in question remain in private ownership, their disposal or the power to direct them into investment fields and the exercise of the voting rights in the case of equity investments would vest in the State. The same desire to concentrate equity control (as distinct from ownership) in the State is discernible in the move to convert Government loans to companies into equity capital and to vest in a Government-appointed public trustee the voting rights of shares held by charitable trusts.

The result will be that, apart from the enormous powers over companies assumed by the Government under the Companies Act and other enactments and the continuous increase of such powers through frequent amendments of these Acts, the Government will have a more direct control over the working of companies through its control over their equity capital and as a substantial creditor of the company. To the extent that such powers will enable the Government to keep a vigilant watch over the working of companies, they will perhaps serve to safeguard the interests of the remaining shareholders. It is significant that the Chairman of the Life Insurance Corporation recently described that body as the best friend of shareholders. But there is more to it than that. The role which the ordinary small shareholder is to be allotted in the new pattern of corporate finance is such as to take away much of the attraction of equity ownership.

Fixed Income

A socialist Government may, perhaps, reconcile itself to the existence of joint-stock companies and shareholders and even to a stock market, but it would certainly frown on anything savouring of high dividends and would strongly disapprove of hopes of substantial capital appreciation. Looked at from this angle, the apparent contradictions in the tax changes introduced in the last Finance Act disappear and the whole approach becomes coherent and intelligible. Personal income, wealth, inheritance, gifts, capital gains and expenditure are heavily taxed, almost to the point of expropriation, in the name of reducing economic inequality. At the same time, companies are to be given tax concessions and incentives and provided with all the financial resources they desire. But the profits that result thereby are to be mostly retained and ploughed back. Dividends are penalised through a tax, bonus issues are taxed both in the company making the issue and in the hands of shareholders. Unit holders in the Unit Trust may expect a return of 6 per cent on their original investment but should not be encouraged to hope for capital growth. The equity holder in a socialist society is to be reduced to the level of a *rentier*, the recepient of a fixed interest in income and no more.

With shareholders put in their proper place, there can be no objection to giving companies all the incentives needed for growth. Rates of company taxation can be lowered for priority industries, inter-corporate dividends can be exempted from super tax, a comparatively mild sur tax can replace the super profits tax and even third-shift depreciation can be allowed for income-tax assessment.

This then is the new pattern. Its great merit in the eyes of its supporters would be that it is essentially socialist in inspiration and yet it involves the minimum disturbance of the institutional framework of a free enterprise system. No nationalisation of industries is called for, with all the conflicts of ideas that such proposals would arouse, no legislation or the complexities of assessing and paying compensation for take-over of privately owned assets. It has the advantage of continuity. Yet it means replacement of a system that is essentially of the nature of private enterprise by one that is basically socialist in character.

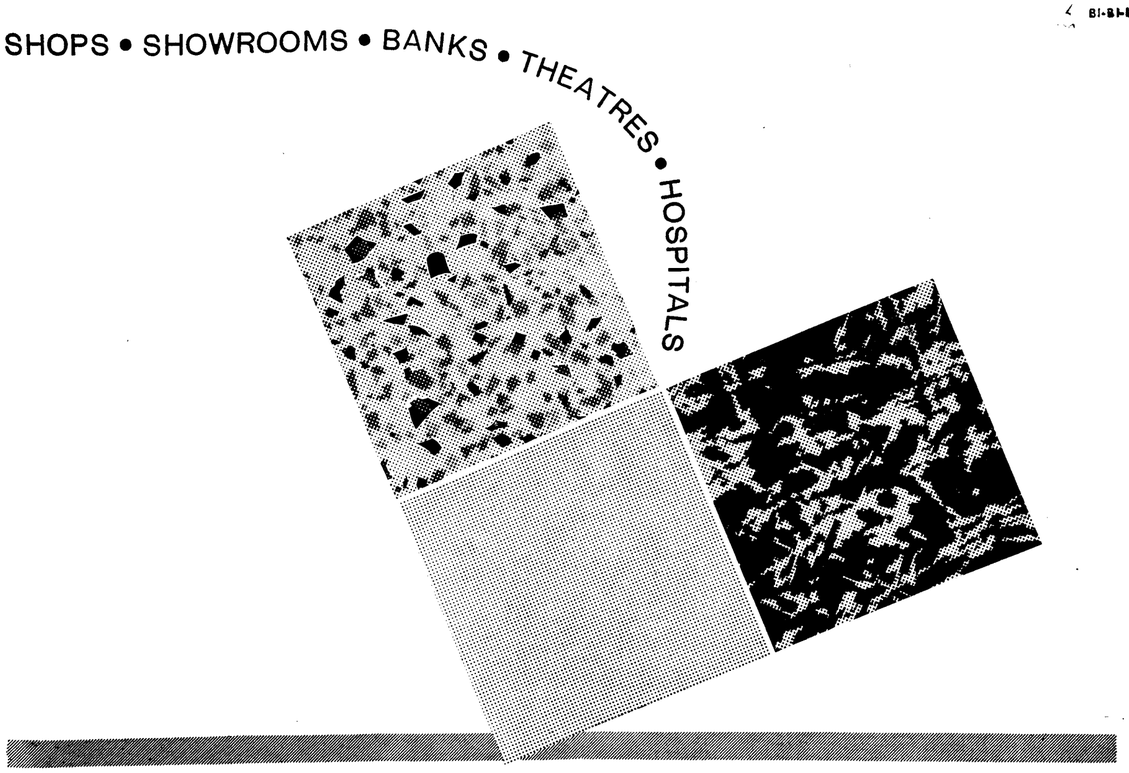
It is going on to half a year since the new pattern took on its present clearly discernible shape. But somehow, it has not produced the wonderful results expected of it. The stock market is still depressed, except for some speculative spurts based on hopes of a shift in policy favourable to private enterprise. The new issues amrket is lifeless and those rash enough to approach the capital market must make sure that the issues are underwritten and that underwriters are prepared to take up what they underwrite. Foreign investors are distinctly cool towards the new pattern and would certainly prefer a real and active market for new issues. Industrial growth is slackening at a time when the need for it is greatest.

It would have been surprising if things had worked out differently. It is incongruous to conceive of a system of joint-stock companies, shareholders, a stock market and a new issues market without a strong, active and vigorous foundation of private saving and investment. It is not possible to replace these vital elements of free enterprise by public saving and investment and hope to build an active, expanding corporate sector thereon. There are no doubt many forms and degrees of a mixed economy but this is not one of them—at least not one that can lift an underdeveloped country to a high stage of development and prosperity.

The reasons are not far to seek. The working of a private corporate sector—even if it is only a shadow of such a system—is dependent on adequate incentives. The greatest weakness of the new pattern is that, like all socialist-inspired ideas—it does not recognise and provide for the necessary incentives. Company promoters and entrepreneurs will hardly be enthusiastic about a system that would strip them of effective control over the enterprises they pioneer and reduce them to the level of salaried managers of State enterprises. The investors on their part, see little charm in the prospect of becoming virtual fixed-interest receivers even when their company makes handsome profits, while left to go without any returns when the companies go through bad spells. They are not enamoured of the prospect of being permitted to call the corporate cake their own and watch it grow but only on condition that they make no attempt to claim a bigger slice of it for themselves. The greatest advantage of equity investment in an inflation-ridden society is that it safeguards its owner against the depreciation in the value of money. But this advantage of serving as a hedge against inflation is denied them under the new dispensation.

Refreshing Trends

Even in the few months that it has existed, there is plenty of evidence that the new pattern does not work and that it cannot deliver the goods. There is reason to hope that in the new set-up of the post-Nehru era, these matters along with others, will be subjected to a searching reappraisal, that impracticable ideologically inspired policies will be discarded and that commonsense and realism will again come into their own. There are pointers to show that this is not a vain hope. Mr. Lal Bahadur Shastri's moderation and freedom from doctrinaire prejudices have already brought about a shift in strategy for the Fourth Plan from long-term to quick yielding projects. There is talk of a moratorium on land reforms, so that the cultivators may be induced to go ahead with plans for increasing output without being haunted by uncertainty about the future of his title to his land. The Planning Commission is likely to be reduced to its proper place as an advisory body, instead of almost a parallel Government. There are reports that private enterprise will be entrusted with greater responsibilities and that its knowledge and experience will be drawn upon through consultation in the formulation of policies. It is even said that current thinking favours restricting the public sector to providing the economic infrastructure leaving the rest of the field to private enterprise. The idea that controls are not an end in themselves, but an evil necessity to be adopted only in the last resort, seems to be gaining favour. It would be in line with this new and refreshing trend of thought if the idea of securing industrial development through a socialist brand of corporate organisation, in which private saving and investment could be dispensed with, were consigned to the scrapheap where it rightfully belongs.—*By courtesy of: "Share Market Report" of Messrs. G. M. Pyne, Calcutta.*



AMAZING, NEW surface for floors!

VYNATILE PLASTIC TILES

Better than any floor covering today !

Exciting things happen to floors—with VYNATILE! It's the wonder floor covering with a superb finish. A delightful addition to rooms. VYNATILE is distinctive on any floor. And that lovely look is sealed on to last for years and years!

VYNATILE is amazing! ● Won't crack, scratch, break or rot. ● Absorbs noise and shock. ● Cleans in a jiffy! Just imagine—no rub, no scrub. ● And it's so attractive. Available in a variety of colours and patterns that match any decor.

Choose VYNATILE in 180 cms x 90 cms sheets, in thicknesses of 1.5 mm. or 2 mm. Or ask for it in any economical size. Better still, take it as tiles to fit into your scheme of things!

VYNATILE...better in so many ways!

- Exceptionally durable... gives lasting value!
- Attractive on any surface—concrete, wood, steel or tile!
- 12 plain colours, 12 'marbalised' tones and 4 mosaic patterns to choose from!
- Dust, grease, spilled drinks and food can be cleaned away in seconds—just wipe with a damp cloth!
- Its hard-wearing flexible surface gives excellent under-foot comfort!
- Professionally laid to last for years!

INTERNATIONAL LIQUIDITY—ITS IMPORTANCE TO DEVELOPING ECONOMIES

By Pierre-Paul Schweitzer

MANAGING DIRECTOR, INTERNATIONAL MONETARY FUND

[The relevance and significance of international liquidity to developing economies and the importance of its availability to them were impressively highlighted by Mr. Pierre-Paul Schweitzer, Managing Director of the International Monetary Fund, in the course of a stimulating lecture delivered by him under the auspices of the School of Economics, University of Bombay, on Tuesday, 29th September. Mr. Schweitzer made the very pertinent point that any international monetary system based on free exchange systems and stable exchange rates was liable to prove inadequate, if certain complementary conditions were not present. In particular, he laid emphasis on three such conditions: adequate flow of long-term international investment to developing countries, greater non-project assistance, and avoidance of excessive export financing by developed countries. He also urged the developing countries to strive for promoting exports, to create favourable climate for foreign private investment, to ensure monetary stability and to avoid persistent inflation. In view of the importance of the subject, the full text of Mr. Schweitzer's speech is published here.—ED.]

OVER the past year or more, the subject of international liquidity has been a major preoccupation of all those concerned with international, financial and monetary matters, and it is, therefore, a matter to which the Fund has devoted an important part of its work. As you are all aware, the manner in which international liquidity is provided under the present international payments mechanism has been intensively debated in recent years and a number of plans have been put forward for reform of this mechanism.

A year ago, on the occasion of the 1963 conference of the Board of Governors of the Fund, it was agreed that the Fund should intensify its studies of this question; at the same time, ten major industrial countries who are the participants in the Fund's General Arrangements to Borrow, also announced that they would undertake a thorough examination of the outlook for the functioning of the international monetary system and the probable future needs for liquidity. These two studies were published last August. That of the Fund was contained in two carefully prepared chapters in its Annual Report. The Study of the Ten took the form of a paper setting out the conclusions reached after long deliberations between senior officials of Treasuries and Central Banks of the ten countries which was issued with a brief covering statement.

There was no great difference of view as to the direction in which steps to strengthen the international monetary mechanism should be taken in the near future, but I intend to comment today on the Fund report. I would like to review some of the basic considerations, which we in the Fund bore in mind in writing our report, and discuss briefly implications of the decisions taken at the recent meeting of the Board of Governors in Tokyo. In doing so I shall try and frame my remarks so as to concentrate particularly on international liquidity as it affects the position of the developing countries.

The Fund clearly recognises that the whole problem of international liquidity is of great importance to the developing countries and also that the position of these countries is of relevance to its discussion. The interests and problems of these countries have to be given due weight in the liquidity discussions for the further reason that they hold in their reserves over $10 billion of foreign currencies mainly in the major reserve currencies, the dollar and sterling, and their continued confidence in these currencies is vital to a smooth functioning of the present international monetary system.

Access to the Fund

Although in the aggregate the reserves of developing countries are a considerable amount, many individual developing countries held relatively small amounts of international liquidity. This, incidentally, makes their potential access to the Fund and its maintenance as an integral part of the international monetary mechanism, of crucial importance to them. The developing countries have need of short-term liquidity just as the developed countries do, although sometimes these needs may not appear particularly dramatic in comparison with the importance of their longer term problems. Furthermore, expansion of their export markets is one of their most urgent needs and an adequate supply of international liquidity is necessary to maintain the level of world economic activity, which would permit such an expansion. In this matter, as in others, the Fund strives to take full account of the interests of all its member-countries at whatever level of development they may be.

The adequacy or otherwise of international liquidity is an important determinant of the levels of world trade and economic activity. International liquidity should not, of course, be regarded as a sort of money which finances international trade which is financed by normal trade and banking credits granted in national currencies. But, consisting as it does of resources which Governments hold or which are available to them to finance payments deficits, it has important implications for countries' domestic financial policies.

Burden of Adjustment

In many cases of difficulty, including those caused by short-term capital outflow, much of the burden of adjustment can properly be allowed to fall on their gold and foreign exchange reserves, i.e., on their immediately available supplies of international liquidity. But, in other cases, it may be that stringent policy measures, both internal and external, may have to be taken. In some cases, this second course of action may be forced unnecessarily on authorities who find that, due to an inadequate supply of or inadequate access to international liquidity, they do not have the leeway to permit the reserves to take the strain. Measures unduly restrictive of economic activity may thus have to be adopted. Of course, in other cases, effective policy measures are essential. This excessive availability of liquidity is also to be avoided as it reduces the discipline of the payments position and encourages postponement of necessary corrective action.

Our recent studies have led us to the conclusion that international liquidity is at the present time adequate. World trade has continued to grow at a remarkable rate. The payments position of industrialised countries as a group does not give cause for alarm and, indeed, there has recently been considerable progress toward equilibrium in the payments relations between them. There are pockets of fairly serious unemployment in some parts of the industrial world but excess demand for labour elsewhere. This generally satisfactory picture is not perhaps entirely descriptive of the position of the developing countries, although recently, as a group, their trade and payments position has also improved markedly. But, of course, no one would maintain that the problems which the developing economies face can be solved merely by the provision of additional liquidity.

While the present level of international liquidity is adequate, the rate of increase of reserves over the next ten years or so appears likely to fall short of requirements. The growth of international trade may possibly slacken from the almost 6 per cent rate of the past decade, but it certainly should not be less than 4 per cent per annum. Also, it would not be safe to assume that there would be any reduction in the magnitude of payments disequilibria relative to the volume of trade.

Supply Side

So much for the demand for international liquidity. On the supply side, reserves are unlikely to grow much more rapidly than 2.5 per cent, especially since their generation through increased holdings of dollars as a result of U.S. payments deficits is likely to slow down. When this is set against the fairly conservative estimate of a 4 per cent increase in world trade, it is not difficult to see why the Fund believes that it is necessary to continue and possibly to broaden international action directed toward creating international liquidity.

It seems to us that the task of ensuring an adequate supply of liquidity does not require any drastic overhaul of the present arrangements which are based primarily on the use of gold and reserve currencies, supplemented by drawing rights on the Fund. The smooth working of these arrangements has not been without its problems and difficulties, but, on the whole, in the last twenty years they have served the world well. Also, I believe, the dangers which arise from crises of confidence in the system can be exaggerated; the reserve currencies are generally recognised to be basically strong and the leading industrial countries have shown great willingness to co-operate in order to overcome severe speculative pressures and have done so most effectively on several occasions in recent years.

Multilateral Action

But, I would not, of course, claim that all is perfect with the international monetary system as it exists at present. We must constantly work toward a more effective functioning of that system to the benefit of all countries. But, I may perhaps be forgiven for stating that I believe that, in any action which may be taken to strengthen the international monetary system, the main emphasis should be placed on multilateral action through the Fund. The Fund has played an important role in the provision of international liquidity in the form of credit facilities and its importance to the developing countries in this respect has been particularly great. Our studies have led us to believe that if the necessity should arise for supplementing the world's supply of international liquidity in the form of reserves the Fund could, if members so desired, adapt its policies and practices to make an important contribution towards meeting this need.

The Fund has become an increasingly important source of liquidity for the developing countries because the constant pressure of their demand for imports has induced them to draw down their own foreign exchange reserves during the past decade or so. During the period 1953-63, gross official reserves of the developing countries as a group have remained more or less unchanged. However, if the oil producing countries are left out of consideration, the reserves of the other developing countries taken together show a marked fall over the decade. Even within this group, of course, there are countries which have in fact, markedly increased their reserves, but the majority of them have been obliged to run down their reserves quite substantially.

At a time when pressures for rapid economic development are intense, it has been considered unnecessarily expensive to hold foreign exchange reserves above a certain minimum and every effort has been made to economise on them. Up to a point, such a policy cannot be considered inappropriate, but it is important for each country to maintain sufficient reserves to meet temporary swings in its balance of payments without unduly upsetting its import programmes or disturbing confidence. The amount required varies from one country to another and from one time to another. In some cases, the pressure of development needs has led countries to reduce their reserves below such minimum levels, but it is important that this state of affairs is not allowed to persist. Notwithstanding the availability of a second line of reserves in the form of Fund resources, countries are well advised to maintain their own reserves at adequate levels.

In the Fund, the ability of each country to obtain assistance is generally limited to 125 per cent of its quota. The quotas themselves are determined with reference to the volume and variability of a country's foreign trade, its foreign exchange reserve holdings and a number of other criteria. The availability of tranches of this total amount is subject to certain policies which have been evolved by the Fund over a period of years. For drawings in the gold tranche—that is, in very broad terms amounts drawn which correspond to the amount of gold the member has contributed to the Fund—the member enjoys the overwhelming benefit of any doubt, which means that drawings are virtually automatic. The procedures for drawings within the gold tranche have recently been further simplified to clarify and emphasise the *de facto* automaticity of such drawings and thus further to encourage countries to consider their gold tranche positions in the Fund as part of their reserves. Beyond the gold tranche, drawings of up to an additional 25 per cent of quota are granted on liberal terms so long as the country is shown to be making a reasonable effort to solve its payments problems. Drawings beyond this limit, however, require more substantial justification and are granted on the basis of a sound programme of action aimed at establishing or maintaining the stability of the currency at a realistic exchange rate.

Extensive Use of Facilities

Over the years the developing countries have made extensive use of the facilities of the Fund. They have quotas totalling about 4.3 billion in addition to their own reserves of about $12 billion. While these quotas are about 27 per cent of total quotas, the drawings of these countries, since the beginning of Fund operations in March 1947 up to June 1964, were $2.8 billion, or about 37 per cent of total drawings from the Fund. They have also made extensive use of the Fund's stand-by arrangements; practically half their drawings since 1952, when these arrangements were introduced, have been under stand-by arrangements. Of the total drawings outstanding at the end of June 1964, amounting to $1.8 billion, about 70 per cent had been granted to the developing countries.

The Fund has always considered the financing of balance of payments deficits arising from short-term fluctuations in primary product exports to be one of its basic functions and such financing had been possible under its ordinary tranche policies. Recently, however, the Fund has been providing special facilities for such financing. Up to an amount normally equivalent to 25 per cent of quota, assistance may be provided apart from the ordinary tranche policies in cases where the Fund is satisfied that a shortfall in export receipts is of a short-term character and is largely attributable to circumstances beyond the control of the member. It is understood, in these countries that the member will co-operate with the Fund, in an effort to find, where required, appropriate solutions for its payments difficulties.

The utilisation of these special arrangements thus far has been limited; only two requests have been received, and the total assistance amounted to about $80 million. The relatively minor recourse to this facility is attributable chiefly to the favourable turn in commodity prices during the past year and a half. In 1963, export earnings of the developing countries increased by some $2.5 billion, and most countries in this group shared in this gain. This was reflected in a swing in the basic payments balance of these countries from a deficit of $650 million in 1962 to a surplus of $850 million in 1963. The improved level of commodity prices has generally been maintained in 1964.

Additional Resources

I hope that what I have said of the financial assistance available and provided to the developing countries through the Fund, indicates the importance to these countries of a strong and active Fund, adequately equipped to carry out its role in a changing world. To be so equipped, the Fund requires particularly to be assured of adequate resources to meet the legitimate needs of all its members. Should additional resources be required, the most permanent way of securing such an increase is by increasing Fund quotas. Those who framed the Articles of Agreement recognised the possible needs for augmentation of Fund resources as the world economy developed by providing for periodic review of the adequacy of Fund quotas. This periodic review is due to come round again next year. Since the last general increase in quotas took place in 1959, world income and trade have continued to grow and the volatility of capital has increased. Also, countries, particularly developing countries, have sometimes found that the amount of assistance available to them within their Fund quotas at the time of stabilisation programmes, was inadequate and that supplementary assistance from elsewhere was often not easy to arrange. In view of these considerations, and following the liquidity studies of the past year, the Fund's Governors, in their meeting in Tokyo, have instructed the Executive Board to study the question of increasing quotas in the Fund and to submit an appropriate proposal [illegible]

Indo-Swedish Arithmagic!

FACIT ASIA'S factory in Madras will be formally inaugurated on October 3 by His Excellency KLAS BOOK, Swedish Ambassador to India. Sri R VENKATARAMAN, Minister for Industries, Government of Madras, will preside. Sri M BHAKTAVATSALAM, Chief Minister Madras State, will participate.

FACIT CALCULATORS AND ADDING MACHINES MAKE BUSINESS ARITHMETIC CHILDISHLY SIMPLE!

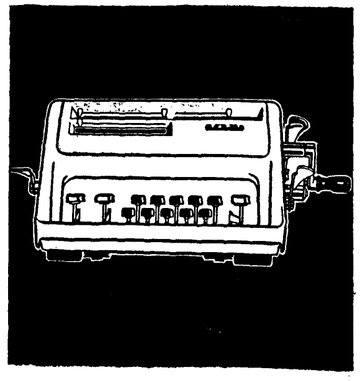
FACIT solves all calculation problems quickly, efficiently, economically and with fool-proof accuracy. Just 10 keys to operate—and just 10 minutes to learn operating!

PRODUCTS OF SWEDISH PRECISION

Every third calculator exported in the world bears the legend "FACIT." Facit comes to India with an unsurpassed reputation for quality and precision in business machines. Over 40 years of research and experience in the making of more than two million business machines, assure the excellence of Facit Asia's products.

ANY BUSINESS NEEDS A FACIT

Wherever there is business arithmetic to be done—in offices, banks, shops, government departments, theatres and restaurants—a Facit business machine is the answer.



WHO IS FACIT ASIA LTD.?

FACIT ASIA LTD. has been formed by AB Atvidabergs Industrier, the world-renowned Swedish makers of calculators and office equipment, in technical and financial collaboration with Indian interests. The factory in Madras is the first Facit factory to be set up in South-east Asia.

AGRICULTURAL RESEARCH IN U.S.

SIGNIFICANT CONTRIBUTION MADE TO FARMER'S EFFICIENCY

By Dr. Byron T. Shah

ADMINISTRATOR, U.S. AGRICULTURAL RESEARCH SERVICE

ONE of the first persons to pass on the findings of agricultural research in the United States to people from other lands was indeed a true American. When European settlers started farming in the New England colonies, the Indian, Squanto, advised them to place two fish in each hill of corn planted on newly cleared forest land. Since that time, experimentation has improved the Indians' contribution of corn and its culture to make this grain a great world crop. Many of these research achievements, such as high-yielding and pest-resistant hybrid corn, were developed through co-operative efforts of the U.S. Department of Agriculture (U.S.D.A.) and the States. Such co-operation has also produced hybrid sorghums to improve another crop widely used for feed and food. In areas of the world where hybrids can be adapted, these highly productive sorghums can contribute greatly to the welfare of hungry people.

The agricultural system that improved these and other grains is extending its *research*, as well as its research *results*, to many countries, on every continent. It is able to do this through the co-operation of other nations and because of its own past achievements.

Land Grant Colleges

Science and agricultural education work together in a unique way in the U.S. They grew up together. The same year that the U.S.D.A. was established, more than 100 years ago, the national Government donated public lands to each State and territory to provide colleges for the benefit of agriculture and mechanic arts. Many of these "land-grant" colleges have developed into great universities of the liberal arts as well—topflight institutions in all fields of knowledge.

As these colleges were established, it soon became apparent that *new* knowledge—as well as old—was needed for the training of agricultural students and the scientists of the future. The State experiment stations were, therefore, established, in connection with the land-grant institutions, to develop new knowledge, prove its practicality, and demonstrate its usefulness.

Later, the Co-operative Extension Service was established to carry the findings of federal and State research to American farms and farmers. County agricultural and home demonstration agents work closely with present and future farmers and homemakers. Both research and extension help urban and suburban consumers, as well as rural people, to make the best use of our land and its products.

No other nation has anything quite like our co-operative system of research. Public support comes from both the Federal Government and the States. Federal funds—which account for a little more than half the total —go to both U.S.D.A. and the States through a complex system of appropriations, contracts, and grants.

Together, the research of U.S.D.A. and the States deals with problems of county, State, regional, national, and international significance. U.S.D.A. research is usually concerned with broad regional or national matters; the State experiment stations are primarily interested in needs within the State, and are responsible only to their State or commonwealth authorities.

The State stations and U.S.D.A. work closely together. We co-operate formally on about three quarters of our farm research, and informally on most of the rest. The States own the facilities at two-thirds of the 222 locations where scientists of U.S.D.A.'s Agricultural Research Service (A.R.S.) work in the United States, Puerto Rico, and the Virgin Islands. A large number of State scientists work in A.R.S. laboratories, and we hope to continue to increase the number of A.R.S. scientists working in the laboratories of the State experiment stations.

In addition to State and Federal research, there is much privately supported research in agriculture, such as that done by related industries and by trade and farm organisations. Industry has become a major force in agricultural research in the last few decades—because of the machinery, chemicals, and biologicals that industry supplies to agriculture, and because of the raw materials that agriculture provides to industry.

I am convinced that our co-operative, publicly supported system of science and education—plus the more recent contributions of privately supported research—is largely responsible for the outstanding progress of agriculture in this country.

A U.S. farmer is so efficient he feeds himself and 28 other persons at home and abroad. In comparison, one farmer in Russia today feeds six persons. Food costs the U.S. consumer less than one-fifth of his income; in other countries of the world, it is common for food to require one-third, a half, or even more of a family's income.

Research has improved breeds of livestock and crop varieties to make them more productive. It has improved technology and mechanisation to take much of the back-breaking labour out of farming. It has shown us how to protect and improve our forests and the fertility of our soils, and to conserve and use water more efficiently. Research has developed improved methods of handling, distributing, and marketing farm products. As a result, consumers are better served and producers maintain wider and more permanent markets.

Benefits to Human Health

Out of agricultural research have also come many benefits to human health, such as vastly improved nutrition, the discovery of vitamins, numerous life-saving antibiotics, and the conquest of many insect-borne diseases—malaria, yellow fever, typhus, typhoid, dysentery, encephalitis and cholera.

The co-operation of other countries, of private foundations, and of international organisations has helped us to make many of these advances possible. Research and regulatory programmes are often conducted outside the United States through the courtesy of other Governments.

For example, A.R.S. carries on cotton breeding and seed increase in Mexico, where the climate gives us an extra crop a year. We co-operate widely with other American countries in mutual protection against the spread of several agricultural diseases and pests. From headquarters in Paris and Rome, A.R.S. entomologists—insect explorers—search the far corners of the world for insects that attack and destroy harmful insects and weeds.

Our plant explorers have been roaming the world for 75 years in search of plant materials to improve U.S. crops and bring in new ones. Shortly before 1900, U.S.D.A. began an exchange of plant materials with other countries. At first, the flow of material was almost entirely toward the United States. But in more recent years the balance has shifted, and plant material moves out from us at about the same rate it comes into this country. We are co-operating with more than 30 countries on five continents in testing cereal grains for disease resistance.

U,S. agriculture profits from research in many *other* parts of the world and those regions profit from *ours*. With our broad range of geography, climates, and soils, we have problems similar to those in many other countries.

Co-operation with Other Nations

In the past ten years, A.R.S. has amplified its co-operation with other countries. A great extension of agricultural research has been made possible under the Agricultural Trade and Development Act of 1954, more commonly known as Public Law 480.

Since 1958, we have been able to contract for about 500 research projects in 27 countries, on every continent. These projects include research on farm production, human nutrition, utilisation of agricultural products, forestry, marketing and economics. The research is financed by U.S. funds received from foreign countries—in their own currency and expended within their own boundaries—in payment for American agricultural commodities we grow in abundance.

All P.L. 480 research must benefit U.S. agricultural producers and processors as well as those of participating countries. It must supplement or complement activities now in progress in U.S.D.A.

Such research is helping to put a vast reservoir of scientific manpower in the free world to its most effective use. It has attracted scientists of very fine calibre, among them three Nobel prize winners.

The stress is on fundamental studies, an area in which foreign scientists have made some of their most noteworthy contributions. Although no one can ever predict the outcome of such explorations, we know from experience that they are the source of the great scientific developments that help agriculture move ahead.

An example is the basic studies of forage plants made by Dr. A. I. Virtanen, a Nobel prize winner, and other Finnish scientists. They found many plants of the mustard family that contain a thiocyanate ion that blocks uptake of iodine by the thyroid in animals feeding on the plants. However, through experiments with humans, they proved definitely that cows on a mustard-family diet do not pass along enough iodine-blocking ions in milk to cause goiter in man.

Applied research is generally limited to work that cannot be done effectively in the United States or that would pose an unnecessary hazard to our agriculture or forestry if done here. For example, P.L. 480 research in Spain has developed a rapid diagnostic test for African swine fever, a devastating disease that has spread from Africa to Europe and thus poses a serious threat to other countries. This research supplements U.S.D.A. investigations of African swine fever and other exotic diseases of livestock that have been carried on in Africa for a number of years.

The U.S. Agency for International Development (A.I.D.) contracts with U.S.D.A. to carry out agricultural programmes of technical assistance in other countries. Last year U.S.D.A. helped to train 3,800 agricultural leaders and specialists from 120 countries, including all new African nations. Of these, A.R.S. planned and arranged the travel and study for about 600 A.I.D. participants and about 800 other foreign visitors.

During the past eight years, nearly 21,000 persons from abroad have received training in U.S.D.A. These foreign agricultural leaders were sponsored mainly by A.I.D. but U.S.D.A. and the land-grant college systems played the major roles in their training.

Salinity in Soils

At Riverside, California, A.R.S. conducts a course for foreign specialists in the sciences and skills of controlling salinity in soils. Salt is a problem in irrigated agriculture in most of the arid and semi-arid parts of the world. Other trainees may attend an A.R.S. school in New York for training in the plant quarantine methods that guard crops against pests and diseases.

A.R.S. also sends specialists to consult on specific agricultural problems in other countries, and conducts several other A.I.D. projects. For example, A.R.S. scientists are directing co-operative research in Africa to learn how to combat the tsetse fly, which carries devastating sleeping sickness to man and animals. It has been said that tsetse fly control would open up enough rich land to help ease the world's food problems for many years.

As increasing populations demand more efficient production of food and fibre throughout the world, we believe that international co-operation in agricultural research will inevitably grow. Its potential for good seems limited only by our capacity to work together for man's future benefit.

The E.E.C. Commission has proposed modifications in the Community levy system on eggs and poultry in order to prevent protective measures against low-priced imports from communist countries affecting Western suppliers as well. The Commission now proposes to create a special offer price for State trading countries, so that, in future, protective measures can be taken against their exports alone without being applied to the produce of free market countries too. Under the existing system, a supplementary levy is applied to all imports when the offer price falls below the community sluice gate price.

MANCHESTER LETTER

MANPOWER SHORTAGE IN COTTON MILLS

EFFORTS TO TRAIN FOREIGN LABOUR

From Our Special Correspondent

MANCHESTER, 22*nd September*

A GLANCE at the "situations vacant" column of Lancashire evening newspaper this week revealed very nearly three columns of advertisements for workers wanted by mills in just one spinning and weaving town. It provided as good an example as any of the industry's continuing problem of matching manpower availability to current trade and production needs.

In times of better trade, no less than in periods of recession, the peculiar fluctuations of the cotton textile industry still remain one of its major handicaps. It is in just such situations as the present that some justifiable sympathy can be felt for the millowner who, heavily involved in re-equipment, is tempted to take the narrow view that industrial diversification in Lancashire has reached the point when manpower-wises, the full benefits of capital expenditure on modernisation in cotton are failing to be achieved, if not actually jeopardised, by a shortage of workers. Measured by the Ministry of Labour's records, cotton's unsatisfied manpower needs are very nearly the top of the list for all north-west industries at the present time.

More Foreign Labour

This week a group that has been in the forefront of spending on re-equipment has announced that, because of labour shortages, it has had to take steps to train foreign workers. Mr. S. M. Ross, Chairman of the Lancashire and Yorkshire Tulketh Group, reporting on a successful year, tells shareholders that yarn production in the group's Lancashire division showed an increase of 18½ per cent over the previous year. Since the end of the financial year (31st March), output had shown a further increase of 16 per cent. "But for the acute shortage of labour, especially for the night shift, a similar or greater increase in production would still be possible," he comments.

Today, the group's order book is more than double that of last year at this time. Discussing the recent series of major takeovers in Lancashire, Mr. Ross hints that similar changes may be on the way in the Yorkshire wool textile industry, in which Lancashire and Yorkshire Tulketh also has a considerable stake. The question of expanding through further acquisitions is under active consideration with the group's financial advisers.

Unemployment Reduced

The quickening rate of activity in the mills since the later months of 1963 has been reflected in the returns issued by the Ministry of Labour. The number of unemployed in the industry has steadily decreased until at the half-year it stood at little more than 2,000.

Recent developments have suggested that more stability may follow the attempts to control the relationship between output and demand. If this can be achieved, one of the major drawbacks facing the industry in recruiting labour will have been conquered. To substantiate the arguments so often raised against textile employment as a regular means of livelihood, it is only necessary to look back for little more than a decade, in which the fluctuations in the unemployment returns have been exceedingly marked.

In the first post-war recession, when the total manpower in spinning, weaving and finishing had been built up after the concentration scheme, unemployment peak of 79,300 was reached in May 1952. In the same month, an additional 72,600 workers were temporarily stopped. The labour force was then sharply depleted, but, by the end of 1953, only 18 months later, the unemployment total had shrunk to a mere 1,500.

Ten years ago, in mid-1954, the jobless total was only 1,620, while, in 1956, the figure ranged between 2,000 and 5,000 out of a regional unemployment total of some 35,000. Less prosperous times followed and, by 1958, as many as 22,600 cotton textile workers were unemployed out of 87,800 without work in the region. In the following year, although the total remained at over 20,000 in the early months, a better rate of activity brought unemployment back to only 4,000 out of 70,000 at the year-end.

Despite the scrapping scheme in 1960, the peak jobless figure that year was 8,000 and a drop to 3,000 ensued. Disappointing business in 1962 kept the unemployment total at between 8,000 and 10,000 operatives out of the regional average of 80,000.

Since demand began to broaden nearly twelve months ago, the anticipated stiffening of prices for most goods has followed the increased call for supplies and the trend of yarn and cloth quotations has been upwards. In the early months of the year, some producers were slow to take advantage of the firmer conditions ruling and even now there is little sign of values getting out of hand as has sometimes happened in the past when order books were extremely well filled.

Greater stability in quotation should follow the recent integration moves in the industry and so avoid the sharp fluctuations which have complicated former trading relationships. Recent advances in selling rates for yarn, as illustrated in the table at the end appear reasonable in the circumstances.

A significant aspect of the above figures is the very substantial change which has taken place in the past two or three months in New York spot rates which are now over 2 cents per lb. lower than in July. The adjustment following the changes in legislation affecting subsidy payments to farmers is being gradually affected, but no corresponding revision in values in Liverpool has taken place. The latter, in fact, have been virtually static for two months or more.

In the case of combed Egyptian type yarns, a similar rise in values has taken place to the average carded count shown in the table. Since the beginning of the year, selling rates have increased by about 6d. per lb. A much larger increase, however, has been recorded in prices for twofold descriptions, the advances ranging from 10½d. per lb. to as much as 20d. per lb. since January.

While price is always an important factor in negotiating fresh business, the current situation in the market has underlined the delivery situation as supplies have often been difficult to obtain in time to fit in with users' requirements. Now that the holiday season is virtually over, the general level of output should rise accordingly and the benefits of modernisation and more efficient working will be self-evident.

FIVE PER CENT

MAHARASHTRA STATE ELECTRICITY BOARD DEBENTURES, 1976

FOR Rs. 450 LAKHS

(Issued by the Maharashtra State Electricity Board)

(Payment of Interest and Repayment of Principal guaranteed by the Government of Maharashtra)

Issue Price: Rs. 100 per cent

REDEEMABLE AT PAR ON 6th OCTOBER, 1976

The Debentures will be Trustee Securities under the Indian Trusts Act and also approved Securities for the purposes of the Insurance Act and the Banking Companies Act. The Debentures will be treated on par with Government Securities for the purpose of advances under Section 17 (4) (a) of the Reserve Bank of India Act, 1934

Subscriptions will be received in cash or cheques from 6th October 1964 but the list will be closed without notice as soon as the total subscriptions amount approximately to Rs. 450 lakhs and in any case not later than the close of business on 10th October 1964.

Applications will be received at (*a*) the office of the Financial Adviser and Chief Accounts Officer, Maharashtra State Electricity Board, Mercantile Bank Building, Fort, Bombay-1 (*b*) the offices of the Superintending Engineers, Maharashtra State Electricity Board at Nagpur, Aurangabad, Vishrambaug (District Sangli) and Chalisgaon (District Jalgaon) and (*c*) the office of the Deputy Chief Engineer, Maharashtra State Electricity Board at Poona.

Copies of the Debenture Prospectus announcing the terms of issue and the application forms are available at the receiving offices mentioned above and at all Divisional offices of the Maharashtra State Electricity Board in the State of Maharashtra.

STABILISING PRICES OF RAW JUTE

BUFFER STOCK SCHEME PLAYS VITAL ROLE

INASMUCH as raw jute is the vital raw material in the manufacture of jute goods and accounts for well over half of the industry's production costs, it is obvious that frequent fluctuations in its prices seriously affect all plans pertaining to production and export. This aspect is to be specially borne in mind in the context of the growing competition in world jute markets that the industry has to face in the coming years. Violent fluctuations in prices are not infrequent in India. A look at the accompanying table will show how the prices of raw jute have fluctuated in the Calcutta market over the past one year. There have been periodical sharp increases and marked declines in prices. Assam bottoms, which was quoted at Rs. 81.72 per quintal towards the close of June, went up to Rs. 92.43 at the end of July and further to Rs. 107.17 a month later since when there has been a fall, the latest available quotation being Rs. 99.13. Such fluctuations must be avoided and there is every need to stabilise prices at a reasonable level. Stability, it is needless to add, is as much in the interest of the industry as in that of the jute grower himself.

The Government of India is seized of this problem and has taken steps to stabilise prices. The industry is lending wholehearted co-operation to the Government in this task. In fact, the industry itself has been operating for some time a buffer stock scheme on a voluntary basis. All these steps, according to Mr. G. C. L. Joneja, Jute Commissioner, who recently attended the meeting of the F.A.O. Study Group on jute, kenaf and allied fibres held at Rome came in for praise by many of the F.A.O. member-countries at the meeting.

Reasons for Instability

The deliberations of the Rome meeting of the Study Group revealed that two major factors are responsible for the instability of raw jute prices. They are: (1) pronounced seasonal fluctuations in the level of stocks and prices, since Pakistan and India harvest their crops from June to September while mill consumption is spread evenly over the year; and (2) over the short period, the demand for jute fibres does not increase or decrease as a result of a fall or rise in the price. This, in turn, is explained by the fact that raw jute represents

Raw Jute Prices
(In rupees per quintal)

Variety	Latest available	A month ago	Three months ago	A year ago
Assam Bottoms ...	99.13	107.17	81.72	80.38
Northern Bottoms ...	97.79	104.49	79.04	79.04
Bihar ...	93.77	93.77	66.98	62.96
Selected Daisee ...	104.49	112.53	88.41	88.41

only a "minor cost element to the final user" and that jute cannot be replaced immediately by substitutes for specific uses. The Group stressed that the competitive position of jute would be considerably strengthened if price stability for jute goods were ensured. It was also necessary to investigate the impact of tariff and non-tariff measures on the market for jute goods. The group also examined the means of improving the collection of statistics on jute production and consumption. It stressed the need for more reliable and timely official forecasts. It also initiated further work on improving and standardising grading, and on ways of expanding the consumption of jute goods.

The Study Group constituted a working party on stabilisation of the market for jute. The working party, which consists of members representing Belgium, France, W. Germany, India, Italy, Pakistan, Poland, Spain, Thailand and the United Kingdom, has been asked to undertake a "critical study of the practicability of the different solutions, national and international" for the stabilisation of jute prices and supplies in the world markets. After analysing the various elements of instability, it would report to the next meeting of the Study Group in about a year's time. The working party is expected to meet at Dacca in East Pakistan by the end of January 1965. It would also invite representatives of the Association of European Jute Industries, The European Economic Community and United Nations agencies to participate in the deliberations.

One of the specific proposals that will surely come for consideration before the working party relates to the creation of an international buffer stock with a view of imparting a measure of stability to raw jute prices. But the implementation of this proposal seems to bristle with serious difficulties. Mr. R. H. Morrison, President of the Jute Buffer Stock Association (J.B.S.A.), in his speech at the annual general meeting of the Association held at Calcutta on Friday, 25th September, pointed out, for instance, that this proposal was not something which could be worked out in a short space of time, as there were many formidable difficulties to be overcome. Indeed, in his opinion, it might well prove impracticable. Nevertheless, he stated that it was encouraging to observe the interest the jute industry in India had stimulated by its efforts in the buffer stock mechanism. To quote him: "Whereas our buffer stock scheme in India was originally introduced as a price support measure, to ensure that the cultivators obtained a fair return, it is becoming increasingly recognised that an equally important objective is price stabilisation in the world jute economy generally. Buffer stock operations will undoubtedly play a major part in any schemes devised to bring about such stability."

Role of Buffer Stock

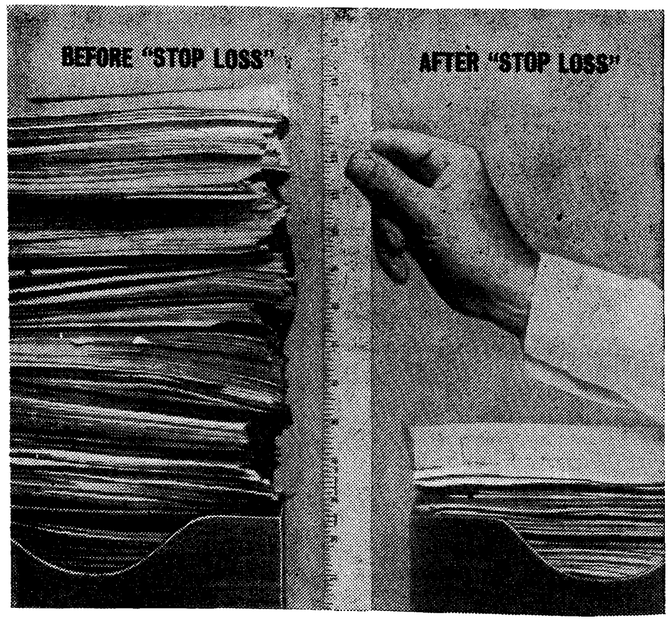
Reviewing the operations of the jute buffer stock scheme in India, Mr. Morrison gave the following details:

The total volume of transactions during the year under review amounted to Rs. 12 crores. In addition to the 625,000 bales of jute mentioned at the last annual general meeting of the Association, there was a further purchase allocation of 250,000 bales, bringing the total to 875,000 bales (of 4.86 maunds each), including a proportion of Pakistan cuttings.

A satisfactory procedure for turning over buffer stock jute was evolved in October 1963, and the target was to achieve a turnover of 50 per cent of the total stocks by December of that year. While the turnover achieved up to March 1964 was reasonably satisfactory, the old crop jute had not yet been entirely replaced by that time due to practical difficulties—the main one being shortage of storage accommodation. Arrangements have since been made to release the whole of the buffer stock jute to the mills, with an extension of the date for its replacement. This step, which was taken after consultation with the Jute Commissioner, was considered prudent, in view of the abnormal rise in jute prices caused by reports of short crops in Pakistan and India in the current season. It is satisfactory to note that this unwarranted price rise has now been checked, and there is now a reverse trend towards more realistic levels.

The buffer stock release has certainly played a significant part in stabilising prices after the recent unwarranted price rise. The effect would have been even more pronounced, if only the Association's stock holding had been bigger. There is, as Mr. Morrison rightly remarked, the need for building up a really substantial buffer stock, perhaps something of the order of three months' consumption.

The Industrial Development Bank will, in future, consider the applications of cotton and jute mills for rehabilitation loans. The Union Commerce Ministry has asked the Indian Cotton Mills' Federation and the Indian Jute Mills' Association to finalise the procedural details regarding the loans with the Bank. The applications were hitherto processed by the Industrial Finance Corporation.



Caltex "STOP LOSS" reduces your paper work by 10% to 60%

If your purchase order costs are anywhere near today's high industry average, it can pay you to look into Caltex's "Stop Loss" Programme. You'll find numerous ways to reduce purchasing department time and expense.

Too often, purchasing costs rise because each department in a plant specified the lubricants it wants without reference to the purchases of other departments. This duplication results in a flood of purchase orders . . . rising clerical costs . . . paper backlogs.

Caltex "Stop Loss" is a complete plan for organizing and centralizing lubrication on an efficient basis. There is no other programme like it. "Stop Loss" will help eliminate interdepartmental duplication, limit inventories to actually needed lubes, and reduce the number of lube purchase orders issued each month by 10% to 60%.

Company executives can obtain a free copy of this booklet by writing on their official letterhead to their nearest Caltex office.

TRADE UNION LEGISLATION IN BRITAIN

NEED FOR AMENDMENT FELT BY LABOUR LEADERS

AMENDMENT to trade union legislation is one of the most important topics being discussed by labour leaders in Britain today. According to them, under the present law, any threat to strike is exposed to legal action against the trade union or union members, and there is, as such, an urgent need for amending the law. Though this reform movement started during the early part of this year, it gained momentum in recent months due to the impending elections in the country. What led to this sudden realisation by the trade unions, particularly the Trade Union Congress (T.U.C.) which represents about eight million workers out of the total trade union membership of approximately ten million ?

Case and the Judgment

In January this year, the House of Lords delivered its judgment in a case affecting the rights and privileges of trade unions. The plaintiff was Mr. Douglas Rookes, a draughtsman in the B.O.A.C. from 1951 to 1956, and a full-fledged member of the Draughtsmen's and Allied Technicians' Association (D.A.T.A.). In 1955, he quarrelled with the Association on some point and resigned from it. The Association, subsequently, passed a resolution threatening the B.O.A.C. that, if Mr. Rookes is not removed from service, a withdrawal of labour would take place. As a consequence, the B.O.A.C. suspended Mr. Rookes in January 1956 and dismissed him after two months. In 1957, Mr. Rookes filed a case for damages against Mr. Alfred Barnard, then branch Chairman of D.A.T.A., and its two other office-bearers. As a sequel to the judgment of the House of Lords, he succeeded in getting an award of £7,500 as damages.

The proceedings of the case and the judgment were based mainly on two factors. One of these was an agreement signed between both sides of the draughtsmen's panel of the N.J.C. in 1949, according to which the employer and employees undertook that no lockout or strike would take place. The second factor was the provisions of Section 3 of the Trade Disputes Act 1906, according to which " an act done by a person in contemplation or furtherance of a trade dispute shall not be actionable on the ground only that it induces some other person to break a contract of employment or that it is an interference with the trade, business or employment of some other person, or with the right of some other person to dispose of his capital or his labour, as he wills." Keeping these factors in view, the House of Lords decided in favour of Mr. Rookes on the ground that the defendants conspired and acted on the conspiracy to intimidate B.O.A.C. by threatening it with a strike in breach of contracts of employment and both the conspiracy to intimidate and the intimidation itself were civil wrongs. They decided that the provisions of Section 3 of the Trade Disputes Act 1906 could not protect the defendants in view of their conspiracy and intimidation.

Views of T.U.C.

The precise effects and implications of the judgment are not very clear, and different labour leaders and experts have interpreted it differently. Even all the leaders of the T.U.C. are not of one view regarding the implications. However, the consensus of opinion in the T.U.C. is that the judgment has made it amply clear that the trade unions have no right to make threats of strike. The T.U.C. fears that the result of this judgment will be an encouragement of unofficial strikes without warning, as this action cannot be accused of threat or intimidation. It has suggested to the Government that Section 3 of the Trade Disputes Act 1906 may be amended by adding a few words, so that it may protect the rights of the workers, and may be read as follows :

" An act done by a person in contemplation or furtherance of a trade dispute shall not be actionable on the ground only that it induces some other person to break a contract of employment *or that it constitutes, or contributes to, intimidation by a threat to commit (or to procure) a breach of any contract* or that it is an interference with the trade, business or employment of some other person, or with the right of some other person to dispose of his capital or his labour, as he wills."

The trade union legislation in Britain is based on the Trade Disputes Act 1906. As the Act is about 60 years old, it is now opportune to examine the legislation, customs and practices relating to the various aspects of the trade union movement, so that, if found necessary, suitable amendments may be made to the Act. In view of this consideration, the Government had earlier proposed to conduct a full-fledged enquiry into the working of the trade union legislation. The General Council of the T.U.C. is, however, reluctant to co-operate with the Government in the proposed enquiry, unless Section 3 of the Trade Disputes Act 1906 is suitably amended to remove the effects of the judgment of the House of Lords. Mr. George Woodcock, General Secretary of the T.U.C., has argued that there is an immediate necessity for such a step, as, according to him, the judgment has created a realisation on the part of employers of the powers they possess to act against the trade unions and they might make full use of these powers in employer-employee disputes.

Labour Minister's Views

Mr. Joseph Godber, Minister of Labour, however, feels that the T.U.C. is unnecessarily taking an extra-serious view about the issue and the judgment is actually not so damaging as the T.U.C. thinks. The Minister admits that the trade unions must have the right to strike and to give notice (which, according to the T.U.C. may be considered as threat by the judiciary and declared illegal) and, *if necessary*, he is prepared to amend the legislation to this effect. But he feels that the precise effects of the judgment are not clear and, unless the implications are properly assessed and it becomes definitely clear that the judgment takes away the right to give the threat of strike, it will not be feasible to amend the Act. In this connection, he has pointed out that, as emphasised by Lord Denning, the Rookes *vs.* Barnard case was a very special case because of the " very unusual contract between employer and employees that no lockout or strike would take place " and he recalled in the House of Lords the opinion of Lord Upjohn that the judgment " certainly did not decide that a trade union official would be unprotected by Section 3 of the 1906 Act when negotiating with an employer and threatening him with a strike." He has requested the T.U.C. to co-operate in the proposed comprehensive enquiry regarding the trade union legislation, which could be started even before the General Elections to meet the T.U.C. demand for early action. In his view, the body constituted to conduct the enquiry may be asked to make a beginning with assessing the implications of the Rookes *vs.* Barnard judgment, so that, if necessary, the Act may be amended immediately after the enquiry into the judgment, without waiting for the outcome of the full enquiry report.

The Minister of Labour has further argued that the employers have always been in a position to sue the employees who go on strike in breach of contract, but that they generally refrain from taking this action because such action damages the relations of employers and employees which generally results in greater harm to the employers than the employees. Moreover, there is nothing on record to show that since January this year, when the judgment was declared, the employers had tried to impede the trade union activities because of the judgment. This argument should be considered in the light of the *Bulletin* of the British Employees Confederation, dated 3rd September 1964. Commenting on the Rookes *vs.* Barnard case, the *Bulletin* says : " In any event employers are, and are likely to remain, reluctant to take industrial disputes to law, believing that litigation is not the best way of persuading people to work willingly together." Mr. Godber therefore feels that there is no need to amend the Act in haste without going into the details.

Effects of General Elections

It seems that the coming elections next month have created a great hurdle in considering the Rookes *vs.* Barnard case in its proper perspective. Out of the eight million workers represented by the T.U.C., about five and a half million are card-holding members of the Labour Party and contribute about 90 per cent of its funds. A very large percentage of the Labour Party's parliamentary candidates are also drawn from the labour leaders. Mr. Harold Wilson cannot afford to lose the support of these people and he has assured the labour leaders that the Labour Government, after coming to power, will immediately make the necessary amendment in the Trade Disputes Act 1906. On the other hand, the Conservative Government has also decided to make trade union law an important election issue and the T.U.C. leaders feel that, if they take a non-co-operative attitude towards the proposed comprehensive enquiry, it may have a damaging effect on the trade union image and the cause of the Labour Party may suffer. It is because of this reason that the General Council of the T.U.C. decided on 4th September to postpone the decision regarding their co-operation until after the General Elections. Mr. Woodcock, General Secretary of the T.U.C., has given a hint that the Council would welcome a comprehensive enquiry into the trade union legislation, provided the Government adopts the " right attitudes." According to him, one of these " right attitudes " would be to pass an immediate (may be temporary) amendment to the Trade Disputes Act to protect the union officials from civil action for threatening strikes.

Employer-Employee Relations in Britain

Though the right of strike and the connected threat to strike cannot be taken away from the trade unions, in view of the comparatively cordial employer-employee relations in Britain, there does not seem to be any urgent need for amending the Trade Disputes Act without ascertaining the implications of the House of Lords' judgment. As pointed out in *Britain*—1963 Edition, an official handbook prepared by the Central Office of Information, London:

" The structure of labour relations in Britain is established mainly on a voluntary basis and rests on the organisation of employers and workers into employers' associations and trade unions. These organisations discuss and negotiate terms and conditions of employment and other matters affecting the workpeople at their work. In some industries these negotiations are conducted simply by *ad hoc* meetings, which are held when necessary ; in others, voluntary joint machinery has been established on a permanent basis. Normally these arrangements for collective bargaining suffice to settle all questions which are raised, but provision is often made for matters not so settled, to be referred for settlement to independent arbitration. . . . Many employers in Great Britain are members of employers' associations which are wholly or partly concerned with labour questions. The primary aims of such employers' associations are to help to establish suitable terms and conditions of employment, including a sound wage structure and proper standards of safety, health and welfare ; to promote good relations with employees and the efficient use of manpower ; and to provide means of settling any disputes which may arise. . . . Altogether there are some 1,500 employers' associations dealing with labour matters and about 80 of them are national federations."

The Handbook makes it clear that strikes and employer-employee disputes are not common features in Britain and, generally, the arrangements for negotiations and conciliations of disputes are effective in making resort to direct action unnecessary. As such, there does not seem to be any need for hurrying through a possible amendment. It is quite possible that, on examining thoroughly the implications of the judgment, it may be found that it does not affect the rights of trade unions in the matter of strike or the threat to strike.

Though the right to strike or the threat to strike cannot be taken away, there is another point which, though equally important, has not come to the surface. The point is whether a trade union can force an employee to become its member, and, if he does not agree, whether it can demand his dismissal from service. Trade unionism is a voluntary movement and trade unions cannot possibly be given the right to force workers into membership at the threat of dismissal from service. The action of B.O.A.C. in dismissing Mr. Rookes is thus against labour ethics. It may be that this point, too, will be considered by any enquiry committee which may go into the working of trade union legislation in Britain.

HOUSEWIVES IN SWEDEN'S LABOUR RESERVE

The increase in labour force in Sweden during the period 1950-60—about 200,000—was primarily made up by married women. About one-third of the married women with small children are now employed outside the home. During the 1960's and 1970's, it is expected that there will be no significant increase in male labour. Though there may be some immigration from the other European countries, in view of the present boom on the Continent a major influx can hardly be foreseen. Dr. Annika Baude, a representative of the Industrial Council for Social and Economic Studies, writing in a recent issue of *The Employer*—an organ of the Swedish Employers' Federation—has estimated that over half a million able-bodied married Swedish women, with no children under seven years of age, stay at home and, if they could be induced to go to work, they would make up the entire labour reserve upto 1970. Investigations have also revealed that some 10,000 women desire to go back to work, but are hesitant because of the lack of baby-sitting facilities. It is expected that the current expansion of day nurseries and play-schools will influence the situation favourably.

A committee, with Mr. M. S. Thacker, member of Planning Commission, as Chairman has been set up by the Union Ministry of Works and Housing to examine the proposals for setting up pre-fabricated housing plants, especially in Delhi and Bhila iin the public sector. The Committee will also assess the effective demand for traditional and pre-fabricated houses in the country. It has been asked to submit its report by the end of December next.

In factories, railyards or docks, wherever trolleys are used, Dunlop cushion tyre equipment will smooth the way for your loads. These tyres are specially designed to reduce vibration so as to give greater protection to your products. They reduce tractive effort and so permit speedier work. They are silent and help to eliminate costly repairs in the maintenance of flooring and pathways.

KERALA STATE INDUSTRIAL DEVELOPMENT CORP. LTD.

CHAIRMAN, MR. K. R. K. MENON, REVIEWS PROGRESS

DEMAND FOR ASSISTANCE FALLS DUE TO DWINDLING INDUSTRIAL LICENCES

ALTHOUGH there was no lack of funds, there was a fall in the number of applications for assistance received by the Kerala State Industrial Development Corporation Limited during the year ended 31st March 1964. This was disclosed by Mr. K. R. K. Menon, Chairman of the Corporation, in the course of his speech at the Third Annual General Meeting of the Corporation held on Monday, the 28th September 1964. This unsatisfactory feature, he said, must be attributed to the rapidly dwindling number of industrial licences which had been granted for units in Kerala. He pleaded for preferential treatment for the State by the Central Government in this matter. He also stressed that achievement of a modicum of political stability and labour-employer stability was an important prerequisite for attracting venture capital into the State. The Chairman added that the Corporation was engaged in active negotiations with certain foreign companies for technical collaboration.

The following is the text of Mr. Menon's speech:

GENTLEMEN,

I have great pleasure in placing before you the accounts of the Kerala State Industrial Development Corporation Ltd. for the year ending 31st March 1964 and the report of the Board of Directors of the Corporation on the working of the Corporation during that period. With your permission I shall take the report as read.

The Urgent Problem

It is only less than twelve months since we held our previous annual general meeting, but, during this short period, two events have occurred which have caused us all much sorrow and concern. Firstly, we in Kerala, along with the whole nation, were plunged into grief by the sudden demise of our late beloved Prime Minister, Mr. Jawaharlal Nehru, who, by his dynamic leadership and far-sighted policies had striven assiduously to set our country well on the path towards the goal of a properly integrated social and political unit. And, secondly, less than four months after this national calamity overtook us, we have had a major incident in our own State where the mounting political tension of some months' duration, culminated recently in the termination of the cabinet form of government and its substitution by President's rule. The untimely passing away of our late Prime Minister has, I believe, served as a grim—and none too early—reminder to the entire nation that we cannot afford to rest on our oars and enjoy the luxury of living snugly in the protective shade of a great leader's umbrella for ever. The passing away of our Government's Cabinet of Ministers will, I hope, bring us Keralites—from the lowliest to the highest among us—to the realisation of the fact that sheer political immaturity of the kind that we have witnessed for some time past in our State in all its naked ugliness must inevitably result, sooner than later, in the sacrifice of the economic progress of the State. In my speech last year I had referred to the feeling of uneasiness and insecurity which even the then political instability in our State had engendered in the minds of outsiders, and the baneful consequences that this had entailed so far as our industrial development was concerned. I sincerely hope and trust that, whatever may be the form of Government we have, our Government will pay due attention to the urgent and immediate problem of industrial development on the massive scale and rapid pace that the dire economic plight of our people today undoubtedly calls for.

The Corporation's work in the year covered by the report placed before you has, on the whole, been rewarding, and financially successful, as the report and accounts placed before you will show. Our gross income rose from Rs. 2.55 lakhs of the previous year to Rs. 6.25 lakhs in the year under report. This has enabled us not only to write off the entire amount of our preliminary expenses, but also to provide for a reserve for depreciation on our investments, and another special reserve for general purposes, amounting to a total of Rs. 1,33,000, and also to carry forward a sum of Rs. 90,369 to the following year. Our issued capital on 31st March 1964 stood at Rs. 1.95 crore, as against Rs. one crore on 31st March 1963.

Number of Applications

While we had no lack of funds during the year under report wherewith to finance the industrial schemes approved by us, I regret to say that there was a slight fall in the total number of applications received for assistance from us. Ordinarily, there should have been an appreciable increase in this number rather than a fall, even though slight. I must attribute this unsatisfactory feature to the rapidly dwindling number of industrial licences which have been granted for units in this State. This is a matter which I have repeatedly stressed as deserving the urgent attention of both the Central and the State Governments, as nothing less than some kind of special and preferential treatment for us at the hands of the Central Government will help solve this problem satisfactorily. I regret to say there is no sign yet that a solution on these lines will be forthcoming. All that I can do on this occasion, therefore, is to re-stress this point with all emphasis, and to request the Kerala Government to take up the matter with the Centre as one of immediate urgency brooking no further delay.

While we must wait patiently for necessary action in this regard being taken by the two Governments, there is a good deal that can also be done by all of us in the way of paving the way for attracting industrial capital and entrepreneurship into our State. The first and foremost is the achievement of a modicum of political stability; this I have already mentioned, and needs no further expatiation. Secondly, we would do well to try and achieve a greater measure of stability in the labour-employer relations in the industrial units already established in our State. We have, in our State, special facilities for developing the sagacity and maturity of judgment that this calls for, in view of the general education and literacy prevalent here; we could profit greatly by capitalising on this. A third thing that our State Government can—and must—do is to take immediate steps to ensure a plentiful and regular supply of electric power for industrial users. We must take note of the hard fact that *cheap* electricity alone will just not suffice; a *regular* supply is even more vitally important.

Fourth Plan

Last, but not least, in drawing up and presenting to the Central Government our State Government's suggestions for the fourth five-year Plan our Government must keep prominently in mind the primary need for trying to reduce by the maximum possible extent the growing pressure of population on our meagre land resources, and diverting it to industrial enterprise, be it in the public sector or in the private sector.

The question of raising additional financial resources for the Corporation will soon have to engage our serious attention, and I hope that we shall find adequate ways and means of solving this problem. We are at the moment engaged in active negotiations with certain foreign companies for securing their technical collaboration in several worthwhile schemes, all of which, I hope, it will be found possible to implement in due course with the assistance of Indian industrialist parties, who will be willing to take over the management. I must, in this connection, make special mention of the assistance and co-operation we have received from the concerned officials of the U.S. Agency for International Development organisation in New Delhi in regard to industrial schemes in which we have sought American technical and financial collaboration. While expressing my sincere gratitude to the A.I.D. for their invaluable assistance and advice, I should also like to add that a team of experts from that organisation has recently completed an on-the-spot study of Kerala's economic—and particularly industrial—needs and potentialities, following the discussions which took place between the U.S. Ambassador, Mr. Chester Bowles, and our then Chief Minister. I am keeping in close touch with the A.I.D. officials in this matter, and I have hopes that appreciable results in the form of substantial aid to Kerala will follow from this in due course.

Thanks

In conclusion, I should like to express, on behalf of the entire Board of Directors, our heartfelt thanks to all the industrial entrepreneurs, Indian as well as foreign, who have helped us, in the course of the year under review, with their co-operation and assistance, often in the face of heavy odds. Our grateful thanks are also due to the Kerala Government for the assistance and co-operation we have received from them, and in particular to the former Industries Minister of Kerala, Mr. K. A. Damodara Menon, whose warm and enthusiastic support of our Corporation's activities had always been a source of inspiration and strength to us all.

THE FERTILISERS AND CHEMICALS TRAVANCORE LIMITED

SHORTAGES OF POWER AND WATER SUPPLY AFFECT SALES

CHAIRMAN, MR. T. A. JOSEPH'S SPEECH AT ANNUAL MEETING

CONTINUED cuts in power supply and a possibility of a severe shortage of water in the Periyar river, after the completion of Idikki power project, are the two major problems confronting The Fertilisers and Chemicals Travancore Limited, according to Mr. T. A. Joseph, Chairman of the Company, who spoke at the Twentieth Annual General Meeting of the Company, held at Alwaye (Kerala) on Tuesday, 29th September 1964. Mr. Joseph pointed out that, due to the drastic power cut during the year under review, sales had suffered to the extent of Rs. 2.5 crores. He resented the Government of Kerala's decision to treat raw naphtha as a petroleum product and impose a sales tax at 15 per cent. This decision, in his opinion, would seriously upset the economics of the Company's production. Referring to the collaboration programmes, the Chairman stated that these were progressing well and disclosed that, though the third stage of expansion was scheduled to be completed in 1965-66, most of the plants would be ready for commissioning by the end of the current year.

The following is the full text of Mr. Joseph's speech:

GENTLEMEN,

I am glad to welcome you to this the twentieth annual general meeting of the Company and to present to you the accounts of the Company and the report of the Directors for the year ended 31st March 1964.

As in the previous year, inadequate power supply was the Company's major problem during the year under review. There was a drastic power cut in the first three months of the year. Again power cut was resumed in February 1964 and continued till the end of June. During the periods of power cut there were several occasions when the position became so critical that there was no alternative but to close down the entire plant as it would have otherwise constituted a grave risk to continue to operate it under marginally safety conditions. The total loss in the sale value of production on account of power cut amounted to over Rs. 2.5 crores during the year. Consequently the Company's results have not been as good as one could have expected. In spite of this position, it is gratifying to note that the Company has been able to break even and to make a small profit of about Rs. 12 lakhs, after meeting charges on account of depreciation. This has been possible only due to the unstinted efforts of the executives and the workers and I would like to take this opportunity to record our appreciation of their efforts.

Power Supply

Power supply continues to be our major problem. A solution to this has to be found as early as possible if the Company should work on a satisfactory basis. There are several major hydro-electric projects under various stages of progress in Kerala State now. I am not aware if any of them will be commissioned this year. Even with all the hydro-electric projects coming into operation we will continue to be at the mercy of nature unless adequate insurance against its vagaries is provided in the shape of a reasonably large thermal power station. Your Company has been making representations to the Government of Kerala since 1960 for the installation of such a station. I am glad to say that our request has at last been taken up during this year and I gather that the Government have decided to put up a thermal station with a minimum capacity of 100,000 kw. at Cochin. I do hope that the work on that project will be taken up expeditiously.

In the light of what I have stated so far, you will appreciate that the Company has not been able to declare a dividend this year. The current year also has started with a drastic power cut that lasted for three months resulting in a loss of production amounting to a sale value of approximately Rs. 1 crore.

The third stage of expansion is well under way. Although scheduled to be completed in 1965-66, it is expected that most of the plants will be ready for commissioning by the end of this year. But we will be requiring another 20,000 kw. of power for operating the plants when the expansion is completed. We are hoping that the Kerala State Electricity Board will be able to give us this power; but if they do not, the Company will not be able to take any benefit from the expanded capacity till the required power is made available.

Another factor that has been causing us concern is the possibility of a severe shortage of water in the Periyar river when the Idikki power project is completed. The Idikki project is designed to generate 800 to 1,000 mw. of power. It is based on the waters that flow into the Periyar now. When the project is completed, all that water will be diverted to the Moovattupuzha river as the power house will be located on one of its tributaries. Such a situation can have dangerous consequences as the Ernakulam-Alwaye industrial belt is bound to suffer during the summer months on that account. Your Company has represented this matter both to the Government of Kerala and to the Government of India. We had suggested that the Government revise the plans for Idikki in such a manner as to provide at least a part of the water to flow back into the Periyar. If the water in the Periyar turns saline near the industrial area, factories like ours may have to be closed down for about three to four months in the year. I understand that the seriousness of this situation has been realised by the Government and that they are considering this proposal along with certain other alternatives.

Raw Naphtha

As most of you must be aware, raw naphtha is the feedstock used in your Company's oil gasification plant for production of hydrogen, which is one of the constituents of ammonia. As this is a very important raw material in the manufacture of chemical fertilisers, the Government of India were pleased to exempt it from the excise duty payable on it to the extent of 95 per cent. This position is recognised in States like Madras and Maharashtra where fertilisers are being made out of raw naphtha. In Kerala, the situation however is different. Originally raw naphtha was charged sales tax at 3 per cent. Recently, the Government of Kerala seems to have decided to treat it as a petroleum product and charge sales tax at 15 per cent. This will seriously upset the economics of production of your Company. A representation has, therefore, been made to the Government of Kerala to reconsider the matter and restore the original position. Raw naphtha is the raw material for most petrochemical industries. In Kerala, fertiliser industries can be developed only on the basis of raw naphtha being used as a raw material. If this raw material is charged this high rate of sales tax like a finished product, it will cripple the fertiliser industry in Kerala. I hope the Government will realise the gravity of the situation and revise the sales tax on raw naphtha.

Last year, I had informed you of the directions received from the Government of India that your Company should plan, design and construct three more major fertiliser plants in South India during the fourth Plan period. Your Company has since then been advised by the Government of the location of two of these plants. One of them is proposed to be built at Madras and the other at Cochin, as near to the refineries as possible. The project reports for these projects have been prepared by the Company and submitted to the Government of India for approval and further directions.

Foreign Collaboration

I had mentioned to you last year of the Company's intention to promote a fabrication shop in collaboration with the Davy-Ashmore group of the U.K. for the manufacture of specialised items of equipment required for the fertiliser and chemical industries. I am glad to say that a formal agreement has been drawn up between your Company and Messrs. Davy and United Engineering Company of the U.K., one of the units of the Davy-Ashmore group, for the establishment of such a workshop. As soon as the Government of India's approval to the agreement is obtained, further steps will be taken to organise the new company.

Your Company has also been able to secure the consent of Messrs. Power-Gas Corporation of the U.K., a member of the Davy-Ashmore group and a well-known engineering and contracting organisation in the field of chemical engineering, to collaborate with your Company for setting up an engineering and contracting organisation. The heads of agreement drawn up in this regard are being submitted to the Government of India for their approval. Further steps will be taken on receipt of Government approval.

Most of you must be aware of the steps taken by your Company to promote the use of fertilisers in South India. These measures have been appreciated by the State Governments as well as the Centre. The fertiliser festival, a new concept introduced by your Company in the field of fertiliser promotion, has now been accepted as one of the best means of propagating fertiliser use. The Madras Government, for example, has started organising fertiliser festivals on their own initiative and with the co-operation of suppliers.

The distribution network has also expanded considerably during the year under review. Today, your Company has 53 central depots and about 1,900 authorised agents in Kerala State alone. In Madras, Mysore and Andhra Pradesh, your Company has been spreading its distribution system at a rapid pace. Recognising the efficiency of the methods followed by your Company in fertiliser distribution, the Government of Madras have invited your Company to assist them in the distribution of nitrogenous fertilisers, sales of which were so far confined to co-operatives. Your Company has gladly accepted the invitation and will be starting distribution of nitrogenous fertilisers in Madras State within a few days.

Your Company's agronomists continued to render useful services to the farmers of South India. The nature of services included the maintenance of demonstration plots, supervision of manuring operations, supervision of application of pesticides and speedy analysis of soil samples.

Labour Relations

Employee-employer relations continued to be cordial during the year under review. But in July this year, a new situation has developed. A member of our managerial cadre has been elected as the president of the union. The union has been insisting on our recognising him as the president of the union. It is most embarrassing for any management to recognise one of its own members as an office-bearer of the union, especially so when he has been the Assistant Personnel Manager of the Company and has conducted negotiations on behalf of the management with the union. It will be difficult to find such an instance anywhere else in trade union history. Along with this, the union had also raised an issue relating to the grant of bonus for the year 1963-64. Bonus payment is governed by the long-term agreement between the union and the management. Any difference of opinion relating to any of the clauses of the agreement has to be referred to the Labour Commissioner for arbitration, according to the agreement. The issues were therefore referred to the Labour Commissioner in terms of the agreement for arbitration.

As the union has refused to accept arbitration, the Government of Kerala has referred the issue relating to bonus for adjudication. In regard to the other point, namely, the anomalous position of a manager holding an office in the union, the union has been conducting an agitation for over a month now. A strike notice was given on the 21st August. The union has been extending this notice on the dates of expiry. So far no strike has taken place. The management believes that for the efficient running of an industrial unit a healthy and strong trade union is necessary, but at the same time no management can afford to compromise on fundamental principles. The question now posed by the union has very grave implications and, if conceded, shall strike at the very roots of management and trade union relationship. The management have therefore advised the union that so long as their president continues to be a member of the managerial cadre of the Company they will find it difficult to hold any discussions with him. I do hope that the union will appreciate the difficulty of the management and take a realistic view of matters.

I now move that the Directors' report and the audited statement of accounts for the financial year 1963-64 be adopted.

Note: *This does not purport to be a report of the proceedings of the General Meeting.*

INDUSTRIAL FINANCE CORPORATION OF INDIA

TERMS AND CONDITIONS OF LENDING LIBERALISED

CHAIRMAN, MR. A. BAKSI, ON CORPORATION'S ACTIVITIES

THE hope that, with the formation of the Industrial Development Bank and the consequential changes in the I.F.C. Act, the Industrial Finance Corporation of India would be in a position to play a more fruitful role in the industrial development of the country was expressed by Mr. A. Baksi, Chairman of the Corporation, at the Sixteenth Annual General Meeting of the Corporation held at New Delhi on Tuesday, 29th September 1964. Co-ordination between sister institutions, Mr. Baksi stated, would grow in depth and the lacunæ in the requirements of industry be filled in more easily. Very large projects which the Corporation could not handle alone, he added, would be assured of comprehensive attention by a consortium of financial institutions.

The following is the full text of Mr. Baksi's speech:

GENTLEMEN,

I have great pleasure in welcoming you to this annual general meeting of the shareholders of the Corporation. We have assembled here only four months after the demise of Prime Minister Jawaharlal Nehru. It is fitting that we should begin by paying our respectful homage to his memory.

Accounts

Printed copies of the sixteenth annual report of the Board of Directors and the accounts of the Corporation are already in your hands and I shall, with your permission, take them as read. During the year ended the 30th June 1964, the Corporation sanctioned a total financial assistance of Rs. 38.27 crores made up of rupee and foreign currency loans of Rs. 25.12 crores, underwritings of Rs. 5.41 crores and guarantees of deferred payments and foreign loans of Rs. 7.74 crores. The quantum of assistance disbursed or made available during the year was Rs. 21.88 crores out of which the cash outgoings amounted to Rs. 17.99 crores. To meet the immediate needs of our borrower concerns, we disbursed during the year interim loans amounting to Rs. 3.42 crores.

The gross income for the year was Rs. 507.28 lakhs. Deducting interest of Rs. 262.04 lakhs on borrowings, and other expenses including establishment of Rs. 18.18 lakhs, the gross profit subject to provision for taxation is Rs. 227.06 lakhs. After setting apart a sum of Rs. 101.62 lakhs towards taxation, the net profit for the year comes to Rs 125.44 lakhs. These results, I hope you will agree, are satisfactory. As for appropriations out of the profits, a total sum of Rs. 106.19 lakhs has been transferred to reserves which now total Rs. 409.19 lakhs as against a paid-up capital of Rs. 7 crores on the 30th June 1964. The balance profit of Rs. 19.25 lakhs is being distributed as dividend.

Financial Assistance

The gross financial assistance sanctioned by the Corporation during the last 16 years upto the 30th June 1964 aggregated Rs. 240.97 crores. The net figure for this period, after taking into account cancellations and withdrawals of Rs. 44.19 crores, totalled Rs. 196.78 crores, made up of rupee loans of Rs. 134.29 crores, foreign currency loans of Rs. 16.89 crores, underwritings and direct subscription to capital of Rs. 14.13 crores and guarantees of Rs. 31.47 crores. Out of the net assistance sanctioned of Rs. 196.78 crores, about Rs. 137.16 crores (70 per cent) was for new projects and Rs. 59.62 crores (30 per cent) for existing concerns for expansion, modernisation, and diversification. As against the net assistance sanctioned of Rs. 196.78 crores, Rs. 124.45 crores had been disbursed or made available upto the 30th June 1964. Assistance outstanding on that date, after providing for repayments, aggregated Rs. 94.02 crores. Cash disbursements upto the 30th June 1964 in respect of loans sanctioned and shares and debentures subscribed to, or taken up by the Corporation as a part of its underwriting commitments, amount to a total of Rs. 105.78 crores. These have been financed to the extent of Rs. 26.87 crores (25 per cent) out of repayment of loans, Rs. 28.24 crores (27 per cent) by borrowings from the market, Rs. 35.60 crores (34 per cent) by borrowings from the Central Government, Rs. 3.98 crores (4 per cent) from foreign credits and the balance of Rs. 11.09 crores (10 per cent) from the paid-up capital and reserves.

Projects assisted during the year under review numbered 75, covering a variety of industries such as textiles (20), metal products (15), electrical and other machinery (14), glass (7), basic industrial chemicals (5), paper (4), and iron and steel (3). The total number of projects assisted by the Corporation since the beginning upto the 30th June 1964 was 334, out of which 224 are new undertakings. The total cost of the 334 projects, for which we sanctioned assistance of Rs. 196.78 crores, is estimated at Rs. 558.00 crores. The last figure is significant because an institution like ours is often judged by the extent to which the projects financed by it are able to mobilise resources from other quarters.

Contribution to Industrial Development

The Corporation's contribution to industrial development in terms of production is also significant. For example, in the paper industry the additional capacity created as a result of our assistance is 1,58,000 tonnes per annum as against the total installed capacity of 5,49,000 tonnes per annum. In basic industrial chemicals, the additional capacity set up is 61,800 tonnes of caustic soda, 2,83,000 tonnes of sulphuric acid and 23,100 tonnes of soda ash per annum. In the cement industry, the additional capacity created is 19,20,000 tonnes and in the refractory industry 2,09,000 tonnes per annum. In sugar, the additional cane-crushing capacity amounts to 67,000 tonnes of sugarcane per day. In cotton textiles, the additional capacity installed is 6,44,000 spindles.

Underwriting Activities

The Corporation has progressively increased its underwriting activities. During the year, we sanctioned 40 applications for a total amount of Rs. 5.41 crores comprising equity shares of Rs. 3.86 crores and preference shares of Rs. 1.55 crores. In a number of cases, underwriting facilities were sanctioned in addition to loans and other forms of assistance. Upto the 30th June 1964, the Corporation had sanctioned underwriting facilities in 77 cases for a net aggregate amount of about Rs. 12.31 crores made up of equity shares of about Rs. 6.02 crores, preference shares of about Rs. 3.86 crores and debentures of Rs. 2.43 crores. During this period, 52 issues involving an aggregate commitment of over Rs. 9.48 crores were placed in the market and shares and debentures of Rs. 7.55 crores devolved on the Corporation as a result of these operations. The main reason for this was the unsatisfactory condition of the capital market in the last two years.

While rupee loans constitute the bulk of our operations, sub-loans in foreign currency have been on the increase. Loans sanctioned during the year under the lines of foreign credit available with us amounted to Rs. 8.04 crores as against Rs. 3.04 crores in the previous year. The net amount of foreign currency loans sanctioned upto the 30th June 1964 totalled Rs. 16.89 crores. Out of the two loans of $30 million from the Agency for International Development (A.I.D.) of the United States of America, the Corporation had committed itself to a total of $23.78 million (Rs. 11.32 crores). We have repaid to the A.I.D. three half-yearly instalments of principal amounting to $150,000 (Rs. 7,14,000) upto the 30th June 1964. Two lines of credit aggregating DM 40 million from the Kreditanstalt Fur Wiederaufbau, Frankfurt, have been fully committed and the demand for DM loans continues unabated. The utilisation of the credit of 50 million francs from the Banque Francaise du Commerce Exterieur (B.F.C.E.), Paris, has unfortunately been slow. We have so far sanctioned four sub-loans aggregating 8.59 million francs out of this credit.

The industry-wise pattern of our assistance has been changing. For some years till 1962, the sugar industry was at the top of the list of our beneficiaries. In 1963, sugar made way for non-ferrous metals. During the year under review, metal prodoucts headed the list with 18.7 per cent of the total assistance, followed by textiles (16.7 per cent) and basic chemicals (15.1 per cent).

As regards the State-wise distribution of our assistance, Maharashtra topped the list in the year under review with Rs. 15.8 per cent, closely followed by Andhra Pradesh with 14.5 per cent and Madras with 12.5 per cent. A sizable proportion of our assistance was claimed by the less-developed areas by the industrialisation of which, as you are aware, the Corporation is keen to assist.

The net financial assistance sanctioned upto 30th June 1964 to industrial co-operatives amounted to Rs. 37.86 crores representing about 19 per cent of our total net financial commitment. This covered 51 sugar co-operatives, three co-operative spinning mills and one unit for extraction of vegetable oil.

A review of our loan accounts has shown that no additional provision is necessary towards the reserve for bad and doubtful debts, the balance in which now stands at Rs. 14.47 lakhs. The existing provision relates to three old accounts, action in regard to which is already being taken.

Credit Record

The credit record and the financial position of our borrowers, including industrial co-operatives, continues on the whole to be satisfactory. The percentage of default in respect of instalments of principal and interest as on the 30th June 1964 was negligible, being 0.88 per cent and 0.66 per cent respectively. Many of the concerns assisted by us have earned sizable profits and 21 concerns have, during the year, declared dividends of 12 per cent or more. The Corporation received during the year a sum of Rs. 77.15 lakhs from borrower concerns on account of premature repayments of principal. The total amount received on account of premature repayments of principal upto the 30th June 1964 was nearly Rs. 7 crores which included a sum of Rs. 1.12 crores from sugar co-operatives. We welcome such premature repayments and do not charge any premium on them.

Among events of interest to us during the year, the establishment of the Unit Trust of India was a major one. We welcome this step taken for the mobilisation of the savings of the public for industrial development.

Mr. Mobert Michel Titus of the Agricultural and Industrial Credit Corporation of Liberia visited the Corporation during the year to study our procedures and working. Dr. G. Varade Gowda, a senior official of Mysore Government and two officials from the Indian Overseas Bank Ltd. and the Punjab National Bank Ltd. were also with us. The General Manager of the Corporation participated in the Second Regional Conference of Development Banks in Asia held at Tehran in October 1963. During the year, one of our senior officers was deputed to the Economic Development Institute of the I.B.R.D., Washington, for a special course in the appraisal of industrial projects. He also studied the organisation and procedures of the International Finance Corporation in Washington and the Commonwealth Development Finance Company Ltd. in London. We thank these institutions for the valuable facilities given.

Our relations with the various chambers of commerce in the country and with our borrower concerns continue to be cordial. We appreciate the constructive suggestions made by them from time to time. Our cordial thanks are due to the U.S.A. Agency for International Development (A.I.D.), the Kreditanstalt Fur Wiederaufbau and the Banque Francaise du Commerce Exterieur for the consideration they have shown us. Their assistance has added to the capacity of the Corporation to serve the development of industries in the country.

Changes in Board

Mr. K. P. Mathrani, I.C.S., who held with distinction the chairmanship of the Corporation from the 1st July 1961, relinquished his office on the 16th May 1964 on appointment as Secretary to the Government of India in the Ministry of Rehabilitation. On behalf of the Board of Directors I would like to express our high appreciation of the valuable services rendered by him to the Corporation. During the year, Messrs. C. C. Desai, M.Ct. Muthiah and V. P. Varde retired from the Board. Their active participation in the affairs of the Corporation was of great value and I thank them on behalf of my colleagues on the Board. I also take this opportunity on behalf of the Board to convey our thanks to the members of the Advisory Committees for the able and objective assistance they gave to the Corporation throughout the year. I would also like to thank the non-officials nominated by us on the boards of our borrower concerns for the interest they have taken in their work.

Industrial Development Bank

Considering the time which elapses between the end of our financial year and the annual general meeting it will not be out of place for me to refer to a few recent developments without which the picture before you would be left incomplete. The most notable of these has been the setting up of the Industrial Development Bank of India on the 1st July 1964. The provisions of the I.D.B.I. Act have been commented upon in the newspapers and journals and the charter of the new body and the role it is expected to play have already received wide notice. Without dilating on these matters, I may usefully draw your attention to certain important amendments which the I.D.B.I. Act, 1964 has made to the Industrial Finance Corporation Act, 1948 with effect from the 1st August 1964. The shares held in the Corporation by the Reserve Bank of India and the Central Government have been transferred at par value to the Industrial Development Bank, and the latter has acquired additional shares so as to bring its total holdings up to 50 per cent of the paid-up capital of the Corporation which now stands at Rs. 834.60 lakhs. Certain changes have been made in the provisions relating to the composition of the Board of Directors and the arrangements for the audit of the Corporation. The power of giving policy directives to the Corporation has passed from the Central Government to the I.D.B. The limit of loan assistance by the Corporation to a single industrial concern has been increased. It has been made possible for the Corporation who have access to financial assistance from the I.D.B. in certain specified ways.

I expect that the formation of the I.D.B. and the consequential changes in the I.F.C. Act will enable the Corporation to play a more fruitful role in industrial development. Already, we have done some joint financing with other bodies. Now, co-ordination between sister institutions in the field will grow in depth, lacunæ in the requirements of industry will be filled in more easily, and very large projects, which the Corporation could not handle alone, will be assured of comprehensive attention by a consortium of financial institutions. The recent amendments to the I.F.C. Act tend to reduce considerably the Corporation's dependence on the Central Government. It is now incumbent on the Corporation to raise funds for its operations to the maximum extent practicable through its own endeavours assisted, of course, by the provision which remains intact in the law that its bonds will be fully guaranteed by the Central Government. As our requirement of outside funds during the current year will be quite substantial, we entered the market a few days ago with bonds of Rs. 6 crores at 4½ per cent per annum at an issue price of Rs. 99.25 per cent with 12 years maturity. The issue was handsomely oversubscribed within a few hours. We thank our shareholders and other investors for the support they gave us. This was our seventh bond issue, the total raisings by this means from the market upto now being over Rs. 39 crores.

Conditions of Loan Assistance

It is our duty in the Corporation to review from time to time our own procedures to see if we can relax any of the conditions on which we render assistance to industrial concerns. A recent review has enabled us to take three or four decisions which may be of interest to you and the industrial circles. As you are aware, it has been one of the standard conditions of our loans that borrower companies shall not declare equity dividend at a rate higher than 8 per cent per annum without the prior approval of the Corporation. In view of the prevailing yields on equity and preference shares and the conditions in the capital market, we have decided to raise the limit of equity dividend from 8 per cent to 10 per cent per annum.

Loanee concerns so far had to seek the prior approval of the Corporation to the disposal of any item of assets mortgaged to it. It has now been decided to permit assisted concerns to sell or write off specified items of assets of a minor nature within prescribed limits, where they find it necessary to do so, without the prior approval of the Corporation. It has also been decided that the restriction on the disposal and pledge of shareholdings should not apply to all directors or members of the managing agency but should be confined to those who have a real stake in the assisted concern. The Corporation has already decided to liberalise the condition about personal guarantee of directors and/or managing agents in suitable cases. We have also decided that our right to appoint nominee directors on the boards of assisted concerns should be exercised more selectively in future. I trust that these relaxations in the standard terms and conditions will be welcomed by our clients. It will be my endeavour to maintain a flexible attitude in these matters and make, from time to time, such variations as experience may show to be useful so long as these are in accord with the basic principles of sound financing.

Thoughts for the furture are a natural concomitant of a review of the past. The Corporation has lived through sixteen years of change, has met with new challenges from time to time and has tried to evolve suitable responses. Now, with the progress of sister institutions set up at the all-India and the State levels and with the growth in the demand for long and medium-term financing of industry, we shall face new tasks which will need imaginative handling. It is essential that we take stock of the changes in the situation and adapt ourselves increasingly to a versatile approach.

Further Credit

For this purpose, we shall need a great deal more of foreign credit than has yet come to us. Negotiations for fresh lines of credit have been under way with the Kreditanstalt and the A.I.D. We have just had news that a further line of DM15 million has been allotted to us. I hope that from the A.I.D., too, we shall get further credit. We must, nevertheless, look for more assistance from institutions abroad to make good our deficiency, particularly in the line of convertible currency. Our record will show that we, as a single institution, have been associated with investment of over Rs. 550 crores in the private sector of industry since 1948. While not oblivious to considerations of profit, we have consistently laboured to give help where help is needed most and not where it can be most easily given. We have tried and shall try harder in future to ensure that the foreign lines of credit that we have and that we get are utilised to the best and promptest advantage of industry, and that no procedural obstacles stand in the way. As for our rupee resources, we have to do our best to add to them by revolving our investment portfolio at every suitable opportunity. In August this year, we added Rs. 1 crore to our funds by sale of certain debentures.

We have to see that while industrial concerns receiving or seeking our assistance are not subjected to excessive rigours or fruitless inquiries, projects are prepared with circumspection and probity, with full attention to technical, financial and managerial details and are implemented promptly and with vigour. A sensitive balance has to be struck by the Corporation all the time between generosity and prudence. An excess of the latter will retard development; an excess of the former may use up valuable resources without bringing an economic dividend. This balance is now particularly necessary when the Corporation has taken a long stride into the field of underwriting. If industry is to flourish, underwriting must go on. At the same time, if the Corporation, which borrows money at 5 per cent interest and is not, basically, an investor in securities on the stock exchanges, has to subscribe in a large measure to new shares, its underwriting has to be wise. In this context, I feel that the staff of the Corporation for technical and financial scrutiny of projects and for advice to entrepreneurs needs strengthening. I am giving my best attention to this matter.

The tasks before the Corporation are not easy. But I am confident that we shall fulfil them and pass on to more difficult ones. To my colleagues on the Board, I wish to express my sincere thanks for their valuable co-operation and wise counsel And to conclude, I record with pleasure the appreciation and thanks of the Board of Directors and my own to the General Manager, and other officers and the entire staff for yet another year of devoted work.

FROM HERE TO UNCERTAINTY?

A SCRAP OF PAPER! But it has served its purpose. A new word was learnt. Or, phrase. Or, problem. Or, visual idea. Also the future is bright for this child—but not for that scrap of paper! From here it goes to uncertainty. But till here, there was no uncertainty, because it was born at Dandeli.

The West Coast Paper Mills Ltd. are at Dandeli. Here, paper is made from bamboo and other fine forest materials. For writing. For printing. For packaging. But the process isn't all that simple. It involves a certain amount of chemistry. Certain highly-skilled personnel trained abroad. And, above all, quality control. To make this certain, a special Research and Development Department works round the clock at Dandeli.

THE JAY ENGINEERING WORKS LIMITED

INTRINSIC STRENGTH UNIMPAIRED BY STRIKE

LALA CHARAT RAM SAYS INVESTMENT MUST BE RETURN-ORIENTED

SOME striking observations on the economic problems currently confronting the country were made by Lala Charat Ram, Chairman of the Jay Engineering Works Ltd., while addressing the shareholders of the Company at their Twenty-seventh Annual General Meeting held at Calcutta, on Friday, 25th September 1964. The topics covered by him included the tribulations of industrial workers caused by pseudo trade unions having political overtones, the failure to achieve adequate increase in the production of agricultural commodities, misconception of the role of profit among politicians and the disturbing impact of continuing rise in production costs on the standard of living of the people.

The following is the full text of Lala Charat Ram's speech:

FRIENDS,

I have great pleasure in welcoming you to the twenty-seventh annual general meeting of the Company.

We should begin our proceedings today, by paying our homage to the memory of Jawaharlalji Nehru. I can hardly add to all what has been said, and what all of us indeed must feel, about this great personality. Mahatma Gandhiji secured us freedom from foreign bondage and was truly the father of the nation; Panditji attempted to bring freedom from material want in the lives of the people. Few peoples are so lucky as to have as their leader, a man of such deep humanism and scholarliness. May I request you to pay homage to Panditji's memory by standing up silently for a while.

We are lucky that a person of Lal Bahadur Shastriji's calibre has succeeded Pandit Nehru as our new Prime Minister. Shastriji is known as a man of sagacity and independence. The pragmatism and the determination with which Shastriji has set about his task is indeed gratifying. In the difficult situation that he has inherited, he has shown firmness of purpose and a sense of realism that augurs well for the future.

Strike and the Aftermath

The annual report of the Company for the year ended March 1964 has been with you for some time. The profit for the year bears the mark of a part of the period of the strike in the Calcutta factories of the Company from 17th December 1963 to the end of May 1964. However, your directors have decided that, as the decline in profits has been due to an abnormal occurrence, the Company should draw upon its reserves to pay a dividend on equity shares, although a lower one at 8 per cent. This is considered equitable, having regard to the overall responsibilities of the Company. I am hopeful that in the course of the year, the Company will be able to replenish its reserves, while compensating the investors adequately.

I should, to begin with, make a reference to the most unfortunate strike which the Company had to face determinedly. A broad analysis of the causes may help to prevent a recurrence of such unfortunate events. The strike affected not only the Company's profits, but also the country's export earnings. It caused enormous loss, running to over a crore of rupees, to the workmen in terms of loss of wages, bonus etc.; the Government lost large amounts of excise duty and direct and indirect taxes; and the community lost much needed supplies. The strike certainly did not win any rewards for the workmen. The demands, which were the ostensible cause of the strike, had already been reviewed by the West Bengal Government and some of them had been referred to the Industrial Tribunal for adjudication. The same position obtains after the strike. On the other hand, the tempo of production achieved over many years was broken, and production-based earnings of workers have been maintaining a low level; there is no work for a large number of workers; and, as violent activity must feed on its own perpetrators, scores of workers, including many basically good, honest men have had to be charged for indulging in violence and intimidation. This picture of desolution and disruption, in an undertaking which has been known for its very high remuneration levels and progressive personnel policy, is certainly most unfortunate. I must repeat what I said last year here, that political and agitational considerations must give way to the paramountcy of the needs of working men and the industry, if labour leadership is to be meaningful and constructive in the economy of the nation. During the year there has been much evidence in the country, apart from our own strike, to show that there is more pre-occupation on the part of a section of our labour leadership with political and other extraneous considerations, than with the ultimate good of the working people, and the industry. It is clear that labour leadership needs to have a fresh outlook in the matter of labour relations, if the working class and the economy of the nation are to be spared the tribulations brought about by pseudo trade unionism having political overtones, I consider the workmen of Jay Engineering Works capable of making a dynamic shift in this matter, as they have shown dynamism in the past on so many other occasions.

Production Only Solution for Economic Ills

Of the several factors in the economic situation, making for what is now recognised as an economic crisis, the foremost pertain to food production and prices. Responsible people in all walks of life have their own analysis of the situation. I am not a defender of any anti-social businessmen, but if a disease is not rightly diagnosed, the cure may be hard to come by There may or may not be some hoarding of foodgrains and other agricultural produce, at the primary level of the producer, or at the secondary level of the distributor; a part of this hoarding must however be distinguished from normal stocking, for unlike green vegetables which are bought for day-to-day consumption, foodgrains are harvested two to three times in a year and stocked for consumption in the coming months. Furthermore, any hoarding could at worse take place only till the arrival of the next crop. I am sure that our Government is not interested now in finding temporary scapegoats, but in a continuing long-term solution of the problem. The fact is that for over a decade now, the price curve of foodgrains has been steadily going up, in spite of shiploads of American bounty food increasing in number year after year. Some economists even fear that at this rate, some day America might be itself short, to meet the widening gap of our demand and supply position. The answer in my view is to be found in inadequate production, and the inadequacy seems to grow year after year. With some hesitation I would like to suggest that the Government might have a second look on some of the so-called socialist objectives, which have become so sacrosanct, at least so far as agriculture is concerned. There is no question that we have to increase our yields from land, and a great many of our policies may satisfy ideology in some quarters not responsible for results, but may not give the much needed food that the people of this country need. Socialism, democratic or otherwise, or communism, or even capitalism may remain a paper satisfaction for the people, if they fail to make for more production, and availability of goods.

Another problem of our country is expensive and unproductive investment. Unless capital investment is done with stringent economy, and unless the overall economic return on total investment exceeds the economic cost of the investment, the economy of the country is bound to be under continuing severe strain. It is a matter of satisfaction that the Prime Minister has already instituted studies for determining the extent to which our economy can bear the load of gigantic long-term investments. I have no doubt that this will result in a review of national priorities with a view to upgrading projects which will yield goods and services in a relatively short time, thus countering inflationary forces and facilitating further investments from earned surpluses.

Is Earning Profit A Social Crime?

The other kind of unproductivity arises from confusion about the character and nature of profits. There seems in some lobbies in our country a view, that it is a crime to make profits; I submit that, on the other hand, it should be considered an economic crime to make losses. The idea that business profits are good for the economy is difficult for many to accept. What the critics of profit say on the surface is, that business aims not at helping people, but at making profits through people. Their instinct tells them that one man's profit is another man's loss, and so they conclude that profit means exploitation. Now the relationship between business profits and economic growth is basically very simple. Profit determines investment, for you obviously cannot invest from losses, and investment is essential to growth. Thus declining profits must mean a serious drop in investment, and therefore a slower growth for the economy; per contra, higher profits would mean higher investment and faster growth. It is no accident that business profits, business investment, and unemployment are the three economic indicators that have remained at recession levels during the current economic down-swing.

The matter of rising costs of manufacture is certainly one of alarm. The "cost-price" squeeze situation about which I referred last year, has worsened for industry in general and for engineering industry in the metropolitan Calcutta region in particular. Management has the primary responsibility for controlling costs by seeking more efficient ways of making and marketing products. But many of the costs of doing business today in our country lie wholly or partially beyond the control of management. To cite only one and latest example, the runaway price situation has led to increases in rates of dearness allowance payments to our workers in the last three months, which would mean increases in costs for your Company to the extent of about Rs. 10 lakhs per year. If manufacturing costs continue to mount up, they must sooner or later be reflected in increase in selling prices. If the goal of our society is to provide the basic necessities of life at prices which the people can afford, we seem to be somehow awfully off the track in achieving it. To me there appears to be some confusion between ends and means.

Satisfactory Trend of Production

Before closing, I should say that our current operations are maintaining a satisfactory trend, considering the aftermath of the strike. Given sustained hard work by the workers without being diverted by self-seeking men, there should be increased earnings and bonuses for the workmen, increased profits for the investor, increased exports for the country and increased supplies for the domestic market. Our shareholders and others concerned with us can feel reassured that the intrinsic strength of the Company remains unimpaired by the strike. The principal asset of any undertaking is its men, and I feel proud to say that the strike has given ample proof of the worth of our management personnel, as well as our rank and file and operating personnel.

Our relationship with our work-force remains good in spite of the fact that most of them had to make common cause with aggressive elements due to compulsive forces that bear upon the working class. To the leadership of our Company's labour, and to the workmen themselves, I take this opportunity of making a personal appeal. Strike against production can never, never be in the interest of either the labour group or the country at large. Management has responsibilities to the consumer, the labour and the investor alike. Let us all work in the coming years to make Jay Engineering the lowest cost factory in India, for that is the only way to also making it the highest profit factory, from which increased investments and payments to labour can come.

All of you are aware that our old and close colleague Shri T. R. Gupta, left the Company during the year to take up the chairmanship of the mammoth public sector undertaking, the Heavy Engineering Corporation Ltd. We are sorry to lose him, but take pride in this singular recognition. Personally to me it has been a great loss, but he remains basically a part of us and we seek his advice in any difficult situation constantly. I am sure you yill join me in wishing him a successful career in his new challenging job.

Shri B. S. Agarwal, along with the officers of the Company, supported by the staff and workers, deserve more than our usual thanks for the manner in which they conducted the affairs of the Company in an eventful year.

Note: *This does not purport to be a record of the proceedings of the Annual General Meeting.*

ALUMINIUM CORPORATION OF INDIA LIMITED

MR. LAKSHMIPAT SINGHANIA'S ADDRESS AT THE ANNUAL MEETING

MOVE FOR STATE-OWNED ALUMINIUM PLANTS SUPPORTED

PRESIDING over the Twenty-sixth Annual General Meeting of the Aluminium Corporation of India Ltd., held at Calcutta on Monday, 21st September 1964, Mr. Lakshmipat Singhania, a Director of the Company, critically examined some of the Government's policies, including the labour policy. He said that the present trend of appeasing industrial labour in the country was very disquieting. He supported the move for establishing aluminium plants in the public sector. He thought that it would be in the interest of the private sector, because it was only then that the Government would realise the real difficulties of this industry as it did in case of steel plants.

The following is the text of Mr. Singhania's speech:

GENTLEMEN,

It is my pleasure to welcome you again to the twenty-sixth annual general meeting of the Corporation. Your Corporation is entering into a new era of development after toiling hard for quarter of a century for establishment of this highly technical industry in this country entirely by local talents and entrepreneurship, which involves competing with big giant companies all over the world having very large resources at their disposal for technical and development research and supported by their national Governments. In India, thinking on the establishment of new industries has been varying from time to time. On political platforms, it has always been emphasised that development of national industries was very important, but, in practice, support to those who pioneer basic industries has not been encouraging and preference is being given on other considerations. These types of industries, in a country like India, can only be developed with the continued support of the national Government and the nation taking a long-range view. The basic factor for development of an industry of this nature is the power rate which is even more important than the physical raw material for the industry, that is, bauxite. Until and unless power is made available for this industry at uniform rate and a rate suited to this industry as is being done all over the world, our problems are not going to be solved. In the normal course, the entrepreneur should be free to establish an industry at a site most suited to the industry. But, in view of the great scrutiny in licensing, if I may say so, the economic factors play the least part as against other factors like regional planning and those not connected with the economies of the industry. The new trend of the State to increase the revenue by tapping sources easily available to them irrespective of its effect on the nation as a whole is very disheartening. I have in mind impositions like excise duty on still undeveloped industries, electricity duty on power, or control on other facilities, including mineral rights such as bauxite, from the point of view of individual States only without any consideration of the national interests.

Economic Size of Plants

Often arguments as to the size of the plant are being advanced and a minimum economic size is being determined and considered. In my opinion, this will depend on the circumstances from time to time. In every country when development of industry takes place, the size increases from small to big in due course and even today if the list of aluminium plants existing in the world is looked into, it will be found that plants in the range of 5,000 tons also exist economically. Therefore, in view of the existing circumstances, construction of new plants of minimum size only is not always a prudent decision to be taken by the Government in countries like India. Probably, after some time when our economy has developed, the present minimum size, to us also, will become rather small. Further, in India today, there is talk about concentration of economic power and monopolies. And, if this trend of thinking prevails, it will not be possible for Indian entrepreneurs even to match the Indian capital requirements even if foreign exchange component is available. Further restrictions are being put by limiting semi-fabrication facilities to producers of basic metals in the country thus making the plants uneconomical. It is a known fact that in a highly capital-intensive industry, as is the case with aluminium metal or even steel, the cost of the plant upto the metal stage is much costlier per ton of installed capacity than the semi-fabrication plants like rolling mills etc. I cannot, therefore, understand the Government's insistence specially in case of aluminium industry that the main producers should be allocated restricted amount of semi-fabrication capacity as low as 50 per cent of their ingot capacity. This means that the intensive capital expenditure has to be incurred by the main producers with a very low return and, the advantage of higher return for semi-fabrication should be thrown open to small fabricators whose investments are comparatively very little. I may cite the example of steel industry in which most of the re-rollers exist on scrap and very small availability of billets. All the basic producers of steel plant have their own semi-fabrication facilities to a much larger extent almost about 85 per cent of their steel making capacity.

Demand for Aluminium

The thinking for demand of aluminium metal in the country seems to be changing every day as more metal is being produced and utilised. The consumption rate is keeping ahead of the metal production and this trend, in my opinion, will continue for some years.

In my speeches in the previous years, I had emphasised that the estimated consumption of aluminium metal in the country can be in the region of 150,000 tons by the end of the third Five-year Plan, as against earlier thinking of 87,000 tons and later change to 115,000 tons. I am happy to state that the considered opinion now is that, by 1966, the demand for aluminium metal will, in fact, be 150,000 tons. With present rate of industrial development, the consumption of aluminium metal in all forms should reach about 300,000 tons by 1970. I am sure that this metal is going to play a very important role in Indian economy and it is all the more important for the Government to help this industry to develop at a faster rate.

State-owned Plants

By various announcements from time to time it is learnt that the Government has been blocking certain available sites for putting up State-owned aluminium plants. Actually, it would be in the interest of the private sector, if Government were to put up State-owned aluminium plants, as, only then, they would realise the real difficulties of this industry, as has been in the case of State-owned steel plants. There are a number of other items which are more important and which the Government should handle as compared to putting up these industries which can be developed otherwise. The present economic progress is more or less stagnant. The rapid growth of economy is more important than anything else in the country today. In the recent meeting of the World Bank, it was rightly emphasised that all unyielding State investments must be curtailed and only yielding investments by the Governments should be encouraged. I only hope this policy will be rigidly followed by our Government, too. The country is suffering, because of fixed political ideas and considerations. For instance, the risk capital in India has never been recognised as really risk capital. Instead of having incentives for real risk capital, the risk capital is penalised. There are instances like your own Company where the shareholders did not get dividend for 18 years. In all new industries of basic nature, the shareholders will have to wait for certain number of years for dividends and thus those industries should be considered as national institutions rather than owned by any individual. From this point of view, there should be much more incentive to the risk capital and such capital must be allowed to be nursed properly.

The trend of appeasing the industrial labour followed in the country is very disquieting. There should be equal status for the industry and labour. Both are joining hands to generate economy in the country. The total industrial employment is hardly 2 per cent of the population. At the cost of the remaining 440 million, why is this category only being promoted to create a new class for all types of special amenities such as high wages, provident fund, dearness allowance, bonus, State insurance and so on. The recent decision of the Government in connection with the Bonus Commission is rather unique. The Bonus Commission was set up for formulating uniform norms for payment of bonus. The latest decision of the Government has increased the complications further which means that both existing uncertain complicated methods of calculation and the Bonus Commission's formula as accepted by the Government have to be applied and whichever be in favour of the labour has to be adopted. The Union Labour Minister's recent statement reveals that further burden of Rs. 18 crores minimum will be added to the consumers, notwithstanding spiral of high prices prevalent at the moment. It is to be realised that the extra burden falls on the remaining population of the country. It will be the happiest day for the country when every one can enjoy the benefits of the generation of the economy.

Corporation's Affairs

I am happy to mention that your Corporation's expansion programmes have been more or less completed. The Corporation can claim to have one of the unique integrated plants where right from the coal raising, power generation, alumina production, smelting of aluminium metal rolled products like sheets and circles, extruded products, A.A.C. and A.C.S.R. conductors and foils are produced in one compound in addition to its own bauxite mining. It is necessary for this size of plant to be integrated for its very existence as without combining all these economies, a plant of this size with many odds like very high power rates and increasing coal prices, will be difficult to exist. The only way to maintain economies of this plant in competition with other bigger plants in India would be on the economies of the semi-fabricated products. I have pleasure in informing you that we are working up with the Government of India for further expansion of the present plant. It is hoped that, in due course, licence will be available to your Company.

All the expansion schemes, which have just been completed, will show full results probably in coming years. For the time being, I have only to refer you to the balance sheet as at 31st March 1964, which has been circulated to all of you. We have achieved satisfactory results by increasing our sales by 48 per cent and reaching a new high figure of Rs. 345.15 lakhs and also our profit has reached a new figure, although the present profit is far below in view of the capital invested. The gross block works out to about Rs. 939.84 lakhs plus working capital and the earning of Rs. 63.38 lakhs as gross without providing for depreciation is rather low earning.

This year the Corporation has further expanded its capital by issuing preference shares of Rs. 25 lakhs and ordinary shares of Rs. 17.81 lakhs. After this fresh issue, the paid-up capital of the Corporation will be Rs. 2 crores and I hope the Corporation will be able to service this capital from its new earnings to the satisfaction of the shareholders.

As I have said earlier, these plants are more of national institutions dedicated to the creation and distribution of wealth for the national economy and are to be viewed in this perspective.

Gentlemen, I must congratulate all our workers, officers and the Managing Agents for their untiring zeal with which they have worked to bring this plant to the present status and I am thankful to the shareholders for supporting this Company on all occasions and also to our esteemed customers for their **continued patronage.**

MACHINERY MANUFACTURERS CORPORATION LIMITED

CHAIRMAN, MR. ALOKE KUMAR MITRA'S SPEECH

STRESS IS ON PRODUCTION OF HIGH QUALITY MACHINERY

ADDRESSING the shareholders of the Machinery Manufacturers Corporation Limited at their Eighteenth Annual General Meeting, held at Bombay on Wednesday, 23rd September 1964, the Chairman of the Company, Mr. Aloke Kumar Mitra, observed that the Company was making constant efforts to ensure that all machinery produced was of the highest quality possible and referred in this connection to the series of technical collaboration agreements concluded with well-known foreign manufacturers. He outlined the difficulties involved in selling machinery to textile mills due to lack of funds with them.

The following is the full text of Mr. Mitra's speech:

It is a pleasure and privilege for me to have the opportunity of welcoming you for the first time as Chairman of your Company. Before I proceed further, I must express our deep sense of loss at the passing away of Pandit Jawaharlal Nehru who was Prime Minister since independence and who guided our destiny.

The year, on the activity of which I am about to report, has been tinged with sorrow. Mr. K. C. Mahindra, our late Chairman, passed away in October 1963. Although he took over chairmanship from the late Sir Purshotamdas Thakurdas in 1956, he along with his brother, the late Mr. J. C. Mahindra, was the architect and pioneer of this Company which was the first public venture of Mahindra and Mahindra as Managing Agents. It had a strong foundation in the clear objective of serving the textile industry, the largest in this country, with quality capital goods of the latest design. From its birth, Mr. K. C. Mahindra devoted himself tirelessly to its progress and growth. Those were the days of struggle caused by customer resistance to indigenous manufactured products. But he never wavered in his belief that a quality product must eventually win. He had full confidence in the ability of your engineers to manufacture a quality product and he insisted that this must take priority over everything else. It was his inspiration that has today enabled your Company to earn high reputation as manufacturers of quality products. Two-thirds of the textile industry's requirement of carding engines is met by your Company and there is wide acknowledgement that MMC cards are fully comparable with similar products manufactured abroad. Simultaneously, he had planned to convert gradually the Company's plant from a single-product to a multi-product unit with diversification as its objective. It was his policy decision and direction that is bearing fruit today, and we are on our way to fulfil some of his aims. All this could not have been achieved, as he told you last year, without your confidence and patience. His greatest regret was that the shareholders had to suffer a dilution of their equity and had to wait a long time for their maiden dividend. He had at least the satisfaction of presiding at the last two shareholders' meetings when dividend was declared, and to see that the market price of the equity was more than its original value. One cannot but wish that he was with us today to tell you the story himself of the Company's continued progress and future development programmes. He is missed by all and his faith and complete confidence will continue to be our guiding principle.

Collaboration

In order to facilitate a most needed modernisation and expansion of the textile industry, it has been our constant endeavour to build the best design and quality of machines. Our late Chairman had mentioned to you last year that our Development Section had kept pace with the latest research in carding technology. Following a careful study of all these developments we have entered into a technical collaboration agreement with Carding Specialists Company Ltd., Halifax, for manufacture of their Crosrol-Varga high production conversion units which when applied to conventional cards will increase production two to fourfold. Crosrol-Varga high production units can be applied to old as well as new cards. An MMC card fitted with Crosrol-Varga device costs much less than other high production cards, some of which are presently being imported. I am pleased to inform you that we have received Government's approval to this collaboration and our engineers are presently in U.K. finalising the detailed programme for the manufacture of the product. We expect to commence manufacture of the Crosrol-Varga device by the end of next year.

Simultaneously, we have also entered into a technical collaboration with Whitin Machine Works, U.S.A., for the manufacture of their reputed high speed draw frames. Many of these machines imported and installed in various mills have given excellent results, and we are confident that when we manufacture Whitin draw frames they will meet the mills' requirements satisfactorily. The proposal for manufacture is still awaiting Government's approval but we have been assured of a favourable decision at an early date.

Speed Frame

The speed frame designed by our engineers incorporates such latest developments as are efficient and necessary. It incorporates features such as ball bearing to spindles and bobbins, telescopic spline shaft bobbin drive, large package suitable for Indian mills and over 500 anti-friction bearings for smooth operation at high speed. Simplicity in design and quality in manufacture have been the main objectives. The speed frame is now undergoing extensive trials under mill conditions. Once our engineers are convinced that the machine undergoing trial is working to the full satisfaction of the mill-owners, batch production of the speed frames will commence. Due to lack of certain types of machine tools yet to be installed the production of speed frames during the current year will be very limited.

I am pleased to inform you that the diesel engines which have been manufactured by your Company have earned a high reputation and our order book is very satisfactory. Here again, production, owing to lack of space and other facilities, and also inevitable teething trouble in locating certain indigenous sources of supply, has been restricted.

Carding Engines

The order book for carding engines remains full and the current production and despatch of cards continue to maintain an upward trend, but it would be unwise to be too complacent. It is true that the textile industry has an ambitious modernisation and expansion plan, but it is equally true that lack of funds, both foreign and rupee, has hampered implementation of the plan. It is widely known that the delay in the finalisation of the Japanese yen credit has upset plans for several new units which in turn has had its effect on the offtake of textile machinery in India. Speaking of carding engines, requests for postponement in respect of firm orders—often a last minute exercise—cannot but be regarded as an indication of the situation. Knowledgeable quarters have assured us that this is a brief and passing phase, and we would like to think that it is so, but we cannot help having reservations about future offtake.

There is another factor which impinges on our order book. Lack of rupee funds is driving the mills to purchase against deferred payment. We as manufacturers of textile machinery can only go so far in this matter. Even bankers have their limits, and we are called upon to go from bank to bank trying to arrange credit terms for customers. Whatever we have been able to arrange with our bankers appears to be inadequate, and we are, therefore, sometimes compelled not to accept orders under these terms and conditions. It is my plea that the mills must induce Government to re-examine their financial requirements because it is well beyond our scope to make credit arrangements which would meet the increasing demand for deferred credit. Your Company itelf in respect of its expansion programme needs further finance, and it cannot possibly be expected to arrange for this type of deferred payment facilities.

Yet another factor is in respect of technological developments which encouraged some of the mills to defer delivery of their cards hoping that they would be able to obtain the latest type of machinery. As I have mentioned before, your Company will be able to supply these high production cards with Crosrol-Varga and we have assured millowners that, as and when Crosrol-Varga units are available, they can be fitted to conventional cards for converting them into high production ones.

The Directors' report together with the statement of accounts which has already been circulated will show that the operation during the year under review has been satisfactory. Sales improved by Rs. 50 lakhs to just over Rs. 2.50 crores. High taxation provision—because of our having to pay for the first time full taxation on our profit—has, however, reduced the profit after tax. The process of rehabilitation of plant and equipment and increasing the capacity of the factory continue at a steady pace. For example, during the last three years Rs. 50 lakhs have been utilised on this account. What is of greater significance and interest is that the entire amount has been raised from self-generated funds and at the same time the indebtedness to I.F.C. has been reduced, the figure is now standing at Rs. 18 lakhs from the original figure of Rs. 59 lakhs. The Government loan of Rs. 5 lakhs which was given to the Company to complete its foundry project, and which was most timely, has since been repaid. The new expansion programme about which I have spoken to you and which will undoubtedly increase the future profitability of your Company, will require additional funds and your Directors are giving careful thought to it and will soon report to you their proposal for raising such funds.

Labour Relations

I should like now to draw your attention to some recent recommendations by Government which have a bearing on labour relations, and therefore, to industrial growth generally. I understand that there is a move by the Government to legislate that employers will be required to pay a portion of the wages in kind. The details are yet to be worked out but from the broad outline of the scheme it is discernible that employers will be required to provide the workers with cereals and certain other basic necessities by establishing fair-price shops. While the object behind this move is commendable, employers will be in an embarrassing predicament if the Government cannot make available to them sufficient quantity and the right quality of cereals and other basic needs for distribution to the workers. I would urge the authorities concerned to take these factors into consideration and take proper safeguards while finalising the scheme.

I must also make reference to the Bonus Commission's report. In making the amendments regarding the inclusion of all taxes in prior charges, the Government has acknowledged the obvious, the obvious being that tax reliefs intended for specific purposes relating to industrial growth cannot be frittered away in wages. Be that as it may, I cannot help thinking that unless bonus is related to productivity, the workers can never derive its full benefit. By fixing the minimum of 4 per cent, the Bonus Commission has indirectly given a proportionate wage award leaving the question of bonus as confounded as ever before.

It is my plea that Government should, once again, give very careful thought to the whole subject and should tackle the problem of wages separately through a wage board and tribunals and that bonus should be viewed exclusively as an adjunct of production and, therefore, directly related to productivity. Without such an approach neither will workers derive the maximum benefit nor will industry secure the appropriate advantage for incentive payments. Half-hearted measures will only aggravate the problem. If, however, legislation is under way to implement the amended Bonus Commission's recommendation, I would urge that the Act be viewed as a stop-gap measure until eventually bonus is related to productivity which I repeat is the only appropriate way of dealing with this issue to the mutual benefit of industry and industrial workers.

I am sure you will like to join me in thanking the staff and workers who have worked loyally and diligently for the satisfactory working of the Company during the year.

Note:—This does not purport to be a report of the proceedings of the Annual General Meeting.

THE IMPERIAL TOBACCO COMPANY OF INDIA LIMITED

Speech by the Chairman, Mr. F. A. Collett, at the Fifty-third Annual General Meeting of the Company on 24th September 1964

Ladies and Gentlemen,

The year under review saw two changes on your Board necessitated by the departure from India of Mr. C. N. Kirkus and Mr. H. C. Reeve on retirement. Mr. Kirkus had served the Company for 28 years and Mr. Reeve for 31 years and so had well earned their retirement, and with them go our best wishes.

In their places Mr. Patrick Evan John and Mr. Balwant Kumar Nehru were appointed to the Board on 1st April. Mr. John joined the Company in 1938 on the accounting side, and Mr. Nehru in 1950 on the engineering side. They bring with them a wealth of experience and drive which is already apparent in our deliberations.

Turning to the Accounts I am afraid that, as I foreshadowed in my speech a year ago, the Company has come through a difficult year.

The reduction in profit from the high figure of 1962-63 is almost entirely due to two main causes, indirect and direct taxation; indirect taxation in the form of excise adversely affecting our Company's gross trading profits, and direct taxation reducing the net profits available for distribution.

As a result of the 1963 budget, when not only were the basic rates of excise raised, but an additional 20% special Emergency excise imposed, your Board decided to absorb a large part of the extra taxation on some of the lower priced brands as it was considered probable that had we not done so the higher prices would have put these brands at prices which many consumers would have been unable to pay.

Despite the disappointing financial results of the year under review your Directors are still of the opinion that that decision was a right one because even despite it, cigarette consumption during the year showed a reduction for the first time for many years: and had prices been still further increased this reduction would have been even more marked. I should perhaps point out that the value of our sales as shown in the Profit and Loss Account shows an increase of some Rs. 5 crores but this figure is largely offset by additional excise paid and does not therefore represent an increased volume of sales. Nevertheless it does mean that this extra money was paid out for your Company's products.

This overall reduction in volume is a clear indication of the fact that we have, anyhow for the time being, reached a point at which many consumers, particularly those in the lower income groups can no longer afford to smoke cigarettes. This must of course soon be reflected in Government revenue: and it is my opinion that if the revenue from the cigarette industry is to maintain its buoyancy, this is most likely of achievement by a reduction of excise, particularly in the lower categories and the removal of the special Emergency excise.

I now come to the incidence of direct taxation because the excise to which I have already referred only accounts for part of our reduction in profits, another large part of which is accounted for by retroactive corporate taxation for which we could not possibly have budgeted.

In the last three budgets there have not only been changes in excise rates: but our liability to direct taxation has been increased by retroactive new impositions and increases in rates. The 1962 budget increased the rate of corporate taxation from 45% to 50% at a cost of Rs. 18 lakhs; the 1963 budget introduced Super Profits Tax at a cost of Rs. 20 lakhs, and there is an unfortunate possibility that the 1964 budget may raise, perhaps unintentionally, our rate of corporation tax to 60% at a cost of Rs. 31 lakhs. I say "perhaps unintentionally" because there are varying interpretations of the provisions of the Finance Act 1964 relating to Super Tax on companies. In view of this uncertainty we have thought it wise to provide for the higher rate of 60% in our Accounts.

In the case of a change in excise duty which is primarily a tax on the consumer the difference becomes effective from the date of imposition, and your Directors are free to decide how much of the change should be passed on to the consumer, and on this decision is the Company's forward pricing policy fixed. In the case of direct taxation being imposed or increased retroactively in the last trading month of the year, forward planning becomes, to put it mildly, difficult.

These very frequent changes in two major forms of taxation, particularly in a trade where on average 50% of the sale value of our product is represented by excise, are bound to lead to erratic results: and if we cannot have a reduction in taxation, then at least a period of stability is overdue.

Your Directors have in previous years considered it advisable to appropriate part of the profits earned to Reserves in order to retain in the business funds needed to replace fixed assets and stocks at current price levels and to finance expansion. Having reviewed the whole situation they have decided to recommend to you that this year no such appropriations should be made and that reserves previously made should be drawn upon in order to cover taxes retrospectively levied for the previous year. It will then be possible to pay a final dividend of 2½%, making a total of 6½% for the year, which I now recommend.

Now to turn to the more cheerful side of the picture.

A more healthy aspect of the current situation is the more intense competition between the manufacturers but your Company is maintaining a satisfactory position and I have no doubt at all will continue to give a good account of itself.

Competition has a stimulating effect on your Company's management, and the results of our various training programmes which we have carried out continuously for several years are now standing us in good stead in overhauling old, and evolving new techniques on all sides of the business.

The year 1963 marked the Diamond Jubilee of our famous SCISSORS brand and we celebrated this by giving it a modern dress which, judging by the reception it has received, has been warmly appreciated by its loyal followers. I mention this particular item because in fact it is probably not untrue to say that this rejuvenation is symbolic of the many changes that we have made, and shall continue to make to keep abreast, and indeed ahead, of today's trading conditions.

In addition, and with an eye to the future, we have been concentrating on the increasing filter tipped trade where we now have the two leading brands in WILLS NAVY CUT Filter and SIMLA which have recently been followed by SAVOY Mentholated for those who like this variation.

Perhaps I should not leave this subject without a lament for the passing away of the round 50s tin, which has been a feature of the market for so long and which has now become a casualty of the Emergency. The Government can undoubtedly put the tinplate, which is in short supply, to a more vital use: and we hope that our public will be satisfied with our various alternative packings.

Generally your Company's products have been able to give a good account of themselves against increasing competition and despite increased prices: but in the few exceptions where this has not been the case you may rest assured that the most vigorous action has been and still will be taken.

In the export field we have exhibited in a number of trade fairs, have sent a representative to various European countries and received assistance from our British associates: and we have also made numerous quotations at competitive f.o.b. prices: but all on the whole with disappointing results. The vast majority of countries now have their own cigarette industries which are equally well protected against imports as is the Indian domestic market. There is a limited market in Rupee payment countries, which seems better handled on a Government to Government basis; and it has been arranged to investigate such an arrangement.

A side of our business which is not perhaps as well known as it might be is the Printing side. We have two printing factories, one in Monghyr and another at Tiruvottiyur near Madras. These were originally set up to supply our own requirements for packaging materials: and they still do this. However Tiruvottiyur, which does some of the most high class offset printing in the country, has of recent years been taking on a certain amount of outside work which we are hoping to develop still further.

I have already referred to the changed outlook of management to meet today's trading conditions and I should now like to say something of our Labour relations, and our relationship with the many trade Unions who represent the workers and clerical staff employed here in Head Office and in our branches throughout the country, in which sphere we consider that our record is good.

The changes in trading conditions to which I have referred necessarily involve changes in working conditions, and these have been under discussion with many of the Unions during the year. Earlier this year we arranged a conference between Management and the leaders of the Unions at which it was agreed, with the unfortunate exception of a small minority of branches, to set up a Committee composed of four members each from Management and the Unions to review working conditions in Head Office and all the branches represented with a view to rendering recommendations to the Board at the end of this year: and it was further agreed to call a moratorium on demands, apart from local adjustments, during this period.

This Committee has already had several meetings in different parts of the country and I have been struck not so much by the constructive work that they are undoubtedly doing, but by the atmosphere of mutual trust in which they are doing it. On the Committee at least there appears to be an understanding on both sides that the interests of Management and Labour in the prosperity of the Company are the same: and if this is really accepted, and although there will certainly be some bargaining on the way, I think that the fact that these matters are being discussed in a free atmosphere and under no form of duress on either side is a major step forward.

Finally it is usual at this meeting for the Chairman to attempt to give you some indication of our future prospects. I have already said a great deal about the difficulty of doing this. However as regards trading prospects in the long run I am still of the opinion that only the fringe of the eventual cigarette consumption potential has been touched: but that the rate of the increase depends entirely upon two factors, the rate at which the standard of living in the country increases and the rates of excise duty imposed. At present I believe these latter rates to have run ahead of the economic development to an extent that they are not able to be absorbed.

In the short term I believe your Company is well equipped to face the present competitive situation and in the absence of further retroactive taxation I would expect improved results during the current year but that these are not likely to be spectacular. As a result of these improved prospects it is possible to revert to our previous rate of interim dividend and the first interim for the current year of 2½% has already been notified to you. What we are eventually able to pay for the year will naturally depend on the final results we achieve.

Note: This does not purport to be a report of the proceedings of the Annual General Meeting.

OIL AND PETROCHEMICAL INDUSTRIES IN JAPAN

MASSIVE GROWTH IN RECENT YEARS

By V. S. Swaminathan, M.A., M.Sc. (Lond.)

A JAPANESE team of experts in petrochemical industry reached India on 10th September on a three-week tour. It was led by Mr. Y. Yagi of the Sumitone Chemical Industries and examined the feasibility of setting up naphtha cracking plants near the refineries for the production of consumer goods like plastics, synthetic rubber, synthetic fibre, etc. It is, therefore, of interest to review here the post-war progress made by the Japanese economy, the growth of petroleum industry including petrochemicals and shipbuildings and prospects for Indo-Japanese collaboration.

The entry of Japan into the O.E.C.D. last April is a measure of her status as an industrial nation. This will have the effect of exposing parts of her protected economy to the sharp winds of international competition. Liberalisation of trade had already been accepted by Japan as a member of I.M.F. and gradually put into practice. By 1st September 1963, 92.2 per cent of the country's trade had been freed from restrictions. Now membership of O.E.C.D. commits Japan to liberalising invisible items including maritime transportation in the very near future. It had been agreed that she would liberalise the market for charter contracts on coal and ore carriers after one year and on oil tankers in two years.

Sixth Largest G.N.P.

Notwithstanding the galloping inflation lasting from August 1945 to March 1949 and the recession in 1954, 1957 and 1961, Japan's economy has been booming since the end of the Second World War. Japan now has the sixth largest G.N.P. in the world (G.N.P. per head in 1962 was $554) and ranks fifth as exporter of manufactured goods. What is remarkable about her G.N.P. is the extremely high proportion absorbed by fixed investment, i.e., 34.7 per cent in 1962, against the average of 19.4 per cent for other O.E.C.D. countries.

Japan is wedded to what may be called "indicated," not mandatory, planning, dominated as she is by private enterprise with only a very few industries nationalised. The country's economy functions according to the dictates of the market and price mechanism. The plan suggests certain output targets which are decided upon after exhaustive discussions with representatives of the more important

Table I: *Japan's Output of Petroleum Products*

private firms. The most significant aspect of Japan's economy is the role of the bank in financing the growth of investment. Nearly 60 per cent of external finance is obtained as loans from banks and other financial institutions. The rate of private savings in Japan which normally takes the form of bank deposits is relatively high. In 1959, the unspent personal income was as high as 17.8 per cent, against 7 per cent in the U.S. and 5 per cent in the U.K.

Here, in brief, are the factors contributing to the economic resurgence and general prosperity of Japan: substantial reserves of underemployed labour, especially in farming, have enabled industry to add to its strength and helped keep the increase of wages well below the rise of productivity. An adequate rate of savings has been achieved. The banking system has acted as an efficient collector and distributor of savings and followed an expansionary policy of credit creation. Hence most big firms were able to find the outside finance which they required. From 1950 to 1962, the share of productive investment in the G.N.P. rose from less than 15 per cent to more than 30 per cent. Lastly, the country's outlay on defence is just one per cent of the G.N.P.

Turning to trade, Japan's expansion of exports in the last five years was at 13.5 per cent a year in value and 12 per cent in real terms. The country's exports consist essentially of manufactured products, the traditionally important items such as textiles and non-metallic manufactures having become less and less important. Exports comprise chemical products, metal goods and machinery which in 1963 accounted for half the total. There has recently been a remoulding of Japan's industrial structure in the light of increased competition from less developed countries. Also, Europe and North America between them now take 46 per cent of Japan's total exports against only 34 per cent in 1953-55.

Energy

This economic boom in Japan has stimulated a demand for all forms of energy, and meant an unparalled rise in petroleum consumption. According to a forecast by the Japanese Economic Deliberative Council, a total capital investment of 6,300 billion yen (equivalent to $17.5 billion) will be required to ensure that the country's rapidly growing energy needs are

Table II: *Japan's Sources of Energy Supply*
(In million metric tons of coal equivalent)

	Average 1956-58	Forecasts 1970	Forecasts 1980	Percentage Increase 1980/1956-58
Coal and lignite production	45.8	48.9	48.9	7
Imports of coal	5.3	22.5	31.9	502
Crude oil production	0.5	1.4	1.4	180
Imports of crude oil	21.0	92.2	173.3	725
Imports of oil products	3.3	14.3	26.9	715

(a) Conversion from tons of coal equivalent by using factor 1 ton of oil = 1.5 tons of coal.
(b) Excluding refinery fuel and loss.

met during the period upto 1970. Of this sum, 960 billion yen are for oil and natural gas (130 billion for crude petroleum and natural gas production and 830 billion for the other sectors of the industry). The indicated investment per ton of new annual capacity is nearly 15,000 yen (say $32), inclusive of replacement of existing facilities.

The earlier forecasts of the Economic Planning Agency (E.P.A.) for 1970 (in terms of coal equivalent) were: coal 71.4 million tons, oil 107.9 million tons, natural gas 1.6 million tons and hydro-electric power 52.5 million tons making a total of 238.5 million tons (*vide* Table). The later data by the Japanese Economic Deliberative Council in respect of oil at nearly 89 million metric tons of actual oil, are higher by 20 million tons of actual oil than the E.P.A. forecasts. At this higher rate, petroleum would account for an estimated 50 per cent of the country's energy supply by 1970. If the forecast is realised, Japan's total imports in 1970 will be around 1.7 million barrels a day (b/d) of actual oil or fourfold the 1959 figure of 441,000 b/d. This is based on the assumption of an average *annual* rise in G.N.P. by 7.2 per cent to 26,000 billion yen, and an increase of population from 93 million in 1959 to 102 million by 1970.

Some of the problems facing the oil industry of Japan are peculiar to it. There is the demand for protection from the ailing coal industry. Domestic producers of crude oil and Japanese firms producing oil in the Persian Gulf and with ties in North Sumatra desire to have guaranteed outlets in Japan by the compulsory offtake of refineries in the country. The rising imports of oil from Russia are causing concern in certain quarters. Finally, except for the three large independent importers, refiners and marketers, namely, Idemitsu, Maruzen and Daikyo, together accounting for 30 per cent of the country's total refining capacity, the processing sector of the industry in Japan is linked with various international oil companies with whom there are contractual obligations regarding crude oil supplies.

Persian Gulf Oil

Japan's domestic crude oil production is negligible in relation to consumption. It rose from 666,000 metric tons in 1961 to 761,000 tons the following year and 800,000 tons in 1963. The most successful Japanese-sponsored foreign oil venture has been carried out by Arabian Oil, specially formed for the purpose by over 60 varied firms with interests in electricity, town gas, steel, shipping, shipbuilding, chemicals, insurance and other fields. With its permanent production and shipping facilities completed in the Persian Gulf late in 1962 this Company's output could be stepped up to 31,800 kilolitre (Kl) a day (200,000 b/d), or not far short of a quarter of Japan's inland demand.

The country's domestic demand for oil in 1961 increased by almost a quarter to 36.5 million Kl or 230 million barrels and was expected to rise by 17 per cent in 1962 to 42.7 million Kl or 268 million barrels, and then go up at more or less the same annual rate

Table III: *Japan: Inland Demand for Petroleum Products*
(1,000 kilolitres)

	Years ending March 1960	1961	1962	% Increase 1962-61
Gasoline	5,860	6,863	8,000	16.6
Petrochemical feedstock	794	1,365	2,184	60.0
Jet fuel	192	242	310	28.1
Kerosine and gas oil	4,041	5,051	6,030	19.4
Fuel oils	18,571	22,229	26,370	18.3
Total	29,458	35,820	42,894	19.7

to reach 77.9 million Kl, or 486 million barrels by 1966. Two main products—gasoline and fuel oils—will then account for about 18 per cent and 6 per cent, respectively, of total demand. Japan's imports of crude oil rose by 32.5 per cent in 1963 to 57.33 million Kl, the Middle East contributing 88.7 per cent and South-East Asia (mainly Indonesia) 10 per cent. The share of Japanese-owned Khafji crude oil from the Neutral Zone in the Persian Gulf rose to 12.3 per cent from 7 per cent in 1962. Although subject to the foreign exchange allocation system, oil imports in recent years have shown a very big rise. Outlay on such imports in 1961 was second only to machinery in value and accounted for 16 per cent of Japan's import bill as against 8 per cent the year before. By 1970, oil imports are reckoned to reach 1.8 million b/d or 19 per cent of the value of total imports.

Natural Gas

A factor of increasing importance is production of natural gas whose output rose in 1961 to over 1,000 million cubic metres. The main increase came from the Higashi, Nugata, Kuliki and Mitsuki fields, all on the West coast. The Nugata-Tokyo gas line was completed late in 1962. Production of gas went up to nearly 1,600 million cubic metres for the year ending March 1963 and is expected to reach 2,500 million cubic metres by 1965. Recent discoveries have encouraged the Ministry of Trade and Industry to undertake a systematic survey of the Kanto plains at an outlay of 100 million yen in 1962-63. Also it is proposed to increase the annual subsidy for natural gas prospecting to 50 million yen in the same year.

Under the stimulus of an extraordinarily rapid increase in demand, nearly 15 million tons of refining capacity was completed in the course of one year, namely, 1961, bringing the total available capacity to close on 50 million tons at the beginning of 1962. Nine further refineries came on stream in 1962 and the remaining three of 10 million tons capacity are due for completion before the end of 1964. Japan Arabian Oil Company is entering refining business as a partner in a newly formed oil company, namely Fuji Oil. The latter is a joint undertaking of two large industrial concerns, Sumitomo Chemical and Tokyo Electric Power. The plant, with an initial capacity of 75,000 b/d, and costing 26,000 million yen, is scheduled for completion towads the end of 1965.

L.P.G.

Demand for liquid petroleum gas (L.P.G.) in Japan has gone up by leaps and bounds. From 113,000 metric tons in 1957 it shot up to 986,000 tons in 1962. The two leading importers of L.P.G. are Bridgestone and Nippon Oil. They have contracted for four 14,000-ton cargoes to be delivered

in the autumn of 1964. For April-September this year, demand for L.P.G. is placed at 859,000 tons to be met by domestic production of 725,000 tons and imports of 160,000 tons, while 26,000 tons will be added to stocks. Japan has four refrigerated L.P.G. tankers each able to make eight voyages a year from the Persian Gulf and they are fully employed. The 22,000-ton d.w. *Paul Endacott* was chartered for four voyages from the Persian Gulf to Japan and the first 14,000-ton cargo reached Japan last July.

The largest L.P.G. tanker in the world, the *Bridgestone Maru*, was built by Mitsubishi Nippon Heavy Industries for Bridgestone L.P.G. company, a subsidiary of Bridgestone Tyre Company of Tokyo. On her maiden voyage she carried from Kuwait to Kawasaki 195,000 barrels (16,600 tons) of refrigerated propane and butane. The vessel is equipped for carrying L.P.G. at atmosphoric pressure in insulated tanks under refrigeration down to —42°C. She will make eight return voyages a year from Japan to Kuwait with L.P.G. bought by Bridgestone from British Petroleum under a long-term contract concluded in 1960.

Petrochemicals

In a short span of time, Japan has made a successful bid to join the ranks of the world's leading producers of petrochemicals. Her activity in this field falls into two divisions—that based on natural gas and that on petroleum gases and refinery fractions. The first division had its start in 1952 and was well advanced before the second came into being five years later. The industry using natural gas produces methanol, ammonia, ammonium sulphate urea and several complex fertilisers.

In April 1957, the Shimotsu refinery of Maruzen Oil Company started producing solvents like secondary butanol and methyl ethyl ketone from refinery gases. This was the first step in a five-year petrochemical development programme which resulted in an investment of $228 million by thirteen companies in fourteen plants. Japan's sales of petrochemicals rose sharply from $4.2 million in 1957 to $220 million in 1960. In the latter year, nearly two dozen companies, about half of them newcomers, applied for permission to build petrochemical facilities or to enlarge existing units.

Plans under way indicate that plant investment in a second five-year programme may well exceed $300 million. The country's annual production of polyethylene plastic is to go up from 70,000 to 140,000 metric tons. Plans for setting up its first polypropylene plant envisage an initial capacity of 55,000 tons a year. The overall capacities of styrene monomer and polystyrene facilities are being stepped up from 15,000 and 25,000 tons to 40,000 tons and 60,000 tons, respectively. Other products whose manufacture or expansion is planned include alkyl benzene detergents, tetraethyl lead (TEL), acetylene, ethyl and butyl alcohols, synthetic general purpose and speciality rubbers, ethylene derivatives, aromatics, acids and solvents of various kinds.

Approval was accorded for the establishment of two new petrochemical plants with foreign technical collaboration in 1962. Under the technical directions of Union Oil of California, Idemitsu erected a plant at Tokuyama to process 400,000 tons of naphtha a year. This unit was commissioned towards the end of 1963. Mitsubishi built the other plant at Mizushima to process 250,000 tons a year of naphtha with the technical co-operation of Stone and Webster Corporation of U.S.A. This plant was completed in October 1963. Fuji Oil has plans to develop a petrochemical complex, with Sumitomo Chemical playing a leading role.

Japanese producers of petrochemicals enjoy tax exemptions in various forms, as well as special facilities for quick depreciation and the acquisition of funds and long-term loans from the Development Bank. Most of the major industrial units in this sector are linked one way or another with American and European interests. The Japanese Government continues to allow foreign companies to participate financially and to accord active technical co-operation in the building up of the country's petrochemical industry. Its growth means increased savings in foreign exchange outlay on imports of highly priced chemical products. Already in 1960 such savings were computed equivalent to nearly $100 million.

Shipbuilding

Japan has also forged ahead as a builder of giant tankers, and her shipbuilders continue to enjoy prosperity. In the fiscal year ending March 1962, they had orders for 71 ships totalling 1,856,000 gross tons worth $375 million. Between April and August last year, shipbuilding orders totalled 1,980,000 gross tons worth $400 million. The U.S.S.R. has placed orders with Japanese shipyards for 320,000 tons, consisting mainly of tankers and bulk carriers. The Transportation Ministry plans to build one million tons of new tankers under the State-financed shipbuilding programme during the year beginning from 1st April 1965. This Ministry has decided on a basic plan for a 16-knot highly-automated 65,000-ton tanker designed to be operated by a crew of no more than 19 men. What is claimed to be the world's first fully automated cargo handling system for oil tankers has been completed and successfully tested by Ishikawajima-Harima Heavy Industries in co-operation with Toshiba Electric Company of Tokyo. A Japanese shipping company recently placed orders for two mammoth tankers, each of 152,000 tons dw. with Ishikawajima-Harima for delivery in 1966 and 1967, respectively. Much of the success of the Japanese shipbuilders is due to the low prices they quote. The building cost per dw.t. of tankers has come down from $209 in 1957 to $123 in 1961 and $114 in 1962. The Japanese shipbuilders are pressing forward with rationalisation and modernisation of operations to cut construction costs.

From what has been stated so far, Japan's capacity and ability for technical and financial collaboration with India in the establishment of such basic industries as shipbuilding, heavy electrical equipment and fertilisers are evident. There is every reason to hope that Indo-Japanese collaboration in the economic and technical fields will grow in the coming years.

NEW PUBLICATIONS

Agricultural Planning in India. By Dr. S. C. Jain, Statistician, Directorate of Economics and Statistics, Madhya Pradesh, Bhopal. Published by Metropolitan Book Company Private Limited, 1, Netaji Subhash Marg, Delhi-6. Pages : 125. Price : Rs. 8.50.

THE need for sound agricultural planning in an underdeveloped country like India cannot be exaggerated. Its importance has become all the greater during the last few years which have witnessed relative stagnation in agricultural production, resulting in an acute food problem during the current year. Viewed against this background, first edition of the above-mentioned book, published this year, is certainly a useful and timely addition to the available literature on agricultural planning. The author has examined in detail the objects, importance and problems of agricultural planning and the techniques of agricultural planning adopted in India. In his view, the methodology of agricultural planning, based on individual approaches to the millions of small farmers, has succeeded only in making marginal increases in agricultural production. He has made out a strong case for the mechanisation of agriculture in the following words:

"Experience has shown that the best and the most effective way to boost farm production is to create possibilities for complete mechanisation of agriculture.... If all the basic components of new agricultural revolution or complete mechanisation are made available to Indian agriculture, crop productivity would rise to double or treble within a period of a year or two."

The author admits that there are the problems of surplus farm labour and huge investment. But he stresses that, as productivity will improve, agriculture can provide huge resources for industrialisation and transformation of other sectors which, in their turn, would absorb the surplus manpower subsisting on agriculture and provide equipment and material for use on the farms.

"Income-tax." By Kanga and Palkhivala. Fifth Edition. Published by Messrs. N. M. Tripathi (Private) Ltd., Princess Street, Bombay-2. Price : Rs. 70, Volumes I and II. Pages : 1,123 Vol. I and 808 Vol. II.

The joint authors of this famous book need no introduction. Its fifth edition coincides with the completion of sixty years in the Bar by Mr. J. B. Kanga. The Indian Income-tax law was introduced in the year 1922 when Mr. Kanga was at the height of his practice. The case law on the subject discloses the assistance he rendered in illuminating the dark nooks and misty corners of that law. What he did in those years is now being done by Mr. N. A. Palkhivala. His guidance is sought not only by income-tax payers but also by foreign investors from many countries. The United Nations tax series in respect of the Indian law was written by this eminent lawyer and author.

The fifth edition incorporates all the amendments to the Indian Income-tax Act, 1961 upto 1963. Even while the book was being re-edited by the authors, the Government was thinking of amending the Act for the fifth time. Now, once again, new changes are being introduced. No textbook on tax laws in this country can remain up-to-date for more than one financial year in view of the speed with which the law is being amended.

Volume I of the book under review contains the important part of the book, that is, the commentary on the subject. Volume II contains the old 1922 Act, the new Act, comparative tables between the old and the new, rules, notifications, the Finance Acts, double taxation relief treaties, rules of Income-tax Appellate Tribunal, etc. The commentary in Volume I is quite exhaustive. The case law on the subject has been brought up-to-date covering almost 1963. The various provisions, especially the definition section, Sections 4, 5 and 6, the chapters dealing with heads of income, special provisions relating to avoidance of tax, super-tax, determination of tax in special cases and liability in special cases, have been explained with admirable clarity and completeness.

However, it would have been nice and convenient if some of the sections had been explained then and there, instead of in the commentary under another section. For instance, there is no immediate commentary in respect of Section 2(18), for the reader is asked to refer to Sections 104 to 108 of the Act. Again, some of the sections have just been summarised. For instance, Section 10(6)(vi) has been generally commented upon, but there is no guidance on Section 10(6)(vi)(c) of the Act. Probably, it is because no concrete issue has arisen that it has not been explained. To a certain extent the draftsman of the Statute would have to be blamed, for he has failed to explain the problem which he hopes to meet. How the tax gatherers would apply such a provision to the particular facts of a case is to be seen. The normal principle in case of doubt is that benefit should be given to the taxpayer.

There is something else which the authors and the publisher should consider. The 1961 Act has been further amended by the Finance Act of 1964 and is being amended by the Bill that is being introduced in Parliament. These require elucidation. A supplement to the book at a reasonable price is, therefore, called for.

India To-morrow—Pattern of Indo-German Future. By J. M. Hunck. Published by Verlag Handelsblatt GMBH. Dusseldorf. Pages: 308. Price not mentioned.

This is a compilation of the various developments that have taken place during the last 17 years of independence in India, with particular reference to Indo-German co-operation and business ventures. The study provides an interesting analysis of the economic structure of the country and has much to say about economic policy. "Economic policy," the author says, "has become so complex that its practical implementation, starting from next to scratch in the young industrial country, can only be in gradual stages. The economic momentum is lacking; above all, experience is lacking, and what is so frequently overlooked, the time needed for the development process is lacking. Often it has been pointed out that it is the people who need a new profile. This mentality has to be formed and fashioned to meet the challenge of industrialisation. And all this takes time. In India, where the economy has barely had time to strike root, an arms industry has to be built up as well. The problem is essentially one of time; and it takes time to learn how to master the problem of time."

In the field of Indo-German co-operation, there is no doubt that Rourkela, Germany's major contribution to India's iron and steel industry, had a difficult birth. And, in its early infancy, the "industrial giant" gave many a headache to the German and Indian official agencies, contractors, suppliers and engineers. But having got over its teething troubles, the weakling developed into a strapping youth, as the author has put it. However, lessons should be learnt from the nursing period; not only because it was costly, but on account of the experience it offered.

Indo-German co-operation at Rourkela will, of course, continue throughout the second and third phases of plant construction, involving the erection and operation of numerous auxiliary installations, besides the iron and steel works extensions proper. But it would be a pity if the joint effort were then to be concluded. According to the author, there are many possibilities in the neighbourhood which, if correctly exploited, could turn the district into a prosperous industrial region providing employment and well-being for the masses.

The pattern of Indo-German co-operation in future, as in the recent past in both the public and private sectors, has been projected by the author against the background of India's economic future. Mr. Hunck's painstaking study will be found useful by the Governments and private industrial sectors of both India and the Federal Republic of Germany, while evolving suitable policies for continued industrial and commercial co-operation between the two countries.

Wool and Woollen. Editor and Publisher : Mr. T. V. E Chandran, 3/49, East Sion, Bombay 22. Price : Rs. 2.5 per copy. Annual Subscription : Rs. 24.

This monthly journal, the first issue of which has just been brought out, is exclusively devoted to the woollen industry. The September 1964 issue contains several informative articles on different aspects of the wool trade and industry, such as research for the development of woollen fibres colour of woollen fabrics and fabric production cost. In his message, Mr. Manubhai Shah, Union Minister of Commerce, has said that the journal has a useful role to play on behalf of both the grower and the exporter of wool. The journal is printed on glazed art paper and neatly presented

* * * *

The issue dated 1st September 1964, of *People's Raj*—a fortnightly publication of the Maharashtra Government's Publicity Department contains, among others, an interesting article on agricultural development by Mr. C. Subramaniam Union Minister for Food and Agriculture. By including an account of the recent "Nehru's Vision and Our Goal" photographic exhibition in the city and President Dr. Radhakrishnan's speech at the meeting of the Nehru Memorial Fund, the issue seeks to recollect the late leader's lofty ideals

THE GROWTH POTENTIAL OF HINDUSTAN MACHINE TOOLS

FIVE MORE NEW FACTORIES PLANNED

THE need for stepping up manufacture of the machines that help manufacturing other machines and goods in the industrially developing economy of India cannot be overemphasised. It is thus heartening to know that the output of graded machine tools came to the aggregate value of Rs. 15.6 crores in 1963, as compared with Rs. 10.7 crores in 1962 (about 51 per cent of it in the public sector and 49 per cent in the private sector). But imports, too, had to be maintained at a high level (Rs. 28.2 crores) during that year. In the first half of the current year (1964), indigenous production and imports have been to the tune of Rs. 9.6 crores and Rs. 17.9 crores, respectively. The demand for machine tools is also going up all the time—it is expected to be of the order of Rs. 100 crores per annum by the end of the fourth Plan—but domestic production in both the public and private sectors is still not equal to the level of imports.

Considered against this background, the objective of the Hindustan Machine Tools Ltd. in the public sector to meet approximately 50 per cent of the estimated annual demand for Rs. 100 crores worth of machine tools by the end of the fourth Plan would seen to be very commendable. This, it hopes to do by establishing five more new factories during the fourth Plan period, thereby raising the combined output of all its ten factories to Rs. 50 crores. That the capital of Rs. 20 crores to be invested in the proposed five factories would be met entirely from the internal resources of the Company speaks eloquently for the operational efficiency and profit-making capacity of this premier public-sector undertaking. There

Progress at a Glance
(In lakhs of rupees)

	For the year ended 31st March			
	1964	1963	1962	1961
Sales and self-consumption	1,069.4	755.4	494.9	356.8
Stock of finished goods	43.2	33.6	39.7	31.7
Other income	19.3	12.2	37.2	35.4

Production (No. of machines)	2,000	2,000	1,251	1,002
Orders booked (No. of machines)	2,270	2,137	1,380	980
Despatches (No. of machines)	1,982	1,673	1,240	1,007
Watches assembled	1,21,602	51,562	14,439	..
Watches sold	1,19,035	36,059	10,738	..

Note :—The dividend is tax-free.

can be no doubt that the Company is poised for such dynamic progress, for its working during the year ended 31st March 1964 is itself an index of its growth potential.

It will be seen from the accompanying table that the production of machine tools has been maintained at the full capacity of 2,000 machines per annum in H.M.T.'s two factories at Bangalore. The orders booked, which rose from 1,380 machines in 1961-62 to 2,137 machines in 1962-63, rose further to 2,270 machines in the year under review. The despatch of machines which recorded a 34 per cent increase last year, registered a further rise of 18 per cent from 1,673 machines in 1962-63 to 1,982 machines in 1963-64. Similarly, the output of watches, too, has gone up tremendously. From a mere 14,439 watches assembled in 1961-62, production reached the level of 121,602 watches, with an indigenous content of 60 per cent during the latest year. The sale of watches has likewise shown a big increase during the last three years since the inception of the watch factory. From a mere 10,738 watches sold in 1961-62, the figure reached 36,059 in 1962-63 and 119,035 in the year under review.

The gross profit of the Company increased by about 33 per cent from Rs. 294 lakhs last year to about Rs. 404 lakhs in 1963-64. The net profit recorded an increase of about 50 per cent from Rs. 171 lakhs to Rs. 245 lakhs. Provision for depreciation was raised from Rs. 79 lakhs to Rs. 103 lakhs. For taxation, too, the provision was increased from Rs. 45 lakhs to Rs. 56 lakhs. Out of the profits which accrued to the Company, a sum of Rs. 70 lakhs was transferred to the general reserve which now stands at Rs. 200 lakhs. A sum of Rs. 37 lakhs was provided for development rebate reserve during the year, as against Rs. 10.4 lakhs in 1962-63. An additional reserve for depreciation (Rs. 40 lakhs) to meet the higher replacement cost in future of H.M.T.—I has also been created. Despite the declaration of a 10 per cent dividend for the fourth successive year, the Company has been able to retain 60 per cent of its profit in business. The carry forward has been constant around Rs. 3 lakhs for the last three years.

During the year 1963-64, the Company received from the Government Rs. 350 lakhs as loans, thus bringing the total Government investment in the Company to Rs. 1,434 lakhs, out of which Rs. 800 lakhs are in the form of share capital and the rest in the form of loans. Over the last eight years of its working, the Company has ploughed back into expansion Rs. 597 lakhs, representing the retained profits, depreciation and other reserves. The capital expenditure by the Company has increased from Rs. 1,062 lakhs at the end of the previous year to Rs. 1,745 lakhs on 31st March 1964, an increase of more than 70 per cent. This has been so because of the progress of work at the third H.M.T. factory, the one at Pinjore, and the start of work on the construction of H.M.T.—IV at Kalamassery in Kerala and of H.M.T.—V at Hyderabad in Andhra Pradesh. The gross block of the Company, which stood at Rs 917 lakhs at the end of 1962-63, has expanded to Rs. 1,467 lakhs, recording an increase of about 50 per cent. This has been written down at Rs. 1,196 lakhs.

Decentralisation of H.M.T.'s management was one of the major developments during the year under review. This was necessitated by the rapid expansion of the Company from one machine tools factory in 1956, employing 1,300 persons, to six factories with a total strength of over 15,000 employees located in different States. Each General Manager was given full powers to manage the unit under his control, subject to overall administrative control by the Managing Director. This decentralisation is expected to improve the operational efficiency of the Company and to promote healthy rivalry between the units.

The Company hopes that its factory at Pinjore will produce machines of "milliong" family and that the first batch of "all-electric" million machines will be despatched from the factory by the middle of the current financial year. The Kalamassery plant is scheduled to commence production of "turning" machines before the end of this year. The Hyderabad factory is expected to begin production of "special purpose" machines and other "metal-forming" and "gear-cutting" machines by the end of 1965. The Company hopes to maintain the rate of "one new factory every year" in the future. This means that five additional H.M.T. factories will be established—one in each of the five years of the fourth Plan period.

I.C.T.'S NEW COMPUTERS

The International Computers and Tabulators Ltd., London, has just launched a new compatible series of computers, called the I.C.T. 1900 Series. This new series will be exhibited at the "Business Efficiency Exhibition," scheduled to commence at London from the 6th of this month. Deliveries of this series are expected to begin within a year. In all, seven Central Processors will be available in the new series.

A noteworthy feature of the series is that any alteration can be made easily and speedily. There are two features of major technical importance, called 'Executive' and 'Standard Interface.' Every Central processor of the 1900 computer is supplied with an 'Executive' programme. 'Executive' performs the following functions automatically.

It controls the interpretation and execution of commands received from the operator; provides him with information on any incidents encountered during the running of programmes, and reports on the status of peripheral devices. All communications between the operator and the computer are via a console typewriter; the peripheral units of the 1900 series are designed for autonomous operation. Executive initiates and controls the transfer of data between the central processor and the peripheral units, checking that such transfers have been completed successfully. By virtue of their autonomous operation a high degree of simultaneity can be obtained. In addition, it enables the more powerful central processors of the series (that is, 1904 and above) to handle multiple programmes concurrently; it allocates peripheral devices and information storage capacity to the programmes as they are loaded onto the machine, and ensures that they do not interfere with one another; controls the switching from programme to programme so that waiting time on the processor and peripherals is reduced to a minimum.

The second device, that is, the 'Standard Interface,' is a process (in the series) by which any peripheral device can be coupled in any central processor. The principle involved in this is that in order to achieve interchangeability between peripheral units of different types, it is necessary to standardise the format in which data and control signals are transmitted between the central processor and the various peripheral units. In the series, the basic unit of data selected for this purpose is the 6-bit character. In turn, this means that every peripheral device has to be provided with facilities for assembling and handling data in this format, and electronic control unit needed for this task is located in the peripheral itself, and not in the central processor as has been done in the conventional types. Some control units are designed to control the operation of several like devices The cable connecting a peripheral unit to the standard interface can be of any length upto 100 ft. Auxiliary equipment can therefore be positioned as free standing units anywhere within this radius of the central processor.

There are, as already stated, seven 1900 series central processors. All these operate with a word identical length (24 bits) and all obey instructions of identical format. Hence these units are fully compatible.

Another novel feature of this series is that programmes can be written in any one of the variety of languages. Various procedures for specifying the input and output of data and magnetic tape sorting operations are also incorporated. Last, but not the least, whether science or business-oriented, large or small, the user of this new computer system has complete freedom of choice to build at a minimum cost, a system that will meet his own specific data-processing requirements.

In India, the I.C.T. 1900 Series will be marketed through International Computers and Tabulators (India) Ltd., Liberty Building, New Marine Lines, Bombay-1.

WORLD ATOMIC ENERGY CONFERENCE

To put it in a nutshell the theme of the valedictory address by Mr. Vasili S. Emelynov (of Soviet Union), President of the third International Conference on the Peaceful Uses of Atomic Energy which concluded at Geneva recently was that "every atom split and every atom fused shall serve the cause of peace alone." The Conference, which opened at Geneva on 31st August 1964 in a friendly atmosphere, was attended by over 2,800 participants.

The voluminous literature, read at the Conference on the peaceful uses of atoms, discloses that, in many countries and regions of the world, atomic power stations are already able to produce electricity at prices either equal to or lower than those of energy produced in coal-burning plants. At present, 500 reactors of various types and capacities are already operating, and more than one type of reactor for industrial use has been designed and tried out. What is more, high hopes have been nurtured that, within the next decade and a half, atomic energy would become the cheapest source of power available.

The problems of desalination of water was also discussed at some length at the Conference. Its solution, according to the President, was not only of great economic, scientific and technological importance, but even opened up fresh clues for the peaceful use of atomic energy.

The concluding session was followed up by a public lecture by way of "summation" delivered by Mr. Glenn T. Seaborg of the U.S. He expressed confidence that "by the turn of the century, more than half of the world's electricity will be generated by nuclear energy." He made the following points:

The world's installed nuclear capacity has grown from five megawatts in 1955 to almost 5,000 megawatts today. Future capacity is expected to reach 25,000 mw. in 1970 and more than 150,000 mw. in 1980. Costs of nuclear power are being brought down through reduced fuel costs and more efficient reactor operation; there is widespread agreement that the world must develop successful advanced converter reactors and near-breeders to use nuclear fuel more efficiently. Breeder reactors (which make more fuel than they consume) are showing good progress. Many nations, including West Germany, the Soviet Union, U.K. and U.S. are planning large prototype fast reactors for production of power; fluid fuels such as molten salt, molten plutonium and water slutties are being studied. Economic re-cycling of bred fuels (plutonium and uranium-233) is within sight; the nuclear safety record remains excellent; waste management systems are safe and economical; progress in direct conversion of nuclear energy to electricity (without the use of turbines) is opening new vistas; conference papers indicated encouraging progress towards the economic use of nuclear power for production of fresh water from salt water and the degree of international co-operation in atomic energy development is surely unusual and perhaps unique, in world history.

NEW PRODUCTS AND PROCESSES

Collapsible Bicycle

THE Eska National Corporation at Cheb, Czechoslovakia, manufactures collapsible bicycles weighing 16.5 kg. The set consists of four parts, namely, front part, handlebars, rear wheel with complete drive and saddle assembly. The whole set can be carried in a 90×75 cm suitcase. Its assembly takes 3 to 5 minutes.

New Insulation Material

The Research Institute of Synthetic Resins and Varnishes at Pardubice, Czechoslovakia, has developed a new thermally insulating material called 'Porofen.' It is a light formaldehyde filling material which resists water, fire and frost. It will withstand temperatures of up to 120° C. It can be easily sawn by means of a saw into slabs and shaped blocks.

Paper from Sugarcane Waste

It is reported from Stockholm that a method of producing paper from bagasse (sugarcane waste) has been developed by Karlstads Mekaniska Werkstad (K.M.W.) which makes paper and pulp machinery. The process is said to have passed the laboratory stage and the first series of production tests with 80 tons of imported bagasse are to begin shortly. It is suggested the paper-making equipment will be available on the market in the not-too-distant future.

Safety Covers for Transmission Shafts

To meet the accidents frequently caused by exposed transmission shafts on tractors and other motorised vehicles, the big Swedish rubber company, Trelleborgs Gummifabrics, AB, has developed a tubular safety cover. Made of natural rubber and of a rotating type, it has been tested on a number of different machines. The Trelleborg protective tubing for power take-off machines operates well and can be stopped by hand even at maximum revolutions and even if stepped on will stop.

Glass Fibre Ladder

A glass fibre ladder, which combines exceptional structural strength with low weight, is being produced by a British firm. It will not twist or warp and is resistant to corrosive chemicals. The finish is permanent, requiring no preservative treatment. It can, in fact, be totally immersed in water for long periods without deterioration. With no metal parts and the ends finished with rubber, it offers complete protection against accidental contact with live lines, making it particularly suitable for use where an electrical hazard exists.

Welding Process

Nippon Kokan, major Japanese steel producer and one of the country's four leading shipbuilders, has announced a new non-shielded arc welding method, for which it claims low cost and ease of welding, combined with high quality and corrosion-proof welds. The heart of the method is understood to be a new type of steel welding electrode which makes it unnecessary to use a shielding gas or flux. The system is applicable to all types of steel for many purposes, both in automatic and semi-automatic plant. The composition of the electrode has not been disclosed.

Automatic Tube-cutting Feeder

An automatic feeder, developed in Britain by Brookes Ltd., Oldbury, Birmingham, when linked to a cutting-off machine, makes the cutting off metal tube a fully automated process. Several feeder/cutter assemblies can be looked after by one man, since all that is required is that the magazines of the feeders should be kept filled with tube. A new tube is drawn from the magazine before cutting on the previous tube is completed. This allows the new tube to follow immediately behind the previous tube, so that feeding is continuous and no time is lost.

Soldering Hot Gas

Jets of hydrogen heated to 700 degrees F. are being used in the U.S. in place of soldering irons for making connections to printed or micro-electric circuits. Sperry Gyroscope Company, of Great Neck, New York, U.S., which developed the system, says the jets leave the joint clear for inspection by the operator during soldering and eliminate the danger that a soldering iron may carry decomposed flux from one joint to another. The jets, in banks of four, are said to solder 80 to 100 joints per minute at each nozzle Solder is placed on the joint automatically before heating.

Error-free Telex Messages

Posts and Telegraphs organisations throughout the world are now evincing great interest in a new AEI-developed equipment to detect errors in Telex transmissions. The Telex network detection equipment, which will reduce to negligible proportions errors introduced in the transmission circuit, has been developed by AEI in conjunction with the British Post Office (B.P.O.). The new error detection equipment is designed for use on both-way Telex and private telegraph circuits operating at speeds of 50 bauds. Housed in a metal case and designed to stand on the table normally supplied with standard telegraph machines, so that the control switches are within easy reach of the operator, the equipment is fully transistorised and very simple to operate.

Non-slip Tape

For coating steel and wooden rolls and drums a Dutch company has developed a non-slip PVC tape that increases friction between rolls and drums to five times its original level. The non-slip binding consists of a cotton backing and a PVC top layer. Its total thickness is about 1.7 mm (0.07"). The firm supplies both rough and smooth tapes and tapes with a bubbled profile in standard widths of 50 and 70 mm. (2" and 2.8"). In addition to the standard tape, oil- and grease-resistant tape is also supplied and, for large quantities, non-slip tape in special colours. The tape is glued onto the drums with a special glue. PVC non-slip tape is used, amongst other things, on the driving drums of conveyor systems, in the textile trade for cladding cloth and yarn beams and for wrapping the reels of winch dyeing machines and, generally, in all applications where roll and drum jackets with high co-efficients of friction are required.

Vibration-free Record Player

Record players and transcription motors developed in Britain for hi-fi enthusiasts and studio use are claimed to be greatly superior in terms of fidelity and freedom from vibration to anything comparable. The British firm of Garrard Engineering Ltd., of Wiltshire, exhibited the new turntables at the London Radio and Television Show recently.

The transcription player, Model 401, is driven by a four-pole induction motor totally enclosed in a heavy cast iron casing to provide full magnetic screening and mechanical stability. To eliminate vibration, the rotor assembly is dynamically balanced to an extremely high degree of accuracy and the turntable which weighs 6 lb., is of die-cast aluminium. The whole assembly is mounted on a cast aluminium top plate. There are three controls and plays at three nominal speeds, 33⅓, 45 and 78 r.p.m. Stroboscopic markings are gear-cut on the rim of the turntable, and the user is able to set the turntable speed to a very high degree of accuracy using an improved eddy current brake. The speed variation is plus or minus 4 per cent.

Rubber Vibrating Screen

A new natural rubber vibrating screen for dewatering sand, coal or any other mined or quarried material is being produced by Wilkinson Rubber Linatex Limited, Camberley, Surrey, England. It is designed for use in an integrated dewatering system where a pre-thickening unit, the linatex separator, first reduces the water or other fluid content from 80 per cent by weight to 25-30 per cent. The screen then further dewaters the material to leave only a small fluid content, which depends upon the nature of the material. Where the specific gravity of the material is high—such as in coarse sand—the figures for moisture content will be low. Where the specific gravity of the material is low—as in coal or graphite—the figures for moisture content will be higher. The screen uses strips of linatex abrasion-resistant rubber instead of the usual wedge or woven wire. This is a specially processed form of natural rubber—95 per cent pure latex, made entirely without heat or mastication. Tests have shown that this tough, gristle-like rubber will last at least three or four times longer than conventional materials and that its screen apertures will not be enlarged so that solids are lost.

NEW IDEAS IN BRIEF

Vapourised metal film can be cheaply deposited, it is reported, on the ceramic tubes and rods used in the electrical industry by a new system developed by Leybold-Anlangen, Neigasse 23, Zug, Switzerland.

Economic recovery of zinc from the dust of iron-making furnaces by a cheap method involving the re-circulation of chemicals is claimed in a method developed by Centre Nationale de Recherches Metallurgiques, 47 rue Montoyer, Brussels, Belgium.

A production-line technique for strengthening wood veneers with plastics, so that they can be deformed without cracking and will fit neatly round corners, has been introduced by Mikroholz, 48 Maybachufer, Berlin-Neukolin, West Germany.

A way of burying insulated pipes and still allowing them freedom to expand when they carry hot fluids, without the use of sliding bearings, has been patented by Hydrobit, 63 Cecilienalle, Dusseldorf, West Germany.

A French car firm has patented a fixture for car doors which allows them to stay open in any given position. It is developed by Renault, 8 avenue Emile Zola, Billancourt (Seine), France.

An inexpensive but long-lasting, anti-corrosive resin emulsion that can be applied quickly to steel bars and rods so that they will not corrode when stacked out in the open has been patented by H. Brunel, 9 rue du General Niox, Paris 16, France.

A way of cutting down on smoking, by drawing less smoke at each puff has been developed by a French firm, Soc. Job Anciens Ets., 13 rue Emile Zola, Perpignan, France, which has produced a cigarette paper that allows smokers to do this.

An emulsion that is claimed to give tanned leather outstanding water-resistant properties while keeping it soft and supple and dry to the touch has been formulated by Farbenfabriken Bayer, Leverkusen-Bayerwerk, Germany.

Air curtain apparatus for the extremely large doorways of factories and workshops has been devised by Bahco, Klara Norra Kyrkogata 31, Stockholm, Sweden.

march together
work together

"*Let people in different parts of the country, however strong their feelings might be on particular issues, never forget that they are Indians first, and that all differences must be resolved within the unalterable framework of one nation and one country. Let us make every endeavour to foster this feeling of oneness and to carry forward the work of national integration.*"

—Lal Bahadur Shastri
Prime Minister

Our way is straight and clear—to build a strong India with freedom and prosperity for all.

Let us march together, work together as one nation, imbued with courage and determination, goodwill and tolerance.

JAI HIND

PRESERVE UNITY, PROTECT FREEDOM

DA 64/57

INDUSTRIAL SPECTRUM OF INDIA

CONTRIBUTION MADE TO NATIONAL INCOME QUITE SIGNIFICANT

ALTHOUGH the annual survey of industries (provisional results) for the calendar year 1962, published recently by the Central Statistical Organisation, relates to a period that is nearly two years old, the findings of the survey are of much useful value. For the findings, besides meeting the urgent requirements of research organisations, enable the public to have a clear idea of the vital role played by the industrial sector in the economic set-up of the country. The industrial sector covered in the survey comprehends all those factories registered under the Indian Factories Act 1948 which employ 50 or more workers with the aid of power or 100 or more workers without the aid of power. Such factories are said to account for almost 87 per cent of the total productive capital of all factories in all the 63 industry groups, 82 per cent of employment and gross output, and 84 per cent of value added by manufacture (see the footnote below Table A for definition of value added by manufacture). The remaining factories, namely, those employing 10 to 49 workers with the aid of power or 20 to 99 workers without the aid of power are covered on the basis of probability sample. The value added by manufacture is especially important, in that it indicates the significant contribution which the manufacturing industries (as a whole and also each industry) make to the national income of the country. Taking the total national income in 1962 at about Rs. 15,000 crores (at current prices), the combined share of the industries covered in the survey comes to as much as 7.2 per cent, the aggregate value actually added by manufacture being Rs. 1,074 crores.

The findings of the survey may be taken to represent the entire industrial sector, for they are based on the returns received from 9,314 factories out of the 9,733 registered in 1962, the coverage being as high as 96 per cent. The figures for 1962, it may be noted here, are not strictly comparable with those for 1961 in certain cases, because of one or more of the reasons mentioned

Table A: *Position at a Glance*

	1962	1961	Percentage increase over 1961
Factories registered (No.)	9,733	9,161	6.24
Factories reporting (No.)	9,314	8,930	4.30
Productive capital	3,078	2,374	29.65
Employment (thousands)	3,215	3,050	5.41
Salaries, wages and benefits (Rs. crores)	574	536	7.69
Ex-factory value of output (Rs. crores)	3,966	3,693	7.39
Value at factory of input including depreciation (Rs. crores)	2,892	2,716	6.48
Value added by manufactured* (Rs. crores)	1,074	987	8.10

* This represents that part of the value of the product which is created in the factory and is computed by deducting from the gross ex-factory value of output, the gross value of input comprising cost of materials, fuels, etc., amount paid for work done by other concerns, industrial and non-industrial services purchased, and depreciation.

in the survey: change in classification of factories, non-receipt of a major unit's return-card, transfer of units not conforming to employment criteria to sample sector, cards of one group appearing in the other, and non-inclusion of certain cards owing to late receipt. As of 1962, the 9,314 reporting factories together accounted for a productive capital of Rs. 3,078 crores, employed 3.2 million persons, paid Rs. 574 crores by way of salaries, wages and imputed value of benefits in kind, and produced Rs. 3,966 crores (ex-factory) worth of goods out of an input (including depreciation) of Rs. 2,892 crores. A broad comparison of 1962 with 1961 as given in Table A shows that, while the aggregate productive capital employed has gone up by 29.6 per cent, the ex-factory value of output has risen by only 7.4 per cent. There has, of course, been a relatively greater increase in the value added by manufacture, the actual increase being 8.1 per cent.

Among the industry groups, the textile industry (spinning, weaving and finishing) occupies the pride of place. This industry, while it covered not more than 11.3 per cent of the reporting units in 1962 and the share of which in the total productive capital was only 15.7 per cent, accounted for over one-third—34.2 per cent to be precise—of the aggregate employment, more than one-fourth (25.8 per cent) of the value of output, and nearly three-tenths (29.3 per cent) of the total value added by manufacture. An approximately similar position obtained in the preceding years in so far as this particular group is concerned. The 1,056 textile companies that submitted returns in 1962 together had a productive capital of Rs. 483 crores, employed 1.1 million persons and produced Rs. 1,024 crores worth of goods, of which the value added by manufacture was Rs. 318 crores. The second largest industry from the point of view of production is that engaged in the manufacture of food preparations, with a gross ex-factory output value of Rs. 376 crores in 1962. Next in importance comes the iron and steel industry, with its total production amounting to about Rs. 363 crores. The fourth biggest industry is the chemical industry, with a total production of Rs. 319 crores, of which the share of the basic industrial chemical sector (as of 1962) is Rs. 131 crores and that of the miscellaneous chemical sector is Rs. 188 crores. Then follows the sugar and *gur* industries, together accounting for an output of Rs. 216 crores. The other industries with the gross output (ex-factory value) exceeding Rs. 100 crores are machinery except electrical, electrical machinery, grain mills and railroad equipment, the actual gross output being Rs. 134 crores, Rs. 23 crores, Rs. 108 crores and Rs. 104 crores, respectively. The details of all these industries and a few more other important industries are furnished in Table B at the end of the page.

The value added by manufacture, as already stated, is a measure of the contribution of manufacturing industries as a whole to the national income. Taking this as an index, the order of importance of fifteen of the more important industry groups for the year 1962 is as follows:

(In crores of Rs.)

1. Spinning, weaving and finishing of textiles 318; 2. Iron and steel industries 83; 3. Miscellaneous chemical products 60; 4. Miscellaneous food preparations 56; 5. Machines except electrical 47; 6. Sugar and gur 43; 7. Railroad equipment 40; 8. Basic industrial chemicals 38; 9. Electrical machinery, etc. 36; 10. Printing, publishing, etc. 30; 11. Rubber products 28; 12. Motor vehicles manufacture 27; 13. Electric light and power 25; and 14. Metal products except machinery and transport equipment 24.

NOTE :—*More or less the same industry groups had their importance by way of larger contribution to the total value added by manufacture during the year* 1961 *also.*

From the point of view of employment, the biggest industry is, as already noted, the textile industry, the number of persons employed in 1962 being over a million, 1.1 million, to be precise. The second biggest industry is iron and steel with a total employment of 269,503 persons, followed by miscellaneous food and railroad equipment with a total of 208,544 and 162,113 persons employed, respectively. The machinery (except electric) industry employed (as of 1962) 130,791 persons and the sugar and *gur* industries about 126,292 persons. The other big "employers" are tobacco manufactures, other textiles, electrical machinery, printing, publishing, etc., miscellaneous chemicals, metal products (except machinery and transport equipment), electric light and power, repairs of motor vehicles, and paper and paper products.

The most highly industrialised States in the country are Maharashtra, West Bengal, Gujarat, Madras, Bihar and Uttar Pradesh. These six States together account (as of 1962) for 67 per cent of the large-scale factories reporting data, 66 per cent of the productive capital employed, 73 per cent of employment, 78 per cent of the value of output and 81 per cent of the value added by manufacture; the position in 1961 was almost similar. Table C gives summary details of industries located in each State. It will be seen from this table that Maharashtra is the most highly industrialised State. The 2,021 reporting factories (out of the 2,073 registered units in 1962) in this State had a total paid-up productive capital of Rs. 623 crores, which represented more than one-fifth (22 per cent) of the aggregate productive capital of all the 9,314 reporting factories, and employed 670,200 persons out of the all-India total of 3.22 million. In other words, out of every five persons employed in industries in India, one is employed in the industries situated in Maharashtra alone. This State accounts for as much as one-fourth of the aggregate ex-factory value of output, its actual

Table C: *State-wise Distribution*

	Factories registered (Nos.)	Factories reporting (Nos.)	Productive capital (Rs. crores)	Persons employed (000's)	Gross output ex-factory value (Rs. crores)	Value added by manufacture (Rs. crores)
Maharashtra	2,073	2,021	623	670	990	307
Gujarat	987	960	223	302	330	92
Andhra Pradesh	499	468	94	142	130	27
Assam	470	390	68	55	72	19
Bihar	304	293	289	185	309	84
Kerala	538	530	56	137	90	25
Madhya Pradesh	414	404	313	179	141	20
Madras	871	833	196	237	315	88
Mysore	390	382	103	122	122	42
Orissa	108	90	252	61	73	7
Punjab	429	410	86	83	131	26
Rajasthan	159	145	35	47	45	12
Uttar Pradesh	664	634	165	253	280	62
West Bengal	1,545	1,495	536	692	847	241

Delhi	183	174	30	45	68	16
Himachal Pradesh	16	12	2	2	2	0.2
Tripura	11	11	0.2	1	0.4	0.1
Pondicherry	22	20	4	3	3	1

share in 1962 being Rs. 990 crores. The combined contribution made by the industries of Maharashtra to the total national income of India during the year 1962 was Rs. 307 crores (the value added by manufacture), 29 per cent of the total for the industry sector. The second rank is held by West Bengal with accounts for about 18 per cent of the total productive capital employed by all industries covered in the 1962 survey, 21.53 per cent of employment, 21.36 per cent of ex-factory value of output and 22.48 per cent of the value added by manufacture. The four other most highly industrialised States in their order of precedence are Gujarat, Madras, Bihar and Uttar Pradesh. The industrially backward States are Assam, Orissa, Rajasthan, and Jammu and Kashmir. In between the highly advanced and the backward States come Andhra Pradesh, Punjab, Madhya Pradesh, Kerala and Mysore.

The total exports from India during the month of July 1964 aggregated Rs. 67 crores, that is Rs. 3 crores higher than in the corresponding month last year, while imports amounted to Rs. 91 crores, as compared with Rs. 70 crores. The trade deficit narrowed down by Rs. 24 crores. During the first four months of the current financial year, the total exports at Rs. 271 crores are higher by Rs. 27 crores, while imports at Rs. 3.69 crores are lower by Rs. 53 crores.

THE MYSORE PAPER MILLS LIMITED

CHAIRMAN, MR. M. D. SHIVANANJAPPA, URGES REVISION OF PAPER PRICES

TWENTY-NINTH ANNUAL GENERAL MEETING

A STRONG plea for revising the prices of paper was put forward once again by Mr. M. D. Shivananjappa, I.A.S., Chairman and Managing Director of the Mysore Paper Mills Limited, in the course of his speech at the Twenty-ninth Annual General Meeting of the Company held in Bangalore on Wednesday, 30th September 1964. He said that the ceiling on prices was a cause for the declining profits of the Company, in spite of an increase in turnover. The grant of an increase in price of Rs. 60 per tonne in 1962, in his opinion, was too inadequate to cover the rise in cost to the extent of Rs. 270 per tonne. He did hold out the assurance that increase in production would be maintained by operational efficiency of the Company, but pointed out that how far it would be reflected in accounts would depend on the official attitude regarding prices. Referring to the expansion schemes, the Chairman disclosed that the full range of equipment received from the foreign and indigenous firms had been installed and passed into service during the year under review.

The following is the text of Mr. Shivananjappa's speech:

LADIES AND GENTLEMEN,

As you are all aware, we are meeting under a shadow of depression due to the sad demise of Pandit Jawaharlal Nehru, our first and illustrious Prime Minister. India and the world have mourned the irreparable loss. May I request you kindly to stand up in silence for a minute and pay homage to the memory of the departed soul.

I have great pleasure in extending to you a cordial welcome to the twenty-ninth annual general meeting of the shareholders of the Company and place before you the report of the Directors and audited balance sheet for the year ended 31st March 1964. These have been circulated already and with your permission I shall take them as read and would proceed to review the salient features of the year's operations.

I am happy to report that your mills have produced 8,922 tonnes of paper which exceeds last year's production by 643 tonnes and the rated capacity by 922 tonnes. Sales during the year amount to Rs. 1,30,30,769, exceeding the turnover of the previous year by Rs. 7,32,009. Curiously enough, production and profits are running in opposite directions and profits are declining year by year. Decline in profits is largely due to the fact that production costs have increased and show no signs of decline, whereas there is a ceiling on the prices of paper. The present satisfactory working results are due mainly to increased production and operational efficiency.

Ceiling on Prices

It should be recalled that the Government of India, on the recommendations of the Tariff Commission, fixed prices in 1960 which were disappointing. On the repeated representations of the industry, the Government of India granted an increase of Rs. 60 per tonne in 1962, as against an increase in cost by Rs. 270 per tonne. It could be seen that this slight increase did not meet the demand of the situation. The representatives of the industry have been making repeated requests and appeals to the Government of India and have also presented their case supported by facts and figures. I take this opportunity again to repeat my appeal to the Government of India immediately to take steps to issue revised price lists, lest the incentive for expansion of production in the country should disappear altogether.

Turning to the balance sheet, I have to state that depreciation on fixed assets calculated in accordance with the rates allowed for normal depreciation and extra shift allowance as per Income-tax Act amounting to Rs. 5,76,201 has been provided. No provision is required for taxation as the Company has no assessable income for the year on account of development rebate allowance. However, provision has been made towards tax on dividends as per the Finance Act 1964 amounting to Rs. 78,750.

Your Directors have carefully considered the question of dividend. In this context, I should bring to your notice that dividend was declared and paid on Rs. 25 lakhs (old capital) and proportionate dividend on Rs. 25 lakhs (new capital) absorbing Rs. 5,46,500 for the year ended 31st March 1962, and Rs. 6,75,000 for the year ended 31st March 1963 on old capital of Rs. 25 lakhs and new capital of Rs. 50 lakhs for the proportionate period, though the new plant had not gone into production. Having regard to the increased production and turnover, your Directors felt it reasonable and fair to recommend declaration of dividend at 9 per cent subject to tax or at the rate of 90 paise (taxable) per share on the old capital absorbing Rs. 2,25,000 and at the same rate on the new paid-up capital also for the proportionate period absorbing about Rs. 8,25,000 for the year ended 31st March 1964, the total being Rs. 10,50,000. It should be noted that though there is a small cut in the rate of dividend, yet it is paid on an enlarged capital which has not begun to earn.

I am happy to inform you that the Industrial Finance Corporation of India have communicated their approval to our declaration of 9 per cent dividend subject to tax in terms of the agreement for which I am grateful to them.

Future Prospects

I have no doubt that in the light of what I have said, you will not be slow to appreciate and approve the proposals. In regard to the future, I can certainly assure you that increased production and high operational efficiency would be maintained but, how far these factors reflect in accounts, mainly depends on the attitude and action of the Government of India regarding revision of prices of paper. I should content myself by reiterating the hope that the Government of India would afford the industry the much needed relief speedily and assuring the shareholders that every endeavour would be made to improve the position.

I am very happy to inform you that the labour-management relations continue to be cordial. Your Directors have been pleased to sanction a bonus of three months' salary or wages and one more month's salary or wages as ex-gratia for having co-operated with the management in increasing productivity and the same has been disbursed to all our employees.

Scheme of Expansion

I am glad to inform you that the implementation of the scheme of expansion has made very satisfactory progress during the year under review.

Before going into details, I have pleasure to inform you that the new paper machine was serviced during the early part of March 1964 and the complimentary pads in your hands have been made on the fine paper turned out of the new machine. The expenditure on development work till the end of March 1964 amounted to Rs. 278 lakhs, inclusive of Rs. 150 lakhs incurred last year.

The foreign currency loan of Rs. 70 lakhs sanctioned by the Commonwealth Development Finance Company Ltd., London, has been drawn in full, a sum of Rs. 61.97 lakhs against a sanctioned loan of Rs. 70 lakhs has been drawn from the Industrial Credit and Investment Corporation of India, Ltd., Bombay, and a sum of Rs. 55 lakhs against a sanctioned loan of Rs. 60 lakhs from the Industrial Finance Corporation of India, Delhi, in rupee currency upto 31st March 1964 has also been drawn.

Imported Equipment

I am glad to state that the full range of equipments, namely, paper machine, stock and chemical preparation plant and other paper machine parts for which orders had been placed with Messrs. Escher Wyss of Ravensburg, Germany, and Messrs. Millspaugh of Sheffield, England, and boiler and steam distribution equipment from Messrs. Babcock and Wilcox have been received, installed and taken to service during the year. The duplex super cutter from Messrs. Masson Scott is received and erected. The erection of black liquor recovery unit ordered with Messrs. Babcock and Wilcox is almost completed.

Messrs. J. M. Voiths of Germany, in execution of the contract for supply of bamboo pulp plant, have despatched the entire machinery which has also been received at site. But there was considerable delay in receiving the three digesters and other indigenous equipments ordered in the country. However, I am glad to say that these three digesters ordered have now been received at site and all the other machinery equipment is also received and erection work is going on in full swing and will be completed by end of November 1964.

The new paper machine and other equipments now installed would help increase production during the current year by the use of imported and indigenous pulps.

Higher Production

It is a matter of special gratification to all of us that while high level of production and efficiency was maintained during the year, the scheme of expansion is also speedily and successfully being implemented.

Your Directors have contributed a sum of Rs. 1,001 to the Swami Vivekananda Centenary celebrations.

On behalf of the Company, I should express by grateful thanks to the authorities of the Commonwealth Development Finance Company Ltd., London, the Industrial Credit and Investment Corporation of India Ltd., Bombay, and the Industrial Finance Corporation of India, Delhi, State Bank of Mysore, State Bank of India, and the Canara Banking Corporation Ltd., for their support and valued assistance in the implementation of the development plans.

I would also like to express on behalf of the Directors and shareholders our gratefu thanks to the Central and State Government for their abiding interest in the progress of the Company.

I am grateful to my colleagues on the Board for their wholehearted support and valuable guidance.

I wish to express on behalf of the Director and my own, our warm appreciation of th willing and efficient co-operation of all ou employees.

Ladies and gentlemen, with these observations, I now move that the Directors' report an audited balance sheet and profit and loss account for the year ended 31st March 1964 b approved and adopted.

N.B.—This does not purport to be a repo of the proceedings of the shareholders' meetin a copy of which shall be sent to the shareholde separately.

Notice

ESSO STANDARD REFINING COMPANY OF INDIA LIMITED

NOTICE IS HEREBY GIVEN THAT THE Register of the Company's 5¼ per cent Debentures 1964-68 will be closed for transfers from 22nd October, 1964 to 31st October, 1964, both days inclusive.

N. RAMANAND RAO,
Secretary & Treasurer,
State Bank of India,
Agents for the Esso Standard Refining Co. of India Limited, for the management of the Debentures.

FORT, BOMBAY 1.

AHMEDABAD ELECTRICITY FARES WELL

REVISION OF TARIFFS DISPUTED

AN upward revision of its energy rates has helped the Ahmedabad Electricity Company Ltd. (Managing Agents: Messrs. Killick Industries Ltd., Bombay) to produce quite satisfactory results for the year ended 31st March 1964. Proceeds of sale of energy after deducting discount have gone up sizably from Rs. 695 lakhs to Rs. 812.42 lakhs and gross profits shows a substantial improvement from Rs. 177.63 lakhs to Rs. 218.69 lakhs. But because of the increase in gross profit the tax provision has nearly doubled from Rs. 23.83 lakhs to Rs. 44 lakhs and with depreciation claiming roughly Rs. 10 lakhs more at Rs. 71.28 lakhs, the net profit shows only a limited improvement from Rs. 83.54 lakhs to Rs. 94.11 lakhs and is, in fact, lower as compared with Rs. 99.99 lakhs obtained in 1961-62. It has, however, been supplemented with Rs. 12.27 lakhs written back from previous years' appropriation and, as a result, the Directors have been able to carry to reserves as much as Rs. 23.87 lakhs, as against Rs. 9.47 lakhs a year before, and still maintain the dividend on the 100-rupee shares at 8 per cent per annum, including the 3 per cent interim paid already.

The following table compares the Company's progress in the past four years:

(In lakhs of rupees)

	For the year ended 31st March			
	1964	1963	1962	1961
Sale of energy, less discount	812.42	695.00	600.32	542.55
Other income	16.34	14.50	12.48	11.80
Consumption of coal and fuel	436.04	374.78	323.12	188.42
Staff expenses	46.95	48.25	43.59	42.04
Other expenses	127.08	108.84	80.33	78.46
Gross profit	218.69	177.63	165.76	145.23

To reserves	23.87	9.47	26.64	19.73
Dividend	69.98 (8%)	69.98 (8%)	69.98 (8%)	61.23 (7%)
Carry forward	..	0.01	..	..

Equity shares' market value (in rupees):	1964	1963	1962	1961	1960
High	106.00	98.00	96.80	97.20	93.35
Low	94.00	87.20	88.00	83.50	78.20

The revision of tariffs has been disputed by the Gujarat Electricity Board. In March 1964, the Board issued a "show cause" notice on the Company. The latter thereafter referred the disputes raised by the Board to the Central Electricity Authority for arbitration as provided for in the Electricity (Supply) Act, 1948 and the Authority accepted the reference. Notwithstanding this, the Board constituted a Rating Committee to examine the Company's charges to its consumers and to make recommendations to the State Government in that behalf. The Company filed a writ petition in the Gujarat High Court against the order of the Board appointing the Rating Committee and the High Court has since issued an interim injunction restraining the Committee from functioning till the hearing and final disposal of the writ petition. In terms of the Injunction Order the arbitration will not be proceeded with till the final hearing and disposal of the writ petition.

Sale of energy, in terms of kilowatt hours, increased during the year by 10.41 per cent from 859,035,720 to 948,446,166, as against by 8.74 per cent from 790,004,664 to 859,035,720 in the previous year. As a result of commissioning of the second 30 MW. set, load restrictions in the form of evening recess staggering were removed in July 1963 and additional loads released at the same time. This set has increased the Sabarmati power station's generating capacity to 217,500 kw. The station peak during the year increased by 26,000 kw. (or 15.56 per cent) to 193,200 kw. The North Gujarat Grid recorded a demand of 46,650 kw., that is, an increase of 8,000 kw.

During the year, 52.47 km. of H.T. mains and 36.77 km. of L.T. mains were laid. In the reorganisation of II kV. ring mains, 58.63 km. of cables were recovered. Thirty-six sub-stations were erected and commissioned, including four for general purposes, 22 for rural electrification, six for industrial purposes and four for municipal drainage pumping stations and tube-wells.

In order to help meet the capital cost of the second 30 MW. unit and other normal expansion, the Company issued 20,000 7 per cent debentures of Rs. 1,000 each at par. These new debentures and the existing Rs. 300 lakhs 5.25 per cent ones are redeemable at par on 14th June, 1970, with the Company having an option to redeem them between 1965 and 1969. Secured loans of Rs. 213.51 lakhs comprise bank borrowings of Rs. 27 lakhs, A.I.D. loan of Rs. 178.15 lakhs and debenture issue application money of Rs. 8.36 lakhs. Taking bank loans of Rs. 27 lakhs and current liabilities and provisions of Rs. 254.52 lakhs, it is seen that the total short-term indebtedness works out to Rs. 281.52 lakhs, as against which current assets, book debts and investments aggregate Rs. 348.40 lakhs. The paid-up capital of Rs. 874.78 lakhs is supplemented with Rs. 232.67 lakhs in reserves and surplus. The gross block, which has expanded during the year from Rs. 21.36 crores to Rs. 23.07 crores, has been written down to Rs. 16.74 crores and, including capital work-in-progress of Rs. 20.73 lakhs, the net block stands at Rs. 16.95 crores.

Currently quoted at Rs. 106 *cum-div.*, the Rs. 100 fully paid ordinary shares of the Company offer a net yield of 6.4 per cent per annum.

GANNON DUNKERLEY AND CO.

The working results of Gannon Dunkerley and Co. Ltd. (Chairman: Mr. M. R. Morarka, Bombay) for the year ended 31st March 1964 are not so impressive as those for the previous year. Indeed, while the turnover of the Company has increased by as much as Rs. 82.29 lakhs to Rs. 376.12 lakhs, gross profit has risen only marginally by Rs. 2.05 lakhs to Rs. 20.33 lakhs. The profit-margin has thus receded from 6.2 per cent to 5.4 per cent. The decline in profit-margin has been due to the sharp rise of Rs. 87.20 lakhs in operating costs and other expenses. The effect of higher expenses would have been reduced greatly but for the reduction in import licences for steel required by the Company's cylinder factory, as a result of which it was not possible to attain optimum production. If the profit margin has not declined more steeply, it is because of the notable improvement in the Company's construction activities, the income from engineering contracts rising to Rs. 274.37 lakhs from Rs. 212.74 lakhs in 1962-63.

Out of the gross profit of Rs. 20.33 lakhs, the Directors have provided Rs. 2.59 lakhs (Rs. 2.62 lakhs in 1962-63) for depreciation. Provision for taxation is substantially higher at Rs. 10 lakhs (including Rs. 70,000 for sur-tax), as against Rs. 7 lakhs. Thanks to heavier tax liability, the net profit has fallen from Rs. 8.16 lakhs to Rs. 6.93 lakhs. The Directors have transferred only Rs. 2.20 lakhs to reserves, as against Rs. 4.00 lakhs in the preceding year. A sum of Rs. 4.50 lakhs has been earmarked for the dividend reserve. The equity dividend has been maintained at 12½ per cent to which level it was raised last year from 10 per cent distributed in respect of the years 1960-61 and 1961-62.

The Company's progress during the past four years is brought out in the following comparative table:

(In lakhs of rupees)

	For the year ended 31st March			
	1964	1963	1962	1961
Sales	376.12	293.83	267.57	259.26
Other income	12.48	15.40	12.15	9.02
Closing stocks	108.53	85.24	71.82	78.99
Expenses	391.56	304.36	259.03	271.40
Gross profit	20.33	18.28	13.52	13.31
Provision for—				
Depreciation	2.59	2.62	2.62	2.88
Taxation	10.00	7.00	4.40	3.60

Withdrawals from reserves and provisions	0.32	0.37	0.67	5.13
Transfer to dividend reserve	4.50	..	..	..
Transfer to other reserves	2.20	4.00	3.29	8.13
Dividend	4.50	4.50	3.60	3.60
	(12½%)	(12½%)	(10%)	(10%)
Carry forward	0.05	0.02	0.10	0.08

Two of the three Company's subsidiaries, that is, Gannon Dunkerley (Orissa) Ltd. and Gannon Norton Metal & Diamond Dies Ltd. have maintained steady progress. The latter company is expected to commence production of Diamond dies before the end of the next financial year. Large orders have been booked for tungsten carbide dies and arrangements for procurement of raw materials have been improved. The third subsidiary, Gannon Electrolytics Ltd., has not reported any improvement. The problems of marketing and satisfactory and elaborate tests of quality coupled with the dislocation of the technical management continue to face the Company. The Directors of that Company are now applying their minds afresh to the project as a whole.

The paid-up capital of the Company as at the end of March 1964 remains unchanged at Rs. 36 lakhs, made up of 36,000 equity shares of Rs. 100 each. This is supplemented by reserves and surplus amounting to Rs. 30.53 lakhs. Thus the total of the Company's own funds comes to Rs. 66.53 lakhs. The gross block is Rs. 50.68 lakhs (Rs. 49.37 lakhs a year before) which has been written down to Rs. 29.95 lakhs. Current assets, loans and advances are shown at Rs. 164.95 lakhs and investments at Rs. 8.51 lakhs. They together exceed the total indebtedness (including borrowings of Rs. 22.11 lakhs) of the Company by Rs. 33.54 lakhs.

EAST ANGLIA PLASTICS

In spite of some improvement in its results, the East Anglia Plastics (India) Ltd. has not been able to pay a dividend for the eighth year ended 31st March 1964. An increase in production from 111 tons to 600 tons is reflected in higher sales of Rs. 57.76 lakhs as compared with Rs. 7.69 lakhs in the previous year. Gross profit has improved from Rs. 1.19 lakh to Rs. 8.71 lakhs and, after depreciation, it amounts to Rs. 6.50 lakhs. This net figure has been utilised to write off accumulated loss of Rs. 4.08 lakhs, to transfer Rs. 10,750 to development rebate reserve and Rs. 2 lakhs to general reserve, and to carry forward the balance of Rs. 31,292 as the surplus, against a debit balance of Rs. 1.22 lakh a year before. Raw materials consumed during the year have cost Rs. 28.58 lakhs, staff expenses Rs. 5.14 lakhs and other expenses Rs. 19.78 lakhs. With a paid-up capital of Rs. 159.49 lakh (Rs. 96.53 lakhs in the previous year) and reserves and surplus amounting to Rs. 4.36 lakhs, the Company has a gross block carried in books at Rs. 33.15 lakhs (Rs. 26.02 lakhs a year before) and written down to a net value of Rs. 27.51 lakhs. The cellulose acetate flakes and plasticisers projects-in-progress are shown separately at Rs. 27.38 lakhs.

The year under review has proved significant in one way, in that the accumulated loss has been liquidated fully. The Directors' report shows a promise of better prospects for the current year. An actual user licence for raw materials received for the first time towards the end of 1963 should reflect itself in better results during the current year through an increase in the activities of the Company. Current year's production is likely to equal the installed capacity. An import licence for capital goods for expansion of the compounding plant has been issued by the Government. The plasticisers project is well under way and steps are being taken to increase the capacity in order to meet the Company's raw material requirements for its P.V.C. operations. The foundation-stone of the cellulose acetate flakes factory at Visakhapatnam was laid by Mr. Lal Bahadur Shastri in January this year. The installation of the pulp unit, perhaps during the current year, will make the beginning of a complex and integrated chemical and plastic industry over a long-range perspective.

The increasing activities at Visakhapatnam and at Dum Dum, where the plasticisers project is sited, will accelerate the Company's capital expenditure in the next few years. An equity issue, already sanctioned, is being deferred, while a preference share issue is under way. New possibilities for further backward integration and diversification are under study, and the Government has been approached for an industrial licence to install an industrial alcohol distillation plant at Visakhapatnam to ensure a steady supply of ethyl alcohol—the most important raw material for the integrated cellulose industry.

DAVANGERE COTTON MILLS

The downward trend in the turnover and profits of the Davangere Cotton Mills Limited (Managing Agents: Messrs. Hanumanthappa and Son, Davangere, Mysore) noted in 1962-63 was arrested during the year ended 31st March 1964. The total turnover of the Company for the year shows a rise of Rs. 26.08 lakhs to Rs. 198.31 lakhs, in contrast to the fall of about Rs. 5 lakhs to Rs. 172.23 lakhs in the previous year. In keeping with the handsome improvement in turnover, the gross profit, which had gone down from Rs. 34.85 lakhs in 1961-62 to Rs. 31.04 lakhs in 1962-63, has risen by about 10.5 per cent or Rs. 4.44 lakhs to Rs. 35.48 lakhs. In view, however, of the increase in essential provisions for depreciation is higher by Rs. 3.47 lakhs at Rs. 12.21 lakhs), Managing Agents' commission rose by Rs. 10,000 to Rs. 2.31 lakhs and taxation by Rs. 13,000 to Rs. 11.70 lakhs), the net profit shows a rise of only Rs. 74,000 to Rs. 9.26 lakhs. In order to maintain dividend at 12 per cent on the enhanced equity share capital after meeting the liability on preference shares, the Directors have reduced the transfer of reserve from Rs. 5.10 lakhs to Rs. 2.95 lakhs.

The progress made by the Company in the past four years is shown in the following table:

(In lakhs of rupees)

	For the year ended 31st March			
	1964	1963	1962	1961
Sales	198.31	172.23	177.18	167.85
Other income	4.48	2.78	2.56	1.68

Preference				
Carry forward	1.04	0.09	0.23	0.15

Market price for ordinary shares (in rupees):	1964	1963	1962	1961	1960
High	132.50	132.50	128.00	128.00	155.00
Low	132.50	132.50	128.00	128.00	140.00

Note: All dividends are subject to deduction of tax.

Last year, it will be recalled, the Company issued 15,000 equity shares of Rs. 100 each at a premium of Rs. 25 per share and 18,000 (9.5 per cent) redeemable cumulative preference shares of Rs. 100 each. This issue has raised the subscribed share capital of the Company from Rs. 34.51 lakhs to Rs. 62.98 lakhs, as at 31st March 1964. This is supported by reserves and surplus amounting to Rs. 54.76 lakhs. Current liabilities and secured loans aggregate Rs. 102.21 lakhs, against which there are current assets and investments amounting to Rs. 130.24 lakhs. The financial position of the Company is thus sound. The gross block of the Company, valued at Rs. 186.49 lakhs, has been written down to Rs. 89.71 lakhs.

The Gadag unit of the Company went into production on 4th May 1964 and it is expected that the full installed capacity of 12,000 spindles will be worked before the end of January 1965. In order to make this an economic unit of 25,000 spindles the Company is adding 13,000 more spindles; it has already obtained the official permission for expansion. The Company has also received permission for the installation of 3,065 spindles and 52 automatic looms for Davangere. Further, it has been allowed to produce two million yards of printed cloth per annum. Orders for machinery have already been finalised. The Company has received an additional loan of Rs. 14.54 lakhs in German currency from the Industrial Finance Corporation to meet the cost of imported German and Swiss machinery. This is in addition to the loan of Rs. 70 lakhs and a deferred payment guarantee of Rs. 52.96 lakhs obtained last year.

The Rs. 100 fully paid up shares of the Company are currently quoted at Rs. 132.50 *cum-div.* On an *ex-div* basis, they fetch a net yield of about 6.8 per cent per annum.

KIRLOSKAR PNEUMATIC'S RESULTS EXCELLENT

DIVIDEND CUT RESTORED

THE Kirloskar Pneumatic Company Ltd. (Chairman: Mr. S. L. Kirloskar, Poona) has reported a major break-through in sales and profits during the year ended 31st March 1964. The turnover, which has been rising since 1960-61 (the first year of full and regular production) at an average rate of about 20 per cent annually, has now spurted by as much as 72 per cent from Rs. 167.52 lakhs to Rs. 288.14 lakhs. The gross profit, which had increased from Rs. 20.81 lakhs to just Rs. 27.91 over the preceding three years, has spurted to Rs. 49.34 lakhs in 1963-64. This improvement, it is heartening to note, has been brought about by improved activity not in any one product line but almost the entire range of the Company's products. The profit-margin (ratio of gross profit to sales), too, has risen in the process from 16.7 per cent to 17.1 per cent—thanks to higher production—notwithstanding an expansion of some Rs. 30 lakhs in other expenses.

The higher gross profit has brought in its wake larger essential provisions from Rs. 17.18 lakhs to Rs. 35.42 lakhs in the aggregate. Itemwise, the actual increase is Rs. 1.80 lakh (to Rs. 4.15 lakhs) in the provision for Managing Agents' commission, Rs. 3.17 lakhs (to Rs. 7.77 lakhs) for depreciation and Rs. 13.27 lakhs (to Rs. 23.50 lakhs) for taxation. More than three-fourths of the gross profit have thus been neutralised by these prior charges. Even so, the net profit is higher by Rs. 3.19 lakhs at Rs. 13.72 lakhs. Out of this, a sum of Rs. 7.75 lakhs, as against Rs. 7.93 lakhs in the previous year, has been transferred to reserves and a further small sum of Rs. 15,000, as against Rs. 80,000, has been set aside to meet the preference dividend liability. The ordinary dividend has been restored to the level of 12.5 per cent, subject, to deduction of tax, and, because of the conversion of 9,107 out of the 10,000 preference shares into ordinary shares, the total amount claimed by the dividend is Rs. 3.88 lakhs, as against Rs. 2.13 lakhs a year before.

The sustained upward trend in the turnover and profits of the Company during the past four years is well brought out by the following comparative table:

(In lakhs of rupees)

	For the year ended 31st March			
	1964	1963	1962	1961
Sales	288.14	167.52	142.19	120.81
Other income	2.07	2.62	1.31	1.10
Closing stocks of finished goods and on consignments	3.52	2.21	14.60	0.11
Raw materials and stores consumed	170.12	86.64	97.40	78.23
Other expenses	72.06	43.20	38.07	22.17
Gross profit	49.34	27.91	22.52	20.81
Managing Agents' remuneration	4.15	2.35	1.80	1.77
Provision for—				
Depreciation	7.77	4.60	5.38	4.19
Taxation	23.50	10.23	8.14	7.01
Net profit	13.92	10.73	7.20	8.84
From reserves and provisions	..	0.17	0.02	..
To reserves	7.75	7.93	4.29	2.37
Dividends—				
Preference	0.15	0.80	0.89	2.26
Ordinary	3.88 (12.5%)	2.13 (10%)	1.93 (12.5%)	1.65 (12.5%)
Carry forward	0.32	0.19	0.15	0.06

Market price of ordinary shares (in rupees):	1964	1963	1962	1961
High	198.75	267.50	350.00	395.00
Low	170.00	267.50	276.25	195.00

As stated above, 9,042 preference shares of Rs. 100 each out of a total of 10,000 shares were converted into ordinary shares during the year. While this conversion has lowered the preference shares capital from Rs. 4.79 lakhs to Rs. 96,000, the ordinary share capital has increased correspondingly from Rs. 30.21 lakhs to Rs. 34.04 lakhs, with the result that the total paid-up share capital remains unchanged at Rs. 35 lakhs. This is supported by Rs. 31.29 lakhs in reserves and surplus. The total "own" funds thus come to Rs. 66.29 lakhs. As against these, borrowings aggregate Rs. 59.73 lakhs, in addition to current liabilities and provisions of Rs. 94.71 lakhs, and the total outside interest is Rs. 154.44 lakhs. Fortunately this is fully covered by the total of current assets, loans and advances which as at the date of the balance sheet, that is 31st March 1964, stands at Rs. 177.25 lakhs. The net assets are valued at Rs. 43.38 lakhs, as against a block account of Rs. 64.29 lakhs, including Rs. 13.58 lakhs as the cost of additions during the year.

Two reciprocating stationary compressors, a single stage machine of 800 cfm output and a two-stage machine of 1,000 cfm output, being the largest sizes made in India, were put on the market during the year. Considerable progress was also made in the development of semi-sealed air conditioning compressors to the design of the Westinghouse Electric International Company of the U.S. and the product has since been introduced in the market. Besides this, the Company has commenced manufacturing 600 cfm portable rotary compressors driven by Indian-built Cummins diesel engines which happen to be the largest machines of their class to be built in this country so far. Continuing its quest for fresher avenues of diversifying its business activity, the Company has signed a licence and technical assistance agreement with the Westinghouse Brake and Signal Company Ltd. of the U.K. for the manufacture in India of air brake compressors suitable for the railways. Similarly, a licence has been received for the manufacture of power transmission equipment (torque converters) and a licence and technical assistance agreement for manufacture of these in India is being finalised with the Twin Disc Clutch Company Ltd. of America.

The Rs. 100 paid-up shares of the Company are currently quoted at Rs. 170 *cum.-div.* and fetch on an *ex-div.* price a net annual return of over 6.2 per cent on fresh investment.

MYSORE ELECTRICAL'S PROFIT RISES

Thanks to its policy of integrated expansion, overall planning for production and careful adjustments in all directions, the Mysore Electrical Industries Ltd. (Chairman: Mr. R. D. Char, Bangalore) has been able to report an all-round improvement in production operations, sales and profits for the year ended 31st March 1964. The realisation from sale of products has risen by about 41.6 per cent, from Rs. 147.21 lakhs to Rs. 208.44 lakhs and the gross profit at Rs. 40.72 lakhs shows a gain of Rs. 17.08 lakhs over the previous year. This improvement is all the more heartening, because raw material supplies have been again the limiting factor which governed the expansion in output. In particular, supplies of steel sheets and plates, as also copper which constitutes an important raw material, have been very unsatisfactory as regards both quality and quantity.

In consonance with the increased gross profit, the remuneration payable to Managing Directors has advanced from Rs. 1.05 lakh to Rs. 1.87 lakh. Taxation also has gone up from Rs. 9.55 lakhs to Rs. 20.65 lakhs. The provision for depreciation, too, has risen, albeit slightly, from Rs. 2.55 lakhs to Rs. 3.28 lakhs. Even so, the resultant net profit at Rs. 14.92 lakhs shows a handsome increase of Rs. 4.43 lakhs. After transferring Rs. 10.84 lakhs out of this to reserves and provisions, the Directors propose to maintain the dividend at 12 per cent, subject to deduction of tax, which claims as before Rs. 4.20 lakhs.

The following comparative table presents synoptically the working results of the Company for the past four years:

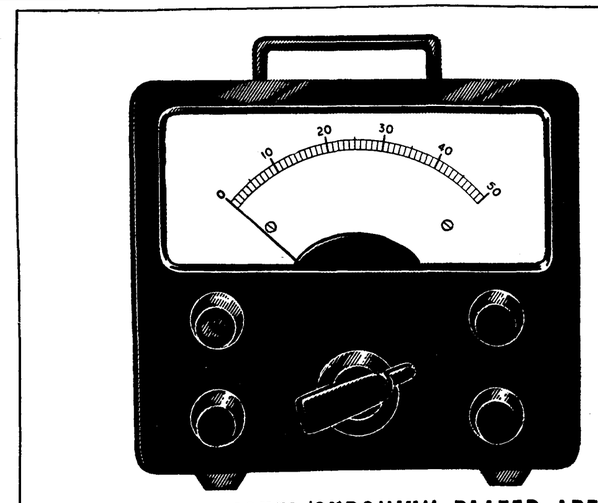
(In lakhs of rupees)

	For the year ended 31st March			
	1964	1963	1962	1961
Sales and services	208.44	147.21	102.74	77.73
Closing stocks of finished goods	6.08	4.13	2.97	3.46
Raw materials and stores consumed	129.17	95.25	64.43	49.86
Other expenses	40.50	29.48	21.75	17.91
Gross profit	40.72	23.64	16.07	12.15
Managing Director's remuneration	1.87	1.05	0.74	0.57
Provision for—				
Depreciation	3.28	2.55	1.17	1.13
Taxation	20.65	9.55	6.91	4.91
Net profit	14.92	10.49	7.25	5.54
Withdrawal from reserves and provisions	0.12	0.11	..	..
To reserves and provisions	10.84	6.39	3.75	2.40
Dividend	4.20 (12%)	3.50 (12%)	3.50 (20%)	3.16 (20%)
Carry forward	0.03	0.03	0.02	0.02

There has been a nominal increase in the paid-up share capital of the Company during the year from Rs. 34.93 lakhs to Rs. 35.12 lakhs, all in equity shares of Rs. 100 each, but the reserve position has improved from Rs. 18.70 lakhs to Rs. 27.77 lakhs. Although borrowings have registered a sharp decline of Rs. 11.29 lakhs to Rs. 26.58 lakhs, current liabilities and provisions have risen from Rs. 36.21 lakhs (including Rs. 4.20 lakhs for dividend) to Rs. 58.67 lakhs. And so the outside interest amounts to Rs. 85.25 lakhs, as against the own funds of Rs. 62.89 lakhs. On the assets side, the gross block, following the additions of Rs. 8.67 lakhs during the year, stands raised to Rs. 41.54 lakhs and, on deducting therefrom Rs. 14.39 lakhs as accumulated depreciation yields a net block of Rs. 27.15 lakhs.

As regards the outlook for the current year, the Directors inform that the order books of the Company are in a very healthy state not only covering the remaining of the current year but also overflowing to the next year, in spite of the increased rate of production.

The Rs. 100 paid ordinary shares of the Company are currently priced at Rs. 166 *cum-div.* On an *ex-div.* price, the net yield works out to 6.1 per cent per annum.



DO YOU MAKE NICKEL/CHROMIUM PLATED ARTICLES?
then test your plating with this instrument

Attention to quality is the first step in the production of goods which *sell*. Eye-catching chrome thinly plated will sell — once. As soon as the plating peels or becomes rusty — the manufacturer's name suffers — affecting repeat sales.

- Is the thickness of the plating specified to the plater?
- Are you aware of the Indian Standard specification 1068:1958 on nickel plating?
- Can you check that the finished article conforms to your specification?

How do *you* ensure lasting quality? Ask yourself these questions.

As a first step write today for further information from

NICKEL INFORMATION BUREAU PRIVATE LIMITED

Transfer to development rebate reserve	1,02	Nil
To income-tax paid for 1960-61	Nil	1,03
To dividends	Nil	Nil
Carry forward (debit balance)	—5,11	—11,61†
Market value of equity shares (in rupees):	1964‡	1963
High	14.06	15.81
Low	11.75	13.25

*Loss after providing for depreciation and Secretaries and Treasurers' remuneration.
† Loss after adjusting with the previous year's credit balance brought forward of Rs. 1,66,274.
‡ High and low upto 21st August 1964.

Extracts from the Directors' report: *Production Operations*: In December 1963 the big tunnel kiln came into production on a slow cycle. The total production during the year was 1,720 tons against the rated capacity of 5,400 tons. The manufacture of first class quality sanitaryware requires specially trained labour to mould and finish the products. The Company's trained and skilled labour are a credit to its foreign technicians who have done a superb job. This has enabled the Company to market its products whose quality and finish conform to International Standards.

This Company is the first in India to produce *Vitreous China Sanitaryware*. Recently, the Indian Standards Institution has laid down specifications and tests for *Vitreous China Sanitaryware* and the Company has applied for a licence to stamp its products with its mark.

Sales: The extraordinary slow progress in new housing has resulted in the offtake being very disappointing. In the Company's products, there is a well-established buyers' market. With the increased production of cement, the demand for sanitaryware is likely to increase but during the current year the plant will only run at approximately half-speed.

Selling Prices: In these days of rising prices this Company is one of the very few which has slashed its prices by approximately 25 per cent, thus passing on the benefit of mass production to consumers.

Accounts in brief as at 31st March 1964 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	59,88,500	Gross block	1,07,03,504
Development rebate reserve	1,02,500	—Depreciation	19,85,994
Other liabilities	61,07,707	Net block	89,17,510
		Block-in-transit	26,427
		Current assets	25,56,719
		Investments	3,000
		Cash	32,826
		Miscellaneous expenditure	2,46,250
		P.L. % deficit	5,10,975
	Rs. 1,21,93,707		Rs. 1,21,93,707

* Paid-up capital consists of 4,00,000 equity shares of Rs. 10 each and 20,000—7 per cent tax-free cumulative redeemable preference shares of Rs. 100 each. Amount paid-up on shares forfeited is Rs. 11,200.

Chemicoat Ltd.

(*Chairman*: Mr. A. N. Kilachand, Bombay.)

Third Annual General Meeting—Held on 25th September 1964.

Extracts from the Directors' report for the year ended 31st March 1964: The profit and loss account shows a loss of Rs. 6,63,758 after providing for depreciation of Rs. 2,71,779 and transferring a sum of Rs. 1,88,051 to the Expenditure during Construction Account. With the previous year's loss of Rs. 46,259 the total loss to be carried forward is Rs. 7,10,313.

Progress and Production: After initial trials starting on 15th July 1963, several difficulties were encountered for the continuous operation of the plant and as such the Company was unable to achieve target production. The quality of Indian paper delivered to the Company was found to be much inferior to that anticipated and as such required installation of certain additional equipment.

A De-humidification Plant has been ordered by the Directors and when it is commissioned the Company hopes to have a sizable volume of production of metalised paper. With the assistance of the technical personnel of the Company's collaborators it has been possible to overcome most of the problems encountered to ensure reaching the rated capacity of production.

During this period of technical adjustments, the Company has been able to develop independently the manufacture of *Stamping Foils* the demand for which has been met from imports so far. The Directors have requested the Government to register the Company as manufacturers of *Stamping Foil*. The market for this item is substantial and with the necessary assistance from Government, the Company hopes to meet the entire Indian demand for this product.

Finance: In addition to the term loan of Rs. 5 lakhs shown in the accounts, the Company arranged for a further term loan of Rs. 3 lakhs from the Company's Bankers against security of fixed assets of the Company by way of second mortgage ranking *pari passu* with the first mortgage created in favour of the Industrial Credit and Investment Corporation of India Limited and against personal guarantee of one of the Directors of the Company. This loan is now fully drawn.

Accounts in brief as at 31st March 1964 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	19,91,125	Gross block	31,84,682
Secured loans	13,27,641	—Depreciation	2,71,779
Unsecured loans	5,08,764

Low	8.55	7.00

* High and low upto 11th September 1964.

Extracts from the Directors' report: The shareholders are well aware that this Company has switched over to production of *Clutch Discs* and *Steering Linkage System*. These products have been well received in the market. To keep pace with the demand of *Tie Rod Ends*, the managing agents have taken up on hand proposals for expansion and the Directors feel that it is an imperative step the Company should take. The Government of India have sanctioned the Expansion Scheme and the managing agents have estimated the expansion to cost Rs. 20 lakhs. This is proposed to be met by raising share capital and long-term loan.

The Company had applied for an Industrial Licence for the manufacture of *Molded Brake Linings* which has a very good potential. Financial and technical collaboration has been arranged. The Board of Directors contemplate the formation of a separate Company, for this purpose with this Company taking a financial interest and offering the balance of the Indian Capital to the existing shareholders.

Accounts in brief as at 31st March 1964 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	15,90,750	Gross block	46,31,719

,, ,, development rebate reserve	25	4
,, ,, dividend reserve	Nil	3,00
Proposed dividend (taxable)	4,50 (9%)	3,00* (6%)
Carry forward	Nil	Nil
Market value of equity shares (in rupees):	1964†	1963
High	33.00	37.50
Low	33.00	33.25

* Dividends for 1963 were paid out of the dividend reserve.
† Upto 22nd September 1964.

Extracts from the Directors' report: During the year the Subscribed Capital was increased to Rs. 5,000,000 with the allotment of 250,000 equity shares of Rs. 10 each as bonus shares.

Operations: In spite of severe competition sales of bottled beer rose by 19.5 per cent as compared with the previous year. The total turnover and profit are the highest so far achieved. Although costs increased appreciably, selling prices remained unchanged.

The dispute with the Mysore State Excise authorities regarding their demand amounting to Rs. 12,48,497 as excise duty on beer despatched outside the State between 1st July, 1959 and 31st July, 1961, has not been settled.

The proposal for the issue of bonus shares of the nominal value of Rs. 25,00,000 is being kept in abeyance in view of the recently introduced principle of taxing such issues in the hands of shareholders. However, the Directors have recommended a proportionately higher dividend for the year.

Subsidiary Companies:

Cardboard Industries Limited: The Company holds 60 per cent of the capital of this subsidiary. The Company is engaged in the procurement and supply of cardboard cartons and partitions to McDowell & Company Limited and intends to set up a factory in due course to manufacture these items.

Carew & Company Limited: The Company holds 53.94 per cent of the equity capital of this subsidiary. The Company owns a sugar factory at Rosa with a crushing capacity of approximately 750 tons of cane per day, a distillery at Rosa with a capacity of approximately 450,000 bulk gallons of alcohol per annum, a distillery at Asansol with a capacity of approximately 750,000 bulk gallons of alcohol per annum, a sugar factory at Darsana, East Pakistan, with a crushing capacity of approximately 1,000 tons of cane per day and a distillery at Darsana, with a capacity of approximately 750,000 bulk gallons of alcohol per annum.

Darlco Cannings Limited: The Company holds 50.99 per cent of the equity capital of this subsidiary. The Company owns a fruit processing factory at Trichur and is the largest canner of pineapple products in India. Kissan Products Limited act as Technical Advisers to the Company. The Company's factory is being expanded in order to take care of the increasing demand for its products.

High Range Breweries Limited: The Company holds the entire issued share capital of this subsidiary, which has not commenced trading as yet.

McDowell & Company Limited: The Company holds 53.94 per cent of the equity capital of this subsidiary. Although the difficulties in securing regular supplies of molasses continue, the Company's business is developing very satisfactorily.

Mysore Wine Products Limited: The Company holds the entire issued share capital of this subsidiary, which had not commenced trading during the year under review. Recently the Company undertook the procurement and supply of grapes to McDowell & Company Limited.

Phipson & Company Limited: The Company holds 74.55 per cent of the capital of this subsidiary, 100 shares having been acquired very recently. Liquor sales have increased substantially, the turnover for the first seven months of the current year being almost equal to the turnover in 1963, and the prospects may be considered to be very satisfactory.

Phipson & Company (Pakistan) Limited: This is a subsidiary of Phipson & Company Limited, who hold 66.68 per cent of its capital. The Company continues to make good progress yielding satisfactory returns.

Prospects for the current year: In spite of increasing competition, during the first two months of the current year sales increased by 11.8 per cent as compared to the corresponding period of the previous year. While this trend would have been maintained based on the orders in hand, despatches dropped heavily from June as the Mysore State Excise authorities insisted on collecting the full rate of excise duty prevailing in Mysore State on beer despatched outside the State. Such despatches had, therefore, to be suspended and were resumed only on 12th August, 1964, after the Government of Mysore issued an order, the effect of which is obscure. The matter is being pursued with the Government.

The Company, as well as the several companies in which it has a substantial interest, continues to make very good progress. The Company can look forward to the future with confidence.

Accounts in brief as at 31st March 1964 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	50,00,000	Gross block	73,35,585
Reserves and surplus	72,96,098	—Depreciation	27,08,709
Other liabilities	62,77,328	Net block	46,26,876
		Current assets	39,20,307
		Investments	1,00,99,432
		Cash	16,811
	Rs. 1,85,73,426		Rs. 1,85,73,426

* Paid-up capital consists of 5,00,000 equity shares of Rs. 10 each. Of the above, 56,680 equity shares are allotted as paid up to the extent of Rs. 7.50 per share without payment being received in cash and 2,50,000 equity shares are allotted as fully paid up by way of bonus shares through capitalisation of reserves.

Ellore Engineering Co., Ltd.

(*Chairman*: Mr. K. L. Narasimha Rao, Madras.)

Registered Office: 20, Second Line Beach, Madras 1.

Thirtieth Annual General Meeting—Held on 29th September 1964.

Extracts from the Directors' report for the year ended 31st March 1964: The name of the Company was changed from The Ellore Electric Supply Corporation Ltd., to its present name Ellore Engineering Company Ltd., and this change became effective from 24th February 1964.

In the year under review the Forging Factory was built, machinery was installed and trial run was commenced from 15th March 1964. The factory would have worked even earlier but for the delay in the supply of permanent high tension power by the State Electricity Board. Fortunately, the temporary power given earlier, i.e. in November 1963, enabled the Company in testing the machines and training workers, which made possible the working of the factory from 15th March 1964. The factory started working second shift from 10th May, 1964.

The second set of *Hammer, Trimming Press* and the *Furnace* are being installed and will go into operation by end of September, 1964.

Though the profit and loss account shows a loss of Rs. 1,14,123, the actual loss incurred is only Rs. 16,404 as the balance of the amount viz., 97,719 represents the amount set aside for development rebate. As the factory commenced production only by about 15th of March, 1964, no depreciation is provided for on buildings, plant and machinery and electrical installation. But development rebate has to be provided for even if the factory works for a day. Hence the provision for development rebate.

Dividend: The Directors recommend a transfer of Rs. 1,44,123 to the profit and loss appropriation account from the surplus on acquisition account to set-off the loss of Rs. 1,14,123 and to recommend for payment of 10 per cent dividend subject to taxes, which will absorb Rs. 30,000.

Accounts in brief as at 31st March 1964 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	3,00,000	Gross block	11,03,614
Reserves and surplus.	97,719	—Depreciation	8,814
Acquisition a/c†	6,51,895		
Other liabilities	7,09,480	Net block	10,94,800
		Current assets	5,75,389
		Investments	7,980
		Cash	7,355
		Miscellaneous expenditure	73,570
	Rs. 17,59,094		Rs. 17,59,094

* Paid-up capital consists of 30,000 equity shares of Rs. 10 each.
† This represents the surplus realised on acquisition of the Ellore Electrical Undertaking by the Government of Andhra Pradesh.

Radio and Electricals Manufacturing Co., Ltd.

(*Chairman*: Mr. T. Shamanna, Bangalore.)

Low	20.87	18.94

* Only a sum of Rs. 100.
† Dividends = Payment out of the dividend reserve.
‡ Upto 22nd September 1964.

Extracts from the Directors' report: During the year, machinery and equipment of the value of Rs. 39,66,928 acquired in connection with the implementation of some of the expansion schemes undertaken by the Company were installed. This includes a sum of Rs. 5,51,496 representing interest due to be paid to the Japanese suppliers for the balance period of about seven years on the cost of machinery obtained on ten-year-period deferred payment terms which has been capitalised. Machinery and equipment have also been re-classified during the year to claim the benefit of full depreciation allowable under the Income-tax Act. Depreciation on these machinery and equipment and other fixed assets increased from Rs. 3,84,333 in the previous year to Rs. 10,74,334.

In connection with the implementation of the various expansion schemes undertaken by the Company, additional loans had to be raised on which interest increased from Rs. 2,36,341 in the previous year to Rs. 4,98,527.

With a view to overcome shortage of power without which the Capacitor Project could not have been implemented, diesel generating sets purchased for the purpose, as mentioned in the previous report, had to be operated which resulted in the increase in the cost of electricity.

Increased expenditure had to be incurred for Workmen and Staff Welfare Expenses, arising out of the truce agreement towards supply of uniforms, shift allowance, etc. The subsidy to canteen and transport also increased.

Competition: Severe competition has developed for some of the products manufactured by the Company. The Directors are keeping a close watch on the market trend and are considering further diversification of production, by taking up new lines of production.

Export: Export has now assumed crucial importance in the economy of this country and Industry has to fall in line with the policy of Government. Successful implementation of some of the expansion schemes undertaken by the Company depends a great deal on the building up, as rapidly as possible, of its exports. The Government of India have issued a Capital Goods Import Licence for the Water Meter Project subject to payment to the suppliers out of a portion of the export earnings. There is the further stipulation that a percentage of production of Water Meters should be exported. In respect of new collaboration agreements for other products also similar instructions are being received.

Expansion Scheme: During the year under review, a beginning was made in the manufacture of *polyphase electricity meters* and paper and electrolytic condensers and these products are now put on the market. Special mention may be made of the development and manufacture on a commercial scale of *Electric Massagers* and *Time Recorders/Hour Meters* without the assistance of the knowhow from outside sources. Import licence for the equipment required for the manufacture of *Loudspeakers* has since been received and production on a commercial scale would commence in about a year's time. Being unable to obtain the import licence for the wire drawing equipment, indigenous equipment has been purchased and is being installed as an additional [illegible]

Bally Jute Co., Ltd.

(*Secretaries & Treasurers*: Messrs. Birla Brothers Private Ltd., Calcutta.)

Kuljian Corporation (India) Private Ltd.

Travelling beyond the field of thermal power generation in India, where giant power plants bear witness to its technological finesse, Kuljian has long since become active in the field of steel and metallurgy. Already technical consultants for the Mahindra-Ugine Alloy Steel Plant in collaboration with Cetig of France and for a number of steel casting foundries in the public and private sectors in several States, Kuljian offers all or any of the following consultancy services to the iron and steel industry with the same confidence as it has been displaying in the field of power generation for the last 15 years.

■ MINING AND BENEFICIATION OF ORES AND FUELS ■ INTEGRATED STEEL PLANTS ■ EXTRACTIVE METALLURGY ■ ELECTRIC SMELTING OF IRON AND FERRO ALLOYS ■ BLAST-FURNACE IRON PLANTS ■ NON-FERROUS METALLURGICAL PLANTS ■ FOUNDRIES AND MACHINE SHOPS.

AN INDO-AMERICAN JOINT ENTERPRISE

The Kuljian Corporation (India) Private Ltd.

ENGINEERS . CONSTRUCTORS

Extracts from the Directors' report: *General*: The working results of the year show a setback in profits, as compared with the position in the previous year. This has been mainly due to the recession in prices of jute goods during the year, whereas the prices of raw jute has been maintained at the minimum operational level of Rs. 30 per maund, as fixed by the Government of India. Throughout the year, the jute industry worked at maximum capacity, and the large volume of production, coupled with stiff competition in overseas markets, has led to accumulation of finished goods. The industry's stock of gunnies, which stood at 91,000 tonnes on 1st April, 1963, increased to 1,25,200 tonnes by 31st March, 1964 and it has further risen to over 1,28,000 tonnes by 30th June, 1964.

Mention was made, in the Directors' previous year's report, of the programme for installation of *Broad Looms*, and they are pleased to report that the Company installed 50 *Broad Looms* during the year and started production of *Carpet Backing*. It is proposed to increase the number of such looms to 75 in the current year, provided the market demand justifies it.

For the financing of the Company's expansion programme, the Directors had to depend on large borrowings from the Secretaries & Treasurers and others. As the present paid-up capital of the Company does not bear a correct relation to the activities and assets of the Company, the Directors propose to offer ordinary capital of Rs. 20 lakhs at par as right shares, to the existing shareholders, on the basis of one new share for each old share held.

Further growth and diversification is one of the management's primary objectives. They have been taking steps in these directions.

Accounts in brief as at 31st March 1964 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	40,00,000	Gross block	2,08,31,514
Reserves and surplus	46,56,493	—Depreciation	1,08,77,173
Other liabilities	1,41,44,555	Net block	99,54,341
		Block in progress	2,56,022
		Current assets	1,19,26,207
		Investments	5,93,791
		Cash	70,687
	Rs. 2,28,01,048		Rs. 2,28,01,048

* Paid-up capital consists of 20,000—10 per cent. cumulative preference shares of Rs. 100 each and 20,000 ordinary shares of Rs. 100 each.

NEWS IN BRIEF

THE free trade zone in Kandla is expected to be inaugurated on the 14th November next by Mr. Mohanlal Sukhadia, Chief Minister of Rajasthan.

The ammonia plant in the fertiliser factory at Trombay, near Bombay, is expected to start trial operations in November next, followed by the urea plant in about six weeks' time. The expenditure incurred up to 31st July 1964 was Rs. 27.93 crores.

The various aspects of fertiliser production and distribution will be critically examined by a committee which has been set up by the Government of India. The Chairman of the Committee is Mr. Shivram, Chief Secretary to the Government of Orissa.

The Punjab Government has been given a loan of Rs. 1.75 crore by the Central Government for financing the Beas project during the current financial year. Including this, the total loan assistance made available by the Centre to the project comes to Rs. 24.87 crores.

A uranium mill with a capacity of 1,000 tonnes of ore per day and with provision for future expansion is being set up at Jaduguda near Jamshedpur at an estimated cost of about Rs. 4.29 crores. It has been designed and is being built entirely by Indian scientists and engineers.

The Government of India has decided to permit the setting up of a woollen spinning mill with 800 spindles in Goa. A Government Press note issued in this connection says that import of raw materials will not be permitted and that indigenous machinery must be utilised as far as possible.

The Neyveli Lignite Corporation raised during 1963-64, as much as 1.2 million tonnes lignite and the target for 1964-65 is placed at two million tonnes. The total amount spent during 1963-64 by the Corporation was Rs. 26.69 crores. There is no proposal to raise the authorised capital of the Corporation.

The Indian railways are planning to manufacture two-coach diesel rail car units at the Integral Coach Factory at Perambur. This unit will consist of two metre-gauge third class cars, having a total carrying capacity of 166 passengers and will be provided with amenities like electric lights, fans and lavatories with wash basins and mirrors.

The total revenue receipts realised from items on which duties and taxes are levied and collected by the Central Government aggregated Rs. 441.62 crores, during the first four months of the financial year 1964-65, as compared with Rs. 408.13 crores collected in the corresponding period last year.

The Governments of India and the United Arab Republic signed on Monday this week an agreement for mutual collaboration in producing supersonic Mach—2 combat aircrafts. Under the agreement, the two countries will exchange technical missions at an early date for further study and consultations.

Licences for starting new sugar factories will be granted only from the early part of the fourth Plan, according to Mr. C. Subramaniam, Union Minister for Food and Agriculture. As against the target of granting licences covering a total of 35.6 lakh tons during the third Plan, only 1.5 lakh tons remained to be covered.

Under trade agreement signed on Monday this week at Bombay between the Governments of Soviet Union and Maharashtra, the Soviet Union will provide six tractors of 300 h.p. and 12 dumps of 25 tons capacity together costing about Rs. 40 lakhs for the construction of an earthern dam under the Mula project. Repayment will be in rupees.

A low temperature carbonisation plant with a capacity of 45 tonnes of coal input per day is proposed to be erected at Kothagudam in Andhra by the Singareni Collieries Company Ltd. during the fourth Plan period. The project report is under preparation. A final decision will be taken after the report is ready and the economics of the project has been worked out.

The committee appointed by the Union Ministry of Petroleum and Chemicals to examine the feasibility of setting up petrochemical industries in Assam has observed that the the proposal will not be economically viable from the point of view of production cost. Even if the entire quantity of natural gas are to be made available for fractionalisation, it is stated, the cost will be more.

The Indian Airlines Corporation and Air Ceylon have tentatively agreed on the collaboration in their India-Ceylon airlines services. At present, both the airlines operate only between Madras and Colombo. In future there are likely to be direct Bombay-Colombo flights. The two airlines will collaborate on the basis of equal frequency rights. They are also understood to have reached an understanding on pooling of revenue and mutual handling of aircraft. An Air Ceylon delegation has been invited to India to finalise the agreement.

The Union Government proposes to revise the series of commodities for the compilation of index number of wholesale prices in the country, according to Mr. B. Misra, Deputy Minister of Industry and Supply. The new series will have 1961-62 as base and cover about 128 commodities and 775 quotations, as against 122 commodities and 555 quotations (of the present series with 1952-53 as base). The weightage assigned to various commodities will be on the basis of value marketed during the base year. Grouping of commodities is also being modified and these will be seven groups instead of five as at present. The new series is proposed to be published by the end of this year.

The production of the field cables at the Ordnance Cable Factory in Chandigarh had more than doubled during the first year of its existence. The factory, it will be recalled, started work in September 1963, by manufacturing 17 miles of field cables per day. At present, it is producing about 40 miles of cables daily, saving over Rs. 2 lakhs per month in foreign exchange. The factory has been set up on a 40-acre site by the Ministry of Defence in collaboration with Messrs. Sumitomo Electric Industries Ltd., Osaka, Japan. The project had cost Rs. 59 lakhs, including Rs. 25 lakhs in foreign exchange. It was formally opened by the Defence Minister, Mr. Y. B. Chavan, in February this year.

The first of the new ordnance factories included in the defence Plan has gone into production and its formal inauguration will take place on 15th of this month. The factory has been set up at Varangaon in Maharashtra with assistance from the U.S. It will be inaugurated by the Union Defence Minister. Situated at 35,000-acre site, the Rs. 20-crore factory is manufacturing 7.62 mm ammunition required for the semi-automatic Ishapore rifle and other arms. The factory has gone into production in the record time of eight months, the first sod of earth having been broken in January this year. The factory has been set up under the overall control of the Directory-General, Ordnance Factories. The installation of the plant has been done entirely by Indian engineeers.

From Abroad

Japan is seeking a $200-million increase in its $500 million International Monetary Fund quota.

The Government of Canada has imposed a limit to non-resident shareholdings to 25 per cent of issued shares of Canada's banks, life insurance companies, trust companies and loan companies.

An agreement on arrangements governing exports of Hong Kong made cotton textiles to the U.S. during the third year of the long-term arrangement has been reached between the Governments of the two countries.

An agreement covering the joint production of 160 Rolls-Royce powered Transall military transport aircraft by Nord Aviation and Messier of France and two German firms has been signed between France and West Germany.

The Italian Senate has defeated a Government measure to increase the turnover tax from 3.3 to 4 per cent by secret ballot. The increase had been sought by the Government as a measure to overcome Italy's economic difficulties.

The number of collective farms in Poland at the end of June 1964 was 1,326, recording a drop of 41 since the beginning of the year. Collective farms now occupy less than one per cent of Poland's farmland, whereas State farms occupy 12 per cent and the rest of the land consists of small private farms.

Britain's first 100,000 d.wt. oil tanker, now being built for the British Petroleum by the Vickers-Armstrong at Barrow-in-Furners, will be launched early next year. The tanker will enter the water with all its machinery installed, making it one of the heaviest ships ever to be launched in Britain.

President Johnson has signed a Bill which envisages the setting up of a commission to study the project for linking sea level canal with the Atlantic and Pacific oceans. This study will cost $5 million in the current fiscal year. The commission while selecting the site, will consider the enormous technical problems and complex political, military and economic considerations.

PERSONAL

MR. K. C. Kuruvilla has been appointed General Manager of State Bank of Travancore Trivandrum.

Mr. K. Srinivasan, Deputy Secretary, Union Ministry of Transport, has been appointed Senior Deputy Director-General of Shipping.

Mr. Harbans Singh, General Manager of the Northern Railway, has been appointed a Member of the Railway Board.

Mr. Leonard A. Berry, a U.N. Press Officer has been appointed Director of the U.N. Information Service in New Delhi.

Mr. Tanubhai D. Desai has been elected the President of the Bombay Shareholders' Association for 1964-65. Mr. D. Maganlal and Mr. Gordhandas Bhagwandas have been elected Vice Presidents.

Mr. Gunnar Ericsson, Managing Director of the Swedish Facit Group and Chairman of the Swedish Metal Working Industries has arrived in India, in connection with the inauguration of Facit Asia Ltd.'s new factory at Madras.

Mr. D. S. Joshi, Secretary to the Union Ministry of Commerce, has left for New York to attend the meeting of the Special Conciliation Committee set up by the U.N. Conference on Trade and Development held at Geneva recently.

Mr. Akbar Hydari, who has been an Executive Director of the Western India Match Company Ltd. since 1951, has been elected Chairman of the Company by the Board of Directors, in succession to Mr. Chunilal V. Mehta who has held the chair for the last 25 years.

The Bank of Japan has accepted the Japanese Finance Ministry's plans to stabilise the stock market. The measures agreed to include substantial increase in the amount of funds available to Kyodo Shoken (Joint Securities Company buying and holding stocks, and postponement of all plans for new capital issues by business concerns for an indefinite period after February 196

The motor industry in West Germany produced 1.71 million cars and estate cars during the first eight months of 1964, recording an increase of 9.5 per cent, as compared with correspondin period of 1963. Output of commercial vehicle increased by 5.7 per cent to 173,844. Exports recorded an increase of 14.2 per cent to 954,19 vehicles.

Imports of coffee and coffee preparations int the U.K. require import licences with effect fro the 1st inst. according to the British Ministry Agriculture. Imports from the members of the International Coffee Agreement will require a certificate of origin or re-export. No quantitative limitation has been placed on entries into Britain of coffee consignments from member-countries of the Agreement.

West German families are now able to spend double, triple and in some cases even more than fivefold on non-necessities than they could a decade or so ago. Latest figures indicate that the corrected or price-adjusted spending of a statistically average family of four in a middle income group more than doubled from 1950 to 1963. Consumption of beverages and tobacco was tripled. Acquisition of household goods went up by 304 per cent. Other increases: for clothing, by 142 per cent; cultural activities and entertainment by 144 per cent, dry-cleaning, toilet articles and other expenditure under the personal care category, 149 per cent. The biggest increase in family consumption was a rise of 539 per cent in expenditures on transportation usually representing ownership and maintenance of an automobile.

TREND OF MARKETS

BANK RATE RAISED

(From Our Own Correspondent)

BOMBAY, *29th September*

A rise in Bank rate from 4½ to 5 per cent with effect from 26th September; replacement of the quota system for bank borrowings from the Reserve Bank by a system which envisages a progressive increase in the cost of such borrowings; imposition of a ceiling of 9 per cent on the lending rate of banks; and fixation of maximum interest that banks can pay on very short-term deposits (deposits upto 14 days; rates being paid on current accounts as on 25th September; 15-45 days: 1½ per cent; 46-90 days: 2½ per cent)—these are the notable developments of the week under review in so far as the short-term money market is concerned. But the developments have had no significant effect on the market so far. The inter-bank call rate for both renewals and fresh money has risen by just ¼ per cent to 1½ per cent with lenders over. Funds are available in plenty and borrowers are finding no difficulty whatever in obtaining their requirements. The Calcutta market, however, is ruling very tight, thanks to large withdrawals and upward pressure of demand. The call rate there has gone up from 1-1½ per cent to 3-3½ per cent.

Thanks to comfortable conditions in the money market, the 91-day Government of India Treasury Bills, tenders for which opened today (Tuesday, 29th September), elicited very good support. The total amount offered (Rs. 4 crores) was double that invited and also accepted. The average rate of accepted tenders was slightly higher at Rs. 2.400 per cent, as against Rs. 2.399. The Intermediate Treasury Bills, too, elicited good support. The Bill actually sold from the 23rd to 26th September aggregated Rs. 13.35 crores, as against Rs. 7.98 crores a week before and Rs. 2.45 crores two weeks before.

There was a further fall of Rs. 15.58 crores to Rs. 1,716.13 crores in the total credit made available by scheduled banks to their clients during the week ended 18th September. At the same time, there was an additional accretion of Rs. 22.32 crores to the deposits of banks. Consequently, borrowings from the Reserve Bank were negligible, being less than a crore of rupees, a fall of Rs. 1.07 crore over the week. Investments improved by Rs. 34.12 crores to Rs. 796.22 crores, while total cash declined by Rs. 2.69 crores to Rs. 158.29 crores.

Despite the increase in Bank rate, the Gilt-edged market has not suffered any setback, excepting one or two Central loans and a few 4½ per cent 1976 State loans. 3 per cent 1986 Conversion loan has declined by 35 P to Rs. 63.15. 3½ per cent 1967 has lost 5 P to Rs. 99.90. 4½ per cent 1976 Bihar, Orissa, Kerala, Rajasthan and Assam loans have declined from Rs. 97.75 to Rs. 97.25, Madras has declined from Rs. 97.50 to Rs. 97.25 and Andhra Pradesh from Rs. 97.25 to Rs. 97.

In the foreign exchange market, the banks' buying and selling rates to U.S. dollars remain unchanged at Rs. 477.50 and Rs. 481 per $100, respectively. In New York, the pound sterling has eased a little *vis-a-vis* the dollar, the spot rate declining by 0.030 cent to 278-310-278.340 cents. The three months' forward has also eased by a like amount to 277.790-277.820 cents.

GOLD WEAK, SILVER FIRM

(From Our Own Correspondent)

BOMBAY, *29th September*

Gold ruled distinctly bearish during the week under review, while silver was firm practically throughout. The bearish trend in gold was due to reports of large arrivals in the wake of subdued demand. The rise in Bank rate also acted as a damper. Consequently, prices suffered a setback. Silver, however, advanced, thanks to lower arrivals and poor stocks, though, later in the week, it declined due to profit-taking at higher levels. The decline, however, was not appreciable. In fact, today's closing rate for the metal was higher than a week ago.

Fourteen-carat gold began the week at Rs. 71.25, same as last week, and declined steadily to Rs. 69. Pure gold also, in private trading, fell from Rs. 124 to Rs. 119 on poor inquiries. In sympathy, sovereign was quoted lower at Rs. 92, as against Rs. 93.

Silver rose smartly to Rs. 258.00 early in the week on upcountry demand. Subsequently it declined to Rs. 256, before closing a shade better at Rs. 256.50. The weekly average arrivals and offtake of the metal were 19 and 8 bars, respectively, as against 23 and 7 bars last week.

The Central Government has decided to issue permits and authorisations for ayurvedic, unani and *siddha* medical practitioners for manufacturing medicines out of gold. The permits are to be given for each quarter upto a maximum of 50 grammes to such practitioners who are unable to furnish figures of consumption prior to the Gold Control Order.

With a view to seeking relaxation in Gold Control Rules, some representatives of the All-India *Sarafa* Association have gone to New Delhi to apprise the Union Government, as well as the special committee appointed by the Congress Parliamentary Party under Mr. A. P. Jain, of the need to review the operations of the Gold Control Rules because of the hardships faced by the goldsmiths, bullion merchants and jewellers.

The international price for gold in the London market was slightly higher at $35.09½, as against $35.09. The sterling price rose by 1d. to 252s. 2½d. While ready silver was unchanged at 112½d., forward silver gained by ½d. to 112¾d. Silver in New York continued to remain unchanged at 129.3 cents.

In order to meet the increasing demand for silver in the space programme and in civil industry, the U.S. Government is taking steps to expand domestic supplies. While domestic consumption has been on an average 106 million troy ozs. a year over the past five years, the internal production has averaged only 34 million ozs. a year. The U.S., the second largest silver producing country in the world (after Mexico), has been relying on imports from Canada, Mexico and Peru to fill the gap between internal output and consumption. Imports, however, is not regarded as a permanent solution, for the free world has been a deficit supply area for the last five years. The authorities have, therefore, reopened several mines in Colorado area such as Camp Bird mines and Hidden Treasure properties. Because of increased mining activity, the output according to Mr. Steward Udall, Secretary of Interior, is expected to rise to 37 million ozs. this year. As a sort of inducement to new private silver exploration ventures, the maximum Federal financial assistance has been increased from 50 to 75 per cent.

The following table shows the trend of prices during the week under review:

	22-9-64 (closing)	High	Low	23-9-64 (closing)
	Rs.	Rs.	Rs.	Rs.
SILVER				
Ready (998 fine) ..	256.50	258.00	255.50	255.50
GOLD				
Ready (14-carat) ..	69.00	71.25	69.00	71.25
Sovereign ..	92.00*	—	—	93.00*
London—				
Gold ..	252s. 2½d.	252s. 2½d.	252s. 2d.	252s. 1½d.
Silver Ready ..	112¾d.	—	—	112¾d.
Silver Forward ..	112¾d.	—	—	112¾d.
New York—				
Silver ..	129.3 cents	—	—	129.3 cents

N.B.—The quotation for gold is per 10 grams (about 0.85 tola) and that for silver is per kilogram (85.73 tolas). London and New York quotations are per ounce. * Unofficial rate.

COTTON FUTURES STEADY

(From Our Own Correspondent)

BOMBAY, *29th September*

Reports of inclement weather in certain cotton growing tracts, followed by sustained short-covering, imparted a firm trend to the cotton futures in the earlier sessions of the week under review. For a while, there was a slight setback as a result of a half per cent rise in the Bank Rate on the 26th instant, but this was quickly got over by further short-covering due to reports of continued heavy rains in the Punjab, Uttar Pradesh and Himachal Pradesh, as also in some parts of the Madhya Pradesh. Thus the market ruled distinctly firm throughout the week. Towards the close, however, much of the gain made during the week was lost owing to profit-taking at higher levels.

The Jarilla March 1965 contract which had closed at Rs. 728.25 last week opened the week Re. 1.50 higher at Rs. 729.75 and, after oscillating between Rs. 732 to Rs. 734 during the major part of the week, declined to Rs. 728.50 today before closing a little higher at Rs. 729. Thus, the net gain over the week was just 75 paise. The trend of the market at the time of writing is steady.

In the spot market at Sewri, spinners continued to evince interest in ready lots of Digvijay, Surti, L.147 and Kalyan at declining prices. The prices of old crop cotton in particular are being marked down substantially. The following are the latest available quotations in respect of certain popular varieties:

Akola L.147 Rs. 1,125, Bengal fine Rs. 737-738 December, Hubli Jaydhar Rs. 1,025, Navapura Rs. 1,137, Shirpur 27/32" Rs. 1,025, Vijaynagar Rs. 735K, Viramgaon Rs. 915, Baramati Co2 Rs. 1,460 new, Akluj Co2 new Rs. 1,490.

Bengal *deshi* of December delivery has been staying firm around Rs. 737-738, though actual sales for exports were not large. Moderate interest from Japan continued to be evinced during the week. There have also been enquiries from the U.K., the Continent and the U.S. Sales registered for export so far are 46,000 bales as against 45,000 bales a week ago.

According to the latest available statistics, mill consumption of domestic cotton upto the end of July 1964 was at a much higher level than the corresponding period of the 1962-63 season. The total consumption of indigenous cotton during the first eleven months of 1963-64 was to the tune of Rs. 50.03 lakh bales (of 392 lbs. each) and of foreign cotton to the extent of Rs. 5.55 lakh bales. It will be interesting to note in this connection that the expected consumption of foreign cotton during the whole of 1963-64 is not likely to be more than Rs. 6 lakh bales which is less by Rs. 2.73 lakh bales than the previous season's total.

As was expected by the trade, the Textile Commissioner has decided that any purchases of the cotton variety ISC-67 irrespective of the year of growth but certified as such in accordance with the provisions of the Textile Commissioner's price notifications each season, will also be included in the quantity of such compulsory purchases, in addition to the purchase of Combodia 'A' and/or 'B' cottons. It will be recalled, in this connection, that during 1964-65 season, the mills which had used Combodia 'A' and/or 'B' cottons in the three previous cotton years are compulsorily required to purchase these cottons to the extent of 7½ per cent of their total consumption of Indian cotton in the season 1963-64.

KIPS ARRIVALS MODERATE

(From Our Own Correspondent)

MADRAS, *28th September*

Arrivals of stocks from the tanneries were of moderate volume and offtake by shippers was good. Prices were steady. Export enquiries were for lower selections in cowhides 5/5½ and 8/8½ lbs., and for cowcalf heavier weights and for buffcalf 2/2½ lbs. Buyers were not willing to increase their limits to meet the higher prices ruling in raw hides market in Northern India. As business in kips has been selective, tanners are finding it difficult to find an outlet for the excesses at economic prices.

Prices of tanned goat skins were steady and there was demand for lower grades in all average weights from the Continent and U.S.A., which has been welcomed by the tanners, as such items have been sticky for some time. It has been reported that during the Paris Leather Show, visiting importers were claiming that E.I. tanners prices were too high compared to those quoted by shippers in other countries, and the volume of trade will suffer if prices are not competitive. Equiries for prime and semi-prime sheep skins were fair sized and the market was firm. Middle class sheep lower grades were also in good demand at unchanged prices.

It is hoped that the tanners will offer competitive prices and enlarge their export trade, in view of the export incentives available.

G'NUT NEW CROP CONTRACT

(From Our Own Correspondent)

BOMBAY, *29th September*

After maintaining a remarkably firm tone for a long time, groundnuts staged a sharp setback during the week under review. Quality Ready, which was ruling around Rs. 78 on Friday, declined to Rs. 67 on Monday, though it rallied slightly to Rs. 68 at the time of writing. The trend in the distant positions was also easy. Oil climbed down from Rs. 32.25 on Friday to Rs. 28.50 on Monday, but, on Tuesday, it staged a mild rally to Rs. 28.72, the October and November positions being mentioned at Rs. 23.65 and Rs. 19.80, respectively. Sentiment in groundnuts was apparently induced by arrivals of new crop, which were said to be gaining momentum as well as by the belief that Gujarat would sooner or later remove the ban on exports of groundnuts, oil and cake from the State. The tendency in Castor however, was firm. The March contract spurted from Rs. 178.78 to Rs. 184.37 before finishing at Rs. 183.25 today. Linseeds maintained a firm tone, the March contract closing the week at Rs. 40.44, as against Rs. 40.31 a week before. Spot linseeds however, were extremely firm at Rs. 52.25 as against the previous week's close of Rs. 52.50 which was a record high level. Oil was also firm.

Doubts regarding the prospects of an early start of trading in new crop groundnuts and groundnut oil have been set at rest with the green signal having been given by the Forward Markets Commission. Trading in Bombay will start on 7th October. The terms and conditions of the contract are not to the liking of the trade, as the level of Rs. 100 per 100 kg. at which margins will come into force is considered too low. The trade would have been happy with a level of Rs. 110. The Commission has laid down that a special margin at the rate of Rs. 20 per 100 kg. for groundnuts and Rs. 4 per 10 kg. for groundnut oil be paid on long positions whenever the price of the contract rules above Rs. 100 per 100 kg. for groundnuts and Rs. 20 per 10 kg. for groundnut oil . Free limits have been provided for both members and non-members. The Government has done well in exempting from margin long positions against actual export commitments on production of the necessary documents. There is a limit on the open position of a member or non-member at 5,000 tonnes of seeds and 2,000 tonnes of oil. There is also a weekly fluctuation limit of Rs. 2.40 per quintal for groundnuts and 55p per 10 kg. in oil. All non-member clients with open positions exceeding 300 tonnes in seeds and 120 tonnes of oil should register themselves with the Exchange.

By the time these lines appear in print, the castor, linseeds and cottonseeds September contracts will have officially terminated. They would go off the board on Wednesday. In fact few noticed, or cared for, their existence for quite some time before they went off the board. They were virtually untraded for many days. This was due to the imbalance between the spot rates and the ceilings for the contracts which were so low that no trading was possible. Castor September opened for trading on 21st May at Rs. 175 and touched its lowest of Rs. 174.25 on 27th May. Subsequently, prices rose almost uninterruptedly and touched Rs. 181.50 on 23rd June. The rising trend was viewed with misgivings by the Forward Markets Commission, particularly because the outstanding long position was said to be as high as 150,000 tonnes. The Commission was understood to have prevailed upon the Association to do something to check a further rise in prices presumably in tune with the Government's determination to hold the price line. It was then stipulated that no business could be done above the Rs. 181.50 level which became the ceiling. Bull operators were disappointed and argued that factors favoured a firm market and that they were not to blame if they went long. The Board of the Exchange, however, assured them that the question would be taken up for consideration if the market were to decline below Rs. 177.

However, the market did not decline. The official rate flattened itself to Rs. 181.50, but, in private transactions, it was standing at as high as Rs. 185. The plight of bulls gave rise to apprehensions of a payments crisis. These fears were aggravated by the crisis which was brewing in the cotton market following the inability of a member to meet his obligations. Bulls in castor were quick to sense the situation and agreed to square up their outstanding positions at Rs. 183. No tenders were issued.

Knowledgeable sources argue that ceilings had no sense in a commodity like castor; they are becoming difficult to obtain. The crop, according to Government sources, was 120,000 tonnes in 1964 but the trade thought that it was around 140,000 tonnes. Domestic offtake of castor oil has been

rising in view of the increasing industrial tempo and is currently put at 50,000 tonnes. Exports of oil until 10th September from Bombay aggregated 22,000 tonnes (55,000 tonnes in terms of castor beans). It is said that about 13,000 tonnes of oil are awaiting shipment against commitments for September, October and November and this means another 33,000 tonnes of castor beans. It is, therefore, apparent that current stocks, estimated at 6,000 tonnes of castor beans, cannot meet the requirements until the new crop moves into the market. So far, domestic and export demand has been to the tune of 138,000 tonnes and the new crop is still five months to come. These factors explain the tendency for the continued firmness of castor.

The story about linseeds and cottonseeds was similar to that of castor. The linseeds September contract was pegged at Rs. 45, but the spot rate was invariably higher than this. Very little business passed through in futures which used to be fluctuating in a narrow range just under the ceiling. Market men take a bullish view of linseeds as things stand today and it is said that, for a very long time, operators in Uttar Pradesh, Delhi and Punjab have been bullish and this when the crop was satisfactory. This year the output of rapeseed is estimated at 700,000 tonnes, as against 1.3 million tonnes in 1963. Cotton seeds should have been ruling so firm, in view of the satisfactory cotton crop, but, then, the trend here was induced by the firmness of groundnuts. Moreover, the increasing use of cottonseed oil for edible purposes has strengthened its position.

The following table shows the closing prices of oilseeds and oils as on 29th September as compared with those of the two previous weeks:

	29-9-1964	23-9-1964	16-9-1964
Groundnuts	Rs.	Rs.	Rs.
Nisam bold	66.00	75.50	75.50
Khandesh quality	68.00	77.50	78.00
Oil ex-mill	29.00	32.75	32.00
Oil Bly. Receipt	27.50	30.50	31.00
Castorseed			
September 1964 contract	183.00	183.00	183.00
March 1965	183.25	178.75	177.37
Ready Madras	40.75	39.37	40.00
Ready Kanpur	40.00	38.37	39.00
Oil B.S.S.	18.80	18.30	18.25
Oil commercial	17.80	17.45	17.50
Linseed			
September 1964 contract	44.97	44.97	44.94
March 1965	40.44	40.31	39.66
Bold ready	52.25	52.50	51.00
Linseed oil	22.00	22.00	21.20
Cottonseed			
September 1964 contract	91.50	91.50	91.50
January 1965 contract	102.25	102.75	102.00

N.B.—All quotations for futures contracts are per 250 kilograms except linseeds for which rates are per 50 kilograms. Spot quotations of seeds are per 50 kilograms and oil per 10 kilograms.

YARNS EASY AGAIN

(From Our Own Correspondent)

BOMBAY, *29th September*

The yarn market continued to rule easy during the week under review, thanks to plentiful supplies and limited demand. Art silk yarns encountered selling induced by rumours of a possible reduction in excise duty. A leading manufacturer was reported to have sold large quantity at low rates and another spinner had offered to sell at a discount. Staple fibre yarns were easy due to poor demand from Surat consumers. Turnover was limited. Cotton yarns continued to be dull with small price fluctuations.

The issue pertaining to the supply of indigenous rayon yarn against allocation cards issued under the export promotion scheme was discussed at a joint meeting of the representatives of rayon yarn manufacturers, Textile Commissioner and the Silk and Rayon Textile Export Promotion Council held in the City on Friday this week. In the light of the discussion, the following decisions were taken:

In respect of allocation cards which have been issued upto 25th September 1964 and in respect of which contracts/allotment letters have already been despatched by the rayon yarn manufacturers and firm commitments have already been entered into and all formalities completed by the allottees, the rayon yarn manufacturers will complete the deliveries against such cards latest by 17th October. The allottees are advised to contact the concerned rayon yarn manufacturers for the supply. In respect of allocation cards already issued, but against which the contracts/allotment letters have not been despatched, the rayon yarn manufacturers will despatch the same latest by the 5th inst. The allottees, on receipt of the contracts/allotment letters are required to enter into firm commitments and complete the formalities of the spinners on or before 24th October 1964. The delivery of yarn should be completed by the rayon yarn manufacturers latest by 21st November next. The yarn supplied will only be in 1st quality and on cones to the powerloom sector; the supply of yarn to the handloom sector will be as far as possible in hanks or alternatively in cakes. The spinners who are at present manufacturing 100 denier viscose rayon yarn should supply 20 per cent of the allocation in terms of 100 denier, if the allottee so desires. Other deniers may be supplied as per mutual agreement between the spinners and the allottee as hithertofore. Supply of 150 denier yarn, however, shall not be more than 50 per cent of the total allotment unless otherwise mutually agreed upon between the rayon yarn manufacturers and the allottees. The yarn manufacturers will accommodate denier-wise requirements of the allottees as far as possible. The yarn shall be supplied at the prices stated in the trade Notice No. EPB/AS/107 dated the 30th June 1964 issued by the Office of the Textile Commissioner. If any allottee, on receipt of the contract/allotment letter fails to enter into firm commitment within the period specified as above, or fails to pay in full and take delivery of the yarn within the period specified as above, as the case may be, his quota will automatically lapse and under no circumstances reallocated.

Among art silk yarns, National Rayon 150D fell by 71P to Rs. 10.87. 120D dropped 55P to Rs. 11. South India Viscose lost 13P to Rs 12.78 and Bright Century 75D shed an equal amount to Rs. 18.02.

In the staple fibre yarn (2×34 French Count) section, Kohinoor eased by 6P to Rs. 9.77. Sitalaxmi declined by 7P to Rs. 9.46, Premier by 15P to Rs. 9.64 and Sriram by 9P to Rs. 9.06. Vasanta was dull at Rs. 9.06. City, however, gained 15P to Rs. 9.48 on special support.

Cotton yarns 17s Modern receded by Rs. 2 to Rs. 26. 68s Minerva and Finlay declined, the former by a rupee to Rs. 84.50 and the latter by 50P to Rs. 105. Others were neglected at last week's levels.

The following table gives the prices of rayon staple fibre and cotton yarns, today, as compared with those prevailing a week ago:

	29-9-1964	23-9-1964
	Rs.	Rs.
Art silk yarn (per kg.)—		
National Rayon 120D	11.00	11.55
Century 75D	18.02	18.15
S.I. Viscose 120D	12.78	12.91
Staple fibre yarn-34 ×2 French Count (per kg.)		
Kohinoor	9.77	9.88
Premier	9.64	9.79
City	9.48	9.35
Cotton yarn - French Count (Rs. per 5 kg.)		
8s Podar	21.00	21.00
17s Modern	26.00	28.50
22s Madura	32.00	32.00
34s Madura	43.00	43.00
52s Pioneer	68.75	68.75
68s Finlay	105.00	106.70

STALEMATE IN PEPPER

(Messrs. Parekh and Co.)

BOMBAY, *29th September*

Stalemate conditions prevailed in Malabar black pepper during the week, as the bears and the professionals preferred to stand on fence pending a clearer picture of the intention of bulls as to tenders against their heavy commitments in October at Cochin. The bulls are reported to have taken delivery of the tender of about 637½ tons against the purchases of *Bhadrapad* in Bombay thus making shortage of contracts in *Asho*. It is possible that they may take delivery of all the tenders against their purchase for October in Cochin. If so, the position of floating stock of garbled pepper will become tight, pending the new arrivals which is not likely to be before early December. The future of the market, therefore, hinges upon the demand from the U.S.A. and on East European countries from now onward.

Arrivals of Lampong ex-August shipment to New York are expected to be heavy. As such, chances for buying enquiries for Malabar from that source are remote, spot in New York having failed to move up despite present seasonal months. Grinders are sidelining, supply position being more than satisfactory.

Singapore is reported down to $M112½, there being sizable arrivals of white and black pepper from Sarawak.

It seems that no panicky view is taken by the trade in the U.S.A., as well as elsewhere, in spite of various disturbing newspaper reports regarding the political situation in the South East Asia. Ready garbled at Cochin is quoted at Rs. 346½, and October delivery at Rs. 357 and December at Rs. 337. *Asho* in Bombay is quoted at Rs. 358 while *Posh* at Rs. 347. Ready is normally quoted at Rs. 180 per 50 kilos.

* * * *

The Forward Markets Commission has permitted the Alleppey Oil Millers' and Merchants Association to commence forward trading in black pepper at Alleppey in Kerala. Actual trading is expected to commence very shortly. The by-laws of the Association are being ammended. The annual arrivals of black pepper into the Alleppey market are estimated at 15,000 tonnes out of the country's total production of about 30,000 tonnes. About 9,000 tonnes of pepper are exported from Alleppey every year.

SUGAR STEADY, GUR SUBDUED

(From Our Own Correspondent)

HAPUR, *28th September*

Crystal sugar stayed steady during the week at Rs. 175 to Rs. 177 a quintal in the open market, due to restricted supply position. Total sugar production in the current season upto 31st August was 25.15 lakh tons, as against 21.10 lakh tons in the corresponding period of last year. Taking in view the bumper cane crop expected in the coming season, which would commence on 1st November, the Union Government has fixed the sugar production target at 35 lakh tons. New crushing season would start here in west U.P. on 2nd November and in east U.P. on 8th November, while some of the factories are likely to start crushing much earlier in the last week of October. Traders and producers were anxiously waiting the announcement of sugar policy for the new season.

Desi khandsari was subdued during the week due to slack offtake in face of heavy arrivals. Stockists were anxious sellers. *Dana minja* quality, however, recorded a strident advance following the removal of restrictions on inter-State movement. The *khandsari* stocks, freezed by the State Government, were now being released, partly for local sales and also for exports against permits. New *khandsari* production would start by the end of November. *Desi khandsari* in the open market was quoted at Rs. 125 to Rs. 160 and *Boora* at Rs. 145 to Rs. 157.50 a quintal.

Ready *gur* was subdued during the week although the stocks in the market were small, especially of wet quality, and new production season, which would have started by now, has again been delayed by 10 days due to unprecedented heavy rains during the week. There was reported to be a bumper cane crop, but it was gathered that, in order to divert cane supplies to sugar factories, the Government was again thinking of some price control on *gur*. *Shakker* is still much in demand and week-end prices (in Rs. per 40 kilogrammes) were:—*pansera* dry-wet Rs. 37.50, wet Rs. 28 to Rs. 30, *shakker* Rs. 40 to Rs. 42.

In the Muzaffarnagar market, while *chaku*, *laddoo* and *khurpapar* varieties of *gur* drifted lower on lack of buying interest, *rusket* variety *gur* and *shakker* firmed up. Small new *khurpapar* variety was lifted at Rs. 45 per 40 kilograms. *Gur chaku* old was quoted at Rs. 46 to Rs. 47. *Rusket khurpa* was firm at Rs. 12 to Rs. 15 and *shakkar* at Rs. 40 to Rs. 50 per 40 kilogrammes.

FOODGRAINS ADVANCE FURTHER

(From Our Own Correspondent)

HAPUR, *28th September*

Firm trend was witnessed in foodgrain prices during the past week. Poor arrivals and brisk consumers demand, as quantity supplied through ration shops was further reduced to 4 kilogrammes per unit each month, were the main influencing factors. The U.P. Government's order, banning inter-district movement of maize, *bajra* and *jawar*, in these grains. Unprecedented heavy rains, again during the week, has resulted in waterlogging and flooding the rural areas and *rabi* sowings are likely to be delayed. Rice crop prospects, however, were excellent and as harvesting is done these days, new grains would reach the markets shortly.

Wheat prices advanced earlier by Rs. 2.50 to Rs. 5 per quintal, according to quality. Later, however, demand turned slack and the prices eased a little. Average wheat was quoted at Rs. 96.25 to Rs. 97.50 in the week-end and farm produce between Rs. 98.50 to Rs. 101 per quintal. Earlier, the farm variety had touched Rs. 104.50 per quintal. Arrivals and stocks both were meagre. Supply position of wheat continued to be tight both in open market and at fair price shops. Rice prices continued to rule firm and prices rose further by Rs. 2.50 to Rs. 6.50 per quintal, according to quality, but at the week-end, prices eased slightly due to new crop arrivals. Marketmen were of the opinion that rice prices would suffer a marked fall in the near future due to the hopes of a bumper crop this year. Week-end prices were:—Rice *basmati* superior Rs. 133 to Rs. 135; *sela* Rs. 129 to Rs. 132; *mainpuri* Rs. 112.50; *ramajwayan* Rs. 115; *rakmunia* Rs. 115; new Rs. 109.85 and *gadda* Rs. 112.50 per quintal.

Gram prices were steadier and prices advanced by Rs. 4 per quintal to touch an all time high level of Rs. 95 to Rs. 97.50 per quintal, because of the ban on its export from the Punjab. Stocks here were negligible. New maize arrivals were heavy at around 1,500 to 2,000 maunds daily and prices consequently eased further by Rs. 4.50 per quintal at Rs. 65 to Rs. 67.50 per quintal. Arrivals were mostly from east U.P. Barley and *bejhar* prices ruled steady in early part of the week but advanced later due to poor stocks and good buying support. Barley was quoted at Rs. 83.50 to Rs. 85 and *bejhar* between Rs. 82.50 to Rs. 85 per quintal. *Jawar* and *guwar* prices were also steadier and prices ranged between Rs. 63 to Rs. 65 and Rs. 62 to Rs. 64 per quintal, respectively. Other coarse grains prices also ruled firm.

Among pulses, peas prices rose further on good demand from the south and East U.P. and continued local demand for seed purposes. Prices advanced sharply upto Rs. 5 per quintal to be quoted between Rs. 86 to Rs. 87.50 for *dara* quality and between Rs. 88 to Rs. 90 per quintal for farm quality. *Arhar* and its *dal* prices were steadier as stocks were negligible.

BANKING

(Concluded from page 588)

them at an early date. This work will be intensively pursued in the coming months. Besides a general quota increase for all members, special increases may have to be considered for those countries, developed or less developed, whose quotas appear to be out of line in the light of their recent economic evolution.

While any increase in quotas would enlarge the drawing facilities of members, they will also be faced with the immediate burden of paying for a part of such an increase in gold. Increases in quotas are normally paid 25 per cent in gold and the rest in the national currency of the member. The gold holding of the Fund is important in ensuring that there is adequate liquidity to meet members' requests even when its available holdings of currencies are low. This gold obligation may constitute a burden both on countries with low reserves and on reserve currency centres which may be asked to provide through conversion part of the gold subscribed to the Fund by other countries. The Fund will, therefore, look closely into this problem in the course of its studies of the general question of quotas to see if there are ways in which it could alleviate these difficulties.

Some Possible Ways

If the evolving economic situation seemed to require an increase in the supply of international reserves, there are various possible ways in which the Fund could contribute to such an increase. Let me mention some examples of ideas that could be considered. It would be possible, by allowing members to draw a part of the credit tranches in the same virtually automatic manner as the gold tranche, to increase the supply of this almost unconditional liquidity. A greater use of the power which the Fund possesses to waive the limit on drawings of 125 per cent of a member's quota could increase the supply of conditional liquidity—that is, liquidity available subject to meeting the Fund's conditions as to policy. A more far-reaching innovation would be for the Fund to make investments in member countries so as to create liquidity at its own initiative. I want to emphasise that all these are, at the present stage, merely illustrative of the range of possibilities. Whether it will be advisable at any time to adopt some of them will depend not only on a careful consideration of the many complex issues involved, including the availability to the Fund of adequate resources needed for the purpose, and also on the relative availability of liquidity outside the Fund.

I should like now to illustrate the type of considerations involved by discussing briefly two of the proposals for changes in Fund policies that have been put forward recently by spokesmen of the developing countries. One urges the introduction of greater flexibility in the time limit for repayments. It should be recognised that from the standpoint of the Fund, it is important that there be some reasonable limit on the period for which Fund drawings can be allowed to remain outstanding if the revolving character of its resources is to be preserved. This limit is five years. Any limit materially longer than that goes to the very heart of the Fund's functions and raises the question whether the financing involved is *bona fide* balance of payments financing rather than long-term development financing. While any extension of the repayment period would increase the leeway available to countries to some extent, it might also weaken any incentive to take corrective actions to reverse adverse swings in the payments position especially where they have arisen out of factors within their control.

The second set of suggestions I should like to discuss relates to the Fund's arrangements for financing fluctuations in the proceeds of primary exports. These suggestions, made particularly at the United Nations Conference on Trade and Development held in Geneva earlier this year, are concerned with the relation of these facilities to the tranche structure, the method of computing shortfalls, and the magnitude and duration of assistance. These matters will all be studied, particularly in the light of further experience of which, as I have said, there has been very little so far. At the same time, it should be noted that the amount of assistance available under the present facility will be augmented by the increase in quotas which is likely to take place in the near future. Of course, arrangements to deal with short-term financing needs do not meet the long-term needs arising from adverse trends in primary products, but this field is outside the Fund's jurisdiction as set out in its charter.

My observations thus far have been confined to discussing the relevance and the significance of international liquidity to developing economies and the importance of its availability to them. However, any international monetary system based on free exchange systems and stable exchange rates is liable to prove inadequate if certain complementary conditions are not present. Of these, I should like to comment here on three which are of special relevance in the context of economic development.

The first is the provision of an adequate flow of long-term international investment, private and official, to the developing countries. If such investment does not help meet the large long-term capital needs of these countries, the liquid funds available to them are liable to be used for long-term purposes in one way or another. Since the War, many of the developed countries have shown a profound interest in the satisfactory progress of the developing economies and have provided large amounts of real resources to them in the form of loans and grants. For this, they should be commended, for these transfers are a real burden on their people. Nevertheless, I think it will be generally agreed that there is scope, not to mention need, to do more in this field, both quantitatively and by adapting the forms of aid to meet changing requirements.

Considerable adaptation has, of course, already been made. When the debt servicing capacity of several borrowing countries seemed to be approaching its limits, the soft loan was developed and is now growing in importance. The urgent need for greater non-project assistance is being increasingly recognised as unfortunate examples come to light of industrial plants set up in the developing countries being operated considerably below optimum capacity because of a lack of foreign exchange to buy raw materials and replacement parts. I am aware that many problems are involved in these matters but hope that further progress can soon be made. Furthermore, it is important to avoid excessively competitive export financing by exporters in the developed countries. These often take the form of liberal extensions of short and medium-term credits which have sometimes led to a disproportionate accumulation of short-term indebtedness by the developing countries. This situation has given rise to many difficulties and has become an important problem in many countries and the Fund is exploring possible ways of assisting in co-operative action to solve it.

But nobody, least of all the developing countries themselves, wishes to see an indefinite continuation of aid programmes. The second of the three conditions I have referred to above is, therefore, a sustained rise in those countries own foreign exchange earnings. Here again the developed countries have a responsibility to remove the impediments in their commercial policies to imports from the developing countries. In several lines of light manufactures those countries can often compete successfully with established industries in the developed countries; the latter would generally gain by transferring their resources to other industries in which they can be more effectively used and it would be in the long run interests of the world economy if such a realignment of the pattern of specialisation were to take place. However, the major burden of policies to increase exchange earnings must be on the developing countries themselves and their development programmes must put greater stress on promoting exports and also on establishing the conditions of stability and confidence that will attract foreign private investment and discourage capital flight.

The variety of specific measures available for this purpose are well-known, but from the Fund's experience in a number of countries, I should like to emphasise the crucial importance of monetary stability in this context. This is, in fact, the last of my three conditions. Persistent inflation will make it impossible for a country to achieve and maintain international economic viability. What is more, under such conditions, no amount of international liquidity provided to it will be found adequate. The importance of monetary stability in the development process is, of course, even broader; by itself, it will not bring about development but without it, development will be mal-distributed.

In all that I have said, I have only touched in general terms on the Fund's role *vis-a-vis* the developing countries. Our activities, of course, impinge on only one sector of the problems of the developing countries—problems which are immense and which will require many years of dedicated work and effort both in the developing countries themselves and in the world economic community as a whole. But, I believe the Fund has, nonetheless, an important role to play. We have always regarded the problems of the developing countries as very much our concern and we will continue to pay careful heed to their situation as a crucial element of the world economic and monetary scene over which it is our responsibility to stand watch. I believe that within its specific responsibility and sphere of activity, the Fund has been of great assistance to developing countries and I hope and trust that in the years to come it will be even more so.

(Concluded from next column)

they are not prepared to accept from them progressively increased imports of manufactures.

Thirdly, there is devaluation, which would be a swindle on friends in the sterling area who have stood steadfastly in recent months and have banked the bulk of their surpluses in sterling in London. But there may be a case for greater flexibility in exchange rate.

The last measure pertains to the increase in the productivity of labour which is comparatively low. There are reasons for this (low productivity): insufficient installation of the most sophisticated machinery; reluctance to use such machinery if it were installed; poor communications between management and labour; the old enemy of social stratification and some element of nepotism which is happily dwindling; and, above all, a defensive attitude on the part of organised labour. The major faults can be eradicated by better management training, all careers open to talent. better technical education, etc. All these should figure among the highest items in the list of policy priorities of any British Government. But the attainment of these objectives will take a long time. A programme based on these will not arrest drift into deficit.

But Mr. Maudling has never been frightened of temporary deficits which could be met by the use of reserves and credits. According to him, the present situation is nothing like so threatening as that which existed at the time of the General Election in 1951.

LONDON LETTER

ECONOMIC "BLOCKAGE" PUZZLES CABINET

(From Our Own Correspondent)

LONDON, *26th September*

THE Cabinet, which met perhaps for the last time before the General Election, surveyed the economic situation, among other items. It came to the conclusion that no special or emergency remedial measure was necessary to cure the present unfavourable balance of payments position. This decision reflects the attitude of the Chancellor of the Exchequer, Mr. Reginald Maudling, on the crisis.

The shock to the economy came from the National Institute's prophecy that Britain would incur a payment deficit of some £500 million in 1964 and that the deficit for 1965 would not be less than £300 million. The seemingly gloomy forecast by the National Institute was confirmed by the July trade figures with their revelation of a "gross" gap of £87 million and a corrected merchandise deficit of £39 million. The Board of Trade returns suggest that the current balance of payments is running at an appreciable deficit but not of the magnitude of £500 million. This figure, of course, includes the net outflow of long-term capital. On this basis, the current deficit for 1964 would be of the order of £125 million and the net export of capital about £375 million. The capital outflow is regarded as one of the consequences of Britain's exclusion from the Common Market. Another result of exclusion has been to keep down the inflow of foreign capital, some of which had previously been coming to Britain on the assumption that this country would provide an effective jumping-off ground from which to serve the European Market. But the large outflow of long-term capital is no cause for concern. Investments are being made by those who hope that they will yield adequate returns both for them and for the country that these will definitely improve the balance of payments position.

The export figures of 1964 are really disappointing. But there are some reasons for the contradiction between these figures and the reports from industry about full export-order-books. This is mainly because there is a substantial amount of orders for the long-term capital goods in the pipeline. But the Government is frankly puzzled by the length of time it takes for industry to produce the finished goods for sale. Ministers have been informed that the industrial production in the first seven months of this year was 9.5 per cent higher than in the comparable period of last year. Some of this output has gone to new construction but not to export. This blockage in the economy has been described by Mr. Maudling as "constipation."

The Government hopes that this blockage will be cleared soon. But it does not know precisely when such a happy event will take place. If it is long delayed, the measures likely to be taken by the Government would be, first, mobilisation of Britain's foreign reserves and borrowing powers and, secondly, use of import control. These are short-term measures to give quick result. But there are other measures such as increase in the productivity of labour and, lastly, devaluation of the pound.

As for the mobilisation of Britain's foreign reserves and borrowing powers, the right time is now to go to the I.M.F. and to the Central Banks of Western Europe and North America before speculation becomes serious. This should be done by making large drawings and borrowings, subject to no commitment other than that of repaying the money when it is due.

The second is the import control. The Cabinet has not yet been asked to consider the use of import controls, although the Board of Trade is now studying the best means of applying them. Mr. Maudling has objection to import controls not on doctrinal grounds but on grounds of practical policy. He points out that their use would be justifiable and permissible under international agreements, if and when the balance of payment difficulties are really so severe that they cannot be dealt with in a better way. His practical objections to import controls are: (1) Britain cannot expect to export machinery and consumer goods unless she is also prepared to import from them; (2) controls may deny the British manufacturers some of the best and most modern machinery; (3) by protecting her industry, she will lose a stimulus to greater efficiency; and (4) her help to developing countries will be frustrated if

MARKET GOSSIP

(*Concluded from page 579*)

mittee (headed by Mr. S. V. Ramaswamy, Union Deputy Minister for Commerce). The State Governments have been requested to constitute local consumer vigilance committees to look after the consumers' interests in all municipal towns having a population of 25,000 and above.

After carefully perusing the statement of Mr. Manubhai Shah, one wonders whether such a complicated scheme of partial control on mill cloth as the one now envisaged will be of much avail in so far as the consumers are concerned. Apart from the difficulties involved in implementing a statutory scheme of this nature—Mr. Shah himself has admitted it—the scheme has one defect. Several mills may, besides inflating the prices of uncontrolled varieties, down-grade the quality of controlled varieties. The tendency to downgrade quality will be prevalent especially among mills which find it really difficult to make the necessary adjustments in production schedules should they find that the bulk of their production comes under controlled categories, giving little scope for making reasonable profits. Why should they, after all, care for the quality of the controlled varieties so long as they can sell such varieties at the stamped prices?

In conclusion, it may be said that the scheme of partial control will cover only a part of the total consumer demand for cloth. The mill production of cloth is currently running at an annual rate of approximately 5,000 million yards, out of which is to be deducted about 800 million yards sold for export and defence. The balance left is 4,200 million yards and 45 per cent of that comes to 2,000 million yards, or a bare four yards per head of population. This quantity represents an insignificant part of the total cloth consumption in the country if account is taken of the entire cloth produced (mill, handloom, powerloom, *khadi*, rayon, other synthetic, woollen and silk fabrics). Viewed thus, the official view that the scheme of partial control will benefit a large section of consumers is, indeed, a tall claim. This is a clear case of sweating for nothing.

Costs In Engineering Industry

The value of engineering goods exported from India in 1957 was only Rs. 4.4 crores. But, in 1963, the country's engineering exports (covering capital, producer and consumer goods) came to as much as Rs. 13.5 crores. Still these exports constituted hardly three per cent of the estimated total output (about Rs. 500 crores) of engineering goods last year. As the overseas demand for these goods has been growing for some years now, the engineering industry and the relevant export promotion council have agreed on the laudable objective of exporting, in the coming years, at least eight to ten per cent of the output of engineering goods so as to earn Rs. 40 to 50 crores of foreign exchange per year. But what chances are there of this target being achieved? These, to say the least, cannot be rate too highly, considering that there are several impediments in the way.

The most serious of these impediments is the persistent shortage of raw materials like pig-iron and steel—a shortage which is generally responsible for under-utilisation of capacity and, consequently, for high-cost production in the engineering industry. That this situation is being aggravated by further cost increases in the industry is the central point made in Chairman Lala Charat Ram's address at the Twenty-seventh Annual General Meeting of the Jay Engineering Works Ltd., held at Calcutta last week. As he has put it succinctly: "Management has the primary responsibility for controlling costs by seeking more efficient ways of making and marketing products. But many of the costs of doing business today in our country lie wholly or partially beyond the control of management." It is in this context that Lala Charat Ram has referred to the alarming "cost-price squeeze" and the higher incidence of labour costs, for instance.

In the particular case of Jay Engineering Works, there has been in operation in recent months the additional factor of labour unrest which has affected not only the Company's profits but also the country's export earnings. Lala Charat Ram, in this connection, has sought to drive home the twin lesson that management has responsibilities to the consumer, the labour and the investor alike and that it is only low-cost production that can produce the higher profits from which increased investments and payments to labour can come. That is not all, for it is only low-cost production that can ensure increased earnings for the country in the highly competitive field of engineering exports. This goal of low-cost production, however, seems to be as distant as ever in industry, generally, and in engineering industry, particularly.

Fertiliser Programmes

The Prime Minister, Mr. Shastri, at a recent discussion, is reported to have expressed the view that a major drive for compost manure ought to go a long way in helping agricultural production; there are still many in this country who share the primitive view that chemical fertilisers damage Mother Earth. Whatever may have been the Prime Minister's personal reservations about the chemical fertiliser programme, having decided that agriculture is a sector which needs modernisation and a concerted drive had to be launched, the Ministry concerned is processing the financial implications of a huge fertiliser manufacturing programme.

The third Plan projection of capacity in the fertiliser industry is nowhere near achievement. In the second Plan, the fertiliser sector had been reserved for development by the public sector. It was when Mr. Shastri was Commerce and Industry Minister that, in response to demand from industrialists, a decision was taken to set apart some part of the fertiliser industry development for the private sector. But the biggest setbacks have been in the private sector in fertilisers. Firms which were given licences for fertiliser plants in Tuticorin, Mangalore and Durgapur told the Government that they could not go ahead with the projects. These, according to Government sources, accounted for 220,000 tons total production capacity. In the public sector, too, the erection of fertiliser plants has lagged behind schedule and, according to the Government, the shortfall will mean that fertiliser production in 1965-66 will be only half of the targets set in the third Plan. Three-fourths of the shortfall are due to failures in the private sector. The present capacity of fertiliser plants in the country is about 386,000 tonnes in terms of nitrogen or a little over a third of the third Plan target.

Mr. Humayun Kabir, Minister for Petroleum and Chemicals, says that he wants to increase the capacity to 2.25 million tonnes by the end of the fourth Plan in 1971. In other words, this means increasing the capacity more than sixfold in less than seven years. By 1966, Mr. Kabir hopes fertiliser plant capacity will go up to 600,000 tonnes and production to 400,000 tonnes.

At the same time, Mr. Kabir says he will do everything possible to encourage private sector firms in entering into collaboration agreements and in securing foreign exchange. In a way, Mr. Kabir's statement, made to members of Parliament, is a departure from the tentative fourth Plan proposals in which only about 15 per cent of the projected total of Rs. 450 crores investment in fertilisers was to be set apart for the private sector.

The planners and the Chemicals Ministry are thinking in terms of a capacity of 2.25 million tonnes, but a report by the U.S. A.I.D. mission recently projected the 1971 Indian demand for fertilisers at 4.7 million tonnes. Closely following the A.I.D. experts' report, there have been discussions between American firms' representatives and the Indian Government officials. The American consortium team, which was in Delhi in the middle of September, included General Lucius Clay and Mr. Stephen D. Betchel, Chairman of the Betchel Corporation, which has signed an agreement with the Indian Government for establishing factories to manufacture equipment for chemical plants. It was the report of a committee headed by General Clay which last year sealed the fate of the late Mr. Kennedy's recommendation that the U.S. Government help India build the Bokaro steel plant. During his Delhi visit, General Clay, however, endorsed the idea of U.S. assistance to sponsor the establishment of fertiliser factories in the Indian public sector. General Clay does not also insist on Americans having a majority shareholding in the enterprise which will build five fertiliser plants with a total capacity of around a million tonnes of fertiliser. Preliminary estimates of investment on these plants is Rs. 250 crores. The consortium and the Indian Government hope to complete the negotiations by March next.

Industrial Finance Corporation

The Industrial Finance Corporation of India—I.F.C. for short—continues to forge ahead, though there was a slight setback in its operations during the year ended June 1964. The total financial assistance sanctioned by the Corporation in 1963-64 was Rs. 38.27 crores, as against Rs. 40.14 crores in the previous year, and the amount actually disbursed was Rs. 21.88 crores, as against Rs. 22.43 crores; the number of concerns securing assistance was 90, that in 1962-63 being 94. The bulk of the assistance rendered by the Corporation, as in previous years, was accounted for by rupee and foreign currency loans, aggregating Rs. 25.12 crores (Rs. 22.61 crores in 1962-63). The balance of Rs. 13.13 crores comprised Rs. 5.41 crores (Rs. 3.37 crores) as underwritings, Rs. 2.72 crores (Rs. 3.35 crores) as guarantees for deferred payments and Rs. 5.02 crores (Rs. 8.99 crores) as guarantees for foreign loans. Out of the total assistance, Rs. 27.76 crores were sanctioned for new units and Rs. 10.51 crores for the expansion, renovation and modernisation of existing units. Public limited companies received Rs. 37.16 crores and co-operative societies Rs. 1.11 crore.

Including the assistance approved during 1963-64, the aggregate financial assistance sanctioned up to the close of June 1964 comes to Rs. 196.78 crores (made up of Rs. 151.18 crores in rupee and foreign currency loans, Rs. 14.13 crores of underwritings and direct subscription to capital, and Rs. 31.47 crores as guarantees), the amount actually disbursed or made available being Rs. 124.45 crores. The total number of projects assisted by the Corporation so far is 334 (including 75 assisted in 1963-64), of which 224 are new undertakings. Industrywise sugar, non-ferrous metals, metal products, textiles and basic chemicals have been the most important beneficiaries. The pattern, however, is changing. The sugar industry, which was on top of the list in 1961-62, gave its place to non-ferrous metals in 1962-63 and, in 1963-64, metal products held the first place. Statewise, the share of Madras moved down from as high as 29.4 per cent of the total assistance in 1962-63 to 12.5 per cent in 1963-64. Although the share of Maharashtra also declined from 17.3 per cent to 15.8 per cent, this State topped the list in 1963-64 even with this reduced share. There was a widespread dispersal of the assistance during the year under review and a considerable portion was claimed by the less developed areas for their industrialisation.

It is encouraging to hear from Mr. A. Baksi, Chairman of the Corporation, who addressed the annual general meeting held at New Delhi on Tuesday, 29th September, that the credit record and financial position of borrowers continues to be satisfactory; the default in payment as on 30th June 1964 was negligible, being a little less than one per cent in the case of instalments of principal and 0.66 per cent in that of interest. As a matter of fact, during the year under review, the Corporation received from borrowers premature repayments of principal amounting to Rs. 77 lakhs; the cumulative total of such payments upto the end of June 1964 stood at about Rs. 7.00 crores.

Reflecting the large-scale operations, the gross income of the Corporation for the year under review, amounting to Rs. 5.07 crores, shows a handsome rise of Rs. 1.12 crore as compared with 1962-63. After deducting the interest of Rs. 2.62 crores on borrowings and other expenses of Rs. 18 lakhs, the gross profit before tax comes to Rs. 2.27 crores, as against Rs. 1.8 crore for the previous year. Of this, a sum of Rs. 1.02 crore has been set aside for taxation and so the net profit for the year amounts to Rs. 1.25 crore, as against Rs. 83 lakhs for 1962-63. Of the net profit, a sum of Rs. 1.06 crore has been transferred to reserves, bringing the total to Rs. 4.09 crores. The balance of Rs. 19 lakhs (same as in 1962-63) is to be distributed as dividend on paid-up capital.

Since the close of the year (June 1964), some important steps have been taken by the Government affecting the working of the I.F.C. The Industrial Development Bank of India (I.D.B.), established on 1st July 1964, has now acquired the shares held by the Reserve Bank of India and the Central Government, as well as some additional shares. Its total holding is now equivalent to 50 per cent of the paid-up capital of the Corporation amounting to Rs. 8.35 crores. With this transfer of shares, the power of giving policy directives has also passed from the Central Government to the I.D.B. The Corporation can now depend on the I.D.B. for financial assistance in certain cases. Meanwhile, it has been decided to raise the limit of loan assistance by the Corporation to any industrial concern from Rs. 1 crore to Rs. 2 crores. With these developments, it will now be possible for the Corporation to finance very large projects both with its own resources and also in co-operation with the other financial institutions.

The recent amendment to the I.F.C. Act has empowered the Corporation to raise funds for its operations through its own efforts, though its bonds will be fully guaranteed by the Government. The Corporation recently raised a Rs. 6-crore loan from the market which was "handsomely oversubscribed within a few hours."

In view of some difficulties felt by borrowers, the Corporation has made certain notable relaxations in its lending terms and conditions. The borrowing companies, which were not allowed to declare an equity dividend higher than 8 per cent without the approval of the Corporation, can now declare a dividend upto 10 per cent. Further, the borrowers who were not allowed to dispose of any item of assets mortgaged to them, without the Corporation's consent, have been permitted to do so in the case of specified items of a minor nature. Again, the Corporation has relaxed its restriction on the disposal and pledge of shareholdings by all directors or members of the managing agency, so that it will apply only to those persons who have a real stake in the borrowing concern. And, lastly, the Corporation will now use its authority regarding the appointment of directors of the assisted concern in very selective cases only.

With enlarged resources and with its ripe experience of several years, the Corporation is today in a strong position to meet the rising credit demand for industrial development in the country. Thanks to the relaxation in its terms and conditions, borrowers will find it easier to make use of the financial assistance offered by the Corporation. The borrowers must feel gratified at the assurance of the Chairman that the Corporation is not contemplating any increase in its lending rate of 7½ per cent (with a rebate of ½ per cent for punctual payment of instalments of principal and interest) consequent on the rise in Bank Rate from 4½ to 5 per cent. Since, however, a considerable part of the borrowings required by industries is accounted for by foreign exchange, there will be the need for a substantially larger amount of foreign credit, mainly in U.S. dollars and German DM. The success of the I.F.C. in the coming years will thus be determined to a large extent on its ability to raise foreign exchange resources not only from foreign Governments but also from institutions abroad.

NETHERLANDS TRADING SOCIETY

The Nederlandsche * Handel-Maatschappiji, N.V. (Netherlands Trading Society), a leading bank established in the Netherlands in 1824, says that its name will be changed into ALGEMENE BANK NEDERLAND N.V. (General Bank of the Netherlands) with effect from 3rd October, 1964. This change in the Bank's name follows the merger of De Twentsche Bank N.V., another leading bank in the Netherlands, with it. The total resources of the merged institution will be in excess of Rs. 670 crores, with capital and reserves alone amounting to Rs. 40 crores.

The General Bank of Netherlands will have nearly 400 branches in the Netherlands. Outside the Netherlands, it will have 22 of its own branches, besides 13 of the affiliated and allied banks.

In India, the Netherlands Bank has been operating since 1920, with two branches, one in Calcutta and another in Bombay. These will continue their operations under the new name of the combined venture.

BOMBAY BURMAH'S TEA CROP

The tea crop of the Bombay Burmah Trading Corporation during the quarter ended August 1964 was lower at 734,238 kg. (made tea), as compared with the 828,630 kg. harvested in the same period last year. The shortfall is attributed mainly to poor weather conditions in the Mud group of estates. The latest indications, however, point to some improvement in the near future.

COMMERCE

"For Commerce, though the child of Agriculture, fosters his parent
Who else must sweat and toil and gain but scanty fare."
William Blake.

WORLD HEADING FOR FAMINE?

IT was only during the 'fifties that food production throughout the world had made striking progress, climaxed by bumper crops in most countries in 1958. But since then, production gains have been few and far between, while the world's population has grown at the accelerated rate of 2.1 per cent a year. At the same time, some sixty countries in the world, many of them in the less-developed category, now have steel plants, as compared with half that number before World War II. But it is precisely in several of these underdeveloped countries that food production has tended to lag behind population growth in recent years. One ironic result of this heavy-industry bias in economic development programmes, according to the latest *Monthly Economic Letter* of the First National City Bank of New York, is that, while food shortages plague many countries today, the world is simultaneously faced with a surplus (!) of steel-making capacity. If these disturbing trends pertaining to food production, population growth and hectic heavy industrialisation continue over the next decade, it may be that the grim prediction made last month by Dr. Raymond Ewell, Vice-President of the State University of New York, will come true partially or wholly. This prediction is no other than that, by the early 'seventies, India, Pakistan and China would be afflicted with serious famines which would spread to most other countries of Asia, Africa and Latin America by 1980.

Incidentally, one advantage of a pessimistic and frightening forecast of that kind is that it make shake many national Governments out of their complacency and impel them to adopt energetic measures—both corrective and positive—for maximising food production and thereby warding off possible famines. That such an encouraging possibility cannot be entirely ruled out may be inferred from the review of national agricultural policies and development plans in *The State of Food and Agriculture 1964*, just published by the Food and Agriculture Organisation of the United Nations. It is, in a way, gratifying to find that these policies and plans of the developing countries in particular are aimed at achieving substantial annual increases in agricultural production—ranging from 3.3 per cent to 8.0 per cent in Latin American countries, from 2.7 per cent to 13.2 per cent in countries of the Far East, from 2.6 per cent to 5.8 per cent in countries of the Near East and from 3.0 per cent to 7.5 per cent in African countries. If the planned shares of agriculture in public investment—ranging from 11 per cent to 19 per cent in 21 countries and from 20 per cent to 30 per cent in 23 countries—materialise, the targeted annual increases in production may well be achieved. But all this cannot, of course, be taken for granted, considering that financial difficulties, caused in part by inflationary tendencies, continue to affect the fortunes of agricultural plans which have been under implementation in most developing countries for some years now. The Director-General of the F.A.O., Mr. B. R. Sen, has, therefore, done well to bring out the gravity of the world agricultural problem and plead for greater international assistance to step up agricultural expansion:

"The achievement of the objectives of the current United Nations Development Decade, which calls for an annual rate of economic growth of five per cent, would take us a long stride toward this goal. However, progress so far is generally less than was hoped. A five per cent rate of overall growth entails an only slightly less rapid expansion in the agricultural sector. F.A.O.'s latest indices of agricultural production confirm that, in contrast to earlier increases in *per capita* production, for five years now world agricultural production has done no more than keep up with the annual population growth of about two per cent. There has been little or no margin for the improvements in nutrition and general levels of living that are so badly needed. What causes special concern is that, in many of the developing countries where the need is greatest, the expansion of food and agricultural production has been even slower than the disappointing world average.

"How to step up agricultural expansion in these countries and apply to their generally primitive agricultures the fruits of modern science and technology (is the question).... In this task, the assistance, both technical and financial, of the more advanced countries is urgently required. Agriculture has often in the past received less than its due share of financial resources and one of the most encouraging developments in the recent food and agricultural situation has, therefore, been the decision of the International Bank for Reconstruction and Development to devote a greater share of its resources to projects in the agricultural sector. This has already given rise to the establishment, earlier this year, of a new co-operative programme between F.A.O. and the International Bank designed to identify and help to elaborate a much larger number of agricultural projects for Bank financing."

But the F.A.O. has always recognised, and continues to recognise, that foreign aid alone will not do the trick. More important than aid is the foreign exchange that the developing countries can earn from their exports which consist predominantly of agricultural products. As the earnings from such agricultural exports have been increasing only very slowly for many years now, especially in terms of their purchasing power for industrial products, they have failed to provide the developing countries with sufficient resources for a satisfactory rate of economic development. But it is heartening to find from the F.A.O.'s preliminary estimates that, for agricultural products as a whole, world prices averaged eight per cent more in 1963 than in 1962. Whether this upswing in agricultural prices actually reflects lasting changes in the world market in favour of agricultural exports is, however, in doubt. For most commodities, according to Mr. Sen, there is little to suggest that there has been any change in the basic long-term factors that largely determine the growth of demand in the main importing countries. Incidentally, one of these factors, limiting the growth of agricultural trade, is the development of synthetic substitutes for agricultural products, especially for those used as industrial raw materials. It is in this context that the F.A.O.'s exhaustive treatment of "synthetics and their effects on

agricultural trade" in a special chapter in its present report will be read with great interest.

Even if competition from synthetics increases in the years to come, there can be no doubt that the "overall" market for agricultural raw materials will increase *pari passu* with the growth of population. In fact, the F.A.O. report itself considers the prospects for the growth of this "overall" market, with the possible exception of soap-making materials, to be favourable. The developing countries can, therefore, look forward to exporting more agricultural raw materials, if they can expand their production to a level at which, after meeting the additional domestic consumption requirements due to growth of population, more substantial surpluses would be available for export. The *if* here is a big one, for the F.A.O.'s regional indices of agricultural production show that, in the world's predominantly underdeveloped regions (Latin America, Far East, Near East and Africa), production has not appreciably increased in 1963-64, as compared with 1962-63. The relevant figures are given below:

Indices: Average 1952-53 to 1956-57=100

	1962-63	1963-64
All Agricultural Products:		
Latin America	126	126
Far East (excluding Mainland China)	124	126
Near East	131	134
Africa	120	122
Food Products Only:		
Latin America	122	124
Far East (excluding Mainland China)	124	126
Near East	129	132
Africa	117	118

The gains in production in the developing regions were less than in North America and Oceania. In the world (excluding Mainland China) as a whole, agricultural production rose by only one to two per cent in 1963-64, as compared with the previous year. It is even more disquieting that for six years now *per capita* world production has remained virtually stationary. The relevant indices in 1963-64 are 106 for all agricultural products and 106 for food products only, whereas, in 1958-59, the former stood at 105 and the latter at 106. The regional indices of *per capita* production in the underdeveloped regions reflect a slightly worse position. It is here that the trend of declining foodgrain stocks in the principal exporting countries (United States, Canada, Argentina and Australia)—from 56 million tonnes in 1961 to 39 million tonnes in 1964 in the case of wheat and from 82 million tonnes to 64 million tonnes in the case of coarse grains—will be noted with some anxiety in several developing countries where P.L. 480 and commercial imports of food have subserved general economic development and restrained, to some extent, inflationary trends. But the immediate future will still not be as gloomy as the relatively distant period of 1970-80 when the widespread famines predicted by Dr. Raymond Ewell, may visit the developing regions of the world unless, of course, the agricultural trends of the immediate past happen to be reversed for the better in the next five or six years.

THE EXPORT TASK

LIKE several other developing countries, India, too, is faced with the twin problem of financing large-scale imports and servicing heavy external debt. Never before was this problem so formidable as it is today and it will be still more formidable in the next few years. The aggregate annual maintenance and development import requirements, which are currently running at a rate of about Rs. 1,100 crores, are expected to be no less than Rs. 1,500 crores in the coming six or seven years. Added to these will be the external repayment obligations (payment of instalments of loans and interest charges) amounting to anywhere between Rs. 100 and Rs. 200 crores every year. India may, of course, continue to get sizable foreign assistance at more liberal terms from the friendly countries abroad. And there may also be a larger inflow of private foreign capital for investment in India. But there is no denying the fact that a considerable part of the import requirements will have to be financed from out of export earnings. Viewed thus, the aggregate export target of Rs. 5,100 crores which the Planning Commission has fixed for the fourth Plan cannot be considered ambitious, though the target represents a rise of as much as Rs. 1,300 crores as compared with the anticipated total exports of about Rs. 3,800 crores during the current Plan period. In other words, the target means an increase of Rs. 260 crores in the annual level of exports over the five-year period.

The above figures impressively highlight the magnitude of the export task involved. Before indicating how the country can address itself to this task, it is necessary to take a quick look at the recent trends in export trade. Initiating the discussions at the fourteenth meeting of the Board of Trade at New Delhi on 15th August last, Mr. Manubhai Shah, Union Minister for Commerce, it will be recalled, had expressed jubilation over the rise of more than Rs. 20 crores in export earnings during the first quarter of 1964-65 (that is, April-June 1964) as compared with the corresponding period of last year and struck a note of confidence to the effect that the overall exports during the whole of 1964-65 "would continue to show satisfactory results." Things since then, however, have gone wrong, as witness the slackness in exports in recent months. The data furnished at the fifteenth meeting of the Board of Trade held at Bombay on Monday this week reveal that the total exports during July 1964 rose by a bare Rs. 3 crores (as compared with July 1963) and, in August, they remained almost stationary at Rs. 67 crores (same as in August 1963). Actually there was a setback to exports during these months, if account is taken of the spurt in prices in the past twelve months.

What is the recent sluggishness in exports due to? The Board of Trade, it is a pity, did not care to go into this question deeply and to spell out in clear-cut terms the measures that should be taken to correct the trend. All that it did was to echo what has been repeatedly stressed by many, including this journal. The Board pointed out, for instance, that lack of adequate export surpluses in critical commodities, such as vegetable oils and sugar, and the general inflationary pressures in the economy had been hampering exports. Who did not know about these handicaps? Further, the Board of Trade stated, as if no one knew it, that it was essential that utmost vigilance was exercised and corrective action taken with reference to the impact of rising prices on the export sector. Instead of suggesting a definite course of action to tackle the problem, the Board indulged in platitudes. The general problem of prices, it said, needs to be more vigorously tackled by the Government; this aspect was considered to be "the most important." And all trade organisations, including export promotion councils, commodity boards and individual trading houses, were urged to put forward their best efforts to overcome the handicaps to exports and step up exports so as to achieve an increase of at least Rs. 5 crores every month over the corresponding level of the previous year.

Mere exhortations to the business community to make increased export efforts will simply mean nothing, if they are not followed up by concrete action to create conditions congenial for launching a more vigorous export trade. The responsibility for such action rests as much on the State Governments as on the Centre. It is, therefore, just as well that the Union Ministry of Commerce has initiated action to hold a series of meetings with the State Chief Ministers in order to enlist the full support, co-operation and participation of State Governments in the vital task of export promotion.

With regard to long-term export problems, the Board of Trade made some general and vague observations. Here are a few of them:

1. Though appropriate institutional arrangements for promoting exports had been greatly strengthened during the last two years, what is now required is a purposive and determined implementation of these policies in the different sectors of the economy to stimulate exports to the desired extent and, to this end, the procedures under these policies must be further streamlined.

2. There is the need to ensure continuity and stability in our export promotion schemes and policies. The export promotion assistance schemes should be allowed to operate unchanged over the next seven years till the end of the fourth Plan in order to enable the industries to plan their export programme on a long-term basis.

3. Difficulties in the matter of release of foreign exchange for business visits abroad continue to be felt by the trade. Allocations of foreign exchange for such visits yield a manyfold return in the shape of export earnings and early study should be undertaken with a view to rationalising and liberalising the allocation of foreign exchange for these and allied purposes at an early date. (A committee with representatives of the Ministries of Finance and Commerce, the Reserve Bank of India, and a few representatives of the Board and export organisations was formed to formulate concrete proposals and procedures; the Committee has been asked to submit its report before the next meeting of the Board convened for 7th December next.)

4. With the formulation of the fourth Plan targets, steps should be taken for establishing an export sector in each industry or group of industries. The Export Sector Committee should now intensify its studies industry-wise.

5. It is necessary to enunciate a code of trading as between manufacturers and exporters which will ensure that supplies for export are forthcoming in time. At present, exporters are not receiving adequate co-operation and assistance from manufacturing industries.

6. As for exports of basic chemicals, soaps and pharmaceuticals, the question of setting up manufacturing units producing principally for export should be examined.

7. There should be an intensification of export promotion measures in their application to trade with Africa, and the problem of arranging for specially assisted shipping services to all important ports in this Continent should be immediately tackled by the shipping interests. The Government should give special assistance for this. All Export Promotion Councils and the All-India Exporters' Chamber must prepare a list of principal Indian exporters to different countries in the African region and call their meeting this month, study their difficulties, give special facilities and fix definite export targets for 1964-65 and 1965-66 for all the main commodities sold to these countries. Exports of green tea, black tea, jute goods, textiles, garments, engineering goods, plastics and chemicals should be specially promoted to African countries.

All these measures will no doubt strengthen the drive to boost exports. But the ultimate success on the export front will depend to a considerable extent on the improvement in the competitive capacity of Indian goods, quantitatively, qualitatively and price-wise. Such an improvement can be ensured only if the official policies are so readjusted as to secure economies of scale in production and marketing. The export industries must be given priority in getting raw materials and capital equipment. Rates of customs duties must be reduced so as to bring down costs in both consumer and capital goods industries. There should be an industrial truce with labour for a fairly long period, so that industry can concentrate on exports.

There are some industries which have great export potential but which are unable to utilise their capacities fully. The biggest impediment lying in the way of maximum capacity utilisation is shortage of industrial raw materials, spares and other accessories. The impediment must be removed forthwith. It is, after all, only the optimum utilisation of capacity that will ensure adequate export surpluses. If such surpluses are created, there will be no need for any restraint on domestic consumption which, it must be emphasised, has serious limitations, besides having unpleasant consequences

MARKET GOSSIP

Deposit Rates: Other Banks Follow Suit

BY a clever combination of the use of its statutory powers through legal directives and moral suasion through firmer rather than gentler hints, the Reserve Bank, as was mentioned in our last issue (*vide* pages 577, 578 and 579), has at last assumed the final responsibility for laying down the structure and pattern of deposit interest rates. On 25th September last, the Reserve Bank issued a directive fixing the *maximum* rates of interest that could be paid on term deposits or notice money for the very short term of three months or less. This was considered necessary because the bankers were paying much more for money which would in any case have remained with them. For deposits beyond three months, the Bank indicated in unequivocal terms the *minimum* rate for 91 days on the basis of which a structure of longer-term rates was to be erected, leaving the banks free to lay down the maximum rates for appropriate periods under their Inter-Bank Agreement.

In spite of such a clear lead from the Reserve Bank, the bankers seemed somewhat reluctant to act forthwith and tried to postpone the final decision until their top leaders returned from abroad or at least until they knew the mind of the State Bank of India. The State Bank, however, was quick to appreciate the situation and raised its effective rates immediately, presumably under confidential instructions from the Reserve Bank or the Government. Faced with this situation, the other banks had no alternative but to follow suit. On the very day the State Bank's decision to enhance deposit rates appeared in the Press—that is, on Thursday the 1st inst.—the Executive Committee administering the Inter-Bank Agreement on deposits met and decided to revise upwards the maximum rates of interest on deposits with immediate effect. The revised rates are identical with those of the State Bank excepting for their maximum rate which is fixed at 6.25 per cent per annum for deposits of seven years and over but less than nine years and at 6.50 per cent for deposits of nine years and over, as against the 6 per cent offered by the State Bank of India for five years and over. This difference is, however, academic, since banks hardly get deposits beyond five years, if ever. The revised schedule of deposit rates under the Inter-Bank Agreement is as under:

Period of deposit	*Rate of interest (Per cent per annum)*
Up to 14 days	Nil
15—45 days	1.25
46—90 days	2.50
91 days *and over but less than* 6 months	4.00
6 months 1 year	4.50
1 year 2 years	5.00
2 years 3 ,,	5.25
3 5 ,,	5.50
5 ,, 7 ,,	6.00
7 ,, 9 ,,	6.25
9 years and over	6.50

The revised rates beyond 91 days are higher by 1 per cent than the rates prevailing before 17th August 1964 at all stages except that the rise upto one year varies between ¼ per cent and ½ per cent and the rise beyond seven years ranges from 1¼ per cent to 1½ per cent.

The bankers must have considered the possibility of offering slightly higher rates than those offered by the State Bank, at least between three months and one year, but they seem to have been deterred by three considerations: one, the deposit rates of the State Bank have remained on a par with the Inter-Bank Agreement rates for about a year and a half without diversion of deposits to the State Bank; two, public sector deposits would in any case go to the State Bank under the Finance Ministry's directive; and, three, if the State Bank were to retaliate by wiping out any differential, bankers would again be paying more than was necessary!

The new deposit rates of banks, like those of the State Bank of India, are also effective from 1st October, though the decision to raise the rates was taken after the close of business on the 1st inst., presumably because they had no intention of allowing the State Bank to get the benefit of higher rates even for a day. This is a clear indication that the bankers do recognise the responsiveness and sensitivity of deposits to interest rates in spite of their declared professions otherwise.

One final word. The Reserve Bank has at last cleared the bankers' doubts regarding the inter-bank call money. Since the inter-bank call money is in the nature of borrowings and not deposits, it is beyond the scope of the Reserve Bank directive.

Inflation And Fiscal Policy

It was, indeed, a timely warning that Mr. Pierre-Paul Schweitzer, Managing Director of the International Monetary Fund (I.M.F.), uttered when he said, in his address at the Indian Institute of Public Administration at New Delhi on Monday this week, that excessive deficit financing was harmful to the country's economy. Contrary to general belief, Mr. Schweitzer said that, since deficiency of demand was not holding back investment in most underdeveloped countries, the argument that the pace of economic development could be spurred by the incentive provided by inflation to investment was not valid. He refuted the argument that inflation promotes savings, as it redistributes the income in favour of the rich whose propensity to save and invest is relatively high; for, in his opinion, though in the short run it may do so, in the long run, it [illegible] maintain its favourable effects on savings, because the fixed income groups would lose interest in saving as soon as it becomes clear to them that the prices would continue to rise. Elucidating his point of view, he is reported to have observed:

"Even whatever savings are generated in the economy are liable to be diverted to unproductive uses such as real estate, speculation, excessively large inventory and gold hoardings, and savings in the form of assets will be discouraged. Moreover, the foreign investors are generally reluctant to invest in a country with inflation and the available evidence shows that private foreign investment has increased most in countries with a stable currency. Even mild inflation cannot be looked upon with any complacency, for it is difficult to tell at what stage the trot of a mild inflation will be transformed into a strong inflationary gallop."

Mr. Schweitzer did admit that a limited amount of deficit financing by the public sector could normally be absorbed in a growing economy without generating inflationary pressures, but made it clear that the art of monetary management lay in carefully balancing monetary expansion with the capacity of the economy to expand output.

Another timely warning given by Mr. Schweitzer was in respect of controls. Without mincing words, he said: "If the Governments try to insulate living costs or the general level of production costs by resorting to controls over prices of strategic goods, such action will only serve to increase the consumption of such goods and discourage their production. The result will be that exportable supplies will be absorbed by domestic demand and imports will increase. Though monetary policy may be able to stabilise the money to some extent, in the long run, this policy alone cannot be substituted for a general policy worked out by proper co-ordination between budgetary and credit authorities." He, therefore, emphasised the need for a sound budgetary policy to maintain a reasonable degree of overall balance between expenditures and non-inflationary financial resources.

The I.M.F. chief spoke appreciatively of the valiant tax efforts of India over the past several years, but felt that the proportion of total national income taken away by taxation was still relatively low and that there was great scope for increasing taxation; the political difficulties in the way of fully achieving the tax potentials could be overcome by making it clear to the people that development involved sacrifice of present consumption for the future. If, as Mr. Schweitzer has suggested, additional taxation is resorted to an anti-inflationary weapon, few will have any objection. But, in the context of the conditions obtaining in India, it is somewhat difficult to agree with his contention that "there is great scope for increasing taxation in the country." One of the factors responsible for the current inflationary trends in the Indian economy is taxation. The high level of taxation has contributed largely to cost inflation, as the series of indirect taxes levied by the Central and State Governments, even on necessities of life, have added to the prices of goods. Actually, what is urgently required to accelerate the tempo of economic activity is not additional taxation but reduction of taxation. The I.M.F. chief was, however perfectly right when he said that, in the light of the current pressure on the general economic situation, which had been accentuated by additional defence expenditure and the slow growth of agricultural output, there was the need for continued monetary vigilance, so that the present inflationary tendencies would not frustrate speedy planned development.

Continuing Coal Problems

The third Plan's coal production target, which was originally fixed at 97 million tonnes, subsequently raised to 105 million tonnes and later reduced by stages to 88 million tonnes, now stands at about 80 million tonnes. But even this drastically reduced target, it is said, is not likely to be achieved. According to the latest estimate by the Union Ministry of Steel and Mines, the aggregate demand for coal in 1965-66 may only be about 75 million tonnes and the actual production may not exceed 76 million tonnes in that year, as compared with about 65 million tonnes in 1963-64. The fact that the number of working collieries has come down from 858 in January 1963 to 808 in January 1964 is indeed disquieting in this connection. This sluggish trend in coal production, even in relation to the reduced final (?) target, is not the only disquieting problem facing the coal industry. There are two other continuing problems, namely, (i) lack of an economic structure of coal prices and (ii) surplus of low and medium-grade coals and distress sale of such coals below cost. These and several other problems have just been discussed in two presidential speeches at Calcutta—one by Mr. Darab C. Driver at the 19th annual meeting of the Coal Consumers' Association and the other by Mr. S. N. Mullick at the 40th annual meeting of the Geological, Mining and Metallurgical Society of India.

Both the speeches are noteworthy for their critical approach to the Government's policies governing the coal industry. Mr. Driver's general criticism is that the remedies adopted by the Government or suggested by study groups are only in the nature of half-measures, while Mr. Mullick has referred generally to "faulty planning" in regard to coal. The very fact that coal production has lagged far behind the originally scheduled annual targets under the third Plan proves that things have gone wrong in this and other related sectors. If planning in regard to coal is not to go wrong again, it would be necessary to adopt reliable norms for estimating consumption and production potentials under the fourth Plan. It is only when fairly reliable estimates are made that a *realistic and attainable* target for the fourth Plan can be evolved. The italicised words in the foregoing sentence are of crucial importance, for, otherwise, there would come about distortions in investment and production patterns as in the third Plan period. The planners should, therefore, take serious note of the criticisms made by persons connected with the coal industry.

Some particular lines of criticism in the speeches of Mr. Driver and Mr. Mullick also call for mention here. Mr. Driver thinks, for instance, that amalgamation of small low-grade collieries would add to the surplus of unsaleable coal. Mr. Mullick, too, is of the same opinion, as will be seen from the following extract from his speech:

"Judging by the yardstick laid down by the Amalgamation Committee that a colliery with an area of 100 acres and having a production potential of 7,000 tonnes a month is an economic unit, it will be found on analysis that most of the collieries which produce the bulk of higher grade coals, down to Grade I, have an installed capacity for producing more than 7,000 tonnes a month, which means, these collieries would ever remain outside the scope of amalgamation. Only producers of lower grades of coal and ungradeable coal which are now being produced in excess of the country's current requirements would, however, come within the ambit of the scheme of amalgamation as recommended by the Committee.

"Considering the recent overproduction of coal in the country and the reduction of the (tentative) coal production target for the fourth Plan from 180 to 136 million tonnes, amalgamation of collieries producing lower grade coal would defeat the very objective of the scheme."

But Mr Driver is not against amalgamation of small "coking coal collieries." In fact, he positively favours their amalgamation in suitable areas with possible Government subsidy. Mr. Mullick, on the other hand, has taken the extreme—and rather unrealistic—stand that "the question of amalgamation of collieries does not arise at all," for, if very small collieries, numbering 4,343 and producing 100 to 800 tons of coal per month each, can exist side by side with very big ones in a highly industrialised country like the United States, there is no reason, according to him, why things should be different in an underdeveloped country like India. Considering that colliery amalgamation is proceeding at snail's pace now, the kind of opposition voiced against it is bound to delay it further.

Steel Exports And Imports

The Government of India is actively considering measures to promote the exports of iron and steel from this country. It may strike one as a little odd that, while the country is short of iron and steel, and imports to the tune of about a million tonnes have to be effected every year, the Government is displaying interest in steel exports. But there is really nothing odd in this, for it should be possible to export some categories of finished steel, especially to other developing countries, whenever domestic supplies of such categories happen to be relatively abundant. It will be recalled, in this connection, that, in the calendar year 1963, some 20,000 tonnes of finished steel were exported.

Of course, the original expectations of planners that the country would be able to export iron and steel in the third Plan period in sufficient quantities and at good prices have been belied. In the meantime, almost every steel producing country has increased its production considerably, many new countries have started production in recent years and the international market has thus become very competitive. It is, therefore, an uphill job now to export steel. So the Government is considering a proposal to form a Steel Exporters' Association to push up exports in pursuance of an earlier decision, fixing the target of exports for 1964-65 at 100,000 tonnes, as against the actual exports of 33,000 tonnes in fiscal year 1963-64. It may be that, if private trade is also associated with the proposed Association, this target will be achieved. The plea advanced by Mr. B. R. Khandelwal, in his presidential speech at the annual general meeting of the Steel Importers' Association of India, held at Calcutta the other day, that the Government should give adequate representation to the Steel Importers' Association in the proposed Steel Exporters' Association, is quite reasonable.

It is reported that the Government has decided that hereafter all imports of iron and steel and their handling would be entrusted to the Minerals and Metals Trading Corporation Limited (M.M.T.C.) in the public sector. This total elimination of the private sector will disrupt the already existing and well-organised trade channels. It may be in order to point out here that steel is a technical and complex item involving hundreds of categories, each category having numerous sizes and sections. The trade in this item is not so simple as in the case of many other commodities and the trader is required to have a specialised knowledge of the subject. There are, thus, no adequate and convincing reasons for transferring steel imports from private trade to the M.M.T.C. It will be even more appropriate and necessary to utilise the knowledge and experience of private traders in promoting the exports of this commodity. Many of the members of the Steel Importers' Association have been exporting some iron and steel goods continuously. They have now established trade contacts with importers in world markets and are very well acquainted with the world practices of steel trade. Under these circumstances, it would be comparatively easier to achieve the target of steel exports, if the Steel Importers' Association of India is more actively associated with the Government's promotional efforts. Incidentally, it is good that steps have been taken to broad-base the Steel Importers' Association of India and to drop the word 'Importers' from its name, so that it may be called "Steel Association of India."

DELHI LETTER

THE STINK FROM RANCHI

FIRE MAY HELP PURIFYING RITES

From Our Special Correspondent

NEW DELHI, *6th October*

ACCORDING to Hindu tradition, fire is a great purifier and the fire in the Heavy Engineering Corporation set-up in Ranchi on 29th January and the inquiry into the events leading up to the disaster may have a purifying effect on the operators in Ranchi. As the site of the head office of Hindustan Steel Limited and the location of the vast complexes to make heavy engineering equipment, Ranchi is among the more important industrial centres and the report of Mr. B. Mukerji, a former judge, into the fire is a case study of the shabby wranglings in public-sector undertakings. The 103-page report, laid before Parliament last week-end, was basically to deal with the fire but sabotage and arson come out only as incidental consequences of deep-seated defects in the organisation of the Heavy Engineering Corporation. In effect, the report is a forceful and eloquent condemnation of the public-sector satraps.

The management, in particular the Chairman (says the ex-judge's report) "completely failed to organise the administration on sound administrative principles with the result that there was schism and inefficiency in practically every important sphere of the administration; he was obviously not an administrator. There was complete lack of appreciation all round of the necessity of a fair and yet a firm deal with labour and also with the subordinate staff. Adequate steps were not taken to maintain discipline." It is natural that since the Chairman, Mr. Nagaraja Rao, and Mr. Sandilya, Director of Finance, were unable to co-operate and exhibit a sense of discipline there could be no question of other people lower in the ladder being amenable to discipline. If Mr. Sandilya persistently defied his superior, the Chairman, and both encouraged groups ganging up on the side of one or the other wrestling at the top level, it was futile to expect the Corporation to work as a team. The inquiry report makes the judgment that the Chairman was not an administrator. The Government has not said whether it plans to take any action against the two senior cantankerous officials who were responsible for the sorry state of affairs at Ranchi. The former H.E.C. Chairman has returned to the post of adviser to the Planning Commission, a job at which he worked earlier. (He had in Yojana Bhavan gained a reputation as a planner.) The other senior official involved in the mess is posted to a public-sector undertaking in the South. It is for members of Parliament to take up the question of punishment of truant officials who misbehave while in charge of industrial undertakings. The administrative serviceman passes on the technical responsibility to the Minister in charge but there must be a new procedure which will ensure that the inefficient, the mischievous and the dangerous elements in the higher service echelons do not go unpunished because of firm contracts of permanent service the Government has assured them. Anyway, the tradition of permanency of Government service was evolved during the times when the Government was engaged purely in governing; now the Government is also a businessman and should deal with the delinquents in a businesslike fashion. Government spokesmen often condemn even legitimate labour agitation as anti-national and the higher officials seek greater power to curb labour in public-sector undertakings, but at some level or other these public-sector officials want to place themselves as a privileged caste whose mistakes should go unpunished.

When the Estimates Committee criticised the administration of the Heavy Engineering Corporation some time ago, a defence against the criticism was that the M.Ps did not have the capacity to interpret technical problems and that some of the comments were uninformed. But, in judging the omissions and commissions of the two senior officials involved in the Ranchi scandal, there is no need for specialised knowledge of technical details.

Labour Laws

In the days when the Communists were mainly responsible for industrial unrest, Congress politicians had acquired the habit of branding them as anti-national trade union men. Now the fashion is sometimes to fix the blame on the pro-Chinese faction among the Communists who are anti-national. When it comes to unions affiliated to the Indian National Trade Union Congress, it is not easy for the Congress bigwigs to condemn them as anti-national (the term national is in their trade mark itself!) But the Mukerji report emphasises a point that is already well known to those who have studied recent trends in labour unrest—that these unions are parochial and provincial in their attitude and more often than not they have the support of some Congress Party factions in the various States where the big industrial units are located.

Mr. Mukerji has unfortunately supported proposals popular with some Ministers and officials at the Centre that what is wanted is a new set of labour laws. And the demand, also supported by the ex-judge, is for the new set of special laws for the Central Government undertakings. To consider that the public-sector undertakings are national and the others not necessarily so is to add new sophistications to the concept of mixed economy by which Nehru's successors swear. There is a wide variety of labour laws on the statute book which have not yet been administered properly. If the Central aim is to make these new laws so that the public-sector administrators can circumvent State administrators, there can be no end to attempts at short cuts to avoid problems which arise because of non-cooperation from the States—whether in agriculture or in industry. The conflict between the Centre and the States in dealing with labour crises in public-sector plants is not new. Even the location of some plants has been due to pressure of some State politicians. When Mr. Ganapathy was in charge of Rourkela, there were tense periods during which the anti-South-Indian stir was at its height. The anti-Bengali feeling is a routine attitude in the oil installations in Assam. Even in Bombay, one of the quips about the I.O.C. is to call it the "South Indian Oil Company." To condemn the Bihar State Governments "stepmotherly attitude" to the H.E.C. as due to provincial antagonism may be an oversimplification. In Rourkela, this correspondent had found that there was validity in the State Government's complaint against some former general managers on their dubious role in dealing with labour. It is almost an accepted practice that public-sector general managers encourage I.N.T.U.C. unions in preference to unions organised by others. When the rivalry was between the I.N.T.U.C. and the Communists it was a simpler problem. But at present the problem is often one between several unions, all of which may claim to be I.N.T.U.C.-flavoured.

The Mukerji report says: "Public-sector undertakings, though commercial in their appearance, are in essence national in their content. I am of the opinion that labour-management relationship in such undertakings need a different approach and outlook and these relationships should not be patterned within the framework of the existing laws. It is difficult to imagine that the National Government, sponsoring a national undertaking which is to subserve national needs, would resort to exploitation." Not many outside the Central Government set-up will be able to agree with these premises. The Central Government's undertakings do not add up to a *Ram Rajya* concept. The public-sector administrators' day-to-day treatment of subordinates in industrial undertakings smacks of the old *burrasaheb's* attitude to the *chaprasi*. To accept the thesis that it is only the Government (and sub-therorising that it is only the Central Government) which represents national interests is the beginning of the acceptance of totalitarian attitudes. Natural interests are not synomymous with interests pursued in public-sector undertakings by the numerous Nagaraja Raos and Sandilyas.

Talks On Steel

The Bokaro steel plant, which was originally to contribute one million tonne steel ingot capacity by the end of the current Five-year Plan in 1966, will now be further delayed and construction work can probably be started only in 1966. The original search for American Government aid for the fourth public-sector steel plant contributed to the initial delay of two years or more and there was a gap of eight months before the rejection of the Kennedy proposal for assistance and the announcement on 1st May of the Soviet offer to underwrite the Bokaro project's first stage. In the five months until the end of September the discussions between the Russians and the Indians were disturbed by some hard feelings among some sections of Indian opinion—officials and non-official experts—about the role Indian technicians should be assigned in designing and implementing the Bokaro project. Dastur and Company had prepared what was described by the Indian firm's admirers as a thorough project report on the Bokaro scheme. But the Russians never made any promise of accepting the Dastur report as the basis for the project they would help build.

As the discussions with the Russians dealt with greater detail, the position of Dastur and Company has become worse. The Russians now have made it clear that it will not be enough to polish up the Dastur report but it will be necessary to "rewrite" it—or rather make an almost new project report for the Bokaro plant. This was inevitable partly because the Dastur report was based largely on American equipment. The Russians also want to introduce some sophisticated methods they have experimented with back home in the recent past. According to the Steel Minister Mr. Sanjeeva Reddy, the Russian may be able to present their final project report by July 1965. The concept of having a first stage of one and a million tonnes of ingot is also likely to undergo a change. The Russian report is now expected to envisage a first stage of two million tonnes ingot. Also, as in the Dastur report, the Soviet report will have to plan for some facilities at the plant site for the further expansion of the Bokaro plant to four and six million tonnes ingot capacity. Some of these facilities may have to be laid even in the first stage. (See also Delhi Letters in *Commerce* dated 29th August 1964 and 9th May 1964.)

The Finance Minister, Mr. T. T. Krishnamachari, who headed the Steel Ministry when it was first formed while the first public-sector ventures in steel were being launched, was an early sponsor of Dastur and Company. But in recent years the biggest patron of Dastur and Company was Mr. C. Subramaniam when he was in the Steel Ministry, and the hostility between Mr. Krishnamachari and the consultants' firm is public knowledge. As a member of the Indian team to visit China to study the Chinese steel industry, Mr.

THOUGHTS ON HOME EXPENDITURE

By Questor

LONDON, *2nd October*

I WAS interested the other day to see the report of a speech which Senator Goldwater had just delivered in Dallas. "There is no surer way," he said, "to condemn this nation to the status of a second-rate power, incapable of exerting influence in the world at large, than to fritter away taxable capacity in do-gooder schemes that waste our substance."

Senator Goldwater was talking about wasteful Government expenditure at home: discussion is gradually beginning to centre in Britain on wasteful expenditure abroad. We are running a large payments deficit at present. A deficit was expected for 1964 since imports always rise sharply at the beginning of an upswing in business. The half-year deficit was swollen by special factors and amounted to nearly $1 billion; the deficit for the year as a whole is generally expected to reach $1.5-1.8 billion — small by American standards, but extremely large by ours. The Government is claiming, not unnaturally since we are in the middle of an election campaign, that this was all anticipated, that we can draw on our reserves and lines of international credit until exports begin rising strongly enough to bridge the gap, and that no special measures are called for. Other people are wondering whether borrowing alone will be enough. Deflation is uncalled for, since the economy is not obviously overstretched. Export incentives are forbidden by G.A.T.T.; import controls, in the form allowed by G.A.T.T., are cumbrous and slow-acting and would in any case protect industry which plainly needs more competition; the promised anti-trust legislation will take a long time to produce its full beneficial effect. What, then, is to be done about the immediate deficit if exports fail to rise as quickly and as sharply as the Government hopes? Whether or not Britain is incapable of exerting influence, nobody is going to accumulate sterling involuntarily for so long or on so large a scale as they have been forced to accumulate dollars.

The half-year analysis of Britain's balance of foreign payments does, however, suggest one possibility. The Government is a generous spender of foreign exchange—$625 million on current account in the first half of 1964, and another $135 million on capital account in the form of loans of one kind and another. If that expenditure had not taken place—and if one ignores a quite exceptional outlay by Royal Dutch-Shell of $170 million to acquire a half-share in the Montecatini petrochemicals business—Britain's foreign payments would not have been in exceptionally large deficit but almost in balance. If economies are to be made quickly, this seems the obvious area for investigation.

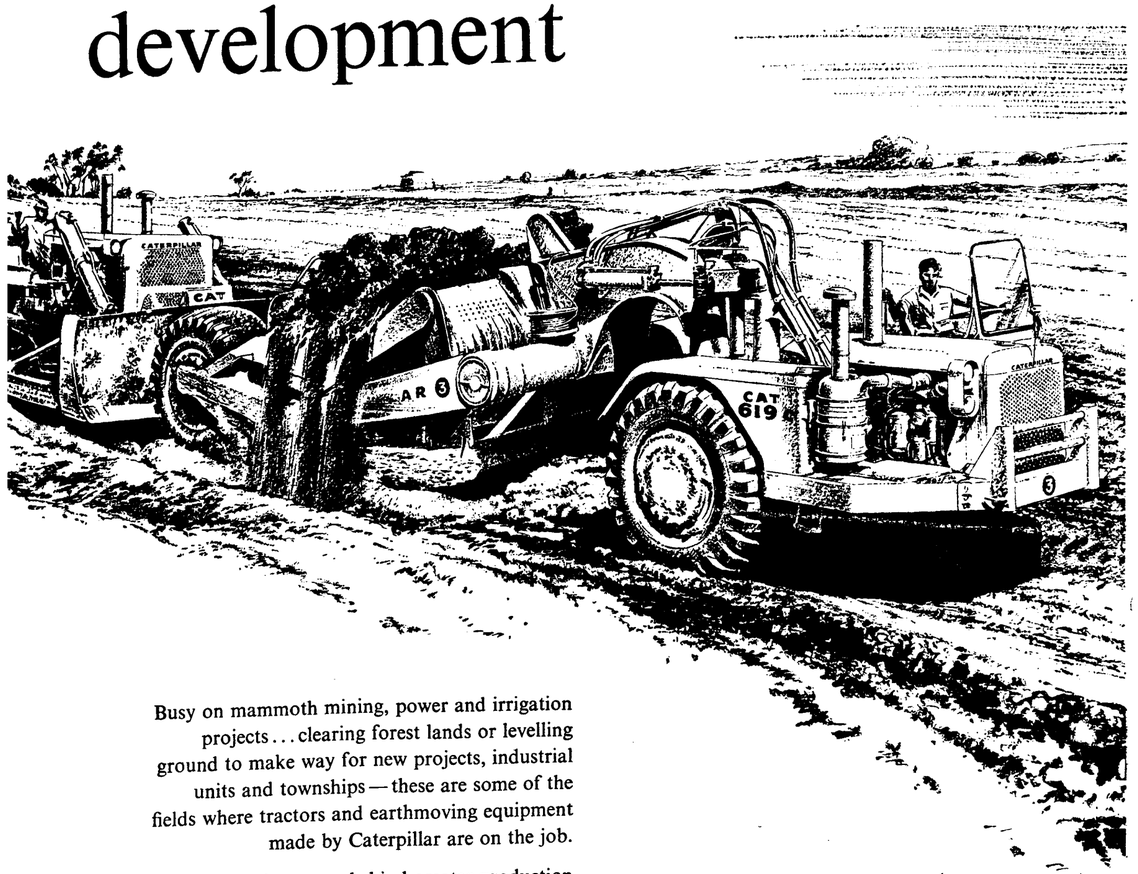
People have been talking about cuts in Government foreign expenditure for some time past, particularly on occasions when the balance of payments is strained. When one looks at the figures, however, it is clear that there has been more talking than doing: on current account, for example, the Government's net outgoings rose by two-thirds between 1959 and 1963 and have risen sharply further this year. Without these 1959-63 expenditures, it can be calculated, Britain's gold reserve would be four times as large as it is at present; we would have been able to take a more forceful line in the debate about international monetary reform, and our own economic growth would not have been stunted by recurrent exchange crises and calls for domestic retrenchment.

What does the money go on? Some—rather less than 10 per cent—goes on diplomatic and administrative services. A quarter goes on economic and other grants. The rest goes on military expenditure, the bulk of it on maintaining a string of British bases around the globe and carrying out police action in former colonies—like Tanganyika, Cyprus and Malaya—for which we still feel a responsibility. Our deficit, like America's is partly due to a sense of political obligation. But when even the U.S. is being forced to trim its overseas expenditure to suit its ability, Britain must follow. The attempt to negotiate with Germany an arrangement for offsetting the foreign exchange burden of keeping British troops there has not been altogether successful, and there is little reason to suppose that negotiations with Aden or Hong Kong could produce better results. There will be strong pressure on the next Government, whatever its colour, to concentrate its military expenditure at home and to abandon exercises which strain Britain's balance of foreign payments.

WORLD BANK MISSION TO BRAZIL

The World Bank has sent a mission to Brazil, at the request of the Government, to review and appraise current economic conditions and future prospects, and study the Government's economic development programme and policies. The mission is headed by Mr. Barend A. de Vires, Economic Adviser of the Bank's Department of Operations, Western Hemisphere. It consists of twenty members from nine different member countries of the Bank and includes economists and advisers on agriculture, industry, transport, tele-communications, electric power and education. The United Nations Food and Agriculture Organisation and the U.N.E.S.C.O. are co-operating with the Bank in this mission by providing advisers in agriculture and education. Of the twenty mission members, twelve are from the Bank's staff.

Opening up new vistas of development



Busy on mammoth mining, power and irrigation projects... clearing forest lands or levelling ground to make way for new projects, industrial units and townships — these are some of the fields where tractors and earthmoving equipment made by Caterpillar are on the job.

Caterpillar, the power behind greater production spells reliability and performance even in the most adverse working conditions And it is backed by the extensive servicing and spare parts facilities of Larsen & Toubro.

For providing spare parts of Caterpillar quality, to keep the machines working round the clock, Caterpillar and Larsen & Toubro have formed Tractor Engineers Limited which is setting up in Bombay, the most modern manufacturing plant of its kind in India.

LARSEN & TOUBRO LIMITED

MANPOWER PLANNING

THE Seminar on Employment Information and Manpower Utilisation, held under the joint auspices of the Employers' Federation of India, Bombay, and the All-India Organisation of Industrial Employers at New Delhi early this week, has highlighted the contradictory situation where, on the one hand, there is a large number of unemployed people and, on the other, there is a shortage of personnel of the right type—technical and managerial—who are in great demand in industries and other enterprises and Government Departments. Hence the appropriateness of the subjects discussed at the Seminar, namely, manpower planning in industry, forecasts of demand and supply of technical manpower for the fourth Plan, and increasing the utility of the Employment Information Programme of the Directorate-General of Employment and Training. These interrelated subjects have come in for expert treatment in the context of the need for better integration of manpower planning with planning for various sectors.

Such integrated manpower planning has not been much in evidence so far. Mr. D. Sanjivayya, Union Minister for Labour and Employment, has, therefore, pinpointed this anomaly in his inaugural speech at the Seminar.

"In all our Plans, we are constantly thinking in terms of resources. We also talk in terms of physical and financial plans; but experience has shown that we worry much more about the financial aspects. Then come material inputs. And the manpower and organisational abilities have been made to play a somewhat subordinate role.... We do not sufficiently realise that the accumulation of high-level manpower should proceed at a rate faster than the national income. In a recent publication, two American professors, who have made an exhaustive study of this subject in about 40 countries of the world—mostly developing countries—have established that the rate of growth in high-level manpower should be about double the rate of growth of national income. In countries like ours, where we have been emphasising development through machine building, the rate of increase should be even higher. But what is established by the American professors, should be the minimum we should aim at."

The accent here is rightly on the training of technical manpower, for such manpower is *crucial* to development in several other sectors and thereby to the creation of wider employment opportunities. There are already 12 million unemployed and there will be 23 million newcomers in the labour market over the fourth Plan period. If the supply of trained personnel is not sufficient, it is bound to have an adverse effect on the country's development capacity and retard efforts in the creation of new non-technical jobs. Hence the need for gearing manpower planning to the goals of development and fuller employment.

But, if manpower planning is to be successful, there should be considerable improvement —in size and accuracy alike—of labour and employment statistics. The estimates available presently are largely guesswork based at best on semi-scientific methods. There is thus a compelling need to undertake continuous and scientific studies of the size and distribution of labour force and the volume of present productive employment and that likely to be available in future. The Directorate-General of Employment and Training, which started the Employment Market Information Survey about nine years back, collects the information regarding employment in public and private sectors, with special emphasis on the creation of new jobs and the categories of personnel in short supply. Mr. Sanjivayya and Dr. V. K. R. V. Rao, member of the Planning Commission, have both asked the employers for prompt rendering of the information on a fuller and more adequate basis, so that quicker analysis may be possible and the data made more scientific and meaningful to serve as a firm base for manpower planning. Dr. Rao has also stressed the need for creating a cell in each of the public and private sector undertakings to make forecasts of the requirements of additional personnel, and appealed to the employers to lend their support for the successful implementation of the training programmes. It may be useful to quote, in this connection, from the speech of Mr. Naval H. Tata, President of the Employers' Federation of India, at the Seminar:

"In a controlled economy, employers in the private sector are not unfettered to give a free play to their imagination in an endeavour to evolve radical plans for creating faster employment potential at their risk and responsibility by accelerating the tempo of industrial expansion. Under the existing conditions, it is impossible to forecast the degree of possible expansion of employment in one's own establishment."

Though regulatory measures are to some extent unavoidable in a planned economy, still it may be good to avoid controls, as far as possible, in the interests of manpower planning and economic development. As regards the training of technical personnel, there is, of course, a great need for adding to the already existing training facilities. But it must also be stressed that, unless the glamour for white collar clerical and administrative jobs is eliminated, optimum utilisation of these facilities may not be possible. It is, therefore, of particular importance that a certain vocational bias be imparted to the educational programmes in this country. The Union Education Commission that has just begun to function, may be expected to recommend suitable measures in this regard.

LAND ACQUISITION

No State Government has authority to acquire land for housing schemes under an amending Act in derogation of powers of the former Act. This, in essence, is the verdict of the Supreme Court, the highest dispenser of justice in India. On Monday the 5th instant, the Supreme Court declared as void two important State Acts, namely, the Land Acquisition (Bombay Amendment) Act of 1948 and the Land Acquisition (Madras Amendment) Act of 1961.

In giving its judgment on the Bombay Act, the Supreme Court no doubt shared the opinion of the High Court that the expression "compensation" in Section 299 of the Government of India Act 1935 should be given a meaning more restricted than that given by the Supreme Court (in earlier decisions) to the said expression in Article 31(2) of the Constitution. It, however, struck down the amending Act as void on the ground that "the legislature made it in contravention of the express provisions of Section 299 of the Government of India Act, 1935. It was a still-born law." Since the amending Act was void from its inception, the Court held, Article 31A of the Constitution could not save it.

The Supreme Court's judgment on the Madras Act is with reference to the dispute between the parties whose lands had been acquired under the Act and the Madras Government. The appellants had contended that the Government had no power to acquire land for housing schemes under the amending Act in derogation of the powers of the former Act and that the acquisition, though it purported to be for a housing scheme, was really intended for selling the lands acquired and raising revenue for the State. It was, therefore, "colourable exercise" of the State's powers. Opposing this contention, the counsel for the State argued that the Government, in its discretion, had the power to acquire land for housing purposes under any one of the three Acts, namely, the Housing Board Act, the Town Planning Act and the amending Act. Delivering the judgment, the Supreme Court upheld the viewpoint of the appellants. Its observations (Press version) are as follows:

"The amending Act in its comprehensive phraseology takes in acquisition for any housing scheme, whether for slum clearance or for creating modern suburbs or for any other public purpose. The provisions of the amending Act are not confined to any agrarian reform and, therefore, do not attract Article 31A of the Constitution. If the compensation is illusory or if the principles prescribed are irrelevant to the value of the property at or about the time of its acquisition, it can be said that the legislature committed a fraud on power and, therefore, the law is bad. If the acquisition pertains to the adequacy of compensation, it is not justiciable; if the compensation is fixed, or the principles evolved for fixing it disclose that the legislature made the law a fraud of powers, the question is within the jurisdiction of the Court. We, therefore, hold that discrimination is writ large on the amending Act and it cannot be sustained on the principles of reasonable classification."

Here are two pieces of wise judgment given by the Supreme Court which provide much food for thought. The State Governments will do well to ponder over them and take a fresh look at the issue pertaining to land acquisition. No one will question any Government's right to acquire lands for *legitimate* public purposes (we have specially italicised the word "legitimate,") provided (*a*) such acquisition does not infringe the property rights vested in individuals by the Constitution and (*b*) the Governments pay due compensation (based on market value as distinct from original value) to the owners of lands so acquired.

PUNJAB AND DELHI CHAMBER ON MONOPOLIES

The latest addition to the list of memoranda submitted to the Monopolies Commission on its terms of reference is the memorandum of the Punjab and Delhi Chamber of Commerce. At the outset the memorandum points out that the concepts of monopoly, restrictive trade practices and concentration of economic power have sprouted from economies where Governments adopted *laissez faire*. In India, however, a social and democratic structure was adopted and from the beginning itself restrictions were put against possible concentration of wealth and economic power. In the opinion of the Chamber, the Commission would have to examine the existence of monopoly conditions, if at all, in the case of essential commodities only because the study of non-essential goods would not only be futile but would also give rise to confused thinking. As the size of Indian industrial units is very small, as compared with their counterparts in the industrially developed countries of the world (the biggest company in India does not figure among the first 450 companies of the world) and as no single producer of any commodity in this country controls so great a part of production or sales as to affect the price of that commodity, the Chamber concludes that there do not exist any monopolies, concentration of economic power and restrictive practices.

The Chamber has urged the Commission to recognise the fact that a minimum size of operation is necessary in almost all fields of production for achieving maximum efficiency and for reducing the unit cost of production and also to strike a balance between undue concentration of productive capacity or distribution rights in a few hands and the bare minimum size of operation required for an economic and viable unit. The people of this country would be better served by production and supply of cheaper goods even though such production is arranged by a few people rather than by spreading out the productive capacity over a large number of uneconomic or constantly marginal-size units and paying more for the finished products. Referring to the role the private sector has played in the planned progress of the country, the Chamber says that this sector has received valuable and effective assistance from foreign collaborations and that Indian entrepreneurs should continue to offer industrial opportunities to the foreign collaborators. It is essential, therefore, that the efficient business houses which have already achieved considerable success in attracting foreign capital to the country, should not be disturbed either in their collaboration programmes or scale of operations.

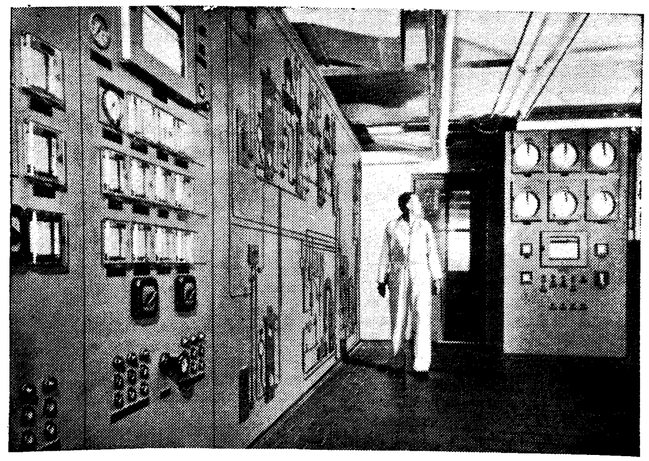
Another point that emerges from the Chamber's memorandum is that already there are several regulations which check the growth of monopolistic conditions. The Government, it is well known, has acquired vast and far-reaching power of control for regulating the economy. The controls imposed under these powers have, however, placed undue fetters on reasonable and justifiable expansion. The Chamber has, therefore, suggested to the Commission that, in any steps the Commission might recommend, further control of industrial activity should be avoided. The Chamber here presumes that the Commission would come to the conclusion that there are no monopolies in this country and suggests that it should thereafter clarify the position in clear terms so as to remove all suspicion in the public mind about the so-called monopolies. The Chamber has given, in this connection, a concrete suggestion to the effect that the Commission should consider the setting up of a permanent machinery which could take care of individual enquiries from time to time. Such an agency, however, should restrict its work to analysis and examination of the situation without acquiring executive powers to exercise control over economic activity. The findings of this agency should be processed by the appropriate authorities from time to time. The Chamber has done well to go a step further and suggest that, even though the terms of reference of the Commission have specifically excluded the public undertakings, the proposed machinery should not differentiate between private-sector and public-sector monopolies, as the objective is to curb and regulate undesirable tendencies which flow from monopolies irrespective of where they exist.

BENAMI LIFE INSURANCE POLICIES

Representatives of sixty Life Insurance Agents' Associations from all over India, who met at Bombay from 30th September to 3rd October 1964 in a Convention, decided to federate their associations as an all-India body for effective representation of their interests. The Convention, which formed this body (Life Insurance Agents' Federation of India), has also approved a charter of demands for presentation to the Life Insurance Corporation. The most important of these demands relate to the abolition of *benami* agencies.

The practice of *benami* agencies, incidentally, dates back to the days when life insurance was handled by private companies. It will be recalled that Mr. Asoka Mehta, while speaking in the Lok Sabha during the debate on nationalisation of life insurance in 1956, gave an indication of the extent of this undesirable practice. He said then: "Forty per cent of the licences of insurance agents are not renewed, and if an enquiry had been made—I do not know why an enquiry of this kind was not made—it would have been found that 80 per cent of those who have licences were also *benami*. As the Finance Minister pointed out, we are experts in *benami* transactions. It is interesting to find that, out of 119,000 licences issued in 1954, as many as 38,409 or 32.2 per cent were issued to women. I did not know that our women had begun to occupy 32.2 per cent of our professional life. This only shows to what extent it is *benami*. I do not know who are the men hiding behind the skirts. I wish an enquiry had been made before nationalisation. We would have perhaps discovered some of the persons occupying positions in official life who have been hiding behind the skirts." The Estimates Committee 1960-61, which also considered the prevalence of *benami* agencies, suggested in its report that the L.I.C. should take effective steps to eliminate *benami* agents. There is nothing to suggest that the number of such agents has gone down since. If anything, it might well have increased considerably. As the persons occupying positions in official life, "who have been hiding behind the skirts," virtually extort insurance business from otherwise unwilling parties, many of the relevant policies lapse after some time. It is indeed revealing that the lapse ratio has risen from 5.1 per cent in 1958 to 8.1 per cent in 1962-63. Thus, a large amount of money and labour is wasted every year. It would be even more revealing to find out, if possible, the proportion of lapsed policies under *benami* agencies.

As pointed out in the presidential address to the Convention, life insurance is a difficult commodity to sell because it is so intangible. There is, therefore, great need for the right type of people to sell it. In advanced countries like the U.S.A. and West Germany, for instance, agents occupy an important place in insurance business. Unless the life insurance agents in this country are tranformed into an enlightened and dynamic force, it will be difficult to achieve a faster rate of growth in life insurance business. The Convention has, therefore, rightly urged the appointment of screening committees to weed out *benami* agents and to select the right type of people as agents who may be given proper incentives and also intensive training in insurance business. Though the Insurance Act of 1938 contemplated a qualifying test before granting an agency licence, the provision has remained a dead letter. It is high time the Government and the L.I.C. took effective steps in this direction, in the interests not only of genuine and hard-working agents but of the Life Insurance Corporation itself.



Look what you get with

HONEYWELL instrumentation

Far more than just instruments, you get a complete control system, custom designed for your specific needs, by men who know your processes.

You get expert, interested assistance every step of the way, with your initial planning and long after your instruments are installed. Blue Star assume full responsibility for the engineering, installation and start-up of your system.

You get training for your instrument technicians in the most up-to-date maintenance methods at the tuition-free Blue Star-Honeywell Instrumentation Education Centre at Bombay.

You get prompt, competent service from your nearest Blue Star office and immediate replacement of emergency repair parts.

These are but some of the plus-values that comprise instrumentation by Honeywell...and they apply regardless of whether you buy a single instrument, a replacement part or a complete control system.

Sold and serviced in India exclusively by

BLUE STAR

AMERICAN LETTER

FOREIGN PRIVATE CAPITAL IN DEVELOPING COUNTRIES

BENEFITS AND COSTS DISCUSSED

By N. Pattabhi Raman

NEW YORK, 3rd October

"WHEN empires cannot enter by the front door, they try by the side and back doors." So said V. K. Krishna Menon recently, articulating his opposition to the Indian Government's efforts to stimulate a larger and more rapid inflow of foreign private investments. This statement was reported in the *New York Times* here. And last week, William E. Knox, Chairman of the Westinghouse Electric International Company and President of the Far East-America Council of Commerce and Industry, cited it in a speech in which he called for the effective demolition of "psychological barriers on both sides" so that "partnership" between the U.S. and the nations of Asia might thrive.

Knox criticised the tendency of the boards of many American corporations, not as fully conversant with overseas business developments as officers of their international departments or divisions, to equate "socialism" with totalitarianism and thus be frightened by *the* "socialism" of many less-developed countries regardless of its specific meaning and content. But he also rejected as unfounded *today* the apprehension felt in the newly emergent countries that foreign capitalism is a forerunner of imperialism. "Does the history of American enterprise abroad justify such a charge?" he asked.

Basically Right

Knox, one must admit, is basically right. Particularly, a big country like India, with a Government that has stood its ground through many years of stresses and strains, need not have any fear of being "annexed" by overseas trading and capital interests. One suspects that all this talk of being swamped by empire-building foreign business interests is due *less* to an understandable hangover from the age of colonialism than to an *idee fixee* rooted in Marxism and a self-serving political interest.

It will be foolish for a person to shut himself in completely, closing all the windows and doors, because the draught from outside might give a cold or worse. He may not catch pneumonia, but he could die of suffocation!

All this is not to deny the need for policy to be based on a careful examination of the advantages as well as the costs of importing private capital. On the contrary, the purpose of this introduction is to invite the readers' attention to an excellent discussion of the subject. The discussion is to be found in a recent book, *Leading Issues in Development Economics*, a selection of writings on development problems, edited with commentary by Gerald M. Meier, Professor of International Economics at the Stanford University in California. (Published by Oxford University Press, New York, 1964).

In a note on "The Contribution of Private Foreign Capital," Professor Meier correctly states that "the essence of the case for encouraging an inflow of capital is that the increase in real income resulting from the act of investment is greater than the resultant increase in the income of the investor." In other words, from the host nation's point of view, the investment is justified "if the value added to output by the foreign capital is greater than the amount appropriated by the investor, [if] the social returns exceed private returns."

Benefits of Foreign Investment

Foreign investments provide capital and foreign exchange, which are generally in short supply in the less-developed countries. Analysing the confribution of foreign investments in greater detail, Professor Meier lists the following additional benefits as likely to accrue to the host country:

1. *An increase in real wages.* Foreign investments in a less developed, dualistic economy may help to transfer labour from the rural areas marked by unemployment, underemployment and low real wages to the industrial sector where wages are higher. "The international flow of capital can thus be interpreted as an alternative to labour migration from the poor country: when outlets for the emigration of labour are restricted, the substitution of domestic migration of labour into the advanced sector becomes the most feasible solution." By assisting the transfer of resources into areas of more productive employment, foreign investments contribute to the process of integrated development.

2. *Benefit to domestic consumers.* This may result when foreign investments lead either to cost reduction by helping to raise productivity, or to better quality through product improvement and innovation.

3. *Higher tax revenues.* In many countries, Governments earn substantial revenues from taxes on the profits and royalties accruing to foreign investors. Such revenues create a basis for social benefit, even if the entire increase in productivity of enterprises in which foreign investors have interest accrues to them as profits.

4. *Benefit from external economies.* Direct foreign investments bring with them managerial ability, administrative organisation, technological knowledge, technical personnel, and innovations in products and production techniques. The supply of these crucial non-capital factors is indeed inadequate in the less-developed countries. The "demonstration effect" must be considered. "New techniques accompany the inflow of private capital, and by the example they set, foreign firms promote the diffusion of technological advance in the economy. This benefit is highly important in a developing country, for while domestic enterprises might not be adept in the practice of innovating, they may make up for this deficiency by imitating the advanced techniques that are being demonstrated by foreign firms. In addition, foreign investment may lead to the training of labour in new skills, and the knowledge gained by these workers can be transmitted to other members of the labour force, or these workers might be employed later by local firms."

(I would add a qualification to this statement, for even *imitation* requires initiative. If a domestic investor enters into a joint venture with a foreign firm only to cash in on its reputation and skill and makes no effort to acquire the managerial and technical know-how coming from abroad, this benefit would be minimal.)

5. *Stimulus to domestic investment.* This stimulus is provided not only because the participation of reputable foreign corporations in a local enterprise usually strengthens the capital market, but also because it helps to create new markets and other conditions which facilitate more investment. It might help break bottlenecks, and thus reduce costs, raise profits and stimulate expansion. If other industries use the product of the foreign investor's enterprise, the product's lower price would benefit them. This "ripple effect" might help stimulate demand too. For instance, foreign investment in the automobile industry can generate or increase profits in the steel and other industries that are its suppliers, in industries that produce complementary products, and in industries that produce goods bought by the factor-owners who now have higher real incomes. "A whole series of domestic investments may thus be linked to the foreign investment."

Costs to Host Country

Professor Meier also discusses the costs of foreign investment to the host country. The likely costs are:

1. *Costs of facilities.* The host Government may have to spend a part of its revenues in establishing special facilities or offering subsidies, etc., in order to attract foreign investments. "These have a cost in absorbing governmental resources that could be used elsewhere." These costs may be worthwhile, but they could be "considerable" if the host country, in competing for global capital with other capital importing countries, resorts to "over-encouraging."

2. *Effects on terms of trade.* "Foreign investments might also affect the recipient country's commodity terms of trade through structural changes associated with the pattern of development that results from the capital inflow. ... It is unlikely, however, that private foreign investment would cause any substantial deterioration in the terms of trade."

3. *Pressure on balance of payments.* This can arise when a net outflow of capital necessitates a reallocation of resources through controls, external and internal, or leads to currency depreciation. Such measures of adjustment have adverse effects which must be set down as the indirect costs of foreign investment, in addition to the direct costs denoted by foreign payments. "To avoid, or at least minimise, these indirect costs, the role of private foreign investment must be related to the debt servicing capacity of the host country."

The point that Professor Meier makes is that, within the context of a development programme and with a careful appraisal of the benefits and costs of foreign investment, policies may be devised to secure a greater contribution from the inflow of foreign private capital. Criticism of foreign capital could thus be more useful and relevant if it is directed at developng such policies.

Private foreign investment is only one of the topics covered in "Leading Issues in Development Economics." Other topics of interest and importance include: (1) Rostow's analysis of the stages of growth; (2) problems of capital accumulation; (3) impact of inflation on development; (4) the relative emphasis to be given to agriculture and industrialisation in the process of development; (5) the influence of international trade on development; and (6) techniques of development planning. The selections reflect different and sometimes opposite viewpoints. Professor Meier himself ties the various pieces together with his commentary. His "Note" on foreign private investment is but a splendid example. This is a book that can be heartily recommended.

ANNOUNCEMENT

Subsequent to the merger of De Twentsche Bank N.V. with the Nederlandsche Handel-Maatschappij, N.V., the business carried on in India since 1920 by the

NEDERLANDSCHE HANDEL MAATSCHAPPIJ, N.V.
(Netherlands Trading Society)

has been continued as from 3rd October, 1964 under the new style of the combined venture:

ISSUES BEFORE I.A.T.A. CONFERENCE

NEED FOR WIDER CHOICE IN AIR TRANSPORT

By Our Aviation Correspondent

EVERY year, at this season, the International Air Transport Association (I.A.T.A.) stages, in one national capital or another, its annual general meeting and its annual conference on fares and rates. These are important aeronautical occasions which seldom pass, moreover, without a hitch or crisis of one sort or another in the Association's affairs. This year, for instance, at Bogota, certain controversial proposals by the Executive Committee set the meeting by the ears. Last year, inability to reach agreement on North Atlantic fares caused quite a crisis—and this year's conference at Athens may be equally as difficult.

Why, it may be asked, all the embranglement? The principal reason, probably, is the size of the Association itself and the fact that national Governments are involved in its decisions. I.A.T.A. member airlines now number in excess of ninety under no less than 72 national flags. They vary widely, moreover, in their resources, their equipment, and, of even greater significance, perhaps, in their objectives. There are large private enterprise carriers, such as Pan American and T.W.A., large State corporations such as B.O.A.C. and Air France, and smaller, though important airlines, such as Air India, Swissair, El Al and Finnair.

In all these cases, and, indeed, in a majority of cases, whatever special national interests may be involved, the principal objective is to operate air transport for profit. On the other hand, there are a number of small carriers whose sole *raison d'etre*, it seems, is the promotion of national prestige. Some of these are so tied to national apron-strings that they even endeavour to bring politics to I.A.T.A. meetings. In such a mixed assembly, it would be strange indeed were no conflict of interests to arise. To add to I.A.T.A.'s difficulties, all decisions concerning fares and rates have to be unanimous. It is a wonder, perhaps, that agreement is reached at all.

Now, while, over the years, more and more airlines have ranked themselves under the I.A.T.A. banner, the number of carriers outside the Association has also been growing. By and large, these latter carriers stake their existence on their ability to offer transportation at cheaper rates than those of I.A.T.A. Some of them, incidentally, are subsidiaries of I.A.T.A. member airlines. B.O.A.C., for instance, has a number of such subsidiaries. In their particular case, of course, competition with I.A.T.A. is strictly controlled and limited. The remainder, however, fend for themselves in a hard and competitive world. The operation of Atlantic charters is where they probably hit I.A.T.A. the hardest.

Group Fares

It is to combat this kind of competition that many of I.A.T.A. special fares and rates are devised. 'Group' fares is one such stratagem. These are special fares which enable I.A.T.A. airlines to carry a 'group' of passengers at rates more or less comparable to those of non-I.A.T.A. charter operators. The rules, however, are strict. The 'group' has to be composed entirely of *bona fide* members of a club or some similar organisation—and *bona fide*, in this context, is taken to mean membership of at least six months' standing. Travel associations, incidentally, are barred.

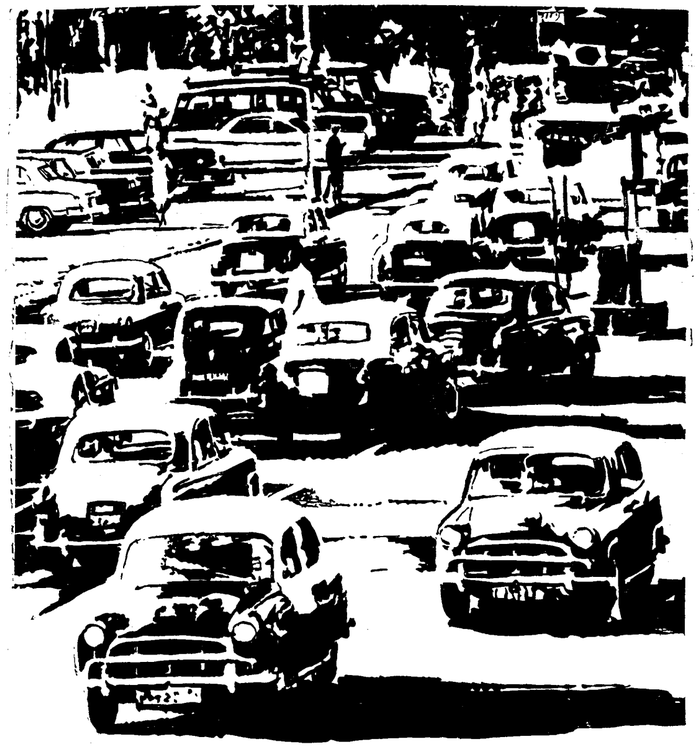
So much for the rules. In practice, no doubt, these, consciously or unconsciously, are sometimes evaded. A rather interesting case of this nature arose quite recently. B.O.A.C made a 'group' booking for 86 passengers, members of a British club called the Midland Dahlia Society. The Society failed to make up the requisite number and advertised a seat in a newspaper—a proceeding which the rules do not permit. The advertisement was seen, and answered, by a secret committee of eight foreign airlines in the U.K. whose collective objective it is to see that I.A.T.A. rules are not infringed. Subsequently—but at a very late hour—B.O.A.C. were informed that a non-member of the Dahlia Society had been booked on the flight. They had then to cancel the charter or risk a fine of £8,000. They cancelled the charter to the great inconvenience of 85 genuine members of the Dahlia Society.

One mentions this incident because it clearly demonstrates the lengths to which I.A.T.A. will go—and, possibly, has to go—to enforce agreed fares, rates and practices, on its own members. Indeed, apart from the snooping of one airline on another, the Association, one understands, employs quite a number of detectives whose duty it is to uncover any evasion of I.A.T.A. rules by members or travel agents. Otherwise, it seems, there might be large-scale undermining of agreed fares and rates. From whatever angle you view it, this is rather a curious state of affairs and one has sometimes to wonder why the Association does not simply split apart at the seams!

In the dim, dark, distant past, long before man inhabited this planet, enormous creatures roamed the swamps and forests. Such a one was the dinosaur, a fierce, four-legged beast of immense proportions. Formidable though it was, however, it failed to survive. Preyed upon by equally fierce but smaller and more active creatures, the species became extinct. Is this, one sometimes wonders, an object lesson for I.A.T.A.? Has the Association, with the handicap which its own voting system imposes upon it, become unwieldy and vulnerable?

If non-I.A.T.A. carriers can undercut I.A.T.A. rates and, in the process, not only survive but thrive, is it unreasonable to suggest that, in some instances at least, I.A.T.A. fares are unnecessarily high? One is well aware of the argument—always trotted out when this question is mooted—that the scheduled carrier is bound to operate at a higher cost. There is something in that, of course—but not nearly so much as the scheduled carriers would have us suppose. The fact is, one suggests, that the more efficient I.A.T.A. airlines could operate—and, in many cases, would like to operate—at reduced fares. Last year's fares and rates conference at Salzburg clearly established that fact. The principal reason that I.A.T.A. fares remain at a comparatively high level is, one suggests, that these have to be tuned to the ability, the equipment, and the objectives, of less efficient members.

The public is uninterested in whether an airline is, or is not, an I.A.T.A. member—the great majority have never heard of I.A.T.A., anyway. The public, however, is interested in safe, reasonably comfortable travel at the lowest possible price. Eventually, as air transport becomes a more normal part of the transport spectrum and less the spoilt and pampered child of national Governments, the law of supply and demand is bound to make itself felt. The public will want a wider choice and, *ipso facto*, a greater degree of price competition than exists today. I.A.T.A., one suggests, will have to move with the times—or, like the dinosaur, because extinct.



Dunlop Gold Seal tyres are being bought by car owners in unprecedented numbers. There are good reasons. They give the highest mileage. Their proven grip on wet roads means that they are the safest tyres. Further, the strength of the casing assures maximum retreadability. You too can have these advantages by fitting a set of Dunlop Gold Seal car tyres.

BRANCH EXPANSION BY BANKS

POLICIES AND PROGRAMMES

THE number of scheduled bank offices increased by 399 to 5,032 during the calendar year 1963, representing an all-time record growth, surpassing the previous best of 340 offices attained in 1959. This acceleration in the pace of branch expansion was the result of the opening of a larger number (347) of new offices and the taking over of a substantial number (68) of offices of non-scheduled banks on amalgamations, mergers, etc.; only 16 offices were closed. During the first half of 1964, again, 220 new offices were opened or taken over, while 30 offices were closed, with the result that total number of scheduled bank offices at the end of June 1964 was 5,222, which, together with the 448 offices of non-scheduled banks, gives a grand total of 5,670 offices of commercial banks.

Since 1954, commercial banks (that is the scheduled and non-scheduled banks) have together opened almost 2,550 new offices upto the end of June 1964, or an average of about 240 offices per year. The time, effort and expense involved in conceiving, exploring, planning and opening new branches at the rate of 20 per month over a period of one decade is not correctly reflected in the net increase of 1,649 offices, for against the continuing progress of scheduled banks must be set the 903 offices closed by non-scheduled banks. The fall in the number of non-scheduled bank offices, on the one hand, represents the desire of the Reserve Bank of India to strengthen the banking system by eliminating unsound units and to regulate the branch network in such a manner as to assist the sound development of the banking system, and reflects, on the other, the inability of the small, uneconomic local banks to face the future with confidence and hope. In fact, the steady fall in the number and offices of non-scheduled banks over the period has been the result of the Reserve Bank's refusal to issue licences for voluntary or compulsory liquidations, conversions into non-banking companies, a large number of amalgamations, take-overs, and mergers with the larger or medium-sized scheduled banks. Even some of the smaller scheduled banks have been able to strengthen their resources position and extend the geographical coverage of their branch network by taking over a number of local non-scheduled banks.

Banking Companies Act

The Reserve Bank's interest in branch expansion policies of commercial banks is as old as the Bank itself. Proposals for obtaining the power to regulate the opening and closing of bank branches through a system of licensing were first made by the Bank in 1940, but, in view of the abnormal conditions created by the war, no action was taken by the Government. A comprehensive legislation on banking had, again, to wait till 1949, on account of changing political structure and differences of opinion between the bankers and the Reserve Bank, the Reserve Bank and the Government, and among the authorities themselves. In the meantime, however, under the impetus of war and post-war boom, the branch expansion programmes of banks displayed several undesirable characteristics, such as undue concentration of banking offices in the larger cities and towns, a mushroom expansion by several small banks involving capitalised expenditure on premises, furniture and furnishing beyond their capacity and resources, and payment of high rates of interest on deposits in order to snatch them away from other banks. In 1946, therefore, the Banking Companies (Restriction of Branches) Act was passed, ahead of the main banking law, with which its provisions were later merged.

The main objects of the licensing regulations have been to ensure continuance and growth only of sound banking companies and to discourage indiscriminate flotations and expansion. Economic changes over the decade have been many and varied, but the object of branch licensing policy continues to be to regulate the opening of new offices of banks in such a manner as to assist the sound development of the banking system and at the same time to enable it to meet the growing requirements of the economy.

Under the Banking Companies Act, the Reserve Bank was required to satisfy itself on several matters before granting permission to open a branch. The most important consideration was, of course, to determine whether *public interest* would be served by opening such a branch. Public interest is no doubt a very elusive and indeterminate concept, but it could be reduced to exact specifications as far as branch expansion was concerned. With the inside knowledge of the working of banks, it would be quite easy for the Reserve Bank whether the number of branches at a particular centre was fully able to tap the deposit potential of that place and whether the banking facilities already existing were adequate. The existing economic, industrial or agricultural development and future potential were also required to be surveyed in order to determine the prospects of earning a profit through banking business in particular area. Prospects of profit and public interest conflict with each other to a certain extent, but both concepts have to be given broad and liberal interpretations. Prospects of profits do not mean immediate prospects, for it may be quite possible that the existence of a bank may itself encourage the development of the area and make the prospects brighter over a quinquennium or so, thus making the public interest identical with prospects of profits.

These two are the general considerations applicable to any bank that wants to open a branch. There are three other specific aspects of a branch expansion proposal relating to a particular bank into which the Reserve Bank must go. They are (*a*) the financial condition and history of the bank, (b) the general character and ability of its management, and (c) the adequacy of its capital structure.

There has been some criticism of the failure of the Reserve Bank to enforce the letter and to observe the spirit of these provisions. The Reserve Bank's assessments of public interest and prospects of profit have been uncertain and casual; the link between the capital funds and the territorial range of operations of a bank is of a minimal character; and no one knows the manner in which the history and management of bank's were appraised. By its own admission, the Reserve Bank found, at the end of a decade of the administration of the Banking Companies Act, that there were 1,400 unbanked towns, that there was duplication of banking facilities in heavily concentrated urban areas, and that their capital funds were inadequate in relation to the vast increase in the resources of banks as a result of branch expansion.

The Bank interpreted its functions strictly as regulatory, and did not take any initiative in suggesting or forcing a bank to open a branch at a particular place. All that it did was to say yes to a proposal or to decline it. And then, all of a sudden, it woke up to the realisation that, while the *pace* of branch expansion since 1954 was generally satisfying, there had not been enough penetration into rural and semi-urban areas where there might be as large a deposit potential as there was the need for credit.

Banks' Difficulties

The banks have their own difficulties in opening new branches: the time, labour and expense involved in exploring and planning new branches is only the beginning of the process. Premises have to be acquired and whatever is available at a heavy cost may not be suitable from the point of location or security. Staff has to be recruited and trained or transferred to new offices. The Bank Awards and the Shops and Establishment Acts limit the discretion of banks in the matter of staff and business hours. When the number of branches at distant and remote places increase, complicated problems of accounting techniques and branch control and supervision have to be solved. Above all, when a branch is to be opened in an hitherto unbanked area, the question of remittance facilities for fresh and soiled notes becomes a major factor. Use of post office or a cash remittance may be costly and risky. Moreover, post office services or police guards may not always be available. It is for this reason that we find branches of State Bank of India precede those of other banks at most of the unbanked places.

The establishment of a branch is followed by the arduous process of gathering deposits and cultivating business. Normally deposits are the easier to come, but the bank which collects deposits and remits funds to the head office lays itself open to the charge that it is draining away rural savings to urban areas. Business takes time to come by and, in the meantime, establishment and interest costs are to be incurred. No statistics of year-to-year progress of new branches in gathering deposits and cultivating business are available, but, if they were, they would have thrown interesting light on the problems facing bankers in their branch expansion programmes. It takes normally not less than four years before a branch would earn enough to pay its own way, although regional and personal variations may be important in this.

In spite of all these difficulties, the pace of branch expansion has been gathering momentum since 1954. By 1956, the Reserve Bank was following a liberal branch licensing policy as will be evident from the fact that 782 licences were issued during 1957 and 1958 for opening new branches, as against an equal number of licences issued during the preceding six years, from 1951 to 1956. The number of unbanked towns came down from 1,400 in 1960 to a little over 1,000 at the end of March 1962, and must now be around 700, if not less. It is a reflection on our banking statistics that, even in the second half of 1964, the Reserve Bank has the statistics only of March 1962!

Not much should be made of these 700 odd towns lacking in banking facilities, for, if the banks were reluctant to open branches in smaller places, they would not have opened branches at 750 odd smaller centres and places which are so small as cannot be designated as towns; in all 5,495 branches of commercial banks at the end of 1963 covered 1,860 centres, of which 1,954 branches were situated in 1,336 centres with a population of less than 25,000. There were only 524 centres with a population of more than 25,000, and they had 3,541 branches. Larger centres are bound to have a larger number of bank branches depending upon business that is available, and that does not detract from the merits of covering as many as 1,336 rural and semi-urban centres. It may be added here, to complete the records, that 2,360 cooperative banks cover 1,864 places, of which 1,432 smaller centres had 1,542 branches and 432 larger towns had 818 branches.

Distribution of Branches

The commercial and cooperative banks together cover about 2,732 centres, of which 2,206 had a population below 25,000 and 526 above that figure. The table below gives the distribution of branches of various categories of banks in places with population above and below 25,000 as at the end of 1963:

	Places with Population		
	Above 25,000	Below 25,000	Total
Number of places			
State Bank of India	526	2,206	2,732
Other Indian Scheduled Banks	538	531	1,069
Foreign Scheduled Banks	2,696	1,153	3,849
	84	2	86
Total Scheduled Banks	3,318	1,686	5,004
Non-scheduled Banks	223	268	491
Co-operative Banks	818	1,542	2,360
Grand Total ..	4,359	3,496	7,855

The month of July 1962 marked a turning point in the branch licensing policy of the Reserve Bank of India. For the first time, it requested the banks to formulate a stage-by-stage programme of branch expansion over a period of three years ending July 1965. In drawing up the programme, the banks were expected to take into consideration the need for expansion in areas which were not having any banking facilities or which were underbanked. After considering the programmes, the Bank has issued licences (up to June 1964) for opening 373 new offices, including 147 for unbanked centres. Further, the Bank has indicated its approval for proposals to open 213 more offices, of which 81 will be at unbanked centres. In order that the earning capacity and overall financial position of each bank may not be adversely affected, each bank has been encouraged to implement a coordinated programme of expansion, embracing areas devoid of banking facilities and suburban areas of urban centres, in addition to towns and cities of commercial and industrial importance.

At the end of June 1964, the total number of offices of the State Bank of India and its subsidiaries stood at 1,686. The total number of offices of all scheduled banks stood at 5,222 on the same data, representing an increase of 416 branches over the year July 1963-June 1964. There is no doubt that banks are displaying a new dynamism in the matter of branch expansion and, by the time the present phase of expansion ends in mid-1965, significant changes will have occurred in the pattern of branch network in the country.

MAHARASHTRA STATE COOPERATIVE BANK'S PROGRESS

PROBLEM OF OVERDUES HIGHLIGHTED

DURING the year ended 30th June 1964, the Maharashtra State Cooperative Bank Limited showed an all-round improvement in its working. There was a rise in branches, deposits, advances, income and many other items. Four new branches were opened during the year, raising the total number to fifteen. The deposits of the Bank, which had increased by Rs. 4.65 crores during 1962-63, increased further by Rs. 5.17 crores to a total of Rs. 35.30 crores at the end of 1963-64. The rise was mainly in fixed deposits which increased by over Rs. 4 crores to Rs. 16 crores and formed 45 per cent of the total deposits, as against 40 per cent last year. Whereas the share of (*a*) current deposits and contingencies, and (*b*) saving deposits remained unchanged at 30 per cent and 6 per cent, respectively, that of call deposits receded from 23 per cent to 18 per cent, that is from Rs. 6.90 crores to Rs. 6.37 crores. The contributions of individuals and cooperative institutions to the total deposits remained unaltered in the ratio of 1:2.

The Bank augmented its reserves further by increasing the borrowings by Rs. 3.34 crores to Rs. 27 crores. Whereas the borrowings from the Reserve Bank of India were up by Rs. 3.91 crores to Rs. 25.42 crores, those from other borrowers declined by Rs. 57 lakhs to Rs. 1.59 crore. The total working capital of the Bank increased from Rs. 65.63 crores to Rs. 75.26 crores—a rise of Rs. 9.63 crores.

Advances and Investment

The advances of the Bank which had declined in 1962-63 by about Rs. 2.40 crores, increased in 1963-64 by Rs. 1.40 crore to Rs. 44.33 crores. Except for Rs. 7 lakhs advanced to individuals, the rest of the advances was cooperative institutions. However, whereas the share of the central financing agencies rose steadily from 59 per cent of the total advances in 1961-62 to 62 per cent in 1962-63 and 64 per cent in 1963-64, that of cooperative societies declined from 41 per cent in 1961-62 to 38 per cent in 1962-63 and 36 per cent in 1963-64. The cooperative sugar factories are the most important borrowers in this category. The amount outstanding on their account as of 30th June last, was Rs. 8.19 crores as against Rs. 7.08 crores a year before. Cash credits, short-term loans and intermediate term loans are the major categories of advances made by the Bank and together these items account for 98 per cent of total advances. Cash credits, which remained at almost the same level as in the previous year, accounted for Rs. 11.64 crores or 26 per cent of the total advances. About three-fourths of the cash credits were clean credits and the remaining one-fourth against hypothecation or pledge of goods. Short-term advances, which increased during the year by Rs. 2 crores to Rs. 27 crores, accounted for 61 per cent of the total advances. Almost the entire amount in this category was advanced for seasonal agricultural operations and marketing of crops.

The investments in Government and Trustee securities also increased from Rs. 8.65 crores at the close of 1962-63 to Rs. 10.31 crores at the close of the year under review.

Income for the Year

The total earnings of the Bank (almost entirely in the form of interest and discount) amounted to Rs. 2.19 crores, as against Rs. 1.95 crore in the previous year. The ratio of expenses to the total earnings remained unchanged at 83 per cent (interest paid on deposits, borrowings, etc. 66 per cent and other expenses 17 per cent). The net profit for the year under review works out to Rs. 38.30 lakhs, being better than that for 1962-63 by Rs. 5.08 lakhs or 15.3 per cent. Although the income increased during the year, the extent of increase was rather inadequate, considering that the working capital was better by nearly Rs. 10 crores as at the close of the year. This was apparently the result of excessive liquidity. As may be noticed from the figures in the previous paragraphs, whereas the working capital increased by Rs. 9.63 crores, advances and investments, put together, increased by only Rs. 3.06 crores. The balance of Rs. 6.57 crores was mainly accounted for by cash and bank balances which rose by Rs. 6.33 crores to Rs. 15.22 crores, a figure which is equivalent to as high as 43 per cent of the total deposits.

Addressing the fifty-third annual general meeting of the Bank held on Saturday, the 26th September 1964, Dr. D. R. Gadgil, Chairman of the Bank, referred to certain weaknesses in the cooperative system. One of these relates to the alarming proportion of overdues to the total outstanding advances of the Central Cooperative Banks. In the case of short-term advances for agricultural purposes, given to the cooperative societies by the Central Cooperative Banks in Maharashtra, the ratio of overdues to outstanding advances increased from 26.3 per cent in 1961-62 to 28.9 per cent in 1962-63. In 1963-64, the percentage came down to 19.1, but the decline was due to "the coercive methods adopted in recovering the dues." If this is the position in Maharashtra, the leading State in cooperative movement, the position in other States may well be imagined. The comparable figures for the Central Cooperative Banks in different States, which are available for 1961-62, show that, of the total outstanding loans of these institutions, the overdues which were 18 per cent in the case of Maharashtra, were as high as 85 per cent in Assam, 42 per cent in Bihar, 38 per cent in Rajasthan, 35 per cent in Jammu and Kashmir, 27 per cent in West Bengal, 24 per cent in Mysore and 21 per cent in Madhya Pradesh, and 16 per cent for India as a whole.

The reason for these overdues, as pointed out by Dr. Gadgil, is the failure of crop in certain areas every year. The remedy, suggested by him, is the conversion of overdues into medium-term loans, for which, he suggests, the creation of a special fund to serve as a cushion for calamities. It may be pointed out, in this connection, that, though the failure of crop is a common feature, the damage is nowhere as high as the overdues seem to suggest. The real reason is to be found in the attitude of the borrowers who treat loans from cooperatives more as a grant than as a debt to be repaid. Unless the cooperative institutions work strictly on business principles, it will be difficult to change this attitude.

Dr. Gadgil drew attention to another weakness in the system of cooperative finance. To quote him: "The big land holders and the farmers growing money crops get the benefit of the crop loan on a larger scale than the small agriculturists growing food crops and having non-irrigated lands, who account for only a very small part of the loans. The conclusion is inevitable that the crop loan system is not much favourable to the poor farmers." This defect strikes at the very roots of cooperative finance in this country. But it must also be kept in view that advances to small agriculturists will inevitably result in raising the proportion of overdues.

Cooperative Marketing

Another point referred to by Dr. Gadgil pertains to cooperative marketing. "As a rule every member of the cooperative society," according to Dr. Gadgil, "is conditionally bound to sell his goods through cooperative agency. For a number of reasons, this condition is not strictly adhered to. Unless the efficiency of the Cooperative Sale-Purchase Institutions is improved, the implementation of this condition is neither advisable nor possible. From this point of view, the progress of cooperative credit and the development and efficiency of cooperative marketing are interdependent and inter-linked with each other. If cooperative marketing is to spread to a wider area, the Government's support is essential. This year's experience has, once again, underlined the significance of price stabilisation and the control over distribution and prices of the food all the year round." Though there can be no two arguments about the desirability of encouraging the Cooperative Sale-Purchase Institutions, they will not be able to make much headway if they always look to the Government for the necessary support. Such continued reliance on the support of the State is a clear commentary on the lack of people's confidence in the cooperatives.

EDUCATION THROUGH EXHIBITION

Canara Bank believes that one of the important services that a Bank should render is to spread the banking habit in urban as well as rural areas.

This service can be rendered best by mass education. The best means of mass education are exhibitions. People from all walks of life, of all income groups, from big towns and small villages come to see exhibitions. They come to learn from the exhibits and explanations.

And so, Canara Bank started its programme of "education through exhibition" in 1958. So far, it has held over 25 exhibitions in South India.

Lakhs of people who have seen Canara Bank's exhibitions have received banking education. They have been taught to save for their future; to keep their money in banks to earn more money; to use a bank to enjoy better living.

Almost everywhere the exhibition authorities have awarded first prizes to Canara Bank pavilions. V.I.Ps and people from all over India have praised Canara Bank's active efforts to popularise banking by "education through exhibition".

In the years to come, Canara Bank plans to educate more and more people through more and more exhibitions.

Distinguished Public men like Mr. V. V. Giri, Governor of Kerala and Mr. Medhi, former Governor of Madras took keen interest in Canara Bank's Educative Exhibition.

RAYON AND SYNTHETIC TEXTILES

SCOPE FOR EXPANSION QUITE VAST

WHATEVER the pattern of development in the textile economy of India in future, there is no doubt that rayon and synthetic textiles will have to meet a large part of the domestic clothing requirements and earn sizable amounts of foreign exchange through exports. The past few years have witnessed a notable expansion in the demand for these textiles. In keeping with this expansion, production has risen quite appreciably. The actual output of art silk and staple fibre fabrics is currently maintained at an annual rate of about 800 million metres, as against the 434 million metres produced in 1956; production in 1952 was no more than 191 million metres. Besides meeting domestic demand, the art silk industry is also earning for the country precious foreign exchange. During the financial year 1963-64, India exported Rs. 10.88 crores worth of rayon and synthetic fabrics (88.5 million metres). The rise in the production of fabrics has followed a substantial increase in yarn production as will be seen from the accompanying table. The production and export performance of the industry would have been more encouraging but for some of the pressing problems confronting the industry and the trade. What these problems are was impressively highlighted by Mr. D. N. Shroff in the course of three speeches delivered by him last week while presiding over the annual meetings of the Silk and Art Silk Mills' Association (S.A.S.M.A.), the Silk and Art Silk Mills' Research Association (S.A.S.M.I.R.A.) and the Silk and Rayon Textiles Export Promotion Council; Mr. Shroff is the President of all the three bodies.

Tax Burden

Addressing the S.A.S.M.A. meeting, Mr. Shroff made a pointed reference to the heavy burden of taxation on the art silk industry and reiterated his plea for the complete withdrawal of excise duty on fabrics at the processed stage. In support of the plea, he said:

"This would result in administrative economies and convenience to the Government, inasmuch as the duty has to be collected from only about a dozen spinners, as against from a couple of hundred weaving and processing units. From the point of view of the industry, it would relieve the industry from procedural hardships without any loss of revenue to the Government. This will also prevent evasion of tax by abuse of concessions given for hand-processed fabrics."

If, however, the Government is unable to concede the plea, it can at least reduce the duty drastically, since there is already a heavy excise duty on yarn.

The need to produce fabrics according to consumer preferences, especially overseas buyers' preferences, was emphasised by Mr. Shroff. It was in this connection that he stressed the importance of rehabilitation and modernisation. The Working Group on art silk industry set up by the National Industrial Development Corporation some years ago had observed:

"Replacement of the existing old machinery is essential, as majority of the plain calico looms falls short of the requirement of weaving man-made fibres and filament yarn, a process which presents problems not generally encountered with in the weaving of cotton or wool. Filament fibres, being smooth, require special surface covering, added tension in the loom, correct spacing of picks, etc. Besides, each type of man-made fibre presents its own weaving problems, as some fibres are very strong, while others very weak, especially when wet. Some fibres are abrasive and cut grooves into the surface they come in contact; some stretch extensively, whereas others have little or no stretch; some have high elastic recovery, while others have little. These are some of the peculiar characteristics not possessed by any natural fibres."

The Working Group had estimated the rehabilitation outlay at Rs. 15 crores, covering only a total of 45,000 looms, whereas the number of looms in place is over 67,000. The Study Group appointed by the Central Government to assess the machinery requirements of the industry in the fourth Plan period has now estimated the total outlay at Rs. 66.51 crores, taking into account the increased use of knitted fabrics. Even the Asoka Mehta Committee has stressed the need for rehabilitation spread over a ten-year period and estimated the outlay at Rs. 40 crores. Recalling all this, Mr. Shroff rightly said that it was not sufficient merely to make estimates; something concrete needed to be done. The Government, through the Textile Commissioner's Office, should, according to him, make available foreign credits to the industry for the import of machinery, especially yen credits from Japan, for the industry is already familiar with Japanese machinery.

Recognising the importance of man-made fibres, the Planning Commission is reported to have fixed fairly high targets for the fourth Plan: 190 million kg. of viscose and acetate rayons and 90 million kg. of synthetic fibres to be achieved by 1970-71. Mr. Shroff considers the targets as "quite appreciable." Indeed, he is afraid that most of the projects will remain on paper and that capital outlay will go up. Here is what he said at the meeting of the S.A.S.M.I.R.A.:

"The unfortunate aspect is that, though the Government has belatedly recognised the importance of synthetic fibres, it is hesitant, rather reluctant, in providing adequate assistance for their development. All these projects are expected to be started either with foreign collaboration or by long-term payments and, secondly, even the raw materials required for their manufacture will have to be imported by earning foreign exchange by way of exporting man-made fibre fabrics. These conditions are too strict and rigid for the projects to materialise in short time. It is a quite well-known fact that our country is in short supply of cotton and, for some time to come, we shall have to import long-staple cotton. The increased manufacture of man-made fibres should, therefore, serve to supplement our requirements of the long-staple cotton. Just as the art silk weaving units were set up in the country by importing art silk yarn in the beginning, which ultimately led to the setting up of rayon spinning plants, similarly, plants for the manufacture of synthetic fibres should be set up by importing raw material required for their manufacture. The fibre plants will slowly receive the raw material from our petrochemical industry. It is only through such practical approach we can fulfil our Plan targets within the specified time. Otherwise, I am afraid most of the projects will remain on paper, and the cost of capital outlay will go up."

Progress At A Glance

	1964*	1963	1956	1951
Fabrics (million metres)	800.4	651.6	435.6	300.0
Of which:				
Art Silk	796.8	648.0	429.6	286.8

* Projected on the basis of actual output in the early months of the year.
† Production commenced in 1962.
‡ Production commenced in 1954.
§ Estimated on the basis of actual shipments during the first half of 1964.

The development of the rayon and synthetic textile industry in the coming years will be shaped in no small measure by the pace of progress maintained in research and technology. The S.A.S.M.I.R.A. has been doing much useful work in this regard. Well could Mr. Shroff claim that the Association had achieved remarkable progress. The S.A.S.M.I.R.A. has not only concluded some important research and technological work and helped the cause of Defence but also expanded its technical education, technical service and testing activities during the last year. It recently concluded the investigation work into the quality of indigenous viscose and acetate rayon filament yarn and, as a result, it was found, there was no uniform basis adopted for grading yarn by indigenous yarn manufacturers. In this context, Mr. Shroff observed that the weaving units were reluctant to use such poor quality yarn and steps should be taken by the spinners to improve the quality. He further said that even the techno-economic survey of the art silk weaving industry recently conducted by the S.A.S.M.I.R.A. has also shown that one of the factors confronting the introduction of automatic looms had been the poor quality of yarn. This survey, which was of art silk weaving industry in Bombay, had also shown several other important trends in the industry, he added. It is interesting to note that the strong demand for shirting made out of synthetic fibres has imparted dynamic spurt to the production of this sort. According to the survey, shirting may assume leading position in total art silk production by relegating satin into the background.

The art silk industry, as already stated, is earning for the country quite a bit of foreign exchange. The year 1963-64 witnessed a notable rise in exports of rayon and synthetic fabrics as compared with the previous year, the actual exports amounting to Rs. 10.58 crores (88.5 million metres), as against Rs. 8.46 crores (77.8 million metres). This amount is well above the export target of Rs. 8 crores fixed for the year. The achievement, as Mr. Shroff said in his speech at the meeting of the Silk and Rayon Textiles Export Promotion Council, is creditable, considering the restrictive trade policies adopted in certain countries and unsettled political conditions in some other countries. Since the beginning of the current financial year (1964-65), however, the export activity has slackened. The quantity actually shipped in the first half of the year (April-September) was 30.3 million metres valued at Rs. 3.33 crores, as against 3.34 million metres valued at Rs. 3.31 crores in the corresponding period last year. As against the export target of Rs. 12 crores fixed for 1964-65, the actual shipments are currently maintained at an annual rate of Rs. 6 crores. The slackness in exports has been attributed by Mr. Shroff primarily to the following three factors.

1. On account of indiscriminate linking of imported art silk yarn as an item of incentive against exports of a number of items for which it is not even a raw material, the art silk yarn market is in a state of instability, with the future remaining uncertain. Consequently, manufacturers and exporters are not finding it safe to enter into any export commitments.

2. Another factor having adverse effect on the export trade is the requirement that spinners who are under an export obligation should earn foreign exchange to import their raw material by exporting rayon and synthetic fabrics. Thus, there are two schemes, with differential compensating benefits, operating with regard to the export of the same item. The items exported, the overseas markets, and the buyers being the same for both the spinners and the rayon manufacturers, the former who are granted incentive on a different basis, and which is comparatively higher, offer competition to the latter. The undermining effect of the preferential benefits given to spinners and the violent fluctuations in the yarn prices which render the element of compensation in the incentive uncertain have in fact set at naught the Council's effort to work with the reduced incentive at 70 per cent.

3. The Schedule of International Prices in the case of certain qualities, trade in which can be built up in a large measure, acts as a discouraging factor, since the price fixed under it is inadequate. The imbalance between the prices attracted by different qualities creates tendencies to export such items which give the maximum incentive benefit even when those items have no established demand in world markets. Such tendencies are unhealthy, as the items are traded for the price and not for the demand and have an overall damaging effect on the goodwill that is built up for the product as well as the trade.

Not only should the declining trend of exports of rayon and synthetic fabrics be arrested, but every effort must be made to raise exports. Urging a new approach to the incentive scheme, Mr. Shroff said:

"The approach should be such as is directed to procure adequate raw material for maintaining and expanding the present supply position whenever required, as well as to allow adequate compensation out of the incentive for the loss incurred in an export transaction. The production of art silk yarn is being expanded as well as diversified in regard to types and quality and, as such, imported yarn may not continue to provide the required incentive and will gradually lose its compensatory element in it, as I have said it many a time. The need for the shift in our approach, therefore, has been never as urgent as it is today."

There is, of course, some force in the observations of Mr. Shroff, but, it must be emphasised that incentives constitute at best only palliatives. The real, effective solution lies in maximum production of quality goods at an economic cost. The rayon and synthetic textile industry will do well to urge the Government to create conditions favourable to such production, instead of repeatedly pleading for export incentives.

EXCISE DUTY ON RUGS PRODUCED FROM TANNERY WOOL

The producers of coarse woollen rugs from tannery wool especially in Bangalore are perturbed over the Government of India's inordinate delay in raising the excise duty exemption limit from the low level of Rs. 12 per blanket. The exemption limit, it will be recalled, was fixed before the state of Emergency was declared in October 1962. Since then, the cost of producing coarse woollen blankets has risen considerably. The price of tannery wool alone has gone up from Re. 1.25 per lb. before the Emergency to Rs. 2 at present. As about five lbs. of tannery wool are required to manufacture one coarse blanket, the incidence of raw material cost has turned out to be pretty heavy. What is worse, labour charges, cost of fuel and power, and the prices of various other stores consumed by mills have all increased and continue to increase. Consequently, the producers of coarse woollen blankets are incurring heavy losses. They will, therefore, be forced to curtail production. Such a step will necessarily lead to retrenchment of labour, besides reducing supplies to consumers, the majority of whom are workers employed in tea and coffee estates. This extreme course could be avoided if the Government were to concede the plea of producers for raising the excise duty exemption limit for coarse woollen rugs manufactured out of tannery wool to at least Rs. 20 per blanket.

MANCHESTER LETTER

OUTLOOK FOR MILL INDUSTRY GOOD

MAXIMUM UTILISATION OF CAPACITY

From Our Special Correspondent

MANCHESTER, 29*th September*

ONLY a handful of mill towns have still to take their final week-end holidays of the year and none of the major centres are involved, so that, for nearly three months, the industry will be hard at work turning out as many goods as possible to meet the demand which has accumulated during the summer. In the past the moment has often been a critical one for producers and managements and the prospect of an autumn buying movement have been closely analysed.

While much consideration has been given to the present circumstances of the trade as a whole, the steady stream of demand, which has come forward since the early months of the year, has provided a very satisfactory background on which the spindles and looms have kept going to the maximum of their capacity, subject only to labour gaps. Despite some forebodings that distributors may restrain their purchases after their extensive operations, it is possible to take a fairly optimistic view of the immediate prospects. Very few concerns express any anxiety about their ability to keep machinery fully engaged to the year-end at least.

Minor extensions to the structural changes which will make 1963-64 go down in history in the trade's annals have lately taken place, but it would be unwise to predict that the movement is anywhere near at its end. Negotiations are nearly always in progress, many of which fail to achieve their final objectives.

A New Link-up

Rumours, however, have lately been circulating about an important project which will have the effect of linking substantial weaving capacity to distributing organisations of some magnitude. Such ambitious plans follow almost inevitably on the major upheavals which have seen substantial quantities of spinning machinery absorbed by the man-made fibre producers and should without doubt strengthen the structure of the trade as a whole.

It has been widely accepted for many years that the links between the different sections have been far too loose for efficiency. Rationalisation of spinning, first through the redundancy programme and, perhaps more effectively, through the forthcoming changes which must be anticipated following the recent mergers, has already been set in motion. An equivalent arrangement through the grouping of moderate-sized weaving units and their closer collaboration with the merchanting community is an obvious and necessary next step.

Among the aims of all the instigators of the new regime, which is being slowly evolved in textiles, is the laudable objective of eliminating the past dismal record of alternating waves of depression and overabundant prosperity, in which the accent has more frequently been on the lower swing of the pendulum. Not even those directly concerned with these developments anticipate that all the fluctuations can be completely exorcised, but tighter integration between all forms of output and marketing is an essential element in any scheme which is proposed for the future benefit of all.

By co-operative action, overlapping inessentials can often be avoided, so that a movement towards the dovetailing of weaving capacity with merchanting "know-how" has much to command it. As the new group expands by the introduction of more looms, it should create not only manufacturing power, but a ready source of supply for distributors to obtain goods without the extensive waits for delivery which have always handicapped the industry in times of keen demand. The present instance is an example of order books stretching too far ahead, involving frustration for those customers who are anxiously pressing for deliveries and who are in turn being urged to provide supplies against outstanding contracts.

International Talks

Consideration of the textile industry's future on world-wide scale can only be given on a very broad basis when the number of countries involved is as large as those attending the forthcoming annual meeting of the International Federation of Cotton and Allied Textile Industries. The conference at Zurich next week has before it a series of discussions on the evolution of productive capacity and current problems affecting world trade in textile goods.

While membership of the Federation represents more than two-thirds of the total world productive capacity, its major support has come from the traditional manufacturing areas in Western Europe. Developments in the past decade have tended to transform the overall picture, with the newly emerging countries taking a much larger slice of the available trade, bringing conflicting arguments over the future pattern of the disposal of surplus supplies for export.

The main item on the agenda of the meeting, according to the preliminary text, is a detailed study of the structure of the cotton and allied textile industries in the member countries of the Federation. The organisation's statistical services have always been of great value to observers of the textile scene throughout the world; any information which can be obtained about the progress and prospects of individual nations will be of benefit in assessing the outlook.

Big Bank Advances

Borrowings from the banks continue to provide a useful barometer to the state of industry generally and to individual trades in particular. For the first time the August returns, issued by the British Bankers' Association, topped the £5,000-million mark, as indebtedness at that time amounted to £5,120,386,000 a rise of over £200 million in three months and nearly £550 million more than in August 1963.

Not only is the grand total larger than ever before but the advances made to the cotton industry have also reached a new peak at £28,584,000. This still represents only very minute proportion of the whole, being 0.6 per cent of the aggregate borrowings, but the actual figure involved is £2 million more than in May and £3 million higher than in August last year.

In view of the changes which have occurred in the structure of the textile industry in recent months it would be interesting to know on what basis in the analysis firms are scheduled as being members of the "cotton" sector, as the other allied trades shown are wool and "other textiles." Borrowings by firms in the wool trade decreased by £4,500,000 to £82,691,000 during the quarter ending in August, but this compares with a total of only £65,525,000 twelve months previously.

In the case of "other textiles," the bigger borrowings from the banks have continued. From a total of £94,850,000 in August 1963, indebtedness rose to £104,225,000 in May this year and to £115,289,000 in August, the latest figure being 2.2 per cent of the total advances made.

Training Programme

Further courses aimed at improving the efficiency of management in textiles are being offered by the Productivity Centre of the Cotton Board, whose activities have enabled the department to establish a secure niche for itself in the forward-looking sectors of the industry. During the next few weeks, supervisors will have the opportunity of studying modern management practice, catering not only for established foremen but also for young assistants in the management team. The programme, claimed to be one of the most thorough of its kind in the country, extends over a wide range of industrial organisation and the provision of modern techniques of management practice.

COTTON UNDER THE FIVE-YEAR PLANS

PRODUCTIVITY MUST BE RAISED

IMMEDIATELY after partition, it may be recalled, India was faced with the pressing problem of ensuring supplies of cotton to the textile industry. The fertile lands of the Punjab and Sind which were growing the best cotton of undivided India went to Pakistan. India was left with just one-fifth of the total irrigated area under cotton and about two-fifths of the cotton crop, of which nearly 45 per cent comprised long and medium-staple varieties, were lost to India. The 409 textile mills, out of the total of 423 in existence in undivided India, experienced a serious shortage of cotton. The shortage led to sustained efforts to raise production of cotton. Thanks to these efforts, the total area under cotton went up from 10.65 million acres in 1947-48 to 14.54 million acres in 1950-51, that is, just before the era of planning began in India, and output increased from 2.18 million bales (of 392 lbs. each) to 2.97 million bales. It will thus be seen that while the area recorded an increase by as much as 4 million acres, actual output rose by only 790,000 bales. Actually the yield per acre declined from 80 lbs. to 78 lbs.

In the first Five-year Plan, special stress was, therefore, laid on the need to bring about an increase in cotton production as much as possible through intensive cultivation. Earlier, in 1949, the Indian Central Cotton Committee had studied the situation and recommended to the Government that, in the short run, all efforts should be made to augmenting the production of cotton, especially of staple length up to 1". It was considered necessary that the annual production must be stepped up from 3 million bales to at least 4 million bales—while, in the long run, emphasis was laid on the achievement of total self-sufficiency and a fair surplus for exports. For the implementation of the short-run policies, cotton was assigned a priority equal to food crops. The year 1950-51 witnessed the inauguration of the Cotton Extension Scheme in the major cotton growing States. The scheme aimed not only at increasing the area but also adopting intensive cultivation methods for which various incentives were provided to growers. The cotton production target for the first Five-year Plan was fixed at 4.2 million bales. The target was achieved a year ahead of the Plan, that is, in 1954-55, when a cotton crop of over 4.22 million bales was harvested. Although production fell short in the last year of the Plan (1955-56) due mainly to seasonal factors, the net rise in the production over the five-year period was to the extent of about a million bales, recording an increase of 35 per cent. Since, however, the increase in output followed largely the rise in area from 14.54 million acres in 1950-51 to 20.0 million acres in 1955-56, the yield per acre showed a negligible increase from 78 lbs. in 1950-51 to 79 lbs. in 1955-56, a rise of 1.3 per cent.

Production Trend

	Area (in thousand acres)	Production (in thousand bales)*	Per Acre Yield (in lbs.)
1947-48	10,655	2,188	80
1950-51	14,536	2,971	78
1955-56	19,978	4,001	79
Net position (1955-56 over 1950-51)	(+)80.6%	(+)35.0%	(+)1.3%
1960-61	18,871	5,390	112
Net position (1960-61 over 1955-56)	(—)5.5%	(+)34.7%	(+)41.8%
1963-64	19,200	6,150	122
Net position (1963-64 over 1960-61)	(+)1.8%	(+)14.1%	(+)8.9%

* One bale consists of 392 lbs.

Encouraged by the results during the first Plan period, a high target of 6.5 million bales was fixed in the second Plan to be achieved by 1960-61. Owing to the unfavourable seasons of 1957-58 and 1959-60, the original target was considered rather high and it was revised downward to 5.4 million bales. The actual production in 1960-61 was 5.39 million bales, the highest on record after the partition. The second Plan period as a whole was exceptionally good for cotton production. Despite a fall of about 5.5 per cent in the total area from 20.0 million acres in 1955-56 to 18.9 million acres in 1960-61, production rose significantly (by 35 per cent), due to the marked increase in the yield per acre from 79 lbs. in 1955-56 to 112 lbs. in 1960-61, an increase of 41.8 per cent.

In the third Plan, the Planning Commission fixed a production target of 7.0 million bales for cotton to be achieved by 1965-66, that is, an additional output of 1.61 million bales. The first year of the third Plan witnessed a sharp setback to production, the crop actually harvested in 1961-62 being no more than 4.52 million bales. The production, however, went up to 5.31 million bales in 1962-63 and further to 6.15 million bales in 1963-64. The estimated crop in 1964-65 is placed slightly higher than the previous season's crop.

Commendable though the progress in cotton production has been during the last fifteen years, the average per acre yield in India is well below that obtaining elsewhere: 122 bales, as against 524 bales in the U.S., 549 bales in Russia, 573 bales in Egypt and 304 bales in Pakistan. Yields can be improved quite significantly if cotton is set on scientific footing with all emphasis on productivity. This aspect is to be borne in mind especially because of the fact that, to the extent yields are raised, large areas of land can be released for other crops. Data relating to average yields per acre in the different States reveal that, with the exception of Gujarat and Uttar Pradesh, all the other important cotton growing States have recorded increases ranging from 5 to 23 per cent during the second Plan and in the first three years of the third Plan. Intensive cultivation and better crop methods in these areas can bring about appreciable increases in per-acre yields. The comparatively low yield in India is attributed chiefly to the adoption of sub-standard crop husbandry methods which, in turn, is due to small average holdings and limited economic resources of the majority of farmers, which do not permit any large-scale initial investment. Further, about 87 per cent of the crop is grown under rainfed conditions so that the success of the production effort is greatly dependent on Dame Nature. In about one-third of the total area under cotton, the rainfall is both uncertain and scanty, with the result that the yield per acre in those areas is extremely low. Even in areas where the rainfall is moderate and more or less assured, the success of the crop depends not only on the total precipitation but also on the evenness of distribution. One of the possible methods of achieving high yields is through the increase in the area under irrigated cotton. There has, of course, been a rise in the total irrigated area under cotton—1.14 million acres in 1950-51 to 2.43 million acres in 1960-61—but the rise has not been appreciable.

Whatever improvement in productivity that has taken place in the last few years must be attributed in no small measure to the efforts of the Indian Central Cotton Committee. The improvement would have been more notable if only Agricultural Departments of State Governments had played their part with zeal and energy. Be that as it may be, with a view to securing adequate data to advise growers on the definite agronomic schedules for maximising yields on different tracts, it is now sponsoring model agronomic schemes in a few important States like the Punjab, Madras, Maharashtra, Gujarat, Mysore, Madhya Pradesh, Rajasthan and Uttar Pradesh. Efforts are also being made by the Committee to bring about a genetic improvement of the yield potential of strains through breeding schemes. Further, increased attention is being devoted to the problem concerning infestation of pests and diseases. Plant protection measures had not been sufficiently developed in this country until recently. With the expansion of area under American cottons which are relatively more susceptible to pest attack than *deshi* varieties, there is naturally the imperative need for adopting those measures greatly on as wide an area as possible. It may be noted, in this connection, that more land has been brought under better quality cottons in recent years; the actual area has risen from 7.24 million acres in 1950-51 to more than 14.95 million acres. In keeping with the expansion in area, the production of long-staple and superior long-staple cotton has gone up from a mere 700,000 bales in 1950-51 to 2.2 million bales in 1962-63.

Varieties of Cotton Grown

	1962-63	1960-61	1955-56	1950-51
Total *Area* (Thousand acres)	19,200	18,871	19,978	14,436
Area under Improved varieties	N.A.	14,954	13,568	7,244
Area under Irrigation	N.A.	2,433	1,810	1,148
Total *Production* (Thousand bales)*	5,312	5,390	4,001	2,971
Of which:				
Short-staple	854	768	662	839
Medium-staple	2,220	2,180	1,762	1,448
Long-staple	2,238	2,068	1,272	637
Superior Long-staple		374	305	47

* One bale consists of 392 lbs. *N.A.*—Not available.

That renewed effort must be made to augment the productivity of cotton lands was strongly urged at the 90th meeting of the Indian Central Cotton Committee. The visit of Dr. M. L. Manning, a former Director of the Central Cotton Research Station at Namulonge in Uganda, under the Empire Cotton Growing Corporation, London, must be welcomed. Dr. Manning has come to this country under the Colombo Plan to advise the Indian Government on the measures to be undertaken for research and development aspects of cultivation of long-staple cotton in both irrigated and rainfed areas. The recent release for general cultivation of five new improved cotton strains, namely, I.S.C.67 in Gujarat, A.K.235, A.K.277 and Y-1 in Maharashtra and 14/2 in Mysore must also be viewed with satisfaction. But the cotton production programme can be successfully implemented only if, as the Committee rightly pointed out, the growers are enlightened enough to appreciate the economic methods of production and imbibe in them the new agricultural practices followed in the different regions.

I.O.B. is big enough to serve you...

I.O.B. is an international bank with offices throughout India and South-east Asia and correspondents the world over. It offers a wide range of services to suit the needs of varied customers. Indeed, I.O.B. is big enough to serve you.

We asked our customers, thousands of them at random, what they thought of our service. They replied: "We are pleased". They also made several helpful suggestions which we are implementing. Indeed, I.O.B. is small enough to know you.

Range of I.O.B. services: Savings and Current Accounts—Recurring and Fixed Deposits—Personal and Business Loans—Bills Payment Service—Gift Cheques—Travellers Cheques—Safe Deposit Lockers—Trade and Export Information and Advice—and whatever other specialised help you may need.

...and small enough to know you

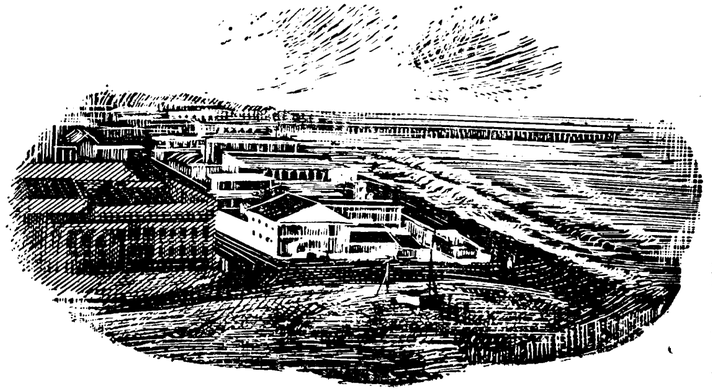
THE E.I.D.-PARRY GROUP
1964

THOMAS PARRY
Founder



PARRY'S CORNER THEN.....

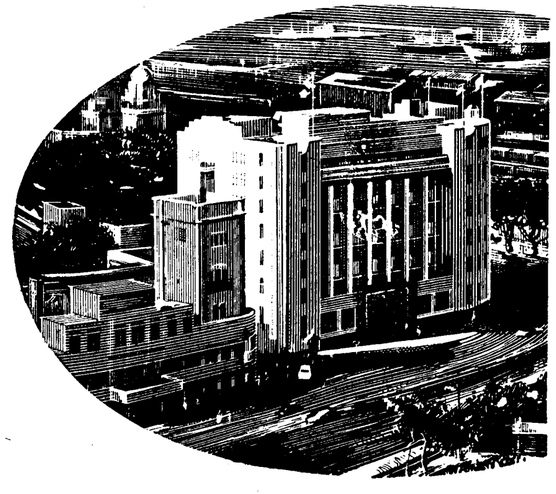
PARRY'S CORNER—one of the well-known landmarks of Madras city, took its name from the firm that was founded at that spot in 1788 by THOMAS PARRY. The illustrations show how Parry's Corner looked in the early 1860's, and how it looks today.

Time has marched on for 176 years. The E.I.D.—Parry Group of today consists of nine companies of substance—manufacturing sugar, confectionery, fertilisers, sanitaryware, industrial and potable alcohol, carbonic acid gas, chemicals and acids, formulating plant protection products, distributing mechanical and electrical power, pharmaceuticals and consumer goods and exporting sugar and confectionery, molasses, spirit and other commodities to earn valuable foreign exchange.

.....AND NOW

PARRY'S PROGRESS AND THE PLANS

The Group provides employment to more than 10,000 people today. The strong position it has achieved gives it courage and confidence further to increase and broaden its activities, in tune with the country's Five-Year Plans, to manufacture more, to provide employment for more.



H. V. R. IENGAR
Present Chairman

TRENDS IN JUTE GOODS EXPORTS

COMPETITION FROM PAKISTAN SEVERE

THE Indian jute industry is facing tough competition not so much from paper and other packaging materials or bulk handling methods as from its counterpart in Pakistan. Indeed, the industry fears—the fear is not exaggerated—that competition from Pakistan will be keener and keener, especially in sacking goods, in the years to come. How the competition offered by Pakistan has already severely affected India was impressively brought out by Dr. B. P. Kedia, the retiring President of the Gunny Trade Association, in the course of his speech at the thirty-ninth annual meeting of the Association held at Calcutta last week. A look at the data furnished by Dr. Kedia—these are given in the accompanying tables—will show that between 1957-58 and 1963-64, India's sacking production and exports have fallen by 8 per cent and 24 per cent, respectively, while those of Pakistan have risen by 26 and 29 per cent.

India's exports to almost all the principal markets (Australia, the U.K., and the African, South American and Far Eastern countries) have fallen appreciably since 1957-58. At the same time, Pakistan's exports to these regions have increased considerably from 16 to 40 per cent. Australia and South American countries, which met practically their entire sacking requirements through imports from India in 1957-58, purchased only 41 and 64 per cent of their needs from this country in 1963-64. The share of Indian goods in the total purchases of sacking made by African countries, too, has declined from 70 per cent in 1957-58 to 44 per cent in 1963-64.

Suggestions

In order to counteract this growing competition from Pakistan, Dr. Kedia suggested the adoption of definite long-term measures for reducing manufacturing costs and improving the quality of products. He also called upon the industry and the Government to devote increasing attention to research on the development of new uses of jute for diversification of production, broadening of export promotion work, market studies, public relations and advertising. As regards the qualitative aspect of jute goods exports, he felt that the proposed legislation for quality control and pre-shipment inspection of goods meant for exports would create confidence in the minds of foreign customers and make positive contribution towards promoting exports. He hoped that the Indian Standards Institution, the task of which is to lay definite standards for goods, would prepare the standards for jute goods in consultation with the industry. The standards so formulated, he stressed, should, while being fair to foreign buyers, not, at the same time, cause undue hardships to producers. Congratulating the Indian Jute Mills Association for setting up within a short time the I.J.M.A.Q.I.C. organisation for independent inspection of goods produced by mills at Calcutta, Dr. Kedia stated that such measures would help shippers and traders, as they would not have to face the displeasure of their buyers and other difficulties arising from the export of sub-standard goods.

It is, however, somewhat difficult to support Dr. Kedia's plea for fiscal support from the Government to counteract the advantage enjoyed by the Pakistan industry in the form of bonus voucher scheme, in addition to the natural advantage of better and cheaper jute. For the grant of direct export subsidy or such other incentives by the Government is no solution to the problem. A direct export subsidy, apart from contravening the provisions of the G.A.T.T., may prompt Pakistan to raise its rate of subsidy. In any case, the adoption of measures and counter-measures is not desirable in the interests of both the countries.

Be that as it may, Dr. Kedia rightly urged the need for ensuring to jute mills steady and adequate supplies of raw jute at a reasonable price. A reasonably fair and stable price for raw jute is in the interest as much of growers as in that of the mills. As Dr. Kedia pointed out, wide and irksome fluctuations in prices are strongly resented by customers and shake violently the confidence created in their minds by the sustained efforts of the industry and the Government; if the prices of jute goods continue to be subjected to such fluctuations, there can be no planning and even the large-scale propaganda and publicity work done by the industry and the Government in the overseas markets at huge costs will go in vain.

India and Pakistan Compared (Sacking Only)
(In thousand tons)

Year (July-June)	Production		Exports	
	India	Pakistan	India	Pakistan

PLEA FOR RAW JUTE EXPORTS

While no official estimate of the current season's (1964-65) raw jute crop are available as yet, private sources expect the total production to be of the order of 7.7 million bales, as against 6.5 million bales in the previous season. In spite of lower production, it is in the interest of the country to export a normal quantity of the crop to other countries, so that contacts with export markets could be maintained. This view was expressed by Mr. C. L. Baid, the retiring Chairman of the Calcutta Baled Jute Association, when he addressed the Association's annual meeting held at Calcutta last week. In support of his plea, Mr. Baid observed:

"Price stabilisation for raw jute can, of course, be achieved by permitting exports of substantial quantities when a bumper crop is produced. It is, I think, well known in the trade that exports limited to East European and Communist countries cannot serve the interest of our country as inequitable terms are dictated by the buyers and purchases are confined to sealed samples for quality. The basis of quality should be essentially the 'standard grades' and not sealed samples of these grades, as is the practice at present. Provision for arbitration should be retained in the contract and disputes regarding either quality or contractual matters should be settled by arbitration in India with the Tribunals of Arbitration attached to the Chambers of Commerce. As you are aware, sales of raw jute under the London Jute Association Contract, which is a fair contract for all, is not possible due to the insistence of our few buyers that Indian jute should be at par value with jute of Pakistan origin. The answer to all these difficulties is, of course, that sales should be allowed to other markets, as it would then be possible to arrive at fair and reasonable terms with the buyers."

Reviewing the situation in the jute market, Mr. Baid said that the trend was much better, though he felt that the growers would not be able to get a price for their crop commensurate with either its high cost of production or the recent increases in the cost of living. In his opinion, ways and means must be found to raise the production of raw jute and improve its quality.

PHILIPPINES MAKING BAGS FROM ABACA WASTES

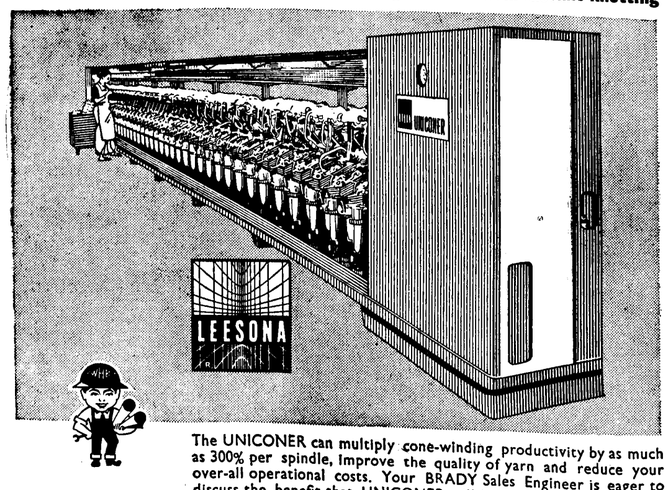
The Republic of Philippines has commenced the manufacture of bags and sacks made from abaca wastes to replace jute bags, some 100 million of which are imported every year. The first factory at Muntinglupa in Rizal Province, with a capacity of six million sacks a year, went into production recently. The Philippine Government is encouraging the establishment of more such plants and inviting foreign investment for the purpose. The new industry will not only save the Philippines a large amount of foreign exchange but also be a source of strength to the country's abaca economy.

Raw jute production in Pakistan during the 1964-65 season is estimated at 6 million bales from a lower acreage. Informed sources view the prospects of the current season as bright considering the success achieved by the Jute Corporation last season when 108 centres of the Corporation purchased about 3.7 million maunds. Growers are said to be holding very little stock. It is expected that the Corporation will be able to increase its quantity of exports from 410,000 bales last season to a sizable figure, following the removal of the minimum price restrictions on export.

ONE STEP AHEAD OF THE REST WITH

UNICONER

—the only automatic cone-winding machine with instant knotting



The UNICONER can multiply cone-winding productivity by as much as 300% per spindle, improve the quality of yarn and reduce your over-all operational costs. Your BRADY Sales Engineer is eager to discuss the benefit that UNICONER will bring to your mill in both immediate and long-range cost savings. Call or drop a post card now

ENGINEERING INDUSTRY IN HOWRAH

FINDINGS OF RESERVE BANK SURVEY

IN the industrial complex of Howrah, adjoining Calcutta, are to be found hundreds of engineering units. These are of varying sizes—ranging from the big concerns employing more than a thousand men to the very small ones employing one or two men. As many as 1,168 units, excluding the purely trading concerns and numerous small smithies, are engaged in production in a relatively small area of a little over ten sq. miles. Taken as a whole, in 1960, 707 of these 1,168 manufacturing units employed less than ten persons each; 198, 10 to 19 persons each; 163, 20 to 49 persons each; 80, 50 to 200 persons each; and 20, over 200 persons each. Another idea of the size of the units can be had from the classification according to the value of plant and machinery. Thus, of the 868 units for which this information is available, 355 units had less than Rs. 10,000 worth of plant and machinery each, 446 units between Rs. 10,000 and Rs. 1,00,000 each and 67 more than Rs. 1,00,000 each. It would thus appear that medium-sized and small-sized units are predominant in Howrah's engineering industry. Incidentally, it is these medium and small units that were surveyed intensively by the Jadavpur University in 1960-61 under the auspices of the Reserve Bank of India. The relevant survey report has just been published (*Survey of Small Engineering Units*, published by the Reserve Bank of India, Bombay, and priced Rs. 10).

The first part of the survey covers 200 medium-sized units (each employing 20 or more workers). These units have been classified according to the value of plant and machinery and size of employment, as in the accompanying table (Table I). At the time of investigation, 56 of these units were proprietorship concerns, 78 partnership firms, 64 private limited companies and only two public limited companies. The survey has examined the flows of different types of raw materials into these engineering units and of their products to the market. The major buyers from the 200 units are the big engineering concerns in the neighbouring areas of 24-Parganas, including Calcutta. Important "direct" buyers from the comparatively small units are found amongst themselves. Further, according to the findings of the survey, pig and scraps flow from the raw materials market to foundries which then pass on their products within Howrah to manufacturers of railway components, machines and machine parts. Mild steel bars, gunmetal, etc. flow from the raw materials market to manufacturers of machines and machine parts, structurals, and makers of railway components, etc. The manufacturers of machines often pass on some finished, or even unfinished, materials to manufacturers of machine parts and get them back with minor processing done to them. The same happens between job shops and makers of railway components, structurals and manufacturers of machine parts or machines. It is this interlocking of production processes which largely accounts for the strength of the Howrah engineering industry, and is the reason why so many new entrants are eager to establish their shops in the overcrowded municipality. Practically every firm can be assured of not remaining idle for want of work. The big units are themselves in a way ancillaries to the neighbouring large concerns in Calcutta, and have, as satellites, the smaller ones round them. A group of a few small units usually gathers around one or two of the bigger ones amongst the 200 units covered. The pull is at times the natural pull of acquaintance over many years. Often it is provided by the advancing of money to the small by the big.

Table I—*Classification of 200 Units*

Value of plant and machinery (Rs. '000)	Size of employment					
	Less than 20	20-49	50-200	201-500	Above 500	Total
Less than 10	6	6	1	—	—	13
10-25	12	26	14	—	—	52
25-50	24	29	11	—	—	64
50-100	5	20	12	2	—	39
100-200	3	5	12	1	—	21
200-500	1	2	3	1	1	8
Over 500	—	—	2	1	—	3
Total	51	88	55	5	1	200

The machines used in the engineering units are generally old. For the units in all the 14 groups of industries (namely, machine manufacturing, machine parts, job work, nuts, bolts and rivets, railway components, foundry, electrical goods, pipes and tubes, sheet metal processing, non-ferrous products, structurals, wire products, re-rolling mills and scientific apparatus), a total number of 3,100 machines has been listed. Of these machines, about 2,000 are over 15 years old and more than 1,000 are over 30 years old. If one takes 15 years to be the normal life of a machine, only the ghosts of them are present for the majority of them. Hence the survey's finding that this age distribution discloses an appallingly large number of very old machines which should not be there at all by any rational estimate of the possible life of machines. Another finding of the study has brought out the replacement cost of major machines at Indian and foreign prices. The accompanying table (Table II) estimates, in this connection, the current replacement cost of machines in the 200 medium-sized units.

The machines which at the original cost as depreciated up-to-date amount to Rs. 1.23 crore will require Rs. 4.62 crores to be replaced at Indian prices and Rs. 8.15 crores at foreign prices. It will be nearer Rs. 8 crores than Rs. 5 crores even for Indian machines in view of the current scarcity of the machines in the market and the high prices at which they sell; they are seldom available at prices declared by producers, especially for quick delivery.

The survey has estimated the gross value of output of the 200 units at Rs. 6.18 crores (*vide* Table III). Their fixed capital and current assets have been estimated at Rs. 2.3 crores and Rs. 3.5 crores, respectively. As many as 154 units have plans for expansion. The requirement of finance, as stated by 150 of these units, aggregates Rs. 2.2 crores for fixed capital (in part replacement) and Rs. 41 lakhs for working capital. Their primary demand seems to be for long-term loans for buying machines, amounting to over Rs. 2 crores for the 150 units. The largest demands are from manufacturers of machines and structurals, the two together accounting for over one-half of the total demand. The total demand for working capital, as stated by the units, is for Rs. 41 lakhs. Here again the structurals and machine manufacturing units' demands amount to Rs. 14.3 lakhs, though here demand is somewhat more evenly distributed among the industries. The other units showing a fairly high requirement for working capital are the manufacturers of railway components, nuts and bolts and scientific apparatus. In the last case the requirements for working capital exceed those for fixed capital. The periods for which these loans are required are comparatively long in view of the large needs for fixed capital. It is seen to be from 10 to 15 years for the majority, a few ask for even longer-term loans, for 18 to 20 years. The rate of interest offered varies for the majority from 3 to 5 per cent, though some ask for cheaper short-term loans. The maximum rate offered for long-term loans is 9 per cent.

Table II—*Replacement Cost of Major Machines*
(Rs. '000)

Machine	Replacement cost at	
	Indian price	Foreign price
Lathe	67,41	1,26,01
Capstan Lathe	45,20	79,10
Shaper	14,55	30,15
Drill	20,12	42,58
Radial drill	17,10	30,40
Planer	13,80	25,40
Milling	13,20	26,40
Sawing	2,58	4,30
Grinding	9,96	16,60
Forging	34,00	64,75
Welding set	16,00	32,00
Pressing	37,00	64,75
Shearing and punching	27,25	43,60
Motors	53,33	1,58,20
Others	90,40	71,10
Total	4,61,70	8,15,34

The second part of the survey covers 396 small-sized units (each employing less than 20 workers). As many as 277 of these units are proprietorship concerns, 102 partnership firms and only 17 private limited companies. The total capital employed by all the units is Rs. 84 lakhs. The fixed capital comes to only Rs. 1,500 per small unit. There are in all 1,646 machines in the 396 units. More than 1,100 out of these 1,646 machines are less than five years old, out of which again one-half is less than three years old. This age distribution is in sharp contrast to the picture of the aging of machines employed by the medium units, more than one-half of which was found to exceed widely the normal expectation of life of 15 years. The comparative newness of the machines for the small units is not surprising in view of the young age of the firms, three-fourths of which were found to be established only in 'fifties, and more than one-half in the second Plan period.

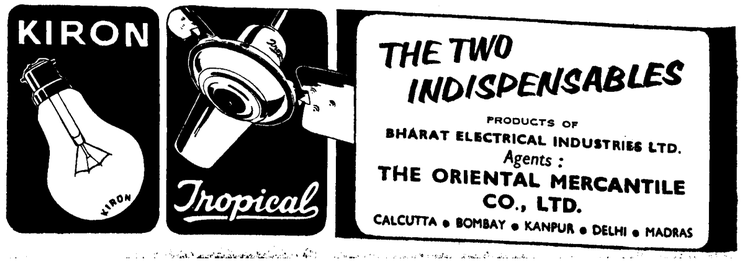
Table III—*Gross Value of Output of 200 Units*

Industry	No. of firms	Total output (Rs. '000)
Machine mfg.	23	41,24
Machine parts	27	63,98
Job work	21	16,39
Nuts, bolts, rivets	13	39,06
Railway components	25	1,20,86
Foundry	44	1,52,75
Electrical goods	5	14,52
Pipes and tubes	5	13,30
Sheet metal processing	11	75,21
Non-ferrous products	3	12,26
Structurals	10	46,31
Wire products	6	12,16
Re-rolling mills	4	6,30
Scientific apparatus	3	4,12
Total	200	6,18,46

The total annual output of the 396 small units during the survey year was estimated at Rs. 1.15 crore and the value of work done by them for others was Rs. 40 lakhs. As many as 350 small units have expansion plans for which they require cash loans to the tune of Rs. 54 lakhs.

An outstanding feature of the engineering industry (covering both medium and small units) in Howrah is the close interdependence among units, exhibited in the practice of farming out of orders to neighbours. This seems to explain why, despite congested surroundings, new units are constantly springing up there. The survey has revealed that, being basically small units, few of them have any internal organisation for production, purchase, sales accounts, etc. and their factory layout is often unscientific. Unlike the medium units, the machines used in the smaller units also are largely new. A rather disturbing feature that has been noticed is that most of the units with relatively new machines are working below capacity. The data collected on borrowings indicate that, even in an industry like engineering with adequate growth prospects, financial assistance provided by credit institutions is meagre by almost any standards. On the whole, the survey clearly suggests that, with adequate financial and technical assistance, a large number of these units could become viable and contribute effectively to the industrial potential of the region.

The survey, it is noteworthy, has broken new ground in the enumeration of the capital goods with the units according to their type, specification and age. This has made possible an estimation of their cost of replacement, as referred to earlier. It has also revealed certain interesting data regarding capital intensity and labour productivity which seem relevant for policy formulation. As a comprehensive inquiry into the financial, technical, institutional and other aspects of small engineering units in Howrah and on the inter-connections between them, the survey has yielded a wealth of information useful for assessing the nature and magnitude of the problems of small-scale industrial units, in general, and engineering units, in particular.



NEW PRODUCTS AND PROCESSES

Wool Fixing Process

A CLOTHING factory at Hamar, Norway, will shortly begin to market 100 per cent woollen garments which have been treated so that they retain pleats and creases forever, even after washing. The Perma Pli process, claimed to be superior to any other method, has been developed and patented by NTFI—the Norwegian Textile Research Institute, Oslo—with financial assistance from the International Wool Secretariat. Unlike the widely used chemical methods, the NTFI developed process employs only moist heat to achieve permanent fixing of wool. Fabrics and pressed garments are heated in a 130°C pressure chamber featuring controlled moisture. This prevents evaporation of natural fibre moisture. After such treatment, pleats and creases become stabilised to water. They can temporarily be removed with a flat-iron, but come back as good as new when submerged in water.

Automatic Crane Alarm

An automatic warning device which can be fitted to a crane, or similar equipment, to warn the operator that the jib is near a power line is being produced by a British firm. The alarm is installed inside the cab and the proximity detector is mounted on the jib. The alarm can be set manually to operate with the jib at any required distance from the power line. A fail-sale circuit causes a bright indicator lamp to flash if, for any reason, the system is not functioning correctly. The system will operate from mains supply or from any battery voltage down to 6 volts. Installation is simple and can be carried out on site without specialist knowledge.

Portable Oxygen Meter

Electronic Instruments Company of Richmond, Surrey, England, in association with the Freshwater Biological Research Association and the Water Pollution Laboratory, has designed a portable, rugged and reliable biological oxygen meter for the direct measurement of oxygen in solution. It is based on a sensitive, stable electrode system with a cathode small in size, but having a large active surface. Oxygen reduced at the cathode produces a current proportional to the partial pressure of dissolved oxygen, the value of which can be read off directly from the meter. The electrode, designed for total immersion, can be dismantled and reassembled without affecting its calibration. The instrument is equally suitable for use in field tests and in the laboratory.

"Rubber" Stamps Ink Themselves

A porous plastics material impregnated with a special ink makes a "rubber" stamp which will give over 25,000 impressions without the use of an inkpad, claims S. C. Johnson and Son, Racine, Wisconsin. Ink contained in the pores of the plastics material is forced to the surface, and on to the paper by pressure on the stamp. Called the Perma-Stamp, it is cylindrical in shape and can be fitted to the end of a pencil so that it is always at hand.

Heat-proof Plastic Goggles

An effective eye protection when welding and grinding is given by plastic protecting goggles manufactured in various models by an Austrian firm. These nylon goggles are an excellent protection against harmful rays when welding, scattered light, blinding, etc. and are able to stand 140°C. (283°F.), have little weight, a modern shape and fit well. They are also fitted with collapsible side-flaps, causing indirect ventilation which prevent moisture covering the glasses. The side flaps can be taken off or put on according to the use by a mere pressure of the finger, and the strap can easily be adjusted to every head. This goggle is also available with splinterproof glass which is an effective protection against grinding particles, sparks, hot and sharp chips, metal or wood splinters.

Locomotive with Laminate Body

In the Skoda Works in Czechoslovakia, a new electric locomotive has been manufactured. It is a prototype of a six-axle electric locomotive with laminate body. It is intended for a railway line fed by 25,000 VA.C. The engine can develop a power of 6,500 h.p. giving the locomotive a speed of 160 km/hour.

Potentiometer Recorder

One of the latest developments of an Austrian measuring instrument producing firm, Messrs. C. P. Goerz, Electro-AG. of Vienna, is a potentiometer recorder which, thanks to its great adaptability to the various jobs of measuring and recording electrical and non-electrical dimensions, is a valuable aid in all branches of physical, chemical, metallurgical and biological-medical research. The instrument is turned out in a flat design and can be used in a vertical or horizontal position. It distinguishes itself by the simple operating, is always ready for use and requires no attendance due to the semi-conductors in the amplifier and a breakdown diode as reference power supply. The new recorder has 11 measuring ranges from 2 mv to 20 mv; moreover in every position of the measuring range selector every intermediate value from approximately 40 to 100 per cent of the selected range can be engaged as measuring range terminal value. In this case, the readings can commence without converting into percentage of voltage values co-ordinated by the dial. The measuring accuracy is 0.5 per cent. The registration is carried out by ink alternatively on a continuous run-down strip or on a single sheet according to DIN A 4. The feeding of the paper is carried out by a synchronous induction motor over a 6-gear transmission, whereby feeding speeds of 30-120-66 mm. per hour and 30-120-600 mm. per minute may be chosen.

Mobile Crushing Plant

A mobile crushing plant, capable of reducing 24-inch lumps of quarried stone to sizes of 1½ ins. and below, in a single crushing unit, has been introduced by Aveling-Barford Ltd., Lincolnshire, England. Designed specifically for quarry work, particularly for roadstone and similar products having a low silica content, the plant has been developed to meet the needs of contractors who require high outputs and an accurately sized product. All the crushing is done in an impact breaker which will give product sizes from 8 in. to 1½ in., by simple adjustment of the breaker plate.

Monorail for Gold Mine

A diesel-powered monorail mines haulage system is being tested underground in the Loraine gold mines in Orange Free State, South Africa. Designed by Wright Anderson (S.A.) in collaboration with mining engineers of the Anglo-Vaal Group, the prototype system consists of a Perkins diesel-engined locomotive, a train of tubs, overhead track fabricated from 10 inches by 8 inches rolled steel joists, and several sets of points. Advantages claimed for the system over conventional railborn systems include an increased drawbar pull of about 6,800 lbs. (compared with 2,600 lbs. for conventional five-ton locomotives of the same power), and the ability to negotiate 25-foot radius bends in either the horizontal or vertical planes. A special feature of the tubs designed for the system is their ability to negotiate very small radius bends in the horizontal plane. In the case of the prototype train, 3½-ton payload tubs have negotiated bends of just over 2-foot radius.

Continuous Carbon Yarn Production

A continuous process for producing strong, uniform carbon yarns for aerospace and industrial uses has been developed by Union Carbide Corporation of New York. According to the nuclear and aerospace marketing manager, these refractory yarns approach the strength-to-weight ratio of general purpose glass yarns and filaments at room temperature. When heated, national carbon yarns retain or increase strength up to 5,000°F. (2,760°C.) and higher, the sublimation temperature being approximately 6,600°F. (3,650°C.). Uniformity of strength and other properties and compatibility with resins assure reliability in reinforced plastics used as aerospace materials. They can be used to make filament wound structures, either by the wet lay-up or pre-preg techniques, and they can be woven, knitted, braided or made into bonded fabrics. The leading industrial use is expected to be in the fabrication of electric resistance heating elements. The new process is adaptable to the production of yarns ranging from 50 to 10,000.000 ohms per foot (30.5 cm.), but initial production will be confined to the 90 to 300 ohms per foot (30.5 cm.) range. Applications include deicing devices, radiant heaters, and heating pads.

Bactericidal Fabric

Bactericidal fabrics based on linen and cotton have been developed by Professor Zakhar Rogovin in his synthetic-fibre laboratory at the Moscow Textile Institute. The bactericidal agent is "fused" with the cellulose molecule. Experiments have also been done in the "fusing" of styptic agents (to stop bleeding) and fungicides to the cellulose molecules. The uses of such fabrics are many—bactericidal ones in hospitals, for filters for river-water, gauze to stop bleeding, anti-bacterial fabrics in the making of antibiotics, and in the preparation of fruit juices by straining without the need of pasteurisation. Pilot production of the fabrics starts next year in Moscow.

Multi-purpose Greases

The Indian scientists working on Esso's grease research projects in Bombay have succeeded in developing multi-purpose greases for the first time in this country. This development will enable Esso to meet the rapidly increasing demand of the Indian industry for these greases and cut down imports. The saving in foreign exchange every year is expected to be of the order of Rs. 50 lakhs. The grease manufacturing programme of Esso India began in 1937 at the Company's plants at Bombay and Calcutta. The need to develop a wider range of greases spurred the Company to set up a Grease Research and Development Section in 1947 and a large-scale development programme was launched to meet the rising demand. As a result, the Company now locally produces 95 per cent of the various types of greases required by the country's industries and plans are under way to achieve complete self-sufficiency. The highlights of the grease manufacturing programme of Esso India include the development of new products to international standards to meet the exacting demands of new industrial plant and machinery in India, improvement of product quality and performance, maximum utilisation of indigenous raw materials and packages and assistance to indigenous fabricators for designing new equipment. Esso India's Grease Research and Development experts have also helped to set up grease plants in other developing countries in Asia.

TRENDS IN U.S. ENERGY PATTERN

NUCLEAR POWER AND OIL FROM SHALE

By John M. Kelly
ASSISTANT SECRETARY, U.S. DEPARTMENMENT OF THE INTERIOR

IN a scant one hundred years, the U.S. economy and the economies of much of the rest of the world have made great strides forward—from the primitive energy pattern dominated by wood to the development of the coal industry at the advent of the industrial revolution in the United States, then to oil, now with increased velocity to natural gas and, in the near future, to atomic energy. A significant factor to note in this intensive competition of energy sources is that the cycles of single fuel dominance appear to be getting shorter. Technical development—and with it, economic change—seems to be compacted into ever more brief time spans. Wood was the principal source of energy for thousands of years; coal for less than one hundred years; petroleum for less than fifty; and there is reason to believe that the new giant—natural gas—will have a similarly fore-shortened period as the energy leader due to the onrush of nuclear energy.

But we cannot deceive ourselves that nuclear energy, if it takes the prime position, will be without challengers as well. As yet, man has only tinkered with the possibilities of solar energy, but greater efforts are in the offng. Consider, also the promise of the fuel cell, and the researchers who propose to tap the heat of the earth itself. Throughout the world different, unconventional, sources of energy are under study.

Complex Energy Industry

Our American economy is built largely on technology and the economic interpretation thereof. Because of this fact, we should look forward to an increasingly complex and sophisticated energy industry. The fantastic investment that has marked the petroleum and natural gas industries, as contrasted with the more modest financial requirements of forestry or coal mining, give support to this conclusion. I venture to predict that we will see an acceleration of the financial and technical complexity of our energy source industries over the years ahead. It is an imperative demand that will be met.

In petroleum, for example, for a number of years it has not been sufficient simply to distil crude and accept the molecular combination which nature first provided. Deep cracking, reforming processes and coking are becoming the rule of the day; which is to say, that the process of making saleable products from crude is becoming sophisticated at an accelerating rate. We have only to note the decline in residual fuel oil yields in U.S. refineries to find substantiation of this basic trend. In 1944, nearly 28 per cent of our refinery yield was in resid. By 1954 this figure had dropped to 16 per cent. And today resid is approximately eight per cent of the total product yield.

The massive financial and technical investment in the development of atomic energy is yet more proof of the direction of things to come. We are on the threshold of further major advances in the technology of dealing with the uranium atom, and only a short distance away from the additional massive investment which inevitably will be applied to the taming of the hydrogen atom as a useful energy resource. The lesson for all of us in these developments is that the combination of sophisticated technology, substantial investment, and prudent application of economics can offset the advantages of less complex naturally-occurring energy resources.

Advent of Shale Oil

We are on the verge of a significant development which further reinforces this line of thinking. Oil, which for millions of years has been locked in the shales of the Colorado Plateau, soon will be liberated by the combined thrust of economics and technology, providing a new and perhaps revolutionary source of liquid fuel which may be in direct competition with the petroleum industry. For the immediate future, we can speculate on the basis of the rather limited data available as to the trends that may characterise shale oil development.

Today, known processes apparently are capable of producing shale oil in competition with domestic crude within a limited marketing area. Take note that, even before construction of a single commercial plant, relatively modest research expenditures—as such items are measured—have been able to offset the natural advantage of deposits in which petroleum is present in its liquid state. Probably the first shale oil plant will be close to the economic margin. The investment therein will be exposed to the hazard of minor changes in the crude oil price structure. I will predict, however, that from the competitive standpoint the second or third commercial establishment for the production of oil from shale—the next generation of technology, in other words—will be an entirely different proposition and will be able to compete on equal terms with conventional petroleum.

Nuclear Sources

Let me turn aside at this point and remind you of the progress in the past ten years in the production of energy from nuclear sources. The first generation reactors apparently are capable of producing electric power at approximately 57 mills per kilowatt hour. The second generation plants have reduced this charge to something on the order of eight to ten mills. And now, the proposed Oyster Creek project of the Jersey Central Company, a late third generation reactor, seemingly will be capable of producing power at four or five mills per kilowatt hour. Thus, in one decade, through the rigorous application of economics to technology, the cost of producing energy from the atom has been reduced by a factor of more than 10, making energy from this source among the lowest in cost now available.

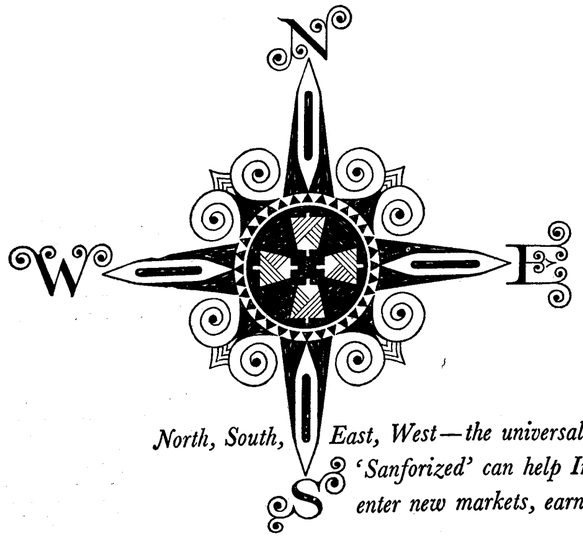
While a similar tenfold reduction in cost is not to be expected in oil shale, it not unreasonable to assume that the energy history of the next decade, so far as oil from shale is concerned, also will show progress as startling as that registered in atomic energy. In fact, it would be most surprising if it did not.

U.S. OIL IMPORTS

About 85 per cent of all oils imported into the U.S. in the first half of this year entered under licence, the remainder being imported from Canada and Mexico overland exempt from import controls. The volume of licensed imports was about 72,000 b/d (barrels daily) greater than in the same period last year and over 200,000 b/d more than the second half of 1963. Overland imports from Canada were about 32,000 b/d above those in the first half of last year and 37,000 b/d more than in the second half. Imports from Mexico were about the same, around 30,000 b/d.

A breakdown of imports according to source shows that three overseas areas supplied over 82 per cent of the total. The Caribbean was easily the leading supplier with 64 per cent of the total. Canada and the Middle East following far behind. The leading countries of origin were: Venezuela 1,020,000 b/d; Canada 299,000 b/d, Netherlands W.I. 290,000 b/d, Saudi Arabia 90,000 b/d, Trinidad 78,000 b/d. Residual fuel oil accounted for 587,000 b/d of the imports from Venezuela and neighbouring N.W.I. No residuals were included in the exempt overland imports.

Associate these numbers with genuine high grade ethical Pharmaceuticals —for "point-o-three" and "point-o-four" millimetre represent the gauge thicknesses of aluminium foil which, coated or combined with polythene, protects your Medicines in Tablet or Capsule form. Extensively used by all reputable manufacturers who know the value of 100% product purity in Pharmaceuticals—the kind of purity that Alfoil packs always ensure.

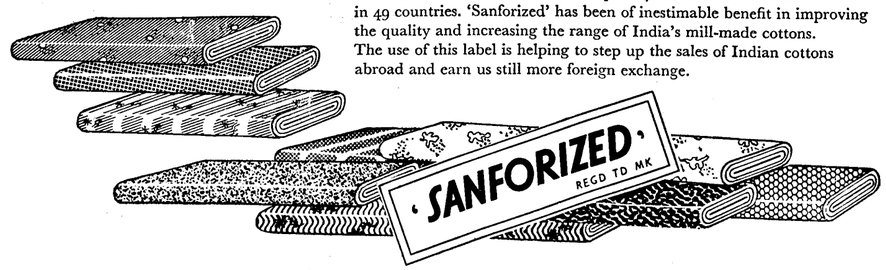


North, South, East, West—the universally recognised label 'Sanforized' can help Indian Cottons enter new markets, earn more foreign exchange

The trademark 'Sanforized' is recognised and inspires confidence on every continent. The name 'Sanforized' on cotton cloth always has the same connotation—a trusted, uniform standard of shrinkage control.

In India, cotton textiles, along with jute and tea, form one of the three most lucrative export items. In 1962-'63, the export of cotton textiles netted the country Rs. 46.50 crores in foreign exchange.

India faces tough competition in world markets; she needs greater diversification of her markets—needs to capture new ones. The label 'Sanforized' can greatly aid the export of cotton textiles, for it is known and relied upon by millions of consumers in 49 countries. 'Sanforized' has been of inestimable benefit in improving the quality and increasing the range of India's mill-made cottons. The use of this label is helping to step up the sales of Indian cottons abroad and earn us still more foreign exchange.



Issued by Cluett, Peabody & Co., Inc. (Incoporated in the U.S.A. with limited liability) proprietors of the registered trademark 'SANFORIZED'. The trademark proprietors use the trademark 'SANFORIZED', or permit its use by authorised registered users, only in respect of tested fabric which meets the trademark proprietors' strict requirements as to residual shrinkage.

JINDAL quality steel pipes

Carriage of water, gas, and chemicals, irrigation and structural work demand quality steel pipes. Equipped with the latest imported machinery and the right technical skill at every phase of production, Jindal manufactures steel pipes upto 4" (100 mm.) dia. according to IS. 1239—1958 to cope with the country's growing demand for quality steel pipes.

BUSINESS NEWS FROM EUROPE

INDUSTRIAL RE-TRAINING IN EUROPE

SOVIET BLOC'S CAMPAIGN FOR EXPORT CREDITS FROM THE WEST

A SEVERE shortage of manpower and the onrush of automation threaten to overwhelm European plans to step up industrial job re-training, it was stated in London last week. The danger was said to come mainly from the fact that plans to intensify training for the unskilled and re-training for older or redundant workers were still largely being discussed rather than put into action. This gloomy view was put forward at a 19-nation seminar on "Job Redesign and Occupational Training for Older Workers," organised by the Organisation for Economic Co-operation and Development (O.E.C.D.). It emerged strongly from the conference that, in general, trade unions, management and Governments in most European countries had done relatively little to upgrade workers' qualifications to cope with redundancy threats from mechanisation or age.

But a new stringency in the British and West European labour markets now underlines the seriousness of these problems. Skilled labour, especially in the building and construction trades, mining and certain service industries, is particularly short. In most cases expanding industry has had to satisfy its needs from an influx of largely unskilled workers from agriculture or from abroad. Immigrant labour, however, is dwindling as a ready source of manpower. Italy's south-to-north job trek is starting to run down; France's Algerian labour supply has been largely absorbed. In Denmark, Sweden, Switzerland and the Netherlands, where virtually full employment exists, foreign workers are at a premium.

West Germany—which recently failed to hold onto homesick Turkish workers—is casting as far afield as South Africa and Chile for more manpower. Belgium, Luxembourg, and Austria have also helped to use up the reserves of immigrant labour from Italy, Spain, Greece, Turkey and Portugal, the chief suppliers. Another curb to the usefulness of such manpower sources is a growing trend for foreign workers to return home as wages and working conditions improve in their native countries. Some Continental countries are trying to increase the entry of older people and women into the labour market, and France, Italy, and the Netherlands have cut military service to release young men for employment. West Germany, with some 680,000 unfilled jobs at end-August and employing about 980,000 foreign workers, has set up three training centres for Spanish labour in the refrigeration, electronics and plastics industries. Britain, not a notable labour importer but benefiting from the recent influx of West Indian, Pakistani, and Indian workers, this year enacted an Industrial Training Act to accelerate apprenticeship training. It particularly lacks skilled and technically trained manpower and by last month had 334,209 unfilled job vacancies.

Manpower Situation

Britain this summer, however, began charting its future labour needs with a first report from the Ministry of Labour's new manpower research unit. The report predicts that the nation's manpower situation will become more critical in the next decade at present or better rates of economic growth. Re-training is still a new concept in Britain and Europe. Official projects to carry it out are virtually unheard of, but some private firms, especially manufacturers of automated plant, have trained some otherwise redundant workers to operate personnel-saving machinery.

Leader in the field so far is the United States, where technological unemployment had in the six years to 1962 cut production workers in manufacturing industry by 1 million, or 7½ per cent. American agricultural labourers have long been declining at the rate of 200,000 per year, and mining has lost a fifth of its labour force since 1957. United States Government concern for re-training is intense because of the severe effects of unemployment on certain occupation groups, the racial tension factor (22 per cent of the unemployed are non-whites), high youth unemployment through early school-leaving, and the problems of the handicapped who make up 12 per cent of unemployed. To this can be added the effects of automation. These include such illustrative cases as two men producing 1,000 transistor radios a day in place of 200 men previously, three men daily making 220 steel rods in place of 30 men, and the cutting of the Chicago stockyards' work force from 25,000 to 4,000.

Direct selling, despite recent setbacks in Britain, seems likely to become an important feature of merchandising in continental Western Europe. Britain's direct sellers are now reassessing their position after the failure of the big Rolls Razor and, more recently, Duomatic washing machine firms this year. But some think conditions in Europe are now ripe for a big expansion of this type of marketing where the manufacturer sells direct to consumers, cutting out retail shops.

European retail developments traditionally lag some years behind comparable British ones, which in turn normally follow American. But the Continent is in the midst of an exceptional spending spree on consumer durables, a situation which in itself suggests that big changes in European marketing techniques may be in the offing. Among these changes, the introduction and expansion of direct selling seems likely to be helped by three main factors:

(1) Lessons learnt in Britain, where lack of a sufficiently broad range of products made such firms as Rolls Razor and Vactric—both virtually dependent on single products and sensitive to changes in demand—would probably help European direct sellers. Vactric, a vacuum cleaner manufacturer turned direct seller, was the first of the spectacular failures in the field.

(2) Many of the components and machines sold by Rolls and Duomatic were in any case made in Europe. Imperial, still continuing in direct selling in Britain, imports its washing machines from Italy.

(3) The relatively slow progress in Europe of cut-price selling, of which the direct variety is a part, indicates that Europe is wide open.

On the other hand, the past ten years do emphasise that Europe is relatively slow to accept new ideas in retailing. In France, for instance, supermarkets still only account for 2.5 per cent of total food sales. Despite this slow growth Europe does follow British-American developments in retailing, even if it takes its time about it. From small beginnings already made in some countries for commodities such as books, European direct sellers could branch out into more ambitious consumer durables. Adding weight to this have been a number of hints from Britain's direct sellers that moves into Europe were on the way. Before the Rolls Razor failure, the firm's founder and managing director, Mr. John Bloom, said he had big ambitions for European developments.

An invasion by British direct-selling organisations in Europe world reflect changing consumer patterns there. Already Britain's biggest multiple tailors, Montague Burton, have started opening shops in France and British mail-order (often itself a kind of direct selling) is making its first inroads on the Continent. Apart from appliances, direct selling has been solidly established in Britain for many years. Specialist books, such as encyclopædias, are widely sold in this way as are brushes, cosmetics and insurance.

Direct selling in Europe may also be helped by the fact that farmers, because of their discontent with the prices paid them by wholesalers, have often set up their own sales outlets. This could encourage similar developments in other spheres of retailing. Experience in Britain, however, has shown that direct selling, because of huge advertising overheads, can be an expensive type of distribution. This points to the need for a really flexible approach and often only a large firm can achieve this.

East Europe and Export Credits

Longer and more liberal credits are the aim of a quiet campaign of persuasion which East European countries, led by Russia and East Germany, are mounting against their West European trade partners. East European diplomats in western capitals point out that most West European countries have lately increasingly paid lip service to the notion of *detente* through more trade. They add that several—France, Italy and Britain—must export more to combat inflation or other economic difficulties. Soviet bloc countries (whose trade and payments position with the West has recently been supported by huge gold sales) insist the time has come for the West to translate this into action with better credit facilities.

East European Governments are now waiting intently for the outcome of two events with an important bearing on the East-West credit situation. One is the Soviet mission to Paris this month to negotiate a new Franco-Russian trade pact; the other, a crucial annual meeting in the winter of the Berne Union. The Union has until now set guidelines for the West limiting export credits for Communist countries to five years.

The breakthrough, so far as Communist countries are concerned, came last month with Britain's decision to guarantee a 15-year loan for the Russian purchase of a man-made fibre plant. A Council of Ministers meeting in Brussels a week later left in doubt the posture some Common Market countries will adopt. But all the signs are of a growing feeling among the Six that commercial considerations now dictate the need for some let-up on the Berne rules.

France, in trade deficit with Russia for the first time in years, hinted last month that she, too, might consider breaking out of the Berne ring for specific Franco-Soviet deals. Like Italy (not a Berne Union member and long active in trade with Russia), France considers that the Communist issue stands on commercial, not political, grounds. But she has been reluctant to break away for fear of a European credit race. Belgium, also anxious to promote trade exchanges with the Soviet bloc, is another country believed to favour breaking the Berne guidelines if world trade competition justifies it.

E.F.T.A.: More Trade Inside the Family

Trade between the seven member-countries of the European Free Trade Association (E.F.T.A.) is now increasing faster than their trade with the Common Market. Until lately Britain, the biggest E.F.T.A. country, had increased trade with the Common Market rapidly, and three others, Austria, Switzerland and, in some sectors, Denmark, had relied heavily on their trade links with the Six. Much of the change is attributed to the growing difficulty of surmounting Common Market tariff barriers, and to the adverse competitive effect on E.F.T.A. goods of internal tariff cuts between the Six.

During the first six months of the year Switzerland achieved a 23 per cent increase in her trade with other E.F.T.A. members compared with a six per cent rise in exchange with the Common Market. Similarly Britain recorded a 15½ per cent rise in trade with E.F.T.A. countries in the same period, against a 7½ per cent increase with the E.E.C.

Last year inter-E.F.T.A. trade rose by 11 per cent to a total of £1,900 million. E.F.T.A's trade with the Common Market increased at exactly the same rate, 11 per cent. But judging by five-year figures, this was the turning point of a period in which E.F.T.A. trade with the Six consistently grew faster than that among the Seven themselves. Internal trade accounted for 22.8 per cent of the total E.F.T.A. exports in 1963 compared with 19.8 per cent in 1959.

In the first half of 1964 total Common Market exports were 25 per cent higher than in the same period of 1963. Imports from the rest of the world rose even more, by close to 30 per cent. In the first half-year total E.F.T.A. exports went up by only 17 per cent and imports by 25 per cent. It is this generally faster growth of the Common Market's world trade which continues to attract several E.F.T.A. countries to the idea of E.E.C. membership or association.

South African Growth Slowing

South Africa's economy, booming for some 2½ years, seems to be entering a period of slower growth. Reserves have been falling moderately since the end of 1963, after increasing since early 1962. By the third week of August this year they were at £242.1 million, which has about £15 million down from last December. Difficulty has been widespread deficiencies of skilled workers and management as well as general labour shortages in building, iron and steel, and the engineering and motor industries. These bottlenecks have slowed total output expansion to an annual rate of around 6 per cent and, together with recent agricultural setbacks, have exerted some upward pressure on prices.

But there has been no general demand inflation and pressure has been eased by a slowing of the increase in private consumption and the easing of import controls. Nevertheless, a Johannesburg business leader said that South Africa's past economic achievements had largely been confined to a quarter of the total population. An average annual growth rate of 8 per cent in real terms—nearly double the average rate of the past two decades—would be required to give equal employment opportunities for all in the year 2000, he said. He added that Government policy on the use of non-European skills clashed with the practical requirements of continued economic development.

Meanwhile, however, official opinion in the world's leading gold producing country continues to be optimistic. In a recent statement in Pretoria, Dr. Gerard Rissik, Governor of the Reserve Bank of South Africa, said that the past three years had been a period of growing prosperity. Gross National Product had increased rapidly and substantially and, although the tempo had lately slowed, growth was still at a "very satisfactory and more sustainable rate," he said. But he did warn against the danger of excess credit for non-essential consumption and urged restraint in public borrowing and in lending by financial institutions.

Progress Report on West Germany

The West German Government, which must soon gird itself for next year's Federal election campaign, seems likely to have the state of the economy as the strongest plank in its platform. The last two years have been strewn with ominous portents—mainly from outside prophets—of slow-down, recession and, more recently the danger of inflation, either home-grown or by infection from other Common Market countries. In the event, it seems improbable that the economy could be on more even keel.

Despite union pressures, successfully contained, price increases since the summer of 1963 have been among the smallest in the Six and virtually confined to food. Germany's consequent ability to restrain export price increases is at the heart of the strength of her international position. Imports, though well up, have lately been checked by a decline in Government purchases of military material.

A large export surplus, producing a heavy increase of reserves, could have had a baleful effect on foreign exchange markets. But luckily for all concerned, the trade surplus has been largely offset by an outflow of funds. And there are signs that the anti-inflation drive elsewhere in the Common Market is now helping to moderate Germany's export performance.

Cost of Living: The index of living-costs (1958=100), which stood at 113 at the end of the last quarter of 1963, reached only 115 by April and stabilised there through most of the summer. Behind this is the exceptional stability of wholesale prices for manufactured goods, which rose only one point (in March 1964) between the middle of last year and July of this year.

Trade and Payments: Export prices, despite some slight fluctuation, were by June, the latest month reported, 1 per cent lower than a year earlier. In consequence, the rise in export revenue in the first seven months of 1964, of nearly 13 per cent to some 37,000 million Deutschemarks (£3,400 million), was almost entirely accounted for by higher volume. By August the export surplus for the year reached about 4,400 million Deutschemarks (£400 million). But this failed to cause a runaway of the reserves, which remained stable close to 7,800 million dollars for most of the first seven months.

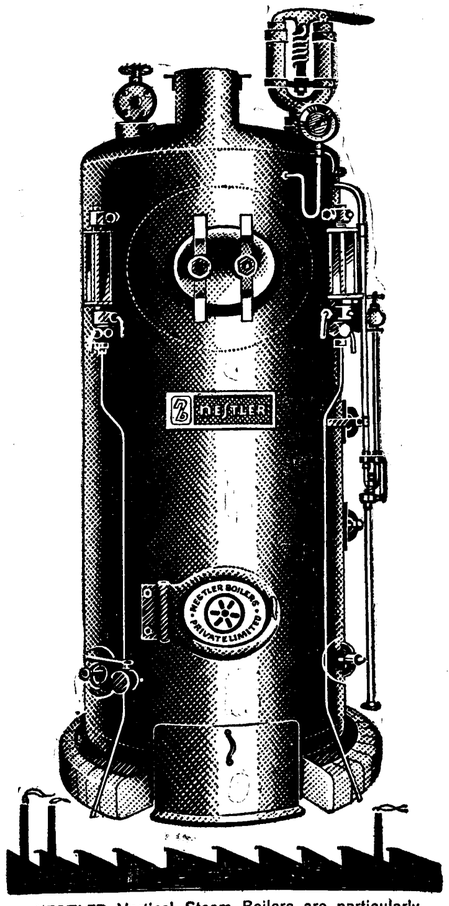
Topical Briefs

The *Common Market* Commission has, for the second time this year, proposed a compromise on the accelerated programme of tariff cuts some member-countries urged. The compromise, announced after the article *E.F.T.A.: More Trade in the Family* above was prepared, involves a 15 per cent cut in intra-Market tariffs on 1st January 1965. This will be in place of the 20 per cent several countries wanted and the 10 per cent reduction the E.E.C. was in any case due to make. The remaining 25 per cent intra-Market duties will be removed in two stages; 15 per cent on 1st January 1966 and 10 per cent on 1st January 1967, when the E.E.C. will become a full customs union.

West Germany has the slowest rate of increase in the cost of living of the Common Market countries. Official figures from Brussels for the first six months of the year show that West Germany had a 2.7 per cent rise in the cost of living compared with the corresponding period of 1963. In the same period Italy, with acute inflationary problems, had a 5.2 per cent cost of living increase, the biggest rise of any Common Market country. Holland had a 4.4 and France a 4.1 per cent rise in the six-month period. The cost of living also rose strongly in Belgium, up by 3.8 per cent in the first half-year

Space-saving, coal-fired, manually operated

NESTLER Vertical Steam Boilers



NESTLER Vertical Steam Boilers are particularly useful: being vertical they save space in crowded industrial workshops; and in rural, non-electrified areas they can be manually operated on coal, or can be converted and made to work on oil.

NESTLER Vertical Steam Boilers are now available in 9 sizes, from 300 lbs. to 1100 lbs. p.s.i., evaporation from and at 212°F.

NESTLER's Warranties guarantee your investment for one year against manufacturing defects and assure top performance.

Send for illustrated technical literature.

SOCIAL ENVIRONMENT AND BUSINESS—I

WELCOME CHANGE IN PHILOSOPHY GOVERNING CORPORATE BEHAVIOUR

By D. L. Mazumdar, I.C.S. (Retd.)

[*The need for equating the business community's requirements for growth and continuity with the social and economic values of the community in general poses a challenging problem. There is realisation of the urgency and magnitude of this problem among some businessmen of this country, but it is yet to permeate the rank and file. The steps taken in India to bring about a general rapport between business and society were described by Mr. D. L. Mazumdar (the former Secretary of the Department of Company Law Administration and now the Director of India International Centre, New Delhi), in an address at Calcutta early last month under the auspices of the All-India Management Association. He did this against the broad background of the changes that have taken place in the philosophy of business in the Western democracies. We have adapted this address of Mr. Mazumdar into an article to be published in two instalments. We have omitted some parts of the address, as a fuller account of these parts are covered in a series of three articles by the author published in our issues dated 15th, 22nd and 29th February 1964, under the title "The Modern Company and Rule of Law." The subject covered by Mr. Mazumdar is of great importance to the business community, for the private sector's prospects will inevitably be influenced by the image created among the public.*—ED.]

I HAVE assumed for the purpose of this article, that business means the most representative form of business, namely, the modern joint-stock company. The characteristics of this form of business are that it deals with a sizable manufacturing and marketing complex; its shareholding is widely diffused and transcends the limits of the family; and the responsibility for top management and therefore of control over its affairs is left in the hands of a few, who belong to a managerial class, as distinct from the wider shareholding class the members of which jointly own the equity of the Company. A later development in the structure and functioning of the modern joint-stock company, which has, however, yet to make its headway in this country, is the gradual induction of a professionally trained element in this managerial class. This element, which now functions in this country primarily at the management and not the control level, may progressively succeed in making its influence felt on the day-to-day control of business—but it looks as though it would have to bide its time yet awhile. This latest development in management practice has sometimes been described as the 'managerial' revolution—although it is hardly a revolution in the ordinary sense of the word, not being any fundamental, structural or behavioural upheaval, erupting abruptly. Instead, it has been essentially a gradual transformation of the traditional scene spread over many years, like, say, the so-called Industrial Revolution in the Western countries, which was brought about in course of many decades. Perhaps a more apposite description of the new phenomenon would be to call it by its latest fancied name, which is 'Managerial' Capitalism.

I would not say more on these semantic issues, except to observe that any study of the problems of business management or of the inter-relations between business and society, in the Indian context, is rendered specially difficult by the continuing fluid and transitory state of business management, which is currently in many different and uneven stages of growth even in the large-scale sector of organised business in the country. I shall assume here that the dominant trends in business management are at present represented by the traditional managerial class of an earlier generation, and to a lesser but increasing extent by the modern joint-stock companies managed by professionally trained managers.

What is Society?

Likewise, to talk of society *simpliciter* in the context of the present discussion may not be particularly rewarding. Indeed, I shall interpret 'society,' in the present context, as that combination and alignment of social forces and societal processes whether embodied in institutions or not or written into their mechanics or not—which provide some direction to our economic and social policies, however imprecise this may be, and thereby influence the organisation and working of joint-stock enterprises. The relevant institutions in the Indian context are mostly laws and those legislative and administrative bodies which are charged with the responsibility for the administration of these laws.

Non-statist voluntary agencies like the institutions in the City of London or in Wall Street, for example, exercising a significant impact on the structure and functioning of joint-stock enterprises have yet to establish themselves in the country. The non-institutional forces consist of the many formal declarations of the aims and objectives of our economic and social policy, the most important of which are embodied in the Directive Principles of State Policy in our Constitution. They constitute a large and dominating part of the social *milieu* in this country, in which large-scale business, as indeed all other major human activities, must necessarily be carried on. In this respect, developing countries like ours differ materially from the older and more developed countries, which have already achieved a workable measure of national agreement as to the ultimate aims of their social and economic policy, and are, therefore, ideologically more stabilised than ours. This difference between the two economies emphasises the importance of establishing a working *rapport* between business practices, values and motivations, on the one hand, and the evolving social and economic values of a community still a long way on the march towards its goal of economic and social development, on the other. This is a crucial issue which confronts business managers in this country whether they belong to the traditional managerial class or the more modern tribe of professionally trained managers.

Need Recognised

I think it will be correct to say that the need for this *rapport* is now generally and broadly recognised both by the enlightened leaders of the business community and the constructive leaders of opinion outside business. And yet this was not so till a few years ago. I shall recall a dialogue between the late Prime Minister, Pandit Jawaharlal Nehru and Mr. G. D. Birla at the annual session of the Federation of the Indian Chambers of Commerce and Industry a few years after Independence, I believe shortly before Avadi. In the full plenitude of his physical and intellectual powers at that time, the late Prime Minister made a vigorous speech deploring the lack of an adequate social perspective on the part of businessmen in this country and urging them, in the long-term interest alike of business and of the society in which they lived and worked, not to shut their eyes to the wider horizon, even when they carried on their day-to-day activities in the market place. Mr. G. D. Birla, rising to thank the Prime Minister for his presence at the annual function of the Federation, acknowledged the need for bearing in mind the social objectives, but argued that businessmen were like other professional experts, and compared them to dentists, if I remember aright, who, according to him, while not forgetful of the human anatomy, naturally concentrated on a particular part of it while they were engaged in their craft. The tenor of Mr. Birla's argument seemed to suggest, at least inferentially, if my recollection is correct, that businessmen could perhaps best serve the community by concentrating on their vocation, that is, the 'business' part of the social anatomy!

This was, as I have already said, shortly before the Avadi session of the Congress. About ten years later, on the occasion of the centenary celebrations of Birla Brothers, speaking before a gathering of all the Chambers of Commerce and Industry in Calcutta early in 1962, Mr. Birla observed that "business in India was no longer a close preserve of a few persons. Capitalism was becoming more broadbased, and the time had come when, he thought, businessmen should think of creating a managerial class in the country to sustain the growth of business." He went on to add that, "in the U.S. and Britain, big business had become the property of the nation" and prophesied that this would be so even in this country after some time. "The business community should not, therefore, be afraid of slogans of socialism; instead social justice should be the main foundation of business activities," and it was the task of businessmen, he concluded, "to give a push to socialism by creating more wealth."

It is not necessary in this context to go into the circumstances which brought about this very welcome change in the tone of the aforesaid dialogue. The new formulation of economic and social policies at Avadi and the far reaching changes in administrative policy relating to the corporate sector which were heralded by the passing of the Companies Act of 1956 would seem, in retrospect, to have been the two most powerful factors in the establishment, in theory at any rate, of this general *rapport* between business and society.

This quantitative recognition of the need for understanding and adjustment between business, on the one hand, and the accepted social and economic values of the community on the other, did not, however, lead in practice to any very widespread change in the traditional methods and practices of individual businessmen or business houses. Over a large sector of organised trade and industry, old-world views and attitudes regarding the rights and obligations of managers, shareholders, creditors and employees continued to persist. Thus, for example, it was still seriously argued by many leaders of business that the management was accountable only to the shareholders and that if the latter had agreed to or acquiesced in or refrained from adversely commenting on any decisions of the management, that would constitute sufficient sanction for the actions of the former. Laws and institutions which provide for the approval by Government or any other duly constituted external authority of business decisions, in the social interest, were resented as undue interference with the legitimate rights of business. During the last three or four years I have argued on many different occasions that the traditional concept of managerial accountability only to a largely mythical shareholding democracy is based on an erroneous view of the legal theory of the corporation in Anglo-American jurisprudence; and there is nothing in the historical growth and evolution of the modern corporation to support this concept. In other words, there is nothing in the history of the development of the corporate form of enterprise in the past, or in its legal foundation which can sustain the claims made either on behalf of the management or of the shareholders in the manner indicated. The truth is that this view of the corporation is essentially a relic of the *laissez faire* philosophy of the early nineteenth century, which fashioned and moulded the early Company Laws in the fifties and sixties of the nineteenth century in England; and, since our Company Laws in this country were based on the English model, this philosophy influenced also the thinking of several generations of company managers, company lawyers and company accountants.

Failure of "Laissez Faire"

It is not necessary to explain here the reasons for the gradual decline and fall of the *laissez faire* philosophy, notwithstanding the hard core of truth about the fundamental importance of the individual in any society which it contained. It provided a simple set of general rules regarding property, contract and honesty, in business dealings. In these rules, the widest latitude for individual freedom of choice was permitted and a minimal amount of conscious governmental direction was required. The incentives to individuals in their various economic roles were designed to be powerful enough to produce a dynamic and progressive economy; and competition was expected to provide a powerful check on unbridled self-interest. In practice, however, many conflicts arose between individual and social interests. Some of these conflicts developed because of the inability or failure of people to accept and to act upto their moral responsibilities, which the system of *laissez fair* required as a condition precedent for the establishment of accord between individual and social interests. Examples were tendencies of businessmen towards deceptive behaviour—especially of the more sophisticated and manipulative varieties associated with merchandising or high finance; failure of businessmen to provide for the protection of life, limb and health of workers; the frequent failure of competition and the lack of restraint in imperfectly competitive situations; and frequent failure to recognise the human rights of workers. The earliest tendencies towards social and governmental control of business in the earlier years of the nineteenth century in the Western countries arose from these failures of *laissez faire*. Society was forced to insist upon higher standards of honesty, protection of persons, restraint of monopoly and

ILES AND SERVICE CAN REACH YOU NO MATTER WHERE YOU ARE IN THE COUNTRY

Through over 34 branches — on-the-spot sales and service for you!

A nation-wide network of sales and service branches—that's another special feature of Avery, leading manufacturers of weighing equipment for over 230 years. Today, Avery have more than 34 branches in the country—and this figure grows each year! Every office is strategically located and carefully staffed with technical representatives and engineers to render on-the-spot sales and service. No matter where you are, remember, you're never far from an Avery office. Call your nearest Avery representative any time He will be there to help you!

Production Of Chemicals Maintained At Peak Levels

Dr. P. S. Lokanathan Reviews Activities

ADDRESSING the Twenty-seventh Annual General Meeting of the Company held at Mettur Dam R. S. on 22nd September 1964, Dr. P. S. Lokanathan, Chairman, said:

I have great pleasure in welcoming you to this, the twenty-seventh annual general meeting of your Company.

At the outset I wish to refer to the great tragedy that has befallen our country in the passing away of our beloved Prime Minister Shri Jawaharlal Nehru. The man who made India what she is today is no more and though some time has elapsed since his death, still we are not able to reconcile ourselves to this loss; it will be no exaggeration to say that the void caused by his death can never be filled. I count it as a great privilege that I had the fortune of personally knowing him from pre-independence days when I served as a member of one of the Committees appointed by him as Chairman of the Planning Committee of the Congress—through all the years as Executive Secretary of U.N. Economic Commission in which Shri Nehru took a great and continuous interest, and as Chairman of the National Productivity Council, and as the Director-General of the National Council of Applied Economic Research. Shri Nehru's keen interest in science and his driving enthusiasm for the advancement of his countrymen made him follow the work of the National Productivity Council as well as that of the National Council with very great personal interest. Both the organisations benefited a great deal from his support and encouragement. Though he is no more, he would have wished nothing better than that every one of us dedicating ourselves with all the energy at our command should strive to improve upon the performance of our allotted tasks so that the country will reach economic independence.

In our own immediate sphere, we suffered another great loss in the sudden passing away of Shri V. Swamy Iyengar on February 4, 1964. Shri Swamy Iyengar was a Director of this Company for more than eighteen years and his charming presence will be very badly missed by me and my colleagues on the Board.

Turning now to the affairs of our Company during 1963-64, the total sales went up to over Rs. 2.65 crores as against Rs. 2 crores in the previous year. We reached a new high of nearly 12,700 tonnes in caustic soda production, and I am glad to inform you that production of all chemicals was higher in the year under review as compared to the production in any previous year.

Control on the prices of caustic soda, liquid chlorine, bleaching powder and hydrochloric acid was removed by the Government of India in December 1963. This enabled us to revise our prices suitably in common with other alkali manufacturers in the country so that we could cover our increased production costs.

I had mentioned in my last year's speech that a scheme of technical collaboration with a leading chemical manufacturer in the U.S.A. had been finalised for the manufacture of organic chemicals and submitted to the Government of India for their approval. However, due to certain reasons beyond our control, this collaboration arrangement could not be implemented. Therefore, Shri R. V. Ramani, ex-officio Director, once again visited the U.S. this year and we have now concluded a satisfactory arrangement with another very well known organic chemical manufacturer in the U.S.A. for technical assistance for the manufacture of the new organic chemicals, i.e. methyl chloride, methylene dichloride, chloroform, carbon tetrachloride and pentachlorophenol. I now confidently expect production of these new items to start by the end of next year or early in 1966.

Shri R. V. Ramani, during his recent visit to the U.S.A. and Europe, has also finalised the orders for the further cells and other auxiliaries required for the manufacture of rayon grade caustic soda in the No. II plant. The orders have been so placed that we get the maximum advantage out of the limited foreign exchange available to us for expansion. Construction work on the new plant is proceeding at a very fast pace and we can hope to start commissioning the caustic soda plant by the end of the financial year and bring it to full production shortly thereafter.

Thanks to our having sustained a satisfactory and increased rate of production, the net profits have shown a rise of about Rs. 10.67 lakhs over the previous year which has enabled us to maintain the usual dividend of 12½ per cent on equity shares though the paid-up capital of the Company has increased from Rs. 1,60,00,000 to Rs. 2,50,00,000. I am sure shareholders will appreciate this fact and join me in congratulating the Managing Agents on this excellent achievement.

You would also have noted with pleasure from our Directors' report for this year that the machinery for production of a further 20-tonne capacity or caustic soda in the existing factory premises was successfully commissioned in March 1964. I am glad to state that this extra capacity is in full production since August 1964.

During the fag end of the year under review, under the Finance Act 1964, Central excise duties on carbon-dioxide gas, liquid chlorine and hydrochloric acid—three of the products manufactured by us—were abolished. Carbon-dioxide was being produced only for self-consumption while the other items were sold well as used for self-consumption. There has been a slight increase in the Central excise duty on soaps.

Super profits tax has been replaced by a surtax on company profits at 40 per cent on the residue of profits after tax and after deduction of 10 per cent on the capital base which includes capital, reserves and long-term borrowings. Thanks to the enlarged capital base and increased limit of 10 per cent allowed as profit, our Company will however not be called upon to pay surtax for the year ended 31st March 1964.

Some basic industries will get a rebate of 10 per cent in corporation tax and 20 per cent in surtax, but our industry is not one of them. Public companies will have to pay dividend tax at 7.5 per cent on the amount distributed as dividend on capital other than preference shares. I feel that this is an unnecessary burden on the companies and looks more like a penalty on the better managed and efficient companies. I hope the Government will be pleased to abolish this unwelcome tax at least next year.

While on the subject of development rebate, I wish to refer to the uncertainty currently prevailing regarding availability of this benefit after 1st April 1966. I hope that Government will continue this rebate, as its withdrawal will affect adversely a highly capital-intensive industry such as ours and also there will be no incentive for the industries to plough back the profits into reserves, which is an absolute necessity for future expansion.

The Hon'ble Finance Minister, in his closing speech on the Budget, announced that by an amendment of the income-tax rules the concession of additional depreciation for the working of the third shift of plant and machinery will be allowed with effect from the assessment year 1964-65. We derive some benefit by this concession.

At the risk of repeating myself, I wish to touch on the unsatisfactory power situation in our part of the country. Some years ago I had made a reference about this and since then it has almost been an annual refrain in my speech. In spite of the commissioning of the thermal units at Neyveli, the power shortage persists. I had stated that unless an atomic power plant was established shortly, we would not be able to see the end of these annual power cuts. From a recent news item, I see that the Government of Madras is indeed seized with the urgency of the situation and has obtained the approval of the Central Government for the construction of two large thermal power stations in our State as soon as possible. This is most welcome.

I would like to make reference to the recommendations of the Swaminathan Committee on the Industries Development procedures. The Committee had some important suggestions to speed up licensing procedures and I am glad to find that the Government has accepted almost all the recommendations.

The speed with which the Swaminathan Committee has submitted both the interim and final reports and the manner in which the Government has accepted the recommendations provided a gratifying instance of a new awareness and earnestness to ensure quick action and I hope the same expedition will be observed in the implementation of the decisions. The simplified procedures will, I hope, go a long way towards helping the establishment of new industrial units, expansion of the existing ones and fuller utilisation of industrial capacity. The efficacy of the techniques devised by the Committee for the speedy disposal of applications for industrial licences can be known only after they have been tried for some time. The Committee is fully aware of this and its suggestion that, after a year of its working, its scheme should be carefully examined by a similar committee, is a valuable one; for, such a study will provide an opportunity for prompt adjustment that may be necessary in the light of experience and the then prevailing circumstances.

While on the subject of industrial licensing, I have to comment in brief on the progress made by the caustic soda industry as a whole. As has been revealed in the mid-term appraisal of the third Plan, the rate of growth of the industry has not been at the pace required by the targets fixed. As a matter of fact, the gap between the target and actual performance has been growing steadily since the second Plan. The reasons for this are many and not the least of which has been the paucity of foreign exchange. It is, therefore, necessary, while framing targets for the fourth Plan, to take a much more realistic view of the capability to perform and set less ambitious targets—targets which are realistic and capable of implementation according to schedule.

The Tariff Commission has recently held an enquiry in June 1964 with regard to the continuance of protection to the caustic soda and bleaching powder industries. Their recommendations are awaited with interest.

I think the shareholders will agree that the affairs of the Company have been fairly consolidated so as to show tangible results. Although the Company has during the year under review as well as in recent years shown excellent results, there are many important tasks ahead of us. The future will certainly throw up new problems in the spheres of finance, management, industrial relations, productivity, cost control and sales. However, with the sound inherent strength of your Company, I am confident that we shall be able to evolve rational solutions leading to greater stability and progress.

I would like to touch briefly on the recent report of the Bonus Commission and the decision of the Government thereon. As a firm believer in the necessity to sustain high production in all fields of industry, and in incentives to attain such production, I feel that as a general principle, it is much more desirable to have bonus correlated to production rather than having profit sharing bonuses. In any event the introduction of a minimum bonus changes the entire concept of bonus as such, and gives it more the character of a deferred wage. There are some recommendations in the majority report with which our Company cannot be in agreement. I trust that, at least, at the time of introducing legislation to implement their decision, Government will give full considera tion to the weighty arguments contained in the minority report. If bonus legislation can ensure better industrial relations, we of course should welcome it. As far as your Company is concerned, we have already been paying bonus slightly in excess of the maximum visualised in the Bonus Commission's report but we are anxious that the scheme as finally approved in Parliament should be fair an equitable and help in maintaining peace and promoting goodwill in industry.

On behalf of the Board of Directors and o my own behalf, I wish to express our warm appreciation of the cordial management-labou relations and the devoted services of all rank of staff and labour, as well as the Managin Agents of the Company.

N.B.—*This does not purport to be a repor of the proceedings of the Annual Gener Meeting.*

CHAIRMAN'S STATEMENT

Alind's Eighteenth Annual General Meeting

MR. S. NARAYANASWAMY REVIEWS ACTIVITIES

Addressing the Eighteenth Annual General Meeting of the Aluminium Industries Limited held at the Registered Office, Kundara on 28th September 1964, Mr. S. Narayanaswamy, Chairman said:

At the outset, let me perform the solemn and melancholy duty of expressing our sorrow on the passing away of our esteemed Prime Minister, Pandit Jawaharlal Nehru. It is not given to every country to have in unchallenged leadership of affairs, a person of his moral and cultural stature, for a cycle of seventeen years —particularly in the wake of discarding the fetters of foreign rule, which was accompanied by the pains of partition. It was good to have had a statesman of his calibre, with an unshakable distaste for wrong doing, in administrative captaincy of India. This exalted the country's image before the world. The sorrow caused by his passing is mitigated in some measure, by one whom he loved, esteemed and trusted becoming his successor. Mr Lal Bahadur Shastri's unanimous choice as Prime Minister of India has been well received and been acclaimed by the world as sagacious and sound. Let me wish Mr Shastri a purposeful and long term of office.

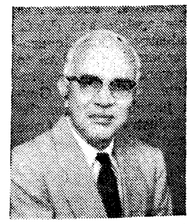
The year 1963-64 has been for ALIND a period of fulfilment and consolidation, no less of expansion and preparation for greater expansion. From the point of view of distribution, it has been the year of restoration of dividend to what may be called its classical level, this having been rendered possible by the abolition of the Super Profit Tax—which is of course not saying much for its twin successors—the Surtax and Dividend Tax. It was not necessary to substitute a retrograde tax by other imposts that tend to render the reliefs somewhat unsubstantial in content. In particular, the Dividend Tax is infelicitous in concept—in so far as it implies that distribution of any dividend on risk capital is among things that Government disapprove, which is far from being Government's intention.

Taxes imposed in post-independence years have proved that the psychological damage done by tax levies has a sinister way of outliving the financial damage done to corporations as to individuals. The long term victim of such damage is the New Issue Market, which Government are so anxious to see revived.

SOLIDAL PLANT

The company's "Solidal" plant for the manufacture of low voltage underground cables has just been erected and will go on stream next month. Members of our Engineering staff that went to Europe to receive training in operating and field-laying of these cables are back in Kundara. The problem of acquainting the Indian consuming market with the properties and high keeping qualities of this comparatively unfamiliar type of underground cable, is being actively tackled. "Solidal" will take ALIND quite a distance on the highway to comprehensive cable production.

Our production of welding cables—the first attempted with Aluminium metal in India—has been well received by consuming markets and the indications are that we shall be considerably augmenting our production of these. Production of microgauge aluminium wire required for stranding in the manufacture of cables has opened up a new field of possibilities in the manufacture of welding and trailing cables.



Your company has received Central Government's approval for substantial expansion of bare conductor capacity at Kundara and Hirakud. Items of balancing equipment are required to be imported to put this expansion through and the required foreign exchange is being secured in part by a loan from the I.C.I.C.I. Licences for the erection of a second rod rolling mill have been received and orders have been placed with the suppliers. This is expected to go into production in the third quarter of 1965.

The company has been in correspondence with Japanese friends with a view to establishing a plant for the manufacture of cable making machines. This has now reached an advanced stage and the Board is actively considering the details of terms of collaboration offered by a reputed Japanese firm for establishing the manufacture of a diversified range of cable making machines. This is but a logical step from cable making in which this company has been engaged for 14 years now. At the appropriate time, your Board will be making a supplementary share issue to finance this project.

The company having set up a tradition of drawing on its current resources for sundry capital programmes, has frequently experienced ways and means discomforts. These are aggravated by the added needs of working funds, generated by the very expansions so put through. The Board has been wrestling with this problem from time to time but beyond a stage it is unwise to subject the company to stresses and strains, stemming from undercapitalisation, which has the direct result of swelling our bank obligations. I may assure you that the Board has this matter under constant review. Consistent with the large draft made on the company's profits by current levels of corporate taxation, we are straining every nerve to plough back funds into the company.

While it is not my purpose to repeat what has been stated in the Annual Report, I think you will be glad to know that the orders for bare conductors currently on our books are of a magnitude as to keep both our bare conductor units occupied for well over two years.

EXPORTS

The company has contributed its modest mite towards export promotion—and has during the first four months of the current financial year exported about Rs. 2.75 lakhs, with orders pending execution being Rs. 11.4 lakhs. We exported Rs. 1.11 lakhs worth cables in 1963-64. We are continually exploring external markets—the African Continent, East European countries, Middle and Far Eastern countries, with our Sales Manager Mr. Peer Mohammed, keeping in personal touch with these developing markets.

In the manufacture of covered conductors, we have been using P.V.C. When we commence production of "Solidal," we shall be using P.V.C. as the principal insulating and sheathing material. Import of P.V.C. has been banned as indigenous production of P.V.C. has been on for some time. However, the price of P.V.C. manufactured in India is somewhat on the high side and tends to push up the end price of our P.V.C. cables of all descriptions, in such a manner as to impair our competitive capacity. Particularly, when Indian rubber production is rather meagre in comparison with the mounting demands made on it, it becomes important to make alternative insulation material for cables available on reasonable terms to the cable industry. It is time Government paid attention to this important aspect of making processing material available to this vital engineering-cum-public utility industry.

HIGH CARBON STEEL

Your company depends on external sources for high carbon steel to operate its high tensile steel wire plant. Supply of this has been uncertain and fitful. The somewhat erratic supply position has compelled us to keep our steel plant idle on two occasions recently. After all, prompt erection of transmission lines for electricity supply depends on the bare conductor industry making cables available according to schedule. Capricious or poorly regulated licensing of high carbon steel can hold up these supplies through shortage of reinforcing wire. We, therefore, appeal to Government to ensure regular licensing of special steel rods until domestic producers commence manufacture of such steel.

ALUMINIUM METAL

Which brings me on to the larger question of aluminium metal. It is some time since the Government of India announced their policy decision that the cable industry in the country should switch over from copper to aluminium, on the ground that we have very little copper production in India and that having regard to our known bauxite reserves and the increasing output of aluminium metal in the country, it would be safer to depend on aluminium. The copper-using cable industries have accordingly been putting through a phased programme of switchover to aluminium cables. Meantime, the statistical position as to the demand for aluminium and supply of the metal from the limited number of reduction units functioning in the country, is far from reassuring. It is true some units are shortly increasing their production and some more units have been licensed. But having regard to the highly capital-intensive character of the industry, blue prints may take time to be translated into production units and it is prudent to expect that they will not be able to add to available metal for at least four years. Meantime, the metal consuming engineering units are fast multiplying. The technical position of aluminium metal availability renders it necessary for Government to license liberal import of the metal for at least the next five years—if we are not to confront shortage and consequent under-utilisation of industrial units, which the country can presently ill afford.

CORDIAL EMPLOYEE RELATIONS

Our relations with labour have been quite cordial. Workers in three out of four manufacturing units are covered by Long Term Agreements that provide for orderly collective bargaining, prompt disposal of grievances, a fair wage system and reasonable working conditions. These agreements further provide for "payment by results" in the matter of incentive bonuses evolved with the help of work study teams. The last of the Kundara Agreements was signed on 1st June 1963. The agreements have in the past secured undisturbed plant operations and a pronounced productivity consciousness among the works as is reflected in output.

The company has been endeavouring to build up a sound framework of Supervisory and Managerial personnel through intensive training and affording of opportunities to the executives to prove their mettle. Apart from domestic facilities provided, we have availed of opportunities to send our men to Management Institutes, the Administrative Staff College, Hyderabad and the National Productivity Council Courses. Under the NPC and allied training programmes, we sent four of our executives abroad for training in Management. The company believes that investment in human material is of vital importance to the future of industry and managerial skills are a basic need of modern organisation.

I would like to conclude my observations with placing on record the Board's deep appreciation of the splendid work done by Messrs Seshasaye Brothers (Travancore) Private Ltd., and in particular, by its Managing Director Mr B. V. D. Menon, and their sustained endeavour to expand and broadbase the company's activities. The fine work done by the General Manager, by the Managerial and Supervisory personnel and by all ranks of workers and staff has been in good measure responsible for the year's results and the Board wishes to convey to them their grateful thanks.

I now move for adoption the company's Report and Accounts for 1963-64. In doing so, I shall be glad to answer any question concerning these.

This does not purport to be a record of the proceedings of the Annual General Meeting

EAST ANGLIA PLASTICS (INDIA) LIMITED

CHAIRMAN, MR. D. N. MITRA, ON PROBLEMS OF CELLULOSE ACETATE INDUSTRY

PROPER INTEGRATION OF OPERATIONS IMPERATIVE

SPEAKING at the Eighth Annual General Meeting of the East Anglia Plastics (India) Limited held at Calcutta on Wednesday, 30th September 1964, Mr. D. N. Mitra, Chairman of the Company, declared that, since the economics of the acetate industry were generally based on a pattern of intricate integration, lack of proper integration of operations often forced some producers to discontinue production. He emphasised that this industry should be integrated backwardly if it was to assure itself of adequate supplies of raw materials at economic prices. Reviewing the affairs of the Company, the Chairman said that the development plan for the Company had been based on a long-term projection. He disclosed that the compounding unit of the Company at Dum Dum was "in the swing of volume production," that the plasticizer plant would soon go on stream and that all groundwork for the cellulose acetate flakes project had been completed.

The following is the full text of Mr. D. N. Mitra's speech:

FRIENDS,

I have much pleasure in extending to you all a warm welcome to this general meeting of the Company. Before this review is presented, it is my duty to refer to the calamity that has befallen us at the death of Jawaharlal Nehru. It is also my duty to express our grief at this great national loss and to preface our proceedings with a tribute to his memory by dedicating our endeavour to the fulfilment of his vision of a modernised industrial India. Objective thinking is our inheritance from the great leader, who is no more. But his ideals, I am sure, will always inspire us and help develop a conviction about the great future of India. To do so we must fully comprehend that industrialisation is basic to the very life of our country. Without such conviction the creative possibilities of large-scale industries cannot be fully realised to achieve economic freedom.

Significant Performance

On this occasion, I propose only to highlight some aspects of our acetate industry which is yet to reach its full growth in our country. This apart, I would like to talk generally on the industrial climate as it is obtaining today in India. So far as the affairs of the Company are concerned, I would request you to refer to the audited statement of accounts and the Directors' report which together give a fair indication of the achievement of our Company over the past years. The performance of your Company during the year under review, in particular, is very significant —being the first year of fruitful endeavour by which the Company has produced some positive results and a token profit. This year is also significant because now we have come to a turning point, wherefrom the growth of our Company will be accelerated. This achievement, however, is to be studied in the context of what remains to be achieved in the years to come. In the annual report there is a brief note titled "The World of Cellulose Acetate." This defines the framework of the canvas of our acetate project. We have just made a beginning in this field. We are yet to go a long way to reach our goal.

Our compounding unit at Dum Dum is now in the swing of volume production. The plasticizer project will soon go into stream. All the groundwork for the cellulose acetate flakes project has also been completed. In planning our schemes we have adopted a pragmatic approach, and in programming the cellulose acetate project we have worked out the detailed data on inputs and investment costs. The elaboration of the development plans has been, in general, started with a long-term projection. For operational purposes, it has been necessary to link aggregative planning to that of the individual phases of our project. In our study, major emphasis has been placed on the analysis of the differential of the fixed investment and other major input requirements in the industry between a developed country and a developing country. The course of our activities has been charted out on an aggregative projection which is fundamental for proper development of cellulose acetate industry.

Looking back, I would recall—and you are perhaps aware—that our original scheme was only to compound cellulose acetate and P.V.C. resins for the plastics industry. Our Government, in sanctioning the scheme, advised us to integrate our project backwardly with the production of cellulose acetate flakes. The Government was very much justified because the modern cellulose acetate industry is one of the most completely integrated industries in the world today.

If you examine the pattern of cellulose acetate industry all over the world, you will find that only very big corporations are now dominating this field. In all advanced countries, mainly the leaders of chemical or man-made fibre industries are engaged in the production of cellulose acetate.

The economics of acetate industry are generally based on a pattern of intricate integration. Lack of proper integration often has forced some producers to discontinue production. A very large and reputed chemical company in an advanced country, once an important producer of cellulose acetate flakes, had to shut down their acetate plant as it was not properly integrated for the manufacture of end-products. To make the cellulose acetate industry very stable, there is no doubt that it has to be properly linked up with end-products industries, such as plastics, yarn, film etc. In a developing country like India, the question of integration of a cellulose acetate industry is far more involved. To be absolutely sure of supply of raw materials from indigenous sources and to be independent of imports, this industry has also to be integrated backwardly to ensure the availability of the raw materials at an economic price.

Local Conditions

The pattern of integration in acetate industry varies in the advanced countries according to local conditions. Besides having major forward integration for manufacture of end-products and auxiliary integration for marketing, most of them also have facilities of chemical conversion plants. Many of them produce all the basic and intermediate raw materials and chemicals like acetic acid, chemical cotton, acetic anhydride and have facilities for recovery of acetic acid; some producers however buy cellulose pulp and acetic acid and only produce cellulose acetate by linking with the production of acetic anhydride and recovery of dilute acid. We also know of cases where even recovery of acetic acid is not undertaken by the acetate producer because they not only buy acetic acid but have also the advantage of returning to the seller the dilute acid for recovery.

But in a developing economy where the chemical industry is still in its infancy, it is to be expected that such facilities will not be available. It is, therefore, incumbent upon your Company to integrate the acetate project not only to the limits upto which your Company has obtained licences, namely, production of acetic acid, acetic anhydride, etc. but also for producing pulp and other chemicals; and it would also be desirable to go a further step, backwardly, to set up a distillery for regular supply of alcohol and to integrate, forwardly, with a yarn spinning plant.

In this context, I would also like to refer to the status of the acetate industry in a developing country like South America where we find that the producer of acetates has even gone as far backward as to undertake sugarcane cultivation in order to ensure supplies of alcohol by crushing of cane and subsequent fermentation. Some internationally-known firms have also diversified in the field of forestry development and timber extraction to produce pulp in the process of integration. Such complexity is inherent for a stable cellulose acetate industry in its larger perspective.

I am glad to report that your Company has made a study of the economics of this industry and the development plan has been based, accordingly, on a long-term projection. This being a resource-tied industry, your Company has studied the various problems relating to the availability of raw materials required for the project. It has also taken into consideration the prospects of the development of petrochemical industry during the next decade which might provide a ready source of acetaldehyde, etc., which, in turn, will ensure economic production of acetic acid.

I feel proud to report that your Company is the pioneer in the field of acetate plastics in India and therefore enjoys a happy position. We are now successfully marketing cellulose acetate compounds to meet the requirements of the plastic end-products industry. Now that we have planned for a wide range of products involved in our integrated project, your Company will be in a position to take up such production progressively and develop the sidelines of trading for a substaining growth in course of time. Our activities however have to be related to the general industrial programme of our country. We should bear in mind that the Indian economy has undergone a major transformation since independence and we are at the beginning of a new era—one in which big industries can fulfil their promises of benefit.

Emotional Prejudices

I would like to observe here that while the country is preparing for a large-scale development, forces are at work to put obstacles to our way of thinking. Despite the fact that big industrial development is an immediate need to generate rapid economic growth, ome of us, perhaps a large section of the Indian people, have a deep-rooted fear out of prejudices and emotional repugnance to it. We shall have to surmount this contradiction. This is not a small job. In the present industrial scene in India, suspicion and emotional prejudices have inevitably created a degree of cynical distrust in all business and downgrading of a businessman's function in society. A time has come for scrutinising what is good for the society and what is not. The feeling resulting from our prejudices brings in a host of untoward consequences in its wake and such feeling will act as a dead load upon our economy —it will slow down the social and economic progress. It will develop a negative attitude which will ultimately refuse to accord honest recognition to the actual benefit of big corporate business.

The Other Reason

The other reason for the negative feeling is the assumption that small-unit business should be the norm. This brings emotional consideration in determining the Government policies towards large industry. To live in the world of big productive machines side by side with handlooming and basket-weaving, is perhaps responsible for the two schools of thought. It would be unfortunate for us if our industrial policies develop any contradiction in the process of planning. In a developing country like ours, both the streams of economic growth—large and small—have come to stay in our "mixed economy." I am not opposed to small industries. In fact, I am all for small and cottage industries. In India ours is not a case for supporting one or the other—the two should be interdependent and interrelated in such a way as to continually add to the wealth of the country as well as to lead to equitable distribution of wealth.

I can appreciate the emotional feeling leading to the negative attitude on the part of certain section of Indians which is probably due to the possible concentration of economic power. But to avoid such concentration it would not be prudent to throttle the economic growth.

Our economic system calls for re-examination of our thinking as well as of the policy of industrialisation. Big industry is inevitable in a big country like ours which is big in every respect—population, external relations as well as natural resources. We should be con-

CHAIRMAN, DR. RAMASWAMI MUDALIAR'S SPEECH

QUALITY OF PRODUCTS IMPROVES APPRECIABLY

THE Seventeenth Annual General Meeting of the National Newsprint and Paper Mills Limited was held at Nepanagar on Wednesday, 30th September 1964. In the absence of Dr. Ramaswami Mudaliar, Chairman of the Company, the speech prepared by him was read out by Dr. A. Seetharamiah, a Director of the Company, who presided over the meeting. In his speech Dr. Ramaswami Mudaliar said that it was for the first time the Company had achieved the target and the quality of production had shown an appreciable improvement. The year under review, according to him, was the first year after sixteen long years that it had been possible to propose a dividend of six per cent. Referring to expansion plans, he observed that, consequent on the decision to raise the capacity of the Mills from 30,000 to 75,000 tonnes, supply of raw materials had been assured by the Government of Madhya Pradesh. He added that negotiations for expansion of existing units were in progress and orders for new paper machine had already been placed.

The following is the full text of Dr. Ramaswami Mudaliar's speech:

I extend to you a cordial welcome to the seventeenth annual general meeting of the shareholders of the National Newsprint and Paper Mills Limited. The Directors' report, the balance sheet and the audited accounts for the year ended 31st March 1964, have been in your hands for some time and with your permission I shall take them as read.

I must once more apologise for my inability to be present in person, largely due to reasons of a personal nature which I have stated at the last meeting.

National Loss

Since our last meeting, the nation has sustained an irreparable loss in the demise of our great Prime Minister, Mr. Jawaharlal Nehru. Prime Minister Nehru took a personal interest in the progress of the Newsprint Mill. I would like to recall to you his visit to Nepanagar on the 26th April 1956 when he formally opened the Mill and inaugurated its production. We shareholders, officers and staff of this Mill at every level mourn his loss with our fellow citizens throughout India.

Production and Quality

It must be gratifying to you, as it is to me, that for the first time the production for the year under review, in your Mill, reached its rated installed capacity, the production being 30,078 tonnes as against the rated capacity of 30,000 tonnes. This is the first year that the target has been reached. During the year, the quality of the production has also shown appreciable improvement—the shade of the paper is not so yellowish as it used to be. The main reason for this improvement in shade is due to the use of salai when it is still fresh as the mechanical component of newsprint. Added to this the bleaching of chemical pulp has also been improved by resorting to multi-stage bleaching.

Financial Results

As you would have seen from the Directors' report, your Company made a gross profit of nearly Rs. 71 lakhs, after setting aside the amount required for depreciation and development rebate reserve. A provision for income-tax of Rs. 20 lakhs has been made out of this gross profit. Taking into account the balance at the end of last year of about Rs. 25 lakhs, the total amount available for distribution under various headings is Rs. 76 lakhs. Your Directors after setting aside Rs. 30 lakhs to be transferred to the general reserve and Rs. 10 lakhs to the tax reserve, are proposing to pay a dividend of 6 per cent subject to tax for the year ended 31st March 1964, to the shareholders. This is the first year after sixteen long years that it has been found possible to propose a payment of a dividend to the shareholders.

The Government of India directed last year that the Company should change the method of calculating depreciation from the written down value to the straight line method, in accordance with Section 205 (2)(b) of the Indian Companies Act. The directive was received too late to be given effect to last year, but the depreciation this year has been calculated by the straight line method. It is a matter of regret that during the previous years account was not taken of the extra shift allowance and a provision of over Rs. 22 lakhs should have been made for this extra depreciation which was not done.

In my speech last year I referred to the vicissitudes through which the Company had to pass, the various pitfalls at the earlier stages and the determined effort made by successive Directors of the Board to make the first newsprint factory in India a success, financially as well as in its product. I am happy that at long last, in its seventeenth year, we have been able to announce that the target in production has been reached, the quality of paper is steadily improving and that the shareholders. particularly the private sector of the shareholders' corporation, which has shown exemplary patience, is at last getting some of its due back for its investment.

While I am happy to announce that the dividend, subject to your approval, will be paid to the shareholders, I regret all the more, that I have not been able personally to be present on this happy and, may I add, auspicious occasion.

Caustic Chlorine Plant

I referred last year to the caustic soda chlorine plant which was under construction. I am glad to report that the installation of the plant has been completed and it is hoped that production from the plant will be available for utilisation in the last quarter of this year.

Expansion

It has been decided in consultation with the two Governments who are the largest shareholders, to expand, the factory so as to raise its capacity from 30,000 to 75,000 tonnes. This proposal which has been under consideration by your Board for some time, has received the approval of the two Governments, and I trust it will have the approval of all shareholders. An industrial licence for this substantial expansion has been granted by the Government of India. The project report which has been prepared fairly in detail for this expansion, involves an additional investment of about Rs. 8 crores and the project has been approved by the Government. It is hoped that most of the money required for this expansion will be found from the earnings of your Company, but I trust not to the detriment of the interest of the shareholders.

In regard to expanding the capacity of the plant, the main question which the Directors had to seriously consider over a fairly long period, was the availability of raw material. We should thank the Government of India for setting up a Committee to examine this question. The Committee composed of experts, has confirmed that there is ample salai for operating the factory at its expanded level for at least a period of over twenty years. The Committee has also recommended and the Government of Madhya Pradesh has accepted the recommendation. that to maintain and sustain supply of raw material for the factory, it will undertake the plantation of eucalyptus, which has proved to be an even better substitute than salai for the mechanical component of newsprint. So far as the supply of bamboo is concerned, we have had confirmation from the Government of Madhya Pradesh that the factory's full requirement will be met. Negotiations are also in progress to acquire some areas of bamboo and salai from the State of Maharashtra and I trust that these will end in fruitful results.

Negotiations are in progress for the semi-chemical pulping plant, the expansion of the existing chemical pulping plant and the chemical recovery plant and water works, and it is expected that they will shortly be finalised for these purposes.

Orders for the new paper machine, including stock preparation and finishing equipment, have been placed with Messrs. Wartsila of Finland and the Managing Director will shortly be proceeding to Europe to finalise the details of the contract as well as to get a first-hand knowledge of the latest technique of manufacturing newsprint.

Labour

On 11th November 1963, a Truce Agreement was signed with the Nepamills Employees Union. The Agreement is for a period of three years. The relations between the workers and the management are quite cordial.

Thanks

I must express my sincere thanks to my colleagues on the Board of Directors, representatives of the Government of India and of the Madhya Pradesh Government, who have taken considerable interest in the working of the Mill and have constantly helped me both at Board meetings and apart from Board meetings, by their advice, suggestions and in other ways. The private shareholders' representative, naturally took an equal interest in the working of the Company and I am sure it will be some consolation to him that at long last he is able to announce to his colleagues, that it has been possible to provide for the payment of a dividend. To the managerial staff, the Managing Director, Mr. Kothari and to Mr. Singhania, I am indebted for their advice on the technical side and on the commercial side respectively. The Managing Director has carried a great load during the year, both for carrying out the work of the Mill and for finding time to prepare plans for expansion and other matters. I should acknowledge also the help that has been given by all the officers at every level, which has resulted in the progress of the Company to the extent realised today. To the workers in particular, I must express my appreciation of their co-operation and their responsive attitude throughout difficult negotiations. I trust that the happy relations to which I have already referred will continue to make this, the first newsprint mill in this country, an example of co-operation at all levels.

Notice

BRIDGE AND ROOF COMPANY (INDIA) LIMITED

NOTICE IS HEREBY GIVEN THAT AN Extraordinary General Meeting of the Members of the above-named Company will be held at the Registered Office of the Company, 21, Netaji Subhas Road, Calcutta, on Thursday, the 29th day of October, 1964, at noon, to consider and if thought fit, to pass the following resolution:—

(*To be proposed as a Special Resolution*)

"That the Regulations contained in the printed document submitted to this meeting and for the purpose of identification subscribed by the Chairman thereof, be and are hereby approved and adopted as the Articles of Association of the Company with effect from the first day of November, One thousand nine hundred and sixty-four, in substitution for and to the exclusion of all existing Articles of Association."

BALMER LAWRIE & CO., LTD.,
D. MANSON,
Managing Director,
Secretaries.

CALCUTTA, 1st *October*, 1964.

Notes:—(1) A member entitled to attend and vote at this meeting is entitled to appoint a proxy to attend and vote in his stead. Such proxy need not be a member of the Company.

(2) An Explanatory Statement pursuant to Section 173 of the Companies Act, 1956, has been forwarded to the members of the Company.

KIRLOSKAR OIL ENGINES LIMITED

IMPEDIMENTS TO HIGHER OUTPUT MUST BE REMOVED

CHAIRMAN, MR. S. L. KIRLOSKAR'S PLEA

A STRONG plea for removing the impediments lying in the way of increasing production of oil engines was put forward by Mr. S. L. Kirloskar, Chairman of Kirloskar Oil Engines Ltd., in his speech at the Eighteenth Annual General Meeting of the Company held at Poona on Saturday, 26th September 1964. In particular, Mr. Kirloskar drew attention to the poor quality of coke, pig iron and steel. In spite of repeated representations to the Government, he said, there was little improvement in the situation.

The following is the full text of Mr. Kirloskar's speech:

LADIES AND GENTLEMEN,

I have pleasure in welcoming you to this meeting. Before I proceed to review the working results of the Company for the last year, I wish, in a mood of reverence, to render our humble homage to the late Prime Minister, Pandit Jawaharlal Nehru. With his passing away, an epoch in the history of India has come to a close. He was one of the greatest personalities of our generation. As a statesman of outstanding, capacity, he has contributed more than any other person to the cause of human freedom. His domestic policy was based on the grand tripod of democracy, socialism and secular state. His role as a nation-builder has won for him the admiration of all. In fact, he was the maker of modern India. He was an apostle of world peace and a firm believer in the concept of one world community. A brilliant writer with unusual sensitivity of mind and refined feelings, he always championed the cause of the weak and the frustrated with profound sympathy. The absence of his dynamic personality has left a void in both Indian and international politics. He will ever be remembered and his services to humanity will ever be cherished in the hearts of men for all time to come.

The report of your Directors and the audited accounts of the Company for the year 1963-64 have been sent to you in advance, and I am sure, you must have gone through the same with interest. I shall, therefore, take them as read.

I am glad to mention that the Company has been able to maintain its steady progress in all directions, in production, in sales and in its development programmes. The figures for the year reveal a profit of Rs. 81,88,996 (as against a profit of Rs. 89,85,375 during the previous year) after providing for depreciation, remuneration of managing agents and the amount set apart for paying bonus to employees as per agreement. Adding to this the balance of the previous year, the total comes to Rs. 82,17,992. In their report, your Directors have made their recommendations, as to how this amount is to be allocated under various heads.

Progress

Last year the provision we had to make in our balance sheet for taxation was considerably high. So, we had to prune our dividend from the previous 16 per cent to 12 per cent on equity shares. However, this year, the provision for taxation is much lower which leaves better margin for providing funds for our expansion programmes and also for paying a higher dividend. We have always recognised the right of shareholders for a legitimate return on their investment in the capital of the Company and it has always been our first concern to make provision for this, keeping in mind the long-range interest of the shareholders. So, this year, your Directors have favoured returning to our normal dividend of 16 per cent on equity shares. I am sure, you will welcome your Directors' recommendations in this behalf.

You will have noticed from the accounts of the Company that it has maintained its rate of progress and has shown increased production and sales. Inspite of higher sales, the net profit for the year is lower than that during the previous year. Naturally, you would be interested in knowing the reason for this.

It is a well-known fact that there has been an all-round increase in the prices of raw materials, labour cost and all other factors which go to make up the cost of production of our engines. No corresponding increase, however, was made in the prices of our engines, for the last four years. Further, the increased proportion in the export of our engines, during the year under review, has also contributed to a reduction in our profits.

Need to Expand Exports

Here, one is likely to wonder, if export trade does not bring in as much profit as inland sales, why should we at all export our products; the reason is not far to seek. Firstly, the economy of the country is facing an acute shortage of foreign exchange and the Government is making a valiant effort to promote export with a view to earn more foreign exchange. Therefore, it behoves every industry in the country to help the Government to earn more and more foreign exchange. The prosperity of the country lies in this. Secondly, when industrial concerns are manufacturing products on a large scale, to depend entirely upon the inland market for the sale of that product, would be a most unwise policy. Fluctuations in internal market conditions may easily upset manufacturing programme, thereby putting the whole organisation out of gear. Therefore, development of an export market for a reasonable percentage of the production of that concern would stabilise the overall demand and facilitate smooth running of manufacturing programmes of industrial concerns. Thirdly, if an industry earns foreign exchange, it will have a claim on the Government for foreign exchange required by it for its expansion schemes, for importing capital goods and other material not indigenously available. Therefore, it can be seen that in the larger interest of industries, it is always a desirable policy for an industrial concern to develop a foreign market for a reasonable portion of its products. Your Company has been benefited considerably due to the last two reasons. The working result for the year has been good and it has more than fulfilled the forecast I had made during the last year.

The demand for our engines and bi-metal bearings continues to be good and we are fully aware of the fact that unless our production keeps pace with the increasing internal and external demand, we will be losing a portion of our market in favour of our competitors.

One of the greatest impediments in our way of increasing production is the poor quality of coke, pig iron and steel that are now being supplied to industries. Inspite of our repeated representations to the Government, we see little improvement in the situation. This affects both the cost, quality and quantity of indigenous production. The Government who are both producer and controller of these commodities would do well to find ways and means of improving the quality of these basic materials which at present are seriously handicapping production.

Regarding developments, we are planning to increase our present production of engines, having in view the internal and external demand for engines.

The production of bi-metal bearings and bushes is also progressing as per schedule. I had reported last year that the Government could not release sufficient foreign exchange for the import of strips from foreign suppliers for making these bearings and bushes. We have, therefore, decided to install our own bi-metal strip plant, which would make us independent of foreign supplies of the bi-metal strips. In this connection, I may report to you, that during the year under review, we have started manufacturing and supplying thin walled bearings and bushes to various new automobile and industrial stationary type of engines, and more and more manufacturers have already started using our bearings and bushes as original equipment.

Our export trade is expanding rapidly and during the year under review several new foreign markets have been opened up. I had reported to you last year that we were feeling the necessity of opening our own branch offices in some of the potential foreign markets. We are studying the situation in various countries before we ultimately decide the countries where to start our own branch offices.

For a foreign distributor, who makes an all-out effort to push the sale of any product, his knowledge about the organisation behind the product he is trying to sell, is an essential factor. The confidence he can inspire in his clients for the products he is trying to sell them depends upon his own confidence in the organisation behind this product. So, to give our foreign distributors an idea of our organisation and the industrial development that has taken place in our country during recent years, we had invited our overseas distributors from more than 28 countries, to attend the Kirloskar Distributors' Seminar, which was held in Poona in February 1964. These foreign distributors were taken to various other Kirloskar factories at Kirloskarvadi, Harihar, Bangalore and were also shown other industries in Bombay, Poona, Delhi, Calcutta Bangalore etc. They were greatly impressed by the industrial progress India has made, in such a short period. The picture they actually saw, belied the image of India they were till then carrying in their minds. This has already started showing its results in increased orders we are receiving for our engines from foreign markets and also increased requests for agencies from distributors from various countries where we are not represented yet.

The Government has set a target to increase the export of engineering goods considerably by the end of the fourth Five-year Plan. This target though vitally important to our economy, looks a bit ambitious. It cannot be said that it would not be possible to achieve this. However, the success of our efforts to attain this would depend upon the extent to which the Government is prepared to go for creating a favourable climate for its achievement. The recent pronouncement of the Hon. Minister for Commerce in this matter is heartening and if conditions for industries are made favourable, the Government can expect the engineering industries to rise to the occasion and achieve the target laid down for the export of engineering goods in the fourth Five-year Plan.

New Activities

Poona is fast growing into an industrial city with more than 50 industrial concerns around it. The city is now humming with industrial activity. So, the necessity for a modern Western-style hotel, with sufficient accommodation, is keenly felt. Hence, some of the leading industrial concerns in Poona have joined hands as promoters and have registered a company by the name "The Poona Industrial Hotel Limited" which will establish a Western-style hotel in Poona. Your Company has got several foreign collaborations. In this connection, representatives of these companies, foreign technicians and also a number of persons from all parts of the country with whom the Company has transactions, come to Poona and we have been finding it very difficult to find suitable accommodation for them. The hotel that is going to be started affords certain concessions and facilities to industrial concerns which are subscribing to its capital. So, investment in the capital of this proposed hotel would confer considerable advantages on the Company. Your Directors, therefore, have recommended that your Company should invest a sum not exceeding Rs. 2 lakhs in this new hotel. A resolution in this behalf is placed before you for approval.

Shivaji Works Ltd., a subsidiary of the Company, too has had a good year. It has increased its production and sales and has been able to declare a good dividend. It had expanded its foundry with a view to increase production and this has resulted in higher production and greater profit.

Judging from the conditions prevailing now, I can say that we can look forward to better results for the current year. The expansion programmes we had taken in hand and which are now on regular production line, would be able to give us more profit. So, the prospects for the coming year look to be bright.

The success we have been able to achieve during the year under review has been possible, thanks to the enthusiasm and loyalty of the staff and the able administration of the management. Permit me to congratulate them on your behalf.

Note: *This does not purport to be the proceedings of the Annual General Meeting.*

THE MYSORE TOBACCO COMPANY LIMITED

CHAIRMAN, MR. I. P. MALLAPPA'S SPEECH

SURPLUS PRODUCTION HAS CREATED MARKETING PROBLEMS

ADDRESSING the shareholders of the Mysore Tobacco Company Limited at the Twenty-seventh Annual General Meeting of the Company held at Bangalore on Thursday, 24th September 1964, Mr. I. P. Mallappa, Chairman of the Company, said that surplus production of tobacco through increased acreage and also lack of required quality had created problems in regard to its marketing. The excess of output in the wake of rising production the world over, was likely to increase competition in the world trade still further. He believed that serious consideration was being given to the question of restricting cultivation of tobacco only on suitable soils with a view to avoiding further surplus. Alluding to the affairs of his own Company, the Chairman stated that the Company had bought during the year under review an increased quantity of tobacco from private growers who were finding it most advantageous to deliver their product to the Company due to the better service the Company was providing to them.

The following is the full text of Mr. Mallappa's speech:

LADIES AND GENTLEMEN,

Before commencing the business of today, I would like to refer to the sad demise of our late Prime Minister, Pandit Jawaharlal Nehru, on 27th May 1964. It is hardly necessary for me to say that his death has created a void in the national and political life of India. He was a great leader, was a great champion of world peace and was one of the greatest sons of India. On behalf of the Board of Directors of the Company and all those who are associated with it, I take this opportunity to express our feelings of profound sorrow at the passing away of Pandit Jawaharlal Nehru who guided the destiny of our country in a matter worthy of emulation during the past seventeen years. We will be showing our deep gratitude for all the good he did for us and honouring his memory if we only tried to follow the lead he has given us and practise the ideals for which he stood and worked.

Sales

The Directors' report and the audited accounts for the year ended 31st March 1964 have been in your hands for sometime and with your permission I take them as read. From a perusal of the accounts, you will have noticed that the sales during this year touched a new record figure of Rs. 49,84,898 which has been the highest since the inception of the Company. I am sure you will be anxious to know why, in spite of this, the profits are less. Firstly, the quality of the crop secured was not the same as that of last year and the production of top grades of tobacco was very much less. Secondly, the Company negotiated successfully an agreement with its employees which necessitated revision of the pay structure of all the employees with retrospective effect and which has increased our cost on establishment. The Company's handling sheds and barns required extensive repairs and the expenditure incurred have been substantial. The operation costs have also slightly increased due to the raise in cost of fuel and other materials required for curing. Expenses in respect of other operations have however been well under control.

Tobacco Curers

A significant feature of this year's business is the increased quantity of tobacco purchased from private curers. Since 1956 we had lost a substantial share of this sector. In the beginning we had encouraged the production of tobacco in this sector by supplying materials and providing financial and technical help but due to increased competition in the purchase of tobacco grown in Mysore, we did not receive all the quantity we had hoped to secure. But your Company has persistently attempted to improve its relationship with the growers by providing better service. The growers have realised the many technical improvements brought about by the Company's staff for improving the quality of their tobacco. As a result of these services rendered, I am glad to report, that tobacco curers are finding it most advantageous to deliver their tobacco to your Company. Encouragement is being given to tobacco growers for taking up flue-curing in new places. Many progressive farmers have taken up during this year the flue-curing of tobacco and I am confident that with new enterprising tobacco growers in this field, this sector is well strengthened to produce more tobacco.

The prospects of the present season have not been satisfactory due to continuous drought during the planting time and subsequent heavy showers which have damaged the standing crop. The unusual heavy rains in Mysore and Gowribidnur areas have caused considerable damage to the tobacco crop and also damage to Company's property. But the quality of the small crop that is there now shows promise of satisfactory results.

Acreage

During this year, there was an increase in acreage under tobacco in India but due to unfavourable weather conditions, the quality required by the traditional buyers was not obtained. The surplus of tobacco through increased acreage and also lack of required quality has created problems in regard to the marketing of the surplus tobacco. The production in other tobacco producing countries of the world has also gone up and this is expected to increase the competition in export trade still further. I believe serious consideration is being given for restricting the cultivation of tobacco only on suitable soils with a view to avoid its further surplus.

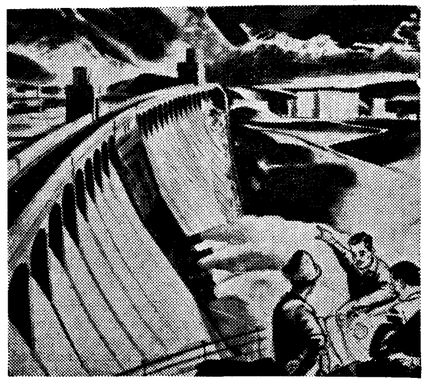
We are grateful to our esteemed buyers, Messrs. The Imperial Tobacco Company of India Ltd., for their interest in our tobacco and the assistance rendered in various ways by them to your Company. Messrs. The Indian Leaf Tobacco Development Company are guiding us on proper lines in regard to the development of tobacco and we are very grateful to them.

I am glad to report that the management entered into an agreement with the employees of the Company in regard to their pay scales and other service conditions. This agreement will be in force for a period of four years from 1st April 1963. I am also glad to report that the employees and workers of the Company have worked wholeheartedly and rendered loyal and efficient service for furthering the interests of your Company.

I wish to acknowledge with grateful thanks the valuable advice, guidance and co-operation which I have received from my distinguished colleagues on the Board. I wish to thank once again the Government of Mysore for the generous assistance and encouragement given to your Company.

I now move that the Directors' report and the audited accounts for the year ended 31st March 1964 with the Auditors' report thereon be adopted.

DEVELOPMENTS IN THE EAST



With the improving living standards in the East comes the prospect of trade expansion and of increasing opportunities for profitable marketing. The world-wide facilities of three great banking organizations, merged into a single comprehensive service, are at your disposal with up-to-date information and expert advice on all aspects of finance and trade in these areas.

EXPORTS OF ENGINEERING GOODS

SHORTAGE OF RAW MATERIALS HINDERS PRODUCTION

ALTHOUGH in terms of value the contribution of engineering goods to India's export earnings is comparatively small, it is gratifying to find that they have made some impact on the export markets round the world. Out of the country's total exports valued at Rs. 767 crores in 1963-64, engineering goods accounted for about Rs. 14 crores, as against a mere Rs. 4 crores in 1957-58. The engineering exports, incidentally, consist of capital goods like machine tools, sugar mill machinery and textile mill machinery, producer goods like electric motors, transformers, switch gears, telephones, pumps, diesel engines, structural fabrications and agricultural implements; consumer goods consisting of buckets, steel trunks, builders' hardware, aluminium utensils, domestic household appliances, lamps, hurricane lanterns, sewing machines, cycles, electric refrigerators, air-conditioners and water coolers, electric fans, A.C.S.R. conductors, X-ray electro-medical equipment and hospital equipment.

Pattern of Demand

It is noteworthy, in this connection, that a recent survey of the exports of engineering goods, carried out by the World Trade Department of the Indian Chamber of Commerce, Calcutta, gives a detailed analysis of the pattern of demand for Indian engineering goods in the markets abroad. It will be seen from Table I that the exports of almost all types of engineering goods—capital, producer and consumer—have registered a remarkable increase during the last four years. They have, in fact, made much leeway in the international markets during the first three years of the current Plan, despite competition from developed countries of the world. For instance, the value of steel tubes and fittings exports increased from Rs. 15.5 lakhs in 1960-61 to Rs. 35.2 lakhs in 1963-64, the quantity having more than doubled from about two million tonnes in 1960-61 to 4.4 million tonnes in 1963-64. Exports of cast iron pipes and fittings have gone up from 2.8 million tonnes in 1960-61 to 6.4 million tonnes in 1963-64, the value having more than doubled

Table I—*Exports of Certain Engineering Goods*
(Value in '000 rupees)

Item	1960-61		1963-64	
	Quantity	Value	Quantity	Value
Steel tubes and fittings (tonnes)	1,987	1,547	4,386	3,519
Pipes and fittings, cast iron (tonnes)	2,778	1,696	6,376	3,454
Finished structural parts of iron or steel (tonnes)	42	123	12,679	6,041
Nails, bolts, nuts, washers etc. (tonnes)	1,028	2,211	1,706	2,427
Handtools etc.	..	809	..	1,086
Household utensils of iron and steel (tonnes)	1,836	2,825	2,113	6,778
Household utensils of aluminium (tonnes)	27	223	633	4,013
Household utensils of base metals, other than iron and steel and aluminium (tonnes)	387	2,495	126	1,320
Safety razor blades (Million Nos.)	75	887	222	2,704
Hardware of metals (tonnes)	462	1,845	578	2,561
Metal containers (tonnes)	423	1,225	864	2,363
Diesel engines (No.)	1,861	2,630	4,036	5,748
Sewing machines, household ('000 nos.)	22	2,192	29	2,302
Textile machinery and accessories	..	1,813	..	4,402
Tea machinery (tonnes)	86	666	224	2,259
Electric batteries (tonnes)	273	722	712	2,265
Electric fans ('000 Nos.)	90	8,103	67	5,214
Bodies, chassis etc. for motor vehicles (tonnes)	137	720	306	3,414
Bicycles ('000 Nos.)	3	423	30	2,404
Parts of aircraft	..	4,561	..	3,547
Metal furniture and fixtures (tonnes)	489	1,203	681	1,846
Iron, steel trunks ('000 Nos.)	204	2,458	225	2,419
Gramophone records ('000 Nos.)	606	1,313	723	1,654

from Rs. 17.0 lakhs to Rs. 34.5 lakhs during the period. Exports of finished structural parts of iron and steel have increased in a big way from a mere 42 tonnes in 1960-61 to 12.7 million tonnes in 1963-64; in terms of value they have registered a sixtyfold increase from Rs. 1.2 lakh in 1960-61 to Rs. 60.43 lakhs in 1963-64. Similarly, exports of diesel engines have increased from Rs. 26.3 lakhs to Rs. 57.5 lakhs, tea machinery from Rs. 6.7 lakhs to Rs. 22.7 lakhs, and textile machinery and accessories from Rs. 18.1 lakhs to Rs. 44.0 lakhs during the said period. The increase in the exports of consumer goods like utensils, fans, blades, bicycles, etc. has also been appreciable. It will also be seen from Table I that exports of household utensils of iron and steel have increased from Rs. 18.4 lakhs in 1960-61 to Rs. 67.8 lakhs in 1963-64, utensils of aluminium from Rs. 2.2 lakhs to Rs. 40.1 lakhs and razor blades from Rs. 8.9 lakhs to Rs. 27.0 lakhs. However, the exports of sewing machines, which stood at Rs. 22 lakhs in 1960-61 and at Rs. 44 lakhs in 1962-63, fell to Rs. 24 lakhs due to a labour strike at the main exporting unit. But bicycles have shown a big increase from Rs. 4 lakhs in 1960-61 to Rs. 24 lakhs in 1963-64.

Main Markets

Markets for Indian engineering goods are widespread throughout the world. South-East Asia absorbs 41.5 per cent of these engineering goods, West Asia 22.0 per cent, Africa 17.9 per cent, West Europe 13.5 per cent, North and Central America 2.8 per cent and Australia and New Zealand 0.6 per cent. It is significant that engineering goods from this country find markets not only in the developing nations of Asia and Africa but also in the industrially advanced countries. To the latter countries, incidentally, are exported engineering items like sewing machines, cast iron pipes, manhole covers, automobile parts, machine tools, component parts of machinery and builders' hardware. Table II gives, in this connection, a countrywise break-up of engineering exports. It will be seen from this table that, during the period 1960-64, this country has nearly trebled its exports to the U.S.A. from Rs. 10.29 lakhs to Rs. 31.94 lakhs and achieved an increase of about one-and-a-half times in its exports to the U.K. from Rs. 28.8 lakhs to Rs. 42.0 lakhs. The French market has been lost to a great extent, but some advance has been made in the Netherlands and West Germany. The export of household sewing machines to these countries deserves particular mention. In 1963-64, India exported 3,485 sewing machines to the U.S.A., 3,099 to the U.K. and 4,922 to West Germany. Of course, India's sewing machines are popular in other countries too. The most important market for them is Afghanistan whose offtake in 1963-64 amounted to Rs. 4.1 lakhs. The other importers are Ceylon, accounting for Rs. 3.5 lakhs U.A.R. for Rs. 2.1 lakhs, Federation of Malaya for Rs. 1.2 lakh and Kuwait for Rs. 0.9 lakh.

East Pakistan

One of the important markets for Indian engineering goods is East Pakistan. Its offtake in 1963-64, consisting of about 150 items, was valued at about Rs. 75 lakhs. The major items are jute textile machinery (Rs. 4.4 lakhs), bobbins for jute machinery (Rs. 4.0 lakhs), refractory bricks (Rs. 1.5 lakh), cast iron pipes and fittings (Rs. 3 lakhs) and umbrella ribs (Rs. 3.3 lakhs). This part of Pakistan also imports from this country parts of machinery of sizable value in order to maintain the machinery already imported. Next in importance is Kuwait whose total imports of engineering goods from this country were to the tune of Rs. 61 lakhs in 1963-64. The other chief customers for India's engineering goods are Ceylon, accounting for Rs. 60 lakhs, Singapore Rs. 57 lakhs, South Vietnam for Rs. 55 lakhs, Iran for Rs. 48 lakhs, Aden for Rs. 45 lakhs and Kenya and the U.K. for Rs. 42 lakhs each, in that year.

This commoditywise and countrywise analysis of the exports of Indian engineering goods brings out the fact that there is vast scope for these non-traditional items of exports. It is, indeed, gratifying, in this connection, that demand continues to rise for Indian engineering goods abroad. The developing countries of West Asia and South-East Asia are now engaged in a programme of intensive industrial development and their requirements of machinery of various types, building equipment and other kinds of goods are expanding in a big way. The scope for establishing joint ventures is also stated to be bright. It will be recalled further that the findings of the Indian economic-*cum*-commercial delegation which explored the possibilities of trade between India and South America also corroborated these expectations. A member of the delegation, Mr. P. V. Mehta, particularly, emphasised this aspect, while speaking to pressmen in Bombay last month. The analysis of the Indian Chamber of Commerce, Calcutta, is also commendable in that it has brought out the scope for further expansion of engineering exports to different regions of the world.

Developed Countries

Industrially developed countries of Europe and the U.S.A. offer opportunities for further exports of Indian engineering goods. The U.S.A., for example, requires about two million dollars worth of iron and steel castings per year. Thanks to the rise in labour costs and the rapid scientific and technological developments, that country, it is said, would find it more economical to attain supplies of all types of engineering goods from the developing nations. Furthermore, the impact of inflation on the countries of West Europe has pushed up their costs of manufacture and affected their competitive capacity. This helps the developing countries to compete with them. Possibilities of marketing Indian engineering goods are also to be found in East Europe, Australia and New Zealand. But the survey of the Indian Chamber of Commerce has rightly pointed out that, only if domestic production is increased substantially, it would be possible to exploit export possibilities more fully. The production of engineering goods in India at present is valued at about Rs. 500 crores per year. About three per cent of it is exported. The engineering industry aims at exporting at least 10 per cent of its output so that it could earn Rs. 40-50 crores of foreign exchange per year for the country. The Government of India, incidentally, provides certain facilities to engineering industries to overcome the difficulties

Table II—*Exports of Engineering Goods to Principal Countries*
(Value in '000 rupees)

Country	1960-61	1963-64
United Kingdom	2,884	4,201
France	3,027	88
West Germany	170	771
Netherlands	13	109
Canada	115	148

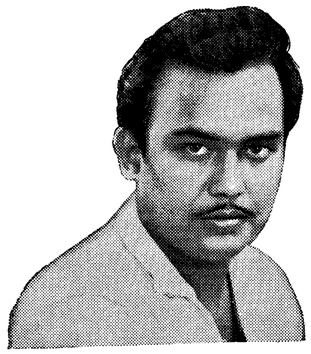
Singapore	2,935	5,731
Thailand	1,112	1,174
South Viet Nam	96	5,489

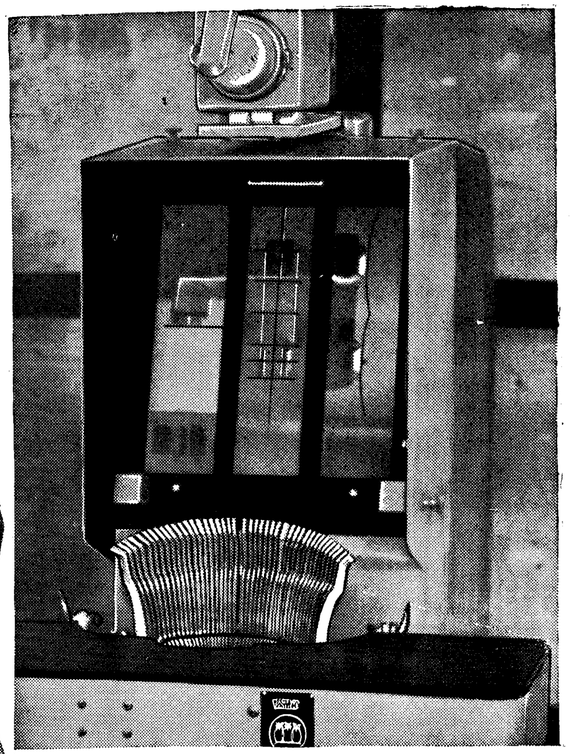
encountered in increasing their production and exports. The facilities include concessions regarding import of raw materials and equipment, replenishment of iron and steel, refund of Central Excise and Customs duty, concession of railway freight and reduction in refinance rate. But these concessions, according to the survey of the Indian Chamber of Commerce, are inadequate. The authors of the survey have the following to say in this connection:

"In spite of these facilities, however, the export of engineering goods has not been picking up as fast as it should, mainly because production is not increasing owing to serious shortage of raw materials. Production in many industries is very much below installed capacity. The availability of raw materials for engineering industries continues to be extremely difficult, particularly in respect of vital items like steel and pig iron, on account of the shortage of foreign exchange and inadequate local production. The mid-term appraisal of the third Plan issued by the Planning Commission has pointed out that against the target of 6.8 million tonnes of finished steel, the output in 1965-66 will be only about 5.8 million tonnes. The delays in the expansion of three steel plants in the public sector and in the establishment of the Bokaro steel plant are mainly responsible for this shortfall. It is stated that the targetted production of 6.8 million tonnes of steel will be available only by the third year of the fourth five-year Plan. So far as pig iron for sale is concerned, the output in 1964-65 is expected to be only 1.23 million tonnes against the target of 1.65 million tonnes and the demand for 2 million tonnes by 1965-66. The availability of alloy steels and special steels will also continue to be difficult until the middle of the fourth five-year Plan. The Engineering Association of India recently made a study of the imbalance in the supply and demand for steel materials in India between 1957-58 and 1962-63, and it observed that the total demand had not been met in any year for more than 30 per cent.

The Indian entrepreneur is also unable to undertake extensive foreign tours to explore the possibilities for marketing Indian engineering goods. The Chamber's survey, therefore, urges the Government to assist exporters by sanctioning them adequate foreign exchange to undertake business tours abroad.

"I check every type of the Typewriter on this machine





"It's the 3-Dimensional TYPE ALIGNING PROJECTOR —simultaneously projecting three images of a type on three adjacent screens. These images reflect three faces of the type (top, side and front) which must conform with pre-drawn markings on the screens. This enables me to check the projected type image for accuracy in type-soldering and bar-alignment. Faults, if any, are immediately corrected and types perfectly positioned to ensure smooth flow and light touch."

Modern precision equipment like the 3-D Type Aligning Projector and Braja Mohan Dan who works on it, are just one team of the multitude of men and machines at the Remington Rand typewriter plant. They are all engaged in a constant endeavour to improve the quality of each tool, die and part that goes into the making of your Remington typewriter.

Over the years people in India have come to expect the standards set by REMINGTON—the highly responsive touch, light positive shift, smooth carriage action, and superior styling and finish—which make them so essential to distinctive correspondence.

F.A.C.T. CURSED WITH POWER CUT

OPERATIONS, HOWEVER, YIELD A NET PROFIT

THE Fertilisers and Chemicals, Travancore Ltd., F.A.C.T. for short, seems cursed with power cut. The year ended 31st March 1964, too, has not been free from this adverse factor, as there was a drastic cut in power supply for three months resulting in a loss of production worth Rs. 1 crore in sales value. Even the success of the expansion plan, the third stage of which is well under way and is expected to be completed in 1965-66, precariously hinges on the availability of power. The Company's Chairman, Mr. T. A. Joseph, told the shareholders at their annual general meeting at Alwaye on 29th September last that, "even with all the hydro-electric projects coming into operation, we will continue to be at the mercy of nature unless adequate insurance against its vagaries is provided in the shape of a reasonably large thermal power station." There is a distant ray of hope, however, in that, after four years of consideration, the Government of Kerala has accepted the Company's suggestion to have a minimum 100,000 kw. thermal power station put up at Cochin. Ironically enough, the Company has represented to the Union and State Governments against the Iddiki project, designed to generate 800 to 1,000 MW of power. But its objection stems from a possible severe shortage of water in the Periyar river, as the project is based on the waters that flow into the Periyar now. The authorities are said to be considering some other alternatives.

The total loss in the sale value of production on account of power cut has amounted to over Rs. 250 lakhs during the year and, consequently, the results have not been as good as expected. All the same, because of some improvement in certain items of production, sales have increased from Rs. 479.92 lakhs to Rs. 530.48 lakhs, with the stock of finished products at close rising from Rs. 50.28 lakhs to Rs. 82.10 lakhs. Gross profit, which had dropped by more than two-thirds from Rs. 99.20 lakhs to Rs. 30.72 lakhs in the previous year, has recovered to Rs. 72.35 lakhs during the year under review. Thanks to this recovery, the Company has been able to close the year with a net profit of Rs. 16.01 lakhs, as against a debit balance of Rs. 33.16 lakhs in the previous year. With the Rs. 3.85 lakhs brought in, the surplus for distribution has increased to Rs. 19.86 lakhs, all of which has been carried to reserves and provisions, while the dividend has been passed over for the second year in succession.

The following table compares the Company's progress in the past four years:

(In lakhs of rupees)

	For the year ended 31st March 1964	15 months ended 31st March 1963	For the year ended 31st December 1961	1960
Sale of products	530.48	479.92	411.49	308.83
Other income	19.23	14.66	12.89	11.07

To reserves	16.86		27.75	23.55
Ordinary dividend			20.76 (6%)	20.76 (6%)
Carry forward		3.85	33.01	26.15
Equity shares' market value (In rupees):	1964	1963	1962	1961
High	6.10	7.55	8.40	11.35
Low	5.00	6.00	6.85	8.50

Provided sufficient power is available and there is no scarcity of water, the prospects are bright. Though the third stage of the expansion programme is scheduled to be completed in 1965-66, it is expected that most of the plants will be ready for commissioning by the end of the current year. A formal agreement has been drawn up between the Company and Messrs. Davy and United Engineering Company of the U.K., one of the units of the Davy-Ashmore Group, for establishing a fabrication shop. Another Davy-Ashmore unit, the Power-Gas Corporation, has consented to collaborate in the setting up of an engineering and contracting organisation. The Company has been advised by the Government on the location of two of the three more major fertiliser plants which it is expected to plan, design and construct during the fourth Plan period. Of direct consequence to the economics of production is the increase in sales tax on raw naphtha, used as a raw material for manufacturing fertilisers, from 3 per cent to 15 per cent by terming it as a petroleum product.

The Company's paid-up capital of Rs. 695.98 lakhs, all in 10-rupee equity shares, is backed by reserves and surplus amounting to Rs. 78.33 lakhs. Borrowings make a pretty high figure of Rs. 10.12 crores, but, out of this, only Rs. 1.99 crore are of a short-term nature, while Rs. 2.60 crores are from the I.F.C.I. and Rs. 5.63 crores are due to the Central and State Governments. The short-term loans, current liabilities and provisions make a total of Rs. 388.66 lakhs, as against which current assets, book debts and investments aggregate Rs. 584.87 lakhs. The gross block of Rs. 9.59 crores (Rs. 10.45 crores a year before) has been written down to a net value of Rs. 5.97 crores. Development projects are shown separately at Rs. 7.93 crores.

MYSORE TOBACCO CO., LTD.

Although the sales of the Mysore Tobacco Company, Ltd. (Chairman: Mr. I. P. Mallappa, Bangalore) during the year ended 31st March 1964 have touched a record level of Rs. 49.85 lakhs, representing an increase of Rs. 10.25 lakhs over the previous year, the gross profit shows a decline of Rs. 1.31 lakh to Rs. 4.47 lakhs. The decline in profit has been due to an increase of Rs. 11.21 lakhs in raw materials purchased and consumed during the year and rise of Rs. 4.30 lakhs to Rs. 19.08 lakhs in expenses of operation and administration. Consequently, the profit-margin (that is, the ratio of gross profits to total sales) has gone down from 14.6 per cent in 1962-63 to 8.9 per cent in 1963-64. After providing Rs. 1.08 lakh (Rs. 84,000 in the previous year) for depreciation and Rs. 1.76 lakh (Rs. 2.42 lakhs for taxation, the net profit comes to Rs. 1.63 lakh, as against Rs. 2.78 lakhs for the previous year. In spite of the lower net profit, the Directors have raised the rate of ordinary dividend to 11 per cent for the year under review from 10 per cent distributed in 1962-63. They have set apart only Rs. 40,000 to reserves while in the previous year the allocation was Rs. 2.59 lakhs (including Rs. 1 lakh for dividend reserve). The dividend absorption comes to Rs. 1.10 lakh, as against the Rs. one lakh paid out of the dividend reserve in the previous year. A sum of Rs. 14,104 has been carried forward, as against the Rs. 1,401 brought in.

The Company gathered during the year under review 8,966,884 kgs. of green leaf from a planted area of 4,609 acres, as against 6,844,477 kgs. obtained from 3,970 acres in the preceding year. Cured leaf acquired was 706,491 kgs. (354,579 kgs. in 1962-63). Exports of the Company's tobacco aggregated 152,264 kgs. the value realised being Rs. 3.16 lakhs. The quantity exported and value realised in the previous year were 161,870 kgs. and Rs. 2.54 lakhs, respectively.

Since there are many limitations to increase the cured leaf from the existing barns of the Company, the Directors are exploring the possibilities of encouraging the plantings of other varieties of tobacco which do not require barns. The progress made in this direction is said to be encouraging. The Directors hope to take advantage of this situation and have already taken necessary steps to impart the technical knowledge to the cultivators in new areas like Harihar, Davangere and T. Narsipur.

The paid-up capital of the Company as at 31st March 1964 is unchanged at Rs. 10 lakhs, all in equity shares of Rs. 10 each. This is supplemented by reserves and surplus amounting to Rs. 5.59 lakhs. The gross block, which has expanded during the year from Rs. 22.77 lakhs to Rs. 25.01 lakhs, has been written down to Rs. 10.64 lakhs. Including bank loans of Rs. 5.32 lakhs and current liabilities and provisions of Rs. 7.76 lakhs, the total indebtedness of the Company Works out to Rs. 13.08 lakhs, as against which current assets, book debts and investments aggregate Rs. 18.03 lakhs.

The Rs. 10 fully paid equity shares of the Company are currently quoted at Rs. 11.90 *cum-div.* On *ex-div.* basis, they give a net yield of 7.4 per cent per annum.

SYNDICATE BANK LTD.

The assets and liabilities of the Kotagiri Bank Ltd., Kotagiri (Nilgiri District) have been taken over by the Syndicate Bank Ltd. with effect from 7th October 1964. This is the seventeenth bank that has merged with the Syndicate Bank Ltd. With this merger, the Syndicate Bank Ltd. has added one more branch to its list in Madras State at Kotagiri (Nilgiri District), raising the total number of branches in that State to 20. The Syndicate Bank Ltd. has also opened a new branch at Basava Kalyan in Bidar District. This place was hitherto an unbanked area. Including this branch, the Syndicate Bank has now a total of 194 branches.

KHATAU MILL SELLS AND EARNS LESS

BUT DIVIDEND MAINTAINED

BOTH sales and gross profit of the Khatau Makanji Spinning and Weaving Company Ltd. (Managing Agents: Messrs. Khatau Makanji and Company (Private) Ltd., Bombay) have recorded a setback during the year ended 30th June 1964. The decline in sales realisation is rather steep, exceeding Rs. 100 lakhs, from Rs. 648.50 lakhs to Rs. 542.89 lakhs, in contrast to an improvement of more than Rs. 65 lakhs from Rs. 583.31 lakhs to Rs. 648.50 lakhs in 1962-63. Gross profit, up by Rs. 19.71 lakhs in the previous year, has dropped by Rs. 2.28 lakhs to Rs. 91.45 lakhs during the year under review. Compared to sales, profit has recorded a limited decline, because of an all-round reduction in costs.

Net profit, on the other hand, has recovered to Rs. 29.34 lakhs from Rs. 20.89 lakhs to which level it had receded in the previous year from Rs. 27.49 lakhs in 1961-62. This recovery has been caused essentially by a considerably lower tax provision of Rs. 24.60 lakhs, as against Rs. 45.95 lakhs, due to (i) the lower gross profit, (ii) a substantial increase in the depreciation provision from Rs. 19.51 lakhs to Rs. 31.59 lakhs and (iii) a larger transfer of Rs. 4.42 lakhs to development rebate reserve (as against Rs. 2.84 lakhs in the previous year). The entire increase in net profit has gone to boost reserves by Rs. 18.29 lakhs, as against by Rs. 9.84 lakhs, while the dividend on the 100-rupee ordinary shares has been maintained at 8 per cent per annum to which level it was reduced in the previous year from 16 per cent for 1961-62.

(In lakhs of rupees)

	For the year ended 30th June			
	1964	1963	1962	1961

X.R.

In order to carry out essential and urgent repairs to the building housing the spinning department, 15,000 spindles had to be stopped for three months during the year. The Company would be installing 8,898 additional spindles, bringing the total to 127,539, under the Government's permission to mills to increase their spindleage by 7.5 per cent and loomage by 10 per cent. New machinery of the value of Rs. 26.18 lakhs was received during the year. This leaves pending orders for about Rs. 117 lakhs of machinery to be received over a period of years for replacement and renovation.

It is proposed to acquire the entire share capital of Messrs. Fashion Prints (P) Ltd. at par so as to make it a subsidiary of the Company. This Company is engaged mainly in processing activities similar to those of the Khatau Mill and the Board feels that its acquisition will be to the latter's advantage.

Out of a paid-up share capital of Rs. 149.64 lakhs, Rs. 29.92 lakhs are in 4 per cent, tax-free, cumulative preference shares of Rs. 100 each and the rest is in 100-rupee equity shares. Reserves and surplus, excluding Rs. 11.13 lakhs from the general reserve required for the year's dividend liability, amount to Rs. 72.54 lakhs. Borrowings of Rs. 196.93 lakhs and current liabilities and provisions, including the year's dividend liability, amounting to Rs. 166.92 lakhs, bring the total indebtedness to outsiders to Rs. 363.85 lakhs, as against which current assets, book debts and investments aggregate Rs. 431.20 lakhs. The gross block of Rs. 506.53 lakhs (Rs. 458.82 lakhs a year before) has been written down to a net value of Rs. 154.84 lakhs.

Currently quoted at Rs. 176.00 *cum-div.*, the Rs. 100 fully paid ordinary shares of the Company offer a net yield of 3.2 per cent per annum.

ILLEGAL LABOUR STRIKE AFFECTS JAY ENGINEERING'S RESULTS

PROFIT FALLS—DIVIDEND CUT AGAIN

AN illegal strike causing cessation of production for 87 working days, or about 30 per cent of the total available working time during the year ended 31st March 1964, has most unfortunately cried a temporary halt to the steady upward trend in the sales of the Jay Engineering Works Ltd. (Managing Agents: Messrs. Madan Mohan Lall Shri Ram, Delhi-6), with a further decline in gross profit. The turnover has slipped back from Rs. 13.44 crores to Rs. 10.42 crores and, although other income has more than doubled, the gross profit has declined by Rs. 21.10 lakhs to Rs. 56.12 lakhs. Fortunately, the profit-margin (ratio of gross profit to sale proceeds), which has never been too high, has decreased only marginally from 5.8 per cent to 5.4 per cent. This is probably because the loss due to strike, as the Directors point out, has been in terms of direct loss of profits and in fixed cost during the strike period. This will be apparent from the fact other expenses, which are mostly of a fixed nature, have declined by about 25 per cent from Rs. 460.07 lakhs to Rs. 322.31 lakhs.

The decrease in profit has naturally resulted in lower provisions for the Managing Agents' remuneration and taxation: Rs. 1.68 lakh and Rs. 8.60 lakhs, respectively, as against Rs. 3.46 lakhs and Rs. 15.20 lakhs. Although the provision for depreciation is raised only from Rs. 32.51 lakhs to Rs. 35.20 lakhs, the resulting net profit is markedly lower at Rs. 10.64 lakhs, as against Rs. 26.05 lakhs. Out of this, a sum of Rs. 3.00 lakhs, as against Rs. 5.90 lakhs, has been credited to the statutory development rebate reserve and a further amount of Rs. 5.00 lakhs has been set aside as before for the payment of preference dividend in respect of the year. Since the decline in profits has been due to abnormal occurrence, the Directors have thought it fit to draw upon the Company's reserves to pay a dividend. Accordingly Rs. 9.50 lakhs have been withdrawn from reserves and a dividend of eight per cent. as against 10 per cent has been proposed.

The working results of the Company for the past four years are presented synoptically in the following comparative table.

(In lakhs of rupees)

	For the year ended 31st March			
	1964	1963	1962	1961
Sale proceeds	1041.62	1344.40	1165.55	1085.90

In his statement to shareholders (*vide* page 600 of *Commerce* dated 3rd October 1964) the Chairman, Lala Charat Ram, observes that the strike has affected not only the Company's profits but also the country's export earnings. Besides, it has caused enormous loss running into crores of rupees to the workmen in terms of loss of wages, bonus, etc., and the Government has lost larger amount of excise duty—the duty paid during the year has dropped from Rs. 63.71 lakhs to Rs. 48.81 lakhs—and other direct and indirect taxes. The loss to the community has been the shortage of much needed supplies. The strike, however, has not won any rewards for the workmen. The demands have been reviewed by the West Bengal Government and some of them have been referred to adjudication. The same position, therefore, obtains after the strike so far as workers are concerned. On the other hand, the tempo of production achieved over many years has been broken and production-based earnings of workmen have been maintaining a low level. Fortunately the situation is showing unmistakable sign of improvement.

There has been no change in the Company's paid-up share capital which currently stands at Rs. 201.88 lakhs, comprising Rs. 50 lakhs in preference shares of Rs. 100 each and Rs. 151.88 lakhs in ordinary shares of Rs. 10 each both fully paid. The reserves, however, stand lower at Rs. 130.66 lakhs, as against Rs. 137.17 lakhs a year ago. The outside interest also shows a marked decline from Rs. 824.45 lakhs to Rs. 626.26 lakhs in the aggregate. This is because borrowings have decreased by Rs. 122.30 lakhs to Rs. 424.46 lakhs, while current liabilities and provisions are lower at Rs. 201.80 lakhs and Rs. 277.69 lakhs, respectively. With the inclusion of new assets worth Rs. 28.59 lakhs during the year, the block account now stands at Rs. 541.30 lakhs and has been written down to Rs. 277.46 lakhs through the depreciation account. There is only a nominal change in the book value of investments from Rs. 5.13 lakhs to Rs. 5.18 lakhs, but current assets and loans and advances have decreased sizably from Rs. 872.83 lakhs to Rs. 676.16 lakhs.

The Rs. 10 paid ordinary shares of the Company are currently quoted at Rs. 18.25 *ex-div.* The net return on fresh investment works out to 3.5 per cent per annum.

FERTILISER CORPORATION OF INDIA

The operating results of the Fertiliser Corporation of India for the year ended 31st March 1964 are satisfactory. Thanks to the retrospective revision of retention prices of fertilisers and record production of the Nangal Unit, the Corporation has earned a gross profit of Rs. 9.29 crores. After providing Rs. 4.95 crores for depreciation and paying Rs. 63.71 lakhs as interest on Central Government loans, the net profit comes to Rs. 3.70 crores, an increase of Rs. 2.25 crores over that for the previous year. The whole of the net profit, together with the Rs. 15.31 lakhs brought in from the previous year, has been transferred to reserves for financing the capital outlay on the Corporation's projects under construction.

The internal resources of the Corporation, arising from the revenue surpluses of its production units and the sum allocated for depreciation reserve during the year, amounts to Rs. 8.74 crores, bringing the total up to 31st March 1964 to Rs. 47.97 crores.

The Corporation's two operating units at Sindri and Nangal together produced 746,596 metric tonnes of fertilisers in 1963-64 as against 688,791 metric tonnes in 1962-63. Production of calcium ammonium nitrate amounted to 374,162 tonnes, which exceeded the target of 370,000 tonnes; it was equivalent to over 97 per cent of the rated capacity. The production of ammonium sulphate from the Sindri unit was 307,107 tonnes. The production of double salt and urea was 47,211 tonnes and 18,116 tonnes, respectively.

The implementation of the projects under construction is said to be progressing well. The Trombay fertiliser project will be the third and the next operating unit to be commissioned. The estimated cost of the project is put at Rs. 33.50 crores. As much as 90,000 tonnes of nitrogen and 45,000 tonnes of phosphate per year in the form of urea and nitrophosphate will be produced. The trial run of the ammonia plant is expected to commence in November 1964 and that of the nitrophosphate plant in February 1965. Meanwhile, the Corporation has decided to enlarge the scope of the Trombay project and will set up a 100-tonne-per-day methanol plant which is estimated to cost Rs. 4 crores. The methanol plant is likely to be commissioned in October next year. The estimated cost of the Namrup project is about Rs. 18 crores. This project is designed to produce 45,000 tonnes of nitrogen in the form of 55,000 tonnes of urea and 100,000 tonnes of ammonium sulphate. It will be commissioned by the end of 1966 or early in 1967. The Gorakhpur plant estimated to cost Rs. 26 crores is expected to go into production early in 1967 and envisages the production of 80,000 tonnes of nitrogen per year in the form of urea. The Korba plant in Madhya Pradesh will be based on gasification of local coals in the immediate vicinity of the project and will be designed to produce 100,000 tonnes of nitrogen in the form of urea. The total capital outlay on this project will be about Rs. 31 crores. The Corporation has recently been asked by the Government of India to take up the work of one more fertiliser project at Durgapur in West Bengal.

share in nation's growing industrial prosperity

When you buy Units of the Unit Trust of India, you acquire an interest in various types of securities of over 150 industrial enterprises, that is, in the entire portfolio of investments of the Trust. The aim of the Trust is to spread out the investments to minimise risk.

Also Units give a steady income. The dividend to Unit holders will be based on the average income of a well-balanced portfolio consisting of Government securities, industrial debentures, preference shares and equities.

Other Important Advantages

Liquidity of Investment

Investment in Units is liquid because the Unit Trust is ready to sell and buy back its Units at prices determined and announced by it every day. Unit holders can also borrow against Units from banks.

Tax Concessions

The income earned by the Trust is exempt from taxes and income upto Rs. 1,000/- distributed by the Trust to individual Unit holders is excluded in computing their total income for purposes of income-tax.

Each Unit is of the face value of Rs. 10. You can buy ten or a multiple of ten Units. Units are sold at prices determined daily by the Trust on the basis of the current value of its investments and other elements as provided in Clause 8 of the Unit Scheme, 1964. Units can be sold back to the Trust from November 15, 1964 at prices announced daily. A Unit holder can always transfer Units in favour of a bank for purposes of borrowing.

Application forms and details of the Unit Scheme, 1964 are available at any branch of the leading scheduled banks throughout the country. In case of any difficulty, call at or write to the Unit Trust of India direct.

Unit Trust of India

Amar Building, Pherozeshah Mehta Road, Bombay-1.

SYNOPSES OF COMPANY REPORTS

Tata Hydro-Electric Power Supply Co., Ltd.

(*Managing Agents*: Tata Hydro-Electric Agencies Ltd., Bombay.)

Fifty-fifth Annual General Meeting—28th October 1964.

Working Results:

	For the year ended 31st March (In thousand rupees)	
	1964	1963
Revenue from power supply	3,46,18	2,30,89
Other income	12,57	11,94
Gross profit	1,46,20	83,30
To Managing Agents' remuneration	8,96	5,55
Transfer to depreciation	24,93	18,54

Low	108.00	100.00

§ Final dividends—payment out of the dividend reserve.
* Includes Bonus of Re. 1.00 per share or 1 per cent.
† High and Low upto 30th September 1964.

Extracts from the Directors' report: *Operation*: The table below gives particulars of generation, purchase and sales for the year under report and for the four previous years:—

	(In million K.W.H.) Generation		Total Purchase	
Year	*Hydro*	*Thermal*	*Koyna*	*Total sales*
1959-60	1418	720	57*	1939
1960-61	1344	1028	65*	2161
1961-62	1510	1157	52*	2448
1962-63	1370	1035	563	2743
1963-64	1369	851	1198	3210

* Figures relate to Railways.

Of the 1198 million units purchased from Koyna this year, 123.7 million units were sold to the Railways against 23 million units last year. Total sales, excluding supplies to Railways, represent an increase of 13 per cent over the previous year.

Tariffs: The Tata Electric Companies' Tariffs to consumers were revised during the year with effect from 1st May 1963. The revision became necessary because of the change in the Bank Rate from 4 to 4½ per cent (in January 1963), the levy of sales-tax by the Maharashtra Government and a substantial increase in energy purchased from Koyna at a price higher than the incremental cost of production at the Companies' thermal Station. In terms of the Trombay License, the Companies are required to purchase Koyna hydro energy in preference to their thermal generation. The tariffs were also rationalised and simplified; only three categories of tariffs now cover all our sales against the previous seven classes.

Fourth Thermal Unit: On the Project for the installation of a fourth 125 MW. thermal unit, civil works like foundations, turbogenerator pedestal, boiler mat, chimney etc. have been completed. Main equipment received is being installed. The unit is expected to be commissioned by about June 1965.

Accounts in brief as at 31st March 1964 are as under:—

Extracts from the Directors' report: *Receiving Stations*: The new 60 MVA transformers are under erection at a Receiving Station. One 25 MVA Condenser and new 22 KV switchgear in replacement of old equipment of inadequate capacity are on order.

Plans have been made to augment at Receiving Stations their transformer capacity to meet the growing demand; the necessary equipment has been ordered.

A new Receiving Station is under construction and two more have been planned, for which orders for the necessary transformers have been placed.

Transmission: For meeting the increased load requirements, the transmission capacity has been raised on various sectors by the installation of new double circuit 22 KV lines.

Accounts in brief as at 31st March 1964 are as under:—

Low	1,030.00	973.75

§ Final dividends—payment out of the dividend reserve.
* Includes bonus of Rs. 10 per share or 1 per cent.
† High and low upto 30th September 1964.

Extracts from the Directors' report: *Generating Stations*: Installation of a 7.5 MVA. transformer at the Tata Hydro Company's Power House for supply into 6.6 KV. distribution system was completed. 22 KV. distribution network to meet the rapid industrial load growth in the area is planned; orders for two 30 MVA. 22 KV. transformers will be placed shortly. 22 KV. switchgears are on order. Design for modernisation of the control and excitation system has been completed and orders for the equipment have been placed.

Orders for new excitation system to replace the old exciters at the Andhra Valley Company's Power House have been placed.

At the Tata Power Company's Power House, the under-rated 110 KV. indoor type circuit breakers controlling the power transformers were replaced by outdoor type circuit breakers of higher rupturing capacity.

Khopoli-Poona Lines and Receiving Station: With the acquisition of the Poona Electric Supply Company's undertaking, the State Electricity Board took over the business of distribution of power in Poona City and of supplying power in bulk to industries etc. in the surrounding areas. Consequently, after negotiations with the State Government, it has been decided to hand over the lines and the Receiving Station equipment to the MSEB at a mutually acceptable price of Rs. 41 lakhs. The Poona area will now be eliminated from the Companies' Licenses.

Accounts in brief as at 31st March 1964 are as under:—

Oriental Power Cables Ltd.

(*Chairman*: Mr. Karamshi J. Somalya, Bombay.)

Registered Office and Works: P. O. Cablenagar, Stn. Alnia, Dist. Kota (Rajasthan).

Third Annual General Meeting—31st October 1964.

Extracts from the Directors' report for the year ended 31st May 1964:

After transferring the amount of Rs. 13,01,277 to Expenditure during construction account and after making the provision for taxation of Rs. 22,000 the Company has incurred a loss of Rs. 59,650. This, together with the loss of Rs. 32,185 brought forward from the previous year, results in a total loss of Rs. 91,835, which is carried forward to the next year.

Progress: The construction of the factory buildings and erection of plant and machineries both imported as well as indigenous were completed in the month of May, 1964 except the erection of Medium Type Laying-up machine, which was erected in the month of July, 1964 because the special type of wagon for transportation of this machine from Bombay docks to the Company's Factory, was not readily available.

The Company has commenced the trial runs under the guidance and supervision of the Japanese technicians deputed by the collaborators. Training to the employees was also imparted side by side. The cables of various sizes manufactured by the Company during trial are found satisfactory. With the modern machines and with the help of the technical know-how of Messrs. Sumitomo Electric Industries Limited, Japan the Company manufacture *Paper Insulated Power Cables* mass impregnated non-draining (or, with normal compound), *Lead or Lead Alloy Sheathed Steel tape or Steel wire* armoured of all sizes and types both for industry and mines. The Company's laboratory is equipped with specialised equipments for the testing of raw materials and finished products. This plant will be the first to manufacture *Paper Insulated Power Cables over* 11 KV in India and can offer 22 KV and 33 KV screened or S.L. Type cables.

The Company has obtained from the Government of India Letter of Intent for increasing the present production capacity of *Paper Insulated Power Cables* from 960 Km. to 1,600 Km. per year. It has also obtained the Letter of Intent from the Government of India for the manufacture of *PVC Cables* of 640 Km. per year.

Accounts in brief as at 31st May 1964 are as under:—

Market value of equity shares (in rupees):	1964‡	1963
High	21.00	26.12
Low	19.25	17.00

* Net profit subject to provision for taxation, estimated at Rs. 33 lakhs.
† Dividends—payable from general reserve.
‡ High and low upto 18th September 1964.

Extracts from the Directors' report: No specific provision has been made for taxation which will be appropriated from the contingencies reserve when the liability is determined.

A total of 52 *Broad Looms* have so far been installed and are working satisfactorily. Demand for *Carpet Backing Cloth* in U.S.A. has slackened and there has been a steep fall in prices. Of late there has been some revival of demand.

Prospects for the current year are not promising. Prices of raw jute have increased disproportionately and trading results have been adversely affected. Production costs have risen due to increase in the cost of power, stores, materials and wages.

Construction of factory buildings and staff quarters for the Company's Caustic Soda Project at Amlai is proceeding in full swing and barring unforeseen circumstances they are expected to be ready before the year is out. Shipments of machineries have started arriving at site and erection work is being taken in hand. The plant is expected to be commissioned during early 1965.

Accounts in brief as at 31st March 1964 are as under:—

TRACTORS AND BULLDOZERS LIMITED

EXPANSION OF CAPACITY—MULTI-SHIFT WORKING

CHAIRMAN, MR. PASHABHAI PATEL'S SPEECH

THE following is the text of the speech delivered by Mr. Pashabhai Patel, Chairman, at the Eighteenth Annual General Meeting of the Company held at Baroda on 30th September 1964:

GENTLEMEN,

We are meeting under the shadow of a great tragedy and equally grave crisis. Our beloved leader, Pandit Jawaharlal Nehru, is with us no more. And our tears mingle with a frightening sense of crisis at the threat of famine and food shortage which is facing us today.

While mourning our loss, I cannot help recalling a day in September 1947 when Panditji paid a visit to our factory and breaking a coconut on the first tractor built by us, which was also the first tractor to be built, in India, said "I am proud to associate my name with this new and important industry of our country."

We manufactured six tractors almost overnight and began to dream dreams. Unfortunately, due to the many controls, restrictions and other bottlenecks which were beyond our power to clear, the project went into cold storage.

This year is noteworthy for another important event. A few days back the citizens of this town celebrated the birth centenary of Mr. Khaserao Jadhav, who, I might say, was the originator of the power farming idea in India. Mr. Khaserao Jadhav, who spent his life dreaming of improvements in Indian agriculture, brought from Germany two tractors way back in 1920. These were the first tractors to come to India and Mr. Khaserao Jadhav spent many hours, days and months dreaming of revolutionising Indian agriculture by introducing power farming in this country.

His story was very convincing. Agriculture in India was carried out with the help of animal power. Farming was a strictly seasonal operation. The total rainfall of the year comes in three months and after the crop is ripe and cut, when the land should be ploughed up, the soil is already hard like cement. Ploughing this land in April and May would put new fertility into the soil but this was not possible with animal power. The farmer had to wait until the coming of the first rains in June and July, when he would have to hurry up, plough the land and plant his crop almost overnight.

Importance of Tractor

The tractor could plough the land easily after the harvest and before the rains, in the dry summer months. These two tractors which Mr. Jadhav brought from Germany were the first tractors to come to India. Mr. Khaserao Jadhav and I spent many months experimenting with them on the Model Farm at Baroda.

From this beginning your Company has developed into its present complex completing the full circle. Starting with that early beginning in Baroda, we imported and introduced many makes of tractors into all parts of India and with the coming of Indian freedom, the demand for tractors rose into high brackets. Later on, under the leadership of our dear departed Prime Minister the Government decided to encourage the manufacture of these tractors in India and your Company is today justly proud of being in the forefront of this industry.

Our business of importing, selling and servicing tractors, ploughs, bulldozers and other farming and earthmoving machinery went on growing and we went on taking an increasing part in India's developing economy so far as cultivation of land was concerned. The Central Tractor Organisation and the various reclamation, irrigation and construction projects were all glad to receive our co-operation in an increasing degree as they went along and we can take pride in having been able to play a not unimportant part in the development of our country.

Foreign Collaboration

In June 1960, we negotiated a collaboration agreement with Motokov, the Foreign Trade Corporation of Czechoslovakia for the manufacture of their 50 horse power ZETOR Diesel Tractors which had already proved very popular in Indian agriculture. On filing this collaboration agreement with the Government of India, we were given a licence to manufacture 1,000 of these tractors per year at Baroda. Government also made available to us all the connected licences for the import of components, raw materials, machine tools, etc. Our progress between June 1960 and today is something which we can look back upon with satisfaction. In the short span of four years, we obtained 48 acres of very centrally situated land near the city of Baroda and constructed a very modern and up-to-date factory covering approximately 2,50,000 sq. ft. of floor space, and obtained many pieces of the latest production machinery and started manufacturing tractors with the help of a team of Czechoslovak experts obtained from Motokov's factory. The choice of location was very fortunate indeed. In the developing economy of Baroda, this land which is bounded on one side by the main railway line from Bombay to Ahmedabad and Delhi and by the Bombay-Ahmedabad highway on the other side, has appreciated in value so rapidly that today its price can be safely assessed at more than 20 times, what we paid for it. Land for which we paid less than two lakhs of rupees in 1961 is valued at more than forty-five lakhs of rupees today. The land was filled, levelled and factory buildings were erected and production started without any loss of time.

Actually production of the tractors started in February 1963. Between then and today we have already manufactured more than 700 tractors. So satisfactory was our progress considered by the Government of India, that they increased our licensed capacity from 1,000 to 2,000 units per year, permitting us to manufacture 1,000 50-H.P. and 1,000 30-H.P. tractors on a single-shift basis. They have now informed us that we can raise the production to 2,000 50-H.P. and 2,000 30-H.P. tractors per year working on multi-shift basis.

Imports

Recently, when it was decided that the country required more tractors and the other licensed units were not coming up satisfactorily and in time, Government sanctioned the import of 2,000 complete tractors. A licence for 882 CKD units has already been received by us and another licence for 1,118 CKD packs is on the way. In other words, over and above what we produce in our factory this year, we are able to import 2,000 complete tractors, which will be assembled in our factory and delivered to the farmers of India before 31st of March 1965.

The Czech collaborators are sending an additional team of engineers to supervise this operation and it is expected that 2,000 tractors will be assembled by the end of our financial year on 31st March 1965. This should prove a very satisfactory and profitable operation by itself, independently of our other manufacturing programmes.

Before we received our industrial licence in 1960, three other firms were already licensed between 1952 and 1960 to manufacture tractors. Judging from the size of factories constructed, capital equipment installed and production and sales achieved, we have reason to be happy with our progress in the short span of four years.

In other words, ladies and gentlemen, if I say that we have acquired the first place in this industry and business in the short span of four years, it is merely a submission of fact and no boast.

Bombay Unit

In the same relation, I would like to say that with construction of a very large and up-to-date manufacturing unit, we set up in Baroda, we decided to part with our Bombay Unit, which our friends Larsen & Toubro Ltd., took over and are going to continue a very important activity of manufacturing track parts for track type tractors. We understand that Larsen & Toubro Ltd., have converted it into a joint venture with the great Caterpillar Tractor Company of America and your Company continues to act as consultants to this new venture for which we are under contract to receive an annual fee of Rs. 2,00,000.00 for the next eight years.

And appropriately with all these new developments, the banking and financial arrangements are now in the good hands of the State Bank of India who have agreed to go along with us in our hopes and ambitions to a great length.

While saying all this, I should be open to the charge of ingratitude if I did not mention here very particularly the part played by Motokov and its Chief Executives who have helped us all down the line by giving us technical assistance in kind and quantity required by us and other assistance in a very very generous measure. They have not hesitated to help us by large and long-standing credits and many other forms of assistance too numerous to mention here. As you know, we are enjoying credit facilities from Motokov, which are considered very good in the present day of foreign business.

Here again, I should not fail to mention the good help generously given to us by the Hongkong and Shanghai Banking Corporation during the last 15 years during which time we created an all-time record of importing and supplying heavy agricultural and earthmoving machinery for all the development projects of our Government and our country. We could not have carried it out but for the long hand of assistance extended to us by this Corporation.

About the part played by our Government in Delhi in our development, I would like to particularly mention here that in a country where it was considered ridiculous to think of manufacturing anything at all if we are meeting here today and talking about the manufacture of a highly developed piece of equipment like the Diesel Tractor, this would have been impossible without the generous part played by the Directorate General of Technical Development and the Department of Heavy Engineering in the Ministry of Industry and Supply and by the encouragement which this industry receives from the Ministry of Agriculture.

Future

And now ladies and gentlemen, to come to the future in front of us. With all these breath-taking developments, it has become necessary to have increasingly large amounts of money invested in the project. Your Directors have already obtained the consent of the Government of India to go into the market for an additional capital of Rs. 50 lakhs. This is the principal reason why your Company has now been converted into a public company from a private concern. I am sure, some of you must be wondering why this operation which has been growing so profitably all along is now being offered to the public. The reason is simple. With the developing project, increasing demands are imposed upon the finances of the firm and a point has been reached where it became absolutely necessary that if we want to take full advantage of the situation, we must have additional capital and appropriately with this your Company has thought fit to invite outside talent also on the Board of Directors and we have been rather fortunate in being able to secure the services of eminent leaders of business and industry on our Board. With our present set-up both in the way of prospective future and the kind of Board we have, investment in our Company should be safe and attractive for anybody who is looking for a good and reasonably sure return on his investment.

Before concluding, I wish to acknowledge the sincere, diligent and hard work put in by the officers and other members of the Company which has largely contributed to such outstanding results of the year in spite of the many difficulties. I must also record here the very sincere efforts of the Czechoslovak technicians in assisting us in organising this new industry on the sound footing right from the beginning and sparing no pains in training our young Indian engineers in the modern methods of production.

NOTE: *This does not purport to be a record of the proceedings of the Annual General Meeting.*

AID FROM SWEDEN

An agreement covering financial development co-operation between Sweden and India was signed at Stockholm last week. The agreement envisages Swedish assistance amounting to Rs. 3.2 crores (36 million Swedish *Kronor*). Of this amount, Rs. 1.08 crore (12 million *Kronor*) will be extended as grants in kind and Rs. 2.16 crores (24 million *Kronor*) as development credit. The purposes for which grants will be made include purchase of 8,000 tons of text book paper for primary education in India, deliveries of forestry tools in connection with a U.N. project for the training of logging instructors at different sites in India and an economic and technical study of the grain storage problems in certain Indian States. The development credit of Rs. 2.16 crores (24 million *Kronor*) has been extended on favourable terms, the period of amortisation is twenty years, the first five years being a grace period, and the rate of interest is 2 per cent. Half the amount will be utilised for import of equipment for fifteen dairies, the balance to be used for purchases of electric switchgear and control equipment, transformers etc. for seven electric power schemes and various other Indo-Swedish joint ventures.

Notices

INDUSTRIAL DEVELOPMENT BANK OF INDIA

APPLICATIONS ARE INVITED FOR THE following posts in the Industrial Development Bank of India :—

A) **POSTS AND SCALES OF PAY:**

(i) Deputy Managers: Rs. 850-60-1,150.

(ii) Officers Grade I: Rs. 430-430-55-815-E.B.-55-925-60-1,045.

(iii) Officers Grade II: Rs. 375-20-535-25-560-E.B.-25-660-30-720.

Note :—Candidates possessing exceptionally good qualifications and experience of value to the Bank may be given a higher starting pay in the prescribed scales.

In addition to pay, the selected candidates in all categories mentioned above will be eligible to draw local pay, house allowance, dearness allowance and other allowances at rates prescribed by the Bank from time to time. The present rates for local pay and other allowances are :

(i) Local pay at 10% of pay.

(ii) House rent allowance at 15% of pay with a minimum of Rs. 60 and a maximum of Rs. 300.

(iii) Dearness allowance:

(*a*) *Deputy Managers :* Rs. 125, provided the pay plus dearness allowance does not exceed Rs. 1,250 per mensem.

(*b*) *Officers Grade I :* 20% of pay upto pay of Rs. 500 and thereafter at 16-2/3% with a maximum of Rs. 125, with marginal adjustments where necessary.

(*c*) *Officers Grade II :* 20% of pay with a maximum of Rs. 100.

(iv) An *ad hoc* allowance of 10% of pay with a maximum of Rs. 100 per month payable upto 31-3-65.

(B) **QUALIFICATIONS:**

(i) **Deputy Managers and Officers Grade I:**

Applicants should have high academic qualifications—preferably a first class Master's degree or a Doctorate with proficiency in one or more of the following subjects—or should be members of the Institute of Chartered Accountants of India :

(*a*) Investment
(*b*) Banking
(*c*) Accountancy
(*d*) Cost Accounts
(*e*) Company Taxation
(*f*) Company Law and Management
(*g*) Corporate Finance
(*h*) Industrial Economics
(*i*) Techno-economic Surveys
(*j*) Statistics and Econometrics
(*k*) Marketing Economics
(*l*) Economic Planning

For posts of Deputy Manager preference will be given to applicants who have had practical experience and/or have done research work in the above fields and who have worked in banks or institutions financing industrial units or in industrial units in a responsible position for at least 5 years.

(ii) **Officers Grade II:**

Applicants should have a good academic record, preferably a first class Master's degree in Economics or Commerce or Statistics ; weightage will be given to specialisation in subjects like Banking, Industrial Economics, Industrial Finance, Accountancy, Company Taxation, Company Law and Management.

(C) **AGE LIMITS AS ON 1st NOVEMBER 1964:**

(i) *Deputy Managers :* Candidates should be between 30 and 40 years of age but the age limit may be relaxed in the case of candidates possessing exceptional qualifications.

(ii) *Officers Grade I :* Candidates should not ordinarily be over 35 years of age but the age limit may be relaxed in the case of candidates with exceptional qualifications.

(iii) *Officers Grade II :* Between 21 and 27 years. The maximum age limit is relaxable but not beyond 32 years in the case of :—

(*a*) candidates possessing special qualifications

(*b*) candidates belonging to the Scheduled Castes or Scheduled Tribes.

2. Candidates who wish to apply for more than one category of posts must submit separate applications accompanied by separate application fees and should clearly indicate the post and the department for which they have applied.

3. Applicants for the above posts must remit with their applications a fee of Rs. 7.50 for each post by cheque or bank draft on a *Scheduled Bank* payable at Bombay or by Postal Order. *The application fee is in no case refundable.* In the case of candidates belonging to Scheduled Castes/Tribes, the fee will be Rs. 2 for application for each post.

4. Applications in the candidate's own handwriting in the prescribed forms obtainable from the Industrial Development Bank's Office at Bombay, accompanied by copies (originals should *not* be sent) of certificates regarding age and educational qualifications, statements of marks secured in the graduate and post-graduate degree examinations and copies of two testimonials should be forwarded to the General Manager, Industrial Development Bank of India, Post Bag No. 10042, Bombay-1, so as to reach him on or before the 14th November 1964. Requests for supply of forms through post should be accompanied by a self-addressed and stamped envelope of size 9″ × 4″.

5. Candidates already in service will be required to produce a proper discharge certificate from their employers at the time of their appointment in the Bank's service.

6. Candidates belonging to Scheduled Castes/Scheduled Tribes should mention this fact prominently in their applications and also enclose a copy of the certificate to that effect from competent authority.

7. Appointments will be subject to candidates being found medically fit for service in the Bank by the Bank's Medical Officer.

8. If any candidate desires to have his application acknowledged, he should send it by "Registered Post—Acknowledgement Due." Apart from those who may be specially called, interviews will not be granted to candidates nor will the Bank enter into correspondence with them.

9. Candidates called for interview will be reimbursed single return railway/bus fares by the shortest route from their place of residence to Bombay, applicants for posts of Officers Grade II being paid II Class fares and those for higher posts, I Class fares.

10. Canvassing in any form will be regarded as disqualification.

THE INDIAN IRON AND STEEL COMPANY, LIMITED

NOTICE IS HEREBY GIVEN THAT THE Register of Members and Share Transfer Books for Preference Shares in the Company will remain closed from the 23rd October to the 27th October, 1964 both days inclusive, for the purpose of payment of Preference Dividend for the half-year ended 30th September, 1964, on or after the 1st November, 1964, to those Preference Shareholders whose names appear on the Company's Register of Members on the 27th October, 1964, or to their mandatees.

By Order of the Board,

MARTIN BURN LTD.,

F. G. LIVERSEDGE,
Managing Director,
Managing Agents.

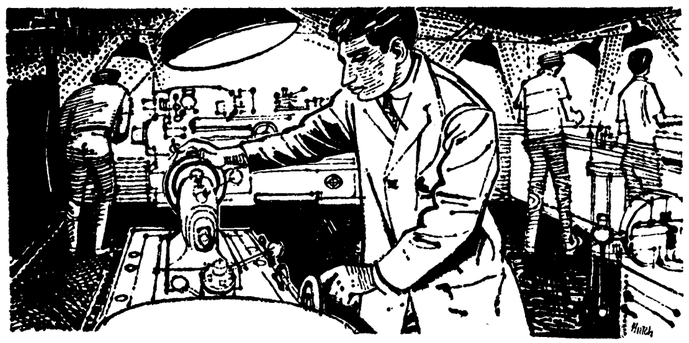
12, MISSION ROW,
CALCUTTA-1.
3rd October, 1964.



In Factories, Hospitals, Schools, Public places...

PUT AN END TO THE DANGERS OF

SUDDEN DARKNESS

In factories sudden darkness can cause injury and damage to machinery. Emergency lighting is the obvious safeguard—and that's where Keepalite comes into its own. Keepalite is an automatic emergency lighting system employing lead-acid storage batteries which are automatically triggered into operation by the actual mains failure. Modern methods of control and 'trickle' charging mean that Keepalite equipment has outstandingly long life and requires minimum of maintenance. That's why architects everywhere specify Keepalite as sure inexpensive protection for factories, hospitals, schools, banks and public places.

KEEPALITE

AUTOMATIC EMERGENCY LIGHTING EQUIPMENT

TREND OF MARKETS

BULLION ERRATIC

(From Our Own Correspondent)

BOMBAY, *7th October*

Both gold and silver moved erratic during the week under review. Following heavy arrivals, prices fell sharply early in the week. In the subsequent sessions, however, there was a recovery induced by strong demand from upcountry centres, especially Calcutta.

Fourteen-carat gold began the week markedly lower at Rs. 67.50, as against the previous close of Rs. 69, and declined Rs. 67 on Saturday. After fluctuating between this level and Rs. 68.50, it finished at Rs. 69.75. Pure gold, in private trading, swiftly declined from Rs. 119 to Rs. 112 on fears of Government action against hoarded metal and poor inquiries. But it picked up strength later and closed at Rs. 116 today. Sovereign was listless throughout at Rs. 92.

In sympathy with gold, silver also began the week on a subdued tone at Rs. 255.50 and came down to Rs. 255 on lack of interest on the part of buyers. It, however, gathered strength on upcountry purchases and rose to Rs. 256. The weekly average arrivals and offtake of silver were 26 and 9 bars, respectively.

The international price for gold in the London market was higher at $35.10½, as against $35.09½ last week due to speculative buying in the uncertain phase ahead of the elections in both the U.K. and the U.S. The sterling price rose by 1½d. to 252s. 3½d. Both ready and forward silver was unchanged at 112½d. and 112½d., respectively, as also silver in New York at 129.3 cents.

The regional office of the Gold Control Administrator in Bombay is to issue permits for the October-December 1964 quarter, for the purchase of gold by industrial consumers falling in the approved categories on the same basis as the July-September 1964 quarter. Applications should reach the office not later than 31st October 1964.

The Hutti Gold Mines Company Ltd., a State undertaking, has fixed the sale price of gold at Rs. 120 per ten grams for the October-December 1964 quarter. The gold will be sold through the branches of the State Bank of India. The traders, however, are surprised at the high price fixed by the Government especially when the market price is downward. Moreover, the Government's intension is to bring down smuggling. They ask if anyone would buy at this price level.

The following table shows the trend of prices during the week under review:

	7-10-64 (closing)	High	Low	29-9-64 (closing)
SILVER				
Ready (996 fine) ..	Rs. 256.00	Rs. 256.00	Rs. 255.00	Rs. 256.50
GOLD				
Ready (14-carat) ..	69.75	69.75	67.00	69.00
Sovereign ..	92.00*	—	—	92.00*
London—				
Gold ..	252s. 3½d.	252s. 4½d.	252s. 3d.	252s. 2½d.
Silver Ready ..	112½d.	—	—	112½d.
Silver Forward ..	112½d.	—	—	112½d.
New York—				
Silver ..	129.3 cents	—	—	129.3 cents

N.B.—The quotation for gold is per 10 grams (about 0.85 tola) and that for silver is per kilogram (85.73 tolas). London and New York quotations are per ounce. * Unofficial rate.

DEPOSIT RATES RAISED

(From Our Own Correspondent)

BOMBAY, *7th October*

Following the Reserve Bank's directive in regard to rates of interest on very short-term deposits, the State Bank of India announced on Wednesday, 30th September, the upward revision in deposit rates with effect from the 1st of this month (for details, please see page 579 of the last week's issue of *Commerce*). Within twenty-four hours after this announcement, the other scheduled banks, too, raised their interest rates on deposits, the actual increase ranging from ¼ per cent to ½ per cent. The revised and the old rates are given below:

Period of deposit			Rate of interest (%) Revised	Old
Up to 14 days			Nil	3
15-45 days			1½	*
46-90 days			2½	*
Of *and over*	*But less than*			
91 days	6 months	...	4	3½
6 months	1 year	...	4½	4
1 year	2 years	...	5	4½
2 years	3 ,,	...	5½	4½
3 ,,	4 ,,	...	5½	4½
4 ,,	5 ,,	...	5½	5
5 ,,	6 ,,	...	6	5½
6 ,,	7 ,,	...	6	5½
7 ,,	9 ,,	...	6½	6
9 years and over		...	6½	6

* Hitherto deposits upto 90 days carried interest ranging from 3 per cent to 3.50 per cent, 4 to 30 days—3 per cent, 31 to 60 days—3.25 per cent, and 61 to 90 days—3.50 per cent.

The above standard rates are applicable to banks in category I with deposits of over Rs. 50 crores. In respect of medium banks (Category II) with deposits of over Rs. 25 crores and upto and including Rs. 50 crores, they have, as before, been allowed to offer 0.125 per cent more than the standard rates and small banks (Category III) with deposits of more than Rs. 10 crores and upto and including Rs. 25 crores will pay 0.25 per cent more than the standard rates.

The short-term money market ruled somewhat tight during the week under review. There was increased pressure of demand for credit, while the supply of funds was less. Consequently, inter-bank call rate tendered to move up. Fresh money fetched 2¼ per cent and renewals were reported at 1¾ per cent. Last week, both were quoted at 1¼ per cent with lenders over.

The 91-day Government of India Treasury Bills, tenders for which opened on Tuesday the 6th inst., evoked poor response. The total amount offered was no more than Rs. 2 crores which was just equivalent to the amount invited and also accepted. The average rate of accepted tenders was higher at Rs. 2.500 per cent, as against Rs. 2.400 per cent. The Intermediate Treasury Bills, too, attracted reduced support. The Bills actually sold from 30th September to 3rd October aggregated Rs. 5.75 crores, as compared with Rs. 13.35 crores a week before and Rs. 7.98 crores two weeks before.

The foreign exchange reserves of India fell by Rs. 1.82 crore to Rs. 97.63 crores during the week ended 2nd October 1964. The whole of the decline was in balances held abroad which receded from Rs. 12.17 crores to Rs. 10.35 crores. The foreign securities held in the Issue Department of the Reserve Bank remained unchanged at Rs. 85.46 crores. There was an increase of Rs. 7.62 crores to Rs. 2,370.28 crores in notes in circulation. Loans and advances made by the Reserve Bank to scheduled banks decreased by Rs. 23 lakhs to Rs. 60 lakhs, while the deposits of these banks with the Reserve Bank rose by Rs. 2.59 crores to Rs. 103.30 crores.

There was a further fall of Rs. 11.43 crores to Rs. 1,704.70 crores in the total credit made available by scheduled banks to their clients during the week ended 25th September 1964. Simultaneously, the deposits of banks went up by Rs. 21.42 crores to Rs. 2,703.83 crores. Borrowings from the Reserve Bank were, therefore, negligible, being less than a crore of rupees. Investments improved by Rs. 18.68 crores to Rs. 814.90 crores, so also total cash by Rs. 6.20 crores to Rs. 164.49 crores.

The Gilt-edged market has taken note of the proposed issue of 5 per cent Rs. 100 Gujarat Electricity Bonds for Rs. 250 lakhs. The Bonds, to be issued at par, will open for subscription tomorrow, that is, the 8th inst. The Bonds are redeemable at par on 10th October 1976. The list of the Rs. 100 Mysore State Electricity Board loan 1976 for Rs. 200 lakhs opened today, the issue price being Rs. 99.50. The Gilt-edged market put on a subdued appearance, following lack of fresh support.

In the foreign exchange market, the banks' selling rate for U.S. dollars was unchanged at Rs. 481 per $100. The buying rate also remained unchanged at Rs. 477.50. In New York, the pound sterling ruled irregular *vis-a-vis* the dollar. Thus, the spot rate declined by 0.020 cent to Rs. 278.290-278.310 cents, while the three months' forward put on 0.010 cent to 227.800-277.820 cents.

COTTON FUTURES FIRM AT CLOSE

(From Our Own Correspondent)

BOMBAY, *7th October*

The cotton futures market began the week on a firm note but developed a sagging tendency immediately thereafter, due to continued favourable weather reports which led to stray bull liquidation. Prices, as a consequence, registered a decline. Even reports of unfavourable rains in Akola and Berar areas failed to have any effect. With the emergence of more sellers, the market turned distinctly easy on the penultimate day of the week, that is, yesterday. Today, however, the market staged a recovery on account of short-covering at lower levels. But the recovery was not marked enough to make up for the earlier losses, so that the closing rates were lower than those prevailing on Tuesday last week.

The Jarilla March 1965 contract moved down from Rs. 729 to touch a low of Rs. 721.50 on Tuesday the 6th instant. The contract advanced to Rs. 726.25 before closing a shade lower at Rs. 726. The net loss over the week was Rs. 3.

In the Sewri spot market, spinners showed interest in new crop varieties. In old crop, sporadic interest continued to be shown by needly mills. The volume of business, however, was small. The following are the latest available quotations in respect of certain important varieties :

Akola Rs. 1,125, Bengal fine Rs. 732 Dec., Davangere Rs. 975, Dabhoi Co 2 Rs. 1,170, Hubli Laxmi Rs. 1,155, Hubli Jaydhar Rs. 1,025, Jagadia Rs. 1,075, Khamgaon 27/32″ New Rs. 1,015, Malegaon CO 2 New Rs. 1,700, Manavdar Kala Rs. 841, Nagar Co 2 New Rs. 1,690, Pratapnagar New Rs. 1,111, Raichur Laxmi Rs. 1,020, Raver Rs. 1,091 and Saurashtra Co 2 Rs. 1.350.

The foreign section witnessed moderate activity. Bengal *deshi* (December delivery) fell from Rs. 738 to Rs. 732 following selling pressure induced by encouraging reports about the season's new. Bengal *deshi* crop. The export registrations till the 3rd instant were 53,400 bales.

Among imported cottons, East African cotton met with sustained demand from spinners. Sudan and Pima cottons also attracted good attention following the imposition of ban on

their latest interest is in plastics and paper

"What are Metal Box doing with plastics and paper?" people wonder.

Why, making packages, of course! Blow-moulded plastic containers for chemicals and toiletries, laminated pouches for dehydrated vegetables and other foods, strip packs for pharmaceuticals, polyethylene bags for garments, foods and chemicals...and precision made paper cartons for a wide range of products.

It's news to many that almost 25% of all Metal Box sales comes from non-tinplate products.

This branching out in new directions is *not* new with Metal Box...in fact, Metal Box started working with plastics a decade ago. But this process has been accelerated by the shortage in tinplate, which many people think is about the only material Metal Box can turn into a package. Small wonder—with a name like Metal Box.

Actually MB Research set out several years ago to develop substitute packaging materials. And so, today, Metal Box are busy in the exciting world of plastics, paper and foil—materials which have already proved to be *right* for a wide variety of products. And, with every day, the range continues to grow.

So that, in time to come, flexible and paper packages could well make 'Metal Box' an even bigger misnomer.

METAL BOX
protective packaging

further sales of Egyptian cotton to India by the Cotton Commission of Alexandria (U.A.R.).

The current season's cotton crop is said to be progressing quite satisfactorily. According to the latest reports, the Western and Central parts of India have had beneficial rains, though the showers have meant a little damage to the 197/3 and Laxmi varieties. The Punjab experienced heavy rains during the last few days, but no damage to crop has been reported and the *deshi* arrivals are estimated at 2,000 bales per day. Both Goarani and Jarilla crops are maturing rapidly. But it is stated that, for better crops, clear spell should continue for some more time.

CASTORSEED SUPPLIES SCARCE

(From Our Own Correspondent)

BOMBAY, *7th October*

Trading in the new crop January 1965 groundnuts and groundnut oil commenced in Bombay on Tuesday the 6th inst. Groundnuts opened at Rs. 94.60 per 100 kg. and, after a fractional setback to Rs. 94.55, moved up to Rs. 95.75 before closing at Rs. 95.70. Price movements in oil were narrow and the January contract was mentioned at Rs. 18.50. It is not possible to discuss the outlook for a contract which runs for a period of five months on the basis of the opening day's trading, but the general feeling is that, although the groundnut contract is firm at the moment, the long-term outlook is bearish. At present, sentiment is induced mainly by the shortage of spot material, but the current year's crop is estimated at 40 lakh tonnes. A section of the market, however, thinks that the crop should not be more than 36 to 38 lakh tonnes, but, by and large, the feeling is that the crop should touch the 40 lakh-tonne level. Further, the chances of the Government revising its export policy are rather remote and the ban is likely to continue at least until such time as a clear picture of the mustard crop becomes available. The case of HPS groundnut kernels also seems doubtful. Their exports may not be allowed. In these circumstances, shippers, who normally hedge their positions by purchases in forward deals will not be in a position to support the market. Above all these factors, there will be the pressure of new crop arrivals which will begin to be felt in the course of the next fortnight.

Pressure of new crop groundnuts did make itself felt and prices of groundnut oil had declined to Rs. 28.50 on 28th September, but later the market shot up to Rs. 33 and, in unofficial dealings, the quotation was mentioned at Rs. 33.50 to Rs. 34. The spurt was induced by the recent heavy rains in Andhra. Oil was quoted at Rs. 31.25, whole October at Rs. 24.30, November at Rs. 20.25, December at Rs. 19.20 and January at Rs. 19.30. In groundnuts, ready Khandesh was done at Rs. 71, 15th October at Rs. 65, whole October at Rs. 56.50, 15th November at Rs. 53, full November at Rs. 50.50. December-January at Rs. 49. Karad bold December-January was mentioned at Rs. 48 and Kanpur bold was quoted at Rs. 47.50. The firm tendency was due mainly to paucity of ready stocks.

Groundnut extractions have been dull and current business is confined to the United Kingdom which is quoting £38-7-6 for October, £37-5 for November, £36 for December, £35-5 for January-February-March. The market in Bombay has been rather easy with spot material at Rs. 415, November at Rs. 388-Rs. 390, December at Rs. 380 and January at Rs. 375. There have been more sellers than buyers. It is said that not more than 25,000 tonnes of extractions have been committed for November-December shipments. Further, solvent extraction plants would be going into production in the course of the next few days.

Castor has been extremely firm and here, too, sentiment is induced by paucity of stocks. It is said that current supplies are not sufficient to take care of the needs of the market until the arrival of the new crop. It is also said that castor oil, which had been held up in the docks for quite some time, has now been cleared. The March contract touched Rs. 185.62 on Wednesday, though it reacted to close at Rs. 185.12. The trend in linseeds is more or less guided by the generally firm conditions in the market and the March contract is mentioned at Rs. 40.56. Cottonseeds are well held with the January contract at Rs. 102.50.

The latest directive from the Government of India prohibiting the use of solvent extracted oils in the manufacture of vanaspati has created a feeling of surprise as well as disappointment in industry circles. An exception has been made in the case of soyabean oil which is to be imported from the United States under P.L. 480. This can be used upto 20 per cent of the oil base processed for the purpose. The decision regarding soyabean oil is said to have been taken as a special case and will hold good until further notice. The order affects vanaspati as well as solvent extraction industries by depriving the former of a cheaper raw material and the latter of a good market for its product. About 75 per cent of the solvent extracted oil is used by the vanaspati industry and the balance of 25 per cent by the soap industry. With the requirements of the soap industry in the matter of its raw materials well taken care of, it is very likely that soap manufacturers will be in a position to dictate their own terms to solvent extraction oil manufacturers. It may further be pointed out that the economy of the solvent extraction industry is based upon the assumption that the oil would be taken up by the vanaspati industry and it is on these hopes that the industry developed by leaps and bounds during the last five years. It is said that, in 1963, about 70,000 tonnes of oil were manufactured in India by the solvent extraction process. In the current year, about 84,000 tonnes are expected to be produced, while, in the next year, the output is estimated at around a lakh of tonnes. Exports of extractions, a byproduct of the industry, have been well maintained earning a considerable sum of foreign exchange and any measures which might contribute to a decline in solvent oil production will mean a corresponding fall in the output of extractions and loss of foreign exchange. It is possible that the Government of India has taken the decision on health grounds. This is understandable, but, at the same time, the use of soyabean oil, essentially a solvent extracted oil, has been permitted. However, trade and industry circles hope that the Government will withdraw the order.

The following table shows the closing prices of oilseeds and oils as on 7th October as compared with those of the two previous weeks:

	7-10-1964	29-9-1964	23-9-1964
	Rs.	Rs.	Rs.
Groundnuts			
January 1965 contract	95.70	..	..
Oil January 1965	18.50	..	..
Nisam bold	N.T.	66.00	75.50
Khandesh quality	136.00	68.00	77.50
Oil ex-mill	31.00	29.00	32.75
Oil Rly. Receipt	30.00	27.50	30.50
Castorseed			
March 1965	185.12	183.25	178.75
Bold ready Madras	84.00	40.75	39.37
Ready Kanpur	82.00	40.00	38.37
Oil B.S.S.	19.20	18.80	18.30
Oil commercial	18.30	17.80	17.45
Linseed			
March 1965..	40.56	40.44	40.31
Bold ready	103.00	52.25	52.50
Linseed oil	21.50	22.00	22.00
Cottonseed			
January 1965 contract	102.50	102.25	102.75

N.B.—The quotation for groundnuts January 1965 contract is for 100 kg. The rates for spot qrgoundnuts and castor for the week ending 7th October are for 100 kg. while so far they had been quoted per 50 kg. Castor and cottonseeds futures are quoted per 250 kg. while linseeds futures are quoted per 50 kg. Groundnut Oil January 1965 and all spot oils are quoted per 10 kg.

NILGIRI TEAS EASY

[*Messrs. Forbes, Ewart and Figgis (Private) Ltd.*]

COCHIN, *30th September*

A total of 746,000 kgs. was offered in tea sale No. 39 held here on Wednesday, the 30th instant. Nilgiri quality was generally slightly inferior, but from other districts it was well maintained. There was strong general demand. The larger selection of Nilgiris on offer were in good demand, but prices eased slightly with quality. Good mediums and mediums were sold well at fully firm to dearer rates. Low mediums elicited fair support, but prices were rather irregular. Whole leaf grades were sold irregularly. C.T.Cs. were in good demand and prices were fully firm to dearer.

The quotations (per kg.) were:

	1964	1963
	Rs.	Rs.
Low mediums	4.00-4.60	4.00-4.50
Mediums	4.60-5.00	4.50-5.00
Good mediums	5.00-5.60	5.10-5.70
Nilgiri B.O.P.	5.25-7.40	5.20-8.60

The average price realised in sale No. 39 was Rs. 4.74 per kilo, as against Rs. 4.68 a week ago and Rs. 4.74 in the corresponding sale last year.

In dust sale No. 38 held today, 313,000 kgs. were offered. There was strong demand. Highgrowns were sold well at dearer rates. Good mediums and mediums were well supported and were generally fully firm. Low mediums were a little irregular, but generally steady. Black leaf types again were a strong feature and were often dearer. Unorthodox types encountered good support and were sold at rates higher than last. Residuals, however, were easier.

The average price realised in dust sale No. 38 was Rs. 4.42 a kilo, as against Rs. 4.39 a kilo and Rs. 4.39 in the corresponding sale last year.

Colombo : A total of 57,46,991 lbs. was offered this week. Highgrown and medium brokens declined by 30 to 50 cents per lb. with the greener uvas registering a drop of 40 to 70 cents. Low-grown were irregular, but generally, about steady. Fannings grades were relatively stronger than B.O.Ps, although all descriptions followed the declining trend of the market.

London: North Indian and other growths: In Monday's sale, there was strong demand at dearer rates with best Assams selling at an advance of up to 6*d.* per lb.

Ceylon and South Indians: In Tuesday's sale, there was strong demand and the best teas were appreciably dearer. Plain description advanced by 2*d.* per lb.

TEAS FIRM

(From Our Own Correspondent)

CALCUTTA, *6th October*

Good demand enlivened activity during last week's internal sale, when dusts on offer aggregated 33,504 chests. Good C.T.C. teas were fully firm, but plain and medium C.T.C. teas eased in an irregular trend. Plain orthodox teas were unchanged at around last levels but were firm. Assam teas were a little irregular. Legg-cut teas were in good demand. The quotations per kg., inclusive of excise duty, were: good Assam C.T.C. dust Rs. 6.20 to Rs. 6.50, medium Assam C.T.C. dust Rs. 5.30 to Rs. 5.50, legg-cut dust Rs. 5.00 to Rs. 5.30, plain C.T.C. dust Rs. 4.90 to Rs. 5.20, medium Assam C.T.C. dust Rs. 4.90 to Rs. 5.40, and plain orthodox dust Rs. 4.20 to Rs. 4.60.

As the current tea season has entered the heaviest cropping months of the year, and arrivals have accordingly increased, the demand for tea space continues to be heavy and is not being fully met. With the improvement in the dock situation, the waiting time for ships at the Sandheads has accordingly been reduced. In October and November vessels to the U.K., tea has already secured a considerable portion of space.

Delays in the dock restricted the quantity of north Indian offerings in the auctions held in London last week. Prices in London in recent weeks have been higher and teas offered have been of good quality. In fact, they formed the best that north India can offer. It is doubted if the present level of prices in London can be maintained as offerings from now would be mostly rain teas. For the same reason, it is believed that the peak level of prices in Calcutta auctions for this season is also over. The average price of leaf tea in the auctions held so far has been only Rs. 5.84 per kg. as against Rs. 5.93 in the corresponding period of 1962-63. The fact that even in the case of quality teas prices have failed to reach last year's level is significant, and this is attributed to the rising world output and consumers' disinclination to build up large stocks.

News of interest to the tea industry this week has been the announcement by the West Bengal Chief Minister, Mr. P. C. Sen, that in an attempt to increase tea exports, suitable land for growing tea would not be resumed under the provisions of the Estates Acquisition Act. Land already resumed is also likely to be returned for tea. The Chief Minister was speaking at a conference in Calcutta which was attended by the Union Deputy Minister of Commerce and Industries and representatives of different chambers of commerce. He also agreed to consider the suggestion to treat investments on expansion of tea acreage from revenue account in order that these expenditures may derive benefit in the scope of the agricultural income-tax.

SPURT IN RAW JUTE

(From Our Own Correspondent)

CALCUTTA, *6th October*

The shorter week under review, in the jute markets, commenced with the setting of easier conditions, emanating from profit-taking in goods and from increased arrivals in fibre coupled with the better inclination on the part of cultivators to transform their holdings into cash. However, as the week progressed, keen activity developed in the hedge market and this led to substantial gains in ready goods. This was followed by a gain of nearly Rs. 2 per maund in fibre prices. The hardening trend in the New York burlap market in the week was noted with enthusiasm, since this indicated that the U.S. consumer was now better inclined to cover against immediate requirements. The report that some mills had to resort to readjustment of production in the last month on the basis of their fibre stocks pushed up sentiment for a time, but it was soon known that such adjustment was purely temporary and that the same did not imply a shortfall in output. Further, in view of the heavy stocks of goods with mills, it was realised that even a shortfall in output would not matter. The Indian Jute Mills Association has now proposed to have a check on purchases of fibre by mills. The Association will do this by collecting weekly production figures from mills and co-relating them to weekly purchases of fibre. This would go to ensure that no mill purchased more than its weekly quota as issued by the Jute Commissioner, and that, at no time, there would be a squeeze. This week's rise in fibre prices has emphasised the need for continued vigilance in the matter of fibre prices.

On behalf of mills, it has been pointed out that a hectic rise in prices was prevented last month only because of the timely release of the buffer stocks. Speaking at the annual meeting of the Jute Buffer Stock Association, the Association's Chairman, Mr. R. H. Morrison, said that experience had brought to the forefront the need for building a substantial buffer stock equivalent to about three months' requirements of mills.

The trade would urge the need for joint Indo-Pakistan campaigns in an attempt to increase world consumption of jute goods. If co-operation in this sphere can be enlisted, there is the hope that India may be able to urge Pakistan to desist from unfair competition in jute goods. A meeting between I.J.M.A. and the P.J.M.A. is suggested as an opening ground.

Although the implementation of the maximum purchase quotas was very satisfactory, fibre prices gained during the week under review. The uptrend was mainly due to the rising trend in goods. Arrivals from upcountry increased, as cultivators are now more eager to sell than previously. The Indian Jute Mills Association denied over the week-end that it had instructed its member mills to cut production by 10 per cent as from this month. This report attracted attention in the fibre market. Ordinarily any plan, real or rumoured, designed to cut production should be able to bring down fibre prices, but in the setting of the issue of maximum quotas and of the belief that requirements of mills exceeded arrivals, the rumours of the proposed cut-back of output helped to boost fibre prices. Assam bottoms hardened from Rs. 37.00 to Rs. 39.00 a maund, *daissee* bottoms from Rs. 39.00 to Rs. 40.00, and *northern* bottoms from Rs. 36.50 to Rs. 38.00. In view of the possibility that cultivators are likely to hold back supplies in anticipation of higher prices, the Jute Commissioner would continue to issue weekly maximum purchase quotas on mills.

The gain in prices of goods in this week followed keen activity in the hedge market. The news that some mills had had to adjust production in the last month gave rise to apprehensions of a possible squeeze in ready goods. However, that these fears lacked basis became clear inasmuch as mills possessed heavy stocks of goods. On Tuesday last, as a result of profit-taking, ready B. twills eased from Rs. 147.25 to Rs. 146.00, and ready hessian 40″ 10 oz. from Rs. 49.80 to Rs. 49.35. At these levels, there was good covering demand, as a result of which B. twills rose to Rs. 149.50 and hessian 40″ 10 oz. to Rs. 49.90 on Wednesday. Keen activity followed in the hedge market, where on Thursday, Nov. B. twills rose from Rs. 143.50 to Rs. 144.30, and Nov. hessian 40″ 10 oz. from Rs. 50.34 to Rs. 51.14. On Thursday last, this was followed by ready B. twills gaining to Rs. 152.25 and hessian 40″ 10 oz. to Rs. 51.25. Friday remained closed, and but for profit-taking, prices would have risen further over the week-end, when B. twills closed firm at Rs. 152.75 and hessian 40″ 10 oz. at Rs. 51.25.

MANUFACTURERS DO YOU KNOW THE MEANING OF IS 1068-1958?

IS 1068:1958 is the Indian Standards Specification covering nickel-chromium plating, and is the first step towards quality control. A strict observance of recognised standards of nickel plating will guarantee satisfied customers and repeat sales, both at home and abroad. Do your own products conform to these standards?

Ask yourself these questions.

Is the product properly designed to make the most of nickel chromium plating? Is the thickness of the plating suitable for the type of job the produc expected to do? How can the thickn of plating be checked without damag the plated surface?

The answers to these questions and n others can be found in the pages of t booklets. Write today for your free copie

United Bank of India Building, 25 Pherozshah Mehta Road, Fort, Bombay 1-BR.

METALS STEADY

(From Our Own Correspondent)

CALCUTTA, *6th October*

While steadiness continued to prevail in the metal market during the week under review, advices from the London Metal Exchange showed a small but welcome decline in quotations of copper, tin and zinc. Lead in London, however, continued to advance. Although the fall in prices on the L.M.E. is a good sign, and it is to be hoped that this tendency would continue, the trend would have to be watched closely for two or three weeks before concluding that the price-boom-phase has come to an end. As far as India is concerned, a fall in world market quotations should lead to the restoration of the cut in the quantum of imports, which will be automatic inasmuch as licences relate to value and not to quantity. It was only recently that the Union Commerce Minister, Mr. Manubhai Shah, held out no hope of liberalisation of imports. However, he was hopeful of efforts to meet the increasing needs of defence, export-oriented, and basic industries. He also said that the Government would endeavour to provide larger imports to the small-scale industries.

Spot tin on the L.M.E. opened at £1,530-£1,540 a ton, and gradually eased to £1,480-£1,490. The fall in the Penang level and the absence of good buying on Continental account, despite a good number of inquiries, initiated the decline. It has been good news that Indonesia has taken a series of steps to raise tin output. By 1970, Indonesia is likely to become the second big producer of tin. In 1963, production in Indonesia of tin-in-concentrates was only 12,947 tons, but since then output has been raised. If the present progress is maintained, it is hoped that this year s output would total around 18,000 tons. Indonesia proposes to develop mines through Dutch assistance. The increased production would be exported to countries in Europe, the U.S.A., West Germany, Netherlands and France. The price of tin in Calcutta was unchanged at Rs. 3,300 per 100 kgs.

This week's fall in copper quotation on the L.M.E., albeit for a while only, had not come as a surprise. In recent months, the price had increased continuously from one high to another. The rising trend in copper has, in no small measure, contributed to accentuate the inflationary conditions the world over, and producers had at once expressed the apprehension of possible moves of substitution by consumers. Spot copper wire-bars on the L.M.E. opened at £465-£475 and dropped to £460-£470, but by the week-end, again rose to £470-£475. Spot cathodes and fire-refined copper opened at £420-£425 and £355-£360 and closed higher at £422½-£427½ and £370-£380. In Calcutta utensil copper scrap eased from Rs. 670 per 100 kgs. to Rs. 655, while lead hardened from Rs. 312 to Rs. 313 and electrolytic zinc from Rs. 361 to Rs. 364 per 100 kgs. Spot zinc in London eased from £122-£123 to £118-£119, while spot lead gained from £116-£116½ to £118½-£119.

GOOD DEMAND FOR " GUR "

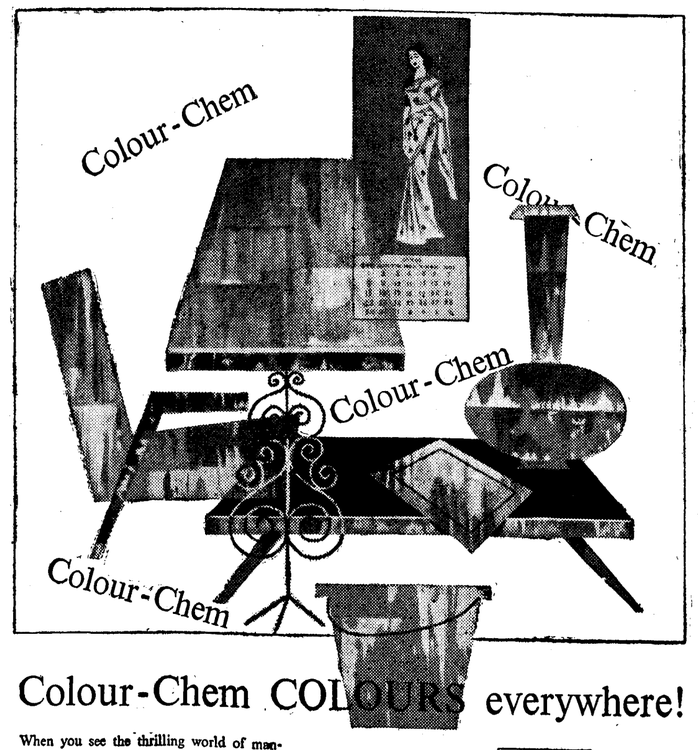
(From Our Own Correspondent)

HAPUR, *5th October*

Sugar ruled firm during the week as supplies were restricted in face of good festive demand, and were quoted in the open market at a premium of around Rs. 40 a quintal over the controlled prices of Rs. 175 to Rs. 177. New sugar policy for the coming season has not yet been announced. Crushing for the new season would start in a few factories in eastern U.P. from the third week of this month and in western U.P. from early next month. With a bumper cane crop in sight, sugar production is likely to increase, but most of it would depend on how much cane is diverted to *gur* and *khandsari* manufacture.

Khandsari was subdued during the week because of slack demand in face of increased arrivals. Demand was slack due to the non-receipt of fresh permits from the Punjab and the supplies came from the producing ends of east U.P. Stockists were anxious sellers as new season was fast approaching. The U.P. State Government had assured the traders that the entire freezed stocks would be cleared by the end of September, but only a small quantity was as yet lifted. *Khandsari boora* improved slightly. The week-end prices in the open market were:—*Deshi khandsari* Rs. 125 to Rs. 155, *boora* Rs. 150 to Rs. 160 per quintal.

Arrivals of new *gur* have commenced in small quantity at an average of 50 maunds daily.



Colour-Chem COLOURS everywhere!

When you see the thrilling world of man-made colours around you—spectacular prints on your fabrics, colourful inks in your magazines, pleasing paints in the interior of your home, fascinating tapestry and the attractive furnishings of your drawing room, plastic balls in the hands of your children—remember that COLOUR-CHEM, India's leading makers of Pigment Colours, is very much a part of your daily life.

FARBENFABRIKEN BAYER AG., Leverkusen, W. Germany

FARBWERKE HOECHST AG., Frankfurt, W. Germany

Thanks to the sunny weather, the arrivals were being lifted briskly by consumers at higher prices up to Rs. 44 per 40 kilograms. Wet quality stuff left in small quantity mixed with molasses is also being reprocessed and quoted upto Rs. 37 per 40 kilograms. The fresh arrivals would soon increase due to prevailing high prices of the commodity. In the Muzaffarnagar market, prices of old *gur* and *shakker* ran down appreciably on weak demand following persistent rumours of likely enforcement of price control. *New produce* in small quantity was being quoted higher. *Dana minja* improved on renewed buying, following the removal of restrictions on its loading.

TRADING IN KIPS SELECTIVE

(From Our Own Correspondent)

MADRAS, *5th October*

Kip trading has been selective with foreign ports. There were good enquiries for lower selections in cowhides light weights, for cowcalf light weights and for buffcalf all averages. Prices ruled firm for calf skins, as the availability of stocks was small. Inland demand for kips was, however, poor.

Tanned skins prices ruled firm. There was good call for goat skins in lower selections in all average weights from one port or another, which has been a welcome change for the tanners. Prices of sheep skins remained steady. Enquiries for middle class sheep skins fifths and inferior fifths were persistent, but buyers were not willing to increase their limits. There was selective demand for suede types.

In the last German public sales, only 20 per cent of the goat skins were sold, which consisted of 8/9 and 11/12 lbs. average, and the prices secured were 6d. below current selling prices. The quantity of sheep skins sold was poor.

The following were the prices per lb. ruling in the Madras market last week for unassorted lots:—

Tanned cowhides 8/8½ lbs. average Rs. 2.00 to 2.06; tanned buff hides 12/13 lbs. average Rs. 1.62 to 1.69; tanned buff calf 1½/2 lbs. average Rs. 2.44 to 2.56.

SOCIAL ENVIRONMENT AND BUSINESS—I

(Concluded from page 644)

other restrictive practices, and treatment of workers as human beings.

The decline of *laissez faire* was not, however, due to these moral failures alone. It was due also to the great changes in the technical conditions of production and distribution that took place at the end of the nineteenth century. These included—

(*a*) the growth and complexity of large-scale enterprise;

(*b*) increasing concentration of economic power over such enterprises;

(*c*) business fluctuations with recurrent periods of unemployment;

(*d*) the growth of technological unemployment;

(*e*) growing disparity in the distribution of income;

(*f*) increasing inequality in the distribution of economic opportunities;

(*g*) wasteful exploitation of natural resources largely as a consequence of unrestricted competition;

(*h*) the growth of combative as distinct from constructive competition, leading to frequent disregard of the social values that might be derived from such activities; and

(*i*) grossly conspicuous consumption which was opposed to social interests, and needs.

The efforts of all progressive societies and of forward-looking groups in such societies, especially in the Western countries, to deal with these problems during the last three-quarters of a century or so, led—for better or for worse—to the gradual but steady decline of *laissez faire* both in theory and practice and to the rapid increase in social control over economic life. In some countries, this development of social control has culminated in outright socialism of one form or another. In other countries, e.g., the U.S.A., in the U.K. and in our own country, it has led to the present-day blend of free enterprise and social control, which is variously described as *modern capitalism*, *welfare capitalism* or *mixed economy*. In the Western countries or in countries like ours which favour a mixed economy, we have, in our treatment of and in our attitude towards the joint-stock enterprises, in a sense, come back to the pre-*laissez faire* philosophy which governed the relations between the joint-stock companies and the society or the State. In other words, the dominant philosophy governing corporate behaviour and corporate motivations in the modern world is much closer to the integrative social view of the corporation during the earlier period of its historical development than to the outmoded *laissez faire* view of the mid-nineteenth century.

(To be concluded)

EAST ANGLIA PLASTICS (INDIA) LTD.

(Concluded from page 648)

scious of the kind of industrial society that our illustrious leaders have planned for India. This calls for an understanding of its fundamental characteristics. We need an enterprising kind of society, an increasingly productive society, an efficient and active society, a realistic and stable society, a forward-looking society that should always be agreed to conserve its resources—a society in which all our institutions, public and private, big and small, are responsible to the interest and the will of the people.

Rational Planning

All this thought leads to the conclusion that a rational planning is very significant for the creation of right economic climate in which proper industrial development might flourish. A change in our feeling is therefore fundamental and should be the prime concern of every one of us. We need a comprehensive industrial policy, a more cogent public investment policy that could act as a stimulus to private enterprise—and such policies that could help speedier implementation of the various projects and remove the negative climate that prevails today in the industrial and economic scene of our country.

Before I conclude, I would like to point out that in India the chemical industry has just begun. And the vast industries, based on petroleum, are yet to come. To accelerate its growth, emphasis must be given on research and development. It is true that the Government now pay increasing attention to scientific research but to me it appears that Government alone cannot take these responsibilities. *Scientific investigation should not remain within* the four walls of laboratories run by the Government or a few individuals. We shall have to translate the technical achievements and discoveries into industrial realities to speed up the development of chemical industries. Significant research and development require large resources and often a long period of waiting during which no result can be forthcoming. To develop a chemical process, a pilot plant may cost enormous money, may take years to build and even then the results may prove unsatisfactory. It is, therefore, necessary for every enterprise engaged in chemical industry to sing substantial sums of money required to develop basic process and chemical engineering research. Our Government should come forward and take up the responsibility of introducing such policies and incentives as would encourage large-scale and widespread research activities. If proper facilities for such basic research are not developed in our country, there will be a continuous drag on our industrial growth. If we depend only on foreign assistance in these areas, we may not ever base our industries on up-to-date technologies and would always remain behind other industrially-advanced countries. Such research activities call for a practical approach. Your Company, within its own resources, has realised the need for the development of advanced technology and has, therefore, taken up some research and development work relating to the various phases of our cellulose acetate project.

Finally, I would like to address on your behalf and on my own, our thanks to the staff and all the employees who have worked in the interest of the Company during the year. The success of the Company's current operation and in the preparatory work in respect of the bigger project is a tribute to the enthusiasm on the part of the Company's personnel.

Thank you.

Note: *This does not purport to be a record of the proceedings of the Annual General Meeting.*

Note :—Outstandings relate to end of period and do not include Indian Union's share of pre-partition liabilities : repayments, however, include those from the pre-partition holdings of Indian investors. A—Discontinued from July 1, 1955. B—Discontinued from June 1, 1957. C—Issued from June 1, 1957. D—Issued from May 10, 1954 to May 30, 1957. E—Including Defence Savings Banks Deposits upto 1954-55. F—No sales from June 1, 1957. G—15 series issued from July 1954 to 1957 and 2nd series issued from January 1958. H—Outstandings in respect of items in column 9 marked 'E' are not included. J—Commenced from 2nd January 1962. K.B.—Five-year prize bonds were issued from 1st April 1960 and the total outstandings amount to Rs. 20.25 crores. Fifteen-year Cumulative Time Deposits commenced from June 1962—the outstandings at the end of June, 1964 amount to Rs. 79 lakhs. Twelve-year National Defence Savings Certificates commenced from 15th November 1962 and the outstandings at the end of June, 1964 amount to Rs. 188.08 crores. Ten-year Defence Deposit Certificates were issued from 10th November 1962 — the outstandings at the end of July, 1964 amount to Rs. 37.89 crores. Five-year Premium Prize Bonds were issued from 1st January 1963 and outstandings at the end of Dec., 1963 amount to Rs. 5.76 lakhs.

A new series of Premium Prize Bonds, 1964 was issued since 1st January 1964. The outstandings at the end of June, 1964 are Rs. 5.46 crores.

STOCK & SHARE QUOTATIONS

Abbreviations :—D.—Deferred shares. P. O.—Preferred Ordinary shares. Y.—Accounts published yearly. H.—Accounts published half-yearly. P.—Company has Preference shares. T.—Company has Debentures. N.—Nominal quotations. x.d.—Ex. Dividend. c.d.—Cum. Dividend. I—Interim Dividend. C.R.—Cum. Right. XR.—Ex. Right.

Shares :—If a company has different classes of shares—as for example : 'A' shares and 'B' shares—these are indicated by the same letters 'A' and 'B' under the columns 'Paid-up Ordinary Capital' and 'Paid-up' per share.

Accounts :—Figures in the Accounts Closed column represent the months or the year in which the respective companies close their accounts, 6 and 12, for instance, indicate the months of June and December, respectively. Reserves include general and other reserves and all other funds which a company may have excluding depreciation fund, reserves for tax liability and provident fund. Block represents actual cost of land, buildings, machinery and all other items on which depreciation is allowed less sales, if any, and stands for the gross figures except where otherwise indicated.

Dividends :—Dividends for completed years are shown as amount per share per annum, but where quoted for portion of a year they represent the proportionate dividend for that period. In the case of those companies which close their accounts yearly dividends shown are for their financial year.

H.—Clive Row Investment—Dividend for 1959 includes additional dividends of 9 P for the year ended 31st March 1955 and 37 P for the year ended 31st March 1956. *Includes bonus.

M.—Managed by the Board of Directors. *N.B.*—Dividends paid since 31st March 1959 are shown as taxable. (k) Investments. §§Investment at cost.

A.—Associated Battery Makers (Eastern) Ltd. The effective dividend for the year 1960 would work out to 16.36 per cent approximate, as the final dividend of 10 per cent was paid on the increased capital of Rs. 118 lakhs whereas the interim dividend of 15 per cent was on a paid-up capital of Rs. 50 lakhs only. X.B.—Ex-Bonus.

TREND OF SHARES

PERSISTENT BULL LIQUIDATION

(From Our Own Correspondent)

BOMBAY, *8th October*

OVER the week, industrials on the Bombay Stock Exchange suffered heavy all-round losses on persistent bull liquidation and absolute lack of follow-up support. Bears took the opportunity to effect short sales in selected counters. The undertone at the close was distinctly weak. Among the leading counters, Tata Steel was down from Rs. 148.50 to Rs. 146, Indian Iron from Rs. 25.15 to Rs. 24.88, Bombay Dyeing from Rs. 60.20 to Rs. 59.20, Century from Rs. 620.50 to Rs. 605, Standard from Rs. 637 to Rs. 610, Kohinoor from Rs. 326 to Rs. 320 and Svadeshi from Rs. 264 to Rs. 262. The decline in the other counters was equally sharp, with Telco receding from Rs. 270 to Rs. 260.50, National Rayon from Rs. 361 to Rs. 347.50, Dyestuff from Rs. 300 to

REORIENTATION OF EDUCATION

IT is, indeed, surprising that the Central Advisory Board of Education should have put forward a series of far-reaching recommendations at its thirty-first session held at Bangalore early this week. It is surprising because the recommendations would tantamount to prejudging the findings of the Education Commission, headed by Dr. D. S. Kothari. The Education Commission, as readers are aware, has been entrusted with the task of evolving a national pattern of education and enunciating the general principles and policies for the development of education *at all stages and in all its aspects.* Although the Commission has been asked to submit its final report before the end of March 1966, it is expected to submit from time to time interim reports where immediate implementation of certain programmes is considered necessary. Mr. M. C. Chagla, Union Minister for Education—it was Mr. Chagla who appointed the Commission—himself stated, while inaugurating the Commission at New Delhi on the 2nd instant, that he was most anxious that the Commission should give interim reports from time to time, so that the Government could immediately take action on its recommendations. Why, then, has the Central Advisory Board of Education ventured to suggest several changes in the meantime? What it should have done was to pose the issues for the consideration of the Commission, instead of itself taking firm decisions. For it is quite possible that some of the recommendations of the Board, which may be given effect to by the Government, may not find favour with the Commission, in which case both the Government and the Commission will find themselves in an embarrassing position.

Take, for instance, the Board's recommendation that the private sector should be barred from entering professional education. All professional colleges, including technical and medical, it is urged, must be started *only* by the Government in future. This is certainly an unrealistic and unreasonable plea. There are, of course, several cases of corrupt practices like the levy of capitation fees and the extortion of donations, not to speak of the low standard of education imparted by many private institutions. But such practices can easily be eradicated through the vigorous enforcement of regulations by the Central and State Education Departments. Merely because a particular system suffers from certain defects, it would be wrong to condemn it entirely and plead for its abolition. A look at the history of education in India and other countries will reveal that educational institutions sponsored and run by philanthropic bodies, charitable and educational trusts, and other private organisations are playing a significant role. But for these institutions, the progress in the field of education would not have been so appreciable, especially in the past few years. One, therefore, wonders whether all this good work should be set at naught and the springs of philanthropy and private endeavour choked.

Let the Governments, by all means, set up more and more colleges and technical institutes. And let them also take whatever steps they deem necessary to put an end to any unethical move to start professional institutions with the object of making profits and commercialising education. But it would be unwise to curb the useful activity of private institutions by vesting monopoly power in the State to establish professional colleges and institutes. Such monopoly power is bound to have one very disquieting effect, namely, misuse of authority. Attention may be drawn, in this context, to the reported decision of the Maharashtra Government requiring all entrants to engineering colleges and technical institutes in the State to execute bonds to serve the Government for a minimum period of two years after receiving their degrees or diplomas; any graduate engineer or diploma holder, wishing to free himself from the bond, would be required to pay Rs. 3,000 and Rs. 2,400, respectively, to the State Government. This decision is, to say the least, authoritarian and unjustified. The decision, besides restricting the freedom of students to accept employment of their choice, will deprive many private-sector companies of the opportunity to select the right persons at the right time. It is common knowledge that several companies have their own special schemes of training engineers and other technical personnel to occupy senior positions. The selection of candidates for such schemes is usually made from the ranks of young men fresh from a college or a technical institute for the simple reason that the social commitments of older persons are too high to be satisfied with the stipends paid during the period of training. Viewed thus, the reported decision of the Maharashtra Government to insist on bonds, as referred to above, will seriously affect both the companies and the students.

To revert to the deliberations of the Central Advisory Education Board's meeting. The Board has done well to urge legislation at the State level to ban any person from imparting education unless he is recognised by the State authority. All the State Governments, it is said, have agreed to introduce such legislation, and, on its part, the Centre has undertaken to send them a model legislation for the purpose. A sensible suggestion made by the Board is that legislative action should be taken to prevent unrecognised educational institutions from conducting examinations or awarding diplomas and certificates. Only two alternatives are open: the existing institutions should either be regularised by improvement in their educational standards or be closed down. Standards of education must always be kept as high as possible, and there can never be any compromise on this issue. The other sensible suggestions made by the Board include introduction of teaching of science in primary schools; a scheme to start *vigyan mandirs* in all the States with a view to enabling students to grow in an atmosphere of science and adults to take interest in science; diversification of courses even at the elementary stage in order to prevent pressure on universities and colleges; facilities for higher training; grant of scholarships to students securing top ranks in universities for pursuing further studies in any university of their choice; obligation on the part of professional colleges in each State to take in a certain percentage of students belonging to other States; production of low-priced textbooks; appointment of a central body for planning and implementing literacy programme; special measures for the education of girls; establishment of 1,000 model primary schools by the end of the fourth Plan; and setting up of centrally-sponsored secondary schools which would be as good as some of the best public schools, with emphasis on talent and with provision of scholarships to poor students.

The special importance attached to science teaching and higher education is only as it should be. The impact of science and technology has been so tremendous all over the world that, if education in India is not science-based, the country will not be able to catch up with the technological and scientific revolution that is taking place in other countries. The vital role played by science in the life of man was vividly described by Dr. Kothari in his speech delivered at the inauguration of the Education Commission. He said:

"It needs no reminding that the new thing in the modern world is science, or rather its cultivation on an intense scale, and its permeation into almost every aspect of our lives. The present world is science-based, even science (not scientist) dominated; and in this there could conceivably be no going back unless civilisation itself suffered a complete collapse, because of man's folly or inability to deal in a *human way*—that is, in the true interests of mankind as a whole—with the forces of almost cosmic dimensions that nuclear energy has placed in man's hands. The characteristic of science-based world is that it is no longer a place of slow and gradual change. On the contrary, the pace of change and innovation is almost terrific and these changes affect not only our material environment but also our cultural and social and, in the end, spiritual values as well. The *doubling period* of science is of the order of 10 years or so. . . . Science has given a new status and a new significance to work and, in this respect, the age of science differs from the classical civilisation. . . ."

These are, indeed, pregnant observations and they show how urgent it is to reorient education so as to make it science-based. Appropriately enough, three scientists of the Council of Scientific and Industrial Research, in the course of a special paper prepared by them, have urged the need for intensified scientific and technological research. If the country is to make a significant advance, investment in such research (

missions and polytechnics to 290 with 45,000 admissions. Significant though this progress has been, much yet remains to be done before the country can cope with the expanding requirements of trained manpower in the coming years. This calls for an integrated and statistical approach to the problem of technical education and training. The Central Working Group on Technical Education has certainly struck a note of realism when it says that, because of the large expansion that had already taken place in the field of technical education in the past 10-12 years, a stage has been reached when our institutions should be consolidated and standards improved. For this purpose, a major part of our resources and efforts should be concentrated during the fourth Plan on the training of teachers, improvement of courses, supply of equipment and instructional materials, post-graduate courses and research, and production of textbooks and standard works.

Whether in the field of scientific and technological research or in that of technical education or, indeed, in the entire sphere of education (elementary, secondary, higher and technical), there is the most pressing need for a uniform national policy. Virtually chaotic conditions exist at present in the education sphere, in view of the whimsical and short-sighted policies pursued by the Governments of different States. The recent shift in universities towards adopting regional languages as the medium of instruction is deplorable in the extreme and, if this shift is not reversed, there would be linguistic chaos in the not too distant future. The Kothari Commission would be rendering a distinct service if it lays down a national education policy that would not merely provide for a unifying language (English is most suitable in this connection) for all universities but also ensure uniformity in curricula in secondary and higher education. One of the necessary measures for evolving a national policy of education is to have an All-India Educational Service. Although this measure has been engaging the attention of the Government of India ever since Independence, it has not so far been given effect to because of the lack of adequate co-operation from the State Governments. It is, however, gratifying to learn now that all States, except Maharashtra, have agreed to the formation of such a Service. Maharashtra's refusal is ununderstandable. It is to be hoped that wiser counsels will prevail and that Maharashtra, too, will give its consent to the formation of an All-India Educational Service.

A thorough reorientation of education in both content and extent suited to the needs and aspirations of modern society will necessarily involve large-scale expenditure. When more and more are knocking at the gates of schools, to borrow the phrase of Mr. Chagla, and when there are not enough school buildings, teachers and textbooks, it is amazing on the part of some to suggest a reduction in expenditure on education. Barring Pakistan and Indonesia, India, we are told, is the only country to spend very little on education; even some of the African countries are spending more. Whatever be the justification for economy drives, education should never be a casualty. No improvement is likely to yield greater returns than investment in human resources, of which the most important component is education. Verily, any amount spent on education is the best investment that a country can make.

PLANNING COMMISSION

THE Planning Commission, whose establishment early in 1950 had been vainly opposed by Dr. John Mathai, the then Central Finance Minister, on the ground that it might develop into a "parallel Cabinet," is here to stay, having taken the country through three successive Five-year Plans. Whether, in the process, it has become a "parallel government," thereby bearing out the correctness of Dr. Mathai's stand which led to his resignation in May 1950, is, however, not wholly clear. Of course, the late Dr. Mathai's fears have been echoed, not without some reason, by several eminent bodies and persons in the light of the Commission's working. The Estimates Committee of Parliament and the Swatantra Party, for instance, have in different ways, voiced the same fears. The former Comptroller and Auditor-General of India, Mr. A. K. Chanda, has taken the view that the Commission has metamorphosed into a kind of "super-Cabinet," encroaching on the legitimate functions of several administrative Ministries. The present Union Finance Minister, Mr. T. T. Krishnamachari, has also urged that the Commission should soon "shed its present skin", thereby implying that this advisory and planning body should be divested of the executive authority which did not rightly belong to it at the time of its formation but which it has nevertheless arrogated to itself, in some measure, over the years.

It was only the late Prime Minister, Mr. Nehru, the father of the Commission, who did not say in so many words that his child had become another centre of administrative power. But even he had this to say about the Commission some ten months before his demise: "A closed body of people, who think and advise Government, has grown into a huge organisation, with all the departments of Government almost duplicated there and each one sending papers to the other. The administrative Ministries, too, have been referring matters of detail to the Commission." And thereby hangs a tale. It is this tale that is told in a timely treatise, just published by the Indian Institute of Public Administration, New Delhi (*The Planning Commission—A Descriptive Account*—by Dr. H. K. Paranjape). This study, the first in a series of studies of much wider scope and deeper content, purports to provide bare facts about the Commission, for, as the Director of the Institute has put it, "there has hardly been any recent development in the sphere of governmental organisation in India, comparable, in its practical importance and general significance, to the growth of the Planning Commission." But this particular study does not seek to evaluate the working of the Commission or to pronounce any judgment on its functioning. It is nevertheless broadly clear from the descriptive account of the Commission's organisation that what was originally conceived as a technical and advisory body, "free from the burden of day-to-day administration but in constant touch with the Government at the highest policy level," has grown into a mammoth machinery with its tentacles all round.

So big is that machinery at present that its own annual budget of expenditure is as much as Rs. 67 lakhs (1964-65), as compared with a mere Rs. 8.6 lakhs in 1950-51. This expenditure of Rs. 67 lakhs is exclusive of what is spent on the Programme Evaluation Organisation (Rs. 21 lakhs), the Research Programmes Committee (Rs. 13 lakhs) and the Committee on Plan Projects (Rs. 9 lakhs). The present staff strength of the Commission proper is nearly 1,100, as compared with about 250 in 1951-52, while the P.E.O. and the C.O.P.P. have together a 600-man staff now. This huge increase in staff strength, incidentally, has not been in accordance with the late Prime Minister's wishes. Mr. Nehru, it will be recalled, had urged at the outset that the Commission "should go slow about the engagement of staff" and that the emphasis "should be mainly on recruiting enthusiastic young men from outside the Service, especially for research posts." But what has actually happened is that. besides having such researchers (good, bad or indifferent), the Commission has duplicated the staff hierarchy of administrative Ministries with their secretaries, joint secretaries, deputy secretaries, under-secretaries, superintendents, upper division and lower division clerks, etc. Set against the fact that there are as many as 30 divisions, units and branches with their 50 secretaries, advisers, chiefs and directors, it is no wonder that staff proliferation has come about at all levels in accordance with Parkinson's Law. But one may also wonder whether so many cooks are not spoiling the broth of planning.

The Commission's composition, too, with its ever-changing pattern, has conformed neither to the ideas of the Advisory Planning Board (1946) nor to the initial ideas of Mr, Nehru himself. The Advisory Planning Board, it will be recalled, had recommended that "no Minister should be a Member of the Planning Commmission and that it should be, as far as possible, a non-political body, whose members will not fluctuate with changes in political fortunes." It had also suggested two alternative compositions —one involving a five-member body (with a person of standing and experience in public affairs as Chairman, two non-officials having knowledge and experience of industry, agriculture or labour, a Government official having knowledge and experience of finance and general administration and a person eminent in the field of science and technology) and the other involving a smaller and more compact three-member body (with a person of standing and experience in public affairs as Chairman, a non-official with knowledge and experience of industry and a Government official, preferably with some experience of finance). Although the Advisory Planning Board's approach was not fully adopted, at least all the Members were working full time for the Commission at the beginning and the Prime Minister, as Chairman, constituted the only link with the Cabinet. But, what is the position now? There are as many Minister-Members as there are full-time Members in the Commission, the total membership varying, from time to time, from 10 to 12. This pattern, as it has evolved over the years, is sought to be justified on the ground that, "in the Indian context, planning must have the closest connection with the administration, if it is not to risk becoming a mere academic exercise." Whether the presence of so many Minister-Members in the Commission has had the effect of making that body a virtual department of the Government is a relevant question. Or, whether its full-time Members, by virtue of their full-time work and expertise, have been able to influence or dominate the Minister-Members and thereby exercise some authority over the Government itself is an equally pertinent question, albeit in the converse. These questions will perhaps be answered in the Institute's future study on the actual working of the Commission.

Pending such a study, it should be possible to infer broadly whether or not the Planning Commission has developed, or sought to develop, as a "parallel government" or as a "super-government." It would be eminently useful, in this context, to highlight the more relevant "factual" observations in Dr. Paranjape's study:

1. By its charter, the Commission has to bear responsibility for formulating a National Plan and for recommending the policies and programmes required for its implementation. At the same time, it is purely an advisory body and, for ensuring that its proposals are accepted and carried out, it has to depend on the close co-operation, collaboration and goodwill of the Union Government and the State Governments.

2. On the other hand, because of the position that the Plans have come to occupy in the economic and administrative life of the country, the Union Ministries and the State Governments have also come increasingly to depend on the Commission for support and advice. Because of the importance that has come to be attached to the advice of the Commission in matters relating to economic policy and development, a convention has grown up that important proposals relating to the economic field should be referred to the Commission for advice. Because of various factors . . . the State Governments have come to rely increasingly on the Union Government for financing their development plans and the recommendations of the Commission carry considerable weight in the Union Government's decisions about such assistance.

3. The Commission also has a special role to play *vis-a-vis* the Ministries at the Centre. The Ministries are the main executive agencies for many of the development programmes. They are headed by powerful political personalities and have more technical expertise, administrative competence and traditional authority in their respective fields than the Commission has. The Commission has to find ways of working with them, at the same time advising and guiding them to work along lines that might not always appeal to them. And it has to do this without any definite and formal authority over them.

4. The Commission has acted, to some extent, as a constructive but informal mediator regarding development problems that involve inter-State or Union-State differences. It has evolved organisational devices and working processes whose object is to ensure that the different operating agencies are in various ways involved in the planning process. Because of its composition, especially the fact that the Prime Minister and some other senior Ministers have been its members, and also because of the approach, the expertise and the working methods developed by it, the Commission has acquired prestige and has built up for itself a position of influence in the machinery of State. Not having any formal executive authority of its own has, therefore, not proved to be a handicap in the functioning of the Commission in regard to formulation of Plans. The implementation of Plans naturally rests with the executive organs of Government, both at the Centre and in the States, and the Commission does not seem to have always been able to ensure that these operate in a way which would lead to successful and effective implementation.

The broad inference from these observations may be that the Planning Commission, though lacking formal executive powers, has somehow come to be deeply involved in administrative affairs, thereby assuming some authority over the Union and State Governments in a stealthy or informal manner. If that is a valid (?) inference, it would strengthen the hands of those who seek to confine the Planning Commission's role to planning in its technical sense, to helping the Union Finance Ministry in co-ordinating the State Plans and to advising it in the allocation of resources, and, what is more, to reinforce that Ministry's prerogative pertaining to co-ordination of economic policies.

MARKET GOSSIP

Another Foreign Exchange Control

ONE more control on foreign exchange is being introduced. Thus, with effect from the 1st of next month, all inflows of short-term banking funds into India and their flow outside the country will be brought under the control of the Reserve Bank of India. In accordance with the decision taken by the Reserve Bank, no authorised dealer in foreign exchange will be permitted to obtain loans and overdrafts exceeding Rs. 20 lakhs from branches and correspondents, whether in or outside the sterling area, without the prior approval of the Reserve Bank. At present, it may be noted, the authorised dealers are allowed to grant freely short-term loans and overdrafts to branches and correspondents in sterling area in the course of their normal exchange business. The limit of Rs. 20 lakhs will apply to the total amount outstanding on account of all the branches/offices in India of an authorised dealer with all his branches/correspondents outside India. In this connection, the Reserve Bank has issued the following two directives:

1. If the above limit is exceeded on account of unexpected drawings under letters of credit, etc., the position should be squared within three days, failing which specific approval must be obtained from the Reserve Bank for the excess limit in terms of the procedure laid down for the purpose.

2. If any authorised dealer in foreign exchange wishes to have a higher limit than Rs. 20 lakhs and/or if he has already obtained loans and/or overdrafts from his branches and correspondents in excess of this limit, he should make an application to the Reserve Bank giving particulars about the amount and purpose of the limit, the period for which the limit is required, and the rate of interest to be paid on the loans and overdrafts. The application has to be made even if the Reserve Bank has previously agreed to a higher limit.

All applications for higher limits, it is said, will be considered on merits. Ordinarily, permission will be given for receipt of loans and overdrafts though only on a term basis for a period not less than thirty days. The rate of interest payable on such outstandings will be determined in each case.

The Reserve Bank's move to regulate short-term banking funds from abroad has apparently been prompted by two considerations. In the first place, such a regulation will make the credit control measures, announced on 25th September last, more effective. Secondly, the regulation will also avoid any strain on the balance of payments position through a sudden outflow of funds caused by comparatively higher interest rates abroad.

Gold Control Rules Valid

The uncertainty regarding the validity and constitutionality of the Gold Control Rules, promulgated by the Government of India on 9th January 1963, has now been removed by the Bombay High Court. Dismissing a writ petition (on Friday last week) filed by some traders challenging the validity of the Rules, the Court held that the object of the Gold Control Rules was to check smuggling and reduce the demand for gold in the country, thereby conserving foreign exchange for defence and development needs. This object, Mr. Justice Tambe declared, was capable of being related to the defence of the country and to the maintenance of supplies essential to the life of the community. Section 44, according to him, does not act as a fetter on the rule-making power of the Government under Section 3 of the Defence of India Act, as those provisions relate to administrative or executive Acts and not to delegated legislation, and it is not necessary to decide whether Section 44 is mandatory or merely directory in effect, as urged on behalf of the respondents. Mr. Justice Naik, who gave a separate judgment while concurring with Mr. Justice Tambe, opined that clause 33 of Section 3(2) of the Defence of India Act explicitly enabled the Union Government to make rules regarding "controlling the possession, use or disposal of, or dealing in, coin, bullion, bank notes, currency notes, securities or foreign exchange."

The petitioners, it will be recalled, had contended that the action of the Union Government in issuing the Gold Control Rules under the Defence of India Act was to circumvent the constitutional protection granted under Articles 14 and 19 of the Constitution. As it was done with the *mala fide* object and intention of rendering the Gold Control Rules immune from challenge and to take undue advantage of the Emergency, they had stated, a fraud had been committed upon the Constitution. Further, it was argued that the Rules prevented people of the Jain faith from carrying out their religious customs, as it prohibited their offering of pure gold to the deity and thereby violated their fundamental rights. The petitioners had also contended that the Rules were *ultra vires* Section 3(1) of the Defence of India Act.

Whatever the legal interpretation of the Bombay High Court, Gold Control does not seem to have still met with success. Almost every day one reads in newspapers reports of seizures of smuggled gold. An official estimate places the total quantity of contraband gold seized by the customs and excise authorities during the first seven months of the current calendar year at 942 kgs. valued at Rs. 50 lakhs at the international price. Further, the surreptitious presentation of 22-carat gold ornaments on important social occasions like marriages continues even now. Several goldsmiths are reportedly engaged in manufacturing ornaments of more than 14-carat pureness in the houses of consumers as well as in their own homes. It is not surprising, therefore, that prices of pure gold continue to rule high. Pure gold, in unofficial dealings, is currently quoted in the Bombay market at Rs. 115 per 10 grams (0.85 tola), which is well above the international price of Rs. 53.12 and the rate of Rs. 105 prevailing before the promulgation of Gold Control Rules. The purpose for which these Rules were framed can be served well only if (*a*) the Rules are enforced effectively by strengthening the administrative machinery, (*b*) the watch against smugglers is redoubled, and (*c*) the Government launches a country-wide campaign against purchases of gold ornaments and restores the confidence of investors in equities.

Statutory Prices For Foodgrains

The Government of India announced this week the maximum and minimum producers' prices for rice (paddy) and all other foodgrains. The maximum ex-mill, wholesale and retail prices have been announced only in the case of rice (milled). In the case of other foodgrains, these prices will be announced at harvest time early next year. The price structure, incidentally, is more or less the same as recommended by the Jha Committee. The prices announced are only for standard varieties, effective at the specified centres. The State Governments have been authorised to determine the prices for other varieties and at other centres, keeping in view the prices fixed by the Union Government. Mr. C. Subramaniam, Union Food and Agriculture Minister, while announcing these prices at a press conference in New Delhi on the 13th instant, said that the prices had been fixed only on an *ad hoc* basis in the light of prevailing conditions, as it would require a more detailed technical assessment to take a long-term decision. This latter task would be assigned to the Agricultural Price Commission which is to be set up in January next year to recommend the long-range price pattern.

The maximum prices of paddy and rice, as fixed by the Government for different States, are as follows:

(Rupees per quintal)

State	Paddy	Rice: ex-mill bagged	Rice: wholesale	Rice: retail
Andhra	39.00	64.33	69.03	71.00
Bihar	36.00	59.67	66.13	68.00
Gujarat	40.00	64.10	69.56	72.00
Kerala	41.00	66.68	71.76	75.00
M. P.	35.00	56.70	62.95	65.00
Madras	39.50	64.45	67.72	71.00
Maharashtra ..	41.00	65.50	71.06	73.00
Mysore	37.50	62.25	67.75	71.00
Orissa	35.00	59.50	73.20	67.00
Punjab	36.00	60.00	65.00	68.00
Rajasthan ..	36.00	60.00	65.00	68.00
U.P.	36.00	60.00	65.00	68.00
W Bengal ..	38.50	64.30	67.80	70.00

In the case of Maharashtra, the price for paddy is the same as declared earlier by the State Government. It is, however, likely to be revised downward in consultation with the State Government. The prices are inclusive of all taxes payable upto the previous stage. The maximum prices for paddy are higher by one rupee per quintal than the producers' support prices at which the Government will be prepared to purchase all paddy offered at the assembling points.

The producers' prices fixed for other foodgrains for the 1964-65 season are as follows:

Wheat: Rs. 45.50 for Red variety, Rs. 49.50 for Common White variety and Rs. 53.50 for Superior variety.

Gram: Rs. 40.00 to Rs. 40.50.

Jowar: Rs. 38.00 to Rs. 38.50 for Yellow variety, with suitable margins for Red and White varieties.

Bajra: Rs. 40.00 to Rs. 40.50 f.a.q.

Maize: Rs. 36.00 to Rs. 36.50 f.a.q.

For gram and coarse grains, the actual prices will be announced by the State Governments within the ranges mentioned above.

Regarding the enforcement of these prices, the Food and Agriculture Minister said that the Government would be prepared to purchase all the foodgrains offered to it at the minimum statutory prices, so that, whenever there was a declining tendency, the cultivator could sell his produce to the Government at these prices instead of selling to the trader at prices lower than these minima. As against this, when prices show a tendency to rise above the maximum statutory level, "the Government will not hesitate to requisition the stocks."

The producers' prices, as fixed by the Government, are higher by about 30 per cent, as compared with the erstwhile procurement prices and by roughly Rs. 4 per quintal, as compared with the average post-harvest prices during the past three seasons. These prices will thus be more remunerative to the producers. As regards consumers' prices, these have been fixed more or less at the existing level, and a margin of 4 to 7 per cent (including transport charges) has been allowed to the retailers. The reduction has been mainly in the wholesalers' prices and, according to the Government's estimates, the wholesale price index for foodgrains would go down from 146 to anywhere between 125 and 130. This reduction will be due to the drastic cut in wholesaler's margin to 1.5 to 2 per cent (including transport charges). Mr. Subramaniam has claimed that these prices allow "reasonable costs and margins for the intermediaries." In other words, the increase in producers' prices, according to the Minister's claim, has been effected not at the expense of consumers but at the expense of foodgrain dealers. Whether the trade has been consulted about the margins and whether it has agreed to them informally or otherwise are not known at the time of going to press.

Wages-in-kind Scheme To Be Dropped?

The labour laws that are binding on the private sector should apply equally to public-sector undertakings. There can be no two opinions on this issue. But the views expressed from time to time by the employing Ministries of the Central Government on the various labour regulations or welfare measures proposed by the Union Ministry of Labour seem to suggest that they want a privileged position in this matter. A recent example was the stand taken by these Ministries on the recommendations of the Bonus Commission. They suggested, in this connection, that the public-sector undertakings should be governed by a different set of rules regarding payment of bonus. More recently, they were reported to have suggested to the Labour Ministry that some changes should be made in the rules regarding the settlement of labour disputes. The suggestion here was that, if conciliation were to fail in any employer-employee dispute in the public sector, the Labour Ministry should consult the employing Ministries before taking any further steps to settle the dispute; this was a plea for departure from the existing system.

Presently, these Ministries are reported to have objected to the proposal for paying, in kind, a part of the wages to workers. It will be recalled that the scheme, worked out by the Indian Labour Conference at Bangalore a few months back, envisaged the opening of fair-price shops in all the industrial establishments in the public and private sectors employing more than 300 people. Under that scheme, whereas rice, wheat and sugar were to be supplied by the Government at controlled prices, pulses, vegetable oils and textiles were to be purchased by the employers at wholesale prices and supplied to the workers at these very prices. It was further envisaged that the cost of distribution should be borne by the employers. The total working capital outlay on the transactions, involving payments in kind upto 50 per cent of the wages, was estimated at Rs. 225 crores in a year. This scheme, it is reported, is not likely to be implemented in the immediate future, thanks to the attitude of the employing Ministries.

Incidentally, it is not meant to convey here that the scheme is desirable in itself and would do good to the economy. Its implications have already been discussed in a recent issue of *Commerce* dated 15th August 1964 (*vide* page 251). The huge outlay of Rs. 225 crores that will be involved in the possible implementation of the scheme can better be invested in new industries and other productive fields. The consequent increase in production will definitely help in restraining inflation much more effectively than the implementation of the scheme. Moreover, the scheme, if implemented, is bound to be viewed as discriminatory in its coverage even within the private sector and will, therefore, breed discontent among those who are not covered. It would be prudent to abandon this proposal in view of its manifest drawbacks and disadvantages.

Revision Of Patent Law

It is well known that "patents" granted under the appropriate statute to inventors and pioneers guarantee the inviolability of their inventions, be they new products or new processes, and protect them for a reasonable period of time against imitation and piracy by others. The "reasonable period" here is normally 15-16 years—a period considered absolutely necessary all over the world for enabling the inventor to recoup, partly or wholly, from his own commercial exploitation of the particular invention or from the royalty income therefor, the development expenditure he had incurred thereon. Incidentally, this is also the guaranteed period for patent protection under the Indian Patents and Designs Act which, in the wisdom and foresight of its original framers, was designed to stimulate industrial research and industrialisation of the country. That the 16-year "term of patent" under this Act is now proposed to be reduced to a seven-year term is indeed disquieting. It is disquieting for more reasons than one.

There can be no gainsaying that an industrialising country like India needs, *more than ever*, a strong patent system to encourage inventions, to provide the financial basis and incentive for substantial research, to disseminate technology and know-how widely, to permit development of inventions into marketable products and generally to stimulate the growth of industries and the national economy. The italicised words (more than ever) in the foregoing sentence are significant, because with industrialisation becoming increasingly diversified and sophisticated, the range of new products and processes required is widening all the time. A strong patent system is particularly necessary for a developing nation like India for obtaining foreign technology and know-how to provide the foundation for indigenous research and development, for interesting foreign technology and research in solving local problems, for encouraging and retaining substantial foreign capital, and for facilitating the flow, where necessary, of patented products from other countries.

That these manifest advantages of the patent system would be brought to nought by the proposed amendment of the Indian Patents and Designs Act is the emphatic opinion of the Indian Chemical Manufacturers' Association which has just submitted a memorandum to the Government of India on the subject. The Association has advanced a strong plea for improving the existing law so as to prevent its being

TREND OF SHARES

DOWNWARD DRIFT

(From Our Own Correspondent)

BOMBAY, 14*th October*

DURING most of the week, Dalal Street tended to drift downwards on tired bull liquidation and virtual lack of follow-up support. Today, however, the market staged a late rally in selected scrips and the list showed small variations either way. The pattern at the close of the week may be termed a mixed one on the basis of prices, but there was no doubt that the market lacked inherent strength. The absence of inquiries at higher levels suggested that the general public had no interest in following up the rise.

Steel shares were well held with Indian Iron in the lead, improving from Rs. 24.88 to Rs. 25.15. Tata Ordinary followed with a rise of one rupee to Rs. 147. Indian Iron was well supported by Calcutta operators, but, by and large, interest in steel shares will continue to be of a professional nature until some time to come or at any rate until new factors emerge. The market at present is influenced mainly by the cotton mill shares which were generally subdued. Bombay Dyeing declined from Rs. 59.20 to Rs. 58.10, but the sharp decline in these scrips was understandable. Century was a shade lower at Rs. 604.50 and Kohinoor lost four points to be quoted at Rs. 316. Standard managed to gain a few points to close the week at Rs. 613, but Svadeshi was quiet at Rs. 261. Sentiment in mill shares was induced by the Government's policy about cloth prices and the market now feels that the industry has virtually lost its hold on the price of the commodity it produces. The price of cloth in the controlled sector is to be fixed in future in relation to the price of cotton at a given time, but market men argue that there are many items, besides cotton, which go into the cost sheet of cloth. The fear, therefore, is that controls will ultimately tend to hit the profit-margin of the industry. Reports from the export side are none too encouraging. In these circumstances, support to mill shares will necessarily be reserved.

Activity in the other sections was rather thin during the week. In the rayon section, National Rayon maintained a steady tone at Rs. 347.50, thanks to a late rally today. Factorwise, nothing very much had happened to induce fresh support, but the rally was due mainly to strong professional support. The long-awaited cut in excise duty on rayon is yet to come and one wonders whether it would ever come. Among other rayons, Indian Rayon were better at Rs. 60.50, as against Rs. 58.50 and Baroda Rayon improved from Rs. 67 to Rs. 68.50. South India Viscose was unchanged at Rs. 113. Sugar shares made a mixed pattern. While Belapur eased by two points to Rs. 223.50, Maharashtra was better at Rs. 140, as against Rs. 138. There were no developments as such in sugar to induce the shares one way or the other and they rose or fell on investors' whims and fancies.

Among Chemicals, Tata maintained a steady tone at Rs. 19.16, but, during the week, the shares lost considerable ground as the dividend at Re. 1.40 gross, which works out to a net figure of Re. 1.28 which is much higher than the last year's figure of 70 paise net, fell short of market expectations. The working results of the Company appears to be satisfactory, but good news as such may not always cheer the market when it has been expecting better results. Indian Dyestuff was fractionally easier at Rs. 289 and, with all the known factors discounted, these shares are likely to remain dull for some time. Synthetics, which has been declining consistently, was down again by six points to Rs. 76. Rubber tyre shares were dull and it looked as though they had been left alone. Premier was steady at Rs. 79.50. The performance of these shares, in fact of rubber shares as a whole, should be watched.

The increase in the dividend announced today by the Scindia Steam Navigation Company was well received by the market and the shares promptly reacted to the news by a rise in the quotation to Rs. 16.04. In fact, the shares had been done down earlier on heavy liquidation owing to fears that the dividend might be lower than expectations. The lowest touched on Monday was Rs. 15.68. The Company is said to have fared well, but figures were not available. Last year, dividend had absorbed Rs. 56.32 lakhs and, obviously, it will take up about Rs. 16 lakhs more this year. The net dividend works out to one rupee, as against 70 paise last year, and yields a little more than 6 per cent. Great Eastern Shipping was better at Rs. 12.12, as against Rs. 11.88.

Electricity shares were dull and quiet with Tata Power at Rs. 1.287.50 and Ahmedabad Electricity at Rs. 105.00 (as against Rs. 106.50). Banks and insurances were virtually neglected. The cash section was also dull and transactions were few and far between. It is difficult for the cash section to maintain its tempo at a time when futures lie low. Moreover, with the continued rise in the prices of foodgrains and other articles of daily necessity, investors are able to conserve little cash to buy shares. Some of the shares mentioned more than others were Associated Bearings which were down from Rs. 102.50 to Rs. 102 and Sandvik which declined from Rs. 175 to Rs. 170. S.L.M., however, were up from Rs. 146 to Rs. 151.

Knowledgeable circles do not attach much significance to the show of steadiness during the week on the part of some of the leading counters, for, according to them, some recovery was and is still due and necessary, in view of the continued decline over the past five weeks. As pointed out last week the comparable levels are those of 24th July and, barring one or two scrips, others are still comfortably above these levels. It is, therefore, possible that the market may stage a rally, but factors seem extremely unhelpful to support the market. No incentives have been forthcoming from the Finance Minister and none is likely to come until the next budget, if at all any is coming. And the budget is still a long way off. Further, bulls have burnt their fingers badly right from 22nd September and, crippled of their financial resources, they just do not have the courage to make fresh commitments. In fact, they have just got out of the market which has now to find fresh bulls. It is on the cards that investors, too, would wait until such time as the market gives some clear indication of an upward move. Thus, circumstances are anything but favourable for a rise, although one should presume that the primary uptrend is still intact so long as the year's lows are not violated. These levels are still too far down.

• • • •

The Calcutta Stock Exchange remained closed for Puja and activity in Madras was rather restricted. Here, too, the market was in a holiday mood and activity was confined to textile shares. Banks, sugars and electrics were generally neglected. Selected plantings came in for support and both Neelamalai and Nelliampathy were better. Mettur Chemicals and Tube Investments attracted some inquiry, but FACTS, in the miscellaneous section, declined to Rs. 5.10. Among bank shares, Indian was in demand at Rs. 154. Bangalore Woollen, among textiles, was in good demand at Rs 265 and Buckingham was favoured around Rs. 276.

MARKET GOSSIP

(Concluded from previous page)

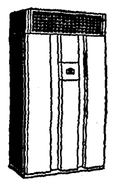
practice. Its suggestions are to the effect that (i) patents should be granted only for a process and not for the product manufactured by such process, (ii) the life of a patent grant should be restricted to ten years only and not 16 years and (iii) there should be compulsory licensing of the patent promptly and automatically, in those cases where the patentee may not take sufficient and concrete steps for working the invention locally, within four years from the date of the patent grant, and the quantum of royalty to be paid for the purpose should be fixed by Government in those cases where the parties may fail to reach an agreement. While the Association has advanced this general plea applicable to all fields of industry, it has done well to make a special plea on behalf of the pharmaceutical industry in view of the fear that patents in respect of pharmaceuticals might even be discontinued. The Association's arguments, in this connection, are quoted below:

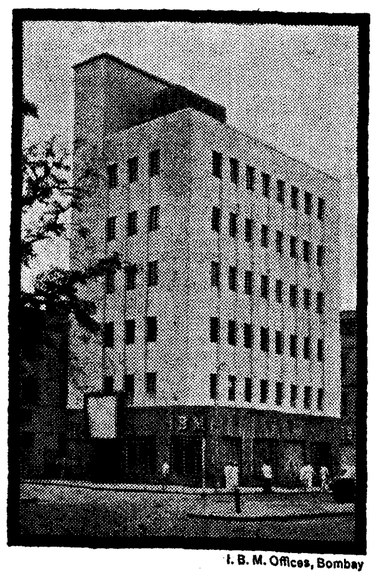
"It is a well-known fact that the drugs industry in India has rapidly progressed during the last decade in collaboration with foreign entrepreneurs and by establishment of subsidiaries of some internationally well-known firms in India. The benefit of their intensive research and the huge investment made thereon have been made available to us by a short-cut through the patent system in our country. Establishment of research organisations equipped with all the modern facilities is a costly proposal for any single unit, particularly in our country where the unit size of a plant is much smaller and financial resources meagre, as compared to its counterparts in the highly developed countries. As such, it will be necessary to borrow the technical know-how for some time to come and it is only a guarantee of protection and security that will attract foreign investment to our country.

"To the extent that research and development is discouraged and the technical progress of the drug industry is slowed down, with the abolition of patent protection, effect will also be felt not only in the domestic markets but also on its exports to other countries. The Government is relying upon the industry to achieve a major expansion in its export earnings in the coming years. Without access to new discoveries or developments of any significance, Indian exports must suffer a setback. Also it has to be remembered that the sale of products produced by copying patented processes will be restricted by overseas inventors where their inventions are protected by valid patents in other countries."

The present indications, however, seem to be that, instead of abrogating patents relating to drugs and food products, the Government wants to reduce the "term of patent" to seven years and to provide for compulsory licensing at a fixed maximum royalty of two per cent. This proposal amounts to substantial weakening of patent protection for drugs, inasmuch as the effective period of such protection woud then be no more than two-three years. This will be so, because there is a time-lag of four or five years between the date of application for grant of patent and the introduction of the product in the market. The time-lag here is on account of extensive pharmacological, toxicological and dosage studies, clinical trials, further trials and studies required by the Drugs Controller before he grants a licence to manufacture, import of equipment, and other formalities. In view of these factors, the pharmaceutical industry is against any reduction in the present 16-year period of protection for patents. As for compulsory licensing, the industry's stand is that a ceiling should be placed on royalty. The pharmaceutical industry's expectations and the I.C.M.A.'s pleas are thus substantially identical. For its part, the Government would do well to finalise its proposals in a manner that would be conducive to the encouragement of research and inventions in this vital field.

YOU CAN COOL A WHOLE FLOOR OR AN ENTIRE BUILDING





I. B. M. Offices, Bombay

WITH BLUE STAR-WORTHINGTON PACKAGED AIR CONDITIONERS 5, 7½, 10 TONS

Give yourself a package deal. Buy comfort with Blue Star-Worthington Packaged Air Conditioners.

These versatile units may be used free standing or with ductwork. Individually they can cool from 1500 to 3000 sq. ft. of floor space; in multiples they form large tonnage central systems to cool a whole floor or an entire building effectively, economically, efficiently.

They offer you the added advantage of flexibility—you can add more units with minimum alterations, as your needs increase.

Blue Star-Worthington Packaged Air Conditioners are ideal for offices, banks, restaurants, canteens, clubs, showrooms, shops, stores... For your next air conditioning job, call in Blue Star.

Get complete details from BLUE STAR offices at:

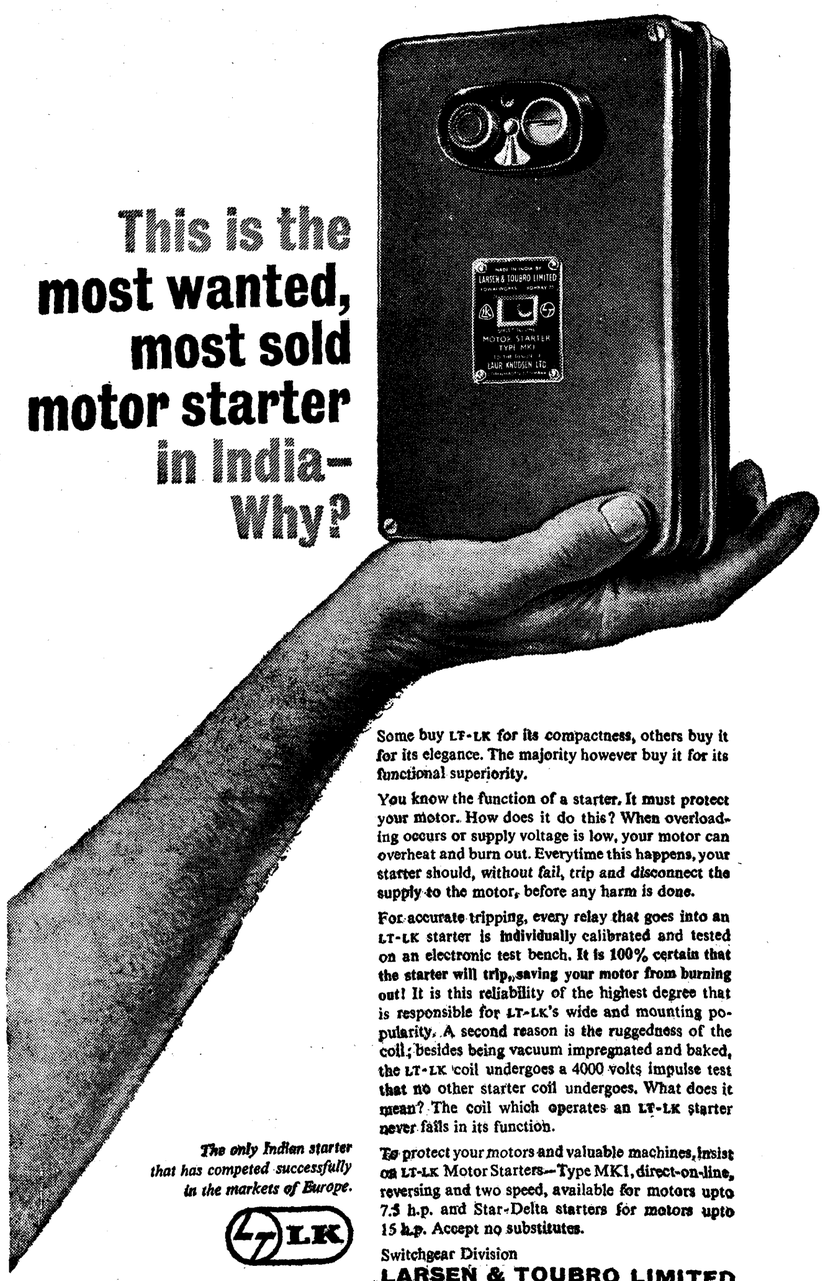
Climate Engineers to Industry Business and the Home

This is the most wanted, most sold motor starter in India—Why?



Some buy LT-LK for its compactness, others buy it for its elegance. The majority however buy it for its functional superiority.

You know the function of a starter. It must protect your motor. How does it do this? When overloading occurs or supply voltage is low, your motor can overheat and burn out. Everytime this happens, your starter should, without fail, trip and disconnect the supply to the motor, before any harm is done.

For accurate tripping, every relay that goes into an LT-LK starter is individually calibrated and tested on an electronic test bench. It is 100% certain that the starter will trip, saving your motor from burning out! It is this reliability of the highest degree that is responsible for LT-LK's wide and mounting popularity. A second reason is the ruggedness of the coil; besides being vacuum impregnated and baked, the LT-LK coil undergoes a 4000 volts impulse test that no other starter coil undergoes. What does it mean? The coil which operates an LT-LK starter never fails in its function.

To protect your motors and valuable machines, insist on LT-LK Motor Starters—Type MK1, direct-on-line, reversing and two speed, available for motors upto 7.5 h.p. and Star-Delta starters for motors upto 15 h.p. Accept no substitutes.

The only Indian starter that has competed successfully in the markets of Europe.

CLOTH PRICES

WIDE confusion prevails in cotton textile circles over the pattern of prices that are to be fixed for the controlled varieties of mill cloth. The confusion is because of the highly complicated nature of the schedule of realisation multipliers for the cloth packed by mills after the 14th of this month. Although there are only four controlled varieties (*dhotis, saris,* longcloth and shirting), which account for 45 per cent of the total mill cloth production, the schedule fixes realisation multipliers for innumerable categories of the controlled cloth. The number of categories in the case of *dhotis* and *saris* alone is 76, divided equally between the two. Provision is made for calculating the prices of grey cloth with adjustments provided for the use of superior and foreign cotton, as well as for the various processes such as bleaching, mercerising, dyeing, printing, sanforising, oiling, backfilling and finishing. Further, stipulations have been laid down for adjustments to be made to the multipliers for variations in counts. Allowances have been made for combing, dobbies, jacquards, drop boxes, charges for use of doubled yarn in the border of *dhotis* and *saris.* Extra allowances for mulls and voiles and charges for the use of artificial silk yarn, too, have been indicated. Again, while fixing the processing charges, the schedule lays down basic minimum specifications of each process which is required to be fulfilled if the charges are to be admitted. The fabrication specification and definitions are to be notified by statutory orders passed by the Textile Commissioner. So far as *dhotis* and *saris* are concerned, the particulars include the counts of warp and weft, reed and picks and the width of the cloth.

The foregoing details bring out the highly complicated nature of the schedule of realisation multipliers for controlled cloth. It will, therefore, take quite a bit of time for all the mills to familiarise themselves with the various intricacies and complete the switch-over. Viewed thus, the fear expressed by some that there will be a considerable shortage of supplies of controlled varieties during the forthcoming *Diwali* days is not exaggerated.

When no one could have had time to calculate the prices of the controlled varieties as per the schedule of realisation multipliers, it is somewhat strange that certain interested sections are carrying on a propaganda to the effect that the schedule is highly beneficial to the mills. Mill circles concede that the multipliers are on the whole not unreasonable, but they point out that, in some respects, the multipliers do not fully reflect the increases that have occurred in the prices of the different elements of production costs. Indeed, the prices that will be fixed under the multipliers, according to these circles, will generally be lower than the prices which were stamped under the Voluntary Price Regulation Scheme, the coarse and medium grey varieties being the worst sufferers. The Indian Cotton Mills' Federation feels that there is a strong case for an upward revision of multipliers for grey and medium cloth. The Government of India may not agree with this view, but there is certainly no substance in the contention of some parties that, as a result of the multipliers, the prices of the controlled varieties will be not only not reduced but actually be raised from the existing levels. It is a pity that the Government of India, swayed by this contention, has just effected a downward revision in the realisation multipliers in respect of nine out of the thirteen groups mentioned in the schedule of prices released on the 1st inst. If it is supposed that the consumers will gain as a result of the downward revision, the supposed gain, as the Federation has clearly warned, would be illusory, inasmuch as the resultant uneconomic prices would lead to a sizable drop in the output and availability of cloth. This, surely, is not the object of the scheme of partial textile control.

INDUSTRIAL COSTS

The relatively high prices of Indian industrial goods continue to cause anxiety from the point of view of not only domestic consumption but also export promotion. This anxiety is widely shared by the public, the Government and the industry itself. In giving expression to it, Mr. H. C. Dasappa, Union Minister for Industry and Supply, who addressed the 37th Anniversary Celebrations of the Maharashtra Chamber of Commerce at Bombay on the 10th instant, has, however, sought to put industry in the dock for a situation for which it has not been wholly responsible. He said:

> "The Indian public has, in the last fifteen years, accepted without much demur the sacrifices imposed on it in the form of higher prices in order to develop Indian industry. But, unless the industry, in turn, is able to prove that these sacrifices have been worthwhile in the sense of rapid development of industry with a consequent reduction in costs and improvement in quality, I fear, it cannot continue to claim the goodwill of the ordinary consumer."

Although this is a partial assessment, there can be no disputing the point that the goodwill of domestic consumers is important. But then, the goodwill of foreign consumers of Indian goods is no less important, for, unless Indian industries can compete in world markets, too, they will never be able to achieve a sound stable footing. It is in this context that some pertinent questions cry out for answers. These are: (i) What are the factors responsible for the high costs of production and how can they be eliminated? (ii) What are the new factors, the introduction of which can bring down costs, and how far is their introduction possible? (iii) What is the Government doing and what can it do in the matter?

One of the important factors contributing to a rise in costs, it is well known, is the ever-increasing incidence of excise duties and other indirect taxes. In a developing country like India, where there is almost an unlimited demand for industrial products, the indirect taxes cannot have disinflationary effects. They will simply increase the prices of (i) intermediate goods and raw materials and thereby add to the manufacturing costs of finished goods and (ii) consumer goods and thereby increase living costs and thus wage costs in industry. There is thus hardly a case for increasing excise duties to fight inflation; if anything, there is a case for judicious reduction of such duties as add to manufacturing costs. But it must be emphasised, at the same time, that there is considerable scope for cost consciousness and cost reduction in manufacturing processes.

Mr. Dasappa, in his address, highlighted the importance of incentives and the part they could play in a competitive market. He said: "The incentive for reducing costs in a normal market economy comes from the fact that there is keen competition and, unless the producer is able to cut his costs, he will not survive. Unfortunately, in a developing economy wherein a vast market is being opened up behind the protective walls of restricted imports, the normal incentives to cut costs do not operate to the same extent." As the country is faced with an acute shortage of foreign exchange, it is not possible to abolish import restrictions. Nationalisation is also not a solution to the problem, because it will simply create a monopoly in the public sector and crush even the already prevalent competition between the various producers. There are thus only two ways of providing incentives. Firstly, production may be increased so that a greater element of competition may be generated in the market. Secondly, fiscal incentives may be provided by way of income-tax reliefs and the like so that the entrepreneurs may feel that he is getting some special benefits because of his investments and efforts to bring down costs.

What facilities, one may ask in this connection, has the Government provided for increasing production? Mr. Dasappa referred to the activities of several financial institutions catering to the capital requirements of industries and to the increasing supply of power, transport and technically skilled personnel, and added: "In terms of facilities, the Indian industrialist has more of them than he ever had before." It may be in order to point out here that in a planned economy such phrases as "more than ever before" or "creation of new records" are not unique in themselves. For, if it is really a growing economy, new records should automatically be established every year of the Plan period and every month of the year. If they are not, then it is not a growing economy and all the planned efforts and investments may be taken to have been wasted. So, there is nothing remarkable about enhancing the facilities. What is important is to consider whether this increase has been commensurate with the desired and planned growth of the industrial sector; and here even Mr. Dasappa will perhaps agree that the facilities have not increased to the required extent. For instance, it is an uphill task to get a licence for establishing a new industry. Even if one gets the licence, it is still more difficult to get an assured supply of raw materials and/or semi-manufactures—both indigenous and imported. What to talk of the new capacity, while a substantial portion of even the already established capacity goes waste because of the shortage of these supplies? The fiscal and industrial policies of the Government are also so uncertain and unstable that a flourishing concern today runs the risk of becoming a losing enterprise tomorrow.

As regards fiscal incentives, especially for modernisation, though Mr. Dasappa ridiculed the suggestion made by Mr. Lalchand Hirachand, President of the Chamber, it cannot be contradicted that, for a reduction in cost of production, comprehensive research in the techniques of production and modernisation of plant and equipment are necessary. All this will involve costly experiments and considerable new investments which may or may not show any immediate results. There is, therefore, a large element of risk here. The entrepreneur can be encouraged to take that risk only when he is assured of a fair and equitable return through fiscal incentives and other adjustments.

PIG IRON FOR FOUNDRIES

For several years now, the two thousand units of the foundry industry, with their aggregate capacity of 2.5 million tonnes of castings, have been working very much below capacity because of an acute shortage of pig iron—the basic raw material of a basic engineering industry. It has been estimated, in this connection, that, as against the current annual demand of 2.5 million tonnes of pig iron and its available supplies of 1.2 million tonnes, the foundries engaged in the manufacture of commercial castings are getting pig iron allotments to the tune of only about 500,000 tonnes—just sufficient for utilising a fifth of the aggregate foundry capacity. The balance of available pig iron is earmarked for specific purposes in the railway, defence and other sectors. As far as the commercial foundries are concerned, the immediate outlook for pig iron supplies will, of course, be a shade better, thanks to the import of 150,000 tonnes from the U.S.S.R. But the difficulty about this imported pig iron, according to Mr. K. Prosad, President of the Indian Foundry Association, who addressed the thirteenth annual meeting of the Association at Calcutta last week, is that it will be available to the foundries only at a high landed cost—higher than the existing controlled price of the indigenous product.

The supply situation in respect of pig iron can also be improved in the short-term, if the Government can take some special steps. The integrated steel plants, for instance, can be persuaded to make available some more foundry-grade pig iron than they do at present. Secondly, considering that the foundry industry has been able to increase its exports of castings from year to year (from Rs. 12 lakhs in 1959 to Rs. 38 lakhs in 1963 and Rs. 33 lakhs in the first seven months of 1964) and that frequent foreign enquiries not only from Asian and African countries but also from advanced European countries and the U.S.A. are being received by the major foundries, it would be worthwhile for the Government to augment further the supplies of pig iron. It may be noted, incidentally, that manufacturers of iron and steel products exported from India are now entitled to supplies of iron and steel up to 133⅓ per cent of the quantity of these materials actually used by them in the exported products. This proportion can be increased suitably in the interests of domestic production and export promotion alike. Besides improving the pig iron supply position in such ways, the Government should also provide a reasonable return to the industry by making suitable allowances for idle capacity suffered as a result of shortage in the availability of raw materials when it (the Government) assesses the rates payable for the castings purchased for public-sector purposes. At the same time, the Government should take steps to improve the quality and grade of pig iron supplied by integrated steel plants.

From the long-term point of view, more positive and imaginative steps are called for. As the demand for pig iron is expected to be of the order of four million tonnes by the end of the fourth Plan, both the public and private sectors would have to establish additional capacities for foundry-grade pig iron. As far as the private sector is concerned, it would be necessary to permit the licensees concerned to establish pig iron plants of upto 500,000 tonnes capacity for facilitating economies of scale, better profitability and support from the capital market. Within the foundry industry itself, there would seem to be no need for creating further capacity for castings in view of the large unutilised capacity that is already there. If anything, there is great need for mechanisation of the foundries, only a few of which are now mechanised. Such mechanisation (or modernisation) would have the effect of augmenting capacity, besides improving the quality of castings and bringing down their costs. Mr. Prosad's presidential address at the Foundry Association is notable for this mechanisation plea, as also for the suggestion that a research institute should be created to help the industry solve new problems arising from the present trend of manufacture of heavy and intricate castings.

WOOLLEN INDUSTRY

The woollen industry has a sizable idle capacity at present. This is, indeed, as disquieting as it is surprising, considering that the additional defence requirements in the wake of Chinese aggression and the increased civilian demand have led to greater production in recent years. The latest estimates indicate that 74 per cent of weaving capacity and 60 per cent of spinning capacity in the worsted sector and 40 per cent in the shoddy sector remain unutilised. This state of affairs in the industry is mainly due to the acute shortage of raw materials. If fuller utilisation of capacity is to be achieved in the interests of the industry and the consumer alike, it would be necessary to increase the foreign exchange allocations for the import of wool tops and shoddy wool. It has been estimated, in this connection, that, in order to maintain its two-shift activity, the industry would require about Rs. 18-20 crores worth of imported raw materials in a year. In any case, the foreign exchange required for achieving even the revised lower target of 22 million yards for the final year of third Plan will be Rs. 16 crores.

Viewed against this background, the stand just taken by the Indian Woollen Mills' Federation and its Chairman, Mr. R. K. Birla, on the foreign exchange question seems to be quite justified. The Federation, incidentally, has conveyed to the Government of India its apprehensions about the serious consequences of an acute raw material shortage that will be felt by the industry under the import ceiling of Rs. 5 crores fixed for the current year (October 1964 to September 1965). That the present foreign exchange allocation is utterly unrealistic and in complete disregard of the actual needs of the industry should be apparent from the fact that the average ceiling since the stoppage of Open General Licence System for import of raw materials in 1957-58 has been to the tune of Rs. 11 crores—an amount supplemented by earnings (Rs. 3 to 4 crores) from exports.

The installed capacity of the industry is 38 million lbs. of yarn (28 million lbs. in the worsted sector and 10 million lbs. in the shoddy sector). But the import ceiling of Rs. 5 crores (out of which Rs. 1 crore is for the shoddy sector) will enable the industry to produce only 17 million lbs. of wool. After adding the quantity of Indian wool that may be available, there will be a shortfall of 60 per cent in raw material supply. And that will inevitably lead to retrenchment and lay-off of workers. That is not all, for woollen exports, too, are bound to go down in the wake of lagging production and reduction of incentives. By all accounts, therefore, the outlook for woollen production and exports will be distinctly gloomy unless, of course, the situation happens to be brightened by timely official remedies.

Cashed in a Minute!

And that is precisely what we mean. It takes no longer than a minute to cash your cheque at any PNB office with the Teller System.

The streamlined Teller System eliminates tokens, queues, all tedious and unnecessary waiting and delay

PNB was the first bank to have introduced the Teller System as far back as 1954. Today, PNB has 90 branches operating this system and plans to introduce this on-the-spot service in 60 more branches throughout the country.

MONTHLY ECONOMIC REVIEW OF U.K.

AIMS OF POLICY AND ACHIEVEMENTS

FLATNESS OF PRODUCTION AND EXPORTS SURPRISING

By W. T. C. King

EDITOR, "THE BANKER"

LONDON, *5th October*

ON the eve of Britain's General Election, which is timed for 15th October, the influences uppermost in London financial markets are not unnaturally political ones: but it cannot be long before economic issues come to the fore again as determinants of stock market behaviour.

In the meantime, it happens that the condition and trend of Britain's economy are more than usually hard to assess with any real assurance. This is not for any political reason: or, rather, it is quite apart from any political reason. For some time past, the available economic indicators have seemed to be in some degree in conflict, and much will depend on which of several possible interpretations of the evidence proves to be the more correct. At present, accordingly, the scope for legitimate differences in judgment is abnormally wide, both in assessing the recent performance and current state of the domestic economy and the future trend of the balance of payments.

To explain what lies in the balance it is necessary first to recall the salient aims and expectations of recent economic policy. In 1962 and 1963, the basic aim was to get the economy expanding more rapidly again after the phase of disinflationary pause and consolidation in 1961. In 1962-63, a series of reflationary measures—ranging from easier money, rising public expenditures, tax reliefs and efforts to promote industrial investment—were introduced with the object of absorbing underemployed resources of plant and labour as rapidly as could safely be done without risk of generating new inflationary strains. The aim, moreover, was not merely to take up the considerable existing "slack" in productive capacity but also to set the economy on a course of long-range expansion at a higher average rate than had been attained in the past: the target fixed for the purposes of the planning under the auspices of the newly-formed National Economic Development Council ("Neddy") was an average annual rate of growth of four per cent for the period 1961-66.

By the beginning of this year, it appeared that the initial aim of absorbing most of the "slack" in productive capacity was on the point of being achieved—in the sense that the additional demand injected into the economy by the several reflationary devices had generated a momentum that would complete the process during the course of 1964. There seemed a risk, indeed, that the pressure of demand might go too far.

The aim of policy in 1964, accordingly, was to damp down the rate of growth of demand to accord with what was thought (or hoped) to be the long-term trend rate of growth of output—the long-range target rate of four per cent rather than the spurt of up to six per cent that was feasible when expansion could come not merely from the rate at which productive capacity itself was growing but from the more complete utilisation of existing capacity.

Bank Rate

This damping down was sought chiefly by the raising of the Bank Rate from 4 to 5 per cent at end-February, and by the imposition of roughly £100,000,000 of additional taxation (on alcoholic drinks and tobacco) in the Budget of last April. This degree of restraint, it was thought, would enable the economy to continue expanding, though at a more moderate rate, without risk of new inflationary strain—provided that there was no undue rise in personal incomes to exert pressure on costs in the future.

On the external side, it was reckoned from the outset that the process of reflation, and of lifting the economy, if possible, to a higher long-term rate of growth, would put strain, probably considerable strain, on the balance of payments. As output expanded, stocks of materials and fuel and components would sooner or later have to be built up more rapidly, and then at least held at the higher levels: work-in-progress and stocks of finished goods would likewise expand: and additional demands would be made upon capital goods industries and upon imports of capital goods as industry stepped up its fixed investment.

Each of these tendencies, and not merely the particular portion directed towards imports, would tend to put pressure on Britain's external balance on current account. But if these domestic capital formation processes were necessary for developing a faster sustainable long-term rate of growth, they could not be regarded as basically weakening the balance of payments: on the contrary, it is axiomatic that if faster growth is to be sustainable, it must generate a substantially increased export potential, and from that increased potential the inroads made into the current balance would be made good.

In other words, on these assumptions the strains put upon the balance of payments by the gearing-up for faster growth could be reckoned as strictly temporary, if not actually automatically self-reversing. It was, therefore, justifiable to meet them by drawing upon reserves or external credit facilities without accompanying these drafts by measures of domestic disinflation, which in the past have sought generally to reduce the external deficit by reducing the pace of domestic expansion.

Precisely the same line of reasoning, moreover, could be applied to any outflow of mobile international short-term capital that might be touched off by the observed strain on the current account—or, for that matter, by any other influence except a fundamental weakening of the domestic economy. So long as the condition of the economy remained basically sound, any such outflow of funds could equally be treated as a temporary, and probably a self-correcting, influence, so that it was likewise justifiable to meet it largely or mainly by drafts on reserves or credit facilities rather than by so-called "corrective" measures that would recoil on the pace of domestic expansion.

An approach on these lines did seem to be, indeed, a condition precedent to the hoped-for acceleration of growth. If the Government was not prepared for an initial phase of external strain, and willing to countenance a presumably temporary loss of reserves, or if external credit facilities were not made available without some understanding that disinflationary "correctives" would be applied, then any effort to promote a faster growth would have been bound to have been checked before long, whatever the fundamental chances of its ultimate success.

Recent Economic Performance

This, then, is the blueprint of intention and expectation against which Britain's recent economic performance needs to be viewed. Because of the statistical uncertainty at many points, the difficulty at present is to decide how far that performance has or has not, conformed to the blueprint. On one basic fact there can be little doubt: after its rapid expansion in 1963, when reflation really got under way, the economy this year has unquestionably slowed down.

There is, however, considerable doubt about its new rate of expansion. To judge, indeed, by the official index of industrial production, one would have to conclude that the process virtually ceased early this year—some months before the restraints applied by the Budget. The index of industrial output as a whole, seasonally adjusted, rose from a monthly average of 115 (1958=100) in the last quarter of 1962 to 124 in the last quarter of 1963; in January of this year it rose to 127, but has remained at that level up to the latest month (July) for which figures are available (the indices for January-June have, recently, been revised from a provisional estimate of 126). This unaccustomed stability is, however, in some conflict with the evidence of certain other economic indicators, including figures from particular industries, the general impressions of businessmen, and the trend of the unemployment figures.

The total of adult persons unemployed was falling much more than seasonally throughout the first half of this year—by an average of nearly 10,000 a month in the second quarter of the year. Only in July and August was there any upturn, and then only a very small one, in the seasonally-smoothed figure; and then in September it turned even more sharply downwards. The true rate of fall then was 10,600; and the total of all workers unemployed was down to 341,600, equivalent to 1.5 per cent of the labour force. This ratio compared with 2.1 per cent at the corresponding date in both 1963 and 1962, but it was only fractionally above the low point reached in September 1961, near the crest of the previous business cycle.

During the current year, the true rate of fall in adult unemployment has totalled not far short of 90,000, and in the regions of strongest demands for labour, the ratio has dropped to only 0.8 per cent. Although the trend of output is by no means the only determinant of the course of registered unemployment, this marked tightening of conditions in the labour market hardly squares with the impression of output stability conveyed by the industrial production index, especially as the tightening has occurred during a period in which it was generally assumed that there would be a significant increment of productivity. It is hard to believe, in short, that aggregate output has not been continuing to rise perceptibly, though certainly more slowly than it did last year.

The other major uncertainty concerns the trend of exports. These had been expected to expand strongly, and since this year has been one of high activity in most world markets, there seemed no reason why these expectations should not be fulfilled, especially as there was ground for believing that in the recent past the trend of Britain's industrial costs, relative to that of its principal competitors, had generally been favourable. But in fact the recorded exports, seasonally adjusted, showed only a moderate further rise in the first quarter of the year, rising to a monthly average of £356,000,000, as compared with £350,000,000 in the fourth quarter of 1963, and £328,000,000 in the first quarter of that year, and, since the spring, the trend has seemed to be no better than flat, and probably slightly sagging. In the latest three

"CAP IN HAND" FOR CREDIT?

By Questor

LONDON, *9th October*

THE balance of payments deficit is playing a bigger part in the British election campaign than most people would have thought likely. Both the main parties were proposing a considerable expansion in Government spending on things like roads, schools and hospitals and the question arose, which party was better able to achieve the faster rate of economic growth needed to finance the spending.

The Labour Party has, therefore, made great play with the size of the payments deficit shown up in the half-year figures. It claimed that the Conservative Government had tried to conceal the facts from the electorate by borrowing short, and argued that we should soon be forced either to impose premature restrictions on economic growth at home or to go begging cap in hand for overseas credits.

Labour's point seemed to be borne out when the gold reserve figures for September were published. These showed a relatively small drop of $45 million in the reserve but they were accompanied by a statement that the Basle arrangements for providing short-term credits between central banks had been reactivated—quite understandably, in view of the speculative capital movements which are likely to occur at election time—and that Britain had drawn on these, and on the mutual swap facility of $500 million with the U.S., to an undisclosed extent during September.

Labour immediately argued that the true facts of the country's economic position and the hollowness of Conservative election promises were at last coming to light. Conservatives fought back by quoting the U.S. example and arguing that there was no shame either in running a temporary payments deficit or in drawing on international credit to finance it. It was all good, rousing political stuff.

What most riled the Conservatives in the Labour attack by all appearances was the suggestion that we were applying for foreign credit "cap in hand"—a phrase which Mr. Wilson had used once before to describe the attitude of his political opponents during the negotiations for entry into the European Common Market.

Certainly the phrase is not applicable to the present drawing (which probably amounts, in any case, to only about $150 million). The essence of the Basle arrangements and of Mr. Roosa's network of swaps is that they should provide short-term international credit in an emergency both quickly and automatically. But it does, I think, raise several questions about the different forms of international credit available at present which deserve serious consideration. With short-term loans between industrialised countries, as with longer-term loans to developing countries, awkward issues of national sovereignty can easily arise.

All but a minority of loans are bound to carry conditions of one kind or another. Even when these conditions appear to be entirely financial, of the sort which any prudent banker must impose, difficulties may be involved. For many years, for example, a considerable number of developing countries have argued that the International Monetary Fund is predisposed towards deflation and that the financial conditions it imposes on the grant of credit are politically impracticable in their own domestic conditions.

Again, in the case of the recent Italian payments crisis, the other members of the European Community were ready to provide credit only if the Italian Government imposed economic restrictions of a severity which would almost certainly have precipitated serious political trouble, leading to a straight confrontation between the extreme right-wing and the Communists.

Whenever it is Governments rather than central banks or international institutions which provide the credit, economic conditions tend to shade rapidly off into political conditions. So far as loans to developing countries are concerned, this constitutes the case for providing as much aid as possible on a multilateral rather than a bilateral basis. Bilateral lending tends always to be in a shape which benefits the giver more than the receiver. So far as credits between industrialised countries go, it constitutes the case for making adequate resources available to bodies like the International Monetary Fund rather than relying on bilateral arrangements or giving a small group dominated by creditor Governments—as in the Group of Ten—a large say in the setting of conditions.

If Britain has to go to the Fund on a large scale, she may be passed on as a first test case to the Group of Ten, and it is not inconceivable that France may then attempt to survey and regulate British economic policy in a manner which no Government would be willing to tolerate. And if, instead, Britain leans on the U.S.? There have been reports in British newspapers recently, reliable or not, that the U.S. Administration would attempt to make any credits conditional on British adhesion to the mixed-manned nuclear force, about which the Conservatives are unenthusiastic and to which Labour is definitely opposed.

This sort of financial blackmail will always linger on to some extent while sovereign Governments remain. But it is a bad thing, since it overlooks the fact that we all have a common interest in the viability of the international monetary system and in attaining a faster rate of world economic growth; and the more lending resources which can be made available to non-political international bodies the better.

The U.S. and Britain could both help to change the climate of opinion and make the taking of short-term credit a respectable formality if they were to cease regarding the Fund as a lender of last resort. Instead of waiting to draw heavily when things go badly wrong, I suggest, Britain should draw month by month on the Fund in the period ahead to offset the regular, relatively small drops in the gold reserve which our deficit is likely to cause.

FOREIGN TRADE OF DEVELOPING COUNTRIES

PRACTICAL U.N. MACHINERY WANTED

By Harlan Cleveland

U.S. Assistant Secretary of State for International Organisation Affairs

THE United Nations has created the political environment within which those who give and those who take, those who lend and those who borrow, those who advise and those who use or reject the advice, can come together in dignity and equality to promote that social progress and those better standards of life in larger freedom which are the promise of the Charter of the United Nations.

An improvement required in the United Nations' capacity "to promote social progress and better standards of life in larger freedom," is the need to institutionalise the United Nations' concern with international trade in relation to development.

The U.N. Conference on Trade and Development (U.N.C.T.A.D.) has recommended a big Conference on this subject at least once every three years, a 55-member Trade and Development Board meeting twice a year, and a Secretary-General and staff serving the new institutions within the U.N. Secretariat.

The aim of this machinery is to provide a forum for a deep and continuing analysis of obstacles to the expansion of trade of the developing countries—obstacles that may lie in the policies of industrialised countries or in the practices of the developing countries themselves.

This will require a new and important dialogue—mainly between developed and developing countries—about their respective national policies, such as trade and investment policies, which may affect the rate and character of development.

We are glad to see this machinery invented, and think it is wise to build it, as the U.N. Trade Conference proposed to build it, as an integral part of the United Nations.

Outcome of U.N.C.T.A.D.

The U.N. Conference on Trade and Development is so fresh in our minds that it may be useful to reflect for a moment on its outcome—and its future. The nations already in an advanced stage of industrialisation do, of course, account for most of world trade. It is a simple fact of economic life that the more highly industrialised nations have a greater capacity to buy and sell and therefore to develop a high level of mutually beneficial trade among themselves.

It is also a plain fact of history that the dominant natural impulse to stimulate trade where it already was profitable has had an effect on the production pattern of all trading countries. This has quite understandably influenced many developing countries to concentrate their production in relatively few export products. This may have tended to discourage structural changes in these economies—more diversification of their production—which in the long run would be to their advantage.

We not only wish for an increase in the foreign trade of developing countries but would particularly hope that in its expansion sound ways and means can be found to stimulate a wider range of their exports in the interest of more effectively balanced economic development. There are many reasons why we would welcome a healthy rise in trade between the industrialised and the developing countries.

First, we are committed morally and politically—and as a matter of plain commonsense—to contribute our full share in the global war against poverty in working partnership with those prepared to do as much themselves.

Second, we have committed vast resources, during nearly two decades of sustained support, for economic and social development around the world. This burden will be upon us, in one form or another, for as long as the problem of poverty exists on a major scale in this world. We carry it with good will as a necessary contribution to international peace.

Third, in addition to aid, trade is one of the most important factors in the process of growth. The sooner a developing country can earn its own way in a competitive world, the better it is for everybody.

Under the circumstances, then, if my Government were to follow any other course than one designed to reduce the barriers to the trade of the developing countries, and to promote the diversification of their economies, we would be guilty of the idiocy of giving with one hand and taking away with the other.

Purpose of U.N. Machinery

This is why my Government looks forward to the establishment of practical U.N. machinery in the field of international trade. Let us now examine what this "machinery" is supposed to produce as an end-product. We like the Secretary-General's definition, in his address to this Council on 16th July. He called on all of us to think of the United Nations as "an instrument for reconciling differences of opinions and not only as a framework in which they can manifest themselves." "Differences of opinions" about what? The rub is here. For when you consider trade in relation to development, you are talking about matters which cut deep into the domestic politics of every country on earth.

In the developing countries, the obstacles to development and to the growth of national trade are certainly in essence "internal affairs." Land reform is often the key to agricultural development; tax systems and budget controls are keys to development. The Government's policies about investment, the Government's attitudes toward private enterprice, the Government's willingness to build development institutions and put them in charge of well-trained technicians rather than political favourites—all these are essentially "domestic" decisions.

In a curiously similar way, obstacles to more imports and better export markets for the developing countries, which appear to them as "external" matters, are regarded as "internal affairs" in the industrialised countries. In several important elections in our history, the tariff issue was the main bone of contention between our two political parties. Aid policy is also a sensitive "internal" problem in every developed country.

The U.N.C.T.A.D. machinery will presumably be designed to promote a dialogue between the developing and the industrialised countries. But the content of that dialogue is not, for the most part, *international actions*—it is, rather, each country's *national policies*. The effectiveness of the new machinery will be measured by whether the dialogue it organises does, in fact, result in our modifying each others' national policies. If we tell you that you must get one with tax reform in your own country because we think you should, you are likely to resent the suggestion and not do anything about the revenue system. Only if we can persuade you that tax reform is in the interest of your own economic growth will we have any effect on your national policy.

In just the same way, if you tell us that our tariffs are too high, we are not likely to make any change just because you think we should. Only if you can persuade us that change will serve the national interests of our country—which is served, of course, by expanding world trade and the development of the less developed areas of the world—is your argument likely to have any effect on our national policies.

Nor will it help if large majorities pass resolutions recommending changes in the commercial policies of nations not part of the majority. The problem here was perceptively stated at the U.N.C.T.A.D. Conference by the delegate from a developing country. "It is an obvious fact," he said, "that on the basis of simple majority, the developing nations can out-vote the developed nations at any time. Yet, what will it avail this Conference to reach decisions by simple majority if the defeated minority includes the very countries from whom concessions are expected?"

There is, I believe, a real danger that the coinage of the United Nations will be debased by premature votes on one-sided propositions. A better approach would be a dialogue in which we settle down to the task of achieving a reasonable consensus about just what we all need to do to raise the levels of trade of the developing countries as a contribution to their economic growth and their social progress.

We will not do this by voting, but by striking bargains in which both the developing and the developed countries agree to try to change their own national policies for mutual benefit. So let us join in applying our impatience to the problem of development, rather than to each other. International co-operation for development will not work if it is conceived as a battleground, and set up as an adversary proceeding, a game of "I win—you loose" between "haves" and have-nots."

We can dare hope that a world too long torn by dissension—and paralysed by sterile confrontation—may be entering a period of healing and fruitful co-operation. But these hopes must be cautiously conditioned: they depend upon the dominance in world affairs of a will to co-operate, to work together, and to approach our tasks with a reasonable capacity to take account of each other's problems and viewpoints.

N.B.: Excerpts from Mr. Cleveland's address before the United Nations Economic and Social

WORLD BREADGRAIN CROP

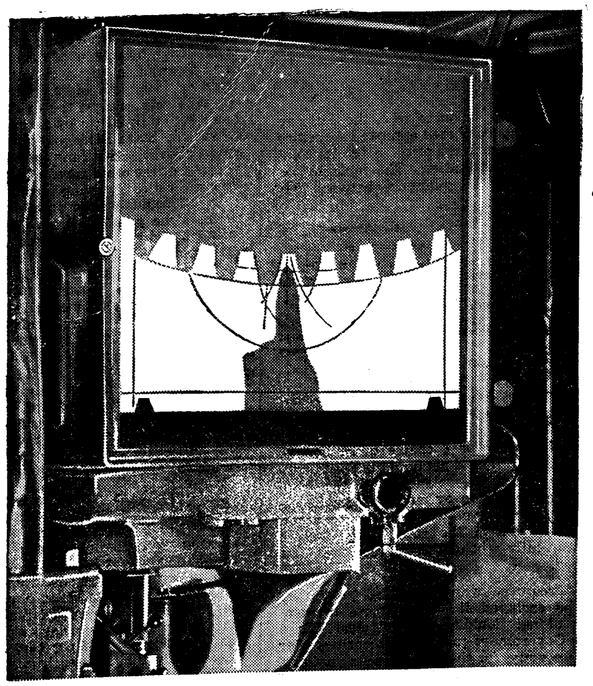
Breadgrain production for 1964 promises to set a new record, on the basis of preliminary information available to the U.S. Foreign Agricultural Service. Northern hemisphere harvests are nearing completion, and there is little doubt that total production will be at a new high. Principal producing countries of the Southern hemisphere have a favourable outlook and expect good outturns if growing conditions continue favourable through November. World production of wheat and rye together is forecast at 303 million short tons. This has been approached only once; in 1958, it was almost that large. The high level of the current forecast is due to the prospective record harvest of wheat. As currently placed at 8,985 million bushels, this would exceed the previous record in 1962 by 250 million bushels. Rye production continues at the reduced level of 1.2 billion bushels, 17 per cent below the 1955-59 average.

Present forecasts are tentative and subject to change as revised estimates become available for Northern hemisphere countries and as crops develop in the later harvesting Southern hemisphere. Thus, growing conditions through late November will determine yields in Argentina and Australia, the largest producers of that hemisphere. The outlook is for much reduced wheat import requirements in a number of countries that were quite active in the market during 1963-64. Foremost is the Soviet Union where crop failures made large imports imperative, and about 380 million bushels were imported during 1963-64. A normal outturn this year is expected to curtail imports to a relatively small amount shipped from the west coast of Canada to areas that present transportation problems for home grown wheat. At the same time, exports are also expected to be well below average. Mainland China was another large importer outside usual trade patterns. Imports came to about 205 million bushels during 1963-64. The crop outturn there this year is reported to be larger, but imports will probably continue, though at a reduced rate.

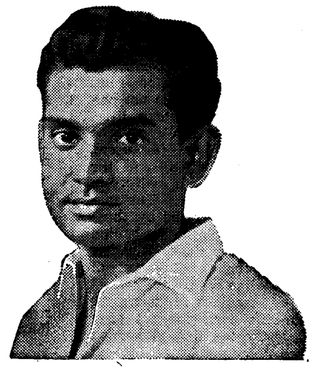
GRAIN STOCKS OF MAIN EXPORTING COUNTRIES

Total grain stocks in the four leading exporting countries (the U.S., Canada, Argentina and Australia) on 1st July 1964 were about 2 per cent above the mid-1963 level, according to preliminary estimates of the U.S. Foreign Agricultural Service. Despite the slight increase, stocks were still considerably below the high level of 1959-62. The increase over 1963 is principally in corn; wheat stocks are the smallest since 1953. An estimated total of 139 million short tons of wheat, rye, barley, oats and corn for the current season is 3 million above stocks on 1st July 1963. Principal changes are in corn and wheat; an increase of 7.7 million short tons of corn is largely offset by a reduction of 6.7 million tons of wheat. Moderate increases were estimated for barley, oats, and rye. An 11 per cent increase in the U.S. corn stocks is the main factor, accounting for 85 per cent of the increase in corn. The United States also accounts for most of the decline in wheat stocks. In addition to the five grains considered above, 1st July stocks of sorghum grain add another 20 million tons to the U.S. total grain stocks. Argentina is the only other producer of any significance and, even with recent expansion there, production is still less than 10 per cent of the U.S. production. Current grain supplies continue to offer large surpluses for export. Import requirements for the current season, however, are expected to be somewhat smaller than the large 1963-64 imports.

A regional breakdown of 1st July stocks shows the U.S. total of 101 million short tons of the five grains accounting for 73 per cent of the total for the four countries. This is the smallest volume since 1959, and is 29 million tons less than the record 1961 stocks. Wheat stocks are down by 295 million bushels from the 1963 level, offsetting an increase of 230 million bushels of corn. Stocks of oats are up by 41 million bushels, while barley and rye stocks are moderately smaller than a



"This machine ensures accuracy of Typewriter parts up to 1/10,000th of an inch"



It's the OPTICAL PROFILE GRINDER, housed in a special airconditioned chamber. Tools, dies and precision parts are machined on it, and *automatically* checked against magnified drawing office specifications — clamped on to a screen. The Grinder projects an image of the same part magnified to the same proportion—upto 50 times. I can see where the part falls short of specifications, and I machine it till its absolutely perfect."

Modern precision equipment like the Optical Profile Grinder and Ujjal Kumar Chatterjee who operates it, are just one team of the multitude of men and machines at the Remington Rand typewriter plant. They are all engaged in a constant endeavour to improve the quality of each tool, die and part that goes into the making of your Remington typewriter.

Over the years people in India have come to expect the standards set by REMINGTON—the highly responsive touch, light positive shift, smooth carriage action, superior styling and finish—which make them so essential to distinctive correspondence.

the composition of reserves would more or less take care of itself. An excessive holding of gold would be costly since gold earns no interest. And so far as *aggregate reserves* are concerned, excessive holdings also become costly, since in this case the country in question would fail to achieve the consumption and investment standards which a rational employment of its surplus holdings could provide. Moreover, if a country should choose persistently to accumulate surpluses, it would soon discover that such surpluses create problems of monetary management in its domestic economy. The West German experience in this matter is well known.

For all these reasons, I see no need to impose uniform gold ratios upon all participating countries once the fiduciary component has been made in effect "as good as gold" by means of the exchange guarantee.

Bernstein's new international reserve units would be based on a pool of currencies contributed by his group of eleven advanced industrial countries—the Group-of-Ten plus Switzerland. He suggests that 3.5 billion new reserve units be issued the I.M.F. serving as Trustee) to be allocated to the participating countries according to their quota contribution. Periodically additional quota contributions would be made if and when required to supply adequate international liquidity. Finally payments between countries would be made at the ratio of, say, two-thirds gold and one-third reserve units. This would become the standard composite unit for international payments. In the transition period, the ratio might, however, have to be as high as 9:1. This would be changed step by step until finally the desired ratio was reached. Over the still longer run, the desired ratio might need to be further reduced in order to supply adequate international liquidity.

The Group-of-Ten

Since Bernstein's plan introduces a new international reserve unit based on the combined currencies of leading industrial countries, it obviously is somewhat closer to an international reserve system than the Posthuma plan. Yet it stops short of being a full-fledged international central bank. The plan is indeed solidly built on strong currencies. This is a step in the right direction. The General Arrangements to Borrow (the so-called Paris Club Agreement) pointed the way to a significant new development. The really vital thing about this agreement was not the $6-billion potential resources made available to the Fund by the Group-of-Ten industrial countries. The important thing to note is the fact that it cut away from the window-dressing hocus-pocus of a hundred or so currency quota contributions, the vast majority of which would never be drawn upon.

The problem of foreign aid to the developing countries is one thing, and the problem of a workable international monetary system is quite another thing. A solid and secure system of international reserves must be erected upon the foundation of unimpeachable Government securities precisely as the Federal Reserve Credit in the United States is based on gilt-edged U.S. Government securities. An international currency cannot be based upon non-marketable loans and investments. (It is this issue which has raised the most serious criticism of Professor Triffin's full-scale plan. In reply to this criticism he has stated that he is content to limit the investments of his reorganised I.M.F. to securities of the World Bank and other "hard-loan" agencies, and to the obligations of strong currency countries. See his statement in Seymour Harris' *The Dollar in Crisis*.)

An International Reserve System

Let the Group-of-Ten set up a Governing Board composed of the Managing Director of the I.M.F. as Chairman and a Board of Directors representing the ten leading industrial countries. Assign to this Governing Board the responsibility of administering a new Division in the I.M.F. which we may call the International Reserve System (I.R.S.) corresponding to the Federal Reserve System in the U.S. Let this Governing Board invite all countries holding foreign exchange to deposit their holdings with the I.R.S. in exchange for International dollars. We have a U.S. dollar and a Canadian dollar; why not an international dollar?

There need be no compulsion, though it might conceivably be advantageous to obtain agreement, that any member of the Group-of-Ten would refrain from adding to its gold stock as long as its gold ratio exceeded 60 per cent. Such a ruling could help to promote acceptance of the new international dollar.

Some considerable part of current dollar holdings would no doubt be retained as working balances. Indeed, an exchange guaranteed dollar might well be regarded as on a par with an international dollar.

Any conversion of existing dollar holdings would, of course, not add at all to the existing volume of international reserves. That would be a matter for the future. And it is here that the new International Reserve System would come into its own. The Governing Board should be empowered to purchase and sell in the open market the Government securities of any of the Group-of-Ten countries, but only with the consent of the monetary authorities of the country in question. The Governing Board, in cooperation with the constituent member-countries, would have the responsibility of controlling the volume of international liquidity.

The Governing Board would not be the sole creator of fiduciary reserves. Any one of the Group-of-Ten countries might, through trading or borrowing, acquire international reserves in the form of exchange guaranteed foreign currencies. The ten participating countries might, however, prefer to obtain their reserves by borrowing directly from the International Reserve System. At all events, the I.R.S. would be the "lender of last resort," and so in the final analysis would be able to exercise a large measure of control over the aggregate volume of international reserves.

Instead of detailed regulations, I should prefer to place full responsibility on the Governing Board of the International Reserve System. This would avoid having to expand international reserves by large discrete jumps such as Bernstein's $3.5-billion quota contributions. Instead, this would be subject to day-by-day management in just the same manner that the quantity of Federal Reserve credit is controlled by the Federal Reserve System in the United States. Moreover, I see no good reason why participating countries shall not have complete freedom with respect to such matters as the composition of their holdings of gold, international dollars or foreign currencies carrying an exchange guarantee.

External Disciplines

Conventional objections are invariably raised to any proposal designed to end once and for all the fears of speculative gold drains and devaluation risks. It is said that, once this goal is achieved, no country would have any incentive to balance its accounts with the outside world. No country would care to contribute its share of responsibility for the promotion of international equilibrium.

The requirements of international equilibrium will remain with us as long as there are separate sovereign nations with more or less diverging economic policies which create problems for themselves and problems for their neighbour countries. Price stability and full employment problems, both with respect to monetary and fiscal management, are intensified by payments surpluses or deficits. These will continue to plague us (though less disruptive than now) even after we get rid of fears of gold drains and devaluation losses. They will have to be faced along with the multitude of disturbing developments which monetary and fiscal authorities are compelled to contend with—cyclical swings, wage-price disturbances, technological shifts, natural disasters, etc.

Once a dependable fiduciary component has been incorporated into the gold-exchange standard and an International Reserve System has been set up to provide adequate liquidity, the equilibrating processes of adjustment could reasonably be expected to produce viable equilibrium without upsetting the "natural" structure of world trade as determined by the human and material resources of the different countries. "Rough" measures, designed to end imbalances quickly, would no longer need to be employed. Thank Heaven we do not have balance-of-payments statistics for each State in the American Union! If we did, what would not our hard-headed disciplinarians be urging, to the detriment of a rational allocation of our productive resources?

The Continental European countries have been asking the U.S. to "put its house in order," but from current newspaper accounts one learns that they are already alarmed at the prospect that their surpluses (the counterpart of U.S. deficits) might disappear. A *drastic* shift in U.S. merchandise trade is not likely to promote world equilibrium and I do not know of anyone who seriously thinks that this could in fact prove to be the way out.

The U.S. trade balances is not the root of the trouble. Rather the disequilibrium in the U.S. international payments should be sought in the capital account. If this could be brought into balance, the U.S. deficits would disappear. (Equally it could be argued that, if U.S. foreign aid loans and grants and U.S. military expenditures abroad could be cut in half, the deficits would vanish. This statement, in view of the feed-back effect, is, of course, an oversimplification.)

Direct investments abroad have been running during the last four years at around $1.6 billion per year. Portfolio investments have grown in this period from $0.9 billion to $1.9 billion. Offsetting this, foreign capital investment in the U.S. averaged $0.66 billion. Taken together these items approximate the U.S. 1960-63 deficits.

"One of the silliest aspects of the international financial scene at the moment," said the London *Financial Times* in its July 1963 issue, "is that the continental countries with far larger external reserves than they know what to do with, are regularly going to the New York capital market for funds to finance their development activities." European capital markets need to be broadened and developed. The interest equilisation tax is a step in the right direction.

Higher growth rates and full employment in the United States would help to cut down capital outflows and stimulate inflows. And the European countries could help both themselves and the United States if they would pursue a low interest rate policy accompanied, if necessary to contain inflationary pressure, by a stiff fiscal policy.

In the exchange-market where private transactions in goods and services are made in response to market forces and profit opportunities, the United States, with a surplus of $6.4 billion in 1958-62 and $6.9 billion in 1963, is obviously highly competitive. U.S. wholesale prices stood at 100.3 in December 1963, compared with 100.4 in 1958. No European country can match this record. The G.N.P. price deflator for the U.S. increased by 2.5 per cent per year from 1950 to 1960, while the average for the Common Market countries, including Switzerland, was 3.9 per cent. The dollar fortunately is not overvalued in the market-place. Should devaluation ever become necessary, it would need to be engineered by international agreement like the famous Tripartite Agreement of 1936 when the U.S. and the U.K. welcomed the French devaluation and announced beforehand that they would take no countermeasures.

Role Of Gold

Under an International Reserve System operating with an exchange guarantee, countries would no longer need to hold large stocks of gold in their reserves. The problem of equitable distribution of gold would no longer be a matter of concern. All countries would be free to hold their reserves in any form: (1) gold, (2) international dollars, and (3) currency of any of the Group-of-Ten countries. All the participating countries would agree to maintain the value of their currency within fixed buying and selling points around parity. Perhaps these points should be widened to permit greater flexibility and thereby ease the long-run adjustment process. Parity would be expressed in gold or in an international dollar defined in terms of the U.S. dollar of "weight and fineness in effect on 1st July 1944" as in the Bretton Woods charter. The International Reserve System would accept deposits and give international dollars in exchange. And these dollars would in turn be redeemable in gold.

Whether the International Reserve System would finally absorb all the world's monetary gold or not is a question that no one can answer. Nor is it important. It is indeed likely that if all the gold should be so concentrated some two-thirds of the I.R.S. assets would first consist of gold, an unearning asset. This would compel the I.R.S. to pay a lower rate of interest to its depositors. But these depositors would in turn be freed from the burden of carrying gold as part of their international reserves. As world trade expands and more international reserves are needed, the I.R.S. would increase its holdings of the Government securities of the participating countries relative to its holdings of gold.

AUGMENTING COTTON YIELDS

I.C.M.F.'S PROJECT INAUGURATED

TUESDAY of this week was quite a notable one in the history of the cotton textile industry in India. For it was on this day that the Cotton Extension Scheme of the Indian Cotton Mills' Federation—I.C.M.F., for short—was inaugurated at Tudialur near Coimbatore by Mr. M. Bhaktavatsalam, Chief Minister of Madras. The Federation has certainly done well in following the lead given by the Indian Jute Mills Association, which, it will be recalled, undertook the jute development work in 1961. In deciding to make its own contribution towards cotton development work, the industry has evidently been prompted by the consideration that the prosperity of the industry, after all, depends to a considerable extent on the conditions obtaining in the primary sector, that is, cotton growing.

The move of the Federation to take up cotton development work is certainly laudable. In spite of all the emphasis laid on higher production of cotton, especially of superior qualities, a wide gap continues to exist between actual output and requirements, necessitating large-scale imports, as is evident from the following figures:

(In million bales of 392 lbs.)

	Production	Consumption	Deficit	Imports
First Plan (annual average) ..	3.70	4.53	—0.83	0.76
Second Plan (annual average) ..	4.60	5.12	—0.52	0.71
Third Plan—				
1961-62	4.50	5.69	—1.19	0.87
1962-63	5.37	5.67	—0.30	0.85
1963-64	5.49	6.00	—0.51	0.72

It will be seen from the above figures that, since the rise in cotton production has not kept pace with the increase in requirements, the country continues to depend greatly on imports from abroad. The value of imports is about Rs. 50-60 crores a year. The drain on foreign exchange for cotton imports will persist in the coming years unless, along with the expansion of the cotton textile industry, earnest efforts are made to step up cotton production. India has the largest acreage under cotton, namely, 19.7 million acres. There is not much scope for increasing the area under this crop, since the equally pressing claims of foodgrains cannot be ignored. The planners have decided that the domestic production of cotton should rise to 7 million bales per annum by the end of the current Plan. This is not an overambitious goal, because the acreage available for cotton is considerable. All that is necessary is to increase the yield per acre. It is 1.15 lbs. in India, as compared with 543 lbs. obtained in the U.S.S.R., 457 lbs. in the U.S.A., 463 lbs. in the Sudan, 586 lbs. in the U.A.R. and 228 lbs. in Pakistan.

Considerable Scope

Apart from the low level of productivity, the acre yields in the country, as Mr. Radhakrishna R. Ruia said on the occasion of the inauguration of the Cotton Extension Centre near Coimbatore, fluctuate from year to year depending upon the vagaries of the monsoon. The crop in 85 per cent of the cotton area is rain-fed. Irrigation facilities are certainly being made available to an increasing extent. The area under irrigated cotton was 1.5 million acres in 1953-54; it was 2.8 million acres in 1962-63, representing 14.3 per cent of the entire area under this crop. Irrigation facilities are, however, mostly confined to canal and well-irrigated lands in the Punjab (Rajasthan, Gujarat, Maharashtra, Mysore and Madras where the acre yields are higher than in the rain-fed regions. Even so, according to Mr. Ruia, the scope for higher yields even in the irrigated areas is considerable. How it is possible to raise bigger crops is best illustrated by the excellent results secured by the Regional Research Centres in their demonstration plots at Sirsa in the Punjab and at Coimbatore in Madras.

The Indian Cotton Mills' Federation decided a few months ago to make its own contribution towards increasing the production of cotton in the country. Towards this end, it appointed a sub-committee, with Mr. Ruia as Chairman, to make proposals for fulfilling this aim. The Sub-Committee emphasised the need for bringing home to the agriculturists the importance and value of modern farm practices. The Committee recommended a Cotton Extension Project to be implemented by the Federation. It was this project which was inaugurated

The Federation's project envisages demonstration on units of 1,000 acres at five centres of the maximum acre yields that could be achieved by implementing the package measures such as use of improved seed, application of an adequate dose of fertilisers and undertaking prophylactic plant protection measures against pests. The Federation has sanctioned Rs. 5 lakh to Rs. one lakh per centre. A Chief Executive Cotton Officer has been appointed to organise and implement the scheme. He will also advise the cultivator about their various problem. A nucleus staff, consisting of a Regional Cotton Officer, two fieldmen and two belders or muccadams, is being appointed at each centre to be in charge of the unit. The services of local co-operative organisations will be utilised for issuing loans in kind, seed, fertilisers and plant protection chemicals to farmers. The Federation staff would follow up the issue of the loan to see that the seed is sown, fertiliser applied at the appropriate time and the plant protection chemicals utilised in spraying the crop.

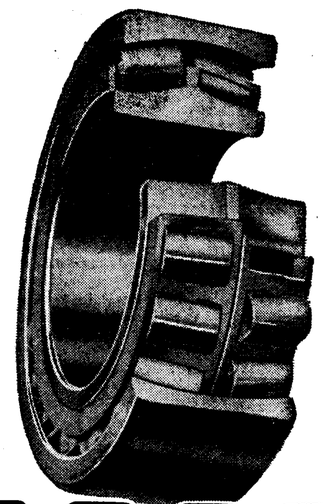
The necessary plant protection equipment is purchased for each centre and it will be utilised for undertaking a mass plant protection campaign in the entire area to serve as an effective demonstration on the need for doing simultaneous spraying or dusting by all growers in any locality. Clean methods of picking would be insisted upon and encouraged. The grading of *kapas* will be done and assistance rendered in ginning and marketing. The recovered loan amount would be retained at the centre for utilisation in the following season, either in the same centres or for other centres. The loan granted would be interest-free. An information bureau will be opened to enlighten the growers on the improved methods of cotton cultivation and enhancing cotton yields. Other necessary leaflets and literature will be distributed to educate the farmers. Propaganda will also be done to enlighten the farmers on modern methods of farming by which their income per acre can increase and so also the yield per acre.

Practical Demonstration

The Indian cultivator is shrewd and hard-working. Mr. Ruia was right when he declared that it would be more profitable to give him practical demonstration. To quote him: "The State and Central Governments have drawn up plans and programmes under the cotton development schemes with the object of helping the farmer to adopt modern methods of farming. Various facilities and incentives are being given to him towards this end but due to procedural and other difficulties, the gains have not been equal to the expectations. The farmer has not been able to take full advantage of these schemes. My Federation feels that it can make a useful contribution to the 'Grow more cotton' campaign through its scheme." Proceeding, Mr. Ruia said:

"If the various schemes that have been introduced to help the farmer succeed in full, I have no doubt that a tremendous fillip will be given to our national economy. I, therefore, make an earnest appeal to the farmers assembled here to take full advantage of the facilities afforded to them and to ensure the success of our demonstration project. I would also like them to make the best use of our Centre which will serve as a liaison between them and the Government Departments. It will bring to the notice of the authorities whatever difficulties and hardships they may encounter in their attempts to adopt modern farm practices."

Since agriculture is the mainstay of national economy and cotton is an integral part of it, it is just as well that the cotton mill industry has decided fully to participate in the general drive towards the goal of self-sufficiency in this important raw material. But its participation will only be of a limited nature. It is the Indian Central Cotton Committee and the Agricultural Departments of State Governments that should intensify their efforts in the direction of achieving a level of cotton production that will not only meet the expanding domestic demand but also leave a sizable surplus for export.



SKF

SKF designs and manufactures a complete line of all types and sizes of the four basic anti-friction bearings... ball bearings; cylindrical, spherical and tapered roller bearings. Because we make all types, you can always be sure of getting the right bearing in the right place.

NET LIQUIDITY POSITION OF BANKS

IMPLICATIONS OF THE R. B. I.'S NEW CREDIT SYSTEM EXAMINED

ALTHOUGH the exact implications in terms of the volume of credit limits available at various rates of interest under the new system of central bank accommodation to scheduled banks, linking the cost of such accommodation to their net liquidity position, are not yet clear, the mechanism of, and the rationale behind, the new system have emerged clearly as a result of several clarifications issued by the Reserve Bank of India during the three weeks following the initial announcement which had stunned the bankers and the monetary commentators alike. It is an indication of the hasty and casual manner in which these important changes were made in the borrowing facilities available to banks. At least three clarifications were required to make the system fully and accurately intelligible. One wonders whether the important changes in the credit control mechanism could not have been made after a full and extensive consideration of all the implications of change in order that no room was left for uncertainty or doubt.

Even now, while each bank may have been able to assess the extent to which borrowing facilities will be available to it at various rates of interest under the new system, it is not possible how, to what extent and in which direction the banking system as a whole will be exactly affected. The banks are, as usual, reluctant to disclose their position, and the Reserve Bank never discusses these matters in public in terms of exact quantities. The prevailing confusion is amply illustrated by three facts: one, the Reserve Bank's intention behind these measures was to increase the cost, rather than directly restrict the availability of Reserve Bank accommodation within the framework of a policy of credit and monetary restraint; two, a banking correspondent of a financial weekly has estimated that borrowing limits for all the scheduled banks at the old Bank Rate of 4½ per cent under the old system of borrowing were Rs. 38 crores, whereas the limit under the revised system at the higher Bank Rate of 5 per cent comes to Rs. 272 crores—more than seven times the old one for a mere ½ per cent rise in the cost; and, third, another monetary commentator in a financial daily feels that the screw has been tightened so much that the Reserve Bank would be forced to relax as the busy season approaches its peak.

There are at least two reasons for the prevailing confusion. First, in the present state of published banking statistics, it is impossible to work out the exact difference between the new concept of *net liquidity position* and the statutory *liquidity ratio;* the amounts of investments in "approved securities" are not known separately from Government securities, and the borrowings from State Bank of India are not available separately from the borrowings from notified banks. Secondly, even if the net liquidity position of the entire banking system can be estimated with reasonable accuracy from the published weekly statement of scheduled banks' position, there are vast differences among the positions of the State Bank of India, its subsidiaries, major, medium-sized, and smaller Indian scheduled banks, and the foreign banks—differcenes which are compensated and adjusted in the overall estimate for the entire banking system, thus giving a rather misleading overall picture.

What is Net Liquidity?

The *net liquidity position* of a scheduled bank has been defined as the ratio of (A) the total of a bank's (i) cash, (ii) balances with the Reserve Bank of India, and other notified banks and balances in current accounts with their banks including the State Bank of India, and (iii) investments in Government securities (excluding other "approved securities," guaranteed by the Governments), presumably at their book value, *less* its total borrowings from the Reserve Bank of India and the State Bank of India, to (B) the aggregate demand and time liabilities as defined for purposes of the weekly return under Section 42(2) of the Reserve Bank of India Act. The net liquidity position as defined above is distinct from the liquidity ratio defined in terms of Section 24 of the Banking Companies Act. The *liquidity ratio* of a scheduled bank consists of the ratio of (A) cash, statutory balances with the Reserve Bank, gold or unencumbered approved securities valued at current market price to (B) its total demand and time liabilities. The table below shows at a glance the difference between the two:

Net liquidity position	*Liquidity ratio*
1. Cash—till money.	1. Cash—till money.
2. Balances in current account with R.B.I., S.B.I., notified banks and other banks.	2. Balance with the Reserve Bank of India under Section 42 of the R.B.I. Act.
3. Government securities (whether encumbered or not, except guaranteed securities) valued at book value.	3. Unencumbered approved securities (i.e., both the Government and Government guaranteed securities) valued at current market price.
4. Borrowing from the R.B.I. and the S.B.I.	4. Gold.
5. Demand and time liabilities.	5. Demand and time liabilities.
The ratio of (1+2+3 *less* 4) to 5.	The ratio of (1+2+3+4) to 5.

The table calls for a couple of comments. The original definition of net liquidity position inadvertently omited the balances with the S.B.I. which were brought in by means of a clarification. That, of course, was a drafting error, but it surely shows the careless manner in which carefully thought out measures are introduced.

The reasons why approved securities should be excluded for the purpose of computation of net liquidity are not clear. In a way, the Government guaranteed securities offer a better security, for they carry two signatures. Moreover, the banks are important holders of these Government guaranteed securities—their holdings are estimated to be of the order of Rs. 80 crores. Probably, the inclusion of these security holdings for arriving at the net liquidity position would have made the new borrowing limits much more liberal than the Reserve Bank would care to allow.

Unencumbered Securities

The Reserve Bank's letter mentions investments in Government securities without any specific reference to the unencumbered securities only as in the case of the statutory liquidity ratio. The intention, therefore, is to include all investments in Government securities, whether they are encumbered or not. Since there is no mention of the manner in which these securities are to be valued, banks would be justified in taking their book values. In the calculation of the statutory liquidity ratio, there is a specific reference to valuation at a price not exceeding the current market value.

Let us now compare the net liquidity position with the liquidity ratio of a bank. Since "balances with banks" cover a wider definition under the net liquidity position, it is likely to be higher by Rs. 22 crores on this account. Investments will more or less be equal under both the heads, because, if the net liquidity position excludes approved securities, this exclusion is partly compensated by the inclusion of encumbered Government securities. Moreover, the market value of Government securities for the ratio purposes is likely to be lower than the book value for the position purposes. Yet again, the exclusion of encumbered securities from the ratio is compensated partly by the higher market value of approved securities. Though the exact position cannot be ascertained with ease, it is a fair guess that the item of investments (item No. 3 in the above table) is likely to be even under both the calculations. If at all, it may give a slightly lower figure for the calculation of net liquidity position. The item of borrowings from the Reserve Bank and the State Bank—Rs. 32 crores on the last Friday of September—will not only compensate for the higher value of 'balances' for calculating the net liquidity position, but always make the net position lower than the statutory ratio. This gap will widen as the borrowings increase with the progress of the busy season.

The net liquidity position thus arrived at will determine the rate of interest which will apply to the *entire* amount borrowed from the R.B.I. If the position is at or above 28 per cent, the Reserve Bank will charge interest on the borrowings from it at the Bank Rate, that is, 5 per cent. For every one full percentage point fall in this position, the rate to be charged will rise by ½ per cent, not only on the additional borrowings thereafter but also on the past borrowings already made at 5 per cent.

There is one merit in this new system of liquidity, a merit in which the older tier system of borrowing quotas and slab rates was totally lacking. Under the former system, any bank could borrow at different rates amounts fixed in relation to its cash reserves with the Reserve Bank of India. This, however, did not take into account the extent to which each bank had utilised its own resources. Whether it was the State Bank and its subsidiaries with credit-deposit ratios ranging between 50 and 60 per cent or the other scheduled banks with credit deposit ratios varying from 70 to 90 per cent, all could borrow from the Reserve Bank in the same proportion. What the new system of net liquidity position does is to link the cost of borrowings of a bank to the use of its own resources. A bank like the State Bank of India, which maintains between 40 and 50 per cent of liquidity at all times and whose advances position is never overextended, will find that it has a borrowing quota of over Rs. 130 crores at Bank Rate (5 per cent), but a bank like the overextended position of the Bank of India may find that it cannot afford to borrow at all from the Reserve Bank of India. The link with net liquidity thus provides a guarantee of *equity* by allowing larger facilities to those who deserve them and by discouraging others who have already used up their resources.

On the basis of the weekly statement of scheduled banks for the week ended 25th September 1964, it appears that the net liquidity position of scheduled banks as a whole is around 39 per cent and that banks are in a position to borrow about Rs. 279 crores from the Reserve Bank of India at 5 per cent. If the net liquidity position of the State Bank of India and other banks is calculated separately, we may find that it is 47 per cent and 35 per cent, respectively, and that each may be able to borrow about Rs. 128 crores at the Bank Rate. Further they can borrow additional Rs. 7 crores and Rs. 18 crores for each increase of ½ per cent in the borrowing rate. Thus at 6½ per cent, the State Bank may be able to get Rs. 149 crores and the other banks Rs. 182 crores. If these other banks could be broken up into various groups, we may get still more interesting and eye-opening results. We may, of course, be able to utilise 1963 statistical tables to calculate December 1963 position, but that position which would be far more liberal, in to calculate December 1963 position, but that would be completely irrelevant to the present view of the high liquidity ratio that banks have been able to build up during the current slack season.

Far More Liberal

It is necessary to ask whether the Reserve Bank has done any arithmetical calculations on the revised borrowing facilities and whether the bankers have done the same before representing against their harsher provisions like abolition of special additional Bank Rate quota for their lending to cooperative and small-scale sectors, or the exclusion of approved securities for computation of net liquidity position. The obvious answer is no, for, otherwise, the Reserve Bank would have had no illusions regarding whether the present phase of its dear money is more liberal than even the so-called short-lived liberal credit policy of October 1963-March 1964 and the bankers would not have made the representation that they actually made, a representation which has very curtly been dismissed. Enquiry at few banks does confirm that their borrowing quotas at 5 per cent, 5½ per cent and 6 per cent are far more liberal than under the older system, even though they may cost them a little more, in view of the abolition of slabs and charging of flat rate of entire borrowings.

Before concluding, we have a suggestion to make. The Reserve Bank has already asked the banks to furnish a footnote at the end of their weekly statements under Section 42(2) of the Reserve Bank Act indicating their net liquidity position. It is further hoped that the footnote will be *published* for general information. But it is also necessary to go a little further and indicate in the statement a few additional sub-groups, so that the net liquidity position as well as liquidity ratio of each group of banks may be quite apparent. Moreover, rather than consolidating all scheduled banks in a single statement, it would be much more informative and useful for making as well as evaluating policy decisions if the weekly statement is published under at least five heads namely, the S.B.I., its Subsidiaries, big five banks, medium-sized ten banks, and the rest of the small banks.

THE GOLD EXCHANGE STANDARD AND INTERNATIONAL LIQUIDITY

OUTLINE OF A NEW SCHEME

By Prof. Alvin H. Hansen

Professor of Political Economy, Emeritus, Harvard University

[Many proposals have been submitted in recent years with a view to improving the international monetary system and increasing international liquidity. One of the central questions in these recommended reforms has involved the improvement of the quality of the fiduciary component of the gold exchange standard. This is attested by the fact that all the proposals include some form of exchange rate guarantee. In this article, appearing in the latest issue (1964:3) of the Skandinaviska Banken Quarterly Review, *Stockholm, the author discusses the proposals that have recently attracted the greatest attention, at the same time, outlining another method of solving the problem.—Ed.]*

TO label the current international monetary standard, a gold-exchange standard, is a bit misleading. The gold ratio for the Common Market countries plus Switzerland, the U.K. and the U.S. is 83 per cent. For the "rest" of the non-communist world it is 29 per cent. It would be more accurate to say that the former group of countries operate on a gold standard, while the latter operate on a foreign exchange standard. And increasingly so. West Germany, Italy, Switzerland, Belgium and the Netherlands added $3.6 billion to their gold stocks from 1958 to 1963, while they actually reduced their combined holdings of foreign exchange. France increased her gold holdings in this period by $2 billion but also increased her foreign exchange by $1.1 billion.

Clearly the fiduciary component of the gold exchange standard is regarded as seriously inferior. The gold exchange standard is a limping standard. Relatively speaking, gold is becoming increasingly scarce. One can observe in recent years a scramble for gold. The fiduciary component runs the risk of devaluation. Fear abounds. Yet if reasonably effective international monetary co-operation could be achieved fear would vanish. In the monetary sphere the famous statement by President Franklin Roosevelt is particularly true: "We have nothing to fear except fear itself."

The Fiduciary Component

The fiduciary component is suspect. That this is at the centre of the issues that confront us in our current international monetary problems is attested by the fact that every proposal for reform (whether a "modest first step" or an extensive overhauling) contains some element of an exchange guarantee. To this there is not, I believe, a single exception. In one way or another, the principle of exchange guarantee is spreading. The assets of the International Monetary Fund are protected, under the Bretton Woods charter, by a gold-value guarantee. The recent "Roosa Paper," so-called, is denominated in the currency of the creditor country. And the widely different proposals that have been made—Maudling, Zolotas, Franks, Bernstein, Posthuma, Triffin—all include an exchange guarantee in some form. The trimmings are different, but the heart of the whole matter is the exchange guarantee. No fundamental improvement of the international monetary system is possible without attacking the problem of improving the quality of the fiduciary component of the gold exchange standard.

Of course, if everyone would unfailingly play the gold exchange game and agree never to hold a higher gold ratio than the overall world average, all would be well. But no reform proposal, if I am not mistaken, has been content to rest the case there. Everyone, as a part of his plan, has called for an exchange guarantee either directly by the deficit country (bonds denominated in the creditor's currency) or indirectly via the automatic gold-value guarantee embodied in the I.M.F. charter.

Gold Ratios

Some plans (Posthuma and Bernstein) attempt to restrain the appetite of the gold-hungry countries by imposing gold ratios, taking care, however, to impose very modest restraints during the period of transition. But the matter is not left there. Professor Posthuma puts it very bluntly as follows: "Central banks cannot be expected to hold considerable amounts of foreign currency without being quite sure that these holdings will never devaluate in terms of either gold or their own currency." Referring to the medium-term U.S. bonds denominated in the currency of the holder, he in that such a guarantee should apply reciprocally to any conventional holdings of foreign currencies in the possession of central banks." Similarly, Dr. Bernstein (in his *Quarterly Review* article, Model, Roland & Co., Fourth quarter, 1963), speaking of his new Pool of Currencies and his Reserve Units, says: "As in all other cases, the currencies held by the Fund would be guaranteed against exchange depreciation."

Professor Posthuma is doubtless realistic when he says that central banks will not agree to limit their gold holdings unless the foreign exchange alternative carries an exchange guarantee. The ever-rising accumulation of gold stocks by the surplus countries during the last six years testifies to that fact.

If the exchange guarantee were applied all around, this would mean that *every* country whose currency was employed as foreign exchange would have to give a guarantee to all foreign holders of its currency either in terms of gold or else in terms of the currency of the creditor country. ("It will be readily apparent that not only the claims on the United States but also the claims of the United States on other countries would have to be similarly secured against the exchange risk."—Lecture by Professor S. Posthuma on "The International Monetary System," Kiel University, 19th July 1963.) This is exactly what Professor Posthuma aims at. As compensation for renouncing the right to convert all holdings of foreign exchange into gold, the creditor countries must have an exchange guarantee. "No country whose currency forms part of the reserves of other countries can therefore expect that it will be released from its conversion obligations without giving a guarantee that it will not alter the exchange rate of its currency." In Bernstein's plan, on the other hand, as I understand it, the gold-value guarantee would apply only to the new Reserve Units which would automatically enjoy the I.M.F. exchange protection. Other forms of foreign exchange (dollars, sterling, marks, etc.) would, as now, carry no exchange guarantee unless specially provided for, as in the case of the Roosa Paper.

A Gold-value Guarantee

Since about $16 billion of the $24 billion of current official holdings of foreign exchange consist of dollars, the bulk of the burden of an all-round exchange guarantee such as Posthuma suggests would fall upon the United States. Two hurdles have been erected, especially by American bankers, against a U.S. guarantee. It is said that the cost would be too great. This objection will not stand up under careful scrutiny. The U.S. still holds some $16 billion in gold. Official holdings of dollars are currently about $16 billion. Accordingly, the gold profit from any dollar devaluation would just cover the cost of indemnifying official foreign holders. Some $9 billion are held by private foreign holders. Let us suppose that half of this amount, in anticipation of devaluation, were transferred to central banks—a fairly extreme assumption in view of the need for working balances. Even so large a devaluation as 20 per cent would then cost the U.S. less than one billion dollars. To ensure against the dumping of private holdings, the guarantee could be limited to the official holdings of each country on the day the plan was announced.

The second objection is that no one would have any confidence in such a guarantee. If we mean business, however, this can quite well be taken care of. Let the U.S deposit with the I.M.F. a non-interest bearing U.S. security, but cashable in full on the day of devaluation, the purpose being to guarantee that the gold-profit would all be used to indemnify foreign official any claims against the U.S. should by prior agreement be made subject to adjudication by the World Court.

The Supreme Court Gold Clause case of 1934 is often cited. But this decision applied specifically to U.S. residents who, of course, could claim no damages. Moreover, this case should not be confused with a *specific pledge* by the U.S. Government to indemnify *foreign governments* in the event of devaluation. At all events, I believe no one has dared to suggest that the United States cannot be depended upon to live up to its obligations under the Bretton Woods Agreement Act, which was enacted by the Congress itself. To question the gold-value guarantee of the Fund is, as Professor Zolotas has said, "to question the credit worthiness of the international community as a whole."

Problem of Liquidity

An exchange guarantee by all countries whose currency forms part of the reserves of other countries (Posthuma) would end a deficit country's fear of gold drains and creditor country's fear of devaluation. So far so good, but this would not of itself solve the problem of adequate international liquidity.

In addition to key currency deficits, enlargement of I.M.F. quotas and the like, there are at least three possible ways to increase the quantity of international reserves:

1. A rigid control of gold ratios, which ratios would be adjusted from time to time so as to permit sufficient expansion of the fiduciary component to provide adequate international liquidity.

2. Establish a new international credit creating institution—an international central bank, controlled by a Governing Board.

3. Return to a full gold standard but increase from time to time the price of gold sufficiently to provide adequate international liquidity.

The plans that currently appear to command the greatest attention are, I believe, the Posthuma and Bernstein proposals and, for this reason, I shall concern myself mainly with them. Both plans involve the first of the three methods outlined above.

There are important similarities and differences between them. Both aim to control the amount of international liquidity by fixing the ratio of gold to the fiduciary component. Given the world's supply of monetary gold, Bernstein would estimate the need for aggregate reserves and would then create enough Reserve Units to satisfy the demand. Having determined the aggregate need and the available monetary gold, the gold ratio is automatically established. Professor Posthuma begins at the other end of the equation. He first seeks to establish the appropriate gold ratio—the ratio which is deemed necessary to produce the right amount of liquidity. (Initially the standard ratio would be 60:40. This ratio is derived from the fact that the fiduciary part of the total reserves of the European O.E.C.D. countries (excluding Switzerland) plus Japan amounted in 1962 to about 40 per cent of total gross reserves. It should be noted, however, that for the Common Market countries plus Switzerland the aggregate fiduciary ratio was only 30 per cent.) He then expects the participating countries, acting under the terms of an international agreement, to acquire the foreign exchange needed to achieve the desired gold ratio. The foreign exchange could be acquired either by means of market-oriented trade or capital account surpluses or by deliberate borrowing for this purpose.

Under Posthuma's plan, the composition of the international reserves of the participating countries would be adjusted so as to yield eventually a uniform gold ratio. Until the United States had built up its holdings of European currencies to the desired standard ratio, the U.S. deficits should, he says, be covered in gold and dollars in the proportion of 60:40. (Actually from 1958 to 1962, only 50 per cent of U.S. global deficits were paid in gold.) Through a process of adjustment (explained in his Annex) the standard uniform 60:40 ratio would gradually be achieved. (In the case of U.S. surpluses, European deficit countries would be allowed to pay 100 per cent in their own currencies until the U.S. has accumulated enough foreign exchange so that its gold—foreign exchange ratio will have reached the standard 60 : 40 proportion.) Once the standard ratio is achieved all around, all deficit countries would pay in (*a*) gold, (*b*) foreign currencies, and (*c*) their own currencies in the proportion 40:40:40.

the composition of reserves would more or less take care of itself. An excessive holding of gold would be costly since gold earns no interest. And so far as *aggregate reserves* are concerned, excessive holdings also become costly, since in this case the country in question would fail to achieve the consumption and investment standards which a rational employment of its surplus holdings could provide. Moreover, if a country should choose persistently to accumulate surpluses, it would soon discover that such surpluses create problems of monetary management in its domestic economy. The West German experience in this matter is well known.

For all these reasons, I see no need to impose uniform gold ratios upon all participating countries once the fiduciary component has been made in effect "as good as gold" by means of the exchange guarantee.

Bernstein's new international reserve units would be based on a pool of currencies contributed by his group of eleven advanced industrial countries—the Group-of-Ten plus Switzerland. He suggests that $3.5 billion new reserve units be issued (the I.M.F. serving as Trustee) to be allocated to the participating countries according to their quota contribution. Periodically additional quota contributions would be made if and when required to supply adequate international liquidity. Finally payments between countries would be made at the ratio of, say, two-thirds gold and one-third reserve units. This would become the standard composite unit for international payments. In the transition period, the ratio might, however, have to be as high as 9:1. This would be changed step by step until finally the desired ratio was reached. Over the still longer run, the desired ratio might need to be further reduced in order to supply adequate international liquidity.

The Group-of-Ten

Since Bernstein's plan introduces a new international reserve unit based on the combined currencies of leading industrial countries, it obviously is somewhat closer to an international reserve system than the Posthuma plan. Yet it stops short of being a full-fledged international central bank. The plan is indeed solidly built on strong currencies. This is a step in the right direction. The General Arrangements to Borrow (the so-called Paris Club Agreement) pointed the way to a significant new development. The really vital thing about this agreement was not the $6-billion potential resources made available to the Fund by the Group-of-Ten industrial countries. The important thing to note is the fact that it cut away from the window-dressing hocus-pocus of a hundred or so currency quota contributions, the vast majority of which would never be drawn upon.

The problem of foreign aid to the developing countries is one thing, and the problem of a workable international monetary system is quite another thing. A solid and secure system of international reserves must be erected upon the foundation of unimpeachable Government securities precisely as the Federal Reserve Credit in the United States is based on gilt-edged U.S. Government securities. An international currency cannot be based upon non-marketable loans and investments. (It is this issue which has raised the most serious criticism of Professor Triffin's full-scale plan. In reply to this criticism he has stated that he is content to limit the investments of his reorganised I.M.F. to securities of the World Bank and other "hard-loan" agencies, and to the obligations of strong currency countries. See his statement in Seymour Harris' *The Dollar in Crisis.*)

An International Reserve System

Let the Group-of-Ten set up a Governing Board composed of the Managing Director of the I.M.F. as Chairman and a Board of Directors representing the ten leading industrial countries. Assign to this Governing Board the responsibility of administering a new Divsion in the I.M.F. which we may call the International Reserve System (I.R.S.) corresponding to the Federal Reserve System in the U.S. Let this Governing Board invite all countries holding foreign exchange to deposit their holdings with the I.R.S. in exchange for International dollars. We have a U.S. dollar and a Canadian dollar; why not an international dollar?

There need be no compulsion, though it might conceivably be advantageous to obtain agreement, that any member of the Group-of-Ten would refrain from adding to its gold stock as long as its gold ratio exceeded 60 per cent. Such a ruling could help to promote acceptance of the new international dollar.

Some considerable part of current dollar holdings would no doubt be retained as working balances. Indeed, an exchange guaranteed dollar might well be regarded as on a par with an international dollar.

Any conversion of existing dollar holdings would, of course, not add at all to the existing volume of international reserves. That would be a matter for the future. And it is here that the new International Reserve System would come into its own. The Governing Board should be empowered to purchase and sell in the open market the Government scurities of any of the Group-of-Ten countries, but only with the consent of the monetary authorities of the country in question. The Governing Board, in cooperation with the constituent member-countries, would have the responsibility of controlling the volume of international liquidity.

The Governing Board would not be the sole creator of fiduciary reserves. Any one of the Group-of-Ten countries might, through trading or borrowing, acquire international reserves in the form of exchange guaranteed foreign currencies. The ten participating countries might, however, prefer to obtain their reserves by borrowing directly from the International Reserve System. At all events, the I.R.S. would be the "lender of last resort," and so in the final analysis would be able to exercise a large measure of control over the aggregate volume of international reserves.

Instead of detailed regulations, I should prefer to place full responsibility on the Governing Board of the International Reserve System. This would avoid having to expand international reserves by large discrete jumps such as Bernstein's $3.5-billion quota contributions. Instead, this would be subject to day-by-day management in just the same manner that the quantity of Federal Reserve credit is controlled by the Federal Reserve System in the United States. Moreover, I see no good reason why participating countries shall not have complete freedom with respect to such matters as the composition of their holdings of gold, international dollars or foreign currencies carrying an exchange guarantee.

External Disciplines

Conventional objections are invariably raised to any proposal designed to end once and for all the fears of speculative gold drains and devaluation risks. It is said that, once this goal is achieved, no country would have any incentive to balance its accounts with the outside world. No country would care to contribute its share of responsibility for the promotion of international equilibrium.

The requirements of international equilibrium will remain with us as long as there are separate sovereign nations with more or less diverging economic policies which create problems for themselves and problems for their neighbour countries. Price stability and full employment problems, both with respect to monetary and fiscal management, are intensified by payments surpluses or deficits. These will continue to plague us (though less disruptive than now) even after we get rid of fears of gold drains and devaluation losses. They will have to be faced along with the multitude of disturbing developments which monetary and fiscal authorities are compelled to contend with—cyclical swings, wage-price disturbances, technological shifts, natural disasters, etc.

Once a dependable fiduciary component has been incorporated into the gold-exchange standard and an International Reserve System has been set up to provide adequate liquidity, the equilibrating processes of adjustment could reasonably be expected to produce viable equilibrium without upsetting the "natural" structure of world trade as determined by the human and material resources of the different countries. "Rough" measures, designed to end imbalances quickly, would no longer need to be employed. Thank Heaven we do not have balance-of-payments statistics for each State in the American Union! If we did, what would not our hard-headed disciplinarians be urging, to the detriment of a rational allocation of our productive resources?

The Continental European countries have been asking the U.S. to "put its house in order," but from current newspaper accounts one learns that they are already alarmed at the prospect that their surpluses (the counterpart of U.S. deficits) might disappear. A *drastic* shift in U.S. merchandise trade is not likely to promote world equilibrium and I do not know of anyone who seriously thinks that this could in fact prove to be the way out.

The U.S. trade balances is not the root of the trouble. Rather the disequilibrium in the U.S. international payments should be sought in the capital account. If this could be brought into balance, the U.S. deficits would disappear. (Equally it could be argued that, if U.S. foreign aid loans and grants and U.S. military expenditures abroad could be cut in half, the deficits would vanish. This statement, in view of the feed-back effect, is, of course, an oversimplification.)

Direct investments abroad have been running during the last four years at around $1.6 billion per year. Portfolio investments have grown in this period from $0.9 billion to $1.9 billion. Offsetting this, foreign capital investment in the U.S. averaged $0.66 billion. Taken together these items approximate the U.S. 1960-63 deficits.

"One of the silliest aspects of the international financial scene at the moment," said the London *Financial Times* in its July 1963 issue, "is that the continental countries with far larger external reserves than they know what to do with, are regularly going to the New York capital market for funds to finance their development activities." European capital markets need to be broadened and developed. The interest equilisation tax is a step in the right direction.

Higher growth rates and full employment in the United States would help to cut down capital outflows and stimulate inflows. And the European countries could help both themselves and the United States if they would pursue a low interest rate policy accompanied, if necessary to contain inflationary pressure, by a stiff fiscal policy.

In the exchange-market where private transactions in goods and services are made in response to market forces and profit opportunities, the United States, with a surplus of $6.4 billion in 1958-62 and $6.9 billion in 1963, is obviously highly competitive. U.S. wholesale prices stood at 100.3 in December 1963, compared with 100.4 in 1958. No European country can match this record. The G.N.P. price deflator for the U.S. increased by 2.5 per cent per year from 1950 to 1960, while the average for the Common Market countries, including Switzerland, was 3.2 per cent. The dollar fortunately is not overvalued in the market-place. Should devaluation ever become necessary, it would need to be engineered by international agreement like the famous Tripartite Agreement of 1936 when the U.S. and the U.K. welcomed the French devaluation and announced beforehand that they would take no countermeasures.

Role Of Gold

Under an International Reserve System operating with an exchange guarantee, countries would no longer need to hold large stocks of gold in their reserves. The problem of an equitable distribution of gold would no longer be a matter of concern. All countries would be free to hold their reserves in any form: (1) gold, (2) international dollars, and (3) the currency of any of the Group-of-Ten countries. All the participating countries would agree to maintain the value of their currency within fixed buying and selling points around par. Perhaps these points should be widened to permit greater flexibility and thereby ease the long-run adjustment process. Parity would be expressed in gold or in an international dollar defined in terms of the U.S. dollar of the "weight and fineness in effect on 1st July 1944" as in the Bretton Woods charter. The International Reserve System would accept deposits and give international dollars in exchange. And these dollars would in turn be redeemable in gold.

Whether the International Reserve System would finally absorb all the world's monetary gold or not is a question that no one can answer. Nor is it important. It is indeed true that if all the gold should be so concentrated, some two-thirds of the I.R.S. assets would at first consist of gold, an unearning asset. This would compel the I.R.S. to pay a lower rate of interest to its depositors. But these depositors would in turn be freed from the cost of carrying gold as part of their international reserves. As world trade expands and more international reserves are needed, the I.R.S would increase its holdings of the Government securities of the participating countries relative to its holdings of gold.

AUGMENTING COTTON YIELDS

I.C.M.F.'S PROJECT INAUGURATED

TUESDAY of this week was quite a notable one in the history of the cotton textile industry in India. For it was on this day that the Cotton Extension Scheme of the Indian Cotton Mills' Federation—I.C.M.F., for short—was inaugurated at Tudialur near Coimbatore by Mr. M. Bhaktavatsalam, Chief Minister of Madras. The Federation has certainly done well in following the lead given by the Indian Jute Mills Association, which, it will be recalled, undertook the jute development work in 1961. In deciding to make its own contribution towards cotton development work, the industry has evidently been prompted by the consideration that the prosperity of the industry, after all, depends to a considerable extent on the conditions obtaining in the primary sector, that is, cotton growing.

The move of the Federation to take up cotton development work is certainly laudable. In spite of all the emphasis laid on higher production of cotton, especially of superior qualities, a wide gap continues to exist between actual output and requirements, necessitating large-scale imports, as is evident from the following figures:

(In million bales of 392 lbs.)

	Production	Consumption	Deficit	Imports
First Plan (annual average) ..	3.70	4.53	—0.83	0.76
Second Plan (annual average) ..	4.60	5.12	—0.52	0.71
Third Plan—				
1961-62	4.50	5.69	—1.19	0.87
1962-63	5.37	5.67	—0.30	0.85
1963-64	5.49	6.00	—0.51	0.72

It will be seen from the above figures that, since the rise in cotton production has not kept pace with the increase in requirements, the country continues to depend greatly on imports from abroad. The value of imports is about Rs. 50-60 crores a year. The drain on foreign exchange for cotton imports will persist in the coming years unless, along with the expansion of the cotton textile industry, earnest efforts are made to step up cotton production. India has the largest acreage under cotton, namely, 19.7 million acres. There is not much scope for increasing the area under this crop, since the equally pressing claims of foodgrains cannot be ignored. The planners have decided that the domestic production of cotton should rise to 7 million bales per annum by the end of the current Plan. This is not an overambitious goal, because the acreage available for cotton is considerable. All that is necessary is to increase the yield per acre. It is 1.15 lbs. in India, as compared with 543 lbs. obtained in the U.S.S.R., 457 lbs. in the U.S.A., 463 lbs. in the Sudan, 586 lbs. in the U.A.R. and 228 lbs. in Pakistan.

Considerable Scope

Apart from the low level of productivity, the acre yields in the country, as Mr. Radhakrishna R. Ruia said on the occasion of the inauguration of the Cotton Extension Centre near Coimbatore, fluctuate from year to year depending upon the vagaries of the monsoon. The crop in 85 per cent of the cotton area is rain-fed. Irrigation facilities are certainly being made available to an increasing extent. The area under irrigated cotton was 1.5 million acres in 1953-54; it was 2.8 million acres in 1962-63, representing 14.3 per cent of the entire area under this crop. Irrigation facilities are, however, mostly confined to canal and well-irrigated lands in the Punjab (Rajasthan, Gujarat, Maharashtra, Mysore and Madras where the acre yields are higher than in the rain-fed regions. Even so, according to Mr. Ruia, the scope for higher yields even in the irrigated areas is considerable. How it is possible to raise bigger crops is best illustrated by the excellent results secured by the Regional Research Centres in their demonstration plots at Sirsa in the Punjab and at Coimbatore in Madras.

The Indian Cotton Mills' Federation decided a few months ago to make its own contribution towards increasing the production of cotton in the country. Towards this end, it appointed a sub-committee, with Mr. Ruia as Chairman, to make proposals for fulfilling this aim. The Sub-Committee emphasised the need for bringing home to the agriculturists the importance and value of modern farm practices. The Committee recommended a Cotton Extension Project to be implemented by the Federation. It was this project which was inaugurated on Tuesday this week.

The Federation's project envisages demonstration on units of 1,000 acres at five centres of the maximum acre yields that could be achieved by implementing the package measures such as use of improved seed, application of an adequate dose of fertilisers and undertaking prophylactic plant protection measures against pests. The Federation has sanctioned Rs. 5 lakh to Rs. one lakh per centre. A Chief Executive Cotton Officer has been appointed to organise and implement the scheme. He will also advise the cultivator about their various problem. A nucleus staff, consisting of a Regional Cotton Officer, two fieldmen and two belders or muccadams, is being appointed at each centre to be in charge of the unit. The services of local co-operative organisations will be utilised for issuing loans in kind, seed, fertilisers and plant protection chemicals to farmers. The Federation staff would follow up the issue of the loan to see that the seed is sown, fertiliser applied at the appropriate time and the plant protection chemicals utilised in spraying the crop.

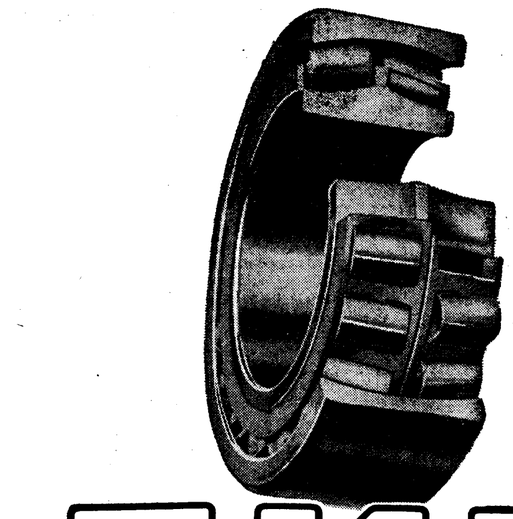
The necessary plant protection equipment is purchased for each centre and it will be utilised for undertaking a mass plant protection campaign in the entire area to serve as an effective demonstration on the need for doing simultaneous spraying or dusting by all growers in any locality. Clean methods of picking would be insisted upon and encouraged. The grading of *kapas* will be done and assistance rendered in ginning and marketing. The recovered loan amount would be retained at the centre for utilisation in the following season, either in the same centres or for other centres. The loan granted would be interest-free. An information bureau will be opened to enlighten the growers on the improved methods of cotton cultivation and enhancing cotton yields. Other necessary leaflets and literature will be distributed to educate the farmers. Propaganda will also be done to enlighten the farmers on modern methods of farming by which their income per acre can increase and so also the yield per acre.

Practical Demonstration

The Indian cultivator is shrewd and hard-working. Mr. Ruia was right when he declared that it would be more profitable to give him practical demonstration. To quote him: "The State and Central Governments have drawn up plans and programmes under the cotton development schemes with the object of helping the farmer to adopt modern methods of farming. Various facilities and incentives are being given to him towards this end but due to procedural and other difficulties, the gains have not been equal to the expectations. The farmer has not been able to take full advantage of these schemes. My Federation feels that it can make a useful contribution to the 'Grow more cotton' campaign through its scheme." Proceeding, Mr. Ruia said:

"If the various schemes that have been introduced to help the farmer succeed in full, I have no doubt that a tremendous fillip will be given to our national economy. I, therefore, make an earnest appeal to the farmers assembled here to take full advantage of the facilities afforded to them and to ensure the success of our demonstration project. I would also like them to make the best use of our Centre which will serve as a liaison between them and the Government Departments. It will bring to the notice of the authorities whatever difficulties and hardships they may encounter in their attempts to adopt modern farm practices."

Since agriculture is the mainstay of national economy and cotton is an integral part of it, it is just as well that the cotton mill industry has decided fully to participate in the general drive towards the goal of self-sufficiency in this important raw material. But its participation will only be of a limited nature. It is the Indian Central Cotton Committee and the Agricultural Departments of State Governments that should intensify their efforts in the direction of achieving a level of cotton production that will not only meet the expanding domestic demand but also leave a sizable surplus for export.



SKF designs and manufactures a complete line of all types and sizes of the four basic anti-friction bearings... ball bearings; cylindrical, spherical and tapered roller bearings. Because we make all types, you can always be sure of getting the right bearing in the right place.

ART SILK WEAVING INDUSTRY IN INDIA

TECHNO-ECONOMIC SURVEY HIGHLIGHTS NEED FOR RATIONALISATION

THE art silk industry in India has entered a rather crucial phase of its career, thanks to the diversification of end-products with the advent of new fibres. So marked has this diversification become of late that the opportunities of substitution of one product by another have expanded considerably. It is the availability of multiple products made out of different yarns that has imparted intensity to the prevailing competition among art silk mills. *Saris*, for instance, are now made of viscose yarn, polyamide, twinkle, polyester, acrylics, etc. and there exists a wide choice of selection. There is also a steady encroachment in the field of art silk goods by the fabrics woven out of blended yarn, namely, cotton and polyester in the case of suitings and shirtings and polyester and woollen in the case of suitings. Viewed thus, there is no exageration whatever in the finding of the techno-economic survey of the art silk weaving industry, conducted by the Silk and Art Silk Mills Research Association (S.A.S.M.I.R.A.), Bombay, that the industry is facing a challenging task of keeping the hold over the market. Indeed, the stage has now been reached when the industry, as the authors of the survey (Messrs. V. P. Chitale, G. K. Kusumgar and J. G. Parikh) rightly pointed out, has to come out of traditionalism and conservatism so closely associated with its parent silk industry; it must be receptive to new and changing ideas, and adapt a dynamic approach. It is imperative that the industry must be organised on a scientific footing through speedy rehabilitation of worn-out machinery, modernisation of equipment and rationalisation of production processes. And the future growth of the art silk industry hinges on the production or performance of man-made fibre industry.

The aforesaid survey was undertaken by the Association in March 1964 with the object of collecting and interpreting the basic data relating to the various aspects of the art silk industry. The coverage of the survey was limited as only twenty mills in Bombay City from four groups classified according to size were selected for intensive examination. In view of the highly restricted coverage—in fact, the smaller units having less than 50 looms were under-represented—the survey cannot, as the authors themselves say, legitimately claim the wider representation of the entire industry. Even so, it can be said that the picture emerging from the survey is fairly true of the organised sector of the industry.

Growth

In order to appreciate the problems and prospects of the art silk weaving industry, it is necessary to review its growth during the last few years. The industry, though it originated in the 'thirties, made its debut in India rather late and its real growth commenced only after the era of planning began in 1951. The higher availability of indigenous yarn has gone a long way towards relieving the weaving industry of acute shortages due to restricted yarn imports which are currently pegged to about 17 million kgs. a year. The domestic production of yarn is at present meeting two-thirds of the total needs of the weaving industry; it is expected that, in the near future, the production of synthetic fibre yarn will gain prominence when the local base of the raw materials for it materialises with the emergence of the fully integrated petrochemical industry. Following the rise in the indigenous production of yarn and the incentive offered by the Export Promotion schemes, the art silk industry has made rapid strides. The number of powerlooms engaged in the manufacture of art silk fabrics has increased from 25,800 in 1951 to over 67,000 at present.

In spite of the marked increase in the number of art silk looms and, consequently, rise in production of cloth, the industry has yet to be organised on scientific and productive basis. This aspect has been impressively highlighted by the findings of the survey. The relevant extract from the report reads thus:

> It is hard fact that this industry is lagging far behind in productivity when compared with its counterpart in other countries. The post-war trend towards automation and rationalisation has greatly accelerated the productivity of the textile industry in the leading production countries of the world. For instance, in six countries of the European Economic Community, though the number of working looms showed a decline of 50 per cent during the period 1936-62, output per loom per year registered a remarkable rise of 300 per cent. It must be realised that not only longer machine hours are responsible for this production but also greater use of automatic looms, better quality of yarn, increasing machine speed, scientific study of workloads and greater rationalisation of production. The proportion of automatic looms (to the total loomage) is of a high order, more than two-thirds of the total. The U.S.A., Japan and Hong Kong have also attained peak level of automation in weaving sectors. The output per loom per year amounts to 24,428 yards in the E.E.C. region, as against India's estimated production of 6,750 yards. This indicates the magnitude of the task that confronts man-made textile industry to improve its productivity in future."

Productivity

Productivity in the art silk weaving industry can be improved greatly by removing the imbalance between weaving and processing capacities and adopting other methods of rationalisation. It is well known that almost the entire production of art silk fabrics is sold in processed condition. Barring the bigger sized units having their own processing facilities, a lare number of small units have necessarily to depend on outside processing establishments for processing their cloth. Invariably the middlemen come in at this stage to buy the grey cloth from the powerlooms and sell it after getting it processed outside. This arrangement usually depresses the prices of the cloth in grey condition. A rough estimate indicates that 50 per cent of powerloom cloth is processed by the bigger sized powerloom factories which take the processing of outside cloth also and the remaining 50 per cent is processed by independent processors. It appears that the weaving units are prevented from installing processing plants because of low loomage.

Rationalisation

The importance of rationalisation is all the greater in the case of the art silk weaving industry which, according to the findings of the S.A.S.M.I.R.A. survey, is labour-intensive in nature. The manpower employed in the industry can be utilised to the maximum extent through rational allocation of work and automation, which is the latest trend in manufacturing industries. Weavers constitute the major component of labour force in the industry. The functions performed by them are of vital importance for maintaining the quantity and quality of production. Wages are based on piece-rate system. Total wages that weavers earn are also dependent on the number of looms allotted to them. Only by proper workload studies—such studies are not being undertaken by way of the units surveyed—the maximum number of looms can be allotted to one weaver on a scientific basis. It is gratifying to find from the S.A.S.M.I.R.A. survey that, of late, the industry has realised the significance of technical personnel in supervisory capacity. Loom supervisors are entrusted with the job of maintaining the overall efficiency of the weaving shed. The survey, however, discloses a lack of job evaluation at his level because of the wide range of variations in the number of looms assigned to him. Next in importance comes the weaving master who heads the technical department and is solely responsible for all technical matters. He also assumes managerial functions for production planning and control and promotion of healthy labour situation. This is a decision-making responsible post demanding unusual talents. The remuneration, therefore, naturally becomes a strong bait in order to attract the right type of personnel. The capacity of units, however, to offer high remunerations is conditioned by the size of the unit. Therefore, the small units, due to their financial handicaps, find it difficult to employ supervisory personnel. A possible solution to this problem lies in the amalgamation of mills which are too small into economically viable units.

Rehabilitation

No less important is the need for rehabilitation. The findings of the S.A.S.M.I.R.A. survey reveal the existence of old silk looms and cotton converted silk looms. Most of the looms are said to be old and obsolete. Though the survey does not find lack of enthusiasm for new ideas and innovations, none of the selected units for study has any concrete scheme for renovation and replacement of worn-out looms. Because of the durability and versatility of textile machinery, an attitude of indifference towards modernisation and rationalisation has developed. This is certainly disquieting. The schemes of modernisation and rationalisation, it is necessary to stress here, must be seen in the larger perspective of the entire man-made fibre industry. There is, of course, force in the contention that the quality of art silk fabrics depends in no small measure on the quality of yarn supplied to it. But the authors of the survey, it is somewhat regrettable, have made certain observations which have no direct bearing on the study undertaken by them.

Cost Structure

An analysis of the cost structure of the art silk weaving industry reveals that costs of materials used account for 57 per cent (average) of the total cost, wages and salaries for 16 per cent, and power and fuel for 2.21 per cent. The high cost of materials underlines the need for greater control over the element of cost through economy in use. The steady supply of synthetic yarns at reasonable prices, according to the authors of the survey, is the only remedial measure to keep the material cost within reasonable margin in the long run.

An interesting conclusion arrived at in the survey is that standardisation in the art silk weaving industry is an improbable phenomenon, in view of the fancy character of its end-products. Owing to the fashions of consumers, there is naturally a considerable variations in the items of production. A sort-wise analysis made by the survey shows that satin has retained its traditional hold and that the majority of units are producing this variety. The commonly used material for satin is viscose rayon, acetate polymaride, twinkle and sparking. The other sorts produced are taffeta, crepe and half crepe, georgette, velvet, *sari*, shirting and suiting. Of late, strong demand for shirting made out of synthetic fibres has imparted dynamic spurt to the production of this variety. In fact, large-scale units are planning shirting-based production programme in a big way. It is expected that shirting may assume a leading position in total art silk production by relegating satin into the background. For *saris* the synthetic yarn has gained ascendancy over cellulose ones as a basic raw material.

WORLD COTTON MEET IN ZURICH

The International Federation of Cotton and Allied Textile Industries (I.F.C.A.T.I.) held its annual meeting at the Kongresshaus in Zurich from the 5th to 10th instant, at the invitation of the Swiss Spinners' Doublers' and Weavers' Association. I.F.C.A.T.I. is the leading international trade association for the cotton and man-made fibre processing industries, with members in Western Europe, the United Arab Republic, Japan, the United States of America, India and Africa, representing more than two -thirds of world total productive capacity. This was the first meeting of I.F.C.A.T.I. to be held in Switzerland since the recent removal of headquarters from Manchester to Zurich.

More than 120 delegates from all over the world attended the meeting. The meeting opened with addresses by Mr. Otto Honegger (Switzerland), President of the host Association, Ambassador Dr. E. Stopper of the Federal Ministry of Economy and Mr. Alfredo Sedo (Spain), the President of I.F.C.A.T.I. The main item on the agenda was a detailed study of the structure of the cotton and allied textile industries in the Federation's member-countries. The evolution of productive capacity and current problems regarding world trade in textile goods were also considered. Three sub-committees discussed matters pertaining to raw cotton production and marketing and man-made fibre supplies. The Committee of management also considered the applications for membership received from the Cotton Institute of Canada and the Cotton and Man-made Fibres Federation of Australia. The meetings, which had a strictly working character and was held behind closed doors, was highlighted by a number of social functions and excursions, including a reception to be given to the delegates by the Mayor of the city of Zurich, Stadtpraesident Dr. E. Landolt.

COTTON TEXTILE EXPORTS TO U.S.

The Cotton Textiles Export Promotion Council has invited applications from established exporters and others for the allotment of residual quantity for the export of cotton textiles under the I.C.T.A. Category 026 (duck) for shipment to the U.S.A. upto 31st March 1965; the applications are to reach the Council before 2nd November 1964. If the total quantity covered by the applications received up-to the prescribed date is more than the balance to be distributed, allocations will be made price-wise. For this purpose, the applicants have been asked to state clearly the minimum guaranteed f.o.b. price per square yard below which he will not export and the minimum quantity below which he will not accept the allocation. In that case, the quota certificates and the corresponding export licences issued to successful candidates will have the condition prescribed in regard to the minimum guaranteed price and the exporter will not be allowed to export below the guaranteed price. The allottees shall execute a performance guarantee which shall be either in the form of "a bank guarantee" or accompanied by cash deposit at the rate of 5 paise per square yard of the quantity allotted. Allottees shall produce irrevocable letter of credit from, and the contract with the U.S.A. buyers for the full amount to cover the value of the quantity allotted.

MANCHESTER LETTER

NEW TRENDS IN TEXTILE INDUSTRY

TWO MORE FIRMS TO POOL THEIR INTERESTS

From Our Special Correspondent

MANCHESTER, *6th October*

TO investors and indeed to the general public, financial deals have now become so magnified that, unless a price tag of several million pounds can be put on any transaction, it tends to be tucked away almost out of sight on the city pages of the newspapers. Those with knowledge of particular trades, however, can make their own assessments of the importance of new links which are achieved either by direct takeovers or through the acquisition of a substantial shareholding in individual companies. Sometimes, in this way, relatively small developments can lead to much more comprehensive changes in policy in the future.

The widely rumoured arrangement between the Directors of John Grey Ltd. and Mr. Henry Pfeffer of Broome and Wellington Ltd., which has now been confirmed, was a case in point. The initial outlay of £60,000 by Mr. Pfeffer, acting purely in a private capacity sows the seed for an expansion of interests which may well prove another major enterprise in a year which has been full of incident for those dealing with textiles and originating new trends and outlooks. Behind the bald announcement that a 40 per cent. shareholding in John Grey has been acquired lies the intention to create a wide chain of weaving capacity, linked with marketing experience which has already proved itself.

Streamlining the Looms

The ability of the Broome and Wellington organisation to dispose of foreign cloth in the midst of an area noted for its own productive skills has caused many hard words to be said in the past. It now remains to be seen whether this faculty for distributing goods can be adapted to Lancashire's own needs.

In this connection, the sponsors of the new group, bearing in mind that they include one of Lancashire's leading spokesmen and trade representatives, are under no illusions as to the task ahead of them. Experience in other sections has shown clearly that standardisation provides invariable benefits and, as the project widens in scope, it is hoped to streamline weaving in the same way as some units have been effectively reorganised in the spinning branch.

One particular aspect of former trading in cloth is regarded with great disfavour by those supporting the new grouping. This is the system of arranging contracts far ahead, so that, on completion, the goods may well be surplus to requirements causing the ardent flow of demand which has been the bane of Lancashire for generations. By concentrating on achieving a steady supply of standard fabrics without involving too many specialities, it is hoped to maintain an extensive stock system which will be at the disposal of customers at all times.

Reasonable Margins

Among the aims of those concerned in this venture is the provision of reasonable margins for suppliers, merchants and their customers. Price-cutting is another of the drawbacks which has caused much confusion in Lancashire for many years and, although the temptation to sell has often proved too strong in times of difficult trading, adequate finance to enable stocks to be deliberately held for the benefit of customers should be available in the case of the proposed grouping.

Already, it is believed, other firms have shown interest in joining the project which from a nucleus of rather less than 2,000 looms may well grow to five times its initial size. Achieving some form of integration in weaving sustained by enterprising distributing facilities has been a goal which would have saved Lancashire firms a great deal of trouble if it had been effectively carried out in the past.

Slight Export Gains

August is scarcely the month in which to expect any major variation in overseas trade returns, but textile shippers can gain a crumb of comfort from the fact that more cotton cloth was exported than in any month since May 1963. Meanwhile, imports of comparable goods were lower than in July, though they were distinctly larger than in August last

Dealing for a change with exports first, the position at the end of eight months of 1964 was that cotton fabrics shipped abroad had aggregated 140,367,000 square yards, as against 151,380,000 square yards in the same period of 1963, while trade in man-made fibre cloth had improved further from 52,006,000 square yards to 60,512,000 square yards. The combined totals, therefore, were little more than 3 million yards smaller than in the eight-month period of 1963.

On the yarn side, the aggregate totals were both higher than last year. In the eight months, cotton yarn and thread shipments amounted to 14,563,000 lbs., as against 14,265,000 lbs. Man-made fibre yarns continued their very satisfactory progress, exports being 63,345,000 lbs., as against 54,015,000 lbs.

Imports

Importation of foreign supplies, however, continues apace. Arrivals of cotton fabrics in August were 64,036,000 square yards, a reduction of over 8 million yards on the previous month, but nearly 15 million yards more than in August 1963. In the eight months, supplies reaching British ports aggregated 551,667,000 square yards, as against 428,011,000 square yards last year and 539,904,000 square yards in 1961, the previous peak period.

The total cost so far this year of imports of cotton yarn and manufactured goods has risen from £40,388,000 to £54,817,000. Grey cloth continues to provide the bulk of this business, the quantity absorbed being 440,973,000 square yards as against 329,174,000 square yards. Finished fabrics comprised 110,694,000 square yards, as against 98,837,000 square yards in the first eight months of last year.

Supplies from India

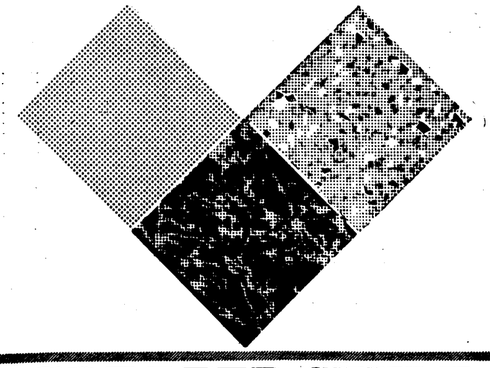
India continues to be by far the largest supplier, having sent 182,122,000 yards of grey cloth, as against 117,175,000 yards, while finished materials from the same source have increased from 9,176,000 yards to 17,903,000 yards. Other countries from which bigger quantities of grey cloth have been taken are Canada, the Irish Republic and China, but both Pakistan and Hong Kong shipments are running at somewhat below last year's levels.

The quantity of cotton yarn and thread imported has increased by 4 million lbs. so far this year at 28,435,000 lbs., of which a substantial proportion is in twofold yarns.

A 50 per cent rise in the volume of man-made fibre cloth entering this country has so far taken place this year. Purchases from abroad have already reached 61,089,000 square yards, as against 40,140,000 square yards in the first eight months of 1963.

Orders and Deliveries

The Board of Trade, in its monthly survey of orders in the textile and clothing industries, always covers itself against any speculative assessment of the situation by observers by a guarded commentary, which brooks no reckless interpretation of its figures. "Sharp month-to-month changes in the rate at which orders are received should not by themselves be taken to imply similar sharp changes in production," it points out. "They may, for example, lead to changes in the length of order books or the level of stocks." Nevertheless, the tables, which cover the wool, hosiery and other knitted goods, made-up clothing and the spinning, weaving and merchant converting sections of the cotton and man-made fibre industries, show that orders on hand at the end of July were 20 per cent higher than the basic period of April 1959.



GREATER STYLE
with new
VYNATILE
WONDERFUL PLASTIC TILES FOR FLOORS!

There's nothing like VYNATILE—the unique new floor covering! Strong, flexible and beautiful, VYNATILE does wonders for rooms—looks distinctive on any floor. Ideally suited to offices, shops, restaurants, showrooms, banks, theatres, homes and hospitals!

Choose VYNATILE in 180 cms x 90 cms sheets, in thicknesses of 1.5 mm. or 2 mm. Or ask for it in any economical size. Better still, take it as tiles to fit into your scheme of things!

VYNATILE...better in so many ways!

- So durable. Won't rot, crack, break or scratch!
- Can be used on any surface!
- Superbly finished. In 28 attractive colours and patterns!
- Can be wiped clean in seconds!
- Professionally laid to last for years!

THE OTHER CHINESE INVASION—I

PEKING'S ECONOMIC OFFENSIVE IN ASIA

By K. Krishna Moorthy

[This is the first instalment of a series of articles on Communist China's aid offers to and trade with communist and non-communist countries in Asia, Africa, Latin America and Europe.—ED.]

COMMUNIST China's expansionist adventures fall into three broad categories—the military aggression as directly evident in the attack on India and the sponsorship of sister communists who are aggressive in Laos and Vietnam; secondly, the political warfare carried on through mass media like radio broadcasting and the printed word and through the use of friendly politicians who abound in the uncommitted countries; and thirdly, through the shrewd use of aid and trade.

The object here is to examine briefly the extent and nature of Chinese communist aid and trade in the past decade. Apart from the Himalayan border hostilities in which the Chinese exercise of military strength gave Peking a triumphant stance before the uncommitted nations of Asia and Africa, China has been trying to isolate India through an organised economic offensive to combat which the Indian administrators perhaps have been as unprepared as during the bad days of 1962.

With Pakistan's willingness to accept Chinese Assistance to the tune of U.S. $60 million, announced after the visit to Peking of Pakistan's Commerce Minister in July 1964, all of India's immediate neighbours are becoming recipients of Chinese communist assistance. The largest amount of Chinese aid has gone to North Korea on whose side China fought against the United Nations. The Chinese wrote off the Korean war debts. Total Chinese offers to North Korea are around Rs. 210 crores. The second biggest recipient has been North Vietnam and some of the largest injections of Chinese aid came at the height of the Vietminh war against the French. For human appeal, China has added the education of one of the sons of Cambodia's Prince Norodom Sihanouk in Peking.

Non-military assistance received by Communist China from the Soviet Union is said to amount to Rs. 400 crores and, according to my calculations based on announcements by the Chinese or by the recipient countries, the total assistance that China has offered to various countries is approaching Rs. 800 crores, or double the non-military aid China is supposed to have received from the U.S.S.R. for her development. Recipients of Chinese aid number nine in Asia—Burma, Cambodia, Ceylon, Indonesia, Nepal, North Korea, Mongolia, North Vietnam and Pakistan—nine in Africa—Alegria, Congo, Kenya, Guinea, Ghana, Mali, Somalia, the United Arab Republic and Tanganyika-Zanzibar—two in Europe—Albania and Hungary—and one in Latin America—Cuba. Of the total offers of around Rs. 780 crores of aid, about Rs. 517 crores have been offered to communist countries and a little over Rs. 260 crores to non-communist countries. Regionwise, the aid offers are Rs. 552 crores to Asian countries, Rs. 96 crores to African countries, Rs. 28 crores to Latin America and Rs. 102 crores to European countries. In Europe the bulk of the Chinese aid offer is to Albania, China's ally in the ideological dispute with the Soviet union.

The Communist Chinese conduct vigorous propaganda against the Soviet Union and India while they make aid offers. India has been offered a total of Rs. 5,000 crores foreign assistance during the years since its development plans were launched, but her aid offers to less-developed countries have been negligible. Advertising their

generosity, the Chinese say that they have been assisting less-developed countries although the only foreign aider who helped China has closed the tap. China also tells Asian and African countries to go ahead with independent and self-reliant economic development. In China's interpretation, the Soviet Union also is a White Western nation which is capable of treating coloured nations shabbily. Some of this propaganda has found echoes in Burma, Cambodia and Indonesia. The Soviet Union, in turn, accuses China of making empty promises which she cannot fulfil. The delay between Chinese aid promises and deliveries is tremendous. In Burma not much progress has been made with projects promised early in 1961. Four-year-old promises to Indonesia have not been fulfilled. Of seven projects promised in Guinea, work has begun on only one project. In Nepal, China has admitted her inability to pursue some projects which were promised.

Outer Mongolia, one of China's sister communist nations, recently disowned her kinship and declared her intention of keeping the Chinese at bay. Earlier this year, Mongolia booted out all Chinese technicians and others who have been working in Outer Mongolia largely because Mongolia has plunged herself on the side of the Soviet Union in the ideological dispute splitting the communist world. Between 24th April and 8th July more than six thousand Chinese were sent out of Mongolia. At one time there were as many as 12,000 Chinese working on projects in Mongolia. Under-populated Mongolia also has fears about Chinese expansionism and claims for territory in neighbouring countries.

Chinese aid to Mongolia went in three instalments U.S. $40 million announced in 1956, U.S. $25 million announced in 1958 and U.S. $50 million announced in 1960. The biggest industrial project with Chinese aid was a woollen textile mill at Ulan Bator, with a capacity of more than a million yards of cloth and blankets a year. The mill is said to have used Soviet designs and British machinery. In May 1960, Chinese Foreign Minister Chen-yi told the Mongolians: "This factory is much more beautiful than the Chinese woollen textile mill in Shanghai and its equipment is more up-to-date. The machines in the Shanghai woollen textile mill are old. Yours is a new factory and a better one."

When the Chinese technicians were being kicked out early this year, the Chinese Ambassador in Ulan Bator, said: Chinese workers "have been enthusiastic in putting forward rationalisation proposals, technical innovations and in practising economy in the use of raw materials. They have taken an active part in voluntary labour and other useful work. They have cultivated a profound friendship between the two people. This friendship, built up and developed while living together, has its basis in proletarianism and internationalism. It is, therefore, everlasting and cannot be undermined by any force on earth."

The Mongolians obviously were not keen to develop the Chinese brand of friendship. In April this year there were clashes between Mongols and Chinese in Ulan Bator. In May, the Mongolian Government asked the Chinese Embassy to stop distributing propaganda pamphlets. Mongols accused the Chinese of "slandering Khrushchev so as to glorify the personality of Mao Tse-tung." Some time before the Mon-

North Korea	210.0
Mongolia	55.0
North Vietnam	150.0
Albania	74.0
Hungary	28.0
Aid to non-Communist States	260.9

gols booted out the Chinese, U Tsedenbal, the first man of Mongolia, kicked out of office L Tsend who was the No. 2 or No. 3 in the regime. Tsend belonged to the anti-Russian group. Incidentally, Outer Mongolia is a member of Comecon which is essentially an economic alliance among the Eastern European communist countries.

Following the Korean war, China wrote off Korean war debts amounting to about Rs. 95 crores. New credits were offered in 1958 and 1960. These were for the construction of a power station, a textile mill, two paper mills and industries like rubber tyres and radio communications equipment. Assistance to North Vietnam includes U.S.$205 million made in 1955 and more than U.S.$100 million offered in 1959. The projects covered by Chinese assistance in Vietnam are railway lines, a cement factory, a motor car repair plant, a tyre vulcanisation plant, a paper mill, a chrome mine, two sugar refineries, a cigarette factory, a knitwear unit, a power plant, a radio station, rice mills, a match factory, a petroleum depot, a printing works, a ceramics plant and a typewriter factory.

Adventure in Ceylon

In relation to non-communist countries in Asia, China opened with an extremely successful trade move in Ceylon in 1952 when she promised to buy rubber at rates higher than world market rates. Both politically and economically China's trade relations with Ceylon are highly significant. To quote A. Doak Barnett from his book, *Communist Economic Strategy: The Rise of Mainland China*: "The 1952 rice-rubber agreement between China and Ceylon was a case in which Communist China stepped in and simultaneously helped to solve a small nation's problem of marketing a major export product, helped to undermine the restrictions on trade with China (rubber was an embargoed item) complicated the relations of that country with the United States, and assured itself access to much-needed supplies of rubber. In 1952, Ceylon was having difficulties in marketing its rubber at prices which it hoped to obtain. China in this situation offered to buy at prices above those prevailing on the world market."

In exchange for the rubber, Ceylon got the rice she badly needed. Two five-year agreements for the purchase of rubber and the supply of rice are over and the third is in operation. Later, in 1958 China also offered grants to Ceylon which would help her with rubber replanting schemes. Chinese aid is claimed to be stringless but in practice the Chinese Government has guaranteed the increased sales of Chinese textiles, incidentally to the disadvantage of Indian textile exports.

Grants and loans to Ceylon from China form the biggest aid promises to Ceylon by any country since 1956, according to the Ceylonese Government which said last year that of Rs. 381 million offered by all countries until the middle of 1963, Rs. 175 million of offers came from China. Another Rs. 50 million loan has been offered and China recently waived the interest on loans and extended the period for use of the grants and loans. Almost all the railway passenger coaches and freight wagons imported by Ceylon in 1963 came from China. China has promised to supply more rolling stock, textiles, powerlooms and sizing plants and materials for a conference hall to be built as a memorial to the late Mr. S. W. R. D. Bandaranaike, the Prime Minister who was assassinated.

Textile equipment promised by China to Ceylon includes 2,400 powerlooms and eight sizing plants to produce 36 million yards of cloth a year. China has prepared the designs for a Rs. 53-million textile plant for the Ceylon National Textile Corporation. The spinning and weaving machinery at this factory is to be capable of producing three million lbs. of yarn and ten million yards of cloth a year *plus* finishing capacity for 30 million yards.

Ceylon's total rubber exports were valued at Rs. 257 million in 1963; rubber exports to China

TABLE III: China's Trade with Ceylon and Burma

(In crores of rupees)

Year	Ceylon		Burma	
	Imports from China	Exports to China	Imports from China	Exports to China
1958	15.2	7.8	7.9	1.4
1959	15.0	7.8	11.8	3.7
1960	13.2	12.1	11.8	2.7
1961	3.5	8.8	9.8	17.8
1962	4.1	13.3	13.6	9.0
1963	13.8	10.1	N.A.	N.A.

in 1963 accounted for Rs. 85 million. Fifteen per cent of the total coconut oil exports were also to China. Out of about Rs. 45 million worth of imports of cotton piecegoods in 1963, Rs. 17 million worth were from China.

A significant fact in the development of Sino-Ceylonese relations is that the first ventures together were launched when a rightist United National Party Government was in office in Ceylon. The leftist Governments of Mr. and Mrs. Bandaranaike only took the Ceylon-China relations further on their course. It is not that the exports from Ceylon to China and the Ceylonese imports from China show a steady increase; there are year-to-year vagaries. An important point is that China was able to increase her rice purchases from Burma and supply some of this rice to Ceylon which is traditionally short of foodgrains. The rice-rubber deal with Ceylon helped China in a three-party trade adventure in which China was also able to increase her trade with Burma, another uncommitted Asian nation which has been establishing close economic and commercial ties with China.

No. 1 Friend

Chinese aid gestures to non-communist Asian countries followed the Bandung conference where India was among those who helped China achieve respectability in the international arena. The first Chinese aid recipient in the non-communist group was Cambodia in 1956. The second Asian neutral to accept Chinese aid was Nepal, to whom also the first aid promise was made in 1956. Mr. Nehru had also introduced Nasser to the Afro-Asian fold at Bandung; when Nasser was reeling under the Anglo-French-Israeli attack, Chou En-lai presented some fraternal assistance to Nasser.

Was the choice of Nepal and Cambodia as the early recipients of Chinese aid accidental? Or, was there a well-conceived strategy in the moves? Among all the Indo-China States which attained independence as a result of the Geneva agreements, Cambodia has been under the greatest Indian cultural influence. Nepal's freedom from Ranas' rule came about as a result of extensive Indian help but by the middle fifties there had been pronounced manifestations of discontent in Nepal against Indian policies which were interpreted as an attempt at dominating the Himalayan kingdom. The middle fifties were certainly an opportune time for the Chinese to try to get under the skin of the Indians in Kathmandu. But, of course, in view of the Hindi-Chini *bhai bhai* situation of those days, the Indian Government also welcomed the Chinese economic assistance moves in Nepal.

Among Asian non-communist leaders the one most proud of his association with the Peking set is Cambodia's mercurial head of State, Prince Norodom Sihanouk. The Prince has made it a habit to go out of his way to praise China's contribution to Cambodia's economic development. China is hailed as Cambodia's No. 1 friend although the Prince has time and again mentioned that Chinese domination of the Indo-China peninsula would mean the end of the royal Cambodian regime. China's aid promises to Cambodia have totalled Rs. 16 crores, *plus* some military assistance promised and supplied in recent months. Textile, paper and plywood factories are among those which have come up in Cambodia with Chinese help. Cambodians are proud of cotton textile mills which Chinese erected for them. A cement factory is being constructed and a steel fabricating unit has been promised. Cambodia has a strong community of Chinese origin and the Chinese technicians, under the aid agreements, live among the workers. The Chinese gave the Cambodians steel and textile products which they sold to raise the counterpart local currency funds for the projects. When the Prince asked the Americans to get out, his major grouse was not that the Americans were not aiding him but that they were aiding his neighbours Thailand and Vietnam more. American aid was poured into fundamental infrastructural programmes including education, but not into industrial establishments. The Americans also picked up the bills for the maintenance of the small Cambodian army. Cambodia, with her numerous matriarchial traditions, is a feminine State pliable to wooings. Cambodia has assiduously cultivated the cult of the courtesan; she will not have dealings with her close neighbours who are her enemies but waits for the warrior from the north. Cambodia, indeed, is China's willing mistress and recently, of course, Cambodia has also, welcomed the wooings of her former overlord, France.

Road to Khatmandu

The Chinese made their entry into Nepal with an offer of Rs. 6 crores in 1956 when Mr. Tanka Prasad Acharya was Prime Minister. This aid included the unloading of Rs. two crores of Indian currency to stabilise the Nepali rupee. Rs. four crores of this aid offer were still unspent in March 1960 when Mr. B. P. Koirala visited Peking to initial the boundary pact. Closely following the boundary agreement, the Chinese offered another Rs. 10 crores, making the total aid available then to Rs. 14 crores, including the balance unutilised from the 1956 aid offer. This agreement was to remain in force for three years from the date of signature of the new aid protocol on 5th September 1961. The projects in this protocol included a cement factory with an annual

capacity of 50,000 tons, a paper factory with a daily output capacity of 20 tons and a small tannery and shoe factory. The three projects were supposed to be completed by 1966 and because Nepal said she would be unable to raise local matching resources for the local costs, China was reported to have agreed to finance the local currency costs also. It was not made clear whether the commodities to generate the local currency were to be included in the Rs. 16 crores assistance offered or were to be in addition. In September-October 1961, King Mahendra, who had taken over the administration of Nepal, visited Peking and signed the boundary treaty. The King was shown a map of a road which the Chinese suggested to link Khatmandu with Lhasa. The King accepted the Chinese offer of £3.5 million for the construction of the seventy-mile road within Nepalese territory to form part of the link with the Tibetan capital. The effect of this agreement and the work which has been done on the road is that next year there will be a comfortable route streching from Lhasa to the Indian border. Eight years ago India had built the Tribhuvan Rajpath to connect Khatmandu with the Indian border. This increases China's military threat across the Himalayas but King Mahendra once scoffed at Indian and other criticism of the project by saying that communism does not travel by automobile. He forgot that military tanks are also automobiles! There has also been talk of Chinese aid for an airport.

In the 1960 agreement with Nepal the Chinese advertised the point that "Chinese experts would have a standard of living not exceeding that of personnel of the same level in the kingdom of Nepal." In the January 1961 agreement with Burma also a similar clause was introduced. This pattern provides some ammunition for anti-Soviet propaganda because Russian experts expect to maintain a high standard of living during their sojourn in the hot climes of Asian countries. The Burmese newspaper *Guardian* wrote: "Inequality in the standard of living of the experts from the aiding country and those in the service of the aid-receiving country is one of the causes which has rendered the smooth implementation of the aid programmes difficult. Experts often feel superior because of their higher cost of living, while the home officials often resent the superiority on this ground which is fully realised by the Chinese Government." The other side of the picture is simply that even the low standard of living in developing Asian countries is perhaps higher than the conditions under which Chinese live under the communist regime.

In Nepal the grand promises have recoiled on China because she has had to admit lack of technical capacity to implement the cement and paper projects. On 27th April 1964, China and Nepal signed what they called a supplement to the 1961 agreements. The new agreement specified that the cement and paper projects were being abandoned and, instead, China would build a 170-kilometre section of the east-west highway, a brick and tile factory and some foodgrain warehouses. Compared to China's promises, India has scored by implementing a variety of projects in Nepal. India's total aid offers to Nepal already are Rs. 40 crores, of which about half the amount has been spent on projects which have come up.

The goings on between Rangoon and Peking are far too numerous to list chronologically in a brief account. The Chinese Prime Minister and the Chinese Foreign Minister have dropped into Rangoon on several transit halts. Chinese aid to Burma dates back from 1958 when the Chinese partly for the establishment of textile mills. About 30 Chinese technicians helped in the erection of a mill. On the site of this mill, at Thamaing, near Rangoon, there already was a mill which was equipped with Japanese and American machinery. It was after Burma signed the border agreement with China that Chou En-lai and a large group descended on Rangoon in January 1961.

The editorial comment in the daily newspaper, *Guardian*, dated 8th January 1961, makes interesting reading. First, the paper's shareholders included some officers high up in the Burmese Army which was later to take over the Government in a *coup* in March 1962. The editor of the paper was at that time friendly to the army although he was later chased underground after the army took over. The comment also exhibits some of the illusions about China's progress in agriculture held by the Burmese. The *Guardian* comment was: "China has made rapid strides in its industrialisation plan by energetic use of its material and human resources, improvisation and the Soviet Union's help. But it is readily seen that by far the greatest stride it has made is in the realm of agriculture. China's ability to export rice in competition with its South-East Asian neighbours testifies to this fact. Therefore, economic and technical assistance from China to be accepted by Burma should be Chinese agricultural machinery and Chinese technical skills in agriculture. If any industrial assistance is to be accepted it should be done on the basis of a study of two considerations. The first consideration is whether China has itself perfected production of industrial machinery and industrial training in a particular field of industry. For instance, there is no doubt that China's technological skill in textile machinery and production is of the best standard and Chinese technical assistance and addition of Chinese machinery at the Government spinning and weaving factory have served to improve the operation of the enterprise which was formerly disparaged as a white elephant. Secondly, assistance should be sought for the establishment of industries for which raw materials are available in abundance within the country. Manufacture of pulp and paper out of bamboo grown in Burma is an obvious choice for new industry and the fact that we have to import newsprint shows that China excels in this particular industry."

The Chinese part of the textile mill has later suffered for want of adequate supplies of spare parts. This strengthens the contention of an East European diplomat who told this writer that some of the machinery supplied by China to the Burmese textile mill was actually made in East Europe. China no longer has East European sources to support her aid programme in the more sophisticated industrial fields and this naturally accounts also for her inability to go through with the paper and cement factories promised in Nepal.

A look at the international situation in January 1961 and later events shows that the Chinese communists were then on the point of embarking on two major adventures. The Chinese and the Russians had already begun to get on each other's nerves and Peking had decided to break itself free from the Moscow line. Peking was later to launch the biggest direct military campaign since the Korean war. This time the strike would be against India.

The Burma operation of Chou and company was to soften the Burmese sentiments before the intensification of the conflict with India. The Burmese were sensible boys; they had negotiated a settlement with Peking on the border. And here comes the Chinese gesture, Rs. 40 crores of economic and technical aid and a long-term trade agreement. The loan was to be repaid in ten annual instalments after 1971 and there would be no interest. The leftist newspaper *Vanguard*, close to the Government, commented that the new Chinese loan differed from Western aid which was given only to strengthen the private sector and thus gain profit. "In the case of loans from capitalist countries the aim is to export essential commodities from their countries to Burma, whereas in the case of this loan from China the aim is to establish industries within Burma for the production of its own essential commodities," the *Vanguard* said.

The range of projects envisaged with Chinese financial and technical aid was wide: three hydro-electric plants; two bridges on the frontier area; a textile and weaving mill; two plywood factories; two sugar mills; assistance to expand the existing State steel mill; a diesel engine plant; a machine tool plant; and 265-mile highway in Kachin State. There were twelve other projects which were to receive Chinese technical assistance. They were a ceramic factory; marble and cement plants; food canning factory; leather and footwear factory; fruit canning and essence preparation; sericulture improvement; poultry farming and animal husbandry; fruit plantation; tea cultivation; irrigation and dam construction; training of Burmese labour and technicians; introduction of new fruit trees into Burma.

Burmese Impatience

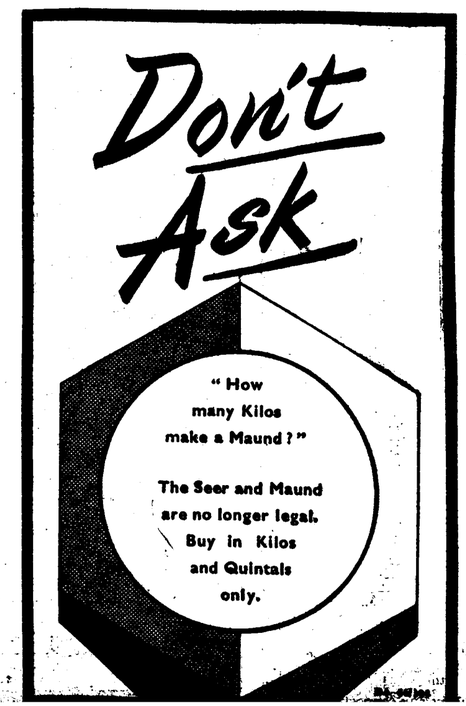
Although the Chinese say that these projects were all planned for being taken up over the decade of the sixties, there has been some impatience on the part of the Burmese over the delay in starting with the projects. The Chinese and Burmese have now agreed to start work quickly on a sugar mill, a textile spinning and weaving mill, a plywood factory, a motor car tyre factory and a paper factory.

In 1962, Chinese sales to Burma reached the record level of Rs. 136 million; the peak in Burmese sales to China was Rs. 178 million worth of goods in 1961 including Rs. 167.5 million worth of rice.

China supplied commodities like rice and cloth to Indonesia and sanctioned credit arrangements for deferred payments. China's aid offers were accepted ceremoniously by President Sukarno but implementation is far away. President Sukarno vocally supports numerous Peking policies and *vice versa* but he is one of the few non-committed leaders who did not get wobbly knees when Peking kicked up a rumpus over the Indonesian treatment of the Chinese community. Sukarno would like Chinese machinery and equipment but does not relish the import of too many Chinese technicians into his islands. China backs Indonesia's confrontation policy against Malaysia but at the same time engages herself in brisk trading with Malaysia, selling consumer goods like textiles and engineering goods. Malaysia's Tunku Abdul Rahman does not recognise Peking diplomatically but encourages trading.

Pakistan's recent acceptance of aid from China is a novel development because Pakistan continues to be a member of military alliances whose primary purpose is to stop the expansion of communist influence in Asia. Pakistan International Airline's Boeing services into China, which began in May with once-a-week trips, have become popular. There are two services a week from September.

(To be concluded)



SOCIAL ENVIRONMENT AND BUSINESS—II

COMPANY LAW'S SOCIAL PURPOSE

By D. L. Mazumdar, I.C.S. (Retd.)

FAR-REACHING changes in the character of the modern joint-stock companies have brought them to the centre of our economic life in the present and have made these companies the concern not only of the management and the shareholders but also of the rest of the community. In other words, as I have argued on many different platforms during the last five or six years, the modern joint-stock companies or corporations, as they are called in some parts of the world, are no longer mere legal or business devices of concern only to shareholders and the management; their needs and requirements and their impact on society have grown to such dimensions that they have become properly the subject of interest and concern also to the society as a whole.

It follows that the structure and behaviour pattern of joint stock companies must be fitted into the structure and behaviour pattern of the wider community to which they belong, and the attitudes and values of the business community must be reconciled with the economic and social values of the dynamic and progressive society. Throughout great areas of life, intelligent and farsighted self-interest is or can be made to be consistent with the social interest; so must it be with business in relation to society. This indeed is one of the great tasks of economic and social engineering in the modern world, and specially in countries like ours, where the compulsions of our economic and social development require that such engineering has to be urgently planned and cannot be left to time-processes to evolve. The purpose of such engineering should be to develop economic and social arrangements under which individual self-interest and the social interest can become to the maximum possible extent, mutually compatible.

Community Relations—American Example

It is not my intention to attempt to sketch the outlines of an integrated and comprehensive economic and social model in the corporate sector which may be expected to reduce the area of tensions and conflicts and to bring about a workable measure of *rapport* as between the internal partners of a business unit and the outsiders in the wider community, who may be affected, in small or large measure, by decision-making authorities in joint-stock enterprises, although they may not be the working partners, namely, the workers, the consumers, the neighbourhood groups and the wider community. The principal elements of a corporate model appropriate to the circumstances of the present can be worked out by the enlightened leaders of the business community themselves from a close study of the best business methods and practices obtaining in the advanced countries of the West to which we usually refer in current discussions on this and connected matters, whenever it suits as to do so. The type of business practices which I have in mind is illustrated by the following extracts from a well-known British thinker on this subject, who is himself a leading executive of an international company:

"In Britain, industry has on the whole tended to shrug off its community responsibilities, on the ground that this is no affair of the company, and this attitude of difference is still common. In North America, the social climate is different. To a degree not yet understood in Britain, North American businessmen look upon work as an opportunity for public service. They seek to win public approval as something of value not only to themselves but also their company. The successful management of a large American company includes close attention to the company's relations with the community. General Motors have a casebook of steps taken by their local plants to improve relations with the local community. General Electric have, since 1953, had a plant-community relations programme describing how the company tries to be 'a good neighbour and active corporate citizen.' Marshall Field have a director in charge of civic affairs. Johnson and Johnson put good community relations even before the interest of shareholders in their official statement of company aims. Such activity by American management is not accidental. Nor is it due to altruism, although altruism may not be wholly absent. It is the result of an imaginative appreciation on the part of the best American management of the psychological connections between good community relations and high productivity, resulting from the collective assessment of the Company's personality in the minds of the workers."

And again—

"There is a disbelief in motives other than the pay-packet in British management circles, which finds it convenient to deny any connection between prise. It is the attitude of the so-called 'tough' businessman, who seeks to over-simplify human motives in order not to have to deal with the natural complexity of human purposes. To such people the researches of Prof. Mayo at Harvard and of Prof. Bakke at Yale are still relevant. In the Hawthorne experiment, Mayo found that the worker's output was related to the quest for human significance. At Yale Prof. Bakke concluded, after prolonged investigation, that workers desire not so much more money as to play a socially respected and admired role to win a degree of economic security customary among one's associates, and in all these to experience satisfying and predictable relations with the members of the groups with which one is most intimately associated."

Researches in human relations and motivations in business have proceeded further afield since George Goyder made the above observations, and it is only fair to add that much as happened in advanced management circles in Britain during the last few years to show British Management in a much more favourable light than these extracts would seem to suggest. Equally, a few leading business houses in our own country have taken a pioneering interest in this branch of business relations, although the social philosophy underlying these studies and researches and their business and social implications have yet to secure the requisite recognition and acceptance.

There are specific provisions in the Indian Companies Act of 1956 which deal with certain fundamental aspects of our social and economic policy. It is in these provisions that one discovers the first faint recognition, at the juridical level, of the fundamental economic fact that the modern joint-stock company is not merely a legal and economic device for the production and marketing of goods and services, but is essentially a sociological institution, embodying a system of non-governmental power, and exercising a significant measure of authority and influence based on it. If this power is not to be used irresponsibly, it must be related to the legitimate purposes of the community in furtherance of its accepted economic and social importance. It is, therefore, essential that the use of such power should be subject to some measure of social control and should conform to a new concept of justice and responsibility in corporate management, capable of being judicially tested according to the canons of a new rule of law applicable to the corporate field.

There are two ways in which, within the structure of the new Companies Act, this attempt at a basic reconciliation of the needs and requirements of business with its social obligations in terms of the accepted social economic values of the community can be made. One way is to subject decision-making in critical areas of the working of the joint-stock companies to the approval of a duly constituted authority, which, in the circumstances of this country, must, for practical reasons, be an accredited organ of the State or a competent independent authority clothed with the powers of the State. The other way is to recast the traditional structure of joint-stock companies completely and to build into it the necessary checks and balances for the exercise of decision-making powers, much in the same way as in the Constitution of our body politic, appropriate checks and balances have been provided for the exercise of governmental authority. The framers of the Companies Act of 1956 preferred to rely largely on the first of these alternatives. That accounts for the fact that, in many sections of the Companies Act of 1956, decision-making in several vital areas of corporate management has been subjected to the approval of the Central Government. The other alternative would have involved a complete break with the traditional structure of the joint-stock company in the English Companies Act, which our own Company Laws have always used as a model. While it is possible that the second alternative approach might have considerably circumscribed the area of discretionary powers now vested in the Central Government, it is a moot point whether, in actual practice, this arrangement would have been an improvement on the present pattern of regulation embodied in the Companies Act.

It is not surprising that the social significance of the distinctive features of the new Companies Act, to which I have just referred, was heavily masked by the overgrowth of its other stereotyped features, which somehow attracted company accountants and the guardians of our conventional wisdom in these matters in the law courts. The need for rewriting our Company Law in the light of the far-reaching social developments of the present age is bound to be recognised before long; but such rewriting would involve such a fundamental reconstruction of the traditional pattern of our Company Law that I do not see that the time for this near revolutionary constructive effort has yet arrived. A great deal of new thinking on the fundamentals of a comprehensive socially-oriented Company Law would be needed in the highest juristic, administrative and business circles before any such attempt can be taken in hand.

In a recent address before the Mysore University entitled the "Modern Corporation and the Rule of Law," I ventured to express some personal views as to the principal directions in which our present Company Law needed changes in order to bring it into line with the social requirements and urges of the future. Whether it will be given to us to have the wisdom and foresight to refashion our existing institutions and the laws which regulate them, so as to enable us to contain within their framework the explosive forces of social change and to guide them along constructive lines is a query which must necessarily be left to the future. But it behoves all of us who would like to believe in the primacy of reason and who may be privileged to have the shaping of our institutions in our hands to bear in mind the classic observation of John Stuart Mill—no idealistic iconoclast but a liberal reformer steeped in the traditional lore of *laissez faire*—"When society requires to be rebuilt, there is no use in attempting to rebuild it on the old plan."

New Image

What are the prospects which the future holds for the type of *rapport* between business and society with which I foreshadowed in the beginning of this paper? Personally I believe that the conventional debate over free enterprise and social control in which we engaged somewhat fiercely a few years ago and the echoes of which still somehow seem to linger on, is largely outmoded and has little relevance to the needs of the present. As I view the corporate scene in the perspective of the future, it is the willing acceptance by all concerned of the new image of the joint-stock company as a sociological institution, with a dynamics of its own and exercising a system of power which must be harnessed to the needs of society, alone that can resolve the internal and external tensions to which our present-day joint-stock enterprises are inevitably subject. The strains on our corporate system begotten of a chronic posture of confrontation with social needs and social urges cannot be effectively eased by any other means. Further, it is my belief that it is only this acceptance which again will enable the business community to find meaning and significance in many of the detailed provisions of the Company Law.

It is no wonder that, viewing the corporate form, primarily as a device for carrying on trade and industry, businessmen are apt to look upon these provisions of the law as most frustrating irritants. And yet the truth is that it is only through the legal provisions of the type that the corporate system of the present can be appropriately shaped, moulded and brought into harmony with the social environment, and businessmen can establish accord with the social forces around them while they are engaged in promoting their own business interests.

Lastly, I feel confident that the recognition of this new image of the joint-stock company by the business community will add new dimensions to the existing inadequate and somewhat perfunctory interrelations between the accredited organs of trade and industry, on the one hand, and the agencies of the State, on the other—thereby helping the former to make a much deeper and more effective impact on the formulation and execution of our national policies. When corporate methods and practices are impregnated with the basic values underlying the country's accepted social and economic policies, the seeming conflict between business and social interests will largely disappear and business in the new society will come into its own. The management of business, and particularly the professional managers, who can be expected to have no vested interest in ideas and attitudes inherited from the past and to have no commitments except to the promotion of business and social interests, have a much larger part to play than other sections of the community in bringing about such a lasting *rapprochement* between business and the social environment.

LONG-TERM WORLD OIL DEMAND

GROWTH NOT LIKELY TO BE STUNTED BY NEWER ENERGY SOURCES

FROM The Hague, Geneva and Lausanne during the past month have come reminders that the international oil industry operates in a highly competitive world. In these cities fuel and power experts from many countries gathered together for the Ninth International Gas Conference, the Third U.N. Conference on the Peaceful Uses of Atomic Energy and the sectional meeting of the World Power Conference.

These meetings have given birth to a mass of papers, some of which provide material for later study in this issue. Together they prompt the immediate reflection that commercial energy has never been so abundant and the choice offered to the consumer never so varied. Does the initial impression of superabundance in an intensely competitive world need to be modified when one lifts one's eyes to the more distant horizon?

Competitive Aspects

The competitive aspect of the relationship between oil and other forms of energy is self-evident. Excluding the important automotive sector of the market where oil enjoys a near-monopoly, there is a growing interchangeability between the different forms of energy. Solid and liquid fuels, gas and electricity are in direct competition in many manufacturing industries and in the households of the West. Though coal has been largely ousted as a fuel for railway locomotives, there is still an active choice between diesel and electric traction. Electricity, in turn, may be derived from water power, from coal or oil-fired thermal power stations, or from nuclear reactors. And town gas, traditionally the product of coal carbonisation, may now be obtained from natural gas or a variety of petroleum products as well.

The oil man studying the past month's crop of learned papers may feel that the main threat to his business is from natural gas, which, as was pointed out by Professor G. A. Brender à Brandis in The Hague, is still a very new industry. In the U.S.A., where indigenous sources abound, the dynamic growth of natural gas production has been one of the factors responsible for the relative stagnation of oil demand in recent years. Natural gas now accounts for some 30 per cent of total energy consumption in the United States, against 40 per cent for oil and nearly 25 per cent for coal.

In Western Europe it is as yet hardly a serious competitor—it covers a mere 2 to 3 per cent of energy requirements, against 35 per cent for oil—but its importance is steadily gaining ground. France's major natural gas field at Lacq and the smaller Italian and Austrian fields are now fully developed, but the prodigious resources of Slochteren in the Netherlands and of Hassi R'Mel in the Algerian Sahara, not to mention the more modest discoveries in Germany, have as yet been scarcely tapped. The full exploitation of the major new fields, and of any hitherto undiscovered resources that may underlie the stormy waters of the North Sea, will introduce significant changes into the energy economy of Western Europe.

The extent to which the oil business is affected by the development of natural gas resources varies greatly from place to place. In France, Italy and Austria almost all the gas is in the hands of state companies, the expansion of which must be to some extent at the expense of privately owned oil companies. In the Netherlands and (in the main) in Germany, on the other hand, it is the privately owned oil companies which control the natural gas. In such cases, a switch of demand from oil to gas may merely mean a transfer of income from one pocket to another. As regards the North Sea, it is impossible to predict whether any of the groups concerned in the search—established oil companies or their various rivals—will be successful in finding and developing commercial supplies of gas.

Regardless of ownership, natural gas competes with oil only in certain sectors of the energy market. It does not, for example, show any present signs of displacing gasoline, kerosine or gas oil in the field of aviation and motor fuels. It rivals fuel oil in many industrial applications and to a lesser extent competes with middle distillates for space heating. Thus the growth of natural gas consumption will generally bring about a shift in the pattern of demand for petroleum products, tending, so far as Western Europe is concerned, to retard the post-war trend towards the heavy end of the barrel. Since the heavy end is the least profitable end, this means that the growth of natural gas consumption is likely to hit the oil man where it hurts least. In some cases, indeed, the wider use of gas may give welcome relief from the pressure of demand for black oils.

Atomic Energy

What of that glamorous parvenu, nuclear power: can this be regarded as seriously threatening the growth of world oil demand? Despite the vast expenditure on nuclear research on both sides of the Atlantic, despite the enthusiasm of atomic scientists as displayed at Geneva last month, several large question marks overhang this subject. There are, for example, doubts in many minds about the feasibility of disposing of increasing quantities of radioactive waste without serious risk to human (and animal) life, and about the adequacy of the world's uranium resources in the event of a steep increase in demand.

There are also unanswered questions about the economics of nuclear power. If this new industry could hold out the prospect of supplying really cheap power in abundance it might have to be taken seriously by suppliers of liquid fuels. So far, however, costs at nuclear stations in developed countries where coal and oil are freely available have not been brought down to the level of the most efficient thermal power stations. It would, of course, be foolish to deny the possibility of some unforeseen technical breakthrough that would drastically cut these costs. For the moment, however, it is low-grade coal rather than oil fuels that seems to be most vulnerable to the competition of nuclear power in the industrialised countries of the West.

In underdeveloped countries which have no coal or oil resources of their own, atomic energy may, it is true, be more competitive with oil. But such countries at present constitute a relatively small market for petroleum products: they account for little more than one-eighth of free world oil consumption. Moreover, in the developing areas of the world, if not elsewhere, the relationship between the various fuels has its complementary as well as its competitive aspect.

Complementary Aspects

In this connection it must be borne in mind that the world's population is at present expanding more rapidly than ever before, and most rapidly in the less advanced countries. In these areas the rate of growth has reached the remarkable figure of 22 per cent in a decade, whereas in the developed areas the maximum rate attained is 13 per cent in a decade. Every year more than 60 million souls are added to the teeming millions of the world—a figure half as large again as it was ten years ago. Thus the total population of the globe, which has approximately doubled since 1910, is expected to double again by the end of this century, to reach a total of well over 6,000 million. These startling figures are of obvious relevance to any consideration of world energy requirements.

Where population growth is rapid, consumption of energy in one form may, by nourishing an improvement in the standard of living, lead to an increased demand for energy in another form. For example, the mechanisation of agriculture, which depends upon an increased consumption of motor fuels and lubricants, may step up the demand for gas and electricity in the home. Again, the introduction of relatively cheap nuclear power into a developing area may speed the process of industrialisation and so boost the demand for liquid fuels and lubricants. The oil man is familiar enough with the thought that general prosperity is good for the oil business. And if prosperity can be brought to the poorer parts of the world by the provision of cheap energy, in whatever form, the oil trade may expect to benefit.

Concentrating on the day-to-day conduct of his business, the oil executive is conscious of the pressure of competition, not only from other firms in the same business, but from solid fuels, gas and electricity as well. He sees life in terms of a struggle by his company to maintain its share in the world energy market. He may, however, find encouragement in last month's message from The Hague, Geneva and Lausanne. The demand for energy is not static. The boost that is constantly being administered by the expansion of population and the relentless drive for higher living standards far outweighs the effect of improved efficiency in use.

The cause of material progress will be best served if consumers are allowed freedom of choice in the matter of energy supplies. They will then use the fuel that will best satisfy their needs at minimum cost. Wherever their choice falls, the higher energy consumption will tend to raise the general standard of living. And in the long run any improvement in living standards will help to increase the demand for other fuels as well.—(By Special Arrangement with the *Petroleum Press Service*.)

TEN THOUSANDTH JEEP OF MAHINDRAS

The 10,000th jeep manufactured by Mahindra and Mahindra Ltd. during the current year was driven out of the plant by Mr. Keshub Mahindra, Chairman of the Company, at a ceremony held at its factory premises on Friday last. This marked the achievement of the annual production target of 10,000 jeeps more than a year in advance. It will be recalled here that the target of 10,000 units had been originally envisaged to be attained only by the end of 1965. Thanks to the co-operation received from the ancillary suppliers and to the efficiency in many departments of the Company itself, this target was fulfilled earlier. Incidentally, as many as 50,000 jeeps have been turned out by the Company to date.

The present indigenous content of a jeep in terms of value is over 80 per cent (of which the contribution of the ancillary industry alone works out to approximately 30 per cent). The remaining 20 per cent, which is the equivalent of about Rs. 1,500 to Rs. 1,600, constitutes the foreign exchange component of the jeep.

In view of the fact that the annual target of production has been fulfilled, the Company is presently examining its future manufacturing programmes in line with the estimates for the fourth Plan. Proposals in this connection have already been submitted to the Central Government.

The ex-factory price of the Mahindra jeep in Bombay is Rs. 15,300, inclusive of excise duty (25 per cent), but exclusive of the 10 per cent sales tax.

ALWEG MONORAIL IN WEST GERMANY

There may be several novel ways of tackling the ever-increasing traffic problems of big cities like Bombay and Calcutta, but, by and large, the least expensive solution would be the introduction of a monorail system. Indeed, the greatest merit of the system lies in its inexpensive construction and easy operation. Both Japan and West Germany, incidentally, have shown the way in this connection.

The Alweg Monorail, for instance, is expected to be put in operation soon in the industrial metropolis of Essen, Ruhr district, West Germany. The train will travel 12 feet above a busy throughfare at a speed of 50 m.p.h. Its carrying capacity will be 100 passengers and platform stops will be located every 800 yards.

This system, designed by Krupp engineers, was first demonstrated to the public in 1957 on a test stretch in Cologne. Further, Alweg monorails have been put to use in Walt Disney Land in Los Angeles and at the World Fair in Seattle, U.S. A monorail system has also been recently inaugurated in Tokyo; it connects Haneda airport with Tokyo's downtown area and has a stretch of 10 miles, the longest so far. The monorail's great advantages are: it can handle a great number of passengers without obstructing automotive and pedestrian traffic; it travels at a high speed while offering the greatest possible degree of safety and, what is more, it is most inexpensive to construct and to operate.

NEW NON-FERROUS METAL PROJECTS

The Central Government is actively considering the setting up of a zinc smelter in the country. Actually, talks are in progress between the Government and a delegation of Polish experts who are currently in this country. The smelter, which will be based mainly on imported concentrates, will have a capacity of 30,000 tonnes, and tentative estimates place its capital cost at around Rs. 12 crores. The delegation, before returning to Poland, will finalise and submit the feasibility report and time schedule for completing the details project report and setting up of the smelter.

In addition to this zinc smelter, the Government is also considering the development of the Zowar zinc deposits in Rajasthan by increasing the production capacity from the present 18,000 tonnes of metal per year to 50,000 tonnes a year. A committee is studying this aspect and will report its findings shortly. It is said that the fourth Plan will provide as much as Rs. 35 crores for the purpose of setting up two more zinc smelters. Incidentally, it may be noted that the demand for zinc at the end of the fourth Plan is expected to be 225,000 tonnes, as compared with 136,000 tonnes at the end of the third Plan.

Currently discussions are also proceeding between the Union Government and a delegation of Hungarian experts on the setting up of an integrated aluminium project at Korba in Madhya Pradesh. The project will have a capacity to produce 120,000 tonnes of aluminium and 36,000 tonnes of aluminium metal per annum, supported by facilities to manufacture aluminium semis. Hungary is expected to provide technical and financial assistance for the project upto the alumina stage. The experts will prepare a detailed preliminary report which will form the basis for an agreement between the two Governments.

NEW PRODUCTS AND PROCESSES

Stainless Steel Beams

A LIGHTWEIGHT stainless steel beam, designed for use in bridge construction, has been developed by International Nickel. Although not yet ready for commercial production, experiments are claimed to have shown that it has great potential for building bridges, particularly those with spans of 50 to 120 feet.

Automatic Lighting Control

An automatic lighting control with a two-minute time delay has been installed by Photronic Controls of Leatherhead, Surrey, England. The time delay is stated to be suitable for street lights, porch lights, advertising signs and children's night lights, and will automatically switch the light on and off according to the intensity of the daylight.

Stroboscope at Low Cost

A stroboscope providing flash rates of 100-15,000 per minute and based on transistorised circuitry is being marketed by Electronic Applications, of Endeavour House, North Circular Road, London. The flash is provided by a xenon tube and is read directly from a calibrated scale to an accuracy of better than plus/minus 3 per cent. It is controlled by a potentiometer through a transistorised generator whose pulse rate is linearly proportional to potentiometer movement.

Three ranges of flashing rates are available to match speeds in many types of mechanical devices and 'freeze' them by synchronising with revolving or reciprocating parts. For instance, the movement of valve rockers can be examined in detail and vibration in other equipment located very quickly. The "Flash-Tac" as it has been called, is mains operated and measures 10 inches by 8 inches by 7 inches and weighs 7½ lbs.

Titanium Carbide Used in Tools

Titanium carbide, cemented by tool steel, is said to increase the life of a punch from 7,500 to 275,000 pieces at a cost only twice that of good steel. The titanium carbide is produced by the Sintercast Division of Chromalloy Corporation, 120, Broadway, New York 5. The steel bonded carbide can be turned, milled, sawed, drilled or tapped with standard tools in its annealed condition. Heat treating done with conventional equipment and without serious dimensional changes, is said to give the carbide a wear resistance 30 times greater than that of tool steel.

Magnifying Television Microscope

A new instrument that employs the electron microscope and television can magnify objects two million times their normal size. The instrument, demonstrated recently by the Radio Corporation of America (R.C.A.) at Camden, New Jersey, increased the capability of the ordinary electron microscope 10 times. It has 2,000 times the magnifying power of the best light (optical) microscope. The instrument is a refinement of the first television-electron microscope, developed in the U.S. by Westinghouse Corporation a year ago which has a magnifying power of one million.

The R.C.A. instrument, however, is less powerful than another device that works on a different principle. It is called the field ion emission microscope and permits scientists to see individual atoms, the basic building blocks of all matter. The R.C.A. instrument can resolve only clusters of atoms (molecules). A field ion emission microscope in use since 1962 at Columbia University achieves direct magnifications of two million, and this image can be optically enlarged 10 times over. The R.C.A. instrument is significant because most U.S. laboratories use electron microscopes, which may be adapted with a television attachment.

Protecting Turbine Blades

Brown Boveri and Co., of Baden, Switzerland, has patented a way of adequately protecting turbine blades from chemical attack and oxidation at high temperatures. The technique is also suitable for other components. The blades are coverded with an electrodeposited layer of iron and this is then covered with chromium. In use, the two become alloyed together to provide the dual protection required.

Laser Beam for Surgery

The laser beam—the high intensity light which constitutes one of the most important scientific discoveries in recent times—is shortly to be used for surgical applications in Sweden. A team of researchers of the Research Institute of the Swedish National Defence (F.O.A.) has after three years of experiments succeeded in taming the laser for practical use. One of the applications of the "new light" is for an instrument used in ophtamological surgery, a so-called photocoagulator by means of which it is possible to "weld" a loose retina to the eye. After a long series of successful operations of this type performed on animals, the Sahlgrenska Hospital in Gothenburg will adopt this method for operations on human beings for the first time. The laser beam might also be used in dental surgery. Experiments have shown that only the caries-stricken parts of a tooth are "burnt away" by the concentrated beam, whereas all sound parts of the tooth are left unaffected.

Vacuum Metallising Plant

A vacuum metallising plant, designed to put a reflective film of aluminium on the interior surfaces of electric light bulbs, has been developed by a British firm. The manufacturers claim that this is the first time that plant applying the metallising technique to this particular operation has been available commercially. It uses no vacuum chamber. The plant, which is semi-automatic, treats eight lamps every 75 second cycle, and is said to have a faster output than the conventional method of treating the inside surfaces of bulbs with silver nitrate. It can also be adapted to treat other articles, including sealed headlight reflectors, front and rear lamp automobile bezels, radio and automobile trimming fixtures and other metal, glass or plastics products which have to be metallised on one surface only.

Stitching Sheet Steel

High-carbon steel wire, stiff enough to be punched through sheet metal to stitch it together, is available from the Prentiss Wire Division, H.K. Porter Co., Porter Building, Pittsburgh 19, Pennsylvania, U.S.A. In one demonstration, five sheets of 0.02 inch steel were stitched together without pre-punching holes. The company says this is twice as fast as other methods of fastening steel of the weights used in motor car bodies. It also claims that stitching has an advantage over spot welding in that it does not require pre-cleaning, painted surfaces are not damaged by heat, and the joint can be inspected visually.

Setting Type by Computer

Setting type with the aid of a computer is the latest and most revolutionary development in the printing world. An organisation which will offer this service to newspapers, and to periodical and book publishing houses is now being set up in London. It will be the first of its kind in Europe.

Use of the computer eliminates two of the main tasks in type-setting—"justifying" and hyphenating. This means the accurate spacing of words in a column and logical breaks in words at the end of lines. With the new system, a typesetter simply produces a punched tape on a machine like an electric typewriter. This tape then goes into the computer which produces another, adjusted and hyphenated to the required column widths. The risk of error is one in five million. Human errors in the making of the original tape can be corrected at computer speeds. The final tape from the computer can be used in a number of ways with conventional printing techniques.

Water Softner

A simple new water softening process producing the equivalent of three times the water at only 40 per cent the cost of conventional processes has been perfected by the Hamerakeh Company, Israel. It has already found wide commercial application in Israel as well as abroad, and has earned the company a number of significant know-how exchanges with "giants" in this field abroad, including Prosim of France.

The Company licensed a number of firms in Europe to manufacture workshop-sized versions of the patented apparatus, of which hundreds have already been installed in Kupat Holim pharmacies, hospitals and in many workshops and garages.

High-speed Painting

Automatic Equipment, Daleside Road, Nottingham, England, has introduced an automatic sprayer for high-speed repetition painting of mixed batches of articles. The unit will paint, stove and cool a variety of electrical instruments, automobile accessories, toys, fancy goods and similar items. Only one unskilled operator is required for loading and unloading the components, and it is stated that tests have shown that during a normal 40-hour, five-day week, the machine is capable of painting 50,000 components.

Small Welding Outfits

Small, lightweight welding outfits which have been designed for both industrial users and do-it-yourself enthusiasts have been put on the market by Esab, Box 850, Göteborg, Sweden. They are intended for the welding of light metals mainly and are contained in polythene carrying cases. Each kit weighs 44 lbs. and measures 9½ by 11 by 15 inches.

Automatic Programming Unit

A new guillotine, being produced by William Guessland Ltd., Cheshire, England, has provision for automatic programming, which is available as an optional extra. The guillotine designed for the paper industry, is of rigid, heavy-duty construction, able to absorb all vibrations and stresses set up during cutting. The all-mechanical cutting action ensures clean, accurate cutting over a maximum capacity of 42½ in. by 42½ in. by 5 in. pile height at 40 cuts a minute. An automatic programming unit providing semi- and fully-automatic control is offered optionally. It employs magnetic tape, storing up to 24 programmes of which any two adjacent programmes can be linked. It is push-button set and the unit incorporates a programme correction device and provision for programme checking without cutting.

New Dragon Reactor

The new "Dragon" reactor, at the Winfirth Nuclear centre (G.B.) in Switzerland, has just been commissioned. The machine for loading and unloading the fuel, which is an important part of the plant, was made in Geneva and assembled at Winfirth by S.E.C.A. Ltd., a firm formed for the job by two big Swiss engineering concerns, Secheron Ltd. and Charmilles Ltd. The machine was subjected to very severe tests, both in the works during preliminary assembly and at the time of the final assembly in the reactor chamber. The quality of the workmanship and the running tests carried out at high pressures and temperatures, corresponding to the operating conditions of the reactor, are entirely satisfactory.

Brake Tester for Lorries

Users of heavy commercial vehicles are being offered brake testing equipment by Triangle Products, Manchester Road, Hyde Cheshire, England. The equipment can be used to test a vehicle's total braking efficiency as well as the effectiveness of each individual wheel brake. It is stated that it takes only few minutes to carry out a comprehensive brake test of the heaviest type of four, six or eight-wheeler with trailing axles or third differential. Each pair of wheels is progressively driven on two pairs of steel rollers which are rotated by two 5 h.p. motors. The wheel try to prevent rotation of the rollers and the amount of tractive effort they produce at the tyre is recorded. By reference to a chart, it is then possible to determine true braking efficiency, the efficiency of each wheel brake and the stopping distance at varying speeds on a normal road surface.

Versatile Silicon Rubber

A silicon rubber produced by VEB Chemiewerk Nünchritz in East Germany remains temperature-resistant within the range of —100° to +250° Centigrade. It is distinguished by high electric insulating properties, physiological harmlessness and adhesive properties. It is ageing-resistant towards air, light and ozone and is chiefly employed in electrical engineering and medicine. Electrical conductor material sprayed with silicon rubber remains flexibile at high and low temperatures; electric disruptions do not produce conductive carbon. Glass-silk fabric covered with silicon rubber represents a high-quality flexible insulating material. Silicon rubber restrains the coagulation of blood and can be hot sterilized. It has been used successfully with blood transfusions, implantations and in dental surgery. Silicon rubber lends itself as an ideal packing and sealing material in the chemical industry, general and aircraft engineering, refrigeration and in gas chromatography.

NEW IDEAS IN BRIEF

Paper is made from bagasse—sugarcane waste—by a new process developed in Sweden by Karlstads Mekaniska Werkstad (K.M.W.), Stockholm, Sweden.

A dash of aluminium powder in wet cement mix is claimed in Norway to produce a non-shrink concrete with more reliable compressive strength. It is being developed by S. Jystad, 12 Trakka, Slemdal, Norway.

A substance called expanded clay is the sole ingredient of new light-weight building blocks which can be either moulded or extruded (squeezed out like toothpaste) to the desired shape in a process patented by Veit Dennert KG., Baustoffbetreibe, Schlusselfeld/Oberfranken, Bayern, West Germany.

The intense light beam from lasers can be used to cut complex repeat patterns in paper in a system developed by Jagenberg-Werke AG., 107 Himmelgeisterstrasse, Dusseldorf, West Germany. Gallium metal, a valuable constituent of transistors and semi-conductors, is now being recovered from the electrolytic refining of aluminium in West Germany and by a new economic distillation process from its crude ore in France. This is being produced by Siemens Schuckertwerke AG., 50 Werner von Siemensstrasse, Erlangen, West Germany.

An electric night-storage heater, designed to be run on cheap off-peak power, has a water filling instead of the usual heavy and bulky fire bricks made by Brush Electrical Engineering Co., 43 Berkeley Square, London, W.1, England.

A West German manufacturer claims its removable plastic radiator grilles for cars are easy to clean and much cheaper than conventional metal ones. The grille mesh can be made fine enough to stop small insects getting in, but does not reduce engine cooling. It is made by Vereinigte Glanzstoff Fabriken AG., Glanzstoff Haus, Wuppertal Elberfeld, West Germany.

The flow of molten metal in a foundry can be stabilised by means of a simple electrical device. Suspended above the surface of the metal is an electrode, which is in circuit with electrically operated feed valves. The device is developed by Gebr. Bohler AG., 12 Elisabethstrasse, Vienna I, Austria.

Notice

THE WEST COAST ELECTRIC SUPPLY CORPORATION LIMITED

Registered Office: MADRAS

NOTICE IS HEREBY GIVEN THAT AN Extra-Ordinary General Meeting of the Members of the Company will be held on Saturday the 31st October 1964 at 11 a.m. at the Registered Office of the Company at No. 20, Second Line Beach, Madras-1, for passing Resolutions under Section 293(1) (c) of the Companies Act, 1956 and for declaring dividend on Equity share capital. Individual notices concerning the above have been posted to the Members of the Company.

FOR CHANDRIE & Co., PRIVATE LTD.,
S. VENKATARAMAN,
Director,
Managing Agents.

MADRAS, *30th September* 1964.

TRADE UNIONS' RIGHT TO THREATEN STRIKES

MORE ON ROOKES VS. BARNARD JUDGMENT

THE issue currently being discussed in trade union circles in Britain is whether it would be proper for the unions to have the legal right to intimidate an employer into doing something which damages or injures a third party. It may be recalled that in the *Rookes* vs. *Barnard* case (discussed in the issue of *Commerce* dated 3rd October 1964, page 594) the union concerned had threatened the employer that, if Mr. Rookes was not removed from service, a withdrawal of labour would take place. The House of Lords, which gave its judgment in this case in January this year, had decided that, in spite of the agreement between the union and the employer that no strike or lockout would take place, the union officials conspired and acted on the conspiracy to intimidate the employer by threatening it with a strike in breach of contracts of employment, and that both the conspiracy to intimidate and the intimidation itself were civil wrongs; that the provisions of Section 3 of the Trade Disputes Act 1906—namely, "an act done by a person in contemplation or furtherance of a trade dispute shall not be actionable on the ground only that it induces some other person to break a contract of employment or that it is an interference with the trade, business or employment of some other person, or with the right of some other person to dispose of his capital or his labour, as he wills"—could not protect the union officials in view of their conspiracy and intimidation. The officials of the Trade Union Congress (T.U.C.), who interpreted this judgment as a negation of the right to make threats of strike, had demanded that the Act might be amended to restore the right to threaten and might be read as follows:

"An act done by a person in contemplation or furtherance of a trade dispute shall not be actionable on the ground only that it induces some other person to break a contract of employment *or that it constitutes, or contributes to intimidation by a threat to commit (or to procure) a breach of any contract* or that it is an interference with the trade, business or employment of some other person, or with the right of some other person to dispose of his capital or his labour, as he wills."

T-U.C. Counsel's Views

However, the legal experts who have been looking into the implications of the judgment have now started feeling that the judgment is not so damaging as the T.U.C. feels. Even the T.U.C.'s legal counsel has made it quite clear that, except in three very special circumstances, in all the other instances—including those relating to claims for higher wages or better working conditions, which form by far the largest category of industrial disputes—there does not seem to be any ground for legal action against the union officials in case of a threat of strike. According to the counsel, for taking any action against the threatener by alleging him as intimidator, it is necessary to prove that the alleged intimidator intended to cause loss or injury to the employer. Regarding the applicability of this reasoning in case of threats of strike unless the employer increases the wages, the counsel said: "Here it is doubtful if any action for intimidation will lie, even if the employer does yield to the threat. In the first place, it might be difficult to show that the threatener intended to cause injury to the employer. The threatener might say that he thought the employer could raise his prices, so as to recover the amount of the increase in wages and anticipated that that was what the employer would do. Secondly, the employer might have difficulty in showing that he had suffered loss as a result of increasing the wages. If he had raised his prices, he might have recovered the amount of the increase. If he had not raised his prices, he would have to show that he had acted reasonably in not doing so." The employer has thus no legal force to take action in such cases.

The three circumstances, where the intimidation and the resultant loss or injury may be proved, were related as follows:

"A strike is threatened unless the employer discharges a non-unionist. This is what happened in *Rookes* vs. *Barnard* case. There is no doubt here that the threatener intends to cause injury to the man. If the employer yields to the threat and discharges the man, the man can sue the threatener for intimidation." Secondly, "a strike is threatened unless the employer ceases supplying *X*, with whom the threatener's union has a dispute. There is no doubt here that the threatener intends to cause injury to *X*. If the employer yields to the threat and ceases supplying *X*, *X* can sue the threatener and recover damages, the measure of which would be *X*'s loss resulting from the cessation of supplies from the employer," and, lastly, "a stike is threatened unless the employer takes certain work away from the members of union *A* and gives it to members of the threatener's union, that is, a demarcation dispute. There is no doubt here that the threatener intends to cause injury to the members of union *A* who are doing the work."

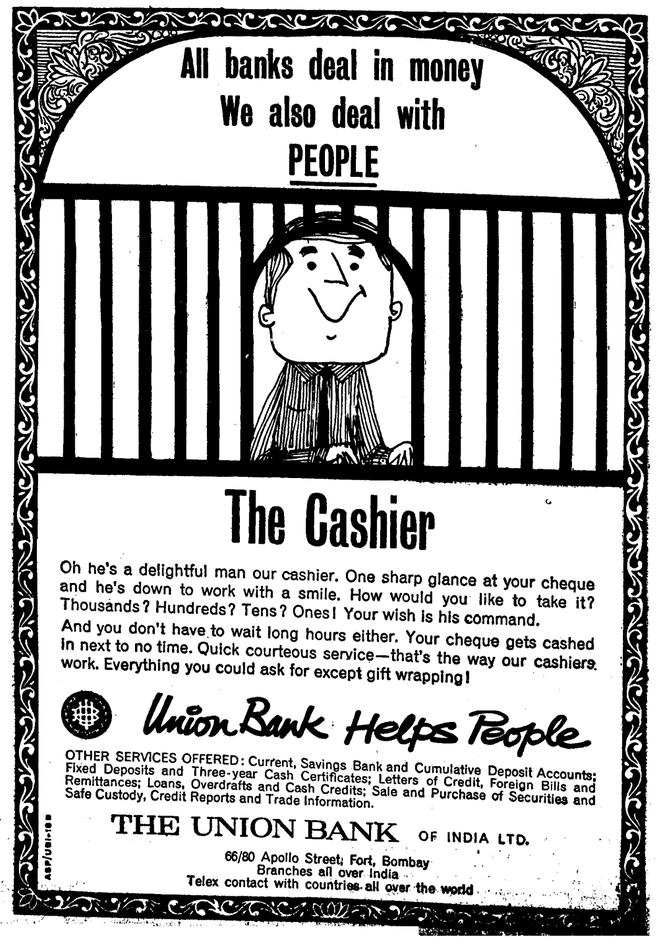
It must be pointed out that even before the *Rookes* vs. *Barnard* judgment, the strikes in many such cases led to successful legal actions against the trade unions. The only difference which the judgment made was that, in addition to such strikes, it declared the threats of such strikes also actionable. When the strike in a particular case is illegal, the declaring of the threat of such strike illegal does not make much difference. Thus, there is hardly anything to be restored. Hence the view that the amendment in the Trade Disputes Act 1906, as desired by the T.U.C., is not so simple as Mr. George Woodcock, General Secretary, suggests, but involves the giving of legal protection to trade unions to intimidate the non-unionist workers or other third parties—a sort of legal blessing to the trade union officials who may threaten that, if a particular employee is not sacked, as was done in the *Rookes* vs. *Barnard* case, or if trade dealings with a particular party are not stopped, the workers would go on strike.

In spite of the comparatively cordial relations between employers and employees in Britain, the proportion of disputes relating to union matters, which was only about 3 per cent of the total disputes in 1953, increased fast during the next two years, reaching approximately 50 per cent in 1955. There was a further rising tendency in this percentage during the next eight years and, in 1963, it was as high as 53. Whereas the disputes relating to improvement in wages and betterment of working conditions may be comparatively justified on economic and hygienic grounds, those relating to union matters are simply waste of time and money and a rise in such disputes displays an unhealthy trend in the economy. If the Trade Disputes Act 1906 is amended, as desired by the T.U.C., and the trade unions are given the legal protection to coerce the non-unionists, the percentage of disputes regarding union matters will rise still further and will definitely harm the economy of Britain.

WORKERS' EDUCATION IN INDIA

In an industrialising country like India—and for that matter in any country embarking on industrial development—the importance of workers' education is self-evident, as it is only through such education that the quality of labour-power and labour leadership can be improved, labour-management relations strengthened and an era of industrial peace and prosperity ushered in. However, education is fundamentally a slow process and workers' education, being in its early stages in this country, cannot be expected to work miracles in a short period.

But it is nevertheless heartening to know that, during the last few years, considerable progress has been made in the country in this regard. There are at present 24 regional and 30 sub-regional centres for workers' education and, by the end of the current financial year, another five or six centres are likely to be established. This, according to Mr. D. Sanjivayya, Union Minister for Labour and Employment, who inaugurated the annual meeting of the Central Board of Workers' Education at New Delhi on the 9th instant, will mean the achievement of the third Plan target one year in advance, and, with the opening of some more centres in the next financial year, the target will be considerably over-achieved. So far nearly 5,000 worker-teachers and 150,000 workers have been trained by the Board. In 1963-64, 65,000 workers were trained and, in the light of this progress, the target of 7,500 worker-teachers and 250,000 to 300,000 workers by the end of the third Plan period seems to be within easy reach.



INDO-AFRICAN TRADE NEEDS EXPANSION

VAST SCOPE FOR ENGINEERING EXPORTS

AFRICA covers nearly a fourth of the world's land area, but its 240 million people represent just eight per cent of world population. It is one of the most trade-dependent areas of the world. With an annual output of $21,000 million, it exports goods worth $4,800 million and imports goods worth $6,400 million. The exports and imports of Africa, expressed as proportions of the overall output, amount to 23 per cent and 30 per cent, respectively. As compared with Britain, which is also a highly trade-dependent area (percentages of exports and imports to total output being 18 and 22, respectively), Africa's share is much higher. Such heavy trade dependence is in part a result of the relatively small sizes of the Continent's 50 and odd countries which can hardly be self-sufficient. But it is mainly a reflection of the economic evolution taking place in these countries.

Africa's exports consist chiefly of primary products and imports of manufactures. The important feature of its present structure of output and trade is that they are entirely complementary or non-competitive in character. But, with the industrialisation of Africa, the existing international division of labour, under which it exchanges primary goods for manufactured items, will undergo a major change. Even now, considerable progress in the direction of changing the structure of imports has been made in Africa. The share of consumer goods has fallen over the last ten years (1950-60) from two-thirds of total imports to one-half and that of intermediate goods and machinery and equipment has correspondingly risen. From a mere three per cent in 1950, imports of machinery and equipment have increased to 12 per cent in 1960—a clear indication of significant expansion in the level and content of investment in industries. The heavy import dependence of Africa is a double-edged advantage. It indicates a large potential for import substitution and, at the same time, provides by way of foreign exchange the very resources for carrying it out. Africa, with its *per capita* imports amounting to $29, has thus an enormous potential for economic growth based on imported capital goods. The African countries have great scope for improving their trade relations with the developing countries of Asia.

Present Trade with Africa

At a time when India's export trade among its traditional partners is confronted with stagnation owing to the competition offered by different countries, there is every need to explore new markets in the resurgent countries of Africa. The Board of Trade in the Union Ministry of Commerce has, therefore, done well in preparing a Paper on the subject of improving India's trade relations with the African countries. The comprehensive Paper, which was discussed at the 15th meeting of the Board of Trade held in Bombay last week, analyses India's present export trade with the principal countries in Africa and outlines the measures that could be taken to improve them. India's exports to Africa, incidentally, have been roughly Rs. 50 crores, which amounts to 7 to 8 per cent of the country's total exports. It corresponds, in other words, to India's trade with the E.E.C. countries. Confined to about ten countries in the Continent, this trade has grown over a period of time without any conscious effort on India's part to promote it. As Table I will show, in recent years, the balance of trade has been slowly turning in this country's favour. The trade deficit, which was Rs. eight crores in 1961-62, has narrowed down to Rs. four crores in 1963-64.

The bulk of India's exports to Africa goes to the English-speaking countries in that Continent. Nearly 68-70 per cent of these exports is purchased by nine of the 50 and odd countries in Africa, as will be seen from Table II. Egypt and Sudan alone account for more than 50 per cent of India's exports to Africa. Though there were falls in exports to the main African countries to the tune of Rs. 6.5 crores during 1963-64, as compared with 1962-63, the total decline in exports to the Continent as a whole in that year was only Rs. 3.9 crores. In the first financial quarter (April-June) of 1964-65, India's exports to Africa has increased by Rs. 1.1 crore over the corresponding period of 1963-64.

Analysing the principal commodities exported from India, the Paper indicates that three items—tea, jute manufactures and cotton manufactures—account for 65 to 72 per cent of the country's exports to Africa. The decline in the level of these exports—from Rs. 4.3 crores in 1961-62 to Rs. 3.0 crores in 1963-64—has been in tune with the fall in the exports of all commodities. However, in the four months of this fiscal year (April-July 1964-65) there has been a slight improvement in the position as exports of tea, jute goods and cotton textiles have gone up by Rs. 0.21 crore over the corresponding period in 1963-64. This trend is brought out in Table III.

Tea exports have gone up from Rs. 1.0 crore in 1960-61 to Rs. 1.3 crore in 1963-64 in spite of the growing competition from Ceylon, China, and East African countries. Egypt, Sudan and Tunisia share among them practically 100 per cent of India's exports to Africa. This should not, however, lull us into complacency, for some of the East African countries like Kenya, are fast coming up as suppliers of tea to the world market. Further, India is losing its market in the smaller territories of Africa, such as Ghana and Rhodesia and Nyasaland, to other countries, particularly Ceylon. In addition, mainland China has a virtual monopoly for supplying green tea to the ex-French territories, namely, Senegal, Ivory Coast, Upper Volta and Morocco. Algeria, another big consumer of green tea, meets its requirements by importing nearly six million lbs. from Japan and Formosa. There is, however, wide scope for India to enter these large markets. In its Paper, the Board of Trade has rightly called for concerted efforts in the direction of promoting India's tea exports in these areas.

Cotton Manufactures

Cotton manufactures, another important item of India's export trade, has been characterised by a sharp fall in the total level of exports—from Rs. 1.3 crore in 1960-61 to Rs. 0.7 crore in 1963-64. Even in the four months of this fiscal year (1964-65), there has been a decline in the exports. It has been more pronounced in cotton piecegoods exported to Sudan, Ethiopia and Kenya in 1963-64. With a number of countries in Africa setting up their own mills, India's exports of grey variety of cotton goods have also begun to shrink. Besides, a change in the tastes of the people from grey to white, bleached and superfine piecegoods is also responsible for the reduction in India's exports of this traditional variety of textiles. Grey cloth, it is said, has no future in the African market. The proportion of cotton grey cloth imports into African countries like Kenya to that of synthetic fibres and other processed cloths has changed considerably. As it is a dying trade, India has to explore every means of supplying processed and finished cloth to these countries in order to improve its trade prospects with them.

As if to reinforce the plea for increasing the exports of synthetic fibres and other textiles to the African countries, the Board of Trade, in its Paper, has indicated the bright chances of expanding India's trade in this category of textiles. Exports of synthetic goods to Nigeria, Sudan, Ethiopia, Kenya, Uganda, Rhodesia, and Nyasaland have increased from Rs. 2 crores in 1962-63 to Rs. 2.45 crores in 1963-64. In 1960, the percentage of home production of cotton textiles—cotton, wool, rayon and synthetics—in the African countries came to only 40, the share of rayon and synthetic fibres being nine and four respectively. Country-wise, the United Arab Republic (U.A.R.) is perhaps the only country meeting all its textile requirements. Thus the general situation, save for U.A.R., is one of overall dependence on imports, less in cotton but almost completely in rayon and synthetics.

Jute Goods

Owing to the severe competition from Pakistan, exports of sacking goods from India declined from 63 per cent in 1960-61 to 46 per cent in 1963-64. Pakistan, which has increased its share from 37 per cent to 54 per cent in the corresponding period, has now virtually reduced the Indian industry to a situation whereby the latter only supplies such portion of the demand as Pakistan cannot fulfil. Another reason for the decline in India's exports is the gradual growth of the jute industry in Africa. However, as the delegation of the Calcutta Jute Fabrics Shippers Association has reported after a visit to the African countries, an improvement in the quality, weight and colour of India's jute bags and granting of deferred payment facilities to the importers will go a long way towards meeting the Pakistan challenge in the field of jute goods exports. Owing to the high prices of raw materials, the reported expansion plans of jute industry in the African countries will be slow and the demand for imported jute goods is not likely to decrease in the near future.

Spices, another important item of India's exports, contribute nearly a crore of rupees to the country's earnings. Though India has not lost much market in the last two years, it is still not very widespread in Africa. This field deserves special attention and efforts to promote exports in this direction are called for. Export of footwear to countries like Nigeria and Ghana is also rising. As the market for footwear is steadily growing, the Paper calls for a team of exporters and manufacturers to visit the African countries.

A new item in which considerable scope exists in the Continent is that of engineering goods, especially light engineering goods. Exports of these goods have shown a tendency to increase in an otherwise declining market. As against the export of light engineering goods worth Rs. 1.46 crore in 1961, India's exports amounted to Rs. 2.4 crores in 1963. While to many countries like Ethiopia, Federation of Rhodesia and Nyasaland, Ghana, Kenya, Liberia, Nigeria, Somaliland, Sudan, Tunisia, Uganda and Zanzibar there have been substantial increases in engineering exports, in respect of countries like Egypt, Tanganyika, French West Africa, Morocco and Mozambique these exports have slightly decreased. Hence, concerted efforts would have to be made to improve India's markets in these areas. Small-scale industries, too, offer good scope for development in many of the African countries as the necessary capital could be raised (upto Rs. 5 lakhs for each unit) from within the areas, and the industries started on assembly and partial manufacturing basis. The Board of Trade, in its Paper, has, therefore, suggested a delegation to visit the different countries and explore the possibilities for setting up small-scale industries with Government assistance, if necessary.

Exports of Capital Goods

Along with the steps to promote exports of consumer goods, the Paper has drawn attention to the prospects for exports of capital goods and to the possibilities of increasing shipping transport to many of the African countries. As India is not capable of competing with the Western countries in the matter of credit arrangements, it is felt that this country should take steps to allow exports of capital goods like machinery and equipment for the purpose of equity investment. Already some Indian industrialists have planned a few joint ventures in Ethiopia, Kenya, Uganda, Libya, Nigeria, Liberia and Sierra Leone. The industries to be set up in

EAST INDIAN COAL SUFFERS A SETBACK

DIVIDEND CUT, BUT RESERVES STRENGTHENED

THE year 1963 was one of general recession for the coal industry as a whole. This fact is fully corroborated by the sharp setback suffered by the East Indian Coal Company Ltd. (Managing Agents and Secretaries: Messrs. Jardine Henderson Ltd., Calcutta) during the year ended 30th April 1964. Following its usual practice, the Company has not disclosed in its latest annual report the turnover figure, but the total earnings, after deducting colliery and Calcutta expenditure, have declined to £368,319 from £499,933 the year before. Consequent on the decline in earnings and rise in other expenses, there has been a sharp drop in gross profit from £433,576 to £310,824. As things would have it, the provision for depreciation, too, has advanced by £14,133 to £85,533, so much so the profit subject to taxation is as low as £225,291, as against £372,176 a year ago. Thanks, however, to the substantial reduction of £133,296 to £64,329 in the provision for taxation, the resulting net profit is £160,962, as compared with £174,551. On adding to this the £33,699 withdrawn from reserves, a sum of £194,661 becomes available for distribution. Out of this, the Directors have provided £3,171 (£21,600) for taxation in respect of prior years and have also credited £133,890 (as against £72,833) to reserves. Of this latter sum, only £57,994 (£52,818) have been transferred to the statutory development rebate reserve, while a comparatively larger amount of £75,896 (£20,013) has gone to the credit of general reserves. The balance after these prior appropriations has been utilised in proposing a reduced ordinary dividend of Rs. 2 per share, as against Rs. 2.75 per share.

The working results of the Company for the past four years are set forth in the following comparative table:

(In pounds sterling)

	For the year ended 30th April			
	1964	1963	1962	1961
Profits after deducting colliery and Calcutta expenditure	368,319	499,933	376,033	206,843

To reserves	133,890	72,833	155,823	81,763
Dividend	57,600 (15%)	79,200 (20.6%)	40,500 (20.6%)	36,000 (15%)
Carry forward	..	..	6,234	16,220
Market price of ordinary shares (in rupees):	1964	1963	1962	1961
High	29.25	50.00	30.25	36.00
Low	27.62	29.00	25.62	32.06

There is no change in the paid-up share capital of the Company which as at 30th April 1964 stands at £384,000 in ordinary shares of £1 each. The reserves, on the other hand, have moved up from £702,761 to £792,188, inclusive of £133,600 in the share premium account. Borrowings, of which £375,000 are in 6½ per cent debenture-stock, amount to £614,693, while current liabilities, minority interest and provisions aggregate £894,555. During the year, the Company acquired new assets worth £292,929, spent £188,975 on fixed assets in course of installation at the date of the balance sheet. Including these amounts and goodwill valued at £32,890, the block account stands at £2,073,229. On deducting therefrom £681,244 as the depreciation earned to date, a net block of £1,391,985 is obtained.

The raisings of coal during the year amounted to 1,429,796 tonnes, as against 1,545,662 tonnes previously, but despatches slumped from 1,553,440 tonnes to 1,378,546 tonnes due to the substantial decrease in the offtake by steel plants which failed to utilise their budgeted coal requirements. The result was an accumulation of stocks at pit-heads which seriously hampered output and greatly added to the cost of production. The Company's representations to have these surplus stocks delivered to other priority consumers were of no avail. This accumulation of stocks at pit-heads had also a deleterious effect on the reorganisation and development of the collieries which was expected to be substantially completed during the year under review.

Since 1959 when pit No. 3 at Kendwadih was sealed off under instructions from the Mines Department on account of fire, there have been several abortive attempts to reopen the area, but, on each such occasion, on signs that heating was becoming active, the main seals had again to be closed. During the year under review, however, the area was successfully reopened. As regards the Company's subsidiary, the development of which was held up on account of delays in receipt of imported equipment, it is now progressing satisfactorily. But this is a long-term project and it will be some time before the benefits of development will become apparent. During the year, serious labour unrest resulted in a substantial reduction in raisings and, as a consequence, the year's working showed a small loss.

The current quotation for the £1 ordinary shares of the Company is Rs. 28.25 *cum-div.* On an *ex-div.* basis, the net annual return on fresh investment works out to over six per cent.

ASSAM HARDBOARDS LTD.

The hardboard manufacturing project of Assam Hardboards Ltd. has made considerable progress. This was disclosed by Mr. Govindnarain Somani, Chairman of the Company, while addressing the fourth annual general meeting of the Company held at Ambari in Gauhati recently. The construction of the factory, and staff and labour housing, according to him, have already been completed and shipment of machinery from abroad cleared at Calcutta. Plant erection is in full swing and, barring unforeseen circumstances, the erection work is expected to be completed before the end of 1964 and production will commence thereafter. The capital cost of the project is said to have gone up owing to factors beyond the control of management. The Industrial Finance Corporation of India has stipulated additional conditions in respect of the rupee loan which the Company has sought from it against a bank guarantee. Condition is laid down, for instance, that the amount advanced to the Company can be withdrawn only with the approval of the I.F.C. Further, the I.F.C. has made it clear that it will not grant any more loans in future. Alluding to these conditions, Mr. Somani stated that the very purpose of financing institutions engaged in providing long-term finance to industries, would be defeated, if the institutions ask the borrowers not to approach them for any additional assistance notwithstanding the fact that all loans are sanctioned against due security and after proper scrutiny. He remarked that it would be better if the I.F.C. and similar financing institutions deferred the collection of interest on loans in the case of new industrial undertakings, at least during the period of construction.

(Concluded from next column)

the current year, but they could not be started till about the middle of the current year was over, because of labour resistance. Again, the new waste spinning plant and the Barber-Colman machinery would be brought into commission only towards the end of the year.

Under the programme of rebuilding and renovating existing plain looms, 72 looms were rebuilt during the year, bringing the total of reconditioned plain looms to 82. A further 75 looms is being replaced by automatic looms and the total loomage is being increased to about 700, of which 288 are automatic.

During the year, the Company issued 14.869 new equity shares of Rs. 50 each as bonus shares in the proportion of one new share for every eight shares held. As a result, its authorised share capital has risen from Rs. 66.68 lakhs to Rs. 74.38 lakhs, with a backing of Rs. 34.71 lakhs in reserves. Total own funds, therefore, aggregate Rs. 109.08 lakhs, against which outside interest amounts to Rs. 210.20 lakhs.

On the asset side, the gross block of Rs. 109.82 lakhs has been written down to Rs. 118.04 lakhs through the depreciation account. Investments are carried in the book at a cost of Rs. 30.96 lakhs, while current assets, loans and advances and miscellaneous expenses aggregate Rs. 170.28 lakhs.

As regards the prospects for the current year, the Directors state in their annual review that, as from the commencement of the current year, the Company has been restored to a moderate rate of profitability as a result of working some of the new machinery and better operating efficiency in general. With effect from 15th October 1964, the new uniform system of statutory control is also expected to come into effect on popular varieties representing 45 per cent for the civil consumption of cloth. This, coupled with decontrol on other varieties, will, the Directors hope, raise the profits of the Company to reasonable levels more consistent with the capital structure and productive capacity.

MYSORE SPINNING INCURS LOSS

OUTLOOK, HOWEVER, ENCOURAGING

THE Mysore Spinning and Manufacturing Company Ltd. (Managing Agents: Messrs. N. Sirur and Co., Private Ltd., Bombay) has suffered a further—and a more severe—setback in its profits during the year ended 29th February 1964. Under the favourable impact of increased prices for coarse and lower medium counts yarn, the turnover has no doubt advanced by Rs. 29.72 lakhs to Rs. 211.99 lakhs and other income by Rs. 11.09 lakhs to Rs. 32.59 lakhs. The closing stocks are also higher at Rs. 85.02 lakhs, as against Rs. 68.86 lakhs. But the gross profit has slumped from the previous year's high level of Rs. 73.29 lakhs to Rs. 51,000 only. This amount is just Rs. 6,000 more than the Rs. 45,000 provided for the Managing Agents' remuneration (same as in the previous year). Since the provision for depreciation is higher at Rs. 8.72 lakhs, as against Rs. 6.11 lakhs, the Company has rounded off the year with a net loss of Rs. 8.66 lakhs, as against the net profit of Rs. 2.04 lakhs earned in the previous year. As there has been no assessable income for the year, no provision for taxation has been made as previously. In order to absorb the net loss and to pay dividend for the year on 4.5 per cent cumulative preference shares, the Directors have withdrawn a sum of Rs. 8.41 lakhs from reserves, besides writing back Rs. 20,000 from provisions no longer required. On the available balance, inclusive of the amount brought in, the Directors have proposed the payment of Rs. 34,000 as preference dividend for the year under review. The dividend on equity shares has once again been passed over.

The steady deterioration in the Company's profit-margin (ratio of gross profit to sales) since 1962 is clearly brought out by the following comparative figures:

(In lakhs of rupees)

	For the year ended February			
	1964	1963	1962	1961
Sale proceeds	211.99	182.27	195.81	168.12
Other income	32.59	21.50	5.56	4.79
Closing stocks	85.02	68.86	44.00	48.99
Cotton, spares, power, etc., consumed	175.01	146.74	120.87	113.08
Other expenses	85.22	73.29	66.88	59.72
Gross profit	0.51	73.29	66.88	59.72
Managing Agents' remuneration	0.45	0.45	0.67	0.45

Items relating to prior years	..	2.40	0.50	2.49
To reserves and provisions	..	3.09	2.53	2.25
Dividends—				
Preference	0.34	0.34	0.34	0.34
Ordinary	..	..	4.87 (12%)	4.86 (14%)
Carry forward	..	0.39	..	..
Market price of ordinary shares (in rupees):	1964	1963	1962	1961
High	45.00	55.00	71.00	75.00
Low	36.00	43.00	54.00	59.00

The reasons for the decline in profit-margin were many and varied. Although the impact of the voluntary price control scheme became intolerable during the year under review, the Company continued to adhere to it inspite of considerably increased costs of production and raw materials. True, the prices of coarse and medium varieties of yarn were raised, but the increased prices were not commensurate with the much higher price paid for the cottons used. However, since lower medium yarn appeared less losing than the higher medium yarn, the loom programme was rearranged to take up a larger quantity of higher medium yarn. Moreover, some spindles were engaged in the production of staple fibre blends and, due to these factors, the turnover of yarn showed a rise. In the absence of this, the decline in profits would have been even more serious.

The major setback suffered by the mills was in the weaving department. Increased production of higher medium cloth did not yield the desired results, because prices higher than anticipated had to be paid for the required cottons. Further, in order to improve the realisation on exports, the Company changed the pattern of export production from ordinary coarse and medium sheeting to towels and furnishing fabrics. These changes led to considerable dislocation in the smooth working of the weaving shed and the realisation from the sale of cloth decreased.

Out of the 144 automatic looms purchased in the preceding year, 120 were under erection during the year. In normal circumstances, they should have commenced working early in

(Continued in previous column)

SHIPPING CORPORATION SAILS AHEAD

INCREASE IN FLEET, CARGO AND EARNINGS

WITH a further expansion of its fleet from 27 to 29 ships and of tonnage from 201,966 G.R.T. to 236,586 G.R.T., the Shipping Corporation of India Ltd. (Chairman: Mr. R. L. Gupta, Bombay) has sailed ahead during its fourth year ended 31st March 1964, carrying a cargo of 1,327,076 G.R.T., as against 1,189,274 G.R.T. in the previous year, and realising operating earnings of Rs. 13 crores, as against Rs. 10.43 crores, and a gross profit of Rs. 331.39 lakhs, as against Rs. 300.29 lakhs. The year's gross earnings are 25 per cent more than those in 1962-63. Gross profit has shown a 10 per cent improvement over the year, even though operating costs increased the world over and staff expenses went up substantially during the year and in spite of the Corporation's continuing to operate some services which are recognised to be not so remunerative, such as the cargo service to Japan and Australia and the passenger services to East Africa and Singapore. But with the essential provisions claiming more, the improvement in net profit is of the order of only Rs. 5.20 lakhs to Rs. 139.75 lakhs. With the Rs. 83.10 lakhs written back from reserves and provisions, the disposable surplus is, however, much larger, and the Directors have thus been able to carry a big chunk of Rs. 213 lakhs (Rs. 135.19 lakhs a year before) to reserves. The surplus, after allowing for adjustments, is Rs. 3.64 lakhs, as against Rs. 22,359 in the previous year.

The progress achieved by the Corporation since it came into being following the merger of the Eastern Shipping Corporation and the Western Shipping Corporation is brought out in the following comparative table:

(In lakhs of rupees)

	For the year ended 31st March			
	1964	1963	1962	1961
Operating earnings	13,00.32	10,43.23	788.53	566.94
Other income	33.80	22.42	24.86	40.34
Operating expenses	915.50	697.39	513.38	385.88
Management and other expenses	59.04	41.77	31.51	25.96

Debits relating to prior years	6.58	2.49	2.39	0.11
To reserves and provisions	213.00	135.19	165.62	100.21
Carry forward	3.64	0.22	..	..
Cargo carried (registered tons)	13,27,076	11,89,274	8,69,784	8,17,619
Number of round voyages	97	80½	65	57
Number of voyage days	10,290	8,984	6,187	4,470

Mr. R. L. Gupta, Chairman of the Corporation, referred to some of the more important developments concerning the Corporation's trading activities during the year in the course of his speech at the shareholders' annual general meeting at Bombay on 28th September last. Mr. Gupta said that the Corporation had firmly established itself in the competitive U.S.A. trade, which it entered in May 1963. It now operates a monthly service between India and the East Coast of the U.S.A. and its five modern fast cargo liners on this trade also call at ports in the Gulf of Mexico. The Chairman, in his speech, stated that the Corporation had fully participated in the notable increase in the trade between India, the U.S.S.R., Rumania, Bulgaria and Poland. The Corporation looks forward to participating in the India-U.A.R. service, which is expected to be inaugurated next year. Since April 1964, one motor tanker of the Corporation (m.t. *Desh Bandhu*—34,294 dw.t.) is engaged in transporting crude oil products from the Persian Gulf to the Visakhapatnam refinery under charter to Caltex (India) Ltd. This tanker has heralded the Corporation's entry in the overseas tanker trade and its share is expected to increase after the 45,250-dw.t. super-tanker, due to be delivered in August 1965, is placed on worldwide trading under charter to Messrs. B. P. Tankers Ltd.

The Directors think that the prospects of the Corporation handling increasing volume of cargoes and achieving higher earnings in the coming years are bright. The tonnage market continues to be favourable also for the construction of new vessels. There are increasing prospects of deferred payment terms being offered by foreign shipyards for construction of vessels for Indian shipowners. The facilities available within the country for shipbuilding as well as ship-repairing are also expected to be substantially augmented during the coming

As a public sector concern, the Corporation has never been in want of capital funds, and its balance sheet, as at 31st March 1964, therefore, presents a really formidable financial position. The paid-up capital, unchanged at Rs. 23.45 crores, is all in equity shares of Rs. 100 each, and is backed by reserves and surplus amounting to Rs. 4.99 crores. Secured and unsecured loans make a total of Rs. 6.25 crores, as against Rs. 4 crores a year before. Dues to shipbuilders, current liabilities and provisions, income earned on unfinished voyages and security and general average deposits altogether amount to Rs. 5.19 crores, as against Rs. 2.71 crores a year before. With the acquisition of two new ships during the year, the gross block has expanded from Rs. 29.82 crores to Rs. 34.96 crores and, on deducting Rs. 7.97 crores as the depreciation earned to date, the net block works out to Rs. 26.99 crores. Besides the net block, payments on account of ships under construction and fittings on leasehold office premises total Rs. 3.09 crores, so that the total net block amounts to Rs. 29.49 crores. Investments in Government securities are carried in books at a cost of Rs. 62.39 lakhs, while current assets, loans and advances and sundry assets and miscellaneous expenditure aggregate Rs. 9.76 crores.

TRACTORS AND BULLDOZERS BECOMES A PUBLIC UNIT

During its eighteenth year ended 31st March 1964, Tractors and Bulldozers Ltd. (proposed Managing Agents: Messrs. Pashabhai Patel & Co., Baroda) has converted itself into a public company and obtained permission of the Controller of Capital Issues to make a public issue of Rs. 50 lakhs in 100-rupee equity shares. It has also strengthened its Board of Directors. These are pointers to the Company's growing progress and bright prospects.

It was in June 1960 that the Company negotiated a collaboration agreement with Motokov, the Foreign Trade Corporation of Czechoslovakia, for manufacturing their 50 h.p. *Zetor* diesel tractors. Actual production started in February 1963. Since then 700 tractors have been made. Impressed with the progress, the Government doubled the licence to 2,000 units per annum for making equal number of 50 h.p. and 30 h.p. tractors on a single-shift basis. Lately, the Company has been allowed to go up to 2,000 units in either case. Over and above what it produces, it has been allowed to import 2,000 complete tractors, which will be assembled by the end of 1964-65. With its present set-up, according to its Chairman, Mr. Pashabhai Patel, investment in the Company should be safe and attractive for anybody who is looking for a good and reasonably sure return on his investment.

The year ended 31st March 1964 has seen a slight setback in sales from Rs. 118.03 lakhs to Rs. 110.30 lakhs. Profit on sale of spare parts, etc., is also lower at Rs. 5.34 lakhs, as compared with Rs. 8.30 lakhs a year before. Even income from other sources has dropped from Rs. 15.13 lakhs to Rs. 4.01 lakhs. But thanks to a limited purchase of trading goods, tractors, ploughs, etc., amounting to Rs. 17.36 lakhs, as against Rs. 56.52 lakhs in the previous year, and a drop in other expenses from Rs. 23.28 lakhs to Rs. 21.37 lakhs, gross profit has edged forward from Rs. 13.05 lakhs to Rs. 14.54 lakhs, though the cost of materials, stores, etc., consumed has increased from Rs. 45.49 lakhs to Rs. 69.60 lakhs and staff expenses have gone up from Rs. 13.09 lakhs to Rs. 16.85 lakhs. After allowing Rs. 4.28 lakhs for depreciation (as against Rs. 4.53 lakhs in the previous year) and Rs. 4.30 lakhs for taxation (as against Rs. 2.75 lakhs), there is left a net profit of Rs. 5.96 lakhs which compares favourably with the Rs. 5.77 lakhs obtained in the previous year.

Notice

DALMIA CEMENT (BHARAT) LIMITED

Registered Office:

DALMIAPURAM (Madras State)

THE GENERAL MEETING OF THE SHAREholders of the Company called to be held on 30th October 1964 is cancelled and instead the general meeting of the shareholders of the Company will be held at Dalmiapuram, the Registered Office of the Company, on 20th November, 1964, at 11.00 a.m. Notices of the Meeting setting out the Agenda and Explanatory Statement on the special business to be transacted thereat have been sent to the shareholders by post.

By Order of the Board,

S. C. AGGARWAL,

Secretary.

Dated: 9th *October* 1964.

It is supplemented with Rs. 1.76 lakh drawn from reserves and provisions. After transferring Rs. 3.38 lakhs (Rs. 1.44 lakh in the previous year) to reserves, the Directors have proposed a dividend of Rs. 24 per share, which is to be paid out of dividend reserves, to which Rs. 3.55 lakhs have been carried from the year's profit. It is estimated that half the dividend will be free of tax.

The Company's authorised capital is Rs. 100 lakhs, all in equity shares of Rs. 100 each. Out of this, Rs. 20 lakhs has been issued and paid up. It is backed by reserves and surplus amounting to Rs. 18.59 lakhs, excluding Rs. 4.80 lakhs from dividend reserves for meeting the year's dividend liability. As against these "own" funds (capital and reserves) of Rs. 38.59 lakhs, borrowings total Rs. 92.35 lakhs and current liabilities and provisions (including the year's dividend liability) Rs. 95.20 lakhs. On the assets, current assets, book debts and investments aggregate Rs. 170.12 lakhs, falling short of the total indebtedness to outsiders by Rs. 17.43 lakhs. The gross block, which has expanded during the year from Rs. 62.03 lakhs to Rs. 74.45 lakhs, has been written down to Rs. 56.02 lakhs.

FRESH CAPITAL ISSUES

Six companies have been authorised to raise fresh capital exceeding Rs. 5.82 crores. Three of them are issuing bonus shares, two are issuing equities and another debentures. One company involves foreign collaboration. The consent of the Controller of Capital Issues is valid for 12 months in all cases. The following are the details:

Ahmedabad Advance Mills Ltd. is to issue capital of Rs. 95 lakhs, consisting of (*a*) Rs. 70 lakhs in 7,000—5½ per cent mortgage debentures of Rs. 1,000 each for cash at par; (*b*) Rs. 10 lakhs in ordinary shares of Rs. 100 each to be issued as bonus shares in the ratio of one share for every five shares held on capitalisation of the share premium account; and (*c*) Rs. 15 lakhs in ordinary shares of Rs. 100 each for cash at par to the existing shareholders in the ratio of one share for every four shares held. The capital from the debentures and rights cash issue will be utilised for modernisation and renovation of the mills engaged in the production of cloth.

Hindustan Ferodo Limited (Bombay) is to issue capital of Rs. 2,68,01,330 in equity shares of Rs. 10 each. Of this capital, Rs. 145.00 lakhs will be issued to Asbestos, Magnesia and Friction Materials Ltd. for taking over their existing assets and Rs. 53,33,330 to their parent company of Turner and Newall Ltd., U.K., for cash at par. The rest of the capital of Rs. 69.68 lakhs will be offered to the Indian public by prospectus at a premium of Rs. 17 per share. The money will be utilised for expansion and manufacture of new articles.

Indian Copper Corporation Limited will be issuing capital of Rs. 125 lakhs in 12,500—7 per cent registered debentures of Rs. 1,000 each for cash at par. The debentures will be issued to the Indian public by prospectus. The money will be utilised for financing the expansion of mine ore production and the setting up of a sulphuric acid plant.

Modi Spinning and Weaving Mills Company Limited is to issue further capital of Rs. 86,50,820 in equity shares of Rs. 10 each as rights shares for cash at par. The capital will be utilised for financing the installation of 25,000 spindles for the manufacture of sewing thread, hosiery, etc.

Grindwell Abrasives Limited will be issuing Rs. 6 lakhs bonus capital in shares of Rs. 100 each to be allotted to existing shareholders.

Ghaziabad Engineering Company (Pvt.) Limited engaged in the manufacture of harrows and trailers and household electrical implements, will be issuing bonus shares of the value of Rs. 1.75 lakh on capitalisation of reserves.

FACIT ASIA LTD.

The Rs. 30-lakh factory of the Facit Asia Ltd. at Perungudi near Madras, which is claimed to be India's first business machines factory, was declared open on 3rd October 1964 by the Swedish Ambassador in India. The factory has been established in technical collaboration with Sweden's Facit Group (one of the world's largest manufacturers of typewriters, calculators and adding machines). To start with, the factory will produce 1,200 calculators and an equal number of adding machines per annum. The sanctioned annual capacity is 5,200 calculators and 5,200 adding machines. The Swedish company's immediate plans in India, according to Mr. Gunnar Ericsson, Managing Director of the Company, are to help the Facit Asia Ltd., in reaching the production target in scheduled time and to provide further technical and financial assistance for expanding the Halda typewriter factory of the Rayala Corporation. The Facit Asia Ltd. hopes to export on a large scale to several eastern countries.

RAMON AND DEMM LTD.

Ramon and Demm Ltd., a new company incorporated for the manufacture of automobile gears, will be entering the capital market in November/December this year with a public issue of Rs. 22.05 lakhs, all in equity shares of Rs. 10 each. The Company is putting up its factory at Thana (near Bombay) in collaboration with the Officine Meccaniche Fratelli Doldi and Matteucci of Milano in Italy, a well-known producer of "DEMM" automobile gears and Messrs. Montex Ltd. of London. Besides supplying technical know-how, the collaborators will also participate in the equity capital of the Company through the supply of machine tools and equipment worth Rs. 15 lakhs. The licensed capacity of the new project will be 2,000 tons of finished automobile gears. The Company is expected to commence production by the middle of 1966 and utilise its full capacity by 1968.

SYNOPSES OF COMPANY REPORTS

Wellman Incandescent India Ltd.

(*Secretary*: Mr. S. K. Basu.)

Second Annual General Meeting: 29th October 1964.

Extracts from the Directors' report: The first and final call of the equity shares was made on 27th January 1964 and as at 31st March 1964, all the call monies with the exception of Rs. 2,46,000 were received by the Company. Subsequently, further unpaid call money has been received and on the date of this report only Rs. 22,000 remains outstanding.

The working of the Company for the year resulted in a loss of Rs. 6,02,189, and the directors recommend that the same, together with the loss of the previous year (Rs. 3,84,231), be carried forward. Depreciation has been provided to the extent of Rs. 82,928 (as against Rs. 25,340 in 1962-63). No provision has been made for development rebate.

The sales value of contracts delivered during the year was somewhat lower than had been expected due to facts over which the Company had no control. There was considerable delay in the issue of import licences for components to be built into the furnaces on order. There was also delay in the supply of bulk power by the West Bengal State Electricity Board, although 50 kva supply was given to the Company in 1963. Bulk import licences have since been received in respect of orders due for execution during the current year. It is expected that sales and operating results for the current year will be more satisfactory. Inspite of the bulk power supply not being available, production at the works and at our sub-contractors' works is making considerable headway. Deliveries of furnaces are being made every month to clients in different parts of India. Erection of low temperature ovens is going on at heavy electricals India Ltd., Bhopal, and Chittaranjan Locomotive Works, Chittaranjan. Erection of one bogie hearth furnace and one plate heating furnace is proceeding satisfactorily at Structural Engineering Works, Bombay. Erection will soon start in other places. The Company has received orders from the Alloy Steels Project of Hindustan Steel Ltd., Durgapur, valued at approximately Rs. 1 crore which was obtained against international competition. It has also received the Indian portion of the orders for steelmaking plant expansion, coke oven machines and 150 ton laddle crane for 1.6 million tons expansion of Durgapur Steel Plant, the main contractors thereof being our collaborators, The Wellman Smith Owen Engineering Corporation Ltd. The total value of these contracts is about Rs. 80 lakhs. The products of the Company have been very well received by both private and public sectors and hope to receive further substantial orders in the near future.

Accounts in brief as at 31st March 1964 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	22,54,000	Gross block	8,71,915
Reserves and surplus..	Nil	—Depreciation ..	1,08,389
Other liabilities ..	38,16,425

High	117.00	107.50
Low	101.00	97.00

* Final dividend—payment out of the dividend reserve.
† Upto 8th October 1964.

Extracts from the Directors' report: Finance: In connection with the Company's development programme during the next five years (1964-69) covering the establishment of 4 additional 22/11 kV Receiving Stations at Malad, Bandra, Chembur and Vikhroli it is proposed to issue in the first instance Rs. 75 lakhs of Debentures to finance the scheme.

Convertible Debentures: In terms of the debenture trust deed dated 28th June, 1963, 10,509 convertible debentures were converted into equity shares upto 31st March, 1964.

New Connections: 16,995 new consumers were connected to the Mains, bringing the total number to 141,915 which represents an increase of 13.60 per cent over the previous year.

The number of units purchased from the bulk suppliers rose by 23.32 per cent. The following table indicates, in terms of units sold, the progress in the sales of energy since the year 1961-62.

Year	Kilowatt-hours sold: Public lighting and general purposes	Power purposes	Total	Percentage increase on previous year
1961-62 ..	69,508,978	104,723,470	174,232,448	20.30
1962-63 ..	80,984,387	124,925,640	205,913,027	18.16
1963-64 ..	91,366,592	160,157,724	251,524,316	22.15

The sale of energy for lights and fans and general purposes increased by 12.82 per cent and for motive power by 28.20 per cent.

System Peak: The maximum load on the Company's system was 58,090 kWs as against 48,580 kWs during the previous year, an increase of 19.58 per cent.

Distribution: The Company's transmission and distribution systems were maintained in good order, and continued to give trouble free service. At the close of the year there were 420 kilometres of high tension and 555 kilometres of low tension mains on the Company's system.

Development: During the year 33 new sub-stations were added (making a total of 329) and the transformer capacity of 21 existing sub-stations was augmented.

Accounts in brief as at 31st March 1964 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	1,85,50,900	Gross block ..	6,78,25,389

* Paid-up capital consists of 2,500—6 per cent. cumulative preference shares of Rs. 50 each and 17,500 equity shares of Rs. 50 each.

Kusum Engineering Co., Ltd.

(*Managing Agents*: H. P. Bose & Brothers (Private) Ltd., Calcutta.)

Registered Office: 25, Swallow Lane, Calcutta-1.

Twenty-first Annual General Meeting—Held on 29th September 1964.

Extracts from the Directors' report for the year ended 31st March 1964: Operation: During the year, sales amounted to Rs. 20,22,398, an increase of Rs. 3,23,946 only over that of the previous year. The Company's turnover is increasing every year with good strides. Manufacturing cost also increased by Rs. 2,96,832. This increase was mainly due to the fact of increased cost of material and labour. Material consumption increased by Rs. 1,40,000 and labour cost increased by nearly Rs. 1,00,000. Power consumption cost also increased by Rs. 27,000.

Profits: The gross profit this year amounted to Rs. 5,31,220 as against Rs. 4,16,022 in the previous year. It increased by 1¼ per cent. The low percentage of increase in the gross profit may be attributed to the rise in production cost.

The net profit for the year is Rs. 55,145 in spite of the increase in gross profit. Increased charge for depreciation was the cause of such decrease. The total amount provided for depreciation was Rs. 1,42,200, the increase being to the extent of Rs. 56,579 over the previous year. The previous year's balance in the profit and loss appropriation account was Rs. 28,778. This added with the amount of Rs. 22,500 being the excess provision for income-tax, reverted and profit for the year, makes the appropriation amount to be Rs. 1,06,423 from which has to be deducted Rs. 40,908 for income-tax for the year 1961-62 and 1962-63 as per assessments. From the balance Rs. 65,514 available, the Directors propose 7 per cent dividend on equity shares, subject to taxation which will amount to Rs. 30,327 and Rs. 3,033 being 10 per cent income-tax on dividend payable by the Company. Thus a total dividend of Rs. 33,359 is proposed to be declared. The Directors propose to carry Rs. 25,000 to general reserve in order to strengthen the financial position of the Company.

Developments: There has been considerable expansion in the productive capacity. Further developments had been made in the Company's Cast Iron Foundry by setting one big *Cupola Furnace* with much larger capacity. Several new machines have been installed in the machinery production department. These developments were carried out during the year at a cost of Rs. 1,91,287. Expansion of buildings and sheds had also been made. One office building is under construction for accommodation of factory office. The total cost of development in this head was Rs. 59,633. The total amount of Rs. 2,94,491 was spent by the Company during the year in carrying out all round developments including the above.

Accounts in brief as at 31st March 1964 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	4,33,240	Gross block	22,37,127
Reserves and surplus..	3,58,520	—Depreciation ..	7,82,123

Refund of tax and provisions written back ..	25	25
Appropriations:		
Total available balance	92	1,91
Transfer to development rebate reserve ..	25	94
To taxation for previous year	5	Nil
To adjustment of loss brought forward ..	62	97
Loss carried forward	—6,42	—7,06
Market value of ordinary shares (in rupees):	1964*	1963
High	85.00	90.00
Low	70.00	70.00

* Upto 8th October 1964.

Extracts from the Directors' report: The production for the year 1963-64 has been 1,59,965 cycles as against 1,28,086 cycles in the previous year and 1,11,670 cycles in the year before. The Directors regret that due to insufficiency of the profits, no dividend either to the preference or to the ordinary shareholders can be declared and the amount of Rs. 11,45,145 on account of depreciation for the years 1958-59 and 1961-62 and dividend to the preference shareholders for the years 1961-62, 1962-63 and the year under review totally amounting to Rs. 7,12,635 could not be provided for. As such, so far as the production is concerned, it will be found that there is steady improvement in the working of the Company, but the financial result of the year in spite of increase in production has not shown any improvement compared to the last year. This is mainly due to the increase in the prices of raw material and stores such as steel tubes, wires, tyres and tubes, etc. and the increase in the dearness allowance paid to the workers. On the other hand, the Government has frozen the price of biocycles on the basis of the price prevailing in the month of July 1963.

The production of chains during the year 1963-64 was 4,42,940 as against 2,70,030 in the year 1962-63. The wage cost per cycle continues to be extremely high and as stated in the last report, unless the wage cost per cycle is brought down, it will be difficult to work the factory economically. The Company exported more than fifteen thousand cycles during the year 1963-64. The Company received orders for manufacture of fuses from the Director General of Supplies and Disposals, the manufacture of which is now being started.

From 1st April, 1964, this Company has been appointed as selling agents of Central India Machinery Mfg. Co., Ltd., for the territory of Greater Bombay for the sale of their looms including *Sakomoto Automatic Looms* and spare parts, etc. The Company has applied for the approval of the Central Government and the same is awaited.

This Company has also agreed to allow Central India Machinery Mfg. Co., Ltd., the use and occupation of 8,000 sq. ft. in their compound, on leave and licence basis with effect from 1st April, 1964.

There has been some further procedural delay in the matter of the merger of the Company with Messrs. Gwalior Rayon Silk Mfg. (Wvg.) Co., Ltd. Meanwhile, the Directors have been able to negotiate lease of the Company's undertaking to Messrs. Central India Machinery Mfg. Co., Ltd., which the Directors consider more beneficial to the Company. As such, the Directors have decided to postpone the merger scheme *sine-die* and have convened an Extraordinary General Meeting of the Company for approving the lease agreement on 7th September, 1964.

Accounts in brief as at 31st March 1964 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	63,57,065	Gross block	1,39,85,840
Reserves and surplus..	9,09,588	—Depreciation ..	55,55,243

* Dividend for 1963 was paid out of the dividend reserve.
† Upto 1st October 1964.

Extracts from the Directors' report: The Rajasthan Textile Mills started production during the year under review. Full production, however, could not be achieved due to non-availability of sufficient skilled labour. Necessary steps have been taken to train the local labour and the position has now improved. The production during the year also suffered due to frequent power failure and shutdowns. Representations have been made to the Rajasthan Government to ensure that regular power supply is available. The working of the mills in the current year is expected to improve. Steps have been taken to add further spindles which will bring the total strength of spindles to 20,352.

Though the working results of the Company's textile mill in Pakistan showed some improvement, the same were adversely affected due to depression in the prices of cotton textiles. On the other hand, increase in the prices of materials, stores and other production costs continued. There was some reduction in the excise duty as a result of a change in the basis of its levy but the same had mostly to be passed on to the consumers.

Export of cloth by the Company's mills in Pakistan on per loom shift basis was the highest of any textile mill in Pakistan. The mill exported over 12 million yards of cloth during the year. During the current year also exports are being maintained.

The Directors regret that since the last report also there has been no remittance of profits from Pakistan.

Accounts in brief as at 31st March 1964 are as under:—

* Upto 22nd September 1964.

Extracts from the Directors' report:

Crop	1963-64: Production Actual	Cost per kg. Actual	1962-63: Production Actual	Cost per kg. Actual
	Kg.	Rs. P.	Kg.	Rs. P.
Tea ..	1,73,850	2 93	1,80,858	2 89
Rubber ..	2,52,400	2 28	2,18,091	1 99
Cardamom ..	27,940	5 08	12,523	8 63
	Tea		Rubber	Cardamom
Prices realised	per kg.		per kg.	per kg.
1963-64 ..	Rs. 4.47		Rs. 3.15	Rs. 15.09
1962-63 ..	,, 4.07		,, 3.18	,, 14.64

Estimates for 1964-65 are as follows: Tea 1,70,000 kg. to cost Rs. 2.97 per kg., Rubber 2,40,000 kg. to cost Rs. 2.38 per kg. and Cardamom 24,000 kg. to cost Rs. 6.78 per kg.

The production so far during the year 1964-65 in respect of tea and rubber and the prices secured are normal. Cardamom picking is yet to be started.

General: The properties of the Company have been regularly visited and are maintained in good condition. A further area of about 97 acres has been newly planted with rubber during 1964-65. Application has been made to Tea Board for a loan under its hire-purchase scheme for purchase of machinery.

Jenmam rights in respect of a portion of about 310 acres on Chulika Estate held under lease previously have been purchased by the Company during the year. Negotiations for the purchase of the remaining portion of the Jenmam rights in respect of Chulika which had been referred to in the last report is still pending.

The Crepe Rubber Factory on Poonoor Estate was destroyed by fire on the 17th August 1964. The factory, machinery and stock of goods in the factory are fully insured and a claim has been lodged with the Insurance Company for the loss sustained. The insurance covers consequential loss (loss of profits) also.

Accounts in brief as at 30th April 1964 are as under:—

Liabilities	Rs.	Assets	Rs.

Extracts from the Directors' report: Crops and Costs—These are given in the following table with corresponding figures for the previous two years:

Year	Crop (Kgm.)	Estate expenditure cents per kgm.	All-in-cost cents per kgm.	Average sale price cents per kgm.
1961-62 ..	2,63,227	273	354	463
1962-63 ..	3,14,942	248	344	464
1963-64 ..	3,12,464	250	350	480

Debenture Stock.—The fourth lot of Debenture Stock of Rs. 30,000 was redeemed on 31st December 1963 the due date for the annual redemption. The balance stock of Rs. 75,000 then outstanding was repaid, after giving due notice to the Debentureholders, on 15th January 1964.

Capital Expenditure:—A sum of Rs. 86,743 was spent on capital account.

Factory Developments:—The first phase could not be completed during the year. However it is hoped that the balance of the I phase and the II phase will be completed during the current year.

The estimates of crop and costs and estimated capital expenditure for the current year are as follows:—

Crop (Kgs.)	Estate expenditure cents per kgm.	All-in-cost cents per kgm.
2,90,000	316	387

Due to continued drought that prevailed in the district during April-May there has been a shortfall in crop to the extent of 25,940 kgs. It is doubtful whether this shortfall will be fully recovered before the end of the year.

Capital expenditure is estimated at Rs. 2,26,079.

Accounts in brief as at 31st March 1964 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	9,00,000	Gross block	17,68,883
Reserves and surplus..	8,51,645	—Depreciation ..	5,54,539
Other liabilities ..	5,26,751	Net block	12,13,844
		Block in progress ..	40,969
		Current assets ..	4,39,572
		Investments	2,01,696
		Cash	3,82,215
	Rs. 22,78,296		Rs. 22,78,296

* Paid-up capital consists of 4,50,000 equity shares of Rs. 2 each. Of the above, 2,70,000 equity shares have been allotted as fully paid up by way of bonus shares through capitalisation of reserves.

Exports are vital to India and the export drive is on. To succeed, the goods exported must attract the foreign buyer through their pleasing finish...and what better finish can there be than NICKEL-CHROMIUM plating? You will find it on all the popular brands in world markets...the secret to their popularity.

You will be wise to use Nickel-Chromium Plating for your products, but see that the plating conforms to a standard specification as regards nickel thickness, as it is the NICKEL beneath chromium that guards against corrosion.

Our knowledge of nickel-chromium plating is at your service.

INDUSTRIAL DEVELOPMENT BANK OF INDIA

APPLICATIONS ARE INVITED FOR THE following posts in the Industrial Development Bank of India :—

A) **POSTS AND SCALES OF PAY:**

(i) Deputy Managers: Rs. 850-60-1,150.

(ii) Officers Grade I: Rs. 430-430-55-815-E.B.-55-925-60-1,045.

(iii) Officers Grade II: Rs. 375-20-535-25-560-E.B.-25-660-30-720.

Note :—Candidates possessing exceptionally good qualifications and experience of value to the Bank may be given a higher starting pay in the prescribed scales.

In addition to pay, the selected candidates in all categories mentioned above will be eligible to draw local pay, house allowance, dearness allowance and other allowances at rates prescribed by the Bank from time to time. The present rates for local pay and other allowances are :

(i) Local pay at 10% of pay.

(ii) House rent allowance at 15% of pay with a minimum of Rs. 60 and a maximum of Rs. 300.

(iii) Dearness allowance:

(*a*) *Deputy Managers :* Rs. 125, provided the pay plus dearness allowance does not exceed Rs. 1,250 per mensem.

(*b*) *Officers Grade I :* 20% of pay upto pay of Rs. 500 and thereafter at 16-2/3% with a maximum of Rs. 125, with marginal adjustments where necessary.

(*c*) *Officers Grade II :* 20% of pay with a maximum of Rs. 100.

(iv) An *ad hoc* allowance of 10% of pay with a maximum of Rs. 100 per month payable upto 31-3-65.

(B) **QUALIFICATIONS:**

(i) **Deputy Managers and Officers Grade I:**

Applicants should have high academic qualifications—preferably a first class Master's degree or a Doctorate with proficiency in one or more of the following subjects—or should be members of the Institute of Chartered Accountants of India :

(*a*) Investment
(*b*) Banking
(*c*) Accountancy
(*d*) Cost Accounts
(*e*) Company Taxation
(*f*) Company Law and Management
(*g*) Corporate Finance
(*h*) Industrial Economics
(*i*) Techno-economic Surveys
(*j*) Statistics and Econometrics
(*k*) Marketing Economics
(*l*) Economic Planning

For posts of Deputy Manager preference will be given to applicants who have had practical experience and/or have done research work in the above fields and who have worked in banks or institutions financing industrial units or in industrial units in a responsible position for at least 5 years.

(ii) **Officers Grade II:**

Applicants should have a good academic record, preferably a first class Master's degree in Economics or Commerce or Statistics ; weightage will be given to specialisation in subjects like Banking, Industrial Economics, Industrial Finance, Accountancy, Company Taxation, Company Law and Management.

(C) **AGE LIMITS AS ON 1st NOVEMBER 1964:**

(i) *Deputy Managers :* Candidates should be between 30 and 40 years of age but the age limit may be relaxed in the case of candidates possessing exceptional qualifications.

(ii) *Officers Grade I :* Candidates should not ordinarily be over 35 years of age but the age limit may be relaxed in the case of candidates with exceptional qualifications.

(iii) *Officers Grade II :* Between 21 and 27 years. The maximum age limit is relaxable but not beyond 32 years in the case of :—

(*a*) candidates possessing special qualifications

(*b*) candidates belonging to the Scheduled Castes or Scheduled Tribes.

2. Candidates who wish to apply for more than one category of posts must submit separate applications accompanied by separate application fees and should clearly indicate the post and the department for which they have applied.

3. Applicants for the above posts must remit with their applications a fee of Rs. 7.50 for each post by cheque or bank draft on a *Scheduled Bank* payable at Bombay or by Postal Order. *The application fee is in no case refundable.* In the case of candidates belonging to Scheduled Castes/Tribes, the fee will be Rs. 2 for application for each post.

4. Applications in the candidate's own handwriting in the prescribed forms obtainable from the Industrial Development Bank's Office at Bombay, accompanied by copies (originals should *not* be sent) of certificates regarding age and educational qualifications, statements of marks secured in the graduate and post-graduate degree examinations and copies of two testimonials should be forwarded to the General Manager, Industrial Development Bank of India, Post Bag No. 10042, Bombay-1, so as to reach him on or before the 14th November 1964. Requests for supply of forms through post should be accompanied by a self-addressed and stamped envelope of size 9" × 4".

5. Candidates already in service will be required to produce a proper discharge certificate from their employers at the time of their appointment in the Bank's service.

6. Candidates belonging to Scheduled Castes/Scheduled Tribes should mention this fact prominently in their applications and also enclose a copy of the certificate to that effect from competent authority.

7. Appointments will be subject to candidates being found medically fit for service in the Bank by the Bank's Medical Officer.

8. If any candidate desires to have his application acknowledged, he should send it by "Registered Post—Acknowledgement Due." Apart from those who may be specially called, interviews will not be granted to candidates nor will the Bank enter into correspondence with them.

9. Candidates called for interview will be reimbursed single return railway/bus fares by the shortest route from their place of residence to Bombay, applicants for posts of Officers Grade II being paid II Class fares and those for higher posts, I Class fares.

10. Canvassing in any form will be regarded as disqualification.

THE MYSORE SPINNING AND MANUFACTURING COMPANY LIMITED

NOTICE

NOTICE IS HEREBY GIVEN THAT THE Seventy-first Annual General Meeting of the Company will be held at the Registered Office of the Company, Temple Bar Building, 70, Forbes Street, Fort, Bombay, on Friday, the 30th October, 1964 at 4.00 p.m. to transact the following business:

1. To receive and adopt the Directors' Report and the Audited Statements of Accounts for the year ended 29th February, 1964.
2. To declare a dividend on Preference Shares.
3. To elect Directors.
4. To appoint Auditors for the current year and to fix their remuneration.

By Order of the Board,
N. SIRUR & COMPANY PRIVATE LTD.,
Managing Agents,
N. D. SIRUR,
Managing Director.

BOMBAY: *17th September,* 1964.

Notes:—(1) A MEMBER ENTITLED TO ATTEND AND VOTE AT THE MEETING IS ENTITLED TO APPOINT A PROXY TO ATTEND AND VOTE INSTEAD OF HIMSELF AND A PROXY NEED NOT BE A MEMBER.

(2) Pursuant to the provisions of Article 84 of the Company's Articles of Association, the holders of Preference Shares of the Company have no right to be present or to vote, either in person or by proxy, in respect of their holdings of such Preference Shares at the above Annual General Meeting.

(4) The dividend on Preference Shares when declared will be made payable at the State Bank of India, Bombay, on and after 6th November, 1964, to those Shareholders whose names stand on the Register of Members on the 14th October, 1964. The Dividend Warrants will be made collectable at par at all Branches and Sub-Offices of the State Bank of India, in India.

(5) The Registrar of Companies, Maharashtra, has, pursuant to the provisions of second proviso to Section 166 (1) of the Companies Act 1956 (as amended), granted to the Company two months' extension of time upto 31st October, 1964 for holding the Annual General Meeting.

(6) Detailed Notice is being posted to the Shareholders individually.

COMMERCE AND INDUSTRY

(*Concluded from page* 697)

these areas include, among others, a glass factory, a paint factory, textile mills, fertiliser unit, sewing machine unit, bicycle plant, air conditioning plant, automobile plant and asbestos cement plant. There are also great possibilities for the small industrial units to manufacture items such as pencils, small bulbs, chalk etc.

The African countries are in a position to exchange many basic mineral and agricultural items with India for the capital goods. India could profitably import minerals, such as rock phosphate, raw cotton, metal and metallic ores (copper, lead, asbestos etc.), agricultural items (palm oil, olive oil, cocoa, cashewnut) and hides and skins from the African countries and thereby provide an opportunity for these countries to import more Indian goods. As part of promoting trade with countries, such as Morocco, Tunisia, Nigeria, Zanzibar, Ethiopia, Ghana, Mozambique and others, it is suggested that India could enter into bilateral trade agreements with them. At present, India has trade agreements with only Morocco, U.A.R. and Tunisia. Other suggested steps to promote trade include visit of delegations, participation in exhibitions organised in these countries, opening of export promotion council offices abroad and commercial representations. Much work has been done in this direction, but much more is called for.

Shipping Facilities

Lack of shipping facilities is a serious hurdle in promoting trade with Africa. The only regular services operating with East and West Africa are some foreign lines. Some of the shipping companies (B.I.S.N.) not only fail to meet India's requirements but also do not carry certain types of Indian cargo. No direct lines exist with Mauritius or Madagascar; goods have to be transhipped at Djibouti and Mombasa. Transhipment is thus a common feature in India's trade with many countries in Africa. In order to overcome these difficulties, it is suggested that a new Indo-African service round the Continent should be started. Starting from Bombay it could touch Djibouti (Somalia), Mombasa, Dar-es-Salaam (Tanganyika), Tamatave (Madagascar), Mauritius, Matadi (Congo), Doula (Cameroons), Lagos, Free Town (Sierra Leone), Dakar (Senegal), Casablanca (Morocco), Algiers (Algeria), Tunis (Tunisia), Port Said (U.A.R.) and Port Sudan (Sudan). Such a line could facilitate the industrialisation of these areas. The Paper has emphasised that it would be worthwhile for the Government to examine this matter and help in promoting India's trade with the African countries.

U.S. FOOD ASSISTANCE TO INDIA

As agreement for the supply of four million tons of wheat, 300,000 tons of rice and 75,000 tons of soyabean oil under the U.S. Food for Peace Programme was signed recently at New Delhi. Two other agreements were also signed. One agreement provides for a loan to the Government of India for economic development projects, the bulk of the rupees resulting from the sale of the commodities provided under the U.S. Public Law 480. The loan is repayable within 40 years at interest rate of ¾ per cent. Under a similar agreement, a sum of Rs. 16.6 crores accruing under an earlier 1962 P.L.480 sales agreement will be given as a loan to the Government of India.

NEWS IN BRIEF

THE Central Wage Board for the iron and steel industry is expected to submit its report some time in December next.

The various schemes for the development of animal husbandry included in the third Plan have been fully implemented, according to the finding of a survey by the Indian Council of Agriculture Research.

The Exports Advisory Committee for handicrafts has approved a target of Rs. 41 crores for handicrafts export by the end of the fourth Plan. The actual exports in 1965-66 are estimated at Rs. 32.5 crores.

A scheme for the economic and efficient production and distribution of consumer gas in Bombay City will be prepared by a team of French technicians for the Bombay Municipal Corporation. The team is expected to arrive shortly.

The Central Sales Tax Act will come into effect in the Union territory of Goa, Diu and Daman on the 1st of next month. Under this Act, every dealer in these areas will be liable to pay tax on all sales effected by him in the coarse of inter-State trade of commerce.

The Central Government has given the letter of guarantee to the DM 7-million loan which West Germany has agreed to make available to the Mysore Iron and Steel Works at Bhadravati, to convert the steelworks into a factory producing wholly special steel. About 22 varieties of special steel are to be produced and the final capacity would be 70,000 tons annually.

A Committee, headed by Mr. A. C. Mitra, Consulting Engineer, Uttar Pradesh, has been constituted by the Union Government to suggest a comprehensive plan for the control of floods in the rich deltaic areas of the Godavari, Krishna and Guntur district of Andhra Pradesh. The Committee will also recommend measures for lowering the flood level of Killeru lake improving the drainage system in the area and preventing floods inundation.

The Joint Board of Mining Engineering Education and Training has set up a committee with the Director of the Manpower Directorate to make a realistic assessment of the demand for mining engineers in the remaining years of the current Plan, as well as in the Fourth Plan period. It will suggest measures for striking a balance between demand for and the supply of mining engineers.

A survey of all the existing primary cooperative societies in the country is proposed to be conducted in order to find out their potentiality for development. A decision to this effect was taken at the Conference of Registrars of Cooperative Societies held recently at New Delhi. The Conference suggested that the moribund and inactive societies should be liquidated, that the potentially viable societies be strengthened and that weak societies be amalgamated.

An agreement for the avoidance of double taxation between India and France has just been concluded at Paris between the Governments of the two countries. One of the provisions in the agreement provides for the grant of a credit for the tax paid in the other country, as also for the tax spared in India for developing its industry. Corporations will be taxed only in the country of their incorporation.

The Union Government has decided to establish two institutes in the country, one in the South with Soviet collaboration and the other in the North with American collaboration, to impart specialised training to the personnel required for large thermal power plants. It has been tentatively proposed to run a six-monthly theoretical instructions course illustrated by suitable models for imparting training to a batch of 32 students at a time. The theoretical course is intended to be followed by field training for six months on a power plant under construction and six months in the operation and maintenance of large size power plants already installed in the country.

* * * *

From Abroad

The Government of Indonesia has so far taken over 104 British and 27 Dutch plantations, most of them being rubber estates.

A nuclear energy power plant to be operated jointly by France and Spain using natural uranium for fuel will be set up at Catalonia in Spain.

Malaysia will have uniform banking legislation by the end of the year, according to Mr. Tan Sieu Sin, the Finance Minister. A Bill is to be introduced in Parliament next month. The law will put all banks under the single authority of the Central Bank of Malaysia.

The Soviet Union has developed folding plastic tanks which can be fitted into specially-built dry cargo ships for transport of oil. After discharge, the tanks can be removed and rolled mechanically, leaving the holds ready for any other cargo without being cleaned.

Canada has repaid a further $50 million out of the $300-million loan obtained from the International Monetary Fund, the outstanding debt is now put at $57.2 million. The loan of $300 million was made in 1962 when Canada was facing a foreign exchange crisis.

Pan American Airways carried the largest tonnage on a flight from San Francisco to transpacific points. The Boeing 707-321C carried 94,644 lbs., including machinery, machine parts, chemicals, military impedimenta, and automobile and tractor parts. The previous record for an all-cargo jet aircraft was 92,375 lbs. carried by a Douglas DC8F from Chicago to the Far East.

Pakistan is expecting a record crop of 60 million lbs. of tea in the coming year, according to the Tea Board of Pakistan. The increase is attributed to the extension of the area under cultivation which is expected to be around 90,000 acres next year. Under the third Plan (1965-70), the area will increase by 28,500 acres to a total of 118,500 acres. Actual production of tea in 1963-64 was 55 million lbs.

New and stricter foreign exchange regulations are proposed to be introduced in Argentina shortly. One of the regulations lays down that approval from the Central Bank must be obtained for all foreign exchange purchases not covered by specific exemptions. Exemptions apply to goods imported under a documentary letter of credit and to "habitual transactions."

The International Finance Corporation is making its first investment amounting to $2.5 million in Ethiopia. In conjunction with Japanese interests, it is helping to finance a major expansion and modernisation programme by the Cotton Company of Ethiopia S.C. I.F.C. is making an equity investment by subscribing to Eth.$2.5 million (equivalent to $1 million) worth of shares of the company and is providing a loan of $1.5 million. The remainder of the capital requirements amounting to $2.9 million being provided by the Export-Import Bank of Japan and two major Japanese companies, Fuji Spinning Company Ltd. and Marubeni-Iida Company Ltd. The two firms last year jointly acquired a substantial interest in the Cotton Company of Ethiopia. The I.F.C. investment in Ethiopia brings to six the number of African countries in whose development it is taking part.

PERSONAL

MR. S. K. Nargundkar, General Manager of the Singareni Collieries, has assumed charge as the Managing Director of the Company.

Mr. Kantikumar R. Podar, a Director of the Podar group of concerns, has been elected President of the All-India Plastics Manufacturers' Association for the year 1964-65.

Mr. Irving S. Friedman, Director since 1950 of the Exchange Restrictions Department of the International Monetary Fund, has been appointed Economic Adviser to Mr. George D. Woods, President of the World Bank.

Mr. Edward L. Robinson, Chief of the Cambodian service of the Voice of America, has assumed charge as Information Officer at the U.S. Information Service at Bombay, succeeding Mr. William J. Miller.

Mr. P. N. Nayer, Director of Weights and Measures, Union Ministry of Commerce, left on the 7th inst. to take over as Chairman of a Committee which has been set up by the East African Common Services Organisation to examine the feasibility of adopting the metric system.

Mr. R. E. Marsh, Head of the Asian Department of the Federation of British Industries, is now in India on a five-week tour of the country. Mr. Marsh is interested in examining the possibility of spreading any further Kipping Aid to industries which at present do not qualify for this aid.

Mr. Donald Rhind, Adviser on Agricultural Research to Britain's Department of Technical Co-operation, who is on a nine-week tour of Asian countries, arrived in New Delhi on Wednesday this week. Mr. Rhind will spend nearly a month in northern India. He will have talks with agriculturists at universities and research institutes in Delhi, Rudrapur (U.P.), Jodhpur, Allahabad, Patna, Calcutta and Cuttack.

SOLOMON'S WISDOM IS YOURS

Solomon's ships sailed regularly to the region that is now Kerala, laden with gold and silver to buy fabulous spices. ■ That wise monarch was known to appreciate only the very best things in life. If he were around today, he most certainly would barter his glory for the excellent products, from soaps to ceramics, being manufactured by Government-owned Industries in Kerala. ■ You, too, show the Wisdom of Solomon when you choose goods from Kerala—Because you know of the emphasis placed on quality control by Government-owned Industries.

TREND OF MARKETS

MONEY DEARER

(From Our Own Correspondent)

BOMBAY, 13*th October*

The short-term money market continued to rule tight during the week under review. Demand for credit was quite heavy. No doubt the supply of funds available was large and the borrowers did not find it difficult to obtain their requirements. But they had to pay slightly higher rates of interest. The inter-bank call rate for renewals moved up further from 1¾ to 2½ per cent. Fresh money fetched 2½ per cent, as against 2¼ per cent a week ago.

There was no sale of Treasury Bills under the usual tender system during the week ended 9th October. However, sales of Intermediate Treasury Bills, which were on sale from the 7th to 10th inst., amounted to Rs. 1.74 crore, as against Rs. 5.75 crores a week before and Rs. 13.35 crores two weeks before.

The total credit made available by scheduled banks to their clients rose by Rs. 9.48 crores to Rs. 1,714.18 crores during the week ended 2nd October 1964. At the same time, their deposits declined by Rs. 6.76 crores to Rs. 2,697.07 crores. Even so, borrowings from the Reserve Bank were negligible, being no more than Rs. 65.05 lakhs, a drop of Rs. 24.90 lakhs. Investments increased by Rs. 15.63 crores to Rs. 830.53 crores, while total cash receded by Rs. 8.64 crores to Rs. 155.84 crores.

The Gilt-edged market depicted an easy trend, thanks to poor buying support. Among Central loans, 4 per cent 1969 encountered selling and dropped 15 paise to Rs. 99.35. 4½ per cent 1973 shed 5 paise to Rs. 100. Among State loans, 4 per cent 1967 Maharashtra and 4½ per cent 1976 West Bengal fell by 35 paise each to Rs. 99.30 and Rs. 99.40, respectively. 4 per cent 1969 Gujarat declined by 15 paise to Rs. 98.40. 4½ per cent 1974 Madras eased by a like amount to Rs. 98.35. 4 per cent West Bengal lost 5 paise to Rs. 98.75.

In the foreign exchange market, the banks' buying and selling rate for dollars were unaltered at Rs. 477.50 and Rs. 481 per $100, respectively. In New York, the pound sterling was irregular *vis-a-vis* the dollar. The spot rate went up by 0.040 cent to 278.320-278.370 cents, but the three months' forward eased by 0.010 cents to 277.790-277.820 cents.

RECOVERY IN BULLION

(From Our Own Correspondent)

BOMBAY, 13*th October*

The bullion market ruled distinctly easy in the earlier sessions of the week under review owing to poor inquiries from local dealers. The market, however, picked up strength yesterday (Monday), following fall in arrivals and scattered support at lower levels. Consequently, prices staged a recovery. The recovery gathered momentum today. Over the week, gold was lower, while silver was a shade better. With the inflationary pressures still strong and the busy season in the offing, traders were inclined to feel that the prices would be steady around these rates for a few weeks.

Fourteen-carat gold began the week at Rs. 69, as against the previous close of Rs. 69.75, and moved down to Rs. 67. However, it improved to finish at Rs. 67.25 today. Pure gold, in private trading, declined from Rs. 116 to Rs. 111.50, before closing at Rs. 113 on reports of seizure of contraband gold worth Rs. 5 lakhs. In sympathy, sovereign was quoted lower at Rs. 91.

Silver receded from Rs. 256 to Rs. 254 on Saturday in the wake of increased arrivals. Subsequently, it moved up on upcountry purchases and closed better at Rs. 256.50. The weekly average arrivals and offtake of silver were 28 and 9 bars, respectively.

The international price for gold in the London market was slightly lower at $35.10½, as against $35.10¾ last week. The sterling price shed ¾d. to 252s. 2¾d. But forward silver was higher on speculative demand at 113d. Ready silver remained unchanged at 112½d. as also silver in New York at 129.3 cents.

The Bombay High Court upheld last week the constitutional validity of the Gold Control Rules while rejecting a writ petition filed by some traders.

The following table shows the trend of prices during the week under review:

	13-10-64 (closing)	High	Low	7-10-64 (closing)
SILVER	Rs.	Rs.	Rs.	Rs.
Ready (996 fine) ..	256.50	256.50	254.00	256.00
GOLD				
Ready (14-carat) ..	67.25	69.00	67.00	69.75
Sovereign	91.00*	—	—	92.00*
London—				
Gold ..	252s. 2¼d.	252s. 3¼d.	252s. 2¼d.	252s. 3¼d.
Silver Ready ..	112¼d.	—	—	112¼d.
Silver Forward ..	113d.	—	—	112¾d.
New York—				
Silver	129.3 cents	—	—	129.3 cents

N.B.—The quotation for gold is per 10 grams (about 0.85 tola) and that for silver is per kilogram (85.73 tolas). London and New York quotations are per ounce. * Unofficial rate.

COTTON FUTURES RISE

(From Our Own Correspondent)

BOMBAY, 13*th October*

Despite reports of favourable weather in almost all the cotton producing tracts, cotton futures registered a rise during the week under review. The rise followed sustained bull support induced by rumours that India will not be indenting for the balance of P.L. 480 cotton from the United States in the immediate future. Better spot advices also imparted strength to the futures. After declining slightly today on account of profit-realising at higher levels, cotton futures rallied again towards the close on reports about damage to crops in the Punjab because of certain crop disease and inclement weather in Berar and Khandesh areas.

The Jarilla March 1965 contract opened the week higher by 50 paise at Rs. 726.50 and after an initial decline to Rs. 725.25 on the first day itself, that is, the 8th inst., went up to Rs. 731.50 on Monday, the 12th inst. It drifted down to Rs. 728.25 on the last day before closing higher at Rs. 729.

In the spot market at Sewri, mill enquiry for both old and new cotton crop was reported. Interest was evinced in old crop Digvijay, Co2, L.147 at lower levels. Stray business in new crop Kalyan and Digvijay was also reported, but the mills in general were not prepared to enter into sizable commitments, in view of the prevailing uncertainty about the multipliers for fixing the prices of the controlled varieties of mill cloth. Following are the latest available quotations of certain popuar varieties:

Amaravati Rs. 1,161, Bijapur Rs. 1,000, Bengal Fine Rs. 742 (December delivery), Hubli Jaydhar Rs. 1,027, Hubli Laxmi Rs. 1,100, Jagadia Rs. 1,071, Kopargaon Co.2 Rs. 1,310, Navapura Rs. 1,137 and Mudhol Jaydhar Rs. 1,030.

In the foreign section, Bengal *deshi* registered a rise from Rs. 732 to Rs. 742 due mainly to the damage to crops in the Punjab. The latest indications put the export sales registrations at 55,386 bales as against 53,400 bales last week. It is reported that, in spite of the abolition of export duty on this variety a few days ago, it is not eliciting large overseas enquiries.

As regards imports, the mill demand is concentrated chiefly on East African varieties. In the absence of Egyptian cotton, Sudan cotton is attracting attention. After the recent auction at Kampala when the prices of African cottons registered increases, mills have turned their interest to the current crop, prices of which are said to be lower.

The current season cotton crop is reported to be progressing quite satisfactorily in general. Accumulation of stocks, it will be remembered, has been posing a problem to cotton growers in certain areas. The cotton growers and cooperative societies in Gujarat are understood to have pressed the Textile Commissioner to release a special export quota so as to resolve the problem of accumulated stocks. But the market is doubtful whether, even after the Government allows such an export quota, the difficulties of growers will be obviated, because more depends on the response from overseas buyers. The experience of Bengal *Deshi* has sufficiently shown, it is said, that overseas demand is not very encouraging. Pakistan cotton presents a touch competition to this country, as its cotton is cheaper than the Indian cotton by over Rs. 100 per candy.

KIPS STEADY

(From Our Own Correspondent)

MADRAS, 10*th October*

Kip market remained steady to firm, as prices in the raw centres were hardened due to purchases by the chrome tanners at high prices. Export demand was selective, with emphasis on lower grades of cowhides in light weights, run and fourths selections in cowcalf and run in buffcalf; but the importers were not willing to follow the prices quoted by the shippers; with the result that shipment trading was difficult and the volume sold was not large.

There was not much change in the tempo of trading in goat skins section. There was good demand for light weight goat skins, especially for lower selections and 11/12 lbs. average, and prices hardened slightly. Sellers of 8/9 lbs. were reserved, despite the fact that slightly increased prices were obtainable. There were steady inquiries for middle class sheep skins 6/7 lbs. all selections from the Continent. Prime class ruled steady, without much business passing; and semi-prime sheep was weak.

Shipments during September were as follows:—3,401 tanned cowhides, 274 cowcalf, 20 buffhides, 341 buffcalf, 650 goat skins and 515 sheep skins to U.K.; 825 goat skins, 290 sheep skins and 1,284 pickled and chrome goat skins to the Continent; 1 cowcalf, 10 buffhides, 5 buffcalf, 436 goat skins and 75 cases pickled and chrome goat skins to U.S.A.; and 6 goat skins and 192 sheep skins to Japan.

FORWARD TRADING IN STAPLE FIBRE YARN

(From Our Own Correspondent)

BOMBAY, 13*th October*

By the time this report appears in print, forward trading in staple fibre yarn will have commenced under the auspices of the Bombay Yarn Merchants Association and Exchange Ltd. It will be inaugurated at 10 a.m. on Friday, the 16th inst., by the Governor of Maharashtra Forward contracts in staple fibre yarn for 17 Nf and 2/34 Nf for both January and March 1965 deliveries will be resumed simultaneously. The terms and conditions of the contracts are as follows: Goods of 100 per cent viscose staple fibre yarn manufactured by the mills of India of standard count, standard test, double cross reeled, double hanks bright and bleached and in original packing will be tenderable; in the contract of 17 Nf staple fibre yarn the goods with a minimum C.S.P. (count strength product) of 800 (French) or 1,600 (English) with 5 per cent variation with count between 16·50 Nf to 18 Nf will be tenderable; similarly, in contract of 2/34 Nf staple fibre yarn, the goods with a minimum C.S.P. of 850 (French) or 1,700 (English) with 5 per cent variation with count between 2/33 Nf to 2/36 Nf will be tenderable.

A trading member will have to pay an initial deposit of Rs. 2,500 against which 100 bales will be allowed free without any margin. Over 100 bales a margin of Rs. 50 per bale will have to be paid. The limit for weekly fluctuations has been fixed at Rs. 20. The unit of trading would be of 5 bales of 100 kgs. each and the unit for price quotation at the exchange will be of 100 kgs.

Those who want to tender the goods in delivery will have to obtain a Certificate about the tenderability of the goods from the Survey Certificate Committee at least three days prior to the tender and a provision has also been made for making an appeal against the Certificate issued by the Survey Certificate Committee either to the Victoria Jubilee Technical Institute or Silk and Art Silk Mills Research Association.

Art silk yarns ruled distinctly easy during the week under review, following persistent selling pressure from stockists. Increased arrivals of low-priced goods following large deliveries by spinners also acted as a damper. In sympathy with art silk yarns and on slack offtake from Surat traders staple fibre yarns also ruled easy. Except for some limited fluctuations in selected counts cotton yarns ruled dull.

Among art silk yarns, National Rayon 150D fell by 18 paise to Rs. 9.90. 120D came down by 33 paise to Rs. 10.45. Bright century 75D shed 2 paise to Rs. 18.02.

Staple fibre yarn (2 x 34 French Count) Vasanta lost 4 paise to Rs. 8.98. Sitalaxmi eased by 7 paise to Rs. 9.42. Sriram declined by 8 paise to Rs. 8.98. Century and Kohinoor were neglected at Rs. 9.61 and Rs. 9.81, respectively.

In the cotton yarn section, 8s Podar receded by 50 paise to Rs. 20.75. 17s Modern dropped Re. 1.50 to Rs. 27. 68s Finlay decreased by a rupee to Rs. 105.

The following table gives the prices of rayon staple fibre and cotton yarns, today, as compared with those prevailing a week ago:

	13-10-1964	7-10-1964
Art silk yarn (per kg.)—	Rs.	Rs.
National Rayon 120D	10·45	10.78
Century 75D	18·02	18.04
S.I. Viscose 120D	12·65	12.65
Staple fibre yarn-34 x 2 *French Count* (per kg.)		
Kohinoor	9·81	9.81
Premier	9·55	9.55
City	—	9.39
Cotton yarn - French Count (Rs. per 5 kg.)		
8s Podar	20·75	21.00
17s Modern	26·00	26.00
22s Madura	32·00	32.00
34s Madura	43·00	43.00
52s Pioneer	68·75	68.75
68s Finlay	105·00	106.00

OILSEEDS MOVE DOWN

(From Our Own Correspondent)

BOMBAY, 13*th October*

There were no fresh developments during the week under review which could influence the oilseeds market in any definite direction. Price movements in groundnuts January were narrow, but this was natural, in view of the fact that the weekly rise has been limited to Rs. 2.40 on the starting rate of the week. However, the contract did react sharply to news early in the week that the Union Government has suggested to the Gujarat Government to withdraw its ban on exports from the State groundnuts and groundnut oil. The news had induced a reaction in the futures contract, but reports came later that the Chief Minister of Gujarat had denied the possibility of any removal of the ban until December. The reports helped the market to look up and, in fact, the market was very firm in initial dealings on Tuesday, although the contract reacted subsequently due to profit-taking. The January contract, which had touched Rs. 97 during the week, closed lower at Rs. 95.75 today. Arrivals during the week consisted mostly of seeds from Karnatak. Spot goods of Karnatak variety was mentioned at the close on Tuesday at Rs. 66. October delivery was very firm, at Rs. 59 and November at Rs. 51. Oils maintained a steady tone, with ready at Rs. 29.50, October at Rs. 24.85 November at Rs. 19.90/20.30 and December at Rs. 19.10. It was said that arrivals from Karnatak would take another week or ten days to gain full momentum.

Groundnut extractions maintained an easy tone with ready goods done at Rs. 415-Rs. 417 per tonne, 15th November position at Rs. 406-Rs. 407, whole November at Rs. 400. The rate in Saurashtra was reported to be Rs. 395 for whole November and Rs. 385 for December. Expellers were also quiet, the spot rate being Rs. 473 and November Rs. 435. The export section was rather dull; the United Kingdom was the only country being in the market. Communist countries which had been buying on a fairly large scale during the past many months are currently out of the market. Latest U.K. advices were: £36-7-6 for December shipments and £35/15 for January-March shipments. The outlook for groundnut extractions is easy, as with the export section being dull and solvent extractions plants going into production, the supply is likely to exceed demand.

Sentiment in castorseeds early in the week was induced by reports that Russia had bought about 5,000 tonnes of oil from Brazil and, although the market staged a sharp rally later, the tendency towards the close was easy, mainly in sympathy with the trend in groundnuts. Spot rates indicated a quiet tone. Linseeds and oilseeds were dull, the business put through being restricted.

The following table shows the closing prices of oilseeds and oils as on 13th October as compared with those of the two previous weeks:

	13-10-1964	7-10-1964	29-9-1964
Groundnuts	Rs.	Rs.	Rs.
January 1965 contract	95.75	95.70	..
Oil January 1965	19.20	18.50	..
Misam bold	N.T.	N.T.	66.00
Khandesh quality	133.00	136.00	68.00
Oil ex-mill	28.75	31.00	29.00
Oil Ry. Receipt	27.75	30.00	27.50
Castorseed			
March 1965	184.37	185.12	183.25
Ready Madras	83.00	84.00	40.75
Ready Kanpur	80.50	82.00	40.00
Oil S.S.S.	18.85	19.20	18.80
Oil commercial	17.85	18.30	17.80
Linseed			
March 1965..	40.44	40.56	40.44
Bold ready	102.50	103.00	52.25
Linseed oil	21.50	21.50	22.00
Cottonseed			
January 1965 contract	101.25	102.50	102.25

N.B.—The quotation for groundnuts January 1965 contract is for 100 kg. The rates for spot groundnut and castor for the week ending 7th & 14th Oct., are for 100 kg. while so far they had been quoted per 80 kg. Castor and cottonseeds futures are quoted per 250 kg. while linseeds futures are quoted per 50 kg. Groundnut Oil January 1965 and all spot oils are quoted per 10 kg.

TIPPY TEAS STRONG

[Messrs. Forbes, Ewart and Figgis (Private) Ltd.]

COCHIN, 9*th October*

A total of 744,000 kgs. was offered in tea sale No. 40 held here on the 8th instant. Nilgiri quality was again inferior, but from other districts an improvement was generally seen. Demand was good, but less active than seen last week. Best highgrowns were sold readily, but lesser types were more difficult to sell, and prices eased following quality. Good medium and medium brokens were well supported and prices showed considerable advances, but fannings in this category were irregular. Low mediums opened on an easier note, but strengthened as the sale progressed. Whole leaf grades came to an irregular market. There was good enquiry for C.T.C. brokens which were dearer but their fannings shed several paise. Tippy teas were strongly competed for, at dearer rates.

The quotations (per kg.) were:

	1964
Low mediums ...	[illegible]-4.60
Mediums ...	[illegible]-5.20
Good mediums ...	[illegible].20-5.70
Nilgiri B.O.P. ...	5.20.-8.00

The average price realised in sale No. 40 was Rs. 4.87 per kilo, as against Rs. 4.74 a week ago and Rs. 4.71 in the corresponding sale last year.

In dust sale No. 39 held today, 310,000 kgs. were offered. The market opened to good general demand which continued throughout the sale. Medium categories were well supported and prices for these were firm with buyers showing more interest for cleaner types. There was useful demand for highgrowns at lower rates than last. Clean black grainy descriptions met less demand than of late and were easier by 20 to 30 paise. Stalky and poorer kinds sold at irregular rates and were mostly easier. Unorthodox descriptions came to a firm market.

The average price realised in dust sale No. 39 was Rs. 4.37 a kilo, as against Rs. 4.42 a week ago and Rs. 4.46 in the corresponding sale last year.

As we go to press, Messrs. Forbes, Ewart and Figgis (Private) Ltd. wire:

"Sale No. 41: 730,000 kgs. offered. Strong demand. Low mediums and mediums irregularly 10 P to 15 P. Good medium stronger. Highgrowns slightly easier. Unorthodox steady."

TEAS WELL SUPPORTED

(From Our Own Correspondent)

CALCUTTA, 12*th October*

In the export sale of last week, leaf offerings aggregated 68,513 packages, which met with a good general demand. Competition was in evidence in C.T.C. teas, the selected bright liquorings of which was appreciated in value. Plain C.T.C. teas met with firm support, with B.P. teas being much in the forefront as compared to their corresponding fannings. Assam orthodox teas recorded a small recession, with the B.P. teas meeting with good support. Fannings were quiet. Other orthodox teas were firm with Dooars B.O.P. teas realising slightly higher rates. Fannings of this category were, however, lower. Whole leaf grades were shown keen attention by bidders. Darjeelings, following quality, were firm. The quotations per kg. inclusive of excise duty were: good Assam C.T.C. fannings Rs. 6.60 to Rs. 7.00, good Assam C.T.C. B.P. Rs 6.60 to Rs. 6.90, medium C.T.C. fannings Rs. 5.70 to Rs. 6.30, clean plain pekoe Rs. 5.20 to Rs. 5.50, plain C.T.C. B.P. Rs. 5.10 to Rs. 5.40, medium C.T.C. B.P. Rs. 5.70 to Rs. 6.30, plain C.T.C. fannings Rs. 4.80 to Rs. 5.10, plain orthodox fannings Rs. 4.20 to Rs. 4.40, and plain orthodox B.P. Rs. 4.10 to Rs. 4.30.

Prices in last week's internal sale eased following a decline in demand. Dusts on offer totalled 34,547 packages. Plain orthodox teas were irregular. Medium Assam teas eased by 30 p. Leggcut teas also suffered a loss. Excepting the smaller lines, which met with better support, all other C.T.C. teas receded. The quotations per kg. inclusive of excise duty were: good Assam C.T.C. dust Rs. 6.10 to Rs. 6.40, medium C.T.C. dust Rs. 5.20 to Rs. 5.90, plain C.T.C. dust Rs. 4.90 to Rs. 5.10, legg-cut dust Rs. 4.90 to Rs. 5.20, medium Assam dust Rs. 4.80 to Rs. 5.20, and plain orthodox dust Rs. 4.20 to Rs. 4.60.

Tax reduction and loans on easier terms are considered essential if the tea industry is to be enabled for expansion so as to fulfil the increased production targets. This conclusion has been reached by the Tea Finance Committee in its meeting held here last week.

If a steady expansion to tea acreage is to be realised, investments should be made more attractive by enabling the industry to improve return on equity capital. This can be done only by tax relief, as this will also permit the industry to plough back an increased proportion of profits to development and expansion. The Tea Finance Committee has found that in addition to tax relief, banks and agencies such as the Agricultural Finance Corporation should be able to provide loans on easier terms. That special assistance to the tea industry is required becomes evident inasmuch as it has been estimated that a sum of Rs. 38.4 crores is required to bring an additional area of 24,000 acres under tea cultivation on the basis of Rs. 4,000 per acre. Wherever there is not much scope for expansion such as in South Indian gardens, the Committee feels intensive cultivation should be resorted to by increased usage of fertilisers. The Committee is scheduled to meet again in the next month, when its recommendations will take final shape.

JUTE GOODS IN KEEN DEMAND

(From Our Own Correspondent)

CALCUTTA, 12*th October*

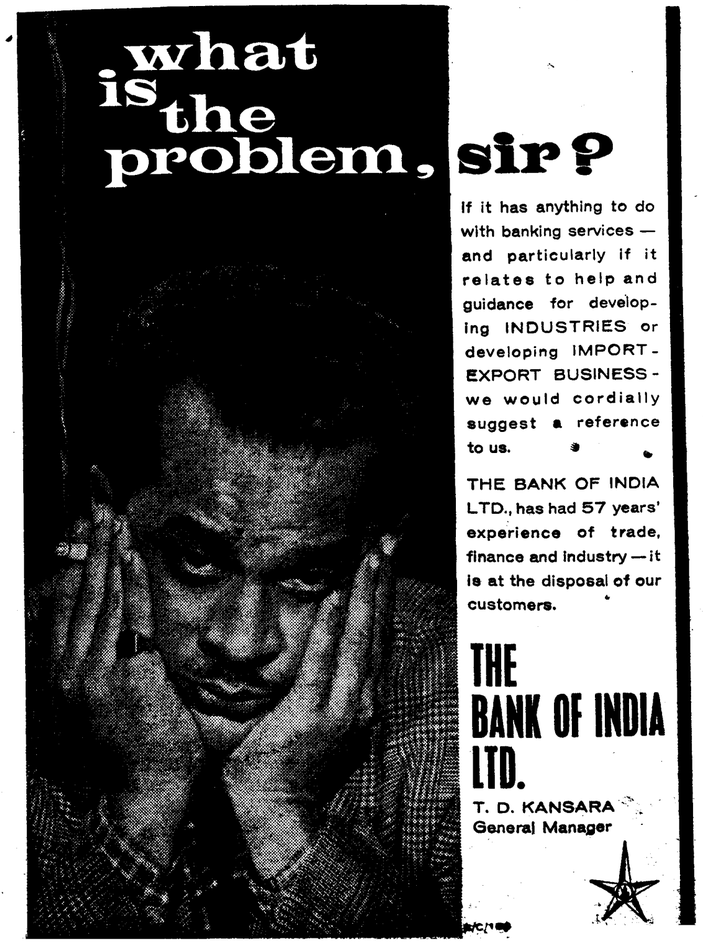
The news of a sizable decline in stock of goods with mills, followed by good offtake by overseas countries, led to substantial gains in the prices of goods during the week under review. At the same time, fibre prices eased by Re. 1 to 50 paise per maund, as a result of increased arrivals and the keenness exhibited by sellers to rivals and the keenness expectations that the U.S. buyers. There were expectations that the U.S. buyers would soon show interest for larger quantities of hessian, since inventories had sharply fallen and burlap consumption has picked up. In the New York burlap market, 7½ oz. hessian increased from 9.50 cents a yard to 9.55 cents, and the 10 oz. hessian, from 12.50 cents a yard to 12.55 cents. As regards heavy goods, now that Pakistani mills are not able to accept any more orders from overseas countries, interest in Calcutta sacking was very much lively this week. Australia placed an order for 15,000 bales of woolpacks and cornsacks. Egyptian orders placed by that country's trade mission amounted to more than 45,000 bales. Sudan also took a good quantity of miscellaneous constructions. The U.S.S.R. showed interest in both near and ready delivery goods. At the same time, the Government of India continued to show interest in B. twills.

The interest in the goods market was followed by the reports of a sizable fall in stocks of goods with mills as at the end of the last month. At 126,300 tonnes, the stock of all constructions fell by 6,100 tonnes. While sacking and miscellaneous goods at 43,700 and 11,000 tonnes, respectively, declined by 6,200 and 2,500 tonnes, hessian and carpet backing cloth rose by 1,900 and 700 tonnes to 47,600 and 24,000 tonnes, respectively. That the sizable decline in the stock of heavy goods followed good demand for this construction from overseas countries went to confirm the belief that Pakistani mills are fully booked.

The East India Jute and Hessian Exchange Association has proposed amending the by-laws relating to trading on transferable specific delivery contracts in raw jute and jute goods. The first amendment proposes defining the "margin" as being the amount of money payable as a deposit by a member or non-member if his net open position at the end of a working day in respect of his outstanding transactions in T.S.D. contracts in raw jute and/or jute goods is in excess of the free limits. The second amendment makes a new by-law which authorises a member to demand from a non-member client any margin money concerning outstanding contracts which the former has to deposit with the Exchange. If the non-member fails to meet the demand within a stipulated time, the concerned member becomes free to square up his outstanding contracts with the non-member on the trading day following the expiry of the time limit at the then prevailing rate. The third amendment also makes a new by-law to stipulate that no member shall trade in raw jute and jute goods either on his own account or on account of any other member with a person who is not registered with the Association except in accordance with the procedure laid down by the Association's Board with the prior approval of the Forward Markets Commission. The Association has now invited suggestions on these proposed amendments.

As a result of increased arrivals and sellers' anxiety to lessen their holdings, fibre prices fell slightly during the week under review. Assam bottoms were quoted at Rs. 38.00, northern bottoms at Rs. 37.00, and daisee bottoms Rs. 38.50 per maund as against Rs. 38.50, Rs. 37.50, and Rs. 39.50 per maund earlier in the week.

Jute goods rose in the week as a result of the improved statistical position and the keen interest shown by overseas buyers. On Tuesday last, prices recorded an erratic movement. At one time, there was the rumour that second-hand bags would be used to pack foodgrains, and this led to heavy loading in the hedge market. As a result, ready B. twills at Rs. 148.50 were quiet, and in sympathy, ready hessian 40" 10 oz. was also



quiet at Rs. 49.85. However, on Wednesday, the hedge market became active, and this coupled with covering demand helped ready B. twills to recover to Rs. 150.40 and ready hessian 40" 10 oz. to Rs. 50.40. This was followed by the announcement of the improvement in the statistical position of goods, and soon B. twills spurted to Rs. 152.50. In sympathy, hessian 40" 10 oz. was firmer at Rs. 50.40. This was on Thursday last, and was followed by interest shown in B. twills on behalf of the Government of India and expectations of keener interest in hessian by U.S. buyers. However, the volume of business being inadequate, B. twills eased to Rs. 151.90 and hessian 40" 10 oz. to Rs. 50.35 on Friday. Over the week-end, there was keen speculative interest shown, and as a result ready B. twills and hessian 40" 10 oz. rose to quote the week's highs at Rs. 154.25 and Rs. 51.30 respectively. The market was closed today for the *Pooja* holidays.

FOODGRAINS EASY

(From Our Own Correspondent)

HAPUR, 12*th October*

Prices of all foodgrains turned easy, thanks to increased arrivals of new *kharif* crops of rice and maize in the maket. Consumers demand has shifted from wheat to new grains and prices of wheat eased in absence of buying urge. Due to ban on inter-district movement of *kharif* grains in U.P. prices of some cereals in many district ran down steeply. The U.P. Government consequently entered the grain trade to build up a buffer stock of 2 lakh tons of coarsegrains. The Government would buy paddy grade .III at Rs. 35 *juwar* yellow at Rs. 38.50, *bajra* at Rs. 40.50 and maize at Rs. 36.50 per quintal. Thanks to good sunny weather and westerly winds, preparation of land for *rabi* sowings were in full swing and it was understood that even in most of the waterlogged areas, timely *rabi* sowings would not be possible.

Consumer demand from wheat was diverted to new maize and rice and prices randown by Rs. 5 to Rs. 6.50 per quintal, according to quality. Wheat average quality was quoted between Rs. 92.50 to Rs. 94 and farm produce between Rs. 95 to Rs. 97 per quintal, as against Rs. 47 per quintal for controlled price. Stocks of wheat, however, were poor. Subdued trend was also witnessed in rice market due to heavy arrivals of new crop and prices declined sharply by Rs. 10 to Rs. 12.50 per quintal, according to quality. Week-end prices were: Rice *basmati* superior Rs. 121 to Rs. 123, *sela* 119 to Rs. 120.50, *mainpuri* Rs. 108.77, *ramajwayan* Rs. 104.49, raw Rs. 93.77 to Rs. 96.45, *raimunia* Rs. 103.77 and *gadda* Rs. 93.77 to Rs. 99.13 per quintal.

Gram prices also drifted lower on poor buying support. Prices moved down by Rs. 5 per quintal and were quoted at Rs. 92.50 for local produce and Rs. 90 per qunital for the Punjab quality. New maize prices declined sharply by Rs. 10 to Rs. 12.50 per quintal and ranged between Rs. 57.50 to Rs. 60 per quintal.

CRYSTAL SUGAR SCARCE

(From Our Own Correspondent)

HAPUR, 12*th October*

Crystal sugar in the open market remained steady during the week on restricted supplies in the face of good festival demand. The week-end prices were Rs. 180 to Rs. 182 a quintal. The Centre's new sugar policy is keenly awaited. The U.P. Government has decided to lift restrictions on power crushers, which manufacture *gur* and *khandsari*, in two of the sugar zones in the State. Restrictions would continue in Meerut zone as the cane crop there is not upto expectations due to water logging in west U.P. Sugar mills in the State would begin crushing in early November, and is expected to manufacture more than 14 lakh tons of sugar this year, as against 11 lakh tons last year.

Desi khandsari suffered further losses during the week due to non-receipt of permits against the frozen stocks. Stockists were anxious sellers following the refusal of the State Government to lift the ban on export of *khandsari* to other States. Production of *khandsari* would start in early December. Prices in the open market were:—yellow quality Rs. 110 to Rs. 120 and white creamish quality at Rs. 125 to Rs. 152.50 a quintal.

Arrivals of new *gur* here as well as in mofussil markets were rising, thanks to sunny weather and prevailing high prices of the commodity. The quality offered, however, was poor but, the entire arrivals at an average of 600 maunds daily were being readily lifted to consuming areas of the South. Prices advanced to be quoted upto Rs. 43 per 40 kilogram for best quality, while inferior stuff was quoted from Rs. 26 to Rs. 35 per 40 kilogram.

COPPER SCRAP SUPPLIES TIGHT

(From Our Own Correspondent)

CALCUTTA, 12*th October*

Higher advices from overseas markets led to firmer conditions in the metal market during the week under review. On the London Metal Exchange, although copper gave way, other metals advanced.

Spot tin in London opened at £1,510 and advanced to as high a rate as £1,565. It is now doubted as to whether the price would return to the level prior to the present boom, which started several months ago. This unwelcome inference is drawn inasmuch as the gap between consumption and output is widening. This has naturally led to the habit of building up of stocks among large consumers in several countries. The situation is prevented from developing into an acute crisis by releases from the U.S. stockpiles. The only hope, therefore, of a return to the earlier price level lies either on increased production or on increased releases by the United States. The rapid increase in price, it is reported, is attracting investment in marginal mines in Malaysia. However, it would be some time before production could be substantially increased. Malaysia produced about 60,000 tons in 1963. That this year's output in that country is unlikely to increase is indicated inasmuch as production in the first seven months of this year aggregated only 34,500 tons as against 35,100 tons in the corresponding period of last year. The world shortage is accentuated by the rapid increase in industrial production in several countries, and the reported pronounced tendency in the U.S.S.R. to build-up stocks of tin. In Calcutta, tin was unchanged, but firm at Rs. 3,300 per 100 kgs.

Copper scrap continued to be in tight supply position in Calcutta. The price of utensil copper scrap was firm at Rs. 660 per 100 kgs. L.M.E. quotations for copper could not be maintained at higher levels due to profit-taking. Spot copper wire-bars eased from £5475-476 to £457-460. Spot cathodes from £430-435 to £425-435, and spot fire-refined copper from £400-410 to £375-380 but over the week-end rose to £472-474, £430-432½ and £390-400 respectively. Spot zins at £119-119½ was slightly higher compared with the earlier level of £118¾-119, while spot lead eased from £119½-119¾ to £119-1/8-119½. In Calcutta, zinc rose from Rs. 365 to Rs. 373, and lead was maintained at Rs. 312 per 100 kgs.

MONTHLY ECONOMIC REVIEW OF U.K.

(Concluded from page 680)

months, June-August, the average was £349,000,000, compared with £360,000,000 in the previous three.

The flatness of Britain's exports as shown by the global figures, like the flatness of industrial production as shown by the index, has equally come as a surprise to many leading industrialists and exporters. Important industrial enterprises have reported a continuing growth of the volume of their output directed towards exports and, possibly more significant still, the official statistics of new orders in a number of vital industries—notably the engineering and heavy electrical industries and machine tools—have shown a further growth in the input of new export orders.

The hopeful assessment of the present condition of Britain's economy argues that, for special reason, the recent showing of neither the output index nor the export returns can be treated as fairly indicative. The most actively expanding sectors of industry recently, it is argued, have been the capital goods industries, where the output cycle is a lengthy one, where work in progress may show itself in the index of production only after a considerable time-lag, and where the reflection in export returns may occur only after a still longer lag.

This interpretation is at least not inconsistent with other salient observed facts about the economy, notably the comparative sluggishness of consumer outlays, and especially public spending in the shops. There is certainly no sign that a consumer boom is seriously pre-empting masses of goods that might otherwise have gone for export.

On the other hand, it is far from clear whether the expansion that has occurred in imports can be attributed mainly to the expected capital-outlay strains associated with the rising trend of output. Imports rose sharply at the beginning of the year, to a monthly average of £453,000,000 in the first quarter, as compared with £423,000,000 in the final quarter of 1963, and £375, 000,000 in the first quarter of that year. In recent months, there seems to have been a renewed rise, after an interval of stability. The average for June-August was £461,000,000.

Chiefly in consequence of the deterioration in visible trade, the quarterly estimates of the balance of payments as a whole showed a further widening of the deficit on current account in the second quarter of this year. The gap then reached £113,000,000, or substantially more than the largest quarterly deficit recorded in 1960, the last year in which the account went significantly into the red.

The deterioration in Britain's overall "monetary" position—measured by the movement in reserves and new short-term liabilities—was, however, substantially less than these estimates implied : the balance of monetary movements was adverse to the extent of £256,000,000 (£165,000,000 in the second quarter). The difference between the two sets of figures represents a balancing item comprising unidentified receipts—whether in the form of unidentified net current earnings or net borrowings.

Up to the middle of the year, as I showed in my last letter, the deficit on Britain's payments were mainly being financed by the net accumulation of short-term balances in London, but since then, as expected, the pressure has been reflected to some extent in the movement of the reserves of gold and foreign exchange.

Likewise as expected, the British authorities arranged in September new "Basle-type" short-term credit facilities by arrangements with oversea central banks, and some use was made of these and other facilities to offset foreign exchange market pressures, mainly around the middle of the month. The recourse to these facilities during the uncertainties on the eve of the election was consistent, it will be seen, with the principles of policy defined earlier in the year. The big question that has to be answered in the coming months is whether these strains will indeed prove to be non-recurring, and eventually self-reversing. And that, as has been indicated, is a question that cannot be fairly answered from the indices yet available.

It's New

only Firestone could do it!

SUP-R-TUF Miracle Rubber

to give you EXTRA mileage with the most advanced tyre ever built!

Firestone research and development engineers have done it again! They have formulated a new miracle rubber—'SUP-R-TUF'—which gives extra mileage...at no extra cost! And at the same time, comes the NEW DeLuxe Champion tyre, with its perfected tread design for safer motoring. Now, every Firestone passenger tyre is built with SUP-R-TUF rubber to give you extra mileage on any road at any speed. And you get greater safety, because SUP-R-TUF is tougher and has more resistance to punctures, bruises and breaks.

Firestone

NEW DELUXE CHAMPION TYRE

with all this were his attempts to introduce some "heretic" innovations on capitalistic lines. One plan aimed at "incentives," involving (i) a limited, factory-by-factory profit system leading to bonuses as incentives and, consequently, (ii) a far-reaching decentralisation of economic management and controls. Further incentives to collective farmers for boosting agricultural production were not also ruled out.

It would appear that this bid made by Mr. Khrushchev to downgrade heavy industry in a possible long-term plan based on a new consumer-oriented philosophy and to introduce capitalistic methods of "profitability accounting" had caused grave disquiet to the orthodox, pro-heavy industry economists, the munitions-conscious military and the powerful technocrats and managerial-minded men. If it is these elements, with their heavy representation in the Soviet Communist Party's Central Committee, that have forced Mr. Khrushchev to resign, there can be nothing surprising about it. But even they cannot possibly ignore the popularity of Mr. Khrushchev and his consumer-oriented economic policies, the growing complexity of the Soviet economy, the need for imparting dynamism to its agriculture and the increasingly sophisticated demands of the Soviet people. How the new leaders will reconcile the vested interests of the military, technocratic, managerial and bureaucratic classes with the complex pressures of the Soviet economy and demands of the Soviet masses is anybody's guess. As of now, the only thing that is clear is that an era—in several respects a glorious era, with its sputniks and luniks, manned space flights, etc.—has ended in Moscow to the dismay of the Soviet people and the world alike. As Mr. Edward Crankshaw has lamented: "The colour has gone from the Russian scene: when will it come back? The first true politician in the history of Russia, Tsarist or Leninist, has vanished without leaving a ripple on the surface. When shall we get another?" It is difficult for one not to share Mr. Crankshaw's grief over the exit of a heretic (among Communists) whose dynamic impact was not confined to the Russian scene. This country, too, regrets the political oblivion of Mr. Khrushchev who, as our New Delhi correspondent evaluates elsewhere in this issue, had played no mean role in promoting healthy Indo-Soviet relations.

EXTERNAL AID FOR INDIA

ALTHOUGH the Union Cabinet has approved a firm outlay of Rs. 21,500 crores for the fourth Five-year Plan—it will be raised by a further Rs. 1,000 crores if additional resources become available during the first two years—the figure cannot be considered a final one. For the outlay would have to be endorsed by that supreme policy-making body in planning, the National Development Council (N.D.C.), which is due to meet at New Delhi on the 27th and 28th inst. Even supposing the N.D.C. okays the outlay of Rs. 21,500 crores as approved by the Cabinet, much significance need not be attached to it now, in view of the many imponderables that cannot be sized up at present with any degree of accuracy. Mention may be made of two such imponderables. There is, first of all, the highly uncertain international political situation. If this situation becomes tense—"explosive" is the more appropriate term to be used—and if India's relations with Communist China and Pakistan get strained further, all calculations about the resources position are bound to go awry. There is then the price factor. Since the outlay of Rs. 21,500 crores has been worked out in terms of 1963-64 level of prices, which was higher by about 8 per cent, as compared with the previous year, it may not be unreasonable to expect the outlay to be much heavier on account of the persistently rising trend of prices, notwithstanding the Planning Commission's special plea for keeping prices "on an even keel" through emphasis on quick-yielding schemes, price regulatory measures and check on expenditure. To add to these imponderables, there are serious doubts about the ability of the State Governments to mobilise resources. The experience in this regard since the commencement of the first Plan has been rather disappointing. Mr. Asoka Mehta, Deputy Chairman of the Planning Commission, was himself provoked to utter a note of warning when he declared at Srinagar the other day that the implementation of the fourth Plan would receive a setback if the States failed to exploit their resources.

Whatever be the final firm outlay that will ultimately be written into the fourth Plan document, there is no doubt that external assistance will have to be on a much larger scale than that (Rs. 2,500 crores) assumed by planners. Indeed, international aid will continue to hold the key to the entire Indian development effort, as the increasing exports will only have a marginal impact on the foreign exchange problem which is not merely one of financing the huge maintenance and development imports but also one of servicing the external debt (payment of interest and repayment of principal). This aspect has been impressively highlighted in the findings of a special research project on public international development financing in India, undertaken by the Colombia University School of Law, New York. The four causes of stress in the third Plan, which the study has listed, may conceivably apply to the fourth Plan too. The absence of foreign exchange reserves is the first of these. (The total of such reserves, as of today, stands at no more than Rs. 95 crores, excluding the gold holdings of Rs. 118 crores.) The pattern of external assistance—the nature of tying involved and the delays involved at either the Indian or the external end—can cause short-term problems, irrespective of the overall adequacy of the amount of aid offered. The third source of stress pertains to possible failures in achieving superior export performance. (The aggregate fourth Plan export target of Rs. 5,100 crores may not be fulfilled if prices are not held within manageable limits and the importing countries, especially the developing ones, do not buy on a much larger scale than they do at present.) And, finally, there is the old problem of miscalculation arising from inadequate preparation of blueprints, the lack of provision for rising machinery prices abroad, the burden that can be caused by fortuitous factors, and the failure in phasing which may cause short-term spurts in the demand for unplanned imports.

The authors of the research study have certainly done a signal service to India by advocating, in a forceful manner, continued large-scale external assistance for some years to come. Assistance amounting to more than a billion dollars per annum, they say, will be required *for at least another decade* (italics ours) before the inter-relationships among local production, exports and imports will have been strengthened to the point where adequate economic growth can be more self-propelling. Without mincing words, they observe: "If India is to continue to grow even at the modest rate that it has been able to achieve, which still leaves much to be desired considering the very low levels of living of its vast population, the massive aid from the more fortunate countries in a position to provide it will have to continue."

Combined with the forceful plea for continued large-scale external assistance for India is the note of optimism to the effect that such assistance will be forthcoming. It is to be hoped that this optimism will not turn out to be wishful thinking. We say this because of two developments of far-reaching importance that have taken place since the authors of the study completed their work. They are the high-level change in the Kremlin hierarchy, resulting in the exit of Mr. Khrushchev, and the nomination of Mr. Goldwater, an extreme conservative, as the Republican candidate for the U.S. Presidency. Special mention has been made of these two developments, since it is the U.S. and Soviet Russia that have given aid on a substantial scale so far. It is difficult to say whether aid on such a scale will continue to be made available in the coming years also. But it can be said that, irrespective of the changes taking place in Soviet Russia and the U.S., those at the helm of affairs cannot afford to ignore the consideration that continued contribution to the development of India is desirable from the point of view of its political stability and genuine neutrality.

It is not the quantum of aid alone that is important, for the terms of aid are equally so. The large increase in loans to India, according to the research study, has meant that the burden of their servicing has moved up from three per cent of the country's export proceeds in the first Plan period (1951-56) to 12-13 per cent at the present time in the middle of the third Plan. Even with softer terms of loans given by the U.S. and the International Development Association, in the considered opinion of the authors, it will not be until the late sixties that there will be an easing of the service burden. "The Indian case, more than any other," to quote them, "has drawn attention to the need for lenient repayment terms in international assistance programmes, if they are to be large enough to have an impact on development." It is in this context that the authors emphasise the need for the grant of capital aid on an untied basis both with respect to the country of expenditure and with reference to specific projects and programmes.

In tying assistance to specific projects and programmes, some donor countries are, of course, prompted partly by the anxiety to avoid misuse of funds. But there is no cause for such anxiety in so far as India is concerned. For India has always taken special care to see that the assistance obtained from the friendly countries abroad is not squandered on unnecessary imports. That there is no exaggeration whatever in this statement is clearly borne out by the findings of the study. Here is the relevant extract from the report:

"While it is recognised that the granting of aid for specific projects releases resources in the recipient country for other, perhaps less desirable, uses, and that the tying of aid to projects cannot assure development unless there is control over all investment and economic policies, there is a feeling that at least the desirable specific projects are being carried out when aid is tied to projects. This is perhaps less compelling a consideration in the case of India than in other countries, in view of its respected public administration, development planning techniques, and general economic policies. There is no feeling, for example, in the case of India that foreign exchange will be squandered on unnecessary imports or that it will be used to shore up a negative balance of payments position caused by internal inflationary policies. Although there may be differences in view between donor countries and India on specific elements of its Five-year Plans, there is satisfaction with the general nature of its development effort and confidence that general foreign exchange provided will be used to promote development. The very definition of aid requirements in relation to comprehensive national economic plans contributes to that confidence."

While the external aid secured by India has not been misused, it must be pointed out that such aid has not been utilised as effectively as one would have wished, with the result that considerable amounts of money authorised for several projects long ago continue to remain unspent. Despite the sophisticated nature of economic planning and public administration in India, there are many problems remaining to be solved in the more effective and more rapid utilisation of aid committed to the country. The authors of the study have done well to make special reference to some of these problems. The sheer size and complexity of the programme, according to them, make it a difficult one to administer. The difficulties are most pronounced in the portion of aid which is tied to specific investment projects. It is obviously much easier to administer commodity aid programmes which are simply a matter of organising distribution mechanisms. Lags in the utilisation of specific project commitments aggravate the scarcity of foreign exchange and delay the favourable effects hoped for on the balance of international payments. There are inadequacies in pre-investment studies, in the budgeting of foreign exchange requirements, in maintaining targets during the execution of projects, and in the coordination of the activities of all the official agencies and dependencies that may be involved.

The aforesaid problems must be attributed largely to the deficiencies in administration and execution. Appropriately enough, the authors of the study have urged the need for focussing "massive attention" on the correction of such deficiencies. A specific solution offered by them pertains to the organisation of an efficient public service. They observe:

"India, like other developing countries, needs a public service trained in, or at least aware of, the mainfold problems of management, accounting and other aspects of business. This is important not only for the conduct of public enterprises, such as India's policy owned steel mills, but also for the many complex and vital planning decisions. They often involve cooperation with foreign and international public institutions, as well as private investors. Precisely because so many vital economic decisions must, in a country like India, be a matter of public rather than private decision, foreign assistance in the training of a public service that has a practical as well as a theoretical understanding of the conduct of business is likely to pay dividends out of all proportion to the financial investment involved."

The need for a public service of the type described above is certainly urgent in all conscience. It is, however, difficult to endorse, without reservation, the finding of the authors that direct control of enterprises and vital administrative controls are indispensable. That overall regulation and control, going with integrated planning, is necessary, especially in a scarcity economy like India's, will be generally conceded. But, in several spheres, there are controls which are absolutely unnecessary. In fact, these controls are so vexatious that they are greatly hampering the pace of growth. Such controls must be eliminated in the interest of speedier economic development.

MARKET GOSSIP

Cess On Textiles

SKY seems to be the limit for tax imposts on the textile industries! As if the series of direct and indirect taxes heaped on these industries are not sufficient, Mr. Manubhai Shah, Union Minister for Commerce, has proposed the imposition of a special cess on all textiles produced in the country, whether made wholly or partly of cotton, wool, silk, art silk, or staple fibre. Addressing the second meeting of the Textiles Committee held in the City on Wednesday this week, Mr. Shah wanted the Committee to collect a small fee on all textiles produced. The proceeds of such a cess, he said, would provide sufficient money to the Committee not only to meet its running expenditure but also for setting apart a portion towards a building fund to enable the Committee to have its own building in Bombay for housing both its administrative offices and its laboratories, etc. The Committee accepted the suggestion of the Minister and constituted a sub-committee to fix the rate of fee.

The imposition of the proposed cess, however small it may be, will doubtless add further to the prices of textiles for consumers. One wonders whether the Government of India cannot give a grant to the Committee for meeting its expenses. The levy of the cess will, however, be justified if the Committee utilises it properly for ensuring standard quality of textiles for internal markets and export purposes.

Cloth Multipliers

Cotton mill circles are keenly disappointed over the new multipliers which, in their opinion, would result in a reduction of prices to uneconomic levels. Sweeping changes have been made in the final schedule as compared with the tentative schedule issued a few days ago. The grey realisation multipliers for coarse and lower medium cloth, which were too low, have remained unchanged, while a reduction ranging from 4 to 4½ per cent has been made in counts of 30s onwards, delivering a drastic blow to these categories as well. The restrictions placed on combing allowance for Indian cotton, it is feared, will greatly discourage the industry's attempts to upgrade Indian cotton; and this will inevitably bring about a deterioration in quality which is most undesirable. The processing charges have been cut down mercilessly and this is considered to be another factor militating against production of quality goods. The Indian Cotton Mills' Federation, it will be recalled, had expressed the fear that any unwarranted reduction in the multipliers would be detrimental to the consumer interests, inasmuch as the apparent gain to the consumer would be more than wiped out by the resulting fall in production. To this has to be added the new fear of a shortage of quality goods.

New 3-Paise Coins

A new coin in the denomination of 3 paise has been issued from all offices of the Reserve Bank of India from the first of this month and from all agency banks of the Reserve Bank of India and all Government treasuries and sub-treasuries. The metal composition of this new coin is aluminium with 3.5 to 4.0 per cent magnesium. The coin is hexagonal in shape with rounded corners and its weight is 1.25 grams. A look at this coin provokes a number of questions.

First, what is the justification for discarding the heavier cupro-nickel alloy in favour of the lighter alumino-magnesium alloy? If the answer is that the elimination of copper saves some fore'gn exchange for the country, the gain is not worth having, considering that the present 3-paise coin is lighter than the 2-paise cupro-nickel coin—so light that it can be blown off in the air like a small piece of cardboard. Secondly, is the intrinsic value of the 3-paise coin (that is, the value of its metallic content), including its cost of minting, substantially less than its face value? If that is so, the economy that is sought to be achieved is a false kind of economy. Such economy is not worth having, for the people at large, finding the coin flimsy and cheap, may begin to think poorly of the Government and its coinage. Thirdly, have the Government's technical experts given adequate thought to the stability and strength of the new coin, and considered whether it would be corrosion-resistant and colour-consistent? Of course, the public will come to know the answer to this question in due course. But in the meantime, the Government would do well to clarify the position, so that the public may be sure that there would be no general departure from the policy of cupro-nickel coinage in all its present denominations.

Private Sector And Fourth Plan

In a mixed economy—which has been accepted as the best system for the economic development of underdeveloped countries—the role assigned to the private sector can be no less important than that of the public sector. India's mixed economy, for instance, has assigned equally important roles to both the sectors. As these roles are complementary in many ways, there is need for greater cooperation and understanding between the two sectors. This need is all the greater now, for the country is facing many hurdles to its economic growth. Most of these hurdles are not new and the economy is not likely to be free from them for a considerable period of time. But it should be possible to mitigate the severity of these problems not only through the adoption of appropriate fiscal policies by the Government but also through cooperation between the public and private sectors.

It is in this context that the views expressed by Mr. K. P. Goenka, President of the Federation of Indian Chambers of Commerce and Industry, at an informal meeting of the Committee of the Indian Merchants' Chamber at Bombay on the 19th instant may strike one as eminently constructive. Mr. Goenka was emphatic that the private sector should at all times play "a definite and constructive role in economic development despite the fact that our views may not receive, at the hands of the authorities, the kind of quick response, as we should like them to receive."

This does not mean that the Government would be justified in turning a deaf ear to the views of the private sector. The private sector is going to be assigned an important role in the fourth Plan too, and, unless the Government keeps the investment market in good shape so as to attract public support for new issues, it may be difficult for the private sector to fulfil the targets laid down for it. In this connection, Mr. Goenka has done well to caution the Government that its taxation should not be allowed to grow and outstrip the rate and yield of investment.

Foodgrains: Prices And Production

The foodgrain prices fixed last week by the Government of India have had a mixed reception in trade circles. The ceiling prices are generally considered fair to the producers, for they would provide them with sufficient incentives to increase production. The same cannot, however, be said about the margins allowed to millers (in case of rice), wholesalers and retailers, considering the expenses to be incurred by way of railway freight, labour, storage, interest on capital, etc. After meeting all these charges, almost nothing will be left to the traders and they will have no encouragement to play their legitimate part in the distribution of foodgrains. It is said that, when the emergency was declared, the wholesalers had agreed to a margin of 1½ per cent, not on a rational basis but purely as a gesture of goodwill for a short time. The President and General Secretary of the All-Punjab Food Grain Dealers' Association have suggested, in this connection, that the margin may be increased, in the case of wholesalers, from 1½-2 per cent to 4-6 per cent and, in the case of retailers, from 4-7 per cent to 6-8 per cent. Though these figures may be somewhat on the high side, there is certainly a case for raising the margins to some extent, so as to provide more fully for overhead and other charges. After all, any such increase will have only a marginal effect on the consumers' prices.

There is very small gap between the minimum and maximum prices fixed by the Government. Though it may be argued that this narrow gap will stabilise the prices throughout the year, the implications of this stability should also be kept in view. If the prices are almost the same throughout the year, the cultivator will have no temptation for holding on to his produce and most or all of the marketable surplus will come to the market at harvest time. The trader, being allowed only a subsistence margin but not any higher prices for storing the goods, will not be in a position to hold stocks because of high storage and interest charges. And it is doubtful whether the Government, too, will be in a position to purchase and store all the residual stocks at harvest time.

It may, incidentally, be pointed out that the main purpose of fixing the producers' prices at a higher level is to provide an incentive for increasing production. But the other factors, such as timely and adequate supply of fertilisers, irrigation facilities, better seeds, pesticides, credit and improved implements have a greater impact on production. Some 10 million tons of foodgrains (one-eighth of the country's production), it has been estimated, are destroyed every year due to damage by pests and disease. If adequate insecticides and storage facilities are made available, it may be possible to reduce the damage by at least 50 per cent and the additional availability of five million tons of foodgrains will obviate the need for annual imports of that order. Moreover, whereas 24 million acres of land are afflicted with waterlogging nad salinity duc to rising sub-soil water-tables and 120 million acres are subject to erosion, no effective steps are being taken to save all this land from possible permanent damage. The food problem has thus become more a matter of inefficient organisation than of anything else.

This factor of inefficient organisation is equally conspicuous in the Government's distribution machinery. For example, while Mr. C. Subramaniam stated recently that Madras State had enough stocks to carry it through till December this year, even in October, that State has begun to feel the pinch. Madras City, in particular, has been passing through an acute crisis on the food front in recent weeks. The foodgrain dealers can in no case be held responsible for this situation, for the extensive controls in that city debar them from making any substantial direct purchases and the responsibility of maintaining the supplies to retailers now rests with the Government. With this prevalent inefficiency in the Government's food distribution machinery, there is no reason to believe that the introduction of food rationing or cooperative marketing (as suggested by some people) would improve the situation appreciably. Though there may be some black sheep among the foodgrain dealers, by and large, their long-established distribution machinery seems to be the best suited for the task. It is, therefore, necessary to enlist their cooperation in foodgrains distribution.

Rayon Industry

Modernisation of the rayon and synthetic textiles industry is the need of the hour, especially in view of the rising domestic demand and the emphasis on export-orientation for earning foreign exchange. The old and obsolete machinery and equipment must be urgently replaced if the industry is to be brought on the road of rapid growth for meeting the home needs and for facing keen competition in overseas markets. At present, the industry is contributing ten per cent of the total textile output in the country and it is expected that its share may well cover about one-fourth of the total production of textiles during the fourth and fifth Plan periods. The proportion of exports to output is about 20 per cent now, but, in view of its expected role in the economy and the vast markets for man-made fibre fabrics the world over, this performance is far from satisfactory. It was, therefore, most appropriate that Mr. Manubhai Shah, Union Minister for Commerce, while addressing a special meeting of the Silk and Rayon Textiles Export Promotion Council held at Bombay on the 21st instant, should have underlined the need for equipping the industry with up-to-date machinery so as to ensure the production and export of quality goods. Characterising man-made fibre as the 'fibre of the future,' Mr. Shah said that the industry was a middle-class industry which had to be well-planned, scientifically developed and harmoniously balanced, so that it could eventually lead to the establishment of more and more processors, small-scale handlooms and powerlooms. He exhorted the producers to be quality-conscious and urged that any assistance given for export promotion should be used by the industry to produce better fabrics, particularly fabrics which cater for selective buyers abroad.

Announcing a proposal of the Government of India to link export assistance to import of machinery, Mr. Shah said that, in the case of the man-made fibre fabrics industry, 20 per cent of the import entitlement should be compulsorily surrendered (against cash compensation) to the Silk and Rayon Textiles Export Promotion Council to be used for the purpose of rehabilitation and modernisation. The percentage of assistance surrendered to the Council, he said, could be increased or decreased depending on circumstances, but he made it clear that the scheme would be given effect to on a permanent basis at least for about seven years. He also desired that the representatives of the industry and financial institutions like the Export Credit and Guarantee Corporation should meet under the chairmanship of the Textile Commissioner to find out how best the machinery requirements of the industry could be met either through hire purchase or otherwise. Given proper cooperation from all interests, the proposal of the Government can certainly be implemented with success.

World Bullion

There has been a spurt in world gold price of late. The dollar price of gold in the London market, which was standing at $35.06¾ an ounce on 26th August last, rose to touch $35.12¾ on the 15th of this month, the highest level since the Cuban crisis two years ago, though it has since then declined slightly to $35.11¾. The spurt in gold price has followed good buying support induced by short-term purchases to cover the General Election in Britain and the imminence of the U.S. Presidential election. Political uncertainties in England and the U.S., together with the situation in Vietnam, have given rise to a persistently good hoarding demand for gold in the last few weeks. It is difficult to say whether the recent upward trend of gold prices will persist in the coming weeks, as the repercussions of the recent changes in the Soviet Union have yet to be felt. Soviet Russia, it may be noted here, sells gold in the world markets now and then.

Along with gold, silver, too, has tended to move up, thanks to speculation about scarcity and price rises. Even the U.S. Treasury's attempt to sell silver freely in New York and peg its market price at the monetary value of 129.3 cents a fine ounce, it is stated, has not helped to curb the speculative demand for silver. Senator Wallace Bennett has forecast that the Treasury's present stock of 1,300 million ounces may last for four more years only, as silver certificates are redeemed. Alluding to this forecast, Mr. Stanley Wilson, in the course of an article appearing in the *Journal of Commerce*, New York, fears that the stock will be exhausted earlier if the Administration decides to use a part of its supply as a permanent defence stockpile. In the long run, according to Mr. Stanley Wilson, a silver shortage will possibly again catch up with the U.S. and the world, as reserves are eaten up. The U.S. has only 16 years production of silver left in the ground—in known reserves.

In order to overcome an acute shortage of silver in the near future, some experts suggest a partial withdrawal of the metal for coinage purposes by the Treasury. Indeed, it is reported that the Treasury is actually considering proposals designed to conserve silver stock with a view to frustrating market speculators who have been bidding up silver futures. The Treasury has already given effect to its decision to replace the present silver coins with others containing little or no silver. Such replacement would lead to the melting of old coins and releasing the supply for industrial uses. The industrial use of silver, in

TREND OF SHARES

TWO-WAY MOVEMENTS

(From Our Own Correspondent)

BOMBAY, 22*nd October*

TRADING pattern on the stock exchange during the week was more or less identical with that in the past week—two-way movements on alternate spells of stale bull liquidation and short-covering with a tendency for prices to ease on balance. Gains, if any, have been more in the nature of an exception than a rule. However, the quantum of losses during the week was not much, but then it must be borne in mind that, in a market which has been declining continuously for six weeks, the scope for a further sharp decline can, after all, be slender. The main point is that there is nothing to suggest that the reactionary trend has by any means ended, for the market is devoid of strength.

It is, therefore, natural that those who were looking forward for the market to recover should be disappointed. Although bears are cautious and are waiting for clear signals to press short sales in a big way, bull operators worth the name have almost disappeared from the market. And it is unlikely that any fresh bulls would be forthcoming in the foreseeable future particularly after the despondent note struck by the Prime Minister with regard to the implications of the atomic tests by China and the worsening food situation at home. It is good that the Prime Minister did not mince words. The food problem is really going to give the Government and the country some very anxious moments. The exit of Mr. Khrushchev from the Soviet political scene did unnerve the market, although the new regime lost no time in assuring that Soviet policy towards India would remain unchanged. Added to this has been the assurance from President Johnson that the United States would come to India's help should there be any serious threat from China. Yet these factors have not been able to embolden the bulls into building up long positions. Bulls may very much like to enter the market again, although they have burned their fingers. But they do not seem to be sure that the general public would follow them. By themselves professional bulls cannot help sustained improvement.

A look at the list shows that steel shares closed the week on a barely steady note with Tata Ordinary at Rs. 147 and Indian Iron at Rs. 25.05. Mukand Iron closed a shade easier at Rs. 16.84. Interest in steel shares was again of a professional nature, for the factors have been fully discounted to enthuse the public. Textile shares were erratic and closings showed a mixed pattern. Century was much in the limelight and moved up from Rs. 607.50 to Rs. 615.50, but Standard lost seven points to Rs. 612. Svadeshi was steady at Rs. 262.50, while Bombay Dyeing and Kohinoor were fractionally easier at Rs. 58 and Rs. 316.50, respectively.

A notable feature of trading during the week, however, was the hectic activity in National Rayon and the spurt in its quotation. It appeared that the scrip was in the hands of a strong bull syndicate. Today, the shares touched their highest level of the week at Rs. 373. Despite a slight reaction at the close to Rs. 369, the shares were still 14 points above their last week's level. In this connection, it must be recalled that the shares were difficult to sell at Rs. 344 only ten days ago, but, today, it was difficult to buy them at Rs. 373. Yet, they are much below their 21st August level of Rs. 393 (kerb). The recent cut in the excise duty on rayon yarn did help boost sentiment in these shares and, as the concession is fully in line with the suggestion put forth by spinners themselves, the general belief is that spinners must benefit as a result of the cut. The latest announcement by the Union Minister for Commerce, Mr. Manubhai Shah, that those exporters who did not choose to import machinery against 20 per cent of the incentives might have it in the form of cash compensation was well received by the market. The overall feeling, therefore, is that rayon shares should in general benefit from these changes. Other rayons were better in sympathy, but the rise in these was small. Baroda moved up from Rs. 68.50 to Rs. 70.50 and Indian Rayon was fractionally better at Rs. 61. Century was also firm as indicated above and the strength of National Rayon has much to do with the rise in Century.

The miscellaneous section was generally dull and prices, wherever changed, showed a tendency more for a fall than for a rise. Telco was down from Rs. 262.50 to Rs. 260.75 and Voltas from Rs. 265.50 to Rs. 264. Interest in these shares have faded, but Larsen and Toubro, among engineerings, was better at Rs. 21.56, as against Rs. 21.40 in the previous week. There was very little of activity in electricity shares and the rise in the Bank rate has by now been fully discounted. Revival of activity has to await fresh developments and it is not known whether there are any in the offing. Prices were fractionally easy with Power at Rs. 1,285, Hydro at Rs. 128 and Andhra Valley at Rs. 1,246.25. Shippings were erratic with Scindia easy at Rs. 15.88, while Great Eastern was a shade better at Rs. 12.56. Scindia is reported to have made it known that 18 per cent of the recent dividend of Re. 1.25 is free from tax under Sections 85 and 101 of the Income-tax Act. The net dividend, therefore, is Re. 1.04. Chemicals were sluggish with Tata Chemicals fractionally better at Rs. 19.28. Citric was steady at Rs. 78, but Synthetics lost two points to be quoted at Rs. 75. Among Sugars, Belapur was one point down to Rs. 223, but Maharashtra was unchanged at Rs. 140. Tyre shares were dull, though prices were comparatively well maintained with Premier at Rs. 79. Automobile shares were weak with Hindustan Motor at Rs. 17.44 and Premier Auto at Rs. 103. Cash shares continued to be dull and among those that came in for trading were SLM (at Rs. 148), Lynx and Associated Bearing.

Knowledgeable sources say that the market will find it difficult to make any headway unless there is a distinct improvement in political as well as economic factors. Rallies there will be, but they will more or less be in the nature of technical corrections, particularly in view of the fact that the decline has been continuous and steep over the last six weeks or so. These sources say that the market is now looking forward to the Budget and will pick up strength if it contains any stimulants. But then the Budget is still a far cry.

* * * *

The Calcutta market remained closed for *Puja*. The volume of business in Madras remained poor at the time of writing. However, selected shares were in demand. Plantings were dull but Periakaramalai, Thamarapally, Highlands and Nonsuch were mentioned. Among sugars, Cauvery was active and among textiles, South India Viscose were done at Rs. 115. Bangalore Woollen was better and there was demand for Krishnarajendra. Mysore cements were steadier, but India Cements and Mettur Chemicals were quiet. Indian Overseas was among those that were traded in the banking section and, among insurances, United India Fire attracted inquiry.

U.S. LOANS TO SEVEN INDIAN FIRMS

The United States Government has extended credits aggregating nearly Rs. 2 crores ($4.2 million) to seven Indian firms, all of which have American equity participation. The firms receiving the loans are Sylvania and Laxman Ltd. (Rs. 50 lakhs); the Shama Forge Co. Ltd. (Rs. 47.5 lakhs); Napco Bevel Gear of India Ltd. (Rs. 40 lakhs); American Universal Electric (India) Ltd. (Rs. 21 lakhs); Rockwell India Ltd. Rs. 16.9 lakhs); Indabrator Ltd. (Rs. 14.3 lakhs), and the Otis Elevator Co. India) Ltd. (Rs. 10 lakhs).

These loans are being extended to the firms under the Cooley Amendment to United States Public Law 480. Under P.L. 480—of which India is the largest beneficiary—a number of developing nations receive U.S. agricultural products, and pay for them in their own currencies. A small portion of the proceeds of these sales is reserved for the Cooley loans to private enterprises—primarily indigenous firms affiliated with U.S. firms.

The credits will help increase the production of fluorescent and mercury-vapour lights, steel forgings, gears, electric motors, power tools, air-blast cleaning equipment, and lifts and escalators. By manufacturing in India products several of which are currently imported, considerable foreign exchange will be saved. In some instances, part of the output will be exported, earning additional foreign currency.

INVESTMENT CORPORATION OF INDIA LTD.

The Investment Corporation of India Ltd. has earned a record profit (before taxation) of Rs. 30.83 lakhs during the year ended 30th June 1964, as against Rs. 21.81 lakhs in the previous year. The provision for taxation is Rs. 9 lakhs (Rs. 8.12 lakhs for 1963). The net profit has improved by Rs. 8.14 lakhs to Rs. 21.83 lakhs. The Directors have transferred Rs. 1.00 lakh (*nil*) to general reserve and Rs. 2.69 lakhs (*nil*) to general reserve 'A' being the amount of foreign dividends. Reserve for gratuity gets Rs. 50,000. The amount transferred to the dividend reserve is Rs. 17.50 lakhs, as against Rs. 15.00 lakhs. The Directors have increased the ordinary dividend from Rs. 7.50 to Rs. 8.50 per share. The preference as well as ordinary dividends (subject to tax) absorb a total of Rs. 17.62 lakhs (Rs. 14.84 lakhs) which will be paid out of the dividend reserve. A sum of Rs. 15,484 is being carried forward as against the Rs. 1,228 brought in. The net dividend earned on shares and on securities during the year was Rs. 29.71 lakhs, as against Rs. 22.69 lakhs in the previous year.

HINDUSTAN LEVER LTD.

The Directors of Hindustan Lever Ltd. have announced an interim dividend of 6 per cent or 60 paise per share, subject to deduction of tax, for the year ending 31st December 1964; it is payable on the 19th November 1964. The transfer books of the Company will remain closed from 6th to 18th November 1964 (both days inclusive).

MARKET GOSSIP

(Concluded from previous page)

the U.S., is currently of the order of 112 million ounces as against 110 million ounces in 1962. The real solution to the problem of silver shortage in the U.S., however, lies in higher production. It is with a view to ensuring such higher production that the Interior Department has recently increased the rate of subsidy from 50 to 75 per cent of the prospector's costs.

Swedish Tax Reform

Some very interesting findings have recently been given by the Swedish Committee on Taxation Policy which was constituted in 1960 with the task of examining the distribution of the tax burden. Though the revenues of the Swedish Government have risen four times and social welfare contributions increased more than tenfold during the period 1948-63, it has not been considered possible to obtain any appreciable increase of revenue by means of steeper tax graduation. As an increasing number of income earners are affected by tax graduation and the Government needs more and more income, the traditional argument against indirect taxes—that the comparatively greater burden of these taxes falls on the lower income groups—is now thought to be less relevant.

Bearing these considerations in mind, the Committee has suggested an overhauling of the taxation system in Sweden. The combined effect of its recommendations is expected to bring about a redistribution of the tax burden towards lower direct taxes and higher indirect taxes and social welfare contributions. In the light of the Committee's estimates about incomes, taxes and social contributions in 1970, when the proposed reforms will have been effected, the proposals would mean a reduction of direct taxes, that is, income and property taxes, by 21.5 per cent. In contrast, however, indirect taxes would increase by 40 per cent and social welfare contributions by about 42 per cent. The total rise in revenue would be over six per cent. The Committee has also recommended a raising of the minimum amount for tax purposes in the case of Government capital and property taxes, the maximum rate of tax being left unchanged at 1.8 per cent. It has been proposed that the present old-age pension and health insurance be abolished; instead employers should be asked to contribute these amounts in respect of their employees. In order that the taxes do not increase solely as a result of a deterioration in the value of money, the Committee has recommended that a regulation of tax scales, basic allowances and children's allowances after changes in price level should be introduced.

The most interesting recommendation of the Committee pertains to the levy of a value-added tax which would replace the present system of turnover tax and a number of special indirect taxes, so that the increase in indirect taxation would be effected by an amount which is equivalent to a rise in the turnover tax rate from the present six per cent to 11-12 per cent. The proposed value-added tax would be levied on the value added at every stage of production and distribution. Companies would have to pay tax on their turnover, but they would have the right to deduct from the tax payable by them the tax already paid in earlier stages of production and distribution on goods and services acquired by them. The tax rate proposed is 13 per cent.

While the Swedish Committee has spoken about the merits of value-added taxation, it would be interesting to refer, in this connection, to the views of the British Committee on Turnover Taxation which issued its report in March last. The Committee, which had been appointed to enquire into the practical effects of the introduction of a form of turnover tax, either in addition to existing taxation, or in substitution either for the purchase tax or the profits tax or both, was of the opinion that the balance of argument was clearly against the substitution of a value-added tax for the profits tax. This, the Committee thought, was more likely to harm than benefit the balance of payments and, in turn, would impede growth. The Committee added that those aspects of the value-added tax which it had been claimed would be likely to assist growth and economic efficiency were considered to be "uncertain" and, from the evidence produced, unlikely to have much force. Indeed, the general level of prices would tend to increase, so that a part of the tax burden would be passed on to consumers.

Comparative Statement of Tea Crop and Sales for the nine months ended 30th September, 1964

New 100,000 BSD Idemitsu Refinery, near Tokyo, now in operation.

Mr. Yasushi Matsui, Project Engineer, was chief engineer for the successful construction of Idemitsu Refinery.

ANOTHER
ACHIEVEMENT BY JGC

NEW IDEMITSU REFINERY COMPLETED IN ONLY 8 MONTHS

Schedules like this are easy when the project is under the wing of Japan Gasoline Company's 'Packaged Chemical Plant' concept. It means total responsibility—preliminary planning, cost estimates, engineering, construction and maintenance are in the hands of one responsible management.

Japan Gasoline Company acts as prime contractor, gives you one contact, one contract, one source for any chemical process plant however involved. There are more than one thousand chemical engineering specialists, such as Mr. Matsui, ready to act as your partner. Use their experience. They have played a vital part in 60% of the refineries constructed in Japan since 1945.

Engineering, procurement and construction for: Oil Refineries ● Petrochemical Plants ● Coal Tar Plants ● Gas Chemical Plants ● Fats & Oils Plants ● Fertilizers Plants ● Other Chemical Plants

LABOUR VOTED TO POWER IN U.K.

IN a week climaxed by the dreadful, albeit expected, event of China's atomic-test explosion, the General Election in Britain produced unexpectedly a rather dubious result. Although the 13-year Conservative rule came to an end and the Labour Party, led by Mr. Harold Wilson, was voted to power, the occasion was not such as to cause either excessive jubilation in Labour ranks or profound dismay in Conservative quarters. For, by electing 317 Labourites, 304 Conservatives and nine Liberals to the 630-member House of Commons, the British people gave Labour an extremely thin overall parliamentary majority of four—something smaller than what the last Labour Government had in 1950 in its five-member majority with which it could not manage, even with the best will in the world, to rule for more than 18 months. What is more, Labour's popular vote, too, this time was a minority vote of 44.1 per cent, as against the Conservatives' 43.4 per cent and the Liberals' 11.2 per cent. The inherent difficulties of running the Government without a clear popular majority and a safe working majority in the House of Commons may be better imagined.

But a jubilant Mr. Harold Wilson has already formed the Government in response to the Queen's invitation and assumed the reins of Premiership with quiet confidence. By naming Mr. George Brown Minister for Economic Affairs, Mr. James Callaghan Chancellor of the Exchequer, Mr. Douglas Jay President of the Board of Trade, Mr. Frank Cousins Minister of Technology and Mr. Richard Crossman Minister for Housing, the new Prime Minister has sought to give the impression that, despite Labour's slender majority, Britain will have a strong Government. Whether the Government is strong or weak in terms of its composition, it is doubtful whether it would be able to survive for more than a year without being defeated in a snap vote or even in a formal vote. That no less a person than the chief of the British Trade Union Congress has forecast the probability of a fresh election within a year may be noted in this connection.

It is in this context that the National Government will have to go to the country again at an early date, there is every likelihood of a shrewd and confident leader like Mr. Harold Wilson doing everything in his power to establish, in less than a year, an impressive record of domestic achievement and of solid preparation for future planned development—a record that could have a wider popular appeal and enable Labour to win a bigger parliamentary majority, with a bigger popular majority, in such a re-election. Already Mr. Wilson and his colleagues in the economic ministries are bracing themselves for the task of improving Britain's balance-of-payments position by possible import curbs. There can be no doubt that, in the coming weeks and months, the Wilson Government will take other active steps in furtherance of several popular promises made in Labour's manifesto for a "New Britain." In a sense, therefore, the Labour-Conservative battle is still on and will be finally decided one way or the other only in a fresh election.

CANE PRICE RAISED AGAIN

Whatever be the object behind the so-called incentive scheme for augmenting sugar production announced by the Government of India recently, this much is certain, namely, that the consumers of sugar will have to pay still higher prices in the coming season, due to begin (officially) on the 1st of next month. For the Government has raised, in accordance with the recommendation of the Sen Commission, the minimum price of cane payable by sugar mills by a further 15 paise per maund (on an average) from the level fixed early in March last, which means that the sugar prices also will have to be raised suitably to compensate for the increase in cane prices. The Government has stated that the recommendation of the Sen Commission in regard to ex-factory prices of sugar and other recommendations are being considered and that an announcement on them will be made soon. Meanwhile, it has decided to allow a rebate of 50 per cent in the basic excise duty on all sugar produced during the months of October and November this year in excess of that produced in the corresponding months of last year.

The basic minimum price of sugarcane delivered at the gate of a factory during the season 1964-65 is now fixed at Rs. 2.00 per maund (or Rs. 5.36 per quintal), linked to a recovery of 10.4 per cent or below, with the provision for an increase of 1.48 paise per maund (4 paise per quintal) for every 0.1 per cent rise in recovery above 10.4 per cent. The new price replaces the price of Re. 1.85 per maund (Rs. 4.96 per quintal) fixed for cane with a recovery of 9.4 per cent announced early in March last. Consequently, the sugar mills will have to pay the enhanced basic minimum price of Rs. 2.00 per maund for *all* cane with a recovery of 10.4 per cent or below. In other words, even if the recovery of some cane is, say, 9 per cent or less, for that matter, the sugar mills cannot pay less than Rs. 2.00 per maund. Expressed differently, *all* producers of cane with recovery ranging anywhere between 0.1 per cent and 10.4 per cent will get the same price!

This ludicrous position apart, it is highly doubtful whether, in the absence of any rigorous control on sugarcane distribution, the increase in cane price now effected would ensure for mills adequate cane supplies for maintaining sugar production at a high level so as to cater to the expanding domestic requirements and exports. Cane price, it is common knowledge, is not the only element that influences the flow of cane supplies from the fields to the factories. There is the more powerful element, the level of *gur* and *khandsari* prices. These prices continue to rule pretty high. Naturally, the cane growers will themselves convert the cane into *gur-khandsari* and sell the same at attractive prices, instead of bothering about carrying it to the gates of sugar mills for sale. There will also be keen competition from other *gur-khandsari* producers for the available supply of cane. This has been the experience of the past several seasons, including the current season. The Central and State Governments ought to display political courage and take stringent measures to regulate the production and prices of *gur-khandsari*. Otherwise, the sugar mills will continue to find it difficult to secure cane supplies adequate enough to maintain optimum crushing operations, the increase in the minimum cane price notwithstanding, so that not many mills will be able to avail themselves of the benefit of excise duty rebate.

If, however, the powers-that-be are not prepared, for political reasons, to enforce a regulated scheme of cane distribution, they must take some other measures which would ensure adequate and regular cane supplies to sugar mills. Two specific suggestions made in this connection pertain to demarcation of cane zones for individual sugar factories and partial decontrol of sugar. The chief merit of the scheme of partial decontrol is that it will, while maintaining the distribution of the bulk of the sugar produced through fair-price shops at stipulated prices, help the mills to sell a part of their production at a higher price in the free market and thereby enable them to meet the competition for cane supplies from *gur-khandsari* producers. A similar scheme was implemented during the seasons 1950-51 and 1951-52 and it met with full success, for sugar production, which had declined from 1.1 million tons in 1948-49 to 991,000 tons in 1949-50, spurted to 1.12 million tons in 1950-51 and further to 1.51 million tons in 1951-52. The Government of India will do well to give a trial to the scheme of partial decontrol of sugar. The earlier such a decision is taken the better it will be.

TRANSPORT IN STEEL BELT

The production of coal and iron and steel in India is concentrated mainly in what has come to be known as the Steel Belt, comprising Bengal-Bihar and Orissa-Madhya Pradesh areas. The economic development of the country depends largely on the supply of coal and iron and steel and this region has to supply these goods to diverse industries and other sectors of the economy throughout the country. As transportation is done mainly by railways, almost half of India's total originating traffic is carried by the railways in this region. By the end of the fourth Plan period, the additional annual production of coal in the country is likely to be of the order of 40-50 million tonnes, as compared with the third Plan increase of about 30 million tonnes and most of that extra production will be generated in the Steel Belt. Moreover, all the existing steel plants will be expanded greatly and the proposed Bokaro steel plant will be in the same region. The production of iron and steel is thus expected to be twice the present level and this will result in further concentration of rail transport in the region. It is estimated that, from the present one-half, the region's originating rail traffic will increase to almost two-thirds of the country's total originating rail traffic. Advance planning is, therefore, necessary, if the expected heavy burden on the railways is to be eased.

It is, in this context that the National Council of Applied Economic Research, which has made a study of the transport requirements of the Steel Belt, has recommended that railways' operational efficiency should be improved in all possible ways and that effort should be made to transfer traffic to roadways, inland water transport and coastal shipping. The N.C.A.E.R.'s study has suggested, in this connection, some specific measures too. Some of these relate to adjustments in the freight structure governing the movement of coal and iron and steel, introduction of special freight rates in trainloads and revision of economic railway rates for "smalls." The Council has recommended that the railway freight rates for coal for the longer distance leads, which are at present substantially below the operational costs, may be raised to at least the level of operational costs. This, incidentally, will have the effect of encouraging the use of road transport. Another suggestion is that stock yards for finished goods should be established both at the steel plants and the principal consuming centres. Similarly, coal dumps should be created at the principal consuming centres. Further trasportation from these centres to the consuming points should be entrusted entirely to the roadways. The effect of this measure will be that, whereas a substantial portion of the traffic will be transferred to roadways, it will also ensure movement by full trainloads. As regards industrial materials meant for general consumption, the Council suggests that rail transport in the Steel Belt should be relieved of this burden so that road transport could handle it. There can be no two opinions on the need for encouraging road transport in a big way in the heavily-congested Steel Belt. The N.C.A.E.R. has, therefore, done well to outline some practical suggestions in this regard.

The Council has also referred to the inadequacy of good roads in the Steel Belt and pointed out that very few of the State Governments have attempted to develop roads to relieve the pressure on railways. As road transport has inherent advantages, in terms of real costs to the country as a whole, in so far as the conveyance of consignments of "smalls" for distances upto about 300 miles and of "wagonloads" for distances upto 75 miles is concerned, the expansion and improvement of roads, particularly in the colliery areas, is urgently called for. As regards coastal shipping and inland water transport, the Council feels that these modes of transportation have not been assigned a significant role to meet the transport needs of the region. It may be that coastal shipping will receive a fillip when the Haldia and Paradeep ports begin to function. But it is doubtful whether inland navigation can be developed to the extent desired, for experience to-date in this field is not quite encouraging. The attempt made early in the current Plan period for transporting coal by river and by canal, it will be recalled, was a failure. The Council's suggestion that, in order to cut down the transportation of coal, power should be generated at the pitheads and transmitted to distant areas is, however, a practical one, although there is nothing new about it.

ROAD SAFETY CONGRESS

The number of passenger cars and motor vehicles in use in India is only about 700,000, as against 78 million in the U.S., eight million each in the U.K. and France, seven million in West Germany, six million in Canada, four million in Italy and three million each in Australia and Japan. The traffic problem in India is, therefore, not so acute as in most of the Western countries. Still the large number of road accidents (many of them fatal) every year has become a matter of concern to both pedestrians and drivers, as well as to the traffic control authorities. The public concern is all the greater now, for the number of such vehicles in India, which has almost doubled during the last decade, is expected to rise at a still faster rate during the coming years. Unless proper and adequate steps are taken to improve the traffic conditions in the country, the public will have to face, sooner or later, the very hazards which Europe and the United States are trying to overcome.

In view of this situation, the Federation of Indian Automobile Associations did well in taking the initiative and holding the first All-India Road Safety Congress in Bombay last week for focussing public attention on the complexities of traffic problems. Mr. Himatlal V. Gandhi, who presided over the Congress, pointed out in his address the main reasons for the growth of these complexities. During the decade 1951-61, the country's population increased from 359 million to 439 million, urban population from 62 million to 78 million and motor vehicles on the road from roughly 339,000 to 683,000. But, during the same period, the growth and improvement of National Highways and urban roads and the development of correct road and traffic sense among the road users were not commensurate with the increase in vehicular traffic. As a result, in 1962, there were as many as 63,000 motor vehicle accidents in the country, or roughly 80 accidents for every 1,000 vehicles—the figures for Maharashtra and Greater Bombay being 100 and 422, respectively. Some of these accidents were fatal and many more serious, resulting in disablement for life. In Maharashtra alone, there were as many as 828 fatal accidents in 1963 and 597 during the first seven months of the current year, raising the monthly average from 69 to 85. In order to reduce the incidence of such road accidents and thereby save precious lives, Mr. Gandhi has emphasised the importance of three E's—education, enforcement and engineering.

Of these E's, education is perhaps the most important, for, unless the user has the correct sense to use the road, even the best of enforcement and engineering cannot prevent accidents. It is necessary that, as in many Western countries, the study of road safety principles should be made a compulsory item in the school curriculum for children. Road Safety Weeks can also be organised for explaining the road safety principles by way of lectures, demonstrations and cinema shows. Along with education and publicity, it would also be necessary to enforce traffic rules and regulations strictly and without any fear or favour.

The part which modern engineering and technology can play in the construction of suitable types of roads and in their maintenance is self-evident. The difficulty in India is that most of the present roads were designed and constructed for slow-moving traffic when motor transport was not widely prevalent or common in the country. Even now slow-moving vehicles account for a considerable portion of transportation in the country. As there are not sufficient roads, the same road has to serve both auto-vehicles and slow-moving vehicles. It is for the road planners and engineers to ensure that roads in future are modernised or constructed according to the needs of the present day, with separate footpaths, controlled crossings, separate traffic lanes for different types of traffic and white markings to guide the traffic. These are no doubt sensible measures from the point of view of reducing the number of accidents. But the ultimate solution is to increase the number, width and mileage of roads—a rather slow process. Much will depend on the availability of funds for road construction.

DELHI LETTER

KHRUSHCHEV'S ROLE IN INDO-SOVIET RELATIONS

NEW IMPONDERABLES IN FOURTH PLAN

From Our Special Correspondent

NEW DELHI, *20th October*

AGAINST Rs. 5,200 crores of total foreign assistance in loans and grants offered to India until the end of September, the share of the Soviet Union is around Rs. 384 crores. All of this Soviet aid and increased Indo-Soviet trade relations was during the decade Mr. Nikita Khrushchev was in a commanding position in the Kremlin. The development of close Indo-Soviet co-operation in economic affairs began early in 1955 with the agreement on the Bhilai steel project. The last important Indo-Soviet contract was on the eve of Mr. Khrushchev's exit from the seat of power in the Kremlin and it also related to steel—the initialling of a contract for a Soviet engineering firm submitting designs for the Bokaro steel project. From Bhilai to Bokaro the growth of Indo-Soviet relations was smooth—there were few, if any, frayed tempers in the negotiations, although the Soviet and Indian bureaucratic systems combined to slow down the pursuit of projects.

When Mr. Nehru provided Mr. Khrushchev with his first big opportunity to test the thesis of peaceful competition in an era of communist-capitalist co-existence, a much-advertised factor was that the Soviet aid would be stringless. A question posed by Western commentators at the time Mr. Khrushchev launched his aid programme to help non-communist countries was based on the premise that the programme was linked to the hope that the Russians could influence the foreign policy of under-developed countries. The poser, as put, for instance, by Joeph Berliner, in his book "*Soviet Economic Aid*: The New Aid And Trade Policy in Underdeveloped Countries," was: What of the domestic policies of the recipient countries? Can the aid programme plausibly be construed as a device for influencing the course of events within the recipient countries? A premise of the Western commentators then was that, if the Indian way should fail and if China should forge ahead, then the cause of communism would be greatly strengthened throughout the underdeveloped regions of the world. On this premise, the Soviet aid programme helping India and the United Arab Republic appeared to conflict with Soviet interests since both were anti-communist on the home front. But these premises could not take into account the deteriorating relations between the Soviet Union and China which came into the open much later.

Bhilai and Bokaro

There is no denying the fact that at no time did Mr. Khrushchev *directly* try to influence Indian economic or political policy. When the Bhilai agreement was signed, the Indian Government had already decided on a policy of a commanding Government sector in the steel industry and the British and the West Germans also came in with assistance for building two other Government steel plants. The Avadi resolution of the Congress soon afterwards spelled out the socialistic aims of the Congress Governments in power at the Centre and in the States. At various stages during the second Five-year Plan and the current third Plan, a conflict of interest developed between India's domestic policies and American foreign aid policies. The most celebrated example of this conflict was in relation to the Bokaro project in which, despite sincere endeavours by the late President Kennedy, the American Administration could not push through the U.S. Congress plans to assist the Indian Government's fourth steel project. It was only eight months after the U.S. Congress had vetoed the use of U.S. Government funds for the Indian Government steel project and the Indian Government had withdrawn the request for U.S. aid in this venture, that the Soviet decision to aid Bokaro was announced. The U.S. Congress veto could be interpreted as an effort to interfere in domestic Indian policies inasmuch as U.S. aid to Indian steel would be available only if the project was in the non-Government sector. The Indian Government, however, did not publicly make such an accusation; it sought a mammoth deal with the United States and had just failed. The Soviet agreement to build the Bokaro project came about strictly as a result of a new Indian request for Soviet assistance. The Indian Government could not and did not try to blackmail American investors by declaring that, if the U.S. did not come in, the Russians would: the Indian Government did not have any such assurance from the Soviet Union then. As a matter of fact, the first reaction of the Indian Steel Minister after the failure of the effort to secure U.S. aid was to canvass a plan for Indian technicians to do Bokaro on their own. This posed difficult problems for the Indian Steel Ministry. Despite brave talk of Dastur and Company becoming capable of designing and supervising the construction of the Bokaro plant with equipment ordered from various countries. There is no doubt that the Indian Government, as well as independent commentators, welcomed the Soviet offer when it came.

Agreement Initialled

When the Soviet technical team arrived in India in the middle of August and started detailed technical discussions, the Indian side found that some of its claims on Indian technicians' capacity to play a major role in Bokaro designing were not acceptable to the Russians whose assessment of Indians' capabilities was not very different from that of the Americans during earlier negotiations on Bokaro. At one stage the Indian and Soviet negotiators got on each other's nerves while discussing Indian technicians' capabilities. The Russians made it clear that the designing part would have to be entirely in the hands of the Soviet technicians. The agreement for the new project report initialled last week, however, contains clauses more favourable in some aspects than Delhi envisaged a few weeks ago. The May Day announcement of Soviet help related to the first stage of the Bokaro plant, envisaged at one and a half million tonnes ingot capacity. The present agreement shows that the first stage will probably have two million tonnes ingot capacity and that the Russians will continue to provide assistance until the plant reaches a capacity of four million tonnes.

When the arguments of Dastur and Company being assigned a prominent role in Bokaro were pressed in the initial stages of negotiations, a conflict of interest between India and Russia was indicated. Apart from the technical assessment of the firm's capacity, the Russians would not bring themselves to agree to promote the development of a private sector firm as the most important steel consultant in India. Such a development, however, was not contradictory to the Indian concept of mixed economy.

The Soviet aid policy to India has been closely linked with the Indian Government's repeatedly-declared desire to establish the primacy of the Government sector in a variety of basic industries, including steel. Soviet aid, naturally, has been directed exclusively to strengthening the public sector. Apart from steel, the Soviet aid helped the Indian Government negotiate from a position of some strength with international oil firms and companies capable of helping India establish a complex of machine building units. It is a natural conclusion that, by and large, the Nehru domestic policies and the Khrushchev aid policies provoked no conflict of interest. They were paralled routes.

In India's search for supersonic planes to strengthen the defences too, India knocked on the doors of the U.S. Administration and sought Soviet help after it failed to secure the planes from the West. In the oil industry, the Soviet intervention on the side of the Indian public sector, as well as the emergence of independent oil operators seeking new avenues, has led to the international oil firms drastically changing their investment policies. In other words, the disadvantages of being a technically under-developed country were partly offset by the Soviet intervention which has resulted in international oil firms offering more favourable terms than some years ago.

Soviet aid to India under Khrushchev thus contributed materially, as well as psychologically, to Indian economic development. The past year was one in which numerous significant contracts were signed between India and the Soviet Union, especially in a variety of machine-building industries. In the debate on the fourth Plan, one of the basic premises in going for more ambitious basic industries, side by side with an intensification of the drive in agriculture, was that there would be a substantial flow of Soviet technical and financial assistance. The crucial question for which an immediate answer is not available is whether Soviet aid to India will continue at the same rate as hitherto in the post-Khrushchev period.

Fourth Plan Premises

The Fourth Plan, whose investment outline had been approved by the Union Cabinet last week, presupposes that the net foreign aid inflow during the years 1966-71 will be the same as during the Third Plan—around Rs. 500 crores a year, excluding commodity assistance from the United States under the food-for-peace programme. The calculation of Rs. 21,500 crores *plus* a possible Rs. 1,000 crores (if the economic climate is sunny) is on current prices. The perspective plan for 1961-76 was based on 1960-61 prices; therefore, in terms of 1960-61 prices, the outlay on the fourth Plan will be around Rs. 20,000 crores. Since the achievements of the current third Plan are expected to show a shortfall of 20 per cent, the present estimate of the total outlay on the Fourth Plan will, in real terms, be a little over twice the size of the current Plan. The third Plan started with aiming at physical targets for which complete financial provisions had not been made. Added to this was the setback resulting from agricultural stagnation and the increased defence spending. The Fourth Plan will also begin with the setting of targets in excess of what resources justify, but the flexibility will be built into the Plan outline, if the planners have their way. In the third Plan there was no detailed specification of the projects or parts of projects to be dropped out if the resources position suffered. The fourth Plan will aim at a phase-by-phase projection of schemes and investment and will mark out the phases or the projects to be dropped out or added, depending on a periodic survey of achievements. An intellectual exercise among planners has been to argue that these cuts in expenditure can be made without affecting key projects contributing to the rate of growth. If this hypothesis is correct, then why not attempt to exclude the fringe expenditures even in the beginning?

In the drafting of the fourth Plan and its implementation the conflict between the States and the Centre may become more pronounced. The Planning Commission wants to have its own agents in the States to evaluate and report on the progress of State projects continuously. The present method of collecting information through periodic visits of central teams and from the Development Commissioners who work under the State Cabinets is not completely satisfactory. But it is doubtful whether the State leaders will appreciate the extension of the arm of the Central Planners. When the Chief Ministers and the National Development Council meet next week, it is not only the fourth Plan and the long-term food policy which will be under discussion. The relations between the States and the Centre, with Nehru out of the picture, will loom large.

IMPORT POLICY FOR CURRENT HALF-YEAR

The import policy for the second half of the current year, announced on the 14th inst. by the Central Government, does not contain any cut in the licences of the established importers. There was also no cut in the case of supplementary or additional licences, where allowed to established importers.

It has been decided that annual licences granted to established importers for the current financial year need not be presented to the licensing authorities for endorsement regarding utilisation in the second half. In cases where fresh licences are yet to be issued to established importers for the current year, the annual licences will be granted for the total yearly entitlements. The licences will be suitably endorsed to permit the import of goods in one lot within the validity period of the licence.

The import policy in respect of actual users for the second half of the current year will be announced later.

FOOD MUST COME FIRST

LONDON, *16th October*

THE Malthusian nightmare—a world in which population continuously expands more rapidly than food supplies—has been uncomfortably close to the reality for some time past, and a good deal of paper and ink has been devoted to it. But the disproportion between the size of the problem and the steps which are being taken to meet it is so great that there is a strong temptation in many countries, developing as well as developed, to ignore the figures and simply hope for the best.

No apology, therefore, need be made for taking the annual report of the Food and Agriculture Organisation of the U.N. as an opportunity for dinning in what many of us would much rather forget.

Between 1850 and 1930 the world's population grew at an annual rate of 0.9 per cent and doubled from 1,000 million to 2,000 million. Between 1930 and 1960 the rate of increase rose to 1.4 per cent and the population rose to 3,000 million. The rate of increase is at present around 2.1 per cent, which implies—if held—4,000 million by 1974, 5,000 million by 1984 and 6,000 million by 1993. By the end of the century, according to the best-favoured U.N. projection, the world's population will have reached 6,280 million, almost twice the present level.

It is increasing most rapidly, moreover, in those regions of the world—Asia, Africa and Latin America—where living standards are already the lowest. Technical advances, in sanitation as well as in medical treatment, have greatly increased the expectation of life in these regions. But the very increase in population has frustrated the improvement in living standards which might have caused a drop in the birth rate. Most of these countries, for all the efforts they are making and the outside assistance they are receiving, are having to run very hard merely to remain where they were.

Although world food output per head is 15 per cent higher than before the last war, the whole of the increase has been achieved in its more developed areas. Output per head in the developing regions is no higher than it was 25 years ago, though the F.A.O. has estimated that between one-third and one-half of the world's inhabitants suffer from malnutrition or actual hunger.

Nor is it easy to see how the situation is to be quickly remedied. In India, food production must be increased in fifteen years, if nutritional standards are not to fall even further, by an amount sufficient to feed a rise in population roughly equal to the total present population of the United States. In China, the population is rising each year by an amount roughly equal to the total population of Australia. In some smaller countries, it is rising proportionately even faster. Yet the latest report of the F.A.O. suggests that for five years past world agricultural output per head has not risen at all and that in Latin America—where population is increasing faster than in any other major region—it has fallen sharply.

The existence of agricultural surpluses in many of the developed countries can only do a little, and for a short time, to alleviate this problem. The shipment of food supplies from the U.S. and other surplus producers to developing countries represents a useful marriage between charity and political convenience. Under certain proposals which have been put forward for international commodity schemes, this sort of arrangement would become a settled habit. But it might then both discourage developing countries from improving their own agriculture as far as they could and enable the developed to postpone uncomfortable changes in their economic structures.

Since most developing countries are anxious to industrialise as the only way out of their difficulties, they are chronically short of foreign exchange. The increase in aid and loans has been largely cancelled out over the past few years by a drop in the price of raw materials and a deterioration in their terms of trade. And, although these terms improved in 1963 for the first time since 1951, a large part of this improvement seems to have been due to temporary factors. What is more, any prolonged rise in the price of many raw materials is likely to lead to the even further development of synthetic substitutes.

Because a shortage of foreign exchange is often the dominant feature of the economic situation, developing countries have so far tended to concentrate on export and import-saving industries. But the basic need in many of them is still to improve agricultural methods and so greatly to increase yields. Such a process usually involves fundamental changes in systems of land tenure, education, and the use of mechanical tools and may well imply a political upheaval. The developed countries can contribute to the success of these attempts at self-support not only by supplying more capital equipment and technical assistance but by realising that the need to feed its population must be the first consideration of any Government.

One of the more encouraging advances during the past year has been the establishment of a joint programme between the F.A.O. and the World Bank to identify a 'much larger' number of agricultural projects suitable for financial assistance—wherever possible, presumably, with soft loans. If we do not make a much greater effort to bridge the gap between food supply and population, it may well be closed, as Malthus predicted, by famine, plague and war.

WORLD BANK LOAN FOR EDUCATION

The World Bank has approved a loan of $6 million to the Philippines. This will be the Bank's first loan in the field of education. The loan will be used for a project in higher agricultural education. The beneficiary will be the College of Agriculture of the University of the Philippines.

The Bank loan is for a period of 30 years and bears interest at the rate of 5¼ per cent. Because the economic benefits of educational projects of this kind are realised only slowly and because the development of the Philippine economy requires a large continuous inflow of capital from abroad, amortisation of this loan will begin only after 10 years, the first repayment falling due in 1975.

AUTO WORKERS GET MORE WAGE BENEFIT

HAVE THE GUIDEPOSTS FOR COST-PRICE STABILITY BEEN VIOLATED?

By N. Pattabhi Raman

NEW YORK, *17th October*

NEW labour-management contracts made in Detroit during the past weeks have strengthened the speculation about inflation and also raised doubts regarding the usefulness of the Kennedy-Johnson Administration's wage-price guideposts. I discussed the background to the new contract negotiations in an earlier article. As indicated therein, the Administration has emphasised that the average wage settlement should not exceed the 3.2 per cent general productivity rate. In its view, wage increases exceeding this figure could upset the stability of the price structure.

The United Automobile Workers (U.A.W.), the trade union of the auto industry's blue and white collar employees, bargained for and obtained benefits which, in money terms, amounted to a much larger increase. It is difficult to calculate the costs of the newly-won benefits exactly, but it would seem that the increases will amount to 4½ per cent to 5 per cent in each of the next three years. The increases were first won by the union from Chrysler, which was particularly vulnerable to pressure this year. Then, Ford and General Motors, the No. 2 and No. 1 of the industry, agreed to similar terms. In the case of General Motors, the union called its members out of most plants for a few days in a show of militancy. The economic terms offered by General Motors were not much different from those offered by Ford or Chrysler and accepted by the U.A.W., but the union demanded some additional improvements in working conditions. The demand was partly political in that it was designed to mollify militant leaders of the union's locals (branch units). In earlier years, agreement at the national level between the U.A.W. and the auto companies has been followed frequently by wildcat strikes in auto plants in different parts of the country; by taking note of the local grievances and demonstrating a spirit of militancy, the union sought to forestall wildcat strikes. The strike against General Motors was short-lived and hence by itself had no impact of any significance on the economy.

The price of the labour peace thus secured in Detroit is, however, a different matter. At the peak of a period of booming sales and profits, the Big Three apparently did not consider that it was too high a price. But it could penalise the economy if it generates inflationary forces.

G.M. Not to Raise Prices

There is no immediate threat of inflation in sight and the generous auto settlement may *not necessarily* break the price stability that has prevailed for a considerable length of time. General Motors, which accounts for some 55 per cent of the industry's production, has already announced that it will not raise prices on the 1965 models; the other manufacturers are not likely to contest the leader by increasing their prices. This means that the increase in labour costs, at least the increase becoming effective in the first year of the three-year contracts, will be absorbed by the manufacturers.

While this is an important consideration, whether inflation will rear its ugly head depends on other factors as well—factors such as the overall strength and direction of the economy; monetary and fiscal policies; and the nature of the wage settlements and pricing policies in other areas of the economy.

The Administration is indeed keen to prevent the repetition of Detriot in other industrial centres. Thus, commenting on the auto settlement, President Lyndon Johnson said: "We know that a new round of inflation could erode our export surplus and undermine our great expansion. All of us have a vital interest in maintaining price-wage stability.

While the auto settlement was a generous one," he added, "it must be judged in the context of the industry's very high profits arising from higher sales, lower cost and taxes, and very high productivity combined with maintained prices. Both labour and management realised the unique nature of the auto settlement," the President concluded, hoping to avoid a mirror effect, "I expect that other industries with profits below the high levels in autos will not use the auto settlement as a pattern."

Such hopes notwithstanding, the impact of the auto settlement on wage-price policies in other industries remains to be seen. Moreover, the current price stability could be upset by pricing policies initiated independent of contract negotiations. The danger of such an upset is particularly evident in steel. As I observed in an earlier article, the steel industry is rolling up its sleeves to deliver a blow to the edifice of price stability. Steel profits "simply do not measure up" to a proper return on invested capital, Mr. Joseph L. Block, Chairman of Inland Steel, declared a few days ago. Mr. Block is not a soloist, for he has company. Other members of the Chorus for Higher Prices include such industry stalwarts as Chairman Roger Blough of U.S. Steel and President Logan T. Johnson of Armco Steel. But Mr. Block's statement was particularly significant because it was he that helped the late President Kennedy to reverse the industry's efforts to raise prices across-the-board in April 1962. At that time, Mr. Block refused to go along with the other majors and the latter were forced to rescind the price raises in order to remain competitive.

Overall Economic Trend

While steel thus poses a threat, the overall trend of the economy encourages the hope that inflation can perhaps be avoided. The consensus is that the economy, now going into its 15th quarter of expansion, will continue to grow, but that it might begin to lose momentum by the middle of next year. Inflation is not expected to occur in the event a lag does set in, even if the narrowing gap between industrial capacity and the rate of utilisation puts pressure on prices. And, even if the economy continues to grow steadily beyond mid-1965 and begins to heat up, inflation need not necessarily creep in because the Administration has a variety of monetary and fiscal instruments to deploy against it. In short, while there is room for apprehension and need for caution, there is no reason to be pessimistic at the present time.

Was Detroit the Waterloo of the wage-price guideposts? This is a valid question. The guideposts were first established in 1961 and it is generally agreed that they have exerted a moderating influence on both labour and management. By focussing public attention on the importance of wage-price stability and the dependence of this stability on prudent wage settlements and pricing decisions, they have introduced concern in the minds of both unions and company managements that, if they flout the guideposts, they might become the target of public displeasure or Government action.

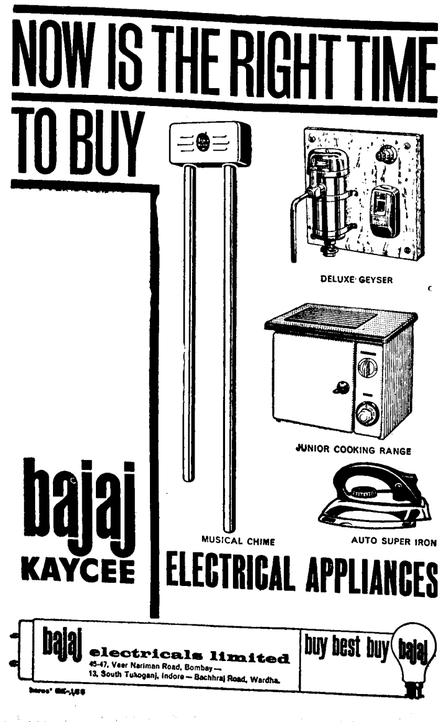
In Detroit, the guideposts were indeed ignored. The concept of the guideposts requires companies enjoying higher than average productivity gains to cut prices, but even prior to the wage negotiations in Detroit, the auto companies announced that they would not cut prices. This attitude strengthened the determination of the U.A.W. to secure as large an increase in the wage benefits packet as it could possibly obtain.

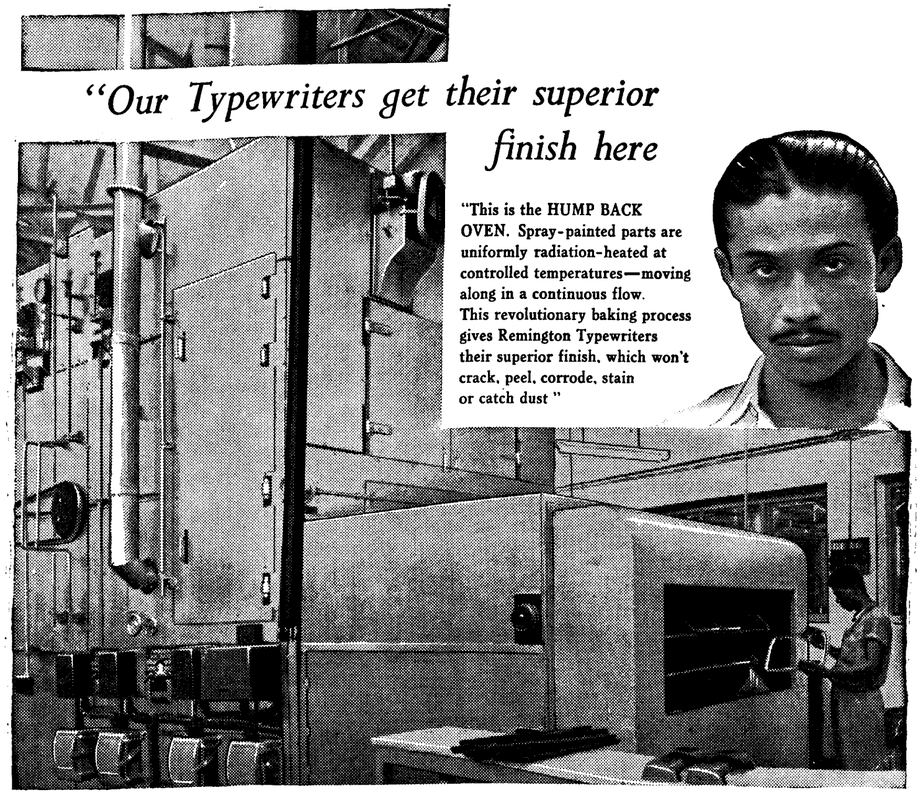
But, as President Johnson pointed out, the Detroit experience does fall within the category of "exceptions" to the Administration guideposts. The guideposts did not rule out the possibility that some wage settlements would be above the average, and some below it, and that some prices would move up while some others would decline. And the increase in wages and benefits which the U.A.W. obtained was fairly close to the productivity gains registered in the industry. Hence it may be concluded that the guideposts have not ceased to be useful because Detroit ignored them.

In fact, both labour and management in America have much to lose if they would repeatedly violate the guideposts. They might destroy the cost-price stability, engender cost-push and inflation, force the Administration to intervene in free collective bargaining or, worse, institute strict controls, and generally upset the health of the economy. As *Business Week* observed recently: "The guideposts are one way a free economy can reconcile different national objectives. Their usefulness is far from ended."

U.S. RICE EXPORTS

The U.S. rice exports during the marketing year ended July 1964 touched a record high of 1,385,000 metric tons (milled rice), which exceeded the previous largest exports of 1,145,000 tons in 1962-63. This was an increase of 21 per cent, and a rise of 77 per cent over the average annual exports of 783,000 tons during the five years 1955-59. The record exports to Asia, at 721,000 metric tons, rose by 60,000 tons over the 1962-63 marketing year and 321,000 tons over the 1955-56 average. The Asian market took over 52 per cent of total U.S. rice exports. The largest shipments were 354,000 tons to India and 105,000 tons to Japan. This was the first significant export to Japan in eight years. Exports to Indonesia dropped sharply—from 254,000 tons to 62,000 tons—due to the curtailment of P.L. 480 sales by the United States.





The Hump Back Oven and Keshab Chandra Bose who works on it, are just one team of the multitude of men and machines at the Remington Rand typewriter plant. They are all engaged in a constant endeavour to improve the quality of each tool, die and part that goes into the making of your Remington typewriter.

Over the years people in India have come to expect the standards set by REMINGTON — the highly responsive touch, light positive shift, smooth carriage action and superior styling and finish — which make them so essential to distinctive correspondence.

COOPERATIVE CREDIT AND BANKING

NEED FOR COMMON DISCIPLINE STRESSED

SHARP controversies over the threefold problems of resources, operations and supervision of the cooperative credit movement and banking structure were recently highlighted in Bombay on the occasion of the Silver Jubilee Celebrations of the Maharashtra State Cooperative Banks' Association. Although the differences were sharp, there was no misunderstanding on either side of what was at stake: the stake was the revival and revitalisation of the cooperatives. There were, of course, differences over the standards of operational efficiency already attained and the standards desired; there were also divergent points of view on their ability to raise resources and to absorb official finance; there was even a lack of proper understanding between the official attitude concerned with the inflationary implications of cooperative financing frustrating the efforts of monetary authorities to control credit and the cooperators' attitude which regards all centralisation as the antithesis of cooperation, an attitude more concerned with the vital functions of the movement. But there was no doubt that everyone regarded cooperatives as a distinct and significant third force in our scheme of planned development. While there was a stray element of competitive jealousies between the cooperative and commercial banks, there was ample recognition of the enormous expansion and considerable diversification of cooperatives in the field of banking and credit.

There is an element of contrast, or even a paradox, in the fact that the quantitative progress of cooperatives so far has been the direct result of official support, assistance and incentives. These very factors, carried to an extreme in several cases, have amounted to spoon-feeding and become the very bane and weakness of the movement. Addressing the Silver Jubilee Celebrations on 10th inst., the Governor of the Reserve Bank of India stressed the need for and the importance of expanding owned resources and mobilising deposits if the cooperatives were to fulfil their purpose. The ability of the movement to finance production and development in increasingly diverse fields, according to the Governor, will ultimately depend on their ability to mobilise the required resources from out of the savings of the rural and urban communities.

Uneven Progress

Outside assistance may be absolutely essential initially to give a momentum to the cooperative movement, but, after a certain period, their financial viability and operational efficiency have to increase to a level that may inspire public confidence and enable them to mobilise savings of both rural and urban people. After all, promotion of thrift is a basic cooperative principle and, unless the cooperatives match the assistance, incentives and concessions they get by increasing their deposits from the public, they cannot be regarded as having fulfilled their purpose. Even apart from this matter of principle, the cooperative banks get various types of help from official sources, help that should enable them to compete with the commercial banks in mobilising resources on more than an equal footing: they have been the first to take banking to the rural areas, they have received official patronage in the form of quasi-Government deposits, they are also able to offer various attractive services to the public, including remittance facilities and other services which should make it easier for them to attract deposits, and they are even able to stand on a par with the commercial banks in the matter of the interest rates they pay for their deposits. In fact, some of the cooperative banks have a good record of deposit mobilisation, but the progress is uneven in terms of both regions and banks. It may be that the deposit potential in areas where cooperatives operate is meagre and it may be that differences in the degree of economic development in various areas are reflected in the actual deposits they have collected, but these are factors which are not independent, for, they can be influenced by the efforts of the banks themselves.

If the cooperative banks are to become progressive institutions with the highest standards of efficiency and, if they are fully to meet the demand for credit for productive efforts in rural as well as urban areas, in agricultural as well as industrial fields, there is no escape from mobilising the genuine savings of the people to the fullest extent possible. A recent Reserve Bank study of the deposit rates of cooperative banks at the end of June 1962, published in the September 1964 issue of the monthly *Bulletin*, points out that deposits formed 32 per cent, 35 per cent and 74 per cent of the total working funds of the State Cooperative banks, Central Cooperative banks and Urban Cooperative banks, respectively, whereas the share of borrowed funds was 57 per cent, 47 per cent and 3 per cent, respectively. The urban cooperatives have set an example in this respect to the other cooperative banks, suggesting the extent to which there is scope for intensifying and widening their efforts to mobilise deposits. But even in the case of urban cooperatives, as much as one-third of the total deposits were from individual *members;* there is, therefore, a scope still, even in their case, to attract deposits from the *public.*

In mobilising deposits from the public, that is, the non-member individuals, the cooperative banks have to compete with the scheduled and non-scheduled banks, as well as the postal savings banks and other forms of national small savings movement. The postal savings banks (first introduced in 1882) and the national savings movement have abundantly justified themselves by their dynamism in collecting the savings of the people from the rural and urban areas; even the scheduled banks

Outstanding	10	..

Note: Bulk of the short-term and medium-term advances are at 2 per cent below the Bank Rate, though some of them, for non-agricultural purposes are given at Bank rate or at 1½ per cent below Bank Rate.

have displayed their vitality in mobilising deposits in recent years, although their progress may have been partly at the expense of non-scheduled banks and as a direct result of rising money incomes under the pressure of mounting deficit financing. The growth of deposits of cooperative banks have not, however, had any relation with the growth in the volume and field of their operations. As has been bitingly pointed out, Sir Frederick Nicholson, the enlightened originator of the Indian Cooperative Movement, has turned out to be the most erring of the prophets: the combined deposits of the Cooperative Movement, even after sixty years of missionary zeal and official props, is only a little above one-tenth of the deposits of commercial banks.

Difficulties of Dichotomy

Cooperative banks have received special treatment and an honoured place in our banking system. They have been beyond the scope of control and supervisory mechanism of the Reserve Bank of India and have received concessional finance on condition that they pass on the benefit of the concession to agriculturists and other borrowers. In fact, the cooperative credit banks hold a unique position. They are an integral part of the Cooperative Movement and yet they are a distinct and separately identifiable group of institutions whose problems are different in many respects from those of the rest of the Cooperative Movement. On the other hand, they are banks in their name, constitution, functions and operations, yet they stand apart from commercial banks in more than one sense. They share common banking interests, as the Governor mentioned at his address at the Silver Jubilee Celebrations, and they constitute "an integral part of the country's banking system"; yet they have not shared the common discipline of the banking and monetary system as represented by the advice and directions of the Reserve Bank of India and by the interest rate mechanism of our financial system. Emphasising the difficulties of such a dichotomy, the Governor of the Reserve Bank said:

> "... whatever be the statutory position it is important that, in matters of evolving appropriate banking practices and progressive policies, in the matter of raising resources as well as employing them fruitfully, and observing canons of sound banking, the cooperative banks should seek an area of common understanding and purpose with the rest of the banking structure of the country."

But it is not merely a question of an area of common understanding or of common national interest that requires policies and procedures of the cooperative banks to be in line with the rest of the banking system. It is also necessary that they should be brought under "a sense of common discipline" and should "conform to those aims of policy which have been set before the banking sector as a whole."

In view of the special significance and increasing importance of the amount and variety of cooperative credit, it is no longer possible to ignore the effect and implications of cooperative credit upon the finances and the economy of the country. While the selective credit controls regulate commercial bank advances against various agricultural commodities in the light of the overall monetary and economic situation, the advances of the cooperative banks here remained altogether outside the purview of such controls. The amounts of such advances "in certain areas and against particular commodities are beginning to be sizable" and "they give rise to an apprehension that they are helping to finance hoarding of stocks."

In the light of this, the role of cooperative credit in frustrating the effectiveness of monetary and credit policies requires to be reconsidered. Cooperative finance has become an important constituent of total bank credit in the field of agricultural marketing and overall monetary discipline. When the Governor referred to the Reserve Bank thinking in terms of making sound and orderly arrangements so that cooperative banking "will not function out of step with the overall purposes and discipline of the banking system as a whole," he was undoubtedly referring to the proposal to extend the scope of the Banking Companies Act to include the cooperative banks.

Enforcement of Discipline

The cooperators' viewpoint as regards both these matters—the need to increase deposit resources and the extension of the Banking Companies Act to the cooperative banks—is broadly similar, at least in principle. But in its practical application, there are sharp differences. Although the Chief Officer of the Reserve Bank's Agricultural Credit Department, Mr. P. D. Kasbekar, addressed the Seminar at the Silver Jubilee Celebrations in his personal capacity, he could not but help echoing the official viewpoint. The thinking in the Reserve Bank is veering round the point that cooperative agencies should reduce their dependence on Reserve Bank credit and that the Reserve Bank should discourage such dependence where cooperative banks have established certain minimum standards of viability. The demand of the cooperators that responsibility for meeting all the credit demands of agriculture should be placed upon the cooperative sector was criticised by Mr. Kasbekar who made it plain that, in the present inflationary situation, the Reserve Bank tap of created money should not be widened to match such expansion of responsibility and that the cooperative banks should undertake only such responsibilities as they can meet out of the resources they are able to mobilise.

Again, although many cooperators may agree in principle to the extension of the same discipline to cooperative banks as is applicable to commercial banks, they object to the application of the blanket provisions of the Banking Companies Act to the cooperative banks. The Reserve Bank, however, is convinced of the necessity of embracing all the cooperative banks under the mechanism of the Banking Companies Act and, if it is hesitating, it is only due to the stupendity of the task of operating under the weighty responsibility of dealing with more than 850 State, Central and Urban Cooperative Banks, not to speak of over 1,500 primary societies.

Reserve Bank's Role

Still another aspect of the controversy that arose at the Seminar was over the role of the Reserve Bank in promoting the growth of cooperatives. The cooperators have from time to time demanded that the presence of a cooperative bank at a centre and the banking facilities provided by it should be kept in mind by the Reserve Bank before permitting joint-stock banks to open branches. This is pushing the competitive elements too much into the picture

BANKING IN RURAL AREAS—I

A NEW APPROACH AND PATTERN OF OPERATIONS NEEDED

By Dr. J. D. Sundram

SCHEMES for the economic development of rural areas continue to languish for want of timely, adequate and cheap credit of all types, in spite of what has often been described as proliferation of financial and banking institutions since independence. Commercial banks in the country have no doubt extended the area of their operations, expanded the volume, and diversified the range of their services during the post-independence period. With the establishment of the State Bank of India in 1955 in pursuance of the recommendations of the Rural Credit Survey Committee, with a special mandate to accelerate the pace of expansion through opening branches in new areas, the number of banking offices has increased and the organisational machinery, particularly for assisting co-operative institutions and small-scale industries, has been improved and strengthened. The political and social bias of Governments at the Centre and in the States, as reflected in the three Five-year Plans, has encouraged the growth of a variety of co-operative institutions and facilitated the extension of assistance, financial, technical, organisational, etc., to them in an equally wide variety of ways. Notwithstanding this institutional proliferation, effective coverage, measured by any standard (spacial, population, size of towns, or volume of credit extended for development schemes in rural areas) continues to be as unsatisfactory as ever

Table 1: *State-wise Distribution of Offices of Scheduled Banks in 1963*

States	Number of bank offices	Population (Lakhs)	Population per office ('000's)
Andhra	371	360	97
Assam	54	119	220
Bihar	189	465	246
Gujarat	402	206	51
Jammu and Kashmir	15	36	240
Kerala	299	169	57
M.P.	203	324	160
Madras	686	337	49
Maharashtra	681	396	58
Mysore	495	236	48
Orissa	59	175	297
Punjab	357	203	57
Rajasthan	207	202	98
U.P.	480	737	154
West Bengal	286	349	122

before. Nay, it would be more correct to say that the availability of institutional credit today is smaller than the needs, because the latter have grown in number, coverage, intensity and urgency in the wake of at least a verbally growing awareness of the importance of the integrated economic development of rural areas.

The details of the State-wise distribution of offices of all scheduled banks in the country set out in Table 1 clearly reflect the absence of any correlation between the number of offices and (*a*) the area, or (*b*) the population, or (*c*) the level of development, of the State. The operational coverage of a bank office varies from nearly 300,000 persons in Orissa to 48,000 persons in Mysore; the number of offices in either of them having apparently nothing to do with either their population or their area. Judged purely by the number of offices and the population each has to serve, Assam, Bihar, Jammu and Kashmir, Madhya Pradesh, Orissa, U.P. and West Bengal are inadequately served, inasmuch as the population each has to serve ranges between 1.22 lakh, 1.54 lakh and 1.6 lakh in West Bengal, U.P. and M.P., respectively, to well above 2 lakhs in the others.

The general impression conveyed by the data on the State-wise location of offices of scheduled banks is further confirmed by the State-wise distribution of even the co-operative banks and their offices. In Table 2 are set out the details of the State-wise distribution of all banks, scheduled and non-scheduled, as well as co-operative banks. A study of the figures in this table points to several additional features which are even more difficult to explain. For example, one may wonder what the justification or explanation is for the comparatively smaller number of places and offices of co-operative banks in Bihar, where the need for development is admittedly pressing because of the sizable number of people living on the margin of subsistence, or, again, why in Kerala, with perhaps the highest level of literacy and the most widespread political awareness, the progress of co-operative banking is confined to less than 10 per cent of the number of places covered by scheduled banks.

What can be broadly stated from the figures is that, in spite of various inducements and assistance over a fairly long period, co-operative banking has not developed either at the pace or in the manner likely to facilitate the implementation of schemes of economic development in areas that need them. Broadly, in the pattern of State-wise distribution and coverage of population, there is no significant difference between the scheduled banks and co-operative banks, in either their respective spacial distribution, or in service of the population, or in their nearness to the potential of economic development.

It is, however, well known that urban areas of the country are more intensively and extensively served by commercial banks. What is, however, strikingly strange is that the distribution of offices of co-operative banks among different types of towns is broadly the same as that of commercial banks.

Even among the urban areas, the pattern of distribution of commercial and co-operative banks follows no logical principle of either area or population. Some towns are served more intensively than others. For example, while the number of bank offices in areas with population ranging from one lakh to two lakhs and from two lakhs to five lakhs are 664 and 546, respectively, town with population ranging between 5 and 10 lakhs, as well as places with populations of 75,000 and 1 lakh, have only 299 and 331 offices, respectively. This merely indicates that, even as between one urban area and another, banks as a rule have not followed any uniform procedure in opening branches. In these circumstances, the oft-repeated references to the population per office in places of varying population, as measures or indicators of the progress made so far (Table 4) has hardly any meaning or significance, because it does not reflect the volume, or quality, of service rendered by the banks or their availability to assist economic development of the population supposedly covered by them.

The primary function of banks, whatever the pattern of organisation, is to mobilise savings of the people and farm them out among those capable of investing the funds gainfully. How far the so-called expansion of banking has equipped itself for the purpose can be judged only by the volume of deposits it has mobilised and the credit it has extended in the different States of the country.

Even a casual study of the data in Table 5 shows that banking development in the country is altogether inadequate and unsatisfactory in spacial coverage and in volume of operations *per capita*. The absence of any correlation between the number of offices and the volume of operations in a State merely reflects the concentration of banking services in some States. For example, while Madras has 13.7 per cent of the total number of bank offices in the country, its share in total operations is only 6.3 per cent in deposits and 9.8 per cent in credit, Maharashtra, which has almost the same number of offices, accounts for 25 per cent of total bank deposits and 32 per cent of total bank credit;

Table 4: *Bank Offices by Classes of Banks and by Population*

Places with a population of	Commercial banks	Co-operative banks	Total	Population per office
10,00,000 and over	818	103	921	13,382
5,00,000 to 10,00,000	253	46	299	19,030
2,00,000 to 5,00,000	477	69	546	14,990
1,00,000 to 2,00,000	537	127	664	13,248
75,000 to 1,00,000	256	75	331	10,778
50,000 to 75,000	386	98	484	10,332
25,000 to 50,000	814	300	1,114	9,197
10,000 to 25,000	1,116	548	1,664	7,101
5,000 to 10,000	411	471	882	5,246
Below 5,000	151	371	522	2,632

and West Bengal, which has fewer offices than either Madras or Maharashtra, accounts for 16 per cent of deposits and 24 per cent of credit. For an explanation of this singular absence of correlation between the number of offices and the volume of operations, one has to look elsewhere.

In Appendix II of *Statistical Tables Relating to Banks 1963*, figures of deposit in places with more than two commercial banks are given. From these, deposits of State capitals in each of the States have been taken. The relation of deposits in these towns to the totals in their respective States can be ascertained from the figures presented in Table 6.

From these figures, it can be seen that State capitals account for a sizable percentage of the deposits in their respective States. The reorganisation of States (which added to the number of important towns in the newly organised States, such as Gujarat, Kerala, M.P. and Mysore) and the partition of the country (which involved, in addition to this accretion of new towns, loss of the traditional capital city (Lahore), as in the Punjab) explain why the present capital cities in these States account for a smaller percentage of total deposits in their States. In Assam, Bihar, Rajasthan and U.P., the percentage of deposits in the capital city is not disproportionately high, because, in these States, there are several towns of almost equal importance and no metropolis. The extent of concentration of banking business in India becomes manifest from the figures set out in Table 7.

To sum up: in spite of the much advertised expansion of banking in the post-independence period, banking services in India are largely concentrated in the four metropolitan centres of Bombay, Calcutta, Delhi and Madras, accounting together for Rs. 1,178.72 crores, or about one half of the total deposits of Rs. 2,290.61 crores in the country. Though during the period since independence some effort has been made, the actual coverage of the banking services today is inadequate and limited to only the major urban areas. The institutional machinery for a really effective extension of banking facilities to the people in rural areas (including small and medium-sized towns) does not exist, except in a numerical sense and that too with resources far too inadequate for serving the population of the size under their respective jurisdiction. The extension of banking operations to small towns in the interior calls for an entirely different approach and pattern of operations.

From what has been said above, it is clear that expansion of banking that has taken place so far has hardly equipped it to assist economic development of rural areas, even to the extent now legally permissible to it. Branch banking, in India as in most other countries, involves constant references to head offices which have neither the required intimate knowledge of the applicants nor the background for an understanding of the implications of the issues they are required to consider and decide. Bank branches are generally in charge of agents who do not at all have (or at best have only limited) power and the essential technical training to deal, independently and on their own, with demands for financial accommodation. In these circumstances, banks have had to confine their activities to financing mainly trade and commerce, and advancing short-term loans on a small-scale to industries. Term-lending to industries attempted by a few large banks in pursuance of the directives of the Planning Commission has been recent and essentially marginal. The recent amendments to the Reserve Bank of India Act and the Banking Companies Act are likely more to restrict than to relax the traditional and legal restraints on their activities to meet the needs of economic development of rural and semi-urban areas.

* The next important town in the reorganised State is Nagpur (Rs. 10.66 crores).
† Inclusive of Howrah and Dum Dum.
‡ Inclusive of Kanpur. The other towns in importance are: Dehra Dun (Rs. 11.43 crores) and Allahabad (Rs. 10.78 crores) and together would account for Rs. 73.51 crores.
§ The next two largest towns here are: Baroda (Rs. 20.00 crores) and Surat (Rs. 13.22 crores) and together have Rs. 83.68 crores.
¶ Coimbatore (Rs. 11.81 crores) and Madurai (Rs. 8.20 crores) are the next largest in this State.

Note: The source of information of all the tables relating to the coverage of banking services given here is *Statistical Tables Relating to Banks in India 1963*, Reserve Bank of India, Bombay, 1964.

though creditable in many ways, merely underlines the still continuing urgent need for intensification of the development process to raise the purchasing power of the rural masses through steadily rising agricultural production, and diversification of occupation and employment through rapid industrialisation. Though there is general agreement on the objective, the effective means to its realisation continue to elude even the dedicated Rural Industries Planning Commission.

In spite of official patronage and assistance, cooperative banking has not yet developed on the required scale or acquired the capacity or skill to mobilise rural savings and to influence their investment. In fact, the growth and acquisition of these skills depend on the very development that they are expected to assist, promote and foster. Their performance to date, though creditable in many ways, merely underlines the still continuing urgent need for intensification of the development process to raise the purchasing power of the rural masses through steadily rising agricultural production, and diversification of occupation and employment through rapid industrialisation. Though there is general agreement on the objective, the effective means to its realisation continue to elude even the dedicated Rural Industries Planning Commission.

The basic economic as well as the psychological fact of the Indian countryside is the inadequacy of the present institutional machinery for the daring tasks implicit in economic development. The institutional machinery one visualises as the catalytic agent for rapid economic development must have a built-in flexibility, in addition to inherent strength, and a capacity for quick adaptation to continually changing needs, situations and problems of a dynamic, growing population of any given area. The *panchayat* and the primary cooperative, though excellent in that they both have their roots deep within the body social and economic, have neither the training nor the expertise nor the resourcefulness to handle on any scale problems of industrial or other development in rural areas. While the ultimate objective must no doubt be to equip them for the tasks that they alone can fulfil in order to realise in full the benefits of development potential, in their present stage of development, they are not the answer for our needs. They can at best initiate efforts at development as they have; but they cannot sustain them, much less expand them, on a continuing basis in the larger social and national interest, because they have not the means at present for that purpose.

As the present structure of banking—commercial and cooperative—does not and, in fact, cannot, provide banking services at anything like economic cost, to all rural areas that have the basic development potential and, as, at the same time, the need for them is being increasingly felt, it may be worthwhile to consider whether it may not be possible to evolve an operational pattern that will meet the needs without basically affecting the structure of banking and its normal monetary discipline.

OUTLOOK FOR INDIAN TEA GOOD

BOTH PRODUCTION AND EXPORTS RISE

THE current calendar year, that is, 1964, bids fair to be "a very good year" for the tea industry from the point of view of both production and exports. This, in brief, is the assessment of the Tea Board of India. The Board, in its customary annual publication, *Tea Statistics* (1963), estimates the production of North Indian tea for the whole year at about 272 million kgs. Production in South India, though at a lower level upto the end of June 1964 due to the late arrival of monsoon, is expected to be slightly higher at 91 million kgs., as against 89 million kgs. in 1963. The estimated total output in India during 1964 thus comes to 363 million kgs., representing an increase of about 17 million kgs. over the 346 kgs. plucked in the previous year. Exports of tea which have been satisfactory since June 1964 are expected to be higher than that in 1963 by about 9 million kgs. at about 233 million kgs.

The anticipated trends in the Indian tea economy are in keeping with the tea situation elsewhere in the world. The review of the world tea situation during the year 1963 as made by the Tea Board reveals that, while the total supply of tea was lower by 5.9 million kgs. at 739.4 million kgs., actual absorption was higher by a million kgs. at 745.7 million kgs., so that the deficit was of the order of 6.3 million kgs. There is, therefore, no evidence of any excess of tea. Indeed, the Tea Board says that there is no likelihood of any excess arising in the near future. This journal itself has been repeatedly saying ever since the U.N. Food and Agriculture Organisation forecast (early in 1961) a world surplus of 220-240 million kgs. by 1965 that the apprehensions are exaggerated and that the F.A.O. forecast may not prove correct. The production performance in the major tea producing countries during the year 1963 does not disclose any marked variation. The output is more or less at the previous year's level in several countries except in the case of Ceylon where it shows a distinct tendency to rise, while it has declined quite markedly, in Indonesia.

Production

Production has increased from 211.85 million kgs. to 219.80 million kgs. in Ceylon, from 23.39 million kgs. to 24.94 million kgs. in Pakistan, from 77.46 million kgs. to 81.10 million kgs. in Japan, and from 19.75 million kgs. to 21.06 million kgs. in Formosa. The countries showing a decline, other than Indonesia are India, Uganda, Nyasaland and Malaya. The following table indicates the trend of tea production in the different countries during the year 1963, as compared with 1962, 1961 and 1951:

(In million kgs.)

	1963	1962	1961	1951
India	345.90	346.74	354.40	285.40
Pakistan	24.94	23.39	26.54	23.63
Ceylon	219.80	211.85	206.49	148.00

*Including peasant-grown leaf manufactured by factories only and excluding hand-made tea produced by small growers.

† Figures represent 'crude' tea and should be reduced by 7½ per cent to give figures of 'finished' or 'refined' tea.

‡ Figures relate to 30th April of the year following that indicated.

This brief analysis provides a general background for assessing India's production and export performance during the year 1963. The most noteworthy feature of the year, according to the data furnished by the Tea Board, was the continued rise in exports from India. The quantity of tea actually shipped, which had increased from 206.3 million kgs. in 1961 to 214.0 million kgs. in 1962, increased again to 223.5 million kgs. in 1963. Thanks partly to the rise in the quantum of exports and partly to the spurt in the average export price realised per kg. of tea, the foreign exchange earnings improved quite significantly from Rs. 124.9 crores in 1962 to Rs. 132.4 crores in 1963, which is the highest figure for the last five years. The proportion of tea exported to the total produced went up from 49.7 per cent in 1962 to 52.0 per cent in 1963. On the financial year basis, however, both the quantity and value of tea exports recorded a fall during 1963-64, the former declining from 220.8 million kgs. to 209.3 million kgs. and the latter from Rs. 129.6 crores to Rs. 123.2 crores. The decline in exports is attributed to reduced shipments in the early months of 1964 following two successive years of unsatisfactory crop and higher exports during both 1962 and 1963, as compared with 1961, which left very little tea to be exported during the initial months of this year. In fact, exports lagged behind 1963 right up to the end of May. It was only in June when the new season's teas were available in sizable quantities that exports exceeded for the first time those in the corresponding month of 1963, though the increase was only a million kgs.

Current Year

As for the current year, the production of tea during the first nine months ended September was higher by 12.5 million kgs. at 257.9 million kgs. as compared with the corresponding period of 1963. The rise has been accounted for entirely by North Indian tea the production of which was 200.1 million kgs.. as against the 180.4 million kgs. produced a year before. This rise has more than made good the fall of 7.2 million kgs. to 57.8 million kgs. in the production of South Indian tea. The rise in production has not, however, been accompanied by a corresponding rise in exports. Actually, the exports have suffered a setback though the trend since June 1964 has been upward; the quantity exported during the first three quarters of 1964 was 124.7 million kgs., as against 135.1 million kgs. a year before. The proportion of exports to total production, as a result, has come down from 55.1 per cent in January-September 1963 to 48.3 per cent in January-September 1964. Since the quantity of tea exported during the early months of 1964 was well below that in the same months last year, total foreign exchange earnings from this commodity have receded from Rs. 83.0 crores to Rs. 77.6 crores. The average export price has been slightly lower at Rs. 6.22 per kg., as against Rs. 6.24 a year before.

The following table shows at a glance the recent trends in India's tea economy:

(In million kgs.)

	January to September		Whole of Calender Year		
	1964	1963	1963	1962	1961
Production:	257.9	245.4	345.9	346.7	354.4
Of which:					
N. E. India ..	200.1	180.4	257.3	262.8	273.6
South India ..	57.8	65.0	88.6	83.9	80.8
Exports:	124.7	135.1	223.5	214.0	206.3
Of which:					
N. E. India ..	99.4	102.6	179.3	171.6	170.0
South India ..	25.3	32.5	44.2	42.4	36.3
Percentage share of production exported	48.3	55.1	52.0	49.7	48.1
Average price of tea exported (Rs. per kg.)	6.22	6.24	5.92	5.84	6.02
Total foreign exchange earned (Rs. in crores)	77.6	83.0	132.4	124.9	124.2

The Tea Board's review of the export trends shows that the United Kingdom continued to be the best customer for Indian tea during the year 1963; its purchases aggregated 135.6 million kgs. (as compared with 119.9 million kgs. in 1962), accounting for as much as 60 per cent of the total shipments. The U.A.R. came second with purchases amounting to 17.1 million kgs. as against 18.5 million kgs. in 1962 followed by U.S.S.R. which took 16.6 million kgs. as compared with 12.4 million kgs. in the previous year. The U.S., however, bought less, its actual purchases in 1963 being 10.1 million kgs. as against 11.4 million kgs. in 1962. It is in this country that Indian tea is facing tough competition from the tea exported from other countries, especially Ceylon and British East Africa.

No Cause for Complacency

Though the prospects as assessed by the Tea Board for the current year are favourable, there is no room for any sense of complacency. In fact, if tea industry is to play a prominent part in the country's planned economy, it is imperative that all efforts must be concentrated on increasing exports of tea. It may be noted in this context that Indian tea is encountering keen competition in world markets as will be seen from the following table:

(In million kgs.)

	1963	1962	1961	1951
India ..	223.5(39.8)	214.0(38.0)	206.3(37.9)	206.0(45.0)
Pakistan ..	0.0(0.0)	4.0(0.7)	2.6(0.5)	21.9(4.8)
Ceylon ..	206.8(36.8)	204.9(36.4)	193.1(35.5)	138.4(30.2)
Indonesia ..	30.3(5.4)*	30.9(5.5)*	33.4(6.1)*	40.6(8.9)
Br. East Africa† ..	35.9(6.4)	36.7(6.5)	31.9(5.9)	13.6(3.0)
China ..	29.5(5.2)	29.5(5.2)	30.8(5.7)	12.7(2.8)
Formosa ..	13.7(2.4)	12.5(2.2)	14.6(2.7)	11.3(2.4)
Japan ..	3.6(0.6)	8.3(1.5)	7.7(1.4)	8.7(1.9)
Malaya ..	1.6(0.3)	1.9(0.3)	1.8(0.3)	0.8(0.2)
Other Countries ..	17.5(3.1)	21.1(3.7)	22.2(4.0)	3.8(0.8)
Total ..	562.4(100.0)	563.8(100.0)	544.4(100.0)	457.8(100.0)

Note:—1 kg.=2.046 lbs. Figures in brackets represent percentage share of world export.

*Including estimates for unreported exports to Malaya and Hongkong.

†Include Kenya, Uganda, Tanganyika, Nayasaland and S. Rhodesia.

It will be seen from the above table that, whereas the share of this country in the world tea market had receded from 45 per cent in 1961 to 39.8 per cent in 1963—it was lower still at 38 per cent in 1962—Ceylon has increased its share from 30.2 per cent to 36.8 per cent. During the last few years, the British East African region, comprising Kenya, Uganda, Tanganyika, Nayasaland and Southern Rhodesia, has more than doubled its share in the world tea market, from a bare 3 per cent in 1951 to 6.4 per cent in 1963.

Fourth Plan Target

The keen competition in world tea markets invests the need for producing quality tea at an economic cost with urgency. Production costs ought to be reduced in the interest of export promotion. The tea industry, being a labour-intensive industry, is highly sensitive to rise in the wage costs. The recent rise in labour costs as a result of Wage Board and Bonus Commission recommendations have adversely affected the implementation of the schemes of expansion and modernisation in tea industry. In the circumstances, doubts have been expressed by many tea planters about the fulfilment of the target of 1,000 million lbs. tentatively fixed for the fourth Five-year Plan. Here is what Mr. T. T. Ratnasabapathy Pillai, a Director of the Peria Karamalai Tea and Produce Company, Ltd. said while presiding over the annual meeting of the Company held recently: "The target... is, I am afraid, rather ambitious and I share the view that it may prove to be unattainable even though the Government may provide measures of relief and other incentives essential to encourage production." If, however, the Government is earnest about the successful achievement of the production and export targets fixed for tea in the fourth Plan, certain relief measures are urgent. Four such measures have been recommended by the consultative Committee of Tea Producers Associations. They are: one, both replacement and extension planting on virgin soil should be allowed as a revenue charge for tax purposes or should at least be given substantial development rebate for both Central and agricultural income-tax; two, a drawback of excise duty should be allowed on all teas exported which is of particular significance to the promotion of tea outside India; three, land suitable for the planting of tea should not be requisitioned by the State Government; and, four, the industry should be protected from excessive demands inflicting higher labour costs than can be borne economically, particularly as a result of the recent Bonus Commission report, labour housing schemes and increased labour wages.

Along with these measures, it is necessary that all efforts are made to create an atmosphere abroad so that demand for Indian tea increases. The relaxation of restrictions on imports of Indian tea in the European Economic Community must be taken full advantage of by a vigorous propaganda aimed at making tea more popular. While export promotion is important, the rising domestic demand for tea cannot be ignored. The internal consumption of tea in India had risen steadily from 82.7 million kgs. in 1953-54 to 139.6 million kgs. in 1961-62. During 1962-63, however, due to lower production and higher exports, the growth of domestic consumption of tea appears to have been arrested. In fact, the estimate for internal consumption in that year is only 133.1 million kgs. But with increasing population and improved standards of living, the demand for this beverage is bound to rise in the coming years. A healthy domestic market, after all, imparts strength to the tea industry to compete effectively in world markets.

TRENDS IN INDIA'S RUBBER ECONOMY

SHORTAGE OF SUPPLY PERSISTS—LARGE IMPORTS CONTINUE

INDIA continues to spend quite a bit of foreign exchange for importing large quantities of rubber to meet the persistent shortage in supplies. The value of actual imports during the financial year 1963-64 was over Rs. 9 crores, of which natural rubber accounted for Rs. 6.36 crores (25,159 metric tons), synthetic rubber for Rs. 2.38 crores (8,904 metric tons) and reclaimed rubber for Rs. 41 lakhs (3,777 tons). The continued large-scale imports must be attributed to the failure of the rise in indigenous production to keep pace with that in requirements. The production of natural rubber during the year 1963-64 amounted to about 37,400 metric tons which, though it was markedly higher than the actual output of 25,697 tons in 1960-61, was well below the actual consumption of 61,155 tons, so that the deficit was of the order of 23,755 tons. The estimated output in the current year (April 1964 to March 1965) is placed at 46,000 tons, a quantity that is considerably less than what is required to meet fully the total demand for rubber (natural, synthetic and reclaimed) which is currently said to be running at an annual rate of about 85,000 tons. Since the production of synthetic rubber and reclaimed rubber continues to be low (about 10,000 tons and 7,000 tons, respectively, per annum), the total deficit comes to 22,000 tons. The deficit will be larger still in the coming years, unless efforts are made from now alone to step up the domestic production of rubber. The Working Group on Plantation Crops has estimated natural rubber production by 1970-71 at 72,000 tons. The Group expects the production to rise further if the various development schemes are fully implemented. It may perhaps go over 100,000 tons under favourable conditions, whereas the demand for rubber of various varieties is put at 224,000 tons.

Judged against this background, there will be plenty of scope for expansion in both the natural and the synthetic rubber sectors. The growers of natural rubber need not, therefore, fear about any excessive competition either from domestic synthetic rubber production or from foreign rubber. The Government, after all, will not be so rash as to issue licences indiscriminately for the establishment of factories to produce synthetic rubber. Nor will it allow unrestricted imports of natural rubber. The assessment about the impact of imports on the domestic rubber economy as made by the new Chairman of the Rubber Board, Mr. P. S. Habeeb Mohamed, when he addressed for the first time the (forty-eighth) meeting of the Board at Kottayam recently, is rather confusing. Thus, in one place, Mr. Habeeb Mohamed stated that the present system of granting actual users' licences for rubber manufacturers and the Government of India's decision to link import of natural rubber to the internal purchases of synthetic rubber had caused "serious apprehension" among the producers of natural rubber. But, in another place, he said that there was no cause for alarm. The import of natural rubber during the first four months of 1964-65, according to him, had actually fallen by 1,966 tons as compared with the corresponding period of 1963-64, while the offtake had increased considerably.

On the issue of imports, the Rubber Board, it may be recalled, had passed, at its forty-sixth meeting held in February last, a resolution urging the Central Government to (*a*) discontinue the system of granting import licences for natural rubber directly to manufacturers, (*b*) to issue import licences in favour of the Board, and (*c*) to authorise the Board to allocate the imported rubber among consumers. The Government has done well, indeed, in rejecting this plea. It is true that the Rubber Act, as Mr. Habeeb Mohamed said, provides for the responsibility of the Board about marketing of rubber. But there are other considerations which should not be overlooked. Commenting on the aforesaid plea of the Board (*vide* page 284 of *Commerce* dated 22nd February), we had observed:

"The Board's plea for monopoly import licensing is not well substantial. When once the overseas sellers of natural rubber come to know about the creation of such monopoly in India, they will naturally put up their prices. It is commonsense that the bargaining power as a buyer of actual consumers and established importers is always stronger than a monopoly buyer. Besides the increase in imported cost, the rubber goods producers may also have to bear an additional cost, since the Board will include its import and distribution charges to the selling prices of rubber. It is to be hoped that the Government of India will bear this point in mind and reject the Rubber Board's plea."

This journal is glad that the Government of India has decided against vesting the Rubber Board with monopoly import powers. The Rubber Board must concentrate attention on developmental activities concerning rubber growing and it should not bother about the distribution of imported rubber. It is necessary to mention this point because there is so much work to be done by the Board to bring about a quantitative and qualitative improvement in rubber production. The past few years have no doubt witnessed a notable improvement in per-acre yield of rubber; the average yield per acre of tappable area has risen from 135 kg. in 1955-56 to 148 kg. in 1960-61 and further to 159 kg. in 1963-64. But the yield is much lower than that (average of 440 kg.) obtained in Malaya; clones are now being tested in Malaya that yield as much as 1,500-1,600 kg. per acre. While it is too much to expect similar yields in India in the immediate future, the potentialities of raising the yield to a level much above what is obtained at present are pretty vast. The potentialities can be utilised fully if the Rubber Board plays its part properly. Mr. Habeeb Mohamed himself stated in effect that the Board ought to be more energetic than has been the case so far, as witness his remarks:

" .... there is a lot which the Board should do to encourage the productivity and yield per acre and reduce the production costs. We can legitimately do a lot about replanting, strengthening of our advisory services and organisation of the small holdings sector. Research activities have also to be intensified."

The aforesaid remarks assume added significance because the progress actually achieved so far in the implementation of replanting and new plantings, as the Rubber Board Chairman himself admitted, has been only modest. The replanting scheme, it will be recalled, was brought into force in 1957. A target of 70,000 acres was fixed for a period of 10 years in the beginning. The scheme had to be modified in 1960, due to poor response, and the subsidy was enhanced to Rs. 1,000 per acre from 1960 onwards. The area covered by the scheme from 1957 to 1963 was only 30,000 acres, as against the target of 54,000 acres. "Compared to Ceylon and Malaya, our achievements," to quote the Chairman, "are very modest." The Board has now two loan schemes, for small holders of rubber financed from the Pool Fund, namely, the new planting loan scheme and the immature area upkeep loan scheme. Both these schemes cater to the needs of planters whose rubber areas are below 15 acres.

Position at a Glance

(In metric tons)

	1963-64	1962-63	1960-61	1955-56
Production :				
Natural ..	37,397	32,239	25,697	23,730
Synthetic ..	9,149	..	..	..
Reclaimed ..	4,267	2,184	..	..
Consumption :				
Natural ..	61,155	53,553	48,148	28,445
Synthetic ..	12,140	10,723	7,397	461
Reclaimed ..	7,500*	6,850	5,453	2,647
Imports :				
Natural ..	25,159	23,360	23,125	4,428
Synthetic ..	8,904	10,297	8,097	1,201
Reclaimed ..	3,777	6,839	5,183	2,853

* Rough estimate only.

The new planting loan scheme was introduced in 1962. The annual target is 2,500 acres. So far the Board has received 426 applications for an area of 3,125 acres. Sanction has been accorded to 60 cases covering an area of 320 acres. The scheme, according to the Chairman of the Board, has not made much progress because of two difficulties. In the first place, in Travancore-Cochin, land is not available for expansion. Secondly, small holders generally experience difficulty in finding land for security. The immature area unkeep loan was introduced in 1963. During 1963-64, 292 applications covering an area of 1,866 acres were received. Of these, 58 applications were rejected because of ineligibility. So far sanction has been given for 10 cases covering an area of 54 acres. The main reason for the poor progress, it is said, is the difficulty experienced by small holders to find land for security. Another scheme is being implemented by the Land Mortgage Banks. Under the scheme, loan at the rate of Rs. 750 per acre is given to persons undertaking planting of rubber in areas not exceeding 15 acres. This scheme, too, is said to have not achieved much progress.

Against this background of poor progress, it is just as well that the Rubber Board has drafted a new scheme, in place of all the three schemes referred to above, to be implemented with financial assistance from Land Mortgage Banks. Loans will be granted under the scheme for new planting and extension of existing rubber areas and also replanting areas which are not eligible for the Board's subsidy. And it is also gratifying to learn that the Board has, in consultation with the Agricultural Refinance Corporation, prepared a scheme for extending agricultural refinance facilities to the rubber plantation industry in the shape of long-term loans through scheduled banks. The scheme is intended to cover 50,000 acres over the next five years. The amount of loan is Rs. 1,600 per acre in the case of individual planters and Rs. 2,100 per acre in the case of companies. The loan will be admissible only to planters undertaking new plantation of rubber in 15 acres or above. The scheduled banks will be responsible for implementing the scheme with the technical assistance of the Board.

The other activities of the Rubber Board as highlighted by its Chairman may be summed up here:

The Board's scheme of distributing planting material at subsidised rates has become much popular in recent years. In order to meet the increased demand, four ten-acre nurseries are suggested to be established soon.

The advisory services of the Board have to play an important role in the development of the industry. With a view to increasing efficiency, the routine duties of Rubber Instructor's have been separated. It is proposed to re-organise the advisory services on Malayan pattern with specialised services for estates and small holders. Necessary steps are being taken to issue a number of advisory pamphlets incorporating uptodate scientific developments affecting rubber cultivation and processing.

The Board is rendering assistance to small growers through the distribution of plant protection equipments on loan, supply of plant protection chemicals at subsidised rates, and distribution of formic acid.

The most important assistance given by the Board for small growers pertains to the processing and marketing of rubber. The Board is subsidising 50 per cent of the cost of construction of smoke houses, subject to a maximum of Rs. 5,000 for a smoke house.

The useful work done by the different divisions of the Rubber Research Institute of India has been strengthened in the past year. The work on soil analysis and field experimentation done by the Agronomy division has been intensified.

Studies on green-budding technique have been taken up by the Botany division. Experiments on spacing in nursery beds and use of polythene materials for budding, undertaken by that division, have given useful results.

The Pathology division could report two new diseases on rubber hitherto unrecorded in Asia, namely, leaf spot disease and thread blight.

The Chemistry and Rubber Technology division started functioning only from June 1963. This division is investigating problems relating to the processing techniques.

The importance of scientific methods of rubber cultivation and processing cannot be stressed too strongly. It is the consideration of ensuring a decent return to rubber growers, and not any apprehension of competition from synthetic rubber, that invests the need for augmenting productivity of rubber lands, both quantitatively and qualitatively, with urgency. To the extent such productivity is raised, the cost of production will be reduced. It may be noted here that the price of rubber in India is higher by Rs. 42 to Rs. 51 per 50 kg. as compared with that of Singapore (Rs. 119.17 per kg.) and Colombo (Rs. 110.87). The disparity is all the more glaring because the price in respect of Singapore and Colombo is for the top grade quality and it is a competitive price, since the natural rubber producers in Malaya and Ceylon, in the absence of an internal market for natural rubber, have to sell their product in a competitive world market. Mr. Habeeb Mohamed did well to draw attention to the wide price disparity and to urge that India should utilise to the utmost the comparatively favourable situation and modernise rubber growing. As he rightly stated, the future definitely belongs to producers of natural rubber, but the distant future belongs to the efficient producers.

MANCHESTER LETTER

ELECTIONS AND THE COTTON INDUSTRY

WILL THERE BE FIRM CONTROL ON IMPORTS?

From Our Special Correspondent

MANCHESTER, 13*th October*

WITH political issues crowding the columns of the newspapers and the rival contestants hotly debating their respective creeds, many businessmen feel the need for less talk and more action on industrial matters. Until the immediate turmoil dies down, however, and the new Parliament assembles, there can be little respite from voices raised in angry controversy. By the week-end at least, some of the direct questions will have been answered and, unless a stalemate is reached, the composition of the next Government will be known.

If the voters verdict is "no change," industrial policy will presumably remain unaltered.* The attitude of the present Government has been criticised in the past for its inability to understand the many frustrations felt by Lancashire traders, particularly over imports. But within the past year, a notable readjustment of ideas has taken place, indicating that more reasonable views are held at the Board of Trade and that the limit in providing any open door for foreign suppliers has been reached.

Should the Labour Party take charge, certain revisions in procedure may follow, but the principle of keeping deliveries of foreign goods within reasonable limits will be maintrained. The Socialist plan for cotton proposed the establishment of firm import controls handled by a permanent committee whose object would be to regulate an even flow of supplies when they were needed.

On wider policy issues, a Labour spokesman on economic affairs has indicated that a much closer watch would be kept on mergers. Although there are instances where monopoly trends could have an adverse effect on many aspects of trading, some of the recent developments in textiles leading to closer collaboration between sectional interests, should be supported rather than opposed. Such arguments may yet be unnecessary, dependent on the polling, but the next few days may bring major repercussions on all aspects of enterprise.

Rich and Poor

Every now and then, statements are made by individuals which, although self-evident in themselves, require stressing, particularly to the outside world and the detractors of textiles. Such a statement constituted the final paragraph of the opening address made by Mr. Alfredo Sedo, the President of the International Cotton Federation, at its annual meeting last week. "The textile industry," he said, "must be judged against the yardstick of efficiency and performance and not against some misguided notion of a social service. It is not a charitable institution, nor can it be expected to make continual sacrifices."

As a producer of an essential product through the suitable employment of both labour and capital, textile firms can only render this service if allowed to make a profit under conditions of equal opportunity, Mr. Sedo continued. In this connection, he delved into the apparent conflict of interests between the rich and poor countries now regarded as the basic problem in all international economic affairs.

Many would agree with the President that this theme not only simplifies the issue too much, but also renders bad service to the cause of the developing countries themselves.

Two Types of Developing Countries

Mr. Sedo made a very valid point in observing that a distinction should be drawn between the two types of "developing" countries. There are those in which all industries, including textiles, are in their infancy. There are others which, as far as their textile industry is concerned, are already in an advanced stage, with a productive capacity not only great but also very modern and highly competitive.

"It is normal," Mr. Sedo said, "that the first of these groups will want to erect new mills and gradually build a textile industry of their own. It is also understandable that the other developing countries, those which already have a successful textile industry, will wish to expand it further still." Whether this desire is also wise is another question, he added. The need for foreign exchange often obliterates basic economic principles and considerations of orderly development.

Earnings from Assets

Stockbrokers, economists, financial observers and many other individual collectors of statistics have their own methods of drawing up tables of industrial profits and, even more important, have their systems for comparison, which rarely coincide. In these days of diversification, it becomes increasingly difficult, if not impossible, to make an accurate analysis of any single industry due to the many overlapping factors which cut across the basic occupation of the firms in question.

The latest figures covering the first nine months of the current year published in *The Financial Times* are a case in point. Under the heading "Cotton Textiles," 28 companies are shown whose results indicate aggregate trading profits this year of £12,883,000, as against £10,400,000 in the same period in 1963. After allowing for depreciation and charging taxation, the ordinary dividend payment distributed is relatively larger at £2,781,000, as against £2,636,000. Net assets of these companies are shown at £120,665,000, as against £111,601,000.

On this basis, the profits percentage of net assets is reckoned to be 10.7, as against 9.3 last year, but this compares with an average over the industrial field as a whole of 19.6. Only shipbuilding and shipping under the general headings are shown to have a lower ratio.

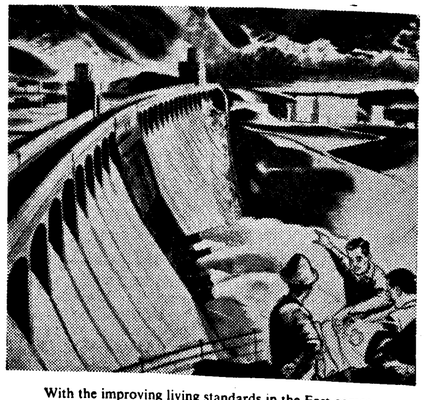
Wool and Other Textiles

In neighbouring industries, the woollen trade with results from 43 companies indicates profits of £15,780,000 and net assets of £77,977,000, so that a percentage of 20.2 is achieved. In miscellaneous textiles, consisting of 45 firms, profits of £90,909,000 are recorded on net assets of £459,785,000, giving a ratio of 19.8 per cent. From the larger figures quoted, it would seem that the "miscellaneous textiles" section would include a number of important companies which might at one time have sailed under the banner of cotton.

Relatively few firms have published their accounts during recent weeks. In the past, the final quarter of the year provided interesting information in this respect, but, due to the takeover wave, several returns will be missing this year. Much will depend in future on the response to the Stock Exchange's call for more detailed figures, as many former textile combines and units are now only a part of much bigger structures.

*Since this letter was despatched, the Labour Party has been returned to power, with Mr. Harold Wilson as the Prime Minister.

DEVELOPMENTS IN THE EAST



With the improving living standards in the East comes the prospect of trade expansion and of increasing opportunities for profitable marketing. The world-wide facilities of three great banking organizations, merged into a single comprehensive service, are at your disposal with up-to-date information and expert advice on all aspects of finance and trade in these areas.

INDIA'S COMPETITORS IN U. K. MARKET

HOW THEY ARE FARING IN 1964

By A Special Correspondent

ALTHOUGH India's total exports in 1963-64 rose sharply by about Rs. 76 crores, as compared with the previous year, the export to some important countries recorded a decline. One such country was the United Kingdom whose offtake of Indian goods was lower at Rs. 160.71 crores, as against Rs. 162.24 crores in the preceding year. In the first quarter of 1964-65, India's export to the U.K. was valued at Rs. 34.68 crores, as compared with Rs. 30.05 crores in the corresponding period of 1963-64.

Among the important items whose export to the U.K. declined in 1963-64 were tea, groundnut cakes, groundnut meal (defatted) and manganese ore. Tea export fell from Rs. 75 crores in 1962-63 to Rs. 70 crores in 1963-64, groundnut cakes from Rs. 1.62 crore to Rs. 40 lakhs, groundnut meal (defatted) from Rs. 12 crores to Rs. 10 crores and manganese ore from Rs. 1.30 crore to Rs. 60 lakhs. But the export of certain other commodities showed a considerable increase. For example, coffee export improved from Rs. 9 lakhs to Rs. 19 lakhs, cashew kernels from Rs. 94 lakhs to Rs. 107 lakhs and grey sheetings from Rs. 5.47 crores to Rs. 6.66 crores.

According to the latest U.K.'s trade statistics, imports from India into the U.K. in January-July 1964 declined by about three per cent to £74.4 million, as compared with January-July 1963. The main items which recorded a decline in the current year were tea, feeding stuff for animals, tobacco, crude minerals (including mica), oilseeds, essential oils and metal ores. On the other hand, the export of several commodities recorded a considerable increase, such as textile yarn and fabrics, leather, sheep's and lamb's wool, and fruits and vegetables. The following table compares India's exports to the U.K. in the first seven months of 1964 with those of the corresponding period of 1963:

India's Exports to U.K. of Selected Commodities

(In thousand £s)

Commodity	7 months 1963		7 months 1964	
	Value	% of total exports to U.K.	Value	% of total exports to U.K.
All commodities	76,663	100	74,161	100
Tea	27,477	35.7	21,346	28.7
Textile yarn, fabrics, etc.	13,157	17.0	19,316	26.0
Of which :				
(1) Grey, unbleached	5,114	6.6	9,466	12.6
(2) Bleached, dyed or mercerised	683	0.9	1,359	1.8
Feeding stuff	9,427	12.3	8,032	10.8
Of which : Oilcake	8,969	11.6	7,522	10.1
Leather	5,778	7.5	6,206	8.3
Textile fibres and waste	1,520	2.0	3,395	4.5
Of which :				
(1) Sheep's and lamb's wool	460	0.6	2,080	2.8
(2) Vegetable fibres (except jute and cotton)	396	0.5	546	0.7
Crude animal and vegetable materials	2,346	3.0	2,313	3.1
Tobacco	6,064	7.8	5,042	6.7
Fruits and vegetables	863	1.0	1,164	1.6
Of which : Edible nuts	166	0.2	919	1.2
Crude minerals (including mica)	1,173	1.5	934	1.2
Fixed vegetable oils	421	0.5	962	1.3
Oilseeds	965	1.2	911	1.2
Hides and skins	429	0.6	325	0.4
Essential oils	389	0.5	331	0.4
Metal ores	1,351	2.5	398	0.5
Of which : Manganese ore	773	1.0	368	0.5

It will be worthwhile to analyse the reasons for the decline in Indian exports in the current year. So far as tea is concerned, according to the U.K. statistics, imports from India declined by 22.5 per cent in value from £27 million in the first seven months of 1963 to £21 million in the similar period of 1964. There is, however, nothing alarming in this because Britain's total imports of tea also fell by 12 per cent in the period under review—from £60 million to £53 million. It may be recalled that tea imports into the U.K. had sharply declined in the last quarter of 1962 on account of the disturbances caused by the Chinese invasion. Consequently, imports in 1963 were heavy because of the pent-up demand and low stocks. During the year, the demand for tea in the U.K. seems to have attained the usual level, resulting in lower imports from India. Imports from Ceylon also declined, though on smaller scale, from £21 million to £20 million. The following table shows the quantity of tea imported into the U.K. in 1963 and 1964:

(In thousand lbs.)

	First 7 months	
	1963	1964
Total imports	311,749	276,688
India	133,290	103,649
Ceylon	102,838	98,514

The import of feeding stuff for animals from India fell by 15 per cent—from £9.4 million to £8.0 million. The share of our main competitors such as Canada and Burma also declined by 13 per cent and 34 per cent, respectively. The decline was due to lower demand. In 1963, the U.K. experienced a severe winter which resulted in a great demand for cattle feed. But in the current year, since the weather was less severe, the demand for cattle feed was lower.

Tobacco (unmanufactured) is another major item whose import from India declined from £6,064,000 to £5,042,000 or 17 per cent. The U.K.'s total imports also fell from £37,151,000 to £35,938,000 although Canada and the U.S.A. were able to improve their share, as will be clear from the following table:

(In thousand £s)

	First 7 months	
	1963	1964
Total imports	37,151	35,938
India	6,064	5,042
Rhodesia and Nyasaland	11,254	6,942
Canada	8,210	9,197
U.S.A.	9,899	10,767

The other items whose import from India into the U.K. dwindled were crude animal and vegetable materials from £357,000 to £309,000; crude minerals including mica from £1,173,000 to £934,000, essential oils from £389,000 to £331,000; and manganese ore from £773,000 to £368,000. The decline in the import of manganese ore was particularly steep, as will be clear from the table below:

(In thousand £s)

	First 7 months	
	1963	1964
Total imports into U.K.	2,788	3,626
India	773	368
Ghana	611	597
S. Africa	696	896
U.S.S.R.	539	691

It will be seen that, while imports from India declined, those from South Africa and the U.S.S.R. recorded a considerable increase of 29 per cent in each case.

Among the Indian goods, the export of which to the U.K. rose substantially in the first seven months of 1964, as compared with those of 1963, cotton textiles were the most important. Import of woven cotton fabrics, grey unbleached, into the U.K. from India increased by 60 per cent to 164,305,000 square yards and of bleached, dyed, mercerised, printed or otherwise finished cotton fabrics by 120 per cent. Imports from Hong Kong declined appreciably but those from China went up by 49 per cent.

The figures below show the imports of cotton textiles into the U.K. in the first seven months of 1963 and 1964:

(In thousand sq. yards)

	First 7 months	
	1963	1964
Grey unbleached :		
Total U.K. imports	290,041	387,649
India	102,703	164,305
Hong Kong	53,868	44,272
Bleached, dyed, etc. :		
Total U.K. imports	88,688	99,953
India	7,550	16,476
Hong Kong	18,262	14,438

The big increase in coffee imports from India is another encouraging feature. Coffee imports into the U.K. rose from £13,158,000 to £18,728,000 while imports from India went up by 220 per cent—from £62,000 to £198,000. It is interesting to see that coffee consumption in the U.K. has shown a remarkable improvement in recent years. At 2.7 lbs. per head, the *per capita* consumption is double that of a decade earlier and nearly four times the pre-war average. Total coffee imports into the U.K. reached a record level of 1,546,347 cwt. in 1963; and the Commercial Section of the Indian Embassy in U.K. reports that the "long-term future for Indian coffee in the U.K. market is fairly bright, particularly with Brazil not burdened with an excessive surplus for the next couple of years."

Encouraging performance has also been reported by fruits and vegetables. The U.K.'s figures show that in the seven months ended July 1964, imports of fruits and vegetables from India rose by 35 per cent to £1,164,000, as compared with the seven months ended July 1963. In this group the import of edible nuts increased by 454 per cent—from £166,000 to £919,000. An official report reveals that the United Kingdom is the largest market for Indian canned or bottled fruits. The quality of Indian canned fruits, especially tinned mango slices, is considered to be very good. But Indian prices are stated to be fairly high. The canned fruit dealers in the U.K. are of the view that India can sell much larger quantities provided the prices are lowered.

FOREIGN TRADE OF COMMON MARKET AND E.F.T.A.

The six members of the European Economic Community (Common Market) have steadily increased their share of world trade in the past 13 years, while the seven members of the European Free Trade Area (E.F.T.A.) have recorded a slightly declining share. The present E.E.C. members' imports rose from 19.4 per cent of world imports in 1950 to 28.4 per cent in 1963. Exports rose in the same period from 16.9 per cent to 28.3 per cent of world exports. Meanwhile, imports by the present members of the E.F.T.A. declined from 19.8 per cent of world imports in 1950 to 18.2 per cent last year and exports from 17.4 per cent to 16.4 per cent. Of the two groups, the country that marked the steepest rise in its share of world commerce was West Germany. As of last year, with 11 per cent of world exports and 9.2 per cent of imports, it ranked in second place after the United States.

I.O.B. is big enough to serve you...

I.O.B. is an international bank with offices throughout India and South-east Asia and correspondents the world over. It offers a wide range of services to suit the needs of varied customers. Indeed, I.O.B. is big enough to serve you.

We asked our customers, thousands of them at random, what they thought of our service. They replied: "We are pleased". They also made several helpful suggestions which we are implementing. Indeed, I.O.B. is small enough to know you.

Range of I.O.B. services: Savings and Current Accounts—Recurring and Fixed Deposits—Personal and Business Loans—Bills Payment Service—Gift Cheques—Travellers Cheques—Safe Deposit Lockers —Trade and Export Information and Advice—and whatever other specialised help you may need.

...and small enough to know you

THE OTHER CHINESE INVASION—II

PEKING SUCCESSES IN AFRICAN SAFARI HIT INDIA

By K. Krishna Moorthy

[This is the second in a series of articles dealing with Communist China's foreign aid and trade relations, with special emphasis on their adverse effect on India.—ED.]

MR. Lal Bahadur Shastri's first trip overseas as Prime Minister—his only trip outside the country earlier was to Nepal in April 1963—was to Cairo to attend the 47-nation conference of non-aligned leaders and to be a State guest of the United Arab Republic for a few days preceding the conference. Although Mr. Shastri, as well as the External Affairs Minister, Mr. Swaran Singh, both described the conference as a success, it is clear to independent observers that India stands isolated amid the countries swearing allegiance to the principles of non-alignment. India was the earliest proponent and practitioner of the policy of non-alignment from involment in big power politics, but no one from among the self-proclaimed non-aligned countries which gathered in Cairo appeared to be willing to discuss some crucial issues of the day on merit. The Cairo *communique* of the non-aligned conference partly reflects the successes of the Chinese communist diplomacy in Asia and Africa.

A third of Peking's diplomatic posts is in Africa, indicating the interest Peking has taken in developing close relations with the newly emerging nations in Africa. India tried in vain to make the Cairo *communique* critical of Chinese aggressive policies. India could not succeed in persuading the nations gathered in Cairo to take a non-aligned critical look at China's policies. The *communique* contained detailed references to various colonial issues and, as usual, blunt criticism of Western nations. There was scarcely a hint of criticism of communist powers, let alone China.

Mr. Shastri suggested the dispatch of a mission to China to dissuade her from testing her nuclear weapon. The conference confined itself to a general declaration against nuclear weapons and appealed for acceptance of the Moscow test ban treaty. But the conference could not bring itself to criticise China directly for her intention to join the nuclear club. She did it soon after the conference.

Indo-African Trade

(Value in crores of rupees)

Financial year	Indian imports	Indian exports	Balance of trade
1961-62	64	56	—8
1962-63	56	50	—6
1963-64	51	47	—4
1963-64 (April-June)	16	10	—6
1964-65 (April-June)	11	9	—2

The African unwillingness to go along with India in a judgment of the aggressive Chinese action on the Himalayan border was also obvious during the Commonwealth Prime Ministers' conference. Ghana had opposed British assistance to India to strengthen her defences against China and in the Commonwealth Prime Ministers' *communique* references to the India-China dispute had to be softened to please some African representatives.

In 1963, about fifty African delegations visited Peking and China sent about forty delegations to various African countries before China's Prime Minister Chou En-lai went on his long tour of Africa—Arab and Negro. Chou En-lai established his first personal contact with Egypt's President Nasser at the Bandung conference and followed it up with fraternal assistance to Egypt when she was reeling under the combined Anglo-French-Israeli attack in hostilities over the Suez Canal. The Chinese also offered military assistance to the Algerians in their fight against the French.

The total Chinese aid offers to African countries are a little less than Rs. 96 crores, with the biggest amount going to Algeria which has been offered Rs. 24 crores, excluding military aid. Tanganyika-Zanzibar has been offered about Rs. 19 crores, Guinea Rs. 12 crores, Somalia Rs. 11 crores, Ghana and Mali Rs. 9.5 crores each, Kenya Rs. 6.5 crores. Other recipients are Congo (when Lumumba was Prime Minister) and the United Arab Republic.

Nigeria has been strongly anti-Peking, not wishing to have anything to do yet with Chinese aid offers. Malawi, since it attained independence a few months ago, under Dr. Hastings Banda, has been pronouncedly anti-Peking and she faced a Cabinet crisis as a result of the policy differences over China. Dr. Banda accused the Chinese Embassy in Dar-es-Salaam as responsible for the Cabinet crises. Six of the nine Malawi Ministers were dismissed by Dr. Banda, following a conditional aid offer by China of £18 million. The condition was not only that Malawi should recognise the Peking Government but also break off relations with Taiwan. Dr. Banda had invited both Peking and Taiwanese representatives to attend the independence celebrations in July. The Peking envoy in Dar-es-Salaam did not attend the celebrations. Dr. Banda had all along been warning his countrymen against Pekings machinations and was shocked when some of his Ministers began questioning his attitude towards Peking.

In Mali and Somalia on the west and east coasts of Africa, separated by the huge continent, Peking has been able to establish strong footholds. Somalia officially denied accepting Chinese military assistance but some Somalis are reported to have undergone military training in China. In both Mali and in Somalia, China has been able to play upon anti-white sentiments while offering assistance. Although the Chinese, who openly preach revolution in Africa, were suspected to have had a hand in the Zanzibar revolt—Zanzibar's Foreign Minister Babu was the New China News Agency correspondent—after the union of Tanganyika and Zanzibar which was partly aimed at stabilising conditions in Zanzibar, President Nyrere has moved close to Peking. He has gone to the extent of accepting Chinese military assistance for training his soldiers.

During Chou's long *safari* across Africa towards the end of 1963 and early this year, he had considerable success in Algeria. Among the more important commercial ventures China and Algeria are negotiating is the supply of up to four million tonnes of Saharn crude for oil-short China. A French firm is also likely to take part in the deal. The Chinese are also likely to win a contract to build roads across the Sahara to link Algerian ports with Mali, Chad, Niger and Upper Volta. A Chinese-built road in the Yemen is said to have impressed the Arabs and Africans. The Chinese Prime Minister went out of his way to please the Algerians, by even declaring that "the Chinese people greatly benefited from the constant and effective support of the Algerian people in the constant struggle for liberation and building of socialism." Algerians started their battle against the French in earnest some seven years after the Communists set up Government in Peking! Chou bent over backwards to please Nasser, then Morocco's King Hassan who considers Nasser to be an enemy, and tried to fraternise equally well with revolutionary Ben Bella as well as the moderate Bourgiba of Tunisia. When Chou was flying over Tunisian territory, Bourgiba received a radio message from Chou's plane. The next day in Algiers the Tunisian Ambassador invited Chou to Tunisia which still had not recognised Peking. Chou visited Tunisia and the recognition was also announced. The Algerians and the Egyptians are at loggerheads with King Hassan whom Chou treated with deference not usually associated with revolutionaries in their behaviour to royalty. Morocco's national drink in Chinese green tea and sugar comes from Cuba. Earlier this year there was talk of the United States cutting off aid to Morocco because of Moroccan exports of cobalt, a strategic material, to Communist China which could have extracted material from this cobalt for her nuclear adventures. Morocco's defence of the deal was that the U.S. could not supply Morocco with Chinese tea and could not sell her sugar at prices quoted by the Cubans. Morocco also exports phosphates to China. Lorries made by a French firm and a Swedish firm in their Moroccan subsidiaries have been sold to China. King Hassan has accepted an invitation to visit Peking.

In Ghana as well as Mali and Guinea, early recipients of Chinese economic aid, construction of Chinese-aided plants has been delayed. Among China's virulent critics today in Africa is the Congo's Tshombe who accuses the Chinese of fomenting rebellions in the strife-torn country.

China announced in July 1960 that she had severed commercial relations with South Africa because of opposition to racialist policies but trade between South Africa and China amounted to £3 million in 1963, according to South African Government sources. This was three times higher than the trade between the two countries in 1962. According to Yugoslav reports, China has sold even explosives to

U.S. TECHNIQUES IN COAL MINING

IMPRESSIONS AND CONCLUSIONS OF BRITISH TEAM

THE American coal industry has attained a high level of productivity—much higher than that of coal industry in Europe. Indeed, the respective productivities, it is said, are in different orders of magnitude. In Europe (including Great Britain), for instance, the overall productivity is just two tons per manshift, whereas in the United States deep-mined productivity is 12-tons per manshift and, if all forms of mining are included, about 15 tons. According to Mr. H.E. Collins of the U.K. National Coal Board's study team which visited several U.S. mines some months back, the productivity in *individual* mines is much higher, ranging from 30 tons to 75 tons per manshift. Even the *best* collieries in Great Britain, on the other hand, can show only a fraction of such productivity (*vide* Report by Mr. H. E. Collins, abstracts from which have been published in *Colliery Guardian* of London, dated 18th September 1964). There are, of course, several advantages in America—advantages stemming from good natural conditions, relatively thick seams, shallow working and single seam extraction. But all this, according to Mr. Collins, accounts for only part of the wide difference in productivity.

The report of mine visits by the British team is quite interesting in this context. One such visit was to an Ohio mine. The object of the visit was to see in operation the Joy Push Button Miner which had been developed for partial extraction beyond the "high wall" at which strip mining had reached its economic limit. Since its installation the machine's operating time has averaged as much as 56 per cent of the total available time and is expected to reach 70 per cent. The total number of men employed on the machine, which operates three shifts per day for five days in a week, is 17. The coal is delivered direct into 10-ton trucks by which it is transported to a nearby disposal point. For the first four months of 1964, the shift output has averaged 752 tons, or over 2,000 tons per day. This works out to an overall output per manshift of 150 tons. It may, however, be noted that the Joy Push Button Miner, which is responsible for such a high level of productivity, is only of application to surface mining.

In a West Virginia mine visited by the team, the Marietta Miner has been in operation. This is a borer-type machine which takes a cut 7 ft. high and 14 ft. wide. The coal is taken from the cutting head by an in-built scraper conveyor. A Joy Loader picks up this coal and loads it on to cable reel shuttle cars which, in turn, discharge it on to a 36-in. belt line. The latter is at present 2,500 yards long and at the outbye end an automatic loading station charges 10-ton mine cars. A gathering locomotive assembles trainloads of mine cars at an intermediate point. The output per manshift on the colliery face is 100 tons.

Thin Seam Mining

An example of thin seam mining is to be found in a Pennsylvania colliery. The method of working here is room-and-pillar, with no attempt to extract the pillars. Nevertheless, extraction is about 60 per cent. Mining is conventional with the sequence of undercutting and shearing with a universal tyre-mounted mobile machine, loading out into shuttle cars. The shuttle cars discharge through a feeder on to a belt conveyor from which the coal is loaded into 8-ton mine cars on the haulage entry. The daily output of the mine is 2,000 to 2,500 tons at an overall output of 12 tons per manshift. It is said that retreat longwall mining could well show better results here than room-and-pillar working.

In another West Virginia mine, which has switched over from room-and-pillar mining to retreat longwall mining, the face is equipped with Westfalia Lunen coal plough, mobile hydraulic supports and compressed-air pushers for the armoured conveyor. The operation of the plough is continuous; there is no stoppage of either plough or conveyor for an instant. Herein, according to Mr. Collins, lies the success of the installation. This plough face produces on two shifts per day with a crew of eight men on each shift. There is a small maintenance shift on nights, giving a total face labour per 24 hours of 20 men. Saleable output has averaged 650 tons per shift, giving a face output of 65 tons per manshift. The armoured face conveyor delivers into a deep-sided feeder conveyor which moves backwards over the gate conveyor as the face retreats. All coal is eventually conveyed to the surface.

A relatively new mine in Illinois, visited by the team, has an overall output of 44 tons per manshift. The seam, which is being worked at a depth of 800 ft., is 8 ft. thick with a strong shale roof. The system of working is room-and-pillar, but is virtually analagous to longwall retreating. The coal is loaded direct from the Goodman Borer into shuttle cars, then on to a 36-in. gate belt. Transfer of coal from this gate belt to the 42-in.-main belt is through a feeder which regulates the feed and ensures that the 42-in. belt is not overloaded. The coal is conveyed to the pit bottom and raised in 10-ton skips to the surface. The skip discharges into a conveyor either direct to the washery or to a temporary storage bunker.

U.S. Bureau of Mines

The team's discussions with the U.S. Bureau of Mines have centred round several interesting developments. One of these, for instance, is that, in practising fire-damp drainage in room-and-pillar workings, it has been found advantageous to inject water under pressure to force out the gas. Work is also in progress with hydraulic mining, using high-pressure jets; this has been applied to room-and-pillar mining in various places. The Health and Safety Research and Testing Centre of the Bureau is currently conducting investigations in several fields—namely, fire control, particularly in abandoned mines; ventilation; health research; dust research; electric and mechanical testing and approval; and diesel engines for underground use. The subject of underground diesel engines is of particular interest, for none has previously been used in the U.S. chiefly because of the strong opposition of the United Mine Workers, who considered them unsafe. However, recently diesel shuttle cars and locomotives have been approved for operation underground.

The team's discussions with the Bureau on the various aspects of roof control have revealed that further research work is in progress with roof bolting—a widely adopted system of roof support in the United States. The importance of roof bolting will be obvious from the fact that 36 million roof bolts are used annually in the U.S. An extension of this principle is being considered; this is meant to achieve "roof bonding" for strata loading and for strengthening the immediate roof. All this, of course, has no relevance to surface mining (that is, open strip mining, for the most part operating with overburden not exceeding 120 ft.) which presently accounts for 30 per cent of the total coal production in the United States.

The team's impressions and conclusions, as summarised by Mr. Collins, are given below:

1. Generally, natural conditions in the U.S. are far more favourable than in Great Britain. Only exceptionally had more than one seam been worked in any take. Hence there has been no experience of interaction of strata movement from previous working. Nevertheless, difference in mining conditions cannot solely account for the wide difference in productivity.

2. Seams being worked are generally of thicknesses of 4 to 8 ft. Indeed, a 4-ft. seam is considered a thin seam.

3. In Great Britain, total extraction is the aim, whereas in the United States partial extraction is general. This factor considerably eases the support problems and makes for lower roadway maintenance, labour, and costs.

4. In the United States, the depth of cover is in the order of 300 to 400 ft., although some workings exceed this depth, and certainly working at greater depth is contemplated. The effect of the relatively shallow depth is twofold. Room-and-pillar working predominates, with maximum mechanisation, and roof support is relatively simple.

5. Continuous mining is practised wherever possible, using principally Goodman, Marietta, Joy Continuous, and Lee Norse miners. Where conventional mining still prevails, this is worked very intensely.

6. Where maximum extraction is obtained in room-and-pillar mining, or where longwall working has been adopted, retreat mining is universally practised. This, too, makes for reduced roadway maintenance labour.

7. Concentration of working is perhaps the main reason for high productivity. The aim is to produce up to 1,000 ton/shift/working section. Moreover, American management and men alike strive for maximum machine shift operating time and are not content unless this is in the order of 70 to 80 per cent of the time available. Moreover, men and management have grown up with mechanisation at every stage of their lives, even in the home; in fact it has become an attitude of mind.

8. The simplicity of underground transport systems in the U.S.A. and frequently relatively short hauls make for low transport costs. There are, however, some exceptionally long hauls.

9. Roof bolting as a means of supporting the roof in workings and on roadways is almost universally practised. This also reduces roadway maintenance labour.

10. Wherever possible, automatic operation prevails, and there is rigorous control of labour.

As a member for production in the U.K. National Coal Board, Mr. Collins has concluded his report by saying that it would be possible to narrow the gap in coal mining productivity between Britain and the United States by a changed attitude of mind to the business of coal winning. His suggestions would not involve considerable additional capital expenditure. Concentration of output at the face, accent on the importance of machine operating time so as to achieve efficiencies of upto 70-80 per cent, greater attention to retreat mining and further application of roof bolting—these are the suggestions made by Mr. Collins for improving productivity in Britain's nationalised coal industry which has the requisite machines and technical manpower for this job.

ELECTRON MICROPROBE

A microscope sees the unseen. A new instrument, described last week at a Washington symposium, sees the unseen and tells scientists what it is. The instrument, the creation of inventors in the U.S. and abroad, is called an "electron microprobe." It shoots a beam of electrons at a target as small as 1,000 million millionth of a gram and enables scientists to determine its chemical makeup by the tell-tale X-rays it gives off.

American, British and Japanese scientists outlined a wide range of uses and potential uses for this instrument on the 14th instant at a symposium held in connection with the 126th meeting of the Electro-Chemical Society in Washington. Dr. Gunji Shinoda of Osaka University said that Japan was using the electron microprobe to expose impurities in steel tubing. Dr. Theodore Hall of the Cavendish Laboratory, Cambridge, said that British scientsts were using the probe to identify weak spots in exotic spaceage metals and that biologists hoped to adapt it to determine the difference between normal and cancerous cells. Dr. K. F. J. Heinrich of the U.S. National Bureau of Standards said that the probe could show defects in tiny microminiaturized electronic circuits not otherwise detectable, sample pollution in the air and expose faked works of art.

The instrument incorporates the technical features of the electron microscope invented in Germany, the X-ray spectroscope developed in France and Sweden, and radiation detectors developed in the U.S. The first working model was built in France in 1950, based on a description by J. Hiller of the U.S. At present about 200 are in use in the U.S., France, England, Japan and the Soviet Union.

L.I.C.'S OWN-YOUR-HOME SCHEME

The Life Insurance Corporation's Own-Your-Home Scheme will be extended to a few more centres from 15th October 1964. The centres are: Kolhapur, Sangli, Amraoti, Bhavnagar, Jamnagar, Tuticorin, Guntur, Vishakhapatnam, Mangalore, Calicut, Faridabad, Kotah, Dhanbad, Ranchi, Durg, Gorakhpur and Ghaziabad. The scheme will shortly be extended also to Goa and Gandhidham.

There has been a fairly good response, it is said, to the Own-Your-Home Scheme which was introduced in 26 centres on 1st January 1964 and extended to 30 more centres on 1st April 1964. The present extension brings the total number of centres operating the scheme to 77.

Upto 31st August 1964, 1,820 applications for loan amount of Rs. 4.51 crores were received. Out of these, loans for Rs. 76.6 lakhs, covering 306 applications were sanctioned. Of the balance, 1,017 applications for a sum of Rs. 2.16 crores are under consideration while the remaining have been rejected. The response is stated to have been particularly good in Delhi, Bangalore, Madras, Hyderabad, Amritsar, Calcutta, Jaipur and Gauhati. The difficult supply position of essential building materials like cement and steel at most centres and the soaring land prices in Bombay account for the limited response.

WORLD'S FIRST NATURAL GAS SHIPMENT

The world's first commercial cargo of natural gas arrived in Britain on the 12th instant from Algeria after a five-day journey at a temperature of 258°F. The shipment—sufficient to supply a town of 30,000 domestic consumers for a year—was unloaded at the British Gas Council's Canvey Island terminal, at the mouth of the River Thames, from the specially-insulated tanker *Methane Princess*. Unloading started almost immediately on the arrival of the ship. After processing, the methane will, within 24 hours, be piped to eight regional gas boards throughout Britain.

The *Methane Princess*, which cost nearly £5,000,000 to build, and a sister ship, the *Methane Progress*, are the first vessels of this type to be built in the world. They will operate a regular service between terminals in Britain and Algeria. Mr. P. Coppack, head of Conche International Methane Ltd.—the group that partnered the Gas Council in the project—described the arrival of the vessel as the "birth of a new world industry." He predicted that in 10 years' time there would be between 20 and 30 methane carriers operating throughout the world, transporting about 2,000 million cubic feet of gas a day.

NEW PRODUCTS AND PROCESSES

Resurfacing Sanitaryware

A PROCESS by which baths, washbasins, lavatories and other sanitaryware can be resurfaced at a fraction of the cost of replacement has been developed by a British firm. Advantages of the process are: it restores sanitaryware to showroom appearance in a choice of colours (any colour can be matched exactly); it is hygienic, since cracks and chips are filled in; there is no lingering odour (the bath or basin is usable again in 24 hours); the surface is resistant to chipping, flaking and cracking; and the cost is low. In carrying out the process, the operator first treats the surface with a chemical and makes good any cracks or chips. One coat of a special compound is applied with an air gun. This is a chemical-based, free-flowing substance with special hardening and adhesive characteristics and, when fully dry, has a surface as tough as alloy steel. Laboratory tests show that the material is unaffected by 24-hour contact with 10 per cent nitric acid, 10 per cent sulphuric acid, 70 per cent hydrochloric acid and 15 per cent citric acid. A 60-day test with petrol, mineral spirits and alcohol caused no damage to the finish.

Folding Containers

A vehicle which with a few simple movements can be converted from a general cargo lorry into a tankertruck and *vice versa* has been designed by a firm in Malmoe, South Sweden. Trelleborgs Gummifabriks AB, has developed the rubber tank container for the vehicle. On a lorry or trailer chassis, a specially constructed platform body is built with side flaps of conventional type. The loading area consists of horizontally placed doors on which the goods are loaded in the usual way. On the underside of these doors the rubber containers, folded in envelope fashion, are attached. For the transport of liquids, the doors are raised to a vertical position and fixed to the side flaps. At the same time the containers unfold and can be filled through bottom valves. Forming "bulkheads" between the containers, the doors contribute to stabilising the load and preventing it from splashing to and fro. The rubber containers consist internally of oil-resistant nitrile rubber and on the outside neoprene rubber, which has good resistance to oil and also to the weather.

Glass-fibre Banding

Glass-fibre tape is now being used by Associated Electrical Industries Ltd., London, for banding the armatures of traction motors, replacing the steel wire traditionally used. It reduces the amount of insulation required and is claimed to improve the electrical design of the motor and to simplify maintenance. More than 300 traction motors with the new banding are already in service all over the world, and a further 600 are in course of manufacture. Banding of traction motors is necessary to prevent movement of the armature windings when the machine is subjected in service to very high rotational stresses. Glass-fibre combines the desirable mechanical properties of high ultimate tensile strength and low elongation under stress. It is used in the form of tape impregnated with a thermo-setting resin, which is wound on to the armature under tension and is then cured by heat-treatment to form a consolidated banding of resin and glass. This has a smooth surface finish which collects little dust and is easy to clean and maintain. Since less tension is required, the glass tape is safer to apply than steel wire, and it needs no soldering to retain it in position. Being an insulating material, moreover, it dispenses with the extra insulation required for steel banding. Its non-conducting nature also means that damage is localised if the armature should suffer a winding fault or accidental electric arcing.

Micro Balance

A micro balance which measures weights or forces to two millionths of a gram has been developed by Combustion Instruments Ltd., Middlesex, England. It is small, robust, resistant to mechanical shock, and does not require levelling. The head can be integrated with production apparatus, giving remote indication, or the indicator can be replaced by a recording millivoltmeter or by a feed-back mechanism to provide automated control. The design incorporates a balance head which produces an electrical output proportional to the applied force by means of an electro-optical stabilising system. The amount of current flowing provides a direct and accurate measurement of the force on the balance beam.

Knitted Fabrics

Knitted fabrics made of paper, which will stretch but not sag, are said to be possible with a process developed by Crocker-Hamilton Papers, 545, Westminster Street, Fitchburg, Massachusetts. The paper, "knitwear," can be washed dry-cleaned and even used for swimming costumes. Paper in rolls of the colour desired for the fabric is fed into the machine and comes out finished and ready for sewing. Crocker-Hamilton says there is no intermediate yarn-making stage in the process. It is now making knitted material 84 inches wide and is attempting to adapt the process to make woven goods.

Pivotless Electrical Instruments

Two taut metal ribbons highly resistant to shock suspend the 'movement' of new electrical instruments made by Crompton Parkinson Ltd.; and their torsion provides the necessary restoring force. They replace pivots, jewelled bearings and control springs, which can cause frictional errors and are easily damaged by shock or vibration. The new instruments have withstood three times in succession the shock tests laid down by the British Admiralty for instruments used in fighting ships, and they remain accurate after ten million full scale deflections of the pointer. At present, ammeters and voltmeters in both moving-coil and moving-iron versions are available, as well as frequency indicators and speed indicators. The suspension ribbons, made of heat-treated beryllium-copper, may be only 0.0005 inch thick—accurate to 0.00001 inch—and 0.005 inch wide. They are held taut by tension springs which are mounted on bushes fitted to supporting brackets on the frame of the 'movement.' Guides on the tension springs and in the hubs at the ends of the 'movement'-shaft ensure that the pull is axial; and spigots on the outer end of each hub, fitting inside the bush, prevent excessive radial or axial displacement.

Machine Lays Bricks

Damarest Machines Incorporated, of 146a Shore Road, Port Washington, New York, U.S., claims to have developed a machine which will lay the ten-inch cavity brick walls so common in house construction. The machine will also construct solid brick walls used for factory and office blocks. Mounted on rails running parallel to the wall under construction, the machine carries its own supply of bricks, mortar and steel ties. The company claims that the machine prevents mortar falling into the wall-cavity and is very quick in action as well as producing high-quality "workmanship."

Cheap Clock

An accurate and low-cost time base giving high output torques and independent of mains supplies has been brought out by Smiths Clock and Watch Division, Sectric House, Waterloo Road, London, N.W.2. It consists of a moving coil balance system as used in a clock, an electronic circuit to detect and amplify the drive pulses of the clock and a slave system consisting of a simple ratchet motor to produce the desired rotary action. The balance wheel is not mechanically connected to the output spindle and is able to swing freely and keep exceptionally good time. A range of output torques can be obtained—the higher the output, the shorter the battery life. For example, a torque of 2,000 gm/cms at one revolution per hour will consume 1.90 milliwatts of three U.11 batteries in series, lasting three months.

Teaching Machine

Reduction in the teaching time required for an industrial electronics course is claimed for a unique machine developed by a member of the Pye group of companies in Australia. Designed and made by Colville Wireless Equipment P. Ltd., the machine is a combined induction and di-electric heater housed in a many-windowed cabinet which was specially planned to provide maximum visibility of all major internal components. This remarkable visibility—even the oil-filled transformer groups and variable capacitors are in transparent plastic or glass-sided housings—is extended by interior lighting. The machine can be used to demonstrate to students almost every aspect of modern industrial electronics. Its particular value is that—in the hands of an imaginative teacher—it will shorten the time required by students to master essential electronic theories.

Camera Contains Own Flash

An amateur's 35 mm. camera with a built-in electronic flash is the latest Voigtlander contribution to the photographer's world. The sole distributors in the U.K. are Johnsons of Hendon and the camera, called the Vitrona, will shortly be available for sale. The electronic equipment is inside the camera itself and the two small batteries needed for some 150 flashes are housed in a pistol grip that fits into the base of the camera by a bayonet fitting. A few seconds are needed to charge the capacitor for a flash photograph. Without the pistol grip the Vitrona is a normal good-quality camera without built-in light-meter or rangefinder, but with a Lanthar f2.8 lens. When flash is used the focusing adjustment is geared to the aperture so that adjustment of distance automatically sets the correct stop.

Electro-hydraulic Crushing

Increased efficiency in electro-hydraulic crushing of materials has been achieved by Britain's Atomic Energy Authority scientists at the Harwell research establishment. The technique employs hydraulic shock waves of explosive intensity, produced by electric spark discharges within a liquid, to crush or shape material within the liquid. The new developments are mainly on the electrical side of the equipment and it is stated that efficiencies of about 20 per cent of those of conventional crushing machinery have been obtained. The method is particularly suitable for crushing materials such as coal, gravel, chalk or glass and refractory materials such as carbides or oxides which, for one reason or another, are difficult to crush by conventional methods. The ease and convenience of this technique for production of repetitive high pressure impulses has led to its increasing use for the forming of sheet metal. In the nuclear field it offers the possibility of crushing irradiated ceramic fuels where remote handling is essential. The chamber used can be small and simple and there are no internal moving parts.

With the Compliments of

THE NEW INDIA INDUSTRIES LIMITED, BARODA

Bombay Office:

Industrial Assurance Building, Churchgate

Foremost Manufacturers of:

"INDIA" BRAND

Best Egyptian Cotton Healds, Steel Reeds, Brass Reeds, Striking Combs, Dobby Harness with and without rubber and Heald Piecing Yarn

Failure-proof Automatic Brakes

To ensure perfect safety in travel by eliminating possibilities of accidents to vehicles—railway trains, automobiles and other vehicles—rendered uncontrollable by accidental failures of their breaking systems, Mr. R. K. Nijhawan, 37, Model Town, Amritsar (Punjab), has patented a new device. Termed as "failure-proof automatic brakes", the device works on the following principle. The normal position of all brakes on vehicles fitted with this system is the 'applied' position which is achieved by a pressure from springs. That is, the brakes would remain 'applied' were they not kept pulled away to an inoperative position, the means of which are under the control of the operator of the vehicle. In other words, the means which are in the hands of the drivers are the means to keep the brakes in check from the 'applied' position and are withdrawn (or rather released) only when braking is desired. Obviously, any accidental failure or a consequent withdrawal of these means also results in braking of the vehicles and avoiding any mishap due to brake failure. The said means are the usual ones—hand lever or foot pedal brakes—mechanical or hydraulic in case of automobiles, vacuum or compressed air braking in railways. The invention also incorporates a new device for transmitting mechanical braking to the whole railway train from the engine pulling (or pushing) the train, and this device can be installed even in the existent present day braking systems.

Metal Sorting Instrument

An instrument which can be used to detect different types of steel alloys and also to indicate whether steel bars and rods or components are too hard or too soft has been produced by Elcometer Instruments, Fairfield Road, Droylsden, Manchester England. Called the 'Minitor' metal sorter and measuring only 4¾ by 2½ by 1⅞ inches, it is battery-powered and operated with a separate three-inch probe. There is also a hand coil which is more sensitive.

After switching on, either the probe or coil is placed on a standard bar or component and set by adjusting a switch. The instrument is then ready for use and any material or component which shows a reading substantially different from that of the standard sample is easily found. On checking for correct heat treatment, the instrument is set in the same way and a plus or minus reading indicates whether the material or component is too hard or too soft.

NEW IDEAS IN BRIEF

A new electronic firing system for torpedoes has been developed by the Swedish firm, Svenska Philips. The equipment is likely to bring in orders worth £5 million from N.A.T.O. countries.

A way of adequately protecting turbine blades from chemical attack and oxidation at high temperatures has been patented by Brown Boveri, Baden, Switzerland. The technique is also suitable for other components.

Ampoules with brittle necks snap off easily for instant use by doctors, veterinary surgeons and chemists. They are developed by R. Anrep, 29 rue Carnot, Suresnes, Seine, France.

Small, lightweight welding outfits, designed for both industrial users and do-it-yourself enthusiasts, are being marketed by Esab, Box 850, Goteborg, Sweden.

A Polish machine is claimed to produce water three times as pure as ordinary distilled water, at half the cost, according to the Polish Chamber of Foreign Trade, Warsaw, Poland.

A newly patented system gives an extra hard, wear-resistant skin to the teeth of saws and the cogs of gear wheels. The new technique involves heating the surface to above 1,000 deg. C. within a tenth of a second and then cooling it even more quickly. It is developed by Wuster, Wieselburg, Austria.

A nylon weir can be inflated to dam flowing streams partly, but will also fold and retract into a recess on the bed when boats need to pass or floods become torrential. It is developed by J. C. Buijze, 4 Duinroosplantsoen, Haarlem, Netherlands.

A domestic pressure cooker with the usual rubber pressure seal is said to be more effective, as well as safer, after the addition of a leaf spring mounted in the cooker head. It is produced by Rudolf Fissler, Idar-Oberstein, Germany.

A range of plastic trees and shrubs has been patented which can be built up in sections to any size. Trunks can have any number of branches and leaves can be added singly or in clusters in a process developed by Flora Plant Societa, 18 Via Fontana, Milan, Italy.

Sets of modular plastic components for making architectural models of buildings and designing layouts are now available. They are produced by Modulex 3-Dimensional Planning, 62 Brompton Road, London, S.W. 3.

A hand-operated pump for inflating all types of tyres and for providing small quantities of compressed air at pressures up to 120 lbs. per square inch has been introduced by Errut Products, Abingdom Road, London W.8.

PERIA KARAMALAI TEA AND PRODUCE COMPANY LIMITED

MR. T. T. R. PILLAI SURVEYS PROBLEMS OF TEA INDUSTRY

LABOUR COSTS MUST BE REDUCED TO MAKE EXPORTS COMPETITIVE

THE Fifty-first Annual General Meeting of the Peria Karamalai Tea and Produce Company Limited was held at Coimbatore on Wednesday, 30th September 1964. In the absence abroad of Mr. J. N. A. Hobbs, Chairman of the Company, Mr. T. T. Rathnasabapathy Pillai, a Director, presided over the meeting. In the course of his speech, Mr. Pillai urged the need for reducing labour costs in tea industry in the interest of export promotion. Rising wages in a labour-intensive industry like tea plantation, he pointed out, would impair the competitive capacity of Indian tea in foreign markets. In view of all-round rise in costs, he added, the industry had been financially strained and all expansion and modernisation schemes had suffered. Referring to the target of 1,000 million lbs. tentatively fixed in the fourth Five-year Plan, he felt that the target was rather ambitious and unattainable, even though the Government might provide measures of relief and other incentives essential to encourage production.

The following is the full text of Mr. Rathnasabapathy Pillai's speech:

GENTLEMEN,

In the absence of our permanent Chairman, Mr. J. N. A. Hobbs, who is unable to be present at this meeting because he is now away in U.K. and has asked me to convey to you his regrets for his absence, the privilege of presiding at this annual meeting has devolved on me.

I have great pleasure in welcoming you to this 51st annual general meeting of your Company and to place before you the Directors' report and audited accounts for the year ended 31st March 1964 for your approval. The Directors' report and audited accounts have been in your hands for the statutory period and I propose, with your permission, to follow our usual practice and take them as read. I shall, however, be pleased to answer any queries regarding them at the end of this address.

Mr. Nehru

At the outset, I wish to refer to the great loss the country has suffered in the sudden demise of Mr. Jawaharlal Nehru. Through the years, Mr. Nehru's name has been writ large in the affairs of men and nations; his leadership in India's freedom struggle, his dedication to the cause of world peace, his championship of the oppressed and downtrodden and his high ideals for the progress of mankind—all these have contributed to his towering stature as one of the world's great leaders, a leader not for today, but for all time. In this moment of our sorrow we can only remain steadfast in our confidence that his selfless dedication to the noblest ideals of mankind will continue to guide and inspire the nation.

I am pleased to say that the year's working results of your Company have been very satisfactory, especially when we consider the shortfall in tea crop of about 143,000 kgs. compared to last year. Despite the shortfall in crop, the gross income from tea has shown an increase of about Rs. 2 lakhs or a net increase of 29 paise per kg. Although there was a general increase in tea prices, the main factor which brought about this substantial increase in price was finer plucking and the resultant improvement in quality.

Cost and Quality

Whilst every effort is being made to improve the quality of tea produced, a simultaneous effort is also made to bring down the cost. As you will see from the accounts, the year's expenditure has shown a considerable reduction, and the saving recorded is about Rs. 2.25 lakhs when compared to previous year. However, our efforts in bringing down costs are being nullified by the enforced increase in the wage structure and the rising costs of materials. As you know, the Government has just declared a second interim wage increase for tea plantation workers and this would cost your Company about Rs. 1,80,000 a year.

In view of the ever-increasing costs over which we have little control, the only possible way to bring down the cost per kilogramme is to increase the yielding capacity of the tea. and with this in view we are going ahead by planting high-yielding clones. I am glad to report that the vegetative propagation methods adopted by us in this direction are proving successful.

The crop estimated for the current season is 2,375,000 kgs. and although we suffered a setback in the early part of the year, due to unprecedented drought conditions, subsequent rush in crop has made up the deficit and I am glad to say that we are in line with the estimate at the end of August. If we get a favourable north-east monsoon, it is possible that we may harvest an all-time record crop.

The Chairman's statement attached to the accounts has dealt in some detail with the Company's affairs relevant to the year under report, and I would now like to touch on some wider issues that are of vital concern to this Company.

Exports

Tea exports were larger in 1963 in spite of a smaller crop. Indian tea was facing difficulties in the European markets because of the quota restrictions and duty. I consider that the decision of the European Economic Community to exempt tea from import tariffs from the beginning of this year will enable India to develop a new field. But this will certainly call for a vigorous campaign to popularise Indian tea on the Continent.

While India's exports to countries other than U.K. have declined during the past few years, the rest of the tea exporting countries, particularly Ceylon, have made a niche for themselves in those areas. As the Estimates Committee points out, "the image of Indian tea has not been well projected in the importing countries," whereas "Ceylon has stolen a march inasmuch as all good tea is now considered Ceylon tea." Tea is one of the three main foreign exchange earners for India. We can ill-afford to yield places of advantage to other countries in the continental tea markets.

I appreciate the Government's gesture in allowing the rebate on income-tax, super-tax and surtax, but the continuance of heavy excise duty on tea gives us concern and affects the benefit of the said rebate. Though provision has been made to leave some funds to plough back for development purposes by the industry, no provisions have been made in the budget to improve the competitive character of Indian teas in the world markets.

Producing countries may be helped by current research to produce an instant tea which tastes like the "real stuff." If successful, this type of tea could win over new customers just as instant coffee has widened coffee sales in the U.K. But any developments on the customer's side are bound to be slow. Meanwhile, rising production will almost inevitably push prices down, mainly of course in the lower qualities where there is greater competition. So, paradoxically, the Government's attempts to earn more foreign exchange by selling more tea are likely to be frustrated.

Targets

The target of 1,000 million lbs. by 1970 in the fourth Five-year Plan is, I am afraid, rather ambitious and I share the view that it may prove to be unattainable, even though the Government may provide measures of relief and other incentives essential to encourage production. Since early Government action in the desired direction is a prerequisite towards achieving the production target, I concur with the views expressed by the Consultative Committee of Tea Producer Associations and consider the following relief measures to be necessary to act as an impetus for the expansion of production and exports.

(a) Replacement and extension planting on virgin soil should both be allowed as a revenue charge for tax purposes, or should at least be given substantial development rebate for both Central and agricultural income-tax.

(b) A drawback of excise duty should be allowed on all teas exported. This is of particular significance to the promotion of tea outside India.

(c) Land suitable for the planting of tea should not be requisitioned by the State Government.

(d) The industry should be protected from excessive demands inflicting higher labour costs than can be borne economically, particularly as a result of the recent Bonus Commission report, labour housing schemes and increased labour wages.

Adoption of these measures would ease the problems of producers who are only too anxious to raise output as they will participate in the benefits which should accrue from an expanded industry, and in the knowledge that the Tea Board is taking steps to ensure that markets are found for the extra production.

Finance

Finance has been a chronic problem for the Indian tea industry, and the industry needs a very large amount of money for the annual recurring needs, as well as development and the implementation of statutory welfare measures. In recent years, after payment of bonus to labour, Central income-tax, State agricultural income-tax, and a reasonable dividend, very little was left with the companies to meet expenditure on capital account or to expend sufficient amounts on purchase of stores etc. I welcome the setting up of a high-powered committee to tackle the basic issue of tea plantation finance, although there are some misgivings as to whether this new Committee could do anything more than what the Tea Board has been trying to do for some time. The Board is well aware of the problems and has put up certain proposals before the Government of India. The most important obstacle in the way of a solution is that even if the Centre gives certain incentives or concessions it will only mean that the States will syphon away a large proportion of them, leaving the estates with very little of the benefits. There is need for co-ordination between the Centre and the States in the matter of taxing plantation crops.

The Central Wage Board for the tea plantation industry has recommended a second interim increase for all tea plantation areas in the country and it comes into force with retrospective effect from May 1964. A comparatively small rise in the individual wage adds large sums of money to the cost of production and there are limits to what we can afford. The decision of the Wage Board would become unrealistic if increase in wages is given without ensuring corresponding increase in productivity. Wages must have some relation to output. The Wage Board is of the view that there is no bar to the revision of workloads and tasks in the tea plantations provided the revision is made by mutual agreement, and is not against the principles laid down in the tripartite recommendations in this regard. The extent to which this view can be implemented is a debatable point as normally mutual agreement on this issue is not easily achievable.

The Wage Board has recommended wage increase for daily-rated workers varying from 7 paise to 18 paise, according to grades and categories. The increase proposed for monthly paid employees ranges from Rs. 10 to Rs. 22 and, to some categories, an increment, in addition to the wage rise, has also been recommended depending on pay scales and regions in which they are employed. The recommendations for the second interim wage increase have disturbed the tea industry.

Expansion Schemes

In view of all-round rise in production cost, the industry, in my opinion, has been financially strained and all expansion and modernisation schemes have consequently suffered. I am afraid, the present increase in wages will impair the competitive power

Indian tea in foreign markets. Indian tea, in fact, has already become difficult to sell abroad owing to high prices. If we are to reduce our cost of production so as to keep it competitive to those of other producers, it is necessary that labour wages should be kept at a level which would not tend to increase the cost of production still further.

The other all-India body whose findings will have great influence on our industry is the Bonus Commission. We understand from the Commission's report that in the case of plantations in South India it has urged the Employers Association and the Unions to continue the present industry-wise agreement with such modifications as might be agreed upon by them. Unless the existing agreements are more favourable to workers than the Commission's formula, there is no chance of renewing them. The fixing of a minimum bonus at 4 per cent or Rs. 40, whichever is higher, has been done without considering its practical application to the plantation industry. Since a maximum and a minimum bonus is prescribed, the maximum will have to be paid if the surplus allowable to bonus justifies it and a minimum is payable whether a profit is made or not. The formula for the computation of the surplus is aimed at only satisfying labour and gives no indication of any concern with resource creation for economic development. The formula is likely to work out very harshly for the plantation industry where the assets were acquired in most cases many years ago and where the book value of the assets (and the capital of the Company) bears no relation whatsoever to the true values.

Bonus for Labour

Quite rightly or properly, fiscal and taxation measures and principles mentioned to govern bonus to labour are all capital-based. In the case of almost all plantation companies the capital shown in the balance-sheet as mentioned above does not correspond correctly to the assets of the companies. This aspect was dealt with at the recent conference of United Planters Association of Southern India. In reality, the plantations are worth many times more than the capital and reserves shown in the balance sheets. As referred to above, there is no provision for depreciation allowance as in the case of industrial companies. In view thus of the low capital, the dividends declared by many of the plantation companies appear to be very high, giving a wrong, exaggerated and distorted picture of the profit earned by the companies leading to erroneous and incorrect impressions in the minds of labour leaders and politicians.

It is obvious that wide variations in the capital structure of plantation companies will result in serious anomalies between companies and the resultant variation in the amounts available for bonus is likely to cause widespread labour trouble. I fear that the Bonus Commission's report will create more problems than it has solved. The plantation industry is under a statutory obligation to provide a comprehensive range of welfare measures for labour. As a labour-intensive industry, plantations are capable of offering greater employment opportunities if resources are available for development. If available resources are frittered away by high bonus payments capital cannot expand or provide new job opportunities.

Excise Duty

The zonal system for fixing differential rates of excise duty has been in existence for some years and it is time the Government re-examined the position on the basis of the average performance of different district teas in the market, apart from reducing the weight of excise duty generally. The Government, in order to make good the loss of revenue from the abolition of export duty, increased the excise duty which the producer has to pay before the tea leaves the factory, and this imposes further financial strains on the producers' resources.

I would now like to thank on your behalf the General Manager, his assistants, the staff and labour for their good work during the year. I would also like to thank my colleagues in the Board for their help and guidance and finally, our Managing Agents, Messrs. Peirce Leslie and Co. Ltd. for their services.

Note: *This does not purport to be a record of the proceedings of the meeting.*

A DECADE OF WAR AGAINST HUNGER

P.L. 480 FOOD PROMOTES ECONOMIC GROWTH

By Dorothy H. Jacobson

Assistant Secretary for International Affairs, U.S. Department of Agriculture

THIS year the U.S. Food-for-Peace programme is marking its tenth anniversary. It has been a momentous decade. It has been a decade of effective war against hunger—man's oldest and most persistent enemy. Food-for-Peace has shown that widespread acute hunger can be eliminated when world food distribution is improved. No major famines have developed in the free world in recent years despite continuing growth of populations.

The Food-for-Peace programme is based on sharing. And it is sharing food on the largest scale in the world's history. Since 1954 the United States has made available on special terms some 125 million tons of food to more than 100 countries—mainly less-developed countries—having a total population of 1,700 million.

Banishing hunger is the primary objective of this great food relief effort, but economic development is another major goal. As U.S. Secretary of Agriculture, Orville L. Freeman, said recently: "It relieves hunger and suffering and promotes education among men, women, and children in developing parts of the world. At the same time it helps those nations to an accelerated takeoff in economic growth that will speed the day when they will become partners in our commercial trade."

The American Record

The United States has been glad to share its surpluses with food-short countries—to help them gain strength and grow economically. A humanitarian concern for the people of other countries is traditional with Americans. The record speaks for itself. The United States has shared its food with the needy when U.S. supplies were short as well as when supplies were large.

As far back as World War I the United States encouraged food conservation and increased food production at home to make increased supplies available to some 200 million Europeans who were on the verge of starvation. U.S. food, coupled with a good 1919 harvest in Europe, eased the crisis and efforts were turned toward the relief of some 10 million undernourished children. Before the children's programme was completed, however, famine hit Russia. That was in 1921. Throughout 1922 and into 1923 American food was poured into Russia. The final tally shows that at least 785,000 metric tons of U.S. food was shipped to that country, of which about $65 million worth, or over 80 per cent of the total value, was donated by the American people. Millions of lives were saved.

Again, at the end of World War II, the American people joined in voluntary conservation measures to make food available to hungry people overseas. Shipments of wheat were so heavy in the 1946 crop year that the U.S. wheat reserve came dangerously close to exhaustion. Nevertheless, heavy food shipments were continued. Records of the Commodity Credit Corporation show that between 1st July 1945 and 30th June 1954 U.S. agricultural exports under various Government programmes were valued at $9,500 million.

Sharing on a vast scale has continued under Food-for-Peace. Close to $14,000 million worth of U.S. farm products have been shipped since 1st July 1954. Shipments include 3,000 million bushels of wheat, a volume equal to almost three U.S. wheat harvests. We shipped 100 million bags of milled rice, equal to two U.S. crops. In addition, we shipped over 900 million bushels of feed grains, 6,400 million pounds (2,880 million kilograms) of fats and oils, 4,800 million pounds 2,160 kilograms of non-fat dry milk, and substantial volumes of other commodities.

Public Law 480

Most of the food shipped under the programme represents exports authorised by Public Law 480—the Agricultural Trade Development and Assistance Act of 1954. P.L. 480 is flexible legislation. Its "titles" authorise several distinct types of operations. Title I authorises sales of surplus farm products and the acceptance of payment in foreign currencies, such as rupees, pesos, and cruzeiros, instead of dollars. Title II permits grants of farm products to other Governments for meeting famine or disaster relief requirements, for use in school lunch programmes, and for wages in "food-for-work" economic development projects. Under Title III, the United States donates food to U.S. voluntary agencies and international organisations carrying on relief activities overseas. Title II also authorises the barter of U.S. farm products for minerals and other durable materials, goods, or equipment produced abroad. Title IV permits export sales of U.S. farm products on credit terms up to 20 years.

These diverse activities are achieving their objectives. Hunger is being battled vigorously. P.L. 480 is making more food available to people whose diets are nutritionally inadequate. Food financed with foreign currencies makes up the bulk of P.L. 480 Food-for-Peace shipments. For some countries the volumes sold for foreign currencies are very substantial. Within the past decade India, for example, bought $2,100 million worth of U.S. farm products, at export market value, paying with rupees. Other major recipients of Title I commodities include Pakistan, Yugoslavia, Spain, Poland, Turkey, Brazil, Korea and Indonesia. Much of the food acquired with foreign currencies is distributed through normal market channels. But the routine way in which the food is handled does not diminish in the slightest its important role in better nutrition.

U.S. food also is promoting economic growth. The United States lends or grants back to needy foreign countries a large share of the foreign currencies received in payment for our farm products. These funds are being used by less-developed countries for flood control, irrigation, reforestation; for improvement of railroads, highways, bridges, communications; for construction of electric power facilities; for building hospitals, clinics, and schools. U.S. food promotes economic growth by helping to control any accompanying food price inflation. Food prices usually rise when new employment creates new purchasing power which in turn increases demand for food. As food prices go up, workers' wages must be increased. Higher wages mean larger costs for development and reduced funds for projects. Increased availability of U.S. food has helped to break this vicious circle.

Supplementary Wage

Food-for-Peace is being used as a supplementary wage in a number of countries. Some five million people are participating in programmes to carry out, through their own labour, some kind of development project—and, in turn, receive food as a wage. Food becomes the genesis of the kind of community development that helps people to help themselves.

In administering food aid programmes, the United States avoids disturbing the agricultures of recipient countries, whose farmers must market their crops at fair prices. We also protect established trade and try to make sure that usual purchases from the United States and other free world countries are continued. We emphasise the use of private trade channels and the observance of customary trade practices.

The United States has found that bread cast upon the waters is being returned. Food-for-Peace is helping to build markets for the United States as well as others. For example, the programme has helped to strengthen Spain's economy, and that country has become a $128 million market for U.S. farm products, a substantial part of which is dollar business. Israel is coming up rapidly as a dollar purchaser. Greece and Formosa are stepping up their cash buying. Some of the foreign currencies accumulated under Public Law 480 are being used in U.S. market development activities in many parts of the world. Foreign currencies also are being used to pay such costs as Embassy expenses, educational exchange programmes, and military expenses.

Food-for-Peace also has become a yardstick. The ability of the United States to feed its own 190 million people well and still have great volumes of food to ship to other countries is proof in itself that unhampered free enterprise is the road to abundance. The failures of regimented agricultures stand out in sharp contrast.

Food-for-Peace, overall, is a tremendous success story—a drama of people at war against want. It is an epic of human generosity pitted against need. As it begins another decade of service to humanity, it is pointing the way to ultimate victory over hunger.

EFFECTS OF SYNTHETICS ON AGRICULTURAL TRADE

FINDINGS OF F. A. O.'S SPECIAL STUDY

MANY of the developing countries, which are struggling hard to improve the low living standards of the masses, secure the bulk of their economic wherewithal from exports of agricultural raw materials. Primary products thus contribute nearly two-fifths of their total export earnings. In recent years, however, these products have been facing keen competition from synthetic materials and other substitutes. It is, in this context, that a special chapter in *The State of Food and Agriculture* 1964 (published by the Food and Agriculture Organisation of the United Nations) has comprehensively analysed the growth of synthetics and their effects on agricultural trade.

The output of synthetic materials is heavily concentrated in the United States, Western Europe, Japan and some centrally planned countries like the Soviet Union. The developing countries, such as India and Brazil, have also established synthetic rayon and rubber industries. The location of synthetic industries in the main agricultural raw material importing countries is, no doubt, inimical to the expansion of trade in natural products. But the establishment of such industries is often inspired by technical considerations. New methods of production are also causing economies in the use of raw materials. In addition, as a recent survey in the U.S. indicates, changing consumer tastes and remarkably rapid rates of innovation cause major adjustments in manufacturing output, and, hence, in the composition of the demand for raw materials. Thus, the better heating of homes and offices, the invention of electric blanket and competition from paper and related materials in packaging and other uses influence the demand for natural fibres just as clearly as competition from man-made fibres. Further, with better marketing and standardising qualities, synthetics are able to compete effectively with natural products.

Synthetic Materials

The principal synthetic or man-made materials discussed in the F.A.O. study are synthetic rubber, man-made fibres and synthetic detergents. Each of these is a group of materials with different characteristics, rather than a single homogeneous product. Types of synthetic rubber include the general-purpose type (S.B.R.), neoprene, nitrile, butyl, polybutadiene, polysoprene, stereo-specific and stereo-regular rubbers. The range of man-made fibres is even wider than that of synthetic rubbers, and are grouped into cellulosics (viscose and acetate rayon) and non-cellulosics, which include the polyamides (nylon), the polyesters (terylene, dacron etc.), the acrlyics (orlon, acrilan, courtelle etc.) and the less important polyvinyl fibres. Synthetic detergents are also of many types, as is evident from the soap products they have been replacing, but are marketed mainly in the form of powders for heavy duty laundry use and liquids for dishwashing and industrial purposes.

An important advantage frequently claimed for the synthetic products *vis-a-vis* the natural raw materials is that they may be "tailored" to meet the requirements of specific end-uses. To an extent, this is true. For synthetic rubbers have been developed for particular purposes and the formulas of basic types could be varied by the addition of carbon black, etc. High tenacity rayon is developed to meet the specific requirements of vehicular tyre cords. Synthetic fibres were, however, first produced and then, by further research and other means, were found suitable for certain end-uses. Another advantage common to all synthetic products is that a greater degree of quality control is possible in their manufacture than is the case with natural materials. This leads to substantial savings in processing costs. Further economies accrue from the greater tenacity of man-made fibres and smaller losses in processing. Utility poundage of man-made fibres, which includes their long lasting attributes, is another factor favouring synthetics. Lastly, the marked stability in the prices of synthetics, in contrast to wide fluctuations in the prices of natural products, can be mentioned as helping the former in their competition with the latter.

Growth Rate Remarkable

Examining the production trends of synthetic raw materials, the F.A.O. study points out that in the last decade (1952-62), production of synthetic raw materials achieved remarkable growth rates unmatched by their natural counterparts even in the prosperous twenties before the advent of synthetics. Synthetic rubber production had grown more rapidly than that of man-made fibres. Production indices of natural and synthetic rubber, which were 97 and 106, respectively, in 1953, were 118 and 255, respectively, in 1962. At the same time, production indices of man-made fibre rose from 118 to 228. In 1962, man-made fibres, as a group, still accounted for only 21 per cent of total apparel fibre output, still dominated overwhelmingly by cotton, whereas synthetic rubber production (even excluding the large output of the centrally planned countries) represented more than half the total elastomer output. Though all the producing countries have contributed to this expansion, the new regions have recorded faster rates of growth than the United States. The United States, however, remains by far the world's largest single producer of all the materials under consideration.

Prices

Prices of all man-made materials, as stated earlier, have remained remarkably stable over long periods of time. The price of S.B.R. rubber in the U.S., for example, has been unchanged at 23 cents per pound since 1953. Again, man-made fibre prices in the U.S. have varied only slightly and, that too, in the downward direction. A similar situation has existed in Britain also. This price stability is in marked contrast to the wide fluctuations experienced in the prices for competing natural materials. Natural rubber prices in New York, for instance, ranged from 20 to 52 cents a pound during 1953-63. The F.A.O. index of lauric acid oil prices also rose sharply in 1959. However, the prices of most of the natural raw materials, such as cotton, wool, etc. were lower in 1962 than in 1953. Prices indices of cotton and wool, which were 97 in 1953, came down to 71 in 1962. The extent to which synthetic competition has contributed to this deterioration in agricultural raw material prices is rather indeterminate. The F.A.O. study has commented on this as follows:

"If at any time, the output of all synthetic materials had ceased, prices of their natural counterparts would have certainly risen in the short term. However, taking into account longer-term supply responses, there is no similar assurance that prices would have been higher than they are today if man-made materials had not come into existence. Prices of some major agricultural products not subject to competition from man-made materials (coffee and cocoa) have declined more rapidly than those of agricultural raw materials."

Competition

Discussing the effects of these developments on the demand for primary products, the F.A.O. study notes that the overall world market for apparel fibres and elastomers has expanded at a rapid rate throughout the post-war period. Between 1952-62, apparel fibre consumption increased by over 50 per cent while elastomer consumption nearly doubled. The markets shared by natural and synthetic products have, in fact, grown faster than those of some of the important food products. To some extent at least, the man-made products have contributed to this growth in demand through the wider range of choice they have offered the consumer. The use of light-weight man-made fibres in suitings may have, for example, encouraged more extensive clothing wardrobes. Synthetic rubber is also greatly used in the footwear industry Expansion of synthetic rubber production has maintained the demand for conventional soap, and hence for fats and oils, at a higher rate than it would otherwise have been through its use in the emulsion process for S.B.R.

The rapid growth in the overall elastomer and fibre markets has been reflected in simultaneous increases in world consumption of natural, as well as synthetic, raw materials. Only, the progress of natural materials has been relatively slow, leading to a sharp fall in total consumption. It is not proper to attribute the relative fall in consumption of natural raw materials to competition with synthetic alone. It has been only one of the limiting factors and, probably, not the most important of the many factors limiting production in developing countries in the post-war period. Others include deliberate policies of diversification, sometimes in favour of food, the shyness of foreign capital and various non-economic factors. Cotton, hides and skins and fats and oils used in soap making have faced a different situation. World cotton output has frequently exceeded consumption and it has affected the United States, where stocks have accumulated—stocks which could not be disposed of either at home or abroad at prices established under Government programmes. Price support for cotton has, however, enabled rayon to win outlets it might otherwise not have obtained.

As far as the future overall demand for synthetic materials is concerned, the position appears to be favourable with the possible exception of soap-making materials. F.A.O. projections suggest a 60 to 90 per cent higher elastomer consumption by 1970. The rate of advance for apparel fibres is expected to be much lower in 1970, some 40-50 per cent over that of the 1957-59 period. The demand for footwear with leather uppers, an indication of the potential demand for leather, may exceed 30 per cent (base 1959-61) by 1970 in all developed countries outside North America, where the demand has reached the near-saturation point. Soap consumption, alone, is expected to continue to fall in all developed regions including centrally planned ones. But, at the same time, it is likely to develop an upward trend in the developing regions. With research and promotion still very active and new synthetics with enhanced capabilities being announced frequently, the total consumption of synthetics is likely to increase. By more closely meeting the requirements of specific end-uses, synthetic materials may be expected to encroach further on the markets for the natural products. In spite of these intense activity in this field, the outlets for existing synthetic products are, by no means, fully exploited. The United Kingdom expects further increases in the proportions of man-made fibres used in carpets. In the U.S.S.R. and other Eastern European countries, all of the industries producing synthetic products have assumed only a fraction of their potential importance, and great developments are planned in this field. The present seven-year plan in the Soviet Union provides for a 240 per cent rise in the output of synthetic rubber between 1958 and 1965.

Future Demand

The implications of the foregoing considerations for the production policies of agricultural raw material producing countries differ somewhat from commodity to commodity. In the case of natural rubber, it is expected that the world demand for it will continue to rise, if it can be made available at prices comparable with that of synthetic rubber. By pursuing a vigorous policy of increasing the total acreage of rubber cultivation, it would be possible to compete effectively with synthetic products. Replanting of rubber trees over large areas would also be of help. Opportunities for expansionist policies to be followed in cotton and wool are also abundant. The present situation of consumption exceeding production, especially in cotton, cannot continue for long. And, unless vigorous policies are pursued, there is the danger of markets being lost to man-made fibres by default. The outlook for hides and skins and fats and oils is in a special position, inasmuch as the former's production policies will be determined mainly by the market for meat. Fats and oils production would depend on the extent of their utilisation in soap. It is, however, only one of their many outlets (soap production) and the prospects for increased food use are more favourable, particularly, in the developing countries.

Measures to Meet Competition

To meet the increasing competition from synthetic materials, there are a number of measures that could be taken by the governments of producing or consuming countries or by producers themselves. It is clearly out of question to expect any limitations on the output of synthetic products. They have won a place for themselves in daily life and it would be retrograde to attempt to alter it. However, in view of the highly competitive conditions in prospect both between producers of natural products and synthetic producers and among the latter themselves, the F.A.O. study suggests that it would be in the interests of both parties to "co-ordinate policies" and avoid some of the less desirable effects of such a situation. It might be useful to recall, in this connection, the measures recommended by the working Party of the recent U.N. Trade and Development Conference:

The measures suggested fall into three categories: developed countries, developing countries and joint action. The developed countries, it has been suggested, should slowly eliminate trade barriers hitting primary products and semi-processed goods competing with synthetics, abolish subsidies on synthetics and prohibit manufacturers from passing off synthetics as natural products.

The developing countries should (*a*) reduce production costs (replace low-yielding rubber trees by high-yielding new stock); (*b*) introduce uniform standards; (*c*) conduct research into new processing methods; (*d*) promote their goods by publicity campaigns; and (*e*) find new ones for finished products containing raw materials.

Both the developed and developing countries should jointly strive to (1) co-ordinate investment plans within the framework of detailed projections of demand and production; (2) consult on steps to prevent manufacture of synthetics competing with the developing countries' exports; (3) study factors influencing substitution; and (4) work to eliminate price fluctuations by commodity agreements and other measures.

Such an approach to the problem of competition between natural and synthetic materials, it is felt, is quite sensible. If this programme were to be implemented, there would be need for close co-operation between the developed and developing countries. Any initial difficulty, such as the opposition from the synthetics manufacturers, especially in the U.S., who have been spending a good deal on research in their products, is not insurmountable.

Synthetic Rubber

The F.A.O. study has, before concluding, given a detailed account of the trade between the principal agricultural raw materials and synthetics. Of all the natural products, rubber, perhaps, faces keener competition from synthetics. The cheapest and quantitatively the most important of synthetic rubbers is styrene-butadiene rubber (S.B.R.). It is superior to general-purpose natural rubbers as it has wear, grove-cracking and aging resistances and fast-curing properties. It is only in resilience that it falls short of natural rubber. This characteristic has made S.B.R. synthetic rubber unsuitable for use in heavy-duty tyres (truck and bus tyres), but it has found wide application in passenger car tyres and captured nearly the entire market in the United States, U.K., France and Federal Republic of Germany. S.B.R. is also used for a great variety of other purposes where cheapness is a paramount consideration. As regards world trade in synthetic rubber, it has now reached about one quarter that of the trade in natural rubber. Till 1959, the U.S. and Canada had a monopoly in this trade as exporters, but, of late, W. Germany has emerged as a major producer and exporter of synthetic rubber. Many of the newly producing countries, such as Australia, Brazil and India, are not currently exporting synthetic rubber. In the decade under consideration, the share of rubber in total world elastomer consumption increased from 38 to 50 per cent. The future prospects about the competition between natural and synthetic rubber are likely to depend on three factors: (a) structure of the synthetic industry, (b) research and development activities and (c) cost and price factors. Natural rubber is not likely to succeed in meeting the enormous demand for elastomers by 1970 (upto 8.5 million metric tons). There is no possibility of any surplus emerging in the consumption of natural rubber in the years to come. Every effort has to be taken to keep its prices stable so that better research and techniques in synthetic rubber would not price the product out of the market.

Apparel Fibres

Apparel fibres have had an expanding market since the war, but in relative terms, the natural fibres—cotton and wool—have lost an appreciable ground to man-made fibres. One reason for the intense competition between man-made and natural fibres has been that the physical properties of the former, like length, fineness, elasticity, etc. can be more easily controlled than in the latter. Production of man-made fibres in 1962 is estimated to have reached 3.9 million tons—rayon accounting for 2.9 million tons. Synthetic fibres achieved a nine-fold rise from 129,000 metric tons in 1952 to 1.08 million metric tons in 1962. Of this, nylon represented nearly 56 per cent of the output in 1962. Since synthetics are still produced in only a few countries, the U.S., the U.K., W. Germany and the U.S.S.R., a larger proportion of world output finds its way into international trade. Total consumption of apparel fibres has grown at a faster rate than world population—from 10.5 to 15.9 million tons in the decade 1952-62. Consumption of man-made fabrics has been much more rapid than in the case of natural fibres. While consumption of synthetics and rayon went up by nearly seven-fold and 78 per cent, respectively, cotton and wool made gains of only 35 per cent. As a result, the market for cotton has fallen from 73 to 65 per cent and that of wool from 10 to 9 per cent during the period. While man-made

INTER-FIRM COMPARISON IN INDUSTRIES

A SIMPLE METHOD OF BRINGING DOWN COSTS

THANKS to the activities of the National Productivity Council in recent years, there is increasing awareness of the need for improving productivity all round for more reasons than one. As Mr. Asoka Mehta, Deputy Chairman of the Planning Commission, has recently put it, productivity is not only "the key to progress or prosperity" but "the key to survival." "Where population is growing and resources are limited, it is really the meaningful deployment of resources and it is only an appropriate combination of the factors of production that can give us the ability to survive and progress. *The price of survival is to move forward and this makes the concept of productivity central and crucial.*" It is not only for the sake of increasing production that the productivity of Indian industries should increase at a fast rate. As industrial costs in India are among the highest in the world, Indian goods are not quite competitive in foreign markets. It is only through higher productivity that costs of production can be gradually brought down to the level prevalent in the industrially advanced countries.

It is not that all the units in Indian industries are working inefficiently. There are some units whose performance is nearly as good as that of some of the best units in the Western countries. For example, it has been recently found that some of the units in cement industry require as little as five man-hours for producing a ton of cement. Moreover, most of the units in the various industries are working efficiently in one or more of their departments, although most of the other departments may be inefficient; or, in other words, almost every department is being run on efficient lines in some of the units. Thus, a lot can be learnt if the units compare their working with each other, so that the managements and the workers become cost-conscious and the best points of each unit could be adopted for bringing down the cost of production. Incidentally, the National Productivity Council has illustrated in its Monsoon Issue of *Productivity* the potentialities of such inter-firm comparisons in the following passage:

"A worker in a factory can certainly be made conscious of the low rate of his output—though machines and materials are identical—if taken, probably just across the road, to another worker in another factory, turning out a lot of more work. Probably incentives would be necessary to induce him increase the output, but incentives can be furnished. In the first instance, however, it appears necessary to create consciousness, both among management personnel as well as among the working classes that a much higher level of performance is possible because all other attendant circumstances are more or less identical. The rest of it is a purely economic problem and can be adequately handled within the present cost-price structure; for when a management comes to realise that a lot of more profit can, in fact, be made by paying a satisfactory wage, if the worker only co-operates in raising the level of output to what is within the limits of possibility, employer-labour relations will improve considerably and much higher productivities would be achieved all along the line.... Here is an area which requires little investment. It involves no overhauling of plant lay-out, installation of new machines, revolution in management, retrenchment of personnel, liquidation of inventories and the like. Of course, it does mean a change in managerial attitudes from treating business as a mystique to considering it as a game for mutual profit and pleasure. Inter-firm comparison is such a game in which without revealing identity or knowing it, we come to know how A, B, C, D are running, why they are running faster than we are and how we can run as well as they do, for the good of the country and for our own good."

Simplified Form

In spite of these advantages and the simple nature of the inter-firm comparisons, hardly anything has been done in the country in this matter so far. Though in the industrially developed countries, the process has become quite intricate, involving complicated capital-output ratios, in India what is required to start with is a simplified form of inter-firm comparisons which the managements can easily comprehend and implement and for which adequate data are available with the industries, but not made public in many of the cases. It is high time efforts were made to initiate this process in the country to increase production and bring down costs in industry.

Apart from the technical problems like differences from unit to unit in the quality of raw materials, management, labour and production processes, which make the data for different units non-comparable unless such data are processed and standardised, there are the human and psychological obstacles to the initiation of inter-firm comparisons. Though these obstacles are prevalent even in the advanced countries, in the underdeveloped countries like India, where the management is not so enlightened, the difficulties become more conspicuous. Many managements feel indifferent about such comparisons as they do not realise the magnitude of their advantages. Thus, a lot of canvassing will be required to convince them about the benefits of inter-firm comparisons. They also feel reluctant to part with the secrets regarding the working of their firms and fear that the data may fall into the hands of competitors. It may be in order to refer here to the security system adopted by the Centre for Inter-Firm Comparison in the U.K., to eliminate the leakage of confidential information. The main features of this system are: (*a*) non-disclosure of the names of participants; (*b*) allocation of a code number to each firm which appears on papers related to that firm, instead of its name and address, the key to the code being known only to the in-charge of the comparison in question; (*c*) collection of performance data in the form of ratios and percentages, if so desired, rather than in absolute figures; (*d*) stringent security arrangements within the Centre to prevent unauthorised persons having access to the data of firms; (*e*) presentation of results in such a way that the data of a particular firm cannot be identified; and (*f*) making the report available only to participants. If these measures are implemented in all seriousness, there is no reason why the secrets should leak out.

"Industry Productivity Councils"

The inter-firm comparison is a process by which everybody gains and nobody loses. Without disclosing the identity of the firm and without revealing the secrets of technology or finance, every participating entrepreneur comes to know the weak points in his enterprise and gets the indications of the ways of improving its working. Thus, if understood in their right perspective and if implemented properly, inter-firm comparisons can help tremendously in raising the productivity of industries. The National Productivity Council, incidentally, is doing some excellent work to popularise and implement inter-firm comparisons. Recently the Council set up study groups to X-ray the productivity in cement, bicycles, electric motors and transformers, jute and rayon industries. It has also decided to set up Industry Productivity Councils which amount to the creation of inter-firm comparison bases in the various industries. Much will, however, depend on the co-operation of industrial organisations which are expected to set up such "industry productivity councils" (as in the printing industry) and to persuade the member-units to make available the data about their own working without any inhibitions.

MORE EMPLOYMENT WITH FOOD AS WAGES

The U.N./F.A.O. World Food Programme could become "a powerful incentive" to mobilise the "hidden capital" of unemployed manpower, for raising rural standards of living. Mr. Boerma, Executive Director of the three-year experimental Programme, told the Council of the Food and Agriculture Organisation early this month that the largest number of projects, now in operation, were directed at putting unemployed people to work. These "labour-intensive" projects involved using food as payment or part payment to the workers whose labour forms a high proportion of the effort put into projects of irrigation, afforestation, land improvement and the building of houses and market roads.

The Programme was set up in 1962 and began operations at the beginning of 1963. Its experimental phase is due to terminate at the end of 1965, when the U.N. and F.A.O. will decide on its future In an enlarged Programme after that date, Mr. Boerma said, labour-intensive projects could "become a major incentive to mobilise" underemployed manpower for development work. These unemployed people constituted a hidden capital, badly needed in promoting F.A.O's basic aims of raising the standard of living of rural populations.

He outlined the various types of projects undertaken by the Programme in aid of economic development, and pointed out that it had, in addition, provided emergency aid worth $10 million in 16 cases. In all, 89 projects, using food aid for economic development in 31 developing countries, had been approved at a cost of $52 million. Another 45 projects were being considered. The Programme, had been pledged contributions in food, cash and services worth more than $92 million. The Republic of South Africa had however, revoked its pledge to the U.N./F.A.O. Programme of $102,500 on the grounds that it had withdrawn from F.A.O. membership.

CALCUTTA ELECTRIC'S 'CLEAR' PROFIT EQUALS 'REASONABLE RETURN'

POWER SELLING RATE, HOWEVER, RAISED AGAIN

THE year ended 31st March 1964 has been quite a satisfactory one for the Calcutta Electric Supply Corporation Ltd. (Chairman: Mr. I. A. Macpherson, Calcutta). Revenue from the sale of electricity and from meter rents at £14.8 million is over £1.7 million (13 per cent) up on the previous year. This is a much higher rate of increase than the rise of 8 per cent in the total energy sold which increased from 2,328 million units, to 2,525 million units. The main reason is that the monetary figure of sales includes coal surcharge revenue arising by reason of increases in the delivered cost of coal—increases which are, of course, also reflected in additional revenue expenditure. The actual revenue expenditure has gone up by almost £1.2 million; of this increase, generation, transmission and distribution costs alone account for £885,000. During the year, the Company's stations, in generating 2,077 million units, burnt 1.49 million tons of coal at a cost of £4.48 million, the comparative figures for the previous year being 1,841 million units, 1.38 million tons and £3.81 million, respectively.

Quite apart from the 10 per cent increase during the year in the controlled price of coal and freight (which was, of course, recovered through the coal surcharge), the additional expenditure on coal was a natural consequence of increased output and would, in fact, have been even greater but for the continued success of the Company's new policy for the procurement of coal to which a reference was made in the previous year's report. Administration and general establishment charges have gone up by £100,000, including the extra premium of £40,000 payable to the Government for the Emergency Risks Insurance now discontinued. Interest charges have increased by £108,000, because the Company had to make almost the maximum use of its overdraft facility with National and Grindlays Bank.

The following table compares the Company's progress in the past four years:

(In £ sterling)

	For the year ended 31st March			
	1964	1963	1962	1961
Sale of current	14,591,588	12,848,739	10,494,687	9,805,661
Other income	251,104	255,092	207,456	196,885
Cost of generation, distribution, etc.	6,945,097	6,059,797	5,278,764	5,088,135
Power purchased	2,467,933	2,412,708	1,940,775	1,070,194
Other expenses	1,189,635	991,179	889,098	834,439
Gross profit	4,240,027	3,840,147	2,593,506	3,009,778
Depreciation	1,061,534	1,029,330	994,487	960,615
Taxation	1,457,074	1,632,848	943,105	1,155,014
Net profit	1,721,419	977,969	655,914	894,149
Transfer from reserves	14,321	...	316,244	356,541
To reserves	1,109,938	395,372	392,406	639,257
To debenture sinking fund	187,918	178,115	168,793	159,966
To gratuity fund and debenture issue expenses	51,671	51,670	51,671	51,671
Dividends—				
5 per cent preference	63,650	63,650	63,650	63,650
Ordinary	319,698 (7.5%)	319,698 (7.5%)	319,699 (7.5%)	319,699 (7.5%)
Carry forward	128,539	125,674	100,524	124,585
Equity shares' market value (in rupees):	1964	1963	1962	1961	1960
High	15.60	15.00	15.31	15.25	16.02
Low	13.87	11.25	14.31	13.94	14.75

The net revenue account shows that, despite an increase of about £560,000 in the balance brought down from the revenue account, the charge for Indian taxes has declined by £150,000. This is due mostly to development rebate allowances claimed on the new plant commissioned during the year, including the new Cossipore extension and the Southern receiving station. The tax saving (not all of which is admitted by the authorities) amounts to some £575,000, the equivalent figure for the previous year being £132,000. Consequently, as against nothing in the previous year, a sum of £201,021 has been carried to development rebate reserve during the year under review. This is a mandatory appropriation under the Electricity (Supply) Act and has the effect of equating the Company's 'Clear' profit with the 'Reasonable return' allowed by that Act. As it was foreseen that the Company would not again benefit from development rebate on the same scale and that its 'Clear' profits would as a consequence be less than its 'Reasonable return,' it had no option but to put into effect further increases in its charges for electricity from the end of the year under review. The 'Reasonable return' is now based on a standard rate of 6.5 per cent, instead of the former 6 per cent, and this is hoped to be achieved in the current year.

Reference is made in the notes on the accounts to a contingent liability now estimated at £801,000 in respect of Indian taxes under appeal. The claim concerns the admissibility of development rebate on capital expenditure on mains, service connections, etc. Although the Company has been successful in the first stage of its appeal against the authorities' ruling in this matter, the latter are likely to take the matter further and, in the circumstances, the Company has built up a taxation contingency reserve with an initial appropriation of £250,000 out of the past year's profit. Inclusive of other appropriations, the total carried to reserves is £1.11 million, as against £395,372 a year before. The dividend on the £1 ordinary stock, including 3.5 actual interim, has been maintained at 7.5 per cent per annum actual.

Discussing the growth of the undertaking in his review, the Chairman, Mr. I. A. Macpherson, makes the following observations:

"In his review of our operations for the last few years, my predecessor has referred to the power shortage in India, in general, and in Calcutta, in particular, and to the regulative measures which the Government had to adopt to ensure the optimum utilisation of available power resources. These measures were aimed primarily at reducing the peak demand on the Company's system and have had relatively little effect on the number of units sold and consequently on the Company's revenue receipts. The commissioning last October of the 50-MW extension to our new Cossipore generating station and more recently of our Southern receiving station designed to take in power from the West Bengal State Electricity Board have already allowed several of the restrictions relaxed. At present, we are importing a permitted maximum of about 110 MW from the Damodar Valley Corporation and 50 MW from the State Board, and there is already a significant increase in units sold. Towards the end of this year, when the output of further generating plant will be put at the disposal of the State Board, our offtake at Southern receiving station will be stepped up to 80 MW and the position will be further relieved when, during the first half of next year, we commission our Belur receiving station, designed to take in 100 MW of power from the State Board's Bandel generating station which is expected to begin generating at about the same time."

The restrictions notwithstanding, the outturn during the year under review broke all previous records, with units sent out from generating stations rising from 1,730 million to 1,955 million, units imported from 803 million to 804 million, units delivered to the system from 2,533 million to 2,759 million, units sold from 2,328 million to 2,525 million and maximum demand sent out from 416 MW to 464 MW.

The Company's forward estimates indicate that, during the period 1963-64 to 1969-70, capital expenditure will amount to some £18.50 million (Rs. 25 crores), including the unpaid balance of expenditure on 1st April 1963 on the new Cossipore extension. Provided profits equal 'Reasonable return,' depreciation and retained earnings are expected to provide about £15 million of this sum. The loan of Rs. 4.70 crores (£3.5 million) finalised with the State Bank of India during the year under review, and repayable on 30th December 1969, should provide the balance of the funds to fulfil the developmental obligations until 1970, when, under its licence, the Company can be taken over by the Government of West Bengal or by the State Electricity Board on one year's notice. In view of this possible take-over, the Company has obtained through an agreement a guarantee from the Government of West Bengal that the latter will repay the outstanding balance of the loan and deduct it from the compensation moneys due to the Company on acquisition. If, on the other hand, by 1st January 1969, the Company has not received notice that it is to be taken over a year later, which will mean that its licence is automatically extended by 20 years, then it will take immediate steps to raise money on the market to return the loan in full on 30th December 1969.

The paid-up capital, including £1.9 million in 5 per cent cumulative preference stock, is unchanged at £6.16 million. It is backed by reserves and surplus amounting to £18.95 million. The 5 per cent 1970 debenture-stock liability has been reduced from £3.11 million to £2.92 million. The gross block of £44.04 million (£41.17 million a year before) has been written down to £26.84 million.

Currently quoted at Rs. 15.50 *cum-div.*, the £1 ordinary stock of the Company offers a net yield of 5.4 per cent per annum.

COOPER ENGINEERING SELLS MORE

BUT PROFIT DECLINES

COOPER Engineering Ltd. (Managing Agents: Messrs. Walchand and Co. Private Ltd., Bombay) has once again suffered a setback in its profits during the year ended 30th June 1964. Thanks to the increase in the demand for diesel engines after its revival in 1962-63, the realisation from the sale of products has increased by about 20 per cent from Rs. 261.67 lakhs to Rs. 311.16 lakhs, but the gross profit has declined by Rs. 7.84 lakhs to Rs. 23.19 lakhs. The profit margin (ratio of gross profit to sales), therefore, has dropped by as much as 4.4 points to 7.5 per cent. Commenting on this unhappy turn of events, the Directors observe:

"The production at both the factories continued to rise and the sales kept pace with it, thereby registering a total figure exceeding all previous performances again. Despite this appreciable increase in sales, however, the net results have been below expectation. This is mainly attributable to the increased cost of raw materials, labour and several other items without a corresponding increase in the selling prices of the various products. The selling prices of diesel engines and shaping machines—the two product lines which account for the largest bulk of the Company's sales—have not been increased for several years and applications for suitable revisions have been pending with the appropriate Government authorities for approval. Approvals for some of the price revisions have now been received and it is expected that the remaining approvals will also be at hand shortly. The full impact of these revisions will be reflected in the results for the current year."

In spite of a lower gross profit, the provision for the Managing Agents' commission has risen, albeit slightly, from Rs. 0.25 lakh to Rs. 0.34 lakh and that for depreciation from Rs. 18.69 lakhs to Rs. 22.60 lakhs. No provision has been found necessary, and hence made, for taxation for the third year in succession. Consequent on the reduction in gross profit and the overall increase in essential provisions, the resulting net profit is as low as Rs. 0.25 lakh, as against Rs. 4.03 lakhs a year ago. Fortifying this with Rs. 9.01 lakhs withdrawn from reserves and after crediting Rs. 1.35 lakh to the development rebate reserve, the Directors have proposed to pay the same dividend, namely, eight per cent subject to deduction of tax, as was paid in the preceding year. This claims Rs. 7.91 lakhs, leaving no carry forward as before.

The vicissitudes in the fortunes of the Company during the past four years are clearly reflected in the following comparative figures:

(In lakhs of rupees)

	For the year ended 30th June			
	1964	1963	1962	1961
Sales	311.16	261.67	193.90	209.67
Other income	7.74	7.22	3.57	2.43

To reserves	1.35	4.87	4.40	8.38
Dividend	7.91 (8%)	7.23 (8%)	5.28 (7%)	5.88 (10% + B. 3%)
Carry forward	...	...	0.01	0.75
Market price of ordinary shares (in rupees):	1964	1963	1962	1961
High	125	127	188	212
Low	98	109	121	153

The Company issued during the year under review 45,200 equity shares of Rs. 100 each at par on which an amount of Rs. 50 per share was called up as at 30th June 1964, the date of the balance sheet. This has raised the paid-up share capital to Rs. 112.86 lakhs with a complement of Rs. 49.96 lakhs in reserves and surplus. As against these 'own' funds of Rs. 162.82 lakhs, outside interest amounts to Rs. 204.69 lakhs, made up of Rs. 135.55 lakhs in secured and unsecured loans and the balance as current liabilities and provisions. With the addition of new assets worth Rs. 13.30 lakhs, the block account has expanded to Rs. 224.52 lakhs and, on deduction of Rs. 107.36 lakhs as depreciation earned to date, yields a net block of Rs. 117.16 lakhs.

Good progress was made during the year under review with regard to the automatic loom project and the parts necessary to produce the first 50 looms were duly received. These looms will be ready for despatch shortly. The import licence for the next set of parts is also in hand and the parts covered by it are expected to be received towards the end of December this year.

The Rs. 100 paid old equity shares of the Company are currently quoted at Rs. 112 *cum-div.* and fetch a net return of six per cent per annum.

T. MANEKLAL'S RESULTS EXCELLENT

HIGHER DIVIDEND ON ENHANCED CAPITAL

THE working results of T. Maneklal Manufacturing Company Ltd. (Managing Agents: Messrs. T. Maneklal and Co., Bombay) for the year ended 31st May 1964 are, indeed, heartening. Maintaining its upward trend, the turnover has expanded from Rs. 136.00 lakhs to Rs. 163.25 lakhs and, in consonance, the gross profit has risen from Rs. 26.35 lakhs to Rs. 40.56 lakhs. The profit margin (ratio of gross profit to sale proceeds) has thus improved by no less than 5.5 points to 24.8 per cent and, considering the continued upward thrust of prices, this is no mean achievement. The increase in gross profit has naturally called for a rise in essential provisions. The amount actually provided for the Managing Agents' commission is up from Rs. 1.97 lakh to Rs. 2.97 lakhs, for depreciation from Rs. 5.16 lakhs to Rs. 6.38 lakhs and for taxation from Rs. 11.21 lakhs to Rs. 18.12 lakhs. Nevertheless, the resulting net profit is higher at Rs. 13.09 lakhs, as against Rs. 8.01 lakhs for the year before. After transferring from this Rs. 5.34 lakhs (Rs. 3.75 lakhs to reserves and providing Rs. 0.31 lakh (Rs. 4 lakhs) for taxation in respect of the preceding year, the Directors have proposed a much enlarged dividend of 25 per cent, as against six per cent, both subject to deduction of tax, which is payable fully on the old shares and proportionately on the new. This claims Rs. 7.37 lakhs, as against Rs. 1.40 lakh, and leaves Rs. 18,875 as carry forward, as against the Rs. 11,654 brought in.

The distinct improvement in the working results has been due mainly to higher production on account of new machinery installed progressively during the year and also because of the progressive increase in the indigenous content of the components for the machineries manufactured by the Company. New plant and equipment of the value of Rs. 8,06,766 were installed during the year, comprising engineering machinery worth Rs. 6,07,957, rubber machinery worth Rs. 1,56,627, and machinery crane worth Rs. 42,182. Towards the end of the year, machinery, etc., under erection and machinery received at the works awaiting installation was Rs. 2,09,103.

The following comparative figures clearly bring out the steady progress made by the Company in each of the four years:

(In lakhs of rupees)

	For the year ended 31st May			
	1964	1963	1962	1961
Sale proceeds	163.25	136.00	112.10	82.61
Other income	7.86	5.90	13.21	3.93
Closing stocks of finished goods	0.91	0.89	1.60	0.08
Raw materials and stores consumed	79.23	74.25	64.87	44.32
Salaries, wages and benefits	24.45	22.31	17.32	12.67
Other expenses	26.89	19.18	17.31	11.61
Gross profit	40.56	26.35	27.33	17.89
Managing Agents' commission	2.97	1.97	2.16	1.45
Provision for—				
Depreciation	6.38	5.16	3.60	2.74
Taxation	18.12	11.21	11.33	5.96

To reserves	3.75	3.75	4.45	4.11
Dividend	7.37	1.40	5.37	3.76
Carry forward	(25%) 0.19	(6%) 0.12	(27%) 0.46	(27%) 0.04
Market price of ordinary shares (in rupees):	1964	1963	1962	1961
High	650	740	1,000 c.s. 576 x.r.	850
Low	480	525		300

At the last annual meeting, it will be recalled, the members had passed a special resolution approving the proposal to issue bonus shares and an application was accordingly made to the Controller of Capital Issues for his consent. Before his reply could be received, the Finance Minister announced his recent budget proposals. In view of the taxation measures introduced by him, it was felt that it would not be in the interest of the Company or its members to proceed with the bonus share issue. In these circumstances, the Directors have now passed a resolution rescinding the Board's previous resolution and also obtained the consent of the Controller of Capital Issues to treat the Company's application as withdrawn. There is as such no change in the number of ordinary shares outstanding as at the date of the balance-sheet, that is, 31st May 1964, but, since the 10,000 new equity shares of Rs. 100 each have become fully paid, the paid-up share capital has advanced to Rs. 29.88 lakhs from Rs. 27.22 lakhs a year ago. The reserve complement has also improved from Rs. 15.80 lakhs to Rs. 21.21 lakhs and total "own" funds, therefore, aggregate Rs. 51.09 lakhs, as against Rs. 43.02 lakhs previously. Borrowings, however, have declined from Rs. 5.43 lakhs to Rs. 3.93 lakhs, but current liabilities and provisions are higher at Rs. 123.83 lakhs, as compared with Rs. 98.44 lakhs. On the assets side, these are slightly under covered by current assets and loans and advances which aggregate Rs. 120.60 lakhs. The net block, inclusive of the value of machinery awaiting installation and cost of building under construction, is worth Rs. 53.91 lakhs and has been obtained by reducing a gross block of Rs. 75.27 lakhs by the accumulated amount of Rs. 24.86 lakhs of depreciation. Investments in Government securities and quoted and unquoted ordinary shares are carried in the books at a cost of Rs. 4.28 lakhs.

During the preceding year, the Company was licensed to manufacture automatic jiggers, chainless mercerisers and four-bowl pad dyeing machines in collaboration with the Benninger Engineering Company Ltd. of Switzerland. The Directors now inform that the manufacture of these items has commenced. The Company has also started manufacturing hot flue machines, float dryers and steam agers, a licence for which was also procured during the previous year. As for rubber rollers and rubber lining jobs, commercial production of the former and the undertaking of the latter has commenced at the Company's factory near Ahmedabad.

The present quotation for the Rs. 100 paid old ordinary shares of the Company is Rs. 502.50 *cum-div.* The net annual return on an *ex-div.* price works out to a little over 4.1 per cent.

SOUTH INDIA SHIPPING CORPORATION LTD.

The P. & O. Steam Navigation Company and the Anglo-Norness Shipping Company, which are associated in the business of bulk carrying, have agreed to contribute to the initial issued capital of Rs. 2 crores of the new Indian shipping company, the South India Shipping Corporation Limited, incorporated in Madras in January last. The actual contribution of the two foreign companies will be to the extent of 35 per cent and 5 per cent, respectively. The project has been approved by the Shipping Development Fund Committee of the Government of India. The South India Shipping Corporation has placed an order with the Bremen Vulkan Shipyard of Bremen for five bulk carriers, each of 38,000 tons deadweight, designed for the carriage of ore, grain and other bulk cargoes.

The Chairman of the Corporation is Mr. A. D. Shroff, a prominent Indian financier and industrialist who is Chairman of the Bank of India Limited, New India Assurance Company and other Indian companies. The P. & O. Steam Navigation Company will be represented on the Board of the Corporation by Mr. K. M. Campbell of London and Mr. J. W. Anson of Bombay. Lord Inchcape, who has large industrial interests in India, has also agreed to join the Board of Directors.

TATA CHEMICALS LTD.

The working results of the Tata Chemicals Ltd. for the year ended 30th June 1964 show a notable improvement over those for the previous year. Sales have gone up from Rs. 714.72 lakhs to Rs. 756.41 lakhs and gross profit (after providing for managing agents' commission) from Rs. 134.06 lakhs to Rs. 174.10 lakhs. The provision for depreciation (including third shift allowance) has been raised to Rs. 69.50 lakhs from Rs. 44.18 lakhs in the previous year. Tax provision is higher at Rs. 35.25 lakhs as against Rs. 10.40 lakhs. Provision for development rebate reserve, however, is reduced greatly; only Rs. 10.88 lakhs has been set apart, as against Rs. 41.00 lakhs (including arrears of earlier years). After making these provisions, the net profit at Rs. 58.47 lakhs shows a handsome rise of Rs. 19.99 lakhs. This has made it possible for the Directors to appropriate a larger sum of Rs. 11.85 lakhs to general reserve (Rs. 3.94 lakhs in the previous year) and increase the allocation to the dividend reserve from Rs. 34.55 lakhs to Rs. 46.62 lakhs. The ordinary dividend is raised from 11 per cent to 14 per cent, inclusive of a bonus element of 0.15 nP or 1.5 per cent. Both the ordinary dividends aggregating Rs. 42.33 lakhs (Rs. 30.24 lakhs in 1963) and the preference dividends amounting Rs. 4.28 lakhs are to be paid out of the dividend reserve.

KERALA RUBBER AND RECLAIMING CO., LTD.

The Kerala Rubber and Reclaiming Company, Ltd. is setting up a factory at Mamala near Cochin to manufacture reclaimed rubber in technical collaboration with the U.S. Rubber Reclaiming Company, Ltd. The factory will use the reclamator process, patented by the American collaborators. The collaboration agreement has already been approved by the Union Government. Eleven acres of land has been purchased and civil engineering work has already been started. The authorised and issued capital of the Company will be Rs. 30 lakhs, of which shares worth Rs. 10 lakhs are being taken up by the Directors and their friends. Underwriting arrangements to cover the balance shares of Rs. 20 lakhs are being finalised. A foreign exchange loan of Rs. 11 lakhs has been sanctioned by the Industrial Credit and Investment Corporation of India to meet the entire foreign exchange requirement for purchase of machinery. The Company is expected to enter the capital market shortly for 49 per cent of the capital.

FRESH CAPITAL ISSUES

Two companies have been authorised to raise capital exceeding Rs. 3 crores. One of them is issuing bonus shares and the other equities. The consent of the Controller of Capital Issues is valid for 12 months in both the cases. The following are the details:

Dunlop Rubber Co. (India) Limited is to issue capital of Rs. 3 crores, being 1,500,000 equity shares of Rs. 10 each at a premium of Rs. 10 per share. The capital will be issued to the existing shareholders in the ratio of two of one to three. The money will be utilised for the expansion projects of the Company at Sahagunj and Ambattur estimated to cost Rs. 349 lakhs.

Khare and Tarkunde Private Limited (Nagpur) is to issue a capital of Rs. 98,600 divided into 986 equity shares of Rs. 100 each, to be allotted as bonus shares to the existing shareholders of the Company, on capitalisation of the Company's reserves to a like extent.

COMMERCE AND INDUSTRY

(*Concluded from page 737*)

fibre prices were fairly stable, there was an almost uninterrupted downward drift in natural fibres since 1952. Man-made fibres have been able to win markets by sheer better performance over natural fibres. An example is to be found in nylon fishing nets as against abaca.

Other natural raw materials, like fats and oils are encountering competition from synthetic substitutes in a number of industrial outlets, chiefly drying oil products, such as paint, varnishes, linoleum and soap. Synthetic detergents are being used to a great extent, replacing fats and oils, to improve the cleansing power of soap. They do not react with minerals in hard water. Even in industries, synthetic detergents are found to be much better than soap. The detergents, such as alkylsulfates and alkylbenzene sulfonates, are developed from natural vegetable or animal oils and fats and a petroleum base like propylene. Used in isolation, these synthetics are good emulsifying agents, and with the addition of "builders" like phosphates, the best results as regards fabric washing are obtained. The growth of synthetic detergents has been rather phenomenal. In the U.S., its output has increased from 125,000 tons in 1946 to 1.8 million tons in 1962. Soap accounted for only 24 per cent of total detergent sales in that country in 1962, as against 92 per cent in 1946. In other developed countries also, synthetic detergents have captured the market for soap to a great extent. However, soap powders for hard laundry soap are being increasingly used. As soap is an almost universal product, consumption trends differ very widely in different areas of the world. The Soviet Union is by far the largest single producer of soap and it has no detergent industry. In many underdeveloped countries, soap is being consumed to a great degree. It appears that the use of synthetic detergents will increase in industrialised countries. But its use in the developing countries is not likely to be very rapid. To that extent, the demand for oils and fats would continue in these areas. Oils and fats are also used for edible purposes and so their demand would increase.

Hides and skins, an important natural raw material, are being increasingly replaced by synthetic leather, especially in the footwear industry in the U.S. Synthetics have invaded almost every use to which leather has been put, and in some cases, like luggage, virtually replaced them. Footwear has been the main end-use of leather, accounting for nearly four-fifths of the leather made from cattle hides and calf skins in the U.S. Some cattle hides and calf skins are also used for clothing, fancy goods, upholstery, and other industrial products, such as belting and saddlery. Goat leather is used in gloves and shoe linings. The future trend of leather consumption in developed areas depends on the extent to which substitution by synthetic materials will be carried out in footwear production, as well as on the probable growth rate of footwear output. Synthetic rubber, especially neoprene, which is admirably suited for its strength and resistance to weathering, is the chief material to replace leather. Footwear provides a major outlet for synthetic rubber, second only to motor tyres. Cheaper and stable prices aid neoprene and other synthetic rubbers to compete effectively with natural leather. With a new synthetic material for footwear uppers introduced recently in the U.S., the demand for hides and skins is likely to be adversely affected in the long term.

SYNOPSES OF COMPANY REPORTS

Jam Shri Ranjitsinghji Spg. & Wvg. Mills Co., Ltd.

(*Chairman*: Mr. S. R. Damani, Bombay.)

Fifty-seventh Annual General Meeting—9th November 1964.

Working Results:

	For the year ended 30th June (In thousand rupees)	
	1964	1963
Sales of cloth, yarn and waste (gross)	1,47,45	1,39,98
Closing stock	61,72	76,97
Gross profit	16,30	3,79
Transfer to depreciation	8,12	2,01
Net profit	8,18	1,78
Excess provisions written back	14	Nil
Appropriations:		
To deferred revenue expenditure written off..	24	10
Transfer to general reserve	54	Nil
To adjustment of loss brought forward ..	4,28	1,67
Transfer to development rebate reserve ..	2,98	Nil
Proposed dividends (taxable) equity ..	98*	Nil
	(6%)	(Nil)
Carry forward credit (+) or debit (—)	+31	—4,28
Market value of equity shares (in rupees):	1964†	1963
High	1,250.00	1,500.00
Low	1,100.00	1,100.00

* This dividend will be paid out of the dividend equalisation reserve.
† High and low upto 14th October 1964.

Extracts from the Directors' report: *Working*: As anticipated in the Directors' last report, the profits of the year have considerably increased as compared with the last year. Better results are due to modernisation of the plant and machinery carried out in previous years and change in the pattern of production.

Production: During the year, the working of the mills was satisfactory. The management is always taking all the necessary steps to change the pattern of the products to meet the consumers' taste.

The Company has got the permission to instal additional 5,216 spindles and 51 looms. Necessary orders have been placed for spindles.

Accounts in brief as at 30th June 1964 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital* ..	15,54,000	Gross block ..	1,09,53,526
Reserves and surplus..	24,66,889	—Depreciation ..	56,47,382

* Includes figures of Hall & Anderson.

Extracts from the Directors' report: *Dividend*: The Directors have pleasure to recommend first time this year, after 1948, dividend on equity shares at the rate of Re. 1 per share, subject to deduction of tax, on the increased capital, after providing fully for development rebate reserve for the current as well as earlier years and full depreciation for the current year and also a sum of Rs. 5.60 lakhs, being the amount of depreciation for triple shift working of the mills for the year 1962-63, and allocating amount for dividend on preference shares at the rate of Rs. 5.85 per share, subject to deduction of tax.

Finance: The Company has issued equity shares worth Rs. 10 lakhs of the face value of Rs. 10 each at par as *Right Shares*, during the year under review, which have been fully subscribed. The Company has also received a further sum of Rs. 21.39 lakhs from the National Industrial Development Corporation Ltd. against the sanctioned loan of Rs. 53 lakhs, for the rehabilitation and renovation programme of the textile mills. The total amount of loans received from the said Corporation, so far, is Rs. 37.87 lakhs.

Textile Mills: The expansion programme in the Company's textile unit is being pursued in right earnest, and 19,660 spindles have so far been installed and put into operation. Under the Government's general permission to the cotton textile industry for increase in the installed capacity of spindleage and loomage, the Company has received further permission to install 8,700 spindles and 163 additional *Automatic looms*. After the installation of the above spindles the total installed capacity of the mills will be 95,801 spindles.

The modernisation of the Company's mills is going ahead as planned. During the year under report a total sum of Rs. 35.21 lakhs was spent by way of additions to plant and machinery in the mills.

As a result of change in production programme, the consumption of foreign cotton has increased. Despite the difficulties in procuring adequate supply of foreign cotton, the Company is fully covered in respect of the same for the current accounting year.

The programme of manufacturing finer and processed goods is being adhered to so as to satisfy the consumers' taste towards these varieties. Endeavours are also being made to promote the export of the mill's fabrics in South-East Asian countries.

Accounts in brief as at 30th June 1964 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital* ..	1,00,00,000	Gross block ..	3,26,48,414
7% debentures ..	47,00,000	—Depreciation ..	1,10,14,218

* Represent dividend for two years 1963 and 1962.
† Upto 14th October 1964.

Extracts from the Directors' report: The sales invoiced have increased from Rs. 2,26,27,992 in 1962-63 to Rs. 4,73,76,194 this year. This increase is mainly due to a higher turnover in conductors and imported material, as well as to the resumption of production in the Company's Howrah Works. In order to cope with the increased volume of business, the organisation had to be strengthened considerably, resulting in higher expenses. At the same time, the interest charges as well as depreciation on fixed assets have gone up, so that there is no corresponding increase in the profit for the year.

The Company's Howrah Works have been reopened on 24th August, 1963 and production has gradually increased since then. The First Industrial Tribunal, West Bengal has passed an award stating that the closure of Howrah Works are *bona fide* and beyond the control of the Management. Production at Baroda and Faridabad has also increased satisfactorily.

In order to implement the project for a new factory at Makarpura near Baroda for the manufacture of *Air Blast Circuit Breakers upto* 220 kV and other items, orders for plant and machinery to be imported have already been placed in collaboration with Messrs. Brown, Boveri & Co. Ltd. Baden, Switzerland. Orders for machine tools locally available have also been placed. The Company has already placed orders for the construction of roads, factory and other associated buildings with the various contractors. The construction work of the new project is under progress. It is expected to commence production in the middle of 1965.
