The desire to show off in peaceful competition and the political considerations which were always in the background led to the Russians striving from the very beginning for the creation of a favourable image. There was humility in the approach of the Soviet technicians and those were the days before the Chinese propagated the thesis of the Russians being as Western as other Europeans—white before they are Red! Anyway, the Chinese thesis had little impact, if any, on Indian technicians. Despite all the de-Stalinisation campaign back home, tropical India was a far better place to live in for the Soviet technicians than the cold freezing clime in Russia. For the Soviet technician, India was like Hongkong is to Indian tourists—a country where consumer goods were in plenty. Almost every Russian technician returning home after his assignment in India went back with trunkloads of consumer goods. I have heard in Bhilai how the Indian technicians in the higher echelons felt superior to the Russians. They acknowledged the technical superiority of the Russians, but the Indian engineers exhibited their social snobbery—the Russian expert had just emerged from the working or peasant class but the Indian engineer would trace his superiority to generations of high caste and upper middle class living.

The Russians succeeded in Bhilai because their political discipline was accompanied by the provision of high-quality technological skill by carefully chosen top personnel. When Mr. Swaran Singh was Steel Minister during the days of the construction of the first stage of the Bhilai plant, Delhi gossip was that his doors were always open for the top Russian from Bhilai to call on him. What was not then widely realised was that the top Russian at Bhilai at that time was high in the Soviet planning set-up and could deal with the Indian Minister almost on an equal footing. The Soviet diplomats, heading the missions in Delhi, like Mr. Menshikov and Mr. Benedictov, were also politically important Russians.

Not Much To Complain

There was not much to complain against Soviet machinery at Bhilai. In defence of the West German and British aided steel plants, it has also to be noted that the Bhilai plant was the least sophisticated of the three steel plants which were coming up simultaneously in the country. If there were defects in the Soviet machinery, they were promptly rectified and the plants made fully operational before the transfer to the Indians. A British journalist who visited Bhilai in October this year expressed his disappointment that he could not see any Russians at the plant. His disappointment is a compliment to the Russians who have trained a cadre of Indians to be in charge of the Bhilai operations. According to an American expert quoted by the Indian Government: "Bhilai's success is not so much its ability to produce up to its rated capacity but rather the steps it has made towards the creation of an organisation capable of producing steel in the future under the direction of Indian personnel entirely."

The million-tonne stage of the integrated iron and steel works at Bhilai was completed in March 1961 and it achieved its rated capacity before the end of that year. Both in 1962 and 1963, Bhilai steel production exceeded targets. Inspired probably by German experts, the Indian General Manager of the Rourkela plant once talked to this correspondent derisively about the Bhilai preoccupation with overworking the plant to produce production records. To the outsider the Bhilai production records and smooth running of the plant demonstrate the competence of the Russians in erection and operation and training. The three steel plants in the public sector were conceived for expansion after the completion of the first stage of one million tonnes capacity in each plant. Here, too, the Russians scored over the Germans and the British by finalising the credit and technical negotiations early. Expansion work at Bhilai began in August 1962 and expansion to 2.5 million tonnes capacity is expected to be completed by the end of 1965. The West Germans, on the other hand, would not agree to the expansion programme until they were satisfied with the technical performance of the first stage.

The Bhilai plant's first stage of one million tonnes cost a total of Rs. 2,000 million, including about Rs. 650 million of rouble credits. The expansion to 2.5 million tonnes ingot capacity is expected to cost about Rs. 1,400 million, including a further Rs. 550 million of rouble expenditure. Among the numerous industrial plants which are coming up with Soviet aid (see attached table for list), Bhilai, which has been trouble-free as compared with the other steel plants run by the Government and private firms, went to create the most favourable image of Soviet capacity and willingness to assist India. Undoubtedly, the Rourkela plant designed by the West Germans is more modern and will produce sophisticated flat products which will fetch higher prices. But mutual recriminations caused much damage to relations with West German experts.

Most Significant Aspect

The most significant aspect of Soviet aid is that, with much smaller offers of aid than American, the Russians have been able to project an image far bigger than the amounts involved. American assistance to India offered hitherto totals Rs. 2,500 crores, while the total of firm Soviet economic aid offers are around Rs. 384 crores. Soviet aid is almost all in the form of loans, carrying two and a half per cent interest and a repayment

TUBULAR STEEL STRUCTURES

India's first tubular structure was made by Stewarts and Lloyds of India and the reason why S & L are still the leading suppliers of steel tubular structures is that no other structure gives you the same feeling of dependability, trustworthiness as an S & L structure.

All S & L roofing structures are delivered complete in every respect with trusses, purlins, columns, hook bolts for roofing and all necessary studs, nuts and washers.

Write today for your requirement of these sturdy and dependable tubular steel structures.

period of twelve years, except the drugs credit repayable in seven years. The United States' assistance comprises large amounts of grants *plus* facilities for loan repayments over forty years. A major factor is that the Russians have been able to satisfy some of the psychological demands of economic development which was well-illustrated in the controversy over the Bokaro steel plant. The late President Kennedy endorsed the concept of the American Government supporting the development of the steel industry by the Indian Government. The former U.S. Ambassador, Mr. Galbraith, also worked hard to convert some sections of American opinion to his way of thinking. But, in August 1963, the American Administration's plan to help the Indian Government steel programme fell through, because of U.S. Congress denial of public funds to encourage the socialist ambitions of the Indian ruling party. When American aid was refused for Bokaro, for some time the Indian Steel Ministry toyed with the idea of going on its own, ordering equipment from various countries. On May Day, however, the Soviet willingness to assist Bokaro construction was announced. The Indo-Soviet technical discussions on Bokaro then led to some unhappy feelings because of the Indian pride over the hypothetical capacity of its technicians and the Russian hesitation in accepting the Indian technicians at their face value. The Russians have insisted that they want to have the clear stamp of Soviet paternity on the Bokaro project. In their judgment of Indian technicians, the Russians have shared the same opinion as the Americans or the Germans. The Russians did a good job, training the operating staff in Bhilai and by the time they finish with the two-million-stage of the Bokaro project, they hope to have trained an Indian team of designers, too.

In the process of building the first two-million-tonne stage of the Bokaro plant, the Russians will also expand the heavy machine building industry in the country. The plants to build machines for steel mills are in Ranchi where mismanagement has been as scandalous as in Rourkela. The heavy engineering complex is a venture in which the present Soviet President, Mr. Anastas Mikoyan, and Mr. T. T. Krishnamachari took a leading part initially. For the troubles at Ranchi, the blame is not cast on the Russian experts. The mismanagement was almost wholly by the Indian administrators who also indulged in personal disputes damaging the industry.

The heavy engineering complex will play an important role in supplying machinery to steel plants and the Russians are also connected with a coal mining machinery plant at Durgapur and a heavy electrical plant at Hardwar.

Oil Sector

Next to steel, the Soviet assistance has been of strategic significance in the oil sector, where both exploration and refinery building have received benefits from Soviet assistance. The two-million-tonne oil refinery at Barauni has already gone on stream and a similar plant is under construction at Koyali, in Gujarat. The Russian refineries, which are both to be expanded to three million tonnes, are somewhat expensive in comparison with present bids by Western oil firms for new refineries, but the most important aspect of the Soviet aid in this field is that it came at a time when Western oil firms were putting harsh conditions to establish refineries. Russian refineries are also less sophisticated than those now planned with Western firms' help.

American aid has been diverted for a large portion of India's power development programme but the Russians, too, are providing power generation equipment. The Neyveli thermal stations to use lignite fuel were built with Russian aid—six units of 50 mW each and a seventh with 100 mW capacity. Five units of 50 mW each are being installed at Singrauli in Uttar Pradesh, four units of 50 mW each at Korba in Madhya Pradesh and five units of 120 mW each at the Bhakra right bank power house. Among other Russian-aided plants are an antibiotics project, a synthetic drugs project, and two precision instruments plants.

In the defence industries, the problem of building a supersonic fighter plane is being solved by the contract to make MIG 21 aircraft.

Trade

Under arrangements made in November 1964, trade with the Soviet Union is planned to increase to Rs. 125 crores each way in 1965 against Rs. 80 crores each way in 1964. In 1955, Indo-Soviet trade was less than Rs. 10 crores, but, by 1963, the total trade turnover had risen to more than Rs 100 crores. Total trading between India and the United States was worth a little more than Rs. 500 crores in the financial year 1963-64. The second partner was Britain with whom India had a total trade of Rs. 330 crores. The West Germans were the No. 3 trading partners in 1962-63 but, in 1963-64, the Japanese took the No. 3 position. In the current financial year, the third position will be the Soviet Union's. As supplier of goods to India, the Soviet Union came after the United States, Britain, West Germany and Japan in 1963-64 but, in 1964-65, the Soviet Union is likely to displace Japan in the No. 4 position as supplier. If the present rate of trade expansion with the Soviet Union is kept up as is envisaged in the long-term trade discussions, the Soviet Union will be the No. 3 supplier and probably the No. 2 buyer of Indian goods in another two years.

TRAINING COURSE IN SOIL BIOLOGY

A four-week international training course in soil biology began at the Indian Agricultural Research Institute, New Delhi, on 21st December 1964. The course, held under the joint auspices of the U.N.E.S.C.O., Ministry of Food and Agriculture, and the Indian Agricultural Research Institute, was inaugurated by Mr. A. D. Pandit, Special Secretary in the Ministry of Food and Agriculture. The training course, which is the first of its kind to be organised in South Asia, is being held for the benefit of soil scientists, research staff of State Departments of Agriculture, universities and institutions in India as well as in neighbouring countries, such as Afghanistan, Nepal, Ceylon, etc. Several eminent experts in the field, both from India as well as from abroad, are helping in conducting the course.

Study of soil biology is of immense interest since soil is intimately connected with life. In the matter of food production, man is dependent mostly on soil. Soil harbours a variety of organisms and the biological activities in the soils contribute directly to their productivity status. As a result of research work done in the field of soil biology, a stage has been reached when artificial inoculation of the soil with useful soil bacteria and algæ has been suggested to increase crop production. The effectiveness of inoculation, however, depends on certain specific conditions which add to the complexity of the problem and thereby make it necessary that the knowledge pertaining to the various disciplines of soil science is pooled together for the purpose. Though the duration of the training course in short, yet the intention is to give a comprehensive background to the trainees, including a study of particular aspects of recent developments in the subject.

CLIMATE FOR FOREIGN PRIVATE INVESTMENT

Enough Not Done To Clear Misconceptions

By ANILA GRAHAM

DIRECTOR, ECONOMIC AND DEVELOPMENT RESEARCH LTD., LONDON

THE announcement of the targets for India's fourth Five-year Plan highlights, once more, the important role that foreign private investment must play if the country is to proceed with her plans for rapid economic development. The foreign aid requirements have been set out at Rs. 2,500 crores—the same level as that in the third Five-year Plan—and it would be naive to believe that Indian export earnings will show a large enough increase to cover the foreign exchange that will be required in the next few years. No one in India is, or indeed should be, under any illusion that inter-Government lending will increase in the near future. The best that can be hoped for, from foreign assistance sources, is a continuance of lending at approximately the present levels; development needs, on the other hand, continually grow. Any balance of foreign exchange that is required must be met from the investment of private foreign capital. Thus, financial and technological resources combine to make foreign private capital welcome. This is a fact that is well appreciated by the Government of India which has taken a number of steps in order to encourage private investment within the framework of its Five-year Plans.

Trends in Developing World

The overall tendency is for the inflow of foreign capital to developing countries to contract rather than expand. A report recently published by the Economic and Social Council of the United Nations shows that, while private capital investment in industrialised countries has been continuing to grow, in the developing countries it has declined steadily since 1960—with the inevitable result that the benefit these countries should have derived from the increased availability of foreign official capital, has been, to a significant extent, cancelled out. The net flow of all private long-term capital to the countries in the "deprived" classification is stated by the United Nations report to have reached $1,127 million in 1960. Two years later, however, it had dropped to $877 million, and the survey asserts that there are indications that it registered a further decline last year. The U.S. has been providing the largest part of the money involved in this traffic, the other principal contributors being Britain, France, West Germany, Switzerland, Italy, the Netherlands and Japan. There is a strong Latin American emphasis in the U.S. activity, while Britain and France have been concentrating their efforts on their former colonies.

The waning of the capital exporting countries' enthusiasm for private investment in the developing countries can be largely set down to the deterioration in the international investment climate produced by the harsh treatment some of the recipients have meted out during the past few years to existing foreign capital for political and other reasons.

Recent efforts to speed the flow of private funds to the less developed regions have paid a good deal of attention to structural modifications designed to reduce the vulnerability of the money involved to total loss.

Some of the hazards of foreign investment include nationalisation without fair compensation, discriminatory and often confiscatory tax-laws, restrictions on the repatriation of capitals, or dividends, or profits, or all three. These are the chief dangers for the private investor abroad.

Position in India

There are a number of factors which, on the face of it, should make India a particularly attractive market for foreign investment, but the fact remains that the flow of such investment has not been nearly as much as it should be. What is it that inhibits the foreign investor from putting his money in a rapidly growing protected market of about 500 million people, and into a country which has an impeccable record about the payment of profits and dividends and the repatriation of capital, and one which has never taken over foreign private property without adequate compensation? For it is only too sadly true that many would-be foreign investors suffer from inhibitions about putting their money into India.

Perhaps one of the main reasons for this lack of enthusiasm, is a failure in communication—the fact remains that enough is not done to publicise the great attractions that India provides as a market for the foreign investor. There is an almost unbelievable ignorance in the minds of many would-be investors about the policy of the Government with regard to this subject, and many popular misconceptions still exist in the minds of investors in the industrialised West. Indeed, there were would-be investors even in Britain (a country which has had a great deal of experience in investing in India) who were surprised to know that dividends and profits on foreign capital are paid out by the Government of India, and the repatriation of capital was permitted!

Singularly little is known abroad about India's Five-year Plans, and the actual progress that has been made with regard to industrial development. The kind of news that is highlighted in the foreign Press deals, not so much with solid achievements, but with stories of food shortages and food riots and harsh import controls and rigorous taxation—giving to the less well informed a rather one-sided picture.

The general feeling of apathy with regard to investing in India, and the general uncertainty in the minds of would-be investors about the policy of the Government of India and the prospects for private investors, prompted the recent trip I undertook to India to examine, at first hand, the actual conditions and opportunities available. I returned from the trip more than ever convinced that the reality of the situation in India is very different from the picture the average investor has about the country. A great deal more has to be done to educate the private investor about the prospects for investment in India, as well as to take the necessary steps to streamline Government procedures which only serve to irritate and frustrate the potential investor.

The actual facts of the situation are that both the Government and private industry are anxious, within the framework of the Five-year Plans, to welcome a much larger amount of foreign capital, but this message has not yet come over, and the earlier attitudes which seemed designed to shut out foreign capital, and only accept it as a necessary evil, are the ones that are reflected abroad.

Popular Misconceptions

More effort should be devoted to abolishing the popular misconceptions that exist in the minds of would-be investors. Take, for example, the question of majority foreign shareholding in ventures set up in India. Many people still believe that it is impossible for a foreign participant to have any but minority shareholdings. It has now been officially stated that an Indian majority stake will not be insisted upon in joint private collaboration schemes where the import content of investment makes this impractical, or where the technology is wholly unfamiliar, as in the case of petrochemicals.

Again, contrary to popular belief, the Government of India is not wedded to price control as a policy. They have recently abolished price control on a number of commodities.

Many people are not aware that the Government itself is prepared to go into partnership with private industry in projects that were originally intended for the public sector only. In actual fact, the Government takes a pragmatic attitude, and is prepared to enlist the help of private enterprise when the national interests so require. A recent example of this was the 2.5 million ton refinery at Cochin. Here, the Government of India retained a majority share, but admitted both domestic and foreign private capital into the project. Thus, the Government of India welcomes private capital, not only in those industries reserved for the private sector, but for those in the public sector as well. This is a further indication of the pragmatic attitude of the Government of India, which, in itself, is one of the best guarantees to the foreign investor.

There are, however, many ways in which both the Government and private industry could do more to make the country attractive for the right type of foreign investment which is essential because it provides technical know-how as well as much wanted foreign exchange. The fact remains that foreign business is still not fully sure of its future place in the country. The attraction of a large and protected market with a remarkably stable Government is obvious to the would-be investor—but unreasoning fears of backdoor nationalisation, blocking of assets, compulsory acquisition and other factors which have affected foreign investment in other countries, continue to exist. This brings about the frame of mind summarised by the comment of an American who said: "Anyone who invests in India is a sucker, but anyone who does not invest in India is an even bigger sucker."

Many Difficulties Remain

Discussions with Indian and foreign businessmen in India made it clear that there are still a number of difficulties and frustrations

that the foreign investor has to face, and the most important of these is the problem of red-tape and procedural delays. The lengthy investment screening procedure before foreign investment is sanctioned has acted as a major irritant to many would-be investors and their Indian partners. The procedure has led to interminable delays and frustrations, and many prospective foreign investors have lost patience and given up. The length of time involved in sanctioning such agreements has also meant that costing of such schemes has become completely unrealistic. Although the top civil servants in India are very good, there is a general feeling that there is far too much bureaucracy and there is a certain amount of irritation at the endless range of bureaucratic interference.

Discussions with the Government revealed that they were very conscious of the difficulties that administrative delays create for would-be investors, and a great deal has been done recently to streamline the process, but it remains to be seen how effective these new measures will be. It should be made clear to the would-be investor that the various procedures covering investment of private capital, spring from two basic requirements—industrial licensing to implement Plan priorities and import control, so that the best use of scarce foreign exchange resources may be made. Delay and minor irritations are, it is true, unavoidable, but much more needs to be done to streamline this process.

Some Helpful Steps

Among the helpful steps that the Government has taken in this field, one should mention the decisions based on the recommendations of the Committee on Utilisation of External Aid to ensure the speedier use of foreign aid and the help that is to be given to entrepreneurs to set up their projects without undue delay. The Department of Technical Development is to back various measures to give quick clearance to applications for import licences. The number of industries which can rely on monetary ceilings, rather than the detailed scrutiny of items, is to be increased. The Government is considering laying down standards of foreign collaboration terms for various industries to help prospective foreign investors to conclude collaboration agreements without too much delay. It is said that industrial units will be offered as wide a range of choice as possible with regard to the sources of supply of raw materials and components which will help them purchase their requirements in the cheapest market. All these factors could do much to improve the climate for foreign investment.

Another difficulty faced by businessman in India, is that of financing maintenance imports. Because of the serious foreign exchange position, it is sometimes difficult to import the raw materials and semis required to carry on production. At the same time when existing capacity is under-utilised, permission is given to new units to set up with claims over the same limited foreign exchange. This brings up the old argument of maintenance *versus* development, and here again, steps are being taken to assist in procuring maintenance imports.

The other difficulties involve those relating to the import of components manufactured in India. The Government, again in view of its limited resources of foreign exchange, is reluctant to give import licences for items which can be manufactured in India, and even if the Indian-made components are not suitable for the plant, permission to import is hard to get and many industries prefer to work under capacity rather than use inferior components which they feel might damage their plant. Again, in view of the general apprehension that lies at the back of the mind of every foreign investor about the possibility of nationalisation and expropriation, recent legislation passed in India relating to the Life Insurance Corporation and the new Unit Trust, served to create alarm and was regarded as a form of backdoor nationalisation. However, the majority of industrialists are convinced that the threat of nationalisation and expropriation does not exist at present, and as the years go by, the risks become less.

Taxation

Another complaint made by foreign investors is the fact that the Indian tax system is pretty harsh. However, the last budget offered a variety of concessions which, when taken in conjunction with the system of tax rebates for new industries, and a number of other concessions which have been made, seriously lessens the impact of such taxation. A fact which is not sufficiently emphasised is that while taxes are high, profits are also impressive.

In view of the rules and regulations which apply to managerial remuneration, the main staff problem for foreign investors abroad is to keep up the quality of European staff who can be attracted to India. It is claimed that the ceiling of remuneration fixed by the Government of India, makes it difficult to recruit the right type of man. Here again, concessions given in the latest budget should go some way towards meeting these difficulties.

Although it is appreciated that, in the long run, India will be one of the largest markets in the world, the fact remains that the effective market in India, at present, is limited to about one per cent of India's population, that import licences are very hard to come by, and sheer shortage of supplies is one of the limiting factors in production. Many of these factors are unavoidable in a country which is in the process of development and is faced with acute foreign exchange problems, but the fact remains that this type of difficulty makes a number of would-be investors a little restive. Many of these businessmen, when considering investing in India, must be reminded of Oscar Wilde's remark on society: "To be in it is a bore, to be out of it is a tragedy."

A Serious Fear

A number of foreign investors take fright when they appreciate the size of India's balance of payments deficit, and indeed wonder whether India is not laying up too many debts which she will be forced to cancel with the consequent deleterious effect on foreign investment. Some investors feel that, in her present financial position, India is not, perhaps, the best country in which to put their money. But this is an argument which applies with equal force to a number of developing countries, and the proper solution, surely, is for a more rational approach to the debt repayment burdens of international lending.

One can only deplore the lack of adequate understanding of the opportunities and problems of getting into India, and for this unhappy state of affairs, Indian businessmen and the Government of India must take their share of blame. A great deal more has to be done to educate the private investor about the prospects for investment in India, and the reality of the climate for such investment as it exists today.

Administration And Our Development Plans

Causes And Remedies For Present Shortcomings

By D. L. MAZUMDAR, I.C.S. (Retd.)

IT is one of the major paradoxes of our development effort in this country that, although from the very inception of planning, the crucial importance of administration in the implementation of developmental plans has been formally affirmed and emphasised in the successive Five-year Plans, this affirmation has been accompanied by increasing public expressions of dissatisfaction with the role actually played by administration in this area throughout this period, culminating during the last three or four years in statements by high authority which have sometimes virtually amounted to a confession of loss of faith in the capacity of administration "to deliver the goods," according to the popular *cliché*. The question that naturally comes up to one's mind is —"Why, in spite of the formal recognition of the basic importance given to administration in our developmental plans at the policy-making levels of Government, has it not been possible over a period of nearly a decade and a quarter to vitalise the system of administration with the dynamics of growth?" Pedlars of administrative nostrums may be ready with their answers. But it is not easy for any serious student of administration to attempt to solve this conundrum in a short article. The subject is much too intricate and complex to be susceptible of any such summary treatment. All that will be attempted in this article is, therefore, a hurried over-view of a few aspects of this problem, which, in the judgment of the present writer, have not received the measure of attention that they deserve from students of contemporary administration in this country.

Observations in Plan Documents

As a preface to the paragraphs that follow, it may be of interest to make a cursory reference to the treatment of this theme in the three Five-year Plans. The First Five-year Plan still contains the most succinct *formal* exposition of the true nature of the process of development in an emerging country like ours. It will suffice to reproduce the following excerpts from Chapter I of the First Five-year Plan Report:

"The problem of development of an underdeveloped economy is one of utilising more efficiently the potential resources available to the community, and it is this which involves economic planning. But the economic condition of a country at a given time is a product of the broader social environment, and economic planning has to be viewed as an integral part of a wider process aiming not merely at the development of human formalities and the building up of an institutional framework adequate to the needs and aspirations of the people. . . . Planning implies the readiness on the part of the community to view the social process as one whole and to take action design to shape this process along the desired lines over a definite period. Inspite of considerable advance in public thinking on the subject, the acceptance of such an approach to the problems of economic development and social change represents a relatively new phase in policy-making and in administration. Planning involves the* acceptance of a clearly defined system of objectives in terms of which to frame overall policies. It also involves the formulation of a strategy for promoting the realisation of the ends defined."

The Second Five-year Plan visualised a more pragmatic future role for administration in economic and social development. "As development goes forward," it observed, "the expression 'administration' steadily assumes a broader content. . . . Increasingly administrative tasks have had to be undertaken in new fields, specially those connected with economic, industrial and commercial operations. . . . Thus, in a very real sense, the Second Five-year Plan resolves itself into serious well-defined administrative tasks." The authors of the report then went on to a detailed classification of the categories under which these tasks might be said to fall, adding that this classification was by no means exhaustive and that "although each of these tasks constituted a theme by itself the various tasks would have to be viewed together as interdependent elements in the execution of the plan."

The Third Five-year Plan adopted a more or less similar stance towards the problem of administration, viewing it primarily as a collection of specific administrative tasks. A mild critical undertone was, however, provided by the following observations:

"The past decade has been a period of considerable change and adaptation in the field of administration. Innovations have been introduced and new institutions established, although perhaps many of them have yet to be fully integrated with one another and with the structure as a whole. With increase in the range of Government's responsibilities and in the tempo of development, the volume and complexity of administrative work have also grown. The administrative machinery has been strained and at many points in the structure, the available personnel are not adequate in quality and numbers. The administrative burden of carrying out plans of development, large as it is at present, will increase manifold under the Third Five-year Plan, and doubtless new problems in public relations will also come up. In the recent past, certain aspects of administration have attracted pointed attention. These include the slow pace of execution in many fields, problems involved in the planning, construction and operation of large projects, especially increase in costs and non-adherence to time-schedules, difficulties in training men on a large enough scale and securing personnel with the requisite calibre and experience, achieving co-ordination in detail in related sectors of the economy and, above all, enlisting widespread support and co-operation from the community as a whole. In the larger setting of the Third Plan, these problems are accentuated and gain greater urgency. It is widely realised that the benefits that may accrue from the Third Plan will depend, in particular in its early stages, upon the manner in which these problems are resolved. As large burdens are thrown on the administrative structure, it grows in size; as its size increases, it becomes slower in its functioning. Delays occur and affect operations at every stage and the expected outputs are further deferred. New tasks become difficult to accomplish if the management of those in hand is open to just criticism. In these circumstances, there is need for far-reaching changes in procedures and approach and for re-examination of prevalent methods and attitudes."

Fundamental Aspects

Two broad conclusions seem to emerge from the treatment of the role of administration in relation to our development efforts as envisaged in the Five-year Plans. In the first place, the formal recognition given in these documents to the importance of administration in relation to our developmental programmes appears to have been primarily in terms of the ultimate goals of policy which administration was intended to help to achieve. Little attempt was made to study on an empirical basis, the organisation and structure or the role of administration, at the major operative levels—much less to analyse the factors which underlay the behaviour pattern of administrators at these levels. Secondly, there was hardly any adequate appreciation of the fact that development planning of the type which we had adopted and which involved a major transformation of our economic and social life, called for the closest participation of all the organs of Government and administration, from the Cabinet down to the village *panchayat*, in the process of administration. In other words, it was not sufficiently realised that the implementation of our development plans was a matter not primarily for civil servants associated with the planning authorities, as in the case of the National Economic Development Council in the U.K. or the *Commissariat général du Plan* in France with the help of their counterparts in organised trade, industry and labour. It was, indeed, overlooked that, in the Indian context, it was also a coaxial responsibility of the political masters of the civil servants at different levels of the administrative system. In the social and economic context of all developing countries, including ours, committed to the modernising process, the word 'administration' must, therefore, include within its compass not merely the members of the different grades of the public services but also all those who are directly associated with the formulation or execution of the development plans, either as masters, agents or collaborators of the civil servants. This basic fact about the true nature of the administrative process in the context of our development plans does not appear to have been sufficiently grasped in the Plan documents.

Major Factors

If this appraisal of the general approach to the problem of administration in the Five-year Plans is substantially correct, this would explain the relative inefficiency of administration in the implementation of our development plans during the last few years. To paraphrase this analysis in positive and concrete terms, the drawbacks and defects of our administration in this area appear to have been stemmed, by and large, from the following major factors:

(i) The role of administration in development planning was enunciated only in the broad global terms of the ultimate objectives of such planning. As these objectives were not reduced into a series of subsidiary goals or objectives appropriate to the different layers of the administrative hierarchy, the role ascribed to administration remained necessarily involved in a cloud of vague ill-defined aspirations. What was *prima facie* needed was a break-up of this role into functional and operational terms, capable of being understood and acted upon at the different levels of administration.

(ii) No objective, empirical analysis was made of the organisation, structure and functioning of the machinery of administration in relation to the need for implementing the development plans in the different sectors of the economy.

(iii) The machinery of administration was viewed primarily as a *mechanical* system. Administrative reforms and innovations introduced from time to time during the last few years were mostly concerned with the "house-keeping" preoccupations of administration and with statistical exercises in the measurement of administrative performance, and with the installation of mechanical checks and balances in office procedure which, it was hoped, would help in the quick despatch of administrative business;

(iv) Man-power development in the superior ranks of the civil services, through pre-entry education and training appropriate to the needs of planned development, was slow to come; as was also constructive innovation in the methods of recruitment and post-entry training and placement of personnel. The urgency of this need has to this day not been sufficiently recognised even in the highest administrative circles.* As a perceptive foreign observer noted some time ago:

"The policy questions with which a quasi-elitist cadre like the I.A.S. must deal embrace the most complex issues of administration, economic and technical assistance and social change. In the last quarter of a century an immense body of literature and experimentation on these questions has developed. An acquaintance with this scientific knowledge is an essential quality of the generalist administrator. The Indian Administrative Service, if it is to maintain its status as a truly superior service in the face of diffusion of administrative knowledge in society, must be equipped intellectually for the task."†

(v) Imaginative political and social leadership was not deployed to infuse a new sense of purpose and mission into the key operative levels of the existing administrative system, with the result that administration could not be galvanised into a new mould and lifted out of its traditional stereotype to a new plane of reoriented attitudes, motivations and a creative sense of achievement. This was matched by corresponding failure in the top leadership of the administrative hierarchy to provide the rank and file of civil servants with the intellectual and moral leadership necessary for stimulating them to a new level of high developmental endeavour.

Failures

Space does not permit of fuller elaboration of the factors listed above. It will, however, be noticed that they may be broadly classified under three principal heads, namely,

(i) Inadequacies in the operational design and 'engineering' of the development plans; and inadequacies in the administrative strategy needed for the requisite reconstructive and developmental efforts.

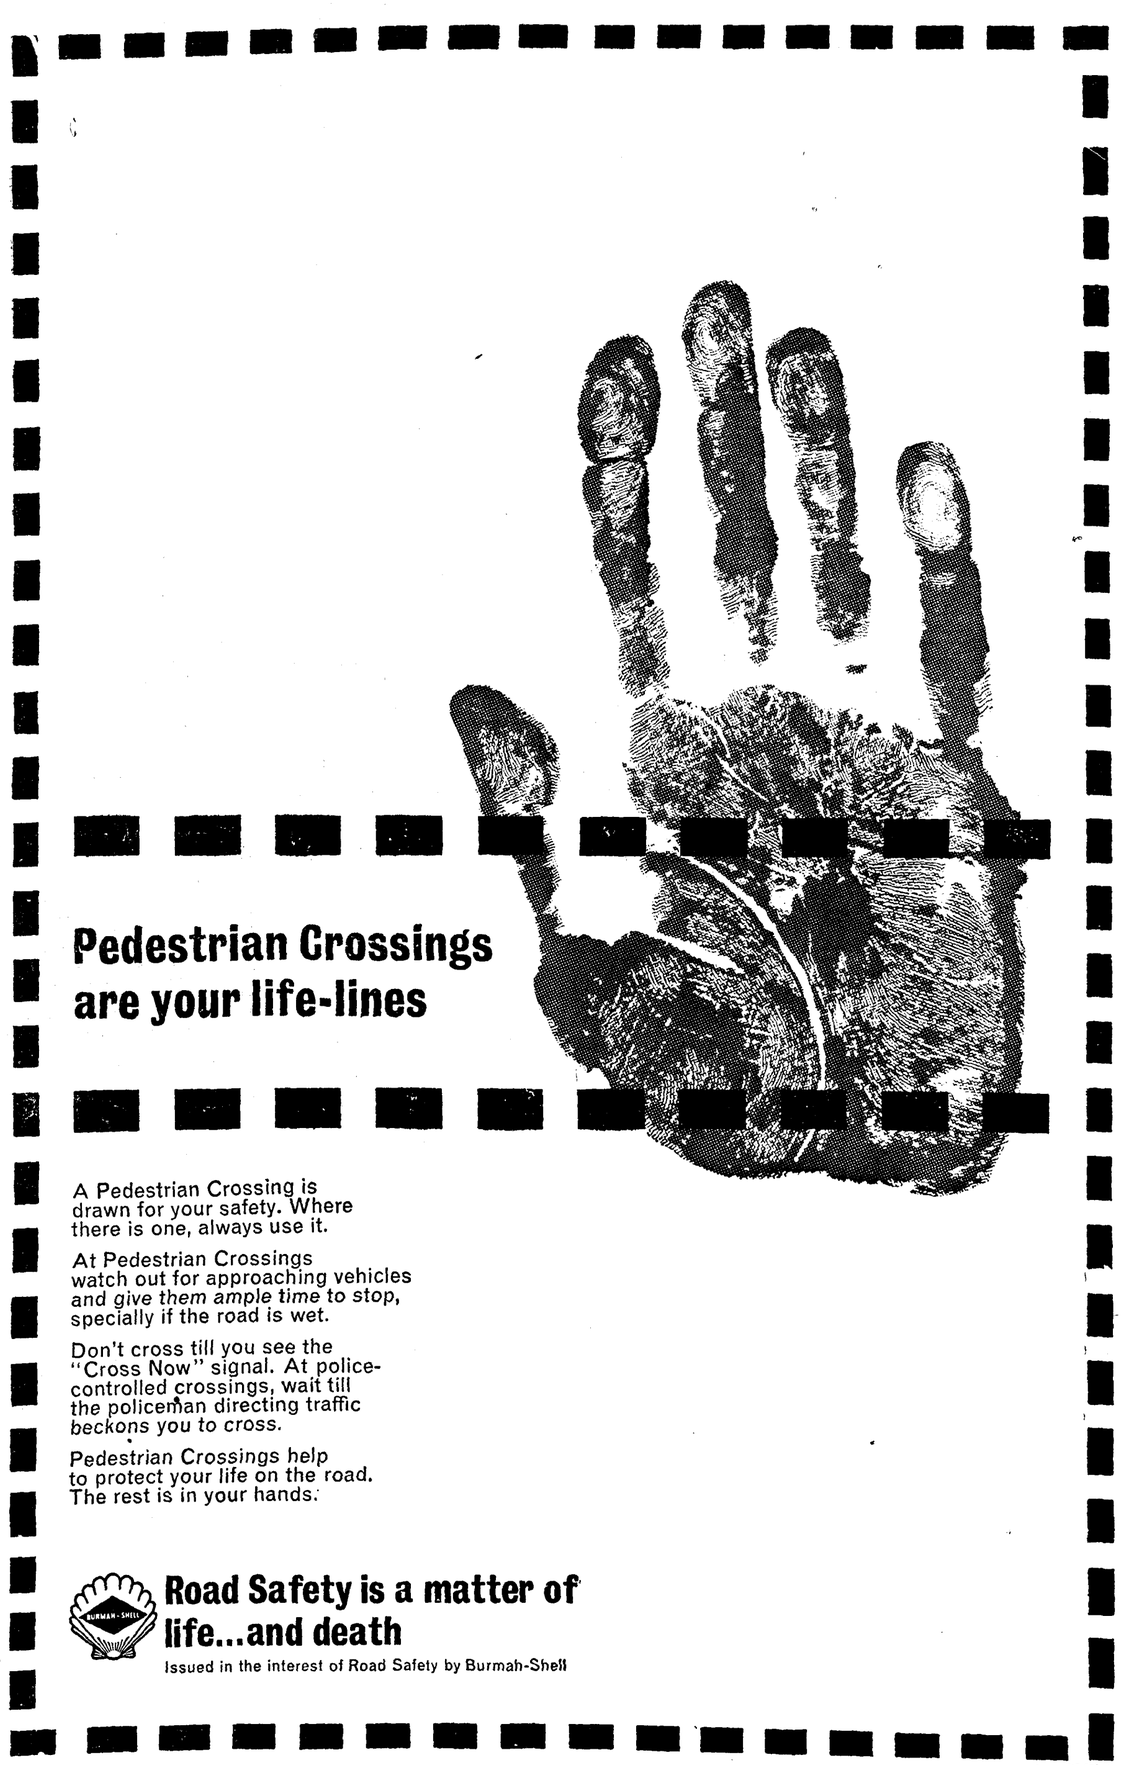
(ii) Secondly, inability on the part of policy-makers both at the political and administrative levels to conceptualise, in terms of organisation and structure, the new type of administrative system which was needed in the context of our development plans; and

(iii) Thirdly, failure on the part of governmental, as well as

---

* In an address delivered before the University of Rajasthan at Jaipur in March 1956, since published under the title "Economics and Administrative Policy" by that University, the author referred to the need for the reorientation of pre-entry education, to be supplemented by post-entry training, in the case of recruits to the senior-most cadres of the civil services.

† *Vide* article by Prof. Ralph Braibanti of Duke University (U.S.A.) in *Administration and Economic Development in India* entitled "Reflections on Bureaucratic Reform in India," published by the Duke University-Commonwealth Studies Centre (1963).



administrative, leaders to provide the administration with the requisite dynamism and a new sense of purpose and direction which the goals of our development planning called for.

These inadequacies, shortcomings and failures were cumulatively responsible for the eclectic and *ad hoc* approach to the problems of administrative reform and reorganisation adopted since the early 'fifties. It is this approach which prevented the introduction of those major changes in the methods of recruitment, training and placement of personnel at the highest levels of administration and in the organisation of the leading service cadres, which many keen observers of the prevailing administrative scene considered urgently necessary in the light of the new demands placed on administration by our development plans. In the result, improvisations and marginal adaptations took the place of imaginative reconstruction of the administrative structure and an alternative cycle of exhortation and criticism of administrative conduct became a substitute for the injection of new motivations and impulses into the behaviour pattern of administration.

A Pessimistic View

It may be pertinent in this context to refer, in passing, to a pessimistic view of the possibilities of administrative development in the context of our new social and economic needs, which is sometimes expressed not only in this country but also in other developing countries in this part of the world. The exponents of this view assert that the scope, range and magnitude of development efforts are beyond the administrative capacity of the traditional administrative systems in these countries, and that their complete overhaul in the interest of economic and social development is necessary. Those who propound this view seldom elucidate the full meaning and implication of the operation which they advocate, much less spell out the details of their recipe for change, in organisational and structural terms; instead, they are content with generalisations about decline in administrative efficiency or capacity, which it is neither easy to refute nor to accept as any helpful basis for constructive reform. To say this is not to ignore the intimate relevance of the general political, economic or social environment to the administration of development plans. Certain basic considerations which inevitably condition the quality and tempo of administration must always be borne in mind, particularly as, in current debates, they are not infrequently forgotten even by those who should know better.

Japanese Example

One basic fact is that the administrative machinery of any country must, of necessity, derive its character and quality, in the long haul, from those of the rest of the population at comparable levels. To the extent that, in the long period, the intelligence, honesty, alertness and the sense of responsibility displayed by the personnel employed in a representative cross-section of the administrative machinery fall short of the desired level, the defect must in the long run be traced to a general lowering of the national character. Theoretically, it may be possible by a careful process of initial selection, systematic post-entry training, at recurrent stages, and by deliberately creating and fostering certain traditions of service, to build up an administrative *elite*, resembling in some ways, for example, the *Samurai* class in the post-Meiji era of Japan, imbued with ideals of public service and conduct far ahead of the prevailing average standards in the generality of the people. Whether it is desirable to create such a class in a democratic society is open to question. Nevertheless, even if this were desirable and an administrative *elite* of the type could be built up, it is very unlikely that it could survive, in the long run, the pulls and pressures of democratic political and social forces which would sooner or later bring down the level of administration to that of the community which it must serve and to which it must necessarily belong. This analysis raises far-reaching long-term issues of our psycho-sociological history on which it is not necessary to dilate further in the present context.

Another Basic Factor

There is another basic factor to which these pessimists draw attention and which, they argue, must also be kept in mind, namely, that Governmental business even at its best, differs in several important ways from private business. By its very nature, they point out and very rightly, that public service is essentially *non-personal*—not in the sense that human relations do not or should not enter into the conduct of public business, but in the sense that decisions by administrators must be taken on the basis of objectives, policies or principles, and *not* on the basis of personalities or individual likes and prejudices. A society which has not, by and large, learnt to distinguish between personal, family, group or party considerations, on the one hand, and public policy or the public interest, on the other, will not, according to the pessimists, be able to create those conditions under which alone administration can be carried on with due regard to the goals of our accepted economic and social policies. Instead, in these circumstances, the social and administrative *milieu* would render efficient and effective implementation of the development plans in the public interest extremely difficult.

What is Needed

The present writer recognises the importance of these basic socio-cultural factors which must necessarily condition the quality of our administration, but, in his judgment, they do not invalidate the inferences which he hopes can be legitimately drawn from the analysis attempted in the earlier paragraphs of the short-term factors, which, according to this analysis, appear to have accounted from the current defects and deficiencies in our administration *vis-a-vis* our development plans. In the context of our sociological history, a deterministic attitude towards administration may come easy to 'no-changers,' whether they are conservative admirers of the *status quo* or iconoclastic detractors of the existing system. And yet, to accept any such attitude would be to jettison the underlying logic of the process of change, which postulates a radical transformation of the social and economic *millieu* in all developing countries, consequent on the execution of their development plans. At any rate, the path of practical wisdom lies in the adoption of an empirical, operational approach to the problems of administrative reform and reorganisation, with due regard to the psycho-social realities of the local situation evolved through history, but without letting them dominate current constructive thinking and planning in this field. In the present writer's view, the socio-cultural realities to which the pessimists draw attention are best regarded as broad parameters within which the plans for administrative reorganisation and reconstruction must be designed and worked out in the short period, in the hope that, in the long haul, these parameters would also change their character and dimension as a result of the impact of the development plans on them. This hope can be realised only if administration, at all levels, succeeds in implementing these plans efficiently and effectively. There is, therefore, an urgent practical need to consider how best administration can be reorganised, re-structured and harnessed for the successful implementation of our development plans.

Essential Conditions

Following the analysis of the foregoing paragraphs, it seems to the present writer that the quickest progress towards this end can be made by concentrating on the major factors which in his judgment have so far gravely impaired the efficacy of administration in this field. These factors are, in effect, the same as those described with rare insight and pre-vision in the First Five-year Plan as the "essential conditions" for the successful implementation of our development plans. "We should like in this context," said the authors of the First Five-year Plans, to stress the essential political and administrative conditions essential to successful planning. Briefly, these are: (*a*) A large measure of agreement in the community on the ends of policy; (*b*) effective power, based on the active co-operation of citizens, in the hands of the State; and earnest and determined exercise of that power in furtherance of these ends; and (*c*) an efficient administrative set-up, with personnel of requisite capacity and quality."

It is a melancholy reflection that even after the lapse of over a decade and a quarter, the adequate fulfilment of these pre-conditions to effective implementation of our development plans remains almost as distant a goal as it was in the early fifties. In most of these areas, increasing knowledge of what is right and proper has remained disconcertingly unmatched by lack of vigorous collective purpose and will. It is this imbalance which would now seem to constitute the core of the administrative problem in relation to our development plans.

INDIA'S FIRST MODERN MARKETING ASSOCIATION

India's first modern marketing association, known as the Indian Marketing Association, Bombay, will be officially inaugurated by Mr. S. K. Patil, Union Minister for Railways, on Friday, 15th January 1965. The elite of the City's industrial and business community, as well as leading educationists, will be invited to the function. The Association has been formed with the active help and co-operation of the American Marketing Association, which will be completing 50 years in June next, and of the International Marketing Federation formed two years ago. The I.M.A. has an ambitious programme to cover all the three major areas of marketing, namely, marketing practice, marketing research and marketing education. Started just a few months ago, the I.M.A. has a membership of over 50 at present, representing practically all the important States in India. The Indian Standards Institution is a corporate Member of the I.M.A. Many more members are being enrolled.

Immediately after the official inauguration, there will be a two-day Marketing Seminar to be held at the Green's Hotel auditorium on 15th and 16th January. An advance programme for the Seminar is attached. Leaders in different aspects of Marketing and well known business and industry leaders of Bombay will be participating in the three sessions of the Seminar. Through the good offices of the Ford Foundation, New Delhi, it is expected that three or four professors of Marketing and Management (including one or two American Professors) from the Indian Institutes of Management at Calcutta and Ahmedabad and the S.I.E.T. Institute at Hyderabad will also participate as

A new symbol in the world of indigenous automobile ancillary components. As a matter of fact, this symbol represents the pioneer manufacturer of Pistons, Piston Rings, Cylinder Liners, Gudgeon Pins and Circlips over 15 years.

This emblem is symbolic of our determination to continue, in the fullest measure, all the factors which have been responsible for our progress—Leadership in original equipment coverage, volume of production, range, price and above all quality. It is a visual pledge of our resolution to continue to serve the automobile industry and the parts trade in the country ■ **INDIA PISTONS LIMITED, MADRAS-11**

SOME ASPECTS OF MANPOWER PLANNING

Goals Must Be Related To Plan Objectives

By Dr. J. N. MONGIA

IN strict economic technology, 'labour' is all manpower that is employed; it is a factor in production, the service of human beings. However, the term 'labour' is popularly applied to a variety of segments of total manpower resources. As a result, its meaning is frequently obscure and confusing. 'Manpower', on the other hand, is a term that avoids most of these conflicting interpretations. It includes all human resources and thus corresponds closely to the economic definition of 'labour.' It includes organised and unorganised employees, supervisors, executives and Government employees. It refers to both those employed and those who might be employed. "Manpower is an economic resource just as material, equipment, electrical energy and money are economic resources. Manpower in the economic sense is the managerial, scientific, engineering, technical, skilled and other personnel employed in creating, designing, developing, managing and operating productive and service enterprises and economic institutions".[1]

It is now being recognised on all hands that manpower is a principal resource of modern society, and that the efficient utilisation and conservation of human resources deserve a careful and objective consideration as do the utilisation and conservation of physical resources. Being a major resource of modern society, manpower is somewhat comparable to such natural resources as timber, petroleum, iron ore and coal. It is even more closely comparable to water-power resources or atomic power resources, because human resources are power resources.

Manpower Not a Commodity

Viewing manpower in this way does not mean that the manpower can be regarded as a commodity, may be a highly valuable though expendable property of society.[2] It also does not imply that the goals of modern societies contemplate only the efficient utilisation and conservation of manpower resources. Rather, it should be recognised that regard for manpower as a resource must be paralleled by regard for the human beings that are manpower as citizens, as individual human beings, as members of society. It is equally important that their participation in society as citizens and their development as well-rounded human personalities are recognised as major objectives.

Conceding that manpower is clearly the most valuable and the most versatile source, it is also believed to be the most complicated one, since human personalities are more complex than any other natural resource. It is no wonder, then, that the control of manpower resources—their conservation and efficient utilisation—combined with objectives seeking personality, expression and development—present problems that are more complicated than those arising in the application and conservation of other resources. This consideration is of special significance in a democratic society, which is bound to preserve a maximum of individual freedom, political participation, and personal and social growth. Out of this complexity arise many of the situations, often described as labour problems which are reflections of the manpower goals of modern society. However, the intention of the present paper is not so much to focus attention on an analysis of all these labour problems as to restrict itself to some aspects of manpower planning alone.

Need for Manpower Planning

Balanced development demands, in addition to material investment, a policy for the fullest and most rational use of human resources. One of the instruments of such a policy is manpower planning. Whereas economic planning has gradually become an essential part of development policies, as a way of obtaining maximum returns on a limited investment budget, it is only now coming to be recognised more generally that planned development of human resources is also needed.

A common experience of industrial countries has been that their economic and social development has usually had to encounter chronic shortages of high-level skills and future requirements of engineers, technicians or physicians have to be forecast. Even those countries which are passing through a phase of economic development are not free from this difficulty as evidenced by the disappointing results of investment, or at least the low level of returns which is usually a consequence of the dearth of skilled workers.

Thus, the dearth of trained manpower has been a deterrent to the expansion of social services, education, and industry. Manpower shortages limit the rate of future growth in many countries. Lack of trained manpower may be more of a limiting factor to future growth than shortages of capital or natural resources.

The particular situation varies from country to country, but certain elements are common to many, such as the following:

1. A shortage of persons adequately educated in certain professional and technical occupations, particularly scientists, engineers, teachers, physicians, nurses, and other health services personnel.

2. More people educated in law and the liberal arts than the demand calls for.

3. A shortage of sub-professional workers to serve as technicians, laboratory assistants, foremen, and supervisors.

4. A shortage of administrative, executive, and managerial personnel.

5. In clerical occupations, a shortage of stenographers, bookkeepers, and skilled office machine operators, but more untrained people seeking work in the less skilled white-collar jobs than can find work.

6. A shortage of craftsmen and skilled workers such as machinists, machanics, machine-repairmen, electricians, and plumbers.

7. A great number of unskilled and semi-skilled workers in cities, creating widespread unemployment and underempolyment.

8. Widespread underemployment in rural areas, affecting particularly agricultural labourers and owners of small farms, caused mainly by the smallness of most farms and by seasonal fluctuations of activity.

On account of such difficulties, more and more countries are endeavouring to strike a proper balance between material investment and training of workers. What is new about this concept of balanced development is that the level of skill of the labour force is now receiving as much attention as its quantitative aspects. Manpower planning is thus seen in the present-day situation as a vital element in a rational policy of balanced economic and social development. It is the indispensable complement to material investment and educational planning. "It might be briefly defined by stating that its aim is the development of human resources and its method, the correlation of total manpower requirements with total material and human resources."[3] In this respect, manpower planning has several affinities with economic planning; it calls for definition of the main alternatives for a long-term manpower policy, forecasting of quantitative manpower requirements and qualitative indication (by level of skill) of the training facilities needed.

Interdependent

As already mentioned, the affinity between manpower planning and economic planning is a close one. The high-level manpower requirements of an economy depend primarily on its structure and level of development; these, however, are determined to some extent by the high-level manpower situation. This interdependence makes it quite unsatisfactory to attempt to balance supply and demand without regard to the level at which this balance is achieved; hence, the necessity of evolving methods and techniques for a close collaboration between the two. Thus, to say that manpower planning is merely an attempt to balance the supply and demand for high-level manpower is not enough, since this statement evades the question as to what determines the demand for high-level manpower. It is here that the state of economic development of a country comes in. A really primitive society may have no such demand, whereas an advanced society does have. It is the strength of this demand and its structure (i.e., the types of high-level manpower needed) that depend upon the level of development and on the structure of the economy of the concerned country. It is quite possible that an underdeveloped country with a particular economic structure may have a strong demand for one type of high-level manpower, a much smaller demand for another type and none at all for still another type. Conversely, a fully developed country has a much larger general demand for high-level manpower and, also, the structure of this demand is usually quite different. "This dependence of demand for high-level manpower on the level of economic development and on the general economic (and social) structure is true at each point of time. It is thus true about the beginning as well as the end of each plan. During the time between the beginning and the end of a general economic plan, the level of development and the economic structure will change and from this change will result also a change in the demand for high-level manpower."[4]

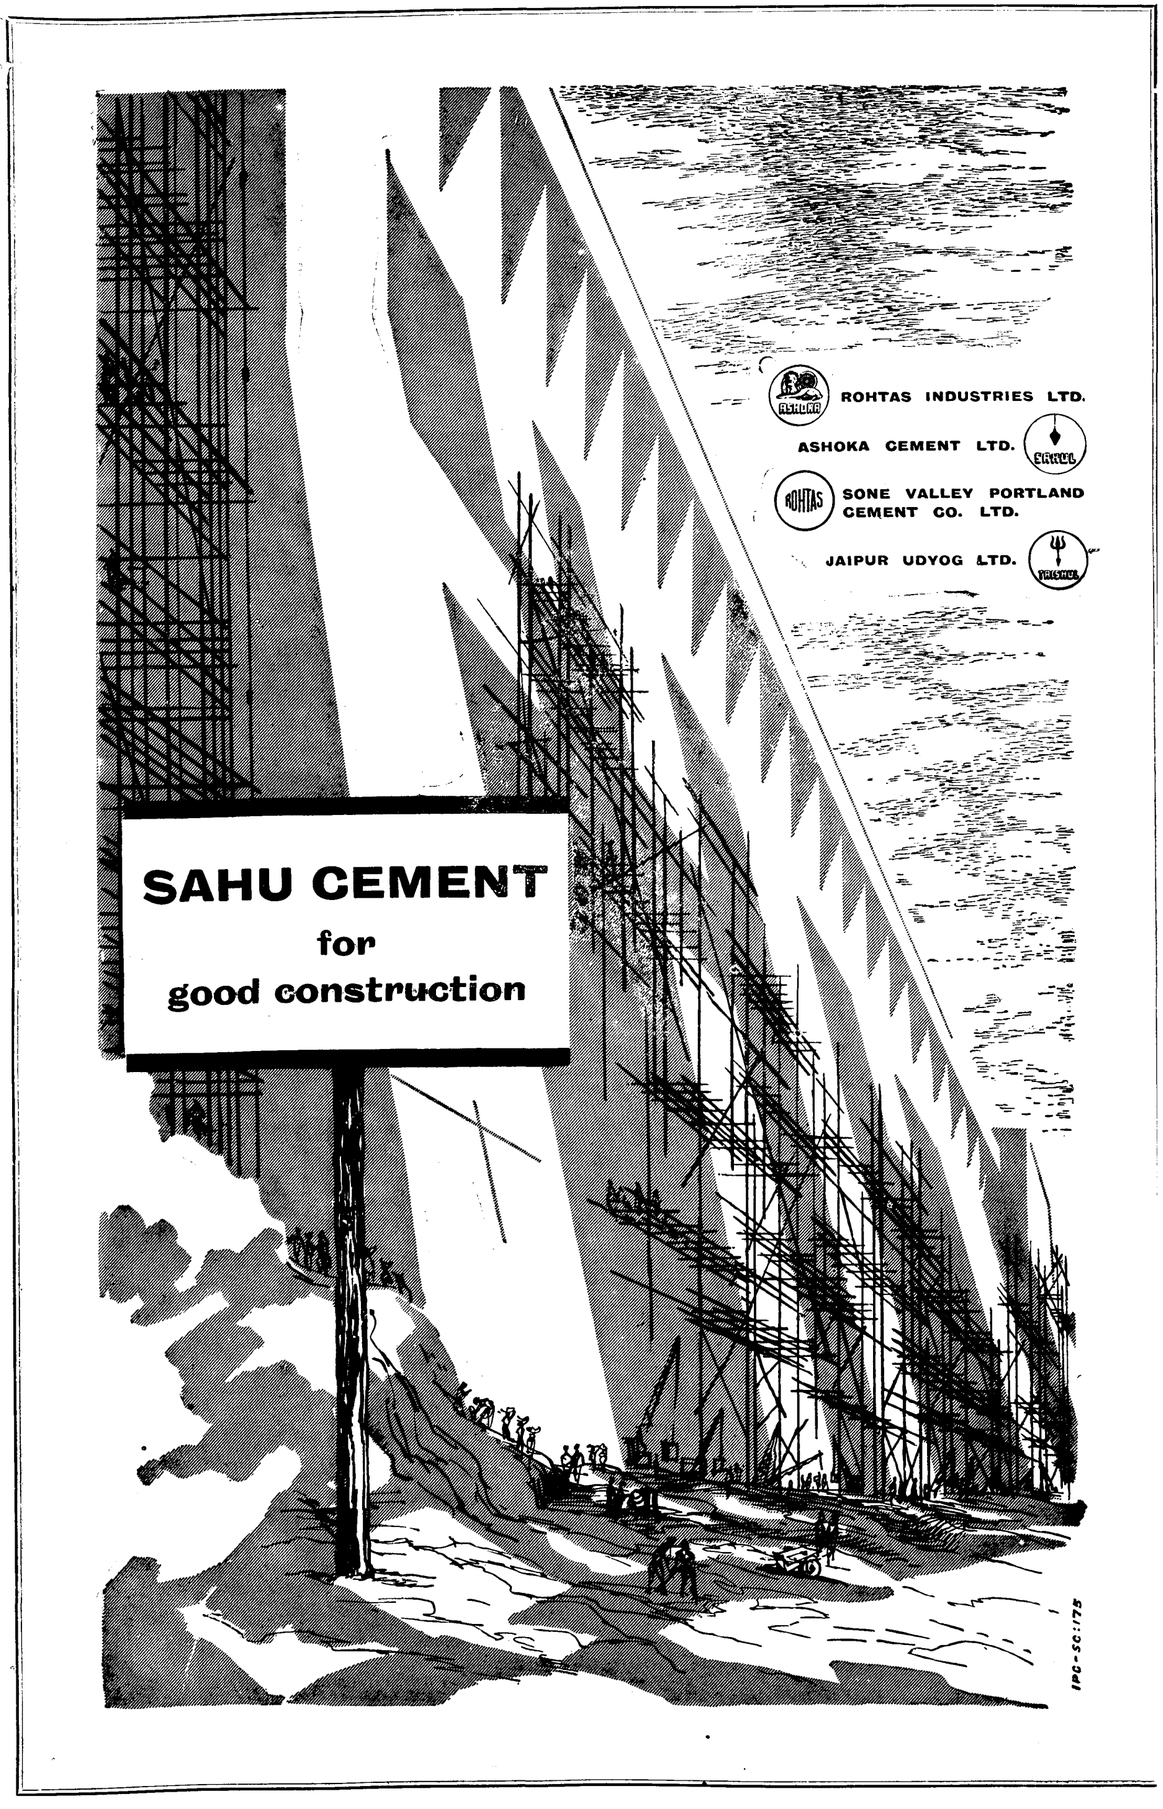
However, there are several factors on which depends the rate at which an economy develops and undergoes structural changes. For example, this rate depends on the resources the economy has, the new resources it develops, the way in which it uses all resources, and the goals it wants to achieve by using them. One of these resources—and an important one—is manpower. Thus, the economic growth and structural changes which determine the demand for manpower themselves depend, in part, on manpower, on the way in which manpower is used and on the way new manpower resources are developed. This finding makes the problem of high-level manpower planning much more difficult, since the demand and supply sides cannot and should not be considered in isolation. It is also evident, at the same time, that the purpose of high-level manpower planning cannot be limited to achieving a balance between the supply and demand; it has to be extended also to the level at which they will balance.

The determination of the level at which there is a balance between supply and demand for high-level manpower, as well as for other types of manpower and for other factors of production, is, of course, the task of the economic plan. Regardless of what ultimate goals it serves, this (the economic plan) seeks to reach a balance between demand and supply for each particular factor of production (including high-level manpower) at a level most compatible with achieving the ultimate goals. Hence, the level at which the supply and demand for high-level manpower (or for any other factor of production) balance cannot be determined in isolation but only with regard to all other factors of production; and in each case, the basic criterion has to be the achievement of "the ultimate goals" of the economic plan. The purpose of high-level manpower planning is thus the same as the purpose of economic planning, that is, the achievement of certain "ultimate goals" which the society desires.

Ultimate Goals

What are these "ultimate goals"? They may be expressed in very general terms, such as "a high level of development," "a high standard of living" or "full satisfaction of material and cultural needs." For practical purposes, these goals must be translated into more concrete targets or objectives, expressing the weight which the society attaches to each of them. The whole economic plan has, as its purpose, the attainment of all objectives (which include, among others, the fastest growth of national income) and the high-level

[1] U.S. Department of Labour: *The Forecasting of Manpower Requirements.*
[2] Dale Yoder.
[3] Michel Debeauvais: *Manpower Planning in Developing Countries.*
[4] F. Paukert.



manpower plan must be geared to this same aim.[5]

It would be interesting to know that, though, as mentioned above, general economic planning and high-level manpower planning have a common purpose, sometimes, there may be conflicts between the two approaches. In the event of the existing structure of skilled supplies falling short for the immediate achievement of all economic objectives, expansion in high-level manpower formation becomes necessary in order to provide manpower needed for expansion in industry and other sectors. This contingency, namely, the expansion in high-level manpower, necessitates the use of scarce resources which the general economic planner allocates among different uses, with the greatest care, trying to achieve the maximum returns from each invested unit of resources. In these circumstances, choices have to be made not only between sectors but also between techniques of production: a given output in a sector can be achieved with differing amounts of capital and with differing labour resources. For this reason, even if output requirements from a particular sector were known in advance and were considered to be optimal, the requirements of the sector for high-level manpower would not automatically follow. Hence, reconciliation between the two is necessary. The optimal method of reconciliation of economic planning with high-level manpower planning, as suggested by some experts, is to treat both as "dependent variable," one on the other. Only in this way is it possible to express the fact that the total demand for high-level manpower, and the pattern of this demand depend, among other things, on investment decisions. The latter are, in turn, influenced by high-level manpower supply.

Methods of Manpower Planning

An attempt has been made, in the foregoing paragraphs, to show the relationship that exists between economic planning and manpower planning. This concept of integrated planning raises new problems with regard to methods and administrative organisation. Several international organisations, being seized of the problem have, in the last two to three years, frequently met to discuss the methods which could be effectively employed for planning the manpower resources of countries, keeping in view the state of their economic development. For example, a mention may be made of the I.L.O. Meeting of Experts on the Assessment of Manpower and Training Requirements for Economic Development (Geneva, October, 1962), the U.N.E.S.C.O. Conference on the Methodology of Human Resource Formation in Development of Human Resources organised by the Organisation of Economic Cooperation and Development (O.E.C.D.) in 1962 and 1963, and the meeting on the Methodology of Manpower Requirements Forecasting Organised by the Organisation of American States at Mexico City in October 1963. The administrative problems of economic and social planning are, at present, being studied by the United Nations. However, it is felt that the theoretical studies and practical experience are still too recent to allow of an authoritative survey of the situation or any recommendations as to universally recognised methods.

To begin with, a distinction need be made between problems of manpower planning for different durations of time that is, short-term, middle-term or long-term. Economic plans can usually be classified according to the length of time they cover. Short-term plans, for a period of two to three years, often constitute a preliminary stage in which immediate objectives can be set until a medium-term plan can be drawn up. The latter covers a period of four to seven years; and an increasing number of countries, nowadays, draw up long-term plans for periods of 10, 15 and 20 years. Forecasting methods, evidently, will vary according to whether plans are made for short, medium or long-term, since forecasts are not, after all, predictions but a coherent framework within which to study the long-term implications of present decisions. This being so, planned development of human resources must comprise short, medium and long-term objectives at one and the same time. Since, however, it takes a long time for a manpower policy to have any appreciable effect on the structure of employment, manpower planning must, therefore, be a part of the long-term perspective, in which it can be integrated with economic and educational planning.

The distinction between short, medium and long-term, though important, becomes artificial when manpower planning is viewed as part of an overall development policy. Admittedly, the transformation of manpower, economic and educational structure is a long-term operation, the precise objectives can be defined in the medium term, and marked imbalances can be remedied in the short term. Manpower planning must, therefore, be conducted at these three levels, which constitute three complementary aspects of development policy. However, whether manpower planning relates to the short, the medium or the long-term, certain steps have got to be taken. For example, manpower planning must start from a critical analysis of the existing employment situation. The next thing is to calculate the total working population and both quantitative and qualititative manpower requirements for the final year of the planning period. The third stage will be to consider how these requirements can be met.[6] Each of these phases which are closely inter-linked in practice, are discussed below, in brief details.

Existing Situation

Assessment of the Existing Employment Situation: This involves a problem of classification which also governs the successive stages. The distribution of workers into categories must be appropriate both for economic planning where manpower is divided by sectors of activity (for example, agriculture, industry, etc.,) and for educational planning, where the distinction is between levels and types of educational institutions. A general population Census usually provides the only complete information on the subject since it classifies workers by occupation. However, what is needed is an overall study based on analysis of all existing sources of information, in other to compare all requirements and resources according to the triple standard of occupation, economic sector and training.

Anticipating Future Manpower Requirements: The Government of a developing country has an additional function. Not only must it provide facts about the current and past manpower situations, it must make an assessment of the future manpower requirements. In order to establish an effective programme and make sound recommendations to the various participants in the manpower programme, an accurate estimate of the future manpower needs must be had. It is of particular importance to estimate as to how many people will be needed in the professional, technical and skilled occupations. Since it takes many years to educate and train people for these occupations, the need must be anticipated sufficiently in advance to allow time for that training. Failure to anticipate the need and develop the required high-level manpower may seriously impede economic progress.

Task of Forecasting

The assessment of future manpower requirements must be a judgment, or a series of judgments, based upon experience and expectations of future developments. These judgments must be made without any magic formula or prophetic powers.[7] The goal is to foresee, as clearly as possible, the occupational needs of the future, the industries in which people will work and the skills they will need to contribute most effectively to the country's development. Thus, the principal steps to be taken for forecasting requirements, after an initial assessment of the existing employment situation has been made as mentioned above, are:

(a) *Estimates of future population and labour force*: The rate of population growth will determine the size of the future labour force. Projections of population by age and sex should be made; the estimated rates of participation in the labour force by various age-sex groups provide an estimate of the future labour force.

(b) *Estimates of future requirements for manpower by industry and occupations*: While talking of this, the question that stares us in the face is: what are the manpower implications of the anticipated development? The answer should be sought by carrying out an intensive analysis of the economy as a whole and of all important industries, to determine the expected level of production and the resulting demand for personnel. Special attention should be devoted to occupations in the high-level technical and skilled categories.

(c) *An estimate of training requirements*: A comparison between the anticipated demand for new entrants to each occupation requiring education and training and the estimated supply of people entering the occupation indicates the extent of the anticipated shortage or surplus. On the basis of such a comparison, training requirements can be estimated for each important occupation.

It may, however, be remembered that forecasts cannot predict with complete accuracy, no matter how carefully and intelligently they are made. But even though imperfect, forecasts will provide valuable insights into the future manpower situation and will result in information which can give meaningful guidance to policy decisions. It is thus important that forecasts are made without waiting for an unattainable degree of perfection in methods, data or conclusions.

Balancing Requirements and Resources: After the first two stages, as mentioned above, have been completed, the next step is to devise measures to balance requirements and resources. This envisages three elements, namely, (1) balance by occupation or level of skill, (2) by branch of activity and (3) by overall employment. Different aspects of manpower policy correspond to each of these elements.

Manpower Administration

Apart from technical aspects of manpower planning, the administrative aspects have assumed a great importance, since they are encountered at all stages of planning. With a view to meeting an obvious need for constantly improving or reviewing the manpower forecasting, it is necessary that manpower planning should ideally be the responsibility of a permanent authority. If there is a central planning authority, this new function can be taken over by it, in order to ensure close co-ordination between economic and manpower planning, as in the U.S.S.R., France, Nigeria, Ghana and Tunisia, etc. In some other countries, e.g., Greece and Spain, where the Ministry of Education is responsible for educational planning, it may be regarded as better able to guide training in the light of manpower requirements. There are also instances when countries prefer to bring this function under the Ministry of Labour. In India, the Directorate of Manpower performs this function within the Ministry of Home Affairs. Another possibility is for manpower forecasting to be conducted by an independent or semi-independent authority. The choice, obviously, depends on the specific situation in each country and the particular planning stage reached but, in all cases, the essential problem is to define the relationship between the authority responsible for manpower planning and the other ministries and socio-occupational authorities, in order to ensure the broadest participation of all competent authorities in preparing a training programme.

According to Robert L. Clark[8] three are basic elements of an effective manpower programme.

The first is a group of well-trained, dedicated research people who not only know the techniques of manpower research but are also of broad enough calibre to relate manpower research and planning to general developmental research.

The second is an organised entity, highly placed within the Government, which coordinates policy formulation, planning and operational activities in the manpower field. This usually involves co-ordination of the manpower activities of a few ministries in the Government of a country.

The third is a field organisation for managing the labour market—bringing the men and the job together, adjusting the supply to short-term demands or to special area requirement and assuring the effective distribution of essential skills in short supply. No substitute has been found for the employment exchange system which not only provides the above services, but, with geographically well-placed offices, is also best equipped to provide employment intelligence upon which manpower, educational and training programmes can be based.

Conclusion

The foregoing paragraphs, wherein attention has been focussed on some aspects of manpower planning, must have revealed that manpower planning is just not a mere collection of employment forecasting techniques. It is an extension of development concepts based on material investment only. The increasing importance of planned human resource development is still hampered by the shortage of statistical information and there is, as aptly remarked by Michel Debeauvais, a long way to go before "human accountancy" can take its place alongside national accounting of goods and services

ROLE OF S.T.C. IN INDIAN ECONOMY

Objectives and Achievements Commendable

By B. P. PATEL, I.C.S.
CHAIRMAN, STATE TRADING CORPORATION OF INDIA LTD.

THE State Trading Corporation of India (S.T.C., for short) is not a department of State nor does it enjoy any special privileges under an Act of Parliament like the Life Insurance Corporation or the State Bank of India. It is a company registered under the Indian Companies Act and has to comply with its provisions like any other company. Its entire capital is, however, held by the President of India. It is thus under the administrative control of the Ministry of Commerce, which is responsible to Parliament for its affairs, and has to undergo the commercial audit of the Auditor-General of India.

Objects

The main objects of the State Trading Corporation are to organise and undertake trade generally with State trading countries as well as other countries in commodities entrusted to it from time to time for such purpose by the Union Government; to explore new markets for traditional items of exports and develop exports of new items with a view to diversifying and expanding the export trade; to undertake at the instance of the Union Government import and/or internal distribution of any commodity in short supply, with a view to stabilising prices and rationalising distribution; to generally implement such special arrangements for import, export, internal trade and/or distribution of particular commodities as the Union Government may specify in the public interest and to deal in merchandise, commodities and articles of all kinds and to carry on any kind of commercial and/or financial business as the Company may determine from time to time. Its central aim is to broaden and enlarge the scope of Indian exports and to procure essential imports on an economical basis.

Trading Activities

The trading activities of the Corporation fall under two broad heads, namely, (i) direct trade and (ii) indirect trade. In the case of direct trade, the Corporation enters into direct contractual obligations and invests its own funds for conducting trade thereunder. Indirect trade is that in which contracts are concluded primarily between foreign and Indian traders and are implemented also by private parties. The role of the Corporation in this type of trade consists of assisting the conclusion and implementation of the contracts, bringing buyers and sellers together, obtaining import licence, guaranteeing quality, observance of delivery schedules and timely payment and using its good offices in matters like settlement of disputes.

The trade of the Corporation, as revealed by the accompanying table, has increased considerably. From a modest beginning of Rs. 9.19 crores in the year 1956-57, the S.T.C.'s direct trade went up to Rs. 86.81 crores in the year 1962-63. The volume of indirect trade has also grown considerably from Rs. 19.48 crores in 1957-58 to Rs. 54.48 crores in 1962-63.

Realising the rapid growth of the trade of the Corporation both in volume and the range of commodities handled by it, together with the need to pay more concentrated attention for developing certain lines of exports, particularly in iron ore, the Government found it advisable to bifurcate the State Trading Corporation into two portions by forming a separate Corporation styled as the Minerals and Metals Trading Corporation of India. This new corporation was brought into being from 1st October 1963 and took over all assets and liabilities pertaining to minerals and metals trade from the State Trading Corporation of India as on 1st October 1963. During the year 1963-64, the trade of the Corporation, excluding the operations of the Minerals and Metals Trading Corporation for the second half of the year, amounted to Rs. 97.46 crores.

The efforts of the Corporation in diversifying trade in terms of commodities and spreading it over an increasing number of markets have yielded significant results. Some 108 commodities constituted S.T.C.'s trade in 1963-64 and its business extended to some 30 countries. Thirteen of these items having since been transferred to the Minerals and Metals Trading Corporation, the State Trading Corporation is in charge of as many as 95 commodities.

There is an impression with some people that the Corporation's trade is confined mainly to East European countries. This is not so. For, by and large, the trade of the Corporation with East European countries is not more than that with other countries.

Exports

So far as exports are concerned, the Corporation's efforts have been directed towards introducing new items in various world markets, particularly the East European countries, besides increasing the level of exports of existing items. Various methods have been tried by the Corporation for promoting exports, namely, participation in international fairs and exhibitions and purposeful co-ordination of activities of Indian participants, opening trade-*cum*-depot centres and offices abroad, aggressive salesmanship through trade representations and directly with various foreign purchase agencies.

The Corporation has created new markets abroad for a number of commodities. This has helped manufacturers not only in augmenting their production but also in improving the quality of their products to suit the requirements of foreign countries. Important commodities which were exported for the first time are:

U.S.S.R.: Woollen fabrics, cotton textiles, knitted wear (woollen), shoes and *chappals*, ready-made shirts, sports goods, razor blades, cigarettes, fruit juices, soaps and cosmetics, nylon socks, packed tea and instant coffee, opium.

Hungary: Woollen fabrics, shoes and *chappals*, woollen knit-wear, cotton textiles.

Turkey: Sewing machines, cycles, fans, electric bulbs, fountain pens, tiles, immitation jewellery.

G.D.R.: Storage batteries, shoes, art silk fabrics, liquor, shrimps, surgical equipment.

Switzerland: De-oiled cake.

Bulgaria: Shoes, razor blades.

Czechoslovakia: *Chappals*, razor blades, woollen undervests and underpants, paint brushes.

Yugoslavia: Sports goods.

Poland: Shoes.

North Korea: Ferro-manganese and chrome concentrate.

Indonesia: Cotton yarn.

In order to develop and maintain export markets for commodities which are difficult to sell due to high internal procurement prices in comparison with world prices, the Corporation takes a long-range view and undertakes exports even if there is a risk of losses in certain transactions or in a particular year. Among the commodities thus exported are groundnut oil, manioc meal, sodium bichromate, deoiled linseed cake and cement.

During the year 1962-63, the most important item of export in the Corporation's operations was iron ore. No less than 37.37 lakh metric tons of this commodity were exported, earning thereby a foreign exchange of the value of Rs. 19.40 crores. During the year 1963-64, other important export commodities were groundnut oil (Rs. 3.50 crores), shoes (Rs. 1.65 crore), pulses (Rs. 0.73 crore), opium (Rs. 0.70 crore), salt (Rs. 0.31 crore), rice (Rs. 0.29 crore), woollen fabrics (Rs. 0.23 crore), lemongrass oil (Rs. 0.26 crore) and cotton textiles (Rs. 0.26 crore).

Imports

As an instrument for the implementation of Government's trading policies, the Corporation has been selected for arranging imports of capital goods and industrial raw materials at international prices from diversified sources of supply and also of certain scarce commodities required for national economy. The Corporation has recently entered into a contract with a British firm for the import of textile machinery required for the use of 18 different mills selected by the Textile Commissioner from the co-operative, private and State sectors. The machinery will be supplied to the mills on deferred payment basis spread over a period of about ten years. Another contract was signed with a firm of Yugoslavia for the import of Torpedo marine engines for meeting the requirements of various maritime States in the country. Under the category "Industrial raw materials," import of items like caustic soda, soda ash, raw silk, fertilisers, camphor, mercury, etc., is channelled wholly or partially through the Corporation. One of the objects of channelling imports through the Corporation is to secure the advantages of bulk purchases and handling and thus bring down their prices for internal distribution. Towards this end the Corporation has achieved significant success. Prices of certain commodities have been lowered considerably and those of others prevented from rising. The price of Chilean nitrate, for instance, has been brought down from Rs. 345 to Rs. 308 per ton. Similarly, the price of muriate of potash has been lowered from Rs. 319 to Rs. 295 per ton.

With a view to facilitating regular supplies to users, commodities like machine tools, photographic goods, paper and chemicals, etc., are kept in stock with the distributors appointed by the Corporation. These sales are made to actual users and nominees of the various technical Ministries of the Government and the Directors of Industries of States at regulated prices determined by the Corporation.

Pricing Policy

Recently, the pricing policy, particularly in respect of imports, has encountered some criticism. It has been alleged that the Corporation is charging very high prices for the goods imported by it and thus earning fabulous profits, which is not in conformity with its avowed objects and functions and the interest of the State.

This criticism arises mainly out of insufficient knowledge of facts and inadequate appreciation of the pricing policy pursued by the Corporation. In fact, in case of commodities like fertilisers, including nitrogenous fertilisers, muriate of potash, Chilean nitrate which are essential for attaining Plan targets, the margin charged by the Corporation is nominal, ranging from ½ to 1 per cent. The entire benefit of low prices resulting from bulk purchases of these commodities is passed on to the buyers. Similarly, for newsprint, the Corporation's margin is as low as ½ to 1 per cent. It may be pointed out that these low margins do not cover even the administrative overheads of the Corporation which are 1 to 1.5 per cent. In case of non-ferrous metals required as raw material for the development of small industries, the margin charged is within 3 per cent. The Corporation's margin is within 10 per cent for other commodities handled by it, namely, pharmaceuticals, chemicals, cinema carbons, raw silk, wood pulp, polystyrene, etc.

The prices of certain goods, which are also produced indigenously, are fixed keeping in view the prices of indigenous goods, so that there is no adverse effect on domestic production nor is there an opportunity for middlemen to earn excessive profits. Such commodities are caustic soda, soda ash, polystyrene, sodium sulphate, etc.

In case of a small number of commodities, which are of a speculative nature, there is a wide difference between the domestic and international price, because imports are restricted owing to an acute shortage of foreign exchange. Under this category come commodities like betel-nuts, cloves, mercury, camphor, ball bearings, etc. Whatever may be the release price of the Corporation, the market price of such scarce commodities would rule high. If the Corporation fixes a lower margin, the difference will go to the middlemen without any benefit accruing to consumers. As mentioned earlier, the Corporation has to export certain commodities at a loss with a view to earning the badly needed

S.T.C.'s Progress At A Glance
(In crores of rupees)

Year	Exports	Imports	Direct	Indirect	Total
1956-57	5.79	3.40	9.19		9.19
1957-58	30.10	17.96	28.58	19.48	48.06

1961-62	40.02	84.26	77.39	48.00	125.39
1962-63	43.08	96.36	86.81	54.48	141.29

The Rs. 200 million Birla-Kaiser aluminium project at Renukoot, near Rihand, in U.P., has, since December 1962, attained and surpassed the initial target capacity of 20,000 tonnes per annum. While the Renukoot plant is already the biggest integrated aluminium manufacturing complex in India, Hindalco is forging ahead with its programme of rapid expansion, for raising the primary aluminium capacity to 60,000 tonnes per annum (and to provide fabrication facilities totalling 37,000 tonnes per annum), to help the country's fast growing industries in their march towards progress and prosperity.

foreign exchange. Keeping this in view, the Government has, from time to time, entrusted the import and distribution of such commodities to the Corporation and directed it to mop up a portion of the high profits which would otherwise accrue wholly to the middlemen ensuring at the same time that the prevailing prices are maintained at lower levels than before.

Cement

Under the Cement Control Order of 26th June 1956, trading and internal distribution of cement has been entrusted to the Corporation from the 1st July 1956, with a view to rationalising the movement of cement within the country and to reducing the strain on railways, to make cement available at uniform prices all over the country and to secure an equitable distribution.

Under this arrangement, cement is supplied to consumers at a uniform price at all rail-heads in the country and every effort is made that the consumer gets his requirements from the nearest factory. During 1963-64, the turnover in cement was of the order of Rs. 128.69 crores.

Link and Barter Deals

The link/barter/parallel deals were introduced as another instrument of export promotion to augment our exports and also to arrest the downward trend in the export of certain commodities to specific destinations. Link deals are operated through firms of repute in those countries. Two distinct advantages flow from these arrangements, namely, that the essential imports are ensured without affecting the limited available foreign exchange and at the same time exports of difficult-to-sell items and also of those items in which there are exportable surpluses are pushed up. Under these arrangements, imports of essential items from a country for a specific amount within a fixed period, are linked with equivalent value of exports of non-traditional items and small quantities of traditional items as "sweetners." Thus, the essential imports are paid for from the earnings of additional exports on which otherwise free foreign exchange would have been spent. The Corporation plays the role of a catalytic agent by initiating, regulating and supervising their performance. The value of the total trade (imports and exports) under these arrangements during the last four years is as follows:—

1960-61	...	Rs. 24 crores
1961-62	...	Rs. 37 crores
1962-63	...	Rs. 32 crores
1963-64	...	Rs. 43 crores

The Estimate Committee has recently commended the performance under link deals in the following words:

"The Committee are glad to note that there has been a steady increase in the business of Corporation under these arrangements during the last three years. They trust that this trend will not only be maintained but improved."

On a recent review of the operations of link and barter deals, a suggestion has been made for making them more effective in regard to additions to exports and elimination of scope for loading of prices on imports by link partners. These improvements have been introduced in new deals which have now taken the shape of specific commodity deals or parallel deals.

Buffer Stock Operations

In pursuance of the Government's policy to stabilise the prices of jute and jute goods, the S.T.C. has been called upon to undertake purchase of raw jute at minimum prices laid down for the purpose. Its operations in 1963-64 have met with signal success. Arrangements were made to establish a network of 386 centres for the purchase of jute in upcountry areas through local co-operatives. The organisation thus set up was effective enough to carry conviction to the growers that they need not sell their produce below the minimum prescribed levels.

The trading community was also impressed that, if they did not fall in line with the Government's object of ensuring payment of minimum prices to producers, they would lose their business to the alternative arrangements that were made. As a result of this, the prices did not fall below the prescribed minima at the upcountry centres, except at a few places where purchases amounted to only 160,700 maunds.

The extension of buffer stock operations of the Corporation to seedlac and lemongrass oil has had the effect of stabilising the prices of these primary commodities in the interest of primary producers and earning of foreign exchange through their export.

E.A.S.I. Scheme

In order to diversify India's exports and develop the export potential of the small and medium-scale industries, the Corporation has launched the scheme of "Export Aid for Small Industries" (E.A.S.I.). Under it, the manufacturers are assisted in exploring export markets, pricing their products, designing attractive packaging, financing, documentation, shipping, etc., connected with their exports.

Through these efforts, it has been possible to conclude export orders worth Rs. 21 lakhs, besides which further orders valued at over Rs. 80,00,000 are in the final stages of negotiations. The salient features of these export orders are that:

84 shipments have been effected for 25 different products, produced by 22 individual manufacturers, and exports have taken place to 28 countries many of which had not bought these products from India before.

All this is new business on behalf of manufacturers who have never exported before and to buyers who have never purchased from these manufacturers.

The working of the Scheme has already proved that a very large variety of products produced by the small and medium-scale industries are acceptable to overseas buyers, if they are effectively marketed. The immense export potential of this sector of industry stands well established. Recently, the Minister for Commerce indicated that, out of the fourth Five-year Plan target of Rs. 5,100 crores, the small-scale sector must contribute as much as Rs. 275 crores of exports. The Corportion has been instrumental in bringing into focus the important role this sector of industry can play in increasing exports from India. The usefulness of the scheme has been recognised by the U.S. aid authorities who have declared that assistance in kind by way of supplying agricultural implements to developing countries would be channelled henceforth under the E.A.S.I. scheme of the State Trading Corporation.

Financial Results

The day-to-day operations of the Corporation have been conducted always with an eye to economy and essential public interest. The overhead cost, for example, has remained within a modest range of 1.1 to 1.5 per cent of its direct trade and only 0.8 per cent of its entire business of Rs. 666 crores over a period of eight years.

The financial results of the Corporation have been most rewarding to the community. On a paid-up capital rising from Rs. 1 crore in 1956-57 to Rs. 2 crores from 1958-59 onwards, during the last eight years of its operation, the Corporation has contributed to the Exchequer Rs. 13.23 crores (income tax Rs. 11.98 crores *plus* dividend Rs. 1.25 crore). In addition, it has built up internal reserves worth Rs. 7.54 crores. Thus, the gain to the community from the operations of the Corporation has been of the order of Rs. 20.77 crores. The contribution to the Exchequer and internal reserves works out to 11.5 times the average employed capital (Rs. 1.8 crore) in a period of eight years. Over the same period, the Corporation has earned foreign exchange from its direct export trade worth Rs. 195.66 crores.

Co-operation with Private Trade

There exists a fear among the business community that the State Trading Corporation has been conceived with the idea of gradually elbowing out private trade. This, however, is not true. In fact, the State Trading Corporation endeavours to supplement and not to supplant private trade, to complement and not compete with the private trade. Wherever it is possible, contracts are implemented through the established trading channels. Every effort is thus made to give concrete shape to the Government policy of building up a mixed economy, lending its support and encouragement to the private trade along with the strengthening of the public sector in the overall interest of the country's economy.

FROM HERE TO UNCERTAINTY?

A SCRAP OF PAPER! But it has served its purpose. A new word was learnt. Or, phrase. Or, problem. Or, visual idea. Also the future is bright for this child—but not for that scrap of paper! From here it goes to uncertainty. But till here, there was no uncertainty, because it was born at Dandeli.

The West Coast Paper Mills Ltd. are at Dandeli. Here, paper is made from bamboo and other fine forest materials. For writing. For printing. For packaging. But the process isn't all that simple. It involves a certain amount of chemistry. Certain highly-skilled personnel trained abroad. And, above all, quality control. To make this certain, a special Research and Development Department works round the clock at Dandeli.

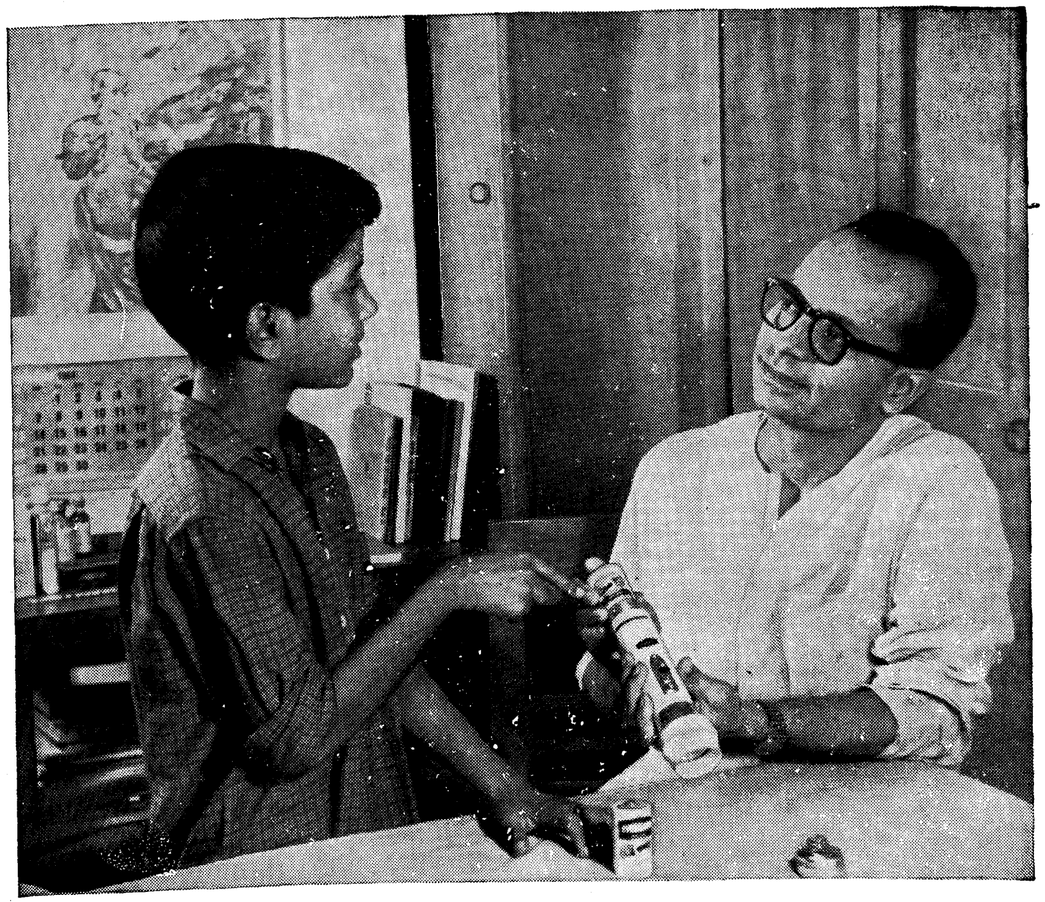
Is this what lights my torch?

Yes, the electricity that produces the bright beam of a torch comes from the dry battery. And the torch is only one of many ingenious devices that work on 'packaged' electricity.



The many types of 'Eveready' dry batteries made by Union Carbide India, power torches and radios...help run telecommunications equipment used by India's armed forces...operate railway signalling systems...furnish power for such diverse applications as hearing-aids, toys, weather balloons, electronic and transistorised equipment.

Union Carbide India established the first dry battery manufacturing plant in India in 1926. And since Independence the demand for dry batteries grew so fast and for so many diverse applications that a second 'Eveready' battery plant was set up in Madras in 1952.

Union Carbide India's dry battery plants and their torch factory in Lucknow—one of the most modern—are but a few seeds of industry that the Company have sown in India. The variety and value of products made by Union Carbide India today show how the resources and the know-how of a world-wide organisation can serve the needs of a developing economy.

UNION CARBIDE PRODUCTS FOR INDIA'S HOMES, INDUSTRIES, AGRICULTURE:

EVEREADY Torch Batteries, Torches, Torch Bulbs, Radio Batteries, Transistor Batteries, Photoflash Batteries, Hearing-Aid Batteries, Dry Cells, Telephone Cells, Railroad & Industrial Cells, Mantles, NATIONAL Arc Carbons.
UNION CARBIDE Polyethylene Resins, Polyethylene Film, Polyethylene Pipe, Plastics, Chemicals, Acetic Acid, Butyl Alcohol, Butyl Acetate, Ethyl Acetate, Agricultural Chemicals, Zinc Addressograph Strips, EMMO Photo-engravers' Plates, UNION CARBIDE Carbon and Graphite products, Welding and Cutting Equipment.

Indian Airlines As a Foreign Exchange Earner

Scope and Conditions for Expansion Examined

By J. S. PARAKH
GENERAL MANAGER, INDIAN AIRLINES CORPORATION

"THE world is a book, and those who do not travel read only one page," said St. Augustine over 1,500 years ago. More than 1,300 years later, Dr. Samuel Johnson set aside his legendary wit to proclaim with all seriousness that "the use of travelling is to regulate imagination with reality, and to see things as they are, instead of thinking how they may be."

Through the centuries we find poets, politicians and philosophers eulogising the values of travel and urging the study of other lands, other peoples, other religions and other ways of life. Whether or not it required such persuasions, international travel has grown from misty beginnings to become the largest single item of trade in the world.

All indications we have today point to one forecast—that 1964 will prove to be a record year for the thriving travel trade, bringing in over Rs. 14,000 crores from more than 80,000,000 international travellers.

India's Share

What is India's share of this fantastic market that has bailed out some countries from economic bankruptcy and is wooed by most, both developing and highly developed? Some would say "tremendous," considering that Tourism is India's No. 5 foreign exchange earner behind tea, textiles, jute and sugar. "Insignificant" would be the verdict of others who note that our share is a miniscule 0.15 per cent of the total.

Conflicting though these opinions sound, they are both correct. Much has been done in our country to bring tourism to its present level of importance, yet much more has to be done if tourism has to grow in a healthy way. No one really doubts the value of aggressively promoting travel to India, in order to secure a larger share of the international travel market which is growing at about 10 per cent per year.

Nearly 141,000 tourists visited India in 1963, and are known to have spent over Rs. 20 crores on hotels, purchases, entertainment and domestic travel. Out of this, Rs. 3 crores were earned by Indian Airlines. About 30,000 individual tourists are estimated to have flown five I.A.C. sectors on an average to account for over 15 per cent of I.A.C.'s gross earnings. And, most important, the three crores of rupees were earned entirely in pounds sterling. This is not taking into account further earnings from foreigners who paid in India in rupees for their air travel.

How can Indian Airlines, with its gamut of operations stretching no further west than Kabul and no further east than Rangoon, earn pounds sterling, one might ask. The answer is simple. As a member of the International Air Transport Association (I.A.T.A.), Indian Airlines' commercial dealings with other airlines of the world are channelised through the I.A.T.A. Clearing House in London. The Clearing House is an agency for disbursement of interline dues, and is a convenience to all airlines. The London House deals only in pounds.

Here is how it works. A passenger wishing to fly by Indian Airlines can purchase his ticket anywhere in the world from any of the I.A.T.A. member airlines operating out of his country. He pays in the currency of the country in which the travel originates. When he completes his travel on Indian Airlines, I.A.C. charges the member airline which had originally collected the fare, through the I.A.T.A. Clearing House. The Clearing House in turn debits the member airline the sterling equivalent of the fare payable to I.A.C., and credits the pounds to I.A.C.'s account.

The Clearing House at London makes collections and disbursements in pounds sterling, regardless of the currency in which the ticket was originally purchased. The rule applies equally to all currencies of the world, from U.S. dollars through Italian Lirae to Indonesian Rupiahs.

While most airlines are in a position to charge each other almost similar amounts to erase one another's dues, I.A.C.'s billings fortunately are considerable and payments negligible. I.A.C. has no commercial expenses abroad worth mentioning. I.A.C.'s earnings of Rs. 3 crores foreign exchange last year were nett after payment of all commissions and other dues, and the benefit of the entire foreign exchange accrued to the Government of India. Out of this, of course, should be set off the value of spares and equipment which I.A.C. must indent from suppliers abroad to keep its aircraft flying.

Handicaps

One of the most frustrating experiences of the travel industry all over the world has been its struggle for recognition as a desirable and beneficial venture. India is no exception. We know that our total effort to promote tourism has not been sufficient for our own good, due, perhaps, to various limitations. It took us some years to be jolted out of our traditional stance of waiting to be "bought from," rather than going out of the way "to sell." Looking back at our experience of the last several years, it is obvious that India was not adequately equipped to look after the hordes of visitors.

We have an over-zealous customs organisation, burdened by stringent rules that, on many occasions, deter a tourist from visiting India a second time. We have an hotel which is the best hotel in Asia, but a dozen more are needed to house the ever-growing tourist intake. We have an adequately spread out airline in Indian Airlines, reaching nearly every tourist attraction, but long waiting lists on most flights discourage a tourist due to non-acceptance of short-notice reservations. Our catering, handling and reservation procedures also need constant vigilance. In many cases, the tourist simply skips the trip. In fact, we know of many instances of "Round the World" tourists who by-passed India altogether for want of hotel or airline accommodation.

We have our own quota of other pinpricks. Collectively, they tend to project a bad image for India, and I feel frustrated to think of the tourist market that we may have lost by the adverse criticism caused by our inadequacies.

A close look at the tourist intake in 1962 will prove my point. While the world tourist traffic had registered a gain of 11 per cent that year, India experienced a decline. Only 134,360 persons visited India against 139,804 in 1961. The drop on our own performance was a bare five per cent, but it has to be reckoned as a 15 per cent drop from what the intake should have been in the context of the world increase.

Part of the blame has been laid squarely on the circumstances that led to the National Emergency when some tourist groups which had booked travel on I.A.C. cancelled their itineraries altogether, but of significance also are the figures for the first nine months of the year—long before the trecherous attack by China—when the declining trend had already set in.

Jha Committee

Concerned by the decline and recognising the material benefits to be gained by the tourist traffic, the Government of India formed a committee to investigate into its potentials and recommend ways and means of ensuring a steady growth of tourism. The Committee (known as the Jha Committee) has submitted an illuminating report which, if implemented, will make a good beginning for our renewed efforts to promote international tourism on a scientific basis.

The most noteworthy feature of tourism in India is a unique and ready-made "purchase motive." We have monuments and temples that have traditionally served as silent attractions, and there are many more spread all over the country that are slowly earning tourist attention. When Shah Jehan built the Taj Mahal, little did he dream of the millions it would bring to India in the years to come. This is not all. We have many other factors that have given India a special place in the tourist diary. As the largest democracy in the world that has gone through three mammoth elections in the first 17 years of independence, as a country which has been both the fountainhead and absorbent of many religions that have spread beyond national barriers, as a nation of diversity marking heroic efforts to bring about unity, and as a resurgent economy that compresses time by leaping from middle ages to modernity, India is the cynosure of the world beckoning foreigners with but one thing in common—an open and inquisitive mind.

But a "purchase motive" does not make the product, nor is it an end in itself. Even before going out to meet the consumer with a "sales message," it is necessary to package the product in a presentable form, establish that the price is right and the supplies adequate, organise a system whereby it becomes easy for the prospect to buy the product and, lastly, ensure that he will be a completely satisfied consumer in order to generate repeat sales and favourable word-of-mouth advertising. What applies to the marketing of toothpaste applies to tourist promotion as well.

The product that a tourist buys is a Tour—whether packaged by the travel trade or not—and consists primarily of two major concomitants—hotel accommodation, and air and surface transportation.

The Hotel classification Committee, which recently completed its work, has recorded only 17 hotels all over India in the four-star category or better, with no more than 3,317 beds in 2,071 rooms. A tourist who can afford to spend as much as Rs. 5,000 to travel to India by air can be assumed to demand accommodation in what are known as first class hotels. These hotels, besides, charge on an average no more than Rs. 55 (or U.S. $11.00) inclusive of boarding; a good price for an American tourist used to fifteen dollars and up for similar accommodation *without* food. It is neither the price tag nor the quality of service that need comment (an average tourist is prepared to rough it out on occasions), but the fact that there are just not enough good hotels in business. When most of the rooms are booked by businessmen in India (who are also our valued customers), the rooms available to foreign-exchange spending tourists are reduced to a fraction of the total.

The Jha Committee has noted this major deficiency, as also the general unwillingness of Indian entrepreneurs to build more hotels. With the establishment of the State Tourist Corporation, Indian hoteliers will get sufficient encouragement to invest in the hotel industry. In the meanwhile, three major hotels in India are either contemplated or are nearing completion. It is my estimation that we need to at least double our hotel capacity in gateway cities and places of tourist interest before 1968 to house the traffic that we expect that year.

The next point to consider is domestic civil aviation with which I have been closely connected for the past 20 years. I.A.C.'s total capacity rose from about 84 million tonne-kilometres in 1955 to 136 million in 1962, a growth that was matched only by waiting lists which grew from nil to almost 5(on some flights. The four Viscounts and ten Friendships acquired between 1961 and 1963 did help to ease the congestion, and the three Caravelles (plus one that will be delivered before this article goes into print) have given I.A.C. a total capacity that is barely enough to meet the traffic during the better part of the year even with the help of a Boeing on charter. Looking at it in restrospect, I.A.C.'s growth has been substantial but not enough to keep pace with the growing demand.

Aircraft—Need for Advance Planning

To buy aeroplanes in sufficient numbers, the country needs foreign currency and to fly them intensively we need adequate landing grounds and navigational facilities the latter again being dependent on foreign exchange. An aircraft manufactured or assembled in India could resolve to an extent the foreign exchange problem, but several years after a project was launched, we are today still in the stage of "discussion." We have a remarkable talent for discussion leading to no fruitful purpose. In my view, even an economically unsuitable aircraft is better than no aircraft at all if we are to go all out to promote tourism. Perhaps, before long we will have the good fortune to look at an Indian-assembled aircraft more closely for our operational needs.

Both hotels and aviation are capital-intensive industries that take time between conception and fruition of plans. A major hotel takes about four years from the word 'go' to the time it can be a going concern. An airline, similarly, takes between one and two

NATIONAL RUBBER MANUFACTURERS LIMITED was incorporated eighteen years ago. Today, the House of NRM represents *the largest single unit in India* manufacturing Industrial and Mechanical Rubber Products. Its activities include production of Cycle Tyres and Tubes, Rickshaw Tyres, Railway Rubber Fittings, all types of Hoses, Industrial 'V' Belts and Fan Belts, Transmission and Conveyor Belting

A *second major expansion programme* envisages increase in production capacity of Cycle Tyres and Tubes and also the manufacture of new items like P.V.C. Conveyor Belting and Reclaimed Rubber. This expansion is not just the result of the need to meet the increased national demand for NRM products, but also to fulfil the ever-widening export commitments.

Recently, the House of NRM sponsored INCHEK TYRES LIMITED—the first wholly Indian-owned Automobile Tyre Company. Marketed under the brand name "INCHEK" these tyres have already won widespread consumer acceptance for quality. The company is already planning the expansion in production capacity from 1,80,000 to 3,00,000 each of tyres and tubes and 6,00,000 kgs. camel back annually.

Inchek Tyres Limited

In brief these are the activities of the House of NRM. They represent NRM as a progressive organisation within the growing economy of the country. They demonstrate that the House of NRM is ever-attuned to the contemporary needs of the nation

years to acquire an aircraft and some months more to integrate it into the pattern of operations whereafter it begins to earn its way. Our plans of today should, therefore, have the anticipated demands of 1967-72 in view, rather than the need of the moment.

Today's influx of over 140,000 tourists per year will grow to about 200,000 in 1968 without any stimulation, and can possibly be egged on to between 250,000 and 300,000 with proper sales promotion. Domestic air traffic in general is expected to rise simultaneously at the rate of at least 10 per cent per year. This would mean that I.A.C.'s tourist-carrying capacity needs to be doubled in the next four years.

The fares on Indian Airlines and the service offered have both been subjects for comment in India and abroad. Most of the criticism has been fair and justified, if we weed out the fads of the fastidious air-traveller who is satisfied with nothing. This number is growing. While the fares on I.A.C. are barely within reach of the average citizen, it should be remembered that they are at a level comparable to fares ruling in the West. The fare structure has been deliberately kept at the lowest practicable level, notwithstanding the abnormal fuel costs ruling in India which are thrice those ruling in the U.S., the need to maintain many stations that are not economical and the high cost of maintenance and stocking of spares.

I would submit that, with all the difficulties we are facing, I.A.C. is offering a not-so-bad domestic service. It would be totally unfair to compare with the luxury offered by international airlines which fly over long distances in competition with one another and which have the time, money and circumstances to offer facilities that are not only beyond I.A.C.'s means but are not expected of a domestic airline running on domestic rates of tariff. The pity of it all is the lack of opportunity to Indians to go abroad and experience domestic air travel in other countries. They would then be in a much better position to judge for themselves to what extent a difference necessarily exists between domestic and international standards.

The next point to consider is who the consumer (or the prospect) is and where he resides. Our experience indicates that the bulk of tourists come from United States, United Kingdom, West Germany, France, the Scandinavian countries, Australia and Canada—if we are to ignore the traffic from Kenya, the Persian Gulf, Malaysia, etc., which is almost entirely made up of people of Indian descent. A country that will send many tourists abroad in the near future is Japan which is due to lift its travel restrictions soon.

There are established trade channels in these countries, consisting of tour operators, travel agents and retailers and wholesalers of special tours. The Government of India has established tourist offices in San Francisco, New York, Toronto, London, Paris, Frankfurt, Tokyo and Melbourne, and is planning an office in Rome. Apart from keeping contact with the travel trade and general servicing of tour groups, the Tourist Offices undertake publicity and promotion. I would consider that the type of publicity and promotion handled by the Tourist Department is satisfactory, but its volume has unfortunately been negligible in comparison with that of tourism-conscious countries such as Italy, Greece and France, due, perhaps, to insurmountable difficulties.

The point to be remembered is that the activities of our Tourist Department are in direct competition with other countries which are sparing neither effort nor expense to achieve the goal. According to a study into the "visible publicity" in U.S. magazines in 1963, India spent a meagre $125,695, as compared to $415,412 spent by Mexico, $938 226 by Canada and $348,165 by little Bermuda. With over fifty countries struggling for the travel dollar, it is obvious that the image of India is more or less snowed under by the avalanche of competition.

Airlines, hotels, health resorts, night-clubs, road transport companies, railways and trade organisations from each of these competing countries are further helping to boost their national effort. Such promotion is handled independently—yet in concert with the other concomitants—so that the total impact of the national image becomes big enough to be taken note of. Unfortunately, the many institutions in India that are directly benefiting from the travel trade are totally silent in "selling their wares" direct to the consumer. Apart from Air India, they undertake little promotion in the Continent or North America where the bulk of the tourists come from.

Export Publicity

I.A.C.'s own "export publicity" has also been negligible, and was hitherto restricted to the publication of time-tables in Airline Guides. The general attitude has been that, so long as I.A.C. had no operations to Europe and the West, there was no need to spend dollars and pounds, especially when the foreign exchange position had become precarious. The shortsightedness of this policy has manifested itself now. In the United States, for instance, the prevalent impression is that India's domestic airline, if it exists, is probably small and equipped with obsolete aircraft. The fact that I.A.C. is one of the largest domestic airlines in the world operating modern jets and turbo-props has not percolated down to the ultimate customer.

What harm has been done to our tourist promotion by this lack of familiarity with I.A.C. is a matter for conjecture. An average American gets only 15/21 days' paid leave a year, and time is of essence to him when on a sightseeing trip. He needs to know that he can see the whole of India during a short stay before he can think of a trip to the country which is halfway around the world. In other words, his mind should be pre-conditioned by the idea that he can see the whole of India in less than three weeks, an idea that can be put across only by projecting I.A.C.

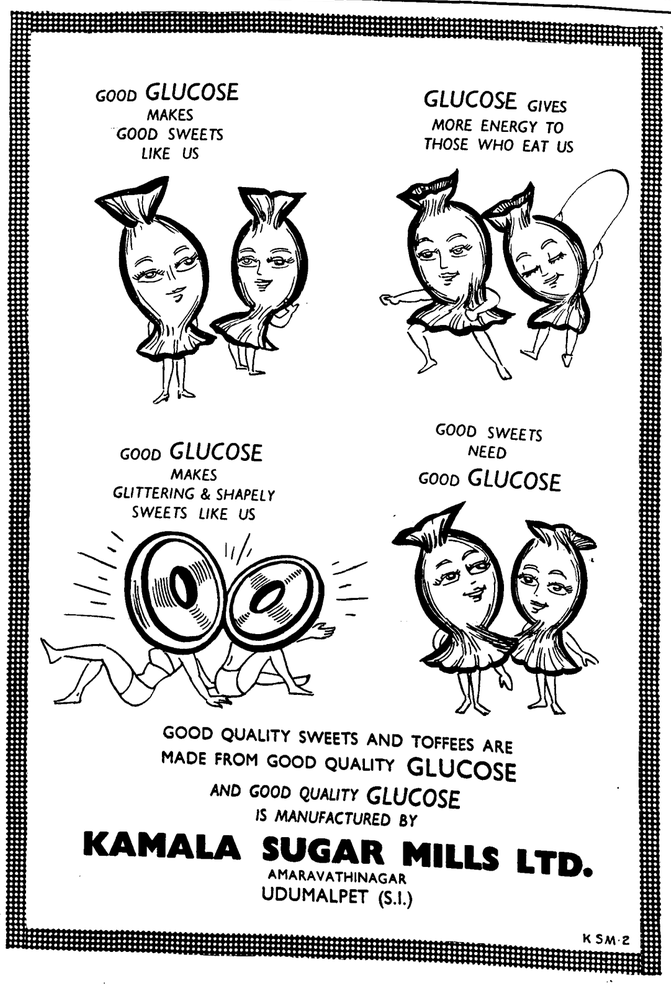
Accordingly, we are planning to set up our own offline stations in a few strategically located cities to undertake our own Public Relations and Publicity work. Initially, these have been envisaged no more than as "desks" attached to the Government's Tourist Offices abroad, and the exercise is designed to give I.A.C. an identity abroad for the first time.

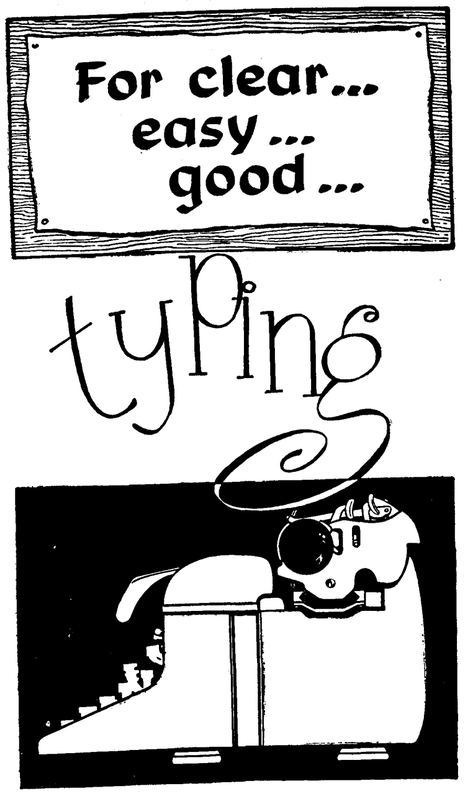
The opening of our own offices abroad is necessary even though it may not be economically feasible. Along with it we need to improve in several directions where our own handling of a foreign tourist is concerned if I.A.C. is to play effectively its very important role in promotion of tourism.

The international travel market is a gold mine and we have just about scratched the surface. Despite the distances from tourist generating countries, India has a bright future ahead. An important part of the selling programme is the necessity for large number of Indians to go abroad also. If educated Indians and those in business particularly could have been able to visit various parts of the world in fairly large numbers, their contacts and behaviour abroad and their knowledge of their own country could attract many more visitors to India in turn. A little foreign exchange spent on them would be worthwhile. As a matter of fact, a scheme to boost Indian exports could be worked out, out of the funds collected on air fares payable by such Indian tourists.

To sum up, while I.A.C.'s role as a foreign-exchange earner is an important one, it is not free from complications. The capacity to meet the demand of tourists is simply not there. The period of waiting for a suitable replacement for the Dakota has stretched too long. The irony of it all is that the more we fly the Dakota, the more we lose. If we lose, the "commercial" aspect of I.A.C.'s operations is questioned. If we declare inability to provide aircraft on the basis of economics, the "public-utility" aspect is placed before us. We are all the time engrossed in trying to blend the two concepts. To earn foreign exchange is good for the country but to earn enough on a flight to balance our books is of equal importance to us. If we are to sacrifice the latter, the result in "red" should not be attributed to inefficiency.

The answer is the right type of aircraft in sufficient numbers and a realistic policy of subsidising losing tourist operations if we are to provide adequate space, special charters and extra services at short notice, in most of which cases the costs exceed the revenues due to the special nature of tourist itineraries.





Look at these advanced features

Easily Removable Platen: For cleaning and replacement.

Handy Platen Detent Release: Now located near carriage release. Changes line-spacing temporarily without losing original line.

Positive Spacing with Instant Control Lever: Permits change from single to double to triple spacing.

Durable Paper Bail: In serrated, rustless metal for accurate bailing of paper.

Convenient Line-space Lever: For moving carriage smoothly and changing space as set by the line-space Gauge.

RAILWAYS AND EXPORT PROMOTION

Contribution Made Quite Significant

BY DR. RAM SUBHAG SINGH
MINISTER OF STATE FOR RAILWAYS

THE rapid development of the Indian railways in recent years symbolises to a large extent the growth and development of modern industrial India. Since the inception of the Plan period, the goods traffic handled by the railways has gone up from 44,117 million tonnes kilometres in 1950-51 to about 110,000 million in 1963-64—a rise of nearly 150 per cent in a span of 13 years. The passenger traffic has also been rising steadily. It has been averred by a team of experts of the World Bank that at no other time and nowhere else in the world has such significant expansion in traffic in the field of railway transportation been handled as by the Indian railways in the last few years.

An idea of the railways' dominant role in meeting our transport needs can be had from the fact that, in 1962-63, the movement by rail (including duplication involved in retail distribution, creation of reserve stocks, etc.) constituted 99.82 per cent of the total production of coal, 104 per cent of manganese ore, 108 per cent of cement, 70 per cent of sugar and 90 per cent of raw jute.

In the sphere of export trade, too, which is currently a problem of the greatest significance to our economy, the railways have a preponderant part to play in facilitating the largest possible movements in the minimum time at the most economical rates feasible. In regard to bulk traffic, in general, and iron and manganese ore, in particular, it is the low-cost structure of rail transport and its capacity for large-scale movements that form the backbone of the export scheme as a whole.

Promotional Rates for Export

The early development of railway history goes to show that the railways were constructed and freight rates to port devised to suit an agrarian and colonial pattern of economy so as to facilitate export of agricultural and raw-mineral products from, and import of finished and consumer goods into, the country. One indirect effect of this policy has, of course, been the rapid industrialisation of the port towns. Raw materials had easy access to the ports and the port towns gradually grew and industries developed in and around the ports, taking advantage of the reduced rates in existence and the big consuming markets. Thus, the low rates for wheat, oilseeds, hides and jute to Calcutta originally quoted for encouraging export led to the establishment of flour, oil and jute mill industries, as also tanneries in and around Calcutta. Similarly the low rates for cotton and wool to Bombay were instrumental in developing Bombay as a textile manufacturing centre. The railways were also not slow to realise the importance of aiding industries even in the hinterland by quoting promotional rates. Iron, coal, sugar, cement and paper industries, among others, have profited greatly from the assistance given by the railways in the shape of low rates both for raw materials and finished products.

Freight Concessions

While thus the railway rates have played a vital role in developing and fostering the industrial growth of the nation from the early stages, it is only to be expected that they should continue to give their helping hand in the nation's drive to secure increased exports. Over 130 commodities from various stations in the hinterland to different ports for export enjoy substantial freight concessions. Among these are:

(i) Metallic ores such as manganese ore, iron ore, etc.;

(ii) Industrial raw materials such as industrial alcohol, crushed bones, salt, mica waste, etc.;

(iii) Edible oils such as groundnut oil, *vanaspati*, etc.;

(iv) Products of engineering industries such as bicycles and component parts, sewing machines, electric fans, radios, motor vehicle batteries, textile machinery and parts, grinding wheels, electric motors, etc.;

(v) Products of food processing industries such as fruit and vegetable preserves, fruit syrups, etc.;

(vi) Products of certain other important industries such as textile industry, jute industry, glass industry, etc.

Freight concessions are allowed not only on transport of commodities actually exported but also on raw materials used in the manufacture of export commodities, particularly where the industries are situated at or near the port and the freight bill is largely on the transport of raw materials. A case in point is the freight concession allowed on the transport of *guar* seeds from stations in Rajasthan and Punjab for manufacture of *guar* gum at Bombay for export purposes.

The freight concession for export traffic is usually 50 per cent of the tariff, but, in certain cases, a lesser quantum is allowed depending upon the needs of each particular traffic. The claims for grant of such rebates are carefully considered in consultation with the Ministries concerned, so as to give the maximum possible relief consistent with the needs of the individual traffic. The monetary value of the freight concessions for export during 1962-63 was well over Rs. 1.37 crore. The figure has since greatly increased.

Iron Ore Exports

In recent years, the railways have launched significant investment and expansion programmes to cater to the new developments in the field of export traffic. Most noteworthy among these are the ambitious schemes undertaken for the exploitation of our enormous iron ore deposits which are credited to be among the biggest reserves of high grade ore in the world. On current indications, only one or two other countries are, perhaps, endowed with larger reserves than ours.

In 1960, the value of the export trade in iron ore was hardly 4 per cent of the total value of all our exports, the figure being around 3.5 million tons in quantity. By the end of the current Plan, it is hoped to step up the iron ore exports to about 19 million tons to rise further in stages to 25 million tons by 1970. These figures convey an idea of the greatly enhanced importance of this export not only in the last few years but also in the immediate future.

In the building up of this export market, there are several difficulties to be reckoned with like the high f.o.b. prices of our ore at the ports, the long distances in movements to our main buyers like Japan, Germany and Italy and the development of competitive mines in Africa and elsewhere. It is obvious that, with the fairly long leads generally involved in transport from the mines to the ports, the factor of cost of rail transport with its attendant concessions is a very vital consideration, where the railways have played, and will continue to play, a significant role.

Exports from Bellary-Hospet and Contiguous Areas

The enormous reserves in the Bellary-Hospet area alone are estimated at nearly 1,000 million tons with a Fe content of 65 to 68 per cent. In developing these deposits earmarked at present almost exclusively for export purposes, the railways have planned for large increases in movement capacity. An additional broad-gauge line is being built between Hospet and Guntakal to move the ore from the Hospet-Bellary area to Madras harbour directly, eliminating the road transport which is at present involved upto Timmanacherala, a station near Guntakal. When this work is completed by September 1965, at an approximate cost of Rs. 6.49 crores, it will be possible to increase the present movements to 2 million tons per annum via Madras.

Plans are afoot to develop Mangalore into a major port to export about 2 million tons via this port. Connected with this work are several railway schemes including the Hassan-Mangalore railway line. A survey is being carried out for the conversion of the section from Londa to Goa and Hassan to Londa from metre to broad-gauge. The present as well as projected planning in this rich iron ore area is a forerunner of large-scale industrial and export development in the entire region.

Ore Exports Through Visakhapatnam

In fulfilment of certain long-term agreements entered into with Japan, six million tons of iron ore (4 million from the Bailadilla deposits and 2 million from the Kiriburu mines) are to be exported to that country annually via Visakhapatnam. For this purpose, over 680 km. of new railway lines were planned for construction on a priority basis, of which the links from Kiriburu to Bimalgarh and Sambalpur to Titlagarh have already been completed. More important is the 448-km. long Kottavalasa-Bailadilla line whose construction is now speedily under way. Traversing through the three States of Andhra Pradesh, Orissa and Madhya Pradesh, this line will not only tap some of our richest iron ore deposits but also open up large tracts of underdeveloped areas. It is one of the most difficult constructions ever undertaken by the Indian railways and has by far the longest continuous grade-line, namely, 64 km. on an unbroken 1 in 60 grade. Reaching upto a maximum elevation of 3,280 ft., it will have the highest point on the broad-gauge alignment in this country. Out of Rs. 55 crores which is the estimated cost of the line for the total length of 448 km., as much as Rs. 20 crores will have to be spent on the 64-km. ghat section alone. This would afford some idea of the immensity of the task in threading through the Eastern Ghats. The line is expected to be completed early in 1966 whereafter shipments of ore from the Bailadilla deposits will commence.

Bulk Transport and Dieselisation

Several sections of railway lines are thus developing as specialised iron ore belts. The pattern which obtained a few years ago when the organisation of mining and scattering of export over a large number of ports was such that movement was more in the nature of wagonloads has undergone a revolution. The technique is now one of heavy bulk movements involving the running of long and heavy trains, high axle loads and the use of special high-capacity lightweight wagons. Dieselisation of motive power, which forms an integral part of the overall planning for increased transport capacity on the railways, is playing an increasingly important role in catering to these large ore movements. In the southern region, for instance, diesel traction has been introduced mainly for the ore traffic from the Hospet-Bellary area to the Madras harbour. The new ghat-line which is under construction for movement of export ores from the Bailadilla mines will be an all-diesel route—3,600 tons of iron ore are proposed to be worked by five diesel engines for the portion down the ghats, while on the remaining portion of the line three engines would do the job. There is a distinct possibility of at least the portions over the ghats being electrified at a later stage, taking advantage of loads coming down for generation of electricity, thereby reducing the cost of operation. With electrification, it will also be possible to increase the line capacity to a total of 9 million tonnes per annum.

Gondola Wagons

The concentrated increase in demand for bulk movements of iron ore has led to the evolution of a new design of all-welded gondola type wagon to give a high payload to tare ratio of over 2.5. Similar in many respects to the BOX wagons, these "gondola" wagons are specially adapted to the loading and unloading requirements of ore traffic and are also more economical in construction requiring less steel in framework as they are low-sided and without side doors. They are suitable for mechanical unloading by tipping.

Expeditious Movement

While heavy outlays have thus been undertaken for export ores, the railways have geared their machinery for all other export movements also. Apart from the high priority classification accorded to such moves, *ad hoc* assistance is arranged from time to time to suit shipping programmes at short notice. Wherever the traffic requires it, clearances are made in block rakes. Sugar for export, for instance, is moved largely in trainloads. In 1963-64, export sugar moved by rail was over 14 lakh tonnes. Operational restrictions which may happen to be in force from time to time are generally not applicable to export traffic. Large labels are fixed on wagons carrying export traffic with the legend "For export only pusl: on."

POYSHA CONTAINERS MAKE IT POSSIBLE

Paints, foods, oils and pharmaceuticals...these are just a few of the many industries that use millions of hygienic, quality-tested tin containers made by Poysha. Already one of the two largest tin container manufacturers in the country, Poysha is expanding rapidly...with new factories coming up at Dighe (Bombay), Ghaziabad (Delhi) and Cochin. By taking its advanced can-making know-how to these three important centres, Poysha will become a nation-wide organisation...to help more industries serve you better.

Priceless pearl of trust...

Renewed acceptance by generation after generation through sixteen long decades has shaped for **BINNY** a priceless pearl—the pearl of trust in **BINNY** quality, trust in **BINNY** dependability, trust in every aspect of **BINNY'S** diverse activities.

BINNY & CO. LIMITED's well-known subsidiaries, the Buckingham & Carnatic Co. Ltd., Madras and the Bangalore Woollen, Cotton & Silk Mills Co. Ltd., Bangalore, have been made famous by the high quality of their fabrics in India and in over 50 other countries around the world.

BINNY also offer a variety of handwoven textiles in delightful designs and colours. The 'BINTEX' mark is a guarantee of quality handwoven fabrics.

BINNY'S ENGINEERING WORKS LIMITED specialise in the manufacture of complete factories and spares for the sugar industry, fabricate and erect structural steelwork of all types, and produce ferrous and non-ferrous castings and light forgings. An ocean-going-ship repair section functions in the Madras Harbour.

BINNY & CO.'s Engineering and Agencies Department handles a wide range of mechanical, electrical, engineering and other products.

GIOVANOLA-BINNY LTD. manufacture penstocks and allied equipment in collaboration with the Swiss firm of Giovanola Freres S. A.

BINNY & CO. LIMITED also provide shipping, stevedoring and insurance facilities. They are booking agents for many international shipping companies and airlines, including the Indian Airlines Corporation.

BINNY - *a name you can trust*

Planning For Larger Exports During Fourth Plan

Commodity-wise Scope—Prerequisites For Success

By MANUBHAI SHAH
UNION MINISTER OF COMMERCE

THE target for exports during the Third Five-year Plan period was placed at Rs. 3,700 crores, though it was felt that a higher figure may be required in view of the import needs of the development programme contemplated. During the first three years of the Third Plan, exports amounted to Rs. 2,160 crores. From the total stagnation in the first two Plans, exports have shown a tendency to increase rapidly in the Third Plan. In the first two years the increase was sizable though not striking; but during last year, i.e., 1963-64, exports took a big leap forward. It is true that it would be very optimistic to assume the same rate of increase every year, but even if we achieve the kind of increase recorded during the earlier years of the Third Plan we will have achieved the export target for the Third Plan.

There is no doubt that the target of exports for the Fourth Five-year Plan period will have to be very much higher. The size of the export target will naturally be related to the magnitude of the Plan itself. Although it is too early to say definitely what the volume of outlay on the Fourth Plan will be, there is no doubt that considering the rapid increase in population and the persistently low standards of living of our people, it will have to be substantially higher than the outlay during the Third Plan. The current thinking is that it will have to be almost double that in the Third Plan.

Task Still Not Complete

If we assume this to be the case, it will necessarily involve large imports both for maintenance and development. Although we have made a large headway in building up a metallurgical and machinery making complex, the task is still not completed. We will have to continue our efforts in that direction during the Fourth Plan as well. Besides, substantial expansion of capacity will have to take place in vital industries like steel, metals, machine building, heavy industries, fertilisers and petrochemicals and corresponding expansion will also have to take place in infrastructure like transport, power and ports. The import of capital goods necessary for all these purposes, in addition to what will be produced at home, is estimated to be in the neighbourhood of Rs. 2,500 crores. In addition, imports of raw materials, components, spares and replacements to utilise fully the industrial capacity that has already been built up will also have to be made. Paradoxically, these tend to grow with industrial capacity even though import substitution is a specific policy and objective of industrial development. This is because even in those fields where components and materials are produced internally, local production is not adequate to meet the ever-growing demand. Secondly, with the constant expansion of industry, the import of one set of components tends to replace another set whose import is being stopped because of local production. Imports on maintenance account are estimated at Rs. 5,300 crores during the Fourth Plan.

Repayment Obligations

These are not the only payments India will have to make during the Fourth Plan period. There will be substantial payments on account of interest charges on loans received in the past and on account of repayments of past short-term and medium-term loans accepted because of the sudden crisis earlier in our balance of payments. Therefore, we have to depend a great deal on the financial assistance from friendly countries during the Fourth Plan period. This assistance will have to come in even at higher level than in the Third Plan. If then we are to have a viable plan, exports will have to amount to something like Rs. 5,100 crores, that is, about 40 per cent higher than exports during the Third Plan.

What we have to remember is that there was total stagnancy on the export front over the last 14 years, that is, since independence upto 1961, when exports were hovering round about Rs. 600 to Rs. 620 crores per year and did not register any increase whatsoever in those years. In some years during that period of stagnation, exports sagged heavily, causing hardship to the Nation's economy. Our export earnings in the periods of the First Plan and the Second Plan were about Rs. 3,100 crores in each of the two Plans. In the Third Plan, due to various promotion measures and climate created for export promotion, we have been able to achieve significant results and the Third Plan target of Rs. 3,800 crores of aggregate export earnings in the five-year period of the Third Plan will be definitely reached. This will raise the annual average of export earning in the Third Plan to Rs. 760 crores from the previous figure of Rs. 620 crores per year in the first 14 years of India's independence. For the Fourth Plan we have now accepted the responsibility of Rs. 5,100 crores. Naturally, the annual average earning will have to be raised to Rs. 1,020 crores, an increase of about Rs. 260 crores per annum from the annual average of Rs. 760 crores of the Third Plan.

The aim of the Fourth Plan is—or will have to be—to raise national income by about 30 to 35 per cent if it is to represent an advance over the Third Plan. On an overall basis, therefore, it would appear that there should be no difficulty in reaching an export target of this order. Such an assumption would be too facile and would gloss over many of the difficulties that will crop up in reaching the target. Therefore, a commodity-by-commodity examination is necessary both to realise the feasibility of the target and—more important—to know the kind of action that has to be taken in advance as well as in the course of the Fourth Plan to reach this target. Unless plans for action are sketched out from now on, the task of raising exports will be extremely difficult.

Pattern of Exports

The pattern of India's exports exhibits certain interesting features. Jute and tea are the two most important exports accounting for about 35 per cent of the total of Rs. 794 crores in 1963-64. These are what may be called our traditional export items. Next in importance, though a long way behind these two, are cotton textiles, oilcakes and iron ore. The first is a traditional item with fluctuating fortunes while the other two are new items with what appears to be a great potential. Then there are a number of traditional items like sugar, leather and raw skins, cashew kernels, tobacco, vegetable oils and spices the exports of which range from Rs. 20 to 30 crores per annum. These are followed by manufactured items like handicrafts, engineering goods, chemicals, art silk textiles and coir goods, with their exports ranging between Rs. 10 crores and Rs. 15 crores. The rest is covered by a long list of items which includes manganese, mica, fish, coffee, iron and steel scrap, cotton yarn, ready-made clothing etc. Some of the items mentioned above are traditional items and face difficult times. Others are new items which have come up in the past five or ten years and which have a large potential. In between lies a range of commodities exports of which could be pushed up with a little bit of concerted action. The notes below examine the position in greater detail.

Jute Manufactures: The exports of jute goods have shown a fairly steady increase during the Third Plan. Since the level of exports is already as high as Rs. 157 crores, the scope for any further increase is naturally limited. The main handicap in increasing the exports of jute goods in the Fourth Plan period is going to be a shortage of jute fibre due to the limit set on the acreage under jute. The extension of the area under jute beyond the present figure of about 2 million acres does not seem to be possible, and any increase in raw jute availability depends wholly on the rise in productivity. In view of the poor quality of the soil in some of the Eastern States, the scope for an increase in productivity seems to be limited. Therefore, unless we are in a position to import jute fibre on a satisfactory scale, there may not be much scope for raising the exports of jute goods beyond the present level. This conclusion is somewhat reinforced by a tendency for jute goods prices to decline. One cannot, therefore, hope for anything more than a rise of Rs. 15 to 20 crores in jute goods exports. It must, however, be stressed that even this modest increase will not be possible, unless firm arrangements are made for importing roughly one million bales of jute.

Tea: Even though tea exports are at a very high level, it would be necessary to raise them by as much as Rs. 30 crores in the Fourth Plan. This could be possible, only if appropriate action is planned and taken from now itself. Although the consumption of tea in our principal market, i.e., the U.K., has reached a sizable figure, there is still scope for expanding sales of tea in the U.K., as also in the U.S.A., Europe, some of the Middle Eastern countries, Africa and Australia. What is required for this purpose is vigorous propaganda in building up the image of Indian tea. While this task is being carried out, tea production also has to show a much greater increase than it has done during the Third Plan. Substantial replanting will have to take place in the course of the Fourth Plan and facilities and equipment for irrigation, etc., will have to be made available. Certain tax reliefs, concessions and liberal financial facilities will have to be extended to the industry, if higher production is to be achieved. However, the impact of all these measures, even if taken immediately, may not be large enough to produce the export surpluses required for increasing our exports by the figure mentioned above. A certain amount of moderate restraint on internal consumption may have to be exercised through taxation.

Textiles: Since the world trade in textiles is not expanding, the market for textiles is highly competitive. It may, therefore, not be possible to raise our exports by anything more than Rs. 25 crores from the level likely to be reached at the end of the Third Plan. Even this can be achieved only if we are able to meet competition from other producers like Japan, Hong Kong, Pakistan, Portugal and Spain through the continuation of our present incentive schemes and larger investment in replacement, modernisation and expansion of all the sectors of textile industry. The order of investment necessary for maintaining our place in the world textile market may be something like Rs. 175 crores.

One of the reasons why we have lost our competitive ability regarding textiles has been the shortage of cheap locally produced cotton and man-made fibres. Efforts will, therefore, have to be continued to grow more cotton and man-made fibres locally and reduce our dependence on imports.

Oilcakes: The export of oilcakes showed increase during 1962-63 and there has been a slight improvement on this during 1963-64. The increase in our exports of oilcakes was due mainly to increased demand from Western Europe and Eastern Europe for use as cattle-feed. It should be possible to raise our exports by another Rs. 10 crores by the end of the Fourth Plan, because of the growing importance of the dairy industry in all the countries in Europe. This export performance is possible only if no barriers are placed on the export of oilcakes, particularly groundnut oilcake. A certain amount of ill-informed opposition to such exports is likely to build up during the next few years as the movement to improve the conditions of our own cattle population gathers strength. It should be realised, however, that cottonseed cake, and not groundnut cake, is the main cattle-feed in our country. Therefore, there should be no difficulty in exporting surplus groundnut cake as cattle-feed to other countries, after meeting our full requirements of cattle-feeds in the form of cottonseed and other oilcakes and quantities of groundnut cake. The Government will have to take steps to discourage the use of oilcakes as organic manure. Unless a firm decision is taken to make available about 12 lakh tons of groundnut oilcake for export, the target mentioned above is not likely to be achieved.

Iron Ore: This is an item which has great export potential. It should be possible to raise our exports to something like Rs. 95 crores—an increase of about Rs. 50 crores from the present level by the end of Fourth Plan. Such an increase, how-

ever, would be possible only if programmes for improving transport facilities, port handling facilities and facilities for ore beneficiation and pelletisation are implemented with the maximum speed. Not only will adequate investment have to be provided for this purpose but also quick action has to be taken on all the projects contemplated.

Sugar: Over the past few years, India has been slowly emerging as a sizable exporter of sugar. During 1963-64, export earnings from sugar reached a record level both on account of a large quantity and an unprecedentedly high price. We were able to export something like 5 lakh tons of sugar valued at Rs. 27 crores. While it would be natural to expect a decline in these high prices during the Fourth Plan, we should be able to double the quantity exported. If this is done, we would be able to maintain the present earnings. Considering the experience of the current year which has witnessed a drastic decline in our sugar exports because of rising internal demand, we will not be able to maintain our exports at the level indicated above, unless the Government specifically decide to accord priority to the export of sugar and also take vigorous steps to increase production. Frequent interruptions in our supplies to carefully built-up world markets like Canada, Malaysia, Japan, U.S.A., etc., lead to a loss of markets. Similarly, since internal costs of sugar are about twice as high as the normal world price of sugar, the policy to grant subsidy on exports of sugar has also to be continued.

Leather: This is another traditional item which has been around this level for some time. Although we have a good market for items like vegetable tanned East India kips, the scope for increasing substantially the exports of leather manufactures is limited because of our inadequate tanning facilities. Again, unless we are able to organise the collection of hides from dead animals in a much better way than we have done so far, it is not possible to increase the supply of hides for tanning. Therefore, exports of leather will continue only at a level slightly higher than during the Third Plan.

Cashew Kernels: Exports of cashew kernels are based largely on imported raw cashew nuts. Since two-thirds of our supply of raw nuts is imported, our ability to maintain and increase exports depends upon our ability to ensure an adequate supply of raw nuts from countries in East Africa like Tanganyika. These countries have already set up their own kernel processing factories and their number is bound to multiply very soon.

When this happens the supply of raw nuts is naturally going to be restricted. Our ability then to maintain, let alone expand, exports of cashew kernels would depend upon our ability to produce more raw nuts locally. It has been established that there is scope for growing cashew in Maharashtra, Mysore, Madras and Andhra Pradesh and, unless a crash programme is undertaken in these areas, it will be very difficult to maintain our exports of cashew kernels.

Tobacco: Here again, the scope for increasing exports is limited, partly because of the natural campaign against smoking and partly because of competition from other suppliers to Europe where our tobacco is used mainly in blending. Competition from Rhodesia is very keen and is likely to increase. Rhodesia as well as other African countries are planning on large increases in their production of tobacco. To some extent in the past we have been balancing our relatively stagnant performance in the West by increasing sales to Eastern Europe. The scope for such expansion is also limited because of the growing internal production of tobacco in these areas and their preference for varieties which are different from ours.

Vegetable Oils: This is another item for which the world demand is good. The market for groundnut oil particularly is extremely encouraging. Our exports during 1963-64 were very large and had raised hopes of our once again being a substantial exporter of groundnut oil. The increase in domestic demand, however, has belied these expectations. With the relatively slow growth in production and increase in population and rise in standards of living in coming years, the pressure of domestic demand on our limited supplies would be so great as to prevent substantial exports of groundnut oil. Even to maintain the existing level of exports Government will have to take a definite decision to set aside a certain quantity of oil for export irrespective of the state of domestic demand. At the same time a crash programme for increasing the production of oilseeds should be worked out and provided for in the Fourth Plan.

Engineering Goods: In future, India will have to look more and more to exports of manufactured goods both because of her increasing industrial capacity and because of the limited scope for the expansion of exports of primary commodities. A modest beginning has been made with regard to exports of engineering goods and our exports during 1963-64 were around Rs. 14 crores. These will have to be stepped up considerably, to a level of something like Rs. 50 crores by the end of the Fourth Plan. The principal items which we will be in a position to export would be metal manufactures and electrical and non-electrical machinery. Over the years, a fair amount of effort has been made to establish a reputation for Indian engineering goods abroad, reliable selling outlets and adequate servicing facilities. What is needed now is adequate production and strict adherence to quality. If we were to make sustained efforts in this direction, it should be possible to overcome the disadvantages of lack of experience, high cost and the high degree of competition.

The necessary increase in production will not, however, take place, unless: (*a*) the required raw materials like pig iron, rolled steel, steel sections, special steel and castings and forgings are made available in adequate quantities and at appropriate prices; (*b*) substantial reductions in rail and sea freights are granted; (*c*) facilities for granting deferred credits to foreign buyers are made available; and (*d*) adequate cash subsidies to cover the gap between external prices and internal costs are granted.

Iron and Steel: Another field in which the scope for expanding exports is substantial is iron and steel and rolled products. There is a certain amount of demand for products like rails, bars, structurals, billets and flat products like sheets, strips, etc., in the countries around India. We should be able to meet this with our increasing steel-making capacity. It should be possible to sell about 5 lakh tons of prime steel and earn about Rs. 20 crores of foreign exchange a year. It is not possible, however, to build up a market of this magnitude, unless continuous and firm supplies are assured. Therefore, it will be necessary to plan additional investment and suitable expansion in each steel plant to achieve a surplus of the kind of products which can be sold in these areas rather than wait for a surplus to emerge and try to sell such surplus products. Unless we plan a definite programme of action, it will not be possible for us to secure a footing in the world steel market because competition is intensive.

Fisheries: Another field which has very great potential for export is fish. The export of fish has been increasing steadily and the export of frozen and canned shrimps and frog legs to the U.S.A. has been the dynamic element in this item. With greater investment in this field, it should be possible to increase our exports during the Fourth Plan to something like Rs. 20 crores. Such a phenomenal increase, however, is subject to certain steps being taken from now on. To raise the production and exportable surpluses to the level required in the Fourth Plan, it is necessary that adequate investment in the shape of oceanographic surveys, arrangements for fresh water supply, large supply of trawlers, freezing equipment, fish harbours, etc., should be undertaken immediately. To encourage investment in trawlers and canning and freezing capacity administrative procedures should be simplified. Government will have to undertake investment in all the infrastructure. Rigorous quality control is also necessary for maintaining the rather fastidious markets in the West.

In addition to these major sectors, small increases can be achieved in almost all items like spices, manganese ore, mica, coffee, handicrafts, clothing, coir yarn and manufactures, footwear, etc. On the whole, a target of Rs. 5,100 crores does not seem to be outside the bounds of achievement. To be able to reach this figure we will have to pursue an export-oriented policy much more assiduously than has been the case in the past. In addition to the various measures which have been indicated for individual commodities, certain general steps will have to be taken as part of our policy for development. Since exports cannot take place unless the necessary surpluses are there, it will be essential to follow a positive policy designed to build up surpluses in those sectors which have export potential. We will have to give up the idea of trying to export whatever surpluses emerge and concentrate on producing surpluses in those fields which have a greater saleability than others. Some of these fields have already been indicated. In addition, the scope seems to be substantial for the export of fresh fruit (like bananas), rice bran oil, cottonseed oil, ores, manioc meal, iron and steel castings, machine tools, etc.

Certain Essentials

Where production cannot be increased to the extent required, it will be necessary to hold down domestic consumption in order to release production for export. To a certain extent, restraint in domestic consumption has been exercised in items like tea, but it will have to be resorted to to a much greater extent in the years to come if we do not wish to face again the kind of awkward situation we had with regard to sugar and groundnut oil. Since continuity of supply is absolutely essential for building up a position in a highly competitive market, fluctuations in internal production which are inevitable where agricultural items are involved should lead not to fluctuations in the availability for export but to fluctuations in availabilities for domestic consumption. Tax policy will have to be worked out appropriately to achieve this aim.

If we are to build up more and more exports of manufactured articles, it will be necessary to provide them with adequate raw materials to ensure production for export. It would be worthwhile even importing raw materials for this purpose because our manufacturing margins are so good that a profitable export business can be built up on these. In any case, there must be a strict adherence to the policy of making available raw materials for export production and there should be no interference with this supply on any account. It may even be necessary to make available raw materials in advance of firm orders, in order to eliminate delay in the fulfilment of these orders when they are actually placed. International markets are fully competitive and, since we have not yet established a reputation, we should not suffer from handicaps with regard to supply of raw materials, etc.

While these steps are being taken, it would be necessary also to provide for speedier and bolder export assistance than hitherto as a gap between internal costs and external prices is inevitable. The procedures for grant of such assistance should be simplified as much as possible. At the same time, there should be a continuity regarding export policies and Export Promotion Schemes, so that businessmen can plan their production programmes for export in a suitable fashion.

The target of Rs. 5,100 crores which would mean an annual increase of Rs. 50 to 60 crores or a monthly increase of Rs. 5 crores over exports of corresponding month of the previous year is within our reach, provided we are conscious of the paramount importance of exports for our development and are willing to strive to achieve them at any cost. Continuity of policy and willingness to bear a certain amount of temporary inconvenience and quicker procedures for export assistance programmes will have to be the watchwords of the export policy for the Fourth Plan.

AUSTRIA AND E.E.C.

Considerable progress has been made these past weeks in Brussels in the discussions on the methods and objectives of an economic arrangement between Austria and the E.E.C. The Member States have accepted the proposition of Austria and the E.E.C. Commission according to which a customs preference—naturally respecting the rules of G.A.T.T.—would be established between Austria and the Community. This represents an important progress, for up until this point in the discussions, some of the Member States had felt that a general European lowering of customs duties such as envisaged within the frame of the Kennedy negotiations, would cause the economic problems between Austria and the E.E.C. to disappear. They will now try in the weeks to come to define the terms and conditions of such a customs preference.

Two possibilities present themselves: one would consist in concluding a customs union or a free trade area with Austria on the basis of Article XXIV of G.A.T.T., which would be completed by certain rules of harmonisation to insure mutual competition. But they are also considering another method by which they would limit themselves to agreeing upon the lowering or suspension of those customs duties which are particularly important in mutual commercial exchanges. By an exception to the general rule of the "most favoured nation" clause, these customs measures would only apply to the trade between the E.E.C. and Austria. However, such an exception to the general rule of "the most favoured nation" clause requires particular authorisation (a waiver) from G.A.T.T. It is hoped in Brussels that a point will be reached early in 1965 where official treaty negotiations on a mutually acceptable base may begin.

how did CHARMINAR become

one of the world's

top selling cigarettes?

because of VAZIR SULTAN

Ask any Charminar smoker this question and he'll say, "Because of the flavour!" Who put the rich flavour and unique taste into Charminar? Dedicated experts at The Vazir Sultan Tobacco Company Limited.

At their factory—the largest in South-East Asia—traditional secrets combine with modern tobacco know-how. Charminar's unique taste starts with the very finest tobaccos developed by experts for Charminar. Other experts carefully blend the select *triple-matured* tobaccos. Then an *extra process* exclusive to Charminar gives you its rich flavour and unique taste. No wonder nearly 900 million Charminar cigarettes are bought every month... making Charminar one of the world's top selling cigarettes.

There's nothing like Charminar—India's greatest cigarette!

PROSPECTS FOR EXPORTS DURING FOURTH PLAN

Firm Policy Decisions Needed in Advance

BY DR. PREM CHAND

EXPORT trade is of vital importance for the economic development of any country. In the long run, it is the only source of foreign exchange; foreign loan and capital have to be repaid at some stage or other. Even in the short ran, it is the most important source. For example, during 1956-59, exports provided six times more foreign exchange than that derived from total net long-term capital inflows and official donations to underdeveloped countries. In spite of such an important role, which exports play, very little planning for exports has been done in most of the countries of the free world. The reason for lack of planning in the export sector is due primarily to preoccupation with import substitution. The great difficulties involved in such planning may also be regarded as another reason.

Lately, however, the importance of export planning is being realised. Experience has shown that no planning is complete, satisfactory or dependable without thorough planning for foreign trade. India has had to face acute foreign exchange difficulties; many targets could not be fulfilled because of shortage of imported machinery and of raw materials.

Preoccupation with Targets

Greater thought is, therefore, being given to the export planning in the formulation of the fourth Plan. But, unfortunately, the main emphasis, even now, is on fixing overall and commodity-wise export targets. No proper attention is being paid to lay down policies for achieving these targets. The achievements of targets will not depend upon mere fixing of targets but essentially on the policies followed with regard to production, and distribution within the country, as well as export promotion and salesmanship. If the policies are properly formulated and implemented, exports can be maximised even without any formal export targets. If, however, policies remain uncertain, fluctuate and are biased in favour of State trading as in the past, it may not be possible to achieve even the modest targets. In order to achieve the export target, it is very essential to lay down the policies and pursue them throughout the Plan period, without much changes.

There has been much controversy about the export targets. But it appears that, more or less, it has been fixed at Rs. 5,100 crores. The exports in the final year of the fourth Plan should be Rs. 1,117 crores, as against actual exports of Rs. 794 crores in 1963-64 (Table A). This means that, in the next seven years, overall exports should expand by 41 per cent. The increase in the exports of ores, minerals and scrap, engineering goods and manufactured goods is envisaged at a much higher rate. This would also mean that pattern of export should change considerably as shown in Table A.

Formidable Task

The achievement of these targets is a formidable task, considering the policies pursued in the past. One of the most important problems is the lack of exportable surplus. India could not expand exports of sugar, vegetable oils, chemicals, engineering goods, plantation products and many other commodities because of high domestic demand. The income elasticity for most of the agricultural products (which are the mainstay of India's exports) is very high and the reasons for it are more than one. Therefore, in the fourth Plan, domestic demand may increase at the same rate as, or at a higher rate than, an increase in the level of income. In working out income elasticities neither the F.A.O. nor the Planning Commission has made any allowance for the shift in income, more equitable distribution of income and minimum subsistance level. If allowances are made for these factors for many goods, particularly agricultural based materials, demand may far exceed the estimates made by the Planning Commission or other organisations. It may, therefore, be difficult to achieve the export targets unless definite policies are laid down.

Until recently, exports have been considered as a residue. Whenever shortages developed, particularly in essential goods, exports have been the first sufferer through cuts and bans. There has been no consistent policy. This policy has greatly harmed Indian exports. A foreign buyer cannot consider India to be a dependable source of supply. An Indian exporter cannot make long-term commitments. In future, if export targets are to be achieved, Government must change its policy. Exports should be a first charge on supplies when there are shortages and it is domestic consumption that should be curtailed first. A minimum quantity should be assured for exports year after year, either by curtailing domestic consumption or by creating buffer stocks, meant specifically for exports.

The other major factor on which exports depend is the position of comparative prices. In the past five years, money supply in India has increased more than in many leading exporting countries. Because of higher increase in money supply and high domestic demand, cost of living in India has shown a greater increase than in many other countries, particularly in 1963-64. During the 12 months ending April 1964, cost of living in India has increased by 10 per cent, the highest rise amongst the countries given in Table B.

Indian Goods Outpriced

Because of higher increase in cost of living in India, we are outpriced for most of the commodities in most of the markets. India has become an expensive country even for traditional items like cotton cloth, jute, tea, spices, etc. The Government has tried to overcome this difficulty by import entitlement schemes for various products. But these entitlements have not been fixed on any scientific basis. In many cases, the entitlement is not adequate to provide the necessary incentives to exporter. Moreover, the procedure of getting benefit is very cumbersome and involves lot of delay. In order to encourage exports, Government should so formulate export policies (whether through import entitlement scheme or otherwise) as to ensure that profitability on exports is greater than on domestic scales. The policy should be dynamic and flexible. The relative changes in domestic and world prices should be automatically recognised without any delay or representations.

Much talk is going on about reducing the cost of production in India, so that prices of Indian goods may be competitive. No doubt, productivity in India is very much less than in most of the other countries, whether it is industry or agriculture, but still past progress suggests that, with the present conflicting and uncertain policies, much cannot be achieved. One of the important reasons for low productivity is the uneconomic sizes of units of production, for which the Government of India is greatly responsible. Many uneconomic-size units are allowed so that there may be no concentration of any industry either in a few States or in a few hands. If the policy of diversification continues unabated, without giving due consideration to the economies of scale, Indian costs will continue to be higher than those of its competitors in world markets.

The other important reason for the high cost of production in India is inadequate mechanisation and modernisation. In this regard also, the policy has been very uncertain. Generally speaking, mechanisation and modernisation have been discouraged because they come in conflict with employment policy, which itself is based on wrong notions. If India has to expand its exports of manufactured goods on the scale envisaged in the fourth Plan, the industrial units should be given full freedom to mechanise and introduce the latest methods of operations and production. A definite policy should be laid down in this regard without any further delay.

State Trading

An attempt has been made to boost exports by State trading. The State Trading Corporation and its younger brother, the Minerals and Metals Trading Corporation, have been allowed to import the items in short supply in India, to make huge profits on them by selling them at high prices, and to use the profits to meet losses on exports. But so far the success has been very limited. The State trading organisations have been successful in expanding trade mainly with Soviet Russia and East European countries which also have State trading, and in commodities like iron ore where all exports have to be made through State trading organisation. The S.T.C.'s success in developing exports to free countries or free commodities, if any, has been far from satisfactory. It is not clear what is going to be the future policy. The trade should be told definitely about the exact policy the S.T.C. would pursue in the fourth Plan, so that there may not be any uncertainty and exporters in the private sector may plan their exports on a long-term basis, with confidence about their future.

The tariff policy and export licensing policy also play a very important role in exports. If India has to develop exports, no export duties can be justified, particularly when no exports are allowed without licences. In the past, export duties were mainly for purposes of revenue for the Exchequer. Whenever profitability on exports improved, the Government used to enhance the duty. This discouraged the exporters, particularly when prices were depressed. He was not able to make good the losses in a bad year from the profits of good years. The position, of course, has greatly changed now. There are hardly any worthwhile exportable goods subject to a duty. Even so, the Government would do well to assure the exporters that it would not go back

TABLE 'A'

Pattern of India's Export Trade

Group of commodities	Value of exports (Rs. crores)		Percentage increase 1970-71 over 1963-64	Percentage to total exports	
	1963-64 Actual	1970-71 Estimated		1963-64	1970-71
1. Agriculture and Allied Products ..	193.0	242.4	25.6	24.3	21.7
2. Plantation Products	131.7	175.0	32.9	16.6	15.7
3. Ores, Minerals and Scraps ..	63.1	122.0	93.3	7.9	10.9
4. Textile Fabrics and Manufactures ..	254.6	321.5	26.3	32.1	28.8

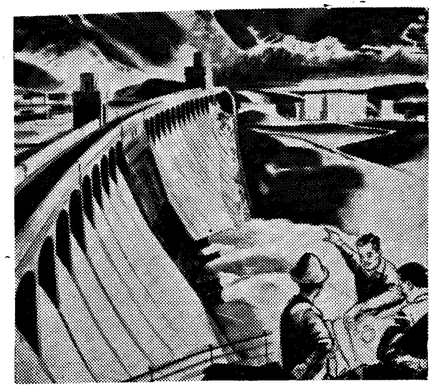
DEVELOPMENTS IN THE EAST



With the improving living standards in the East comes the prospect of trade expansion and of increasing opportunities for profitable marketing. The world-wide facilities of three great banking organizations, merged into a single comprehensive service, are at your disposal with up-to-date information and expert advice on all aspects of finance and trade in these areas.

to the policies of the past if and when circumstances turned favourable for them.

The Government has greatly liberalised export licensing policy. More items have been brought on the free licensing list and in many other cases licences are issued more freely than in the past. Still much remains to be done. Except a few vital items of defence and food, all others should be allowed freely to be exported if the aim of maximising exports is to be achieved fully and in time. The licensing procedure should also be simplified; the Government has recognised the need, but, unfortunately, very little has been done so far.

Salesmanship

Besides availability of exportable surplus, competitive prices and right export policies, another most important factor for the success of export drive is vigorous salesmanship. Unfortunately, this factor is also not favourable in India. The State Governments take very little interest in the development of exports. They look purely from local point of view and do not encourage the development of exports to the desired extent. The trade is also inexperienced, particularly the newcomers, and many of them do not have sufficient resources and knowhow to develop exports. The Central Government has given some thought to it. Indian Government commercial offices abroad have been strengthened to supply more information to trade, conduct trade fairs, exhibitions and shows, etc. But the most effective method, the opening of sales depots, has received very little attention. Opening of sale depots in all the big commercial centres of the world is the best way of conducting publicity and promoting sales. When India is planning to expand exports of engineering goods and consumer durables, this is one of the effective ways of expanding exports, particularly for items requiring after-sales service. Thought should be given by leading manufacturers, exporters and Government to the question of appointing selling agents for branded products. If the selling agents are local persons who are allowed to import on consignment basis, sales of durable goods may receive a good push, provided the commission offered to them is higher than that offered by established exporting countries or what they earn on home produced goods.

There are several other problems such as adequate storage facilities at ports, quick and dependable transport, adequate and cheap credit, plentiful supplies of raw materials, etc. These problems have been discussed times without number and the Government recognises their importance. But so far no satisfactory answer has been found for any of them. There has been more talk and less action. Unless the Government takes a more realistic attitude, it may be difficult to solve them.

The policies of India apart, the policies pursued by the importing countries also play an important role in developing export markets. There are various types of restrictions imposed by the developed, as well as underdeveloped, countries on imports. Efforts are being made to secure liberalisation of import restrictions and reductions in tariffs. But, for a variety of reasons, India cannot depend upon them to any great extent, for the likely reliefs may be small and belated, though there is a lot of lip-sympathy in the Western world for the difficulties of developing countries in finding export markets.

World trade is expanding fast. Viewed in this context, the export targets fixed by India for its fourth Plan are not ambitious. If realistic policies are followed and more free hand is given to exporters in the private sector, it will not be difficult to surpass the targets. But the "if" here is a big one, for none can take it for granted that the policy-makers in this country would be wiser than they have been hitherto.

RAILWAYS AND EXPORT PROMOTION

(*Concluded from page 72*)

The transit of such wagons is carefully watched right up to the port.

The other important side in the foreign exchange drive is the reduction on the strain on the balance of payments through efforts to save on imports. Here again the railways have achieved valuable results by setting up their own production units and fostering indigenous production of wagons, tele-communications, electrical equipment, etc. It is noteworthy that, while the foreign exchange component in the Railways' second Plan was Rs. 319 crores out of a total outlay of Rs. 1,043 crores, the corresponding figure of the much larger third Plan outlay of Rs. 1,581 crores is just Rs. 283 crores. The railways' production units at Chittaranjan, Perambur and Varanasi are standing monuments of the great strides made to attain competency in manufacturing modern equipment of the most up-to-date designs.

In the context of substantial progress in developing technique and know-how in the manufacture of railway rolling stock and other equipment, there is abundant opportunity of entering the export field, especially the developing countries in West and South-East Asia, Africa, etc. The development of industry in these countries is somewhat rudimentary at present and, with one or two exceptions, they are not large enough to maintain a well-deeloped railway equipment industry which, of necessity, has to be based at least, in the first instance, on internal demand. In some of the neighbouring countries, there are some common standards and practices in railway working as a result of past associations when under British rule. This is an added factor in our potentiality to enter the market of these countries.

The main field for substantial exports of railway equipment would at present appear to lie in freight wagons and passenger coaches. Although the Indian railway rolling stock manufacturing industry is more or less fully booked with home orders, some capacity has to be diverted for export purposes, when the need arises. Several handicaps have to be faced due to shortage of raw materials like pig iron, coke, special steels and other non-ferrous metals and also the generally higher steel prices obtaining in this country *vis-a-vis* the ruling international prices. Also, for most of the developing countries, a decisive factor is the affording of some long-term credit or deferred payment terms. Despite these difficulties, the task of acquiring a foothold in the export markets is being tackled resolutely. Some exports of track materials have already commenced to some neighbouring countries. These were of the order of Rs. 38 lakhs in 1963-64. It is expected that, with the coordinated efforts of the railways, the Ministry of Commerce, State Trading Corporation and the railway equipment manufacturers in the private sector, the export of rolling stock and equipment would gain momentum and increasingly earn precious foreign exchange for the country.

General Insurance As An Item Of Invisible Foreign Trade

By R. M. DESAI

GENERAL MANAGER, INDIA REINSURANCE CORPORATION LTD.

SERIOUS efforts are being made at the present time to improve the balance of India's foreign trade. It may, therefore, be topical to consider in this context an important invisible item of foreign trade, namely, general insurance.

When an Indian insurance company grants insurance cover on any foreign property or interest, this constitutes an 'export' of insurance services. The company may accept the insurance either from its office in India, or through a branch office or agency organisation located abroad. Alternatively, the company may accept foreign business by way of reinsurance from an overseas insurance company. In this article, the word insurance is used in its broad sense to include 'reinsurance,' the latter term being specifically referred to where necessary. It may just be explained that, when an insurance company issues a policy for a large amount, it may not wish to carry the whole liability for its own account; the company may, therefore, agree with another company to pass off a portion of the liability to the latter, in consideration of an appropriate premium. This transaction is known as reinsurance.

Gain and Drain

An Indian company accepting foreign business would earn the premium for shouldering the liability. A portion of the premium goes to meet the acquisition costs of the business—e.g., agency commission, brokerage, etc.—and the administrative costs of any foreign organisation maintained by the company. The company has also to settle any claims in respect of the foreign business accepted by it. The balance of premium remaining after providing for all outgo represents the net 'gain' of foreign currency. If, however, the outgo by way of costs, claims, etc., exceeds the premium income, the export of insurance services would result in an exchange 'drain,' instead of giving rise to an exchange 'gain.'

An 'import' of insurance services similarly arises when a foreign insurance company insures any property or interest in India, the acceptance being made by the company's office abroad, or through its branch office or agency organisation in India, or by way of reinsurance from an Indian insurance company. The premium on such insurance, after deducting the outgo by way of claims, expenses, etc., constitutes the 'drain' of foreign exchange from the import of insurance services; if the outgo exceeds the premium, an exchange 'gain' accrues.

India, in common with other developing countries, is a net importer of services like shipping, banking and insurance. The bulk of the import of insurance services is from the United Kingdom. There are several well-established British companies operating in the Indian market, and, in 1962, they accounted for over 70 per cent of the total gross direct premium income of foreign companies in India. Apart from this, a large portion of the reinsurance from the Indian market gravitates to London, where there is a large and competitive reinsurance market provided by Lloyd's Underwriters and various other companies. The other chief countries sharing in the insurance and reinsurance from the Indian market are Switzerland, Germany, France, Sweden and Italy on the Continent of Europe, the United States of America and Commonwealth countries like New Zealand, Australia and Canada.

Recent Trends

In order to appreciate the present position of the exchange drain from India arising out of insurance, it is necessary to consider the trend in the development of insurance business in India and abroad in recent years. For this purpose it should be noted that general insurance is customarily divided into three branches, namely, Fire, Marine and Miscellaneous. The Marine branch is further sub-divided into two classes, namely, cargo insurance and hull insurance of vessels. All classes of business not falling under fire or marine are grouped under the miscellaneous category. The chief component of the miscellaneous section is motor business; other important classes of business under this section are burglary, cash-in-transit, fidelity, personal accident, public liability, workmen's compensation, engineering, aviation, etc.

Fire Insurance

In India, fire insurance business has shown consistently good profits over a number of years. This branch has furnished the main support for the development of Indian companies, as the experience in other classes of business has either been marginal, or the liabilities involved so high that Indian companies could keep for their own retention only a small proportion of the premium. Insurance development in India, in relation to the size and population of the country, has been much less than that in other developed markets. The smaller volume of business requires a higher safety margin in the premium rates, so that a few catastrophic losses may not upset the overall account of the Indian companies. Similarly, as the insurance organisation has to be spread over a larger geographical area for tapping a relatively small volume of insurance business, the acquisition and administrative cost of the business tends to be higher. Fire rates in India have, in view of very good experience, been reduced thrice in the past ten years. It is, however, clear from the considerations mentioned above that the rates must be stabilised at a level which would leave a reasonable margin of profit to ensure the proper growth of Indian companies. This alone would enable them to build up adequate reserves, which most of the companies operating in the more developed markets have already done.

Marine Business

As regards other classes of insurance in India, marine cargo business has been showing only marginal results for quite some time. The parties entering into foreign trade have the option of placing the marine insurance at either end of the voyage and, therefore, marine premium rates are subject to the influence of international competition and the level of marine rates in recent years has been barely adequate to cover the cost of acquisition and of claims. Marine hull business, on the other hand, has shown very good profits in India in the recent past and the premium volume has also expanded considerably, due to the rapid growth of Indian shipping tonnage. The business, however, involves high liabilities which may arise in the event of a total loss of a large vessel. As a result, Indian companies have been able to retain for their own account only a relatively small proportion of the hull premium and the bulk of the business has had to be reinsured. During the past couple of years, marine hull rates have been substantially reduced, and the profit-margin on this business is, therefore, likely to decline.

Miscellaneous Business

Motor business, which accounts for about 70 per cent of the premium under the miscellaneous section, has shown a high loss ratio, and the number of claims is ever increasing. Motor rates have been increased on a couple of occasions in recent years, but the experience of the business still appears to be just marginal. Other branches of miscellaneous business have shown generally good results, but the premium volume is small. The premium from aviation insurance has increased substantially with the growth of the fleets of the commercial airlines in India, and the business has shown large profits. Just as for marine hull business, Indian companies have been able to retain only a small portion of the aviation premium, in view of the high liabilities involved, and the bulk has been reinsured. Quite recently there has been a substantial reduction in the aviation premium rates.

Overseas Markets

In the overseas markets, too, fire insurance has traditionally been the most profitable branch. Certain territories like the U.S.A. and Canada, however, have shown adverse results for fire business for a long period. In the U.K. and most countries of Europe, the results were good in the early 1950s. However, starting from about 1956 onwards, there has been a steady decline in the results of fire business in these territories and conditions have so deteriorated by now that companies are incurring sizable losses on their business. Companies in the developed markets have built up large funds over a period of years and have, therefore, tended to place more reliance on their investment income than on their underwriting profits. Nevertheless, companies have now become concerned with the increasing underwriting losses, and rate increases have recently been introduced. It will take years before the full effect of the rate increases can be felt on the fire insurance results in these markets. From amongst the other developed countries, fire insurance results are found to be profitable only in Japan and to some extent in Australia and New Zealand.

Results of fire business in the undeveloped markets have generally been good, but operations in these areas are rendered difficult by unstable political and economic conditions, currency devaluation and restrictions on transfer of money. Marine insurance has for a long period been showing generally marginal results in most territories; moreover, due to the underwriting-year system of accounting adopted for this class of business in view of its peculiar nature, the trend of the results is difficult to gauge until a few years have elapsed. Motor business has been bad in most of the areas, with a further deteriorating tendency, and has at best been marginal in other areas.

Components of Invisible Foreign Trade in General Insurance: Adequate statistics are not available to find out the exact drain of foreign exchange through general insurance. An attempt is, however, made here to analyse the chief components of the invisible foreign trade in general insurance, which are set out below, to see to what extent they contribute to foreign exchange gain or drain, and to consider the ways in which the position could be improved in the future:

Invisible Exports

1. Insurance transacted by foreign branches of Indian companies.
2. Reinsurance accepted by Indian companies from foreign companies.
3. Insurance accepted in India by Indian companies on foreign properties or interests.

Invisible Imports

1. Insurance transacted by Indian branches of foreign companies.
2. Reinsurance ceded by Indian companies to foreign companies.
3. Insurance accepted abroad by foreign companies on Indian properties or interests.

Before passing on to the consideration of the individual items, a general remark may be made regarding the statistics given in the paragraphs that follow. The figures for the insurance transacted by foreign branches of Indian companies, and by the Indian branches of foreign companies, show the profit or loss made by these companies in different years. Similarly, the figures for the net exchange drain arising out of reinsurances accepted from abroad and ceded abroad, have been estimated on the basis of the profit or loss from these operations. In computing these figures of profit or loss, certain provisions for future liabilities, such as reserves for unexpired risks or for outstanding losses, would be included, in addition to the items of cash income and outgo. There may thus be a considerable divergence between the actual currency transfers, which represent the exchange gain or drain, and the profit and loss figures which show the underwriting experience. All the figures quoted in the following paragraphs are from the *Indian Insurance Year Books.*

Insurance Transacted by Foreign Branches of Indian Companies: Indian companies write a substantial volume of business abroad through their overseas branches and agencies. The operations of these companies are extensive in many countries of Asia and Africa, particularly those where there is a large Indian trading community. In 1962, Indian companies wrote outside India a total gross direct premium of about Rs. 10 crores, as against Rs. 35 crores written by them in India.

In normal course, these foreign operations of Indian companies should yield a considerable exchange gain to India. Unfortunately, however, the claim experience of this business appears to have been adverse in the past few years, resulting in exchange drain; estimates of the underwriting losses incurred by the companies are given in the following table:

Claims Experience of Foreign Business
(In crores of rupees)

Year	Profit (+) or loss (—)			
	Fire	Marine	Miscellaneous	Total
1960 ..	+0.10	—0.38	—0.46	—.74
1961 ..	+0.01	—0.51	—0.53	—1.03
1962 ..	—0.05	—0.18	—0.95	—1.18

The chief losses have been incurred in marine and motor business, the experience of the latter being specially unfavourable in a number of countries.

In computing the above figures, it is not clear how head office expenses incurred in India to administer the foreign business, have been treated. If these expenses have been taken into account in arriving at the figures, the actual exchange drain in foreign currency would be that much lower.

Future prospects for overseas business of Indian companies are beset with difficulties. Nationalisation of insurance has recently closed for Indian companies certain important markets like Egypt, Burma and Ceylon. Political and economic conditions, and restrictions on currency transfer, have made operations in certain other areas, e.g. Pakistan and Indonesia, increasingly difficult. Domestic insurance companies are getting progressively more powerful in their national markets, and the business available to foreign insurers, including Indian companies, tends to be of inferior quality or involves higher cost of acquisition, thus reducing its profitability. Motor business, which accounts for an important and growing proportion of general insurance premium, is becoming increasingly unprofitable in most territories, owing to a number of causes like increasing density of traffic, expensive designs of cars, and ever larger third party awards granted by law courts in motor accident cases. In addition to all this, insurance business in general is itself going through an unfavourable cycle in many of the areas.

In the circumstances, many Indian companies operating abroad have started pruning their portfolio, so as to eliminate much of the unprofitable business. At the same time, it must be recognised that insurance business runs in cycles and companies have to keep their overseas organisations going during an unfavourable cycle in the expectation of recouping their losses when the business improves.

Insurance Transacted by Indian Branches of Foreign Companies: Before the Second World War, foreign insurance companies in India were in a dominant position and wrote a major portion of the insurance business in the country. Since then, Indian insurance companies, aided by the passing of the control over industry and commerce to Indian hands and the rise in the national consciousness to support Indian enterprise, have made rapid progress, and the percentage share of foreign companies in insurance business in India has been declining progressively. In 1948, foreign companies wrote 44 per cent of the total insurance business in India; the share had come down to 37 per cent by 1956, and this has declined further to 26 per cent by 1962.

Most classes of general insurance in India have shown good profit over a number of years. The experience of foreign companies in India has even been better than their Indian counterparts. This is probably because a large portion of the business of foreign companies comes from tied accounts of foreign commercial concerns in India, whose loss experience is better than the general market business. These companies can also be more selective about their underwriting in India as compared with Indian companies for whom the Indian market would be the chief source of business. The following table shows the profit made by non-Indian insurers relating to insurance business transacted in India during the years 1958 to 1962:

(In crores of rupees)

Year	Profit (+) or loss (—)			
	Fire	Marine	Miscellaneous	Total
1958 ..	+0.66	+0.20	+0.19	+1.05
1959 ..	+0.76	+0.18	+0.22	+1.16
1960 ..	+0.86	+0.13	—0.16	+0.83
1961 ..	+0.95	+0.13	+0.25	+1.33
1962 ..	+1.05	+0.23	+0.32	+1.60
Total 1958-62..	+4.28	+0.87	+0.82	+5.97

The above statistics relate only to the underwriting experience of the companies and do not include figures of their miscellaneous income.

The income of the foreign companies in India, including underwriting profit and miscellaneous income, would be subject to Indian tax at the prevailing rates. The surplus remaining with the companies would give rise to exchange drain only as and when the actual funds are remitted out of India.

India follows the policy of freedom of trade, and foreign companies would thus always have an opportunity of transacting whatever business they can secure in India. Their share of the total premium has been declining. But, in recent years, a number of industrial enterprises are being set up with foreign capital collaboration and a portion of the insurance business of such enterprises is naturally placed with the Indian branches of overseas companies with whom the foreign collaborator has connections. Thus, the drain of foreign exchange, through the operations of foreign companies in India, would remain.

Reinsurances Accepted by Indian Companies from Foreign Companies and Reinsurances Ceded by Indian Companies to Foreign Companies: Under the current Reserve Bank regulations, it is generally not possible for a party in India to place direct insurance abroad. There is no restriction, however, on an insurance company writing business in India about placing reinsurance with companies in India or abroad. This freedom of reinsurance is vital, because, unless adequate reinsurance coverage is available, a company's financial position could be severely strained by a catastrophic loss. Reinsurance fulfils the useful function of achieving an international spread of large risks. There is similarly no restriction on the acceptance of reinsurance by companies in India from overseas companies.

Separate figures are not available to indicate exchange gain or drain arising respectively from reinsurances accepted from foreign companies, and those ceded to foreign companies. However, the net drain in respect of both these types of reinsurance transactions taken together has been estimated as under:

(In crores of rupees)

Year	Net exchange drain			
	Fire	Marine	Miscellaneous	Total
1960 ..	1.26	—0.32	0.90	1.84
1961 ..	0.99	0.43	1.85	3.27
1962 ..	1.78	0.04	0.24	2.06

Most of the reinsurance transactions with foreign companies are done under "reinsurance treaties." A treaty is a formal agreement between the insurer and the reinsurer, whereby a specified portion of the former's business is automatically reinsured with the latter. Treaties are often exchanged on a 'reciprocal' basis, each company accepting a portion of the reinsurance of the other, with the idea of matching the business exchanged. Certain business of inferior quality or involving high liability may not merit reciprocity, and would be reinsured on a non-reciprocal basis.

The bulk of the reinsurance transactions in the fire branch are done on a reciprocal basis, and it will be seen from the above figures that it is this branch which has contributed the most to the exchange drain in recent years. This is due to the fact that reinsurance trading by Indian companies has been subject to a double disadvantage. Indian fire business has shown good results and has thus given rise to large profits being given away to companies abroad on reinsurances placed with them. On the other hand, as fire business has been unprofitable in most of the areas from which Indian companies accept reinsurance business, the companies have incurred losses on their reinsurance acceptances. The following are some of the measures for improving the position and companies in the Indian market have already started implementing most of these measures:

The underwriting capacity of the companies in the Indian market can be gradually stepped up so as to retain as much as possible of the profitable Indian business within India. There are a number of methods to achieve this objective. Companies can consider increasing their net retentions within the limits dictated by prudent principles of underwriting. One method by which retentions could be increased to a level beyond what would otherwise be feasible is to obtain reinsurance cover on "excess loss basis" to protect the increased retentions. With this method of protection, the company has to bear on its own account all small losses upto a stipulated figure, and the reinsurer is responsible only for the occasional larger losses in excess of this figure, as a result of which the premium to be given away to the reinsurer is modest in comparison with the premium retained by the company.

Another way of increasing the business absorbed within India is for companies in India to exchange as much as possible of the reinsurance business amongst themselves. It would be useful to evolve a voluntary understanding among companies in India that they should not seek reinsurance abroad before exhausting the capacity of the Indian market. A convenient method of organising an exchange of business amongst companies in India in a systematic way would be to organise a pool to which all companies can contribute a good portion of their business. The business so pooled may be suitably protected by an excess of loss cover, so that the results of the pooled business may not be upset by a few catastrophic losses. The pooled business can then be distributed back to the companies, generally in proportion to their contributions. It is felt that there is good scope for increasing the retention capacity of the Indian market substantially by these methods.

There would still be a good volume of reinsurance business to be ceded abroad. The drain on such reinsurances can be reduced by obtaining higher commission and profit commission terms on the reinsurances given out, so as to restrict the net profit to the foreign reinsurers to a reasonable margin.

For reinsurance business ceded out on reciprocal terms, the difficulty has been that the reciprocal reinsurance acceptances, emanating largely from the U.K. and Europe, have recently tended to be unprofitable. This has made it necessary for Indian companies to develop contacts with companies in other markets where the insurance business is still profitable and to achieve greater geographical diversification of business by establishing reinsurance exchanges with such companies. The companies in the markets where the business has been unprofitable for some years are also getting concerned over the situation. Various steps, including increase in premium rates, are being implemented to reverse the trend and this might lead to a gradual improvement in the quality of the reinsurance business obtained by Indian companies from these markets.

It may be noted that the increased absorption of business in India by obtaining excess of loss protection does leave a certain exchange drain arising out of the premium payable to the excess of loss reinsurers. If the surplus business of the country could be exchanged against business of similar profitability from foreign companies, even this drain can be avoided. However, in the context of the present disparity in the profitability of business in India and that abroad, the stepping up of retentions by means of excess of loss protection would involve a smaller exchange drain than might otherwise arise. Even apart from this, a certain drain on foreign exchange from fire insurance will continue, mainly from premium paid to foreign reinsurers for obtaining excess of loss covers to protect Indian companies against catastrophic losses arising as a result of earthquake, riot, etc.

There are certain classes of insurance business, such as aviation insurance and hull insurance of vessels, where the liabilities involved are very large and the relative premium income is comparatively modest. Reinsurance assistance to a substantial extent from overseas markets is necessary for these classes of business. The bulk of the exchange drain from marine and miscellaneous business arises from these classes. The margin of profit available on the business appears likely, however, to go down in future, as the premium rates for these classes have recently undergone a substantial reduction, and the profit drain to foreign reinsurers is also expected to be reduced correspondingly. With the rapid growth of Indian shipping tonnage in recent years, the premium income from hull business has increased substantially; there is now a much better balance between the premium income and the liabilities involved in hull business. As a result, there is good scope for increasing the absorption of hull business in India by adopting the pooling method referred to earlier. Some exchange drain arises from excess of loss covers for motor business placed with foreign reinsurers, but there is now the capacity to absorb such covers fully in the Indian market and companies should avail of this facility to avoid the drain.

In order to enlarge the capacity of the Indian market, most of the companies operating in India, both Indian and foreign, joined together in the formation in 1956 of a reinsurance company as a co-operative venture. Another company in the public sector started later to operate as a reinsurance company. These two companies have been recognised as approved Indian reinsurers and, under an amendment of the Insurance Act in 1961, they receive, by way of reinsurance, fixed shares of the general insurance business whitten by all companies in India. These reinsurance ventures are expected to help the Indian market in a number of ways. They help to increase the retention of business in India, first by contributing their own retention capacity, and further by pooling a portion of the entire Indian business received by them under the provisions of the Insurance Act and distributing it back to the various companies in small shares, which each company can keep for its own account. These reinsurance companies could also be of assistance in the organisation and management of voluntary pools, mentioned earlier

Economic Planning and Control of Industrial Costs

Problem Getting More and More Complicated

BY DR. S. K. MURANJAN

A USEFUL approach to understand the problem of control of industrial costs in our present-day economy would be to divide industries initially into two broad categories. There are industries which are based on raw materials supplied by our agriculture in the sense that these raw materials account for from 40 to 90 per cent of the total product costs. In other industries, costs may depend largely on the prices of raw materials fabricated by other industries or are spread over a myriad heads of expenditures, so that no particular head predominates.

Agriculture-based Industries

Industries based on agriculture as indicated above have to be considered separately, for their competitive position and efficiency depend on agricultural policy for the country in general. This is not the place where we can embark on a general analysis of our agricultural policy of the last three Five-year Plans. The shortages of foodgrains have merely highlighted our dismal failure on this front. But it is doubtful whether the public in general has grasped the complex character of this failure. In an eight-column article in the *Commerce Annual Number* of December 1961, I had made an effort to discuss the vexed question of incentives in land cultivation. Our agricultural crisis had then been in the incubation stage for more than two years. Under the influence of importations of wheat and rice, foodgrain prices were relatively stable. But agricultural raw materials were already out of parity with world prices and quite contrary to world trends.

A Few Examples

A few examples may well be cited. Prices of our raw cotton have always been knocking at the stipulated ceilings. In the world at large, on account of the U.S. policy and massive exportation of American and Mexican cotton, prices have shown a constant downward trend. If the average ceiling price of our relatively low-staple cotton is compared with similar price of American high-staple cotton, our cotton is clearly too high priced. Is it any surprise that our cotton goods are in most cases sold at a loss or at prices which are substantially less than the domestic prices? It is well known that till Cuba came to our rescue in an unexpected manner, our raw sugar was sold abroad at heavy loss. This is largely because of the political influence of producers of sugarcane in U.P. and Bihar. Sugarcane growers in these areas hardly produce 10 tonnes of cane per acre. But, although till the advent of Cuba the cost of sugarcane for one maund of refined sugar was more than the corresponding world price of sugar, the political trend was to demand and concede a higher and higher price. The cultivator in the South demanded and obtained a comparable price for his cane, although his output per acre is more than 30-40 tonnes. Even before the present upsurge of groundnut prices, our position relatively to the world was not less deplorable. Groundnut oil from Nigeria was laid down in London at Rs. 1,400 per ton. Our groundnut cost of manufacturing one ton of oil even after taking into account all by-products was several hundred rupees in excess of this level. We were then exporting oil and *vanaspati* by making the consumer of copra oil pay a price several hundred rupees per ton higher than he need have paid on the basis of actual costs.

It is difficult to say, on the basis of available evidence, to what extent the present food crisis has been aggravated by shift from foodgrains to commercial crops. In a general inflationary situation, the secondary factors are apt to remain smothered and invisible. What is quite clear is that agricultural prices have to be considered together in their proper mutual alignment as well as their world alignment. All are agreed that the only real solution of our agricultural situation and, therefore, of a large part of our industrial situation, as in cotton textiles, sugar, oil, *vanaspati*, etc. is to raise in a marked manner the per-acre productivity of our agriculture. But what have we achieved in the last three Plans? Not even a dent is visible on this great impediment to progress. We shall make no dent so long as we prefer to create and live in a political Bedlam from which escape is becoming more and more difficult.

Other Industries—Location

It is difficult to generalise about the other category of industries indicated above. Their levels of costs depend on innumerable factors like location, technology and scale of production which are closely interrelated, standardisation of products, scope for initiative and innovation, labour-efficiency insofar as it depends on labour itself, management insofar as management is free to manage anything, etc. For this reason, every industry is in a class by itself. No uniform methods of cost analysis or cost control can be devised which will hold valid for even a limited number of industries. Any effort to reduce cost control to routine procedures must inevitably end in frustration. It might be fruitful, however, to indicate here some of the difficulties which are impeding our transition to lower levels of costs.

Location of industrial units will always raise difficulties. Each decision of location has to be made in the context of existing and foreseeable circumstances. When bamboo pulp displaced soft-wood pulp previously imported, the pioneer units of paper industry found themselves considerably embarrassed. If bagasse takes the place of bamboo pulp on any large scale, the migration of the industry to new areas is quite a possibility. The sugar industry of U.P. appeared very attractive till the South proved to be a much more prolific area for cultivation of sugarcane. The Indian Aluminium Company correctly located its rolling mill near the market in Calcutta when aluminium ingots were imported for fabrication. When Kerala developed cheap electricity, an alumina melting plant with alumina imported from abroad was erected at Alwaye. But when cheap electricity developed near bauxite areas, all the three branches of the industry began to think of locating themselves in Bihar, Maharashtra etc. The light-fingered and light-bodied labourer from West Maharashtra, with his traditional inclination developed by the cotton-goods exporting textile centre of Bombay, is found much more suitable for that industry than his heavy-fingered, peasant prototype in Rajasthan. Light and heavy engineering industries can be located almost anywhere, provided economic overheads and skilled and industrious labour are available.

As if all these factors are not sufficient, regional pressures are playing havoc with our planned industry. In several States, units are prohibited from removing themselves out of their original habitations. It is true that industry attracts industry and mere prior start confers an initial advantage which clings obstinately to the favoured region. But the proper remedy is not political pressure in the location of units. If our public investments were concentrated on the provision of economic overheads like land, power, water and transport to the maximum extent wherever they could be developed, industry will localise itself to the best advantage of the country. Cost analysis of existing industry should be very helpful in indicating the trends of location and localisation and in correcting serious errors of policy.

Fuel

In the matter of electricity charges, there has yet to be framed a rational rates policy. Both in regard to demand and energy rates, there prevails a multiplicity of levels which are not rationally explicable. In the matter of demand charges, most States are content with three or four scales. But in regard to energy charges, the scales vary from four or five to as many as nine. That the rates should taper off as consumption increases is to the advantage of industry. Industries with small power consumption can bear higher rates, while those like aluminium, with very large consumption of energy, are possible only with considerable concessions in electricity charges. It is nevertheless a matter for high policy how far rates should be allowed to be varied from State to State according to the cost of generation in each unit and how far they should approximate in the interests of the country as a whole. In the framing of these rates, sufficient weight has to be given to the requirements of exporting industries which have to compete with countries where the cost of electricity is only a fraction of what it is in India. In the matter of electrolytic industries which aspire for export markets, this factor plays a very vital part.

Structure and Scale of Production

In an underdeveloped country like ours, the question of scale of production, technology and structure is very complex indeed. The great industrial countries have had their industrial growth spread over periods ranging from one to two centuries. Great industries like iron and steel, textiles, transport by rail and sea, chemicals, electrical goods, motor cars, etc., which are the hallmarks of modern life and civilisation made their appearance at long intervals of twenty to fifty years. These countries had, therefore, the opportunity to concentrate at a time their rising investment resources on a relatively narrow range of production and achieve a scale of production which had an outlet not only at home but also abroad. Our planned development which is meant as an answer to retarded growth of centuries means a task which is truly enormous. Even with liberal foreign aid, our investment resources relatively to the objects of investments must remain for a long time strictly limited. With these limited resources, we are attempting to achieve what is euphimistically called balanced industrial growth.

Balanced industrial growth means in reality the whole complex of modern industries from basic metals to fabricating industries. Self-evidently, with no foreign markets because of the established hold of old industrial giants, all these new industries must depend on domestic markets which because of the level of incomes and development are themselves limited. These markets are no doubt growing with expanding investment but must take considerable time to reach the size which justifies modern technologies and scales of production. Meanwhile, we are faced with problems of industries which boast of no more than half a dozen or less units and whose scale of production is in no way comparable with what prevails elsewhere. Close study of costs should throw much valuable light on scale structure and technologies current in these industries.

Case of Automobile Industry

Our manufacture of motor car and trucks is an example of industry which was launched into existence in haste without proper exploration of the implications of scale, technology or structure. Even after some twenty years of existence, our installed capacity does not exceed thirty thousand passenger cars and fifty thousand trucks. Apart from shift in production, caused by defence requirements, foreign exchange restrictions, imposed partly perhaps by the desire to stimulate expansion of indigenous content, do not permit the full exploitation of even this limited capacity.

Expansion of capacity is a matter of judgment about the investment resources we can afford to spare and the relative claims of passenger cars, passenger buses and trucks. The heavy taxation imposed on automobiles and the heavy, unsatisfied registrations for passenger cars clearly indicate that the total demand is at least twice what the industry is able to meet today. A diesel passenger car is probably more in conformity with income levels of this country, but there is the quite well-founded fear that the appearance of this vehicle would arrest the growth, if not spell the doom, of the petrol car manufacturers. As the Nazis used to say, substance is holy and must not be prematurely discarded. Without a diesel car, therefore, a doubling of the present capacity seems amply justified, if the absorbing capacity of the market is only to be taken into account.

A doubling of the present capacity of automobile industry, with three or four units to share it, would not, however, mean any change in technology. General purpose machinery would still retain its advantages over special purpose machinery. The methods of mass production in vogue elsewhere presuppose a size of the market which we can only dream of in this country as a very distant possibility. Still, it is a reasonable estimate that full capacity production with a doubling of capacity should give us an economy of about Rs. 500 to 1,000 per piece.

Motor car manufacturing units with an output of 40 to 50 thousand

PRESSMAN

eces are not unfamiliar in Europe. he quality of the product is cer-inly in no way inferior to that of roducts put out by mass manu-acturing methods. The clue to eir success lies in the structure olved by European industry. Not ore than 25 per cent of the value f the car is manufactured under e roof of the main factory itself. ll other parts are relegated to an-illary producers who achieve the conomies of large-scale production hen they work for several main roducers. The motor car industry n India made its appearance in uch circumstances that we were recluded from such an evolution ven if our producers were inclin-d to favour it. Engineering indus-ries of the ancillary type were not nuch in sight in the 'forties of this entury. They appeared on the stage nly during the late 'fifties when notor car manufacturers had lready taken decisions to set up nachinery for almost all parts they ould produce. High cost of produc-ion was the inevitable result. The rend has now to be reversed but t must take time. On several rounds, reasonable or otherwise, he main manufacturers, by and arge, are not enthusiastic over uch prospects. The recent sugges-ion to set up a main assembly lant and to derive most of the arts from the present motor car nanufacturing units was only a oetic form of this basic idea.

Basic Industries

The position of the so-called basic ndustries is materially different. The scale of production is becom-ng larger and larger as more and more economies are sought. One reason is that by the very character of their products, they do not lend themselves to much diversification of structure. For this very reason, the scope for automation is un-limited. They are great consumers of one or two raw materials or fuel in which economies can be achieved only by bulk use. In the iron and steel industry, advanced countries have ceased to install blast-furnaces of less than 2,500 tons capacity as utmost economy of coal is the primary aim and by-products are important. In the aluminium industry, cells of 60,000 amperes mean substantially less consumption of electricity than cells of 25,000 or 30,000 amperes. A kiln of 500-ton capacity consumes relatively much less coal in the cement industry than a kiln of 300-ton capacity which is now being rapidly eliminated. The petroleum refining and fertiliser industries have even more complicated pro-blems of scale. Yet as the quality of raw materials like coal, lime-stone, etc., vary from factory to factory, no generalisation is pos-sible without close study of costs in the context of each set of circumstances.

From the foregoing discussion, which is inevitably general, one thing should be quite clear. Under our economic planning, the Gov-ernment is taking very far-reaching decisions regarding size, structure, location, number of units, etc., in each industry. Yet, no studies of relative costs in different circum-stances have been made on the basis of which alone sensible de-cisions could be reached. We are depending too much on empirical hunches and guesses which may turn out plausibly correct when industry has to work in close con-formity with natural conditions and facts. But if these natural facts themselves change as in the case of the paper or sugar industry, even these decisions may disclose unsus-pected errors.

That we have been laying up serious troubles for ourselves is abundantly clear from the perils which our export trade is facing. From 1950, our national output has increased in a substantal manner. The world export trade has also recorded a substantial growth. Yet, our own export trade was almost stagnant till two years ago and is showing an upward trend only be-cause of unorthodox export pro-motion measures and because we are prepared to make sacrifices to earn foreign exchange. It is self-evident that this hot-house growth cannot be indefinitely sustained. The basic fact is that whatever monetary or financial policies we pursue, we cannot export unless the quality and prices of our export goods are competitive. But, under economic planning, the classic reasoning about relative prices, exchange rate, etc., holds valid only to a limited extent. Our investment takes place not under the pressure of international trade and competition but in ac-cordance with certain preconcep-tions of economic development in which immediate economic condi-tions and factors play but a subordinate role. As economic planning proceeds, the external disequilibrium, therefore, may not abate and may even become aggravated.

The difficulty can be met only by recognising that growing export trade is a pre-condition of econo-mic planning and export trade can be expanded by deliberate creation of an export sector in every indus-try which offers products accep-table in foreign markets. Under our planning which severely restricts both domestic and outside competition and assures a seller's market for everybody and anybody, not all units in an industry are in a position to make competitive ex-ports. But there must be some efficient units which can make headway even in the highly com-petitive foreign markets. By close cost investigations such units could be identified and marked for export expansion. They should have prio-rity for expansion and capital issues including expenditure of foreign exchange on condition that the whole or substantial portion of the increased output is exported. The present schemes of export-incentives are operating in a curious manner. Even units which are incurring overall losses are participating in exports lured no doubt by import entitlements which either cover their losses by sales of these entitlements to others in a position to pay or enable them to obtain foreign goods of which they are in dire need. It is obvious that the present indiscriminating encouragement does little to place this country on a sound export basis.

Even in industries like vegetable oils and *vanaspati* in which the basic raw material conditions are adverse to export, efficient and enterprising units have found re-medies which may not be all to the benefit of the country. To cover their losses on exports, they have expanded into more diversified products many of which are luxury goods which fetch high prices from the more well-to-do classes. Even if the diversified products are not luxuries, the community has to pay a higher price simply because of our inability to plan rationally.

Our discussion till now estab-lishes at least one or two facts. Investigations for cost reduction must cover a much larger area than those which are needed for fixation of tariffs or fair selling prices. An effort is necessary to place in its correct perspective the cost structure of the industry as a whole. Industrial units which em-bark on diversified products or bring under one umbrella quite unrelated products present difficul-ties of their own. A measure which is suitable to indicate levels of efficiency in one industry may prove altogether inapplicable to other cases. A very wide ex-perience of industries and high analytical techniques have to be combined to reach practical re-sults. Again, cost reduction investi-gations will bear little fruit, if price policies for agriculture, mineral raw materials and pro-ducts of industry are pursued in isolation. It has happened too fre-quently in the past that measures taken in one field have frustrated completely efforts in other fields. With the adoption of planning, we have inevitably created a complex economic structure not amenable to the ordinary forces of demand and supply. There is, therefore, all the greater need that our economic decisions should be strictly rational and not influenced by political and personal whims and preferences.

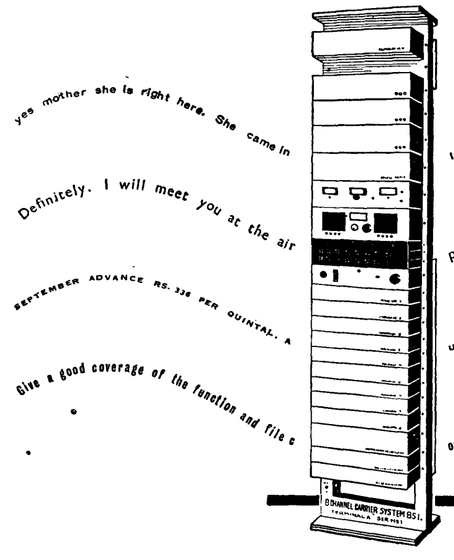
several trunk calls on one line



Do you know that ninety per cent of long distance calls are carried by "carrier" channels. These are derived from the basic bearer wires by special carrier equipments which make it possible for several simultaneous conversations to be carried over a single pair of wires.

The special 'Carrier' equipment that provides these broad superhighways for telephone conversations, are manufactured in ITI, and are supplied to Indian Posts and Telegraphs Department for multiplexing the capacity of the long distance lines whether they be open wire, paired cable or coaxial.

Carrier equipment manufactured by ITI include 3 Channel, 8 Channel and 12 Channel Systems as well as Voice Frequency Telegraph Systems which allow as many as 24 telegraph circuits to work on one speech channel.

DEVELOPMENT OF INDIAN SHIPPING

Plan Target Exceeded, But Many Problems Remain

BY RAGHUNATH SINGH, M.P.
CHAIRMAN, NATIONAL SHIPPING BOARD

ALTHOUGH historically India has been a maritime country and her maritime traditions are well known, the growth of Indian shipping is of comparatively recent origin. India had no national shipping policy before she became independent. Efforts made by patriotic Indians to revive the shipping industry in the pre-independence period received practically no encouragement or assistance from the alien Government. On the other hand, the dominant position which the foreign shipping interests enjoyed both in the coastal and overseas trades of India made the progress of Indian shipping extremely difficult.

Progress Since Independence

It is only in the post-independence period that the Government of India have been able to follow a national shipping policy and adopt positive measures of assistance to the national shipping industry. The reservation of coastal trade for national shipping, the setting up of shipping companies in the public sector, the grant of loans to shipping companies on concessional terms for the purchase of ships, the development of national shipbuilding industry, the grant of preference to Indian ships in the allotment of Government-controlled cargoes and, more recently, the raising of the limit of foreign participation in the shipping industry are some of the important measures taken in this behalf. The establishment of a statutory National Shipping Board to advise Government on matters relating to shipping should also be mentioned in this connection.

In the Merchant Shipping Act 1958, statutory recognition has been given to the objectives of a national shipping policy. As a result of the various measures of State assistance, Indian shipping has made steady progress during recent years. The Indian tonnage, which was hardly 100,000 g.r.t. at the end of the last war has now increased to over 1,300,000 g.r.t. While Indian shipping had only a one-third share in the coastal trade of India during the pre-war period, Indian shipping is now carrying the entire coastal trade in dry cargo. (The movement of oil products on the coast is of comparatively recent origin for catering to which there are at present only three Indian tankers carrying a share of about 30 per cent of this trade.) While the operation of Indian shipping was previously confined to the coasts of India, Burma and Ceylon, Indian shipping has now entered most of the important overseas trade routes, such as India/U.K./Continent, India/North America, India/Black Sea Ports, India/Poland, India/Far East/Japan, India/Australia, etc.

Current Plan Period

The progress of Indian shipping during the current Plan period, in particular, has been spectacular. The target originally set for the third Plan was about 1,080,000 g.r.t., the financial allocation for achieving this target being Rs. 51 crores. This target was achieved even before the end of the first two years of the Plan period. A revised target of 1,250,000 g.r.t. which was subsequently set has also since been exceeded. While during the latter part of the second Plan period, the rate of acquisition of additional tonnage was of the order of about 100,000 g.r.t. per annum, this has been stepped up to about 200,000 g.r.t. per annum during the last two years. As already stated, Indian tonnage stands at over 1,300,000 g.r.t. at present and, according to present indications, the tonnage in operation at the end of the current Plan period is expected to reach the figure of 1,500,000 g.r.t. Taking, however, into account the orders for additional tonnage which the shipping companies are expected to place during the rest of the current Plan period for delivery during the early part of the next Plan period, Indian shipping might reach the figure of 2.4 million g.r.t.

A significant feature of the expansion of our shipping during the last one year or so has been the addition of quite a few bulk carriers and bulk tankers for catering to the large movement of bulk commodities like ore, foodgrains, fertilisers, petroleum products, etc., moving in our export and import trades. Till recently, the expansion of Indian shipping had been mostly in overseas liner trades in which it is now having a substantial share. In the tramp and tanker trades, Indian shipping had made little progress but a beginning has now been made in the building up of a fleet of bulk carriers, smaller tramps and bulk tankers.

Long-term Target

Development of shipping is a continuous process. At the same time, we have to review the position periodically and lay down tonnage targets having regard to the trade prospects. The Post-war Reconstruction Policy Sub-Committee had in 1947 recommended a target of 2 million g.r.t. for Indian shipping. This target was intended to carry 100 per cent of the coastal trade, 75 per cent of the adjacent trades and 50 per cent of the distant trades. The volume of our coastal trade was then 2.4 million tons and of the adjacent and overseas trades of about 16 million tons. The total amount of cargo which Indian shipping was supposed to carry when it reached the target of 2 million g.r.t was about 12.2 million tons. The basis on which that Committee made their assessment of our tonnage requirements has, however, considerably changed. For example, the large-scale movement of foodgrains from U.S.A. and the export of ores to various foreign countries are novel features of our overseas trades which were not taken into account by that Committee. Similarly, the requirements of tankers on the coast for the movement of oil products consequent on the establishment of oil refineries also could not be taken into account by the Committee.

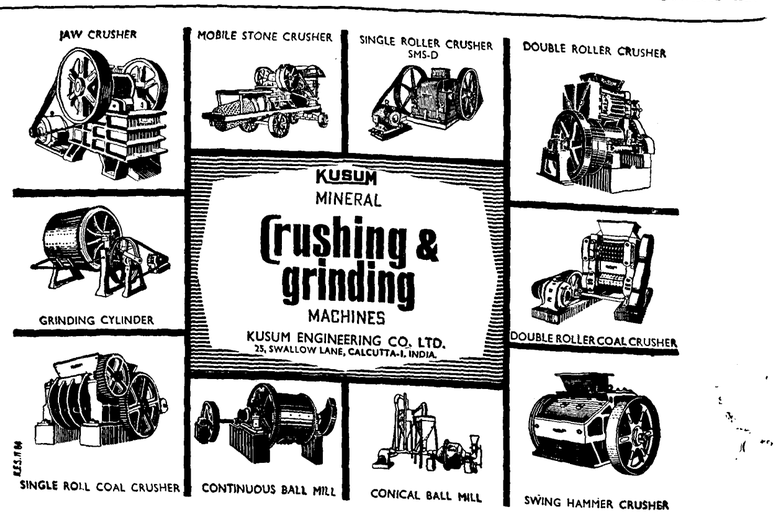
Apart from these changes in the pattern of our maritime trade, the total volume of these trades has also since considerably increased. The volume of our coastal trade is at present about 3.5 million tons of dry cargo (excluding the cargo moving by sailing vessels) and 2 million tons of oil cargo. The volume of our overseas trade has also now increased to about 30 million tons. In view of this change both in the volume and pattern of our maritime trade, we have to fix a revised long-term target for Indian shipping to cover the next 10 to 12 years, say, the period up to the end of the fifth Plan. This question is being examined by the National Shipping Board. Indications are that it will be necessary to fix a target of not less than 5 million g.r.t. to be achieved by the end of the fifth Plan, the target for the fourth Plan being of the order of 3 million g.r.t.

I shall now briefly deal with some of the problems facing the Indian shipping industry today. The most important of these is the existing foreign exchange difficulty on account of which ships are permitted to be purchased from abroad only on self-financing basis. According to this basis, the purchase price has to be paid in instalments over a period of years, together with interest, if any, from the foreign exchange earnings of the ship purchased, no foreign exchange being released from free sources either for the down payment or for any subsequent instalments. While Indian shipowners have been enterprising enough to acquire several ships on this basis, I am told that the acquisition of ships on this basis adds to the capital cost of the ship both by way of premium on the price and interest charges on the outstanding instalments to the extent of 20 to 30 per cent. Such increase in the capital cost tends to jeopardise the competitive position of Indian ships in international trades. Besides, it would be difficult to acquire coastal ships on self-financing basis as such ships do not earn foreign exchange except to a limited extent in adjacent trades. At the same time, the existing coastal fleet contain a large number of overaged and uneconomic units aggregating about 165,000 g.r.t. which will become due for scrapping during the rest of the current Plan period. Their replacement would be possible only if adequate foreign exchange could be found for the purpose. Having regard to the importance of shipping to our national economy, I strongly feel that expansion of shipping should be accorded priority of a higher order in our development Plans and necessary finance and foreign exchange for the purpose should be allocated on that basis. Shipping is a quick earner of foreign exchange and the foreign exchange cost of a ship can be generally recouped from its earnings over a period of six to eight years.

Bulk Cargoes for Coastal Shipping

Another important problem is in regard to the provision of adequate cargoes to coastal shipping on a long-term basis. Coastal shipowners are still uncertain about the prospects of availability of bulk cargoes like coal and salt on a long-term basis in order to enable them to plan their expansion programmes on a rational basis. In the past, coal and salt have constituted 60 to 70 per cent of the coastal trade and the future of coastal shipping largely depends on the continued availability of these cargoes in adequate quantities. There are, however, reports of the volume of seaborne coal being reduced from the present level of 2 million tons per annum for various reasons such as electrification and dieselisation of railways, availability of nearer sources of supply of coal in the South, additional railway capacity to move coal, etc.

It was only three years ago that a decision was taken by Government to move 2 million tons of coal by sea per annum and it was then indicated that this movement would continue on a long-term basis. Encouraged by this assurance, the coastal shipowners have



Imagine a world without colour—a light-and-shadow world instead of our multi-hued universe. Colour implies life, vigour, variety...

Primitive man realised the significance of colour and made it very much a part of his life. He incorporated it in ritual. He used it for adornment or to make himself fearsome in battle.

Modern man uses colour even more—to make life varied and joyful—with bright colour schemes for homes, offices, automobiles—and beautiful illustrated magazines, multi-coloured rubber and plastic articles. All these and many others need pigments, and more so organic pigments such as those manufactured by COLOUR-CHEM.

Textile printers use organic pigment emulsions as well as synthetic binder materials, both of which COLOUR-CHEM were the first to manufacture in India. With the technical knowledge of Germany's leaders in the field—FARBENFABRIKEN BAYER AG. and FARBWERKE HOECHST AG.—and skill born of experience and unceasing research, COLOUR-CHEM continue to manufacture the finest quality products.

during the last two or three years embarked on a programme of expansion of coastal tonnage and it is, indeed, unfortunate that the question of reducing the quantum of coal to be moved by sea should have arisen at all at this stage. If any such reduction is effected, the coastal shipping industry will receive a grievous setback from which it may find it difficult to recover. Essentially, the problem involved is one of transport co-ordination, in order to ensure that each form of transport is utilised to the best advantage in the larger national interest. I hope that the Committee on Transport Policy and Co-ordination set up by the Planning Commission will bear this aspect in mind and that their report, which is expected to be submitted shortly, will contain suitable recommendations for assisting coastal shipping in this regard.

The Two Sectors

Another problem which has attracted attention recently is that of the relationship between the public sector and private sector in shipping. Although I do not feel that this is a problem as such faced by the shipping industry, I would like to refer to it briefly as there has been some controversy about it. This is also one of the important problems on which the National Shipping Board have recently tendered their advice to Government. It will be readily agreed that, when our national shipping has to face international competition in overseas trades, there should be no wasteful competition between the private sector and the public sector within the national shipping industry. It will also be agreed that, when Indian shipping still carries much less than its legitimate share in the overseas trades, there is scope for the expansion of both the sectors in those trades without the interests of one being affected by the other. In my view, which is also the view of the Board, both the sectors should play equally important roles in the development of national shipping for which equal opportunity should be provided. Both the sectors should fully co-operate to mutual advantage and work in harmony in the larger national interest. There is no question of one expanding at the expense of the other, as there is large scope for the establishment of new shipping services in overseas routes. I hope the Board's views in this matter will be accepted by Government.

Manning Personnel

An expanding merchant navy like ours would give rise to several other problems on the solution of which will depend the efficient and economic operation of ships. The most important of these is the requirement of manning personnel. There is already a shortage of officers both on the navigating and engineering side and the position has been accentuated by the drift of officers from sea to shore jobs. It is, therefore, very necessary that steps should be taken to build up an adequate and well-trained cadre of merchant navy officers. The Merchant Navy Training Board have recently gone into this question and have recommended several steps to improve and augment the training facilities for manning personnel. The more important of the steps recommended by the Board are the establishment of a Merchant Navy Training Academy for the provision of a combined initial pre-sea training course for both navigating and enginering cadets, increase in the intake of more direct entry cadets both on the navigating and engineering side, introduction of short-term courses for direct entry apprentices, etc. The National Shipping Board have also appointed a sub-committee to go into this question and that Sub-Committee's recommendations are expected to be placed before the Board shortly.

The acquisition of additional tonnage, particularly bulk carriers and tankers, would necessitate the expansion of the capacity of Indian ports to suit the dimensions and draft of such vessels. It is understood that the port authorities have already under consideration various schemes for the expansion of the capacity of ports and it is very necessary that these schemes should be implemented as expeditiously as possible. It is also necessary that the facilities for loading and unloading of cargo should be improved and modernised in order to minimise the delays suffered by vessels at ports. Undue detention of vessels at ports not only results in wastage of national tonnage, but also leads to their uneconomic operation, involving not only financial losses to shipowners but also increase in the cost of sea transport to the consumers. The recent experience of foodgrains vessels from abroad having to wait in queue at the Bombay port at a time when the country was faced with scarcity of foodgrains is an instance of such delays. The facilities at the ports have an important bearing on the freight rates charged by shipowners. In the case of bulk commodities like foodgrains and ore moving in our import and export trades, any possible reduction in freight rates as a result of improvement of loading and unloading facilities will tend to lower the cost of our import bill and also make our exports competitive in foreign markets. The National Shipping Board have recently appointed a sub-committee to go into the question of mechanising the loading and unloading facilities for bulk cargoes at the ports.

Simultaneously with the development of port facilities, attention should also be paid to the need for the expansion of ship repair and dry dock facilities in the country to ensure the efficient and economic maintenance of ships. Owing to the inadequate facilities available in the country, Indian ships are often compelled to go to foreign ports for repairs, dry-docking and survey and this involves foreign exchange expenditure. This matter has also been recently gone into by the National Shipping Board who have recommended several steps for improving and augmenting the repair and dry dock facilities in the country. It is hoped that it would be possible for Government to implement these recommendations soon.

The development of shipping and shipbuilding industry presupposes the production of the necessary materials and ancillary equipment. The position at present is that many of these items are not indigenously available and their import is also restricted on account of the present foreign exchange difficulty. The Indian shipowners are seriously handicapped on account of the non-availability of these items. The paucity of raw materials, particularly steel, has also constituted a serious bottleneck to the shipbuilding and ship-repairing industry. It is, therefore, essential that steps should be taken to develop the indigenous production of the various items of raw materials, marine stores and equipment needed by the shipbuilding and ship-repairing industry.

All these and other problems will receive the constant attention of the National Shipping Board and it will be the Board's endeavour to formulate proposals for their solution. As I have stated earlier, some of these problems have already been examined by the Board and its proposals have been submitted to Government.

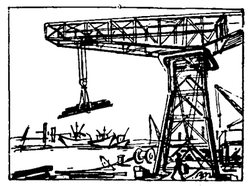
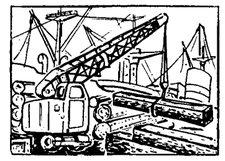
Planning TOWARDS
A BETTER PORT

As the life-line o Eastern India's trade and commerce, the Calcutta Port faces recurring problems every ear. The emphasis on industrial progress in the Plan period has considerably changed the type of cargo to be handled. Steel and mechanical equipment, heavy machinery and huge plant form a considerable bulk of the import. On the export front it is coal or ore.





To-day's well-equipped Port needs be made into a better Port to-morrow. But this is possible not by more equipments alone. The Calcutta Port needs most the whole-hearted co-operation from all fronts.—from those who use and also from those who serve it.

COMMERCIAL BANKS IN INDIAN ECONOMY

By TULSIDAS KILACHAND

President, Indian Banks' Association and Chairman, Bank of Baroda Ltd.

THE successful implementation of the massive investment programme proposed under the fourth Plan will necessitate equally massive efforts to stimulate and mobilise savings in the economy. The magnitude of the effort can be imagined from the figures of the average *annual* development outlay during the fourth Plan period, estimated at Rs. 4,300-4,400 crores, about 30 to 33 per cent more than the total public and private sector outlay during the entire first Plan period, and about 58 per cent of the total outlay during the entire second Plan period. The banking sector in India, as the largest organised financial network in the economy, will have to face this challenge of mobilising the savings of the people and channelising them on an unprecedented scale, according to investment priorities. On the basis of their performance so far, I feel fully confident about the capacity of Indian banks to shoulder this heavy social responsibility.

Functions of Banks

The primary function of commercial banks in India, as in other countries, is to mobilise the savings of the people and channelise them for productive investment, thus bringing the monetary resources within the organised sector where they are amenable to fiscal controls. With the diversification and the acceleration in the tempo of our economy, this primary and simple objective assumes complex ramifications. The banks have to adapt themselves to the changing economic structure of the country, keeping intact their specialisation of providing short-term credit. The banks have to operate mostly with depositors' money, the safety and liquidity of which remains their guiding principle. All the functions of the banks, and the various roles they are called upon to play in our development programme, must conform to this basic tenet of sound banking. It must be said to the credit of Indian banks that, without sacrificing this fundamental principle, they have shown remarkable vigour and dynamism to suit the changing economic structure of the country during the planning era.

Lending Pattern

The banks have not only mobilised peoples' savings on a satisfactory scale, but have also diversified their lending pattern in accordance with planning requirements. With the rising tempo of industrial activity in the country, there has been a noticeable and welcome shift in bank credit from commerce to industry; they have been taking increasing interest in extending credit to small-scale industries; their lending to the agricultural co-operative banks which have been assigned a special role by the Government in agricultural finance has been on the increase; their share in export finance has increased significantly; and, of late, they have even started taking keen interest in medium and long-term finance in the fields of industry and exports through direct loans and guarantees. Besides investing increasing amounts in Government securities, they have been underwriting and investing in the debentures and share capital of industrial concerns and industrial finance corporations. The range of services offered to clients has widened considerably and, through their vigorous branch expansion programme, they have been contributing towards enlarging the area of the monetised sector, which is a prerequisite for effective monetary and fiscal controls in the economy.

Mobilisation of Savings

In all economies like ours, which are characterised by a low degree of economic integration and monetisation, the task of mobilising savings is truly gigantic. Even after intensive development efforts of more than a decade, about a third of the Indian economy is still non-monetised—the degree of monetisation varying from region to region. Moreover, our economy is still broadly divided into two compartments, agricultural and non-agricultural, or rural and urban. The low degree of monetisation and economic integration hampers the growth of banks. Nonetheless, undeterred by these obstacles, they have made significant progress in mobilising savings, as judged by the growth of their deposits. From Table 1, it can be seen that the total deposits of all commercial banks in India increased from Rs. 904 crores in March 1951 to Rs. 2,535 crores in September 1964, a rise of more than 180 per cent during the period, as against an increase of 80 per cent in the currency in circulation, and 62 per cent in the national income (at current prices) during the corresponding period. Bank deposits increased between 1951 and 1964 from 66 per cent of the currency in circulation to 101 per cent, from 46 per cent of money supply to 68 per cent, and from 9 per cent of national income to 16 per cent.

The degree of success attained by commercial banks in mobilising savings can be seen from the figures in Table 2 which show that bank deposits during the three Plan periods (1951 to 1964 September) increased by Rs. 1,631 crores, considerably more than the currency in circulation, which increased by Rs. 1,148 crores. Their efforts in this direction are being intensified to meet the growing credit requirements of an expanding economy.

Changing Pattern of Bank Credit

How Indian banks have adopted their credit policy to changing requirements of the economy may be judged from the analysis of the level and structure of bank credit during the planning period. This period witnessed a more than three-fold rise in total bank credit (scheduled banks only), from Rs. 579 crores in 1951 to about Rs. 1,816 crores in March 1964. With increasing emphasis on industrialisation, especially after the first Plan, the Indian banks re-oriented their lending pattern in consonance with planning requirements. Industries, which received only 33 per cent of the total bank credit in 1951, increased their share significantly to 57 per cent in 1963, the latest proportion being as high as 60 per cent. The share of trade declined from 52.7 per cent to 27.6 per cent during this period. Even within the industrial sector, high priority industries, such as engineering, cement, steel and transport equipment, have obtained more from the general expansion in bank credit.

Term Finance and Guarantees

Commercial banks in India are the only financial agency providing working capital to industry and trade. In order to meet the requirements of medium- and short-term loans to industry during the planning era, they began to extend 'term loans' on an increasing scale. The extent to which commercial banks contributed towards 'term finance' is indicated by a survey undertaken by the Reserve Bank which covered 57 major banks accounting for 94 per cent of the total deposits. It shows that, as at the end of 1962, the outstanding amount of long- and medium-term finance by these banks amounted to Rs. 103.6 crores, about 8 per cent of the total outstanding credit. Of this amount, the formal term loan amounted to Rs. 53 crores, the rest being 'rolled-over' credit. The Governor of the Reserve Bank of India, in a recent speech, estimated the latest figure at Rs. 85.90 crores.

The commercial banks have also indirectly participated in providing medium- and long-term industrial finance and in promoting the new issue market. Of the total new issues amounting to Rs. 125 crores underwritten between 1960-63, banks were responsible for about Rs. 24 crores, or 19 per cent of the total. Moreover, commercial banks have also subscribed to the share capital of the industrial finance institutions to the extent of about 25 per cent, and to their bonds about 60 per cent. Moreover, Indian banks are extending guarantees in favour of industrial companies in respect of deferred payment for imported machinery and long-term loans from industrial financial institutions.

The banks were obtaining assistance from the Refinance Corporation of India in their term-lending operations, but, since the inception of the Industrial Development Bank, official policy in respect of term-lending operations by commercial banks appears to be in a transitory stage.

Small-scale Industry and Agriculture

Contrary to popular belief, commercial banks have been extending credit to small-scale industry, and the progress in this direction has been the fastest. This can be gauged from the figures of advances, to this sector, which were Rs. 27.54 crores in 1960 and Rs. 47.72 crores in 1963.

In the field of agricultural credit, the banks do make advances to farming units run on commercial lines, including plantations, and have been financing the storage and movement of crops for long. The banks are, however, handicapped in this direction, as the great bulk of farming units in India are subsistence units of small size, whose requirements can be better met by co-operative institutions. A country-wide network of such institutions has been set up and developed during the last 50 years, but, for various reasons, their success has been limited, despite the active support of the Reserve Bank of India and the State Bank of India. In view of the importance of agriculture at the present stage of our national economy, commercial banks are considering the problem of utilising a greater proportion of their resources for rural credit by reinforcing the co-operative sector, opening branches in rural areas and by other means. The lending of commercial banks to the co-operative institutions has increased from Rs. 6.24 crores in 1960 to Rs. 11.67 crores in 1963. Further progress in this direction is expected, as the banks are keen on sharing the responsibility in this matter, and are discussing this problem with the monetary authorities.

Financing Foreign Trade

Another significant achievement of Indian banks is in the field of foreign trade. Indian commercial banks, which used to finance about 20 per cent of foreign trade ten years ago, have now increased their share to about 50 per cent. Helped by the Export Credit and Guarantee Corporation through refinance facilities, Indian banks have been extending credit to exporters on an increasing scale. Besides, they are also playing a useful role by acting as guarantors for importers. With the wider spread of the Packing Credit Policy and the Shipment Risk Policy offered by the E.C.G.C. to exporters, the banks will be coming forth to discount even small exporters' bills, which are now being accepted only for collection.

Table 1: *Growth Indicators of Commercial Banks*

	Number of bank offices in India	Bank Deposits: Amount (Rs. crores)	Bank Deposits: As per cent of currency in circulation	Bank Deposits: As per cent of money supply	Bank Deposits: As per cent of national income (at current prices)	Currency in circulation (Rs. crores)	National income (current prices) (Rs. crores)

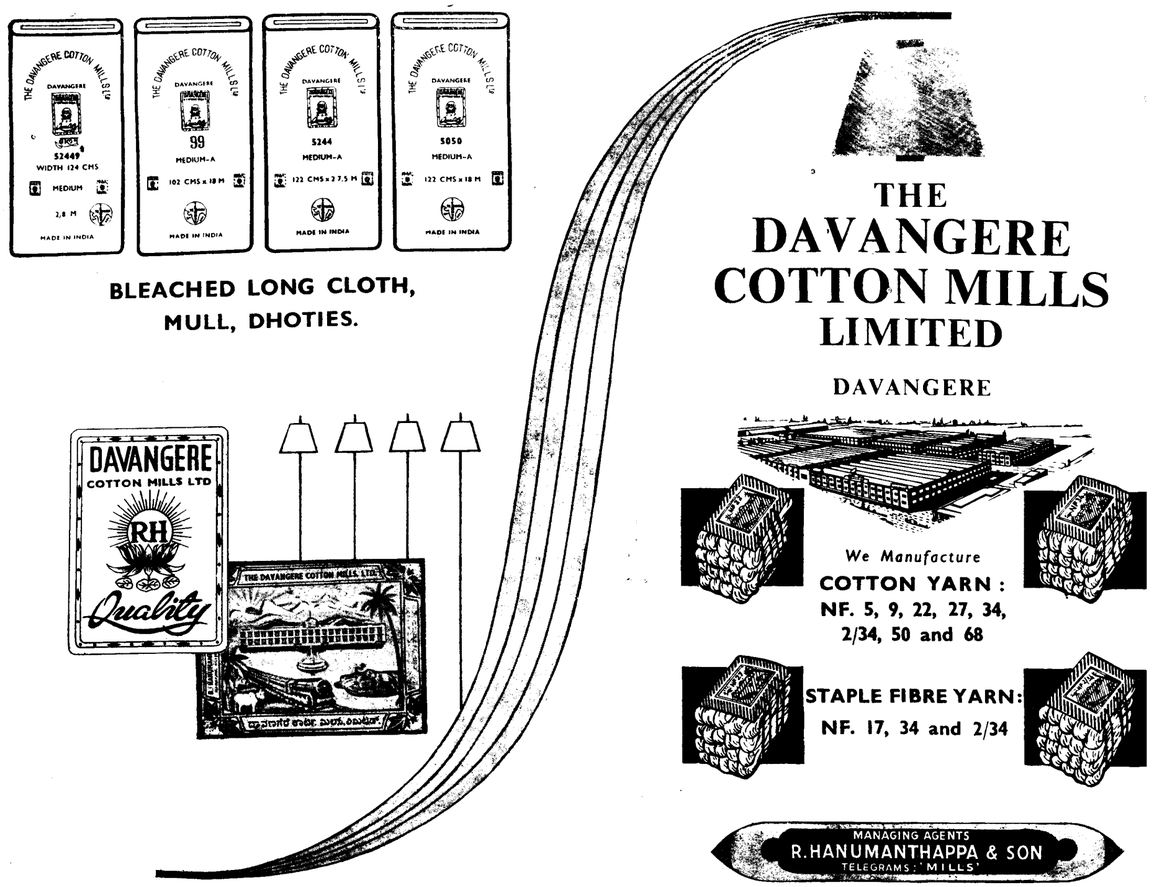
	Increase in currency (Rs. crores)	Increase in bank deposits (Rs. crores)
First Plan (1951-56) ..	204	206
Second Plan (1956-61) ..	527	495
Third Plan (April 1961 to September 1964) ..	417	930
Total (1951 to 1964 Sept.)..	1,148	1,631

Conclusion

The achievements of the Indian commercial banks described above have to be judged in the context of our economic organisation and development requirements. As explained earlier, the various sectors of our economy are yet to be integrated; and the monetised sector, though expanding gradually, is still not large enough to make the monetary and fiscal controls fully effective. Even in the organised sectors, a substantial part of transactions is still currency-oriented. These characteristics of our economy, as also the low *per capita* income, and the low role assigned to private savings, act as constraints on the growth of banking. The erosive influence of the recent upsurge in prices on peoples' savings will also render the task of mobilisation of savings more difficult.



THE FERTILISERS AND CHEMICALS
TRAVANCORE LIMITED

(Established in 1943)

Registered Office: ELOOR, UDYOGAMANDAL P.O., ALWAYE

Telegrams: "FACT," Udyogamandal — Telephones: 48, Alwaye and 474, Ernakulam

CAPITAL AUTHORISED	Rs. 10,00,00,000
CAPITAL ISSUED	Rs. 6,95,97,740

PRODUCTION: At present FACT has an annual production capacity of 100,000 tons of ammonium sulphate, 8,000 tons of ammonium chloride, 35,000 tons of ammonium phosphate 16:20 (FACTAMFOS), 44,000 tons of superphosphate, 100,000 tons of sulphuric acid and 3,500 tons of liquid sulphur dioxide.

EXPANSION : In 1954, the Company launched a multi-phased expansion programme. The first and second stages of this expansion programme, involving respectively Rs. 3 crores and Rs. 2 crores, have since been completed. The second stage, completed in 1962, ushered in the Company's new oil gasification complex, the first of its kind in India.

FACT is at present engaged in putting through its third stage expansion programme estimated to cost Rs. 12 crores—a programme which will more than double its present production capacities.

L.I.C.'S APPROACH TO CLAIM SETTLEMENT

Perceptible Improvement In Settlements, Despite Several Constraints

BY B. K. KAUL, I.C.S.
CHAIRMAN, LIFE INSURANCE CORPORATION OF INDIA

EVER since the Life Insurance Corporation (L.I.C.) was established, not only Parliament and the Press but also the intelligent citizen has been taking a keen interest in various aspects of its working. To encourage this welcome trend, L.I.C. has been attempting to present a progressively fuller and more comprehensive picture of its activities in its annual report and accounts, which is the main source of information about its working. However, the account presented in this document has perforce to be somewhat concise and, as a consequence, a critic, especially one who is not sufficiently familiar with the technical background of life assurance business, is likely to experience difficulty in arriving at a correct appraisal of some of the facts and figures given therein. When faced with a situation of this type, the most effective course open to L.I.C. is to seek the good offices of the Press to correct such misunderstandings as might have arisen.

It can be said that a life assurance office exists to pay claims. It is natural, therefore, that the promptness with which claims are settled should be considered as one of the major criteria for judging the efficiency of working of such an office. This aspect of L.I.C.'s working has accordingly been the subject of occasional critical comment in Parliament, the Press and the public.

The primary source of information on various aspects of the working of L.I.C. as has been remarked above, is its annual report and accounts. The only item of information bearing on the pace of settlement of claims which appears in this report is the figure of "estimated liability in respect of outstanding claims," given in the balance sheet. This figure, when examined in relation to the figures of new claims by death and maturity which occurred during the year, as given in the revenue account, provides an indication of the time-lag between the occurrence of claims and their settlement. However, to appreciate the precise significance of this time-lag, it has to be interpreted against the background of the procedures and practices of life assurance business. There is reason to believe that some critics, not familiar with life assurance practice, have drawn from the figures given in the annual accounts inferences about L.I.C.'s performance in this area, which are not fully justified. The purpose of the present article is, therefore, to provide some background material which should enable the problem to be viewed in correct perspective. It is also proposed to take this opportunity to correct some misconceptions in the popular mind about L.I.C.'s policy in the matter of repudiation of claims which have arisen as a result of wide publicity given by the Press to one or two recent decisions of Courts.

I

Responsibility for Delays

To begin with, I would like to reproduce from the various annual reports of L.I.C., figures of the outstanding claims as at the end of and the total new claims which occurred during each accounting year. These are shown in columns (2) and (3) of Table I.

It will be seen from column (4) of Table I that the claims outstanding as at 31st March 1964 equalled 33 per cent of the new claims during the preceding year. This means that the claims remaining unpaid as on that date were equal to four months' new claims. When faced with this result, a lay critic, who is under the impression that an insurer can pay a claim as soon as he learns that the life assured has died or survived to the date of maturity, and, hence, presumes that the time-lag between the occurrence of the claim and its payment is accounted for solely by the time taken by L.I.C. in processing the claim, would naturally rush to the conclusion that it takes L.I.C. nearly four months on an average to process a claim for payment. He would accordingly conclude that L.I.C. suffers from gross inefficiency; and might even suspect that deliberate attempts are made to postpone or avoid payment. If he had access to more detailed figures showing the dates on which the outstanding claims had actually arisen, it is not unlikely that this impression would be reinforced. For instance, he would be surprised to find that the claims remaining unpaid as at 31st March 1964 were not all recent claims. Of the total amount of outstanding claims as on that date, 64.2 per cent represented claims which had arisen within the last year, 16.9 per cent those which had arisen during the preceding year and the balance of 18.9 per cent those which had arisen even earlier.

Delay By Claimants

To arrive at a correct appraisal of the figures mentioned above, it must be borne in mind that an insurer, even when he learns that the life assured has died or survived to the date of maturity, cannot pay the claim until the claimant has furnished certain essential requirements. The time-lag between the occurrence of a claim and its payment can, therefore, be considered to comprise two parts: the first represented by the period till all the requirements have been furnished by the claimant; and the second by the time taken by the insurer to make payment after all the requirements have been received. Strictly speaking, it is only if the second part is longer than it need be that the insurer could be said to have delayed paying the claim. In actual fact, as we shall presently see, this part is relatively small in extent and delay in settlement is accounted for mainly by the first part. To bring about a reduction in the first part of the time-lag, apart from simplifying the requirements as much as possible and avoiding any delays in calling for them, all that the insurer can do is to devise ways and means to influence the claimants to expedite submission of the requirements. Various measures taken by L.I.C. to that end are referred to later. As the ultimate outcome of such measures must perforce depend on the response of the claimants, it is feared that the process of reducing the overall time-lag is likely to be slow and time-consuming.

It is fully recognised that there is scope for improvement in the efficiency of L.I.C.'s offices in dealing with claim settlement work. The performance of the various offices in this regard is kept under continuous watch and measures are taken from time to time to bring about an improvement therein. However, what is important to bear in mind is that the full solution of the problem of reducing the overall time-lag in settling claims lies to a considerable extent beyond the control of L.I.C.

II

Outstanding Maturity Claims

I will proceed next to indicate briefly the nature of the requirements which claimants are required to furnish and give some figures to support the contention that the major factor responsible for the rather large time-lag between the occurrence of claims and their settlement is failure of the claimant to furnish these requirements. For this purpose, it is convenient to discuss claims by maturity and death separately.

In the case of maturity claims, the requirements necessary are of a comparatively simple nature. As the policyholder is alive and the payment is almost invariably made to him, the question of producing proof of title of the claimant to receive policy moneys does not generally arise. If the policyholder has furnished proof of age during the currency of the policy, a discharge form is issued to him well before the date of maturity of the policy, with a request to complete and return it with the policy document. The policy document is required by the insurer for cancellation of the contract and verifying that the policy does not stand assigned to a person other than the policyholder. If the age has not been admitted, the policyholder is generally asked to furnish proof of age and the discharge form is issued to him only after age has been admitted. In order that the claimant may be in a position to return the discharge form well in time to enable payment being made by the maturity date, L.I.C. has laid down that intimation of maturity should be sent to the policyholder and requirements called for one to two months in advance of the date of maturity. It is found, however, that even when such a simple nature and plenty of time is given to the policyholder to furnish them, the majority of policyholders fail to furnish them in time and, hence, the claim cannot be paid by the date of maturity.

In the case of paid-up policies, the policyholder frequently forgets that he holds a policy and does not inform L.I.C. of changes in his address. As a consequence, when such a policy is about to mature, intimation is sent to an address which is out of date and does not reach the policyholder. This is one of the major reasons for maturity claims remaining unpaid. In order to ensure that such cases come to light as early as possible, L.I.C. has now provided that, in the case of all paid-up policies, intimation of maturity should be sent by registered post A/D. If this is returned undelivered by the postal authorities, the local branch manager or assistant branch manager is required to make exhaustive enquiries at the last known address of the policyholder to trace his present whereabouts. A vivid illustration of the importance of this factor was provided by the results of the Service to Claimants Campaign recently carried out by L.I.C., to which reference is made later. During this campaign, branch managers and assistant branch managers were required to call on claimants who had delayed furnishing requirements. These officers found that, in nearly one-third of the cases enquired into by them, the claimant's address furnished to them was out of date. They succeeded in tracing the correct address in only one-half of such cases.

In this connection, an analysis of the claims outstanding as on 31st March 1964 according to the reasons for their remaining unpaid would be interesting. On that date, the number of maturity claims oustanding on the books of L.I.C. was 57,069. During 1963-64, on an average, 13,874 maturity claims occurred every month. The number of outstanding maturity claims was thus equal to that of maturity claims occurring in a period of about 4.1 months.

Of the maturity claims outstanding on 31st March 1964, 15,137 were claims which had occurred within the previous three months. Of the remaining 37,233 claims, 61.4 per cent were outstanding on account of the policyholder not having returned the discharge form duly completed. In a further 19.1 per cent of such outstanding claims, it was known that the address of the claimant in the records of L.I.C. was wrong, but the correct address could not be traced. The next largest category, consisting of cases whereunder the policyholder had not furnished age proof, included 6.3 per cent of the outstanding claims. The remaining 13.2 per cent of outstanding claims remained unpaid on account of various reasons such as dispute in regard to title, exchange control difficulties, loss of policy documents, etc.

As the procedure for settlement of a maturity claim is relatively simple, responsibility for delays occurring in such settlements can be apportioned between L.I.C. and the claimant with comparative ease. The results of an investigation recently carried out for this purpose are given in the following paragraph.

To ensure payment of maturity claims by the date of maturity, all

Table I: *Outstanding and New Claims*
(In crores of rupees)

Year	Liability in respect of outstanding claims as at the end of the accounting period	New claims during the accounting period	Percentage of outstanding claims as at the end of the accounting period to claims intimated in the accounting period
(1)	(2)	(3)	(4)
1956-57	13.03	28.70	60.6*
1958	13.39	25.05	73.5
1959	14.04	28.14	49.9
1960	13.47	30.69	43.9
1961	13.93	34.11	40.8
1962-63	13.55	43.96	38.5*
1963-64	14.90	44.65	33.4

* Proportions adjusted to allow for the accounting periods being in excess of 12 months and relate them to new claims over a 12-month period.

What price value?

PRICE IS WHAT YOU PAY

VALUE IS WHAT YOU GET

At your Bombay Dyeing retailer's is a vast range of cotton fabrics for you and your home! Take your pick from the exciting dress materials, the smart drills and tussore for men, the fine furnishings and attractive table-linen, beautiful bed sheets and towels. Whatever you choose and whatever its price, you will get excellent value for your money! □ Available at all leading retail cloth shops throughout the country.

THE LESSON

The alphabet...then the word...then the sentence...

The delicate process of educating the young. Everywhere massive plans are under way—in education and in other fields as well. Public health, agriculture, engineering, housing, to name a few. A vast programme is on to improve the living standards of our millions.

LIC is very much a part of this programme. It invests nearly 3 million rupees a day in various economic spheres. Remember, when you insure or are already a policyholder, your premiums are helping in two ways. Firstly, in protecting yourself and your family, and secondly in helping to improve economic conditions for the country at large.

Some LIC investments at a glance

Cement	Rs. 628 lakhs
Cotton textiles	Rs. 1,216 lakhs
Electricity	Rs. 985 lakhs
Iron & Steel	Rs. 998 lakhs
Food, drink & tobacco	Rs. 128 lakhs
Government Securities (Central, State, Municipal & other approved securities)	Rs. 44,924.49 lakhs

LIC—YOUR COMPANION IN PROGRESS

that L.I.C. can do is (i) to send intimations of maturity and call for requirements sufficiently in advance of the date of maturity, so as to enable the policyholders to furnish requirements in time; and (ii) to see that no delay occurs in making payment after the requirements have been received. As already stated, L.I.C.'s procedure requires that intimations of maturity should be sent one to two months in advance of the date of maturity. Offices dealing with claim settlement work have also been instructed to see that payment of claim is made within one week of the date of receipt of requirements. Recently, a special machinery has been set up to ensure that these time limits are adhered to by all the operating offices. The reports for August and September 1964, the first two months in which the machinery operated, show that, during these months, intimations of maturity were issued one month or more in advance of the date of maturity in 80 per cent of cases and three weeks or more in advance of that date in 90 per cent of cases. There was a distinct improvement in the position between August and September and it is expected that, within the next few months, all the offices would succeed in adhering to the prescribed limits in cent per cent of cases. In regard to payment of claims, the reports show that payment was effected within one week of the receipt of all requirements in 86 per cent of cases and within two weeks of that date in 97 per cent of cases. These figures show that, even as matters stand at present, the extent of delay in settling maturity claims attributable to L.I.C.'s offices is not considerable.

Recently, with a view to obtaining an idea of the total time taken to pay claims, a twenty per cent sample of policies on the books of a large unit which matured in February and March last was studied. It may be mentioned that nearly 15 per cent of all maturity claims paid by L.I.C. are handled by this unit. It was found that this unit issued intimations one month or more in advance of the date of maturity in 71 per cent of cases, the average intimation in this group of cases being issued 40 days in advance of the date of maturity. In regard to payment of claims, cases in respect of which intimations had been sent one month or more in advance of the date of maturity and those in respect of which they were sent later were examined separately. The results are shown in Table II.

It may be mentioned that the time taken by this unit to pay claims after receiving all requirements is somewhat less than the average time taken by L.I.C. as a whole. Table II shows that, even in cases where intimations had been sent sufficiently in advance, only 38 per cent of the claims could be settled by the date of maturity, and only 79 per cent of the claims could be settled at the end of three months after the date of maturity. These figures provide a measure of the tardiness of the claimants' response. It will be seen from a comparison of columns (1) and (3) that, even when the unit succeeds in conforming fully to the prescribed norms in despatching intimations, the percentage of claims paid by the date of maturity would increase only from 31 per cent to 38 per cent; and more than one-fifth of the claims would continue to remain unpaid at the end of three months after the date of maturity.

III

Outstanding Death Claims

The requirements necessary for payment of death claims are of a relatively complex nature. The requirements necessary for admitting liability are enumerated hereunder:

(a) An application from the claimant in the prescribed form.

(b) Proofs of death and identity of the life assured. Where at the time of the claim, the policy has been in force for over three years, only a municipal death certificate is generally called for. In other cases, certificates from the last medical attendant, from a responsible citizen who was present at death or cremation etc. are also obtained.

(c) Proof of title of the claimant to the policy moneys, such as a succession certificate. This would not be required if the policy is assigned in favour of the claimant or if he has been nominated to receive policy moneys.

(d) Proof of age of the deceased, if age has not been admitted previously.

(e) A report on investigation into the claim, in case it has occurred within two years of the commencement of the policy or suspicious features are otherwise present.

On receipt of the documents listed above, the insurer, if satisfied about the validity of the claim, admits liability and a discharge form is then issued to the claimant. On receipt of the discharge form duly completed with the policy document, payment is made.

On 31st March 1964, the number of death claims outstanding on the books of L.I.C. was 31,826. During the year 1963-64, on an average 2,800 death claims occurred every month. The number of outstanding death claims was thus equal to the number of death claims occurring in a period of about 11.4 months. The reason for the proportion of claims remaining unpaid being larger in the case of death claims than in the case of maturity claims is to be found in the fact that much more elaborate requirements have to be complied with before a death claim can be admitted and paid.

Of the 31,826 outstanding death claims, 7,333 had been intimated within the preceding three months. Of the balance, the proportions of cases which had remained outstanding for various reasons were as follows:

	Per cent
Claim forms (i.e., requirements specified under items (a) and (b) in "Analysis of outstanding death claims" above) not received	54.3
Proof of title not received ..	18.0
Discharge form not received ..	12.3
Claim investigation not completed.	5.7
Age proof not received	2.1
Other reasons	7.6

One of the categories enumerated above, namely, claim investigation not completed, calls for comment. In this are included cases in respect of which all the requirements had been furnished by the claimant but the claim had remained unpaid as the investigation was still incomplete. Unlike the other categories, the responsibility for delay in payment in this case could not be attributed to the claimant. This category, although it comprised less than 6 per cent of the outstanding claims, is of great importance from the point of view of public relations and has been a prolific source of complaints from the public. In the case of other categories, the claimant realises that the delay is caused by his own inaction and complaints are, therefore, relatively rare. As explained later, investigations cannot be dispensed with and their duration is to a large extent beyond the L.I.C.'s control. L.I.C. is, however, keenly aware of the need to improve its performance in this area and has been attempting to speed up investigation by educating the field officials, to whom they are generally entrusted, and improving the quality of supervision and control over their work. There is always a fear that undue pressure on the investigating officials to speed up the investigations might result in their being carried out in a perfunctory and superficial manner. It must also be remembered that the duration of investigation would, to some extent, depend on the cost which L.I.C. is prepared to incur on them. Obviously, quicker results could be obtained if a large organisation of special investigators is set up. The management has to decide whether the additional cost this would entail would be justified by the increased efficiency. After careful consideration, it has been decided that the work should be entrusted to the development officials in the first instance; but special investigators are appointed to take up more complex cases.

Reference has been made earlier to the steps taken by L.I.C. to influence the claimant to expedite submission of requirements. The most obvious step is to issue frequent reminders by post; and a systematic procedure for that purpose has recently been laid down. However, experience shows that, inspite of postal reminders, a large number of claimants fail to furnish even comparatively simple requirements for a long time. This indicates that many of them must be experiencing special difficulties and, unless personal guidance can be provided to overcome these, further routine reminders would prove of little value. Although, technically, it is the claimant's responsibility to furnish the necessary requirements to enable L.I.C. to pay the claim, in Indian conditions, where frequently neither the claimant nor any other individual in his immediate circle of relations and friends is sufficiently well educated to understand what is required to be done, it becomes necessary for L.I.C. to make arrangements to give the claimants every guidance and help.

It is generally recognised that one of the many functions of the insurance agent is to render such service to the claimant, which assumes special importance in Indian conditions. While there are, no doubt, instances where agents remain in touch with the policyholders and render effective after-sales service, both during the currency of the policy and after a claim has occurred, the large number of cases in which payment is inordinately delayed show that a substantial proportion of claimants do not receive sufficient assistance from the agents. L.I.C. is attempting to bring about an improvement in the quality of service rendered by the agents through better selection, training, etc. but this must perforce be a slow process. It was, therefore, recently decided that responsibility for contacting claimants and rendering them the necessary help should be placed on the branch managers and assistant branch managers.

In future, in every case where the claimant does not furnish such requirements as the Claim Forms or the Discharge Voucher within prescribed time limits, it would be the duty of one of these officers to call on him and assist him in furnishing the requirements. To enable the divisional offices to exercise effective supervision and control over the work of these officers, an elaborate system of reporting has been devised. To clear up the backlog of such cases existing at the time when the new procedure came into force, a Service to Claimants Campaign was organised.

Another step which L.I.C. has recently taken in this direction is to arrange for the translation of the claim forms and the instructions to claimants (which are sent to the claimant at the time when claim forms are issued) in various Indian languages.

IV

Investigation of Claims

Insurers, as trustees of the policyholders' moneys, are required to safeguard the interests of policyholders against fraudulent claims. It is, therefore, the practice of insurers all over the world to make thorough and exhaustive enquiries in all cases where a claim is premature or is otherwise doubtful. It must be remembered that payment of a doubtful claim without investigation would not only jeopardise the interest of honest policyholders but would be tantamount to putting a premium on fraud. Once an impression goes round that a thorough probe is not carried out in all doubtful cases, frauds are bound to increase and multiply.

It must be remembered that to repudiate fraudulent claims it is not enough for the insurer to satisfy himself that it is not genuine. There is always a possibility that the claimant would take the matter to a court of law, and the insurer, before he can repudiate a claim, must therefore secure sufficient evidence which would stand in a court of law. A few illustrations should suffice to bring out the difficulties involved in the search for such evidence.

Most of the fraudulent claims arise out of the suppression by the proposer of material facts regarding the past history of illnesses suffered by him. To detect such cases, the investigator tries to secure information about such illnesses; but information of adequate evidential value is hard to come by. Reports from relations, neighbours or friends to the effect that the deceased had suffered from such illnesses would have little evidential value by themselves. Even a statement from a doctor who actually treated the deceased for a past illness might not be attached much weight, if it is based solely on his recollection and is not supported by documentary evidence such as certified copies of prescriptions, entries in patients' registers, diaries, etc. In India, many doctors do not maintain day-to-day records in the course of their business and those who do are frequently unwilling to co-operate with

the insurer. It is therefore exceedingly difficult to obtain information which would provide an adequate basis for repudiation.

Again, if hospital records show that the deceased at the time of admission to the hospital on a subsequent occasion had reported a history of an earlier illness, this information may not prove of much value, unless the doctor who recorded the history can be traced and he certifies that the history was narrated to him by the deceased himself. Another common type of fraud is where a person, who had passed beyond the insurable age, secures insurance by grossly understating his age. In such cases it is frequently difficult to secure documentary evidence of age based on a municipal birth register, school or college records, etc. On the other hand, statements by other persons who have known the proposer or even opinions of qualified persons like doctors, if unsupported by some documentary evidence, may not be considered as sufficient proof in a court of law.

The consequences of the difficulties experienced in collecting acceptable evidence are twofold: first, the investigator has to spend considerable time in trying to tap various possible sources of documentary evidence and the investigation is hence delayed; and, second, frequently, even when the insurer is morally certain that the claim is fraudulent, in the absence of evidence which would stand in a court of law, is forced to entertain the claim. In borderline cases, where he is satisfied that the claim is fraudulent, but there is doubt as to whether the available evidence would or would not be considered as adequate in a court of law, he generally seeks the guidance of the legal advisers and takes a decision accordingly. Where such claims are repudiated and the claimant contests the decision in a court of law, in a proportion of cases the decision would go against the insurer. It is important to remember, however, that, generally, a claim would not be repudiated, unless the insurer is satisfied that it is not genuine and has in his possession evidence which has a reasonable chance of being found adequate in a court of law.

An Untenable Impression

It is believed that the practice of a few erstwhile insurers in India was government by the letter of the contract to such an extent that they repudiated liability on the slightest grounds, which no doubt were legally sustainable. However, a number of better managed insurers brought to bear a more enlightened approach on interpretation of contracts and made it a plank of their policy to transcend in well deserving cases the rigid approach of contractual rights. As a consequence, they often made payments to policyholders and claimants which might not have been justified on the strict interpretation of the contract. As a national institution, L.I.C. naturally follows the same enlightened policy. In the circumstances, the impression that there is a tendency in L.I.C. to resist claims on "frivolous pleas and reckless allegations" has no basis in fact. This is amply borne out by the results of an analysis of the experience of L.I.C. during the period 1st September 1956, to 30th September 1962, in regard to repudiation of claims and suits filed against it in various courts in India. These are summarised hereunder:

(i) The proportion of repudiated claims to total claims was 1.1 per cent.

(ii) The proportion of repudiated claims in which suits were filed in courts was 11.3 per cent.

(iii) Of the suits decided during this period, the decisions were in favour of L.I.C. in 44 per cent of cases, in favour of the claimant in 27 per cent of cases and the suits were compromised in 29 per cent of cases.

These figures show that not only the number of repudiated claims is small but also that the decisions to repudiate are not taken lightly. It will be noticed that, in an overwhelming proportion of cases, the decisions were not disputed by the claimants.

As explained earlier, investigations are carried out by L.I.C. mostly in cases where a death claim occurs within two years of the issue of the policy. It is found that about one death claim out of ten is investigated. As decisions to repudiate claims are taken on the basis of such investigations, the fact that one per cent of all death claims are repudiated, would mean that about 10 per cent of the investigations lead to repudiation. As explained above, a number of claims which are believed to be fraudulent are not repudiated, because adequate evidence cannot be found to support repudiation. It would appear, therefore, that, among premature claims, the proportion of cases in which there is reasonable ground to suspect fraud is much larger than 10 per cent. This figure gives an idea of the extent of prevalence of fraud, even when most premature claims are investigated. If L.I.C.'s rule regarding investigations is relaxed, the extent of fraudulent cases is bound to increase. It may be mentioned that one of the reasons why investigations are unnecessarily prolonged is the tendency of the proposer to suppress particulars of personal history in the fear that this might result in the terms offered to him being highly unfavourable. Frequently, the suppressed information is of a comparatively innocent nature. But when after a claim occurs, the fact that information had been suppressed comes to light in the course of the investigation, this raises a cloud of suspicion and at times it takes a long time to ascertain precise details of the personal history not disclosed.

Beyond L.I.C.'s Control

It is necessary to carry out investigation of claims expeditiously for two reasons: firstly, it is essential that, where the claim is genuine it should be settled promptly; secondly, in the case of fraudulent claims, chances of getting evidence which can stand in a court of law are greater if the investigation is made early. Therefore, the need for completing investigation speedily, is impressed on the investigating officials and efforts are made to eliminate avoidable delays. However, in spite of such efforts, some investigations take considerable time, depending on the nature of the investigation. facts which are brought to light in the course thereof, places where the investigation is to be made, etc. Many of the factors which cause delay are beyond the control of L.I.C. Many doctors and other agencies who are in possession of material information are often unwilling to disclose it; some hospitals are not equipped to make a search for information in their records, which becomes necessary when particulars like the precise dates of admission to the hospital, etc., are not available; interested parties sometimes succeed in tampering with existing records; often the claimant does not co-operate fully or at all.

It is sometimes suggested that it would be better if L.I.C. probed into every case fully at the proposal stage, so that no further investigation would be necessary when a claim occurs. A moment's consideration should show that the suggested procedure would not be workable. The proportion of policies which become claims within the first two years after issue would be, roughly, 1 in 300. The present practice requires only such cases to be investigated. If it is decided to investigate every proposal, the cost would, therefore, be 300 times as high. Further, if the investigation is to be as thorough as a claim investigation, it will take considerable time to complete and acceptance of the proposal would remain pending till then. Hence, the suggestion cannot be accepted in view of the cost and the delay which it would involve. Some enquiries into the moral hazard aspect of the risk is made even now at the proposal stage in selected cases: but these are not expected to be as thorough and exhaustive as a claim investigation.

The repudiation of a claim means some adverse publicity for L.I.C. However, it is clearly in the interest of the policyholders themselves that all bad claims are resisted. There is no place for sympathy for the claimant in such cases, even though he or she might not have been a party to the fraud. The best way in which adverse propaganda from interested parties can be countered is by adopting a policy of sympathetic, efficient and prompt settlement of all genuine claims.

Conclusion

The foregoing discussion should indicate the nature of the various constraints within the limits of which L.I.C. has had to function in the matter of settlement of claims. Firstly, in the context of the socio-economic conditions prevailing in this country, the terms of the insurance contract themselves impose a major constraint. A claim cannot be settled, unless the claimant has completed certain essential requirements; and, in certain circumstances, until an investigation into the claim has been completed. These lead to delays in settlement of claims which are, to a considerable extent, beyond the control of L.I.C. Secondly, there is the constraint imposed by considerations of the cost of operation. The basic service rendered by L.I.C. to its clients is twofold: it protects the family against untimely death of the bread-winner and provides a method of saving for old age. Unless this service can be rendered at a reasonable cost, L.I.C. would fail in its statutory duty to spread insurance more widely and lose ground to competing savings media in mobilising personal savings of the people. It has also to remain within a statutory limit of costs. Although it would have been possible to speed up settlement of claims to some extent by setting up large special organisations for helping claimants and investigating claims, L.I.C.'s freedom of action in that respect is severely restricted by considerations of cost.

Lastly, a constraint resulted from the fact that L.I.C. had inherited a large part of its organisation from over 240 erstwhile insurers, who varied widely from the point of view of administrative efficiency. As would be expected, the administrative efficiency of the inherited personnel varied from very good to very poor. Hence, it was inevitable that, for some years, the average administrative efficiency of its employees should remain below that of the employees drawn from the best managed erstwhile insurers It took L.I.C. some time to raise the standard of efficiency of this staff by enforcing uniform procedures. carrying out a sustained programme of training and improving supervision. This problem was rendered more difficult by the rapid growth of L.I.C.'s business after nationalisation and the consequent need to recruit and train additional staff. To arrive at a fair and objective appraisal of the performance of L.I.C. in the field of claim settlement, the effect of these constraints on its action and achievement must be borne in mind. I am confident that, if this is done, L.I.C.'s performance so far would be found to have been quite creditable.

Of the claims occurring during a given period, say, a quarter, a certain proportion remains outstanding at the end of that quarter, a smaller proportion at the end of the next quarter, a still smaller proportion at the end of the subsequent quarter, and so on. In a period when administrative measures have been effective in improving the efficiency of claim settlement work, the proportions of claims remaining outstanding at the end of successive quarters will show a declining trend as compared to the proportions of claims arising in an earlier period. Such reduction in the time limit in the disposal of claims would show itself a gradual reduction in the proportion of claims outstanding as at a particular date to the claims intimated during a given preceding period. The percentages of claims outstanding to claims intimated as at the end of successive accounting periods which are shown in column (4) of Table I should, therefore, serve broadly to judge the effect of the steps taken by L.I.C. for improvement in the claim settlement work. It will be seen that these percentages show a progressively decreasing trend.

GENERAL INSURANCE

(*Concluded from page* 83)

as a useful method of increasing the retention capacity of the Indian market. By reason of their specialised organisation, they may also be in a better position to trade on favourable terms with overseas companies, as compared with many of the Indian companies for whom reinsurance is a subsidiary part of their business. Further, these companies would make reinsurance facilities available to the Indian market on reasonable terms, and thereby also influence, for the benefit of Indian companies, the terms obtainable by them from foreign reinsurers.

Insurance Accepted in India on Foreign Properties or Interests and Insurance Accepted Abroad on Indian Properties or Interests: Though no definite figures are available, the volume of premium involved in insurance accepted in India on foreign properties or interests, or insurance based abroad on Indian properties or interests, should be quite small. As regards the latter, it is generally not possible for a person in India to insure his property or other interest with an insurance company abroad. under current regulations of the Reserve Bank of India, unless he can establish that similar insurance cover is not available from any insurance company operating in India, whether Indian or foreign.

It can be said that, of late, Indian companies, have become quite conscious about the results of their reinsurance trading with companies overseas, not only from the point of view of avoiding exchange drain, but also in their own interest of increasing their profits. The results of their efforts have, to a large extent, been offset by the deteriorating tendency of much of the foreign business. The changes to be introduced in the overseas trading pattern have also to be gradual, with a view to preserving as far as possible long-established connections with insurance companies abroad. It is, however, felt that, when the measures mentioned above are fully implemented in due course, and with the hoped-for reversal of the unfavourable cycle for insurance in many overseas territories, the adverse balance of trade resulting from general insurance will be substantially corrected in the near future.

Growth Of Pharmaceutical Industry Remarkable

Future Expansion Depends On Correct Understanding Of Problems

By JAMES McGEE
MANAGING DIRECTOR, PFIZER PRIVATE LTD.

PERHAPS few other industries in India have developed since independence as fast as the pharmaceutical industry. Indeed, the rate of growth of pharmaceutical manufacture and the expansion of product range have been so remarkable that what was only a small processing enterprise only a decade and a half ago today bids fair to be one of India's major integrated industries, manufacturing and exporting both intermediate products and finished preparations from indigenously available and imported raw materials.

Measured in quantitative terms, the pharmaceutical industry recorded a tenfold rise in production (in terms of value) during the period 1948-62, from Rs. 11 crores in 1948 to Rs. 100 crores in 1962. This rate of growth surpasses the growth rate of, perhaps, all other industries. The following table indicates the trend of pharmaceutical production during the period 1948-62:

	Production (Value in Rs. crores)
1948	11
1958	58
1959	60
1960	70
1961	87
1962	100

This quantitative growth represents only one aspect of the remarkable progress of the pharmaceutical industry. Simultaneously, there has also been an astonishing expansion in the number and range of products manufactured from basic stages. Thus, whereas formerly almost all of the pharmaceutical products available in India were either manufactured from imported intermediates or were merely processed and packaged from bulk imports, at present, many products are manufactured within the country from basic stages. Consequently, imports of finished preparations, with very few exceptions, have virtually stopped. New processing and production units have been established and old ones are being expanded to undertake the manufacture of pharmaceutical preparations from basic stages. New units already set up and those that are under way are most modern in design and layout, employing the latest techniques and processes of production evolved in foreign countries after many years of research and experiments. Many of these units have been set up in collaboration with reputed pharmaceutical firms of countries like U.S.A., U.K., W. Germany and Switzerland. An advantage of such collaboration is that India is able to benefit from advances in technology and pharmaceutical research in these countries at a much smaller cost of foreign exchange than would have been possible if the finished drugs were imported.

Basic Manufacture

Some of the important items of basic manufacture undertaken in the private sector are antibiotics, synthetic hormones, vitamins, tranquilisers, antihistamines, drugs of vegetable origin, glandular products and many modern synthetic drugs. The third Five-year Plan envisages a production target (in terms of value) of Rs. 175 crores for the pharmaceutical industry. This represents a 75 per cent increase in production over the 1962 output. The main brunt of this substantial expansion required to reach the Plan target has necessarily to be borne by the organised sector of the industry, especially the major firms on the list of the Directorate General of Technical Development, which number about 120.

Cost Aspects

What are the problems facing the industry? What steps are necessary to enable the industry to achieve the Plan targets and make the country self-sufficient in medicine? The main problems of the industry may be broadly classified under two heads. First, problems which are common to all industries; in the case of the pharmaceutical industry, these have been made more complex by the fast tempo of development. Secondly, special problems. Among the first category, the most important is the high cost of production of medicines. This question has been examined in detail by a Technical Sub-Committee of the Development Council for Drugs and Pharmaceuticals. Its findings and conclusions throw some revealing light on the cost of manufacture of drugs in the country and indicate why costs in India are higher than in foreign countries. Some of the important findings of the Sub-Committee are the following:

(1) Prices of imported raw materials and intermediates are higher in India than in foreign countries due to the heavy incidence of customs duty.

(2) Prices of indigenously available raw materials are 150 to 200 per cent more than the prices prevailing in foreign countries.

(3) The quality of indigenous raw materials is, in many cases, inferior, resulting in higher processing and production costs.

(4) Solvent losses are high due to high temperatures.

(5) Excise duties and the procedures insisted upon by the excise authorities in handling stores, which involve special insurance premium, bank commission, etc., inflate cost by an amount almost equal to the total value of the landed cost of the raw material.

(6) Not only is the cost of imported equipment 35 to 40 per cent higher than in foreign countries, due to all the charges involved, but the cost of indigenously fabricated equipment is even higher in many cases.

(7) The scale of production in Indian factories is much smaller than in Europe or U.S. with the result that process loss, factory, general and sales overheads, etc., are high.

A study of the various factors listed above pointed to the following conclusion about the relationship of cost and prices of medicines in India:

"Despite the fact that the cost of basic drug is usually higher in India than in other developed countries, the cost of finished preparations is, in most cases, much less than the domestic price of similar products in foreign countries. The differences between the consumer prices and the ex-factory cost of the finished preparations is much less in this country than in most of the more developed countries."

This observation should serve to correct the general impression in the country that the high cost of drugs manufactured in India is due to the "large" profits made by manufacturers. It is noteworthy that the complaint against high cost is made not only against units in the private sector but also those in the public sector. It is relevant, in this connection, to quote the following remarks of the Committee about the comparability of the prices of imported medicines and their cost of production in countries manufacturing them:

"It has to be remembered that prices of imported drugs cannot be taken in all cases as an indication of the actual cost of production in other countries, since subsidising of exports is often resorted to by the exporting countries."

Patents on Medicines

Now to turn to the special problem facing the pharmaceutical industry. The high cost of production, heavy taxation, irregular and inadequate supply of raw materials and lack of pilot plant facilities, etc., are problems enough for the industry. But to these has now been added a far more serious problem in the form of a threatened virtual abrogation of patents on medicines. If this threat materialises, it is certain to affect very adversely the future growth and development of the pharmaceutical industry.

The move is presumably based on the mistaken belief that patents are responsible for the prices of drugs and medicines being what they are and that abolition of patents will result in lower prices. How futile such a move will be in bringing down prices and how dangerous its consequences are can be easily shown. For one thing, abrogation of patents will not result in lower prices, because it is the high cost of production, not patents, that determines the price of medicines. Royalties charged by patentees represent only a very small percentage of the total cost of a pharmaceutical preparation. On the other hand, abrogation of patents will discourage research, because, in the absence of patent protection, which helps recoup the money spent on research, pharmaceutical companies will be reluctant to embark on research so vital for progress. Plans of international companies to establish new factories and research centres will also be shelved and the local industry will suffer a distinct setback. Foreign firms will also be reluctant to impart their technical know-how to Indian firms if there is no patent protection for drugs. It is for these reasons that the Development Council for Drugs and Pharmaceuticals, Government of India, was constrained to make the following remark in its latest (1962-63) report:

"The Council felt that if, at this crucial juncture, Government resort to drastic steps like suspension of patents so far as drugs and medicines are concerned, it might do immense harm to this industry. Modern pharmaceutical industry evolves the use of very complicated techniques and equipment which it would take years for any country to develop on its own. It is desirable, if not essential, that the complexities of such processes should be seen personally by those who are to take a decision on this very vital subject."

The Indian Pharmaceutical Delegation which recently visited U.S.A., U.K., Switzerland, West Germany, Italy and Japan, in its report submitted to the Government a few months ago, also strongly advised against any drastic change in patent law on drugs and pharmaceuticals. It observed:

"It is patent protection that acts as the main incentive for undertaking the very expensive and risky research work on a massive scale necessary for the discovery of new drugs. The abolition of patent protection for new drugs will, therefore, deter pharmaceutical manufacturers from setting up research laboratories and carrying out expensive research programmes in India. There were indications that some leading pharmaceutical firms, who have extensive research facilities in their home countries, may follow the example of CIBA and set up independent research laboratories in India also and thereby introduce into our country well-organised system of team research that has proved so fruitful in the advanced countries of the West. It is a foregone conclusion that all such plans would be abandoned, if patent protection to new drugs is abolished or substantially weakened. It is equally certain that commercial firms in India will not venture to make any substantial investments in research laboratories and research work."

Related to the question whether abrogation of patents will reduce drug prices is the issue of drug prices itself. The pertinent point here is not whether pharmaceutical prices in India are higher than in foreign countries but whether drug prices are higher when compared to those of other commodities in India. The reason is that Indian prices cannot be compared with price in foreign countries where the industry is well established, employs mass production methods using the latest techniques of manufacture and has all the advantages of cheap and good quality raw materials, trained manpower and long experience in pharmaceutical manufacture.

A Perspective

An examination of the trend of pharmaceutical prices will show that medicines, far from being costly, when compared with other essential items, belong to the very few groups of commodities whose prices have remained steady. In fact, prices of many pharmaceutical products have come down. While the general index to wholesale prices (base 1952-53 = 100) has risen from 100 in 1952-53 to 127 in 1962, the index of drug prices, with the same base, has gone up by only 2 per cent, to 102. What is more, the 2 per cent rise in the index of drugs conceals certain significant price falls registered in respect of some important medicines such as antibiotics. For instance, the wholesale price of tetracycline capsules has dropped 51 per cent between 1957 and 1962. Similarly, there has been a 33 per cent fall in the price of Chloramphenicol. The price of Vitamin C has also fallen by as much as 30 per cent since 1954.

It is evident from the foregoing that there is no substance in the charge that drug prices in India are

Another Star crowns TELCO's 10 productive years

the new '1210' Series TMB 7-tonner

■ 40% increase in payload ■ unsurpassed quality

Ten years ago, Telco introduced the first TATA MERCEDES-BENZ vehicle in India and operators swiftly named the TMB the Star that hauls a fortune. ■ Throughout these years, Telco has continuously kept ahead of the times by offering vehicles that are ideally suited to actual operating conditions in this country. ■ The prototypes of these new vehicles have been fully tested and proved in every respect.

Special features of the new TMB:

EXTRA HEAVY DUTY FRONT AND REAR AXLE ASSEMBLIES designed to carry the increased payload

NEW STEERING ASSEMBLY fitted with a Universal Joint to cushion all road shocks and provide driving comfort

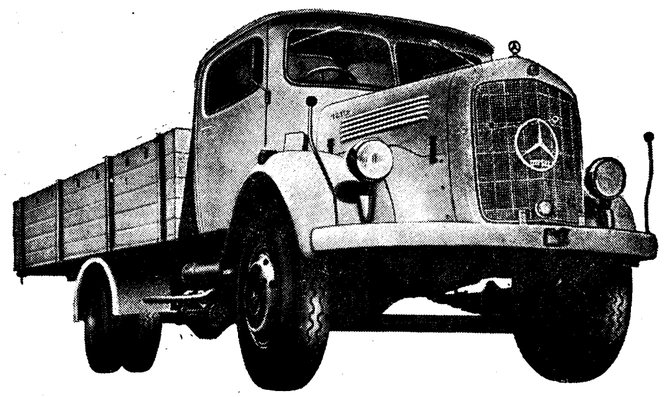
HYPOID GEARS for greater tooth contact, resulting in long life and quieter operation

Other technical features:

NEW CHASSIS FRAME of special quality high tensile steel

NEW FRONT AND REAR SPRINGS—wide, thicker and heavier

OM 312 DIESEL ENGINE, tried, tested and proved over millions of miles by thousands of satisfied customers



The TMB is a valuable, gilt-edged investment which offers maximum transport capability for every rupee invested. The TMB's built-in quality retains its value throughout its long operational life. Its economical, trouble-free performance and low maintenance cost make it a strong favourite of transport operators.

OUTLOOK FOR TYRE INDUSTRY BRIGHT

Much, However, Depends on a Variety of Factors

By A Special Correspondent

THE tyre industry established its foundations in India about 30 years ago and is now one of the most technically advanced industries in the country. The first large-scale modern factory for the manufacture of automobile tyres was set up in 1936 by Dunlop at Sahaganj near Calcutta. It now ranks as one of Asia's largest rubber manufacturing enterprises.

Two factors are favourable for the growth of the industry in the country: (1) it has a developing home market; and (2) its close association with leading tyre manufacturers in the world ensures the technical know-how necessary for its advancement.

The productive efficiency of the industry will be evident from the fact that, between 1956 and 1963, when the general index of industrial production increased by an average of 9 per cent per annum, the average annual growth rate of automobile tyre manufacture was as high as 15 per cent. That the industry is developing on sound lines can be seen from the accompanying table of production figures for selected years.

Aspects of Marketing

Tyres and tubes are indispensable consumer durables in motor vehicle operation. The demand for them is related to the automobile population in the country and the extent of its utilisation and this, in turn, depends on the rate of growth of the economy and the progress of the vehicle manufacturing industry. Although the road transport industry has a vital role to play in the economy of the country, its growth is impeded by high taxation and inadequate development of roads.

To meet the requirements of the different vehicles and their varying operating conditions, the tyre industry manufactures a wide range of tyres in sizes and patterns to suit many types of service. For example, a popular size of truck tyre is manufactured in as many as six patterns for use under conditions as widely different as good surfaced roads to off-the-road conditions in quarry sites.

The vast accumulated experience of old-established units, which have been catering to the different and exacting needs of the Indian market for several decades, enables the industry to design and manufacture the right tyre for different local conditions. In fact, the average truck operator, who has had experience with imported tyres in recent years, has a definite preference for Indian-made tyres for fitment to his truck.

The industry has pioneered an extensive dealer network for the distribution of its products. These outlets, developed over many years, enable consumers to obtain their requirements easily and at competitive rates. Since tyre dealers are not restricted from dealing in competing brands, the new manufacturing units which have started production in recent years have been able to avail of this established channel to market their tyres in all parts of India.

A notable feature in the marketing of tyres is the stress given by the industry that service is an integral part of sales. The tyre companies maintain a specialised service department staffed with technical personnel who are constantly at work investigating service conditions and making recommendations to ensure that customers obtain maximum life out of their tyres. These efforts are supplemented by providing tyre users with copious technical literature on all aspects of maintenance and servicing.

Spectacular multi-purpose projects and intensive mechanisation in open cast mining have been made possible in the last decade by the introduction of special off-the-road vehicles. The tyre industry has kept pace with the introduction of these special earthmoving machines and off-the-road tyres, many of tremendous size and capacity, are now manufactured in India.

Cost Factor

The steadily rising incidence of indirect taxes, particularly the excise duties levied under the successive Finance Bills is the main reason for the cost of tyres in India being high compared to those manufactured elsewhere in the world. To illustrate this point, the price of automobile tyres to a consumer in India today is enhanced by approximately 40 per cent in respect of excise duty and sales tax. In 1955-56, the revenue from excise duty on tyres and tubes amounted to Rs. 5.53 crores, while in 1964-65 the yield from this source is expected to be about Rs. 23.52 crores. In other words, during the last ten years, the revenue from excise duty on tyres and tubes has increased fourfold.

In October 1955, the basic selling price without excise and other taxes to a dealer for a popular car tyre size 6.00-16 6PR was Rs. 83.22 whereas the current basic selling price for the same tyre is only Rs. 83.66 (an increase of 0 44 in nearly ten years). Similarly, in October 1955, the basic selling price to a dealer for a popular tyre size 8-25-20 10 PR was Rs. 269.32, as opposed to Rs. 270 82 now (an increase of only Re. 1.50).

The price of indigenous natural rubber, the main raw material of the tyre industry, is about 20-30 per cent higher compared to prices ruling in world markets, while that of locally manufactured synthetic rubber is nearly 50 per cent more than the price of the imported variety. The prices of other raw materials such as carbon black, rubber chemicals, rayon tyre cord, etc., which are now manufactured in the country, are all much more expensive than the imported equivalent. In spite of the efforts made by the industry to increase productivity, the high cost of raw materials has neutralised the cost economies made in this direction. It is also one of the reasons why the Indian tyre industry is not able to compete in export markets, despite the favourable quality of its products.

Despite advanced techniques and modern equipment, tyre manufacturing is "labour-intensive" throughout the world. The levels of skills obtaining in a country have, therefore, a great bearing on the cost of production. In India, where the "learning curve" is extended, allowance should be made both for this and also the growth of automation in other countries.

Manufacturing Capacity

It is estimated that the demand for automobile tyres by 1965-66 would be 3.0 million. Against this, a capacity of 5.18 million has been licensed and it is expected that about 3.4 million of this capacity will be implemented by 1965. During the current year (1964), automobile tyre demand is estimated at 2.4 million.

The production of automobile tyres requires considerable outlay of capital in equipment and raw materials. Tyre production cannot be easily altered to suit rapid changes in market demands and, to allow for flexibility, tyre manufacturing units prefer to have some excess capacity over their estimated market requirements. Installed and licensed capacities in the country at present are in excess of current demand, but, despite this, new units which have commenced manufacturing operations in the last two to three years are making steady progress. Under such circumstances, a judicious blend would be to strike a balance between expansion of new units and expansion of old-established units which have the requisite cushioning power to withstand the vagaries of a changing market. Economies of scale would be lost, if additional manufacturing units are licensed to take care of the increasing demand in the next Plan period.

Raw Materials

An impediment which may hold in check the plans of expansion of the tyre industry, and indeed the rubber manufacturing industry, is the inadequate availability of raw materials, chief among them being rubber. During 1964, the gap between demand and indigenous availability of all kinds of rubber is estimated at 20,000 tons. According to the planning group for petrochemicals, large deficits in rubber are expected to appear by the close of the third Plan period and swell to even greater proportions by 1970-71.

Although the plantation industry is taking vigorous steps to double its output of natural rubber from its present level by 1970-71, the shortfall in requirements cannot be met from this source alone. In this context, the efforts now being made to create additional capacity for synthetic rubber deserve an objective approach. The operating conditions obtaining in India require tougher tyres capable of running with heavy loads at high ambient temperatures. The type of synthetic rubber now manufactured in the country and that contemplated for future manufacture preclude their being used in large quantities in truck tyres which form the bulk of tyre production in India. Any attempt to change the ratio of natural to synthetic beyond reasonable levels in truck tyre manufacture will adversely affect the cost of road transport operations.

The Outlook

The draft fourth Plan envisages a rate of growth of 6.5 per cent per annum for the economy. In other words, the economic activity by 1970-71 will be at twice the level of today. The Plan envisages commercial vehicle production to increase from 54,000 in 1965-66 to 100,000 in 1970-71, while the demand for all kinds of personal transport such as cars, motor cycles and scooters is also expected to be nearly double their present level.

The popularity of bicycles, the common man's conveyance in our rural and urban areas, will grow enormously in the coming years. In 1964, the number of bicycles for each 100,000 of population was estimated at 1,900. Bicycle production in 1965-66 is estimated at 1 6 million and in 1970-71 it is expected to increase to some 3.5 million.

Development of agriculture is given high priority in the fourth Plan and the rate of growth in this important sector of the economy is expected to be 5 per cent per annum. A specialist group, appointed by the Government of India to investigate the low productivity of Indian agriculture, recently observed that inadequate availability of tractors was one of the reasons for the slow progress of agriculture. Already Government have sanctioned a number of projects for the manufacture of tractors and plans are being formulated for the production of small tractors on mass scale. According to one study, an addition of 20,000 tractors of 15 h.p., by partly replacing bullocks, could release roughly one million tonnes of fodder or enough land to produce a quarter million tonnes of foodgrains.

In any scheme of rural economic development, the bullock cart deserves consideration. It is estimated that there are over 10,000,000 bullock carts in India, serving for the most part the feeder traffic generated by our farms, factories and commercial establishments. But their utility is restricted by two disadvantages. The vehicles have a low payload capacity and their iron-tyred wheels damage road surfaces. The tyre industry manufactures special pneumatic equipment for bullock carts which increase their carrying capacity and eliminate damage to roads. The number of bullock carts that have been converted to this equipment is still extremely small.

All these point to the vast scope for the development of the tyre industry in the next five years. This is reinforced by the strikingly low *per capita* rubber consumption of India estimated at 0.3 lb., as against 2.0 lbs. in Brazil, 10 5 lbs. in West Germany, 12.6 lbs. in the U.K. and 19.5 lbs. in the U.S.A. The outlook for the tyre industry is bright—how bright depends on the growth of the economy and the success of the fourth Plan

Annual Output of the Tyre Industry

Category	1960	1961	1962	1963
1. Automobile tyres (comprising truck, car, jeep, motor cycle and scooter tyres) ..	1,363,200	1,562,400	1,710,000	1,926,000
2. Bicycle tyres	10,830,000	11,346,000	11,940,000	14,186,400
3. Tractor tyres	49,476	48,456	56,556	43,212
4. Aero tyres	2,664	2,652	8,064	15,660
5. Animal-drawn vehicle tyres	48,900	71,988	90,600	85,368
6. Off-the-road tyres	3,432	6,180	6,864	8,328

Moti of Jamshedpur

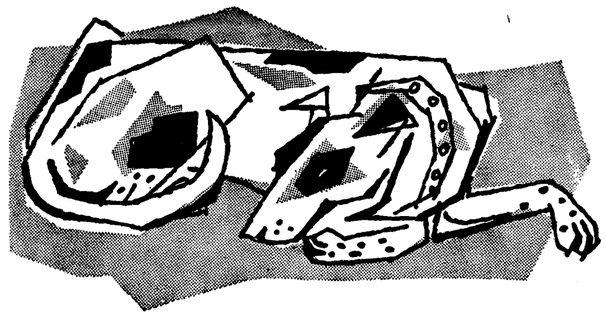
Not a show dog perhaps. But Moti doesn't worry about that. Nor about anything else, as long as he has enough to eat and the sun to bask in. Certainly he neither knows nor cares that he lives in Jamshedpur—a city devoted to producing one of today's most precious metals...steel.

Nor does Moti care to know that the town he lives in is the result of private enterprise... that the town produces steel for factories, houses, hospitals, railways and for the varied consumer needs of this modern age...that it is built and maintained by Tatas.

This is just one of the ways in which Tatas contribute to the growth and development of the country. In such widely differing fields as steel, textiles, electric power, chemicals, locomotives and engineering, machine tools, radios, air conditioning... private enterprise plays an important role.

It's a pity Moti knows nothing of all this. An individualist himself, he'd be the first to appreciate such private enterprise and initiative.

TATA INDUSTRIES Private LIMITED



Her heart with the right man her money with the right bank!

Let's face it. The most sensible gift for your daughter about to be married, is a Savings Account with the State Bank of India. Sensible because it will grow and multiply. In the years ahead it will be her friend in need. And in the evening of your life, you rest content, for you know her heart is with the right man, her money with the right bank. Could you ask for anything more?

Your Best Friend

Savings are a man's best friend. Keep your money safe, sound and earning good interest in a Savings Account with the State Bank of India. Savings Accounts can be opened with as little as Rs. 5/-.

Today over 1600 offices of the State Bank and its Subsidiaries serve the nation by holding in trust the savings of our people.

PERSPECTIVE ON COPPER

Smelters Based On Imported Ores Would Be Good For India

BY V. S. SWAMINATHAN

COPPER has been associated with the progress of civilisation since prehistoric times, possibly as long age as 6000 B.C. It was probably the second metal used by man, gold being the first. Definite records have been found of the working of copper mines of the Sinai Peninsula by King Seneferu about 3800 B.C. In the historic island of Cyprus, copper mining began about 2500 B.C. However, the acceleration in growth of world demand from 10,000 tons to four million tons annually has occurred in the past 150 years, largely as a result of the development of electric power and expansion of the brass and bronze industry.

Copper has numerous valuable properties that individually or in combination give it a wide variety of uses. Its main characteristics are high electrical and thermal conductivity, ductility, malleability, formability, strength and corrosion resistance. In addition, this metal has a pleasing colour, is non-magnetic and is easily finished by plating or lacquering: it can be welded, brazed and soldered satisfactorily. When it is desirable to improve certain of these basic properties, and when such an improvement can be effected without sacrificing any required qualities for a particular application, alloying often solves the problem. As a consequence, the popular commercial brasses, bronzes, copper-nickel alloys and nickel-silvers, to mention only a few, have been developed.

I

Uses

The use of copper and its alloys is well-nigh universal. They are virtually synonymous with all things electrical, and they have myriad outlets in construction, automobiles, aircraft, missiles, railroad equipment, marine equipment, appliances machinery and equipment, scientific instruments, utensils, jewellery, cladding and many other applications. Copper is used in virtually pure metallic form, primarily by the electrical industry in manufacturing generators, motors, electric locomotives, switchboards, telephone and telegraph equipment, light and power lines and other items.

The uses to which copper and its alloys are put vary from country to country. Here is how the U.S. consumed refined copper in 1961: wire mills 823,799 short tons, brass mills 599,756 short tons, chemical plants 1,269 short tons, secondary smelters 9,504 short tons, foundries 17,078 tons, and miscellaneous 11,415 short tons, making a total of 1,462,830 short tons. Reclamation of copper from scrap now provides nearly one-fourth of the U.S. supply. The U.K. is free world's second largest consumer of copper. In 1961, it used 582,900 tons of primary metal and 180,400 tons of copper in scrap or a total of 763,300 tons. World consumption of copper by leading countries is given in table 3.

Aluminium serves as a substitute for copper and its alloys in a number of electrical, mechanical and decorative appliances, while stainless steel, copper-clad metals and plastics have replaced copper for some uses. A study of the use of copper and aluminium in 1954 as compared with 1947 for selected product groups by the U.S. Business and Defence Services Administration shows the trend: in power transmission equipment, use of copper was *plus* 92 per cent and of aluminium 310 per cent; in radio and radio products, copper *plus* 74 per cent and aluminium 261 per cent; in engine electric equipment, copper *plus* 32 per cent and aluminium 556 per cent; in metal stampings, the use of copper dropped 27 per cent, while aluminium rose 25 per cent; in telephone and telegraph equipment copper fell 11 per cent but aluminium rose 170 per cent; and, in the grand total for all industrial groups, while the use of copper dropped 14 per cent, that of aluminium rose 104 per cent.

Sources

Copper occurs in many types of deposits associated with igneous, sedimentary and metamorphic rocks. Porphyry copper deposits make up most of the world's reserves, being found in Sweden, Western United States, Chile, Peru, and the U.S.S.R. In Central African copper belt, copper ores of Northern Rhodesia occur in sedimentary deposits underlain by metamorphic and igneous rocks and overlain by a series of thick sediments. At one time, the world's main source of the metal was cupiferous pyrite found in crystalline schists or slates in Spain, Cyprus, Turkey, Sweden and the United States. Vein deposits of copper are the result of filling open fissures, or of replacing wall rock along narrow cracks. A typical example of vein deposit is found at Butte, Montana, in the United States.

The world reserves of copper in terms of metal content are estimated at 170 million tons. The principal resources accounting for 93 per cent of this total are found in the following seven countries: Chile (46 million tons), U.S.A. (32.5 million tons), Northern Rhodesia (24.5 million tons), Congo (20 million tons), Soviet bloc (16 million tons), Peru (12.5 million tons) and Canada (17 million tons). The large quantity of copper in use and recoverable as scrap provides an additional dependable reserve of available copper. In the United States alone, it is of the order of 30 million tons.

Most of the copper produced in the United States comes from five Western States. Chile's output comes principally from three mines and that of Northern Rhodesia from four mines. Congo's copper comes from the properties of one company, and three mines supply nearly 75 per cent of Canadian copper production.

The porphyry copper deposits are mined principally by open pit or block caving methods. In 1958, for example, open pit mining accounted for 76 per cent of copper ore mined, and 71 per cent of copper produced, in the U.S. Most of present copper output comes from sulphide ores beneficiated by flotation. Smelting sulphide concentrate involves production of matte and slag in a reverberatory furnace and then oxidising the sulphur and iron in the matte in a converter to release copper metal. Impurities in the copper are removed by electrolytic or fire refining. Leaching followed by concentration or electrolysis is employed to recover copper from oxide ores—carbonates and silicates. Recovery of metal from mixed oxide-sulphide ores is more difficult, but is accomplished by ferric sulphide leaching or leach-precipitation-flotation. Today sulphides account for 85-90 per cent of world copper output, and oxides for 10-15 per cent, while native copper production is of the order of one per cent.

The concentration mills and smelters are usually near the main mines and some process customs ores. World mine production of copper (content of ore) averaged 3,280,000 short tons in 1952-56 and amounted to 4,850,000 short tons in 1961. World smelter output of the metal averaged 3,460,000 short tons during 1952-56 and was 5,060,000 short tons in 1961. Mine production of copper and smelter production of the metal by leading countries are found in tables I and II.

II

World Price Trends

While world production of refined copper was recently estimated at 4.6 million tons, consumption of both primary and secondary metal was 4.1 million tons. To correct the imbalance between demand and supply in world market, major producers in the U.S.A., Chile and Northern Rhodesia announced voluntary output cutback programmes and, with producers offering a price support policy, the price of copper held steady at £234 a ton in London Metal Exchange. In the U.S., too, the price of copper was steady around 31 cents per lb. The industry believed that it had entered an era of price stability unprecedented in the history of copper. The situation has, however, changed dramatically in the past few months.

In recent months, copper has shown increased price strength under the influence of a strong demand coupled with reduced production occasioned by strikes, both in the United States and elsewhere. Following the settlement of strikes which had plagued an American producer since 1st July 1964, the U.S. producer price of refined electrolytic copper was raised 2 cents per lb. to 34 cents late in September, the highest price since early 1957. Prior to being increased to 32 cents, the price had remained at 31 cents since May 1961, the longest period of stability in peace-time history.

The U.S. copper producers were reluctant to mark up prices, in view of the competitive substitutes, both metallic and non-metallic. But pressure, due to higher production costs stemming from labour settlements, scrap price being in excess of the refined quotation, reported pressure from the Chilean Government, and the sky-rocketing of prices in marginal markets proved too great to resist. American dealer copper, for example, has been selling as high as 55 cents per lb., while futures prices in New York and quotations on the London Metal Exchange, too, have been far in excess of the producer price. The U.S. producer price was also out of line with that of the foreign producer which in mid-August was stepped up 2 cents per lb. to 32.5 cents per lb., thereby bringing it 0.5 cent above the then U.S. price. At the time of writing, the U.S. producer price is 34.50 cents. Thus, the rise in the latter, once the major labour difficulties were resolved, was a foregone conclusion. Normally American producer price of copper, reflecting the U.S. import duty of 1.7 cents per lb., is above the foreign price. In India, too, the prices of electrolytic copper wire bar soared from Rs. 368 per kg. on 25th October 1963 to Rs. 451 on 27th October 1964. The boom in metals has come after a summer in which anticipated seasonal slackness of demand did not make itself felt. This has been followed by intensified autumn stock replenishment by industry, aided by critical shortage of supply. Thus prices for copper, tin, silver, mercury, tungsten, lead and zinc have all reached new heights in recent weeks.

During the short period, the prices of commodities are sensitive to the many complex economic and political forces which influence producers, merchants, consumers and brokers. Labour disputes at mines or docks, Governments' stockpiling policies, sudden dumping of metals by countries with surplus output, all find expression in the prices which represent the opinion of experienced dealers. These price fluctuations are valuable indicators to merchants and consumers of impending surplus or scarcity and as such they stimulate or postpone buying, or hasten or retard the provision of suppliers.

During the longer period, the trend of prices determines when adjustments are required to be made to the productive capacity of a metal. A too low price indicates over-production and has the effect of cutting back output of the higher cost sources, whilst a too high price encourages production from additional sources. The consumer benefits by being able to obtain supplies at all times from the most economically desirable sources at reasonable prices.

III

Position in India

Copper ore mines, many of which are uneconomic under modern conditions, were worked centuries ago in Bihar, Rajasthan, Andhra Pradesh and other areas in India. The use of copper and its alloys was initially restricted to domestic utensils. This red metal and its alloys helped the early Indian craftsmen to display their rare skill in casting and moulding. Yet it is only in the present century that copper achieved an importance next only to steel. The increased reliance on electricity has led to enhanced consumption of the metal, since copper cables brought power to factories and homes situated in distant parts. In addition, copper and its alloys constitute components of the engineering, building, transport, communications and other industries.

Copper is known to have been produced in the Singhbhum district of Bihar some 3,000 years ago. Later, owing to political turmoils and vicissitudes through which the region passed in the succeeding centuries, the industry lost its ground and eventually disappeared from the scene. In 1839, Mr. Wilson Jones reported the occurrence of copper ore deposits in this region extending over an area of 80 miles. In Rajasthan, too, copper ores are found in the Khetri and Daribo districts. The Indian Bureau of Mines has proved a prospective reserve of 28 millon tons of ore in the Khetri belt containing 0.8 per cent copper. The tenor of ore at Daribo is stated to be somewhat higher. The recent finds in the Roam Sideswar block of Singhbhum district is esti-

mated to have a reserve of 18 million tons containing 2 per cent copper at a depth of 600 metres from the surface.

Early in 1857 a private concern, Singhbhum Copper Company, was formed to undertake mining operations at Seraikela, Nandup and Jamjora areas in Bihar. This firm got into financial difficulties, and went into liquidation within the next two years. Thereafter, another company, the Hindustan Copper Company, was established and commenced commercial operations in 1862, but it met with the same fate as its predecessor. Yet another concern, Rajdoha Mining Company, tried its luck in 1891, but paucity of funds compelled it to abandon its efforts. The successive failures of these companies disheartened private initiative.

Following the detailed investigation of the ore resources of this region by the Geological Survey of India in 1906-08, interest in the copper belt revived. The Cape Copper Company took over the Rakha mine of Rajdoha Mining Company in 1908, and set up a milling plant and commenced production in 1914. The smelting of ore began in 1918. Meanwhile, this Company also ran into financial difficulties and. its activities came to an end in 1923. During this period, the Cordoba Copper Company, managed by John Taylor and Sons, obtained a leasehold option from the Cape Copper Company in the Mosabani area covering 20 sq. miles. This Company was eventually reconstituted into Indian Copper Corporation in 1924. Three years later a concentration plant and a smelter were erected, and actual production of copper was started in Ghatsila a year later. that is, in 1928.

Since then, the Indian Copper Corporation has been the sole producer of copper in India. The entire output is of fire-refined quality, and the country's electrolytic requirements of copper are met by imports. This Company has in hand a project, based on imported blister copper, envisaging production of 8,400 tonnes electrolytic metal annually.

India's demand for copper which was 56,000 tonnes in 1958, rose to 130,000 tonnes in 1963, and is reckoned to reach 250,000 tonnes by 1970-71. Indigenous production went up from 7,697 tonnes in 1958 to nearly 10,000 tonnes in 1963, and is projected, on paper though, to go upto 90,000 tonnes by 1970-71. Already the copper import bill has gone up from Rs. 17.8 crores in 1959-60 to Rs. 26.7 crores in 1963-64. It may rise further to nearly Rs. 50 crores by 1970-71. India's imports of copper and projected demand for the metal are given in tables 4 and 5.

IV

Controls on Imports

The Minerals and Metals Trading Corporation (M.M.T.C.) was formed on 1st October 1964, and it took over the functions of the S.T.C. with regard to import and distribution of non-ferrous metals. For the eleven months from 1st October 1963 to 31st August 1964, the M.M.T.C. had contracted for 17,180 tonnes of copper valued Rs. 6.56 crores to augment its stocks for distribution to actual consumers both in the small-scale and scheduled sectors. It also handles almost exclusively imports under rupee payment arrangements. At present, nearly 30 per cent of total imports of all non-ferrous metals is handled by the M.M.T.C.

Mr. D. P. Kajaria, President of E.I.M.M.A., complained in Calcutta on 1st October 1964 that the normal trade channel in the total imports of non-ferrous metals had declined from 75 per cent to 20 per cent, because of the withdrawal of non-ferrous items from o.g.l. and the banning of imports or tightening of import restrictions. Import canalisation through M.M.T.C. had elbowed out a large number of established importers from the avocation of their life. Matters arising out of import control of non-ferrous metals were raised in the Port Import Advisory Committee meetings held at the office of Mr. A. K. Sen, Joint Chief Controller of Imports and Exports, and suggestions made by it were forwarded to the Chief Controller for consideration.

The quota percentage for established copper importers for copper scrap, whether ingotted or otherwise, fall under Sl. No. 42/1; copper unwrought and in the form of ingot, etc., fall under Sl. No. 47/1: brass, bronze and similar alloys. unwrought and in the form of ingot, fall under Sl. No. 46(A)/1 and silicon falls under Sl. No. 122 (XLIV). Imports under these were not below 50 per cent, which, Mr. Sen hoped the members of E.I.M.M.A. would agree, was not small. In the case of copper unwrought falling under Sl. No. 47/1, it was as high as 100 per cent, he said.

The quota percentage for established importers falling under Sl. No. 44(A)/1 has remained at 30 per cent during the last three licensing periods. With brass, bronze and similar alloys, unwrought and in the form of ingot and scrap, etc., falling under Sl. 46(A)/1, apart from the fact that the quota percentage remained at 50 during the last three periods, the question of extension of the basic period for this item is under consideration.

The Minerals and Metals Trading Corporation makes imports against funds available from free resources from U.S. Aid programmes and Colombo Plan allocations. Purchases are effected either by direct negotiations, or by inviting competitive tenders from the overseas suppliers. Imported metals are stocked in its own godowns. In accordance with the provisions of the Non-Ferrous Metals Control Order, the M.M.T.C's selling price of copper to the allottees are fixed at the landed cost *plus* a margin of 3.5 per cent. The corporaton charges on its sale prices to State nominees a lower margin of profit, i.e., 2.5 per cent in the case of copper.

V

Research

The Metals Research Committee and the Mechanical Engineering Research Committee of the C.S.I.R. have undertaken a detailed study of scarce base metals. They have been asked to make specific recommendations on the substitution of such metals by others and their alloys in more abundant supply. A report drawn up by the Director of N.M.L. and Dr. B. D. Kalekar and Mr. K. N. P. Rao, on substitution of copper and other scarce non-ferrous metals by aluminium and other metals available indigenously, is to form the basis of the survey. The Defence Research and Development Organisation has suggested that the production of aluminium and titanium should be increased.

A saving of Rs. 35 lakhs was made during 1961-63 by substituting aluminium for copper in cable industry. The use of aluminium in place of copper in switchgear panels is under study. The utilisation of aluminium die-cast motors in electric motors and fans which has been started on a limited scale would eventually result in an annual saving of copper worth Rs. 40-50 lakhs. There is divergence of opinion among experts on the use of aluminium and its alloys in air conditioning and refrigeration equipment. This problem is under further study. Considerable work would have to be done before copper can be replaced by aluminium in automobile industry. It is estimated that copper and nickel worth Rs. 90 lakhs a year can be saved if copper and nickel alloys are mainly used in ten, five and two-paise coins.

VI

Production Plans

Rather belatedly. the Ministry of Steel and Mines is to initiate advance action to achieve an output target of 62,700 tonnes of copper from native ores during the fourth Plan. Another 30,000 tonnes is planned to be produced from imported concentrates. Projects included in the next Plan include the Khetri project with a capacity of 21,000 tonnes, the Indian Copper Corporation project of 12,700 tonnes, Kolihan, Rakha Mines, Agnigudala and Dickchu projects with a total of 29,000 tonnes.

The Khetri project was originally scheduled to go into production in 1966, but, in view of its enlarged scope, output is now expected to commence a year later. A supplementary agreement is being entered into with the American consultants. Western Knapp Engineering Company. It is proposed to install a flash type smelter at Khetri for easy recovery of sulphur dioxide and its utilisation in the manufacture of sulphuric acid.

The Kolihan deposits near Khetri, it is estimated, can sustain a production unit of 10,000 tonnes capacity. The National Minerals Development Corporation has been asked to prepare a feasibility report for siting a smelter in Rakha-Sideswar area of Singhbhum copper belt in Bihar. The copper deposits of Agnigudala in Guntur district in Andhra are admittedly small, and would only be adequate for producing 2,000 to 3,000 tonnes of copper. The concentrates obtained from Sikkim deposits would be taken to Ghatsila in Bihar to be smelted by the I.C.C. plant. Output of 500 tonnes of copper would be feasible from Rangpo deposits before the end of the current Plan period, and another 1,000 tonnes of metal could be had from the Dickchu mine in Sikkim.

VII

Always Too Late and Too Little

To conclude, what is needed in the case of copper, as indeed with non-ferrous metals in general, is planned action in the fields of prospecting. mining, concentrating, smelting and refining. Copper concentrates are available in the international market at more favourable and less fluctuating prices than the metal. Countries with large surplus production like Northern Rhodesia and Chile have expressed their willingness to enter into long-term contracts with India with price stipulations for delivery of concentrates. Indeed, West Germany and Italy have smelters based on imported copper concentrates. It would do India good to emulate their example. Lastly, there should be more rigorous control on the end uses of copper and its alloys, and a more assiduous and systematic search for its substitutes. The policy of the Government with regard to the development of base metals has, in practice, meant "too late and too little!" The time for action is here and now.

INDUSTRIAL GASES AND THE WELDING INDUSTRY

Progress Remarkable, But Much More Remains To Be Done

By A Special Correspondent

THE growth of the industrial gases and the welding industry is closely linked with (a) rapid changes in the production of iron and steel and (b) the growth of production and consumption of steel. Should steel production reach the estimated target by the end of the fourth Five-year Plan, it will inevitably generate an enormous demand for oxygen for purposes such as welding, cutting, heating, etc. By 1970-71, the demand may go up to nearly 2,000 million cubic feet per year. The corresponding rise in demand for acetylene is likely to be in the neighbourhood of 250 million cubic feet.

The revolutionary development in making steel, using huge quantities of oxygen in L.D. and other processes, has already brought about far-reaching changes in the industrial gases industry. The entire steel industry now relies heavily on oxygen for making steel, and all the three public-sector steel works are equipped with what is known as tonnage oxygen plants. There is no doubt that all the new steel works also will be similarly equipped. In the private sector, Tata Steel Works at Jamshedpur is also equipped with its own tonnage plant. In view of the vital role oxygen is playing in steel production, it is possible to assert that the future of oxygen really lies in steel. The estimated demand for oxygen for making steel is likely to rise to 1,400 tons per day by 1965-66 and to nearly 4,000 tons per day by 1970-71.

Scope for Expansion

If present research regarding application of oxygen for blast furnace factories yields fruitful results, then, literally, the sky will be the limit for demand for oxygen. This acceleration of the industrial gases industry in India is a reflection of similar development the world over. With the development of welding as a specialised branch of technology and exchange of ideas and information on international levels, new vistas have opened up before the welding industry.

In India, happily, within the last thirty years, practically all the major welding processes have been successfully introduced. Partly to ensure regional self-sufficiency in addition to national adequacy of capacity, the Government has granted manufacturing licences for industrial gases to 33 new firms up-to-date. About half of them have installed plants. A few have gone on stream.

The tardiness with which new plants have been installed points to several important aspects of the industry, such as its capital-intensive nature and the extreme importance of economies of scale. It is interesting to note that, although due to increases in cost of power and labour, selling prices for oxygen have shown an upward trend, the average realised selling price is lower than that obtained more than twenty years ago. This is an achievement which arises directly out of the economies resulting from the increasing scale of operations of the main existing units.

Argonarc Welding

Large-scale use of stainless steel, heat-resistant steel, aluminium, copper, nickel and their alloys was severely handicapped till recently because of the proneness of these metals to oxidise during welding. The problem has now been overcome with the introduction of argonarc welding. The process allows these difficult metals to be easily welded in an inert atmosphere of argon, thus preventing oxidisation. The growing emphasis on the use of these metals in industries is evident from the following production targets envisaged under the third Plan:

	1965-66 *Tons per year*
Stainless steel and special steels ..	100,000
Aluminium	87,000
Copper	20,000

The industrial gases industry responded to this new emphasis by setting up an argon purification plant at Asansol in 1961 which is now producing approximately 2 million cubic feet of argon per year. The second argon purification plant of India will soon be installed in Bombay. This move is expected to make the country self-sufficient in argon.

Automatic and Semi-automatic Welding

The object was to devise automatic means of maintaining a constant arc length in precision welding which was not practicable as long as the somewhat unreliable human factor in welding could not be eliminated. The answer was automatic and semi-automatic arc welding.

Automatic arc welding is broadly categorised into open arc and submerged arc processes. The Fusarc/CO_2 is a comparatively new development in the open arc process. This is widely used in India in the manufacture of road rollers, penstock pipe, water mains, ships and petrol wagons.

Equally familiar to Indian industry is the submerged arc automatic welding process. The Unionmelt process has been used in the locomotive industry and also in the manufacture of penstock at Jog Falls and Koyna Project.

Semi-automatic arc welding of aluminium and stainless steel, as observed earlier, has been in use for quite some time. Aluminium carbonating towers, stainless steel vessels for chemical and fertiliser industries, bus-bars for the aluminium industry and fabrications for atomic reactors are some of the jobs which have been done with the help of semi-automatic welding.

Two recent developments in semi-automatic arc welding of mild steel, namely Bare Wire/Co_2 and the Unionarc processes, will prove highly efficient in the manufacture of B.O.X. wagons, automobiles and transformers.

The scope for automatic and semi-automatic welding in Indian industries is continually expanding. One nagging obstacle is the lack of indigenous facilities for the manufacture of complex equipment necessary for these processes. Plans are, however, being actively pursued to begin local manufacture and to reduce and eventually to do away with import of equipment.

A modest beginning in this direction has already been made. Practically, all equipment for gas and manual arc welding are now being made in India.

Until 1957, all gas and manual arc welding equipment had to be imported. But soon the soaring demand outstripped the meagre foreign exchange available for imports. Urgent measures were called for to initiate indigenous manufacture. The first equipment factory was thus established in Calcutta, which is still today the only one of its kind functioning in India. It has overcome the initial difficulties in respect of raw materials, standards, quality control, etc., and now turns out a wide range of welding, cutting and heating blowpipes, cutting machines, regulators, gas valves and a host of accessories.

In order to increase production, this factory will soon undergo a large expansion plan, while licences have been granted to four new independent units in the country to manufacture similar equipment.

Arc Welding Electrodes

The growing use of arc welding can be gleaned in the emphasis the Planning Commission has placed on the production of general and special purpose electrodes. By 1965-66, the welding industry is to turn out 900 million feet of electrodes per year. The current production is of the order of 500 million feet per year; and, if the industry fails to achieve the Plan target, the reasons for such performance will have to be partly attributed to factors beyond the control of the industry.

Shortage of core wire, the most important raw material, has dogged electrode production ever since the first batch of indigenous electrodes were extruded in 1947. Large quantities of core wire had to be imported for a long time and even when the Indian Steel Works began core wire manufacture, the welding industry had to wage protracted battle of wits against any lowering of standards of electrode quality steel. Finally, largely at the initiative of Indian Oxygen Limited, Bhilai Steelworks took over the responsibility of supplying the entire quantity of electrode quality steel required in the country. Initial deliveries have already been made and these have been found satisfactory.

So far only two established firms have been manufacturing electrodes. Recently manufacturing licences have been granted to 17 new units. Only six of these have installed plants and fewer still have gone into production.

Plant Manufacture

This development poses a new challenge to the industrial gases industry. The need for complete oxygen plants for steel, fertiliser and other heavy industries using huge quantities of oxygen is a distinct possibility in the very near future. With the avowed national aspiration of self-sufficiency in every possible direction, the industrial gases industry is actively considering plans to manufacture small to medium size oxygen plants.

Liquid Oxygen Explosives

Oxygen has found its way to the mining industry too in the form of liquid oxygen explosives (LOX). This is a unique innovation and LOX explosives are now widely used in practically all the open-cast mines of India for blasting purposes. In certain respects LOX compares more than favourably with conventional explosives, and its production is estimated to rise to 9,000 tons per year by the end of the third Plan.

Export efforts of the industry have been severely restricted by its heavy commitments at home. But, for some time now, electrodes and nitrous oxide are being exported to large areas of South-East Asia.

Research and Development

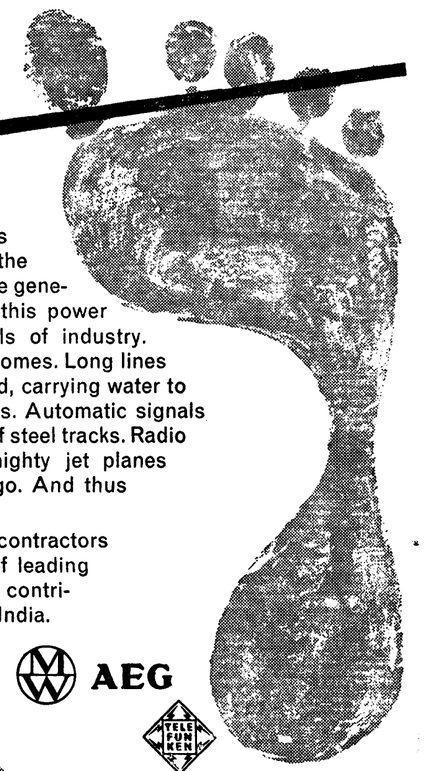
From gas to automatic welding, from electrodes to welding transformers, from high flying oxygen used in aviation to liquid oxygen explosives for mining—all in just thirty years—the industrial gases industry has come a long way and is now one of the highly diversified industries of India. Nearly three dozen new firms have entered the field and at least eight of them are armed with foreign collaboration. Total fixed investment in the industry (for oxygen and dissolved acetylene alone) stand at Rs. 11 crores during the third Plan period. A decisive factor of growth at this stage will be the ability of the industry to organise research and development. The pioneers of the industry have sorted out the teething troubles of quality and standardisation. When Indian Oxygen began operating thirty years ago, there were no Indian standards for the various industrial gases, electrodes, the welding processes or for the user equipment. Over the years, the industry has worked hand in hand with the Indian Standards Institution and have formulated Indian standards to cover practically the entire range of its operations. Quality-consciousness has emerged at both the manufacturers' and the users' end. Now is the time to begin thinking in terms of advanced research. Exciting innovations abroad are frequently reported. The Plasma-arc process, Electron Beam welding and that breath-taking break-through—the LASER—have pushed the horizon of welding to dizzy distances. Many basic applications of cryogenics have become closely allied to welding technology. The full impact of these revolutionary innovations will undoubtedly take a long time to make itself felt in India where the classical paradox of the jet plane and the bullock-cart prevails in the industrial gases industry too. While the lion's share of the industry's turnover comes from the handful of heavy engineering and steel works using liquid oxygen and advanced processes, the overwhelming majority of consumers are still the little wayside welders. This is, perhaps, not the proper background for the glamour and excitement of advanced research. But somewhere, sometime a beginning has to be made.

POCKET INSTRUMENT FOR SORTING METAL

A pocket-sized instrument for sorting mixed batches of steel has been produced by a British firm. The instrument has two functions—segregating different types of steel alloys and sorting heat treated steel. A typical application is sorting steel rod or bar when coding labels have been lost and it is particularly suitable for checking mixed batches of components on the shop floor. The instrument, built on a printed circuit board incorporating transistors and sub-miniature components, is battery-powered. It measures 4¾ in. long, 2½ in. wide and 1⅜ in. deep. The instrument operates through a 3 in. self-contained probe or hand coil, connected to the main instrument. The probe has a V base to enable it to be placed on the centre of bar or rod of different diameters. The hand coil is more sensitive and can be used with racked or machinery components.

DONATE LIBERALLY TO THE NATIONAL DEFENCE FUND

STEPPING OUT TO TOMORROW



Day by day, month by month, the face of India changes fast. Mighty steel penstocks guide the rushing river waters to turn the turbines to produce electric power. Massive generators, dotted across the country, send this power vibrating along wires to turn the wheels of industry. Electric lamps are switched on in village homes. Long lines of steel pipes girdle vast stretches of land, carrying water to thirsty villages and liquid gold to refineries. Automatic signals guide rolling wheels along a criss-cross of steel tracks. Radio waves race across the skies to help mighty jet planes land on our soil with their precious cargo. And thus a nation steps out to tomorrow.

As electrical and mechanical contractors and maintenance specialists on behalf of leading West German manufacturers, we too are contributing our bit towards building a new India.

THE CHALLENGE OF FEEDING OUR MILLIONS

Chemical Fertilizers—Key To Raising Agricultural Production

(Contributed)

IN the context of the present food position, it is of the utmost importance that India should make an all-out effort to raise its agricultural production. The indispensable role of chemical fertilisers in the production of the nation's food is now well recognised. A high level of agricultural production cannot be achieved with the low productivity of the soil. A corrective must be applied and applied quickly. As a result of continuous cropping over the years, the soil has been depleted. This deficiency must be met by restoring plant foods to the soil. Among the main plant foods are nitrogen, phosphorus and potash and these are used in large quantities by crops. How to restore these to the soil? One way of doing this is to apply farmyard manure and other organic manures, but the limiting factor is that they are not available in quantities required and are of low concentration in terms of plant nutrients. This underlines the urgent need of supplements in the form of chemical fertilisers, which supply the various plant needs in an easily available form.

We still have to go a long way towards meeting the demand for chemical fertilisers in terms of these three major plant nutrients keeping in view our area and population. While India's fertiliser consumption per hectare of agricultural land (in terms of nitrogen, phosphorus and potash) is 2.43 kg., in France it is 67.12 kg., West Germany 160.65 kg., Italy 41.88 kg., Netherlands 203.15 kg. United Kingdom 70.12 kg., U.S.A. 16.65 kg., Japan 233.69 kg. and U.A.R. 94.78 kg.

Third Plan Targets

In the context of the rapidly increasing demand for chemical fertilisers, the third Five-year Plan has set a consumption target of one million tons in terms of nitrogen, 400,000 tons in terms of phosphate and 200,000 tons in terms of potash. In order to meet these consumption targets, an additional capacity of over one million tons of nitrogen was licensed for installation. The existing nitrogen production capacity is 366,550 tons, while the current production, mostly in the public sector, is about 270,000 tons. Out of this existing installed capacity, 348,300 tons are in the public sector and 18,250 tons in the private sector. The capacity licensed is 1,001,250 tons out of which 425,000 tons are in the public sector and 576,250 tons in the private sector.

The broad picture of the fertiliser industry as it emerges today is as follows: There are now seven factories producing nitrogenous fertilisers. In the public sector, under the Fertilizer Corporation of India, there are two—Sindri (117,000 tons nitrogen annually) in the form of ammonium sulphate, ammonium sulphate-nitrate and urea; Nangal (80,000 tons nitrogen annually) in the form of calcium ammonium nitrate. In addition there are three other factories in the public sector: Rourkela under Hindustan Steel (120,000 tons nitrogen annually) in the form of calcium ammonium nitrate, Alwaye under F.A.C.T. (30,000 tons nitrogen annually) in the form of ammonium sulphate, ammonium phosphate and ammonium chloride and Belagula under Mysore Chemicals and Fertilizers (1,300 tons nitrogen annually) in the form of ammonium sulphate. The remaining two are in the private sector: Varanasi under Sahu-Jain Chemicals (10,000 tons nitrogen annually) in the form of ammonium chloride and Ennore under E.I.D. Parry (8,250 tons nitrogen annually) in the form of ammonium phosphate.

Public Sector Projects

So far as new projects are concerned, four are under implementation by the Fertilizer Corporation of India—Trombay (Maharashtra), Namrup (Assam), Gorakhpur (U.P.) and Korba (Madhya Pradesh). Good progress has been made with all these. The Trombay factory is expected to be commissioned in the beginning of 1965. It is designed to produce 90,000 tons of nitrogen and 45,000 tons of phosphate in the form of 99,000 tons of urea and 330,000 tons annually of nitrophosphate (12.9:12.9), a complex containing both nitrogen and phosphorus.

The Namrup factory is designed to produce 45,000 tons of nitrogen per year in the form of 100,000 tons of ammonium sulphate and 55,000 tons of urea per year. The factory is expected to be ready for production in 1966-67.

The Gorakhpur factory is designed to produce 80,000 tons of nitrogen in the form of 174,000 tons of urea per year. The factory is expected to go into production in 1967-68.

The Korba factory (in Madhya Pradesh) will have an annual output of 100,000 tons of nitrogen in the form of 217,800 tons of urea. It is expected to go into production in 1967-68. Incidentally, this factory was to have been established in the private sector, but was later assigned to the public sector.

The third stage of the expansion programme of F.A.C.T. (Alwaye) is expected to be completed by 1965 as scheduled. This programme will raise its capacity to 70,000 tons of fixed nitrogen and 33,500 tons of phosphate per year.

Another factory in the public sector, which is being established as part of the Lignite Project at Neyveli in Madras, is expected to go into production in 1965. This factory is designed to produce 70,000 tons of nitrogen per year in the form of urea.

Private Sector Projects

Of the eight private sector projects which have been licensed, progress has been made in respect of only four, namely, those at Visakhapatnam (Andhra Pradesh) under Coramandel Fertilizer (80,000 tons nitrogen annually) in the form of ammonium phosphate and urea, Baroda under Gujarat State Fertilizer Company (96,000 tons nitrogen capacity annually) in the form of urea and ammonium phosphate-sulphate, Kothagudem (Andhra Pradesh) under Andhra Sugars Ltd. (80,000 tons nitrogen capacity annually) in the form of urea and Ennore (Madras) under E.I.D. Parry Group (8,250 tons nitrogen annually—expansion) in the form of ammonium phosphate.

It is now reckoned that the total indigenous production at the end of the Plan may be of the order of about 500,000 tons of nitrogen as against 800,000 tons of nitrogen initially assumed. The anticipated shortfall in production is mainly attributable to the slow progress in the implementation of the private sector projects.

As a measure of advance planning for the fourth Plan, the Fertilizer Corporation of India has been asked to investigate the feasibility of expanding the capacity of the existing factories at Sindri and Nangal and to undertake techno-economic studies in respect of possible location of new factories at Rihand (U.P.), Barauni (Bihar), Haldia (Bengal) and Rajasthan. It has been agreed in principle to go ahead with the Durgapur Project and preliminary work has been undertaken by the Fertilizer Corporation. The Durgapur factory will have a capacity of 100,000 tons in terms of nitrogen and 108,400 tons of phosphate (P_2O_5) per year in the form of ammonium phosphate-sulphate. This provisional capacity is now being revised.

F.A.C.T. has been asked to get prepared to plan for the establishment of two new factories, one in Cochin and the other in Madras, during the fourth Plan.

So far as phosphatic fertilisers are concerned, production at the end of 1962-63 was 80,000 tons in terms of phosphate. For some years, there have been no imports of straight phosphatic fertilisers and the country's requirements are being fully met by indigenous production. There are at present over 24 units producing superphosphate. The current offtake is below the available production capacity. Adequate capacity to cover the Plan target of 400,000 tons in terms of phosphate has been licensed. This includes complex fertilisers such as ammonium phosphate and nitrophosphate.

Fourth Plan Perspective

If India has to become self-sufficient in food, the first step is that we should become self-sufficient in our fertiliser requirements. For some years, we have been spending on an average Rs. 25 to 30 crores annually on importing fertilisers to meet the gap between indigenous production and the actual demand. In addition, we have been importing many crores of rupees worth of foodgrains. A much larger expansion of our fertiliser production is, therefore, clearly indicated. The Planning Group on Fertiliser Industry has tentatively envisaged the target of fertiliser production at two million tons of nitrogen and one million tons of phosphate (P_2O_5) and 0.35 million tons of potash (K_2O) by the end of the fourth Plan. This will pose a gigantic task both in terms of resources and technical manpower.

A new development has been the offer of an American consortium to build five giant fertiliser factories in India, each with a capacity of 200,000 tons of nitrogen per year, during the fourth Plan period. The consortium has now undertaken to submit feasibility reports concerning possible locations of these five factories to the Government of India by the end of this year. After these reports have been considered by the Government of India, a clear picture of the future development will be available.

The fertiliser industry is highly capital-intensive. So far, we have been mainly dependent on the supply of equipment and machinery for fertiliser factories from abroad and this has imposed a very heavy burden on our foreign exchange resources. All efforts will have to be made to explore the possibilities of indigenous manufacture of equipment and machinery for the expanding fertiliser industry. It is gratifying to learn that the Fertilizer Corporation of India has, through its Planning and Development Division, developed adequate technical know-how and experience to plan, design, engineer and build new fertiliser plants in the public sector. The pioneering effort was made by the Fertilizer Corporation when it built a major part of the Fertilizer Plant at Rourkela. The Ammonium Sulphate Plant at Namrup (Assam) is also being designed and built by the Fertilizer Corporation. The first plant that will be completely designed, engineered and built by this Division will be the Korba Plant. This central technical organisation is being strengthened to undertake departmental planning, designing, engineering, procurement and installation of major plants each of a capacity of one lakh tons of nitrogen annually during the fourth Plan period. The Corporation has also been successfully tackling the problem of training of technical personnel for manning its new projects.

It is noteworthy that F.A.C.T. also has its own design organisation and has developed the by-product gypsum process for ammonium sulphate production. It is going to undertake the establishment of two factories in the South, one in Madras and the other in Cochin.

Considering the magnitude of the task, engineering and process know-how will have to be developed considerably. It will be necessary to develop and expand efficient engineering and contracting organisation and also to provide fabrication facilities to produce specialised plant and equipment for factories that are to be set up during the fourth Plan period. When the Heavy Engineering Project at Ranchi now under construction commences production, a considerable advance will be made in the domestic production of equipment. It is significant that a special big-sized fabrication unit is being set up in the public sector to meet the future requirements of highly specialised equipment for fertiliser and petro-chemical industries.

Fertilizer Distribution and Prices

According to the current policy, the distribution of nitrogenous fertilizers is at present being handled by a trading scheme known as the Central Fertilizer Pool, administered by the Union Ministry of Food and Agriculture. The entire indigenous production and the imported fertilisers are taken over into the Pool and quotas are allotted to the various State Governments for distribution within the States through co-operatives and in some cases through commercial channels as well. Both the retention prices to the manufacturers and the Pool prices to different distribution points in the States are fixed by the Ministry of Food and Agriculture. While it is necessary that the prices of fertilisers to the farmers should be as economic as possible, the retention prices should be remunerative. The Fertilizer Corporation of India, the largest producer of nitrogenous fertilisers in the country, has endeavoured to keep the production costs as low as possible, so as to make fertilisers available at economic prices. But, in view of the increase in raw material prices and the deteriorating quality of raw materials and other factors, it has not been possible to effect an appreciable reduction in the cost of production of

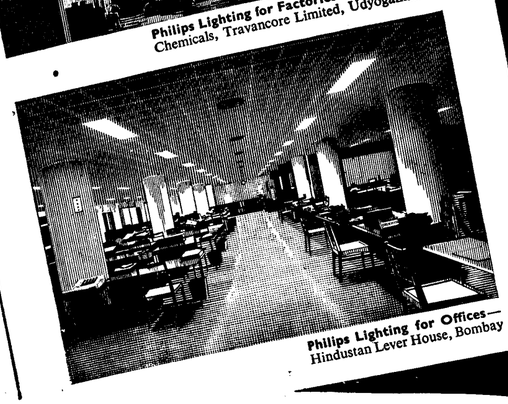
Philips Lighting for Factories—Fertilizers and Chemicals, Travancore Limited, Udyogamandal



Philips Lighting for Offices—Hindustan Lever House, Bombay

Correct, functional lighting, whether it is for a factory, office, shop or roadway, cannot be left to chance. It has to be *planned*... by people who have the experience and know-how. With their long experience of Indian conditions, and ready access to the vast resources of their international associates, Philips are fully equipped to design suitable lighting plans for every application. The Philips Lighting Service Bureau first studies the individual requirements of customers—then recommends the best and most economical lighting. And this expert Philips service is available *without obligation !*

Philips make in India a wide range of lamps, fittings and accessories to suit specific functional requirements. And in the widely varying and often severe Indian climatic conditions, Philips lighting equipment made to higher than international specifications, gives long, trouble-free service with minimum upkeep. That's why, all over India, Philips lighting equipment is specified for all-round economy.

ROAD AND ROAD TRANSPORT

Development Under III Plan—Perspective for IV Plan

By G. L. ANDERSON

PRESIDENT, INDIAN ROADS AND TRANSPORT DEVELOPMENT ASSOCIATION

BY common consent, India needs more and better roads. Inland surface transport as a whole has, in fact, lagged considerably behind the times, resulting in economic strangulation and a brake to every form of national activity. As is only too well known, with power, tansportation combines to form the very basis of developmental growth. Its fundamental importance makes it imperative to plan for it on a far wider perspective than the indices of both industrial and agricultural production. This unfortunately has not been the case in the three successive Five-year Plans in India, an anomaly which, by throwing the present economic complex off gear, has tended to jeopardise future planning in the country.

In assessing the progress recorded in road development during the first three years of the current plan, one finds that, despite the achievements made, the magnitude of the dimensions involved are in no way realistically aligned to the country's persistent needs. As a result of several additions to road development programmes undertaken to cater to the various needs of heavy traffic in the north-eastern regions, the total outlay on roads in the third Five-year Plan now stands at Rs. 416 crores, as against Rs. 324 crores envisaged at its commencement. This revised provision includes certain National Highways centrally-aided State roads and roads other than National highways in Sikkim. While the investment of Rs. 416 crores will at best touch the fringe of our mounting needs, an outlay of Rs. 590 crores as recommended by the framers of the Twenty-year Road Development Plan—though extremely modest in itself, would have catered to our marginal requirements more adequately.

National Highways

Owing to financial limitations, National Highway programmes seek to concentrate attention mainly on the development of the existing system by providing missing links, bridging unbridged crossings, improving existing low grade sections, etc. Of the 300 miles of missing road links, 35 major bridges and improvement on 3,000 miles of sub-standard sugments scheduled under the Plan, nearly 120 miles of missing roads, 20 major bridges and 1,200 miles of improvement on low-grade sections were completed by 1963-64. A sum of Rs. 18.12 crores was expended on maintenance and repairs during the first three years of the Plan, while expenditure on original works during the same period figured at Rs. 61.57 crores, including the Development Credit extended by the International Development Association, the World Bank affiliate.

The I.D.A. Development Credit of $60 million (approximating Rs. 29 crores) is intended for the financing of certain specified national highway works in the States of West Bengal, Orissa, Maharashtra and Bihar, as also on the Eastern Express Highway in Bombay. The credit includes a provision of $395,000 (Rs. 18.81 lakhs) for a techno-economic study of the traffic problems of Bombay City, and in addition provides for the purchase of road-building equipment for works forming part of the programme, estimated to cost Rs. 2.5 crores—the bulk of it to be imported from abroad.

Owing to the delay in the arrival of a number of imported items (including earth-moving and earth-compaction equipment) and the time expended in undertaking detailed investigations, collection of hydraulic data, finalisation of designs, etc., the works covered by the credit which were scheduled for completion at the end of September 1964, have now been extended to March 1966.

Statewise, the programmes in progress are as follows:

In ***Maharashtra,*** progress on the 13.63-mile Eastern Express Highway with a four-lane carriageway at an estimated cost of Rs. 194.47 lakhs, by 1963-64 was 49 per cent. On the 37.50-mile Ghodbunder-Manor section of National Highway No. 8, estimated to cost Rs. 200.85 lakhs, progress was only 16 per cent. With regard to major bridges on National Highway No. 8 in the State, the overall physical progress on the Rs. 100-lakh Bassein Creek bridge project, was about 4 per cent. On the Rs. 12.42-lakh Vaitarna bridge, progress is far better, at 45 per cent; and on the Tansa bridge being constructed at a cost of Rs. 12.42 lakhs, the work is in an advanced stage, with 60 per cent of overall physical progress recorded. On the Vandari bridge, the work done has been considerable at 63 per cent. On the Kaman Creek bridge, however, the collection of material was still in progress at the time of the mid-Plan appraisal.

In ***West Bengal,*** on the 25.21-mile by-pass from North Calcutta to Saptagram on the Delhi-Calcutta National Highway No. 2, a 15 per cent progress was recorded. This project is estimated to be completed at a cost of Rs. 367.6 lakhs. Twenty per cent of the 104.81-mile Joypurbeel-Bihar border on the Calcutta-Bombay National Highway No. 6 has been completed. Of the major bridges on National Highway No. 6, the construction of the Kangsabati bridge has been completed at a cost of Rs. 8.60 lakhs. The overall physical progress on the Rs. 116.0-lakh, Rupnarain bridge was 32 per cent in 1963-64.

In ***Bihar,*** work is in progress on sections of four National Highways—the 14-mile Chichra to Subernavekha section of National Highway No. 6, the 64-mile Muzaffarpur section of National Highway No. 28, the 100.95-mile stretch from Barauni to Phulweria on National Highway No. 31, and the 124.41 miles from Ranchi to Baharajora on National Highway No. 33.

The Mahananda bridge at Dingraghat on National Highway No. 31 has been completed in Bihar at a cost of Rs. 104.12 lakhs, and has already been opened to traffic. Work is still in progress on the Sone bridge on National Highway No. 2, estimated to cost Rs. 266 45 lakhs, and the Burhi Gandak bridge on National Highway No. 31, estimated to cost Rs. 48.88 lakhs. The physical progress on these two major bridges has been 27 per cent and 41 per cent, respectively.

In ***Orissa,*** the Cuttack-Bihar border section of 168-mile on National Highway No. 5, is being developed with a single-lane carriageway (except for a 7-mile stretch of dual carriageway) at a cost of Rs. 774.49 lakhs. The Birapa bridge on the same highway has been fully completed at a cost of Rs. 32.55 lakhs. Work is in progress on other major bridges including the Rs. 155.12-lakh Mahanadi bridge, the Rs. 48.27-lakh Brahmani bridge, the Rs. 61.00-lakh Baitarni bridge, the Rs. 41.50-lakh Kharsuan bridge, the Rs. 23.23-lakh Budabalang bridge, and the Rs. 15.25-lakh Salandi bridge—all to be constructed on National Highway No. 5.

Roads Other Than National Highways

As against the third Five-year Plan allocation of Rs. 2,718 lakhs for roads other than national highways in Union Territories including Nagaland (which became a full-fledged State of the Union in December 1963) and Sikkim, but excluding Goa, Daman, Diu and Pondicherry (provision for them being made under the budget of the Ministry of External Affairs), the actual expenditure incurred during the first three years of the Plan totals Rs. 1,112.88 lakhs. In addition, Rs. 275.86 lakhs have been spent on their repairs and maintenance.

Centrally-aided State Roads

In continuation of the Government of India's programme of helping State Governments in improving inter-State road communication facilities and undertaking road works of special economic importance in backward areas, except for a few new projects during the current Plan, there was concentration of activity mostly on projects carried over from the previous Plans. Expenditure on the various works under the programme totalled Rs. 1,118.75 lakhs during the 1961-62-1963-64 period. The States covered under it include Andhra Pradesh, Assam, Bihar, Gujarat, Jammu and Kashmir, Kerala, Maharashtra, Madhya Pradesh, Madras, Mysore, Orissa, Punjab, Rajasthan, U.P. and West Bengal. The special projects of the West Coast road and the Passi-Badarpur road also form part of this programme.

The total length of the ***West Coast Road*** is 763 miles, including the portion lying in Goa. The entire project is estimated to cost Rs. 24.42 crores—which includes an additional cost of Rs. 5.50 crores involved in aligning it through Goa. The third Plan provision, of Rs. 7.50 crores—which does not include the latter, is inadequate to complete this project, originated in April 1955. Though the allocation of Rs. 5.50 crores was provided for its Goa portion after the mid-Plan appraisal, additional funds will be required if the road is to be completed as far as possible during the current plan period.

Other important projects approved for Central financial assistance include the Pipri-Singruali road intended for connecting the coal-fields in Madhya Pradesh with the rail-head at Pimpri. Of the total estimate of Rs. 72.22 lakhs, Central aid accounts for 50 per cent, the remaining 50 per cent being met by the Governments of U.P. and M.P. The Jagdalpur-Dantewada-Kameli road is intended to provide a link to the iron ore deposits at Bailadilla in Madhya Pradesh, at a cost of Rs. 67.78 lakhs—50 per cent of the sum being given as a grant-in-aid and 50 per cent as loan. Further, the Hubli-Karwar road is being widened to two lanes in Mysore State, with a grant of Rs. 42.71 lakhs from the Centre.

Border Roads

The initial programme of the Border Road Development Board formed in March 1960 has been considerably extended to include the construction of a 3-ton road from Manali to Leh via Rohtang, and its connection with the rear link from Chandigarh to Manali via Nangal, Bilaspur and Mandi. As a result of this commitment, the construction mileage has been raised from 2,500 to 5,300, and improvements on existing roads from 1,500 to 2,300 miles. Up to the end of 1963, formation curving was completed on 1,453 miles (of which 860 miles were cut to 20 feet widths required for three-ton vehicles), 1,500 miles of existing roads were improved and over 600 miles were surfaced. The progress here is no doubt satisfactory, in view of the appreciable work involved in rock cutting and earth-moving in the Himalayan regions.

Road Transport

Steps have been taken since the inception of the third Five-year Plan to assist the development of road transport with particular emphasis on the formation of viable units in the industry. The State Financial Corporations Act of 1951 has been amended to make road transport operators eligible for financial assistance under it, and the Inter-State Transport Commission is taking measures to extend the facilities of long-distance inter-State traffic.

Expansion programmes for State Road Transport has proceeded according to the Plan, though, at the onset of the Emergency, the National Development Council recommended that, as far as possible, programmes for expanding the fleets of State Road Transport Undertakings, should be held back for some time. A Central road transport organisation has been established for maintaining essential supplies in the Assam-North Bengal area. It is proposed to set up a Central Organisation of State road transport undertakings with a view to securing uniformity in procedures and methods of operation in the procurement of supplies at economic rates.

With regard to the progress of automobile manufacture in the country, as against the target of 100,000 vehicles comprising 30,000 passenger cars, 60,000 commercial vehicles and 10,000 jeeps, the output at the close of the Plan in 1965-66 is expected to be 89,000; with the output of commercial vehicles estimated at 54,000. It is, however, expected that, with the completion of the expansion programmes including manufacture of approved engines, the target of 60,000 commercial vehicles may be reached during the first year of the fourth Plan. Moreover, on the basis of the foreign exchange releases made, it is being expected that the indigenous content of 90 per cent envisaged in the Plan, may be achieved by 1965-66.

Fourth Plan

While in absolute terms the growth and progress in India over the past decade and a half of planning has been appreciable, it has by no means been dramatic. The first Five-year Plan did not involve much well-directed or integrated planning: the second Five-year Plan was no doubt conceived within a more rigid framework but the foreign exchange crisis of 1957-58, along with the coal crisis arising out of severe transportation bottlenecks, combined to thwart achievement of income and production targets. With the third Five-year Plan, planning in the country was better stratified, but, as its mid-term appraisal has shown, the fourth Plan will have to start with a serious setback.

The prevailing complacency with regard to the so-called satisfactory transport situation today is entirely misplaced. It is being expressed solely on the ground that the railways are expected to fulfil their Plan target of 260 million tons as scheduled. What is simultaneously not being apreciated is that the country's demand for haulage capacity by no means ends with the railways. On the basis of national income projections, provision will have to be made for an additional minimum of 115 million tons of traffic at the commencement of the forthcoming Plan if the lessons of past shortages have to be avoided. The fact that road transport is being geared to cater at best for only 23 million tons of traffic and that the contributions of inland water transport and airways cannot be relied on for appreciable relief, goes to illustrate the gravity of a situation which is inescapable, unless massive allocations are made to liberate road transport in its fullest potential.

The charge that transport planning in India is railway-oriented is not entirely without its justification. Though the railways are by no means superfluous in the Indian context as in many advanced Western countries today (where they seem to be in an era of their twilight), they constitute an undoubted drag on the economy, particularly if it means diverting investment to them from an infinitely more efficient means of transport, namely, roads. Where inland surface transportation is concerned, ours is the age of roads—but roads which must be such as to cater for the efficient operation of heavy modern mechanised traffic as also to enable vehicles to use the speed built into them. The free flow of traffic alone can ensure the adequate operation of transportation networks. Cheap rail transport in itself cannot benefit the economy. The application of nineteenth century solutions to twentieth century problems will necessarily prove abortive.

Good Source of Employment

It is no exaggeration to claim that the United States economy owes its astronomic progress to road transport more than any other single industry. One business in every six is automotive, providing total employment to 11.9 million persons. Considering the tremendous employment potential of road transport—estimated at 11.63 persons per commercial truck, by the National Council of Applied Economic Research, and considering also the vital need to use surplus man-power for productive purposes in a consumption-oriented, unemployment economy, economic wisdom dictates the development of this strategic industry on as extensive a plane as possible.

Road transport has helped revitalise the growth structure of numerous economies, its benefits being particularly great in underdeveloped countries where the metropolis alone achieves balanced growth owing to a lack of homogeneity that characterises more advanced nations. Developed areas combine to grow; underdeveloped ones stagnate. To break out of this depressing spiral, it is necessary to move faster and further by channelising scarce resources more efficiently, and orienting investment into those channels where the gains to society are the greatest. In any scheme of planning it is imperative to give thought to the basic choices of development. An economically realistic appraisal of priority adjustments can only be arrived at by looking sufficiently ahead, with a fullness of determination to release the forces of dynamism.

PHARMACEUTICAL INDUSTRY

(*Concluded from page* 100)

high. It is obvious that, if medicines are to be made cheaper, the attack should not be on patents, which are not responsible for the alleged 'high' price. Raw material prices should be brought down, taxes should be reduced and import duties cut substantially so as to enable cost and prices to decline. Abrogation or weakening of patents is a wrong remedy for the disease of cost inflation for which patents are not the cause.

The pharmaceutical industry has a record of which it could be justly proud. It holds even greater promise for the future. When plans for the basic manufacture of pharmaceuticals were drawn up by the Development Council, there was a feeling, in certain quarters, that they were too optimistic and that many of them would fall by the wayside. But experience has proved otherwise and it is likely that even the most optimistic estimates would be surpassed.

The achievement of the pharmaceutical industry in future, as in the past, will not be confined only to reaching production targets but will also embrace other fields such as exports, quality, research and expansion of product-range. Research in India has already produced some encouraging results. Many more new products and processes may be expected to be evolved in future through pharmaceutical research which is growing fast in India too. Let us not halt this wheel of progress through hasty and ill-conceived steps of uncertain promise.

PAINTS TO KILL GERMS

Germ-killing paints will soon help to decrease the danger of infection caused by a number of tenacious microbes in hospitals and sanatoriums. Scientists at the West German Bayer Laboratories have developed a substance in years of experimentation that has an anti-microbe effect when added to paints. The highly effective substance (Preventol A 1 and A 2) that is completely harmless for humans is worked into paints used for walls and furniture. The germs that come to rest on these painted surfaces are killed or at least retarded in their development. The use of Preventol paint will not only prove to be a considerable improvement in the field of hygiene but will also be of great value when used in meeting halls, barracks, baths and wash rooms as well as in all public buildings. In addition, the new preparation can also be used to treat walls befallen by fungi.

Disinfected floors made of synthetic products and plastic fabrics treated with a substance related to the Preventol A group, namely, Preventol K I, can now also be manufactured. The scientists hope to be able to prevent the spreading of "athlete's foot" with their new anti-microbe floors and foot mats that are to be placed mainly in public swimming pools and wash rooms. In addition, the substance is said to have a strong anti-termite effect. Rubber gloves, aprons and mats can be treated with similar germ-killing and non-verminous preparations. Antimycoticum A, a third substance developed by the Bayer Company against pathogenous germs, can be used in processing rubber.

URBAN DEVELOPMENT IN MAHARASHTRA

Steps Taken In Recent Years Recalled

BY DR. RAFIQ ZAKARIA

MINISTER FOR URBAN DEVELOPMENT, MAHARASHTRA STATE

THE Maharashtra State comprises an area of 306,345 square kilometres, with a population of 40 million. About 30 per cent of the total population is residing in urban areas. According to the 1961 Census Report, an "urban area" is one which has a population of 5,000 and three-fourths of the male workers therein are engaged in non-agricultural pursuits.

Urban development means briefly the development of towns and cities with local self-government as the base for the purpose of providing the people with basic amenities such as water supply, drainage, street lights, etc.

Municipal Corporations: There are four municipal corporations in the State. The Bombay Municipal Corporation is governed by the Bombay Municipal Corporation Act, 1888; the Nagpur Municipal Corporation is governed by the City of Nagpur Corporation Act, 1948—and the Poona and Sholapur Corporations are administered under the Bombay Provincial Municipal Corporations Act, 1949.

The Government appointed a committee in July 1963 to recommend how the various Corporation Acts should be amended so as to provide for more rational distribution of powers between the deliberative wing (elected body) and the Executive Wing (headed by the Municipal Commissioner who is the chief executive officer). The Committee has just submitted its report to the Government—on 31st October, 1964, to be precise.

Some of the changes contemplated in the report are (i) a common cadre of class I and class II officers of municipal corporations, who will be recruited through a Municipal Service Commission, (ii) the setting up of a Co-ordination Committee headed by the Mayor which will function somewhat on the lines of the Cabinet in the State, and (iii) the setting up of a Development Board in each corporation area, somewhat on the lines of the Nagpur Improvement Trust. It is expected that, with the establishment of such Development Boards in each corporation area, it will be possible to execute development works speedily.

Municipalities: There are 219 municipalities in this State, governed by four municipal laws, namely, the Bombay District Municipal Act 1901; the Bombay Municipal Boroughs Act 1925; the Central Provinces and Berar Municipalities Act, 1922 and the Hyderabad District Municipalities Act, 1956. As the use of four Municipal Acts is administratively inconvenient, Government appointed a committee in July 1963 to recommend how the various Municipal Acts could be unified. The Committee has completed its work and submitted its report on 31st October 1964. It has recommended that the unified municipal law should contain some radical changes in the matter of constitution, term of office, controls, taxation structure and establishment of a common cadre for class I and class II officers of the municipalities to be recruited through a Municipal Service Commission.

Improvement Trust: There is only one improvement Trust in the State, that is, the Nagpur Improvement Trust, governed by the Nagpur Improvement Trust Act, 1936. The Improvement Trust is virtually the development wing of the Nagpur Municipal Corporation and executes all development works on behalf of the Corporation. An important feature of the Nagpur Improvement Trust is that the jurisdiction of the Trust can extend beyond the limits of the Nagpur Municipal Corporation for the purpose of carrying out the development works. The Nagpur Improvement Trust is not a taxing authority, except to the limit provided under Section 77 of the Nagpur Improvement Trust Act and its main source of income is from the sale of developed lands and the contributions which the Corporation and the State Government make to the Improvement Trust.

Cantonments: The cantonments are established by the Central Government under the Cantonments Act, 1924, where there is an appreciable concentration of military personnel and where the Central Government considers it necessary to constitute a special authority to administer local services. Under the Constitution of India, local self-government in cantonment areas is a Union subject and the State Government has no control over the administration of cantonments. The State Government, however enters into the picture when the cantonments and the neighbouring municipalities levy jointly certain taxes like octroi. There are seven cantonments in the State, namely, Poona, Kirkee, Deolali, Dehu Road, Ahmednagar, Kamptee and Aurangabad.

Town Planning: The Bombay Town Planning Act, 1954, applies to Western Maharashtra, while the Central Provinces and Berar Town Planning Act, 1948, applies to Vidarbha. So far as Marathwada is concerned, the provisions regarding Town Planning are included in the Hyderabad District Municipalities Act, 1956, and the Maharashtra Zilla Parishad and Panchayat Samitis Act, 1961. A Bill to unify the Town Planning law for the State has been passed in the legislature session at Nagpur.

Under the Bombay Town Planning Act 1954, every urban local body is required to prepare, within a specified period, a development plan for the entire area under its jurisdiction. The development plan gives a broad outline of the development of the entire urban area with reservation of lands for different users such as industrial, commercial, residential, etc. It is on the basis of the proposals made under the development plan that detailed individual town planning schemes are taken up for the development of specified localities in the urban area. In order that building activities should not come to a standstill pending the scrutiny of the development plan, it has been provided in the unified Town Planning law that Government will have power to sanction development plans in parts, if necessary.

The Bombay Development Plan: The Bombay Development Plan which has been prepared under the Bombay Town Planning Act, 1954, covers the entire area under the jurisdiction of the Bombay Municipal Corporation and contemplates an outlay of Rs. 700 crores. It has been prepared on the basis of the anticipated growth and needs in the ensuing 20 years. Under the said Act, Government has to sanction the plan with or without modifications, or refuse sanction, within a maximum period of 18 months. Government has appointed a retired consulting surveyor to Government as the Special Consulting Surveyor to scrutinise the plan, which is expected to be done within about six months. The recommendations of the Bombay Municipal Corporation and the Special Consulting Surveyor will be examined by the two High Level Committees to be appointed by the Government before taking a decision on the said Plan.

Urban Land Policy: An important question which arises in connection with town planning and development and valuation of lands is that of the policy to be adopted to keep down the prices of land at reasonable levels. The Government of India has accordingly constituted a committee on "Urban Land Policy." The work of this Committee is almost over and its report is expected shortly.

The Golden Jubilee of the Town Planning and Valuation Department: The State's Town Planning and Valuation Department was started in the year 1914 and has completed 50 years of service. Government has decided to celebrate the Golden Jubilee of this department in January 1965, when the fifth Conference of the State Ministers in charge of the Town and Country Planning and the tenth meeting of the Central Council of Local Self-government will be held in Bombay. On this occasion it is proposed to arrange an exhibition on town planning and public lectures by experts in India on the same subject.

Financial Assistance to Urban Local Bodies: The financial assistance given by the Government to urban local bodies is not statutory but purely voluntary. The pattern of financial assistance may change in view of the recommendations made by the two Committees set up for the purpose of (i) unification of Municipal Laws and (ii) the revision of the Municipal Corporation Acts. The Government of India has set up a committee under the chairmanship of the State Minister for Urban Development to consider the question of the augmentation of financial resources of urban local bodies in the whole country. That Committee's work has almost been completed and its report will be submitted to the Government of India shortly.

Water Supply and Drainage Schemes of Municipalities: Water supply and drainage schemes of municipalities are prepared and executed through the agency of the Public Health Engineering Organisation of the Government. Therefore, so far as water supply and drainage schemes are concerned, the municipalities have no difficulties; but, due to the shortage of technical personnel, the municipalities find it very difficult to secure qualified staff to advise them on other schemes of providing civic amenities. The Government has recently decided that the Public Health Engineering Organisation of the State Government should be made available to the municipalities for (a) advising them on schemes, other than water supply and drainage; (b) drawing up of such schemes; and (c) issuing completion certificates so as to enable the municipalities to claim subsidy on the works, wherever admissible.

The Superintending Engineer, Public Health Circle, Nagpur, used to look after the water supply and drainage schemes in the Marathwada and Vidarbha regions. Government has recently created a separate Public Health Circle at Aurangabad with three divisions to look after the schemes for that region.

An amount of Rs. 700 lakhs has been provided in the third Plan for payment of loans and grants to municipalities in the State for their water supply and drainage schemes. For financing the new schemes of the municipalities in the third Plan, the following policy has been laid down:

(i) 10 per cent of the capital cost of the scheme to be contributed by the municipality from its own resources.

(ii) 23¾ per cent or 40 per cent of the cost as grant-in-aid to major and minor municipalities respectively.

(iii) 66⅔ per cent or 50 per cent of the cost to be contributed by major and minor municipalities respectively from their own funds or by raising loans wholly or partly from the agency fixed by Government on Government guarantee. The Life Insurance Corporation of India has agreed to grant such loans.

The expenditure incurred by the Government so far on payment of loans and grants for municipal water supply and drainage schemes is as under:

(In lakhs of rupees)

	Loans	*Grants*	*Total*
(i) 1961-62	3.00	48.52	51.52
(ii) 1962-63	41.73	160.59	102.32
(iii) 1963-64	80.00	80.00	80.00
(iv) 1964-65 (proposed)	129.74	129.74	
Total ..	44.73	298.85	343.58

Development Plans of Municipalities: An allocation of Rs. 100 lakhs (Rs. 50 lakhs for loans and Rs. 50 lakhs for grants) has been made in the third Plan for payment of loans and grants to Municipalities for implementation of the proposals for provision of public amenities included in their development plans, prepared under the Town Planning Acts. So far, grants were being paid at the rate of 23¾ per cent and 40 per cent to the major and minor municipalities respectively, only to cover the cost of the acquisition of lands. Government has recently decided to increase the rate of grant to 33⅓ per cent and 50 per cent in respect of major and minor municipalities, respectively. The grants will now be paid not only for the acquisition of lands but also for the actual implementation of the works in the development plan. The balance of the cost will be paid as loans to municipalities. The borough municipalities in Western Maharashtra, the city municipalities in Marathwada and class I, II and III municipalities in Vidarbha are "major" municipalities. The rest are "minor" municipalities.

Bombay Municipal Corporation Co-ordination Committee: The Bombay Municipal Corporation poses special problems and it is necessary in order to solve these problems to co-ordinate the views and the activities of the Government on one hand and the Corporation on the

COMMERCIAL BANKS & AGRICULTURAL CREDIT

Is There Scope For Significant Role?

By N. M. CHOKSHI
MANAGING DIRECTOR, BANK OF BARODA LTD.

OF late, a question that is frequently asked is this: "Why have the scheduled banks neglected agriculture, the key sector of our national economy?" It is pointed out that agriculture, which contributes about 45 per cent to the national income and employs 70 per cent of the total labour force, got in 1962-63 a paltry sum of Rs. 4 crores only out of the total scheduled banks' advances of Rs. 1,611 crores. In other words, agriculture received less than even 30 paise out of every hundred rupees advanced by scheduled banks. What is more disconcerting than this meagre sum is the declining trend of the share of agriculture in the total bank advances, accompanied by wide year-to-year fluctuations.

TABLE 1

Share of Agriculture in the Total Bank Advances

(Rs. in crores)

Year	Advances		Percentage share of agriculture
	Agricultural	Total	
1	2	3	4
1951	13.0	579.7	2.2
1952	21.1	508.8	4.2
1953	11.9	497.7	2.4
1954	4.5	557.0	0.8
1955	11.3	644.9	1.8
1956	13.8	793.6	1.7
1957	24.2	880.6	2.7
1958	21.6	831.5	2.6
1959	25.7	935.7	2.7
1960	6.6	1,118.4	0.6
1961	8.4	1,226.9	0.7
1962-63 ..	4.0	1,611.0	0.3

The problems faced by scheduled banks in the field of agricultural credit have come to the fore mainly for three reasons. First, credit requirements of Indian agriculture have been mounting up year after year. For instance, they are expected to rise to Rs. 1,385 crores in 1965-66—the last year of the third Plan—from Rs. 750 crores in 1951-52. Although the co-operative credit system has been providing a larger volume of credit, supply is far short of demand. Co-operative agricultural credit societies advanced around Rs. 250 crores in 1962-63. Assuming that the co-operative system succeeds in advancing the targeted sum of Rs. 530 crores by the end of the third Plan (which appears improbable), there would still be a gap of Rs. 850-900 crores.

It is argued that scheduled banks, being the biggest and most important of the Indian financial system, should shoulder the burden of meeting the rising "credit hunger" of agriculture. Even in the highest quarters of policy-making, it is suggested that scheduled banks' credit should be disbursed in accordance with Plan priorities. It is argued that, since agriculture will come to occupy the top priority in the fourth Plan, a corresponding revision in the lending policies of scheduled banks is called for. At present, the entire burden of servicing credit requirements of agriculture rests on the Reserve Bank and, to some extent, the State Bank. It is suggested that, in the interest of monetary stability, scheduled banks should help in sharing the burden of agricultural development. A prosperous agriculture is as much in the interest of the banking system as in that of the national economy.

The case for a larger share of agriculture in scheduled bank advances is usually built on the experiences of advanced countries. Owing mainly to the lack of reliable data, it is difficult to determine the extent of assistance provided by banks to the agricultural sector in underdeveloped countries. The table below shows the percentage share of agriculture in total bank advances in a few developed countries for the year 1933.

TABLE 2

Share of Agriculture in Total Bank Advances

Country	Percentage share
U.K.	9.8
U.S.A.	5.1
West Germany	8.7
Italy	5.2
Sweden	12.7
Japan	5.0
India	0.3

In Britain by far the largest institutional source of credit for agriculture is banks. The proportion of total bank advances which has gone to agriculture in recent years has averaged around 10 per cent; this may be compared with agriculture's contribution of about 4 per cent to the gross national income.

In the United States, credit extended to agriculture is divided into (1) farm mortgage credit, and (2) non-real estate credit. Commercial banks are the second largest suppliers of mortgage loans, accounting for one-fourth of the volume of mortgages recorded in the course of the last few years. The most striking feature of the non-real estate credit is the domination of commercial banks as a source of these funds. Since 1949, they account for about 70 per cent of the loans held by the lending institutions.

In West Germany, the situation in respect of farm finance is very similar to that in Britain.

In Italy, farmers receive credit from regional banks, the operations of which are confined to certain regions only. These regional banks bear a close resemblance to our small banks. In addition, there are rural banks specialising in farm credit.

In Japan, the share of agriculture in bank advances is around 5 per cent. The most important source of agricultural finance is the co-operative movement—its share being around 45 per cent.

An Important Difference

Commercial banks in advanced countries play an important role in the provision of agricultural credit, because agriculture in these countries is carried out strictly on commercial lines. The average size of holdings is fairly big, farm operations are highly mechanised, a substantial portion of agricultural produce is marketed and, in his motivation and behaviour, an agricultural entrepreneur is very similar to his counterpart in industry. Agriculture in underdeveloped countries like India, on the contrary, is of a subsistence nature, producing food crops mainly for self-consumption. The size of an average holding is very small and usually divided into a number of fragments. The economic standard of farm operations is very low. Moreover, a large part of the working funds which the subsistence farmer needs has the appearance of being related to his consumption rather than to his production.

In India, further and more complicated elements are introduced into the problem by reason of the socio-economic structure of the village with its characteristics of caste and inequality. A study conducted by E.C.A.F.E. (U.N.) on "Credit Problems of Small Farmers in Asia and Far East" (1957) leads to an important conclusion. In all underdeveloped countries, an unsatisfactory agricultural situation makes it difficult to institutionalise credit, which, as a result, remains largely in the hands of private credit agencies like the moneylender.

TABLE 3

Per Capita Utilisation of Institutional Agricultural Credit in Selected Countries, 1957

Country	Credit in use per head of agricultural population
	Rs.
Cambodia	1.42
Burma	2.37
India	2.85
Ceylon	13.77
Philippines	58.90
Japan	133.95

Although co-operative financing of agriculture in Japan began as early as in 1900, its rapid development started only after 1950. Unlike in many other countries, the co-operative movement in Japan has substantial funds with it. The success of the co-operative movement in that country can be explained by a number of factors. Land reforms on an extensive scale had been expeditiously carried out after the war. The State sponsored as well as assisted the movement. What is more, the link between credit and marketing is strongly forged and an adequate provision for medium and long-term finance exists.

In recent years, the Philippines has recorded good progress in institutionalising farm credit. An extensive institutional network has been built up and a huge amount of subsidies and grants are provided to the farm financing institutions. These institutions not only disburse credit but also provide technical guidance. Ceylon's agriculture is mostly confined to plantations owned by the British, and the British banks in Ceylon, as elsewhere in Asia and Africa, have been taking keen interest in financing them. It can be observed that the position in Burma, Cambodia and India is very unsatisfactory. It is interesting to know the role of various credit agencies in agricultural finance in these countries. Unfortunately, data in this respect are obsolete and available only for a few countries. The table given below illustrates the position in India, Japan and Thailand:

TABLE 4

Sources of Agricultural Credit in Selected Countries

	India '51-52	Japan '51-52	Thailand 1953
Government ..	3.3	5.8	0.2
Co-operatives ..	3.1	36.9	14.0
Relatives	14.2	46.1	55.4
Landlords	1.5	..	2.0
Agricultural money-lenders	24.9	5.7	27.3
Professional money-lenders	44.8		
Trade and commission agents	5.5	..	..
Others	2.7	5.5	1.1

The point to be noted is that commercial banks which are included in "other sources" played comparatively a minor role in all these three countries and moneylenders played the dominant role in India. The institution of moneylenders is not peculiar to India alone; it is prevalent in one form or another in all underdeveloped countries. Moneylenders are the outcome of a backward agrarian economy. The Report of Fredrick Nicolson (1895) which became the basis of the co-operative movement in India vividly described the conditions in Europe in the late nineteenth century. They were not very different from our own. The failure of co-operative movement in India as also the lack of interest on the part of the banking sector in regard to farm credit can be very largely explained by the backwardness of our agriculture.

Basic Weakness Persists

In spite of more than a decade of planning, the basic weaknesses of our agriculture continue to persist and they put very serious limitations on the expansion of the institutional credit, commercial or co-operative. After all, the demand for credit is a derived demand —derived from the increasing tempo of development in agriculture. The fact of the matter is that the bulk of cultivators being small, their ability to use the borrowed funds for productive purposes is very limited. As many as two-thirds of the cultivators have the average size of holdings less than five acres —if that is the limit put for small farmers.

The analysis of the nature of economy of small farmers, as revealed by the Rural Credit Follow-up Surveys of the Reserve Bank, provides certain interesting facts. The size of holdings of small farmers varied from 0.4 to 2.9 acres and the value of gross produce from Rs. 65 to Rs. 278. The share of agricultural produce in the total cash receipts was considerably low, varying from 4 to 7 per cent. Borrowings by small cultivators were meagre, but what is more important is the fact that a major portion of borrowings was utilised for meeting the family expenditure. The repayment performance was extremely poor—usually between 20-30 per cent of the borrowings.

This poor performance of repayment is a measure of risk involved in financing the needs of small cultivators. It is considerably beyond the capacity of even the State-aided co-operative banking to undertake risks of heavy bad debts. Small cultivators, therefore, continue to borrow from moneylenders who charge a rate of interest high enough to cover adequately the risk of non-payment. The solution of the credit problem of small farmers primarily lies in readjusting the agrarian structure in such a way as to enlarge their holdings and to improve their operational efficiency.

State Bank's Contribution

The foregoing analysis is sufficient to show why in underdeveloped countries commercial banks do not directly lend to agriculture. The erstwhile Imperial Bank of India was nationalised with the avowed objective of making it more responsive to the credit needs of the agricultural sector. Its performance in the

course of the last few years provides many important lessons. In the first place, it is important to note that the State Bank has not undertaken financing of agricultural production *directly*. Although finance provided to the co-operative movement for the purpose of marketing and processing has been steadily increasing, the increase is not to the extent anticipated. A substantial portion of the finance is given to co-operative sugar factories which otherwise would have met their requirements from the scheduled banks.

Certain characteristics of agriculture in developing countries like ours require that special arrangements should be made for financing this vital sector of the economy. There has been unanimous opinion that such arrangements should be co-operative in form. The co-operative movement, particularly at the rural level, should be strengthened so as to become an effective instrument of rural progress.

The Committee of Direction of the all-India Rural Credit Survey appointed by the Reserve Bank of India in 1951 undertook a thorough investigation of the problem of rural credit and submitted at the end of 1954 their General Report. The Report brought to light many revealing facts. The most important is that the organisation of credit on co-operative basis for the last 50 years had failed in its application; that only 3.1 per cent of the rural credit needs were met by this source. Even out of this meagre finance supplied by co-operatives, a major share went to 'big' and 'large' cultivators, leaving small cultivators to the mercy of private agencies. Small and medium cultivators whose needs are more pressing constitute the *majority*. Nevertheless, the authors of the scheme were determined to retrieve the movement. Accordingly, they suggested a thorough overhaul of the co-operative credit organisation and recommended a comprehensive scheme of reorganisation of the co-operative system called the Integrated Scheme of Rural Credit.

Position Improving

The combined effect of various measures taken under the scheme is on the whole satisfactory. It is observed that the share of co-operative finance in the total credit requirements of Indian agriculture put at 3.2 per cent in 1951-52 has increased with the help of the Integrated Scheme to around 19 per cent in 1961-62. It is estimated that, by the end of the third Five-year Plan, this share may go up to 35 per cent or so if the progress of the co-operative movement takes place as scheduled. The following table briefly illustrates the progress recorded by the primary agricultural credit societies between the period 1951-52 and 1961-62:

TABLE 5

Progress of Primary Co-operatives

	1951-52	1961-62
Number of agricultural credit societies ..	1,07,925	2,15,081
Memberships (million) ..	4.8	19.6
Working capital (Rs. crores)	45.22	325.33
Loans advanced ,,	33.66	228.31

Similar progress was recorded in respect of the central co-operative banks, State co-operative banks, and to some extent in regard to marketing and processing societies. This progress would have been more impressive had the constraints operating against development been removed completely. It is common knowledge that most of the period during the second Plan coincided with the oscillating policy of the Government in relation to the State partnership and the size of the primary societies, creating in consequence, uncertainty and indecision. This came in the way of reorganising the co-operative institutions in time and effectively, particularly at the primary level. Primary credit societies by and large continue to be in bad shape. For instance, it is estimated that more than two-thirds of the primary societies are weak and dormant. For all practical purposes, they are either not functioning or functioning inefficiently.

Crux of the Issue Not Yet Fully Realised

The preponderance of dormant societies in a large number is, perhaps, the biggest obstacle in the way of co-operative development. It is not realised fully still that the aims and purposes of co-operatives are primarily economic and so, if they do not operate in accordance with economic and business principles, they will not be effective. Further, as a result of weak societies at the base, integration of business so essential for growth is not achieved. The progress in this respect is confined only to a few States such as Gujarat, Maharashtra, Andhra and Madras where a well-developed structure of central financing agencies and sound traditions of the co-operative movement exist. In many co-operatively underdeveloped States such as West Bengal, Bihar and Orissa, central financing agencies are not in existence or are organised so badly that they fail to meet the demand of lower units of the co-operative system. It is no doubt true that, with the advent of the Integrated Scheme, serious attempts are being made by the Reserve Bank to build up and rationalise central co-operative banks, but this work on the whole does not add up to much. Co-operative institutions, particularly at the primary level, have failed to attract deposits on an appreciable scale. Partly due to this but mainly as a result of the Government's policy, the dependence of co-operative institutions on the concessional finance provided by the Reserve Bank has been growing very rapidly. It is necessary to analyse objectively the working of the Integrated Scheme and rectify its defects. The scheme is on the whole logically conceived and so its effective implementation may go a long way in meeting the credit needs of agriculture. What we require at present is not a new scheme to replace the existing one but devising of ways and means for strengthening the existing co-operative credit system.

Scheduled Banks Too Can Assist

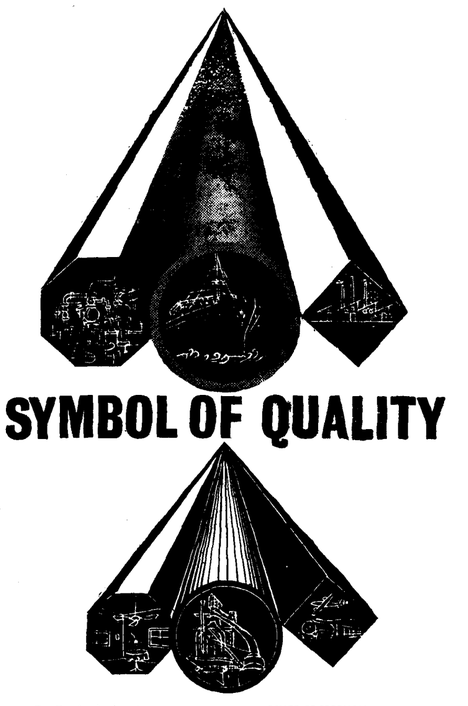
Like the State Bank, scheduled banks, too, can associate in an increasing measure with co-operative institutions. To a small extent they are doing it at present but surely that is not enough. At the end of June 1963, scheduled banks' advances outstanding with co-operative institutions amounted to Rs. 10.17 crores—46 per cent to co-operative financial institutions, 28.6 per cent to processing societies, 5.7 per cent to marketing societies and so on. It is feared that, owing to the recent withdrawal of additional borrowing quotas available to banks at Bank Rate, this promising development may suffer a setback. In future, some satisfactory arrangements should be worked out by which scheduled banks can more actively associate themselves with the co-operative movement which in turn can help cultivators. This is the only rational and realistic approach in the present circumstances.

It is a well-known fact that commercial banks in India have been playing a significant role in financing the movement of agricultural produce. They have more than doubled their advances for this purpose during the last decade. The amount advanced increased from Rs. 67 crores at the end of 1952 to Rs. 153 crores at the end of March 1963. In recent years, selective credit controls have come in the way of a free flow of finance for agricultural marketing. This finance ultimately flows to millions of cultivators. In providing finance for agricultural marketing, banks are performing a service of national importance, because the act of production is not complete until the produce is marketed. If bank finance were not available for this purpose, the marketing of agricultural products would have been hampered seriously and there would have been distortions in the structure of relative and regional prices of agricultural products, with all their serious consequences.

Commercial banks have also been subscribing to debentures of land mortgage banks which provide finance for long-term agricultural development. With the establishment of Agricultural Refinance Corporation in July 1963, scheduled banks are expected to associate themselves in an increasing measure with the schemes of long-term agricultural credit. The promotion of agricultural development, especially through major schemes and plantations could not be done in a large number of cases appropriately except through the help of scheduled banks. The inclusion of scheduled banks among the constituents of the Corporation is a deliberate step and casts a new responsibility on them. With refinance facilities now available, it may be possible for scheduled banks to take a more constructive interest in schemes of progressive farming and agricultural development. Banks are also advancing loans against warehouse receipts. The agricultural processing units such as cotton ginning and pressing factories and rice mills almost invariably depend upon banks for their credit requirements.

Thus, it is not correct to say that banks have kept away from agriculture altogether. For obvious reasons, they have taken to those agricultural activities which do not involve serious risks. Given the financial prudence and accepted banking practices, they could not have done otherwise. By and large, it is not possible for scheduled banks to enter the field of agricultural finance directly and in a "big way." However, bankers do realise that a satisfactory provision of credit is essential for raising agricultural production and productivity. Within certain well defined limits, they are prepared to play their part.

To what extent scheduled banks should help agriculture, what type of institutional arrangements should be devised, how the risk involved in financing agriculture should be shared among different agencies—these and similar other questions are matters of detail which can be worked out if there is agreement on the basic approach.



CAPITAL MARKET & RESOURCES MOBILISATION

INVESTMENT OF TRUST FUNDS NEEDS FLEXIBILITY

By H. T. PAREKH

AVAILABILITY of capital being one of the factors that determine the pace of industrialisation, the capital market has to grow to keep in step with a developing industrial sector. The real strength of a capital market lies in its ability to attract a growing volume of long-term funds seeking industrial investment. Although the progress made by the Indian capital market in recent years is impressive as far as the establishment of new financial institutions is concerned, it cannot, perhaps, be considered to have been sufficiently developed in its capacity to mobilise resources available for direct investment in industrial securities.

Personal savings, whether through life insurance, provident and pension funds, postal savings deposits, deposits with banks, schemes of small savings or as direct investment in industrial securities and in unit and investment trusts, is but one common pool of investible capital, channelled differently to suit the varying needs and requirements of the lender and the borrower, the investor and the entrepreneur. For judging the efficiency of the capital market one test could well be to examine how capital funds are allowed to flow freely between alternative employment into productive investment. This question can be studied by looking into the statutory requirements prescribed for investment of long-term savings funds under different legislation.

Existing Laws Old

A considerable part of the private savings such as trust funds, provident and gratuity funds, life insurance funds, etc., have to be invested in the manner laid down in the Indian Trusts Act 1882, the Employees' Provident Funds Act, 1952 and in Sections 27 and 27A of the Insurance Act, 1938, as amended from time to time.

In essence these laws specify that the funds coming under their purview can be invested either wholly or substantially, only in Central and State Government securities and in securities guaranteed by these Governments. The object behind this requirement is that such hard-earned savings of the people should not be exposed to any risky investments and that the safest form of investment suitable for them is Government securities. This may involve a sacrifice of income, but the assumption is that the sacrifice is worthwhile as a price for security.

Prior to independence, there was, perhaps, justification in laying down such an investment policy, but, since the coming into existence of a national Government and following the era of planned economic development, the basis of such a policy needs re-examination. Many new industrial and other securities have come into being which offer both security and a higher interest than Government loans. At the same time, the experience of the last two decades bears out that the safety factor envisaged in an exclusive investment in Government securities is actually not realised. On the contrary, on account of the marked inflationary trend, the investor in Government securities has suffered in two ways. His money income from these securities is fixed but the purchasing power of this money income has fallen sharply. Secondly, he has not derived any benefit of capital appreciation of his investment which normally takes place in an inflationary situation. Moreover, the interest yield on Government bonds having been kept down by deliberate Government policy, the investor, who is obliged to invest in Government securities, has actually been penalised. This has meant a serious erosion of capital for the small saver, especially with regard to the growing volume of provident fund investment on which his retirement income will mainly depend.

Interests Affected

The large number of charitable and other trust funds, such as those established to run hospitals, universities and other endowments, have been particular sufferers under the aforesaid policy, because, while their cost of maintenance and establishment has steadily risen, their income from Government securities has been kept down on account of a low return and the falling purchasing power, due to the regulation which does not allow investments to be diversified.

Investment under the Employees Provident Funds Act is governed by the provisions of the Indian Trusts Act, 1882 and several other statutory investments likewise are based on this statute. The Indian Trusts Act is a legacy of the British days and was based on the prevailing British legislation. However, the Trustee Investments Act of the U.K. was recently revised. Under this Act in the U.K., it is now permissible to invest upto 75 per cent of the funds in securities other than Government loans in the manner specified in the Act. The Indian Trusts Act is, to say the least, an anachronism and requires to be revised to suit present-day conditions.

An Anachronism

It is surprising that Government has not yet enquired into the validity of its investment provisions under present-day conditions, because this legislation is more than 75 years old and, judging from the wording of Section 20 which deals with investment, a modification of its investment provisions is obviously called for. Section 20 of the Indian Trusts Act provides that investment of trust moneys must be made in securities of a State or Central Government where principal and interest are fully and unconditionally guaranteed by such Government. Trustee securities include also those issued under the authority of Central or a Provincial Government Act or on behalf of any municipal body, port trust, etc. The section still retains old provisions which permit investment in the securities of the British Government, and in railway and other companies, the interest on which has been guaranteed by the Indian Government, though such securities do not exist any more. The Act also permits investment of trust money on a first mortgage of an immoveable property, but this is a non-marketable kind of investment outside the bounds of this article. The provisions of the Act are, no doubt, subject to the instruments of each trust which may allow investment in any other security.

Apart from the application of the Indian Trusts Act to individual trusts, the greater importance of the Act lies in the fact that Section 20 also applies to investment of funds covered by the Employees' Provident Funds Act, 1952 as amended from time to time. This Act applies to all the provident fund schemes in force in the country.

According to the figures published by the Reserve Bank of India, investments in Government securities on account of public and private trusts amounted to Rs. 60 crores at the end of March 1963, while investment of provident funds in Government securities amounted to Rs. 312 crores at the end of March 1963. This latter amount increased by over Rs. 60 crores in the preceding one year alone, which is a measure of the annual accumulation of funds under provident fund saving schemes. The statutory provision of investment of these funds only in Government securities has resulted in keeping these funds altogether out of the market for industrial securities. Thus, the capital market, insofar as it is concerned with industrial securities, is beyond the field of investment of these funds. When a growing source of funds such as the provident fund is kept wholly out, the development of the capital market is bound to suffer. The pursuit of this policy has acted as a serious impediment to the broadening of the Indian capital market. Where capital markets in other countries have developed, it has been in no small measure due to absence of such restrictions. This is particularly true of the U.S.A. and the U.K.

Anomalies

This factor has even created many anomalies in the investment field. For example, it is today possible to invest trust moneys not only in shares of the State Bank of India but also in shares of its various subsidiary banks, because, under their respective legislation, they have been declared trustee securities. It is, however, not open for trust moneys to be invested in shares of other established banks whose dividend record may be much better, because these are not branded "trust securities." Likewise, while trust money can be invested in shares and securities of the Industrial Finance Corporation of India and the various State Financial Corporations, because of the statutory Government guarantee they carry, it cannot be invested in shares and securities of similar financial institutions such as of the Industrial Credit and Investment Corporation of India, merely because the latter institution's securities do not carry any guarantee. Similarly, units issued by the Unit Trust of India are not deemed to be trustee investments and, therefore, trust money cannot be invested in these units, even though the Unit Trust of India is a Government-sponsored institution and operates under the direct care of the Reserve Bank of India. Shares and securities issued by the various State enterprises are also not eligible for investment of trust money, as they do not carry any formal guarantee of the Governments concerned.

Government guarantee is doubtless a vital aspect of security in any investment, but marketability of investment is also an equally important factor which provides the sense of security. The Indian Trusts Act takes little account of the latter element. As such it fails to take into consideration what concerns most an investor—his ability to liquidate his investment easily whenever he wishes to do so. Several of the "guaranteed" investments are not easily marketable and as such have not evoked any investment response.

An anomalous position in regard to investment of similar funds can also be seen in the different investment provisions which apply to the life insurance funds, on the one hand, and those which apply to provident funds, on the other. Insurance funds and provident funds are of the same genus, but they are subject to different investment regulations.

Under the Life Insurance Corporation Act, 1956, the Central Government is authorised to make rules governing investment of the Corporation's funds. The Government of India has declared that Sections 27 and 27A of the Insurance Act shall govern investment of the funds of the Life Insurance Corporation. And these sections are much more broadbased than Section 20 of the Indian Trusts Act. They cover not only all securities eligible under the Indian Trusts Act but go further and permit investment in debentures, preference and ordinary shares of companies which satisfy the various conditions laid down in Section 27A. This latter section allows investment in debentures of companies which are secured by first charge on companies' property or which are secured by a flotating charge on all assets of the company. Similarly, conditions which make preference and ordinary shares of companies eligible as "approved investments" under the Act are laid down. What is more, "approved investments" for the purpose of this section include such other investments as the Central Government may by notification declare as such.

The Life Insurance Corporation's funds can thus be invested with a great deal of flexibility; not less than 25 per cent of the funds should be invested in Government securities, and a further sum equal to not less than 25 per cent in Government securities or other approved securities; of the balance, not more than 15 per cent can be held in "other" investments, while the remaining 35 per cent can be held in "approved" investments as defined in Section 27A. The Life Insurance Corporation, as well as other insurance companies have, therefore, been enabled to earn a higher average return on their investments than would have been possible if they were required to invest only in Government securities. At the end of March 1964, the L.I.C.'s total investments amounted to Rs. 708 crores, of which 75 per cent was in the public sector, while 19 per cent was in the private sector industrial securities. The Corporation realised a gross rate of investment of 5.11 per cent per annum. Savings similar in nature to life insurance funds should logically be permitted to be invested with equal flexibility, so that they can also earn higher interest income.

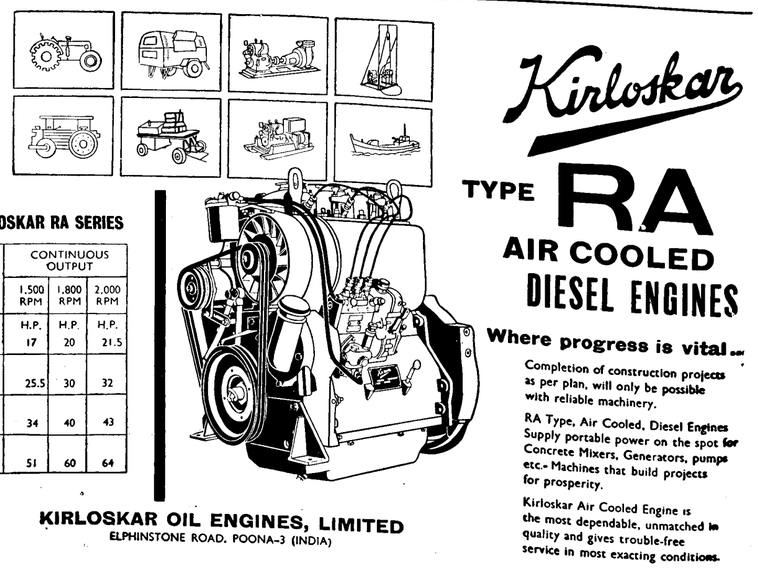
Today, Government loans do not carry an interest rate of more than 5 per cent, while industrial debentures yield 7 per cent, preference shares 8-9 per cent and equity 7-9 per cent. A diversified investment portfolio can secure the benefits which accrue from investment in higher income yielding securities.

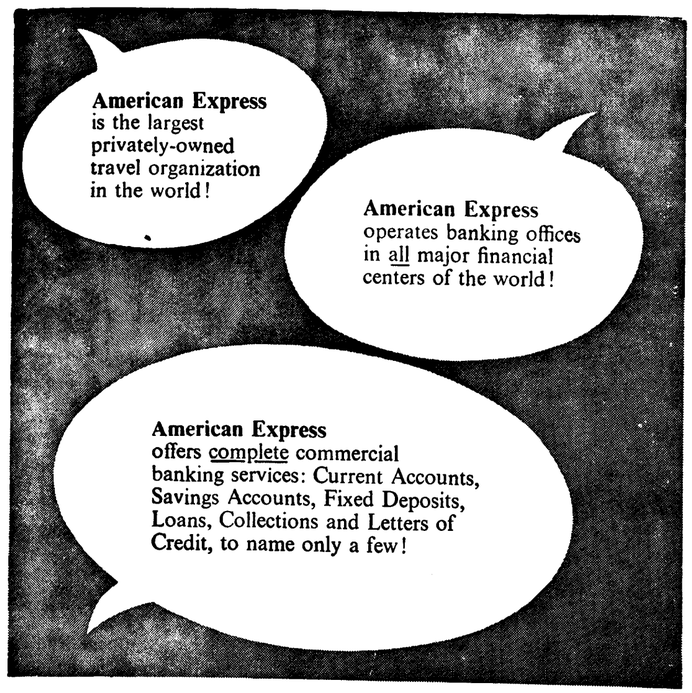
It would be most appropriate, if the Government can see their way to incorporate in the Indian Trusts Act the investment provisions of Sections 27 and 27A of the Insurance Act. The revision of the Indian Trusts Act on these lines will go a long way towards broadening the capital market. It would radically improve the current investment climate and would help revive the market from its depressed state. This would also establish a uniform law for investment of insurance funds, as well as of provident and other trust funds.

The existing inequitable treatment to pension funds by compelling their investment wholly in Government securities needs to be removed by enabling provident funds to be invested in Government securities as well as in industrial securities in order to secure a higher average return on investment. This will also secure for the provident funds facility to invest in securities having prospects of capital appreciation, which is a hedge against inflation. In foreign countries such as the U.S.A., there are no restrictions on investment of pension funds only in Government bonds and in Great Britain the Act has been recently amended to permit investment in industrial securities which can go up to as high as 75 per cent of the total funds. In India, while it may not be possible to go so far, it is certainly essential to relax the existing provisions to enable upto 25 per cent of funds to be invested in debentures, preference and ordinary shares of sound companies without sacrificing security.

The only possible argument against this recommendation would be that this would adversely affect the absorption of new Government loans. This is, however, not likely to be the case, because the volume of such long-term funds is steadily rising and only a very small proportion of such funds would flow into industrial investment. Admittedly, a large part of savings must continue to be invested in Government securities, in order that Government may have command over funds needed for development. But funds which go into industrial securities assist development no less and it is also the Government's duty to see that the capital market is not starved of funds. This would make a great deal of difference to the capital market, while it will affect only marginally the Gilt-edged market. Of the total issue of Government loans of Rs. 3,200 crores at the end of March 1963, only about 10 per cent was held by provident funds. The yield differential between the two classes of securities would thereby narrow, which would in the long run benefit the Gilt-edged market too.

The Government should take a balanced view of the situation and in fairness to those whose savings have to be invested at a satisfactory return, should provide flexibility in investment as between Government loans and industrial securities. This can accelerate industrial development by very considerably supporting the capital market. Hospitals, Universities and other charitable trusts need larger income from their investments for continuation of their activities and they would be greatly helped, if they are enabled to have a wider choice of investment. Private charity trusts have in some cases been approaching the Charity Commissioner to relax the investment requirements and have been permitted to invest in debentures or preference shares. An isolated view of the market for Government bonds without regard for the larger economic considerations would impede development rather than accelerate it. It is to be hoped that the Government would look into this whole question of savings and investment from a larger perspective and safeguard the interests of the small man.





PLANNING IN AN EMERGENT COUNTRY

Absence Of A Well-Developed Private Sector, A Great Handicap

By G. O. HOSKINS, O.B.E.

General Economic Adviser to the Government of Uganda

[How fortunate India has been in many respects in regard to preparation and implementation of development plans as compared with other developing countries will be evident from this comprehensive article on the problems of development facing Uganda, a British African Colony till recently and part of the former East Africa. With an area of 93,981 square miles, including 13,680 square miles of water, it has a relatively small population of 6.85 million (estimated 1961) and attained Independence just two years ago. Those who feel depressed over the shortcomings in India's economic planning and growth may feel a little elated after reading this article. At the same time, the powers-that-be and others who are protagonists of the public sector will realise that the existence of a well-developed private sector in trade, industry, banking and insurance has been a great boon to this country and that, without it, India's achievements in the sphere of planned economic development would have been much less than they are today.

The author of this article, Mr. G. O. Hoskins, it may be noted in passing, was our London Correspondent since the 'thirties till September last, when he left for Uganda on a short assignment.—ED.]

"GOVERNMENT is seeking to alter the whole way of life of the people, and for the better. Government is pressing to increase agricultural output by direct action through agencies and by farmers, and is introducing techniques of production such as mechanisation, and methods such as Group Farms, which have never been used before. Government is urging the production of commodities for which no marketing channels exist, and is also seeking to create marketing channels. Government is developing new industries and is raising vast sums for development, and drawing on assistance from various parts of the world. Above all, Government has set to increase the output of work per head beyond what our people have ever, in the past, considered natural. Government's objective is no less than doubling the standard of living in 15 years." So concluded the speech of the President of Uganda at the opening of the third session of the First Parliament. It indicates the nature of the planning problem which a new country like Uganda faces: a problem different in *kind* from that which, for instance, faces India.

The direction of planning in Uganda is in the hands of a Planning Commission of which the Chairman is the Prime Minister. Recently, this commission had the benefit of advice from Dr. V. K. R. V. Rao of the Indian Planning Commission following his short stay in this country which enabled an interesting comparison to be made between the planning problems facing the developing economy of India and the different sort of problem facing what we are terming, the planning of an *emergent* country. The stress is on the word 'emergent,' to indicate that this is a country which has, in fact, entered a period of economic revolution; a revolution going right down to the roots of the whole manner of living. It is not here a question of improving and expanding; it is a question of creating out of very little indeed. The British, during their relatively short stay in Uganda, left the country with a valuable heritage of communications, power, basic banking and industry, advisory and scientific agricultural services an educational and health network and the framework of a Government machine; but there were two grave deficiencies in this legacy.

Independence and After

The first was in the framework of Government Administration. The Government machine in all its higher posts was staffed by expatriates: the people of the country had had things done for them and to nothing like a sufficient degree had been permitted to operate the machine which did these things. This criticism does not apply at the political level so much as at the administrative and executive levels. Thus, when in 1962 Uganda achieved Independence, the wholesale emigration of expatriates which followed left a vacuum which the Government has had and still has the greatest difficulty in filling. Neither had sufficient Ugandans been trained for the posts they were now summoned to fill nor was there a cadre of people with the necessary educational background waiting to be trained. To a substantial degree the dislocation caused by the emigration of expatriates could have been lessened had proper terms for the change in administration been established. But, in the end, nothing could compensate for the fact that the earlier administration had not brought along the people of the country for the posts which one day they would have to fill.

The second deficiency was that of the Governmental organisations, which were geared primarily to maintain law and order and, in agriculture, aimed at steady improvement by existing methods but made no attempt towards a full development of the country's potential. It was as if the administrative machinery of the country was designed to 'tick over' but had no resources for full speed ahead. Hence, as soon as the Government turned itself to *revolutionising* the agricultural system and gearing it to new crops, new techniques of farming and new productive organisations, a new machine needed to be built.

Scope of Coverage

Thus, planning in Uganda has to cover every aspect of the economic life of the community. In the first place, the Government has had to come to a realisation that the administrative machine which it had inherited was no longer capable of doing the work required. This is because it was an intricate finely balanced machine for the use of expatriates planned on a model developed in the United Kingdom over much more than a century. But large pieces of this machine had been taken out and could not be replaced. Other pieces were replaced with people who were not trained to run the old sophisticated machine. Furthermore, the machine was now being asked to perform all manner of additional tasks for which even the original design would have been inadequate. (The experience of the present British Government in reorganising part of the Whitehall machinery to cope with the requirements of socialist planning, is witness to this.) Thus, the planners in Uganda have had to face the need for the actual reorganisation of the Civil Service, a reorganisation designed to simplify the machine for efficient working by the people available and this implies two basic requirements:

(i) that, as far as possible, every officer has a clearly defined responsibility which embraces the whole of a particular subject,

(ii) a shortening of the line of communication between the officer responsible for policy at the top and the officer executing policy at the end of the line.

One can illustrate this problem in terms readily appreciable by Indian experience: this is in the matter of responsibility for the production and marketing of crops. Under the old system, the Ministries had a vertical structure in which officers normally were responsible for one aspect of a great number of commodities e.g. one man was concerned with price policy, another with marketing policy, another with assistance to producers and so on. So that before one could decide who was responsible for the development of, say, cotton production, one had to bring together perhaps half a dozen officers each of which had his part to play in the formulation and execution of policy. Under the simplified structure (which incidentally was used in the United Kingdom both during the war and in the years of control that followed it), one man would be allocated cotton as his complete sphere of responsibility. That man—call him a "Director of Cotton" would be responsible to the Minister and would cover all aspects of production and marketing. This does not, of course, mean that he has to do everything himself. He has a staff. In particular, he may have a field staff solely concerned with the pushing of production of cotton e.g. in areas where this is the main crop. On the other hand, he will be assisted in marketing by the existing Lint Marketing Board which has full responsibility under the Minister from the point where the crop has been collected, ginned and centralised.

This sort of arrangement does not cut across certain generalised services such as the Agricultural Advisory Services which exist to help all farmers on all aspects of their production. The average farmer will use these general advisory services no matter whether he is concerned with cotton or any other crop; but the cotton Agricultural Officer is a specialist and he will spend his time wherever he can most profitably do so with farmers for whom cotton is the most important crop and who are interested in improving or expanding their production.

One Man, One Job

Broadly then, the principle of simplifying administration is that of one man, one job. But, of course, this does not solve the problem of having enough men who know how to do the necessary jobs. The problem of recruitment both inside the country and outside remains: but because one is seeking to train specialists, rather than men-of-all-trades, which is the British Civil Service principle, the task of training and recruitment is rendered easier. As for the expatriate Civil Servants they are career men and can only be held through a Commonwealth Civil Service which can offer them a career. Without them the rate of development will certainly be slower.

There is another valuable advantage gained from the horizontal administrative structure. Because one defines responsibility, one also encourages initiative. A man finds that he is both expected to and that he can take decisions within his own sphere. He will also discover, one hopes not belatedly, that, while he may earn praise for successful initiative, he must also carry the blame for his failures. He cannot "pass the buck." He cannot seek refuge in not taking decisions because, if things do not happen, he will be held responsible by his Minister or his superior officer. Because he is the chosen instrument for his Minister's policy he is obliged to carry out that policy, using all such agencies as are available to him but with overall responsibility both for what is done and, equally important, for what is not done. This is a well-understood commercial principle and, under the new conditions in which Government takes a leading role in enterprise, it needs to be adopted in Government.

Group Farming

It is worthwhile taking another agricultural illustration which may be novel to India, since the idea was introduced into Uganda from Israel. This is the concept of "group-farming." A group-farm is an area of several hundred acres farmed by perhaps, 60 or more farmers, most of whom are probably already living on the land though by no means farming all of it. It should be explained that Uganda is a country with vast tracks of empty land. Now these farmers will be organised into co-operatives. The total area of land which they are to farm will be surveyed and carefully mapped. It will be provided with roads; it will be divided up into large fields, in each of which strips will be allocated to each farmer. These farms are worked on a six-year rotation of which three years are arable, for example, cotton, millet and groundnuts, and each farmer will have a strip corresponding to each item of the rotation. The farmers form a committee for the fair allocation of these strips and also for decisions about crop sequences and of course to settle all the other problems which are liable to arise when any sort of group enterprise is undertaken. But the Ministry of Agriculture provides a farm manager who is concerned with the *technique* of production. His job is to run a machine cultivation team and to supervise good husbandry.

The Ministry of Agriculture provides the finance for the initial clearing of the land from bush; the provision of roads and also most of the equipment for mechanical cultivation. The farm manager ploughs the first year's land and sews it mechanically while the farmers are responsible from that moment on for weeding, tending and picking. The problem of organisation arises in this way. Under the present arrangements, the land for such a farm is laid out by one body of experts: another officer decides how much land is going to be cleared and when; another decides the crop rotation and another is concerned with finance and so on. It is not surprising that the farm managers feel that managing is the last thing they are expected to do. Under the "one man one job" principle, the Minister will appoint one officer responsible for all group-farms and that officer in turn will appoint a farm manager for each farm which farm

manager is then fully responsible for the setting up and the operation of his farm in conjunction with the committee of cultivators. He calls on the services of the surveyors to survey his farm, he calls on the services of land-clearance contractors as clear, he calls on the Advisory Services for crop rotation and so on. But the essential point is that the manager *determines* the jobs to be done as if he were running his own estate and is, therefore, in control of all his operations.

Thus Uganda, a pioneering country undergoing an economic revolution, needs to adopt the techniques which Governments in other countries have adopted in critical times. In addition to the simplification of the system of administration, the shortening of the lines of communication and the devolving of responsibilities on field commanders, individual initiative is developed. In the first place, the officer is given the opportunity to take an initiative; secondly, he is encouraged to do so; finally, he stands or falls by the results. Break the jobs down into clear units, make each man responsible for his unit, that is the only way to efficiency. For the essence of the principle of "one man one job" in pinning down responsibility is to make it clear that the job, whether ill-done or well-done, is the responsibility of the man concerned.

Planning Machinery

The next broad task of the Government, after tackling the set-up of its administrative machinery, has been to improve its planning machinery. At the outset, it was pointed out that planning is in the hands of a Planning Commission. This Planning Commission has not only the Prime Minister at its head, but consist almost entirely of Ministers. The exceptions are the chairmen of the most important State bodies and the Director of Planning, who is specially appointed to take charge of the conception and progress of the long-term plans. It is sometimes argued that it would be as well to bring in full-time members or other representatives of outside interests. There are two objections to this: to the extent that the Commission does not consist of Ministers, to that extent its Cabinet authority is weakened and it becomes more of an advisory body. The strength of the Planning Commission as at present constituted is that in effect it determines economic policy. What the Planning Commission has decided, the Cabinet is most unlikely to amend or reject.

So far as full-time members are concerned, the need of men to ensure that what the Commission decides is carried into effect is fully recognised and there is thus being built up a Secretariat to the Commission which is charged not only with the preparation of papers for the Commission, but also with seeing to it that decisions of the Commission are carried into effect. Thus, it reports periodically to the Commission on the progress of each decision until such time as the Commission has decided it needs no further reports. This new development is the most important step in linking policy-making with execution.

Another point that is sometimes queried, is whether the Prime Minister should in fact chair such a Commission. Again the question of authority arises. What does one require a Planning Commission to do? In Uganda, the Planning Commission is in effect a specialist body of the Cabinet. Thus, the Cabinet normally expects the homework on planning issues to be done by its Planning Commission members and have only to ratify rather than re-examine propositions coming from the Planning Commission. In these circumstances, the chairmanship of the Planning Commission needs to fall to the Prime Minister. If by any chance he is unable to conduct a meeting, then, by custom, the Minister of Planning takes his place, and, of course, the Minister of Planning is also by way of becoming the Prime Minister's deputy on all economic matters; while the Planning Secretariat will no doubt evolve as a body which takes a great deal of the economic load off the Prime Minister's shoulders.

Advisory Councils

In order to bring Government's planning before the public, and to enable a helpful degree of non-governmental participation in the planning processes, the Commission has the assistance of various advisory councils. Up to date, these councils have existed in name rather than in fact; but they are now about to become effective. The principal of these is known as the National Economic and Social Advisory Council (N.E.S.A.C.). This is representative of banking, industry, the co-operatives, the trade unions, farmers, independent economists and social and educational services. In addition, it has representatives of the 15 Kingdoms and Districts of Uganda. It will meet under the chairmanship of the Minister of Planning. The one criticism that can be made is that a body of between 30 and 35 members is too large; but this is the result of bringing in 15 members to represent the Kingdoms and Districts which, in Uganda, have nearly as much significance as the States of India. It would, of course, be possible to remove these regional representatives and there are arguments on both sides.

On the official level, the success of planning depends upon the proper co-ordination of all departments and, of course, the co-ordination between Ministers and their own officials. Where the latter does not happen, Ministers are liable to run off on some independent planning, leaving their officials wondering what it is all about. This co-ordination can be carried out in two ways; either by a small inter-governmental committee of Permanent Secretaries or by a strong Ministry of Planning. It is this second method which is currently being pursued but one has always to remember that a strong Ministry of Planning can easily cause jealousies among the other executive departments of State who fear that some of their rights and responsibilities are being filched from them. Only time can provide the right answers and it is up to the officials themselves in their own interests to ensure that the machinery of co-ordination is a smooth one. Equally, it is up to the Ministry of Planning to avoid doing work which belongs to other departments while exercising its function of making sure that that work is done and that it can properly report to its ultimate masters—the Planning Commission.

But in a rapidly developing economy, there are many projects on which preliminary work needs to be done before they can come to the Planning Commission. In some cases, this preliminary work will be done within a particular ministry; but, where the interests of several ministries are involved or where external aid may loom large in the project, then it is the function of the Ministry of Planning to undertake this preliminary work in consultation with the other departments. When a project is of particular importance and involves a good deal of work, it is important to get the prior blessing of the Planning Commission on its preparation. For this purpose, the device of working party is very useful. Whoever is responsible for initiating the project brings the case in principle before the Planning Commission with the proposal that a working party of those concerned and experts be set up under the general terms of reference indicated. This gives the Planning Commission an opportunity to approve of, or amend, the general concept and is as good an insurance as it is possible to have that the preliminary work on the project will not be wasted.

Finally come the actual processes by which a five-year plan is prepared. The concept of a perspective plan—that is a plan looking ahead over a long period—is widely accepted among planners. In Uganda, the perspective plan objective is a doubling of the gross national product over 15 years. Now this plan has been announced, work begins on the five-year plan and at this stage a number of specialised working parties are set up to deal with the different sectors of the economy. There is a tendency in all economic planning to plan from offices and to announce the results to the country, with the kind observation that the public may now discuss. This method of approach indicates an understandable lack of confidence in any contribution the public could make to the plan. It assumes that discussion will keep the people happy but it does not assume that the people have anything to contribute. In Uganda, the local planning and development committees provide a means whereby the districts can be brought into the preparation of the plan. It is, after all, the districts who will have to work the plan and local co-operation is just as important in the preparation as it will be in the execution.

Local Committees

Thus, it is now being considered whether these local committees should build up a series of projects, some of which they can finance entirely themselves, some of which will require Central Government assistance, but all of which represent what each district wants to see happen in the years ahead. The local committees will prepare their projects through a series of sub-committees corresponding to the working parties of the centre. The work of the sub-committees (invariably assisted by the Central Government's district officers) is approved or amended by the local committee and then sent to the Central Government. There each sector is examined by the working parties who are then able to prepare a plan based, on the one hand, on broad economic considerations and, on the other, on these specific local projects. In the course of this exercise, the working parties will find that some of the projects do not fit into the broader concepts or are inadequate. Reference back is made to the local committees and by a process of to and fro between local committees and Central Government there finally emerges a plan which both makes sense overall and also makes sense in the districts, which conceive of it as *their* plan since they have taken a real part in the process of setting up the projects. With the districts regarding the plan as theirs, local co-operation in getting the plan carried out is assisted.

Organisation of Finance

Having now established the Government machinery and the machinery for planning, the next need is the organisation of finance. To a country like India this would seem a simple problem in its principles, while, in its practice, she would look to the international bodies and to special arrangements with particular countries. But in Uganda everything must be organised from the bottom, for, while this country has a strong representation of commercial banks based overseas, it has only one institution that approaches a popular bank, whose branches by no means cover the whole country, whose resources are so small that at present they are unable to be of any assistance to farmers and which does not offer a full banking service. There is no central bank; there is no co-operative bank; no agricultural mortgage corporation; no organisation of foreign bankers to channel money into large-scale development projects; nor even is there a central bank for East Africa. Thus Government finance depends upon borrowings from the E.A. Currency Board, which performs many of the functions of a central bank, borrowings from the commercial banks, and obtaining aid *ad hoc* wherever it can. This picture, however, is in process of changing.

Already it has been decided in principle that East Africa should have its own central bank, and it becomes a matter of mechanics whether the Currency Board evolves into such a bank or whether a separate institution will be set up which will take over the Currency Board. It has also been decided in principle that Uganda is to have its own national bank. What Government is now having to create is a whole banking structure, other than the overseas-based commercial banks, necessary for a developing economy.

The first point which will have to be resolved will be the nature of the national bank—whether it is to be a bank for commercial and development purposes as well as central banking. It is probable, however, that the proper economic choice will be made of confining the operations of the national bank to central banking as understood by bankers, because the function of this bank will be to maintain confidence in the currency of Uganda, to earn the full co-operation not only of the commercial banks but of international organisations, while, at the same time, serving all the functions of a Government banker. To do this it must live in a somewhat rarified atmosphere and, from its supervisory seat, delegate to other agencies some of the financial functions which bankers tend to look upon with some suspicion.

These other functions are the provision of agricultural and small business finance and the provision of large-scale industrial finance. For the first, Uganda already has, in its Credit and Savings Bank (U.C.S.B.), a framework which can be expanded to provide a proper agricultural and small business credit service. To this may be added a co-operative bank with its branches, although it is dubious whether Uganda has the resources to devote to two banks performing similar functions side by side.

Furthermore, since the U.C.S.B. is not merely an advancer of credit to farmers, etc., but is also a repository for savings from the public, it must conduct its affairs on recognised banking lines. It can only extend medium- and long-term credit, if, in turn, it can off-load its loans on to some central institution. Thus, behind this people's bank, there will have to be a credit corporation financed partly by Government, and, perhaps, partly by the F.A.O. and the World Bank—that is, national and international institutions prepared to wait for their money and to lend it at low rates of interest. It will, indeed, be a central reservoir of agricultural credit.

As for major industrial investment, a separation must be made between profit-making investment and straightforward long-term infrastructure investment. For the latter, Uganda must depend again on international sources, including credits from countries with which special arrangements are made; but, for profit-making business, there should be no difficulty. There are many banks with international interests who are prepared to co-operate in providing funds for development, subject to those funds being used in

a manner they understand. This can be ensured by the creation of a consortium of bankers, managed by the partners, which will mobilise funds for joint investment in commercial enterprises. In Uganda, there is a Government-owned Development Corporation which is the agency for promoting individual enterprises. If the consortium can be induced to take a high participation in the conduct of a joint enterprise with the Corporation, there will be a fruitful partnership between Government and foreign banks. Where major industrial development is initiated by a commercial company of standing which is prepared to carry half the risk, it should not be difficult to raise the other half of the money through the consortium envisaged. And there would no doubt be cases where Government, commercial enterprise and the consortium would jointly provide the funds.

I.M.F.

A further source of funds which has not been thoroughly explored is the I.M.F. Uganda, like India before 1960, carries substantial sterling assets. These assets are worth only their own sum. In theory, assets lodged by way of subscription with the I.M.F. should be worth many times their own sum since they carry drawing rights. Developing countries with sterling assets need, therefore, to consider with the I.M.F. the extent to which, they can increase their drawing rights for development by increasing their subscriptions, instead of temporary balance of payments purposes. Admittedly, this should not be a device for straightforward borrowing for an indefinite period from the Fund. If this were widely adopted, the Fund would soon find itself dry. But it could be recognised that it is legitimate to use I.M.F. funds for development purposes where it is possible to see a return within a relatively short period, or where the investment can be regarded as bridging to a more permanent form of loan. But all this needs working out between the Fund and countries so placed as Uganda.

Domestic Capital

What then about the mobilisation of domestic capital? In India, where there is a large trading community, that capital exists. In Uganda, the trading community is almost entirely of Indian origin, and they have been the sole capital accumulating class up to now. But there has been no outlet for their own investment, except, of course, in the expansion of their own businesses—an expansion strictly limited hitherto by the lack of a growing market. Not unnaturally, much of the capital accumulated has gone outside the country. Uganda, therefore, if it is to utilise the capital accumulating inside the country, and if it is to encourage the further accumulation of capital by its nationals, must offer opportunities for investment. This is not an easy thing to do in a community which has not got the investment habit—as India herself knows only too well. Nevertheless, the facilities for investment must be provided and people made acquainted with them and encouraged to use them. The educating process, however, is bound to be a long one.

As to the forms of investment, they must, as in more sophisticated countries, appeal to different instincts. There must be the Gilt-edged security in which the capital itself is guaranteed by the Government, but it is not so easy to determine beyond security of capital, what attraction to offer the investor—that is, a fixed rate of interest or a gamble, as in premium bonds. Uganda has already tried an issue of premium bonds on a limited scale, but without adequate advertising or selling points. In consequence, it had a poor response, but this is by no means indicative of what the response might be if a large selling effort were made such as, for instance, many countries adopt for their national lotteries.

National lotteries in themselves may be a useful way of raising Government funds, though they can hardly be termed investments for the subscribers. But lotteries, to be worthwhile, must produce enough revenue or else the effort and expense of organisation become out of all proportion to the money raised.

Where a country such as Uganda requires commercial investment finance, it is possible to attract private local savings through a Government investment agency channelling investment into selected enterprise. But where the enterprises are new and therefore unknown, and where there is no habit of investing in industrial enterprises, this investment must be guaranteed by the Government. Two forms of such investment can be offered—fixed interest industrial investment (both medium and long-term:) designed to mop up capital which might otherwise be exported and containing a sterling parity clause so that the sum is secure in an international as well as a national sense and can appeal to the investor who has to be drawn away from his usual outlets.

As for encouraging equities, investment in the Government guaranteed unit trust is probably the answer. The shareholder can purchase a number of units at a fixed sum. His capital will be guaranteed by the Government and the investment will be widely spread. Such securities can, of course, be offered without a Government guarantee, but that is likely to be a later development.

No Capital Market

A problem in all this type of investment is the absence of a market for buying and selling. There is a simple security market in Nairobi but none at all in Uganda, and the creation of such a market when there is very little to deal in is obviously extremely difficult. It may be that the right answer will be found on the lines of a 'Government broker' who will also become a 'Government jobber.' This jobber's office will constitute a market for the buying and selling of both fixed interest and equity investments. It may be that once such a central marketing agency has been adopted, a competitive market with banks as well as private financiers may develop. There is nothing against this provided it serves the purpose of mobilising the growing savings of the people to some productive purpose, avoiding hoarding and above all avoiding the outflow of capital.

In a country in which high dependence must be placed for some time on overseas aid—using aid in the sense of helping to improve trade using arrangements in which repayment is made over a long period on 'soft' terms—there is a case for establishing a capital investment board or committee. The function of such a board would be to examine all projects requiring finance and to decide the most suitable manner for financing a particular project; whether, for example, by direct Government investment, by a partnership between Government and an overseas banking consortium, by the formation of a private company under direct Government agency or in association with an overseas commercial interest by an international loan application, and so forth. The secretariat of such a board would then act as a kind of company promoter, get the organisation set up and financed, and then leave it to pursue its way.

All this indicates that Uganda is a country lacking in finance institutions, other than the few commercial banks. It has to weigh up the different forms of finance institutions which can be adopted and to set these up by Government enterprise, since the factors which would normally induce commercial enterprise to establish them are absent.

The last sector of the economy to be considered is that of the physical instruments of development both internal and external: that is the actual agencies which, having been provided with policy decisions and financed, are to implement the decisions and produce results. In countries which already have developed economies, enterprise is normally already in the hands of commercial companies, and the decision of Government has to be whether to let an enterprise be handled by a conventional private concern or whether to handle it itself, using the same technique but in Government ownership. There is another alternative—that of co-operative ownership—such as developed agricultural countries have used.

In Uganda, an instrument for implementing Government decisions was set up some years ago in the form of the Uganda Development Corporation (U.D.C.). This is a wholly-owned Government holding and promoting company, and, whenever Government has wanted a decision implemented in the commercial sense, it has handled the execution over to the Development Corporation which has then proceeded to set up a company to operate the concern. The original thinking was that such companies might have private participation and gradually be turned over to entire private ownership. In fact, the development of these subsidiary companies had been somewhat different. They have tended to be either wholly financed by the Government or else mainly financed by a private commercial interest. In cases where U.D.C. (that is, Government) has wholly financed them, no commercial interest is involved, except as managing agent, and there is no particular inducement on the part of commercial interest to come in and buy the enterprise; nor is there any clear advantage to the Uganda State to transfer an industry at the profit-making stage to private management and ownership. The Uganda State, having gone through the difficult years of development, may just as well reap the benefit of the profit-making years. What has hardly been tried yet is a genuine partnership between Government and private industry; yet this is a form particularly suitable for large-scale industries where a great deal of technical know-how and marketing knowledge is wanted, where developments are expensive to finance; and where, if the expertise and the funds of private enterprise are brought in, the Government will have relatively little difficulty in providing the balance of the finance through international agencies since the private commercial stake will be a guarantee of sound investment.

It is, however, unlikely that U.D.C. will be able to undertake the ever-expanding volume of investment which the country will undoubtedly require. This is because corporations—even Government-owned corporations—are not devices for escaping the problems of management, and as they grow, so their problems of control increase. There is a danger in bigness. A Government corporation in a developing country does not have a bottomless fund of manpower resources on which it can simply draw at the words of command. To set up a new company it has to advertise for management, and, once it has its management, it has to exercise policy control. There is no particular benefit served by creating a super commercial monopoly which will suffer from all the disadvantages of monopolies when the advantages can be gained by a division of functions.

Agriculture

Thus, while, in the early stages, it is possible to assign Government-sponsored industrial enterprises to U.D.C., the injection of capital into agriculture and agricultural processing will require other organisational media. For example, the Uganda Government recently decided to develop a dairy industry, and the chosen instrument is to be an executive dairy board on the lines of the two boards which already exist in the country for the marketing of coffee and lint. There is no reason why a similar board should not be set up for other agricultural production such as meat, fish, a whole range of lesser crops, and so on. Such boards lend themselves to ultimate acquisition by co-operatives, which is a strong political argument in their favour. At present, the co-operatives—which exist as the infrastructure of the Lint and Coffee Marketing Boards—do not have management resources to undertake these major commercial functions. Thus, the Government-controlled Board must precede the co-operative form of organisation.

Incidentally, another advantage that public Boards have over publicly-owned companies is that the relationship with Government is clearer. The company tends to regard itself as entirely autonomous and Government tends to disclaim responsibility for its activities or non-activities: thus, the purpose of Government enterprise is defeated. Who pays the piper calls the tune: yet, oddly enough, Government having created its commercial infant, is too often content to let the child develop in a wayward fashion, owing no allegiance to its parents.

Boards, corporations and companies can market and can operate factories and offices. But what of the biggest producing unit of all—the land? Here we are in a strange world of custom and caprice. The basis of the custom was that land belonged to all. It was free as the air and there was enough for everyone, but to keep order the right of allocation rested with local rulers—and it was a remunerative right.

Under modern conditions, land becomes capital. However, there is enormous traditional, sentimental and therefore political appeal in the idea of "Every man his own *shamba*" (farm) and the Government must needs step warily before following the advice of every person who has examined the economy of Uganda that the land tenure system must be reformed. But does it need to be as cautious in developing the empty lands? Cannot these lands be developed in a way that makes economic sense without offending against the concept of a stake in the land by the farmer? At the moment, every large land scheme—group farms, estates, ranches—tries to do this by functionalising the scheme land into small units for individual working, while trying at the same time to provide for overall machine cultivation. On the other hand, the most successful agricultural production is seen in the tea and sugar estates, company-owned enterprises (in some cases Government companies) carrying out large-scale farming with the most modern techniques. Is there any reason why the man who gets his living from agriculture should have a different relationship to the place where he works than the man who gets a living from public administration, medicine, education, commerce or industry? And, especially where the whole progress of a country depends upon its agriculture, is it in the interest of the people that that should be the only industry permitted to retain the techniques of a more primitive age? Custom and

(Continued on page 171)

WHITHER MANAGING AGENCY SYSTEM?

By An Esteemed Correspondent

ONCE again, for the third time, to be precise, the managing agency system in our country would be finding itself standing at the cross-roads of destiny, for several very important reasons. This would be in the coming year, about the time before 15th August 1965. In view of this, a study of the present state of managing agencies, in general, will be timely.

Like the heart in human physiological system, the institution of managing agency, which came into existence for certain geographical and economic reasons and also as a result of imaginative thinking of the Englishmen who also planted the institution of joint stock companies in our country in the middle of the last century, played a crucial life-sustaining role in the corporate sector for over hundred years. It is only during the last two decades or so that doubts have come to be expressed about its central role and it has come to be regarded not as the heart but as a superfluous limb in the corporate body, something like the vermiform appendix in the human body, which could be surgically dispensed with without causing any disorders in the system or affecting its general health and vitality. Eulogistic references to managing agency system are today very rare to read in current literature on economic development and, instead, we read and hear a lot that brings out the ills of the system as also its anachronistic character in the changed economic conditions in the country. In a sense, existence of managing agency system has become vulnerable.

History

To go back into the history of this unique system of corporate management. It had its first confrontation with destiny in 1936 after it had experienced an uninterrupted period of fine and glorious ascendancy lasting for nearly a hundred years or so. It was in that pre-war year that a Bill was sponsored by the Government to amend the Indian Companies Act, 1913, principally for prescribing some restrictions on the working of the managing agents which had till then enjoyed complete freedom in running the affairs of their managed companies, without having required to account for their doings to shareholders and the board of directors which, in many a case, or invariably, was dominated by the representatives of the managing agents.

The second confrontation with fate took place in 1955, when the present Companies Act came up for detailed discussion in Bill form before a very critical Parliament. There were many factors responsible for the adverse climate that prevailed at that time for the managing agencies. At one time during the discussion of the Companies Bill in Parliament, it appeared as though the system would be completely brushed off the corporate scene. But, then, by a sudden act, the then Finance Minister Mr. C. D. Deshmukh, saved the institution by bringing up the proposals, now contained in Section 324 of the Act. These placed the managing agencies on parole, as it were, which could be ended by the Government at the latter's pleasure, after, of course, complying with a certain prescribed procedure spelt out in the Rules framed by the Government for that purpose. Also to turn the spotlight away from the managing agencies, the then Finance Minister brought into existence the institution of Secretaries and Treasurers to be adopted by company promoters as an alternative to the managing agency system. In a way the new institution could be said to be an "expurgated form of the managing agency system," inasmuch as they were to be merely "contracted managers" for the company functioning under the supervision and control of the Board of Directors.

Public Opinion Still Critical

Thus these two moves saved the managing agency system from being guillotined in 1955. Notwithstanding this, however, the system has been having a disquieting time, as the Government policies have continued to have an increasing emphasis on the need to check tendencies of concentration of economic power in private hands. It is no doubt true that the managing agency system has in the past been one of the known instruments of centralisation of power in the hands of leading business groups and houses. It is against this background that the managing agency system faces, for the third time, a crack of doom.

There are three principal reasons that might seem to raise this alarm. First, the Vivian Bose Commission Report on an important business group in the country has aroused deep suspicions of the public against the system. More accurately speaking, the report deals with the doings of the business group before the present company law came into existence and under the old settings of an inadequate law and weak administration. But these facts are overlooked by the public and the various revelations made by the Commission are related to contemporary times. Secondly, the Mahalanobis Committee Report and the expert report on concentration of economic power by Dr. R. K. Hazari have thrown out rather heavyweight suggestions for abolishing managing agencies in certain industrial fields and in others, where allowed to exist, to put them under some additional restraints and curbs. In other words, all this would amount to a narrow noose which would sooner or later strangle the managing agency system. Thirdly, the great cross-section of the managing agency re-appointments pertaining to small, medium and big-sized managed companies would become due for the approval of the Government at the end of their five-year tenure given to them in 1960 under the provisions of Section 330 which say "where a company has a managing agent at the commencement of this Act, the term of office of such managing agent shall, if it does not expire earlier in accordance with the provisions applicable thereto immediately before such commencement including any provisions contained in the Indian Companies Act, 1913, expire on the 15th day of August 1960, unless before that date he is re-appointed for a fresh term in accordance with any provision contained in this Act."

Although the provisions of the section cited above gave the opportunity to put in applications for the re-appointments to be approved by the Government from the date the present Companies Act came into force, that is, the 1st April 1956, an overwhelming number of applications for re-appointments was made in 1960. And further as these re-appointments were approved for a period of five years only, the bulk of renewals has become due in 1965, latest, by 15th August 1965. In a sense, managing agencies are to have only a predetermined tryst with destiny and not any sudden confrontation with it next year. But certain ominous factors that have cropped up during the last few years pose a 'life-or-death' proposition before the system.

Basic Issues

Crucial as the time is for taking a comprehensive review of the system which for nearly three-quarters of a century played the role of a catalytic agent for industrial development of the country and during the Great Depression served as the sheet-anchor for the survival of the few industries that we had in the country then, one should see as to how far the objectives aimed at in putting various restrictions and curbs over the system have been achieved. Secondly, has the managing agency system affected the growth of industrialisation in the private sector since the beginning of the second Plan when it came under the regulation by the present Companies Act? Thirdly, has the 'Secretaries-and-Treasurers' system made any impact on the corporate sector? Fourthly, is the system of director-managed companies an improvement over the managing agency? Lastly, are the evils of managing agency, if any, being perpetrated in other forms or manners, and, if so, will the mere abolition of the system help the objectives of the reformers?

II

Statutory Controls

Before we marshal out the restrictions imposed upon the managing agents in 1955 and discuss the objectives sought to be achieved by them, it would be appropriate to take stock of the statutory controls imposed in 1936, but became quite infructuous for checking the proliferation of abuses which came to be noticed in corporate management during the World War II period and the years following it. The Amending Act of 1936 inserted nine new sections—87A to 87I—in the 1913 Companies Act and with these, for the first time, the managing agency system came within the purview of the Legislature. Each of these sections imposed some sort of restrictions. Section 87(1) limited the duration of appointment of a managing agent to 20 years at a time and in the case of the existing agencies notwithstanding the terms of their agreement or any provision in the articles of association, the period of office was to come to an end after 20 years, whereas before this enactment, the managing agents held their appointment either on a very long term basis or even in perpetuity. Clause (c) of Section 87B restricted the right of transfer of office by management except with the approval of the company in general meeting. Section 87C laid down that the remuneration of the managing agent should be a sum based on a fixed percentage of annual net profits of the company, with provision for a minimum payment in the case of absence of or inadequacy of profits, together with an office allowance to be defined in the agreement of management.

Any stipulation for remuneration in addition to or in any other form than the remuneration specified in terms of percentage of net profits had to be sanctioned by a special resolution of the company. For calculating the percentage remuneration, 'net profits' were also defined in this section, namely, profits of the company calculated after allowing for all the usual working charges, interest on loans and advances, repairs and outgoings, depreciation, bounties or subsidies received from any Government or from a public body, profits by way of premium on shares sold, profits on sale proceeds of forfeited shares, or profits from the sale of the whole or part of the undertaking of the company but without any reduction in respect of income-tax or super-tax, or any other tax or duty on income or revenue or for expenditure by way of interest on debentures or otherwise on capital account or on account of any sum which may be set aside in each year out of the profits for reserve or any other special fund. This provision was introduced to put some check on the practice of providing in the managing agency agreements for exorbitant remunerations and commissions irrespective of the profits earned by the company.

Definition of 'net profits' to which remuneration was to be related, was spelt out in law to give a reasonable basis for making calculations.

Section 87D stipulated that no company could make to a managing agent of the company or to any partner of the firm, if the managing agent was a firm, or to any member or director of the private company, if the managing agent was a private company, any loan out of moneys of the company or guarantee any loan made to a managing agent. Further, except with the consent of three-fourths of the directors present and entitled to vote on the resolution, none of the foregoing parties which constituted or were connected with the managing agents of the company could enter into any contract for the sale, purchase or supply of goods and materials with the company. Section 87E applied restrictions to making of loans or guaranteeing of loans to or by companies under the same management. Section 87F laid down that a company other than an investment company could not purchase shares or debentures of any company under management of the same managing agent, unless the purchase has been previously approved by a unanimous decision of the board of directors of the purchasing company. Section 87G prohibited a managing agent from exercising in respect of any company of which he is managing agent, the power to issue debentures or except with the authority of the directors and, within the limits fixed by them, a power to invest the funds of the company, and any delegation of any such power by a company to a managing agent was void. Section 87H laid down that a managing agent shall not, on his own account, engage in any business which was of the same nature as and directly competing with the business carried on by a company under his management or by a subsidiary company of such company. Lastly, in order to check the packing of the board of directors by the nominees of the managing agents Section 871 laid down that, notwithstanding anything contained in the articles of a company other than a private company, directors, if any, appointed by the managing agent would not exceed in number one-third of the whole number of directors.

Checks Evaded

The foregoing provisions, though very much resented by the managing agents in 1936 for being wholly unwarranted encroachments upon their powers that had fullest sanctity of contract, lost their bitter taste for the managing agents during the World War II period

when they evolved new devices and ways of perpetuating their control over the managed companies at the cost of the latter and to their own greatest good, in utter disregard of the ethics of business which at the minimum stresses the need for the observance of fairness and equipoise in benefits between the concerned parties to a contract. Both for their striking novelty and superabundance in the corporate sector, the new practices of the managing agencies attracted the attention of the public and the Government and were commented upon by the Bhabha Committee in 1952. Notwithstanding the provisions of Section 87A(1) of the 1913 Act that stipulated a period of 20 years for the duration of managing agency contract, a practice had grown up of securing from the present shareholders a renewal of a managing agency agreement long before the expiry of the existing contract. The Bhabha Committee held this to be objectionable "because it does not enable the shareholders of a company to assess the actual performance of a managing agent before they are called upon to consider his application for renewal of extension of term and in any case it is wrong in principle that the future shareholders should be deprived of their right to have a say in the matter." By securing the renewal of managing agency contract long before the 20-year period, many a managing agent raised their remuneration to higher levels that they found their other compeers to be drawing.

Further, even though clause (c) of Section 87B of the 1913 Act imposed the curb on transfer of managing agency only with the approval of the company in general meeting, it was observed that such approval came to be "engineered by the holders of a small majority of shares on promise of payment of a large compensation, in collusion with the transferee," resulting in "an unwarranted burden on the company." In fact, trafficking in managing agency and management rights became a normal practice. The worse thing about it, apart from the golden handshake that was collusively arranged, was that, sometimes, the close associates or relatives of the former managing agents were appointed at increased remuneration and thereby the same group of persons doubly benefited without losing control over the company. It became a device to earn windfall gains.

Moreover, apart from trafficking, in the absence of any provisions regarding resignation, many a time "managing agents resigned their office in favour of new-comers either in collusion with the latter or with their full knowledge, on the tacit understanding that they would receive suitable compensation from the company for loss of office on their resignation." Sometimes, a managing agent who had thus resigned from his office was subsequently found to have committed gross irregularities in respect of the affairs of the company, but, by the time this discovery was made, it became impossible to compel him to render accounts or to seek redress from him in any other manner legally open to the company.

Another prolific source of abuse was that, while Section 87C laid down the method by which the remuneration of managing agents could be calculated, exorbitant remunerations quite out of proportion of the financial resources of the managed companies had been fixed and many unscrupulous managing agents under the law unjustifiably supplemented their income directly as a result of the defects and deficiencies in the provisions of this section. In so far as the provisions of law permitted other payments also to be made to the managing agents, alongside the remuneration as related to net profits, managing agents in many cases entered into agreements to receive a commission on sales or turnover. In some cases, the percentage on the net profits was kept low but the office allowance charged was comparatively large and in almost all cases, besides the office allowance and the percentage on net profits, managing agents also drew remuneration in the form of commission for various services rendered to the company and the rates of these commissions varied from company to company. The real incidence of these when related to net profits worked out to an unconscionable amount.

Bhabha Committee

Among the payments received by the managing agents, the most blatant source of abuse was reported to be in regard to the office allowance received by them, for, in this way, the managing agents passed on the expenditures incurred for their own business, etc., to the managed company and, in many cases, the managing agents hardly maintained any separate staff and office for the benefit of the managed company. Another widespread undesirable practice among the managing agents was to "put in their partners, or directors or managers of the private companies of which they were members, in managerial positions in the managed company, thereby indirectly augmenting their income or the income of their friends."

Another charge was that the managing agents had usurped all such powers that gave real control over the affairs of the business from the boards of directors, which, instead of directing the affairs of the company, became a subservient body to the managing agents. This amounted to complete erosion of authority of directors. Commenting on this practice, the Bhabha Committee said:

"It has come to our notice that many managing agency agreements contain clauses which, directly or indirectly, seem to ascribe powers and duties to managing agents which, far from recognising their subordinate position *vis-a-vis* the directors, purport to confer on the former powers which override the authority of the latter in many important aspects of company management."

Yet another malady was that the managing agents made borrowings from the managed companies for extraneous purposes with a view to affording benefits to nominees or allied firms, as a result of the loopholes in the law. Many managing agents had misused the moneys of the managed companies which they held in the current accounts on behalf of the latter. Very often, in the absence of a limit upto which the managing agents could have moneys in such accounts, huge funds of the managed companies had been diverted into them. Further, taking advantage of the wordings of Section 87E which confined the efficacy of the section to "companies under the management of the same managing agent," the managing agents made the fullest possible use of loophole where they were managing agents of one company but not that of the other, though the latter was his own company, or where neither the lending nor the borrowing company had a managing agent but they had common boards of directors which followed a common policy. The evasion of the provisions of this section was also noticed where the names of the managing agents of the lending and the borrowing companies were different, although, in fact, the constitution of the two managing agents and the policy they pursued in respect of the managed companies were the same.

Similarly, advantages were taken in respect of inter-company investments. To make matters more objectionable, managing agents often adopted vague or indefinite modes of valuation of shares and concealed facts about the market value of investments. While Section 87H prohibited a managing agent from engaging in a competing business in his own name, they took advantage of this and individual partners or shareholders of the managing agents got engaged in competitive businesses and weakened the foundations of the managed company. Invariably, managing agents or their associates were appointed as buying or selling agents of managed companies. Notwithstanding the fact that it was the duty of the managing agents to effect purchases and sales for the company, they proceeded to charge high commissions from the company. Many a time, they charged commission from the third parties or tilted the price in their favour when they were appointed as buying or selling agents.

Lastly, the managing agents had widened their network so much that, apart from resulting from excessive concentration of economic power in their hands, the attention that they could give to the managed companies diminished proportionately with every addition of the managed companies, for they were not always in one specialised field but ranged over a wide area of industrial activities which is typified by what is known as horizontal diversification. Above all, it was a common practice among the managing agents to provide for the issue of shares loaded with excessive and disproportionate voting rights by a company of which they acted as promoters.

III

The 1956 Act and After

Thus, the cumulative effect of all the foregoing was that the interests of the managed companies and their shareholders were thought to be seriously jeopardised and required effective remedial measures both by further raising the hedges planted in the provisions of Sections 87A to 87I of the 1913 Act and by providing for a new set of provisions. In fact, every one of the foregoing abuse has been covered by the provisions written into the Companies Act, 1956, pertaining to company management in general and to managing agents in particular. A beginning to check the more objectionable practices of the managing agents was made by passing the Companies Amendment Act of 1951, which brought into existence a special Advisory Commission to regulate appointment and remuneration of managerial personnel. Really speaking, the provisions of the present Companies Act are based both on the recommendations of the Bhabha Committee and the subsequent experience of the above named Commission.

The present Act contains about 60 sections pertaining to managing agents, of which about 40 sections impose restrictions of various nature on the managing agents. Further, about a dozen sections of the Act were made more stringent by the Amendment Act of 1960 in their application to managing agents. Not only that such a large number of restrictions of quite wholesome nature was put in the 1956 Act, but also the Act sponsored a new institution of management, namely, the secretaries and treasurers as an alternative to the managing agency form of management to dissuade companies from adopting the traditional type of management set-up. This reflected a positive streak of thinking of the law-makers who appeared to be dissatisfied or even disgusted with the managing agency system and wished the vacuum created by voluntary retreat or by forced exit effectuated by Government action, to be filled up by another institution of management shorn of bad characteristics of the managing agencies if the companies hesitated to be run by the board of directors directly. The regulatory provisions concerning secretaries and treasurers are contained in Sections 378 to 383 of the Act.

Another provision which is more awe-inspiring than any of the restrictions in the Act is Section 324 which provided for the ending of the managing agency system at any time after a review of the position relating to the continuance of the system in the light of its performance under the new restrictive provisions according to the rules framed by the Government, in a class or description of industry or business or groups of industries, etc., as might be specified in the notification to be issued by the Government. This notification can be issued by the Government after an inquiry has been conducted as per procedure laid down in Rule 11 of the Companies (Central Government's) General Rules and Forms, 1956 and after the recommendations of the enquiry committee have been considered by the Company Law Advisory Commission and its advice has been duly taken. The third step before issue of the notification in final form is to place the draft notification before both the Houses of Parliament for a period of not less than thirty days while Parliament is in session. When all this gamut of action has been gone through the notification will become operative after three years from the date of its publication.

Room for Lobbying

According to the provisions of Section 324, it appeared as though the Government would initiate action almost immediately after the passing of the Companies Act, 1956, but, as nothing has been done so far, any action that might be thought of now, within the ambit of Section 324 and the relevent rule thereto, could have the terminatory effect on the managing agency system in any class or classes of industry not before the end of 1968. It is thus quite clear that this provision is hardly an appropriate one if a quick decision has to be taken in the matter. Moreover, an unsatisfactory feature of this provision is that the procedure laid down under it gives great room for lobbying as also for making suitable arrangements for minimising the effects of termination of managing agency by the managing agents.

Thus, while the foregoing general provisions do exist within the framework of the present law, the restrictive provisions of the law have had a decisive influence on the working of the managing agencies in the country.

Now to take up the provisions that restrict the working of managing agencies one by one. Section 89 of the law has robbed the managing agents of the excessive voting rights which they had secured for themselves through issue of deferred shares at promotional phase of the company in their capacity as the promoters. Section 325 debars a company acting as managing agent to be managed by a managing agent. As an extension to the principle underlying the above provisions, Section 325A, which was added by the 1960 Amendment Act, prohibits the appointment of a subsidiary of a company, but existing arrangement was not to be disturbed. Here it may be noted that, under the respective laws governing the insurance and banking companies, these classes of companies, as also the Government companies are not to have managing agents, *vide* Section 618. Further, contrary to the posi-

came into force when an appointment of managing agent could take effect on the ratification of the agreement by the company in general meeting, Section 326 makes the appointment of managing agent subject to the approval of Central Government. This is also required to be taken in regard to many other matters concerning the managing agents. The Central Government under this very provision has been asked to accord its approval not in any arbitrary manner but after satisfying itself that it is not against the public interest to allow the company to have a managing agent, that the managing agent proposed is a fit and proper person to be appointed or re-appointed and further that the conditions of the managing agency agreement proposed are fair and reasonable and that the managing agent has fulfilled any conditions which the Central Government requires him to fulfil.

In order to ensure that all the managing agencies have been screened from the standpoint of the foregoing tests as also in regard to their terms of appointment, etc., Section 330 provided for the termination of the tenure of all managing agents which had not obtained prior approval under the present Act, on the 15th August 1960. As regards the tenure of office, Section 328 has further cut it short to the outside limit of 15 years in the case of first appointment and to 10 years in the case of re-appointment, and the latter cannot be done if the existing term of the managing agent has two years or more to run, unless the Government was satisfied that it was in the interest of the company so to do. The statutory maxima of tenures mentioned above, however, have been generally kept down to ten years and five years, respectively, by Government action following the recommendations made by the Company Law Committee and the Advisory Commission.

Government Sanction

Another provision, namely, Section 329, ordains that the variation of managing agency agreement, which is not a normal thing, should, besides having the approval of company in general meeting, be also sanctioned by the Government who are to look into the propriety and reasonableness of the change. Section 332 of the Act places restriction on a managing agent to have not more than ten companies under their management and asks them to fall in line with this requirement by the 15th August 1960. Private companies which were neither a subsidiary nor a holding company of public companies, unlimited companies and association not for profit are exempted from this stipulation, but sub-section 4(a) of this section, which was put on the statute book in 1960, has amplified the scope by including along with the managing agent every member of the firm acting as the managing agent and, where a body corporate acts as the managing agent, every director, or member thereof. Sections 334 to 342 require the vacation of office, removal and resignation of managing agents under certain ostensible circumstances and, with a view to seeing that the managing agents do not get away lightly and without being called upon to make good the loss caused to the managed company, the previous sanction of Government has been made a mandatory requirement in certain circumstances. This is provided for in addition to civil remedies that can be sought.

Section 365 prescribes a prohibition for loss of office in certain cases such as the reconstruction or amalgamation of company, vacation of office in pursuance of Sections 324, 330, 332, 334(e), 335, 336(a) to (d), 337, 338, 340(2) or where the managing agent has instigated or has taken part in bringing about the termination of his office. In cases other than these when he became entitled to compensation, it was to be within certain limits as stipulated in Section 366 of the Act. Section 343 lays down that the transfer of office by managing agents would require Government's approval in addition to the approval of shareholders by ordinary resolution. This section was completely revised by the 1960 Amendment Act to cover cases of arrangement having the effect of transfer of managing agency effected by the managing agents by giving irrevocable power-of-attorney to third parties to manage the affairs of the company of which the managing agents are in charge and by reserving to themselves a portion of profits. Further, insofar as the transfer involved a change in the constitution of the managing agent, under provisions of Section 346 the approval of the Government was called for. This requirement was provided for to check trafficking in managing agency. The provisions of Section 343 have been further given complementary support by those of Section 364 which says that a company was not bound by assignment of or charge on managing agent's remuneration. Sections 344 and 345 completely rule out passage of managing agency through inheritance by agreements entered into after the 1956 Act came into force. Where agreement entered into before 1956 existed, the heir's case was to be approved by Government on the touchstone of "fit and proper" criterion. Section 347, read with Schedule VIII, provides for certain compulsory disclosures to be made by the managing agents by filling returns with Registrars of Companies and making available the copies thereof to the members for inspection.

Remuneration

As regards remuneration, the Act contains a string of Sections, namely, Sections 348 to 354 read with the provisions of Section 198. The Act has restricted the remuneration to a ceiling of 10 per cent of the net profits as defined in the statute. Additional remuneration can be given only if sanctioned by the company by special resoultion and then approved by the Central Government as being in the public interest. Managing agents are not to be given any office allowance, but may be permitted to reimburse themselves in respect of actual expenses to the extent sanctioned by the board. In the absence or inadequacy of profits, the minimum remuneration payable to managing agents should not exceed Rs. 50,000 in any year but the Central Government are empowered to grant suitable relaxation in special cases. It must be mentioned here that the permissible ceiling of 10 per cent was not allowed *suo moto*, but it became one end of a sliding scale of remuneration prescribed by Government under the advice of the Advisory Commission, the range of this remuneration being 4 per cent for the last slab of net profits and 10 per cent for the first one. Sections 356 to 360 restrict the scope of appointment of managing agents or their associates as buying or selling agents of the managed companies. Section 356 prohibits the receipt of any commission or remuneration by *managing agent* or his associate in respect of sale of goods produced by the managed company within the country and Section 358 the receipt of any payment for purchases made in the country. Section 360 requires that contracts between managing agent or associate and managed company for the sale or purchase of goods or the supply of services would have to be approved by the Government.

Further, by the 1960 Amendment Act, even a managing agent who had resigned his office is prohibited under Section 294(4) from taking up the appointment as sole selling agent in his erstwhile managed company before three years from such cessation. Certain very strict restrictions and limits have also been prescribed for making loans to managing agents, loans to companies under the same management including those under common managing agents, etc., investment in shares etc., of other companies in the same group under Sections 369 to 373. Restrictions in respect of loans to directors who may be from the managing agency set-up have also been placed under Section 295.

In regard to investments, the new form of profit and loss account as prescribed in Part I of Schedule VI requires detailed disclosure of all material particulars. To re-establish the authority of the board of directors *vis-a-vis* the managing agents, Section 377 restricts the right of managing agent to appoint directors of the board of the managed company to two directors where the total number of directors exceeds five and one director where the total number does not exceed five.

Tight Jacket

It is thus evident that managing agents have to function under a very tight straight-jacket. It has been observed that there is an overwhelming number of provisions of law, very specific in their restrictive application. In cases where the Government has been given discretion to administer the law, the administrative policies have generally been more restrictive than the substantive provisions of the law. Only marginal reliefs have been given even in the case of the relatively few cases that satisfied the various criteria laid down under the rules framed therefor. One instance of the rather restrictive orientation of discretionary powers vested with the Government is the administration of sections dealing with remuneration. With the help or concurrence of the Advisory Commission, the Government has evolved a detailed eight-step sliding scale for fixing percentage remuneration of managing agents. Even for determination of minimum remuneration within the statutory ceiling of Rs. 50,000, a refined formula has been evolved. For dealing with cases with uncommon features or requiring a distinctive treatment, certain criteria have also been evolved.

Another instance of the restrictive prescription is that relating to approval of guarantee commission that managing agents or their associates charge for guaranteeing or providing security in connection with loans or advances obtained by the companies under their management from banks and other parties. Having being convinced of the fact that, in the great majority of cases, these guarantees were never invoked and the risks borne were purely formal and as such the commission merely meant an additional burden on the managed company for which practically no commensurate service was being rendered, the Government has restricted such payment and evolved some definite rules for determining it. One of the criteria laid down says that the guarantee commission is not to exceed one-tenth of the remuneration payable to the managing agents by way of commission on the net profits as sanctioned by the Government and further that the total remuneration payable to the managing agents, inclusive of the guarantee commission, should not in the aggregate exceed 10 per cent of the net profits of the company in that year.

Thus the Government's attempt has been quite strict with the managing agents, in particular, and other managerial personnel, in general. It is in this spirit that, notwithstanding the fact that the Act placed no restriction in regard to tenure or remuneration payable to managing agents by private companies who have only to get the approval of the Government for the appointment or re-appointment of their managing agents, the Government have sought to regulate the tenure of appointment in regard to them also in the same manner as in the case of public companies. As for the remuneration, the Government have fixed a ceiling and some other working criteria.

IV

Results of Regulations

While much criticism can be levelled against the restrictive nature of the provisions of the law as amended after the passing of the substantive Companies Act, 1956 as also against the over-zealous approach of the Government to make the administration of these provisions further regressive and restrictive, fair indications are available that most of the abuses of the managing agency system have been banished from the corporate scene. The abuses that have virtually disappeared are trafficking in managing agency rights, payments of various nature including compensation moneys got by the managing agents directly and payments secured for the associates, unrestricted or free use of various powers in directing the affairs of the managed company that essentially belonged to the board of directors, and suppression of facts. Not only that the managing agents cannot derive any undue benefits from the managed companies under the terms of agreement or otherwise because of the requirement of approval of the Government clamped upon them and of the constant vigilance exercised by the Government, but also after relinquishment of managing agency, a managing agent cannot for a period of three years or so think of availing themselves of any benefit as a result of their past association or influence.

Apart from these general abuses curbed during last ten years of the operation of the present Act, two very distinct beneficial and healthy influences have been generated. One such beneficial result has been the improvement in quality of management by managing agents who have to satisfy the Advisory Commission and the Government about their *bona fides* and fitness. Not only the past record of the managing agents, where re-appointment is sought, is seen but objections and complaints received from the shareholders of the managed companies are also closely scrutinised. It is, however, difficult to assess this improvement, or say well-nigh impossible, to use any quantitative indices and therefore, "the best that can be said would be on the basis of close observation and detailed searching inquiry only." In this connection, the comments of Dr. Raj K. Nigam in his article, "The Impact of the Companies Act on the Managing Agency System," published in the *Company News and Notes* of 2nd September 1963, are worthy of note. He wrote:

"A possible index that could very roughly show this change could be the number of complaints received about mismanagement of companies, manipulation of transactions, etc., against the managing agents. Apart from studying the number and nature of such complaints since the Act came into force, it would also be necessary to assess them in relation to the complaints received against companies which have adopted other forms of management. The relevant data on complaints are not available in any processed form in official sources but broad trends in number of complaints fall against the managing agents and

cases of lapses committed by them prove that their behaviour pattern has improved. There is now a widespread awareness among the managing agents that they have to adjust themselves to the new disciplines imposed both by the statute and by the Government through various administrative measures, all designed to rid the system of its many undesirable features and to make it a more efficient instrument of company management. Many of the managing agents who could not just readjust themselves to the imposition of new discipline and stand the scrutiny carried out by the Administration at the time of their re-appointment dropped out and did not apply for re-appointment and of those who applied for re-appointment, the cases of 11 per cent were rejected."

The improvement in the quality of management by the duly screened managing agents finds adequate reflection in the sustained growth of companies managed by them and in the reduction in the number of failures of the managing agency managed companies both in absolute terms and as a proportion of total failures in any year.

Besides the qualitative improvement in management, the administration of various provisions pertaining to remuneration has resulted in economy in management by managing agents. Before the 1956 Act came into force, the average for managing agents' remuneration as percentage of profits in such major industries as tea, coal, sugar, cotton textiles, jute textiles, shipping, etc., ranged between 15 per cent and 24 per cent and in many individual cases it reached near about 30 per cent even. In addition, there used to be other heavy payments too. The percentage remuneration after the 1956 Act came into force has steadily fallen from 11.5 per cent in 1956 to 10.2 per cent in 1958 and to around 9 per cent in recent years. But for the minimum remuneration that is allowed to the managing agents when profits are inadequate or there are losses, the percentage figure would have recorded further reduction. The biggest managing agents, under the slab system, on the average, could get about 6½ per cent only. The biggest company in the private sector in the country which is managed by a managing agent, namely, the Tata Iron and Steel Company, managed by the Tata Industries Ltd., in 1962-63 paid only Rs. 37.5 lakhs as remuneration to the managing agents, as against a net profit of Rs. 1,047.5 lakhs, that is, 3.6 per cent on net profits.

Hold Goes Down

A third effect of the present Act and Administration thereunder has been that the number of both managing agents and their managed companies has very markedly declined, partly, it is believed, due to voluntary action and partly as a result of screening by the Government. According to a study made by Dr. Nigam, the total number of managing agents before the present Companies Act came into force, was 3,944 looking after the management of affairs of 5,055 companies. The proportion of managed companies to the total number of companies at work came to 18 per cent, that is, one out of every six companies was under managing agents' management. The proportion for public limited and private limited companies separately came to 45 per cent and 5 per cent, respectively. In terms of paid-up capital, 54 per cent of the corporate sector was with the managing agents. As against this position, in 1962-63, out of 24,598 companies at work (excluding banking, insurance and Government companies which are forbidden from having the managing agency form of management) 1,440 were managed by managing agents numbering around 1,000. That is only 6 per cent of the total number of companies at work were under managing agents' managerial control, the separate proportions for the public limited and private limited companies being 22 per cent and 1.2 per cent, respectively. The paid-up capital coverage declined to 34 per cent, but this fall has to be read in conjunction with increase in total paid-up capital of companies, excluding the three exempted categories not permitted to have managing agents, from Rs. 870 crores to Rs. 1,200 crores.

The extent to which the positions vacated by managing agents have been taken up by the alternative form of management, namely, the secretaries and treasurers or have been allowed to remain with the boards of directors with or without managing directors or whole-time directors, is the next important point to be looked into in the context of withdrawal of managing agencies from the corporate scene as it would give a clue to the future trend of developments.

According to the published data by the Company Law Administration during the period 1956-60, appointments of 45 secretaries and treasurers for about 180 companies had been made. Out of these, about half the number of secretaries and treasurers were actually the managing agents who had got themselves appointed in the managerial form to comply with the provisions of Section 332. Such managing agents who converted themselves into secretaries and treasurers held their appointments in the latter name for 137 companies. Since 1960, more than 20 new and genuine secretaries and treasurers have sprung up. The total number of secretaries and treasurers' managed companies could not be reckoned to exceed more than 250 at the outside and that of the genuine secretaries and treasurers more than 40. The institution of secretaries and treasurers has found favour only with the big managing agency houses, presumably because of its use as a device to retain control over the companies managed by them. Neither this form of management nor the other one of 'managers' has become popular with others. Figures of new company registrations are more telling both for the secretaries and treasurers and for the managing agents. During the seven-year period, 1956-63, out of 9,150 newly formed companies, only 18 of them wanted to adopt secretaries and treasurers form of management, whereas 134 opted for managing agency system. Only 15 new companies showed preference for the 'managers' and the rest, numbering 8,983 new companies, proposed to be managed by board of directors with or without managing directors. From these figures it is clear that the verdict of the corporate promoters, many of whom were absolutely new entrepreneurs, has gone against the tried institution of managing agents and the untried one of secretaries and treasurers.

No Better

The overwhelming switch-over in favour of direct management by board of directors with or without managing or whole-time directors is, however, not to be taken as conclusive proof of economical and better management. It has happened very largely due to apprehensions that appointment of managing agents created a lot of paper work as quite a few returns had to be filed with the Government and that the responsibilities undertaken were not commensurately rewarded. None of the studies on remuneration so far made have shown that the board of directors form of management is more economical than that of managing agency system to any significant extent. It is quite common to find that companies having a board of eight directors, of which two are appointed as managing or whole-time directors, have been found to pay total remuneration varying from 8 to 9 per cent. In terms of percentage, these stray figures, of course, show an edge in favour of the board of directors form of management. But this advantage of reduced cost of management has to be considered along with a few other questions. For instance, does a company without a managing agent experience any difficulty in securing loans and advances from banks and other financial institutions? Has the general progress or growth of the company suffered a setback because it was without a managing agent? These and other questions can only be answered by a comprehensive enquiry. But there is at least one notable instance of a big company deciding in September 1964 to switch-over from management by directors to that of managing agency.

Current Abuses

While, however, advantages resulting from the board of director form of management yet remain to be conclusively established, the criticism of the managing agency system has of late been made not so much on grounds of proliferation of any new types of abuses as on some basic reasons. Among the new abuses, the one most often mentioned is that, since the present Act came into force, several managing agents have augmented their income with guarantee commissions for making up the loss in their remuneration. As against 14 per cent of the total loans and advances obtained for the managed companies being guaranteed by the managing agents before the present Act came into force, this proportion has gone up to 67 per cent in the case of big-sized companies and 49 per cent in the case of small companies. It was only 23 per cent before in the case of the British managing agency managed companies. A few cases have come to light where guarantee commission worked out to about 150 per cent of the managing agency remuneration received in the form of commission on net profits. A system of circulatory loans which circumvents the provisions of Sections 295 and 369 of the Companies Act, 1956 has been noticed to operate in a number of cases. Moneys from the managing agency managed companies passed into the hands of the managing agents through the intermediary channels of non-associated companies. Further, the managing agency constitutions have been so ingenuously devised that they are not covered by the definition of an "associate." This has been done to avoid the rigours of Section 332 of the Act. As a matter of expediency, housewives have been made directors or partners in managing agency companies or firms. Also, it has been observed that, by employing friends and relatives in key posts and by getting them contracts with companies for various kinds of non-managerial services on lucrative terms to them, the managing agents have increased the total cost of management. By these practices, the managing agents seem to be checking the growth of professional cadre of managers and thereby keeping the efficiency of companies at a low key; they are still perpetuating the hereditary lineage in management. All these are operational defects noticed in the system of managing agency.

Case Against

But these apart, the gravamen against the system is that a great majority of the managing agencies are too poorly equipped technically to render specialised services to the managed companies and do not maintain any secretariat of their own. Today, the promotional and financial aids to entrepreneurs are available in such a superabundant measure with the establishment of many State-sponsored units that the need for the system of managing agency has gone down appreciably. The direct financial stake of the managing agents has declined to about 2.5 per cent from 14 per cent noticed prior to 1956. Similarly the quantum of loans and advances given by them to their managed companies has come down from 24 per cent to less than 2 per cent in the post-1956 Act period. An overall view of all this is that an overwhelmingly large section of managing agents is not rendering sufficient services or incurring any expenditure for the managed companies out of the commissions they are receiving from them, as they have resorted to the device of employing highly paid personnel at the expense of the managed companies for rendering services which would ordinarily be rendered by them. In the light of all this, a large section of the powers-that-be consider it desirable to abolish the managing agency system.

It has further been mentioned that the well-established industries like cotton, jute, paper, sugar, tea, cement, rayon do not offer any special difficulties or problems of management and, therefore, the managing agency system in those industries could easily be abolished. Similarly, in cases where managing agents managed only one or two companies, the managing agents in such cases should be abolished as no benefits or economies resulting from group management accrued to the managed companies. Available statistics show that the number of managing agencies with one managed company formed 80 per cent of the total number, whereas managing agencies with one and two managed companies came to nearly 88 per cent of the total.

It has also been argued that the managing agency system in the case of private companies which were subsidiaries of other companies, public companies in which public is not substantially interested, investment companies, etc., may be abolished, as the employment of managing agents in such cases was only a clever device to get the maximum possible remuneration in addition to the dividend earned from the substantial investments held by the controlling interests. Thus, the more rational thinkers and informed persons plead for the sector-wise abolition of the managing agency system on the above basis. But the more radical people base their argument for the abolition of the system on the general ground that the system tends to concentrate economic power in the hands of a few persons who would not hesitate to indulge in restrictive practices.

The foregoing arguments suggest a strong case for the abolition of the system. Perhaps, the concerned sections in business circles may not contest the position either, as certain degree of resilience in favour of or adaptability to board-of-directors form of management has already been in evidence during the last few years. What really seems to be the essence of the matter is that the timing and phasing of the abolition of "the much glorified and the much condemned" institution of managing agency should be carefully planned and democratically effected, after taking the advice of some Expert Committee or Commission and by avidly and swiftly discussing its

INDO-BRITISH TRADE

Continuance Of Surcharge Will Have Adverse Effects

By N. C. SEN GUPTA, I.C.S.
MINISTER (ECONOMIC), HIGH COMMISSION OF INDIA, LONDON

INDO-U.K. trade prospects have recently suffered a serious jolt after the imposition of a 15 per cent import charge on all landed costs by the U.K. at the end of October this year. Indian trade with the U.K. has prospered over the centuries not only because of historical association but also because of duty-free entry which has enabled Indian exporters to surmount the large freight disadvantage.

Over the years trade with the U.K. has all along been regarded as occupying the pride of place in India's foreign trade. The managing agency firms established through British enterprise in India during the eighteenth and nineteenth centuries necessarily aimed at obtaining a balance in this two-way traffic. While they developed tea gardens, jute fields and other enterprises to meet the requirements of industries in the U.K., they were also keen to buy consumer goods and other Indian requirements in the British market. The railway system in India was specially tailor-made to facilitate such transactions and Indian production was geared towards exports to the U.K. market through the three ports developed by the British at Calcutta, Bombay, and Madras.

While very conscious efforts have been made to diversify India's foreign trade, particularly after independence and more so after tied credits from various countries became the fashion, while other ports have been developed in India and while local production has taken the place of imports in the supply of consumer goods, the largest single chunk in India's foreign trade continues to be the trade with the U.K. At the beginning of the twentieth century India used to send 28 per cent of all her exports to the U.K. and used to obtain 50 per cent of all her imports from the U.K. In 1963, about 24 per cent of India's exports went to the U.K. and India obtained 18.8 per cent of all her imports from the U.K. Similarly, the U.K. has been all along buying from 2.9 per cent to 3.8 per cent of all her imports from India and sending between 3 per cent and 5 per cent of all her exports to India.

E.C.M. and After

In 1962 when Britain submitted an application for entry into the European Economic Community, India became worried mainly because of the apprehension that the U.K. would be obliged to introduce, may be by stages, the Community's common external tariffs against imports from India. India would thus be losing her Commonwealth preferences in the U.K. market; on the other hand, the advanced European countries, along with their associates, would enjoy free entry into the U.K. Britain then took particular pains to demonstrate that she was fully aware of the difficulties of developing countries of Asia and made very serious attempts to obtain a large measure of liberalisation regarding the entry of goods from countries like India, Pakistan, Ceylon and Hong-Kong. Similarly, when the U.K. had earlier become a member of the E.F.T.A., the U.K. had obtained a release from India on her obligation under the Indo-U.K. Agreement of 1939. The Government of India had given them a conditional release that India's trade with the U.K. should not be affected and that the other E.F.T.A. members should not get more preferential treatment than India herself in the British market.

That is why the imposition of the 15 per cent charge on all imports into the U.K., excepting those specifically exempted, has caused so much worry to India. Through sustained intensive efforts India has started obtaining some benefits of the ex- industrialisation achieved through the Five-year Plans and manufactured and semi-manufactured goods from India have begun to show foreign exchange earnings. A good 30 per cent of India's exports to the U.K. are no longer raw materials. The imposition of the additional charge nullifies India's duty-free entry facility and increases the already heavy freight disadvantage.

Double Restraint

The tragedy is accentuated by the fact that some of the important Indian exports to the U.K. are already subject to restrictions. Exports of cotton textiles, for example, are already covered by a voluntary agreement which limits imports into the U.K. from India to a quantum of 195 million square yards for textiles and 11.5 million pounds for textile yarns. An additional 15 per cent levy will make Indian exports expensive and would lead British consumers either to prefer local products or to switch over to substitutes. Similarly, Indian exports of jute goods to the U.K. are subject to a control and also to marking-up of prices by the Jute Controller in order to safeguard the interests of production of jute mills in Dundee; the additional charge will make the handicap more severe for Indian exporters and will largely nullify the reduction in mark-ups that had been obtained during the last two years. India has started selling in the U.K. a variety of light engineering goods like sewing machines, pumps, bolts and nuts, clasps, buckles, furniture fittings, iron and steel springs, etc. Qualitatively, India, perhaps, has not yet reached the standards expected by consumers of an affluent society and a rise in the prices of Indian products because of the additional charge will be a positive disincentive for British customers. Immediately the additional charge was imposed, prospective British customers cancelled large orders for these engineering goods. On a very rough estimate, India will probably lose half the market which she had taken so many years to develop in the U.K. for her manufactured and semi-manufactured goods so long as this additional charge continues to be levied.

Main Items

We may look into the main items which figure in India's export trade to the U.K. a bit more closely. The chief foreign exchange earner is tea. Tea is in the exemption list and will not be subject to the additional charge. However, since 53 million British people already consume more than 600 million pounds of tea every year, there is hardly any prospect for increasing sales of tea in the U.K. On the other hand, there is a positive danger that competition from other beverages and revival in the interest of drinking pure milk may cause a reduction in sales. India, therefore, has opened three Tea Centres at London, Edinburgh and Dublin, so that the high quality of Indian tea could be demonstrated all the time.

Our next biggest item of export is tobacco. Here also, the Indian tobacco fields were developed mainly in the interest of British consumers and through the active collaboration of the Imperial Tobacco Company. Raw tobacco also continues to be in the exemption list. There is, however, a risk that, if the present tendency towards discouragement of cigarette-smoking continues, we may lose a part of our market. Indian tobacco is ordinarily used as fillings in the Virginia brand cigarettes and, with the general introduction of filter tips, the proportion of fillings has been reduced and will probably continue to be reduced. Moreover, the 15 per cent charge will be attracted by Indian cigars for which a market had just started being canvassed in the U.K.

Leather trade in India has been developed by mutual efforts of Indian tanners and British importers for more than a century. The British Government has always treated Indian tanned hides and skins as basic raw materials for the manufacture of dressed and finished leathers and leather goods. It is well known that East India kips, sheep and goat skins are only tanned roughly with vegetable tanning materials in order to preserve them during shipments; these Indian exports are, in fact, the raw materials on which the British leather industry is, to some extent, based. However, though there was no exemption at the time of the imposition of the 15 per cent levy, recent amendments have freed most of the leather items in which India is interested. Hand-made carpets and coir matting illustrate another group of items where large numbers of people are employed in India for catering to the demand in the U.K. market. Due to long familiarity, British households have shown a continuing preference for Indian hand-made carpets. But the imposition of the levy will, to a great extent, take away the attraction for Indian carpets *vis-a-vis* mill-made carpets, and already some of the orders booked before the imposition of the levy had been cancelled.

Temporary, But How Long?

It has been repeatedly emphasised by the spokesmen of the British Government that the additional 15 per cent charge is purely temporary and will start being reduced in stages and will in fact be abolished as early as feasible. However, it is a very relevant question how temporary this is likely to be. If the charge is meant to fulfil its objective, namely, to rectify the balance of payments deficit of the U.K., it will have to be retained for sometime, so that its impact can be effective. Moreover, immediately the balance of payments position starts improving it may not be feasible to give up the instrument with which the debit with regard to imports is reduced. In other words, unless British export earnings rise significantly, it will not be clear when and to what extent Britain will be able to take away this additional charge which has contravened not only the Commonwealth trade agreements but also the E.F.T.A. and the G.A.T.T.

India's total exports to the U.K. amounted in value to £135,938,210 in 1962 and improved by 3.5 per cent to £140,793,993 in 1963. The imposition of the additional charge at the end of October 1964 had led to a number of cancellations of shipments which would have come in November and December and are bound to have an adverse effect on the year's trade as a whole. Upto the end of September 1964, the value of India's exports was only 1.8 per cent less than that of the corresponding period in the previous year—a marginal seasonal variation—and it was anticipated that the large orders being booked for Indian manufactured and semi-manufactured goods and also for items like handloom products and carpets, particularly for presentation during Christmas, would have taken the export figures for the year beyond last year's.

This prospective fall in exports will also affect India's imports from the U.K. There is a tremendous demand for British capital goods in India and large lines of credits are negotiated every year not only on Government-to-Government account under the World Bank Consortium arrangements but also under the private suppliers' arrangements guaranteed by the Export Credits Guarantee Department. These credits, however, also depend to a large extent on the U.K.'s ability to spare foreign exchange for a developing country like India to make purchases. If India's own foreign exchange earnings come down because of British Government's action to restrict imports and because of British difficulties with the balance of payments, there are grave doubts if Britain would be in a position to increase the level of credits so that India might maintain its level of purchases of British goods.

Sales Promotion Efforts

India has already taken steps to promote exports, particularly in the U.K. The Tea Board of India maintains an office in London. The Tea Adviser has, as already indicated, opened three Tea Centres. The Engineering Export Promotion Council has appointed a whole-time officer in London in order to provide information about facilities of production of both simple and sophisticated light engineering goods in India. The Cotton Textiles Export Promotion Council also maintains a liaison officer in London. London is the location of the Secretariat of six International Commodity Councils and Study Groups and it is advantageous to exhibit continuously exportable goods of proper quality in London. It may soon be justifiable to maintain a permanent India Trade Centre in London which may probably be financed jointly by all the Export Promotion Councils with facilities for exhibiting the samples and to attend to enquiries with technical competence.

Apart from export earnings and lines of credit, India also obtains valuable capital equipment through financing by British private investors who have been collaborating with Indian parties in setting up industries and manufacturing enterprises in India. Indeed, British investments in India have risen practically three times since India became free not only because of the attraction of the growing consumers' market in India but also because of the maintenance by the Government of India of very equitable procedures for remittances of dividends, royalties, etc. Industries started with foreign collaboration have all along enjoyed all the advantages of tax-free holidays which are available to new industries in India and foreign technicians have special concessions for specified periods as regards liability for Indian income-tax. It is gratifying to note that the level of flow of private investment is being more than maintained this year.

LONDON, *8th December*

PUBLIC SECTOR UNDERTAKINGS

Some Thoughts On Economics And Management

By S. RAMAYYA, I.A. & A.S. (Retd.)

IN the days of colonialism, when countries like India were dependents of the West, the imperial powers did not fully follow their pet *laissez-faire* policy for various reasons. Apart from a few Government-run-armament factories, the British rulers of those days undertook some big public enterprises. One was the huge State-owned railways and others were a few big irrigation projects. They also started some small industrial factories as pilot projects under State auspices as an eye-wash for industrialisation.

Objectives of Public Sector

Leaving aside State intervention or control which is a separate subject and also certain armament production, the main objects of direct State participation in a growing economy can be easily defined. First comes what is called creation of social overhead capital. Omitting investment in human beings in the shape of better education or better public health, this represents State investment in huge irrigation and power projects, port installations, and communications like railways, road systems, etc. Secondly, it may invest in very big industrial undertakings like iron and steel factories or mining as basic necessities for other industries, because adequate private-sector industries and capital may not be forthcoming for such vast magnitudes. Thirdly, the State may take over a unit, say, a textile mill from the private sector for reasons like incompetent management and to avoid closing and throwing lots of people out of employment and creating idle capacity. And, recently, the idea of producing more consumer goods to combat inflation is gaining ground, since private sector is not coming forward now to do the work with enthusiasm. These are more or less the basic principles underlying the Industrial Policy Resolution of 1956.

The third case is a simple one. Government will operate in the competitive private sector, improve the decadent mill by fresh capital and management, produce the same result as an average entrepreneur and probably hand over the mill to another joint-stock company, after setting the organisation on its feet.

Basis for Criterion

It is the second and first categories, especially the first, which require analysis. The first category covers basic services without which direct productive action will not start. In an arid tract, unless water is stored and let out, agriculture is not possible. Unless power is given in bulk, a complex of industries will not spring in a region. Secondly, they involve huge and lumpy investments with technical indivisibility. Railways, roads and ports require thousands of crores. They have to be done on a large scale and not in bits here and there. They are neither suitable nor possible for small capitalists in a developing country. The most important feature of these projects is that, invariably, they do not directly produce marketable goods. A big irrigation dam invites farmers to produce cereals. A huge power plant induces industrialists to invest in a ring of industries. Railways assist in bringing raw materials cheaply from a distance to an industrial nexus and help in distribution; similarly port installations. We cannot, therefore, directly measure the productivity of capital output of social overhead capital. The only method is to aggregate all the connected investments and measure the output; an irrigation project of the public sector and connected private investments by the farmers in cultivation; the public power project outlay and the investments of the industrialists. If the aggregate output in these cases is adequate, it is enough.

From an overall point of view, if the capital output ratio is 3, that is, Rs. 100 aggregate investment gives an output of Rs. 30, it is satisfactory. Out of it we can take the necessary taxes, induce further savings for reinvestment and in early stages even give subsidy in one portion as inducement which will more than amply be covered by production later. For example, from one of the big steel factories, we may give subsidised steel to certain types of engineering factories in their early stages. When these engineering industries later stand on their own, we can stop the subsidy. The pricing policy can be flexible. The objective, of course, is clear. It is a means to an end to induce greater overall production in the country, greater income, greater savings and further investment.

These are absolutely basic fundamentals in public-sector undertakings. In some of my articles published earlier in *Commerce* on the "Economics of Big Irrigation Projects," I argued how we forget such principles in the case of a big irrigation project and simply encourage a weak agricultural sector with holdings of two or three acres by poor farmers who are incapable of investing adequately on their part who will go on clamouring for water and other subsidies permanently. It is something like installing a huge port installation for 5 million tons while the traffic is only 500,000 tons. It is obvious that, in planning investment in social overheads, we should see that it is neither too much nor too little but adequate for the task of stimulating private productive investment activity.

Once we understand this clearly, solutions to various ancillary problems like pricing in public sector, making profits or incurring losses in early stages due to subsidies, labour policy, etc., will fall in line. Most of all, principles of management can also be formulated clearly. There is a good deal of confusion in India still in all these basic matters even in high circles who ought to know better. Some want high profits, others speak of a financial return, some want them to work for the so-called benefit of the people at a loss while others say they should be on a par with private sector; all sorts of confused ideas are now floating.

II

Structural Side of Public Undertakings

First, we shall consider briefly the organisational set up, since the structure defines the limit, and affects efficiency to some extent. There are certain well-known types now in use in advanced countries and we in India copy them with modifications, suited to our conditions.

The older type was the departmental management under a secretary or board. The best examples are the Railway Board and the recent Postal Board. In the Boards themselves, a certain amount of functional specialisation, with experts in technical, and administrative and financial sides, is intended. The objection to this form of organisation is that it leads to bureaucratic red-tapism, delay and loss of efficiency and lack of flexibility.

The most popular modern system is the special statutory corporations, with all the main features of joint-stock companies, but intended for definite purposes; for example, Hindustan Steel Company, the Damodar Valley Corporation, Electricity Boards, etc. The principle underlying these institutions is large autonomy, under a board of control with a chairman, technical and accounts experts; generally, the Chairman is supposed to be an administrative man. The internal freedom is expected to engender quicker decisions, provide freedom from Government's conventional rules and create a certain business-like atmosphere. Almost allied to this is the Government limited company mentioned in special sections of the Companies Act, as, for example, the Hindustan Machine Tools and the Bharat Electronics. In these cases, the usual Chairman, Board and Managing Director are featured.

Recently, a hybrid hotch-potch organisation has come into existence, called the Control Boards of Irrigation Projects. It is supposed to represent political levels of administration, with the Chief Minister of the State presiding, Departments helping, and Government of India also being represented on the Control Boards, as in the case of Nagarjunasagar Project and Rajasthan Canals. This system is also supposed to be conducive to quick decisions. It has a variety of shades and, sometimes, it is very difficult to decide the position of the Board legally, administratively and financially.

Whatever be the structure or nature of the organisation, it is the spirit behind, the ideals dominating the men in control, their sound and correct approach to administrative and other problems and their equipment to deal with them adequately and the evaluation of their work, concurrently or subequently, that are more important. Everybody will admit this point and will stress its importance in a developing country like India where we have to be economical with our precious capital resources. There is a good deal of criticism not only by well-informed public—the intelligent private sector people—but also by the critics inside the Government and the legislature that all is not well with the management of the public sector.

Evidence is very easy to find. We get glimpses of it, as, for instance, when we read in the newspapers about a fire in the Ranchi Heavy Engineering Factory or a scandal in a River Valley Project. Anybody who goes through the Audit Reports of a few years of an Accountant General will, however, get details in a clear matter-of-fact way. The pages will be strewn with losses, infructuous expenditures and some evaluation of these undertakings.

The why and wherefore of this state of things we have to analyse in some detail. This is a rather delicate subject, may provoke some controversy, and is surrounded in darkness, full of prejudice and cheap ideas. But, in public interest, the task has to be faced and done. The fundamental problem is the basic values obtaining in Indian Public Administration and to some extent in such administration in the modern world.

III

Fundamentals of Indian Administrative Problem

The fundamentals of Indian Admistrative Problem constitute a vast subject which cannot be dealt with in detail in a short article. I shall review here only the important aspects. The words 'Administration,' 'Administrator' have unfortunately gathered about them a glamour, an aura which they do not deserve. Essentially, administration means doing a thing or getting things done and anybody, even an ordinary person, can be trained to do a thing. After all, doing is not so fundamental even in this so-called world of action. Before doing comes the mental world of ideas, represented by thinkers in various fields, scientists, philosophers, poets. From their dreams is born the world of action. Action is not a thing in itself or for itself. It is for the benefit of society at large. It is governed by expertise, controlled by laws, economics, finance and resources, the conscience of the workers and the ideals of the society. Only for the smaller mind is the man of action a great hero. Unfortunately, in India the administrator in public administration still continues to be a hero for certain historical reasons.

There are two fundamentally opposed ideas in Public Administration. One is the typically feudal idea of the Administrator, especially the military hero, sent by God and representing the divine king, protecting his demesne by his valour. When the Vikings attack he rides hard into them with his armed retainers and puts them to flight. Says the Lord, "I give you protection and only under the shadow of my castle can the little handicraft and agriculture flourish; otherwise you serfs will perish. You have to be obedient to me in every respect." This is one view. At least from the days of Rousseau's Social Contract, the modern idea has gained ground. Society, in its economic aspect which is its major activity, organises production. For convenience and to avoid internal and external intrusion, some people are asked to guard and protect, while the rest are in the field. The guards, that is, the Government and administration, are subordinate to society, have to act in public interest and, if they fail in their duties, they will be chucked out and replaced by a better set. Intelligent people now hold only this view.

The old British administration had a glamour in the early days of its rule, since it claimed, justifiably to some extent, to have brought law and order internally and protected the country, externally. There was a police *raj* and the officials were mainly general administrators, collecting some land revenue and looking into police work, with a little other all-round activity. They were not asked to be in charge of huge iron and steel factories or a Nagarjunasagar project. Their Indian successors, unfortunately, trained for general purposes but put in charge of huge industrial works or dams, are only to be pitied.

IV

Who Shall be the Administrator?

There is a huge iron and steel company in the public sector, with three giant plants under its care and a fourth one to come. The Board of Directors, Parliamentary and Government controls are all there. To whom shall we entrust its general day-to-day management? Shall we give it to the general administrator or the industrial engineer or the financial-*cum*-accounts expert. There are, of course, prodigies who can combine all these talents in one person. But they are *rara avis*. Even brilliant men can specialise only in one branch.

The general administrator is a bright fellow, the pick of the Universities, generally comes through stiff competition and is trained to know something of everything. He is a social bird, with a social wife, has good contacts in New Delhi with his own service chaps manning key posts in all departments, and can get things done there. But, unfortunately, in this modern world, things are complicated. To attain proficiency in any subject requires long training and specialised handling for many years afterwards. Banking, accounting, income-tax collection, agriculture, etc., require a lifetime work of specialisation and mastery. For a brilliant botany graduate, with a high I.Q., good command of English and a smattering knowledge of Sanskrit, to handle in 35 years all sorts of subjects in Central and State Secretariat and Districts from *Bhagavad Gita* to *Bharata Natyam* is something grotesque. And people have been led to believe by persistent propaganda that the General Administrator can handle any subject. Actually, it is the other way about.

First one should know a few subjects well and their peripheries tolerably, and then only can he become an administrator. Specialised knowledge is more important. The so-called administrative ability is less important. For the latter, common sense, some knowledge of human nature, good and sincere feelings, affable social qualities and a sense of justice are enough. They are easy to learn and most have it naturally but the former, expert knowledge of a subject, is very difficult to attain. The general administrator's trouble is that he has to be surrounded by a host of advisers, engineers, financial and accounts experts, market specialists, etc., and he can come to decisions only on their advice since he has only a vague idea of these subjects. During critical moments, his judgment, more often than not, will go wrong, due to the conflicting advice. What machinery shall we buy for this project? How much shall we spend on the township? What will be the quantum of staff, the majority of whom may have to be disbanded after construction activities are completed? He is like the old *raja* or the feudal lord and he wants to control all the specialists under him, saying that he is the general administrator co-ordinating all activities as if it is a wonderful thing and there is a great virtue in it. This is unfortunately the greatest defect in modern Indian Administration in an age of specialisation, when co-ordination can be easily got by sensible experts sitting across a table and arriving at agreed decisions.

The next type is the specialist and technical administrator, the engineer, the scientist of various categories, the lawyer, the doctor or anybody who specialises in his job or vocation. If he is a competent and cost-conscious man, no finer type can be found. His defects, imaginary and real, can be rectified. His main defect is supposed to be a narrow mind and an inability to take a broad view of things. With better and scientific education and its leavening with humanities and training in allied disciplines, he can be very much improved in his administrative abilities.

Sometimes, a specialist of this type is not cost-conscious. He is not incapable of understanding costs and accounts, if he wants to, being generally a brilliant mathematician, unlike lots of general administrators who have no aptitude whatsoever for accounts and finance. Often, he deliberately smudges cost for 'extraneous reasons. But he has his great asset. Being a technical man, he knows his internal job, production secrets and machinery and only he can control his technical men, and deliver the goods. Although at present the finer and competent types of this category may be few and far between in India, it is not difficult to produce them in large numbers, in future by education and training. And the future of India is in their hands and they are going to be its administrators. At present, they are a frustrated lot, because they are forced to work under ignorant general administrators.

The third category, the economic-*cum*-financial administrator, is the most modern, the most controversial and the most hated not only in India but throughout the world. He is only half emerging and the figure is still shadowy. He is yet to evolve a single image and figure. His all-important work in modern administration is cut up in various sections and is yet to be unified. He is not an administrator in the conventional sense of the world.

Importance of Finance Minister

To understand him we should know something about the modern State, as against the old agrarian society. The modern State is an economic and industrial State, with huge production and high consumption. Even in the older industrial societies gone are the days of the good old *laissez faire*. The State has to intervene, interfere, regulate and control multifarious economic activities—banking, currency, foreign trade, production, consumption, distribution, etc.—apart from budget and public finance in vastly expanded magnitudes. Today the dominant man in a Cabinet is the Economic-*cum*-Finance Minister. The Prime Minister, unless he is also the Economic Minister, is of lesser importance. He is a relic of the feudal age, like the *raja* or the feudal baron, and like the general administrator at lower levels. In India, where economic development is the main work of the State, the position of Economic-*cum*-Finance Minister is even more crucial. He is the man who calculates total production, consumption, investment, foreign loans and guides the economy. He and his organisation control and direct the vast economic activity of the society. The Economic Minister, his administrators and his agents are, of course, the mouthpiece of the public and the public speaks through its Legislature. Ultimately, the Legislature controls these crucial activities.

In the nineteenth century, new techniques of this control were evolved, especially in England, and is spreading throughout the civilised world. It was Gladstone, the great English Parliamentarian, who saw the necessity and started and encouraged such institutions like the Public Accounts Committee and the Audit Department. He enacted the famous Exchequer and Audit Act and enforced strict accounts for all departments. The pervasive control of the Economic and Finance Minister is now becoming clear. The other ministries are all secondary, though they have a certain autonomy within their spheres, but only after their resources are severely earmarked and their activities strictly outlined. The priorities of resource expenditure will be fixed by the Finance Minister. Their day-to-day work will also come under the strict scrutiny of finance either concurrently or *ex post facto*.

The emergence and dominance of the Economic administration is already visible by the commanding position of the British Treasury and the Chancellor of the Exchequer; the American President's great concern in the economic prosperity of the U.S.A., and his constant confabulations with his panel of economic advisers; the German Economic Ministry and so on.

However, a new system reflecting the aforesaid development has yet to make headway. Apart from the political and administrative level, a huge organisation has to be built up, embracing central banking, currency, statistics, trade and industry, Audit and Accounts, Budget and revenue collection, planning, investment, production, consumption, etc. To some extent, even in advanced countries, these are all placed under various commands and have no cohesion. The integration and co-ordination of all these elements, each group specialising in its branch but ending at the apex in the Finance Ministry which will enable the Economic Minister to have a commanding view of the economic field is yet to come about.

Audit and Accounts

The audit and accounts have a special feature, being independent, directly dealing with legislature, which relies on it for various purposes and expects it to do all sorts of functions, especially supervision, and control of all departments, including Finance which is now considered to be part of administration. This is because the Legislature has no other independent economic service organisations through which it can articulate itself, finance being sometimes subordinated to administration. This is the requirement, a vast independent economic organisation directly dealing with the legislature, controlling all other administration on one fringe even like the judiciary which after centuries of struggle is now more or less an independent organisation in another flank of administration. The fundamental point is that finance and economics with all their ancillaries should be separated from administration proper and function independently. Its functions are *control* and *not administration proper* even as judiciary's main functions are dealing justice between citizen and citizen and citizen and the State, even though they have also got administration proper internally.

In the Indian context, the position has to improve a lot. At the political administrative level, the dominance of the Finance and Economic ministry has yet to arise, though it is emerging slowly. The build-up of the organisation at the lower levels with the apex in the Economic Ministry is not yet complete. Financial functions are sometimes cut to pieces and placed under the general administrator. For example, a chief accounts officer works under a chief engineer or a general manager of a railway. That this Chief Accounts Officer is ultimately responsible to the legislature to render correct accounts through the Finance Minister, that he should have a channel of control only along this line and that no administrator should threaten or bamboozle him is not yet clearly understood in this country.

The Crucial Issue

When we come to the administrative levels proper, the position is still worse in India. In Europe, the feudal and post-feudal States had

(Continued on page 131)

Contributing to Nation's Progress....

After achieving Independence India is marching ahead with national development projects. The Five Year Plans are further steps forward towards building up a newer and better India. The Private sector should contribute towards the fulfilment of the ambitious plans.

We, on our little part, are always striving to serve our country by manufacturing the following:—

PHARMACEUTICALS—Drugs and Galenicals, Medicinal Specialities, Injectables.

CHEMICALS—Heavy, Fine and Technical.

LABORATORY RE-AGENTS

SOAPS & COSMETICS—viz. Margo Soap, Neem Tooth Paste, etc.

ESSENTIAL OILS & AROMATIC CHEMICALS

DISINFECTANTS & ANTISEPTICS

●

Sale Offices and Depots:

DELHI, MADRAS, BOMBAY, VIZAG, RANCHI, PATNA, JAMSHEDPUR, NAGPUR, KANPUR, BILASPUR, SILIGURI, BANGALORE, BHAGALPUR, HYDERABAD, PALGHAT, ASANSOL AND MADHUPUR.

INDUSTRIAL RELATIONS IN PUBLIC SECTOR

Enlightened Personnel Policies and Respect for Labour Laws Needed

By B. N. MEHROTRA

DEPARTMENT OF COMMERCE, PUNJAB UNIVERSITY

SINCE the Central Government employees' strike in 1960, industrial relations in the public sector have been a matter of serious concern both for the Government and the people. Labour-management relations in major public undertakings are far from satisfactory and some of them are constant trouble spots. Instead of improving, the situation has shown definite deterioration in recent years. In the past one year or so, there have been more labour disturbances in the public sector than in the private sector. To mention only a few. We may refer to frequent labour troubles in Rourkela, necessitating an on-the-spot study of the labour situation by Mr. Solven, a high official of the West German Economics Ministry; persistent labour unrest, often accompanied by violence, as reflected in a pitched battle between the police and the strikers in February 1962, demonstrations in September 1963, shutdown in March-April 1964, etc., all these in the Heavy Electricals, Bhopal; incidents of violence resulting in destruction of machinery worth Rs. 40 lakhs in the Heavy Engineering Corporation, Ranchi, in May 1964; a strike followed by lockout at Lalooah, one of the biggest railway workshops in India, in November-December 1963; showdowns at Sindri in July 1964; demonstration by 8,000 workers of Durgapur Steel Plant in October 1963; strike by 15,000 workers in Bhilai in August 1963; happenings at Antibiotics Ltd., Pimpri; hold-ups in Bombay and Marmagoa ports, and the boisterous demonstrations at the headquarters of the State Bank of India in August 1964, alleging favouritism. At one time, the situation in the three steel plants was so unsatisfactory that, Mr. Gulzarilal Nanda, when he was Union Labour Minister, was constrained to decide that he would himself make a case study of industrial relations in these units. The delay in the handling of cargo at Bombay and Calcutta ports has become so serious that the foreign shipping companies presently engaged in the transport of foodgrains to India are considering the levy of an additional surcharge on freight for the carriage of goods to Indian ports.

Model Employer !

Besides inflicting heavy financial losses on the enterprises concerned, frequent work stoppages in the key sectors cause dislocations in the economy at various strategic points and are a big obstacle in the implementation of Five-year Plans. The failure to do adequate social justice and maintain cordial and constructive relations with the employees has shattered the much publicised image of the public sector as a "model employer." The rejection of the demand for nationalisation of banks by the Bombay Reserve Bank Employees' Association in July 1964 speaks for itself. These developments not only weaken the case for the expansion of the public sector but also give a serious blow to the very philosophy of democratic socialism which the nation has accepted for its economic and social reconstruction.

A number of factors influence the climate of industrial relations in a unit, but some of the major ones—acting and reacting upon one another—which have particularly aggravated the situation in public undertakings are: serious deficiencies in personnel policies and practices, non-recognition or favouritism in recognition of unions, half-hearted implementation of labour laws, disregard of tripartite decisions, factionalism and rivalry among trade unions and improper handling of the situation by the Government.

The top personnel have been largely drawn from the civil service, so much so that there is a general impression that the public enterprises have become a dumping ground for retired and superannuated Government officials. In the initial stages, this heavy reliance on the civil service was understandable, but that this should continue to be so even after more than ten years of their functioning, only shows that no serious efforts have been made by the Government undertakings to develop and train managerial personnel. Even as late as March 1964, half of the chairmen of public-sector undertakings in the Central sphere belonged to the I.C.S. cadre. Civil servants are generally widely informed and have administrative ability but they lack business acumen and have an inadequate appreciation of labour problems. Further, frequent changes in top posts have prevented the incumbents from acquiring an intimate knowledge of the problems of the enterprise and necessary experience in handling labour.

One example of the unbusiness-like functioning of public enterprises is the serious overstaffing in them. The Estimates Committee had come to the conclusion that "public undertakings are invariably overstaffed."* It adversely affects industrial relations in two ways; first, by unduly raising labour costs, it imposes serious limitations on the capacity of the enterprise to meet the legitimate expectations of workers. Secondly, there is the well-known saying that empty minds and idle hands are devil's workshop. With insufficient work to tire them out, the workers devote their time and energy in conspiring against the management and fellow workers/rival unions.

Inept Handling

The lack of experience in handling labour situations is a serious handicap. Unwise action or ill-advised abstention from action, premature attempts at compromise or too long delayed offers of acceptable terms have, in many cases, unnecessarily prolonged or aggravated labour unrest. The basic cause of the breakdown of the consultative machinery in Hindustan Machine Tools Ltd., Bangalore was the undue haste with which the Joint Management Council was set up. In their anxiety to be the first in the public sector to introduce the scheme of labour participation, the management artificially boosted up the union and went out of the way to facilitate its growth. Since the union had not firmly established itself, a rival union soon came up. The inter-union rivalry ultimately resulted in strikes, lockout, violence, etc. As against this, absence of a recognised union in Rourkela made a negotiated settlement difficult in April 1962; the management declared a lockout, causing a daily loss of production worth Rs. 5 lakhs. Commenting on the shutdown in H.E.L., Bhopal, in March 1964, the *Indian Worker*—organ of I.N.T.U.C.—observed:—"By this act, the management has played into the hands of trouble makers. Its handling of the situation is most inept."

Well-defined and clear-cut rules of recruitment and promotion and standardised conditions of service and terms of employment are the basic principles of efficient personnel management. Their absence gives rise to allegations of favouritism and nepotism, resulting in avoidable worker discontentment. But these have been ignored in public enterprises. Twenty-eight (including some set up as far back as 1948 and 1950) out of 58 undertakings covered by the Estimates Committee had not framed recruitment rules, 31 of them (including Hindustan Cables and Heavy Engineering Corporation) had not laid down rules and regulations for promotion and 19 undertakings had not framed disciplinary rules. Similarly, a formal grievance procedure is an essential element of a sound industrial relations machinery. In the absence of a satisfactory procedure to handle them, day-to-day grievances accumulate with the consequent risk of their degenerating into disputes. In utter disregard of it, 28 undertakings, including Hindustan Steel—the worst trouble spot—had not set up a well-defined grievance procedure.

Recognition of Unions

The problem of union recognition is at the root of much bitterness that has spoiled industrial relations in many a public undertaking, including all the three steel plants, Heavy Electricals, Sindri Fertilisers, Hindustan Machine Tools, etc. Managements' attitude is generally described as hostile, that is, firstly to prevent, by all possible means, the formation of the union and later to delay recognition as long as possible. In Rourkela, recognition was granted to the union as late as in March 1964. The Hindustan Cable Workers' Union complained in January 1961 "that the management are doing their best to crush the union which is the majority union. Management have appointed *goondas* in the Security Department who are threatening peaceful workers not to join the I.N.T.U.C. union." The recognised union in Neyveli Lignite regretted in April 1962 that "even the preliminary privilege of exhibiting the notices of the recognised union on the departmental notice boards is denied." Commenting on the trouble in Sindri in April this year, the Fertilisers Factory Workers' Union observed in a press note: "It has been the habit of this management to get the union workers involved in court cases, because of their trade union activities. Management encourages those elements who defy and work against the recognised union."

The plain truth is that, brought up as the top managerial personnel are in a bureaucratic tradition and an authoritarian atmosphere, their acceptance of the union is half-hearted. It is too much to expect them to regard the union as an integral part of an industrial society and to deal with it at a level of equality. Prof. Harold J. Laski had long back emphasised "the grave undesirability of placing in an executive position anyone whose acceptance of the validity of trade unionism is in doubt. In the absence of a clear-cut policy and necessary sanction, it may take an unusual administrator to have that required degree of adjustability with workers on equal footing. In such cases of mixed motives of the person at the wheel, lie the seeds of unrest which may spark off a big dispute."

Rift in Unions

More significant from the immediate point of view of industrial relations, however, are the serious allegations of favouritism in matter of recognition. Whether by chance or design, in practically all major public enterprises, the recognised union belongs to I.N.T.U.C. which being aligned to the party in power has closer links with the Government. In every case, recognition is challenged by A.I.T.U.C. which claims to be more representative and that is the beginning of trouble. The A.I.T.U.C.-affiliated unions adopt every possible device, including coercion, threats, demonstrations, strikes, etc., to force the management to withdraw recognition from the I.N.T.U.C. union. The mood and intentions of A.I.T.U.C. are evident from the following statement which appeared in *Trade Union Record*—published by A.I.T.U.C.—on 5th October 1963: "If the public-sector managements continue to bolster up the I.N.T.U.C. unions, with the sole purpose of disrupting the workers and denying them genuine trade union rights, a major crisis in industrial relations is imminent." Factionalism among unions has further aggravated the situation. The strike at Sindri Fertilisers which caused a loss in production of about Rs. 20 lakhs was engineered, in order to force the management to accord formal recognition to one of the two rival factions in the workers' union affiliated to I.N.T.U.C. All the central organisations of labour are plagued by groupism. The I.N.T.U.C. is divided into ministerialists and dissidents; in A.I.T.U.C., there are pro-Moscow and pro-China elements; H.M.S. has pro-Mehta and anti-Mehta groups.

The union problem is particularly difficult in public undertakings due to the excessive attention paid by the trade unions in general. Both for prestige and political reasons, all the central labour organisations have been striving their utmost to increase their hold on workers in public enterprises and capture the unions. This has naturally intensified inter-union rivalry. Whatever may be the truth in allegations of favouritism, the presence of widespread dissatisfaction on the issue of recognition and its impact on industrial relations cannot be questioned. The dissatisfaction with the present "verification procedure" for the determination of the representative union strength-ens the case for the ballot system.

Laws More Honoured in the Breach

Public sector undertakings have also been guilty of showing scant respect to labour laws and labour policies. The classic example is that of Rourkela. The State Implementation and Evaluation Officer detected 46 instances of violation of labour laws, tripartite agreements and settlements by the management. He is understood to have pointed out, in his report in May 1963, that these instances of breaches of law were so serious that, if they had occurred in any private industry, it "will have meant the closure of industry." Instead of feeling embarrassed and expressing regret, the plant authorities described the report as "an ill-assorted mass of exaggerations and repetitions." They further accused the Evaluation Officer of not realising "that the damage done to the fair name of the public sector by such reports can sometimes be irreparable."

This only confirms the prevailing impression that the public enterprises are asking for a preferential treatment. To quote, Mr. Ramanujam, Vice-President, I.N.T.U.C., "Public sector has to cover a long way to achieve the desired objective of becoming an ideal employer. For the present, labour would be satisfied, if the public sector does not claim any preferential treatment and is not allowed to claim any exemption or privileges not available to private sector employers, particularly with regard to arbitration and application of Industrial Disputes Act." Expressing the disappointment of railwaymen at the failure of the Government in implementing its avowed labour policy, the President, Western Railway Majdoor Sangh, observed: "The implementation of labour policies in the public sector has been so far very discouraging."

The Estimates Committee had reported that, in respect of 17 undertakings, standing orders had either not been framed or not certified. This is a clear violation of the Industrial Employment (Standing Orders) Act, 1946 which stipulates the formulation of Standing Orders within six months of the setting up of an undertaking. Non-implementation of labour laws is one of the causes of unrest in the Heavy Engineering Corporation. For example, there is no overtime payment for overtime work. Withdrawal of D.A. by management in September 1962 without giving proper notice was regarded by the Bihar Labour Commissioner as a clear violation of the I.D. Act. In Sindri, non-implementation of award of 14th April 1964 led to trouble resulting in lockout on 22nd July. The experience at the Hindustan Antibiotics Ltd., Pimpri, illustrates the dilatory policy followed by public sector managements to settle labour disputes.

Many Lapses

Labour participation in management is one of the major planks of Government's labour policy. The public sector is, however, indifferent to it. In none of the major undertakings, has the scheme so far been introduced nor are there any indications of the intention to do so. Only small units, some of them employing 100 workers or so, have so far set up the Joint Management Council in the public sector. Even if only the Indian Railways or a few big projects like the Hindustan Steel, Heavy Electricals, Heavy Engineering, Fertiliser Corporation, etc, could be persuaded to introduce the scheme, the prestige of the public sector would have been considerably enhanced. The failure to do so has caused disappointment among workers, whose expectations were even higher.

The same applies to Code of Discipline which has been hailed by all sections of the industrial society as an effective instrument for promoting industrial peace. The Life Insurance Corporation of India, Port Trusts, Defence Ministry establishments, Indian Railways, etc., have not yet accepted the Code. Their attitude is not conducive to the success of the Code.

It is on account of these lapses of the public sector that the Government is accused of indulging in double standards of social justice, a stringent one for the private sector, and another for the public sector which is not so stringent.

States *vs.* Centre

The industrial relations situation in public undertakings has also been complicated due to the fact that the administration of labour laws is the responsibility of the respective State Governments. The Union Labour Ministry is not satisfied with the manner in which the State Governments are handling the labour situation in public enterprises and is of late feeling quite concerned about it. The Minister clearly stated at a Press conference on 11th May, 1964 that the best way to ensure industrial peace in central undertakings in various States was to take over the control of labour by the Government of India. The States are, however, resisting the proposal and there is no hope of its early acceptance.

Even the Central Ministries are not prepared to accept the intervention of the Labour Ministry in the formulation of labour policy for the projects under their charge. Prof. J. H. Richardson had disapproved of the present practice of the various Ministries determining their industrial relations policies without reference to the Labour Ministry and had recommended that a senior officer of the Labour Ministry should be attached to employing Ministries to assist in their personnel and industrial relations work. This recommendation has not yet been implemented. Instead, early this year, an adviser has been appointed by the Labour Ministry for advising public undertakings on labour matters. The Ministry desires that, as far as possible, the adviser should be associated by management at the policy-making stage.

The problem of industrial relations in public sector undertakings has been briefly examined in the foregoing paragraphs. This leads us to the conclusion that, if public enterprises are to be efficiently run and to justify their claim of being an ideal employer, they should follow more enlightened personnel policies and scrupulously and sincerely implement labour laws and policies. The managements should adopt a more co-operative attitude towards trade unions and should not only observe strict neutrality between different unions but also appear to be doing so. They should consider themselves bound by tripartite decisions and every moral responsibility in labour matters should be regarded as a legal responsibility. There is no alternative to this new approach to industrial relations in public undertakings, if the key sectors of the economy have to be saved from recurring work stoppages and avoidable wastes and if the Congress Party's objective of democratic socialism has to be achieved.

* For details see Report of the Estimates Committee on Personnel Policies of Public Undertakings, March 1964.

PUBLIC SECTOR UNDERTAKINGS

(*Concluded from page* 129)

the non-specialised single administrator, the military, feudal baronial lord in the earlier days and the general administrator in the early modern ages discharging a lot of simple functions. The modern industrial States of Europe and America are generally addicted to free enterprise and do not have many public undertakings on a large scale. Only, they have to control and provide guidance to economic activity. Where economic and financial expertise is required, these States can borrow it from the vast private sector or the high academic experts. They still manage with the so-called general administrator who is getting more and more converted into an economic administrator.

The Indian evolution in administration was different. The general administrator had no military power after the very early British days but he continued long as an all-round administrator in the police *raj* of the British days, doing all sorts of work, fiscal, judicial, police and some administration proper. In later days and in independent India, has judicial power is being removed.

The fundamental problem of the Indian Administration today is the persistence of the quasi-feudal general administrator, who wants to dominate the scene with a host of advisers. This idea correctly belongs to the political administrative level where the Minister is not expected to know all the details of the department but manages with his common sense and his expert advisers to run the show. His main work is parliamentary, contact with the public and policy making. To continue this technique in the lower administrative levels of the secretariat and the district (in India, even educated people cannot think of a district without a collector and, when I tell them that there is no district collector in America and England, they are struck dumb with surprise) leads to inefficiency and waste. The worst place for this type of general administrator is the industrial field in the public sector (though, of late, there is a welcome change of ideas, with competent engineers being put there). A story is generally spread that the engineers who should run such shows lack imagination and that the finance and accounts people obstruct production efficiency. It will surprise many to know that an accounts expert and administrator has made a wonderful success of some public undertakings like Hindustan Machine Tools. This is generally done to hide the incompetence of the general administrator and, unfortunately, the unwary top level politicians fall into this trap.

Combined with this goes the feudal ideas of the single administrator controlling all functions. The Chief Engineer or the General Manager of a big project says that he cannot run the show, unless he gets, according to what he considers as suitable and correct, estimates, budgetary allotments staff, their pay, their special pay; he himself must recruit them, he must purchase his stores, keep control of the Chief Accounts Officer who should pass the bills of his contractors under his orders and he must pay them himself (that is, the Engineer or the General Manager). When I tell him, as a financial adviser that, under principles of modern administration, he has to discuss and justify his estimates, his budget will be passed by the legislature after discussion, the general stores department of the State will purchase his stores as well as the stores of the other departments on a large scale which will lead to economy and he should send his approved indents to that department, that the Public Service Commission will recruit his staff after their quantum is fixed by Finance, the pay will be common for all departments for equal qualifications as determined by Finance, that an independent C.A.O. or A.G. will pass his bills and pay the contractors, relieving him of this work, that his work is only to build a dam or run a project under these controls and relief, he demurs or pretends not to understand and heaps unsavoury compliments on Finance.

It is well known that, in most projects and big undertakings, quarrels and bickerings between the so-called general administrator and the financial expert and the technical expert are always going on.

The Solution

The solution to the question I posed about public sector management is now clear. First of all, the general administrator type, belonging to the Indian Administrative cadre, should be removed from the management of the projects. The cost-conscious competent engineer is the man for such shows. An equally good man is the financial administrator who at least understands a large segment of the undertaking, namely, costs, accounts, etc., but he is best reserved for control work. This is first necessary reform in India.

The second defect is the confusion between ordinary administration and the financial administration. Finance and economics are an entirely separate field and their main work is control. In early days, one man could do all. But today the general administrator wants to do both for which he may not be competent. One day he is a Land Revenue Collector, next day he is the Secretary of the Home Department and on the third day he is the Finance Secretary. Apart from the difficulty of the job, the question of responsibility is there. Any mistake of his can be covered by a financial sanction, unless Audit discovers it. The inference is obvious. A vast economic-*cum*-financial service, each specialising in its own field, must come into existence. Nothing prevents the general administrator who has aptitude for such work from coming in there; but he cannot change places whenever he likes and go back to the general administration side when it suits him. He cannot also be allowed to dominate the other services like Audit and Accounts, etc., who now form the core for such a service built-up and whose services are yet to be fully utilised. The half-hearted attempts to build some economic service or financial pools by the general administrators are a failure.

Thirdly, each particular sphere of administration should have its own specialist administrators. the medical men in the public health and medical services, the engineer in his domain, the scientists in their fields.

Fourthly, the overall control of the Economic and Finance Department no one can escape in any field of administration. It will never interfere in their details but through a separate echelon of command will be responsible to the Finance Ministry only.

This long detour in the field of public administration is the answer for the defects in our Public Sector Undertakings. The essential point is that the Finance man should not be put under the General Manager. The American or European examples are different. They are mature nations, with free enterprise in general. They do not require public sector specialists on the same scale as the present-day India does.

TRADE UNIONISM IN INDIA

The Task Ahead

By Dr. J. L. RASTOGI

LECTURER IN APPLIED ECONOMICS, FACULTY OF COMMERCE, LUCKNOW UNIVERSITY

SINCE the beginning of trade unionism, the basic purpose has been to achieve a better life for workers, in general, and members, in particular, though the means adopted to attain it have changed from direct action to constitutional methods. The success of a trade union is not measured by the membership it has mustered, funds at its disposal or the number of strikes it has resorted to, but by the measures adopted in securing its ultimate end and the extent to which it has succeeded in promoting the cause of labour and in safeguarding, at the same time, the interests of the industry and the nation as a whole.

The organisation and functions of trade unions have passed through a number of stages. Richard A. Lester has aptly summarised these stages of development as:

"In their early stages, such organisations will be militant and turbulent, with internal factionalism and vigorous external opposition. At first, they are considered radical. Under the circumstances, membership participation is likely to be high and leadership positions in the organisation are apt to be won by the agitator and the table-pounder. Later on, as the organisation gains acceptance and security and succeeds in establishing new rights and other aims, a transformation tends to occur not only in the organisation's goals but also in the nature of its leadership, in its internal operations, and in the distribution of power and functions among different structural levels. Instead of being simply an opposition or antibody, the new organisation becomes more and more integrated into the life of the community. Instead of pursuing a crusade against the 'enemy,' it co-operates increasingly with other groups in industry, Government and society. As some of the organisation's initial goals are achieved, its objectives tend to broaden and become more complex, so that they are increasingly difficult to define and delimit. As the organisation grows in size and its activities and responsibilities enlarge, it faces new problems of administration, discipline, and public relations. The need for specialists becomes more pressing, a hierarchy and bureaucracy tend to develop and the relationship of top officials to the rank-and-file grows more impersonal. Some functions and decisions shift from the local to higher levels in the organisation. And, as the top positions come to require more administrative and manipulative talents, the oratorical agitators are superseded by skilled managers." (Richard A. Lester, *As Unions Mature*, pages 21-22.)

Still in Infancy

In spite of the rapid growth enjoyed in the post-independence period, trade unionism in India is still in its infancy. It covers only a very insignificant proportion of the working class, *vide* table below:

Number of Workers and Union Membership in 1960-61

(In '000)

Industries	No. of workers employed	Membership in unions submitting returns
Agriculture, mining, quarrying, etc. ..	36,673	649
Manufacturing, except household	7,957	1,642
Construction ..	2,055	75
Trade and commerce..	7,640	181
Transport, storage and communication ..	3,003	827
Other services ..	31,579	395
Total ..	88,907	3,769

N.B.—1. Figures relating to workers employed have been taken from the Census of India, 1961.

2. Figures relating to trade union membership have been taken from the Indian Labour Statistics, 1963.

Trade union activities are, generally, concentrated in large-scale industry sector and there too in regard to manual labour only and mainly in bigger industrial cities. Although there is a greater awareness of the utility and benefits of unionism among white collar workers, they have not organised themselves to any substantial extent. Trade union development in lower managerial cadres is even more unsatisfactory. Their interests are, usually, identified with those of the management and they are discouraged by the employers to form and join trade unions. Still there are certain fields into which the idea of unionism is yet to permeate, particularly in spheres in which workers are widely scattered and therefore difficult either to contact or organise them, e.g., workers in small-scale enterprices, domestic servants, agricultural labour, etc.

A Drawback

The most important reason in this connection has been the way in which trade unionism in India was born and developed. Instead of it being developed through the evolutionary process, the whole of the movement has been engineered by outsiders, mostly politicians. The politician-leaders follow the path of least resistance and, instead of exploring the new spheres of activities, they concentrate their work in fields where the idea of unionism has taken roots and it is comparatively easy to contact and organise the workers.

Not only the coverage of trade unions in India is very insignificant, but the unions have not played their true role. Unionism is still in the first stage of development in our country. To an average observer, unions stand for class conflict. It is the basic philosophy of most of them. Their main task, usually, is to spread dissatisfaction and a spirit of non-co-operation, organise strikes and sometimes aid and advise members during industrial conflicts. They have thus failed to attract and retain membership.

No doubt, the growth of unionism is an offshoot of the present industrial system which gives rise to various classes in society, namely, entrepreneurs, financiers, managers and workers, and their interests are adverse to each other, yet the tasks of trade unions are much more than mere protection of the interests of the members against employers/managements by militant means.

The result of inadequate development of trade unions in the country has been that, while the working and living conditions of employees in organised industrial sector have improved to a marked extent, the exploitation of unorganised labour still continues. Such workers have, generally, to work for longer hours, at below subsistence wages and in unwholesome conditions.

Main Weaknesses

Even in the organised sector, the members/workers have failed to reap full benefits of unionism. This can be attributed to a number of causes:

1. The union scene in India is still dominated by small trade unions with small membership. Because of limited funds at their disposal, they have practically failed to protect the interests and promote the welfare of labour. Such unions cannot engage the services of experts to aid and advise members in times of need; nor can they face the challenge of the employers for long, because of their weak bargaining and staying power. Thus, such unions, instead of proving useful to members, are a liability to them.

2. Because of multiplication of trade unions at the plant-level, each trade union commands only a negligible proportion of workers in an establishment and does not enjoy the confidence of most of the employees. These splinter unions have assumed only a limited range of functions. Instead of diverting members' energies to constructive and co-operative channels, they have encouraged strife, disloyalty and non-co-operation. They do not undertake any responsibility for the conduct and discipline of the members. Welfare activities on their part are yet to be organised. Much of their time is, generally, wasted in fighting the rival factions.

3. In bigger unions, direct contact between the rank-and-file membership and the top leaders is missing. Because of their hold on a number of trade unions in varied fields, they have failed to pay adequate attention to any union. Sometimes, these leaders are not adequately aware of the needs and problems of the membership. They are thus unable to put forth the case of labour effectively.

4. The most important reason for the ills in the trade union movement in India has been political affiliation of most of the unions and their leadership. It has made the cause of labour subservient to the personal/political interests of the leaders. Moreover, as these leaders are not, generally speaking, from the rank-and-file and lack industrial background and technical knowledge, they fail to protect the cause of labour. Again, political affiliation and domination have prevented the rapid growth of internal leadership to make the movement strong and self-reliant.

One of the important consequences of infiltration of outside leadership and of political domination has been the growth of corrupt practices in trade unionism. Corruption has penetrated labour movement at every level. Union leadership has, in most cases, fallen into the hands of selfish and dishonest persons who are leading a superfluous life and working for the betterment of their own fortunes at the cost of the well-being of the working class. Sometimes even the worker-leaders have succumbed to some form of bribery in their dealings with employers. Some of the leaders, it is alleged, are regularly paid by the employers and provided with other personal comforts and benefits, just to win over their co-operation in exploiting labour. Rival unions are said to have been initiated by the management itself in order to create rift in the working class. Even union dues on the part of members are paid by the employers to keep up the competitive capacity of such unions.

Experience in the West

Trade unions in the West have passed through a number of stages of development with the growth of industrialisation, consciousness among workers of their strength and responsibilities and effectiveness of collective bargaining, and have reached a degree of maturity still unknown in India. Today, they are accepted as an integral part of community life. They are no longer militant organisations, and much of the external opposition has also disappeared.

Sweden

Sweden offers a typical example. One of the most important features of trade union movement in that country is the high degree of organisation. The total membership of the trade unions represents some 80 per cent of all employed persons, both wage earners and salary earners. In terms of total population, more than one Swede in every four is a member of a trade union, according to an I.L.O. publication on Sweden. Today, there are two central trade union bodies in Sweden, the Confederation of Swedish Trade Unions (L.O.) and the Central Organisation of Salaried Employees (T.C.O.) "The overlapping of trade union influences," to quote the I.L.O. publication, "has not given rise to serious jurisdictional disputes, largely because of the relatively clear division between the respective fields of the various unions and, in the case of L.O. and T.C.O., the work of a joint co-operation committee, set up in 1949, which meets whenever required to settle borderline cases. Other factors that have limited the competition for members are the vertical structure of most L.O. unions, a close understanding between L.O. Unions catering for different crafts, and a rather strict definition of boundaries in the horizontal T.C.O. unions. Moreover, the machinery provided in both L.O. and T.C.O., by which the executive committees of the respective organisations are empowered to make a final decision in any inter-union dispute, and the policy of discouraging small groups of workers from taking independent action have, no doubt, contributed to the present position."

"Despite some centralisation and expansion in union headquarters' staff, the top officials in the national unions", according to Mr. Richard A. Lester, "seem to have been fairly successful in maintaining close contact with the locals and the membership. In spite of the size of the country, the top officers visit the locals frequently, which is facilitated by the size of unions there. Swedish unions hold many meetings and have extensive educational programmes.... The most important achievement of the Swedish labour movement is the broadening of membership perspectives and the changing of their attitudes through discussion. Certainly good communication has reduced the likelihood of a significant gap or cleavage between the top officials and the general membership."

Swedish labour movement has reached a fairly advanced stage of development. Trade union leaders and many among the rank-and-file have taken a broad and comprehensive view of the affairs. While promoting the interests of the working people, "they have," says Mr. Lester, "come to accept responsibilities for the health of the nation's economy."

Britain

Let us see the position in Britain. There the proportion of all employees organised into trade unions stands at about 43 per cent. Of course, this proportion varies considerably by occupation and industry. Certain skilled crafts and old-established industries have a high proportion—between 80 and 100 per cent organised; while the distributive trades, office workers and those in agriculture come at the other end of the scale. However, only 17 unions account for about two-thirds of the total membership.

The Trades Union Congress alone covers about 85 per cent of the union membership. The T.U.C. is "in the nature of a federation. It is not a central authority which can give instructions to the affiliated unions or which has the power to issue charters authorising the setting up of unions or branches. Its powers are essentially to formulate policy for the trade union movement as a whole and to promote co-ordinated action on matters of common concern .... However, the affiliated unions retain their autonomy; decisions taken by the Trades Union Congress are not automatically binding upon them and the authority of the General Council in this connection is very largely one of moral persuation." (I.L.O., *The Trade Union Situation in the United Kingdom*, 1961, page 21.)

With the growth of the size of the unions and greater centralisation of the movement, the gap between high union officials and the rank-and-file has, however, tended to widen. "National negotiations," according to Mr. Lester, "are remote from the rank-and-file and from local officials of the union, who do not participate in them, even as observers. Nor are they likely to be kept well informed of the discussions that occur in the privacy of the three or four negotiating sessions." Nevertheless, Mr. Lester says that, "in one respect, the top British leaders are closer to their membership.... Their incomes and levels of living are not much above those of the men at the bench. They and their families remain part of the working class both in mode of life and in type of residence." Again, "leadership rivalry and inter-union competition have declined significantly during the past three or four decades, primarily because all negotiations now are on a multi-union basis, because the labour movement has fostered a cult of team-work, and because public opinion frowns on unconventional forms of individual aggressiveness or selfishness." Mr. Lester goes on to say: "Corruption in the form of shakedowns, misuse of union funds for personal profit, or side-door deals, are practically unknown in Britain. Such factors as class loyalty, the egalitarian ideals of socialism, and social restraints on conspicuous consumption serve as curbs on acquisitive inclinations. And, although union leaders may through frequent meetings may come to know employer representatives well, sell-outs or bribes have been conspicuous by their absence from the union scene."

West Germany

In West Germany, "of the total labour force of about 20 million employed (including the public service), roughly one-third are at present organised, among them 6.3 million who are members of unions affiliated to the D.G.B. (the German Confederation of Trade Unions). D.G.B.'s main functions lie in matters which affect all workers alike, regardless of the industry in which they are employed, such as economic policy, social security, general labour legislation, research and education. But every affiliated union is entirely free and independent as regards its internal structure and the administration of its business. Thus, every union has its own by-laws and regulations. Nevertheless, there are certain organisational principles that are generally accepted by all the member unions of the D.G.B."

Trade union rivalry and jurisdictional disputes are not very common in West Germany. "Since the unions have agreed among themselves on very clear demarcation lines between the various industries or branches of economy and since the industrial union principle is never challenged by the craft union concept, jurisdictional disputes between several unions hardly occur. If such a dispute should arise, it would be settled by a special conciliation and arbitration procedure provided for the by-laws of the D.G.B." (*vide* I.L.O., *Labour-Management Relations Series*: No. 6, p. 38).

The U.S.

Even in the U.S., the unionism covers only a section of the working population. "Although the figure of 18 million trade union members appears very high, this represents," according to the aforesaid I.L.O. publication, "only one-quarter of the total working force—which includes farmers and self-employed—and one-third of the workers in non-agricultural employment. Furthermore, the extent of unionisation differs considerably from one industry to another.. It is very high in major industries such as mining, the manufacturing industries, construction, transport and public utilities. Generally speaking, the larger in size the undertaking, the more likely it is for its workers to be organised. On the other hand, the service industries and wholesale and retail trades are less well organised, while only a very small number—generally put at less than 5 per cent—of office workers are union members." The A.F.L.-C.I.O. the most powerful workers' organisation fully appreciates the challenge and describes the organising the unorganised as "the major unfinished task of the American labour movement." Since the merger of A.F.L. and C.I.O. in 1955, "organising has been and still remains at the heart of the trade union programme. It might even be said that, to some degree, the A.F.L. and C.I.O. abandoned their separate identities in order better to organise. Leaders of both federations realised that the obstacles to union growth were too formidable to be overcome by a divided labour movement." (I.L.O. publication.) A constitutional standing committee on organisation was set up in 1961 for developing programmes and policies to assure more effective pursuit of labour's organising mission.

However, the position of trade unions today is much stronger than ever before. The A.F.L.-C.I.O. serves the constituent unions by speaking for whole labour movement before the Congress and other branches of the Government; representing American labour movement in international bodies helping in organising the unorganised workers of the country and co-ordinating a whole range of activities, such as community services, to avoid duplication and waste motion. But the A.F.L.-C.I.O. does not control its affiliated unions. Each is free to follow its own path, except in matters of broad, general principles, in which the unions have voluntarily ceded a degree of authority to the A.F.L.-C.I.O.

In the United States, with the centralisation of the movement, the role of local union leaders has been reduced. "Collective bargaining," says Mr. Lester, "has tended to be increasingly factual, statistical and full of economic reasoning, so that the amateur negotiator feels himself at a disadvantage. But it is particularly the technical nature of the new subjects in negotiations that has increased the role of the national headquarters and the staff. Subjects like job evaluation, time and motion study, pensions, medical and hospital care, and supplementary unemployment benefits, are generally beyond the training and know-how of persons at the local level. For guidance in such matters, the union may need to rely upon the advice of staff experts.

The American labour movement is, however, not free from corrupting influences. We have the authority of Mr. Lester who says that "such influences to which union officials may succumb may take many and subtle forms. Often it is difficult to draw a clear distinction between valid application and abuse of their power. Involved are such questions as the proper use of union moneys (including expense accounts and welfare funds), the distribution and receipt of favours and union patronage, the use of questionable means to achieve organisational aims, and the levy of compulsory payments of different kinds, ranging from union assessments and fines to various forms of extortion." In order to eliminate corrupt practices between employers and union leaders and to safeguard the interests of the ordinary members, Section 302 of the Taft-Hartley Act declared it to be illegal for any payment to be made by an employer to a representative of his employees, except under certain circumstances. The Landrum-Griffin Act, 1959 further "broadened Section 302 of the Taft-Hartley Act concerning prohibition of payments to persons acting as representatives of the workers within a given establishment or to employees for the purpose of influencing their fellow workers in the exercise of their trade union rights." (See *The Trade Union Situation in the United States*, an I.L.O. publication.)

The A.F.L.-C.I.O. is also fully aware of the corrupting tendencies in the trade union movement and, in order to check these, it has adopted four Ethical Practices Codes. "Every affiliated union must comply with the A.F.L.-C.I.O. Ethical Practices Codes, which establish basic standards of union democracy and financial integrity." Under the direction of the Ethical Practices Committee, the affiliated unions are bound to take suitable actions against the corrupt officials and clean their house.

Measures Suggested

As the basic philosophy of Trade unionism remains the same everywhere, we in India can learn much from the experiences gained in the organisation and working of trade unions in different countries. Most of the ills in trade unionism in India can be removed by a strong trade union movement. In order to serve the best interests of the working class and the nation, it should be immediately dissociated from the political parties. The trade union movement in the country should be unified and consolidated into a National Federation of Labour. It should have its separate wings, each dealing with the affairs of wage-earners, salaried employees, lower managerial cadres, etc. Besides, each wing should have sections dealing with the specific needs of the major industries of the country. The National Federation should have its own branches at the regional and local levels. All trade unions should be affiliated to the National Federation, irrespective of the aims, aspirations and political affiliation of the leadership.

In order to avoid overlapping and confusion, the tasks of the National Federation and its branches should be clearly laid down. The National Federation of Labour should act as the co-ordinating force and spokesman for the trade union movement and should frame its own policies within the broader framework of the national interests, it should also help solve labour problems of national and inter-regional importance and undertake research on various aspects of trade unionism and labour-management relations. Its regional branches should aid and advise the affiliated unions on various problems and help in solving specific regional problems. The branches at the local level should co-ordinate the activities of local trade unions, aid in solving inter-union disputes and provide meeting places to the representatives of different trade unions to exchange views and solve specific problems.

At the plant level the principle of one trade union in each establish-

ment would be desirable. But, in view of the existence of more than one union in each concern, it may not be feasible to do this at one stroke. Therefore, until such a unification in trade union movement becomes possible, a trial should be given to the British system for solving the problem of multiplication and rivalry of trade unions at the plant level. Thus, various rival trade unions in each plant should come to an understanding in dealing with the management to promote the cause of labour on lines that are consistent with the interests of the industry and the nation as a whole.

An Uphill Task

The most important task before trade unionism in India today is to organise workers who are either unorganised or not well organised. Although this is an uphill task, it can be achieved by joint action on the part of trade unions. "Basically, workers will organise—leaving aside the fears and falsehoods inculcated by all-out employer opposition—when they decide that, for them, union membership is desirable or necessary. Workers organise themselves; union organisers can only assist them with knowledge and experience. What the union offers is the key ingredient in workers' decision." This is the experience in the U.S. The proposed National Federation of Labour should have its own special organisation committee to take up the task of welding the unorganised or inadequately organised workers into the movement. It should be properly and adequately staffed, financed and directed. It should chalk-out its own programme for the purpose and decide what step should be taken to organise each type of labour force and what types of organisations should be developed for them. Attention should immediately be given to the organisation of white collar workers and lower managerial cadres. While the former would supply the trade union movement with educated leadership, the latter would help management change their outlook towards workers and trade unions and take a humane view of the affairs of labour.

The National Federation of Labour advocated here should have its own code of conduct for members and officials. In order to prevent the abuse of power by unscrupulous leaders, their power and jurisdiction should be clearly prescribed. Moreover, the rank-and-file members should be encouraged to take active part in the working of trade unions and "to get rid itself of every vestige of persons and practices which tend to pervert a union at any level of organisation from its fundamental reason for existence." They should be vested with adequate power to remove any leader who is guilty of the breach of the Code of Discipline/Conduct or who acts against the interests of the members/union. If a corrupt practice can be established against a union leader/official, he should be debarred from holding any office in any trade union for a minimum period of five years.

Employers' Responsibility

The employers should also adopt a more reasonable attitude towards labour and trade unions. The interests of various agents of production—capital, management and labour—are complementary and not competitive. None of these can benefit at the cost of another. They have to work together as an integrated whole to achieve the desired goal and the contribution of one cannot be separated from that of the other. While the entrepreneurs provide the initiative, the financiers adequate funds to undertake the task and the management (executives) necessary direction, supervision and control, the workers invest their working lives to make the enterprise a success. Similarly, trade unions are not the rivals of employers but the co-operative and responsible agencies of workers. If properly recognised and taken into confidence, they would contribute substantially towards industrial peace and prosperity by:

1. making workers/members responsible and duty-conscious;
2. providing members adequate and correct education and guidance;
3. inculcating self-help and co-operative spirit among members;
4. undertaking responsibility for the conduct of members both inside and outside work-sheds;
5. serving as effective organisations of workers for negotiating with the management;
6. acting as a channel of communication between the management and workers; and
7. serving as clearing houses for management's grievances against workers and *vice-versa*.

Thus, employers must recognise the true worth of labour and trade unions in the modern industrial structure. They should completely withdraw from the internal affairs of trade unions and refrain from corrupting trade union leaders, as these tactics would ultimately harm the interests of the industry and the nation.

No doubt, the most important object of trade unions is to safeguard the interest of workers/members, but this is subservient to the interests of the industry and the nation. They are the trustees of the latter in the same way as any other agent of production. They should, therefore, take the broader perspective of the affairs and try to achieve their objectives by resorting to various democratic and constitutional methods without harming the interests of the industry and the nation.

Guide-lines

In order to be more useful and effective, the trade unions must possess some basic characteristics. Mr. George Meany, the President of A.F.L.-C.I.O., U.S.A., has neatly summarised the virtues of a good union as follows:

"First and foremost, a good union must be able to protect its members and win a reasonable measure of economic justice for them.

"Second, a good union must be run by the members and for the members. There must be leaders—strong leaders, able and willing to stand firm for what they believe is right, and to fight for it against what might appear at times to be a popular position. But they must always be subject to the support or rejection of the general membership of the union.

"Third, a good union must be an honest union. This goes beyond finances; just being 'money honest' is not enough. The integrity of a good union is all-inclusive. It extends to its relationship with employers; to what it says to its own members; to the formulation of its policies and the evaluation of its own performances.

"Fourth and last, but by no means least, a union must look beyond its own horizons. It must recognise and fulfil its proper role in the life of the nation and community in which it lives."

The foregoing quotation can well serve as a model of guidelines for trade unions in India, today, for any democratic country.

EXPORTING FABRICS?

EXPORT

THAT'S WHERE WE COME IN!

Our job is to help the exporter of Rayon & Synthetic fabrics, hosiery and non-fabric art-silk textile items, in every way. Here are some of the more important things we can do:—

* We can put him in touch with the prospective overseas buyers.
* Give news of overseas trends in fashion fabrics and their prices.
* Organize market surveys, advertising campaigns and exhibitions in foreign countries.
* Provide information about the assistance available on export.

In fact, the exporter need never be at a loss while we are here to guide him in his business of selling abroad.

THE SILK & RAYON TEXTILES EXPORT PROMOTION COUNCIL
Resham Bhavan, 78, Veer Nariman Road, Bombay-1

With the best compliments

of

KOTHARI & SONS

Share and Stock Brokers, Merchants and Agents

Head Office:

"ORIENTAL BUILDINGS," ARMENIAN STREET, MADRAS-1

BIRLA BROTHERS PRIVATE LIMITED

RECENT DEVELOPMENTS IN AMERICAN REGULATION OF THE SECURITIES MARKETS

BY LOUIS LOSS, B.S., A.M. (Hon.), LL. B.
WILLIAM NELSON CROMWELL PROFESSOR OF LAW, HARVARD

THE American system of regulation of the securities markets—which, by virtue of the great "New Deal" statutes of the 1933-40 era, has long since developed into a fine art—was given its greatest impetus in more than two decades when President Johnson on 20th August signed into law the Securities Acts Amendments of 1964.

It had required nothing less than the stock market crash of late 1929 and the unprecedented, world-wide depression of the early 'thirties to produce enough political thrust to overcome the force of legislative gravity that had defeated reform proposals going back to the turn of the century and even earlier. The immediate result of the economic upheaval was the election of President Franklin Delano Roosevelt thirty-two years and exactly half of the expired portion of the twentieth century ago, together with the passage of the Securities Act of 1933 in the famous "hundred days" following his inauguration.

Fortunately, the long needed line-straightening operation represented by the 1964 amendments had an easier labour. But, just as the Jenkins Committee in the United Kingdom (whose report was apparently allowed by the late Government to gather dust) followed certain eyebrow-raising incidents in the City, the chain of events that culminated in the recent amendments in the United States was touched off by a scandal that rocked the second stock exchange of the country. For better or worse, it is apparently the squeaky axle that in an "unplanned" society gets the grease.

The seven statutes under which the S.E.C. (Securities and Exchange Commission) functions proceed on a variety of fronts:

(1) Building on the prospectus provisions of the British Companies Act of 1929—with which India and other Commonwealth countries are quite familiar—Congress in the Securities Act of 1933 carried the disclosure philosophy a good deal further through the requirement of advance examination of a "registration statement" (of which in practice the prospectus is the principal part) by an administrative agency with power to investigate and enter a "stop order," after appropriate hearing, if it is not satisfied with the accuracy and adequacy of the disclosure. As the procedure during the "waiting period" between filing and effective dates (currently about thirty-five days on the average) has developed, the S.E.C. has insisted on appropriate distribution of the prospectus, especially with respect to promotional issues, so that investors and their financial advisers can inform themselves by the effective date, when for the first time it becomes legal to proceed beyond offers to actual sales.

(2) Securities listed for trading on a stock exchange must also be registered with the S.E.C. under the Securities Exchange Act of 1943. And since the 1964 amendments a registration statement under either statute must be kept current through the filing of annual reports, containing certified financial statements, as well as semi-annual and even monthly reports in certain contigencies. Before the 1964 amendments, these reporting requirements applied, so far as registration statements under the 1963 Act were concerned, only when the securities offered to the public (together with others of the same class already outstanding) came to at least $2 million on the basis of the public offering price. But that limitation has now been removed for future offerings.

(3) The 1934 Act requires also the registration of the several stock exchanges with the S.E.C.; gives the Commission certain supervisory functions with respect to their rules as well as various practices such as short-selling and brokers' rehypothecation of customers' securities; provides for a measure of self-control of the securities industry by the exchanges and the National Association of Securities Dealers, Inc. (the N.A.S.D.), a semi-official organisation designed roughly to parallel the self-regulatory functions of the exchange so far as the offboard or so-called over-the-counter market is concerned; and requires also the registration of brokers and dealers trading in the over-the-counter market, with broad authority in the S.E.C. to specify book-keeping and capital requirements and to deny or revoke registration (just as it may suspend or expel a member of an exchange) for violation of the statute or the S.E.C.'s rules.

(4) Both the 1933 and 1934 Acts, but especially the latter, contain broad provisions to curb fraudulent, deceptive and manipulative practices in the securities markets.

(5) Under the 1934 Act, the Board of Governors of the Federal Reserve System (which is the nearest equivalent the United States has to a central bank) regulates the amount of credit that brokers, dealers and banks may extend for the purpose of buying or carrying securities, and those rules are enforced by the S.E.C.

(6) Under another of the major "New Deal" reforms, the Public Utility Holding Company Act of 1935, the S.E.C. required a full quarter-century to complete the process of geographical integration and corporate simplification of the vast electric and gas holding-company systems that had blanketed the country during the first third of the century. Moreover, the Commission continues to regulate, far beyond a mere disclosure philosophy, many of the practices of the companies in the eighteen systems that have survived those stringent procedures: their issuance of securities, reporting and accounting practices, acquisitions of securities and utility assets, inter-company loans, and dividend payments, among other things.

(7) Still another piece of legislation, the Investment Company Act of 1940, which runs to fifty-eight pages in the statute book, pervasively regulates the six hundred or so investment companies of various types.

(8) Under the Trust Indenture Act of 1939, *debt* securities that are offered to the public must be issued under a trust indenture that has been qualified by the S.E.C. The purpose of that statute is to provide for independent trustees to protect and enforce the rights of holders of debt securities.

(9) Under the Investment Advisers Act of 1940, which was little more than a continuing census of the nation's investment advisers until it was given a set of sharp teeth in 1960, all persons engaged for compensation in the business of rendering advice or issuing analyses or reports concerning securities must be registered with the S.E.C., which now regulates them much as it does brokers and dealers.

(10) The S.E.C. also exercises unique functions under Chapter X of the Bankruptcy Act, enacted in 1938 to provide, when feasible, for the reorganisation (reconstruction in British terminology) of insolvent corporations rather than their liquidation. Chapter X represents a noteworthy experiment in judicial-administrative co-operation by making the S.E.C. the impartial adviser to the federal courts in reorganisation proceedings.

(11) Perhaps the most effective single force for "corporate democracy" in the S.E.C.'s arsenal is the elaborate set of rules that it has developed to govern the solicitation of proxies. The central importance of these rules results, of course, from the fact that the widespread distribution of corporate securities, with the concomitant separation of ownership from management, puts the entire concept of the shareholders' meeting at the mercy of the proxy device. It has accordingly been the Commission's aim in this area of its activities to make that device the closest possible substitute for attendance at the meeting. Until the 1964 amendments, the proxy rules applied to three categories of companies: those with securities listed on a stock exchange as well as those subject to either the Public Utility Holding Company Act or the Investment Company Act.

(12) Finally, the famous Section 16 of the Securities Exchange Act (which also has its analogues in the Holding Company and Investment Company Acts) is aimed at the evils of "insider trading." Officers, directors and ten per cent beneficial shareholders must fully report their changes of ownership, and any profit resulting from short-term trading (which is to say, any purchase and sale, or any sale and purchase, within less than six months) must be paid over to the company, with no offset for losses resulting from such trading.

II

This, in brief compass, describes the system of securities regulation as it existed in the summer of 1964. Since the seven statutes under which the S.E.C. functions do not constitute an integrated code, it is not surprising that they reflected both overlaps and gaps. A truly incandescent piece of historic illogic was the double standard based on exchange listing. Listed companies were subject to pervasive and continual disclosure requirements through the reporting, proxy and insider-trading provisions. But (apart from the specialised companies falling under the Holding Company and Investment Company Acts) equally large companies with equally public distribution of their securities could avoid the proxy and insider-trading provisions by simply not listing on an exchange, and they could avoid even the reporting requirements if they could manage to generate sufficient capital without going to the public for new money so as to be required to register under the Securities Act of 1933.

This double standard was due partly to constitutional doubts with respect to the regulation of unlisted companies in the early 1930's and partly to the relative ignorance at that time of the size and workings of the over-the-counter market, which has always loomed far larger in the United States than anywhere else in the world. But, whatever the explanation, the double standard represented not only a logical inconsistency. For, just as surely as water will run downhill, business will flow from a regulated into an unregulated market. And there was considerable evidence that many companies did refrain from listing in order to avoid the additional regulation.

Agitation to eliminate the double standard began to be heard in some stock exchange quarters only a few years after the passage of the Securities Exchange Act of 1934. By 1946 the S.E.C. itself took up the legislative struggle. Bills were introduced that year and again in 1950 and 1956, only to get nowhere—not so much because of legislative opposition as because of the sheer inertia that any economic "reform" measure must overcome in a national legislative body that is quite understandably concerned above everything else, in this far from perfect world, with questions of revenue and national defence.

Then in 1961 came the scandal that sowed the essential seed on the ready soil. The S.E.C. expelled two members of a substantial firm of "specialists" on the American Stock Exchange (formerly the New York Curb Exchange), a father and son named Re, for violation of the fraud, manipulation and other provisions of the Securities Exchange Act, and they have since been convicted on criminal charges. As a direct result of their expulsion, Congress in late 1961 directed the Commission to make a study and investigation and to file a report with its recommendations, legislative or otherwise. The American Stock Exchange soon underwent a substantial process of self-reform. But the S.E.C. study turned out to be the most thorough investigation of the securities markets since the early 'thirties. In some respects it was even more thorough. The report prepared by the special study staff of some sixty members under the direction of Mr. Milton H. Cohen, a key S.E.C. official in its early years and now an eminent practitioner at the Chicago Bar—a report running to five volumes and some 3,000 pages—led, after extensive hearings by committees of both Houses of Congress to the Securities Acts Amendments of 1964.

One branch of these amendments is aimed at strengthening the system of broker-dealer regulation, partly through the N.A.S.D. and partly by increasing the S.E.C.'s direct controls, especially over the minority of brokers or dealers who are not members of the N.A.S.D. But by far the more significant aspect of the amendments is their treatment of the large, publicly held companies just as if they were listed on an exchange, in that they are now required to register with the S.E.C. and are thus subjected to the reporting, proxy and insider-trading provisions. The line is arbitrarily drawn at those companies with at least $1 million of assets (gross, not net) and a class of equity security held by at least 750 persons (500 after 1st July 1966). Whereas there were 2,467 listed companies on all the exchanges as of 30th June 1964, it is estimated that the new provisions will bring under the statutory umbrella no fewer than 3,100 additional companies (3,900 when the standard falls to 500 shareholders).

III

It is an interesting commentary on the adaptability of the human animal that, whereas there was a great deal of opposition to proposals along these lines when they were first urged by the S.E.C. in 1946 and 1950, they encountered virtually no opposition this time. The only substantial controversy that Congress had to resolve concerned the treatment of banks and stock (non-mutual) insurance companies.

In the United States there are both State and "national" banks; indeed, banks are virtually the only kind of corporation chartered by the Federal Government. There are several federal banking agencies that regulate not only the national banks, as might be expected, but also (along with the State authorities) the vast majority of State banks as a result of their either being members of the Federal Reserve System or having their deposits insured by the Federal Deposit Insurance Corporation. Insurance companies, on the other hand, have been regulated traditionally by the States alone, to the point where the Federal Government's abstention has become something of a political shibboleth. Both industries, through their not inconsiderable legislative lobbies, took the position that they were already regulated so thoroughly that they should be exempted from the new requirements. The S.E.C., on the other hand, made a good case for the proposition that existing regulation was directed at protection of the depositor or the policy-holder, not the investor; and it reminded Congress that, although only a handful of banks and insurance companies had securities listed on a stock exchange, those that did choose to list had never been given special treatment by the Securities Exchange Act.

At the same time, the S.E.C. took the statesmanlike position that the desideratum was comparable investor protection in comparable situations, and that it was of no great consequence whether the additional provisions were administered by the S.E.C. or by the State and Federal authorities that already regulated other aspects of the activities of banks and insurance companies. The result was a compromise whereby Congress (1) substituted the several Federal bank regulatory agencies for the S.E.C. so far as banks are concerned, giving those agencies the same rule-making powers as the S.E.C. but without any obligation to follow the S.E.C.'s rules, and (2) exempted insurance companies entirely on condition that the State of incorporation should undertake substantially similar regulation under the ægis of the National Association of Insurance Commissioners.

These amendments of 1964 also enlarge automatically the scope of the other great development of recent years in American securities regulation—the judicial implication of private remedies as a matter of Federal law for violation of various statutory provisions and S.E.C. rules even when the only express sanctions take the form of public remedies (criminal prosecutions, suits by the S.E.C. to enjoin further violations, and various disciplinary proceedings at the administrative level such as revocation of a broker-dealer's registration or his suspension or expulsion from any stock exchange of which he may be a member). The courts have done this largely on the basis of a common-law doctrine that originated in England a century ago and then fell into disuetude on that side of the Atlantic only to flower in many American State courts—a doctrine to the effect that a person injured by violation of a criminal statute passed for the benefit of a class of which he is a member has an implied remedy against the violator.

The significance of this development must be judged against the considerations that the basic corporation law in the United States is State law; that the only proxy legislation in any State is that which makes it possible for a shareholder to give a proxy, something that could not be done at common law; that many if not most State courts have followed, at least in principle, the English view, exemplified by *Percival* vs. *Wright* ([1902] 2 Ch. 421), to the effect that officers and directors have a fiduciary obligation only to the corporation and not to individual shareholders; and that, in the absence of statute, this leaves officers and directors as free to trade as individuals in the securities of their companies as any strangers are, which is to say, they have no affirmative obligation to disclose material facts that may substantially affect the price of the securities they buy or sell as long as they are careful not to misrepresent or deceive by word or deed.

IV

What might be called the "implied liability" doctrine under the S.E.C. statutes has not been limited to the proxy and insider-trading fields. But those have been the most important areas of its application. For example, under the S.E.C.'s innocent-looking Rule 10b-5—which in broad terms makes it unlawful for *any* person to engage in any fraudulent or deceptive practice, or to indulge in material misstatements or half-truths, in connection with the purchase or sale of any security—the Federal courts have consistently held that directors or other "insiders" (the concept here is an elastic one) have an affirmative obligation as a matter of Federal law, whatever may be their position under State law, to disclose all material facts when they engage in securities transactions with individual shareholders or bondholders. In other words, corporate "insiders" at long last have been placed substantially on a par with trustees, agents and other fiduciaries. The far-reaching implications of this development need no expatiation.

The Supreme Court has yet to speak on Rule 10b-5. But, apart from the fact that there has not been a single dissenting voice among the lower Federal courts, the result is virtually a foregone conclusion in view of the Supreme Court's holding a few months ago in *J. I. Case Co.* vs. *Borak* (377 U.S 426) in the context of the S.E.C.'s proxy rules. There it held not only that a shareholder had an implied right of action in the Federal courts if he could show a violation of the rules, but also that the court should decide as a matter of Federal law what sort of remedy was appropriate under the circumstances, even to "unscrambling" a corporate merger (amalgamation) effected by the use of proxies declared to be void on account of their having been solicited in violation of the S.E.C. rules.

The Securities Acts Amendments of 1964 do not enlarge the scope of Rule 10b-5. But they do very significantly enlarge the scope of the proxy rules and hence of the Supreme Court's holding. At any rate, if nothing else, the last two or three years have been significant in the securities field in that they have given us not only an S.E.C. proceeding entitled *In re* Re but also, as we have just seen, a *Case* case!

Thus it is that, just as the late 'twenties and early 'thirties seem rate law reform—with new corporate legislation in the United Kingdom, Belgium and the Netherlands in 1928, significant advances in France the next year, an excellent German statute in 1931 (two years before the legal blackout in that country), new "blue sky laws" in all the Canadian provinces between 1928 and 1935, and, of course, the S.E.C. legislation in the United States—widely separated parts of the free world have recently been witnessing a similar tendency, with more emphasis this time on the securities regulatory aspect of company law.

The 1962 report of the Jenkins Committee in the United Kingdom, though on the whole a reasonably conservative document, does recommend, in substance, that Parliament overrule *Percival* vs. *Wright*—which would presumably bring the English law in line with American developments under Rule 10b-5. Moreover, although the Jenkins Committee did not see fit to recommend anything like a British S.E.C., considerable interest in the American experience was demonstrated by the invitations extended to several Americans (among whom this writer was privileged to be included) to give testimony in London in the spring of 1961. It will be interesting to see what the new Labour Government, with its hair-line majority, will do to the Jenkins Committee's recommendations.

On the Continent, both France and Germany have required increased financial disclosures of publicly held companies in recent years. And outside of Europe there have been major developments in areas as far apart as Australia and Canada, with their drives towards uniform State or Provincial companies legislation; Ghana, which has probably one of the most advanced Companies Acts in the world, and certainly one of the most skilfully drafted, as a result of the efforts of Professor L. C. B. Gover (who has since left his Commercial Law chair at the London School of Economics to organise a new law faculty in Nigeria); and of course, India, where the year 1956 marked not only the adoption of a Securities Contracts (Regulation) Act, following the labours of the Gorwala Committee, but also a new Companies Act, which has already undergone considerable amendment and is under further study at this moment. In the past two years alone, this writer has participated in seminars in India and Japan (which has preserved virtually unchanged the occupation-imposed system of securities regulation based on the S.E.C. statutes of 1933 and 1934); has testified before legislative committees considering securities statutes in South Africa and Israel; and has visited both wings of Pakistan at the request of the International Bank in order to recommend appropriate regulatory measures for that country.

Perhaps not the least of the many advantages of the spread of the English language among so much of the globe is the ready access that many countries now have to variegated attempts at solving common problems. It remains only for all of us to learn to drink more readily from the others' springs.

SARU
NON-FERROUS ALLOYS FOR SAFE MAINTENANCE OF INDUSTRIES & METALS JOINING

ALLOYS :
Anti-friction White Bearing Metals, Tin-Solders, Type Metals, Gun Metals, Bronze, Antimonial lead, Die casting alloys etc.

RESIN & FLUX CORED SOLDER WIRES :
Single or Multiple Cores with plain or activated non-corrosive fluxes in all alloy compositions and sizes.

SILVER BRAZING ALLOYS :
In all shapes, sizes and alloy compositions to suit every type of brazing job.

BRONZE GAS WELDING RODS :
Manganese, Silicon, Aluminium. Phosphor, Nickel Bronze Rods of all sizes and alloy compositions.

WIRES :
Solid Solders, Refrigeration Solders, Babbit, Tin, Lead, Zinc, Brass, Bronze, Cadmium, Monel Metal Nickel, Cupro Nickel etc.

Also ALUMINIUM SOLDERS, Paste and Liquid Solders, Tinning Compounds, Soldering, Brazing and Welding Fluxes, ELECTRIC CONTACTS, WELDING TRANSFORMERS, ELECTRODES AND ACCESSORIES

ECONOMIC UPSWING IN U.S. FORGING AHEAD

Unemployment And Payments Deficit, However, Still The Major Problems

By N. PATTABHI RAMAN

FOUR years ago, a young Bostonion of great charm and 'vigah' bearing the now legandary name of John Fitzgerald Kennedy, pledged to the American people that, as their President, he would "get the country moving again." That cardinal economic pledge has been largely fulfilled, even though an assassin's bullets removed the hero prematurely from the role he clearly relished.

The American economy is, indeed, moving again. It is working its way through a transition from a dying post-war boom to what Albert T. Sommers of the National Industrial Conference Board calls a prosperous future of "growing markets, growing supply, an abundance of investment opportunities, and technological excellence."

The current economic upswing is the longest in the post-war years: the low point of the last recession is almost four years behind it. And, despite its remarkable longevity, it is still forging ahead with a vitality usually found only in the early stages of a cyclical recovery. Some problems persist stubbornly, but there can be no doubt about the prosperity. The Gross National Product, which is the sum of the values of goods and services produced in a given period, seems likely to equal $625 billion for 1964—some $35 billion larger than it might have been if economic growth had continued at the sluggish pace it did during the administration of President Dwight D. Eisenhower. The estimated 7 per cent gain in G.N.P. over 1963 reflects advances in all key segments of the economy.

Industrial Production

In September, industrial production reached a new high—133.9 per cent of the 1957-59 average. This represents a 6.5 per cent increase over the output a year earlier. Strikes in the automobile industry affected national production in October, but the disruption was temporary and without any significant impact on the growth trend. Automobile production and sales are actually heading for their third straight record year—something never accomplished before by this bell-wether industry. The steel industry is operating at close to 85 per cent of capacity and production this year is expected to total a record 125 million tons, larger than the previous high of 117 million tons produced in 1955.

From their doldrums of the late 1950's, profits have now reached an annual rate of $58 billion, some 13 to 14 per cent ahead of a year ago. After-tax earnings, nourished by lower taxes, are about 20 per cent higher than a year ago. Personal incomes, too, are high and rising, helping in turn to spur consumer spending and retail sales. A recent survey found a "significant" rise in consumer optimism over the economic outlook compared to three months earlier and a "greater readiness to spend." There is a boom in capital spending, and when the ledgers are complete, the 1964 outlay is expected to be 13 per cent higher than the expenditures incurred on new plant and equipment in 1963.

Stress on Tax Cuts

The growth in prosperity over the past four years was generated in a large measure by some conventional and some bold steps taken by the Government. Initially, to lift the economy from the low. low point it had reached in February 1961, the Kennedy Administration stepped up Government expenditures. After about two years of pump-priming, it switched to cutting taxes. It liberalised depreciation allowances and granted tax credits on investments, thus stimulating business outlays on new plant and equipment. Finally, with President Johnson supporting the concepts and programmes of his predecessor, the Administration put through a gigantic reduction in individual and corporate taxes. Originally estimated to reduce the tax burden by $11 billion, the size of the tax cut is now estimated at about $14 billion.

The tax cut was recommended as a remedy for the slow rate of economic growth by the President's Council of Economic Advisers which was headed until recently by Dr. Walter W. Heller. In analysing the factors impeding a faster rate of growth, the Council developed a concept called "the full employment surplus" which suggested that the economic impact of any budget is best calculated by the deficit or surplus which would arise if the economy were operating at full employment level. The Council concluded that an implied full employment surplus too large for a given level of economic activity would result in a fiscal drag, that is, a slowing down of the economy because of inappropriate tax burden. And while theoretically a large surplus might be implied, a sluggish economy might yield a smaller actual surplus or even result in budget deficits, as happened in the pre-Kennedy years.

Dr. Heller's Theory

Aggregate demand could be stimulated by further increasing public expenditures, of course, but this measure was set aside in favour of releasing to individuals and corporations, through a reduction in taxes, greater proportions of their incomes for their own use. Both the late President Kennedy and his successor President Johnson supported the recommendation of the Council of Economic Advisers for a giant tax cut. The spurt in the economy that has since occurred has helped to develop a broad consensus in favour of reducing taxes further, at the appropriate time, to keep the economy on high gear. Dr. Heller has estimated that, as the economy grows further and yields larger revenues, it might be appropriate to declare a "fiscal dividend" of $6 billion to $7 billion each year; it would mean either reducing taxes, stepping up expenditures or making up a combination of the two that yields this annual sum.

Cost-Price Stability

In addition to taking the revolutionary step of reducing taxes when the budget was in substantial deficit, the Kennedy-Johnson Administration also boldly decided to maintain an easy money policy in the presence of continuing deficits in the balance of payments. Despite the powerful dose of this compound of expansionary medicines, the upswing has remained virtually free of inflation. At least four major factors have contributed to this cost-price stability. Firstly, there was substantial underemployment of plant and machinery to begin with, and, even today, there is less than full employment of industrial facilities. Secondly, a high rate of productivity has been maintained. Thirdly, with a large surplus of unemployed labour and with automation threatening the displacement of additional thousands every year, trade unions have concentrated on job security and accepted moderate increases in wages and fringe benefits. And, fourthly, the Administration has exercised public pressure on management as well as labour through its wage-price guideposts which suggest that the cost-price stability is best maintained through wage and price adjustments which hew close to the average annual gain in productivity.

Balance of Payments

Along with stimulating the economy to higher levels of activity, the Administration has been moderately successful in reducing the size of the problem of payments deficit. Even though the United States has had a payments deficit for more than a decade, initially it was no cause for concern; in fact, America's loss was the world's gain, inasmuch as the U.S. deficits helped to supplement the limited supply of dollars available for international trade transactions. But, in the last years of the 1950's, the deficit swelled to such large amounts that the strength of the dollar was threatened. Since then, the U.S. has been seeking to restore equilibrium to its balance of payments through cutbacks in official expenditures abroad, the curtailment of the outflow of private short-term capital, and the expansion of its exports. Progress has come on all fronts and, for 1964 as a whole, the payments deficit on regular transactions is expected to be some $2 billion, a sharp improvement over the last six years when the deficit was always in excess of $3 billion and sometimes close to $4 billion. The problem is still serious, however, and continues as a soft spot in the economy.

Unemployment

Unemployment has been less tractable. Despite the rise in the level of economic activity, the rate of unemployment still hovers close to 5 per cent of the civilian labour force. The problem is quite complicated. It reflects, in one of its two aspects, a race between population increase and economic growth. Between 1950 and 1960, there was a net addition of 300,000 teenagers (18- and 19-year olds) to the labour force; as against this, the anticipated increase next year alone is 600,000. Or, to cite another set of statistics, during the current decade, the number of people aged 18 to 21 in the labour force will grow by 48 per cent, as compared with 7 per cent in the 1950's. Young people are entering the labour market in such large numbers now because of the huge baby crop in the aftermath of the Second World War. The economy has not been growing rapidly enough to absorb them. And even though the rise in activity accompanying the tax cut has reduced joblessness to some extent, the teenagers have not benefited much. In mid-November, for example, the unemployment rate among adult males was 3.5 per cent, the lowest in more than seven years; the comparable rate for youths of 18 and 19 years of age was 14.5 per cent, 50 per cent higher than the 1957 level and almost three times as high as the overall rate of 5 per cent.

With unemployment and the payments deficit as the only two major problems, the economy is in essentially sound condition as Lyndon Johnson assumes the Presidency of the United States in his own right. Judged by its present vitality, the economy will continue to grow at least for several months to come. Government economists are now predicting that the Gross National Product next year will total $655 billion. Leading business economists also concur in this forecast of a 5 per cent rise in G.N.P. A recession is not sighted for 1965. but there is general expectation that the rate of growth will be slow and that further stimulation will be necessary in the second half of 1965.

Potential Trouble Spots

Maladjustments could arise in several areas, of course. To list some potential trouble spots:

- A fresh fiscal drag could develop. The second stage of the big tax cut will not add much punch to the economy as it did in 1964. Additional tax cuts will have to go through the legislative mill. If a fiscal drag develops and the counter-attack is delayed. the economy could be slowed down.
- A spurt in inventory building could take place in anticipation of a steel strike in the middle of 1965, thus disrupting the demand pattern and the growth pattern. Actually, big consumers such as automobile producers have already begun stock-piling steel as a hedge against the strike possibility.
- Profit margins could begin to shrink again if the growth in sales slows down and makes it difficult for companies to cover the higher fixed costs likely to result from capital spending undertaken in 1964 and the preceding years. Profit margins could be squeezed also by more than moderate increases in labour costs.
- Inflationary pressures could develop. The fact that still only 86 per cent of industrial capacity is in use. the large labour surplus, and the high rate of productivity increase—these are among factors which minimise the threat of inflation. Much will depend, however, on wage settlements and price adjustments made in the months ahead. While the economy is not overheated and a demand-pull inflation is therefore not in sight, inflation of the cost-push type could easily develop.
- The cost of borrowing could go up, should inflation or a worsening of the balance of payments problem or a combination of both result in a tightening of monetary policy.

These are potential trouble spots. No major maladjustments may, however, develop, and the economy might perform close to expectations or better. As for long-term prospects, most economists are bullish. One prediction is that prudent, expansionary monetary and fiscal policies directed towards developing and satisfying the unprecedented markets that should grow over the next five years as a result of the swift rise in the working-age population, could result in an economy with a Gross National Product of $825 billion to $850 billion by 1970. A little visionary, perhaps but not impossible.

ECONOMIC TRENDS IN BRITAIN

End Of Deceleration In Sight?

By J. R. H. PRINGLE

ASSISTANT EDITOR, *THE BANKER*, LONDON

ECONOMIC news and economic measures have dominated newspaper headlines in Britain in recent weeks. During the campaign that preceded the General Election, all the major political parties placed major emphasis on the need to maintain and, if possible, to increase the rate of economic growth, and to stimulate the competitive power of British industry. Since the election, the prompt action taken by the new Labour Administration to improve the balance of payments, the measures and proposals announced in the special autumn Budget and other related moves to further the implementation of an incomes policy have all aroused intense interest—both at home and abroad. The prospects for the British economy have become a major talking-point in the world's financial and commercial centres. Inevitably, attention must focus on these measures, and on their bearing for the future course of the economy. First, however, it is as well to put the current situation into perspective.

Perspective

In retrospect, the past year may be regarded as marking the second phase of the business upswing that got under way in the spring of 1963 and continued vigorously throughout the remainder of that year. The seeds of the recovery were planted in the autumn of 1962, when the then Chancellor of the Exchequer, Mr. Maudling, announced the removal of all 'directive' controls over bank lending, a slashing of the purchase tax on cars, and an increase in investment allowances. These were backed up by a reduction of Bank Rate in January from five to four per cent. The impact of these measures was delayed and obscured by the appalling weather during that winter—one of the worst in living memory. With the melting of the winter snow, however, it became evident that a new surge of activity had begun. The index of industrial production, after adjustment for seasonal factors, rose from 113 in February to 116 in March, and to 117 in April. The budget in April, through which Mr. Maudling injected another £250 million of purchasing power into the economy, administered a further stimulus.

For the remainder of 1963, all the main indicators of economic activity pointed steadily upwards. The index of industrial production rose to 118 in June, to 121 in September, and reached 125 by December—though this last figure is the product of a subsequent revision. Unemployment fell, but the supply of labour remained adequate: at the December count, the unemployment rate, at 2 per cent, was no lower than the average for 1962. Despite further increases in wages, and a leap in the costs of certain foods and raw materials used in industry, reflecting their scarcity on world commodity markets, prices remained relatively stable. Above all, the external situation remained satisfactory: imports rose by 6.6 per cent to £4,335 million but exports rose by 7.3 per cent to £4,286 million and, after crediting the surplus Britain regularly earns on invisibles, the current account recorded a surplus of £113 million. This went far towards meeting the increased outflow of long-term capital, so that the overall balance (current account plus long-term capital) was £42 million in the red.

The crucial question facing policy-makers as the bells rang in the New Year, 1964, was to decide how long the current rate of expansion could be maintained without putting pressure both on the home economy and the balance of payments. The secret of the rapid expansion of 1963 lay in the margin of excess capacity existing at the beginning of the year—a margin created by the investment boom of 1961 in conjunction with the deflationary measures of that year. In 1963, while this slack was being taken up, production could forge ahead, wages and other costs could be spread over a wider range of output, and prices could be held down. The crude measure of productivity—output divided by the number employed—could rise rapidly. But the underlying growth of productivity—i.e. that attainable in conditions of full employment—was plainly well below that. What was not clear—and what is still far from certain—was whether this 'true' rate had been stepped up sufficiently to enable the economy to reach (with the increment of production arising from the expansion of the labour force) the four per cent growth rate enshrined in the reports of the National Economic Development Council and accepted by the Government.

Plainly, the rate actually achieved in the latter part of 1963, which then appeared to be about six per cent, could not be sustained indefinitely. Accordingly, official policy for most of 1964 was directed towards slowing the pace down before the economy ran into a severe shortage of resources. "Growth without Inflation" remained the theme. The first step was taken on 28th February, when Bank Rate was raised from four per cent to five per cent for reasons that seemed to owe more to domestic considerations than to external ones. The second—and by far the most important—was taken in the Budget. When Mr. Maudling rose in the House of Commons on 14th April, most unofficial observers expected him to take a pretty sharp bite at the growth of demand—about £200 million was a figure frequently heard. In the event, he chose to withdraw only about £100 million—by the time-honoured means of raising the duty on alcoholic drink and tobacco. In displaying this moderation, he explained that he was relying on several "natural factors" to assist him: first, he expected the rate of savings to increase, which would of course, automatically reduce the growth of demand; and second, he thought that stockbuilding, which was running at an exceptionally high rate in the last quarter of 1963 and, to a lesser extent, in the first quarter of 1964, would slacken off.

Growth Rate

Careful scrutiny was, therefore, accorded to the regular economic indicators as they flowed in over the following months. They proved exceedingly puzzling. The official index of industrial production suggested that the growth of output had slowed down, while other evidence, such as the surveys conducted by the Federation of British Industries and the unemployment figures, suggested a further rise. Gradually, however, the conclusion became inescapable that the growth rate had indeed levelled off—and had begun to slow well before the Budget. The latest available figures show the seasonally-adjusted index of production rising sharply to 127 in January but remaining flat for the succeeding seven months and the provisional index for September recorded a slight fall, to 126. The national income figures tell the same story: after a jump from £5,807 million in the third quarter of 1963 to £6,127 million in the fourth, gross national product (at 1958 prices, seasonally-adjusted) fell to £6,057 million in the first quarter of 1964. In the second quarter it rose, but only slightly, to £6,070 million.

Undoubtedly, this declaration stemmed in part from one of the natural forces upon which Mr. Maudling relied—a growth of savings. Personal savings (expressed as a proportion of personal disposable income) rose to 10.9 per cent and 10.5 per cent in the first and second quarters respectively, as compared with a ratio of 8.3 per cent in the first half of 1963. In part, however, it may have been associated with the rise in prices. In the first six months of the year, the index of retail prices rose by about three per cent, from 104.2 in December to 107.4 in June. About one point of this rise was due to the Budget measures. Certainly, this increase played a part in the falling-off of the volume of retail sales in the first half of the year.

Foreign Trade

Unhappily, it appears that relief from the pressure of demand at home was also obtained via the external account—by increasing imports relatively to exports. Britain's import bill rose from a monthly (seasonally-adjusted) value of £423 million in the last quarter of 1963 to £453 million in the first quarter of 1964. After that, the trend levelled, with values of £461 million and £460 million recorded for the second and third quarters, respectively. The latest return, for October, suggests a further fall, to an estimated £455 million. Exports have been broadly stable—a rise from £350 million a month in the last quarter of 1963 to £356 million in the first quarter of 1964 being followed by slight falls, to £352 million in the second quarter and £349 million in the third. The October figure is provisionally put at £351 million. In the full balance of payments figures, which are as yet available only for the first two quarters of the year, the deficit on visible trade (before seasonal adjustment) totalled £215 million, compared with a surplus of £36 million in the corresponding period of 1963.

In appraising these figures, however, three points may be noted: first, that, while an expansion of exports is essential, it had always been anticipated that re-expansion would entail a temporary slide into deficit; second, that the high level of imports in the first half of the year was undoubtedly associated with stock-building, which at £217 million was the highest since 1960; and third, that, while this increase in imports has undoubtedly imposed a strain on Britain's balance of payments, it has, by the same token, rebounded to the benefit of other countries—and not least to the rest of the Commonwealth.

The deterioration which the trade deficit brought to the balance of payments has been aggravated by a further decline in the invisible balance and by an acceleration in the outflow of long-term capital. In the first half of the year, the surplus on invisibles narrowed to £90 million (before seasonal adjustment), compared with £126 million in the corresponding period of 1963 and £129 million in 1962. This decline was mainly attributable to an increase in net Government spending abroad, which rose from £192 million in the first half of 1963 to £223 million in the first half of this year. Such expenditure has doubled over the past six years. There were, however, some non-recurring transactions which also affected the invisible balance: in the first quarter, a special payment was made to the U.S.A. of £9 million and in the second there were substantial additional tax payments made by oil companies as a result of an agreement with one of the large oil producing countries to change the time basis of payment. The net outflow of long-term capital totalled £216 million, compared with £73 million in the first half of 1963 and £7 million in the corresponding period of 1962. This too was due in part to exceptional factors, particularly the outlay associated with the acquisition by the Shell group of a half interest in Montecatini's petrochemicals business.

The overall (current and long-term capital) deficit in the first half totalled £341 million. After crediting a "balancing item" of £85 million—which represents certain unrecorded capital flows and net errors and omissions throughout the accounts—the "balance of monetary movements" was negative to the tune of £256 million.

But while the deficit had been running at a relatively high rate since the end of 1963, the central reserves actually rose on balance during the first half of 1964. The high earnings of many primary producing countries were reflected in a substantial increase in their holdings of sterling balances in London, which rose from £2,461 million in December 1963 to £2,580 million in June 1964. This played a large part in shielding the reserves over this period. During the following four months, the reserves declined to £907 million in July, £923 million in August, £907 million in September and £876 million in October. During the latter two months, some use was also made of the credit facilities arranged with a group of overseas central banks and with the Federal Reserve Bank of New York. But sterling weathered the period immediately before and after the election remarkably well.

New Government Acts

As expected, though, one of the new Government's first concerns on taking office on 16th October was to study methods of curtailing the deficit. Its appraisal of the situation and the first steps to deal with it were announced in a White Paper on 26th October by the two Ministers primarily responsible for the economy—Mr. George Brown, First Secretary of State and Minister of the newly-created Department of Economic Affairs, and Mr. James Callaghan, Chancellor of the Exchequer. The White Paper discussed that the Government expected the deficit for the year as a whole, taking current and long-term capital account together, was unlikely to be below £700 million and might reach £800 million. It pointed out that in 1965, even without a change of policy, there should be a considerable improvement, but that the deficit would still be

at an unacceptable level. While there was ample support for sterling in the facilities available, "we cannot rely on them alone or indefinitely," nor was the Government willing to do so. "We must no longer be forced into the position that every time we seek to increase our national production we are forced almost immediately into deficit."

The White Paper drew a sharp distinction, as far as imports are concerned, between the increase in raw materials required to service an expansion of production and the increase in manufactured goods most of which this country should be perfectly capable of producing on a competitive basis.

The Government had also examined the domestic economic situation. Apart from special problems of individual areas and a limited number of industries it concluded that there was no undue pressure on resources calling for action. Moreover, the Government specifically rejected any policy based on a return to stop-go economics.

Having thus ruled out deflation of demand as a means of curbing imports, it was decided to tackle the trade balance directly. The principal method chosen was the imposition of a temporary surcharge of 15 per cent on all imports, with the exception of foodstuffs, raw tobacco and basic raw materials. This amounted virtually to a doubling of Britain's tariffs. A scheme for relieving exporters of some part of the burden of indirect taxation which enters into the cost of production of exports was also introduced. The relief is expected to average some 1½ per cent of the value of exported goods.

Reactions Abroad

Understandably, the import surcharges provoked widespread criticism abroad, and it has to be admitted that they mark an unhappy departure from the principles of free trade and that some of Britain's allies and friends will be sorely affected. Government spokesmen, however, repeatedly stressed the temporary nature of the levy and that it is designed to support sterling. It may, perhaps, also be pointed out, not only that many other countries have on occasion resorted to similar methods to restrain a sudden surge of imports, but also that, if this action does enable the authorities to dispense with the drastic curbing of home demand that has been deemed necessary in former periods of deficit, and does allow the economy to continue to expand, those who export to Britain cannot but benefit in the long run. A growing economy is by definition a better market than a stagnant economy.

Moreover, it is essential that these immediate measures to redress the balance of trade be considered in conjunction with the longer-term correctives foreshadowed in the White Paper and with the action taken in the Autumn Budget on 11th November. The White Paper stated that the Government would consult immediately with both sides of industry on the outline of a plan to increase productivity and to ensure that an incomes policy that covers all forms of income and is related to productivity becomes effective. It is believed that some progress towards this has already been made in the last few weeks. A Price Review Body would be established, and steps would be taken to make it easier for workers to change their jobs in accordance with the needs of technological progress.

The main emphasis of the Budget was on measures of social improvement, which the Government believes must go hand in hand with economic expansion. Pensions and other social benefits will be substantially raised, though for administrative reasons the increases cannot actually be begun to be paid out until April next year. It is evident, however, that the economic effect of the changes has been carefully calculated. The imposition of the surcharge is expected to curb imports by about £300 million in a full year, and therefore by about £125 million in the remainder of the present financial year. Most of the demand that would otherwise have been directed to these imports will go on home-produced goods instead. Although the revenue expected from the surcharge would mop up perhaps £90 million of this extra demand, the net effect would undoubtedly have been inflationary in present conditions, with the economy close to full employment. It was to prevent this that Mr. Callaghan also raised the duty on petrol by 6d. a gallon. This will bring some £32 million into the Exchequer this year.

Other Changes

Among the other changes foreshadowed by Mr. Callaghan were a rise of 6d. in the standard rate of income-tax from 6th April 1965, a replacement of the income and profits taxes on companies by a corporation tax (the rate has yet to be fixed), a new capital gains tax, a rise in National Insurance contributions and improvements in the levels of National Assistance.

Unofficial expectations of the effect on the economy of this package of measures vary: it has been described both as inflationary and as deflationary. Perhaps the safest assumption on the information so far made public is that the immediate effect on demand should be deflationary but that the longer-term effect could be inflationary. Much, therefore, depends on whether the economy is already operating near the limits of its capacity. Evidence for taking the view that it is may be adduced from the flatness of the official industrial production figures, from trade deficit, and, above all, from the low level of unemployment—the number out of work in November, at 342,000 was the lowest since September 1961. On the other hand, unofficial surveys continue to throw some doubt on the official index: 49 per cent of firms replying to the latest survey by the Federation of British Industries conducted in the fortnight after the election state that their output has risen over the past four months while only 11 per cent report a fall. Moreover, in reply to questions inquiring what factors they thought likely to limit their output over the next four months, 47 per cent named orders, as against 38 per cent naming skilled labour, 18 per cent other labour and 23 per cent plant capacity. There is still no conclusive evidence of a general and severe shortage of labour—still less of capacity.

Investment

This is just as well. On current trends, total final demand would be likely to rise next year: quite apart from the essential increase in exports, the welcome uptrend in investment in itself virtually ensures this. Total fixed capital expenditure (at 1958 prices, seasonally adjusted) rose from £491 million in the last quarter of 1963 to £514 million in the first quarter of 1964 and to £536 million in the second; it is now expected to be about 14 per cent higher in the full year than in 1963. Moreover, an official survey suggests that this may rise by a further 10 per cent in 1965. Perhaps the most heartening feature of the measures taken is that they should encourage, not deter, this trend; for investment is of course the key to growth.

If there were varied opinions in Britain about the effects of the new measures, it became apparent soon after the Budget that the package was not regarded overseas as bringing a sufficiently quick-acting remedy to bear on the balance of payments. Pressure on sterling increased and the authorities were obliged on some days to provide substantial support. Selling was particularly active on Friday, 20th November and on the following Monday Bank Rate was raised from 5 to 7 per cent. Towards the close of dealings on Monday, however, and again on the following two days a substantial speculative movement again developed. But at seven o'clock on Wednesday evening a dramatic announcement that the central banks of eleven countries and the Bank for International Settlements had agreed to make available up to $3,000 million—this being in addition to the $1,000 standby credit with the International Monetary Fund—produced an immediate and pronounced recovery. This massive support operation will provide the Government with the breathing space needed for its longer-term policies to bear fruit.

URBAN DEVELOPMENT IN MAHARASHTRA

(*Concluded from page* 115)

other. Accordingly, the Government has recently set up a co-ordination committee for this purpose and so far three meetings have been held.

A Committee to Investigate Problems of Pollution of Rivers and Streams by Industrial Effluents and Trade Wastes: Last year, the Government reconstituted the Regional Committee to investigate the problems of pullution of rivers and streams by industrial effluents and trade wastes. The Committee submitted its report to Government on 14th September 1964. The Committee is of the view that the pollution problem is created not by industrial trade wastes alone, but also by letting out domestic sewage and sullage into rivers and streams. Since the waste waters thus let out in streams of natural water adversely affect its potability, the Committee has recommended that it is necessary to have an effective legislation providing for prevention, abatement and control of both surface and underground waters. It has also recommended that the legislation should not only include preventive and penal measures but should also provide for administrative machinery and technical organisation for effective control.

The legislation, as proposed by the Committee, will be the first attempt to initiate effective measures for the prevention and control of water pollution by a common policy throughout the State.

Board of Urban Development for the Entire State: In order to have a co-ordinated approach towards the problems that arise in urban areas and to advise the Government on solving these problems, a Board of Urban Development has been set up under the chairmanship of the Minister for Urban Development. It consists of 42 members, 24 officials and 18 non-officials including four persons who have distinguished themselves in municipal affairs. On the Board, adequate representation has been given to the municipal corporations and municipalities in the State. The purpose of the Board is to advise the Government on the problems of urban local bodies regarding water supply, drainage and sanitation schemes; public health; medical aid; urban housing; development of industries; town planning and development programme; municipal finances and taxation.

ECONOMIC TRENDS IN WEST GERMANY

1964, A Golden Year—1965 Not Likely To Be So Good

By Mrs. INGA KRUGMANN-RANDOLF

WHEN businessmen of the Federal Republic of Germany close their books at the end of this year, they will have every reason to be extremely satisfied. The year 1964 was, indeed, a golden year, with well-nigh ideal business conditions. Although other European countries, as, for example, France and Italy, experienced great difficulties because of inflationary tendencies, the West German Government managed to maintain a favourable economic climate and eradicate the dangers of business being "too good." German businessmen and economists were moderately optimistic, as they stood on the threshold of the year 1964 and the year did indeed exceed their every expectations. However, even during such a year, certain branches such as the coal-mining industry, the leather and cotton industries and parts of the paper industry did not have such a happy time of things. Generally speaking, however, that acceleration of economic growth, which began to manifest itself way back in the autumn of 1963, continued to snowball during the first months of 1964. The continuing expansion of exports also became reflected on the domestic markets. The trend towards economic investments continued to increase. In addition to the heavy demands from abroad, increased investment desires also contributed considerably towards stepping up demands as a whole. Moreover, the money spent by private households rose at a higher rate than in the previous year. The high demands encountered a relatively flexible supply, which proved to be expandable by dint of high imports.

Government Places the Damper

In the early summer of 1964, however, there did seem to be the danger of creeping inflation. There were more and more indications that the German economy had reached the limits of its efficiency. The degree to which capacities were utilised rose very high and the number of unfulfilled orders grew and grew. Despite the fact that one million foreign workers—for the most part from Italy, Spain, Greece and Turkey—had come in and were being employed in Germany, labour was scarcer than it had ever been before. Price increases were to be anticipated. The threat to the stability of the price structure caused the Federal Government and the Federal Bank to introduce a series of measures. Briefly these were:

1. In order to facilitate imports, the internal tariffs which applied to the partners in the European Economic Community were lowered as well as 320 different duties on goods from outside the Common Market.

2. The Federal Government made every effort (and is still doing so) to have the Common Market tariffs on goods from third countries reduced still further.

3. The expenditure of the Federal Government for 1964 and for 1965 was adjusted to tally with the growth rate of the gross social product.

4. The Federal Government is doing everything possible by pursuing an anti-cyclic finance policy to stifle economic activity during boom periods and activate it during periods, when business falls off.

5. In order to guard against "hot" foreign moneys, the Federal Government decided to introduce a 25 per cent capital yield tax on the income from stocks and shares with a fixed interest rate in the hands of foreign investors.

6. The Federal Government submitted the proposal to the Council of Ministers of the E.E.C. to launch a joint campaign to stabilise business conditions and this led to the drawing up of a stabilisation programme.

7. Government expenditure for building purposes was curtailed, in order to relieve the tense situation on the building market, where price increases were particularly accentuated.

8. The Federal Bank introduced measures to restrict the granting of credits.

All this proved to be an effective contribution to stifling demand and stabilising prices. Moreover, the effectiveness here was very considerably influenced by seasonal conditions and a slight falling off of export orders. The observation made during the last few years, namely, that usually, a recession in economic activity occurs during the summer months of July and August was very clearly confirmed in the year 1964. Because of the shortage of labour and the impossibility of obtaining temporary replacement staff for the holiday period, more and more industrial and trading firms are going over to the measure of closing their business premises for three weeks in the summer and introducing the so-called "firm's holiday." In 1964, the wheels of business started to turn slowly before gaining their usual rhythm after the summer "recess." According to the Federal Bank, the slight levelling out of the upward trend on the demand side was closely related to the fact that foreign demands, which up to the early summer had constituted the most important impetus of the trade boom, did not continue to grow in the ensuing months. On the other hand, the heavy rise in domestic demand has continued unabated, so that it now has become the principal cause of trade growth during the past few months.

The result achieved in 1963 corresponds roughly with the prophesied estimates. The final result for 1964, on the other hand, will manifest a higher growth of the real and the nominal social product. It is anticipated that the nominal gross social product (G.S.P.) will rise above the figure of 410 thousand million Deutschmarks.

Income Development

The economic situation of the year 1964 resulted in certain reclassifications in both the formation and the distribution of income. A particularly noteworthy feature is the fact that, for the first time for a number of years, business profits rose more sharply than increases in wages and salaries. Gross wages and salaries increased during 1964 by 8 per cent as compared with 7.3 per cent in the year 1963. To quote but one example, which is synonymous with development: in April 1964, the average gross hourly wage of men working in industry amounted to 4.08 Deutschmarks, that is, three per cent more than at the beginning of the year. In the case of female workers, the gross hourly earnings rose to 2.76 Deutschmarks. In April 1964, the number of paid weekly hours in the case of men totalled on a general average 45 hours and in the case of women 41 hours. This amounted to an increase of 0.7 hour or 1.6 per cent. The rise in the number of paid hours per week has resulted in the fact that the gross weekly earnings have increased more than the hourly earnings, namely, by about 5 per cent. In April, the male workers had an average gross weekly wage of 184 Deutschmarks and the females one of 113 Deutschmarks.

Private Consumption and State Consumption

After the relatively small growth rate in the year 1963, private consumption in 1964 rose more sharply again. Not only have wages risen, but also old-age pensions for workers and salaried employees. These are now adjusted every year in conformity with developments in wages and in productivity. At the beginning of 1964, the increase was one of 8.2 per cent and at the beginning of 1965, they will go up again by 9.4 per cent. The turnover of the retail trade achieved a growth rate of 6 per cent in 1964. That is more than in the previous year, but not so much as the optimists in the spring anticipated. It is clear that services (particularly those connected with the running of a car), travel and education are attaining to a steadily higher quotient in the expenditure of the private consumer. Added to this, the Germans are great savers. The savings quota of 1963, which amounted to 9.6 per cent of the income, was regarded as a record which could hardly be excelled, but nevertheless the first six months of 1964 brought the percentage up to 10.6.

A further salient characteristic of the year 1964 is the fact that, for the first time for years, the increase of State consumption will be lower than the growth rate of the social product. State consumption has in fact risen by only 7 per cent as compared with almost 10 per cent in 1963 and 15 per cent in the year 1962.

The expansive economic developments of the year 1964 are reflected particularly in the increase in investment activity which has ensued. All the expert observers of economic factors such as the German Federal Bank, the Federal Ministry of Economic Affairs and the economic research institutes are all unanimous in the conclusion they draw in the reports recently published, namely, that investment activity is at present the strongest motivating force in business. The promising judgments of the selling prospects on both the foreign and domestic markets has caused many boards of directors to decide to extend their production capacities and to spend more money in modernising and rationalising their factories and business premises. The principal investors are, of course, the so-called growth branches, such as the mineral oil industry, which has during the past few years spent many thousands of millions of Deutschmarks on the building of new refineries.

Investments Growing

Moreover, the competition of oil as a raw material for energy purposes has caused considerable difficulties for the firms mining opencast coal. High investment activity has also been registered by the automobile factories, which are attempting to fortify themselves in the face of the increasingly stiff competition in the European markets. The chemical industry and the electro-technical branch were also among those where higher than average expansion was noted. The investment rate in the consumer goods industry can only be described as average. However, the trend towards investment activity might well grow here, for the business prospects in the consumer branch for 1965 are especially good. This derives from the tax reduction, which is to come into force on 1st January 1965 and the increases of wages and pensions, in all making for a strong increase in consumer expenditure.

Not only the good sales prospects, but also the shortage of labour, technical progress as well as the obligation, ensuing from the keenness of competition, to rationalise as much as possible and lower costs are all strong factors which give impetus to investment activity by West German firms. Questionnaires also reveal that the balance of shortage of labour, coupled with the importing of new products, head the list of motives for investment activity. The higher profits booked by businessmen during the year 1964 are encouraging them to realise their investment plans relatively quickly. It can, however, hardly be expected that the favourable yield situation will continue, for costs are rising fast everywhere.

Despite all the refinements of market research, the decisions taken with regard to investment projects always involve a considerable element of risk. This is all the more true, because it is not only a case of making an accurate pre-estimate of developments on the inland market but also of taking into consideration the prospects for foreign business and these are usually very difficult to calculate. Exports play a particularly important role for German firms, for, approximately, a third of the industrial production is sold in foreign countries. In the case of the car manufacturing firms, it is even more than half.

Exports, which were largely responsible for the favourable business developments of the year 1964, have become more difficult during the past few months. This trend seems likely to persist during the year 1965. Imports, on the other hand, have continued to increase sharply right up to the present. The reason for this is to be found not only in the attempt to fill the supply gap and fulfil the great demands of the domestic markets, but also in the policy of the West German Government, which does everything possible by pursuing a liberal trade policy, to open up the German market to the young States of Asia and Africa and make it easier for them to sell their products. As a result, the trade balance surpluses, which were rising steeply right up to the early summer, have now been diminished.

Utilisation of the Gross Social Product (G.S.P.)

(Value basis in each case)

Growth rates as compared with the previous year

Utilisation types	1961	1962	1963	1964
Private consumption	9.8	9.1	5.4	6.9
State consumption	14.0	14.9	9.6	7.4
Investments proper	14.3	11.5	4.9	11.7
Equipment investment	14.2	9.6	2.6	8.1
Buildings	14.4	13.5	7.1	15.0
Exports	4.6	4.7	8.6	11.9
Imports	5.9	10.6	6.9	7.9
Gross social product	9.9	8.8	6.2	9.0

Capital Movements

As far as economic relations between West Germany and the developing countries are concerned, the Federal Government attaches importance to an expansion of trade and also regards it as urgent and imperative for there to be an increase in the amount of private German capital exported to the young States. It is hoped that this will assist them in building up economic branches, which are vital to the national economies of these States. The Federal Republic of Germany has made general tax concessions so far for capital investments in the developing countries, in order to encourage private firms and private individuals in West Germany to make productive capital investments on a long-term basis in these emerging nations. This ensued by means of the Development Aid Taxation Bill, which came into force on 23rd December 1963 and which began to make itself felt during the course of the year 1964. It is anticipated that these arrangements introduced in West Germany, which incidentally are regarded as exemplary, as well as the planned concessions in the United States will serve as a stimulus to other industrial States to take similiar steps. Once again, during the year 1964, the Federal Government contributed a great deal of money from public funds to assist the emerging nations in building up their economies. India was allotted particular preference in this context.

As far as West Germany is concerned, capital imports are higher than capital exports. The Federal Republic among the nations of the European Economic Community seems to be particularly favoured by those anxious to make capital investments. The first place among the investors is filled by the Americans, followed by the French. Moreover, the Americans invest in the countries of the E.E.C. to overcome the customs barriers of the Common Market. In this manner, they are looking for a favourable point of departure for exports into those countries associated with the European Economic Community. The Americans derive advantages here not only from their world-wide sales organisations but also from their extraordinarily strong capital power in comparison with European firms. In 1964, the Americans invested more than a thousand million dollars in the countries of the Common Market. That constitutes indeed a quarter of all the foreign investments made by American companies. During the coming years, it is to be expected that the Americans will invest in Europe on an even larger scale.

Prospects for 1965

Expert observers of trade conditions are all unanimous in stating that the climax of this short-lived and not particularly sensational boom in Germany has already passed by. They prophesy a slight decrease in business growth for the year 1965. The factors which come into play in determining such a decrease are the following:

(*a*) The assumption that the growth rates of exports will be lower.

(*b*) The fact that State expenditure will only increase by 7 per cent (as compared with almost 10 per cent in 1963 and 15 per cent in 1962).

(*c*) There is likely to be a considerable decline in the building boom.

(*d*) The steel boom is coming to an end, because the extra-ordinarily high demands of the year 1964 were for the most part involved in the filling up of warehouse stocks.

(*e*) The coal-mining industry will suffer to an even greater extent from the competition of oil as a raw material for producing energy.

(*f*) It is doubtful whether the high growth rates in the automobile industry can be maintained (even in 1964 sales on the domestic markets rose hardly at all, because large numbers of second-hand cars exercise pressure on the markets: the increase was to be attributed predominantly to export successes. A keener competitive struggle is to be expected and for this reason the large German firm of Volkswagen has now agreed to cooperate more closely with Auto-Union/Mercedes-Daimler-Benz).

Nevertheless, business conditions are likely to remain good, because there is sufficient incentive at hand. This stems primarily from private consumer trends and from the high investment activities of many firms. Strong impulses will be derived from private consumption, due to the fact that the amount of cash available will increase as a result of tax decreases to the tune of 3,200 million Deutschmarks, of an increase of 10 per cent in pensions and of increases in wages and salaries amounting to 8 per cent on the average. The firms will be obliged to invest more vigorously by dint of the keener competition and of the labour shortage. In addition, the excellent profits booked during 1964 will encourage investments.

The great unknown factor for 1965 is how exports will develop. Trade conditions have deteriorated so tremendously in the important purchasing countries that foreign trade business is becoming ever more difficult for the German firms. This is particularly true of Italy, where the Government has done everything possible and has succeeded in restoring the equilibrium of its balance of payments. The measures taken by the Italian Government, involving a stifling of demand and a throttling of imports have, however, resulted in a considerable lowering of German exports to Italy. In France, too, restrictive measures have exercised, to a considerable extent, a detrimental influence on imports and this again has become reflected in the order books of the West German supplier firms. Another very heavy blow to German exports was dealt by the customs increases introduced by the British Labour Government shortly after taking office. Indeed, during the past few years, Great Britain has gradually developed into one of West Germany's important foreign trade partners. Germany occupies fourth place among the countries, which supply Great Britain with goods. Exports to the United States present a much more optimistic picture and will continue to flourish. The Americans are passing through the longest trade boom they have ever had in times of peace. In view of the fact that the United States is the world's largest trading nation, the business situation there is extraordinarily important for the world economy as a whole.

When all the factors are taken into consideration, it looks very much as if the phase of general boom conditions in the Federal Republic of Germany is over and that, in 1965, it will be replaced by a period of calmer but nonetheless satisfactory growth. The financial report issued by the Federal Government estimates that, in 1965, the gross social product will rise by a nominal 8 per cent to attain to 445 thousand million Deutschmarks. The real growth has been fixed at 5 per cent, as compared with the 6 per cent increase registered in the year now drawing to a close.

BRITAIN AFTER THE ELECTION

Labour's Economic And Social Policy Elucidated

By JOHN J. MENDELSON, M.P.

THE first decisive fact about the recent British General Election is the massive defeat of the Conservative Government. A Government which went into the election with a majority of 100 received a clear vote of no confidence from the electorate. The second fact about the election is the victory of the Labour Party, albeit by a narrow majority. This victory was achieved against the built-in advantages of the Conservative Party which are inherent in the British economic and social system.

The Conservative Party had a great deal of money at its disposal. They were able to use their financial resources not only during the election campaign itself but, equally important, during the twelve months preceding the General Election. The Conservative Party were furthermore supported by a number of quasi-political organisations which specialised in a vast anti-nationalisation campaign directed against the Labour Party. The two most prominent organisations employed in this field were "Aims of Industry" and the Economic League. A number of industries and some individual firms conducted costly campaigns in carefully selected constituencies. It was, for instance, estimated that the firm of John Summers, one of the big steel firms, spent as much as three hundred and fifteen thousand pounds in one constituency alone. This was the constituency of East Flint which has major steel works within its boundaries. In spite of this effort, the Labour candidate, Mrs. Irene White, was returned with a vastly increased majority.

Complete Unity

The economic programme upon which Labour based their election campaign had been agreed upon at two Labour Party Conferences in the two years before the General Election of October 1964. The Labour Party had been completely united in support of this programme. The programme contained an important, but limited, element of socialisation which was incorporated in the general broad aim to get the British economy moving again. This aim was put into the centre of his campaign by Mr. Harold Wilson, Leader of the Labour Party and now the Prime Minister. The programme foresaw the taking into public ownership of the steel industry and of land released for development purposes. It also included an expression of intent to develop certain new industries on socialist lines where this would be in the public interest. For the rest, help would be given equally to privately-owned industries and public corporations to develop their export potential. It was also declared that the Labour Party would wish to concentrate upon an export drive in order to secure a decisive improvement in the British balance of payments' position.

Since the new Government took office they have proceeded with great rapidity and decisiveness to the implementation of Labour's election manifesto. Mr. Harold Wilson and his colleagues made up their minds on the day after the election they would govern the country firmly and fully in accordance with their election programme in spite of the small majority. This made an excellent impression throughout Great Britain and won the respect and support of many people, including some who had not actually voted Labour during the General Election. This point was proved in the first Gallop Poll published after the Government had been in office for four weeks, which gave Labour a lead of 11½ per cent over the Conservatives.

Payments Crisis

The new Government, however, found themselves in an extremely difficult international financial situation. They had inherited from the previous Conservative Government a grave balance of payments crisis. The balance of payments deficit had been growing apace during 1964 and had already reached very serious proportions by April of this year. Realising that the position would get much worse during the summer, Mr. Reginald Maudling, who was Chancellor in the previous Conservative Administration, had urged upon the Conservative Prime Minister that the General Election should be held in June. Sir Alexander Douglas-Home turned down this suggestion. in spite of the powerful economic arguments advanced by his Chancellor not to allow the balance of payments situation to deteriorate through the enforced uncertainty pending the holding of the General Election in Britain. Sir Alexander Douglas-Home decided, on purely political grounds, against a General Election, because he was afraid of being heavily defeated. In this, from a narrow party point of view, he may well have been correct, but, meanwhile, the international balance of payments position continued to deteriorate.

When Labour came to power, the new Government faced a balance of payments deficit estimated at £700 million by the end of the year. Quick and drastic action had, therefore, to be taken, in order "to stop the bleeding." as Mr. Harold Wilson recently put it in one of his speeches. The method chosen was the 15 per cent surcharge on most imports into Britain. This measure is of a temporary nature which will be abolished as soon as the balance of payment has shown the desired improvement. Raw materials and certain other items are exempted from the surcharge payment. This policy was designed to reduce unnecessary imports and to encourage British manufacturers to produce some of the items which could easily be produced within Great Britain, thereby lessening the drain on foreign exchange. At the same time, the Government announced a very limited measure of support for British firms engaged in the export trade. The encouragement and expansion of exports is one of the recurring themes of Government policy since Mr. Harold Wilson took over the reins of government. The Government are convinced that British exports could be very greatly increased, if our productive effort were to be definitely geared to an active export policy. The Labour Government, therefore, intend to release economic resources and manpower for the export drive. This would imply some curtailing of investment in defence expenditure and in prestige projects. To this end, the Government have announced that they are undertaking an urgent review of defence expenditure, particularly overseas. Military expenditure overseas has, of course, a direct and continuous influence upon Britain's balance of payments position.

Give and Take Budget

It was against this background that Mr. James Callaghan, the new Chancellor of the Exchequer, introduced his first short budget. The budget incorporated the 15 per cent surcharge which had previously been announced, an increase of sixpence in the standard rate of income-tax and an increase in the petrol duty. On the expenditure side, the Budget allowed for pension increases for retirement pensioners as well as for widows and other groups in receipt of pension benefits. These increased benefits will only become effective on 29th March 1965, and will be paid for partly by an increase in social insurance contributions, imposed upon workers and employers. These increased contributions. as well as higher income-tax rate, also start at the end of March next year. The increased petrol duty, however, became effective immediately on the day of announcement. This budget, as can readily be seen, is therefore "a give and take budget." Its total impact is to some degree deflationary and was so designed to meet an anticipated degree of pressure within the economy that looks like developing late in 1964 and early in 1965.

The increased pension payments have been long delayed and long overdue. This is common ground among all those who know about the standards of living of old age pensioners, widows, the war injured and those injured through industrial accidents. This policy of social improvement and reform was an integral part of Labour's Election programme and had received the fullest support of the electorate. In introducing these measures. however, the Chancellor of the Exchequer had taken great care to raise additional revenue in one way or another which would more than fully cover the increased expenditure. It is, therefore, a serious misconception to read any easy-going inflationary tendencies into Mr. Callaghan's first budget.

Sterling Under Pressure

In spite of this, the budget was soon denounced by the Conservative Opposition in Parliament as both inflationary and irrelevant to Britain's economic problems. There is no doubt that these attacks upon the budget by Mr. Maulding, the ex-Chancellor of the Exchequer, and other senior members of the out-voted Conservative Administration, had a bad effect upon the Government's reputation and. as the result, on the strength of sterling. Until the budget debate, sterling had been firm on the international exchanges. The pound was still holding its ground when the budget measures were announced. But it was after the consistent denunciation and misrepresentation of the budget by opponents at home and abroad that the speculation against sterling developed in earnest. It is assumed in London that it was not so much the actual measures contained within the budget that enlarged the Opposition and some sections of the City, but two important announcements made by the Chancellor during his Budget Speech. In that speech, the Chancellor firmly committed the Labour Government to an introduction of a capital gains tax next April, but he did not forecast any of the details of this new tax. The Chancellor also announced a new corporation tax to come into effect next year which would replace the present system of taxing company profits. Here again, in the nature of things, the Chancellor was obviously unable to make known any details about his next budget to be introduced in 1965.

The Chancellor of the Exchequer, both in his budget statement and in all his policy declarations before and after the budget, has been firm in announcing the Government's intention to maintain the value of sterling. He has persistently denied any intention to proceed to a policy of devaluation. In spite of these assurances, backed by a policy designed to improve Britain's balance of payments position, the run on sterling developed most dangerously during the week between 16th and 22nd November. This forced the Government to increase the Bank Rate from 5 to 7 per cent. The announcement was made on a Monday instead of the traditional Thursday and was an indication of the serious view taken by the Government about the developing speculation against sterling. However, the drastic increase in the Bank Rate brought only a brief respite, and the speculative attack on the pound, aided by a considerable outflow of foreign money from London, was soon renewed. This led to the need of further international credit arrangements in addition to the standby loan provided by the International Monetary Fund. The short-term loans, which Mr. Maudling had arranged through various central banks abroad when he was still in office, would soon be due for repayment and would probably require most of the first slice drawn from the I.M.F. All these circumstances made a further large-scale provision of credit for Britain absolutely imperative. This was accomplished through the three billion dollars credit jointly provided by the central banks of ten countries. As is well known, the United States Federal Reserve Banking Authorities took a leading part in mobilising these monetary resources to come to the aid of sterling. In this operation, the central banks of the countries concerned were, of course, serving their own interests as well as the interests of Britain, because they are naturally interested in maintaining the value of sterling as one of the international reserve currencies.

Incomes Policy

It is now to be hoped that the pound will settle down and that the British Government will have an opportunity to proceed with its economic policy and take the necessary measures to increase production and productivity throughout the British economy. The Government regard an agreed incomes policy as one of the cornerstones of all their efforts in this respect. The First Secretary and Minister of Economic Affairs. Mr. George Brown, is spending a great deal of his time in trying to achieve the implementation of an incomes policy. He has had several meetings with the representatives of the employers' federations and with the General Council of the Trades Union Congress. The discussions between these bodies and the Government are only in their first stages. They are reported to be going reasonably well. The Government have in mind a programme in three phases for these negotiations. First the Government are inviting the unions and the employers to put their names to a "Declaration of Intent" to bring about an effective incomes policy. It is hoped that this declaration may be agreed upon and published by the beginning of 1965.

The Labour Government are pledged to have due regard to all types of income in their approach to an incomes policy. This is the essential precondition which would make possible the co-operation of the Trade Union Movement in the search for such a policy. This means that profits, prices and rents, as well as wages and salaries, must be incorporated in any plan for the agreed and necessarily limited growth of incomes. With this end in view, the Government are proposing the setting up of a new price-review body which, it is hoped, would play some part in checking the rise of prices. The employers' federations find this particular proposal rather difficult to accept. At the same time, a policy of a limited growth of wages without an effective price review body would not make sense to the industrial workers of Great Britain, who are organised in the Trade Union Congress. The first draft of the proposed Declaration of Intent was returned to Mr. George Brown by the employers and by the trade unions with suggested alterations an emendations to the original draft. Since then the Minister has held further meetings and joint agreement on the basis of a revised draft declaration is now reported to be within sight. An agreed incomes policy would be a tremendous achievement for the Labour Government, an achievement which had been attempted by the previous Government and had regularly ended in failure. It would provide a basis for the steady expansion of production at home and for a vigorous export drive abroad.

For all these constructive policies to develop and bear fruit, the new Labour Government need time. The Government believe that the policy of expansion can be accomplished and the international balance of payments position greatly improved without recourse to heavily deflationary policies which would involve unemployment and widespread short-time working. The Government are convinced that there is, therefore, no need to return to the stop-go-stop economic policies of previous Conservative Administrations. Contrary to this view, Britain is now receiving a great deal of advice, from our trading partners abroad, urging a policy of deflation. This was made very clear at the current meeting of O.E.C.D. in Paris. M. Pierre Brasseur, the Minister of Foreign Trade in the Belgian Government, made himself the leading spokesman of this view and told the conference that Britain should adopt a rigorously deflationary policy and that this would be, in his opinion, the only potentially successful means of surmounting the difficulties besetting the British economy. This view is rejected by the British Government and was firmly resisted at the Paris Conference by Mr. Gallaghan and his ministerial colleagues. Mr. Anthony Crosland, one of the younger and one of the ablest Ministers at the Treasury, voiced some surprise that people should be so certain about the dose of deflation that ought to be imposed upon the British economy. He maintained that there are many widely differing views held by economic experts on this matter. The British Government for their part firmly adhered to the view that a heavily deflationary policy was unnecessary and would be positively harmful to the long-term prospects of economic growth in Great Britain.

U. N. CONFERENCE ON TRADE AND DEVELOPMENT

BACKGROUND—A RESUME OF MAIN DECISIONS

By Dr. N. A. SARMA

THE discussions at the United Nations Conference on Trade and Development convened in Geneva during March-June 1964 are likely to be of major significance in reshaping the foreign trade possibilities and the economic development of the less-developed countries of the world, in due course. The representatives of as many as 120 nations came together at this Conference for the first time and, while no spectacular results of immediate benefit to the developing countries were obtained, the Conference served to underline the main problems faced by these countries in the field of economic development and foreign trade, the attitudes of the few industrialised countries, and also helped to evolve certain useful approaches.

G.A.T.T.

Earlier, in 1947, the Havana Conference did not result in the setting up of an International Trade Organisation. The G.A.T.T. was a by-product of this Conference and has been an effective instrument in restoring order into the pattern of world trade which had been disrupted during the Depression and War years. However, despite some efforts on the part of its secretariat, the G.A.T.T. has, on the whole, failed to promote the trade of primary producing and other developing countries of the world. This failure is mainly attributable to (*a*) the most-favoured nation principle and the principle of reciprocity on which G.A.T.T. is based, and (*b*) the lack of political will on the part of the industrially advanced countries in implementing even such measures as have been agreed upon during G.A.T.T. sessions. In the recent Geneva Conference, the institutional machinery became the subject of rather animated discussion and some controversy. A compromise solution finally emerged, under which the proposed new machinery would function, without replacing the G.A.T.T.

Development Decade

The U.N. Development Decade growth target by 1970 is a modest one of 5 per cent per year in national income. Given the population growth of 2 to 2.5 per cent in many of the less-developed countries, this growth rate, even if achieved, would indeed be inadequate. In fact, in recent years, the overall growth rate has been noticeably less; 4.4 per cent in the 1950's—but in more recent years 4 per cent or less. Fluctuations and declines in export earnings from primary commodities adversely affect the development effort of low-income countries. While essentially the economic development of a country is dependent on its domestic effort, sustained over a period of years, there is a crucial role played by external resources, particularly in the initial years. Imports need to grow at about 6 per cent a year, if a growth rate of 5 per cent is to be attained, due to higher import content of investment which is accelerating. Hence it is that the import capacity of a country has a direct and important bearing on a country's economic prospects. This import capacity comprises export earnings, net invisible receipts, and external assistance in grants and loans. Together they have fallen short of minimum requirements related to the development decade targets. In particular, the trends in export trade of less-developed countries and in their invisibles have been disquieting. This experience is clearly illustrated in Latin America, where excessive dependence on a few primary commodities, balance of payments difficulties, slow economic growth and social progress, and inflation have all been inter-related.

Population and Growth

To raise the living standards of the people, and to correct the structural imbalances in their economies are the common objectives of policy in the economic sphere in less-developed countries. The rather high population growth rate naturally sets the pace for development effort. In the less-developed world, with an annual rise in population of 2 to 2.5 per cent, there is virtually a "population explosion." But this is due not so much to a rise in the birth rate as a decline in the death rate. National and international programmes in all these countries have had a most welcome influence on mortality rates. In India, for instance, family planning and population control have been accepted as desirable and necessary, but the average expectation of life has risen from 30 years three decades ago to over 40 years now, and the rate of population growth has risen from 1.5 per cent during 1941-50 to 2 per cent during 1951-60, and to 2.4 per cent currently. Therefore, if there is to be any impact at all of economic development on the living standards of the average citizen in these countries, after providing for the necessary investment effort, the aggregate national product has to rise by much more than the population growth rate. Therefore, the 5 per cent growth rate has been postulated for this decade. This has to be construed as the minimum. As the Secretary-General of the Conference underlined in his statement at the Conference: "... I have proposed a series of measures, bearing in mind that the 5 per cent rate set by the United Nations General Assembly as a growth target for the developing countries by 1970, is a very modest rate which must be exceeded as soon as the necessary conditions for raising it have been created. I have thus proposed measures which can be considered reasonable, but at the same time, modest and moderate."

Growth Rate for India

India should be among the first to welcome higher income targets, as the average income levels in India are among the lowest in the world—equivalent to no more than $70 *per capita*, after over a decade of conscious development effort. During the 13 years since the first Plan commenced, the growth rate (measured in terms of aggregate national income at constant prices) has averaged 3.5 per cent, compound, per annum. We have striven to raise domestic resources—the rate of domestic savings has gone up from 5 per cent to over 10 per cent; and the domestic resources have been supplemented to a useful extent by external capital assistance from friendly countries and international institutions. Even so, the growth rate has not been spectacular. Perhaps, the results may have been better purely from this viewpoint, if another pattern of investment had been chosen. But, while not concentrating wholly or unduly on heavy industries, some necessary priority has been assigned in investment allocation to power and heavy industry, with a view to correcting the basic structural imbalance in the economy and improving the growth potential, so that the foundations for sustained growth in future years are well and firmly laid.

Any income target has to be construed as and translated into the means for attaining it—i.e., the major tasks that have to be undertaken. While growth has to be based essentially on domestic effort, increased trade opportunities and larger aid from developed countries have an important role to play in the economic growth of developing countries, particularly in these initial years. For the present, proceeding on the basis of a 5 per cent growth rate, the volume of capital needed from developed countries is estimated to be one per cent *net* of their aggregate national product; it is important that this one per cent should be net of repayments. On this basis, the total would be substantially larger than what is provided currently. This should be the minimum contribution from developed countries; a larger contribution of 1.5 per cent or more of national income would be required to enable a growth rate of 5 per cent *per capita* in the developing countries.

Financial Aspect

Even so, considerable effort is needed by ourselves, those of the less-developed countries, to raise domestic resources to the maximum extent possible. The higher our sights are set, the more heroic would our own effort need to be, for, over any length of time, much the larger part of development effort has to be our own. While this domestic development effort has several facets, the most important relates to improving savings for investment. In formulating a development plan not only should the practicability of particular programmes of development be thoroughly examined from the viewpoint of availability of the necessary real resources, including organisational aspects, but the feasibility of the whole programme of development should be viewed against the limits set by the financial resources that could be mobilised. The financial aspect should, therefore, be considered concurrently, and as strict an estimate of financial resources, *ex-ante*, as possible, according to assumptions clearly understood and procedures precisely followed, would surely help in formulating a plan that is likely to be implemented in full.

Trade in Commodities

During 1963 and 1964, there has been an improvement in the prices of primary commodities and, on the whole, the developing countries have shared fairly satisfactorily in the expansion of world trade. However, it is unlikely that this improvement will be sustained and mark a reversal of the trends in the last 10-12 years. The aggregate share of less-developed countries in world trade has steadily declined from about one-third in the early 'fifties to one-fourth at present. In fact, excluding petroleum crude and products, the share of developing countries in world exports is now less than one-fifth. Their export volume increased on an average by about 4 per cent per year. This growth in the export volume was itself lower than the growth rate in world trade; this was accentuated by the adverse movements in terms of trade against them, mainly due to a decline in commodity prices, both agricultural and mineral.

Common to All

The problem is common to all developing regions, whether in Latin America, or in Africa, or in Asia. Illustratively, Latin America's share in world total of exports fell from 9.4 per cent during 1950-54 to less than 7 per cent in 1960-62. During the so-called commodity slump period, i.e., 1955-56 to 1961-62, the foreign trade picture of developing countries turned particularly gloomy. During this period, the value of the combined exports of developing countries increased at about 2 per cent per year, as against 6-7 per cent growth rate in exports of developed countries; the average rate of growth in exports was 2.9 per cent for Africa, 1.4 per cent for Asia, and 0.9 per cent for Latin America. The trade gap has been further worsened by the unfavourable balance under invisibles, especially under external debt servicing and transportation account (shipping).

Certain projections based on past trends, made by Prebisch and his colleagues, place the combined deficit of all developing countries together at as high a level as $20 billion by 1970, unless deliberate steps are taken to counter these trends. An earlier G.A.T.T. study by Harberler and others in 1961 placed the 'gap' by 1975 at $15 billion. It is, of course, not possible to be precise about such projections. Whatever the actual size of this gap, and it would in fact depend on the assumptions made and the method adopted, there is no doubt that it is large and widening. The problem has also to be viewed against the larger perspective of the development requirements of these countries.

Committee I

The primary commodities problem was the concern mainly of Committee I of the Conference.* Technological progress, reflected in the growth of synthetic substitutes and more economical use of raw materials, has been affecting demand for a number of commodities. According to several F.A.O. studies, even in the normal course and under fairly favourable conditions, demand for many of these commodities rises but slowly, at not more than 1½ to 2 per cent per year. Greater production of such commodities within the industrialised countries themselves in the last 15 years has had an adverse impact on the trade of developing countries in these commodities. The foreign exchange problem becomes acute for a country whose exports are concentrated in one or two commodities. The solutions sought are in the direction of liberalised market access, and commodity agreements with price stabilisation features.

The stabilisation of prices and markets for primary commodities could be attempted in a series of commodity agreements covering the main cereals, fibres, beverages, vegetable oils, rubber, minerals and metals. A measure of discipline both on the consuming countries (by way of balancing the growth of synthetics and substitutes) and on producing countries (by periodic restraints on production, to be determined from time to time, which might otherwise tend to overstrip demand) has to be an accepted feature of such commodity agreements. Secondly, the building up of stocks and markets operations based on them would require financial contributions by developed countries, particularly the principal consuming countries. An arrangement within each commodity agreement for a "trade development and price fluctuation fund" should also be considered. There may also be several commodities in respect of which there may not be any definite commodity agreements but which may have to be subjected to a certain degree of informal regulation through the process of consultation and confrontation in a common forum and may require a certain modicum of financial assistance for reconversion operations or for tiding over difficult periods of adjustment.

One way of assisting the primary producers is to conduct systematic research seeking new uses for some of these commodities, and thereby to some extent offset the consequences of technological progress which results in the development of synthetics and more economical use of raw material resources. Much greater effort and finance must go into this area of investigation than hitherto. Finally, the enduring solution to the problem of primary producers lies in the diversification of their export trade, so that undue dependence on one or two items is gradually reduced; this diversification could be partly in the agricultural sphere itself, but should certainly be also through industrialisation. Various ideas were brought together under a so-called *chapeau* —an umbrella—that obviously is a compromise, which would have to be tested in actual implementation.

Committee II

Trade in manufactures was the concern of Committee II. The main proposals made by developing countries were: (*a*) all duties at below 10 per cent to be abolished on exports of manufactures and semi-manufactures by developing countries to developed countries and duties above 10 per cent to be reduced by half, for a period of about ten years, and (*b*) preferential treatment to be accorded to such goods for a limited period of, say, ten years. The main case for such preferential treatment rests on the infant industry argument extended to the international trade field. It should be recognised that, even with such preferential treatment, it would take long before the likely total increase in exports of manufactures and semi-manufactures by developing countries to developed countries would assume any large proportions. Therefore, to counter this demand by arguing that it would lead to disruption of markets in industrialised countries does not seem generally valid. The scope among the less-developed countries themselves for increased trade and co-ordinated developmental effort is also important in this context. The Secretary-General of the United Nations was requested to appoint a Committee of Government representatives to consider the matter with a view to working out a method of preferences on a non-reciprocity basis for manufactures of developing countries.

Committee III

Committee III was assigned questions relating to the financing of international trade, and invisibles. The Committee identified a few major questions during the course of its deliberations: (i) The need for higher growth rates in developing countries, and measures to be taken by developed and developing countries including measures to improve foreign exchange availability; (ii) guide-lines for international financial co-operation, terms and conditions of aid, and the relation of trade and aid to maintain the continuity of development programmes, which themselves need to be well-formulated; (iii) the need for and ways and means of increasing the flow of financial resources to developing countries; (iv) compensatory financing—both short-term and in the longer run; (v) the increasing burden of external debt servicing, and the need for rescheduling or consolidating debt, in appropriate cases, after suitable appraisal; (vi) shipping problems, from the viewpoint of the trade of developing countries, especially their unfavourable balance on 'invisibles' account. Some of the main issues became subjects of protracted, often difficult, but, on the whole, fruitful discussions both within the Committee as well as outside; the attempt was to obtain the largest possible measure of agreement among developed and developing countries. A consensus was finally reached, though complete agreement was not always possible. From the viewpoint of developing countries, the recommendations represent a definite step forward, and in accord with the substance of their original proposals.

A major debate developed around shipping—the procedures and practices of shipping conferences and freight rates. The following resolution was finally adopted, unanimously:

"The Conference recommends that appropriate inter-Governmental procedures, including any Committee that might be deemed necessary, be established under the U.N. system or as part of the institutional system that might be set up under the U.N.C.T.A.D., to promote understanding and co-operation in the field of shipping, and to study and report on economic aspects of shipping that might be referred to it."

Growth and Aid

The agreed text on "growth and aid" brought together the various ideas, but avoids 'targets' and 'quantification.' The substance of this rather comprehensive recommendation is as follows:

The Conference recognises the urgency of accelerated growth in developing countries and notes that rates of growth of national income of developing countries in recent years have been generally unsatisfactory. It also recognises the wide concern expressed regarding inadequacy of the growth target of 5 per cent per annum set for the U.N. Development Decade. The Conference acknowledges the need for steps to be taken by both developed and developing countries to mobilise domestic and international resources for accelerated growth in developing countries at rates even higher than those envisaged for the development decade, where possible. It is recognised that the import capacity of developing countries (i.e., the combined total of export proceeds, invisible earnings and capital inflows) should rise sufficiently, so as to enable these higher rates of growth to be achieved, and that all countries, developed and developing, should take, individually and in co-operation, such measures as may be necessary to ensure this. The Conference also recommends that each economically advanced country should endeavour to provide financial resources to developing countries of a minimum *net* amount approaching as nearly as possible to one per cent of its national income.

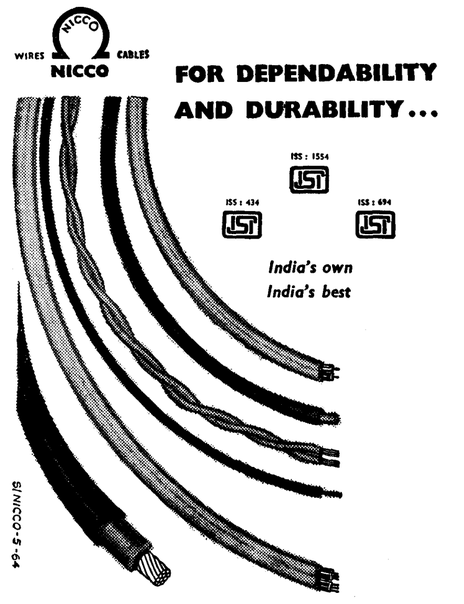
Committees IV and V

As for institutional arrangements, which were discussed in Committee IV, what finally emerged at the Conference was the proposal for a Trade and Development Board, with 55 member countries, which will have under it a commission on commodity arrangements and policies, machinery for shipping, and other bodies. The Conference itself, as an organ of U.N. General Assembly, is to be reconvened periodically, once in about three years. The Secretary-General of the United Nations was requested to appoint a Committee for Conciliation Procedures before voting in this Trade and Development Board. Committee V of the Conference concerned itself with principles of international trade.

The Gains

As stated at the outset, a main gain from the Conference is the distinct progress in thinking on the various problems, both among the developed countries as well as among developing countries; in particular, the need for relating trade and aid policies to development efforts. The so-called North-South division is also to be noted, into industrially advanced countries and developing countries; in particular, the emergence of the so-called "75" as a cohesive and active force to be reckoned with. How effective the institutional arrangements will prove to be in helping forward the cause of developing economies would depend mainly on how the proposed organisation is built up and how it would function, particularly in the initial three or four years. In any case, the G.A.T.T. itself is likely to become more active in regard to the trade problems faced by developing countries.

*Each of the five committees was a committee of the whole Conference, and they were in session for 8-9 weeks.



RANGE OF PRODUCTS:

Rubber Insulated Cables, P. V. C. Cables, V. C. Cables, Paper & Cotton Covered Copper Wires & Strips.

A. A. C.—A. C. S. R., Copper Conductor Solid & Strands. Grooved Contact Wire & Cadmium Copper Catenary Enamelled Copper Wires.

THE HUMAN FACTOR IN ECONOMIC GROWTH

(*Concluded from page 30*)

sons in the country are suppressed in their development by those above them, who live in the fear of being outshined by junior persons and therefore prefer to keep them down the ladder as far as possible. Promotions in various establishments based either on routine seniority or favouritism makes it impossible for brilliant young persons to do their best. In the academic field, the dominance of the administrator works havoc, by reducing academic persons to routine workers seeking favours from the administrator by flattery. All these tendencies result in wastage of human resources by which the growth of so many capable persons is stunned.

It will thus be seen that there is considerable room in many spheres of human activity for improvement in the human factor in order that it may contribute its due share to economic growth. Investment of material resources may not bear the desired fruit if the increasing weaknesses of the human factor such as those referred to above are not corrected in time. One may venture the suggestion that it may be in the larger interests of the country, if we have a five-year Plan of Consolidation in which we may continue the activities to which we are committed including the removal of some urgent immediate deficiencies such as food, and concentrate on the development of the human factor. If this is achieved, the foundations of a sound and rapid rate of economic growth will be firmly laid and the country prepared to face all difficulties with determination to succeed.

THE PROBLEM OF RISING PRICES

Disciplining Consumption Not An Effective Solution

By Prof. P. C. JAIN

THERE has been an unprecedented rise in wholesale and retail prices in India during the past few months not only of foodgrains and industrial raw materials but of all commodities of daily use such as milk, vegetables, eggs, ghee and oil. There has also been a rise in the prices of manufactured goods but, in the wake of an enormous increase in food prices, this has not received much attention. The general index of wholesale prices touched a peak level of 160.1 in the week ended 19th September 1964—this registering an increase of over 17 per cent in wholesale prices and a much greater increase in retail prices over the past year. The wholesale prices have since somewhat declined but they are still very high and there has been no reduction in retail prices, which in some cases continue to rise.

As has been the experience in recent years, the prices of food articles and industrial raw materials have recorded a much greater increase than the prices of intermediate and manufactured goods. Between October 1963 and September 1964, the prices of food articles and industrial raw materials recorded an increase of over 23½ per cent and 22 per cent, respectively, while the prices of manufactured goods, over this period, increased by nearly 4½ per cent. Commodity-wise, the increase has been "more noticeable in wheat (51.7 per cent), rice (11.0 per cent), gram (108 per cent) and groundnut (37.8 per cent).

There is no theoretical justification for holding such a view, but it seems reasonable to assume that, once the prices of foodgrains are brought down and stabilised, the other prices will also come down. There might be a time-lag in this but that would not really matter much. The effort at present, therefore, is primarily at stabilising the prices of foodgrains. Once these prices are stabilised, it would not be difficult to stabilise the prices of industrial raw materials, intermediate goods and manufactured goods.

Obvious Remedies Not So Easy

There is no controversy about the long-period methods of stabilisation. An increase in production, and especially in productivity, is a sovereign method of stabilising the price level. But increasing production and productivity are not so easy as they appear to be. In the case of agricultural production, the supply of seeds, fertilisers and irrigation water has to be properly balanced, the cultivator has to be supplied the necessary finances for buying improved implements and bullocks and has to be persuaded to use improved methods of cultivation. Above all, the administrative machinery in charge of increasing agricultural production has to be made more efficient and honest. These things are not impossible but the efforts which the State Governments have so far made in this direction are quite inadequate.

It seems that, in India, the law that with increased incomes the cultivators tend to reduce production has also interfered with the Government's policy to increase agricultural output. Moreover, with an improvement in the cultivator's economic condition, his own consumption of foodgrains and the stocks which he holds for future sale have increased, thereby defeating the purpose of higher agricultural production in increasing the supply of foodgrains in the market for the non-cultivating consumers. This, of course, does not mean that efforts to improve the economic condition of the rural people and to ensure the cultivator an adequate price for his produce should not be continued. But this certainly means that, while efforts are made to provide incentive prices to the cultivators, equal efforts should be made to persuade him to resist his temptation to reduce production with rising money income and to spare as much 'surplus' as he can for the market. Moreover, although the Reserve Bank's policy for liberalising credit facilities for the cultivators should be continued, the State Governments' machinery should ensure that the increased credit is not used by the cultivators —especially the bigger cultivators— for withholding 'surplus' stocks from the market but is used for increasing production and productivity, for which it is really meant.

Controls

The Government have so far relied, in their effort to stabilise foodgrain prices, on creating wheat and rice zones and regulating the flow of foodgrains between zones, controlling the stock which traders, cultivators and consumers can hold and on fixing minimum and maximum statutory producer's prices for selected foodgrains and regulating the wholesale and retail prices of rice, wheat and some other food article. But whatever might be the theoretical justification for these methods, in practice, they have failed to make any marked impression on food prices in India. There are many reasons for it. The controls and regulatory measures adopted by the Union and State Governments are so excessive, and conflicting with each other, that they have actually hindered the free flow of commodities from the 'surplus' areas to the 'deficit' consuming centres. In their misguided zeal and from a purely 'provincial' point of view, some States have imposed completely uncalled for restrictions on the inter-State movement of *gur* and *khandsari*, pulses, gram and oilseeds. The 'surplus' States have deliberately failed to supply the promised quantity of wheat and rice to the 'deficit' States.

With these conflicting policies and inter-State jealousies, the traders have not found it possible to move food articles from surplus to deficit areas, which in the past was instrumental in preventing an inordinate rise in food prices in any particular area. It is also true that, in the process, some traders have also indulged in black marketing and profiteering. But a dispassionate study shows that such activities have not been the major cause of rising food prices. The real cause is the holding of greater stocks, especially by the bigger cultivators, and a defective movement of cereals, pulses, oilseeds and other food articles from surplus to deficit areas.

Corruption Gets New Lease of Life

This shows that, in order to stabilise the price level, it is necessary to reduce the number of controls and regulatory measures, if they could not be abolished altogether, and to remove the contradictions and conflicting policies which have crept into these control measures. It is an unfortunate fact that, with every tightening of controls, the traders and businessmen are 'forced' to grease the palm of unscrupulous subordinate officers with more illegal gratification to continue in business. The net result of control measures has been to increase corruption in the country, to make some category of officials 'richer' and to make a mockery of the Essential Commodities Act, the Defence of India Rules and other regulatory measures.

Unless the administrative machinery is considerably improved and better class of officials are placed in charge of this work by the State Governments, the existing control measures, and every tightening of control and regulation, would make the lot of consumers worse. The condition at present is that, although the fair price and ration shops are selling foodgrains at controlled prices, the quality has deteriorated by an increase of dust and debris in the goods sold and thus the effective price which the consumers actually pay is higher. Moreover, in most cases, the consumers have to buy foodgrains in the 'free' market to supplement their meagre rations and have to pay higher prices for a part of their food consumption. It appears that, with the withdrawal of controls, on a gradual and phased time-schedule, the condition of consumers would improve and, although they might have to pay somewhat higher than the 'controlled' prices for meeting their requirements, the actual increase in the cost of foodgrains purchased and consumed by them would not increase appreciably. Incidentally, this will help the Government to save a huge amount of expenditure which is at present incurred on the administration of controls and food rationing. It is possible that some difficult pockets might arise in some parts of the country as a result of withdrawal of controls, but reserve stocks held, from imported wheat and rice and from internally purchased foodgrains, at strategic points in the country should enable the Government to prevent a crisis from developing.

Food Corporation

It is unfortunate that, instead of thinking on these lines, the Government's policy is for still further tightening the control on the distribution and prices of foodgrains. While introducing the Bill to set up the Food Corporation of India in the House of the People, Mr. C. Subramaniam pointed out that, since statutory controls had not been found adequate to control the traders, a "new economic instrument" is being forged for this purpose. In the beginning, this Corporation will only act as an "alternative machinery" to purchase, process and distribute foodgrains, but it might be given monopoly powers for buying and selling foodgrains at the wholesale, and possibly the retail, stage later on to teach a lesson to the traders. There is already a 'gap' in the resources available to the Government for the fourth Plan. From where will the Government get the huge capital required for monopolising even the wholesale trade in foodgrains? We know the quality of administrators which is available to the Government and even if they are especially recruited, as Mr. Subramaniam pointed out, there is no hope that they would be able to show the degree of initiative, promptness and boldness which is required in handling the foodgrain trade. The trade in foodgrains is not as foolproof and automatic a process as the Government would like to believe.

There is every likelihood that, instead of ensuring incentive and remunerative prices to the farmers and guaranteed maximum prices to the consumer, the Corporation, if it is ever given monopoly powers, would result in the cultivators getting still lower prices and the consumers paying higher prices for foodgrains than is the case at present. But, as long as the Food Corporation remains only an "alternative machinery," it cannot do much damage except that the confusion of the already complex situation would become a little worse.

Investment Policy

The experience of the past few years in India shows that food prices, or for that matter any other prices, could not possibly be stabilised by merely regulating the supply of that commodity. It is necessary to regulate demand and for this purpose the fiscal, monetary and investment policies of the Government have to be properly coordinated. There has been an inordinate increase in the development and defence expenditure of the Government during the past two years. This enormous increase in public expenditure has increased the purchasing power in the hands of the people and unless this is reduced, there is no hope of stabilising the price level, in spite of all we might do to regulate the distribution of available supplies both from internal surpluses and from imports. Since defence expenditure has a high priority, there has to be a reduction in development outlay, and especially in the non-developmental outlay, of the Union and State Governments to prevent the prices from rising. Although sometimes the Union Finance Minister and some Reserve Bank officials refer to this matter and point out that Government's total outlay should be reduced and deficit financing should be eschewed, no steps have so far been taken to adjust the Government's investment policy to the requirements of price stabilisation.

The Government has, instead, relied on an increase in taxation to mop up the 'surplus' purchasing power in the hands of the people. This method has undoubtedly some validity, but the manner in which it has operated in India has been such that it has actually caused hardship to consumers, belonging to lower income groups, who have already been hard hit by rising prices, and has increased the costs of production of producers, especially industrial producers, thereby adding to cost inflation in the economy. What the taxation policy of the Government has failed to do is now expected to be achieved by a national consumption policy. But in an economically backward country like India, with lack of suitable statistical information, poor administrative machinery and people's resistance to any discipline of personal consumption, such a policy, although theoretically sound, is not likely to be very helpful in stabilising the price level, at least in the immediate future.

INDIAN MACHINE TOOL INDUSTRY

Progress Made Spectacular—Problems Of Expansion Intricate

By S. M. PATIL
MANAGING DIRECTOR, HINDUSTAN MACHINE TOOLS LTD., BANGALORE

THE Machine Tool Industry is the main plank on which modern industrialisation is based. In the ultimate analysis, the capital equipment required for the large-scale industrialisation is very much dependent upon the products of this industry Its ability to produce multi-farious types and varieties of machine tools necessary for industrialisation is a vital factor affecting the industrial progress and the material prosperity of a nation. Besides, the industry's importance is strategic more than quantitative. The machine tool is the mother of mass production and of modern industry itself. Nearly every artifact of our civilisation is either made on machine tools or made by machines that are made on machine tools. Hence the necessity for developing this basic industry is as urgent and important as any other infrastructural needs of our country. In a rapidly industrialising country like India, the demand for machine tools has hence been steeply rising. In spite of the very commendable progress achieved by the indigenous machine tool industry during the past two decades, the consumption of machine tools, including metal-forming machines, in the country has completely outstripped the capacity of the industry so far; presently, about 75 per cent of the country's requirements of these are being met through imports at the cost of valuable foreign exchange.

Although the early records of machine tools made in India go back to 1890, India emerged out as country with some machine tool industry only after the Second World War. The history of progressive development of the Indian machine tool industry can be chronologically phased into, perhaps, different periods. The first phase of development is the period between the Second World War and the time after India became independent and embarked upon the first Five-year Plan in the year 1950, namely, the period between 1942 and 1950.

Phase I—1942 to 1950: With the outbreak of the Second World War, the Indian industry had to gear itself to the manufacture of defence equipment, with the consequent increase in the demand for machine tools. Although the situation even as late as 1941 was not so acute as imports of machine tools from the Allied countries continued to come through, the situation was far from satisfactory. Apprehensive of the future, the British Government in India took all possible measures to develop the indigenous machine tool industry. With the keen patronage of the Government, the industry established itself well, as can be seen from the figures of production and imports from the year 1942 to 1945:

(Values in Rs. millions)

Year	Production indigenous	Imports	Total consumption
1942	0.61	5.69	6.30
1943	6.36	5.36	11.72
1944	7.78	15.27	23.05
1945	11.16	18.20	29.36

Immediately after the war, however, the Indian machine tool industry faced a debacle, mostly because of its structural weakness and technical inability as can be seen from the following statistics of production and imports of machine tools during 1946 to 1950:

(Values in Rs. millions)

Year	Production indigenous	Imports	Total consumption
1946	9.12	18.32	27.44
1947	4.68	36.76	41.34
1948	5.47	41.44	46.91
1949	4.72	41.96	46.68
1950	2.86	24.90	27.76

In this declining period of the Indian machine tool industry, namely, 1946 to 1950, many small-scale manufacturers of machine tools, who were unable to improve the quality of their products and diversify their programme by taking up new and modern types of machine tools required in the country, could not face competition in the open market and, therefore, abandoned gradually the manufacture of machine tools. Even some of the leading firms who had undertaken the manufacture of machine tools during war-time, had not been able to organise their factories to the peace-time requirements and in the manner necessary for the manufacture of precision machine tools. Most of them either did not possess adequate, modern equipment for the manufacture of precision components or the required knowledge of the technique of building precision machine tools. Practically every one of them suffered from financial difficulties. On the other hand, imports of machine tools during this period had been increasing consistently with the growing manufacturing activities in the country after independence, as can be seen from the above statistics.

Phase II—1950 to 1955: The Independent Government, realising the basic and vital importance of the machine tool industry, had, therefore, to take suitable measures to ameliorate the conditions. The State policy of participating in the industry in the public sector came into reality when the Government of India signed an agreement in 1949 with Messrs. Oerlikon Machine Tool Works, Buehrle & Co., Zurich, Switzerland, to set up the Hindustan Machine Tools (H.M.T.) Factory in Bangalore. The period between 1949 and 1955 seems to have been spent in finalising the project, location of the site, construction of the factory buildings, recruitment and training of the required staff and workmen, etc., since the actual production in the factory commenced only from the year 1956. Indigenous production of machine tools during this period somewhat increased at a very slow rate, in spite of the fact that the imports of machine tools had registered a steep rise as can be seen from the following import and production figures for 1950 to 1955:

(Values in Rs. millions)

Year	Production indigenous	Imports	Total consumption
1950	2.86	24.90	27.76
1951	4.73	25.00	29.73
1952	4.44	22.11	26.55
1953	4.41	31.27	35.68
1954	4.71	28.64	33.35
1955	6.79	52.89	59.68

Phase III—1955 to 1960: During the second Five-year Plan (1955 to 1960), tremendous impetus had been given to develop the indigenous machine tool industry. There had been considerable improvement in the industry's performance, since H.M.T. stated contributing its mighty share. The total production of machine tools which stood at about Rs. 6.8 million during 1955 shot up to nearly eight times, namely, Rs. 55 million during 1960, of which H.M.T.'s contribution rated as high as 55.7 per cent as can be seen from the following figures for the period.

(Values in Rs. millions)

Year	Production indigenous	Imports	Total consumption	HMT's contribution	
				Value	Percentage of indigenous production
1955..	6.79	52.89	59.68	..	..
1956..	10.82	83.72	94.54	4.19	38.7
1957..	23.48	146.43	169.91	14.83	63.3
1958..	30.40	153.10	183.50	20.24	66.6
1959..	43.50	176.40	219.90	21.40	49.2
1960..	55.00	230.00	285.00	30.60	55.7

Current Period—1961 to 1963: During the third Five-year Plan, encouraged by the past performance of the indigenous machine tool industry and realising that, with greater emphasis on the development of basic and heavy industries, there would be heavy demand for machine tools (estimated to reach Rs. 650 million during 1965), the target of indigenous production was set at Rs. 300 million per year towards the end of the Plan period. Actual performance so far can be seen from the following figures of imports and productions for the year upto 1963 with H.M.T.'s contribution:

(Values in Rs. millions)

Year	Production indigenous	Imports	Total consumption	HMT's contribution	
				Value	Percentage of indigenous production
1961..	77.10	260.00	337.10	40.50	52.5
1962..	115.02	333.28	448.30	55.79	48.5
1963..	165.91	494.42	660.33	78.83	47.5

At first, it was thought that the third Plan target of Rs. 300 million per annum would not be reached. But the latest study holds optimistic results for the Indian machine tool industry, as the estimated target is likely to be surpassed by about Rs. 30 million.

Although during the last 14 years of planning, the machine tool industry has made such phenomenal progress, the industry's capacity has been totally inadequate to meet the demand for machine tools as can be seen from the following statistics:

(Values in Rs. millions)

Year	Production indigenous	Imports	Total requirements	Percentage of production to total requirements
1950 ..	2.86	24.90	27.76	10.3
1951 ..	4.73	25.00	29.73	15.9
1952 ..	4.44	22.11	26.55	16.8
1953 ..	4.41	31.27	35.68	12.3
1954 ..	4.71	28.64	33.35	10.8
1955 ..	6.79	52.89	59.68	11.3
1956 ..	10.82	83.72	94.54	11.4
1957 ..	23.48	146.43	169.91	13.8
1958 ..	30.40	153.10	183.50	16.6
1959 ..	43.50	176.40	219.90	20.0
1960 ..	55.00	230.00	285.00	30.0
1961 ..	77.10	260.00	337.10	22.8
1962 ..	115.02	333.28	448.30	25.6
1963 ..	165.91	494.42	660.33	25.1
1964* ..	89.79	299.50	389.29	23.1

* The figures are given for six months—January to June 1964.

The production of graded machine tools including metal-forming machines (through steadily increasing) is today hardly 25 per cent of the total requirements, the balance 75 per cent having been imported at the cost of heavy expenditure in foreign exchange.

Outlook for the Future: The machine tool demand estimates for the fourth Plan period 1965-70 have been worked out and are placed at Rs. 1,000 million per annum by 1970. The Working Group of the Planning Commission has recommended an investment of Rs. 3,670 million for the machine tool industry in the fourth Plan. This amount of investment according to the Group will ensure the industry's capacity to meet at least 75 per cent of the estimated demand for machine tools by 1970, as against 25 per cent at present. The capacity target of Rs. 950 million has been recommended by the Working Group out of which Rs. 500 million would be met by the public sector and the rest by the private sector. The Working Group has also anticipated that it would be possible for the industry to aim at exports of machine tools at the rate of Rs. 40 million per year 1970.

The foregoing account provides the quantitative performance of the Indian machine tool industry in the past. However, there are many complex details which the indigenous machine tool builders will have to take into consideration if they have to meet the qualitative demands of the machine tool customers, particularly through high degree of modernisation and diversification in their programme of production. It is very much easier to estimate the demands for machine tools by value or by even numbers. It may not be even difficult to assess the requirements of machine tools, split up into main categories like, say, lathes, drilling machines, boring machines, grinders, gear cutting machines, etc. What has been the most difficult problem is to assess what different design-types, sizes etc., of machine tools will be needed by the machine tool users industries. This depends so much upon the technique, methods of production, processes, etc., of the machine tool customers that it is practically impossible to furnish a ready reckoner on the data of future demands for machine tools split up into various design-types, sizes etc. However, the following could be said for the guidance of the machine tool manufacturers:

By and large, it may be surmised that the future requirements of machine tools in our country will be for more and more heavier types and more modern in the design concept. The trend appears to be in favour of single and special purpose machines and machine tools to do specific operations. The modern trend in the highly developed countries is towards machine tools designed for automation, transfer line machines and for machine tools with automatic repeat cycle systems and positioning and measuring by numerical controls. I, for one, feel sure that, in a matter of five to ten years hence, we will have to produce many types of these machines, if we are to make any substantial progress in our industrialisation comparable by standards of other highly developed countries. What is most essential for the machine tool manufacturers in our country is to think in terms of flexibility and gear up their production planning, control systems, etc., so that they are elastic enough for assimilating the required diversifications. It is natural to diversify production of machine tools within the group itself, so that it could be possible to widen the

PACKAGING INDUSTRY

Problems and Prospects

By ASHOKE CHATTERJEE

ALTHOUGH vitally linked to the growth of industry, the promotion of exports and the strategy of our national defence, it is only very recently that official recognition has been extended to the place of Indian packaging industry in national development. This long neglect is, perhaps, not altogether surprising, because, as a service industry, packaging must of necessity operate behind the scenes. Happily there are signs of change: the Planning Commission has recently appointed a panel to investigate and advise on the prospects of the industry in the third and fourth Plan periods. The Government and the Indian Institute of Foreign Trade are contemplating the establishment of an Institute of Packaging which will concentrate primarily on raising the nation's packaging standards for export.

Before discussing the problems of and prospects for Indian packaging, it might be useful to review briefly the present position this industry holds in the economy. It is estimated that, in 1960-61, the Indian packaging industry's output was s. 107 crores, serving the marketing of consumer goods valued at s. 2,870 crores, or fully 12 per cent the aggregate supplies in the untry during that year. By 1965-, the industry's output will be an timated Rs. 230 crores, serving the istribution of Rs. 6,620 crores of nsumer goods. The industry, its w material suppliers and its cusmers helped the collection of s. 250 crores of tax revenue in 960-61 or as much as 19 per cent of ne total tax revenue in that year. mployment in the industry is exected to rise from some 100,000 perons in 1960-61 to 150,000 persons by ne end of the third Plan period.

These statistics provide a framework for constructive thinking on ndian packaging. They serve to nderline an important fact: that he growth of packaging is a function of development and an index f rising standards of life.

Packaging for Export

It is in the sphere of exports that he importance of consumer packaging had its first impact in the minds of Indian planners. Currently some Rs. 30 crores of packaged consumer goods are exported from India each year: *vanaspati*, canned ish, cashew nuts, confectionery, toilet preparations, paints, varnishes and many others. This is quite apart from the direct export of empty packages to packers overseas. The contribution of this sector to the export effort takes an impressive significance with the need to diversify India's exports into non-traditional fields. The role of consumer goods in this export effort is obvious and there is no doubt at all that, if our consumer goods are to succeed in export markets, this success will depend very largely on India's ability to package her products to world standards of construction and finish.

The dramatic rise in Kerala's exports of canned shrimp from a mere Rs. one lakh in 1955-56 to almost Rs. 8 lakhs in 1962-63, constitutes a fine example of the type of earnings which becomes possible when India's products are processed, packaged and presented to world standards. Major targets for India's prawns are the highly competitive markets of the United States, Canada and Western Europe. Such indirect exports apart, the packaging industry has also made a significant advance in the direct export of empty containers and closures, components and related machinery: over Rs. 40 lakhs were exported in 1962-63 to markets in South Asia, West Asia, East Africa and even as far afield as the Caribbean countries.

While the national situation demands that our sights be trained on export markets, the standard of export packaging is in itself directly dependent on the packaging standard maintained in the domestic market. The economies of package-making are based squarely on large-scale operation: it is virtually impossible on the same equipment to maintain a high quality for export markets and a separate utility standard at home. As newcomers in export fields, we naturally have no assurance of volume. Export markets alone cannot justify the installation of up-to-date package-making equipment nor the development of ancillary raw materials essential to an international standard of finish. These are by definition expensive propositions and only the sum total of home and export demand can warrant such investment. What we need to do, therefore, is to pitch our domestic standards high, so that our products become increasingly worthy of exports.

In getting to the targets set for consumer products in the Five-year Plans, consumer packaging today makes a significant contribution. The scientific package transports the fruits of planning essential products, each with their set production target—to the ultimate consumer; protecting its contents through transport over long distances, climatic extremes, insect infestation, contamination, pilferage and a lot of other hazards inevitable in the marketing situation.

Agriculture

Equally important perhaps to its export function is the role of modern packaging in agriculture. Fully 40 per cent of our agricultural produce is today wasted for lack of suitable preservation facilities. With an output of 60,000 tonnes, the processed food industry in India is, by international standards, an infant one. India's total consumption of open top cans for processed foods is some 50 million as compared to 10 to 15 thousand million in some countries in the West. The processed foods industry today has, however, chalked up several outstanding achievements to its credit, including such export success stories as that of Kerala canned shrimp. Mango slices, fruit juices and vegetables are other thriving export items, but we have so far merely scratched the surface of what is destined to be a vital element in any programme to lift Indian agriculture out of its present stagnation. Canning and other preservation facilities are a major incentive to the grower by providing him a year-round demand for his produce and opening to him markets far beyond the immediate vicinity to which he today must confine his attention in face of the enormous problems of transportation and rapid spoilage. The contribution which the development of adequate facilities for processing and preservation can play in holding the price line is a very major one in our economy which is plagued not only by poor storage facilities and short inventories, but also by the enormous distance which exist between the sources of agricultural produce and their point of ultimate consumption.

The industry is also as essential to defence as to development. During the present emergency, package manufacturers have been called upon to divert a significant portion of their capacity to the manufacture of various ordnance stores: a switch made possible by the inherent diversity of package manufacture. This is apart from making continuous supplies for defence—the open top can for processed foods, is, for example, very often the sole means of transporting food to frontier forces.

Perhaps, the most characteristic feature of modern packaging is its specialised character. Precision, mass production methods alone can maintain a high and consistent standard of quality. To take one instance, a can for processed foods must be manufactured to tolerances within one-thousandth of an inch. Manufacturing capacity must be flexible to meet sudden expansions in demand, the rule rather than the exception in India's predominantly agricultural economy. The customer must be serviced with research, marketing and technical development facilities. And the industry must offer all this—and packing media at prices low enough to assist in the development of mass consumer markets. To keep pace with these demands, and to act as a competitive advantage in the export effort, packaging requires technology of a high order. It is essential, therefore, that India keeps itself in the mainstream of world packaging development.

Raw Material Problems

Every Indian industry today faces raw material problems and packaging is no exception. For its primary raw material, tinplate, the Indian industry is still heavily dependent on imports. According to estimates formulated by the National Council of Applied Economic Research, the tinplate demand in 1970 will rise to 524,400 tonnes, against 261,800 tons in 1965-66, the last year of the third Five-year Plan. Indigenous availability by 1965-66 will be some 145,000 tons rising to 338,000 tons by 1970. Demand will, therefore, remain well ahead of indigenous supplies for many years. This may well have an immediate inflationary impact for the simple reason that many essential products depend on tinplate packages for safe distribution. If tinplate is so short that packaging supplies are seriously curtailed, the distribution of cooking media, baby foods, processed foodstuffs, pharmaceuticals, lubricants, paints, etc., and many others will suffer with obvious repercussions on prices. The danger is aggravated by the fact that, by the end of the third Plan, there will be a shortfall in paper, board and polyethylene powders also.

While the packaging industry must, of course, operate within the framework of national priorities and the restrictive foreign exchange situation, in the short-term, there is no alternative to imports. Taking tinplate, the prime raw material, there is no sizable prospect of replacing the can with substitute packages. All over the world, despite the enormous growth in competitive packaging materials, tinplate has maintained its prime position. With the extremes of temperature and humidity, shelf-life and protective considerations, tinplate will remain for a long time to come the most efficient packaging material. In allocating scarce foreign exchange, one needs to keep in mind that Rs. one crore spent on tinplate imports serves the distribution of Rs. 17 crores of essential consumer goods (and assists in the collection of Rs. 5 crores of tax revenue). Apart from the inflationary impact (already experienced at the time of the Korean war and again in the foreign exchange crisis of 1958), the implications of a tinplate shortage are particularly serious when 40 per cent of fruit and vegetable production in the country are already deteriorating for want of preservation facilities—and food imports cut heavily into the country's foreign exchange resources.

Packaging Technology

Advances in packaging technology have brought about an incredible expansion in the range of packaging materials and package types (cans, laminated flexible packages, collapsible tubes, treated cartons, etc). These advances overseas are reflected in the current packaging scene in India where they become highly relevant to packaging's essential contributions to consumer protection, prevention of wastage and export promotion. An interesting example is the vast field of flexible laminated packaging developments resulting from combinations of plastics, metal and paper. The laminated package, such as the strip pack for pharmaceutical tablets, has streamlined distribution methods by providing an ideal low-cost protective medium. While convenience has been the principal advantage of laminated packages overseas, here they combine convenience with a low-cost single-unit packaging and protection against contamination, atmospheric spoilage, breakage and substitution. In addition, the heat-sealed laminated pack is tamperproof, carrying indelibly printed trade names and trade marks: three essential weapons in the fight against spurious and sub-standard products.

The world over, package manufacture is located in the organised sector, requiring as it does large-scale investment in complex machinery, long-term research and development and close scientific collaboration among package-makers, raw material suppliers and manufacturers of consumer products. As the N.P.C. Productivity team observed: "The packaging industry in the countries we visited operated on a very large-scale. . . . We were informed that small-scale units were virtually non-existent. In modern packaging, it is virtually impossible for small-scale units to cope with the multifarious requirements such as development and research, package design, quality control, service before and after sale." Economies of scale are basic to package manufacture and a high price may have to be had if these are ignored. Opportunities exist, however, for utilising small units for supplies of components to the organised sector. The largest container makers in this country annually purchase more than Rs. 60 lakhs of goods and services from small-scale suppliers. Besides, the majority of any package makers' customers are small-scale manufacturers. To them, a specialised packaging service, backed with research and technical development facilities, is an invaluable aid, witness once again the successful prawn export industry in Kerala.

A strong and economic packaging industry is, therefore, essential to the achievement of national development targets, for the promotion of exports and in defence strategy. Packaging is today regarded as an integral part of civilised life and the rapid growth and expansion of Indian packaging is a barometer of our progress in these vital activities

SYMBOLS OF PROGRESS

Progress takes different shapes at different times. These shapes constantly keep on changing in the minds of planners who design and build the symbols by which progress can be perceived.

For around fifty years engineers at Gammon India Limited have actively engaged themselves in building large numbers of these symbols—Bridges, Water Storage Tanks, Reservoirs, Industrial Cooling Towers, Factory Sites, Power Transmission Tower Foundations, Materials Storage Facilities, Silos, Aircraft Hangars etc.—which serve as massive milestones in concrete along India's road to progress, contributing in a large measure to the country's industrial advance and economic well-being.

KEC-670 D

SOME PROBLEMS OF ALUMINIUM INDUSTRY

By T. C. SABOO

THE uses and applications of aluminium in India are increasing and are bound to grow at a more rapid rate in view of the needs and opportunities in a fast developing economy, as is the case in India now.

The total consumption of aluminium in India has generally been estimated at about 125,000 tonnes for 1965-66 and, approximately, 260,000 tonnes for 1970-71, and, even if the possibility of export is ruled out (for the present), the necessity of making provision for production reserves and for reserve capacity would call for a production target of the order of 270,000 tonnes and a capacity target of the order of 300,000 tonnes for 1970-71.

Table A gives a broad picture of the production, import (or shortfall) and consumption of aluminium in India between 1960 and 1965-66 and 1970-71. One is struck by the fact that the shortfall, requiring import of aluminium, is likely to continue and grow larger by the end of the fourth Plan. This would create an imbalance between demand for aluminium and its supply and hence efforts must be made to increase the present manufacturing capacity of aluminium to the utmost by 1970-71. It is always desirable and preferable to set the production target a little higher than the estimated requirements. The achievement of the production target for 1965-66 might be considered as a matter of immediate interest deserving top priority from the Indian aluminium manufacturers today.

The effective primary aluminium production capacity by the end of the third and fourth Plans may be estimated as shown in Table B. As against the estimated consumption of about 125,500 tonnes for 1965-66 (which would demand an even higher capacity target), the indigenous capacity is expected to reach a figure of only about 93,500 tonnes. The gap is likely to widen by 1970-71, when the (currently) envisaged production capacity of 188,500 tonnes would be far too inadequate to match the capacity requirement of about 300,000 tonnes.

Need for Advance Planning

The gestation period for an aluminium plant is, on an average, about three years or more in India, as it takes considerable time to conduct (*a*) the feasibility survey, (*b*) determine the site of the plant, (*c*) arrange for the very large finances required, (*d*) provide for the necessary technical know-how, (*e*) arrange for the import of machinery and equipment, (*f*) provide for housing, roads, and other social amenities, before (*g*) the actual work of construction and (*h*) installation of the plant can begin. As such, it is necessary to provide for additional manufacturing capacity much in advance. It is, of course, not enough to produce the required quantity of aluminium. There must be a proper balance between the pattern of demand and the actual pattern of supply. It is necessary to ensure that the smelting and fabricating capacity are properly co-ordinated and the metal made available in the desired shapes and specifications. In other words, fabrication facilities should develop side by side and in tune with the production capacity of aluminium in India.

There are also other problems which require consideration. It is a matter of common knowledge that the aluminium industry is highly power-intensive and, therefore, the setting up of any new aluminium manufacturing unit or expansion of the capacity of an existing unit would call for adequate power supply. The generation of electric power in the country is extremely inadequate and this has compelled some aluminium manufacturers to turn to almost any source of power that is available. Thus, some aluminium producers have to rely on thermal power, which is very much more expensive than hydro-electric power. On the other hand, some aluminium manufacturers have had to postpone their expansion programme or accept reduction in output (with idle capacity adding to their manufacturing cost) due to power cuts or/and inadequate supply of power.

In view of the very high consumption of power in the aluminium industry, the Government of India and the State Governments should seriously consider the possibility of allocating power to aluminium producers on a priority basis and at cheap and stable rates.

As the country has fairly abundant reserves of bauxite (the ore required for the production of aluminium, which is not the case in relation to other non-ferrous metals), it would be desirable to encourage the indigenous production of aluminium and the substitution of aluminium in place of other and more scarce non-ferrous metals which are almost wholly imported.

The substitution of indigenous aluminium for imported copper, zinc, tin, nickel etc., would not only save considerable sums of foreign exchange for the country but the use of aluminium in place of such other non-ferrous metals, as also in the case of other metals and materials, is justified economically and technically. The switch-over from copper to aluminium conductors and cables is not merely a necessity in India, where there are very little resources for the production of copper, but it is also technically and economically desirable, as one tonne of bare copper conductor can be replaced by about half a tonne of bare aluminium conductor, for the same current-carrying capacity, at less than half the cost. In the case of insulated conductors, aluminium conductors, being larger in volume, would need a little more of the insulating materials but, even then, making use of cheap modern insulating materials like thermo-plastics, an overall cost saving of 15 to 30 per cent may be achieved for the complete cable, when aluminium is used in the place of copper. This illustration is significant, because the electrical industry is by far the biggest user of aluminium in India and is sure to retain its position for several years to come.

Electrical power is generally regarded as the key to industrial development and, as transmission of electrical power would have to depend more and more on aluminium conductors and cables in India, the importance of aluminium industry, as a factor of industrial and economic growth of the entire nation cannot be overemphasised.

Apart from the use of aluminium in the electrical industry, aluminium is an excellent material for utensils and household appliances, transportation, canning and packaging, building and construction and several other industrial and engineering uses.

In the field of utensils, aluminium is fast replacing brass and competing very satisfactorily against stainless steel.

In the field of transportation, aluminium bus bodies are already popular, as against steel, and the light metal (which increases the carrying capacity of vehicles) is proving economic in railway coaches, automobile parts and, of course, aircrafts, where it reigns supreme.

The use of aluminium is very limited in the sphere of building and construction, in this country, largely because of the fact that it is not commonly realised that, in spite of its higher initial cost, the metal has ample long-term economies to justify its use in durable applications. It may be interesting to point out that only about 2,500 tonnes of aluminium (per annum) are being used for building and construction in India at present, whereas about 650,000 tonnes of aluminium (per annum) are used in building and construction in the U.S.A. In fact, the building and construction industry is the biggest user of aluminium in the U.S.A. which, in turn, is the biggest user of aluminium in the world.

In the field of canning and packaging, too, the light durable and hygienic metal is a very good substitute for tin, lead and plastics.

Conclusion

With bigger manufacturing units, cheaper and adequate power, greater facilities for transport of raw materials and finished products (and at lower freight rates) and greater emphasis on research and development, it should be possible to accelerate the growth of aluminium industry and enable it to contribute more and more to the industrial and economic welfare of the country as a whole. Some of the major problems have only been taken note of here, but, they are, certainly, very vital for the Indian aluminium industry.

The quest for developing facilities of production of aluminium (virgin and semis) is necessarily continuous and there must be constant attention to the problems that exist and arise in relation to this industry in India.

On the successful and quick solution of these will depend the growth and improvement of aluminium industry in this country. As a matter of fact, aluminium—hitherto considered as predominantly suitable only for kitchen utensils and wares—has become a basic and major industrial raw material in our fast-moving economy and today it stands on the threshold of immense technical and economic possibilities in the world of major metals. In India, more than in many developed countries, it has a vital role to play on account of a shortage of non-ferrous metals and as a major metal it will contribute to the advancement of the country through its myriad uses and potentialities.

Table A: *Production, Import (or Shortfall) and Consumption of Aluminium in India (1960-63, and 1965-66)*
(In thousand tonnes)

Year	Total indigenous supply		Net import	Estimated consumption
	Primary production	Secondary production		
1960	18.2	6.3	23.0	47.5
1961	18.4	6.6	27.0	52.0
1962	34.7	7.8	37.5	80.0
1963	55.2	8.0	20.8	84.0
1964*	60.0	9.0	31.0	100.0
1965-66*	93.5	10.0	22.0†	125.5
1970-71*	198.0‡	20.0	42.0†	260.0

* 1964, 1965-66 and 1970-71 figures are estimates.

† Net imports figures represent the shortfalls needed to be met by imports unless additional manufacturing capacity is brought into operation.

‡ In arriving at the figure, the assumption has been made that Mysore, Madhya Pradesh and Maharashtra projects will go into production, and at target capacity, by 1970-71. If the schedule does not work out as assumed, the shortfall will be considerably greater.

Table B: *Primary Aluminium Production Capacity 1965-66 and 1970-71*

Manufacturer	1965-66 (Capacity in tonnes)	1970-71 (Capacity in tonnes)
Aluminium Corporation of India Ltd.	7,500	7,500
Indian Aluminium Co. Ltd.	36,000	36,000
Hindustan Aluminium Corporation Ltd.	40,000	60,000
Madras Aluminium Co. Ltd.	10,000	10,000
	93,500	1,13,500

Note : The following projects have also been proposed but are uncertain.

	1965-66 (Capacity in tonnes)	1970-71 (Capacity in tonnes)
Mysore Project (Sharavathi)	30,000	30,000
Madhya Pradesh Project (Korba)	25,000*	25,000*
Maharashtra Project (Koyna)	20,000†	20,000†
	1,68,500	1,88,500

*May be revised upwards to 30,000 tonnes. †May be revised upwards to 25,000 tonnes.

man's . . faith

Faith that makes man aspire, strive ...
awakening him to tasks in the early-glow of dawn.
That melts rock, shapes granite; transforms
still waters to surging power.

A faith in the living future:
in a world that offers a little more—
a little less of the care, a little more of the joy.
Faith that gives meaning to life.

Today, as in the past, our products help to make homes cleaner, healthier, happier. But today we are also working for ... Tomorrow, when the evergrowing urge for better living will demand still greater efforts. And we shall be ready with wider service, new ideas, new products ...

Today and Tomorrow... Hindustan Lever serves the home

SOME THOUGHTS ON CEMENT INDUSTRY

By Dr. R. R. HATTIANGADI
MANAGING DIRECTOR, CEMENT AGENCIES LTD.

THE manufacture of Portland cement in India was first attempted in Madras in 1904, when the South India Industrials Ltd. put up a plant with a capacity of 10,000 tons. This venture failed. The real foundations of the industry could, however, be said to have been laid a decade or so later—between 1914 and 1916, when three plants went into production—Tata's plant at Porbandar, Khatau's at Katni and the third one put up by Killick Nixons at Lakheri. These three plants had a combined capacity of 76,000 tons.

This year, the cement industry completes 50 years of useful service to our country. The industry's stability, efficiency and stature are entirely due to the initiative and ability of the private sector. From less than a thousand tonnes of cement produced in India in 1914, production today is well over 9.5 million tonnes.

The table given below shows how the cement industry has grown in India over the last fifty years:

Year	No. of factories	Production Tonnes
1914	1	947
1919	3	88,205
1924	9	265,135
1929	9	569,681
1936	11	968,382*
1941	15	1,827,110
1946	17	1,567,102
1951	22	3,222,285
1956	28	5,021,580
1961	34	8,245,596
Today	37	9,647,000

* Formation of the A.C.C.

This rate of increase and the high standards of production achieved and maintained by the Indian cement industry would indeed be a proud record but for the large gap that exists between the demand and supply of cement.

Reasons for Retarded Growth

The development and progress of the industry could have been very much faster, and very much more satisfactory in relation to the Plan targets, if the price policy of the Government of India had been such as would have encouraged the establishment of buoyant conditions for the cement industry—conditions which would have provided, not merely for the manufacture of large quantities of cement which could be sold at the lowest possible prices and yet pay reasonable dividends to investors, but would also allow a portion of the profits to be ploughed back into the industry to ensure a rapid and healthy expansion.

The following table brings out the unfavourable position of the Indian cement industry as a whole in comparison with other Indian industries:

Profits After Tax as Percentage of Net Worth—1962-63

Woollen textiles	17.4
Iron and steel	12.8
Medical and pharmaceutical preparations	12.0
Electrical machinery, apparatus and appliances ..	11.5
Basic industrial chemicals ..	11.4
Silk and rayon textiles ..	11.1
Machinery (other than transport and electrical) ..	10.7
Cement	9.4

Cement is a capital-intensive industry and, unless there are sufficient incentives, money will not be invested in the industry with as much enthusiasm as in certain other consumer industries, and it is for this reason, among others, that the growth of the industry has been slow and halting. Furthermore, the industry suffers from too many controls. Its growth, its price, the fuel it must use, its distribution and even the kind of packing that must be employed are rigidly controlled by Government. These controls, too, stifle the growth of the industry and have also succeeded in discouraging the entry of new entrepreneurs into the field.

The extent to which the cement industry is suffering in respect of capital formation can be seen from the following figures:

Capital Issues During 1960-63 in Important Industries

(Ordinary, preference shares and debentures)

	Rs. crores
Engineering	99.51
Chemicals	24.13
Cotton textiles	15.57
Paper	15.34
Rubber and tyre	14.64
Cement	5.95

In a capital-intensive industry like cement, where installation of a new standard cement plant will cost an entrepreneur about Rs. 160 per tonne capacity and about Rs. 120 per tonne capacity even for expansion of an existing factory, it is doubtful whether the targets set for the third and the fourth Five-year Plans will ever be reached, if capital is not attracted sufficiently and is not forthcoming in time. As far as can be seen, even if the cement industry goes "all out" to produce as much cement as possible, the capacity at the end of the third Plan cannot possibly be more than some 12.50 million tonnes.

Some Correctives

In order to stimulate the growth of this industry at a much faster rate than is currently achieved, it will be necessary

(*a*) to encourage the expansion of existing units on a priority basis,

(*b*) to harness the "know-how" of established manufacturers by encouraging them to install new factories, by a pricing policy which will ensure sufficient plough-back for the generation of internal resources, earmarked for expansion and modernisation activities,

(*c*) to establish procedures enabling expeditious availability of effective foreign exchange requirements, and

(*d*) to encourage the manufacture and use of new types of cementitious materials which should be subject to specific standards in order to ensure quality and reliability.

The Price of Cement

It has been stated that the price of cement in India is too high as compared with many international prices. This belief must be examined from the point of what the manufacturer gets in relation to what the consumer pays, in the context of extra costs by way of excise duties, freight, sales tax, etc. As against a price of Rs. 73.50 which the A.C.C. gets for naked cement, the consumer in Bombay City pays Rs. 159.54 for A.C.C. cement, the difference being accounted for by excise duty, railway freight, packing charges (controlled by Government), sales tax, etc.

Another matter which needs to be pointed out is the fact that the cost of labour per unit of cement production in India cannot be assumed to be cheap merely because Indian labour is relatively cheap as compared with Western and American standards. We must take into account the fact that the *per capita* productivity of labour in India is very low on account of many factors—including lack of appreciable mechanisation of operations. In the U.S., the U.K., Germany and Japan, the labour utilisation varies from 0.8 to 1.5 man-hours per tonne of cement. In India, the average tends to be as high as 12/13 man-hours per tonne of cement. And, Indian cement manufacturers have to bear certain expenses which their confreres in other countries do not have to bother about. I refer to such things as housing, hospitalisation, education and other amenities.

It has been stated that the cement target under the fourth Plan will be 23 million tonnes. This figure is also said to be approximated by an indirect calculation on the basis of the construction component of the physical targets aimed at in the fourth Five-year Plan. The means that the production of cement must be almost doubled in five years. If past experience can be regarded as a guide, it would seem that this target is overambitious, unless very drastic methods for tackling this problem can be set in motion quickly.

Cement Corporation

Reports appearing in the Press recently state that, in order expeditiously to bridge the wide gap between the demand and supply of cement, the Government feels compelled to enter the field and set up a company in the public sector to be called "The Cement Corporation of India." One of the objects of this Corporation is said to be to carry out surveys, prospect for potential limestone deposits and make cement-grade limestone available. This is a constructive approach inasmuch as a long-felt want is thereby sought to be met. The Corporation will, it is said, also direct its efforts towards facilitating investment in the private sector, especially for expansion programmes. This too would be very welcome. If the Corporation is able to channel the flow of more capital into the existing units to help them expand rapidly and achieve economies of scale, it would render yeoman service to the industry.

Cement Machinery Manufacture

In comparison with the Indian cement industry which is 50 years old, the manufacture of cement-making machinery on an organised scale is of somewhat recent origin. It was the Associated Cement Companies Limited that made a beginning in this field in 1942 during World War II when it was impossible to obtain cement-making machinery from abroad, by setting up a workshop at Shahabad to fabricate such units as it required for its own maintenance and expansion. The post-independence period made real advances possible. Today, seven firms which have been licensed to manufacture cement-making machinery have already entered into or are in the process of concluding technical collaboration agreements with established manufacturers outside India in order to keep abreast of technical developments in the field of design.

Amongst the major units of machinery which are manufactured in India today are rotary kilns up to 300/450 tonnes/day capacity and 500/600 tonnes/day capacity, Lepol grates for 500/600 tonnes/day capacity, nodulizers, Fuller coolers, Turbo-Air-Separators, vibrating screens, slurry-mixer basins, wash mills, plate-conveyors for carrying limestone, drag-chain conveyors, Shaking conveyors and elevators.

The already licensed manufacturers have indicated that they can produce 16 standard plants of 2 lakh tonnes each, every year, by the beginning of the fourth Plan. Present indications are that the industry will not only be able to make the new cement plants required during the fourth Five-year Plan, but will also be able to produce sufficient machinery to rehabilitate older plants.

It is hoped that Government will be firm in seeing that entrepreneurs going in for cement manufacture patronise cement-making machinery of indigenous manufacture; otherwise, these firms which have sunk a great deal of money will come to grief and the country will never get a real start in the indigenous fabricating of machinery. Currently, the foreign exchange allotted for the fabrication of a complete 600 tonnes/day standard plant is of the order of Rs. 45 lakhs, against a total of Rs. 150 to 160 lakhs required for machinery and plant alone. Even this Rs. 45 lakhs could be progressively reduced, if certain large steel castings, large motors and gear-boxes could be manufactured in India.

If this young engineering industry is to grow rapidly to full stature, Government must allot foreign exchange on a continuing basis, so as to avoid gaps in production. There is no objection, however, to periodical review of the needs of foreign exchange, consistent with the growth of the ancillary industries such as steel-castings, large size gear-boxes, and electrical motors, with the ultimate object of reducing the foreign exchange requirements.

Different Types of Cement

Blast Furnace Cement: If the cement industry is to achieve the huge targets set for it under the third, fourth and fifth Five-year Plans, it must prospect for and ensure adequate supplies of suitable grade limestone. In order to harness every material which can be used for making cementing material of quality, the Government of India's planners have asked manufacturers to make use of the slag arising as a waste-product from our steel works. The output of steel in the third Plan is likely to be more than 10 million tonnes. If this target is achieved, there will be a large amount of blast furnace slag, which, by special treatment, can be blended with Portland cement to make a cementitious material of proved quality. It is obvious that, by producing this blended cement, not only will an industrial waste be put to gainful use, but it will also enable the country to have additional quantities of cement expeditiously. Portland blast furnace slag cement, when made according to prescribed specifications, can be used on all constructions where Portland cement is used. In addition, it has certain special properties such as resistance to sulphate waters and a naturally lower heat of hydration.

The Associated Cement Companies Limited, pioneers in the manufacture of Portland cement in India, were the first to produce this special cement by utilising the slag from the blast furnace plants at Jamshedpur.

Portland Pozzolana Cement: This type cement also has great potential in India. Pozzolana is a natural or artificial material containing silica in a reactive form. To manufacture this kind of cement Portland cement slinker and Pozzolana are either ground together, or Portland cement and fine Pozzolana are intimately and uniformly and very carefully blended.

Although Portland Pozzolana cement used as constructional material attains initial strength at a slightly lower rate than ordinary Portland cement, it has certain good points, including low heat of hydration, which make it specially suitable for mass constructions. The ultimate strength of constructions made from Portland Pozzolana cement, however, is just as good as that of constructions made with Portland cement.

In India, we have chiefly to depend on artificial materials as the source of Pozzolana, the most common being the calcined clay commonly known as *surkhi*, the other source being the fly-ash available from many factories. The choice of the proper type of clay for the manufacture of *surkhi*, however, requires experience and some experimental investigation.

White Cement: Modern architectural trends demand new materials and new techniques both for exterior and interior finishes, not only to enhance their æsthetic appearance but also to provide more congenial surroundings to those engaged in productive work. White cement is ideal for both these needs. Apart from *in situ* white cement renderings, precast concrete facing-slabs provide the architect with a unique material with unlimited scope for decorative effects. These can be made in a wide range of colours and tones. For large-scale construction, the slabs can be prefabricated and, in consequence, produced much more cheaply.

White cement is also extensively used in the manufacture of terrazzo tiles, especially in light pastel shades. Another important use for white cement is in the manufacture of cement paints. The A.C.C.'s Silvicrete brand of white cement is being widely used for all these purposes.

Research and Technical Service

The importance of research and technical service to the Indian cement industry and the Indian consumer of cement cannot be overstressed. The industry is fully alive to the need for a technical service wing backed by adequately equipped research facilities to enable it to keep abreast of all scientific developments.

All the principal cement-manufacturing countries have their own research stations where problems relating to the manufacture of cement and concrete are examined. Unfortunately, we in India have been lagging behind in this regard. While the Central Building Research Institute and the Central Road Research Institute have been handling some items of research on cement and concrete, what they have done can by no stretch of imagination be considered adequate, for they cannot deal with more than a small fraction of the multitude of problems which wait to be tackled and solved.

We must here admit that both the Concrete Association of India and other services like Sahu Cement Service have been dependent principally on research done in other countries for up-to-date information regarding cement and concrete technology. The Associated Cement Companies Limited have recently set up a Central Research Station at Thana near Bombay. Under centrally planned direction, the project will cover all aspects of manufacturing techniques, the evolution of more efficient and economic methods of processing and also developing diversified products.

The end-uses of cement such as in concrete of all types under varying conditions of climate will form part of its research programme. There will also be a Technical Service and Development Division of the Institute which will be equipped to carry out comprehensive testing of soils and aggregates for Government, local authorities, architects, and private parties, so as to design concrete and soil-cement mixes suitable for various types of construction.

The Cement Manufacturers' Association is also considering the question of setting up a cement research institute at Delhi for research work for the benefit of the industry. This institute will be financed equally by the industry and the Council of Scientific and Industrial Research. When this institute begins to function, it is hoped that it will help provide answers to the many scientific and technological problems which face cement manufacturers and the users of their end-products today.

INDIAN MACHINE TOOL INDUSTRY

(*Concluded from page* 149)

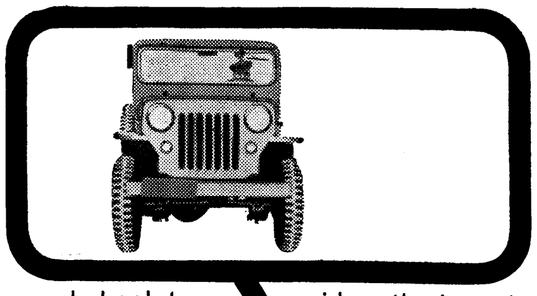
range in design-types within the 'family' rather than taking basically different groups of machine tools outside the family range. Even within the specialised family, there is bound to be demand for a wide range of machines, i.e., for simple mechanically controlled machines to highly engineered all-electric/electro mechanical/electro-hydraulic machines, with numerical controls, repeat cycle systems, multi-spindles, hydraulic slides, etc., in different sizes. To be able to cater to such varieties of machine tools and produce them economically, considerable degree of rationalisation in manufacture and simplification and standardisation in designs become necessary.

If the Indian Machine Tool makers have to meet satisfactorily the growing needs of the manufacturing industry in the country, they will have to concentrate on the technological research and development in designs of machine tools. This is evident from the rapid and spectacular progress that has been achieved by all the countries abroad. Unless the country's machine tool industry follows the examples of the highly developed countries abroad in this direction, I do not see any salvation for them to keep up pace with the growing diversified needs of the modern manufacturing industry in the country.

Summarising the position, the Indian Machine Tool Industry has accounted for itself admirably well and made a phenomenal progress during the past two decades. Primarily this has been due to the unstinted patronage and assistance and even preferential treatment the industry has received from the Government of India. The State participation in the machine tool industry which was not so much appreciated in the beginning has now been recognised as a great asset to the industry and in fact has become a stimulus for the remarkable progress which the industry has achieved in such a short period. Added to this, foreign collaborations for obtaining the technical know-how and comparatively higher degree of diversifications have all accounted for the rapid growth of the industry. Hence there is more ground for optimism than perhaps the industry admits, particularly if the indigenous machine tool builders refurnish their plant, raise their research sights and look sharp to selling. All the same, it would be unwise on the part of the machine tool makers to be complacent in the present comfortable situation and ignore the future demands on the machine tool industry.

THIS LITTLE VEHICLE DOES ALL BIG JOBS

A jeep has tremendous functional value. Through its 3-power take-off points, it supplies mobile power to rim, drills, winches, compressors. And more, it gives you additional savings with long life and low upkeep. □ In performance and absolute trouble-free service...the world's biggest little vehicle has an unbeatable record.



With its 4-wheel drive, it is built to be used under the most rugged conditions, to operate with maximum efficiency and economy at all times. □ The farmer, industrialist, jawan, social worker, traveller, hunter, considers the jeep the most versatile, useful and dependable vehicle he owns...especially because it has a 4-wheel drive.

BUSINESS AND GOVERNMENT

Commonsense and Consideration Should be the Motto for Both

By M. V. ARUNACHALAM
PRESIDENT, SOUTHERN INDIA CHAMBER OF COMMERCE, MADRAS

IN a well-ordered Democracy, if the two functional groups of Business and Government played their respective roles effectively and well, there should be no antithesis as between one and the other and also between either of them and the public who constitute society as a whole. But then such a well-ordered society would be thought of by many as utopian and, therefore, impossible of achievement. The result is that there is a tendency to allow matters to drift. There is no zeal or enthusiasm for purposive corrective action to check further deterioration and bring about a climate which would be conducive to co-operation and consequent dynamic growth. Mutual recrimination and distrust appear to be the order of the day.

Business believes that most of the economic ills that beset the country today are of the Government's making. The Government, on the other hand, is equally convinced that the record of business to date is what has necessitated the various regulatory and punitive measures enacted by it. The public, at the best of times, when generous, are inclined to concede that the truth lies midway between these two extreme accusatory positions. However, when things go wrong, as, for instance, in respect of the availability of foodgrains in our country at the moment, the public cannot help feeling that both the Government and business have bungled badly and does give expression of its disapproval and displeasure. Besides such spasmodic criticisms, the public generally chafes for a while and then philosophically resigns itself to await better days. It is too lazy and unco-ordinated to join issue with the all-powerful State or even moderately influential business. To let such a state of affairs continue in a democratic society is most unfortunate, to say the least. A greater *rapport* must be brought about between the different sections of society, more particularly between Government and Business.

The Rotary Clubs of Madras and Madras South organised a "Business Relations Conference" on the 21st and 22nd November at Madras to spotlight the inter-relationship between business, Government and society. There was a galaxy of highly knowledgeable speakers, representing business, Government and the community. They made an intelligent and constructive analysis of the problems that beset the country. Various ways of solving the problems were also suggested. The approach to the entire question which was displayed by the participants in this Conference deserves the attention of all who are interested in our country's future. Accordingly, this article will attempt to deal with some of the good points that were made at this Conference in the hope that it will bestir members of the Government, Business and the Public not only to give serious thought to the various proposals but to initiate action on the lines suggested.

Areas of Conflict

The areas of conflict between Government and business need to be identified first. These include levels of taxation, both direct and indirect. More recently, the conflict has intensified with the growing food scarcity, on the one hand, and the general rise in prices, on the other. Government have conducted raids on office premises and private houses to detect cases of evasion of income-tax or sales tax, or of disregard of foreign exchange regulations or hoarding of foodgrains. A controversey has also been raging for long on the respective roles to be played by the public and private sectors. The increasingly complex and difficult legislative measures in respect of Company Law, Labour Law and Salaries and Wages Administration have certainly not helped matters. Regulatory measures, licences, permits and controls have proliferated in recent years, adding to the problems of business in falling in line with these measures, on the one hand, and the problems of Government in administering these measures, on the other.

An examination of the issue of the levels of taxation will reveal very clearly that the levels obtaining in our country today are excessively high. The burden is so onerous as to prove a disincentive to the honest man. In fact, it holds out a powerful temptation to evade taxes. The Government's action, in the past, has always been to plug the loopholes and make the penalties for evasion harsher. There has not been any attempt to examine whether a lowering of the tax structure will actually assist in bringing in greater revenue by helping to eliminate or at any rate, reduce evasion.

Agriculture

In the matter of foodgrain production and distribution, there has been so many impediments to increase production and productivity. If the available statistics are any guide, there is a clear indication that foodgrain production in the country has increased steadily over the past several years. However, there has also been a substantial increase in population and qualitative shift to rice and wheat consumption from other foodgrains. The scarcity situation leads to some elements among the traders, producers and consumers laying by stocks more than they normally need to. When such a situation becomes unmanageable, then accusations of hoarding and profiteering are levelled against the trade more particularly. If, as is generally made out, there are adequate stocks of foodgrains available and the fault is with the distribution system, the problem certainly is not an insurmountable one. With goodwill on all sides, it can be tackled effectively. But the problem is more serious than that, as, fundamentally, production has been lagging far behind the demand. This calls for provision of further incentives for increasing foodgrain production substantially, in order to reduce imports of foodgrain within the foreseeable future thereby calling a halt to the serious drain on foreign exchange which would otherwise be available for vital industrial imports of both capital goods and raw material. Here business has an obligation which may not appear so obvious but which is nevertheless extremely important even in its own enlightened self-interest. In a society where 80 per cent of the people live in rural areas and are dependent for their livelihood in one way or another on agriculture, business should play a positive role in strengthening the agricultural base of the country. This would at once help in providing adequate raw material for agriculture-based industries and a vast market for consumer goods, once purchasing power is available to the rural population. It appears that business is awakening, though belatedly, to its responsibilities in this regard, as is evident from a letter addressed by the President of the Federation of Indian Chambers of Commerce and Industry to the heads of various commercial organisations to give necessary attention to this important matter. Also it is learnt that some leading business houses have made proposals to the Government for running large-scale agricultural operations on a modern and scientific basis to be managed by corporate bodies. If the Government's attitude and policies encourage these welcome moves initiated by business, then a breakthrough can be achieved.

Sectoral Controversy

The Public *versus* private sector controversy seems to be a never-ending one, inspite of the vociferous protests from either side from time to time that they ought to be complementary to each other and that, in fact, there is no incompatibility or divergence of purpose as between the two. Business recognises that the public sector has a very substantial part to play in basic industries such as power and transport. Certain fields, as for instance, heavy machinery manufacturing which demands a large investment in capital and management, are beyond the immediate capacity of the private sector. In these the establishment of public-sector enterprises is necessary. However, the scope for the public sector in strengthening the infrastructure is so great that it is unfortunate that it should seek to fritter away its energies and resources in other areas such as consumer industries where the private sector is better equipped to achieve quicker and better results.

Also very frequently, the Government has accused business of not fulfilling its responsibilities in attaining certain production targets set for industry. Those in charge of these industries in turn complain that there have been factors beyond their control such as limitations of profits by selling, price fixation, wage board awards and the like which have made it impossible to earn enough to expand adequately. Again, the record of public-sector industries, barring a few exceptions, generally presents a most disappointing picture. It is only recently that there has been a realisation that public-sector enterprises should also earn profits, and adequate profits at that, and that they should be run exactly on the same lines as autonomous private-sector corporations. The absence of any continuity in top level management in several public-sector enterprises and their being bound by red-tape and cumbersome governmental procedures have resulted, in the past, in very considerable national loss. It is also essential that the treatment accorded both to the public and private sectors should not discriminate in favour of one or the other. The national interest will be best served by private enterprises operating in an atmosphere of encouragement and responsible regulation, in partnership with a well-run public sector.

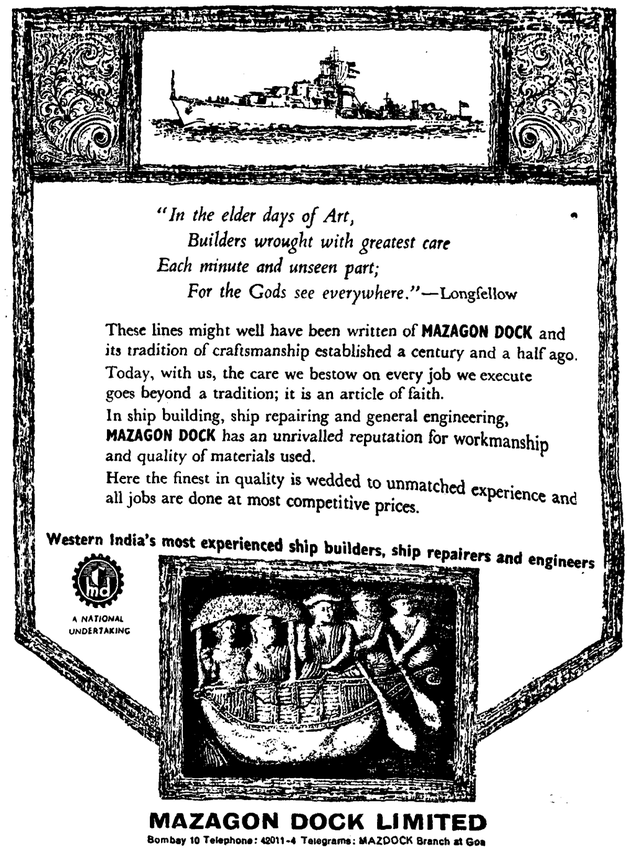
Controls

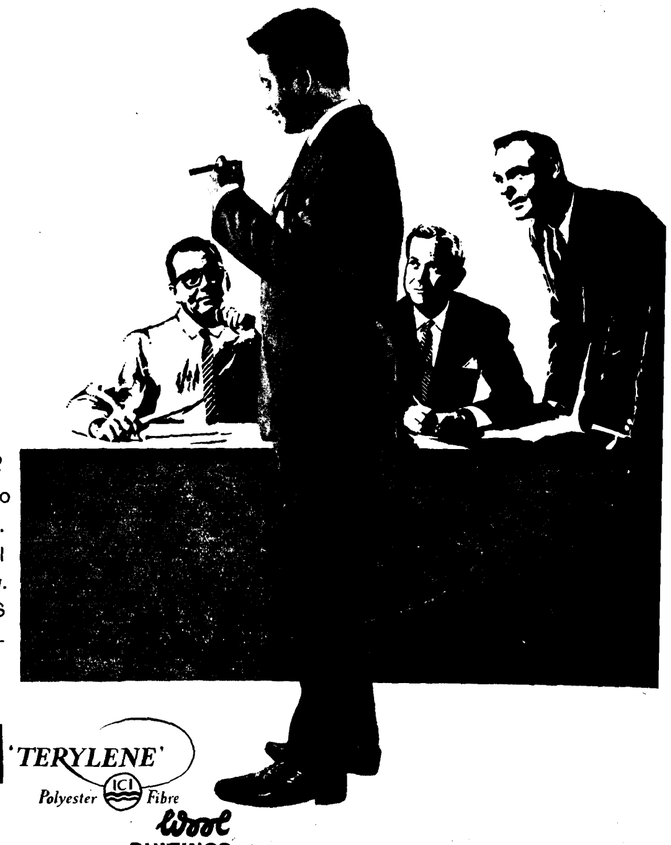
Another most irksome area of conflict between Government and Business has been the diverse regulatory measures, controls, licences and permits which have become part and parcel of entrepreneurial activity in this country. If controls and regulatory measures were of a temporary kind to meet specific situations, then, perhaps, the disagreement over them would not be so bitter. Government themselves grant that they are not happy to introduce these controls and that they would far rather not have them. They say they are obliged to wield such powers, as, otherwise, they would be failing in their duty of protecting the interests of the public. Here business has a tremendous responsibility. They have an obligation to run their enterprises efficiently. They have an obligation towards their shareholders, their employees and their consumers. All these obligations have to be squarely met. It must be admitted that there have been instances where business has failed to meet its obligations by one or other of these sections. This does not mean that the Government should automatically impose regulatory measures which actually hamper the efficient functioning of private enterprises.

The Government, in its anxiety to serve what in its opinion is the social purpose of business, has imposed so many regulations, forms, controls, permits and licences and obstructions of considerable magnitude that one wastes one's time in complying with these measures, instead of doing the things that are essential and which, if properly attended to, will produce the best results in the quickest time. The advantageous balance between entrepreneurial freedom and the social needs of a free nation is a very delicate one. Those in Government are naturally exposed to the temptation of arming themselves with unlimited powers with the avowed intention of serving the best interests of the public. To the extent they yield to this temptation, they acquire in their hands instruments of patronage which are both used and abused. In this process, the free play of economic factors is rendered difficult, if not impossible, and results in lop-sided and inadequate development. If only the Government would adopt economic criteria in dealing with what are essentially economic problems, they will find that they are automatically serving the social needs of society as well.

Unfortunately, political predilections and considerations heavily influence governmental fiscal and economic policy in our country. Where such policies have led us to, is clear enough for everybody to see. The state of our economy and nation today is certainly not such as to congratulate ourselves about. At any rate, we could have achieved much more with the talent and genius native to our people. At least, now before it is too late, there should be serious rethinking both on the part of Business and Government to get together for the common good of the country. A very important suggestion that was made at the Business Relations Conference held at Madras was the

(Continued on page 160)





Taxation on Plantations

Need for Centre-States Co-ordination

BY P. S. SUBRAMANIAM, F.C.A.

PLANTATION crops, by their very nature, lend themselves to easy taxation, and taxation takes many shapes and forms. In the beginning, these crops were only taxed indirectly through a levy of excise and export duties, besides a simple local land tax. Later, with the introduction of crop controls and promotional schemes, various new levies like export cess and licensing fees began to be made. The *panchayats* in whose jurisdiction the plantations are situated also began levying a host of taxes like building tax, profession tax, water supply tax and factory tax. State Governments, in their turn, also started levying sales tax, local as well as inter-State. Some municipalities began levying an octroi duty when the plantation crops passed through their boundaries. Thus, over the years, there have been a multitude of indirect taxes levied from plantations and the basis of taxation has been the planted acreage, production, export, consumption, housing, profession and purchases and sales. Even these are probably only illustrative and not exhaustive. We shall consider the progressive impact of these taxes at a later stage in this article.

Genesis of Income-tax on Tea

Direct taxation on plantation crops consists of income-tax and super-tax and allied taxes like wealth tax, estate duty, etc. Income-tax itself consists of two parts—Central (now Union) and State. For many years since the plantations were established, they were treated as agriculture and the tax gatherer had not extended his net to income derived from agriculture. It was in 1919 that the Central Government for the first time announced its intention of levying income-tax on a portion of the profit of tea plantations—to be precise, on the profit derived from the manufacture of tea leaf into tea. This step was taken as a result of a legal decision in an income-tax case. In the Killing Valley Tea Company case, decided in 1920, the court held that factories were liable to pay tax on the profit derived from the process of manufacture. A new income-tax Act was passed in 1922, and at a meeting held in April in that year between the Chief Commissioner of Income-tax, Government of India, and representatives of tea planters, it was agreed that 25 per cent of the net profits of tea plantations should be assessed to Central income-tax, on the assumption that this percentage represented the element of profit derived from manufacture. The remaining 75 per cent was to be considered as the profit derived from agriculture. The necessary provision was written into the Income-tax Rules to give effect to this arrangement.

There was no argument regarding the fairness of this allocation until 1927, when the Central Board of Revenue, without any warning, notified a new draft Rule 24, which sought to increase the rate from 25 to 40 per cent. Protests were made against this increase but to no effect. On the contrary, when presenting the Central Budget in 1927, the Finance Minister, Sir Basil Blackett, threatened to increase the rate to 50 per cent, while at the same time proposing to abolish the export duty on tea. Luckily for the planters, the increase did not take place, while the abolition of the export duty went through. Throughout this period, the planters argued that even the 25 per cent rate was fixed on an arbitrary basis and there was no justification for increasing it to 40 per cent as had been done by merely amending the rule.

This was the position regarding Central income-tax on tea in 1933, and considering the fact that the rate itself is arbitrary, it is fortunate that the percentage assessable to income-tax has remained the same ever since. But that is not to say that there have been no complications over the actual interpretation of the rule. Numerous difficulties have cropped up from time to time and some of them continue even to this day. There is still no clear-cut decision on what should be the net income assessable to income-tax.

Complications Over Ascertainment of Taxable Income

In 1933, the Income-tax Department raised difficulties on the actual expenses 'admissible' against revenue charges. Officers of the department reversed the practice of allowing expenditure on 'infilling' and 'supplying' of tea, and took the stand that these are in the nature of capital expenditure. The tea industry had regarded, and the department had until then agreed, that any expenditure incurred in maintaining the crop at the level of expected productivity should be treated as revenue expenditure. Expenditure designed to increase production by means of an increase in the area under cultivation was admittedly a capital charge. As there was no regular schedule of depreciation applicable to tea gardens for income-tax purposes, it was stressed that all expenditure incurred in maintaining the property up to its maximum revenue-earning capacity should be a fair revenue charge, since it was in the nature of expenditure incurred for earning the profits.

Arguing on these lines the tea industry represented that the cost of 'infilling' or 'supplying,' that is to say, the actual cost of replacement of tea bushes which have earlier died or passed the age of economic productivity, is an expense of upkeep and maintenance, and should be allowed as such by the Income-tax Department. But, strangely enough, the department seemed to think that the unit of production was the tea bush and not the estate as a whole and it regarded each individual 'infilling' as a capital charge! The department subsequently agreed that the expenditure on 'infilling' and 'supplying' should be treated as a revenue charge, but it would not apply to planting on areas previously abandoned. Meanwhile, the department had made a large collection of tax by its previous incorrect interpretation, but it declined to consider a refund when it was requested by the planters.

While this ruling allowed the full expenditure on 'infilling' and 'supplying' to be charged to revenue account, it still did not fully serve the object in view. There were instances in which whole blocks of tea had to be abandoned, because any amount of 'infilling' and 'supplying' thereon would not bring the area back to a reasonable level of productivity. The purpose of 'infilling' and 'supplying' would have been equally served, if a new block of virgin land of the same extent as the area abandoned were planted up with new plants. This was a common practice in the industry and was known as 'replacement' of abandoned areas. Although it did not involve any increase in the total planted area, the department refused to consider the cost of such 'replacement' as a revenue charge, and even now it insists on treating the expenditure as a capital cost.

The tea industry has frequently represented to the Central Government that suitable provision should be made in the Indian Income-tax Act for allowing certain types of expenditure peculiar to this industry. One such item is depreciation on field assets mentioned earlier. Another item is the expenditure on roads constructed in plantations. These are treated as capital cost, but there is no provision for depreciation. A deduction of 25 per cent or even 30 per cent for depreciation on roads would not be unreasonable. Machinery like rollers used to be allowed on revenue account until about 15 years ago, but this facility has now been withdrawn, and the expenditure is treated as capital. Then, there is the expenditure incurred by tea plantations on the compulsory provision of housing and welfare amenities. No other industry is called upon by law to lay out amenities on such a large scale as the tea plantation industry. Yet the industry's request to consider this expenditure as a revenue cost has not been conceded.

Efforts to Tax Rubber and Coffee

The circumstances justifying the treatment of a portion of the profit earned by tea plantations as liable to income-tax do not exist in the case of coffee and rubber plantations, but from time to time efforts have been made by the taxing authorities to bring some part of the profit earned by coffee and rubber plantations also within the scope of taxation. The process of curing of coffee is nothing more than the process ordinarily employed by a grower to render the produce fit to be taken to the market, and this process falls squarely within the definition of "agricultural income" in Section 2 (1) (*b*) of the Indian Income-tax and hence becomes eligible for exemption under Section 4 (3) (viii) of that Act. Similarly, the process employed in raw rubber to make it saleable also falls within the definition mentioned. The Government of India announced in 1923 that no attempt would be made to assess the profits of coffee and rubber estates to Indian Income-tax so long as the phraseology adopted in Section 2 (1) (b) of the Indian Income-tax Act 1922 was retained. Notwithstanding this clear decision, the Income-tax Department went on asking planters to "give a short description of how rubber (or coffee) is dealt with on the estate," hoping perhaps to trace a small loophole through which the rubber and coffee planters could also be made to pay income-tax on at least a portion of their profits!

Even as late as August 1953, an Income-tax Officer held that the entire income from coffee could not be regarded as agricultural and a portion thereof, which he reckoned at 33⅓ per cent, should be deemed to be non-agricultural as it arose from a manufacturing operation. To planters it seemed inconceivable that an income which had always been regarded as agricultural and exempt from tax should, without any changes in cultivation and processing practices, be regarded as otherwise and taxed. Many Income-tax Officers asked planters to furnish returns for several previous years hoping to assess them retrospectively under Section 34. However, this hope was shattered by the High Court of Mysore, giving a decision in appeal on the 26th November 1957 that no part of the income of coffee growers was liable to Indian income-tax.

But it was not long before the Provincial Governments, in their search for new fields of revenue, seized the opportunity to assess the very incomes which the Central Government had decided to leave alone. As far back as 1937, a suggestion had been made that Provincial Governments who introduced prohibition should make up their loss of excise revenue by levying suitable taxes on alternative articles of consumption like tea and coffee. Towards the end of 1949, the Government of Travancore-Cochin introduced an Agricultural Income-tax Bill, even though prohibition had not been introduced in that State. The entire profit earned by coffee, rubber and cardamom plantations and 60 per cent of the profit earned by tea plantations became liable to this tax. Agricultural income-tax at the rate of four annas in the rupee was proposed for all agricultural companies including plantation companies. Apart from proposing this high rate of tax, the Bill did not allow for rebates and reliefs normally allowed in the computation of income for Indian Income-tax as well as Travancore State Income-tax. In particular, there were no provisions corresponding to those provided under Section 10 of the Indian Income-tax Act, allowing expenditure on the upkeep and maintenance of immature areas, expenditure on replanting, writing off of bad and doubtful debts, additional depreciation on new buildings, expenditure on scientific research, etc. The Bill was, however, passed into Act, with practically none of these items included.

The rubber plantations, 88 per cent of whose area is situated in Travancore-Cochin, were seriously affected by this tax, as the sale price of rubber had been fixed on a cost plus basis, while tea plantations also were hit quite hard. It was pointed out that the levy would greatly retard the work of rehabilitation of the rubber plantations, a matter which at the time had been considered to be extremely urgent.

The Travancore-Cochin Agricultural Income-tax Act was almost immediately followed by agricultural income-tax legislation in Coorg which came into force with effect from the 14th June 1951. The rate of tax for companies was fixed at 4 annas in the rupee.

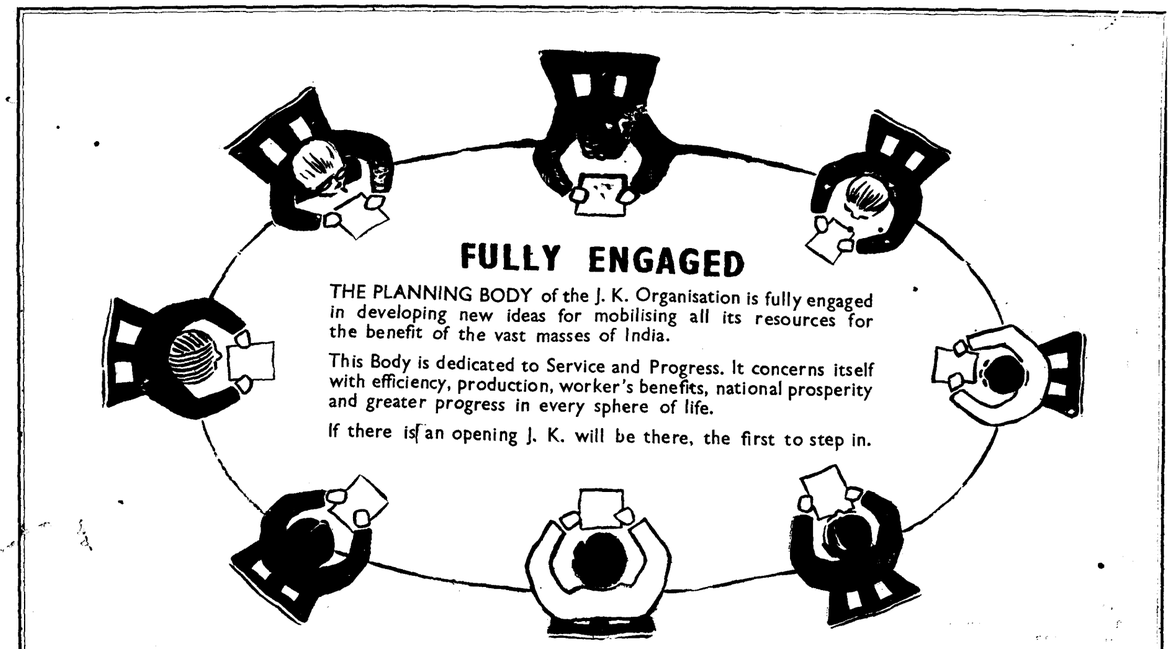
Madras followed next, and the Government introduced a Bill in June 1953. The Act came into force from 1st April 1954. An important difference in this Act was that the levy was to be confined to plantation crops only and not all agricultural crops. Companies were to be assessed at 5½ annas, which, at this time, was also the rate prevailing in Travancore-Cochin.

Mysore came last, in March 1955, with an Agricultural Income-tax Act which, like the Travancore-Cochin Act, applied to plantations as well as other agricultural crops. The rate of tax for companies was 4 annas.

Lack of Co-ordination in Tax Policy

As the years passed, numerous changes were effected both in the structure and the rating of agricultural income-tax in the different States. It would be extremely difficult to narrate them all, or even to dilate upon the more important ones. There was little co-ordination among the States, with the result that disparities were observed in the principle, rating, and method of application of the tax between one State and another. Increased revenue seemed to be the main criterion for the numerous changes proposed and effected, without any co-ordination among the States concerned.

It has been a well-established principle in Indian income-tax that corporate incomes should always be assessed at a flat rate and not on slab rates as in the case of indiv



FULLY ENGAGED

THE PLANNING BODY of the J. K. Organisation is fully engaged in developing new ideas for mobilising all its resources for the benefit of the vast masses of India.

This Body is dedicated to Service and Progress. It concerns itself with efficiency, production, worker's benefits, national prosperity and greater progress in every sphere of life.

If there is an opening J. K. will be there, the first to step in.

duals. This wholesome principle was given the go by in at least two States. For the first time in the history of taxation in India, slab rates of agriculture income-tax were introduced, the effect of which was to penalise the larger companies, though these were not necessarily more profitable than the smaller companies.

It would not be out of place to mention here two instances of the variations in the different State Acts in the method of computation of assessable income, deductions and allowances. In Madras, for example, the expenditure on the maintenance of immature plants has been allowed on revenue account, but not so in Kerala and Mysore. However, a recent Supreme Court decision allows such expenditure in the case of tea plantations. In Mysore a recent amendment disallows the salaries paid to partners in the case of a firm and sitting fees paid to a director in the case of a company, although such expenditure has always been allowed within reasonable limits both under the Indian Income-tax Act and the Agricultural Income-tax Acts of the other States.

Differences of this kind between the tax structure and procedures of the Central and State Governments, on the one hand, and those between the State Governments themselves, on the other, have been causing a great deal of confusion in the plantation industries. Taxation has a direct influence on the growth and development of industries. When the Central Government has assumed responsibility for the control and development of the plantation industries, realising their important role in India's economy, it is upto that Government to ensure that adequate co-ordination exists between the Centre and the States in this regard. Without such essential co-ordination, the sum total of taxation by the Centre and the States could easily become an impossible burden for the plantation industries to carry.

It is, therefore, suggested that, to begin with, corporate agricultural taxation on the plantation industries should be kept at the level of Union income-tax or a little less, and, secondly, that, as between the States themselves, there should be some mutual understanding as regards the actual level of agricultural taxation to be levied from the plantation industries. In the third stage, an effort should be made by the States concerned to achieve some uniformity in the rules and procedures, scales of allowances, refunds, rebates, etc. The present practice of the States competing with one another in raising the rate of agricultural taxation and going their own way with the rules and procedures should be given up.

Disincentive to Investment

It is true that Union income-tax and agricultural income-tax are not particularly directed against the plantation industries only. However, the excessive levy on both these counts has had a twofold impact on these industries. First, it has reduced the ability of these industries to reserve a part of their profits to implement their own development schemes, and, secondly, it has worked as a strong disincentive to new investment in plantations.

As regards conservation of own funds for development, it should be mentioned that the growth of plantation companies over the past 50 years or more has been achieved mainly by re-investment, or ploughing back, a large part of the profits earned in the business. If instead of doing so, the entire profits earned had been distributed in dividends, the plantation industries would have never reached their present level of development. Taxation is now making such deep inroads into plantation earnings that this very important source of development fund is being virtually cut off.

Secondly, plantation investment is rated as risk investment, for not only is the profit dependent upon highly variable factors such as the climate, soil, and pests and diseases, but the investment in new plantings gives no return for a period of seven years or more, that is, until the first crop is harvested and sold. It is worth mentioning that, over the past 15 years, no company has been registered for the opening of tea plantations in India. The time has, therefore, come for a complete rationalisation of the tax system as applied to the plantation industries.

BUSINESS AND GOVERNMENT

(*Concluded from page 156*)

formation of an Economic Council, consisting of representatives of industry, agriculture, trade and transport and other functional sections of society concerned with the economic activity of the nation, to guide, assist and advise the Government in formulating and administering its economic policies.

A Pertinent Quotation

The example of the prosperous countries of the West is available for us to benefit from wherever it is practicable. It would be pertinent to quote *in extenso* from the concluding paragraphs of a speech by the U.S. Ambassador in India, His Excellency Chester Bowles, to the All-India Management Association Seminar held at Calcutta in September 1964. I believe these words are most expressive and sincere.

"All the successful democratic countries have one basic ingredient in common, they have managed to distribute the benefits of modern industrial production equitably through the society without crushing private economic initiative.

"This human initiative, the yeast which makes wealth grow, must be present. Recognition of this fact seems recently to have grown even in the Soviet Union which has announced its intention to study the incentives capitalist countries offer managers and workers alike for increased production.

"The evidence before us suggests one overriding conclusion. The full benefits of modern industrialisation can be achieved most effectively where human beings are free to seek more efficient methods and to initiate, but only when they serve the canons of social justice which is the primary objective of all free people.

"Any Government of a developing nation that discourages and discredits private initiative will fail in its objective of rapid economic growth. Any private business that ignores the rights of its workers, the interests of its customers and the responsibility of its Government for the national welfare will remain a road block to progress.

"Business needs enlightened liberal Government and Government needs enlightened private enterprise—neither can do without the other."

The motto that was given to a leading Women's College in Madras by its first Principal at the Golden Jubilee Celebrations held earlier this year appears to be most appropriate in the context that Business and Government find themselves in today in our country. It is none other than "Common sense and consideration."

Progress Of Warehousing

Storage Capacity Created Substantial

By C. S. RAMACHANDRAN, I.C.S.
Managing Director, Central Warehousing Corporation

WAREHOUSING facilities in developed countries like the United States, Canada, the United Kingdom, Australia, Scandinavia and France are available on a vast scale both for agricultural produce as well as consumers' goods. The warehouses have mostly been set up in these countries in private and co-operative sectors. Most of these warehouses are built in specialised structures, with mechanical devices for handling and preservation operations. The agricultural produce is generally stored in bulk, after pooling the deposits of various depositors who have no objection to the same after evaluation of grade standards. Economically, most of these warehouses are viable units, in view of the large turnover of the deposits.

The warehousing facilities in India were given a concrete shape by linking credit with agricultural marketing in the year 1956, with the enactment of the Agricultural Produce (Development and Warehousing) Corporations Act, 1956, as a result of the recommendations of the All-India Rural Credit Survey Committee, appointed by the Government of India on the suggestion of the Reserve Bank of India. This Act provided for establishment of:

(i) a National Co-operative Development and Warehousing Board;

(ii) a Central Warehousing Corporation; and

(iii) a State Warehousing Corporation in every State except the State of Jammu and Kashmir.

Though the Central Warehousing Corporation was constituted by the Government in March 1957, it actually started functioning in July of that year; the State Warehousing Corporations were organised during the period from July 1957 to August 1958.

The areas of operation have been defined as centres of all-India importance for the Central Warehousing Corporation and those of the State and/or district importance for the State Warehousing Corporations. It has also been envisaged that special problems, such as provision for specialised storage, storage for export purposes and inter-State purposes should be the special concern of the Central Warehousing Corporation.

In the year 1962, the Agricultural Produce (Development and Warehousing) Corporations Act, 1956, was replaced by the National Co-operative Development Corporation Act, 1962, and the Warehousing Corporations Act, 1962. The Warehousing Corporations Act, 1962, came into force on the 18th March 1963, when the Central Warehousing Corporation was formally re-established under this Act.

The functions of the Central Warehousing Corporation and the State Warehousing Corporations remained, by and large, the same under the new Act, but the scope of activities was enlarged by the inclusion of "Notified commodities" (commodities which the Government may declare by a notification in the official *Gazette* by the powers vested in Parliament by virtue of Entry 33 in List III of the Seventh Schedule of the Constitution), such as cement, steel, textiles, leather and rubber goods, coir and coir goods, etc.

Functions

The functions of the Corporation, as provided in the new Act, are: (*a*) acquire and build godowns and warehouses at suitable places in India as it thinks fit; (*b*) run warehouses for storage of agricultural produce, seeds, manures, fertilisers, agricultural implements and notified commodities offered by the individuals, co-operatives and other institutions; (c) arrange facilities for transport of agricultural produce, seeds, manures, fertilisers, agricultural implements and notified commodities; (d) subscribe to the share capital of the State Warehousing Corporations; (*e*) act as agent of the Government for the purposes of purchase, sale, storage and distribution of agricultural produce, seeds, manures, fertilisers, agricultural implements and notified commodities; and (*f*) carry out such other functions as may be prescribed.

Working of Warehouses

The warehouses of the Central and State Warehousing Corporations work under the respective Warehousing Acts passed by the different States. These warehouses are licensed under the provisions of the Act.

A depositor is required to bring his produce to the warehouse for storage. The goods, on receipt, are weighed. A representative sample is taken from the stock for ascertaining the quality and evaluation of grade standard. A sealed sample is given to the depositor and two such sealed samples are kept in the warehouse for comparison with the stocks at any stage. A warehouse receipt, which is a negotiable instrument under the Warehousing Act, is issued to the depositor in token of the goods received in the warehouse for storage. The receipt contains particulars regarding the quantity and quality of the goods tendered for storage together with a certificate of insuring the same.

The warehouse receipt is accepted by the State Bank of India and other scheduled banks, and the goods, though actually stored in the warehouse, can be pledged with the bank on the production of the Warehouse Receipt. The banks advance loans upto 75 per cent of the value of the goods and the interest charged by them is one to one and half per cent less than what is usually charged by them. The grades of the produce mentioned in the warehouse receipt are generally recognised by the trade throughout the country. A depositor can easily sell his goods on the basis of these warehouse receipts whenever the rates are favourable to him. Since the produce is stored in a scientific manner, there is very little deterioration, and as such, these fetch better price than those stored in private godowns.

Some of the important benefits of storing produce in a warehouse are:

(a) elimination of loss from damage and deterioration due to insect pests and moisture;

(b) avoidance of distress sale by pledging the goods with the banks and obtaining advance to meet the immediate requirements;

(c) transferability of ownership of the goods without the actual movement of the produce, the Warehouse Receipt being transferable;

(d) safety through insurance against fire, flood and theft;

(e) easy evolution and adoption of grades and standards for various commodities; and

(f) a better price to the producer and more equated and less erratic price to the consumer, since in flow of goods into the market is regulated.

Storage charges at Central warehouses have been fixed as low as economically possible. The charges vary from commodity to commodity, but, on an average, 18 to 20 paise per standard bag per month is charged for most of the commodities. Storage charges are chargeable in full for the first month and, for subsequent periods, it is payable on 'weekly' basis. The facility of a rebate is allowed to co-operative societies. The depositor can draw part delivery of his deposits according to his needs. Recently, storage charges on a weekly basis have also been introduced to facilitate short-term deposits.

With the overall shortage of foodgrains in the country and the consequent need to import grains year after year, scientific storage by the Central and State Warehousing Corporations has assumed added significance. It is not only necessary to produce the maximum but also to conserve what is produced. A rough estimate places the annual losses of grains during storage at about 5 per cent and, if the Corporations are able to save even half of it, the question of foodgrain shortages can practically be solved. This loss in terms of weight comes to about four million tonnes. Besides foodgrains, considerable loss is caused in the storage of other commodities also. Most of these are very valuable to our national economy; some of these are good foreign-exchange earners. It is of utmost importance that these commodities are stored on scientific lines and saved from deterioration.

Range of Commodities

A wide range of 110 agricultural commodities are stored in warehouses, including notified commodities such as iron and steel, insecticides, fungicides, weedicides, rubber, cement, leather and coir, etc. Another Bill has been introduced in Parliament to further enhance the scope of activities of the Corporations and, when enacted, it will enable them to store commodities like lac, tobacco, wool, etc., requiring specialised storage.

The methods adopted for preservation are those which the F.A.O. and Ford Foundation have testified to be efficacious. Many agriculturists have found that the foodgrains stored in the warehouses fetch higher prices than those kept in their private old-fashioned storehouses, because of efficient preservation.

Generally, agricultural commodities are stored either in bulk or in bags and the types of storage structures vary from region to region depending upon climatic conditions and the nature of commodities.

Setting up of Warehouses

As a rule, warehouses are, in the first instance, set up in hired accommodation with a view to gauging the storage potential of that particular centre and only when it is found to have sufficient potential as to make it a viable unit, own construction is undertaken. It has not so far been possible to accelerate the pace of construction, due to the general scarcity of building materials, difficulties in acquisition of suitable sites, non-availability of scientifically designed warehouses, etc. Despite these handicaps, however, the work of construction of warehouses has progressed side by side with opening of centres in hired accommodation and, by the end of March 1963, the Central Warehousing Corporation owned a constructed capacity of 46,600 tons. By the end of 1963-64, 19 centres were completed, raising the constructed capacity to 92,135 tons and construction at 14 more centres, including a cold storage at Calcutta, was in progress. By 1965-66, the number of constructed warehouses will go up to 36, with a total capacity of 168,900 tons and by the end of the fourth Plan the Central Warehousing Corporation has a target to complete construction at 86 units with a capacity of 368,900 tons.

Different spices pose special problems for storage where great care and skill is required. Spices deteriorate rapidly while in storage, due to development of fungus, if the produce is not dry. These generally require to be stored in separate rooms.

To overcome storage losses, specialised storage structures are being designed on scientific lines for spices like turmeric, etc. The establishment of such structures is being considered for centres like Calicut, Cochin, Alleppey, Quilon, Virudhunagar, Mangalore, Nizamabad and such other places which are centres of spice production/storage. Such structures are already functioning at Sangli and Mangalore.

Training of Technical Staff

The responsibility for proper grading, storage and preservation of these commodities for a sufficiently long time and for their return to the owner in the same quality and quantity, devolves on the field staff manning the warehouses. As such, intensive theoretical and practical training for them is essential. One of the major difficulties confronting the programme of expansion of the warehousing scheme is the paucity of properly trained technical staff. The Central Warehousing Corporation is organising training courses at regular intervals every year, and even sometimes more than one course in a year, for imparting training to the candidates selected by the Central and State Warehousing Corporations. Since its establishment in 1957, the Central Warehousing Corporation has held eleven such training courses and trained 827 candidates. In addition to the regular training courses, conducted on an all-India basis, regional refresher courses are also conducted to keep the field staff well-versed with the latest developments in the fields of their activities. So far, five regional refresher courses have been held. The training courses are primarily conducted for inspection and storage officers, warehousemen and technical assistants-*cum*-graders recruited by the Central and State Warehousing Corporations. However, a limited number of candidates from co-operatives, commercial institutions, trade and private individuals are also accepted. In order to maintain high standards in field work, the candidates admitted to these courses are graduates in Agriculture, Zoology, Chemistry, Commerce or Economics.

Warehousing in a new venture, launched hardly seven years back, and it will necessarily be some time before its impact on the rural economy of a vast country like India can be felt. Beginning with just seven warehouses in 1958, the Central Warehousing Corporation has now 86 warehouses in different parts of the country, while the State Warehousing Corporations have established 525 centres during this period. In terms of storage capacity, the Central Warehousing Corporation started with 7,000 tons which increased to 80,000 tons by the end of the second Five-year Plan and is 250,000 tons now. The deposits by the end of 1963 had increased to 135,000 tons. This is reinforced by another 400,000 tons capacity in the warehouses set up by the 14 State Warehousing Corporations.

The Warehousing Corporations propose to give all possible assistance to the Food Corporation of India in the matter of storage of foodgrains likely to be procured by them, and a plan of expansion of such facilities specifically to meet their requirements is now under active implementation.

What's behind this name?

The activities cover many industries such as coal, fertilizers, jute, mining, mining equipment, packaging, pesticides, shipping, tea and many more. This vast array comes through a family of more than twenty companies which together make the Jardines Group. This integrated force ...this combined skill and know-how gained through nearly a century and a quarter of service represents the best in modern management and industry today.

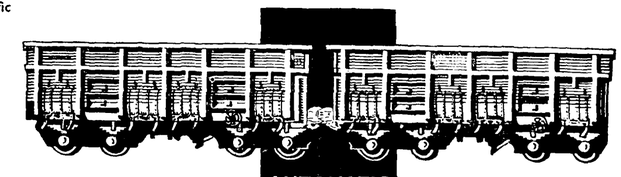
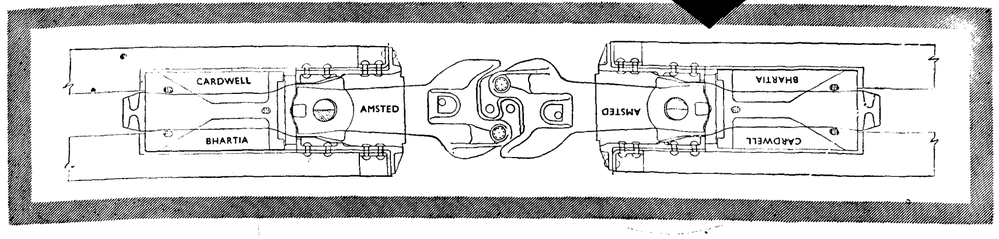
SO MUCH DEPENDING UPON SO LITTLE

Rs. 1,16,000 million—the stupendous budget target for India's Third Plan signifies our great stride towards industrial revolution. A 13% of this total plan outlay i.e. Rs. 15,350 million is the allocation for Indian Railways, and on the Railways depends *so much* of the vital task of carrying 264 million tonnes of goods traffic as envisaged under the Third Plan.

About 20,000 BOX Wagons, at an estimated cost of about Rs. 1,000 million, will have to be made by 1966-67 to facilitate and accelerate the movement of an additional 21 million tonnes a year. BOX Wagons fitted with Buffer Couplers carrying nearly two and half times of ordinary 4-wheeler wagons will not only eliminate the slow and risky manual operations, but also permit speedier movement as much as 60 miles per hour for heavier trains of 6000 tonnes as against that of the present 2000 tonnes.



AUTOMATIC CENTRE BUFFER COUPLER



In terms of money Rs. 50 million worth of such Automatic Centre Buffer Couplers that we are to produce by 1966-67 is really *so little*. But in the perspective of our bigger national stake where the Railways have to bear the brunt of the burden, we feel proud to be a cog in the gigantic wheel of our national uplift.

Small-scale Industries

Assistance Programmes Reviewed

By K. V. VENKATACHALAM

THE growth of modern small-scale industries is one of the most significant aspects of planned economic development in our country during the last decade. The programme of development of modern small industry which was initiated towards the end of the first Five-year Plan yielded results quickly. Our experience has shown that fostering of modern small industry can make a significant contribution to economic decentralisation in our planned development.

A Decade of Growth

An idea of the growth of the small-scale sector during the second and third Five-year Plan periods may be had from the data regarding investment and employment in this sector, presented below:

(In crores of rupees approx.)

Fixed investment	Second Plan	Third Plan*
1. *Institutional/Government sources:*		
(i) State Aid to Industries Act	12.91	17
(ii) State Finance Corporations	7.25	15
(iii) Hire/purchase of machinery	5.69	15
(iv) Industrial Estates	10.22	30
	36.07	80
2. *Private resources of entrepreneurs*	72.14	160
Total	108.21	240

* The figures for the third Five-year Plan period are estimates, based on the actual figures for the first three years and anticipated outlays for the other two years.

The ratio of investment by private entrepreneurs to investment by institutional and Government sources has been very conservatively estimated at 2 : 1. Actually, the ratio is bound to be much higher. A study conducted by the Central Small Industries Organisation in eight industrial estates disclosed that "for every rupee invested by the combined resources of the National Small Industries Corporation and the Government towards fixed capital, the entrepreneurs themselves have invested about 4.8 times from the combined sources of private savings, friends, relatives and moneylenders." Similarly, a study of 250 small-scale industrial units selected at random from all over the country showed that, "in the year 1962, the ratio of institutional investment to private investment was 1:7 (*vide Financing of Small Scale Industries*, published by Central Small Industries Organisation, 1963). The Working Group which prepared programmes for small industries for the third Five-year Plan was of the view that this ratio would be of the order of 4 or 5 : 1 but felt that it would be safe to assume a ratio of 2 : 1, in the absence of data collected on an all-India basis. The same ratio has been adopted here, though, on the basis of the studies mentioned, a much higher ratio is justified.

Employment

Comprehensive data on the number of persons employed in the small-scale sector is not available, since many of the units in this sector are outside the purview of the Factories Act. However, from the *Annual Survey of Industries*, 1960, it is known that there were 36,457 small-scale factories in existence in that year, employing over 13.38 lakh persons (of these 14,629 factories employing over 5.54 lakh persons belong to industry groups which were being specifically encouraged during the last ten years).

A number of studies conducted by different agencies during the last few years have been analysed to estimate the *per capita* fixed investment in this sector. The data examined were those available from (i) The *Annual Survey of Industries* 1960, (ii) the *Ancillary Industries Surveys in Mysore, Kerala and West Bengal*, (iii) the unit-to-unit survey conducted by the Central Small Industries Organisation covering 1,000 units in six different industry groups, (iv) the unit-to-unit surveys conducted in various districts of Uttar Pradesh by Small Industries Service Institute, Kanpur, and (v) the Model Schemes prepared by the Central Small Industries Organisation. From the data available from all these sources, nearly 300 ratios were calculated showing the fixed capital invested per worker in different industries. It was found that the fixed capital investment exceeded Rs. 3 000 in 60 out of the 300 cases. In all other cases, it was less than Rs. 3,000, varying from Rs. 735 to 3,000. If this is any guide, it may be concluded that the fixed investment required to create a job opportunity in the small-scale sector is about Rs. 3,000 during the third Five-year Plan. The Working Group which prepared schemes for the third Plan estimated that the fixed investment per worker at that time was about Rs. 2,583 on the basis of the data available from the *Census of Manufacturing Industries*, 1954. However, to be on the safer side, we might estimate the fixed capital investment per worker at Rs. 3,000 both during the second and third Plan periods. On this basis, the employment opportunities created in the small-scale sector will be as follows:

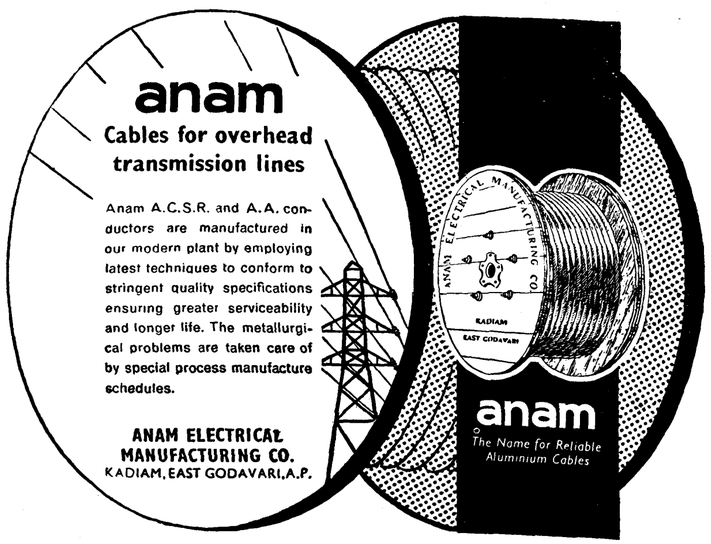
	Second Plan	Third Plan
(i) Total fixed investment (Rs. crores)	108.21	240 approx.
(ii) Employment:		
(i) Job opportunities created (on the basis of Rs. 3,000 per job) (lakhs)	3.6	8
(ii) Supervisory, managerial and other indirect jobs, estimated at 25 per cent. of the above (lakhs)	0.9	2
(iii) Total employment potential created (lakhs)	4.5	10

It should be kept in mind, however, that the employment potential might not have become fully effective due to (1) the inevitable time lag between investment in fixed assets and the actual employment of workers, and (2) the non-availability in adequate quantities of certain kinds of essential scarce raw materials.

Production

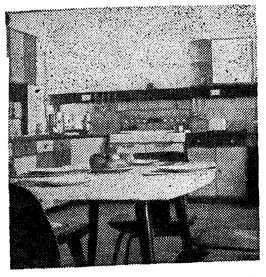
On the basis of the data available from the *Annual Survey of Industries*, 1960, the Ford Foundation International Perspective Planning Team (which visited India in 1962-63) estimated that small-scale factories with a fixed capital of Rs. 211.57 crores accounted for a gross output of Rs. 1,232 crores, thus giving a fixed investment-output ratio of over 1 : 5.5. In the case of industries specifically encouraged under the various assistance programmes, this ratio was of the order of 1 : 4.5. This ratio, however, could be considerably improved, if adequate raw materials are supplied to the sector.

The Assistance Programmes launched by the State and Central Governments have stimulated the growth of the small-scale sector though the initiative and enterprising spirit of the private entrepreneurs have greatly contributed to the growth. The actual

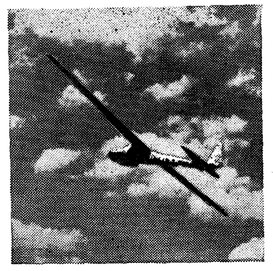


WESTERN INDIA PLYWOODS make the widest range of specialised plywoods and hardboards

y modern industry and architecture demand woods in a variety of specially processed forms: aircrafts demand light yet strong plywoods; engine rooms require fire-proof plywoods; radio cabinets need specially processed plywoods for resonance; building construction and coach building demand oil-tempered superhardboards. WESTERN INDIA PLYWOODS, the largest manufacturer of processed woods in India, make over three thousand varieties and sizes of plywoods and hardboards to meet such industrial, architectural and defence needs of our country. They are marketed under the trade names 'Westindply' for plywoods, and 'Weston' for hardboards. Other products include 'Wipex' paper laminates for tabletops and dining tables, Flushdoors and Block Boards.



Chairs, table tops, panels, shelves, cup boards, flooring—infinite is the scope of 'Westindply, 'Weston' and 'Wipex'.



Special aircraft plywoods engineered to meet the demands of lightness and strength, go into the gliders and other aircrafts built in India.

Specially shaped compressed-wood seats—only Western India Plywoods make them in India—for railway coaches, supplied to the Integral Coach Factory, Perambur.

executive responsibility for the programme rests with the State Governments, the Centre coming in only in an advisory capacity to render industrial extension service. A brief review of the magnitude and directions of assistance during the second and third Plan periods is provided in the following paragraphs.

The State Governments operate various schemes which could broadly be classified as (1) Financial Assistance, (2) Service Schemes, (3) Commercial Schemes, (4) Others, including special assistance to industrial co-operatives, subsidy on supply of power. An analysis of the expenditure on these schemes during the second Plan is presented below:

(Rs. crores)

(1)	*Financial Assistance:* (Loans to entrepreneurs)	12.91
(2)	*Service Schemes:*	
	(i) Training schemes	3.24
	(ii) Demonstration schemes ..	0.56
	(iii) Quality marking schemes ..	0.21
	(iv) Common Facility Centres ..	2.13
	(v) Other service schemes	0.93
(3)	*Commercial Schemes*	5.97
(4)	*Others*	0.73
(5)	*Strengthening of administration* ..	2.92
	Total ..	29.60

The expenditure on the States' side on small-scale industries during the third Plan is likely to be about Rs. 60 crores, though the actual expenditure during the first three years was of the order of Rs. 24 crores only. Details on the lines presented above are not yet available for all the States, but it has been observed from the available data that the pattern of expenditure over various types of schemes is more or less the same as in the second Plan.

A Review of States' Schemes

Loans under the State Aid to Industries Act (Block Loans) which account for over 40 per cent of the total outlay on small-scale industries is an item of long-term financial assistance and adds directly to employment potential. Some States like the Punjab, Rajasthan, Orissa, Madhya Pradesh, Kerala, Bombay and Bihar devoted over 50 per cent of their outlay on small-scale industries towards these loans, while other States, notably West Bengal and Madras earmarked less than 20 per cent of their outlays for this purpose, in the second Plan.

Training schemes intended to upgrade the technical skills of workers in small industrial units have been taken up uniformly in all the States and account for over 10 per cent of the expenditure on small-scale industries. However, outlay on quality marking schemes to test and certify the quality of small industry products have not received the priority they deserve.

Common Facility Centres, through which the services of technicians and costly machinery which small industrialists could not otherwise afford are made available, have been taken up by all States. However, Madras has made notable progress in this regard, investing in these units as much as Rs. 1.8 crore out of Rs. 5.7 crores outlay on small industries programme in the second Plan.

A review of the pattern of expenditure on different types of the schemes during the second and third Plan periods in the different States disclosed that even amongst the advanced States the pattern varies. While the Punjab emphasised on loans to small entrepreneurs, Madras laid stress on Common Facility Centres.

The Central Government is conducting the Industrial Extension Service through the Central Small Industries Organisation with its network of 21 Small Industries Service Institutes and 64 Extension Centres. This service, as is well known, includes various aspects of small industry development like advice on industrial possibilities, technical advice, industrial design, training, surveys, economic information, marketing information, demonstration, publicity, etc., throughout the country. This service is operated at a cost of about Rs. 1.5 crore per annum on an average during the last few years.

The various other forms of assistance available to small industries are: (1) credit assistance, (2) accommodation in Industrial Estates, (3) participation in Government's store purchase programme, (4) development of ancillaries, and (5) hire-purchase of machinery.

Credit Assistance

Besides loans under the State Aid to Industries Act mentioned above, assistance is available from the State Finance Corporations for long-term capital. Working capital is ordinarily provided by the State Bank of India and other commercial banks. The Reserve Bank is operating a credit Guarantee Scheme on behalf of the Government of India. The loans advanced by the State Bank and its subsidiaries to small-scale units for working capital are of the order of Rs. 34.5 crores (September 1964), while the amount lent by other commercial banks was about Rs. 31 crores (June 1963).

Industrial Estates

This scheme which is intended to provide readymade factory accommodation with all amenities has made rapid progress during the second Plan period. An amount of Rs. 11.2 crores was spent during that period and a provision of Rs. 30.2 crores was made for the third Plan. So far (March 1964), over 325 industrial estates have been planned. Of these, 111 have been completed and are actually functioning.

A review of the working of the industrial estates disclosed that those located in metropolitan and urban areas quickly attracted entrepreneurs, while the facilities in these estates in semi-urban and rural areas have been utilised much more haltingly. To make the industrial estate an effective instrument of spatial decentralisation of small industries, more careful and intensive planning seems necessary. Location of industrial estates will have to be based on an assessment of growth potential at the perspective points and it should be made sure that the basic infrastructure (such as power, water, transport, etc.,) facilities are available or will be made available quickly.

The group of industries to be located in an industrial estate should be carefully planned so as to provide for inter-firm transactions, essential services, utilisation of local raw material, etc.

Government Stores Purchase

The National Small Industries Corporation, in co-operation with the D.G.S. and D., is operating a programme to ensure adequate participation by small industries in the Government Stores Purchase Programme. According to this programme, 70 items are reserved for exclusive procurement from small-scale industries and in the case of a number of other items small industries can compete with other suppliers. Nearly 13,500 small-scale units are now participating in this programme. The actual supplies to the D.G.S. and D. under this programme have been doubling every year during the last four years, the amount supplied during 1963 being over Rs. 34 crores.

The fixed capital limit of Rs. 5 lakhs applicable to small-scale units has been raised to Rs. 10 lakhs in the case of ancillary units supplying components/sub-assemblies to large-scale industrial units in certain industry groups. These units will be eligible for the following other assistance:

(a) Technical Assistance.
(b) Supply of machinery under Hire-purchase Scheme, and
(c) Allotment of accommodation in Industrial Estates.

While Government can provide assistance for development of ancillaries, the actual progress will depend on the industrialists—large-scale and small-scale—themselves. Chambers of commerce and other associations of industrialists should take a lead in fostering ancillary relationship between large and small-scale units.

Hire-purchase of Machinery

The National Small Industries Corporation is also operating a scheme for the supply of machinery on hire-purchase basis to small industrialists. Under this scheme both indigenous and imported machinery are supplied against the deposit of an earnest money of 20 per cent of the cost of the machines, the balance being payable in instalments over a period of seven years, the rate of interest being 6 per cent. So far, machines worth over Rs. 19 crores have been supplied under this scheme.

The Future

A few words may now be said about the place of the small-scale sector in the forthcoming fourth Plan. There are now over 57,000 small-scale units in the country. Our experience has shown that the units in the small-scale sector can effectively compete with those in the large-scale sector in terms of quality and price, provided they are given equal access to facilities like raw materials, finance, etc. However, it has been found that the bulk of the units are unable to utilise their production capacities fully due to non-availability of what are called "scarce raw materials." Any programme for the future should necessarily take into account the need for consolidation of existing units, so that they might work more economically and provide more employment.

The production of steel within the country is rapidly increasing. At the same time, a variety of basic industrial raw materials like caustic soda, P.V.C., etc., which were being previously imported are now manufactured more and more within the country. As the supplies of these increase, the scope for small industries would further increase. This will provide a continuously increasing opportunity for small-scale industries to develop.

While new small-scale units based on non-scarce, indigenous raw materials can be established freely as now, those based on scarce and imported raw materials may have to be screened and directed into selected, priority industries to ensure that maximum advantage is derived from scarce resources. It must, however, be emphasised that the small-scale sector should continue to grow hand in hand with the large-scale sector.

In order to achieve the objective of decentralised development, it will be necessary to develop this sector much quicker, so that, during the next decade, the small-scale sector will contribute about 50 to 60 per cent of the total industrial production in the country. It may be hoped that, by that time small industries will play as important a role in our economy as those in other advanced countries like Japan and the United States.

Automobile Industry

Critics Ignore All Proved Facts

By C. RAMASUBBAN
EX-CHAIRMAN, TARIFF COMMISSION

AMONG the industries which have received tariff protection and developmental assistance during the last two decades, quite a large number have flourished and have been firmly established in our country. To mention only a few, we may cite aluminium, artificial silk, bicycles, caustic soda, soda ash, cement, cotton textile machinery, sheet glass, grinding wheels, iron and steel, machine tools, batteries, paper, plastics, sewing machines, sugar, automobile ancillaries, rubber tyres and tubes, electric conductors and transformers. In strange and melancholy contrast to these, we have the case of automobile manufacture, particularly of passenger cars, which has faced one misfortune after another since 1953, and, besides being the most reviled of our industries, has also been the victim of a most amorphous policy of control and development on the part of the Government.

There are three important reports no automobile manufacture, namely, (i) the Tariff Commission's Report of 25th April 1953 supported by a Technical Report by V. R. Worwig, referred to later in this article as T.C.R. 1953 (ii) the Tariff Commission's Report of 6th October 1956 referred to later as T.C.R. 1956, and (iii) the *Ad-Hoc* Committee's Report—the L.K. Jha Committee—of 25th January 1960, referred to later as J.C.R. 1960. None of these reports seem to carry much weight either with the Government or with the public, although all the recommendations and conclusions in the reports, especially those relating to the general principles of development of the industry, were accepted by the Government at the time of their release. The only possible explanation that I can think of for the continuing misfortune of the industry and the loss of status of these reports is that the days on which these reports were written and signed were, perhaps, wholly inauspicious and that the planets that ruled on those days were malefic to the industry!

Public Reaction

Representatives of the people in Parliament, Government spokesmen, members of the public and newspapers have, since the commencement of 1964, expressed various views. Summed up, these views are: (*a*) prices of cars are unreasonably high and should come down; (*b*) production is totally inadequate to meet demand; (*c*) there are too many units in manufacture in relation to the smallness of the demand; (*d*) no solution can be found by permitting expansion of all the three existing units; (*e*) one method of rationalisation would be to bring about their integration into one common unit to produce one, or perhaps two, makes of cars; and (*f*) the feasibility of Government setting up a new unit for the production of an *economy* car, with, if possible, the collaboration of an existing manufacturer, requires to be examined.

All these views have been discussed widely, with passenger car manufacturers standing with their backs to the wall, trying to justify their performances and prices and their very existence, while economic journalists and newspaper commentators have been spelling out the whys and why nots of integration, rationalisation, standardisation, and price reduction, and Government spokesmen loftily calling for maximisation of indigenous content alongside slashing of prices.

In the midst of all these bright and interesting happenings there appeared a news item in leading newspapers in the country that the Chief Minister of Maharashtra had discovered a private automobile manufacturer in his State who had assembled a small car *without importing any component from outside*, a cent per cent indigenously manufactured vehicle, which could be sold for Rs. 4,000 to Rs. 5,000. If "it could be sold" for Rs. 4/5,000, it means that the price includes profit to the manufacturer, dealers' commission, sales tax, excise duty and the like. I mention this only because it has emanated from a high source, but refrain from making any comments for obvious reasons.

Reasons for High Cost

It is an admitted fact that prices of cars are high but they are so due to factors beyond the control of manufacturers. First, it is a proved fact that every item of increase in indigenous content increases the cost of the car and this factor has been firmly stressed in T.C.R. 1956 as the inevitable price we have to pay for maximisation of indigenous manufacture. Secondly, the one major element in the price structure of cars which has to be taken note of is the amount that is made up of taxes and duties. From the figures publicised by two of the manufacturers, Premier Automobiles Ltd., and Standard Motor Products of India Ltd., it is seen that the tax and duty element in the price of a Fiat car (Rs. 12,871 in Maharashtra) is Rs. 5,111, while the corresponding figure for a Standard Herald car (Rs. 13,217 in Madras) is Rs. 5,174. The Jha Committee has asserted that it is in many ways natural and inevitable that, when the Government does need higher revenues, the class of people who can afford to own cars should have to bear a relatively high proportion of the tax burden. It follows, therefore, that the tax and duty element at current levels is justifiable and inevitable. How then could car manufacturers be blamed for the price which they charge? If it is the view that they should be able to absorb the major portion of the tax element themselves, without passing it on to consumers, I can only quote the opinions of the Tariff Commission (T.C.R. 1956) and the Jha Committee (J.C.R. 1960) that none of the units in the automobile industry have been making profits adequate for payment of more than moderate returns to their shareholders. Indeed, the frequent cost investigations that have taken place have proved that the profits made by manufacturers on the sale of each car is thoroughly inadequate to provide for the scale of plough-back or amortisation that is considered necessary for the industry.

There are certain basic factors which militate against reduction in prices. The cost of raw materials in India is very high as compared with that prevailing in Europe, special steels require to be imported, and productivity per worker is also comparatively low. The degree of automation in automobile factories in India stands no comparison with what prevails in Europe or U.S.A. Capital equipment with Indian machine tools cost roughly twice as much as in the U.K. or Germany. To give a few illustrations, a radial drilling machine costs about Rs. 34,800 in India, as against Rs. 13,000 in the U.K. An internal grinder costs Rs. 1.2 lakh in India, as against Rs. 44,500 in the U.K., and a bar capstan costs Rs. 48,000 in India, as against Rs. 26,000 in the U.K. Components cost much more in India than in the U.K. or Germany, and are taxed not only as components but once over again after assembly. To give only one example. The Standard Car in the U.K. is fitted with tyres which cost the consumer only Rs. 196 in which the purchase tax element is only Rs. 34. In India, the same type of car is fitted with tyres which cost the manufacturer Rs. 443 (in which the excise duty is Rs. 154.80) but, again, after being fitted to the car, a levy of excise duty of Rs. 58 and sales tax of Rs. 44 is made, so that the final price to the consumer becomes Rs. 545. There are a large number of ancillary manufacturers who supply components to car producers, but they also suffer from similar disabilities which militate against price reduction of components and do not have a volume of production large enough for any elbow room. A combination of factors comprising high duties, low volume, low productivity and high cost of materials results in a feeling of helplessness and inevitability as far as manufacturing costs are concerned.

Production Inadequate

Production of passenger cars is, indeed, totally inadequate to meet demand, but it is unfair to blame manufacturers for this. Apart from the fact that they have had no affluence during all the past ten years to built up internal resources, the most important reason is that expansion has not been encouraged as it involves foreign exchange in which our resources are very low. Further, over the last few years, passenger car production has been accorded a low priority in the country's planning. This factor is not being adequately borne in mind. On the other hand, efforts are being made to toss the ball in the manufacturers' court by suggesting that there are too many units in manufacture in relation to the smallness of the dmand. that no solution can be found by permitting expansion in all the three existing units and that they should integrate or give room for a new unit to produce an *economy* car.

All these suggestions amount to abrogation of all prior commitments and should be wholly deprecated as being grossly unfair to enterprises which have come up as a result of Government-approved planned development and in which a large measure of private middle-class investment has taken place. I would herein emphasise (quoting from T.C.R. 1956) that each approved project in the automobile industry is part of an overall plan which requires to be successfully implemented, and the grant of Government approval to any project should carry the implied assurance that no difficulties will arise, as result of Government policies themselves, in the way of its successful implementation. The development of automobile industry should not be allowed to follow the law of the survival of the fittest, but should be so planned as to avoid difficulties in the way of the smooth implementation of the projects already approved.

Government Too Responsible

It should be remembered that, in 1953 and for some years thereafter, industrial projects were sanctioned by Government not strictly nor solely in relation to the demand, but also with a view to avoiding monopoly; they were also sanctioned on regional considerations. Thus, the existence of three units in the manufacture of passenger cars is not a mere accident, but the result of Governmental planning and approval. The three units established in three of the major cities in the country were expected to develop manufacturing complexes in their respective regions with diverse ancillary units for production of components, and this expectation has been fulfilled. They were also expected to solve the problem of freight on the avoidable movement of new cars over large distances. Purchasers consider the freight element as a deterrent to buying cars manufactured outside their own area of domicile. To wake up to the fact (after eleven years) of there being too many units in relation to the total demand for cars is to admit bad planning. which in itself may be an honest admission of error, but when coupled with the implied admission of despair and drive to destruction, amounts to a complete lack of faith in human ingenuity which is capable of evolving some solution to save the situation.

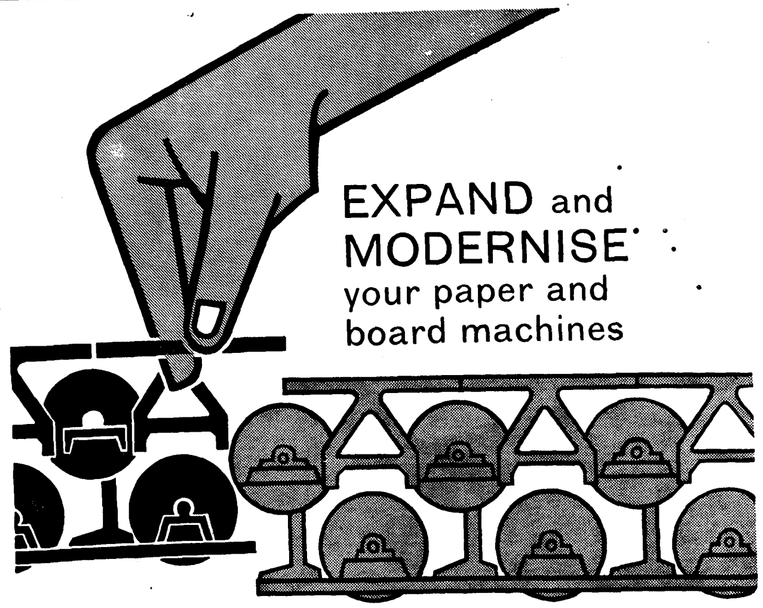
Integration

The suggestion regarding integration can be easily dismissed i it is recognised that each ca which is now being manufacture has its own standard specification in regard to engine, transmission front and rear axles, frames, etc and each manufacturer has tool and jigs only for his own manufacture. No unit can find an merit in any form of integration as each produces a distinctive make of car entirely different from the others, and has also to fulfil obligations to its foreign collaborators. The large measure of misunderstanding that exists in this regard is apparently due to reports of financial amalgamations and standardisation that have taken place in foreign countries, but such amalgamations are totally different from manufacturing integration.

Economy Car

The present rated capacity of the three car manufacturers in India is, I believe, 25,000. The production in 1963 was reported to be 15,900. The demand stands unabated but cannot be accurately assessed, as much of it is a natural reaction to declared scarcity and delivery time. To think of starting another unit for the manufacture of an *economy* car (almost a contradiction in terms) is thoroughly inconsistent with the sound principle that projects in existence with planned approval must be protected and assisted by every civilised community which has any solicitude for middle class investors. Further, the success of a new venture for the production of an *economy* car cannot be assured, if the deterients to prosperity which envelop the three existing manufacturers are not wholly eradicated. The new venture cannot be expected to fare any better.

The provision of an *economy* car to the people of India, in the present stage of the country's overall economy, cannot fulfil any conceivable *social purpose*; there are far greater ills affecting the lives and fortunes of our people than the absence of cheap passenger cars. This factor is all the more important, if it is realised that the establishment of a new unit can only result in disaster to the existing units. misdirection of existing scarce resources, and a negation of all previous commitments to the concerned manufacturers and their shareholders.



EXPAND and MODERNISE your paper and board machines

You can increase the output of your existing paper and board machines to an appreciable degree on a very modest capital. Lengthening of wire parts, modernising of press parts, extension of the Dryer Section and new Mechanical Drive — all this will lead to a lowering of maintenance costs and to a higher output.

We submit our recommendations for your projects and also engineer and supply complete projects. Working to the design and rigid specifications of Messrs. James Bertram and Son Ltd., Edinburgh, we assure you of our prompt and efficient action regarding your jobs and enquiries.

Automobile Industry

Critics Ignore All Proved Facts

By C. RAMASUBBAN
EX-CHAIRMAN, TARIFF COMMISSION

AMONG the industries which have received tariff protection and developmental assistance during the last two decades, quite a large number have flourished and have been firmly established in our country. To mention only a few, we may cite aluminium, artificial silk, bicycles, caustic soda, soda ash, cement, cotton textile machinery, sheet glass, grinding wheels, iron and steel, machine tools, batteries, paper, plastics, sewing machines, sugar, automobile ancillaries, rubber tyres and tubes, electric conductors and transformers. In strange and melancholy contrast to these, we have the case of automobile manufacture, particularly of passenger cars, which has faced one misfortune after another since 1953, and, besides being the most reviled of our industries, has also been the victim of a most amorphous policy of control and development on the part of the Government.

There are three important reports on automobile manufacture, namely, (i) the Tariff Commission's Report of 25th April 1953 supported by a Technical Report by V. R. Worwig, referred to later in this article as T.C.R. 1953 (ii) the Tariff Commission's Report of 6th October 1956 referred to later as T.C.R. 1956, and (iii) the *Ad-Hoc* Committee's Report—the L.K. Jha Committee—of 25th January 1960, referred to later as J.C.R. 1960. None of these reports seem to carry much weight either with the Government or with the public, although all the recommendations and conclusions in the reports, especially those relating to the general principles of development of the industry, were accepted by the Government at the time of their release. The only possible explanation that I can think of for the continuing misfortune of the industry and the loss of status of these reports is that the days on which these reports were written and signed were, perhaps, wholly inauspicious and that the planets that ruled on those days were malefic to the industry!

Public Reaction

Representatives of the people in Parliament, Government spokesmen, members of the public and newspapers have, since the commencement of 1964, expressed various views. Summed up, these views are: (*a*) prices of cars are unreasonably high and should come down: (*b*) production is totally inadequate to meet demand; (*c*) there are too many units in manufacture in relation to the smallness of the demand; (*d*) no solution can be found by permitting expansion of all the three existing units; (*e*) one method of rationalisation would be to bring about their integration into one common unit to produce one, or perhaps two, makes of cars; and (*f*) the feasibility of Government setting up a new unit for the production of an *economy* car, with, if possible, the collaboration of an existing manufacturer, requires to be examined.

All these views have been discussed widely, with passenger car manufacturers standing with their backs to the wall, trying to justify their performances and prices and their very existence, while economic journalists and newspaper commentators have been spelling out the whys and why nots of integration, rationalisation, standardisation, and price reduction, and Government spokesmen loftily calling for maximisation of indigenous content alongside slashing of prices.

In the midst of all these bright and interesting happenings there appeared a news item in leading newspapers in the country that the Chief Minister of Maharashtra had discovered a private automobile manufacturer in his State who had assembled a small car *without importing any component from outside*, a cent per cent indigenously manufactured vehicle, which could be sold for Rs. 4,000 to Rs. 5,000. If "it could be sold" for Rs. 4/5,000, it means that the price includes profit to the manufacturer, dealers' commission, sales tax, excise duty and the like. I mention this only because it has emanated from a high source, but refrain from making any comments for obvious reasons.

Reasons for High Cost

It is an admitted fact that prices of cars are high but they are so due to factors beyond the control of manufacturers. First, it is a proved fact that every item of increase in indigenous content increases the cost of the car and this factor has been firmly stressed in T.C.R. 1956 as the inevitable price we have to pay for maximisation of indigenous manufacture. Secondly, the one major element in the price structure of cars which has to be taken note of is the amount that is made up of taxes and duties. From the figures publicised by two of the manufacturers, Premier Automobiles Ltd., and Standard Motor Products of India Ltd., it is seen that the tax and duty element in the price of a Fiat car (Rs. 12,871 in Maharashtra) is Rs. 5,111, while the corresponding figure for a Standard Herald car (Rs. 13,217 in Madras) is Rs. 5,174. The Jha Committee has asserted that it is in many ways natural and inevitable that, when the Government does need higher revenues, the class of people who can afford to own cars should have to bear a relatively high proportion of the tax burden. It follows, therefore, that the tax and duty element at current levels is justifiable and inevitable. How then could car manufacturers be blamed for the price which they charge? If it is the view that they should be able to absorb the major portion of the tax element themselves, without passing it on to consumers, I can only quote the opinions of the Tariff Commission (T.C.R. 1956) and the Jha Committee (J.C.R. 1960) that none of the units in the automobile industry have been making profits adequate for payment of more than moderate returns to their shareholders. Indeed, the frequent cost investigations that have taken place have proved that the profits made by manufacturers on the sale of each car is thoroughly inadequate to provide for the scale of plough-back or amortisation that is considered necessary for the industry.

There are certain basic factors which militate against reduction in prices. The cost of raw materials in India is very high as compared with that prevailing in Europe, special steels require to be imported, and productivity per worker is also comparatively low. The degree of automation in automobile factories in India stands no comparison with what prevails in Europe or U.S.A. Capital equipment with Indian machine tools cost roughly twice as much as in the U.K. or Germany. To give a few illustrations, a radial drilling machine costs about Rs. 34,800 in India, as against Rs. 13,000 in the U.K. An internal grinder costs Rs. 1.2 lakh in India, as against Rs. 44,500 in the U.K., and a bar capstan costs Rs. 48,000 in India, as against Rs. 26,000 in the U.K. Components cost much more in India than in the U.K. or Germany, and are taxed not only as components but once over again after assembly. To give only one example. The Standard Car in the U.K. is fitted with tyres which cost the consumer only Rs. 196 in which the purchase tax element is only Rs. 34. In India, the same type of car is fitted with tyres which cost the manufacturer Rs. 443 (in which the excise duty is Rs. 154.80) but, again, after being fitted to the car, a levy of excise duty of Rs. 58 and sales tax of Rs. 44 is made, so that the final price to the consumer becomes Rs. 545. There are a large number of ancillary manufacturers who supply components to car producers, but they also suffer from similar disabilities which militate against price reduction of components and do not have a volume of production large enough for any elbow room. A combination of factors comprising high duties, low volume, low productivity and high cost of materials results in a feeling of helplessness and inevitability as far as manufacturing costs are concerned.

Production Inadequate

Production of passenger cars is, indeed, totally inadequate to meet demand, but it is unfair to blame manufacturers for this. Apart from the fact that they have had no affluence during all the past ten years to built up internal resources, the most important reason is that expansion has not been encouraged as it involves foreign exchange in which our resources are very low. Further, over the last few years, passenger car production has been accorded a low priority in the country's planning. This factor is not being adequately borne in mind. On the other hand, efforts are being made to toss the ball in the manufacturers' court by suggesting that there are too many units in manufacture in relation to the smallness of the dmand. that no solution can be found by permitting expansion in all the three existing units and that they should integrate or give room for a new unit to produce an *economy* car.

All these suggestions amount to abrogation of all prior commitments and should be wholly deprecated as being grossly unfair to enterprises which have come up as a result of Government-approved planned development and in which a large measure of private middle-class investment has taken place. TREND OF WORLD COMMODITY PRICES

Soft Spots Seen Likely In 1965

By A Special Correspondent

LONDON, *30th November*

AFTER a year in which the recovery and advance of 1963 was generally consolidated and further expanded, the booming world commodities trade seems likely to develop some soft spots during 1965.

Voicing this fear, the London food and raw materials markets remain confident, however, that the general level of high prices ruling over the past nine months will be held. But there is also a feeling that the agricultural sector in particular will be prone to levelling or declining price trends. A tightening of credit—reflecting the current trend of rising interest rates in some countries—is seen as making life harder for primary producers and commodity traders alike.

Some price levelling may have already got under way, as in the case of sugar, cocoa, coffee, or rubber. Unfavourable factors for all these have been a slowing down in the growth of demand against generally increased supply.

Nevertheless, there is thought to be little likelihood that the low values of before 1963 will again be general throughout the commodities trade next year.

More Agreements Likely

But 1965 is also expected to see a greater role played by various international schemes to stabilise commodity prices in certain fields. Such agreements, often including both producer and consumer countries as signatories, are already in operation for coffee, sugar, wheat, and, more recently, cocoa. Stabilisation efforts imposed by commercial producers are also functioning in some of the metals.

In addition, such groups as wool producers and others are becoming increasingly active in promoting greater consumption of their output, through research into new and better applications and vigorous publicity campaigns in consumer markets.

All these influences are expected to make a greater impact on the world commodity trade next year than they have had a chance to do so far. This, it is felt, is because the producers have now had virtually two years of buoyant trading conditions, in comparison with the slump in commodities of 1960-62, against which to base in strength further output and/or export-limiting programmes needed to iron out the severe price fluctuations which upset market stability.

Demand Likely to be Sustained

Meanwhile, the fundamentally optimistic outlook for commodities in 1965, as generally implied in London, New York, and other major marketing centres, is based on the belief that the present buoyant world economic climate will persist in the long-term. Barring unforeseen developments and temporary reversals, industry and business in the more advanced countries are expected to continue at their current brisk levels.

This will sustain demand for commodities and keep values for the most part at their current good levels. Where supplies remain short, through weather, political or labour factors limiting output, prices for the materials concerned will, as in the past 18 months or more, rule at high levels.

Only the threat of substitution of a costly commodity with cheaper alternative media can foreseeably keep values for some booming materials from climbing to exceptional heights. But even here substitution is often forestalled by the great expense of converting industrial plant so that the alternative material can be employed.

This has been an important factor in the price behaviour of such booming commodities as aluminium, tin or copper where a cheaper metal or plastic, for example, might often be preferred. Similarly, items like sisal for agricultural binder or baler twine and mica, the transparent mineral for electrical appliance and other uses, might, in the long-term, be capable of pricing themselves out of markets in favour of synthetics which can do the job as well, and at costs below the natural commodity's prevailing price.

But these and some others are in the early stages of substitution and the man-made alternatives are still costly.

Broadly speaking, most of the major commodities traded on London have advanced substantially in price beyond year-ago levels. Based on London spot prices for the end of November, this is true of the base metals, which have hit record post-Korean War levels, most grains and fibres, edible oils and oilseeds, and spices. But there have been notable exceptions, some of which admittedly may be only temporary.

Australian and English wheats, cocoa, coffee, sisal, sugar, teas, and wooltops finished November at cash prices lower than their year-ago levels.

Among sectors responding most strongly to demand pressures have been the metals, especially tin and copper. Others, notably platinum, mercury and tungsten reflect to various extents the virtual absence during 1964 of former supplies, sometimes large, from the Communist countries. These are believed to have been withheld partly because of their need in the further industrial expansion of the Soviet Union and its allies and China, but also probably because the East bloc producers have in several cases waited in the hope of profiting from the Western price booms.

The risk of Communist supplies of, say, silver, tin, platinum or tungsten ores, returning suddenly to world markets is a potentially important factor in the outlook for these materials.

Indicative of the upward price movements seen this year on the London commodity markets are the following examples of gains in spot values per ton, unless otherwise noted, between 28th November 1963 and the same date in 1964:

Antimony rose by £39 net; copper wirebars by £262 10s. net; lead £69 12s.; mercury (per 76 lbs. flask) £68; tin £489 10s.; tungsten ore £3 17s.; black pepper, per lb. 3½d. groundnut oil £43; linseed oil £10; soyabean oil £33 10s.; copra 8 dollars; jute £26.

Copper

These gains over the past year show the biggest cash price advances for copper and tin, both of which have been in great demand while at the same time their supply has been statistically tight. Copper production has suffered this year from a series of setbacks in the main production centres due to labour unrest at the mines or in directly related activities affecting supply. These account for about 100,000 tons of production lost to consumers, which cannot be made up.

Besides mining site strikes in Chile, the United States and the Rhodesian copper belt this year, there was also a Central African railway strike which for a time held up shipments of metal.

Roughly half the annual world consumption of copper at 5 million tons still goes into electrical goods. But the ground lost to the producers eight years ago when high prices provoked a swing to steel-cored aluminium power cables has never been regained. Another blow to future copper usage may prove to be an announcement in the United States by the General Electric Company in October this year that it had evolved an electricity-conducting plastic.

Tin

Tin is another case of prices spiralling upwards on a scarcity of supplies, due in part to political unrest in the Far East, the main producer area, output lost to labour difficulties in Nigeria and Bolivia, and the drying up since 1961 of large supplies from Communist China. As a result, cash tin briefly hit an all-time record of £1,715 per ton earlier this year.

By the last half of November, however, a delayed reaction to American intentions of releasing an extra 12,000 tons of supply stockpile tin in their disposal year to next March brought about a sharp price decline. This also shook out, it was suspected, a large speculative element in values and confirmed some long-term forecasts that tin next year might return to lower, preboom (but not slump) levels.

Nevertheless, the world tin deficit for 1964 still looks like working out at around 25,000 tons. In spite of this prospect, tin producers are not so anxious over substitution threats, because prices, by early this month already back down near the £1,400-per-ton mark, are not a major factor in determining the price of tinplate, the main outlet.

But tinplate used in canning is facing keen competition from aluminium, glass and plastics. This contingency and the possibility of sudden revival of the Chinese supplies, which once accounted for a net supply to the West of 17,000 tons a year, are bearish points in tin's longer-term outlook.

Lead and Zinc

Lead and zinc were slower to join in the year's metal boom. But the high points they reached have lately been modified by reaction and profit-taking. Moreover, zinc price behaviour is limited by the possibilities of replacement in die-casting with aluminium, and lead, often subject to weakening from periodic "invasions" by scrap supplies, might face plastics substitution, structually, in batteries, its largest single application. Already plastics are making some inroads into lead usage in cable sheathing.

Agricultural Commodities

On the agricultural side, there has lately been concern for wool values, which have declined on buyers' anticipation that this season's world wool clip will be a record. Output *plus* carryover is forecast as providing supplies which will exceed 1963-64's by more than 100 million lbs. 28th November Bradford spot prices for wooltops were at only 112 pence per lb., against year-ago levels of 132 pence. But the larger turnover should offset the lower prices which in turn are likely to encourage consumption. This is the view of several analysts, including experts in the United States Department of Agriculture.

While the wool industry implements its new propaganda drive to increase consumption, the Alliance of Cocoa Producers—Ghana, Nigeria, Ivory Coast, Togo, and Brazil—has been meeting to further perfect a quota system for withholding portions of output from world markets in order to strengthen prices.

These, on a spot basis, have fallen from a year-ago level of 205*s.* per ton to only 181*s.* 3*d.* at the end of last month. Besides the quota idea, the producers have also considered possible destruction of older stocks, although no firm intentions in this regard have yet emerged.

Coffee also suffers from oversupply, but through East African overproduction of the Robusta types (mainly used for instant coffee manufacture) rather than Brazilian output which has recently been rationalised. London shipment prices early this month have been about 37*s.* per cwt. below year-ago level, although grinders, content so far to watch for further possible declines, should begin stock replenishment in the New Year.

Sugar prices, at present lower than they were in January 1963, at the start of the commodity's recent boom, are not expected to rise much above the £29 15*s.* per ton obtaining at the end of last month. The recovery of the European beet crop, in contrast to that damaged in the severe winter of 1962-63, and non-repetition of the 1962 hurricane damage to the Cuban and other Caribbean cane crops have produced supplies exceeding demand. This demand, moreover, appears to have been slowing down in growth rate over recent years.

Cuban standing cane ready for harvesting is believed to be equivalent to a crop of some 5 million tons, against an estimated 3.8 million tons last season. But mounting labour and transport difficulties again make harvesting of the whole crop doubtful.

In the longer term, dealers foresee the commodity once again ruling at the present lower but more realistic price levels.

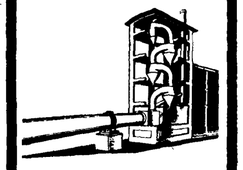
PLANNING IN AN EMERGENT COUNTRY

(*Concluded from page 122*)

tradition are hard to break—though in Buganda, most important kingdom of Uganda, custom is that the *Kabaka* (king) decrees and custom changes when the *Kabaka* decrees change!

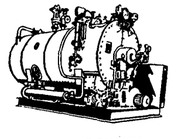
Perhaps, a solution can be found in a wholesale development of estates in which each employee can buy, by instalments, a share entitling him to participate in profits. There is enough land at present to enable all who wish to own a small piece of subsistence land, worked by his family in addition to earning a cash income from factory or estate work. In this respect, Uganda is most fortunate, but, unless the estates are developed now on the empty land, the opportunity for economic development will pass away and the country may doom itself to a peasant economy.

Little has been said in this article of private enterprises for the simple reason that such enterprises, with a few notable exceptions in tea and sugar, operate only in commerce or in small-scale industry. Yet a great deal of the much needed managerial skill of the country is in this private sector and one of the most important organisation problems is how to involve this private commercial skill in the larger enterprises which the Government must needs sponsor. The effective development of public enterprise and even of public administration may in the end depend upon the success of Government in finding ways of involving invidualistic private enterprise into its operations.



PREHEATERS
Highly efficient Preheaters for the Dry Process of Cement Manufacture

PRESSURE VESSELS
For the Chemical and Process Industries



PACKAGED BOILERS

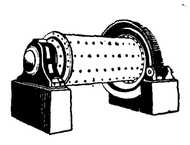
HEAVY ENGINEERING EQUIPMENT FOR INDUSTRY FROM

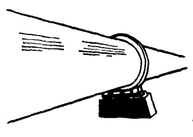
AVB

AVB's Heavy Engineering Works at Durgapur in West Bengal is geared to supply a wide variety of equipment ranging from High Pressure Boilers and Pressure Vessels to machinery for the Cement, Mining, Metallurgical and Chemical Industries. In addition to the machinery illustrated, the following equipment is also being manufactured at AVB Works:

FULLER COOLERS & CLINKER BREAKERS
FULLER-KINYON PUMPS & ACCESSORIES
FULLER-HURON AIRSLIDES & ACCESSORIES
DRACCO DUST COLLECTORS
AIRMERGE BLENDING SYSTEMS
FULLER AIRVEYOR-AIRSTREAM CONVEYING SYSTEMS
TRAYLOR JAW CRUSHERS
FULLER-HEYD AIR SEPARATORS
WATER TUBE BOILERS



GRINDING MILLS
Closed and Open Circuit Grinding Mills for the Cement and Mining Industries



ROTARY KILNS
Rotary Kilns for the Cement Industry. Also Kilns for the Chemical, Paper and Pulp and Steel Industries.

BRITISH TEXTILE INDUSTRY QUITE CHEERFUL

Productivity Rises—Order Books Lengthen—Prices Improve

By ARTHUR TATTERSALL

NOBODY with any experience of the textile industry in Britain during the past five years or so can legitimately argue that their life has been dull. Important projects have followed one another with bewildering rapidity, the millowners and their workers have frequently hit the headlines, while national and international economic trends have often impinged on the state of trade and governed the outlook.

Compared with 1963, the general conditions ruling in Lancashire have been intensified in every respect. Order books have lengthened; deliveries have become more extended; productivity has improved; manpower shortages have been uncovered; prices have strengthened, in some cases to a marked degree; and machine activity has been fully sustained. The industry, in fact, is undergoing one of its occasional spurts of prosperity, at least so far as pulsating machinery and keen demand for all its products is concerned.

In the eighteen months which have elapsed since the exciting change of structure arising from the intervention of the chief man-made fibre producers into the manufacture and marketing of textiles, a revitalised industry has already begun to emerge. That the action taken to integrate some of the larger groups happened to coincide with a gathering demand for the industry's products was to some extent accidential, but it had the effect of creating a surge of interest in the activities of the mills, reaching far beyond the traditional boundaries of textile manufacture.

More Capital-intensive

As a result, there has been much speculation as to the way in which a more closely knit and a far more capital-intensive industry will develop in the years ahead. The moves to bring a more modern approach to the many problems still facing individual managements have been aided by a more favourable attitude on the part of the Government. This changed relationship has been illustrated very effectively by the acceptance of the trade's case on imports.

In June 1963, the then President of the Board of Trade was quite obviously unmoved by the protestations of the industry's leaders in calling for safeguards against a series of attacks from foreign competitive suppliers, many of whom were able to quote prices which local producers could never approach because of the difference in labour costs. Shortly afterwards, in an unexplained reversal of policy, the Government agreed to support measures involving categorisation of imports, so that the prospect of continual diversions into individual sections of the trade by competitors became a less depressing prospect for those concerned.

This, indeed, was the break-through so far as the controversial import issue was involved. Subsequent events followed a pattern which many local traders had despaired of achieving after so many rebuffs in the past. In two separate instances, the Board of Trade imposed licensing restrictions, affecting Macao and Korea, when arrivals from these sources took on substantial proportions.

The Merger Movement

Amid the almost weekly flurry of major events, the continuation and growth of the merger movement has provoked the most resounding and persistent controversy in trade circles. When the first important step was taken eighteen months ago, through which the man-made fibre producers gave financial backing to the English Sewing Cotton-Tootal link, the ramifications of subsequent structural changes could scarcely have been imagined. That the industry's "blue chips" would be absorbed, leaving virtually no independent spinning combine of any size, would never have been forecast at that time. Within the past six months, however—indeed within a single fortnight—no less than four of the biggest groups passed into new ownership. The influence of these adjustments has been the most important single factor in trading during the period.

Observers had gladly suggested that more changes of this kind would follow the inroads already made by Courtaulds and I.C.I. through the Viyella group, most of which had been in the Midlands and in the processing sectors. The switch to the absorption of spinning capacity on an overwhelming scale, although not entirely surprising caused complications which have not yet been fully cleared up. Buyers were naturally anxious about their prospects of securing adequate supplies from sources with which close contact had been kept throughout many years. Despite recent assurances that no major interference with the flow of goods is contemplated, the fear that readjustments will be necessary lingers in the minds of many interested parties.

High Machine Activity

Throughout the year, the mills in Lancashire and surrounding countries have been working at full pressure to deal with the orders currently held by spinners and manufacturers. Machine activity has rarely been below 90 per cent of capacity. According to official figures, the amount of shift working is gradually increasing and undoubtedly the introduction of modernised plant has had a considerable influence on efficient output and has brought about an improvement in actual production. Small percentage increases in output per working day have been recorded from month to month; from this angle alone the reorganisation scheme can be said to have proved its worth.

The scheme itself, which was originally launched in 1959, officially ended in early July this year when the final installation of new machines was required in order to participate in the re-equipment grant. Government payments to the industry had, at that time, amounted to £19.6 million, of which £11.2 million were on account of the scrapping scheme and £8.4 million for re-equipment. The Cotton Board has estimated that the final cost of the aid given to the industry might reach about £26 million.

Statistics covering the amount of plant in place and working show phenomenal variations in the five years. The initial impetus of the redundancy programme cut the physical size of machinery installed almost by half; since then constant attention has been given to new projects, some of which are still only at the blueprint stage. Perhaps the most encouraging feature of the whole operation has been the entirely new approach now adopted by a large proportion of the remaining firms in accepting the basic premise that modernisation is a continual process, whether stimulated by State subsidy or not.

Prior to the Government's drastic move on imports generally in October involving the surcharge, the cotton trade had continued its own battle to secure more favourable terms in competing with its foreign rivals. The former Government had recognised the validity of many of the arguments put forward and the Board of Trade had introduced revised licensing arrangements aimed at restraining new suppliers from gaining a foothold in the British home market in order to claim a corresponding quota.

To substantiate its position and put on record its policy for the future, the Cotton Board issued its "Case for a Viable Cotton Industry," which was in general terms accepted by the then Secretary for Industry. In this document, which clearly set out the facts surrounding the importation of cotton textiles into this country, the Board submitted a novel suggestion that a levy should be introduced which would be repayable to exporters in the country of origin as a means of narrowing the price gap between Eastern costs and those in the more developed areas. Alternatively, a global quota for cotton imports was advocated, within which the supplying countries could compete with one another.

These proposals were put before the Government well in advance of the negotiations which must take place with representatives of a number of countries next year, as the existing level of quotas is scheduled to expire at the end of 1965. In the meantime, the previous system, which involved additional quotas for Commonwealth suppliers in the event of order books in Lancashire extending beyond 20 weeks, has been scrapped. Special extra quotas for the second half of this year and during 1965 have been agreed, in the same ratio as those already operating, for India, Hong Kong and Pakistan.

Events in the field of hours and wages have their separate sections wherein details are given, but mention must be made of the important arrangement reached between the employers and trade unions on a progressive improvement in the terms of employment for workers in the industry over the next three years. This "package deal" sets a precedent for a major British industry and may well provide a pattern for other trades in due course. It gave the operatives a regular wage advance annually over the three years, a regular reduction in hours and an additional day's holiday each year.

Although not as widespread in its application the pact which establishes a new wage structure in modernised spinning mills represented just as much a landmark in the history of joint discussions on such matters. Over the years, any arrangement of this type can scarcely avoid becoming outdated and basic revisions become a necessity. The moment for changing the structure while the industry itself is in the throes of readjustment was clearly opportune.

Buying Accelerates

Buying in most sections of the market accelerated during the summer months when there seemed to be signs of some supply shortages developing. This continuation of the trend which first started last autumn, enabled most sellers to obtain better terms and margins improved. The big financial deals which took place in July caused hesitation in some quarters, but inquiry was stimulated by the belief that new sources of supply would be needed and many negotiations ensued, bringing a fair offtake in their train. Reports from distributing centres did not live up to the expectations of traders, although actual sales were higher than in 1963. This, combined with the rising trend of available supplies, made customers more cautious in the closing weeks of the year, although the imposition of the surcharge on imports brought an additional surge of demand. Very few firms were able to offer delivery of finished fabric earlier than mid-1965.

The accompanying tables indicate the latest position of exports, imports, employment and production as compared with recent years.

Labour Matters

Reference has already been made to the far-reaching arrangements between employers and trade unions in the spinning and weaving sections whereby hours, wages and conditions were fixed in June covering the three year period ahead. This complete reversal of previous systems, where by haphazard applications were made from time to time by the leaders of the operatives, was only achieved after very lengthy negotiations and its acceptance by both sides was symptomatic of the new spirit which already pervades the various branches of the industry. The agreement provided for wages to be increased by 4 per cent in July, to be followed by similar advances in the same month in 1965 and 1966. Working hours are to be reduced by half-an-hour weekly from January 1965 and in each of the two succeeding years. An extra day's holiday is to be granted during the forthcoming Christmas and New Year period and a further day added during the following two years.

Both sides in the negotiations eventually made concessions. The employers agreed to the progressive scheme to improve conditions in the hope that recruitment will be stimulated, while the foreknowledge of the various changes will enable them to assess their forward costings more accurately. The unions have recognised that steady gains in this sphere are more satisfactory than spasmodic claims with their ensuing bargaining and often protracted talks. The pact also contained a restraining clause to penalise those operatives who are prone to bad time-keeping, especially after holiday periods. This, it was felt, would cut down absenteeism and aid productivity.

Early in 1964, it became known that the spinning employers and the Cardroom Amalgamation were on the verge of completing a new agreement covering a completely revised wage structure to be applied in moder

mills. At the end of June, it was announced that this pact had been signed and that it also included apprenticeship and training schemes which were regarded as essential if the industry was to maintain a regular flow of young people into the mills.

In this sphere also, the shadow of the big financial developments loomed large. Collective bargaining on wages and similar issues has been the basis of negotiations between the employers' associations and the trade unions for many years, but the new structure of the industry posed problems as to future relationships of this kind. The Cardroom Amalgamation, for example, indicated in August that approaches were being made to Courtaulds for talks on the whole topic of wages and conditions affecting its members. This led to the belief that more individual agreements with the giant firms which now have such a substantial stake in the industry may be necessary.

Raw Cotton Prices and Supplies

After all the fanfares which greeted the news earlier this year that the American Government had passed new cotton legislation which provided for the reintroduction of a single-price system, the result can scarcely be regarded with any enthusiasm by traders in the raw material. The same desultory operations have continued and the inactive mood of the market has been undisturbed. Nothing, in fact, has occurred to stimulate demand apart from the steady movement of supplies into consumption and the markets generally no longer reflect the price of the fibre with any degree of accuracy. This has been particularly the case in Liverpool where for long periods the quotations for futures have remained unaltered and business has been almost completely at a standstill. Prices for spot cotton have been equally lethargic, although occasional revisions have taken place in outside growths, mostly South American or Middle Eastern qualities.

One of the most significant developments in the United States was the decision of the members of the New Orleans Cotton Exchange to suspend dealings. At the beginning of July, it was proposed that trading should cease on the liquidation of outstanding contracts. This left the New York market alone as the arbiter of rates for American cotton. Early in October, an attempt was made to breathe fresh life into the market by introducing a second futures contract with the intention of reflecting world prices on the New York Exchange. So far the experiment has not met with much success and the turnover has remained at a low level.

Lack of Balance

The major statistical situation affecting the raw material has been the continuation of a lack of balance between output and consumption. Stocks at the end of the 1963-64 season had increased by more than two million bales and were then estimated at more than 25 million bales, of which half was held in the United States. On the other hand, other net exporting countries had reduced the supplies held, chiefly in the Sudan and Brazil. Few of these areas retained surpluses and the use of cotton in many of the developing countries tended to increase as the local mills stepped up their production of grey cloth and finished textiles.

Latest figures for the new crop in the United States already suggest that the yield per acre will comfortably exceed last season's record. The general impression is that, in growing areas outside the United States, better crop conditions will lead to further advances in the total production so that another large global crop, combined with the expansion in carryover stocks, will result in a new high record supply.

Returns covering last season suggest that world consumption of the fibre was in excess of 48 million bales, a rise of nearly 2½ million bales as compared with the previous year. It is significant that a large part of the increase, consisting of one million bales, was shared by the Soviet Union, Eastern Europe and China.

Mill activity in many parts of the world is expected to continue at a satisfactory level during the current season and bigger exports have been forecast despite the incidence of competition from the man-made fibres. The rising trend in consumption, in fact, should offset any curtailment of stocks by importing countries. A large harvest is undoubtedly on the way and the availability of supplies should be more than adequate to fulfil demand.

Mill managers have been extensively sampling the types of cotton now being offered by countries which have only lately appeared on the list of exporters in their own right. In particular, the emerging nations in Africa are keen to show their worth as producers of the natural fibre and arrivals from such sources, coupled with the substantial quantities acquired from the Middle East, now make up a major part of imports into the United Kingdom.

Raw cotton imports into the United Kingdom so far this year to the end of October aggregated 998,067 bales, including 240,024 bales American, 79,868 bales Brazilian, 76,982 bales Sudan, 73,246 bales Pakistan, 39,610 bales Peruvian, 32,516 bales Russian 28,155 bales Mexican, 26,238 bales East African, 24,082 bales West African, 21,757 bales Egyptian, 6,181 bales Argentine, 3,408 bales Indian and 346,000 bales sundries.

Exports and Imports

Despite a sharp drop in shipments of cotton yarn and thread in September, the position at the end of nine months of 1964 showed practically no change in exports of such goods as compared with the same period last year. The quantity sent abroad was 15,953,000 lbs. as against 15,591,000 lbs., the respective values being £9,640,000, as against £9,575,000. The average price per lb. of yarn and thread exported in nine months this year was 145.02d., as against 147.39d. last year. In contrast, there has been a further rise in the volume of cotton yarn imported so far this year. For the first nine months, the total volume of arrivals from abroad was 32,154,000 lbs. as against 26,936,000 lbs. in the same period in 1963. Although all categories showed a rising tendency, the major expansion in imports was in single yarns up to 20s counts and throughout the whole range of doubled yarn.

In the first nine months of 1964, imports of cotton cloth amounted to 610,251,000 square yards, as compared with a total of 636,209,000 square yards in the whole of last year. Practically the whole of the increase was accounted for by larger shipments of grey cloth amounting to 488,226,000 square yards, as against 363,253,000 square yards in the first nine months of 1963. Finished cloth imports in the same period amounted to 122,126,000 square yards, as against 109,907,000 square yards.

Cotton cloth exports to the end of September were some 15,500,000 yards lower than in the first nine months of 1963, being 156,228,000 square yards. Shippers of man-made fibre cloth, however, again came to the rescue and stepped up their overseas trade by some 10 million yards, so that the combined total was less than 3 million yards lower than at the same stage in 1963. The average price of cotton cloth exports so far this year was 35.42d. per square yard, as against 33.51d. twelve months previously.

Further welcome gains were achieved by exporters of man-made fibre goods during the first nine months of 1964. The volume of yarns shipped abroad increased by over 10 million lbs. from 60,381,000 lbs. to 70,852,000 lbs., the earnings from this trade being more than £5 million up on last year at nearly £29 million. China became the largest single importer of British man-made fibre yarns, absorbing more than 7 million lbs., but the value of these supplies was little more than £1 million, whereas Australia, which took 6,500,000 lbs., paid nearly £3 million for its purchases.

In the first nine months this year, shipments of man-made fibre piece-goods also continued their upward trend, aggregating 67,167,000 yards, a rise of 10 million yards on the 1963 level. The value was £14,020,000, as against £11,505,000. New Zealand took the largest quantities at 6,768,000 yards, followed by the Irish Republic and South Africa. At the same time, larger imports of man-made fibre goods were also recorded, the quantity of yarn and thread arriving in this country reaching 21,906,000 lbs., nearly double the volume secured from abroad in the same period last year. The cost of these purchases was £10,673,000, as against £5,468,000. Cloth imports also increased, from 45,441,000 yards to 68,927,000 yards, at a cost of £16,140,000, as against £11,154,000.

Increased Productivity

A survey of capital expenditure covering a slightly more extensive sector of the trade than the cotton industry as defined by the Cotton Board shows that, in 1958, £14.2 million were spent; by 1961, this had risen to £25.5 million and, in the five years from 1958 to 1962, total capital expenditure exceeded £100 million.

Total spindleage was reduced by 65 per cent between 1958 and 1963, but yarn production decreased by only 28½ per cent over the same period. In the spinning section, mule spindles now represent only 12 per cent of total spinning capacity and an even smaller proportion if shift working is taken into account. Only 5 per cent of spindles were running on two or three shifts before the reorganisation scheme; the current figure is near 40 per cent.

The percentage of automatic looms running in the industry had risen from 19 per cent before the reorganisation scheme to 37 per cent in mid-1964. Whereas about 20 per cent of the looms were engaged on shift work prior to 1959, the ratio has now increased to 40 per cent.

Since the reorganisation scheme, output per head has improved by around 20 per cent on average, despite the effect of the shorter working week. About half the yarn spun on the cotton system and some 60 per cent of the cloth woven in the industry is now produced on machinery working two or three shifts.

American Levels in Sight

All these facts were included in the closely reasoned memorandum submitted to the Government by the Cotton Board a few months ago. The claim was then made that the most efficient firms are within sight of American levels of productivity. The statement was also made that this rate of progress would not only continue, but could be expected to accelerate in the next few years, provided confidence could be maintained as a result of Government backing. The Administration then in office did, in fact, indicate its acceptance of the general principle that the industry had an important role to play in the future economic progress of the nation. Unless its spokesmen are to repudiate their past words, the new Government will take an equally progressive line.

With such an encouraging record of the past five years behind it, the industry could justifiably assert that it had played its part in modernisation and establishing a sound basis on which to plan its future in a modern world of textiles which bears little resemblance to the situation ruling only a decade ago and one which is poles apart from the pre-war scene. Few of those directly concerned, however, would deny that much remains to be done and that there is still ample opportunity for improving the character of the trade by creating a more efficient co-ordination of effort.

Process of Integration

Moves to strengthen the structure have been in progress for eighteen months and the developments of the past year have gathered together many of the loose strands which prevented the essential links between output and distribution from making their maximum impact. It is a simple matter to forecast that additional arrangements will be made, either by direct absorptions or through more informal systems, to continue this process of integration in the months ahead.

By the very nature of the deals which have been put through recently, the actual size of future mergers may be relatively small when compared with earlier transactions, but some rationalisation of weaving in particular would be a natural outcome of the steps already taken to give this section more stability. A visit to almost any mill in Lancashire these days shows at least one room in which machinery is either being dismantled or installed. Those firms which have more than one unit to operate are busily engaged in transferring their productive capacity to the best possible advantage by improving the flow, handling and distribution of their products.

By providing financial backing to the extent of millions of pounds, the man-made fibre producers have already been able to open up new vistas for companies whose horizons had, of necessity, been limited in the past by their cash of credit boundaries. It will be some time before these changes in outlook become fully apparent, but, within the space of a few years, a notable feeling of expansion has developed among those concerns which have in the past been held back by circumstances beyond their control.

At the end of April, Courtaulds and I.C.I. jointly announced their intention to readjust their financial arrangements which had been complicated by the abortive bid made by I.C.I. for its chief rival in the man-made fibres field more than two years earlier. As a result, Courtaulds transferred its 50 per cent holding in British Nylon Spinners to I.C.I. in exchange for I.C.I.'s holding of ap-

UMESH YOGA DARSHAN

(First Part)

In Four Languages: English, Hindi, Gujarati and Marathi

(Author: Shri Yogiraj Umeshchandraji)

An excellent treatise on the true meaning of Yoga, which explains to you how to control your digestive, nervous, respiratory and other body systems. The book is fully illustrated with 108 real Asana Photographs and explains to you about their efficacy in attaining complete remedy of various ailments or disorders through the medium of Yoga, Naturopathy, Chromopathy, Psycho-Therapy, etc.

Useful for men and women alike, young or old, healthy or unhealthy. Deserves a rightful place in every home, hospital and library.

PRICE: Rs. 15/- Plus Postage Rs. 2/- extra.

RAMTIRTH HINDI MONTHLY

Edited by Shri Yogiraj Umeshchandraji and published by SHRI RAMTIRTH YOGASHRAM, the main idea behind this magazine is to develop Physical, Mental and Moral aspect of the common man. It contains detailed information about cure of diseases by naturopathy etc.

MORE THAN 200 PAGES PER ISSUE

Annual Subscription Rs. 5/- **Single copy 65 nP.**

Yogasana Chart

A Chart printed on Artglazed paper and fully illustrated with attractive pictures is also available here. You can perform the Asanas shown therein at your home, which will keep you fit and healthy. Price: **Rs. 3/-** including Postage to be sent by M.O. only.

Yogic Classes

are also regularly conducted in the morning and evening at Shri Ramtirth Yogashram. Special classes for Ladies are also conducted. Lady teachers instruct Ladies.

Ramtirth Brahmi Oil SPECIAL NO. 1 REGISTERED.

An invaluable hair tonic for the prevention of dandruff and falling hair. RAMTIRTH BRAHMI OIL is manufactured scientifically with many precious ingredients, which cool brain, improves system, and brings sound sleep. Most ideal for body massage. It is useful to every one in all seasons. Available everywhere.

SHRI RAMTIRTH YOGASHRAM

BLACK PEPPER—A BUYERS' MARKET

Outlook For 1965, However, Better

By I. T. PAREKH

A D. 1964 saw pepper as a buyers' market. It had ceased to be a sellers' market that it was immediately after the last war. To some extent, it was because world production proved to be on a par with consumption and there was competition in selling among major producers such as Indonesia, Sarawak, Brazil and India. To a greater degree, however, it was because of the inexperience of Indonesian traders in dealing with overseas buyers. Until recently, before the confrontation, they were shipping their produce to Singapore for processing and resale. As such, they were not in the know of the pulse and the psychology of the U.S. and the European buyers. The U.S. dealers never buy in a weak market. They buy only in either a strong or a steadier market. Indonesian traders, inexperienced as they are, offered to New York lower prices in an unsteady market and the result was small business and still lower prices.

A retrospective study of arrivals and purchase price of Lampong by New York will bear out the force of the statement. New York purchased almost all its yearly requirements of black pepper at an average price of $0.31½ to $0.32½ from Indonesia. Arrivals of Lampong pepper were so heavy during the year that even a second-hand market for the major part of the year could not go beyond an average of $0.34½. New York market suffered from the overburden of pepper stock almost throughout the year. During the year, two noticeable rallies were seen: one when the price in New York touched a level of $0.44½ and the other when it touched a level of $0.41½. These two upsurges came to pass only when Indonesia was out of the field as sellers and the field was almost left to India.

Our important buyer, the U.S., could afford to buy Malabar pepper sparingly throughout the year 1964, since, after the boycott of Singapore by Indonesia, Lampong pepper was being sold in big lots to New York at lower prices. Arrivals in the U.S. from January through October 1964 equalled the total arrivals of 1963 which were estimated at a post-war high of over 20,000 tons. The major part of these arrivals were from Indonesia. Thanks to the Russian and other East European purchases and satisfactory home consumption, Malabar black pepper was not forced to compete with Lampong in New York. Otherwise, still lower prices would have been witnessed in the world's market. Prices ruling in the New York market are always taken as a criterion for the world pepper prices.

Significant Developments

Following, among others, are some of the important considerations and significant developments of the year in pepper in major producing and consuming markets:

1. Indonesia's self-imposed trade and economic ban against Malaysia assumed a more acute form.

2. Indonesian as well as Malaysian Governments enforced stricter vigilance against smuggling of Indonesian produce into Singapore. The former did it to save precious foreign exchange and the latter did it for stopping smuggling of arms and volunteers under the cover of produce cargo.

3. Holland's come back to Indonesian market; tin, rubber and other produce were routed to Holland instead of to Singapore for processing and resale in the world market.

4. The floating of a couple of State trading companies in the U.S. and Europe by the Indonesian Government in collaboration with prominent Dutch firms experienced in the produce trade of the world. These were known as "Joint Ventures."

5. Revision of export regulation by Indonesia, announcing that the official rate of exchange will be 250 rupiahs to one U.S. dollar, instead of 315 rupiahs to one U.S. dollar, but, with the increase in the entitlement from 15 to 25 per cent on the value of the export. Previous change in the rate of exchange for selling export proceeds to the Indonesian Bank was made in the month of May 1963. The rate of exchange at 45 rupiahs to one U.S. dollar was raised to 315 rupiahs for one dollar. This meant a heavy devaluation of Indonesian rupiahs and it was responsible for a heavy drop in the price of Lampong pepper in terms of dollar in 1963.

6. Ban by Malaysian Government against any kind of barter trade between Indonesians and some of the Malaysian merchants using small crafts sailing from Rhio Island and some places of Sumatra to Singapore and the Malay Peninsula. The ban was imposed for security reasons. The barter trade between Indonesia and Malaysia and Singapore ran into millions of dollars despite Indonesian confrontation. In view of the above ban, Singapore lost its former importance in the pepper trade of the world.

7. Failure of all the conferences between the Indonesian and Malaysian Governments for the peaceful solution of the present impasse arranged through the good offices of the Governments of Thailand, Cambodia and Japan.

8. The selling policy of the Indonesian merchants; they never offer less than 50 tons or 100 tons in one lot. This may be one of the reasons why Lampong was selling cheaper than Malabar as a party with a big financial stake can only offer to buy such sizable quantity in one single transaction.

9. There being lack of garbling and shipping facilities in Indonesia, most of the shipments of Lampong to the U.S. was done without proper cleansing and garbling and, hence, the exporters of Indonesia had to pay on arrival at the ports very high reconditioning charges. Such charges at times ran into as much as $0.04 per lb. This was also one of the reasons why Lampong was purchased at a sizable discount by New York dealers when compared with the price of Malabar pepper. When pepper is shipped without garbling, it is always detained by the U.S. authorities and hence a lot of delay in reaching consumers' doors.

10. Longer voyage time from Indonesian ports as against India is also attributed as one of the reasons why lower prices are realised for Lampong in the U.S. market.

11. Some sales of Lampong to Russia and other East European countries as a barter against the purchase of arms and ammunitions by Indonesia.

12. Sporadic border clashes in the North Borneo, communal riots in Singapore and trouble created by guerrillas, often affected Singapore market. But the offering from that source being very small to New York, it did not reflect on the U.S. market so much as was the case before. It, however, affected London where Sarawak was preferably traded.

13. According to the U.S. Government's official figure, the import of pepper into the U.S. reached a post-war high over 40 million lbs. during 1963. Pepper consumption in the U.S. in 1963 increased by about 2,000 tons and the same high mark is likely to be maintained during 1964.

14. Malabar pepper being cheaper than other spices, the outsiders took more interest in ready and hedge contracts both at Cochin and Bombay.

15. A proposal for the establishment of a pilot plant for making white pepper out of black pepper on the Malabar Coast.

16. The Indonesian Government and trade are reported to be seriously tackling the problems for shipping and processing of their exportable produce and these things are likely to improve in due course in the near future.

17. The Indonesian Government is now reported to be following a more realistic policy in fixing check price for pepper for export, keeping in view the ruling prices in other producing countries.

18. The establishment of forward trading in pepper at Alleppy on 10th December under the auspices of Alleppy Oil Mills and Merchants Association. Forward trading in pepper was hitherto conducted only at Cochin and Bombay.

Spurt in Price

January opened on a hopeful note for Malabar black pepper, there being a sizable enquiry from New York for January-February-March shipments. New York dealers paid for Malabar black pepper for January-February-March shipments the price ranging from $0.32 to $0.33 afetr a lot of haggling. Singapore improved from $(M)105 to $(M)112½, as hopes of an early settlement between Indonesia and Malaysia faded and the barter situation in North Borneo deteriorated. New York spot rallied to $0.34, as Indonesia withdrew as sellers and Lampong remained unquoted. In the middle of January, however, New York spot came down to $0.32½, as Lampong started underquoting after a short respite. The sentiment in India on the contrary remained bullish, despite the expanding arrival of new crop; traders thought that New York would sooner or later come to India as buyers in preference to Lampong because shipments from that source might become uncertain should the political situation worsen. January delivery on Cochin Ring moved between Rs. 292 and Rs. 282, February delivery between Rs. 299 and Rs. 278 and March delivery between Rs. 296 and Rs. 284. *Maha* delivery in Bombay ring went off the board at Rs. 303, while *Adhik Chaitra* fluctuated between Rs. 327 and Rs. 313. The future of the local pepper market appeared to be depending more upon the speculative manœuvring by outsiders. The temporary ceasefire between Indonesia and Malaysia following the good offices of Mr. Robert Kennedy was the feature of the month. It was responsible for the quietness in the market. Spot in New York moved between $0.32½ and $0.34, with interest thin and grinders mostly sidelining.

The month of February showed a sizable rise under pressure of heavy speculative buying and short covering by exporters, although enquiries from New York were discouraging. Indonesia was continuously underselling India. Speculative interests in Bombay were emboldened on the report that the exporters who were short against their sales to East European countries came out to cover at Cochin for the steamers waiting in the stream for loading. They started pushing up the prices of garbled and were successful to raise it to Rs. 290. February delivery at Cochin moved up from Rs. 281 to Rs. 287, March delivery from Rs. 286 to Rs. 318 and May delivery from Rs. 300 to Rs. 336. In Bombay, *Adhik Chaitra* fluctuated between Rs. 313 and Rs. 336 and *Vaisakh* between Rs. 321 and Rs. 349. Spot in New York moved between $0.31½ and $0.33½, with business slow. Singapore was quoting at $117½ for black pepper. The highest and the lowest of spot pepper in New York were $0.33½ and $0.31½, respectively.

The month of March and the earlier part of April were noted for a firmer trend. Spot price in New York was lifted from $0.34½ to $0.44, owing to scarcity of contracts and withdrawal of Indonesia as a seller. New York bought sizable parcels of Malabar at price ranging from $0.40 to $0.41, as grinders' demand in the U.S.A. was improving. Indiawise, there was a tussle between bulls and bears. Bears were forced to pay through their nose. Pepper position in Indonesia looked like a Chinese jig-saw puzzle and it required really a clever brain to put the different pieces in the correct position to have a real picture of the situation. Singapore moved up from $(M)120 to $(M)135 under pressure of buying by the Continent and London and in view of the scarcity of stock of both Lampong and Sarawak. Enquiries from Soviet bloc countries gave support to the ready goods. But the futures were mostly guided by the selling and buying bouts of bears and bulls. The local bulls tried to paint a rosy picture of the stock position of Malabar. But the estimate of the stock with growers is mere guesswork. One's guess is as good as another's. March delivery on Cochin Ring rose from Rs. 301 to Rs. 321, May from Rs. 317 to Rs. 418 and July from Rs. 341 to Rs. 432. *Adhik Chaitra* in Bombay spurted from Rs. 323 to Rs. 360, *Vaisakh* from Rs. 336 to Rs. 422 and *Jeth* from Rs. 371 to Rs. 415. Ready goods at Cochin rose from Rs. 297.50 to Rs. 390. The future of the market depended upon the attitude of Indonesian sellers, as India, left to itself, would not easily part with pepper unless at its own price. A rise of about Rs. 100 was noted during these months and that proved the highest for the year.

Confrontation by Indonesia against Singapore (Malaysia) proved to be a blessing in disguise to the former, as shipments and offers from Indonesia were becoming more business-like to meet foreign importers' requirements. Consequently, foreign trade of Indonesia improved greatly.

As the Indian Government included black pepper in its list of commodities to be purchased by East European countries under fresh trade agreement with them, chances of larger export of Malabar pepper to these countries improved. But it was not likely to help improve India's balance of payment position as our exports to the U.S.A. did.

Decline

The later part of April, however, proved disastrous. The price levels were badly mauled when the news of new foreign exchange regulations from Indonesia was received. The Indonesian market seemed to have been paralysed, though temporarily, and "in complete panic" over the new regulation. The highest and the lowest of spot pepper in New York during the month of March were $0.38 and $0.34½, respectively. During the month of April, they were $0.44 and $0.39.

After hectic activities of two months, May turned out to be a month of "exhaustion." Business became thin. Prices ruled irregular. New York came to buy its immediate requirements and bought some parcels at prices between $0.37 and $0.36½. But it did not help improve undertone of the market. The traders were waiting for the actual reaction of the new regulation in Indonesia. Singapore came down from $(M)120 to $(M) 110.

The future of the market depended upon the estimate of New crop of Lampong which was estimated by traders at as high as 35,000 tons, as against 15,000 tons in 1963. New Sarawak was estimated between 10,000 and 12,000 tons and exporters there were inviting bids to test European markets. The highest and the lowest of Spot pepper in New York were $0.39 and $0.34½, respectively.

Prices Fall Again

After a boomlet of March-April, the month of June found itself in distress. The prices reacted rather sharply. New York was supplied by Lampong at cheaper price after the revaluation of the rupiah. New crop Sarawak was on sale. Some parcels of Sarawak black were sold at 24d to Europe. Spot in New York came down to $0.31½ with the report that Indonesia was offering June-July and July-August at around $0.29½. Brazil was reported to be offering a small quantity at the parity of $0.27. Comparatively the position in India was not so bad, as speculators were strong holders. They were holding sizable contracts which they were switching from one month to another for getting a better price later on. Singapore was reported steady at $(M)107½. The highest and lowest of spot pepper in New York were $0.34½ and $0.31½, respectively.

The month of July saw two-sided movements. Stock of Lampong and Montok pepper in Singapore was fast dwindling, as strict security measures were taken by the Government of Malaysia for stopping smuggling of all kinds of commodities from Indonesia to Singapore. As a consequence, Singapore lost its importance as a major distributing centre of pepper. Singapore was now handling most of the export of Sarawak pepper to Europe. Price fluctuations in Singapore were only locally manipulated affairs or were merely a reflection of war psychosis created by the news of the deterioration in the political situation between Indonesia and Malaysia. This, however, had no significant effect on consuming markets as was the case before. Price of black pepper in Singapore moved between $(M)107½ and $(M)115. New York spot improved from $0.31½ to $0.34 before coming down to $0.32½ under pressure of arrivals. Under new incentive, Indonesian exporters were keen sellers for shipment June through September. They were reported to have sold at as low as $0.29. The Indonesian Government increased the check price for Asta to $0.38½ and thereafter to $0.40. This made the holders of pepper in New York raise their price. But it proved to be a passing phase, since Indonesia allowed all outstanding lower priced contracts to be shipped by 31st of August.

Shipment of Lampong during August was as high as 3,000 tons. The Indonesian exporters shipped most of their unfulfilled contracts of Lampong even without proper cleansing and processing, as they wanted to ship before the deadline fixed by the Government. Most of the pepper thus shipped was detained by the Food and Drug Authorities in the U.S. As a consequence, scarcity of spot pepper was created for some time. As India's parity for export was much higher than that of Lampong, export business of Malabar became well-nigh impossible. Our market, as a result, was guided by local conditions. Local speculative purchases and the news of Russian and East European buying brought forth firmer tone even with falling off of our export to the U.S. The highest and lowest of spot pepper in New York were $0.36 and $0.30½ respectively.

Manipulation by Outsiders

The months of August, September and October were more or less a manipulated affair by outsiders who tried to rig up prices. They took delivery of about 1,500 tons of pepper both garbled and ungarbled at Cochin and Bombay for supporting the market. These goods were tendered to them against their forward purchases on Cochin and Bombay Rings. It, however, failed to affect the world's market as New York was slow to react and was suffering from overstocked condition. The highest and the lowest of spot pepper in New York during August were $0.34½ and $0.32½, respectively, while, in September, they were $0.34½ and $0.34, respectively. During October, the highest and the lowest seen in spot in New York were $0.35½ and $0.33, respectively.

Turning Point

The months of November and December proved to be a turning point, to the otherwise flat market, weak holders in New York having been liquidated. The bears who sold in New York both to grinders and on the Produce Exchange were cornered, as a greater part of the spot stock in New York was hedged against sales either to grinders and on the futures. Absence of fresh arrivals either from Indonesia or India gave the bulls a strong grip on the market. They raised their selling price for spot at every small next sale. Spot price was raised from $0.35½ to $0.40 within a couple of days. The expected dock strike in the U.S. made bears more nervous. It was reported that they tried to divert or to reship a few hundred tons of Lampong from Europe to New York. In spite of new arrivals, the Indian market improved much against the chagrin of bears, as New York bought some parcels of Malabar for immediate shipment at price ranging from $0.39 to $0.41. Russian purchases fanned the fire and December delivery on Cochin Exchange improved from Rs. 332 to Rs. 370 and January from Rs. 328 to Rs. 368. In Bombay *Posh* improved from Rs. 343 to Rs. 390 and *Maha* from Rs. 353 to Rs. 397. The highest and the lowest in Spot at New York were $0.55 and $0.41, respectively. Black pepper in Singapore rallied to $(M)130.

Outlook

The end of the year is considered the appropriate time to record the happenings of previous twelve months as well as to indulge in forecasting the immediate future outlook. It provides a convenient opportunity to take stock of the past and to have a peep into the future. As compared with last year, there has been bigger import of pepper into the U.S. and this is interpreted in knowledgeable quarters as an increase in the consumption of U.S. by about 2,000 tons which remained static in past so many years. No review of pepper during the year will be complete without a reference to harsh facts about the marketing policy of Lampong. Viewed in perspective, however, the year 1964 can be seen in its truer guise as a second stage in the evolution of selling policy of Lampong after the confrontation. In spite of conflicting reports, Indonesia revised its check price higher to $0.41½ immediately the prices in India advanced, thus forcing New York dealers and grinders to scramble for supply and raising the tempo of the market. This is the first constructive step in the direction of the shape-to-come in selling policy of Lampong in the coming year. With higher production in both Indonesia and India during 1964-65, world pepper in ordinary course would have gone down but for the sane selling policy of Indonesia and prospect of increase in the world's consumption in general which is slowly going up as can be seen in the statistical figures of imports published in the U.S. and elsewhere. Uncertain political situation in South East Asia and elsewhere and heavy inflation in Indonesia are likely to make growers and traders as reserved sellers.

Sarawak

The political trouble in Sarawak brought forth heavy shipment of old crop as well as new to Singapore, thus making the position in the producing centre more healthy. Singapore shippers were also reported to be reserved sellers, as they were not getting the supply of Lampong and Montok from Indonesia, for the import of all commodities from Indonesia was banned for reasons of security. It is too early to forecast the coming crop of Sarawak for 1965. But it can be safely put between 10,000 and 12,000 tons, provided there is no further political trouble and the present fair weather continues.

Indonesia

The production of Lampong for the year 1964 is estimated at 30,000-35,000 tons. Out of this, a few thousand tons are reported to have been sold to Russia and other East European countries. The remaining crop is lying intact and is going to be marketed at the rate fixed by the Indonesian Government which, as the present pointer indicates, will be more realistic than it was in previous years, as the Indonesians will be getting guidance from one or the other international Dutch firms.

FUTURES TRADING IN BLACK PEPPER

An impression has been created in the minds of the public recently by the issue of statements on the effect of imposition of special margins on futures trading in black pepper at Bombay and Cochin. Attempts are being made by such statements to mislead and misdirect the business community into believing that export business and earnings of foreign exchange are affected by this step. Describing these statements as misconceptions, the President of the Pepper and Ginger Merchants Association, Bombay, observes:

"Recently there was a marked increase in speculative activity in the black pepper futures markets and there was an apprehension that unhealthy trends would develop and would endanger the future market as well as export of this important commodity. Black pepper is an important export commodity and earns valuable foreign exchange. In the interests of healthy development of export trade it is necessary to have stabilised prices at reasonable levels and future trading at both the centres was initiated with a view to achieve this end. Unfortunately due to increase in speculative activity instead of showing stabilising trends, the market showed erratic behaviour. It was, therefore, in the interest of stabilising price levels and checking excessive speculation that the Pepper and Ginger Merchants' Association Limited imposed special margins at Bombay with the concurrence of the Forward Markets Commission and similar margins were also imposed at Cochin and Alleppey markets. However, with a view to ensuring that prices do not fall below reasonable levels, margins have been imposed on shorts also.

"The statements referred to above however claim that there is a foreign demand for Indian pepper at abnormally high price and that as a result of curbing of speculative activity, the country will not be able to realise high price for pepper. Nothing can be further from the truth because pushing up of values of Indian pepper beyond parity levels would only lead to scaring away buyers and encouraging them to find alternative sources of supply. In fact even at today's prices, business with important markets like the U.S.A. is impossible because as against a parity of 46 cents for Indian pepper, Indonesian pepper is offered at a price of 42 to 43 cents. Under the circumstances, responsible exporters feel that unless speculative activity is curbed, India would lose foreign markets. Moreover, exporters having genuine export contracts are exempt from paying margins on hedge purchases effected by them. The special margins therefore do not come in the way of genuine export business.

"An additional factor indicating the excess of speculative activity can be seen from the fact that prices for future deliveries of pepper were very much higher over prices of ready goods and acquiring of irresponsible bull positions was likely to endanger the entire market. Even in the interests of stability and security of the market, imposition of margin was necessary. After the imposition of special margins, future quotations which were very much higher than spot have readjusted to more realistic levels without in any way affecting the natural prices of ready goods.

PRICES RISE TO MENACING LEVELS

Food Scarcity Acute—Cost of Living Too High

THE alarming price increases of 1963 assumed menacing proportions in the current calendar year and the pace for the rise in general index was set, for the third year in succession, more by the "food articles" group than by any other group of commodities. As the latest Annual Report (1964) of the Reserve Bank of India has recorded, "there has been a strong and persistent increase in wholesale commodity prices which has also been transmitted to the cost of living. The increase in the index of wholesale prices during the year (1st July 1963 to 30th June 1964) was larger than in any previous year, except 1955-56, since the commencement of the Five-year Plans in 1951. The major components of the increase were in the prices of commodities of agricultural origin, such as foodgrains, oilseeds and vegetable oils, sugar, *gur*, etc. The magnitude of the recent increase in prices associated with the failure of the post-harvest decline in prices to wipe out the increase in the preceding lean period has imposed considerable hardship on sections of the community." This estimate of the price situation has been confirmed even more luridly by the further increases in wholesale price index (Base: 1952-53=100), in general, and in the "food articles" group index, in particular, since June 1964. The relevant increases, incidentally, have been from 146.7 in June 1964 to 156.8 in November 1964 in the former index and from 153.5 to 166.3 in the latter, as will be seen from the following table (No. 1) giving month-wise index numbers for three successive years:

Table I: *Month-wise Index Numbers*

(Base: 1952-53=100)

Month	General Index			"Food" Group Index		
	1964	1963	1962	1964	1963	1962
January ..	136	126	123	138	123	118
February ..	138	127	124	141	124	120
March ..	139	127	124	142	123	119
April ..	143	130	124	143	128	121
May ..	143	132	126	148	132	124
June ..	147	134	128	154	135	126
July ..	151	136	130	159	138	129
August ..	155	136	131	165	139	132
September ..	159	137	131	170	139	130
October ..	158	136	130	169	139	129
November ..	157	135	130	166	137	130
December ..	..	135	126	..	136	123

It will be seen from the above figures that the usual seasonal downtrend in prices set in by December 1962 and lasted till March 1963. The "food" group index, which touched 130 in November 1962, fell to 123-124 in the next four months, and then rose to 128 in April 1963; the general index, moved in sympathy with the food index, 130 in November 1962, 126-127 in the next four months, and 130 in April 1963. But this seasonal break in prices was not in evidence in 1963-64, for the food index, standing at 137 in November 1963, moved up to 142 in the next four months, nd to 143 in April 1964; and the eneral index behaved likewise, 135 n November 1963, up to 139 in the ext four months, and 143 in April 964. It remains to be seen whether his unusual trend of a persistent rise n prices, without any seasonal reak following *kharif* harvests, will e in operation in the 1964-65 season. The chances, of course, are that this rend may persist, for, at the time of oing to press (21st December 1964), he price trends in wholesale commo- ity markets are again upward, the light fall witnessed towards the close f October and early November hav- ng proved to be a passing phase.

Weekly Index Numbers

The monthly index numbers examined thus far are only simple arithmetic averages of weekly figures which the wholesale price index provides in the first instance. The main analysis of price trends in this review has, therefore, to be in terms of the weekly index. Table II, in this connection, gives figures for two sets of comparable dates in 1963 and 1964. It will be seen therefrom that there was an unprecedented rise in the general level of prices between January and November of the current year—a rise much bigger than in the corresponding period of last year. The figures show that, for all commodities, the index, which was at the level of 125.8 in the week ended 5th January 1963, had risen steeply to 133.5 in the week ended 30th November 1963, that is, by 7.7 points (6.1 per cent). But. *in the current year*, the index, which was at the level of 13..7 in the week ended 4th January, rose even more steeply to 157.4 in the week ended 30th November, that is, by 21.7 points (16.0 per cent).

Likewise, a comparison of the price trends, *covering whole years*, leads to the broad conclusion that the price rise in the period, namely. 30th November 1963 to 28th November 1964, was much steeper than in the period, namely, 5th January 1963 to 4th January 1964. It will be noticed, in this connection, that the index rose from 125.8 in the week ended 5th January 1963 to 135.7 in the week ended 4th January 1964, that is, by 9.9 points (7.9 per cent), whereas it rose from 133.5 in the week ended 30th November 1963 to 157.4 in the week ended 28th November 1964, that is, by 23.9 points (17.9 per cent). In whichever way the analysis is done, the inference is obvious that the rate of price increase in 1964 was nearly three times that in 1964.

Group-wise Trends

How the accelerated inflationary trend in the current year was shared by the various commodities would be clear from a closer look at Table II which gives index numbers groups and sub-groups. It will be seen from the figures that the pace for the rise in general index in the current year, as in 1963, was set more by the "*food articles*" group index than by any other group of commodities. The rate of rise in the food index from 137.1 in the week ended 4th January 1964 to 168.8 in the week ended 28th November 1964, that is, by 31.1 points (22.7 per cent), was more than double the rate of increase in that index from 122.7 in the week ended 5th January 1963 to 134.5 in the week ended 30th November 1963, that is, by 11.8 points (9.6 per cent). The increases in food prices were general, covering foodgrains and other foodstuffs; they were particularly steep in the case of cereals, pulses, edible oils, fruits and vegetables.

The general food scarcity in the current year, incidentally, has been largely due to a genuine physical shortage in the context of virtual stagnation in foodgrains production—79.4 million tonnes in the agricultural year 1963-64, as against 78.4 million tonnes in 1962-63. The marginal increase of one million tonnes, representing 1.3 per cent, over the previous year has fallen short of the annual population increase of 2.4 per cent. At the same time, the increased expenditure on defence, development and refugee rehabilitation, the larger magnitude of bank credit and the increase in money supply have all meant greater liquidity in the economy and a bigger gap between aggregate demand and aggregate supply. The consequent inflationary pressures have persisted, despite the unprecedented taxation measures since 1963-64, and led to a steep increase in the prices of foodgrains (the demand for which has considerably gone up partly because of the growth in population and partly because of the operation of the factor of demand elasticity in the context of additional money incomes in the hands of the poorer classes) and thus in the general level of prices. The scarcity situation has somewhat eased since November, thanks to the stepped-up arrivals of P.L. 480 foodgrains from the United States, the arrivals of *kharif* cereals and the official steps taken to improve distribution arrangements. But, as pointed out at the outset, the usual seasonal downtrend in foodgrain prices has not set in so far in December and, on present indications, is not likely to do so in the next two or three months.

Table II: *Index Number of Wholesale Prices*

(Base: 1952-53 = 100)

To revert to the group-wise analysis of price trends. The rise in prices in two other commodity groups, namely, "liquor and tobacco" and "fuel, power, light and lubricants," it will be seen, has been relatively less in the current year than in the last. The "liquor and tobacco" index, for instance, rose from 99.1 in the week ended 5th January 1963 to 118.6 in the week ended 30th November 1963, that is, by 19.5 points; it has risen from 122.7 in the week ended 4th January 1964 to only 135.8 in the week ended 28th November 1964, that is, by no more than 13.1 points. Likewise, the "fuel, power, light and lubricants" index has risen in the current year from 139.3 to 144.9, that is, by only 5.6 points, whereas it rose from 125.2 to 139.4, that is, by 14.2 points in the previous year.

The "industrial raw materials" group, however, has registered a much bigger increase in the current year in sympathy with the rise in food prices and in the context of virtual stagnation in agriculture. It will be seen that the rise in this group index was only marginal last year—from 133.8 in the week ended 5th January 1963 to 136.6 in the week ended 30th November 1963, that is, by 2.8 points. On the other hand, in the current year, the index has risen steeply from 140.4 in the week ended 4th January 1964 to 166.0 in the week ended 28th November 1964, that is, by 25.6 points (18.2 per cent). Among the raw materials, oilseeds have registered much larger increases in prices than fibres.

All in all, increases in industrial raw material prices and in wage costs (in the wake of higher food prices) seem to have been largely responsible for the higher prices of manufactures, particularly of textiles and intermediate products. The "manufactures" group index shows, *in this connection*, a rise of 7.9 points (6.0 per cent) in the current year—from 131.4 in the week ended 4th January 1964 to 139.3 in the week ended 28th November 1964—whereas it rose by only 1.9 points, or 1.5 per cent, last year. But the consolation is that an increase of about six per cent in the prices of manufactures in the current year has been very much less than the increase of about 23 per cent in food prices and of about 18 per cent in the prices of industrial raw materials. It is difficult to figure out what overall effect the sixteen decontrolled industrial commodities—decontrolled since December 1963—have had on price trends in the "manufactures" group, for, while the prices of some products like caustic soda and soda ash have increased since decontrol, the prices of some others have been steady. Considering that several industries like iron and steel, cement, paper, mill cloth (partly) continue to be subjected to price controls which do not allow adequately for cost increases, the rise *in the* "manufactures" index *in the* current year should be attributed mostly to higher food and raw material prices.

Inflation *Versus* Stability

To round off this price analysis, a reference may be made here to Table III. This table, unlike Table II which conveys the price trends with reference to two comparable sets of dates in the years 1964 and 1963, presents the average level of prices in each of the three years—1964, 1963 and 1962. The figures in Table II represent, incidentally, simple arithmetic average of monthly figures which, in turn, are simple arithmetic averages of weekly index numbers. They should suffice for the broad purpose of comparing general price trends between any two years, for the annual average figures may be taken to have cancelled out the week-to-week fluctuations. A rough-and-ready comparison of the kind provided by Table III indicates the degree of price inflation that has taken place over the years. Since the wholesale price index has 1952-53 as its base year (*100*), the simple inference is that prices have increased by 44 per cent since that year. In other words, the buying power of the 1952-53 rupee has shrunk, by stages, to about half now. But, at the same time, it should not be forgotten that everybody gets more money income now than he did in 1952-53. To what extent the increase in the money income of an average individual has neutralised the increase in prices is, however, a matter for intricate *statistical analysis covering* the different income strata.

This much, however, is certain: the race between the ever-rising prices and the money incomes seeking to catch up with them gives no rest or respite to anybody (including the Government) and causes distortions all round. A degree of stability in prices will certainly make for a healthy economy, secure defence and development alike and strengthen the balance of payments. What is manifestly required for such stability is a sizable expansion in the output of consumer goods, particularly agricultural products. The Reserve Bank of India has pleaded precisely for this in its latest annual report. The Planning Commission, too, has recognised the imperative need for raising the rate of agricultural growth and for securing maximum benefits from past investments and quicker returns from present and future investments in order to correct the imbalance between aggregate demand and aggregate supply. But its accent is not entirely on production, for, in the same breath, it has urged that "the country should keep itself in readiness to contain the pressure on prices of basic commodities through direct measures of controlled distribution." (*vide* Memorandum on Fourth Plan). Significant, in this context, are the steps currently being taken or proposed to be taken to bring within State control the distribution, at regulated prices, of foodgrains, common varieties of textiles and other essential consumer articles. It is, however, by no means clear, as of now, whether the planners and the Government would go so far as to adopt *in toto* the Union Finance Minister's suggestion (just aired as his personal view) that a scheme of State trading in essential commodities should be enforced at the wholesale level to solve the problems of unaccounted money, price spiral and erosion of the rupee value.

Cost of Living

The steep increase in prices in the current year has had its impact on living costs all round, especially in middle-class and working-class homes. The fixed-income groups of the middle class in urban areas seem to have been particularly hit hard, for both food and cloth prices have increased during the year—and food and cloth together account for anything from 55 to 60 per cent of their family, budgets (*vide*: Central Statistical Organisation's recent "Middle Class Family Survey"). But no middle-class cost of living index number has been constructed so far. In its absence, one has to rely exclusively on the working-class index number of consumer prices. It will be seen from Table IV that cost of living in almost all the States has risen sharply in the January-August 1964 period, as compared with the whole of 1963. In all-India, the general index (base 1949=100) has risen from 134 in 1963 to 147 in the January-August 1964 period, that is, by 13 points (9.7 per cent) and in the January-September 1964 period to 148, that is, by 14 points (10.4 per cent).

But the averages for 1963 and the *January-September 1964 period do* not bring out clearly the extent of rise, say, between December 1962 and *December 1963* and between December 1963 and September 1964. In this connection, the monthly index numbers *show that the rise* was from 131 in December 1962 to 140 in December 1963, that is, by 9 points (6.9 per cent).

* Relate to January-July period. *Source:* Labour Bureau, Ministry of Labour and Employment.

As compared with this, the rise was from 140 in December 1963 to 159 in September 1964, that is, by 19 points (13.6 per cent). In other words, the 1963 rate of increase in cost of living has doubled in the current year; this is still less than proportionate to the rate of price increase which has nearly trebled in the current year, as compared with 1963. It would appear that the cost of living indices do not seem to reflect in full all the price increases during the year, for the new series of consumer price index numbers with 1960 as the base year is yet to be adopted for all-India. It is said that only such an index, when adopted on an all-India basis, can be relied upon to reflect more faithfully the current pattern of working class consumption and the changes in the price level.

As for the middle class, its pattern of consumption and family expenditure is known to be different from that of the working class in several respects. Unless a separate middle class index is constructed, on the basis of the C.S.O.'s middle class family budget survey, at an early date for the major cities and towns and for all-India, the salaried class, caught between the price inflation and the tax squeeze, may continue to feel that its interests are not safeguarded as well as those of the organised working class. A sullen middle class, it is needless to add, will not make for social stability in the long run.

ASSOCHEM ON PRICES

The following resolution on prices was adopted at the annual general meeting of the Associated Chambers of Commerce and Industry held at Calcutta on 21st December, 1964:

"The unprecedented increase in the general level of prices during the current year is, perhaps, the biggest economic challenge the country's economy has had to face since Independence. In their attempts to bring down prices Government have resorted to controls and rationing, procurement of foodgrains, zonal restrictions on their movements, tightening of bank credit and exhortation to the public and trade. These do not, however, offer a long-term solution. Controls and rationing are, at best, palliatives, procurements, merely a form of re-distribution, and exhortation, only an appeal to emotions; they do not produce more.

"*Growing shortages of agricultural* and consumer goods on the one hand, and mounting non-productive public expenditure and increasing money supply on the other, have brought about an inflationary situation. The remedy surely lies in stimulating agriculture and production, particularly of consumer goods, a rigorous pruning of non-productive expenditure, and in *according priority to investments* of shorter gestation, though in no way ignoring the need for building the industrial base.

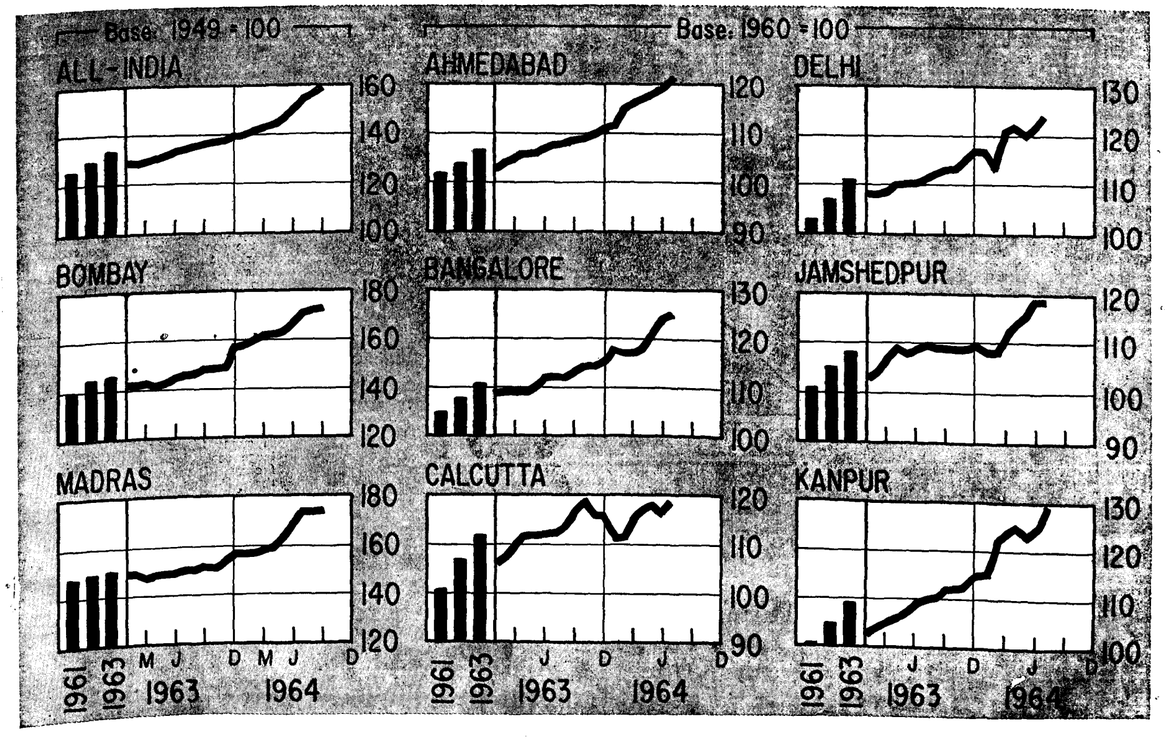
"Happily, Government keenly appreciate the need to combat boldly the problems of production and the problem *of containing inflation*. The Associated Chambers in welcoming this, would urge that a certain freeing of the economy and a more pragmatic approach will help to produce the *greater flow of food and* consumer goods which is required to stabilise prices."

CAPITAL AND THE JOB IN THE U.S.

A startling indication of the rising cost of providing a job in manufacturing industry is contained in the results of a recent study made by the United States bureau of labour statistics.

Taking U.S. manufacturing industry *as a whole*, the capital necessary to provide tools, equipment and facilities for a production worker is shown to have more than doubled between 1950 and 1961, going from an average $10,079 to $20,400. The cost of providing a job varies considerably from industry to industry, being highest in 1961, as in 1950, in the capital-intensive petroleum, tobacco and chemicals industries. However, investment per production worker has risen most sharply over the past decade in the highly labour-intensive motor vehicles and primary metals industries, having nearly tripled.

CONSUMER PRICE INDEX NUMBERS FOR WORKING CLASS



A BAD YEAR FOR COAL INDUSTRY

Fall In Demand—Distress Sales—Reduced Target

THE coal industry has been in such bad shape for some time now that the current calendar year does not seem to have witnessed even a moderate rise in output, as compared with the previous year. If anything, judging by the trend of production in the first nine months, the estimated output of 64.1 million tonnes in the current year is somewhat less than the 66.9 million tonnes of 1963, though somewhat more than the 61.6 million tonnes of 1062. Likewise, judging by the trend of despatches from collieries in the January-September period, the estimated level of despatches (56.6 million tonnes) in 1964 is somewhat less than the 58.8 million tonnes of the previous year but a little more than the 54.9 million tonnes of 1962. The difference between aggregate raisings and aggregate despatches, it will be noted, is 7.5 million tonnes in the current year, as compared with 8.1 million tonnes and 6.7 million tonnes, respectively, in 1963 and 1962.

It may be broadly inferred from all these figures that the trend of falling demand for coal, which set in during the second half of last year and led to output restrictions in the first half of this year, is yet to be reversed. There has lately been no improvement in this trend, considering the almost static level of despatches at 4.6 million tonnes in July 1964, 4.6 million tonnes in August and 4.6 million tonnes in September. Incidentally, the pithead stocks have been at a high level—5.0 million tonnes, as of September 1964.

Indeed, in view of this slow coal offtake in recent months, the Union Ministry of Steel and Mines has recently asked the coal industry to "adjust" (that is, slow down) its production programme further (*vide* Ministry's press release of 31st October 1964). The Ministry's directive has been issued on the basis of a study of production and consumption trends in the period April-August 1964. Actual production and despatches of coal from April 1964, according to this study, were 26.1 million tonnes and 23.4 million tonnes, respectively, as compared with 27.2 million tonnes and 24.0 million tonnes, respectively, in the corresponding period last year. Two of the factors responsible for the slow movement of stocks, according to the Ministry, have been the failure of some State Governments to lift their quotas and the lag in certain industrial sectors like power, steel and brick burning. The situation is such that actual consumption (exclusive of colliery consumption) in 1964-65 fiscal-year is likely to fall substantially below the original estimate of 66 million tonnes.

Fiscal-year Trends

It would be relevant, in this connection, to examine the fiscal-year trends of production and despatches. Production in the first six months—April to September—of 1964-65 works out to a monthly average of about 5.2 million tonnes and offtake to an average of 4.7 million tonnes. In the light of the shortfall of more than one million tonnes in production in the period April-September 1964 (as compared with the corresponding period of 1963) and in the light of the Ministry's recent directive to the collieries to curtail their production further, it may be broadly assumed that the shortfall in the second half of 1964-65 (as compared with the second half of 1963-64) might not be less than two million tonnes. In that case, aggregate production in the whole of 1964-65 may come to only 61 million tonnes, as compared with the actual of 66.3 million tonnes (52.6 million tonnes in the private sector and 13.7 million tonnes in the public sector) in the whole of fiscal 1963-64 with its production target of 69.0 million tonnes (54.0 million tonnes in the private sector and 15.0 million tonnes in the public sector). Likewise, aggregate despatches in the whole of 1964-65 may come to only 55 million tonnes, as compared with the actual of 58.8 million tonnes in the previous year. It should thus be obvious that both production and consumption of coal in 1964-65—the fourth year of the third Plan—will be very much less than the currently revised target of 80 million tonnes for 1965-66—the end-year of the Plan.

Revised Plan Target

Incidentally, it may be recalled here that the Plan's original target of 97 million tonnes, which was subsequently raised to 105 million tonnes and later reduced by stages to 88 million tonnes, now stands at 80 million tonnes. It is a sad commentary on the state of affairs that even this drastically reduced target, according to the Union Ministry of Steel and Mines, is not likely to be achieved. The Ministry's latest estimate has it that the aggregate demand for coal in 1965-66 may only be about 75 million tonnes and the actual production may not exceed 76 million tonnes in that year. The fact that the number of working collieries has come down from 858 in January last year to about 800 now may be noted in this connection. It is extremely doubtful whether the tempo of production will accelerate in the last year of the Plan to such an extent as to bring about an actual increase of about 15 million tonnes over the previous year's level of output (61 million tonnes).

At the most optimistic estimate, actual production in 1965-66 may come to only 70 million tonnes—roughly 16.0 million tonnes in the public sector, as compared with its *original* target of 36.6 million tonnes, and 54.0 million tonnes in the private sector, as compared with its original target of 60.0 million tonnes. This, incidentally, would mean an additional annual production of no more than 15 million tonnes, as compared with the actual output of 55 million tonnes in 1960-61—the last year of the second Plan. The gap between the 37 million tonnes of *additional* annual production originally envisaged in the third Plan and the 15 million tonnes of likely *additional* production in 1965-66 will be 22 million tonnes. That much shortfall in the target of additional production, for which the planned investment outlays (about Rs. 200 crores) have been largely made in both the public and private sectors by now, cannot, of course, be wholly explained by that inhibiting factor, namely, lack of an economic structure of coal prices. To a large extent it may be explained by these factors: (i) Faulty norms for estimating the additional consumption requirements of steel plants, metallurgical industries, railways and other industries under the third Plan; (ii) delay in the execution of the Bokaro Steel Project and the expansion projects of the existing public-sector steel plants; (iii) switch-over from coal to furnace oil in several industrial establishments; (iv) fuel efficiency drive on the railways and some consuming industries; (v) dieselisation and electrification trends in the railways and many industrial establishments; (vi) reduced offtake of coal by thermal power houses in certain areas of hydel power development; and (vii) the general lag in industrial growth in terms of both establishment of new units and expansion of production in existing units. Thanks to the cumulative effect of these factors, a relative surplus of low and medium-grade coals in particular has emerged in the last one year. This has led to distress sale of such coals below cost. If the smaller collieries, producing such coals, happen to be amalgamated, whether voluntarily or compulsorily, it is expected that the problem of surplus low-grade coals will become more acute. By this we do not mean that consolidation of small units into large economic ones is unwelcome.

Low-grade Coal Problem

Several problems connected with production and disposal of these low-grade coals used mainly by low-priority industries like brick-kilns, as well as by thermal power stations—grades II and IIIA and IIIB—have just been highlighted in a memorandum submitted by the Soft Coke Proucers' Association to the Government. The small collieries producing these coals are stated to be in a desperate financial situation, for the ceiling prices fixed for them, while undoubtedly benefiting the consumers, do not enable the producers to implement even the various welfare and mine safety measures. The removal of distribution control on low-grade coals, with effect from 1st July 1964, seems to have led to a steep fall in their actual sale prices. It has been estimated by the Association that, while the ceiling price differential between the higher and lower grade coals is only about 14 rupees, the differential between their actual sale prices is as much as 26 rupees in view of the present buyer's market for low-grade coals. The Association's estimate may be deemed reliable, for the Government itself had foreseen in July last that the market prices of these grades of coal, which were even then less than the official ceiling prices by two to three rupees, would fall further because of increased competition in the wake of removal of distribution control.

Annual Trends
(In million tonnes)

	Raisings	Despatches
1964 (Estimates) ..	64.1	56.6
1963	66.9	58.8
1962	61.6	54.9
1961	56.1	50.3
1960	52.6	46.3
1959	47.8	42.3
1958	46.0	41.0
1957	44.2	38.3
1956	40.1	35.5
1955	38.8	33.5

The present market situation is extremely unfavourable to low-grade coals because of some other factors too. Firstly, many industrial consumers, who used to manage with whatever grades of coal they got in the tight transport situation in the earlier years of the current Plan, now opt for grade I coal, of which, too, there are sizable pithead stocks in most collieries. Secondly, the railways, which used to be a big purchaser of grade II coal, have lately reduced their offtake of this variety. Thirdly, the thermal power stations are now increasingly purchasing washery middlings instead of low-grade coals. Despite these trends the market for low-grade coals can improve (i) if the brick industry greatly expands its production to meet the needs of building construction in both the public and private sectors, (ii) if the use of soft coke as a domestic fuel is widely encouraged, thereby giving a fillip to soft coke production out of low-grade coals, (iii) if future plans provide for relatively larger thermal power generation than at present, especially in the colliery areas, and (iv) if bagasse, which is now mostly burnt as fuel in sugar factories, is diverted on a large scale for use in paper manufacture. It may be noted, in passing, that, if the brick industry is not experiencing a vigorous growth, it is because of shortage of cement and its adverse effect on the pace of building construction.

Metallurgical Coal

If the plight of the low-grade coal sector is unenviable, the state of the coking (metallurgical) coal sector, too, leaves much to be desired. The output of metallurgical coal in 1960-61, it will be recalled, was 15 million tonnes. The third Plan target of *additional* output of such coal was fixed at 12 million tonnes, that too mostly in the private sector (raising the total to 27 million tonnes) on the basis that the steel expansion projects (including the proposed Bokaro plant) would get under way according to schedule. The collieries in Raniganj and Jharia have mostly carried out their costly expansion plans—costly because deep mining of coking coal, especially of superior grades, involves stowing, mechanisation, etc.—in the light of the additional production target. But these collieries have been recently subjected by the Government to production cuts on the ground that the requirements of steel plants and merchant cokeries are only about 13 million tonnes per annum at present, that is, two million less than the actual production in the last year of the second Plan. The result is that coking coal production, which reached the level of about 18 million tonnes in 1963-64 and which should have normally gone up further in accordance with the expansion schedules of collieries, is running at an annual rate of only 15 million tonnes in the current fiscal year, that is, 1964-65. In other words, the target of *additional* production of coking coal is as far away as ever, for the output of such coal in the fourth year of the current Plan will be the same as, or possibly less than, than that in the last year of the second Plan. Consequently, the expansion assumptions on which the large borrowings of collieries that have availed themselves of the World Bank loan (Rs. 17 crores) have been upset and, in the absence of hoped-for price increases, their finances seem to have been seriously affected. The situation in the coking coal sector may be expected to improve only when the steel expansion projects come to fruition. It has been suggested by some that the Government should encourage producers to explore export markets for coal, instead of allowing stocks to accumulate. This would be a better method of disposing of the surplus stocks than asking the railways to consume more of coking coal, as suggested by some others. That pithead stocks of both coking and non-coking coals continue to be of the order of more than five million tonnes and that stocks held by different industries are about four million tonnes now may be noted in this connection.

In the context of a smaller turnover consequent upon reduced offtake and curtailed production and in the absence of the hoped-for price increases, even the larger collieries may not show fair working results in the current year. It is extremely doubtful whether the selective price increases sanctioned twice this year—(i) in March 1964 when the prices of coking coal of grades A to E were increased by Re. 1.25 per tonne, those of coking coal of grades F, G and H by Re. 0.75 per tonne and those of non-coking coals of selected A and B grades in West Bengal/Bihar coalfields and "selected grade" in the outlying fields by Re. 1.25 per tonne; and (ii) in October 1964 when the prices of non-coking coal of selected grades and grade I were increased by Re. 0.50 per tonne and those of coking coal of grades A to E by Re. 1.25 per tonne and of grades F, G and H by Re. 0.75 per tonne—will make much difference to the situation. The price increases in the case of coking coal, it should be noted, have been made applicable to every colliery owner only where, in pursuance of an agreement between him and the consumer, the grade of the coal supplied is determined by sampling and analysis at the destination. Taken together, the two selective price increases seem to have met the expectations of the industry to the extent of only 30-40 per cent at the most. In any case, these price increases have been given only for neutralising, to some extent, increases in cost. The industry's basic claim for raising the notional gross profit of Re. 1.75 per tonne is yet to be conceded. Only when this is done, it is said, will there by a more economic price structure for coal.

Non-Price Incentives

Of course, it must not be overlooked here that the Government, while it has been rather niggardly in sanctioning price increases, has considered it desirable to provide several non-price incentives since March last year. These include liberalisation of the scheme of assistance to collieries handicapped by difficult mining conditions, reduction of import duty on certain items of mining equipment and enhancement of the development rebate from 20 per cent to 35 per cent for the coal industry. The Union Budget for 1964-65 has also included coal in the list of industries made eligible for a rebate of corporation tax equivalent to 10 per cent of the income-tax and super-tax normally payable by them and of 20 per cent of sur-tax. These fiscal concessions, albeit good insofar as they go, cannot be thought of as substitutes for the hoped-for depletion allowance and increases in depreciation allowance and stowing subsidy.

Coal in Fourth Plan

It is needless to add that only when a sound and integrated structure of price and non-price incentives is evolved would the state of the coal industry change decisively for the better. Otherwise, it would be extremely difficult for the industry to sustain investment in expansion and modernisation to the extent envisaged under the fourth Plan. Incidentally, of the projected *additional* annual production potential of 60 million tonnes in both the public and private sectors in the fourth Plan, the share of the private sector is laid down as 19 million tonnes. To establish an *additional* annual production potential of this order, the private sector will need to invest Rs. 64 crores (with a foreign exchange component of Rs. 17 crores) during the fourth Plan period. On the other hand, to establish an *additional* annual production potential of the order of 41 million tonnes, the public sector will need to invest as much as Rs. 443 crores (with a foreign exchange component of Rs. 141 crores) mostly in new mines. Perhaps these capacity and investment targets may have to be revised downwards on the basis of fresh norms relating to consumption. Be that as it may, there can be no doubt that substantially more coal will be produced during the fourth Plan period (say, 100 million tonnes, as against the provisional target of 136 million tonnes) than during the third Plan period. That much production will call for a more efficient and enlarged transport system, especially in the Iron and Steel Belt of India. It is in this context that the suggestions advanced recently by the World Bank Team on Coal Transport and the National Council of Applied Economic Research for expanding and improving railway haulage capacity in time would need to be considered for advance action, so that the kind of transport bottleneck experienced in the early years of the third Plan may be avoided in the early years of the next Plan.

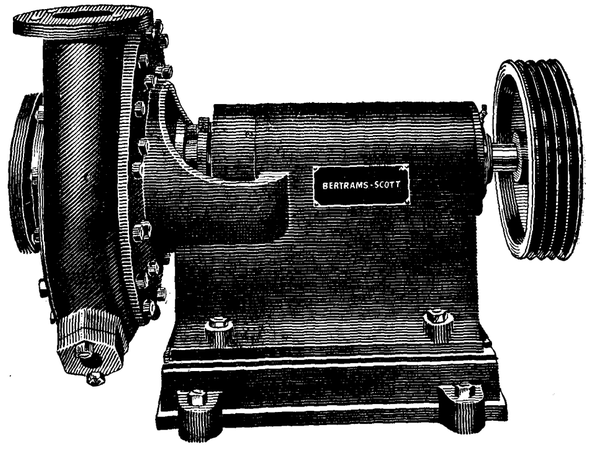
FEEDING OUR MILLIONS

(*Concluded from page 110*)

ammonium sulphate. As regards urea, ammonium sulphate-nitrate and calcium ammonium nitrate, the production cost has steadily come down with the progressive increase in output. While comparing the retention prices of our nitrogenous fertilisers with those of the imported fertilisers, it is well to remember that, in the U.K. and some of the European countries, there is an element of subsidy on fertiliser prices granted by the Government of the countries concerned. For instance, in the U.K., the subsidy ranges between 40 and 50 per cent and in West Germany 20 per cent. The E.C.A.F.E. Conference on Fertiliser Industry which met in Bombay in November last year, recommended that nitrogenous fertilisers be sold at subsidised rates as an incentive to the farmer.

Another important related problem requiring immediate attention is to reactivise our promotion programme to popularise the use of fertlisers among the farmers. With the increased production of fertilisers, it is absolutely essential that an efficient and effective agency to promote their wider use among the farmers is set up. In other advanced countries, the manufacturers themselves take the responsibility for promotion and sales programme. It is time now that these promotional activities are strengthened in collaboration with the existing agencies, so that the farmers have full knowledge about the use of various fertilisers that will be made available to them. New types of fertilisers require greater effort to popularise. Advance promotional work in such cases will have to be undertaken to educate the farmer through demonstrations in his own field, so that there may be no consumer resistance to any fertiliser on account of its newness.

COMPLETE PAPER & BOARD PLANTS
ENGINEERED AND MANUFACTURED FOR THE
PRODUCTION OF ALL GRADES OF PAPER & BOARD



We also offer the following :—
HIGH SPEED REFINERS
CENTRIFUGAL STOCK PUMPS
BEATERS
SAVEALLS and
AUXILIARY EQUIPMENT FOR
PAPER & BOARD MACHINES

We work to the rigid specification and workmanship of our foreign Technical Collaborators.
All your enquiries will receive our prompt attention.

FORTUNE SMILES AGAIN ON JUTE INDUSTRY

Both Production And Exports At High Levels

FORTUNE smiled again on the Indian jute industry during the calendar year 1964. Raw material (*jute and mesta*) supplies were plentiful, demand for manufactured goods was excellent, and the production capacity of industry was larger than in 1963, following the installation of more broad-looms, spindles and other auxiliary equipment. And, what was more, there was no regulation whatsoever on the production operations of mills, as the quarter-century-old Working Time Agreement, designed to regulate the number of looms to be worked and the hours to be worked per week, taking into account the market conditions, was scrapped with effect from 1st February 1964. Thanks to these factors and to the jute mills' own earnest efforts to maintain production at as high a level as possible, 1964 turned out to be one of the most happy years in the history of the jute industry. The estimated total output of jute goods, namely, 1.27 million metric tons, which, incidentally, represents an all-time peak, is almost equivalent to the third Plan production target of 1.30 million tons fixed to be achieved by 1965-66. Not only did the industry produce more, but it also endeavoured its best to sell more of its production abroad, thereby earning for the country a sizable amount of foreign exchange. Indeed, out of the estimated exports aggregating about Rs. 810 crores, jute manufactures alone accounted for about 21 per cent, their actual share being approximately Rs. 170 crores. The production and export performance of the industry is creditable, especially when viewed in the context of the heavy restraints on imports by a number of developed countries, growing competition from the Pakistan jute industry, and the growing use of alternative packaging materials and bulk handling methods.

So impressive have been its achievements in the past three years that the jute industry today can certainly look back with justifiable pride. But whether the industry can look forward with confidence will depend on a number of factors. Four of these are worth mentioning and they are: trends (production and price) in raw jute economy; official economic and fiscal policies; impact of tariff and non-tariff measures taken by the Governments of importing countries; and co-operation from labour. It may be noted here that the planners, after taking into account the future world demand for jute goods and domestic requirements, have tentatively fixed the fourth Plan production target at 1.7 million tons, or an additional output of about 400,000 tons between now and 1970-71. No one need have any doubt about the industry's capacity to fulfil this target, provided, of course, it gets proper production aids and other incentives. The Central and State Governments, it is to be hoped, will not grudge the same, considering that the industry is India's ace earner of foreign exchange. A heavy responsibility is cast on the industry itself. As was aptly remarked by Mr. R. H. Morrison, Chairman of the Indian Jute Mills' Association, recently, the industry cannot afford to seek refuge in the continuing growth of demand for its standard goods stemming from the so-called unsophisticated developing countries as yet unable to take advantage of modern techniques. For "jute both in the packaging and in the industrial field," to quote Mr. Morrison, "must sell on its own merits and not in default of something better to use."

These are, indeed, words of wisdom which can be ignored by the jute industry only at its peril. In the rising world demand for new materials for packaging and industrial uses, the position of jute goods ought to be strengthened. What is wanted is a concerted and co-ordinated drive to intensify research work in the field of product development and marketing. Never before was the need for such a drive so urgent as it is today. It is, therefore, gratifying to hear that the industry is continuing its efforts to build up new productive capacity in wide hessian for tufted carpet backing, apart from standard constructions of hessian and sacking. Carpet-backing cloth produced during the year 1964 is estimated at not less than 95,000 tons, accounting for nearly eight per cent of the total jute goods production.

Taking the first ten months of 1964 only—these are the months for which full statistical data are available at time of writing this article—the actual carpet backing cloth output of 77,700 tons was higher by 7,100 tons as compared with the corresponding period of 1963. The production of hessian and "other" goods was also higher, the former by 13,100 tons at 449,800 tons and the latter by 14,000 tons at 113,300 tons. These increases more than made good the further decline in sacking cloth output (417,900 tons, as against 420,500 tons), so that the aggregate production of all jute goods during the ten months ended October 1964 was higher at 1,056,700 tons, as against the 1,025,100 tons produced in the same period last year.

A feature of Indian jute industry is the declining share of sackings in total production. On the basis of the actual trend of output in the first ten months, the total production of sacking cloth during the whole of 1964 works out to about half a million tons; this is lower than the actual output of 507,100 tons in 1963, 551,800 tons in 1962 and no less than 617,600 tons in 1956. The continued downward trend in sacking cloth production (as well as in export) is not surprising, for it is in this field that Pakistan is offering keen competition, not to speak of the establishment of several sacking mills in other countries. But it is true that the internal demand for sacking cloth is picking up. The total despatches of this cloth for internal consumption during the year 1964 are expected to be of the order of 266,000 tons, a rise of 16,000 tons as compared with the actual despatches in 1963. The rising domestic demand for sacking cloth is, of course, an encouraging sign—with agricultural and industrial production gradually increasing, it cannot be otherwise. But the country cannot afford to lose the crores of rupees of foreign exchange earned from sacking exports. Something effective must be done, so as to enhance the competitive capacity of Indian sacking cloth in world markets. So far, there is no indication of either the Government or the industry having found any new methods for reversing this disturbing trend.

The overall production of jute goods registered a rise during 1964, despite a reduction in the number of loom-hours worked, the average for the January-October period being 2,016 hours, as against 2,040 hours a year before. In other words, this means that the productivity of the industry must have improved to some extent, in keeping with the progress made in modernisation of spinning and weaving sections.

The jute mills would certainly not have been able to maintain the output at a high level, if they had not been assured of easy availability of raw materials. Bumper raw jute and mesta crops were harvested in the 1963-64 season (July-June); 5.96 million bales and 1.82 million bales, as against 5.45 million bales and 1.70 million bales, respectively, in 1962-63. In view of such bumper crops, as also of a sizable carryover stocks (3.21 million bales, as against 2.83 million bales), the total available supply of raw jute and mesta in 1963-64 was markedly higher at 11.13 million bales, as against 10.24 million bales, notwithstanding the fall in imports from 272,000 bales to 142,000 bales.

The comfortable position in regard to supply of raw material fortunately coincided with a high level of demand for jute goods from the external and internal markets alike. The total despatches from mills during the first ten months of 1964 were at an annual rate of over 1.25 million metric tons, as against the actual despatches aggregating about 1.20 million tons in 1963, 1.15 million tons in 1962 and less than a million tons in 1961. Despatches for exports were higher by about 23,000 tons at 890,000 tons (estimate) and those for internal consumption by 31,000 tons at 364,000 tons (estimate). Of the total rise thus of 54,000 tons, hessian accounted for about 18,000 tons, sacking cloth for 4,000 tons and other manufactures (including carpet backing cloth) for 32,000 tons, the respective estimated despatches being 534,000 tons, 507,000 tons and 213,000 tons. The estimates for 1964 are all projected on the basis of actual despatches from mills during the first ten months of the year.

Although both production and offtake of jute goods were higher in 1964 than in the previous year, it would be rash to conclude that the financial position of the jute industry improved greatly during the year. For the industry had to pay higher prices for raw jute (+6 per cent), stores and accessories and enhanced wages, besides bearing the burden involved in the raw jute buffer stock operations. Nevertheless, considering the rise, albeit small, in selling prices of jute manufactures (as reflected in the wholesale price index) and the reduction in the unit cost of production following higher output and improvement in productivity, the working results of many mills for the year 1964 may be expected to be slightly better as compared with the previous year.

The prosperity of the jute industry cannot, of course, be judged on the basis of the profits earned by it in one or two years alone. It ought to be judged from the long-term point of view. The question then is whether, over a reasonable period, the industry would be in a position to earn enough profit that would, besides ensuring a decent return to investors, leave sufficient funds at its disposal for further expansion and development. The industry, by virtue of its being the foremost earner of foreign exchange for the country, has a right to expect the authorities (Central and State) to create conditions that would ensure such profits. At the same time, a heavy responsibility is cast on the industry itself. The responsibility is that of removing certain defects in burlap to which overseas buyers have drawn pointed attention, namely, wrong and uneven weaving, mouldy cloth, splash marks, leopard spots, narrow width, more short belt ends and shortage in measurement. There is an urgent need for improvement in quality and proper pre-shipment inspection. No less urgent is the need for constant research in the ever-changing user habits in discovering new uses, and in developing methods to sustain the buyers' interest in jute goods in the face of competition from substitutes. Given this vigilance and adequate, regular supplies of quality raw jute at reasonable prices, the Indian jute industry will, there is no doubt, compete effectively for its share of the expanding world trade in jute goods.

BRITISH TEXTILE INDUSTRY

(Concluded from page 173)

proximately 37½ per cent in Courtaulds ordinary stock. In addition, a payment of £2 million per annum for five years is to be made by I.C.I. to finance development expenditure by Courtaulds in the production of nylon.

To appreciate the full impact of this important period in the history of the trade, it is necessary first to look back to the end of 1961, when the original attempt was made by I.C.I. to gain control over Courtaulds. The offer, on a share exchange basis, was then calculated at around £180 million. If the deal had gone through, the joint group would have had net assets of more than £900 million and would have employed some 140,000 people. It would have been responsible for more than nine-tenths of man-made fibre output in Britain and, incidentally, for about 25 per cent of United Kingdom paint production. The battle was broken off after I.C.I. had increased its bid by about £20 million and, in March 1962, it was officially stated that the result of the offer was that I.C.I. had acquired 37.4 per cent of the equity of Courtaulds, representing nearly £30 million.

Current Year

Courtaulds continued to figure prominently in a fresh wave of takeovers in the first few weeks of 1964. An agreement was reached to buy a controlling interest in Fras. Hinde and Co., the Norwich textile manufacturers, from family interests. The balance would later be purchased from outside shareholders, it was reported, leaving a minority interest for the family. A bid was also made for the Macclesfield firm of Barracks Fabrics Printing Company, the value being approximately £150,000. In the meantime, Courtaulds had sold its shareholding in Koppers Company, the American firm of chemical and plastics manufacturers at Pittsburgh.

Following the interest taken in Viyella International by I.C.I., the Viyella group again entered the takeover field in February by bidding first for Ferguson Bros. of Carlisle, the vertical textile firm, the price being approximately £1.2 million, and later offering £6 per share for J. Chadwick and Co., the Oldham textile finishing company, the value put on the privately held shares being £2.5 million. In the previous month, Viyella International had announced its intention to make a bid for the capital of G. Stibbe and Co., manufacturers of hosiery machinery and knitwear, of Leicester, but this deal was subsequently abandoned.

Surprise Acquisition

Another bid made later in February by Viyella which surprised the trade as much as any in the series was that which offered approximately £825,000 for the ordinary capital of Clegg and Orr Ltd. This spinning and weaving group, based at Littleborough with interests at Bamber Bridge near Preston, was known to have installed some of the best modern machinery, but lacked marketing facilities on a sufficiently large scale to meet the requirements of current distributive trends.

Early in March, Courtaulds announced an agreement with an Austrian firm, Chemiefaser Lenzing A.G., for joint collaboration on research, production and development of viscose rayon yarns and fibres. Subsequently the group disclosed a number of expansion schemes at various works which clearly illustrated a militant approach towards the problems of output and distribution in the years ahead.

Carrington and Dewhurst, a company in which both Courtaulds and I.C.I. hold minority interests, acquired Pinehurst Textiles, warp knitters and textile finishers, at Lurgan, Northern Ireland, at a price of £870,000.

One of the textile trade's success stories in recent years has been the major expansion carried out by Klinger Manufacturing Company, which has grown from a small outfit to a very substantial group of textile engineers and hosiery manufacturers. In April, I.C.I. announced its intention of taking up 20 per cent of the enlarged equity in this company. Additional loans funds of up to £2 million were also put at the disposal of the Klinger group to assist in further expansion.

Prelude to the Storm

The beginning of the big deals came in June when Viyella International indicated that negotiations were in progress for the acquisition of Bradford Dyers' Association. The cash and share exchange bid, it was then stated, would be worth at least £6.4 million. At the same time, Viyella's earlier purchase of the Talbot Spinning and Weaving Company from Barber Textile Corporation was officially reported to have cost £700,000.

Carrington and Dewhurst reentered the picture at this stage with a bid for William Tatton and Co., the manufacturing and finishing firm at Leek. Co-ordination of technical development between Hindley Bros. and Carrington and Dewhurst was also initiated by the formation of a jointly-owned company.

Avalanche of Offers

The highlights of the year came in mid-July when offers were made for several of the biggest firms in the industry. Launching the avalanche, Viyella International put in a bid for Combined English Mills (Spinners) worth approximately £2½ million. On the following day, a share exchange deal worth some £4 million was announced by Calico Printers' Association for Oxendale and Co. (Proprietors) the Manchester mail order business.

Ten days later, Courtaulds made its now historic move to acquire the capital of both Lancashire Cotton Corporation and Fine Spinners and Doublers. This particular transaction involved payment of over £36 million. In terms of cash, the subsequent purchase of Barlow and Jones by English Sewing Cotton Company for about £2½ million seemed relatively small, but it marked the end of as hectic a period of absorptions as the trade had witnessed since the 1920's.

In addition to the bid for Combined English Mills, the Viyella Group also spent about £250,000 in July in the purchase of Robinson Bros. (Blackburn), a yarn dyeing subsidiary of the British Cotton and Wool Dyers' Association. An offer was also made during the same month by the big American firm, Deering Milliken Inc., of New York, for the Bury spinners and doublers, Waterside Mill, involving a payment of £540,000.

Viyella Moves

If Courtaulds had stolen the thunder in July after Viyella's initial thrust, the Viyella group dominated the deals in the following month. First a bid was made for Birtwistle and Leigh, involving the payment of about £1½ million; then an offer for George Tingey, the Manchester manufacturers and merchant converters, was completed; a large share in Winflex Engineering, of textile machinery manufacturers, of Worthing was taken; and finally an offer worth £1 million was made for Makerfield Mill, a substantial private weaving company at Wigan.

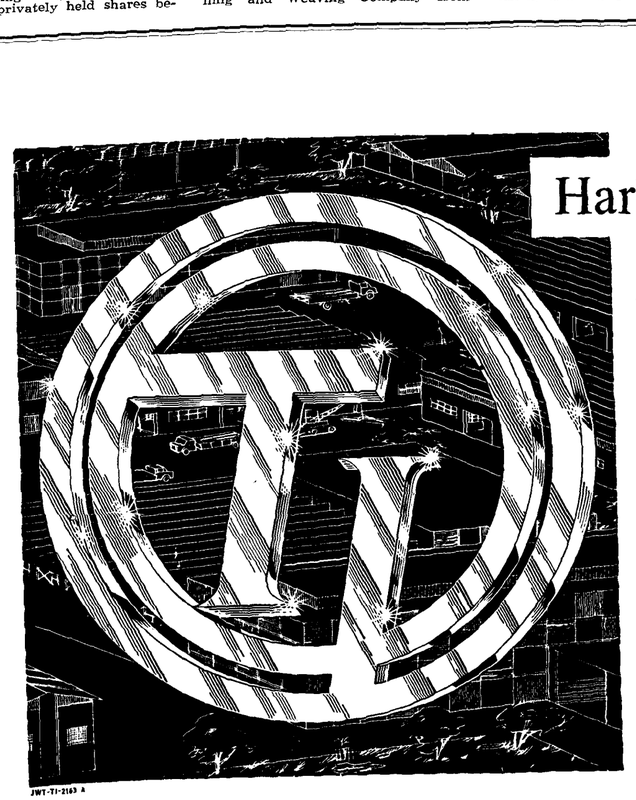
The man-made fibre producers announced further plans for expansion during August, British Enkalon indicating its aim to treble existing output at its Northern Ireland factory by 1968 and I.C.I. forecasting developments at Wilton to increase Terylene capacity to around 100 million lbs. annually by the end of next year. Ashton Bros. and Co. completed the acquisition of a specialist firm, the Lappet Manufacturing Company at Calder Vale, near Preston.

The biggest deal announced in September again went to Courtaulds, when the two operating subsidiaries of Hayeshaw, J. and J. Hayes and Greenhalgh and Shaw, were acquired for £1,140,000. Earlier in the year, Hayeshaw had successfully obtained a separate stock exchange quotation for its subsidiary, Quickmix Concrete Company.

Courtaulds' Northern Board

Arising from the important mantle over Lancashire textiles now assumed by Courtaulds, the formation of a Northern Board of the group, with offices and secretariat based in Manchester, announced during September, was a sensible step; it was welcomed in local trade circles as indicating that the mills would not be divorced from their new owners. The chairmanship of the Northern Board went to Mr. F. C. Kearton, who was shortly afterwards nominated as also Chairman of Courtaulds itself. Subsequent announcements established a strong liaison team to keep close watch on the northern activities of the group.

After several months in which the reconstruction of the spinning industry had been the focal point, interest switched to weaving early in October when John Grey, Burnley, announced details of a capital reduction scheme and the sale of a 40 per cent interest to Mr. Henry Pfeffer, a Director of Broome and Wellington, the Manchester merchanting firm, acting in his private capacity. It was made clear at the time that the sponsors of the arrangement visualised the formation of a substantial weaving group of anything up to 10,000 looms, supported by marketing facilities and the maintenance of large stocks of Lancashire-made cloth following rationalisation plans.



Harbinger of a new Industrial era

AMBATTUR, a tiny village twelve miles away from Madras, lay sleepily, neglected by history, by-passed by the industrial revolution. Then, on a cool morning in November 1949, the village woke suddenly to life. Bulldozers and excavators arrived on the scene to be followed by a mass of steel and weird-looking machines. The T.I. Cycles factory had come into being. T.I. Cycles was only the first venture of Tube Investments of India, a joint enterprise of Murugappa & Sons of Madras, and Tube Investments of England. The scope of the T. I. group had been widening year by year and today it embraces steel strip rolling, tube making, the manufacture of cycles and cycle accessories and industrial chains. T.I. Cycles was the harbinger of a new industrial era for Ambattur, and its environs are today among the busiest industrial townships in our country.

TUBE INVESTMENTS OF INDIA LIMITED

52/53, Jehangir Street, Madras-1

Proprietors of: T. I. CYCLES OF INDIA—Manufacturers of HERCULES, PHILLIPS and BSA cycles and BRAMPTON cycle fittings. TUBE PRODUCTS OF INDIA—Manufacturers of TRU-WEL ERW steel tubes and cold-rolled steel strips. THE WRIGHT SADDLES OF INDIA—Manufacturers of cycle saddles. T I METAL SECTIONS—Manufacturers of cold roll-formed sections ● Subsidiaries: T I DIAMOND CHAIN LIMITED—Manufacturers of roller chains. T I MILLER LIMITED—Manufacturers of Dynamo lamps.

JWT-TI-2163 A

COTTON MILLS PRODUCE MORE BUT SELL LESS

Export Performance Encouraging

FOR the Indian cotton mill industry, the year 1964 was a mixture of good and bad. The year was good, because it witnessed a number of heartening trends in the economy of the industry: a further addition of spindles and looms, increase in employment, more intensive utilisation of capacity, a marked rise in the production of both yarn and cloth, thanks to comfortable raw cotton supply position, and larger exports. As against these heartening trends, there were three disquieting features, namely, persistent cost inflation, continued low productivity (in terms of output per worker) and reduced offtake for domestic consumption. The advantages and disadvantages appear to be well balanced, but, by and large, it may be said that the year 1964 was slightly better than 1963 or 1962, though the majority of mills must have managed to keep their heads just above water.

The production performance of the mill industry during 1964 was quite encouraging, the estimated output being 4,655 million metres of cloth and 953 million kgs. of yarn, as against 4,428 million metres and 888 million kgs., respectively, in 1963. The notable rise in production was neutralised to some extent by the increase in the unit cost of output resulting from the rise in raw cotton prices, higher wage bill, increased cost of components and stores, and additional taxation. The rise in production followed greater utilisation of the expanded capacity in both the spinning and weaving sectors.

Machine Activity

The average number of spindles run during the first nine months of 1964 was larger (as compared with the corresponding period of 1963) in all the three shifts: 13.06 million in the first shift (as against 12.52 million a year before), 13.08 million in the second shift (12.37 million) and 9.91 million (8.49 million). Similarly, the average number of looms run was higher at 184,333 in the first shift (177,924 in January-September 1963), 179,778 in the second shift (172,638) and 60,778 in the third shift (49,793). The average number of workers at work in all the three shifts, too, was greater at 825,000, as against 797,000. While the number of workers at work thus showed a rise of only 28,000, the total number of workers on the books of mills (including general staff and *badlis*) rose by 33,000 to 968,000.

Out of the 537 cotton mills in existence (246 spinning units and 291 composite units), only ten mills (three spinning and seven composite) remained closed at the end of August 1964. As a result of this closure, about 221,120 spindles and 4,217 looms remained idle, the number of workers affected being 8,810. When these figures are compared with those for the industry as a whole, it will be seen that the percentage of idle capacity to the total was relatively small, nay, negligible, in the year under review.

The cotton mills were able to utilise their capacity more intensively during 1964 than in 1963, as they could get adequate supplies of raw cotton, though they had to pay quite high prices for the same. The total available supply of cotton during the 1963-64 season was markedly higher at 8.93 million bales (despite reduced imports of 630,000 bales, as against 851,000 bales), as compared with 8.25 million bales in 1962-63. The larger supply was due partly to increased production (6.13 million bales, as against 5.77 million bales) and partly to heavier carryover (2.17 million bales, as against 1.63 million bales).

Supply Position

Despite the notable rise in cloth production, the supply of cloth actually available during 1964 was less than in 1963: 3,891 million metres during January-September 1964, as against 3,985 million metres in the same period last year. The reduction in supply was due to the appreciable decline in the stocks brought in from the previous year aggregating no more than 415 million metres, as against 686 million metres a year before. Deducting from the total supply the closing stock of 464 million metres as of 30th September 1964 (453 million metres a year before), the offtake during the first nine months of the year comes to 3,427 million metres, representing a fall of 105 million metres, as compared with the corresponding period of 1963. This fall was accounted for entirely by offtake for domestic consumption which declined from 3,116 million metres to 2,971 million metres; deliveries for exports, however, rose from 416 million metres to 456 million metres.

Despite the reduction in offtake for domestic consumption, the industry's aggregate sales realisation during the year 1964 must have been higher, albeit slightly, as compared with 1963 for two reasons. One, not only was the quantity of cloth exported higher (estimated at 520 million metres, as against 481 million metres in 1963), but the average export price realised was also better. Two, several mills had put up the prices of their cloth sold in the internal market. There was, of course, a decline of 5-6 per cent in the prices of controlled varieties after the statutory partial control on mill cloth was enforced in October 1964, but it is believed that whatever loss the mills have incurred was made good by selling the non-controlled categories at prices higher than before.

Be that as it may, the rise in mill cloth output during the year 1964 was accounted for by all the categories, except fine counts the production of which declined slightly. The rise was particularly marked in the case of medium varieties, and that too in respect of lower medium cloth.

The bulk of the mill cloth produced during 1964 was, as usual, processed. The quantity actually processed during the first nine months of the year was 2,479 million metres, as against 2,346 million metres in the corresponding period of 1963, or a rise of 133 million metres. Of this quantity, the share of bleached cloth alone was 1,323 million metres (1,260 million metres in January-September 1963). Piece-dyed cloth accounted for 655 million metres (610 million metres) and printed cloth for 501 million metres (476 million metres).

The aggregate packings of mill cloth for civil consumption, export and other purposes during the nine months ended September 1964 amounted to 3,478 million metres, as against 3,336 million metres a year before, or a rise of 142 million metres. The rise was mostly in wearables, the total packings of which were higher by 130 million metres at 3,260 million metres. The packings of non-wearables were also higher by 12 million metres at 218 million metres. Out of the total packings of 3,478 million metres, the combined share of the five categories which are brought under statutory control (namely, *dhotis*, *saris*, longcloth, shirting and drills) comes to 1,429 million metres.

Controls

The most outstanding development of the year 1964 was the statutory enforcement (with effect from 20th October) of control on roughly half of the aggregate production of mill cloth. It was the Cotton Textile Consultative Board that first recommended, when it met at Bombay early in July 1964, a scheme of partial control in the place of voluntary price regulation scheme which was abandoned in quick stages by a large number of mills after working for well over three and a half years from September 1960. The voluntary scheme might have continued to work and there would have been no need for statutory controls, had the Government conceded the industry's reasonable plea for an increase in prices commensurate with the increase in costs. The scheme of partial control (statutory) on mill cloth, introduced with effect from 20th October 1964, envisages three operations, production control, control over quality and standardisation, and price control. The details of these controls are as follows:

Production control: The entire production of *dhotis*, *saris*, longcloth, shirtings and drills other than the supplies made to Defence and for exports is subjected to control. The total production of controlled varieties is expected to be about 2,000 million metres a year; the varieties cover cloth of mass consumption and form more than 50 per cent of the total production of mill-made cloth, excluding about 600 million metres for export and Defence requirements. Each composite mill is required to produce a minimum quantity of the controlled categories. The minimum obligation of each mill is fixed after taking into account exports and defence supplies (a further rebate at two per cent for every additional ten per cent of supplies to Defence and exports), as well as the pattern of production and the technical capacity of each mill to produce the controlled categories.

Standards and quality control: Definitions of the terms of controlled categories have been specified. In the case of *dhotis* and *saris*, standard specifications of width, counts of warp and weft, and reed pick have been laid down. The production of *dhotis* and *saris* must fall within the specified construction particulars as notified by the Textile Commissioner.

Price control: The prices of the controlled categories are based on a schedule of realisation multipliers. Provision is made for calculating the prices of grey cloth with adjustments provided for the use of superior and foreign cotton, as well as for the various processes such as bleaching, mercerising, dyeing, printing, sanforising, backfilling and finishing. Stipulations have been laid down for adjustments in respect of variations in counts. Allowances are made for combing, dobbies, jackards, drop boxes, and charges for use of doubled yarn in the border of *dhotis* and *saris*. Extra allowances for mulls and voiles and charges for the use of art silk yarn, too, have been indicated. While fixing the processing charges, the schedule lays down basic minimum specifications of each process which is required to be fulfilled, if the charges are to be admitted.

Complicated Scheme

The foregoing details bring out the highly complicated nature of the controlled mechanism. In order to ensure the effective implementation of the control scheme, the Government of India has set up a Textile Control Advisory Committee (with Mr. V. P. Naik, Chief Minister of Maharashtra, as Chairman) and a Central Consumers Vigilance Committee (headed by Mr. S. V. Ramaswamy, Union Deputy Minister for Commerce). The State Governments have been asked to constitute local consumer vigilance committees to look after the consumers' interests in all municipal towns having a population of 25,000 and above.

Several millowners have criticised the scheme of partial control. Here is what Mr. Naval Tata, Chairman of the Central India Spinning, Weaving and Manufacturing Company, Ltd., says in his annual statement:

"Frankly, it is difficult to understand the *raison d'etre* of statutory controls on cloth produced by the organised sector only, particularly when the country was not suffering from such acute shortage of cloth as was noticeable during the last world war to warrant such controls. ... It is difficult to appreciate the logic of regulating the price of the cloth produced by the centralised mill sector only, when the production and prices of the powerloom and handloom sectors remain unregulated. An elaborate and costly system of controls, administered by a mass of officials, assistants and clerical staff to control a mere 2,000 million yards representing a bare 25 per cent of the estimated 8,000 million yards from the three sectors, seems hardly justified. In any case, the scheme should have been introduced progressively, starting with 10 or 15 per cent of the productive capacity of the industry, to assess its merits, before launching headlong with 50 per cent. What India most needs today is increased production and continuous flow of cloth to the consumer to prevent any attempt on the part of the trade to exploit shortages."

If the scheme of partial control is to fulfil the purpose for which it has been introduced, three things are necessary. One, the mills must be encouraged to expand their capacity, rehabilitate the worn-out machinery modernise equipment and rationalise production methods. Two, the scheme

of cotton prices. It is, of course, implied here that, in adjusting the multipliers, the Government is bound to take into consideration the extent to which millowners alter their selling prices of uncontrolled varieties. Three, the heavy incidence of taxation—direct and indirect—on the industry, which produces one of the basic necessities of life, must be reduced. It may be noted here that, out of the ex-mill value per metre of cloth, the incidence of indirect taxes alone accounts for about 20 per cent.) Unless these things are done, several mills may be compelled to downgrade the quality of controlled varieties and to inflate the prices of non-controlled categories disproportionately. The tendency to downgrade quality, it is needless to say, will be prevalent especially among mills which find it really difficult to make the necessary adjustments in production schedules should they find that the bulk of their production comes under controlled categories, giving little scope for making reasonable profits. These tendencies cannot but be considered as natural consequences of rigidity in the Government's pricing and fiscal policies, for no unit of production can afford to be in the red for any significant length of time.

In any case, the scheme of partial control cannot be relied upon as a long-term solution to the problem of shortage and high prices of cloth. The real, effective solution lies in a determined bid to boost production.

Powerloom Enquiry Committee Report

Viewed thus, it is deplorable that the Powerloom Enquiry Committee (Chairman: Mr. Asoka Mehta), in its report published in September 1964, has recommended (a) the reservation of the entire anticipated increase in the demand for cloth (amounting to about 2,300 million metres) during the fourth Plan period for the decentralised sector by freezing the mills' weaving capacity at the existing level after taking into account the additions already agreed to, (b) a freeze on the mill output of *dhotis* and *saris* at the 1963 level, (c) exclusive reservation of all colour-ed *saris* production to the handlooms, and (d) imposition of further restriction on the processing capacity in mills. These recommendations, if implemented, will (1) deny the consumers the freedom of choice and the opportunity of getting good quality cloth at an economic cost, (2) endanger the exports of cotton textiles, and (3) ensure a closed market for the existing textile mills which is the surest way of allowing them to become inefficient and unenterprising. It is, therefore, gratifying to hear from Mr. Manubhai Shah, Union Minister for Commerce, that the Government's decision on the Asoka Mehta Committee's report would safeguard the interests of the mill sector, the *khadi* sector, handlooms and powerlooms. Intervening in a two-hour debate on the report in the Rajya Sabha, on 3rd December 1964, Mr. Shah stated that it was the Government's intention to help all the sectors of the cotton textile industry. This sort of omnibus answer is, of course, vague, but it clearly implies that the Government will not toe the line taken by the Asoka Mehta Committee.

Second Wage Board

A notable development of the year was the setting up of the second Wage Board for Cotton Textile Industry on 14th August 1964 to consider the question of a further revision of the wage structure in the industry; it is presided over by Mr. K. Bhimasankaram, a former Judge of the Andhra Pradesh High Court. While making its recommendations, the Wage Board has been asked to keep in view the recommendations of the first Wage Board for the cotton textile industry and Government decisions thereon; the principles of fair wages as set forth in the report of the Committee on Fair Wages; the needs of the industry in a developing economy (including the need for maintaining and promoting exports); the various elements of labour costs (excepting bonus) apart from wages; the requirements of social justice; the need for adjusting wage differentials in such a manner as to provide incentive to workers for advancing their skill; and the desirability of extending the system of payment by results. In applying the system of payment by results, the Board is required to bear in mind the need for fixing a minimum (fall-back wage) and also safeguarding against overwork and undue speed. Further, the Wage Board shall consider the demands for the introduction of a gratuity scheme on an industry-wise basis.

Exports

The reduction in the available supply of mill piecegoods for civilian consumers during 1964 did not, however, affect exports. For the upward trend of exports (noted in 1963) persisted throughout the year. In fact, the rate of shipments was much higher in 1964 than in 1963, the actual increase being 49 million metres, as against 20 million metres. The aggregate exports of mill cloth during 1964 are estimated at about 530 million metres, as against the 481 million metres exported in 1963 and 468 million metres in 1962. The estimate is based on the actual exports during the first nine months of the year amounting to 397 million metres, as against 360 million metres in the corresponding period last year. The improvement in export performance was due largely to increased offtake by some European markets (particularly the U.K. which is India's biggest customer), Ceylon, Afghanistan, Malaysia, Nigeria and Indonesia. The improvement would have been more marked but for the keen competition from a number of countries especially Hong Kong, Pakistan, Taiwan, Communist China, Spain and East European countries. Despite such competition, it is notable that the export prices of mill cloth showed an appreciable rise. The average price realised per metre of cloth exported during the nine months ended September 1964 was 96 paise, as against 82 paise in the same period last year and 84 paise in the whole of 1963.

The encouraging performance on the export front must be attributed in no small measure to the good export promotion work done by the different interests concerned, especially the Cotton Textiles Export Promotion Council (Texprocil).

World Competition

While the upward trend of cotton mill cloth exports and the rise in export price realisation are heartening, there is still a long way to go before Indian textiles can successfully weather the growing competition in world trade. It is true that India has an industry which is more than a hundred years old, second only to the U.S. in output, with the second largest cotton crop in the world and the necessary skill with which to meet the various requirements of the international market. Even so, the outlook for Indian cotton textile exports in the coming years will depend on five important factors: (1) increase in the production of superior varieties of raw cotton at an economic cost, (2) efforts to achieve speedy modernisation and rationalisation, (3) assistance from the Government, (4) co-operation from labour, and (5) the willingness of the importing countries, especially the developed nations, to buy more cloth from India. Emphasising the last point, Mr. Neville N. Wadia, who has been doing signal service in the cause of export promotion, made the following significant observations in his speech at the last annual meeting of the International Federation of Cotton and Allied Textile Industries held at Zurich in October 1964:

" ... I would like to emphasise the importance of lowering the tariff barriers. The exporting country will be able to secure the foreign exchange required by it with the export of less yardage, if, due to the lowering of the tariff, it obtains a higher price per yard. At the same time, the textile industry of the importing country is benefited by having to put up with correspondingly lower yardage of imports. I would, therefore, like to make a plea for settlement of all our difficulties by bilateral arrangements under which the developed countries open their doors to the extent of 10 to 20 per cent of their home consumption for imports from developing countries. These should be allowed to be brought in across a low tariff which would be of benefit only to the parties concerned. ...

"It is indeed most foolish to shut one's eyes to the changes which are taking place. The long-term agreement has been a bitter disappointment to the developing countries. We regard it as a masterly exercise in expressing restrictive intentions in expansionist phrases. I can assure you that the developing countries are not going to agree to any extension of the long-term arrangement beyond September 1967 in its present form. On the other hand, India, at least, is prepared to sit down with their opposite numbers in each of the developed countries to make a serious attempt to reach agreement satisfactory to both parties and to co-operate in an attempt to reach a general formula. We believe that this is the statesmanlike way to solve our mutual problems and that, like all wars, a textile conflict in 1967 would benefit no one."

Comments on these remarks are superfluous. It is only to be hoped that the developed countries will heed the observations of Mr. Wadia.

Outlook for 1965

With this review of the developments during 1964, we may now attempt a brief assessment of the prospects for the cotton mill industry in the coming year (1965). It looks as though the upward trend of production will continue. This expectation is based on three grounds. In the first place, the cotton supply position in the current (1964-65) season is comfortable; the total available supply (9.52 million bales, as against 8.93 million bales in 1963-64) is said to be much more than what is actually needed to meet the entire requirements of the mills. Secondly, the productive capacity of the industry has registered further expansion. And, thirdly, the offtake of cloth for both domestic consumption and exports is at a high level.

As against these helpful factors, there is the disquieting factor that of high cotton prices. It is as much in the interest of the industry as in that of the consumer that the Government must take suitable steps, so that the mills can obtain their requirements of cotton within the ceilings.

Scarcity and High Prices of Sugar Persist

Prospects of Significant Relief to Consumers Not Bright

LONG queues in front of sugar shops: This was what one witnessed in the different parts of the country practically throughout the past November 1963-October 1964) sugar season. Consumers could not only not obtain their full requirements of sugar, but they had also to pay markedly higher prices, much higher than those paid in the previous (1962-63) season. The *per capita* supply of sugar available for domestic consumption—that is, carryover stock of the previous season *plus* actual production *minus* export commitments—was no more than 4.96 kg., as against 5.70 kg. in 1962-63 and 7.91 kg. in 1961-62. The reduction in *per capita* supply was due to the addition of about ten million to the country's population, on the one side, and the poor opening stocks (149,000 metric tons, as against over a million tons a year before) and low level of production (2.56 million tons), on the other, *vide* Table A. The prices of sugar payable by consumers were much higher (by about 5-6 per cent on an average) because of the upward revision in the ex-factory prices twice during the season—on 18th November 1963 and on 22nd May 1964—which was necessitated by increase in cane prices and rise in the production costs of sugar mills. Since not many could get their requirements of sugar at controlled prices, the increase in consumer prices was much higher.

Production

The sugar production of 2.56 million tons during the 1963-64 season was no doubt higher than the previous season's output of 2.16 million tons to which level it had gone down from 2.71 million tons in 1961-62 and 3.03 million tons in 1960-61. But, it was well below even the revised lower target of three million tons fixed by the Government of India to be achieved in the season; the original target was 3.3 million tons. The shortfall in sugar production occurred despite the bumper cane crop harvested in the 1963-64 season. The aggregate cane yield was as high as 100 million tons, as against the 93 million tons harvested in 1962-63, or a rise of seven million tons. For a significant part of the additional output was diverted from the sugar mills to the manufacture of brown sugars (*gur* and *khandsari*, the prices of which continued to rule pretty high. In fact, in several centres, the prices of *gur* and *khandsari* were higher than those of white sugar. So attractive were these prices that many cane growers converted the cane into *gur-khandsari* themselves and sold the same at attractive prices, instead of bothering about carrying it to the gates of sugar mills for sale, the steep increase in minimum prices payable by mills notwithstanding. There was also keen competition from the regular, professional *gur-khandsari* producers for the available supply of cane. *Gur* producers, it may be noted here, do not pay any excise duty at all and the *khandsari* units pay a comparatively much lower excise duty than that (Rs. 10.70 per maund) paid by the sugar mills.

If only the powers-that-be—the State Governments, to be more precise—had summoned enough political courage to enforce some sort of a regulated scheme of cane distribution, while sugar production would definitely have been much higher than the 2.56-million-ton figure. The sugar industry could have easily hit the production target (original) of 3.3 million tons if it had been assured of even one-third of the total cane crop (100 million tons) harvested. Was the problem of ensuring this much supply to the sugar industry really so tough for the authorities, Central and State? The authorities not only failed to take any effective steps to check large-scale diversion of cane supplies to *gur-khandsari* production but also prevented the sugar mills from paying enhanced prices for cane through rigid controls on prices and distribution of sugar. Just before the crushing operations began in the 1963-64 season, the Government of India had assumed, under the Defence of India Act, specific powers to regulate cane supplies in reserve areas for factories. The powers were not, however, used; actually, in January 1964, the Union Food and Agriculture Minister announced that the Defence of India Rules would not henceforth be resorted to. Since the cane supply was insufficient, many sugar mills were compelled to curtail their crushing operations drastically. Actually by May 1964, the sugar mills, barring a few here and there, had stopped crushing completely.

Before the sugar season under review commenced (on 1st November 1963), the Union Government no doubt announced some incentives to boost sugar output, but the incentives were only of a limited nature; they included:

1. Permission to the mills to purchase cane at about the minimum price up to a maximum of Re. 1.75 per maund, or Rs. 4.69 per quintal of cane with a recovery of just 9.4 per cent, and include the whole of it in the ex-factory price of sugar.

2. A rebate in excise duty on additional production during the 1963-64 season over the base year 1961-62 as per details as under:

Period	Rebate (per cent. of basic excise duty)
1st July 1963—31st October 1963*	50
November 1963	50
Normal season, that is, between 1st November or 1st December 1963 and 31st March 1964	20
1st April 1964 to 30th June 1964	50

* The sugar mills that commence production during this period are mostly in South India.

For the purpose of rebate, additional sugar output will be calculated with reference to the quantity actually produced in the corresponding periods of the 1961-62 season.

3. Maximum deduction for road transport charges from the cane price is limited to 12 nP and the balance left from the existing maximum of 36 nP is allowed to be included in the calculations for arriving at the ex-factory price.

Note: On 20th November, the Government announced that the new units which had not yet attained their full capacity in production would get rebate at the flat rate of 30 per cent "over the production in excess of their real or notional production in the previous period of the 1961-62 season."

About two months later, that is, on 30th October 1963, the Government announced, as already stated, a further increase of 25 nP per maund in the price of cane in factory areas when the factories experience difficulty in securing cane supplies due to higher prices offered by *gur* and *khandsari*.

The sugar industry generally was not quite happy about the amount of rebate it would get for additional production. The total amount of gain was estimated at about Rs. 4.5 crores, as against as much as Rs. 9.0 crores obtained in 1960-61 when the aggregate sugar output had touched the all-time peak of about three million tons. If only the Government had taken the average of the 1961-62 and 1962-63 seasons as the base for calculating additional output, instead of 1961-62 season alone, a larger number of sugar mills might have availed themselves of the benefit of rebate, and the incentive itself would have been handsome. For the average of the two said seasons, namely, 2.44 million tons, would be much lower (in view of the low level of output in 1962-63) than the output of 2.71 million tons touched in 1961-62. The incentive scheme was thus of a niggardly nature and, therefore, of limited value.

Considering the existence of a lot of idle capacity (thanks to inadequate cane supplies), high production costs and uneconomic price structure, the profits earned by the sugar industry have been low, lower than those of several other industries, as the findings of the Reserve Bank's study of the finances of Indian joint-stock companies for the year 1962-63 show. The relevant figures are given in Table B.

Sugar Price Policy

It is against this background that one has to judge the Central Government's sugar price policy. For several days after the 1963-64 season actually began, the Government had continued the low prices fixed on 17th April 1963. The prices were revised upward only on 18th November 1963. The rise in prices (as compared with prices fixed in April 1963) varied from Rs. 2.65 in the case of Assam to Rs. 12.15 in respect of some mills in South India In between these ranges, the price was raised by Rs. 5.15 for Maharashtra, Rs. 8.65 for the Punjab, Rs. 8 for certain mills in the U.P. and by only Rs. 3.80 for sugar mills in Mysore, Madras, Kerala and Pondicherry. Although the increase was steep, it was not sufficient to cover the additional incidence of higher cane prices and rise in production costs. Representations to this effect were made by the sugar interests. As a sequel to these representations the Government revised the prices upward again but only on 22nd May 1964, that is, several days after the majority of mills had stopped their crushing operations. The actual increase (per quintal) was as much as Rs. 22 in Rajasthan, Rs. 15.75 in West U.P., Rs. 14 in the Punjab, Rs. 12 in South Bihar, Rs. 10.50 in Assam and Rs. 9 in East U.P., whereas it was marginal in respect of other States and there was a cut in prices of sugar produced in the Lucknow Division of U.P., Gujarat and Orissa.

After taking into account the increases allowed in cane prices subsequently and estimates of duration and recovery for the season (1964-65), the Government announced new ex-factory prices for sugar on 12th November 1964. Under this revision, the country has been divided into six sugar zones, and not four as was reported recommended earlier by the Sen Commission. The six zones and the prices fixed for each zone are as follows:

Zone	Price (Rs. per quintal)
1. Maharashtra, Mysore and Lucknow Division of U.P.	116.00
2. East U.P., Rohilkhand and Agra Divisions of U.P., North Bihar, West Bengal, Gujarat and Andhra Pradesh.	118.75
3. Dehra Dun and Saharanpur districts of U.P.	121.25
4. Madhya Pradesh, Orissa, Madras, Kerala and Pondicherry	123.00
5. Assam	126.00
6. Meerut, Muzaffarnagar and Bulandshahr districts of U.P., the Punjab, South Bihar and Rajasthan	129.25

How the revised prices compare with those fixed on 22nd May 1964, 18th November 1963 and 17th April 1963 will be clear from the following. With the latest revision, the net increase in sugar prices as compared with the position obtaining prior to the reimposition of price and distribution control in April 1963 is quite significant. The actual increases per quintal in different States are as follows:

Area	Net increase in Rs. per quintal since April 1963
Meerut, Muzaffarnagar and Bulandshahr.	20.75
Punjab, Rajasthan and South Bihar	19.40
Madhya Pradesh	13.15
Dehra Dun and Saharanpur districts of U.P.	12.75
Orissa	12.50
Assam	12.15
North Bihar, East U.P., Rohilkhand and Agra divisions	10.25
Andhra Pradesh	8.90
Lucknow division of U.P.	7.50
West Bengal	6.55
Gujarat	6.25
Maharashtra	6.15
Mysore	4.80
Madras, Kerala and Pondicherry	1.80

When Mr. C. Subramaniam took over the portfolio of Food and Agriculture, one had hoped that he at least would bring a new approach to the problems of sugar industry. The hope seemed justified by his statement in July 1964 that he had appointed a special committee, with Dr. S. R. Sen of the Planning Commission as Chairman, to go into the entire cost price structure of the sugar industry and distribution, as well as the policy regarding licensing of new sugar factories and expansion of existing ones. Mr. Subramaniam had also then given the assurance that the Government's sugar policy would in future be shaped in accordance with the findings of the Sen Commission, as the Tariff Commission's formula for price fixing had become rather out-of-date. The aforesaid hope has, however, been belied, for Mr. Subramaniam announced in October 1964 that the whole question of sugar industry's costs had been referred to the Tariff Commission. The question of Mr. Subramaniam shedding the allergy he had developed for the Tariff Commission apart, one only hopes that the Commission, which is an independent body, would recommend a new sugar price formula which woud be fair to both sugar industry and the consumer.

Cane Prices

Following the frequent changes in ex-factory prices of sugar, consumers of this commodity, one of the essential items of food, are today paying prices much higher than those prevailing during the days of decontrol. The increase in prices is due not to the mere imposition of control on sugar but to the irrational cane price policy pursued by the Government. Under the policy announced for the current (1964-65) season, the basic minimum price of cane delivered at the gate of a factory is fixed at Rs. 2.00 per manud (or Rs. 5.36 per quintal), linked to a recovery of per cent or below, with the provision for an increase of 1.48 paise per maund (4 paise per quintal) for every 0.1 per cent rise in recovery above 10.4 per cent. In other words, *all* producers of cane with recovery ranging anywhere between 0.1 per cent and 10.4 per cent are getting the same price! In short, sugar prices have been so fixed as to provide an excessive premium for sugarcane of low sucrose content.

Besides the steep upward revision in cane prices, the Government has no doubt granted a rebate of 50 per cent in the basic excise duty on all sugar produced during the months of October-November 1964 in excess of that produced in the corresponding months of 1962. And it is also true that the installed capacity of the sugar industry has expanded markedly (the total installed capacity as of October 1964 is about 3.2 million tons) and that the 1964-65 cane crop is likely to be larger than the one harvested in 1963-64 (about 103 million metric tonnes, as against 100 million tonnes. But, in spite of all these favourable factors, it is highly doubtful whether sugar production will register any appreciable increase during 1964-65. Reports from different parts of the country suggest that the sugar mills continue to experience great difficulty in securing the requisite supply of cane. For, in view of the persistently high level of *gur* and *khandsari* prices, the cane growers in several areas are either themselves converting the cane into *gur-khandsari* or selling the same at attractive prices to others engaged in the production of these brown sugars, instead of bothering about carrying it to the gates of sugar mills for sale. In Maharashtra, the position has been rendered more critical, thanks to the demand of cane growers who supply cane to joint-stock sugar mills for a substantial increase in cane price (to the extent of Rs. 8 to Rs. 9 per quintal) and the discriminatory approach of the Central Government towards the fixation of sugar price; no change, as already stated, has been made in the ex-factory prices of sugar produced in Maharashtra. Further, the sugar mills in the joint-stock company sector are at a greater disadvantage with the mills in the co-operative sector, as, under the present tax laws, the latter are in a favourable position to offer higher prices for sugarcane.

Viewed thus, the prospects of any substantial rise in white sugar output during the 1964-65 season do not appear to be bright. Even now, it is not too late for the authorities (Central and State) to wake up to the situation and take some positive steps designed to ensure higher sugar production. If, for political reasons, the authorities are not prepared to enforce a regulated scheme of cane distribution they must at least concede the sugar industry's pleas for demarcation of cane zones for individual sugar mills and for partial decontrol of sugar. The partial decontrol proposal, it is argued, will, while maintaining the distribution of the bulk of the sugar produced through fair-price shops at stipulated prices, help the mills to sell a part of their production at a higher price in the free market and thereby enable them to meet the competition for cane supplies from *gur-khandsari* producers. A similar scheme adopted during the seasons 1950-51 and 1951-52, one may recall here, had met with full success—sugar production went up from *991,000 tons* in 1949-50 to 1.12 million tons in 1950-51 and further to 1.51 million tons in 1951-52—and there is no reason why the Government should not give a trial to it now.

Fourth Plan Target

The official sugar policy has necessarily to be production-oriented, if the object of the Government is to enable the consumer to obtain his requirements of sugar freely anywhere and at a reasonable price. The need for augmenting sugar output is paramount from the point of view of rising demand for domestic consumption and export. The total domestic demand for sugar is expected to rise from about three million tons by 1965-66 (end of third Plan) to four million tons by 1970-71 (end of fourth Plan). On this basis and after taking exports into account, a tentative production target of 4.5 million tons has been fixed to be achieved in 1970-71; the target represents an increase of 800,000 tons between the end of the current Plan and the end of fourth Plan; the total licensed capacity at the end of October 1964 was 3.7 million tons, including the additional capacity of 500,000 tons which the Government decided to license early in 1964. In order to fulfil this target and to meet the rising demand for *gur* (estimated at 6.75 million tons) and *khandsari* (estimated at 480,000 tons), the cane output is fixed at 135 million tons. Although this target represents an increase of as much as 35 million tons as compared with the 100 million tons annually harvested in the 1963-64 season, its achievement is possible without any notable rise in area. The lands devoted to sugarcane in several parts of the country can certainly be made to give larger yields of superior quality cane, provided (*a*) the cane price policy is a rational one and (*b*) the State Agriculture Departments apply themselves wholeheartedly to help the cultivators through provision of better irrigation facilities, distribution of quality seeds and supply of fertilisers. The State Governments do collect every year crores of rupees by way of cane purchase tax. They should either utilise the whole proceeds from this tax for cane development or transfer the responsibility to the factories themselves.

Outlook for 1964-65

With this review of developments in sugar economy, we may now sum up the outlook for the current season which began on 1st November 1964. The outlook is by no means bright for the consumer. Production of sugar may be a little larger than in 1963-64, but the increase will not be sufficient to cover the growth in domestic demand. While the free market prices may come down a little (at present they are Rs. 3.50 per kilo in retail in Bombay City), the prices controlled by the Government will undergo an upward review. This cannot be helped, because of the failure to hold the general price line and cost of production as a whole. In fine, a further increase in the cost of white sugar will have to be provided for in the common man's budget for good.

For far too long there has been muddled thinking about sugar and it is time some clear rethinking on sugar policy was done. The immediate objective of the policy should be to secure as high a level of production as possible in the current season and the long-term objective should be the sound and orderly development of the sugar industry, including the *gur-khandsari* sector also. Such a policy can certainly be formulated and implemented if political considerations are not imported into the examination of the sugar industry's problems. Otherwise, the less vociferous poor consumer will continue to make a heavy sacrifice by paying unconscionably high prices for such an essential item of consumption as sugar. Instead of endeavouring to formulate a rational sugar policy and creating conditions congenial to maximum sugar production, it is, indeed, deplorable that the authorities are toying with the idea of setting up a monopolistic and bureaucratic Sugar Marketing Corporation, as if the sugar problem is one of distribution and not production. What is lacking in the sugar economy is not a proper distribution mechanism but a vigorous production-oriented programme, a programme that envisages full utilisation of the sugar mills' capacity and improvement in the productivity of cane lands in terms of both per-acre yield and sucrose-content.

Table A: *Sugar Balance Sheet*

ALL-ROUND IMPROVEMENT IN PLANTATION CROPS

Rubber Board's Work Commendable

THE Government of India, the Plantation Commodity Boards and the planters themselves may feel pleased that the year that is just closing will set up new records in plantation crop production. At least in so far as tea, coffee, rubber and cardamom are concerned, the reports from plantation districts have been showing a steady increase in crops, particularly from about the middle of the year. It is admitted that these increases are largely due to the prevailing favourable weather conditions and not to any special efforts on the part of the planters themselves. Even so it is a matter for gratification that the country has been able to produce a larger output of plantation crops than in any previous year, in spite of various handicaps.

Tea

In North-East India, where the production of tea had suffered serious reverses in the last two years, due to continued bad weather, conditions changed very favourably this year and up to the end of October a total of 546.7 million lbs. had been produced, being an increase of 48.8 million lbs. over the same period of last year. This very remarkable increase has been offset to some extent by an estimated loss of production of 12 million lbs. in Southern India. This is the first time in many years that South India is experiencing a reduction in crop due to adverse weather. The reduction was mainly caused by late rains, due to which large areas had to be left unplucked. However, taking both the North-Eastern and Southern regions together, it is expected that there will be a net increase of 36 million lbs. over last year's crop. This would bring up the year's crop to 796 million lbs. If this rate of increased production continues next year, it would mean that the target figure of 830 million lbs. for the final year of the third Plan would have been easily achieved.

The target of production for the final year of the fourth Plan has been fixed tentatively at 1,000 million lbs., allowing for an average annual rate of increase of 34 million lbs. between 1966 and 1970. The figure has been worked out on the basis of increased productivity in existing stands, production from new extensions and replacements and the prevalence of favourable weather. There are planters who believe that in both North-East and South India the productive capacity has reached saturation point and that it would be futile to expect further rises in yield from the same area. This fear is not shared by the Tea Board which believes that better and intensive methods of cultivation, adequate use of fertilisers and control over drought and pests will bring about a steady rise in yield.

Coffee

In regard to coffee, the current season's crop of 68,500 tonnes is the highest on record, the previous record figure being 67,794 tonnes obtained in 1960-61. Here again, favourable weather, more than anything else, was the factor influencing the high production. But it is significant that, despite the variations in production normally resulting from the adequacy or otherwise of blossom showers, there is a clear tendency for the crop to increase from year to year. The Coffee Board claims that this is partly due to the adoption by the planters of improved and disease-resistant seed material evolved by the Research Department of the Board as well as intensive methods of cultivation and protective measures against pests and diseases.

Owing, however, to inadequate blossom showers, it is feared that the next season's (1964-65) coffee crop might not be as good as this season's crop, and a tentative estimate places the figure at 62,300 tonnes only. The target of production for the final year of the fourth Plan has been fixed at 85,000 tonnes. Both in view of the steady trend of increased production (after making due allowance for adverse weather), and the Board's own efforts to intensify production from existing stands, it is felt that this target figure is within the limit of practicability.

Raw Rubber

The production of raw rubber this year is expected to exceed last year's figure of 37,500 tonnes by about 4,000 tonnes. Actual production for the period January-September is 26,451 tonnes, as against 24,766 tonnes only produced in the same period of last year. With the expected further increase in crops during the remaining three months of the year, this year's crop is likely to total about 41,500 tonnes. Although this figure would be a little short of the target, it does represent a steady and satisfactor rise in production. brought abou largely by the Rubber Board' schemes of replantation of old rub ber over the past six or seven years In fact, it is only in the case o rubber that one is able to see steady trend of increased produc tion as a direct result of replanta tion, this being absent in both te and coffee up to now.

Cardamom

At the beginning of this year, was strongly feared that the prc duction of cardamom would suffe a serious reverse due to bad wea ther as well as the absence of effec tive measures to control pests an diseases. This fear has now dis appeared and reports receive from producing districts indicat that production would be maintain ed at the normal level of abou 3,000 tonnes, if not, in fact, at slightly higher level. The Carda mom Development Committee ha not so far instituted any scheme for intensified cultivation or fo eradication of pests. If suitabl measures are taken in this direction it would be possible to increase th yield from the existing stand alone.

Exports and High Targets

The Government's desire to se increased production of tea, coffe and cardamom seems to be actuate by a feeling that such increase essential to bring about an increas in the level of exports. Fixing hig targets of production are designe mainly to aid export promotion, an to earn more foreign exchange. I urging the planters to increase pro

duction, the Government argues that it would also help the planters to reduce the cost of production. This is true only up to a point, for there are immense difficulties in increasing crops. In the case of tea, for instance, the existing factories are only capable of dealing with crops of a certain size and, if greater crops are to be produced, it would mean more financial outlay in factory expansion and modernisation. Further, it is by no means certain that a greater volume of crops will automatically ensure a corresponding decrease in cost; the price of fuel and packing material, excise duty, freight insurance and many other items increase directly with each kilo of tea produced. Also, if the production of tea increases unhampered all over the world, the world price may be such as to depress the earnings from foreign exchange. These possibilities were brought to the notice of Government by the spokesmen of the plantation industries during the year in connection with the fixation of production and export targets.

It has been estimated that, to fulfil the targets for tea, some 24,000 acres would have to be planted up each year during the next five or six years. Similar large-scale expansion will also be needed in the case of coffee and cardamom. In the case of rubber, large-scale expansion has been planned with a view to reducing the quantity of raw rubber imported into the country. These programmes involve heavy expenditure of a capital nature. The Plantation Commodity Boards have instituted a number of schemes of financial assistance but these do not seem to be either adequate or suitable.

The Tea Board has made a total corpus of Rs. 10 crores available under its Plantation Finance Scheme (for replantation and extension of gardens) and the Machinery and Irrigation Hire Purchase Schemes. Of this, about Rs. 6.4 crores has already been committed up-to-date, indicating that the planters are utilising the facility. In the case of coffee, a development loan scheme, involving Rs. 12 crores, has been prepared and placed before the Government, but no decision has been taken as to its availability. Cardamom has not yet had any development loan schemes under consideration. Rubber, which is not an export crop, has a very liberal subsidy-cum-loan development scheme, the object of which is to increase production for local consumption. But the granting of loans alone, at high rates of interest, cannot meet the planters' needs. What is particularly needed is the restoration of an economic climate in which the plantations will be enabled to retain and utilise their own funds for development. This leads to the question of taxation discussed in detail on page 158 of this Number.

Export Performance

This year's export performance has been satisfactory for tea, coffee and cardamom. During the first half of the year, exports of tea were actually lower than those for the same period of 1963 by 17 million kgs., in spite of the larger crop. It was explained that, following two successive years of lower production in North-East India, very little tea was available for export during the first few months of 1964. With the arrival of the new season's tea from June, exports have improved and it is hoped that the year's total would be a little above the 224 million kgs. (493 million lbs.) exported during 1963.

Due to a shortfall in the total world production of coffee which synchronised with the highest Indian crop on record, it has been possible not only to increase the exports of Indian coffee but also secure good prices this year. Out of the 68,500 tonnes delivered to the Board's pool, some 35,000 tonnes were sold for export, the highest so far in any year. Apart from meeting the export obligation of 21,600 tonnes under the International Coffee Agreement, the Board had to do careful planning for the disposal of the remainder of the allotment, and the result has been very satisfactory. The Board was also able to make quick payments of dividends to the growers and, by the end of August this year, a dividend of Rs. 2.00 per point had been paid, as against Re. 1.30 only by the same period last year. A further payment of 20 paise per point was due to be made in November, making a total of Rs. 2.20 per point.

The heavy increase in the present crop and the anticipated increase in future crops has compelled the Board to ask for a much higher allotment than 21,600 tonnes fixed under the International Coffee Agreement. In fact, it has been represented that the basic quota for India should be raised to 50,000 tonnes. A technical committee of the International Coffee Organisation is due to visit India shortly to examine this request. Meanwhile, the Indian quota for 1964-65 has been fixed at 22,176 tonnes.

Domestic Consumption

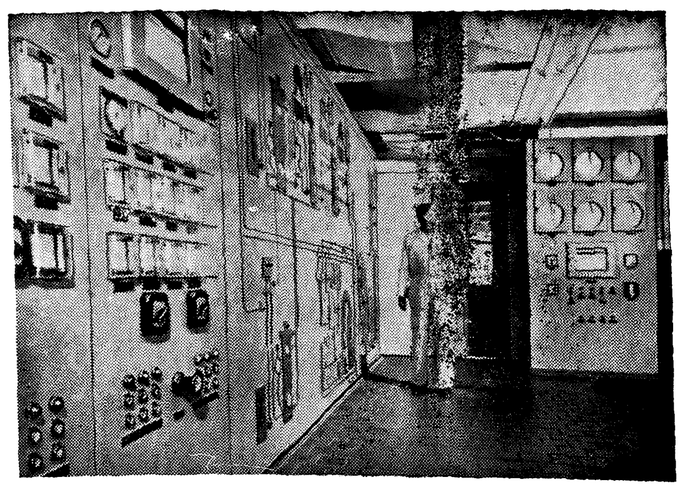
Internal consumption of tea and coffee has continued to rise, in spite of the curbs imposed by Government. Now that the world production of tea is going ahead of last year, a suggestion has been made to the Government that the curbs should be withdrawn and steps taken to increase local consumption. The increasing level of coffee production also makes it necessary for more coffee to be consumed internally. Up to the end of September this year, 25,450 tonnes had been released for the internal market out of the 1963-64 crop. The total release in the calendar year 1963 was 33,630 tonnes.

It is necessary to pay a special tribute to the work of the Rubber Board for increasing the production of raw rubber. The replanting scheme is now in full swing and some 30,000 acres have been covered during the period 1957 to 1963. The production of synthetic rubber has not reached the expected level and Government may be devoting more attention to it in order to reduce the gap between internal requirements and imports. But the Chairman of the Rubber Board has pointed out that there is no need for apprehension that there might be indiscriminate issue of licences for starting factories for synthetic production.

An important development this year in the tea industry is the production of instant tea based on green leaf. Considerable scope for selling instant tea made in India seems to exist in the U.S.A. At the instance of the Tea Board, the C.F.T.R.I. has developed a new process of producing instant tea as well as a process for producing ready-made tea powder consisting of tea, sugar and milk.

Wage Boards

The Plantation Wage Boards have completed their task but the final results have not been announced in all cases. Large interim rises in wages have been announced for tea, coffee and rubber and their implications to the profit-margins of planting companies have to be watched. The most disquieting aspect of the Wage Boards has been that there has been, so far, no attempt to make a scientific approach to the problem of wage fixation, although enough material has been placed in the hands of the Board for such a necessary and valuable effort.



Look what you get with

HONEYWELL instrumentation

Far more than just instruments, you get a complete control system, custom designed for your specific needs, by men who know your processes.

You get expert, interested assistance every step of the way, with your initial planning and long after your instruments are installed. Blue Star assume full responsibility for the engineering, installation and start-up of your system.

You get training for your instrument technicians in the most up-to-date maintenance methods at the Blue Star-Honeywell Instrumentation Education Centre at Bombay.

You get prompt, competent service from your nearest Blue Star office, and immediate replacement of emergency repair parts.

These are but some of the plus-values that comprise instrumentation by Honeywell... and they apply regardless of whether you buy a single instrument, a replacement part, or a complete control system.

NO ACCELERATION IN INDUSTRIAL GROWTH

Power Situation Improves—Shortfalls In Targets Continue

THE provisional national income data for fiscal 1963-64, released in August last, show that the contribution of "mining and factory establishments" (other than small enterprises) to net national output at constant (1948-49) prices in that year was 9.1 per cent higher than in 1962-63. The relevant contribution, in absolute terms, in 1962-63 was Rs. 1,336 crores. On this basis, the net output of the "mining and factory establishments" sector in 1963-64—the third year of the third Plan—works out to Rs. 1,458 crores, representing an increase of about 26 per cent over the level in 1960-61 (the end-year of the second Plan). That provides a broad measure of industrial growth in the organised sector during the first three years of the current Plan. It may be that the rate of growth in the current fiscal year (1964-65) will not be less than that of the previous fiscal year. But this can be inferred only broadly and indirectly from the calendar-year trends of industrial production as reflected in the relevant index number series.

This index (base 1956=100) showed 163.3 in 1963, as against 149.6 in 1962. The 1963 number represented an increase of about 9.2 per cent over that of the previous year. As far as the current calendar year (1964) is concerned, the monthly average of index numbers in the January-June period worked out to 170.0, as against 156.4 in the corresponding period of 1963, representing an increase of 7.3 per cent. On the assumed basis of a somewhat higher percentage increase, say, 9.5 in the July-December period of 1964—the assumption here has been made in the light of the differential *between* the increase of 6.8 per cent in the January-June period of 1963 over the corresponding period of 1962 *and* the increase of 9.0 per cent in the July-December period of 1963 over the corresponding period of 1962—the monthly average of index numbers in that second half of the current calendar year comes to 184.3, as compared with the monthly average of 168.3 in the corresponding second half of 1963. It may be noted, incidentally, that the actual index numbers, as announced, for July, August and September 1964 are 179.1, 173.6 and 179.5, respectively.

In the next stage, from the averages of the two halves of 1964, the index number for the year can be placed at 177.2, as against 163.3 in 1963. In other words, it can be roughly estimated that industrial production in the current calendar year (which may be taken to correspond broadly to fiscal 1964-65, the fourth year of the third Plan) has registered an increase of 8.5 per cent over 1963, as compared with the 1963 increase of 9.2 per cent over 1962, the 1962 increase of 7.7 per cent over 1961 and the 1961 increase of 7.3 per cent over 1960. It would thus appear that, if there has been no perceptible acceleration in the rate of industrial growth in the current year, there has been no pronounced deceleration either. This is on the assumption that the *actual* growth percentage figure for 1964, when it becomes available in March or April 1965, may not vary unduly from the estimate made here. Incidentally, if the estimate is confirmed, one may take it that the average annual rate of growth in the first four years of the third Plan has been in the neighbourhood of only 8.0 per cent, as against the planned average increase of 11.0 per cent per annum for the Plan period. This substantial shortfall in industrial achievement may be attributed as much to the lag in agricultural performance as to the prevalence of power and raw material shortages since the beginning of the Plan.

Groupwise Picture

So much for the overall trend of industrial growth in general. To have an idea of the performance of selected individual industries, the reader may have a close look at the table (No. I) accompanying this review. This table gives an industry-wise picture of absolute production in the two comparable periods of January-June 1964 and January-June 1963. The percentage increase or decrease in production in the first half of 1964, as compared with the first half of 1963, has been worked out for each industry. A further comparative picture of industry-wise performance can be had from the figures of percentage increase or decrease in production in the first half of 1963 over the first half of 1962. The production figures for July-1964, as they became available at the time of going to press, have been included in the table to make it as up-to-date as possible. Even a cursory glance at the figures in the table will reveal the highly uneven performance of different industries.

To take first those industries, the production of which is *crucial* to the level of production in a number of other industries or to the level of performance in the sectors of agriculture and transport. Among such *crucial* industries, the ones in which production has *decreased* by anything from three to seven per cent in the first half of 1964, as compared with the first half of 1963, are coal, plywood tea-chests, ammonium sulphate, iron and steel, paper and paperboard (insofar as they are necessary for packing and other purposes in all industries), refractories and dry cells. The industries, in which percentage *decreases* in production have been much larger, are woodscrews (21) and looms (20). The industries which have registered modest production *increases* up to nine per cent are jute manufactures, commercial plywood, soda ash, bichromates, rayon acetate yarn, cement, aluminium, vehicular diesel engines, power-driven pumps, ring spinning frames and carding engines, while those that have maintained the same level of production are bleaching powder, copper and electric motors. Salt (insofar as it is a raw material for several chemical industries like caustic soda and soda ash), sheet glass, sulphuric acid, superphosphates, paints and varnishes, petroleum products, rayon viscose yarn, stationary diesel engines, machine tools, storage batteries, power transformers, bicycles, typewriters and house service metres are the industries in which substantial production increases, ranging from 10 to 24 per cent, have been registered. The remaining industries in the first category have to their credit production increases of 25 per cent and more. These, incidentally, are electricity generation, crude petroleum, caustic soda, liquid chlorine, lead, ball bearings, sugar mill machinery, conduit pipes, railway wagons and automobiles.

In the category of consumer durables several industries have registered increases in production during the first half of 1964, as compared with the first half of the previous year. The relevant industries, with the percentage increases within brackets, are hurricane lanterns (5), electric lamps (4) and radio receivers (6). Some industries in this group have fared badly, with the result that their production has declined steeply; these are sewing machines (—75) and electric fans (—29).

As far as consumer goods industries are concerned, the ones which have registered increases in production during the first half of 1964 are salt (23), wheat flour (47), *vanaspati* (7), cotton mill yarn and cloth (4 and 2, respectively), matches (7), soap (8), and razor blades (18). In some industries in this group, production has actually declined during the period; these are sugar (—12), woollen fabrics (—39) and paper (—5).

In sum, therefore, the substantial improvement in the output of several industries has been partly cancelled out by decreases or relatively very small increases in the production of other industries. So much so, the overall rate of industrial growth in the first half of the current year has not accelerated significantly. But a redeeming feature of the situation is that the rate of growth has not markedly slowed down either.

Individual Industries

This review would not be complete without a brief reference to trends in some important individual industries other than coal, textile, sugar and plantation industries, covered elsewhere in this *Annual*. To take the iron and steel industry first. It will be seen from Table I that the production of both iron and ingot steel marginally declined in the first half of 1964, as compared with the first half of 1963, while it had increased by 25-26 per cent in the first half of 1963, as compared with the corresponding period of 1962. This comparative picture is by no means disquieting, for the new public-sector steel plants and the expanded plants in the private sector had not reached the stage of optimum utilisation of capacity in 1962. In fact, they achieved near-capacity production only in the first half of 1963; hence the big increase of 25 per cent in that period, as compared with the first half of 1962. A three per cent fall in ingot steel production in the first half of the current year serves to show that 100 per cent utilisation of capacity in the iron and steel industry is neither always possible nor, perhaps, wholly desirable.

A welcome turn for the better seems to have taken place in the sphere of power generation. That the amount of electricity generated in the first half of 1964 represents an increase of 27 per cent over that of 1963 may be noted in this connection. This compares with an increase of only five per cent in the first half of 1963, as compared with the corresponding period of 1962. Considering that there have been shortfalls in industrial targets and there have been no reports of serious power shortage in the industrial belts in the current year (ignoring, of course, the seasonal setback suffered in the generation of hydel power in the Madras State in the summer months—April, May and June—which was particularly severe this year), there can be no gainsaying that the situation has improved considerably. In fact, the second All-India power survey, carried out by the Central Electricity Authority this year, has estimated the amount of "energy available" (42.0 billion k.w.h.) to be substantially more than the amount of "energy required" (33.2 billion kw.h.) in 1964-65. Of course, there may be substantial *unsatisfied* demand over and above the level of estimated energy consumption, for the forecast regarding "energy required" is not strictly a "demand forecast" but only the possible aggregate "energy consumption" at the estimated level of actual power deliveries for ultimate power consumption. On this basis there is, of course, really no substantial surplus in energy supplies.

In the cement industry, which is of basic importance, production in the first half of the current year has not significantly increased over the level of January-June 1963. The critical cement shortage is thus a continuing phenomenon. There is no doubt that it has slowed down construction activity in all sectors of development, including agriculture.

The petroleum refining industry, on the other hand, has maintained a steady rate of growth. It will be seen from Table I that the rate of increase in the output of petroleum products has been 14 per cent in the January-June period of 1964, as compared with the corresponding period of last year. The performance of heavy chemical and fertiliser industries has, however, been quite uneven as usual. The decrease of five per cent in the production of ammonium sulphate in the period under review serves to underline the disappointing growth of fertiliser production at a time when the need for increasing fertiliser inputs is acutely felt in the sector of food production.

The growth of production of non-ferrous metals has also not been quite heartening in the current year. It is surprising that aluminium production has only marginally increased in the first half of the year, as compared with the corresponding period of last year. But, as usual, it is a redeeming feature that the general and electrical engineering industries have generally maintained steady progress during the period under review. Particular mention should be made here of the substantial production increases registered by several engineering industries manufacturing industrial machinery, machine tools, ball bearings, diesel engines, automobiles, railway wagons and bicycles. However, the progress of engineering industries, in general, would have been more impressive but for the acute shortage of foundry-grade pig-iron and rolled steel—the two most vital raw materials.

Targets of Third and Fourth Plans

As it is now reasonably clear that the average annual rate of growth in the third Plan period will be around eight per cent, as against the original target of 11 per cent, latest estimates of likely production in several industries in 1965-66 logically reveal substantial shortfalls, as compared with the respective targets. The relevant estimates, the targets laid down under the third Plan and the targets currently proposed for the fourth Plan—all taken from the Planning Commission's Memorandum on the fourth Plan—are given in Table II. It will be seen from the figures in this table that, in most industries there will be varying shortfalls in actual production, as compared with the relevant third Plan targets. The fourth Plan, which will thus start at a comparatively lower industrial base than what was originally contemplated, is, however, designed to achieve relatively much bigger targets in the sectors of power, organised industry and mining, and transport. This is on the assumed basis of an aggregate investment of Rs. 11,250 crores during the period 1966-71 in both the public and private sectors. A sector-wise and industry-wise break-up of the proposed aggregate outlay is given in Table III. It will be seen that, as far as organised industry and mining are concerned, the outlay of Rs. 2,400 crores set for the private sector under the fourth Plan will open out a broader vista of opportunities for private enterprise.

Table III: *Fourth Plan Outlay on Power, Transport and Organised Industry*

(In crores of rupees)

STAGNATION IN AGRICULTURE CONTINUES

Grim Situation For Food And Raw Materials

SINCE the beginning of the third Five-year Plan, agricultural production in India has continued to stagnate year after year. The last crop year (July 1963-June 1964) was the third consecutive year of stagnation. There was an all-round shortage, both of foodgrains and raw materials, resulting in larger imports of foodgrains and substantial decline in the exports of many raw materials and agricultural-based industrial products. As agriculture continues to be the mainstay of the economy, providing employment to nearly 60 per cent of the population and accounts for 45 per cent of the national income of the country, continued sluggishness in this key sector has become a matter of concern. Against a rise of 30 per cent, projected for the third Plan period, both for agricultural production and national income, the actual rise during the first three years of the Plan period has been less than one per cent in agricultural production and nearly ten per cent in national income. The poor performance of agriculture has not only had a direct effect on national income, by contributing a lower percentage to it, but also contributed to slower growth of industrial production, due to shortages of raw materials; it thus had an indirect effect too on the national income growth.

Agricultural production is a factor of area and yield. In a country like India, where the proportion of forest area to total land is one of the lowest in the world and the pressure for housing and industrialisation increases year after year, it is not possible to increase the area under cultivation by any perceptible degree. For any increase in production in India, improvement in yield per acre is thus the only determining factor. Unfortunately, instead of showing any rise, the per-acre yield of foodgrains has gone down during the last three years. As compared with the previous year, yield in 1961-62 was lower by 1.4 per cent. In 1962-63 it receded further by four per cent. Although there was some recovery in 1963-64, it was not sufficient to take care of the decline even in the previous year. The result was that at 666 kgs. per hectare in 1963-64, the yield was less than four per cent of 713 kgs. in 1960-61—the base year of the third Plan. It was because of over two per cent increase in area (from 113.4 million hectares in 1960-61 to 115.8 million in 1963-64) that the production—at 79.4 million tonnes in 1963-64—did not fall by more than two per cent. But even this marginal decline created conditions of scarcity. As the population during the last three years increased by eight per cent, the per capita availability of indigenous foodgrains came down by nearly ten per cent.

Rice Sluggish; Wheat Declines

About forty per cent of the production of foodgrains is accounted for by rice. The variations in the production of this commodity, thus, play an important role in the total production of foodgrains. As compared with 33.6 million hectares in 1960-61, the area under rice was higher at 34.9 million in 1962-63 and 35.5 million in the following year—nearly six per cent more than that in 1960-61. The corresponding figures of production (in tonnes) have been 34.2 million, 31.9 million and 36.5 million—a rise of about seven per cent in three years. The yield during this period improved by one per cent—from 1,018 kgs. per hectare to 1,029 kgs. It may be seen that 1962-63 was a very bad year for rice crop, when both production and yield recorded substantial fall. Compared to this abnormally poor year, 1963-64 was much better. Although the area was also higher by 1.7 per cent, the yield improved by thirteen per cent and production by nearly fourteen per cent. But since 1963-64 succeeded an exceptionally lean year, there was no relief on the food front.

Wheat is the next important cereal and contributes twelve per cent to the total production of foodgrains. The area under wheat rose from thirteen million hectares in 1960-61 to 13.7 million in 1962-63, but came down to 13.3 million in the following year. Yield improved from 847 kgs. per hectare in 1960-61 to 890 kgs. in 1961-62 and production by one million tonnes to twelve million tonnes. In the following two years, however, there was a drastic cut, both in yield and production. The yield came down to 793 kgs. in 1962-63 and a further 730 kgs. in 1963-64 and production to 10.8 million tonnes and 9.7 million tonnes, respectively. As compared with the base year of third Plan, the wheat crop in 1963-64 was shorter by 1.3 million tonnes; and, as compared with 1962-63, by 1.1 million tonnes.

Other Cereals Also Recede

The area under *jowar*—which is only slightly less important than wheat—recorded a rise year after year, the total increase during the last three years being 887,000 hectares or five per cent, reaching 18.2 million hectares last year. In spite of this larger area, production came down sharply from 9.4 million tonnes in 1960-61 to 7.7 million in the following year, and the yield from 542 kgs. per hectare to 435 kgs. In 1962-63, there was an almost equally fast rise to 9.6 million tonnes and 534 kgs. But there was again a fall last year to 9.2 million tonnes and 508 kgs. As compared with 1960-61, the crop last year was poor, both in terms of production and yield.

All the other cereals put together were only slightly better. The area declined gradually by four per cent in the last three years—from 26.2 million hectares in 1960-61 to 25.1 million in 1963-64. The production—at 14.8 million tonnes in 1961-62—was considerably larger than 13.8 million in the previous year. But most of this gain was lost in the following years, when it was lower at 14.6 million and further at 14.1 million. The fast fall in the production and yield of barley was largely responsible for it. Although area under barley decreased from 3.2 million hectares in 1960-61 to three million in 1962-63 and 2.8 million in 1963-64, production fell at a faster pace from 2.9 million tonnes to 2.4 million and two million, respectively, because of a decline in the yield per hectare from 888 kgs. to 802 kgs. and as low as 710 kgs.

Pulses Were the Poorest

The poorest performance, perhaps, took place in case of pulses. The area moved only marginally and stood at 23.8 million hectares last year. The production and yield have, however, been declining continuously. From 12.6 million tonnes in 1960-61, production dropped to 11.4 million in 1962-63 and as short as 9.9 million in 1963-64 and yield from 541 kgs. to 477 kgs. and 415 kgs.—a fall of 23 per cent in three years. This decline was 38 per cent in case of tur and 27 per cent for gram.

The sum total of all these performances has been that, in spite of a rise of two per cent in the area under foodgrains during the last three years, production receded by nearly two per cent and yield by four per cent. As compared with 1962-63, the betterment of production and yield was marginal at less than 1.5 per cent.

Oilseeds No Better

Whereas foodgrains account for two-thirds of the total agricultural production in India, oilseeds are the next in importance with nearly ten per cent. During the last three years, the area under oilseeds advanced by eight per cent or over one million hectares, reaching a total of 14.6 million hectares in 1963-64. The yield per hectare remained more or less unaltered at 490 kgs. and the production, as such, moved parallel to the area, rising from 6.6 million tonnes to 7.1 million—both in 1962-63 and 1963-64. Groundnut is by far the most important crop, accounting for a little less than half of the total area and about three-fourths of the total production. The area under groundnut increased from 6.3 million hectares in 1960-61 to 6.9 million in 1962-63, declining marginally to 6.8 million last year. The production increased continuously from 4.5 million tonnes to 4.8 million and 5.3 million, respectively. The yield, which had come down from 712 kgs. per hectare in 1960-61 to 702 kgs. in 1962-63, increased at a fast rate in the following year to 778 kgs. But there was an equally sharp decline in another important item—rapeseed and mustard. Production was lower from 1.36 million tonnes in 1960-61 to 1.29 million in 1962-63 and only 909,000 in 1963-64 and yield from 472 kgs. to 416 kgs. and as low as 303 kgs. As oilseeds are mostly interchangeable for consumption, the poor crop of rapeseed and mustard put larger pressure of demand on groundnuts and other oilseeds, creating a strong sellers' market.

As against 2.35 million hectares in 1960-61, the area under sugarcane was lower at 2.28 million in 1962-63 and 2.21 million in the following year. Production (in terms of *gur*) also receded from 10.6 million tonnes in 1960-61 to 9.5 million in 1962-63, though it recovered partially to 10.3 million in 1963-64. Thus, during the last three years, the area shrank by six per cent and production by three per cent; the yield being slightly better by about two per cent—being 4.63 tonnes per hectare in 1963-64. In the face of a fast expanding population and higher standards of living, a stage has come when production of sugar is insufficient to meet the demand for consumption and exports.

Fibres Slightly Better

Production of cotton in India is substantially short of the requirements of textile industry. A considerable quantity is imported every year to fill the gap and prices in recent years have remained high; in the case of some varieties, prices were well above the world parity. In the face of all this, it is not surprising that the area under this crop has been increasing continuously, rising from 7.64 million hectares in 1960-61 to 7.85 million in 1962-63 and 7.92 million in the following year. The production, however, did not behave so favourably. From 958,000 tonnes in 1960-61, it came down to 956,000 in 1962-63, but increased to 977,000 in 1963-64. Thus, as against a rise of about four per cent in area during the first three years of the third Plan period, the rise in production was only two per cent, the yield falling from 125 kgs. per hectare in 1960-61 to 122 kgs. in 1962-63 and 123 kgs. in 1963-64.

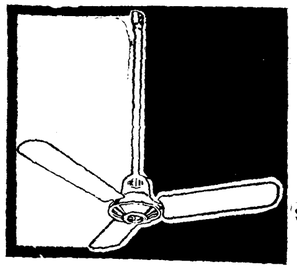
Jute and mesta are, perhaps, the only crops recording a rise of nearly fifty per cent in production in three years' period. From 722,000 tonnes in 1960-61, production of jute improved to 981,000 tonnes in 1962-63 and 1,072,000 tonnes in 1963-64. But this 48 per cent increase in production was mainly due to a rise of over forty per cent in area—from 612,000 hectares in 1960-61 to 862,000 in 1963-64, the yield improving by only five per cent to 1.24 tonnes per hectare. The position of mesta was relatively better; the area advanced by about forty per cent to 385,000 hectares, production by sixty per cent to 327,000 tonnes and yield by fifteen per cent to 850 kgs. The production of plantation crops improved by four per cent during the last three years, the index of production rose from 135.1 in 1960-61 to 140.7 in 1963-64. But all of this rise took place in the first year of the Plan period and stagnation prevailed during the rest of the period.

Imports of Foodgrains and Prices

Due to the poor performance of agriculutre since 1961-62, imports of foodgrains have increased considerably. As 1960-61, was a comfortable year, the imports in 1961-62 had come down. But there was a fast rise in the following two years. From 2.08 million tonnes in 1961-62, the imports of wheat increased to 2.61 million in 1962-63, and 2.85 million in 1963-64. During the current year, they are expected to be more than double at 5.81 million tonnes. In the case of rice, the imports rose from 318,000 tonnes in 1961-62 to nearly 430,000 tonnes in 1963-64 and are expected to be 586,000 tonnes in 1964-65. These imports in the current year are estimated to cost approximately Rs. 300 crores.

Even this fast rise in imports was insufficient to take care of the shortages in production and a larger demand, due to an ever-expanding population. Thus, there has been a decline in the per capita availability of foodgrains which fell from 16.2 ozs. in 1961 to 16.0 ozs. in 1962 and 15.3 ozs. in 1963 and may be no better in 1964. Prices of foodgrains also increased at an unprecedented pace. With 1952-53 as base, the index number of wholesale prices for rice, which stood at 105 in 1961-62, and had advanced to 111 in 1962-63 and 125 in 1963-64, rose from 122 in March this year to 146 in September—a rise of twenty per cent in six months. In the case of wheat, the rise was twelve per cent. But, whereas the prices of rice declined marginally in October—due to the partial arrival of new crop—the rising tendency in wheat persisted, the index number being higher by one percentage point. The

FARE BETTER WITH METRO FANS



Here's how. They are the FIRST and only fans (900 mm. and 1200 mm. Sweep) approved by Indian Standards Institution-proof of dependable performance. They consume less electricity; so save on your electricity bills.

That is the Metro know-how in manufacture. Make your choice of Metro fans from a wide range of sizes and modern designs-all sleek in finish.

prices in the six months advanced by 32 per cent in the case of pulses, 36 per cent edible oils and 23 per cent sugar and *gur*.

What have been the causes for stagnation in agriculture? The most important reason has been the continuously adverse weather conditions during the last three years, which came in the way of higher agricultural production and exposed the continuing dependence of Indian agriculture on weather. The rainfalls in India are divided into four seasons. The Pre-Monsoon Season, which extends from March to May, accounts for ten per cent of the total rainfall in the year. These showers are important for the sowing of *kharif* crop in north-east India, particularly for autumn rice and jute. Although rains were deficient in March last year in Assam and West Bengal, April and May were practically normal and sowing conditions were more or less satisfactory. The South-west Monsoon Season—June to September—is, however, by far the most important. 75 per cent of the total rains fall in this period, affecting 80 per cent of the total cropped area in the country. This season was, on the whole, favourable in rice-growing areas, but most of the other *kharif* crops suffered due to deficient and untimely rains. The result was an improvement in rice, jute and mesta, although in the case of many other crops the yield was lower.

Post-monsoon season starts on 1st October and closes with the close of the calendar year, and accounts for 13 per cent of the total rainfall in the year. These rains are generally received only in the eastern, southern and south-western parts of the country—other regions getting only light showers. But even these light showers play an important role in the growth of late *kharif* crops and in sowings of *rabi* crops. Generally speaking, these rains were not favourable in 1963-64 in the northern States, namely, the Punjab, Uttar Pradesh, Rajasthan and Madhya Pradesh. The Winter Monsoon Season, which covers the months of January and February, gets only two per cent of the total rains—the life-blood of *rabi* crops and vital for their proper growth. Out of the 31 Rainfall Divisions into which the country has been divided, seven divisions received no rains, sixteen had scanty rains (60 per cent below normal), five were in the deficient category (20-59 per cent below normal) and only three unimportant divisions, namely Bay Islands, Himachal Pradesh and Orissa, had normal rains. There were also cold waves in January in some parts of northern India. Thus, *rabi* crop had both a poor sowing season and a poor growing season and, consequently, the yield in the case of most of the crops like wheat, gram etc., came down by substantial degrees.

The second, and perhaps equally important, factor has been the poor performance in the matter of agricultural inputs. The six per cent per annum growth in agricultural output, laid down for the third Plan period, was based on a certain amount of increase in inputs like irrigation, soil conservation, fertilisers and manures, better seeds and implements and plant protection measures. It was proposed to increase the area under major and medium irrigation schemes by 12.8 million acres. The actual coverage during the last three years has been no more than 3.9 million, that is, less than one-fourth. In the case of minor irrigation, for which another equivalent target of 12.8 million was laid down, the coverage was comparatively better at 6.8 million, though far behind the schedule. Thus, during the first three years of the five-year period, the irrigation facilities were made available to an additional 10.7 million acres, against the Plan target of 25.6 million acres, the achievement being equivalent of only 40 per cent of the target.

It is believed that, even with the optimum utilisation of irrigation facilities in the country, there would still be left a large area of 140 to 150 million acres, where increases in output will have to be attained mainly through soil conservation and improved dry farming practices. The third Five-year Plan aimed at a substantial extension of these activities. It was proposed to cover an area of 11 million acres of agricultural lands with soil conservation measures, while 22 million acres were to be brought under better dry-farming techniques. The coverage under soil conservation measures during the last three years has been 4.2 million acres—38 per cent of the target. In regard to dry farming, whereas the data for 1963-64 are not available at the time of writing, the coverage during the first two years was 4.9 million acres or 22 per cent of the target.

Fertilisers and Insecticides

Fertilisers and manures are among the key supplies, necessary for raising agricultural productivity. About 40 per cent of the third Plan target for increased foodgrains production was envisaged to be achieved by the use of fertilisers and manures. The increase in consumption during the last three years was, however, far from satisfactory. Consumption of nitrogenous fertilisers was proposed to be raised from 210,000 tonnes of nitrogen in 1960-61 to over one million tonnes in 1965-66. Whereas the demand has been rapidly increasing in recent years, it has not been possible to meet it in full due to lack of adequate production and imports. In 1961-62, the demand for nitrogenous fertilisers was 534,000 tonnes (*N*) while the supply amounted to 281,000 tonnes. In 1962-63 the demand rose to 590,000 tonnes, supply improving to 350,000 tonnes, and in 1963-64, whereas the demand is estimated to have been at 687,000 tonnes, the supply was only 460,000 tonnes—equivalent of two-thirds of the demand. Out of the anticipated rise in production of nearly 800,000 tonnes (*N*) in five years, the actual rise in three years has been no more than 250,000 tonnes—less than one-third of the projected growth. The consumption of phosphatic fertilisers was also no better. From nearly 50,000 tonnes in 1960-61, it rose during the next two years to 80,000 tonnes in 1962-63—still a long way left to reach the target of over 400,000 tonnes in 1965-66.

In order to supplement supplies of chemical fertilisers, it was proposed to intensify measures designed to increase the utilisation of local farm manurial resources. The consumption of urban and rural compost was proposed to be raised from 87 million tonnes in 1960-61 to 157 million tonnes and the area under green manure from 12 million acres to 41 million. As against these targets, the utilisation of compost in 1963-64 rose to only 103 million tonnes and the area under green manures to 20.5 million acres. Thus, here too performance has been behind schedule.

Plant protection measures have been accorded the status of a major development programme under the third Five-year Plan. The target for this is to increase the coverage from 16 million acres in 1960-61 to 50 million in 1965-66. Steps were proposed to be taken to increase the supplies of insecticides, pesticides, sprayers and dusters and other plant protection equipment to the farmers. The greater the importance of this measure, the poorer has been its progress. From 16 million acres in 1960-61, the area covered under plant protection measures reached only 20 million acres last year. This means that, as compared with the target to increase the area by 34 million acres, the actual rise in three years was four million acres—a 12 per cent achievement in 60 per cent of the Plan period.

In view of the importance of better quality seeds for raising the yield, an additional area of 148 million acres was proposed to be brought under improved seeds. The coverage so far has been 39 million acres—nearly one-fourth of the planned area.

It will thus be seen that inputs in agriculture during the first three years of the third Plan have been substantially short of the targets and this, in turn, must have been instrumental to a large extent in retarding the progress of agricultural production.

There is hardly any scope left for raising the area under cultivation in India. Nevertheless, 2.3 million acres of additional land was reclaimed for cultivation during the last three years. The volume of inputs also increased, although the rise was far short of expectations. Moreover, in spite of the fact that 1963-64 was not a favourable season for agriculture, the meterological data show that it was not as bad as 1961-62; at any rate, it was not worse. Then, what is the reason for the index of agricultural production in 1963-64 remaining almost unchanged (there was actually a decline of 0.6 per cent) at the same level as in 1961-62? Have all the additional efforts and investments, made during this period, gone down the drain? There are reasons to believe that it has been so.

Unco-ordinated Efforts Deliver No Goods

It has now been proved beyond doubt that maximum advantages can be derived from agricultural inputs only when they are applied in the form of a 'package.' The validity of this argument is well illustrated by the growth of production in areas covered by the Intensive Agricultural District Programme (also known as Package Programme), where the approach of concentrating administrative talent, technical expertise and supplies of important inputs has shown very encouraging results. Applied individually, the benefits of these inputs may be negligible or *nil* and may sometimes be even harmful to the crop. For example, if fertilisers are applied to the soil without adequate irrigation facilities, or exposed to irregular rainfall, the crop may be thinner than normal. It is doubtful whether this factor was given adequate consideration at the time of laying down the targets of agricultural growth. The growth of inputs during the last three years has, however, not shown any integrated pattern. Agriculture being a State subject, whereas irrigation facilities increased in one State, the distribution of fertilisers improved in a second State and improved seed were made available to the farmer in a third State. Even in the same State, various needs of cultivators are dealt with by different Government departments, and these departments are so watertight that they generally do not know the activities of one another. This lack of co-ordination has resulted in, by and large, wastage of effort and investments in agriculture.

Current Season

The current agricultural season (1964-65) has been comparatively better so far. *Kharif* crop has already come in the market. Although no reliable data have yet become available regarding the size of the crop, the indications are that the production of most of the foodgrains has increased. The rise is, however, not substantial. Production of rice is estimated to have gone up by one million tonnes—a less than three per cent increase over last year's crop. Production of other *kharif* cereals is reported to be only "somewhat

Table I: All-India Final Estimates of Principal Crops

	Area (thousand hectares)			Production (thousand tonnes)			Yield (kgs. per hectare)

For Any Service Involving Money

THE

STATE BANK OF TRAVANCORE

(Subsidiary of the State Bank of India)

Head Office: TRIVANDRUM

With 117 Branches mostly spread all over Kerala and having agency and drawing arrangements with all the 1,644 Branches and Sub-Offices of the State Bank of India and its Subsidiaries, the Bank offers complete Banking facilities. ACCEPTS GIFTS AND DONATIONS FOR THE NATIONAL DEFENCE FUND AT ALL OUR BRANCHES.

DEPOSITS

The Bank Now Offers 6¾ per cent Maximum For Term Deposits

Savings Bank Accounts are opened with an initial deposit of Rs. 10 and interest allowed at 3 per cent per annum upto a maximum of Rs. 50,000. Withdrawal by cheques, twice a week, upto Rs. 5,000.

Minors over 14 years of age can open and maintain Savings Bank Accounts in their own names with balances upto Rs. 1,000.

ADVANCES

The Bank grants all types of advances against Government Securities, Post Office Cash Certificates, Gold Ornaments, Shares, Life Insurance Policies, Foodgrains Warehouse Receipts—in short, any standard commodity which is readily marketable.

Medium Term Finance and Financial assistance to Small Scale Industries, and Co-operative Marketing and Processing Societies at specially reduced rates.

K. C. KURUVILLA,
General Manager.

higher." The total rise in *kharif* foodgrains is not expected to be more than 3-4 per cent. Even this increase is reported to be mainly due to a rise in the area under cultivation. The overall *kharif* crop estimate, according to a statement of the Union Food Minister in the Lok Sabha on 1st December 1964, "is expected to be higher than the average production in the last three years in most parts of the country."

With the *rabi* crops still to come, no kind of estimate can be given for the overall food crop for current year (*July 1964 to June 1965*). The sowings are, however, reported to be good and it is, perhaps, on this basis that the President of the Foodgrains Dealers' Association expects the total production during the year at 85 million tonnes. The estimate seems to be rather optimistic and its accuracy will depend on favourable weather in the months of December, January and February. But even at 85 million tonnes, the increase over 1963-64 will be no more than six per cent—the annual rate of growth envisaged in the third Plan—leaving the gap of the last three years untouched.

As for other major crops, groundnut production is reported to be higher by 5-6 per cent. No estimate for sugarcane is available so far, but the crop is confidently expected to be distinctly better than last year's. Cotton crop, on the other hand, is said to be slightly smaller by 1.5 to 2 per cent. On the whole, the rise in agricultural production during 1964-65 is expected to be only modest and may not reach the annual target of six per cent growth.

The Planning Commission has made some estimates of agricultural production for the last year of the third Plan and it would be relevant to recall them here, in the context of the outlook for food production. Foodgrains production is expected to reach 92 million tonnes, as against the original target of 100 million tonnes. On this basis, a target of 120 million tonnes has been laid down for the fourth Plan. The production of cotton in 1965-66 is expected to be 6.34 million bales, as against the original target of 7.06 million bales. The proposed target for the fourth Plan is 8.50 million bales. The corresponding figures for oilseeds are: 7.50 million tonnes, 9.82 million tonnes and 10.00 million tonnes, respectively. The estimates for 1965-66 are optimistic, if the experience in the first four years of the current Plan is any reliable indication of the country's ability. But, if production does not come up to this level, the base of the Fourth Plan will be weaker and the targets for 1970-71 will appear to be the dream of a visionary.

Planned and Increased Inputs

Planning for agriculture does not simply mean the laying down of targets for agricultural production. It is an intricate process involving the production and creation of many other goods and facilities, which determine the growth of agriculture. As the creation of these agricultural determinants depends on many other factors, a complete and integrated study of agriculture, according to the input-output analysis, is necessary.

Irrigation, of course, plays a major role in agriculture. Fortunately, nature has blessed this country with vast resources of water in the form of perennial rivers and low levels of subsoil waters. The need is to harness these resources for human welfare Out of a total of 330 million acres of crop area, 120 million acres do not need irrigation. Irrigation facilities are at present available for 80 million acres which is equal to 38 per cent of the 210 million acres requiring irrigation. Since the beginning of planning in this country, attention has been given mainly to large irrigation projects. In the case of medium and small projects, there has been negligence even in regard to maintenance of the existing tanks. But some of the States have now exhausted their potential of large projects. Moreover, billions of rupees are required for each of these monsters of cement and steel and the gestation period is also considerable. It is welcome to note, in this context, that the seminar on irrigation, held at Trivandrum in October this year, decided to speed up the work on 340 medium irrigation schemes, whose completion would help irrigate 44 million more acres. The seminar laid down a target for increasing the irrigated area by 20 million acres to 100 million acres within five years (by October 1969). If this target were hit, about half of the area in need of irrigation would be covered. But the creation of new irrigation potential is not everything. It is equally important to ensure that the facilities are used promptly and economically. As pointed out by the Union Minister, Mr. C. Subramaniam, the need is to convert the present P.W.D.-oriented irrigation into agriculture-oriented irrigation. The irrigation regulations which are of the eighteenth and nineteenth centuries, must also be changed to achieve this aim.

The importance of fertilisers can be assessed from the fact that even without using tractors, or even (in most cases) ox-ploughs, Japan has obtained nearly four times as much rice per acre as India, mainly due to a scientific application of fertilisers. It is in view of this importance of fertilisers that a target of 2.2 million tonnes of N and 1.0 million tonnes of P_2O_5 has been fixed for the fourth Plan. Fertiliser plants take generally five to six years to go into full production. This means that, in order to achieve the target, plans for the installation of new plants should be vigorously pursued without any further delay. It is encouraging to find that the Government of India is negotiating with a consortium of American firms to establish five fertiliser plants in this country, which would, together, enable the production of an additional one million tonnes of nitrogen. It is to be hoped that no ideological considerations by the Government would stand in the way of these initiatives yielding positive results.

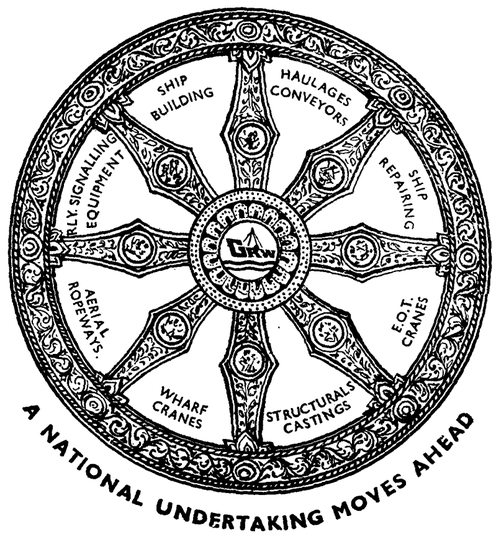
Substantially larger efforts will also be required in the field of better seeds, improved implements, pest control, etc. And, what is more, all these inputs should be made available to the cultivator in a planned form, in the form of packages, so that the maximum benefit can be derived out of them. With the proper and adequate distribution of irrigation and manuring facilities, it would also be possible to extend substantially the area sown more than once—against only 14 per cent now—and thereby increase the production considerably.

The Government has already fixed producers' prices for foodgrains at a remunerative level, and it is to be hoped that the farmer would now be able to concentrate wholeheartedly on growing a better crop and not worry about the future prices of his produce.

There is no need to adopt a defeatist attitude in regard to the performance of agriculture, simply because in the last three years it was discouraging, and to think that agriculture in India has reached a saturation point, with no vast scope for further improvements. If efforts are made in right earnest, it is definitely possible to raise a substantially better crop. This assessment is based on the fact that, in crop competitions, Indian farmers have obtained yields more than ten times higher than the all-India average. To achieve this, however, considerably greater attention will have to be paid to the most important factor—the human factor. Hitherto, not much has been done in this direction, in spite of the so-called Community Development projects. All policies and planning should ultimately aim at increasing the farmer's response to accept the facilities that are created. The farmer should be made aware of what improved farm practices can do, namely, larger production, more money and better living standard. He should be made conscious of his capacity to raise production. One way to do this is to make the farmer literate, and the importance of this measure can in no way be exaggerated. Another way is to hold production-raising demonstrations in every village and on the field of the farmer, under the conditions almost similar to those which prevail in the village and under the limitations which the farmer has to face. A few demonstrations, here and there, away from the farmer's field and under unidentical conditions, only serve to create a suspicion in the mind of the cultivator and are not conducive to success.

There is great need for a general spread of entrepreneurship in agriculture, an urge to make cultivation a business proposition. Agriculture, however, being largely non-monetised in this country, it has not been possible for the cultivator to assess the actual profit by applying different measures in cultivation and by growing different crops on the same field. This results in a large area being sown by such crops for which it is not suitable, thereby giving low yields. Government can, however, guide the farmer and induce him—for his own benefit—to grow only that crop which is most suitable for his land. For this, the imperative need is to give individual attention to each farm or at least to each village, and to bring down planning to the village level.

WHEEL OF PROGRESS



Contributing to both Indian Industry and international shipping, Garden Reach Workshops continue to expand its manufacturing lines and engineering services.

1964—A YEAR OF EXCELLENCE IN EXPORTS

But Need For Vigour And Vigilance Remains As Urgent As Ever

BY R. J. VENKATESWARAN

IN his address to the Export-Import Advisory Council meeting in September this year, Mr. Manubhai Shah expressed confidence about India's ability to achieve the third Plan's export target of Rs. 3,800 crores. Since then, export statistics have revealed more encouraging trends. The figure for September, the latest month for which statistics are available at the time of writing, was Rs. 75.67 crores. This was about Rs. 8 crores more than that of the preceding month and Rs. 14 crores more than that of September 1963. At this rate, exports in 1964 were running level of Rs. 900 crores, as compared with Rs. 600-Rs. 620 crores per year during the first two Five-year Plans. Even on the basis of the average of monthly exports in the first nine months ended September, total exports for the whole of 1964 works out to Rs. 820 crores, that is Rs. 200 crores above the annual average in the first two Plan periods. This is, indeed, gratifying. It is often said that taxation is the only sphere in which the third Plan target has been exceeded. So if Mr. Manubhai Shah could show that the target could be surpassed in a difficult field like export, it is surely an achievement on which the Government of India, and the Commerce Minister, in particular, deserve congratulation. But excessive optimism may prove premature. We have yet to cover fifteen months more for completing the third Five-year Plan and we do not know how exactly the U.K.'s 15 per cent import surcharge would affect our export earnings. The Commerce Minister has estimated that India may lose about Rs. 10 crores per year on account of the surcharge, the actual amount depending on the duration of the levy. It remains to be seen, therefore, to what extent India will be able to achieve the third Plan's export target.

End of Stagnation

But, on the basis of recent performance, the country has, indeed, cause for satisfaction. The Planning Commission stated at the commencement of the third Five-year Plan that, over the decade 1950-60, India's exports, on the whole, had been stagnant. Over the decade, the total world export trade had doubled but India's share in it fell from 2.1 per cent in 1950 to 1.1 per cent in 1960. But, in the last two years, the situation has changed. The era of stagnation seems to have ended and the export trade has entered a period of vigorous expansion. As Mr. Manubhai Shah said in the Rajya Sabha on 26th November 1964, Indian exports during this latest period have risen much faster than the rate of growth of the overall world export trade. He revealed that the rate of growth of Indian exports was three times that of world rate and 2.5 times the rate of advanced countries like Japan. This is commendable, especially in view of the fact that only 17 per cent of our export trade is covered by assistance schemes. It is significant that, in the current calendar year, almost every month Indian exports were much higher than in the same month of 1963. This will be clear from Table I.

Jute Goods: Targets Surpassed

Analysing the trend in terms of a few major commodities, we find that the export of jute goods has been most encouraging. The third Five-year Plan had fixed an export target of 9 lakh tonnes of jute manufactures for the last year of the Plan. But this was exceeded in 1963-64 itself when exports amounted to 9.13 lakh tonnes valued at Rs. 157 crores, as compared with 8.44 lakh tonnes valued at Rs. 148 crores in the preceding year. We had a record production of jute goods at 13.34 lakh tons, in 1963-64, as compared with the Plan's target of 13 lakhs tons. The progress achieved in the production of carpet-backing cloth used for manufacturing tufted carpet has been remarkable. During the last ten years, the jute industry has installed about 2,600 carpet-backing looms. Another 500 of these looms, it is estimated, will have been set up by 1965-66 and a further 1,000 looms by the end of the fourth Plan. Production at present is of the order of 110,000 tonnes per annum and the entire output is exported to the U.S.A. The official figures given in Table II show the trend in the production and export of carpet-backing cloth.

No doubt we have to contend with increasing competition from Pakistan and from substitutes, but, if the Government of India and the Government of West Bengal take care to provide the industry with adequate quantity of raw jute of the right quality at fair prices and if the demand for power is also fully met, there should be no serious danger to export. In the coming months, attention has to be concentrated on increasing substantially the yield of raw jute per acre, on evolving new uses for jute, on diversifying the pattern of production, on improving the quality and durability of jute bags, and on carrying out market surveys on scientific lines. It may be recalled that the Estimates Committee of the Lok Sabha, which submitted its report in March 1964, had pointed out that market surveys for jute exports had been "somewhat inadequate and were not made on a proper scientific basis."

Tea: Scarcity of Funds

Tea exports in 1963-64 earned Rs. 123.40 crores as compared with Rs. 129.00 crores in the preceding year; and in the first quarter of 1964-65, the earnings were Rs. 11.55 crores against Rs. 13.40 crores in the similar period of the previous year. Despite its crucial importance to our economy and export, the tea industry has not been developed properly and, at a time when it needs large funds for expansion, it is unable to find them. The industry, it is estimated, will have to undertake new plantings of 24,000 acres per year to achieve a steady increase in production. The Government should, therefore, implement expeditiously the recommendations of the Committee on Tea Finance. The Committee is reported to have suggested that expenditure on re-planting and new planting should be regarded as revenue expenditure and that the excise on exports should be refunded. If, in addition, the authorities refrain from imposing on the industry further burdens in the form of amenities to labour unrelated to productivity, the industry will be in a better position to improve its output and export.

Cotton Textiles: Better Performance

Higher exports by cotton textiles are another bright feature in our export trade. In 1961-62 and 1962-63 cotton textiles earned Rs. 48.40 crores and Rs. 51.90 crores, respectively. But, in 1963-64, the earnings went up to Rs. 54 crores. In the first quarter of 1964-65, cotton textiles earned Rs. 16 crores, against Rs. 12 crores in the similar period of 1963-64. Though the industry has improved its exports, it has to be assisted actively to expedite its programme of modernisation. A recent United Nation's Survey has revealed that one-third of India's cotton spindles are forty years old and less than one-tenth of her cotton looms are automatic. It has pointed out that modernisation would be a very costly and lengthy process. But Japan is well on the way to full modernisation of its cotton textile industry and her mills have plans to scrap about 15 per cent of their spindles during the next three years. Cotton textiles are more vulnerable to foreign competition and so the Government of India and the industry should give particular care to see that nothing is done to reduce its competitive capacity.

New Rivals in Manganese

Among mineral exports, iron ore did better in 1963-64 than in the preceding year. Its export earnings were Rs. 36 crores which were Rs. 1 crore more than in the previous year. The Commerce Ministry expects that exports in the current fiscal year would be about Rs. 5 crores more than in 1963-64. But the outlook for manganese ore does not appear very encouraging. Its export fell from Rs. 7.88 crores in 1962-63 to Rs. 6.72 crores in 1963-64, though in the first quarter of 1964-65 the exports were higher at Rs. 3.09 crores against Rs. 1.68 crores in the corresponding period of 1963-64. The larger exports are attributed to barter deals. But it is significant that, of late, Indian manganese ore in the U.S. market has to contend with new competitors. In the first five months of 1964, for instance, Gabon supplied to the U.S.A. 52,923 short tons and Ivory coast 22,588 tons of manganese ore. Both these countries had no share in the U.S. imports of manganese ore in 1963. India exported to the U.S.A. 114,414 short tons in January-May 1963, but, in the corresponding period of 1964, there was a sharp decline to 27,777 short tons.

Vegetable oils and oilcakes are also major items of exports, earning Rs. 13.40 crores and Rs. 31.10 crores in 1962-63 but, in the next year, there was a sharp increase to Rs. 20 crores and Rs. 35.37 crores, respectively. The export of vegetable oils was stopped from July this year owing to scarcity but the export of oil cakes is officially estimated to bring about Rs. 35 crores in 1964-65 also.

Traditional items continue to dominate our export trade and the non-traditional goods have made hardly any headway except sugar. Export earnings from sugar amounted to Rs. 26.10 crores in 1963-64 against Rs. 17.30 crores in the previous year and in the first quarter of 1964-65 the figure was Rs. 13.32 crores against Rs. 12.72 crores in the similar period of 1963-64. But owing to sugar scarcity, the export has been sharply cut and so the earnings in 1964-65 will be substantially smaller. The trend in the export of some non-traditional items is shown in Table III.

Direction of Trade

So far as the direction of trade is concerned, a major change has been the phenomenal increase in the exports to East Europe, particularly to Russia. From Rs. 3.28 crores in 1953 our exports to East Europe rose to over Rs. 100 crores in 1963 and in the current year, they are expected to reach a still higher level. The export to U.S.S.R. went up from Rs. 36 lakhs in 1953 to Rs. 48 crores in 1963. The Commerce Ministry estimates that the volume of Indo-Soviet trade in 1964 would amount to Rs. 80 to Rs. 85 crores each way. Under the new arrangements completed in November this year, both Russia and India have agreed to increase the trade further to Rs. 125 crores each way in 1965. Of the total exports from India, about 40 per cent is expected to consist of manufactured goods. Exports to Czechoslovakia, Rumania and Hungary are also to go up significantly to about Rs. 52 crores in 1965 from Rs. 41 crores in the current year.

But our export to the European Common Market has not shown any

Table I: *Trends in Trade*

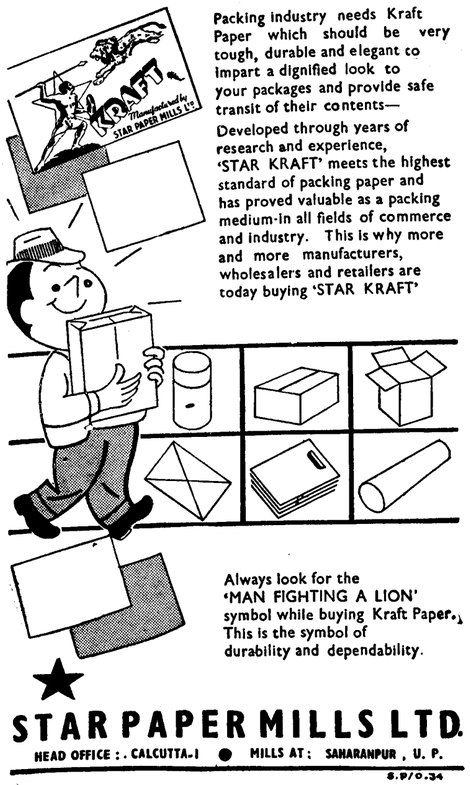
PACKING PROBLEMS - SOLVED



Packing industry needs Kraft Paper which should be very tough, durable and elegant to impart a dignified look to your packages and provide safe transit of their contents—

Developed through years of research and experience, 'STAR KRAFT' meets the highest standard of packing paper and has proved valuable as a packing medium in all fields of commerce and industry. This is why more and more manufacturers, wholesalers and retailers are today buying 'STAR KRAFT'

Always look for the 'MAN FIGHTING A LION' symbol while buying Kraft Paper. This is the symbol of durability and dependability.

significant improvement. To the E.C.M. India exported more in 1963-64 but the earnings were not appreciably higher than in the preceding year. Exports to France increased from Rs. 8.50 crores to Rs. 8.86 crores, to West Germany from Rs. 15.2 crores to Rs. 18.6 crores, to Italy from Rs. 9.5 crores to Rs. 11.2 crores, to Netherlands from Rs. 8.9 crores to Rs. 10.4 crores and to Belgium-Luxembourg from Rs. 4.5 crores to Rs. 6.5 crores. The imports from E.C.M. into India declined sharply. In the case of West Germany the decline was from Rs. 99 crores to Rs. 89 crores, Italy from Rs. 22 crores to Rs. 16 crores and Netherlands from Rs. 14 crores to Rs. 10 crores. Consequently, the E.C.M.'s adverse balance with India was reduced by about Rs. 30 crores in 1963-64 as compared with the previous year. Both to East Europe and to West Europe, the export of non-traditional items from India has made little progress.

As regards the other regions, our export to the U.S.A. went up from about Rs. 114 crores in 1962-63 to Rs. 128 crores in 1963-64, largely because of sugar whose off-take rose from Rs. 3.9 crores to Rs. 10.3 crores. But the export to the U.K. fell from Rs. 162.24 crores to Rs. 160.71 crores in this period. The export to Africa, West Asia and South Africa has revealed no new significant trends, though greater efforts are now being made not only to increase exports but also to set up joint ventures in many countries of these regions.

Import Bill

India's import bill rose from Rs. 1,127 crores in 1962-63 to Rs. 1,214 crores in 1963-64. The increase was mainly due to larger imports of foodgrains from Rs. 166 crores to Rs. 197 crores. Imports of capital goods also increased from Rs. 173 crores in 1962-63 to Rs. 192 crores in the next year and industrial raw materials and components from Rs. 696 crores to Rs. 744 crores. But the import of consumer goods other than foodgrains fell from Rs. 92 crores to Rs. 81 crores. In the coming years, the import of capital goods, raw materials and components will continue to increase because of the intensive industrialisation envisaged in the fourth Plan.

In the meanwhile, India has been making gradual progress in import substitution in capital equipment as well. The *Economic Survey of Asia and the Far East*, 1963, has pointed out some important instances of import substitution. The production of sugar machinery in India met only 5 per cent of the requirement in 1955, but, by 1962, it had gone up by 33 times, and India was even able to export some quantity. In the same period, the production of machine tools rose by 13 times, though in 1962 it was able to meet only 34 per cent of the domestic requirement while the production of textile machinery went up by 93 per cent, meeting nearly 64 per cent of the domestic needs. Other items where considerable progress has been achieved in import substitution are electric motors, diesel engines, typewriters, sewing machines, electric fans, bicycles and domestic refrigerators. The import policy at present gives priority to the requirements of defence, agriculture, basic industries and to those that are export oriented. Nevertheless, there is an imperative need to maintain eternal vigilance so as to effect savings in imports, however small and temporary.

Policy for Exports

In conclusion, it may be observed that, while foreign trade policy is, on the whole, well conceived, its implementation has yet to acquire that degree of dynamism it ought to have, considering our massive requirements of foreign exchange. There does not seem to be sufficient appreciation yet of the fact that export promotion can be really effective only when every section of the economy functions at a high level of efficiency. This means that fiscal policy, industrial policy and labour policy should be particularly geared to export promotion. But it cannot be said that these policies are being carried out in a manner helpful to exports. The increase in taxation, direct and indirect, has enormously pushed up the costs of production and made many Indian goods uncompetitive in world markets. The remarks made by Mr. J. R. D. Tata on this subject, in his address to the annual meeting of the T.I.S.Co. in July 1964, are worth recalling. He pointed out how Indian steel, among the cheapest in the world until 1955, had now become one of the costliest, although the basic elements that made up the total manufacturing costs had not materially changed in relation to those of other countries. The average price of the common categories of steel in India at the end of 1963 was more than two and a quarter times the 1948 price, one of the largest single element of increase being in excise duty which increased no less than fifteen times from Rs. 5 to Rs. 75 per ton. Mr. Tata added: "The damage caused by rising costs to the economy and to the country's long-term plans of development cannot be exaggerated. ... They have already rendered uncompetitive in world markets almost every exportable Indian product other than tea and jute, thus severely restricting our earnings in foreign exchange."

Bias Against Bigness

The implementation of industrial policy is being done with some bias against big business, forgetting the fact that, in India, the size of the industrial undertakings is quite small as compared with their confreres in the West. India's National Productivity Council recently sent a Study Team on Techniques of International Trade to West Germany, the U.S.A. and Japan and its observation on the size of exporting firms abroad is significant. "By far and large," says the Team, "export business is a large-scale operation, whether it is handled directly by the manufacturer or through a merchant. The complexities of international trade, the intensive competition in the world market, often the low margin of profit and relatively large initial capital outlay dictate that the business operation be sizable. It is not surprising, therefore, that almost everywhere the export scene is dominated by the larger industrial and business houses." The Study Team has suggested that "if Indian manufacturers and exporters are to compete effectively in the world market, they will have to match international trading houses in the strength of their organisational structure, in the scale of their operations and in the excellence of their marketing skills." That labour policy of the Government of India is also not conducive to export promotion is well known. Indian wages may be low as compared with Western countries, but many industries here have to carry the burden of surplus labour because of legislation that seeks to pamper the workers for political reasons. So if we are really serious about export promotion, official policies in regard to taxation, industrial development and labour have to be so adjusted as to give adequate encouragement to businessmen to venture forth into difficult markets in distant lands.

Effective improvement of agriculture will considerably help to strengthen the balance of payments by reducing imports of foodgrains and by increasing the competitive capacity of important export industries like jute, cotton textiles, tea and sugar. Although the investment on agriculture under the three plans has been impressive, the results have not been encouraging. It is hoped that the critical foreign exchange situation will serve to rid the country of complacency and that serious efforts will be made both by Government and by the private sector to see that development schemes in agriculture are prepared properly and carried out effectively.

Hold up at Ports

Improvement of ports, more intensive publicity, and strengthening of India's Trade Representatives in foreign countries are among the other major measures required for achieving a continuous increase in exports. The inability of ports to cope with the growing volume and variety of cargo has been a serious obstacle to our import and export trade and, generally, to our economic development. The volume of traffic in the five major ports has increased from 22 million tons in 1951-52 to about 37.5 million tons in 1962-63 but their capacity to handle efficiently all this traffic has been quite inadequate. The Union Ministry of Transport has revealed that against Rs. 110.8 crores earmarked in the Plan for increasing port facilities, only Rs. 38 crores have been spent in the first three years of the Plan. Calcutta port, in particular, which handles about 40 per cent of the export trade, has not received proper attention. The deterioration of the Hooghly river, lack of co-ordination among the different departments of the port authorities, paucity of officers with experience in port administration, indiscipline among workers and slow progress in mechanisation—all have considerably affected the efficiency of the Calcutta Port. Attempts are being made to improve the situation by intensive dredging operations, by introducing an incentive system of wages, by speeding up mechanisation and by expediting the construction of the subsidiary port at Haldia. But, unless the problems are tackled with a real sense of urgency, Calcutta, as well as the other major ports, will be unable to play their proper part in the fourth Five-year Plan.

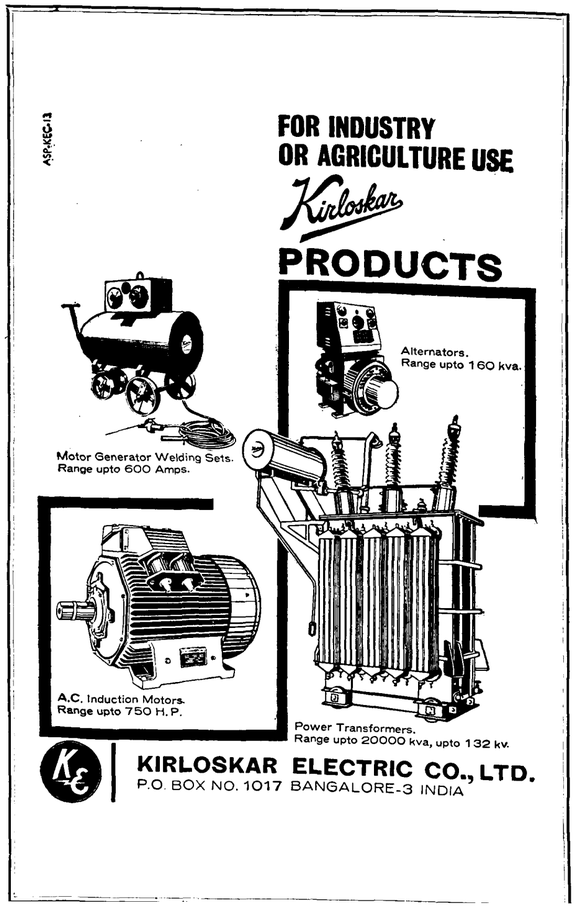
Publicity Must Improve

Publicity for export promotion has to be done on a much more comprehensive scale. Commercial publicity is now undertaken by the Directorate of Commercial Publicity, Directorate of Exhibitions, Director-General of Commercial Intelligence and Statistics, Export Promotion Councils and Commodity Boards, Indian Trade Missions, Trade Associations and Export Houses. The Directorate of Commercial Publicity is supposed to co-ordinate but it appears that this aspect of the work is not really effective. There are far too many publications, not all of them well produced, issued by various agencies, many of them duplicating the work of one another. The market surveys are not as up-to-date and comprehensive as they should be; and, generally, they do not bring out clearly the scope for more exports. Publicity in the countries of Africa, Middle East and South East Asia is inadequate, as will be evident from the very small share of Indian goods in these countries. Even in West Europe, India is still known mainly as an exporter of traditional items. Indian tea has not made headway in many countries like Australia and Iraq, chiefly because of lack of sustained publicity. We should, therefore, make better use of the press, film, radio and television media to create a good impression of our products in foreign countries.

Trade Commissioners Should Do Better

The working of India's Commercial Representatives has often been criticised in the past. Lately, there seems to be some improvement but it is not enough. Our Trade Representatives should be more alert; there should be closer co-operation between them and the commercial organisations in India; and they should be provided with adequate staff. Recently, a report from Manila said that the Commercial Secretary of the Indian Embassy in the Philippines was unable to function effectively because the Commerce Ministry had not provided him even with a stenographer. An official trade delegation that visited Latin America in 1964 disclosed that in that continent whose annual import was about Rs. 4,000 crores, Indian Missions were functioning only in three places; and none of them had a Commercial Section. It is not surprising then that India's share in the import of Latin America is only about Rs. 17 crores. It has also been revealed that, out of India's 44 Commercial Representatives posted abroad, only 13 know the language of the country to which they are accredited; and out of these, only three are working in non-English speaking countries. All this shows that a good deal more has yet to be done before we can derive full advantage from our Commercial Representatives abroad.

World trade is expanding rapidly and the advanced countries now seem to have a better appreciation of the needs and difficulties experienced by the developing nations. The Kennedy round of negotiations, if really successful, will help to reduce the tariff barriers and also mitigate the severity of non-tariff barriers like internal taxes, quotas, mixing regulations, customs valuation procedures, anti-dumping regulations, and so on. But India can benefit from these favourable factors, only if the economy expands vigorously and production in field and factory records a continuous increase both for domestic markets.



Over 100 Years of Banking in India

NATIONAL AND GRINDLAYS BANK LIMITED

(Amalgamating National Bank of India Limited, Grindlays Bank Limited, and the Eastern Branches of Lloyds Bank Limited)

Registered in London under the Companies Act of 1862 on the 23rd March, 1866. The Liability of Members is Limited.

Bankers to the Government in Aden, Kenya, Uganda and Zanzibar.

ISSUED CAPITAL AND RESERVES OVER £ 11 MILLIONS

HEAD OFFICE: 26, BISHOPSGATE, LONDON, E.C.2.

London Branch:

13, ST. JAMES'S SQUARE, S.W.1.

Branches throughout Aden, Ceylon, India, Kenya, Pakistan, Rhodesia, Somalia, Tanganyika, Uganda, Zambia and Zanzibar.

The Bank conducts all classes of Banking and Exchange Business throughout the world.

Bombay Branches:
90, Mahatma Gandhi Road; 270/272, Dr. Dadabhoy Naoroji Road, (Lloyds Branch); Mint Road, (Corner of Mint Road and Sir P. M. Road); 21/29, Princess Street, (Lloyds Branch); 117-119, Kazi Syed Street, Mandvi; 65F, Linking Road, Santa Cruz; 2/571, Gowalla Tank Road, Cumballa Hill; Shivaji Mandir, N. C. Kelkar Road, Dadar; 24B, Club Road, Byculla. THANA: Agra Road, Kolbad Road, (Near Castle Mills).

TODAY, AS EVERY DAY OF THE PAST SEVENTY YEARS, BATLIBOI MEET THE DEMANDS OF GROWING INDUSTRIES IN INDIA

Batliboi manufacture a wide range of products including industrial air-conditioning equipment, wood working machinery and engineers' steel files. Also, Batliboi supply specialised heavy machinery, and other essential equipment, to such diverse industries as textile mills, foundries, workshops, agricultural and power projects. Their offices in many important cities in India make certain that these supplies are punctually and efficiently delivered and serviced.

AND NOW, ANSWERING THE VITAL NEED OF THE HOUR, BATLIBOI BECOME EXPORTERS

Among the products they have exported so far are air-conditioners, sewing machines, water heaters and diesel engines. Besides, Batliboi's office, associates and agencies—spread over the world—are making a tremendous effort to develop a sound market for Indian products abroad.

As industrial demand increases, Batliboi develop their resources and know-how...so that seven decades from now they will still play a dynamic role in the country's economy.

BANKING AND MONETARY TRENDS

Cost of Credit Goes Up—Wage Bill Higher

THE main trends in the sphere of banking and money during 1964 were dearer money, greater restraints on credit, and higher operating costs. Both money supply and bank deposits, of course kept up their upward trend and the phenomenon of monetary inflation was more perceptible than in the previous years. The demand for bank credit was high, the increase in its cost notwithstanding. It is, however, doubtful whether the profits of banks were better; it would be surprising if the results for 1964 were to show, when announced, as they would be in the second and third weeks of January 1965, any pronounced increase in their profits as compared with those for 1963, which was undoubtedly the best profitable year; on the contrary, they might be a little lower. For, while banks might have earned more on a larger turnover, their outgo in the form of interest on deposits and borrowings from the Reserve Bank, and establishment charges were also on the high side.

It may be recalled that labour trouble, which had been simmering ever since the Desai Award became effective, erupted suddenly into a major dispute, which, as subsequent events clearly showed, neither the bankers nor the Government tackled in a tactful manner. A sharp rise in deposits has enabled bankers to build up their own deposit resources beyond the Rs. 2,500-crores level, but the steep rise in prices and the negotiated settlements with the employees giving better wage scales and other facilities than those allowed under the Desai Award, and the opening of 346 new branches during the first three-quarters of the year alone (preceded by 355 new branches opened during the whole of the preceding year) are bound to be reflected in higher establishment and staff costs, quite apart from the consequential rise in rent, insurance, lighting and other expenses. The increasing competition in the number and size of advertising budgets of banks must also have exerted an upward pressure. The higher liquidity ratio, effective from 16th September 1964, has forced the banks to invest almost one-third of their resources in low-yielding Government securities (quite apart from the risk of capital losses in a period of rising interest rates).

Above all, the October 1963 liberalisation in the cost and availability of Reserve Bank credit, which was hailed as a turning point in credit policy, proved to be a short-lived facility. When the rapid and substantial rise in bank credit at the most unprecedented rate took the scheduled bank borrowings from the Reserve Bank to a high of Rs. 107 crores in the first week of March 1964, the Reserve Bank suddenly got panicky and the credit policy was reversed in the middle of the busy season. Credit squeeze has remained ever since. On the eve of the current busy season, an entirely new technique of credit control, raising the cost of credit rather than restricting its availability, was introduced. Deposit interest rates were raised twice within a span of 1½ months during the 1964 slack season (though the Reserve Bank directives enforcing ceilings on very short-term deposit rates may compensate the banks to some extent). While the rates of interest on advances were substantially raised, the Reserve Bank placed a ceiling of 9 per cent on the rate that could be charged by larger banks.

Trends in Deposits

As Table I shows, between end-November of 1963 and 1964, the aggregate deposit liabilities of the scheduled banks rose by Rs. 312 crores, which was more than Rs. 100 crores higher than the rise of Rs. 207 crores in the previous year. In fact, if the growth of deposits is considered after excluding the distorting effects of P.L. 480 and P.L. 665 counterpart funds, the rise in net aggregate deposits is as large as Rs. 347 crores, as against Rs. 255 crores in the previous year.

During the first eleven months of the calendar year 1964, the rise in net aggregate deposits was of the order of Rs. 323 crores, as against a rise of Rs. 233 crores and Rs. 283 crores in the entire years 1962 and 1963, respectively. By the time this Number is in the hands of readers, the growth in deposits for the entire year will have been known. Available indications at the time of writing show that the actual growth rate in deposits will definitely exceed the peak of 14.7 per cent achieved last year.

The growth in deposits was, however, not evenly spread throughout the year: it assumed a gradual momentum from Rs. 43 crores in the first quarter of 1964 to Rs. 99 crores in the second quarter and to a grand Rs. 147 crores in the third quarter. The growth rate fell steeply during October-November to a mere Rs. 18 crores per month, largely because the refusal of banks to open new loan accounts under the pressure of the credit squeeze had forced some of the business houses to rely upon their own resources.

The pronounced shift in favour of demand deposit noted in 1963 continued during the year under review. In the first eleven months of 1964, demand deposits rose by Rs. 200 crores, as against a rise of Rs. 181 crores in the whole of 1963 and Rs. 84 crores in the whole of 1962. During the same period, time deposits (exclusive of P.L. effects) rose only by Rs. 100 crores as against a rise of Rs. 103 crores and Rs. 148 crores in the whole of 1963 and 1962, respectively. It is not possible to say whether the higher deposit rates that are being offered since October will again bring a shift in favour of time deposits, nor is it possible to indicate the extent to which highest growth of demand deposits is a statistical illusion, as a result of the change in the classification of savings deposits from time deposits to demand. If, however, the growth of demand deposits is really greater than that in time deposits, it is a welcome trend for the banks, which will be glad to have a larger proportion of their deposits at a lower cost.

Before considering the changes in deposit rates, it is necessary to refer to the still continuing confusion about P.L. counterpart deposits with the scheduled banks in India. The latest available official estimates indicate that the total amount of P.L. funds with the scheduled banks were no more than Rs. 10 crores at the end of October 1964. It is, therefore, still inexplicable how fresh arrangements could have been made for further transfers of Rs. 40 crores out of existing P.L. deposits with the State Bank of India to the Reserve Bank of India in five monthly instalments of Rs. 8 crores with effect from November 1964, as is reported in a footnote to the weekly statistical supplement to the *Reserve Bank of India Bulletin* dated 14th November 1964.

Deposit Rates

Even before the Governor of the Reserve Bank indicated in March 1964 that bankers should re-examine their interest rates on deposits in order to accelerate deposit mobilisation, some of the bankers themselves were advocating reconsideration of the structure of deposit rates but many of these were unwilling to go all the way with the advocates of higher deposit rates. Sharp differences of opinion developed amongst bankers on the efficacy and role of interest rates in the process of deposit mobilisation and their consequences on the structure of banking costs. Grudging recognition of a compelling situation came six months after the Governor's advice, when, after prolonged discussions in committees and conferences and within and between the banks, it was ultimately agreed to allow, with effect from 17th August 1964, (i) short-term deposit rates up to six months to remain unchanged, (ii) a rise of ½ per cent in term deposits between six months and three years, (iii) a rise of ½ per cent beyond three years' term deposits, and (iv) a rise of full 1 per cent beyond seven years' term deposits.

The Reserve Bank did a bit of quick and rational thinking within a little over a month of these rates becoming effective and pointed out to the bankers that the changes made by them in deposit rates were insufficient to attract deposits, that they were still paying much more than was really necessary on the very small term deposits, and that their deposit rates on the term deposits beyond three months were still not attractive. A directive was, therefore, issued by the R.B.I. on 25th September, 1964, prohibiting payment of interest on deposits for less than 14 days, fixing the ceiling rates on deposits between 15 days and 45 days at 1.25 per cent and between 46 days and 90 days at 2.50 per cent; the directive was accompanied by an informal advice that the interest rates structure beyond 91 days ought to begin with a minimum of ½ per cent per annum. It was very unfortunate that the need and wisdom of this type of reordering and rationalisation of deposit rates and of widening the unnaturally narrow spread between the very short and somewhat longer term rates was not recognised by bankers, despite some efforts made in this direction by the Bhabha Committee of the Indian Banks' Association at first and the Exchange Banks' Associations later. Anyway, the central bank's directive and the advice did not come as a surprise to the bankers, because the Governor had already given an indication of the way he was thinking at the Bombay Bankers' Dinner a clear 25 days before he acted. As the bankers had failed to take note of the hint, they deserved what they got. The net result is that deposit rates are now lower by some 0.50 per cent to 1.75 per cent for periods of less than three months, and higher by 0.25 per cent to 0.75 per cent between 91 days and one year; higher by 1 per cent between one year and seven years, by 1½ per cent beyond seven years and 1½ per cent beyond nine years.

The trend towards dearer money and higher rates has found its culmination in the 5 per cent Bank Rate effective from 26th September 1964. The 5 per cent rate is the highest so far in India since the formation of the Reserve Bank of India. As in January 1963, the ½ per cent rise in Bank Rate on this occasion also was only an adjustment to the existing pattern of interest rates. The effective rate of borrowing by the Central Government on its long-term loans had gone up earlier from 4.50 to 4.75 per cent and the average rate of central banking credit to the scheduled banks at the peak of the last busy season was only a little below 5½ per cent. The Reserve Bank Governor was opposed to any rise in Bank Rate until recently, but the mounting inflationary pressures forced his hands. The era of planning has brought about a gradual shift from cheap money to dear money, and, during this entire period, the intention behind raising the Bank Rate, on each occasion, has been to strengthen the credit restraints necessitated by the strains and stresses in the economy due either to world forces or to development expenditures.

In fact, it must be said to the credit of the monetary authorities that the increase in Bank Rate during 1964 was not merely a reflection of the renewed faith in the value of sound monetary policy: it also represented a lead to the commercial bankers to reconsider their interest rate policies and problems. It was further intended to induce economy in the use of credit and to provide incentive to save rather than to spend.

Since the Bank Rate increase, all interest rates have been gradually edging forward. Most of the local authorities' borrowings during the last three years have been made at 5 per cent. The minimum advances rate under the Inter-Bank Agreement has gone up to 7 per cent by virtue of its link with the Bank Rate, but for all practical purposes hardly any bank now lends below 7½ to 8 per cent. For line borrowers of small means, the rate might be as high as 9 per cent, and would have gone up further, had it not been for the ceiling on the advances rate of larger scheduled banks prescribed by the Reserve Bank. The smaller banks have in fact been charging as much as 10 or even 11 per cent. Moreover, apart from the rate of interest, many borrowers who found that they were unable to obtain bank credit at all, added to the demand for credit from the non-banking, unorganised sector and helped to push up the interest rates there. Thus, contrary to popular belief, even in Indian conditions, the effect of the higher Bank Rate has a perceptible impact on borrowers outside the banking sector also. The effect of dear money is more prompt and telling than that of cheap money. With the higher Bank Rate, therefore, the Reserve Bank has succeeded in bringing about tight money and dearer credit.

Credit Squeeze in Perspective

The much publicised and long-awaited liberal credit policy came on the eve of 1963-64 busy season. The purpose was to encourage industrial production and revive the confidence of investors and thereby raise the level of activity in the capital market. The mechanism was to raise the borrowing quotas of banks from the Reserve Bank from 100 to 150 per cent of the banks' statutory reserves and to reduce the cost of borrowing marginally, by allowing half the quota at Bank Rate and the balance at 6 per cent. The penal slab was abolished and additional discretionary quota was also made available at 6 per cent. At that time, banks were flush with money and their resources position was comfortable, so they did not particularly care for the relaxations so willingly given. Margin restrictions against share advances were also relaxed.

All this was done to enable banks to maintain reasonable credit supply for productive purposes. Later, however, when it became really necessary for the banks to make use of the liberal credit facilities, the Reserve Bank decided to become tight-fisted. With the progress of the 1963-64 busy season, credit expansion tended to become rather too sharp and the Reserve Bank wanted to emphasise the need for caution, particularly in view of the growing pressures on prices and the worsening supply position of agricultural commodities. When the scheduled banks' borrowings from the Reserve Bank touched an all-time peak of Rs. 107 crores as against Rs. 98 crores borrowed at the height of the previous busy season, the Reserve Bank suddenly reversed its policies and a series of credit control measures were taken. Within the system of borrowing quotas and slab lending rates, the Bank reverted to the tighter credit policy that prevailed before 30th October 1963 liberalisation. The quota was reduced to 100 per cent of the statutory reserves, 50 per cent being available at the Bank Rate of 4½ per cent and the balance at 6 per cent. Special accommodation beyond the quota was to be charged at the penal rate of 6½ per cent. Banks were further asked to bring down the level of clean advances to borrowers other than industrial borrowers. Selective controls on rice, wheat and groundnuts were re-imposed or tightened.

Despite these various measures, the scheduled banks credit showed a record expansion of Rs. 377 crores over the 1963-64 busy season, as against Rs. 203 crores in the previous season: what is more, Rs. 60 crores of this expansion took place after the imposition of credit controls. This huge expansion was financed by a Rs. 110 crores rise in net aggregate deposits (Rs. 98 crores in the previous season) in addition to liquidation of Government securities to the extent of Rs. 145 crores (Rs. 98 crores in the previous season), larger borrowings from the Reserve Bank at Rs. 43 crores (Rs. 22 crores in the previous season) and drawing down cash balances to the extent of Rs. 30 crores (as against a rise of Rs. 4 crores in the previous season.) Throughout the busy season, the money market was characterised by stringency. The call money rate not only touched the 6½ per cent level both in Bombay and Calcutta, but it ruled as high as 5¾ per cent and 5½ per cent respectively even at the end of the season.

Slack Season

The main features of the slack season of 1964 were an inadequate contraction in bank credit, a substantial growth of deposits and a strengthening of the liquidity position of the banks. The fall in bank credit by Rs. 137 crores was larger than the fall of Rs. 121 crores in the 1963 slack season, but was much smaller in relation to the expansion of Rs. 377 crores that had taken place in the preceding (that is, 1963-64) busy season. It is interesting to note from the September-end figures that are available so far that while in the 1963 slack season both the seasonal as well as non-seasonal credit declined, in the 1964 slack season, decline in advances against seasonal commodities was partly counteracted by a rise advances against non-seasonal commodities. The result of this inadequate credit contraction was that the credit-deposit

ratio on the eve of the 1964-65 busy season was slightly higher at 67.5 per cent, as against 67 per cent on the eve of the 1963-64 busy season.

Nevertheless, a substantial improvement took place in the resources position of the banks as a result of sharp increase in deposits. Banks were able to build up their investments in Government securities to the tune of Rs. 259 crores (as against Rs. 146 crores in the 1963 slack season), to reduce their borrowings from the Reserve Bank by Rs. 44 crores (as against Rs. 29 crores in the 1963 slack season); apart of this was, however, achieved at the cost of banks' cash reserves with the Reserve Bank, for, while the latter increased by Rs. 43 crores in 1963 slack season, they rose by only Rs. 10 crores this season. The ratio of investments in Government securities to aggregate deposits during the slack season improved from 26.5 per cent to 34.5 per cent. This was also fractionally higher than the ratio at the end of 1963 slack season; the higher ratio is to be viewed in the context not only of the higher liquidity requirements of 28 per cent with effect from 16th September 1964, but also of the revised credit control formula with effect from 26th September 1964.

Emphasis on Cost

In the context of large credit expansion by the banking system in the Government as well as in the private sector and of the rapid increase in prices, the September 1964 series of credit control measures laid a primary emphasis upon increasing the cost rather than directly restricting the *availability* of Reserve Bank credit. The lending system based on borrowing quotas and slab rates which during the four years of its currency had clearly failed to achieve its purpose of holding down the rate of interest for Government borrowing, was abolished, because it had also failed to realise in full the objectives of credit controls. The new credit control formula is based on differential interest rates related to the *net liquidity* position of the borrowing banks. Changes were also made in the selective credit conrols, and the concessional accommodation based upon advances to small-scale industries and co-operatives was discontinued.

The fact that it was necessary to modify the scope and definition of "net liquidity" several times within a period of two months is an indication of the hasty and incomplete manner in which complicated and vital decisions are taken by the Reserve Bank. Barring this defect, the new system is more *equitable* as between the banks, because it links the cost of borrowing to any particular bank with the position of its net *liquidity* and every progressive loss of liquidity tends to raise the rate of interest on borrowing, the higher rate being applicable not only to the additional borrowings on a *slab* system, but flatly to the entire amount including the amount already borrowed.

The net liquidity position of a bank is determined by the *total* of its cash, balances with the Reserve Bank, current account balances with the other banks including the State Bank of India, investments in all approved trustee securities, *less* the total of its borrowings from the Reserve Bank, State Bank and the Industrial Development Bank of India. A bank can obtain Reserve Bank accommodation at Bank Rate (i.e. 5 per cent) so long as the net liquidity position (which it will be observed, is different from its statutory *liquidity* ratio) is 28 per cent of its total of demand and time liabilities. The rate charged on the *entire* amount of Reserve Bank borrowing will be stepped up by ½ per cent for every loss of 1 per cent in net liquidity.

The revised credit control formula implies several far-reaching and fundamental changes in central banking technique and policies. The first casualty of the new formula has been the bill market scheme so patiently built up by the Reserve Bank since 1951: since all borrowings from the Reserve Bank would now depend upon a banks' holdings of Government and other approved securities, no bank would find it worthwhile to undertake the additional trouble and cost of obtaining usance bills or pro-notes from the borrowers. The bill market mechanism will be particularly unattractive for the banks, since the currency of such accommodation has also been curtailed from one year to nine months.

Secondly, although the revised credit control formula means that banks could afford to borrow much larger amounts from the Reserve Bank than was possible under the old system, they will not be able to supplement their borrowings by selling their investments as in the past: for any liquidation of investments would immediately affect the net liquidity, and raise the entire cost of borrowing. Thus, the overall resources position of the banks is no better under the net liquidity mechanism than under the older slab and quota system; but it is worse to the extent that average cost of borrowing from the Reserve Bank in order to *maintain* the same resources position would be higher. To a certain extent, the banks may be able to pass on the burden of higher costs to their borrowers, and have actually done so. The minimum advances rate for all the borrowers, except the very first class and influential ones, is now around 8 to 8½ per cent. But the larger banks' ability to pass on the burden to the borrowers in order to compensate themselves for their higher cost of borrowing has been severely restricted by the ceiling of 9 per cent in the advances rates that they can charge. In practice, therefore, the revised liquidity mechanism of credit control formula effectively regulates the availability of central bank credit also through its influence on cost. In fact, it is said, many banks have been unable to open new loan accounts; it is hardly worthwhile for them to *obtain* costlier resources for meeting the increase in the demand for credit.

Labour Unrest

The Desai Award governing the service *conditions* of bank employees, which came in 1962, was liked neither by the bankmen nor by the bankers. The employees were vociferous in their opposition, but the employers must have found that, despite their declared feelings, any revision of the Desai Award would be worse for them. Not only did they accept it fully, but requested two extensions, one of which was easily available, but the second was very reluctantly granted by the Government in the face of mounting discontent among employees. Bankers argued that the time, effort and expenditure that had gone behind Desai Award would not be worth it, if the Award were to expire so soon: but their real feelings and fears were that another Award might involve additional burdens which they might not be *able* to bear in face of the revised liquidity requirements. They were able to take the Desai Award in their stride and were willing and eager to perpetuate it as long as possible. The employees' case against the Desai Award was based upon various grounds—largely upon what they described as anomalies, defects, and inadequacies. They never got a hearing from the employers, because the bankers were able to convince the Government of the justice of their case. It was, however, the failure of the third Plan to hold the price line that torpedoed the Desai Award finally. The trend of mounting prices forced the Government to persuade the bankers to consider the genuine grievances of bank employees, even if that meant going beyond the Desai Award. In the face of an unprecedented country-wide agitation of bank employees and the consequent pressure from the Government, negotiations were begun in Delhi, and are still continuing for the purpose of evolving a mutually agreed long-term settlement on service conditions and wage scales. Meanwhile, some interim relief has been given to the employees.

Profits Squeezed

So far as the financial implications are concerned, this year's wage bill of the banks is likely to run up heavily, because the rising prices and the mutual settlement have together put up the dearness allowance payable to clerks and subordinates from 27 and 36 per cent of salary, respectively, in December 1963 to 48 and 64 per cent of salary, respectively, in December 1964. In addition, settlement of long outstanding bonus disputes by several banks and the large staff employed in the newly opened branches, as well as to meet the expansion of existing branches are also likely to affect the total wage bill substantially. The double burden of higher establishment and higher interest rates in a single year is more than can be taken in stride and all the available indications suggest that bank profits may have been squeezed to a certain extent this year. In fact, the interest burden will affect the banks from several angles. Not only have the banks' deposits and borrowings become costlier, but, on the other hand, their ability to employ funds has been severely restricted by the higher liquidity ratio and other restrictions on lending implicit in the new credit control formula of net liquidity. The margin between the average rate of interest payable by banks and the average rate earned on low-yielding investments (which will now be larger) and advances (which will now be smaller) seems to have been narrowed.

Outlook

Apart from the labour unrest and the squeeze on profits, bankers faced a number of worries and uncertainties in 1964. In March 1964, for instance, the Government of India issued instructions to all the public and semi-public authorities, organisations and corporations and directed those institutions which received Government grants or assistance in any manner to do all their banking with the State Bank of India or its subsidiaries. Secondly, while the new credit control formula was not intended to discriminate between banks, the higher liquidity position of the State Bank of India gave it an advantage over all other banks. Thirdly, technical points of interpretation have enabled the State Bank to retain all its previous three days' notice money at 3 per cent at a time when all other banks have already notified their customers that old contracts have been abrogated by the Reserve Bank directives. This would no doubt cost the State Bank more than other banks in interest charges, the cost in terms of loss of goodwill to other banks must be quite substantial. It is feared that all these factors together may add up to a *loss* of business to other banks and a gain to the State Bank of India.

There was much less talk about the competition for deposits from industrial houses this year, particularly because, with the higher rates of interest obtainable on bank deposits, the industrial houses were less attractive. There were reports, however, that since the interest rates paid by banks for deposits below three *months'* period have been reduced, the industrial houses will now concentrate in obtaining extremely *short-term* deposits at attractive rates of interest. The Reserve Bank is still busy collecting and processing information on deposits accepted by non-banking institutions under its newly acquired powers, and bankers feel that something ought to be done about regulating the conditions under which non-banking institutions accept deposits.

Bankers are now so much involved in these problems and preoccupied with their day-to-day working that they hardly find any time or inclination for the longer term problems of organisation and methods of operations. In the final analysis, the progress of the banks and their ability to meet the growing requirements of their customers depend upon their capacity to improve the speed of their operations and quality of service. This calls for a constant endeavour to modernise their operations. Further, the methods and techniques of banking have to be adapted to the needs of changing times. The State Bank of India and a couple of larger banks have begun to make some stray efforts in this direction, but, by and large, the banks lack the organisation and mechanism to undertake the immense volume of business that lies ahead. It is high time they and their associations paid some thought to this important aspect, before they are overtaken by the growth in the other sectors of the economy.

NOW... WE GO UNDERGROUND WITH A BRAND-NEW CABLE
ALIND SOLIDAL!

Here's an exciting new design in aluminium cable construction... which is yet another classic example of Alind's forward-thinking!

Making the fullest possible use of the properties of aluminium as a conductor and pvc as an insulant, ALIND SOLIDAL will be a light, compact, easy-on-the-budget, easy-to-lay-and-joint cable!

Alind will gladly send you further information on this new type of cable

ALIND
THE ALUMINIUM INDUSTRIES LTD.
India's largest manufacturers of aluminium conductors and accessories.
Registered Office: Kundara • Hirakud • Hyderabad

SESHASAYEE BROS.(TRAV.) PRIVATE LIMITED

TREND OF MARKETS IN 1964

Frustration Overtakes Stock Exchanges

Sustained Recovery Depends On Coming Budget

BOMBAY, 22nd December

LAST year, while reviewing the Bombay Stock Exchange, we had struck a cautiously optimistic note and had said that equities were out of the doldrums. We had pointed out that the crisis of confidence which had gripped the market had seen its end and had hoped that, on balance, the year 1964 might prove to be a better one for investors. At the same time, we had expressed some misgivings, because of the renewed emphasis on socialism by the Congress Party. Unfortunately, the hopes were belied and the misgivings turned out to be correct during the year under review. Investors, much to their grief and dismay, saw the slow but sure erosion of their capital, with no likelihood of any change for the better in the foreseeable future. The crisis of confidence is now deeper than ever. The revival of optimism which had characterised the mood of the market at the end of 1963 has proved deceptive, yielding place to disillusionment caused by T.T.K.'s anti-rich fiscal policy. Speculators, bull operators to be precise, have been driven to the wall. In fact, the stock market, at the time of writing, is really *in* the doldrums. And as the year drags on to its close there is everywhere a feeling of frustration and despondency. Nothing holds out the sorry spectacle in more vivid terms than the Reserve Bank of India Index for variable dividend equities. The all-India figure (1952-53=100) had moved up from 71.9 on 7th December 1963 to 173.0 by 21st December 1963 and, although it had reacted to 172.8 a week later it was still 11 per cent higher than the end-June 1963 low of 158.1. But, by 1st February 1964 the Index was down again at 168.5. Similarly, the Bombay Regional Index rose from 165.8 in June 1963, the lowest for that year, to 180.5 on 28th December only to decline to 175.6 by the end of January 1964.

The optimistic note on which the market ended 1963 was justified by events. The Finance Minister, T.T.K., had raised high hopes by spelling out the measures with which he proposed to revitalise the capital market. The steps he announced early in December 1963 included the raising of the exemption limit both for industrial licensing and capital issues control from Rs. 10 lakhs to Rs. 25 lakhs and the removal of price control in respect of 16 commodities, principally in industrial use. The Finance Minister also suspended for the first quarter of the year the premium collections under the emergency risks insurance scheme.

However, the hopes proved to be a short-lived affair, for towards the close came a big damper in the shape of the Congress Working Committee's resolution on democratic socialism which, among other things, sought to bring about a limitation of incomes and property in private hands. Fears were also entertained that the Industrial Policy Resolution would be amended in such a way as to facilitate the rapid expansion of the public sector. On top of this came the Congress President's suggestion at Bhubaneshwar for the creation of a monopolies commission to check the growth of huge corporations. Reports that the Bonus Commission was ready with its recommendations further depressed the sentiment, the result was that, at the end of January, Tata Steel was quoted at Rs. 142.50 (low) against Rs. 147.25 (high) on 21st December 1963, Indian Iron at Rs. 24.44 against Rs. 25.25. Standard at Rs. 772 against Rs. 844, Century at Rs. 666.50 against Rs. 694.50. National Rayon had eased from Rs. 425.50 to Rs. 409.50, Telco from Rs. 295 to Rs. 285, Hindustan Motors from Rs. 19.28 to Rs. 18.48 and Scindia from Rs. 15.56 to Rs. 13.28.

Pre-Budget uncertainties did not last long and during the greater part of February the market maintained a confident tone. Besides hopes of reliefs and concessions, sentiment was strengthened by the absence of fresh taxation in the State Budgets. The curve of optimism rose steadily as reflected by the Reserve Bank of India index for Bombay which moved up from 175.1 at the beginning of February to 176.6 at the end of the first week, 178.6 at the end of the second, 180.2 at the end of the third to the highest of the year 184.3 just before the Budget. Tata Steel was then quoted at Rs. 151.75 (high), Indian Iron at Rs. 26, Century at Rs. 706.50, Standard at Rs. 814, National Rayon at Rs. 443.50, Scindia at Rs. 16.20, Hindustan Motor at Rs. 20.20, and Telco at Rs. 317.50. During the month the all-India index had moved up from 168.5 to 174.3.

The hopes which the market had placed in the Finance Minister came to nought on 29th February. Despite attractive concessions like the removal of the much criticised super profits tax, grant of a rebate of 10 per cent on income and super taxes at source from 30 per cent to 20 per cent on dividends, withdrawal of C.D.S. in respect of incomes below Rs. 15,000 and last but not least the exemption from capital gains of bonus shares issued from out of share premium accounts, Mr. Krishnamachari's Budget left behind it a feeling of disillusionment on account of the 7.5 per cent dividend tax, inclusion of bonus shares for capital gains tax, heavy excise duties on commodities like rayon coupled with the steep upgrading of gift and wealth taxes. The market which had been geared up to the anticipation of substantial relief in direct taxes plus fiscal incentives to promote investment found that the net effect of T.T.K.'s budget was adverse to the medium and big investors. Bulls liquidated their positions, while bear operators took the opportunity to hammer the market. The decline was further accentuated by the sad demise of Mr. Nehru on 27th May 1964. It is true that there had been some favourable factors during the period such as the reliefs and concessions announced by the Finance Minister on 17th April, prospects of a larger share held out to the public sector in industrial development under the fourth Five-year Plan, decision to liberalise foreign exchange to manufacturers/exporters for the import of raw materials for export-oriented industries and reports of growing American investment interest in the country. But the forces opposite to these were even more formidable. The Kashmir situation had given rise to no small apprehension and the frequent but annoying incursions on our frontier by Pakistani intruders was viewed by the market with considerable alarm. Furthermore, the net effect of the Budget for 1964-65 was distinctly bearish, as it had hurt the vital section of savers who normally invest in equities. The downward drift went on for a long time until the market registered its lowest levels of the year on 27th May —the day Mr. Nehru died—with Tata Ordinary at Rs. 142.50 (low), Indian Iron at Rs. 23.60, Century at Rs. 570, Standard at Rs. 580, Telco at Rs. 259, National Rayon at Rs. 335, and Hindustan Motors at Rs. 17.16. The All-India Index had receded from its end-February high of 174.3 to 161.4 on 30th May or, in other words, a decline of about 13 points. Incidentally, the end-May Index was just three points above the all-time low of 158.1 reached at the close of June 1963. The Bombay Regional Index had declined from its February high of 184.3 to 169.1.

The market, however, took a turn for the better during the second quarter. Sentiment was aided among other things by the coming into being of the Industrial Bank and a hint by the Finance Minister at the possible relaxation of the debt-equity ratio in suitable cases. Money was easy and then there was the hope, which springs from nowhere whenever the market is set for a rise, of fiscal incentives. Prices looked up almost until the middle of July and after a brief spell of reaction moved up again to new high levels which were just under the February-end highs. The Reserve Bank Bombay Index had moved up to 176.3 by 11th July and, after reacting to 173.7 by 25th July, improved again to 181.3 by 29th

August. The day's highs on 2nd September were as follows: Tata Ordinary Rs. 162.75, Indian Iron Rs. 27.95, Century Rs. 640.50, Standard Rs. 682, National Rayon Rs. 383, Telco Rs. 320.50, Scindia Rs. 16.36, Hindustan Motors Rs. 19.28. These were more or less the highest levels for 1964.

From September onwards, sentiment deteriorated and, for full 14 weeks or so, prices suffered a continuous fall. The continued violations of the cease-fire line by Pakistani troops on the Jammu border, publication of the Bonus Commission's report and fears of fresh labour troubles, coupled with the worsening food situation and rising living costs, created a feeling of anxiety. Equities tumbled down on continued bull liquidation and occasional hammering by bear operators. Hopes of fiscal incentives in the next budget were shattered after the Guntur session of the A.I.C.C. The resolution calling for a limit on urban property though accorded excellently with the socialistic pattern of society was viewed by the stock market with the utmost misgivings. The explosion by China of the atomic bomb came close upon food riots in Kerala. On top of this, the Prime Minister's statement, hinting at the possibility of Government establishing even some selected consumer industries, as well as his suggestion for an ordinance to bring profiteers on summary trial, worsened sentiment. No one questioned the measures against anti-social elements but the stock market took it that there was something radically wrong with the entire situation in the country. Meanwhile, there was talk of the gradual abolition of the managing agency system as well as a rise in the tax structure at State levels. Amendments to the Wealth Tax Bill caused further uneasiness. The increase in the Bank Rate here and the recent 15 per cent surcharge on imports into the United Kingdom as well as the 2 per cent rise in the Bank of England Rate acted as a drag on the market. In view of these, several good factors like Mr. Lyndon Johnson's election to the American Presidency and assurances on the part of the new Soviet rulers were lost on the market. A bad market has no use for good news. The main point is that high taxation and abnormal rise in prices of daily necessaries of life leave little for investment, and no speculator, howsoever strong, can carry the market with him unless he has the support of the general body of investors. After September, this support was just not forthcoming in adequate measure.

And so, at the end of the second week of December, one found oneself more or less in the same position as at the close of May. Tata Ordinary was quoted at the close of 12th December at Rs. 144, Indian Iron at Rs. 25.20, Scindia at Rs. 15.12, Century at Rs. 549, Standard at Rs. 579, Telco at Rs. 261.50, National Rayon at Rs. 334, and Hindustan Motors at Rs. 16.24. They were all at or around the low levels of 27th May and lower in some cases.

In the third week of December, however, a slight recovery was noticeable, creating a general impression among market circles that the bear phase, which had started early in September, had at last come to an end. At the time of writing (22nd December), Tata Ordinary has recovered a part of the earlier losses to stand at Rs. 147.50; Indian Iron is standing at Rs. 25.80, Scindia at Rs. 15.44, Century at Rs. 573, Standard at Rs. 598, Telco at Rs. 272, National Rayon at Rs. 365.50 and Hindustan Motors at Rs. 16.88. It will thus be noted that, in the last ten days, there has been a substantial recovery in active counters such as Tata Ordinary, Telco, Century, Standard and National Rayon. The rise was no doubt due to speculative activity (some fresh buying by bulls and short covering by bears) but what is more important is the factor that led to this activity. This factor is a vague feeling that the Central budget for 1964-65 will contain some relief in direct taxation. Operators are now of the opinion that the Government is convinced of the grave damage done to investment climate by the last two budgets and that it is bound to rectify the past mistakes at least to some extent. This impression—it is nothing more than that—is said to have been strengthened by the statement of Prime Minister Shastri at the meeting of the Associated Chambers of Commerce on 21st December to the effect that the Government was "giving serious attention to measures needed to revive the capital market" and that "all assistance would be given to private enterprise to help it achieve the targets assigned to it in the (memorandum on) fourth Plan." Similar optimism prevailed towards the close of 1963 also, as would be seen from the introductory paragraphs of this review. But the events in 1964 totally belied them, with equities finishing the year with sizable losses on a wide front. Will the experience of equities in 1965 be different? It can be, if the Union Minister wills it. But will he? That is the question of questions. Since he is an unpredictable person, no useful purpose would be served by trying to answer it. One's guess is as good or as bad as that of another.

Section-wise Details

Now for a brief review of the main sections of the Bombay Stock Exchange in 1964. Activity in steel shares was on the whole well maintained throughout the year. Working results of both Tata Steel and Indian Iron fulfilled the market's expectations of them. Dividends were higher, although the increase in the case of Indian Iron came in the shape of a bonus. However, there was considerable disappointment over the Government's decision to decontrol steel only partially, whereas the stock market was banking on full decontrol. Nevertheless, the statements of the Chairmen of the two companies confirmed the market's ideas of growth prospects for steel and the likelihood of further expansion helped sustain the market sentiment. The statement of Mr. J. R. D. Tata that future issues of capital would be on terms satisfactory to shareholders and that no expansion would be undertaken, unless the directors were hopeful of maintaining the dividend, was well received. Other factors which helped sustain interest in steel shares was the belief that the retention prices would include a special element to cover the repayment of loans due to the Government as well as the feeling that the Government might not insist on converting the loan into equities. It was under the influence of these factors that steel shares were bid up to higher levels—Tata Ordinary to Rs. 163.50 and Indian Iron to Rs. 28.05—mentioned earlier although they had to recede along the general line of reaction after September.

Steel shares have, however, shed their once pre-eminent position in the market and the pride of place now belongs to such counters as Telco, Century, Standard and National Rayon, as well as one or two miscellaneous scrips. These shares guided the destinies of the market for good or bad throughout the year. Century was the particular favourite of speculators and its bonus issue, together with the increase in the dividend, added much to their attraction. The shares had been bid upto a high of Rs. 709 and, after a rather sharp decline to the year's low of Rs. 549 were quoted at Rs. 573 at the close. Standard fluctuated in a wide range of Rs. 855 on the high side and Rs. 533 on the low, but there was a time in 1960 when these shares fetched Rs. 2,100 in a wild bout of gambling. The closing rate on 22nd December was Rs. 578. Kohinoor and Svadeshi were the other two active counters in the textiles section, their respective highs and lows being Rs. 344.50/308 and Rs. 270/235. Central India made a disappointing show. With dividends passed over again, the shares were done down to Rs. 93. Although exports of cotton textiles have been quite satisfactory during the first 11 months of the year at Rs. 433 million against Rs. 374 million in the corresponding period of 1963, textile shares have been on the defensive. This was because of the fact that the industry has lost its hold on nearly half its production while its costs have been rising day by day. Cotton has become difficult to obtain except at above the ceilings while prices of other raw materials, stores, dyes and chemicals have gone up, not to speak of the electricity tariff. It is therefore difficult to expect investors to put in their money on textile shares for the present.

The career of National Rayon has been as exciting as that of Century; in fact, the two of them were like twins. In June 1960, this scrip was considered cheap at Rs. 617, but, in 1963, it was friendless even at Rs. 295. After this steep decline, however, the shares moved up to Rs. 448.50, the highest for 1964, but declined in the post-Budget period to Rs. 335 and further to Rs. 326, the lowest for the year. The main factors behind this decline were the disappointment over the high excise duty on rayon yarn, the cut in export incentives, a slump in art silk market, and a long strike in the works of National Rayon. Among other rayon shares, Baroda had been taken down from Rs. 99 to Rs. 60.50 but, following satisfactory working results, the scrip made a dash to Rs. 73 during the second week of December. South India Viscose was in a bad way, and the scrip which at one time was quoted as high as Rs. 192, fell below par level early in December and closed around Rs. 103. Gwalior Rayon retreated from Rs. 47 to Rs. 36 but at the close it was mentioned at Rs. 37.25.

Among Engineerings, Telco was concerned in erratic fluctuations. Early in the year, the shares were beaten down to Rs. 276 but by Budget time they had moved up to to around Rs. 259 on 27th May. The year's lowest, however, was Rs. 254. Following the Chairman's statement hoping to maintain the equity dividend despite the right issue, the scrip moved up by 60 points to the year's highest level of Rs. 321 but retreated again to Rs. 256 *x.r.*, *x.d.* during the general decline of the market after September. Currently the scrip is quoted at Rs. 272. Voltas moved between at Rs. 270.50. Premier Construction made a recent spectacular dash to Rs. 223 from a low of Rs. 157, following the 30 per cent rise in the dividend of Hindustan Construction. It may be pointed out that Premier Construction is entirely a holding company with interests in Cooper Engineering, Walchandnagar and Scindia Steam besides holding about 99 per cent of the capital of Hindustan Construction. They have all been doing well and the surmise therefore is that Premier might come out with a higher dividend. Mention must also be made of Larsen and Toubro which has pleased investors so well by repeated issues of right shares and has now proposed a bonus scrip also for the first time. The scrip ends the year happily at Rs. 22.36. Motor shares were in a bad way with Hindustan at

Investors Become Victims Of A Pincer Attack

By Messrs. Maconochie & Co., Madras

THE year that is just drawing to a close has proved to be a pernicious one for stock markets. Although subdued optimism, prompted by the pragmatic pronouncements of the Finance Minister, the policy of orderly withdrawal of price control enunciated at the close of 1963 and the prospects of a reorientation of the fiscal and monetary policies with a view to lifting the economy out of the morass, was discernible at the beginning, developments during the year have turned out to be disappointing and disheartening to such an extent that confidence in equity investments has suffered a serious setback. The bogey of nationalisation of banks reared its head again in the deliberations of the Bhubhaneshwar session of the Congress Party but was scotched, at any rate for the time being, by the firm stand of the Finance Minister. Nevertheless, the exercises on the new slogan of "Democratic Socialism" and the pet proposals of the leftist elements in the party for a ceiling on income, inherited wealth and urban property, cast a gloom. Incidentally, they gave the clue to the shape of the forthcoming Budget. Added to this, the Bonus Commission's fantastic proposals caused quite a stir. The pre-Budget period was marked by caution and, despite the ominous portents, a fond hope that the taxation proposals would be so framed as not to cause yet another jolt but to create the necessary psychological conditions for the revival of the investment market was entertained. However this was not to be.

Impact of Budget

Not only did the new taxation proposals fail to enthuse the market but they proved to be a nightmare as it were, for they were complicated in their import and it took more than a week to assess the full implications of the ingenious measures. The S.P.T. was substituted by a sur-tax which would be less rigorous in its incidence. Further, basic industries like steel, copper, aluminium, mining of coal lignite, iron ore and bauxite, industrial machinery, cement, fertilisers, paper and pulp and tea were granted tax rebate with a view to encouraging their development. Welcome as these concessions were, they were whittled down to a considerable extent by the Capital Gains Tax on bonus shares and the 7½ per cent tax on dividends declared by companies—new company dividends exempted upto 10 per cent. Of vital significance to the market were the proposals relating to personal taxation. The steep escalation of the Estate Duty, Gifts Tax and Wealth Tax rates to expropriatory levels and the re-introduction of the Kaldorean weapon of the Expenditure Tax would directly hit the entrepreneurs who have, by their savings, diligence and hard work contributed in no small measure to the industrial development of the country. Their virtual extinction in course of time would make an enormous difference to the industrial development in the private sector. It was this thought, coupled with the feeling that growth prospects would be blunted by the dividend tax and the capital gains tax on bonus shares, that unnerved the markets, notwithstanding a few concessions conferred on the corporate sector. Consequently, share prices recorded steep falls. Even the news of decontrol of a large category of steel made little impression on the price of steel shares.

In March, the Reserve Bank tightened the credit control measures by reintroducing the three-tier structure of lending rates. Although this measure was aimed at restricting bank credit to essential commodities in short supply with a view to arresting the spiralling up of prices of such commodities, the ushering in of dear money conditions naturally aggravated the post-budget debacle. Stock markets were in a state of suspended animation as the Finance Minister refused to concede any major relief in his new taxes and made it clear that only some minor refinements could be expected. The modifications he announced late in April fell far short of market expectations and, when the Finance Bill was passed on the 21st April, panicky conditions were witnessed. The Sur-Tax Bill, which was passed on the 22nd April, contained a few concessions for broadening the capital base and markets, thankful for small mercies, recorded a mild recovery. Nevertheless, the primary trend tended to be bearish.

During the major part of May, somewhat quieter conditions prevailed and trading was thin and featureless. The sudden death of our beloved Prime Minister Nehru on Wednesday, 27th May, stunned the whole world and brought about an unprecedented gloom. Stock markets remained closed for a few days as a mark of respect to the memory of the departed leader and this incidentally averted a crash in prices. Markets regained equilibrium, when they reopened and recovered the lost ground, as, by then, it was manifestly clear that the transition of power would be smooth and that Mr. Lal Bahadur Shastri—well known for his moderate views and amiable disposition—would unanimously be elected Prime Minister.

Unit Trust

In June, the Unit Trust of India (which started functioning in February this year with a paid-up capital of Rs. 5 crores) announced its Unit Scheme, under which sale of units of Rs. 10 each in multiples of ten units was commenced on 1st July. This had a favourable effect on share prices, as the funds realised found their way to the market. The relaxation of margin regulations relating to cleared securities and the declaration of a higher dividend of Rs. 12 per share by Tatas which was in accord with the expectations enabled markets to shake off their lethargy and put on a cheerful appearance. Corporate results made good reading and many companies declared increased dividends, which, with the support extended by the Unit Trust and L.I.C., sustained the morale of the market and till the end of August a steady trend was maintained.

Another Bear Phase

On the 25th September, the Bank Rate was raised from 4½ to 5 per cent and its immediate impact on share values was bearish, but, on second thoughts, it was realised that this would only bring the official rate more in alignment with the prevailing interest rates and so sentiment regained equipoise and prices recovered lost ground. The mid-October developments in the international horizon, namely, the abrupt change of leadership in the Kremlin which coincided with the explosion of a nuclear bomb by China caused a ripple in the apparently tranquil waters of the market. From then onwards, the markets entered another bear phase, thanks to a series of unfavourable factors such as, to mention only a few, the deteriorating food situation, the ever-increasing cost of living, the proposal to restrict the currency of blank transfers, the talk of gradual abolition of the Managing Agency system and the A.I.C.C.'s decision to accept the unofficial resolution for introducing ceiling on urban property. Hopes of possible tax relief in the forthcoming budget yielded place to fears of fresh imposts when the National Development Council approved the size of the fourth Plan, envisaging an overall outlay of Rs. 21,500 crores, which, if resources permitted, would be increased by Rs. 1,000 crores. The task of mobilising the resources on the scale required for a plan of this magnitude is formidable indeed. The Finance Minister has already hinted that the advance action required for implementing the fourth Plan would be reflected in the next Budget. No wonder, therefore, share values were marked down almost daily. At the time of writing, the crisis of confidence has deepened and the atmosphere towards the close has been surcharged with gloomy prospects, in sharp contrast to the subdued optimism which pervaded stock markets a year ago.

The Outlook

The economy of the country has been subjected to severe stresses and strains, as a result of the taxation and fiscal policies of the past two years. The problem of soaring prices of essential commodities is still to be tackled effectively. What with the increased cost of living, higher taxation, compulsory savings—presently in the form of annuity deposits—funds seeking investments in shares have dwindled. The concept that equities are a hedge against inflation has failed to be applicable to the Indian economic situation of today. It is paradoxical that, while under the inflationary impact, the real value of money has diminished, the value of equity shares has also depreciated heavily. The investor is thus caught within the pincers of a mounting cost of living and the daily erosion of value of his hard-earned savings invested in equity shares. Although it is accepted on all hands that steps should be taken to improve the investment climate, no concrete measures have so far been taken. What is worse, thanks to the proposed gigantic size of the fourth Plan and the resultant problem of raising the requisite resources, it is feared that the forthcoming budget would be harsher still.

The shares of new companies started in the years 1960 to 1962 have

India has reached the goal of self-sufficiency in

SUGAR MACHINERY

We manufacture, erect and commission complete Sugar Plants of any capacity upto 4,000 T.C.D. **The FIRST 1,000 T.C.D. Sugar Factory made in India was manufactured, erected and commissioned by our technicians in the year 1961.** By now we have installed **SIX** such complete sugar plants. One more plant is under supply and erection. Also we are regularly supplying the machinery for replacement and expansion programme to most of the sugar factories in India. Worthy of mention is the supply of a **2,000 T.C.D. MILLING PLANT AND 3,000 T.C.D. CENTRIFUGAL STATION**, to Mawana. We are now venturing on the **EXPORT OF SUGAR MACHINERY.**

To serve our esteemed customers with the **QUALITY PRODUCTION** and efficient **after sales service** we have a well equipped Heavy Engineering Workshop, supported by a team of qualified and experienced technicians.

We solicit all your enquiries in Sugar Machinery **especially** about :

1. Car Spotters.
2. Wagon tippers.
3. Cane carriers with variable speed drive.
4. **Milling Plants :** 24"×48", 28"×26", 30"×60", 33"×66", 36"×72".
5. Cane Levelling and cutting knives.
6. Improved type Chokeless pumps.
7. Improved type continuous Sulphur Burners.
8. Continuous Juice and Syrup Sulphitation Equipments.
9. High Velocity Vertical Juice Heaters.
10. Modern and Efficient Evaporators with Vapour Bleeding arrangements.
11. Low Head Calendria Vacuum Pans with or without Mechanical Circulators.
12. Multi Jet Spray Condensers.
13. Air and Water Cooled Crystallisers.
14. Magma and Massecuite Pumps.
15. Rotary Molasses Pumps.
16. High Speed Centrifugals with automatic process controllers.
17. Magma Mixers.
18. Multi Tray Grasshopper Dryers.
19. Sugar Graders.
20. Continuous Sugar Melter.
21. Water Tube Boilers.
22. Steam Accumulators.

We have recently entered into a collaboration agreement with M/s. Prerov Engineering Works, Czechoslovakia, for the manufacture of complete Cement Plant—capacity 600 tons, wet process.

slumped further as the progress made by them has not been upto expectations. The capital outlays in many cases have exceeded the original estimates. Prospects of payment of maiden dividend have receded further. The foreign exchange situation is far from encouraging and, with the increased imports of foodgrains, maintenance imports for industries would have to be curtailed. No wonder the capital market is depressed and even first-class new issues are not evoking worthwhile market response. More often than not, the underwriters have to play the role of undertakers. The Industrial Development Bank of India, set up in July, would no doubt aid the industrialisation of the country. All the same, it cannot bring about the revival of confidence. A healthy stock market is a *sine qua non* for a vigorous capital market. The need of the hour is to soften the rigours of those taxation measures which militate against the improvement in the investment climate and provide powerful incentives.

The situation, therefore, demands a thorough reappraisal. Will the policies continue to be motivated by ideological considerations? Or will realism be brought to bear on the solution of the economic ills afflicting the country? Perhaps, we will know the answer in the budget that will be presented in about two months from now. And in that answer will depend the future of stock exchange investments.

Government Securities

Activity was by and large confined to short-dated securities. Buying support was mostly from institutions. The 1986 Conversion Loan which started the year at Rs. 65.80 declined to Rs. 62 when the Bank Rate was increased to 5 per cent and has remained at that level since then.

Section-wise Trend

Banks: Somewhat greater attention was paid to bank shares during the year in view of the steady and reasonable return they offer coupled with comparative capital safety. The 1963 working results of banks disclosed higher earnings. In most cases, dividends were maintained and a few banks declared slightly better dividends. It is expected that, despite the increased interest offered for garnering deposits, higher establishment expenses and the pressure of the modified liquidity requirements, profits for 1964 could be maintained at a satisfactory level.

Electrics: This section noted broadening of investment enquiry, but paucity of floating stocks restricted business. The rise in the Bank Rate will benefit electricity companies and so after this announcement these shares recorded moderate all-round improvement. With the exception of Tinnevelly-Tuticorin, all the companies either repeated the dividends or stepped up the same slightly.

Sugars: The problem of rising cane prices and providing adequate cane supplies due to diversion to *gur-khandsari* production continued to beset the industry. However, sugar companies reported satisfactory earnings and distribution to shareholders was maintained. Deccan Sugars paid the final dividend of 11½ per cent on a capital increased by the issue of bonus shares. Prospects for the 1964-65 sugar season hold promise of a higher production, inasmuch as the sugarcane crop is expected to be larger than in the previous period and the industry's overall crushing capacity has expanded. The ex-factory price for 1964-65 season has been revised recently, but this has failed to meet the requirements of sugar producers. A further revision, based on cost structure and other relevant factors, would be made after the Tariff Commission submits its report. It is hoped that the price fixation would be so made as to provide incentive to boost up production. Sugar companies, therefore, can view the future with confidence.

Plantings: The shares of plantation industry attracted better attention in 1964 than in the previous years due to the uncertain outlook for industrial equities. It is common knowledge that planting shares offer a comparatively higher yield and risk of capital depreciation is rather limited. Despite increased production costs and the absence of tax relief, the general run of companies reports received during the year disclosed satisfactory working results mainly due to enhanced output. Given adequate incentives, the industry can grow from strength to strength and contribute in a larger measure to the economic advancement of the country.

Rubber: Prospects for natural rubber in India are bright considering that demand is far in excess of production. Consumption of rubber has increased at a faster rate and notwithstanding the marked growth in the total production of both natural and synthetic rubber, the shortfall is estimated to be of the order of 35,000 tonnes annually. Imports of rubber—both natural and synthetic—during the financial year 1963-64 amounted to Rs. 9.75 crores. The capacity of rubber goods manufacturing industry is expanding at a rapid pace and its requirements are said to be growing at a rate of 10,000 tonnes per annum. There is, therefore, no need to fear that synthetic rubber will imperil the prospects of natural rubber consumption and production. Rubber companies repeated their past performances and select shares such as Cochin Malabars, Pullangodes, Rajagiris and Thirumbadis continued to be popular with the investors.

Tea: During the first half of the year, South Indian production suffered a setback due to drought conditions and amounted to only 39 60 million kgs., as compared with 45.78 million kgs. upto June, 1963. For the nine months ended September, 1964, the output was of the order of 61 million kgs. against the corresponding last year's figure of about 63 million kgs. Even this shortfall of 2 million kgs. can be expected to be wiped off during the last quarter. In fact, South Indian output for 1964 is estimated at 91 million kgs., as against 89 million kgs. in 1963. The total production in India during this year is expected to be about 363 million kgs., representing an increase of about 17 million kgs. over the 1963 figure of 346 million kgs. Indian tea is encountering keen competition in world markets. All the same, with the vigorous propaganda carried on by the Tea Board in foreign countries, exports which showed a downtrend in the first half of this year, have turned to be satisfactory since June, 1964 and are expected to be higher by about 9 million kgs. at about 233 million kgs. Internal demand is steadily rising and is bound to grow still further with the increase in population and improvement in standard of living. The Government seem to have realised the need to strengthen the competitive capacity of this beverage in international markets and are likely to grant substantial relief to this basic industry which is an important foreign exchange earner.

Internal prices of quality teas have by and large been satisfactory. Investors' preference for tea shares, especially of companies producing high grown teas, was reflected in the rise in share values. Performance of tea companies was mixed, because the crop gathered by some companies whose year ended with June was lower on account of the late arrival of monsoon. Current year's prospects bid fair to be good.

Coffee: An important feature is the upward trend in production. The 1963-64 season's crop of 68,500 tonnes constitute a record in the annals of this industry. Pool payments for this season are likely to aggregate Rs. 2.59 per point which is again a record in recent times. Due to untimely and inadequate blossom showers, the estimate for 1964-65 season has tentatively been placed lower at 62,300 tonnes. Internal markets, under the impact of our expanding economy, possess tremendous scope for increased consumption. Conditions in world markets are also favourable to coffee exporting countries, owing to the serious shortfall in the Brazilian coffee crop. What is more, it does not seem likely that the Brazilian output will approach its previous level in the foreseeable future. Under the International Coffee Agreement, India has been allotted a basic quota of 21,600 tonnes. The Coffee Board has taken active steps to have this quota enhanced to at least 50,000 tonnes per annum. Further, prospects for exporting coffee to non-quota countries are reported to be reasonably bright. The industry is thus on a good wicket.

Coffee shares came in for moderate business. Most coffee companies have reported higher earnings and declared increased dividends. The market leader, Consolidated Coffees, have gathered a record crop of 4,001 tonnes for the year ended 30th June 1964 and earned a record pre-tax profit of Rs. 72,43,814. The dividend has been stepped up by 7½ per cent to 27½ per cent.

Textiles: The textile industry continued to be confronted with the problems of high cost of production and excise levies. The supply position of cotton during the 1963-64 season showed a welcome improvement. Production of cloth is still lagging behind the third Plan target. With the growing population and rising purchasing power, the demand for cotton piecegoods is bound to expand continuously in the coming years. The decline in exports is reported to have been not only arrested but the trend is stated to be distinctly upwards. At a time when the outlook appeared to be getting better, partial control on production of cloth was imposed. This statutory control is likely to fall more heavily on those mills which are exclusively or predominantly producing the controlled varieties. Buying of textile scrips in 1964 was extremely selective and was confined to popular shares such as Anglo French, Bangalore Woollens, Buckinghams, Lakshmis, Maduras and Rajalakshmis.

Excise duty on rayon yarn was increased by 50 per cent in the budget. In October, the duty on viscose rayon and filament yarn was reduced but the reduction was not upto expectations. Accumulation of stocks led to distress sales by some companies. Rayon shares went out of favour and slumped to new low levels in recent times. Unless the excise levies are substantially reduced, the travails of this industry threaten to continue.

Cements: The gap between demand and supply continued. In July the retention price was slightly increased from Rs. 77.75 to Rs. 79 per tonne. Cement companies' profits for the current year should reflect this increase. Profits of India Cements for the year ended March 1964 were higher but allocation to Development Rebate on account of the Sankandrug unit reduced the disposable surplus and so the dividend was pruned by 3 per cent to 6 per cent. Towards the close of the year, interest in cement shares waned.

Miscellaneous: Select Industrials like Aluminium Industries, Ashok Leylands, Mettur Chemicals, Indian Steel Rollings and Textools attracted investment support. The automobile tyre industry is confronted with the problem of accumulation of stocks and the newly established units are affected most. Consequently these shares suffered sharp falls. Madras Rubbers slumped to Rs. 9. Travancore Chemicals were consistently sought for and closed better.

Fixed Interest Securities: In the wake of the declining trend of equity prices, investors' preference for this type of investment grew as the year progressed. First class preference shares and debentures were avidly taken up, but, in the absence of sellers, the volume of business was not substantial.

BOMBAY STOCK EXCHANGE

(*Concluded from page* 210)

Rs. 16.92 on 17th December, against the pre-Budget peak of Rs. 20.20 and the year's low of Rs. 16.08. Premier Auto was down to Rs. 97. Tyre shares made a poor show, most of the new ones quoting below par levels. Selling in the new tyre shares began with the alarming note struck at the annual meeting by Ceat chairman regarding the outlook for the industry. His views, however, were not shared by many others in the industry. At the time of writing, Madras Rubber was quoted at Rs. 9.36, Premier at Rs. 77 and Ceat at Rs. 84, as against the year's high of Rs. 14.37, Rs. 98, and Rs. 133.75, respectively.

Cement shares were well held but the short spell of firmness in A.C.C. during the third quarter was attributed more to the shortage of floating stocks than to any encouraging news about the Company. At the time of writing, the scrip was around Rs. 152.50, comfortably above the year's lowest of Rs. 146.50 but far below the highest of Rs. 167 touched during the year. Similarly, Digvijay declined from Rs. 194 to Rs. 168 but was quoted at Rs. 177 towards the close of the year. The price pattern of sugar shares followed the general trend. Their leader, Belapur, moved between Rs. 240 and Rs. 198 to close at Rs. 223 on 22nd December. Scindia, among shippings, failed to be enthused by the favourable statement of Chairman Khatau. Earnings during the first four months of the Company's current fiscal year have been higher by Rs. 40 lakhs on the corresponding period of last year but the shares closed on 17th December just around Rs. 15.48, as compared with the year's highest level of Rs. 16.60. Great Eastern had been bid up to Rs. 18.28 but touched a low of Rs. 11.72 before closing at Rs. 12.24. Paper shares failed to attract attention apparently in view of the present excess of supply over demand.

Activity in cash shares was not up to the mark. No doubt some of the good ones in the list like Associated Bearings, Lynx Machinery, Hind. Aluminium, members of the Kirloskar group, S.L.M., T. Maneklal, Sandvik, Zenith Steel, Universal Cables, etc., were popular and well held, but, by and large, cash shares as a whole have suffered more than the forward scrips. This is true particularly of the scrips of new companies established towards the close of the second Five-year Plan and first year of the third Plan.

BUSINESSMEN PREFER UNION BANK

For nearly half a century now, businessmen have found a constant friend in the Union Bank of India. Whether you are in the export market or trading within the country, Union Bank's streamlined methods can help you. We have branches all over India covering all main towns, and Telex contact with countries all over the world. You will benefit from our fast, personalised and comprehensive banking service Businessmen prefer Union Bank because of the extra speed, extra convenience and extra prestige of banking operations through Union Bank.

Calcutta Stock Exchange

Values Drift Downward

PERIODICAL claims on company profits from increased taxation, heavier wage bill and rise in other charges have gradually diminished the importance of stock markets in India. Investment in Government bonds and savings certificates, public utility undertakings, Unit Trust of India, and in Government-backed enterprises are preferred, since these, in most cases, carry a definite return and other advantages such as income-tax rebate and/or concession. Although the return on investment in the private sector is usually larger than that on fixed interest-bearing bonds, uncertainties are on the increase. While in times of "underemployment" inflation as at present—the liquidity preference of people is higher, a rising rate of interest does mean capital depreciation to the holder of Government bonds but capital appreciation to holders of good-yield equities. Even so, the capital market has become shy, not only has the number of public issues shrunk but the demand for underwriting such limited issues by brokers and institutional investors (such as the L.I.C., U.T.I. and investment corporations) has also meant lending a thick old-fashioned *purdah* to the already shy capital market. This is so because, with the certainty of tax increase every year, business uncertainty has developed beyond a measurable stage. Naturally, stock markets in India have become dull and insipid. Witness as on 28th December the regional index for Calcutta of the variable dividend industrial securities compiled by the Reserve Bank of India (base: 1952-53=100) was 161, which gradually declined to touch the year's low of 148.7 in the week ended 20th June. A recovery thence took the index up to 152.4 in the week ended 26th September, to be followed by a decline to 148.9 by 21st November, but looking up at 149.1 in the following week.

This is not to say that the possession of equity shares has become unattractive. Far from it. As against the return of about 6 per cent to 8 per cent on Government bonds and other fixed interest-bearing securities, several well-established joint-stock companies have announced dividends of even 20 per cent and above in the course of 1964. However, it is implyingly known that the Government does not look upon well dividends above 8 per cent or so. This is only too evident from the definition of "available surplus" in the Bonus Commission's report, accepted by the Government with modification. There is provision of only 8.5 per cent return on equity capital and 7.5 per cent in the case of banks, with 6 per cent and 5 per cent on respective reserves, respectively. That the Government does not look with favour on higher dividends is also evident from the imposition of a 7½ per cent dividend tax, 12½ per cent tax on bonus issues, and the attraction of the capital gains tax to bonus issues. That being so, although no statutory provision of dividend limitation would be envisaged (the Government would not apparently like to be confronted, as in the not distant past, with a situation to justify complaints that the Government is literally tieing the hands and legs of private entrepreneurs) the implied hint that company taxation would move up until dividends generally fall to the level of interest rates on Government bonds is what explains investors' apathy to the capital market. Despite the abolition of the super profits tax and the grant of some other concessions especially to foreign investors, tax changes in the 1964-65 budget meant a net addition to revenues by Rs. 40 crores in addition to Rs. 50 crores from the annuity deposit scheme. If a sum of Rs. 50 crores is taken from the medium-and high-salaried class, that cannot but mean the diversion of such a colossal sum from the capital market to Government coffers.

The decision of the Government of India to set up consumer goods industries is a significant pointer to the denial of funds to private industry for rehabilitation and expansion. The Bonus Commission's report glaringly rejects the industry's claim for provision of development from profits, and the Government is not at an embarrassment to reconcile with such a rejection. In view of limited expansion, consumer goods industries, which have so far been the preserve of the private sector, have failed to cope with the rising demand, and shortages have occurred. Had only the private sector been allowed a reasonable measure of freedom to plough back profits, that is, without the policy of taxing to the hilt, this state of affairs could have been prevented. The Union Minister for Industry and Heavy Engineering, Mr. T. N. Singh, recently announced that the Government was soon setting up some cement and paper plants "in view of the slow progress of these industries and the general lack of response by the private sector." The Prime Minister, Mr. Shastri, had also listed sugar, cotton textiles, and drugs and medicines as the possible fields of public sector. Blaming the private enterprise for lack of enterprise and at the same time making conditions difficult for it and then make the former as the justification for the Government to set up industries in the basic consumer goods sector is what that is being dramatised!

These were then the causes for depression on the Calcutta Stock Exchange during the year 1964, which was eventful for the rapid recession in values with exceptions.

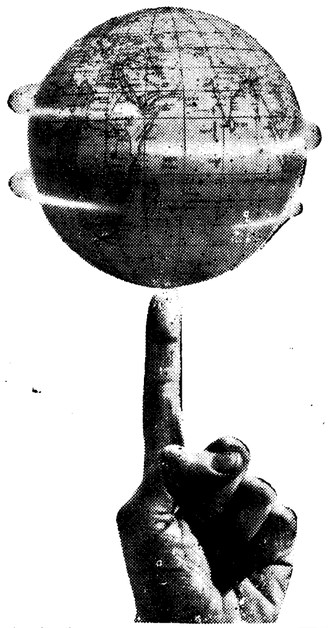
Miscellaneous Industrials

The price decontrol of sixteen commodities on the eve of 1964, coupled with the raising of exemption limit from Rs. 10 lakhs to Rs. 25 lakhs for both capital issues control and industrial licensing, and the suspension of emergency risks insurance premium for the first quarter of 1964, should have generally provided a good stimulant. But the disturbed law and order situation at Calcutta and its industrial environs led to depression in trading early in January. Soon followed the Congress's renewed emphasis on socialism and socialistic policies at the Bhubaneshwar session, as well as the vociferous demands for nationalisation of banks. The recommendations of the Bonus Commission accentuated and accelerated the easing phase. From 161 at the end of 1963, the Calcutta regional index steadily moved down to 156.9 by 8th February. Although the 1964-65 Budget was not bullish in its real, studied sense, its favourable features, including provision of specified rebates of surtax, income-tax and super-tax to certain important industries (including basic metals like steel, copper and aluminium, coal mining, cement, fertilisers, paper and pulp, tractors, industrial machinery and machine tools, tea, and equipment for generation of electricity) drew attention to Calcutta shares, leading to a recovery in the index to 159.3 by 7th March.

The next phase should be called "demoralisation," the signal for the somersault emanating from the Finance Minister's refusal to modify some of his harsh proposals such as the dividend tax, capital gains tax on bonus shares and the surtax. This stage continued up to the week ended 20th June, the index moving down to 148.7, the year's low. The cold wave, despite summer's vigour, was so fierce that it did not allow good corporate news to be effective to boost sentiment. Note was taken that new issues took refuge underwriting. Despite the disappointment caused by the I.I.S.Co. dividend falling below earlier expectations, the Company's expansion programme and the introduction of an interim dividend henceforth led to recovery during July and August. Also, Mr. Shastri's realistic approach to planning in his emphasis for revision of priorities to serve as an antidote to inflation attracted support to the existing low levels. By 12th September, the index had picked up to 152.8 Subsequently, there was the dull phase which continued till the close of the year. The sharp rise in the prices of essential commodities, the rise in interest rate, and the accentuating inflationary conditions demanded the payment of higher dividends, but the spiralling costs of production held out no prospect.

Jute Textiles

It is significant that the year's high and low of the group index for Jute Textiles were the opening and closing (latest), that is, 96.2 (week ended 4th January) and 83.5 (week ended 28th November). This demonstrates the rapid loss of enthusiasm of investors in an industry which is no mean contributor to the country's earnings of foreign exchange. It is to the credit of mills that they have been able to increase both output and exports and fulfilled the respective third Plan targets a year ahead. How-



The Bank of Baroda has been handling foreign business for many years. Today, the Bank has branches in London, East Africa, Fiji Islands, Mauritius and East Pakistan.

The Bank of Baroda through any of its foreign branches or its correspondents is fully equipped to offer all the services needed in foreign trade and to handle every type of foreign exchange business—including opening Letters of credit, the negotiation/collection of export bills, clean bills and cheques, foreign remittances, credit information, etc., and is always willing and prepared to assist you in solving your problems concerning imports, exports and foreign travel with prompt and efficient service.

THAT EXPERT TOUCH COMES WITH EXPERIENCE

THE BANK OF BARODA HAS BEEN HANDLING FOREIGN BUSINESS FOR YEARS & YEARS

Branches in London, Nairobi, Mombasa, Kampala, Dar-es-Salaam, Moshi, Mbale, Mwanza, Jinja, Kisumu, Naraingani (East Pakistan), Port Louis (Mauritius), Suva and Lautoka (Fiji Islands) and correspondent banks all over the world.

ever, with the increase in fibre prices, labour charges and prices of mill stores, costs have risen out of proportion to the rise in prices of goods. As the year was coming to a close, the industry was threatened with labour strife as a result of difference of opinion relating to annual bonus. There was concern in the fall in sacking exports due to unfair competition by Pakistani mills, although, in view of the prolonged strike in Pakistani mills, Indian exports of sacking in October and November increased impressively. Excepting for minor breaks, the group index eased week after week and touched 83.8 in the week ended 18th July. An improvement set in then, as a result of the rise in prices of goods and, by the week ended 5th September, the index had recovered to 87.6. While Birlas went up to Rs. 38.87 from Rs. 34.44 early in the year, New Centrals declined to Rs. 9.44 from Rs. 13.19.

Teas

High taxation, lower average prices at tea auctions, and lack of adequate finance for rehabilitation and expansion all led to falling interest in Tea shares. Despite increased production, there were no signs of a rise in internal consumption of tea, and this was evident from the fact that tea was one of the few consumer goods, which failed to participate in this year's spiralling price trend. The group index for the week ended 28th December 1963 was 139.9, and, excepting small ups, the trend was throughout a falling one to reach the year's low at 123.1 in the week ended 21st November. The possibility of the Government's acceptance of the tea Finance Committee's recommendations, which would provide the industry with a development allowance, should have normally meant an atmosphere of cheer. With the proposed formation of a Tea Finance Corporation, an answer would be found to the prolonged problem of finding medium- and long-term finance.

Coals

Coal is another important industry the fortunes of which received commanding attention on the Stock Exchange. The group index was at its high for the year at 106.7 in the week ended 4th January (107 for the week ended 28th December 1963) and at its low, which is the latest available, that is, 91.1 for the week ended 28th November. The grant of an increase in the price of good quality coal was small satisfaction for an industry which was disappointed with the volume of consumption as against growing accumulation of pit-head stocks. Bengal Coal experienced a gradual fall to Rs. 230 from Rs. 270, since the dividend for 1963 was only 16 per cent, as against 19 per cent in 1962 and 21 per cent in 1961. The Government's decision to cut the production of coking coal meant general weakness.

Engineerings

The Steel index had the distinction of touching the year's high of 175.8 in the week ended 29th August, as compared with the opening of 159.5 in the week ended 4th January or the 1963 closing of 161.2 in the week ended 28th December. The latest index of 160.9 for the week ended 28th November was thus higher on balance by 1.4. The year's low of 155.7 was noted during the week ended 25th April. Indian Irons were at Rs. 25.82 as at mid-December, as compared with Rs. 24.86 early in the year. The scrip had risen to Rs. 26.82 as at the end of August and moved down to Rs. 23.90 in April. Rising production, talks of further expansion, despite increased costs and discouraging dividend, and disappointment on partial decontrol of steel led Indian Irons to tread a different path as contra-distinguished with the general trend.

Generally, other engineering scrips also did well, considering the general trend. Paucity of basic metals and other essential imported raw materials meant under-utilisation of capacity. However, shortage of electricity did not cause difficulties as in 1963, although some restrictions continued to be in force.

Cements and Sugars

The Cement index touched the year's high of 150.2 in the week ended 7th March, after being lower at 147.2 in the week ended 4th January. For the rest of the year, the movement had been zigzag, the week ended 28th November witnessing a low of 138.9. Growth prospects for this industry provided some grips from the general slippery phase. The check for the move-down was even stronger in the case of Sugars as evidenced in the group index for the week ended 28th November (latest) of 131.8 being so close to 133.3 in the week ended 4th January and also to 134.2 in the week ended 28th December 1963. The year's low of 122.5 was touched in the week ended 6th June.

The year is coming to a close with neither optimism nor pessimism ! It is an anomalous situation that, despite the generally rising trend of industrial activity, the capital market has become a place of dread. The ills would require a closer examination by both the Government and the industry. They also need methods by which a sense of mutual trust is rebuilt.

BULLION: SILVER SOARS TO A NEW PEAK

Trading in the bullion market during the calendar year 1964 was highlighted by remarkable strength in silver which soared to a new all-time peak of Rs. 269 per kilo or Rs. 313.65 per 100 tolas. Gold prices, too (both of primary gold and the 14-carat variety) were firm, despite the Government's gold control policy. Pure gold was bid up to Rs. 129 per 10 grams (Rs. 150.41 per tola) against its rate of Rs. 105 before the promulgation of Gold Control Rules. Unlike in the previous year, 14-carat gold displayed a higher trend and at one time gained as much as Rs. 12.75 to Rs. 72.75 during the year. Over the year, ready silver at Rs. 266, was Rs. 15.50 higher, pure gold, at Rs. 114, showed a gain of Rs. 12. 14-carat gold appreciated from Rs. 60 to Rs. 68.50 and sovereign improved from Rs. 85 to Rs. 91 per coin.

Paucity of stocks and a free market explained the strength in silver. But fluctuations were erratic. Before the end of January itself, the price reached the year's highest level of Rs. 269. Heavy arrivals from Nepal and of Tibetan coins at Kanpur receded the price to Rs. 254 by 11th February. But this setback was short-lived, as strong upcountry 'demand pulled up the price to its original level. the next three months saw a gradual recession, thanks to a larger inflow of the metal into the market and on 13th June the price dropped further to Rs. 242.50 on reported sale of 250 bars by a prominent industrialist. Southern demand and the entry of two local refineries for buying raw silver pushed up the price to Rs. 261 by the end of the first week of August. Upcountry offerings kept the price a few points lower in the next two months, but the firm trend reasserted itself during *Divali* and after.

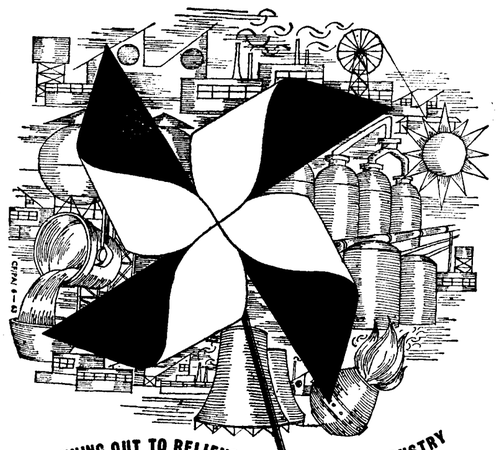
Fears of a stiffer wealth tax and estate duty in the budget kept gold subdued till February. But subsequently on unofficial buying, the price rose to Rs. 122 from the year's opening of Rs. 102. The highest level of Rs. 129 was reached on 22nd June. In September, because of the Enforcement Directorate's raids on houses of film stars and businessmen, the price slumped to Rs. 106 to recover later to Rs. 114. Fourteen-carat gold displayed a firm trend, though demand for jewellery made from this gold remained unencouraging. The price rose in stages to Rs. 72.75 by the middle of August from Rs. 60 at the start of the year. In September, it dropped to Rs. 64.50, but later recovered to Rs. 68.50.

Sovereign rose from Rs. 85 to Rs. 93.50 by the middle of August, dropped to Rs. 90.50 in September, and was later steady around Rs. 91.

Since its licence to conduct forward trading was not renewed after it expired in the first week of October 1963 and since its efforts to convince the Government to allow it to resume futures trading failed, the Bombay Bullion Association Ltd. decided, during the year under review, to sell its main building in order to meet its heavy debts.

COAL RESERVES IN MAHARASHTRA

The Indian Bureau of Mines has just established the workability of five rich coal seams in the Kamptee coalfield, 12 miles north of Nagpur city in Maharashtra. Detailed investigations have indicated the existence of 705 million tonnes of coal (including 226.5 million tonnes of proved reserves) in a small area of 31 sq. kilometres. Of the five coal seams, the bottom two are of very superior grade (Grades I and II) and can be utilised as a source of loco fuel. They alone are estimated to exceed 100 million tonnes. The comparatively inferior (Grade III and lower) seams found in the upper portions offer can be used for power generation, gasification and synthetic liquid fuel preparation. The coal reserves are spread over five district coal horizons, whose lateral extent has been proved over a length of eight kilometres and down to a maximum depth of 450 metres. The new coal seams are expected to extend beyond the areas established so far.



FANNING OUT TO RELIEVE THE STRAIN ON INDUSTRY

The history of Calcutta Fan, ploneers in the field of industrial ventilation, is a mirror of their growing contribution to the industrial progress of India. The best of INDIGENOUS SKILL AND RESOURCES were harnessed by Calcutta Fan Engineers to solve diverse problems of industrial ventilation—at Durgapur, Rourkela, Belpahar, Jamshedpur, Hirakud, Perambur, Alwaye, Trichinapalli, Bangalore, Bhadravati etc. The wide range of Calcutta Fans so superior in design and performance can relieve the strain on any industry.

COTTON NO EXCEPTION TO RISE IN PRICES

CURRENT SEASON'S CROP BELOW PLAN TARGET

WHEN rise in prices has come to be a prominent, though an evil, feature of our Five-year Plans, cotton has shown that, in spite of sufficient supply in the past few seasons, it need be no exception to the general trend. Indeed, raw cotton prices during most part of the 1962-63 season (September-August) and also the 1963-64 season ruled at or above the ceiling rates, despite commercial production striking a new high of 5.77 million bales (of 400 lbs. or 180 kgs.) in 1962-63 and 6.13 million bales in 1963-64, and closely approximating the Plan target of 5.78 million bales and 6.18 million bales for the two years, respectively. Apart from the higher outturn, the total available supply, despite progressively lower imports, increased from 7.7 million bales to 8.25 million bales in 1962-63 and further to 8.93 million bales in 1963-64. Again, after meeting all requirements, the carryover surplus improved from 1.63 million bales to 2.24 million bales in 1962-63 and further to 2.52 million bales in 1963-64. The statistics of production, distribution and surplus would naturally indicate a fall in prices. In point of fact, the price behaviour has been none too different in the recent years of record production and satisfactory supply. The reasons are many: primarily, (*a*) weather uncertainties and the absence of machinery to determine precisely their good or bad effects on the size of the crop, (*b*) inflationary psychology and the speculative tendency to cash in on the scarcity mania, (*c*) relatively limited increases in the growth of the choicest varieties, (*d*) poor marketing arrangements, (*e*) rising mill consumption and the tendency on the part of mills to grab what is going only at that time when the arrivals fail to correspond to the size of the growth, (*f*) the Government's policy (i) of incentives and price support and (ii) to delay import announcements, and (*g*) the evil nature of prices not to beat a retreat from an advanced point except in conditions of a glut in the market.

Within the first four months of the current season (1964-65), spot rates pierced the ceiling levels—in the case of choicest varieties by as much as Rs. 150 to Rs. 200 per candy—and the futures I.C.C. Jarilla 25/32" March 1965 contract commanded an unofficial premium of Rs. 4-6 over the non-

delivery period ceiling of Rs. 775 per three quintals, after trading came to a standstill from about the middle of December. The spurt in prices was attributed to (i) trade estimate of a same size crop as in the last season, that is, around 6.15 million bales, (ii) slow movement of the early crop, and (iii) delay in the announcement of import quotas. The price situation caused serious concern to the Government and mills, and their representatives, at a meeting with those of growers and the trade in Bombay on 17th December, jointly agreed that survey of cotton sold above the basic ceiling prices should be reintroduced. They also agreed to introduce the system of fixing definite dates for ginning and/or pressing, depending upon the movement of different varieties of cotton in the areas concerned. At the meeting, the Government representatives made it clear that, if these measures were unable to restore "normal market conditions within a reasonable time," requisitioning of cotton by the Textile Commissioner at different points, including stocks with the mills, could not be ruled out. This meant good-bye to fully free marketability in cotton, permitted last season for the first time in recent years because of a record crop.

The present trade estimate of the current season's crop at 6.15 million bales, unlike in the previous two seasons, falls considerably short of the 1964-65 Plan target of 6.63 million bales. Recent experience has been that the trade figure around this time of the season has been an underestimate. It may well be, therefore, that the 1964-65 actual production may turn out to be 100,000 bales higher and constitute a new record of, say, 6.25 million bales. But even then, the achievement would be unimpressive against the Plan target. The official thinking seems to be that the crop would show no improvement over the last season's actual. It was possibly in anticipation of this that, at the start of the season, the Government

committed itself to licence imports of a sizable quantity of 950,000 bales. Actual arrivals during the season are expected to total 750,000 bales, 120,000 bales more than in the last season. The total availability, including the carry-over from 1963-64 and imports, is likely to be 9.50 million bales, as against 8.93 million bales a year before. After allowing 6.50 million bales (including 700,000 bales of foreign cotton) for mill consumption and after meeting other requirements, the surplus to be carried over is likely to be higher at 2.64 million bales, as compared with the 2.52 million bales brought in from the last season. The statistical position is thus strong. But all the same, mills are today finding it hard to procure cotton at the ceiling levels and, indeed, those in Kanpur have threatened to close down unless the Government gets them cotton at fair prices. Lately, with the announcement of the season's first import quota of 214,000 bales on a global basis on 7th December, more particularly after the cotton interests' joint decision to reintroduce compulsory survey, spot prices have dropped 50 points in some cases. But the crux of the problem is the shortfall in production target after two seasons of satisfactory outturn.

There is every reason now to attribute the recent satisfactory seasons (actually, the turn for the better was noticed from 1961-62, but it was only in 1962-63 and 1963-64 that the production approximated the Plan targets) to favourable weather than to any significant improvement in the yield. At the 90th meeting of the Indian Central Cotton Committee held in Bombay on 19th September 1964, the President of the Committee, Mr. A. D. Pandit, reverted to "production and yield" as the theme of his speech. He said :

"There has been some slight improvement for the last three years in respect of cotton yields. We have not yet been in a position to say that that improvement is due to the application of science and technology to cotton. I would grant that you have evolved varieties, the plant breeders have done a good job, we have replaced *desi* and short-staple cottons by medium and long staple cotton, but, as far as the yields are concerned, I am not able to say yet that the somewhat improved performance of the last three years has been due to something that either agronomists or the extension workers have done. We have to thank only the good seasons for the good performance. We know that seasonal factors can exercise a much greater influence than of the order of two or three per cent (improvement noticed in production), and here we have a large acreage under unirrigated cottons. The agronomists and soil scientists here have to join hands to prove that it is possible to get something of the order of 200 or 300 lbs. lint per acre even under those conditions. If application of fertilisers is not possible because of inadequate water resources, we must find how we can conserve moisture in the soil. If it is not possible to take successive crops of cotton in a particular soil on account of lack of moisture, we must find a rotation crop which will make it possible to take a crop of 200 to 300 lbs. per acre, so as to restore the moisture conditions and the fertility of the soil. But I would urge again that our scientists should direct their attention to the specific problems, instead of adopting the classical attitude of research for the sake of research."

As noted at the outset and as is evident from the foregoing table, the supply position during the 1963-64 season was extremely satisfactory. This is more satisfying because the improvement in the total availability was due to a larger surplus obtained from the previous season and a considerable increase in the 1963-64 season's crop to a record level of 6.13 million bales. Imports, on the other hand, were again kept low; the actual arrivals being 630,000 bales, as against 851,000 bales in 1962-63 and 855,000 bales in 1961-62. The season closed with a larger surplus of 2.52 million bales, as compared with 2.24 million bales in 1962-63.

The official estimate put the crop, however, at 5.49 million bales, barely 2.2 per cent over 5.37 million bales in the previous season. The acreage under cultivation increased by a meagre 0.9 per cent from 19.38 million acres to 19.57 million acres, as against the rise of 3.3 per cent noted in the previous season. But the yield per acre, which had improved from 93 lbs. to 106 lbs. in 1962-63, edged forward to 110 lbs. in 1963-64. But the figure is far too low as compared with what is obtaining in some of the cotton producing countries, for instance 500 lbs. in the United States.

Mill consumption, which had receded slightly from 5.68 million bales to 5.67 million bales in 1962-63, rose considerably to 6.08 million bales during 1963-64. The total comprised 5.47 million bales of indigenous cotton and 605,000 bales of imported cotton, as against 4.79 million bales of Indian cotton and 881,000 bales of foreign cotton in the previous season. The whole of the increase in mill consumption, it will be seen, is accounted for by Indian cotton thanks to the season's larger crop. In view of the improved supply position, the Government relaxed the stricter cotton control and announced a liberal policy for the 1963-64 season. The floor prices of cotton, for instance, were raised by Rs. 100 per candy. Further, the mills were permitted to buy 100 per cent of their requirements of Indian cotton based on their 1961-62 consumption. And the Compulsory Quality Survey and Supervision Scheme was discontinued. It was only in the case of Digvijay 'A' cotton that the Government had to restrict movement and purchase towards the end of January, because its prices pierced the ceiling. In sympathy with this cotton, the other varieties were also marked up, but the action in connection with the rise in price of Digvijay 'A' had a salutary effect and the premia commanded by the other varieties dropped subsequently. The restriction on Digvijay 'A' was removed in April.

In spite of a bigger Bengal *Deshi* crop of 567,000 bales in 1963-64 as compared with 431,000 bales in the preceding season and in spite of free licensing of its exports, the total exports declined from 335,612 bales to 266,709 bales, because of (i) larger consumption of Bengal *Deshi* by mills for supplying the Defence orders and (ii) delay on the part of the Government in following Pakistan's action to abolish the export duty on this variety of cotton. It was only on 31st August that the Government notified its decision to abolish the export duty of Rs. 25 per bale on Bengal *Deshi*. The major buyer of Indian cotton was, as usual, Japan.

Despite expectations of a bumper crop, spot prices remained pretty high right from the start of the season. The cold wave in January and the extraordinary situation in regard to the availability of Digvijay 'A' cotton imparted further strength to all other

varieties of cotton. Deficiency of good quality cotton was yet another factor contributing to the price rise. And even after action was taken in connection with Digvijay 'A' cotton, prices ruled generally around the ceiling levels. Large-scale purchases by mills particularly when arrivals dropped and reduced arrivals of foreign cotton helped the prices to maintain a firm trend during most part of the season.

Out of the three futures contracts, March ruled firm on speculative buying prompted by fears of delayed P.L. 480 allocation and a downward revision of the season's crop and ended its career at the ceiling rate of Rs. 798, May was rigged up earlier from Rs. 716 to Rs. 770.25 but retreated to Rs. 735 in the wake of a fair assessment of the crop, and August finished at Rs. 784.75, less than 14 points below the ceiling of Rs. 798, after a five-day suspension of trading on a payment crisis created by bulls routing bears following the F.M.C.'s levying a margin of Rs. 75 per bale on 30th July to stem the speculative rise in the price. The March contract attracted tenders of 7,150 bales, the May contract of 1,650 bales and the August contract of 36,150 bales. The extraordinarily large figure of tenders against the August contract was the result of bull-bear tussle.

For a variety of reasons listed at the outset, cotton prices have shown no noticeable decline in spite of successive increases in the indigenous crop and more and more comfortable supply position. This trend must be reversed and the only way to reverse it is creating a glut in the market, a situation unlikely to be reached in the foreseeable future. There is a yawning gap of 2.35-2.85 million bales to fill between now and the fourth Plan, if the tentative cotton piecegoods target of 11,200 million yards is to be attained by 1970-71. Considering the rate at which cotton production is progressing in the country, the prospects are clear for anyone to see.

Oilseeds Prices Spurt To Unprecedented Levels

TRADING in the Bombay oilseeds market during 1964 was notable for the unprecedented levels to which prices rose under the lead of groundnuts, eluding the efforts of the Forward Markets Commission and the Government to hold prices in check. The harvest of groundnuts was considerably larger than in 1963, being estimated at 37 lakh tonnes, as against the final outturn of 32 lakh tonnes in 1963, in terms of kernels (that is, 70 per cent of nuts in shell); yet this could not stop prices from soaring high. The Government banned the exports of vegetable oils in the hope of inducing a downward trend in prices; but prices did not recede. The Forward Markets Commission came out with various physical measures such as ceilings, margins, double margins and the abolition of exemption limits. The market did not oblige. The Government negotiated for imports of soyabean oil from the United States under P.L. 480, in order that the augmented supply position of all edible oils might make the market behave. Even then the market maintained its high levels, ignoring every single measure calculated to help maintain the price levels at a moderate level. This, however, is not to suggest that these measures were by themselves unnecessary or unwarranted. They were certainly conceived in the best of faith, but it was a pity that they failed to bring about the desired results. Maybe it was a case of right things done at the wrong time or wrong things done at the right time. Or it may be that they were not adequate. As we reach the year's close, we find the futures market at a standstill, spot prices virtually out of control and goods unable to find except at the prices asked for by sellers. In the process of the market's journey to its record high levels, bull operators were utterly routed and either fled the market having burned their fingers or turned bears to hammer the market with a vengeance. At the end, there was a payments crisis. This was the tragedy of oilseeds in the year of grace 1964.

Price Pattern

The price pattern at the beginning of the year was as follows: Groundnut oil Rs. 17.75 per 10 kg., castor oil commercial Rs. 13.60, B.S.S. Rs. 14.30, linseed oil Rs. 15.50, cottonseed oil Rs. 16.40, groundnut expeller cakes Rs. 385 per tonne, deoiled cake (extractions) Rs. 370 ready, Rs. 360 January and Rs. 352 February, linseed cake Rs. 390, groundnuts January Rs. 222.25 per 250 kg., April Rs. 227.50, castor March Rs. 164.62, June Rs. 167.75, cottonseed January Rs. 95, April Rs. 100, linseed March Rs. 36 and June Rs. 37.06. In the spot section, groundnuts ready Khandesh were quoted at Rs. 46.50 per 50 kg., Nizam Bold at Rs. 45.62, Karad Bold at Rs. 44.75, Kanpur Bold at Rs. 44.62, castor Madras small at Rs. 32.62, Kanpur Bold at Rs. 31.82, linseed at Rs. 37.50 and cottonseeds at Rs. 20.90.

These levels were extremely satisfactory. There is no sanctity as such of any level of prices but the prices which prevailed at the beginning of the year were agreed on all hands as harmless. Then began the process of production figures losing their grip on the markets and exports having no bearing on price trends. And ultimately it developed into a crisis of confidence from which the market was suffering as the curtain rang down on the year. On 1st June, groundnuts Nizam Bold was quoted at Rs. 58.50, Khandesh at Rs. 60, Karad at Rs. 57.50, Kanpur at Rs. 56.75, castor Madras small at Rs. 34.25, Kanpur at Rs. 33, linseed at Rs. 42.50, groundnut oil at Rs. 22.75, castor commercial oil at Rs. 13.50, B.S.S. at Rs. 14.40, linseed oil at Rs. 18 and cottonseed oil at Rs. 20.80. On the same day, groundnut expeller cakes had moved up to Rs. 467, extractions to Rs. 405, linseed cake to Rs. 425 and cottonseed cake to Rs. 325. But the end of the same month, the market had scaled further high levels with Nizam Bold at Rs. 62.25, Coromondel at Rs. 63.25, Karad Bold at Rs. 63, Kanpur at Rs. 60.50, castor Madras at Rs. 36, Kanpur Bold at Rs. 35, linseed at Rs. 47.25, groundnut oil at Rs. 24.75, castor commercial oil at Rs. 15, B.S.S. at Rs. 15.50, linseed oil at Rs. 19.25 and cottonseed oil at Rs. 22.60.

Meanwhile, lots of things had happened in the spot section. The groundnuts January 1964 contract which had opened on 17th October 1963 at Rs. 218.25 dropped to its lowest level of Rs. 212 on 18th November but went off the board on 28th January at Rs. 236 which was its ceiling. The April contract which had started its career on 19th November at Rs. 218.50—about the lowest point—went up to touch Rs. 241, its ceiling. There was in addition a penalty of Rs. 5. The July contract came on board on 23rd March at Rs. 235.87 and touched its ceiling on 14th May. Thereafter, trading was virtually at a standstill. The trade and the Government engaged in a wrangling bout each blaming the other for the rise in prices. The trade maintained that the price pattern was guided by the forces of supply and demand; the Government argued that the rise was due to speculation. Then, from 1st June forward trading in groundnuts, groundnut oil and cake was ordered to be closed down.

Exports

While much might be said on both sides, the trade and the Government, the fact remained that exports of groundnut oil were extremely good. Exports of groundnut oil, seeds and cakes in the fiscal year 1963-64 were of the order of 10.37 lakh tonnes, fetching Rs. 49.00 crores in foreign exchange, out of the total exports of all oils and oilseeds of 11.58 lakh tonnes valued at Rs. 58.01 crores. The single item to earn the largest amount of foreign exchange was defatted groundnut meal, its exact share in 1963-64 exports being Rs. 30.47 crores. The role played by groundnut cake and groundnut oil in the exports is obvious. A hue and cry went up that these exports were responsible for the rise in prices and that to export oil to overseas countries depriving domestic consumers of their needs of fat except at abnormally inflated prices was condemnable as a policy. In fact, it was the Government that had encouraged exports of oil by means of incentives and, unable to face the Frankenstein it had created for itself, it banned the exports of vegetable oils effective 11th July. There was no futures trading in groundnuts September contract.

By the middle of September, however, spot prices had touched all-time highs. Coromondel had shot up to Rs. 77 per 50 kgs., Karad Bold to Rs. 75 and Kanpur to Rs. 74. Groundnut oil advanced to Rs. 3,300 a tonne on 14th September and it was said that unofficial deals were put through at prices even higher than this. In sympathy with groundnuts, castor Madras small moved up to Rs. 40.25 and Kanpur Bold to Rs. 39.25. Groundnut expeller cake touched a record high level of Rs. 515 and the deoiled meal (extractions) advanced to Rs. 447. Castor, however, had to see its highest level yet. Its highest for the season was Rs. 43, touched towards the end of the year. The following were around the highest for the year. Linseed Rs. 57 per 50 kg., groundnuts Rs. 80, cottonseeds Rs. 27, groundnut oil cake Rs. 515, per tonne, deoiled meal (extractions) Rs. 458, linseed oil Rs. 23.50 per 10 kg., castor oil commercial Rs. 18.50, B.S.S. Rs. 19.25, linseed cake Rs. 500 and undecorticated cotton cake Rs. 450.

Then another hue and cry went up and this time it was a clamour for permission to trade in new crop groundnuts futures. The arguments advanced in favour of the resumption of futures were the familiar ones. The new crop, a larger one, could not be marketed without hedge facilities and it would be anomalous to ban forward trading in groundnuts when trading was allowed in castor and linseeds. The Government was inclined to yield and this set off talks between the Exchange, on the one hand, and the Forward Markets Commission, on the other. The divergence of opinion between them as to the terms and conditions of the new crop groundnuts contract was rather wide. When, ultimately, permission did come from the Government it was realised that, while ceilings had been given up, trading had been subject to regulatory measures involving special margins if the rate touched Rs. 100 per 100 kg. in the case of groundnuts and Rs. 20 per 10 kg. for groundnut oil. Of course, there were exemption limits.

Groundnuts

Groundnuts January (1965) contract opened for trading on 7th October at around Rs. 94.60 per 50 kg. The market was subdued for a time and it was thought it would now behave itself. Meanwhile, much to the disappointment of everyone and general condemnation by the country, the Governments of Gujarat and Uttar Pradesh had taken what was termed as unconscionable the decision to ban the exports of groundnuts and groundnut oil from their States. The ban on the part of he Gujarat Government was viewed with particular anxiety, for the State harvests about one-third of the total crop of the country. It is this ban that had created an alarm in the market following which prices rose to all-time highs which has already been discussed earlier in this article. Protests followed, but the State Government appeared immovable. However, the ban was partially lifted later, in that while exports of oil were allowed to move out of the State, seeds were held back. At the time of writing, the ban on exports of groundnuts from Gujarat is still in existence.

It is common knowledge that Bombay depends mostly on Gujarat for its requirements of groundnuts for use by millers and *vanaspati* manufacturers. Arrivals have been satisfactory from inside Maharashtra, Mysore and Madras, but these are not sufficient to meet the needs of the city. With supplies far short of demand, it was only natural that groundnuts should shoot up and this is exactly what has happened. The January (1965) contract crossed the first line of margin easily in the last week of November itself. The Exchange, under instructions from the Forward Markets Commission, introduced the system of double margins on 24th November. According to this, bulls pay a margin of Rs. 10,000 per 25 tonnes if the rate were to cross Rs. 103. Furthermore, the exemption limits were removed. But bulls were undaunted. Trading came to a standstill, for the contract shot up to beyond the limits of fluctuation which is Rs. 2.40 in a week. At the time of writing the contract is unofficially traded at around Rs. 109 but it had shot up to as high as Rs. 111. On 14th December, the F.M.C. fixed a maximum price of Rs. 110 per quintal for groundnuts January and Rs. 22 per 10 kg. for oil. Outstanding positions in January were squared up unofficially at Rs. 110.50.

Neither the Government nor the Forward Markets Commission seems to be in a position to do anything. It is difficult to understand why exports of H.P.S. groundnuts should have been allowed when the need of the hour was to hold the price line. Exporters had already committed sizably and it was they who were gobbling the limited stocks in the market.

Exports of groundnuts deoiled cake (extractions) have been well maintained, thanks to the keen interest taken by communist countries. However, there were reports that they were reselling Indian oil in third party ports but we had better not discuss the subject here. Our traditional buyers—the United Kingdom and Continental countries—had been shying away from the Indian market but towards the close of the year inquiries from them broadened. Prices of extractions, as already discussed, rose to record high levels in sympathy with groundnuts. Trade estimates for exports during 1964 are for a total of one million tonnes earning about Rs. 38 crores in the shape of foreign exchange on f.o.b. basis or Rs. 45 crores on c.i.f. basis. Exports during 1965 are expected to be even better and again trade estimates are for a figure of 1.25 million tonnes fetching Rs. 50 crores. Larger exports are apparently facilitated by a bumper crop of groundnuts. Almost every member of the communist bloc has been a buyer of Indian groundnuts deoiled meal and it is believed that, during 1965, Russia would be buying substantially larger quantities. The estimated figure is 2.5 lakh tonnes valued at over Rs. 12 crores.

It is natural that in view of these favourable factors prices here should tend to look up. A desperate drive for exports and lower domestic prices are in consistent with each other. The trade feels that permission had better been given for futures trading in groundnuts expeller cakes at various centres, in order to enable exporters of groundnut deoiled cake to provide themselves with hedging facilities through the medium of expeller cakes. At present, they are forced to take recourse to hedging either in groundnuts or groundnut oil futures which hardly provide a genuine or reliable hedge against sales of groundnuts deoiled cakes.

Castorseeds

The fortunes of castor closely followed those of groundnuts. In fact, other seeds contented themselves with accepting the lead of groundnuts. Here, too, the story was one of chasing the prices and getting frustrated in the end. Let us take, for example, the September contract for castorseed. Trading in this commenced on 21st May 1964 at Rs. 175 per 250 kg. The contract touched its lowest level of Rs. 174.25 within the first few days of trading. Thereafter, the market maintained a consistently upward trend touching its highest level of Rs. 181.50 on 23rd June. The Forward Markets Commission took a serious view of the rising trend and of the heavy long positions built up by bull operators. The outstanding position was put at 1.5 lakh tonnes and the Commission prevailed upon the Exchange to take remedial measures. The result of this was the imposition of a ceiling of Rs. 181.50 on the September contract. No business could be transacted above this level. Officially, trading came to an end, but, in the kerb, the contract was being bid up to Rs. 185. The continued firmness increased the fears of the authorities. Bulls too got a little

THE DURGAPUR PROJECTS LIMITED

SIGNIFIES

PROGRESS

•

West Bengal is a State advancing rapidly in many fields. The Durgapur Projects Ltd. is making a significant contribution towards this progress. Durgapur Coke, for instance, is used in foundries all over India. It reaches even the smallest, remotest industries in India swiftly and economically through Distributing Agents.

Durgapur Projects Ltd. also plays a vital role in the progress of industries by producing Benzol (Ind.), Benzene (Pure), Toluene (Ind. and Pure), Heavy and Light Solvent Naphtha, Creosote Oils (Light and Heavy), Crude Naphthalene, Road Tar, Resin.

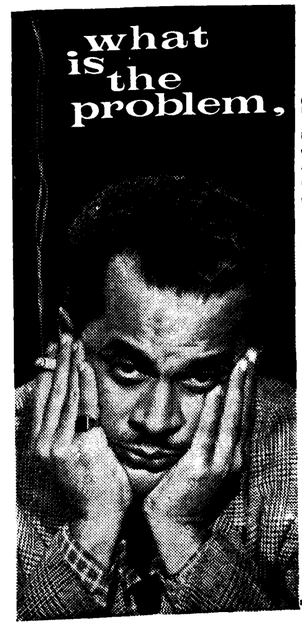
"INDIA EXCHANGE"

India Exchange Place, Calcutta-1



nervous and agreed to square up their outstanding positions at a price of Rs. 183, lest their stubbornness might lead to a crisis similar to the one which the cotton market had just passed through. No tenders were issued for delivery against the contract.

The case of the March 1965 contract was identical with that of September. The Exchange, under instructions from the Forward Markets Commission, imposed a ceiling of Rs. 190 in the last week of November 1964 but the contract flared up to as high as Rs. 197 in the kerb in the first week of December. Ultimately, the outstanding positions were squared up at Rs. 192.50 by mutual agreement between members and in linseeds March at Rs. 46.25. Apart from the rise being induced by the conditions in the groundnuts section, the factors governing price movements in castor were anything but conducive to bearishness. The outturn has been stagnant for almost 17 years but domestic consumption has been increasing and there is a good export market. During the current season, about 32,000 tonnes of oil have already been exported which mean an equivalent of 80,000 tonnes of castor beans. Domestic requirements are estimated at 50,000 to 60,000 tonnes (in terms of beans) a year. Estimates of castor crop vary rather widely. Government sources put the outturn at 100,600 tonnes (beans), while one section of the trade places it at 125,000 to 130,000 tonnes. Even taking the trade figures to be correct, the gap between demand and supply seems a narrow one. The new crop is still a long way off, there being still three months for its arrival in the market. Attempts at any estimate of the new crop are premature. How can castor help being expensive in these circumstances?

Linseed

Futures of linseed remained untraded for long periods, for the contracts used to cross the ceilings soon after the start of trading. The facts about linseed itself did not warrant the spurt in it, but sentiment was induced by the firmness in groundnuts and castor. Exports of linseed oil have been extremely difficult, in view of the disparity in rates, but the decline in the outturn of rapeseed and mustard seeds also induced a firm trend in linseed. Output of linseed during the current season is placed at about 4.5 lakh tonnes, as against 3.85 lakh tonnes in 1963-64. The outlook for linseed is difficult to forecast, but, given normal conditions, prices should be moderate. Rivalry from Argentina and Brazil is so keen that the chances of our exporting linseed oil to overseas markets are absolutely bleak. But much also depends upon the trend in mustard oil which had risen during the year under review to as high as Rs. 4,000 a tonne in Uttar Pradesh and Rs. 5,000 in West Bengal.

Cottonseeds

The trend in cottonseeds was guided by the conditions in the cotton market. With cotton quoting above the ceilings and futures at a standstill, having touched their operational ceilings, the outlook for cottonseeds can be anything but bearish. The January cottonseeds contract is also at around its ceiling of Rs. 118. It would not be a surprise, if, by the time these lines appear in print, trading here comes to a standstill. There is considerable anxiety on the part of cottonseed crushers about the future. Exports are almost out of the question on account of price disparity, while, in the meantime, the Government's ban on the use of solvent extracted oils in the manufacture of *vanaspati* has delivered another blow. The cottonseed crushing industry maintains that it was brought into being on the implicit understanding that cottonseed oil would be bought by *vanaspati* manufacturers and point out that, unless the policy is reversed, crushers will have to close their units. A representation on behalf of crushers is understood to have been made to the Government, but so far the Government does not seem to have done anything in the matter.

The year 1964 is ending amidst feelings of uncertainty, anxiety and apprehension in the oils and oilseeds market. Several factors have contributed to bringing the market to the present impasse, with futures trading practically at a standstill. It is agreed on all hands that farmers would not have been keeping back oilseeds but for the support and encouragement of co-operative societies. The Government is blamed for not taking the societies to task. Furthermore, the foodgrains policy of the Government has driven hoards of traders into other commodity markets, including the oils and seeds. These elements are wealthy enough to speculate in a big way and know no other field like industry or administration. Therefore they have brought their resources, estimated at more than Rs. 500 crores, into cotton, oilseeds, spices and other commodity markets to build up heavy long positions. Another point on which the Government is being criticised is its inability to stop the State Governments from following their chauvinistic policy by restricting the movement of grains and oilseeds from their respective States. The policy of the Gujarat Government and, to a lesser extent, of the Uttar Pradesh Government, in this connection, has played great havoc. This raises a fundamental question. Has the Centre no voice with the States even in matters affecting the economy of the entire nation? The outlook for the current year depends on the extent to which the Government of India pursues a realistic policy in economic matters and wields a strong hand in its relation with the State Governments. Knowledgeable sources feel that, in view of the large-scale deficit financing which the Government will necessarily have to undertake in the next busy season, the chances are remote for a fall in prices. But these sources also feel that prices could be held in check, if the Government fixes spot prices for groundnut oil at ports and main consuming centres like Bombay, Calcutta, Madras and Delhi, at levels not exceeding Rs. 2,000 a tonne. The maximum prices for groundnut oil which these sources suggest are Rs. 2,200 per tonne in the main consuming centres and Rs. 2,000 at producing centres. It is further said that exports of H.P.S. should be banned forthwith, and that the question of oil exports need not be revived. These sources are also very critical of the export incentives schemes. In addition to these, they suggest that a ceiling of 6 lakh tonnes a year be placed on the exports of groundnuts deoiled cake, on the ground of the need for preserving extractions for the cattle wealth of our country. These measures, if taken, would have a salutary effect on prices, they say.

The latest reports from reliable sources indicate that the Government of India is worried about the present state of the oilseeds market and has under contemplation some measures for bringing down prices. Besides banning the export of H.P.S. groundnuts and fixing a ceiling on those of deoiled cake, the Government might also ban the export of sesamum cakes, mustard cakes and linseed and copra cakes. It is also likely that regionwise export quotas will be introduced and steps taken towards the removal of the incentives for some of the items, if not all.

At the time of writing, talks are said to be going on between the Forward Markets Commission and the Exchange with regard to the start of futures trading in groundnuts and groundnut oil April contracts. With the fate of the running contracts being what it is, one wonders whether any real purpose would be served by allowing trading in the April contract. It is, however, believed that the Bombay Oilseeds Exchange is in favour of tightening restrictions in order that the present unhappy experience might not be repeated. The Exchange is said to favour the removal of exemption limits, while allowing the limit of weekly fluctuations to continue to be Rs. 2.40. A new proposal said to be under consideration is the introduction of deposits at each and every transaction, purchase or sale, at a rate varying from Rs. 2 to Rs. 5 per candy. Automatic clearings are also suggested at a difference of Rs. 5 in fluctuations. These proposals, however, are in the preliminary stage and have to go through another meeting of the Exchange before being presented to the Forward Markets Commission.

INDUSTRIAL RESEARCH DEVELOPMENT

Foreign exchange worth Rs. 1.8 crore is estimated to have been saved during the year 1963-64 by the use of the know-how provided by the National Development Corporation of India, as against Rs. 1.30 crore in the previous year, according to the tenth annual report of the Corporation for the year ended 31st March 1964. Thirty-three inventions were reported for development by 16 research institutes and individuals, bring the total number of inventions to 681. Of these, 280 were dropped or withdrawn, leaving 401 effective inventions in hand.

The accounts of the Corporation show a deficit of Rs. 1.90 lakh. Deficit during the year 1962-63 amounted to Rs. 3.10 lakhs. The reduction in the deficit is the direct result of increased royalty receipts, reduced expenditure on developmental work other than that of capital nature and reduced expenditure on administration during the year under review. Even this deficit will have no significance, says the report, when due consideration is given to the object of the Corporation. The Corporation is enjoined to develop and exploit the patents and inventions of C.S.I.R., Government departments, universities, research institutions and individuals in the public interest but at the same time is required to try to pay its way. These two obligations may not be readily be reconciled. Some deficit, therefore, is more or less natural.

CONTROLS ON DISTRIBUTION OF FOODGRAINS

The Story Of Their Growth

THE year 1964 has been one of the poorest year for the country's food economy, resulting in an abrupt rise in prices. The rise actually started from the second quarter of 1963. The index number of wholesale price (Base 1952-53) for rice rose from 110 in March 1963 to 117 in April, reaching 132 in October, due to the poor crop in 1962-63 and the resultant reduction in market arrivals. The wheat prices, which should have declined during this period because of the arrival of new crop, did not do so, because the crop was substantially lean. After remaining constant at 88 upto June 1963, the index of wheat prices started rising thereafter and reached 94 in October. On the whole, the index for cereals rose from 102 in March to 119 in October 1963.

With the arrival of the new rice crop in November 1963, the index for rice took a downward trend and stood at 120 in January 1964. But wheat prices went on increasing at a still faster rate, under the influence of decline in market arrivals the index reaching 112 in January 1964, nullifying the effect of decline in rice prices. The index for cereals thus remained almost unchanged during this period. In the following two months—February and March—the price levels advanced both for rice and wheat, and the index for cereals rose from 118 in January 1964 to 123 in March. As wheat crop came into the market in April, prices started coming down. But this tendency lasted for only two months, and thereafter the prices rose at an unprecedented rate, the index for wheat reaching 136 in October 1964, an increase of 44.6 per cent in 12 months. In the case of rice, the price inflation continued unchecked, the index reaching 146 in September, although due to the partial arrival of the new crop, it was slightly lower at 144 in October. The index for cereals stood at 150 in September. In October, there was a decline by one percentage point to 149 and in November by another point to 148. But the decline has been already checked. As compared with 145 in the first week of November, the index during the last week of this month was as high as 150, and the year may close at a still higher level.

Trade Control Measures

In order to help maintain supplies and exert a steadying influence on prices, the Government first undertook large distribution of foodgrains through fair price shops, which was made possible through imports from abroad and by procurement in surplus areas. But these measures had little effect on prices, because of the very low rice imports and the preference for the indigenous varieties of wheat. As a result, the regulatory measures on trade were tightened in varying degrees by the various State Governments. In certain States, marketing margins for traders were fixed, licensing controls made more stringent and limits were fixed beyond which producers and dealers could not hold stocks without a declaration. Most of the food control measures, which had been relaxed in 1961, were reimposed. Restrictions on roller flour mills to make purchases of indigenous wheat in the open market, were reintroduced. The Central Government and hte Reserve Bank also imposed restrictions on the activities of traders. In the paragraphs that follow, we give an account of the various controls introduced by the authorities for keeping the price situation under control, in order to refresh the reader's memory, leaving it to him to draw such inferences as he deems fit.

On 8th February 1964, the Reserve Bank of India issued a directive to all member banks, regulating advances against rice and paddy. Under this directive, the banks were asked to maintain in each two-month period, commencing January-February 1964, average aggregate levels of advances against paddy and rice (including advances against warehouse receipts) equivalent to 60 per cent of the levels of such advances in the corresponding periods of 1962. Further, within the overall ceiling, the non-warehouse advances were restricted, in respect of each bank, to 90 per cent of such advances in 1962.

By another directive, issued on 21st March, the scheduled banks' advances against 'other foodgrains' (excluding rice and wheat) were also restricted. The directive required every scheduled bank to maintain—in each two-month period commencing from March-April 1964—an average aggregate level of credit against the security of 'other foodgrains,' equivalent or lower than such levels of credit maintained in the corresponding period of 1962. The objective of these credit controls was to curtail the capacity of traders to hold stocks.

Wheat Zones

In order to regulate the supplies of wheat to the consumers, the Government of India enacted the Interzonal Wheat and Wheat Products (Movement Control) Order 1964, which came into force on 23rd March 1964. The Order extended to the whole of India, except the State of Jammu and Kashmir. The country was divided into eight wheat zones, namely (1) the Punjab, Delhi and Himachal Pradesh, (2) Uttar Pradesh, (3) Rajasthan, (4) Madhya Pradesh, (5) Bihar, (6) Maharashtra, (7) Rajasthan and (8) Andhra Pradesh, Madras, Mysore, Kerala and Pondicherry. The Order prohibited the export of wheat or any wheat products, except under and in accordance with a permit issued by the Government. It was, however, subsequently amended on 29th April 1964, whereby the licensed roller flour mills were allowed to export wheat products, namely *maida*, *suji* and *rawa*, across zonal barriers.

By a directive dated 21st April 1964, the Reserve Bank imposed the restrictions on bank advances against wheat also. It may be recalled that all regulatory measures on advances against wheat were withdrawn on 15th May 1961. Under the new directive, the banks were asked to maintain a minimum margin of 35 per cent on advances against wheat, subject to the margin of 25 per cent in respect of warehouse receipts. The ceiling limit for each two-month period, commencing from May-June 1964, were fixed separately for the State of Punjab and all other States taken together, at levels equivalent to 80 per cent of such advances, maintained in the corresponding two-month period in 1962.

N.A.—Not available at the time of writing.

In order to consider the food situation in the country and to chalk out a national food policy, a three-day conference of the Chief Minister was held in New Delhi from 24th June 1964 to 26th June. It was decided at the meeting to form a Southern rice zone, consisting of Andhra Pradesh, Mysore, Madras and Kerala; to stop, with immediate effect, the procurement of rice in Andhra Pradesh and Madras and to remove all restrictions on the movement of rice and paddy in Southern Zone, so that Kerala and Mysore (the deficit States) would be able to get the supplies from Andhra Pradesh and Madras (the surplus States). It was also decided to lift immediately all restrictions on the movement of coarse grains from one State to another. There was a discussion about the extension of this policy to Eastern Zone, comprising of Assam, Bihar, Orissa and West Bengal. But the Chief Ministers appeared to have felt that, in view of the peculiar situation of Calcutta (a bottomless pit), it would be too much of a risk. in the case of the Western States of Madhya Pradesh, Gujarat and Maharashtra, the restrictions on inter-State movement of rice were allowed to continue in deference to the wishes of Madhya Pradesh Government. The Madhya Pradesh Food Minister, however, agreed that the State would deliver nearly a thousand tonnes of rice to Maharashtra every day.

On the basis of the proposals received from the State Governments, and retail prices were also announced, it was decided that, in the case of other foodgrains, the prices would be announced at the harvest time early next year. The prices, which were based on the recommendations of the Jha Committee, related to standard varieties, effective at the specified centres, and the State Governments were authorised to determine the prices for other varieties at other centres, keeping in view the prices fixed by the Union Government. The producers' prices, fixed by the Government, were higher by about 30 per cent, as compared with the erstwhile procurement prices, and by roughly Rs. 4 per quintal as compared with the average post-harvest prices during the past three seasons. As regards consumers' prices, they were fixed, more or less, at the then existing level and a margin of 4 to 7 per cent (including transport charges) was allowed to retailers. The wholesale prices were, however, considerably reduced by a drastic cut in wholesalers' margin to 1.5-2 per cent (including transport charges). On the question of enforcement of these prices, the Union Food Minister announced that the Government would be prepared to purchase all the rice offered to it at the minimum statutory prices, so that, whenever there was a tendency for prices to decline, the cultivator could sell his produce to the Government at those prices, instead of selling to the traders at prices lower than the minima. Conversely, when the prices showed a tendency to rise above the maximum level "the Government will not hesitate to requisition the stocks."

Rice Zone

Owing to unexpected difficulties, the Southern Rice Zone broke down in the last quarter of the year. Early in November, the supply position in Kerala became quite acute. The rice crop in the State suffered a marked setback. Further, in parts of Madras State, too, the rice crop failed to come up to expectations. In many parts of this State, particularly in Madras City, people could not get their normal requirements. These developments induced the traders and millers in Andhra Pradesh to withhold stocks in expectation of higher prices. As a result of all this, Andhra Pradesh and Madras Governments banned the movement of rice to this deficit State. The reason given by the Chief Ministers of Andhra Pradesh and Madras for this anomaly was that, in view of the high prices of rice in Kerala, most of the grains had a tendency to flow into this deficit State. Ultimately, the entire Kerala State had to be condoned off and the Central Government assumed the responsibility for meeting the requirements of this State. Another outcome was that each State became a rice zone, with the Centre assuming the responsibility for meeting the needs of deficit States. Thus, the Union Food Minister announced that, with effect from December 1964, there would be a ban on the movement of rice from State to State in the Southern Zone; that the surplus States would make over their surpluses to the Central Government and that the latter would assume the responsibility for movement of the same to the deficit States.

As the price situation continued to deteriorate in spite of the above mentioned regulatory measures, an emergency measure, namely, the Essential Commodities (Amendment) Ordinance, providing for stringent punishment and summary trial of food offenders, was promulgated by the Government of India on 5th November 1964. The Ordinance was subsequently replaced by the Essential Commodities (Amendment) Bill 1964, which was passed by the Lok Sabha and Rajya Sabha on 9th December and 17th December, respectively. This legislation provides for summary trial by First Class Magistrates, specially empowered in this respect by the State Governments, or by the Presidency Magistrates, of the offenders, contravening the provisions of the Essential Commodities Act, be they traders or officials conniving at the offence. A provision has been made for a sentence of imprisonment lasting upto one year and there is no provision for appeal for an imprisonment not exceeding one month or a fine not exceeding Rs. 2,000 or both. The public servants, charged with the abetment of crimes, will also be treated in the same way as the perpetrators of food offences.

Chief Ministers Meet

The Chief Ministers' Conference which was held at New Delhi on the 17th November 1964, reviewed the Government's food movement, price and distribution policy. It was decided at the Conference to ban the inter-State movement of rice and coarse grains. As already stated, each State was constituted into a separate rice zone and the supplies from one State to another were allowed on Government-to-Government account. In other words, the normal trade channels were completely ousted from the inter-State trade in rice. It was also decided that the surplus States, namely, the Punjab, Madhya Pradesh, Orissa, Andhra Pradesh and Madras would procure rice internally and turn over these stocks to the Centre, thereby enabling the latter to fulfil its commitments to the deficit States. Another important decision involved the introduction or continuation of informal rationing in big cities and industrial towns and grant of discretion to State Governments in respect of statutory rationing.

Food Corporation

The Food Corporation Act 1964 was also passed (in the year under review) both by the Lok Sabha and the Rajya Sabha, on 25th November and 7th December respectively. The bill provides for the setting up of the Food Corporation of India—a State agency for undertaking trade in foodgrains and other foodstuffs. It may also promote the production of foodgrains and other foodstuffs; set up or assist in setting up rice mills, flour mills and other undertakings for the processing of foodgrains and other foodstuffs, and discharge any other supplemental, incidental or consequential functions like giving advances to the growers or guaranteeing the advances made by the financing agencies to the cultivators. The initial capital of the

A Year Of Gratifying Experience For North Indian Tea

Record Crop—Prices Not Unremunerative

THE year under review, unlike recent seasons, has been remarkable for its *freedom from* drought or devastating floods and the resultant fall in output, from delays or disruption in the transport of teas to centres of distribution in the country or from any other unusual or unfortunate event. In fact, the movement of teas has been smooth and their sales swift, with demand keeping admirably abreast of supply, notwithstanding the record crop harvested during the *current season*.

By December 1963, which marks the *beginning* of the period of this review, it was clear that the North Indian production *figures for the year* would show a sizable deficit as against 1962. While values showed no *signs* of appreciation, at least the progressive decline in prices, witnessed in November, was halted and levels stabilised.

Although as usual four auctions were scheduled for January, sales during one week had to be cancelled owing to *civil disturbances* in Calcutta. However, demand continued to be active throughout the month, with prices during the last week tending to change in sellers' favour.

Final production estimates for 1963 now became available and the North Indian crop showed a short*fall of* over 5 million kgs. as compared with 1962, which was also a year of reduced yield. The *shortfall* was particularly disappointing to the tea industry in North India as all the *main* competing tea-growing areas, with the exception of Indonesia, produced *bumper crops*.

With February, the appearance of the 'leaf' offerings began to show a *seasonal* decline. Nevertheless, *no* signs of a general slackening in demand were evident *and especially* teas with autumnal flavour were keenly sought after. Another strong ature of the market was "plain" as which, thanks to an unusually tive enquiry from Tunisia, found ady *support* at prices seldom be- w Rs. 4.40 per kg.

This trend was extended to March ith only poor "end-of-season" teas eing discounted. A notably welome feature of the month was conued buying by the Soviet Union hich was known normally to complete its purchases much earlier. hree "leaf" auctions were held uring the *month* and these virtually rought to a close the 1963 Season's leaf" offerings. As usual, "dust" ales continued until May and the fferings were readily absorbed at uite satisfactory prices.

Neither Relief, Nor Fresh Burden

The Union Government's budget *or the year* 1964-65 proved to be ingularly uneventful for the tea industry, as no changes whatsoever were proposed in the taxation on ea. Some circles in the trade and ndustry had cherished the hope that he Government would streamline nd *rationalise* the multifarious Central and State taxes into one consolidated levy but the hope was belied. Another concession, justifiably expected by the industry, was allowing *the expenditure on* replanting and extension as a revenue charge. Apart from problems which it shares *with* other *industries*, the tea industry has its own peculiar handicaps such as helpless dependence on the *vagaries* of the weather, and on factors of immediate demand and supply in a competitive international market, especially owing to the perishable nature of the product. But, above all, the country depends so substantially for her foreign exchange earnings on tea that the budget proved to be disappointing.

The budget was followed by the Wage Board's interim award which embodied an increase in the daily labour wage—an *increase* ranging from 3 to 15 paise. The Board went on to stipulate for every labourer an annual bonus, the minimum amount payable being Rs. 30 regardless of whether an estate makes a profit or incurs a loss.

However, *it is now* reported that the Tea Finance Committee has recommended to the Union Government substantial relief to the industry and enlargement of facilities for development loans. The *Government has* also of late indicated that some re*lief will* shortly be given to the tea industry.

Sale of season 1964 tea commenced with two "leaf" *auctions held* during the latter fortnight of May. As compared with May 1963, more than twice the quantity was sold during the *month*, clearly reflecting the larger crop being harvested. Prices, however, were nearly 50 paise per kg. lower than a year ago.

June witnessed five "leaf" auctions and the total offerings were 34 per cent higher than those in the same month of 1963 while prices were 31 paise per kg. lower. The first sales of the new season's dusts were also held during the month and demand was on the whole satisfactory.

As is normal, July auctions represented the peak in seasonal quality. The *offerings* comprised "*second-flush*" teas which are the choicest produced in North India. Prices paid were *attractive*, but generally lower than a year ago, which was not surprising in view of the 14 million kgs. increase in crop.

With August began the seasonal falling away in cup quality. Demand continued to be active, although buyers followed quality closely which was only to be expected in a year promising to be a record one in *output*. Nevertheless, overall price-levels were by no means unremunerative nor was the statistical *position unhealthy*. Uptil the end of the month, 7.8 million kgs. more tea than upto the same time *last year* had been sold on the Calcutta market; shipments were over 5 million kgs. higher, the bulk of this increase being contributed by tea meant for *auctions* in London.

The seasonal decline in quality was further extended in September and the offerings largely consisted of average "rains" manufacture. While prices *did come down*, the decline was not commensurate with the falling away in quality in a season of plentiful supply (by *now* the North Indian crop was 16 million kgs. *ahead*). Price-levels, by and large, were not much lower than, if not equal to, those prevailing a year ago. The healthy statistical position of North Indian tea, coupled with the fact that production in Ceylon and South India was running behind and *that the world* output was only 12 million kgs. ahead, doubtless played its part. Nonetheless, the *buoyancy* of the Calcutta market could largely be ascribed to the strength of demand *in London* where the dock workers had resorted to go-slow tactics with inevitable interruptions in *the flow of offerings*.

Owing to the annual *Puja* holidays, only two "leaf" and three "dust" auctions could be held *during* October. The labour situation in the London docks remained difficult and the U.K. blenders continued to operate strongly. For *a similar* reason, there was improved enquiry from the U.S.A. *with* buyers there requiring prompt *shipments* as a precaution against the threatened *nation-wide dock strike in* December. Fears of possible interruption in Russian purchases, raised by political changes in that country, proved to be unfounded and the normal mid*season fall in prices* was as yet nowhere in sight.

With the advent of November came news that, in October, North India had produced 2.4 *million kgs. more* than during the same month *last* year. The total up-to-date production *now* stood at 248 *million kgs.*, which *not only* amounted to a rise of 22 million kgs. over a year ago but also *meant* that, by October, *nearly as* much tea had been harvested as during the whole of 1963. *Inevitably*, *the much* apprehended but hitherto averted fall in prices began and the steepness *with which values tumbled* proved even more surprising than the delay in decline. Outturn during the first fortnight of November was also abundant and prices fell con*tinuously during the month*. The category to suffer most was Assam C.T.C. teas (strong liquoring and quick-brewing *variety*) which are particularly popular in the U.K. In the *course of the month*, the overall price-level dropped by about 40 paise, while Assam C.T.Cs lost the best part of a *rupee and* a half, or more.

Barring, of course, November, the current season so far has been *a gratifying* experience for the industry in North India. After two seasons of *falling* yield, an all-time record crop has been harvested—which has so far proved *profitable on account of* a *shortfall* in the outputs of Ceylon and South India, both of which have been associated for the last decade with continually rising production. Price-averages generally, as has been stated earlier in this review, *have* not been much below last year's levels nor unremunerative—a phenomenon which did not accompany the bumper crop of 1961. The North Indian industry can, therefore, look back with some satisfaction on its performance hitherto this season, provided of course it is prepared to reconcile itself to perpetually rising costs and learn to live with this seemingly irreversible phenomenon.

Outlook

The North Indian production figures available so far show a rise of nearly 28 *million* kgs. over last year, whereas world output is higher by 27 million kgs. With more than half the season's production yet to be marketed, there is more cause for caution than reason for elation in the future and the industry is quite conscious of this uncertainty.

There is one more year left before the third Five-year Plan period draws to a close. Despite the record crop that North India has made this year, it is unlikely that the total Indian production for 1964 will exceed 366 million kgs. *This* is indeed a far cry from the original plan tar*get* of 408 million kgs! *The* lag between Plan and performance appears even wider when it is observed that, over the past decade, production has failed to rise by more than 2½ *per cent* annually. South India has no doubt done well by increasing its out*put* at a fairly steady rate of 6 per cent annually but the corresponding rate of North Indian *progress has been only* 1½ per cent and North India contributes over three-fourths to *the* country's total production. Going more by actual performance in the past and less by Plan targets, it *is unlikely* that the original third Plan target will be achieved long before the end of the fourth Plan period!

Disturbing Feature

Indian exports present an even more discouraging picture. Ten years ago, India exported 205 million kgs. of tea annually, whereas at present annual shipments amount to *no more* than 212 million kgs. Export figures for 1964 are unlikely to be much higher as the 1963 total included *some of the shipments* which would have been made in 1962 but for the prolonged strike by the crews of the River Steamer Companies and the Chinese aggression. In other words, India's tea exports *have failed* to rise by much more than ½ per cent per *annum* over the past decade. The increasing difference between rising output and near-static exports has fortunately been absorbed by the home market. In the last ten years, *internal offtake has* risen by about 8 per cent annually and over the period it has gone up by as much as 80 per cent *to aproximately* 135 *million* kgs.

The progress of India's production and exports make particularly disturbing reading when studied in the context of Ceylon's and East Africa's (India's main competitors in tea) achievements in the same decade. Production in Ceylon and East Africa has been forging ahead at annual rates of 4 per cent and 14 per cent respectively. These *countries'* exports over the decade have also risen annually by 4 per cent and 15 per cent, respectively.

Main Obstacles

The principal obstacles in the path of the Indian *industry* expanding its production has been the crippling rate of taxation coupled with expensive labour-welfare facilities stipulated by plantation labour laws with resultant scarcity of *funds* for block reinvestment. An added disadvantage *to the* North Indian industry is that it enjoys only one monsoon and *as a* consequence cannot produce perennially, unlike South India and Ceylon.

Apart from the relatively slow rise in production, what has, perhaps, come in the way of India increasing her exports is her home consumption as also the increasing quantities purchased against rupee-payment barter agreements by countries which often lay only a modest emphasis on price. The pressure of competition from the internal *demand* and the barter-trade countries frequently renders price-levels uncompetitive, thus compelling traditional markets into at least partially diverting their demand to other centres.

Paradoxically, however, these present obstacles to exports may well become future bulwarks of the Indian industry, especially if the fearful forecast, made by the U.N. Food and Agriculture Organisation that world supply of tea will exceed demand by 45 million kgs., comes true in the *near* future. In the event of a glut of tea and consequent slump in prices, India's internal consumption as well as her system of barter-trade agreements must prove invaluable in giving her industry vital resilience. Neither Ceylon nor East Africa can avail of *such support* to any *decisive* degree because of relatively small populations at home and of comparatively limited capacity to import goods. Despite all the inadequacies of its re*cent progress*, the Indian tea industry should, therefore, prove to be the fittest in a crisis of survival.

CONTROLS ON DISTRIBUTION OF FOODGRAINS

(*Concluded from page 226*)

Corporation will be Rs. 100 crores, provided solely by the Central Government; but, in order to augment its resources, *the Corporation* is authorised to take loans against the stocks held by it from the financial institutions. The Corporation will start its activities by the purchase of rice in the Southern Zone from January 1965.

It will be seen from the above description that the Government has taken to distribution controls rather reluctantly. Even now, it is not keen on introducing compulsory rationing in all the cities and towns. This reluctance proceeds from the realisation by the Ministers in the States, as well as Centre that people are opposed to rationing and that its introduction would make them unpopular with the majority of the people. But, in spite of all the measures taken this year the prices have not come down to any significant extent. It is still to be seen how far the Food Corporation will make any improvement in the situation. One of the basic reasons for the failure of the Government's distribution policy is the creation of food zones in the country. The tendency of each State to look after its own interests, has intensified the difficulties *of deficit States*. It has caused wide differences in prices between States and encouraged smuggling; and when the difference in price is large and it is profitable to take the grains across the border to another State, it becomes rather difficult to stop smuggling. The need for viewing the whole country as a single national market has, therefore become necessary. But the Government continues to stick to Food Zones. The earlier announcements that the restrictions on the movement of rice may be removed after the arrival of new crop, have been falsified. As already reported, the Conference of Chief Ministers' held at New Delhi in November 1964, decided for the constitution of each State into separate Rice Zone, except the Northern Zone which comprises Punjab, Delhi and Himachal Pradesh. As regards wheat, the Chief Ministers decided that the present zonal restrictions would continue and the position would be reviewed in March, when the new crop is due. However, their attitude in the last meeting is any guide, there are no chances of the abolition of Wheat Zones.

The stand taken by most of the Chief Ministers—opposing the introduction of statutory rationing—was, however, realistic. Among the cities with a population of over one million Calcutta alone was to have statutory rationing. It was realised that a fullfledged system of controls would involve a costly diversion of the limited administrative personnel at the disposal of the Government and that it would be extremely difficult to standardise consumption pattern without serious hardships to the public. The Government of India has already decided to import substantial quantities of rice, too, in the coming year. The *rabi* crops are also expected to be a little larger. In view of these conditions, it is expected that the Government will have no need to revise its decision in favour of statutory rationing in *all cities* and towns, though it is a moot point whether the restrictions on trade will be relaxed. On the contrary, the controls on distribution of foodgrains have come to stay for a long time.

BASE METALS MOVE UP FURTHER

Continuing Shortage And Idle Plant Capacity

CALCUTTA, 14*th December*

THE year 1964 witnessed an unprecedentedly acute scarcity of non-ferrous metals in world markets, and it was believed that world consumption had not jumped so markedly as to lead to the trend of insatiable demand and daily gains in quotations in the principal world markets—the guess is that able consumers and the speculative fraternity the world over have raised their inventories. Only timely and large releases of tin, zinc and lead by the United States from that country's strategic stockpiles prevented the supply crisis from taking an even worse turn. As late as 1963, copper producers were complaining of inadequate market for their output, and large Soviet exports of zinc and lead to Europe caused depression. These features were conspicuous by their absence in 1964, and the Communist countries turned large buyers of zinc, copper, lead and tin. Producers turned vociferous and protested against U.S. releases on the ground that these would disrupt market forces. Tin-producing countries, including Malaysia and Bolivia, naturally desired that, if tin production should visibly rise and thus close the gap between supply and demand, higher prices must be paid. The plea was that cost of production had risen, that more intensive mining operations were called for, and that marginal, sub-marginal and abandoned mines should be worked.

Although it was only in this year (1964) such countries as the U.K., the U.S.A., Germany and the U.S.S.R. felt the acute shortage in non-ferrous metals, India has been experiencing the shortage ever since the foreign exchange crisis in the second Plan period. While Government permitted manufacturers to increase the capacity of the existing plants and also issued licences for the setting up of new plants, both of which depended for their input on non-ferrous metals, the policy since 1958 has been the enforcement of continued curbs on imports of these essential metals.

The import restrictions have meant for India idle plant capacity which adds to costs, while non-ferrous semis, which can be manufactured in India in existing plant capacity, have to be imported if only to maintain the tempo of industrial advance. The earlier this anomalous situation is ended the better, and the solution is a proper review of requirements of the evaluation of requirements of these essential metals and provision for increased imports. Increased imports would mean saving of much higher foreign exchange in imports of non-ferrous semis.

Indian industry is also in a position to export such goods as cables and other light engineering goods such as electric fans and accessories, into the making of which non-ferrous metals are no small input. Despite competition in foreign markets, India's export of non-ferrous metals and their manufactures in 1963-64 totalled Rs. 5.43 crores. While industry is striving hard to raise exports, it has urged revision of the import entitlements.

Aluminium Industry

With the progress made in aluminium and the country's inexhaustible reserves of bauxite ores, it is confidently expected that India would soon emerge as one of the foremost smelters of aluminium and manufacturers of aluminium products. Aluminium ingots and utensils are being exported in fair proportion to their manufacture and India is also developing export outlets for aluminium semis, all aluminium and A.C.S.R. conductors, slugs and collapsible tubes, capsules and closures, insulated cables, foil products, architectural specialities, and busbody kits. The foreign exchange which India thus earns should be used for the import of the metals in short supply. Increased availability of non-ferrous metals in order to diminish idle plant capacity is an effective way to reduce production costs and raise the competitive strength of Indian products. Costs rise not only as a result of idle capacity but also of inflationary conditions in a shortage situation as at present.

The table below shows the movement of prices in the principal markets in 1964. It is significant that the gap between the highest as well as the closing levels is infinitesimal and insignificant, but their proximity attracts attention and study as a result of their wide gap, as compared with the opening levels as well as the lowest levels. In other words, the uptrend has been steady. Reference to the principal factors for the same both abroad and in India has already been made in the preceding paragraphs. It is now proposed to discuss the chief factors that led to the price-trend in the four metals, copper, zinc, tin and lead.

Copper

Even in the beginning of the year, indications were not wanting that the quotation of £234 a ton on the London Metal Exchange, so steadily maintained at that level for years as a result of producers maintaining sufficient stocks in London, was not going to remain at that level. For, London warehouse stocks were being eroded, and by the middle of February copper wire-bar touched £241, as against the year's opening of £235½. Despite the onward march of aluminium and its progressive replacement by copper, U.S. consumption of copper was moving up, and so was the case in other countries, notably the U.K., West Germany and Japan. Copper producers could no longer continue to shut down 15 per cent capacity; not only did they rescind all cutbacks but massive investments were proposed in Chile and other countries in an attempt to raise production. It is expected that the results would have an impact on prices in 1965.

By the end of March, the price of wire-bar rose to £302½, and in Calcutta the price of utensil copper scrap picked up to Rs. 680 per quintal from Rs. 640 at the beginning of the year. The L.M.E. price continued to rise despite attempts by producers to wrest the initiative from speculators, as witness the announced desire of the Rhodesian Selection Trust to sell copper to its customers at the reduced price of £236. However, the Trust soon withdrew its offer since it found that the price advantage was not being passed on to industry. While India's import policy did not provide for larger imports—the rising world price meant lower imports as licences and quotas related to values, not quantities—industry urged for prompter U.S. imports of copper from the loan of $225 million. The inability of U.S. producers to make prompt supplies meant that India had to turn to U.S. commercial sources which charged higher prices.

Reports of possible Chilean attempts to nationalise U.S.-owned mining facilities in Chile caused anxiety in early April. These were in fact followed by raising income-tax of these mines, which were also now required to lend to Chile the entire value of their copper exports in U.S. dollars and to increase their copper sales to the Chilean industry from 20,000 tons to 100,000 tons a year. Reference to these events are made here, since the increased costs of mines lent a 'stabilising' influence to the rising trend. No wonder, by the end of April, the L.M.E. price for wire-bars rose to £319½.

Reports that producers had intensified their operations in an earnest attempt to meet demand in full were followed by a reaction which took down the rate to £264 by the third week of May. The price stabilisation policy of the Anglo-American and Rhodesian Selection Trust, hailed by the North Rhodesian Prime Minister, Mr. Kenneth Kaunda, also aided the reaction. By the beginning of July, the price of utensil copper scrap in Calcutta eased to Rs. 650. It was soon becoming evident that, unless producers increased their free supplies, the world price could not be prevented from moving up. London reports referred to the anxiety of producers arising from the tendency among consumers to substitute aluminium for copper. This was the beginning of August, when the L.M.E. price had shot up to £331. From now on, it has been a steady rise for the rest of the year, and the year's high of £530 was touched on 6th November. The bid of producers to stem the up-tide by making direct sales to consumers at a much lower price failed to succeed, since consumption, better say, demand, rose far higher than output. The base price of producers was raised twice in the year, once in January to £244 from £234, and again in August to £260. In October, Chile directed producers in that country to raise the price to £280.

Zinc

Considering that zinc has no substitute for its various uses, especially in the battery industry, the efforts of leading smelting firms in the U.K., the U.S.A., Australia and Japan to arrest the uptrend received the approbation of industrial consumers, and in fact these efforts succeeded where similar efforts in regard to copper had failed. In India, the shortage commanded new attention in view of necessary expansion of the battery industry to match with the progress in automobile production and defence needs. By the end of February, the L.M.E. quotation rose to £104, as against the year's opening level of £96 with the Calcutta price moving up from Rs.285 to Rs. 298. This followed early indications of shortage and the realisation in world markets of the increase in production not matching with the increase in demand.

The shortage in the U.S.A. meant for India delayed imports under the D.L.F. licences, the trade demanding free licensing from other countries too. India's 1964-65 import policy caused disappointment, since not only it failed to take into consideration the rising demand, but the 10 per cent quota of the established importers in respect of zinc scrap, zinc dross, zinc ashes, zinc granulation, zinc dust, zinc wrought, including wire rods, sections and sheets, stood withdrawn. This meant fanning the flames of the hardening trend, and by early May the Calcutta rate soared to Rs. 302 from Rs. 272 to which it had fallen prior to the import policy announcement. This time was also the beginning of the surge forward on L.M.E. as stocks stood depleted. By early May, the London rate touched £114. The report of a 5½ per cent increase in world consumption at 2.85 million tonnes in 1963 acted as a price-booster. In India, the news of official arrangements for regular import of non-ferrous metals from South Korea against export of light engineering goods was cheerfully noted. Similarly, good note was also made of the $33 million World Bank Loan to the Indian P. & T. Department for the import of copper and zinc and equipment for telecommunications.

The steady London trend took the quotation upto £133½ by the end of May, with the Calcutta rate rising to Rs. 312. The U.S. decision to release 75,000 tons zinc and 50,000 tons lead led to a reaction on the L.M.E. where the quotation gradually moved down to £121 by mid-June, the Calcutta rate hardening to Rs. 311 notwithstanding. Soon, it was realised that such U.S. releases would not even satisfy increased needs within that country, and the L.M.E. quotation started to move up. By early August, the rate rose to a height of £155.

Apparently to derive benefit from the higher price, the U.S.S.R. turned a seller in world markets, and this coupled with the producers' stabilisation policy forced a break, which took the L.M.E. rate down to £114 by early September, but caught betwixt acute shortage and surging demand the Calcutta rate rose to Rs. 366. Since then the continuous rise saw the year's high at Rs. 490 on 9th November, while on the L.M.E. the rate was kept nearer to producers' price of £125 for a considerably long time since the stern stabilisation measures adopted by producers. However, by the end of November the price regained to £139 on good consumer demand in the face of shortage.

Tin

The gap between world production and consumption, varyingly estimated, was met by U.S. stockpile releases. Yet, the price added gain after gain, and producers thought their compensation for increasing output should be higher and also could have been higher had only the U.S.A. chosen to remain aloof from the scene. Except for an insignificant and ineffective break, the price moved up all the time in the year. With no buffer stocks, the International Tin Council could only be a silent spectator of the operation of the free market trend.

For India, the shortage was all the greater, and industry had to remain content with limited supplies. Early in the year, the world shortage was estimated at 10,000 tons but this was soon revised as being 30,000 tons. This led to the decision for increased releases by the U.S.A., the policy of which was not to disturb the market trend. For, there was the realisation that only a free market trend would encourage mines to raise production and that a minimum period of five years would be necessary for a substantial increase in raisings. The U.S. surplus totalling 127,000 tons, it was estimated, would be sufficient to meet the world's deficit until that time. World production in 1964 was expected to be no more than 1963's total, which was 141,500 tons. The 1963 world consumption having totalled 160,800 tons, the deficit of 20,000 tons was met by releases of stocks by the U.S.A., Italy, and Canada, and also by the exhaustion of the I.T.C.'s buffer stocks in London.

The deficit in 1964 is estimated to have risen to 30,000 tons which would be the total release by the U.S.A. for the twelve months to March next. The I.T.C. fixed the new floor price at £1,000 a ton which, according to mines, failed to offer an incentive to them. This was towards the end of November when the L.M.E. quotation was around £1,490. The year's high of £1,715 was reached on 30th October on the L.M.E. This level was preceded by sustained rise in earlier months. However, a fall since took down the rate to £1,405 by early December, as there was the news of increased output in Indonesia, which was reported considering placing an embargo on tin exports to the U.S.A. The recession on the L.M.E. was nevertheless aided by the fall in offtake by the U.S.S.R., Japan and other countries.

Lead

In lead too, large releases by the U.S.A. prevented the supply crisis taking deeper roots, but, although producers realised that, with heavy stockpiles, the responsibility of the U.S.A. to correct the market trend was great, it should be noted that it was as a result of heavy purchases of lead and zinc, mines were overworked and prices had been inflated prior to 1964. At this stage, the U.S.A. discontinued stockpile support, and after a phase of

Jute Goods Buoyant

Fibre, Too, Rises

CALCUTTA, *9th December*

THE outstanding development in the jute markets during the year 1964 was the lengthening of the already yawning gap between prices of fibre and the finished product. The increased labour charges as a result of the implementation of the Wage Board's award and higher prices of mill stores also meant a rise in costs. The 1964-65 fibre crop compared well in respect of both quality and quantity with the previous crop. This factor, coupled with a good carry-over, enabled the mills to raise output as well as exports; but such a performance was brought about by the sacrifice of mills of some profit margin, although, towards the end of the year, the manufacture of heavy goods became a more attractive proposition than that of hessian and other special constructions. Prices of other manufactures no doubt registered a rise, but the rise is incomparable with the rise in fibre prices and operational costs. What was a sagging sacking market in the later months of the year was arrested by the two-month-old strike in Pakistani mills which forced many overseas consumers of heavy goods, who had delayed purchasing in the hope of a fall in prices, to turn to India for urgently-needed consumption and replenishment supplies. The increase in internal consumption of sacking was also significant.

The imposition of a 15 per cent surcharge on imports by the U.K. in October 1964 was resented by the industry. The surcharge on jute goods which are already subjected to the mark-up value scheme means levy of double duty. Representations from India for consideration of relief at least in respect of some items including jute manufactures were rejected by the British Government, though the assurance was given to the effect that the surcharge would be removed immediately after Britain's economic crisis eased. The fall in U.S. burlap consumption was also a cause of anxiety—the average monthly consumption in the ten-month period ended October was only 73.5 million yards, as against 76 million yards in the corresponding period of 1963. It was apprehended that substitutes and synthetics, as well as bulk handling methods, were depriving jute goods from expansion in the U.S. and other highly industrialised countries.

Pakistan Competition

Another anxiety for the market was the unfair competition of Pakistani mills in overseas sacking markets. In order to place India's exports on an equal basis as the Pakistani goods, the Government of India was on several occasions pressed for counter-measures like grant of subsidy as in the case of sugar. However, no steps were taken and, although, as a result of the labour strike in Pakistani mills, overseas purchases of Indian sacking increased in the later months of the year, export statistics make no mistake of the unpalatable fact that India's market for sacking has gradually shrunk. In other words, not only is India not getting a fair share of the increased sacking requirements of the world, but exports to traditional markets have fallen.

In the beginning of the new season, anxiety was caused by the steep rise in fibre prices, following a spurt in prices in Pakistan and the mistaken belief that the 1964-65 crop would be inadequate for mills to continue operation to full working hours with all looms unsealed. The Government of India was prompt in taking measures which soon led to realism in the price trend, although the pre-rise level has not yet been reached and is unlikely to be reached, thanks to the spiralling general trend. The Jute Commissioner began issuing 'maximum' purchase quotas every month, instead of his earlier practice of issuing 'minimum' quotas as a price support measure, and no mill was to exceed this maximum. Excepting for a brief period, described as adjustment mills operated the entire installed capacity at the maximum level.

Although the Commissioner issued in January a purchase quota of 760,000 bales, which was adequate to cover daily arrivals, there was a tendency even from the beginning of the year for holders to become reserved. The disturbed law and order conditions in Calcutta and suburbs affected trading in goods, but it was pleasing to be told by the Indian jute delegation (headed by Mr. G. C. L. Joneja, the Commissioner) to Europe that the demand for quality hessian and 'finer' grades of other constructions was on the increase, though Mr. Joneja warned that, unless quality improved, the benefit of increased demand of the sophisticated and fastidious markets of Europe would go to their own jute industries.

Working Time Agreement

The annulment of the I.J.M.A. Working Time Agreement, which for years adjusted output from time to time in accordance with demand and which had operated satisfactorily in times of both acute fibre shortage and slackness in overseas demand for gunnies, was a feature in February. This did not amount to any difference, inasmuch as mills were already operating their maximum capacity. Even so, prices of goods moved down for two important reasons. One, there was the apprehension of the possibility of a glut in hessian. And, two, the U.S. preferred to purchase limited quantities only. With the advantage of about Rs. 400 a ton in the cost of production over India, Pakistani offers of heavy goods were naturally preferred by foreign buyers, thus leading to a gradual rise in stocks with mills in India. Reports that researches were being conducted in the U.S. to find a substitute for carpet backing cloth were noted with concern, since the mills have increased capacity of this speciality by installing more broad looms and depending on the sole U.S. market. It should also be noted that exports of this cloth to the U.S. was below installed capacity.

Despite the abolition of the export duty on raw jute, announced in the 1964-65 budget, exports of inferior fibre failed to rise, in view of Pakistani competition in this field also. A Pakistani delegation visited the African countries with a view to exploring the possibility of securing a bigger share of the rising requirements for sacking in these developing countries. B. twills and hessian 40" 10 oz. were around Rs. 112 and Rs. 46 respectively, during the months of January, February and March, with Assam bottoms being maintained at Rs. 30 as a result of the minimum purchase quota.

Prices Sustained

Prices in April were sustained, as both the U.S.S.R. and Argentina accorded good support to hessian. In heavy goods, support was principally from Australia and the Continent. As regards raw jute, prices rose with Assam bottoms at Rs. 32. Mills could not purchase as much of the selected grades as desired by them. Also, there was the apprehension of a likely shift in acreage from jute to paddy, in view of the latter's larger profit margin.

Absence of increased hessian shipments to the U.S. was, to a certain extent, nullified by higher offtake by the U.S.S.R. and the East European countries, but it was becoming clear that hessian and carpet backing cloth output was exceeding demand. That accounted for the fall in hessian 40" 10 oz. to Rs. 42.25 in May, while B. twills scored to Rs. 114.35. June was comparatively uneventful, but, as the new season began, crop arrivals were limited, causing concern and, this, by the end of July, raised Assam bottoms to Rs. 33.50. In turn, hessian 40" 10 oz. rose to Rs. 45.35 and B. twills to Rs. 118.85.

Forward Trading Suspended

Prices in Pakistan were also rising, despite abolition of minimum export price of raw jute and reduction in export duty. Buoyant conditions set in by August and, to curb speculation, futures market trading was suspended as and when prices rose above prescribed limits. Special margins were imposed on all forward transactions. By early August, Assam bottoms had risen to Rs. 36 when it was decided to release the buffer stocks to mills. B. twills and hessian 40" 10 oz. advanced to Rs. 127 and Rs. 48.15, respectively. The highest level of the year for Assam bottoms, touched on 24th August, was Rs. 47. In Pakistan, the high was Rs. 56. By this time, B. twills had increased to Rs. 140 and hessian 40" 10 oz. to Rs. 50.25.

The sharp upward trend was resented by overseas consumers and the Government of India took a series of steps, including the issue of maximum quota in accordance with arrivals. The effect was immediate, for, within a week, that is, early in September, Assam bottoms eased to Rs. 40. The Jute Commissioner considered the earlier rise entirely unwarranted, but he attributed the same to speculation unleased by some Pakistani jute traders who had slipped into Calcutta and circulated the rumour of a shortfall in Pakistani production. The effective measures taken by the Government and the stability imparted thereby met with approbation by consuming countries which participated in the international jute study group that met in Paris. Subsequently, prices fell gradually; Assam bottoms were quoted at Rs. 36 early this month (December 1964).

The strike in Pakistan jute mills during the months of October and November meant a production loss of 48,000 tons, and several countries which had been delaying purchases turned to India. Consequently, B. twills shot up to a high of Rs. 158.60 on 21st November. In the first week of December, the Pakistani strike was called off and, as a reaction, B. twills in Calcutta eased to Rs. 154.

Although the year is closing with substantial gains in the prices of heavy goods and, with a nominal gain in hessian, the profit margin has been affected by the rise in fibre prices. The better statistical position in heavy goods has been obtained by increased internal offtake, including larger purchases on Government account, and a substantial chance rise in overseas purchases. The latter was the result of the prolonged strike in Pakistani mills. With the end of the strike, sacking prices have already begun their downward march. The jute industry would urge the Government for early counter-measures against the 'unfair' competition of Pakistani industry to enable it to fulfil the role of increased production and exports desired of it in the fourth Plan. After the Wage Board award, mills thought that they were in a phase of industrial peace, but the difference of opinion on the interpretation of applicability of the Bonus Commission's recommendations to the jute industry has unfortunately arisen and this has already led to some loss of production in mills.

BASE METALS MOVE UP

(Concluded from previous page)

depression both lead and zinc had shown signs of price stabilisation in 1963. However, in view of the abrupt rise in demand, such a situation could not be maintained in 1964. Producers declared that, if stockpiles were used to meet a sudden spurt in demand or a temporary fall in production, supply was brought to nearer demand through the force of exogenous factors, thereby postponing normalcy.

On the L.M.E., lead opened at £79 on 2nd January and rose gradually to £85½ by the end of February. An early reaction in March put back the rate to £79. This was short-lived and a rise developed from mid-March. This took the rate up to £90 by May, when the Bulgarian offer of a substantial quantity to the U.K. forced down the rate to £87¼ by early June. Up to mid-August, it was a sustained rise to £116¼. A decline put back the rate to £107 by early September, but since the rise was more rapid to reach a new high since 1952 of £149¼ on 11th December.

The rate in Calcutta rose to a high of Rs. 355 from Rs. 215. The rise is attributed to acute shortage, increased demand and limited imports.

HIDES AND SKINS

Export Outlook Encouraging

MADRAS, 21st November

THE production and merchandising of hides and skins—raw and tanned—pose an interesting study. Hides and skins are the by-products of the meat and mutton trade, and the animals are not slaughtered for their hides and skins in India where the cattle population is more concentrated than in other parts of the world. The tanning industry is in the hands of the private sector and, in South India, it has been developed as large-scale loosely-knit cottage units depending mostly on manual labour. It is the tanners' skill that has primarily contributed to the major export trade from South India, and is an important earner of foreign exchange for the country. It is an "import saver" also, as the industry does not make serious demand on the supplies of other industries having an import content, and, therefore it merits special treatment at the hands of the Government.

India's need for foreign exchange to ease the balance of payments position is pressing to a degree. In order to boost production and export, the Government announced, in November 1964, that the Export Credit Guarantee Corporation would guarantee the creation of a revolving fund of Rs. 15 crores in foreign exchange which would be available, under specific guarantees, to manufacturers who are export minded. Banks have been asked to assist exporters by extending credit facilities during pre-shipment and post-shipment periods. Incentives have been offered to shippers with a view to enabling them to concentrate on increasing their exports. Such incentives are no doubt expected to be productively employed on a continuous basis in order to enable exporters to offer their products competitively at world parity.

Export Performance

The export performance of the hides and skins trade during the year 1964 was praiseworthy, though not spectacular. Preference for good standards was marked throughout the year. Total exports of tanned hides and skins amounted to Rs. 22.75 crores in 1962, Rs. 25.38 crores in 1963 and Rs. 18.42 crores during the first eight months of 1964, as against Rs. 16.63 crores in the corresponding period in 1963. Raw hides and skins exports stood at Rs. 10.36 crores in 1962, Rs. 11.37 crores in 1963 and aggregated to Rs. 5.82 crores during the first eight months this year, as against Rs. 7.90 crores in the same period last year.

The total volume of shipments of East India tanned hides, calf and skins to the U.K. during 1964 was maintained at about the same level as in 1963. There was a marked decline in the offtake of hides and calf to the Continent and the U.S.A. Exports of tanned skins to the Continent and the U.S.A. were well above the comparable levels of last year, while those to Japan were slightly less.

Shipments of tanned cow hides to the U.K. were less by 10 per cent and of buff hides by 60 per cent during January-October 1964 than in the corresponding period last year and this was offset by larger exports of cow calf and buff calf skins. The monthly average shipment of tanned cow hides and cow calf to the Continent was 44 bales during January-October 1964 as against 145 bales in the same period in 1963 and that of buff calf was 12 bales, as against 41 bales. The U.S. took only a monthly average of 80 bales tanned buff hides and buff calf in January-October 1964, while it was 200 bales in the corresponding period last year.

Expansion of trade with the U.K. was not possible, because importers on the Continent were buying goods direct from India, instead of through financing houses in the U.K. as in the past. However, the U.K. continued to be the largest importer of kips from India and took a monthly average of about 2,588 bales during January-October 1964, as against 2,603 bales during the year 1963. Demand for kips has been on the wane, and, as soling material, leather has been losing ground to rubber and synthetics. Further, leather dressers preferred pickled and wet blue chrome pelts to bark tanned for their work, and were becoming more and more quality and price conscious; and price declines alone did not induce sufficient interest in the overseas market.

The U.K. Government, on 26th October 1964, suddenly imposed a surcharge of 15 per cent on imports—food articles and basic raw materials excepted—with a view to strengthening the sterling and to narrow the anticipated trading gap of nearly £800 million as a consequence of falling exports and soaring imports in the U.K. About 30 per cent of the exports from India were affected by the levy and E.I. tanned skins and hides were included in the list. Fortunately, after three weeks, E.I. tanned hides and skins were placed on the exempted category and were declared as basic raw material not attracting the new surcharge.

Cow Hides

Importers in the U.K. were keen on prime tannages and top marks. Lightweights and lower selections useful for making sides for their export trade were comparatively in good demand throughout the year. During the first quarter of the year under review, prices of superior tannages declined by 5 to 7 per cent on December 1963 levels and F.A.Q. marks by over 10 per cent. Prices ruled steady at the lower level subsequently and trading was selective till the imposition of 15 per cent surcharge on imports in the U.K. in October. This was a shock to kip tanners whose main outlet was the U.K., and forward business came to a standstill. With the announcement in November of the withdrawal of the levy on E.I. tanned hides and skins, prices locally recovered sharply, but export trading was slow to pick up. Tanners would do well to remember that kips are slowly losing their hold on the U.K. market, though demand for inland consumption has been on the increase, due to the rapid industrialisation in India.

Cow Calf

E.I. tanners output was not large, as the quality of raw supplies was not upto the mark. Good standards were in demand throughout the year with emphasis on lightweights and lower selections. Prices declined slightly in the beginning of the year and fell slowly month by month till the middle of the year when it was 7 per cent below December 1963 level and remained firm thereafter.

Buff Hides

Production of buff hides was not profitable to tanners and was taken up mostly for inland trade. Importers, finding that rubber and synthetics were more economical for soling materials than bark tanned hides, were not keen in this section. Shipments to the U.K. have been on the decline year after year. The monthly average shipment for January-October 1964 was 7 bales to the U.K., while it was 20 bales in 1963, 24 bales in 1962 and 31 bales in 1961. Even with the U.S. the decline was marked. The monthly average of U.S. imports during January-October 1964 was only 17 bales, as against 109 bales in 1961, 39 bales in 1962 and 28 bales in 1963.

Buff Calf

Preference for good tannages and standards was marked throughout the year. Demand was brisk during the first quarter of the year but fell off in the next six months, as Madras prices were not competitive. During the last quarter of the year under review, there were several inquiries from various destinations, including Australia, which incidentally is a new outlet. Prices slightly hardened with the demand but failed to hold during the middle of the year and declined by five per cent on December 1963 level. Towards the close of the year, however, prices recovered the lost ground.

Shipments to the U.K were heavy during the first half of the year, being 20 per cent more than those in the same period in 1963 and the monthly average for January-October 1964 was 531 bales, as against 438 in the corresponding period in 1963. The Continent took only 12 bales per month during January-October 1964, as against 41 bales in 1963, 34 bales in 1962 and 69 bales in 1961. Shipments of buff calf to the U.S. were also on the decline. The monthly averages during 1961 to 1963 were 154 bales, 132 bales and 157 bales and that during January-October 1964 was only 57 bales. The poor offtake was to the severe competition from Pakistan where tanners were in a more fortunate position regarding proximity of raw stocks and cheap tanning materials.

In the tanned skins section, the overall trading conditions were difficult. Prices in the raw centres were uneconomical to the E.I. tanners, due to the high prices paid by exporters of pickled and wet blue chrome pelts of finished leather. As compared to tanners of kips, tanners of skins had a better balance sheet, though the profits were too meagre to compensate for the risks involved.

In the goat skins section, price fluctuations were narrow and mediums held the pride of place and ruled very firm throughout the year. Superior tannages in light and medium weights were favoured on the Continent. Heavier averages in medium tannages were in good demand from the U.S and Continent.

In sheep skins, middle class tannages in lightweights found ready outlet on the Continent throughout the year at firm prices. Primes and semi-primes sheep enjoyed selective market, as the demand for clothing leather and suedes was persistent on the Continent. During the first half of 1964, increased prices were obtained on December 1963 levels and, with the slowing of demand during the second half of the year, prices eased by 5 per cent on December 1963 levels.

E.I. tanners of skins were not unduly disturbed over the imposition of 15 per cent surcharge in the U.K., because they had several outlets for their products. Only the exporters of finished leather and leather goods from India were hit by the new levy.

The volume of production of and export trading in tanned skins during 1964 was on the increase as the following average monthly shipments of E.I. tanned goat and sheep skins will show:

(In bales of 560 lbs. net)

	1961	1962	1963	1964*
Tanned goat skins:				
To U.K. ...	446	415	466	461
To Continent ...	857	695	733	839
To U.S. ...	173	254	268	298
Tanned sheep skins:				
To U.K. ...	323	268	351	351
To Continent ...	356	305	418	385
To Japan ...	179	196	222	214

* January-October.

It will be noticed that the U.K. and Japan were steady buyers, while the offtake to the Continent and the U.S. was on the increase. In view of labour shortage in the U.S., it was reported that larger quantities of skins—chrome, pickled and bark tanned—from India would be in demand in that country. As regards chrome and pickled goat skins, shipments from Madras to the East European countries were as under:

Second half 1962	3,154 cases
1963	11,186 ,,
January-October 1964 ...	8,072 ,,

It is believed that the lower volume exported this year has been due to the dearth of rupee exchange available in importing countries. Socialist countries have been providing firm and expanding markets for the industrial and primary products from India. Expansion of trade with the East European countries have been significant. The volume of imports into India has been conspicuous, and genuine attempts are being made to boost exports to these countries. Shippers in South India are keen to develop further export trading in pickled and chrome tanned skins, and have sent sample shipments to the U.K. and the U.S.

Reptiles Skins

There was a spurt in demand for the import of reptile skins like whips, cobras, vipers, watersnakes and lizards from the U.K., Continent and the U.S.A. Prices of snake skins advanced by 100 per cent during January 1964 and improved further in March 1964 and by May-June failed to hold the second spurt, as the fashion for the leather was not firmly held. However, large quantities were exported, bringing in foreign exchange for India.

General

The Trade Agreement exchanged with the U.S.S.R. in November 1964 provides for a 50 per cent increase in trade both ways;—from Rs. 80 crores it is expected to reach Rs. 120 crores in which 40 per cent of the exports will be industrial products. Leather shoe production has increased considerably in several countries, including the U.S.S.R., and the demand for hides and skins from India will be good. But it should not be forgotten that the competition from exporters in Pakistan and China will impose a severe strain on the price structure on E.I. tanned skins and hides and calf. Footwear production target for 1965-66 has been set as 140 million pairs in India to meet increased demand. Demand for industrial leather in India has been significant, as a result of the Five-year Plans. Tanners have been installing labour-saving machinery to improve their output.

Apart from the trade delegations sponsored by the Government, several tanners from Madras visited dressers and importers in the U.K., Continent and the U.S.A. and Japan to study their needs first hand and these visits should enlarge exports during the New Year. The International Leather Fair held at Paris every year has of late assumed enormous dimensions, and its activities unfold tremendous opportunities for buyers and sellers all over the world for better understanding of each other by personal contacts and for the promotion of the trade as a whole on an increasingly healthier trend. Indian leather exhibits attracted buyers from overseas and business has developed to the advantage of the tanners in India, especially those engaged in goat and sheep skins. The second Indian Leather Fair in Madras is due to be held in January next year, and it is hoped that this Fair also will produce good results.

An international team of experts in foreign trade arrived in New Delhi in November 1964 to study India's export efforts and suggest improvements. The visit has been arranged by the Ford Foundation. The relative report is awaited with interest. The prospects for the industry seem optimistic and the trade could move into the New Year with confidence.

RAW GOAT SKINS EXPORT POLICY

The All-India Exporters' Chamber (Bombay) has urged the Government of India to revise its export policy for raw goat skins. In a communication addressed to the Secretary, Union Ministry of Commerce, the Chamber points out that the present policy has adversely affected exports of raw goat skins to the U.K., the U.S., Soviet Russia, Czechoslovakia, France, West Germany and several other European markets, which are India's important buyers. These markets, it is said have turned their attention to other countries like China and Pakistan which have gained an upper hand, driving India out of these markets. The specific suggestions put forward by the Chamber are:

1. In order to achieve the objective of earning a greater amount of foreign exchange and realising adequate prices and a proper development of this nascent industry, adequate incentives should be given to finished dressed leather and leather goods only instead of giving it to a dozen lower items like pickle, blue chrome, semi-chrome, E.I. vegetable tanned etc., like pickles and semi-dressed varieties.

2. All the intermediate and raw varieties of skins should be allowed to be exported without any restrictions and without any incentives, so that the foreign buyers can buy freely what they like and may not be tempted to look to other sources for their requirements. Such a policy is followed by Pakistan and China and they have succeeded in stepping up their exports. This is recommended mainly because the foreign buyers have developed their own technique of processing and tanning, which are not available in our country and, therefore, they require our material in raw form.

DEVELOPMENT OF COLD STORAGES

The establishment and maintenance of cold storages in the country are regulated with effect from 1st January 1965 under the Cold Storage Order, 1964, issued in accordance with the provisions of the Essential Commodities Act, 1955. According to this Order, all cold storages used for storing food, milk and, dairy products, vegetables, seed potatoes, meat, fish and other food products will have to obtain a licence for carrying on the business of cold storage from the Agricultural Marketing Advisor to the Government of India. Technical staff of the Government of India will be deputed periodically to inspect the cold storages and render assistance to the cold storage owners on technical matters.

The Order provides that a list of foodstuffs stored in a cold storage must be displayed prominently at the entrance and that no foodstuff, which is repugnant or alien to the foodstuffs already kept there, shall be stored. The objective of the Order is to ensure the depelopment of cold storage industry in the country on modern scientific lines, to regulate storage conditions of perishable foodstuffs in cold storages and also to help the producers in storing their products and ensuring adequate marketing facilities.

SAVE AND INVEST IN NATIONAL DEFENCE BONDS

ESTD. 1868

Ninety-three years ago, when India was still sceptical about all things new and progressive, an imaginative group of enthusiasts banded together to form the nucleus of the first pharmacy to sell modern medicines. In 1868, they established, in Bombay, a small chemists and druggists shop. Thus, the original Kemp & Co. was born, selling and compounding up-to-date specifics to alleviate sickness and disease ■ Over the years, Kemps has developed into a widely known and respected chain of stores in Bombay and Delhi, Calcutta and Madras. Kemps were the first to introduce to India new medicines made by reputed American and European Drug Houses. Kemps were also pioneers in the manufacture of both ethical pharmaceuticals and household remedies known and used all over India today ■ With nearly a century of valuable experience behind them, Kemps is participating in the country's rapid industrial growth by helping to make her self-sufficient in modern medicines ■ By increased manufacture of drugs and cosmetics, and by improved service to the public, Kemps is contributing to the welfare of the nation.

THE TEST OF QUALITY

At any time, in any place, since the emergence of competitive enterprise, the quality of a product—tested continuously by that most critical of critics, the consumer—has made or marred the manufacturer's reputation. And a product, once firmly established by virtue of its Quality, is difficult to dislodge even in the intense price market of India, if that Quality is steadily maintained.

For more than a decade, Sen-Raleigh has been increasing its production of the well-known Raleigh, Rudge, Humber and Robin Hood bicycles. Yet their demand seems to be insatiable.

Sen-Raleigh manufactures, in addition to these bicycles, quality Union components and Wittkop saddles.

Win the battle of international trade

There is a rich market for Indian goods abroad. But as an exporter, you cannot sell sub-standard goods. You have to bear the brunt of the battle against powerful western rivals in the world market.

You can win this battle of international trade only on quality, competitive prices and service facilities. The export market can be a source of continuous earning power, provided you exercise strict quality control in the manufacture of goods, adopt modern techniques in production and adhere to high standard of specifications.

Thus you can help the country tide over her foreign exchange crisis and also maintain her prestige in the world.

We are here to guide and assist you in promoting your export.

Why Choose Steel for Castings?

For High Strength
For Resistance to Shock
For Resistance to Abrasion
For High Fatigue Strength
For Weldability
For Malleability
For Ductility and
For High Elastic limit

But, Why Choose **Himmat** *for Steel Castings?*

For their quality in which they surpass others.
For their reliability—their castings are made to strict specifications.
For their prompt deliveries and excellent business relations.

At Kumhari, on the National Highway between Bhilai and Raipur,

HIMMAT STEEL FOUNDRY (P.) LTD.,

the States' first Steel Foundry in Private Sector, is progressively reaching the installed capacity of 250 tonnes of Steel castings per month.
