As stated in the previous year's report, the Rolling Mill and new Conductor Works at Ghaziabad have gone into regular production and satisfactory level of production has been maintained. The Company has got sufficient orders in hand for the conductors to maintain the production for the current year. The order position for electric motors and transformers is also satisfactory. The Company has recently supplied the first batch of *Air Blast Circuit Breakers* of 25 kV suitable for electric locomotives in Indian Railways according to BBC design, out of the initial order of 100 breakers received from the Indian Railways.

Increase of Share Capital: The Company issued and allotted 20,000 6 per cent income-tax free cumulative preference shares of Rs. 100 each to the Company's collaborators, Messrs. Brown, Boveri & Co. Ltd., Baden, Switzerland. The Company has also offered 1,20,000 new equity shares of Rs. 100 each to the existing shareholders of the Company for cash at par in accordance with the resolution passed at the thirteenth annual general meeting held on 17th February, 1964.

Accounts in brief as at 30th April 1964 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital* ..	1,40,00,000	Gross block ..	1,14,67,087
Reserves and surplus..	4,00,376	—Depreciation ..	38,73,897
Other liabilities ..	2,80,18,761		
		Net block ..	80,93,190
		Block in progress ..	24,50,565
		Current assets ..	2,54,92,208
		Investments ..	1,12,574
		Cash	62,70,600
	Rs.4,24,19,137		Rs.4,24,19,137

* Paid-up capital consists of 1,20,000 equity shares of Rs. 100 each and 20,000—8.57 per cent. cumulative preference shares of Rs. 100 each. Out of the above Messrs. Brown, Boveri & Co., Ltd., Baden, Switzerland, the holding Company, hold 60,001 equity shares

Balmadies Plantations Ltd.

(*Managing Agents*: Messrs. Planting Agencies Private Ltd., Madras.)

Twenty-first Annual General Meeting—Held on 5th October 1964.

Working Results:

	For the year ended 31st May (In thousand rupees)	
	1964	1963
Proceeds of coffee crop	2,00	3,62
Gross profit	78	1,36
To Managing Agents' commission	9	12

Carry forward	9	1
Market value of equity shares (in rupees):	1964*	1963
High	1.85	1.90
Low	1.69	1.65

* High and low upto 13th October 1964.

Extracts from the Directors' report: *Estate Development and Rehabilitation*: A reserve of Rs. 25,000 has been created out of the profits of 1953-54 towards Estate development and rehabilitation. Since the Company has been unable to utilise this reserve so far, it has been decided to transfer this amount to general reserve fund.

Taxation: As there is a balance of Rs. 13,316 at the close of the year under provision for taxation and this Company expects a refund of Rs. 30,000 of tax already paid, no provision has been made towards taxation on the current year's profit.

Crop and Cost: A crop of 43,490 kgs. of coffee was harvested at an all in cost of Rs. 268.6 per 50 kgs. as against the estimate of 70 tonnes at an all in cost of Rs. 175 per 50 kgs. Due to poor setting this year the crop anticipated was not harvested.

Rejuvenation Programme: The programme of rejuvenation 30 acres every year is being continued. All the replanted areas are coming up satisfactorily. By this process the Company hopes to reduce gradually the old coffee bushes and supply the fields with high yielding, disease resistant selections.

Accounts in brief as at 31st May 1964 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital* ..	3,75,000	Gross block ..	4,59,296

Extracts from the Directors' report: Limestone.—Output at 14,86,585 tonnes and sales at 14,66,701 tonnes during the year were almost on the same level as last year when the output and sales were 14,67,632 and 14,46,832 tonnes respectively.

Dolomite.—Raisings decreased from 4,97,869 tonnes to 4,08,470 tonnes as compared with the previous year. Sales also declined from 5,04,042 to 3,90,452 tonnes. The decline in output and despatches was due to reduced offtake by the steel Companies.

General.—Birmitrapur was unfortunately seriously affected by the disturbances which broke out in the area in March, 1964. Mining and loading operations were completely at a standstill for about five days and it took nearly two months for production and despatches to revert to normal. As a result the Company's trading results were adversely affected.

Accounts in brief as at 31st March 1964 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	40,00,000	Gross block ..	1,61,31,625

NEWS IN BRIEF

THE Hindustan Aircraft Ltd. has been dissolved and reconstituted as the Hindustan Aeronautics Ltd. with effect from the 1st inst.

East German experts will prepare another project report for the Salem steel plant on the basis of "the low shaft furnace" system of processing iron ore into steels.

The meeting of the Central Advisory Council of Industries, scheduled to be held at New Delhi on the 30th inst., has been postponed to 11th November next.

India exported processed foods worth Rs. 99.04 lakhs, during the first four months of the current financial year (April-July 1964), as against Rs. 92.00 lakhs in the corresponding period last year.

The total loss resulting from the recent floods and rains in the four worst affected districts of West Godavari, Krishna, Guntur and Mahboobnagar in Andhra Pradesh is estimated at about Rs. 25 to Rs. 30 crores.

The National Buildings Organisation is erecting an integrated plant for producing facing bricks, heavy duty bricks and vitreous clay tiles. The capital outlay on the project is estimated at Rs. 8.50 lakhs, with a foreign exchange component of Rs. 50,000.

The Union Government's Department of Tourism has organised a training course in tourism for the E.C.A.F.E. member countries. The course, the third in the series, which is being attended by the representatives from Iran, Iraq, Afghanistan, Thailand, Nepal and the Philippines, is expected to last one month.

The Government of India has placed a $12.40-million order for 54 diesel electric locomotives with the Alco Products Inc. of the U.S. The delivery of locomotives will start shortly and be completed by the first quarter of 1965. The U.S. Agency for International Development is financing the purchase of these locomotives.

A trade delegation led by Mr. S. V. Ramaswamy, Union Deputy Minister for Commerce, left this week on a four-week visit to Czechoslovakia, Rumania, Bulgaria, Hungary and Yugoslavia. It will review the growth of trade with these countries during the current year and also explore the possibilities of stepping up the trade in the coming years.

An extensive programme for promoting science clubs for university students was announced by the Esso in Bombay on Tuesday this week. An Advisory Committee consisting of about 20 professors and heads of departments, with Dr. A. B. Kulkarni, Head of the Department of Chemistry, Institute of Science, as Chairman, has been formed to finalise the details of the programme.

The Indian High Commissioner in Canada and the President of the Canadian Export Credits Insurance Corporation signed on 16th inst. at Ottawa an agreement under which Canada is to give India credit for about two million dollars. The loan will be made available to the Hindustan Steel Limited for purchase from the AMCO Furnace Contractors Ltd. of reheating and heat treating furnaces for the mills at Durgapur.

India exported 28.83 million kgs. of tea worth Rs. 18.1 crores during the month of September 1964, as compared with 25.4 million kgs. worth Rs. 15.78 crores in the same month last year. During the first six months of the current financial year (April to September 1964) exports of tea from India were of the order of 90.63 million kgs. worth Rs. 55.93 crores. In the same period of last year, exports of tea were 87.22 million kgs. worth Rs. 52.54 crores.

The Governments of India and West Germany have recently signed an agreement regarding protection of German capital investment in India. The agreement, which comes into immediate effect, reiterates the Government of India's policy on foreign investment in India. It provides fair compensation for investments in case of nationalisation and adequate facilities for remittance of profits, dividends and capital in case of liquidation and expropriation. The agreement, it is hoped, will give further impetus to German industry to invest in India.

The high power committee appointed by the Gujarat Government to examine the various aspects relating to the development of the sugar industry in the State is reported to have suggested about 20 locations for the possible establishments of new sugar mills. Initially in order to reduce the gap between demand and supply; the setting up of three units with an aggregate capacity of 30,000 tonnes has been recommended. At present there are only three sugar factories in Gujarat State, they are situated at Kadonar, Bardoli and Gandevi. Their combined annual capacity is 40,000 tonnes.

The Union Ministry of Industry and Supply has called upon the manufacturers of agricultural implements to take immediate steps to ensure that their products are made available to farmers to them, the Ministry has stressed that the easy availability of such implements to the farmers at reasonable prices would help increase food production and bring down the prices of foodgrains and other agricultural commodities. It has urged the manufacturers to make available implements to farmers through the authorised dealers and stockists at their published list prices and also ensure that the trade strictly adheres to these prices.

A series of management development programmes which are claimed to have a high impact potential for development of men for effective action and results, will be inaugurated in Bombay on the 24th inst. by Mr. Prabhu V. Mehta, Vice-Chairman of the National Productivity Council. The programmes, sponsored by the Business and Industrial Consultants Combine, will be conducted by Dr. R. M. Shah and his associates. The programmes comprise organisation goals and their achievement; employee morale and productivity; sale targets and their achievement; production targets and their achievement; leadership and direction for results; profitability and returns (*including costings*); *managing materials*; effective industrial relations; managing results; personnel selection and utilisation; work study for results and incentives for results.

The Indian Bureau of Mines has stepped up field investigation works concerning important metals. So far in the current year, it has taken up 17 investigations in copper, limestone, iron ore, gold, salt and tungsten. Eight more investigations are likely to be undertaken shortly. It is also engaged in carrying out detailed investigation for minerals which consist of prospecting, drilling and mining and is entrusted with the work of coal prospecting. Six investigations in copper, limestone and iron ore are likely to be completed during the current year. With the transfer of the entire coal prospecting work to the National Coal Development Corporation in April this year, more drills have been made available to the Bureau. The total number of workable drills has now increased from 29 to 63 and will increase further when 30 new drills and the drills being reconditioned are received.

An Indian tax delegation led by Mr. V. T. Dehejia, Secretary, Ministry of Finance, has returned after negotiations with the Governments of the United Arab Republic and France for agreements for the avoidance of double taxation of incomes with these countries. In Cairo, the Indian and the U.A.R. delegations drew up a draft agreement which is comprehensive covering all sources and types of incomes. It is based on the principles followed by India in similar agreements with other countries, subject to necessary modifications to suit the conditions prevailing in the U.A.R. and India. The agreement will come into force after the draft is approved by the two Governments and instruments of ratification have been exchanged. In Paris, the Indian delegation completed the pending negotiations for an agreement with the tax delegation of the French Government. The discussions resulted in a settlement of the outstanding points relating to an earlier draft agreement for the avoidance of double taxation of incomes between the two countries on a comprehensive basis. This draft also embodies the principles which have been followed by India with other countries. A formal agreement is now expected to be concluded shortly.

From Abroad

The Government of West Germany has agreed to give a loan of £2 million to Malaysia for constructing a new port at Butlerworth in North Malaya.

The U.S. gross national product during the third quarter registered an increase of almost of $9,000 million, as compared with the second quarter to touch an estimated annual rate of $627,500 million.

A Pakistani team, headed by Mr. Said Hasan, Deputy Chairman of the Planning Commission, is leaving this week for Peking to negotiate the terms of the Chinese Government's offer of a $60 million interest free loan to Pakistan.

The purchase of two new British-built 17-knot cargo passenger ships by Pakistan will be financed by a £2.8 million loan from the British Government under an agreement signed at Karachi recently. The loan, which is ninth to be made to Pakistan, is repayable in 15 years.

A special Committee known as the Committee on Trade and Development is to be created by the G.A.T.T. as part of a new deal for developing countries that will make membership more attractive to them. This new committee will replace the existing two committees, that is, the Action Committee and Committee III.

A five-year trade agreement providing for a 35 per cent increase in the mutual trade between Greece and the Soviet Union during the year 1965 has been signed by the Governments of the two countries. Under the agreement each of the signatories will export goods to the other worth about $31 million, which will rise to $42 million by 1969. Soviet Russia will export 450,000 tons of crude oil to Greece.

The aggregate world production of nitrogen fertiliser in 1963-64 is estimated to have risen by some 1.65 million tonnes to 15.2 million. The in-

led for a rise of 8.5 per cent to 10.45 million tonnes, and Eastern Europe for a rise of 19.6 per cent to 2.7 million tonnes. In the developing countries, the production increased by 23 per cent to 2.03 million tonnes.

Ceylon will export to the Soviet Union more than double the quantity of tea now exported to that country from next year under a new trade pact signed between the two countries recently. Ceylon will also export, for the first time, leather footwear, shirts, towels and other industrial consumer goods. The Soviet Union will supply Ceylon with various types of machines and equipment, petroleum products, cement, cotton piecegoods, etc.

A new group of plastic materials capable of conducting an electric current has just been announced by the General Electric Company of the U.S. The new material, it is claimed, can be applied almost like a paint to produce a conductive coating on the surface of an ordinary plastic or other insulating material. They can also be used in the form of a paste which would be used instead of solder to attach connections. Laboratory tests show that the materials do not deteriorate when conducting current and that the degree of conductivity can be easily controlled.

The W. German export surplus has taken a sharp downturn, based on the latest available figures. While the surplus (+2,382 million DM) in the first quarter of 1964 was more than three times as high and in the second quarter (+1,974 million DM) still two-thirds as high as in corresponding periods of last year, in August (+126 million DM), it sank to less than one-fourth of its total of August 1963. The August 1964 surplus was, in fact, the smallest since January 1963, a month in which exceptionally cold weather limited production.

The Conference of Asian Economic Planners began its second session at Bangkok on the 19th inst. under the auspices of the U.N. Economic Commission for Asia and the Far East. The Conference is bringing together Government representatives who play key roles in the shaping of their countries' economic development programmes, and provide them an opportunity to make out a future common course of action towards progress and development. The meeting is considering the progress made in economic development planning and Plan implementation in the recent past; interim report on regional harmonisation of national development plans in the region; the approaches to regional harmonisation of national development plans in the E.C.A.F.E. region; the report of the Governing Council of the Asian Institute for Economic Development and Planning and the work and recommendations on priority tasks in the work programmes of subsidiary bodies.

Some 375,000 books of pamphlets were published throughout the world in 1961, according to U.N.E.S.C.O's *Statistical Yearbook* which has just been published. This total, based on information furnished by 70 countries in five continents, is substantially larger than in previous years and compares with 360,000 books published in 1960, and 335,000 in 1959. Book production in the world is divided as follows: 44 per cent in Europe, 22.9 per cent in Asia, 19.7 per cent in the U.S.S.R., 6.9 per cent in North America, 4 per cent in South America, 1.6 per cent in Africa and 0.8 per cent in Oceania. The Soviet Union leads the list for the number of publications during 1961, with about 74,000 titles including official publications and works of propaganda distributed free, which made up about 41 per cent of the total production, followed by the U.K. (25,000 titles), Japan (24,000), W. Germany (22,000), the U.S.A. (18,000) and France (12,700). India which ranked sixth in 1959 with some 12,000 titles, lost this position when the number dropped to 11,000 in 1960 and 9,000 in 1961; it now ranks behind Czechoslovakia and the Netherlands.

PERSONAL

MR. Herbert L. Jacobsen, a former European Regional Director of the Cotton Council International, has been appointed head of the G.A.T.T. International Trade Centre at Geneva.

Mr. O. V. Alagesan, Union Minister of State for Petroleum and Chemicals, left for the U.S., Canada and Japan to study the latest developments in petrochemical and fertiliser industries.

Mr. K. R. Damle will relinquish charge as Secretary to the Ministry of Petroleum and Chemicals by the end of this month and take up duties as the Secretary to the President.

Mr. C. A. Cornelius, General Manager, Calcutta Telephones, has been appointed Officer on Special duty, Hindustan Teleprinters Ltd. He will take over as the Managing Director of the Company in December next.

Mr. C. Subramaniam, Union Minister for Food and agriculture, will lead the Indian delegation to the forthcoming Asian Regional Conference of the Food and Agricultural Organisation scheduled to be held at Manila in the second week of November next.

Mr. V. Ramchandran, Deputy Director of the National Productivity Council, has taken over charge as the Regional Director of the Bombay branch of the Council, *vice* Mr. M. N. Unni Nayar who has left for Geneva to join the professional staff of the International Labour Organisation.

TRAVANCORE SUGARS AND CHEMICALS LTD.

CONSTANT ENDEAVOUR TO IMPROVE OPERATING EFFICIENCY

CHAIRMAN, MR. H. V. R. IENGAR, ON DIVERSION OF CANE SUPPLIES

A WARNING that diversion of cane supplies for jaggery making would continue to persist in the absence of any law prohibiting manufacture of jaggery in the natural area of the sugar factory, has been given by Mr. H. V. R. Iengar, Chairman of the Travancore Sugars and Chemicals Ltd., in the course of his statement circulated to the shareholders of the Company. Mr. Iengar has stated that the trend towards declining profits in the sugar industry has unfortunately continued. The outlook for the coming season, according to him, is somewhat obscure, as the Government has already increased the cane price by 10 paise per maund but without any indication of a higher price for sugar. Alluding to his own Company, he has held out the assurance that it is the constant endeavour of the management to improve the operating efficiency of the factory.

The following is the full text of Mr. Iengar's statement:

The accounts and Directors' report for the year ended 30th April 1964 will, by the date of the meeting, have been in your hands for the statutory period and, with your permission, I shall take them as read.

During the year under review we have suffered a most painful and irreparable loss in the sudden demise of the nation's most beloved Prime Minister, Pandit Jawaharlal Nehru. Pandit Nehru was not only the principal architect of post-independent India, but also the champion of international peace and, in this respect, the world has also sustained a great loss. The measure of gratitude we owe Pandit Nehru cannot be expressed in words; the nation has progressed very substantially in the social, economic, and industrial sphere, as a result of his guidance and vision, under a system of planned economy.

Production and Sales

Production of sugar at 9,032 tonnes fell substantially short of last year's figure of 12.000 tonnes, because of the high *gur* prices which resulted in the diversion of cane for jaggery making. In the absence of any law prohibiting manufacture of jaggery in the natural area of the sugar factory, such diversion will continue to take place when jaggery prices are high.

Sales of sugar were greater in 1964 because of a carryover of 7,000 tonnes and higher releases to meet sugar scarcity in Kerala. It is unfortunate that sales were effected at a narrower margin of profit due to higher costs resulting from lower production and also increased cane prices which were not adequately compensated in the selling price of sugar. At the end of October 1963, for instance, the price of cane was increased from Rs. 40.20 to Rs. 45.00 per tonne, but the sugar price was only increased by Rs. 3.80 per quintal. To cover adequately the higher cane price, the sugar price should have been increased by at least Rs. 5.00 per quintal. Again on 12th December, the cane price was increased to Rs. 46.90 per tonne, but this time, there was not increase whatsoever in the sugar price until the 22nd of May in the following year, by which time 85 per cent of the sugar produced by the factory had been sold at the lower rate.

Profits of Sugar Industry

The trend towards declining profits in the sugar industry, which was mentioned in my review last year, has unfortunately continued. The latest study made by the Reserve Bank on Companies' Finance (July 1964) shows that the ratio of profit after tax to net worth had declined from 7.9 per cent in 1961-62 to 3.5 per cent in 1962-63 (against 9 per cent for all companies in 1962-63). The outlook for the factory next year is somewhat obscure as the Government has already increased the cane price by 25 paise per maund from the 1st November 1964, but without any indication of a higher price for sugar. Shareholders are aware that the Sugar Inquiry Commission is at present examining the cost structure of the industry and its recommendation is expected shortly. In the meantime, it is our constant endeavour to improve the operating efficiency of the factory, and, to this end, improved equipment is being installed—particularly a Dorr Oliver filter in the sugar factory and an automatic bottling plant in the distillery.

Potable Liquor

In all these circumstances, it is extremely fortunate that the new still which was installed last year has worked satisfactorily and the output has more than doubled. We were able to meet the demand for spirit from local buyers and export a sizable quantity to Ceylon. The relaxation of prohibition in the Maharashtra State has already resulted in increased sales of potable liquor and we anticipate a substantial increase in sales in the current year.

Steps have been taken to mechanise the packing section in the distillery and already an automatic bottling machine has been installed.

Apart from this, we enjoyed a favourable cash position during the year, as we were not required to carry heavy stocks and, in fact, substantial sums were placed and still remain on deposit with our bankers; the interest earned thereon contributing additional revenue during the year under review.

Higher Dividend

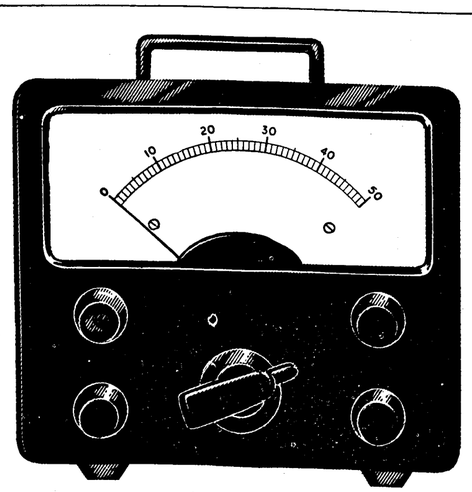
All these factors have made it possible for your Directors to increase the dividend on the ordinary share capital of Rs. 30,00,000 to 7.5 per cent, compared with 5 per cent paid in the previous year, thus restoring it to the same level as in 1961 after strenthening the general reserve by the transfer of Rs. 90,000 from current year's profit.

Shareholders are aware that an application has been made by us to the Controller of Capital Issues for capitalising the sum of Rs. 6,00,000 from out of the sum of Rs. 6,50,000 available in the share premium account, by the issue of one bonus share for every five ordinary shares held. Our application is under consideration of the Controller of Capital Issues and, when his consent is received, arrangements will be made to issue allotment letters as soon as possible. The bonus shares will not rank for any dividend which may be declared in respect of the year ended 30th April 1964.

Staff Relations

Our relations with the staff and labour were marred by an illegal strike on the issue of bonus from the 19th to 26th December 1963. This dispute was referred to adjudication. There were also some other labour disturbances during the year including a "go-slow" in the months of November and December. Apart from these incidents, the relationship between the management and the employees has been cordial, and I would like to take this opportunity to thank all employees and particularly the management staff who had to work under stress and strain during the period of the strike, for their co-operation during the year under review.

Note: *The above statement is not a report of the proceedings of the Annual General Meeting, which will be held on 28th October 1964.*



DO YOU MAKE NICKEL/CHROMIUM PLATED ARTICLES?
then test your plating with this instrument

Attention to quality is the first step in the production of goods which *sell*. Eye-catching chrome thinly plated will sell — once. As soon as the plating peels or becomes rusty — the manufacturer's name suffers — affecting repeat sales.

- Is the thickness of the plating specified to the plater?
- Are you aware of the Indian Standard specification 1068:1958 on nickel plating?
- Can you check that the finished article conforms to your specification?

How do *you* ensure lasting quality? Ask yourself these questions.

As a first step write today for further information from

NICKEL INFORMATION BUREAU PRIVATE LIMITED
United Bank of India Building, 25 Pherozshah Mehta Road, Fort, BOMBAY 1-BR.

TREND OF MARKETS

MONEY COMFORTABLE

(From Our Own Correspondent)

BOMBAY, 21*st October*

The firm trend of the short-term money market noted in the past two weeks abated during the week under review. Indeed, conditions were distinctly easy. Demand for funds was on a reduced scale and the supply position was quite comfortable, thanks to the return flow of funds. Consequently, interest rates drifted downwards. In the inter-bank call section, the rate for renewals receded from 2½ to 1½ per cent and fresh money fetched 1-1½ per cent, as against 2½ per cent a week ago.

The easiness of money is reflected in the encouraging response evoked by the 91-day Government of India Treasury Bills, tenders for which opened on Tuesday the 20th inst. The amount offered, namely, Rs. 4 crores, was double that (Rs. 2 crores) invited and also accepted. The average rate of accepted tenders was Rs. 2.500 per cent per annum. The Intermediate Treasury Bills also elicited good support, the Bills actually sold from the 12th to 17th inst. aggregating Rs. 2.43 crores, as against Rs. 1.74 crore a week before.

There was a small improvement of Rs. 29 lakhs to Rs. 94.59 crores in India's foreign exchange reserves during the week ended 16th October. The whole of the improvement was in balances held abroad which rose from Rs. 8.84 crores to Rs. 9.13 crores. The foreign securities held in the Issue Department of the Reserve Bank were unchanged at Rs. 85.46 crores. Deposits of scheduled banks increased by Rs. 12.70 crores to Rs. 109.48 crores. Loans and advances obtained by them from the Reserve Bank also rose by Rs. 2.03 crores to Rs. 3.99 crores. Notes in circulation declined by Rs. 2.58 crores to Rs. 2,437.93 crores.

The total credit made available by scheduled banks to their clients increased by a further Rs. 1.70 crore to Rs. 1,715.08 crores during the week ended 9th October, while their deposits receded by Rs. 1.38 crore to Rs. 2,696.69 crores. Borrowings from the Reserve Bank, as a result, rose by Rs 1.26 crore to Rs. 1.91 crore. Investments declined by Rs. 2.89 crores to Rs. 827.64 crores, but total cash was higher by Rs. 59 lakhs at Rs. 156.44 crores.

On Monday the 19th inst., the Reserve Bank of India resumed its open market operations in Gilt-edged securities which had remained suspended since the 8th inst. The Bank is now selling outright, as well as in switches, the 4 per cent 1970 and 4½ per cent 1989 Central loans at Rs. 99 and Rs. 100, respectively. It is also buying outright the 3½ per cent 1965 loan at Rs. 99.95 and in switches the 3 per cent 1966-68 at Rs. 98.35 and 3½ per cent 1966 at Rs. 100. Despite the resumption of open market operation, business put through in the Gilt-edged market was limited and values were more or less unchanged at last levels. 3½ per cent 1965 loan met with special support and spurted by 20 paise to Rs. 100.20.

The outstanding balance of the 1½ per cent Hyderabad Loan 1964 is repayable at par on 31st October 1964 and no interest will accrue thereon from that date. To facilitate payment of discharge value on the due date, the holders are required to tender their securities at the Public Debt Office, treasury or branch of the State Bank of India or its subsidiary banks at which they are enfaced—registered for payment of interest on or after 17th October 1964. Full details of the procedure for obtaining the discharge value of the securities can be obtained from any of the foregoing offices.

In the foreign exchange market, the banks' selling and buying rates for U.S. dollars rose by 25 paise each to Rs. 481 and Rs. 477.75 per $100, respectively. In New York, the pound sterling weakened *vis-a-vis* the dollar, the spot rate declining by 0.050 cent to 278.270-278.300 cents and the three months' forward by 0.210 cent to 277.580-277.610 cents.

GOLD EASY, SILVER ERRATIC

(From Our Own Correspondent)

BOMBAY, 21*st October*

Gold ruled easy during the week under review, while silver moved erratically. The easiness of gold was due to increased arrivals and absence of interest on the part of the traders. Over the week, gold was lower by 75 paise, whereas silver was unchanged. Traders were inclined to feel that both gold and silver might continue to hover around these levels at least in the next few days.

Fourteen-carat gold began the week a rupee higher at Rs. 68.25 and moved up in the earlier sessions to Rs. 68.50 on some upcountry support. In the subsequent sessions, however, it declined sharply to finish at Rs. 66.50 today. Pure gold, in private trading, declined from Rs. 113 to Rs. 110 on increased arrivals of contraband metal. Sovereign was quoted lower at Rs. 90.50, as against Rs. 91 last week.

Silver, after opening the week 50 paise lower at Rs. 256, moved upto Rs. 257 on Friday the 16th inst. But as no regular support came from operators, it declined to Rs. 256.50 on Monday. Following lower arrivals, however, silver rose again to Rs. 257 yesterday but closed lower at Rs. 256.50 today. The weekly average arrivals and offtake of silver were 22 and 8 bars, respectively, as against 28 and 9 bars, respectively last week.

The international price for gold was hihger at $35.11¼ as against $35.10¼ last week. The sterling price was also higher on speculative demand at 252*s.* 4*d.* However, both spot and forward silver were unchanged at 112¾*d.* and 113*d.*, respectively, as also silver in New York at 129.3 cents.

The following table shows the trend of prices during the week under review:

	21-10-64 (closing)	High	Low	13-10-64 (closing)
SILVER	Rs.	Rs.	Rs.	Rs.
Ready (996 fine) ..	256.50	257.50	256.00	256.50
GOLD				
Ready (14-carat) ..	66 50	68.50	66.50	67.25
Sovereign	90 50*	—	—	91.00*
London—				
Gold	252*s.* 4*d.*	252*s.* 4¼*d.*	252*s.* 1¾*d.*	252*s.* 2¼*d.*
Silver Ready ..	112¼*d.*	—	—	112¾*d.*
Silver Forward ..	113*d.*	—	—	113*d.*
New York—				
Silver	129.3 cents	—	—	129.3 cents

N.B.—The quotation for gold is per 10 grams (about 0.85 tola) and that for silver is per kilogram (85.73 tolas). London and New York quotations are per ounce. * Unofficial rate.

SPURT IN COTTON FUTURES

(From Our Own Correspondent)

BOMBAY, 21*st October*

The cotton futures began the week on an easy note but forged ahead immediately thereafter, following encouraging spot advices which suggested bulk buying by a few leading mills. The firmness gathered momentum in the subsequent sessions, thanks to short-covering induced by reports of damage to crops in the Punjab and Khandesh areas. The increasing uncertainty regarding the allocation of cotton under P.L. 480 to India during the current season also imparted strength. The closing rates today were well above those at the end of last week.

The Jarilla March 1965 contract opened 50 paise lower at Rs. 728.50 and moved up to touch a high of Rs. 738.25 today. The gain over the week was Rs. 9.25.

In the Sewri spot market, good activity was reported during the week. Mills started showing increasing interest in new crop varieties. Spinner interest was being evinced in new crop Co2, Digvijay, 197/3 and L.147 and the turnover was showing a steady improvement. Following are the latest available quotations in respect of certain popular varieties.

Akola New Rs. 1,017; Aurangabad Rs. 880, Aurangabad Co2 Rs. 1,341; Bardoli Red Rs. 1,071, Bengal Fine Rs. 751K, Dabhoi New 1,141. Hingloi New Rs 1,010; Hubli Laxmi Rs. 1,020; Viramgaon New Rs. 937 and Navapura Rs. 1,140.

In the foreign section, Bengal *deshi* registered a significant rise during the week. From Rs. 742 per candy, the December delivery reached Rs. 751. It was reported that the exports had been constantly picking up and sale registrations during the first six weeks of the season amounted to about 64,000 bales as against a total of 59,000 bales registered till the 9th inst.

Among imported cottons, African cotton evoked moderate demand. Although the actual announcement has not yet come, there are rumours in the market that the Textile Commissioner has received advice regarding the availability of dollars for the import of about 30,000 bales of American cotton under the M.M.T.C.—C.C.C. barter deal 1963. Allocation letters are expected to be issued to mills either as an advance against their normal export entitlements or on a flat quota basis.

The latest reports about cotton crop for the current season indicate that some quantitative damage has been done to the 197/3 crop due to infestation in the Khandesh district. Heavy rain did not allow the sowing of Laxmi crop. While fairly satisfactory progress of crop is reported in Gujarat, Maharashtra (Broach, Surat, Vidarbha and Akola districts), and Madhya Pradesh (Ujjain and Khandwa districts), it is feared that heavy showers in the South may harm the standing Mungari crops.

An important development of the week has been the commencement of cotton marketing in the new crop cotton which is coming into the terminal markets in the Punjab. It is being well received by the local mills. Marketing activity in Vidarbha and Khandesh areas is expected to start in about two weeks. Spinners are reported to be finalising their production plans under the new statutory control on textiles and are expected to enter the cotton market for large-scale buying. The quality of the new product, it is said, is quite satisfactory. With a carryover of 25 lakh bales and an estimated crop of 60 lakh bales, it is expected that prices will come down in tune with the ruling prices of other farm products. The exact trend of cotton prices will depend on pace of new arrivals, as well as on the holding capacity of producers. Mills expect cotton prices to decline by at least Rs. 60 per candy, in order that it may become attractive under the new situation arising from the reduction of about 10 per cent in the prices of cloth.

EXCISE DUTY ON RAYON AND STAPLE FIBRE YARNS

(From Our Own Correspondent)

BOMBAY, 21*st October*

There were two notable developments during the week under review insofar as the yarn market is concerned. They were: (1) resumption of forward trading in staple fibre on Friday the 16th inst. and (2) duty relief of rayon and staple fibre yarn. Inaugurating the forward trading in staple fibre yarn, the Governor of Maharashtra advised the trade strictly to adhere to the rules and regulations of the Forward Markets Commission and conduct business honestly. Mr. Kantilal Nahalchand, President of the Yarn Merchants Association and Exchange Ltd., in his welcome speech, pleaded for the resumption of forward trading in art silk yarn also. Pointing to the marked increase in the production of this yarn in the last two years, he disclosed that the Association was trying to impress upon Forward Markets Commission to lift the ban on forward trading in art silk yarns.

The Government of India has announced the complete abolition of the special excise duty of 15 paise per kg. on cellulosic staple fibre yarn of 1.5 denier and above, and reduction in the basic duty on the cellulosic staple fibre yarn from a rupee to 75 paise per kg. In the case of cellulosic staple fibre of less than 1.5 denier, the basic excise duty remains unchanged at a rupee per kg., as also the special excise duty at 15 paise per kg. In respect of all other staple fibres, too, the basic excise duty will continue at the present rate of Rs. 2 per kg. The Union Government has also withdrawn the special excise duty at a rupee per kg. on all viscose filament yarn of 120D and above and reduce it from a rupee to 50 paise per kg. on yarn of above 100D but below 120D.

The Indian Cotton Mills' Federation has made telegraphic representation to the Central Board of Excise and Customs regarding the double levy effect of the new excise duties imposed on yarn made from staple fibre, which has already borne duty at the old rates. The Federation has represented that mills with existing stocks of staple fibre will be penalised, because they have already paid excise duty on these stocks at the old higher rates and they will now also pay excise duty on the yarn made or to be made from these stocks. It has, therefore, suggested that the excise duty be levied only in respect of the yarn manufactured out of the new stocks of cellulosic and non-cellulosic staple fibre on which excise duty will be paid at a reduced rate.

In a further teelgram, the Federation has welcomed the overall relief offered to staple fibre yarn of 20s count. It has, however, expressed its disappointment at the net result of the revised fibre yarn of counts 40 and 60. In 60s count made from 1.2 denier, according to it, there is no reduction in duty on staple fibre and the imposition of an excise duty on staple fibre and the imposition of an excise duty of 60 paise per kg. in regard to yarn, therefore, represents a straight forward new impost. This will cause hardship to users of yarn in this count group, particularly handloom weavers. The Federation has made a request that the new schedule of duties should be so revised that there is no net increased impost on staple fibre yarn in the higher count groups.

The distinct easiness noted in the art silk yarn section last week persisted during the week under review also following the reduction in excise duty and increased offerings from stockists. Staple fibre yarns, however, put on a cheerful appearance thanks to the resumption in futures trading and on increased offtake from Surat Weavers. Cotton yarns were dull.

Among art silk yarns, National Rayon 150D fell by 32P to Rs. 9.68. 120D dropped 13P to Rs. 10.32. Bright Century 120D declined by 11P to Rs. 12.54.

In staple fibre yarn section, the forward section 2×34 January 1965 contract commenced the trading on Friday at Rs. 851 per quintal and closed the week at Rs. 854. thus gaining Rs. 3 over the week. In spot, vasanta put on 8P to Rs. 9.06. Sitlaxmi gathered 13P to Rs. 955. Century gained 7P to Rs. 9.68.

The following table gives the prices of rayon staple fibre and cotton yarns, today, as compared with those prevailing a week ago:

	21-10-1964	13-10-1964
Art silk yarn (per kg.)—	Rs.	Rs.
National Rayon 120D	10 32	10 45
Century 75D	18 02	18 02
S. I. Viscose 120D	12.54	12.65
Staple fibre yarn (2×24 NF) January 1965 (per quintal)	847.00	—
Staple fibre yarn-2×34 *French Count* (per kg.)		
Kohinoor	—	9.81
Premier	9.81	9.55
City	9.55	—
Cotton yarn - French Count (Rs. per 5 kg.)		
8s Podar	21.50	20.75
17s Modern	27.00	26 00
22s Madura	32 00	32 00
34s Madura	43.00	43 00
52s Pioneer	68.75	68.75
68s Finlay	104.00	105.00

GOOD MEDIUM TEA FIRM

[*Messrs. Forbes, Ewart and Figgis (Private) Ltd.*]

COCHIN, 14*th October*

A total of 730,000 kgs. was offered in tea sale No. 41 held here on the 13th inst. Quality of teas from Nilgiris continued to be irregular, while that from other districts was fully maintained with few brighter invoices on offer. The market opened to strong demand which continued throughout the sale. Low mediums and mediums elicited strong enquiry and were irregularly dearer by 10 to 15 paise with more emphasis on brokens. Good mediums were also held strongly and these were sold at fully firm rates. There was useful support for highgrowns, but, these were sold at slightly easier rates. Highgrown fannings met better support than last week, but, here again, prices were a little lower. Unorthodox descriptions were sold readily, but inclined a little easier. Prices for F.Ps were firm on last while O.Ps came to a lower market. There was good support for a small selection of tippy teas on offer.

Quotations (per kg.) were:

	1964	1963
	Rs.	Rs.
Low mediums	4.20-4.75	4.20-4.65
Mediums	4.75-5.10	4.70-5.25
Good mediums	5.10-5.75	5.30-5.70
Nilgiri B.O.P.	5.25-6.80	5.10-8.00

The average price realised in sale No. 41 was Rs. 4.82 per kilo, as against Rs. 4.87 a week ago.

and Rs. 4.76 in the corresponding sale last year.

A total of 296,000 kgs. was on offer in dust sale No. 40 held today. There was good general demand at lower rates. Highgrowns met less support and declined in value, following quality. Good medium types were irregularly easier. Medium and low medium descriptions, meeting only fair demand, came to an irregular and slightly lower market. Clean black grainy kinds were weak and showed substantial declines. Fibrous residual sorts again came to an easier market. Unorthodox teas, especially primary grades, were easier.

The average prices realised in dust sale No. 40 was Rs. 4.41 a kilo, as against Rs. 4.37 a week ago and Rs. 4.52 in the corresponding sale last year

Colombo: Just over 5 million lbs. were offered this week. The market opened to stronger and more general demand than in previous weeks. The liquoring brokens were fully firm to 10 cents dearer while lowgrowns advanced by 5 cents. Fannings grades also shared in the general rise and advanced by 10 to 20 cents.

London: *North Indian and other growths*: In Monday's North Indian sale, there was strong general demand and best Assams were firm. Others were irregular and easier, following quality, while Dooars were firm to dearer.

Ceylon and South Indians: There was strong general demand in Tuesday's Ceylon and South Indian sale, with prices generally showing slight advance.

As we go to press, Messrs Forbes, Ewart and Figgis (Private) Ltd. wire us as follows:

"*Sale No.* 42: 841,000 kg. offered. Strong general demand. Low mediums and mediums stronger, sometimes 10 P to 20 P dearer. Good mediums fully firm, except fannings which were lower. Highgrowns easier. Unorthodox firm."

MODERATE CLEARANCE IN KIPS

(From Our Own Correspondent)

MADRAS, 19*th October*

Arrivals of stocks from the upcountry tanneries have been fair-sized and clearance from the market was moderate. Prices of light weight cowhides ruled firm and for other averages were weak, as export enquiries were mostly for 5/5½ lbs. Cow-calf and buffcalf were in moderate demand for export. A few sales of tanned buffcalf skins were made for shipment to Australia, for early shipment.

The market for tanned goat skins was steady. There was brisk demand for 8/9 lbs. average in which line tanners seem to be in a well sold position, and consequently offers were not freely available. Buyers on the Continent and the U.S.A. were interested in goat skins all weights but not at the prices offered by shippers here. Demand for mddle class sheep skins 6/7 lbs. was good and for others quiet. In view of the labour strike threat in the tanneries in north Arcot District, tanners have been reducing their soakings of raw stocks in the pits. Prices in the raw centres remain firm for goat skins and steady for sheep skins.

OILSEEDS BEARISH

(From Our Own Correspondent)

BOMBAY, 21*st October*

Oilseeds and oils suffered a sharp all-round decline in prices during the week under review on heavy bull liquidation following easy spot advices. Groundnuts led the decline and castor and linseeds were easy in sympathy. There was virtually no support forthcoming to groundnut futures and the disparity between spot and forward rates, which at one time was very wide, tended to narrow down. Market circles had been saying that, with the tendency being what it was in the spot section, there was scope for the two to come much nearer each other. In fact, the market was weak even on Wednesday last and, after touching Rs. 96.35, it reacted gradually to close at Rs. 95.20 at the end of the week. Sentiment in groundnuts was induced by heavy arrivals of Khandesh in the terminal centres, while the crop was said to be moving in full swing in Madras and Karnatak. And with the harvest being very satisfactory at an estimated 40 lakh tonnes, it was only natural that traders should have been eager to dispose of their stocks before prices declined further. At the time of writing, Khandesh quality spot was quoted at Rs. 106; no transactions were reported in the November and December deliveries. There was a time when the disparity between spot and future prices was around Rs. 100, but this was narrowed down considerably.

There is a strong feeling among trade circles that, sooner or later, the Gujarat Government will remove its ban on the exports from the State of groundnuts and groundnut oil as well as cakes. These argue that the ban cannot continue for long, particularly after forward trading in groundnuts new crop has been permitted. Further, seeds and oil prices are declining there and this has already led to considerable agitation on the part of growers and the trade. The feeling, therefore, is that the Gujarat Government will have to adjust its policies in such a way as not to offend the sentiment of the people of the State. Added to these is the very powerful factor of the ban on exports of edible oils from the country and it is very unlikely that the Government of India will relax its policy. Factors, therefore, are overwhelmingly in favour of a decline—a big decline. The outlook for oil is the same as that for seeds. Spot oil, which at one time had shot up to Rs. 3,300, is currently fetching Rs. 2,400, October Rs. 2,300, November Rs. 1,975, December Rs. 1,960 and January Rs. 1,875.

Another important factor in the outlook for groundnuts will be mustard. Informed sources think that the Government of India is unlikely to take up the question of groundnut oil exports from the country until such time as a clear picture of the mustard crop becomes available. Reports, however, indicate that the acreage this time has been larger by 30 per cent and, if the winter rain obliges, the harvest should touch 16 lakh to 17 lakh tonnes, as against a five-year average of 13 lakh tonnes and the actual outturn of 6.5 lakh tonnes last year. It is also talked about in the market that the Government may fix maximum ex-mill and retail selling prices for *vanaspati*. All these suggest that the scope for a rise in the quotation for the contract is rather slender and the reading is that it might be moving in the Rs. 100-Rs. 80 range.

The extractions market is also weak. Currently the spot price in Bombay is Rs. 430, while November is quoted at Rs. 400, December at Rs. 390, January at Rs. 385. Supplies of groundnut extractions will increase, as solvent extraction plants have already started working. On the other hand, demand is not sufficient enough to absorb the increase in supplies. The Continent and the United Kingdom are not active just at present and it remains to be seen how the winter demand will turn out to be. Communist countries have been our principal customers for quite some time, but latest reports indicate that they are not interested in big quantities just at present. Market reports are that about 1.5 lakh tonnes of extractions are committed for November-March deliveries, but, with adequate supplies, the market is likely to remain quiet.

It is true that groundnuts have induced to a very large extent the trend in castor. However, on its own merits, too, the castor market should be easy. Reports from trade sources aver that sowings are generally for a larger harvest except in Gujarat where last rains have had an adverse effect. It is rather premature to talk about crop estimates, but, by and large, the forecast is for a satisfactory harvest. Exports of castor oil in the current year have so far been to the tune of 23,000 tonnes and about 10,000 tonnes to 12,000 tonnes are expected to have contracted for shipments in the next two months. The market, in these circumstances, should be well maintained, but much depends on the Brazilian situation. It is said that Brazil has harvested a bumper crop and that it has been selling to communist countries at rates much cheaper than India's. The United Kingdom and the Continent are not interested in Indian oil just at present. Stocks of castor are very poor and this explains the comparatively steadier trend in ready prices of seeds although oils are easy.

Linseeds do not appear to have any trend of their own and is content with following the lead of other oilseeds. The long-term trend in linseeds will, however, depend to a considerable extent on the outlook for mustard stocks which at present are said to be small. But market circles are expecting a very good harvest in mustard and, if this turns out to be correct, then the outlook for linseeds will be rather bearish. Currently the March contract is quoted at Rs. 39.84. Export business at present is virtually *nil*. Cottonseeds are steady and the trend here depends on the cotton crop and the position in the other sections of the market.

The following table shows the closing prices of oilseeds and oils as on 21st October as compared with those of the two previous weeks:

	21-10-1964	13-10-1964	7-10-1964
Groundnuts	Rs.	Rs.	Rs
January 1965 contract	95.20	95.75	95.70
Oil January 1965	N.T.	19 20	18 50
Akash kolo	N.T.	N.T.	N.T.
Khandesh quality	106 00	133 00	136 00
Oil ex-mill	24 50	28.75	31.00
Oil Rly. Receipt	23.75	27.75	30.00
Castorseed			
March 1965	182 87	184 37	185.12
Ready Madras	83 50	83 00	84.00
Ready Kanpur	81 25	80.50	82 00
Oil B.S.S.	18 70	18 85	19.20
Oil commercial	17.80	17.85	18.30
Linseed			
March 1965	39.84	40.44	40.56
Bold ready	96 00	102.50	103 00
Linseed oil	20.80	21.50	21.50
Cottonseed			
January 1965 contract	102.00	101.25	102.50

N.B.—The quotation for groundnuts January 1965 contract is for 100 kg. The rates for spot groundnut and castor are for 100 kg. Castor and cottonseeds futures are quoted per 250 kg. while linseeds futures are quoted per 50 kg. Groundnut Oil January 1965 and all spot oils are quoted per 10 kg.

FOODGRAINS DECLINE

(From Our Own Correspondent)

HAPUR, 19*th October*

Bearish trend continued in foodgrains during the week under review and sizable losses were recorded in prices of cereals. Fall was in sympathy with sharp decline in maize prices, due to very heavy arrivals of around 50,000 maunds during the week. Arrivals were mostly from Madhya Pradesh, Punjab and Rajasthan. Preparation of land for *Rabi* sowings was in full swing and, thanks to sunny weather with westerly winds, all *Rabi* sowings even in the last waterlogged areas, would be in time by first week of November.

Slack buying enquiry at higher price levels and heavy arrivals of maize accounted for a downward trend in wheat and prices declined sharply by Rs. 7.50-Rs. 10 per quintal, according to quality. Average quality was quoted between Rs. 82.50 and Rs. 85 and farm produce between Rs. 85.50 and Rs. 87. Arrivals were reported better. Rice market also ruled easy as arrivals of new rice also mounted and prices eased by Rs. 2.50-Rs. 5 per quintal of all varieties. The Central Government and U.P. Government have announced the purchase price of wheat, rice and some coarse grains. This is to build up buffer stocks in U.P. Week-end prices were:—Rice *basmati* superior Rs. 120-Rs. 122; *sela* Rs. 155-Rs. 117.50; *mainpuri* Rs. 91.09; *ramajwayan* Rs. 103.77; raw Rs. 91.09; *raimunia* Rs. 102.50 and *gadda* Rs. 85.74 per quintal.

Among coarse grains, maize led the decline. It fell appreciably, by Rs. 20 per quintal to Rs. 42.57-Rs. 45. Barley and *bejhar* prices sought lower levels, having declined by Rs. 5 per quintal each to be quoted between Rs. 67.50 and Rs. 70 and between Rs. 67.50 and Rs. 70 respectively. Prices of *bajra*, *juwar* and *guwar* also drifted lower. Oats and other coarse grains ruled quiet. Gram prices were subdued on poor buying support. Prices moved down by Rs. 10 per quintal to be quoted between Rs. 80 and Rs. 81.50.

Easy trend was witnessed in pulses, and prices in all sections drifted lower due to poor buying at higher price levels. Peas lost Rs. 10 per quintal to be quoted between Rs. 70 and Rs. 72.50 for *dara* quality and between Rs. 73 and Rs. 75 for farm quality. Peas *dal* prices also eased to Rs. 72.50 per quintal. *Arhar* and its *dal* prices declined on poor demand. *Urd* prices ruled quiet, while *moong* prices eased on better arrivals from South. *Masoor* and other *dal* prices eased in sympathy with other *dals*. Week-end prices were:—*Arhar* Rs. 80-Rs. 86. *arhar dals* Rs. 114; *urd* Rs. 69.66-Rs. 75.02; *urd dal* Rs. 91.09; *moong* Rs. 100-Rs.103.77; *moong dal* Rs. 117.50; *masoor* Rs. 82.50-Rs. 87.50; *masoor dal* Rs. 110 and *gram dal* Rs. 91.09 per quintal.

"GUR" RECEDES

(From Our Own Correspondent)

HAPUR, 19*th October*

Sugar continued to be steadier during the week, thanks to increased festive demand in the face of poor supplies. Prices in the open market improved from Rs. 180 to Rs. 185 a quintal as against the controlled rates of Rs. 136 to Rs. 138. The Union Government, in order to encourage sugar production in the coming season, has announced two incentive measures to the industry. Firstly, the price of cane has been increased from Rs. 4.96 a quintal to Rs. 5.36, and secondly, a rebate of 50 per cent has been allowed in the basic excise duty of sugar produced in October-November 1964 in excess to the production in 1962.

Khandsari continued to be subdued during the week as, despite the festive season, offtake was very poor and stockists were reported as anxious sellers. Nervous conditions were in evidence in the *khandsari* market, due to non-receipt of import permits from the Punjab against the freezed stocks. With the new season round the corner, *khandsari* godowns were still packed to capacity. Only about 20 per cent of the stocks freezed some four and a half months back have been released and the State Government has declined to remove restrictions on export from U.P. until the prices come down to the level fixed for different varieties. Prices at week-end were Rs. 125 to Rs. 152 per quintal as against the fixed rate of Rs. 109.83 to Rs. 128.19. New production season would start in early December in mill reserved areas.

Ready new *gur* drifted lower, thanks to increased arrivals here as well as in the mofussil markets. Daily arrivals improved to an average of 2,000 to 2,500 maunds here, but entire arrivals were being readily lifted mostly to consuming areas of Gujarat, Saurashtra and other centres. *Gur* producers are busy these days with *rabi* crop sowings. *Gur* arrivals would increase early next month. Week-end prices (in rupees per 40 kilogram) were: *gur pansera* superior 37, inferior 31 to 34 and *shakker* 36 to 40.

In the Muzaffarnagar market, new *gur* sagged due to poor demand at higher price levels and increased new produce arrivals at different producing centres. It eased by Rs. 5 to Rs. 8 per 40 kilogram to be quoted at: *khurpapar* Rs. 38, *gur laddo* Rs. 37 to Rs. 39.50, *pansera* Rs. 31 to Rs. 37 and *shakker* Rs. 40 to Rs. 46.

• • • •

Information so far available on the 1964-65 crop season suggests that the increase in world agricultural production "may once again be on the small side" according to the F.A.O. Council on the current state of food and agriculture. The first tentative estimates suggested that wheat production in 1964-65 would be some five per cent above that in 1963-64. There was a recovery in Western Europe and things were even better in the Soviet Union, where the crop was expected to be above average. Eastern Europe, the Near East, northwest Africa and parts of the Far East would probably have smaller wheat crops. Increased production of wheat would, however, be partly offset by a fall in the output of coarse grains. Final rice harvests could not yet be estimated, but in a number of countries in the Far East—including Thailand, Indonesia, Japan, India good crops were forecast. More sugar might be available in 1964-65. The soya bean harvest in the U.S. would be a record, and Mainland China was reported to have more available for export. Both Nigeria and Senegal expected large groundnut crops. Copra, coconut oil and palm oil outputs might remain unchanged.

CALCUTTA REPORTS

This issue does not carry the usual weekly reviews of the Calcutta jute, tea and metal markets, in view of *Pooja* holidays.—ED.

BANKING

(*Concluded from page* 720)

for the criteria in licensing new bank branches should not be whether a commercial bank may or may not be allowed to enter a field where a cooperative bank exists; rather it should be the capacity of the centre to support the two banking institutions. Although the Reserve Bank Governor conceded the main point by promising to bear the existence of a cooperative bank in mind while considering the grant of a licence, he was blunt enough to declare that a cooperative bank cannot become fully a substitute for a commercial bank.

Prof. D. R. Gadgil, Chairman of the Maharashtra State Cooperative Bank, who presided over the Seminar. was the chief spokesman of the cooperative point of view. He was quick to respond to the Reserve Bank Governor's plea for making progressive bankers out of cooperatives on the side of lending too. Crop loan system followed by many cooperatives in Maharashtra is the answer to the Governor's plea for "productive programmes of lending," but Prof. Gadgil was not unaware of the two obvious weaknesses of the system, namely, the high and rising proportion of overdues and the failure to link credit with marketing. The ratio of overdues to outstanding advances in Maharashtra was 26.3 per cent in 1961-62 and 28.9 per cent in 1962-63: in some of the other States. it was as high as 85.1 per cent in Assam, 42.1 per cent in Bihar and 38.1 per cent in Rajasthan; for the country as a whole, it was 16 per cent. Prof. Gadgil's suggestion to convert all overdues into medium-term loans deserves careful consideration. but the high ratio of overdues suggests that borrowers treat loans from cooperatives more as a grant than as a debt to be repaid.

The Reserve Bank Governor again referred to the excellent achievements of urban cooperative banks in financing the programmes of development of small industries and urged the Apex and Central Cooperative Banks to extend their sphere of operations to include, in addition to rural and agricultural industries, the credit requirements of small industrialists in towns and cities. Prof. Gadgil, however, was critical of the attempts to force the pace. The Planning Commission, according to him, had tried to do so for cooperative credit expansion and insisted on a 100 per cent coverage, but all that could be achieved was to overstrain the movement in an attempt to reach the rising targets set before it.

The State Cooperative Banks and the District Central Cooperative Banks are the intermediaries for distribution of resources to primary societies which are responsible for individual loan transactions with hundreds of thousands of agricultural and rural borrowers. Each one of these three tiers has a vital function to fulfil in the chain of cooperative credit. Neither the Reserve Bank is in a position to dispense with the intermediary of Apex banks nor are the District Central banks in a position to dispense with the hundreds of primary societies which actually enter into lakhs of transactions at thousands of centres.

This three-tier structure of cooperative banking mechanism, as Prof. Gadgil pointed out. is able to provide short-term funds to the ultimate borrowers in the agricultural and rural sectors at about 7¾ to 8 per cent, and that this compares very favourably with the rates charged by any banks for loans with similar administrative burdens and costs. The money rates in the commercial banking field are almost similar. While the State Bank of India and some of the scheduled banks have been doing useful pioneering work in the rural and agricultural sectors, the cooperative banks also find that professional and part-time moneylenders are still in the field. They are, in fact, as important as at any other time, and the commercial and cooperative banks will have to evolve a sort of common partnership if they hope to free the rural economy from this dependence upon the moneylenders.

"BANK OF INDIA WEEKLY ECONOMIC SURVEY"

The Bank of India has come out with a new weekly publication entitled *Bank of India Weekly Economic Survey* (Editor: C. S. Krishnamurthi). In the course of a message to the inaugural issue, Mr. A. D. Shroff, Chairman of the Bank, has expressed the hope that the *Survey* would serve as a useful medium for enabling shareholders, customers (present and prospective) and the public in general to keep themselves in touch with the Bank. The *Survey* contains an article on monetary policy and economic growth, a digest of the week's financial news, market round-up and select economic indicators. Copies can be had from the Bank of India's Head Office at 70/80 Mahatma Gandhi Road, Bombay 1. Annual subscription is Rs. 5. Single copy, 10 paise.

THE OTHER CHINESE INVASION—II

(*Concluded from page* 729)

South Africa. Chinese purchased 80,000 bales of Uganda cotton during 1963. China bought no cotton from Uganda in 1962 but purchased 65,000 bales of Uganda cotton in 1961.

Of China's aid promises of Rs. 96 crores to African countries, a little less than Rs. 20 crores is said to have been utilised, according to estimates made by sources in Hongkong. China has entered into trade pacts with African countries envisaging a total trade turnover of between Rs. 60 and 70 crores but actual trading in 1962 was around a third of the amount envisaged in the pacts. Among goods which China supplies to African countries are light industrial articles like pots and pans, chinaware, cotton piecegoods, fans, sewing machines, radios. Cotton and foodgrains and non-ferrous ores comprise some of the important commodities China takes from Africa.

In the case of India, exports to Africa accounted for Rs. 50 crores worth in 1962-63 and Rs. 47 crores worth in 1963-64. Imports from African countries were valued at Rs. 56 crores in 1962-63 and Rs. 51 crores in 1963-64. India's exports to Africa add up to seven to eight per cent of the country's total exports. Nine or ten countries in Africa buy nearly 70 per cent of the Indian exports and 70 per cent of the exports are also in three commodities—tea, jute goods and cotton textiles. In the case of tea, competition for India is likely to come from within Africa where some countries have expanded production. Pakistan has already emerged as a keen competitor in jute goods sales to Africa; and Japan and China are both capable of further inroads in African markets for cotton textiles.

(*To be concluded*)

Notices

THE MYSORE KIRLOSKAR LIMITED

NOTICE

NOTICE IS HEREBY GIVEN THAT THE 23rd Annual General Meeting of the Company will be held on Saturday the 28th November, 1964. at 3-30 p.m. (I.S.T.) at the Registered Office of the Company at Harihar to transact the business, the details of which have been made known to the Shareholders separately by notice sent them individually.

A MEMBER entitled to attend and vote is entitled to appoint a proxy to attend and vote instead of himself and a proxy need not be a member of the Company.

The Share Transfer Books of the Company will remain closed from the 20th November, 1964 to 28th November, 1964 (both days inclusive).

By Order of the Board,

FOR THE MYSORE KIRLOSKAR LTD.,

V. K. BODAS,
Secretary.

P.O. YANTRAPUR,
HARIHAR.
Date: 23*rd September*, 1964.

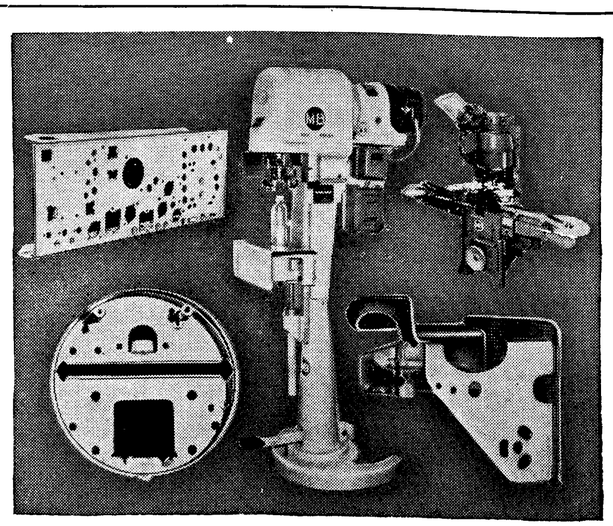
By Order of the Board,

MARTIN BURN LTD.,

F. G. LIVERSEDGE,
Managing Director,
Managing Agents.

Registered Office:
12, MISSION ROW,
CALCUTTA-1.
19*th October*, 1964.



Whatever will Metal Box think of next!

The objective—an all-out drive to save foreign exchange. The means—over 30 years' experience in precision drawing and forming of sheet metal. The result—a national saving of almost Rs 1 crore in foreign exchange with industrial components for the radio, automotive, electrical and ordnance industries...and can-closing and bottle-sealing equipment. All these components and machines were previously imported.

And alongside this effort the Metal Box Research Department is busy developing local substitutes for many imported packaging materials. Metal Box also earn foreign exchange by exporting annually some Rs 30 lakhs worth of packages and machinery.

Whatever will Metal Box think of next? More ways to earn and conserve foreign exchange, of course!

* Loans held entirely by the Trustees † Bombay State Transport

ABBREVIATIONS. N—Nominal. (*f*) Income-tax free. C—Held by Commissioners. D—Domestic Loan not marketable.
A—Held by Government of India. B—Taken up by State Bank of India.
††Rate of Interest reduced from 6 to 3 per cent with effect from 1st June 1944. ‡ Rate of Interest reduced from 4½ to 4 per cent with effect from 1st April 1956.
— Interest free for first 12 years. † — Interest free for first 7 years. Z—Ex Twelve instalments but inclusive of accrued interest.
M—At the option of the Government after three months' notice. K—On September 1956 or later at the option of the Government after three months' notice.
T—Liability taken over by Madhya Pradesh. ● Total amount invested in Gold Bonds up to 15th February 1963.

STOCK & SHARE QUOTATIONS

Abbreviations :—D.—Deferred shares. P. O.—Preferred Ordinary shares. Y.—Accounts published yearly. H.—Accounts published half-yearly. P.—Company has Preference shares. T.—Company has Debentures. N.—Nominal quotations. x.d.—Ex. Dividend. c.d.—Cum. Dividend. I.—Interim Dividend. C.R.—Cum. Right. XR.—Ex. Right.

Shares :—If a company has different classes of shares—as for example : 'A' shares and 'B' shares—these are indicated by the same letters 'A' and 'B' under the columns 'Paid-up Ordinary Capital' and 'Paid-up' per share.

Accounts :— Figures in the Accounts Closed column represent the months or the year in which the respective companies close their accounts, 6 and 12, for instance, indicate the months of June and December, respectively. Reserves include general and other reserves and all other funds which a company may have excluding depreciation fund, reserves for tax liability and provident fund. Block represents actual cost of land, buildings, machinery and all other items on which depreciation is allowed less sales, if any, and stands for the gross figures except where otherwise indicated.

Dividends :—Dividends for completed years are shown as amount per share per annum, but where quoted for portion of a year they represent the proportionate dividend for that period. In the case of those companies which close their accounts yearly dividends shown are for their financial year.

COMMERCE

"For Commerce, though the child of Agriculture, fosters his parent
Who else must sweat and toil and gain but scanty fare."
William Blake.

VOL. CIX. No. 2793 BOMBAY, 31st OCTOBER 1964 PRICE Rs. 2

N. D. C. ON FOURTH PLAN

THE overall size of a five-year plan, that is, its aggregate outlay, has always been a matter of controversy. It is so in the case of the fourth Plan, too, for which the Perspective Planning Division had originally envisaged an outlay of Rs. 22,000 crores in terms of 1960-61 prices. A much lower but more realistic size, involving an aggregate outlay of no more than Rs. 18,000 crores, it will be recalled, was canvassed early in May last by some sections of the Planning Commission and the Union Government. As a compromise, however, the figure of Rs. 20,000 crores in terms of 1960-61 prices was then adopted by the Commission as a "working basis" for the formulation of the fourth Plan. That the Commission has kept this compromise framework more or less intact is seen from its draft memorandum which has recommended a minimum outlay of Rs. 21,500 crores and, resources permitting, a maximum outlay of Rs. 22,500 crores—both figures being in terms of 1963-64 prices which, as reflected in the wholesale price index, were 10 per cent higher than those of 1960-61. As the Union Cabinet and the National Development Council have both endorsed the Planning Commission's memorandum, it may be supposed that there is an air of finality now about the size, strategy and objectives of the fourth Plan. But it is not really so, and it is upto the press, public and Parliament to take the debate on the Plan to a wider level.

It is, indeed, a pity that the National Development Council, while according its broad, albeit tentative, approval this week to the proposed size of the fourth Plan, has forgotten the Union Finance Minister's assessment in May last that the foreign exchange resources in prospect would not be appreciably more than what were available for the third Plan. At the then assumed level of foreign exchange availability —Rs. 3,200 crores, including the amount needed for servicing debts—it will be recalled, the general belief was that only a Plan of the size of Rs. 18,000 crores might be ultimately decided upon by the planners. The prospects for foreign aid even on that scale have since receded because of greater opposition in the United States to all aid, leadership changes in the Soviet Union and greater calls for help from a host of emerging countries round the world. That, in these circumstances, the N.D.C. should have thought it fit to endorse the proposed outlay of Rs. 21,500 crores (Rs. 14,500 crores in the public sector and Rs. 7,000 crores in the private sector covering agriculture, power, transport, village and small industries, mining and large industries, housing and inventories), with its foreign exchange component of Rs. 3,500-3,800 crores to cover the payments gap, is not an act of bravery but of mere bravado.

This show of courage in the face of current adversity—as reflected in the third Plan's stresses and strains, agricultural and industrial shortfalls, food and raw material shortages, high levels of unproductive but essential defence spending, and so on—is all the more unconvincing in the context of prospective realities. By far the most crucial of these realities will be the near-impossibility of garnering as much as Rs. 9,000 crores of foreign exchange (export earnings *plus* foreign aid) or, perhaps, more, so as to provide for other contingencies like imports of food and defence stores and equipment, price increases in exporting countries, and under-estimates of the foreign exchange components of projects. It would not be far wrong to say that, unless foreign exchange availability (from exports and aid together) can be assured at an average annual level of more than Rs. 2,000 crores over the fourth Plan period, the Plan, being so big in size, might be in for bigger and, consequently, graver difficulties than the second or the third Plan had ever faced. From the point of view of internal resources and their availability, too, the case for a smaller Plan is unassailable. Several discouraging factors may be noted in this connection. One is the persistence of inflationary trends which preclude both deficit financing and additional taxation beyond reasonable limits. Another is the proclaimed reluctance of State Governments to commit themselves to raising additional resources of the order of Rs. 2,500-3,000 crores in their sector. Yet another factor is that the certainty of expected or unsuspected surpluses emerging from better agricultural performance and the operations of public-sector enterprises cannot be taken for granted.

Viewed thus, the only realistic and practicable size for the fourth Plan would seem to be Rs. 18,000 crores in terms of 1963-64 prices on the twin basis of a cautious estimate of foreign exchange availability and a conservative estimate of possible internal resources. This can be treated as Part A, covering first-priority projects and programmes, while Part B, covering second-priority projects and programmes, can be of any size from Rs. 1,000 crores to Rs. 4,000 crores, depending on the availability of both external and internal resources. It would be better to adopt this approach to the fourth Plan at the stage of its formulation itself, instead of at a later stage in Plan implementation, as was done during the second Plan period after stresses, distortions and imbalances had developed. If, at the same time, quick-yielding projects like minor irrigation covering tanks and wells, intensive cultivation in irrigated areas, consumer industries, road transport, labour-intensive works programmes, and fuller utilisation of idle capacities in industries, of irrigation potentials created under major and medium projects and of other facilities developed by the Plans, are given priority treatment in Part A of the Plan, salutary results are bound to manifest themselves in two or three years' time in terms of unsuspected additional resources for development and of more plentiful supplies of wage-goods that could neutralise or reverse inflationary pressures, if any. Such results, incidentally, will greatly enhance the prospects of implementing Part B projects and programmes in the latter part of the fourth Plan period. It is, therefore, of the utmost importance that the private sector in both agriculture and industry be given the fullest scope and encouragement to produce more food, commercial crops and consumer goods by processing or manufacture. Incidentally, the public sector can have no legitimate or worthwhile role to play in these fields except to the extent of providing *infrastructure* facilities.

There can be no gainsaying that, from the point of view of the country's needs in terms of higher *per capita* income, additional employment opportunities and potential for future growth, an aggregate outlay of the order of Rs. 22,000 crores is quite reasonable. That it is the barest minimum required to ensure economic growth (that is, increase in real national income) at an average annual rate of six per cent, as compared with the scheduled (but unrealised) five per cent of the third Plan may be readily conceded. But a need-based Plan, by itself, would not mean much, except on paper, if internal and external resources cannot be mobilised on the scale required without subjecting the economy and the democratic policy to undue stresses and strains. Nor would financial resources, by themselves, ensure the full attainment of physical targets in a situation of ever-rising prices, administrative inefficiency, technical and technological deficiency, organisational inadequacy and other physical limitations. Hence the plea here for a feasible fourth Plan of the modest size mentioned earlier, with provision for later expansion in the light of achievements in the first two or three years of the Plan. It would be very good, indeed, if the sub-committee on resources, just set up by the N.D.C., were to reconsider the financial size of the Plan from this angle.

DISPERSAL OF INDUSTRIES IN MAHARASHTRA

GREATER Bombay alone accounts for two-thirds of the total industrial employment, three-fourths of the value of output and four-fifths of the value added by manufacture in Maharashtra. The rest of the State, with the exception of a few pockets like Poona, Sholapur, Nagpur, Thana and Ahmednagar, is backward in every respect. This imbalance in development has been, and continues to be, responsible for the vast movement of labour from rural to urban areas, especially to Bombay, in pursuit of jobs. Both the State Government and the business community are, therefore, thinking in terms of balanced industrial development, so that the State's underdeveloped regions (Marathwada, Vidarbha, Konkan, hilly areas like Mawal and Melghat and some scarcity areas) may have the benefit of planned progress. It is in pursuance of this objective that the Maharashtra Government has recently announced a series of concessions and incentives—over a dozen in number—to industrial enterpreneurs who intend to locate their enterprises in the hinterland of the present industrial centres and in the industrially backward regions of the State. And it is in pursuance of the same objective that the Maharashtra Economic Development Council—whose work is both complementary and supplementary to the work carried on by the various chambers of commerce in different regions—has held this week its Third Commercial

doubt the State Government and the business community are broadly agreed on the need for industrial dispersal. But they are not wholly agreed on the means towards that end. The State Chief Minister, Mr. V. P. Naik, for instance, thinks that sufficient *infrastructure* facilities and technical skills are being created, that finances for small and medium industries are assured, that the State Government has undertaken to participate in "joint-sector" projects and to underwrite capital issues in the sphere of large industry and that several other concessions and incentives have been recently announced—all in pursuance of the goal of industrial dispersal. In his view, these helpful measures and incentives are quite reasonable and sufficient and the State's industrialists should not, therefore, make further demands in the manner of politicians but make the best use of such concessions and facilities without putting forward any excuses. But the two leading representatives of industry—Mr. Naval H. Tata and Mr. S. L. Kirloskar—do not seem to be quite convinced that all that is humanly possible to do is being done.

Mr. Tata's view (*vide* his presidential address at the Conference) is that *dispersal of industries* (in the sense of moving some established industries out of Greater Bombay) is becoming exceedingly difficult for a variety of reasons. These are: (i) Prohibitive cost of building new factories; (ii) heavy standing charges incurred during the transfer from Bombay to other areas; (iii) heavy compensation payable to workers who lose their jobs in Bombay and reluctance of workers to continue working in the new location in preference to receipt of compensation; (iv) negation of possible benefit from sale of Bombay land owing to capital gains tax; and (v) non-availability of transport, electricity, water and amenities for workers, such as schools, markets and cultural centres in the new location. All these factors, according to Mr. Tata, have operated as disincentives to the dispersal of some Bombay industries to new locations. He is, however, convinced that, in order to relieve the pressure on Greater Bombay (with its already acute housing, water and traffic problems), *dispersal of industries* (in the sense of locating all *new* industries outside Bombay) should be encouraged as far as possible. It is in this context that he has strongly supported the idea of creating a satellite town in the mainland across Bombay Harbour, connecting it with the existing city by a long bridge. And he is confident, too, that half the land available in such a satellite town could be developed by the Government and the other half by industrialists. This is a constructive, though by no means novel, idea which certainly deserves to be pursued.

The stand taken by Mr. Kirloskar in his speech at the Conference is not substantially different from that of Mr. Tata. But it is somewhat different in its emphasis on some aspects. For instance, the incentives offered for new industries in underdeveloped regions, in the opinion of Mr. Kirloskar, fall short of the kind of tax concessions or subsidies given in Britain for the establishment of new industries in its depressed areas. Moreover, according to him, several other amenities (largely cultural and educational) available at present only in cities like Bombay and Poona would have to be created in new industrial areas so as to make them attractive not only to workers and middle class technicians but to businessmen as well. On the question of "decongesting" Bombay, Mr. Kirloskar's opinion is that, although the City is not large or congested by world standards, it would do well to grow vertically and construct bridges at suitable points across its creeks.

It would thus appear that the representatives of industry do not share the Government's optimism in regard to attracting large-scale industries to new locations. Their acceptance, in principle, of the need for industrial dispersal and diversification, however, augurs well for the future. From their present realisation to large-scale action, there will, of course, be a long way to go. In the meantime, the Government would be well advised to concentrate its activities in underdeveloped regions on intensive cultivation of food and commercial crops, establishment of small-scale agro-industries in both private and co-operative sectors, construction of new roads and development of road transport, and intensive exploration of mineral deposits. When the poorer areas of the State begin to develop in these fields, they are bound to attract large-scale industry in due course, even if no further incentives are offered.

W. GERMANY - SOME RANDOM IMPRESSIONS

By S. V. Rayan

REVISITING West Germany in the first half of this month after an interval of one year and talking to a wide range of official and non-official spokesmen, I found no diminution in the desire of both the public and private sectors in that country to help underdeveloped countries. Only a few days before my arrival in Germany, another industrial exhibition had been held in Berlin under the scheme of "partnership for progress." This year, the main guest countries were from Latin America. But the Asian countries, which were the principal guests last year, were also represented. All the expenses involved were borne by the German Government. India, too, participated in the exhibition for the second year in succession. Last year, the Indian stall had been poorly organised and left much to be desired. A wide variety of goods ranging from carpets to cashewnuts and from machine tools to models of Tata-Mercedez trucks had been displayed in a manner which was unattractive and lacking in imagination. Very little business was booked and what little transpired was mainly due to the enterprise of a German businessman. This year, however, India had learnt from its mistakes. It concentrated on a single product, namely, carpets and carpet backing material. The display, according to an official of the Berlin Industries Fair, was more imaginatively done and the number of orders booked was quite substantial.

The fact that Asian countries were given all facilities and financial assistance to display their manufacturing skill for the second time in succession is illustrative of Germany's desire to encourage imports from underdeveloped countries. The German delegates to the U.N. World Trade Conference in Geneva last year were on the whole helpful and evinced friendly interest in the proposals of underdeveloped countries. They readily agreed to the suggestion that economic aid to underdeveloped countries should be one per cent of the national income of developed countries and that this one per cent should be net of repayment of earlier obligations. Talks with the officials of the Federal Ministry of Economics at Bonn showed that the policy of German Government was to strive for the successful conclusion of Kennedy Round at G.A.T.T. which envisages a sharp all-round reduction in import duties in Europe, to keep down the list of exceptions and escape clauses as much as possible, and to defend the open-door policy in world trade conferences.

There are, of course, many instances of trade and fiscal policies in Germany which run counter to its declared objectives. So far as India is concerned, there are the quotas on imports of jute goods and cotton textiles. When the attention of officials was drawn to this contradiction between practice and profession, they frankly admitted of its existence, but added that the transition had to be effected smoothly, as sudden jolts to the domestic jute and apparel textile industries would create unnecessary political, as well as social, complications. In other words, they want to permit more imports without providing shocks to the economy as a whole, or to any particular section thereof. A point that emerged from the discussions on this subject was that, in the case of jute goods, in particular, the German Government was rather keen to extend the period of transition, as the jute mills there were yet to adapt themselves to the changing conditions by switching over to other activities. "We shall, however, provide for a progressive increase in import quotas," they added. So the quota system for jute goods will be retained for a longer period than India had bargained for.

Consumption of tea in West Germany is slowly rising, but requires to be pushed up through sustained, high pressure marketing campaigns and by opening tea centres in a number of German cities and industrial complexes. But the fiscal policy of German Government is still a deterrent to increasing tea consumption. Although imports of tea into Germany are not subject to any import duty, the consumption tax is pretty heavy. On a kilo of tea costing about ten rupees, this tax is as high as six rupees. It is strange that the Government of an affluent society, which Germans undoubtedly are, should subject a mild beverage like tea to such a high incidence of indirect tax. The Government of India, in co-operation with the Governments of Ceylon and Pakistan, should continue to press the German Government to reduce this internal duty on tea. The Germans contend that this duty is being continued as a revenue measure and that their Exchequer is reluctant to curtail its income. But it should not be difficult for the Exchequer to cover the loss of revenue arising from the abolition of consumption duty on tea by increasing the taxes on luxuries and consumer durables slightly. Surely, neither the consumers nor the manufacturers of these goods would mind a fractional increase in the taxes on these, if it is explained to them that this is necessary for helping the less-developed countries of the world.

There is good scope for expanding India's trade with Germany in a variety of consumer goods, particularly of specialised food articles, including cashewnuts and fish. But an essential condition for success is that quality must be high and uniform and the goods must be packed in attractive containers with contents adequately described in German language. It must be remembered, in this connection, that, due to shortage of workers, super-markets and department stores, with emphasis on self-service, are rapidly gaining in momentum. The buyers have, therefore, to be familiar with the goods stacked in the racks, so that they can be sure of their selections. In order to serve this purpose, it will be necessary to hold "India Week" in selected stores in all important cities, organise small exhibitions for groups of specified products, and establish trade centres as the Americans and others are doing. All these must, of course, supplement the usual modern methods of sales promotion. What is true of Germany is also true of the majority of Continental countries and the U.K. Consequently, any special efforts that we in India make to sell our consumer goods and food articles in Germany will be useful for Western Europe as a whole.

In discussions with Germans, officials and non-officials alike, on the prospects for investment of German private capital in India, one point was repeatedly stressed by them, namely, the need for a firm investment guarantee by the Government of India. It appeared to have become almost an obsession with them. It is, therefore, gratifying to find that the Governments of both India and Germany have since reached a satisfactory agreement on this important issue. Final notes were exchanged between the Indian Ambassador in Bonn and the State Secretary of the Foreign Office of Germany and the agreement guaranteeing protection to German investors was formally signed on 15th October 1964. The significance of the guarantee agreement and the history behind it merits a separate article and this will be done in a later issue. Suffice it to say that the most important feature of this agreement, which distinguishes it from the one signed with the U.S., is the provision for arbitration by a tribunal of three persons—one Indian, one German and a third party—of disputes pertaining to fair compensation in the event of nationalisation of private investments. In agreeing to accept arbitration, the Government of India has made an important departure in principle, but has demonstrated to German investors and German Parliament that India has no intention of saying one thing and doing another. The conclusion of this valuable agreement, on top of the double taxation agreement that already exists, has vastly improved the chances of obtaining German collaboration and capital for both large-scale and medium-scale industries. Accordingly, it augurs well for the success of private sector in the fourth Plan, other things remaining the same.

On the subject of future financial aid to India, the stress in German circles is more on private investment than on Government-to-Government credit. The general impression that one got was that India might get considerably less than it has had so far and that the aid would be more of a tied nature, that is, tied to specific projects. It is, however, too early to form any definite conclusions or take a pessimistic view. Much will depend on the international political situation, economic trends in Germany and Western Europe, and developments in world trade. After all, Germany has to sell its capital goods and India offers an excellent market with great potentialities for the future. The Government of India and the business community must play their cards skilfully and realistically. A high-powered business delegation consisting of leading industrialists and bankers is due to visit India in February next. It is for us to sell our ideas and impress upon them the soundness of our policies and programmes.

MARKET GOSSIP

An Ugly Situation Averted

AN ugly situation that would otherwise have developed in the city from Monday this week has happily been averted, following the timely intervention by Mr. V. P. Naik, Chief Minister of Maharashtra, and the spirit of accommodation exhibited by millowners. A section of the cotton mill workers, led by the Communists, had threatened an indefinite strike as a protest against the refusal of millowners to concede their demand for payment of bonus for the year 1963 before *Diwali*. The threat was unjustified and illegal. For the bonus dispute is before a conciliator and the proceedings are in progress. In spite of this, the Millowners' Association had asked the managements of mills to give advances equal to a month's basic wage to celebrate *Diwali*. It must be said to the credit of I.N.T.U.C. leaders that they strongly opposed the move of Communist-led workers and appealed to the entire workers to take the advance offered by the millowners rather than go on strike. But the Communists contended that bonus for any year should be paid within eight months in accordance with the Bonus Commission's recommendation which had been accepted by the Government. Since the two parties failed to reach an agreement and in his anxiety to avoid a strike, the Maharashtra Chief Minister spent quite a bit of his precious time in holding discussions with the representatives of millowners and labour leaders. After these discussions, he suggested the payment (before *Diwali*) of an interim bonus of 4 per cent of the total earnings of workers for 1963 pending a final settlement of the issue. The suggestion was accepted by both the parties. Agreeing with the verdict of Mr. Naik, the Millowners Association decided to give the workers the option to receive either the interim bonus or one month's salary in advance as preferred by the I.N.T.U.C.

It is a moot point whether the Communists' call for a strike would have been heeded had not Mr. Naik interfered. The I.N.T.U.C. leaders are of the view that Mr. Naik should have kept aloof, instead of hastening to save the face of Communists whose trade unions are not recognised as the most representative body. Perhaps, they are right. This is not the first time that Mr. Naik, in his understandable anxiety to preserve peace and maintain law and order, has compromised with the illegal and coercionary tactics of the leftists. It is significant that the vast majority of workers have followed the advice of I.N.T.U.C. and taken an advance, rather than accept Mr. Naik's compromise proposal.

Strike by mill workers, had it taken place, would have led to a sharp fall in production which the country could ill-afford in the difficult situation now prevailing. Just one day's closure of Bombay City mills means a production loss of about 4.5 million yards of cloth and 1.4 million lbs. of yarn. The Bombay City mills, it may be noted here, account for as much as 28 per cent of the all-India production of mill piecegoods. It is highly desirable to prevent any interruption in cloth production, for the stocks of cloth lying unsold with mills (as of end-September) aggregate no more than 214 million yards which are well below those (241 million yards) held a year before. It is, however, a matter for some satisfaction that there has been a notable expansion of mill cloth output, the quantity actually produced during the first nine months of 1964 being 3,793 million yards, as against the 3,626 million yards produced in the corresponding period of last year. A consistently high level of production ought to be maintained in view of the rising domestic demand and the exigency of earning the badly needed foreign exchange through exports. For ensuring such production, it is needless to say, a rational official textile policy envisaging a reasonable amount of freedom to mills to expand their capacity and output is imperative.

General de Gaulle Threatens Again

General de Gaulle has threatened again that France would leave the European Common Market, if the common agricultural policy were not implemented as foreseen. Lest the threat be construed as only a casual (personal) opinion, the French Minister for Information announced publicly after the Cabinet meeting on Wednesday (the 21st inst.) last week that the French Goverment emphasised its irrevocable determination to make the common agricultural policy the touchstone of European integration. Indeed, speaking more explicitly and without any ambiguity, he said: "There is no possibility of negotiating usefully with the U.S. so long as the European Economic Community, agriculture included, is not completely organised. These two problems are regarded as essential, and France will stand firm." So even the Kennedy Round is at stake. Apparently, the French Government wants to bring pressure on the Americans also, so that they might influence their German and other friends in the E.E.C. to be more accommodating to France.

A similar warning, it will be recalled, had been given by France by about the middle of December last when Gen. de Gaulle threatened nothing less than the dissolution of the Common Market, unless West Germany and other member-countries agreed to implement a common agricultural policy before the year 1963 was out. Since this threat came at a time when only a few days were left for the zero hour, there was wide consternation. The consternation was so great that it looked as though the fate of the Common Market was at stake. It was also feared that the proposed Kennedy Round of tariff negotiations under the auspices of the G.A.T.T. would be hampered. But, fortunately, the crisis was averted, thanks to the tentative agreement reached at the end of the marathon Ministerial talks at Brussels. The agreement was, of course, a largely symbolic one, because it did not seek to reconcile the conflicting interests among the Common Market countries, more precisely between France and West Germany; it merely indicated a time-table for the gradual implementation of the Common Market's agricultural policy and outlined broadly the Market's position in the Kennedy Round of tariff negotiations. It was then clearly stated that decisions on agriculture must be completed by 15th December 1964.

General de Gaulle now wants agreement on harmonisation of cereal prices before the target date. Obviously, he thinks that a reduction in the German cereal prices under the Commission's plan would provide new outlets for French surplus production which now seems to be rather heavy after another summer of heavy crops. The French farmers have also been demanding of their Government to do something more effective than hitherto. West Germany, however, does not appear to be quite prepared to adhere to the deadline. The problem confronting West Germany has been succinctly described by *The Financial Times* of London as follows:

"Professor Erhard . . . will not find it easy to yield to French demands. With an election now less than a year away, he must be aware that General de Gaulle is not the only man who can put pressure on him; Herr Rehwinkel, the German farmers' leader, disposes of some formidable weapons as well, all the more so since the Bavarian wing of the C.D.U. Government party and the Free Democrats are standing strongly by the agricultural producers. Moreover, Professor Erhard knows all too well that it is not only German agriculture and the Kennedy Round which are in question."

In spite of the renewed threat by France, West Germany is confident that the differences would be overcome. Replying to a question in the Bundestag (West German Parliament) on the very next day after General de Gaulle made the statement, Dr. Karl Carstens, West German acting Foreign Minister, is reported to have observed:

"The difficulties which have arisen concerning farm policy can be solved in the appropriate body of the E.E.C., taking into account both the spirit of the Rome Treaty and the interests of the national farming community. . . . The Rome Treaty contains no provision for any member to withdraw unilaterally. . . . In spite of General de Gaulle's threat, Bonn would press on with its plans for closer political cooperation among the Six. Bonn would honour its obligations under the Treaty."

Meanwhile, the European Economic Commission has proposed a number of measures designed to maintain the vitality and dynamism of the Common Market. The measures do not constitute a package deal, for the Commission is of the opinion that each individual suggestion must be examined separately. Briefly summed up, the measures suggested are:

Customs Union: The Commission considers that the time has now come to fix the date for completing the Customs Union and that this should be 1st January 1967. The Commission proposes that, on 1st January 1965, the member-States should again reduce total customs charges by 15 per cent in conformity with Article 14(4) of the Treaty. On this date, customs duties should be reduced for each product by at least 10 per cent in relation to the basic duty. However, the reduction may be limited to 5 per cent in certain special cases. On 1st January 1966, the member-States would again reduce total customs charges by 15 per cent. Customs duties would again be reduced for each product by at least 10 per cent in relation to the basic duty. On 1st January 1967, any remaining customs duties on industrial products would be abolished. As regards agricultural products—those which carry customs duties or "fixed components"—the speed-up provides for the abolition of these duties by 1st January 1968. The Commission will also submit in due course, if possible before 1st January 1966, and without prejudice to any other action which it considers appropriate, proposals concerning definition of origin; application of anti-dumping and compensatory duties; rules for the definition of customs value; elaboration of common arrangements for processing traffic; unification of national provisions concerning free entry on economic grounds, bonded warehouses and free ports; and the working out of a procedure for operating Community tariff quotas and of rules for the uniform application of the common customs tariff. The aim is free movement of goods between the member-States beginning in 1967.

Monetary Policy: The Commission considers that the aims set out in its Action Programme of October 1962 have become even more pressing and that they should be examined in the light of experience. The interpenetration of markets which has meanwhile come about between the member-States makes progress in the field of monetary policy increasingly urgent. The aim of the Community is not merely to expand trade between the member-States; it implies merging the six markets in a single internal market and the establishment of an economic union. It, therefore, appears indispensable to adapt the monetary policy of the Six to the degree of integration already attained in other fields. The Commission will submit without delay to the Council proposals for the progressive introduction of a monetary union. The Monetary Committee of the E.E.C. and its Committee of Governors of Central Banks will be consulted in advance on these proposals.

Social Policy: In the social field, the Commission places emphasis on two lines of action. As indicated in the Action Programme of October 1962, the Commission has concluded from the experience of the first years "that the Fund should not merely be an organisation for refunding member-States' expenditure on restraining schemes, but that it should also be in a position to encourage the various countries to initiate schemes and carry out experiments in this field; in this way the Fund could fully achieve its purpose. The second line of action is of a more general nature. The Commission wishes to call the attention of member-States to the need to intensify the close collaboration provided for by Article 118 with a view to levelling living and working conditions in an upward direction.

These proposals, however important they are, would simply be of no avail if, by any chance, the difference between France and West Germany were to deepen. What is worse, the failure to reach agreement on the common agricultural policy would greatly hamper the progress of the Kennedy Round tariff negotiations. These negotiations are of special significance to India and other developing countries which have all along been hoping that the negotiations would lead to an improvement in their exports to the developed countries. For the primary objectives of the Kennedy Round is a substantial cut in barriers to trade in both industrial and agricultural items. For his part, President Johnson of the U.S. has recently reaffirmed the commitment of his Administration to the "full and vigorous implementation of the Trade Expansion Act." This reassuring statement will doubtless be welcomed by one and all.

Reactions To Import Surcharge In U.K.

One of the steps which the new British Government has taken to eliminate the country's balance of payments deficit—estimated at between £700 million and £800 million for the current year—is the imposition of an immediate surcharge of 15 per cent on all imports of manufactured and semi-manufactured goods. These imports currently run at £1,350 million a year and the new levy is expected to bring them down by nearly £200 million. Broadly, the average of Britain's external tariff on manufactures has been doubled by this measure—from 15 per cent to 30 per cent—and it will affect 56 per cent of the country's imports from the E.E.C., 48 per cent from the U.S., 36 per cent from E.F.T.A. and 13 per cent from the Commonwealth. Although the measure has been stated as "essentially temporary and will be reduced as soon as the balance of payments situation permits and it will be abolished at the earliest opportunity," all the coun-

tries affected have doubts about the force of this statement and there have been wide reactions.

Practically all the international trade agreements contain escape clauses which allow even a developed country in balance of payments difficulties to impose quantitative restrictions on imports. But there is no elaborate international machinery in existence to enforce this measure and the steps permitted under the agreements and rules take considerable time to show results. There is, however, no agreement, including the G.A.T.T., which allows an across-the-board increase in tariffs on a wide category of goods. Viewed against this background, the imposition of a surcharge is not in accord with Britain's international obligations. A precedent for the British action, however, exists in the imposition of import surcharge by Canada in June 1962. The Canadian Government then asked the G.A.T.T. to waive its action as a special case, on the ground that the surcharges were necessary and temporary and would be removed as soon as possible. (Britain's circumstances and assurances are closely identical to those of Canada two years back). In spite of Canada being able to get general support for its measure from the I.M.F., the G.A.T.T. did not issue a waiver. In November 1962, the contracting parties of the G.A.T.T. "regretted that the Government of Canada should have found it necessary to impose temporary measures, inconsistent with Article 2 of the G.A.T.T." But, by the time the G.A.T.T. undertook a thorough examination of Canada's surcharges, they were already reduced and subsequently withdrawn in April 1963. Thus they lasted only nine months and the G.A.T.T. was able to have its say to change the decision by the Canadian Government. In case of Britain, the issue is even more complicated, for a considerable amount of funds is available to the country, virtually automatically, from the I.M.F. The British Government has not availed itself of this facility. Nor does it appear to have consulted the I.M.F. before taking the action. Accordingly, the I.M.F. is not likely to back the British measure, as it did in the case of Canada.

Britain will thus be called upon to explain its position and justify the surcharge to other contracting parties of the G.A.T.T. at the meeting of the Council which opened at Geneva this week. The defence arguments of Britain are almost identical to those put forward by Canada in 1962 and it remains to be seen whether they will carry weight with the G.A.T.T. this time, though they had failed in the case of Canada. Surely the new British Government will have to do a lot of explaining.

Britain being a member of E.F.T.A., the other member-countries of E.F.T.A. are very much perturbed by this sudden measure put into force without consultation with them. The measure has been described as an extremely serious blow and most depressing. Although the E.F.T.A. Secretariat has not made any statement so far regarding its attitude towards the surcharge, it has been decided to discuss it at the meeting of the Ministerial Council fixed for 19th and 20th November. Britain is likely to have a very tough time at this meeting, especially as, under the accelerated tariff-cutting time-table, all members were due to reduce their tariffs by a further 10 per cent of their starting level at the end of the year. Commenting on the British measure, the Foreign Affairs Minister of Denmark termed it as "directly against the spirit of E.F.T.A. agreement that exactly aims at a removal of obstacles to free trade" and the Chairman of the Federation of Danish Industries pointed out that many other member-countries face similar balance of payments difficulties as Britain and, if all of them were provoked to adopt similar measures, the E.F.T.A. co-operation would be in danger.

As already stated, 56 per cent of Britain's imports from the E.E.C. will be affected by the imposition of surcharge, and the proportion will be as high as 95 per cent in the case of Belgium. As a result, the exports of E.E.C. to Britain are likely to be considerably reduced. The news has, therefore, thrown the Six into a turmoil. In Belgium, the British Government's action has been described as "half a devaluation, and the worst half at that." The Belgian Trade Minister, Mr. Maurice Brasseur, has accused the British Government of failing to consult others before taking the decision and said that "we must not forget that everything pertaining to the pound sterling—a key currency—is of interest to the whole world." West Germany, which has been consistently championing the cause of Britain in the Common Market counsel's, is also reported to have taken a serious view of the British Government's emergency action.

The effect on the exports of the Commonwealth countries, in general, is not likely to be very serious, as their exports to Britain mainly relate to food articles and raw materials. The Australian Minister of Trade, for example, has stated that "it appears that the bulk of Australian exports to Britain will be exempt from payment of new duties." Moreover, almost all the Commonwealth countries, which are within the sterling area, feel that the measure may help them indirectly by giving strength to the pound sterling. It is also being felt that, if Britain had been forced to devalue the sterling as a measure to tide over the balance of payments deficit, the effects on the economies of these countries would have been more serious. So far as India is concerned, however, the impact of surcharge is likely to be pretty serious, as has been explained in a separate article on page 762 of this issue.

The U.S. Government has given a tacit approval to the British Government's new policy, in spite of the fact that it will affect almost half of U.S. exports to Britain. The U.S. Treasury noted in its statement that "the import charges will, for a time, have a moderately adverse effect on our trade as well as upon that of other countries, but there is no painless corrective, either for the U.K. or for the rest of the world," and emphasised that "the U.S. welcomes the British determination to reduce and remove these import charges at the earliest opportunity." Evidently, the U.S. Government regards the alternatives open to the British Government, such as an increase in the Bank Rate, imposition of import quotas and introduction of exchange controls to correct the disequilibrium in the balance of payments, more harmful than the step now taken.

From the point of view of the underdeveloped countries as a whole, which have based their hopes on world-wide reduction in import duties on the basis of the Kennedy Round of Geneva negotiations, the surcharge will have a drastic and long-lasting effect. Though Britain, which is an important supporter of the reduction in import duties, will continue to press its point of view for maximum reduction in import duties, the force of its statements may be considerably less than before. The fate of the Kennedy Round, already in doubt, thanks to the attitude of France, is rendered even more doubtful following the latest action of Britain.

Tax Reductions In U.S.

Described by late President Kennedy as "an insurance for prosperity and an insurance against recession" and hailed by President Johnson as "the single most important step to strengthen U.S. economy since World War II," the tax reduction measures, introduced in March last, have already had their favourable impact on the economy. It is only the first stage of the tax relief programme, envisaging a cut of two-thirds in the rates of taxation, that is being implemented; the remaining one-third cut will be enforced in 1965. The benefit accruing from the tax cuts is now said to be much more than what had been anticipated before. Thus, speaking at Washington on the 25th inst., Mr. Douglas Dillon, U.S. Treasury Secretary, stated that, whereas at the time the Tax Bill was enacted, it had been reckoned that the addition to the total individual and corporate incomes accruing from the tax reductions would amount to only $11,500 million, new estimates, which also took into account the expected increase in 1965 income levels (as compared with those prevailing when the Tax Bill was originally drafted in 1963) placed the overall increase in incomes at $14,000 million. Indeed, Mr. Dillon claimed that the response of the economy to the 1964 tax cut had been excellent and there was every indication that it would continue in 1965. That there is no exaggeration whatever in this claim is borne out by the latest available data released by the U.S. Department of Commerce. The data reveal that the total disposable personal income in the U.S. economy has increased from $419,500 million in the first quarter of 1964 to $431.300 million in the second quarter, a rise of 2.8 per cent (the quarterly data are seasonally adjusted totals at annual rates); the rise in the corresponding quarter of last year was only 1.2 per cent. In 1963, the entire increase in disposable income was consumed, for the total consumption expenditure showed a corresponding absolute increase of $4.700 million from $367,400 million in the first quarter of 1963 to $372,100 million in the second quarter, with savings unchanged at $27,100 million. But the position since tax reduction has been entirely different. Although the total consumption expenditure rose from $390,000 million in the first quarter of 1964 to $396,100 million in the second quarter, personal savings also have increased appreciably by as much as 19.3 per cent, from $29,500 million to $35,200 million.

The "conservative" fears expressed earlier that the release of additional income would add to inflation by placing more purchasing power in the hands of taxpayers have thus not proved correct, at any rate for the present. The rise in income has flown into saving channels which strengthens the case for further tax reductions. Actually, Mr. Dillon has stated that, together with the excise tax reductions the Administration will seek next year, personal income-tax adjustments should provide a continuing strong and healthy stimulus to consumer purchasing power. President Johnson, too, has assured the U.S. electorate that, in case he is re-elected to office, his Administration would propose further "carefully timed" tax reductions to maintain the health of the economy and to safeguard against recession. The eventual tax reduction proposals which are already under consideration include, it is said, provision for repeal of major taxes charged at the retail level, namely, on cosmetics, furs, jewellery and leather goods.

BANK OF INDIA'S CREDIT-DEPOSIT RATIO

In our article on the net liquidity position of banks appearing on page 684 of *Commerce* dated 17th October 1964, we had stated that a bank like the Bank of India with an over-extended position might find that it could not afford to borrow at all from the Reserve Bank of India. Apropos this observation, Mr. T. D. Kansara, General Manager of the Bank of India Ltd., in a communication addressed to us, says:

"The statement is incorrect, inasmuch as the Bank of India credit-deposit ratio is very much in line with the average ratio of all scheduled banks, excluding the State Bank of India, and the Bank of India is in a position to borrow a fairly large amount at the Bank rate from the Reserve Bank of India in terms of the net liquidity ratio formula."

The Managing Agency System might be abolished in the well-established industries from the middle of next year. This was indicated by Mr. T. T. Krishnamachari, Union Minister for Finance, while inaugurating a two-day conference of Regional Directors and Registrars of Companies at New Delhi on Tuesday this week. A number of proposals for the renewal of managing agency would come up for Government's consideration in the first half of 1965 and the Finance Minister asked the Company Law Board to consider them and find out whether the system could be gradually abolished sectorwise in the well-established industries.

TREND OF SHARES

DOWNWARD DRIFT AGAIN

(From Our Own Correspondent)

BOMBAY, 29*th October*

INDUSTRIALS failed to maintain their early show of steadiness during the week and the tendency for prices was again to drift downwards, thereby accentuating the present reactionary phase. Losses, however, were not big, though the trading pattern indicated that the market was absolutely lacking in strength. The damage might have been serious but for the strength in steel shares. In hectic activity, steel shares were bid up to higher levels under the lead of Indian Iron which touched Rs. 26.50 during the week and Tata Ordinary was quoted around Rs. 151. There was no particular factor as such warranting support for steel shares; the rise was due to speculative buying by Calcutta operators. Towards the close of the week, however, the shares tended to sag. In this process, Indian Iron was quoted at Rs. 25.60, as against Rs. 25.05 a week before, and Tata Steel at Rs. 147.50, as against Rs. 147.

National Rayon dominated the scene even more than steel shares. The share was initially in the grip of a bull syndicate and in a terrific buying spree was bid up to Rs. 375.50. Thereafter, its fall was as precipitous as its rise had been spectacular and, on Thursday, the shares had been done down to Rs. 352, its lowest level of the week and the lowest for quite a long time, following the reported break-up of the syndicate. It lost nearly 16 points on balance at the week's closing level of Rs. 353.50. Century came in for some very hard hitting on reports that the Company was contemplating a cut in its tyre cord output and that there would be a possible lay-off of the labour staff. Thanks to support at lower levels, the scrip managed to close with just a small loss at its ex-dividend quotation of Rs. 600 (dividend Rs. 11.20), as against its cum-dividend price of Rs. 615.50 in the previous week. Other members of the textile group were generally weak with Standard having lost six points to Rs. 606. Kohinoor and Svadeshi finished with fractional losses at Rs. 316 and Rs. 261.50, respectively.

More important than the actual fall in the quotations of shares was the feeling of nervousness which pervaded the stock exchange. The hangover of the recent atomic explosion by China was still there and the market had not been able yet to shake off the anxiety created by the food situation. On top of this came the Prime Minister's statement hinting at the take over by the Government of consumer industries, as well as his suggestion for an ordinance to bring profiteers to book, including summary trial of offenders. No one denies the patriotic motives with which the Prime Minister is actuated, but the stock market has its own way of looking at things. Sentiment was also disturbed by the Finance Minister's suggestion for a gradual abolition of the managing agency system as well as a rise in the tax structure at State levels. With this the market almost gave up hope of any relief and thought that, on the other hand, the country might be called upon to get ready for a fresh dose of taxation. Rising taxation is hardly conducive to strength in the stock market. The decision of the British Government to charge a 15 per cent duty on imports into Britain was taken as a bear factor, for it would certainly affect our exports to that country and in turn our foreign exchange earnings.

Miscellaneous issues followed the general trend. Premier Construction was beaten down from Rs. 188.25 to Rs. 185.50 and Indian Dyestuff lost four points to Rs. 281. Telco, however, was well maintained, showing a modest gain at the week's closing level of Rs. 263, but Voltas was slightly shaded at Rs. 263.50. Among automobiles, Hindustan Motor was well held at Rs. 16.56 *ex-div.* but Premier Auto closed on a slightly easy note at Rs. 102.25 presumably because of the delay in the announcement of the dividend. After being dull for a few weeks, electricity shares attracted buying, and Tata Power improved from Rs. 1,285 to Rs. 1,297.50. The rise in other shares was moderate. Among shippings, Scindia eased from Rs. 15.88 to Rs. 15.72. The rise of almost 50 per cent in the dividend on Great Eastern Shipping failed to enthuse the market and, in fact, the scrip closed the week with a loss of 23 p at Rs. 12.28. It appears that those who were looking for a higher dividend had already bought well in advance of the actual announcement and, when the news came, there were more sellers than buyers. Sugar shares were steady to quiet. While Belapur remained unchanged at Rs. 223, others in the section showed small losses. The slump in National Rayon did induce some hesitancy in other rayons though the actual decline in their quotations was not much. Tyre shares were virtually neglected. Among chemicals, Tata Chemicals were easy at Rs. 18.96, as against the previous week's level of Rs. 19.28. This was to be expected, as all favourable factors have now been discounted. Dharamsi was steady at Rs. 117.50, but Synthetics lost a further two points to be quoted at Rs. 73. Cash shares were extremely dull and transactions even in selected counters were few and far between. A notable feature, however, was the spurt in T. Maneklal from Rs. 497.50 to Rs. 540.

As has been mentioned in this column since quite some time, factors at present are overwhelmingly bearish and the chances of a reversal of the present tendency seem rather slender. In view of the fact that the market has been falling right from 2nd September, there might be a rally, but as things stand today, these rallies cannot be anything but technical. The market needs some very strong bull factors to hold it up and set it on its feet, but, the political and economic situation in the country being what it is, these factors may not be forthcoming in the way the market would want them. If they come, well, it is a different matter. A tired market now awaits the Budget, though it has no illusions about it.

MECHANISATION AND AUTOMATION IN BANKING AND INSURANCE

PIONEERING EFFORTS OF L.I.C. AND S.B.I.

THE simple and largely unnoticed announcement regarding introduction of electronic data processing computers by the State Bank of India about six months ago has now been followed by a determined and firm move by the Life Insurance Corporation to introduce computers in its Bombay and Calcutta offices. Both in the State Bank of India and the Life Insurance Corporation of India the guiding principle behind the mechanisation of some of the work is to provide better banking and efficient insurance services to the public. The original proposal of the State Bank was a modest one—to use the computer for reconciliation and adjustments in the accounting of inter-bank transactions: the progress made so far in acquiring the computer or in specifying the exact scope and extent of its operations is not yet known. The absence of any sharp reactions from the employees or the customers of the State Bank of India indicates that the proposal is still at a very preliminary stage.

In the case of Life Insurance Corporation of India, the plans to install electronic computers appear to be on a much more ambitious scale, covering various operations of the administrative and executive departments as well as the policyholders' servicing departments. In fact, the whole purpose behind the introduction of a computer in L.I.C. seems to be to open a way for a break-through into a large and sudden expansion of business.

While the L.I.C. employees recognise the role of computers in reducing costs, improving productivity and bettering service through administrative reorganisation and rationalisation of accounting procedures, etc., their opposition to the computers rests on four main grounds. They fear displacement of men by machines. During the eight years of its existence, the L.I.C. staff has risen from 19,000 to 50,000 and it is feared by the employees that installation of computers may render at least half of them redundant. Their second ground is that people who have been doing particular jobs for years at certain places, may be forced to work at different places and in newer jobs. Their third ground is a possible reduction in future employment potential: this concerns the number of newer jobs that will never come into being, for, on the one hand, the computer will have surplus capacity and, on the other hand, the manpower rendered surplus will continue to be absorbed against fresh vacancies for a fairly long period. Their last argument is that in the underdeveloped economy of India, having a large mass of unemployed and underemployed people, the emphasis should be more on labour-intensive methods than on the capital-intensive techniques.

Effect on Employment

It is, however, hard to justify the opposition of L.I.C. employees to computers on any of the grounds, whether of employment or expediency, whether of displacement or dislocation. The Chairman of the L.I.C. has already given an absolute and unqualified assurance that, in spite of all rationalisation, there will be no retrenchment under any circumstances. There is bound to be some dislocation or rather a change of location from the point of view of an individual employee, but this will be more a result of administrative reforms following the introduction of computers than a direct result of automation. Moreover, in many individual cases, the change in the nature of job will involve better and more useful, and perhaps better paying job. The change will be from dull repetitions and voluminous mass of a job to one involving more intelligence, use of initiative, judgment and discretion. The complaint regarding the loss of future employment potential does not directly concern the relations between L.I.C. and its existing employees, but, even if it did, it is totally unjustified. The conception of L.I.C. in introducing computers is to break new ground where old systems cannot work, and to expand its activities. The effect of installing computers has most aptly been described as expansionist, not restrictive.

The severe indictment of the quality of service rendered by L.I.C. by the Calcutta Policyholders' Association last year, served to focus attention on the difficulties of performing large mass of voluminous routine and repetitive processes manually. A stage has come when no further progress and expansion would be possible except through automation. On the issue of labour-intensive investments *versus* capital-intensive projects, the L.I.C. employees have quoted the third Plan report as well as the International Labour Conference and have argued that introduction of computers will be contrary to national interest. In a way, this displays a total lack of perspective. The 150 per cent increase in the labour force of L.I.C. at a time when its premium income has risen hardly by 100 per cent, represents not an inconsiderable financial burden upon the policyholders, reflected in a high and still rising expense ratio in the accounts of L.I.C. The national objective of providing maximum employment and promoting economic development with the least amount of capital cost could hardly be served by perpetuating an inefficient system of top-heavy administration. The arguments against automation on the ground that it would result in unemployment are old and completely irrelevant; what is more pertinent and relevant to the current problems is the level of costs of a new technique to the community. The costs that are relevant here are not merely the capital and maintenance costs of computers, nor merely the social costs of potential underemployment which may be large, but also the overall cost of inefficiency to the consumer and the society, which are larger still.

Automation in Banking

The problem of a computer age in banking is not on the same footing as in insurance, for, firstly, there is no bank, not even the State Bank of India, which is as large as the L.I.C. and which has the same problems of zonal and divisional administration and accounting as the L.I.C.; and, secondly, personal contact and confidence over the counter and across the table between the banker and customer, whose transactions have a daily frequency, are far more important in banking than in insurance where the frequency of contact may range from once a month to once a year.

Nevertheless, there is no doubt that the solution to the increasing flood of paper work and volume of other routine operations in banks (as in other branches of economic life) lies in automation. The sight of bank clerks totalling page after page of ledger accounts and day books and handling cheque after cheque individually, both in the clearing house and in the accounts departments of banks, in 1964, is an anachronism.

Recalling the experience of the First National City Bank in America, Mr. R. E. Grant, Vice-President of the Bank in charge of its Indian branches, said recently that the Bank has never had occasion to regret its computer innovation. The volume of cheques, manually unmanageable, are now well within the capacity of electronic data processing machines. But the measure of a computer's usefulness is not tested merely by its capacity to handle and manage impossible volumes of work, but also on its ability to prospect fresh business developments and additional customer services. The resulting economies of scale from increased utilisation of the electronic data processing machinery are self-evident. Moreover, the Bank, as he pointed out, foresees a time when the computer may resolve senior management decisions regarding the location of new branches and thus assist the management. They may also provide banks with more precise and probably more efficient machinery for assisting in management of financial portfolios. The point he makes is that pitfalls of computers must be avoided while enjoying its fruits. Referring to Indian conditions, he points out that a 110 per cent increase in cheque clearances over the past thirteen years gives an indication of further growth in which computers may have to be called in service, even though two-thirds of the money supply may be outside the banking system. Introduction of the computer may not result in the displacement of labour, for the surplus staff could easily be absorbed in extending banking services to unbanked or underbanked towns or in providing new services. It may also create additional employment opportunities in the night shifts, so essential for the running of computers, as well as in the middle and junior executive levels. The computers will further release individuals from the drudgery of bookkeeping and entry-passing to fill posts of greater interest and promise.

State Bank's Scheme

As already pointed out earlier in the article, the State Bank's interest in computers is a modest one. Its intention is described as a pragmatic approach of using the computer only for those specific tasks which cannot be manually performed or effectively undertaken, such as the clearing of cheques or reconciliation of inter-bank transactions. Obviously, the use of computers for operational research (a field in which a lot of work is yet to be done in India) or for economic analysis of trends and prospects, may introduce new possibilities and additional scope for increased business, may bring much wanted speed and efficiency in banking transactions with the public and in ledger accounting, and add tremendously to employment potentialities. Nothing is known at all about the State Bank's thinking on the various problems involved in the introduction of computers, but this much is certain, that it intends to experiment with the introduction of computer to tackle difficulties of administering over 1,500 branches through several local head offices and increasing volume of inter-branch accounting.

It is possible to ask the question as to how far it will be a practicable proposition to have a costly computer only for a limited purpose: ordinary commonsense will suggest that a computer is worthwhile only if its overheads are spread over a much larger field of volume of operations. In fact, even in the U.S. and the U.K., banks, which have large spheres of their operations covered by electronic data processing equipment, still find it necessary to recover their costs by selling spare computer time and capacity to other firms and customers. But it may not at all be necessary to ask and answer this question, if we raise a far more fundamental question: whether banks should at all go in for computers and other electronic data processing equipment.

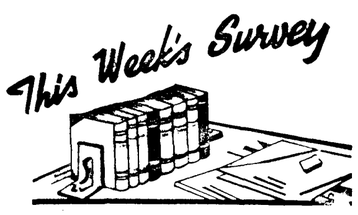
Simple Mechanisation

Let us be very clear on what is at stake. The need for mechanisation of banking operations is urgent and imperative, and we are not questioning it, but to talk of computers and electronics, when banks do not even have a sufficient number of ordinary adding calculating and listing machines, may be as much of an anachronism as the manual summation of day books etc. No doubt many banks today have adding, listing and calculating machines and comptometers, exchange calculators, etc. The branches of the First National City Bank of New York in Bombay and Calcutta were far more mechanised thirty years ago than many of the Indian banks are even today. But largely, the progress towards mechanisation has been slow and halting. Adding, listing or calculating machines have been introduced only under the force of circumstances. There were times within our memory, nay, there are several banks even now, when banks used to prepare their clearing lists in manuscript; those who have equipped their clearing departments with machines, did so only when they found that they were unable to cope with the sheer physical pressure of keeping to the clearing time schedules. Beyond this simple mechanisation, no much progress has been made. Nor is there any indication that banks are doing any advance planning to go further.

Most of the banks are, however, alive to the need for, and importance of, mechanisation in their operations to a larger degree than now. Their associations have for long been asking for import licences for purchasing their requirements abroad. But the shortage of foreign exchange has stood in their way. Insistent pressure from the associations of banks have elicited the reply from the Government that they have given licences to four firms for manufacturing calculating machines, etc. in India; but only one of them has so far come to the market for raising capital, and one does not know how long it will take to go into production on a significant scale. The progress of others is not yet known. It may take at least four to five years before the machines come to the market. Meanwhile, the banks have to carry on in the same old irritating and time-consuming ways. A Government which has hardly any foreign exchange for banks' requirements of calculating machines, can scarcely be expected to sanction purchases of computers for them.

Secondly, even if the Government were to sanction import of computers, none of the

(Continued on page 789)



U.K.'S EMERGENCY ECONOMIC POLICY

THE first task to which the Labour Government in Britain has addressed itself in right earnest pertains to economic problems. On Monday this week, the Government spelt out the elements of what it called an "emergency economic policy" designed to solve the most formidable problem which it inherited from the Conservative Government, namely, deteriorating balance of payments. Forming part of this policy is the drastic curb on imports through the imposition, with immediate effect, of a surcharge of 15 per cent on all imports with the exception of foodstuffs like tea, unmanufactured tobacco, and basic raw materials such as raw jute and cotton. Simultaneously, the Labour Government has announced an export incentive scheme estimated to cost the Exchequer about £70 million annually. The scheme, the details of which are being worked out, provides for the grant of a rebate in indirect taxation to those who export goods of various broad industrial categories; the rebate is expected to average about one and a half per cent of the value of exported goods. The three other export measures announced by the Government relate to: (*a*) creation of a Commonwealth Exports Council; (*b*) improvement of export credit facilities; and (*c*) review of other means of helping exporters, particularly by organising co-operative selling arrangements overseas to assist small firms play a part in the export drive. Besides the aforesaid import and export steps, the Labour Government has stated that it will:

create a price review body,

take steps to make it easier for workers to change their jobs in step with the needs of technological progress,

consult both sides of industry on the outlines of a plan to increase productivity and work towards an effective incomes policy linked to productivity,

hold necessary consultations with the International Monetary Fund on the use by the British Government of its drawing rights, and

carry out a strict review of all its spending to relieve the strain on balance of payments; the French Government has already been informed about its wish to re-examine urgently the Concorde project.

The aforesaid measures signify the Labour Government's determination to set right the "profoundly unsatisfactory"—this is the term used in the official statement—economic situation. That the British economy has been subjected to certain stresses and strains for quite some time now is well known. There has been no serious inflation as such, with retail prices as of September last having gone up by only 4.3 per cent over the previous twelve months and export prices by 3 per cent. But there has been a steady increase in imports of manufactured goods of all sorts and the trade deficit has been progressively rising. The overall payments deficit in the current year is expected to be no less than £700-800 million. It is not surprising, therefore, that the pound sterling continues to be subjected to pressure. The spot rate for sterling *vis-a-vis* the U.S. dollar quoted in the New York market, which was above the parity level of 280 cents early in May last, is now quoted at a discount, the actual rate being about 278.300 cents per £.

Viewed in this context, the levy of a surcharge of 15 per cent on imports by Labour Government is, of course, necessary. One may treat it as a lesser evil than the adoption of monetary measures of deflationary nature. And one may also feel gratified at the absence of any measures either to curtail Britain's aid commitments or to restrict outflow of private foreign capital. Reassuring, too, is the statement that the levy of the surcharge on imports will be a purely emergency measure and that it will be withdrawn "as soon as a fair balance in trade is restored." But one does not know how long this emergency will last; the British Government has indicated no time limit. And there is no denying the fact that this levy will affect India to a considerable extent. Britain, it may be noted here, is the single largest customer for Indian goods. Out of every five rupees worth of goods exported by India, the U.K.'s share alone comes to one rupee. Currently, exports to Britain are running at an annual rate of about Rs. 160 crores. The total exports may suffer a perceptible setback following the imposition of the surcharge on imports. The inclusion of India and other developing countries for the purpose of the levy is rather in contradiction with the avowed objective of the Labour Party to buy on a larger scale from the developing countries. Only six days before the British Government's decision on import restrictions was announced, Mr. Douglas Jay, President of the Board of Trade, had declared at a meeting of the British National Committee of the International Chamber of Commerce that the best of all ways to help the developing countries was to buy more of their goods and that Britain would not give up liberal policies.

The two commodities the exports of which will be affected most are cotton textiles and jute goods. Cotton textiles exported from India to Britain are now subject to two curbs, instead of one as hitherto, the ceiling pact already in force and the 15 per cent surcharge. The object of levying the surcharge is to discourage imports. So far as cotton textiles are concerned, this objective was already being achieved for some years now through a quota system. It is, therefore, unfair for the new British Government to have subjected them to the additional handicap of a stiff import duty. Since cotton textiles constitute one of India's staple earners of foreign exchange and since more than two-fifths of India's exports go to Britain, the impact of the levy of import surcharge is bound to be severe. In the case of jute goods, whatever benefit that had been conferred by the abolition of the power of Jute Controller in Britain to "mark up" prices for certain categories of imported jute goods has now been nullified. While India has full sympathy for Britain's present economic plight, it will be quite justified in asking the Labour Government to include at least cotton textiles and jute goods in the exempted category and exempt them from the surcharge. Its failure to do so will embolden other developed countries also to act likewise in the name of balance of payments considerations. It may be recalled that, by forcing India, Pakistan and Hong Kong to accept limitations on their exports of cotton textiles, Britain had encouraged other countries also to follow suit.

THREE-TIER SYSTEM FOR EXPORTS

One of the essential prerequisites for successful export drive on a long-term basis is the creation of confidence in Indian goods among overseas importers. Although the need for creating such confidence has been emphasised time and again, serious complaints of irregularity on the part of Indian exporters continue to pour in from outside. The complaints are due largely to the malpractices indulged in by a small section of exporters. This aspect has been highlighted in the report of the Selectivity Committee on Foreign Trade (Chairman: Dr. A. Ramaswami Mudaliar) appointed by the Board of Trade at the Ernakulam meeting in November last year. Quite bluntly, the Committee says:

"A number of fair-weather exporters embark only upon exports in the hope of obtaining quick gains at the risk of spoiling the chances of building up trade on a sound and lasting basis. . . . Persons interested in the import of items permitted under export incentive schemes take to the export of products in which they have neither interest nor experience. Such a situation is fraught with grave danger to the orderly development of exports. . . . It is essential that the chaotic situation cannot be allowed to develop wherein a number of exporters of inadequate competence and doubtful ethics engage themselves in cut-throat competition in limited market."

The disquieting features of export trade must be eliminated forthwith, for it is far more difficult to revive the confidence of foreign buyers once lost than to build up goodwill right from the start. The need for some measure of selectivity in export trade cannot, therefore, be stressed too strongly. Such selectivity can be ensured if the three-tier pattern of categorising exporters as recommended by the Mudaliar Committee is introduced. The three tiers are "registered exporters" at the lowest level, "export houses" in the middle and "consortia of exporters" of a product or a group of products at the top rung.

The criteria for registering exporters, in the opinion of the Committee, must be not only more specific but also separate and distinct for each product or group of products, the exporters being divided broadly into two groups, one for traditional items and the other for non-traditional items. The criteria suggested include installed capacity and actual production if the exporter is a manufacturer; tie-up arrangement with domestic suppliers if the exporter is a merchant; quantum of domestic and export turnover in the product or allied products; quality specifications of the product, including inspection and testing facilities available prior to export; record of commercial disputes and their settlement; general standing in trade; and overseas channels of trade and customer servicing facilities.

The Committee has also suggested a voluntary convention of trading covering maximum and minimum prices for different qualities and specifications; quality control; export quotas, global or regional; agreements on delivery schedules, payment terms, commissions, packing and after-sales benefits and other customer services; specification of the range of brands to be handled by each exporter wherever appropriate; and reporting and settlement of commercial disputes.

There is considerable force in the plea of the Committee that any export promotion policy should deliberately provide for the building up of a cadre of efficient business houses which accept the total commitment to concentrate on export trade and which possess the required qualifications and adequate resources to undertake overseas trading "in a large measure, in a sustained manner and over a long period." While the Committee has no objection to private limited companies being eligible for recognition along with public limited companies, it has recommended that partnership firms and proprietary concerns should be kept out. A minimum paid-up share capital, according to the Committee, should be insisted upon before a company can be considered eligible for recognition. The scheme of recognition of export houses should be reoriented to make it more specific with reference to commodities and with reference to markets. Only business houses of standing and possessing the following qualifications should be eligible for recognition: substantial experience in handling the commodities in question for export generally and preferably to the selected markets; and exports constituting a substantial proportion of production in the case of manufacturing concerns and export turnover constituting a substantial proportion of total turnover in the case of trading concerns. Recognition should be for a limited period, say, three years. Renewals should depend on substantial export performance.

At the third and highest level in the suggested three-tier system will be the consortia of exporters which may be formed for the sale of identical or complementary products to overseas markets. Such consortia, in the opinion of the Committee, would be composed of all, or a group of, exporters in a single commodity or a batch of commodities and would be in a position to negotiate with foreign businessmen as a single entity and parcel out foreign orders among their constituent members. Membership, it is said, should be as wide as possible and an equitable scheme of allocation of business should be drawn up in advance.

Some measure of selectivity in export trade is certainly urgent, but it will be rash to say that that alone will work miracles. For the ultimate success on the export front will depend greatly on the competitive capacity of Indian goods, price-wise and quality-wise. No effort should, therefore, be spared to bring down production costs in industries and to maintain high quality standards.

COAL TRANSPORT

Thanks to the concentration of a large proportion of coal production, as also of iron and steel production, in Eastern India, the transport problems of that region have been causing anxiety to the authorities for some time now. Their anxiety is bound to increase, for the proposed Bokaro steel plant, the expansion projects of the existing steel plants and the bulk of additional coal production envisaged during the fourth Plan period would, together, aggravate the region's none-too-easy transport situation. Another complicating factor here is the concentration of a large proportion of coal production in that small area, while many of the larger users of coal are concentrated in relatively distant areas. Advance planning is, therefore, called for, if transport bottlenecks are not to develop in the early years of the fourth Plan in a more acute form than in the early years of the third Plan. But advance planning requires prior studies of transport conditions and problems. Timely, therefore, are the two studies recently carried out—one by the National Council of Applied Economic Research (*vide* note on transport in Steel Belt on page 714 of *Commerce* dated 24th October 1964) and the other by a World Bank team of experts. The two studies, albeit not wholly identical in their findings and recommendations, should greatly help the Government in evolving a suitable transport policy, with particular reference to the Steel (and Coal) Belt.

The World Bank team, like the N.C.A.E.R., has recognised the dominant role (current and prospective) of railways in bulk transport. The team has estimated, in this connection, that the tonnage of coal to be moved by rail will increase by approximately 80 per cent between 1962-63 and 1970-71 and the ton-kilometres of such coal movement by more than 50 per cent. Likewise, the total volume of freight traffic (the major proportion of it consisting of a limited number of bulk commodities, including coal) on railways is expected to increase by more than 80 per cent, measured in tons originating, and by almost 70 per cent, measured in ton-kilometres between 1962-63 and 1970-71. It is to meet this situation that the team has recommended a series of measures for the development of additional railway haulage capacity. These measures, which go farther than the N.C.A.E.R.'s proposals for improving railway efficiency, are: (i) Doubling of 3,500 kilometres of route, with first priority to 1,600 kilometres; (ii) equipping 1,500 kilometres of main routes with automatic signals; (iii) replacement of vacuum brakes with air brakes on 15,000 bogie wagons which are less than ten years old and equipping of the necessary coal pilot locomotives for handling wagons with air brakes; (iv) electrification of approximately 2,600 kilometres; (v) purchase of 625 electric locomotives for goods services and 100 diesel shunting locomotives; (vi) purchase of 86,000 bogie wagons; and (vii) conversion of 821 kilometres of route from metre to broad gauge. These priority programmes alone, according to the team, will involve an expenditure of Rs. 1,150 crores. Other capital expenditure required by the railways till the end of the fourth Plan is, of course, not included in this amount. Further guidelines for future railway policy have also been indicated in the team's report. These include, among others, the adoption of the principle that goods trains should be in excess of 5,000 gross trailing tons, the use of large-capacity bogie wagons with centre buffer couplers for all broad-gauge operations, the extension of electrification or dieselisation to all main line routes, the extension of automatic block signal systems on all main routes, the completion of doubling of tracks of the principal routes between the four largest cities, the avoidance of additional main tracks beyond doubling, except in areas close to the large cities and in the coalfields, the conversion of metre to broad-gauge on certain specified routes and the determination of dates for the cessation of manufacture of broad-gauge steam locomotives and four-wheel wagons.

It would appear from the World Bank team's recommendations that alternate modes of transport are not rated highly. In fact, the team has estimated that the proportion of coal which can be moved economically by means of transport other than railways will not exceed 10 per cent. It is only movement by sea that offers, in the opinion of the team, definite possibilities for expansion, provided the Haldia port is developed and a fleet of 15,000-ton vessels for coastal trade is built up. The team has ruled out water transport, for rail transport costs are only a fraction of those by waterways. Nor, according to the team, is there any economic justification for the use of pipelines for coal transport. Road transport within limits and expanded coastal shipping may thus account, at the most, for 10 per cent of all coal transport. This finding and the consequent accent on railway transport (which, according to the team, will be the cheapest for coal movement even after upward adjustments in freight rates), it will be seen, run counter to the Government's tentative proposals for developing water and pipeline transport and to the N.C.A.E.R.'s suggestions for developing, in particular, road and water transport so as to relieve the burden on railways. But at the same time it must be said that the team's suggestions appear to be more practicable.

A DESPERATE SOLUTION?

The current food situation, characterised by shortages and high prices, seems to have so unnerved the Government that it is now thinking in terms of stricter control and possible rationing in big cities. Both the Prime Minister and the Union Food Minister, who addressed the conference of State Chief Ministers and Food Ministers at New Delhi on the 26th instant, have proposed this desperate solution. The Centre's suggestions, as outlined by Mr. C. Subramaniam, are as follows: (i) Cordoning off Ahmedabad, Bangalore, Bombay, Calcutta, Delhi, Hyderabad, Kanpur and Madras and introducing statutory rationing in these cities; (ii) cordoning off the entire Kerala State and introducing statutory rationing throughout the State; (iii) introduction of informal rationing in urban areas having a population of one lakh and above; and (iv) introduction of statutory rationing in industrial cities and revision of issue prices of imported wheat and rice in fair-price shops. The Prime Minister has also suggested the control of other items like cloth, *vanaspati* and sugar and their distribution on food cards or on separate cards. The Government's current thinking on the food question, incidentally, is not far different from the approach of the National Council of Applied Economic Research which has recommended the introduction of rationing as, more or less, a permanent mechanism for a more equitable distribution of scarce consumer goods, including foodgrains. The Director-General of the Council, Dr. P. S. Lokanathan, has stressed the need for such rationing on the ground that even a five per cent rate of growth in agriculture would not be able to ensure plentiful supplies of foodgrains to a population rising by 2½ per cent per annum and that the only way to ensure minimum supplies to consumers at reasonable prices is rationing.

There can be no two opinions on the need for ensuring supplies to consumers at reasonable prices. But the question is whether, as forecast by Dr. Lokanathan, there is going to be a perpetual scarcity of foodgrains and other consumer goods in the country. If this is also the Government's view, it should state it frankly instead of allowing its spokesmen to make divergent forecasts on the food situation in the coming months. It is indeed amazing that while the Prime Minister has said that things are going to be difficult on the food front in the months to come, the Food Minister has stated that the prospects of rice crop are *extremely good* and that the *rabi* crop also would be equally good. If what the Food Minister has said can be taken as correct, there seems to be no reason for being pessimistic. However, it would be prudent to take all possible measures here and now to enable the agriculturists to produce a better crop in the forthcoming *rabi* season itself. Agriculture generally does not have a long gestation period and, if some emergency measures are implemented in right earnest, they should show results in terms of higher production of wheat and gram. At the same time, efforts should also be made to prevent the wastage of foodgrains on the farms and in storage, for every ton of food so saved is as good as a ton of food produced.

The main problem relates to organisation and proper implementation of schemes. If lack of organisation stands in the way of improving production, it may equally stand in the way of improving distribution—rationing or no rationing. Many people still remember the miserable conditions under rationing, which prevailed more than a decade back, and many have already got a taste of it under the semi-rationing conditions now prevailing in the urban areas, with their fair-price shops and informal ration cards. The Food Minister himself has admitted that inefficient distribution has been responsible for shortages. And if this is the position under semi-rationing, it may be that it will become still worse if full rationing is introduced. It will breed corruption and lead to vexatious delays and hardships. Before adopting this desperate solution in a panicky hurry, the Government would do well to watch the market arrivals of *kharif* crops and the progress of *rabi* cultivation and then decide on their course of action more calmly.

AN ECONOMIC NOT A FINANCIAL CRISIS

By Questor

LONDON, 23*rd October*

THE gold standard has gone, and the rules of the new monetary system are different from those of the old, but it is still traditional practice in Britain to meet the danger of a run on the gold reserve with an increase in the discount rate.

Sometimes the object of such an increase is to lend psychological support to more direct restrictions on credit and demand and to produce a quick deflation. Sometimes it is to reverse the flow of international short-term capital: a rise in the rate to 7 per cent has twice proved extremely effective in dispelling rumours about the devaluaton of the pound and relieving speculative strains on the reserve.

The reserve had already fallen enough in September to make it desirable for Britain to make a first, token drawing on the Basle arrangements and the U.S. swap facility. The general election, and the narrow Labour victory, has certainly caused it to fall further, though by an unknown amount, in October. Many people, both at home and abroad, therefore, assumed that the first step taken by the new Government to meet the balance of payments problem would be a rise in the discount rate—especially since Labour spokesmen have made it clear that they would not hesitate, for all their dislike of high interest rates, to raise the discount rate sharply to meet a speculative crisis.

The crucial Thursday came, however, and the discount rate remained unchanged at 5 per cent. This does not mean, of course, that it may not rise in the future, but it indicates that there are several respects in which Britain's current foreign exchange problem differs from those which have been met with a high discount rate in the past.

Mr. Harold Wilson, the new Prime Minister, is understandably anxious to attach as much responsibility as possible for the present situation to the outgoing Government, and has talked freely about an economic crisis: but he made it clear, even during the course of the election campaign, that there was no financial crisis.

The fact is that speculative pressure against the pound has been extraordinarily small. The balance of foreign payments has been in heavy deficit for a year; a general election, and the likelihood of a Labour victory, has been in the offing as long. Yet nobody has regarded devaluation as a serious possibility, and short-term funds have been coming freely into London.

No doubt the position has been eased by the Bank of England's decision to let the spot rate drop towards its floor, by intervention in the forward market, and by a widespread feeling that no private speculator can play against a syndicate of central banks and win. The result, however, is that short-term movements of private capital have been small. The reserve has fallen recently mainly because other sterling countries are no longer accumulating their surpluses in London and the effect of Britain's own payments deficit is becoming apparent.

The quietness of the exchanges is one of the factors which have made it unnecessary to raise the discount rate in the traditional manner. Another, connected factor is the new wealth of international credit facilities available for Britain's use in the common interest of preserving stability—the Basle arrangements (which have provided up to $1,000 million in the past), the mutual swap arrangement with the U.S. of $500 million, the $2,500 million drawing rights on the International Monetary Fund (of which $1,000 million is instantaneously available on stand-by credit), on top of a reserve of $2,500 million and Government-held dollar investments of around $1,000 million. These massive resources have so far inhibited the development of speculative pressure against sterling and will probably be more than adequate to meet it, without the need to raise the discount rate, if it develops in the future.

And if a rise in the discount rate is not forced on us, I believe, there are good reasons for not making it voluntarily. In the first place, it would produce large movements of short-term private capital accross the exchanges: the inflow which eased our balance of payments problem might well make that of others more troublesome.

In particular, the short-term outflow from the U.S. would almost certainly increase. It, and other countries, might be forced to raise their discount rates in competition whatever the requirements of domestic economic policy. The chief principle of the new and valuable attempt at international co-operation in financial and economic policy is that nobody should take measures to deal with domestic economic problems without considering their likely impact on other countries.

In the second place, a sharp rise in the discount rate has become, in Britain, the signal for deflation. The actual increase in the cost of credit it involves is likely to be less important than its effect on business confidence and on plans for new investment in capital equipment.

There is a general feeling in Britain, which both parties share, that our habit of meeting recurrent deficits with regular deflation is largely responsible for our relatively low investment ratio and rate of economic growth: Labour will not be prepared, nor would the Conservatives have been if returned to power, to meet the current deficit by a squeeze on credit.

It is encouraging to learn that Mr. Roosa holds the same point of view. Neither the U.S. nor most other industrialised countries, he believes, can overcome a deficit nowadays by deliberately increasing unemployment, or checking growth for more than a short time, or regularly devaluing the currency. Provided that the new Labour Government acts vigorously in dealing with real economic problems, it will deserve and command the full support of the U.S. in handling its temporary financial problems.

Get local help for your foreign exchange problems

Your State Bank Agent is just a telephone call away!

The State Bank of India and its Subsidiaries have 1700 branches at home and several branches abroad to deal with your problems regarding import and export trade.
Services rendered include
- Exchange Control Formalities
- Foreign Bills • Letters of Credit
- Packing Credit Facilities
- Guarantees and Indemnities
- Forward Exchange • Remittances
- Foreign Travel Regulations and Facilities.

World wide network of Correspondents.

Our special information service deals with all your questions on:

(a) trading opportunities in other countries and names of likely buyers or suppliers
(b) reports about the standing and financial status of business people in any part of the world, and their ability to fulfil contractual obligations
(c) the currency and customs formalities of the country you do business with

In approved cases, we also furnish Letters of Introduction entitling you to the courtesies of our offices and correspondents in all principal centres of the world.

INTEREST RATES ON EXPORT FINANCE

CEILING SUGGESTED BY CHABLANI COMMITTEE

THE cost of post-shipment credit, whether examined in relation to domestic rates for other borrowers or by comparison with the export credit rates in other countries, is, on the whole, relatively high in India. Latest studies show that the Indian exporter has to pay 50 to 100 per cent more than his rivals abroad. There are no concessions in regard to pre-shipment credits either. Whereas the prime or first class borrowers may be paying nearly seven per cent as the rate of interest, the second line of borrowers have to pay as much as 8½ to 9 per cent. The rates of medium-term finance to exporters are also too high, except in some cases where the banks obtain refinance from the Industrial Development Bank. These are the hard facts, though they may look rather strange in a country like India where the economy depends to a very large extent on the supply of foreign exchange for its growth. A reduction in the rates on pre-shipment finance would help to reduce the cost of production per unit, whereas the reduction in the cost of post-shipment finance would enable the exporter to grant extended credit to his buyers abroad at a cheaper rate or reduce his sale price. Thus, the net result of cheapening the cost of export credit would be to enhance the exporters' competitive power in the world market. In view of this situation, it is heartening to find that the Working Party on Cost of Export Credit (otherwise known as Chablani Committee) set up by the Government of India, has recommended that a ceiling may be fixed on the rates of interest charged by the banks on the exporters—both for pre-shipment and post-shipment finance. The Committee was appointed in February 1964—with Dr. S. P. Chablani the versatile Managing Director of the Export Credit and Guarantee Corporation (E.C.G.C.), as convenor—to go into the cost of export credit and devise ways and means of reducing it and bringing it in alignment with the rates in other countries.

The Committee's report is comprehensive but to the point. It has made a lucid analysis of the problem and put forward workable solutions. In the paragraphs that follow an attempt has been made to bring out the main features of the report.

Present Rates

Post-shipment credit is generally provided through the negotiation of bills. The duration depends upon the nature of the commodity exported and the terms of contract between the exporter and importer. But, except in the case of engineering goods, where the terms may be large, period generally does not exceed six months. The cost of post-shipment finance in India depends on the currency in which the export bills are drawn and their usance. Of the total sight bills negotiated in 1963, Sterling bills accounted for 51 per cent, Rupee bills 34 per cent and Dollar bills 15 per cent. In case of usance bills, the corresponding figures were 59 per cent, 21 per cent and 20 per cent, respectively. The following table shows the rates of interest charged on purchasing/discounting of export bills in India:

	Rupee Bills	Sterling Bills	Dollar Bills
Sight Bills	6½	5½	5½ to 6½
Usance Bills:			
(*a*) 3 months ..	6½ to 7½	6¾ to 7¼	4 to 6½
(*b*) 6 months ..	6½ to 7½	7¼ to 7½	4 to 6¾

The rate for usance bills, covered by the Reserve Bank's Rupee Export Bill scheme, is 6½ per cent, irrespective of the fact whether they are for three months or six months.

In addition, there are other expenses like stamp duty, bank's commission for handling the documents and premium for the coverage of risks by the E.C.G.C. Thus, on an average, the cost of short-term post-shipment finance varies between 6½ and 7½ per cent in India, as against 4-5 per cent in Belgium, 4¼-4½ per cent in Italy, 4½ per cent in France, 4¾-5½ per cent in Japan, 5-6½ per cent in West Germany, 5½ per cent in the U.S. and 5½-6 per cent in the U.K.

The position regarding pre-shipment short-term credit is no better. The bulk of pre-shipment finance is in the form of cash credit overdrafts from banks. The minimum rate of interest on such advances, as stipulated under the Inter-Bank Agreement, is two per cent above the Bank Rate. On the basis of the current Bank Rate of five per cent, the minimum advance rate under the Agreement comes to seven per cent. This, as already pointed out, is for first class parties. For the second line borrowers and new customers, it may be as high as nine per cent, though the average comes to about 7½ per cent. The corresponding rates in many leading countries are much lower.

As regards medium-term export finance, the rate goes up to 7½ per cent in case of post-shipment credit and the total cost, after including stamp duty, exchange, commission, etc., reaches 8½ per cent. For pre-shipment credit, it goes up to even nine per cent. The comparable figures in many leading countries are much lower. The comparable rates are: 5-5½ per cent in France. 5½ per cent in Japan and the U.K., 5½-6 per cent in Italy and 6 per cent in the U.S. for post-shipment finance and 5½-6 per cent in France and the U.K., 6 per cent in the U.S., 7 per cent in Italy and 7½-8 per cent in Japan for pre-shipment credit. The Indian exporters have thus to pay higher interest charges as compared with their competitors in other exporting countries. These high rates of interest apply both to post-shipment and pre-shipment credit—whether for short-term or medium-term. If India is to compete successfully in the world markets, it is necessary to bring down the costs, and a reduction in the cost of finance is one of the ways of achieving this end.

Rupee Export Bills Scheme

The Chablani Committee has suggested some measures to make the present Rupee Export Bills Scheme more effective and less expensive. It may be recalled that this scheme was introduced by the Reserve Bank in March 1963, as an adjunct to the Export Bills Credit Scheme. Under the latter scheme, advances are made by the Reserve Bank to eligible scheduled banks—within their overall quotas—against demand promissory notes, upon a declaration of the holdings of eligible usance export bills purchased/negotiated/discounted by them. The Rupee Export Bill Scheme provides in this context a special facility to banks in respect of their holdings of Rupee export usance bills and entitled the banks to borrow against a declaration of their holdings of Rupee bills at the Bank Rate, provided they did not charge interest/discount/commission to exporters at a rate higher than 1½ per cent above the Bank Rate. Although the system of quotas has been discontinued since last month, and with that the Export Bills Credit Scheme too, the concessions with regard to the Rupee Export Bill Scheme are being continued and the banks can obtain finance against their holdings of Rupee usance export bills at the Bank Rate, subject to the above mentioned stipulation regarding the maximum rate of interest they can charge from exporters. The Chablani Committee has now recommended that this Scheme should be placed on a permanent footing and the ceiling rate under the Scheme should apply to all rupee usance export bills, *irrespective of whether the bank obtains refinance from the Reserve Bank or not.* This Scheme of concessional refinance may also be enlarged to cover usance bills drawn in Sterling, Dollar or any other currencies and export finance found through methods other than purchase or discount of bills, namely, advances against goods exported on consignment or against bills for collection. The Committee has not favoured the extension of the Scheme to sight bills, as it felt that it would make no dent on the exporter's cost and yet adversely affect the banks' profits.

It has been recommended that, in the case of post-shipment credit, the ceiling rate for export bills upto six months should be one per cent above the Bank Rate—irrespective of whether or not the banks obtain refinance from the Reserve Bank. On the basis of the current Bank Rate of five per cent, this ceiling will reach six per cent. The implementation of this recommendation will result in a substantial reduction in interest costs which may go up to 1½ per cent.

Pre-shipment Credits

It has already been seen that the lending rates for pre-shipment credits in the leading exporting countries are considerably lower than those in India. Moreover, in the past few years, this rate in India has increased at a fast face—from an average of 5.64 per cent in 1959 to 6.41 per cent during the first half of 1962 and 7½ per cent at present. If this trend continued, the average may very soon be as high as the present highest of 8½-9 per cent. As a safeguard against this tendency, the Committee has recommended that pre-shipment export finance may be brought within the purview of the Reserve Bank's concessional scheme for export finance.

There is, however, a snag here. At present, the pre-shipment finance is generally indistinguishable from domestic credit, as many products that are exported are also produced for the home market. In order to obviate this difficulty, the Committee has suggested the adoption—with suitable modifications—of the Export Advance Bills Scheme of Japan. Under this Scheme, the banks in Japan provide finance to exporters for the purchase, production, processing, transportation and storage of goods by discounting Export Advance Bills on the strength of firm export contracts. An exporter can obtain funds from a bank against an Export Advance Bill, irrespective of whether he is a manufacturer or a merchant drawing his goods for exports from others. Similarly, a manufacturer, working to the order of an exporter, may himself obtain finance directly from a bank by issuing an Export Advance Bill. Under the scheme, the Bank of Japan provides refinance facilities to banks against the security of Export Advance Bills at a concessional rate; and, if the bills are accompanied by letters of credit, they are discounted at a still lower rate than the rate at which refinance against the security of bills is provided. The scheme, however, covers only the exporters who have firm orders, and not the manufacturers who produce goods in anticipation of export orders, in the light of past experience or on the basis of future prospects. The Committee has recommended the extension of concession to such manufacturers in either of the following two ways:

(*a*) The credit may initially be made available at the prevailing rate and, at the completion of the export contract, the exporter may get a rebate or drawback of interest on such part of the credit which corresponds to export finance.

(*b*) The benefit of concessional rate may be given initially, and on such part of the credit,

COFFEE CROP PROSPECTS

EXPORT QUOTA UNDER WORLD AGREEMENT MUST BE RAISED

ALTHOUGH the outlook for the current coffee season that began on 1st July last is considered to be quite bright, the earlier expectation of a bumper crop being harvested may not materialise, for the crop has been adversely affected by untimely and insufficient blossom showers. Indeed, indications are that the total production will be less than that in the previous season (1963-64). The latest trade estimate places the output at no more than 67,000 metric tonnes, as against the earlier estimate of 72,000 tonnes made at the blossom time and the record crop of 68,500 tonnes harvested in 1963-64. The downward trend is, however, expected to be reversed again in the next season, that is, 1965-66 which corresponds to the last year of the third Plan. This, at any rate, is the view of Mr. M. M. Appaiya, the retiring Chairman of the Mysore State Planters' Association, who spoke at the sixth annual general meeting of the Association held at Bangalore on the 27th instant. The condition of estates, according to Mr. Appaiya, gives rise to a "quiet optimism" that the 1965-66 season's crop may touch about 75,000 tonnes.

In the considered opinion of Mr. Appaiya, "big surpluses" of the order of 45,000 to 50,000 tonnes of coffee will become available in the coming years. Such surpluses and the exigency of earning foreign exchange for the import of a wide range of goods invest the need for a more vigorous export drive with urgency. This need was most forcefully highlighted by Mr. Appaiya. He said:

"In spite of the vigorous plea by the Chairman of the Coffee Board in the International Coffee Council for a more generous allotment, our quota for export for the second year continues to be pegged at around 22,000 tonnes. The fixation of export quotas on the basis of exports in the past, without taking into consideration levels of production and trends for the future, has been particularly disadvantageous to us who have promoted internal consumption to roughly 50 per cent of the crops produced in the country. Our export quota represents a meagre 33 per cent of our poduction, as against a quota of upto 80 per cent of the maximum production fixed for the chief coffee growing countries. We have a very strong case for an immediate revision of our export quota so as to enable us to sell our available surpluses in assured markets during the coming years. I am sure the Investigation Team of the International Coffee Council, which is visiting the country later in the year, will appreciate this requirement of ours and recommend to the Council suitable export quotas commensurate with our production and surpluses. We have, on the basis of our trends in production, a right to a quota of 50,000 tonnes and every effort should be made to secure this. An increase of the order indicated is not going to upset the balance of supply and demand in the world market and for a country that has been responsible for the spread of coffee cultivation in most of the leading producing countries of the world, India has a right to expect just and considerate treatment in the fixation of quotas.

"Our production figures for the third Plan period would just suffice to meet our internal demands at present levels and permit of our reaching an export target of 50,000 tonnes. Internal markets, however, under the pressure of our growing economy, have a tremendous field for absorbing increased production and we should programme for an increase of 15,000 tonnes in this market by the end of the fourth Plan period. Our foreign exchange position would require us to remain not content with the exporting of 50,000 tonnes, but of much larger quantities, if necessary outside the quota countries. We have made a good beginning in the last two years and the demands for our coffee in the non-quota countries is encouraging. We should cultivate these countries and be in a position to export a further 10,000 tonnes over the export of 50,000 tonnes we are seeking to the quota countries."

World Trends

While India's case for a more liberal export quota is strong, it must be emphasised that the mere grant of a higher quota will not be of any avail, unless India is in a position to compete effectively in world markets both quality-wise and price-wise. The competitive capacity of India, in turn, depends partly on the conditions obtaining within the country and partly on the trends in the world coffee markets. According to the latest reports, the world markets are currently depressed due partly to the delay in the ratification of the International Coffee Agreement by the U.S.—the U.S. imports nearly half of the total world exports of coffee—and partly to the offer of surplus African robusta coffee at prices below those agreed to at the meeting of African producers at Paris. Uganda robusta grade 10 (unwashed) coffee is currently quoted in the London market at £13 per cwt. (f.o.b. Mombasa), as against £16-16 early this year. There is a feeling among coffee circles that, despite a reduction of 300,000 bags to 48 million bags in world coffee quotas for the current season, the aggregate quota is higher than the world demand by about 1.2 million—1.5 million bags.

Whatever the international coffee situation, India should spare no effort to augment exports of coffee. The scope for selling large quantities of coffee in the non-quota countries is said to be quite good. These countries include Japan, Middle Eastern countries and rupee-payment countries such as the U.S.S.R., Poland, Rumania and Hungary. At present, Japan imports considerable quantities of coffee from other countries and India should certainly be able to capture a part of the market there. It may be noted here that the exporters of coffee enjoy an incentive in the form of imports entitlement for chicory upto 3 per cent of the f.o.b. value of exports, but the incentive is limited only to coffee exported to non-bilateral quota countries. The study group on Plantations appointed by the Board of Trade suggested sometime ago that, in order to give sufficient incentive to develop exports in non-quota countries like Japan, the incentive should be extended to exports of coffee to include all non-quota countries.

Existing Markets

Along with efforts to explore new markets for coffee, every care will have to be taken to see that the existing markets are not only preserved but actually developed further. It is necessary to mention this aspect because Indian coffee is said to be lately losing ground in certain European countries such as Austria, Norway, Sweden, Denmark and Finland. About five years ago, India held a pretty high place amongst the suppliers of coffee to Austria, but, last year, the share of this country fell. The actual share now is 1.4 per cent, as against 5 per cent five years ago. A similar trend has been noticed in some other countries also. Whereas India's share of exports in these countries has been going down, Brazil, Colombia and Costa Rica have increased their shares.

Increased targets for exports, coupled with rising consumption at home call for a higher level of production. It will be necessary, says Mr. Appaiya, to raise the present level of production by about 25,000 tonnes. Steps have already been taken to maximise production from the existing stands of coffee by replanting low yielding old arabica coffee with the new strains of high yielding selections bred in the Coffee Research Station. The Mysore State Planters' Association has submitted a coffee development scheme to the Central Government. The Association expects Government's decision on the scheme shortly, making available the requisite financial assistance for the rapid rehabilitation of the old stands of coffee. This measure is expected to increase production by about 10,000 metric tonnes per year. But this would still fall short of the projected requirement. It is imperative, according to Mr. Appaiya, that this country increases area under coffee in order to fulfil demands of exports and internal consumption. There are, however, certain handicaps to the expansion of acreage, handicaps which even the Coffee Board, as its Chairman himself frankly confessed recently, cannot tackle. One such handicap relates to the land ceiling legislation in the traditional coffee States of Mysore and Madras. In other States, too, the expansion envisaged under the current Plan is not being realised. Only Andhra Pradesh has reported some addition to acreage. Reviewing the recent trends, Mr. Appaiya observed:

"Trends in production have indicated that a substantial portion of the increase in coffee crop will have to come from within the State of Mysore. While we have increased our production from 11,000 tonnes in 1944 to 53,000 tonnes in 1964, the increases in the other coffee growing States have not been as satisfactory. Attempts to grow coffee in new regions have not been very successful with the result that, for some time to come, much of the increases envisaged will have to come from within our State. To meet this increasing demand, we must aim at bringing 30,000 acres more under coffee cultivation during the course of the next six years. It would, therefore, be necessary for Government to give its serious consideration to making available land for genuine coffee cultivation at the rate of 5,000 acres per year in the first instance. . . ."

Some Pertinent Suggestions

Mysore, it may be noted, accounts for 60 per cent of the total area under coffee and 80 per cent of the actual output. A special responsibility is, therefore, cast on the Government of Mysore. The Government will do well to consider the five pertinent suggestions put forward by Mr. Appaiya. One, the extension of land under plantation crops should be consistent with the forest requirements of the State as indiscriminate reduction of areas under forests cannot be in the national interest. The State Government should undertake a quick survey to determine the extent of land that can be made available for plantation crops. With the afforestation of more and more lands outside the plantation belts of the State, it should be possible to make available lands for this expansion in the coffee growing districts of the State. Two, the Government should re-examine the policy of allotting lands eminently suited for growing plantation crops in the Giris and the other plantation growing areas of the State to the growing of crops quite unsuited to these lands, avowedly to satisfy the cry of the landless. Denuded of their forest wealth and subjected to cultivation practices contrary to every known law and practice in soil conservation, these lovely rich slopes of the Giris are fast becoming barren and useless for any purpose. The Mysore Government should soon evolve a scheme that will not permit of such profligate action. Three, the Coffee Board should carefully consider the U.P.A.S.I.'s scheme for introducing an optional quota system for exports with a view to encouraging better preparation of coffee at the producer level. Four, the Government should ensure that, in the process of the settlement of disputes between the planters and labour, long delays are avoided. Five, the Government and the Coffee Board should allow necessary imports of machinery and spares required for the application of developments in planting techniques, as well as for the adoption of better and rational, cultural and manurial practices.

Besides these suggestions, Mr. Appaiya put forward a strong plea to the Government to allow the coffee industry to build up necessary resources so vital for the regeneration of this wasting agricultural enterprise. The plea is certainly unexceptionable. For such resources must, after all, come out of the savings made possible by fair taxation measures. Agricultural income-tax rates have been steadily rising; presently, they stand at as high as 60 per cent of the profits over a lakh of rupees. The coffee industry, unlike the manufacturing industry, does not enjoy any advantages of tax relief on depreciation and development. Tax concessions, as Mr. Appaiya said, would attract fresh capital into the industry. If the regeneration and expansion envisaged under the Plan have to be gone through, the industry would necessarily have to attract considerable capital —this will not be possible unless the return to the producer is made more attractive—as, otherwise, Mr. Appaiya warned planning in the industry would only remain an excercise on paper without much being achieved. Speaking about labour costs, Mr. Appaiya said that, since coffee was a labour-intensive industry, any increase in wages would have a great impact on its production. There is considerable force in his contention that, if the wage rates are so increased as to damage the economy of the industry, the resulting instability in employment would be more harmful to labour than the good the immediate increase in wages might do.

MANCHESTER LETTER

HIGH MACHINE ACTIVITY IN TEXTILES

STOCKS RISE DUE TO DULL RETAIL SALES

From Our Special Correspondent

MANCHESTER, 20th October

RESULTS of General Elections measured purely on voting strengths are one thing; the way in which the mandate of the country is carried out through Parliamentary procedure is quite another. Whether the tiny working majority established by the Labour Party will enable all its promised reforms to be introduced remains to be seen. There must in any case be a period of some uncertainty ahead in view of the close nature of the result.

Only a few days before the polling, a firm of Manchester stockbrokers, which uses considerable insight in its assessment of industrial and financial trends, almost assumed the role of prophet by suggesting that future Government policy would need to be framed in the light of political and trade developments overseas. The startling foreign news from Russia, which coincided with the Election, was obviously not foreseen, but it provides an example of how domestic plans need to be shaped in line with events which are well beyond the control of party leaders.

In the same report, the statement by the Chairman of the London Stock Exchange calling for more disclosure of information by public companies is discussed in detail. Most observers naturally favour the idea of having more data on which to base their assumptions and predictions of the probable progress of individual companies. The companies themselves may not view the prospect with quite the same degree of enthusiasm.

Companies on Trial

When the Election result can be viewed in perspective, its short-term implications will become correspondingly evident. The report suggests that the political significance of a favourable response from company chairmen is perhaps more important than the economic aspects. "Unless the Stock Exchanges can illustrate beyond doubt that they are capable of curbing those aspects of financial activity which are most unacceptable to developing social and (perhaps) political mores, there is a very real threat that the present system of surveillance will be replaced by a more bureaucratic one, along the lines of the Securities Exchange Commission in the United States" it warns and adds:

"In the even more immediate future, any inference that the present financial organisation is not the one best suited for changing social requirements could quite feasibly result in private enterprise being superseded by State control, with all the frustrations this might bring at both Board and personal levels."

Warning on Supplies

It has often been said that the Lancashire textile industry, through its former focal point of the Manchester Royal Exchange, was inclined to talk itself into a depression when conditions in the trade were by no means disheartening. In the past month or two, there have been indications of such an attitude developing in certain quarters; the mood has now been officially taken up by the Cotton Board in its latest statistical survey. "There is no doubt that supplies of cotton textiles this year will be appreciably in excess of final offtake" is the direct warning issued in the current review of the situation.

After commenting that trading prospects in the very short run still appear satisfactory and that output per working day is still above last year's level, the survey views the longer term outlook with some concern. It is clouded by two unfavourable factors, according to the review, the disappointing performance of retail sales and the huge increase in imports this year.

Allowing for price increases, expenditure by consumers on clothing in the first seven months of 1964 is officially estimated to have been about 4 per cent greater than in the same period last year; on a seasonally adjusted basis, however, the report adds, retail sales have been, if anything, rather smaller than in the second half of 1963.

Lack of buoyancy in retail sales, coupled with greatly increased supplies of imported cotton piecegoods and made-up garments, has led to a disquieting increase of stocks in the pipeline. Weavers, converters and grey cloth consumers now hold about 44 million more square yards of cotton cloth than at the end of the second quarter. Stocks beyond the converting stage also seem to be rising.

The only comforting factor is that a good deal of the increase in imports has been caused by India shipping the bulk of her annual quota in the first half of the year. The countries mainly involved in this rise in the receipt of foreign cloth, apart from India, are Israel, China, Japan, Canada and the Irish Republic. Inroads are also being made by countries with no former record of exporting to Britain, such as Brazil and South Korea.

Detailed figures showing the situation in Lancashire mills in the second quarter this year continue to underline the progress being made in raising productivity. In the spinning section, the number of spindles in place in running mills has for the first time fallen below 6 million ring equivalents. The actual spindles running consisted of 4,810,000 rings and 900,000 mules. Machine activity at 91.5 per cent capacity was equal to the average peak performance reached in 1961, when nearly 8 million ring equivalent spindles were running.

High Machine Activity

The gradual trend towards more shift working in spinning also persisted as 1,660,000 rings were operating on two shifts and 450,000 were on three shifts. This compares with 1,440,000 spindles on double shifts in 1961 and only 180,000 on three shifts. An evening shift was also being worked on 1,660,000 ring spindles, an increase of 38,000 spindles on the same period last year.

The high rate of machine activity in waste spinning was fully maintained at 96 per cent, although the number of actual spindles running has fallen from 668,000 in 1961 to 533,000 this year. In this section, shift working is still relatively scarce as only 80,000 of these spindles are operating more than a single shift.

In the doubling branch, although the quantity of spindles in place has been reduced over the years those running in the second quarter at 1,012,000 are slightly in excess of the 1962 average. Machine activity has improved to 86.8 per cent, a higher level than in any recent years.

Much the same general trends follow throughout the weaving branch. Machine activity in the second quarter, at 89.3 per cent, was second only to the 1961 average of 90.8 per cent, and the number of looms in place continued to fall. The operable total was 119,000, of which 106,300 were running, including 42,500 fully automatic machines.

Enterprise in Research

Technical progress in nearly every section of the textile industry has been a major influence in improving its image both as a far-from-spent force in industrial affairs and as a prospective provider of regular employment in the years ahead. Many of the larger groups already have their own development sections, but the hub of the forward movement has been the Cotton, Silk and Man-made Fibres Research Association. The annual report of this organisation, presented by the Chairman, Mr. G. H. Jolly, has laid down the basis on which further enterprise can be stimulated. The main considerations, he declares, centre not only on increased productivity but also the ability of the industry to sell its products.

Developments embodying improved or original finishes, producing sophisticated and new end-products attractive to consumers continue to rank high in the present programme of Shirley Institute. Details given in the report of the many different experiments and studies which have been carried out illustrate how science is increasingly playing a vital part in the industry's progress.

New Spinning Methods

In the earlier phases of production, however, a change in emphasis in the research programme has been effected. The view is now widely held that the ring and traveller system has entered a stage where increases in productivity per spindle are likely to be small, says Mr. Jolly. As a result, a great deal of thought has been given to new methods of spinning. An investigation has been undertaken with the assistance of a grant from the National Research and Development Corporation into what has been described as the "automated spinning project." The results, the Council of the Association believes, will be of considerable value to the industry as an extension of the development of the automatic "lap drawing" system for linking cards and drawframes, which has now been brought to the stage of mill trials.

FIVE PER CENT

Madras State Electricity Board Bonds, 1976
For Rs. 300 Lakhs.

(PAYMENT OF INTEREST AND REPAYMENT OF PRINCIPAL, GUARANTEED BY THE GOVERNMENT OF MADRAS.)

The Bonds will be trustee securities under the Indian Trusts Act and also approved securities for the purposes of the Insurance Act and the Banking Companies Act. The Bonds will be treated on par with Government Securities for the purpose of advances under Section 17(4)(a) of the Reserve Bank of India Act, 1934

ISSUE PRICE Rs. 99.75 PER CENT.

REDEEMABLE AT PAR ON THE 16th NOVEMBER, 1976.

Subscriptions will be received in cash or cheques from the 16th November 1964. But the lists will be closed without notice as soon as the total subscriptions amount to approximately Rs. 300 lakhs and in any case not later than the close of business on the 21st November 1964.

Applications will be received at all branches of the State Bank of India within the State of Madras and at the State Bank of India at Madras, Bombay, Hyderabad, Calcutta, Delhi, Bangalore and Bangalore City.

Copies of the Notification announcing the terms of issue and application forms are available at all the receiving offices mentioned above, at all treasuries and sub-treasuries in the State of Madras and at all offices of the State Electricity Board.

IMPROVING SUGARCANE CULTIVATION

MR. SUBRAMANIAM'S ALLEGATIONS AGAINST SUGAR INDUSTRY UNJUSTIFIED

IT is regrettable that the Union Minister for Food and Agriculture, Mr. C. Subramaniam, should have hurled some wild and unjustified allegations at the sugar industry, in general, and the mills in North India, in particular, while delivering the convocation address at the National Sugar Institute at Kanpur last week. His main allegation was that the industry had amassed huge profits and that it had not done anything to improve conditions in the primary stage, that is, sugarcane cultivation. We better quote the Minister's own words:

"One is tempted to ask the question: what has the sugar industry of India, which has had no lack of profits from sugar, done to step up yield and productivity in the Indo-Gangetic plain and elsewhere? Apart from the pioneering work done in the sugarcane research stations of the Government, one sees very little evidence of any sustained interest by the industry. This is absolutely a shortsighted policy on the part of the industrial magnates of sugar as such. In any advanced country of the world, an industry of the size and potential as the sugar industry of U.P. and Bihar would have to put in adequate resources for research and development of sugarcane cultivation. The passive and pathetic attitude of Indian sugar industry during all these years of protection is the worst possible justification for their continued existence."

Quite apart from the propriety—the convocation of the National Sugar Institute was surely not the forum where Mr. Subramaniam could indulge in such wild allegations—his statement does not stand the test of scrutiny. It may be true that the sugar mills in Uttar Pradesh, Bihar and some other States have not done anything in the sphere of cane cultivation. But the question is: why should they bother about cane cultivation? The cane areas do not belong to them and the mills have no control over the cane grown in the fields. Moreover, the Governments of the States have all along assumed direct responsibility for cane development. They have been raising crores of rupees every year in the form of cane cess. The object of the levy is specifically for cane development, but the Governments have been utilising the major portion of the proceeds of the cess for various purposes other than cane development. Although attention to this aspect has been repeatedly drawn by many, including this journal, time and again, the State Governments have simply not cared to take notice of the criticisms. We wish Mr. Subramaniam had, instead of accusing the sugar industry, urged the State Governments either to utilise the whole of the cess proceeds for cane development or to transfer the responsibility to the mills themselves. There is no reason to think that the mills will shirk this responsibility. In fact, several sugar millowners themselves have been asking for such a transfer of responsibility.

Deccan Sugar Mills' Efforts

Mr. Subramaniam's allegation against the sugar industry is also not justified because of the excellent cane development work done by the sugar mills in the Daccan region. But what is the reward that the mills have received in return? The joint-stock sugar mills in Maharashtra have been dispossessed of their cane farms on which they had spent so much money, time and energy for many years. Thanks to the untiring efforts of the mills, the productivity of cane lands that formerly belonged to them compares very favourably with that of other areas. The average per-acre yield of cane in Maharashtra is as high as 32.8 tons, as against the all-India average of 18.3 tons, the U.P. average of 15.4 tons, and the Bihar average of 14.6 tons. Similarly, the recovery percentage of sugar in cane raised in Maharashtra is 12.1, as against 10.2 for the whole of India, 9.6 in the U.P. and 9.7 in Bihar. Mr. Subramaniam himself admitted the distinct improvement achieved in the Deccan plateau and stated that what has been possible in this plateau "should be at least the aim and target for the sugarcane grower in the North." But he was silent on the Maharashtra Government's acquisition of the cane farms of sugar mills.

The Union Food and Agriculture Minister was, however, right when he said that, if the present adverse trend in productivity of sugarcane in the Northern belt were to continue, it would be difficult to resist the movement of sugar industry, at least the newer units, to other areas. "The country," he declared, "cannot continue to subsidise uneconomic and inefficient forms of cultivation." Curiously enough, only a week earlier, Mr. Subramaniam's own Ministry announced the fixation of a higher cane price of Rs. 5.36 per quintal linked to a recovery of 10.4 per cent or below at the factory gate, whereas the previous formula, announced in March last, had fixed the minimum price at Rs. 4.96 for cane with a recovery of 9.4 per cent. As was pointed out by us in our Survey columns last week, all producers of cane with recovery ranging anywhere between 0.1 per cent and 10.4 per cent will get the same price (Rs. 5.36 per quintal) during the ensuing season! Does such a scheme not encourage uneconomic and inefficient forms of cultivation?

Manufacturing Efficiency

While the need for augmenting the productivity of cane lands both quantitatively and qualitatively is urgent to a degree, no less urgent is the need for maintaining a high level of manufacturing efficiency in the factories. Over the long run, the health and growth of sugar industry depends, as Mr. Subramaniam observed, on the level of technology and science brought to its management. In this connection, Mr. Subramaniam put forward three pertinent suggestions. First, a separate productivity division should be organised in the National Sugar Institute for the purpose of systematically going into the reasons for low productivity and remedying them. Secondly, it would be well worth legislating that sugar factories should have as their managers men who have been qualified at the Sugar Institute or similar institutions. It was only through the insistence on such technical management, Mr. Subramaniam averred, that we could raise the general level of productivity; "we should go into the whole question of manning of sugar factories and see that the scarce capital resources of the country are properly safeguarded by technical experts being put in charge of them." Thirdly, the Sugar Institute must have a management division specialising in the problems of management peculiar to the sugar industry; this division should not only do research in problems of management but also assist in introducing the technologists to some of the better ways of handling them.

The suggestions of Mr. Subramaniam sound pertinent and logically sustainable. But one would like to know whether the Sugar Institute itself is fully equipped for taking up the responsibilities proposed by the Food Minister. Further, what certainty is there that his successors also would subscribe to his views and continue the policies laid down by him? Be that as it may, there is force in his observation that there should be a substantially increased allocation of effort and money to the various problems facing the sugar industry and that the sugar millowners and sugar technologists must come forward to draw up "a dynamic plan" for tackling them. He, however, did not indicate clearly what he meant by "joint action." All that he said was that the Government of India would assist any plan born of such common consultation. If what Mr. Subramaniam wants is the establishment of a separate private research body sponsored by the sugar industry, the idea is to be welcomed. Similar research institutions sponsored by the cotton textile industry and the art silk weaving industry are already working with Government assistance, and the sugar industry will do well to follow this lead now that Mr. Subramaniam has held out assurance of Government support.

WORLD SUGAR POSITION

Conditions in the world sugar markets continue to be rather dull. There has not been any change in the past one month in the London price of raw sugar which stands at £32 10s. per ton, as against the rate of over £90 prevailing early this year. Sugar circles do not expect any rise in prices in the near future, though they feel that the market would be steady at its present level if consumers decide to replenish their stocks. This, in brief, is the overall assessment as contained in a recent review by the Commodities Staff of the *Financial Times*, London. The review brings out the following trends in the world sugar economy:

"The market has been extraordinarily quiet for some time. Any tender put out has been met by a flood of offers. For the last six months, buyers, convinced presumably that there is no point in buying on a falling market, have not been replenishing their stocks. As a result, the amount of sugar sold has barely represented physical consumption. The existing market is complicated by being in fact two markets. One is that for cane sugar, largely required for the fulfilment of short sales to Chile. These must originate from Latin American Free Trade Areas, and has meant that firsthand sellers have been able to pay a premium. Recently dealers had to go to Peru and paid the equivalent of £34 a ton. Buyers of sugar against the U.S. global quota have also had to pay prices higher than ordinary world levels. The other market is at present dominated by the European beet producers. The F.O. Licht estimates have now been published, and the surprise is that they have not affected the market (this is partly due perhaps to the close attention dealers now pay to the statistical position throughout the year).

"The European beet harvest this year should, according to Licht, amount to 23.2 million tons, an increase of 3.6 million tons on last year. Western Europe, a net importer of sugar, is expected to produce nearly one million tons more this year. Its import requirements are thus likely to be lower than usual. France is expected to market 400,000-500,000 tons, some of which will have to be disposed of fairly soon owing to storage difficulties. Some dealers, largely on the strength of the substantial European output forecast, think that the sugar price could fall to £25 a ton by the end of the year. Much depends on how accurate estimates of the East European crop are. Russia is believed to have planted four million hectares, and Licht puts its output at 8.6 million tons. But it depends very much on how large the yield is likely to be. In the past few years, the Russian yield has varied from 1.86 ton a hectare to 2.5 tons. Earlier this year, it was thought that Russia would enter the world market for whites, but did not—possibly because it felt it was worth risking a fall in stocks to low levels. Now it appears that a substantial tonnage, 75,000 to 100,000 tons, has been delivered to Russia from other Eastern European producers. That probably does not reflect on this year's crop, however, but merely serves to tide the Russians over until deliveries from their own crop can be made. These sales seem to have had the effect of making most of the Eastern European producers with the exception of Poland less eager to sell recently. Even Poland has been fairly circumspect, offering only at tenders where the price has been £32 10s. or higher.

"So far as cane sugar is concerned, supplies will probably be more than adequate over the next year. Some time ago, Argentina announced its intention of exporting 100,000 tons. Brazil could have 350,000 tons, and 200,000 tons of Mexican sugar are already in the hands of dealers. The size of Cuba's crop remains a mystery, while hurricanes did less damage to the Louisiana crop than was first thought (the loss is now put at 150,000 tons).

"Overall, therefore, there seems little chance of higher prices prevailing, although, if consumers decided to replenish their stocks, they would help to keep the market steady at its present levels."

TARIFF COMMISSION TO INQUIRE INTO SUGAR COSTS

The way in which the Government of India is handling the affairs of the sugar industry continues to be confusing. How else is one to explain the Government's decision to ask the Tariff Commission to inquire into the cost structure of the industry? It was only in August last that Mr. C. Subramaniam set up the Commission of Enquiry, presided over by Dr. S. R. Sen, to "go into the *entire* cost-price structure of the sugar industry." Announcing the appointment of this Commission, Mr. Subramaniam gave the clear assurance that the Government's sugar policy would in future be shaped in accordance with the findings of the Commission. At that time one thought that, since Mr. Subramaniam was somewhat allergic to the Tariff Commission—his observations on the Commission with reference to steel retention prices made when he was the Minister in charge of steel some time ago are well known—he had preferred to appoint an enquiry body consisting predominantly of officials. The Sen Commission has already submitted its report. The Government, too, has accepted two of the recommendations made by the Commission (these relate to cane prices and excise duty rebate referred to in our last issue, *vide* page 714), and stated that the other recommendations in regard to ex-factory prices of sugar, etc., were being considered and that an announcement on them would be made soon. One, therefore, fails to understand why Mr. Subramaniam has chosen to refer the whole question of costs to the Tariff Commission. Be that as it may, the official Press release announcing the Government's decision says:

"Fresh examination of the cost structure and fair price payable has become necessary, as, since the last report of the Commission in 1959, changes have taken place in the wage structure as a result of the report of the Central Wage Board for Sugar Industry and the capital structure of the industry on account of the establishment of a large number of new units and expansion in existing units. Also new units which had been established with large capital outlay were using modern equipment which was more efficient and labour-saving compared with the equipment available with old factories, and a number of factories, which had effected substantial expansions, have increased their capacities several-fold. The Tariff Commission had last examined the cost structure in 1958-59 and suggested four cost schedules—one each for the Northern Bombay, Madhya Pradesh and Rajasthan and the Southern regions. These schedules were adopted by the Government for determining the sugar prices from year to year."

Considering that the Tariff Commission is an independent body, one hopes that it will recommend a new sugar price formula which would be fair to both sugar industry and the consumer.

We at Remington Rand have been with typewriters a long time—you can say we have always been the first with typewriters. That's why we are so careful about them—careful about things that matter, like *precision, touch.*

The equipment we've invested in at our factory—the Optical Profile Grinder and the Type Aligning Projector—are for just this reason: that the typewriter you invest in is *perfect.* The care we take over accuracy—1/10,000 th of an inch in machined parts, tools and dies, and the perfect alignment of types and typebars, you can call us fussy—even finicky. But then that's why Remington Typewriters are such a good buy.

Our attention to detail means you get precision balanced typebar action that flashes to and from the paper, keys that don't stick even with several typebars in flight, finger-fitted keys designed to cushion finger tips, smooth carriage and lighter, more rhythmic, highly responsive typing.

Remington Typewriters are now better than ever

That's why we are so proud of....

THE OTHER CHINESE INVASION—III

DOWN WITH KHRUSHCHEV: UP WITH NIPPON

By K. Krishna Moorthy

[This is the third in a series of articles on Communist China's aid and trade relations. The fourth and final article will deal with Peking's success in improving commercial relations with Western countries.—ED.]

WHEN the Soviet bear and the Chinese dragon parted from their embrace, there was no limit to their snarling and fuming. In the eyes of the Chinese Communist Party, "as a result of the Khrushchev revisionism, the first socialist country in the world" was facing "an unprecedented danger of capitalist restoration." To quote other invectives used against Khrushchev in the Peking *People's Daily* and the *Red Flag* of 14th July this year: "The Soviet privileged stratum and the revisionist Khrushchev clique serving the interests of the bourgeoise . . . rapidly swelling the forces of capitalism . . . colluding with Soviet imperialism and wrecking the socialist camp and the international communist movement."

Now that Khrushchev has been pushed out of the seat of power in the Kremlin, there is considerable speculation on efforts for a reduction of tension between Moscow and Peking. It was immediately after Stalin died that Soviet-Chinese economic co-operation reached its peak. According to Mr. M. A. Suslov, the leading theoretician of the Soviet Communist Party, it was at Mr. Khrushchev's initiative that "elements of inequality in relations between China and Russia—one of the manifestations of the Stalinist personality cult"—was removed. But it was at the height of Khrushchev's power that the clash between Moscow and Peking became vicious.

The contributions made by the Soviet Union to China's economic construction and the consequences of the Moscow-Peking clash are relevant to a study of the growth of China's foreign aid and trade relations which have been reoriented in recent years when the Soviet Union sought to close the tap to reduce the flow of aid to and trade with China.

Extent of Soviet Help

In a report made to the central committee of the Communist Party of the Soviet Union, Mr. Suslov said on 14th February (reported in *Pravda* on 3rd April): "In the past fourteen years, the U.S.S.R. helped China build over 200 large industrial enterprises, shops and other projects equipped with modern machinery. The Chinese People's Republic has built with Soviet aid whole branches of industry which China has not had before: aircraft, automobiles and tractors, power and heavy engineering, precision and instrument engineering, radio engineering and various branches of the chemical industry. The factories built and reconstructed with Soviet assistance enable China to produce annually 8.7 million tons of iron, 8.4 million tons of steel, 32 million tons of coal and shale. Enterprises built with the help of the Soviet Union account for 70 per cent of China's tin output, 100 per cent of its synthetic rubber output, 30 per cent of its electric power output and 80 per cent of the annual production of lorries and tractors. More than 10,000 Soviet specialists were sent to China between 1950 and 1960. Some 10,000 Chinese technicians and engineers and skilled workers were taught and trained in the Soviet Union. More than 11,000 Chinese students and post-graduate students graduated from higher Soviet educational establishments between 1951 and 1962."

In 1958, according to Mr. Suslov, the Chinese had begun trying to curtail economic relations with the U.S.S.R. In July 1960, Russia withdrew nearly 1,400 Soviet specialists working in China. Incidentally, the clash with the Chinese developed after Khrushchev began experimenting with increased deliveries of economic aid to India and the United Arab Republic.

Big Decline in Trade

In 1960, according to the U.S.S.R. *Trade Statistics* published in Moscow, Chinese imports from the Soviet Union were valued at more than 735 million new roubles. Chinese purchases fell to 330 million new roubles in 1961, about 210 million new roubles in 1962 and to a little over 168 million new roubles in 1963. As for Chinese exports to the U.S.S.R., they were 763 million new roubles in 1960, about 496 million new roubles in 1961, about 468 million new roubles in 1962 and 372 million new roubles in 1963. In 1960, for example, Russia supplied China with 336 million new roubles worth of complete plant; in 1963 complete plant supplies were valued at 13 million new roubles. It was not as if the Soviet-Chinese joint effort in the decade of the fifties had led to an industrial leap forward as a result of which China no longer needs complete plants. Peking is seeking heavy industrial plants from West Europe and Japan. Russia has also cut petroleum product supplies from 91 million new roubles worth in 1960 to 55 million new roubles worth in 1963. In 1961, Soviet petroleum product supplies to China were 2.9 million metric tonnes worth 109 million new roubles; in 1963 these exports were 1.4 million metric tons. In 1960, Communist countries as a whole sent to China goods worth $954 million, compared with $687 million worth of goods sent by non-communist countries. In 1963, Communist countries' exports to China fell to $209 million, while the non-communist countries' exports to China were still as much as $663 million worth of goods. Of these imports by China from non-communist countries, Australian and Canadian grain sales accounted for U.S. $300 million in 1963. There was no grain export in 1963 from Russia to China. Against $1.642 million worth of imports by China in 1960 from all sources in the world, imports fell to $872 million in 1963. Chinese exports totalled $1,729 million in 1960, including $985 million to Communist countries and $745 million worth to non-Communist countries. In 1963 Chinese exports to the Communist countries had fallen to $437 million and exports to non-communist countries were maintained at $761 million worth to non-Communist countries. In the Soviet Union than they purchased, so as to pay off another big instalment of the credits which China had taken.

Choice Invective

While the Chinese used choice invective to abuse the capitalist trends of Khrushchev, their big trading partners outside the communist world (excluding Australia and Canada which sell only grain) were Hong Kong and Japan, both upholders of the free enterprise system. China also used Malaya, another firm believer in free enterprise, as a market to earn surpluses.

China has had big successes in persuading Japanese businessmen and people on the great advantages in increasing sales to and purchases from China. Japan had more than $200 million worth of two-way trade with Taiwan in 1963 but Japanese businessmen appear to be inclined to risk offending Taiwan for the bigger fortunes awaiting in trading with Communist China.

Before the Second World War, China was a major market for Japanese goods accounting for more than a third of Japanese sales; as an invader Japan had built up a sorry reputation in China. During the Korean war, the Japanese economy prospered when the Americans and other U.N. forces converted Japan into a huge base for production and supply of a variety of goods to sustain the forces fighting the Chinese communists. But Japanese sales of goods to China were resumed soon after the end of the Korean war. By 1956, Japan was selling more than $67 million worth of goods a year. In 1957, the Japanese sales to China were of the value of more than $60 million and in 1958 nearly $51 million. Japanese purchases from China totalled more than $80 million in 1956 and 1957. The two-way trade was about $150 million in 1956 and more than $140 million in 1957. Then one day in 1958 a Japanese agitator tore down a Red Flag which was flying at a Chinese fair at Nagasiki. Peking immediately severed trade relations with Japanese firms.

Appreciable Rise

After Mr. Ikeda became Prime Minister, he maintained in the beginning that trading with China was difficult, because Peking demanded political concessions to resume trade. For some years after the flag incident, the Chinese named friendly firms and would do trade only with them. Chinese imports from Japan fell to $3.6 million in 1959 and to $2.7 million in 1960 but rose slowly to U.S. $16 million in 1961. By 1962, even without formal encouragement by the Japanese Government, Japanese sales to China rose to more than $38 million and Japanese purchases from China to $46 million. The U.S. liked the clash of commercial relations between the Chinese communists and the Japanese, but businessmen in Japan never gave up attempts to press for Government action to encourage trade with Communist China. Despite protests from the U.S. and Taiwan, in November 1962, a prominent Japanese politician, who was also an industrialist, Mr. Taksunosoke Takasaki, signed an agreement with the Chinese for planned annual two-way trade turnover of $150 million for the five years 1963 to 1967. In 1962 itself, the total trade between China and Japan was more than U.S.$84 million. In 1963, the total turnover was more than $137 million. Present predictions are a total trade turnover of more than $200 million, according to official sources, and $250 million according to more optimistic businessmen. In the first half of the year itself, the total China-Japan trade crossed the level for the whole calendar year 1963.

Japan's Premier Ikeda has ultimately agreed to the appointment of an official Chinese trade representative to be stationed in Japan. He arrived in Tokyo in August. Twelve Japanese radio, television and newspaper reporters left Tokyo for Peking on 27th September and two days later seven Chinese journalists arrived in Tokyo. This was the second swap, closely following the exchange of trade representatives. China and Japan had been permitting visits by journalists since 1954, but these were short-term visits to accompany trade delegations. But now the journalists are to be permanently stationed in Tokyo and Peking. Last year, there were successful Japanese exhibitions in Peking and Shanghai and this year the Chinese held a fair in Japan. Another big Chinese exhibition is planned for in Japan next year.

The Japanese Government's involvement in China-Japan trade, which was resumed on a large scale towards the end of 1962 following the agreement signed by Takasaki, came about when a Japanese firm, Kurushaki Rayon, sought the approval of the export of a Yen 7,200 million vinylon plant on deferred payment terms, 25 per cent down and the balance payable over five years carrying interest at 4.5 per cent per annum. The firm wanted credit extension through the Japanese Export-Import Bank with which the Government is associated as an investor. The Japanese Cabinet approved of the deal, provided the interest rate was increased to six per cent, partly to satisfy international objections which included the charge that the low rate of interest amounted to aid. The firm had to agree to increase the interest rate on deferred payment but it promptly reduced the price, so that the total amount payable by the Chinese would remain at Yen 7,200 million (£7.2 million sterling). This was soon followed by arrangements for the big Japanese fairs in Peking and Shanghai for which a former Japanese Prime Minister, Mr. Tanzan Ishibashi, agreed to be president of the fair organisation. The sale of another vinylon plant from Japan has been negotiated and this deal also has aroused criticism from the U.S. and Taiwan. Government approval of the deal had not been given until the end of September. The Government has had hesitation in approving the deal which again is framed on a low 4.5 per cent rate of interest. The firm, Nichibo of Osaka plans to raise non-Governmental financing of the credit, according to Japanese newspaper reports in October.

Steel, fertiliser, complete plant and textiles are the main planks on which Japan hopes to increase her sales with China. China's major exports will be pig iron, iron ore, and coal and soyabean oil. In the current fiscal year (April-March), Japanese steelmakers hope to sell 120,000 tons of ordinary steel, or more than double the steel exports to China in the last fiscal year. Japan's steel exports to China were 40,000 tons in 1962 and 50,000 tons in 1963. Chinese exports of iron ore to Japan next year may reach about one million tons.

(To be concluded)

NEW TYPES OF SOVIET AIRCRAFT

New types of Soviet aircraft were shown to Soviet and foreign correspondents at the Vnukovo airport this week.

The Chairman of Aviaexport, the Soviet trade agency in charge of aircraft exports, announced at a press conference that the Soviet Union was exporting aircraft to more than 30 countries. About 1,500 Soviet-made planes and helicopters are flown by foreign air companies. The IL-62 and TU-134 planes as well as the MI-8 helicopter will be available for exports by 1967.

Ten planes of different types were ranged on the flying field of the airport. The correspondents' attention was most attracted by IL-62 and TU-134 planes as well as by a MI-8 helicopter. These are undergoing final tests.

The IL-62, designed by Sergei Ilyushin, will carry nearly 200 passengers over a distance of several thousand kilometres, flying at an altitude of 10-12 kilometres at a cruising speed of 850 kilometres an hour. A representative of Ilyushin said that, with 70 passengers and luggage on board, the liner will be able to cover non-stop the distance between Moscow and New York.

Like Ilyushin's latest plane, the TU-134 turbojet-liner, designed by Andrei Tupolev, carries the engines in the tail part of the fuselage, which means greater comfort for the passengers. The new plane can carry 50 per cent more passengers than the previous model, TU-124, and its range has also been increased considerably, reaching 3,000 kilometres.

The MI-8 turboprop helicopter powered by two engines will replace in the near future the helicopters that earlier came off the drawing boards of the designing bureau under Mikhail Mil. The new helicopter can fly 450 kilometres non-stop at an average speed of 200 kilometres per hour. Flight and engine control are automated.

NOW—A NEW VEE-BELT WITH 40% INCREASED HORSE POWER RATING

DUNLOP introduces

MAXRATE

Maxrate is one more major development by Dunlop in the field of industrial rubber products in India. This premium rated belt will bring economy of drive space, weight and cost. How? Read on.

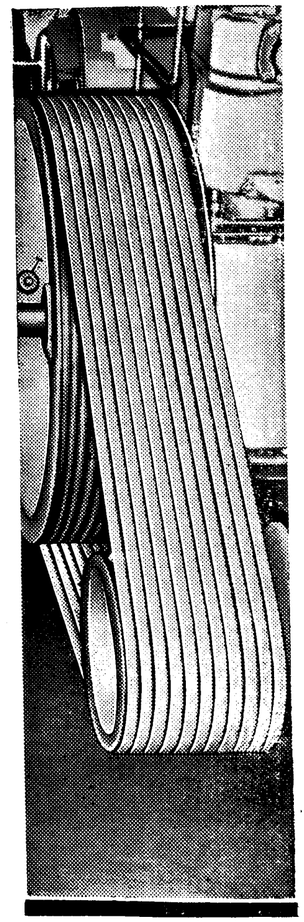
The basic factor in assessing the utility of any vee-belt is its horse-power carrying capacity. More hp means more profitability. Maxrate is developed to do exactly this. Besides, it is backed by the technical know-how and expertise of Dunlop and manufactured from the finest materials for top performance.

Here's why Maxrate 40% higher hp capacity means more economy than normal vee-belts.

1. Higher hp capacity results in compact drives.
2. Compact drives mean savings in space, weight and cost.
3. No increase in price ; thus increased value for your money.

Maxrate is manufactured by Dunlop in a wide range to suit every requirement. See your nearest Dunlop dealer for details or write to :

THE DUNLOP RUBBER CO. (INDIA) LIMITED
Industrial Products Division, 57B, Free School Street, Calcutta-16.



THIS IS THE MARK THAT IDENTIFIES

Maxrate

THE VEE-BELT WITH 40% INCREASED HP CAPACITY

62/DLP 3

RISING TIDE OF SOVIET OIL EXPORTS

THIRTY-EIGHT MILLION TONS THIS YEAR

THE tide of Soviet oil exports is still rising, though no longer at the threatening pace of the late 1950s. Then, oil deliveries from the U.S.S.R. and other East European countries to the free world increased each year by around 50 per cent, but the rate of advance declined to an annual 20-25 per cent in 1960 and 1961, and to an annual 10-15 per cent in 1962 and 1963. Now, progress is slightly more rapid than in the quite recent past, and the rate of advance may be around 15 per cent for the next year or two.

Last year, as is shown in Table I, the U.S.S.R. alone delivered some 29 million metric tons of crude and products to the countries of the free world, compared with 25 million tons the year before. In addition, some four million tons a year are being sent from countries such as Rumania, Eastern Germany, Hungary and Poland, and total shipments from the Soviet bloc thus appear to have reached a record of around 33 million tons. In the current year, according to present indications, there will be a further rise of some 5 million, with total shipments from the bloc reaching around 38 million tons. Beyond that, the authoritative U.S. National Petroleum Council has recently forecast a figure of some 43 million tons for 1965, to be followed by a gradual rise to between 65 and 80 million tons by 1970.

For 1964, preliminary trading figures—shown in Table II—indicate that the free world's imports of oil from the whole Soviet bloc in January-June, at 17.5 million tons, were 15.7 per cent higher than in the same period of 1963. Shipments early in 1963, however, were hampered by extreme weather conditions and, allowing for this, the rate of advance for 1964 as a whole may well be slightly lower than in the first six months. Crude oil deliveries in January-June 1964 were 28.5 per cent higher than the year before, and crude accounted for the larger part of recent shipments; the increase for products amounted only to 4.5 per cent.

The figures in Table II clearly demonstrate that one of the major purposes of Soviet oil exports is to finance the purchase of urgently needed imports from industrialised countries. Over three-quarters of the recent oil shipments went to Europe and more than one-tenth to Japan, leaving little more than another tenth for the rest of the free world. No Russian oil enters North America, though the Russian Soyuznefteexport has now proposed a deal under which Soviet oil would in future be delivered to the eastern provinces of Canada, in exchange for oil shipments from western Canada to the Soviet Far East.

Europe—The Main Target

Western Europe in January-June 1964 imported rather more than 160 million tons of oil from outside the area, and of this some 13½ million tons or over 8 per cent (roughly divided equally between crude and products) came from the Soviet bloc. These product imports were mainly black oils and they accounted for well over a quarter of the oil imported as products from all regions into the European area.

Virtually all European countries take some Soviet bloc oil, but its relative significance varies greatly. Finland and Iceland depend on the U.S.S.R. for the great bulk of their requirements, while in some other markets, including the U.K. and Benelux, Soviet bloc oil has so far remained a relatively minor factor. Among the larger European countries, however, Italy in January-June this year obtained from the Soviet bloc over 13 per cent of its overall imports of oil, Western Germany obtained 8½ per cent, and in Sweden—after a fairly sharp increase in recent months—the proportion reached as much as 17 per cent. Italy is indeed the world's largest importer of oil from the U.S.S.R., and a recent trade agreement foresees that Russian deliveries are to rise gradually from 6 million tons of crude and 700,000 tons of fuel oil this year to 9 million and 1,100,000 tons respectively in 1969.

A glance at Table II shows that, in response to the increase in local consumption, there have recently been sharp increases in oil exports from the Soviet bloc to Finland. There have also been increases in supplies to Greece and to Austria. The latter country depends mainly on its own crude but there are rising supplementary imports the larger part of which comes, for the time being, from the U.S.S.R. and other East European sources. Austria's reparation deliveries of crude to the Russians, incidentally, ended early this year. Another interesting recent development is the purchase, for the first time, of some Soviet crude (250,000 tons) by Spain, where the possibility of larger deals is under consideration.

World-wide Exports

Japan's imports of Soviet bloc oil in the first six months of this year reached 1.9 million tons, or 64 per cent more than in the same period of 1963. There, as in Sweden, last year's oil imports from the U.S.S.R. lagged behind the mutually fixed quotas, and they are now more in line with the official trade agreement. Beyond that, however, the Russians are trying to obtain an official Japanese commitment to take as much as 10 million tons of crude annually after the completion of the proposed pipeline from Irkutsk to the Pacific. Idemitsu, one of the largest refiners and marketers, has already offered to buy the suggested quantities, but the commitment would have to be endorsed by the Government.

The main recent purchasers of Soviet bloc oil among the less developed countries are Brazil, Egypt, Ceylon and India (in that order), and in future the U.S.S.R. will also deliver 500,000 tons of crude annually to Ghana. Egypt—the oldest Russian customer in this group—is becoming increasingly independent of imports, but Brazil foresees purchases of 1.5 million tons of Russian oil in 1964 and 2-3 million tons in 1965, and Ceylon now covers almost all its requirements from the bloc. India's oil imports from Russia have recently remained more or less static, and no sharp increases are foreseen in the near future.

Inside the Communist World

The figures in Table I, supplemented by those in Table III, also give some insight into recent developments in the pattern of oil movements within the Communist world itself. Exports of crude and products from the U.S.S.R to other Communist countries rose from 20.2 million tons in 1962 to 22.2 million in 1963 or by 10 per cent, but this increase was confined to the countries in Eastern Europe and there was an actual drop in Russian deliveries both to China and Cuba. Russia's own imports of gasoline and other products, chiefly from Rumania, remained unchanged at 2.3 million tons. No firm figures are available to show Rumania's deliveries to Communist countries other than the U.S.S.R., but these are believed to be barely higher than 1,000,000 tons annually.

Russian exports to China in 1959-61 were in the region of 3 million tons annually but, under the impact of the Sino-Soviet conflict, they declined to less than half that figure by 1963. Since then, Chinese spokesmen have repeatedly stated that their country has now become "in the main self-sufficient"—there has even been talk of oil exports from China itself in the near future. Be that as it may, Russian deliveries may be expected to dwindle further in the course of this year.

The modest recent decrease in Russian deliveries to Cuba is, on the face of it, more surprising. The explanation seems to be that the 4.4 million tons sent in the course of 1962 (*plus* some shipments from Rumania) included an element required for reserve stocks, in anticipation of the diplomatic show-down with the U.S.A., and this was naturally followed by somewhat lower deliveries in 1963. This year, on the other hand, tanker movements to Cuba appear to be some ten per cent higher than a year before, and there will no doubt be further gradual expansions as time goes on.

The supply of Russian oil to countries in Eastern Europe has been rising year by year, and will now be given a further boost with the recent completion of the Druzhba pipeline system. In 1963 the U.S.S.R. delivered to these countries 10.7 million tons of crude and 5.2 million tons of products; in 1965—according to various indications—crude oil deliveries alone will be of the order of 18 million tons. Thereafter, the U.S.S.R. will no doubt arrange for further massive increases even though there have been hints that the rate of increase will be less rapid than desired by the Governments concerned. It cannot be easy for the Russians to decide whether the oil they allocate for export should be used to serve the growing needs of the Soviet bloc as a whole or to strengthen Russia's trading position in the non-Communist world.—*By Special Arrangement with the Petroleum Press Service.*

POYSHA MAKES QUALITY CANS FOR MAJOR INDUSTRIES

FOR FOODS. Poysha is one of the very few producers of open-top sanitary cans needed by the foods industry.

FOR OILS. Leading brands of lubricating oils, greases, cooking oils and vanaspati come in lithographed Poysha cans.

FOR PAINTS. Last year, paints worth crores of rupees were packed in decorated Poysha cans.

FOR PHARMACEUTICALS... and chemicals, dyes and defence requirements, too. Poysha supplies a large part of their needs.

WILL SERVE OTHERS WITH THREE NEW FACTORIES

One of India's two largest manufacturers of tin containers, Poysha will soon be a nation-wide organisation that will offer on-the-spot services with 3 new factories. At Dighe (Bombay), Poysha will make 4 million cans a month, to serve industries in Western and Central India. At Cochin, Poysha's second new factory will make 3 million cans a month for the fishing, pineapple and other industries in the South. At Ghaziabad (Delhi), Poysha's third factory will also produce 3 million cans a month for the rich fruit and vegetable districts of Northern and Eastern India.

This production is on a single-shift basis. If at any time circumstances demand more output, this can readily be achieved by working multiple shifts.

To finance this increase of Poysha's capacity to a crore of cans every month, the Company is raising its Paid-Up Capital from Rs 25 lakhs to Rs 110 lakhs.

BANKING IN RURAL AREAS—II

CONSORTIUM OF FINANCIAL INSTITUTIONS AND MOBILE BANKS

By Dr. J. D. Sundram

EXPERIENCE of workers in rural areas indicates recurrent situations in which the following features can be observed either in isolation or in varying combinations: unused capital, unused but valuable raw materials capable of multiple uses; varying degrees of technical skill, enterprise and talent; educated, enlightened and adventuous young with ideas, but no scope or opportunity to try out any one of them and consequently migratory; shortages of skills commonly in demand and, therefore, often imported from outside; enterprising traders who also do moneylending on the side. While these features do not by any means exhaust the list of the possible complex of economic situations that exist in rural areas, they are adequate to project a clear enough picture to discern the potential of development and to appreciate the need for early action to utilise it for the realisation of the common objective.

To these features must also be added the essential socio-economic institutional complex and its influence. Most rural areas have men of character and leadership, whose social or educational status in the community can well be used to assess groups and individuals resident in the area. Also, there are organisations like the *panchayat*, or institutions with experience of constructive work, most of whom have intimate knowledge of the area and are familiar with the people, their status, their character, their aptitudes and their dependability. In most cases, while there has been no dearth of ideas or of even actual proposals for industrial effort, institutional assistance to initiate and sustain effort has been lacking. While banks cannot normally assume responsibility for initiating development, they certainly can assist, and, in fact, have assisted, agreed and approved projects of industrial development. Much of the indigenous trade of these areas, both within and without, has been developed by unlicensed moneylenders who, through both commodity and credit loans to the residents, have acquired a tenacious hold on the socio-economic life. Their enterprise and trade acumen have brought into the isolated rural areas something of the great change in tastes, fashions and preferences of the outside world. So far, theirs has been a role, the value of which has tended to be at best ignored where it has not been emotionally condemned. The problems of vastly accelerated development of rural areas arise precisely from the socio-economic conflict between groups of population; and the challenge they offer is for an institutional set-up that will mobilise and direct the energies of the various groups towards the common objective of socio-economic well-being.

Operational Strategy

Our concern here is not to present a blueprint for the reform of the entire socio-economic institutional set-up. Our modest objective is to suggest an operational strategy that seems to promise the maximum flexibility and economy together with maximum physical coverage of areas, without adding to the prevailing problems. The working of any suggested mode of operations will involve a number of adjustments to suit the needs of the specific areas covered; but these adjustments are essentially administrative and not fundamental change in organisation or in operation. Whether the suggestion outlined below is or is not appropriate can be examined only against the nature of the problems experienced in rural areas for the organisation and conduct of non-agricultural, particularly industrial, operations.

As pointed out above, few doubt that, in some rural areas and in some larger semi-urban areas, there is vast potential for development in the form of raw materials, skills, managerial personnel and, for some products, limited markets. What has often been lacking is technical guidance for the adoption of an appropriate technique that will ensure production on a scale commensurate with the available market and at prices suitable to ensure progressive expansion. The problems in the interior of the country are not different in nature or in their essence from those in urban areas; but because of the locational peculiarities and the almost primitive infrastructure available, they call for a new set of standards of assessment and evaluation of proposals for new activities.

It is, however, common knowledge that entrepreneurs, even in the large urban areas, have not been able to secure loans from the country's established financial institutions. Experts in their own line have testified to the soundness and feasibility of the proposals for the manufacture in rural areas of products based on local raw materials catering to local markets; but, owing to their inability to secure the assistance needed to get off to a start, the majority of them (entrepreneurs) have migrated to urban areas. Public sector assistance, that is, financial assistance provided by all-India bodies, such as the Khadi and Village Industries Commission and the All-India Handloom Board, has been motivated, at least in part, by various ideological considerations and the consequent restrictive selectivity in the kind of activities for assistance. The financial assistance provities. This restriction on their operations associated with certain techniques or modes of production, and to the arrangements for the subsidised sale of their products. This approach to development narrowed the scale of their operations, because of the inevitable restrictions imposed by effectiveness of administrative organisation, inspection, etc., to prevent abuse or outflow of assistance to unauthorised activities. This restriction on their operations precluded in practice an approach to, and the consideration of, the totality of the development potential in a given area and the scope for its gainful and socially significant exploitation, in favour of unproductive semantics of purity, etc.

The experience of entrepreneurs with State Financial Corporations and similar public institutions has been one of frustrating delays. The mode of applications for assistance, the many involved processes for their scrutiny, the manner and types of inspection and verification, and also the stipulations regarding the percentage of owned resources, etc., to qualify for accommodation have been found to be unrealistic, cumbersome and wearying even to entrepreneurs in the large urban areas; and they certainly have been, and are far beyond the resources of the simple, unsophisticated entrepreneurs in rural areas. It is on this account that institutions like private banks have had greater success even within the limited volume of operations and coverage; and it is precisely the reason why a suitable operational strategy for them acquires a special significance.

Relaxation of Restrictions

Constituted as they are at present, private commercial banks are subject to two principal restrictions, legal and operational. Statutory restrictions confine the activities of banks to what are considered to be "safe," even when the periods for which they advance loans are short. If banks are to be effective and operative institutions in rural areas and assist, sustain and promote diverse industrial activities, there will be need for relaxation of a number of legal and conventional restrictions, normal inspection procedures as well as positive aids in their operational modes. None of these, however, poses a problem beyond the competence of the Government or the monetary authority to solve satisfactorily. As what is proposed is a departure from present practice and is, therefore, new, conventions to accord with the new patterns of operations and services may have to be evolved and adopted.

Among the operational difficulties extension of banking services to rural areas presents, the most important are the problems of establishment and effective operation at economic cost. It is the opinion of bankers that a new branch even in an urban area takes about three years to become fully self-supporting; and in a rural area that has had no banking before, this period may be much longer. To have a fixed office in a satisfactory building, etc., in a rural area will entail expenditure that may be altogether uneconomic from the point of view of savings mobilised from, and funds invested in, the area. Earnings of the banks will be small and slow to materialise. In these circumstances, having an office in every likely area may not be worthwhile at all. If, however, an office can effectively serve what may be decribed *as a viable area with a viable population in a non-conventional manner. the total net expenses may well be offset by total net earnings from the total area effectively covered by it.*

Mobile Banks

What may be considered a viable area and a viable populaton can be covered through mobile banks mounted on trucks appropriately fitted and suitably manned, that is, banks that on certain days of the week visit certain places at a given time and for a given period of those days. Any one office in a centre can, through such mobile banks, cover areas within a radius of, say, 15 miles around it. The number of mobile banks required per office will depend on what is considered to constitute a viable area and population and the number of places that will need to be covered on that basis. Each mobile banking unit can cover several areas per day depending on its distance from the centre. Effective banking hours for the public even in metropolitan centres, such as Bombay and Calcutta, are not more than three to four hours a day; and in a small rural area, it may be possible to serve the population, after the initial period, even with a two-hour working day. If the work-schedule is planned for each mobile bank in detail, it may be possible for each mobile bank to cover in a day two or three places, depending on the degree of familiarity acquired by the people in the areas visited and the distance to be travelled from the centre. To ensure continuity of contact, the same mobile unit with the same personnel may visit two or three areas on all the days of the week or, to attain greater coverage, it may visit certain areas on certain days and others on certain other days during a six-day week. On this basis, one bank office situated at a convenient centre in a district or a taluka town can ensure the widest possible coverage and avoid, at the same time, *pro rata* increase in operational expenses—on building, maintenance and staff. The net addition to cost of the mode of operations suggested here would be the expenses on the operation and maintenance of the truck and some marginal addition to the allowances to staff for the extra hours or work involved. Some standardisation in this respect also can be visualised by evolving over a period of time work-schedules for each mobile unit in such a way that the hours of work per week do not exceed a given number. This is a matter of detail, and intrinsically there is nothing in it that poses any insuperable problem. It need not, therefore, be examined in detail here.

Organisation

The point that needs the most objective and earnest consideration is the organisation of the central office that runs the mobile banks, the functions it is prepared to undertake and discharge through the mobile units in the area, and its structural and monetary relationship with the hierarchy of banking and financial institutions in the area to be covered through mobile banks and in the rest of the country. It may once again be stated that the purpose of extending banking services to rural areas is not merely to correct the statistical imbalance that exists at present but to evolve an operational strategy that has the potential to make available to rural areas the types of financial, technical and commercial assistance that can now be had in large urban areas.

It is common knowledge that industries in rural areas must be based either on the output of agriculture in the area as their principal raw materials or on the processes of agriculture itself or the pattern of the evolving and growing demand of the population resident in the area. The development process itself generates a number of forces of varying intensity and influence that affect the pattern of prevailing demand and lead it into newer directions. The increased number and variety of activities, mostly non-agricultural, that a development process includes necessitate and make possible intensification of agricultural activities, rise in productivity per unit of input and larger gross output. It is an economc commonplace that integrated development of rural areas implies and involves activities that will, over a short period, affect to a smaller or greater degree every segment of the rural population. A deliberate attempt at development involves in addition the provision for a socially significant pattern of inequalities in the distribution of its benefits without at the same time dampening private initiative, enterprise and leadership.

What, therefore, appears to be of paramount importance is the concept of area or regional development. which is large enough an ideal to enthuse the people and evoke a sense of loyalty and, therefore, secure their co-operative participation, and small enough to derive from it significant social and economic results.

At the lowest level of operation, the legal and operative niceties that divide banking and financial institutions lose much of their significance and value. While banks, by convention and law, confine their activities to financing short-term commercial transactions or at best to medium-term loans to industries, other financial institutions cover medium-term and long-term activities mostly for industries. For agricultural activities, we have again a separate structure of co-operative credit institutions or land mortgage banks providing short, medium and long-term capital. Besides these, there are institutions on the fringe such as the wide variety of corporations for industries (Industrial Finance Corporation, State Finance Corporation, Industrial Credit and Investment Corporation of India, etc.), refinance corporations separately for agriculture, and industries, and corporations for small industries, warehousing corporation, and comparatively new institutions such as the Industrial Investment Bank and the Unit Trust.

Quick Service

The functional differentiation of these institutions no doubt facilitates mobilisation and utilisation of funds for varying periods and purposes, but, at the lowest level of operation, the administration of these aids by each institution separately becomes involved, cumbersome, and altogether bewildering to the unsophisticated in the rural areas. As in the larger urban areas, so also in rural areas, there is need for short, medium, and long-term loans for agriculture, industry, local and regional trade. Effective institutional service, however, depends on the utmost simplicity of procedures, consistent with maximum security of funds. This again emphasises the need for an operational strategy that, while maintaining organisational and functional differentiation, will assure quick service of all types through one agency under one roof.

In the matter like evolving an effective and efficient operational strategy, one can at best suggest for serious consideration what appears workable and leave the details of actual institutional arrangements for further detailed consideration. Viewed from the point of view of the small entrepreneur, the trader or the agriculturist in the rural area, the present multiplicity of agencies is indeed frightening. And, in relation to the individual bank's financial or administrative capacity, these needs are far too many in number and far too diverse in character. The problem then is whether it is possible to reconcile functional differentiation with operational and administrative unity, without sacrificing the basic essentials of each of the financial institutions concerned or of their respective investors.

The most effective way seems to be to set up a consortium of financial institutions, requiring each of them to invest a given volume of their respective funds so as to involve every one of them in the process of the integrated development of rural areas. The stake of each in any given area will depend wholly upon that area's capacity to absorb its aid, that is, utilise it effectively and realise its promised results, with an assurance of the availability of all other assistance that may be simultaneously needed.

An illustration here may simplify what is sought to be conveyed. An entrepreneur, who has a command of required personnel to manufacture a product likely to find a large market and raw materials for which are locally available, needs long-term loans for land and buildings, and for certain types of imported machinery and spares. He may get a loan for buildings, let us assume, from the I.F.C., for machinery from the I.C.I.C.I. and short-term loans for working capital from one or more banks. One who manages to secure financial assistance of these types may be in a position to provide collateral acceptable to each of these several institutions, singly or in co-operation with others. His venture necessitates assistance not merely for his start but also for continued operations of production, transport and sale, the last two being entrusted to others, who, in their turn, will seek working capital from appropriate agencies.

Unification of Aids

In an urban area, approach to different insituations and negotiation of loans of varying duration for various purposes are well known and have been practised for long periods of time. In the rural areas, even in the comparatively large ones, people are not familiar with the sophisticated processes of application and procedures of investigation. In the initial stages, it may not be possible to make much progress in development, unless the institutional set-up is simple enough to encourage confidence, and procedures are informal enough to elicit fullest cooperation. Unification of aids under one administrative agency may not be as difficult as in large commercial centres such as Bombay or Madras, where investigational procedures have to be rigorous and thorough. In a rural area, proposals for any developmental activity can be assessed far more easily, provided the contact is established as the base itself. The status and antecedents of the applicants, their character and aptitudes can each be ascertained, checked and evaluated quickly, as the banks in several areas have been able to do already in the areas where they operate. Extension of this idea to cover all the economic activities in a given area may pose no more than an administrative problem: a method for more extensive investigational procedure to cover activities not so far brought into an overall assessment.

The consortium of financial institutions that is suggested here will have for its area of operation (of unified credit of all types) the district where its area is manageable and the population fairly homogenous. The existing socio-economic-administrative complex of the district, or any smaller part of it that is taken as its field for effective coverage, should form part of its consultative agency. The institutional complex referred to here includes not merely administrative officers, such as the collector or tehsildar if the unit of operation is the taluka, but also heads of co-operative unions, banks, land mortgage banks, and also of constructive workers or their institutions, chairmen of *panchayats* or of *zilla parishads*. Effective operations may need the active assistance and involvement of all these agencies in the programme of integrated economic development. Such a body will represent a knowledgeable board of reference and assessment, provided the basis of evaluation of a given project is freed from ideological predilections such as techniques, but is based on its economic and technical and, where need be, commercial viability. Such a body will be too large for effective day-to-day work; and, therefore, its functions may be confined to the consideration and approval of the broad strategy of integrated, economic development of the given area, its implications for administrative adjustments, social or economic discipline and the host of measures that will be necessary to assist the implementation and working of the programme of development that is finally and jointly adopted.

For the assessment of the viability or soundness of projects brought in by the mobile units from the areas, the body of reference must be more compact and consist of people of the areas themselves. The basis of any assesment of any project will be its economic and operational feasibility over a period of time, its potential for expansion, etc., and the security of loans determined in each case on the basis of the individual or individuals concerned. In brief: the operational strategy suggested here provides the means to establish the type of contacts between the institutions and the persons, in which character, that is, the integrity and ability of the person, becomes an essential part of the final assessment and in which a potentially viable project does not suffer for want of merely financial assistance of the type and for the duration needed.

The adoption of a consortium of financial institutions at the centre and a number of mobile banks to extend and provide banking and financial services to places within a given area should be confined for the present to areas that are known to have the potential for rapid economic development. At all costs, the temptation to adopt a system as this for the entire country must be avoided, because the personnel to provide services of this nature are not at present readily available, and too rapid an extension may pose problems of essential security too difficult to handle effectively and successfully. It may, however, be possible to provide the types of services visualised here in some of the districts where the package programme is in effective operation or where rural industries projects have been introduced, or where the Khadi Commission's Intensive Area Scheme has been successfully implemented and obtain valuable experience, in the light of which legal and operational norms can be evolved and adopted, and the training of administrative and managerial personnel can be planned and undertaken.

Institutional Framework

It has already been pointed out that provision of effective assistance in an efficient manner for the integrated economic development of rural areas will involve several changes in the present laws governing the functions and operations of the various banks and other financial institutions. The basic institutional framework, however, does exist in many districts in the shape of branch offices of large commercial banks, including the State Bank of India. What is needed is institutional integration, reorientation and direction to subserve the basic purpose of economic development of areas where the majority live in grinding poverty.

What has been suggested here may appear novel, and to some even revolutionary; and some may consider the proposal as one that involves a convergence of too many lines of communications and reference to be effective. That it is novel in the sense that an attempt at effective unification of aids is suggested has to be accepted; but the second point of view should be dismissed as reflective of the continuance of an outlook from the urban centre to the rural areas rather than *vice versa*. What needs to be fully and wholly appreciated is the need for an integrated system of financial assistance at the base, where development is most needed. What type of institutional set-up will ensure it is a matter for administrators to consider. All that is claimed for the proposal outlined above is that a consortium of financial institutions assisted by fleets of mobile banks seems to offer a model that appears workable.

CAN CHAMBERS OF COMMERCE HELP COMBAT CORRUPTION?

SANTHANAM COMMITTEE'S PROPOSALS ANALYSED

By A Special Correspondent

THE Government of India is now making serious efforts to combat corruption in the country. Every citizen is, or ought to be, interested in ensuring a clean administration. The chambers of commerce and trade associations should be particularly concerned with this problem, because nothing will do more damage to our economic progress than corruption in Government and business community. But the precise role which these organisations can play in fighting this menace does not appear to have been properly recognised.

The Federation of Indian Chambers of Commerce and Industry, as the premier industrial organisation in the private sector, could have taken some courageous measures to assist the Government in this campaign. But the Federation has not only not taken any initiative but, unwisely, withheld its cooperation from the Santhanam Committee. In its report (page 12), the Committee says: "We have to point out, with regret, that, while a number of trade associations and chambers of commerce readily accepted our invitation to help us with their views and advice, the Federation of Indian Chambers of Commerce, which could have given powerful support to fight corruption, would not even accept our invitation to meet us."

It is, however, never too late to co-operate and one hopes that the Federation and its constituents throughout the country will play an active part in the war against corruption.

But how exactly can this be done? Before answering this question, it will be worthwhile to trace briefly the role of these organisations in our economic life.

Basic Functions

Chambers of commerce have been in existence in our country for over a hundred years. In the beginning, they were few in number and their functions were relatively restricted. Briefly, their work was to protect and promote the trade and commerce of the country. After the attainment of independence, many chambers began to take a keen interest in the industrial development of India and more particularly of the regions in which they were situated. Some chambers have enlarged their activities in recent years and they now take interest in the advancement of commercial and technical education, in undertaking research work and in improving the civic administration. But, broadly speaking, the functions of chambers continue to remain what they were many years ago, namely, to safeguard and promote commerce and industry, to urge or oppose legislation concerning commerce and industry, to secure concerted action on subjects in which the interests of their members are involved, to nominate delegates and advisers to various conferences, to collect and circulate statistical and other information regarding economic development, to arbitrate in trade disputes, and to do such other things as will help the development of commerce and industry.

As regards the role of chambers and trade associations in rooting out corruption, the Santhanam Committee has made some important observations. Since a considerable amount of corruption arises in the process of granting licences and allocating scarce goods, the Committee feels that it would be advisable to utilise the services of these organisations for this purpose. The organisations, which gave evidence before the Committee, pointed out that they would not be able to undertake full responsibility in matters relating to the grant of licences and the allocation of scarce goods. The organisations could only act in an advisory capacity. But then there are some impediments. Membership of these bodies at present is purely voluntary. Those who remain outside them or who, for some reason or other, are expelled, can continue to get their licences or permits. The Santhanam Committee, therefore, has recommended that "serious thought should be given as to how trade associations or their representatives could be associated in the matter of granting licences and allocation of scarce goods."

The Committee observes: "We consider that membership of a recognised trade organisation should be a necessary condition of eligibility for obtaining a licence or permit. The organisation should screen the capacity of the applications, their past performance and conduct and make recommendations to the licensing authority. These organisations may also be usefully associated in investigating modes of misuse and misutilisation of goods obtained under licence and modes of manipulation of prescribed rules, procedures and forms for obtaining undeserved advantage. We recognise that many details will have to be worked out like the principles of recognition, protection of the small trader, prevention of arbitrariness, etc. We suggest that this question may be dealt with by the concerned Ministries in consultation with the trade organisations."

Some Practical Difficulties

But till now it appears that neither the Ministries concerned nor the trade organisations have made a move in working out the details of such a scheme. Obviously, there are practical difficulties. In the first place, there are very few chambers or trade organisations which have the staff and the resources necessary for undertaking such a vast and responsible work.

Secondly, apart from major cities like Calcutta, Bombay, Madras, Delhi and a few others, in the other parts of the country, there are no trade associations worth the name. Even if some are started now, it will require several years before they can take up with confidence such a complicated task. Businessmen in the mofussil areas, generally speaking, lack the education, the background, and the organising capacity to set up and manage industrial or trade associations.

Thirdly, if chambers and trade associations are to take up this work, it is likely that, at least in some cases, their normal work may be affected, for example, export promotion. The Mudaliar Committee suggested that chambers "must, on their own, and with the active assistance of Government, interest themselves in probing the international market with a view to studying overseas needs in the light of Indian possibilities. More specially, they should undertake market researches and cost studies and take such other measures as would give a fillip to the country's export activities." But it would seem that, if chambers are to play a big role in export promotion, not many of them will be able to assume fresh responsibilities on the scale proposed.

Fourthly, it should be emphasised that even with the best will in the world, it would be difficult for non-official bodies to draw up, for recommending licences, rules or procedures which will be wholly free from arbitrariness.

It does not mean, however, that chambers or trade associations cannot play an effective role in curbing corruption. Even if they do not take over the type of work recommended by the Santhanam Committee, they can still render valuable services in eliminating the evil. They can, for instance, remove from their ranks members who have been convicted of corrupt practices. They can also create strong public opinion against corrupt practices and persuade their constituents to refrain from resorting to them. Some of these practices are: applying for licences on the basis of forged essentiality certificates, selling of goods imported against actual users' licences instead of utilising them in the industry; applying for licences on the basis of invalid income-tax verification number; trafficking in licences; selling of goods before their clearance through customs and violating other conditions of licences; over-invoicing and under-invoicing of goods at the time of import and export; pledging of goods without the licensing authority's permission; applying for duplicate copy of licences by concealment of facts; importing goods against bogus licences; and smuggling of goods.

But the chambers can play their part effectively only if the Government also adopts appropriate measures. Apart from eliminating administrative delays, the Government must avoid creating conditions which breed corruption. Representatives of trade organisations and other non-officials told the Santhanam Committee that a major cause for corruption was that Governments took upon themselves more than what they could manage by way of regulatory functions. On this point, the Santhanam Committee commented: "We are not in a position to assess the correctness of this criticism. But it is to be recognised that, in all those fields where Government interferes to regulate and control, there is scope for abuse. While it is not possible to accept the proposition that Government should divest itself of all regulatory functions and powers of control, it appears that it would be desirable for each Ministry/Department to undertake a review of the regulatory functions which are its responsibility and also examine whether all of them are necessary and whether the manner of discharge of those functions and of the exercise of powers of control are capable of improvement. We recommend that such a review be made."

However, so long as the belief persists that socialism is synonymous with a steady expansion of the public sector, it is doubtful if the Government will be prepared to divest itself of any of its present functions or to refrain from further encroachment on the sphere of the private sector.

TWENTY YEARS OF BENELUX

Travelling to Belgium, the Netherlands or the neighbouring Grand Duchy of Luxembourg, one crosses borders without any control; the turnpikes are always open, and there are no customs officers. Some travellers may think that this is one of the achievements of the European Economic Community, popularly known as the Common Market. But that is not quite true, as travellers going on to Germany, or from there to France or Italy, will still be "controlled" by border officials at the borders of these three E.E.C. countries, though less thoroughly than in former times. The difference is due to the fact that, inside the as yet incomplete E.E.C. customs union, there is already a smaller complete customs union, consisting of the three smaller countries of the Community, namely, Belgium, the Netherlands and Luxembourg. This union is known as Benelux.

Benelux was established twenty years ago by the Belgian, the Netherlands and Luxembourg Governments while in exile in London. (The three countries were still under occupation in 1944.) The treaty establishing the customs union came into force in 1948. Ten years later, that is, in 1958, came the establishment of the E.E.C. (consisting of France, Italy, Germany and Benelux). Three years later, that is, in 1961, the Customs Union among the Benelux countries became an economic union through a supplementary agreement among themselves concluded in 1958.

Under this agreement the Benelux countries set themselves the goal of establishing an economic union, similar to that of the E.E.C. They have in the past excluded currency and financial policy, agricultural and social integration. Now, however, in the wider scope of the Community of the Six, these fields will be gradually aligned also in Benelux union. Between the three partners, there is very close co-operation, above all, in all important fields of economic life. On trade policy, in particular, there is continuous consultation. In the industrial field, Benelux already forms one unified region today.

It is obvious that the experiences, the success and failures of the ten-year-old Benelux organisation are of great practical use for the designers of the European Community of the Six. In view of the stormy development of the E.E.C. in the last few years, the Benelux market, with its well over twenty million inhabitants, may have had less attention by the general public than it would deserve. Moreover, the observer would in vain look for any institutional establishments, in the style of the European Community where executives with far-reaching authorities represent the joint interests of the Community. But the establishment of institutions such as those of the E.C.S.C., E.E.C., and EURATOM was urged by the Benelux countries in particular, based on their own experiences with their economic union.

THE CALCUTTA ELECTRIC SUPPLY CORPORATION LTD.

CHAIRMAN, MR. I. A. MACPHERSON, REVIEWS ACTIVITIES

RECENT RISE IN SELLING RATES OF POWER UNAVOIDABLE

THE Sixty-seventh Annual General Meeting of the Calcutta Electric Supply Corporation Limited was held at London on Friday, 23rd October 1964. In his review for the year ended 31st March 1964, Mr. I. A. Macpherson, Chairman of the Company, has stated that the Company had no option but to put into effect further increases in electricity charges towards the end of the year 1963-64. These increases, he explained, were designed to enable the Company to earn its reasonable return which was based on a standard rate of 6½ per cent, instead of the former 6 per cent. In the absence of unforeseen circumstances the Chairman said, the Company would be able to achieve this result in the current year.

Following are extracts from Mr. Macpherson's review:

The event which, for us, as for everyone in or connected with India, overshadows all others has been the death of Pandit Nehru on the 27th May. It would be a presumption for me to try to add to the world-wide tribute already paid him, but I may perhaps be permitted to remark that it would be difficult, if not impossible, for a company such as this to operate under any other system than that of the parliamentary democracy of which, in India, Pandit Nehru was the architect and custodian.

Growth of Undertaking

The regulative measures which the Government had to adopt to ensure the optimum utilisation of available power resources were aimed primarily at reducing the peak demand on the Company's system. The commissioning of the 50 MW extention to our New Cossipore Generating Station last October and more recently of our Southern Receiving Station have already allowed several of the restrictions to be relaxed. Towards the end of this year, when the output of further generating plant will be put at the disposal of the State Board, our offtake at Southern Receiving Station will be stepped up to 80 MW and the position will be further relieved when, during the first half of next year, we commission our Belur Receiving Station designed to take in 100 MW of power from the State Board's Bandel Generating Station. Provided they are backed by adequate State Board resources, the commissioning of these two receiving stations should enable Government to relax the restrictions remaining. Restrictions notwithstanding, our outturn again broke all previous records and over the five-year period 1959-60 to 1963-64 as a whole the average rate of growth in terms of units was about 8½ per cent compound.

Revenue Account

Revenue from the sale of electricity and for meter rents at £14.8 million was over £1.7 million (13 per cent) up last year. This is a much higher rate of increase than is suggested by the increase in units sold. The main reason is that the monetary figure of sales includes coal surcharge revenue which arises by reason of increases in the delivered cost of coal—increases which, of course, are also reflected in additional revenue expenditure. Revenue expenditure increased by almost £1.2 million; of this £885,000 was due to enhanced generation, transmission and distribution costs. During the year our stations, in generating 2,077 million units, burnt 1.49 million tons of coal at a cost of £4.48 million, comparative figures for the previous year having been 1,841 million units, 1.33 million tons and £3.81 million. The net revenue account shows that, despite an increase of about £560,000 in the balance brought down from the revenue account, the charge for Indian taxes declined by nearly £150,000. This is, for the most part, due to the fact that our estimated Indian income-tax liability on the profits of the year has been greatly reduced by income-tax development rebate claimed on new plant commissioned during the year. It is this saving of tax that gives rise to the appropriation in the net revenue account of £201,021 to the development reserve, This is a mandatory appropriation under the Electricity (Supply) Act and has the effect of equating the Company's clear profit with the reasonable return allowed by that Act. We have thought it prudent to build up a taxation contingency reserve with an initial appropriation of £250,000 which is accordingly debited in the net revenue account. As last year, we have again made a special appropriation to plant expansion and contingencies out of net revenue. although this year it has been increased to £550,000. I would emphasise that this latter appropriation, together with those to the development rebate and to the taxation contingency reserve, remained invested in the undertaking where, in conjunction with the revenue account allocation to depreciation of over £1 million, they played a major part in financing the expansion of the undertaking during the year.

No Option

Although the Company's clear profit was, for the first time for several years, equal to the reasonable return, this was in large measure, due to the substantial saving in Indian tax arising out of development rebate. Had it not been for this the clear profit would have been substantially less than the reasonable return. As it was foreseen that we would not again benefit from development rebate on the same scale and that our clear profits would, in consequence, be less than our reasonable return, we have had no option but to put into effect the further increases in our charges for electricity which were introduced towards the end of the year 1963-64. These increases were designed to enable the Company, in a normal year, to earn its reasonabe return which, as was explained last year, is now based on a standard rate of 6½ per cent instead of the former 6 per cent. In the absence of unforeseen circumstances, we hope to be able to achieve this result in the current year.

Finance

In ordinary circumstances, the financing on a more permanent basis of the recent £3½ million extension at the New Cossipore Station would have been achieved by an issue of shares or debentures or both, but we were advised that this would not be practicable in view of the fact that, under its license, the Company can be taken over by the Government of West Bengal or by the State Electricity Board on the 1st January 1970 provided either of those authorities gives one year's notice of its intention. We had, therefore, to explain to the Government of West Bengal that if Government could not tell us now either that we would not be taken over in 1970 (in which case we would have hoped to be able to raise medium-term finance), or alternatively, that they would be taking us over in 1970 (in which case a short-term loan repayable out of the compensation moneys would have been possible) we saw no prospect of being able to raise the money unless Government themselves would guarantee repayment. Government's decision was that they would guarantee repayment and we were thus able to go ahead and arrange a loan from the State Bank of India. This loan is for a sum of Rs. 4.7 crores (£3½ million) repayable on 30th December 1969. The Company's forward estimates indicate that during the period 1963-64 to 1969-70 capital expenditure will amount to some £18½ million (Rs. 25 crores), inclusive of the unpaid balance of expenditure on 1st April 1963 on the New Cossipore extension. Provided the Company can continue to earn its reasonable return we estimate that we can look to internal sources (mainly depreciation and retained earnings) to provide about £15 million of this sum. The recent loan from the State Bank will bridge this gap which means that, as far as can at present be foreseen, it should provide the balance of the funds we shall need for the development of the undertaking in order to fulfil our statutory obligations until 1970.

The report and accounts were adopted.

Note: *This statement is not a report of the proceedings of the Annual General Meeting referred to above.*

THERMAL SCHEMES

The fourth Plan thermal schemes for which advance action is to be taken in the third Plan itself are: Ramagundam extension (200 m.w.) and Kothagudam extension (240 m.w.) in Andhra Pradesh; Pathrathu extension (400 m.w.) in Bihar; Basin bridge extension (30 m.w.), Neyveli extension II (200 m.w.) and Ennore (300 m.w.) in Madras; Satupura extension (375 m.w.) and Korba extension (200 m.w.) in Madhya Pradesh; Nasik (250 m.w.), Purli (60 m.w.) and Chanda (500 m.w.) in Maharashtra; Dhuvaran Extension 250 m.w.) in Gujarat; Harduaganj extension (100 m.w.) in Uttar Pradesh, and Durgapur extension (140 m.w.) in West Bengal.

PROGRESS REPORT ON PORT DEVELOPMENT

OPTIMISTIC REVIEW BY TRANSPORT MINISTER

THE aggregate amount of *sea-borne* cargo handled at all the ports in India has been increasing by about four million tonnes per annum in recent years. According to the statistics provided by all the Port Trusts and the Administrations of Maritime States, the total cargo passing through them has increased from 46.6 million tonnes in 1961-62 to 50.6 million tonnes in 1962-63 and 54.0 million tonnes in 1963-64. If the yearwise figures pertaining to *coastal trade* are deducted from these totals, it is seen that the aggregate amounts of cargo involved in *overseas trade* were 32.6 million tonnes in 1961-62, 34.6 million tonnes in 1962-63 and 37.3 million tonnes in 1963-64. For the first time, however, the *Monthly Statistics of the Foreign Trade of India* has provided its own figures of the quantity of cargo involved in India's overseas trade during 1963-64. According to that publication, the aggregate cargo handled in that year was 30.9 million tonnes—that is, 6.4 million tonnes less than the figure (37.3 million tonnes) worked out from the returns of the Port Trusts and the Administrations of Maritime States. There is thus a discrepancy between the two sets of figures, and Mr. M. A. Master, a leading commentator on port and shipping matters, has recently drawn pointed attention to this difference. A more reliable and authoritative estimate of cargo involved in India's overseas trade (both imports and exports) is, therefore, called for.

For the present, both the estimates—30.9 million tonnes and 37.3 million tonnes—for 1963-64 may be adopted for working out the quantity of cargo handled by Indian bottoms. It will be recalled here that the Chairman of the National Shipping Board, Mr. Raghunath Singh, recently estimated the share of Indian shipping in overseas trade at about 18 per cent in 1963-64. If this proportion is deemed correct, it would mean that anything from 5.6 million tonnes (18 per cent of 30.9 million tonnes) and 6.7 million tonnes (18 per cent of 37.3 million tonnes) must have been carried by Indian ships during that year.

Third Plan Outlay

That is by the way. What is immediately in question here is whether port development in India is proceeding well and fast enough in the context of a possible annual increase of about three million tonnes of cargo in overseas trade or about four to five million tonnes in all seaborne (including coastal) cargo. It is by no means certain that port expansion and development schemes of the third Plan period, involving an aggregate outlay of Rs. 111 crores in respect of nine major ports (Calcutta, Bombay, Madras, Mormugao, Visakhapatnam, Cochin, Kandla, Mangalore and Tuticorin), will be completed according to schedule, considering that the actual expenditure in the first three years of the Plan has come to only Rs. 46 crores. Mr. Raj Bahadur, Union Minister for Transport, is, however, confident that, in view of the present momentum of port development, as much as Rs. 104 crores will have been actually spent over the third Plan period, *vide* his speech at the meeting of the National Harbour Board, held at Panjim in Goa last week. The important points made by the Transport Minister in that speech are highlighted in the following paragraphs.

Calcutta: Most of the schemes carried forward from the second Plan have been completed. The remodelling of the marshalling yard is expected to be completed by March 1965. As regards new schemes, the estuarian dredger, costing Rs. 2.5 crores, will be delivered in March 1965. Two new pilot vessels, costing Rs. 1.8 crore, have already arrived. Work on the expansion of the arms of King George's Dock is in progress.

Haldia: A Master Plan has been prepared for this new port to be constructed near Calcutta to accommodate ships with a draft of 35 feet. The rail and road links to the port are under construction. A pipeline is being laid to connect the port with the Barauni Refinery. The World Bank is actively considering the grant of a loan to cover the foreign exchange requirements of the project.

Bombay: Tenders for works connected with the Dock Expansion Scheme have been received and are being scrutinised by the Port authorities. Meanwhile, preliminary arrangements connected with the project are under way. As regards dredging of the main harbour channel, the work on the first and second expansions to Phase I, covering the north and middle sections of the channel, has already been completed and work on Phase III, covering the southern section of the channel, will commence presently for completion by December 1965:

Madras: The new Wet Dock has just been completed and will be formally declared open on 6th November. The port can now handle increased quantities of foodgrains. One of the three berths on the eastern side of this dock is proposed to be earmarked for iron ore traffic. This ore traffic will be handled with an up-to-date mechanical plant, with a capacity of 2,000 tons per hour. The foreign exchange required for this mechanisation project is proposed to be met from the savings available in the loan already made by the World Bank to the Port Trust.

Visakhapatnam: The work on the iron-ore handling plant has gathered momentum and is likely to be ready by April 1965. At present, the port can handle vessels of 33 ft. draft only. It is expected that the Port Trust will prepare a full project report soon for carrying out the work to enable the port to handle vessels of 38 ft. draft.

Kandla: The scheme for bringing the second oil jetty into use is being finalised. The Ministry of Railways has decided to go ahead with the execution of the B. G. link between Kandla and Ahmedabad via Jhund.

Cochin: All the new berths in the Ernakulam Channel are now in commission. In addition, the construction of an open berth in this channel for handling coal has been sanctioned and the work is in progress.

Mangalore and Tuticorin: Preliminary works connected with the construction of these two new ports in South India are under way. Detailed lay-outs and designs for breakwaters and other installations for the two ports have been finalised. The projects will be executed with the least delay.

Mormugao: This port, which handled 5.6 million tonnes of iron ore in 1963-64, is proposed to be developed to handle an export of the order of 10 to 12 million tonnes of ore and about two million tonnes of general cargo. To deal with this large ore traffic, mechanical facilities for loading at a rate of 3,000 tons per hour are contemplated. In order to enable the port to take in deep draft ore carriers, an order for a new dredger has been placed; this is expected to arrive by the middle of next year.

Intermediate and Minor Ports

Mr. Raj Bahadur's review is also notable for its reference to intermediate and minor ports. The Centre has provided nearly Rs. two crores for the four years 1961-65 to maritime State Governments for carrying out works in minor ports. This actual allotment, incidentally, is very much less than the third Plan provision of Rs. 7.2 crores for such Central loans. Important items of work are in progress in Mirya Bay, Cuddalore, Neendakara and Okha. Foreign exchange for the Paradip port project in Orissa is being provided according to requirements and the Orissa Government's request for financial assistance for the completion of the project is under consideration. An expert committee has recently reported on the improvements required in intermediate and minor ports for alongside berthing of small coasters and mechanised sailing vessels The Hydrographic Survey Committee of the National Harbour Board has also urged the need for completing the survey of India's coastline from the point of view of coastal trade and port development.

All in all, if port development proceeds according to plan, the handling capacity of India's ports is bound to increase appreciably in the coming years, thereby preventing the recurrence of the kind of congestion that has been witnessed in recent months in the major ports of Bombay and Calcutta. The acute congestion in these ports from May to August last, caused by the bunching of arrivals of foodgrains ships, has vividly brought to light the inadequacy of berthing capacity with mechanical equipment. Of course, the port of Kandla has given some relief to Bombay. But Haldia will be in no position to give similar relief to Calcutta for a number of years for the simple reason that its construction has scarcely begun. Apart from the need for improving the discharge of foodgrains at these ports by installing grain pumping machines, the incentive schemes for stevedore workers engaged in the handling of such foodgrains would have to be continuously in operation. But, from the long-term point of view, better relations between dock labour and port authorities seem to be called for. The Government's decision to set up a wage board for port and dock workers is, therefore, a welcome development. Industrial peace, particularly in the major ports at all times, will go some way towards neutralising the effects of inadequate port development.

COKE RATE IN JAP BLAST FURNACES

Thanks to the rapid progress in technology, Japan's ironmakers will soon be in a position to reduce blast furnace coke consumption to a national average of below 500 kg. per ton of hot metal. This is claimed in the latest issue of *Steel Industry Report*, published by Japan Iron and Steel Federation. Japan, incidentally, has already the lowest record level of 502 kg. of coke consumption per ton of hot metal; this is also the lowest coke rate so far attained in the world.

The decrease in coke consumption has been achieved mainly by the exceptionally uniform distribution of gas flow in furnace, leading to efficient heat exchange and reduction in gas. The uniform distribution of gas, in turn, is the result of extensive performance of crushing, screening and sintering of iron ores, resulting in the uniformity of the "burden materials" charged into blast furnace. Another factor which contributes to this unique achievement is the rise in blast temperatures from the erstwhile 500-900° C to 950° C, at present. This, according to the report, has not only led to lower coke consumption and coke ash but also to less limestone consumption. All this allows the furnace to accept more iron ores, thus producing a greater amount of pig iron.

The injection of heavy oil has played the most important role in lowering coke rate. First put to practical application in Japan in 1961, it was found that an injection of 1 kg. of oil would substitute some 1.2 to 1.7 kg. of coke. Although some furnaces are running with 100 kg. or more of oil per ton of iron, the average rate of oil injection is about 60 kg. per ton. However, an excessive injection of oil is inadvisable, the report mentions, and if the sulphur content of oil is high, it can deteriorate the composition of the pig iron.

High top pressure operation, first experimented in 1962, is also mentioned as a contributing factor. It is noted that higher top pressure allows the furnace to take more wind, thus increasing the pig iron output.

FIRST ALUMINIUM SUBMARINE

Reynolds "Aluminaut" is the world's deepest diving and first aluminium submarine. Conceived by Mr. J. Louis Reynolds and developed under his direction by Reynolds International, Inc., U.S., it has just been launched at Groton with a view to harnessing the oceans' vast untapped storehouse of natural wealth. The 75-ton "monster of the deep" is designed to operate as deep as 15,000 feet—far deeper than any other submarine. It will make its initial test dives in a short time. But it will not make dives to the maximum operating depth of 15,000 feet until some time next spring.

The "Aluminaut" will have a crew of three, but it can carry as many as 15 people in addition to the crew. It is actually a deep sea laboratory, equipped with the most advanced instrumentation and communications equipment, including underwater telephone and television. It will also be provided with a pair of robot hands to collect specimens and to assist core drilling operations. It will be offered to industries and the Government for use in mineral exploration, salvage, mapping and research.

The "Aluminaut" will also have commercial and scientific assignments. First, it will offer the major oil companies an opportunity to speed their present quest for petroleum and natural gas under the waters of the North Sea between England and Holland. Secondly, it will help in salvage work. Thousands of ships loaded with precious ores, minerals and other cargoes that were sunk in the two world wars are known to lie intact on the Atlantic shelf and they just lie too deep for normal salvage techniques. With the "Aluminaut" it will be possible to examine visually these sunken vessels and determine the best methods for bringing them up. Thirdly, it will help in mapping the ocean bottoms. Finally, the "Aluminaut" will demonstrate that man can permanently occupy the floor of the ocean.

But the launching of "Aluminaut" also involves a problem in international relations, for new world agreements would have to be reached on territorial and resource rights under the sea. Questions of national sovereignty and corporate ownership of ocean resources thus await to be defined in a new perspective.

Europe's most modern steel works located in Duisburg-Hamborn produces not a single smoke or smog cloud. The youngest plant of the August-Thyssen-Hütte is the first to be completely outfitted with a dust-free installation. The four huge building complexes—the oxygen steel works, the universal slab works, hot belt conveyors and the first cold belt conveyors in operation—cover a surface of 200,000 sq. yards and lie in the middle of green space twice as large as the actual factory on which no soot or sulphur dioxyde mar the vegetation's growth. And fish actually live in the plant's waste waters. The protective measures taken to keep the air clean swallowed 14 million DM (Rs. 168 lakhs). This Europe's "cleanest" steel works will produce three million tons of steel per year.

NEW PRODUCTS AND PROCESSES

Driverless Switch Engine

THE first Swedish electric switch engine operated by remote control is at present being tested by the Swedish State Railways (SJ) at a shunting station near Stockholm. The push-button controls of a shunting engine, which ordinarily operate the drive and brake systems by means of a servo system, have been replaced by special apparatus connected to a radio receiver. With the aid of this equipment, the engine obeys impulses from a radio transmitter within a 1 km radius. It can be made to go forwards and backwards at desired speed, roll, brake and signal. If the radio connection is interrupted the engine comes to a standstill as the brakes are automatically applied. The radio equipment, which has been developed by Storno radio manufacturers in Copenhagen, operates on ultra-high frequency (450 Mhz). The 1 W transmitter weighs 2.5 kg. SJ and Grangesberg group, which jointly have developed the project, expect that the engine will be used primarily in switch service, where the operator can overlook the tracks.

Stainless Steel Mower Blade

Stainless steel is being used for the blade of a new rotary lawnmower produced by a subsidiary of the American Machine and Foundry Company, of 261, Madison Avenue, New York 16. The blade is said to hold its edge longer and to resist pitting and corrosion. The design also permits the jointed blade to swing back when it hits a stone, avoiding damage to the engine cam shaft. In ordinary use, the blade is held extended by centrifugal force. The mower can be raised or lowered by moving a single lever which works on all four wheels.

Air-Operated Hand Grinder

A hand-controlled, air-operated grinder with a speed of between 4,500 and 6,000 r.p.m., is being produced by Thor Tools Ltd., 34 Victoria Street, Westminster, London, S.W.1. It weighs 10 lb. and is 7½ in. high. Made of heat-treated aluminium alloy castings with steel helicoil inserts, the grinder has a wheel spindle that runs in double row ball bearings at the nose end and in a single row of ball bearings at the upper end. An automatic oiler, capacity ½ pints, is built into the grinder's cylinder housing cap.

Storm Warning Radar

A new meteorological radar system, which can track and pinpoint storms and rain-producing clouds within an area of 125,000 sq. miles, is being produced by a British firm. High power, long range, ease of installation and relatively low cost are four of the main features of the system. It is suitable for use at airports, where it can provide first-hand meteorological information for air traffic control staff. Because of its mobility and ease of installation, it is also suited for meteorological surveillance in large areas, where a number of installations may be needed.

Finding the Cracks

When structural materials are overstressed they develop micro-cracks which, though invisible to the eye, act as stress raisers and lead to rupture. The Czech Academy of Sciences of 3, Narodni, Prague, says that these can be detected by painting strips of electrically conducting varnish on to a test specimen of the material (with an insulating undercoat if it is a metal) and then passing a current through the varnish. At the cracks, heat is not conducted away as it is elsewhere and the varnish melts and shows them up.

Industrial Space Heaters

A range of portable oil-fired industrial space heaters for use in or out of doors is now being marketed under the name Master by W. C. Youngman of Denmark Road, London, S.E.5. The range consists of four models with output capacities from 75,000 to 320,000 B.t.u. per hour and a heated air flow from 345 to 1,500 cubic feet per minute. Each model comprises a forced draught heater mounted above a fuel tank on two rubber-tyred wheels. Leg supports and handles are provided to make handling and positioning easy. The heater unit, which is contained within a heavy gauge mild steel protective casing, has a pressure atomising burner, suitable for use with ordinary paraffin, a stainless steel combustion chamber and a fractional h.p. motor driving a propeller type fan and fuel pump. The smaller model has a vacuum feed system and employs a sliding vane type air compressor.

Metal Coating

Plant for the continuous coating of metal strip with paint or plastics, has been developed by a British firm. Strip up to 48 in. wide can be handled, and the bond between coating and metal is so strong that the strip can be shaped without disturbing it. Excellent results, have so far been obtained. In the process, strip is fed from a reel to an alkali degreaser, where it is scrubbed on both sides by revolving brushes in a recirculated degreasing solution. The strip is then rinsed with cold water and pre-treated with phosphating solutions on both sides. After another rinsing, it passes through chromating solution. The paint or plastics is then applied by a three-roll reverse coater. Solvent is removed, the coating is cured, and after cooling the strip is recoiled.

Strapping Packages with Nylon

A banding machine which will strap nylon strip around packages and seal the strip at a fast rate—up to 25 ties a minute—has just been put on the market. It is especially suitable for strapping soft packs and cartons in sizes ranging from 3 x 3 inches to 39 x 18 inches. It is supplied by Gordian Strapping Company, Middlesex, England.

Bench Drilling Machine

Sturdy, versatile, economic bench drilling machines are being made by Fidax Engineering P. Ltd., Sydney, Australia. The machine, known as 'Fidax Mark 3,' is used in engineering, plastics and woodworking industries, motor repair shops and home workshops. Its features include a high tensile solid steel column and an accurate spindle fully supported at top and bottom with thrust taken by a heavy-duty totally enclosed thrust race. All parts are machined to fine toierances and lubricated by an oil cup in the spindle cap. The drive belt is guarded to ensure safe operation, and speed changing belt tensioning or replacements are achieved simply. The drill is precision built and compactly designed. It operates at four speeds: 630, 1,150, 1,820 and 3,200 r.p.m. Capacity of the machine is ½ inch mild steel and 1 inch hard wood. It has a drilling depth of 3 inches with depth gauge side mounted on the quill. Ideally suited for production line work, the Fidax drill is available with or without motor to allow for frequency and voltage differences in various overseas countries.

Versatile Antenna

A short-wave receiving antenna for the range 200m down to 10m has been developed by Rhode and Schwarz, Muehldorfstrasse, 15, Munich, West Germany. It picks up separately vertical and horizontal field-strength components from all azimuthal directions without requiring rotation. It makes it possible to pick up the component showing least interference and also to carry out good polarisation diversity operation. By selecting the respective inverse polarisation during reception, it is possible to isolate the receiving antenna from transmitting antennas which, for lack of space, have had to be erected nearby.

Sensitive Photocell

A range of high sensitivity cadmium-selenide photocells for use in relays, counters, exposure meters and controls has been brought out by the International General Electric Co. of New York, 296, High Holborn, London, W.C.1. They act as light-controlled rheostats or relays without contact surfaces and have a dark resistance of 5 megohms or more. At two foot-candles, this drops to 10,000 ohms. Response is fast with the resistance dropping by about 1 to 10 milliseconds when 25 foot-candles are applied to previously unexposed cells. The peak spectral response is 7,400 Angstroms and the new range includes both plastic encapsulated and glass metal units.

Advances in Chemical Plating

Many non-conductive materials can now be plated with a variety of metals as a result of developments in electroless chemical plating metal plating using chemicals instead of electricity) made by Sperry Gyroscope Co. Ltd., England. Substances which have been plated successfully include ceramics, glasses, plastics (including P.T.F.E.) and glass fibre laminates. The metals used include phosphocobalt, nickel, copper, gold and palladium. This advance in metallic coatings is made possible by the use of a range of extremely penetrative catalysts which initiate the reduction of metal on the treated surfaces. The metals so reduced are corrosion resistant, uniformly thick, and have a high degree of adhesion even on complicated surfaces containing re-entrant cavities and holes.

Scribing and Dividing Apparatus

A Dutch engineering firm in the Hague (N. V. Machinefabriek "Gefra," Jupiterkade) has invented a scribing and dividing apparatus with which plates, castings and workpieces to be drilled can be scribed and checked both rapidly and accurately. The apparatus, which can also be used for inspection purposes in testing shops and for lining out castings, consists of a horizontal shaft mounted on top of a cast-iron pedestal provided with set screws parallel to the surface plate. At one end, the shaft has a permanent magnetic setting-up plate and at the other, a hand-wheel, graduated in degrees, by which the setting-up plate can be rotated through 360° in the vertical plane. By means of a special pivoting point, this plate can be swivelled in two directions by 90° in relation to the shaft. The extent of pivoting can be read off on a graduated scale. The movements of shaft and setting-up plate can be indexed by means of an indexing pin, while the intermediate positions are set using a vernier scale that can be read off in minutes.

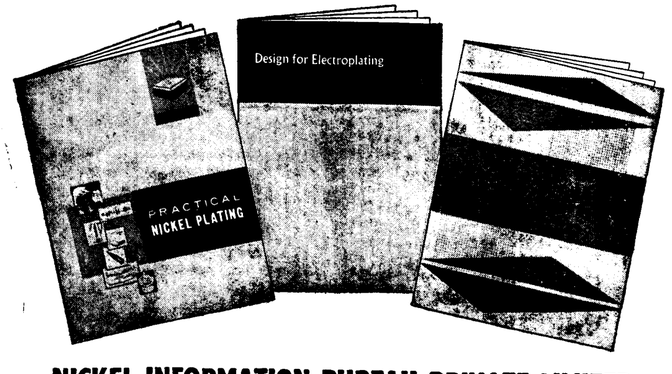
MANUFACTURERS DO YOU KNOW THE MEANING OF IS 1068-1958?

IS 1068:1958 is the Indian Standards Specification covering nickel-chromium plating, and is the first step towards quality control. A strict observance of recognised standards of nickel plating will guarantee satisfied customers and repeat sales, both at home and abroad. Do your own products conform to these standards?

Ask yourself these questions.

Is the product properly designed to make the most of nickel chromium plating? Is the thickness of the plating suitable for the type of job the product is expected to do? How can the thickness of plating be checked without damaging the plated surface?

The answers to these questions and many others can be found in the pages of these booklets. Write today for your free copies to



NICKEL INFORMATION BUREAU PRIVATE LIMITED

United Bank of India Building, 25 Pherozshah Mehta Road, Fort, Bombay 1-BR.

WORLD SHORTAGE OF TIN

INCREASE IN PRODUCTION NEEDED

INDIA'S mineral resources are such that while there is an abundance of some of them like iron ore, manganese and bauxite there is a paucity of other important minerals such as copper, zinc, lead and tin. Of the latter major non-ferrous metals that are of vital importance for a modern developed economy, it is only in the case of tin that India is chronically deficient as it has no worthwhile reserves at all. Some very small quantities of tin ores have been found in certain parts of the country such as Hazaribagh in Bihar. As these mines are not very promising, the country depends solely on imports of tin ores to meet the increasing internal demand from the tin-plate and alloy-making industries. The demand for tin is at present around 7,000 metric tons and is expected to go up to 10,000 metric tons by 1965-66 along with the increase in the production of tin-plates and copper-tin base alloys. As the accompanying Table I shows, India's imports of this mineral, mainly from Malaya and Burma, have been steadily rising. From 3,609 metric tons (worth Rs. 3.8 crores in terms of value) of tin imported in 1960-61, it has gone up to 5,288 metric tons (worth Rs. 6.4 crores) in 1963-64. Even in the first four months of the fiscal year 1964-65 (April-July period), the imports were of the order of 1,755 metric tons (Rs. 2.4 crores).

In view of India's heavy dependence on imports of tin ores for meeting its rising requirements, it would prefer stable prices for tin ores in the international markets such as London and Penang. But the upward price spiral in tin witnessed in the last few weeks has been of an unprecedented nature and is causing concern to all importers of this commodity. The London price for spot metal which was as high as £1,395 a ton in the middle of September last, shot up further to touch a record high of £1,655 a ton on 13th October, 1964. This was well above the previous high of £1,620 reached at the peak of the Korean boom in early 1951. Although the price of tin has since then declined to £1,590 it is still very much above the average price of £910 for 1963, £963½ a year ago and £1,025½ the lowest level touched earlier this year. In the other major tin market, namely, Penang in Malaya, the price of tin recorded an all-time high of $(M)805¾ a picul on the 17th inst. In the U.S., the price of tin has gone up by 60 cents a pound since the beginning of this year to about $1.95 a lb. This has meant an increase of $6 in the cost of producing a ton of tin plate by the U.S. steel mills.

Causes for Rise

What are the factors responsible for this phenomenal rise in the price of tin? The major political changes in Britain and the Soviet Union could at best be only a short-term factor. The "price explosion" in tin is due mainly to the growing gap between demand and supply. Owing to fears of acute shortage of the metal, some heavy buying by consumers to replenish dwindling stocks has been reported. Further, world demand for tin, especially in the U.S., has been growing steadily, perhaps a little faster than was anticipated earlier. The continuing high level of production in most of the industrially advanced countries is a strong factor influencing the present uptrend in prices. In addition, purchases of tin by the Soviet bloc countries of around 5,000 tons in recent months have accentuated the price spiral.

The International Tin Council has estimated the smelter production of primary metal (tin) during the first six months of 1964 at 70,000 tons, as against a consumption of 85,000 tons. The Council expects the shortfall in production to be more than 25,000 tons this year. As the accompanying Table II shows, the world production of refined tin (excluding the U.S.S.R.) is not keeping pace with demand. From 176,538 long tons in 1962, production had actually come down to 174,621, in 1963. In the first quarter of 1964, it had picked up and was running at the rate of 177,000 tons per annum. Even so, the growth of production has been lagging behind that of demand. While the leading producing country, Malaysia has increased its output, production of primary tin (tin concentrates) in Bolivia, the second largest producer of tin in the free world, has been impeded by labour unrest. Indonesia, too, is an equally important producer of tin, but it is handicapped by shortage of capital and skilled personnel, not to mention its preoccupation with confrontation with Malaysia and unhelpful treatment to private foreign captal. The importance of Congo as a producer of tin has been affected by political instability and no marked gain in its performance can be expected in the near future. The only other country where there has been a continuous expansion in the production of tin is Thailand. In 1962, its production of tin concentrates was about 15,000 metric tons, as against Congo's 7,321 tons (as shown in Table III). In 1959, Thailand's production was no more than 9,800 tons. The high level of prices of tin in the past few months may result in a marginal rise in the world production of primary tin, for, barring Malaya and Thailand, the other producers are not in a position to take full and quick advantage of the record high prices for a variety of reasons, political and economic alike. The prevailing shortage of tin may, therefore, last for another three or four years, if not longer. The buffer stock arrangement under the International Tin Agreement has failed to achieve its objective, namely, ensuring an orderly increase in production of tin at stable prices.

U.S. Stockpile

At present, a part of the shortage in tin is being made good by sales of stockpiled metal by the General Services Administration (G.S.A.) of the U.S. The G.S.A. announced some time ago that it would sell 20,000 tons of stockpiled tin under a one year programme ending 20th March 1965. Recently, Mr. Maurice Connell, Administrator, Defence Material Services of G.S.A. stated that it was free to sell more tin if the situation so warranted the same. Unfortunately, however, at the meeting between the International Tin Council and the G.S.A. officials early this month, no decision was taken to increase the stockpile releases of the latter agency. Thus, the deficit in supply continues. Meanwhile, it is expected Russian buying in the coming months would be in excess of 30,000 tons. In these circumstances, one fails to see how prices would fall to any significant extent, unless the U.S. Buffer Stock releases a much larger quantity than the one it has agreed to sell.

A world shortage of tin has substantially raised the cost of the metal to users—chiefly the steel and packaging industries. Moreover, the fear that this shortage will continue for many years has led steel manufacturers to use substitute material for coatings. Steel producers in the U.S. according to the *Journal of Commerce*, New York, use about 30,000 tons of tin annually in the production of tinplate for tin cans, for beverages, food and other products. In view of the shortage of tin, many consuming industries will have to reduce the consumption of the metal. Already, tin plate in many parts of the developed countries is experiencing keen competition from aluminium, paper board, plastics, glass and other packaging materials. Excessively high prices for tin is, therefore, not in the interest of producers of tin concentrates themselves. Accordingly, they must take all possible steps to raise their production quickly and thereby help bring down the prices to reasonable levels. Meanwhile, every effort is being made in India also to keep down the imports of this metal by recovering it from scrap and tin residues. This is only as it should be, for, unlike the developed countries, India has neither the foreign exchange to pay for the imports of tin at enhanced prices nor the highly sophisticated packaging materials developed in the West.

Table I: *India's Imports of Tin Alloys*

Year	Value (In crores of rupees)	Quantity (In metric tons)
1960-61	3.8	3,609
1961-62	5.8	4,995
1962-63	5.1	4,296
1963-64	6.4	5,288
April-July 1964	2.4	1,755

DRIVE AGAINST SUB-STANDARD PRODUCTS

Between January and June this year, over 3,300 kg. of fruit and vegetable products which were either sub-standard or were manufactured by unauthorised parties were seized and destroyed by the officers of the Directorate of Marketing and Inspection of the Union Ministry of Food and Agriculture. Several thousand kilograms of these products were also detained for analytical investigation. During the same period, the inspecting staff of the Directorate detected 74 manufacturers of fruit and vegetable products carrying on business without licences and in premises that did not conform to the minimum standards prescribed. Production in these units has been stopped till such time as they carry out the necessary improvements and obtain licences.

Under the Fruit Products Order, 1955, it is compulsory for every manufacturer of fruit and vegetable products to take out a licence from the Agricultural Marketing Adviser to the Government of India. Before the licence is issued, the Directorate ensures that the manufacturer has set up a factory under hygienic and sanitary conditions that have been prescribed under the Order. The manufacturer is also required to prepare fruit and vegetable products according to the specifications laid down in that Order.

IMPORTS OF RELIEF GOODS FROM BRITAIN

An agreement providing for the duty-free entry into India of relief supplies donated by specified agencies in Britain was signed at New Delhi on the 20th inst. by Mr. C. S. Jha, Commonwealth Secretary, Ministry of External Affairs, and Sir Paul Gore-Booth, the British High Commissioner. The agreement provides, with immediate effect, for the duty-free entry into this country of relief supplies and drugs donated by specified relief agencies in Britain to voluntary relief and rehabilitation organisations approved by the Government of India. Up to the time of the signing of this agreement, all British donors of relief supplies have had to meet the cost of paying import duties initially and then claim a refund. Arrangements have now been made for officials in designated Indian seaports and airports to be advised of the shipment of agreed relief items from Britain and for these to be cleared free of duty on arrival. This will simplify the procedure for the import of such relief supplies.

Some 2.9 million tons of cheese were produced in 1963 in the 21 major cheese-making countries, according to the F.A.O.'s Committee on Commodity Problems. Production in 1962 was 2.88 million tons. Among the six countries of the European Economic Community, French cheese production showed an increase of about 80 per cent in the decade of 1953-62. West Germany increased its production slightly, but other countries in western Europe achieved substantial gains. Production in the U.S.—the world's largest producer—increased rather rapidly. In Australia and New Zealand there was a tendency to reduce cheese output. The Soviet Union and other east European countries showed "a general upward tendency." According to the studies, the increased production was due primarily to an increase in demand, but in some other countries there was a change in the use of milk for various products.

The Imperial Chemical Industries of Britain has effected substantial cuts ranging from 5 to 15 per cent in the prices of polythene, one of the high three plastics used in the manufacture of products ranging from packaging materials to household goods. The cuts vary according to grade from 1*d.* to 3*d.* a pound, the price of injection moulding grades has been reduced by 3*d.* to 1*s.* 4*d.* a pound. All other grades, previously priced at 1*s.* 8*d.* a pound, have been cut by 1*d.* to 2*d.*, polythene used in the production of special cable insulate on and sheathing came down by 1*d.*, film and bottle blowing resins by 1*d.* to 2*d.* according to type and general purpose cable and paper coating resins by 2*d.*

U.P. LETTER

INDUSTRIAL PRODUCTION DECLINES

ANOTHER EXPERIMENT IN RURAL EMPLOYMENT

From Our Special Correspondent

LUCKNOW, *26th October*

THE statistical data released by the Directorate of Industries show that, in sharp contrast to the other big States in India, U.P. registered a fall of over 2 per cent in the value of industrial production from Rs. 352½ crores in 1962 to Rs. 345 crores in 1963. Moreover, although the total number of registered factories increased from 2,567 in 1962 to 2,633 in 1963, the total number of persons employed in these factories actually declined from 268,519 in 1962 to 267,344 in 1963. The declining trend which industrial production and employment have registered in 1963, for the first time since the beginning of the first Plan, has unfortunately persisted in 1964. It is quite evident that it would not be overcome, unless some specific measures are taken to reverse it.

This peculiar behaviour of industrial production and employment is explained by the fact that the three major industries of U.P.—sugar, cotton textiles and oil-milling—are agro-based. With a fall in agricultural production, the supply of raw materials to these industries was reduced, thus resulting in a fall in production. But this was not the only reason. The machinery and plant in most of the factories belonging to these industries are worn-out and outmoded. This state of affairs has not only resulted in a fall in production but in a rise in production costs, thus placing the U.P. industries at a disadvantage *vis-a-vis* industries in some other parts of the country.

The production of machine tools, agricultural implements, *vanaspati*, paper, leather goods and plastics has been higher but the increase was of a small order and could not compensate for the fall in the output of sugar, cotton textiles and oils.

Pattern of Development

The pattern of industrial development in U.P. has largely been agro-based—sugar manufacturing, cotton textiles and oil milling being the most important industries—and such industries as mechanical and electrical engineering, machine manufacturing, and heavy chemicals, which are based primarily on advanced technique and knowledge, have not yet been properly developed. This is what has kept Uttar Pradesh as an industrially backward region.

Another important fact which the data reveal is that small units are making better progress than the large-scale units, although the total capital investment and employment in large-scale industry is higher. In 1963, the total capital invested in 266 large-scale units aggregated Rs. 210 crores (including Rs. 80 crores for working capital) while it was only Rs. 45 crores (including 24 crores for working capital) in 2,367 small-scale units. In 1963, the number of persons employed in large-scale units was 166,773 and the total output of this sector was Rs. 249 crores, as against 100,571 persons employed in the small-scale sector with a total output of Rs. 96 crores. This shows the high employment potential of small-scale industries. The small-scale units are more varied in nature and cover a larger field, though the number of small-scale units is not yet commensurate with the size of the State or its population and there is much scope for further expansion.

Food Position

The U.P. Government has banned the export of gram and has fixed the wholesale and retail prices of rice, maize, *jowar* and *bajra*. Efforts are being made to build up adequate buffer stocks of rice and coarse grains. But the anti-hoarding order has not produced hidden stocks which were expected to ease the situation, the arrival of the *kharif* crop in the market has not been quite satisfactory and, above all, the Government of India has failed to supply the State the promised amount of foodgrains. The Central Government had agreed to supply 1.05 lakh tonnes of foodgrains to U.P. every month, while the U.P. Government has been demanding a monthly allotment of nearly 2 lakh tonnes. But even this reduced amount of 1.05 lakh tonnes has not reached U.P., thus causing scarcity of foodgrains not only in the *kaval* towns but in all the urban and rural areas.

An important experiment in the shape of the Phulpur project is being conducted near Allahabad jointly by the Government of India and the I.L.O. experts, with a view to finding out practical means of increasing employment through agricultural and rural industrialisation schemes. The project covers an area of 290 sq. miles in three blocks of the district and aims at providing fuller and more gainful employment to people. There are some 25,000 landless labourers in this project area and it was expected to provide employment to nearly 10,000 of them by the end of five years. But as yet the project has not made satisfactory progress, partly because the programme has not been quite comprehensive and the local population has not evinced as much interest in it as was expected. As is unfortunately the case with all projects of this kind, the schemes are good on paper and bad in their actual implementation. This fact now seems to have been realised by the officials in charge of the project and a meeting of officials of the Planning Commission, I.L.O. experts and officials of the U.P. Government has decided to draw up a fresh and more comprehensive agro-industrial programme for providing further and more gainful employment to nearly 2½ lakh persons in this project area. If the 'pilot' project is successful, it would show a practical method of solving the problem of 'disguised' unemployment in India's rural areas.

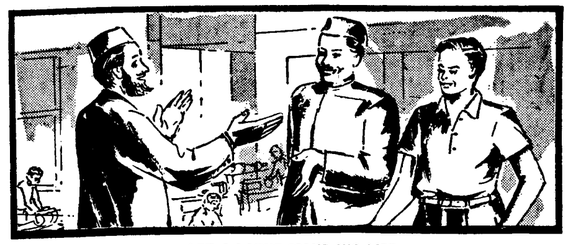
In fact, the need for increasing employment opportunities by agro-industries run by local bodies has been recognised for quite some time, but, somehow, it has not been possible to give a practical shape to this programme. Inaugurating the Rohilkhand Division's *Panchayat* Seminar at Faridpur (near Bareilly), the Chief Minister, Mrs. Sucheta Kripalani, suggested that the Block Development Committees should step in the sphere of cottage industries and should set up their own ventures to meet the requirements of *Zila Parishad* schools and the villages covered by them. It is one thing to exhort the block committees to try and increase agricultural production and quite another to ask them to run small-scale and cottage industries. It is not only a matter of finance but of technical knowledge and experience and of marketability of the goods produced. It may not be possible to increase the tempo of agro-industries of the kind the U.P.'s Chief Minister has in mind, unless the character of the *Zila Parishads* and Block Development Committees is drastically changed.

U.S. GRANTS FOR RESEARCH IN INDIA

The University of Allahabad and the Forest Research Institute of Dehra Dun have received two research grants aggregating Rs. 2,39,070 from the U.S. Government. The first grant, of Rs. 78,930 has been extended to Allahabad University for a three-year research project to study the biology and life cycle of gall midges. The larvæ of the gall midge, a small fly-like insect, cause extensive damage to lemon, orange, and other citrus trees by boring into plant tissues. Dr. S. N. Prasad will be in charge of the project. The second grant, of Rs. 1,60,140, will finance a five-year study by the Forest Research Institute of the density and fibre characteristics of Indian timbers as indicators of wood quality. Mr. K. Ramesh Rao will be the principal investigator. The grants have been extended from U.S.-owned rupees generated by the sale of agricultural commodities supplied under the U.S. Food for Peace (PL. 480) Programme.

The intensive sugarcane development blocs set up in the State of Uttar Pradesh during the year 1963-64 have produced an average of 177 quintals of sugarcane per acre. In the reserved areas, the per-acre yield has gone up from 141 quintals in 1962-63 to 163 quintals in 1963-64. An intensive cane development block covers an area of 4,000 acres in each of the 71 sugar factory zones.

The U.P. Government has decided not to remove the ban on movement and control on prices of *khandsari* even when the new season's production comes to the market. It has also released most of old *khandsari* stocks which had been frozen earlier.



LET A LATHE MAKE HIS LIFE

Ramlal: Abdul, I have brought my son Narayan to show him your workshop.

Abdul: With pleasure, Ramlal. Narayan, now that you have finished your studies what you wish to do for the future?

Narayan: Uncle, we came here to seek your advice in this matter.

Abdul: I shall gladly give it. Let us go on our round of the workshop.

Ramlal: Abdul, I am seeing your workshop after some years and I am glad to observe that you have very much increased your operations.

Abdul: You are right. I had only one Harihar Lathe when I started. I have built up by intelligent and hard work a reputation for good workmanship and my business is growing every year. We insist here on always doing a thorough job.

Ramlal: I am very happy about your progress. But tell me, Abdul, why you have all Mysore Kirloskar Lathes only installed here?

Abdul: Ramlal, the first lathe gave me such satisfactory work that I bought another of the same model. I then made a rule that we should have only Mysore Kirloskar Lathes in this workshop. Made by a pioneer manufacturer, these Lathes are dependable, sturdy, always uptodate in design and construction. They are economical and need practically no servicing.

Ramlal: Now turning back to the question of Narayan's future what do you suggest?

Abdul: Well, seeing my workshop is an advice in itself. I suggest that you get him started as I did with a Kirloskar Lathe and lead him to a life of independence. If he wants I shall arrange for his training in my workshop where he will learn to operate these various lathes made by Kirloskar.

TATA CHEM IN "A STATE OF AFFLUENCE"

SEVERAL RECORDS IN SILVER JUBILEE YEAR

SEVERAL records, in sales, profit, production of different items and in dividend to shareholders, have been reached by Tata Chemicals Ltd. [Managing Agents: Messrs. Tata Industries (Private) Ltd., Bombay] during its silver jubilee year ended 30th June 1964. Up by 5.76 per cent against 34 per cent a year before, sales, at Rs. 756.40 lakhs, have exceeded the previous year's figure of Rs. 714.72 lakhs by almost Rs. 42 lakhs. Gross profit, which had nearly trebled in the previous year from Rs. 52.69 lakhs to Rs. 141.66 lakhs, has expanded further to Rs. 184.97 lakhs. With the plant at Mithapur exceeding the rated capacity of 400 tonnes per day, production of soda ash has gone up by 19 per cent to 153,000 tonnes. The year has witnessed a record salt harvest of 314,000 tonnes (as against 245,000 tonnes a year before); 225,000 tonnes from the Mithapur area and 89,000 tonnes from the area leased at Okhamadhi. Bromides output has been 22 per cent higher, but, with demand remaining static, sales have dropped substantially. On the other hand, a spurt in demand has caused a 100 per cent increase to 800 tonnes in the production of copper oxychloride. Caustic soda is the only major item to have shown a limited production of 4,000 tonnes, in spite of increased capacity of 7,000 tonnes; this is due to insufficient utilisation of the chlorine generated as a by-product in the electrolytic process of making caustic soda.

The improved results have enabled the Directors to raise the dividend on the 10-rupee equity shares to 14 per cent per annum from 10 per cent to which level it had been raised in the previous year from 6.5 per cent per annum for 1961-62 and 1960-61. They have also ploughed back to reserves Rs. 24.73 lakhs. This amount is lower as compared with Rs. 46.47 lakhs credited in the previous year because the credit to development rebate reserve has been reduced from Rs. 41 lakhs to Rs. 10.88 lakhs; evidently, the need for this compulsory reserve provision has diminished. It has also become possible during the year to repay short-term loans amounting to Rs. 40 lakhs and to reduce borrowings from the cash credit account by Rs. 38 lakhs. Total borrowings of the Company have now declined to Rs. 312 lakhs from Rs. 390 lakhs during 1962-63. This reduction in borrowings has been achieved after financing an addition of Rs. 77 lakhs of capital expenditure to the block during the year.

The following table compares the Company's progress in the past four years:

(In lakhs of rupees)

	For the year ended 30th June			
	1964	1963	1962	1961
Sale of products	756.40	714.72	531.12	415.72

	(14%)	(10%)	(6.5%)	(6.5%)
Carry forward	0.03	0.04	0.05	0.04

Equity shares' market value (in rupees):	1964	1963	1962	1961	1960
High	19.72	18.96	20.36 CR	22.08 CR	22.04
Low	16.00	12.08	11.80 XR	16.00	15.08

If one were to pick on one single factor which has contributed to what the Directors describe as the Company's present state of "comparative affluence" it is the working of the soda ash plant having reached a stage of sustained optimum output. It is only proper for the Directors to have decided to raise the capacity to 600 tonnes per day within two years and to reach eventually a 1,000 tonnes capacity. It is pertinent to note that a higher realisation from the sales of soda ash which were effected on an ex-works basis as against ex-port town basis for six months in the previous year, is among the various factors accounting for the improvement in profit during the year under review. However, since 16th December 1963, when the statutory ceiling prices for soda ash and caustic soda were removed, the Company has not increased its selling prices. The improvement in profit has been achieved in spite of certain adverse factors, such as increases in the prices of fuel and other raw materials, the use of sea water in place of fresh water in the soda ash process, untimely rains in October and November and a cyclonic storm in June which curtailed the production of salt and marine chemicals.

A comparison of the first annual report and the one for the year under review shows that, in the 25-year period, the paid-up capital of the Company has increased from Rs. 66 lakhs to Rs. 362 lakhs, the gross block from Rs. 35 lakhs to Rs. 1,014 lakhs and gross revenues from Rs. 5 lakhs to Rs. 771 lakhs.

In conclusion of his statement to the shareholders Mr. J. R. D. Tata, Chairman of the Company states:

"As we look back upon these 25 years in the light of the results of the last two years, we can afford to forget the endless trials and tribulations, the setbacks and disappointments which frustrated the effort, expenditure and hard work showered upon this enterprise. Apart from what I might call legitimate difficulties, some of which were no doubt due to our own inexperience of a highly complex technology kept closely guarded secret throughout the world, our efforts were dogged by an amount of ill-luck which belied the care which I understand the original sponsors of the project took to ensure that the stars were in our favour from the very start, and of which the last two disastrous monsoons seem to be continuing manifestations. Let us hope that, in the next 25 years, both nature and good fortune will for a change smile upon us.

"We have now the management and technical knowledge and skills and the financial strength to enable us to make rapid and continued progress in the years to come. We shall spare no effort to that end and can only hope that extraneous circumstances or policies will not deny us the opportunity to make the full contribution of which we are now capable to the growth of the Indian chemical industry and thus to serve our country and its people."

A paid-up capital of Rs. 362.34 lakhs, including Rs. 59.97 lakhs in 5 per cent cumulative preference shares, and reserves and surplus of Rs. 134.36 lakhs, excluding Rs. 46.62 lakhs shown under dividend reserve to meet the year's liability, bring the Company's "own" funds to Rs. 496.70 lakhs. Borrowings total Rs. 251.84 lakhs and comprise debentures of Rs. 55.31 lakhs a Government housing loan of Rs. 3.78 lakhs and bank loans of Rs. 251.84 lakhs. Taking bank loans and current liabilities (including the year's dividend liability) and provisions, the total short-term indebtedness amounts to Rs. 454.50 lakhs, which exceeds current assets, book debts and investments aggregating Rs. 367.77 lakhs. The gross block of Rs. 982.03 lakhs (Rs. 901.95 lakhs a year before) has been written down to Rs. 611.27 lakhs and, including capital works-in-progress, the net block is shown at Rs. 643.53 lakhs.

At their current market value of Rs. 19.24 *cum*-div., the Rs. 10 fully paid ordinary shares of the Company offer a net yield of 6.1 per cent per annum.

(Concluded from next column)

This is supplemented by Rs. 81.25 lakhs in reserves, so that total "own funds" amount to Rs. 253.62 lakhs. As against these outside interest aggregates Rs. 591.33 lakhs, comprising Rs. 461.25 lakhs borrowings (Rs. 144.30 lakhs from I.F.C., Rs. 10.27 lakhs from U.P. Government and the balance from banks) and Rs. 130.08 lakhs current liabilities and provisions. The higher incidence of borrowings is clearly dictated by the expansion undertaken in previous years and is balanced on the assets side by a gross block which now stands at Rs. 616.54 lakhs inclusive of additions worth Rs. 170.46 lakhs made during the year. On this, a total depreciation of Rs. 243.46 lakhs has so far been provided, so that the net block as at 30th April 1964 works out to Rs. 373.08 lakhs. There is also a further capital expenditure on new units amounting to Rs. 9.07 lakhs yet to be properly allocated to various capital heads. Current assets, investments and loans and advances total Rs. 462.80 lakhs and exceed short-term indebtedness by about Rs. 59 lakhs.

The present market quotation for the Rs. 10 paid ordinary shares of the Company is Rs. 13.31 *cum-div.* At this rate, fresh investment in them will fetch a yield of 6.4 per cent per annum.

MODI SPG. AND WVG.

RESULTS ENCOURAGING

"THE working results of the Company for the period beginning from 1st May 1963 are quite encouraging and better than the last year's and, if the prevailing conditions of the trade continue, the results are expected to be much better for the current year." Thus said the Directors of Modi Spinning and Weaving Mills Company Ltd. (Managing Agents: Messrs. R. B. Gujarmal Modi & Bros. Pvt. Ltd., Modinagar, U.P.) in their report to the shareholders a year ago. The Company's annual report for the year ended 30th April 1964 fully bears out their optimism. With the commencement of commercial production by the new mill which was under erection in the previous year, the realisation from the sale of products has touched the highest ever level of Rs. 970 lakhs or Rs. 164.14 lakhs more than that in 1962-63. As a result and also because of some betterment in the profit-margin flowing from the continuing process of renovation and rehabilitation of the mills, the gross profit has risen by as much as Rs. 37.56 lakhs or about 70 per cent to Rs. 91.41 lakhs. Although the provision for depreciation has increased quite substantially from Rs. 25.73 lakhs to Rs. 41.38 lakhs, the provision for the Managing Agents' commission—calculated on the amount of profit after providing for depreciation—is up by only Rs. 1.38 lakhs at Rs. four lakhs. What is more, the provision for taxation is only marginally higher at Rs. 13.50 lakhs, as against Rs. 13.10 lakhs the year before. Accordingly, the net profit is substantially higher at Rs. 32.53 lakhs as against a mere Rs. 12.40 lakhs for the previous year. From this the Directors have credited as much as Rs. 16.95 lakhs (as compared with only Rs. 2.51 lakhs a year ago) to development rebate reserve. They have raised the dividend only fractionally to 10 per cent from nine per cent, both subject to deduction of tax. The dividend is, however, payable on a bigger capital and absorbs Rs. 15.50 lakhs as against Rs. 10.65 lakhs, leaving Rs. 20,505 as carry forward as against Rs 12,095 brought in.

The following table synoptically presents the fluctuations in the Company's fortunes during the past four years:

(In lakhs of rupees)

	For the year ended 30th April			
	1964	1963	1962	1961

	(10%)	(9%)	(16%)	(17%)
Carry forward	0.20	0.12	0.18	0.37

Market price of ordinary shares (in rupees):	1964	1963	1962	1961
High	13.62	15.82	18.50	18.41
Low	11.94	11.44	15.75	10.15

The programme of renovation and rehabilitation initiated some years ago was continued and the Company installed during the year under review a sanforizing range and other processing machinery. The total amount spent on plant, machinery and buildings during the year was of the order of Rs. 138.11 lakhs. The erection of the new mill was also mostly completed and 19,184 spindles out of the licensed complement of 25,000 were commissioned into production. The remaining 5,816 spindles are expected to be added during the current year. The Company has entered into an agreement for setting up a new mill comprising 25,000 spindles for the manufacture of sewing thread and hosiery and industrial yarns for which there is a good demand and ready market within the country. The entire scheme is likely to cost about Rs. 2.25 crores. The finance for this scheme would be raised partly from internal resources, partly by loans from the Industrial Finance Corporation of India and other financial institutions and partly by a fresh issue of capital if necessary.

The 576,722 equity shares of Rs. 10 each issued during the previous year and on which an amount of Rs. five per share only had been called up during that year became fully paid during the year under review. The paid-up share capital of the Company has therefore risen to Rs. 172.37 lakhs, all in equity shares.

(Continued in previous column)

GAMMON REPORTS GOOD RESULTS

SHAREHOLDERS GET A SLIGHTLY BETTER DEAL

THE performance of Gammon India Ltd. (Chairman: Mr. J. C. Gammon, Bombay) in the year ended 31st March 1964 has been impressive. The value of contracts completed which has been on an increase ever since the Company went public in 1961, has expanded further by Rs. 124.83 lakhs, or about 22.5 per cent, to an all-time high level of Rs. 680.33 lakhs. Since other income and the value of closing work-in-progress too have very substantially increased, the gross profit stands raised at Rs. 82.48 lakhs as against Rs. 52.08 lakhs for the year before. The profit margin (ratio of gross profit to contracts completed) thus works out to 12.1 per cent or 2.7 points higher than that for 1962-63. It is interesting to note that improvement has been achieved notwithstanding the more than proportional increase in total expenses from Rs. 526.74 lakhs to Rs. 781.28 lakhs. The essential provisions are also higher—that for depreciation at Rs. 28.32 lakhs as against Rs. 17.10 lakhs and that for taxation at Rs. 20 lakhs as compared with Rs. 16 lakhs. Even so, the net profit is larger by no less than Rs. 15.18 lakhs at Rs. 34.16 lakhs. Nearly three-fourths of this, however, has been credited to reserves and the Directors have raised the dividend only by a point to 12 per cent, subject to deduction of tax. This claims Rs. 13.80 lakhs as against Rs. 12.65 lakhs and leaves a lower carry forward of Rs. 0.96 lakh as against Rs. two lakhs brought in.

The rapid strides made by the Company during the past four years are well reflected in the following comparative figures:

(In lakhs of rupees)

	For the year ended 31st March			
	1964	1963	1962	1961
Contracts completed	680.33	555.50	432.20	322.58
Other income	22.10	4.31	12.06	21.90
Closing work-in-progress	738.50	577.17	558.56	570.10
Materials and stores consumed.	487.53	301.10	199.27	247.67
Salaries, wages and benefits ..	246.66	187.67	147.18	130.06
Other expenses	47.09	37.57	44.26	38.41
Gross profit	82.48	52.08	42.01	41.95
Provisions for—				
Depreciation	28.32	17.10	9.20	8.36
Taxation	20.00	16.00	17.25	13.50
Net profit	34.16	18.98	15.56	20.09
To reserves	21.40	4.39	7.13	9.48
Dividend	13.80	12.65	8.80	10.50
	(12%)	(11%)	(16%)†	(35%)†
Carry forward	0.96	2.00	0.06	0.48

Market price of ordinary shares (in rupees):	1964	1963	1962	1961
High	15.00	19.52	21.68	..
Low	11.76 XR	14.88	18.24	..

† On 5,50,000 old shares only.

During the year, the Controller of Capital Issues was approached for permission to issue 50,000 preference shares of Rs. 100 each at par and 2,30,000 ordinary shares of Rs. 10 each at a premium of Re. 1.50 per share. The sanction was given but only the equity shares were for the time being issued and were fully taken up. This has increased the paid-up share capital of the Company from Rs. 115 lakhs to Rs. 138 lakhs. The reserve complement is correspondingly up by Rs. 20.36 lakhs to Rs. 115.71 lakhs. 'Own' funds, therefore, are higher at Rs. 253.71 lakhs as compared with Rs. 210.35 lakhs a year ago. But even then they are very small in relation to the turnover and hence there is considerable reliance on borrowings which during the year have advanced from Rs. 83.95 lakhs to Rs. 180 lakhs. In addition, there are current liabilities and provisions including those for taxation and dividend at Rs. 145.29 lakhs, as against Rs. 142.35 lakhs a year before.

The Company has been making extensive efforts to equip itself with additional modern plant so that it can competently meet the demands, judged by modern high standards, being made on it for the economic execution of works of greatest technical complexity. Expenditure on this account amounted to Rs. 130.74 lakhs during the year under review, while the total cost of additions during the year was Rs. 146.27 lakhs. As a result the block account now stands raised at Rs. 328.81 lakhs as at the date of the balance sheet, that is, 31st March 1964. This has been written down to a net block of Rs. 134.70 lakhs including Rs. 23.97 lakhs as the cost of capital work-in-progress. Investments are carried in the books at a cost of Rs. 29.19 lakhs made up of Rs. 21.90 lakhs in quoted investments and the balance Rs. 7.29 lakhs in other investments. It is pleasing to note that the present market value of all quoted investments is Rs. 64.79 lakhs. Current assets and loans and advances aggregate Rs. 298 lakhs while capital issue expenses yet to be written off stand at Rs. 1.75 lakh.

Prices and costs continued to increase during the year and the same trend continues in the current year as well. Construction contracts frequently run for several years and the effect of rising costs, cautiously remark the Directors, has to be kept in mind while assessing the trend of earnings. The demand for the Company's service, however, continues but, due to the limited resources available, the intake of new orders has been limited to Rs. 11.5 crores as against Rs. 16 crores the year before. As regards subsidiary and associated companies, the Freyssinet Prestressed Concrete Company had a satisfactory year and the Company paid a dividend of 22.5 per cent as against 20 per cent for the previous year. Shah-Gammon Ltd. and the Gammon-Shah partnership showed a generally satisfactory position but Gamsha Pipes Ltd. again went into red due essentially to the low demand for precast concrete pipes and the necessity to run the factory well below its capacity. The current year, so far as this Company is concerned, is also not likely to witness any appreciable improvement in working.

The Rs. 10 fully paid ordinary shares currently available at Rs. 13.88 *cum-div.* offer a net return of 7.4 per cent per annum to a fresh investor.

TEXTOOL'S RESULTS SATISFACTORY

Despite an all-round increase in expenses, the Textool Company Ltd. (Managing Agents: Messrs. Balasundram and Company, Coimbatore) has reported satisfactory results for the year ended 30th April 1964. Sales have maintained an upward trend, recording an increase of Rs. 39 lakhs from Rs. 242.95 lakhs to Rs. 281.85 lakhs. This improvement has stemmed from the rise in production (in terms of value) by Rs. 50 lakhs over the year. But because of higher costs of raw materials, stores and power and fuel and also because of higher staff expenses, gross profit shows a limited increase of Rs. 6.81 lakhs to Rs. 35.82 lakhs. Net profit, after essential provisions, is higher by barely Rs. 3 lakhs at Rs. 15.20 lakhs. After carrying Rs. 2.24 lakhs, as against Rs. 2 lakhs a year before, to reserves, the dividend on the 100-rupee ordinary shares has been maintained at 12 per cent per annum, to which level it had been pruned in the previous year from 15 per cent for 1961-62.

In spite of the increased net profit, neither the appropriation on dividend account nor to reserves is higher, because almost 40 per cent of the distributable surplus. Rs. 5.85 lakhs against Rs. 4.48 lakhs in the previous year, has been claimed by bonus to workers and staff. This is apart from the wages and salaries amounting to Rs. 79.06 lakhs, as against Rs. 70.18 lakhs in the previous year, Rs. 61.45 lakhs in 1961-62 and Rs. 56.52 lakhs in 1960-61. Employees have thus been the principal beneficiaries of the Company's improved results over the years.

The following comparative table gives a clear idea of the progress made by the Company in the past four years:

(In lakhs of rupees)

	For the year ended 30th April			
	1964	1963	1962	1961

Equity shares' market value (in rupees):	1964	1963	1962	1961	1960
High	156.50	157.00	191.00	193.50	199.00
Low	135.00	145.00	148.00	172.00	143.75

The Company has put on the market cone winders produced in collaboration with Messrs. Kamitsu Seisakusho Ltd., Japan. These are said to be working satisfactorily.

The Company's paid-up capital of Rs. 59.62 lakhs, all in equity shares of Rs. 100 each, is backed by Rs. 23.36 lakhs in reserves and surplus. During the year under review, the Company was able to reduce the Madras Industrial Investment Corporation Ltd.'s loan from Rs. 17.09 lakhs to Rs. 14.76 lakhs. But bank loans, secured and unsecured, have increased from Rs. 102.68 lakhs to Rs. 124.39 lakhs and together with current liabilities and provisions bring the total short-term indebtedness to Rs. 273.48 lakhs. On the assets side, liquid assets total Rs. 299.16 lakhs and the gross block, up from Rs. 109.68 lakhs to Rs. 119.79 lakhs during the year, has been written down to Rs. 72.04 lakhs.

The net yield on the Rs. 100 fully paid ordinary shares of the Company at their current market value of Rs. 155 *cum-div.* works out to 6.6 per cent per annum.

SYNOPSES OF COMPANY REPORTS

Shree Gopal Industries Ltd.

(Secretary: Mr. B. R. Singhi, Kotah.)

Registered Office: Kotah Junction (Rajasthan.)

Eighth Annual General Meeting—16th November 1964.

Working Results:

	For the year ended 30th June (In thousand rupees)	
	1964	1963
Sales of yarn and waste	56.25	44.24
Closing stock	3.21	3.80
Gross profit	15.12	12.50
Transfer to depreciation	8.80*	8.80
,, ,, provision for taxation ..	1.50	Nil
Net profit	4.82	3.70
Transfer from development rebate reserve ..	1.40	Nil
Balance brought forward	18	48
Appropriation:		
Transfer to development rebate reserve ..	4.20	4.00
,, ,, general reserve	50	Nil
Proposed dividend (taxable) equity ..	1.60	Nil
	(10%)	(Nil)
Carry forward	10	18

* This includes Rs. 1,38,800 for earlier years.

Extracts from the Directors' report: The satisfactory working of the year under report has enabled the Directors to provide fully for development rebate for the current as well as for the earlier years. There is now no arrear either for development rebate or depreciation. The Directors are pleased to recommend a dividend of Rs. 10 per share for the first time.

The expansion programme of additional 13,000 spindles is making rapid progress. During the year 6,320 spindles were put into commission and the remaining 6,680 spindles are expected to be put into operation by the end of this year. Under the Government's general permission to increase the installed capacity of looms and spindles in the country, the Company has received further permission for 2,504 spindles, the orders for which have already been placed. The total licensed capacity of the mills is now for 27,504 spindles and efforts are being made to achieve this capacity by the end of 1965. The working for the current year has so far been satisfactory and the Directors hope that the same will improve further with the installation of additional spindles.

Accounts in brief as at 30th June 1964 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	16,00,000	Gross block ..	59,80,292
Reserves and surplus..	7,40,235	—Depreciation	17,58,197
Other liabilities ..	56,27,188		
		Net block ..	42,27,095
		Block in progress	11,420
		Current assets	37,09,580
		Investments ..	7,970
		Cash	11,358
	Rs. 79,67,423		Rs. 79,67,423

* Paid up capital consists of 16,000 equity shares of Rs. 100 each fully paid up. Of the above, 12,880 shares are held by The Shreeniwas Cotton Mills Ltd., the holding company in its own name and 100 shares in joint name with others.

Hasimara Industries Ltd.

(Managing Agents: Messrs: Davenport & Co. Ltd., Calcutta)

Annual General Meeting—9th November 1964.

Working Results:

	For the year ended 31st March (In thousand rupees)	
	1964	1963
Sale proceeds of tea	1,31,84	1,40,1 8
Sale of cotton goods	3,41,19	Nil

		Net block ..	.. 62,44,76
		Block in progress	.. 11,02,62
		Current assets ..	.. 2,76,34,64
		Investments ..	.. 59,13,36
		Cash	.. 3,56,71
	Rs. 4,12,52,110		Rs. 4,12,52,11

* Paid-up capital consists of 6,40,000 ordinary shares of Rs. 1 each and 3,000—7 per cent cumulative preference shares of Rs. 10 each. Of the above 6,00,000 ordinary shares of Rs. 10 each are allotted as fully paid up by way of Bonus shares by capitalisation of general reserve and appreciation of fixed assets.

NEWS IN BRIEF

THE proposed increase in freight rates on the India-Pakistan-U.K.-Continent route was deferred at the two-day session of the shipowners of these routes held at London last week.

The Punjab Government has decided to drop the plan to set up an air rifle factory near Pinjore at a cost of Rs. 50 lakhs owing to lack of adequate financial resources.

The fourth Finance Commission will be holding meetings with the representatives of the State Governments between December 1964 and April 1965 in Bombay, Calcutta, Madras and Delhi.

The total cash contributions to the National Defence Fund upto 30th September 1964 amounted to Rs. 59.08 crores. The contributions in gold and gold ornaments aggregated 2,399,803 grams (205,815 tolas).

The Minerals and Metals Trading Corporation has decided to establish an office at Tokyo to promote its trade interests. Japan is the largest single buyer of Indian iron ore. In 1963, it imported over 5.84 million tonnes of iron ore from this country.

A pipeline from the Koyali refinery in Gujarat to Bombay and Poona is under consideration, according to Mr. P. A. Gopalakrishnan, Chairman, Indian Oil Corporation. The Koyali-Ahmedabad pipeline is expected to be completed shortly.

A two-member team of the Minerals and Metals Trading Corporation, headed by its Chairman, Mr. Govind Narain, left on Monday this week for Brazil to study the techniques of iron ore mining in this ore-rich region of South America.

A two-week conference of the International Organisation for Standardisation, sponsored with the support of the Indian Standards Institution and the Union Government, will be inaugurated at New Delhi on 8th November next by Dr. Zakir Hussain, Vice-President. Delegates from 50 countries will participate in the conference.

A Central Housing Board would be formed soon by the Government of India to give a fillip to the housing programme, according to Mr. Mehr Chand Khanna, Union Minister for Housing and Works. The fourth Plan would provide a total of Rs. 600 crores for housing works.

The European office of the Indian Investment Centre was opened at Dusseldorf on Thursday this week. This is the Centre's second branch office abroad and its first in Europe. The new office is headed by the Resident Director, Mr. N. G. Swami, and is located in India Dugal House, Karlstr 76, Dusseldorf 4, West Germany.

The Government of Maharashtra has promulgated an order, called the Maharashtra Jowar (restriction on purchase and sale and Control of Movement) Order, 1964 for securing the maintenance of supplies. It will remain in force for one year with effect from 15th November next. Under the order, no dealer shall, except under an authorisation, purchase or acquire jowar from any agriculturist for sale or storage for sale.

The World Bank experts are to advise the Union and State Governments on the establishment of fishing harbours at some of the major and minor ports. Bombay's Sassoon Dock, the biggest fish landing site on the Western coast, and Versova, one of the country's leading fishing centres, are to be developed as full-fledged fishing harbours. The Union Food and Agriculture Ministry is said to have allocated Rs. 18 crores for the purpose.

The cotton textile mills' production in September 1964 is provisionally placed at 83 million kg. of cotton yarn and 403 million metres of cotton cloth, as against 77 million kg. of yarn and 367 million metres of cloth produced in the same month last year. At the end of the month, the composite mills of the cotton textile industry held an estimated cloth stock of 130,000 metric bales as unsold and 181,000 metric bales as sold but unlifted.

The Planning Commission has accepted the proposal to set up consumer co-operatives to meet the consumer needs covering about 20 per cent of the urban population. The Department of Co-operation will draw up detailed programmes for expansion of consumer co-operatives under the Centrally sponsored scheme. The Planning Commission has also accepted the proposal that 10 per cent of the retail trade in consumer articles should be brought under the co-operative sector.

An Indo-Ceylonese Commission will be set up soon to promote the sale of tea of the two countries abroad, under an accord reached at New Delhi on the 27th inst. between the Ministers of Trade and Commerce of the two Governments. The proposed Commission will consist of three senior officials of each Government, including the secretaries of the concerned ministries. It was also agreed that efforts should be made by both the Governments to secure a substantial reduction in the internal duties on tea in West Germany.

The Textile Commissioner has invited applications from units of cotton textiles, art silk and woollen textiles industries for import of permissible items of capital equipment of textile machinery from the Soviet Union. Applications in the prescribed form with the proforma invoices and complete in all respects should reach the Joint Chief Controller of Imports and Exports, Bombay, on or before 30th November next. It is clearly stated that the applications for import of textile machinery from the U.S.S.R. submitted in response to earlier announcements will not be considered.

India has submitted, in collaboration with E.N.I. of Italy and Phillips Petroleum of the U.S. a tender for a concession area in Iran for oil exploration and production. Although India was not one of the 20 original eligible bidders selected by Iran last year, Iran agreed to India joining with E.N.I. and Phillips in seeking concessions. The Union Government has already approved an expenditure of $7 million in foreign exchange, which will cover the share of the Oil and Natural Gas Commission to meet the cost of the joint venture. The total cost is estimated at $20 million. The concession area of 40,000 sq. miles is located east of the Kharg Island in the Persian Gulf.

The International Development Association has announced a loan of $62 million to the Indian Railways for financing imports of steel and components for locomotives, electrical multiple units, coaches and wagons, track and signalling equipment, and materials for the electrification programme from 1st July 1964 to 30th September 1965. The credit is for a period of 50 years, the repayment of the principal beginning on 15th September 1974. Thereafter, one per cent of the principal will be repayable annually for 10 years. The credit is interest-free, but a service charge of ¾ per cent per annum on the amount withdrawn and outstanding will be charged to meet I.D.A.'s administrative costs. Including this credit, the total I.D.A. loans to India amount to $129.5 million. The World Bank has also extended to the railways loans amounting to $378 million in the past 15 years.

An American delegation, consisting of 21 businessmen, arrived at New Delhi on Thursday this week to explore investment possibilities in India. It is led by Mr. N. D. Abbey (Jr.), President of the Abbey Etna Machine Company. The delegation, which is sponsored by the Action Committee for International Development representing over 21,000 American houses, will stay in the Capital till the 6th of next month. It will meet the Union Ministers for Commerce and Industries and Supply and Secretaries of the Economic Ministries to assess the chances of joint ventures in a number of industries such as pharmaceuticals, electronics, hotel, steel, forging and castings, aircraft and agricultural implements. It will also hold talks with the representatives of industry and members of the Federation of Indian Chambers of Commerce and Industry.

A sum of Rs. 9 crores will be made available for advance action programmes in the field of general education for the remaining period of the third Plan. An additional sum of Rs. 2 to 3 crores is also likely to be available for similar advance action programmes in the sphere of technical education and craftsmen's training in the years up to 1965-66. The decisions to this effect were taken at a meeting held at New Delhi on the 21st inst. under the chairmanship of Prof. V. K. R. V. Rao, Member, Planning Commission. Out of the Rs. 9 crores, about Rs. 4 crore will be for advance action programmes in 1964-65 and the remaining amount in 1965-66. The programmes to which special importance has been attached by the Planning Commission are those for training of teachers for elementary and secondary schools, accelerating the progress of girls' education, correspondence course for arts and science students and teachers' training, and establishment of junior agricultural schools.

From Abroad

A draft agreement providing for the grant of seven-year French credits to Soviet Russia for the purchases of capital goods was finalised by the French and Soviet Ministers at Paris on the 27th inst.

The Hino Motor Company of Japan is studying the possibility of a sales tie-up with the Renault Corporation of France, so that both companies can use each other's sale networks in France and Japan.

West Germany imported goods worth DM.42.2 billion and exported goods valued at DM.47.2 billion during the first nine months of 1964. Imports rose by 8.6 per cent as compared with the same period last year, and exports registered an increase of 12.3 per cent.

Australia has sold 1½ million tons of wheat worth £40 million to China. The delivery will begin on 1st December next. The wheat board will negotiate another wheat sale before the deliveries are completed. Australian exports are expected to encounter stronger competition next year from European countries with large harvests.

West German tax payers will be able to save some DM.3,200 million (about £290 million) a year in their income-tax from the beginning of next year. A Bill seeking to cut income-tax rate has been voted by the Bundestag. Under the same Bill, the State will subsidise families with more than one child if they keep children at school beyond 15 when compulsory education ends. This payment of subsidy paying monthly amounts to DM.40.

Europe's most modern steelworks, located in Duisburg-Hamborn, is the cleanest steel plant. It does not produce smoke or smog cloud. The steelworks, the youngest plant of the August-Thyssen-Hutte, is the first to be fitted with a dust-free installation—an unavoidable measure against the health hazards from air pollution. The four huge building complexes lie in the middle of a green piece of land. No soot cloud or sulphur dioxyde mars the growth of vegetation.

All import permits issued to private firms in the United Arab Republic have been cancelled and the Government has become the country's sole importer. The decision was taken by the Planning Committee under the chairmanship of the Prime Minister, Mr. Aly Sabry, which also decided to introduce within three months a new system for using hard currency. These latest decisions follow earlier steps to cut back the Government expenditure at home and closing of a large number of offices overseas and recalling of staff.

Sweden's exports of ready-made clothing increased by 30 per cent to Kr. 46 million in the first half of this year. Imports were up by 14 per cent to Kr. 103 million. This is the first time for several years that exports show a larger relative increase than imports. If the trend persists, exports may hit a new peak figure for the full year in excess of Kr. 100 million. A growing share of Swedish ready-made exports goes to neighbouring Norway and Denmark. Sales to Great Britain have also shown a gratifying development after a large export drive on that market.

Britain's motor industry received orders worth more than £40 million on the first day of the International Motor Show which began at London, on the 21st inst. The British Motor Corporation said that its European distributors alone had placed orders for cars worth £31 million in the previous 24 hours. Fords said that show orders for their Cortina and Corsair models totalled £8.25 million. The industry is expected to produce more than 1.75 million cars this year, of which 700,000 would be exported. This year the emphasis was on the perfecting of proved features rather than on revolutionary innovations.

Two of Europe's biggest car firms, the former West German rivals Volkswagen and Auto-Union, makers of DKW cars, are to join forces under a new arrangement announced recently. The Volkswagen has acquired a half share in Auto-Union, which is a fully-owned subsidiary of Daimler-Benz. The Auto-Union's capital was being increased by 80 million marks (about £7,272,000) Daimler-Benz and Volkswagen would hold equal shares. The move is designed to combat an increasing tendency by American companies to ally themselves with European car manufacturers or expand their own subsidiaries.

Industrial production in Sweden during the month of August was 8 per cent higher than in the corresponding month last year. Output of capital goods was up by 7 per cent and consumer goods by 6 per cent. The production index of the Central Bureau of Statistics touched 326 points in August (1935=100), as against 301 a year ago. The seasonally adjusted index for August was 332, as against 337 for July this year. In the capital goods sector, production in iron ore mining registered an increase of 4 per cent over August 1963. For the steel and other metal works the rise was 18 per cent and for the timber industry 10 per cent. Employment in the engineering industry was up 1 per cent on last year. All consumer goods sectors showed higher figures than in August 1963. Production of pulp and paper was up 22 per cent, leather and footwear 3 per cent and foodstuffs 1 per cent. Preliminary figures for the textile industry indicate an increase of 1 per cent.

PERSONAL

MR. Dodda Thimmaiah, M.P., has been appointed Parliamentary Secretary to the Minister for Steel and Mines.

Mr. S. K. Banerji, Additional Secretary in the Ministry of External Affairs, has been appointed Ambassador to West Germany.

Mr. D. N. Shroff and Mr. Surendra M. Mehta have been re-elected Chairman and Vice-Chairman, respectively, of the Silk and Art Silk Mills' Association.

Mr. V. S. Natarajan, joint Divisional Manager, Minerals and Metals Trading Corporation, has been selected by the Government for training in trade practices in Britain under the Colombo Plan.

Dr. W. G. Macmillan, Research Director, Indian Jute Mills Association, has been awarded the British Textile Institute Medal for 1964. He will be retiring in 1965 after more than 27 years of meritorious service.

Mr. V. Shankar, Secretary to the Union Ministry of Civil Aviation, has been appointed Chairman of the Indian Airlines Corporation *vice* Mr. Satish Chandra who has resigned. Mr. Shankar will take up the new assignment in addition to his present duties.

Mr. Raymond Buck and The Hon. William Hunter McLean have been appointed Co-Chairmen of the Board of Governors of the International Invitational Insurance Seminar. The first world-wide meeting of approximately 300 insurance leaders is being sponsored by the University of Texas and will be held in Austin (Texas) from 4th to 7th April next.

TREND OF MARKETS

MONEY EASIER

(From Our Own Correspondent)

BOMBAY, 28*th October*

The short-term money market continued to rule distinctly easy during the week under review. The supply of funds available was more than adequate to meet the day-to-day demand for credit. Actually, money was left unemployed at the end of each day. Interest rates in the inter-bank call section, as a result, drifted downward further. Fresh money fetched no more than one per cent—¾ per cent after the clearing hours—as against 1¼ per cent a week before and 2½ per cent two weeks before. The rate for renewals, which had receded from 2½ per cent to 1¼ per cent last week, declined by a further ¼ per cent.

In view of the persistently easy money conditions, it is not surprising that the 91-day Government of India Treasury Bills, tenders for which opened on Tuesday the 27th inst., met with excellent support. The total amount offered was well above that invited and also accepted: Rs. 4.70 crores, as against Rs. 2.00 crores. The average rate of accepted tenders receded from Rs. 2.500 per cent to Rs. 2.400 per cent. The Intermediate Treasury Bills, too, evoked excellent support. The Bills actually sold from the 21st to 24th inst. aggregated as much as Rs. 27.64 crores, as against Rs. 2.43 crores a week before and Rs. 1.74 crore two weeks before.

The easiness of money is also reflected in the sharp fall of Rs. 28.65 crores to Rs. 2,409.29 crores in notes in circulation during the week ended 23rd October and a drop of Rs. 3.55 crores to Rs. 44 lakhs in loans and advances given by the Reserve Bank to scheduled banks. Deposits of scheduled banks with the Reserve Bank were, of course, lower by Rs. 8.56 crores to Rs. 100.92 crores. India's foreign exchange reserves declined slightly by Rs. 37 lakhs to Rs. 94.22 crores, the entire decline being in balances held abroad which stood at Rs. 8.76 crores. The foreign securities held in the Issue Department of the Reserve Bank continued unchanged at Rs. 85.46 crores.

Excepting for a rise of Rs. 13.93 crores to Rs. 170.37 crores in total cash and a fall of Rs. 10 crores to Rs. 817.64 crores in investments, the consolidated statement in respect of scheduled banks for the week ended 16th October shows minor changes. The total credit made available by banks to their clients was practically unaltered at Rs. 1,715.81 crores. Deposits fell by Rs. 1.38 crore to Rs. 2,694.31 crores, while borrowings from the Reserve Bank increased by Rs. 2.27 crores to Rs. 4.18 crores.

Despite resumption of open market operations by the Reserve Bank last week, turnover in the gilt-edged market was restricted, and changes noted were against holders. Both 4 per cent 1979 and 1980 Central loans dropped 50 paise to Rs. 97.50, 4 per cent 1981 receded by 75 paise to Rs. 97.50, 3 per cent 1986 conversion by 90 paise to Rs. 92.50 and 3½ per cent 1965 by 10 paise to Rs. 100.10. Among State loans, 4¾ 1976 Mysore loan eased by 25 paise to Rs. 97. U.P. loan by 20 paise to Rs. 96.80 and Maharashtra loan by 15 paise to Rs. 99.60. The Rs. 1-crore issue of 5 per cent Maharashtra State Financial Corporation Bonds (1976) was closed on the very first day when the list opened (Monday the 26th inst.), as it was over-subscribed. The Madras State Electricity Board has announced the issue of 5 per cent Bonds for Rs. 3 crores redeemable at par on 16th November 1976. The issue price is Rs. 99.75, that is, a discount of 25 paise. The list will open for subscription on the 16th of next month.

In the foreign exchange market, the banks' buying rate for U.S. dollars declined by 50 paise to Rs. 477.25 per $100. Their selling rate also declined by 25 paise to Rs. 480.75. In New York, the pound sterling has strengthened *vis-a-vis* the dollar, following the announcement of the emergency economic policy by the Labour Government and the firm official declaration to the effect that the strength of the sterling "can and will be maintained." But the recovery has not been appreciable. Thus, the spot rate for sterling has risen by just 0.180 cent to 278.460-278.480 cents and the three months forward by 0.300 cent to 277.890-277.910 cents.

BULLION SUBDUED

(From Our Own Correspondent)

BOMBAY, 28*th October*

Both silver and gold ruled subdued during the week under review. The decline in silver followed selling pressure, as enquiries from up-country centres were poor. Demand for gold was also at a low ebb in the face of increased arrivals. Over the week, silver was lower by Rs. 3 and gold by 50 paise. The poor demand for bullion on the eve of *Diwali* festival is attributed by traders to high cost of living which is deterring purchases on a large scale.

Silver began the week 50 paise lower at Rs. 256 and declined steadily to Rs. 253 today. The demand for silver in the market was so poor that even the lower arrivals were not readily absorbed by traders. The weekly average arrivals and offtake of the metal were 25 and 9 bars, as against 28 and 9 bars, respectively last week.

Fourteen-carat gold, after rising from Rs. 66.50 to Rs. 67 in the earlier sessions, declined later and finished at Rs. 66 today. Pure gold, however, improved by Rs. 2 to Rs. 112 on some inquiries and reports of seizure of contraband metal. Sovereign was quoted a rupee higher at Rs. 91.50.

The international price for gold in the London market was lower at $35.10¼, as against $35.11¼ last week. The sterling price was also lower at 252s. 1½d., as against 252s. 4d. last week. Both spot and forward silver were unchanged at 112½d. and 113d., respectively, as also silver in New York at 129.3 cents.

In the Surendranagar district of Gujarat, over 500 goldsmiths have so far been granted loans aggregating to Rs. 7.44 lakhs according to an official announcement. The Registrar of Co-operatives has also granted loans amounting to Rs. 22,800 to nine persons. Further, employment for nearly 70 goldsmiths has been provided through employment exchanges.

The following table shows the trend of prices during the week under review:

	28-10-64 (closing)	High	Low	21-10-64 (closing)
SILVER				
Ready (996 fine) ..	Rs. 253·00	Rs. 256·00	Rs. 253.00	Rs. 256.50
GOLD				
Ready (14-carat) ..	66·00	67.00	66.00	66.50
Sovereign	91.50*	—	—	90.50*
London—				
Gold ..	252*s.* 1½*d.*	252*s.* 3½*d.*	252*s.* 1½*d.*	252*s.* 4*d.*
Silver Ready ..	112½*d.*	—	—	112½*d.*
Silver Forward ..	113*d.*	—	—	113*d.*
New York—				
Silver	129.3 cents	—	—	129.3 cents

N.B.—The quotation for gold is per 10 grams (about 0.85 tola) and that for silver is per kilogram (85.73 tolas). London and New York quotations are per ounce. * Unofficial rate.

SPURT IN COTTON FUTURES NOT FULLY SUSTAINED

(From Our Own Correspondent)

BOMBAY, 28*th October*

Although the futures section of the cotton market suffered a setback on the first day of the week under review on account of bull liquidation, the upward trend started on the same day following encouraging spot advices. Reports regarding damage to crops in certain cotton tracts and consequent short-covering also imparted firmness to the contract almost throughout the week. The trend was actually buoyant on Monday, the 26th instant on continued adverse weather reports, speculative support and the millworkers' decision to postpone strike which was to begin on that day. The rising trend of prices was so strong that, even reports that global import quota of 2.14 lakh bales of cotton would be announced next month, did not have any effect. On Tuesday, however, there was a perceptible dip in the futures due to profit-taking at higher levels by a leading bull operator who is said to have sold about 30,000 bales. This trend continued today also, though towards the close a mild recovery in prices was in sight on account of reported damage to the crop in Khandesh and general expectation of lower crop for the country as a whole.

The Jarilla March 1965 contract opened the week lower by 25 paise at Rs. 738 and, after declining to Rs. 737 on the first day itself, moved up to touch a high of Rs. 744.75 on Tuesday, the 27th instant. After dipping to Rs. 737 on the last day of the week, the contract closed higher at Rs. 740.50, with a net gain of Rs. 2.25 over the week.

The Sewri spot market was brisk with activity almost throughout the week. Mills were regular buyers of both old and new varieties. Spinners evinced interest in new crop with fresh arrivals at the terminal markets. The main varieties in demand were L.147, Co2, 197/3, Digvijay and Kalyan. The following are the latest available quotations in respect of certain popular varieties:

Amod (current) Rs. 1,125, Bengal Fine Rs. 758, Bawla New Rs. 970, Amravati Buri Rs. 1,100, Dharangaon Rs. 1030, Dabhoi Line New Rs. 1,160, Ganganagar Rs. 775, Hubli Laxmi Rs. 990, Mandal New Rs. 935, Morvi New Rs. 910, Wardha L.147 Rs. 1,205 and Viramgaon New Rs. 948.

Hectic activity was noticed during the week in the December delivery contract for Bengal *Deshi*. A rise in the rate in this variety was recorded on the very first day from Rs. 751 per candy to Rs. 753. Short-covering by shippers and brisk buying by upcountry mills following reports of damage to crop in the Punjab, lifted prices upwards to Rs. 770 on Monday, the 26th instant. But the higher levels could not be maintained because of heavy selling by spot merchants and lack of demand from overseas. At the time of writing the rate for Bengal *Deshi* is Rs. 758 and the export sale registerations are about 72,000 bales, as against 64,000 bales last week.

As regards imports, there are expectations that the season's first global quota to the extent of 2.14 lakh bales will be released early next week. Spinners are reported to be showing keen interest in American cotton under P.L. 480 which may not be difficult to obtain after the issue of global quota. Enquiries about Sudanese, Pima and other African cotton are also reported.

Latest reports about the current season (1964-65) cotton crop indicate satisfactory progress, in spite of the fact that there has been some damage to crops in certain areas such as Punjab, Khandesh and Berar. In the South, the north-eastern monsoon was quite active. Though the rains have affected the early arrivals of Laxmi variety, it is reported that Co2-170 strains have benefited by rains. Favourable weather reports are being received from Vidarbha and other areas. Arrivals of most of the cotton varieties are reported to be gathering momentum.

Although the earlier expectations of a total crop of about 65 lakh bales (of 392 lbs. net each) from the current season may not materialise, the trade estimates still place the crop at 62-63 lakh bales. With expected imports to the tune of 6.5 lakh bales and opening stocks of cotton at 25 lakh bales, the total cotton supply is likely to be about 95 lakh bales. With consumption around 62 lakh bales and exports about 3 lakh bales, there are indications that the carryover may be well near 30 lakh bales.

PEPPER ADVANCES

(Messrs. Parekh and Co.)

BOMBAY, 28*th October*

The bulls having taken delivery of about 847½ tons of garbled pepper against their commitments in October delivery on the Cochin Ring, Malabar black pepper garbled improved during the week from Rs. 348 to Rs. 359. Scarcity of floating stock at both Bombay and Cochin made bears to withdraw from the market. Sales of about a couple of hundred tons to East European countries by bulls gave them necessary courage. As a result, they came to support the market by purchasing sizable contracts of December delivery at Cochin and *Posh* delivery in Bombay. The rise from $M112½ to $M122½ at Singapore and from $33 to $35½ in spot at New York was responsible for the improvement in the overall sentiment of the market. The future of pepper, however, depends upon the selling policy of Indonesia, though it is considered risky to take a bullish view, as the whole production of new crop of Lampong and that of coming crop of Malabar are intact without any advance sales to cushion the pressure of arrival of new crop of Malabar at the peak of the harvesting seasons.

The news of further devaluation of Indonesian currency from 250 rupias to 517½ rupias per U.S.A. dollar failed to have any impact on the market, as Indonesian rupias are already selling unofficially at a very high premium.

Posh and *Maha* delivery in Bombay are quoted at Rs. 363 to Rs. 367, respectively, after touching the highest at Rs. 368 and Rs. 372. December and January delivery at Cochin are quoted at Rs. 352 and Rs. 355, respectively, with small turnover.

Ready ungarbled in the local market is selling at Rs. 182 per 50 kilos.

IMPORTS OF ART SILK YARN

(From Our Own Correspondent)

BOMBAY, 28*th October*

Thanks to the Government of India's decision to grant advance import licences for art silk yarn and synthetic yarn to manufacturers and exporters of fabrics and hosiery articles, art silk yarns drifted downward during the week under review. Sustained selling by stockists, improvement in supply position and poor demand from consuming centres also imparted easiness. There was a slight set back in the staple fibre yarn future, thanks to tired bull liquidation, coupled with small turnover. Business put through was meagre. Ready staple fibre yarns were dull. Cotton yarns also were dull.

Advance import licences for art silk yarn and synthetic yarn, referred to earlier, will be granted on a recommendation by the Textile Commissioner and subject to certain conditions. This new facility for the exporters is intended to relieve them of the hardships of securing the raw materials which they might need in executing export orders. The licences will be given against an undertaking by the exporters that they will effect the export of the declared quantity within a stipulated time. A bond accompanied by a bank guarantee will have to be submitted by the shippers. The licences will be given on the basis of 50 per cent of the entitlement to be earned on the future exports. As licences are now given on the basis of 70 per cent, the advance licence will be 35 per cent of the f.o.b. value or the official international value of the exports.

Among art silk yarns, National Rayon 150D receded by 20 P to Rs. 9.48. 120D fell by a like amount to Rs. 10.12. Bright Century 75D sagged by 16 P to Rs. 17.86.

In the staple fibre yarn section, 2 x 34 January 1965 contract began the week at a premium of Re. 1 at Rs. 855 per quintal and, after rising to Rs. 859 on Saturday, declined subsequently to close the week at Rs. 852. Spot Pioneer shed 2 P to Rs. 9.24. Premier dropped 13 P to Rs. 9.68. City, Kiran and Sitlaxmi were neglected. Vasanta, however, put on 9 P to Rs. 9.15 on special support.

Cotton yarn 68s Moderns lost a rupee to Rs. 101. 34s Vasantas eased by 25 P to Rs. 41.75. All other counts were unchanged at level.

The following table gives the prices of rayon staple fibre and cotton yarns, today, as compared with those prevailing a week ago:

	28-10-1964	21-10-1964
Art silk yarn (per kg.)—	Rs.	Rs.
National Rayon 120D	10 12	10 32
Century 75D	17 86	18 02
R. I. Viscose 120D	12.54	12.54
Staple fibre yarn (2 x 34 NF) January 1965 (per quintal) ..	852.00	847.00
Spot (per kg.)		
Vasanta	9.15	9.15
Premier	9.68	9.81
City	9.55	9.55
Cotton yarn - French Count (Rs. per 5 kg.)		
8s Podar	21.50	21 50
17s Modern	27 00	27 00
22s Madura	32 00	32 00
34s Madura	43.00	43 00
52s Pioneer	68.75	68.75
68s Finlay	104.50	104.00

OILSEEDS BEARISH

(From Our Own Correspondent)

BOMBAY, 28th October

Trading pattern in oilseeds during the week indicated that the market not only lacked strenght but was set for a further decline. Sentiment was affected by the sharp setback in spot groundnuts which in turn induced a decline in

futures. More interesting than the decline in prices was the reversal of the price relationship between spot and futures seeds. Time was when spot prices were commanding a premium of as much as Rs. 120 per candy over the contract, but the disparity narrowed down to a trickle and at one stage during the week, the spot was easier than futures.

It is, however, not unusual for spot prices to come closer to the level of the forward rates as the new season gets going, but what attracted comment this time was the unprecedented levels to which spot prices had shot up. Groundnuts had touched as high as Rs. 76 per 50 kg. and oil was generally traded for quite some time at Rs. 3,300 per tonne, although stray unofficial transactions were reported even at Rs. 3,400. Today seeds Khandesh was mentioned at Rs. 49.75, Quality at Rs. 48.50 spot and November at Rs. 46.25 all per 50 kg. Ready oil was available at Rs. 20.60 per 10 kg. and November was mentioned at Rs. 18.60, December at Rs. 18.45, January at Rs. 18.45.

Reports from Rajkot indicated that the tendency there was weak with the spot rate at Rs. 17 (loose). Arrivals of seeds were reported to be heavy with the average at 8,000 to 10,000 bags a day and these were mainly from Varad, Khandesh and Mysore. The Madras crop was also reported to be moving in full force. The Saurashtra crop had begun to move and market circles both here and in Saurashtra were eagerly looking forward to the removal of the ban on exports from the State and the necessary announcement was expected to be made before Divali. In these circumstances, selling pressure was rather heavy. This explained the weakness in groundnuts January which has declined from the last week's level of Rs. 95.20 to Rs. 94.25, while the week's low was Rs. 93.70.

Groundnut extractions were weak evidently in sympathy with seeds. Rates at the time of writing were: Ready Rs. 420; November Rs. 403; December Rs. 392; and January Rs. 385-Rs. 386. Offerings here, too, were heavy and knowledgeable sources thought that the prices might decline by a further Rs. 15 to Rs. 20 per tonne. Expellers were also easy with ready goods quoted at Rs. 432, November at Rs. 410 and December at Rs. 400. With the start of the solvent extraction season, offerings of extractions will be larger and these might induce a further reaction in prices. Market sources felt that this reaction might be anything upto Rs. 25 to Rs. 30. Overseas advices are steady. London prices were: November £37-10, December £36-10, January £35-10 and January-February-March £35-5.

The outlook for extractions depends to a considerable extent on the offtake by communist countries which have been consistent buyers since several months. With the change in Russian leadership and the policy of conciliation which the new Soviet leaders are likely to adopt towards China, it is wondered whether communist countries will come to support the Indian market in the same measure as they have been doing all these days, for, with communist countries, trade and politics are invariably interlinked. If they continue to buy, well and good. Otherwise, India will have to turn to its traditional customers like Britain and the Continental countries.

Although the statistical position of castorseeds should favour a continued firm trend yet for some time, the market has taken a downward turn. The March contract has eased to Rs. 181 from the week's high of Rs. 183.75. Sentiment in castor seems to have been induced mainly by the decision of the United Kingdom to impose a 15 per cent charge on imports. This might put Indian castor oil out of parity and it will, therefore, be difficult to sell in that market unless our prices ease to suit buyers' ideas there. Linseeds do not seem to have any independent trend of their own and are led mostly by groundnuts. Fluctuations here during the week were narrow. The March contract opened around last week's level and, after recording a fractional rise to Rs. 40, it was quoted at Rs. 39.89 towards the close. The outlook for linseeds, as has been mentioned many a time in this column, depends much on the mustard crop which is likely to be very satisfactory this season.

It was rather surprising that cottonseeds should have turned bullish and maintained a consistently firm tone, although the January contract tended to react towards the close on profit-taking. It may be pointed out here that the January contract had shot up to Rs. 106.25, as against the previous week's closing of Rs. 102, and was quoted at Rs. 104.25 at the close. The rise here was induced by the firmness of cotton futures which were bid up on talk that the crop estimate should be revised downwards, in view of the damage to the harvest due to untimely rains in certain tracts. Otherwise cottonseed oil was very weak and, as against quotation of Rs. 26 just a month ago, it was quoted today at Rs. 20, 15th November at Rs. 18 and December at Rs. 17. There was hardly any justification for cottonseeds futures to be so firm and it, therefore, remains to be seen whether present levels would be maintained.

Cottonseed crushers are apparently worried over the weak tendency in oil. It appears that they have made a representation to the Government suggesting that the ban on the use of solvent extracted oil by *vanaspati* manufacturers should be removed in order that demand for cottonseed oil might be stimulated. They are also understood to have pointed out that the import of soyabean oil from the United States should not be allowed to affect the offtake of straight oil by the *vanaspati* industry. Another point which cottonseed crushers are understood to have made is that an incentive by way of a rebate in excise duty should be given to soap manufacturers to the extent of the cottonseed oil used by them in soap manufacture.

Sentiment in the market was by and large induced by the Prime Minister's statement that oil and *vanaspati* prices would be controlled. Further, crop outlook for groundnuts is excellent and, in these circumstances, the tendency for the market would be to remain easy, allowing for technical rallies now and then.

The following table shows the closing prices of oilseeds and oils as on 28th October as compared with those of the two previous weeks:

	28-10-1964	21-10-1964	13-10-1964
	Rs.	Rs.	Rs.
Groundnuts			
January 1965 contract	94.40	95.20	95.75
Oil January 1965	N.T.	N.T.	19.20
Khandesh quality	97.00	106.00	133.00
Oil ex-mill	21.00	24.50	28.75
Oil Rly. Receipt	20.50	23.75	27.75
Castorseed			
March 1965	182.00	182.87	184.37
Ready Madras	83.00	83.50	83.00
Ready Kanpur	81.00	81.25	80.50
Oil B.S.S.	18.60	18.70	18.85
Oil commercial	17.70	17.80	17.85
Linseed			
March 1965..	39.69	39.84	40.44
Bold ready	95.50	96.00	102.50
Linseed oil	20.15	20.80	21.50
Cottonseed			
January 1965 contract	104.25	102.00	101.25

N.B.—The quotation for groundnuts January 1965 contract is for 100 kg. The rates for spot groundnut and castor are for 100 kg. Castor and cottonseeds futures are quoted per 250 kg. while linseeds futures are quoted per 50 kg. Groundnut Oil January 1965 and all spot oils are quoted per 10 kg.

TIPPY TEAS DECLINE

(From Our Own Correspondent)

COCHIN, 22*nd October*

Offering in tea sale No. 42 held here on Tuesday the 20th inst. amounted to 841,000 kg. Nilgiri quality was barely maintained, but that from other districts was usually improved. There was strong general demand. Highgrown brokens evoked less enquiry, but eased in value. Their fannings were irregular, but generally easier. Good medium brokens were about firm on last rates, but their fannings were slightly easier. Medium and low medium brokens were well supported and came to a firm and sometimes appreciably dearer market: their fannings, however, were steady. Whole leaf grades were taken up at firm to dearer rates. Unorthodox teas were in good demand, but prices declined slightly. Tippy teas were easier.

The quotations (per kg.) were:

	1964	1963
	Rs.	Rs.
Low medium	4.20-4.80	4.20-4.65
Mediums	4.80-5.20	4.70-5.15
Good mediums	5.20-5.70	5.30-5.70
Nilgiri B.O.P.	5.00-6.70	5.00-7.85

The average price realised in sale No. 43 was Rs. 4.86 per kilo, as against Rs. 4.82 a week ago and Rs. 4.75 in the corresponding sale last year.

In dust sale No. 42 held today, 456,000 kgs. were offered. The market opened to strong general demand which continued throughout the sale. Low medium and mediums elicited strong enquiry and were irregularly dearer by up to 15 paise. Good mediums also were well supported and generally realised higher prices than last. Highgrowns encountered irregular support at easier rates, with some withdrawals. Fibrous and stalky kinds were in better demand than of late and registered advances. There was irregular support for unorthodox descriptions. The best continued to sell at lower rates while below best, meeting better support, are sold at around last rates.

The average price realised in dust sale No. 42 was Rs. 4.52 per kilo, as against Rs. 4.41 a week ago and Rs. 4.47 in the corresponding sale last year.

Colombo: The market met with good demand. Dimbula brokens were irregular, while good mediums were sold at around last rates. Plainer kinds eased by 5 to 15 cents. Brighter uvas were firm to dearer, but lowgrowns showed a decline. B.O.P. fannings were strong and dearer, particularly mediums and uvas.

London: North Indian and other growths: There was good general demand in Monday's sale. Best Assams were fully firm, but others were irregular and lower with quality. Dooars were very strong and often advanced by 2*d.* and more.

Ceylon and South Indians: In Tuesday's sale, 25,839 packages were offered, of which 6,149 packages came from South India. There was good demand. Best Ceylons tended easier, while others were strong. Mediums advanced by 1*d.* to 2*d.* and lowgrowns by 1*d.* Fannings were dearer by 2*d.* to 6*d.* South Indians were generally dearer with better quality advancing substantially.

TEAS IN GOOD DEMAND

(From Our Own Correspondent)

CALCUTTA, 27*th October*

Good demand featured yesterday's export sale. Although there was good demand during last week's internal sales, too, prices realised were generally lower. After the *Pooja* holidays, the demand for shipping space both in ready and forward liners has considerably increased.

Up to the end of the last month, North Indian tea output aggregated 441,223,796 lbs. showing an increase of 43,579,605 lbs. as compared with the same period last year. All indications are that this year's crop would surpass that of 1961. Normally, such an increased crop should have depressed demand, but this has not been so in view of lower raisings both in Ceylon and South India as a result of the drought conditions earlier this year. Prices have not risen in tune with the increased demand in export auctions, and the Tea Board recently stated that the average price of tea sold particularly at Calcutta and London auctions showed a downward trend, but that prices realised were not by and large "unfair."

India's tea exports this year are expected to show a rise, both in relation to quality and foreign exchange earned, as compared to last year. Last month, exports were 28.83 million kgs., valued Rs. 18.1 crores as compared to 25.4 million kgs. valued Rs. 15.78 crores in September 1963. The tea trade here believes that internal consumption of tea, which rose from 82.7 million kgs. in 1953-54 to 139.6 million kgs. in 1961-62, has fallen this year. This is attributed to the absence of internal promotional campaigns, and consequently other soft drinks have taken advantage and expanded at the cost of tea. Such an inference is in good stead, as tea is one of the few consumer goods in India that has failed to participate in the present boom in evidence in many other consumer stores. In other words, while people's purchasing power has in this year impressively increased, people are drinking less tea. The fact that tea prices have not much changed as compared to the beginning of this year and that cost of production in gardens has risen rather steeply does not hold out hope for any improvement in the return on investment in the tea industry.

Dusts on offer during last week's internal sales were 35,434 packages, which met with a good demand at lower levels. Plain orthodox teas and medium Assam teas eased in an irregular trend, and legg-cut teas met with support at slightly discounted rates. C.T.C. teas also met with good support at lower rates, but the recession in respect of the better varieties was less marked. The quotations per kg. inclusive of excise duty were: good Assam C.T.C. dust Rs. 6.00 to Rs. 6.40, medium C.T.C. dust Rs. 5.15 to Rs. 5.35, plain C.T.C. dust Rs. 4.80 to Rs. 5.10, legg-cut dust Rs. 4.85 to Rs. 5.10, medium Assam dust Rs. 4.80 to Rs. 5.10, and plain orthodox dust Rs. 4.20 to Rs. 4.60.

During yesterday's export sale, leaf on offer aggregated 71,962 packages, which met with a good general demand. Firm prices were realised in respect of plain orthodox brokens and Dooars B.O.P. teas of clean appearance. Fannings were irregular and easier. Assam orthodox teas also eased, but the few selected brighter teas were steady. The quotations per kg. inclusive of excise duty were: good Assam C.T.C. fannings Rs. 6.60 to Rs. 7.00, good Assam C.T.C. B.P. Rs. 6.40 to Rs. 6.70, medium C.T.C. fannings Rs. 5.60 to Rs. 6.10, medium C.T.C. B.P. Rs. 5.60 to Rs. 6.00, clean plain pekoe Rs. 5.20 to Rs. 5.50, plain C.T.C. B.P. Rs. 5.00 to Rs. 5.20, plain orthodox B.P. Rs. 4.20 to Rs. 4.40, and plain orthodox fannings Rs. 4.20 to Rs. 4.40.

JUTE GOODS RECEDE

(From Our Own Correspondent)

CALCUTTA, 27*th October*

If, despite the strike in Pakistan jute mills, prices of jute goods in the Calcutta market did not rise during the week under review but actually fell slightly, it was due to the fact that, both before and during the *Pooja* holidays, prices had impressively moved forward in anticipation of large orders from overseas countries. Although the loss of production has heavily curtailed the Pakistan's ability to cater to overseas requirements, overseas buyers are in no hurry to place orders with India. Orders so far placed have fallen below earlier expectations. In spite of this week's small fall in prices, it is believed that the profit margin of mills has somewhat improved. It is, therefore, felt that not many mills would like to maintain the trend towards a lower output that was in evidence last week.

Mills in India produced last month 104,000 tonnes of goods, thus showing a fall of 7,500 tonnes as compared with the previous month. The fall, which occurred despite the increase in working hours in the month to 208 from 200 in the previous month, clearly showed that mills had readjusted their production by sealing looms. In terms of the Working Time Agreement, already abrogated, if and when looms were sealed, the same had been announced much in advance and the percentage of looms to be sealed applied uniformly to all mills. Now that the Agreement is no longer in force, the mills are not under any obligation to seal looms according to a pre-planned basis. The fact that production had visibly fallen last month showed that mills had voluntarily sealed a portion of their looms, either in consideration of the depleted raw material position and/or of higher stocks of particular constructions. Although mills are not expected to maintain the adjustment of production made last month, output this month is expected to be considerably less, in view of the intervention of too many holidays. However, as already stated, overseas buyers have not been in a hurry to place orders, as they think that the prices of goods must decline further.

Pakistan's ability to cater to overseas requirements is no doubt restricted, first because order books are complete up to March next and secondly because the loss of production as a result of strike would mean an extension of delivery dates. The trade here points out that the Pakistan loss of output can by no means be taken as a redeeming event to gain temporary advantages. Fair prices, maintenance of quality, and adherence to delivery dates continue to be important factors to gain foreign markets. There are already reports that, in the United States, substitutes are preventing to give jute goods the latter's full share of the increased need of packaging materials. U.S. wool manufacturers are considerably pleased with the South African wool shipments packed in paper bags. As compared with gunny, paper bags are not only cheaper but readily available. Some U.S. firms are at present engaged in research to develop synthetic packing materials. Although world consumption of jute goods would not fall as a result of inroads by substitutes, it is apprehended that jute goods would not be able to derive 100 per cent benefit from the

increased demand for bags as a result of larger agricultural and industrial output.

The trade has noted with satisfaction that, despite stiff competition from Pakistan mills, India increased exports of goods in the first six months of this year to Rs. 82 crores, showing a rise by 2 per cent as compared with the corresponding period of last year. Considering the fact that this year's price level has been considerably lower in view of the better relationship between demand and supply, the quantity exported should have shown a more impressive increase. In 1963, the Indian jute industry very nearly achieved the third Plan export target fixed for it. The trend of increased exports this year is attributed to more reasonable prices for goods. Consumption of jute goods and sacking in the U.K. has increased, although the U.K. is now importing less ready-made goods and more hessian cloth. The U.S. consumption of burlap has in recent months increased, and it is expected that last year's monthly average would be realised this year. This is heartening, since, in the early months of this year, U.S. consumption had been markedly falling. The demand for specialised constructions such as tufted carpets and floor coverings has been increasing in the U.S.

As a result of increased offerings, fibre prices fell by about Re. 1 per maund during the week under review, the latest quotations being Assam bottoms Rs. 38; Northern bottoms Rs. 37; and Daisee bottoms Rs. 38.50. The compulsory maximum purchase quota for the current week ending 31st October 1964 is 175,000 bales.

The gunny market re-opened on 19th October (after the *Pooja* holidays) on an easier note, as it was realised that the pre-*Pooja* rise in prices had been a little overdone. Excepting business with Government involving 3,000 bales of B. twills, nothing else of interest took place in the ready market on that day. However, interest in the hedge market was soon revived and the earlier losses were made good. Ready B. twills and hessian 40" 10 oz. were quoted at Rs. 153.50 and Rs. 50.70, respectively. The market was closed on Tuesday last on account of the local holiday and the feature on Wednesday was once again Government interest in B. twills. The quantity involved this time was 4,000 bales. However, there was no other interest shown and that explained for the small recession in prices to Rs. 153.35 and Rs. 50.60 for B. twills and hessian 40" 10 oz. respectively. On Thursday last, business in woolpacks took place with Australia. The Government placed an order for 5,000 bales of B. twills. Since, however, orders from overseas countries failed to materialise to the extent expected earlier, B. twills fell to Rs. 151.25 and hessian 40" 10 oz. to Rs. 50.15. Government orders on Friday covered 7,000 bales of B. twills against November-December delivery, as a result of which ready B. twills hardened to Rs. 151.65. In sympathy, ready hessian 40" 10 oz. improved to Rs. 50.35. Over the week-end, however, prices eased to Rs. 151.25 and Rs. 50.25, respectively. With B. twills at Rs. 150.50 and hessian 40" 10 oz. at Rs. 49.75 prices declined yesterday following bearishness in the hedge market. Excepting for Government business involving 4,200 bales of B. twills, there was little else of interest.

KIP EXPORTS SELECTIVE

(From Our Own Correspondent)

MADRAS, 26*th October*

Export trading has been selective in all the sections of the trade. Importers find that the prices quoted by the tanners are not economic and that other origins offer pretty low and attractive prices. Tanners at this end are unable to buy raw stocks at workable prices, in view of the higher prices paid by exporters of raw skins and by tanners who cater to the inland trade. Business has been very difficult for the shippers.

Enquiries for cowhides were for light and medium weights, and for cowcalf light weights and for buffcalf and buyers have been choosy. Prices on the whole remained steady.

Demand for tanned goat skins is good but buyers have been trying to buy at lower prices. Enquiries for middle class sheep skins 6/7 lbs. average are brisk and for other tannages dull. Importers have been bitterly complaining about the adulteration in the tannages of sheep skins and making claims for quality. The strike notice given to the tannery owners in the North Arcot has been withdrawn.

In the last London tanned skins public sales, very little quantity of skins were sold and the prices realised were poor.

SPURT IN COPPER AND TIN

(From Our Own Correspondent)

CALCUTTA 27*th October*

Higher advices from the principal overseas markets continued to pour in during the week under review, and this factor coupled with the acute shortage as a result of lower imports as against increased demand helped to maintain metal prices at higher levels in Calcutta during the week under review.

The feature on the London Metal Exchange in the week under review was the buoyant rise in copper quotations. Spot copper wire-bars at £512-515 touched a new high for recent years. This week's opening was higher at £505-506, as against last week's closing of £494. As the week progressed, however, the quotation gave way to close at £500-505. Spot cathodes moved up from £465-470 to £490-495, and spot fire-refined copper from £383 to £397½ a ton. These rises followed the direction of the Chilean Government to copper producers in that country to sell their metal for export at 35 cents a lb., that is, at £280 a ton. Hitherto, the selling price was only £260 a ton. For a long time, the selling price was only £234 a ton, which was also the L.M.E. quotation for a pretty long period until early this year. In spite of the present boom, the chief producers in the free world have kept their selling price at much below the L.M.E. quotations for fear of an ultimate fall in demand on substitution. However, it was not altogether unexpected that the Chilean Government would desire to benefit from the buoyancy in the price, which has been steady now for nearly a year. In the last six months or so, the L.M.E. quotations have been touching new high levels practically every week.

It is now expected that copper mines outside Chile would also follow the Chilean price rise. It is however noted that the Kennecott Copper Corporation, while accepting the Chilean decision in respect of copper produced by its mine in Chile, that is, Braden Copper Co., has announced that copper produced domestically by Kennecott and sold abroad would continue to be priced at £260 a ton, while its domestic price would remain unchanged at 34 cents a lb. On behalf of Union Miniere, it has been stated that this mine does not propose to follow the price rise. A similar announcement has also been made by the Rhodesian Selection Trust, while Anglo-American has been non-commital so far. Earlier, Anaconda raised the price to £280 a ton, although on its behalf, the statement that the Company's decision to follow the Chilean directive should not be taken as amounting to the acceptance by the firm of Chilean right to fix the price for export has been made.

Although indications are that the world consumption of copper has considerably increased since the past one year, it is not thought that the increase has been of such a magnitude as to justify the present high level. Accordingly, the belief that consumers all the world over have increased their inventories is entertained, and assuming that this belief is justified, a break in prices should follow, although the prospect of the price touching £234, the base level until about a year ago, should by all means be dismissed as an objective beyond reach. Output in this year should have increased more remarkably than at present had it not been for interruption in production in the principal copper producing areas of the free world, namely, the United States, Africa and South Africa, on account of labour unrest and other troubles. The news that Chile has commenced production in the new State-owned smelter with a capacity of 30,000 tons of blister copper a year is soothing, as it encourages the hope that before long, copper output would outstrip demand. India would welcome that day, as then only the country would be in a position to import adequately. At the same time, the country is proceeding with efforts to step-up the domestic output of copper. It has been stated that the Indian Copper Corporation's new electrolytic refinery is almost ready to commence operations. India's own production is at present 9,500 tons, and imports are about 75,000 tons a year. Demand has been steadily rising and by the end of the third Plan, it is estimated to total 170,000 tons. The price of utensil copper scrap in Calcutta rose from Rs. 660 per 100 kgs. to Rs. 665 during the week under review.

In the last week, spot tin on the L.M.E. touched as high as £1,645-1,655, but since then, the price has been falling and in this week, the price level was about £1,585-1,595 a ton. The fall has been due to some indications in the U.S.A. of the likelihood of greater releases from stockpiles. However, the spiralling price trend is attributed to the absence of any agreement so far between the U.S. General Services Administration and the International Tin Council in regard to the U.S. releases from April next. Of the 20,000 tons which the U.S.A. has agreed to release in the twelve months ending next March, only 6,000 tons remain yet to be released: but the world deficit is now placed at 30,000 tons a year. If the U.S.A. continues to release 20,000 tons a year, that country's surplus stocks would be exhausted within six years. By that time, however, it is hoped that world output would increase more materially than hitherto, although how far the disturbed relations between Indonesia and Malaysia would affect their efforts to increase output remains to be seen. Tin in Calcutta at Rs. 3.350 per 100 kgs. was higher by Rs. 100.

On the L.M.E., spot zinc moved up from £124½-125 to £126½-127½, and spot lead from £120½-120¾ to £122½-123, but eased to close at £120½-121½ and £121¾-121¼ respectively. In Calcutta, zinc rose from Rs. 373 per 100 kgs. to Rs. 430 lead from Rs. 311.00 to Rs. 317.00.

FOODGRAINS RISE AGAIN

(From Our Own Correspondent)

HAPUR, 26*th October*

Bullish trend was again witnessed in foodgrain prices during the week under review. Shortage of stocks, coupled with good demand and latest State Government restrictions on trade were the main influencing factors. Maize prices, which had declined from Rs. 75 to Rs. 40 per quintal in last few weeks, thanks to heavy arrivals from other States again spurted to Rs. 60 per quintal, following seizure of maize stocks by State Government. Prices of other grains also recorded sizable gains in sympathy with maize. Rabi sowings have commenced under ideal weather conditions and record sowings are in sight.

After declining by Rs. 5 to Rs. 7.50 per quintal initially wheat prices advanced sharply in the week-end on good demand for seed purposes against meagre supply position. The average quality was quoted between Rs. 90 and Rs. 92.50 and farm produce between Rs. 93 and Rs. 95 per quintal. Subdued trend continued in rice market and prices in all sections drifted lower by Rs. 10 to Rs. 20 per quintal, according to quality following heavy arrivals of new crop. Week-end prices were:—Rice *basmati* superior Rs. 110 to Rs. 112.50, *sela* Rs. 105 to Rs. 107.50, *mainpuri* Rs. 83.06, *ramajwayan* Rs. 85.74, *raimunia* Rs. 85.74 and *gadda* Rs. 77.70 to Rs. 80.38 per quintal.

Gram prices also ruled firm during the week having advanced by Rs. 7.50 to Rs. 10 per quintal because of the ban on export from Rajasthan and good buying enquiry. Prices ranged between Rs. 90 and Rs. 95 per quintal. Barley and *bejhar* prices were almost stationary in limited trading. Barley was now quoted at Rs. 70 and *bejhar* at Rs. 68.75 to Rs. 70 per quintal. *Juwar* and *guwar* prices ruled steady while oats and coarse grains prices were steadier as stocks were negligible. Week-end prices were:—*juwar* Rs. 61.50 to Rs. 63.50, *guwar* Rs. 60 to Rs. 63, *methi* Rs. 62.25 to Rs. 62.50, *bajra* Rs. 60 to Rs. 62.50 and oats Rs. 75 to Rs. 77.50 per quintal.

Quiet to steady trend was witnessed in pulses market during the week. While peas and *arhar* prices ruled quiet, *urd* and *moong* prices sought higher levels on meagre arrivals. Pea prices ruled quiet at Rs. 71 to Rs. 75 per quintal. *Peas dal* prices also eased to Rs. 72.50 per quintal. *Arhar* prices were stationary while its *dal* prices were subdued on lack of support. *Urd* and *moong* prices recorded further gains due to meagre arrivals. *Masoor* and other *dal* prices were listless due to poor trading. Week-end prices were:—*arhar* Rs. 80 to Rs. 86, *arhar dal* Rs. 110, *urd* Rs. 71 to Rs. 75.02, *urd dal* Rs. 91.09, *moong* Rs. 102 to Rs. 105, *moong dal* Rs. 115, *masoor* Rs. 82.50 to Rs. 87.50, *masoor dal* Rs. 108.51 and gram *dal* Rs. 100.87 per quintal.

SUGAR SUPPLIES SCARCE

(From Our Own Correspondent)

HAPUR, 26*th October*

Crystal sugar supplies continued to be scarce during the week and, as pre-*Diwali* demand was brisk, prices in the open market increased further by Rs. 2 a quintal to Rs. 182 to Rs. 185, as against the controlled prices of Rs. 140. In order to step up sugar production in the forthcoming season next month, the Union Government has given some incentives to sugar industry. However, the Government's policy regarding sugar, *khandsari* and *gur* is being eagerly awaited by the trade. Factories in west U.P. will commence crushing operations before 10th November.

Desi khandsari recorded a steadier trend during the week, thanks to better demand mostly of local nature due to *Diwali* and some support from east U.P. The stockists were very much worried over the non-disposal of the accumulated stocks and the fast approach of the new season. Traders have again urged the Government to make arrangements for the immediate lifting of *khandsari* against permits or to remove the ban on inter-State movement of the commodity. *Khandsari* in the open market was quoted at Rs. 128.60 to Rs. 165 a quintal according to quality, as against the controlled prices of Rs. 109.83 to Rs. 128.29.

Ready *gur* displayed a sagging trend during the week under pressure of arrivals which averaged 3,000 maunds daily. Arrivals have also improved in mofussil markets, but as festive demand from South is fairly heavy, they are being readily lifted. Cultivators being busy with *rabi* sowings, large-scale arrivals would commence only after a fortnight. The week-end prices (in Rs. per 40 kilogram) were:—*gur pansera* best 35, inferior 28 to 32, *balti* 36 and *shakker* 35 to 39.

MECHANISATION AND AUTOMATION IN BANKING AND INSURANCE

(Concluded from page 761)

banks other than the State Bank of India has a size large enough to enable it to make effective use of electronic computers. It is quite conceivable to argue that the use of computers will enable the banks to expand more rapidly into unbanked areas, or that several banks could jointly own and operate a compufer. But then, computers are of several types and it remains yet to be determined which one would suit Indian conditions the best. The evolution of a most suitable and effective computer for Indian banking is essential and banks and their associations must come together to do the necessary thinking and devise the practical specifications even before the State Bank of India purchases its own computer; for, from the long-term point of view of Indian banking, standard equipment and standard computer procedures are absolutely essential.

Apart from all these considerations, there is a very vital point to be remembered before importing large and costly foreign equipment, and this applies equally well to the L.I.C. and the State Bank of India. Spares, equipment and skilled staff to maintain and repair, if need be, the costly computers will also have to be imported and whether the additional cost of all that will be worth the benefits to be gained, must be weighed and valued in each case before the decision to import and introduce computers is taken. Meanwhile, and for many banks, the progress of and prospects for automation must consist of simple adding and calculating machines. Their introduction and use will increasingly lead to a revolution in the procedures, practices, methods and techniques of banking in our country, and prepare the minds of staff, as well as of management, for acclimatising themselves to more advanced types of mechanisation to be followed ultimately, wherever possible, to the introduction of electronic computers.

* The production statistics relate to six 'A class' units only. Hence the index based on their production has been inflated by the ratio of production of all units in 1961 to production of six 'A class' units in that year.

† Due to non-availability of production data, May 1964 figures has been repeated.

Notices

THE BARNAGORE JUTE FACTORY COMPANY LIMITED

(Incorporated in England with Limited Liability)

DIVIDENDS

THE FOLLOWING DIVIDENDS HAVE BEEN recommended in respect of the year ended 31st March, 1964, payable on the 9th December, 1964:—

(1) On the Preference Shares at 5 per cent (Five Shillings per share) less U.K. Income-tax of Seven Shillings and Nine Pence in the £ Sterling.

(2) On the Ordinary Shares at 30 per cent (£1-10s.-0d. per share) less U.K. Income-tax of Seven Shillings and Nine Pence in the £ Sterling.

Payment of any Dividend declared will be made only to those Members whose names are registered in the Books of the Company on 2nd December, 1964 or to their Mandatees.

Dividend Warrants to Members on the Calcutta Register will be made payable in Calcutta.

No applications for warrants will be necessary. Claims on behalf of holders of shares on blank transfer will not be entertained.

The Share Transfer Books will be closed from 19th November to 2nd December, 1964, both days inclusive.

By Order of the Board,
JARDINE HENDERSON, LIMITED,
C. EVANS,
Secretary,
Agents.

4, CLIVE ROW,
CALCUTTA-1, *19th October*, 1964.

THE MORARJEE GOCULDAS SPINNING AND WEAVING COMPANY LTD.

NOTICE IS HEREBY GIVEN THAT THE 93rd Annual General Meeting of the Company will be held at its Registered Office at Dr. Ambedkar Road, Parel, Bombay 12, on Friday, the 27th November 1964, at 4.30 p.m. (I.S.T.), to transact the following business:—

1. To consider and adopt the Directors' Report and Audited Statements of Accounts for the year ended 30th June 1964.
2. To declare a dividend on Preference and Equity shares.
3. To elect a Director in place of Shri Gopikisan Piramal who retires by rotation and being eligible, offers himself for re-appointment, and to consider and, if thought fit, to pass the following Resolution as a Special Resolution in respect of which a Special Notice as required by Section 261 of the Companies Act, 1956, has been received by the Company and is hereby given to the Members:—

"RESOLVED that Shri Gopikisan Piramal who retires by rotation and who is a Director and Member and hence an Associate of Piramal Sons Private Ltd., the Managing Agents of the Company (which Managing Agents are authorised by the Articles of Association and the Managing Agency Agreement to appoint an Ex-Officio Director to the Board) be and is hereby re-appointed a Director of the Company."

The reasons which make this Special Resolution necessary are fully set out in the Resolution itself and in para 1 of the Explanatory Statement annexed to this Notice.

To elect a Director in place of Shri Binod Kumar Kanoria, who retires by rotation and being eligible, offers himself for re-appointment and to consider, and if thought fit, to pass the following Resolution as a Special Resolution, in respect of which a Special Notice as required by Section 261 of the Companies Act, 1956, has been received by the Company and is hereby given to the Members:—

"RESOLVED that Shri Binod Kumar Kanoria, who retires by rotation and who is an Associate of Messrs. Piramal Sons Private Ltd., the Managing Agents of the Company (which Managing Agents are authorised by the Articles of Association and the Managing Agency Agreement to appoint an Ex-Officio Director to the Board) be and is hereby re-appointed a Director of the Company."

The reasons which make this Special Resolution necessary are fully set out in the Resolution itself and in para 2 of the Explanatory Statement annexed to this Notice.

5. To consider and, if thought fit, to pass the following Resolution as a Special Resolution:—

"RESOLVED that the Company hereby approves of, adopts, ratifies and confirms all contracts entered into by and on behalf of the Company with the firm of Messrs. Banarsilal Nevatia & Co., an associate of Piramal Sons Private Ltd., the Managing Agents of the Company, in excess of the limit mentioned in respect of such contracts in the Special Resolution of the Company passed on 8th November, 1958, for the sale or supply by the Company to the said firm during the financial year ended on 30th June 1964 of goods manufactured by the Company."

6. To appoint Auditors for the current year and to fix their remuneration.

A MEMBER ENTITLED TO ATTEND AND VOTE IS ENTITLED TO APPOINT A PROXY TO ATTEND AND VOTE INSTEAD OF HIMSELF AND A PROXY NEED NOT BE A MEMBER.

The Share Transfer Books of the Company will be closed from Monday, the 2nd November 1964 to Saturday, the 28th November 1964, both days inclusive.

By Order of the Board,
FOR PIRAMAL SONS PRIVATE LIMITED,
MOHANLAL PIRAMAL,
Director,
Agents.

BOMBAY,
Dated: 17th October 1964.

The Dividend, if sanctioned, will be payable from Monday, the 30th November 1964 to those shareholders whose names stand on the Registers of the Company on 31st October 1964.

Dividend Warrants will be posted in due course to the Registered addresses of the shareholders. Change of address, if any, should be notified without delay.

AN EXPLANATORY STATEMENT AS REQUIRED BY SECTION 173 OF THE COMPANIES ACT, 1956, IS BEING POSTED ALONG WITH THE NOTICE TO ALL THE SHAREHOLDERS.

BANKING

(Concluded from page 766)

which is subsequently found not to correspond to export finance, a penal rate of interest may be charged by the banks.

The Committee is of the view that the cost of export credit at pre-shipment stage is not of the same significance as the rate for post-shipment finance. Moreover, as the amount of such finance will be considerably large, a substantial reduction in the rate of interest will have wider implications on the policy of credit control. It has, therefore, suggested a higher margin of 1½ per cent (exclusive of other charges, if any) over the Bank Rate. Thus, on the basis of the current Bank Rate, the maximum rate of interest will be 6½ per cent. But even this higher ceiling would result in a reduction of ½ per cent to the prime or first class borrowers and up to 2½ per cent to the second line borrowers.

Although long-term export finance has not yet assumed any significant importance, medium-term finance plays an important part in the non-traditional goods. As India is keen on fostering the exports of these goods at a fast rate, the fixation of maximum interest rates, both for post-shipment and pre-shipment medium-term credit, is necessary. In view of this consideration, the Committee has recommended a maximum margin of one per cent in case of post-shipment credit and 1½ per cent for pre-shipment credit over the rate at which refinance is provided by the I.D.B.—*irrespective of the fact whether or not financial institutions avail themselves of the refinance facilities.* On the basis of the current lending rate of I.D.B. at 4½ per cent, the maximum rate of interest charged by the banks will be 5½ per cent on medium-term post-shipment credit and 6 per cent on medium-term pre-shipment credit. These rates compare well with the rates prevailing in such countries as the U.S., the U.K., West Germany, France and Japan.

The next problem tackled by the Committee pertains to the scope of coverage, commodity-wise, of its suggestions. It is of the view that, though the problems facing exports of non-traditional items are somewhat different from those of traditional items, in the context of the changing pattern of India's exports in the competitive world market, a distinction between the two items would be artificial and arbitrary and will create many administrative difficulties. The Committee has, therefore, suggested that its recommendations regarding the reduction in the cost of credit should be applicable to the entire export sector.

These are all very commendable recommendations and if they are implemented fully, the exporters will have access to credit at 6-6½ per cent, which compares favourably with the rates for the domestic users of credit and those prevailing abroad. It is, perhaps, for the first time that a suitable scheme has been evolved to distinguish between domestic credit and preshipment export credit, and its adoption may make it difficult for borrowers to divert export credit to non-export sector. The success of the scheme will, however, depend on the availability of adequate refinance to the banks at Bank Rate. The Committee itself has pointed out that the mere fixation of the ceiling on the rates of interest for export credits may not be enough and that due consideration should be given to (*a*) the provision of adequate refinance facilities to banks, and (*b*) the maintenance of a reasonable spread between the cost at which a bank raises funds and its lending rates. It has suggested that the Reserve Bank may provide refinance to banks against the collateral of all usance export bills pertaining to post-shipment credits of short-term nature. Similarly, for medium-term credit, the I.D.B. is expected to provide the additional amount of refinance to the banks. As regards pre-shipment credit, only a partial coverage has been recommended and the Reserve Bank has been asked to formulate a scheme, analogous to that in operation in respect of advances to small-scale industries and co-operatives, until the quota system was abolished last month. This scheme, as readers are aware, provided an additional quota at concessional rate, not on the basis of banks' actual lending but on the basis of the increase in the banks' lending to the special sector. But, whereas, under this scheme, it was not incumbent on banks to pass on the benefit of the concessional rate to small-scale industries and co-operatives, the Committee has suggested that, under the proposed scheme for pre-shipment finance, banks are required to charge the exporters only at the stipulated ceiling rate.

Besides, the banks have been asked to provide export finance at ceiling rates, whether or not they obtain refinance facilities. Herein lies a difficulty. How are the banks to be compensated for the loss of profit they suffer by providing export credits at lower rates of interest? It is needless to add that, unless the banks have adequate incentive, they will fight shy of providing export credit which in turn will adversely affect India's export performance. One solution will be to permit the banks to increase their lending rates for non-export finance in order to meet the losses in export finance. The Committee has actually given a hint to this effect and asked the banks to determine whether any adjustment would be necessary in their rates of interest for non-export finance to recompense them for the loss of earnings resulting from the imposition of ceiling rate on export finance. But the lending rates for domestic credit in India are already high: a minimum of 7 per cent, an average of 7½ per cent and a maximum of as high as 9 per cent. These are some of the highest among both the developed and the developing countries. A further rise in these rates may not be a desirable proposition, as it may have adverse effects on the general economy of the country as a whole. Further, there may be practical difficulties in implementing a scheme of such differential rates. Again, the larger the difference between the rates of interest for export credits and those for other credits, the greater will be the disinclination among banks to finance exports. It would thus appear that the Committee has not done sufficient thinking on this particular problem. The simplest thing to do, perhaps, would be for the Reserve Bank and the I.D.B. to show special concessions to banks that provide export credit at concessional rates. They may, for instance, be given corresponding or a little more refinance facilities at or even below the Bank Rate. The success of the scheme outlined by the Chablani Committee hinges on the readiness of the Reserve Bank to extend such a concession to the banks

NOT A REALISTIC APPROACH

THE rise in prices and cost of living and the consequent suffering of the vast majority of people in the past have been, understandably enough, a source of grave concern to Prime Minister Lal Bahadur Shastri. He has been trying hard to stem the upward pressure and restore normalcy, though success is still eluding him. But it is rather unfortunate that he should have allowed the deterioration in price situation to warp his disposition towards the private sector as a whole. Mr. Shastri as an administrator has been known for his pragmatism. When he was in charge of railways and transport and commerce and industry, he used to take a practical view of development problems and never hesitated to put in cold storage solutions based on doctrinaire grounds. Much credit goes to him for getting postponed, almost *sine die*, the nationalisation of goods transport by road, for facilitating expansion of shipping in the private sector, and for allowing the private sector to take up certain industries (as, for instance, chemical fertilisers) that had been reserved for the public sector. Now the same Mr. Shastri says: "In the context of rising prices and the difficulties the common man has to face about basic consumer goods, it would be necessary to develop some of the consumer goods industries also in the public sector," *vide* his speech at the twenty-first meeting of the National Development Council at New Delhi on 27th October 1964. He is of the view that the Government should set up textile mills, sugar factories, and plants for the manufacture of cement, drugs and medicines. "It is only then," he feels, "that shortages experienced since recent months will not become chronic." Besides, "such industries," in his opinion, "will give us better profits and scope for larger employment." Another argument put forward by him in favour of his stand is that it would encourage healthy competition between the two sectors, with beneficial results for both.

The more one thinks of the rationale behind Mr. Shastri's latest advocacy the more one feels that it is chiefly the product of embittered feelings rather than of calm deliberation. One can hardly blame the private sector for the supply of consumer goods lagging behind demand or for the rise in their prices. The unsatisfactory state of affairs in this respect is largely the outcome of defective policies pursued by the Government itself during the past 15 years. The reasons given by Mr. Shastri are untenable, as we shall presently show. Nor has the performance of the public sector in the fields already dominated by it been perfect enough to warrant the assumption that, in the manufacture and distribution of basic consumer goods, it would fare better. In any case, the rise in the prices of manufactured goods pales into insignificance as compared with that in those of foodgrains. And much of whatever increase that has taken place is mainly due to factors beyond the control of manufacturers—increase in wages unaccompanied by any significant, let alone corresponding, increase in productivity, higher cost of raw materials, stores, transport, fuel and power, and monetary inflation, to mention only the crucial ones. It will thus be seen that, by and large, the manufacturers of consumer goods cannot be held responsible for the plight of consumers. There may be exceptions, but they do not provide enough ground for a change in the Government's policy in regard to sector-wise disposition of consumers goods industries. The contention that establishment of consumer goods industries in the public sector would give better employment opportunities and yield larger profit to the Government is the weakest. If the public sector employs more workers than the private sector usually does, it will surely earn less profit and pay less tax to the Government.

For a long time, the Government has been following a pricing policy which allows only a small margin of profit to manufacturers and places a premium on inefficiency. On top of it, the incidence of taxation has been pretty high. The result is that the more efficient manufacturers have suffered, a lot of uneconomic units has come into existence, the cost of production has become needlessly high, the supply has failed to keep pace with the demand, the quality of product has deteriorated and dissatisfaction among consumers has increased. In the earlier stages, the consumer paid a much lower price than he should have, while now he has to pay much higher prices than he need to, as the pricing and fiscal policies pursued have not been correct and far-sighted enough. What is more, the increase in prices in recent years appears to be so glaring as to have an adverse effect on the psychology of the people. Some of the worst victims (commodity-wise) of such defective economic policies are steel, cement, coal, fertilisers and paper. Expansion in the capacity of these industries has been handicapped by the reluctance of investors to put their savings in them. Those who did, have either burnt their fingers or find that they have missed the chances of earning more by investing in industries free from the difficulties mentioned here. The Government-owned companies could easily remain unaffected by these handicaps, for they have neither the limitations of finance nor the necessity to declare satisfactory dividends in order to attract the savings of the people. The private sector cannot afford to run a fertiliser factory as Sindri is being done nor a cement factory as is being operated by the U.P. Government. If it does, it will have to go into liquidation sooner or later. But it must be remembered that the losses suffered by the public sector units will ultimately be borne by the people through taxation and inflation.

The Prime Minister has specifically mentioned textiles, sugar and drugs as the industries in which the public sector should enter as a manufacturer. But these are also industries the end-products of which have been subject to Government controls. In sugar, the real difficulty is non-availability of enough sugarcane and the solution for it does not lie in establishing factories in the public sector. Further, as a matter of policy, the cooperative sector has been enjoying Government patronage for some years now and the stress is on this sector for the future too. Whether this sector can deliver the goods as efficiently as the private sector is still a debatable point. Besides, for all practical purposes, the sugar mills in the cooperative sector are as good as being in the public sector. So, where is the necessity for the State itself to establish sugar plants? Again, consumers have suffered more as a result of shortage of *gur* than of white sugar. The crux of the problem in this respect is the basic cause of consumers' difficulties. and utilisation of sugarcane are properly handled—this is primarily an issue of administrative drive and efficiency at the State level—consumers of sugar will have no problem, assuming, of course, that healthy expansion of sugar industry is not impeded by the intervention of State on ideological grounds.

The stunted growth, coupled with the slow pace of modernisation, of cotton mill industry is the basic cause of consumers' difficulties. Here, too, the Government is primarily responsible, for it is the ill-conceived policy of favouring the decentralised sector that has been the root of the trouble. The pity of it all is that even now there is no significant change of heart among the policy-makers. It

the Asoka Mehta Committee's recommendations pertaining to the mill sector were implemented as they are, the problem of clothing the people would be worse still five years hence than it is today. It would clearly mean disregarding the interests of consumers, for whom Mr. Shastri is now shedding tears. It would be pertinent to recall, in this connection, that Prof. Mahalanobis's policy for consumer goods, which was the sheet anchor for the second Plan and has been continued without any fundamental change in the third Plan, has miserably failed. It has not solved the problem of either the consumers or the rural unemployed. In any other country, free or communist, such a person would have been sacked, but, in this country, he continues to be a member of the Planning Commission. And what is more, the powers-that-be do not seem to be willing to learn from past mistakes. On the contrary, the consequences of these mistakes are used as arguments for extending the public sector to the large-scale manufacture of consumer goods. It would be a sheer waste of public money to do so. The private sector can and is very willing to expand the production of all essential consumer goods, including cement and drugs, provided the defects in the fiscal and pricing policies are eliminated.

TOWARDS MORE EFFICIENT PLANNING

IT is being increasingly recognised by some sections of the public that planning in India has become unrealistic in some ways, that the planning processes leave much to be desired from the technical point of view and that the planning machinery itself would have to be reorganised in a manner calculated to reinforce its technical competence. Slowly but surely the realisation also seems to be dawning on the authorities at Delhi that, if planning techniques are to be improved, the Planning Commission itself should be the first to be reorientated. This heartening trend in official thinking is clearly in evidence in the proposal announced by the Prime Minister, Mr. Lal Bahadur Shastri, at the meeting of the National Development Council last week. The proposal is to the effect that, in order to associate more technical experts with the preparation of the fourth Plan, an *ad hoc* body, consisting of scientists, engineers, economists and other experts, would be constituted to assist the Planning Commission on a part-time basis.

The new body, which will be called the "National Planning Council," is to have 15 to 20 members, with the Deputy Chairman of the Planning Commission as its Chairman. Mr. Shastri's idea here "is not to have yet another advisory body—or a body which will meet for a day or two at long intervals, look at some memoranda, offer its comments and disperse—but to get people (experts) to work on the Plan, spending a week to a fortnight in Delhi at a stretch and giving their best to our national effort." The consideration that has weighed with both the Prime Minister and the Planning Commission, in this connection, is that "the number of top-level experts in the country is limited and it would not be easy for them to give up the important tasks on which they are already engaged in order to work, on whole-time basis, on the formulation of our Plan."

As the Prime Minister is keen on having "a complete, self-contained and well-coordinated plan for industry and another one for agriculture, each closely bringing out the employment aspect," he seems to think(?) that, in the absence of top-level expertise and expert assistance, the Planning Commission, by itself, would not be in a position to meet his expectations.

All this, whether explicit or implicit, certainly reflects a fresh approach to planning. Whether it is sufficiently realistic and far-reaching cannot, however, be predicted with certainty, for what is proposed seems to be only in the nature of a cautious experiment confined to the preparation of the fourth Plan. There is no indication here that the decisions of the Planning Commission, with its full-time Members and Minister-Members, would necessarily conform to the findings and conclusions of the proposed expert body. And there is not even the certainty that the expert team of the National Planning Council would be clearly treated as a part of the collective body of the Planning Commission with its membership and high-level staff and its divisions and sections. It is not enough to be told that the National Planning Council is not being conceived as "yet another advisory body." The possibility of its becoming, in actual practice, a purely "advisory body," whose recommendations may or may not be accepted by the Planning Commission, cannot be ruled out. If it is true, as, indeed, it is in many cases, the Planning Commission, which was originally conceived as an expert advisory body, has become, in actual practice, either a "parallel-Cabinet" or a "super-Cabinet" or, perhaps, a "virtual department of the Government," the role of the proposed National Planning Council *vis-a-vis* the Planning Commission may well turn out to be just an advisory one.

Another possible inference is that the intention of the Prime Minister and the Planning Commission is merely to enlist, on some basis or other, the services of "top-level experts" in different fields for rendering technical assistance in the formulation of schemes and projects in the manner of U.N. or U.S.-A.I.D. technical experts, *but not in the integrated formulation and coordination of the diverse aspects of the Plan as a whole.* If the latter function is going to be discharged, as usual, only by the full-time and ministerial Members of the Planning Commission, there will be no question here of the Commission being made a compact and non-political expert body in conformity with the ideas of the Advisory Planning Board (1946). It will be recalled, incidentally, that this Board, under the chairmanship of Mr. K. C. Neogy, had envisaged a planning commission with five members—namely, a person of standing and experience in public affairs as Chairman, two non-officials having knowledge and experience of industry, agriculture or labour, a Government official having knowledge and experience of finance and a person eminent in the field of science and technology. In the context of present economic complexities, industrial advances and diverse technical problems, a possible compact body of the Advisory Planning Board's conception might have to consist of at least ten full-time members. And there should be no Minister-Members, too, in such a body. But all this is perhaps a case of looking too far ahead or contemplating the impossible in view of the present political set-up in the country. But the Government can do at least one simple thing. It can raise the competence of the Planning Commission by having more practical-minded people with industrial and technical background as full-time members in the place of some theoreticians who can render more useful service elsewhere.

TONING UP ADMINISTRATION

IT is just not enough if public administrators are, as they should be, like Cæsar's wife, above suspicion. They must also be efficient and alert. The need for a large number of such administrators is all the greater in a developing country like India, not merely for planning, execution and operation of development projects but for the very functioning of the economic system itself. Although this is an obvious prerequisite, the fact is that it is not being adequately met, nor are the prospects promising. While the administrative structure has grown in size enormously since the era of planning began in 1951, it has become slower and inefficient in its functioning, with the result that the implementation of projects, whether in the public or private sector, is being seriously hampered, leading to deferment of expected outputs. Even before the third Plan began (in April 1961), the Planning Commission had clearly stated that the administrative machinery had been strained and that, at many points in the structure, the available personnel were not adequate in quality and numbers. The position since then has worsened considerably. The public sector has not been successful in attracting adequate talent for discharging the growing responsibilities that are being entrusted to it by the powers-that-be. This conclusion is supported, among others, by the findings of a recent survey by the Union Public Service Commission. Although the survey is based on statistics for the six-year period from 1957 to 1962, the validity of its findings holds good with equal, if not greater, force today. Some of the relevant findings are:

> There has been a marked decline in the number of candidates appearing and qualifying at the Indian Administrative Service examinations. Thus, as against the 5,216 candidates appearing and 1,010 qualifying at the written examination in 1957, only 4,446 appeared and 434 qualified in 1962. The pass percentage of candidates has dropped from 19.4 to less than ten, 9.8 to be precise. The overall pass percentage among first divisioners has almost been stationary, and the performance of second and third class graduates has been deteriorating.

These figures impressively highlight a disturbing trend which must be corrected as soon as possible. The volume and complexity of administrative work have already increased to a significant extent and they will increase manifold in the next few years, with expansion in the range of Government's responsibilities, as well as in the tempo of development under the fourth Five-year Plan. Unless a concerted attempt is made here and now to make the administration much more action-oriented than has been the case all these years, the objectives and targets set in the fourth Plan will remain largely unfulfilled, thereby causing deep frustration among the people who it is that will continue to make a heavy sacrifice for the sake of development. Viewed thus, it is, indeed, gratifying to find that Mr. Lal Bahadur Shastri, Prime Minister, is seeking to bring a new approach to the problem of administration. Inaugurating the twenty-first meeting of the National Development Council at New Delhi on 27th October, Mr. Shastri declared that the toning up of administration "is essential, whether we think of our short-term problems or of our long-term problems, of agriculture or of industry." Without better administration, he warned, control over prices, a more equitable distribution of available supplies and all the other things needed to impart stability to the economy *would be impossible.* And again, it was only through better administration, he added, that the public sector projects could be completed with speed and the private sector, too, could discharge its responsibilities in the way that it should.

Mr. Shastri did not merely admit the deficiency in administration and urge the need for improvement. He also indicated the broad lines on which such an improvement could be brought about. His one specific suggestion pertains to co-ordination at district level. In his opinion, the State Governments should restore to the district officer, that is, the Collector or the Deputy Commissioner, the status of a co-ordinator of all Governmental activities in the district and confer upon him the responsibility for guiding all the efforts undertaken on behalf of Government, Central or State. Closely allied to this suggestion is Mr. Shastri's plea for splitting up the larger districts into more compact administrative units, even if such splitting means additional expenditure "which will be well worthwhile."

There is much to commend in the suggestion of Mr. Shastri. It is certainly a realistic and practical one. But co-ordination at district level alone is not sufficient; similar co-ordination must be ensured at all other Central and State levels, too. Such coordination, if it is to be effective, presupposes adequate availability of officers with the requisite training and experience. This is a task to which the Governments will have to address themselves in right earnest from now alone, since it would be clearly impossible to train all the men required in a short span of time. Simultaneously, no efforts should be spared to make the higher posts in public services as attractive as possible. It is necessary to mention this point, because Government service is no longer remunerative enough, let alone the loss of prestige and charm it once enjoyed. Talented young men generally prefer private institutions to State service due to three important reasons. In the first place, the jobs in the private sector are highly remunerative and the conditions of service more congenial. Any person who is competent enough to pass the I.A.S. examination can always expect to get a much higher salary, besides several other perquisites, than what he would get if he were to join I.A.S. service, the salaries in which have more or less remained static. Secondly, a Government officer does not enjoy that amount of freedom which his counterpart in the private sector does. Thanks to bureaucratic rules and procedures, decision-taking is a rather laborious process in Government departments. And, finally, in any service in the public sector, unlike in the private sector institutions, one has to work under the constant fear of being subjected to allegations of corruption and nepotism. This is one of the consequences of excessive controls and the tendency on the part of politicians to influence and interfere with the work of officials at all levels, more particularly at district levels. If Mr. Shastri is really earnest about the efficient, successful implementation of development programmes and the proper enforcement of the needed economic controls, he will do well to initiate appropriate action designed to eliminate all these shortcomings in public service. Never before was the need for such action so urgent as it is today.

MARKET GOSSIP

Room For Optimism

THE gloom in the international scene caused by the forced retirement of Mr. Khrushchev and the Communist China's loud display of the possession of nuclear bomb is gradually fading. The new leaders in Kremlin have reiterated their faith in peaceful co-existence and have assured India through Mrs. Indira Gandhi that there would be no change in Russia's policy in regard to either economic or defence aid. The counsel given by some observers in this country that India should not rely on the new Russian Government reflects their ignorance of the changing world and blind opposition to Russia based on ideological grounds. Indeed, it would not be wrong to dub them as the Indian counterpart of Mr. Goldwater in the U.S. There is really no point in rubbing the new Russian Government on the wrong side. We should take its assurances in good faith, until there is proof to the contrary. It is even possible that the new regime in Russia may help India in getting a peaceful solution of its border conflicts with China.

Mr. Lyndon B. Johnson's landslide victory over the reactionary Senator Barry Goldwater in the U.S. presidential election, coupled with the success of the Democratic Party in improving its majority in both the Houses of the Congress, is also a welcome development that should help to lift the gloom that descended on the world a fortnight ago. It is a good augury for peace in this troubled world and the policy of peaceful co-existence between communism and democracy has a better chance of success. For India, in particular, Mr. Johnson's victory is a heartening event for a variety of reasons. It can rest assured of both defence and economic aid. With Mr. Johnson as the head of the U.S. and Mr. Harold Wilson as that of Britain, India's Plans for economic development might be appreciated better in these two countries and through their influence by other developed countries also. If the Government of India follows realistic economic policies and the people remain united, India's economic progress in the coming years could be speedier than it appeared to be a few days ago.

The State Of Capital Market

There is, as Mr. J. R. D. Tata (Chairman, Investment Corporation of India Ltd.) has just said in his statement to the shareholders of the Company, much in the Indian economy which is basically sound and on which progress and prosperity can be built. As he sees the general economic situation, industries, by and large, are doing well sectors; exports have risen to a higher level; the and growing apace in both the public and private imperative need of increasing agricultural production is now fully recognised by the Government and the Planning Commission; and the L.I.C., other Government-sponsored financial institutions and the potentially powerful Unit Trust have done everything that could be expected of them to support a sagging and dispirited share market. But on one point, namely, the basic health of the financial markets, Mr. Tata has expressed, rightly in our opinion, some strong reservations.

The root causes of the continuing depression —continuing in spite of "pump priming" by the L.I.C. and other Government-sponsored institutions—lie, according to Mr. Tata, in the fiscal policies and measures enacted under the last two budgets. The overall impact of old and new taxes, coupled with the erosion of savings by inflation, has brought about inertia on the Stock Exchanges and other arms of the capital market. The rising costs of living, the rising production costs in industry and the additional burden of taxation leave little room for individual and corporate savings. This is shown by the slowing rate of growth in bank deposits, the drying up of the individual's incentive and capacity to save and the poor public response to a majority of new capital issues during the last few months. Mr. Tata has referred, in this connection, to the depressing fact that, in the new capital issues market, the overall market value of 196 initial capital issues, made in the period between January 1960 and September 1964, is today below their paid-up value and that, out of these 196 scrips, as many as 139, or 70 per cent, are quoted at or below par. It is a dismal commentary on the situation that the underwriting institutions have had to take up the bulk (as much as 90 per cent in several cases) of underwritten issues. It is also an equally depressing fact that foreign capital has generally shied away from supporting equity investment in Indian industry in spite of the concessions offered for such investment. And conditions in the markets for old existing issues have been no better, for the index of variable dividend industrial securities, which stood at 174.3 in February 1964, stands now at about 165.

The remedies suggested by Mr. Tata are unexceptionable. As the capital gains tax on bonus issues and the new tax on dividends, in particular, have contributed largely to the breakdown in investment morale and activity, their continuation will have no justification. If the fiscal policies, which have provided a further stimulus to the black money market and driven a considerable part of the country's trade underground in a frantic attempt to escape from the excessive burden of taxation, are suitably modified, there will be a return of confidence. Mr. Tata favours, at the same time, powerful deterrents against tax evasion. As the question of monopolies and concentration of economic power is also relevant in the context of fiscal policies, Mr. Tata has done well to say what he has said:

> "In recent months, and more particularly with the appointment of the Monopolies Inquiry Commission, much has been said about the alleged concentration of economic power and the growth of monopolies, through the expansion of the activities of large industrial houses like Tatas. I welcome the appointment of this high-power Commission as a timely move on the part of the Government for making of a comprehensive study and examination of the whole subject of monopolies. A considerable degree of misconception prevails on the existence and operation of monopolies. It behoves all industrial interests, therefore, to provide the Commission with all the information at their disposal to enable the Commission to carry out its functions and duties."

Readers will recall that this was precisely the stand this journal took when the appointment of the Commission was announced. It is gratifying to find that it has been endorsed by one of India's top-ranking, enlightened industrialists.

"Moorat" Trading

This year's *moorat* trading on the Stock Exchange was amongst the dullest in history. A mood of despondency pervaded the markets and transactions on New Year's Day were mostly of a formal nature. Brokers were heard to remark that the volume of business was hardly more than one-fourth of a normal *moorat* day. Institutional buyers such as the Life Insurance Corporation and the Unit Trust were active buyers, but that was about all.

In view of the fact that the market had been declining right from 2nd September, quotations on the *moorat* day (Tuesday, 3rd November) were not significant by themselves. But a passing mention might be made. Century was quoted at Rs. 599.50 on Tuesday, against Rs. 618.50 this day last year and Bombay Dyeing at Rs. 58.50, against Rs. 63.40. Last *Diwali*, Standard was mentioned at Rs. 681 but this time it was just around Rs. 608 while National Rayon was quoted at Rs. 357, against Rs. 381.50 last year and Rs. 432 the year before last. Scindia which had moved up from Rs. 11.88 in 1962 to Rs. 13.69 last year, stood at Rs. 15.68 on the 1964 *moorat* day.

Market circles take a pessimistic view of the future, though it has not given up hopes of the Government doing something to help the market rise from the rut of despondency into which it has fallen. One has to wait and see till the Budget is presented at the end of February next.

Unlike the stock exchange, the trend in cotton futures was firm though the turnover, estimated at 10,000 bales, was very much below that of last year. Jarilla March was bid up to Rs. 747.50, though at the close it reacted to Rs. 746.25. The slightly upward trend in cotton has been induced by the recent untimely rains in some of the cotton tracts and the feeling that imports might not be as easy as they had been in the past.

Groundnuts were the only active section in oilseeds, but the volume of trading was rather small. Support at higher levels seemed to be absent, but knowledgeable sources say that the chances are for the market to look up. Time was when groundnut oil was fetching Rs. 3,400 a tonne, whereas today the price is hardly around Rs. 2,000. The fall has been steep enough. Castor has no trend of its own and so is linseed. Cottonseed is firm evidently in sympathy with cotton, but it remains to be seen whether the current firmness will be sustained.

In bullion, silver maintained a firm tone, though the turnover was hardly around 25 to 30 bars as compared with 100 bars on the *moorat* day of last year. Silver 996 improved by Rs. 2 to Rs. 260. Gold was listless. Gold 14-carat was steady at Rs. 67 but pure gold was quiet at Rs. 111. Market men think that bullion prices will remain firm and that the current year might see higher levels.

The yarn market was absolutely dull on *moorat* day. Staple fibre yarn futures remained unchanged at the opening level of Rs. 850.25 and the turnover was about 20 bales—much below the daily average of 40 to 50 bales. Cloth was an exception to the general rule and a turnover of about 125,000 bales of cotton cloth was reported, though this was confined to uncontrolled varieties. The trend of prices was slightly better. Business in controlled varieties was very little due to lack of stocks.

Indian Investment Centre

The formal inauguration of the second overseas office of the Indian Investment Centre on the 30th October 1964 at Dusseldorf (West Germany), which is one of the most important business centres of the Continent, is a landmark in the brief but impressive history of the Centre. The Centre, it will be recalled, was established three years ago for the purpose of providing authoritative information to Indian and prospective foreign investors on economic conditions, laws, procedure and specific opportunities relating to foreign investment in India. It also functions as a liaison body between the Indian and foreign enterprises, helping them to find suitable partners for joint ventures and formulate terms of participation in the light of official policies. Through its headquarters at Delhi, overseas office at New York and with the help of diplomatic and commercial accreditations abroad, the Centre has been trying to serve its objectives. But the need for an office at a central place on the Continent was felt from actual experience. Thus, in the course of examining a large number of proposals received from European countries during the last three years, it was noticed that many of the firms making enquiries did not appear to have sufficient knowledge of the economic climate and investment conditions in India or of the potentialities for profitable business.

India's earnestness about securing foreign private investment was appreciated by the State Secretary of Federal Ministry of Economics in West Germany, Dr. Langer, who inaugurated the Dusseldorf office of the Investment Centre. He stated that the Centre constituted "a seriously meant invitation by India to European investor" and its establishment clearly manifested the Indian Government's great interest in foreign private investment. Dr. Langer listed three points which he thought had led to an improvement in the climate for private investment in India: (1) remarkable growth in infrastructure facilities; (2) liberalisation in the import of raw materials, semi-manufactured goods and spare parts; and (3) conclusion of investment guarantee agreement between West Germany and India.

Welcoming the guests on the occasion, Mr. G. L. Mehta, Chairman of the Centre, gave a lucid account of the objectives of Indian planning, testified to the considerable role given to the private sector in the projects for the economic development of the country, mentioned the fact that the Government has given fair, and in some cases even generous, compensation to private investors in the event of nationalisation, and pointed out that there had been no single case of discrimination between an Indian and a non-Indian concern since independence. He, of course, took care to add: "No doubt, the fiscal and monetary and industrial policies of the Government are subjects of criticism by foreign entrepreneurs even as they are by our own industrialists. But in India, a public debate on the various issues involved has become a recognised process in governmental decisions." Proceeding, he explained the rationale for control on capital issues and foreign collaboration agreements thus: "Government offers all facilities for remittance of interest, dividends and profits as well as repatriation of capital and this, indeed, is one of the first charges on our foreign exchange budget. We have an enviable record in meeting our foreign obligations, governmental or private. Indeed, this very fact makes it necessary that private investments from abroad are channelled into more essential industries which assist exports or substitute for imports rather than satisfy the demand for luxuries."

The European office of the Investment Centre at Dusseldrof is being managed by Mr. N. G. Swami, the Resident Director. Mr. Swami knows Germany intimately, having been there for 15 years. He has already received a number of offers and the chances of the Dusseldorf office doing useful work are promising.

During the three years of its existence, the Investment Centre has received nearly one thousand enquiries from overseas industrialists (U.S.A. 400; Europe 250; U.K. 150; Japan, Canada and Australia 100; and other countries 100) many of which sought to establish joint ventures in association with suitable Indian parties. The Centre has been instrumental in promoting 74 joint ventures between Indian and overseas enterprises. Of these, 50 involve financial and technical collaboration and 24 only technical collaboration.

Baker Perkins Group

Although the flow of foreign private investment into India has been falling behind expectations, it is encouraging to find that foreign investors continue to explore the possibilities. Not a week passes without the visit of foreign businessmen to this country, either in groups or individually. They come from all parts of the free world. Among the British firms that are currently studying the prospects of entering or expanding the field of manufacture are the Baker Perkins Group of companies. Mr. A. I. Baker, President of the Group, visited this country a few days ago. Mr. Baker, an engineer and expert in business administration, became the Chairman of the Group in 1944. He is the President of the Bakery Equipment Manufacturers' Society in Britain and a member of the Engineering Advisory Council of the Board of Trade. He is said to have returned to the U.K. impressed with the good scope that exists in this country for expanding the manufacturing activities of his Group. It may be mentioned here that one of his lines, namely, the manufacture of bread and biscuit-making machines, is already being done in Bombay by the Brady Engineering Company Ltd.

More On British Surcharge

As a sequel to the reactions against the imposition of 15 per cent surcharge on British imports, the Labour Government has decided to launch an all-out diplomatic offensive and is reported to have asked British diplomats to give publicity to three main points, in particular, in order to smooth over the international storm. The three points are: (a) that the surcharge is purely temporary to tide over the balance of payments difficulties, (b) that it is a 'blanket' measure and is non-discriminatory, and (c) that it will strengthen the British economy, a result which is in the interest of the Western alliance and the Commonwealth countries. Sir Paul Gore-Booth, the British High Commissioner in India, talking to journalists in Bombay on 29th October 1964, stressed these points and said that the surcharge was a "simple, quick and non-discriminatory" measure, had the merit of "universality and simplicity" and hence the absence of any favourable treatment to the imports from underdeveloped countries.

The British Government has rejected the suggestion for a time limit for the surcharge. Speaking on this point last week, Mr. James Callaghan, Chancellor of the Exchequer, said: "This action on imports is short-term. We have said this and we mean it; and although I cannot put a time limit on it as yet, I can say that it will be modi-

AMERICAN LETTER

PROTECTIONIST PRESSURE STRONG

SENATOR JAVITS' ADMONITION

By N. Pattabhi Raman

NEW YORK, 31*st October*

"When the Trade Expansion Act was enacted in 1962, the event was hailed as one of the most celebrated achievements of President Kennedy's administration and as the dawn of a new era of elightened and liberalised trade policy. But, in one of the classic ironies of the legislative process, the actions of Congress and this Administration since then have represented a retreat from that landmark legislation and have begun to place this Nation once again on the path of protectionism.... It is time to ring the bell loudly and to issue a strong warning now as to the consequences of pursuing such a policy."

SOUNDING the tocsin with these words was Senator Jacob Javits of New York, a liberal Republican. Javits' admonition, voiced recently on the floor of the Senate, came none too early. During its last session, Congress nibbled away at the foundations of the U.S. foreign economic policy, while the Administration chose to remain passive. It considered eight protectionist measures. Five of these Bills passed the House of Representatives; four passed both the House and the Senate; and three of them were signed into law by the President.

One of the three approved measures established a standby mandatory quota on beef imports, even though the imports were, by every objective test, found to be not more than a minor cause of a weak market situation. U.S. meat imports have been mostly of manufacturing quality required for processed meats important to low-income families; yet, domestic cattlemen, whose business miscalculations resulted in oversupply and falling prices, lighted the fires of political pressures to restrict imports. Responding to these pressures, Congress voted the standby quota. No less a person than Mike Mansfield, leader of the Democratic Party in the Senate, sponsored the restrictive measure. As in the other two successful examples of protectionist encroachment on a liberal trade policy this year, the Senator from the cattle State of Montana secured majority approval of the measure by tacking it on as a rider to an important Bill that could not be voted down.

Congress also strengthened some Buy American provisions. It sought, too, to restrict imports of timber from Canada through technical regulations governing marking of imported items as to their origin. It approved an interest equalisation tax, which is a tax on U.S. exports of portfolio capital. And it refused to approve legislation that would enable the implementation of the International Coffee Agreement of which the U.S. is a signatory. Outside Congress, the tendency towards economic parochialism was evident in the recent "dumping" decisions of the Tariff Commission and the rising harassment of importers under the Anti-Dumping Act.

These actions have helped to make the protectionists more strident than ever in their demands. The success of the cattlemen in obtaining a standby quota against beef imports has rekindled pressures for quotas on imports of shoes and woollen textiles. There is increasing talk about further restrictions on imports of lead and zinc.

Protectionist pressure is also strong in seeking to enlarge the list of "exceptions" to the Kennedy Round of G.A.T.T. negotiations. The Trade Expansion Act would allow a 50 per cent across-the-board reduction in tariffs, but would also allow some "exceptions" to this rule. A report of the Committee for Economic Development, a business-supported research organisation, observed recently: "We do not believe that tariff disparities constitute a strong reason for departing from the general rule of equal across-the-board tariff cuts.... Our recommendation is that exceptions from the general equilinear rule on disparities grounds, like other exceptions, should be kept to a minimum and should be justified, case by case, with a showing of serious consequences." Yet, many segments of American business have begun exercising strong pressure for being included in the list of exceptions.

A major reason why protectionist groups have seemingly gained strength and support is that this is an election year. Members of Congress seeking re-election and those newly seeking election to the House or the Senate, have either been unable or unwilling to resist protectionist pressures, while some have thought it to be worthwhile to support them actively. Those always holding protectionist views have thus had welcome company.

The forthcoming elections (this despatch was prepared just before the elections to reach the current issue of *Commerce* in time—ED.) have apparently affected the public attitude of the Administration also. Administration officials seem to believe that the trade policies of the U.S. will be straightened out after the elections. In the meantime, the Administration has shown no inclination to antagonise domestic groups by actively opposing their demands. This has called into question the credibility of its purported support of trade liberalisation. Commenting on this aspect, Senator Javits observed in a speech in Congress:

"When the Administration does not insist on adherence to Trade Expansion Act criteria, it encourages protectionism in, and out of, Congress. By failing to insist on adherence to the machinery created by the Trade Expansion Act in the resolution of problems arising from import competition, the Administration encourages industry to seek solutions through political means which undermine vital national interests."

Accenting positive solutions, Javits declared:

"I submit that the lasting solution to import competition lies in increasing the efficiency and productivity of the American economy. It is the job of the Federal Government to encourage the growth of the more efficient and competitive elements of this economy through such measures as tax incentives, the reciprocal reduction of trade barriers, revision of anti-trust laws, manpower training, aid to higher education, encouragement to labour mobility, and export promotion. Much of our economy is highly competitive. A smaller segment is not able to compete against more efficient domestic or foreign competitors. In the Trade Expansion Act of 1963, Congress recognised the existence of national responsibility, should injury to domestic workers or businesses result from tariff cuts, and authorised the President to raise tariffs, negotiate an international quota system, or provide Federal assistance to those injured, or a combination of tariff or quota relief and Federal assistance. These, plus the national security exemption, are the means to use—not political protectionism by special discrimination in favour of one economic bloc or another... the balance of payments problem can be solved only by making internal adjustments, here and abroad, that will enable national economies to accept each other's goods. A liberal trade policy lies at the very heart of the solution to the problem."

The view that the distortions of the liberal trade policy can be straightened out after the elections on 3rd November is based on the belief that President Lyndon Johnson will be given a new lease to occupy the White House for at least four more years. All indications are that Mr. Johnson will indeed win the election, defeating Senator Barry Goldwater.

The defeat of Barry Goldwater is important to America and the world for many reasons; not the least among them is that, if Goldwater triumphs in the national poll, America would most certainly turn its back on a world seeking to liberalise its trade. Considering that Goldwater has frequently proclaimed that he is in favour of *less* government and that his chief economic adviser, Prof. Milton Friedman of the University of Chicago, has gone on record in favour of abolishing tariffs and all restraints on free trade, this may sound paradoxical. But an analysis of Goldwater's Senate voting record—and the Republican Party's election platform or manifesto—shows this danger to be very real.

Ever since he entered the U.S. Senate in 1953, Barry Goldwater has consistently voted against measures designed to liberalise international trade. Responding to Senate roll-calls on foreign trade issues, 13 out of 14 times he cast votes unfavourable to trade expansion. The only time he voted in favour was when he joined the majority in approving the Trade Agreements Act in 1955; this he did after he had previously supported unsuccessful efforts to add restrictive amendments to the Bill.

In his stand against trade liberalisation, Goldwater frequently parted company with the majority of his own party. Thus, for example, in 1962 he was one of the only seven Republican Senators who voted against the final passage of the Trade Expansion Act.

The Republican Party has traditionally supported the bipartisan policy of trade liberalisation. But, under Goldwater's influence, the party's election manifesto this year has embraced a view that would restrict rather than expand international trade. The party platform has pledged... "a determined drive, through tough, realistic negotiations, to remove the many discriminatory and restrictive trade practices of *foreign nations*", and coupled it with a pledge to secure... "meaningful safeguards against irreparable injuries to any domestic industries by disruptive surges of imports, such as in the case of beef and other meat products, textiles, oils, glass, coal, timber and steel...." The Republican Party's election manifesto thus encourages specific pressure groups to expect protection. Incidentally, except in the case of glass, none of these industries has been prepared to substantiate its claim for protection under established rules and regulations.

In contrast, President Johnson's record in the Senate shows him to be in favour of trade liberalisation. From 1949 through 1958, he voted consistently in favour of freer trade. In fact, as Senate Majority Leader, he actively promoted legislation designed to loosen the grip of protectionism and expand commerce between the United States and the rest of the non-communist world. As Vice-President, he cast no votes in the 1962 legislative battle over the Trade Expansion Act, but he spoke frequently in favour of the trade expansion policies of the Kennedy Administration.

Over 100 Years of Banking in India

NATIONAL AND GRINDLAYS BANK LIMITED

(Amalgamating National Bank of India Limited, Grindlays Bank Limited, and the Eastern Branches of Lloyds Bank Limited)

Registered in London under the Companies Act of 1862 on the 23rd March, 1866. The Liability of Members is Limited.

Bankers to the Government in Aden, Kenya, Uganda and Zanzibar.

ISSUED CAPITAL AND RESERVES OVER £ 11 MILLIONS

HEAD OFFICE: 26, BISHOPSGATE, LONDON, E.C.2.

London Branch:

13, ST. JAMES'S SQUARE, S.W.I.

Branches throughout Aden, Ceylon, India, Kenya, Pakistan, Northern and Southern Rhodesia, Somalia, Tanganyika, Uganda and Zanzibar.

The Bank conducts all classes of Banking and Exchange Business throughout the world.

Bombay Branches:
90, Mahatma Gandhi Road; 270/272, Dr. Dadabhoy Naoroji Road, (Lloyds Branch); Mint Road, (Corner of Mint Road and Sir P. M. Road); 21/29, Princess Street, (Lloyds Branch); 117-119, Kazi Syed Street, Mandvi; 65F, Linking Road, Santa Cruz; 2/571, Gowalia Tank Road, Cumballa Hill; Shivaji Mandir, N. C. Kelkar Road, Dadar; 24B, Club Road, Byculla. THANA: Agra Road, Kolbad Road, (Near Castle Mills).

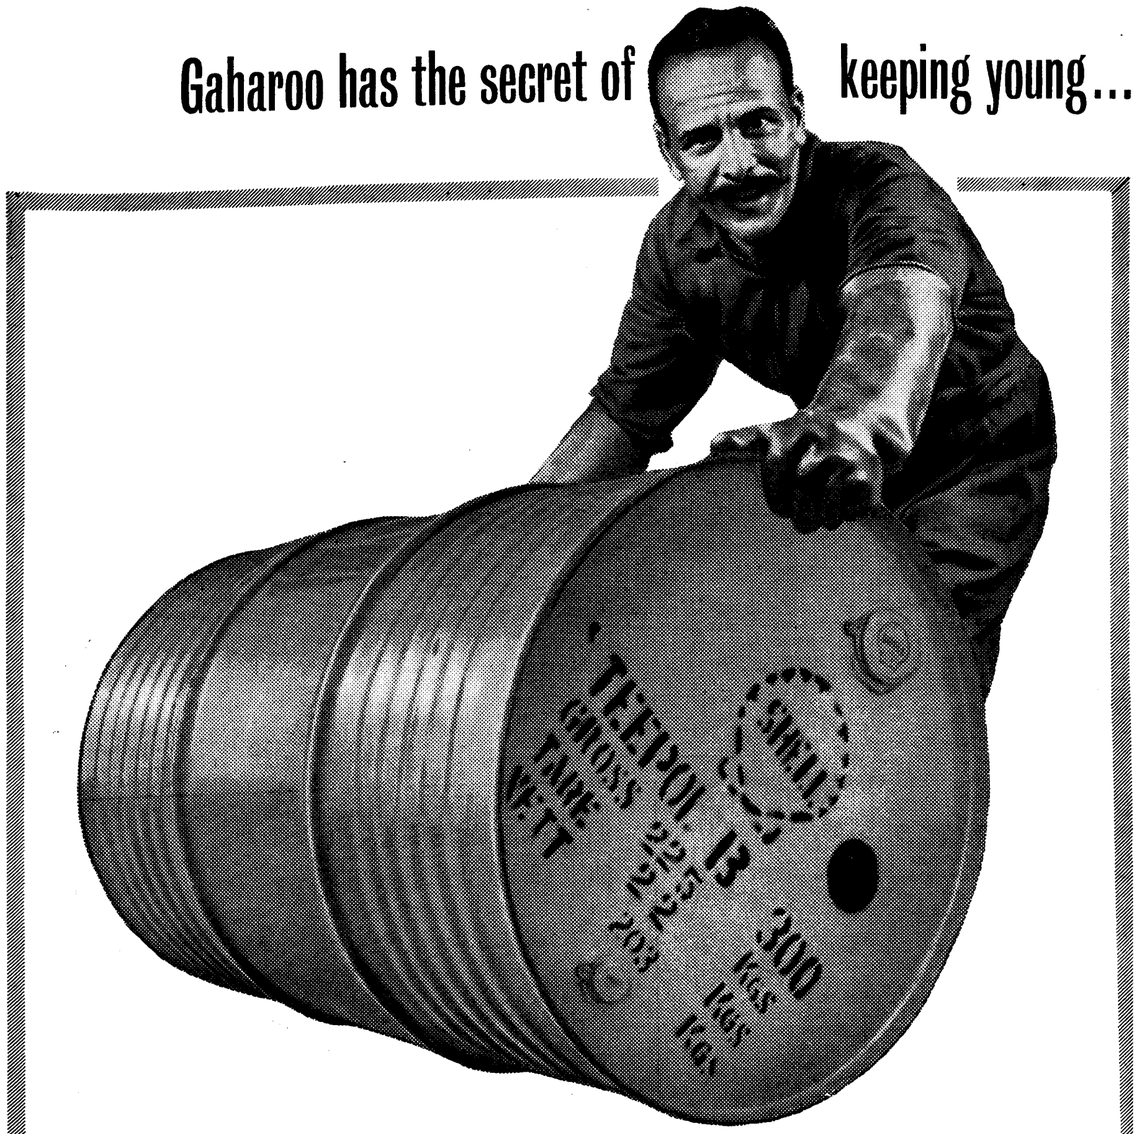
Gaharoo has the secret of keeping young...



Gaharoo Kaloo used to be the champion wrestler in his village. Today, no one would guess that he is fifty...and a grandfather. Dumb-bells. Ten press-ups every morning. Regular sessions at the gym. This is how Gaharoo keeps fit, young and on top of the job. His personal philosophy: 'Keep to the straight path. Never quarrel. Put your whole self into your work...'

THE RIGHT ATTITUDE

It is just this attitude which has won Gaharoo the respect of his work-mates and which makes him good at his job in the Benzine Installation, Sewree, Bombay. He attends to the blending of Chemicals and the filling of containers. Accuracy matters. If too much were to go in...the Company would lose. If too little...the customer would complain. A careful check on the dips and meters is a must. Gaharoo is careful.

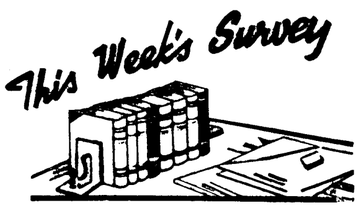
TODAY, AS EVER, PEOPLE LIKE GAHAROO ARE WORKING FOR YOU

To understand Gaharoo one must know that he comes of farming stock—yet, even as a little boy he felt the city's pull. And to the city he migrated when still only a youth. The adjustment was made long ago. Gaharoo spends his holidays on a farmstead at Pratapgarh... which he has added to with his own savings. His working life with Burmah-Shell is equally active and rewarding. After 22 years with the Company, Gaharoo says, quite sincerely, 'This is a job I like.'

Gaharoo and people like him—at all levels of responsibility—are Burmah-Shell. Today, as ever, they are hard at work... working to ensure that vital petroleum products, essential to India's growth and progress, are brought to you at the right place and time, in the right quantities.

BURMAH-SHELL

BURMAH-SHELL are People in the service of the People



SEVENTEENTH AMENDMENT

THE Constitution (Seventeenth Amendment) Act 1964, extending the meaning of the word "estate" to include grants of land, land held under *ryotwari* settlement and certain other categories of land, was declared constitutionally valid in a Supreme Court judgment on 30th October. The judgment was a sequel to a batch of writ petitions which challenged the validity of the Amendment on the principal grounds that (i) it curtailed certain fundamental rights, (ii) the power to amend the Constitution did not include the power to take away the fundamental right of the citizen to challenge the validity of Acts saved by the Seventeenth Amendment, (iii) the effect of curtailing these fundamental rights was to amend Article 226 of the Constitution by restricting the scope of jurisdiction which had been given to High Courts under that article and (iv) the Seventeenth Amendment Bill, as passed by Parliament, required for its valid enactment the ratification of not less than one half of State Legislatures before it was presented to the President for his assent.

In rejecting these and other contentions, the Supreme Court observed that the expression "amendment of the Constitution" plainly and unambiguously meant amendment of all provisions of the Constitution, including those relating to fundamental rights, that legislative power to make laws in respect of areas entrusted to the legislative jurisdiction of legislatures could be exercised both prospectively and retrospectively, that the Seventeenth Amendment was enacted to assist the State Legislatures to give effect to the economic policy and the agrarian reform in which the party in power believed and that, therefore, the effect of the Amendment on the area over which the High Court's powers prescribed by Article 226 would operate was incidental and, in the present case, could be described as insignificant.

Now that the Supreme Court has upheld the Seventeenth Amendment, ceilings on *ryotwari* land holdings and acquisitions of such lands cannot be undone, except, possibly, by a different political majority or through a change of heart on the part of the Congress Party itself. The possibility of a left-wing majority taking advantage of the Amendment to introduce even more radical measures of land reform cannot also be ruled out. As long as the present ruling party continues to have the parliamentary majority, it may be that it would be content with its achievement of reducing the present and future inequalities in land ownership. But, whether it would take advantage of the Amendment to deny fair market value compensation in some cases is the question. For instance, the proviso added by the Seventeenth Amendment to clause (1) of Article 31-A of the Constitution would not permit the payment of market-value compensation to lands under acquisition other than personally-cultivated ones within the prescribed ceiling limits. What this journal said on this crucial question of compensation, while commenting on the Seventeenth Amendment in its issue of 6th June 1964, may be usefully repeated here:

"Two crucial questions arise from this proviso. First, if any land within the ceiling limit is under tentant-cultivation and if any portion of that land is acquired by the State, would it not be equitable to pay compensation for such acquisition at market value? Secondly, if personally-cultivated land alone within the ceiling limit is made eligible for compensation on the basis of market value presumably on the ground that the landholders concerned are smallholders, does it not constitute discrimination in favour of one set of landholders and against another set of landholders from whom lands above the ceiling limit are acquired? After all, all of them are owners of identical landed property. Further, what crime have investors in agricultural land committed to deserve such expropriatory punishment from which investors in urban property and in shares and stocks are free?

"Equity demands that the acceptance of the principle of market value compensation for personally-cultivated land within the ceiling limit should be extended to all lands acquired under land reform legislation. After all, thanks to widespread documentary dispersal of bigger landholdings over the last seven or eight years, the surplus lands above the ceiling limits fixed in different States may aggregate, at the most, two million acres only in the entire country. Payment of market-value compensation for this relatively small quantity of land would present no insuperable difficulty. What is more, uniform application of this principle of market-value compensation to all lands acquired under the Land Reform Acts would severely discourage any future attempt by a State Government to reduce the ceiling limits to ridiculously low levels."

The above arguments and pleas are generally applicable to all the States which have enacted land ceilings legislation. Specifically, here in Maharashtra, there is the additional need for exempting the efficiently-managed and integrated sugar factory farms from the purview of ceilings legislation in line with what most other States have wisely done.

PLANTATION LABOUR

The Industrial Committee on Plantations met at New Delhi on Friday last week after a gap of full three years. This gap is certainly regrettable considering the vital functions assigned to the Committee when it was appointed some years ago. The Committee is one of the oldest of industrial committees (and one of the most effective too), has a long record of good work to its credit, and, more than anything else, its deliberations have had the effect of bringing the parties together and promoting harmony of relations even when their views seemed difficult to reconcile. All this was clearly acknowledged by Mr. D. Sanjivayya, Union Minister for Labour and Employment, himself when he addressed the eleventh session of the Committee held at New Delhi on Friday last week.

Never before was the need for the Committee to maintain harmony of relations in the plantation industry so pressing as it is today. Higher production of plantation crops is urgently required to meet the expanding domestic requirements and to earn the badly needed foreign exchange through exports. Tea is India's second largest earner of foreign exchange: about Rs. 130 crores a year. Coffee also fetches a foreign exchange of Rs. 8 crores annually. Mr. Sanjiviyya was, therefore, quite right when he said that higher production of plantation crops, especially tea and coffee, had "a significant bearing on the entire economy."

An important item on the agenda before the meeting pertained to workers' housing. It was revealed during the discussions that only about 53 per cent of the houses covered under the programme launched a decade ago has actually been completed. This slow progress is not surprising, in view of the several difficulties confronting the plantation industry, especially inadequacy of funds and low profit margin. Fully appreciating the difficulties, the Working Group on plantations has recommended substantial financial assistance to planters for completing the housing programme and liberalisation of conditions of security to be furnished against loans. The Government of India will do well to accept these recommendations. In fact, it looks as though such acceptance is a foregone conclusion, as witness the remarks of Mr. Sanjivayya that, "if these recommendations are accepted, it would be easier for all to go ahead with the housing programmes."

The amendment of the Tea District Emigrant Labour Act also came up for consideration at the meeting. This subject, it will be recalled, was discussed at one of the earlier sessions and it was then thought that, since local labour was available in plenty, it might not be necessary to retain the Act any longer. The position now, however, seems to be different. Alluding to this subject, Mr. Sanjivayya said:

"For one thing, local labour is not sufficiently mobile and, for another, illicit recruitment is being resorted to on a rather large scale. With the higher targets of production likely to be set in the future Plans, about 60,000 new workers may have to be recruited every year. This would mean the retention of the Act, as well as the Organisation of the Controller of Emigrant Labour. But

A ROAD IS NOT THE ONLY PLACE WHERE YOU CAN DRIVE A JEEP.

DRIVE IT OFF THE ROAD. RUN IT THROUGH IMPOSSIBLE TERRAIN. ON A CART TRACK. UPHILL. DOWN A ROCKY SLOPE. THROUGH SLUSH AND MUD. VIRTUALLY ANYWHERE. YOU WILL BE ASTOUNDED BY ITS STRENGTH AND VERSATILITY! POWERFUL, MANOEUVRABLE, THE WORLD'S BIGGEST LITTLE VEHICLE IS UNBEATABLE IN PERFORMANCE AND ECONOMY. IT HAS A 72 BRAKE HORSE POWER ENGINE. A 4 WHEEL DRIVE...CAN BE EASILY ADAPTED TO MANY USES.

THE JEEP UNIVERSAL IS THE MOST DEPENDABLE VEHICLE YOU CAN OWN

the retention of the Act in the same form may not be possible. The constitutional validity of some of the provisions has been questioned. The problem in retaining the Organisation is the problem of finding the financial resources. I hope it would be possible for the Committee to have a frank exchange of views on the subject and arrive at a suitable arrangement."

As for the opening of fair price shops, Mr. Sanjivayya expressed his dissatisfaction at the slow progress and reiterated that legislation might have to be introduced to enforce the tripartite agreement. We wish Mr. Sanjivayya had cared to understand the difficulties faced by planters and offered a helping hand in the removal of these difficulties. He was, however, pertinent when he declared that, while examining the proposals for the amendment of the Plantations Labour Act or the State Plantations Rules, one should bear in mind that uniformity in labour legislation was quite an important factor. Surely, the merit of each amendment ought to be gone into from the all-India point of view before taking decisions.

POWER SITUATION IN CALCUTTA EASES

The highly industrialised South Bihar-Lower Bengal region seems to be turning the corner insofar as power supply is concerned. This area, which is at present served by the D.V.C., Calcutta Electric Supply Corporation, Durgapur Project's power station and a few small utilities, had a firm capacity of 952 M.W. in 1963-64, as compared with 880 M.W. in 1962-63. The shortage in that year was only to the tune of 32 M.W., as against the 80 to 100 M.W. shortage in the previous year. When the Bandel thermal power station of the West Bengal State Electricity Board, the Pathratu thermal station of the Bihar State Electricity Board and the D.V.C.'s Chandrapura units are commissioned in the next few years, the firm capacity of this region's power system will increase further. It is expected to be 1,365 M.W. in 1964-65 and 1,567 M.W. in 1965-66. If this expectation materialises, there will be a surplus of 67 M.W. in 1964-65, as against a shortage of 32 M.W. in 1963-64. The additions to power generating capacity in the current year will thus lift firm capacity above peak load, thereby putting an end to power shedding.

In fact, there is already some relief from power shortage, for instance, in the area served by the Calcutta Electric Supply Corporation and further improvement is expected in the current year and in the next. Mr. I. A. Macpherson, Chairman of the C.E.S.C., has confirmed, in his speech at the sixty-seventh annual general meeting of the Corporation held last week, that several of the recent restrictions for reducing the peak demand on the Company's system have been relaxed, following the commissioning, in October last, of the 50 M.W. extension to its New Cossipore generating station and, more recently, of its Southern receiving station designed to take in power from the West Bengal State Electricity Board. While, at present, the Corporation is importing the permitted maximum of about 110 M.W. from the D.V.C. and 50 M.W. from the State Electricity Board, its offtake of State Board's power at the Southern receiving station will be stepped up to 80 M.W. towards the end of this year. The position will be further relieved during the first half of next year when the Corporation's Belur receiving station, designed to take in 100 M.W. of power from the State Board's Bandel generating station, will be commissioned. Mr. Macpherson is confident that the commissioning of the Corporation's two receiving stations should enable the State Government to remove the remaining restrictions on peak demand, provided they are backed adequately by the State Board's power resources.

If, thus, everything goes well, there will be no further power shortage of the kind that Calcutta's industries had experienced in 1962-63. As the Corporation's future capital expenditure upto 1969-70 would be overwhelmingly on transmission and distribution, it is not to be expected that the units of power sent out from the Corporation's own generating stations would significantly exceed the 1964 level of 2,000 million units. The Corporation, therefore, looks forward to a big increase in its intake of power generated by others from the 1964 level of about 800 million units (which, incidentally, is the same as that of 1963). Any upset in the supply of imported power on the scale required in future may not only affect the production performance of Calcutta's jute, engineering, steel re-rolling, chemical and paper industries and the export performance of jute and engineering industries in particular but also compel the Corporation to effect further increases in its charges for electricity so as to cover what will certainly turn out to be higher unit costs of generation, transmission and distribution in a situation of less-than-optimum sales of power. It may be noted, in this connection, that the Corporation has recently had to increase its charges for electricity so as to earn, *in a normal year*, its reasonable return which is now based on a standard rate of 6½ per cent, instead of the former six per cent. Since annual normalcy in future will depend, more than ever, on availability of power produced by the State-owned agencies, the State Electricity Board should meet the Corporation's increasing power requirements fully and according to firm schedules. Otherwise, either the return actually earned by the Corporation will be less than the reasonable level or the consumer will have to come to the Company's rescue by accepting, without murmur, further increases in electricity charges.

A SCIENTIFIC CATTLE-FEED

The inauguration of the cattle-feed plant of the Kaira District Milk Producers' Union at Kanjari (near Anand in Gujarat) on 31st October 1964, marks an important step taken in the country for scientific and low-cost feeding of the cattle and to improve the supply of dairy products. For this project, India is indebted to Britain and other foreign countries, for it is virtually a gift from them. Thus, the entire plant and equipment, worth Rs. 14 lakhs, has been donated by Oxfam (Oxford Committee for Famine Relief) from collection under the auspices of the U.K. Freedom-from-Hunger Campaign Committee. Besides, the World Food Programme is donating about 17,000 tons of grains—worth Rs. 50 lakhs—to be compounded into cattle-feed.

The plant will produce 60,000 tons of cattle-feed every year and the milch-cows, fed on this cattle-feed, are expected to increase the yield of milk by 40 to 45 per cent. The cattle-feed—to be marketed as Amuldan—will cost less than cattle-feed, are expected to increase the yield many parts of India. When used extensively, it will save cottonseed oil for use as human food and for exports. An important factor in the development of Amuldan is that a long list of 33 possible ingredients of grains and seeds, cakes and meals and certain trace (mineral) elements has been prepared, of which six to eight raw materials will be used at a time to produce the feed. As the prices of the ingredients vary widly from month to month, it will be possible to change the constituents, so that the cheapest six to eight ingredients are selected every time to prepare the cattle-feed. The other advantage claimed for this cattle-feed is balanced nutrition, as a result of which calving and lactation periods will become regular and the milk yield of animal will increase. Shaped in the form of pellets, this processed feed affords no scope for adulteration by middlemen. It will also save a lot of time and labour, now being spent in preparing the conventional feed, as, for instance, cottonseed meal.

The poor yield of milk in India is well known. Even where cows and buffaloes are well-taken care of, as, for instance, in Kaira, the average yield of milk is only about 7 pounds per day per buffalo, as against twice that quantity in New Zealand. The average for the country as a whole is much smaller. The main reason for such poor yield in India is the undernourishment of cattle. Because of the high cost of conventional cattle-feed such as cottonseeds, groundnut cake and grams and paucity of green fodder and grazing land alike, it has not been possible to maintain the cattle well-fed and healthy. The new feed will, therefore, play an important part in this context and may go a long way towards improving the yield of milk, if its production is undertaken in all the States of India.

The production of the plant at Kanjari will at best be able to feed only 200,000 out of the total cattle population estimated at over 200 million. Almost the entire production will be absorbed in the neighbourhood of Anand. Similar plants for processing mixed feed, suited to meet the requirements of different breeds of animals, deserve to be established as part of the plan for increasing the production of milk. Fortunately, Larsen and Toubro Limited, Bom-

S. & L. AND POWER PLANTS

The modern Thermal Power Plant, with its high working pressures and temperatures, demands perfection in the piping systems required for its efficient operation. S. & L's experience in this vital field is of prime importance to the new projects now coming up.

Recognised as the leading manufacturers in India of fabricated pipework, S. & L. offer a complete service from design to commissioning, with all materials and workmanship of the traditional high standards associated with S. & L.

NAS-S & L-1074

bay, has just announced its plan for the manufacture of cattle-feed processing plants, similar to the one installed by the Kaira District Milk Producers' Union and supplied by the Company from the works of its principal, Buhler Brothers of Switzerland. The Company will offer plants capable of producing 10 tons, 4 tons, and one ton of finished mixed feed per hour. To begin with, 75 per cent of the components of the plants will be made locally in the first year of manufacture, but the indigenous content is expected to rise progressively to 90 per cent by the third year of manufacture. Thus, the installation of cattle-feed plants will not require any substantial amount of foreign exchange.

A LAUDABLE ENTERPRISE

In the continuing context of shortage of good grade constructional timber and considering the persistently rising demand for the same, the imperative need for tapping alternative building materials is quite obvious. Two such materials are fibre boards (like hardboard and insulation board) and particle boards. It is the manufacture of these boards that is now being undertaken in the factories of the Anil Hardboards Ltd. and Particle Boards India Ltd. situated at Mulund in Bombay. The third mill of the former Company and the particle boards mill of the latter Company were inaugurated on Sunday this week by Mr. Lal Bahadur Shastri, Prime Minister of India. Since these Companies are the pioneers in the field of fibre board and particle board manufacture and since Anil Hardboard Ltd. is also earning for the country foreign exchange worth a crore of rupees every year through exports, the tribute paid by the Prime Minister to their managements is certainly well deserved. Credit must go particularly to Mr. G. R. Jolly, a Director of both the Companies, who it is that first sponsored and promoted the project.

Manufacture of hardboards and insulation boards, it is claimed, allows a conversion of more than 90 per cent of wood to highly efficient multi-purpose building materials, combining in one product qualities such as covering, insulation, decoration and protection. Among the distinguishing qualities attributed to the hardboard are: it is tough and durable, is easy to erect, does not split, crack or come apart, and there is no wastage. Moreover, it costs less than the traditional timber, the supply of which is scarce. The insulated board is considered to be ideal for interior panelling of walls and ceilings, as well as for thermal and acoustic insulation. The Anil Hardboards' factory has on hand a project to manufacture mineral wool boards and tiles also. These are completely fireproof, besides possessing acoustic and thermal advantages. The particle board is an economical and suitable substitute for the more expensive and inadequately available building boards and construction timber. Particle Boards Ltd. has obtained an industrial licence for the manufacture of moulded particle boards, which will be the third plant of its type in the whole world.

The efforts of the Anil Hardboards Ltd. to maintain output at as high a level as possible with a view to meeting the needs of Defence and civilian requirements are commendable. The Company's plants, according to Mr. Jolly, are working round the clock on all days, including Sundays and holidays. Equally commendable are the efforts to export abroad in spite of heavy obstacles and competition. The products of the Company, it is said, have carved out for themselves a dominating place in the Middle East countries and, lately, they have penetrated into the highly competitive fibre-board markets in Britain and the Continent as well.

POYSHA INDUSTRIAL CO. LTD.

The Poysha Industrial Co. Ltd. engaged in the manufacture of tin containers and metal cans of a wide range used for packing, is raising its subscribed capital by Rs. 85 lakhs to Rs. 110 lakhs —through a right issue of Rs. 25 lakhs and a fresh issue of Rs. 60 lakhs which will be offered for public subscriptions—with a view to financing its modernisation and expansion programme. The public issue of Rs. 60 lakhs is divided into 600,000 equity shares of Rs. 10 each to be offered for cash at par; the list is due to open for subscription on the 13th instant and will close on the 23rd instant or earlier but not before the 16th instant.

The Company's main factory is now located at Bombay and its branch factory, that is the reforming unit, is at New Delhi. The two wholly-owned subsidiaries of the Company are Colrige Ltd. which manufactures (in Bombay) rigid containers and collapsible metal tubes for cosmetic, pharmaceutical and other industries and the Kaira Can Company, Ltd. at Anand which produces containers for the Kaira District Co-operative Milk Producers' Union. The Company's plans include the establishment of two new factories (one at Cochin and another at Ghaziabad), shifting of the main plant from Bombay City to the Kalva industrial area (near Thana) of the Maharashtra Industrial Development Corporation, modernisation, and expansion of production capacity of cans from four million to ten million per month on single-shift basis: the factory of Colrige Ltd. is also proposed to be shifted to the Kalva industrial area. Mr. Madanmohan R. Ruia, a well-known industrialist, is the Chairman of the Company.

INTERNATIONAL TRACTOR COMPANY OF INDIA LTD.

Mahindra and Mahindra Ltd. has announced that it will offer privately approximately 65,000 equity shares of Rs. 10 each of the International Tractor Company of India Limited to those shareholders of Mahindra and Mahindra whose names stand on the register of members as on 19th November 1964. Another 60,000 shares will be offered in the first instance to the staff and workers of Mahindra and Mahindra Ltd., Voltas Limited, and their associates. A stipulation made by the Government is that these privately offered shares cannot be sold or transferred within a period of one year from the date of allotment. The issue is not a rights issue in the terms of Section 81 of the Companies Act. The basis of allotment has been fixed as follows, but shareholders can apply for additional shares should they so desire.

No. of equity shares held in Mahindra and Mahindar Ltd.	*No. of equity shares to be offered*
1 — 200	10
201 — 500	15
501 — 5,000	25
5,001 — 10,000	50
10,001 onwards	100

HINDUSTAN DOWIDAT TOOLS LTD.

The production of the Hindustan Dowidat Tools Ltd. is quite satisfactory, both quantitatively and qualitatively, and the tools manufactured by the Company have established a firm reputation for quality. This was disclosed by Mr. D. P. Mandelia, Chairman of the Company, in his speech at the annual meeting of the Company held recently.

The Company, an Indo-German venture commenced manufacture of hand tools early in April 1964, with open ended spanners in various sizes which is being followed by other tools such as ring spanners, adjustable wrenches, multigrip pliers, etc. Construction of the factory building and erection of plant and machinery were completed towards the close of the financial year 1963-64. The Company has launched a well organised training programme of Indian workers and personnel under the supervision of experts from abroad. Efforts are now under way to accelerate the training programme with a view to introducing the second shift as early as possible.

The Company faced some difficulties in the import of raw materials but the position, it is said, has since improved and the directors hope that adequate import licences will be made available to meet the requirements.

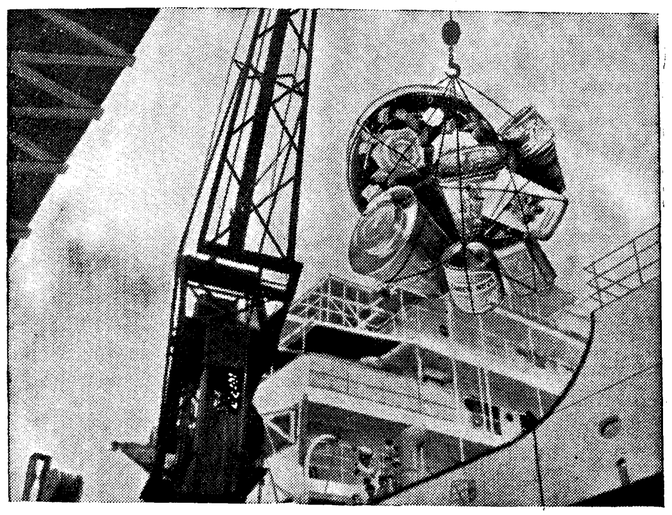
NEW STANDARD ENGINEERING CO., LTD.

The New Standard Engineering Company Ltd. has issued the second and third call of Rs. 25 each on the 24,961 partly paid up equity shares of the Company. The second call is payable on or before 30th November 1964 and the third call is due on or before 31st March 1965. The amount payable on the second call will be eligible for dividend from 1st December 1964 and the amount paid in respect of the third call will be eligible for dividend from 1st April 1965. In case of default of payment by the due dates, interest at 9 per cent per annum, will be charged. The calls are made payable directly to the Company's bankers, Devkaran Nanjee Banking Company Ltd., at Horniman Circle, Bombay 1.

MODELLA WOOLLENS LTD.

The working results of the Modella Woollens Ltd. for the year ended 30th June 1964 show a rise of Rs. 4.80 lakhs to Rs. 22.91 lakhs in gross profit. The provision for depreciation has been raised substantially from Rs. 5.25 lakhs to Rs. 11.46 lakhs (inclusive of Rs. 93,666 for extra depreciation for third shift for the previous year). The amount taken to development rebate reserve is, however, only Rs. 65,000, as against Rs. 5.82 lakhs. Tax provision is Rs. 3.55 lakhs (Rs. 1.31 lakh). After these essential provisions, there remains a distributable balance of Rs. 7.26 lakhs (Rs. 5.73 lakhs). The Directors have utilised Rs. 50,000 (Rs. 56,626) for writing off preliminary expenses and allocated Rs. 2.50 lakhs (Rs. 2.50 lakhs) to general reserve. The taxable ordinary dividend has been raised from 6 per cent to 7 per cent on the increased ordinary capital of Rs. 65 lakhs.

An agreement providing for a loan of DM 60 million (approximately Rs. 7.2 crores) has been signed at Frankfurt recently between the German Development Bank and the Mysore Iron and Steel Company Ltd. The special feature of the agreement is that, unlike the Rourkela steel expansion project, where only a checking of the technical plan was envisaged for the first time as it is to be applicable in future also, the technical, financial and economic aspects have been examined before entering into the contract. In its enlarged shape, the Mysore project is estimated to cost Rs. 7.2 crores in foreign exchange, which is covered by this agreement for the import of equipment from Germany. When complete, the production capacity of the plant will be 77,000 tons per annum of high speed steel, high alloy steel, free cutting and spring steels and structural steels.



In quest of gold

More and more Indian manufacturers are today earning valuable foreign exchange by selling their products abroad. Exports of cashew nuts, fish, vanaspati, toiletries and other consumer goods in Metal Box packages alone earned over Rs 8 crores last year. That's a lot of foreign exchange, and for the nation it's as good as gold.

To sell in highly competitive overseas markets the product must be of the finest quality. *And so must the package.* It must be of the *right size* and must have the *right finish.* And an *attractive surface design* that will score over competition in sales appeal

All this requires research, experience, resources. Metal Box have them. They also have access to the fund of marketing and technical know-how of their world-wide associates. This is why Metal Box can provide a comprehensive packaging service as no one else can. This is why, too, so many packers come to Metal Box for advice, send their goods abroad in packages designed and manufactured by Metal Box.

And Metal Box customers are not located in India alone. Last year Metal Box exported nearly Rs 30 lakhs worth of containers, closures and machinery direct to packers abroad.

You see, word gets around.

MB METAL BOX *protective packaging*

ANTI-G.A.T.T. BUT NECESSARY

By Questor

LONDON, *31st October*

THE new Labour Government's scheme for imposing a temporary surcharge on tariffs had been thoroughly anticipated in Britain—it was possible to put it into practice so promptly, after all, only because the preliminary work had already been commissioned by the outgoing Conservative Government. But it has caused some surprise abroad as well as the inevitable uproar from those hoping for special concessions: one of the few virtues of the scheme in the eyes of the G.A.T.T. is that it is non-discriminatory and it is to be hoped that this uproar will go unheeded.

It is unlikely, nevertheless, that the G.A.T.T. will feel inclined to grant the waiver it refused Canada two years ago for a form of import restriction which, though the only kind practicable in modern conditions, is formally incompatible with its rules. And it is probable that, when the International Monetary Fund calls on the Group of Ten for supplementary resources, as it will certainly have to do if Britain asks for any more than its $1,000 million stand-by credit, some of the members—particularly, of course, the French—will raise difficulties.

The attitude of France will be determined by political as well as purely economic considerations, and it is quite possible that a political clash will develop within the Group on the question of Britain's deficit. The striking fact is that Britain's decision to restrict imports has received prompt and solid support from the U.S. Treasury, for all the short-term disadvantage it will undoubtedly cause to the U.S. balance of payments. Mr. Roosa declared several weeks ago that most industrialised countries were unable nowadays to meet a payments deficit with a traditional squeeze on credit.

The U.S. Treasury statement issued immediately after the introduction of the surcharge said that it would hit directly at the inflated imports which had been the main immediate cause of pressure on the pound and that longer-term measures to deal with prices and productivity would improve Britain's competitive position: "the import charges," it said, "will, for a time, have a moderately adverse effect on our trade as well as upon that of other countries, but there is no painless corrective either for the U.K. or for the rest of the world."

Mr. Roosa expanded this first reaction a couple of days later by admitting that the Europeans had expressed concern at the absence of the customary orthodox procedures (namely, a squeeze on credit), but claimed that they had not realised the full extent of Britain's difficulties or the inevitability of the measures which had actually been taken.

This was generous support, and I think it was only partly due to the fact that Britain has refrained from raising its discount rate at a time when the case for and against a rise in the U.S. rate is unusually vexed. The fundamental fact is that the recent and uncomfortable experience of the U.S. as a debtor nation has given it more understanding of the position which Britain has been trying to urge since the Bretton Woods conference of 1944—that, in a rational monetary system, creditors as well as debtors have a responsibility for action.

It would have been palpably absurd for the U.S. to tackle its deficit with an orthodox squeeze on credit: its real problems, after all, were a high level of unemployment and a relatively low rate of growth. It sensibly preferred to exert its diplomatic strength and to tackle the payments problem gradually—stemming the run on its reserve, trimming Government expenditure abroad, intervening to prevent prices from rising, restricting the outflow of capital, and so on.

It is now apparently prepared to back up a similar, gradual programme for curing the British deficit. Britain does not have the U.S. unemployment problem, but there is little doubt that the need to check the growth of demand for payments reasons soon after every upturn has hindered the growth of investment, the abolition of restrictive practices, and the other structural changes which are needed to make the British economy more competitive.

This support is extremely welcome, since it holds out the possibility that, even under the present, rudimentary system, Britain will be allowed sufficient credit for long enough to improve our efficiency without the resort to deflation which is nowadays politically impracticable. Nobody who matters here in London wants to devalue the pound, nobody else wants it devalued, and provided that we are allowed to exercise our normal drawing rights on the International Monetary Fund the question need not arise.

But the fact that the U.S. has backed the new Government's initiative so strongly, while the Europeans have merely made the orthodox objections, underlines the fundamental difference which became apparent in Tokyo a couple of months ago between the Anglo-Saxons and the rest about the proper function of international credit.

There are, of course, political overtones, particularly at a time when the future structure of N.A.T.O. and of the European Community are a matter of some doubt. But, if the U.S. and British Treasuries are now prepared to recognise that their operation of reserve currencies does not so much make them rivals as give them similar problems to overcome, there is great scope for co-operation—not least, of course, in the fashioning of a more stable international monetary system.

COROMANDEL FERTILISERS

Coromandel Fertilisers Limited has awarded a contract for the supply of naphtha to Caltex Oil Refining (India) Limited. Naphtha, a by-product of oil refining, will be used as a raw material in the fertiliser production process. Naphtha is a vital raw material in fertiliser production, and the manufacturing process is based on the gasification of naphtha with oxygen. The Coromandel plant will annually produce 365,000 metric tonnes of ammonium phosphate (20-20-0) and 16,500 tonnes of urea prills fertilisers, *plus* other product mixtures which will prove a boon to farmers. This giant private sector Rs. 32½-crore fertiliser plant is to be built in the Port Area of Visakhapatnam, Andhra Pradesh, and will be located adjacent to the Caltex Refinery. Construction is scheduled for the latter part of the year, following completion of preliminary engineering work.

FIRST DETONATOR FACTORY IN INDIA

The first factory in India to make detonators—Indian Detonators Ltd.—will be going into production shortly.

Pioneers in setting up this vital unit to foster mining, quarrying, high-way construction and hydel projects, INDIAN DETONATORS LTD., aim at meeting the ever-increasing demands for detonators, while saving valuable foreign exchange.

Detonators for Dam Construction

Detonators for Mining

Detonators for Tunnelling

Production range includes: Ordinary, Electric and Delay detonators and Safety fuses

INDIAN DETONATORS LIMITED

Kukatpalli, Post Bag No.1, Sanatnagar (I.E.) P.O., HYDERABAD-18.

NEW CENTRAL BANKS

SALIENT FEATURES OF THEIR TOOLS AND TASKS

DURING the last seven years, that is, between 1957 and 1964, at least nineteen new central banks have come into existence, most of them on the African continent, following the exit of colonial powers. The present phase of the establishment of central banks began in 1957 with the Central Bank of Ghana, followed by the Central Bank of Malaya and the Central Bank of Tunisia in 1958. In 1959 came the Central Bank of the States of Equatorial Africa and of Cameroon, the Central Bank of the States of West Africa, the Bank of Morocco and the Central Bank of Nigeria. The Bank of Sudan, the Bank of the Republic of Guinea and the Somalia National Bank were established in 1960. While no new Central Banks were established in 1961, 1962 saw three more of them—the Bank of Jamaica, the Malagasy Bank of Issue and the Bank of the Republic of Mali. The Central Bank of Algeria and the Central Bank of Cyprus came in 1963.

The year 1963-64, in particular, saw many more changes, in addition to the establishment of new central banks. The Bank of Lebanon, the National Bank of Rwanda, the Bank of the Kingdom of Burundi and the National Bank of Congo were established in 1964. Some of them are yet to begin their operations in the near future—they are the Central Banks for Sierra Leone, Jordan and Trinidad and Tobago. The Central Bank of Malaya was converted into the Central Bank of Malaysia, in keeping with the political integration of the once British territories in this region. The break up of the Federation of Rhodesia and Nyasaland brought into being three new central banks, one for each of the partitioned countries: The Reserve Bank of Rhodesia has already commenced operations and others are likely to follow suit.

In another group of countries—including Ethiopia, Iceland, Iran, Nicaragua and the United Arab Republic, where central banks had exercised both central banking and commercial banking functions, there has been a reorganisation and separation of their functions.

These institutions have been converted into central banks proper, with their commercial banking operations transferred to existing or newly established commercial banks.

In this article, an attempt is made to examine the trends in the functions and organisation of these new central banks. The facts are taken from an article in a recent issue of the *Monthly Review* of the Federal Reserve Bank of New York.

Differences and Distinctions

The countries served by the new central banks vary considerably with respect to the degree of their financial and economic development. While in some of the States like Lebanon and Jamaica, the banking systems are highly developed, in others many economic transactions take place outside the monetary sphere. The share of currency in the total money supply, an indication of the degree of spread of banking habit, varies from 30 per cent to 65 per cent, as against only 20 per cent in the case of United States. The other point of difference and distinction between these various countries is the degree and extent to which financial institutions other than commercial banks have taken roots.

But the similarities are more striking than differences. Among the most universal and common characteristic is the dependence of all these newly independent countries on international trade. Foreign capital—both aid and investment, on private as well as Government account—has already played or is expected to play a considerable role in the economic development of these countries. Further, in each case, foreign commercial banks constitute a major element in the banking system of each of the countries.

A similar agreement is also found in the objectives, powers and obligations of the new central banks. Maintenance of external and internal stability of currency and promotion of a monetary environment for economic development are the two main statutory objectives which are universally and uniformly found in all cases. Exclusive right of note issue and the obligation to act as fiscal agent and Government banker are the acknowledged fields of all central banks: So also the power to buy and sell gold and foreign exchange and the authority to purchase, negotiate, rediscount, sell or collect specified types of financial obligations. But, in addition to all these, all the new central banks have some and some of them have all of the following powers of control and supervision over the commercial banking system:

To prescribe minimum cash reserve requirements, to set limits on lending and deposit rates, to prescribe quantitative limits and qualitative types of assets distribution and the total volume of credit outstanding as well as composition and nature of securities to be taken, to examine and inspect books, to call for statistical returns and reports and to set minimum capital and liquidity requirements.

Relation with Government

The relations between central banks and the respective Governments also follow a uniform pattern. Most of the new banks are owned by the Governments of the countries, except that, in one or two cases, the French Government holds a small share in the capital of the central banks of their former colonies. In most cases, the presiding officers (Chairman or President) and the Boards of Management are all appointed by the Government for a fixed term, but reappointments for further terms are possible. In the former French colonies, of course, the French Government has retained the right of appointing half the members of the Boards.

Again, the Governments are able to exercise effective influence upon the Boards of Management by providing that their officials or representatives shall sit upon the Boards. Normally, the Government representatives number two, but in cases like Algeria or Mali, the law is flexible enough to enable the Governments to appoint the majority of members on the Boards. In Mali, there is also a provision for two representatives of National Legislative Assembly to sit on the Boards. In addition to the right of appointing directors or nominating officials as ex-officio representatives on Boards, the Governments have the ultimate right to supervise or approve aspects and policies of some central banks. In Cyprus, for example, the approval of the Finance Minister is necessary, if the reserve requirements are to be raised above a certain level. In Jamaica, the Finance Minister may issue written directives to the Governor, although it is provided that such directives must follow mutual consultations between them. In Somalia, a key cabinet committee supervises the working of the central bank. In Burundi, the Finance Minister's approval is necessary for every major policy decision of the Central Bank. In Congo, a Finance Ministry official attends all board meetings as an observer.

There is nothing unique in these provisions, for the world over central banks are in a secondary position to the Governments. Even before its nationalisation, the celebrated independence of the Bank of England was as little in effect as it has been in recent days. Even in a system of checks and balances in the United States, the President recently asked the Secretary of Treasury to ensure that all bank supervisory agencies, namely, the Comptroller of Currency, the Federal Deposit Insurance Corporation and the Federal Reserve Board acted in unison. In India, if the careers of two of the Governors of the Reserve Bank of India after its nationalisation were cut short chiefly because they were not liked by the Finance Minister, the position was no different prior to its nationalisation, when its Governor was powerless to prevail upon the Government during war and immediate post-war years. Whatever independence the older central banks had were taken away or drastically whittled down in the post-war years. The question does not at all arise in the case of the new central banks which have all been conceived as State-owned and State-managed institutions, subject to the wishes of their Governments in all material respects.

Limitations

Nevertheless, there are several formal and statutory limitations on the central bank financing Government expenditure. The limitations apply both to direct financing (through ways and means advances or purchases of securities) and to indirect financing (through open market operations or rediscounting of Government securities). The most common form of limitation is a variant of the proportional reserve system of note issue—the total volume of Government indebtedness that may be held by the central banks is limited to a specified proportion varying from 10 per cent to 15 per cent of ordinary Government revenues. The proportions are prescribed in a very complicated manner in Cyprus and Jamaica. There are further variations. Burundi Bank's assistance to Government is limited to an absolute total, while, on the other hand, there are no limits at all in Mali and Equatorial Africa. In Rwanda and Lebanon, the limits are there, but they could be exceeded in circumstances of "exceptional gravity."

Effective action for credit control through traditional weapons of central banks as well as new tools of action is not the only or even the most important objective of the new central banks: the broadening of the financial structure as a pre-requisite for sustained economic development is one of the prime tests of virtually all these new central banks. They aim not only at price, currency or balance of payments stability, but also at promoting the growth of sound and diversified financial institutions and, what is more important, fostering confidence in money and banks.

Monetary Control

The new central banks display several distinct though overlapping approaches to the problem of general monetary control. At one end, there are banks which place primary reliance on the control through variations in central bank accommodation to banks and other financial institutions mainly through the mechanism of the discount rate or variable credit ceilings. At the other end, there are central banks which make substantial use of their powers to deal with the non-bank public. By altering the volume of central bank credit to the non-bank public, these central banks have a direct means of influencing the liquidity of the non-bank sector as well as that of the bank sector of the economy.

In between the two extremes, central banks rely for the purposes of credit control on a combination of variations in commercial bank reserve requirements, rediscount mechanism and open market operations, *plus* a varying array of direct controls.

All the new central banks have special legal powers going beyond the traditional tools, so that they can fulfil their general mandate for promoting economic development and special responsibilities for developing financial institutions, credit mechanisms, negotiable instruments and domestic money markets.

In highly underdeveloped countries, where the money market is practically non-existent or insensitive and the financial sector is thin, central banks have obtained powers for dealing directly with the depositing and the borrowing public. These powers of granting advances, discounting bills and accepting deposits from non-financial customers distinguish many new central banks from their older confreres. Where such powers are not given, the central banks are supplemented and strengthened by separate Government-owned development banks.

Liberal definitions of eligible commercial or financial paper for the purpose of discounting, rediscounting, outright purchase or /as a loan collateral are intended to assist in the process of financial development. The maximum usance varies between 180 days and one year, though, in some cases, it is as short as the traditional 90 days: yet there are provisions for granting term loans to commercial banks and other financial institutions for as long as five years in order to finance export, housing and development plans. In these and in various other ways, the new central banks are fully fortified with the powers and weapons to foster the development of their respective countries.

FIVE PER CENT

Madras State Electricity Board Bonds, 1976
For Rs. 300 Lakhs.

(PAYMENT OF INTEREST AND REPAYMENT OF PRINCIPAL, GUARANTEED BY THE GOVERNMENT OF MADRAS.)

The Bonds will be trustee securities under the Indian Trusts Act and also approved securities for the purposes of the Insurance Act and the Banking Companies Act. The Bonds will be treated on par with Government Securities for the purpose of advances under Section 17(4)(a) of the Reserve Bank of India Act, 1934

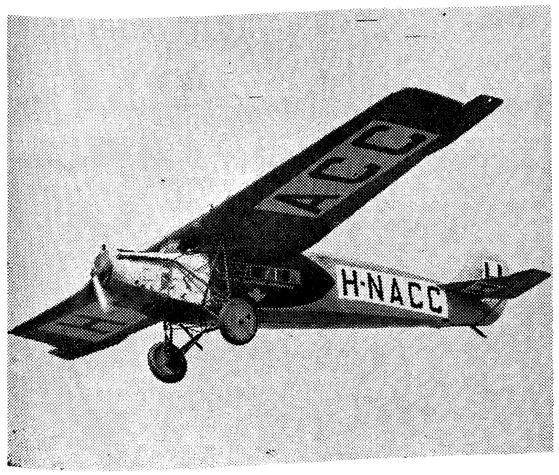
ISSUE PRICE Rs. 99.75 PER CENT.

REDEEMABLE AT PAR ON THE 16th NOVEMBER, 1976.

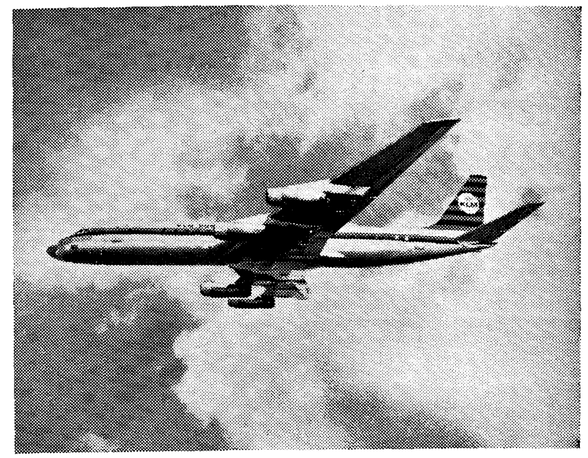
Subscriptions will be received in cash or cheques from the 16th November 1964. But the lists will be closed without notice as soon as the total subscriptions amount to approximately Rs. 300 lakhs and in any case not later than the close of business on the 21st November 1964.

Applications will be received at all branches of the State Bank of India within the State of Madras and at the State Bank of India at Madras, Bombay, Hyderabad, Calcutta, Delhi, Bangalore and Bangalore City.

Copies of the Notification announcing the terms of issue and application forms are available at all the receiving offices mentioned above, at all treasuries and sub-treasuries in the State of Madras and at all offices of the State Electricity Board.



Fokker F-VII—**1924**



DC-8 Jet—**1964**

It's 40 years now since the first KLM plane touched India

In November 1924, 40 years ago, KLM Royal Dutch Airlines landed in India for the first time, pioneering a new air route between Europe and the Orient.

This flight was operated by KLM with a single engined Fokker F-VII, the last word in commercial aircraft in those days. It carried a crew of 3, no passengers, and flew from Amsterdam all the way to Jakarta (then called Batavia) to prove that commercial flights of great distance were possible. The plane took 44 days to reach Calcutta from Amsterdam.

Dutch airmen in Calcutta Leaving to-day for Akyab

The Dutch airmen, Pilot Van der Hoop, Pilot H. Poleman and Mechanic Van der Broeke, arrived at Calcutta yesterday afternoon, en route to Batavia.

Leaving Allahabad at 7 a.m. they landed at Dum Dum Aerodrome shortly before 2 o'clock after an uneventful flight. The Fokker monoplane passed over the heart of Calcutta, and its occupants appeared to have some difficulty in sighting the aerodrome. By means of a fire, however, their attention was attracted and they made a perfect landing.

—Statesman, Nov. 14, 1924

Today KLM DC-8 jets cover the same distance from Europe to India in a matter of a few pleasant hours. Profit from KLM's long experience. Book your passage on any of KLM's twice weekly flights from India to Europe—on Saturdays from Calcutta, on Tuesdays from Delhi. Or take advantage of KLM's five-weekly DC-8 jet flights ex-Karachi.

KLM also operates two flights a week from India to the Far East, which speed you direct to Bangkok, Manila and Tokyo and offer convenient connections at Bangkok to Hongkong, Singapore or Jakarta, in conjunction with the services of its interline partners.

KLM—an international carrier in 1924

Founded in 1919, KLM's operational history began in 1920 when it inaugurated a trial service from Amsterdam to London. In 1924 it had scheduled flights to London, Hamburg, Bremen, Brussels and Paris. Today KLM serves 44 cities in Europe alone and its network covers all the six continents in the world, serving 104 destinations in 68 countries.

A new record—Europe/India

A new record was set by KLM in 1933 when KLM carried Christmas mail from Holland to Jakarta in a Fokker F-18 "Pelikaan" An extract from The Statesman of December 22, 1933 is highly interesting to read:

Dutch plane's dash to Batavia—a new record

A new flying record between Europe and India was established yesterday when a KLM (Dutch) aeroplane carrying extra Christmas mails from Amsterdam to Batavia arrived at Dum Dum Aerodrome shortly after 10.10 a.m. accomplishing the journey between Amsterdam and Calcutta in 72 hours, including halts en-route.

KLM 'firsts'

DC-8 jets were introduced in India for the first time by KLM—in 1960. They are now operating on all KLM's flights through India—in eastbound as well as westbound directions.

KLM pioneered in passenger comfort. Sponge rubber seats were a KLM idea. They went into use on KLM planes in 1927. KLM was also the first airline to equip its fleet with blind-flying instruments and the first one to use radial air-cooled engines.

The world's first air booking office was opened in Amsterdam in 1921—by KLM.

Reliability—an important KLM factor

KLM has been busy providing reliable service for 45 years, longer than any other airline. That is why many experienced travellers recommend flying KLM Ask your travel agent or the nearest KLM office for more information on KLM and its world-wide network of air-routes.

MARINE INSURANCE IN INDIA

NEED TO BRING DOWN CLAIMS RATIO

THE progress of all branches of general insurance is closely connected with the economic development of a country and the availability of expert managerial personnel. In both these respects general insurance in India is well placed. The economic progress of the country, accelerated by planning and the active participation of the State, has broadened the market for general insurance. And, fortunately, India is well provided with sufficient experts to exploit this opportunity. In a modern economy the complexity of risks to be covered is increasing. While this is true of every type of insurance, it is particularly so in the case of marine insurance—the oldest of the main branches of insurance business. Marine insurance was in practice even in the pre Christian era, though in a crude form. Sea traffic at that time was very much different from what it is today. But even in the Roman era, there were fairly large ships undertaking considerably long journeys, which many times used to have some sort of insurance cover. It was, however, in the eighteenth century that marine insurance, as we know it today, began to assume considerable importance. The Industrial Revolution—introduction of power-driven machines in industries—and the Commercial Revolution, aided by the invention of the joint-stock corporate form of limited liability, speeded up production, and the Transport Revolution—invention of steam ships and other improved transport practices—made it possible to increase trade with countries overseas. This increase in trade and the growth in the size of ships made marine insurance more and more necessary.

The vital importance of marine insurance to a modern economy will be evident when it is realised that it is mainly because of this insurance that overseas trade is conducted on credit basis. The buyer, generally, does not pay at once and the bill of exchange has provided a convenient way of settling debts. This is linked with the banking system, because by the system of discounting bills whereas the seller can get his money without delay, the buyer is also not put to any undue inconvenience. It is marine insurance which has made this system workable, as the banks which discount the bills require the protection of such insurance so that they run no uncovered risk in their financing.

Growth in India

India being one of the important trading countries in ancient times, marine insurance in a crude form might have been present in the country even in those days. But, in its modern form, it gained in importance only in recent times, due to the growth of Indian shipping and trade. Table A shows the growth of marine insurance business in India since the advent of the planning era.

It will be seen from the table that the gross marine premium written directly in India has increased in 1962 to almost double that in 1951, from Rs. 5.94 crores to Rs. 10.34 crores. What is more important is that the rise has been almost entirely in the business of Indian insurers (from Rs. 2.58 crores to Rs. 7.16 crores). In the case of non-Indian insurers, though there has been a continous increase since 1959, the business transacted in 1962 was actually lower by Rs. 17 lakhs, as compared with that in 1951. As a result, there has been a steady and gradual increase in the share of Indian companies in marine business—rising from 43.5 per cent in 1951 to 69.2 per cent in 1962. The share of foreign insurers has correspondingly come down from 56.5 per cent to 30.8 per cent.

Ratio of Claims

The ratio of claims payable to the gross premium has, however, been far from satisfactory in the case of Indian insurers. Although the figure has been fluctuating widely from year to year, the general trend has been upward, as will be seen from Table B.

It will be noted that, during 1962 (the latest year for which data are available) as much as 71.2 per cent of the gross premium written direct in India by Indian insurers was accounted for by claims. In the case of miscellaneous insurance the corresponding figure was 50.2 and in the case of fire only 23.3. As compared with the foreign insurers in India, the ratio was higher by only 1.2 percentage points in the case of fire and 8.7 percentage points in case of miscellaneous insurance, but the difference was as much as 18.1 points in marine insurance. The result is that, though the commission and expenses in the miscellaneous and fire insurance business of Indian insurers have been substantially higher than those in marine insurance, the balance was still considerable at over 16 per cent and 34 per cent, respectively. In the case of marine insurance, it was only 4.5 per cent for them, as against no less than 15.8 per cent for foreign insurers. All this clearly shows that Indian insurers have to improve their efficiency in the sphere of marine insurance.

Taking an average of the 12-year period, one finds that, whereas claims accounted for two-thirds of the gross premium written direct in India by Indian insurers—the ratio has been higher still since 1959—for foreign insurers it was less than half. The Indian insurers were able to show a balance of 6.5 per cent—as against 16.6 per cent by foreign insurers—only because the ratios of their commissions and expenses were much lower than those of the foreign insurers. If the commission and expenses of Indian insurers rise to the levels of non-Indian insurers, the balance will actually be in the negative. It is, therefore, very essential to bring down the ratio of claims payable. This can be done if the insurers are more vigilant in assessing the risks and circumspect in accepting sub-standard risks.

Business in Foreign Countries

Some of the Indian insurance companies, notably the New India and Orient, are also working directly in foreign countries. The gross premium of marine insurance, written direct by these companies in foreign countries, has been fluctuating widely from year to year, but the average amount during the last 12 years has been roughly Rs. 180 lakhs. In 1962, it stood at Rs. 212 lakhs, though slightly lower than Rs. 215 lakhs in the previous year. Taking the compulsory re-insurance of foreign companies in India also into account, the volume of India's business abroad was not much lower than the business of foreign companies in India. However, the Indian insurers operating in the marine insurance field abroad have been incurring a loss year after year. In the year 1960, for instance, their gross marine insurance premium written abroad stood at Rs. 197 lakhs and other income Rs. 2 lakhs, making a total of Rs. 199 lakhs. As against this total, the claims payable amounted to Rs. 160 lakhs (over 80 per cent of the income), commission Rs. 29 lakhs, other expenses Rs. 37 lakhs, and increase in reserves Rs. 12 lakhs, resulting in a loss of Rs. 39 lakhs. In 1961, the loss was still higher at Rs. 53 lakhs, though it came down in 1962 to Rs. 18 lakhs. Here again the need is to bring down the ratio of claims by accepting only quality business and by being more vigilant in paying claims.

Need for the Fourth Plan

There has been a spectacular growth of Indian shipping during the last three years. From 857,000 G.R.T. in 1960-61, it has risen to 1.3 million now and is expected to rise to 1.5 million by the end of the third Plan period. Even so the Indian vessels are able to handle only 18 per cent of the country's trade. Although the target for the fourth Plan has not become available so far, the aggregate tonnage is expected to rise to somewhere between three and four million. The exports are also rising and average annual figure for the fourth Plan has been proposed at over Rs. 1,000 crores. There will thus, be a considerable increase in the availability of marine insurance business. As the situation stands, there is already a considerable drain on foreign exchange on account of marine reinsurance transactions abroad, which stood at Rs. 43 lakhs in 1961, though it came down considerably to no more than Rs. 4 lakhs in the following year. Actually, with the bulk of the marine insurance written in India in the hands of Indian companies and with direct representation of some of them in foreign countries, marine insurance should become a source of foreign exchange supply rather than that of a drain. This would be possible if Indian insurers exchange business more freely among themselves, and the Indian traders patronise the Indian insurance companies increasingly. In order to induce the business people to patronise Indian insurance, Mr. P. K. Ghose, the ex-President of the Indian Insurance Companies Association, Calcutta, made a suggestion recently and asked the Government to allot additional import licences to such traders on the basis of difference between the c.i.f. or c. & f. price, as the case may be, and the f.o.b. price of imports. The suggestion seems to be useful and requires investigation for ascertaining its practicability. The expansion of the economy in the fourth Plan period will throw both a challenge and an opportunity to Indian insurers underwriting marine business. The responsibility to take it in full stride is primarily that of insurers, of course. But the Government, too, must play its part by providing them with suitable facilities. In this country, the Government's control on all branches of economic activity, especially of trade, industry and finance, is so far-reaching that insurers themselves can do very little, unless official policies and practices are helpful.

MARINE INSURANCE IN PRE-CHRISTIAN ERA

An example of the type of marine insurance practised in the pre-Christian era is given by Mr. Harold E. Raynes, author of the publication *A History of British Insurance*. He refers to a case in the fourth century B.C. wherein two lenders jointly advanced the money on the security of wine, to be picked up by a ship belonging to the third party. If the cargo arrived safely, the borrowers were to pay the lenders the capital advance *plus* interest. But the loss at sea or any goods jettisoned for the general safety was to be at the risk of the lender. Although the loan was essentially an advance of money on a ship during the period of voyage, it was not a loan in the ordinary sense of the term, for the repayment of the loan along with interest were to materialise only if the ship and cargo were to reach the destination safely. The interest here corresponded to the modern insurance premium. But, if the ship was lost, then the borrower was freed from his obligation to repay.

Table A: *Gross Marine Premium Written Direct in India*
(Amount in thousand rupees)

Better than anything before — Plastic covering for your floor!

NEW VYNATILE
PLASTIC TILES

Beautiful designs! Superb value!

Amazing... the wonderful qualities of VYNATILE! It's the exciting new surface for floors today. Strong, flexible and beautiful VYNATILE has a superb, smooth finish... looks distinctive on any floor. Its varied patterns and colours will match any decor, and VYNATILE is sealed on floors to last for years and years. Ideal for offices, shops, restaurants, showrooms, banks, theatres, homes and hospitals!

Choose new VYNATILE in 180 cms x 90 cms sheets... in thicknesses of 1.5 mm. or 2 mm. Or ask for it in any economical size. Better still, take it as tiles to fit into your scheme of things!

VYNATILE...better in so many ways!

- Exceptionally durable. Won't crack, scratch, break or rot. Absorbs noise and shock!
- Attractive on any surface—concrete, wood, steel or tile!
- 28 delightful colours and patterns to choose from!
- Dust, grease, spilled drinks and food can be cleaned away in seconds. Just wipe with a damp cloth!
- Its hard-wearing, flexible surface gives excellent under-foot comfort!
- Professionally laid for lasting value!

RAISING PRODUCTION AND EXPORTS OF WOOLLEN GOODS

LEVY ON RAW WOOL IMPORTS BY ACTUAL USERS

ALL raw wool imported by actual users will be subjected to the payment of a special levy of 10 per cent on the f.o.b. value of imports. A decision to this effect was taken by the Export Promotion Council for Wool and Woollens which was inaugurated at New Delhi on Friday last week. The entire proceeds of the levy will be utilised by the Council for promoting exports of woollen goods. Since the decision was in accordance with the suggestion made by Mr. Manubhai Shah, Union Minister for Commerce, who inaugurated the Council, the Government's acceptance of the decision is only formal. Actually, the special levy has already come into force, as it will be applicable to the import of wool worth Rs. 3 crores, for which essentiality certificates were issued last week.

The exact impact of this additional incidence on consumers of raw wool is not known, because of the lack of data relating to the breakdown of imports by actual users and manufacturer-exporters against import entitlements issued under the Export Promotion Scheme; private traders, it may be noted here, are not given any licence to import raw wool. But considering that the bulk of the imports is against actual user licences, the new levy will affect quite a significant part of the wool imported into India. The import ceiling fixed for the October 1964-September 1965 period is Rs. 5 crores. Ten per cent of this amount comes to Rs. 50 lakhs which will represent the income that will accrue to the Council for its export promotion activities.

The new import levy will no doubt add to the production costs of the woollen industry. It will be borne by domestic consumers and has become necessary in the interest of earning foreign exchange through exports. The need for earning as much foreign exchange as possible through exports of woollen goods is especially great because of the problem of financing the large-scale wool import requirements of the industry which are bound to go up in step with the expansion of the woollen textiles output. It may be noted here that the Planning Commission's Working Group on the woollen textile industry has recommended a production target of 41 million yards of woollen piecegoods to be achieved by the end of the fourth Five-year Plan, that is, 1970-71. The target represents a rise of 19 million yards as compared with the estimated actual output of 22 million yards in 1965-66 (end of the third Plan).

Cash Incentives for Exports

The proceeds of the 10 per cent levy on wool imported by actual users, as already stated, would be utilised exclusively for promoting exports of woollen goods in a manner to be determined by the Council. One of the specific export promotion measures will presumably pertain to the grant of cash incentives. For Mr. Shah, in his speech, advised the Council to constitute immediately a sub-committee to be in charge of cash incentives for exports. This (the appointment of the Committee), he said, "would facilitate the speedy fixation of cash incentives and any alteration of these in future, if needed." Incidentally, Mr. Shah made it clear that, in the present foreign exchange crisis, it would not be possible to raise the rate of import entitlements for the woollen industry under the Export Promotion Scheme from 85 per cent to 90 or 95 per cent.

Table A: Capacity And Production
(Yarn in million lbs.: fabrics in million yards)

	Yarn		Fabrics worsted
	Worsted	Shoddy	
Production capacity on 2-shift basis* ..	28.2	8.14	37.5
Expected production† in 1964-65 with Rs. 5 crores allocation (Rs. 1 crore for shoddy)	11.2	6.0	9.0
Third Five-year Plan target	28.0	10.0	35.0
Shortfall in production with Rs. 5 crores allocation	60%	40%	74%

* Based on: (a) Worsted yarn: 2 lbs. per shift per week per spindle for 50 weeks a year. (b) Shoddy yarn: 5 lbs. per shift per week per spindle for 50 weeks a year.
† Taking into consideration the availability of 6 million lbs. of indigenous wool and the raw material imports under the Export Incentive Scheme.

Some may consider the grant of cash incentives for export promotion as a contravention of G.A.T.T. rules governing fair trade practices. But, as against this argument, it must be remembered that the principal market of Indian woollen mills is domestic, that they have to be kept in operation for taking care of the needs of domestic consumers of woollen goods and of the employment provided by the mills, that exports of woollen goods are being supported only to the extent necessary for covering the foreign exchange cost of raw material and that, by doing so, the countries exporting wool are assured of their market in India. Further, India's exports of woollen goods constitute only a small fraction of the world trade in them. It will thus be noted that this export promotion measure does not infringe, to any significant extent, the interests of other exporting countries, most of which, in any case, are highly developed economies. But this does not mean that India should rely on this remedy as a permanent future. It must be regarded as nothing more than an emergency measure of short-term nature. A permanent and a more effective solution to the problem of exports lies in producing woollen goods which will compete effectively in overseas markets. Not only should the quality of goods be of a high standard but the prices also be sufficiently attractive to compete successfully with the goods exported by other countries.

Modernisation

Viewed thus, the need for steady rehabilitation, modernisation and rationalisation cannot be stressed too strongly. The biggest problem of the woollen industry, as Mr. R. K. Birla, Chairman of the Development Council for the industry and Chairman of the Indian Woollen Mills Federation, has rightly emphasised, is to keep pace with the progress being made

Table B: Raw Wool Imports
(Quantity in million lbs.; value in lakhs of rupees)

	1963-64		1962-63	
	Quantity	Value	Quantity	Value
Raw wool	15.90	589.00	13.91	500.00
Shoddy wool and wool waste ..	15.74	128.70	14.00	100.70
Wool tops	16.23	854.00	11.75	614.40
Total ..	47.87	15,71.70	39.66	12,15.10

in the more scientifically advanced countries and also to meet the challenge of national needs from the ever rising population in this country. "This involves," to quote him, "modernisation or rehabilitation of outmoded machinery and rationalisation of production cost, so that the consumer may be able to get goods of durable quality and at reasonable prices."

What is the extent to which modernisation is possible in the present tight foreign exchange situation? It is true that the industry would like to have all the machines to replace the present ones. But, since this would not be possible, there should be an effort to find out the possible from the impossible. Emphasising this aspect, Mr. Raj Kumar Seth, Vice-Chairman of the Indian Woollen Mills Federation, has given the following interesting data:

Exports being the first concern, that sector of the industry should be modernised where there is a possibility of a large increase in exports. There are 52,205 woollen spindles, 16,271 shoddy spindles, and 141,696 worsted spindles in the industry and another 2,003 looms. The proposed modernisation during the third Plan is supposed to replace 20 per cent of the woollen spindles, 26 per cent of the shoddy spindles, 54 per cent of the worsted spindles and 34 per cent of the looms. During the fourth Plan, 50 per cent of the woollen spindles, 40 per cent of the shoddy spindles, 54 per cent of the worsted spindles and 50 per cent of the looms would be modernised. Foreign exchange being meagre, modernisation could be first linked to export performance. This would mean that modernisation has to be linked to a direct increase in exports which, in turn would earn the foreign exchange needed for repayment of loans acquired for modernisation.

The question arises as what part of the industry should be modernised to achieve the best results on the export front. The opportunity to modernise will no doubt be given to the whole industry, but it will be obvious that some firms will be able to take better advantage of it than others. Apart from this, modernisation should also balance a complete series of processes involved in making cloth in the particular mill concerned. There is, for example, no advantage in providing a modern loom if the main operations before and after weaving are to remain out-of date. To achieve the proposed export target of two million linear metres, some 200 new "complete loom assemblies" will be required. Thus, if this scale of modernisation is accepted, then the total capital sum needed would be relatively small, just under £2 million and certainly much smaller than what was originally envisaged. However, the industry would like to have modernisation on a much larger scale. Apart from increasing exports, it is also necessary to reduce the cost of production of the fabrics so as to give the benefit of it to the indigenous consumer.

The Federation, one is told, has recently submitted a scheme of importing woolen textile machinery on deferred payment terms on its own initiative. A number of countries such as the U.K., Italy, West Germany and the U.S. are prepared to supply machinery on this basis. The Textile Commissioner has endorsed

Table C: Wool And Woollen Goods Export
(Quantity in millions; value in lakhs of rupees)

	Unit	1963-64		1962-63	
		Quantity	Value	Quantity	Value

Carpets and druggets ..	Sq. yds.	1.88	525.65	1.50	422.72
Wollen hosiery ..	Lbs.	0.44	59.09	0.23	25.15
Grand total ..		..	15,00.88	..	11,23.46

the scheme evidently because the machinery required by the woollen mills are not manufactured in this country. Commending the scheme for acceptance by the Government of India, Mr. Seth observes:

". . . if the scheme is accepted by the Government, then the industry will stand on a very firm footing. Repayment should not pose much difficulty, as avenues for exports are considerable. Raw wool alone can bring in considerable foreign exchange. This would be supplemented by fabric exports which are sure to go up during the coming years. Carpet exports of the mechanised sector will bring better results and all these combined together will solve the foreign exchange difficulty of the industry. So the scheme of the Federation is worth a try by the Government."

The Immediate Problem

Modernisation of woollen industry is, however, of long-term importance. The immediate problem is one of utilising the existing capacity to the maximum extent possible. Quite a large part of the capacity, we are told, continues to lie idle for want of adequate raw materials. The figures given in Table A are sufficiently illustrative. As against the actual raw materials (imported) requirements of the industry, estimated at Rs. 18·20 crores per annum on two-shift working, the allocation of foreign exchange made for the year October 1964-September 1965 is only Rs. 5 crores. The allocation, it is stated, will enable the industry to work only to the extent of 40 per cent of its capacity, after taking into account the availability of Indian wool and raw material earnings from exports. Drawing attention to the critical raw material situation, Mr. R. K. Birla put forward the following two suggestions while presiding over the meeting of the Development Council at New Delhi last week.

1. Since the present advance licences system against promised exports is not satisfactory, the Export Promotion Council or any other agency appointed by the Government should establish a reserve or stockpile of wool from which manufacturers can draw against export orders.

2. If the Government is not prepared to link imports of raw materials against the total value of exports, including raw wool, it may fix a limit on the value of Indian wool to be exported, keeping in view the average of the last 4-5 years, and any increase over this limit should be made available to the industry for import of raw wool.

The two suggestions of Mr. Birla are pertinent and deserve favourable consideration. When so much of capital—a scarce resource—has been sunk in creating capacity in the woollen industry, existence of idle capacity constitutes in effect waste of capital which the country can ill-afford at present and for some years to come. The Government of India will do well to liberalise its import policy for woollen industry's raw materials, since the type of wool needed is not available in adequate quantity. It would, of course, be desirable to increase more production in India itself. But this will take a long time even if energetic measures are taken without any delay. Further, India is

MANCHESTER LETTER

MILLS WELCOME IMPORT SURCHARGE

CLASH AMONG TRADE UNIONS OVER "PILOT SCHEME"

From Our Special Correspondent

MANCHESTER, *27th October*

IN Lancashire cotton circles, the British Government's decision to impose a 15 per cent surcharge on imports was welcomed by manufacturers. It would reduce the flow of cheap imports and help increase the sales of home-produced cottons. But Mr. Henry Pfeffer, head of Broome and Wellington, Manchester, which claims to be the biggest firm of cotton grey cloth merchants in the world, said: "Prices for all cotton textiles are bound to go up." The public would have to pay more for clothing and household textiles made overseas or manufactured from imported cloth. As a result home-produced cottons would also tend to rise in price.

Mr. K. O. Boardman, Chairman of Boardman, Marden, the Stockport-based garment manufacturing and textile firm, described the move as a "bull point" for Lancashire. Imports were bound to fall and home manufacturers would be working flat out to meet the demand. Lancashire manufacturers pointed out that, because the surcharge was "temporary," importers would be discouraged from placing orders in case it was abolished in the future and this would lead to a bigger call from home-produced supplies.

Shortest-ever Working Week

A clash has developed among trade unions in the Lancashire textile industry over a revolutionary experiment which would have the effect of introducing a working week on shifts of about 33 hours—the shortest in British cotton history. The basic week would be limited to three nights' work, but the two teams involved would also alternate in staffing a four-hour Saturday morning shift. The limited experiment has been authorised by the executive of the Cardroom Workers' Amalgamation, the largest spinning union. But after a meeting in Manchester attended by officials of ten unions —including the Cardroom Amalgamation—it was stated that every other union was opposed to it.

The six-month "pilot scheme" would be tried out at a mill that has been the focal point for a £2,000,000-modernisation programme and has been described as "the most modern and best equipped in Lancashire"—Sir John Holden and Sons at Leigh, part of the Combined English Mills group.

After the meeting, Mr. Lewis Wright, General Secretary of the Weavers' Amalgamation, said: "Every textile union was opposed to the principle other than the executive of the Cardroom Amalgamation, which has authorised the experiment." The opposition was based primarily on the inroads which would be made into week-end leisure in an industry with a "family tradition." "We do not think the social upset that would be involved by this new method is necessary," said Mr. Wright.

The experiment would be limited to two small teams of men workers employed as ring spinners. One team, Mr. Wright explained, would work on Sunday, Monday and Tuesday nights, and the other on Wednesday, Thursday and Friday nights. They would also take their turn on a four-hour Saturday morning shift. There would be no loss of earnings from the shorter week. On wages and working hours, the cotton unions have adopted a united front.

Imports of Garments

Quite apart from the very substantial rise in imports of cotton piecegoods, the quantity of foreign cotton garments reaching British ports in the second quarter this year remains a major factor in assessing future trade trends. The value of the total imports of made-up cotton articles was £14,514,000, as against £13,872,000 in the first quarter and £10,805,000 in the second quarter of 1963.

Within the different categories, imports of woven household textiles aggregated 6,996,000 lbs., as against 5,974,000 lbs. in the first quarter and 4,915,000 lbs. in the second quarter last year. Sheets, pillow and bolster cases accounted for a large part of this trade, being 1,634,000 lbs., as against 1,516,000 lbs. in the first quarter and only 538,000 lbs. in the corresponding period of 1963.

Foreign terry towels of all descriptions arrived to the extent of 2,256,000 lbs., as against 1,831,000 lbs. in the first quarter and 1,591,000 lbs. in the second quarter of last year. Other towels followed the trend, being 1,650,000 lbs., as against 1,220,000 lbs. in the first quarter and 1,309,000 lbs. in the second quarter of 1963.

Eastern Suppliers

The major suppliers of woven household textiles were India, who provided 2,665,000 lbs. and Hong Kong with 1,820,000 lbs. In the case of the Colony, this was at a lower level than in the second quarter last year, but was distinctly higher than in the subsequent three quarters.

In woven clothing, the total arrivals in the second quarter this year were valued at £8,638,000, as against £8,196,000 in the first quarter and £6,500,000 in the second quarter of 1963. Men's and boys' coats, waist-coats and trousers accounted for 5,671,000 garments, as against 4,463,000 garments in the first quarter. Women's and girls' dresses secured from abroad were slightly lower than in the first quarter at 1,215,000, as against 1,414,000, but the comparative imports in the second half of last year were only 741,000 garments.

In a number of undergarments, imported cotton goods were slightly smaller in volume than in the first quarter this year, but remained well above the 1963 average. Men's and boys' shifts accounted for 414,000 dozen. as against 447,000 dozen in the first three months of the year and 340,000 dozen in the same period of 1963.

A sharp fall was recorded in arrivals of corsets, suspender belts, brassieres, etc., at 574,000 dozen, as against 982,000 dozen in the first quarter of 1964. But the quarterly average arrivals of these articles in 1963 was only 292,000 dozen. Imports of handkerchiefs in the second quarter this year were 718,000 dozen, as against last year's average of 490,000 dozen per quarter.

Mergers: The Union Angle

The merger movement in the industry has been the subject of innumerable comments from a multitude of sources, but, until recently, little has been heard of the attitude of the trade unions to the changing structure and ownership of large sectors of textile capacity. The representatives of the operatives in both spinning and weaving, however, have now aired their views. On behalf of the Northern Counties' Textile Trades' Federation, Mr. Lewis Wright, the Secretary, has in general terms commended the movement. "So far as the industry's future is concerned it is all to the good," he says in his annual report. "It should have occurred years ago and over a longer period, so that the industry could have conditioned itself more gradually to the change." The moves, he adds, will mean a much closer integration of spinning, weaving, finishing and merchanting, without which the industry could not for long have functioned efficiently, nor met the challenge of the times.

How these developments will affect the workers themselves is clearly the key point for the union leaders. Mr. Joseph King, Secretary of the Cardroom Amalgamation, contends that the trade unions have a right to know more about the implications of what is taking place. The policy of seeking a meeting with the parent Company has been adopted and several such conferences have already taken place.

JUTE INDUSTRY IN INDIA AND ABROAD

PAKISTAN'S GROWTH IN LOOMAGE REMARKABLE

THE growing competition from Pakistan in the sphere of both production and exports of jute goods poses by far the most serious problem to the jute industry in India. Pakistan, keen on carving for itself a larger share of world trade in jute goods, produced as much as 330,932 tons in the year ended 30th June 1964, representing nearly 25 per cent of India's production. In 1961-62, its production was no more than 271,081 tons, so that, in two years, it has been able to step up its output by no less than 22 per cent. As a result, consumption of raw jute within Pakistan has jumped up from 1,590,000 bales to 1,942,000 bales. It plans to raise its output further by 20 per cent in the coming 16 months and by a much greater percentage in the subsequent three or four years. This remarkable, continuing expansion of jute goods reflects the rapid growth in the size of jute industry in Pakistan. The total number of looms in operation in July 1964 (that is, the first month of the current jute year 1964-65) was 10,616, as against 8,040 in 1960 and a bare 1,000 in 1952. Pakistan's share in the aggregate world jute loom capacity, according to the latest *Loom and Spindle Statistics*, published by the Indian Jute Mills Association (I.J.M.A.) Calcutta, this week, has increased from just 0.80 per cent in 1952 to 7.8 per cent in 1964.

Viewed against this remarkable expansion of Pakistan's loom capacity, India's growth in the last twelve years (1952-64) is not very striking. The number of looms in the country has gone up by only 5,737 (from 68,557 to 74,294). And of the 74,294 looms installed till the beginning of this year, nearly 5,000 are looms other than hessian and sacking. The changes in the position of jute industry in other countries are indicated in the accompanying table below:

Table I: *World Distribution of Looms in Jute Mills*

Country	Number of looms		Percentage of world total	
	1964	1952	1964	1952
India	74,294*	68,557	57.57	56.00
Pakistan	10,066	1,000	7.80	0.80
United Kingdom ..	6,661	11,151	5.16	9.10
Brazil	4,647	4,987	3.60	4.10
Spain	3,836	800	2.97	0.70
Belgium	3,192	4,807	2.47	3.90
France	3,142	7,698	2.44	6.30
West Germany ..	3,031	6,349	2.35	5.20
Italy	3,009	4,631	2.33	3.80
U.S.S.R.	2,909	1,315	2.26	1.10
Poland	1,600	1,600	1.24	1.30
China	1,296	756	1.00	0.60
Netherlands ..	1,127	N.A.	0.87	N.A.
Japan	1,000	615	0.77	0.50
Other Countries ..	9,239	8,244	7.17	6.60
World Total ..	1,29,049	1,22,510	100.00	100.00

* Includes 5,097 looms other than hessian and sacking and excludes a few circular looms installed on an experimental basis.

N.A.—Not available.

Note :—Figures of West European countries except Spain given in 1964 column refer to the end of 1962.

The table shows that the number of jute looms in European countries such as the United Kingdom, Belgium, France, West Germany and Italy has decreased during the period from 1952 to 1963. There has been more than a 50 per cent fall in the number of looms in West Germany and France and a little less than 50 per cent in the U.K. Spain, the U.S.S.R. and Japan have, however, increased their loom-strength considerably.

The I.J.M.A.'s latest brochure, *Looms and Spindle Statistics* provides comprehensive data on the capacity of jute mills in India, of both member and non-member mills, of which there are still a few. The data pertain to the position as of 1st January 1964. Out of the 74,294 looms at the beginning of 1964, hessian looms accounted for 43,570, sacking looms for 25,491, carpet-backing and other looms for 5,097 and one-mack' looms for 136. As the reed spaces of these last-mentioned looms are not known, they are not classified as either hessian or sacking. The actual looms-strength of the member and non-member mills of the I.J.M.A. according to types is given in Table II.

Table II: *Total Loom-strength*

	Hessian	Sacking	Others	Total
I.J.M.A. mills :				
W. Bengal ..	41,103	22,294	4,493	68,026*
Other States ..	493	1,288	Nil	1,781
Total ..	41,596	23,582	4,493	69,807*
Mills outside I.J.M.A. :				
W. Bengal ..	1,668	740	604	3,012
Other States ..	306	1,169	Nil	1,475
Total ..	1,974	1,909	604	4,487
Grand Total ..	43,570	25,491	5,097	74,294*

* Includes 136 ' Onemack ' looms.

The I.J.M.A. member-mills account for more than 90 per cent of the total looms (69,807 out of 74,294). Another interesting feature is that West Bengal accounts for 95.5 per cent (or 71,038 looms) of the total loomage in India. Other States having jute mills of some importance are Andhra, Bihar and Uttar Pradesh, their respective share being 1,086, 1,059 and 891 looms.

While all the non-I.J.M.A. mills (hessian and sacking) looms of 3,883 are electrically driven, there are still over 5,000 (hessian and sacking) looms of the I.J.M.A. member-mills to be electrically operated. They are at present operated by steam-power. There has been a decrease in the number of electrically driven looms in the Association mills by 821 since 1962 due to the recent reversion of two mills from electricity to steam driven looms. This was, perhaps, due to shortage of electric power and the erratic nature of supply in Bengal. The reed space of looms in jute mills varies from 40" (102 cms.) to 120" (305 cms.) in the case of hessian and from 32" (81 cms.) to 39½" (100 cms.) in the case of sacking.

For the first time, the publication includes statistics relating to the distribution of spindles installed in the jute mills. As on 1st January 1964, the member-mills had a total of 659,702 spindles. Of these, sliver spinning spindles accounted for more than half, 368,792 to be precise. Rove spinning spindles (both ordinary and high speed) were 290,910 and twisting spindles (both ordinary and high speed) 25,386. The non-member mills possessed 43,266 spindles comprising 22,872 rove spinning spindles and 2,582 twisting spindles.

WORLD JUTE OUTPUT AND CONSUMPTION

Over the past decade, world production and consumption of jute, kenaf and allied fibres have increased by more than 4 per cent annually and present levels are some 40 per cent higher than before the Second World War, according to a report recently prepared by the Food and Agriculture Organisation. Western Europe now manufactures only 18 per cent of jute goods, as against 32 per cent in 1954. India's share has also gone down from 55 to 42 per cent. As for consumption, the developing countries, including China, now use as much jute and allied fibres as the rest of the world. Consumption has not been stagnant in the industrialised countries either. In the U.S., over the past ten years, consumption has increased as quickly as national income. However, technological changes and competition from synthetics have reduced the use of jute in packaging, although new uses such as carpet backing have increased rapidly.

The greatest scope for international collaboration for jute and allied fibres, in the opinion of the F.A.O., lies in the field of market stabilisation. It suggests basic improvements in marketing, including a revision of grading practices and an expansion of warehousing facilities. The report recommends a 'critical study' of the practicability of adopting an international buffer stock policy with carry-over stocks held in several countries. It refers to various means for achieving stability in the world jute economy, ranging from the setting up of an advisory committee on co-ordination of national buffer stock and price policies to the setting up of an internationally financed buffer stock. The long-term expansion of the market for jute goods, the F.A.O. report adds, will continue to be affected by the degree of stability in prices and supples.

RAW JUTE IN PAKISTAN

Production of raw jute in Pakistan during the 1963-64 (July-June) season was slightly lower at 5.9 million bales as compared to 6.3 and 6.9 million bales in 1962-63 and 1961-62, respectively. With stocks of 1.1 million bales brought in from the previous season, the supply available was no less than 7 million bales, though 500,000 bales smaller than that in 1962-63 and the same as that in 1961-62. The total disappearance of raw jute was 6.3 million bales, as against 6.4 and 5.8 million bales in the previous two years. Home consumption accounted for 2.1 million bales, that is, 100,000 bales more than in 1962-63. Exports to overseas countries excluding India remained unchanged at 4.1 million bales, but was 400,000 bales higher than in 1961-62. Exports to India were no more than 100,000 bales. India's intake of Pakistani jute has been falling steadily. In 1959-60, it was 600,000 bales, averaged to 400,000 bales per year in the subsequent two years and fell further to 300,000 bales in 1962-63.

TEXTILES

(*Concluded from page 806*)

not ideally suited, from the climatic point of view, for raising sheep that yield fine and superior quality wool. In view of the synthetic substitutes that are growing apace, it would be desirable to invest capital and effort on them rather than on the difficult project of producing natural wool of finer types. But this does not mean that India should not try to increase the production of such types of wool for which it has an advantage over countries like Australia, New Zealand, Argentina and South Africa. Larger production of this wool would enable it to export more and use the foreign exchange thus obtained for importing finer wool and synthetic fibres.

It would not be right to assume that adequate availability of raw material and machinery would solve the ills of woollen industry in this country. If the industry is to be efficient and produce goods that can withstand even a reasonable measure of competition, it must consist of economically viable units. It is for the leaders of woollen industry to consider whether or not there is scope for integration of small units into fairly large ones and for weeding out old and outmoded units which would not have survived but for the closed market caused by scarcity of foreign exchange. They have an obligation to the society in this respect, for woollen clothing is not a luxury to consumers in those parts of the country where climatic conditions necessitate its use.

EXCISE ON STAPLE FIBRE

Some modifications in the levy of excise duty on staple fibre, staple fibre yarn, and other synthetic and mixed yarns were announced recently by the Central Board of Revenue. The net effect of these modifications may be summed up thus:

The excise duty on staple fibre of 1.5 denier and coarser has been reduced from 115 paise per kg. (including the special excise duty of 15 paise which is now abolished) to 75 paise.

However, all staple-fibre yarns other than counts below 16s are now subjected to the same duty as is applicable to cotton yarn. Staple fibre yarns below 16s continue to be free from excise duty.

Synthetic yarns and mixed yarns bear higher rates of excise duty.

These modifications are very realistic and will result in better demand for staple fibre. This at any rate is the view expressed by a spokesman of the Gwalior Rayon Silk Manufacturing Company Ltd. Describing the favourable impact of the modifications, the spokesman observes:

"It now becomes more economic to spin staple yarns of 16s in place of the current 20s. By doing this, there will be a saving of 40 paise per kg. on staple fibre, of 25 paise per kg. in yarn duty and 10 paise per kg. on spinning cost. In other words, a total of about 75 paise per kg. will be saved by staple fibre spinners. This should make it attractive for spinners, power-looms, handloom weavers and textile mills alike to spin 16s counts, so as to derive the maximum benefit from the new duties. For composite textile units, it now becomes economical to spin medium counts of 28s, 30s, and 44s by blending 16 per cent or more of staple fibre with Indian cottons to produce superior, even and fuller yarns which could be used in the manufacture of fabrics comparable to any cotton fabric in physical properties, perhaps even better than cotton fabrics in appearance and feel. Another variety that can now be economically manufactured and introduced in the market is a combination of cotton warp and staple weft (particularly 16s and fancy) which should appeal, particularly, to consumers of fancy fabrics, tapestry and dress material. If the staple content in the fabric is over 60 per cent, no excise duty will be payable on the fabric in the grey state, the fabric then falling under the category of art silk. In this case, only 9.7 paise per square metre processing duty will have to be paid and that should make the fabrics very cheap. The fabric will also be fine and lustrous.

"In short, the introduction of the more realistic excise duties will popularise a new count of 16s in the Indian market, encourage blends of staple fibre in cotton, woollen and polyester spinning on a larger scale than before and the market for staple fibre may be expected to be brighter than ever before. The latest reduction in duty will no doubt give some relief, but even the reduced excise duty is still very high. If consumption of staple fibre, which is a valuable complement to cotton, has to be increased to replace cotton, as must be done, what is needed is not just a reduction but a wholesale removal of the excise duty."

The Indian Cotton Mills Federation has also welcomed the relief that staple fibre yarn of 20s will get under the revised scheme of excise duty. But it points out that 40 and 60 counts will be subjected to an additional burden of 5 paise per kg. on the former and 60 paise per kg. on the latter (manufactured out of 1.2 denier fibre). The Federation fears that, unless necessary relief is given, demand for yarn of 40 and 60 counts and, consequently, for staple fibre, will be affected. It has, therefore, urged a suitable modification of excise duties on staple fibre and staple fibre yarn, so that there may be no increase in the burden placed on staple fibre yarn, thereby giving an impetus to the production of this yarn.

Leaders in Instrumentation

Now Pioneers in Automatic Process Controls

WE LIVE ON THE PAST: Four years ago, we ventured into the manufacture of a wide range of industrial measuring instruments in collaboration with Electroflo Meters Co. Ltd. of U.K. a member of the Elliott Automation Group. ■ WE LIVE IN THE PRESENT: Our present range of measuring instruments has been fully accepted by users as conforming to the rigid specifications required of precision instruments. Some users have done us honour of specifying the brand name 'Mahindra-Electroflo' against their requirement. ■ WE LIVE FOR THE FUTURE: And now we look ahead, with plans under way for the manufacture of a further range of sophisticated pneumatic, electronic, hydraulic process control equipment in collaboration with the same British Group. These instruments will find wide application in industries like... steel, paper, power generation, chemicals, fertilisers etc. where precise measurement and accurate control of Flow, Level, Pressure and Temperature is required.

OUTLOOK FOR SUGAR EXPORT NOT BRIGHT

WORLD MARKETS TURN IN FAVOUR OF BUYERS

THE prospects for Indian sugar exports which were very bright some time ago, thanks to the buoyancy of world sugar markets, have receded again of late. In fact, the chances of large-scale exports are remote and whatever sugar that is shipped abroad (largely against the commitments already entered into) will be at a heavy loss. For the gap between world and Indian sugar prices has widened considerably, as the former have suffered a distinct setback, while the latter have registered a steep rise. The latest available quotation for raw sugar in the London market is Rs. 433 (£32 10s.) per tonne against which the wholesale price at Bombay is standing at Rs. 895, after taking into account the full remission of the excise duty of Rs. 291 and the cane cess of Rs. 52 per tonne. It is thus clear that, on every tonne of sugar exported, the loss works out to as much as Rs. 462 per ton, whereas, a year ago, India would export sugar at a profit, since the Indian price of Rs. 878 per tonne was well below the world price of Rs. 1,400 (£105) per tonne. In other words, the Government of India will have to pay a handsome subsidy to meet the loss on exports, now that the world market has turned out to be in favour of the buyer. In the absence of any indication of the Government of India's approach to the question of exports and the uncertainty regarding the trend of production during the current season, it would be rash to make an assessment of the outlook for sugar exports at this stage. But, by and large, the prospects, as already stated, are rather bleak.

World Market

That the world sugar markets have turned in favour of the buyer is evident from the marked fall in prices. From as high as Rs. 1,400 (£105) per tonne prevailing in November, the price of raw sugar in London has gone down to Rs. 433 (£32 10s.) at present. The earlier expectations that the declining trend in prices was temporary have not proved correct, as the London price has been ruling steady around Rs. 433 (£32½) per tonne during the last one month. Certain sugar dealers in London are inclined to feel that, in view of the substantial European beet sugar output, prices might fall to Rs. 333 (£25) per tonne. Whether or not this assessment is correct, time alone will say. But there does not seem to be any possibility of a spectacular recovery in prices, at any rate in the immediate future. For the current sugar season (September 1964-August 1965) is expected to witness a further marked rise in world sugar output. The European beet sugar output alone is estimated at 23.2 million tons, representing an increase of 3.6 million tons as compared with the 19.6 million tons produced in 1963-64. Moreover, France is likely to market 400,000-500,000 tons and there is said to be plenty of cane sugar forthcoming from the Latin American producers (350,000 tons from Brazil and 200,000 tons from Mexico, among others).

1963-64 Season

The past season (1963-64) was also a bumper one, in that the total world production of sugar was appreciably higher than in the two previous seasons, though it was below what was produced in 1960-61. The third estimate of Messrs. F. O. Licht of London places the total world sugar production during the season 1963-64 at 54.8 million tonnes, as compared with the second estimate (as of 20th March 1964) of 54.4 million tonnes and the actual output of 51.5 million tonnes in 1962-63. It will be seen from table A that the appreciable increase in world production of sugar during 1963-64 was accounted for by both beet sugar and cane sugar. The total output of beet sugar rose by 1.65 million tonnes to 23.58 million tonnes and that of cane sugar by 1.68 million tonnes to 31.22 million tonnes.

These estimates corroborate the earlier estimates released by Messrs. C. Czarnikow of London. Several European countries achieved a very high level of output during 1963-64. The production in both West Germany and France exceeded the two-million-tonne mark. The total production in Western Europe was 9.2 million tonnes as against 7.9 million tonnes, a rise of 1.3 million tonnes; this rise more than made good the slight decline in output in East Europe. The increase in sugar beet production in Europe is the direct result of larger acreage. The area actually sown to beet crop in 1964 is estimated at 7,236,000 hectares, as against 6,281,000 hectares in 1963 and 6,141,000 hectares in 1962. Out of this total acreage, West Europe accounts for 1,911,000 hectares (as against 1,721,000 hectares and 1,693,000 hectares in 1963 and 1962, respectively) and Eastern Europe for 5,326,000 hectares (as against 4,560,000 hectares and 4,448,000 hectares in the two previous years, respectively).

Table A: World Sugar Production
(In thousand metric tonnes)

Continents	1963-64 3rd estimate (10th Sept.)	1963-64 2nd estimate (20th Mar.)	1962-63
Beet sugar :			
Western Europe	9,203	9,105	7,875
Eastern Europe	10,400	10,419	10,690
Europe Total	19,603	19,525	18,526
Overseas Countries	3,977	3,898	3,401
World Total	23,581	23,422	21,926
Cane sugar :			
Europe	31	28	29
North and Central America	11,084	11,168	10,801
South America	6,374	6,374	6,118
Africa	3,400	3,402	3,015
Asia	8,319	8,043	7,268
Oceania	2,006	2,021	2,301
World Total	31,215	30,986	29,533
Total world sugar production	54,796	54,409	51,459

Efforts are being made in the Soviet Union to raise beet acreage with a view to augmenting output. Increases have also been reported from the U.S. and the U.K. The latest crop report of the U.S. Department of Agriculture says that the prospects for U.S. sugar beet have improved. In July last, warm weather favoured the growth of beet in most of the areas and water supplies were generally adequate. The sugar beet crop is currently estimated at 25 million tonnes, showing a 6 per cent increase over the previous year. The beet acreage has increased by 13 per cent while the per-acre yield has gone down from 20 tonnes to about 17 tonnes. The average per acre yield during the period 1958-62 was about 17.5 tonnes. In the U.K., for the second season in succession, the area under sugar beet from which the British Sugar Corporation is permitted to produce beet-sugar, has increased. Between 1958 and 1963, the total area remained almost unchanged at 165,840 hectares. In November last, it had been officially announced that there would be an increase of about 5 per cent to 174,140 hectares during 1964, in view of the prevailing world situation. Another 3,000 hectares are to be added next year. The expansion in domestic area follows the decision to end U.K.'s commitment to purchase sugar from South Africa. It will be recalled that, before South Africa left the Commonwealth, it was a member of the Commonwealth Sugar Agreement and had a basic negotiated price quota of 150,000 tonnes. Following the expiry of the agreement, a bilateral agreement was entered into between the U.K. and that country whereby the U.K. agreed to purchase 150,000 tonnes of South African sugar each year. This agreement will terminate at the end of 1964. (South African sugar in the current season is estimated at 1,222,725 tonnes.)

N.A.—Not available.

Australia is one of the biggest exporters of sugar. The expansion of sugar output in this country is attributed to the sharp decline in Cuban and Indonesian sugar output. Australia has become a major sugar supplier to Japan, the U.S. and the U.K. Last year, it shipped

BIRD'S CENTENARY YEAR

MINERALS IN MULTI-MILLION TONNES FOR STEEL

India's rising steel production demands an increasing supply of raw materials. To help meet this demand, the total minerals output of the Bird-Heilgers Group has increased in the last five years from just under 4 million tonnes to over 7 million tonnes per year. The Group is among the biggest mining organisations in the world—and still growing— producing coal, iron ore, limestone, manganese and dolomite.

Deploying the skills acquired over a hundred years, the Bird-Heilgers Group is making important contributions to the economy . . . through planned diversification and expansion.

ANNOUNCEMENT REGARDING THE PROPOSED ISSUE OF CAPITAL

This is NOT a Prospectus. Persons interested in full details may obtain copies of the Prospectus from the Registered Office of the Company or from the Underwriters, Bankers, Brokers and Issue House named hereinafter.

POYSHA INDUSTRIAL COMPANY LIMITED

(INCORPORATED UNDER THE COMPANIES ACT, 1956)

Registered Office: **Messent Road, P. O. Tank Road, Bombay-33 DD.**

EXISTING AND PROPOSED ACTIVITIES OF THE COMPANY

The Company is engaged in the manufacture of a wide variety of containers ranging from simple slip-cover cans such as are used for cosmetics and other dry products to friction-top cans for paints, open top sanitary cans for fruits and vegetables, and other precision-made containers. Metal cans, mostly decorated and lithographed are manufactured by the Company in a variety of sizes and shapes to meet the needs of the different products to be packed. The Company also makes other light-gauge tinplate and sheet-metal products.

The Company's wholly owned subsidiary, Colrige Limited, is engaged in the manufacture of rigid containers and collapsible metal tubes for cosmetic, pharmaceutical and other industries.

Another subsidiary, Kaira Can Company Limited, will be manufacturing containers at its factory to be established near Anand mainly for the requirements of Kaira District Co-operative Milk Producers' Union Limited.

The proposed activities of the Company as well as of subsidiaries will be the same as described above.

LOCATION OF THE FACTORIES

The Company's existing factory is at present situate at Messent Road, P. O. Tank Road, Bombay-33 DD. The Company has a branch factory, viz. a reforming unit at Najafgarh Road, Motinagar, New Delhi-15.

The Company proposes to establish two additional factories, one at Cochin in the South to cater to the requirements of South India and the other at Ghaziabad in North India to take care of North and East Indian requirements.

The main factory situate at Messent Road, P. O. Tank Road, Bombay-33 DD, is proposed to be shifted to the Kalva Industrial Area near Thana of the Maharashtra Industrial Development Corporation and fully modernised.

The modernisation and expansion programme will increase the Company's capacity from 40 lakhs to 1 crore of cans per month, on a single-shift basis.

The factory of Colrige Limited, a wholly owned subsidiary which is now in rented premises at Sewri, is also proposed to be shifted to the new site near Thana of this Company.

The factory of another subsidiary of this Company, Kaira Can Company Limited, is proposed to be established near Anand in Gujarat State.

BOARD OF DIRECTORS

1. SHRI MADANMOHAN R. RUIA, (*Chairman*), 96, Nepean Sea Road, Bombay-6.
2. SHRI DAYANAND C. KOTHARI, "Kothari House," 15, Kothari Road, Madras-31.
3. SHRI CHANDRAKANT M. KHATAU, 6, Wilderness Road, Malabar Hill, Bombay-6.
4. SHRI VIJAY M. MERCHANT, Mewar, 40A, Peddar Road, Bombay-26.
5. SHRI NARENDRA N. KAPADIA, Malhotra's Bungalow, T-1/54, Juhu Tara, Bombay-54.
6. SHRI KUMARIL V. MEHTA, 25, Doongersey Road, Malabar Hill, Bombay-6.
7. SHRI RASIKLAL M. KAPADIA, 'Lansdowne Court', Flat No. 1, 5, Lansdowne Road, Calcutta-20.
8. SHRI BHOGILAL P. SHAH, 'Karunasagar', No. 5, Deodhar Road, Matunga, Bombay-19.
9. SHRI DHANANJAYA R. MEHTA, 75, Warden Road, Bombay-26.
10. SHRI HARKISHAN N. KAPADIA, "Viller Villa", Ghodbunder Road, Bombay-54.
11. SHRI HARSHAD N. KAPADIA, Ocean View Annexe, 3rd Floor, Warden Road, Bombay-26.
12. SHRI JAYANTILAL R. MEHTA, 75, Warden Road, Bombay-26.

MANAGING AGENTS

INDUSTRIAL FACTORS PRIVATE LIMITED, 'Jiji' House, Raveline Street, Fort, Bombay-1.

SHARE CAPITAL

	Rs.
AUTHORISED:	
15,00,000 Equity shares of Rs. 10 each	1,50,00,000
SUBSCRIBED:	
2,50,000 Equity shares of Rs. 10 each	25,00,000
PAID-UP	24,98,625
PRESENT ISSUE:	
8,50,000 Equity shares of Rs. 10 each	85,00,000
OUT OF THE PRESENT ISSUE:	
2,50,000 Equity shares of Rs. 10 each have been offered to the existing Shareholders by way of rights	25,00,000
NOW OFFERED FOR PUBLIC SUBSCRIPTION FOR CASH AT PAR:	
6,00,000 Equity shares of Rs. 10 each payable as follows :	
(i) Rs. 2.50 per Share on application.	
(ii) Rs. 2.50 per Share on allotment, and	
(iii) the balance of Rs. 5 per Equity Share payable on further calls as may be determined by the Directors, but no call shall exceed Rs. 2.50 per Share and there shall be an interval of at least three months between any two calls	60,00,000

BANKERS TO THE ISSUE

THE BANK OF INDIA LIMITED, 70, Mahatma Gandhi Road, Fort, Bombay-1.

1. NARENDRA LALBHAI SHETH, Manek Chowk, Ahmedabad.

ISSUE HOUSE

INDUSTRIAL INVESTMENT TRUST LIMITED, 61, Apollo Street, Fort, Bombay-1.

APPLICATIONS

Applications for shares must be for a minimum of 50 shares or multiples thereof.

Copies of Application Forms and Prospectus can be obtained from the Company's Registered Office, from any of the abovementioned Underwriters, Bankers, Brokers, Issue House or from the main offices of any of the said Banks in any of the cities mentioned below :

Bombay, New Delhi, Kanpur, Indore, Lucknow, Calcutta, Ghaziabad, Surat, Baroda, Ahmedabad, Hyderabad, Bangalore, Madras, Cochin, Ernakulam, Trivandrum, Nagpur, Poona, Amritsar, Jamshedpur, Jaipur, Rajkot, Coimbatore, Varanasi, Allahabad, Meerut City and Agra.

THE SUBSCRIPTION LIST WILL OPEN AT THE COMMENCEMENT OF BANKING HOURS ON 13TH NOVEMBER 1964 AND WILL CLOSE AT THE CLOSE OF BANKING HOURS ON 23RD NOVEMBER 1964 OR EARLIER AT THE DISCRETION OF THE DIRECTORS BUT NOT BEFORE THE CLOSE OF BANKING HOURS ON 16TH NOVEMBER 1964.

BUSINESS NEWS FROM EUROPE

SHADOW OVER EAST-WEST TRADE

NO FALLING OFF IN TOURIST TRAFFIC

From Our Special Correspondent

AFTER the political changes in Moscow, Western diplomats and businessmen are pondering the effect the overthrow of Mr. Khrushchev may have on East-West trade. Above all, they are worried that a Sino-Soviet rapprochement, which Khrushchev's departure is thought to make more likely, will lead to a lessening of trade with Western Europe. Some even fear a possible abrogation of contracts already entered into.

So far, there has been no hint of any change in trade policy from the new Soviet rulers themselves. But these are still early days and the West will not know for some time if policy is to be altered.

If there is a change, it is thought that the most serious damage would be done to the West German economy. Germany has established strong links with Eastern Europe and, while a large part of these are with Soviet bloc countries other than Russia, it is thought unlikely that Russia and her satellites would stay out of step for long. German sales to the East, comprising mainly heavy goods and machinery, are not the sort of exports that West Germany could off-load easily elsewhere. Already she is meeting serious competition in the same field from Japan in Asia, the one area where an expansion of such sales might be possible.

Germany is not the only country likely to be affected. France hopes to get firm orders soon for capital equipment worth £148 million. Finland may take Russian natural gas and hopes to increase two-way trade by four per cent a year. Britain has recently sent a Ministerial party through Eastern Europe on a trade mission and Italy has its eyes on a potentially rich East European market.

These orders may go through and there may be no interruption in exchanges with Western Europe. But, until the new Russian leaders have made their plans clear, Western businessmen are likely to remain apprehensive about the future course of trade across the curtain.

Still More Tourists: Portugal Excels

Total income from tourism in Europe is expected to reach about £2,200 million this year, a 10-12 per cent increase over last year. A considerable part of this will be a dollar income, as American tourists are thought likely to spend nearly £250 million during the year. Biggest recipients of the American tourist invasion are expected to be France, Italy, Germany and Britain.

At one time, it was feared that the New York World Fair, efforts by the American Government to reduce the outflow of tourist dollars and higher prices in Europe would have an adverse effect on the rate of increase in the number of Americans travelling to Europe. But, as some countries, particularly Portugal, Britain and Spain, have recorded fairly substantial increases in Americans in the first five months of the year, it is thought unlikely that the flow of dollar traffic will dry up yet.

Fastest rate of increase in tourism in the first half of this year has been achieved by Portugal. While the figures are still small—254,000 visitors in the first five months—the 58.2 per cent increase far outstrips that recorded by any other European country. The reasons for the increasing popularity of Portugal are not far to find. What is rather more difficult to explain is the suddenness of the increase since last year. Stable prices, good weather, strenuous advertising and more hotels have all played their part in attracting more visitors. Last year, 38 hotels, with over 1,000 beds, were built and another 24 hotels (with 1,700 rooms) are now going up. More important from the point of view of the visitor, hotel rates have not risen since they were fixed in 1957, helping to offset the cost of reaching the country. In order to attract even more visitors, special facilities are being offered to hoteliers and builders by the Portuguese Government. Nearly £0.5 million has been made available interest free and about half as much again at 4.5 per cent interest. Hotels and other places of tourist importance are exempt from property and industrial tax for 10 years as well as from certain local taxes and rates.

Portugal has probably also benefited from the continuing popularity of Spain. The number of tourists visiting Spain in the first five months of the year rose by 36.4 per cent to 3.62 million, a rate of increase second only to Portugal and a total influx second only to Italy's 7.72 million. Spain too has been increasing the number of hotels rapidly and nearly 200, with 11,500 rooms, were added last year. Lower prices than in the rest of Europe and a growing demand for land for building houses to retire to have also helped to increase Spain's attractiveness.

Italy's increase was disappointingly small—3.4 per cent—and was a long way behind the Netherlands, 35.2 per cent in the first quarter, Yugoslavia's 29 per cent in four months, Austria's 18.3 per cent Britain's 16.9 per cent and Switzerland's 16.5 per cent, all in the first five months of the year.

In no country was there a falling-off in tourist traffic last year, though figures have not yet been made available for France. It is possible that the number of people who stay in France may be down (because of the country's reputation for high prices) but for this to be covered by those who pass through the country on their way elsewhere being shown as tourists.

In seven countries, this year is expected to show a balance of payments surplus on account of tourism—Italy, Spain, Austria, Switzerland, Ireland, Greece, Portugal—eight if France is included. The surplus is likely to be largest in Italy (approaching £300 million: last year's figure was £268 million) and lowest in Portugal (probably £23 million, as compared with last year's £15 million). West Germany is by far the largest deficit country in Europe on tourism—£207 million last year—and there were considerable deficits in Britain, Belgium, Sweden and Turkey, too.

Europe Sells More Cars to U.S.

European car exports to the United States are now climbing back from the trough of 1962. While the palmy days of 1959, when the United States took 614,000 foreign cars, still seem to be a long way off, there has been considerable growth this year. By the end of the year, some 450,000 foreign cars, most of them European, are expected to have been sold in America, a 14.5 per cent increase over last year and 110,000 units more than the low point of the previous year.

West Germany will continue to take the lion's share of the market, with Volkswagen alone taking nearly 40 per cent of the market, and the total German share being nearer 45 per cent. Second, but a long way behind the Germans, comes Britain.

British makes are now the second (BMC) and third (Triumph) most popular in America and Britain could probably carve a larger share of the market, if it were not for policy decisions. Both Ford and Vauxhall, fully-owned subsidiaries of American companies, do not compete in America because of decisions taken in Detroit by their parents.

France, third most successful nation in the U.S. car market, is having a mixed year. Renault sales are down in the first seven months, as compared with the same period last year, but Simca, through its link with Chrysler, has made an encouraging bid for a share of the market and its 4,750 cars sold represents about a third of the well-established Renault sales.

The future increase of sales in America is thought likely to depend, to a large extent, on how successful European nations are in maintaining prosperous native motor industries. Italian import restrictions have already hit the industry hard, particularly the German and British, but otherwise the outlook for 1965 is thought to be good.

Pensions in Europe

Who gets the best pension in Europe? This seemingly simple question has no simple answer, since the value of a pension to the recipient depends largely on its correlation with the cost of living, final wage before retirement or even the amount paid in. The effective value of a pension also varies according to the extent to which pensions hamper mobility of labour, by making workers afraid to change jobs because their pensions are not transferable.

The greatest value will obviously arise from pensions that are in some way tied to earnings. In relation to the actual amount paid, Belgians, Germans and French do well; Britons, Danies and Italians less well.

In France, the old-age pension is part, and only a modest part at that, of the pension structure. On top of the state scheme, skilled and salaried workers get additional income from compulsory industry schemes which are tied closely to the level of industrial wages. The cost of these industrial schemes is borne mainly by industry and sometimes accounts for up to a third of the wages and salaries roll. In addition, a widow gets half her husband's pension.

Germany is also a generous provider of pensions, with the employer and the employee each contributing about seven per cent of income. On retirement, the pension paid is on a sliding scale with the lower-paid worker receiving half his finishing salary and the higher-paid proportionately rather less. A widow gets 60 per cent of her husband's pension. There are also many private pension facilities in Germany run by individual firms, mainly because of the shortage of labour and the need to offer fringe benefits to attract workers.

The movement to private pensions has grown in the past five years in Britain, too, though more because it is realised that the state pension is inadequate for attracting workers. As a result of this trend, the Government introduced its own superannuation principle on top of the flat-rate pension, but this has not stopped the movement towards the private sector. A married couple in Britain receive approximately 30 per cent of the average industrial wage in pension and the employee contributes about six per cent of that wage; the employer's contribution is slightly more.

Belgium provides pensions of 60-75 per cent of average earnings from contributions in the region of nine per cent, equally shared between employer and employee. There is also a cost of-living adjustment, so that the pension rises by 2.5 per cent steps as prices rise. A widow gets 60 per cent of her former husband's pension.

By contrast with the others, the Dutch get relatively low pensions, approximately £3 a week for a single person and £5 for a married couple (roughly in line with British pensions), though possibly worth more than the British in real terms because of the lower level of prices. But, unlike in Britain, the pension is automatically adjusted for every three per cent rise in the cost of living.

Norwegian pensions are approximately the same, the single rate being slightly higher than the Dutch. But (again as in Holland) there are comprehensive supplementary schemes by which a pension of up to two-thirds of the final wage or salary is paid.

On the Iberian peninsula, pensions are low even by comparison with the lowest north European ones. Spain has two compulsory schemes, national insurance and mutual aid, and the pension from the former—£28 a year—is reduced to £18, if there is mutual aid. Contributions are equally low, employees paying one per cent of earnings and there are few supplementary schemes.

Portugal's old-age pension is paid at a weekly rate equivalent to two per cent of average annual salary for the years of contribution. Since wages in Portugal are low, the pension cannot reach very high levels. Employees pay a relatively high sum—5.5 per cent—to get the pension and employers an even higher amount—15 per cent. These contributions, however, cover all social benefits. Again, there are few supplementary schemes, though there is a small lump sum for a widow.

French Hopes in Latin America Checked

Results from President de Gaulle's four-week tour of South America are thought likely to fall short of the high hopes of French officials before the trip began. Nevertheless, some expansion of trade is likely to result from the visit as well as an increase of French influence in that continent. How far trade expands is now considered to depend on the drive of French businessmen. They have a hard task in front of them. The area is still regarded as a fairly impregnable preserve of the United States in spite of some governmental changes to the left.

France will also have to combat West German and Japanese trade drives which have captured a small, but important, part of the market. There is also considerable goodwill remaining towards Britain, since, up to 1914, that country had a major share of world trade with the continent.

Agreements for technical and cultural co-operation were signed with nearly all the countries on the President's itinerary and a large number of specific projects were discussed. It is thought that France is using the cultural links as a back-door approach to trade, building up a cultural connection first and then expanding trade from that base once French institutions have been accepted.

Specific proposals have ranged from French participation in a possible Atlantic-Pacific canal, in conjunction with Colombia, to a request from Brazil for French expatriate farmers from Algeria. Paraguay wanted French capital for its oil industry and Chile for its petrochemical and metallurgical industries.

In return, Latin America hopes to get more favourable terms for its goods in crossing the Common Market tariff wall. General de Gaulle held out optimistic hopes of this, but it is thought he may be thwarted by the remainder of the Six.

Denmark Controlling the Boom

With other European industrial nations, Denmark has had trouble in controlling her boom this year. Consumption and investment have leapt ahead of productive capacity and the Government has had to step in and dampen down the economy. Bank rate was increased a point to 6-1/2 per cent at mid-summer. This was largely because consumption rose 10 per cent in the first four months of the year, despite higher taxes on tobacco, liquor and petrol, and investment expanded even faster, especially on house-building and industrial restocking. For the past two years, economic policy has been aimed at keeping domestic demand in check through hard money and controls over some sectors of the economy such as building. The extent to which the Government had to move in these very fields again this year is taken to indicate the degree to which this policy has been unsuccessful.

The import surplus in the first four months of the year was about £75 million, three times as great as last year, and total imports are running about 20 per cent higher. Under the influence of falling tariff barriers, trade with the European Free Trade Association has been expanding steadily and now accounts for nearly half the total amount.

The rate of increase in both imports and exports of Denmark has tended to slow down recently but the role of EFTA is continually becoming more important. While Danish imports from the Seven grew by 2.4 per cent last year, as compared with a 38.7 per cent increase in the period 1959-63, those from the rest of the world declined by 0.1 per cent, against a rise of 32.6 per cent over the longer period. Similarly, exports to the Seven rose by 17.2 per cent last year, while those to the rest of the world went up 14.8 per cent. Over the longer period, E.F.T.A. took 51.3 per cent more Danish goods while the world took 35.7 per cent more.

Butter Prices Up

Butter prices are now moving up almost everywhere in Europe as shortages become more widespread. At this time of the year, prices usually move up, as European production eases, but this summer dry weather conditions have meant a bigger than average cut in production. Incidentally, butter prices even in North America have gone up, as the surplus has been reduced.

Re-organisation of the E.E.C. milk market has also stimulated the upward trend. While most European countries have experienced stagnant milk production this summer, France had an actual fall in output—by 9 per cent. From being Europe's principal butter exporter, France has had to buy from America and this in turn led to a big cut in United States' stocks. Because of the fall in French exports, both Italy and Britain have been forced to buy American butter. The sizable reduction in the American butter stocks could mean that, in future, European buyers will have some difficulty in getting extra supplies there.

Poland Extends Grain Support

In an effort to reduce its substantial grain import bill, Poland is in effect to increase guaranteed prices paid to cereal farmers. Under the 1966-70 Five-year Plan, Poland will develop the system of state purchasing contracts already applied to wheat and brewing barley, and include barley for general use and rye in the system. The aim is to encourage Poland's largely private farmers to increase their acreages of higher-yielding cereals, such as wheat and barley. The Government wants wheat acreage to be increased by nearly 36 per cent to about 5.1 million acres and barley by 20 per cent to about 2.2 million acres by 1970.

Agricultural setbacks in other East European grain producing countries have coincided with rising demand in Poland for both food-grains and cereal feeds for her livestock and substantial poultry and egg industries. As a result Poland has had to purchase larger amounts for western currencies. Increased supplies of wheat and barley have come mainly from North America and have this year included a £5.3 million purchase of some 7.4 million bushels of Canadian wheat. As well as taking small shipments of barley from Britain, Poland formerly bought fairly substantial amounts within the Soviet Bloc, mainly from Czechoslovakia. Until recently, Poland herself was a significant barley exporter.

Poland's third-country rye purchases continue to be largely from the Common Market. Its barley imports from all sources, which were 231,000 tons in 1960 and have averaged 320,000 tons since then, rose to 408,000 tons last year. They now account for about one-quarter of total supplies. Imports of wheat, in which domestic acreage has lately fallen, have averaged about 1.5 million tons in recent years and now provide about one-third of total supplies.

Topical Briefs

Trade between *Sweden* and Britain has increased considerably in the first nine months of this year. Swedish exports to Britain have risen by £24 million to about £120 million compared with the same period of last year while her imports rose by some £19 million to £141 million. This left a trade gap of just over £20 million. Largest single item in increased imports was machinery (a traditional British export), followed by chemicals and cars. Swedish pulp and paper accounted for the largest rise in exports, followed by iron and steel. There was a drop in sales of food and drinks to Britain and a rise in imports of them. At the rate imports are now flowing into Sweden from Britain last year's import surplus will be easily exceeded. The figure then was £24 million and the projection from the nine months' figures shows that this year's surplus is likely to be at least £26 million. Expansion of trade between the two countries—thought most likely in engineering, chemicals and textiles—will obviously depend on the trade gap being kept within bounds, but overall trade is thought likely to expand as E.F.T.A. tariffs are lowered.

Business expansion in *West Germany* appears to have reached the stage where demand for imports is helping to reduce the export surplus. There was an accelerated growth of imports in July and the £21 million trade surplus for the month was the smallest for over a year. For the first seven months of the year, however, the surplus of £375 million is £41 million more than for the January-July period of 1961, the record year for a balance of payments surplus. Part of the increase in imports has come through re-stocking but stable raw material prices in the primary-producing countries have helped. Despite a falling-away of sales to the Common Market, in particular to Italy, exports have remained buoyant through a big increase to the United States. The economy itself remains highly prosperous and increased output and bigger profit-margins have led to a rapid rise in profits this year. Retained profits in the first six months are about £550 million, half as much again as last year.

A study of ways of speeding the turnround of timber ships in *British* ports is likely next year. To be undertaken by a group of leading members of the timber trade, shipowners and port authorities, the study is likely, it is thought, to cost £50,000 and important business organisations will contribute to the cost provided the government's Department of Scientific and Industrial Research does so as well. The projected survey is all the more important because of the possibility of a dock strike, general unrest in the docks and delays and congestion which appear to be endemic. Much of the timber reaching Britain (as well as that exported) is unloaded (and stowed) piece by piece. Many people in the industry believe that efficiency could be vastly improved if modern packaging methods were adopted. The use of fork-lift trucks and cranes would enable ships to halve the turnround time, it is claimed. But many shipowners believe bulk storage would reduce the amount of timber that can be carried in a ship and there are doubts about the effect of packaging on the seasoning of wood.

Foreign investment in *Israel* is expected to show a 20 per cent drop this year to £28.6 million. Last year's figure of £35.5 million will not be reached this year by a considerable amount, according to Dr. Zvi Dinstein, head of the country's investment authority. The drop is not due to any decrease in the pressure of applications but to greater selectivity in granting "approved" status by the Israeli authorities. The decline has also been brought about by the need to cut back the rate of economic advance, in order to avoid the danger of inflation. Dr. Dinstein has said that a radical slow-down in luxury building projects might be necessary, with only houses, essential service buildings and business premises getting top priority. Since Israel clearly still needs a great deal of investment, it is thought that more incentives must be offered to induce local capital to play a greater role. This may mean more controls on consumption expenditure.

I.O.B. is big enough to serve you...

I.O.B. is an international bank with offices throughout India and South-east Asia and correspondents the world over. It offers a wide range of services to suit the needs of varied customers. Indeed, I.O.B. is big enough to serve you.

We asked our customers, thousands of them at random, what they thought of our service. They replied: "We are pleased". They also made several helpful suggestions which we are implementing. Indeed, I.O.B. is small enough to know you.

Range of I.O.B. services: Savings and Current Accounts—Recurring and Fixed Deposits—Personal and Business Loans—Bills Payment Service—Gift Cheques—Travellers Cheques—Safe Deposit Lockers—Trade and Export Information and Advice—and whatever other specialised help you may need.

...and small enough to know you

WHITHER SUPERSONIC AIRCRAFT?

NOT MUCH ENTHUSIASM FOR IT STILL

By Our Aviation Correspondent

FEW developments in commercial aviation—not even the jet airliner which has had such far-reaching consequences—have occasioned so many doubts, or created such a sharp division of opinion, as has the supersonic transport. Two years have elapsed since the International Air Transport Association (I.A.T.A.), at its Annual General Meeting, held that year in Dublin, first took the S.S.T. into serious consideration. At that date, it may be recalled, the Anglo-French project had not materialised and American plans were still entirely nebulous.

Writing of that Dublin meeting, your correspondent reported (*Commerce*, 6th October 1962) that airline reactions to the S.S.T. were, to say the least of it, unenthusiastic. "It is only natural, the article ran, "that the airlines oppose an early introduction of supersonic flight. They have passed—and, indeed, are still passing—through a period of great financial difficulty. Their losses for the year 1961-62 totalled some £50 million . . . and are directly attributable to the transition from piston to jet. . . . Nevertheless, there are indications of an improvement in the situation. In due course, possibly by 1964, jet re-equipment will bring its own rewards. . . ."

Concord

Much, of course, has transpired since then. The Anglo-French Concord has advanced to the stage of cutting metal for the prototype. Although the Americans have yet to take a final decision, the firms of Boeing and Lockheed have been awarded contracts further to develop the designs which they respectively submitted last January. If one is not in error, those contracts expire at the end of October. A decision, of course, may now be postponed till after the Presidential election but it can only be a matter of weeks before American intentions in respect of an S.S.T. are known.

And so, as S.S.T. projects on both sides of the Atlantic begin to take a firmer shape, the airlines may soon be confronted with what may well be an agonising choice. It is true, of course, that the majority of major carriers have already placed orders for either the Concord or the American S.S.T—and, in some cases, for both. Such orders, however, are a form of insurance—an insurance designed to ensure, if and when the supersonic race should start, that they will not be left at the post. The real choice, however lies not so much on which vehicle to stake their money but in whether, as an Association, they should commit themselves to the race at all.

Fortunes Change

Their situation, of course, is now very different from that of 1962. The present year has seen a remarkable change in their fortunes. For many, it has probably been the most prosperous year on record. Lower Atlantic fares, coupled with a more favourable world climate in both political and economic spheres, have conjured up a quite unexpected expansion of traffic. Load factors, from the low forties, have shot up to 60 and even 70 per cent. At the same time, and in spite of a lower income yield per seat, the superior economics and productivity of jet airliners have reduced the average break even load factor to something like 42 per cent. And it is, of course, in the difference between the break even and actual load factors achieved that profit—or loss—lie.

With such a successful season behind them, when I.A.T.A. delegates assembled in Bogota, Colombia, for this year's A.G.M., they had shed, one can legitimately suppose, many of the fears and anxieties which beset them in 1962. Perhaps they had—but with prosperity come visions of greater prosperity. They can now see ahead the prospect of many years of profitable operation with subsonic jets. They are reluctant, consequently, to jeopardise this comparatively rosy prospect by embarking on another and hideously costly period of trial and error with supersonic jets.

At Bogota, then, the symposium convened to discuss the S.S.T. was, perhaps, the most important item of the agenda. It was, moreover, the very first occasion that a technical report has been presented at an open session. The symposium was addressed by a technical representative of each of the three firms primarily concerned with the S.S.T.—Sud Aviation, Boeing, and Lockheed. The aim was to give delegates a first-hand account of the progress achieved. The secondary aim, one has to presume, was to persuade them that the S.S.T. is a practical proposition.

It would be futile, in the course of a short article, to attempt any coherent account of the proceedings. It may suffice, perhaps, to say that, while some delegates may possibly have accepted the technical representatives' claims that the S.S.T. would be able to operate in a subsonic jet environment—with existing runways, aids, and facilities, that is to say—all were highly sceptical of claims that it would be economical to operate. The environment question is, of course, important but, for airline presidents and managements, economics are an over-riding consideration.

Mr. J. R. D. Tata's View

One can best convey the sense of the meeting, perhaps, by quoting the comments of leading delegates—and who, in that respect, more appropriate than Mr. Tata? Questioning, amongst other things, the justification for introducing an aircraft which, although it might be twice as productive, would cost at least five times as much, Mr. Tata voiced the doubts of a majority of the delegates. "I must say" he concluded, "that, notwithstanding some of the very encouraging or reassuring statements made on the economic side of it, my worries on the subject have not been allayed."

For an even more forthright opinion, let us turn to Sir William Hildred, I.A.T.A.'s Director-General since 1942—and who, incidentally, is shortly due to retire. According to a well-known American aeronautical publication, *Aviation Week*, he told a reporter: "I hope I shall not live to see the damned thing!" and added, "I can afford to say things like that but airline presidents cannot."

In the face of opinions such as these, one can only conclude that the airlines, as a whole, would be heartily relieved to see the introduction of an S.S.T. postponed for at least another ten years.

And, of course, there is such a possibility. The recently elected British Government has already informed the French Government about its desire to re-examine the Concord project, on economic grounds. There are rumours that it may even cancel their end of the Concord project. It seems unlikely—but it could happen. Whether the French would then carry on alone is problematical. At present, moreover, the Americans are uncommitted. They, too, on technical or financial grounds, might postpone initiation of the project.

Bound to Come

Nevertheless, one is, on the whole, inclined to the view that the airlines will get no such 'reprieve.' By 1972, or thereabouts, an S.S.T. will almost certainly have been developed. Its economic qualities will remain unproven but, in the event, will that deter the airlines? I.A.T.A. has formulated its "ten supersonic commandments"—the minimum technical and economic requirements which are essential in an S.S.T. before any I.A.T.A. airline will introduce it into service. But can the Association depend on 100 per cent obedience in this regard? Or will one or two of the more powerful and ambitious carriers initiate a race in which all will then be compelled to join?

Exports are vital to India and the export drive is on. To succeed, the goods exported must attract the foreign buyer through their pleasing finish... and what better finish can there be than NICKEL-CHROMIUM plating? You will find it on all the popular brands in world markets... the secret to their popularity.

You will be wise to use Nickel-Chromium Plating for your products, but see that the plating conforms to a standard specification as regards nickel thickness, as it is the NICKEL beneath chromium that guards against corrosion.

Our knowledge of nickel-chromium plating is at your service.

MODI SPINNING AND WEAVING MILLS CO. LTD.

CHAIRMAN, MR. G. M. MODI'S SPEECH AT ANNUAL MEETING

SCHEME OF REALISATION MULTIPLIERS CRITICISED

THAT neither the consumer nor the textile industry would ultimately stand to gain by the scheme of realisation multipliers was pointed out by Mr. R. B. Seth Gujar Mal Modi, Chairman of the Modi Spinning and Weaving Mills Company, Limited, in the course of his speech at the Eighteenth Annual General Meeting of the Company held at Modinagar on Saturday, 31st October 1964. He apprehended that, as cloth prices would be reduced to uneconomic levels, the apparent gain to the consumers by way of lower prices would be more than wiped out by the resulting fall in production and that the disadvantage to consumer would not only be from shortage of production but also from deterioration in quality. Referring to the distribution of imported cotton, Mr. Modi urged the Government to distribute this cotton on a spindlage or loomage basis throughout the country rather than give it to a few mills which have somehow secured or created a monopoly.

The following is the text of Mr. Modi's speech:

LADIES AND GENTLEMEN,

It gives me very great pleasure in extending to you all, a hearty welcome to the eighteenth annual general meeting of the Company. The Directors' report and audited accounts for the year ended 30th April 1964 have been in your hands for sometime now and with your permission I take them as read.

Before I proceed to review the working of the Company during the past year, I wish to pay our humble homage to the late Prime Minister—Pandit Jawaharlal Nehru, an apostle of peace, architect of new India and one of the greatest personalities of the world. Since independence there has been tremendous advancement in all the fields of national activity and our beloved Prime Minister was the guiding force behind it.

It is a matter of great pleasure that the country has elected unanimously Mr. Lal Bahadur Shastri as our new Prime Minister. From my personal experience, I am in a position to say that during the regime of our new Prime Minister, good relations throughout the world will prevail. He is a person of balanced mind, mature judgment and quiet disposition. He has a deep and detailed understanding of the problems of the country. With his kind-heartedness and dynamic administrative ability, India is bound to prosper. We wish him good health and long life in the service of the nation and assure him of our fullest cooperation.

Prices

Unfortunately our country is passing through a great crisis of spiral rise in prices, more particularly in respect of food which accounts for about 70 per cent of the total money spent by a common man. It will take many more years before India will be self-sufficient in meeting its requirements of foodgrains. With the rapid growth of population and also slow progress in agricultural production, we have been facing such difficulties for a long time. Difficult as it is, to control the growth of population, it is equally difficult to make land produce sufficient food to make the country self-sufficient. It is a difficult time for us to prove that we can be steady and stable even in the hardest times.

Working Results

Now looking to the working of your Company, you would have noticed from the Directors' report that the Company's profits have considerably improved over the figures of previous year; the gross profit during the year is Rs. 87,41,128 against the previous year's profit of Rs. 51,92,559 and after fulfilling the statutory obligations of depreciation amounting to Rs. 41,37,718 as compared to Rs. 25,72,622 and development rebate reserve Rs. 16,95,000 as compared to Rs. 2,51,000 and taxation Rs. 13,50,000 against Rs. 13,10,000 the net profit available for distribution is Rs. 15,70,505 as compared to Rs. 10,77,095 of previous year. The share capital of the Company has increased to Rs. 1,72,37,066 against Rs. 1,51,33,261 hence your Directors have proposed a payment of dividend of 10 per cent on the equity shares for this year as compared to 9 per cent paid during the previous year. Dividend on new equity shares issued in February 1963, will be paid in proportion to the period and amount paid thereon.

New Installations

The net sales of the Company have also increased to Rs. 970.00 lakhs in 1963-64 against Rs. 805.86 lakhs during 1962-63. This has been achieved by the addition of a new mill named 'C' mill, which went into production during the year and the continuous process of renovation and rehabilitation of the mills, carried out to keep the plant and machinery up-to-date. We have also installed, during the year under review, sanforizing range and other processing machinery. The Company has spent a sum of Rs. 1,70,45,644 on these additions to the plant and machinery, building and other assets during the year.

You will be pleased to know that the erection of new 'C' mill, which was taken up in hand during the last year, is now running satisfactorily with 19,184 spindles and we hope to add 6,104 spindles more during the current year to make it a full-fledged unit consisting of 25,288 spindles.

Right Issue

You would be further glad to hear that your Directors have entered into an agreement with a famous firm—Messrs. Platt Bros. of U.K.—for the supply of complete plant to manufacture sewing thread, hosiery and industrial yarns for which there is a good demand. We have received sanction from the Controller of Capital Issues Government of India, to raise the share capital of the Company by issue of one right share for every two shares held by a member, that is, right shares of the face value of Rs. 86,50,820, but your Directors have not decided to issue the right shares for the time being.

Your Vice-Chairman, Raizada Seth K. N. Modi, and General Manager, Seth Krishnan Kumar Modi, visited the most modern sewing-thread plants of Switzerland, U.K., Germany, etc. Building construction of this project has been taken in hand and it is believed that by the end of 1965, we will be able to put this plant into commission. With the addition of this plant along with the addition of 5,955 spindles under the general permission, the Company would have an installed capacity of 1,14,783 spindles in total and will be one of the substantially big units.

Your Directors are further pleased to report that the working results of your Company during the six months of the current year are quite encouraging.

Modinagar, where your Company is situated, is purely an industrial town established in 1932. There is plenty of sweet water and natural facilities available at hand. It enjoys an excellent climate and a very peaceful atmosphere. All sorts of recreations, sanitation, social, religious and educational facilities exist in this township for the healthy life and development of the industrial workers of your Company.

Education to the children of the workers and staff are provided free; even books and clothes are provided free by the Company to the children of low-paid staff. Residential accommodation has to be provided to every worker we employ.

We are thankful to Uttar Pradesh Government for maintaining peace and order within the State but there has been very little industrial growth in this State as compared to general index of industrial growth in India. U.P., which was known for cheap electric supply in Northern India, has now increased its electricity rates higher than the rates of neighbouring States. It is also one of the reasons of retarded industrial tempo in the State.

Several fair price shops under the consumers' cooperative society have been opened by your Company for the supply of foodgrains and other rationed commodities at fair prices to the workers, but on account of insufficient supply of rationed commodities to these shops, these have not been able to serve the purpose fully. To maintain peace and order it is desirable that the Government must supply sufficient quantity of rationed goods to these shops for distribution to industrial workers at the fair price.

Cloth Control

Miseries created on account of the food control, were not yet over when the Government imposed partial control on the production of mill cloth with effect from the 20th October 1964 with the hope that the common man will get cloth at cheaper rates. So far as the idea of giving relief to the common man is concerned, it is not bad, but the question is: at whose cost? Neither the consumer nor the industry would ultimately stand to gain.

The realisation multipliers as were tentatively declared and subsequently revised are not conducive to the lot of the mills situated in Northern India, up-country, and mofussil which are capable to undertake the production of cloth of mainly higher medium, medium and coarse varieties.

It is a matter of disappointment as the revised schedule of realisation multipliers will not benefit anyone. The apprehension is that the new scheme will reduce the cloth prices to uneconomic levels. The apparent gain to the consumer by way of lower prices would be more than wiped out by the resulting fall in production and the disadvantage to consumer will not be only from shortage of production but also from deterioration in quality.

Raw Cotton

There seems to be no idea of imposing restrictions on combing the Indian cotton. This would greatly discourage the use of Indian cotton for better qualities of cloth.

Mills in U.P. and mofussil areas are not being given imported cotton whereby they could produce fine and superfine qualities or a better type of quality to produce the balance 55 per cent production which they could sell in the market at a better price. It is desirable to save the industry in this area and the Government should distribute the imported cotton on a spindleage or loom basis throughout the country rather than giving it to few mills who have somehow secured or created a monopoly. The Government should also revise the realisation multipliers in a realistic manner taking into account the higher cost of cotton and labour charges, whereby the mills could get the overall fair return and produce quality goods and maintain the production.

I thank you all once again on behalf of your Directors and on my own behalf for placing your confidence in this humble concern and I assure you to the best of my abilities that every effort will be made to serve your cause to your entire satisfaction.

Before closing, I am sure, you will join me in thanking the officers, staff and workers who have worked with loyalty and sincerity for giving satisfactory results during the year. Our relations with our workmen remain quite good to the mutual benefit of industry and workers and inspite of the great hardship caused to them for want of food during the present food crisis, they have still maintained the efficiency and quality of their work. We hope that they will give similar cooperation for the future expansion of this concern.

JAI HIND

BIRKMYRE BROTHERS LIMITED

INCREASING PRESSURE ON BOMBAY PORT

DOCK EXPANSION SCHEME MARKING TIME

AMONG the major ports of India, Bombay receives the largest number of ships—more than 3,300 with a gross registered tonnage exceeding 22 million—and handles the largest amount of export and import traffic in a year. The weight of cargo (in both overseas and coastal trades) handled by the port has progressively increased from about 7.0 million d.w. tonnes in 1950-51 the pre-first Plan year) to as much as 17.4 million d.w. tonnes in 1963-64. The port's passenger traffic is also quite substantial, the aggregate number of passengers (both inward and outward) being nearly 750,000 in a year. With so much goods and passenger traffic to handle, it is no wonder that the pressure on the port's facilities continues to be exceedingly heavy. The newer port of Kandla in Gujarat, it may be noted in this connection, has not relieved the pressure on Bombay to any significant extent, for the import and export traffic handled by that port is yet to exceed two million tonnes a year. In fact, the pressure on Bombay has actually increased in recent years, as will be seen from the traffic figures in the accompanying Table I.

The commodity-wise break-up of Bombay port's traffic in 1963-64 shows that, on the import side, crude petroleum and foodgrains alone account for about 6.0 million tonnes and 1.5 million tonnes, respectively. These are imports involved in overseas trade. The principal item on the export side is composed of petroleum products, accounting for an aggregate cargo weight of about 3.3 million tonnes. These exports figure predominantly in coastal trade. The two oil refineries in Bombay are thus responsible, between them, for 9.3 million tonnes or about 54 per cent of the port's entire traffic. If, in due course, the refineries are allowed to expand their capacities further, the volume of petroleum (crude and products) traffic handled by Bombay port is bound to increase proportionately. It will be seen from Table 2 that, if at all some commodity traffic is to be diverted from Bombay to Kandla, it can only consist of items other than petroleum.

Port Trust's Finances

The port's traffic statistics, which have been interpreted in the foregoing paragraphs, are to be found in the Bombay Port Trust's Draft Administration Report for 1963-64. This report, incidentally, deals with the financial position of the Port Trust, the port development and modernisation programmes under the third Plan and the advance action being taken on some fourth Plan schemes. As for the port's finances, it is seen from the report that the General Account for 1963-64 closed with a surplus of Rs. 131 lakhs, as compared with a surplus of Rs. 36 lakhs envisaged in the Revised Estimates for the year. The aggregate revenue on General Account, including surcharge, amounted to Rs. 15.98 crores in the year under review, as compared with Rs. 14.02 crores in 1962-63. The total expenditure on General Account amounted to Rs. 14.68 crores in 1963-64, as compared with Rs. 12.33 crores in the previous year. The Pilotage Account resulted in a surplus of Rs. 20 lakhs, as compared with the surplus of Rs. 16 lakhs envisaged in the Revised Estimates. The total revenue on Pilotage Account amounted to Rs. 36 lakhs in 1963-64, as compared with Rs. 27 lakhs in 1962-63, while the total expenditure on this Account was Rs. 15 lakhs in the former year and Rs. 16 lakhs in the latter. The state of finances, as reflected in the General Account, over the period 1950-51 to 1963-64 may be noted from Table 3. It is noteworthy that a sizable part of revenue expenditure on this Account subserves the General Reserve Fund and the Renewals and Replacements Fund.

Table 1: Yearwise Growth of Traffic
(In million d.w. tonnes)

Year	Imports	Exports	Total
1950-51	5.3	1.7	7.0
1951-52	5.9	1.7	7.6
1952-53	4.8	2.0	6.8
1953-54	4.9	2.0	6.9
1954-55	5.7	2.0	7.7
1955-56	6.8	3.7	10.5
1956-57	8.4	3.8	12.2
1957-58	9.5	3.9	13.4
1958-59	8.6	3.4	12.0
1959-60	9.6	3.8	13.4
1960-61	10.8	3.9	14.7
1961-62	10.4	4.1	14.5
1962-63	11.1	4.9	16.0
1963-64	11.9	5.5	17.4

This is what the report says about these funds and the need for augmenting revenues to support them:

"A notable feature of the revenue expenditure was the new contribution of Rs. 2 crores made to the General Reserve Fund and the enhancement by Rs. 80 lakhs in the contribution to the Renewals and Replacements Fund as duly approved by the Board and Government. The former was necessitated by our commitment to the International Development Association that we would manage our finances in such a way as to ensure that the entire funds required for executing the projects, for which foreign exchange assistance was to be provided by it, would be found from our own resources. At the time the matter was negotiated with the Association, we gave it to understand that we would be setting apart from our own revenue at least Rs. 2 crores for the projects. Accordingly, it was decided to make a fixed annual contribution of Rs. 2 crores to the General Reserve Fund from the report year onwards. In addition, it was decided to make an *ad hoc* addition of Rs. 80 lakhs to the annual contribution from revenue towards the depreciation of wasting capital assets (other than the M.O.T. assets, for which provision is made separately). The amounts being provided for financing the I.D.A. projects and towards depreciation, as indicated above, are, however, likely to prove inadequate, having regard to (i) the rising trend of prices and the large outlay which we will have to incur on unavoidable and essential works during the fourth Five-year Plan period and (ii) the more ample provision for depreciation, on replacement cost basis, which will probably have to be made, pursuant to the recommendations of the firm of chartered accountants employed for the reorganisation of our system of accounting. Looked at in this light, there is no reason for being jubilant at the surplus realised and we will seriously have to consider, in connection with our next Budget, whether we should not commence strengthening our finances by the levy of a surcharge on rates, so that the incidence of the financial burden may be spread over a period of years and may not be felt to be too heavy."

Table 2: Commoditywise Break-up of Traffic
(Year 1963-64)
(In '000 tonnes)

Item	Imports	Exports
Cement clinker and sand	389	..
Chemicals	45	..
Coal and coke	101	1

Iron scrap	..	87
Machinery (other than railway materials)	417	..
Manures, chemical	233	..
Oilcakes	..	433
Ores, iron	..	307
P.O.L.:		
Crude oil	5,822	..
Diesels and other products	292	3,154
Lubricants	345	97
Railway materials	50	..
Sugar	..	149

The total expenditure on Capital Account during 1963-64 was Rs. 2.02 crores, as against the Revised Estimate of Rs. 3.39 crores. The withdrawals during the year from the General Reserve Fund, the Renewals and Replacements Fund and the Pilotage Depreciation Fund for capital expenditure amounted to Rs. 1.80 crore in all. Incidentally, the net capital expenditure of the Port Trust since its inception has aggregated Rs. 50.8 crores (net). Against this, the outstanding debt is Rs. 16.8 crores, of which Rs. 6.6 crores is due to the public and Rs. 9.1 crores to the Government.

Progress of Plan Schemes

The year under review has registered further progress in the execution of the Port's third Plan schemes. The Dock Expansion Scheme (1962), however, is marking time, for the drawings, designs and tender documents for the main civil engineering works were completed only recently. But other schemes like marine oil terminal, mechanical works at Trombay, dredging project, installation of electric cranes in Alexandra Dock, harbour survey, and electrical works and some others have made progress during the year. As for the fourth Plan, advance action on the preliminary investigations connected with the replacement of submarine pipelines from Butcher Island by overhead pipelines has been taken. This fourth Plan scheme, incidentally, is intended to improve the bulk oil and general cargo handling facilities at the port. The Master Plan for the development of the Port, which is to be drawn up in three years' time, is also not of immediate relevance. Currently it is the Dock Expansion Scheme of the third Plan that would need to be implemented with greater expedition. It is, of course, gratifying to be told that there has been no delay in the execution of several ancillary works connected with this scheme.

Table 3: General Account of Port Trust
(In Rs. crores)

Year	Revenue	Expenditure	Surplus
1950-51	5.5	5.0	0.5

I.O.C.'S BLENDING PLANTS

The Indian Oil Corporation, the young but fast-growing public-sector oil giant, has added one more feather to its cap with the formal opening of a blending plant—the first of its kind in this country—for processing the base stock oils into high grade lubricating oils at Trombay near Bombay on 29th October 1964. The plant was opened by Mr. P. A. Gopalakrishnan, its Chairman, and the function was graced by Mr. V. A. Bellman, President, Mobil Petroleum Co. Inc., (U.S.), who had come specially for the occasion. A second blending plant was commissioned at Calcutta, two days after the opening of the Bombay plant. The two blending plants have been put under the direct control of Indian Oil Blending Ltd. (I.O.B.L.), a subsidiary of the I.O.C. The I.O.B.L., incidentally, is a joint (50 : 50) venture of the Indian Oil Corporation and Mobil Petroleum Company of the United States. The Company was incorporated in March 1963. The authorised capital of the I.O.B.L. has been increased from Rs. 20 lakhs to Rs. 40 lakhs to enable its future expansion. The subscribed capital has also been proportionately increased to Rs. 20 lakhs.

The installed annual capacity of the Bombay plant, the bigger of the two, is 64,000 tonnes, on single-shift basis. But the capacity can be increased easily by the addition of another blender and some filling equipment. It will initially produce industrial, automotive and marine lubricants. It has also been designed for the inclusion, at a future date, of a grease manufacturing plant with a capacity of five million pounds of grease per year. The second plant, the one at Calcutta, has an annual capacity of 32,000 tonnes on single shift, with provision for future expansion. The two plants together will produce, under a phased programme, 50,000 tonnes of lubricating oils during the first year and gradually step up production to one lakh tonnes in the third year. Hitherto, the mobil lubricants were being imported and, with the commissioning of the plants, India can hope to save foreign exchange worth Rs. 4 crores every year.

The most noteworthy feature of the two plants, which have been built at a cost of more than Rs. 80 lakhs, is the installation of electronic controlling units, the world's most modern equipment for controlling the blending of lubricating oils. They are also equipped with modern laboratories for ensuring high quality.

NEW PRODUCTS AND PROCESSES

Telemetry Terminal Equipment

PORTABLE telemetry terminal equipment, comprising six self-contained units which together weigh less than 100 lb. and occupying less than 2 c.ft., is being produced by E.M.I. Electronics Ltd., England. The equipment is intended for use in telemetry systems with carrier frequencies in the range 430-490 Mc/s, handling 2,000 samples per second. The required combination of modular self-contained units can be selected for any application, stacked in a variety of ways and interconnected as convenient with existing apparatus.

Membrane Permeable to Gases

The U.S. General Electric Company (U.K. inquiries to International General Electric Company, 296, High Holborn, London, W.C.1) has produced a new thin membrane of synthetic material selectively permeable to gases of different molecular weights, according to the difference of pressure between one side and the other. It is made of a silicone rubber and is one-thousandth of an inch thick. It is a thousand times as permeable as the plastic films used for wrapping foods. Such a membrane would allow unwanted water vapour and carbon dioxide to escape easily into the vacuum of space while holding in needed oxygen. Water vapour passes through 60 times as fast as oxygen, so the membrane could be used on earth for drying air. If ordinary air is in contact with such a membrane and the pressure on one side is reduced, oxygen goes through more quickly than the nitrogen from the high-pressure side to the low-pressure side. Thus on this low-pressure side the air is enriched. This could serve as a useful way of getting oxygen-enriched air for hospital and infant incubators. Other medical applications are obviously possible. Underwater applications are also feasible and the company has demonstrated a hamster breathing easily in a bag of the membrane submerged in a tank of water. The air in the water gets through, but the water does not, and carbon dioxide goes through the membrane in the opposite direction.

High Tensile Stainless Steel

A new stainless steel, which combines high tensile strength with good resistance to stress and corrosion, is being produced by a British firm. It is being used in the TSR2 supersonic aircraft and the Vickers VC10 airliner for parts of the structure most likely to be affected by heat from the engines. Suitable for hardening to tensile strengths up to 90 tons per sq. in. without its resistance to stress-corrosion cracking being materially affected, the steel can be produced in the form of forgings, rolled bar, or plate. To develop high tensile strengths, the steel needs only a single stage heat treatment at the relatively low temperature of 450° C. As this is a black heat, surface oxidation is slight and distortion is virtually eliminated.

Plastic Transistors

Transistors of diodes of plastic instead of metallic compounds are now a distant possibility, following work by Drs. John Lupinski and Kenneth Koppel of the General Electric Company, 1, River Road, Schenectady, New York. They have prepared electrically conductive plastic in film form and work is now proceeding on the possibility of adding impurities to make a semiconductor. The G.E. plastic can be cast on glass surfaces and can accept painted-on silver electrodes for connections. It is said to be stable up to 212° F. Plastic transistors would be probably easier to make than metallic ones.

Ultrasonic Flow Detector

Capable of probing through 20 ft. of steel, a new transistorised ultrasonic flaw detector developed in Britain has the performance of a valve model and yet is easily portable. It weighs 28 lb. including batteries. The makers, Ultrasonoscope Company Ltd., London, claim that it is the world's first fully-transistorised instrument of its type with so comprehensive a range of facilities. The detector, which operates like a miniature echo sounder, has a 5 in. cathode ray tube, essential for accurate thickness measurement and viewing in on-site conditions. The amplifier is high gain, with quick recovery, and is capable of reproducing the very short pulses of the probes.

Underwater Television

The Fisheries Institute in Gdynia, Poland, has designed the prototype of an apparatus for underwater television, called "Telwod." A light tube construction with a watertight camera inside will be lowered to the depth of some 100 metres. A system of floats, stabilisers and rudders will keep the apparatus in the required position and depth. A steering desk and a television receiver will be installed on board the ship. The "Telwod" can be used not only for deep sea research but also for the observation of fishing nets in water, wrecks and marine constructions.

Railtrack Laying Machine

A machine for laying or taking up railway track which is simple, cheap and easily operated in restricted spaces by only a few people has been patented by Franz Plasser, of Johannesgasse , Vienna. It is claimed to handle long lengths f track as easily as short ones and to be capble of laying both straight and curved track at ery high speed. Mounted on the end of the railway wagon used to transport the rails and sleepers, the machine incorporates cantilevered rippers which hold the rails rigidly at a given eight above the ground and a mechanism which otates the individual sleepers below the suspend-d rail.

Cine Projector

Cine projectors independent of mains electricity are available from Hanover House, Hanover, Pennsylvania. Power for the projection lamp comes from torch batteries, which also operate a small motor moving the film. The projector takes only 8 mm. film.

Concrete Cutter

British Oxygen Company Ltd., in London, has developed an oxygen lance which can be used in place of a pneumatic drill to cut through masonry or concrete. The lance is of particular value in work on repairing or modifying buildings. It is first heated by an oxyacetylene flame until it is red hot. Oxygen is then passed through the lance while it is applied to the stone or concrete. The lance oxydises in the process, and the reaction produces sufficient heat to melt the concrete. The blast of oxygen passing through it clears away the melted concrete leaving a clear hole or channel.

Powdered Sulphuric Acid

A process for converting sulphuric acid into a fine, grey, free-flowing powder has been developed by the Helmer Chemical Company, Calgary, Alberta, Canada. It is easy and safe to handle. Details of how it done have not so far been revealed, and patent applications have been made in many countries. Uses so far include its incorporation into the mud used on the drilling for oil and gas. In commercial air-conditioning the powder will reduce alkalinity. The developing company believes that there are uses in pH control for many industries.

Fibre Filter

Almost complete removal of mists from air or gas streams is said to be possible by the use of hydrophobic fibre filters being produced by Begg, Consland and Company Ltd., in Glasgow, Scotland. All particles down to half micron in size are removed. These self-draining filters are inexpensive to install and have low running and maintenance costs. Efficiency is maintained over wide fluctuations in mist loads and concentration. In addition to handling oil and smoke fumes, they can be used in radioactive waste disposal and in cleaning corrosive gases. They will remove water soluble fumes, or water insoluble fumes provided that the solid particles can be kept in colloidal form by the addition of a dispersing agent to the irrigating liquid. Used to remove oil mist, there is complete recovery of oil resulting in lower production costs, particularly when expensive oil is used in quantity.

Cutting Metal by Thread

Metal can be cut with a textile thread impregnated with a chemical, avoiding strains and deformations which occur as a result of other cutting methods in a process invented by the Metallurgical Developments, Reliant Works, Betchworth, Surrey, England. Any metal for which there is a known chemical solvent can be cut by means of a terylene thread impregnated with the solution. Six inches of the thread pass along the cutting line at each cycle, 24 times a minute. At the end of each cut, the chemicals resulting from the reaction of the metal with the solvent are removed and the thread recharged. Pressure of the thread can be regulated to suit requirements and to allow for even wear, a small amount of the thread is paid out from one spool and taken up by the other in each cycle.

Instant Fuse Tester

Most types of cartridge fuse and china fuse can be tested quickly with the aid of a small device marketed by Euco Tools, Surrey House, West Molesey, Surrey, England. The user has to place the fuse against contacts on the tester. If the fuser is good, a bright green signal appears. If the fuse is 'blown' there is no signal. The tester is very compact.

Ionising Calorimeter

Soviet physicists have established that a scientific instrument invented by the Institute of Nuclear Physics, seven years ago, has extraordinary possibilities. This instrument—the ionising calorimeter—usually serves for measuring the energy of one elementary particle. Physicists have established that it can help solve several fundamental contemporary physical problems. The instrument is just as good for measuring the energy of charged and neutral particles with a precision which increases with the growth of the particle's energy. The world's biggest such instrument—an ionising calorimeter with an area of ten square metres—has already been built in the Soviet Union.

The ionising calorimeter can be used on a much wider scale than was done heretofore. For instance, if it is sent up by means of a satellite outside the limits of the atmosphere, it can give answers to questions of fundamental importance for the theory of elementary particles. A number of characteristics of the collision of particles of energies from 100 to 10,000 billion electron-volts can be measured. The instrument will make it possible to carry out these measurements with the same precision with which the particles of a much lower energy are measured at the accelerators in the laboratories on the earth. Studies have shown that the ionising calorimeter can further be used to study the chemical composition and power spectrum of cosmic rays particles in the field of tremendous energies—from 100 to a million of billions electron-volt. But the possible fields where this instrument may be applied are even more important: studies of nuclear inter-action when cosmic ray particles have energies of 100 billion electron-volts; studies of photons and electrons contained in space radiation reaching us directly from the distant sources; and even the search for the very sources of cosmic radiation in the universe.

A Unique Corticosteroid

Betnovate, betamethasone 17-valerate, discovered and developed by Glaxo Research, is claimed to be a new and unique topical steroid. It is said to be outstanding in therapeutic effect and fast anti-inflammatory, anti-allergic and anti-pruritic action. Development of a superior dermatological corticosteroid preparation has hitherto been hampered by the lack of a suitable screening method. With the vasoconstrictor test, devised by McKenzie and Stoughton, it is now possible to actually demonstrate the potency of a topical steroid by a specific objective test carried out on healthy human skin. The test is applied to human skin, areas of pallor are produced due to vasoconstriction. The degree of blanching serves as an index to the potency of the steroid, which can be correlated to its clinical effects. Using this method to screen over 50 new compounds, specially evolved by Glaxo for dermatological assessment and steroids already in clinical use, the unusual degree of potency of betamethasone 17-valerate was discovered. This compounds was immediately selected for clinical evaluation. Extensive clinical trials confirmed that betamethasone 17-valerate was therapeutically more effective than any other topical steroid in current use; this new steroid is marketed under the trade name of Betnovate, and presented as a skin ointment, with or without neomycin, for use in a variety of skin conditions.

Impressive results in psoriasis, chronic eczema and in several stubborn dermatoses of many years' duration, in which other steroids have failed, have been documented in the U.K., and Betnovate has proved equally impressive in treating less serious and more common skin conditions. Betnovate and Betnovate-N skin ointments which are now made in India are presented in one strength only —0.12 per cent betamethasone 17-valerate. Betnovate-N also contains 0.5 per cent neomycin sulphate.

IDEAS-IN-BRIEF

Synthetic foam injected just beneath the surface of sand dunes and arid soils will stop erosion, hold moisture and provide a firm grip for the roots of plants in a process developed by Chemische Fabrik, Frankenthal, Pfalz, West Germany.

An indelible "pencil" for writing on metals while they are red hot, so that they may be identified during production, has been patented by Coudurier Freres, Chemin du Grand Verger, Chabery (Savoie), France.

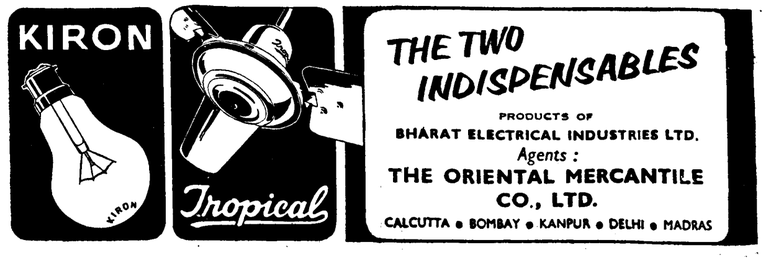
A treatment to induce synthetic polymers to accept dyes more readily and to produce sharper colours has been invented. It involves immersing the polymers first in a warm solution of boron trifluoride and alcohol. It is developed by Societe Rhodiaceta, 21 rue Jean-Goujon, Paris 8, France.

When structural materials are overstressed, they develop micro-cracks. These can now be detected by a new Czech process which paints strips of electrically conducting varnish on to a test specimen of the material and then passes a current through the varnish. Tell-tale melting of the varnish takes place over the cracks. It is produced by Czech Academy of Sciences, 3, Narodni, Prague 1, Czechoslovakia.

A walking excavator with a 100-metre boom and an 80-cu.-metre capacity bucket has been designed. Information regarding this excavator is available from the Soviet Information Service, 3 Rosary Gardens, London, S.W.7.

Significant cuts in cost and erection time are claimed for a new decorative wall cladding in a tongue-and-groove effect made from a plastic-coated steel. It is manufactured by Panther Ceilings, Irvine, Ayrshire, Scotland.

An emergency braking device which, it is claimed, will stop lorries from running away when their brakes have failed can be controlled from the dashboard by a simple push-button in a system developed by Mecanique Automatique Moderne, 19 rue du Gaz, Kain Lez Tournai, Belgium.



WHAT ROLE FOR CHIEF MINISTERS IN EXPORT PROMOTION?

NO NEED FOR NEW OR SPECIAL INSTITUTIONS

"The State Governments do not always seem to be alive to the primacy of export promotion; and some of their policies, particularly in the fiscal field, have hindered the even flow of exports. Several instances have come to our notice where the State Governments have resisted remission of fiscal levies and prevented inter-State movement of raw materials entering into products destined for export markets, purely from their provincial stand-point, unmindful—or at least unconscious—of the effect of their policies on the export drive. The nation cannot afford to function compartmentally."

THESE remarks were made by the Import and Export Policy Committee in 1962. Has there been a change since then in the outlook of State Governments towards export promotion? Are they now fully aware of the urgency and importance of exports to the Indian economy?

It is necessary to consider this aspect in some detail. The Fourth Plan's export target has been laid down at Rs. 5,100 crores. This means that the annual exports must be of the order of Rs. 1,020 crores, as compared with the average annual export of about Rs. 760 crores in the third Plan. It is obvious that exports cannot be stepped up to this level without the wholehearted co-operation of the State Governments.

The Union Commerce Ministry, therefore, has decided to enlist the active support of the State Governments. It has planned a series of separate meetings with the Chief Ministers of different States and their colleagues on matters relating to export. The first meeting in this series was held recently in Calcutta. It was attended by the Chief Minister, the Finance Minister as well as the representatives of the chambers of commerce, trade associations and export promotion councils.

It is but appropriate that the Commerce Ministry should make a beginning with West Bengal, for this State occupies a strategic position in India's export trade. Two of the major exports of Bengal are jute goods and tea, earning about Rs. 160 crores and Rs. 135 crores per year, respectively, and in both these items West Bengal has a substantial share. And the State Government can do a good deal to improve the competitive capacity of these industries so as to enable them to increase their export earnings.

Jute

So far as the jute industry is concerned, its main requirement is the regular and adequate supply of raw jute at fair prices. Considerable progress has been made already in increasing jute production in West Bengal. The yield per acre of raw jute in certain areas of the State is four bales, though the average for the State is only 2.9 bales. If the State Government can step up the average yield at least to 3.5 bales per acre and also improve the quality, it will greatly help the jute industry.

The jute industry, moreover, requires a continuous supply of electric power. Shortage of it in the past has sometimes held up production and affected exports. The State Government has allowed jute mills to set up their own captive generators. But the industry's requirements of power are bound to increase considerably during the Fourth Plan. The additional power required by the jute industry is estimated at 40 MW on the basis of the Fourth Plan's target of 17 lakh tons as compared with 13 lakh tons in the third Plan. The State Government, therefore, has to draw up schemes for the expansion of power so as to provide fully for the needs of the jute industry.

Another way in which the State Government can help the jute industry is by exempting it from taxation. The State levies a cess on raw jute at 12 paise per bale and on the manufactured jute, the Government has taken powers to levy a cess not exceeding 75 paise per ton. The Central Government has suggested to West Bengal that the latter may exempt manufactured jute from this levy.

Tea

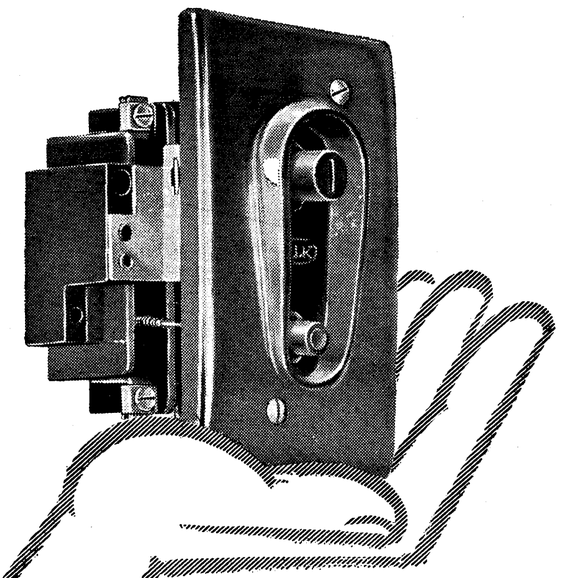
To the tea industry also, the Government of West Bengal can do a good deal to increase production and improve its efficiency. The area under tea in West Bengal has hardly shown any significant increase in recent years—it was 82,820 hectares in 1962 against 82,120 hectares in 1939. On the one hand, replantations and extensions have been negligible; on the other, there has been a large-scale resumption of land from tea gardens under Section 6 (3) of the West Bengal Estates Acquisition Act, 1953, as well as requisition of land for defence purposes. The Central Government has, therefore, suggested to the State Government that the request of the tea estates for additional lands for tea plantations and ancillary purposes may be assigned due priority and that the land under tea may be requisitioned for defence only after other alternative sites have been explored and found unsuitable. The Central Government has further advised on the desirability of the removal of the tax on tea in Calcutta area at the rate of 13.78 paise per kg. This levy, it is stated, considerably adds to the cost of tea to foreign buyers.

Cost to the State

It remains to be seen how far the West Bengal Government will be prepared to cooperate with the Government of India in export promotion, particularly in regard to the major industries like jute and tea. The State Government may, perhaps, hesitate to provide tax relief, because of the loss in revenue. The abolition of the tax on tea in the Calcutta area, for instance, will mean a loss of about Rs. 2½ crores per year. It is only reasonable, therefore, to suggest that the Centre should make good any loss in revenue sustained by the State Government. Similarly, the Assam Government can assist the tea industry by reducing the incidence of the Agricultural Income Tax. It is hoped that the Tea Finance Committee will expedite its study of all aspects of the fiscal burden on the tea industry and make suitable recommendations which, while safeguarding the legitimate financial interests of the States, will help the tea industry to obtain adequate funds for its expansion and efficient working.

Other Ways

Apart from lightening the fiscal burden, State Governments can assist export promotion in other ways as well. First of all, the States should give the maximum encouragement to agricultural production. "A great deal of attention has, no doubt, been paid to achieve a measure of self-sufficiency in foodstuffs for our growing population," says an official report. "But," it adds, "the cardinal importance of the complementary advance of commercial crops and their bearing on industrial development and export promotion has not been sufficiently appreciated." The report suggests that "a serious attempt should be made to review the vital



Presenting the new
FLUSH MOUNTING STARTER

The popular LT-LK push button operated type MF 1 starter is now available for flush mounting—provided with an attractively finished die cast aluminium front plate. This is eminently suited for mounting on control panels, machine tools, etc.

THAT EXPERT TOUCH COMES WITH EXPERIENCE

THE BANK OF BARODA HAS BEEN HANDLING FOREIGN BUSINESS FOR YEARS & YEARS

The Bank of Baroda has been handling foreign business for many years. Today, the Bank has branches in London, East Africa, Fiji Islands, Mauritius and East Pakistan.

The Bank of Baroda through any of its foreign branches or its correspondents is fully equipped to offer all the services needed in foreign trade and to handle every type of foreign exchange business—including opening Letters of credit, the negotiation/collection of export bills, clean bills and cheques, foreign remittances, credit information, etc., and is always willing and prepared to assist you in solving your problems concerning imports, exports and foreign travel with prompt and efficient service.

Branches in London, Nairobi, Mombasa, Kampala, Dar-es-Salaam, Moshi, Mbale, Mwanza, Jinja, Kisumu, Narainganj (East Pakistan), Port Louis (Mauritius), Suva and Lautoka (Fiji Islands) and correspondent banks all over the world.

role which the development of agriculture, pisiculture, and forestry can play in our economic progress." It is interesting to observe that the expenditure on revenue account on agriculture, including animal husbandry and co-operation, by the State Governments in 1964-65 is estimated at Rs. 120 crores, as against Rs. 66 crores in 1960-61. On capital account also, the outlay on agricultural schemes has been considerably stepped up. But it is necessary to ensure that the funds are utilised in the most effective manner so as to derive the maximum advantage.

Secondly, State Governments should give priority to export industries in the allocation of land, power and water. Further, industrial development should be accelerated in every State at a far faster rate than hitherto. Even relatively advanced States like West Bengal and Maharashtra have vast scope for expanding the existing industries and for setting up numerous other industries, many of which can have an export potential.

Thirdly, public sector undertakings in the States should be encouraged to participate in export promotion. Even undertakings under the control of the Government of India do not seem to have made serious efforts to export their products. In fact, Dr. A. Ramaswami Mudaliar disclosed recently, while addressing a conference of engineering industrialists in the Southern region at Madras, that industries in the public sector "so far have not taken any interest in exports." He pointed out that many public sector industries like Indian Telephone Industries and Hindustan Machine Tools were in a position to export their goods. If the Central Government's undertakings could give a lead in this matter, their counterparts in the States could, in due course, play their part in export promotion.

Fourthly, State Governments must considerably improve their administrative efficiency. Although foreign trade is a Central subject, the State Governments are also intimately connected with it in various ways; and State policies can often help or hinder export promotion. The proper working of the administration at State level is, therefore, of considerable importance. It is, however, regrettable to find that Governments in many States are not as strong as stable as they ought to be. Some Chief Ministers are facing serious charges of corruption. Many States are also confronted with financial difficulties. As the Reserve Bank's Report on Currency and Finance, 1963-64, points out, "despite the buoyancy in tax receipts and the growth in Central assistance at a rate faster than that envisaged in the Plan, a number of States have been continuously facing ways and means difficulties of a serious nature."

Chambers of Exporters

Finally, stress must be laid on the need for closer co-operation between the Centre and the States. For this purpose, however, it is not necessary to set up new or special institutions for export promotion. Two years ago, the then Ministry of Commerce and Industry requested all State Governments to set up Chambers of Exporters at important industrial and trading centres and to establish an Association of Export Chambers in each State. These State Associations were to be affiliated to an apex body called the Federation of Indian Chambers of Exporters. The Union Ministry of Commerce has now revived these proposals. It has further suggested that, in each State, there should be a State Export Promotion Committee, consisting of the Chief Minister, Finance Minister, Minister in charge of Commerce and Industry, and three or four representatives of the Export Association. Such a Committee, it is felt, can play a useful role in export promotion, especially by providing speedy relief to exporters in the matter of excise duties, sales taxes, State and municipal regulations, road transport and other difficulties.

But are such associations and committees really necessary? There are already a number of export promotion councils. There are also export promotion advisory committees at the ports of Calcutta, Bombay, Madras and elsewhere. If the State Governments are fully seized of the vital role of export promotion, they can certainly be expected to deal promptly and effectively with the difficulties of exporters without resorting to the multiplication of committees or associations as suggested by the Union Ministry of Commerce. A case can, perhaps, be made out for the creation of a machinery to co-ordinate the export efforts of the State Governments. The Import and Export Policy Committee observed: ". . . . It will be necessary to have a co-ordinating machinery, sufficiently powerful to be able to cut through the tangles of the conflicting inter-departmental interests, reorient the thinking of State Governments and reconcile their stand-points with the national objectives of export promotion. It should be capable of taking quick decisions on the day-to-day issues and of translating them into practical terms. Such an organisation is lacking in the present system; and, unless one is established, both at the decision and at the implementation level, no plans of export promotion, however grandiose, will be of any avail." But closer analysis will show that even such an organisation is really unnecessary, for the Union Ministry of Commerce, assisted by the Board of Trade, ought to be able to bring about whatever coordination is essential in the field of export promotion.

HIGH NICKEL ALLOY IN FORD ENGINE

A high nickel alloy, recently introduced by International Nickel, has played a major part in the development of the Ford Motor Company's gas turbine engine which powers the revolutionary truck announced by the Company in Los Angeles on 26th October. The new alloy, known as alloy 713LC, is used for critical components in the 600-horsepower engine and, together with other nickel alloys in the power unit, has helped provide optimum engine reliability and performance at minimum cost. Incidentally, the gas turbine truck, revealed to the public for the first time at the American Trucking Association convention at Los Angeles, is designed to meet transportation requirements of the 1970s and embodies design features never before used in this type of vehicle.

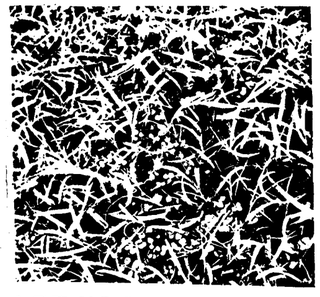
A vital contribution, it is said, has been made by alloy 713LC, which is particularly suited to precision casting of integral turbine wheels. It provides excellent ductility and strength in the highly stressed heavy hub sections which operate at relatively low temperatures and also provides the high-temperature strength required for the turbine blades. The combination of such properties has made possible the design of lightweight high speed turbine wheels to aid engine efficiency and performance. One-piece investment casting, requiring a minimum of machining, also helps to cut production costs.

The new alloy is a low carbon version and a modification of the established alloy 713C. These alloys are patented and produced under licence from International Nickel. Alloy 713LC contains 74 per cent nickel, 12 per cent chromium and other alloying elements, such as molybdenum, aluminium and columbium. The nominal carbon content is 0.05 per cent and iron content is kept as low as possible.

CONFERENCE ON STANDARDS

Important matters relating to trade in agricultural and food products, spices and condiments, tea, iron ore, manganese ore, coal and steel will be discussed at the conference of the International Organisation for Standardization (I.S.O.), which opens at New Delhi on Monday, 9th November 1964. For India, discussions on these issues will be of special interest, since these products are vital to its export trade.

Over 500 delegates from 40 countries of the world will participate in the New Delhi discussions which will last for two weeks. Among those attending the conference from abroad are Andrei Viatkine of U.S.S.R. who is currently the I.S.O. President; Jean Birle (France), I.S.O. Vice-President; Henry St. Leger, Secretary-General of I.S.O.; H.A.R. Binney, Director, British Standards Institution; and Roger E. Gay, Managing Director, American Standards Association. Over 200 technical experts in various fields from India will also participate in the conference.



LET US TAKE A WALK

Now let's take a deep breath, and go forth into the open air. Now for the open road, the world out of doors, source of all health and pleasure. Surely there's no more healthy and enjoyable pastime than walking. And to keep on walking, two feet deep in comfort, in a pair of Bata shoes.

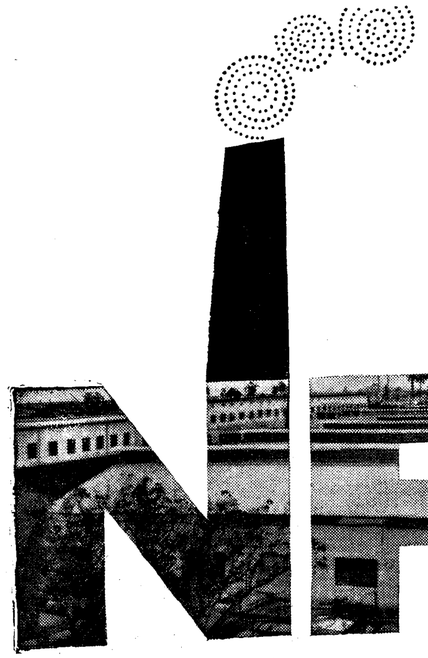
NEW COMFORT 26.95

ACTIVE 22.95

NEW LONGLIFE DERBY 17.95



On December 15th 1946, NATIONAL RUBBER MANUFACTURERS LIMITED was incorporated. Today, the House of NRM has grown into *the largest single unit in India*, manufacturing Industrial and Mechanical Rubber products.

The story of the growth of NRM is a search for progress within a growing national economy. Conceived primarily, to meet the contemporary needs of the nation in Rubber, NRM programmes include the manufacture of Cycle Tyres and Tubes and a versatile range of Industrial and Mechanical Rubber Products. Some of the latter are: Hoses of all types, Industrial 'V' Belts, Railway Rubber Fittings, Fan Belts, Transmission and Conveyor Belting.

Inchek Tyres Limited

Recently, NRM sponsored INCHEK TYRES LIMITED—the first wholly Indian-owned Automobile Tyre Company. Manufactured specially to suit Indian road and climatic conditions, INCHEK TYRES have received widespread consumer acceptance.

Today, the scope of NRM activities has widened. With the implementation of its *second major expansion programme*, the House of NRM hopes to adequately supply the growing demand for its products in many foreign markets, and at the same time earn the country vital foreign exchange.

INVESTMENT CORPN. FARES BETTER

RESERVES ENHANCED—FINANCES SOUND

THE Investment Corporation of India Ltd. (Chairman: Mr. J. R. D. Tata, Bombay) has reported fairly encouraging results for the year ended 30th June 1964. The income by way of dividends and interest, inclusive of the tax deducted thereon at sources, has increased by Rs. 7.51 lakhs to Rs. 38.32 lakhs and as other income is also higher at Rs. 9.53 lakhs as against Rs. 7.77 lakhs, the total income at Rs. 47.85 lakhs shows a gain of Rs. 9.27 lakhs over that in the preceding year. A part of this rise is, of course, due to the inclusion of dividends and interest pertaining to previous years but the balance represents the better return on the Corporation's total investments in the year under review. Considering the sorry plight of the capital markets, this is no mean achievement and is largely the reason why the Corporation's ordinary shares are quoted at par while those of other reputed investment companies are still priced well below their par values. Although total income is thus well above the previous year's, expenses at Rs. 16.89 lakhs as against Rs. 16.66 lakhs are only marginally higher and consequently the gross profit stands improved by as much as Rs. 9.04 lakhs at Rs. 30.96 lakhs. On deducting therefrom Rs. 0.13 lakh as against Rs. 0.11 lakh as the provision for depreciation and Rs. 9.00 lakhs as against Rs. 8.12 lakhs as the provision for taxation one gets a net profit of Rs. 21.83 lakhs, showing an impressive improvement over that (Rs. 13.69 lakhs) for the year before. It is, however, a shade below the record of Rs. 22 lakhs earned in 1961-62. Considering the necessity to reduce borrowings and to soften the impact on the Corporation's profits of changes in foreign investment markets, the Directors have transferred a sum of Rs. 4.07 lakhs to the reserve out of the available profit. The preference dividend in respect of the year claims Rs. 3.15 lakhs as against Rs. 2.07 lakhs previously. With a large balance still available, the Directors have stepped up the ordinary dividend by a point to 8.5 per cent subject to deduction of tax. This claims Rs. 14.47 lakhs, leaving Rs. 15,484 to be carried forward, as against Rs. 1,228 brought in.

The following comparative figures present a clear picture of the Corporation's performance during each of the past four years:

(In lakhs of rupees)

	For the year ended 30th June			
	1964	1963	1962	1961
Income by way of dividend and interest (gross)	38.32	30.81	41.80	38.79
Other income	9.53	7.77	8.27	7.43
Payments and provisions for employees	4.69	4.39	4.34	3.26
Other expenses	12.20	12.27	9.58	7.86
Gross profit	30.96	21.92	36.15	35.11
Provision for—Depreciation	0.13	0.11	0.05	0.03
Taxation	9.00	8.12	14.10	16.72
Net profit	21.83	13.69	22.00	18.36
Past provisions written back	...	...	3.00	...
To reserves	4.07	0.16	5.00	0.58
Dividends—Preference	3.15	2.07	3.21	2.77
Ordinary	14.47 (8.5%)	12.77 (7.5%)	16.17 (9.5%)	14.47 (8.5%)
Carry forward	0.15	0.01	1.32	0.71
Market price of ordinary shares (in shares):	**1964**	**1963**	**1962**	**1961**
High	102.00	117.50	154.00	147.00
Low	87.00	100.00	113.00	105.00

There has been no change during the year under report in the paid-up share capital of the Company which therefore continues to stand at Rs. 220.22 lakhs, of which Rs. 50.00 lakhs are in preference shares and the balance in ordinary shares, both of Rs. 100 each. The reserves, however, have increased from Rs. 134.42 lakhs to Rs. 138.82 lakhs. Borrowings have increased, albeit slightly, to Rs. 177.38 lakhs from Rs. 177.07 lakhs but current liabilities and provisions are down to Rs. 49.82 lakhs from Rs. 54.60 lakhs a year ago. On the assets side, the Corporation's investment portfolio, at or below cost, is carried in the books at Rs. 557.31 lakhs, of which investment worth Rs. 357.51 lakhs are in quoted shares with a market value of Rs. 357.43 lakhs Rs. 185.61 lakhs in unquoted shares and the balance in shares of the subsidiary company, the Indian Standard Metal Company Ltd.

During the year, the Corporation was entrusted with the work of acting as the registrars for the initial issues of capital by Fibreglass Pilkington Ltd., Chemicals and Fibres of India Ltd., and Cochin Refineries Ltd. The Corporation will continue to act as transfer agents of the last two companies. After the close of the year, the Corporation's offer to act as the registrars and transfer agents has been accepted by one more Company, namely, Bayer (India) Ltd. The underwriting activity of the Corporation, however, continued to be at a low ebb during the year under review, as conditions in the capital markets remained unsatisfactory owing to a variety of factors. Inclusive of the outstanding underwriting commitments to the extent of Rs. 26 lakhs, the Corporation's underwriting obligations totalled Rs. 60.37 lakhs during the year, and it was only in one instance that the Corporation was required to take up shares worth Rs. 1.80 lakh face value. In the current year, the Corporation has so far accepted an underwriting proposal for Rs. 6 lakhs equity shares of Bayer (India) Ltd.

Taking advantage of the prevailing higher prices for British shares, the Corporation liquidated a part of its portfolio of sterling investments and realised a sum of Rs. 19.35 lakhs. As under the Reserve Bank's order dividends on and sale proceeds from foreign investments cannot be reinvested as hitherto, the entire amount has been repatriated to India from England. As regards the Corporation's investments in Ceylon, the Directors say that, consequent upon the announcement in the budget of the Government of Ceylon, no exchange will be released in any form for the remittance of any profits, dividends, or any other investment income in that country with effect from 1st July 1964. In the circumstances, the Directors observe, the authority for despatch of dividend and interest warrants to non-residents has been withdrawn, with the result that, for all practical purposes, the Corporation will be deprived of its Ceylon income, at all counts until such time as this notification is withdrawn. This, coupled with the already existing prohibition against transfer of capital assets from Ceylon, makes it necessary to set up a reserve against losses in foreign investments that might arise in future. The Directors have, therefore, decided to transfer all the income received on its foreign investments to a separate reserve to act as a cushion against losses on foreign investments.

Discussing the factors responsible for the continued sluggishness in the financial markets, Mr. J. R. D. Tata says that the prolonged inactivity and depression in the capital markets in spite of improvement in corporate profitability are not surprising. For it is the individual that promotes and builds up corporate activity. He must be left with the wherewithal to save and the desire to invest if the flow of individual savings to the corporate sector is to continue. He must be assured of stable fiscal policies which will act as an incentive to capital formation and hold the promise of appreciation. The capital gains tax on bonus issues and the new tax on individuals are two specific levies which have contributed largely to a breakdown in the morale and activity of investment markets. As regards the future of the Corporation, Mr. Tata is "slightly more optimistic." He says:

"Over the 27 years and more of its existence, the Corporation has built up a quietly efficient and loyal organisation which has come to be looked upon as specialists in the field of administration and management of new corporate issues and company transfer registers and records. Many come to us for advice on marketing of their shares and others for managing their share-holding portfolios. In the U.S.A., the great Trust Corporations have had their origin in some such humble beginnings, and it is possible that, in the industrial India of the future, there will be a revival of free, though controlled, enterprise, and this Corporation will come into its own in the field of service to the corporate community and the investing public."

The Rs. 100 fully paid ordinary shares of the Corporation are currently quoted at Rs. 101.25 *cum-div.* and offers a net yield of 6.8 per cent per annum.

(Concluded from next column)

aggregate of Rs. 49.82 lakhs on fixed assets. Of this, Rs. 22.87 lakhs were for acquiring new plant and machinery and Rs. 22.59 lakhs were expanded on the new building to house the additional 45,000 spindles. The building is getting ready and the new spinning machinery is expected to be commissioned before the expiry of the current working year. By about the same time, the expansion and renovation programme is also likely to be completed. As it takes some time to get the benefits of expansion programme, the Directors state that the impact of expansion programme on the profits of the Company will be felt only in the coming years.

The Rs. 100 fully paid ordinary shares of the Company are currently quoted at Rs. 252 *cum-div.*, to yield a net return of five per cent per annum on fresh investment.

MORARJEE GOCULDAS

SHARP FALL IN PROFIT—DIVIDEND CUT AGAIN

THE financial results reported by the Morarjee Goculdas Spinning and Weaving Company Ltd. (Managing Agents: Messrs. Piramal Sons Pvt. Ltd., Bombay) for the year ended 30th June 1964 are rather disappointing. For, whereas, in common with the general trend of textile industry, sales realisation has advanced, from Rs. 582.64 lakhs for 1962-63 to Rs. 765.02 lakhs, the gross profit has gone down by as much as Rs. 19.96 lakhs to Rs. 51.21 lakhs. The profit-margin (ratio of gross profit to sales), therefore, works out to be the lowest for the past many years, being only 6.7 per cent for the year under report as against 12.2 per cent previously and 15.9 per cent for 1961-62, the peak year so far. The factors which have affected the profit-margin are: (1) the increase in prices of stores, colours and chemicals and a larger wage bill, (2) continued stagnation in selling prices of cloth at old levels owing to the voluntary price control scheme, (3) execution of defence orders at unremunerative prices, and (4) dislocation in operations on account of the expansion and renovation programmes under execution.

The decline in gross profit, assisted by the rise of Rs. 4.16 lakhs to Rs. 40.37 lakhs in the provision for depreciation, has led to a decrease in the provision for the Managing Agents' commission from Rs. 1.56 lakh to Rs. 1.05 lakh. The provision for taxation, however, has risen from Rs. 1.65 lakh to Rs. 2.35 lakhs. The resulting net profit is, therefore, as low as Rs. 7.54 lakhs, as against no less than Rs. 31.75 lakhs for the previous year. At this level, the net profit is inadequate to cover even the reduced dividend of 15 per cent as compared with 20 per cent for 1962-63 and 24 per cent for the year previous to that. It will thus be noted that the Directors have had to cut the equity dividend for the second year in succession. Even this has been possible only by dipping into the reserves built up in previous years. As will be seen from the comparative table of results for the past four years, there has been a net reduction of Rs. 3.92 lakhs in the reserves of the Company as a result of adjustments made to reserves and provisions in 1963-64:

(In lakhs of rupees)

	For the year ended 30th June			
	1964	1963	1962	1961
Sale proceeds less excise	765.02	582.64	461.28	497.63
Other income	20.77	20.56	8.01	11.11
Closing stocks	199.33	173.34	100.70	88.13
Materials consumed	340.50	277.64	202.47	176.09
Stores, spare parts, dyes, chemicals, power and fuel	128.24	102.33	74.40	69.35
Staff expenses	229.02	174.64	134.35	125.84
Other expenses	62.81	40.06	32.35	30.49
Gross profit	51.21	71.17	78.43	61.84
Managing Agents' commission	1.05	1.56	5.50	4.39
Provision for—Depreciation	40.37	36.21	17.26	15.91
Taxation	2.35	1.65	26.00	16.50
Net profit	7.54	31.75	24.67	24.55
Provisions written back	2.71	...	...	...
Withdrawal from reserves	14.83	17.72	...	...

Ordinary	1.11 (15%)	1.11 (20%)	1.11 (24%)	1.01 (24%)
Carry forward	...	...	1.09	1.55
Market price of ordinary shares (in rupees):	**1964**	**1963**	**1962**	**1961**
High	400	451	550	493
Low	250	355	388	309
	x.r.			

Towards the close of the year under review, the Company issued 22,976 ordinary shares of Rs. 100 each on which the full amount of Rs. 100 per share was paid-up during the year itself. This has raised the share capital from Rs. 69 lakhs to Rs. 92 lakhs, made up of Rs. 17.25 lakhs in preference shares (of Rs. 100 each) and Rs. 74.75 lakhs in ordinary shares. The new shares, however, are not eligible for the dividend for 1963-64. The reserves and surplus aggregate Rs. 57.15 lakhs excluding Rs. 8.87 lakhs to be utilised for the payment of dividends. Although there has been slight decrease in secured loans of Rs. 12.93 lakhs to Rs. 320.61 lakhs, unsecured loans have risen from Rs. 12.41 lakhs to Rs. 38.98 lakhs. Total borrowings thus aggregate Rs. 359.59 lakhs besides current liabilities and provisions standing at Rs. 91.64 lakhs. The outside finance is, therefore, Rs. 451.23 lakhs as against the own funds of Rs. 149.15 lakhs only. On the assets side, current assets, investments and loans and advances are shown at Rs. 361.29 lakhs and the net block at Rs. 239.09 lakhs. This has been obtained by reducing a gross block of Rs. 572.81 lakhs by Rs. 333.72 lakhs being the amount of depreciation provided to date. Thus, a good part of the capital expenditure has been financed by bank loans.

The Company spent during the year an

(Continued in previous column)

SUGAR

(Concluded from page 810)

over 200,000 tonnes to the U.S. and the figure is expected to be higher this year.

Supply and Consumption

Thanks to the notable increase in production, the aggregate world supply of cane and beet sugar during the season 1963-64 was higher at 62.9 million tonnes (as against 62.2 million tonnes in 1962-63) even though the carryover stocks were considerably lower at 8.1 million tonnes, as against 10.7 million tonnes. The total supply was, however, well below that (68.4 million tonnes) in 1960-61; details are given in Table B.

The world sugar consumption during the seasons 1961-62 and 1962-63, it may be noted here, could be covered, in spite of the reduction in production because of the huge carryover stocks following the appreciable rise in production during the year 1960-61, as well as in 1958-59. The position has since changed considerably. Inasmuch as world sugar stocks have thinned greatly, increase in consumption in the coming years will necessarily have to be met by a corresponding increase in production. It is encouraging to find that such an increase is being expected in the current (1964-65) season.

This analysis will be incomplete without a reference to world trade in sugar during the 1963-64 season. According to the statistical report on world agricultural production and trade published by the U.S. Department of Agriculture, the total world sugar exports during the calendar year 1963 amounted to nearly 17 million tonnes, reflecting a decline of about a million tonnes as compared with 1962. The 1963 exports were about 13 per cent below the record shipments of 1961, but they exceed those of 1958-59 by about 15 per cent. The United States accounted for about 24 per cent of the world sugar imports in 1963, though the quantity imported was slightly lower than in the previous year. After the diplomatic rupture with Cuba, the U.S. gets its supplies from the Philippines, Dominican Republic, Brazil, Peru, Mexico, Argentina and India. Imports by the U.S.S.R. in 1963 showed a decline of 54 per cent as compared with 1962. In Asia, Japan is the largest importer, followed by Mainland China, the latter country getting its supplies mainly from Cuba.

Exports

The decline in world sugar exports during 1963 was due to the fall in the rate of increase in world consumption. The declining trend persisted in the first half of the current year (1964). Since the beginning of the second half, however, there seems to have been a recovery. Even so, taking the whole of 1964, the total world exports are expected to be about 5 per cent lower than in 1963. Incidentally, it may be mentioned that the U.S. Department of Agriculture has increased, with effect from 16th September 1964, the import fees on foreign sugars to be subsequently authorised or approved for import. Sugar imports from Philippines, which enjoys a basic quota of 945,000 tonnes, are, however, exempted from the payment of any fee.

BAN ON BOLD GRAIN SUGAR

The Government of India has banned with immediate effect the manufacture and sale of sugar of grain size A and B. The ban has been imposed since the Government considers it a waste to manufacture sugar of these grains from the point of view of both the manufacturer and the consumer. It also results in higher prices to the consumer. The ban will not, however, apply to the sale of sugar already manufactured. These grains are manufactured mainly in West Uttar Pradesh. There are about 26 factories producing bold grain sugar in the country, of which about 17 are in Uttar Pradesh. This variety of sugar costs roughly Rs. 2 to Rs. 3.25 per bag more than the price of the standard variety.

COMPOUNDED EXCISE ON *KHANDSARI*

The Government of India has revised, with effect from 1st November, the weekly rates of compounded levy of excise duty in respect of *khandsari* manufactured with and without the aid of sulphitation plants. The salient feature of the revision is that, on payment of prescribed weekly rate, the manufacturer will be free to work his centrifugals throughout the week without any restriction on the daily or weekly working hours.

WELLMAN INCANDESCENT ELECTRIC FURNACES

A wide range of Electric Furnaces for industrial use are now being manufactured in India by Wellman Incandescent in collaboration with Metalectric Furnaces Ltd., of Smethwick, England.

Electric furnaces for heat treatment, enamelling, induction heating, dialectric heating, wire and strip annealing as well as furnaces for light alloys, non-ferrous metals and the ceramic industry can be supplied against order. Special furnaces can also be designed to meet the customers requirements.

Specialists in industrial heat engineering, Wellman Incandescent are also experts in the manufacture of mechanical handling equipment, much of which will shortly be made in India.

NEWS IN BRIEF

THE Textile Commissioner has extended the last date for receipt of applications for import of textile machinery from the U.S.A. from 31st October to the 15th of this month.

The co-operative sugar factories in the country are expected to produce 700,000 tonnes of sugar during the current year, as against 600,000 tonnes actually produced in the previous year, representing a rise of 16 per cent.

The total net collections in small savings during the first half of the current financial year amounted to Rs. 55.33 crores. Maharashtra led the other States with a total collection of Rs. 11.47 crores, followed by West Bengal which accounted for Rs. 10.74 crores.

The Planning Commission will begin discussions with the representatives of State Governments on the annual plans of States for the last year of the third Plan, that is, 1965-66, on the 23rd inst. The discussions will be on the basis of an assessment of resources available for each States plan prepared by the Commission.

India exported Rs. 19.74 crores worth of cashew kernels (39,300 tons) during the first nine months of the current calendar year, representing an increase of Rs. 2.77 crores over the corresponding period of 1963. Exports of cashewnut shell liquid during the same period amounted to 10,200 tonnes valued at Rs. 1.52 crores, as against 5,900 tonnes worth Rs. 73 lakhs.

The revenue collections of the Central Government during the first five months of 1964-65 aggregated Rs. 562.69 crores, as against Rs. 516.47 crores in the corresponding period last year. Of this total, collections from customs accounted for Rs. 160.56 crores, excise duties for Rs. 298.56 crores, corporation tax for Rs. 48.29 crores, income tax for Rs. 51.41 crores and estate duty for Rs. 1.22 crores.

An agreement covering the construction of the third stage of the Kundah hydro-electric project in Madras was signed at New Delhi on Monday this week between the Governments of India and Canada. The Canadian Government will contribute 22.2 million Canadian dollars to meet the external costs of construction of three additional power houses. The three power houses will have a capacity of 190,000 kilowatts.

The Union Government has banned with immediate effect the manufacture of crystal sugar. The ban applies to what is known as A and B grain size. The reason for banning the manufacture of crystal sugar is that it is wasteful since the entire quantity used in a cup of tea or coffee does not dissolve, necessitating the use of more sugar than is really necessary. However, the Order provides for exemption of sale of sugar of sizes A and B manufactured before the commencement of the Order.

Under an agreement arrived at recently between Air India and the Government of Kenya, Air India has undertaken to train four Kenyans in aircraft maintenance engineering at its engineering base. The four-year training programme is scheduled to commence in January 1965. Air India has also undertaken to pay the living expenses for the trainees while in India, besides bearing the entire cost of training. The programmes will cover theoretical instruction in basic aeronautical engineering school and practical training on Boeing airplane in the maintenance and overhaul establishments at Santa Cruz.

The Government of India has approved of a code of conduct for Ministers. The code lays down that all Central and State Ministers must submit by 31st March every year returns of their assets and liabilities to the Prime Minister or the Chief Ministers, as the case may be. They should also disclose their business interests, as well as those of the members of their families, and furnish particulars regarding their immovable properties and approximate values of their holdings in the form of cash, jewellery and company shares and debentures. Further, they are required to ensure that members of their families do not start or participate in business concerns having business deals with the Government.

From Abroad

Skoda, the Czechoslovak motor concern, is believed to be shelving a plan to set up an assembly plant in Austria.

Esso Petroleum is to build a 50,000-ton-a-year styrene plant at its Fawley, England, refinery. The cost is expected to be at least £3 million.

Dunlop, one of Britain's big tyre manufacturers, has introduced a new tyre which it claims will give up to 80 per cent more tread mileage than standard tyres.

Pakistan hopes to meet by 1970 about 30 per cent of the total world demand for jute goods estimated at 3.7 million tons. Plans are afoot to install an additional 38,000 looms by 1970.

Switzerland's first nuclear power station is to be built seven miles west of Berne. Construction is expected to begin in 1967 and will be completed in four years' time.

The U.S. Ford Motor Company has announced the establishment of a new nation-wide car-rental system, known as the Ford Rent-a-Car, which provides for daily or weekly rentals of automobiles through established dealers.

A new Norwegian shipping company, Sigship, has been formed by a leading Norwegian shipowner, Mr. Berge Sigval Bergesen, and two of his companies, Signi and Berge Sigval Bergesen. A fifth of the capital of the new company will be taken up by a consortium of insurance companies.

Thomas De La Rue, of New York, a member of the British-based Thomas De La Rue International group, has come to an agreement with Bowne to provide a joint security printing and creative and financial print service in the United States.

The Imperial Chemical Industries' agricultural division is to sign an agreement to use the new Toyo Koatsu total recycle process for a new urea plant to be built at Billingham in northern England. This will be the largest urea plant in the world, with a capacity of 1,000 tons a day.

Under a trade agreement reached between China and Austria, the latter will supply iron and steel, piping, electrical, optical and pharmaceutical goods, industrial installations and technical literature in exchange for tungsten ore, mercury, tin, asbestos, soya beans, rice, tea, silk, Kashmir wool, hides, furs, gut and technical literature.

West Germany is subsidising the Weigmann Institute in Israel which is conducting research on the peaceful uses of atomic energy, according to a West German Cabinet spokesman. During the year 1963, about DM 12 million were made available to the Israel institute and another DM 3.5 million has been provided for during the current year.

The British Government has announced that it wishes to see the present arrangements (with the French Government) for surveying and studying the possibilities of a tunnel under the English Channel to go ahead unchanged. The geological survey of the tunnel route will proceed as planned, and discussions by British and French officials on the project as a whole, including the legal and financial problems will continue.

PERSONAL

MR. S. M. Patil, Managing Director, Hindustan Machine Tools, left for Australia and Japan to explore export possibilities for HMT products.

Mr. Carl Edwards, Manager of Mobil Oil Company's Franklin, Pa, grease plant, has been appointed Managing Director of Indian Oil Blending Ltd., Bombay.

Dr. Santi Gupta, Joint Secretary, in charge of the newly-created Economic Division in the External Affairs Ministry, has been appointed India's Consul-General in New York.

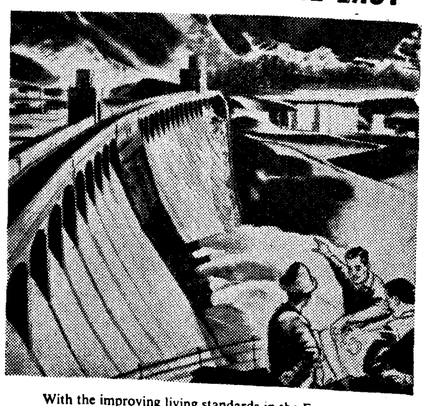
Mr. S. Krishnamurthi, Joint-Secretary, Economic Affairs, Union Finance Ministry, is being appointed India's first High Commissioner to Zambia (Northern Rhodesia) which became independent on 29th October 1964.

Mr. T. N. Singh, Union Minister for Heavy Engineering, will temporarily hold charge of the Department of Industry in the Ministry of Industry and Supply. Mr. K. Raghu Ramaiah, Minister for Supply, will be temporarily in charge of the Department of Supply and Technical Development.

Dr. Thomas Balogh, Reader in Economics at Oxford, has been appointed as economic adviser to Mr. Harold Wilson, the British Prime Minister, while Mr. Nicholas Kaldor, Reader in Economics at Cambridge University, has been appointed as special adviser to the Chancellor of Exchequer on "the economic and social aspects of taxation policy."

Mr. M. I. Prichard, Managing Director, F. Perkins Ltd., Peterborough (with whose collaboration Perkins diesel engines are being manufactured in India by Simpson and Company Ltd., Madras) and Lord Robens, Chairman of National Coal Board of Britain, are to receive the top marketing awards for 1964 from the British Institute of Marketing. The award is given for notable achievement in ensuring and expanding markets for British industry.

DEVELOPMENTS IN THE EAST



With the improving living standards in the East comes the prospect of trade expansion and of increasing opportunities for profitable marketing. The world-wide facilities of three great banking organizations, merged into a single comprehensive service, are at your disposal with up-to-date information and expert advice on all aspects of finance and trade in these areas.

THE SOUTH MADRAS ELECTRIC SUPPLY CORPORATION LIMITED

Registered Office: **Power House: Tennur, TIRUCHIRAPALLI**

NOTICE

THE DIRECTORS HAVE SANCTIONED THE payment of an *ad-interim* dividend for the year 1964-65 of 5½ per cent on Equity Shares and 2¾ per cent on First and Second Preference Shares plus 30 per cent thereon both subject to the deduction of tax.

2. The warrants will be made out in the names and addresses of shareholders standing registered in our books as on 19-11-1964 or holders of mandates and posted on and after 10-12-1964. The shareholders are requested to notify immediately any change of their address to the Company.

3. The Register of Members and Share Transfer Books of the Company will be closed from 19-11-1964 to 30-11-1964 (both days inclusive).

4. Such of those shareholders who are not liable to pay Income-tax may apply to the concerned Income-tax Officers for Income-tax Exemption Certificate under the proviso to Section 194 of the Income-Tax Act and file the same with the Company on or before 1-12-1964. In such cases of compliance, no deduction of Income-tax will be made from the dividends.

N.B. Holders of Blank Transfers are advised to have the shares registered in their names in time before closure of books.

(By Order)

SESHASAYEE BROTHERS PRIVATE LTD.
Managing Agents & Chief Engineers.

TIRUCHIRAPALLI,
12th October 1964.

MADURA MILLS COMPANY LIMITED

Registered Office:
New Jail Road, MADURAI

NOTICE IS HEREBY GIVEN THAT IN connection with payment of interest to Debenture Stockholders, the Debenture Stock Transfer Register of the Company will be closed from 16th to 30th November 1964, both days inclusive. It is recommended that:

1. All persons holding debenture-stock on blank transfers should immediately arrange to have the stock registered in their own names, as the Company will pay interest only to the person(s) in whose name the stock stands on the date of payment of interest.
2. Stockholders desiring interests to be paid to Banks or other Mandatees shoud register the mandates with the Company before 16th November 1964.
3. Intimation of any change of address should be given to the Company immediately.

27th October, 1964.

JESSOP AND COMPANY LIMITED

NOTICE IS HEREBY GIVEN THAT IN compliance with the provisions of the Preference Shares (Regulation of Dividends) Act, 1960, the Board of Management has sanctioned the payment of an interim Dividend on 5 per cent Cumulative Preference Shares for the half-year ending 31st October, 1964, at the rate of Rs. 3.25 per share subject to deduction of tax in accordance with the Finance Act currently in force.

The Preference Share Transfer Register will be closed from 16th November, 1964 to 20th November, 1964 both days inclusive.

Dividends will be paid only to the Shareholders whose names are registered in the Books of the Company on the 20th November, 1964, or to their Mandatees.

By Order of the Board,

K. S. BASU,
Secretary.

63, NETAJI SUBHAS ROAD,
CALCUTTA, *30th October*, 1964.

THE BOMBAY BURMAH TRADING CORPORATION, LIMITED

NOTICE

NOTICE IS HEREBY GIVEN THAT THE One Hundred and First Annual General Meeting of the Shareholders of the Corporation will be held at the Tata Auditorium, Bombay House, 24, Bruce Street, Fort, Bombay 1, on Wednesday the 25th November, 1964, at 4-30 p.m. (S.T.), for the purpose of transacting the following business:—

1. To consider and approve the Statement of Accounts for the year ended 31st May, 1964 and the Balance Sheet as well as the Reports of the Board of Directors and Auditors.
2. To sanction the declaration of a dividend.
3. To appoint a Director in place of Mr. M. G. R. Aitken who has attained the age of 67 years and who retires by rotation and, being eligible, offers himself for re-appointment; and to consider and, if thought fit, to pass the following Ordinary Resolution of which special notice as required by Section 281 of the Companies Act, 1956 has been received by the Corporation:—

   "Resolved that Mr. M. G. R. Aitken who has attained the age of 67 years and who retires by rotation be and is hereby re-appointed a Director of the Corporation and it is hereby specifically declared that the age limit for Directors prescribed under Section 280 of the Companies Act, 1956, shall not apply to him."
4. To appoint a Director in place of Mr. Arvind N. Mafatlal who retires by rotation and, being eligible, offers himself for re-appointment.
5. To appoint a Director in place of Mr. Neville N. Wadia who retires by rotation and, being eligible, offers himself for re-appointment.
6. To appoint the Auditors of the Corporation to hold office for the period until the conclusion of the next Annual General Meeting and to fix their remuneration.
7. To appoint Branch Auditors at a remuneration to be fixed by the Board of Directors.
8. To consider, and if thought fit, to pass the following resolution as an Ordinary Resolution:—

   "Resolved that the capital of the Company be and is hereby increased to Rupees Ten Crores (Rs. 10,00,00,000) by the creation of Twenty-eight Lakhs (28,00,000) shares of Rupees Twenty-five (Rs. 25) each."
9. To consider, and if thought fit, to pass the following as a Special Resolution:—

   "Resolved that Article 67 of the Company's Articles of Association be deleted."

By Order of the Board,
WALLACE AND COMPANY,
Secretaries and Treasurers.

Registered Office:
9, WALLACE STREET,
FORT, BOMBAY 1.
Dated the 8th day of October, 1964.

Notes:

(1) Any member entitled to attend and vote is entitled to appoint a proxy to attend and vote instead of himself and such proxy need not be a member of the Company.

(2) In respect of Items Nos. 3, 8 and 9, the Explanatory Statements as required under Section 173 of the Companies Act, 1956 have been posted to the shareholders.

(3) The Memorandum and Articles of Association of the Company will be open for inspection at the Registered Office of the Company at 9, Wallace Street, Fort, Bombay, on any working day, except Saturdays, between the hours of 3 p.m. and 5 p.m., and on Saturdays between the hours of 11 a.m. and 1 p.m.

(4) The Transfer Books of the Corporation will remain closed from the 3rd day of November, 1964 to the 24th day of November, 1964, both days inclusive, for the purposes of the Annual General Meeting.

(5) Warrants in respect of dividend, if declared, will be posted to shareholders on the 27th day of November, 1964. Dividend will be payable on and from that date to those shareholders whose names stand on the Register at the close of business on the 24th November, 1964.

INAUGURATION OF THE FACTORY OF PARTICLE BOARDS INDIA LIMITED

AND

OPENING OF THE THIRD MILL OF ANIL HARDBOARDS LTD.

BY

HON'BLE SHRI LAL BAHADUR SHASTRI, PRIME MINISTER, ON NOVEMBER 1, 1964

WELCOME BY SHRI G. R. JOLLY

Managing Director, Managing Agents

HON'BLE PRIME MINISTER SHRI LAL BAHADUR SHASTRI, HON'BLE SHRI S. K. PATIL, HON'BLE SHRI V. P. NAIK, DISTINGUISHED GUESTS, LADIES AND GENTLEMEN,

On the occasion of the inauguration of the third mill of Anil Hardboards Limited and the mill of Particle Boards India Limited, I welcome you all here today.

As originally planned, we have rigidly kept to our planned progress and within the last six years, we see the third mill commissioned today by our Hon'ble Prime Minister, who had inaugurated our First Hardboard Mill with his auspicious hands at this very premises on 22nd November 1958. I am extremely grateful to the Hon'ble Prime Minister for making himself available for the purpose in spite of his very heavy engagements.

The first Hardboard Mill and also the Insulation Board Mill started in November 1961 are contributing to save foreign exchange worth a crore of rupees every year. Besides catering to the country's civilian requirements, we are fully meeting the needs of the Defence Department required for the border areas from Ladakh to NEFA, by even continuously working round the clock, including Sundays and holidays. Every effort is made to export our products in spite of heavy obstacles and competition in the international market. I am pleased to add that our mills have carved out a

Shri G. R. Jolly

marked and dominating place for its supplies in the Middle East countries, and our products have also started penetrating into the highly competitive fibre-board markets in U.K. and Africa as well.

We have in hand our next progressive move to manufacture mineral wool boards and tiles —completely fireproof, besides possessing acoustic and thermal advantages. This product will create revolution in the vast field of building industry. This being the first mill of its kind in this part of the world, will earn foreign exchange to the tune of about a crore of rupees.

Particle Boards

Being the pioneers in the hardboard and insulation board industry in India, we are offering to the building industry another product, viz., particle board. Particle board had its initial development in the last two decades. Being highly competitive and economical, its production and use have spread considerably. Particle board is an economical and suitable substitute for the more expensive and inadequately available building boards and construction timber. We aim to maintain the manufacturing standards of our particle board strictly as per the internationally acceptable specifications also to earn much needed foreign exchange for our expanding economy.

We are indeed happy to announce that the Company has already received industrial licence and are going into production soon for the manufacture of Moulded Particle Boards, which will be the third plant of its type in the world.

We are indeed fortunate in having in our midst our Hon'ble Prime Minister, Shri Lal Bahadur Shastri, for inaugurating both the mills. We extend our sincere thanks to him, to Hon'ble Shri S. K. Patil, Hon'ble Shri V. P. Naik and other Cabinet Ministers and other distinguished guests for gracing this occasion.

THE FUTURE OF PARTICLE BOARDS IN INDIA

By JASWANT SINGH MATHARU

Development Officer (Timber)
Directorate General of Technical Development
Udyog Bhawan, New Delhi

PARTICLE Boards differ from the more well-known fibre boards in that these are composed of distinct particles (splinters, flakes, shavings, chips, shives, etc.) of wood or other ligno-cellulosic fibrous materials which are bonded together by an organic binder—generally Urea-formaldehyde or Phenol formaldehyde resin. F.A.O. has tentatively classified particle boards on the basis of density. Most of the current indigenous production of particle board lies in the medium density range, viz. 400-800 kg/cub. metre; one unit is also manufacturing considerable quantities of low density insulation type particle board from sugarcane bagasse.

Raw Material Base for Wood Panel Products

The quality of wood raw material required for the manufacture of panel products like plywood, fibre board and particle board varies widely. Technically speaking, fibre boards and particle boards manufacture can be based on a fairly wide range of ligno-cellulosic fibrous materials such as wood waste residues from groups of saw mills, wood working factories, plywood factories. forest management wastes, forest thinnings and lops and tops of trees, secondary or non-commercial species of timber of low economic value under the existing pattern of forest utilisation, fuelwood, sugarcane bagasse from sugar mills and agricultural wastes like jute sticks.

Contrary to this broad range of wood and other ligno-cellulosic fibrous materials that can be successfully utilised for particle board and fibre board manufacture, the raw material base for the other important wood panel product, plywood, is comparatively narrow and the quality of wooden raw material required is exacting and of a high order. No doubt in recent times it has become possible to use successfully more and more species of timbers; the quality of logs required for economical manufacture of plywood is however still of a high order—large, cylindrical, defect-free logs always give better yields. Secondly, the transformation co-efficient of plywood manufacture is rather low—roughly speaking, less than half of every cubic foot of log timber peeled is reflected in the finished plywood. The manufacture of particle board and fibre board, on the other hand, enables us to convert these low economic value wood wastes mixed with forest management wastes into a board material of high economic value. This need not be taken to mean that plywood has no future. Plywood has a bright future on the basis of its intrinsic superior mechanical properties and would continue to forge ahead in its special fields of use. There need, however, be no doubt that in the next 50 years particle board and fibre board industries will expand much faster as compared to plywood. The faster growth of particle board and fibre board industry will not only enable us to bridge the gap between the demand and supply of board products in the years to come but will also go a long way in improving economies of our national forests.

Trend of Particle Board Production and Consumption in Other Regions of the World

Particle board is essentially a post-war development though considerable work on the laboratory manufacture of particle board was done during the last war in the major forest products research laboratories of the world, including the Forest Research Institute, Dehra Dun. The work done on the utilisation of indigenous species of timber and jute sticks for particle board manufacture by Dr. D. Narayanamurti deserves special mention. The successful commercial exploitation of the basic research on particle board manufacture, however, took place in post-war West Germany. World particle board production increased from less than 15,000 tons in 1950 to more than two million tons by 1960 and its consumption increased more than eighty times. It would be obvious from these facts that there is enormous scope for the growth of particle board industry in India. Added to this enormous scope for future development in investment required per daily ton of particle board capacity is a little less than half of that required for fibre board. The investment per daily ton, however, varies considerably with the process of particle board manufacture adopted. Location of a suitable site for particle board is less critical as compared to fibre board because water requirements for particle board are almost negligible whereas for fibre board large quantities of fresh water are required. Power requirements per ton of particle board vary from 100-300 kilowatt hours, whereas in case of fibre board the requirement is 300-800 kw.h.

The adequate availability of urea formaldehyde resin at reasonable prices is an important consideration in the economics of particle board manufacture.

The particle board industry would need about 700-1,000 tons of urea formaldehyde resin solids during 1964 and by 1965-66 this requirement is likely to rise to a minimum of 2,000 tons of resin solids per annum. It is, therefore, necessary that the indigenous manufacturers of urea formaldehyde resin adhesives should gear up their plants to meet the rising demand for urea formaldehyde resin adhesives from the fast expanding particle board industry. It is quite on the cards that by the end of the

(*Continued on page* 831)

Shri Lal Bahadur Shastri, Prime Minister, declaring open the third Mill of Messrs. Anil Hardboards Ltd. From left to right: Shri S. K. Patil, Union Minister for Railways, Shri Chunilal B. Mehta, Chairman of the Company, and Shri G. R. Jolly, Managing Director, Managing Agents.

Shri Lal Bahadur Shastri pressing the button to switch on the mill.

SHARE OF PARTICLE BOARDS TOWARDS BETTER UTILIZATION OF FOREST WEALTH IN INDIA

By G. R. JOLLY

INDIA is one of the few countries of the world representing many pleasant, unpleasant, curable, incurable, traditional and non-traditional extremes of climate, religions, customs, flora and fauna and other related aspects of nature. Forests have had their share of extremes to a pleasant or perhaps unpleasant degree which is reflected in a wide variety of plants, flowers, bushes and trees growing throughout the length and breadth of the country. It is estimated that the number of species of timbers growing in India run into four figures, which taken on a theoretical basis, are expected to deliver to Indian consumers of timber virtually everything that one expects and wants from wood, especially for constructional purposes, viz. beauty, durability, strength, economy and flexibility. The situation, however, when viewed on a practical basis is very different and often discouraging—but challenging—providing lot of material of thought to Indian and world technologists, foresters and economists. This has also been responsible to a great degree for encouraging and nourishing both fundamental and applied research and enquiry on timber utilisation in India.

The number of Indian timbers actually fit for utilisation directly in their natural form is rather limited and their quantity has also been dwindling continuously as unfortunately very little attempt was made to replenish the quality and quantity used since time immemorial. The shortage of good grade constructional timber was felt by Indian and world construction industry during and especially after the Second World War rather acutely. There were two alternatives left for the forestry and timber utilisation agencies to meet the situation, either to plant fresh trees of selected species or to find methods and technologies to utilise non-favoured, non-traditional and so-called inferior species in all forms and stages of growth. The first aspect of utilisation has obvious limitations as it takes a long time for a tree—even under favourable conditions of growth—to attain utilisable maturity. Under the present circumstances, the second alternative is the only way to put wood to the service of construction industry.

Wood seasoning and preservation were one of the earliest methods adopted for utilising timber from non-durable species in certain form and grade of growth for many construction jobs. These procedures, however, have obvious limitations, thus leaving a large proportion of a tree either unusable or fit for uneconomic use such as fuel. It was further very difficult, if not impossible, to get the product in sheet form of uniform texture and properties. A better step towards more efficient utilisation of solid wood was its conversion to plywood, which also went a long way towards improving the basic properties of solid wood and enlarging the fields of its applications. Plywood, however, can be manufactured out of long clean cylindrical logs from certain species and even while working with the selected material an average maximum of 40 per cent can be converted to sheet form—leaving more than half of the valuable timber in a state fit for uneconomical use only.

Manufacture of fibre boards such as hardboard and insulation board allow a conversion of more than 90 per cent of wood to highly efficient multi-purpose building product combining qualities such as covering, insulation, decoration and protection in one material.

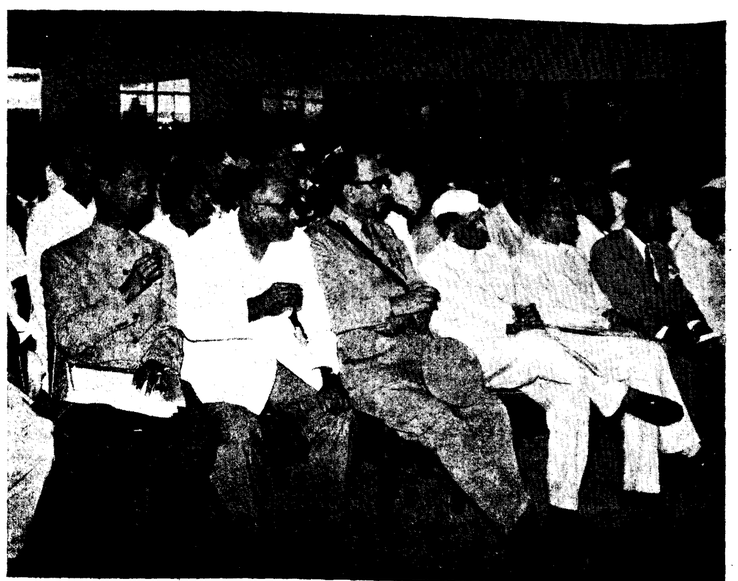
Manufacture of fibre board is thus an industry of national importance allowing hitherto neglected species of wood to conversion of an excellent material—thus helping in preservation of fast dwindling forest wealth of the country. We were the pioneers in introducing this industry in the country and are happy to make our own contribution towards a better utilisation of our national forest wealth. We are further glad to note the growth of this industry. The production capacity of our first mill has been increased by incorporation of another hardboard unit.

Conversion of wood to particle board allows the manufacture of a product of thickness beyond that of fibre boards and still permits over 80 per cent utilisation of wood of all grades. This product was developed not only for better utility of wood but also for removing and reducing some of the inherent defects of solid timber such as dimensional instability, susceptibility to insect and fungal attacks, inflammability and extreme variation in physical and chemical properties. Particle board can find applications in various fields where hitherto plywood and solid wood have been the favoured items of construction.

We are again happy today to start an industry in conformity with the latest line of thinking in timber utilisation and hope to make available to Indian consumers a product, which while combining the basic qualities of solid wood, possesses various improved characteristics by reducing some of its fundamental handicaps.

Shri Lal Bahadur Shastri, Prime Minister, inaugurating the factory of Messrs. Particle Boards India Ltd. From left to right: Mrs. Shastri, Mrs. G. R. Jolly and Shri S. K. Patil, Shri G. R. Jolly, Managing Director, Managing Agents, is on the extreme right.

Shri Lal Bahadur Shastri switching on a button which started the mills. From left to right: Shri S. K. Patil, Shri V. P. Naik and Shri G. R. Jolly.



A view of the audience.

PARTICLE BOARDS—SUBSTITUTES AND SUPPLEMENTS

By DR. V. B. KUMAR

WOOD has been a favoured item of construction probably ever since the dawn of creation. While recognising its superior constructional, technical and architectural advantages, mankind was alive to its down-grading and unfavourable handicaps, such as instability, movement due to humidity changes, swelling and shrinkage, vulnerability to fire, insect and fungal attacks. Timber constructions were thus viewed with suspicion and associated—often unjustifiably—with temporary structures as against concrete and brick construction considered everlasting. A dream of the timber technologist from centuries has therefore been to remove or reduce these handicaps by artificial means.

Since wood is a material of organic origin, its physical, chemical and structural properties are subject to wild variation due to many controllable and uncontrollable influences. Thus there is a wide overlapping field between superior and inferior types of wood which has introduced always an element of uncertainty whenever a particular type of timber was chosen or recommended for any job demanding endurance, strength and stability. Majority of the strength tests for wood are destructive in nature which very often could be economically used only as post-mortem analysis for failed structures as it was practically impossible to test every part of every species designed for structural uses. economically. A large safety factor was therefore introduced whenever timber had to be utilised or recommended for risky assignments. Another dream of timber technologists has therefore been to "tame" these variations within reasonable and predictable limits.

Dr. V. B. Kumar

Among many possibilities, conversion of natural wood to a suitable synthetic material through precisely controllable steps of manufacture, was one of the achievable aspects. By this procedure one could, not only perform routine tests for a continuous check of quality, but by employing suitable modifications or alterations, the product tailored to any particular need could be fabricated. Manufacture of particle board, hardboard, insulation board, etc. offer such a possibility. Whereas hardboard and insulation board are well-known products in India, particle board is the most recent development.

Particle board has had its most extensive commercial manufacture in West Germany, especially after the Second World War. Germany was required to surrender a substantial portion of its forests to the allies as war reparation and was consequently faced with an acute shortage of good quality industrial and commercial timbers suitable for plywood industry. This provided an impetus for the German machine building industry and forest research to look for processes and equipment for moulding second grade commercially useless wood species to a multipurpose building board urgently needed by the devastated German building industry and economy. The product when developed and perfected was almost immediately commissioned for multipurpose utilisation by German building industry. The manifold continued expansion of particle board industry is a testimony to its satisfactory performance for the purposes it is designed and its ready acceptance by consumers for many applications so far claimed by solid wood, block-board or plywood. Ironically, the punishment inflicted on Germany proved an immense commercial blessing for her as large number of plants for the production of particle board were sold by her to the conglomeration of nations forming the winning side of the last World War. Incidentally, this development offered an economically workable possibility for making available to the builders in underdeveloped and forest-poor countries, a product for diverse utilisation.

The details of manufacture of particle board are explained elsewhere on this page. The motivating idea at the back of the development of this industry was to mobilise the favourable characteristics of natural timber and waterproof, insect-proof, strength-providing properties of synthetic resins in a balanced way. This combination reduced some of the serious handicaps of natural wood. The demand of the raw material for its manufacture is not very exacting—almost any moderate density species can be applied. By altering the manufacturing conditions, a wide variety of products can be obtained from the same material so that the inherent characteristics, merits and demerits of timber used for its manufacture becomes only of a secondary rather than of decisive importance.

Particle board could be considered as an adjunct to hardboard, semi-hardboard and insulation board (commonly designated as fireboard) and so to say, takes over where fibre board stops. Common manufacturing thickness range of fibre building board is between 3 and 12 mm, 3 mm being the most extensively produced and used, whereas particle board is fabricated in a range of 6 to 35 mm. or more, most common being 19 mm. Its strength properties, dimensional stability, water resistance, etc. is adequate for most common purposes in furniture and building industry.

Particle board offers a uniform defect-free surface which could accept most of the external decorative treatments normally given to plywood or block board. Thus it could be veneered by commercial and/or decorative veneers from ornamental species of wood thereby extending its horizon of applications both for utility and luxury constructions providing an economic substitute for thick plywood and block board. The appearance of the raw uncovered board is a pleasant blending of æsthetic characteristics of natural wood and improved man-made modern synthetic surface. With appropriate techniques particle board can accept all types of paints, lacquers, enamels, etc. which allows its use for table tops, flooring, panelling,

(*Continued on page 831*)

At a meeting held later, Shri G. R. Jolly welcomes the Prime Minister. Seated from left to right are Mrs. Shastri, Sir C. B. Mehta, Shri V. P. Naik, Hon'ble Prime Minister, Shri N. K. Petigara, Chairman, Particle Boards India Ltd.

The Prime Minister blesses the new mills.

INTRODUCING PARTICLE BOARD

By R. C. KOHLI

THE manufacture of particle board consists of reduction of solid round wood into thin chips and then gluing them together with suitable adhesives in hydraulic press to form a sheet under the effect of heat and pressure. Though most of the species can be used in this industry, yet it is advisable to use woods of lighter density and colour. After moistening and debarking of the raw wood, it is fed into chipping machines where it is reduced to thin chips of specified thickness. Generally, chipping machines which produce flat and thin chips are preferred for surface layer chips which are also passed through a beater mill for reducing the size of the chips still further. In a plant, where there is provision for processing the surface-layer and core-layer chips separately, two chipping machines are installed, each producing chips for surface-layers and core-layers respectively. In other plants, chips from all the machines are mixed together and, therefore, either they are used to make a one-layer board or they are separated by wind blasts at the time of spreading to form a three-layer board. After leaving the chippers and beater mills, the chips are carefully dried in steam-heated mechanical driers to a particular moisture content whereafter they are fed in storage bins, till they are required for gluing process. Simultaneously, the gluing material, urea formaldehyde resin in admixture with a suitable hardner and water-repellent reagent are kept ready. Now the dried chips from the storage bins are fed into mixing machines where they are sprayed with resin solution by means of pressed air and led into spreading

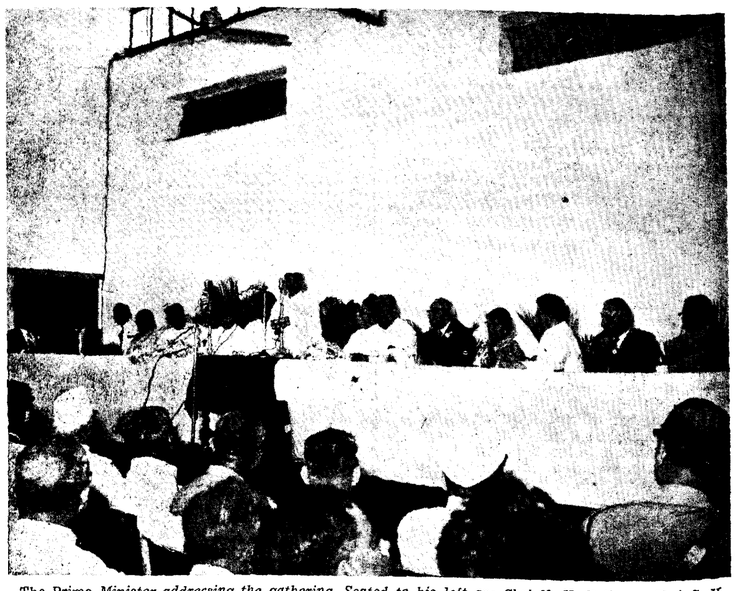
Shri R. C. Kohli

machines. From here, a measured quantity is allowed to be spread uniformly on press cauls to give a desired thickness of the end-product. Generally, it is a continuous process and the cauls travel one after another in a row and stay in a loading device after the spreading machines, before they are fed into the hydraulic press for pressing. Now these cauls carrying glued chips are led into the hot press and pressed for a suitable period depending upon the thickness of the board, quality of resin used and quality of board desired, till the resins set to its final form and excess moisture escapes. After the pressing time is over, the press is opened, the boards along with the cauls are taken out of the press by an automatic device. Immediately thereafter, the boards are separated from the cauls and stacked for conditioning before being trimmed, sanded and despatched. The boards produced by this technique are strong, tough and possess dimensional stability to make it suitable for furniture and constructional purposes. Further, by the orientation of oblong, laminar thin chips into a definite direction, and their overlapping gluing, wood chip material with oriented strength can be obtained. There is also another process for the manufacture of particle boards known as extrusion process which is similar to the above-mentioned process but differs in technique. In this, chips are not spread into sheets before pressing but they are fed in lots into an extrusion press with heated sides. As the orientation of the chips is such that there is little scope of satisfactory interlocking of the fibrous particles, the board is considered to be of an inferior quality. Hence it is necessary to cover it with veneers on both sides to impart its strength, stability and make it pleasant to appearance. Owing to its inferior qualities, the extruded boards have a restricted use in the furniture industry.

Since the introduction of particle board, several processes were developed but in the beginning most of them were not successful, as the raw materials were not specially prepared and flaked but consisted mainly of scrap and saw-dust which resulted in panels with inferior physical properties. In the simple one-layer board system, made out of an admixture of fine and coarse flakes, where coarse particles

Another section of the large gathering present on the occasion

★



The Prime Minister addressing the gathering. Seated to his left are Shri N. K. Petigara, Shri S. K. Patil, Shri A. D. Shroff, Mrs. V. P. Naik, Shri S. G. Barwe and Shri M. H. Hasham Premji

are imbedded in fine ones, the boards must be veneered or coated with plastic films. In the three-layer boards, the coarse and fine flakes are separated and hence impart not only superior technological properties to the boards but also enable to obtain a graduated structure and smooth and flawless surface.

Research and Industry

Though almost every ligno-cellulosic fibrous material can be utilised in the manufacture of particle board, yet it is imperative that a thorough investigation be carried out for the economical utilisation of raw material towards a technically sound end-product. Particle boards were prepared from jute sticks (Narayananmurti and Kohli 1961), followed by other raw materials (Narayananmurti and Jain 1963) and it is quite evident that there exists a sound basis for the development of this industry in India. As far as can be judged, considering various factors, an enormous increase in production and consumption of particle board can be expected during the coming five years. On account of its distinctive features it has been possible to utilise particle boards in almost every place where wood and plywood were used previously and, therefore, it is bound to play an important role in providing an impetus to building and housing industries in India.

(Concluded from page 827)

fourth Plan, the particle board industry would become the major consumer of urea formaldehyde resin adhesives in the country. As the formulation of urea formaldehyde resin adhesives required by the particle board industry are somewhat different from those required by the plywood industry, the indigenous manufacturers should come forward to tailor their adhesives to suit the requirements of the particle board industry. It is estimated that by the end of the fourth Plan the particle board industry in India would consume about 8,000 to 10,000 tons of resin solids per annum. The developing plastic industry in India would, therefore, have to think ahead to meet this rising demand for synthetic resin adhesives from the wood panel products industries.

Urea formaldehyde adhesive industry is developing quite well in the country and there is reason to believe that the demand from the growing particle board industry would be met in full.

(Concluded from page 829)

etc.—a field where so far solid wood, plywood and block board have been dominating.

Particle board further provides an excellent substrate for virtually every type of wood working glue, which allows its adhesion not only to other wood-based materials but also to high polymeric plastics, such as melamine, polyvinyl chloride, phenolics, etc. which further makes it a suitable foundation material where enhanced resistance to water, scratch and heat is desired—particle board can thus find a welcome entry into modern kitchen construction.

Since particle board is generally a medium density woody product with sufficient air space in between it combines the heat and sound insulation capacity of soft insulation board with the strength and compactness of hardboard in a balanced way and can be employed for the construction of false ceilings and protective panelling. On account of its gluability to other wooden materials it can either substitute or supplement the conventional items of construction.

Like any other traditional items of construction particle board had to overcome considerable opposition in every country—including Germany—during its initial entry into the field of construction. The users were however quick to recognise its potentialities which are reflected in its maximum rate of growth all over the world out of all other competitive wood-based materials such as plywood and block board. It is hoped that particle board will find its due place and share in the quickly expanding Indian economy and fast growing industrialisation.

We extend our Best Wishes
& Hearty Congratulations to
M/s. Particle Boards India Ltd.

on the occasion of the
Inauguration of their new Mills
and we are proud to
associate ourselves in completing all the
CIVIL ENGINEERING WORKS
for their new Mills.

MARKET GOSSIP

(*Concluded from page 795*)

fied and ultimately withdrawn as soon as we can do it without endangering the future of British economy. But let me make it clear that this restriction runs counter to the British emergency action dictated by the situation that we found on assuming office."

The trading countries of the free world as a whole, however, have not quietly accepted the surcharge, though none of them has resorted to any retaliatory measures. The Council of G.A.T.T. which held a discussion on 30th October 1964, has appointed a twelve-member group to go into the details of Britain's import curb and examine its balance of payments position. The group will study the effects of surcharge on the other member-countries and discuss the possible alternative measures with the British Government. At the G.A.T.T. meeting, the criticism came mainly from the E.E.C. In a *communique*, the Commission of the Six said: "Countries trading with Britain, including the E.E.C., are seriously affected by the measures taken by the British Government, and the Commission has asked itself whether measures increasing protection are in fact appropriate. It feels they are not. The Commission finds it regrettable that the British Government made no prior approach to the countries with which it has trade relations and which are fellow-members of several international organisations." The indications are that the E.C.M. countries would prefer to terminate or at least postpone the tariff negotiations under the Kennedy Round. They have already expressed their reluctance to deposit their exceptions list on the scheduled date of 16th November.

The mounting opposition to the British step in the European countries may well have an immediately adverse effect on Britain's means of meeting the balance of payments gap. The country needs to activate its standby credit of $1,000 million from the I.M.F. But the I.M.F. has very little supply of currencies—namely, German marks, French and Belgian francs and Dutch guilders—which Britain requires; and in order to meet the requirements of Britain, the I.M.F. will have to raise new funds in Europe. For that, it will have to activate the borrowing agreement according to which the Paris Club—comprising ten industrial countries, mainly European—had promised conditionally to provide a loan of upto $6,000 million. If these countries are not pacified, it is quite possible that some of them may refuse to honour the agreement or delay payment. In that case, the I.M.F. will be put to difficulties in accommodating Britain.

Although only 13 per cent of the exports of Commonwealth countries are estimated to be affected by the new surcharge, in the case of India it will tell on over 28 per cent of its exports to Britain. As pointed out by Mr. K. P. Goenka, President of the Federation of Indian Chambers of Commerce and Industry, early this week, "the mere fact that a number of India's manufactured and semi-manufactured products like cotton textiles, Jute, wollen carpets and rugs, East India kips—including tanned, semi-tanned and treated leather-coir manufactures and newly developing lines of exports like engineering goods, which had hitherto enjoyed duty-free treatment, would now attract a levy of 15 per cent *ad valorem*, cannot be viewed with equanimity, especially because larger exports for the Indian economy are vital for the success of our current and the next Plan." The Federation has urged the Government of India to seek a high level meeting with the British Government, so that the problems of the developing Commonwealth countries, in seeking greater outlets for their manufactured and semi-manufactured products, do not receive any serious setback. The Indian Cotton Mills Federation has also stated, in a Press note, that the new surcharge has forced the duty-free imports of Commonwealth countries into the arena of commercial negotiations and thus the Commonwealth countries have been placed on par with the other countries in regard to which the British Government could always change the import duties. Mr. G. G. Siraj, President of the All India Exporters' Chamber, has pointed out that, while levying a surcharge, the British Government should have respected the long-established principle of preferential treatment for Commonwealth goods. He has estimated that, as a result of the British levy, the exports of cotton textiles to Britain will drop by 20 to 25 per cent.

India's official reaction to the surcharge has been more of sorrow than of anger. The Indian representatives at the G.A.T.T. Council charged the British Government with the failure to take into account the effects of the surcharge on the Indian economy. He made an interesting point by pointing out that items like kips, cotton, jute and coir yarn and grey cloth were considered as raw materials for British industries and as such these goods should be exempted from the surcharge.

The British Government is not likely to accede to the demands of India—and for that matter of any other country—which has asked for a special treatment to its exports to Britain. It has been pointed out by British spokesmen that non-discrimination is one of the important merits of the surcharge and that, if special treatment is accorded to the imports from a particular country, or a particular group of countries, their Government will be accused further for discrimination. Sir Paul Gore-Booth, however, observed in Bombay last week, that, in the case of cotton textiles, the regulating quota and surcharge on such imports are different measures, designed to meet two distinct situations, and hinted that India could negotiate with the British Government on its difficulties in this particular context. It is now for the Government of India to take up the matter with the British Government, so that, if the surcharge is not removed or reduced, in the near future, at least the import quotas for cotton textiles may be suitably adjusted.

VOL. CIX. No. 2795 BOMBAY, 14th NOVEMBER 1964 PRICE Rs. 2

MADRAS PETROLEUM PROJECT

THE Union Oil Ministry, now bearing the name of Ministry of Petroleum and Chemicals, became the big, imperious Moghul of the Government of India when Mr. K. D. Malaviya took over the portfolio. Its deals were conducted in great secrecy and the Press got only such information as the Minister was pleased to give. Even reports and data were made available only long after they had become old and ceased to be of any current value. But this did not mean that the Ministry was successful in maintaining secrecy. The interests concerned managed to get all they wanted and so also the special representatives of daily newspapers stationed at New Delhi. Mr. Malaviya's exit has made no significant difference in this respect, with Prof. Humayun Kabir zealously following the dubious traditions of his predecessor. The Government has, therefore, to blame itself, if it feels that comments in the Press on its oil deals are not well informed. A typical, latest instance is provided by the Government's decision about the Madras oil refinery project. Official information on this important development consists of only a few words. All that one is told is that the Government has selected as its partner the National Iranian Oil Company and the American International Oil Company out of a large number of foreign companies that competed for this project and that it will carry on further negotiations with this group. It has given no reasons for choosing this group as its collaborator in preference to the well-known international oil companies that have been operating in this country for a long time now. Nor has it taken the public into confidence by giving such details as are already agreed to. Nevertheless, a flood of material claiming to be the details of the deal has appeared in the daily Press. One does not know as to how much of it is speculation, but the reports have a ring of authenticity about them. In any case, they do not appear to have been contradicted by the Oil Ministry or by any of the oil companies that made a bid for the Madras project. Would it not have been better for the Government to have published the main features of its broad agreement with the Iranian-American combine for the benefit of both the public and the entire Press?

It has been known for quite some time that the Government has been in favour of two new refineries of 2.5 million tonnes (in terms of crude) each, one in Madras and another in Haldia. A decision has now been reached at Cabinet level that work on the Madras refinery should be expedited, so that it may go on stream by the middle of 1967 and achieve full production in 1968, and that simultaneously the necessary preliminaries for implementing that Haldia project should also be taken up; this means that the Oil Ministry will soon initiate steps for choosing a foreign collaborator. A village, Manali, north of Madras City, has been provisionally selected as the site for locating the refinery. The Government also proposes to have a sulphur extraction plant, a lubricant plant, a petro-chemical complex and a fertiliser plant near the Madras refinery and reports are that the Iranian-American Combine will participate in all these projects as well. It is said that the Combine will provide equity participation to the tune of 26 per cent and a foreign exchange loan repayable in 10-12 years. The daily Press versions about the respective shares of equity and loan vary. One report says that the total of both equity and loan would be $60 million (about Rs. 28.80 crores), while another puts the loan at $40 million (Rs. 19.20 crores). There is no indication whatever about the rates of interest and the repayment terms. Anyway, on the face of it, the loan appears to be a hard one. Besides, the foreign exchange facilities offered, it is said, will not be adequate to take care of the requirements of all the projects mentioned above. It is just possible that the Government might find another financier and collaborator for the fertiliser project.

In the absence of details about the competitive bids made by other foreign companies, one is at a disadvantage in making a comparative study of the bid that has been accepted with the bids rejected. It does not, however, require much inside information to say that the amount of foreign equity participation should be large enough to cover all the foreign exchange cost of the project and to ensure that the stake of foreign investors is high enough to induce care and competence in the execution, as well as in the working, of the project. The deal with the Iranian-American Combine does not satisfy this desirable condition, for its equity investment is no more than 26 per cent, leaving the major element of risk to be taken by the Government of India. It may be argued that, in the long run, this arrangement would be favourable to India, but, in the circumstances in which this country finds itself today, the short-term and medium-term considerations are more important. The amount of dividends to be remitted abroad would be much smaller than the interest on the loan and its repayment instalments, which may fall due just at the time when the country will be faced with the onerous task of honouring the foreign debts incurred in the second and third Plans. Further, there may be no remittance of dividends at all for several years to come, if the foreign partner is allowed to participate in future expansion and marketing activities. On the contrary, there may be an inflow of fresh foreign capital.

From all these points of view, the offers made by the ESSO Standard and Burmah-Shell Group appeared to be quite attractive. ESSO was even prepared to promote an export industry and through it earn enough foreign exchange to pay for the imports of crude and to meet the dividend remittances, if any, arising from its equity participation. Both these companies have been successful in erecting refineries in this country and marketing their products. Their technical competence and financial ability are well known. What was it that induced the Government to reject their proposals and accept the Iranian-American Combine's bid? Was it the desire to diversify foreign participants, a desire induced by the Government's (needless) anxiety to avoid concentration of economic power in a few hands? Were any political considerations involved? Or was its decision based on the finding that, from the economic, technical and practical points of view, the Iranian-American Combine's offer was more advantageous than the rest? The Government must answer these questions fully and frankly.

Meanwhile, one may take note here of unofficial comments in favour of the Government's decision, lest one should be accused of being one-sided. This journal, it is unnecessary to add, does not hold a brief for any oil company. Its objective is rapid economic development of the country in a climate of stability and at minimum cost. It is this test that must be applied for judging the schemes for expanding the petroleum refining capacity in this country. If the Iranian-American Combine's offer stands this test well, the Government's decision would surely carry conviction.

Some of the reported advantages of the deal with the Iranian Company are listed below, with a brief examination of the merits of each one of them:

1. The Darius crude, which will be used in the Madras refinery, is capable of yielding substantial sulphur as a by-product. A sulphur treatment plant, designed to extract 16,000 to 18,000 tons of much needed sulphur, will be attached to the refinery.

This is a technical point and the advantage claimed is better judged by experts. But even a layman may wonder whether the other companies that competed for the project could not have satisfied India's requirements in this respect. This issue apart, there are some who say that Darius crude is a new type, having been discovered only recently and that its performance in terms of various products yield has not been fully established. These observers have cautioned the Government to make appropriate safeguards in the final agreement with the Company.

2. India's chances of obtaining exploration rights in oil rich Iran have greatly improved and, if it discovers crude there, it will be assured of a substantial and regular supply of crude for its refineries without involving much foreign exchange.

There are, however, many 'ifs' here. India does not have at present sufficient skill and equipment of its own to carry out exploration of all the promising areas in the country itself. Iran, of course, is considered to be a more promising land to find oil and there may be some justification for diverting a part of our resources to that country, provided the foreign exchange cost is found in the form of equity capital from the foreign collaborators who are willing to share the risk with this country and assist it by providing the know-how. To borrow money abroad on hard terms for a gamble like oil exploration in a foreign country does not appear to be a sound proposition in the present state of our economic development. One must, however, know all the details of the contemplated venture abroad to judge its merits and demerits, though it is seemingly attractive.

3. India, a net importer of oil, has broadened its oil horizon by establishing direct contacts and partnership links with an oil-producing country, in refreshing contrast to

the state of affairs, hitherto, namely, the link through international oil companies which only serve the purpose of intermediaries.

There is some novelty in this argument. But its value should not be exaggerated. Three things must be borne in mind in this respect. First, India is now seeking to play the same role which the international oil companies have been doing for years. So this does not make any difference to Iran or to any other oil-rich West Asian country with which it may seek to enter into similar relationship. Secondly, for obvious reasons, the international oil companies are of far greater importance to Iran (and other oil-bearing countries) than India. It would be sheer moonshine to think that Iran will give this country more favourable terms than it does the oil companies. Thirdly, Iran is still an underdeveloped country and it is participating in the Madras refinery with the help of an American oil company. Indeed, it is a moot point whether India will have accepted the Iranian offer, if it had not been backed by the Pan American Petroleum Company. It is well to remember, in this connection, that the Madras refinery project includes a petrochemical complex as well, for fulfilling which Iran does not have the know-how. But for the American backing, the whole deal would be a case of blind leading the blind.

4. Supply of crude has been assured at a price more favourable than that offered by anyone so far and that too for a period of ten years.

An arrangement of this type need not necessarily be in favour of India. This pattern has been adopted for the Cochin refinery and it has now been found that it may work to the disadvantage of the country. Ordinarily, it is inconceivable as to how anyone can guarantee a price for as long a period as ten years from the time the refinery goes on stream, that is, more than 2½ years from now. But the prospects are that, with more and more petroleum and gas resources being discovered all over the world, especially in Africa and Russia, prices may go down. Apparently, it is this possibility that must have induced Iran to enter into such a long-term commitment with this country.

5. The deal will help improve the economic and political relations with Iran. India must do something effective to counter Pakistan's growing influence over Iran. Mention is made, in this connection, of the efforts of Iranian and Pakistani Governments to form themselves into a common market.

A more specious argument cannot be thought of. The major portion of India's requirements of crude are already being met from Iran. In 1962-63, 76 per cent of India's imports of crude came from Iran; in 1963-64, its share was 61 per cent. Although the percentage was lower, the absolute figures of both the quantity and value were substantially larger, as India's total imports had gone up markedly. Similarly, Iran's share in this country's imports of refined products is no less than 30 to 32 per cent. Even if the Burmah-Shell Group's bid had been accepted, Iran's exports would have gone up, as this Group obtains most of its crude requirements for the Indian market from Iran. Further, despite its closer bonds with Pakistan, Iran's exports to that country are only a fraction of those to India. Pakistan's total imports from Iran in 1962-63 were no more than Rs. 14 crores, as against India's imports of Iranian oil alone of the order of Rs. 44 crores in that year. Pakistan's total imports of mineral oils were Rs. 25 crores in 1962-63 and were at the annual rate of Rs. 28 crores in the first half of 1963-64. So even if Pakistan obtains all its oil requirements from Iran, an unlikely event, it will be absorbing only about half of what India does. If, therefore, Iran's political relations with its adjacent countries were determined by the size of its export trade with every one of them, India should already be its best friend and ally, and not Pakistan. The fact is that it is not economic factors but other considerations that have brought Iran and Pakistan together.

As already stated, it is not our intention to condemn the deal that has been concluded with Iranian-American Combined. The object is to see whether it has greater merits than the propositions put forward by the other competitors for the project, especially the oil companies that are already operating in this country. If it has, they are not discernible. The Government, therefore, owes a clear explanation to the public, for it is the money of the general public that is going to be invested in the Madras refinery and its allied projects. That these projects are urgently needed, nobody denies. The point is that they must be implemented as quickly and economically as possible.

U.S. ELECTION AND AFTER

It was an unusually bitter election campaign this year in the United States—that major centre of world power. But all's well that ends well and the year's shocks and surprises have not had their climax, thank God, in an unexpected victory for Mr. Barry Goldwater, the Republican candidate for the Presidential election held on the 3rd instant. The world has heaved a sigh of relief that Goldwaterism —an extreme brand of conservatism, capable of deteriorating into Fascism, if tolerated for long,—has been crushed in an avalanche of electoral and popular votes captured by the Democratic Johnson-Humphrey team. By winning 44 States with their 486 electoral votes (out of a total of 50 States with their 538 electoral votes) and as many as 42.5 million popular votes (out of a total of about 69.0 million votes polled), the Johnson-Humphrey ticket has, incidentally, established a record for the percentage (nearly 62) of popular votes with its plurality of about 16 million. By all accounts, this is a resounding victory for the Democratic Party which has thus emerged as the authentic representative of the "mainstream" of U.S. national life. And, conversely, this is a shattering defeat for the Republican Party led by Mr. Goldwater who chose to stand outside that "mainstream."

That this political "mainstream" in the United States is not a myth but very much of a reality has been confirmed beyond the shadow of doubt by the electoral verdict of 3rd November. This "mainstream" is no other than the vital centre of moderate republicanism and liberal democracy, covering almost two-thirds of the American nation. It represents a broad consensus of political opinion, involving the widespread acceptance of the liberal welfare-State policies and programmes of successive U.S. Administrations (including the Republican Eisenhower Administration of 1952-60) since 1932 when the electorate plumped for Roosevelt's "New Deal" philosophy. As of now, a precise characterisation of this political current can be made in terms of some widely held beliefs—namely (i) that a moderate but steady expansion in the power and jurisdiction of the Federal Government is necessary, (ii) that the free market's distribution of incomes and opportunities is not wholly equitable and that one of the functions of the State is to correct this imbalance, (iii) that the cold war against Communism must be waged in piecemeal terms, not as an all-or-nothing crusade, and (iv) that change must be willingly accepted as a part of political life in international, as in national, fields. Thanks to these strongly and widely held beliefs, a bipartisan majority has managed to keep "mainstream' America securely on its old river bed.

In concrete terms, the aforesaid first two beliefs have been reflected in the American electorate's majority approval of the concept of "The Great Society"—a term used by President Johnson to sum up his domestic programme of equal opportunity, social security, economic strength, full employment and development of national resources. The widespread electoral support for this programme has been due in no small measure to the energetic educative campaign conducted by the Democratic candidate for the Vice-Presidency, Senator Hubert Humphrey. The fears dispelled or the ideas propagated by Mr. Humphrey deserve to be highlighted here:

The Federal Government is not a remote and all-powerful bureaucracy, constantly interfering with the people in their daily life and curtailing their freedom. A democratic Government like that of the United States is not something apart from and set against the people; it is, in fact, an extension of the people rather than their enemy.

The genius of American political thought and action is that these have constantly related themselves to the realities of life and have reflected the realisation that life is much more than logic. Hence the people have rejected utopian, dogmatic or apocalyptic solutions for their problems, whether offered by the Communists a generation ago or by the ultra-rightists of today.

The traditional distinction between urban and rural life has all but disappeared in America. Instead, there is the emergence of a vast metropolis. The needs of this metropolis in transportation, education and recreation and the eradication of poverty demand a great co-operative effort, involving the Federal, State and local Governments, as well as private organisations and individuals.

The other two beliefs of the American "mainstream," namely, that the cold war against Communism must not be waged as an all-or-nothing crusade and that change must be willingly accepted as a part of political life in international, as in national, fields, are related to the first two beliefs which have been reflected in President Johnson's domestic policy, as elucidated by Senator Humphrey, and in his victory statement that the election result "is a mandate for unity, for a Government that serves no special interest—no business Government, no labour Government, no farm Government—but a Government that serves all the people." As the beliefs pertaining to cold war and foreign affairs are not nihilistic or reactionary but positive, pragmatic, peaceful and progressive, President Johnson's foreign policy constitutes a natural projection of his domestic policy. The principal elements of his foreign policy are a commitment to strengthen the United Nations, a ceaseless effort to achieve disarmament under effective controls, a continuing programme of aid to developing countries in Asia, Africa and Latin America, an expansion of trading opportunities for these countries and, in short, a constant, patient effort to move the world, in various ways, towards peace instead of war.

Fortunately for the United States and the world, the Johnson Administration will be in a position to implement its interrelated domestic and foreign policies with the help of a more co-operative Congress. That the new House of Representatives, which has just been elected, has a bigger Democratic majority (295 Democrats to 140 Republicans) is not the only happy result. As several conservative Democrats and conservative Republicans have been unseated this time, the usual informal but effective coalition of these elements will not be strong enough, over the next two years, to obstruct or maul the Johnson Administration's progressive domestic and foreign-aid programmes. In the Senate, too, the already handsome Democratic majority has also marginally improved this time.

Whether the Administration would be able to implement this welfare and anti-poverty programme and maintain, at the same time, general economic growth with price stability is the question. Currently and in the immediate future, there is certainly some cause for anxiety in this respect. The Federal Reserve Bank of New York, for instance, has cautioned in its review for November, that, "although broad price indicators have continued to reflect a substantial degree of overall stability as economic activity has held to its strongly rising course, there is a possibility that upward pressures on prices may become more intense." Specific price increases, it is pointed out in this connection, have become more numerous of late, affecting such important products as sulphuric acid, zinc, lead, reinforcing steel bars and steel pipes. With very high operating rates in a number of industries, reports of shortages of several types of skilled labour and the possible spread of labour cost pressures spurred by the substantial gains obtained by the auto workers, price stability may now be approaching, according to the Bank, a testing period. Several commercial banks, too, have called attention to threats of an early round of inflation and urged the adoption of tighter money policies to safeguard against it. As against this view of conservative bankers, a liberal member of the Federal Reserve Board has uttered a different note of caution. This is against "permitting concern about inflation to absorb our attention so completely as to cause us to overlook a problem of quite different character —the need to foster all sustainable forces of expansion now in order to prolong current rates of growth in 1965."

How President Johnson will reconcile these divergent views (on the state of U.S. economy) in appropriate measures will be definitely known only in his message to the new Congress after his inauguration in January next year. But there are some indications already that he may frown on the threatened increases in steel prices, for, in his view, any such price increases would be hard to justify in the context of record profits made by steel producers this year. It is inconceivable that the Administration will allow price stability to be undermined by excessive price or wage increases in any crucial sector of the economy. **Several task forces have already been set up by President Johnson to report promptly on different aspects of his domestic economic, external trade and foreign aid policies. His Administration is thus closely watching the situation and can be expected to do its best to maintain the internal and external value of the dollar while implementing its promised economic programme.**

MARKET GOSSIP

Textile Control Scheme

It is, indeed, a matter for some satisfaction to consumers of cloth that, after all the confusion the scheme of partial product on and price control of cotton textiles has got into good stride. From the deliberations of the Textile Control Advisory Committee's inaugural meeting held at Bombay on Wednesday this week, it is gathered that (a) almost all difficulties of the schedule of multipliers and price allowances have been resolved, (b) the industry, trade and all the other interests concerned are extending their "full" co-operation in the task of successfully implementing the control scheme, (c) the controlled cloth (comprising *dhotis, saris*, long-cloth and shirting) is coming into the market in sizable quantities, and (d) there has been a reduction of 5 to 10 per cent in the prices of most of the controlled varieties of most mills. In the next two or three weeks according to Mr. Manubhai Shah, Union Minister for Commerce, who addressed the first meeting of the Committee, large quantities of controlled cloth would be available in the market. It may be mentioned in passing that only the mill sector is covered by these controls, with the powerloom and handlooms sectors, which together account for 40 per cent **of the total production of cloth, being outside** their purview.

The quarterly production of controlled varieties is expected to be of the order of 450 million metres, as against the actual average quarterly output of 410 million metres before the scheme was introduced on 20th October 1964. To this quantity is to be added about 40 million metres **of drill which will also be subjected to produc**tion and price control with effect from the 1st of next month. In other words, the total quantity of "controlled" cloth will be about 1,960 million metres per annum or 490 million metres a quarter or 163 million metres per month. The minimum obligation of each mill in respect of controlled cloth has been calculated in the following manner:

From the actual production (4,428 million metres) by mills in the calendar year 1963 is deducted the supply made to Defence and export. **Of the balance of internal civil packings, 45 per** cent is fixed as the *gross* obligation. Further, a rebate of two per cent on every ten per cent of supplies made to Defence and exports is deducted, and the net obligation on each mill is thereby arrived at. While fixing the obligation of each **mill, due account, one is told, has been taken of** the pattern of production and the technical capacity of each mill to produce the controlled categories.

It is proposed to revise the minimum obligation with effect from 1st April next after obtaining figures pertaining to the production, export and Defence supplies of cloth during the current calendar year. Claiming that the schedule of multipliers and processing dule of realisation multipliers and processing charges has been formulated on "a most scientific basis" Mr. Manubhai Shah held out the welcome assurance to the industry and trade that the Government would do its best to rectify any defects or maladjusments brought to its notice by the Textile Control Advisory Committee. The specific functions assigned to this Committee, by the way, are to advise and guide the Central **authorities on the enforcement of controls, to ex**amine the difficulties (if any) experienced by the industry, and, above all, to ensure that the objective of control, namely, ensuring an adequate supply of good cloth of popular varieties at reasonable prices for common mass consumption, is fulfilled. In constituting the Committee, due representation has been given to all the concerned **interests, producers, wholesalers, retailers, co-**operatives, members of Parliament and consumers.

Speaking on behalf of the Committee, its Chairman Mr. V P. Naik (Chief Minister of Maharashtra), declared emphatically that the Committee would endeavour its best to protect the interests of consumers. Without mincing words Mr. Naik warned the industry and trade against any attempt at subverting the scheme of partial control. He observed:

"The responsibility for ensuring that the prices are properly worked out according to the multiplier rests under law with the mills. I am sure that the mills will strictly observe the provisions of the law and will stamp prices correctly according to the multiplier and schedule of processing charges. Of course, it will be necessary for the Textile Commissioner to build up swiftly an adequate organisation to supervise the con**trols, the correct stamping of prices and to take** deterrent action against the defaulters . . . Suggestions from the industry and the trade to overcome practical difficulties are always welcome and these are necessary for the successful implementation of the statutory controls. But I must caution that these suggestions should not be with a view to creating loopholes which would enable either higher prices being obtained for the controlled categories or sub-standard goods being produced. While, on the one hand, it is expected that a spirit of sympathy and understanding will guide the controlling authorities, it must be made clear that the ultimate objective of controls is the benefit of the consumer. Therefore the controlling authorities will have to effectively and firmly enforce the control orders and ensure that no evasion takes place and that offenders are brought to book."

Even in regard to the non-controlled varieties, Mr. Naik wanted the producers and traders to ensure that prices would not go out of hand. He went a step further and said: "If there is speculative rise in prices, it will be necessary for the Government to think seriously about the extension of controls to other items also."

It is very clear from the observations of both Mr. Naik and Mr. Manubhai Shah that the authorities are determined to enforce the production and price controls on cotton cloth effectively. It will be in the mills' (and also traders') own interests that they play their part well and serve the consumers as best as they could. There is no reason to think that the mills will not do so, provided certain prerequisites are observed. The mills, for instance, must be encouraged to expand their capacity, rehabilitate the worn-out machinery, modernise equipment and rationalise production methods. Again, the schedule of multipliers needs to be so revised as to compensate for the steadily rising trend of cotton prices. Several mills it is stated, are paying a premium over the basic ceiling prices of different varieties of cotton in their anxiety to maintain production of cloth at a high level. This is clearly wrong. If the mills are not able to get cotton at control prices, they ought to ask the Textile Commissioner to procure cotton for them at the ceiling prices and not to demand a suitable increase in the prices of controlled varieties. But the heavy incidence of taxation—direct and indirect—on the industry which produces one of the basic necessities of life must be reduced. Unless these things are done we are afraid several mills may be compelled, by sheer force of circumstances beyond their control, to downgrade the quality of controlled varieties and to inflate the prices of non-controlled categories. The tendency to downgrade quality, as we have pointed out on more than one occasion in the past, will be prevalent especially among mills which find it really difficult to make the necessary adjustments in production schedules should they find that the bulk of their production comes under controlled categories, giving little scope for making reasonable profits.

T. T. K. On Excise And Customs

When the Government of India announced (some months ago) the decisions it had taken on the recommendations made by the Central Excise Reorganisation Committee (Chairman: Mr. A. K. Chanda) in March 1963 one hoped that something concrete would be done to streamline the collection machinery and to rationalise the content of excise duties. Nothing has been done in this direction, so much so the position in respect of excise duties continues to be practically the same as that obtaining at the time when the Chanda Committee submitted its report. Similarly in the sphere of customs duties, no worthwhile improvement has been effected in the direction of achieving maximum efficiency at minimum cost. All this has been frankly admitted by no less a person than Mr. T. T. Krishnamachari (*vide* his inaugural speech at the annual conference of Collectors of Central Excise and Customs held at Madras this week). One, however, wonders whether Mr. Krishnamachari himself could not have done anything so far at least in regard to excise duties, since the Chanda Committee's report had been submitted long before he returned to the Finance Ministry.

In his speech, the Finance Minister indicated the broad lines on which reorganisation of excise and customs could be effected. The three specific suggestions he put forward are: 1. Those excise duties which are unremunerative from the point of view of the exchequer should be removed from the list. (The Minister thinks that the Government should not levy any duty that would not yield about a crore of rupees.) 2. Levies should be compounded in as many cases as possible, though compounding invariably works against the exchequer. 3. The toning up of the customs and excise administration is necessary to prevent smuggling and to check evasion of duty. Significant in this connection are the following remarks of T.T.K.:

"Corruption in the Customs and Excise Departments account for the enormous post-war increase in evasion of duties and in smuggling, and all kinds of wrong things. I am definitely voicing the strong public feeling when I say that wrong-doers are in close touch with the officials. There is something very rotten in the whole system of recruitment of the cadres in the Customs and Excise Services."

There is no use in merely highlighting the defects in administration and condemning it in public. There could be no better way of demoralising the services. What is wanted is prompt, quiet action to eradicate the defects. The need for such action is especially urgent in the case of excise and customs which account for over one-half of the aggregate revenue receipts of the Central Government. T.T.K. aptly described them as "the bread and butter" of the Government. The budget estimates for 1964-65 place the gross revenue receipts from excise duties at about Rs. 770 crores and from customs at Rs. 337 crores, or a total of Rs. 1,107 crores. If, according to T.T.K., tax evasion is to the extent of 70 per cent, the Government must be losing something like Rs. 2,580 crores in the current financial year alone. This cannot be true, for the value of industrial production as a whole in this country even at current prices cannot be more than Rs. 5,000 crores. It would be useful if the Finance Minister explains the manner in which he has estimated the extent of tax evasion in this country. Be that as it may, greater vigilance on the part of excise and customs officials will certainly go a long way towards checking evasion of duties and enhancing the Exchequer's revenue. While the Government should, of course, mercilessly put down corruption, it must also improve the conditions of service in Customs and Excise Departments, so that the staff may not fall a prey to the temptations of receiving bribes and other favours from taxpayers.

World Sugar

It looks as though the forecast made by some London sugar dealers a few days ago about a possible decline in world sugar prices, which have been held steady at Rs. 433 (£32 10s.) per tonne since mid-September last, will prove correct. The latest reports emanating from London indicate that Brazil and Argentina have turned out to be anxious sellers of their disposable quantities amounting to about 60,000 tons and 130,000 tons, respectively. It seems likely, says the Commodities Editor of *The Financial Times* (London), that "an anxious producer, needing the cash from its sugar crop, will tempt a buyer into the market with a cheap offer and end the stalemate, which has existed while the consumers have refused to purchase in bulk." The easiness of the world sugar market may be expected to persist practically throughout next year (1965). That this expectation is justified is evident from the latest estimates made by the International Sugar Council which met at London on the 5th inst. The Council, on the basis of the data furnished by its Statistical Committee, estimated that the supplies of sugar for the free market in 1965 would exceed the minimum net import requirements of 14.76 million tonnes (including the 3.07 million tonnes to be obtained by the U.S. from foreign sources) by at least a million tonnes. Any exact forecast of available supply is, of course, not possible, in view of the non-availability of data pertaining to East European countries. But, according to available reports, the European beet harvest is progressing well and abundant sugar will be forthcoming. There is as yet no indication that the Eastern producers are pressing sales.

The overall world sugar picture being one of excess supply, the only favourable factor for recovery is that consumers' stocks for the past two years have been at a very low level and that the major question confronting the market is as to when consumers would resume restocking. A minority view in the London market suggests that, if a sale could be made above £32-10 per tonne, it might bring many consumers to the market. But this possibility is considered by several others to be very unlikely and all indications according to them, point to the possibility of a further downward drift

Additional Coffee Quotas?

Will the Executive Council of the International Coffee Agreement, which is meeting at San Salvador next month, decide to allocate any additional quotas of coffee for exporters? There is considerable speculation on this question among coffee traders the world over. One section feels that an increase in export quotas is likely, whereas another section discounts such a possibility. On its part, India is hoping for an additional quota. The aggregate export quota fixed for the year 1964-65, it may be noted here, is 47.5 million bags and the Council has an option to raise this quota by 500,000 bags before January next.

Meanwhile, an interesting development of import to the world coffee market has taken place. Under an agreement reached at London recently among the countries of the Inter-African Coffee Organisation, of which the main members are the O.A.M.C.A.F. (Cameroun, Central African Republic, Congo, Dahomey, Gabon, Ivory Coast, Malagasay Republic and Togo) and the franc zone producers (Angola and Uganda), one-third of their export quotas is being held back for the first quarter of 1964-65, that is, October-December 1964. This move, it is said, is a sequel to the need for clearing off all the coffee that was consigned for export in 1963-64 but which remained unsold during the period. The holding back has prevented an unwanted flood of robusta coffee from swamping the U.S. and European markets.

With the African countries' determination "to manage their selling as skilfully as possible," it is not surprising that coffee prices have tended to decline. The latest available quotation for Uganda Robusta grade 10 coffee (unwashed) in London is £13 2s. per cwt., as against £13 5s. a week before and the high of £16-16 touched in March last.

World Conference On Standards

An event of this week, which is of considerable importance to Indian industrialists and exporters, is the sixth general assembly of the International Organisation for Standardisation in New Delhi. The Conference was formally inaugurated by India's Vice-President, Dr. Zakir Hussain, on Monday the 9th inst. More than 500 representatives from over 40 countries are participating in the Conference, for which the Indian Standards Institution is playing host. During its 13-day session, the Assembly, which is being held in an Asian country for the first time since its inception in 1946, will discuss standardisation of various commodities to facilitate the smooth growth of international trade.

While one will have to wait till the conclusion of the present Conference to get a picture of its achievements, it will be appropriate to highlight here the importance of standardisaton, as it is a rarely discussed subject.

In the modern world today, the thought of not having standards in any industrialised country is inconceivable. The wheels of industry would very soon grind to a halt without them. Whereas standardisation is important for every country, the need is all the greater for the newly developing countries like India, as, in the ultimate analysis, it leads to the conservation of scarce resources and improving productivity.

The principal advantage of standardisation is that it helps to produce goods of uniform quality.

TREND OF SHARES

FURTHER FALL IN VALUES

(From Our Own Correspondent)

BOMBAY, *12th November*

DALAL Street continued its nine-week old downward drift, with most of the leaders registering widespread losses on tired bull liquidation and heavy bear pressure. Support was nowhere to be found and the tendency for the volume of business to pick up on declines indicated that the chances were more for a further fall than for a recovery. Trading pattern during the week confirmed earlier forecasts in this column that the market was basically weak and that share prices should seek lower levels. The market has now lost its nerve and nothing except some big, positive incentives can help it keep its head above water. In fact, the market had been expecting some kind of encouragement but the Guntur session of the A.I.C.C. proved the biggest damper. The resolution calling for a limit on urban property of individuals, though accorded excellently with the socialistic pattern of society, was viewed by the stock market with the utmost misgivings. With the food problem staring the country in the face and reports of bread riots from several States coming in day after day, the stock market could not help taking a despondent view of the future. Despite U.S. and Russian assurances, the Chinese continue to pose a serious threat and it was no wonder that President Johnson's victory in the U.S. election failed to impart any sustained enthusiasm to the market. The main point is that inflation and heavy taxation have left little for investment and no speculator, howsoever strong and clever, can carry the market with him unless he has the support of the general body of investors. At present, this support is just not there.

During the week under review, the worst sufferers were Standard, Century, National Rayon, Teleo and Indian Dyestuff, not to speak of Belapur, Tata Chemicals and Bombay Dyeing. Some of these saw fresh low levels in the current downtrend. As against the 2nd September peak of Rs. 640.50, Century was quoted during the week at Rs. 584 and Standard has been beaten down from Rs. 682 to Rs. 573. National Rayon is down from Rs. 383 to Rs. 349.50 during the course of this period while Indian Dyestuff has lost more than 11 points in the week under review to be quoted at Rs. 269. Only six weeks ago this scrip had been bid up to Rs. 315. Steel shares tried to look up early in the week on reports of larger production of saleable steel during October but initial enthusiasm was short-lived and, at the close of the week, both Tata Steel and Indian Iron showed sizable losses on the previous week—Tata Steel having eased from Rs. 148.50 to Rs. 146.25 and Indian Iron from Rs. 26.05 to Rs. 25.45. The sharp decline in Teleo rights which came in for trading during the week had much to do with the fall in the value of original shares from Rs. 265.75 to Rs. 258.50.

Among other textiles, Kohinoor escaped with small losses but it must be remembered that, at this week's level of Rs. 315.50, the scrip has lost 22 points on its 2nd September level. Apart from the main factors, the recent speech of the Union Minister of Commerce, Mr. Manubhai Shah, at the Textile Control Advisory Committee announcing the extension of control to drill, had a rather unwholesome effect on the market. His warning against violation of the control scheme at another meeting was not relished either, although it was agreed in principle that the guilty should not go unpunished. The feeling was that no industry could work successfully under periodic threats and warnings from the Government. The plight of rayon shares is not hard to understand, particularly against the background of a sizable fall in the exports of rayon cloth during last month and the decision by National Rayon to effect a substantial reduction in its prices for the November-December delivery contracts. There is apparently much more to this price cut than the recent concession in excise duty, for it is greater than warranted. The market links it to the problem of overproduction and heavy accumulation of stocks. The setback in National Rayon did affect other members in the rayon group. Indian Rayon lost seven points to Rs. 50 while Baroda Rayon declined from Rs. 68.50 to Rs. 66. South India Viscose also suffered a loss of four points to be quoted at Rs. 110 at the close of the week.

Activity in other sections was dull but prices were generally marked down. Sugars were weak and Belapur, their leader, eased from Rs. 222.25 of the previous week to Rs. 215 during the week under review and Maharashtra Sugar from Rs. 139.50 to Rs. 137. West Coast Paper furnished the characteristic example of good news failing to impress a weak market and, despite a rise in the dividend, the shares eased from Rs. 179.50 to Rs. 169.50 during the week. Tyre shares were hardly traded but chemicals were weak, with Tata down from Rs. 19.20 to Rs. 18.76, Dharamsi from Rs. 121.25 to Rs. 120 and Dhrangadhra from Rs. 113 to Rs. 112.50. Synthetics lost further ground and was quoted just around Rs. 70, a loss of Rs. 3.50 during the week. Electricity shares were well held, but, among shippings, both Scindia and Great Eastern were considerably weaker.

The story of falling prices is a very long one but what is important is that the market has broken its 24th July lows and almost all the leaders are in a much weaker position than they were then. Now the comparable levels are the lows touched on 27th May when Century was quoted at Rs. 579, Standard at Rs. 580, National Rayon at Rs. 335, Tata Steel at Rs. 141, Indian Iron at Rs. 23.60, Kohinoor at Rs. 308 and Scindia at Rs. 13.36. These levels form the future base and it remains to be seen whether the market will break these levels too. It is on the cards that they might as well drift towards these levels, unless some new factors, strong enough to change the course of the market, come to help. A technical rally is not, however, ruled out for the fall has been steep as well as continuous.

* * * *

At the time of writing, Calcutta was steady at lower levels but sentiment here, too, is induced by the same factors which have brought the Bombay market to its sorry state. The cash list is virtually neglected as in Bombay. Teas and jutes are just not wanted at the moment, though there have been transactions in engineerings at prices suitable to buyers.

* * * *

Forward shares have been easy in Madras due to lack of interest. Business in the cash section has been selective. Banks have been quiet and insurances are neglected.

SANDOZ (INDIA) TO ENTER CAPITAL MARKET

Sandoz (India) Limited, one of the 39 overseas affiliated companies of Sandoz Limited, Basle (Switzerland) manufacturing pharmaceuticals, dyestuffs, optical brighteners, textile chemicals and agronomicals, proposes to enter the Indian capital market next month with a public issue of Rs. 30 lakhs in equity shares of Rs. 10 each. This is only a part of the total new issue of Rs. 75 lakhs all in equity shares. Of the balance of Rs. 45 lakhs, Sandoz Limited, Switzerland, will be allotted Rs. 23.60 lakhs partly for cash and partly in consideration for the planning and development of the Company's medicinal herbs scheme and extraction plant. Shaw Wallace and Company Limited, which has been associated with Sandoz for many years, has agreed to take up Rs. 7.50 lakhs; and the rest Rs. 13.90 lakhs have been reserved for allotment to the existing shareholders, directors, employees and friends.

The Company has an authorised dapital of Rs. 2 crores divided into 20 lakhs shares of Rs. 10 each. So far Rs. 75 lakhs worth of equity shares have been issued and fully paid-up. After the proposed issue the paid-up capital will double up to Rs. 150 lakhs, of which Sandoz Limited, Switzerland, will hold 60 per cent. This means 40 per cent of the capital will be held by Indian nationals. The balance of the funds required by the Company will be met partly by a loan of Rs. 35 lakhs from Sandoz Limited, Switzerland, and partly by another loan of Rs. 60 lakhs from a financial institution.

The proposed new issue of Rs. 75 lakhs is meant to finance a part of the requirements of the capital expenditure and working capital of the Company's dyestuff scheme, the expansion of the agrochemical plants and the auxiliary plants and the planning of future expansion. The dyestuff plant involves a capital outlay of Rs. 80 lakhs and other expansion Rs. 70 lakhs. Requirements of working capital are placed at Rs. 20 lakhs.

Sandoz (India) has acquired the necessary licence for importing plant and machinery for the manufacture of dyestuffs and textile chemicals. A part of the equipment has already been delivered and firm orders have been placed for the rest. The raw materials for the dyestuff plant will be raised from indigenous sources to the extent possible. Those raw materials that are to be imported are expected to be made available in particular by means of export promotion licences and barter arrangements.

Sandoz began its trading operations in this country in 1947 and took to manufacturing activities in Bombay eleven years later. It has been working successfully and its results for the current year are expected to be much better than those for 1963.

POYSHA INDUSTRIAL CO., LTD.

More details pertaining to the expansion programme of the Poysha Industrial Company Ltd. (a reference to which was made in last week's issue of *Commerce*, *vide* page 800) were furnished by Mr. Madanmohan R. Ruia, Chairman of the Company, at a press conference on the 9th inst. According to Mr. Ruia, the programme envisages the setting up of two new factories at Ghaziabad and Cochin with a production capacity of three million containers per month and the modernisation of the existing factory at Bombay. By 1966-67 when the Company would reach full expansion, the gross profit is expected to be about Rs. 80 lakhs on a turnover of about Rs. 6 crores, as against the gross profit of Rs. 23 lakhs on a turnover of Rs. 1.70 crore in 1964-65 and a profit of Rs. 16 lakhs on a turnover of Rs. 1.29 crore in 1963-64. The estimated net profit for the current year (1964-65) is about Rs. 7 lakhs (Rs. 4.24 lakhs in 1963-64).

The fresh capital of Rs. 85 lakhs (including Rs. 25 lakhs by issue of right shares) will only partly finance the expansion scheme of the Company which is estimated to cost Rs. 250 lakhs. The Company has made arrangements for a long-term loan of Rs. 74 lakhs from various financial institutions. The balance of Rs. 91 lakhs is expected to be met from bank borrowings and owned funds. The Company hopes to maintain the dividend rate at 10 per cent for the current year; the dividends paid for the years 1962-63 and 1961-62 were 9 per cent and 7 per cent, respectively. The Company is the second largest manufacturer of tin containers in India. With a good demand for its products, the Company looks forward to a brighter future.

WELLMAN INCANDESCENT INDIA LIMITED

The overall position of the Wellman Incandescent India Limited, engaged in the manufacture of industrial furnaces and thermal engineering, has improved considerably, though difficulties exist in certain areas. Thus observed Mr. P. B. Deo, Chairman of the Company, in the course of his speech at the Annual General Meeting of Company held at Calcutta on 29th October 1964. The Company, according to Mr. Deo, has not been able to fulfil its production targets, first, because of a delay in receiving the import licences as a result of which the Company was unable to complete the orders for a number of contracts. Secondly, the products of the Company demand large quantities of steel plate and sections, some of which are in short supply. Thirdly, the shortage of electric energy at Howrah resulted in an extremely low utilisation of machinery.

Things have, however, improved since then. All the necessary import licences have been received. The position in regard to power supply is better. The progress of order books is satisfactory. The Company has received another substantial order from the Alloy Steel Plant of H.S.L., Durgapur. The total value of orders received from this organisation and now under execution is over Rs. 1.25 crore, and is expected to reach Rs. 1.5 crore. The operating results indicate that the Company will show a profit for the current year though no actual figures can be forecast at this stage. The erection and commissioning of the Company's products in many parts of the country are an evidence of its increased productive efforts.

The Company proposes to manufacture "Bibby" resilient couplings to the design of Wellman Bibby and Co., Ltd. a subsidiary of the company's colaborators, and place them on the market in the second quarter of the coming year.

MARKET GOSSIP

(Concluded from previous page)

In the case of consumer goods, it ensures for the consumer the quality of goods, free from adulteration, and makes it easy for them to make a choice by comparing the various brands available in the market. The standardisation of raw materials and semi-finished goods helps in the production of final products of standard quality and reduces wastage in the process of converting them into finished goods. When applied to machinery and tools, it makes it possible to standardise the process of production and results in maximum utilisation of raw materials and minimum rejections. In the case of exports, standardisation of goods satisfies the buyer that they are of uniformly good quality and pertain to the declared standard. Standardisation thus plays an important role both at home and in relations with the overseas markets.

India took standardisation in the first year of independence; the Indian Standards Institution (I.S.I.) was established in 1947, with the active support of industrial, scientific and technical organisations in the country. The aims and objects of the Institution are to prepare and promote the general adoption of standards on national and international bases, relating to products, commodites, materials and processes; to promote standardisation, quality control and simplification in industry and commerce; to co-ordinate the efforts of producers and users for the improvement of materials, products, appliances, processes and methods and to provide registration of standardisation marks applicable to products and commodities. During the last 17 years of its existence, the Institution has done some commendable work. As on 30th September last, 2,747 Indian Standards on different subjects, ranging from articles of everyday use to various industrial products, had been prepared, and 2,357 draft standards were at different stages of formulation.

The information regarding the use of these standards by the producers is, however, not so flattering. By the end of September, only 798 licences covering 242 products had been granted by the Institution for using I.S.I. Certification Mark. It seems that, in view of the scarcity of almost every type of manufactured goods in the country, the manufacturers are not much worried about sales and are not enthusiastic about affixing the I.S.I. Certification Mark on their products. Although the Institution is making efforts to encourage wider implementation of Indian Standards by holding conferences and conventions at various important centres from time to time, the major need is to make larger efforts to create standard-consciousness among the consumers. The public can assist the quality-conscious producers, as well as protect themselves, by refusing to accept the products of doubtful standard, in spite of the temptation to buy them because of their cheapness. This will be possible only where consumers become aware of the fact that the I.S.I. Certification Mark is in effect a bond given by the Institution, shouldering all responsibility about quality; that it is a mark of unquestioned reliability. As the situation exists today, the buyers give no special preference to the goods with I.S.I. Certification Mark, probably because they are doubtful about the perfection of the quality in spite of this mark attached to the products. It is, therefore, necessary that wide publicity should be given to the importance of I.S.I. standards, assuring the public that the goods bearing its Certification Mark are of uniformly good quality. The I.S.I. should launch on this educational campaign only after making sure that it is in a position to verify the claims of manufacturers accepting its Certification Mark that they do strictly follow the standards specified, and attend to consumers' complaints effectively as well as expeditiously.

Although it is important to lay down national standards, equally important is the need for an international body to facilitate close accord in the standards of different nations, in order to facilitate a faster and smoother growth of foreign trade. It is also necessary to build a system of technical documentation to help regulate the exchange of goods and services among nations. It was to serve these objectives, as well as to encourage and facilitate the development of new standards in the national and international sphere alike, that the International Organisation for Standardisation (I.S.O.) was created in 1946. Since its formation, it has endeavoured to bring together technicians from different countries for discussing their problems, thereby rendering a very useful service to the economy of the world as a whole. The present series of meetings in Delhi are, to quote Mr. H. A. R. Binney, Director of British Standards Institution, "yet another step forward in the campaign to break down artificial trade barriers."

CHECKING TAX EVASION

TAX evasion and tax avoidance within the four corners of law are as old as the system of taxation itself. This is a problem concerning not merely India but practically every other country in the world, the only difference being one of degree, or, more precisely, in the extent to which tax is evaded or avoided. By and large, however, it has to be admitted that tax evasion which is illegal (as distinct from tax avoidance which is legal), in India has increased considerably in recent years following the increase in the incidence and complexity of taxation. The common belief is that evasion of direct taxation is far greater than that of indirect taxation, such as sales tax, excise and customs duties. It is true that the total yield of revenue to the Central exchequer from direct taxes has gone up quite significantly in the past few years, from a bare Rs. 150 crores in 1950-51 (before the era of planning began) to as much as Rs. 578 crores (budget estimate) in 1964-65. But the rise would have been more appreciable had it not been for widespread tax evasion. While the exact extent of tax evasion is anybody's guess, the loss must be pretty heavy. Addressing a Press Conference on Monday this week, Mr. J. P. Singh, Chairman of the Direct Taxes Board, made the vague remark that "hundreds of crores of rupees go underground every year." Considering (*a*) the ever-increasing burden of financing economic development, (*b*) the exigency of defence requirements, and (*c*) the urgency of eradicating the several evils associated with tax evasion, no one need take any strong exception to the series of fresh measures that the Government of India has decided to take to trace black money and to catch the tax evaders; some of these measures were announced by Mr. Singh at the Press Conference just mentioned. These are:

The reward to persons giving information which would lead to the detection of large-scale taxation has been raised from 2.5 per cent to 7.5 per cent of the additional tax realised. The reward can go up to 10 per cent, depending upon the extent of the help rendered by the informant and the risk or sacrifice incurred by him in securing the information. The amount of the reward will be free of income-tax. The identity of the informant will be kept secret. The Commissioners of Income-tax will be authorised to sanction rewards upto Rs. 10,000 without any reference to the higher authorities. Interim awards will be granted in suitable cases.

Searches and raids on the premises of suspects will be intensified. A separate intelligence unit is proposed to be set up for this purpose. (About 51 searches covering 88 places have been carried out so far, and these have yielded a lot of unaccounted wealth in the form of cash, jewellery, shares, etc.)

The Income-tax Department will show consideration to anyone making voluntary disclosure of their concealed incomes and co-operating with the Government during the assessment. No prosecution will be launched against them and there will be leniency in regard to the penalty also.

Door-to-door surveys will be conducted to find out new assessees and to trace concealed assets and businesses. (It is hoped to find more than 500,000 new assessees during the current calendar year; more than 350,000 assessees have already been traced. By the end of the year, the number of people on the tax register is expected to exceed two million.)

These measures are in furtherance of the steps taken by the Government of India in the field of both legislation and tax administration to counter the evil of unaccounted money and tax evasion in a more effective manner. The Income-tax Act has been so amended as to make the arms of the law longer and more effective in finding out and bringing the tax evader to book. The Income-tax Department has now wider powers than before to search for unaccounted wealth and secret sets of account books, to seize and seal safe deposit lockers, and to compel banks to disclose the records of their customers. Unaccounted money and undisclosed investment in jewellery and valuable articles can now be brought to tax as the income of the person concerned. The secrecy provisions in the Income-tax Act and other Central direct taxes enactments have been removed. Further, the provisions regarding imposition of penalty for concealment of income has been tightened. If an assessee understates his income by more than 20 per cent of the income determined by the Department, the onus for establishing that the income has not been deliberately concealed lies on the assessee. A minimum punishment of six months' rigorous imprisonment has been laid down for persons convicted in a court for submitting false returns.

That the circulation of a very large amount of unaccounted money—black money, as it is familiarly called—is one of the factors responsible for inflationary pressures in the economy is a well-known fact which few can dispute. And the evil of tax evasion, as Mr. Singh averred, deprives not only the exchequer of financial resources but also the country of sinews for its developmental programmes, besides necessitating greater and greater tax burdens on the honest and law-abiding citizens. Viewed thus, the bold bid made by the Government of India to put down the twin evils of unaccounted money and tax evasion with a firm hand is certainly laudable. Indeed, in this task, the public should lend its stout support and unstinted co-operation.

Those who are honest and scrupulous need have nothing to fear of these Draconian measures or of the drive to catch those who have transgressed the laws. The Government, however, has to take care to see that assessees are not subjected to any undue harassment, hardship and scandal-mongering as a result of irresponsible persons turning out to be so-called informants. Secondly, it must take some positive steps to discourage persons who come forward with fabricated "stories and information" in order to wreak vengeance on their rivals or out of spite. Thirdly, the raids and searches must be conducted in a human manner, with complete regard for decency and courtesy. Fourthly, any damage suffered by the victims of search and raids (as, for instance, ripping open of furniture, walls, floors, wardrobes and cupboards) should be made good if nothing incriminating were found against them. Fifthly, appropriate steps must be taken to prevent impersonation of Enforcement Branch officials by bogus persons who cheat both their victims and the Government. And finally, there have been cases where thieves posing themselves as Enforcement Branch officials have harassed the assessees by raiding their houses and decamped after obtaining illegal gratification from the persons concerned. It is necessary for the Government to observe these conditions scrupulously, to distinguish itself from fascism, and to prevent its officials from behaving like the Gestapo.

It is also necessary to make one important point here. If tax evasion and tax avoidance are so rampant today, it is largely because of the high incidence of taxation, as well as of its punitive character. The fiscal policy is weighted excessively in favour of expropriation and offers no reward for talent and no incentive to hard work, efficiency and enterprise. It simply ignores human nature. So long as the basic causes of tax evasion are not tackled with a sense of realism, no amount of raids and searches will succeed in keeping down this evil to the irreducible minimum. The Government's failure to realise this fundamental point will ultimately endanger the very foundations of democracy and open the flood-gates to some form of totalitarian regime. Unfortunately, all available evidence suggests that the power-that-be are soaked with so much socialism that they do not realise the danger that lies ahead.

A "DIVALI" GIFT!

The Essential Commodities (Amendment) Ordinance, promulgated by the Government of India on *Divali* (5th November 1964) is notable for some novel features. It provides for summary trial by First Class Magistrates, specially empowered in this respect by the State Governments, or the Presidency Magistrates, of the offenders contravening the provisions of the Essential Commodities Act, be they traders or officials who connive at the offence. The Magistrates can pass a sentence of imprisonment in such cases, for a term not exceeding one year; and there shall be no appeal by the convicted person for a sentence of imprisonment not exceeding one month or of fine not exceeding Rs. 2,000, or both.

The provisions of the Ordinance are definitely of an extraordinary character. It is not to suggest that the traders who exploit food shortages for personal gains should be treated leniently or loopholes should be provided for unnecessary litigation. But the denial of the right of appeal, in cases where the punishment does not exceed one month's imprisonment and/or a fine of Rs. 2,000, is a fundamental departure from the democratic procedure for dealing with civil offences. The only justification for them is the prevailing emergency on the food front and the public reaction to it has been extremely mild. It remains to be seen to what extent these extraordinary powers will be justly exercised. Some are of the view that this measure has increased the scope for harassment of traders by officials. It must be kept in mind that there are six to seven lakhs of dealers in foodgrains—small and big—in the country, and it will be a stupendous task to find out which of them indulge in contravening the provisions of the Essential Commodities Act. The result will be that in many cases even the genuine and law-abiding merchants may suffer and there may be miscarriage of justice. There are already large-scale restrictions on foodgrains dealers in carrying out their normal trade activities. Their business is subject to many Government regulations and a number of periodical returns have to be sent to the Government. The Government's entry into foodgrains trade and the opening of fair-price shops have considerably restricted the availability of business to them. Moreover, the recently announced foodgrains prices leave the traders a margin hardly sufficient even for existence. Inflation has affected their cost of living as well as the cost of their business. All these will give a new impetus to the operation of Gresham's Law in foodgrains trade. As bad coins push out good coins out of circulation, so also the honest traders will yield place to dishonest ones, especially as many other avenues of trade are open to the former to carry on their business with honour and less risk. The Government distribution machinery, being what it is, will find it difficult to replace these honest traders and a vast unbridged gap will be created in the foodgrains distribution trade. The Government will, therefore, have to be vigilant and see that the measure designed for the good of the people does not become a source of trouble to them.

KIRIBURU IRON ORE PROJECT

With its abundant iron ore deposits, this country has been in a position since 1957 not only to meet the increased requirements of the domestic iron and steel industry but to step up progressively ore exports to several countries. Of the export markets, that of Japan has been, and continues to be, the most important and promising. This is not quite surprising, for the Japanese iron and steel industry, with its dependence on imported ore, has attached not a little importance to India as one of the major sources of supply on a long-term basis. It is this interest that has been responsible for Indo-Japanese collaboration in the development of the Kiriburu mine (with its proved reserves of 314 million tons of iron ore) astride the boundary of Bihar and Orissa. The relevant project, which has been under implementation since early 1959, is one of the mineral development projects entrusted to the National Mineral Development Corporation. It is, in fact, a multi-purpose project, comprising (i) the provision of a rail link between Sambalpur and Titlagarh and between Bimlagarh and Kiriburu, (ii) the expansion and mechanisation of ore handling facilities at the Visakhapatnam port, and (iii) the development of the Kiriburu iron ore deposits. Thanks to the financial assistance (Rs. 3.7 crores) provided by Japan and the U.S. President's Fund for Asian Economic Development, the project has just been completed and inaugurated this week. The aggregate capital cost (including its foreign exchange component) has come to Rs. 11.20 crores.

The target output of the Kiriburu mine is two million tons of sized ore per annum. This is in accordance with the Indo-Japanese agreement of 1958 under which Japan has undertaken to purchase two million tons of Kiriburu ore from 1964 onwards. In order to ensure regular supplies of quality ore to a secure market like that of Japan, the project authorities have devised an elaborate sampling system and constructed a fully mechanised ore handling plant. The entire ore handling operation is remotely controlled from four control rooms in the crushing, screening and sampling sections. The average grade of the lump ore, thus obtained after crushing and screening, has an iron content of as much as 63 per cent. It may be reasonably assumed that the Japanese iron and steel industry, finding the quality and price of this Kiriburu ore acceptable, may take equally kindly to the Bhailadila ore. Incidentally, the Bhailadila Project, too, is being implemented with Japanese financial assistance. When this project is completed in 1966, the quantity of ore purchases by Japan may be expected to increase substantially. Between them the two mines—Kiriburu and Bhailadila—should be in a position to export as much as six million tons of sized ore per annum after full development and thus earn valuable foreign exchange on a secure basis year after year.

FOODGRAINS HANDLING AT PORTS

In the grave food crisis of July-August last, it will be recalled, the U.S. Ambassador to India, Mr. Chester Bowles, announced a series of measures to help this country tide over the crisis. One of these was of a short-term nature, involving stepped-up deliveries of P.L. 480 foodgrains in the current year. In the context of these projected deliveries and of possible further food imports in the coming years under a new P.L. 480 agreement, another measure announced by Mr. Bowles related to the appointment of a group of American shipping and handling experts to advise the Government and port trust authorities in India on the unloading of foodgrains at ports and their distribution therefrom. In view of the recent acute congestion, following the bunching of foodgrain ships in the ports of Bombay and Calcutta, this technical group's prompt studies are of considerable significance. These studies, incidentally, have just led the group to make some recommendations for a short-term solution of the problem of handling imported foodgrains at the seven major ports of India. Presumably the team will outline in due course its ideas on the required long-term arrangements for handling foodgrains imports which are expected to continue practically throughout the fourth Plan period.

The group's present report, it is said, is a simple and brief document, dealing with the problem—that is, how best to step up the handling of imported foodgrains—at each port separately. In the opinion of the team, it should be possible to reach a maximum discharge rate of 780,000 tons of foodgrains a month, and a normal monthly rate of 650,000 tons, at all the ports together. It is significant that the team has given the finding, in this connection, that these targets can be generally achieved with little addition to available equipment and by using fewer berths than is greater co-ordination in several directions. One such direction is the advance planning of loading dates in such a manner that arrivals of food ships at Indian ports "are not bunch-

DUNLOP OFF-THE-ROAD TYRES

for the toughest job

Here are Dunlop Off-The-Road tyres of great strength and durability—Power Rib, EM. 7 Earthmover and Power Grip. The tread patterns and the especially tough casings of these tyres have been developed after prolonged field trials on many kinds of terrain in many parts of the world. These are tyres that have proved themselves in service at multipurpose projects, like Koyna, Nagarjunasagar, Kosi, Sharavathi, Beas...in the iron ore mines of Bihar Madhya Pradesh, Goa... In the far-flung coalfields of the National Coal Development Corporation and at many other sites all over India.

LONGEST TYRE MANUFACTURING EXPERIENCE IN INDIA

A QUIET REVOLUTION

PLASTICS REPLACING TRADITIONAL MATERIALS

THE recent announcement in the Press that the increased use of plastics in building has been the subject of a report prepared by a technical group representing members of the British Plastics Federation, the Royal Institute of British Architects and the Ministry of Public Works and Building, draws attention to the fact that, within recent years, new man-made materials have invaded yet another sphere of industry.

Many people for whom the word plastics is, understandably, associated primarily with pliable and flexible characteristics will find it surprising that there should be so many outlets for it in a field where strength and rigidity would seem to be among the chief requirements. This may be due to the fact that, though "plastics" is a term in common usage, most people have a limited conception of its range of applications, and fail to recognise it in the wide variety of forms in which it is encountered even in everyday life. Members of the general public tend to think of it in relation to particular classes of articles such as domestic or luxury appurtenances—washing-up bowls and detergent containers, or sachets and ampoules for toilet and medical purposes. They do not think of it when they meet it in other forms, such as car steering wheels, refrigerator liners, leathercloth, oilskin, telephones, radio cabinets, picnic ware, spectacles, paint and pencils.

The reason for this failure to recognise it in its multifarious forms is precisely the reason why the net for plastics end-products can be cast so wide. Plastics are extremely adaptable and, being highly artificial, can be manufactured to specific purposes in a way which is not possible for older and conventional materials. Wood, glass and metal are limited by their special properties to a certain range of applications; plastics, on the other hand, can, within limits, be designed from the outset to incorporate the properties which are required in the final product.

Plastics can combine strength, lightness and resistance to corrosion and balance the characteristics of rigidity and flexibility to the extent that is required. It is this capacity which makes them unique and gives them an exclusive value. It is this capacity, moreover, which makes it quite wrong to regard plastics as a cheap substitute for well-established conventional materials. The teething troubles which may have given rise to this misconception are well in the past, and to dwell upon them is to miss the special character of these new materials which, in a wide range of cases, can be "tailored" to combine qualities that precisely fit the requirements of a particular job.

For instance, qualities of lightness, water resistance and low thermal conductivity can be combined in polystyrene to make it an excellent material for the construction of refrigerator liners; while its low weight, dimensional stability and good insulating properties also make it extremely suitable for battery boxes and electric motor housings. Its moisture-resisting capacity also makes it suitable for installation in humid conditions in the form of wall tiles for bathrooms, hospitals and laundries; and the lightness of such tiles and their ease of fixing make them particularly appropriate for structural conditions where heavier materials could not be supported.

Another example is that of PVC piping, in which hardness can be combined with an excellent mechanical strength and chemical resistance. At the same time, it is of light weight and therefore easy to transport and handle. It can be shaped and jointed on site without difficulty and laid with ease, since it can be snaked into a narrow trench after joining above ground, or buried by means of a mole plough. It is a non-conductor, requires no painting and does not suffer galvanic or electrolytic attacks as is often the case with metal pipes. It is not affected by fungi or bacteria, and being odourless and tasteless can be used for conveying potable water and other consumable liquids such as beer and spirits. It has excellent weathering qualities, cannot rust and, in case of fire, is self-extinguishing. Thus, it is suitable for a wide variety of applications such as water mains, rainwater and soil systems, sewers, chemical plant and electrical conduits.

The use of plastics has steadily increased over the years in the transport and motor industries. In 1940, the weight of plastics per car in the U.K. averaged 5 lb.; by 1963 this figure was over three times as great, while the equivalent U.S. figure was 23 lb. This growth is partly due to the fact that the price of plastics is falling, while the cost of sheet steel and aluminium is rising, and partly to the trend towards smaller, lighter vehicles; but also to the special qualities of plastics components themselves, the use of which in certain cases enhances performance and in others enables engineering problems to be overcome. Nylon bushes in suspension units, and the polypropylene self-hinging accelerator pedal are examples of such developments.

Among synthetic materials in frequent use for car engine components are nitrile rubbers. These, on account of their excellent resistance, are used for oil seals, gaskets, "O" rings and other flexible parts in constant contact with oil, petrol or solvents. Extruded they are used for fuel hoses: compounds based on them form the components of brake-linings; reinforced with man-made fibres, they are fabricated into crash-proof fuel tanks. Another material offering special advantages is high density polythylene, the thermal resistance of which—in excess of 100° C—enables it to be used for components situated near the engine. It can be mass produced by blow moulding to complex shapes at a comparatively low cost, and since it is translucent it is extremely suitable as reservoirs for brake and clutch-lining fluids, enabling levels to be checked instantly. It can also be used for screen-washing systems, heating and ventilating ducts, and instrument cowls. Other examples of plastics components are nylon speedometer gears, water pump bearings, and cooling fans; polyacetal carburettor components, handbrake cable pulleys, window crank and door handles; phenolic distributor covers, and reinforced polyester bumpers.

There has recently been talk of the possibility of a plastics car engine; but this development will not be realised until plastics materials can be designed to withstand temperatures of 120° C and above for long periods without deterioration. A more immediate possibility would seem to be plastics car bodies which could be mass-produced when injection or blow-moulding processes can be operated at high speed. As it is, there is an increasing use of polyester/glass for complete bodies in the case of individual sports cars, taxis and commercial vehicles; and also for the major parts in the body work of tankers, trucks, fire engines and other heavy vehicles. Polyester laminates generally obtain a weight saving of up to 30 per cent over sheet steel and aluminium for a comparable strength; and they offer considerable reduction in raw material and tooling costs. They have excellent electrical properties and a high resistance to chemicals and oil. They impose few limitations upon the designer and can be moulded into complicated shapes impossible for conventional materials. They do not require painting since they can be pigmented during manufacture, and in the case of damage they can be easily repaired by the simple process of cutting out and refilling.

One important field of manufacture to which plastics materials are particularly relevant is that of packaging. Indeed, the enormous growth of the packaging industry is largely due to the existence of these new materials which offer just the necessary qualities of hygiene, lightness, strength, convenience and availability. This fact is clearly demonstrated in the supermarkets, which could be described as the show-rooms of packaging, where a very high proportion of products are enclosed either in plastics wrapping or containers. The existence of the materials from which they are fabricated actually influences domestic habits, for the modern development of cooking prepared food in packs has only arisen as the result of the existence of non-contaminating material such as polythene film. Its tough and impermeable qualities also make it ideal as wrapping for liquid and greasy food; and its use for pre-packed vegetables raises the standard of hygiene.

Polystyrene is another material widely used for the packaging of food—as light but strong containers for sweets and jellies in cafeterias and, recently, for butter and cream in dairies. The great advantage of plastics materials in such cases is that they combine non-toxicity, cleanliness and disposability. Polystyrene is being used increasingly to make disposable containers both for fruit drinks and for milk. In its translucent form, it is valuable to the shopkeeper as containers which will display goods and at the same time are not fragile; while its capacity for moulding makes it an excellent source for threaded caps and stoppers.

The latest development in the food packaging line is that of PVC for wine bottles. In this role, it is light, strong and does not splinter, while problems of "corking" are eliminated through the use of a PVC stopper which does not split and requires no cork-screw. The use of the PVC bottle is spreading rapidly in France, and is soon likely to be seen in other countries not only for wine but for other liquids such as vinegar.

Packaging applications of plastics materials are, of course, not limited to food containers, toilet packs, detergent bottles or aerosols. Outside the domestic sphere, they include drum liners for corrosive materials in heavy industry, unbreakable carboys for dangerous chemicals, sterile containers for surgical instruments. They extend from minute capsules for medical purposes to cocoons for gun turrets on laid-up battleships.

Petroleum is increasingly the source for plastics raw materials, the fastest-growing of which, polyethylene, polypropylene and polystyrene, are all based upon it. Coal is also an important source, and there is a more limited use of wood and cotton waste. All these are of organic origin; and this fact sets certain thermal and mechanical limits to the use of plastics materials. Nevertheless, research is constantly directed to widening these limits; and the imagination of even the most sober estimator boggles at the possibilities which may emerge in the course of the next ten years.—*By special arrangement with Petroleum Press Service.*

SURVEY

(*Concluded from previous page*)

ed any more than chances dictate." Given greater co-ordination in management, it should also be possible to eliminate unnecessary delays in dock handling in the shed or in the movement from shed to lorry or rail wagon. The team has further recommended that the charter terms for tankers should be adjusted to provide incentive for a discharge rate higher than 1,500 tons a day and that a ship responsible for its own off-loading should not be allowed to remain on berth, unless it maintained an acceptable rate of discharge. Above all, in the opinion of the team, steps should be taken to ensure continuous cargo operation (unloading from the ship and dock handling in the shed or in the movement from shed to lorry or rail wagon) to the maximum extent permitted by weather.

Besides making these recommendations which are generally applicable to all the ports, the team has given some interesting findings in regard to foodgrains handling at the ports of Bombay and Calcutta. Bombay, according to the team, can easily handle its normal target of 220,000 tons a month with just two berths, as against the present four, provided there is a foodgrains controller at the port, vested with overriding powers to take on-the-spot decisions which will be binding on the representatives of all Ministries. A particularly noteworthy recommendation relating to Bombay is that direct rail wagon loading at or adjacent to ship berth should be maximised to reduce the heavy lorry traffic. This should be particularly welcome to Bombay City with its already heavy vehicular traffic and consequent congestion on roads. Equally welcome to Bombay's industries and port authorities alike should be the team's recommendation that additional pressure on Bombay be avoided by making the fullest possible use of Kandla after providing it with pneumatic equipment to step up the rate of daily discharge to 3,250 tons from ship. As for Calcutta, the team's finding is that the monthly grains handling rate can be pushed up to 225,000 tons, if only Visakhapatnam can lighten Calcutta-bound vessels upto 60,000 tons. All in all, therefore, the team's recommendations relating to Bombay and Calcutta ports are calculated to avoid undue pressure on them by way of additional foodgrains handling—additional to the normal targets. This is a sensible and realistic approach, considering that these two premier ports, with their growing industrial hinterlands, have to handle non-food imports and exports on an increasing scale and load or unload large numbers of ships carrying such merchandise.

CREDIT DIFFERENCES COMING TO A HEAD?

By Questor

LONDON, *7th November*

IT is significant that the new British Foreign Secretary should have chosen to give a public assurance on his visit to Washington that the British Government has no intention of raising the discount rate in the immediate future and had, indeed, deliberately chosen not to raise it as a means of meeting its inherited balance of payments difficulties.

There is little doubt that this decision, however unorthodox, was extremely welcome to the U.S. Administration—was a principal reason, in fact, for the hearty welcome given by Mr. Roosa to Britain's even more unorthodox decision to impose a temporary surcharge on tariffs. A rise in the British rate would almost certainly have forced the U.S. to follow with a rise in its own.

Yet it was a little odd to read in one column of a newspaper that Mr. Roosa considered the European reaction unrealistic and the tariff surcharge inevitable, and in another that the American Banking Association was calling upon the U.S. monetary authorities to curb the expansion of credit. The internal difference of opinion between the Administration and the banking community about the risk of inflation, which has been developing ever since the tax cut came into effect, is obviously coming to a head. The Federal Reserve has been allowing credit to expand rapidly this year, and short-term interest rates have been kept remarkably stable.

But there are plainly two views about the wisdom of this policy. The President, Mr. Dillon and Mr. Roosa, have all gone out of their way recently to repeat the line laid down in January's Economic Report, that it would be self-defeating to cancel out the effect of the tax cut with tighter money and that monetary policy should aim at interest rates likely to encourage private investment until it became clearly necessary to change course. Governor Mitchell of the Federal Reserve has said that an increase in U.S. interest rates large enough to cut down the outflow of capital abroad would require a tightening of credit which would seriously check the growth of the national income.

On the other hand, Mr. Martin, Chairman of Board of Governors of the Federal Reserve System, was quoted last month as saying that, within the next few weeks, the U.S. would have to decide whether or not to make a major shift in monetary policy: "two situations—potential inflation on the domestic side and the balance-of-payments picture—will be coming to a head, as they usually do, at the same time."

Mr. Alfred Hayes, President of the Federal Reserve Bank of New York, said recently that, from the domestic point of view, the question was whether the rise in the money supply had been too fast rather than too slow: and, on the international side, he added, the continuing outflow of short-term capital suggested that "a lesser degree of monetary ease can at any time, if needed, make a significant contribution to the balance of payments."

Whatever the strength of the domestic case for higher interest rates, the international case seems to be growing stronger. The interest equalisation tax has had a marked effect on one form of capital outflow from the U.S., and it remains to be seen whether it or the British tariff surcharge will turn out to be the more temporary. Mr. Roosa recently hinted that the tax might well have to be extended beyond the end of 1965, if there were not further substantial gains in export earnings. But it has so far had no effect on other forms.

The latest *Bulletin* of the Federal Reserve Board points out that the net outflow of private capital in the first half of 1964 amounted to an annual rate of $5½ billion, much the same as in the first half of last year. Net purchases of foreign securities have remained relatively low, but there have been "continued large extensions of long- and short-term bank credit"—long-term loans, in fact, tending to fall recently but short-term loans continuing to rise. Bank loans were deliberately exempted from the interest equalisation tax, mainly for fear that a reduction in trade finance might affect U.S. exports, but the President does have stand-by authority to apply the tax to long-term loans if he considers that they are being used to circumvent the object of the legislation.

There is no clear evidence that they are being used deliberately in this way. Indeed, a rise in U.S. bank loans to foreigners would appear to be an almost inevitable consequence of the efforts of these banks to expand abroad and the relative lawness of U.S. interest rates.

Whether the Administration will find it possible to avoid the consequences of the rate-gap, even with further resort to exchange controls, and how it should reconcile its domestic aims with its international responsibilities is not for me to guess. But President Johnson will presumably remain prejudiced in favour of cheap money, even if Mr. Roosa leaves the Administration, and the internal argument will continue. Britain can only be grateful to receive such wholehearted support for her policies in return for a ready refusal to take sides.

F.B.I. PRESIDENT'S STATEMENT ON INDIA

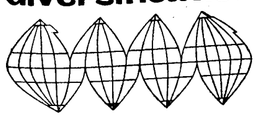
A warm tribute to the Indian Government's methods of financing development plans was paid in London on 3rd November, 1964 by Sir Peter Runge. President of the Federation of British Industries. Sir Peter, who made a brief visit to Delhi in September to see the Indian Institute of Technology, for which F.B.I. members have been supplying equipment, told a news conference: "India's attitude towards foreign capital is exemplary. If every developing country had the same attitude, they would get on much better."

There was, Sir Peter declared, room for more foreign capital in India, and even more for technical aid. Skilled manpower was the real shortage, he said. It was the aim of the Institute of Technology to help relieve the shortage of technologists, and British industry could be proud of the part it was playing in supplying equipment for the students' use.

The first appeal to industrialists, said Sir Peter, raised more than £260,000. A second appeal had been launched which had raised £55,000. It was hoped to raise another £95,000 by the end of March 1965.

"The new Institute," said Sir Peter, "is going to be superb. We in Britain are extremely proud to be associated with it. It is an enormous project, most cleverly devised, so that each new building for the different subjects can be expanded. Long before completion, a large number of sections are already operating. It is hoped that the Institute will be completed by the end of 1965, and that perhaps the Duke of Edinburgh will open it early the following year."

a world of diversification



A growing nation has diverse needs and diversification is the bedrock of modern industrial progress. SANDOZ, a modern research and industrial complex, is constantly alert and alive to the old and new needs of a changing market, a changing India.

The Sandoz enterprise is an integrated unit equipped for mass production, quality control, market and motivational research, planned selling and countrywide distribution. Sandoz is geared to the demands of the new industrial India.

PHARMACEUTICALS: The discovery and development of many new drugs and medicines spring from the extensive research Sandoz carries on in this field. Sandoz explores new pathways in the service of medical science.

DYES AND CHEMICALS: Another important arm of Sandoz activity. The Dyes Research Department concentrates on the problem of dyeing the new synthetic fibres. Special attention is also given to the easy application of dyestuffs of greater fastness to traditional materials like wool and cotton.

AGRO-CHEMICALS: Another established field where Sandoz has made remarkable progress. Sandoz Insecticides, Fungicides, Herbicides and Rodenticides are extensively used in Indian agriculture today, increasing yield by preventing crop destruction.

RESEARCH & DEVELOPMENT: The research knowledge and talent of Sandoz scientists all over the world are pooled to create products that fulfil human needs and contribute to India's industrial and technological progress.

BANKING IN SLACK SEASON REVIEWED

RECORD EXPANSION IN DEPOSITS—BETTER LIQUIDITY POSITION

THE slack season of 1964 was unprecedentedly slack. This is evident from the substantial contraction of money supply with the public. The return of currency to the Reserve Bank of India was pretty large and the reduction in bank credit and the expansion in bank deposits were heavy. They, however, were not the only significant or noteworthy features of the 1964 slack season. Equally important were the several structural and organisational changes in practical and procedural banking and the new beginnings towards a more rational and practicable credit control policies based upon net liquidity position of banks.

The seasonal contraction in scheduled bank credit was the largest for any slack season in the post-war years. The unusually large contraction of Rs. 139 crores in the bank credit, accompanied by an equally unprecedented expansion of Rs. 223 crores in their deposit resources, has increased the liquidity of banking system. The 1964-65 busy season thus begins with a much more comfortable resources position than in the previous years, particularly even more comfortable than the position on the eve of the last busy season; but the *tone* and *temper* of the Reserve Bank's credit policy which was then attuned to a larger volume of expansion in order to stimulate industrial and capital market activity is different today. The credit policy was in fact tightened on 11th March 1964 at the height of the last busy season in view of the unusually rapid and large pace of credit creation by banks, financed by a larger recourse to the Reserve Bank than in the past. As one approaches another busy season, which will add further to the pressures on the banking system, the official policy is geared to the need for continuing a policy of monetary restraint, particularly in the context of difficult supply situation of agricultural commodities and the serious and continuous uptrend of price levels.

How comfortable is the resources position of banks in the face of tighter and dearer credit policy and in spite of the revised liquidity ratio and the new arrangements for central bank accommodation on the basis of the net liquidity position will be apparent from the analysis of variations in banking and monetary data presented in Table I.

Table I—Analysis of Variations in Banking and Monetary Data

(In crores of rupees)

1	Outstanding as on 24th April 1964 2	Outstanding as on 30th October 1964 3	Variations during Slack season 1964 4	Slack season 1963 5
1. Demand deposits	1,076	1,196	+120	+ 85
2. Time deposits	1,242	1,335	+ 93	+ 64

*Estimated as best as possible with the aid of such data as are published and available.

Note:—Figures in the brackets in columns 2 and 3 are the percentages to aggregate deposits, while those in the last column are similar percentages at the end of the 1963 slack season.

The money supply with the public contracted during the season by Rs. 95 crores, as against an exceptional and contra-seasonal expansion of Rs. 28 crores last year. This order of contraction is comparable to a contraction of Rs. 97 crores and Rs. 65 crores in the slack seasons of 1961 and 1962, respectively. Unlike in the previous years, however, this contraction was achieved in spite of a large increase in deposit money as will be evident from Table II.

Of the total decline of Rs. 179 crores in the currency with the public as much as Rs. 139 crores was accounted for by the decline in notes in circulation.

Among the factors affecting money supply variations, two of the most important are the net bank credit to Government and the net bank credit to the private sector. Official figures up to the end of August reveal a decline of Rs. 194 crores in net bank credit to the private sector compensated by a Rs. 84 crores rise in net bank credit to the Government, in addition to the minor influences of several other factors like the net currency and net non-monetary liabilities of R.B.I., net foreign assets of R.B.I. and net non-monetary liabilities of banks. It will be some time before the October-end position is known, but broad and provisional estimates confirm the August-end results and show that the contraction in money supply with the public stemmed mainly from a substantial decline in net bank credit to the private sector.

Scheduled bank credit, the main component net bank credit to the private sector, declined sharply by Rs. 139 crores during the 1964 slack season as against a decline of Rs. 121 crores in the 1963 slack season. The Reserve Bank has, however, expressed a feeling that the pace of return of funds to the banking system during the slack season that has just ended was markedly inadequate in relation to the previous seasonal expansion. The seasonal pattern of the busy and the slack periods which was gradually being effaced during the last several years has in fact reasserted itself since 1963, and the slack season contractions of both 1963 and 1964 are quite large, as could be seen from Table III. Nevertheless, the Reserve Bank is right, for the slack season contraction of Rs. 121 crores in 1963 came after the previous busy

Table II—Analysis of Slack Season Money Supply Variations

(In crores of rupees)

	Slack season of			
	1961	1962	1963	1964
Money supply ..	— 97	— 65	+ 28	— 95
Currency ..	—101	— 71	— 54	—179
Deposit money ..	+ 4	+ 6	+ 82	+ 84

season expansion of Rs. 203 crores, whereas the 1964 seasonal contraction of Rs. 139 crores followed an all-time record expansion of Rs. 377 crores in bank credit in the 1963-64 busy season.

The glaring inadequacy of the seasonal contraction of Rs. 139 crores in relation to the preceding expansion of Rs. 377 crores is heightened if one looks at the nature and pattern of expansion in the 1963-64 busy season. Of the total expansion, Rs. 97 crores or 26 per cent was against seasonal commodities and Rs. 280 crores or 74 per cent represented non-seasonal advances. In the 1962-63 busy season, an expansion of only Rs. 40 crores (19 per cent) was against the seasonal commodities and Rs. 163 crores or 81 per cent against non-seasonal commodities. When the division of 1964 slack-season contraction of bank credit into seasonal and non-seasonal advances is known two months hence, it will be possible to evaluate fully the extent to which the slack season operated upon the pattern of bank credit.

Meanwhile, one has to rely upon other indications, namely, those of resources and liquidity of the banks. In the 1963 slack season, the fall in credit-deposit ratio was from 76 per cent to 66 per cent: the amplitude was much wider this time, the fall being from 80 per cent to 67 per cent. Although the credit-deposit ratio on the eve of the 1964-65 busy season is fractionally higher than the ratio on the eve of the previous busy season, this has to be evaluated in the context of the likely resources position of the banks in the months to come and in the light of the Reserve Bank's recent amendments to credit controls and other measures.

The accretion of deposits to scheduled banks in the 1964 slack season was substantially larger than in the previous slack season. As against a rise of Rs. 158 crores in their aggregate deposits (excluding P.L. funds) during the 1963 slack season, the rise was a spectacular Rs. 223 crores in the 1964 slack season. Under the directions, advice and guidance of the Reserve Bank of India, the banks have already rationalised and revised their deposit rates structure and geared it for the purpose of more intensive deposit mobilisation. It is, therefore, reasonable to assume that the present pace of deposit mobilisation will continue in the months to come, particularly in view of the steadily expanding coverage of branch banking. These additional resources should enable the banks to maintain a comfortable position, inspite of the stringent attitude adopted by the Reserve Bank of India in regard to rediscounting facilities in the busy season that has just commenced.

Banks have built up their investment portfolios of Government securities by Rs. 259 crores in the 1964 slack season as against only Rs. 146 crores in the previous season and taken their investments deposits ratio to 35 per cent, one point higher than the ratio on the eve of the last busy season. Bank's investments in Government securities have touched the record level of Rs. 874 crores and they should be able to provide enough cushion for the banks for meeting the legitimate and genuine demand for credit from trade and industry.

All this has no doubt been the result of the revised liquidity requirements which came

Table III—Analysis of Slack Season Variations in Banking Data

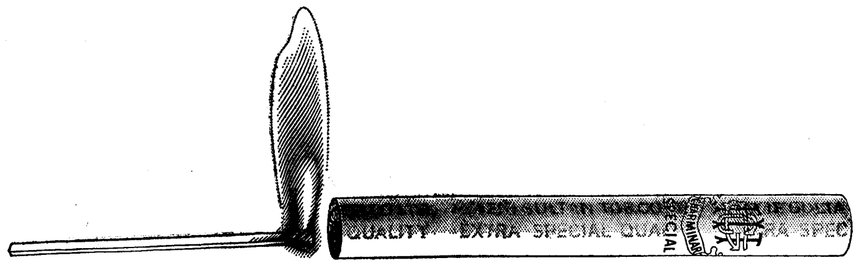
(In crores of rupees)

Seasons	Aggregate deposits	Investments in Government securities	Bank credit	Borrowings from R.B.I.	Cash and balances with R.B.I.
Slack 1961	+ 44	+ 68	— 77	— 32	+ 10
Slack 1962	+ 84	+112	— 42	— 3	— 7
Slack 1963	+148	+146	—121	— 29	+ 43
Slack 1964	+213	+259	—139	— 44	+ 10

into force, with effect from mid-September, but an analysis of the liquidity ratio and net liquidity position of banks is rendered extremely difficult in the absence of relevant data. Weekly data of *unencumbered approved* securities held by banks in their portfolios for the purpose of liquidity ratio is not available at all, let alone the problem of segregating the holdings of the State Bank of India, larger scheduled banks and other scheduled banks. Similarly, the absence of separate weekly data of borrowings by banks from notified banks and the State Bank, as also of the State Banks' investments in *Government* securities (as distinct from *approved* securities) makes it difficult to estimate the net liquidity position of the other scheduled banks as distinct from that of the State Bank of India. The data against item Nos. 11, 12 and 13 in Table I are, therefore, to be regarded as only rough but fairly correct estimates. They, however, show that the liquidity ratio of the State Bank of India and other scheduled banks at 52 per cent and 37 per cent, respectively, at the end of 1964 slack season was higher than the ratio of 41 per cent and 31 per cent, respectively, at the beginning of the slack season, and indicates the measure of liquidity gained, as well as the extent to which banks have prepared themselves to meet the credit requirements of the economy, while at the same time complying with the higher statutory requirements of liquidity.

The revised arrangements of central bank accommodation based upon net liquidity position of banks were fully explained in *Commerce* dated 17th October 1964. The liquidity position of the State Bank of India and the other scheduled banks on the eve of the busy season 1964-65 works out at 48 per cent and 35 per cent, respectively, which means in concrete terms, that the State Bank would be able to borrow about Rs. 135 crores at Bank Rate, while other scheduled banks will be able to borrow Rs. 146 crores at Bank Rate from the Reserve Bank of India in the months to come. It may be noted here that these levels are much higher than the amounts actually borrowed by the scheduled banks at the peak of any of the busy seasons in the past. The latest R.B.I. decision to make the bill limits for borrowings under the bill market scheme against usance bills applicable up to the end of June only instead of up to the end of September hitherto, will hardly have any material effect upon the banks' ability to lend for the amounts outstanding against bills beyond June have always been negligible. All these indicate that banks will be able to meet the coming seasonal demands for credit fairly comfortably. Nevertheless, the 1964-65 busy season will be more interesting than the ones that have preceded, for it will provide the first practical test to the new credit and monetary policies based upon the net liquidity position of banks.

OVER 20,000 TIMES A MINUTE...



It works out to nearly 900 million Charminar cigarettes sold every month ! Yes, Charminar is certainly the most popular cigarette in India—by far ! Why ? Because no other cigarette can match Charminar's rich flavour and unique taste. How does The Vazir Sultan Tobacco Company do it ? With quality tobaccos, special processes and expert know-how . . . in the largest cigarette factory in South-East Asia !

Experts choose only the finest tobaccos, developed specially for Charminar. Skilled workers prepare the leaves. Scientists laboratory-check each batch. Connoisseurs blend the tobaccos, which are *triple-matured*. Next, an *extra process* exclusive to Charminar. Only then do the tobaccos go to the automatic machines for rapid, 'untouched-by-hand' manufacture . . . to produce over 20,000 Charminars a minute !

There's nothing like Charminar — India's greatest cigarette!

TREND OF LABOUR DISPUTES

PAST YEAR RELATIVELY MORE PEACEFUL

FOR successful industrialisation in any country, the importance of good industrial relations cannot be exaggerated. But for a planned economy like India's, where there is great need for faster growth of industrial production and price stability, the maintenance of industrial peace is of extreme importance. Unless labour and management co-operate with each other, it will be difficult to fulfil the targets laid down in the Plans. It is, therefore, gratifying to find from the data, collected and analysed in the October (1964) issue of the *Indian Labour Journal*, published by the Labour Bureau, Ministry of Labour and Employment, Government of India, that the year 1963 was a comparatively peaceful year. As compared with the trends in the previous year, there was a decline in the number of disputes, workers involved and mandays lost and the loss of wages and value of production. In fact, the loss of mandays, wages and production was the lowest in five years.

The number of disputes declined in 1963 to 1,471 from 1,491 in the previous year. Except for 1961, when the figure was considerably low at 1,357, the number was the lowest for the five years ended 1963. About two-thirds of the total disputes originated in four States, namely, Kerala, Madras, Maharashtra and West Bengal. As compared with 1962, though the number of disputes increased in Madras and Maharashtra, there was almost an equivalent decline in Kerala and West Bengal, so that the total for the four States remained nearly unchanged. Industrywise, manufacturing accounted for by far the largest number of disputes; in 1963, there was a rise in both the number (from 962 in 1962 to 1,047 in 1963) and the percentage to total disputes (64 per cent to 71 per cent). Cotton mills were the worst affected, the number of disputes in them increasing from 144 to 246. But the position remained unchanged in mining and quarrying, while there was a substantial decline in plantations, especially tea.

The number of workers involved in these disputes came down from 705,000 in 1962 to 563,000 in 1963. As in the case of number of disputes, two-thirds of the total numbers of workers involved happened to be in the States of Kerala, Madras, Maharashtra and West Bengal. The workers involved in disputes declined in Kerala and West Bengal in keeping with decline in the number of disputes in these States. In Madras, the workers affected rose reflecting the increase in the number of disputes. However, in Maharashtra, the workers involved declined in spite of a rise in the number of disputes, indicating thereby that, in 1963, there were more disputes in smaller units than in the previous year. In Gujarat, the workers involved increased to more than double due to a 70 per cent increase in the number of disputes, but in Madhya Pradesh they declined to almost half. There were no major changes in the other important States. Manufacturing continued to be the most important sector and accounted for 407,000 or 72 per cent of the total workers involved. Whereas the workers involved, on the whole, declined by 20 per cent in 1963, in the case of manufacturing there was a rise by 8 per cent, or nearly, 29,000. The rise was as much as approximately 68,000 in cotton mills, 26,000 in cement and 23,000 in tobacco manufactures, though, in the case of food preparation industries, there was a substantial decline by 71,000. There was also a decline by 17,000 in the case of plantations (16,000 for tea plantations), 31,000 in the case of mining and quarrying (20,000 for coal mining) and as much as 79,000 in case of restaurants and hotels.

Against a decline of 20 per cent in the workers involved, the decline in mandays lost was as much as 43 per cent—from 6.12 million to 3.27 million—indicating that the disputes were of shorter durations than in 1962. Except for Gujarat, where the number of mandays lost increased by 83,000 to almost double, and Madras where the rise was 277,000, raising the figure to nearly three times its level in 1962, all the other major States experienced a saving in the mandays lost. This was 105,000 mandays in Rajasthan, 154,000 in Madhya Pradesh, 163,000 in Maharashtra, 253,000 in Uttar Pradesh and 425,000 in West Bengal. In the case of Kerala, the saving was as high as 1,967,000—the reason being that in 1962, there was a prolonged strike in cashew industry, lasting for a month, raising the loss of mandays to 2.14 million. Whereas the number of disputes in manufacturing units increased by nine per cent and workers involved by eight per cent, the mandays lost came down by 47 per cent—from 4.74 million in 1962 to 2.52 million in 1963. Although the mandays lost increased by 111,000 in transport equipment industry and 259,000 in cotton mills, there was a decrease of 146,000 in electric machinery, 197,000 in structural clay products, 203,000 in glass and glass products and 1,616,000 in food industry, including the cashew industry which had suffered a long strike in 1962. As regards other sectors, there was a decline of 166,000 in mandays lost in restaurants and hotels and 280,000 in mining and quarrying, of which coal mining alone accounted for 259,000.

Although complete data pertaining to loss of wages and the value of production are not available, the available figures for 1963 show a substantial fall. Out of a tota of 1,491 disputes in 1962, the loss of wages arising from 1,172 disputes amounted to Rs. 140 lakhs. In 1963, out of a total of 1,471 disputes the loss of wages on account of 1,226 disputes was Rs. 96 lakhs. The maximum loss took place in cotton textiles, where 219 of the 246 disputes resulted in the workers losing Rs. 21 lakhs. The next on the list was jute textiles with 30 of the 34 disputes leading to a loss of Rs. 13 lakhs. The value of production lost in 1963 was Rs. 5.25 crores in 661 disputes, as against Rs. 7.07 crores in 684 disputes in the previous year. The loss would be much larger if the data for all the disputes were available. Here again the industries that suffered most were cotton textiles and jute textiles, with a loss of Rs. 1.05 crore in 124 disputes and Rs. 74 lakhs in 24 disputes, respectively.

A study of the causes of industrial unrest reveals that the disputes relating to wages and allowances were the highest in number, being as many as 408 in 1963. They also involved the maximum number of workers (158,000) and resulted in the maximum number of mandays lost (1,077,000). In all the three respects, personnel disputes were second on the list and

EXCELLENT COVERAGE!

HARVEY CANVASES

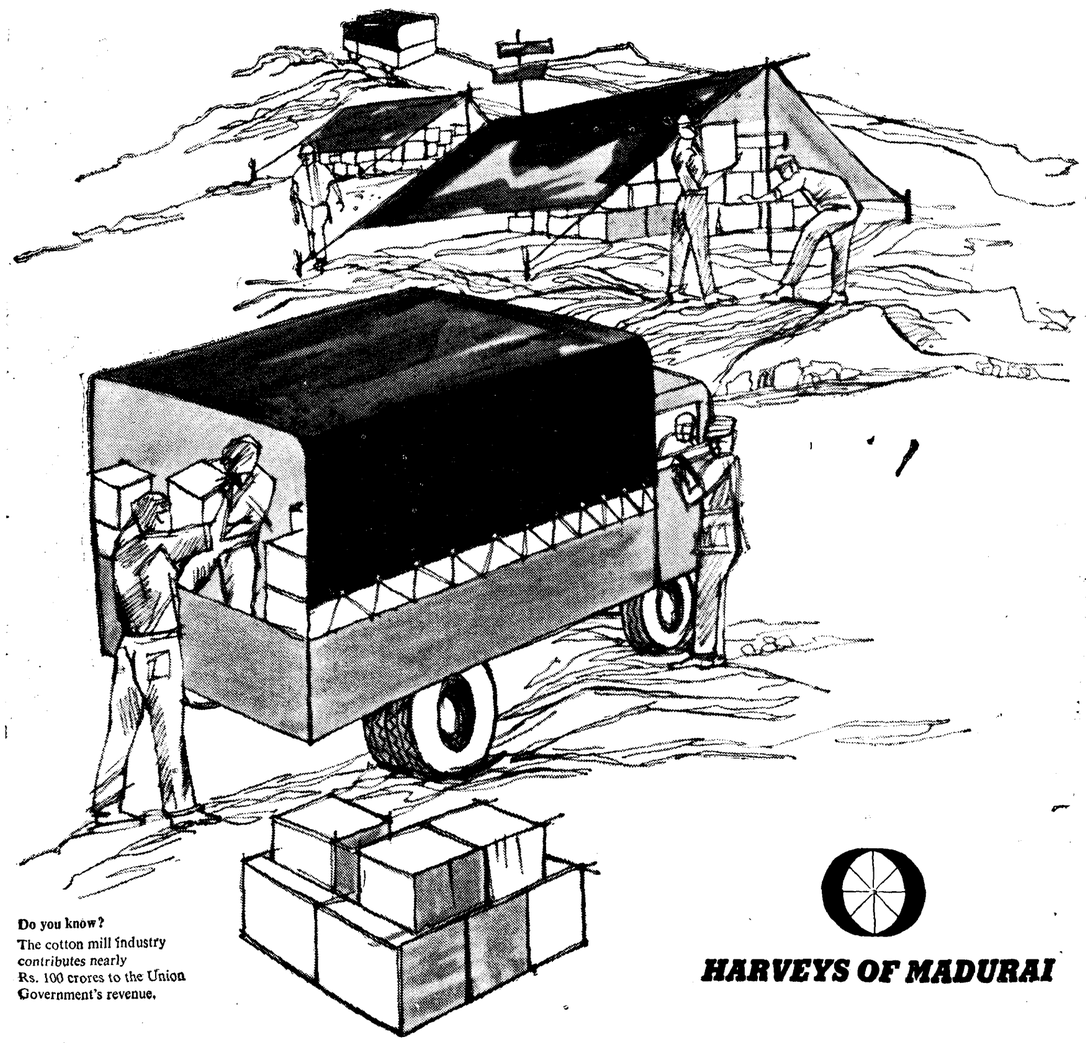
provide the finest, surest protection for men and material

When the safety and protection of men and vital materials are at stake, one can't afford to take risks. Nothing but the finest coverage material will do! That's why top-ranking manufacturers like Kilburns insist on Harvey Canvases—the strongest and most reliable fabrics for making superior quality tarpaulins, tent canvases, etc.

Harveys' Madura Mills are today India's largest producers of industrial fabrics. Through the years they have built up a world-wide reputation for consistently high quality. They have the men, machines and knowhow to produce a wide range of industrial fabrics such as Tyre Cords, Belting Ducks, Jacket Ducks, Light and Heavy Canvases.

What's more, Harveys can weave industrial fabrics to your specifications—however rigid. Recent expansion at Madura Mills, with the installation of up-to-date high-speed looms and precision machinery, has further increased Harveys' weaving capacity. They can now meet all your requirements in industrial fabrics - to your complete satisfaction.

For further particulars and samples, contact: MADURA MILLS CO. LTD., Madurai. *Managing Agents:* A. & F. HARVEY LTD.



Do you know?
The cotton mill industry contributes nearly Rs. 100 crores to the Union Government's revenue.

HARVEYS OF MADURAI

61-MMC-7CR

TEXTILE MACHINERY INDUSTRY

BOTH CAPACITY AND PRODUCTION EXPAND

THE production of textile machinery in India is expected to register a notable rise during the current calendar year (1964), the estimated value of actual output being Rs. 25 crores, as against Rs. 20 crores in 1963 and a mere Rs. 5.3 crores in 1955. The rise, of course, reflects partly the increase in prices of machinery. But even after making allowance for the price increase, the rise in production will be quite appreciable, as is evident from the trend depicted in Table A. The aforesaid figures exclude accessories which are produced to an extent of about Rs. 18 to 20 crores annually. The expansion of production would certainly have been more spectacular but for some of the hardships facing the textile machinery industry. Special mention may be made of three such handicaps: one, shortage of specialised components and raw materials such as hard coke, pig iron, stainless steel and tin plates; two, inadequate credit facilities; and, three, paucity of physical orders. It is because of these handicaps that the industry is not in a position to utilise the licensed capacity fully. The licensed capacity (a part of this capacity is yet to be established) actually lying idle at present is as much as 38 per cent in carding engines, 91 per cent in draw frames, 93 per cent in speed frames, 46 per cent in ring frames and 65 per cent in looms.

Why is it, one may ask, that there is so much capacity lying unutilised when there is such a heavy demand? This, in fact, was the poser which Mr. T. N. Singh, Union Minister for Heavy Engineering, raised in his speech at the fifth annual general meeting of the Textile Machinery Manufacturers Association held at Bombay last week-end. Although Mr. Singh was aware of the shortage of raw materials and difficulties in regard to availability of hard coke, etc., he stated that the idle capacity in the textile machinery industry could not be due solely to these handicaps. He, however, did admit that the problem had to be studied in some detail and that every effort should be made jointly by the Government and the industry to overcome the difficulties. Speaking earlier, Mr. Prabhi V. Mehta, Chairman of the Association, had referred to certain prerequisites for utilising the capacity to the maximum extent possible; by the end of the third Plan (March 1966), the industry will have a total capacity to produce machines worth Rs. 45 crores per annum. To quote Mr. Mehta:

"The prerequisites are availability of acceptable qualities of raw materials in required quantity. This would include steels, special steels, non-ferrous metals, cement, pig iron, etc. We would also need some imported machine tools, if our expansion programmes are to be fulfilled. These prerequisites cannot be met by the efforts of my industry. The various Ministries in the Government have to do proper allocation and distribution of most of these essential raw materials. ... It is necessary to mention the points which are engaging our attention at the moment: (1) adequate supply of controlled indigenously produced raw materials such as pig iron and steel; (2) financing of deferred payment sales of machinery manufactured indigenously to the consuming industry; (3) expansion of manufacturing capacity and requirements of indigenous, as well as imported, machine tools; and (4) need for design-oriented textile machinery research organisation."

Apropos these remarks of Mr. Mehta, Mr. Singh did not commit himself in any way. All that he said was that the Government "would be prepared to do all that is possible to remove some of the difficulties." On pig iron supplies, too, Mr. Singh was non-commital. This was just what he said:

"Government had some time ago convened a meeting of the representatives of producers and users of pig iron. During discussions at this meeting, it transpired that the production of foundry grade pig iron was extremely limited. This was in view of the fact that the pig iron was being manufactured in large blast furnaces. If more foundry grade pig iron was to be produced, it would be necessary to set up comparatively smaller units capable of producing specialised varieties required for specific industries. It is hoped that the future planning will take care of the demand for foundry grade pig iron. Meanwhile, we have to make the best use of material being produced in the country. Perhaps what is required is that the users should be educated as to how to make the best use of available qualities of pig iron. Some upgrading of quality at the users' end, in cupolas, is possible. We are setting up shortly a study team consisting of technical experts drawn from manufacturers of pig iron and the foundry industry as well as from the National Metallurgical Laboratory to examine the needs of pig iron of various user industries from the qualitative point of view and to make recommendations to Government regarding the quality of pig iron required for such industries. It is hoped that the studies to be conducted by this team would be useful and educative for the industry."

* As of June 1964.
† Projected on the basis of the available data.
‡ Upto January-August.
§ Relates to the year 1957.

The disquieting factors hampering the progress of the textile machinery industry must be removed. It is on this industry that rests the responsibility for supplying a large portion of machinery and equipment for the expansion, rehabilitation and modernisation of the textile industries. A glance at Table B will give an idea of the total machinery requirements of the textile industries during the fourth Plan period (April 1966-March 1971). It will be seen from this table that, as between the aggregate requirements (in terms of value) of Rs. 346 crores (that is an annual average of about Rs. 69 crores) and the anticipated availability of Rs. 272 crores (annual average of Rs. 54 crores), there is a gap of Rs. 74 crores (annual average of Rs. 15 crores). These figures at once suggest the need for imports of some items of textile machinery. Before, however, the Government takes any decision on imports, it will do well to bear in mind the following factors which Mr. Prabhu Mehta mentioned in his speech:

"It is estimated that, for expansion, modernisation and rehabilitation, approximately 6 to 7 million spindles will be needed by the textile industry within a period of six years, that is, by the end of fourth Five-year Plan. The industry has an approved and installed production capacity to meet this demand. It, however, cannot meet this demand within a period of 12-24 months. The demand has to be phased. One aspect of this estimated demand I have not been able to understand is that, though this demand is said to be in existence and permission for the installation of new spindles and permits for rehabilitation of old have been given, in our order books, we have not more than two million spindles. It would, therefore, mean that, though a mathematically ascertained demand does exist, there does not seem to be adequate machinery in existence to transform this mathematically calculated demand into physical orders with the machinery manufacturers. On the other hand, there is a persistent demand for permission to import ring frames. It would ultimately be the function of the Government to decide what is to be done. I am only mentioning this point, so that let it not be said that the Indian industry, given raw materials, is incapable of meeting this demand, if the installation programme is phased. And it is being phased irrespective of the fact whether it is so organised or not. It is being phased because of shortage of investment capital and shortage of several other essential raw materials like cement, steel and electricity."

The Union Minister for Heavy Engineering, on his part, gave the assurance that the Government could permit the imports of only such items as are not available within the country. The textile machinery producers must have certainly felt gratified at this assurance. When they themselves feel that their hands are more than full and that they are not in a position to meet the requirements within a reasonable period of time, it would, as Mr. Singh rightly pointed out, be unreasonable to refuse imports. A completely closed market for the textile machinery industry, or, for that matter, any other industry, is not desirable. Some imports are doubtless needed in order to induce the indigenous industry to strive for reduction in costs and improvement in quality. The textile machinery producers must have also felt gratified at the assurance of the Minister that the Government "would do everything possible, within limitations of foreign exchange, to meet the requirements of scarce raw materials" of the textile machinery industry.

The estimated total value of textile machinery production in 1964 is, as stated at the outset, Rs. 25 crores. The production in 1965-66 (end of third Plan), according to Mr. Prabhu Mehta, will be of the order of Rs. 45 crores. Mr. Singh, however, considered this estimate to be somewhat optimistic, though he did admit that it should be possible to register a fairly large step-up in the next two years. On the basis of available estimates, he said, even after the expansion of existing units was taken into account, there would be a gap of about Rs. 75 crores between the likely availability and estimated demand for textile machinery during the fourth Plan period. Emphasising that the gap had to be covered, Mr. Singh observed:

"There can be no room for complacency and we must pursue with persistence the objective of achieving a fair degree of self-sufficiency in regard to textile machinery by the end of the fourth Plan period. I agree that complete self-sufficiency in a field like this is not possible and perhaps also not desirable. At the same time, let us not forget that the country is still importing textile machinery worth about Rs. 25 crores per annum and we can ill afford such a heavy recurring drain on our foreign exchange resources."

The need for augmenting the production of textile machinery is urgent not merely from the point of view of meeting the rising domestic demand and saving foreign exchange which would otherwise have to be spent on imports but also from that of the exigency of earning foreign exchange through exports. The industry, one is happy to note from Mr. Mehta's speech, is striving to gain a foothold in other countries. The actual exports at present are, of course, limited, but the scope for improvement is quite big. Through various incentives available to an export industry, it should be possible, as Mr. Singh said, to meet its requirements of imported components and raw materials to a larger extent than is possible in the normal circumstances. This possibility further strengthens the case for more exports of textile machinery.

Whether it is for domestic use or for exports, the quality of textile machinery produced in the country is of the utmost importance. The industry itself is fully conscious of this factor as witness the remarks of Mr. Mehta that the manufacturers "are anxious to serve the consuming industry with quality machines." "The industry," to quote him, "has voluntarily agreed to submit itself and has co-operated in arriving at the decision to inspect the Indian-made textile machines. This very fact would signify the importance the indigenous machinery manufacturers attach to the quality of their manufacture." That the consumers of textile machinery are generally satisfied with the quality of production is evident from the statement of Mr. Singh that the Government has not received many complaints against quality. Even if there are any complaints, the Textile Machinery Manufacturers Association has its own arrangements to look into such complaints. While all this is gratifying, it is necessary to stress that no effort should be spared to produce machinery and equipment that conform to the best performance standards and quality specifications. It is also necessary for the industry to keep abreast of the developments in foreign countries, so that the textile mills in this country could get machinery of the latest types employed by their competitors. Since the textile industry in this country has to compete hard for export markets and win foreign exchange, the textile machinery manufacturers owe an obligation to the spinners and weavers of this country not to lag behind in technological developments in their field. Appropriately enough, Mr. Singh, therefore, urged the speedy development of an efficient and well-equipped research and development organisation of the textile machinery industry. He also commended the sharing of know-how by the leading textile machinery manufacturing firms with new units.

Technical know-how, however important it may be, will not be of much significance, if the raw materials used by the industry are of doubtful specifications. With such raw materials, quality control at every stage of manufacture will be very difficult, if not impossible, not to speak of the addition to production costs. Viewed thus, the plea of Mr. Prabhu Mehta to the Government immediately to attend to the question of ensuring adequate supplies of pig iron and steel of requisite quality is unexceptionable.

Table B: Fourth Plan Requirements

Name of machine	For rehabilitation*	For expansion†	Total quantity	Anticipated availability

MANCHESTER LETTER

SHIRLEY INSTITUTE'S TWO NEW GIFTS

AUTOMATIC CARDROOM SYSTEM—A NEW FIBRE DISCOVERED

From Our Special Correspondent

MANCHESTER, *3rd November*

SCIENTISTS at the Shirley Institute, the British cotton industry's research centre at Manchester, are on the brink of perfecting a process which could revolutionise the trade and make the fully-automated mill a reality within a few years. An automatic cardroom system has been developed after seven years' research, and extensive mill trials are taking place with a prototype at Pear New Mill, Stockport, part of the Combined English Mills group, Atherton, Lancs, a member of Viyella International.

The aim of the system is to cut out a number of separate processes—often done by hand—traditionally associated with the production of yarn from raw cotton. The automated spinning project involves the use of overhead conveyors and an electronic control panel. Dr. D. W. Hill, Director of the Shirley Institute, said:

"This is the beginning of a new era in the textile industry. This is going to be a fully automated industry from one end to the other. The mill of the future could run with only one operative. Two would be adequate to ensure that the process ran smoothly. This is one way we can compete with Eastern countries that have a large surplus of cheap labour."

When trials have been completed in the mill, the Institute will be seeking a manufacturer to make the machinery. "The system could be adapted to operate in most mills with existing modern machinery, although it would involve quite a big capital outlay," added Dr. Hill. "At this stage, we cannot say how much it would cost, but if the system was run continuously—which is the aim—it could produce yarn cheaper."

Dr. Hill also revealed that the Institute had discovered a new fibre "of a completely new character," of very high strength and low cost, made from plastic sheeting. When heated and stretched under certain conditions—which at present are kept secret—the sheets split up into fibres.

"The actual starting material is not unlike the familiar polythene bags used for packing foodstuffs and other items in the shops," said the Institute. The "split-fibre" could be used for end-products requiring strength, such as cords, ropes and fishing nets. It has also been woven into fabric. Although it is too rough for clothing it is extremely hard-wearing and could be adapted for industrial uses. "The production of split-fibres is advancing from the experimental to the pilot scale and it is hoped that before long it will be put to commercial use," said the Institute.

"Keep Heads Down" Warning

A warning against exploitation of the extra protection offered by the British Government's 15 per cent imports surcharge has been given to the Lancashire cotton industry by a leading union official. Mr. Lewis Wright, General Secretary of the Weavers' Amalgamation and a member of the T.U.C. General Council, urged Lancashire to "keep its head" and not to repeat the mistakes of the early 1950's, when brisk demand and full order books led to "fantastically high prices which could not be justified."

In a comment on the effects of the surcharge, Mr. Wright said, if this situation was repeated, it would "seriously damage Lancashire's future and prejudice any help we might expect from the Government." The surcharge, he said, would act as "an effective temporary protection for Lancashire against many textile exporting countries, and will doubtless stimulate demand considerably for Lancashire textiles."

Before the Surcharge

Looking back over the years, September tends to be a month when overseas trade returns often reach a low point. This was generally true in 1964, both as regards exports of cotton goods and imports.

Shipments of cotton yarn and thread were the lowest since the same month last year and at 1,384,000 lbs. brought the nine-month total to 15,953,000 lbs., as against 15,591,000 lbs. in 1963. Compared with August, exports of cotton cloth were nearly 4 million yards lower at 15,770,000 yards. For the nine months the aggregate was 156,228,000 yards, as against 168,750,000 yards. Cloth shipments of cotton and man-made fibre fabrics combined, however, were little more than 2 million yards lower than at the same stage in 1963, as the offtake in man-made fibre piecegoods was 10 million yards higher at 67,167,000 yards.

All Import Records Broken

It remains to be seen what effect the higher tariffs on imports will have during the final quarter of the year, but, in the nine months to the end of September, all previous records for arrivals of cotton cloth were broken. The total of grey and finished fabric concerned was 610,251,000 yards, as against 473,160,000 yards last year and the previous peak of 588,208,000 yards in 1961.

Imports of cotton grey cloth in the nine months reached 488,226,000 yards, which exceeded the total quantity entering British ports in the whole of last year. Equally, the volume of man-made fibre cloth arrivals to the end of September, at 68,927,000 yards, was higher than the quantity absorbed from abroad throughout 1963.

The corresponding totals last year were 363,253,000 yards of cotton grey cloth and 45,441,000 yards of man-made fibre cloth. In the case of finished cotton fabrics, the upwards movement in arrivals was not so pronounced, being 122,025,000 yards, as against 109,907,000 yards.

Sources of Supply

India still far exceeds any other supplier of cotton grey cloth, having shipped nearly 200 million yards of material in the nine months, this total being larger than in the whole of last year. The actual figures were 197,440,000 yards, as against 130,204,000 yards in the first nine months of 1963 and 184,627,000 yards throughout last year.

Arrivals from Hong Kong so far are 10 million yards smaller than the 1963 level at 58,783,000 yards and China has now stepped up into third position, having despatched 45,164,000 yards, as against 28,194,000 yards. Reduced shipments from Pakistan have amounted to 40,818,000 yards, as against 46,901,000 yards.

Belgium has regained her position as chief supplier of finished cotton fabrics to this country with 20,154,000 yards, as against 17,760,000 yards, closely followed by India with 19,119,000 yards, as against 10,853,000 yards and Hong Kong with 18,281,000 yards, as against 21,375,000 yards.

A big increase has occurred in purchases of man-made fibre cloth from Italy and the United States. In the nine months, Italian shipments to this country were 17,133,000 yards, as agaist 10,639,000 yards, while America sent 14,226,000 yards, as against 8,147,000 yards. In both instances, the totals this year have already exceeded the 1963 aggregate.

COTTON SEASON 1963-64 IN RETROSPECT

SUPPLY POSITION COMFORTABLE—CONSUMPTION RISES MARKEDLY

NOW that final figures relating to production, consumption, imports and exports are available, it is possible to assess the position in respect of supply and distribution of cotton during the past season, that is the one which ended on 31st August last. The season (1963-64) witnessed a record crop, high level of indigenous cotton consumption, reduced imports, free licensing of Bengal *Deshi* cotton exports and relaxation of the rigid Cotton Control Order. The official final estimate of the cotton crop places the total output at 6.13 million bales, the biggest on record since the partition of the country, which exceeds the previous season's record crop of 5.76 million bales by 365,000 bales. As compared with the 1961-62 season, the 1963-64 crop shows an increase of as much as 1.43 million bales or a rise of 30 per cent. It will be seen from Table A below that bumper crops were harvested in the Punjab, Uttar Pradesh, Rajasthan, Maharashtra and Madhya Pradesh.

The area-wise break-up shows that the combined crop of Punjab, U.P. and Rajasthan, which had receded marginally from 1.04 million bales in 1961-62 to 1.03 million bales in 1962-63, rose to 1.48 million bales in 1963-64. In the same way, the cotton crop of Maharashtra and Madhya Pradesh had improved further to 2.26 million bales from 1.49 million bales in 1961-62 and 1.96 million bales in 1962-63. In Gujarat, however, the crop was marked by a severe cold wave in the month of January and the yield was adversely affected. There was a slight setback to the crop in the Southern States of Mysore, Madras and Andhra, the combined cotton production of which fell from 887,000 bales in 1962-63 to 880,000 bales in 1963-64. As for quality, the crop was excellent in the Punjab, Uttar Pradesh and Rajasthan. These areas produced cotton of good quality and grade after some years, especially the Bengal *Deshi* variety. Punjab American M.14 and 320 F had also quite good staple. In the Oomras, 197/3 and L.147 were quite satisfactory in both grade and staple.

Supply

Thanks to increased production and large carry over of 2.68 million bales (as against 1.63 million bales a year before), the total available supply of cotton during the 1963-64 season was markedly higher at 8.93 million bales (despite reduced imports), as compared with 8.25 million bales and 7.70 million bales in 1962-63 and 1961-62, respectively. Details are given in

Table A: *Area-wise Break-up of Production*
(In thousand bales of 400 lbs./180 kgs.)

Areas	1963-64	1962-63	1961-62
Punjab, U.P., Rajasthan ..	1,477	1,032	1,042
Maharashtra, Madhya Pradesh	2,255	1,963	1,488
Gujarat	1,504	1,871	1,388
Mysore/Madras/Andhra ..	880	887	766
Assam	14	12	16
Total ..	6,130	5,765	4,700

Table B. A noticeable feature of the season's cotton balance as depicted in the table is a perceptible decrease in imports which have come down from 851,000 bales in 1962-63 to 630,000 bales in 1963-64. Imports during 1963-64 comprised 183,000 bales from U.A.R., 230,000 bales from the U.S., 126,000 bales from Sudan, 76,000 bales from E. African and 15,000 bales from other countries.

As regards distribution, mill consumption of cotton has gone up by about 15 per cent from 5.67 million bales in 1962-63 to 6.05 million bales in 1963-64. The whole of the increase is accounted for by Indian cotton, the quantity actually consumed being 5.45 million bales, as against 4.79 million bales in 1962-63. Foreign cotton consumption, which had fallen from 1.01 million bales in 1961-62 to 881,000 bales in 1962-63, has declined again by about 33 per cent to 600,000 bales in 1963-64. Despite the comfortable supply position, exports have suffered a further setback. The actual shipments during the season aggregated no more than 280,000 bales, as against 334,000 bales in 1962-63 and 358,000 bales in 1961-62. Although the mill consumption of Indian cotton was quite high during the season, the stocks at the end of the season were substantially higher at 2.52 million bales, as against 1.74 million bales a year before. The stocks of foreign cotton, however, were lower at 242,000 bales, as against 287,000 bales.

Government Policy

In view of the improved supply position, the Government of India relaxed the stricter Cotton Control and announced a liberal policy for the 1963-64 season. The floor prices of cotton, for instance, were raised by Rs. 100 per candy. Further, the mills were permitted to buy 100 per cent of their requirements of Indian cotton based on their 1961-62 consumption. And the Compulsory Quality Survey and Supervision Scheme was discontinued. It was only in the case of Digvijay 'A' cotton that the Government had to restrict movement and purchase towards the end of January last, because its prices were at or above the ceiling. Even this restriction was removed in April 1964.

The prices of all varieties of cotton were generally below the ceilings in the early part of the season. In view, however, of the rising indigenous consumption, the prices tended to increase as the season advanced. The rise in prices was temporary for a slight downward tendency was noticed later, following certain official restrictions and the agreement with the U.S. under which India was to obtain 300,000 bales of American upland cotton.

Bengal Deshi

An event of great importance during the season 1963-64 was the abolition of the export duty of Rs. 25 per bale on Bengal *Deshi* variety, as also the free licensing of its exports. At the beginning of the season, the Government had announced an export quota of 200,000 bales, but, later on, it decided to issue export licences freely without quantitative limitations on individual exports. This was possible because of a bigger Bengal *Deshi* crop of 567,000 bales in 1963-64 as against 431,000 bales in the preceding season. It may be recalled, in this connection, that enquiries for this variety from India's traditional buyers, namely, Japan and Europe, were small because they were awaiting India's reaction to the abolition of export duty on *deshi* variety by Pakistan in June last. After the abolition of export duty on Bengal *Deshi* by India, the sales picked up. Out of the total exports amounting to 280,000 bales, Bengal *Deshi* alone accounted for 228,000 bales. The share of Assam-Comilla, Zoda-yellow and others was 13,900 bales, 32,100 bales and 6,000 bales, respectively. The major buyer of Indian cotton was, as usual, Japan which bought 208,500 bales, followed by the European countries which took 34,600 bales, and U.S. and Canada 18,700 bales.

DO YOU MAKE NICKEL/CHROMIUM PLATED ARTICLES?
then test your plating with this instrument

Attention to quality is the first step in the production of goods which *sell*. Eye-catching chrome thinly plated will sell — once. As soon as the plating peels or becomes rusty — the manufacturer's name suffers — affecting repeat sales.

How do *you* ensure lasting quality? Ask yourself these questions.

- Is the thickness of the plating specified to the plater?
- Are you aware of the Indian Standard specification 1068:1958 on nickel plating?
- Can you check that the finished article conforms to your specification?

As a first step write today for further information from

कर्तव्यपरायणता
"DEVOTEDNESS TO DUTY"

As we celebrate the Silver Jubilee of DENA BANK, our thoughts turn in grateful homage to our revered founder, Shri Pranlal Devkaran Nanjee.

Endowed with remarkable foresight and business sagacity, Pranlalbhai - as he was affectionately known - nurtured DENA BANK from a sapling, leaving to us a mighty growing tree with its roots embedded in solid foundation and branches spreading in all directions.

Inscribed on the pedestal of his marble bust in our Board Room are these words which admirably sum up his life and work: 'Kartavyaparayanata'-Devotedness to Duty.
To make DENA BANK worthy of his noble memory is our mission and endeavour.

PAKISTAN'S THIRD FIVE-YEAR PLAN

SALIENT FEATURES OF THE OUTLINE

By Dr. Anwar Iqbal Qureshi
ECONOMIC ADVISER, PAKISTAN GOVERNMENT

PAKISTAN'S second Five-year Plan will terminate at the end of June 1965. It is hoped that the third Five-year Plan will be finalised in the second quarter of 1965 and brought into force on 1st July 1965. In the meantime, an outline of the third Five-year Plan has been published and the President of Pakistan, Field-Marshal Mohammad Ayub Khan, who also happens to be the Chairman of the Planning Commission, has ordered that this be circulated to elicit public opinion.

In a foreword to the outline, the President has observed that "the aim of the planning in Pakistan is the creation of equal opportunities for all rather than equal distribution of wealth. In fact, perfect equality of incomes has never been achieved, not even in the communist countries, because differences in aptitudes and talents make for differences in incomes even when individuals start off with equal opportunities. And this is as it should be. The important thing is that every individual must be given the fullest opportunity to develop his natural talents and that he should not be inhibited by an oppressive economic and social framework." Proceeding, he says.

"There are three cornerstones of this policy of ensuring equal opportunities to which we are committed. Firstly, it is the intention of the Government to provide universal free primary education to all. Secondly, it is our aim to ensure a system of merit scholarships at the secondary education level. Thirdly, we intend to provide competitive entry to jobs at all levels. These objectives are already embodied in the Constitution. Their achievement will automatically ensure that a child gets the maximum possible opportunity for advancement, irrespective of his economic or social class."

Before I give the salient features of the third Five-year Plan, it will be helpful if a brief account is given about the achievements of the second Five-year Plan.

Increased Expenditure in the Second Plan

The second Five-year Plan (1960-65)—now in its fifth and final year—was announced in June 1960, envisaging a total development expenditure of Rs. 1,900 crores. It was revised in November 1961 to Rs. 2,300 crores, to take account of price increases since the original calculations were made in 1959, underestimation of the cost of several projects shown by subsequent engineering reports, the higher rate of population growth revealed in the 1961 census and the need in a few sectors to enlarge the physical dimensions of the Plan. The revised Plan allocated development outlays of Rs. 1,462 crores in the Government sector and of Rs. 838 crores in the private sector.

As the Plan is coming to a close, the actual expenditure incurred so far and projections for 1964-65 suggest that the Plan will terminate with a total expenditure of Rs. 2,445 crores, Rs. 145 crores more than the revised estimates of Rs. 2,300 crores. The entire excess expenditure is estimated in the private sector. As against the Plan target of Rs. 838 crores in this sector, the expenditure will now be Rs. 983 crores. The revised phasing of expenditure is shown below:

Revised Phasing of the Expenditure of the Second Five-year Plan
(In crores of rupees)

Financial year	Public sector	Private sector	Total
1960-61 (actual)	198	123	321
1961-62 (actual)	234	162	396
1962-63 (actual)	276	203	479
1963-64 (estimated actual)	359	235	594
1964-65 (proposed)	359	260	655
Total	1,462	983	2,445
Plan target	1,462	838	2,300

Public Sector Programme

The public sector programme, while maintaining an overall balance, shows that certain key sectors, namely, agriculture, industry, fuels and minerals, and housing and settlements fell in arrears. Thus, in the agriculture sector, the expenditure is estimated at Rs. 213.9 crores against the target of Rs. 251.5 crores, a shortfall of 14.9 per cent. Industry, fuels and minerals sector will finish with a shortfall of 9.4 per cent and housing and settlement sector of 3.9 per cent.

The expenditure will exceed the targets in the water and power sector by 6.7 per cent and in the transport and communications sector by about 13 per cent.

In the education sector, the expenditure will slightly exceed the target, while in the health, social welfare and manpower sector, it will marginally fall behind.

The table below shows the public sector allocations and the estimated utilisation:

Public Sector Allocations and Estimated Utilisation in the Second Plan
(In crores of rupees)

Sector	Plan allocation	Estimated expenditure (1960-65)	Increase (+) decrease (—)
Agriculture	251.5	213.9	—37.6
Water and power	414.0	442.2	+28.2
Industry, fuels and minerals	191.0	173.0	—18.0
Transport and communications	272.5	307.7	+35.2
Housing and settlements	188.5	181.0	— 7.5
Education	95.5	95.6	+ 0.1
Health, social welfare and manpower	49.0	48.6	— 0.4
Total	1,462.0	1,462.0	

Third Five-year Plan—An Outline

A gross development programme of Rs. 5,200 crores is proposed for the third Five-year Plan (1965-70). The gross plan size assumes a shortfall of about Rs. 650 crores in the public sector. Thus, the net outlay during the Plan period will be Rs. 4,550 crores. Of the gross Plan size of Rs. 5,200 crores, no less than Rs. 3,400 crores, is allocated to the public sector and Rs. 1,800 crores to the private sector. The gross Plan size of Rs. 5,200 crores is inclusive of expenditure of Works Programme and on anti-waterlogging and salinity measures in West Pakistan. The geographical distribution of the proposed allocations is as follows:

(In crores of rupees)

	East Pakistan	West Pakistan	Total
Government-financed programme	1,800	1,600	3,400
Private sector	900	900	1,800
Total	2,700	2,500	5,200

Objectives

The principal objectives set for the third Plan are as follows:

(a) A minimum increase of 30 per cent in national income over the Plan period ending 1969-70.

(b) To reduce disparity in *per capita* income between East and West Pakistan from a provisionally estimated 25 per cent at the beginning of the Plan to about 20 per cent by 1970.

(c) To provide 4.5 million new job opportunities.

(d) To strengthen the balance of payments by reaching a level of Rs. 425 crores in the country's foreign exchange earnings by 1970, compared with Rs. 295 crores in 1965.

(e) To develop basic industries for the manufacture of producer goods.

(f) To secure the transformation of agriculture through a massive works programme.

(g) To arrest the menacing growth of population.

(h) To diminish inequalities in the distribution of income, wealth and economic power and provide a measure of social security.

Sectoral Targets

The sectoral break-up of the net Plan expenditure of Rs. 4,550 crores is shown in the accompanying table.

The main physical targets proposed for the agricultural sector are: increase in foodgrains production by 25 per cent, cotton production by 35 per cent, jute production by 21 per cent, tea by 27 per cent, sugarcane by 34 per cent and tobacco by 33 per cent.

In the water and power sector, it is proposed to irrigate an additional area of 3.6 million acres and improve an area of 11 million acres through drainage, flood protection, anti-waterlogging and anti-salinity and other measures. It is proposed to increase the power capacity installed to 2,800 MW in 1969-70 from 1,435 MW in 1964-65.

In the industrial sector, the major emphasis will be on heavy producer goods industries. It is expected that domestic production of capital goods will increase from Rs. 50 crores in 1965 to Rs. 100 crores by 1970. The main physical targets in the industries sector are: cotton textiles 620 million lbs. of yarn; jute manufacture 720,000 tons; white sugar 640,000 tons; cigarettes 30,000 million; tea 79 million lbs.; cement 5 million lbs.; steel 1.2 million tons. In addition, substantial capacity will be installed for the production of petrochemicals, machine tools and heavy engineering and electrical equipment.

In the transport and communications sector, the main emphasis in East Pakistan will be on inland water transport, roads and air services, whereas, in West Pakistan, the road programme will receive greater priority. The Plan also provides for improving the existing port facilities at Karachi and Chittagong and converting the Chalna anchorage into a permanent major port. The Plan proposes provision of 150,000 additional telephones; postal services, particularly in the rural areas, will be expanded by opening 2,000 new post offices, thereby raising the total number to 13,500. Television facilities will be expanded with greater emphasis on educational programme.

The main object of the Education and training sector programme will be to widen the base of primary education and greatly increase the facilities for technical and vocational education. In the field of higher education, existing colleges and universities will be consolidated for improving the academic standards and quality of instruction. A larger scholarship programme will be maintained to support meritorious students. Adequate provision has also been made for adult education, promotion of arts, culture and sports.

In the health sector, main emphasis will continue to be on preventive measures; about 60 per cent of the allocation will be provided for preventive programmes such as eradication of malaria, tuberculosis control and health education. The curative services will include provision for 17,000 additional beds and 400 rural health centres. Family planning has been accorded high priority and an allocation of Rs. 15 crores made for this programme.

Sectoral Allocations in the Third Plan
(In crores of rupees)

Field of development	Government sector	Private sector	Total	Second Plan estimated actual	Percentage increase of (4) over (5)
1	2	3	4	5	6
Agriculture	434	200	634	294	116
Water and power	863	30	893	464	93
Industry	475	830	1,305	580	125
Fuels and minerals	90	75	165	86	92
Transport and Communications	587	310	897	444	102
Physical planning and housing	274	315	589	385	53
Education	274	30	304	108	181
Health	274	4	122	51	133
Manpower	118	6	41	8	412
Social welfare	35	..	250	80	213
Works programme	250	1,800	5,200	2,500	108
Total (gross)	3,400	Nil	—650	..	..
Less estimated shortfall	650				
Total (net)	2,750	1,800	4,550	2,500	108

According to Article 145 clause (3) of the Constitution, a primary object in plan formulation "shall be to ensure that disparities between the Provinces and between different areas within a Province, in relation to income *per capita* are removed and that resources of Pakistan (including resources of foreign exchange) are used and allocated in such a manner as to achieve that object in the shortest possible time." The third Five-year Plan seeks to implement this Constitutional provision to the maximum extent possible.

The third Plan earmarks Rs. 2,700 crores for East Pakistan out of a total gross Plan size of Rs. 5,200 crores. It is tentatively estimated that this would lead to an increase of 34 per cent in the national product of East Pakistan, as compared with 27 per cent in West Pakistan.

Out of total Plan allocation of Rs. 2,700 crores for East Pakistan, Rs. 1,800 crores is in the public sector and Rs. 900 crores in the private sector. West Pakistan has been allocated Rs. 2,500 crores—Rs. 1,600 crores in the public sector and Rs. 900 crores in the private sector. East Pakistan has thus been provided with a margin of Rs. 200 crores during the third Plan as a whole, and an average annual margin of Rs. 40 crores. Net public sector expenditures in East Pakistan will rise from an estimated Rs. 700 crores during the second Plan to Rs. 1,800 crores in the third, an increase of about 150 per cent. In West Pakistan, they will rise from an estimated Rs. 840 crores during the second Plan to Rs. 1,600 crores during the third, an increase of nearly 90 per cent.

Resources for the Government Financed Sector
(In crores of rupees)

	Second Plan		Third Plan projection
	Target	Revised estimates	
Domestic resources:			
Surplus on revenue account (a)	192	216	730
Net capital receipts	140	146	190
Local bodies	20	20	30
Additional taxation	175	180	300
Deficit financing	Nil	66	150
	527	628	1,400
External resources:			
Project loan (including technical assistance)	525	351	700
Commodity loans	350	342	550
P.L. 480 counterpart funds	60	141	100
	935	834	1,350
Total resources	1,462	1,462	2,750
Domestic resources as a percentage of total	36	43	51
Foreign resources as a percentage of total	64	57	49

In the private sector, it is proposed that Rs. 1,800 crores should be allocated equally to East and West Pakistan. In East Pakistan, this means an increase from an estimated level of Rs. 330 crores during the second Plan, that is, an increase of about 173 per cent. In West Pakistan, it means an increase from an estimated second Plan total of Rs. 630 crores or about 43 per cent.

In the third Plan, the Works Programme will form a separate sector mainly concerned with the growth and development of a rural economy. The Plan provides for a works programme of Rs. 250 crores, Rs. 150 crores in East Pakistan and Rs. 100 crores in West Pakistan. The works programme will mobilise the idle manpower by providing wages for economically productive public utility works. It will offer over one million additional job opportunities.

Since independence, most of the development works have been concentrated in urban areas and the rural areas have been in a state of depression, with large-scale unemployment and underemployment, absence of capital works and a moribund local self-government system.

Economic growth needs an infrastructure of capital works and financial institutions and resources which stimulates entrepreneurs and makes the desired development possible. This is precisely what rural Pakistan lacks. And it is this the works programme seeks to supply.

The creation of social capital like schools, dispensaries, marketing centres, community houses and communications will make the rural community aware of the significance of the country-wide development effort which is being made. The increasing income of the farmer will tend to increase the demand for consumer goods produced by the urban and rural industries.

Financial Allocations

In financing the net Plan size of Rs. 4,550 crores, it is estimated that about Rs. 2,900 crores will be available by way of domestic savings and another Rs. 1,650 crores can be raised from foreign assistance and P.L. 480 assistance. The level of external assistance envisaged in the third Plan implies an annual commitment of about $600 million, as against the current rate of $500 million. It is hoped that foreign assistance of this magnitude will be forthcoming.

The gross allocation for development expenditure in the public sector is Rs. 3,400 crores but after allowing for a shortfall of Rs. 650 crores, net public expenditure during the Plan period is likely to be Rs. 2,750 crores. It is expected that, over 50 per cent of the public sector development programme, will be financed from domestic sources, as compared with only 43 per cent during the second Plan. A substantial portion of increased public savings is expected from larger surpluses from existing taxes and from capital receipts, but about one-third of the total domestic finance must come from the imposition of new taxes and deficit financing.

The performance of the private sector in respect of fixed capital formation has exceeded the targets set in the second Plan. The amount of savings projected during the third Plan in the private sector is Rs. 1,500 crores. Foreign loans and credits to the private sector has been projected at Rs. 230 crores. In addition, the foreign private investment is estimated for the third Plan at Rs. 70 crores, bringing the total of external resources for the private sector to Rs. 300 crores.

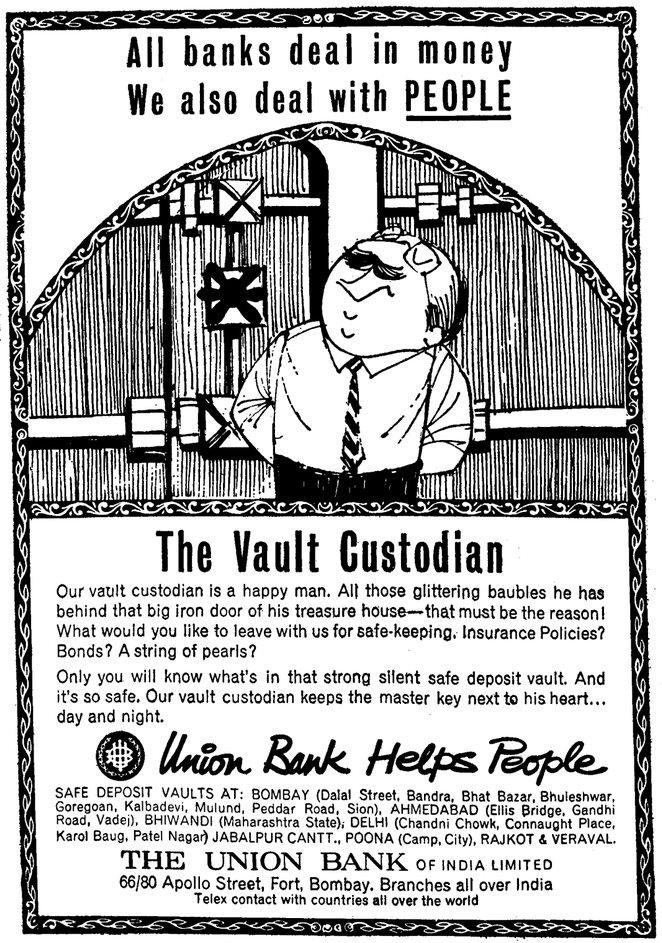
ANNUITY DEPOSIT SCHEME

The main features of the Annuity Deposit Scheme have been explained by the Government of India in a Press Note dated the 10th September, 1964. One of the points mentioned in it was that, where a self-assessment had been made, the annuity deposit was required to be made within thirty days of the assessee's filing his return, but persons who filed their returns of income by the end of September, 1964 could make their annuity deposits by 31st October 1964.

From some representations received from the public, it seems that some persons have got the impression that annuity deposits had to be made in all cases on self-assessment, and that the last date for making annuity deposits for the current year in all cases was 31st October 1964.

This is not the correct position. During the current year, annuity deposits have to be made voluntarily on self-assessment, that is, on the basis of the income declared in the return for the assessment year 1964-65, only in those cases where income-tax is payable by an assessee on self-assessment. Income-tax is payable on self-assessment only in those cases where the tax on the returned income, as reduced by any tax deducted at source or any advance tax paid, exceeds Rs. 500. It follows that where the tax payable on the basis of the income returned for the assessment year 1964-65 as reduced by any tax deducted at source or paid in advance does not exceed Rs. 500, no annuity deposits will have to be made by the assessee voluntarily on the basis of his return of income. In such cases, annuity deposits on the income assessable for the assessment year 1964-65 will have to be made when the income-tax assessment for that year is made and a demand notice is received by the assessee.

Where income-tax is payable on self-assessment, annuity deposit on the basis of the return of income has to be made within thirty days of filing the return. However, as the Annuity Deposit Scheme came into force on 1st October 1964, this time limit was relaxed and assesses who filed their returns of income by the end of September were allowed to make annuity deposits on self-assessment by 31st October 1964. Representations have since been received for extending this time limit. On considering these representations, it has been decided that, in cases where income-tax returns for the assessment year 1964-65 have been filed by 31st October 1964 and assessees are liable to make annuity deposits on self-assessment, time will be allowed to make such deposits till 15th December 1964. Where returns of income are filed after 31st October 1964 and tax is found payable by the assessee on self-assessment, annuity deposit on self-assessment should be made within thirty days of filing the return.



JOINT COMMISSION FOR TEA PROMOTION

HOW INDIA AND CEYLON CAN HELP EACH OTHER

THE decision of India and Ceylon to set up a joint commission for promoting the sale of tea will benefit not only these major producers but also, indirectly, many other countries that have recently entered the world market. The principal tea producing countries are India, Ceylon, Indonesia, Kenya, Uganda, Tanganyika, Nyasaland, China, Japan, Pakistan, Malaya and Argentina. But India and Ceylon are the most important, their production in 1963 being 346 million kg. and 220 million kg., respectively. China produced in the last year 158 million kg., Japan 81 million kg., Indonesia 38 million kg., Pakistan 25 million kg. and Kenya 18 million kg. The output of other producers was relatively negligible.

India and Ceylon are also the major exporters of tea. The following table shows the share of tea in the export of the different producing countries during 1963; figures in bracket show the percentage share in world exports of tea:

(In million kg.)

Country	*Export*
India	223.5 (39.8)
Ceylon	206.8 (36.8)
Indonesia	30.3 (5.4)
British East Africa (Kenya, Uganda and Tanganyika)	35.9 (6.4)
China	29.5 (5.2)
Formosa	13.7 (2.4)
Japan	3.6 (0.6)
Malaya	1.6 (0.3)
Other countries	17.5 (3.1)

Among the countries shown above, apart from India and Ceylon, the share of other countries at present is quite small, but some of them, at any rate Kenya, Indonesia and China are capable, in due course, of expanding their production and exports. But, for the present, India and Ceylon are the principal suppliers and they will continue to retain their dominant position for a long time. For both countries, tea constitutes a major source of foreign exchange.

For India, tea accounted for nearly 17 per cent of its total export earnings in 1963. Out of Rs. 779.21 crores worth of exports from all commodities in that year, the share of tea was Rs. 132.37 crores. For Ceylon, out of its exports of Rs. 173.06 crores in 1963, tea earned Rs. 113.98 crores or 65.86 per cent of the total.

Ceylon Leads

Although India and Ceylon are the chief sources of supply for most countries, in some India has a far larger share than Ceylon. In others, Ceylon's share is higher in the U.K., for instance, out of 255 million kg. of tea imported in 1963, India's share was 128 million kg. and that of Ceylon about 80 million kg. But, in the U.S.A. out of 55 million kg. of tea imported in 1963, Ceylon's share was larger at about 24 million kg., as compared with that of India at nearly 13 million kg. To Australia Ceylon sold last year (1962-63) over 16 million kg. but India exported hardly 5 million kg., Australia's total import in that year being about 30 million kg. Some of the other countries, where Ceylon has a much larger share than India, are Canada, New Zealand and Iraq. On the other hand, in Poland, West Germany, U.S.S.R., Egypt and Sudan, it is India, not Ceylon, which has the dominant position.

The Joint Commission can do a good deal of useful work by undertaking intensive propaganda for tea and by trying to reduce or remove such barriers to tea exports as are still imposed by many countries. In Europe, apart from the U.K. and Eire, the *per capita* consumption of tea is very low as will be clear from the figures shown below:

Country	*Per capita tea consumption in 1962* (In kg.)
U.K.	4.34
Eire	3.82
Netherlands	0.73
Italy	0.04
West Germany	0.15
Belgium and Luxembourg ...	0.04
France	0.04
Denmark	0.33
Austria	0.08
Spain	0.01
Greece	0.02
Finland	0.10
Norway	0.11
Sweden	0.15
Switzerland	0.23
Portugal	0.02

Some of these countries such as West Germany and Italy are predominantly lovers of coffee. Even in the U.K., coffee consumption has shown a remarkable increase in recent years. In 1962, the per head consumption of coffee in the U.K. was 2.7 lbs. which was nearly double that of a decade ago. In the U.S., tea consumption per head was 0.31 kg. and in Canada 0.98 kg. The U.S.A. is mainly a coffee drinking country. Coffee imports into the U.S. are about 2,300 million lbs. per year, as compared with only about 108 million lbs. of tea. In Canada, tea consumption has not increased significantly, because a large proportion of the immigrants have come there from coffee-drinking countries of Europe. In Asia also, there are several countries where *per capita* tea consumption is low such as Saudi Arabia, Syria, Iran, Turkey, Thailand and Singapore.

Propaganda Must be Intensive

Tea propaganda, to be successful, has to be done intensively over a period of years. This will involve a considerable expenditure that may be rather too heavy for India and Ceylon individually. In the U.S., in particular, advertisement and other aspects of publicity campaign cost enormous sums of money. But, with the combined resources of India and Ceylon, the financial strain will be far less. It is necessary, however, to see that the campaign is conducted effectively so that both the countries can derive full benefit. The techniques may, perhaps, differ in detail from one country to another. In some countries, the propaganda will have to be directed to particular regions or to sections of the population. In Australia, for instance, a tea delegation led by the Chairman of India's Tea Board, suggested recently that the public relations campaign must have "a strong bias towards the young, for it is among the youngsters that the tea position is weakest."

The Joint Tea Commission is also expected to try to reduce the internal taxes on tea which are imposed in many European countries. In West Germany, the tax on tea is the highest, namely, Rs. 2.26 per lb. In other countries it is lower—Re. 0.87 in France, Re. 0.64 in Italy, Re. 0.40 in Belgium and Re. 0.07 in Luxembourg. Restrictions are imposed by some Asian countries as well. For example, Iraq levies an import duty Re. 1.13 per kg., Turkey an import duty of 75 per cent *ad valorem*, and Saudi Arabia an import duty at 6 per cent *ad valorem*. In Sudan, the import duty is Re. 1.36 per kg., while in the U.A.R. it is 50 per cent *ad valorem*, with a minimum of Rs. 2.27 per kg.

While efforts are made to promote the sale of tea in various countries, greater attention has also to be given to increase production. India's Tea Board has just pointed out that there is "no evidence of any excess of tea nor is there any likelihood of an excess arising in the near future." This is based on the following figures:

The total supply of tea during 1963 was 739.4 million kg. (1,630 million lbs.), while absorption was 745.7 million kg. (1,644 million lbs.), resulting in a deficit of 6.3 million kg. (14 million lbs.). Total supplies of tea decreased by 5.9 million kg. (13 million lbs.) to 739 million kg. (1,630 million lbs.) in 1963 from 745.3 million kg. (1,643 million lbs.) in 1962. Absorption, on the other hand, continued to rise to 745.7 million kg. (1,644 million lbs.) in 1963 from 744.8 million kg. (1,642 million lbs.) in 1962.

So the Tea Board discounts the possibility of any excess of tea in the coming years.

In India, during the last three years, while the area under tea was increasing, both the total production and the yield per hectare were on the decline. The area rose from 331,299 hectares in 1956 to 332,524 hectares in 1962 and 334,036 hectares in 1963. But production fell steadily from 354 million kg. to 346 million kg. and 345 million kg. respectively. The yield per hectare also fell from 1,070 kg. in 1961 to 1,043 kg. in 1962 and 1,036 kg. in 1963.

In Ceylon, on the other hand, there has been a continuous increase both in production and yield per hectare. Production increased from 206 million kg. in 1961 to 212 million kg. in 1962 and 220 million kg. in 1963. The yield per hectare went up from 869 kg. to 886 kg. and 925 kg. in the last three years, respectively. But the area under tea which rose from 237,712 hectares in 1961 to 239,216 hectares in 1962 dropped to 237,702 hectares in the next year.

So far as India is concerned, the adverse weather to some extent affected production in the past. But it cannot be denied that the tea industry continues to face difficulties of various types in increasing production. Lack of finance, owing to excessive taxation, has been a serious obstacle. The problem is now under study by an official Committee. In view of its important role in the export trade, the industry's handicaps need to be tackled with more speed and sympathy.

TEA EXPORTS TO JAPAN

There is a potential market for Indian tea, especially black tea, in Japan, according to the Chairman of the All-Japan Black Tea Association who visited India recently. The Chairman hopes that exports of tea from this country could be substantially increased. Meanwhile, the Tea Board proposes to introduce several long-term measures for boosting exports of tea to Japan. Currently, it may be noted here, India exports only a small quantity of tea to Japan. The actual shipments during the first seven months of the current calendar year aggregated no more than 22,571 kgs. worth Rs. 1.49 lakh.

FLOCAR
forklift trucks
solve your materials handling problems

You scoop, dig, haul, raise, load, unload, stack, save third dimensions, time and money eliminating considerable cost.

First in India to produce Forklift Trucks of capacities 1000 to 5000 kgs., at 25" load centre.

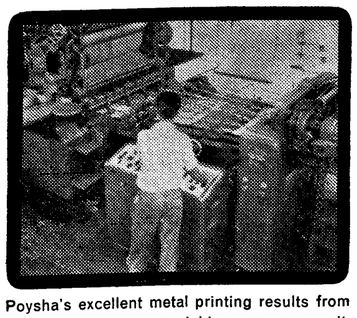
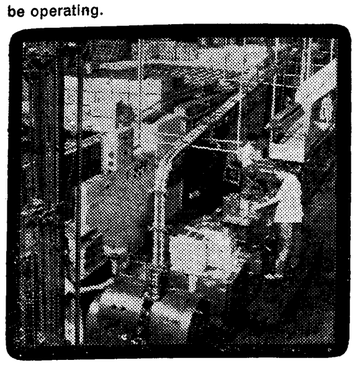
POYSHA IS ONE OF INDIA'S TWO LARGEST CAN MAKERS

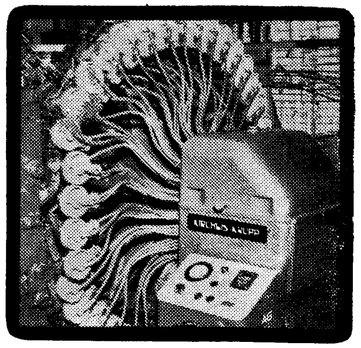


Poysha's excellent metal printing results from this modern wet varnishing process unit. Soon a new two-colour printing unit will also be operating.

Quality control is strict! Cans even undergo laboratory check-ups...to meet Poysha's own high standards.



Poysha has advanced automatic machinery. This high-speed bodymaker line, for instance, mass-produces over 300 cans a minute.



This completely automatic air tester checks cans under air pressure to ensure that they are perfectly leak-proof and airtight containers.

WILL SOON GROW LARGER... WITH 3 NEW FACTORIES

By 1965-66, Poysha will be taking its advanced can-making know-how into the heart of the industrial centres of India with 3 new factories. The largest, at Dighe (Bombay), will serve industries in Western and Central India. The second, at Cochin, will serve the fishing, pineapple and other industries in the South. The third, at Ghaziabad (Delhi), will serve vast fruit, vegetable and industrial areas in Northern and Eastern India.

It will mean a capacity increase to one crore cans a month for Poysha...which will raise its Paid-Up Capital from Rs. 25 lakhs to Rs. 110 lakhs shortly

USED MACHINERY AND EQUIPMENT

THEIR UTILITY FOR DEVELOPING COUNTRIES

THERE are two widely separate schools of thought in the West on the advisability of making available used or reconditioned machinery for use in underdeveloped countries. One expert view is broadly to the effect that, while the reconditioned machines will not be as efficient as new models, it is obviously important for the developing countries that every possible economy should be practised in order to conserve their foreign exchange resources. The other view is broadly to the effect that old machinery or even the best reconditioned machinery will produce only inferior goods and that the developing country should not be handicapped with obsolete techniques or worn out machinery which would only hamper its strides towards improvement. Both these views have been examined, with supporting details and examples, in an article in the September 1964 issue of *The Fund and Bank Review: Finance and Development*. The author of this article is Mr. Albert Waterston, a staff member of the Development Advisory Service of the International Bank for Reconstruction and Development.

Arguments For and Against

Advocates of greater use of second-hand equipment in developing countries contend, Mr. Waterston observes, that not only do firms using such machinery do well in the domestic market, but, because of low wages, they may be able to compete in export markets with companies in high-wage areas which operate with more modern machinery. Two striking examples have been given in this connection. One is that of a Calcutta firm which bought from its British associate a used semi-automatic machine for making wood screws. As this Calcutta firm pays wages at the low rates prevalent in India, it not only undersells the British company in India but also exports to neighbouring countries at a lower price than its associate. The other example is that of a South American company which imported from a U.S. foundry some of the old casting equipment that required in the United States uneconomic amounts of high-cost labour to operate. Although steel for casting also had to be shipped to the South American company, the U.S. foundry found that it was cheaper to import the South American castings than to produce similar castings with modern equipment in its own plant. But, in spite of such advantages in using old machinery, most entrepreneurs prefer new equipment on the grounds that the new is inherently better than the old, that it is not always easy to locate the right type of usable second-hand equipment when it is needed and that it is psychologically more satisfying to own the latest equipment. The author has also recognised the point that any one who advices a developing country to acquire used machinery may be accused of wanting to saddle a country with the cast-off equipment which another country wishes to scrap. He is, however, convinced that, in certain cases and with adequate safeguards, it would be advantageous for developing countries to acquire second-hand machinery or equipment which, although obsolescent in industrialised countries, is capable of producing satisfactory goods at marketable prices when used in developing economies. The facts and points mentioned by him in this connection are highlighted below:

1. The quantity of used machinery and equipment of all kinds in the United States is considerable and is increasing in the context of large-scale modernisation and automation under way.

2. The idea that used machinery and equipment can be put to advantageous use in a developing economy can hardly be called new. In several underdeveloped countries round the world large amounts of used machinery have actually been in operation for many years in cement, iron and steel, aluminium, engineering, textile, chemical, sugar and mining industries.

3. Many prosperous industries in the United States itself started their plants with second-hand equipment. Many of these plants are still in operation. Even today at least two second-hand machine tools are sold in the U.S. for every new one. In 1960, for instance, about 88,000 used machine tools were sold, with a dollar value that greatly exceeded the value of the 40,000 new machine tools sold.

4. The use of second-hand equipment does not necessarily imply backwardness. Indeed, old equipment has been employed for the most modern purposes. Lockheed Aircraft Corporation's outer space research, for instance, is depending to a large measure on a 52-ton, 40-year old generator that formerly fed power to the inner reaches of Boston's subway system.

5. In an advanced industrial country, many pressures, which have little or nothing to do with age or usability, operate to make machinery and equipment obsolescent before they are worn out. But such machinery may be well suited for operation in economies which have not moved so far along the industrial road. In Yugoslavia, for instance, the replacement of 50-year old textile machinery by 5-year old machines, which cost only about 40 per cent of what new machines would have cost, has been a great step forward.

6. Even machinery which makes products of less than the best quality has sometimes been found to be satisfactory in some markets.

7. Used machinery can often be obtained at 30 to 75 per cent of the original cost (which nowadays may be only 20 to 40 per cent of what the same machine would cost, if it were to be made today, and even a lesser percentage of the cost of a more modern machine doing similar work). But used machinery is a good bargain only if it will produce satisfactorily and if the price is right. The price must take into account repairs needed to make the equipment operable to the required standards.

The author, of course, concedes that in some cases where a new process eliminates the need for skilled labour which is chronically short in the less developed countries, it might be better for them to acquire equipment that embodies the latest innovations. But, in most cases, while automatic machinery requires few workers, it may demand more *skilled* workers than older machines. Again, according to him, where local capital or foreign exchange funds are scarce, and interest rates are high relative to wage rates, the lower cost of used equipment is often important, for the smaller the investment in equipment, the lower the amount of fixed costs. Highly automated production lines, he points out, can be supported only when they are running at or near capacity, for otherwise the fixed cost per unit produced would be extremely high. This means that the market must be large enough to absorb the output of the automated machinery.

Ways of Acquiring Used Machinery

Other points of general applicability where used machinery may be preferable to new are as follows:

1. A manufacturer may require from six months to two years to supply new machinery and equipment. In contrast, used machines can usually be acquired immediately and installed quickly to start yielding returns.

2. Repair parts for modern automatic machines are likely to be costlier than for older machines.

3. The difficulty of getting spare parts for second-hand equipment is often either over-stated or under-stated. In most developing countries, there are machine shops that can reproduce almost any parts likely to be found in used machinery—parts which usually are less complicated than newer models.

The first rule for someone who wishes to acquire used machinery is that he should know or learn the *exact specifications* required to meet his needs, for the more detailed the knowledge, the greater the possibility of locating the equipment wanted. Another way in which used machinery and equipment, technical operating knowledge, and an understanding of local conditions can be merged successfully is through joint business ventures in which both local citizens and foreigners own shares. If, however, an entrepreneur in a developing economy is either unable or unwilling to enter into partnership with an outside firm, there are other ways in which he may go about acquiring used machinery and equipment. For instance, if he knows *exactly* what he wants and if he can qualify under the terms of the U.S. Mutual Security Act of 1954, he can locate the item he needs through the appropriate U.S. official channels set up in his country for this purpose. Or, he may attempt to locate the machine or piece of equipment he wants through private channels. There are also several hundred established and reliable dealers in used machinery and equipment in the United States, many of whom are interested in exporting. Some manufacturers of new equipment also sell used machinery of their own make which they have reconditioned. This source, according to the author, is a particularly desirable one, since the buyer usually gets a warranty or guarantee with his purchase and can expect to obtain repair parts for the rehabilitated machinery. Yet another source is the U.S. Government itself which sells surplus machinery and equipment under sealed bids from time to time. In all these cases, it would be well for a would-be buyer to enlist the services of a knowledgeable employee, or to seek the impartial and qualified assistance of persons or companies specialising in inspecting, testing, appraising and certifying equipment of all kinds. Such an expert employee or a specialist firm can help the entrepreneur select the equipment he needs for his particular purposes.

TUTICORIN HARBOUR PROJECT

There are three intermediate ports in Madras State—Cuddalore, Nagapattinam and Tuticorin. Of these, Tuticorin Port, which lies 315 miles south of Madras Harbour, receives nearly 300 steamers and 1,100 sailing vessels a year and handles more than 2,000 tons of cargo per day, has been selected for development as a deep sea harbour and major port under the third Plan. Estimated to cost Rs. 15 crores and expected to be completed by the end of 1969, this project is to be designed and constructed entirely by Indian engineers. When completed, the harbour will have a basin of 9,000 feet by 4,000 feet, with two breakwaters curved at the seaward end, and a 400-feet wide entrance. It will have a 30-feet draft. While the project has provision for 17 berths, only six, including one oil berth, are to be provided in the first stage.

The project, the construction of which was formally inaugurated by the Prime Minister, Mr. Lal Bahadur Shastri, on the 5th instant, has involved an expenditure of about a crore of rupees on preliminaries, road and rail links, water works and first block of staff quarters in 1963-64. Work on the project proper, particularly on the north breakwater, has just begun; this is expected to involve an expenditure of Rs. three crores in 1964-65. When the whole complex of works is completed, the harbour will be in a position to handle two million tons of cargo a year. Being quite close to the Indian Ocean, it is bound to attract further trade in due course. And that will open up the backward hinterland in the districts of Tirunelveli and Ramanathapuram and usher in an era of industrial and commercial prosperity in the far south of India.

JAWAHAR WET DOCK AT MADRAS

The new wet dock, constructed at a cost of Rs. six crores at the Madras harbour, was formally inaugurated at a simple but impressive ceremony on the 6th inst. by Mr. Lal Bahadur Shastri, Prime Minister. The wet dock was named after the late Prime Minister, Mr. Jawaharlal Nehru. The total number of berths in the Madras Port has been considerably stepped up from 12 to 18 now, with the inauguration of the new wet dock with its six berths. Incidentally, the new dock, which measures 1,700 ft. by 500 ft. has three berths on each side and is provided with all port facilities, such as cranes and transit sheds. It has been constructed with sidewalls consisting of concrete monoliths on three sides. On the southern side, it is closed with a steel sheet pile bulkhead to enable easy future expansion. It has taken nearly five years to construct this dock.

The three berths on the western side of the new dock are designed to take 500 ft. ships with a draft of 31 feet at low water. The other three berths on the eastern side will be deepened to 36 ft. to take in long carriers upto 35 ft. draft. Road and railsiding facilities have been provided for all the six berths with modern standard dockside cranes of three to ten tons capacity.

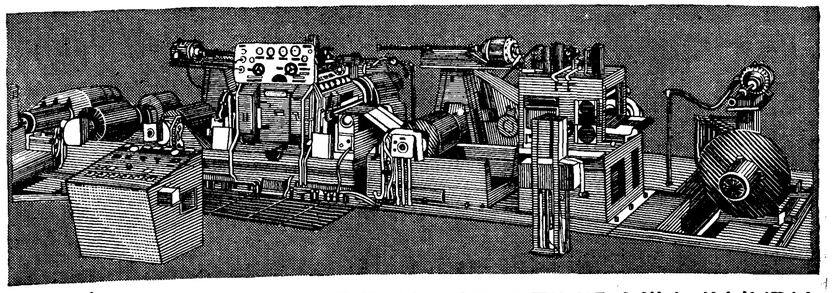
The Madras Port Trust has plans to equip the northern berth with a fully mechanised ore handling plant with a capacity to handle upto three million tons of ore initially per annum. The handling capacity is expected to be increased to four to six million tons at a later date. The Port Trust is also planning to build a sheltered oil dock in the harbour, with deep water berths, in view of the Central Government's decision to put up an oil refinery at Madras.

MACHINE TOOL DELEGATION TO JAPAN

A ten-member delegation, sponsored by the Indian Machine Tool Manufacturers' Association with the encouragement of the Union Ministry of Heavy Engineering, left India on the 7th instant for a fortnight's tour of Japan. The delegation, which is led by Mr. J. V. Patel, Managing Director of New Standard Engineering Company and President of the Association, will visit the Japan International Machine Tool Fair at Tokyo and also several Japanese industrial and machine tool manufacturing units. It will hold discussions on matters of mutual interest with machine tool manufacturers in that country and investigate the possibilities of technical collaboration on mutually advantageous terms. What is more, it will not only explore the avenues for exporting Indian machine tools but also assess the products which India could import from Japan. It is noteworthy that, Mr. R. N. Basu, Development Officer (Tools), Government of India, is accompanying the delegation as Technical adviser.

Air-India and Middle East Airlines have signed a pool agreement, covering their services between India and Lebanon and *vice versa*. The agreement came into effect from 1st October, 1964. The pool covers Air-India's three transit flights a week, through Beirut, in each direction, and Middle East Airlines twice weekly flights to Bombay and the India/Lebanon route. This new pool arrangement will enable the two airlines to work together closely, coordinate their schedules, provide better service to the travelling public and promote traffic between the two countries.

BETTER THAN THE BEST IN 50 YEARS



INAUGURATE THE FIRST SENDZIMIR MILL IN INDIA

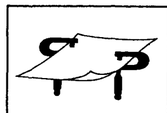
For a Sendzimir Mill can roll ferrous and non-ferrous metals to thinner gauges while greatly reducing the dimensional tolerance.

Better accuracy and uniformity of gauge, superior finish and appearance of parts acquired by 80% closer micro-inch control, more reduction per pass and the elimination of intermediate annealing are some of the more important advantages of a Sendzimir Mill.

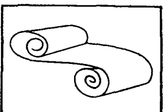
The new U. S. manufactured Sendzimir Mill will be yet another step by Devidayal's - pioneers in India for 5 decades in the manufacture of cold rolled non-ferrous metal sheets and strips - to give the best of their expert knowledge and inside resources to the manufacturing units they feed.

With the commissioning of the Sendzimir Mill - the first of its kind in India and the only one between Yugoslavia and Japan, Devidayal's will be able to meet the demand for high precision metal sheets and strips for radiator core and cylinder head gasket manufacturers, to defence production units and factories making precision parts for use in aircraft and electronic devices.

DEVIDAYAL
METAL INDUSTRIES
REAY ROAD, DARUKHANA, BOMBAY-10.



Maintains precise gauge across the width and along the length of strip.



Metal strips can be rolled as thin as the paper in your hand, or less....i.e., 0010 of an inch with tolerance of + or -.0001 of an inch.

NEW PRODUCTS AND PROCESSES

"Stahalit" Homes

MASSIVE and at the same time lightweight is the new building material "Stahalit" that is expected to revolutionise pre-fabricated housing construction. After several years of experimentation, West German construction experts at Krupp in Essen have constructed a pre-fabricated house that equals a normally-built solid house. The walls are made out of a new material strong enough to hold refrigerators, and yet so light that the individual wall elements can float on water. The material's extremely lightweight keeps long distance transportation costs down. "Stahalit" can have nails hammered and screws turned into it as well as being sawed. At the same time, it is heat, cold, decay and insect resistant. The degree of insulation for the 4-inch thick foam walls equals that of a 25-inch thick brick wall. Realisation of the new building material was based on the idea of the most stable raw material known to modern construction technology today: cement. Normal cement is heavy, however, and offers poor protection against the cold. Thus the gravel in cement was replaced with burnt clay pellets: vitreous-like kernels with many tiny air-bubbles effect excellent protection against sound and the cold. Technicians went even one step further and replaced the amount of cement needed to thicken the material with a foamable bakelite. Steel profiles and mounting iron give the stahalit wall elements the necessary stability.

One-piece Wheel

A new commercial vehicle wheel, designed for smoother running and resulting in substantial reductions in high-speed wheel wobble and tyre wear, has been developed by Dunlop Rim and Wheel Company Ltd., in England. The wheel's principal feature is the use of a one-piece component combining disc and rim gutter. The rim gutter is a jointless groove true with the disc. The integral disc and rim groove are circumferentially welded to a rim base and fixed flange-fabricated from hot rolled section. The entire assembly is produced by a combination of presswork and rolling. The combination of disc and rim gutter not only ensures a truer wheel in itself but substantially increases the wheel's strength, the disc acting as a buttressing support behind the rim gutter. The jointless groove feature also eliminates high stress areas on the flanges and lockrings, improving the service life of both these components. These construction techniques ensure much smoothern running, with less radial runout than is possible with conventionally-built wheels.

Washing Laboratory Glassware

One of the more wearisome jobs in the laboratory—washing up the glassware—can be speeded up by a machine called the Hei-thermo-jet which is to be introduced by the Heinicke Instruments Company, of Hollywood, Florida, U.S., shortly. The machine washes, rinses and dries, and operations can be either automatically or manually controlled. The duration of each phase is adjustable and it is claimed that the most stubborn contaminating material can be removed.

Plastic Pipes for Drainage

An Austrian plastic firm has taken up the production of drainage pipes from PVC plastic. These pipes are suited for permanent temperatures of up to 60° C. (140°F.) and liquids of even higher temperatures may pass through in intervals. They are joined by means of simple sockets, sealed with oil and acet resisting neoprene gaskets and may be used for drainage purposes in the dimensions of 40 to 150 mm. (1.7 inch to 5.9 inch) diameter. Main technical advantages of the plastic pipes are chemical resistancy, smooth pass through and little weight. The appealing outward appearance which requires no painting nor any other care allow them to be fitted above surface.

Compact Truck Crane

Herkules' is a lightweight, compact truck crane manufactured by Gustavson and Steiner and marketed by Herkules Bilkraner Company, Stavanger, Norway. It is easy to install on practically all types of trucks and a clearance of only 12 inches between cab and body is required for mounting. Operation is by one man only with all movements hydraulically controlled. Lifting and turning can be effected simultaneously. Side mounting and jib extension give long outreach. Hydraulic support leg is provided to relieve strain on chassis and springs. The model which is now being exported to U.K. is approved for a lifting capacity of 2 tons at 6½ ft. radius, 1 ton at 10 ft. radius, and 15 cwts. at 13 ft. radius. Maximum height of lift is 21 ft. A safety valve prevents overloading. It has manual jib extension. Complete with pump and power take-off, the crane weighs 1,222 lbs. It stows compactly behind the cab when travelling.

Voltage Divider

Voltage division with an accuracy of 1 part in 10 million—greater than anything previously possible—is achieved by a new AC divider invented by Sigital Measurements Ltd., Hampshire, England. It can be used for the precise measurement and production of AC voltage ratios or for the comparison of standards of resistance, inductance, capacity or ratio. The equipment consists of a series of auto-transformers, with each transformer divided into ten equal divisions. Any selected division may be sub-divided by the succeeding transformer. Basis of the equipment's efficiency is an alloy of exceptionally high and reliable magnetic permeability from which the transformer cores are wound. It is rigorously tested and controlled for both chemical and physical properties and has an initial permeability greater than 100,000, the maximum exceeding 500,000.

Tiling System

A simple way of fixing wall tiles without the use of an adhesive has been devised by Bertil Waldemar Bourwall, of Van Kyrkogatan 1, Umea, Sweden. Two plastic mounting strips each having a T-shaped cross-section are used. The first strip is nailed into the wall. The edges of the tiles are then slipped into position in it and a second strip clipped over the first one to hold the tiles in position. The strips form neat, permanent attractive joints, it is claimed.

Easier Reading for Invalids

A page-turning device, worked by a clever combination of electrical and mechanical equipment, recently announced in Britain, by Cambridge Instrument Company Ltd., London, enables physically handicapped persons, or patients confined to bed, to read without discomfort or help from anyone else. Designed, at present, for use with paper backed books, it consists of a mobile tubular steel frame which supports the book face downwards above the reader; the frame is adjustable for height and a reading lamp is incorporated. The edges of the pages are held by sprung metal "fingers," and the faces of the open pages rest on a perspex window. Pressure on a remote switch button causes the "fingers" to retract, releasing one page so that it falls against the window. Pressure on a second button—by elbow, chin, cheek or other part of the body—causes the window to move to one side for a moment, and as the page then hangs downwards the window slides back to its original position, straightening out the page, revealing the next side for reading.

Novel Electric Lamps

A novel range of small electric lamps intended mainly for use in window displays or exhibitions has been designed by Arredoluce, Via Priv. Confalonieri 18, Monza, Milan, Italy. They are best described as small spotlights made in the form of standard lamps or as lamp brackets which can be screwed to a wall. They have their own power transformers and the electric bulbs are contained in a small, ventilated sphere about 4 inches in diameter. The spheres are held in sockets by permanent magnets and can be swivelled in almost any direction.

Water Softening Units

Water softening units built into bath sprays are being offered by the Wantz Consumer Products Division of Illinois Water Treatment Company, 840, Cedar Street, Rockford, Illinois, U.S. The spray head is fitted in the end of a cylinder about the size of an electric torch. A rubber hose from the tap is attached to the other end. The cylinder contains a resin which softens the water as it flows over it.

New Fibre

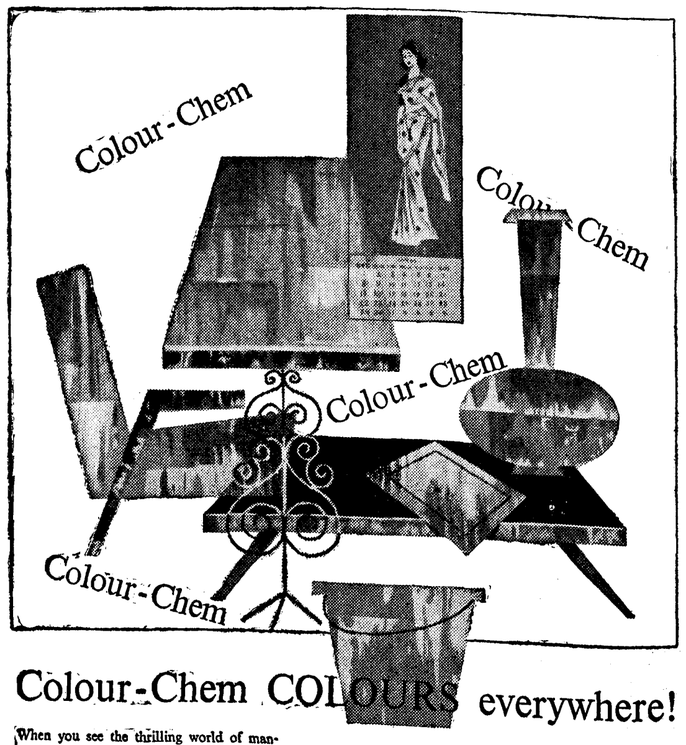
Textile scientists at the Shirley Institute in Manchester, England, have developed a completely new method of making a cheap high strength fibre by splitting sheets of plastic. They have worked out a secret means of heating and stretching the sheets of polypropylene to split it into fibres. The new fibre could be used to provide a new and unique type of textile material. It is extremely suitable for products requiring great strength such as twines, cords, ropes, fishing nets and lines. While it is too rough to be used for clothing at present, it is hoped that it would soon be put to commercial use.

Removing Burrs from Castings

A grinding machine has been developed by the Caledonian Grinding Machine Tool Company, 79, Berkeley Street, Glasgow, England, for chamfering or removing the flash or burrs from the edges of flat-surfaced components of irregular shape. It will remove burrs from intricate components in seconds, and is especially suitable for use in factories mass-producing castings, stampings and pressings. The component has only to be held against a guide on the machine, and an unskilled operator could maintain an output much higher than could be achieved by "a shopful of hand-filers." The grinder measures 18 by 19 by 17 inches and weighs 140 lbs. It is powered by a ½ h.p. electric motor and different grinding wheels and motors can be fitted to suit particular types of operation required.

Automatic Cleaning Equipment

Apparatus made in Germany for cleaning many kinds of office equipment (including typewriters and accounting machines), motor vehicle components and engines, is being marketed by an English firm. Known as the Drego automatic washer, it is a self-contained unit employing an electrically-operated pump, seven spray nozzles and a turntable which are all contained within a tank. The cleaning process can be watched through a window in the tank and there is an armhole to enable the operator to direct a jet into a particular direction.



Colour-Chem COLOURS everywhere!

When you see the thrilling world of man-made colours around you—spectacular prints on your fabrics, colourful inks in your magazines, pleasing paints in the interior of your home, fascinating tapestry and the attractive furnishings of your drawing room, plastic balls in the hands of your children—remember that COLOUR-CHEM, India's leading makers of Pigment Colours, is very much a part of your daily life.

ETHICS IN ECONOMIC THEORY

EXPEDIENCY OF THE MOMENT DISPLACES BASIC PRINCIPLES

By G. Carl Wiegand

PROFESSOR OF ECONOMICS, SOUTHERN ILLINOIS UNIVERSITY

FOR almost two centuries, economists have attempted to treat economics as a mechanistic science, free from value judgments. The "law" of supply and demand, supposedly, has no more to do with what is morally right or wrong than the "law" of gravitation. While by no means all economists have shared this view in the past, and the idea is far from universally accepted today, the notion of a "value-free" economic "science" was so well adapted to the positivistic-scientistic intellectual climate of the nineteenth century, that the idea was widely accepted as the only proper way in which "modern" man can think about economics.

This in turn has led to a widespread belief among people, whose knowledge of economic theory is largely confined to hearsay, that "economics and ethics do not mix." Ruskin called economics "the Gospel of Mammon"; Carlyle referred to it as "a dismal science"; and Walter Bagehot, for many years the editor of the *Economist*, remarked that "no real Englishman in his secret soul was ever sorry for the death of a political scientist." This feeling is particularly strong in those parts of the world —e.g. in India and in Latin America—where traditional social values retained their importance in the face of Western positivism:— and this in turn has produced a basic misunderstanding of and a hostility towards "economics" in the free enterprise sense.

The premise that economics is a purely mechanistic, morally neutral discipline is actually a theoretical oversimplification. and while probably the majority of the living American and western European economists at one time or other have paid lip service to this scientistic shibboleth, few actually base their work on the doctrine they proclaim.

Microeconomic Theory

Economic theory is inherently teleological rather than mechanistic. It nature, scope and mode of reasoning is determined by the "spirit of the time" (which the American economist Frank Knight once called the "ultimate economic reality") and the overall objectives of a civilisation. Throughout the centuries—and down to our days—some of the greatest economists have been metaphysicians, and social or moral philosophers, including Adam Smith, who is widely regarded as "the Father of Economics." While economic theory uses such mechanistic concepts as "equilibrium" and "maximisation" (of both output and profit), the nature of its reasoning is determined by the goals of the society. Economic theory develops along different lines, depending upon whether the economist, and the society in which he lives, regard the maximisation of the output of goods and services, personal freedom, social security, or equality as the foremost goal to be achieved. The shift from nineteenth century microeconomics (which was concerned with the problems of price and distribution of income) to modern macroeconomics (with its emphasis on national income, full employment, and economic growth) is a reflection of the shift from an atomistic-individualistic concept of society to an organic-social. The growth of macroeconomic theory since the 1930s would not have taken place, if the economists and society as a whole had retained their nineteenth century belief that the individual (rather than society) is the ultimate economic entity, and the welfare of the individual the determinant of economic theory and policy.

The day-to-day socio-economic tinkering which passes today for economic planning, in the U.S.A. as well as in most of the developing countries, and the tendency of many economic theorists to retreat more and more from reality into purely abstract (usually mathematical) models do not represent the spirit of economics *per se*. It reflects the lost faith of our time in an orderly universe, and the widespread intellectual confusion:—just as certain forms of atonal music and non-representational art reflect the "irrationality" of our age.

Economics has always been one of the least understood disciplines and, even though economists seem to have learned a great deal about economic processes during the past 50 years, economics, as a discipline has been in a state of crisis during the past two to three decades. The faith in many of the premises of yester-years has been lost and no new rational premises have been developed to take their place. As the English economist Lionel Robbins wrote some years ago: "We all talk about the same things, but we have not yet agreed what it is we are talking about."

There are at least three basically different ways in which one can look upon economics: (1) as a normative discipline, a form of applied ethics: (2) as an analytical discipline, a science which attempts to discover the innate forces of society: and (3) as a pragmatic-operational discipline, a tool of practical politics. These are not mere semantic and theoretical differences. Which one of the three concepts of economics predominates at a given time depends upon the prevailing social and intellectual climate; and the way we think about economics, in turn, has a great deal to do with the world in which we live.

During the past 30 years, the character of economics has undergone a fundamental change from a predominantly analytical science striving to discover the forces which govern the economic life, to a pragmatic-operational discipline, which is not primarily concerned with the discovery of universal "economic laws," but which attempts to "solve" the concrete problems of the moment.

Normative Economics

In order to appreciate the importance of this shift, which represents a significant aspect of our age, one must understand clearly the basic philosophic premises of normative and analytical economics.

Normative economics, which predominated in Europe throughout the Middle Ages, starts with the basic assumption that man's sojourn on this earth, especially the relationship of man to man, and man's attitude towards the material world, are part of a divine cosmic plan, the rules of which are known *a priori*. The mediæval writers could find them in the Bible and the teachings of the Church. Their task consisted in analysing business activities and social customs, and in judging them in the light of the eternal and universally known principles. The situation is still quite similar in India today. Normative economics thus dealt—or one should say "deals"—with the "what-ought-to-be," not with the "what-is."

Contrary to a widepread belief, normative economics is not dead, even in the Western world, though it is certainly not characteristic of our age. The difference between the American Economic Association and the Catholic Economic Association is a basically different view of the nature of economics: the former assumes economics to be an analytical science, while the latter regards it as a normative discipline. The papal social encyclicals, such as *Rerum Novarum, Quadrogesimo Anno,* and *Mater et Magristra* are based on the normative approach to economics. They do not try to discover the underlying forces of economic trends, nor do they provide prescriptions for concrete socio-economic problems. They expound, instead, ethical principles, by which everyday problems are to be judged. *Rerum Novarum,* for instance, emphasised that "the right to possess private property is derived from nature not from man; and the State has by no means the right to abolish it." But the encyclical also held that "the earthly goods so abundantly produced in this age of industrialism are far from rightly distributed and equitably shared among the various classes of men." Thus, while the State does not have the moral right to take away private property, the individual is morally bound to see to it that there is a fair distribution of the world's riches. This is something quite different from the philosophy of socialism and of the modern Welfare State. Normative economics appeals to the moral sense of the individual, while socialism and the Welfare State attempt to achieve "economic justice" through Government intervention. A multitude of laws and regulatory agencies have replaced the individual's sense of social responsibility. Whether the traditional sense of responsibility to one's neighbours can survive in our modern world of individualism, materialism, and metropolitan existence (where man no longer knows about the problems of his neighbour two blocks away) is one of the basic and critical moral issues of our time. The statists and socialists think it is impossible; the believers in free enterprise believe that it is possible.

Mercantilism—An Age of Transition

Generally speaking, the normative approach to economics can prevail only if the overwhelming majority of the members of a society accept as valid and binding a given set of ethical norms, and regard these norms as eternal standards and not as momentary social and political expediencies. As far as Western civilisation is concerned, this general acceptance of uniform ethical norms ended with the break-up of mediæval society and the division of Christianity into a number of churches with often radically different attitudes towards socio-economic issues. Many of the developing countries, including India, are now experiencing a similar disintegration of the traditional system of ethical values.

In Europe, the disappearance of the uniform ethical standards of the Middle Ages resulted, as far as economic thought was concerned, in a moral and intellectual vacuum which lasted from about the sixteenth to the eighteenth century.

The people had lost the guiding ethical principles which had governed their economic activities for hundreds of years, and they had not yet developed the new scientific principles to take their place. Instead of relying upon a divine plan, man attempted to solve the problems of the day as he understood them. It was the age of Absolutism, and economics, under the name of Mercantilism, became a tool of practical politics, designed to strengthen the State. Without generally accepted standards, either ethical or scientific, to guide man, policies were determined by what seemed expedient at the moment to the men in power. While the scholastic economics of the Middle Ages had called for "just" wages and "fair" prices, Mercantilism strove for the lowest possible wages and farm prices, and, as a rule, a minimum of consumption on the part of the common people, so that the State might accumulate more gold and silver, which was regarded a the basis of national strength—just as "steel mills" (however unprofitable) are today.

The results were disastrous in the end. The chaos of Government regulations; the excessive tax burden (the French writer Boisguillebert spoke of "the great executioner of the consumer"); declining production; and spreading poverty finally led to the great social and economic upheavals of the late eighteenth century, including the American and the French revolutions.

The Rise of Analytical Economics

In the meantime, however, an even more important intellectual revolution had taken place. A long line of brilliant thinkers had "discovered" what came to be known as the "natural laws," until, towards the end of the seventeenth century, Sir Isaac Newton achieved the great synthesis by "proving" that the same force, which he called gravitation, controlled not only the fall of the apple but also the movement of the stars. The whole physical universe was apparently governed by a small number of basic forces, which could be understood by the human mind.

The philosophic implications of the Newtonian system changed the character of Western civilisation and, in due course, the character of economics as well. It was at this point that the foundations for modern science were laid, and that the Western world, the countries which we call today "industrialised" or "developed," began to follow a different course from the "non-Western" countries, namely, those which are now referred to as the "developing." Three hundred years ago, the general attitude toward life of the great mass of the people were strikingly similar in Paris, London, Lima, Rio de Janeiro, Calcutta and Madras. The people's actions were governed by traditional values which centered around deeply rooted religious beliefs. Their knowledge of the material world in which they lived had changed but little during the preceding 500 years, and their productive capacity was strikingly similar—and by modern western standards extremely low.

The non-western countries retained their traditional outlook, while Western Europe and North America began to develop a new cosmic philosophy and based upon it a new attitude toward the material world and a new social and economic philosophy. The all-powerful God of the Middle Ages, who, through miracles, could freely change the course of the material world, gave way to the God as conceived by the Deists, who had created the material universe in time and space, and had made it subject to its own eternal and immutable laws, with which God refused to interfere. While the finite mind of man could never hope to fathom the infinite mind of God, he could learn to understand, as Newton had shown, the finite material world in which he lived. It is this notion which constitutes the basic premise of science.

The eighteenth century went a step further. If God in His wisdom had created an orderly physical universe subject to eternal laws which the human mind could perceive, it was only logical to assume that he had created also a social order whose blueprint could be understood by man. Francois Quesnay, the founder of the French philosophic-economic movement which has come to be known as Physiocracy, claimed that his *tableau Economique* (which can best be translated with "Economic Blueprint") disclosed the "laws" of economic life, just as the Newtonian "laws" of gravitation reflected the orderly system of the physical universe.

Thus began a new phase in economic thought, the development of analytical economics. The new approach was based on two basic assumptions; (1) that we live in a social universe which is subject to an orderly system of self-equilibrating forces; and (2) that man's mind is capable of discovering these forces. As Professor Arthur Burns told the U.S. Senate Committee on Banking and Currency some years ago: "Economics is a branch of knowledge which is approaching very slowly, very gradually the status of an exact science."

A third assumption can be made—and in the optimistic spirit of the Enlightenment, the eighteenth century made this assumption—namely that we live in "the best of all worlds." The poverty of the masses is not due to defects in the divine design, but to the interference by the hoards of bureaucrats with the operation of the perfect machine. Hence, as the Physiocrats proclaimed, *"Laissez faire, laissez passer, de monde và de lui meme."* (Freedom of production! Freedom of trade! The world runs by itself.) If we believe in the perfaction of the divinely designed universe, we must logically believe in *laissez faire,* that is, a minimum of Government intervention in the socio-economic processes.

On the other hand, we can also postulate, that the material world is far from perfect, even though created by God. The notion of evil inherent in the material world, and the doctrine of the original sin, have a long Christian tradition and the same is true of many other religions. If we believe that our social and economic system is inherently prone to be defective, we concede that there is room for human intervention to overcome the inherent defects.

The conflict between the believers in *laissez faire* and in economic intervention thus rests ultimately on basic philosophic assumptions regarding the nature of man and of the material world, and these assumptions have obvious quasi-religious overtones. Modern interventionism reflects the widespread pessimism which is characteristic of modern Western civilisation. We no longer believe that this is "the best of all worlds," the inner workings of which can be understood by man's mind. Instead we worry in the words of the existentialists, about man's "dreadful freedom"; about life as something "infinitely beyond our obtuse theories about it"; and about the "impenetrable darkness of a universe that exists for no purpose." We no longer believe that man is inherently a social and moral being, capable of handling his own affairs, but we have come to think of the individual, in the words of Harry Hopkins, one of the chief advisers of President Roosevelt, as "too damned dumb" and hence in need of guidance and control by the powerful State.

The Philosophy of Free Enterprise

In these circumstances, it is not surprising that our age finds it difficult to grasp the philosophy of free enterprise, and to understand its dynamics and balancing mechanism. This is equally the case with many well-meaning people in Western Europe and the United States, as with many intellectuals in Latin America, India and other developing countries.

What causes the free economy to prosper? Or, as Adam Smith put it, what are the "causes of the wealth of nations"? Free enterprise to Adam Smith was not a struggle for survival among hungry jungle beasts. His *Wealth of Nations* should always be read in conjunction with his earlier work, the *Moral Sentiments.* Man, according to Adam Smith (and to the whole group of Scottish moral philosophers to which Smith belonged), is an extremely complex being. He cannot be explained simply in terms of the "economic man," a silly text-book oversimplification;—just as it is silly to explain man purely in Freudian terms. As the eighteenth century moral philosophers saw it, man is at the same time an individual and a social creature, and these two aspects of his nature tend to be in conflict with each other.

As an individual, man attempts to promote his personal interests and in doing so—by producing goods and services (for profit) and by saving his money and reinvesting it profitably—he promotes progress in general. As a social being, man attempts to fit himself into the pattern of society either because of an inborn moral sense, or because, as a rational being, he realises that his own well-being is closely tied up with the welfare of society in general. A constant battle is thus going on in man's mind and heart between the forces of "egoism" and "altruism," between the desire for self-improvement and the sense of social responsibility. As long as we regard man as an inherently moral and rational creature, it is reasonable to assume that the dynamic forces of man's sense of self-interest will be balanced by man's sense of social responsibility. In this, Adam Smith saw the great, divinely designed self-equilibrating mechanism, which made for economic progress without destroying the social texture.

If man's drive for self-improvement is paralysed through social institutions, economic progress will be retarded and will eventually come to a standstill. This is undoubtedly the case in many underdeveloped countries. If, on the other hand, man loses his sense of social responsibility (and this has been a chronic danger in Western civilisation for almost a hundred years under the combined impact of a one-sided sense of individualism and materialism), society will disintegrate, until the all-powerful State takes over.

The philosophic—or ethical—premise regarding the nature of man, which underlies the economic theory of Adam Smith, is in direct conflict with (1) the "survival of the fittest" doctrine of Herbert Spencer; (2) the purely mechanistic approach to economics, which assumes that economic progress and social justice depend upon an unimpeded interplay of the forces of the market; and (3) the modern statist philosophy, according to which Government intervention is needed to curb the selfishness of the individual, assure social cohesion, and promote economic progress.

Adam Smith rejected the Physiocratic notion that the socio-economic order can be compared with a perfectly running machine,— de la Metrie's idea of *l'homme machine,* man as a machine, both in a physical and intellectual sense,— because, as Adam Smith saw it, a "perfect machine" leaves no room for deviation and hence for human decisions. The perfect machine of the Physiocrats, the rigid rules of natural laws, thus in effect replaced the rule of the "Leviathan" of the Mercantilists, the absolute rule of man. Neither left room for the freedom of decision of rational and moral human beings.

Freedom Based on Social Responsibility

The difference between the socialism and the Welfare State philosophy, on the one hand (as we find them today in the United States, Britain, India, and most countries of Latin America) and the *Soziale Marktwirtschaft* (which Erhard represents in Germany) does not lie merely in the relative importance of the public as against the private sector, which can be expressed in statistical terms. (As a matter of fact, the Government accounts for a larger share of the Gross National Product in Germany than in the United States.) The difference lies in the basic social philosophy. Erhard does not believe that our socio-economic system can be compared with the solar system governed by automatic self-equilibrating forces. He feels that man plays, and must play, a decisive role in bringing about this equilibrium, and, as Adam Smith, he believes that, despite much evidence to the contrary, that man can be made to see that a one-sided pursuit of his own

interest must lead to social and economic chaos, and ultimate Government intervention.

History may prove Erhard to have been a foolish idealist, but, if he is proven wrong, there is only one alternative, and that is the ever expanding all-powerful State, which, by its own logic, must eventually turn into a totalitarian State. The American writer, George Orwell, provided the blueprint in his sensational book "1984."

The modern interventionist does not believe in the inherent goodness and rationality of man—a view which he shares with the majority of the authors of the American Constitution. But there is one fundamental difference. While Madison agreed that, "if men were angels, no Government would be necessary," he did not seek a strong Government to rule over the weak and the wicked. He realised that the Government itself consisted of men who could not be trusted with too much power and whom he tried to restrain through an elaborate system of checks and balances.

Nineteenth century American political and economic philosophy did not follow the pessimism of Madison, but the optimism of Jefferson, who believed that "our people in a body are wise, because they are under the unrestrained and unperverted operation of their understanding." Man was capable of governing his own life, and, as an inherently rational and social being, he would always consider the needs of society. America thus developed on the basis of a political philosophy which provided for a weak Government for strong people.

The Philosophic Basis of Modern Statism

All this has changed during the past 30-40 years. The faith in the ability of the individual to look after his own affairs was lost largely during the Great Depression, and with it was lost the faith in the individuals' sense of social responsibility. As the U.S. Senator Paul Douglas wrote in a recent book review:

"The author demolishes the myth cultivated by the public relations men that the ethical standards of the corporate managers will furnish an adequate restraint against their acting in an anti-social fashion."

Strangely enough, few of the critics of free enterprise, who argue that man is an inherently weak and a social creature, in need of a strong Government, seem to realise that their arguments also destroy the rationale upon which democracy rests. If the businessman and the consumer cannot be trusted in their economic decisions because they are supposedly driven by a social greed and duped by powerful advertising companies, by the so-called "hidden persuaders," how can they be expected to vote intelligently and with the general welfare in mind, if they are duped by the "hidden persuaders" in the politicians' and bureaucrats' clothing, who manipulate the news, public images, and official statistics to serve their own purpose?

Pragmatic Economics

This brings us to the tool of modern statism: pragmatic economics. The decline of normative economics at the end of the Middle Ages left Europe with an intellectual vacuum, and man looked, therefore, to the all-wise and all-powerful State to provide the norms by which society could live and prosper. Economic policies became a tool of State making, following no basic principle—either moral or scientific—but the expediency of the moment.

This is the spirit which dominates much of modern economic thought. After 200 years of hopeful search, analytical economics has failed to find the ultimate secrets of economic life. On the eve of World War I, the famous Austrian-American economist Professor Schumpeter still felt that the "most general laws which manifest themselves in any economic system regardless of time and nation" had been discovered. "The theory of the socio-economic process (had been) unfolded as an organic whole" (namely by Boehm-Bawerk). Forty years later, during World War II, two well-known professors at Princeton University, Neumann and Morgenstern, were far less optimistic: "There exists at present no universal system of economic theory," they warned and ... if one should ever be developed, it will probably not be during our lifetime." In a later study, published in 1950 (and revised in 1963), Morgenstern estimated that "national income and consumers' spending (two of the most important figures in economic planning) probably cannot be known now, without an error of plus/minus 15 to plus/minus 20 per cent."

Yet just at the time when economists are becoming increasingly aware of their own limitations, the public expects from them ever more perfect business forecasts and economic planning. *Time* magazine once reported John Kenneth Galbraith, economist, author of the controversial *Affluent Society*, and a former U.S. Ambassador to India, as saying that he did not believe anybody in the Kennedy Administration would make the pretentious mistake of thinking that he knew what was going to happen. But *Time* also reported Walter Heller, the chief economic adviser to President Kennedy and President Johnson, as describing himself as a "pragmatist," and the *Time* reporter continued by saying: Pragmatism "is the vogue word among economists today, the term that most of them use to label themselves and one another. When economists call themselves pragmatists, they mean that they are the opposite of dogmatists, that they are wary of broad theories, that they lean to the cut-and-dry approach to public problems, and that they believe that it is possible to improve the functioning of the economy by tinkering with it."

What passes today in Washington and in much of the world for economic theory is neither normative nor analytical in character, but consists of a day-to-day tinkering to meet the problems of the day. Keynes' offhand remark that, "in the long run, we are all dead" and that economists should concentrate on immediate problems characterises the spirit of our "age of impatience." But the Keynesian word has taken on a new subtle flavour, unhappily reminiscent of Louis XV's *d'apres nous le deluge*, the collapse will come after we have passed from the scene.

From a purely economic point of view, the record of 30 years of economic "tinkering" is about as bad as the record of eighteenth century Mercantilism. In the noisy boom of an ever-rising "prosperity" in Western Europe and the U.S.A., people tend to overlook the danger signals: creeping inflation in many countries, chronic unemployment and a serious deficit in the balance of payments in the U.S.A., and the inability or unwillingness of most Governments to balance their budgets. The record of Government intervention is even worse in most of the underdeveloped countries.

Yet more serious are the ethical implications, the growing dependence of the people upon the Government, and the growing tendency on the part of the Government to deprive the people of their moral right to make decisions. Modern socialism and economic planning are based on the political philosophy of a strong State for weak people. It is based on the philosophic notion that man is unable to manage his own affairs, because he is neither an inherently rational nor moral creature. Without these implied premises, modern economic theory is meaningless, just as Adam Smith's economic theory would have been meaningless without the ethical premise that man is capable to balance, in his own mind and heart, the forces of "egoism" and "altruism."

The Bank of Baroda has been handling foreign business for many years. Today, the Bank has branches in London, East Africa, Fiji Islands, Mauritius and East Pakistan.

The Bank of Baroda through any of its foreign branches or its correspondents is fully equipped to offer all the services needed in foreign trade and to handle every type of foreign exchange business—including opening Letters of credit, the negotiation/collection of export bills, clean bills and cheques, foreign remittances, credit information, etc., and is always willing and prepared to assist you in solving your problems concerning imports, exports and foreign travel with prompt and efficient service.

THAT EXPERT TOUCH COMES WITH EXPERIENCE

THE BANK OF BARODA HAS BEEN HANDLING FOREIGN BUSINESS FOR YEARS & YEARS

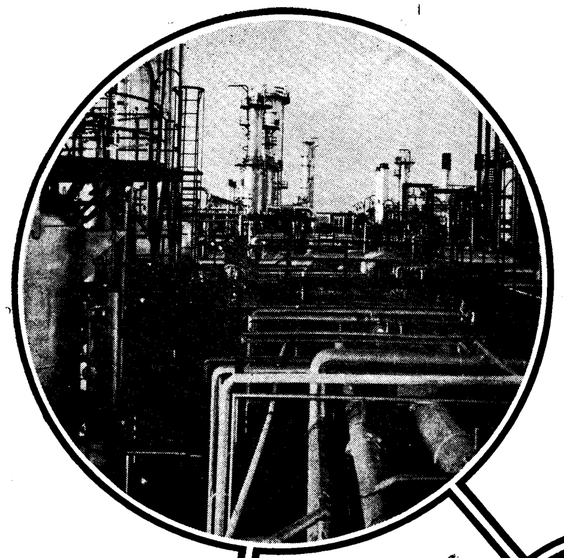
Branches in London, Nairobi, Mombasa, Kampala, Dar-es-Salaam, Moshi, Mbale, Mwanza, Jinja, Kisumu, Narainganj (East Pakistan), Port Louis (Mauritius), Suva and Lautoka (Fiji Islands) and correspondent banks all over the world.

Write-in for our free booklet 'May We Help You?' which gives details of all our services.

THE BANK OF BARODA LIMITED

(Estd, 1908) Head Office: Baroda

JWT-BB. 2232



New 100,000 BSD Idemitsu Refinery, near Tokyo, now in operation.

Mr. Yasushi Matsui, Project Engineer, was chief engineer for the successful construction of Idemitsu Refinery.

ANOTHER ACHIEVEMENT BY JGC

NEW IDEMITSU REFINERY COMPLETED IN ONLY 8 MONTHS

Schedules like this are easy when the project is under the wing of Japan Gasoline Company's 'Packaged Chemical Plant' concept. It means total responsibility—preliminary planning, cost estimates, engineering, construction and maintenance are in the hands of one responsible management.

Japan Gasoline Company acts as prime contractor, gives you one contact, one contract, one source for any chemical process plant however involved. There are more than one thousand chemical engineering specialists, such as Mr. Matsui, ready to act as your partner. Use their experience. They have played a vital part in 60% of the refineries constructed in Japan since 1945.

Engineering, procurement and construction for: Oil Refineries ● Petrochemical Plants ● Coal Tar Plants ● Gas Chemical Plants ● Fats & Oils Plants ● Fertilizers Plants ● Other Chemical Plants

ENGINEERS & CONSTRUCTORS

TOWARDS A RATIONAL DAIRY STRATEGY

AAREY COLONY BY NO MEANS AN IDEAL MODEL

By A Special Correspondent

THE Aarey Producers' Association, claiming to represent 175 of the 200 milk suppliers to the colony, have recently asked for a fresh agreement providing for higher prices. They have threatened to terminate their agreement with the Government of Maharashtra to supply milk and take recourse to legal action. Although the Director of the Greater Bombay Milk Scheme has pointed out that a reasonable profit-margin of 10 per cent is allowed to the suppliers of milk to the colony on their investment and has discounted the other alleged grievances, the dispute still remains unresolved and threatens to disrupt the essential milk supply to the city any time. This demands a thorough review of the Aarey experience to see if there are any basic defects in this experiment. It is pertinent to note here that the type of threats by the milk contractors, noted above, are not new; nor do we have any assurance that they will not become a perennial feature.

In the field of dairy development, the Aarey Milk Colony has attracted much attention. It was established in 1949 in order to provide a basic source of good and wholesome milk to the consumers in the city of Bombay and to rid the city of 15,000 animals housed in the most unhygienic stables which constituted a permanent menace to the health of the general public. Accordingly all cattle with the exception of 500 animals or so, in the city have been moved to the cattle sheds built at Aarey. The Aarey Colony is primarily a cattle concentration centre. There are some 16,000 cattle inside the colony which were formerly housed within the congested parts of Bombay City. The cattle continue to belong to private contractors who pay various fees to the Government and sell milk to Aarey. The total Government investment on the Aarey Colony is about Rs. four crores.

Demonstration Value

The setting up of this colony has been a great boon to Indian dairy industry. It has solved, though partly, the problem of ridding Bombay City of cattle sheds. It has developed an efficient and elaborate milk transport and distribution system. It has attracted the attention, by juxta-position though, of people in this country and abroad to the general neglect of dairy industry in India and was responsible for attracting greater attention and help from authorities in India and agencies abroad.

To express in technical jargon, the Aarey Colony has had a great demonstration value. It has been described as a unique project, developed for the first time in any part of the world, where thousands of privately-owned cattle have been removed from congested areas to a modern milk colony. One American magazine said that the "Colony is the Mecca to which pilgrims from all over India can come and learn cow culture." Accordingly, picnic-crazy Bombayites flock in their thousands to the colony even today, while national and international leaders are faithfully escorted to it on their first visit to Bombay.

All this is all to the good. But it has tended to set a pattern of dairy development for which India may have to pay dearly in the long run. In the meantime, imitation of the Aarey set-up has been going on in larger cities of the country, the latest and spectacular of this being the proposed second colony in Maharashtra at Wankas to house 10,000 cattle at a cost of Rs. five crores. This, unfortunately, is an unhealthy pattern of development for Indian dairying, for the Aarey colony system suffers from a number of defects.

High Cost

It is a well-known fact, pinpointed in the seventh report of the Estimates Committee of Maharashtra, released last year, that not only are there still about 500 head of cattle in the city of Bombay but the cattle population in the suburbs has gone up to 70,000. Thus, these private cattle owners continue to supply more than 50 per cent of Bombay's requirements. It is so because these people find it very profitable to operate under the umbrella of high prices maintained by the milk colony. The milk colony in turn is forced to keep prices high, because of high cost of production in the City.

Thus we have the curious spectacle of the colony paying Rs. 105.64 per 100 litres of milk from the Bombay contractors, who have been given various facilities through Government expenditure, and the Anand Milk Union delivering milk, from a distance of 260 miles, for Rs. 79.85 per 100 litres (f.o.r. Bombay.) Surprisingly this figure is not mentioned in the Estimates Committee report though higher payment for milk from some neighbouring areas of Bombay have found a place. This high cost is closely related to the type of colony system that we have here.

In an alternative situation (Kaira District, for instance), the cattle is kept where it naturally belongs, namely, the farm. Only cost of transporting milk is incurred. Under the colony system, first, the cattle is brought into the city from the districts and sent back at the end of the lactation period—an avoidable process surely. This involves the cost of full-time employees in the city during the lactation period and salvaging charges to upcountry farmers when the cattle is dry. In addition, the colony system involves the transport of thousands of tons of cattle-feed every year and this in turn tends to push up production costs.

Cattle refuse has been recognised as a good source of farm manure. Thousands of tons of this manure is being transported to sugar plantations in Maharashtra, more than hundred miles away. Hence the supply and disposal problems connected with the colony system imposes a severe strain on the transport resources of the country. Of late, the water problem in large cities like Bombay is becoming acute. The requirements of Aarey in this respect are put at 1.2 million gallons of potable water and 8 million gallons of non-potable water. This not only eats into the slender water supplies but also increases the overhead costs since potable water is rated at 75 *paise* per 1,000 gallons.

Skimmed Milk Subsidy

In spite of all these disadvantages, Aarey seems to have wiped off its dues, to the Government and is showing an annual profit as can be seen from the following table:

Net Profit and Loss
(In lakhs of rupees)

Year	Skimmed milk powder scheme	Other scheme	Total profit (+) or loss (—)
1958-59 ..	+20.5	—25.0	— 4.5
1959-60 ..	+26.7	— 3.2	+23.5
1960-61 ..	+23.0	+13.2	+36.2
1961-62 ..	+38.1	+ 6.5	+44.5

The profit from selling local milk made lately must have been accounted for mainly by the higher profit-margin on Anand milk which is being delivered at a much lower rate than the colony milk. In order to protect the economic balance between the cost of milk supply in Bombay and the expenditure pattern of Aarey Colony, the toned milk programme has been initiated, with the result we have a paradoxical situation of Bombay importing milk powder at the cost of precious foreign exchange while Anand straining itself to convert surplus milk into powder and selling it in competition with the imported product. On this aspect, the Estimates Committee of Maharashtra says:

"The Public Accounts Committee had an occasion to consider this aspect of the case when the accounts relating to the colony for the year 1959-60 were under scrutiny. It was contended on behalf of the department that the colony has shown a profit of Rs. 23.48 lakhs for that year. On a closer scrutiny of the matter, however, it was found that the so-called profit was only a make-believe, since a large amount of nearly Rs. 26.72 lakhs earned as profit on the sale of imported skimmed milk powder was taken on the profit side, on the ground that the import and sale of skimmed milk powder formed an integral part of the milk scheme. The Public Accounts Committee, however, did not agree with this contention and observed that the colony was not entitled to take into account the profit made by the sale of skimmed milk powder, as it was nothing but a hidden subsidy or grant made available in the form of sale proceeds of the milk powder for financing the capital and other developmental expenditure of the colony."

Thus, the milk scheme has been making more than 100 per cent profit from sale of toned milk to poor consumers, in order to maintain the myth of profitability and support high-cost cattle owners. But, unfortunately, the Estimates Committees has bypassed the logical conclusion. It is that this import should be stopped and every attempt should be made to reduce production costs. Instead the Committee wants the Milk Scheme to buy milk from private producers in the city, which is also, obviously, high-cost milk, and "reduce the precarious dependence on sources outside the State"—an ill-concealed reference to the present cheap supply from Anand!

Reverse Weeding

There is yet another pernicious and less known feature about the Aarey Colony system. To rear calf from birth to maturity, it takes three years and costs in the Aarey Colony about Rs. 1,500. But one can purchase a good buffalo for Rs. 1,000 from upcountry areas. Consequently, the cattle owner within the colony does not find it profitable to rear the calf, unless the Government is prepared to subsidise heavily. This explains why the colony has only under 2,000 calves, whereas the normal number should have been between 40,000 and 60,000, upto the age of four. This fact supports the assumption that, every year, nearly 8,000 of the best female calves, in addition to an equal number of male calves, are destroyed in some form or other. For all practical purposes, the licensees prefer sending calves to the slaughter houses rather than go through the bothersome process of sending them to villages and taking care of them.

The implications are that the operational details and financial arrangements obtaining in the Aarey type of colony provide sufficient incentive to attract the best cattle from all over the surrounding region, but, from the long-range point of view, they have the deleterious effect of depleting the overall cattle wealth of the country. In these circumstances, the claim made by the champions of the colony that it is helping the Government in its efforts to rear better stock is rather dubious. As a matter of fact, milch cattle from all over the surrounding regions, including Rajasthan and Delhi, are regularly being brought to the colony and other private sheds in Bombay and are destroyed after the lactation period. Viewed from this angle, the economic and locational pattern of Aarey is a potential danger to the cattle wealth of the country. India's policy-makers will do well to realise this defect in the Aarey Colony scheme before blindly copying it as a model for other cities.

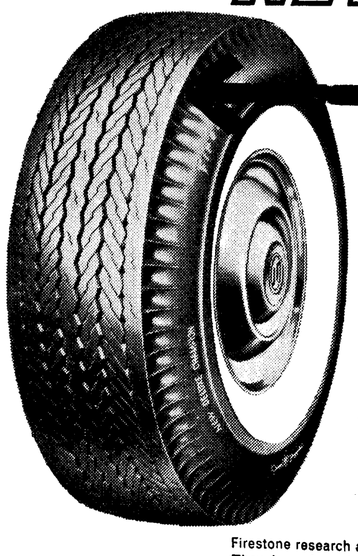
If the cattle is kept on the farm, it reduces the cost of production, gives side employment to farmers and involves the transport of only milk. The Aarey Colony system works in the opposite direction, besides depleting the country of its best cattle stock. It is, therefore, best that dairy farming remains a rural industry, preferably on co-operative lines. The Aarey Colony had a historical rationale which does not necessarily exist today everywhere. On the contrary, its imitation will result in most highly undesirable trends in dairy development. The third Plan document, it may be noted, does not support the Aarey pattern. On the contrary, it clearly says:

"The policy to be pursued in regard to dairying is to develop dairy projects with greater emphasis on milk production in the rural areas linked up with plan for the marketing of surplus milk in the urban centres. The supply and collection of milk will be undertaken by a network of producers' co-operatives in the villages. The processing and distribution of milk and manufacture of milk products will be organised through plants operated, as far as possible on co-operative lines. ... Even in the case of large dairies in big cities, every attempt should be made to link such schemes with the countryside."

This is a sound policy and a departure from it in favour of Aarey Colony system will not be in the larger interests of the country.

The association of milk producers at Aarey has demanded an independent inquiry commission to look into the working of the colony. Perhaps their main interest is higher prices for themselves which may or may not be justified. But there is undoubtedly a case for such an inquiry. Only the scope should be wider: it should cover such issues as cost of production, animal husbandry, reverse weeding and a score of other related issues. One day, the harassed citizens of Bombay are likely to be asked to pay a higher price for the milk they get from the State and, before they concede this demand, they have a right to ask the authorities whether everything is proper with their colony and whether the scheme cannot be improved in order to make it a more economic proposition.

"DRAMATIC NEW TYRE"



with the record mileage
SUP-R-TUF
Miracle Rubber
the most advanced tyre ever built to give you EXTRA mileage

Firestone research and development engineers have done it again! They have formulated a new miracle rubber — 'SUP-R-TUF' — which gives extra mileage...at no extra cost! And at the same time, comes the NEW DeLuxe Champion tyre, with its perfected tread design for safer motoring.
Now, every Firestone passenger tyre is built with SUP-R-TUF rubber to give you extra mileage on any road at any speed. And you get greater safety, because SUP-R-TUF is tougher and has more resistance to punctures, bruises and breaks.

Firestone NEW DELUXE CHAMPION TYRE

IMPORT POLICY FOR METALS

While the continuance of the quotas for non-ferrous metals in respect of established importers under the import policy for the current six months of the financial year 1964-65 has been of some relief in the present context of tight foreign exchange resources, it is noted that, inasmuch as value is the criterion, actual imports would be lower because prices in foreign markets have moved very high as compared with the levels that existed in the beginning of the year. This circumstance, coming as it does against the background of the steady increase in the requirements of non-ferrous metals, has led to the buoyancy in metal markets. The import policy in respect of actual users is yet to be announced. It is to be hoped that actual users may be allotted increased imports having regard to the growing needs of industry. This hope is strengthened by the improvement in exports.

The replacement of aluminium in the cable industry to the extent possible has made available copper for other important uses, as, for example, in the electrical equipment and telephone accessories industries, but there is no substitute in so far as zinc is concerned. If India is to realise the increased target in automobiles, more zinc should be made available to battery-making units. It is unfortunate that India's efforts to set up zinc smelters have not proceeded smoothly. In this context, the recent news of the possibility of Polish collaboration to set up a 30,000-tonne zinc smelter at a cost of Rs. 12 crores is noted with satisfaction. By the end of the fourth Plan, India's demand for zinc is expected to be 225,000 tonnes, as against 136,000 tonnes by the end of the current Plan. It is also planned to set up two more smelters each having a capacity of 50,000 tonnes. At the same time, it is proposed to raise the deposits of the Rajasthan Zawar mines to 50,000 tonnes a year from the present 18,000 tonnes.

The feature of trading on the London Metal Exchange in recent weeks has been the steady rise in the price of spot tin from £1,605-1,610 to £1,695-1,700. The rise is attributed to uncertainties in regard to U.S. stockpile releases for the coming year. Although the U.S. desires to raise the releases for the next year, no agreement has yet been reached on this point between the U.S. and the International Tin Council. The U.S. and I.T.C. officials held discussions at London recently, but the outcome is yet not known. An early *communique* is expected to be issued in Washington. In the meantime, Bolivia is stated to oppose increased releases by the U.S., and the Bolivian Mines Minister has attributed the U.S. inclination for increased releases to consideration of benefit from higher prices. His statement that world shortage is only around 11,000 tons is believed to be an underestimate. The fact is that, if the U.S. does not release at least about 30,000 tonnes a year, the price of tin would continue to move ahead. Tin may as well become the most-sought-after metal second only to gold.

U.S. TARIFF CUT EXCEPTIONS

The U.S. Government announced last week that it would deposit at Geneva on the 16th instant the list of industrial products it wants excepted from tariff cuts in the "Kennedy Round" of negotiations under the General Agreement on Tariffs and Trade. This was the date earlier agreed to in the G.A.T.T. for key countries to table such lists. Negotiations will begin in Geneva early next year.

The U.S. action represents no change in the basic U.S. position that a satisfactory "Kennedy Round" must include industrial as well as agricultural products. This had been unanimously agreed to by the negotiating partners in the G.A.T.T. ministerial resolutions. A number of talks on agricultural products have been held, some progress made, and the talks will continue.

After the exchange of lists on the 16th instant, there will be time for countries to examine each other's lists. The next stage of confrontation and justification of the industrial exceptions would begin early next year. And substantive negotiations on agriculture could begin at about the same time.

The U.S. Government support for European economic integration has long included recognition of the need for a common agricultural policy. From the U.S. point of view, it is important that this policy be as liberal as possible and subject to negotiation. In its efforts to assure success in the "Kennedy Round" of negotiations on tariff concessions, the U.S. has decided to open most of its dutiable items—over 5,000 in all—to consideration for concessions.

We can help EXPORTERS to expand their business by providing pre-shipment finance. We can advise EXPORTERS of trade enquiries, put them in touch with foreign buyers, and obtain credit information and status reports on foreign buyers. We can give to EXPORTERS effective Letters of Introduction on our Foreign Branch Managers and Correspondents, provide them with Travellers' Cheques, Foreign Currency Notes, and Letters of Credit—when they travel.
We can collect and negotiate for EXPORTERS all types of foreign bills; give Excise guarantees where necessary and guarantees under Export Promotion Schemes; and buy various foreign currencies, at the finest rates, both "spot" and "forward".
We can advise EXPORTERS on matters concerning import restrictions, duties, etc. in foreign countries.
With our 14 branches overseas and correspondents in almost all parts of the world, we are well equipped to handle FOREIGN EXCHANGE BUSINESS of any description.

BOMBAY BURMAH SATISFIES

DIVIDEND ACTUALLY HIGHER

THE transfer of timber operations at Sabah from its Wallace Bay Branch to a subsidiary company, Wallace Bay Ltd., from January 1964 has materially affected the financial results of the Bombay Burmah Trading Corporation Ltd. (Secretaries and Treasurers: Messrs. Wallace and Company, Bombay) for the year ended 31st May 1964. Thus, in spite of a higher income from sale of tea and coffee, total sale proceeds show a setback from Rs. 573.70 lakhs to Rs. 520.82 lakhs, because sales realisation of timber has receded from Rs. 270.81 lakhs to Rs. 207.20 lakhs. Closing stocks, though higher in the case of plantation products, are lower at Rs. 43.37 lakhs in the aggregate, as compared with Rs. 49.70 lakhs a year before, because the Wallace Bay Branch stocks have been transferred to Wallace Bay Ltd. Lastly, purchases of materials have declined in total from Rs. 85.27 lakhs to Rs. 58.78 lakhs. Since the net result of the year's operations is a slightly higher gross profit of Rs. 154.14 lakhs as compared with Rs. 153.25 lakhs in the previous year, the Company can be said to have fared satisfactorily during the year under review.

Net profit, after essential provisions, shows a substantial improvement from Rs. 48.38 lakhs to Rs. 70.56 lakhs. This again reflects the transfer of timber business to the subsidiary company, since it has led to a reduction in the depreciation provision from Rs. 36.64 lakhs to Rs. 18.63 lakhs. With a higher net profit, the Directors have been able to declare a final dividend of Rs. 3.30 on the Rs. 25 fully paid shares which is better as compared with Rs. 3 for the previous year. If the special centenary dividend of 80 paise per share paid in the previous year is ignored, the total dividend for 1963-64 is higher at Rs. 4.50, as compared with Rs. 4.20 for 1962-63. At the same time, as against a net depletion of reserves to the extent of Rs. 5.31 lakhs in the previous year, the Directors have been able to strengthen them with a net addition of no less than Rs. 23.98 lakhs to reserves and provisions during the year under review.

The following table compares the Company's progress during the past four years:

(In lakhs of rupees)

	For the year ended 31st May			
	1964	1963	1962	1961
Sale proceeds	520.82	573.70	538.48	516.57
Other income	88.82	84.86	86.21	93.58

* Rs. 25 paid up. † Rs. 125 paid up.

Of the Corporation's activities, tea, coffee and other plantation products account for the major portion these days, with timber coming second. In the year under review, for instance, the former accounted for a sales revenue of Rs. 252.85 lakhs and the latter for Rs. 207.20 lakhs. Next come manufactured goods, with their share being Rs. 60.77 lakhs. It will thus be noted that a substantial part of the Corporation's fortunes still depends upon timber business which in turn depends on political stability in South East Asia.

Now to give a brief picture of the progress of the Corporation's main divisions. During the seven months of the Wallace Bay Branch's operations in the year under review, production of hardwood logs amounted to 88,046 tons and mill production of sawn timber totalled 3,702 tons. There were certain cost increases, but selling prices of log shipments yielded a satisfactory margin and selling prices for sawn timber also showed some advance. Since January 1964, the Branch has been supplying transport, equipment and agency and other services. As for Wallace Bay Ltd., there was some temporary stoppage and disruption of operations caused by hostile raids from across the near-by border with Indonesia from 28th December onwards. A loss was incurred for the five-month period. No provision has been made in Bombay Burmah's accounts in respect of this loss, amounting to M.$104,365. There has been an improvement in working results in recent months.

The North Borneo Timbers Ltd. repeated two interim dividends, each of 20 per cent free of Sabah tax. In the Sandakan area, some continued decline in log supplies from the Bay Lands was offset by an increase in output from the Kretam Concession; elsewhere, production rose appreciably in the Apas Balung forests. Shipments kept pace. Plantation development work continued, both on the Company's Quoin Cocoa Estate and on the Mostyn Oil-palm Estates in which the North Borneo Timbers owns a half interest. During the year, North Borneo Timbers formed in Sabah a wholly-owned subsidiary—Leila Lands Ltd.—to which it sold all its lands and properties in the Sandakan area, while retaining timber extraction rights against royalty payment. This is expected to facilitate future company developments which may involve working in a fresh forecast concession area elsewhere in Sabah.

Production from the South Indian estates amounted to 3,977,167 kgs. of made tea, which exceeded the previous year's record figure of 3,836,961 kgs. Unit costs rose from Rs. 3.203 to Rs. 3.394 per kg. and the average gross return declined from Rs. 5.421 to Rs. 5.277 per kg.—this drop being in the main attributable to difficult trading conditions in the Middle East markets. Since facilities for tea packaging in the existing factory in Bombay are limited, it has been decided to erect a full-scale modern tea blending and packaging plant at Bangalore. It is expected to start working early next year.

Coffee crop increased from 930 tonnes to 1,020 tonnes; the increase having been mainly derived from the Coorg estates. The crop was valued at Rs. 2.40 per point, as against Rs. 2.20 in the previous year. Cardamom crop rose from 10,627 kgs. to 19,549 kgs., as trials and fresh plantings on the Singamapatti group began to bear fruit. Sale prices also showed an advance.

In Tanganyika, output of made tea from Herkulu factory amounted to 224,944 lbs. (130,880 lbs. in 1962-63) and sales were made in the Nairobi and London markets. On the Marvera estate, a tea factory is under construction; meanwhile, as in previous years, the crop of green leaf—761,730 lbs. (489,826 lbs. in 1962-63)—was sold to a local factory.

The Corporation has agreed to sell the Namshan tea factory in Burma for Rs. 5,00,000 and has received an advance of Rs. 3,00,000. But the arrangements are yet to be finalised. Its activities in the Rangoon dockyard are closed, except for some small items of repair work. The Corporation's branch now concentrates on the asbestos cement plant and the concrete products plant both in Rangoon. Although these two enterprises have shown improved results, working conditions in Burma have been difficult and, in the light of taxation, remittance and other factors operating in that country, the future of the branch is under review.

N.V. the Indo-Java Rubber Planting and Trading Company reported an increase in crop from 987,867 kgs. to 1,051,000 kgs. But the volume of disposals was lower and, against the higher Rupiah sale price which it realised, it had to set the continued and sharply inflationary rises in cost during the year. Three small amounts were received from this company as part instalments against the 1958 profits, but the flow of remittances has since been stopped. The difficult conditions noted in the previous year have worsened and, as with most other plantation enterprises there, the management of the company has been brought, since February 1964, under the supervisory control of a body appointed by the Ministry of Agriculture, Government of Indonesia. Work on the company's Tjiseru-Tjipari estates continues.

Formica India Ltd., in which the Corporation is participating on a large scale, will start manufacturing industrial and surfacing plastic laminates by January next. The Corporation's investment in this company has gone up from Rs. 3.67 lakhs to Rs. 44.10 lakhs in the course of the year, as against a face value of Rs. 73.50 lakhs.

The Corporation's financial position is pretty strong. The paid-up capital, unchanged at Rs. 268.33 lakhs, is backed by reserves and surplus aggregating Rs. 301.82 lakhs. Borrowings at Rs. 20.91 lakhs and current liabilities and provisions shown at Rs. 266.14 lakhs bring the total indebtedness to outsiders to Rs. 287.05 lakhs. This is more than fully covered by current assets and book debts consisting of Rs. 312.25 lakhs. Investments have jumped up from Rs. 96.64 lakhs to Rs. 243.49 lakhs, the great bulk of which represents holdings in subsidiaries and are unquoted. The chief reason for the rise in investments is the separation of timber operations and the formation of a new company for handling them, as mentioned at the outset. This also explains the drop in the gross block to Rs. 513.12 lakhs from Rs. 667.64 lakhs a year before which has been written down to a net value of Rs 298.69 lakhs (Rs. 334.19 lakhs a year before).

A feature of the Corporation's balance sheet is that, of the total assets (book value) of Rs. 857.20 lakhs, investments alone account for no less than Rs. 243.50 lakhs. Of these, more than half—Rs. 157 lakhs, to be precise—represents investments in South-East Asia (mostly in Malaysia), subject to high political instability.

The net yield on the Rs. 25 fully paid ordinary shares of the Corporation at their current market value of Rs. 56.40 *cum*-final div. works out to 6.6 per cent per annum.

MYSORE KIRLOSKAR'S RESULTS HEARTENING

RESERVES AND DIVIDENDS ENHANCED

A SUBSTANTIALLY higher turnover, an improved profit-margin (ratio of gross profit to sales) and a bigger dividend payable on an enlarged capital are the most outstanding features of the annual report of Mysore Kirloskar Ltd. (Managing Agents: Messrs. Kirloskar Associates, Yantrapur P.O., Mysore State) for the year ended 30th June 1964. The keen demand for machine tools and the continued good progress in the manufacture of existing lines as well as the capstan and turret lathes have enabled the Company to push up its sales to the all-time high level of Rs. 306.82 lakhs from Rs. 228.82 lakhs in the year before. And, even though expenses have continued to rise, the gross profit (before taxation, depreciation and Managing Agents' commission) is larger by Rs. 25.63 lakhs at Rs. 90.72 lakhs. The profit-margin thus works out to 29.6 per cent, as compared with 28.5 per cent for the previous year. It is but natural that, with a higher gross profit, the essential provisions should also have risen. Thus, the provision for the Managing Agents' commission has gone up from Rs. 4.71 lakhs to Rs. 7.80 lakhs, for depreciation from Rs. 13.86 lakhs to Rs. 18.97 lakhs and for taxation from Rs. 27.40 lakhs to Rs. 31 lakhs. In spite of these heavier prior appropriations, the net profit has expanded by as much as Rs. 13.83 lakhs to Rs. 32.95 lakhs. The Directors have wisely conserved almost the entire increase in net profit by increasing the amount ploughed back into business. Thus, taking into account the debits and credits to reserves, one finds that the net additions to reserves are of the order of about Rs. 11½ lakhs. Only a small part of the improvement in profit has been utilised to raise the dividend on ordinary shares, from 10 per cent to 12½ per cent per annum. All these facts are clearly brought out in the following comparative table:

(In lakhs of rupees)

	For the year ended 30th June			
	1964	1963	1962	1961
Gross sale of products	306.82	228.82	185.54	176.10
Other income	1.79	3.57	3.82	4.34
Closing stocks of finished goods	6.65	4.46	5.82	4.40
Raw materials, stores and spare parts consumed	111.43	76.38	71.23	56.89
Gross profit	108.65	89.56	77.06	81.82
Managing Agents' remuneration	90.72	65.09	42.49	39.40
Provision for—	7.80	4.71	3.15	3.22
Depreciation	18.97	13.86	11.87	9.35
Taxation	31.00	27.40	15.95	11.80
Net profit	32.95	19.21	11.52	15.03

Ordinary	7.54 (12.5%)	5.75 (10%)	6.90 (12%)	6.00 (12%)
Carry forward	..	0.03	0.03	0.04
Market price of ordinary shares (in rupees):	1964	1963	1962	1961
High	165	171	190	190
Low	155	173	171	132

During the year, 15,000 ordinary shares of Rs. 100 each and 25,000 redeemable cumulative participating preference shares, also of Rs. 100 each, became fully paid up and this has increased the paid-up share capital of the Company to Rs. 89.61 lakhs from Rs. 70.13 lakhs a year before. The reserves and surplus have also moved up from Rs. 58.37 lakhs to Rs. 81.11 lakhs so as to give total own funds of Rs. 170.72 lakhs. As against these, the "outside" interest amounts to Rs. 203.35 lakhs and is made up of Rs. 94.13 lakhs by way of secured and unsecured loans and Rs. 109.22 lakhs of current liabilities and provisions. This is, however, fully covered on the assets side by current assets and book debts which amount to Rs. 205.68 lakhs. Besides, there are investments—all in the capital of associate companies—shown at Rs. 3.26 lakhs. Additions to plant and machinery during the year have been of the order of Rs. 57.65 lakhs and, as a result, the block account has expanded to Rs. 241.15 lakhs. On deducting therefrom Rs. 107.68 lakhs being the depreciation provided so far one gets a net block of Rs. 133.47 lakhs. Capital work-in-progress, including deposits made for the purchase of land, aggregates Rs. 31.63 lakhs.

Currently the Rs. 100 old ordinary shares of the Company are quoted at Rs. 157.50 *cum-div.* and give a net yield of 6.8 per cent per annum.

DELHI CLOTH GROWS FURTHER

PROFIT BETTER—LARGE AMOUNTS CONSERVED

THE results of the Delhi Cloth and General Mills Company Ltd. (Managing Agents: Messrs. Bharat Ram Charat Ram Private Ltd., Delhi) for the year ended 30th June 1964 are in keeping with the Company's reputation as a growing progressive concern. The Company, scheduled to celebrate its seventy-fifth year in the last week of November 1964, has achieved a most remarkable growth record since its inception in 1889 and more particularly during the last 50 years. Thus, during this eventful period, its gross block has advanced from a mere Rs. nine lakhs in 1894 to no less than Rs. 32 crores; the shareholders' funds, which were as meagre as Rs. seven lakhs 50 years ago, now stand at the impressive level of Rs. 13.34 crores. The Company has to its credit an equally encouraging record in other sphere as well. It now contributes a sum of Rs. five crores to the national exchequer as against only Rs. three lakhs thirty years before.

In the year to 30th June 1964, the Company's net sale proceeds have shot up by about Rs. five crores to Rs. 42.17 crores and, as both other income and closing stocks have also increased, the gross profit at Rs. 393.11 lakhs shows a gain of Rs. 58.13 lakhs or 17 per cent over the previous year. This improvement is commendable, considering that it has been achieved in the face of heavy odds such as continuously rising production costs, voluntary price fixation on cotton textiles and shortage of sugarcane, all of which tended to deflate the profit-margin (ratio of gross profit to sale proceeds). It clearly reflects the managements' success in improving the productivity of Company's plants and diversifying its manufacturing operations.

The working results of the Company for each of the past four years are set forth in the following comparative table:

(In lakhs of rupees)

	For the year ended 30th June			
	1964	1963	1962	1961
Net sale proceeds*	42,17.68	37,92.98	35,08.24	33,09.75

Low	43.80	40.00	45.00	35 57

* Represents sales less excise duty, cane cess and royalties.
† Including jubilee bonus of 2 per cent subject to deduction of tax.

A substantial portion of the improved gross profit has been mopped up by essential provisions. Following the commissioning of some of the new or expanded units and third-shift working, the provision for depreciation has more than doubled to Rs. 240.76 lakhs from Rs. 110.15 lakhs the year before. The provisions for the Managing Agents' commission and taxation are, however, lower, the former at Rs. 8.98 lakhs as against Rs. 12.40 lakhs and the latter at Rs. 27 lakhs, as against Rs. 105 lakhs. The resulting net profit, therefore, shows a modest gain of Rs. 5.94 lakhs at Rs. 116.37 lakhs. From this, however, an amount of no less than Rs. 95 lakhs, as compared with only Rs. 33 lakhs last year, has become transferable to the statutory development rebate reserve while an additional Rs. 25.30 lakhs (Rs. 45 lakhs) have had to be set aside to meet depreciation and development rebate provisions for the preceding year. The balance available being too inadequate to declare a reasonable dividend, the Directors have considered it safe ("in view of the future promising results from new units") to withdraw a sum of Rs. 87.96 lakhs from reserves and past provisions. After setting aside from the available balance Rs. 8.23 lakhs for the payment of preference dividend, they have declared a dividend of 15 per cent, as against 13 per cent for 1962-63, and a further two per cent as jubilee bonus, making a total of 17 per cent for the year under review. This claims Rs. 74.40 lakhs, leaving a carry forward of Rs. 2.80 lakhs as against Rs. 1.47 lakhs brought in.

In common with other textile mills in the country, the working of the Company's textile units was quite satisfactory, despite increasing costs of raw materials and an expanding wage bill. On the export front also, the Company was able to maintain its position, notwithstanding the restrictions imposed on imports by several foreign countries. The new spinning unit of the Hissar Textile Unit with 28,000 spindles, under construction during the preceding year, was commissioned during the year and so also the new waste spinning plant attached to the Company's Swatantra Bharat Mills. The Hissar Textile Mills have now started manufacturing mixed fibre yarns and these are in good demand in the local markets.

The working of the chemical units, including the *vanaspati* factory was on a satisfactory basis but inadequate supplies of sugarcane continued to pose a serious problem for the sugar factories. The factories, therefore, could be worked, as during the previous year, for a part of the season only and this naturally had its impact on the working of the distillery.

As regards the Company's two new projects, the PVC plant at Kotah went into commercial production in January 1964 and its products, namely, caustic soda and PVC, are already in the market. So far as the rayon tyre cord project is concerned, the work in connection with the construction of buildings and erection and installation of machinery is progressing "according to schedule" and it is expected to commence production by the end of the year. Realising that a part of the spinning machinery of the Delhi Cloth Mills is old, the Directors have decided to replace it with more up-to-date equipment at an estimated cost of Rs. 170 lakhs.

During the year under review, the Company made a further and final call of Rs. five per share on the 3,99,731 ordinary shares issued in 1961-62—thereby making them fully paid—and also issued a fifth series of two-lakh redeemable cumulative preference shares of Rs. 25 each fully paid. This has raised its paid-up share capital to Rs. 576.06 lakhs from Rs. 503.42 lakhs a year ago. Because of the heavy plough-back effected during the year under review, the reserve complement has also risen from Rs. 767.66 lakhs to Rs. 820.74 lakhs exclusive of Rs. 82.62 lakhs (as against Rs. 55.18 lakhs a year before) earmarked for the payment of dividends for 1963-64. Borrowings too have continued to rise, the secured loans having advanced from Rs. 786.82 lakhs to Rs. 1119.68 lakhs, including Rs. 250 lakhs in debenture bonds, and unsecured loans from Rs. 323.76 lakhs to Rs. 591.31 lakhs. Current liabilities and provisions, on the other hand, have declined quite materially from Rs. 504.50 lakhs to Rs. 376.86 lakhs.

On the assets side, additions to the block account during the year aggregated Rs. 714.05 lakhs and so the gross block now stands as high as Rs. 2648.57 lakhs. The depreciation provided to date on this is Rs. 1334.21 lakhs. The net block, therefore, works out to Rs. 1314.36 lakhs. Capital work-in-progress other than projects is valued at Rs. 1.14 lakhs as against Rs. 114.59 lakhs a year before. Projects under construction are placed at Rs. 555.35 lakhs with Rs. 20.68 lakhs as advances and deposits on capital account, as compared with Rs. 462.98 lakhs with Rs. 136.10 lakhs as advances and deposits on 30th June 1963. Investments total Rs. 42.31 lakhs as against Rs. 38.23 lakhs, while current assets, loans and advances amount to Rs. 1778.06 lakhs, as against Rs. 1608.05 lakhs.

The Rs. 25 fully paid ordinary shares of the Company are currently quoted at Rs. 51.12 *cum-div.* and fetch a net annual return of a little over seven per cent on the *ex-div.* price.

Credit adjustments	Nil	3
Appropriations:		
Transfer to development rebate reserve	55	91
,, ,, general reserve	1,60	Nil
Proposed dividend (taxable) equity	2,06 (10%)	1,03 (5%)
Carry forward	3	1

* Includes Rs. 34,000 for super profit tax reserve.

Extracts from the Directors' report: Both the turnover and the profitability have increased than previous year and the Directors expect a better result during the current year. The Company is still pursuing on diversification in order to make better profits. The Company is also endeavouring to promote exports of Company's products in addition to the exports already made in Middle East and Far East.

Subsequent to the closing of the last financial year, the Directors have called the 2nd and final call money and also have approved the capital expenditure to the extent of Rs. 1,64,000 for constructing an additional bay in the existing factory. Besides these there has been no material change or commitment made affecting the financial position of the Company in between the end of the financial year of the Company.

Accounts in brief as at 30th April 1964 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	20,63,375	Gross block	24,67,344
Reserves and surplus	4,59,639	—Depreciation	4,09,338
Other liabilities	78,96,379		
		Net block	20,58,006
		Current assets	79,45,121
		Investments	83,848
		Cash	2,61,639
		Miscellaneous expenditure	1,00,779
	Rs. 1,04,49,393		Rs. 1,04,49,393

* Paid-up capital consists of 79,470 equity shares of Rs. 10 each fully paid up and 1,70,530 equity shares of Rs. 10 each—Rs. 7.50 per share called up. The calls in arrears amount to Rs. 10,300.

Kothari Sugars and Chemicals Ltd.

[*Managing Agents*: Kothari & Sons (Industries) Private Ltd., Madras.]

Fourth Annual General Meeting—21st November 1964.

Working Results:

	For the year ended 30th June (In thousand rupees)	
	1964	1963
Sale of sugar	87,23	26,27
,, molasses and press mud	1,65	34
Closing stock	41,25	7,51
Gross profit (+) or loss (—)	+12,81	—16*
To Managing Agents' remuneration	50	48
,, provision for depreciation (for 1962-63)	7,35	Nil
,, ,, ,, (for 1963-64)	4,46	Nil
Net profit (+) or loss (—)	Nil	—16
Carry forward	—1,27	—1,27†

* Loss after providing Rs. 48,333 for Managing Agents' remuneration.

† Including the debit balance of Rs. 1,10,276 brought forward from 1962.

Extracts from the Directors' report: As no depreciation was provided in the last year's accounts, depreciation to the tune of Rs. 23,02,889 has to be provided for two years. After setting off the profit against this provision, the balance depreciation of Rs. 10,71,418 has to be carried over to the following year 1964-65. No development rebate could be provided for want of adequate profits.

Capital Expenditure: During the year 1963-64 Rs. 4,59,513 was incurred as expenditure on lands, buildings, machinery and plant, etc., bringing the total to Rs. 1,45,57,861.

Supply of Sugarcane: In the last report, the Directors had forecast the crushing season as 130 days with a production of 12,000 tonnes sugar. The Factory commenced crushing on 14th December 1963 and closed the season on 18th May 1964 with a total crushing of 1,29,005.457 metric tonnes of cane and a production of 11,431.682 metric tonnes of sugar, at 8.86 per cent recovery as against 9.42 per cent recovery during the previous season.

The percentage of recovery in the trial season was higher due to the fact that the Factory crushed the cane during the months of January to April, which normally is a peak recovery period. During 1963-64 season, however, because of the longer duration of the crushing season which commenced in December and had to be extended into the hot month of May, the overall recovery was 8.86 per cent only. Admittedly, this low recovery was rather disappointing, but it was a factor over which the Company had no control, as the *Sucrose* content in the cane was lowered on account of shortage of water and excessive heat, due to lack of timely rains.

Performance: By and large, the Company had no serious trouble with its machinery and plant, and as already explained, the lower recovery obtained was due to climatic conditions and not to any inefficiency in the working of the plant.

The quality of the sugar produced was good and the Company bagged 1,13,078 quintals of E 30 sugar and 1,238 quintals of E 29. The cost of production compares very favourably with other well established factories in our neighbourhood.

Sale of Sugar: Out of the 11,431.682 metric tonnes sugar produced, upto 30th June 1964 the Company had sold 6,815.8 tonnes and at the time of writing the report a further quantity of 2,160.4 tonnes has been sold leaving a balance of 2,455.4 tonnes which is 21 per cent of the total production.

Prospects for 1964-65 Season: The total area under sugarcane plantation registered by the Company during the previous year was 4,000 acres. This has now been stepped up to 6,300 acres for the 1964-65 season, and at the average rate of 30 tonnes per acre, it will be possible to obtain 1,89,000 tonnes of cane. It will thus be seen that the Company can step up its crushing by 45 per cent, and if the climatic conditions are not unfavourable, it should be possible to produce 17,000 tonnes of sugar.

Accounts in brief as at 30th June 1964 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	79,99,000	Gross block	1,45,57,861
Other liabilities	1,16,20,771	—Depreciation	12,50,471

High	40.50	43.00
Low	39.75	40.00

* Upto 23rd October 1964.

Extracts from the Directors' report: Due to the sad demise of Shri Chunilal Narbheram, partner in the firm of managing agents of the Company M/s. Chunilal Narbheram & Son, there was a change in the Constitution of the said firm. Smt. Prabhavati Chunilal has been admitted as a Partner in place and stead of Shri Chunilal Narbheram as from 4th March, 1964 and the Central Government has accorded its approval to the said change in the Constitution of the firm of Messrs. Chunilal Narbheram & Son, managing agents of the Company.

Accounts in brief as at 31st March 1964 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	15,00,000	Gross block	1,21,21,312
Reserves and surplus	20,50,383	—Depreciation	59,31,821

		Current assets	44,20,390
		Investments	48,848
		Cash	12,137
	Rs. 1,01,25,868		Rs. 1 01,25,868

* Paid-up capital consists of 60,000 equity shares of Rs. 25 each. Of the above, 48,000 shares are allotted as fully paid up by way of bonus shares (Rs. 12,00,000) by capitalisation of reserves.

† Written off as per capital reduction scheme as sanctioned by High Court Order dated 10th March 1939.

Nenmeny Rubber and Produce Co., Ltd.

(*Managing Agents*: Messrs. A. V. George & Co., Ltd., Kottayam, Kerala.)

Twenty-second Annual General Meeting—14th November 1964.

Working Results:

	For the year ended 31st December (In thousand rupees)	
	1963	1962
Sales of rubber, tea and minor produce	7,70	8,16
Closing stock of rubber	1,47	2,31
Gross profit	70	2,43
To Managing Agents' commission	9	28
Transfer to depreciation	24	25
,, provision for taxation	8	96
Net profit	29	1,00
Balance brought forward	1,19	90
Excess tax provision written back	27	Nil
Appropriations:		
Proposed dividends (taxable) preference	21	21
,, ,, ,, equity	34 (10%)	50 (15%)
Carry forward	1,20	1,19

Extracts from the Directors' report: *Estates*: Nenmeny & Eldorado Estates are in good condition and well maintained. As reported by the Directors in their earlier report, the rubber trees in the low yielding areas (approximately 157 acres in Nenmeny Estate and approximately 205 acres in Eldorado Estate) were sold during the year with right for slaughter tapping so as to replant the entire areas, with high yielding rubber trees under the subsidy scheme of the Rubber Board. 38.56 acres in Eldorado Estate was replanted with high yielding rubber plants, during 1963.

Crop and Prices: The rubber crop harvested during the year was 1,70,202 kg. at an estate cost of 325.05 P per kg. as against an estimate of 2,50,000 kgs. at 211.38 P per kg. The crop estimated for 1964 is 1,85,000 kgs. at 308.86 per kg. As reported by the Directors in the earlier report, the shortfall of crop was anticipated since the rubber trees in 362 acres were sold out with right for slaughter tapping, resulting in the reduction in tapping area.

Managing Agents: The Directors regret to inform that the Government of India has not given sanction for the renewal of the appointment of the managing agents for a further period of five years from 1st January 1965. This matter was considered by the Directors at their meting held on the 23rd September 1964 and it was considered advisable to appoint a Managing Director for the Company from 1st January 1965 and the necessary resolutions for this are included in the Agenda.

General: The crop harvested till 31st August 1964 is 79,514 kgs. compared to 86,926 kgs. in 1963.

Accounts in brief as at 31st December 1963 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	6,35,000	Gross block	17,68,529
Reserves and surplus	6,32,145	—Depreciation	3,60,741
Other liabilities	4,53,421		
		Net block	14,07,788
		Current assets	2,02,235
		Cash	10,543
	Rs. 16,20,566		Rs. 16,20,566

* Paid-up capital consists of 30,000—7 per cent. tax-free cumulative preference shares of Rs. 10 each and 33,500 equity shares of Rs. 10 each.

Asher Textiles Ltd.

(*Managing Agents*: Messrs. Setna & Co., Tirupur, South India.)

Twenty-seventh Annual General Meeting—19th November 1964.

Working Results:

	For the year ended 30th June (In thousand rupees)	
	1964	1963
Sales of yarn, waste, raw materials, etc.	82,29	91,47
Closing stock	31,15	37,48
Gross profit	9,75	12,91
To Managing Agents' remuneration	42	79
Transfer to depreciation	4,50	3,67
,, provision for taxation	1,20	5,55
Net profit	3,63	2,90
Balance brought forward	10	21
Appropriations:		
To Managing Agents' remuneration paid less last year	9	Nil
To bonus relating to prior years	78	42
Transfer to reserves	1,57	1,10
Proposed dividend (taxable) equity	1,20 (10%)	1,50 (12½%)
Carry forward	8	10

Extracts from the Directors' report: The fall in the profits for the year under review is due to the following factors:—The cost of cotton consumed during the year—both Indian and Foreign—has been about Rs. 100 more per candy, whereas yarn prices remained fixed at the same ceilings as in last year. This has occasioned a substantial fall in Company's earnings. There was loss of production for 14 days in November 1963 due to strike by the mill workers followed by a lock-out on bonus issue. There was also loss of production and payment of lay-off compensation to workers for 17 days due to 100 per cent power cut which was in force, in the beginning as well as at the end of the accounting year of the Company. Increased dearness allowance was paid to employees to the extent of about Rs. 32,000 as a result of steady increase in cost of living index. The cost of electric energy consumed during the year was higher by Rs. 35,000 as a result of imposition of 20 per cent surcharge on power consumption.

Modernisation of and additions to Machinery: Conversion of the conventional 3 *Roller Drafting* system on 34 *Rieter Ring Frames* (1938 make, *with GX-2 Pendulum Arm Drafting System* is now completed. All the existing 84 *Carding Engines* are now equipped with Japanese *Ever Clearers* and *Dust Removers*. Orders have been placed for four *Ring Frames* of 400 spindles each, towards additional installation against general licence issued by the Government of India for installing 1,600 additional spindles. Orders have also been placed for fifteen *Ring Frames* of 400 spindles each, at an estimated cost of Rs. 6,30,000 to replace the existing 15 *Ring Frames* purchased in 1950 which are not working efficiently. For the processing unit of the Mill, one *Effluent treatment Plant* costing about Rs. 10,000 and one *Drying Chamber* costing about Rs. 20,000 have been ordered.

It is proposed to increase the authorised capital of the Company from Rs. 14,00,000 to Rs. 20,00,000 and cancel the 2,000 6 per cent non-cumulative preference shares of Rs. 100 each, none of which has so far been taken up or agreed to be taken up by any one. The proposed alteration in the capital structure has been given effect to in the revised Articles.

Accounts in brief as at 30th June 196 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	11,98,600	Gross block	71,16,62
Reserves and surplus	12,08,105	—Depreciation	39,25,77
Other liabilities	52,95,909		
		Net block	31,92,85
		Current assets	44,90,06
		Investments	11,00
		Cash	8,70
	Rs. 77,02,614		Rs. 77,02,61

* Paid-up capital consists of 11,986 equity shares of Rs. 100 each. Of the above, 3,986 shares are allotted as fully paid-up bonus shares by capitalisation of reserves.

NEWS IN BRIEF

THE fifth annual general meeting of the National Federation of Co-operative Sugar Factories is to be held at New Delhi on the 22nd inst. Mr. C. Subramaniam, Union Minister for Food and Agriculture, will inaugurate the meeting.

A sub-office of the Textile Commissioner to cover the western zone will be opened at Indore, sometime in December next. The office will have an Assistant Commissioner and four technical officers.

A four-member delegation led by Mr. D. B. Anand, Member of the Central Water and Power Commission, left for Bangkok to participate in the sixth regional conference on water resources development in the E.C.A.F.E. region which began its one-week session on the 12th inst.

Good quality coal is reported to have been located on the banks of the Bokaro River opposite the existing Swang colliery. The National Coal Development Corporation proposes to open a mine there shortly. The coal structure is claimed to be as good as the Raniganj coal.

India will participate in a big way in the Ceylon industrial exhibition, due to open at Colombo on 11th January next. The Indian pavilion, which occupies a floor space of 8,000 sq. ft. will display a large number of engineering items and products of small-scale industries.

The Minerals and Metals Trading Corporation exported as much as 389,000 tonnes of iron ore during the month of October 1964, as against the 348,000 tonnes exported in the same month last year. Of this quantity, Japan alone accounted for 205,000 tonnes. Rumania bought 49,000 tonnes and Poland 36,000 tonnes.

The Technical Development Wing of the Union Government will be the technical adviser to new industries, including the extension of the existing ones and allocation of scarce raw materials, according to Mr. K. Raghuramiah, Union Minister for Supply. This arrangement will also be applicable to petroleum, chemicals and heavy engineering.

The six-week winter session of Parliament will begin on Monday the 16th inst. In addition to the 20 pending Bills, 15 new Bills are expected to be presented, the notable among them being the Payment of Bonus Bill, the Patents Bill, Industrial Disputes Act (Amendment) Bill and the Indian Tariff (Amendment) Bill.

India exported engineering goods worth Rs. 1.53 crore during the month of September 1964, as against the exports amounting to Rs. 1 crore in the same month last year. The total exports during the first nine months of 1964 touched a record of Rs. 11.2 crores, as compared with Rs. 8.5 crores in the corresponding period of the previous year.

The Government of India has sanctioned a project for the expansion of the hamycin plant of the Hindustan Antibiotics Research Laboratories, from 50 kgs. to 250 kgs. per annum at an estimated cost of Rs. 55 lakhs, including a foreign exchange component of Rs. 20 lakhs. The plant and machinery required for this antibiotic project will be imported from the U.S.

Air-India and Middle East Airlines have signed a pool agreement covering their services between India and Lebanon and *vice versa*. The agreement has come into force with effect from 1st October 1964. The pool covers Air-India's three transit flights a week through Beirut, in each direction, and Middle East Airlines twice weekly flights to Bombay and the India-Lebanon route.

A final decision on the question of food zones in the country is expected to be taken at a conference of State Chief Minsters to be held at New Delhi next week, according to the Prime Minister, Mr. Lal Bahadur Shastri. The question of introducing food price controls and rationing in some of the bigger cities will also be discussed at the conference.

Iron ore production in India during the first eight months of 1964 amounted to 132 million tonnes, representing a fall of 4 per cent, as compared with the same period last year. The production during the month of August aggregated 1.50 million tonnes. Orissa was the leading producer with an output of 414,000 tonnes, followed by Goa with 367,000 tonnes and Bihar with 303,000 tonnes.

The Union Government has just entered into an agreement with Cambodia and Thailand for the supply of 25,000 tons of rice to India. It has already concluded an agreement with the Government of U.A.R. for the supply of 70,000 tons of rice and negotiations are well under way with Pakistan for the supply of 15,000 tons. About 300,000 tons of American rice under P.L. 480 will begin arriving from the end of this month.

The State-owned Sindri Fertiliser Factory has produced different types of fertilisers worth Rs. 127 crores since it commenced operation fourteen years ago. The actual production is 3.83 million tonnes of ammonium sulphate, 251,000 tonnes of double salt and over 76,000 tonnes of urea. Plans have been evolved and approved for the setting up of a sulphuric acid plant which would eliminate the necessity of depending on gypsum as the source of sulphate radical.

A contract for the supply of Soviet equipment to Farakka Barrage project in West Bengal was signed at Calcutta on 4th inst. between the representatives of the U.S.S.R. and the Chief Engineer of the project. The first consignment, consisting of bulldozers, pile drivers and sinkers is expected to be delivered in February next, and the rest within the next six months. The value of equipment, which is estimated at Rs. 9 lakhs, will be paid in rupees.

A detailed market survey of art silk fabrics in India has been undertaken by the Silk and Silk Mills' Research Association, Bombay. The market for textile goods is greatly expanding in recent years and has undergone significant changes in product-composition, price situation and demand and supply position. The market survey will, therefore, attempt mainly to investigate the changing nature of trade in art silk goods, study of the methods of retailing, and ascertain the impact of promotional measures on sales.

Four contracts were signed at New Delhi on the 5th inst. between the Soviet trade organisation *V/O Machinoexport*, and the Uttar Pradesh State Electricity Board, for Soviet assistance in the construction of Harduaganj "B" power station. These contracts cover the delivery of the equipment and materials, the preparation of working drawings, training of engineers of U.P. State Electricity Board in the U.S.S.R. and deputing Soviet specialists to India for technical assistance in erection and commissioning of the equipment. The major part of the equipment will be supplied early in 1965.

The findings of a recent study of the public sector undertakings made by the Planning Commission and the Committee on Plan Projects reveal that many of these undertakings are unable to adhere to time schedules and cost estimates. In several cases, this has been due to inadequate technical, economic and financial planning. There is said to be ample scope for applying improved management practices in the training of enterprises which have reached the production phase. A systematic effort, it is urged, should be made to adapt and incorporate the best available practices in the management codes of the public sector projects. In respect of larger projects, the study makes it clear that there should be continuous plannings and that each year, an enterprise should project forward its physical and financial plans for a further period of four to five years.

The Industrial Committee on Plantations, which met at New Delhi recently, recommended that a one-man fact-finding committee be set up to inquire into the aspects of the employment position in plantations and report to the Union Government within six months. Payment of compensation in the event of death or injuries to the worker or his family due to house collapse was also suggested. Further, the Union Labour Ministry was urged to request the State Governments to expedite action in the matter of fixation of wages in minor plantations. Government was requested to give subsidy to employers for building houses for plantation workers. The Committee recommended that 14 days' sick leave should be made available to workers with wages at the rate of two-thirds of their earnings subject to a minimum of Re. 1 a day.

The commemorative coins in memory of the late Mr. Jawaharlal Nehru will be issued from the 14th inst. These coins will be of the denominations of Re. one and 50 paise and will be issued, in the first instance, from all State capitals and Allahabad. The coins will be available to the public in exchange, for a period, from all the branches of the State Bank of India and its subsidiaries in each State capital (except Kohima), and also from the Reserve Bank of India offices at Bombay, Calcutta, New Delhi, Madras and Bangalore. At Kohima, these coins will be issued from the district treasury. The coins will have the same shape, size and weight as the current decimal coins of the same denominations, except that on one face of the coins an effigy of the late Prime Minister in profile will appear with the name "Jawaharlal Nehru" in English and the figures "1889-1964." There will also be a star on either side of the effigy between the name and the figures. The other face of the coins will bear the lion capital of the Asoka pillar and the words "Bharat" in Hindi and "India" in English inscribed thereon. These coins will be legal tender just like the ordinary Re. one and 50 paise coins.

* * * *

From Abroad

The Bank Rate in Sweden has been raised by ½ per cent to 5 per cent with effect from the 5th inst.

A new combined organisation of shipping companies called the Ceylon East Bound Conference, engaged in trades between U.K.—Continent and Ceylon has just been formed. It combines the secretariats hitherto operated by J. B. Westray and Company for the U.K. trade and the Continent—Ceylon Secretariat for the continental trade.

Simon-Carves of Britain and some firms in Denmark and Austria are negotiating with Polish authorities for the construction of a fertiliser factory in South Poland. The factory is estimated to cost about £17.86 million.

The Government of Indonesia has imposed a compulsory surcharge of 1,350 rupiahs (roughly 5s.) for every U.S. dollar (c. & f. paid) on imported goods except rice, cotton, fertlisers, newsprint, medicines and scientific literature.

The Japanese Government has just approved the requests of three local refining companies to expand their capacities by a total of 155,000 barrels a day. With this addition, the total refining capacity of the Japanese refineries will be 2.1 million barrels per day by the end of the fiscal year 1966.

The year 1963-64 was the best-ever year for the British Overseas Airways Corporation, the net profit earned being £ one million. The total revenue earned was up by 12.3 per cent at £100 million, while expenditure recorded a decline of 3.5 per cent. Over one million passengers were carried during the year. The operating account, which ended with a loss of £2.7 million last year, showed a net overall surplus of £8.70 million. The management has decided to make a special provision of £12.4 million in the accounts "of which a substantial proportion arises not on 1963-64 account, but out of the reorganisation scheme account introduced this year, with the result that the accumulated deficit since the formation of the Company 25 years ago is now up from £80 million to £90.5 million."

Britain has granted long-term credits to finance Soviet purchases of British-made equipment for the second time in a few months. The Government Export Credits Guarantee Department has guaranteed a 13-year credit of £3.7 million provided by a banking consortium headed by Lazard Brothers to the Soviet import body Techmashimport. The money will partly finance the purchase of a £5 million acetic plant from the British Power Gas Corporation. The plant, to be completed by 1968, will have a yearly output of 35,000 tons of acetic acid needed for the manufacture of synthetic fibres and various organic chemical products. It will also produce propionic and formic acids. In September last, it will be recalled, the Export Credits Guarantee Department had backed a 14-year credit of some £24 million to finance the export to the Soviet Union of a British terylene plant.

The population of West Germany and West Berlin set a new "baby" record last year with 1,054 million live-born babies. Nearly 542,000 were baby boys. Thus, an average of 18.3 infants were born per 1,000 inhabitants. The number of still-born babies sunk to 1.3 per cent, the number of illegitimate children to 5.2 per cent. The increase in population per 1,000 inhabitants reached 6.6 per cent, 507,000 marriages were performed. The Federal Bureau of Statistics discovered that female labourers are the youngest to marry. 26 per cent of them were less than 21 years of age and 70 per cent less than 25 years of age on their wedding day. Only 39 per cent of all women in higher positions and professions were less than 25 years of age.

World rice production is again expected to reach a high level, according to the Commonwealth Economic Committee. India, it is said, is likely to produce a record crop, and Japan a bumper crop. Thailand and Cambodia also expect good harvests. A record output in the U.S. is forecast for the third successive year. The area under cultivation in the United Arab Republic has shown a further expansion. Prospects in Western Europe too are very less favourable. In Burma, however, the position is much less favourable where flood damage has occurred. Rice exports for 1963 so far recorded are above those of last year, reflecting the expansion in supplies in some exporting countries and strong demand from importing countries, particularly India, Indonesia, Japan, the Philippines and the Soviet Union. Shipments from the U.S. in the first seven months of the year were one-quarter larger than a year earlier, while provisional figures for August suggest that exports during January-August aggregated one million tons.

PERSONAL

MR. Eisaku Sato has been elected Japan's new Prime Minister *vice* Mr. Hayoto Ikeda who resigned due to ill health.

Dr. P. V. Cherian, a former Chairman of the Madras Legislative Council, has been appointed Governor of Maharashtra in place of Mrs. Vijayalakshmi Pandit.

Dr. Louis E. Haley of International Minerals and Chemical Corporation, Illinois, U.S., has been appointed Marketing Manager of the Coromandel Fertilisers Ltd., Secunderabad.

Mr. Richard V. Thomas, President of Goodyear International Corporation, has been named a member of the Advisory Committee of the Indian Investment Centre.

Mr. A. R. Bhatt, President of the Federation of Associations of Small Industries of India, and Dr. S. T. Merani, Development Commisioner, Small-scale Industries, left for Tokyo to attend a symposium on small business development sponsored by the Asian Productivity Organisation.

Mr. S. R. Vasavada, General Secretary, Indian National Trade Union Congress, has been awarded the Jehangir gold medal for the current year for outstanding contribution towards the cause of industrial peace. The medal is donated by the Xavier Labour Relations Institute of Jamshedpur.

Mr. S. L. Kirloskar, head of the Kirloskar Enterprises, has left for a six-week tour of the U.S., Canada and the Latin American countries. He will explore the possibilities of exporting the Companies' diesel engines, water pumps and machine tools to these countries.

Mr. C. Subramaniam, Union Food and Agriculture Minister and leader of the Indian Delegation to the Seventh Food and Agriculture Organisation Regional Conference for Asia and the Far East left for Manila; the Conference opened there on the 9th inst.

THE OTHER CHINESE INVASION—IV

VISCOUNT AIRCRAFT AND SALESMEN FROM U.K.

By K. Krishna Moorthy

[This is the fourth and concluding part of a series of articles dealing with Communist China's foreign aid and trade relations. The earlier articles in this series appeared in Commerce *dated 17th, 24th and 31st October 1964.—Ed.]*

A EUROPEAN diplomat once berated this correspondent jestingly for commenting on the sale of six Viscounts to Communist China. According to him, apart from the six turbo-prop planes, Britain had sold another Viscount to China, Field-Marshal Montgomery! In promoting commercial relations with Communist China, high personages from various sectors of British society are interested. The Chairman of the Industrial and Trade Fairs Holdings Limited, which has organised the big British show in Peking which opened on the 2nd inst., is Lord Drogheda, who is also Managing Director of the Company running the *Financial Times* daily newspaper of London. The British Government, Tory or Labour, is as much interested in promoting China trade as numerous British firms which have been campaigning for the past few years to make the best out of the prospects offered by a developing economy containing a population approaching 700 million.

The British show in Peking is the biggest Western exhibition in Peking since the Communists took over the reins of Government. By the beginning of 1964, the British had delivered £3.7 million worth of aircraft and parts to China. Having recognised Peking diplomatically from the very early days of the Communist Government, Britain has had direct diplomatic ties to promote commercial endeavours. And the Colony of Hongkong also has been immensely useful to promote commercial contacts. But as long as the Soviet Union underwrote the supplies for major projects in China, the British as well as other Europeans had only a marginal role in supplies of industrial equipment to Communist China. Numerous Chinese technicians have been visiting Britain in the past few years, and, early in 1963, Lu Hsu-chang, China's Vice Minister for Foreign Trade, visited Britain. The first British exhibition in Communist China was held in the summer of 1963 by the I.C.I., Formica Limited and the Morgan Crucible Group. From 12th to 25th April 1964, the British Scientific Manufacturers' Association held an exhibition in Peking. This was followed a few weeks later by the Mining and Construction Equipment Exhibition. The fourth and biggest show is that which opened on 2nd November. Associated with the organisation of the exhibition is also the Sino-British Trade Council. Participating are more than 200 British firms, of which nearly 150 are directly represented. More than 350 British businessmen are visiting Peking in connection with the show.

Communist China's Orders of Complete Plants

(In crores of rupees)

Plant	Country of origin	Value
Vinylon	Japan	10.0
Vinylon	Japan	15.0
Urea	Holland	3.5
Palm oil	Holland	*
Ammonia	Britain	3.5
Fertiliser	Italy	3.7
Oil refinery	Italy	4.5
Alcohol	France	*
Oil cracking	W. Germany	6.2
Polyethylene	Britain	6.5

* Value not yet known.

Among the bigger British firms represented at the Peking show are Associated Electrical Industries, B.O.A.C., Babcock and Wilcox, Bristol Siddeley, British Insulated Callender's Cables, Crompton Parkinson; Dunlop, EKCO, English Electric, Fairfield Shipping, Hawker Siddeley, Jardine Matheson, Leylands, Lithgows, Longmans Green, Joseph Lucas, Marconi, Massey Ferguson, Perkins, Pye, Rank Organisation, Rolls Royce, Rootes Vickers, Viking Engineering and Whitely.

After the sale of Viscounts, the British also tried to negotiate supplies of Comet jet airliners. Negotiations are now going on for the sale of VC-10 planes. The French have been interested in selling Caravelles but the U.S. State Department has issued warnings against the sale of Caravelles with American-made components. B.O.A.C. has also signed an agreement for the sale of air tickets direct to Chinese towns, a reciprocal arrangement with the Chinese State airline organisation. An important British sale of complete plant to China was the deal in September this year by Simon Carves, in association with Imperial Chemical Industries, of a high pressure polyethelene plant. Other major West European deals under negotiation include a Mannesman steel tubing plant, a Swedish paper mill, a Japanese uric acid plant and a big French oil refinery. Ten major plants have been sold hitherto by West European and Japanese firms to Communist China (see table). These are estimated to cost about Rs. 60 crores. The Japanese have negotiated sales of two vinylon plants. In September 1963, the Continental Engineering Company of the Netherlands sold China equipment for a urea plant. The capacity will be for the production of 175,000 tons of urea a year and the plant is expected to go into production in 1965. The Dutch plant will be run in conjunction with a fertiliser plant being supplied by Humphreys and Glasgow, a British firm. The contract for this was signed in October 1963. In December 1963, the Chinese Government signed an agreement with the Italian Montecatini for two fertiliser plants. In the same month, the Chinese made a deal with Snam-Projetti, a subsidiary of E.N.I., for a petroleum refining plant. In January this year, the French signed a contract to sell an alcohol plant. Some three years ago, the Chinese Government ordered two of the capitalists' luxury cars, Rolls Royce. Two more were ordered later and the Chinese leaders appear to have acquired a taste for Rolls Royce luxury because a deal is being negotiated for the purchase of eighteen more Rolls Royce cars. Among the variety of modern equipment supplied by British firms were some which were useful in China's atomic bomb programme.

Peking has been negotiating with Britain, France, Japan, the Netherlands and West Germany for ships and a recent order was for two cargo ships to be built in France whose shipyards have been laying off men in view of paucity of orders. A British shipbuilders' delegation also visited Peking in the middle of this year. Incidentally, the underemployed French shipyards also recently accepted an order to build warships for Portugal. The French have also conducted an exhibition of measuring and control apparatus in Peking in September and are planning a big show towards the end of 1965 or early in 1966.

Under the Berne agreement of 1963, the N.A.T.O. member countries agreed to deny long-term credits to Communist countries, but, in recent months, there is a belief growing that France may extend long-term credits to China. Private firms in West Germany have set up committees to try increase trading with China which fell during 1963. The West German Government has so far been against any Government-to-Government contracts between Bonn and Peking, partly in view of American policies and partly because China recognises Communist East Germany.

(Concluded)

British Exports to China

(In £ sterling)

A seminar on development of management consultancy will be held at Bombay under the auspices of the Bombay Productivity Council from the 30th of this month to 2nd December next. The Asian Productivity Organisation has agreed to provide the services of experts to lead the seminar. The objectives of the seminar are to promote management consultancy in India, provide an understanding of how best to utilise a consultant, provide an opportunity of exchanging ideas on the ways to ensure means of making management consultancy an instrument of higher productivity and better management.

Notice

THE SINGARENI COLLIERIES COMPANY LIMITED

NOTICE

NOTICE IS HEREBY GIVEN THAT THE Forty-third Annual General Meeting of the Shareholders of the Singareni Collieries Company Limited, will be held on 28th November 1964 at 12.00 Noon at the Registered Office of the Company, "Meher Manzil," Khairatabad, Hyderabad (A.P.), to transact the following business:

1. To consider and adopt the Directors' Report and the Audited Statement of Accounts for the year ended 31st March, 1964.
2. To declare a dividend for the year ended 31st March, 1964.
3. To note the Donations paid by the Directors.
4. *(a)* To appoint Directors in place of Shri S. N. Sahgal and Shri M. A. Abbasi, who retire in accordance with Section 256(1) and (2) of the Companies Act, 1956 and Article 93 of the Articles of Association of the Company. They are eligible for re-election.

   (b) To appoint Directors in place of Shri H. L. Guha, Shri K. Subbarao and Shri S. K. Nargundkar, who retire under Article 98 of the Articles of Association of the Company and are eligible for re-election.

Note: 1. The Transfer Books of the Company will remain closed for the purpose of dividend from 15th November 1964 to 28th November 1964, both days inclusive.

2. Subject to the Directors' recommendation being accepted, Dividend Warrants will be posted by 28th December 1964.

3. A member entitled to attend and vote is entitled to appoint a proxy to attend and vote, instead of himself and that such proxy need not be a member.

By Order of the Board,
A. SAMBASIVARAO,
Secretary.

"MEHER MANZIL,"
KHAIRATABAD P.O.,
HYDERABAD—A.P.
Dated 30th October, 1964.

MONTHLY ECONOMIC REVIEW OF BRITAIN

STERLING FARES BETTER THAN EXPECTED

NEW GOVERNMENT'S APPROACH EXPLAINED

By W. T. C. King
EDITOR, *"THE BANKER"*

LONDON, *3rd November*

SO far as can be judged from its performance in the foreign exchange markets, sterling has come through the strains of the past month a good deal more smoothly than might, perhaps, have been expected. It has had to face not only the uncertainties inseparable from the final stages of a general election and the first stages of the inauguration of a new Government, but also the dawning realisation and then the confirmation that the gap in Britain's balance of payments has been steadily widening to proportions far beyond anything contemplated when the main lines of economic policy were last laid down, around Budget time last April.

The combination of electoral and economic factors imposed increasing pressure as the election date approached, but at no stage was there any significant speculative "run" against the pound. The monetary authorities had taken the precaution of arranging "Basle-type" short-term credit facilities with a group of oversea central banks: and when the customary statement revealed that, during September, the central reserves of gold and convertible currencies had fallen by £16,000,000, it was simultaneously indicated that some use had been made of these facilities, mainly around the middle of the month.

A similar indication has now been given with the October gold statement, revealing a decline in the official reserves by a further £31,000,000 to £876,000,000: but the amount of these drawings on the credits has not been disclosed. It is probable that the sharpest pressure was felt on the morrow of the election—at a time when the outcome was still in some doubt, and when a particularly disappointing set of trade returns was released into the prevailing uncertainty.

The authorities followed their recent tactics of allowing part of the pressure to be taken by the exchange rate, and the spot quotation for the U.S. dollar dipped on 15th October to a shade above $2.78¼, normally the lowest operation point above the officially fixed limit of $2.78. In the ensuing week, there was a modest improvement and then, on and after 26th October, quite a marked recovery upon the announcement of the new Government's first economic measures.

Stock Exchange

This movement, it may be briefly noted, was broadly paralleled in the stock exchange. Industrial ordinary share prices, as measured by the *Financial Times* index, had risen steeply during September to reach an all-time peak of 377.8 on 1st October, only to plunge back to 355 on 1st October, only to plunge back to 355 377.8 and then rally moderately in the next few days.

Immediately after the election, there was a further dip, to a low point of 350: but the first policy statement was followed by a six-point rally, to 362.8—though this gave place to renewed falls as the moment approached for the Government's presentation of its initial programme to Parliament. Gilt-edged securities also rallied well soon after the election, and especially when it became certain that the immediate measures for dealing with the problem of the balance of payments would not include an increase in Bank Rate.

This recovery, especially of the sterling and gilt-edged markets, doubtless came as a reassurance to the new policy-makers, for their first assessment had declared the underlying economic situation to be "profoundly unsatisfactory." Urgent studies set in motion immediately after the election had culminated, ten days later, in the issue of a White Paper giving their findings and proposals. These were introduced on 26th October by the two Ministers primarily responsible for economic policy, Mr. George Brown, First Secretary of State and Minister for the newly-created Department of Economic Affairs, and Mr. James Callagham, the new Chancellor of the Exchequer: and the Prime Minister, Mr. Harold Wilson, explained them to the nation in broadcast addresses the same evening.

After taking stock of the international financial situation, the Government was satisfied that, "with the facilities available, the strength of sterling can and will be maintained." Several Ministers have since emphasised that this is seen as a prime objective. But the studies had led up to the estimate that, for the year 1964 as a whole, the deficit on Britain's external balance of payments, including net outgoings on long-term capital account as well as the gap on current account transactions, was most unlikely to be below £700,000,000, and might reach £800,000,000—much larger figures than had seemed in prospect on the basis of the last estimates publicly available before the election.

The September trade figures had, however, shown a sharp dip in the seasonally adjusted export total and only a slight fall in imports from the high point recorded for August. The visible trade gap, calculated on a balance-of-payments basis (with imports as well as exports shown f.o.b.) widened to a new high point of £59,000,000, and even for the third quarter as a whole, it averaged as much as £49,000,000 (an annual rate of nearly £600,000,000), compared with £44,000,000 in the second quarter and £35,000,000 in the first. In 1963, by contrast, the visible account had been almost in balance.

Disappointment

These figures disappointed the hopes, which had been steadily shrinking in preceding months, of an early and large turn-round of the depressing trend. The White Paper acknowledged the likelihood of a substantial improvement in 1965, even in the absence of a change in policy: but it considered that any improvement would still leave the overall deficit—current and long-term capital—at an "unacceptable level." No breakdown was given of these global estimates, but it seems clear that the essence of the problem was regarded as a basic imbalance in visible trade, a chronic tendency for imports to outpace exports, so that "every time we seek to increase our national production we are forced almost immediately into deficit."

Because of the sharply rising trend of imports of manufactured goods, the pressures experienced this year could not be dismissed as mainly attributable to the increase in primary imports required to service an expansion of production. At the same time, it was implied, the strains on the balance of payments could not be attributable to any overloading of the home economy. The Government concluded that "apart from the special problems of individual areas and a limited number of industries, there is no undue pressure on resources." (It has to be noted, however, that the external deficit on current account is in itself a means of diminishing the pressure that would otherwise be experienced at home.) In consequence, it saw no need to try to correct the external disequilibrium by measures of domestic disinflation: on the contrary, it rejected "any policy based on a return to stop-go economics."

This being so, and since it recognised that it neither could nor should rely on external facilities "alone or indefinitely," the Government was left with no quick-acting means of improving the visible balance other than by restricting imports and trying to improve the immediate profitability of exports. The major device selected was the imposition, with immediate effect (subject to later resolution of Parliament), of a temporary import charge at the uniform rate of 15 per cent. on landed value, on all imports except foodstuffs, unmanufactured tobacco and basic raw materials: this duty to be additional to any existing duties.

Very broadly, it amounts to a doubling of the average level of Britain's import tariff on manufactures, and of course it applies in some instances to trade that was previously duty-free. At the existing level, the volume of imports affected amounts to about £1.360 millions a year: but it is hoped that its effect, together with other influences tending to reduce imports, may be to reduce the total by around £200,000,000 per annum. On this basis, the tax yield from imports that come in and bear the duty is estimated at about £170,000,000 a year—which would give a fairly neat apparent non-inflationary balance between the reduction in the supply of goods to the home market and the amount of domestic purchasing power mopped up.

Inevitably, this move has been widely deplored as a reversal of the world-wide trend towards freer trade and payments, and the Government has been criticised for taking the step without full prior consultation overseas. Government spokesmen have, however, pointed to the need for urgent action and have said that they deplore it no less: in the words of the Chancellor, "our aim is to secure freer trade all the way round: we were most anxious, as we still are, to make the Kennedy Round, for example, succeed." Hence it has been stated categorically that the charge is "essentially temporary, and it will be reduced as soon as the balance-of-payments situation permits and it will be abolished at the earliest opportunity." Although the duty will inevitably have a protective effect on British industry, this is far from being its aim, the Government has emphasised.

Longer-range Correctives

The longer-range correctives, the White Paper indicates, are to be sought by a drive to make British industry "more competitive and aggressive." The role of the new Department of Economic Affairs, it is stated, will be to ensure that "everything is done to develop those sections of industry which are needed to expand exports, replace avoidable imports and to strengthen our industrial base": whilst the new Ministry of Technology has the task of accelerating the process of modernisation and innovation in industry.

As an immediate but modest aid for exports, exporters are to be relieved of a part of the burden of indirect taxation which enters into the cost of production of exports. The amount of taxation thus borne is to be calculated in respect of each of a number of broad categories and expressed as a percentage of export sales: corresponding payments, ranging from 1 to 3 per cent with an average of perhaps 1½ per cent., will be made to exporters—at an estimated cost to the exchequer of £70,000,000 a year at the present rate of exports. The possibility of co-operative selling arrangements overseas for small firms, and of improving export facilities, is to be examined.

More generally, the While Paper foreshadowed renewed efforts, in conjunction with both sides of industry, to establish a plan to increase productivity and to promote an effective incomes policy "which covers all forms of income and is related to productivity": a policy to promote labour mobility in the interests of technological advance, including a system of severance payments: and efforts to promote the fuller utilisation of the under-employed areas.

There is also to be a strict review of all Government expenditure, to relieve the strain on the balance of payments and to release resources for more productive purposes "by cutting out expenditure on items of low economic priority, such as 'prestige projects.'" Existing programmes, it is observed, would in the aggregate absorb for years ahead the tax yield increments that would come even from a steady 4 per cent growth of gross national product: and room must be found for the additional social outlays to which the new Government is pledged.

Notice

MADURA MILLS COMPANY LIMITED

Registered Office:
New Jail Road, MADURAI

NOTICE IS HEREBY GIVEN THAT IN connection with payment of interest to Debenture Stockholders, the Debenture Stock Transfer Register of the Company will be closed from 16th to 30th November 1964, both days inclusive. It is recommended that:

1. All persons holding debenture-stock on blank transfers should immediately arrange to have the stock registered in their own names, as the Company will pay interest only to the person(s) in whose name the stock stands on the date of payment of interest.
2. Stockholders desiring interests to be paid to Banks or other Mandatees should register the mandates with the Company before 16th November 1964.
3. Intimation of any change of address should be given to the Company immediately.

A. & F. HARVEY LTD.,
Managing Agents.

MADURAI,
24th October, 1964.

Notices

BENGAL POTTERIES LIMITED

NOTICE

NOTICE IS HEREBY GIVEN THAT THE Fifty-third Annual General Meeting of the Bengal Potteries Ltd. will be held at the Registered Office of the Company at 45, Tangra Road, Calcutta-15, on Monday the thirtieth November 1964 at 4 p.m., to transact the following items of business:—

(1) To receive and adopt the Directors' Report, the Audited Balance Sheet and the Profit and Loss Account for the half-year ended 30th June, 1964.

(2) To declare a Dividend.

(3) To elect Directors in place of those retiring.

(4) To consider, and if thought fit, to pass with or without modification, the following Resolutions:—

(a) *Special Resolution*:

"That, in pursuance of Section 360 of the Companies Act, 1956, the Company approves the agreements to be entered into between the Company and other concerns which are or may be deemed to be Associates of its Managing Agents, more particularly General Industries Corporation, the material terms whereof are as follows:

(i) The one will supply to/buy from other:—

—their products, as required by the other

—other goods and things which one can supply and the other may require.

(ii) The price of the products or other supplies will be the suppliers' ruling market price (subject to applicable discounts) at the time of supply.

(iii) Payment of price will be within one month of the receipt of goods.

(iv) The agreement will be determinable by either party at will."

Explanatory Statement under Section 173 (2):—

The Shareholders' approval is required for sale/purchase transactions between the Company and its Managing Agents/their Associates under Section 360 of the Companies Act, 1956 Messrs. General Industries Corporation are not. in the view of the Company 'Associates' of its Managing Agents, but the resolution is proposed for abundant caution. Material terms appear in the Resolution itself:

Interest of Directors

Shri Bharat Ram and Shri Shri Dhar, Directors of the Company, are Directors of Shri Ram Associates Private Ltd., a partner in General Industries Corporation. Mrs. M. G. Bhagat, a Director of the Company, and her relatives are partners in General Industries Corporation. Except as aforesaid, no other Director or Managing Agents have any interest in the Resolution.

(b) *Special Resolution*:

"That the appointment as a Director of the Company of Shri Shri Dhar, to whom Section 261 of the Companies Act, 1956 may be deemed to apply, be and is hereby approved."

Explanatory Statement under Section 173 (2):—

This Resolution is proposed as the Company is advised that provisions of Section 261 of the Companies Act, 1956 may be deemed to apply to Shri Shri Dhar, a Director of the Company. The Resolution is proposed accordingly. Requisite Special Notice has been received and is hereby given to the Shareholders and is open for inspection at the Registered Office of the Company during business hours.

(c) *Ordinary Resolution*:

"Resolved that subject to the approval of the Company Law Board, the present Managing Agents of the Company, Messrs. Bharat Ram Bhagat & Co. a firm at present consisting of Madan Mohan Lal Shri Ram Private Ltd. and M. G. Bhagat and Sons Private Ltd., two private limited Companies, be and are hereby reappointed as the Managing Agents of the Company for a term of 10 years commencing from 16th August, 1965 in terms of the draft agreement proposed to be entered into between the Company of the one part and Messrs. Bharat Ram Bhagat & Co. of the other part and placed before this Meeting and signed by the Chairman hereof for identification, with such modifications, if any, as the Company Law Board in according its approval may require and the Directors of the Company are hereby authorised to execute and complete the said agreement with such modifications."

Explanatory Statement under Section 173(2):

The term of appointment of the Managing Agents of the Company, Messrs. Bharat Ram Bhagat & Co., will expire on 15th August, 1965.

The Directors propose that they be reappointed as Managing Agents for a fresh term of ten years from 16th August, 1965.

An abstract of the proposed terms of appointment and the Memorandum as required under Section 302(3) of the Companies Act, 1956 is given hereunder. The draft agreement can be inspected at any time between 2 p.m. to 4 p.m. at the Registered Office of the Company and half an hour before the Meeting it can be inspected at the venue of the meeting.

Memorandum of Interest of Directors:

Shri Bharat Ram and Shri Shri Dhar, Directors of the Company, are Directors and members of Madan Mohan Lal Shri Ram Private Ltd., a partner in Bharat Ram Bhagat & Co. and to that extent they are interested in the reappointment of Managing Agents.

Mrs. M. G. Bhagat, a Director of the Company, is a Director and Member of M. G. Bhagat and Sons Private Ltd., a partner in Bharat Ram Bhagat & Co., and to that extent she is interested in the reappointment of the Managing Agents.

Abstract of Managing Agency Agreement:

1. The agreement is between the Company and Bharat Ram Bhagat & Co. for reappointment of the latter as Managing Agents of the Company. Messrs. Bharat Ram Bhagat & Co. is a co-partnership consisting of the following partners:—

—Madan Mohan Lal Shri Ram Private Ltd.

—M. G. Bhagat and Sons Private Ltd.

2. The Head Office of Bharat Ram Bhagat & Co. is located at DCM Premises, Bara Hindu Rao, Delhi-6.

3. Abstract of the Clauses of the Managing Agency Agreement is as follows:—

Parties: This recites the parties of the agreement.

Preamble: Recites the background of the proposed agreement.

Clause 1: Provides for reappointment of Bharat Ram Bhagat & Co. as Managing Agents for ten years from 16th August, 1965.

Clause 2: Lays down that Managing Agents shall use their best endeavours to promote the interest and business of the Company and shall not carry on competitive business.

Clause 3: Provides that subject to the control and directions of the Directors, and to the provisions of the Companies Act, the Managing Agents shall have the general conduct and management of the business and affairs of the Company and sets out specific powers to be exercised by them.

Clause 4: Provides for the custody of property, books of accounts, etc. of the Company by Managing Agents.

Clause 6: Provides that Managing Agents shall fully comply with provisions of Statutes.

Clause 7: Provides that the Company shall pay to the Managing Agents commission at 10 per cent of net profits computed in accordance with Sections 349-351 of the Companies Act, 1956 subject to the minimum remuneration of Rs. 50.000.

Clause 8: Provides for payment of Guarantee Commission to Managing Agents or their Associates for guaranteeing loans obtained by the Company.

Clause 9: Provides for facilities to the working members of Managing Agents.

Clause 10: Provides for compensation to Managing Agents if their Office is determined at any time before the expiry of the period of appointment.

Clause 11: Provides for:

—Reimbursement of expenses to Managing Agents.

—Indemnification of Managing Agents against all losses and costs suffered by them in the discharge of their duties and obligations to the Company.

Clause 12: Provides for sub-delegation of powers by the Managing Agents.

Clause 13: Provides for nomination of working members by the Managing Agents.

Clause 14: Provides for nominees of Managing Agents on the Board.

Clause 15: Provides for Managing Agents' lien on assets of the Company.

Clause 16: Provides that the agreement will be subject to tripartite agreements between the Company, the Managing Agents and the Industrial Finance Corporation of India in connection with the loans taken by the Company from the Corporation.

Clause 17: Provides for arbitration in case of disputes.

(d) *Ordinary Resolution*:

"Resolved that the Members of the Company approve of the appointment and continuation as a Director of Bengal Potteries Limited of Shri D. N. Sen who has attained the age of over 65 years, and declare that his age limit of 65 years as specified in Section 280 of the Companies Act, 1956 shall not apply to him."

Explanatory Statement under Section 173(2) *of the Companies Act,* 1956 *regarding Ordinary Resolution under Section* 281.

Special notice has been received by the Company on 1st November 1964 of this Resolution from three of its Members under the provision of Section 281 of the Companies Act, 1956.

Shri D. N. Sen will retire by rotation at the next Annual General Meeting of the Company. He has attained the age of over 65 years. If appointed Shri D. N. Sen will get remuneration from the Company as provided in its Articles of Association, and he is interested to that extent. Save as aforesaid no other Director or the Managing Agents have any concern or interest in the above resolution.

(5) To appoint Auditors for the current year and to fix their remuneration.

The Share Transfer Register of the Company will be closed from 28th November 1964 to 1st December 1964, both days inclusive.

A member entitled to attend and vote at a Meeting is entitled to appoint a proxy to attend and vote instead of himself and a proxy need not be a member.

By Order of the Board of Directors,
BHARAT RAM BHAGAT & COMPANY,
Managing Agents.

45, TANGRA ROAD, CALCUTTA,
Dated, 2nd November, 1964.

THE BRITANNIA ENGINEERING COMPANY LIMITED

ISSUE OF 9.3 PER CENT REDEEMABLE PREFERENCE SHARES

MEMBERS OF THE COMPANY ARE HEREby informed that the last date for receipt of applications in response to the Company's Offer relating to the above Share Issue has been extended up to 21st November, 1964.

3, NETAJI SUBHAS ROAD,
CALCUTTA.
6th November, 1964.

TREND OF MARKETS

BUSY SEASON SETS IN

(From Our Own Correspondent)

BOMBAY, *11th November*

The busy season has actually set in, with the formal end of the slack season on 28th October. In the first week of this month, the short-term money market experienced some stringency and the inter-bank call money rate jumped up in quick succession but, thereafter, conditions became a little easier, especially in the past two days. The initial stringency was due to pressure of demand for funds associated with *Diwali*, superimposed by the requirements for payment of annuity deposits and bonus to mill workers. This week, however, there was some improvement. Demand for credit no doubt continued to be high, but borrowers found no difficulty in meeting their needs, as adequate funds were available following the return flow of funds. Only they had to pay high rates of interests which were, of course, lower than those a week ago. The following are the rates:

(Per cent per annum)

	11th November	*A week ago*	*Two weeks ago*
Bombay:			
Renewals ...	3	4½	1
Fresh money ...	2½	4½	1
Calcutta:			
Renewals ...	5	5	1
Fresh money ...	4½	5½	½

The tight conditions of money are reflected in (*a*) the marked increase of Rs. 70.31 crores to Rs. 2,467.59 crores in notes in circulation during the week ended 6th November, (*b*) a rise of Rs. 4.20 crores to Rs. 5.88 crores in loans and advances made by the Reserve Bank to scheduled banks, and (*c*) poor response to 91-day Government of India Treasury Bills. The total amount offered against the Bills the tenders for which opened on Tuesday the 10th inst. was no more than Rs. 2.05 crores, as against the Rs. 2 crores invited and also accepted. The average rate of accepted tenders was Rs. 2.499 per cent per annum. The response to the Intermediate Treasury Bills, too, was poor, the total amount of bills actually sold from the 4th to 7th inst. being just Rs. 48.50 lakhs as against Rs. 7.02 crores a week before and Rs. 27.64 crores two weeks before.

India's foreign exchange reserves improved by Rs. 2.10 crores to Rs. 95.89 crores during the week ended 6th November. The whole of the improvement was in balances held abroad which rose from Rs. 8.33 crores to Rs. 10.43 crores. The foreign securities held in the Issue Department of the Reserve Bank, however, continued unchanged at Rs. 85.46 crores. Deposits of scheduled banks rose by Rs. 7.76 crores. At the same time, their borrowings from the Reserve Bank went up, as already stated.

The total credit made available by scheduled banks to their clients increased by Rs. 4.40 crores to Rs. 1,707.30 crores during the week ended 30th October. There was also an increase of Rs. 6.52 crores to Rs. 2,720.00 crores in deposits and so the borrowings from the Reserve Bank declined by Rs. 61.70 lakhs to Rs. 1.22 crore. Investments improved by Rs. 34.21 crores to Rs. 873.66 crores while total cost receded by Rs. 36.05 crores to Rs. 152.42 crores.

The gilt-edged market ruled dull. Business put through was restricted, with values moving narrowly.

In the foreign exchange market, the banks' buying rate for U.S. dollars rose by 25 paise to Rs. 477.50 per $100 during the week while their selling rate was unaltered at Rs 480.75. In New York the pound sterling eased *vis-a-vis* the dollar, the spot rate declining by 0.120 cent to 278.350-278.970 cents and the three months' forward by 0.160 cent to 277.710-277.730 cents.

SPURT IN SILVER

(From Our Own Correspondent)

BOMBAY, *11th November*

Silver staged a spurt during the fortnight under review due mainly to brisk demand from local and upcountry dealers. Gold, too tended to move up as demand was good. The rise would have been more marked but for increased arrivals. Over the fortnight, silver gained Rs. 4 and gold 25 paise. Operators are generally inclined to feel that the new year (*Samvat* 2021) has begun on a promising note and that prices of both silver and gold would scale fresh levels in the months to come.

Silver moved up from Rs. 253 to Rs. 260 in the *Moorat* session on 3rd November. Subsequently, however, it declined to Rs. 256 on account of lack of sustained demand at higher levels before closing at Rs. 257 today. The average arrivals and offtake of the metal were 26 and 12 bars respectively.

Fourteen-carat gold improved steadily from Rs. 66 to Rs. 67 on *Divali* day but declined later to Rs. 66.25 following steady support from the South. Pure gold was quoted at Rs. 111 on some enquiries and seizure of contraband metal. It, however, declined to Rs. 109.50 on fresh arrivals in the market. Sovereign was steady at Rs. 91.50-92.

The international price for gold in the London market, after moving up to $35.11¾, was lower at 35.09¼, as against $35.10⅛ a fortnight back. The sterling price was quoted at 252s. 1¼d., after touching 252s. 2½d. in the earlier sessions. While spot silver was unchanged at 112½d., forward silver gained ¼d. to 113¼d. Silver in New York was also unchanged at 129.3 cents.

The Punjab Government has decided to exempt displaced goldsmiths from payment of stamp duty on bonds to be executed by them for taking loans from the Government for rehabilitation purposes.

The following table shows the trend of prices during the week under review:

	11-11-64 (closing)	High	Low	28-10-64 (closing)
SILVER				
Ready (996 fine) ..	Rs. 257.00	Rs. 260.00	Rs. 253.00	Rs. 253.00
GOLD				
Ready (14-carat) ..	66.25	67.00	66.00	66.00
Sovereign	91.50*	—	—	91.50*
London—				
Gold ..	252s. 1¼d.	252s. 2½d.	252s. 1¼d.	252s. 1¼d.
Silver Ready ..	112½d.	—	—	112½d.
Silver Forward ..	113¼d.	—	—	113d.
New York—				
Silver	129.3 cents	—	—	129.3 cents

N.B.—The quotation for gold is per 10 grams (about 0.85 tola) and that for silver is per kilogram (85.73 tolas). London and New York quotations are per ounce. * Unofficial rate.

PEPPER QUIET

(Messrs. Parekh and Co.)

BOMBAY, *10th November*

Malabar pepper ruled quiet during the week, in view of the proximity of the new season. Arrivals of light berries have started coming at Alleppy. They are exerting pressure when the quality is larger than the demand. Balance of unsold old pepper in the hands of growers are estimated at about 3,000 tons. The new crop's first estimate is placed around 30,000 tons. Floating stock of old garbled pepper in the Cochin market being in strong hands, the market is resisting downgrade revision of prices at every new low level. Such a state of affairs is likely to continue for some time to come until the sizable arrivals of matured pepper. Some of the exporters are reported to be offering to New York on views Malabar black for December-January shipment at $0.36 for testing U.S.A. market even without margin or with small loss.

Indonesia's latest check price for Lampong is reported to be $0.40. The report that Lampong is being offered in New York at $0.33 seems to be without foundation. Singapore is steady at $(M)122½. New arrivals of Lampong in Singapore is few and far between because the Malaysian Government are alert against the smuggling of arms under the cover of commodities. Ready and garbled at Cochin are quoted at Rs. 332 and garbled at Rs. 344. *Posh* delivery in Bombay is quoted at Rs. 352, after touching the highest at Rs. 370. *Maha*, after establishing a high level of Rs. 374, came down to Rs. 356 under pressure of selling by exporters who feel that, with the advance of the seasonal arrivals, the prices will go down, as importing countries are sitting on the fence. December delivery at Cochin is quoted at Rs. 338, the highest being Rs. 352.

Situation in Malaysia and South Vietnam is a restraining factor against bear selling. Ready ungarbled in local market is quoted at Rs. 180 per 50 kilos.

COTTON FUTURES FIRM

(From Our Own Correspondent)

BOMBAY, *11th November*

Sustained short-covering and some speculative buying induced by reports of inclement weather in Khandesh and certain parts of Punjab and the consequent fear of damage to crops in these tracts, helped the cotton futures contract to firm up to new highs, since the commencement of the current season. This is the outstanding feature of the cotton market since we reviewed it in these columns a fortnight ago.

In the initial days of this fortnight, the market ruled easier because of nervous selling induced by apprehensions of stricter measures by the Government to curb the rising level of commodity prices. Operators thought that any step to bring down price levels in the country would affect cotton, too, as it was an essential commodity. This fear soon faded as no action was taken apart from an Ordinance to tackle the foodgrains dealers. A steadier feeling returned which was quickly followed by a distinctly firm trend engendered by adverse weather reports. The *Moorat* session was somewhat listless as the turnover at 9,000 bales was much less than expected. But the buoyancy in the futures section continued unabated in the post-*Divali* sessions with the Contract daily touching a new peak. Today, however, the futures closed below the best, because of profit-taking by bulls at higher levels.

I.C.C. Jarilla March 1965 which opened the fortnight on 29th October at Rs. 741.25 per candy, as against the closing price of Rs. 740.50 on 28th October declined to Rs. 738 on the second day itself. After touching its highest level so far at Rs. 757.75 on the last day of the fortnight closed at Rs. 756, thus gaining Rs. 15.50 during the fortnight. It may be recalled that the Contract had started its career on the 30th July last at Rs. 727.

As regards the *Moorat* session on the 3rd inst. it may be mentioned here for the purposes of record, the Contract opened the session Rs. 2 higher at Rs. 746.50 but moved within a narrow range. After touching a high of Rs. 747.50 on that day, it closed the session at Rs. 746.25.

Good demand featured the trading in spot market at Sewri. Prices of all the popular varieties showed a preceptible rise during the fortnight under review. Spinners, who were hesitant for some time, entered the market and booked moderate quantities of new crop varieties. The prices of staple varieties, like Co2 L147 and Digvijay, progressively hardened. Reported damage to crops provided a fillip to demand. The ruling prices it may be noted in passing, are Rs. 50 to Rs. 75 higher than those which prevailed this time last year. The following are the latest available quotations (per candy) for some of the popular varieties:

Amravati Old Rs. 1,175; Anjangaon L147 New Rs. 1,270; Bailhongel CO2 Rs. 1 141; Bengal fine Rs. 788; Digvijay New Rs. 1,215; Dhulia Rs. 1 400; Hubli Laxmi Rs. 1,100; Kalyan New Rs. 991; Pachora New Rs. 1 135; Pandharpur New Rs. 1,080; Shahda Old Rs. 955; Talera AK 235 Rs. 1,151; Yeotmal L147 New Rs. 1,181.

Among short-staples, Bengal *Deshi* has swiftly moved upwards during the last two weeks following hectic short buying. The increase in demand is attributed mainly to the expectations of a smaller crop; the latest estimate is 375,000 bales as against the earlier expectation of 550.000 bales. The rate for the December delivery contract touched a high level of Rs. 791 per candy on the 9th inst., as against Rs. 758 on 28th October 1964. But towards the close of the fortnight, it eased to Rs. 787-788. The January 1965 contract is quoted at a discount of Rs. 8. The export registrations for the December contract stood around 73,000 bales, as against 72,000 bales two weeks ago. Among foreign cottons, interest was evinced only in the African varieties. Mills have been showing keen interest in new crop Sudan cotton, as, following a good crop, offers from shippers are said to be quite easy.

According to the latest statistics available, imports of foreign cotton into India during the months of September and October 1964 were about 215.000 bales as against 91.500 bales (of 180 kgs.) during the corresponding period last year. Of this American cotton accounted for 82 per cent, followed by Sudan 6 per cent, U.A.R. 4.5 per cent, East African 4 per cent and other countries 3.5 per cent.

Reports from Karachi say that cotton production in Pakistan in 1964-65 season will hit an all-time high of 2.6 million bales (of 400 lbs. each), as compared with 2.3 million bales in the last season and 1.7 to 1.8 million bales in 1961-62. The increase in production is attributed to the introduction of better-yield varieties, improved agricultural and irrigation practices, extensive plant protection measures, and larger use of fertilisers.

ART SILK YARN EASIER

(From Our Own Correspondent)

BOMBAY, *11th November*

In the absence of any fresh development during the fortnight under review the yarn market ruled dull and easy. The *Moorat* session on Tuesday the 3rd inst. was an extremely dull affair. Indeed, practically the entire ring was deserted in the mid-session. A leading spinner did not open the *Moorat* deals at all. The total turnover was not more than 1,200 cases. Art silk yarns lost further ground during the fortnight, thanks to reduced demand from consuming centres. Even at low levels, support was lacking. Staple fibre future moved narrowly owing to lack of interest on the part of either buyers or sellers. Spot staple fibre yarns were easy on prospects of some supply from local mills and poor inquiries from consuming centres. Cotton yarns continued to be dull.

Export of rayon and synthetic fabrics during the month of October 1964 were lower at 4.49 million metres valued at Rs. 47.19 lakhs, as against 6.50 million metres valued at Rs. 71.85 lakhs in the previous month and 7.05 million metres worth Rs. 70.13 lakhs in October 1963. The average price realised per metre was also lower at Re. 1.07, as compared with Re. 1.10 in the previous month.

Among art silk yarns, National Rayon 150D fell by 20 P to Rs. 9.28. 120D receded by 13 P to Rs. 9.90. Bright Century 105D dropped 20 P to Rs. 12.10. South India Viscose 120D and Bright Century 75D were dull, the former at Rs. 12.36 and the latter at Rs. 17.60.

In the staple fibre yarn section, the 2 x 34 January 1965 contract began the week at Rs. 851 per quintals; the closing rate on the *Moorat* trading was Rs. 851.25. It rose to Rs. 853 on Monday but declined subsequently and closed at Rs. 850 today. Spot Sitalaxmi shed 4 P to Rs. 9.39. Madhav eased by 7 P to Rs. 9.28. Venkatesh slipped by 6 P to Rs. 8.99. Sriram and Premier were unchanged at Rs. 9.06 and Rs. 9.61, respectively.

Cotton yarn 50s Minerva lost Rs. 2 to Rs. 58. 52s Finlay eased by 50 P to Rs. 80.50. All other counts were quoted at last week levels.

The following table gives the prices of rayon staple fibre and cotton yarns, today, as compared with those prevailing a week ago:

	11-11-1964	3-11-1964
	Rs.	Rs.
Art silk yarn (per kg.)—		
National Rayon 120D	9 90	10 03
Century 75D	17 60	17 60
S. I. Viscose 120D	12.36	12.36
Staple fibre yarn (2 x 34 NF) January 1965 (per quintal)	850.00	851.25
Spot (per kg.)		
Vasanta	—	9.06
Premier	9 61	9 61
City	9.42	9.42
Cotton yarn - French Count (Rs. per 5 kg.)		
8s Podar	21 50	21 50
17s Modern	27 00	27.00
22s Madura	32 00	32 00
34s Textt	40 50	40 50
52s Pioneer	58.75	58.75
68s Finlay	102.00	103 50

KIPS DULL

(From Our Own Correspondent)

MADRAS, *9th November*

Madras kip market was lifeless. Arrivals of stocks from the tanneries have been delayed by the rains. U.K. buyers have been quoting low prices to sound the attitude of the shippers in order to see how far the sellers will meet the 15 per cent surcharge on imports into the U.K. It has been reported that a few transactions have been closed at 2d. to 3d. per lb. lower than the rates ruling last month. In view of the export

incentives offered to the U.K. exporters, it is believed that the relative buyers will be in the market again shortly.

Inquiries for tanned goat skins were free from the Continental buyers, with emphasis on medium weights. Prices remained steady. The market for prime and semi-prime sheep skins was dull, but for the middle class light-weight lower ends which was firm, and sellers were not keen to book further orders, in view of the arrivals being of heavier average.

Shipments during the month of October were as follows:—1,647 bales tanned cow hides, 190 cow calf, 5 buff hides, 204 buff calf, 402 goat, and 268 sheep skins to the U.K. ports; 1 bale cow calf, 869 goat, 314 sheep and 938 cases chrome and pickled goat skins to the Continent; 27 buff hides, 41 buff calf, 360 goat and 154 cases chrome and pickled goat to the U.S.A.; 10 goat and 194 sheep skins to Japan.

OILSEEDS ADVANCE

(From Our Own Correspondent)

BOMBAY, 11*th November*

From the pattern of trading during the week, it appeared that oilseeds had seen their worst and that they were well on their way to recovery. Bulls had the upper hand and prices staged a sharp recovery on short-covering and renewed support. It might be asked as to how, against the background of a ban on the export of edible oils from the country and reports of a bumper harvest in groundnuts, the market could be so buoyant. The answer does not seem difficult. As mentioned in this report some time ago, prices of oils and oilseeds had suffered such a sharp reaction that a recovery was due and necessary at least on technical considerations. Further, the fact that oil prices had touched as high as Rs. 3,400 a tonne is still fresh in the minds of market men and the setback to the Rs. 2,000-level obviously attracted support. The gap was rather wide and as such there was considerable scope for its being narrowed down.

The decision of the Gujarat Government to remove the ban on exports from the State of groundnuts and groundnut oil was welcomed, although market circles had no doubt in their minds that, sooner or later, the State Government would have to reverse its decision. To a large extent the news had been discounted by the time the statement of Mr. Balwantrai Mehta appeared in the press. Market circles were wondering whether the State Government would not impose price restrictions which were withdrawn some time ago, but this had not been done until the time of writing. However, it appears that the State Government proposes to control exports by means of permits and reliable sources have it that district collectors have been asked to issue permits for November on the basis of individual performance during the same month of last year.

Apparently, the promulgation of an ordinance providing for the punishment of food offenders on the basis of summary trial has failed to strike terror in the minds of oil interests. The talk—and it is a very light talk—is that, so long as prices are not pegged at certain levels, the question of profiteering does not arise. At any rate one can talk of profiteering only if oil crosses the Rs. 3,300-level which was actually the figure from which the market began to react. And, therefore, bull operators are emboldened to take the market up. During the week, the Groundnuts March contract touched Rs. 98.15. Knowledgeable sources think that, once the contract crosses the Rs. 100-mark—at this level, margins come into force—one could expect the market to forge ahead. There is also a vague feeling that the Union Government might lift the ban on exports from the country. But this is rather a hazardous guess.

The extractions market is well maintained. The rates at the time of writing are: November Rs. 418-Rs. 420, December Rs. 405, January Rs. 400 and January-February-March Rs. 395. Sentiment in the market is induced by reports that the United Kingdom, Continent and the East European markets are together committed to buy about 275,000 tons of new crop oil for shipments during November, December and January, leaving little for sale. Moreover, the ban by Uttar Pradesh continues and it is said that solvent extraction plants are finding it difficult to find cakes for feeding their mills. This is apparently behind the strength in extractions and the talk is that distant positions might improve by Rs. 15 to Rs. 20 before long. United Kingdom advices indicate £38-5 for November, £37-10 for December, £36-10 for January and £36 for January-March. The oil market is also well maintained with spot oil at Rs. 24. November at Rs. 20, December at Rs. 19.70 and January at Rs. 19.80.

Castor has been extremely firm but the trend here is induced mainly by groundnuts. There are no factors as such in this section, for the castor crop is still a long way off and the crop is expected to be just about normal. The March contract was bid up to Rs. 184.62, the highest in recent days, but closed a shade lower at Rs. 184.50. Export prospects for castor have never been good, particularly with too many rivals about in world markets, but stocks here are not comfortable either. It would be rather difficult to guess the outlook for castor on its own merits at least now. Perhaps it will be content to be led by groundnuts. The Delhi and Punjab operators who are supporting the market will have a big say in its future. The trend in linseeds is more or less identical with that of castor. There are no exports of oil and the market is content with being led by linseeds. The rapessed harvest will certainly have a say in the outlook for linseeds, but, as sowings have just begun, it would be too early yet to talk in terms of the harvest. The March contract was quoted at Rs. 41.94 at the time of writing.

Cottonseeds were also firm and the price of Rs. 111 touched on Monday was not only the highest for the week under review but a record high. As has been pointed out many a time here, the trend is induced by the firmness of cotton which, in turn, has maintained a firm tone due to factors such as damage to crop in certain tracts and the feeling that imports might not after all be as easy as they have been until now. Otherwise, the crushing industry is worried over the ban on the use of solvent extracted cottonseed oil in the manufacture of *vanaspati*. The industry had made a representation pleading for the removal of the ban as well as for exemption from excise duty of soaps manufactured from cottonseed oil in order to stimulate demand for the oil. One does not yet know the reaction of the Government to this plea.

The following table shows the closing prices of oilseeds and oils as on 11th November as compared with those on 21st and 28th October:

	11-11-1964	28-10-1964	21-10-1964
Groundnuts	Rs.	Rs	Rs.
January 1965 contract	98.15	94.40	95.20
Oil January 1965	N.T.	N.T.	N.T.
Khandesh quality	120 00	97.00	106.00
Oil ex-mill	24.00	21.00	24.50
Oil Rly. Receipt	23.00	20.50	23.75
Castorseed			d
March 1965	184.50	182.00	182.87
Ready Madras	83.50	83.00	83.50
Ready Kanpur	81.50	81.00	81.25
Oil B.S.S.	18.55	18.60	18.70
Oil commercial	17.85	17.70	17.80
Linseed			
March 1965..	41.94	39.69	39.84
Bold ready	101.00	95.50	96.00
Linseed oil	21.50	20.15	20.80
Cottonseed			
January 1965 contract	109.50	104.25	102.00

N.B.—The quotation for groundnuts January 1965 contract is for 100 kg. The rates for spot groundnut and castor are for 100 kg. Castor and cottonseeds futures are quoted per 250 kg. while linseeds futures are quoted per 50 kg. Groundnut Oil January 1965 and all spot oils are quoted per 10 kg.

JUTE MILL WORKERS' AGITATION

(From Our Own Correspondent)

CALCUTTA, 10*th November*

Steady conditions were in evidence in both jute goods and fibre markets during the week under review. While the possibility of the British Government agreeing to exempt jute goods from the general import duty of 15 per cent imposed recently has been hopefully noted, the unrest among jute mill workers in and around Calcutta over the demand for payment of bonus in accordance with the Bonus Commission's recommendations has caused anxiety. India has pointed out to Great Britain that, if an import duty of 15 per cent were levied, jute goods imports into the U.K. would be subjected to double duty. For, with a 10 per cent levy on imports, already the Dundee mills are protected against cheaper-priced goods. If the 15 per cent duty on jute goods were maintained, Britain's own manufacturing industry would be hit. For carpet manufacturers in Britain depend on imported yarn to meet most of their requirements. At the same time, it is difficult for Dundee mills to increase production; their order books are full and the Dundee industry is faced with a shortage of skilled workers. In other words, Britain would have to continue the present level of imports of jute goods, although, with increased prices in view of the new import duty, if maintained, substitutes would get an impetus. The progress of substitutes in the U.S. has been aided by increased domestic consumption, and the U.S. manufacturers of substitutes would not let the opportunity of exporting to the U.K. to go.

The demand of jute mill workers for payment of annual bonus on the basis of the Bonus Commission's recommendations in place of the Wage Board's award is affecting operations in mills. The National Union of Jute Workers, affiliated to the I.N.T.U.C., has already taken a decision to stage a day's strike soon. Already with the disparity in prices of goods and fibre and the increase in cost of production, the profit margin of mills has been considerably affected. A tonne of heavy goods is capable of making a profit of only Rs. 100 and a tonne of hessian only Rs. 35. If labour charges as a result of the present agitation of workers were to increase, prices to consumers would naturally go up. That any fluctuation in prices should be avoided is clear from the warning spelt out in a recent F.A.O. study on trends and prospects for jute goods in the world market. For the study, after analysing production and consumption trends in recent years, concludes that the expansion of jute goods market would depend on the maintenance of stability of price and supplies. In this context, it has been unfortunate that prices of jute goods have been subject to wide fluctuations already in this year and if, as a result of the unrest among jute mill workers, prices of goods were to increase, that would be considered very unfortunate. When mills implemented the Jute Board's award, they had fondly hoped for employer-employee peace at east in respect of the period the award was specifically related.

While the F.A.O.'s study view that the world demand for jute goods, especially in the developing countries, is likely to rise steadily up to 1970, having regard to the rising output of goodgrains, fertilisers and cement, has caused satisfaction to the trade and industry against the background of increased production and export targets fixed in the fourth Plan, significant note should be taken of the considerable increases in jute growing and jute manufacturing now taking place in the Far East and Africa. With the emergence of Pakistan as the largest fibre exporter by choice since 1947, when India was compelled quickly to formulate and implement self-sufficiency plans for fibre as a result of the unfriendly pricing policies pursued by Pakistan, many countries have also emerged as jute goods manufacturers. While, therefore, both India and Pakistan plan to increase their output, Formosa, China, the U.S.S.R., Burma, Thailand, Brazil and the U.A.R. would also increase their output. Although output of these countries is not likely to figure in exports, it is realised that their dependence on India and Pakistan for supplies of jute goods would diminish. While the offtake of these countries of jute goods from India is not expected to decline, it is likely that Indian goods would derive little or no benefit from expanded needs of packaging requirements in the low-income or developing countries, which have set up jute mills.

The fact that the Indo-Pakistan share in world output of jute goods declined from 92 per cent in 1946-51 to 53 per cent in 1962-63 emphasises how far other countries have put to good use Indo-Pakistan trade discords. When Pakistan was inaugurated, that country desired to exploit India's dependence on Pakistani fibre. Such short-sighted policy, although it paid good dividend for Pakistan for a time, has now resulted in permanent harm to the jute industry of the sub-continent. In the same breath, Pakistan is now offering unfair competition against India in the export of heavy goods. Mills in India have been pressing the Government of India for similar advantages to them in an attempt to regain overseas markets for heavy goods lost by India. The Government of India, however, has so far refrained from taking any steps in retaliation in haste, as that would only mean taking the war of unfair competition a stage further. It is in the abiding interests of the sub-continental jute industry that Pakistan stops from continuing to offer unfair competition against India in overseas markets for goods. A conference between the representatives of India and Pakistan has been often suggested by the trade interests here. As a preliminary, the representatives of the industry in India and Pakistan should meet, it is felt.

Fibre prices were maintained during the week under review, with the latest quotations being: Assam bottoms Rs. 37.50; northern bottoms Rs. 36.50; and daissee bottoms Rs. 38.00. For some weeks now, prices have been maintained at these levels which, as pointed out earlier, admit of little profit to mills in simultaneous business in fibre and goods. The latest *Bulletin* of the Indian Central Jute Committee attributes the strength of the fibre market "partly to the snow-balling effect of a buoyant gunny market and partly to mill buying under maximum quotas." There is the apprehension of supply this year having fallen below last year's level.

In the goods section, sackings were steadier. In view of the marked decline in the profitability of hessian, mills are inclined to transfer more looms to sacking and, as a result of the loss of production in Pakistan mills, it is expected that more orders from overseas countries for heavy goods would be received in India. Last week's order from Burma for a substantial quantity of sacking would not have been entirely placed on India had it not been for the difficulties being encountered in Pakistan mills. It is unfortunate that labour unrest in India has also lately been affecting mills' output. Considering that the U.S. had up to now bought only in driblets, it was expected that U.S. interest would begin to be shown for larger quantities. Such an expectation was encouraged by the somewhat steadier trend in the New York burlap market where in the week under review hessian 40" 7½ oz. rose from 9.65 cents a yard to 9.75 cents and 40" 10 oz. hessian from 12.65 cents a yard to 12.75 cents. On Wednesday last in Calcutta, ready hessian 40" 10 oz. and B. twills were nominally steady at Rs. 50.25 and Rs. 152.50, respectively. The feature on the following day was the jump in B. twills to Rs. 155.50, as a result of keen activity in the hedge market. However, hessian 40" 10 oz. was quiet at Rs. 50.05. On Friday, the quotations were Rs. 155.25 and Rs. 50.25. Over the week-end an easier trend saw the rates decline to Rs. 154.25 and Rs. 49.95, respectively. Steadiness revived yesterday to take up B. tills to Rs. 156.00 and hessian 40" 10 oz. to Rs. 50.05.

GOOD DEMAND FOR COPPER

(From Our Own Correspondent)

CALCUTTA, 10*th November*

With no sign of an easing of shortage, the non-ferrous metals market in Calcutta displayed buoyant conditions during the week under review. With the pronounced victory of the Democratic Party and the retention of the presidentship by Mr. Johnson and the voting to the vice-presidency of Mr. Hubert Humphrey, both of whom are credited to hold liberal views, the trade has here expressed the hope for a possible increase in the U.S. aid and larger provision for import of non-ferrous metals from the U.S.A. It should be noted that if the United States so desires, it can relieve the shortage in India by allocating copper, tin, lead and zinc from surplus stocks. Unless world production of the principal metal increased in tune with the sharp rise in world demand as evidenced since the beginning of this year, prices are not expected to move down. In this context, it has been reported that massive investments have been planned by the Cerro Corporation in an attempt to raise Chilean copper output substantially. The optimistic view of Mr. Jean Vuillequez, President of Ametalco, Inc., that he expected copper production in 1965 to be adequate to meet demand and to allow some replenishment of depleted inventories of producers and consumers has been hopefully noted. It is also some satisfaction to find that the International Study Group of Lead and Zinc has felt that output of these two metals would be adequate by 1967.

The feature on the London Stock Exchange during the week under review has been the decline in spot tin from £1,625-1,630 to £1,470-1,475. The decline followed the news of plans by the U.S. General Services Administration to release 18,000 tons of tin more before March next. This, together with the releases already done, namely, 14,000 tons, would bring total releases for the twelve months to March next to 32,000 tons. Against the background of the estimate, according to which the world gap between production and consumption is placed at 30,000 tons a year, it is seen that U.S. releases would completely bridge the gap. It has not been surprising that Bolivia has protested against the plan of the U.S. G.S.A. on the plea that these releases would artificially depress quotations for tin in world markets. Dissatisfaction in Thailand and Malaysia has also been expressed. With the price advance, it is natural that consumers should increase their inventories to the extent possible; this factor is also one of the causes for the steep rise in the price of tin as indeed of prices of other metals in the principal world markets. Recently, there had been reports that the U.S.S.R. has increased its offtake of tin from world markets, but it now appears that total Russian purchases of tin in this year would not exceed 3,000 tons. Tin in Calcutta was firm at Rs. 3,350 per 100 kgs. although at the higher level consumer demand was poor.

On the L.M.E., spot copper wire-bars opened at £515-518 and after declining to £512-515 rose initially to £528-530 before closing at £520-522. Spot cathodes closed higher on balance at £475-485 after opening at £470-480 and being earlier lower at £455-465. Impetus for the rise was provided by the report that the Kennecott Corporation had invoked the *force majeure* clause for some of the contracts for shipments up to January. The fall in the level of stocks in the face of intense outside demand also aided the uptrend. Earlier, it had been reported that the Phelps Dodge Corporation decided to cut down its copper shipments by 25 per cent in view of the need to adjust its order pattern to the available supply. Anaconda announced the rise by 1 cent to 35 cents a lb. in the price of Chilean copper exported to the U.S.A. In Calcutta, utensil copper scrap, caught in an acute scarcity, touched a new high at Rs. 700 a quintal.

The rapid deterioration in the supply position of both zinc and lead in Calcutta was reflected in their rise to Rs. 470 and Rs. 345 respectively from Rs. 438 and Rs. 325 per 100 kgs. Spot lead on the L.M.E. opened at £122½-123½ and closed slightly higher on balance at £123-123½. On the other hand, spot zinc closed lower on balance at £119½-120 after opening at £122-123.

FOODGRAINS SUBDUED

(From Our Own Correspondent)

HAPUR, 9*th November*

Foodgrain prices drifted lower in Hapur during the week because of the release of frozen maize stocks for sale in open market at rates fixed by U.P. Government. The step resulted in a fall in maize prices. Barring scattered areas which were badly waterlogged, *rabi* sowings were now nearing completion and thanks to good moisture in the soil, first report received indicate that germination has been very satisfactory.

Wheat prices were subdued on poor buying support and eased by Re. 1.50 to Rs. 2.50 per 40 kilogrammes, according to quality. Average quality was now quoted between Rs. 34 and Rs. 35 and best quality between Rs. 35.50 and Rs. 37 per 40 kilogrammes. Arrivals however were nominal and demand for seed was being met through wheat imported from Punjab. Rice prices also continued subdued and declined further by Rs. 3 to Rs. 5 per 40 kgs. as arrivals were better and stocks were increasing. Week-end prices were:—Rice *basmati* superior Rs. 42 to Rs. 44, *sela* Rs. 40, *mainpuri* Rs. 31.50, *ramajwayan* and *raimunia* Rs. 33 and *gadda* Rs. 27 to Rs. 28 per 40 kilogrammes.

Following the fixation of imported maize prices at Rs. 44.50 per quintal by the district authorities, maize prices in open market sagged here by Rs. 3 to Rs. 5. Demand was brisk and stocks declined to 8,000 quintals. Prices were quoted between Rs. 17 and Rs. 20 per 40 kgs. Gram prices also eased by Rs. 2.50 per 40 kgs., to be quoted now between Rs. 34.50 and Rs. 35.50. Barley and *bejhar* prices ruled quiet at the week-end after ruling firm in the early part of the week, and ranged between Rs. 28 and Rs. 28.50 for barley and Rs. 28 and Rs. 28.50 per 40 kilogrammes for *bejhar*. *Juwar* and *guwar* prices subdued in sympathy with other grains. Other coarse grains were listless. Week-end prices were:—*Juwar* Rs. 21 to Rs. 23, *guwar* Rs. 20 to Rs. 21, *methi* Rs. 24, *bajra* Rs. 24 to Rs. 24.50, and oats Rs. 29 per 40 kilogrammes.

Steadier conditions prevailed in the pulses market during the week due to tight supply position. Peas prices rose by Re. 1 per 40 kilogrammes on good demand. The commodity was quoted between Rs. 31 and Rs. 32 for *dara* and between Rs. 32.50 and Rs. 33.50 per 40 kgs. for farm variety. *Arhar* and its *dal* were also steadier, as stocks were nominal.

MEDIUM TEAS STRONG

[Messrs. Forbes, Ewart and Figgis (Private) Ltd.]

COCHIN, 5*th November*

Approximately 750,000 kgs. were offered in tea sale No. 43 held here on Monday the 2nd inst. Quality from all elevations was generally well maintained. There was less general demand than in the previous sale. Even so, offerings were well supported at firm rates. Highgrown brokens and fannings evoked less widespread enquiry following quality and were sold at generally lower levels. There was strong demand for good medium brokens and fannings and they were sold well at firm to dearer rates. Medium and low medium teas were well absorbed at fully firm rates. Plainest and black leaf descriptions were readily sold at around last prices. Whole leaf grades were irregular and were often discounted, with the exception of liquoring flowery pekoes which were firm. The few tippy teas on offer were sold well. Teas of unorthodox descriptions were well sought after, but often were sold at lower rates.

Quotations (per kg.) were:

	1964	1963
	Rs.	Rs.
Low mediums	4.20-4.80	4.20-4.65
Mediums	4.80-5.20	4.70-5.00
Good mediums	5.20-5.85	5.10-5.60
Nilgiri B.O.P.	5.00-6.40	4.80-7.70

The average price realised in sale No. 43 was Rs. 4.84 per kilo, as against Rs. 4.86 a week ago and Rs. 4.71 in the corresponding sale last year.

A total of 401,000 kgs. came under the hammer in dust sale No. 43 held here today. There was good but selective demand. Nilgiri dusts encountered less support, prices eased and they were often neglected. Good mediums were strong and were taken up at fully firm rates. There was good enquiry for mediums and low mediums at generally slightly lower rates, with the exception of Wynaad types which were usually a little dearer. The better unorthodox description again depreciated in value, while the lesser varieties were disposed of at firm rates. Residuals and milled sorts were strongly competed for and prices were irregular, but generally considerably dearer. Black leaf descriptions were sold at fully firm rates.

The average price realised in dust sale No. 43 was Rs. 4.43 a kilo, as against Rs. 4.52 a week ago and Rs. 4.43 in the corresponding sale last year.

SUGAR QUIET

(From Our Own Correspondent)

HAPUR, 9*th November*

Sugar turned quiet during the week in the open market as *Diwali* demand subsided. Some factories in west U.P. have already begun crushing operations and the rest would commence very shortly. Despite record cane crop, there were fears that sugar output this year may not be far in excess of the modest produce last season. Sugar stocks with the mills are reported to have exhausted and releases in the second half of November would be made from whatever is produced in first half. The cane crop is expected to be 10 per cent more than the last best crop of 1960-61. Competition from the *gur* industry is keener as there is no likelihood of imposition of any restrictions on the *gur* in the mill areas. The Government is reported to have turned down the industry's plea for partial decontrol of sugar. Sugar in the open market was quoted at Rs. 180 per quintal as against the controlled price of Rs. 140.

Downward trend persisted in the *khandsari* prices during the week as *Diwali* demand subsided and stockists were anxious sellers. Prices of the commodity eased by Rs. 2 to Rs. 5 per quintal in unofficial trading and ranged between Rs. 120 and Rs. 152.50 per quintal according to quality. The U.P. Government has relaxed the time restrictions imposed on power crushers last year but they have been permitted to commence crushing from 7th December. The trade has represented to the Union and State Governments either to withdraw the restrictions imposed on the inter-State movement of the commodity or to allow export against permits freely to the deficit areas.

Ready *gur* prices recorded a sagging trend under pressure of arrivals which were mounting as *rabi* sowings were nearing completion. Arrivals here averaged 4,000 to 5,000 maunds daily; in the mofussil markets it was roughly around 12,000 maunds daily, but as demand continued from the consuming areas of the South, entire arrivals were being readily lifted. *Balti* quality, however, being in better demand from Gujarat and Saurashtra side, was being quoted Rs. 2 per 40 kilogram higher than the *pansera* variety. Week-end prices (per 40 kilograms) were:—*pansera* superior Rs. 34, average Rs. 32, *balti* Rs. 36, *shakker* Rs. 36 to Rs. 39.

TEA ARRIVALS INCREASE

(From Our Own Correspondent)

CALCUTTA, 10*th November*

With the continuation of good weather since about a month now, tea arrivals have progressively increased. Although shipments are also heavy, the difficulties in the Calcutta port, which cause detention of a large number of vessels at the Sandheads awaiting entry into the river, are depriving tea of the space it demands. Shipments to the U.K. were heavy during the week, and an indication of recent heavy bookings in U.K.-bound vessels is the increase in the U.K. tea stocks in the week ended 30th October to 98.36 million lbs. from 97.24 million lbs. in the previous week. Exports to the U.K. from 1st July to 15th October amounted to 49,593,732 kgs., showing an increase of 3,367,249 kgs. as compared to the corresponding period of last year. Total exports in the same period have been 70 million kgs. as against 64.65 million kgs. It is thus encouraging to note that the increased crop is being reflected in increased exports. However, despite increased costs, prices realised have not risen.

LABOUR

(Concluded from page 844)

the third were those relating to bonus. Details are shown in Table C. It will be seen from this table that, in 1962, bonus, as the bone of contention, was responsible for the largest number of mandays lost, though it ranked second on the basis of number of workers affected. It will also be noted that about one-third of the total disputes are grouped together as 'others' for which the precise reasons are not known. The frictions among the rival trade unions have now become quite common and a large number of the disputes is attributed to them. These may take various shapes and may be covered under the different causes given in the table. It will be quite useful if separate figures are made available regarding such disputes, so that the people may know the loss to the economy due to such spurious activities of trade unions.

It is heartening to find that employers are becoming more and more conscious of their responsibilities towards the workers. An idea of this improvement can be had from the fact that the number of disputes due to non-implementation of labour enactments, awards and agreements came down from 229 in 1962 to only 69 in 1963. The number of workers involved in such disputes declined from 78,000 to 13,000 and mandays lost from 541,000 to 177,000.

The number of disputes settled in 1963 aggregated 1,422. Of these, 610 or 43 per cent were settled through Government intervention, 287 or 20 per cent by mutual understanding and 453 or 32 per cent by voluntary resumption. The corresponding figures for the previous year were 42 per cent, 24 per cent and 27 per cent, respectively. Of the total number of disputes terminated in 1963, the number of successful or partially successful disputes aggregated 578 or 40 per cent of the total. Of these, 61 per cent were settled by Government intervention, 31 per cent by mutual adjustment and 6 per cent by voluntary resumption. So the Government continues to play a dominant role in resolving the quarrels between capital and labour. The decline in the percentage of disputes settled through mutual negotiations (collective bargaining) is rather unfortunate.

An analysis of the disputes by the affiliation of workers' unions to the central organisations of workers, showed that 36 per cent of the disputes and 56 per cent of workers involved were accounted for by the Congress-controlled Indian National Trade Union Congress (I.N.T.U.C.). The respective figures were 35 per cent and 21 per cent for the Communist-controlled All-India Trade Union Congress (A.I.T.U.C.) and 15 per cent and 10 per cent for the Socialist *Hind Mazdoor Sabha* (H.M.S.). In 1962, however, the I.N.T.U.C. was the second with 29 per cent of disputes, though in the case of workers involved it was on top with 31 per cent. The corresponding figures were 39 per cent and 28 per cent for A.I.T.U.C. and 13 per cent and 8 per cent for H.M.S.

Although the loss of production due to labour disputes was reduced substantially in 1963, it was still substantial, being in the neighbourhood of Rs. 10 crores, which is a luxury for a country like India. If the country is to rid itself of its proverbial poverty, it will have to shed off work stoppages. But, as pointed out by Mr. D. Sanjivayya, Union Minister of Labour and Employment, in his inaugural address to the seminar on industrial relations held at Guntur on the 7th instant, "No system, however elaborately worked out, can hope to take care of all the elements that determine the state of industrial relations. What a good industrial relations system can, at best, seem to achieve is to minimise possibilities of conflicts; and when conflicts do arise, provide for their smooth and speedy settlement." The steps taken by the Government in this respect, especially the establishment of tripartite wage boards, are commendable and may prove more rewarding in due course.

The International Sugar Council, at its 18th session held in London on the 5th inst., estimated the next (1965) year's minimum net import requirements of the free market at 11.69 million metric tons and those of the U.S. from foreign sources at 3.07 million tons. The Council felt that the total supplies available would be in excess of the estimated requirements.

William Blake.

VOL. CIX. No. 2796 BOMBAY, 21st NOVEMBER 1964 PRICE Rs. 2

MODERNISATION OF RAILWAY TRACTION

STEAM traction on the railways is rapidly becoming obsolete in the advanced countries of the world. It is so because steam traction, as compared with diesel or electric traction, has certain drawbacks and limitations—namely, low hauling capacity, limited speed, use of steam even when the train is not running, longer time taken for acceleration and deceleration, and the inevitable smoke resulting from the burning of coal. In the United Kingdom, for instance, it is being eliminated by diesel traction as quickly as economic and other factors allow. More than 80 per cent of Soviet railways, it is claimed, have by now been switched over to progressive forms of traction—electric and diesel. It is the same story in the United States, Germany and other Western countries, where steam locomotives have become a rarity. This unmistakable dieselisation (and electrification) trend is an index of modernisation of railways in these countries. The beginning that India has lately made in diesel traction, albeit in a small way, is thus in keeping with the modern trend. It will be recalled, in this connection, that, till the beginning of the second Plan, the use of diesel locomotives on the Indian railways was mainly confined to shunting services. During that Plan, main line diesel traction for through freight services was introduced as a prelude to electrification of the congested routes of the coal and steel belts in the eastern regions of the country. It was with the help of 100 main line diesel locomotives (out of the total of 146 broad-gauge diesel locomotives that were in operation by the end of the second Plan) that heavier trains loaded with coal and raw materials for steel plants were being moved more easily. During the current Plan, the dieselisation programme has made further headway, for there are at present 350 diesel locomotives (besides 220 electric locomotives) on the Indian railways.

But it must not be overlooked that this progress is relatively very modest, for the railways in this country continue to be heavily dependent on steam locomotives, of which there are as many as 10,600 at present. By the end of the third Plan, however, there will be more than 600 diesel locomotives, while, by the end of the fourth Plan, according to a tentative estimate, 1,200 of such locomotives will be in operation. At this rate of quinquennial addition to the stock of diesel locomotives, it may take upto eight or ten decades for the Indian railways to eliminate steam traction completely. Obviously the railway system cannot afford to be so dreadfully slow in modernising itself. It is, therefore, gratifying to hear that the Railway Board has all but decided to replace steam locomotives by the operationally more efficient and economical diesel and electric locomotives in a phased programme spread over three to four decades. Of course, even this time schedule may seem to be comparatively long, but, then, there are several difficulties in the way of more rapid modernisation.

For one thing, it will take this country not less than three decades to manufacture the large number of diesel and electric locomotives required to replace the steam locomotives completely. The Varanasi diesel loco factory is expected to go into full production only in 1967-68, manufacturing 150 units a year. It can, of course, be expanded to manufacture 250 diesel locos a year thereafter. As for electric locomotives, of which there will be 500 by the end of the fourth Plan, the Chittaranjan Locomotive Works, producing at an annual rate of 75 units from 1965-66, can be expanded to manufacture 150 units a year. On a rough calculation, the maximum aggregate output of the Varanasi factory and the Chittaranjan Works, assuming that they may not be expanded beyond the aforesaid limits, would be about 10,000 diesel and electric locomotive units over 30 years from now—just sufficient to replace all the steam locomotives. But, if the additional requirements for locomotives by that time are to be met fully, either a couple of new diesel or electric loco factories may have to be established or the capacities of the existing two units may have to be expanded further. Perhaps, no such expansion may be required, for each diesel or electric locomotive is the equivalent of two steam locomotives in terms of efficiency. It may even be that diesel locomotives (with power transmission or progressive hydraulic transmission) will be supplemented in due course by the more efficient gas-turbo locomotives (with free-piston gas generators), the first of which has just been developed in the Soviet Union.

For another, since dieselisation would involve large-scale imports of diesel oil, it would call for considerable foreign exchange expenditure which the country could ill-afford. The pattern of inland demand for petroleum products, of which high speed diesel oil accounts for 20 per cent, will be changed so markedly by railway dieselisation that the proportion of diesel oil will go up steeply. It is in this context that the plans for setting up new oil refineries in the country and the plans for expanding existing refineries in the public and private sectors acquire an added significance. The need for evolving a long-term plan for the petroleum industry in the light of projected dieselisation of railways and lorry transport over the next three decades can hardly be overstated. This calls for a more realistic oil policy than is the case at present.

Another related problem is the likely impact of railway dieselisation on the country's coal economy. It may be noted, incidentally, that the need for conserving the limited resources of better qualities of coking coal for the steel plants and the growing metallurgical industry has inevitably meant the use of lower grades of coal by steam locomotives designed for burning selected higher grades. The use of such lower grades has tended to increase the railways' coal consumption and, consequently, their fuel bill. But this development undoubtedly provides some relief to the coal industry with its relative overproduction of inferior coals. Railway dieselisation will only add to the problems of the coal industry, if, at the same time, more thermal power stations, which could burn inferior coals, are not established as part of the railways' electrification programme. In other words, dieselisation of some railway sections and electrification of some other railway sections should proceed in a co-ordinated fashion, so that the coal industry, while losing its biggest old customer, namely, the railways, over a period of time, may have an equally big new customer in the sector of thermal power generation. Another point to be noted is that modernisation of traction would also mean a saving in wagon capacity, for a considerable number of wagons now used for carrying the coal required by the railways themselves could be made available to others.

The problems incidental to switching over to diesel and electric locomotives are thus quite capable of solution, given forethought and co-ordinated planning. The Railway Board has, therefore, done well to propose, as a first step, the gradual curtailment of steam locomotive manufacture with a view to stopping it completely by 1970-71. The Chittaranjan factory, incidentally, is manufacturing nearly 200 broad-gauge steam locomotives, mostly freight-type, per annum at the present time. The Tata Engineering and Locomotive Company, which has been manufacturing metre-gauge steam locomotives, has also decided to discontinue their production after supplying the railways an aggregate of 200 locomotives during the fourth Plan period. This means that, if the Railway Board's proposal is accepted and implemented, no steam locomotives, whether for broad-gauge or metre-gauge, will be manufactured in India after 1970-71. Just as T.E.L.Co. is confident of switching over its locomotive manufacturing capacity to other engineering products thereafter, the Chittaranjan Works, too, may have no difficulty in diverting its surplus capacity to other uses, including electric locomotive manufacture.

BLANK TRANSFERS FOR SHARES

MUST the system of blank transfers be abolished or continued without any restrictions or modified in some ways? This is a question on which there has been a keen controversy in this country from time to time during the past four decades. The controversy began in 1923 when

transfers with a view to curbing further the abuses to which it can be put.

Blank transfers, it is said, encourage anti-social activities in three important ways: They held (a) the black-marketeer to hide his ill-gotten wealth, (b) the evader of income-tax and (c) the clandestine manœuvrer to obtain control of companies without the cognisance of directors. It is precisely to curb these activities that an amendment is sought to be effected in the Company Law. Thus, Clause 13 of the Companies (Second Amendment) Bill 1964, now before the House, lays lown that

1. every instrument of blank transfer shall be in the prescribed form, bearing the date of issue stamped by the prescribed authority, and

2. the said instrument must be delivered to the company within six months from the date of issue in the case of listed shares (that is those listed on the stock exchanges) and within two months in the case of others.

In deciding to limit the currency of blank transfers, the Government of India has been prompted by the anxiety not merely to eliminate certain defects inherent in the system, defects most impressively highlighted by both the Vivian Bose Commission and the Dapthary-Sastri Committee, but also to put an end to speculation indulged in by anti-social elements who are in possession of considerable unaccounted money acquired through black-marketing and tax evasion.

A blank transfer, by the way, is a transfer deed carrying only the signature of the transferor (that is, the seller) and delivered along with the share certificate. It does not contain the transferee's (that is, buyer's) name. Nor is it dated when the document and share certificate are delivered. The purpose of a blank transfer is to facilitate negotiability. Stamp duty is not paid at each transfer. Blank transfers make for the swift movement of securities from party to party and enable the holder to sell the security without getting his name registered in the books of the company which issued the shares. Their negotiability makes it easy to obtain credit. It will be clear from this brief description that blank transfers provide scope for some malpractices. Mention, for instance, may be made of concealment of identity of the real beneficial owners behind their nominees and evasion of tax by suppression of secret profits invested in shares on blank transfers. There is then the window-dressing of company balance-sheets by reshuffling of shares held on blank transfers between associated companies with the object of substituting inter-company loans and advances at the time of the closing of accounts by investments. Mention may also be made of fictitious or ante-dated transactions in the books of companies in order to create fictitious losses in investments for the purpose of reducing taxable profits.

It is, of course, true that the scope for some of these abuses has been eliminated by the reforms made in the laws pertaining to joint-stock companies, stock exchanges and income-tax. It is also true that the misdeeds discovered by the Vivian Bose Commission in the Dalmia-Jain group of companies were all perpetrated before the Company Law was comprehensively codified in 1956. But the Bose Commission's recommendations on blank transfers were made long after the new Company Law and the legislation on stock exchanges. It is rather far-fetched to say that Justice Vivian Bose was not aware of these developments when he made the recommendations. In any case, all these recommendations were reviewed by an expert judicial team, namely, the Dapthary-Sastri Committee. Surely, neither the Vivian Bose Commission nor the Dapthary-Sastri Committee can be accused of being ignorant of the prevailing laws of the land or of having taken any partisan stand on the issue of blank transfers. Viewed thus, it is, indeed, regrettable that the presidents of all the eight recognised stock exchanges should have opposed tooth and nail the Government's move to restrict the currency of blank transfers. Instead of sticking to their ancient views, they should have taken a more enlightened stand. They seem to have conveniently ignored the fact that some of the leading share brokers and businessmen themselves have been pleading for curbs on blank transfers. In his note on blank transfers appended to the Gorwala Committee's report, the late Mr. J. J. Kapadia, a prominent member of the share-broker fraternity, had minced no words when he said: "I can say from experience that the system of blank transfer exercises unhealthy influence on stock exchange transactions. He had advocated the imposition of a limit on the currency of blank transfer.

The exceptionally long memorandum submitted by the Stock Exchanges to the Government is like the brief of a clever lawyer defending his client whose guilt is writ large on his face. It is common knowledge that, in a case of this type, the lawyer tries to confuse the basic issue by bringing in all sorts of irrelevant issues. This is what the eight wise men of our stock exchanges have sought to do in their quite readable memorandum. A typical instance is provided by their argument that, when there are various ways in which tax is evaded, why tackle only the blank transfers, while leaving out the others? It may be that there are other ways—currency notes, jewellery, precious stones, Government securities, etc., as suggested in the memorandum—open to anti-social elements to hide their ill-gotten wealth. It may also be that, in spite of restrictions on blank transfers, tax evasion and black-marketing will continue. But this is no argument against the proposed restrictions on the currency and use of blank transfers. Every little bit helps. Incidentally, the tax evaders are unlikely to take the tip of stock exchange Presidents, given free of charge, that Government securities offer a better means for holding the black money than blank transfers. The fact that holding of Government securities by individuals is negligible and that they are held mostly by institutional investors is significant, in that it exposes the exaggeration in their argument. Nor does it sound convincing to be told that compulsory registration of blank transfers is redundant and unnecessary, as, under the Income-tax Act, share-brokers and dealers are required to furnish detailed particulars of all parties purchasing shares exceeding in the aggregate Rs. 10,000 in value, irrespective of whether the shares are held on blank or otherwise. For this can be (and are probably being) easily evaded. The stock exchange Presidents surely know how. All that a speculator or the tax evader has to do is to spread his operations over a number of brokers. This rule is, therefore, no use for the purpose the Government has in view.

Another unconvincing argument of stock exchange Presidents is that the blank transfer system is an entirely neutral factor not responsible for either nominee holdings or tax evasion. The example of the U.S., where the blank transfer system is very popular, cited by them is not relevant to Indian conditions. In the U.S., the blank transfers are meant to protect the interests of small investors, whereas in India they are used mainly by the big operators for making quick gains. With the vast majority of companies in the U.S. declaring dividends quarterly, there is an indirect check on the currency of blank transfers in that country. In any case, the conditions for operating on the stock exchanges in America are far more stringent than in India. The margin system, for instance, is more comprehensive and stiff. Further, the operations are not carried on in such great secrecy as in this country. Given all the conditions prevailing in the U.S. stock exchanges, the blank transfer system may be less injurious to the Exchequer. But the fact is that those conditions do not obtain here.

Equally unconvincing is the argument that, as India is a country of long distances and as companies take a long time for registering transfers, any limit on the currency of blank transfers will dislocate the stock exchange machinery. Thanks to the improvement in postal communications between important cities where the great bulk of the companies the shares of which are quoted on the stock exchanges is concentrated, no great inconvenience will be caused to the investing public as a result of the limit on the currency of blank transfers. The physical limitations on companies' ability to effect the transfers in their registers and return the share certificates to buyers expeditiously can be overcome by mechanising the operations of their share departments. Quite a few companies have taken the initiative in this direction and there is no reason why others with a large number of shareholders should not do so.

Ordinarily the intention of the transferor is that a person to whom the blank transfer is handed over is thereby authorised to fill in the name of the transferee, whether as a buyer, mortgagee or nominee; such a transfer may also be lodged as security for credit, the intention being that the buyer or mortgagee may later fill in the blanks and perfect the security by getting himself registered. While this is a perfectly legitimate intention and a normal trading practice, the trouble with blank transfers in our country has been that they allow the buyer or even his nominee to keep the shares blank for *any* period of time. That company registers remain incomplete may not be a very serious objection against blank transfers, for there are other factors also which lead to the same results. The real objection to indefinite currency of blank transfers is that they encourage *benami* holdings, where the registered holder may not be the real owner, or may not be even a nominee of the real owner. It has also been the experience of the authorities at least in this country that blank transfer forms enable evasion of tax and facilitate concealment of identity of the real owner.

Again, it is hard to believe that the proposal seeking to limit the currency of blank transfers will restrict genuine investment and trading, or even genuine speculation. Genuine and healthy speculation has never been defined and, in practice, it is hardly possible to identify or distinguish the one from the other. In fact, it should be clear to anyone that *bona fide* investors do not keep their shareholdings unregistered for any length of time. There is thus no question of middle class investors being deprived of the facilities. Blank transfers, as already stated, are actually kept by those who have large schemes for making quick profits and other motives like tax evasion or acquisition of controlling interest without revealing their own identity to the existing management.

Much is made of the argument that restricting the currency of blank transfers would affect the banking world, but the banks themselves have been silent about it. Advances against shares are very small, although shares may form the collateral in a large number of cases. But six months' currency for blank transfers should be enough for purposes of banking accommodation and, in case it should prove to be inadequate, longer currency of blank transfers for this limited purpose could always be provided. All the experts and committees who have recommended abolition of or restrictions on blank transfers have agreed that banks and lending institutions should be treated on a special footing.

The stock exchange Presidents certainly cry "wolf" when they say that the proposal to restrict the currency of blank transfers will seriously affect the liquidity and negotiability of shares, thereby undermining the confidence of investors. This is a gross exaggeration, as the experience of Britain has shown. Mr. K. R. P. Shroff, the learned President of the Bombay Stock Exchange, himself has admitted that no more than five per cent of the volume of transactions on the stock exchanges is dependent on the existence of the facility of blank transfers. Even assuming that this portion of the transactions will be completely eliminated—an extreme assumption—,the result would not be such as seriously to dislocate the stock exchange as a venue for healthy speculation. To the extent that some at least of the speculation so eliminated is unhealthy in character, the reform will be a desirable one from the point of view of the stock exchange itself. It is pertinent to mention, in this connection, that the various indirect restrictions on the life of blank transfers introduced in recent years have not adversely affected the liquidity of the market. The imposition of one more restriction is unlikely to produce such frightening consequences as are made out by the stock exchange Presidents.

It will be evident from the foregoing account that the evil practices associated with, and flowing from, the blank transfer system have given a bad name to it, and it can no longer be allowed to continue unrestricted. The stock exchanges will do well to recognise that the Government's move to limit the currency of blank transfer represents a compromise between two extreme alternatives, namely, complete abolition of the system and continuance in its present form. They are, however, perfectly justified in asking for a downward revision of stamp duty on transfer of shares. Such a revision throughout India will reduce greatly whatever hardship the proposed restriction may cause to investors and professional operators. It will also augment the revenues of the Exchequer, since a larger collection from an increase in turnover and reduction in tax evasion will more than make good the loss resulting from a lower rate of duty. In conclusion, it may be stated that, even though the move to restrict the currency of blank transfers is sound and justified, it is necessary to give careful consideration to all its implications. The Finance Minister will, therefore, do well to agree to refer the Companies Amendment Bill to a Joint Select Committee of Parliament, instead of rushing it through as he did in regard to amendments to the Banking Companies Act last year.

MARKET GOSSIP

Equities Depressed

THE stock exchanges are in the doldrums. There has been a steady fall in values week after week, even though the turnover is not large. Tired liquidation by bulls, some short-sales and almost virtual absence of support from investors have been the experience of markets these days. Most of the corporate results published in recent weeks have been encouraging. A good number of companies has increased the dividends for 1963-64. Speeches of company chairmen have also been marked by subdued optimism. Nevertheless, stock exchanges continue to remain depressed. The reasons are not far to seek. Investors of means do not have much surplus to spare for adding to their holdings. The high level of taxation, rising cost of living, obligations on account of annuity deposits, and the issue of a number of right shares—all these leave little margin for making fresh purchases. The large capital depreciation which they have already suffered on their existing investments is also having a deterrent effect, from the psychological point of view. Normally, at some stage large investors enter the market to average their losses, but that stage, many consider, has not yet been reached.

An important reason for this feeling is the absence of confidence about the fiscal policy that will be unfolded in the next budget. The A.I.C.C. resolution favouring ceiling on urban property, the Government's anxiety to end the managing agency system, the continued stress in the literature on the fourth Plan about the need for reducing the gap between the rich and the poor and for effecting structural changes in order to ensure price stability and equitable distribution of scarce resources have combined to create doubts whether the Congress Party will ever be realistic in pursuing its socialist policies. The fear is that, in the next budget, taxation of individuals might be rendered harsher still, even though the corporate sector might be left alone. Thus, the hope of some relief in taxation has yielded place to serious misgivings.

There are also other reasons for the continued weakness of equities. The rayon manufacturers and cotton textile mills are having a bad time. The newly established paper mills are suffering from unremunerative prices. There are delays in the progress of new industrial projects, for which capital was raised in the years 1960 to 1962. In these three years, it will be recalled, investors fell head over heels for new equity issues. The vast majority of these scrips are standing at a heavy discount and, even at these levels, buyers are scarce. It looks as though several of these companies will take two, three or four years more to declare even a modest maiden dividend. The capital outlays of many of these new companies have exceeded the original estimates and their debt-equity ratio has become high to the detriment of shareholders. And the pity of it all is that a good proportion of investors who have gone in for them belongs to the middle class. They are disheartened and disenchanted with investments in equities.

Then, there is the ever-rising cost of production, with no sign of relief in the foreseeable future. Increased allocation of foreign exchange for importing more foodgrains may result in a cut in the resources available for maintenance imports. If this were to happen, the bad effects of cost spiral would be aggravated by shortages of raw materials, stores and spare parts.

Taking all these factors into account, it looks as though a sustained and substantial recovery in equity values is a long way off. Much depends on the Union Finance Minister.

Wages In Kind: Move Dropped

The recent session of the Indian Labour Conference, held at Bangalore on the 29th and 30th July 1964, it may be recalled, had recommended that it should be made compulsory for employers to pay a part of the wages in kind, in view of the high prices of essential commodities in the country. The Conference had also made another recommendation that it should be made compulsory for employers to set up fair-price shops for industrial workers. Both these recommendations were considered by the Standing Committee on Industrial Truce, which met at New Delhi on the 13th instant. The Committee has decided to drop the scheme for the payment of a part of the wages in kind. As an alternative, the various benefits which would have accrued to the workers under the scheme—had it been implemented—will now be made available through fair-price shops—to be opened compulsorily by the management—or co-operative stores. The commodities to be covered are rice, wheat, wheat substitutes and sugar—to be supplied at control rates—and textiles, cooking media and pulses at wholesale prices; any addition to the list of commodities is to be decided by a joint committee of employers and employees. The cost of transportation and distribution will be borne by the employers. A Bill to this effect is likely to be introduced in the current session of Parliament, making it obligatory on industrial establishments —in both public and private sectors—employing more than 300 persons, to open such shops if 200 or more employees opt for them. A worker will be entitled to buy from these shops commodities worth Rs. 150 or 40 per cent of his monthly salary, whichever is lower. There will also be a provision for the supply of goods on credit—the amount to be deducted from the salary of the worker.

The representatives of employees—both of the Indian National Trade Union Congress and the All India Trade Union Congress—were doubtful about the utility of the scheme. It is feared that the scheme might freeze the dearness allowance and adversely affect the retirement benefits of workers. The Union Food Ministry was also not confident of ensuring an adequate supply of commodities and a privileged treatment to factory workers who number no more than 3.1 million out of a total population of over 450 million in the country.

But the decision taken by the Standing Committee on the opening of fair-price shops seems to be even worse. Numerous difficulties are involved in industrial employers becoming grocers as well. These have been fully discussed in some of our earlier issues. To these have now been added one more. As a provision has been made for supplying goods on credit, it may be assumed that most of the transactions will be on credit and the employers will have to find additional finance. This apart, the Food Ministry has made it clear that it was not possible for the Government to give preferential treatment to these shops and that they will only be considered on par with other fair-price shops. This has created a serious lacuna and, because of it, both the employers and employees are doubtful about the successful working of the scheme. Moreover, it has not been made clear how the scheme will affect the dearness allowance of workers. If the workers continue to get the benefits of higher dearness allowance for every rise in the cost of living index, it will mean a double burden on the employers, resulting in a further rise in the cost of production and inflation.

The decision to open fair-price shops in industrial establishments was first taken at the twenty-first session of the Indian Labour Conference held at Delhi in July last year. The Standing Committee on Industrial Truce Resolution, appointed by the the Conference, had also decided that all industrial establishments employing more than 300 workers, should open such shops. By virtue of the fact that the decision was a tripartite one, the Government, the employers' and workers' organisations were all bound by it. But much water has flowed under the bridge since then. Several developments have taken place, rendering that decision out of date. In the first place, prices of most of the commodities covered by the scheme are now controlled. In the case of cereals and sugar, not only the prices are controlled, but even the distribution is done through controlled sources in urban areas. The Government has also fixed the prices for a little more than half of the production of cotton textile industry and most of the varieties of cloth purchased by the working class come within this arrangement. And, secondly, fair-price shops have been opened for all consumers in most of the industrial areas, which sell not only the controlled items but a large number of other necessities of life. Informal rationing has already been introduced in the major cities like Bombay, Calcutta and Madras and the Chief Ministers Conference, held at New Delhi on the 18th instant, has taken a decision to extend it to all the big cities and industrial towns. Although introduction of statutory rationing has been left to the discretion of the State Governments, it is likely to be started in Calcutta and the urban areas of Kerala very soon; some other States may follow the example later. In these circumstances, opening of fair-price shops by the employers becomes redundant, resulting in waste of scarce resources. It may be found in due course that many of the workers prefer to purchase their requirements from the fair price or ration shops near their residence rather than from the shops opened by their employers.

Indo-East European Trade

Out of the total annual exports from India valued at about Rs. 800 crores, about 25 per cent, or Rs. 200 crores, is accounted for by the eight Eastern European countries (including U.S.S.R.). Russia alone imports approximately one half, the other half being shared by the remaining seven countries, namely, East Germany, Poland, Yugoslavia, Hungary, Bulgaria, Rumania and Czechoslovakia. That there are good possibilities of bringing about a further substantial rise in Indian exports to this region is the view expressed by an Indian trade team which toured some of these countries for a month under the leadership of the Deputy Minister of Commerce, Mr. S. V. Ramaswamy. The countries visited were Czechoslovakia, Rumania, Bulgaria and Hungary. Giving his impressions of the visit, Mr. Ramaswamy told newsmen at New Delhi this week that, during 1965, India would be able to increase its exports to these four countries alone by about 25 per cent from the current level of Rs. 41.5 crores to Rs. 52 crores.

Some findings of the trade team are certainly revealing. It is a sad commentary on our export promotion efforts abroad that the East European countries, according to the trade team, have a distorted vision about industrialised India. This country, we are told, is still regarded as an exporter of some food articles and raw materials. This finding, in fact, reflects the inefficacy of the various export promotion councils and other agencies, including India's participation in a number of trade fairs in the region concerned. The trade team claims to have corrected the wrong image by creating an impression that India could sell such articles as lathes and machine tools, chemicals, pharmaceuticals and leather footwear. How far this claim is correct can be judged only by the results in the coming years. But by that time most people will have forgotten it. The team and its leader, therefore, need not have any fear that a post mortem will be held and the accuracy of their claim assessed.

More important is the team's observations on the type of goods that India can try to sell in East Europe. There is, according to it, good prospects for India to sell railway wagons to countries other than Rumania. It is heartening to hear that Hungary has already bought a large number of railway wagons and a Hungarian team is shortly expected in this country to work out the final details of the purchase. Similarly, a Czech team is also expected in India for effecting a purchase of railway wagons. Trade prospects with Czechoslovakia are very bright; it is expected that the total value of trade each way may well increase from the current level of Rs. 15 crores to Rs. 24 crores in 1965. India hopes to buy more spare parts and components for tractors and sell to that country tyres, tubes, tea, and even vitamin and hormones intermediates. Although India's trade with Rumania has not been upto expectations so far, arrangements are afoot to increase exports. Rumania has agreed to buy a large quantity of Iron ore for its Galatz steel plant from India, in the face of competition in this commodity from Brazil and Egypt, and textiles worth Rs. 150 lakhs, including Rs. 50 lakhs worth of handlooms. India, in turn, has signified its intention to take more of Rumanian fertilisers, axle oil for railways, soda ash (heavy as well as light) and caustic soda. Trade with Hungary and Bulgaria is likely to increase from the current levels of Rs. 10 crores and Rs. 4.5 crores each way to Rs. 14.5 crores and Rs. 5.5 crores each way, respectively. Zinc from Bulgaria, chemicals and wheels and wheel sets from Hungary are mentioned as the items that will contribute to increased imports from them, while, on the export side the goods included are iron ore, textiles and engineering products.

One difficulty that is being felt by almost all the countries visited by the trade team, according to Mr. S. V. Ramaswamy, pertains to the insufficiency of rupee funds for effecting purchases in India. This difficulty is inherent in the nature of trade between India and the countries concerned. Theoretically, the value of trade exchanged is balanced but, in practice, there is a time-lag. This is due to the fact that, while India imports capital goods the delivery of which takes time and pays in instalments separated by four to six months, the East European countries buy articles which are readily supplied and have to be paid for, as if they were cash purchases. The "swing credit" which India has been giving to some of these countries have not been found adequate as it is rapidly exhausted. Mr. Ramaswamy disclosed that the Government of India has offered to issue import licences more quickly and to discuss how best the payment arrangements could be improved. Incidentally, it may be mentioned that a bankers' delegation from Czechoslovakia is scheduled to visit India in the near future for this purpose. All these are steps in the right direction.

World Tin

Spot tin in the London market, which had climbed down from the high of £1,697-10 per ton last month-end to £1,425 last week following the release of an additional quota of 18,000 tons of tin from the U.S. stockpile for the second half of the disposal year ending March next, has staged an impressive recovery since then, the latest available quotation being £1,500. The recovery has followed excellent buying support induced primarily by the increase in the floor price of tin from £850 to £1,000 a ton and the ceiling price from £1,000 to 1,200 announced by the International Tin Council at its meeting held at London on the 13th instant. The floor price has been raised apparently with a view to boosting the production of tin in keeping with the rising trend of consumption. The aggregate world consumption of tin is said to be currently running at an annual rate of 160,000 tons which is well above the actual output of about 140,000 tons.

Announcing the upward revision of floor price, Mr. H. W. Allen, Chairman of the Council, disclosed that a special committee was being formed to keep the problem of tin shortage under constant review and held out the assurance that this committee would do everything in its power to promote production. Despite this statement, the producing countries seem to feel that tin prices would not fall to "unrewarding or uneconomic" levels. For they know full well that the Buffer Stock Manager must purchase the metal to boost the price, if it is quoted below £1,000 per ton on the London Metal Exchange. It is true that the ceiling price at which the Manager must sell tin has also been raised as already stated but the increase is only of academic importance, since the Buffer Stock is without metal. Meanwhile, the Tin Council does not expect any further price changes to take place under the Buffer Stock Scheme during the present Tin Agreement due to expire in June 1966.

The Council's decision to raise the floor price has been widely welcomed by the mining interests the world over. It is believed that the mines in Malaya which have already been worked and which have become uneconomical at the floor price of £850, will now be reworked. As a result of the upward revision in floor prices, tin production in Malaya is expected to go up by at least 10 per cent by the middle of next year.

Philips India's Rights Issue

Philips India Limited will shortly be raising additional capital of Rs. 40 lakhs (nominal) in equity shares of Rs. 10 each at a premium of Rs. 6 per share. Out of this, one lakh equity shares will be offered to the Company's foreign collaborators N.V. Philips Gleollampenfabrieken, Netherlands, partly for cash and partly for consideration other than cash. The balance of three lakh shares will be offered to the Indian shareholders for cash in the ratio of three new shares for five shares held.

At present Philips India's shares are held between the foreign collaborators and Indian shareholders in the proportion of 77 : 23, but, with the issue of rights shares, the proportion of shares held by Indian investors will increase to nearly 31 per cent. The Controller of Capital Issues has already given his consent to this issue and it is valid up to 30th April 1965.

It may be recalled that, in April 1963, the Company obtained sanction for issuing capital to the

W. GERMANY—SOME RANDOM IMPRESSIONS—II

By S. V. Rayan

MOST parts of West Europe are modern in their look and life. The reconstruction of war-devastated Europe provided an opportunity for rebuilding cities and towns, factories and homes, roads and parks in a manner that allowed for greater comfort and better living than before the Second World War. In this task, the builders of post-war Europe have put to best advantage the benefits of scientific research and new inventions that received a great impetus during and after the war. The new materials developed in the sphere of metals, chemicals (plastics in particular) and ceramics have helped Europe to wear a new look, neat, clean and glittering.

The greater the devastation suffered during the war, the larger has been the reconstruction on modern lines. The best example of this is provided by West Germany. Almost three-fourths of this country is new now. Some of the cities, such as West Berlin, Hamburg and Cologne. have been rebuilt practically in full. It is said that, in air raids and ground fighting, more than 2.3 million dwellings in the area now constituting the Federal Republic of Germany were either totally destroyed or so badly damaged that they were no longer habitable. Since 1949, when the Federal Republic was formed, some eight million dwellings have been completed, i.e., at the rate of one dwelling a minute. One out of every three inhabitants of West Germany (total population 57.6 million in 1963, as against 51.3 million in 1953) has received either a new or rebuilt dwelling since 1950. The housing shortage in the whole of Germany and Berlin is now placed at less than half a million. Nevertheless, intense building activity is still going on, especially in private commercial, industrial and public building spheres, so that the building trade continues to be the most important branch of German economy. At least half the factories in Germany must be less than ten years old. The machinery in them must be younger still in age. With factories well laid out and with first-class equipment, there is no wonder that the productivity of German workers, who are well known for their aptitude for discipline and hard work, is pretty high.

Labour unrest in Germany is, perhaps, at its lowest in the Western world. There are many reasons for this. First, in the initial post-war years, the workers were conscious of the fact that only hard work would place their country back on its feet. Secondly, the German Government itself took care to see that workers were given adequate representation on the boards of companies engaged in basic industries. Thirdly, the workers are well paid and, what is more, well looked after. They are housed in comfortable dwellings; they are given adequate holidays; and the social benefits provided for them compare favourably with the best of the developed countries. Fourthly, despite the large influx of refugees from East Germany, the economic growth was rapid enough under the social market economy of Dr. Ludwig Erhard that everybody had work, unemployment being confined only to those who could not work. Today, there is more work than the available workers. The number of foreign workers employed in Germany has exceeded the million mark. The arrival of foreign workers in such large numbers does not seem to have caused any resentment among the German workers. There are yet about 900,000 vacancies, while the unemployed are no more than 100,000. And fifthly, Germany is one of the few countries in Europe where price stability has been remarkable, with price increases being kept within narrow bounds. Consequently, the real wages in Germany have increased faster than in any other country in the Western world. Thus, between 1950 and 1961, they had gone up by 94 per cent in Germany, as against 65 per cent in France, 34 per cent in the U.K., and 31 per cent in the U.S. In the subsequent two years, cost of living in Germany has risen by only 3.1 per cent per annum, as against which wages have gone up by nearly 12 per cent per annum, so that there has been a further rise in the real wages of German workers.

One gets the feeling while in Germany that both employers and the Government want to keep the workers happy and contented as a matter of deliberate policy. They have an objective in doing so, the objective being to show to East Germany, in particular, and Eastern Europe, in general, that their socio-economic system is far superior and meaningful to the common man than the communist system. The desire among West Germans to bring about the unification of two Germanys is intense. One has to visit Germany to realise fully how strong and passionate this desire of theirs is. They are practical-minded enough to realise that, in this nuclear age, unification of the two parts can be brought about only through peaceful means and persuasion and by setting up a good example of model State. It would appear that German workers also share this view and co-operate with employers as well as the State.

Working hours in West Germany have progressively gone down. In the very early years of reconstruction, it was common for workers to do a ten-hour duty a day. In 1955, the average number of paid hours put in weekly by an industrial worker was 49.1. The number went down to 45.4 in 1961 and has been 44 since then. Five-day working week is becoming common now. More than 11 million, that is, half the total number of employees, no longer work on Saturdays. The workers enjoy a paid holiday of three weeks if they have been with an employer for less than five years and four weeks if their service is more than five years. This does not mean that German workers have become easygoing; because of shortage of workers and high level of economic activity, a large number of them work longer hours and get sumptuous overtime allowances. (Even so, increase in productivity is keeping ahead of the rise in wages.) What this means is that workers have been allowed to have a progressively increasing share in the prosperity of their economy.

Despite strains in the labour market arising from an acute shortage of workers, the German economy is continuing to move forward. Order books are running high and profit-margins are favourable. The growth in gross national product (in real terms) is estimated to have been at the rate of 5.2 per cent per annum in the first half of this year and is expected to be about 7 per cent for the whole of 1964. Such a high rate of growth has been rendered possible by vigorous capital investments by industry. The labour shortage itself has impelled the industrialists to invest heavily in labour-saving equipment and automation, which in turn has stimulated investment in heavy industry, particularly electronics. Everywhere, whether at home, or factory. or schools and colleges, the stress is on labour-saving devices. This pursuit over a period of years has resulted in the production of a numerous variety of gadgets and equipment. Unlike in some of the developed countries, as, for instance, the U.S., there is hardly any opposition in Germany to automation from the ranks of labour. And the result has been beneficial to all through higher productivity, stable prices, expanding exports, and comfortable balance of payments position, which is the envy of all the Western countries, particularly the U.K. It may be noted here that the increase in Germany's exports has not been secured through a denial of domestic consumption, but after saturating the domestic markets. If this were not so, there could have been no stability of prices, nor the high standard of living the Germans enjoy now.

(*Concluded from next column*)

sures that make workers more prosperous can also help businessmen. In an area of direct confrontation between management and labour, the Council of Economic Advisers, under Dr. Heller's Chairmanship, has asserted the right for a third interest to be considered: that of the public. In present conditions, the Council said in its annual reports, decisions on both wages and prices must not produce inflationary pressures.

The Council then laid out its famous and controversial "guideposts" to give businessmen, workers and the public a means to estimate whether specific private decisions were "reasonable" or "inflationary." It is impossible to gauge how much influence the "guideposts" have had. Nevertheless, concludes the correspondent, it is a fact that most wage and price moves have remained within the bounds described by the "guideposts."

U.S. PRESIDENT'S PAN OF ECONOMISTS

DR. HELLER RETIRES

ALMOST revolutionary changes occurred in U.S. thinking on Government economic policies during the four years that Dr. Walter W. Heller was Chairman of the President's Council of Economic Advisers. Dr. Heller left his Government post on the 16th instant and another member of the three-man panel, Mr. Gardner Ackley, was sworn in to take his place. But, according to an economic correspondent writing from Washington, there is no reason to believe that the change signals any reversal in economic policies. Dr. Ackley is felt to be closely aligned with the policies promoted by the administration during the past four years.

President Johnson had urged Dr. Heller to remain, but the economist decided to return to his post on the Faculty of the University of Minnesota. Ironically, it is finances—he can earn more as a university professor than as a Government servant—that is sending Dr. Heller back to the college campus.

Also sworn in on the 16th instant as a new member of the Council of Economic Advisers was Mr. Arthur M. Okun, who had been serving on the Council's staff. The third member is Mr. Otto Eckstein, former Economics Professor at Harvard University.

During his swearing-in ceremonies at the White House, President Johnson called Dr. Ackley "one of the nation's most respected economist." Mr. Johnson expressed regret that he had not been able to persuade Dr. Heller to remain, and referred to the success of policies the outgoing Chairman had promoted. He said that "clear and enormous" benefits, for example, had come from tax reduction policies. Dr. Heller was a noted advocate of tax policies as a means to promote growth even before he came to Washington. With his encouragement, President Kennedy and, later, President Johnson supported tax changes that have increased incentives for business investment, have added thousands of millions of dollars to consumer buying power, and are credited with sustaining the longest period of economic expansion in U.S. peace-time history.

In the past, continues the Washington correspondent, the traditional method of dealing with recession or lagging growth was to make it easier and cheaper for businessmen, consumers and homebuyers to obtain loans. But Dr. Heller argued that post-war economic expansions were being cut short because tax rates were too high, not because interest rates were too high. The high tax rates caused the Government to absorb money from the economy at times when it should have been pumping buying power into the economy, Dr. Heller said. Thus excessive taxes, he contended, were choking off economic expansions, prematurely causing recurring recessions and making it impossible for the U.S. economy to live up to its potential. Also, "easy money" policies that greatly lowered interest rates at home tended to encourage more U.S. investments funds to flow abroad. The administration pointed out that such policies were inappropriate for a country whose payments abroad were already exceeding its international receipts.

The U.S. Government was already spending more than it was taking in. A tax cut would mean making this budget deficit larger—temporarily, at least. Thus Dr. Heller's prescription ran counter to a strong conviction, long held by many people, that taxes should be cut only when Government budgets showed surpluses. Dr. Heller's learned but lucid arguments helped overcome such doubts and a significant cut in Income-tax rates went into effect early this year. The Kennedy Administration had also sponsored other important changes in tax rules during Dr. Heller's Chairmanship of the Council of Economic Advisers. These were designed to encourage businessmen to invest in new and more modern equipment by making new investments more profitable. The purpose was to speed economic growth, cut production costs and, by increasing the competitiveness of U.S. goods in international markets, to help bring U.S. international transactions back into balance.

The concern of the Democratic Administration over investment incentives also illustrates another trend in U.S. economic thinking—the growing realisation that measures promoting the prosperity of businessmen can also promote the prosperity of workers, and mea-

Kyushu Oil Company Refinery at Oita, southern part of Kyushu, now under operation.

Mr. Iwamoto, supervising engineer and his group in charge of Oita Refinery construction.

HOW DO YOU BUILD AN OIL REFINERY IN A REMOTE INACCESSIBLE REGION?

Most companies in Japan would turn to Japan Gasoline Company because JGC builds them fast and builds them right. The Kyushu Oil Company refinery at Oita is a typical example. When work began on the 40,000 barrel capacity Oita Refinery, there were no paved roads, no wharves and very few laborers in the area. JGC solved all these problems and after only 10 months the job was completed and Oita Refinery began operation after a test production run. A real achievement record in the annals of refinery construction.

In a briefing with Kyushu Oil, Mr. Iwamoto, supervising engineer in charge of construction explained that construction schedules were rigidly drawn up and timing factors minutely studied. Parts, component and material delivery times were controled right to the exact hour of the day they were to be used. Subcontractors were provided with sufficient lag-time contracts to enable them to meet all deadlines regardless of difficulties and unforseen problems. Material flow-charts controled delivery into pre-arranged staging areas eliminating man-hour waste and inefficiency. Technical, skilled and semi-skilled workers, and laborers were brought into the area as they were required and housing was established on the spot as the work force arrived. Many untrained laborers were recruited, instructed and trained in the finer arts of refinery construction.

There are more than one thousand chemical engineering specialists ready to act as your partner. Use their experience. They have played a vital part in 60% of the refineries constructed in Japan since 1945.

Main Plants: Oil Refineries • Petrochemical Plants • Coal Tar Plants • Gas Chemical Plants • Fats & Oils Plants • Fertilizers Plants • Synthetic Resins Plants • Other Chemical Plants

FOOD CORPORATION BILL

THE Union Government's proposal to establish an autonomous public corporation for large-scale trading in foodgrains on commercial lines has been under public discussion for some time now. At last, the proposal has taken a concrete shape in the form of a Bill, introduced in the Lok Sabha this week, to constitute the "Food Corporation of India." The central objectives of the Corporation, which is to be set up as a "wholly Central Government-owned agency for the purpose of undertaking trading in foodgrains in a commercial manner but within the framework of an overall Government policy," are "to implement any policy of ensuring that the primary producer obtains the minimum price that may be announced from time to time and to protect the consumer from the vagaries of speculative trade," as also to build up buffer stocks gradually.

In pursuance of these objectives the Corporation, which may have its head office at Madras, will engage itself in the purchase, storage, movement, distribution and sale of foodgrains; it may deal in other foodstuffs, too, if considered necessary by the Government; it may also set up or assist in the setting up of rice mills, flour mills and other undertakings for the processing of foodgrains and other foodstuffs and it may, in addition, promote the production of foodgrains and other foodstuffs by such means as it thinks fit. When the Corporation starts functioning, it is expected to be given, under the appropriate rules, a monopoly over rail movement of foodgrains in the country. With an initial capital of upto Rs. 100 crores which could be increased by the Government from time to time, with guaranteed loan facilities for its operations and with its substantial capital participation in a chain of food corporations (each having an initial capital of Rs. 10 crores) in the States, the proposed Food Corporation of India is bound to be a gigantic thing. It can, therefore, be expected to secure for itself a strategic and commanding position in the foodgrains trade of the country.

Some of the provisions in the Bill, relating to management, are calculated to ensure a fair degree of autonomy for the Corporation. The provision that there shall be no more than three official representatives (one each from three Union Ministries—Food, Finance and Co-operation) in the 12-member Board of Directors may be noted in this connection. This Board of Directors, incidentally, will be vested with the requisite powers of general superintendence, direction and management. In discharging its functions, the Board is expected to act on business principles, having regard to public interest. But it is also expected to abide by such instructions of policy as may be given to it by the Central Government. Another provision empowers the Board to constitute a five-member executive committee from its own ranks. Subject to the general control, direction and superintendence of the Board, this executive committee shall be competent to deal with any matter within the functions of the Corporation. Although, between them, the Board of Directors and its Executive Committee will have vast powers, the actual extent to which they can exercise them freely and without frequent interference from the Union Food Ministry will depend on a sound, stable and coherent food policy (including the policy governing minimum prices for producers). If the Government's overall food policy itself were to change frequently, as it has always done, there would be frequent occasions for Ministerial interference in the guise of policy instructions. This, in turn, will adversely affect the efficient working of the Corporation.

The Bill's provisions relating to finance are quite liberal and imaginative. It is laid down, for instance, that the Corporation can take advances against stocks of foodgrains or other foodstuffs held by it, or borrow money from any scheduled bank or from any other bank or financial institution approved by the Central Government. Such loans and advances taken by the Corporation will be guaranteed by the Central Government in respect of the repayment of principal and the payment of interest thereon. Thanks to such guaranteed loan facilities and its large initial capital, the Corporation will have at its disposal enormous funds to finance its trading operations and, in the process, provide production credit to growers. There is, of course, a specific provision that "the Corporation may lend or advance money to any person, engaged in the production of foodgrains, upon the security of foodgrains, or such other security as may be prescribed, for any purpose connected with such production." This means that the Corporation will function, within limits, as one more agency for providing direct agricultural credit. But more important than this direct lending, which may or may not be on a substantial scale in actual practice, will be the Corporation's loan guarantees to growers. The relevant provisions in the Bill are as follows:

> The Food Corporation may enter into agreement with any grower of food crops for the purchase of foodgrains after the harvest of such crops and any agreement may provide that any such sum payable by the Corporation to the grower under such agreement shall be payable to any scheduled bank or other financing agency nominated by the grower in this behalf to such extent as may be specified in the agreement.
>
> The scheduled bank or other financing agency specified above may, on the basis of any aggrement, lend money to a grower of food crops who has entered into such agreement.
>
> The Food Corporation may, upon such terms and conditions as it may think fit, guarantee any loan referred to above and also any other loan raised by a grower of food crops, which is repayable within a period not exceeding five years.

Since the Corporation's agreement to purchase foodgrains after the harvest, presumably at the fair minimum prices laid down by the Government, will provide the basis for lending by scheduled banks or other financing agencies, the usurious private moneylender who largely provides short-term production credit to agriculturists can be gradually eliminated from the rural scene. Whether or not the Corporation conducts its commercial trading and buffer-stock operations efficiently, at least it may have a wholesome impact on the rural credit structure and thus indirectly help maximise foodgrains production.

NATIONAL METALLURGISTS' DAY

The expert knowledge for extracting, refining, alloying, casting and fabricating ferrous and non-ferrous metals is provided by metallurgists. Thanks to their technical guidance, metals and alloys of the right quality, shape, size and specification are made available to the bridge builder, motor car producer, aeroplane manufacturer, railroad engineer, machine tool maker, shipbuilder and other users. Their role in large integrated steel and non-ferrous metals plants is thus crucial. In two other fields, too —ordnance factories and atomic energy—they play an invaluable role. Metallurgists working in ordnance factories help make not only high quality metals and alloy steels but also cast, forge, machine and test the metals and weapons made, while those engaged in the field of atomic energy specialise in the manufacture of fissionable metals like uranium and zirconium. With the continuing growth in demand for ferrous, non-ferrous and rare earth metals and for a variety of alloys of exacting specifications, metallurgists are being called upon to investigate new Indian raw materials and minerals and to do research (as in the National Metallurgical Laboratory) and development work on a far larger scale than ever before. In view of the shortage or non-availability of particular metallic resources, they are also working increasingly on the related problems connected with conservation and substitution of metals. That so important a class of people like metallurgists should celebrate a National Metallurgists' Day every year to focus attention on their work and on the importance of metals and metallurgical industries is wholly appropriate. The Second National Metallurgists' Day, celebrated on the 13th instant under the auspices of the Indian Institute of Metals at Durgapur and in fourteen other metallurgical centres in the country, was thus an event of more than ordinary significance.

The two highlights of the day were the inaugural speech by Mr. N. Sanjiva Reddy, Union Minister for Steel and Mines, and the presidential address of Dr. D. P. Antia at the Institute. The Minister's speech, however, was mostly general and superficial in its approach. The only specific points he made were that suitable techniques should be evolved by metallurgists to make cheaper and better quality steel, that substitute materials should be discovered and that waste should be avoided. Even Dr. Antia's address was not directly concerned with metallurgical problems, although it was certainly notable for its treatment of some aspects of industrial management and productivity. Regarding industrial management he expressed the view that it was very important to train technical people in the art and science of management. He also stressed that, in order to obtain high productivity, managers should not exert undue pressures on their organisation but use methods which would reinforce the economic motives with the non-economic ones.

It was only in his broadcast talk on the eve of the Metallurgists' Day that Dr. Antia had something direct to say on metals and metallurgy. Although the research organisations' efforts for conservation and substitution of metals were commendable in his view, "our total requirements are such that we have to import steel and non-ferrous metals valued at over Rs. 135 crores per year even with very restricted import licensing." His emphasis on the need for large-scale substitution of aluminium for copper was thus relevant. But that would call for increasing aluminium production, over the next six years, to 250,000 tons per year, as compared with 55,000 tons at present. As aluminium, alloyed with four per cent copper and properly heat-treated, can acquire tensile strength almost three times that of ordinary steel and still continue to be light, rapid expansion of the aluminium industry would seem to be of crucial importance to the economy from every point of view.

KENNEDY ROUND

So one more crisis that would otherwise have thwarted the Kennedy Round tariff negotiations under the auspices of the G.A.T.T. has been averted, at any rate for the present, thanks to the spirit of compromise exhibited by the United States and the European Economic Commission. It is the U.S. which first cleared the way for the resumption of negotiations by giving up one of its important conditions. It had all along insisted that an agreement with the Common Market on access for its agricultural products was essential for reaching an understanding on industrial tariffs. Abandoning this pre-condition, the U.S. Government submitted its list of proposed exceptions (from the general 50 per cent across-the-board tariff reductions) by the 16th of this month, the deadline fixed for the submission of exception lists by all participants. The U.S. lead was followed by Britain and later by the E.E.C. countries. Austria, Denmark, Norway, Sweden and Switzerland have not asked for any products to be exempted, but they have made the reservation that reciprocity would be safeguarded to mutual advantage. Czechoslovakia, too, has no exception list to submit. With the submission of exception lists by the main negotiating countries, the Kennedy Round has now entered the next and more crucial stage; substantive negotiations on both industrial and agricultural products are expected to begin early in the new year and go on for at least twelve months. It is, however, too early to draw the comforting conclusion that all would be well with the tariff negotiations, though the spirit of give and take among the developed countries is stronger than six months ago.

Since the exception lists are kept secret their exact composition is not known. From whatever information that is available, however, it is gathered that the U.S. list is quite a formidable one, while Britain's list is more modest, with the E.E.C.'s list occupying the middle of these two. The exceptions list of Britain is said to be a modest one because it covers less than five per cent of the total imports of industrial products from the most-favoured-nation countries which, in practice, means all countries other than the Commonwealth countries (enjoying preferential tariff) and the E.F.T.A. countries, in which all tariffs are due to disappear by the time the Kennedy Round of tariff reductions take effect, that is, by about the end of 1970. The list is likely to include, among others, cotton textiles (now subjected to an import duty of 17½-20 per cent) and plastics (10 per cent duty), besides lead and zinc (which are subjected only to low import duties). The exceptions list submitted by the E.E.C. covers, it is said, just under one-fifth (or, approximately $1,300 million in value) of the Six's total dutiable imports, several of the proposed reductions being conditional or partial as indicated below:

In the case of mechanical and electrical machinery, France, which had originally asked for nearly the whole of this sector to be placed on the exceptions list, has now made concessions amounting to 30 per cent of additional items it had sought. But a large proportion of machinery will be exempted. Fine paper will be subject to the 50 per cent cut, but paper pulp and newsprint will not go on the list, pending negotiations to revise special price advantage to producers in Scandinavian countries. Chemical products will not be placed on the list on condition that the U.S. changes its "selling prices" system of duties which brings the price of imports up to that of internal chemical products. Similarly, cotton fabrics will not be placed on the list, provided the international cotton agreement safeguarding imports from countries where production costs are abnormally low is renewed in 1967. Other textiles will be excluded, if similar world agreements are reached as for cotton. Watches will also not be placed on the exceptions list, if the Swiss give an undertaking to revise their statute banning the export of precision watch-making machinery. Aluminium will be treated as a partial exception. The Community's 9 per cent external tariff will be maintained, by a Community quota at a reduced tariff of 5 per cent for imports from non-member countries will be consolidated in G.A.T.T. nuclear reactors will be placed on the list but the Community's external tariff on reactors will be suspended until the end of December. About $80 million worth of steel tubes have been placed on the exceptions list. Planes weighing less than two tons have been placed on the exceptions list. Those weighing between two and 15 tons will be subject to the full 50 per cent cut on conditions that the U.S. and Britain also agree to this. Aircraft weighing more than 15 tons and large helicopters will be totally exempt. Magnesium will be treated as a tariff disparity and also as a partial exception entailing a reduction of the Community's tariff from 10 to 8 per cent.

The above list, according to Press reports, was adopted by the E.E.C. Ministerial Council after an all-night session at Brussels on Saturday last week. The basic argument in the Council centred on the issue whether the Community should have a high tariff wall around it or reduce the tariff barriers substantially as a good example to others. Claiming that the session was "a full success," Herr Fritz Neef, West German State Secretary for Agriculture, who presided over the meeting, stated at a press conference that the final list, though it was a compromise, was proof enough to show that the Community was not protectionist-minded in its commercial policy or in its attitude towards the Kennedy Round. This statement is certainly reassuring especially to India and other developing countries which are seeking larger export outlets for their products in the markets of developed countries. Mr. Jean Rey, the member of the E.E.C. Commission responsible for the negotiations at Geneva, described the list as "extremely presentable" and comparable to the lists submitted by the other negotiating partners.

The adherence to the 16th November deadline for tabling the exceptions lists by all members is a welcome development, as it has at least permitted an advance to the next stage of the Kennedy Round. But, as already stated, it is anybody's guess as to how far and to what extent the Geneva parleys will conclude to the satisfaction of all the participating countries. There are four major issues on which serious discussions and hard bargaining at the Kennedy Round will take place. They cover final exceptions lists, disparities rule, non-tariff barriers and agriculture. Of these, it is the disparities rule that is subject to sharp divergence of opinion. What exactly is the issue at stake is succinctly brought out by *The Economist* of London thus:

> " . . . big arguments lie ahead on the 790 tariff headings, accounting for around 10 per cent of Common Market trade, covered by the present E.E.C. disparities list, on which the Common Market will claim that it is entitled to cut tariffs by only 25 per cent, because its tariffs are already less than half the American and British ones. Neither Britain nor the United States likes the disparities rule, but, in practice, the argument will be about the number of headings. If this were not reduced, Britain could itself invoke the disparities rule on the basis of some higher American tariffs on products that are of exporting interest to the Common Market."

It will, indeed, be interesting to watch how this ticklish controversy will ultimately be resolved. The issue pertaining to agriculture is equally ticklish. There is wide disagreement not only between the U.S. and the Common Market but also among the Common Market countries themselves. The U.S. has been repeatedly emphasising the point that, unless progress is made towards liberalisation of tariffs on the import of its farm products (as well as on factory products) into Europe, ultimate agreement cannot be reached on any aspect of tariff reduction. But, according to the E.E.C., talks on tariff cuts on agricultural products are not at all possible in the absence of an agreement on cereal prices within the Common Market and on common agricultural policy. Such an agreement is by no means an easy one, what with the conflicting views of France and West Germany. General de Gaulle of France has more than once threatened that his country would leave the Common Market if the common agricultural policy were not implemented as foreseen, that is, by the 15th of next month. Reiterating this threat, albeit indirectly, the French Agriculture Minister, Mr. Edgard Pisani, declared at Brussels after the first session of the three-day meeting of Agriculture Ministers, which began on Tuesday this week, that, unless the problem of European agricultural prices was solved by 15th December, "something very serious would happen." At the session itself, he called upon the Ministers to begin at once discussing the problem and the way of solving it.

These threats and warnings by France have not perturbed West Germany in the least. It has not made any new concessions to resolve its differences with France, but its spokesmen seem to be quite confident that the differences would be overcome. One only wishes that their hopes will not go in vain. For, otherwise, the progress of the Kennedy Round itself will be greatly hampered. Such a development will not help India and other developing countries which are most earnestly hoping that the success of Kennedy Round would facilitate exports of their industrial and agricultural products to the markets of the developed countries. This hope of theirs, it is needless to add, is based on the assumption that the lists of exceptions (as yet a secret) would not be as disappointing and unfavourable as their recent experiences.

Scientists are at work throughout West Germany to determine just what "Pure Air" is and what contaminates the atmosphere. Seven air-testing stations are to be established at points ranging from the black forest to the heart of the Ruhr industrial area. One of the tasks will be to determine the extent to which contamination is caused by sulphur dioxide from industry, and by fumes or carbon monoxide from automobile exhausts or by smoke from house chimneys. Meanwhile the German petroleum-processing industry succeeded over the past five years in reducing the sulphur content of heavy fuel oil from an average of 4 per cent to less than 2.3 per cent. The industries are incurring enormous expenditure on installing new equipment and on adopting new methods to keep the air and water pure. In the highly industrialised State of North Rhine Westphalia, a sum of DM 80 million (approximately Rs. 96 lakhs) were invested from mid-1963 to mid-1964 for air-purification. Participants included the iron and steel industry (about DM50 million), energy-producing branches (nearly DM 16 million) and the cement and chemical industries (around DM 14 million).

The Indian Pulp and Paper Technical Association has organised a two-day seminar on "Recovery of Chemical and Forestry operation and Plantation problems" at the premises of the West Coast Paper Mills Ltd. at Dandeli, in North Kanara (Mysore) from the 24th and 25th inst. It will be inaugurated by the Chief Minister of Mysore, Mr. S. Nijalingappa. The seminar will discuss some very important aspects involving the economy and productivity of the pulp and paper industry in India. It is expected that many valuable papers revealing the wealth of experience and research in the industry in general will be read and discussed, contributing further to the development of this industry in India enabling it to further the vital task of manufacturing this product to a given quality and economy which is of such an essential nature in everyday life.

With our 14 branches overseas and over 1,000 correspondents almost all over the world, we are well equipped to assist you in every way.

Trade enquiries? Letters of Introduction? Credit information and status reports? Exchange Control Regulations? Travellers' Cheques? Remittances? Purchase and sale of foreign currencies? Import problems? Export problems?

Bring your problem to us and let us guide and assist you.

SUPERSONIC AIR TRANSPORT

TO BE, OR NOT TO BE, THE BASIC QUESTION FOR ATLANTIC NATIONS

By Our Aviation Correspondent

IN a recent article on the subject of the supersonic transport (*Commerce* dated 7th November), this Correspondent endeavoured to illustrate some of the problems which will confront the airlines if, and when, an S.S.T. (supersonic transport) is developed. Since then, events have moved swiftly. The indications are that crucial decisions are shortly to be taken by the three Governments involved. It may be of interest to trace those events and to speculate, perhaps, on the probable outcome.

It is now clear that the financial implications of the Anglo-French Concord are causing considerable anxiety—and not to the British Government alone. For some time past, the French Government, too, has been concerned at the escalating costs. Against the original estimate of £135 million, the bill is now expected to reach some £280 million for each country—and that figure, too, may well be exceeded. But to reassess a project, and to abandon it, are two very different things. It does not seem that the French ever entertained an intention of taking the latter course—and this for very good reasons.

The French aviation industry, compared with that of the British, is small. By 1965, according to *Flight International*, almost 60 per cent of the entire French industry will be involved in the Concord project. Cancellation, consequently, would entail not only the loss of £50 million which, according to French sources, has already been expended—*plus* large sums payable in compensation—but could also lead to widespread unemployment.

Difference in Outlook

The British Government, on the other hand, appears to think that the numbers presently employed on the British end of the project, and the money already spent, do not involve serious problems. The British Minister for Aviation, in the course of a debate in the House of Commons, certainly conveyed that impression. "If there is a case for review at all," he said, "it is surely an advantage to have a review now." And it is true, of course, that, at present, a comparatively small section of the British industry is directly engaged on the Concord. In the short term, therefore, cancellation would affect Britain less than France. These reasons alone are sufficient for the considerable difference that exists in the outlook of the two Governments.

But this is not to say that British industry is unconcerned. On the contrary, both the aviation and electronic industries have expressed grave concern—and in no uncertain terms. Not only, their spokesmen claim, has the technological know-how, which has sprung from this very advanced project, proved to be extremely valuable, but the long-term interests of both industries are deeply involved. Some go so far as to predict that to withdraw from the project at this stage would mean the competitive extinction of both the British and French industries in the long-haul airliner field.

What has, perhaps, galled the French Government most is the rather tactless manner in which the new British Government announced its intention to reconsider the Concord. In the Government's White Paper, the Concord was described as "a prestige project of low priority"—not, perhaps, a very flattering description of what is commonly regarded as an extremely important experiment in Anglo-French collaboration. Be that as it may, the question now is whether Britain will withdraw from the project and what would be the consequences if they did. In the first place, one suggests, outright withdrawal is unlikely but a measure of "go slow"—probably most equally as damaging to the project—might be adopted. In any event, neither measure by the British would necessarily mean the end of the Concord—or should one say, perhaps, the Concord? The French might continue independently—though this seems unlikely. Alternatively, they might invite German or American co-operation. Both the latter industries, it seems, have made tentative proposals.

Let us turn now to the American scene. As one has already reported, both Boeing and Lockheed have now submitted their re-worked designs. Precise details have not been disclosed but both manufacturers are sanguine. Boeing claim a 30 per cent improvement in the economics of their new design. Lockheed similarly claim much improved payload-range characteristics. According, once again, to a report in *Flight International*, the swing-wing Boeing S.S.T. will carry 250 passengers over a 5,000-mile sector—a performance, incidentally, which far exceeds the 30,000 lbs. payload over 4,000 miles originally specified by the F.A.A. The new Lockheed design, the same report suggests, will come in two versions—one for 170 passengers, the other for 250. Power has been stepped up by 25 per cent and the aircraft will have Mach 3 capability (about 2,000 m.p.h.).

Confidence in U.S.

Of considerable significance is the claim, advanced by both designers, that the new designs will match the seat-mile costs of present subsonic jets over medium and long-haul routes. But this, one has to suppose, is to take much for granted—the fleet utilisation figure, for instance, on which the calculations are based. It is pertinent to observe, in that context, that, according to a report in *Aviation Week*, a study made by United Airlines, one of the largest American domestic operators, arrives at very different conclusions. They calculate that the seat-mile costs of any S.S.T. will exceed those of present subsonic jets by about 26 per cent.

Boeing's and Lockheed's new designs are now under evaluation by a 120-man technical committee headed by Mr. Gordon Bain of the F.A.A. Recommendations are due at the end of November. Concurrently, two other vital aspects of S.S.T. development are under investigation by separate committees. The first aspect is that of the sonic boom; the second concerns the development costs—and methods of financing them—of the kind of S.S.T. at which the United States is aiming. Both problems are, obviously, of an extremely critical nature; either, at this stage, could provide a barrier to immediate progress. The sonic boom, for instance, might impose such restrictions on S.S.T. operations as to make these financially quite unattractive. Alternatively, the boom may raise psycho-sociological problems of such dimensions as to give the authorities pause.

As for the financing of development, this must, presumably, be related to the cost per copy and the potential market. Boeing, according to one report, estimate that their S.S.T. will be priced at $25 million per copy. They further estimate a potential market, up to 1980, of 350 aircraft. This seems to indicate a development cost of $8,750 million. If that estimate is approximately correct, is the outlay within the resources of the industry? Even were the U.S. Government, as the industry now demands, to find 90 per cent of the cost, it might still remain, one imagines, a doubtful proposition.

To be, or not to be?—that is the question which has to be answered on both sides of the Atlantic. What the outcome will be is, of course, pure speculation. There are those who see in the present Concord situation, a golden opportunity for the Americans. That, one suggests, is a natural but facile assumption. If the Americans decide to initiate an S.S.T. project, that decision, one believes, will be based strictly on the technical and economic aspects of the case.

WAS BRITAIN'S EMERGENCY BUDGET NECESSARY?

By Questor

NO Chancellor of the Exchequer who increases taxation can expect to be popular, and Mr. Callaghan, Britain's new Labour Chancellor, has run into trouble with his first Budget. It has been criticised for being inflationary and for being deflationary, for containing too much and containing too little, for helping the poorer members of the community and for not doing enough to soak the rich. Even those who think that it was pretty much the right sort of Budget to produce at this time find it difficult to get up much enthusiasm.

Why have an emergency Budget at all after only three weeks in office? Its main object was to legalise the tariff surcharge on imports and the arrangements for giving a tax rebate to exporters which had already been announced—and Mr. Callaghan, a little shaken perhaps by the strength of the reaction to his surcharge in G.A.T.T., E.F.T.A. and O.E.C.D., made a point of stressing that it would be reviewed, reduced and removed as soon as the balance of payments had recovered.

But the tariff will have a fiscal and an economic effect at home as well as on the balance of foreign payments. To the extent that it succeeds in its purpose, it will divert demand on to home production; to the extent that it fails, it will absorb purchasing power and increase Government revenue.

It is quite impossible, of course, to predict the effect of the surcharge precisely. But Mr. Callaghan and his advisers naturally assumed that it was more likely to work than not and that it was, therefore, likely to increase demand at a time when most industries are already fairly fully occupied. They decided, therefore, to increase indirect taxation to match their necessarily rough estimate of its effect—and, since tax on two of the heavy revenue-raisers, drink and tobacco, had been raised in the spring, they chose to raise tax on the third, petrol.

Having gone so far in the direction of a full-scale Budget, Mr. Callaghan was easily led on to go further. It was not to be expected that the revenue authorities would be ready after three weeks with the complicated schemes for tax reform to which the new Government is committed. But a high priority is being given to the attempt to reach an understanding with trade unions over wage restraint, and it was thought that some simple and emergency tax on profits might be imposed to help this along. In fact, Mr. Callaghan resisted the temptation, committing himself instead to introduce a corporation tax and a tax on long-term capital gains in his next Budget in April.

What he did to pave the way for a voluntary agreement on price and wage restraint was to carry out Labour's election promise to raise social security benefits, particularly pensions, and to abolish the charge at present made for prescriptions under the National Health Service. The main cost of this concession, which will not come into force until the spring, is to be met by an increase in the social security contributions of employers and workers. But the rest—a quite large rest—is to be met by an increase in the standard rate of income-tax, which will fall on company profits, unearned income, and on workers whose earnings are above the average.

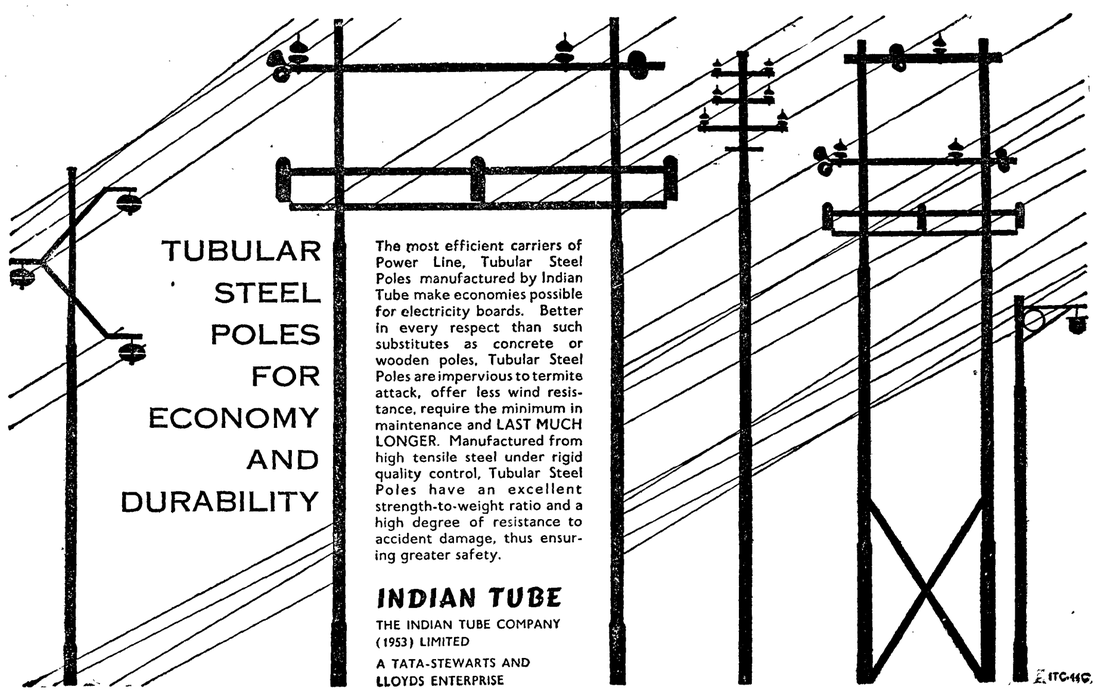
One can hardly blame the new Government either for carrying out its pre-election promises or for recognising that higher Government expenditure ought to be balanced, in the present state of the economy, by higher taxation: much of the criticism the Budget has attracted is basically political. But it is fair to point out that, when employment is full and demand is high, as they are at present, business tends to recoup an increase in its costs by charging higher prices and workers seek to offset higher taxes by demanding higher wages. The Government is well aware of this. One of its main aims, in fact, is to hammer out with business organisations and trade unions details of a policy for controlling the behaviour of prices, profits and wages.

A Price Review Body is to be set up which will attempt (in the manner of the late President Kennedy over steel) to discourage increases in the price of key commodities. Profits are to be taxed more heavily if they rise too fast. And the unions, convinced that the Government is acting in the interests of the whole country rather than of a particular section, are expected to work out means between themselves of keeping the average increase in wages to the figure which the growth of productivity allows.

It is an ambitious programme, and I have no doubt that something can be done along these lines to affect the free play of market forces. But it is doubtful whether progress towards a national agreement will be made as quickly as the Government appears to hope. And it is very doubtful whether national agreements will cut very much ice in the individual factory while labour remains as scarce as it is at present. Unless he is very lucky, therefore, or unless demand slackens of its own accord, Mr. Callaghan may have to make himself still more unpopular in the spring.

U.K.'S MINISTRY OF OVERSEAS DEVELOPMENT

The purpose of the newly constituted Ministry of Overseas Development in the United Kingdom is to promote the progress of developing countries, keeping in mind Britain's "special ties with Commonwealth countries," including the dependent territories. The Ministry will be in charge of development programmes in overseas countries. Announcing this in the British Parliament last week, Mrs. Barbara Castle, U.K.'s Minister for Overseas Development, pointed out that it would be responsible for the aid programme as a whole, and its make-up between bilateral and multilateral aid and between capital aid and technical assistance. The terms and conditions of capital aid and the principles on which technical assistance is granted would also be the responsibility of the Ministry. Further, it will have the task of co-ordinating British policy and programmes with those of international aid organisations (U.N.E.S.C.O., F.A.O., etc.). Aid questions arising from United Nations Conference on Trade and Development will also be handled by this Ministry. These functions, it may be noted here, were hitherto being discharged by the British Treasury and the overseas departments.



TUBULAR STEEL POLES FOR ECONOMY AND DURABILITY

The most efficient carriers of Power Line, Tubular Steel Poles manufactured by Indian Tube make economies possible for electricity boards. Better in every respect than such substitutes as concrete or wooden poles, Tubular Steel Poles are impervious to termite attack, offer less wind resistance, require the minimum in maintenance and LAST MUCH LONGER. Manufactured from high tensile steel under rigid quality control, Tubular Steel Poles have an excellent strength-to-weight ratio and a high degree of resistance to accident damage, thus ensuring greater safety.

AMERICAN LETTER

NO RADICAL DEPARTURE EXPECTED

L.B.J. FACES STIFF TEST IN THE YEARS AHEAD

By N. Pattabhi Raman

NEW YORK, 14*th November*

SPEAKING before the election on 3rd November, 1964, Lyndon Baines Johnson, the late President Kennedy's successor seeking the Presidency in his own right, said repeatedly: "I want the mandate of this election to be written strong and clear, so that none will mistake the meaning." By giving him 42.1 million of the popular votes, as against about 26 million for his opponent Barry Goldwater, the people of America have given him what he wanted: an overwhelming victory and a strong mandate. They have echoed his theme: "Let Us Continue!" and firmly rejected the Republican nominee's phoney conservatism, and his call for a switchback to a yesterday that never was.

"The Johnson majority is indisputable proof that the preponderant mass of the American voters are in the centre, inside the two extremes, and that the reason for the Democrats' win is that Kennedy and Johnson have worked carefully to make the Democratic Party represent the centre," Walter Lippmann, the sage commentator, wrote after the election. "This surely is the primary mandate of the 1964 election, a mandate to both parties to seek their strength and define their issues within, not against, the prevailing consensus."

During the campaign, Johnson repeatedly staked out for himself the role of a "unifier"; he proclaimed the wish to be "the President of all the people," not a partisan of business or labour or any other group in the society. His victory—the 61.3 per cent of the total vote that he received—is a reflection of the people's faith that he can be trusted to handle the nation's affairs with vision and responsibility, without deviating sharply either to the right or to the left. The nature of the election campaign was such, however, that neither Johnson nor Goldwater addressed himself to specific issues. L. B. J. promised to build "The Great Society" but he spoke in generalities only. Hence it is difficult to predict the course of developments during the next four years. All that can be said with certainty is that there will be no radical departure from the basic policies of the past four years. Additional strides will likely be taken towards an enlargement of the Welfare State concept, but the primary emphasis will still be on private initiative and enterprise.

A More Liberal Congress

Johnson's own landslide victory has been accompanied by a considerable strengthening of the Democratic Party in Congress. When the new Congress meets in January, the House of Representatives will have some 296 Democrats to 139 Republicans—a gain of more than 35 Democrats. The shift has more than numerical significance, because many members of the House with beliefs close to those of Barry Goldwater have been defeated and replaced by moderates and liberals. The coalition of Southern Democrats and conservative Republicans that blocked many progressive legislative measures over the past four years or more has been virtually knocked out. This means that the House will be controlled not only by Democrats but by Democrats sympathetic to the legislative programme of the Administration. In the Senate, this is already the case, and the elections on 3rd November have only strengthened the hands of the Administration in that chamber.

All this does not mean that the Administration will have clear sailing on every piece of legislation. One cannot be certain of this, because of the dominant power of the committees in Congress. Many of these legislative committees have reactionary southerners or conservatives for chairmen who frequently employ every legislative tactic and rule to prevent Bills they do not like or favour from coming to the floor. Whether the strengthening of the liberal and moderate elements in the House membership will help weaken the autarky of the committee chairmen remains to be seen. But democratic leaders in the House are hopeful. Speaker John McCormack has forecast early passage of such long-blocked measures as the Bill to provide medical care for the aged under the social security system. According to the House Democratic Leader, Carl Albert of Oklahoma, the election has given the Democratic Party a real "working majority" in both Houses of Congress. "I think we'll do pretty well on most of the President's programmes," he observed recently.

Labour's Expectations

As the votes have shown, Lyndon Johnson has the broad support of the people, even if some of this support merely reflects a rejection of the extremist Goldwater alternative. In return for this support, each of the different segments of the society has its own hopes and expectations of what the Administration will do for it.

"The people have given their overwhelming mandate to the Great Society," George Meany, President of the A.F.L.-C.I.O., the confederation of American trade unions, said, welcoming Johnson's election and calling for progressive legislation. He added: "That mandate can and must be fulfilled." Meany and other leaders of organised labour, proud of the role that trade unions played in registering voters and getting them to the polling stations on 3rd November to support the Johnson-Humphrey ticket, are hoping that the next Congress would take action friendly to labour. For instance, they would like Congress to amend the Taft-Harley Act, the basic trade union law, to prohibit State legislatures from enacting "right to work" laws. Some 20 States have passed "right to work" laws which prevent a union and an employer from agreeing that a worker must join the union 30 days of being hired or face discharge. In other words, the "right to work" laws ban what are known as "union shops." Organised labour considers them to be anti-union.

Labour also hopes for favourable action on other measures which it has been supporting. These include: an increase in the minimum wage from $1.25 an hour to $2.00 an hour; double time for overtime; a shorter work week; federal aid to education; expansion of social security to include hospital insurance for the aged; additional public works projects and other programmes to reduce unemployment; federal standards for unemployment compensation; and consumer protection in packaging, etc.

Businessmen too are generally pleased with the results of the election. Even those who supported Barry Goldwater seem to feel assured that the Johnson Administration will not take any steps likely to upset business and the economy. There is general faith in Johnson's sense of moderation. Walter Mack, founder of the grass-roots "Republicans and Independents for Johnson" and himself a businessman, expects to see "a reasonably prosperous United States, with no great deflation ahead, and no inflation either," and also a "more moderate and more flexible administration." Many businessmen hope that there will be more moderation and flexibility particularly in regard to anti-trust action.

Johnson's emphasis on frugality in Government expenditure is definitely a factor in the welcome given to him by the business community. His statements praising private enterprise and calling for close co-operation between Government and business have also helped considerably. There was some concern in the business community, when, in the week prior to the election, President Johnson expressed his opposition to any increases in steel prices at this time. But there was no spurt of hostility towards Government, as there was when the late President Kennedy vigorously squelched the steel industry's decision to increase prices in April 1962. One conservative businessman commented: "Steel prices have come into the public domain, because they are so important. Philosophically, I think it is wrong for the President to interfere, but, as a practical matter, a little horse trading is infinitely preferable to an injunction."

Whether President Johnson will be able to satisfy the expectations of the different groups and whether he will be able to harmonise their sometimes conflicting demands and aspirations remains to be seen. If the President is known for his superb skills as a politician, he surely faces a stiff test in the years ahead. He probably will succeed in giving shape to his programmes and taking the country forward without dividing it. But there is the possibility also that, in trying to be "President of all the people," he might be tempted to soft-pedal action where it is needed. Thus, the *New York Times* wrote in a recent editorial: "No matter how massive the electoral victory—and it was massive—the Administration cannot merely ride the crest of the popular wave rolling along on a sea of platitudinous phrases and euphoric promises. It has no time to relax. It made a reasonably good start before the election; and now that it has a broad popular mandate, it has the moral as well as the political obligation not to try to be all things to all men but to settle down to a hard, concrete, purposeful course of action."

Yes, it is a hard task that Johnson has undertaken. But he has the support and the good wishes of the people in a measure that is almost unparalleled in American history.

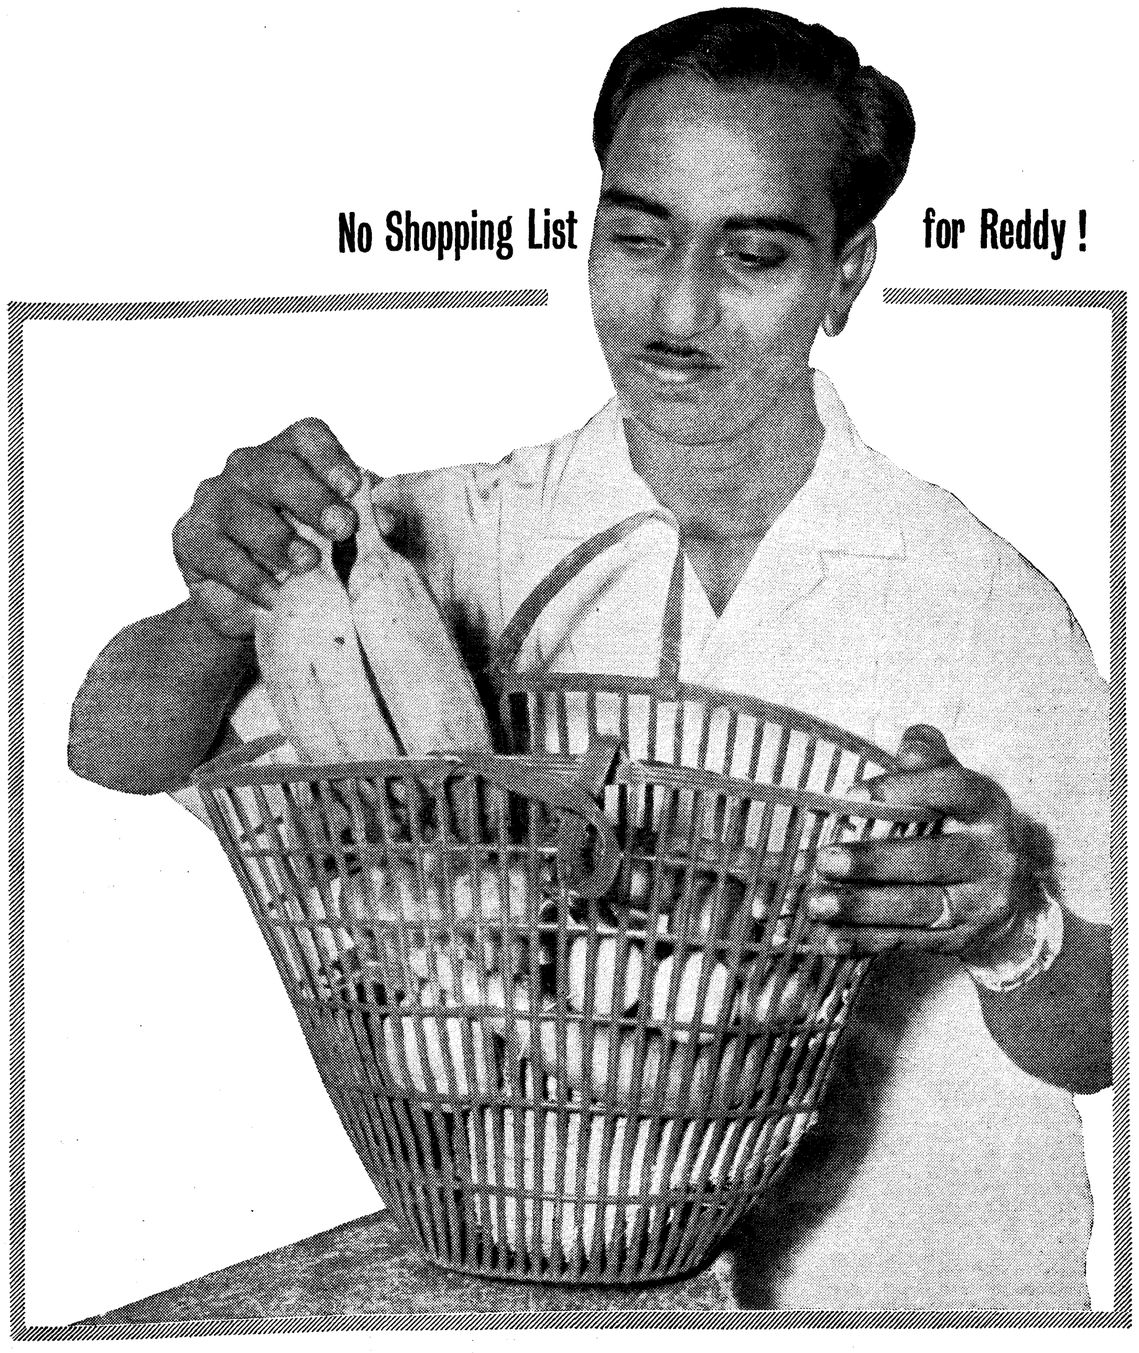
No Shopping List for Reddy!



Venkata Reddy's memory is good at work and at home. Mrs. Reddy never needs to write a shopping list. Just one telling...and the day's shopping list is clear in his head, down to the smallest chilli. Memory matters too in playing cards; the winner of many bridge tournaments, he enjoys the game. The same patience, concentration and an eye for detail that make Reddy a good bridge player, provide him with the basic qualities required as a draughtsman with Burmah-Shell, Madras.

EVERY ITEM MUST TALLY

He helps keep records of the Company assets throughout Madras Branch. Hundreds of details and data collected from blueprints, completion certificates, amendment sheets, items for sanction or disposal. Every item must tally—a plug, a culvert, a godown—description, cost, site. Sometimes his search takes him to 1928 for records; but often the figures he needs are in his head.

TODAY, AS EVER, PEOPLE LIKE REDDY ARE WORKING FOR YOU

Reddy comes from Razampet in Andhra. He has a farm there and when he goes on leave, he relaxes midst orchards and paddy fields, or at leisurely rubbers of bridge.

Reddy and people like him—at all levels of responsibility—are Burmah-Shell. Today, as ever, they are hard at work...working to ensure that vital petroleum products, essential to India's growth and progress, are brought to you at the right place and time, in the right quantities.

BURMAH-SHELL are People in the service of the People

OWNERSHIP OF GOVERNMENT SECURITIES

RESERVE BANK IS THE BIGGEST HOLDER

THE *total marketable* rupee debt of the Central and State Governments increased by Rs. 235 crores or 7.9 per cent during the year ended March 1963—from Rs. 2,977 crores to Rs. 3,212 crores. The corresponding rise was Rs. 193 crores or 6.9 per cent in 1961-62 and Rs. 203 crores or 7.9 per cent in 1960-61. However, in 1959-60, it was much higher at Rs. 343 crores or 15.3 per cent. This rise of Rs. 235 crores in 1962-63 was made up of (a) flotation of new market loans (Rs. 158 crores net), (b) funding of *ad hoc* Treasury Bills into further issues (Rs. 50 crores) (c) receipts from Gold Bonds (Rs. 3.4 crores), (d) receipts through National Defence Bonds (Rs. 22 crores), and (e) issue of Bonds by some State Governments in connection with the payment of compensation to intermediaries in landholdings (Rs. 1.6 crores net).

The marketable rupee debt of the Central Government increased by Rs. 149 crores to Rs. 2,519 crores and that of State Governments by Rs. 86 crores to Rs. 693 crores. Relatively to their total public debt, the States have been progressively stepping up their annual rate of borrowings. Consequently, the share of the State Governments in the total public debt of India which stood at 14.8 per cent in December 1957 and had advanced to 20.4 per cent by March 1962, increased further to no less than 21.6 per cent in March 1963. At this rate, their share may be as much as one-fourth by the end the third Plan.

The statistics quoted above are taken from a study on the pattern of ownership of

Table B: *Maturity Pattern of Securities*

(Figures in crores of rupees)

Note :—Where loans bear two dates of maturity, the earlier date has been taken for the purpose of classification; for loans not redeemed on earlier date, later date has been taken.

Government debt, made by the Economic Department of the Reserve Bank of India, and published in the October issue of the *Reserve Bank of India Bulletin*. For the purpose of this survey, the Government rupee debt excludes treasury bills, small savings, prize bonds, premium prize bonds, outstanding balances of expired loans and non-marketable rupee securities. On this basis, the Reserve Bank's holdings on its own account, exclude the special issue of the non-marketable 4 per cent loan, 1973, for Rs. 300 crores, created in July 1958, and fully taken over by the Bank against the cancellation of the equivalent amount of *ad hoc* Treasury Bills.

Pattern of Ownership

The ownership pattern of Government debt has undergone a change during the last few years. Whereas the commercial and co-operative banks were by far the principal holders of Government securities till 1959-60, the Reserve Bank of India came to occupy the top position in 1960-61 and continues to maintain it. As a matter of fact, of the total increase of Rs. 631 crores in Government rupee debt during the three years ending March 1963, the absorption by the Reserve Bank was Rs. 482 crores, or over three-fourths of the total addition to rupee credit; and its share in the total credit to the Government increased from 18.1 per cent or Rs. 467 crores in 1959-60 to 29.6 per cent or Rs. 949 crores in 1962-63.

About 90 per cent of the total holdings of commercial and co-operative banks are accounted for by the scheduled banks. The holdings of commercial and co-operative banks which increased from Rs. 478 crores or 24.0 per cent of the total marketable debt of the Governments in December 1957 to Rs. 734 crores or 28.4 per cent in March 1960, declined to nearly Rs. 600 crores in the next two years, the percentage share falling to 21.9 in March 1961 and 20.2 in March 1962. In March 1963, however, the amount was somewhat higher at Rs. 643 crores, though the percentage came down further to 20.0. The main reasons for the decline in 1960-61 were two: (1) phased transfer of P.L. 480 deposits from the State Bank of India to the Reserve Bank, with effect from July 1960, which led to a depletion in the Government securities portfolio of the State Bank of India, and (2) sales of securities by the banks in order to meet the persistent high demand for bank credit, in the context of slower rate of expansion of bank deposits. In 1961-62, though the resources position of banks was somewhat comfortable, relatively speaking, the banks invested mainly in securities other than those covered by the survey, namely, Treasury Bills and Treasury Savings Deposit Certificates, and there was as such no increase in the securities holdings under review. 1962-63 was again a tight year due to a faster growth of credit than deposits. As a result, though the holdings increased by Rs. 41 crores, the rise was less than proportionate to the growth of total securities and the percentage share to total Government rupee debt came down to some extent.

The Reserve Bank, commercial banks and co-operative banks together accounted for nearly one half of the Central and State Government securities. The various departments of Governments—especially State—also invest their surplus funds in marketable Government loans. Such holdings also rose, albeit slightly, from Rs. 218 crores in December 1957 to Rs. 284 crores in March 1963; and the share to the total declined gradually year after year from 10.9 per cent to 8.8 per cent. State Governments were responsible for almost the entire holdings, Central Government's own holdings declining from Rs. 7 crores to Rs. 2 crores. Next in importance to banks as holders of Government debt come the insurance companies, with the Life Insurance Corporation accounting for over 90 per cent of the holdings of this group. The total investments of this sector has nearly doubled in the six years ended 1963: from Rs. 270 crores in December 1957 to Rs. 418 crores in March 1962 and Rs. 457 crores in March 1963. Its share to the total, however, remained almost constant at 14 per cent. Then come the provident funds: their share in Government loans has been rising fast, from Rs. 110 crores in December 1957 to Rs. 261 crores in March 1962 and Rs. 312 crores in March 1963; in terms of percentage, it has risen from 5.5 to 8.8 and 9.7 respectively. The reasons for this *rapid rise are*: the enhancement of the statutory rate of contributions to the provident fund and the increase in the coverage of new units under the scheme. As regards the holdings of Industrial Finance and State Financial Corporations, of Reserve Bank of India on others' account and non-residents, their total share continued to be negligible, varying between 2 and 4 per cent over the years.

Investment Portfolio

The investment portfolio of the residual category "others" has, however, been declining. From Rs. 543 crores in December 1957, the amount came down to Rs. 502 crores in March 1962 and Rs. 497 crores in March 1963, and the percentage share to the total from 27.2 to 16.9 and then to 15.5. A complete breakdown of the *group* is not available. But a breakdown of the data collected from 64 scheduled banks regarding the securities held by them on behalf of their customers, reveals that such holdings declined from Rs. 240.7 crores in 1961-62 to Rs. 197.0 crores in 1962-63—a decline of Rs. 43.7 crores—accounted for by the decline in the holdings held on behalf of trusts (Rs. 31.5 crores), joint-stock companies (Rs. 6.5 crores), individuals (Rs. 3.6 crores) and local authorities (Rs. 2.1 crores). It will thus be noted that individuals as investors in Government securities hold only negligible portion of the marketable public debt of India.

Almost the entire holdings of the Reserve Bank of India and Provident Funds continued to relate to the Central Government securities. As regards the Governments' holdings (held mainly by the State Governments), about three-fourths related to Central Government securities and one-fourth to State Government securities, and in the case of the holdings of commer-

NOTE :—For item IX 'Others,' the break-up is not available for the entire amount. For Central Government Securities, the break-up as on March-end 1959, 1961 and 1963 is available for Rs. 282·07 crores, Rs. 292·90 crores and Rs. 143·10 crores, respectively. The corresponding figures for State Governments' Securities are Rs. 49·47 crores, Rs. 65·50 crores and Rs. 53·90 crores respectively.

It's 9.30—let's listen to the National Programme

Long before the power cables brought electricity to India's villages it was possible to listen to the radio —thanks to the battery-operated set.

Union Carbide India were the first to manufacture radio batteries in India. And they were the first to make special batteries for transistor and electronic equipment.

Electrical appliances need no longer depend exclusively on mains plug points because of these versatile 'Eveready' radio and transistor batteries. Their exceptionally compact construction and capacity to recover power between uses make them ideal for portable radios, gramophones, tape-recorders, electric shavers and a whole range of electrical equipment.

Union Carbide India's battery manufacturing plants are but a few of the seeds of industry that the Company have sown in India. The variety and value of products made by Union Carbide India today show how the resources and know-how of a world-wide organisation can serve the needs of a developing economy.

IWTUC 1961

UNION CARBIDE Polyethylene Resins, Polyethylene Film, Polyethylene Pipe, Acetic Acid, Butyl Alcohol, Butyl Acetate, Ethyl Acetate, Agricultural Chemicals, Plastics, Zinc Addressograph Plates, EMMO Photo-engravers' Plates, UNION CARBIDE *Carbon and Graphite products*, LINDE *Welding* and Cutting Equipment.

PROBLEMS OF NEW ENTERPRISES—I

PRELIMINARIES FOR STARTING—ASSISTANCE FROM I.C.I.C.I.

WITH the increasing use of development loans in the starting and running of industrial enterprises in India, it has become imperative for these enterprises to accept financial planning and discipline in line with their counterparts in the Western countries. This fact was impressively highlighted by Mr. G. L. Mehta, Chairman of the Industrial Credit and Investment Corporation of India (I.C.I.C.I.), while speaking at a conference of I.C.I.C.I constituents held at Bombay on Friday, the 13th inst. Over the last few decades, Mr. Mehta pointed out, the industry in the West had become subject to essential financial discipline, as it had tried to use institutional funds like those of life insurance companies. He wanted the entrepreneurs borrowing funds from I.C.I.C.I. to realise that, since they were using "other people's funds," they must be responsible for the way in which such funds were handled. In this connection, he explained the methods of appraisal of borrowers adopted by the I.C.I.C.I. and told the conference that the Corporation insisted on certain minimum debit-equity ratio, allowances for preliminary and pre-operative expenses, and market surveys. Revealing that the Corporation had helped more than 300 companies, many of which were engaged in non-traditional industries, he said that the Corporation had tried to build up procedures in such a way as to arrive at an institutional, impersonal decision on a project.

Explaining the circumstances in which the I.C.I.C.I. has to work, Mr. Mehta said:

"We deal with new entrepreneurs for whom the project seeking our assistance is their first industrial venture; we also deal with many old entrepreneurs who are moving out from traditional to non-traditional industries; several entrepreneurs have taken up many projects at the same time. Many old entrepreneurs, because of their past experience, appear to consider our requirements and conditions unwarranted in their case. This is hardly justified. All entrepreneurs face, and have to deal with, new problems—phasing of work, arranging of finance, setting up organisation to carry out the project according to schedule."

The Problems

The problems involved in the starting and running of an enterprise in this country have been vividly brought out in the agenda notes circulated at the I.C.I.C.I. Conference. Briefly summed up, the problems of starting an enterprise pertain to project preliminaries (that is, Government consents, financial arrangements and legal formalities of licensing, etc.), collaboration and plant supply, delays and over-runs, while the problems connected with the running of the enterprise relate to management, finance, raw materials, ancillary facilities like power and transport, labour and marketing. All these problems can certainly be solved satisfactorily, provided (*a*) the managements of industries are vigilant and efficient, and (*b*) the authorities (Central, State and local) accord the necessary facilities and encouragement. In view of the importance of the subject, this journal proposes to give a resume of the problems as highlighted in the I.C.I.C.I. agenda notes for the benefit of readers. This will be in two instalments, dealing, respectively, with the problems of starting an enterprise and those of running it; the second instalment will appear in our next issue.

The task of setting up an enterprise in India is a more complex one than in Western countries, partly because there are more formalities to be fulfilled and sanctions to be obtained and partly because the industrial system in this country is not as versatile as in the West. First of all, an industrial licence need to be obtained for establishing an industry above a specified size and if imports of capital goods are involved, it will be necessary to secure an import licence, with a detailed list of approved items. Then comes the permission of the capital Issues Committee for issue of capital. These formalities are time-consuming and require an expert handling to see that the proposed project gets through expeditiously. Time element is of utmost importance at all stages of project planning and promotion. Although project promotion, by its very nature, does not lend itself to simultaneous progress on all aspects, a recognition of the "critical" elements in a project and co-ordinated action on inter-dependent stages of work would help speedy implementation of the project. Applications to the import control authorities for import licence and to the Reserve Bank of India for exchange control consent, for instance, could be co-ordinated, supplemented by active follow-up in respect of these as well as other aspects. Several new units, unlike many older and established industries, do not have such follow-up cells for various types of work. This is a lacuna which must be removed in the interest of expeditious implementation of projects.

Some Difficulties

Besides Government consents for various purposes, there are many other preliminaries, such as feasibility studies, location of the project, scale of operations, technical consultancy and management arrangements, on which simultaneous or advance action has to be initiated if the success of the enterprise is to be ensured. Satisfactory progress in this field itself assists not only in speeding up grant of Government consents but also in all the subsequent stages of project implementation. The experience of the I.C.I.C.I. has shown that feasibility studies are not always given the attention they deserve. Much difficulty is experienced by promoters in securing possession of lands for building the factory. The difficulty is all the greater in cases where the company either depends on Government acquisition of land or procures land privately from an undivided Hindu joint family. If it is Government acquisition, care has to be taken to ensure that the documents like *sanad* or *patta* do not contain prohibition against alienation, mortage or charge in favour of lending institutions. Difficulty is also experienced in certain cases due to the absence of Collector's permission for change in the classification of lands from agricultural to non-agricultural purposes which holds up mortgage transactions.

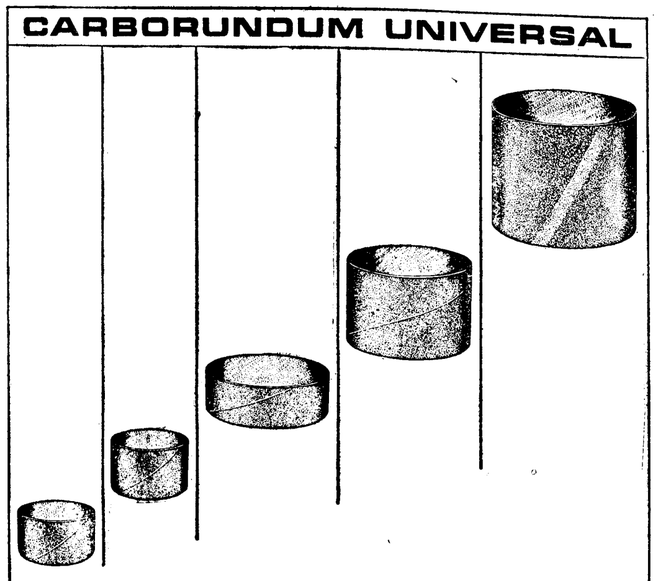
While the aforesaid preliminaries are being proceeded with, the promoters will have to prepare carefully compiled estimates of the constituent items of capital outlay and arrange for the requisite financial accommodation. A common pitfall in capital estimates is that these estimates fail to allow for major contingencies like price escalation, with the result that some projects, taken up for implementation with the idea that the financial resources had been fully arranged, would in fact be found to be under-financed, thereby causing financial embarrassment to promoters at a later and more critical stage. Inasmuch as there is no substitute for a technically well conceived project, the financial structure prepared for a project should reflect its individualities and, in this respect, there can be no simple financial rule applicable to industries at all times or even in the same industry at any point of time. The criterion adopted by the I.C.I.C.I. in its lending policies is to see that the financial structure has within itself a built-in-safety factor to enable the company to withstand any shocks arising from either over-run in costs, as compared with original estimates for production or market problems. The proportion of equity in the total capital employed and the ratio of loans to assets are decided from case to case. Referring to this aspect, Mr. Mehta pointed out in his speech that the I.C.I.C.I. had always insisted on a strong equity position, the exception being only in some rare cases of highly capital-intensive industries like aluminium. The I.C.I.C.I. decisions are mostly guided by the technical and financial viability of the units rather than by the 'coverage' principle alone, though care is taken to ensure that the units impose on themselves some sort of financial discipline and do not overextended their financial commitments in the form of borrowings.

Foreign Collaboration

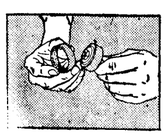
As for the financial and technical collaboration from abroad, it is crucial for an underdeveloped country like India to import technical know-how. That the Indian entrepreneurship has realised the importance of foreign collaboration is evident from the fact that, out of the 299 companies assisted by the I.C.I.C.I. upto the end of September 1964, 158 companies had received foreign technical and/or financial participation. A collaboration agreement is a long-term arrangement (usually upto 10-12 years) for the supply of engineering services, technical know-how and technical assistance by the collaborators both during the initial stages of project finalisation and construction and during the subsequent operating period of plants, as distinguished from a mere arrangement for the supply of plant and machinery from abroad. The promotors should be careful in selecting a firm with which financial or technical collaboration is sought. It is particularly necessary to find out when old processes become absolete and new processes are recognised as standard ones. It is equally necessary to avoid any imbalance in the productive capacities of equipment supplied by foreign machinery manufacturers, as otherwise there would be idle production periods and rise in overhead costs.

While the vast majority of collaboration agreements is for technical collaboration only, there are agreements called 'joint ventures' where there is financial participation in share capital by foreign partners. This arrangement has four distinct advantages. First, the foreign firm has a stronger incentive to make the project a success, as it has a financial stake. Secondly, in some cases, a part or whole of the foreign exchange cost of the project is covered by the foreign collaborators, apart from making available foreign technical and managerial skill. Thirdly, where the foreign firm invests substantially in the equity capital, lending institutions like the I.C.I.C.I. have found it easier to have access to information required. And, finally, a joint venture facilitates a rigid functional specialisation in which the Indian partner deals with problems like supply of local raw materials, sales, publicity and labour relations and the foreign partner looks after technical operations, fundamental research, foreign supplies and finance. In the final analysis, however, technical and financial collaboration agreements are drawn on the basis of a 'give and take' attitude on both sides.

CARBORUNDUM UNIVERSAL



COATED ABRASIVE SLEEVES



Mounted on expandable mandrels and used on high speed pneumatic or electric grinders, these coated abrasive sleeves have countless uses. They are virtually indispensable for grinding and polishing hard-to-get-at corners, grooves, shoulders of moulds, dies, etc. The abrasive sleeves are available in sizes ranging from 1/2" to 4 1/16" diameter, and in various widths as required.

Delays

Perhaps the most ticklish and intriguing problem in starting an enterprise is the occurrence of delays and over-runs. After the sanction of I.C.I.C.I. loan, a normal time lag of six months is allowed for completing the various formalities like permission of capital issues control authorities, issue of capital, obtaining of import licence and legal formalities relating to assistance. In fixing up the schedule of construction, the I.C.I.C.I. does not accept the estimates of its clients; rather it provides for much longer gestation periods in order to allow for the various problems involved in the setting up projects. Even so, it has been found that in the case of 95 projects construction has been lagging behind their original estimates, the extent of delay ranging from 7 to 48 months.

Out of the 316 projects of 281 companies to which the I.C.I.C.I. has given financial assistance up to the end of June 1964, 130 projects have been completed (as of 30th June 1964), 111 projects are in various stages of production, while 75 are still to commence. Of the completed projects, 37 were delayed by more than six months; of the projects under construction, 32 show a delay of more than a year; and, of the projects on which work is still to commence, 25 projects are likely to be delayed.

The reasons for delays are not far to seek. Usually, the delays occur in the finalisation of design and specification of plants and buildings, agreement on foreign collaboration, land acquisition and execution of legal formalities connected with institutional assistance. In some cases, inadequate estimation at the planning stages results in delays. Similarly, difficulties in procuring essential building materials, power supply, transport bottlenecks and extended delivery periods for equipment by suppliers upset the schedule envisaged. The schedules are also upset by the unsatisfactory capital market conditions which hinder arrangements for raising capital from the public. Delay in the issue of import licence, too, affects most of the projects. It is, however, hoped that, with the recommendations of the Swaminathan and Rao Committees, the procedural delays would be cut down.

Few projects, according to the agenda notes prepared by the I.C.I.C.I. for the Conference, are completed in time or within the original cost estimates. In recent years, this has been due to steadily increasing costs, but, in many cases, it has also been due to careless, incomplete and overoptimistic estimates. Though in certain cases over-runs occur due to pre-construction and construction delays, they also happen because of (*a*) changes in project details, (*b*) failure of authorities in providing ancillary service facilities as, for instance, power as originally promised and (*c*) increasing tax imposts by the Government. As the financial difficulties caused by over-runs are more serious in the case of new entrepreneurs, it is considered absolutely essential to include in the original estimates an allowance for unforeseen costs to take care of errors, omissions, price increases and additions. The sources of finance for meeting over-runs are deposits from promoters and their friends, etc., bank borrowings, issue of additional share capital, retained earnings and further institutional finance. The I.C.I.C.I. is keenly aware of the problem of over-runs and delays and it keeps a constant vigil on cases which are likely to face difficulty in this regard. It very rightly impresses upon promotors the need for making more valid cost estimates in order to avoid future difficulties in financing.

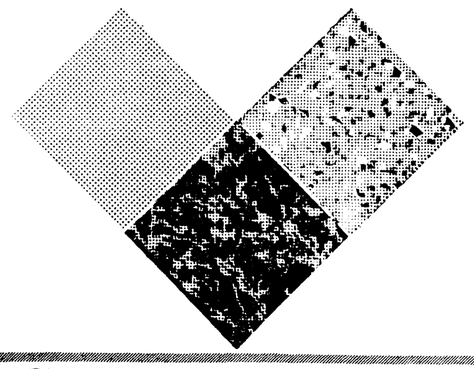
Although the I.C.I.C.I. applies rigid standards in financing the projects, these are, it is rightly felt, beneficial both for the Corporation and for its clients. When the I.C.I.C.I. agrees to provide financial assistance to a project, the relationship that is envisaged is not a one-transaction borrower-lender relationship but a long-term relationship for achieving the common objective of bringing into being a viable project. It is therefore, just as well that the Corporation should be concerned with not merely the successful completion of the projects assisted but also their long-term growth and prosperity.

WHEN A STRIKE IS NOT A STRIKE

A unique contract was recently signed between the Dunber Furniture Corporation of Indiana (the U.S.) and the Upholsterers International Union of North America. It establishes the paradox of workers continuing to work while on strike. The features of this contract are: "For the first six weeks of any strike, the workers place 50 per cent of their wages in the hands of an independent outsider or referee. The management matches these funds. If the strike is settled in the six-week period, the money is refunded to the parties concerned. At the end of nine weeks, if a settlement is reached, workers and management get a refund—but only 75 per cent of what they have contributed. A settlement at the end of 10 or 11 weeks would bring only a 50 per cent refund of the funds set aside. This figure drops to 25 per cent during the twelfth week. If no settlement is reached after this period, all funds in the special fund are sacrificed by management and labour. Money under the control of the referee, which is not refunded to the parties concerned, is turned over to a community project or to a charity, beyond the control of either the company or the union." In essence, whereas this system ensures the continuity of production, both labour and management will be anxious for the early termination of the dispute to save their contribution to the special fund. On the face of it, the system seems to be useful not only to the economy but also to the parties to the disputes. It may be worthwhile to give it a trial at least in some industries—with some modifications, if necessary, in this country.

India accounts for nearly 75 per cent of total world exports of ginger. Moreover, ginger ranks fourth among the spices exported from India in terms of value, the first three places being taken by pepper, cardamom and chillies. Export of ginger during the year 1964 amounted to 4,873 tonnes valued at Rs. 14.5 lakhs, as compared with 6,087 tonnes valued at Rs. 120.2 lakhs in 1962-63 and 7,600 tonnes valued at Rs. 109.0 lakhs in 1961-62. The principal importers of ginger from India are Aden, Saudi Arabia, Sudan, Britain, U.S.A., Iran, Malaysia, Japan, Morocco and East Germany. Latest figures relating to production of ginger are not available. Actual output in 1962-63 was 17,500 tons, the area under cultivation being 29,800 acres.

The existing Indo-Rumanian trade agreement has been extended by one year, that is, up to the end of December 1965 under a protocol signed by the Indian trade delegation led by Mr. S. V. Ramaswamy, Union Deputy Minister of Commerce, with the Government of Rumania at Bucharest on the 1st inst. The protocol provides for a 15 per cent increase in trade from the 1964 level. The Indian exports cover iron ore, cotton textiles, handloom goods and various manufactured goods, including engineering goods and the traditional items like tea, coffee, jute manufactures, tinned fruits and juice. Rumania will export plant and machinery, fertilisers, caustic soda, soda ash and petroleum products, besides several other machinery items and industrial raw materials.



GREATER STYLE
with new
VYNATILE
WONDERFUL PLASTIC TILES FOR FLOORS!

There's nothing like VYNATILE—the unique new floor covering! Strong, flexible and beautiful, VYNATILE does wonders for rooms—looks distinctive on any floor. Ideally suited to offices, shops, restaurants, showrooms, banks, theatres, homes and hospitals!

Choose VYNATILE in 180 cms x 90 cms sheets, in thicknesses of 1.5 mm. or 2 mm. Or ask for it in any economical size. Better still, take it as tiles to fit into your scheme of things!

VYNATILE...better in so many ways!
- So durable. Won't rot, crack, break or scratch!
- Can be used on any surface!
- Superbly finished. In 28 attractive colours and patterns!
- Can be wiped clean in seconds!
- Professionally laid to last for years!

MANCHESTER LETTER

MAINTAINING BALANCED PRODUCTION IN TEXTILE INDUSTRY

NEW SPECIALIST COURSE FORMULATED

From Our Special Correspondent

MANCHESTER, 10*th November*

MAINTAINING a balanced production has been a fundamental problem for management in textiles ever since the industry became an important peg in Britain's economy. With so many independent producers often working in isolation, the inevitability of one section failing to meet the requirements of another or exceeding its needs is a factor which constantly leads to difficulties in equating supply with demand. One of the assets which, it is hoped, will accrue from the recent wave of mergers is that more control over the flow of supplies through the different processes will follow. In this connection, the methods of integration and rationalisation of particular units of the big groupings should prove of incalculable benefit.

Balance of an entirely different kind, however, provides the basis for a new specialist course which has lately been the subject of experiments at the Productivity Centre of the Cotton Board. Looking at the whole question of business generally, the pioneers of these experiments have drawn up a syllabus which links the twin concepts of finance and production in a most imaginative manner. So far two pilot courses have been completed; another is scheduled for early next year; later it is anticipated that the trade will have the opportunity of participating fully.

Intended primarily for managers, salesmen and prospective executives, the course offers a glimpse behind the scenes at boardroom level. It attempts to assess why particular decisions are made in the policies of individual firms, decisions which may well differ according to the particular circumstances of the Company involved.

Those whose task it is to determine policy will be well aware of the alternatives facing them at any given instant. To others along the line of directive the particular action chosen may not always seem appropriate without knowledge of various aspects which may dictate decisions. And so, in order to prime those who may eventually be put in a position of policy-making, several of the more progressive companies in the industry suggested that a course dealing with balance in business should be drawn up.

The small number of "guinea pigs" who have so far attended speak with admiration of its effect and the value they have gained from the broader outlook presented by the many new horizons opened up. Training for manual and administrative work has long been accepted as a basic requirement for trade and commerce; the even more important necessity of being trained for senior management posts has too often been left to chance.

Utilisation of Resources

The mechanics of the course itself relate the thinking of an accountant with the practical necessities of the production engineer at mill level. At the outset, the perils of letting production and sales get out of balance are emphasised, coupled with a clear understanding of how liquidity and stocks can effect company performance. From this point, the detailed knowledge of how to read a balance-sheet and a profit and loss account becomes essential, but, throughout the instruction, it is stressed that different policies may be equally and eventually successful, always providing balance is maintained.

The emphasis during the ten days of detailed instruction, which follows a week-end playing the "decision-making game" at Chester with the aid of a computer, centres on the interplay which exists between methods of working, cost structure, stocks, material price and selling price. Sample "cases" are provided to illustrate the alternative policies which can be adopted to deal with particular sets of circumstances.

All this is valuable practice for the budding policy-maker, but the whole exercise can be resolved into the simple basic idea of utilising all the resources of the Company to their maximum effect. The practical application of such theories is, as the sponsors of the course point out, sometimes limited by outside influences such as the necessity to take particular orders for reasons which do not fit in with maximum efficiency. The object throughout, however, is to obtain the best possible return on the assets of the company, so that a proper balance between finance and production is achieved.

Down to Brass Tacks

One of the criticisms sometimes levelled at research organisations is the tendency of "scientists" to spend too much time and energy on projects which may be interesting from a professional point of view, but which are unlikely to produce any practical results for industrialists and manufacturers.

At the Shirley Institute, Manchester—the headquarters of the Cotton, Silk and Man-Made Fibres Research Association—there has been a complete reappraisal of the research programme. Dr. D. W. Hill, Director, told the annual meeting that this had been requested by the Research Committee of the Council "in order to satisfy itself that the present work is wholly relevant to the needs of the industry." The number of research projects in the new programme has been reduced from more than 200 to 125. Wherever possible, an estimate of the potential value to the trade of a successful outcome has been considered.

Dr. Hill said that the distribution of the Institute's resources on research for cotton and man-made fibres was: 33 per cent on man-made fibres; 20 per cent on cotton, and 47 per cent on work common to both groups. There was a continuing trend for more and more consultations on problems concerned with man-made fibre processing.

Suspended Publication

Cotton's casualties have been many in the past few years as a result of closures and mergers. Mostly these have been in Lancashire and surrounding counties, but occasional reports of similar developments have been received from the Continent and further afield. Almost in inverse ratio, however, the observers and scribes of the industry appear to have redoubled their efforts to provide statistical evidence about the remaining and by no means insignificant cotton sector of the huge textile trade. Circulars and reports about its progress and modernisation have emerged in profusion.

In America, however, one of the foremost weekly newspapers devoted solely to cotton trade affairs has lately suspended publication. This is the Memphis-based *Cotton Trade Journal* which has for 63 years offered a weekly commentary on all aspects of cotton, from the plantation to the finished garment.

"The period of suspension is indefinite," says the paper in a special editorial. "Weekly publication will be resumed when, and if, conditions within the trade warrant resumption of publication. Basic among these conditions is the return of cotton marketing to its historic normal channels of trade, unhampered by crippling administrative regulations."

The publishers are not closing down their plant entirely. A monthly magazine aimed at the interests of the larger and more efficient cotton growers in the United States is to be launched at the beginning of next year.

MANUFACTURERS DO YOU KNOW THE MEANING OF IS 1068-1958?

IS 1068:1958 is the Indian Standards Specification covering nickel-chromium plating, and is the first step towards quality control. A strict observance of recognised standards of nickel plating will guarantee satisfied customers and repeat sales, both at home and abroad. Do your own products conform to these standards?

Ask yourself these questions.
Is the product properly designed to make the most of nickel chromium plating? Is the thickness of the plating suitable for the type of job the product is expected to do? How can the thickness of plating be checked without damaging the plated surface?

The answers to these questions and many others can be found in the pages of these booklets. Write today for your free copies to

SUGAR PRICES REVISED AGAIN

MILLS IN MAHARASHTRA DISAPPOINTED

THE ex-factory prices of sugar have been revised once again, for the third time after the reimposition of controls on prices and distribution nineteen months ago, on 17th April 1963, to be precise, the official notification fixing new prices was issued by the Union Ministry of Food and Agriculture on the 12th of this month. The first revision, it will be recalled, was announced on 18th November 1963. The revision was upward in respect of all the sugar mills, the actual rise per quintal ranging from Rs. 2.65 in the case of mills in Assam to Rs. 12.15 in that of some mills in South India. In between these ranges, the price was raised by Rs. 5.15 for Maharashtra, Rs. 8.65 for the Punjab, Rs. 8 for certain mills in Uttar Pradesh and only Rs. 3.80 for Mysore, Madras, Kerala and Pondicherry. The increase was, however, considered to be not sufficient to cover adequately the additional incidence of higher cane prices and rise in production costs. Representations to this effect were made by the sugar industry and, as a sequel to these representations, the Government revised the prices on 22nd May 1964. The revision was extremely favourable for Rajasthan (+Rs. 15.75), Punjab (+Rs. 14), South Bihar (+Rs. 12), Assam (+Rs. 10.50), and East U.P. (+Rs. 9), whereas it was marginal in respect of other States and there was actually a cut in prices of sugar produced in the Lucknow division of U.P., Gujarat and Orissa.

Six Zones

Subsequent to this revision, the Government of India raised further the minimum price of cane payable by sugar mills during the current (1964-65) season which officially began on the 1st inst. In view of this increase and after taking into account the estimates of duration and recovery for the season 1964-65, the Government of India announced, as stated at the outset, new ex-factory prices for sugar on the 12th inst. The country has been divided into six zones and not four zones as was reportedly recommended earlier by the Sen Commission. The six zones and the prices fixed for each zone are given below:

Zone	Price (Rs. per quintal)
1. Maharashtra, Mysore and Lucknow Division of U.P.	116.00
2. East U.P., Rohilkand and Agra Divisions of U.P., North Bihar, West Bengal, Gujarat and Andhra Pradesh	118.75
3. Dehra Dun and Saharanpur districts of U.P.	121.25
4. Madhya Pradesh, Orissa, Madras, Kerala and Pondicherry	123.00
5. Assam	126.00
6. Meerut, Muzaffarnagar and Bulandshahr districts of U.P., the Punjab, South Bihar and Rajasthan ...	129.25

The prices mentioned above relate to sugar of I.S.S. grade D-29. The notification prescribes premia and discounts for superior and inferior grades of sugar with the price for D-29 grade being the base. These prices, it is understood, have been arrived at on a production estimate of 3 to 3.3 million tons. They may be revised, as was done last year, on the basis of actual output and recovery at the end of the current season, some time in May next year or after the Tariff Commission completes its exhaustive study of the cost structure of sugar industry and fair price payable for the sugar produced in the different regions.

How the revised prices compare with those fixed on 22nd May 1964, 18th November 1963 and 17th April 1963 will be clear from the table at the foot of column one.

It will be seen from the above table that the revised prices are higher (as compared with the prices fixed in May 1964) by Rs. 9 per quintal in Orissa, Rs. 7 in Madras, Kerala and Pondicherry, Rs. 2.75 in Punjab and 75 paise in Andhra Pradesh, but lower by Rs. 8.75 in Rajasthan, Rs. 4.75 in South Bihar, Re. 1.25 in North Bihar, Rs. 3.25 in the Punjab, Re. 1.50 in Madhya Pradesh, Re. 1 in Assam and 25 paise in West Bengal. In Uttar Pradesh, the lowest price has been raised by Rs. 2.75 per quintal and the highest price reduced by Re. 1.75. There is no change in prices in so far as Maharashtra and Mysore are concerned.

Some Important Questions

This brief account of the changes in ex-factory prices of sugar raises some important questions. In the first place, is there any basis for fixing such widely differing ex-factory prices for the different areas? Secondly, what justification is there for fixing the same price for all sugar, irrespective of differences in the processes of manufacture? Thirdly, is the Government of India justified in according step-motherly treatment to the sugar mills of Maharashtra and Mysore where the prices fixed are very low? Fourthly, how can South Bihar, a low productivity area, be linked with the three highly productive districts of Meerut, Muzaffarnagar and Bulandshahr in Uttar Pradesh, as well as with the Punjab? And, finally, could the sugar mills in East Uttar Pradesh and North Bihar be put on a par with those in West Bengal, Gujarat and Andhra Pradesh? These questions, we hope, will be raised in Parliament and the Government spokesmen will clarify the whole position by indicating the exact criteria adopted for fixing the ex-factory prices of sugar.

The sugar mills in Maharashtra have reason to feel aggrieved about the Government's refusal to concede their plea for higher ex-factory prices. The Government's negative policy, according to a prominent sugar mill-owner of Maharashtra, "will act as a disincentive to greater production at a time when everything should be done to increase the sugar output and relieve the acute shortage, so that the open market prices could be lowered." One fails to understand the rationale behind the Government's decision not to effect any increase in sugar prices from the low level of Rs. 116 per quintal fixed for Maharashtra and Mysore.

It is true that, since the costs of production in Maharashtra are lower than in several other regions, the ex-factory prices of sugar will be below those of sugar produced elsewhere. But one should not ignore the marked increase that has taken place in these costs since the last revision (in May 1964) which itself was only of a marginal nature in regard to the Maharashtra sugar mills. The cane cost alone has risen quite appreciably, especially in the case of the joint-stock sugar mills which have been compelled to pay prices much higher than the minimum prescribed. The premium paid is already said to be as high as Rs. 5-6 per quintal. What is worse, the cane growers who supply cane to these mills are demanding a still higher premium of Rs. 8-9 per quintal, which represents the difference between the ex-factory price paid by the joint-stock mills and the ex-field price paid by the co-operative units. The co-operative mills pay an ex-field price of Rs. 59 per quintal excluding the transportation and harvesting costs, while the joint-stock factories pay an ex-factory price of Rs. 59, inclusive of these overhead charges. It is, therefore, argued by cane growers that they are suffering a loss in selling their crop to the

§ Rs. 111.25 for 30 mills and Rs. 116 00 for two mills in East U.P. and Rs. 115.25 for 21 mills and Rs. 116.50 for 19 mills in West U.P.

HPG WIRED GLASS
for safe glazing
in factories

The built-in safety of HPG wired glass comes from the steel wire netting inserted into the semi-molten ribbon of glass during the rolling process. This ensures perfect safety. For should the glass break, the pieces are held together — no flying splinters to injure workers or cause damage to property. HPG wired glass has proven fire-retarding characteristics. It may crack in an intense blaze but holds together — thereby reduces draughts which spread flames. ■ You can depend on HPG wired glass. It is manufactured by Hindusthan-Pilkington Glass Works Ltd. in full collaboration with Pilkington Brothers of UK — people who have been making glass for more than a century!

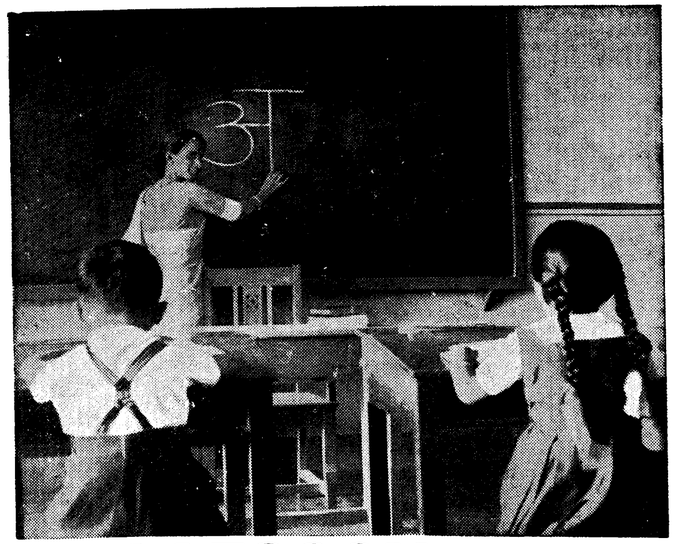
PRESS NOTE

The Uttar Pradesh State Electricity Board has resolved to float a loan of the nominal value of Rs. 400 lakhs redeemable at par at the end of 12 years. The bonds will carry interest at 5 per cent and will be issued at Rs. 99.75 per cent. The issue will open on November 23, 1964 and will be closed on November 28, 1964 or earlier. Subscriptions will be received at the Head Offices of the State Bank of India at Calcutta, Bombay, Madras and New Delhi and at all branches of the Bank at district headquarters within the State of Uttar Pradesh. The Head Office of the State Bank of India at Calcutta will be in charge of the issue and management of the bonds. The bonds are fully guaranteed by the Government of Uttar Pradesh in regard to the repayment of the principal and payment of interest. The bonds will be trustee securities under the Indian Trusts Act, 1882 and also approved securities for the purposes of the Insurance Act, 1938 and the Banking Companies Act, 1949. The bonds will also be treated at par with Government Securities for the purpose of advances to Scheduled Banks and State Co-operative Banks under Section 17(4) (*a*) of the Reserve Bank of India Act, 1934 (II of 1934). The Electricity Board will be providing in each financial year from 1964-65 to 1976-77 (both inclusive) for contribution to the U.P. State Electricity Board Bonds Redemption Fund such sums as, together with interest thereon, will amount to the total nominal value of the bonds by the time the repayment of the bonds becomes due.

2. All sections of the investing public are requested to extend full support to the bonds now under issue.

3. The issue is in terms of the Bond Prospectus, copies of which can be had from the aforesaid offices of the State Bank of India.

B. B. LAL, I.C.S.,
Chairman,
Uttar Pradesh State Electricity Board,
Lucknow.



THE LESSON

The alphabet...then the word...then the sentence...

The delicate process of educating the young. Everywhere massive plans are under way — in education and in other fields as well. Public health, agriculture, engineering, housing, to name a few. A vast programme is on to improve the living standards of our millions.

LIC is very much a part of this programme. It invests nearly 3 million rupees a day in various economic spheres. Remember, when you insure or are already a policy-holder, your premiums are helping in two ways. Firstly, in protecting yourself and your family, and secondly in helping to improve economic conditions for the country at large.

Some LIC investments at a glance

Cement	Rs. 628 lakhs
Cotton textiles	Rs. 1,216 lakhs
Electricity	Rs. 985 lakhs
Iron & Steel	Rs. 998 lakhs

BANKING IN RURAL AREAS—III

MERITS OF CONSORTIUM IDEA EXPLAINED

By Dr. J. D. Sundram

ANY institutional set-up suggested for the extension of financial services to rural areas should be capable of evolving, over a reasonable period of time and in accordance with the pace and pattern of economic development, healthy relationships with the financial and banking institutional hierarchy in the rest of the country. The preoccupation of planners, as well as of policy-makers, has so far been with the correction, if not the elimination, of the almost crippling disadvantages arising from the non-availability of credit in adequate volume and variety at reasonable cost for agricultural production and allied activities. The problems of integrated credit for agriculture have no doubt received attention from various committees that studied them. Their proposals were, however, designed to enlarge or improve or adapt the co-operative institutions to tackle them, and the types, quantum, etc., of aids and concessions that would be necessary towards that end. The aim of this study is a critical appraisal of an organisational pattern and an operational strategy for a functional integration into a consortium of all financial institutions, including the co-operative, at the district level, and for the provision, through the medium of mobile banks, of integrated credit to selected, viable areas.

In order to be effective and useful, any suggested institutional framework must have adequate, inherent elasticity to adapt itself and grow in accordance with the pace and pattern of development in the selected areas; and, at the same time, the capacity to evolve and maintain, expand and diversify its relationships with the financial and monetary authorities in the rest of the country.

Better Than Co-operatives

Apart from the basic legal aids to evolve and establish the consortium of financial institutions and to undertake, through a fleet of mobile banks, the planned extension of integrated credit, the institutional machinery suggested here will need no other specific financial assistance on a continuing basis, as co-operatives do. In fact, the pattern of organisation and operation suggested here is mainly to ensure the extension to rural areas of the principles of integrated economic development, in which evaluation of the integrity of individuals with skills and ideas, in the context of available resources and markets, forms an essential part of the much-needed objectivity in the assessment of programmes, projects and schemes. Such an institutional set-up may help establish meaningful relationships not only with every one of the participating parent bodies, but, functioning on the basis of sound principles, may help extend the effectiveness of the national system of financial and monetary discipline to the operations and activities in rural areas.

It is common knowledge that monetary discipline is possible of purposive and effective operation only in an economy that is well covered by banking services. As we have seen earlier, in spite of its sizable expansion since Independence, banking today covers only a small part of the country; and its effective servicing, measured in terms of its share in production and distribution, or trade and transport or savings and investment in rural areas, is negligible. The operational strategy outlined earlier, it is submitted, can assist in extendng the area of effective coverage over a period of time at economic cost.

Bill Market

Extension of banking facilities to viable areas in the manner suggested here will pave the way for an increase in the volume of goods in the areas covered by the mobile banks. The expansion in the volume of exchange and transport will necessarily increase the number of bills drawn by traders on one another. The interlinking of areas within a district through a fleet of mobile banks can thus provide the basis for the growth as well as diversification of banking services in rural areas. As the consortium of financial institutions at the district level provides credit of all types for further economic development, imports of goods and services into the district from other districts, at least immediately, will tend to rise. This increase in the movement of goods will further increase the number of bills of trade, the acceptance of which can provide a sizable volume of business to the banks and the basis for the emergence of an "acceptance" market.

Among the many hurdles to the development of a modern bill market in India, the most frustrating has been the absence of an acceptance market, owing to the non-availability of the right type and, therefore, of acceptable bills. The operations of a mobile bank from a centre of vantage may help to establish the type of contacts and knowledge of firms and individuals, in which banks can undertake with calculable risk an increasing volume of acceptance work.

At the district level immediately and at the major urban industrial and monetary centres later, the growth of an acceptance market will improve the quality and supply of bills, enabling banks to purchase them in accordance with their own needs and resources. From this, it is but a short step to develop even in the rural areas right from the beginning of any degree of modern economic development, a sensitive bill market, based upon a solidly built acceptance market. The development of a bill market in the rural area may help to remove the causes for the widely varying rates of interest at present in both rural and urban areas, and to grow towards a healthy money market in the country. In other words: the institutional set-up suggested here may help to evolve the essential basis for a scientific integration of the widely varying interest rates into at least a cognizable, regional rate of interest. How effectively and how quickly, a self-regulating and self-governing discount market can be evolved and operated will depend wholly on the earnestness and effectiveness with which mobile banks are organised, guided and operated.

Under the institutional set-up suggested here, it may be possible, far more effectively than under the present co-operative structure, to make available to the farmer and the artisan in rural areas the benefits of concessional interest and other financial aids on the basis of actual performance. The partners and participants of the consortium have already the expertise and institutional effectiveness for quick transfer of funds from one area to another and from one branch to another; and the operational strategy envisaged here involves no additional problem or cost, because there is no lateral transfer or cost involved. When the consortium of institutions in different districts evolve their own norms for each specific operation in the areas under their respective jurisdiction, there can be an organised, cognisable, local, district and a regional bill and discount market that will faithfully reflect the condition in the area, district and region.

Closer Inter-relationship

As banking institutions share in the organisation and operation of the consortium in this regard, close inter-relationships between consortiums in the districts and units at various levels are not too difficult to establish or regulate or control. The policies of the monetary authority that now directly affect banks only in the metropolitan and large urban centres but leave the rural areas almost wholly unaffected, can become effective in rural areas as well through the discount market. Of course, in the same way as prices of commodities vary between one place and another in the same region and from one region to another, owing to distances that separate them and the inevitable time-lag transport of commodities involves, the prices of credit or interest rates may vary between one area, district or region and another; but the extent of variations will be much smaller than now, owing to the greater ease with which funds can flow from one area to another. At any rate, the bewildering variety of interest rates that have defied effective control in the absence of an integrated bill market will cease to be operative. On this account, the impact of any change in monetary policy will become easier to analyse and measure, and, therefore, monetary discipline can be deliberately chosen and effectively enforced.

It is again common knowledge that any large-scale development of rural areas involves an appreciable expansion of infrastructure to cope with its needs. Whether the pattern of development begins with the intensification of agricultural operations, or industrial development, or proceeds, as in all probability it will, with a simultaneous attack on agriculture, industry and services, monetisation of the countryside is likely to grow at a much faster pace than hitherto. It ought to be a primary objective of the authorities to make advance preparations to deal with the problems that are bound to arise as a result.

The absence of banking services on an adequate scale and of appropriate quality has in part been responsible for the almost total failure to mobilise savings in rural areas and direct them towards national goals. The continuance of non-monetised operations over more than one half of the economy has merely condoned the increasing inequity in the distribution of the incidence of taxation between rural and urban areas. Integrated economic development of rural areas, irrespective of its actual pattern of operations, will reduce the area, as well as the influence, of non-monetary operations. Extension of banking services to rural areas as suggested here will help mould the pattern of monetisation and assist mobilisation of savings. Banking, in other words, can help in imparting character and direction to the pattern of development of rural areas and fostering and developing healthy relations between rural and urban areas.

Rural Industrialisation

It is conceded on all hands that integrated economic development will involve, over a period of time, industrialisation of the countryside. The present ideas about rural industries are more often vague and nebulous than precise or clear. Any large-scale industrial development, based on local raw materials and catering to local or regional markets, will involve investment of capital of carying duration. The consortium of financial institutions at the district level can not only meet these needs from their own resources, but also arrange to secure for rural projects technical and administrative expertise through their institutional links with the large urban or metropolitan centres. One cannot, however, indicate, in the state of the present knowledge of the thinking on rural industries, the nature of the capital needs and, therefore, of the market that can be built up by the consortium in the districts.

Just as mobile banks in the rural area can assist the growth and development of a bill, acceptance and discount market, with fairly clear relations with similar markets at other levels, so also the consortium at the district level can help foster the development of a capital market. Underwriting of capital issues has so far been confined to a few institutions; and banks are only recent entrants to the field, even in urban areas. The consortium visualised here, however, has, as its participants, all the financial institutions, and, therefore, has the pooled expertise essential for a commercial and financial assessment of any industrial project in the area or district. The endorsement of the consortium of any rural project virtually places it on the national capital market. In other words: a national capital market in which all financial institutions participate for national economic development will be possible.

The entrepreneur in rural areas in such conditions will no longer be compelled to seek financial assistance or support at the present exorbitant rates of interest. The consortium, which is in contact with him through its mobile bank and the local board, can, by underwriting his venture, place him on par with his counterparts in the most advanced urban areas in the country. The disadvantages of the small, rural entrepreneur, with integrity, ability and ideas but no resources, can be substantially mitigated, if not altogether removed, under this institutional arrangement.

Infrastructure

It would not be too difficult to project a picture of the probable or possible role of the public sector institutions in this set-up; but it has been tacitly assumed at almost every stage that the authorities can and will extend their co-operation to the evolution and establishment of this type of institutions, and through appropriate amendment of the various Acts and the rules framed thereunder, help the actual operations of the consortium at the district level. It must, however, be stated that rural economic development, in general, and rural industrialisation, in particular, can move forward to an economically and socially significant pace, only if the essential infrastructure, that is, transport, industrial-materials surveys, communications (and road and rail facilities necessarily) and training facilities, is deliberately built up. As the provision of this essential infrastructure will add to the volume of employment in the area and the size of the effective market for a wide variety of goods, the needs of banking and financial services, which, as explained above, have a vital role even in moulding and directing the development process itself, should be carefully assessed and provided for as early as possible.

In a country as large as India, with a population stratified widely and deeply on almost every ground—geography, language, religion, education, culture and social mores—rural industrialisation, even as a concept, poses large enough problems; but, as a specific matter of policy and programme, it provides challenges that can be accepted only on the assumption that all sections of the people and their authorities will co-operate in this national venture at deliberate development of backward areas. Rural industrialisation thus implies no less than cutting across the concept of localisation of industries, that is, deliberate provision at national cost of basic facilities and aids to promote the growth of industries in areas that, from a merely commercial or purely economic point of view, have not been found to be favourably situated. This involves no doubt additional cost per unit of production of some commodities or the supply of specific services.

Net Benefit

As against this addition to costs must be set (i) the present set of costs of services that are provided by urban authorities to make centres of industrial activity as attractive to entrepreneurs and to workers as they are today, (ii) the continuing loss of resources in men, materials and markets in the rural areas that have large unemployed population, and (iii) the steep rise in costs of industrial sites, in wage rates, etc., in the periphery of most urban centres. What one ought to assess is not merely the cost of one unit of production in one set of conditions, but the net social cost of production to the economy as a whole. In a rapidly growing economy, the costs of urbanisation tend to be ignored, as they are spread over a wide variety of services, to the provision of which payment is made over a period of time, whereas the marginal addition to the price of a product is more specific and its impact immediate.

Viewed in the perspective of the increasingly intricate problems of India's metropolitan centres and of the steep rise in costs—wages, storage, insurance, water, transport, etc.—in addition to a growing, restive labour, rural economic development not only appears socially necessary but economically inevitable. If it is to yield significant social results, advance planning of services for that purpose is essential. What has been studied here is a possible mode of providing at economic cost one of the services, namely, banking, a service indispensable to economic growth.

(Concluded)

5 PER CENT

WEST BENGAL STATE ELECTRICITY BOARD BONDS, 1976

For Rs. 125 Lakhs

(Payment of Interest and Repayment of Principal Guaranteed by the Government of West Bengal.)

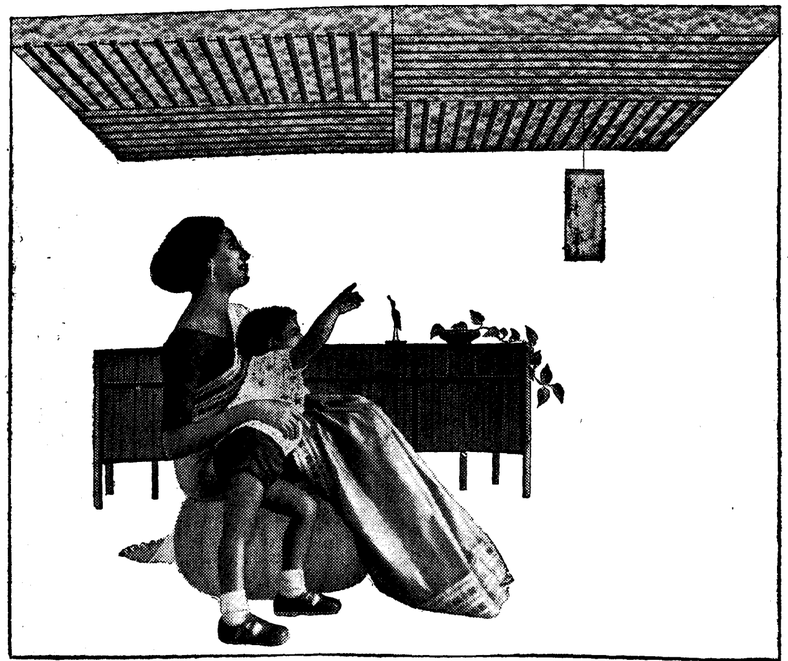
The Bonds will be trustee securities under the Indian Trusts Act and also approved securities for the purposes of the Insurance Act and the Banking Companies Act.

ISSUE PRICE Rs. 99.75 PER CENT

REDEEMABLE AT PAR ON THE 23rd NOVEMBER, 1976

SUBSCRIPTIONS will be received in cash or cheques. Applications will be received at the head offices of State Bank of India at Calcutta, Bombay, New Delhi and Madras from 23rd November 1964 to 28th November 1964, both days inclusive. But the list may be closed earlier without notice if the total subscription is reached.

Copies of loan prospectus and application forms are available at all the offices mentioned above and at the Head Office of the State Electricity Board, 1, Hastings Street (7th Floor), Calcutta-1.



Thermocole

keeps your room so cool, so gay!

THERMOCOLE is foamed polystyrene: the lightest rigid insulation material. It is available in white slabs, as well as in gaily patterned tiles that make attractively gay false ceilings.

THERMOCOLE is efficient. Its closed cells provide an effective barrier against heat, noise and moisture. In fact, one inch of THERMOCOLE insulates better than four feet of concrete.

THERMOCOLE is versatile. It is ideal for insulating roofs, walls and floors in all kinds of buildings. It is also excellent for fabricating light-weight insulating partitions and doors.

THERMOCOLE is feather-light yet strong, durable and easy to work with. It cuts structure and labour costs. Efficiency with economy—that's the insulation THERMOCOLE provides.

PROBLEM OF BRINGING DOWN PRODUCTION COSTS

CAUSES—REMEDIES—FEASIBILITY

By Dr. Surendra C. Dholakia

IT is a common observation that the price of almost every consumable commodity is steadily rising in this country. According to the classical economic theory, whenever there is a rise in the demand for a particular commodity, the prices also tend to rise. This should, however, hold good only in a stagnant society where the positive efforts to raise production to meet the rising demand have come to a standstill. In a modern society, whenever a rise in demand occurs, efforts are made to raise production to meet the demand in such a way that the prices remain at a fairly steady level although there may be a time-lag. Thus, under a modern progressive economic system, a rise in demand leads to an increased tempo of investment and production in a particular industrial field and hence the prices tend to remain steady and sometimes even tend to fall because of some temporary surplus in productive capacity. Conversely, whenever the demand tends to remain static or fall, the prices tend to increase, because no fresh investment for additional production is attracted towards such an industrial field. During the last few years, we have already outgrown the age of stagnant economic condition and are fast moving towards an area of progressive and planned economic progress on all fronts. The factor of rise in prices, therefore, should cause us grave concern, as it may well prove to be a major stumbling block in our cherished path of economic progress for the masses.

Prices and Consumption

There are various angles from which the problem of rise in prices may be approached. We would, however, concern ourselves here only with such factors as are operating in the fields of organised industrial production. It is admitted that the problem of rising prices cannot be conclusively studied in isolation from several interrelated socio-economic factors. This may be illustrated by way of an example. The price of caustic soda in international markets is about Rs. 380 per ton, as against about Rs. 800 per ton in this country. Caustic soda is used in the manufacture of soap among other things. Thus, the high price of caustic soda tends to make the soap correspondingly expensive. Although soap is an item of mass consumption, its demand tends to be restricted probably because its price is higher in relation to the purchasing power of an average consumer in the country. This purchasing power is a function of employment and earning capacity. Out of the earnings, a certain minimum has to be spent on the basic essential requirements like food and clothing and only surplus savings would be available to determine the purchasing power of the masses.

We are all aware of the tragic national inadequacy of employment and of basic earnings. When the rising prices of essential commodities of food and clothing are taken into account, the residual savings and purchasing power for commodities like soap tend to be severely restricted among the masses. This tends to restrict the consumption and more so at relatively high prices. Restricted consumption does not encourage increase in investment necessary to raise production, unless the investor is convinced that, by raising production, the costs of production could be reduced to such a low level that the selling price of the article could be reduced to a point at which the article is brought within the purchasing power of many more million people and thus there is a likelihood of a sudden spurt in demand. It may be observed that the only way to break the vicious circle of restricted demand, rising prices and lack of increase in production is to reduce the cost of production in any manner possible. Only by positive efforts to reduce cost of production could we bring down prices to a level low enough to encourage a substantial increase in consumption in the country. Once the consumption tends to take an upward trend at a particular price level which should, of course, be profitable enough to encourage further investment, our progress towards achievement of better standards of living for the masses would be steadily continued.

High Cost of Production—Causes

The following table lists the prices of certain basic materials in international markets and in this country:

Item	Recent International price	Correspondingly recent Indian price
	(Rs./ton)	(Rs./ton)
Caustic soda	350/380	750/800
Soda ash	160/200	380/420
Benzene	380/400	650/700
Aluminium metal	2,300/2,500	3,200/3,500
Urea fertiliser	420/450	670/700
Ammonium sulphate fertiliser	120/190	280/300
Sulphur	120/135	180/200
Synthetic rubber (S.B.R.)	2,300/2,500	3,500

It is possible to make the above list longer but the figures given above are enough to illustrate the basic point that prices of important industrial commodities in the country are substantially higher than those in international markets. It is not suggested that this observation holds good in the case of each and every item manufactured in the country, as in some cases our prices are already competitive to those prevailing in international circles. The latter position could, however, be probably ascribed to certain unusual favourable local factors which we do not propose to discuss here. Suffice it to say that the prevailing high prices are primarily due to high costs of production for which the following factors may be directly or indirectly considered responsible:

(i) Relatively low scale of production.

(ii) Inferior quality of some raw materials.

(iii) High cost of some of the imported raw materials.

(iv) High cost of transport due to long distances and inadequacy of modes of transport.

(v) Inefficient techniques of production, including obsolete plant and methods of operation.

(vi) Relatively low productivity of the worker.

(vii) Relatively high investment costs in relation to the output.

(viii) Non-scientific management techniques, including faulty practices of purchases, quality control, distribution, personnel selection and labour relations.

(ix) Duties, levies and taxes imposed by the authorities.

(x) Restricted choice of source of imported equipment due to scarcity of free foreign exchange.

(xi) High cost of foreign technical know-how and personnel where required.

(xii) Cost of financing a project.

Rising Cost *vs.* Falling Prices—Experience Abroad

It should, of course, be mentioned that this economic phenomenon of rising prices is not exclusive to our country. In some of the industrially advanced countries, however, it has been observed that, while the manufacturing costs have been steadily rising, the selling prices have tended to decline, because of competition among various producers, substitute materials and alternative consumers. In the face of falling selling prices, the industrial units in the advanced countries have had to devise effective methods to offset the rising manufacturing costs. Increase in production costs has taken place due to high investment requirements for new plants, high cost of labour and supervision, complexity of operational skills, high costs of social insurance and other benefits and taxation, more expensive raw materials and fuel, premature obsolescence of modern plants and processes and high financial charges.

The measures that have been adopted by some of the industrial units abroad to offset the rising manufacturing costs have been of varied character. In order to offset the impact of rising wages, the productivity in terms of output per employee has been considerably stepped up through improved technology, equipment and training of labour. Full use has been made of technical advances in manufacturing techniques and plants and considerable emphasis has been laid on purposeful research and systematic techno-economic development of new products, processes and equipment. The rate of utilisation of plant capacity has also been stepped up by adopting continuous processing techniques and more precise criteria for design of the project and its equipment. Efficiency of management is being continually improved by rationalisation and reorganisation. Modern marketing techniques are being effectively employed to enlarge growth of demand which would justify steady expansion of production facilities. As it became obvious that the rising cost of manufacture cannot be simply absorbed or compensated by realising higher prices, it became inevitable for the industrial units in the advanced countries to offset such additional costs through continuous expansion and higher productivity so as to enable them to ensure profitable operations even in the face of falling prices under free competition.

Thus, this process of modernisation, technical advancement, cost reduction, expansion and diversification is more or less being carried forward on a continuous basis. It is possible and desirable for us, who are yet in a preliminary stage of development, to benefit from such a process to the maximum extent. Only when we are in a position critically to analyse the application of successful techniques developed abroad in our context and to adopt the selected ones to our benefit, will we be able to meet this challenge of rising prices and the resulting restriction of consumption.

Economic Plant Size

As already mentioned above, our scale of production in most of the industries is relatively low as compared with international standards. Low output leads to unfavourable investment per unit output. High investment per unit output requires not only the higher cash capital per unit of production, but also leads to more expensive product because of higher fixed and financial costs per unit produced. While it may not be feasible for us to build immediately large production facilities which would compare favourably in terms of output with the most economic operating units in the world, it should certainly be possible to install only such units as would be economic in terms of size at least.

Economic size of a productive unit is a function of several economic factors. Primarily, an economic size of a production unit may be defined as that capacity of production which would enable the investor to realise reasonable profits when operating the plant under the prevailing costs of plant, raw materials, utilities, labour, finance and freight charges and the current selling prices of its products. This would also depend on the trend of demand for the particular product, adequate availability of physical requirements for installation of such a project including raw materials, utilities and transport and competition from the established producers and imported supplies. Policies of the Government on matters such as the regional development, concentration of economic power, import control, taxation incentives and other duties may also influence the size of an economic unit.

Investment per unit output for a particular industrial unit goes down as the economic plant size increases. Even for a plant of the same size, the investment required in this country would be higher by about 67 per cent than that required in an industrially advanced country as may be seen from the following figures:

	Per cent
Cost of plant installed in an industrially advanced country	100
Add freight and insurance to this country	8
Add import duties, etc.	24
Add higher costs (by about 50 per cent) of indigenous components which may be 40 per cent of the total plant (50 × 40 per cent.)	20
Development costs for new sites	10
Additional financial costs	5
Total	167

The above estimate would naturally vary from industry to industry and from location to location but does illustrate an average picture. In addition to the above factors, the financing charges on account of the shortage of foreign and indigenous capital are also likely to add further to the overall investment costs. Such charges are unavoidable when the plant is required to be obtained only through an allotted source of foreign credit. Even the plant quotations tend to be somewhat inflated in the absence of free competitive tenders.

Thus, this increase in investment tends to be partly offset by increase in value of output under local conditions. In other words, the higher selling prices are an effort to nullify the adverse effect of higher investment per unit output, thereby leading to a comparable ratio of amount of investment to value of output.

Cost of Production—Comparison

Relative costs of production as compared between some of the industrially advanced countries and this country may also be discussed along similar lines. Let us assume that 70 per cent of the cost of production represents variable costs proportionate to production and 30 per cent represents fixed costs related to overheads, depreciation, interest etc. On the basis of these assumptions, the cost of production may now be estimated.

It is likely that raw materials in this country, either by virtue of costs or quality, may cost about 10 per cent more than in the developed countries. Efficiency of production and of plant may also add about 10 per cent to the variable cost, as it is relatively low in this country. As regards fixed costs of 30 per cent on overheads which may account for about 33 per cent may increase by 100 per cent because of low level of production and productivity, thus adding 10 per cent on the basis of the overall cost of production. Depreciation and interest charges may amount to 67 per cent of the 30 per cent fixed costs, that is, 20 per cent of the overall cost of production. This percentage in turn is affected, first, by the ratio of cost of Indian plant to the foreign plant just discussed above (1.67) and also the ratio of scale of production as reflected in the investment per unit output. The latter ratio in quite a few cases may work out as 1.67, assuming that the economic size of the unit in this country would be about half of an average economic size by international standards in that particular industry. Thus, the cumulative effect of two ratios mentioned here would work out as 1.67 x 1.67=2.80 times by 20 per cent contribution to the overall cost of production on account of fixed charges like depreciation and interest. The figures estimated above may now be summarised as given alongside.

(Cost of Production %)

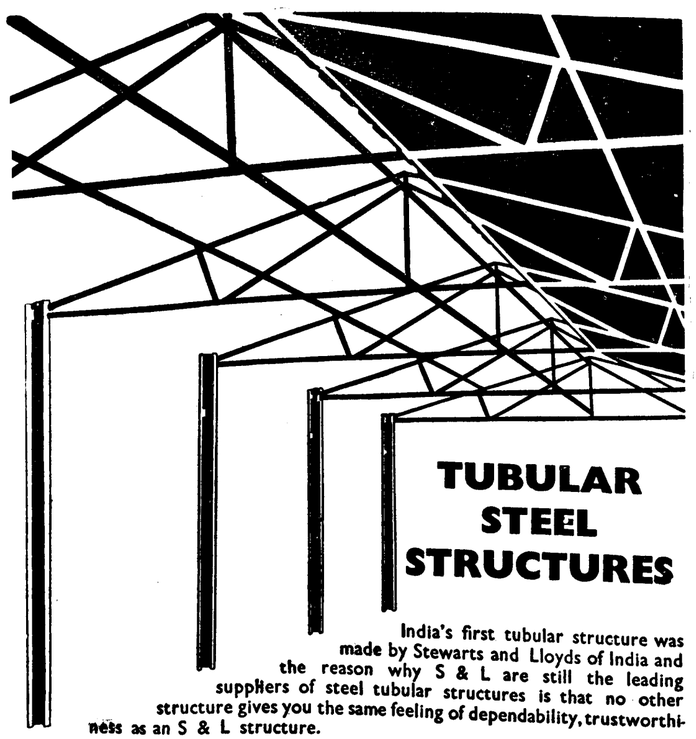
	Foreign basis	Indian basis	
Variable costs	70%		70%
Raw materials		10% of 70%	+ 7%
Efficiency		10% of 70%	+ 7%
Fixed costs	30%	30%	+30%
as follows:			
(a) Overheads		33% of 30% =10%	+10%
(b) Depreciation, etc.		67% of 30% =20%	
influenced by:			
Cost ratio of Indian plant to foreign plant		1.67	
Ratio of investment/output due to scale foreign		1.67	
Cumulative effect		1.67×1.67 =2.8	
Other fixed charges		2.8×20%	+56%
Total cost of production	100%		180%

As may be seen from the above figures, the Indian costs are higher than the foreign costs for reasons which are identifiable relatively easily. The question, however, is not only about the identification but also about the remedial measures for reducing the Indian costs to the maximum extent practicable.

Not much can be done regarding quality of raw materials, especially if such raw materials are intrinsically inferior even though available locally in abundance. However, with due care in selection, quality control and proper purchase policy, it should be possible to make substantial improvements in the raw material economics by way of quality, price and transport. These aspects should also be considered at the time of deciding location of a project which should be fixed only after obtaining full satisfaction regarding availability of requisite quality and quantity of major raw materials at reasonable prices.

As regards efficiency of conversion of raw materials and that of operation of the plant, it should be possible to achieve high levels by adopting properly planned training programmes and scientific control of production and management. Design and selection of the plant and equipment and major process steps should also be so undertaken as to ensure the maximum available efficiency in that particular technology.

If as a result of economic studies it is found that a project could be located at a port and could produce the product sufficiently cheaply, provided the scale of production is made substantially larger than the magnitude



India's first tubular structure was made by Stewarts and Lloyds of India and the reason why S & L are still the leading suppliers of steel tubular structures is that no other structure gives you the same feeling of dependability, trustworthiness as an S & L structure.

All S & L roofing structures are delivered complete in every respect with trusses, purlins, columns, hook bolts for roofing and all necessary studs, nuts and washers.

Write today for your requirement of these sturdy and dependable tubular steel structures.

S&L **STEWARTS AND LLOYDS OF INDIA PRIVATE LIMITED**

Regd. Office: 41, CHOWRINGHEE ROAD, CALCUTTA-16 PHONE: 44-2311

Branch Office: Himalaya House, 5th Floor, Paksn Road, Bombay

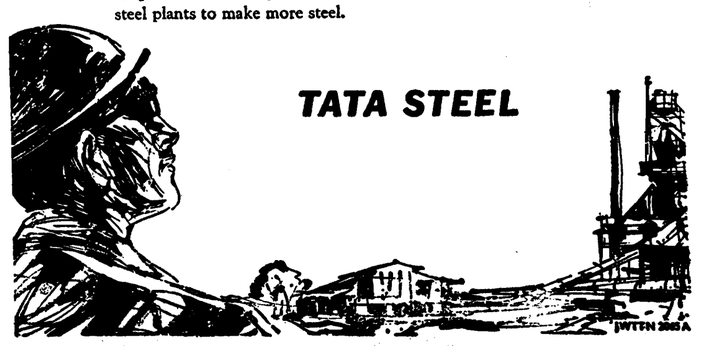
NAS-5 B L-1864

A great beginning...

In 1907, when India could not even produce a decent pin, the House of Tata announced its intention to build a modern steel works in India. There were not a few who doubted that the project would ever be a success.

Yet, shortly afterwards, India's first steel works was set up at Sakchi, as Jamshedpur was then called, and the first steel ingot was successfully rolled in February 1912. This event not only marked the birth of India's steel industry but also proved that India had the necessary potential in terms of iron ore and other raw materials to sustain an ever-expanding steel industry on modern lines.

The steel that has flowed out of Jamshedpur for over 50 years has helped India to take her first steps on the road to industrialization. And Tata Steel will continue to play an important role in our developing economy now poised to produce atomic power and manufacture steel plants to make more steel.



TATA STEEL

JWTEN 2854

of immediate demand in the country would justify, then it may be possible to export surplus production from an over-capacity plant until adequate market is built up within the country for its entire production. Modern processes where continuity of operation and use of proper instruments and automatic controls lead to substantial economies in investment per unit, output and cost of production are particularly amenable to the economies of large-scale production.

It is better to have only a few plants with high production capacity per unit than to have a large number of plants with relatively small output per unit. Regional dispersal of factories should only be considered as a secondary instrument of policy as compared with the important objective of producing the products as economic prices.

Consequences of Indigenous Equipment

It would naturally help if the cost ratio of Indian plant to foreign plant could also be reduced. This may, however, be particularly difficult, in view of the fact that manufacture of more and more equipment is being undertaken in the country and hence progressive shift from imported equipment to indigenous equipment is bound to proceed at a rapid pace. The manufacture of indigenous equipment in specialised industries could, however, be undertaken only by a small number of workshops and factories in each field. There are, therefore, certain economic and technological consequences of increasing the use of indigenous equipment in the place of imported equipment some of which are listed below:

(a) Increased cost of total plant facilities because of relatively higher cost of indigenous components.

(b) Delayed execution of the projects due to long deliveries from the indigenous manufacturers which may be due to limited plant capacities, large number of pending orders and difficulties of getting structural materials and complex but vital components.

(c) Restrictions in technological choice about design, size, capacity, flexibility and quality.

(d) Partial obsolescence of processes, techniques and equipment.

(e) Loss of availability of technical know-how and engineering services, normally obtainable from foreign plant suppliers and process manufacturers.

(f) Adverse effect on competitive position of our exports of the manufactured goods as a result of the above factors.

The above observations definitely do not form the arguments against the increasing use of indigenous equipment. These are mentioned here only to highlight the nature of the problems involved in this transition from imported to indigenous plant and equipment. We will have to find some way to ensure that the benefits of research and development and technological improvements of processes, techniques and equipments continue to flow from abroad and are not halted because of our lack of interest in the purchase of imported equipment. This could perhaps be done along the following lines:

(1) Encouraging the bright students to proceed for advanced studies abroad.

(2) Technical collaboration at know-how design level from consultants and engineering contracting firms of repute from various advanced countries.

(3) Operation of a suitable patent system to ensure availability of progressive technical know-how.

(4) Industrywise research and development associations, with periodic exchange of personnel between industry and research institutions.

(5) Introduction of comprehensive cost reduction advisory services, with specialised sections for various industries.

The abovementioned considerations would also broadly apply when various industries have to learn to depend progressively on Indian personnel for all types of complex technological services as against their present dependence on foreign personnel. However, it is reassuring to note that, in a few industries, Indian technologists have already undertaken complicated technological tasks independently and have achieved results comparable with those expected from the reputed foreign experts.

"Fractional Distillation" of Industrial Units

In order to arrest this unhealthy trend of rise in costs, positive efforts at what may be described as "fractional distillation" of industrial units under heat of rising costs and pressure of competition have to be directed. Under such conditions, various units in each of the major industries should be scrutinised and those which are found to be inefficient and incapable of substantial improvement through application of modern concepts of technological and management efficiencies would have to be closed down forthwith. This action would release raw materials, foreign exchange and management personnel for better production activities elsewhere. Those units which are run relatively efficiently at their particular level of production should be given scope for immediate expansion to the economic scale of production with reference to their particular industry. As regards the new units, these should be encouraged only after detailed investigations regarding techno-economic aspects and should be installed only in economic sizes at proper locations after ensuring that the modern know-how techniques and plant would be available.

In a country like ours where the capital resources are scarce and unemployment situation is serious, the fractional distillation suggested above may run into practical difficulties. Establishment of new units would require considerable capital, while the closing down of inefficient units would throw a large number of people out of employment. In these circumstances, the best use of scarce capital resources could be ensured by expansion of the present efficient units to economic sizes wherever feasible. The closing down of inefficient units should, however, be considered unavoidable and should not be delayed and the problem of finding employment for the discharged labour from such units should be handled by providing proper facilities for training and employment exchanges.

Matching of Demand and Production

One of the major causes of rise in costs is time-lag between the growth of demand and the availability of goods and services from the increased production to meet the growing demand. When it is realised that the demand has grown up and a new unit of economic size should be installed, it would be another three to five years before the production of the proposed unit could be realised by which time the demand will have grown even further. It is, therefore, necessary to cut down the average time-interval of implementation between planning and production to the bare minimum. This would require that almost continuous surveys on industry-wise basis should be carried out in different parts of the country with regard to main factors of production such as availability of raw materials, their reserves and quality, power and water resources, transport facilities and pattern of demand. If the results of such surveys are made widely available and the potential locations for various industries are studied in advance, the period of project development and implementation could be considerably cut down to a reasonable level. This would also have the advantage of not only making the production available relatively quickly but also of keeping the investment costs within the estimated figures.

To sum up, from what has been stated above, it would be obvious that relatively higher costs of investment and higher costs of production would be inevitable during the next few years as compared with international standards. We have, however, to endeavour to keep the excess at the minimum level by adopting modern technology, economic plant size, proper care in selecting location and reduction in time-lag between growth of demand and availability of production by preliminary techno-economic surveys. Indigenous talent and indigenous equipment manufacturing activities would have to be encouraged in the interest of long-term development. Reduction of costs all round is a continuous process and the nation at the individual, as well as the collective, level would have to be incessantly keeping a watch over the situation so as to keep the price structure under reasonable control. Only then will we be able to reach the so-called "take-off" stage in technology and economy.

JINDAL quality steel pipes

Quality steel pipes are essential for industrial and agricultural development. For carriage of all kinds of fluids and gases and fabricating structural jobs quality steel pipes count.
And **Jindal** make quality steel pipes! Produced from the imported modern machineries and by the right technical skill at every phase of operation,
Jindal steel pipes are available upto 4" (100 mm.) diameter according to IS. 1239—1958.

PIPES FOR PROGRESS

WHAT IS WRONG WITH FOOD PRODUCTION?—I

By S. Ramayya, I.A. and A.S. (Retd.)

WE started planning in India in right earnest from 1950 and have passed through two Five-year Plans and 3½ years of the third Plan. It is time to make an evaluation of the progress. When the Plan implementation began in the early fifties, our national income was about Rs. 10,000 crores at 1960-61 prices. Our objectives were then, or somewhat later when we reviewed the position in 1955, to double this national income to Rs. 20,000 crores, by about 1967-68, in 17 years, with an annual growth rate of 5 per cent. Similarly, our idea was to double our *per capita income* of Rs. 284 in 1950-51 (at 1960-61 prices) to Rs. 568 by 1973-74 in 22 years. The assumption was that population would grow at 1½ per cent a year. The country was very hopeful about the results.

Let us see how far we have realised these expectations. We did invest about Rs. 3,500 crores in the first Five-year Plan, Rs. 6,750 crores in the second Five-year Plan, and till now about Rs. 6,000 crores in the third Five-year Plan, in all about Rs. 16,000 crores. Our national income in 1963-64 is of the order of Rs. 15,000 crores. An increase of Rs. 5,000 crores for an investment of Rs. 16,000 crores cannot be said to be unsatisfactory from an overall growth point of view since it has given a capital output ratio of 3:1. It has, however, fallen far short of our original expectations. In 13 years, our national income has increased only by 50 per cent, instead of the 82 per cent we wanted. Our *per capita* income has improved only to Rs. 330 from Rs. 284, a growth of 16 per cent, instead of the 60 per cent that we contemplated. The total income growth has been a bare 4 per cent, instead of the 5 per cent thought of, while the *per capita* growth has been 1½ per cent, instead of 4½ per cent expected. Meanwhile, the growth of the population has been more than we bargained. Between 1951 and 1956, it grew at 1.86 per cent. In the period 1956-61, it expanded at a rate of 2.18 per cent. In the last three years, it is almost an explosion, the rate being about 2.3 per cent.

Agricultural Sector: An Overall Picture

Apart from the population explosion, the most alarming symptom today is the snail's pace of growth of the national income at 2.4 per cent in 1961-62 and 2.6 per cent in 1962-63, though in 1963-64 it is slightly better at over 4 per cent. Sector-wise analysis has to be done to locate the weak spots. In such an exercise it does not take one very long to pinpoint the weak sector, namely, agriculture. Let us now get a complete picture of this sick area. I am restricting myself only to the food production side of the agricultural sector and all figures and statistics below relate to it, omitting plantations, cash crops, fibres, etc.

An overall picture may first be taken. The food crops in the agricultural sector accounts for one-third of national product—about Rs. 5,000 crores. It, however, employs nearly two-thirds of the population of about 46 crores today. Concretely, we can say 30 crores of people, or about 5 crores of families, live by producing food in India. Already its poverty is apparent. Further aggregate analysis confirms this. In direct tax contributions in the shape of land revenues (omitting water rates which are really prices paid by the farmers for water supplied by the State), this sector may now contribute about Rs. 50 to Rs. 60 crores. In indirect revenue, in the shape of excise (import and export duties can be excluded) we cannot rate its effort beyond Rs. 12 *per capita*, that is, in all Rs. 30 crores×12=Rs. 360 crores. Consequently, out of a total revenue of about Rs. 2,600 crores in the present-day India, State and Central, the agricultural sector (covering food crops only) cannot at its best, give more than Rs. 400 crores, about 8 per cent of its product. The All-India tax effort is over 17 per cent of the national product. The other sectors have, therefore, to contribute more to make up the deficiencies of the agricultural side.

Even if we allow Rs. 10 *per capita* as saving by the food producers (and this is doubtful), this sector cannot contribute more than Rs. 300 crores as national saving, that is, a bare 6 per cent of its production, while net domestic savings has reached over 8 per cent in 1960 itself. We not only see the utter poverty of this sector but also how other sectors have to make up for its shortcomings.

In the first Plan, calculations show (I have indicated the method in detail below) that we invested about Rs. 700 crores for food production and an additional output of Rs. 600 crores can be estimated as a result thereof. Similarly in the second Plan, we invested about Rs. 800 crores and extra output was of the order of Rs. 700 crores. In other words, for Rs. 1,500 crores investment in the two Plans in the food sector, we got an additional output of Rs. 1,300 crores, that is, a capital output of 100 to 86. There is nothing surprising about this result. We mainly concentrated in the promotion of medium and minor irrigation schemes, did some work in providing fertilisers, improving research, etc. and they all paid quickly. The farmer's incentive was not curbed, but prices rose quickly. The technical improvements possible yielded quick results.

When we come to the third Plan we get surprising results. I give some detailed figures below:

Plan Outlay
(Third Five-year Plan)
(In crores of rupees)

			Investments in public sector
Agriculture: C. D. Schemes:	226crores / 126 crores	50% of 352 crores may be taken as investment	176
Total	352		
Soil conservation			72
Major irrigation			600
Minor irrigation			176
		Total investment	1,024
Deduct 10 per cent. for non-food area investment			100
Net investment in food in public sector			924
Take approximately 60 per cent. of Rs. 925 crores for private sector investment (on page 31 of the III Plan summary the figure given is Rs. 850 crores)			555
		Total	1,479

Say, a total of Rs. 1,500 crores investment in third Plan for food. Of this, the proportion for the first three years: Rs. 500 crores.

As against this outlay, the production of foodstuff (in million tons) was:

		+ or —
1960-61 Base year	80.97	
1961-62	81.036	+0.07
1962-63	78.75	—2.22
1962-64	80.00	—0.97
Total		—3.12

It will be seen that the net result over the three-year period is 3 million tons *minus* in production. At Rs. 500 per ton approximately, the *minus* production in terms of value is of the order of Rs. 150 crores. Rs. 500 crores invested has produced a *minus* production of Rs. 150 crores. This is a very serious matter which requires analysis.

Other Symptoms of the Malady

Today's 46 crores of Indian population at the minimum ration of 16 ounces a day require about 85 million tons of cereals. We have already seen how from 1961-62 our food production has refused to move beyond 80 million tons. No wonder our imports of foodstuff have now become chronic and at about 5 million tons a year consume precious foreign exchange to the tune of about Rs. 130 to 150 crores. We can ill afford this outlay, seeing that our nascent industries are struggling for foreign exchange.

Another alarming feature is the day-by-day increase in food prices. The wholesale index for rice in January 1956 was 77 (base 1952-53=100) and in August 1964 it is 146. In the last eight months of 1964, rice prices have shot up by 26 points. The case is more or less similar with all other cereals. Everybody is fully aware of the consequences of such a price spiral. Economically, it hits hard the urban middle class, the industrial worker and the proletariat who come to cities in search of odd jobs. It equally affects the rural landless labourer and artisans who are paid in cash. It leads to agitation for rise in wages and salaries, provoking cost inflation problems in industry, Government services and even in agriculture. To the middle class, life is becoming a nightmare. Problems of social unrest, law and order are there for anybody to see. It may lead to chaos and political disorder.

One extremely bad result which is becoming clearer day-by-day is the aggravation of inflation by this agricultural investment. Today's inflation in India is a vast subject and requires elaborate treatment. It is becoming a hydra-headed monster in our developing economy and we are getting worried over it. That agricultural investment in the third Five-year Plan should lead to inflation is a new phenomenon which should be carefully understood. This did not happen in the first two Plans when the agricultural output was fairly good.

It is a well-known fact that any *additional investment* expenditure has a dual effect. It first generates money income by its multiplier effect. Meanwhile, the *total investment* increases productive capacity by a new factory or a new dam. The new productive capacity adds to the marginal income ultimately. The income generated by the expenditure proper with its multiplier effect will produce certain amount of inflation till overtaken by the additional output. If Rs. 170 crores are invested in food production every year of the third Plan, it will generate, with, say, 3 as multiplier, an immediate additional income of Rs. 500 crores. Meanwhile, the additional production from agriculture with a good capital-output ratio of 80 per cent will swell to Rs. 400 crores or so. The income generated and output gained will and should match soon with neither inflation or deflation.

These are, of course, ideal conditions rarely met with even in advanced countries. We, however, expect some return at least, for an investment of Rs. 170 crores a year in additional output. It may be 20 or 30 or 40 per cent. In agriculture it should be 75 to 80 per cent. The awful fact is that we are not getting any such return. It follows that the investment simply by its multiplier effect only generates additional money income and inflation sets in with no balance of output to absorb it on the other side of the equation. Worse still, there is a *minus* return of Rs. 50 crores annually, that is, something like disinvestment. The annual investment of Rs. 170 crores is not only abortive in return but it leads to further disinvestment! Why then invest such money on agriculture to the tune of Rs. 3,000 crores in the third Plan? Is it not a colossal waste? This is a very serious matter, indeed, and requires a deep probe.

Our Objectives and Superficial Remedies

We should be very clear about our objectives in the agricultural sector. There are no two opinions about the need for ample food production for the existing and growing population. The 70 per cent rural and subsistence cultivators naturally consume two-thirds of their production in kind. The one-third surplus which is consumed by the urban people should be sold to them at reasonable prices. The non-agricultural sector is none too rich and cannot afford to pay fancy prices. At the same time, the farmers should also be paid their cost of production, as well as a reasonable profit, and should not be put to any loss or penalised in any way Otherwise, there will be no incentive for them to increase food production.

More than that, what is our view regarding the agricultural sector? We still seem to be labouring under a good deal of confusion by mixing mediæval and modern ideas. Our present-day thinking should be to treat it as a major productive sector (now sick and unproductive in underdeveloped India), get the best *per capita* income for the farmers, make them save as much as possible, reinvest the savings there and in other sectors and steadily get it out of the morass into which it has sunk. In the late nineteenth century Japan, the savings were from agriculture to industry. To treat it as an object of pity, pour all our sympathies and sentiments into it, look at it as if it is there for purposes of charity only, are all false notions and will be productive of no result. We should, therefore, carefully see whether all our hullabaloo and palliatives will improve production in this sector. The poor monsoon which has been with us, and is going to be with us, for thousands of years, is the first scapegoat. The distribution side is the next. We should certainly remedy any defects therein but nobody can agree that huge State trading will improve production which is the need of the hour. More fertilisers, pesticides, better implements, cheap credit, big warehouses are all good in their own way. They will not, however, solve the fundamentals of the problem. More dubious remedies are: importing rice mills, when 5,000 rice mills in the country have barely a month's work in a year, long-standing subsidies for irrigation water or fertilisers to farmers, cheap grains to the proletariat, control of prices, levy, etc. All these may have some temporary effect but we should go to the root of the matter and see what is wrong with this sector.

(To be continued)

BUSINESS NEWS FROM EUROPE

JAPAN'S NEW SHIPPING THREAT

EUROPE'S SHARE IN FOREIGN AID EXPECTED TO FALL

From Our Special Correspondent

A PLAN reported for Japan to double her merchant fleet in the next four years could have a serious double-edged effect in Europe if it succeeds. It will produce a glut of shipping on the carrying side and tend to make Japanese yards even more efficient and able to produce at low cost. The glut of shipping is probably the more serious, since there is already an overstretched market. Ship charterers are finding increasing difficulty in filling holds, particularly in the Pacific.

Although Britain would be hit most hard, especially in the Pacific, the high-cost American fleet, much of it already forced out of service by the Europeans, would take another hammering. The second consequence—more efficiency in the yards—would also hit Britain, where orders have been falling steadily. But it would also affect those European nations such as Norway and Sweden which have worked hard to bring down costs and increase efficiency in their own yards.

If the Japanese plan works out, it would mean the expansion of her ocean-going fleet to 17.2 to 17.6 million tons, still behind the British figure but way ahead of almost every other maritime nation in the world. There have been some doubts expressed that the Japanese may not be able to reach the target figure, but it is not thought that too much store should be put on these. Japan has both the unused capacity and the labour available to make the plan a reality. Projects for half a dozen docks for the construction of 150,000-ton tankers and upward in the past year are only the most spectacular of a number of new investments.

Europe Lends Less

World foreign aid is expected to rise this year by eight to nine per cent—but the European share of the distribution is likely to fall. Net official aid is thought likely to reach 6,600 million dollars from 6,075 million dollars in 1963. The European contribution may well fall for the third year running to under 1,900 million dollars. To the figure of official aid must be added private direct investment and guaranteed export credits for longer terms than five years which, according to the Development Assistance Committee of the Organisation for Economic Co-operation and Development, qualifies as long-term aid. When all these items are included, the total long-term aid this year is expected to be over 9,000 million dollars.

That foreign aid will increase this year is largely due to the policies of the American Government. Since 1960, U.S. aid has increased by nearly one-third, from 2,817 million dollars to 3,844 million dollars and should be well above 4,000 million this year. After rising to 2,256 million dollars between 1960 and 1961, the European amount has since slid down to 1,960 million dollars, and there are reasons for believing that this year will show a further falling-away.

Italy's economic and balance of payments problems caused a general retrenchment earlier in the year which will have affected her lending; France is running down her lending as her commitments in Africa, particularly Algeria, become fewer; and Germany has tended to devote less to foreign aid for the past four years, though this year may see a slowing in the rate of decline.

The European aid record is not considered outstanding and to have decreased at a time when the underdeveloped countries of the world are seeking more working capital is thought to be an unfortunate trend.

Half the European lending is provided by two countries—France and Britain. Most of France's goes to her former African territories and is tending to be run down as she becomes less involved with them. Similarly, a considerable proportion of British lending is to her allied territories in the sterling area.

By far the largest part of the flow of assistance to less-developed countries is through bilateral arrangements. As a method of helping the recipient countries bilateral lending is not necessarily the best form since it ties them to the donor. But the economies of the donors have to be considered and it is thought unlikely that there will be much of a move away from this form of lending in the near future.

The biggest proportionate increases in bilateral lending last year were made, in Europe, by Italy and Norway, which both doubled their contributions. Small decreases were recorded by France, the Netherlands and Britain. The decrease by the Dutch was due to the discontinuation of bilateral assistance to Western New Guinea, which had amounted to 30 million dollars in 1962.

The flow of private investment is still an important contribution to foreign aid, but few countries achieve a substantial amount and most of which does take place is to develop oilfields or search for more petroleum. The United States is the only major supplier of private investment and the largest part of that goes to South America (principally Venezuela) to develop oil.

Although Germany's contribution to aid has fallen over the last four years her help is still made to the greatest number of countries—about 90. This surpasses the number of countries which the United States helps—about 70.

Britain and France are both tending to give their aid over a wider field, but the Belgians still incline to concentrate much of their aid on Africa because of their previous associations with the Continent.

Behind the greater diversification of the geographic pattern lies less exclusive concentration on former dependent territories, a realisation that aid must be spread even more evenly and more widely, and a reflection of actual or desired trade patterns. This is especially so of Germany where aid is seen very much as a help to trade.

More Medium-sized Firms

The noticeable trend towards concentration in European industry does not appear to have affected the growth, or profitability, of medium-sized firms. A survey undertaken in Germany showed that the country's large industries have grown over the past decade but there are more medium firms now than ever before. A part of the reason for the continued growth of the medium-sized firm has been the maintenance of economic expansion. But more important has been the attack on monopolistic practices which has allowed the smaller firm to compete, and expand, at the expense of cartels and other monopoly organisations.

The survey discovered that, out of 30 major industrial branches in Germany, there were more firms in existence now than 10 years ago. Only eight branches had fewer firms. The major firms have expanded because of the need for increased capital which goes hand-in-hand with technical progress. Competition from abroad is also rising, causing European firms to be more growth conscious, and it has been necessary to safeguard sources of raw materials, which can be more easily done by larger firms.

The large European firms had a particularly good year in 1963—better than the American, which also had a good year. Combined sales of the world's 200 leading non-American firms rose by 10 per cent over 1962, as compared with seven per cent for the leading 500 American companies. Apart from Japan, a few European countries dominate this list of 200. Fifty-three of them are British, 33 German, 25 French. Altogether Europe accounts for 141 of the 200.

Of the major industry groups, the car companies showed the biggest rise in sales last year; the 14 among the 200 recorded a gain of nearly 12 per cent. The list would have been 15, if Simca, of France, had not dropped out on being taken over by Chrysler. In 1962, it was safely in the upper central position in the table, being 90th. The largest single firm by a long way was the Royal Dutch/Shell Petroleum group, whose sales touched £2,330 million last year. Another British-Dutch company, Unilever, was second, with £1,530 million (and Britain's state-owned National Coal Board third with almost £900 million).

For a small country, the Netherlands did exceptionally well by having a third company in the top 10, Philips' Gloeilampen-fabrieken at number seven, the only company in the first 10 to move up one place during the year. Only Germany—Volkswagen at 8 and Siemens at 9—had more than one company in the 10. There was a long drop before the next Dutch company appeared, the chemical firm AKU being 45th, a rise of two places over 1962.

First Swiss firm was Nestle at fifth, first Italian Fiat at 10th. Other leading national companies were Rhone-Poulenc, the French chemical group at 18, a drop of three places during the year, ARBED, the Luxembourg iron and steel firm at 38, Belgium's Petrofina at 50, KF, the Swedish Co-operative Union at 54, and Austria's VOEST, which produces iron and steel, at 169. No representative of Norway, Denmark, Finland, Spain, Portugal, Greece or Turkey appeared in the list.

The degree of concentration in certain industrial group is shown by the appearance of a small number of them in the first twenty. Eliminating two nationalised coal industries—in Britain and France—five automobile firms, four chemical firms and three electricals appear. There are also two firms each producing petroleum, foodstuffs and iron and steel. The same pattern recurs in the next 20: there are seven iron and steel firms, three each from petroleum and electricals, two from chemicals and one each from food and automobiles. Six industrial groups are, therefore, represented by 31 firms out of the leading 40, a pertinent comment on the degree of concentration.

Most E.E.C. Produce Now Under Rules

With the entry into force of new rules covering dairy, beef and veal production, more than 85 per cent of the Common Market's farm production is now within Community regulations. Cattle-raising and dairy production are the most important source of farm income in the Common Market. The new regulations for milk products, of which the Community is normally a net exporter, are based on a market system of import levies, export refunds and target prices.

Butter is to get special treatment. If the price falls too much, there will be market intervention to uphold it. Butter exports will be through a licence system. Because of the wide variety of cheeses produced by E.E.C. farmers, the target price will be fixed by groups.

In the transitional period up to 1970, when the full community structure comes into force, E.E.C. member countries will gradually align prices and cut subsidy payments to farmers. For beef, of which the E.E.C. is a net importer, the system adopted is liberalisation of imports and a continuation of customs duties at their current levels. If the market situation changes, then the levy system can be introduced. There are still target prices for Community farmers.

Red Trade Star in India

Russia is making a big attempt to win a large share of the Indian market. A new trade agreement is expected soon which will show that two-way trade between the countries should rise by about 40 per cent next year. The Russian authorities are in a particularly strong position to meet Indian demands because Russia is not tied over export credits as most Western countries are. India needs more industrial goods but cannot afford to pay immediately for them. Therefore she wants long-term credits.

The West is bound by the Berne agreement that export credits should exceed five years only in exceptional circumstances. And, although a number of European countries have broken this understanding (ironically, mostly in their trade with Russia), it still holds generally. Russia can offer whatever terms she like and is no way bound by Western "rules." Next year's increase comes on top of a 70 per cent expansion in trade to £127.4 million this year and a tenfold expansion over the last 10 years.

One of the European nations to be hit from this trade expansion will be West Germany, which has been building up trade successfully with India over the last five years or so. British trade could also be affected, but, on the rest of Europe, the consequences are thought likely to be no more than marginal.

Italian Washing-Machine Drive

Italy is about to make an all-out attack on Europe with its washing machines. Based on the rapid growth of the home market over the past three years, it is now set to expand abroad at a fast rate. Since 1957, washing-machine production has leapt ahead in Italy. In that year 78,500 machines were produced; by 1962, the figure had risen to half a million. This year production is expected to top the million mark.

The average rate of growth has been about 50 per cent a year.

It is to maintain this rate of growth that the Italians are moving outwards. Although only one in two Italian homes has a machine, this figure is probably second only to the Dutch in Europe and is almost certainly reaching saturation point. Main spearhead of the sales drive is thought to be in Britain, where the Italians have already achieved a considerable bridge-head through agreements with local producers and agents. There is also likely to be an intense drive in Italy's Common Market partners, France and West Germany. France probably has the fewest machines per head in the Six and, while West German demand has been rising in the past two years, there is thought to be a lot of room for expansion.

Italy's competitive position has arisen from the willingness of the producers to plough back profits into productive investment and the almost fanatical lengths firms will go to to introduce automation at every possible stage of production. Further drives will take place in Switzerland, Scandinavia and Austria, where there is already a ready acceptance of domestic appliances, but it will be some years before the Italians make a line for Spain or Portugal.

Portugal: Defence Still the Problem

Large increases in exports, receipts from tourism and remittances from nationals living abroad have helped to meet difficult economic problems in Portugal this year. To a considerable extent these problems stem from high defence spending which has made short-term economic stability dependent on the maintenance of financial stability. At present levels of output and consumption, especially taking into account the country's need for economic development, the authorities are constantly having to avoid deflationary tendencies. Gold and foreign reserves, however, remain at a high level and the balance of payments provides a substantial margin for a policy aimed at speeding industrial production and investment.

The Portuguese authorities have decided to follow the long, five-year, development plan, ending this year, with a shorter one for 1965-67. If it is to succeed, it will, it is thought, need a much more active role from the public authorities. This year should see a big increase, about 24 per cent, in investment expenditure over last year. Foreign credits are expected to meet about a third of this outlay.

In spite of the increased investment, Portugal is still unable to absorb all its labour force and there is persistent unemployment. Even migration abroad, much of which is illegal and therefore concealed in the official statistics, has done little to help the problem. Net emigration is expected to be about 50,000 this year, though the real figure is probably three or four times as large.

Israel Farm Plan

Israel is to raise farm output by 40 per cent over the next five years. The Israeli Ministry of Agriculture said that increased output would come from a relatively marginal—seven per cent—increase in the labour force. At the top of the programme is a 35 per cent rise in vegetable production. Milk production is planned to increase by 27 per cent and egg output by 28 per cent during the next five years. Commercial crops, however, are expected to expand by only eight per cent. The plan shows that Israel is pressing on with greater diversification of farming. Market gardening is to become increasingly important, in view of good sales prospects for Israeli produce in Europe and parts of Africa.

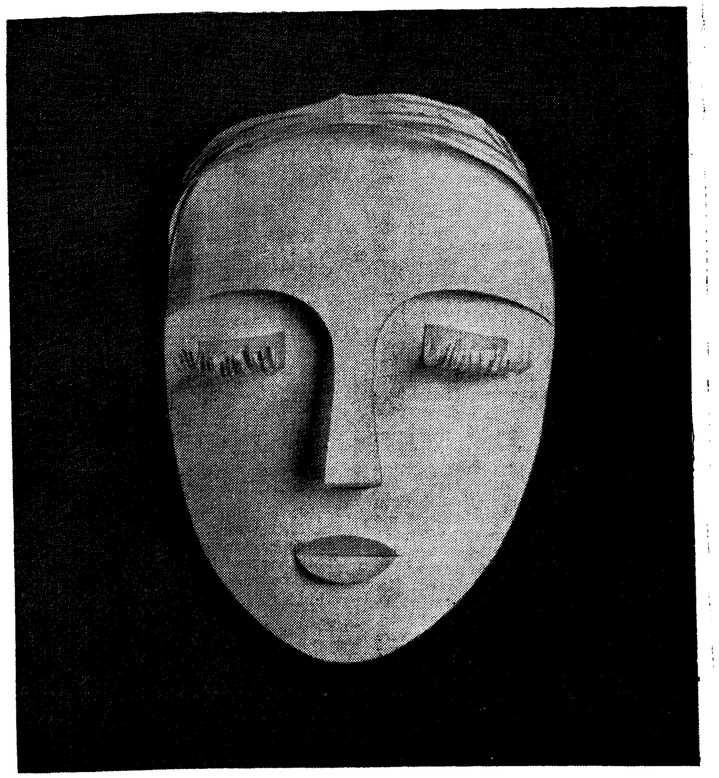
Topical Briefs

Increased imports of *Japanese* sewing machines next year are likely to make the European market much more competitive. Not all the European countries are apprehensive about the increased competition but all know that profits and margins will be cut. The extent to which they are cut will depend on the extent to which national markets are largely made up of the cheaper machines, where Japanese competition will be most severe. In Britain, the Japanese have already had success with their low-priced machines. But the British market probably now comprises 40 per cent in the higher-price ranges and imports are not thought likely to have much effect here. Other European countries may be more susceptible to Japanese pressure, because the sewing machine is a more important domestic appliance. In Switzerland, for instance, the rate of purchase is thought to be double the British. Italy and Spain are also likely to suffer from the imports. Spain has been building up its industry recently, especially in cheaper models.

Bankers in *West Germany* are continuing their attack on a withholding tax on non-residents' incomes from German bonds. The tax is wanted by both the Government and the Bundesbank for balance of payments reasons. It was made known earlier in the year when the Government was afraid of an inflationary influx of capital from abroad. But the bankers now think the position may have been reversed and the economy be thankful for any inflow of capital. The bankers argue that the country's international payments have undergone a fundamental change since the spring and that the withholding tax has lost its point. To some extent, the reserves support this. From end-March to end-September, they declined by £55 million, of which some £45 million was probably due to the repatriation of foreign-owned bonds caused by the threat of the tax. But the Government is determined to press on with the tax even though the original deadline—June 20—has long since passed.

Shipyards in *Britain* showed a fall in orders in the third quarter of the year. New orders, at 113,000 gross tons, have been admitted to be disappointing and are only a third of the volume of work needed to keep the industry at full capacity. If business continues at this rate it is expected that there will be a considerable amount of unemployment in the yards within the next 18 months, possibly sooner. The total for the quarter represents a sharp fall below the level of ordering in the first half of the year and it is thought that the latest figures represent a reaction to the Government's £75 million shipbuilding credit scheme. The scheme had been introduced as a once-and-for-all measure to get work back into the yards. It was successful in doing that. But once the credit had been absorbed there was no influx of new, continuing orders. It is thought now that there is likely to be a fairly extensive shake-up in the industry to eliminate the small and unprofitable yards and to create more efficiency, the only yardstick that will win back new orders from abroad.

Price increases have hit a number of *Common Market* countries over the summer. A fairly steep rise is recorded by the Commission in Italy during July and August, despite improvement in the demand and supply position, and Luxembourg also suffered a setback. There has also been an accelerated movement in German prices, where the trend had previously been moderate. France and the Netherlands have stood out against the general trend and increases have been kept within bonds. The growth of industrial production in the Six slackened during the summer. Industrial and consumer spending was at a reduced level in Italy and it was also weak in France. Dutch expansion of output showed signs of slackening, too. Common Market officials believe that German and Belgian production reflects the inelasticity of supply rather than any growth of demand.



BINNY fabrics do not wear a mask
You buy what you see and feel

NO STARCH By tradition Binny fabrics are not starched or given any other form of temporary finish. Every cloth is left literally to speak for itself.

NO OVER-BLEACH Binny fabrics are not over-bleached. Bleaching weakens the fabric and reduces its life. The avoidance of extreme whiteness by over-bleaching is one reason why Binny fabrics have a world-wide reputation for durability.

FAST DYES The use of only the world's fastest dyes and a large experienced staff of highly qualified research chemists—this is the unfailing formula that guarantees the colour fastness of every Binny fabric.

BINNY - a great name in textiles

CO-OPERATIVE MOVEMENT IN MAHARASHTRA

BULK OF AGRICULTURAL SECTOR COVERED

MAHARASHTRA is one of the few States in India where the co-operative movement is deeply and firmly established. Although this State has only 9 per cent (39.5 million) of the total population of the country, in terms of deposits, paid-up capital and working capital of all the societies, it accounts for roughly 25 per cent of the corresponding figures (for 1961-62) of the co-operative societies in the whole of India. After independence and especially in the last 13 years of planned development, the co-operative movement has grown to a considerable extent and made striking progress in almost every sphere of activity. Originally conceived for credit purposes, the movement in recent years has become extremely diversified and covers several other fields of economic activity like joint farming, agricultural processing and marketing, sale of consumer goods, industrial production, housing and insurance. Along with the steep increase in the total number of societies, their membership, owned funds and working capital, the co-operative movement has spread its coverage to the State's rural and urban areas alike.

According to data made available by the Government of Maharashtra last week to synchronise with the "Cooperative Week" observed all over the country, the co-operative movement covers nearly 98.4 per cent of the villages and 63 per cent of the population in the Maharashtra State. The total number of all societies has more than doubled—from 16,817 in 1951 to 35,929 in 1964. This approximates to 10.5 per cent of the total number of co-operative societies (341,841) existing in the entire country as at the end of 1961-62. At the end of the co-operative year 1963 (July 1962-June 1963), the aggregate membership of all societies in the Maharashtra State was 5.16 million and their paid-up capital Rs. 76.11 crores. During the same period, the working capital, owned funds and deposits of these societies increased to a considerable extent to Rs. 400 crores, Rs. 104 crores and Rs. 106 crores, respectively. Agricultural credit societies constituted 55 per cent of the co-operative movement in the State and at the end of the co-operative year 1964 (June 1964), the total number of such societies was 19,937. In the last 13 years (1951-1964), the aggregate agricultural finance advanced by them increased from a bare Rs. 5.39 crores to as much as Rs. 56.08 crores.

The growth in the co-operative movement in Maharashtra is reflected to some extent in the progress of the Maharashtra State Co-operative Bank, the apex co-operative bank. The working capital and owned capital of this institution which had risen from Rs. 61.6 crores and Rs. 4.47 crores, at the end of June 1962 to Rs. 65.6 crores and Rs. 5.24 crores by the end of June 1963, advanced further in 1963-64 to Rs. 75.2 crores and Rs. 5.59 crores respectively. The Bank's deposits alone increased from Rs. 25.4 crores to Rs. 35.2 crores in the two-year period. The total loans sanctioned by the Bank were up from Rs. 41.8 crores in June 1963 to Rs. 45.3 crores in June 1964. Even so, there was a perceptible fall in the total amount of Bank's overdues from Rs. 12.79 crores to Rs. 10.09 crores.

Co-operative Credit

In dispensing with co-operative credit—agricultural short-term, agricultural long-term and non-agricultural loans—Maharashtra has been in the forefront, leading other States in the country. As of 1961-62, such advances accounted for 18.4 per cent, 27.5 per cent and 29.8 per cent, respectively, of the corresponding figures for the entire country. In respect of service co-operatives which have received a new momentum in recent years, there were as many as 16,460 societies operating in the State this year. Nearly 8,000 agricultural credit societies have undertaken useful multi-purpose activities such as distribution of manure, seeds and implements and, in some cases, even marketing of agricultural produce. They have thus been helping roughly 67 per cent of the cultivating families in the State, inclusive of the weaker sections of the agriculturists, by providing them with credit facilities and other services.

The progress made in providing long-term credit during the period July 1951 to June 1963 was particularly significant in respect of both loan advanced and shift in the policy governing the purpose of such advances. The stress was placed on land improvement rather than on redemption of old debts and purchase of lands. The long-term advances, which stood at a mere Rs. 12 lakhs in 1950-51, had increased considerably to Rs. 9.59 crores in 1962-63. Most of them were granted for specific productive purposes such as land improvement, construction, repairs of wells and installation of pumps. By successfully floating debentures, the Apex Bank in the State collected during 1962-63 about Rs. 5.50 crores for this purpose.

Co-operative Farming

The development in another important field of co-operative movement, namely, co-operative farming, has also kept pace with the general progress. With a view to increasing agricultural production, the co-operative farming societies (865) both in pilot and non-pilot areas, are helping in stepping up agricultural production. In 1963, the pilot and non-pilot areas together commanded an area of 120,000 acres, including 75,000 acres under cultivation. The State's current Plan (third Five-year Plan) aims at organising 975 co-operative farming societies. In order to propagate joint farming, many State Governments, including Maharashtra, are utilising large tracts of waste land. In addition, nearly 124 lift irrigation societies have been organised in selected places for providing adequate water for irrigation purposes.

Co-operative milk unions and societies and fisheries co-operatives are the other important service co-operatives that have been set up in the State. As many as 901 co-operative milk unions and 243 fisheries co-operatives were in operation at the end of June last. An idea of the valuable services rendered by these co-operatives could be had from the fact that their total sales in 1962-63 were about Rs. three crores.

Marketing Co-operatives

The performance of marketing co-operatives in the last few years was by no means insignificant, considering that their value came to be realised only a few years ago. In 1962-63, the marketing co-operatives (398 excluding apex societies) and other co-operatives such as agricultural credit, processing, etc. handled agricultural produce worth Rs. 37 crores and supplied agricultural requisites worth Rs. 22.31 crores, as against Rs. 32 crores and Rs. 15.81 crores, respectively, in the previous year. The percentage of the value of agricultural produce marketed to total agricultural credit was 84 during 1962-63 as against 76 in 1961-62. These marketing co-operatives also supplied consumers goods worth Rs. 10.42 crores during 1962-63.

As Government agencies, the co-operatives are further supposed to play a prominent role in the procurement of foodgrains. The apex marketing society has received a guarantee of Rs. 15 crores from the Government for this purpose. Maharashtra, of all the States in the country, has the largest number of regulated markets (226) and they facilitate orderly and profitable sale of agricultural produce under proper supervision and open auction.

In the sphere of co-operative processing of agricultural produce also, the State has made significant progress. Maharashtra has been the first State in India to organise sugarcane processing in the co-operative sector, and has at present 20 co-operative sugar factories. The 17 factories that were in operation in the 1962-63 crushing season manufactured 292,000 metric tonnes of sugar (including 51,000 metric tonnes of raw sugar for export). Some 229 (excluding sugar factories) other agricultural processing co-operatives such as cotton ginning and pressing, oil mills, paddy processing, banana processing, *gur* and *khandsari* have been functioning this year in the State. There were even eight co-operative spinning mills by the end of 1963-64. This progress in the processing field was largely due to the initiative taken by the State Government not only in organising them but also in finding the funds. The State Government gives loans to farmers to enable them to subscribe to the capital of the societies, in addition to large loans at favourable rates of interest. The State Bank of India, the Industrial Finance Corporation of India and the State Financial Corporation also provide funds to these societies. In short, these are co-operatives spoon-fed by the State Government and other public-sector organisations.

Industrial Co-operatives

In the field of industrial co-operatives, the movement has made some useful contribution. Of the various industrial co-operatives (4,114) as at the end of last June, the handloom weaving co-operatives (774), the forest labourers (374) and the labour contract societies (676) are said to have progressed well and helped the backward classes and other weaker sections of the community in solving their social and economic problems in a modest way. The production and sales of handloom cloth by weavers' co-operatives in 1962-63 were worth Rs. 6.06 crores and Rs. 7.32 crores, respectively, as against Rs. 4.19 crores and Rs. 5.88 crores in the previous year.

In other socio-economic activities such as housing and consumers stores also the State's achievements are outstanding. Maharashtra has the largest number of housing (3,090) and consumers (1,179) co-operatives as compared with the other States in India. By the end of 1962-63, the capital invested in the form of land and buildings by the housing co-operatives was of the order of Rs. 23 crores, the number of houses and tenements constructed in that year being 10,349. By June 1964, as many as 32 wholesale consumers stores and 1,147 primary consumers stores, excluding consumers sections opened by service co-operatives in rural areas, were in operation. The purchases and sales effected by the wholesale stores during 1962-63 amounted to Rs. 3.04 crores and Rs. 3.05 crores, respectively and that of the primary stores to Rs. 6.28 crores and Rs. 6.7 crores respectively.

I.O.B. is big enough to serve you...

I.O.B. is an international bank with offices throughout India and South-east Asia and correspondents the world over. It offers a wide range of services to suit the needs of varied customers. Indeed, I.O.B. is big enough to serve you.

We asked our customers, thousands of them at random, what they thought of our service. They replied: "We are pleased". They also made several helpful suggestions which we are implementing. Indeed, I.O.B. is small enough to know you.

Range of I.O.B. services: Savings and Current Accounts—Recurring and Fixed Deposits—Personal and Business Loans—Bills Payment Service—Gift Cheques—Travellers Cheques—Safe Deposit Lockers —Trade and Export Information and Advice—and whatever other specialised help you may need.

...and small enough to know you

RENATIONALISATION OF STEEL

TORY AND LABOUR ARGUMENTS HIGHLIGHTED

RENATIONALISATION of the steel industry, it will be recalled, was one of the major planks in the British Labour Party's electoral platform. Now that the Party has been voted to power, albeit with an extremely thin majority, it has announced its readiness to go ahead with nationalisation in the teeth of opposition from the Conservative and Liberal parties. And it has just won, too, in the new Parliament's first division by defeating the Opposition censure amendment on the proposal to renationalise steel by 307 votes to 300. Incidentally, the debate on this amendment has brought to the fore several arguments both for and against the nationalisation proposal. These are presented in the following paragraphs:

The general argument advanced by Mr. Iain Macleod, Conservative Opposition's chief spokesman on the steel issue, is that nationalisation of the steel industry would be "irrelevant to the modernisation of Britain and damaging to the national economy." Specifically, steel nationalisation, according to him, would involve very real problems insofar as "mixed" groups are concerned. For instance, there is the problem of Tube Investments, which has a new £32-million steelworks at Parkgate and which has gone into the steel business mainly to provide steel of the quality it requires for itself. Another example is that of Dorman Long which has a vast steel interest and also other interests in bridge building, engineering and chemicals. Against the Labour argument based on the recent adverse judgment of the Restrictive Practices Court on the Heavy Steel Association's price agreement, Mr. Macleod made the following points:

1. The verdict of the Court is a valid one. There is certainly need for more competition in the steel industry. But the way to ensure more competition is not a vast expansion of State direction and control.

2. The price agreements, though not legally binding, have no doubt been generally operated so that there is no competition in price. But there is competition in quality.

3. Out of 35 restrictive agreements, all of which have been registered, one on scrap has been successfully defended, one on heavy steel has been lost—that amounts to no less than 25 per cent of the British steel output—and six have been abandoned. While one would be right in condemning these agreements, one should also try to understand how they arose. On both sides of the industry they had their origin in past memories and in fears of recession. For 30 years, in good times and bad, in war and in peace, there has been public supervision of uncompetitive prices. The fear of recession has led to it.

4. It is probable, and indeed almost certain, that the other restrictive agreements would have to follow the heavy steel agreement into oblivion. Probably there is another fear behind these agreements, that of excessive capacity brought about largely by Government intervention. Notwithstanding this fear, it is right that these agreements, except those successfully defended before the Court, should go. If the industry is confident that a major recession is unlikely, there could be no reason for their retention. When the agreements are abandoned, it is upto the Government to consider whether the Steel Board should have power over minimum as well as maximum prices.

5. As the main Labour argument in favour of steel nationalisation will fall to the ground if all the restrictive agreements happen to be abandoned, there will be no case for steel nationalisation.

Liberal Party's Stand

The Liberal Party (with its nine members in Parliament) has taken the stand that it is opposed to nationalisation not out of any "blind devotion to free enterprise" but out of the conviction that it will not solve any of the problems of the industry. Unlike the majority of the Conservative Party, it accepts that basic changes are necessary in the steel industry. But it feels that "there are no grounds for believing that a public monopoly, which is what nationalisation really entails, will be any more beneficial to the industry than the present set-up." What the steel industry needs more than anything else at the moment, in the opinion of the Liberal spokesman, is a reasonable degree of certainty as to its future being raised from the dingdong battle between nationalisation and denationalisation. The Liberal Party's latest stand in the light of the parliamentary debate is that, while it opposes a "doctrinaire" take-over of the industry as a whole, it would be prepared to consider a public shareholding in certain major steel firms.

Labour Government's Stand

On behalf of the Government, the Minister for Power, Mr. Fred Lee, has put forward several arguments in support of steel nationalisation. First, whatever may be the case for regulating actual prices charged, this, according to him, should not be left in the hands of those whose first responsibility is to their shareholders rather than to the nation as a whole. Secondly, although for the next four or five years the steel industry should be able to provide the capacity needed to sustain a growth in the national economy of about four per cent annually, it is more than doubtful whether the industry in private ownership would be able to provide capital on a large scale—at the rate of £150 million for a major new works—in the longer term. Thirdly, although the best firms observe the highest standards, consumers seem to have all sorts of doubts about service and quality in the industry as a whole. Fourthly, over the past ten years, British steel prices have increased by one-third; by contrast, in Germany and Holland, prices have gone up by only one-sixth and in France by a little over one-twentieth, while in Italy they have actually fallen. Fifthly, the British steel industry, as of today, is not as efficient as most of its competitors and its prices are rising much more rapidly than theirs.

Sixthly, the Labour Party's criticisms on the lack of expenditure on research have been fully confirmed by the special report which the Iron and Steel Board has made on research. Big changes in the structure of the industry are needed to make modernisation and rationalisation possible. An industry, consisting of a dozen large groups and a very large number of small companies, even though they be prodded by the Steel Board, simply cannot achieve the far-reaching rationalisation which the national situation demands. Seventhly, the steel industry has an inherent tendency towards monopoly and, in almost every producing country, it is subject to special regulations. A great, strong economic power bloc, such as the private monopoly in steel now, is a threat to the progress of democracy; it is a private monopoly not responsible to Parliament and the Government. Eighthly, while in some industries Government ownership of shares might be justified, in the steel industry only public ownership of its *main* part will make it possible to remedy the industry's shortcomings with the speed which the national situation demands and to ensure that the industry plays the part in Britain's economic recovery which it must play. It may be noted here that it is not intended to nationalise the *whole* of the steel industry. Finally, according to the Minister, nationalisation has shown that, under good leadership, it can fight vigorously for sales in difficult markets, can carry through major revolutions in technology and bring about big improvements in efficiency and productivity. Obviously, he must have had in mind the British coal industry which, after nationalisation, has made rapid strides under the leadership of Lord Robens. Although a leader of the Labour Party, Lord Robens accepted the Chairmanship of Coal Board even when the Conservatives were in power and worked hard for the success of nationalisation.

Some Labour Members' Dissent

Two Labour Members of Parliament, however, have openly expressed doubts about the nationalisation proposal. It is said that they cannot be relied upon to follow the party line, if and when a sweeping Steel Nationalisation Bill is actually introduced in Parliament. One of them is Mr. Woodrow Wyatt. He has listed five points which, according to him, must be satisfied in any legislation to make steel flourish. These are:

(*a*) Legislation should be directly and positively designed to improve the efficiency of the steel industry and hence all other industries depending on steel.

(*b*) The actual methods used must carry middle of the road option with it. The latest National Opinion Poll shows that only 24 per cent of people favour nationalisation of steel as they understood it in the old sense. Any legislation should reverse those figures and not confirm them, for otherwise it would be more difficult to win the next election.

(*c*) Alterations in the structure of the steel industry must be made in such a form that the Conservatives will be put in an intolerably embarrassing position if they seek to undo them.

(*d*) Legislation should take a form which the Liberals could at least abstain from voting against.

(*e*) Any nationalisation measure should be as short as possible, for a too contentious Bill would have very little chance with Labour's slender majority in Parliament.

According to Mr. Wyatt and his friends, such a piece of legislation would necessarily involve some compromise. They seem to be firmly of the opinion that 100 per cent old-fashioned style of nationalisation would not be good. Their plea is for bringing the steel industry under *public control* and for achieving a *decisive degree of public ownership* in a new, original and dynamic way that would enable the Government to carry out its plans in that industry without detriment to other promised social benefits. The type of compromise that will finally take shape may depend on the weight of opinion expressed by Labour dissenters like Mr. Wyatt and by the Liberal Party which is anxious to bring about a political armistice on the steel question.

SOVIET AID FOR POWER PROJECTS

For the rapid economic growth of any country, electricity is a basic prerequisite. India has thus assigned a high priority to power projects in the era of planning. And it has made rapid, albeit not wholly adequate, strides in this sphere of the economy, thanks to the aid given by friendly countries like the United States and the Soviet Union. Under the current Plan, the power generating capacity is being increased from 5.7 million k.w. to 12.7 million k.w. The Soviet-aided power projects alone are expected to contribute more than 35 per cent of this projected additional installed capacity.

The role played by the Soviet Union in furthering the economic development of this country, in general, and the development of power, the 'Archilles' heel of industrial development, in particular, is brought out in a nicely got-up booklet, just published by the U.S.S.R. Embassy, New Delhi. This booklet, fourth in the series, *Friendship on the March*, has been published in commemoration of the approaching tenth anniversary of Indo-Soviet co-operation in the economic and technical spheres, which began with the signing of the Bhilai agreement on 2nd February, 1955. It will be followed by several such special numbers on heavy engineering, steel, etc.

The booklet under review deals with the Soviet Union's assistance in power generation. The article by Mr. O. P. Mehrotra provides an insight into the assistance provided in cash and technical know-how. Mr. Tribhuwan Nath has reviewed the setting up and the working of the Neyveli project, India's biggest thermal power plant. It also gives information relating to the projects completed and the projects in erection. Two small statistical tables provide a bird's-eye view of the Soviet-aided power stations financed under credit agreements and the power stations being built under Soviet trade contracts.

The distinctive features of the Soviet-aided power projects, it is claimed, are that (1) no power station has so far given any trouble in operation; (2) the capacities of the units supplied in most of the cases are not less than 50 000 kw. and, in some cases, they are upto 100,000 kw.; and (3) the import of Soviet power equipment does not strain in the least India's valuable foreign exchange resources, for Soviet credits are to be repaid only in Indian currency.

WATER TURBINE OF UNUSUAL SIZE

What is claimed to be the largest water power turbine in the western world, a 302,000 h.p. Francis unit for the Swedish State Power Board's Seitevare power station on the Lilla Lule river, is now under construction at the N.O.H.A.B. engineering works, in Sweden. The turbine is designed for a head of 180.5 m (356 ft.) and a flow of 120 cu. m. (4,240 cu. ft.) per second.

The turbine, which costs about Kr. 4 million, will have a nominal output of 204 MW (277,500 h.p.) and an efficiency of 95.8 per cent. At the permitted overload of 10 per cent. the guaranteed turbine output will be 222 MW, which is equal to 302,000 h.p. The unit will thus be 50 per cent more powerful than the present record unit in Sweden.

The design of the Seitevare turbine includes a number of technical innovations. Thus, every wicket gate is operated individually by a torque servo motor, whereby the operating ring, gate levers, breaking links and coupling bolt are dispensed with. Further, every wicket gate is self-closing, which means that a fast-closing intake gate and an inlet valve can be omitted. The shaft seal is of axial type with the carbon rings rotating with the shaft system. This type of box has proved to require less maintenance than a conventional box of the radial type and offers better accessibility to the carbon rings. By a special design of the seal clearances, the hydraulic load has almost been balanced over the whole load range, and the trust bearing of the unit is only loaded by the weight of the rotating parts of the machine.

SOVIET DIESEL LOCOMOTIVE INDUSTRY

The Soviet diesel locomotive industry celebrated its 40th anniversary recently. This branch of industry has made a big leap in its development in the past few years. Last year the U.S.S.R. manufactured over 1 500 sections of big diesel locomotives. More than 80 per cent of Soviet railways have been switched over to progressive forms of traction—electric and diesel.

At present Soviet plants manufacture diesel locomotives with power transmission and a series of machines with progressive hydraulic transmission and a capacity of up to 3,000 h.p. in each section. The first gas-turbo locomotive with a free-piston gas generator has been developed. Another gas-turbo locomotive, now under construction in the Ukraine, will have twice its

NEW PRODUCTS AND PROCESSES

Cryosorption Pumps

EXTREMELY clean vacuums can now be produced efficiently and economically by a new vacuum pumping system being marketed by Union Carbide. Based on the principle of gas adsorption at cryogenic temperatures, Union Carbide's cryosorption pumps have no moving parts or working fluids, thus completely eliminating the danger of contamination from back-streaming of oil from mechanical or diffusion equipment. The first commercially available Union Carbide unit is the SN-12 cryosorption vacuum pump, which can be used to evacuate volumes up to 20 cubic feet. Pump-down performance is improved if the space to be evacuated is first purged with dry nitrogen gas to eliminate uncondensable gases such as neon and helium. The SN-12 consists essentially of an adsorption chamber packed with molecular sieves which can be sealed in a liquid nitrogen reservoir. The unit is made ready for operation by filling the reservoir with liquid nitrogen which precools the adsorbent to around-320° F. (-195.5° C.) in 10 to 20 minutes. Pump-down begins as soon as the vacuum valve is opened in the pipeline connecting the pump and vacuum chamber.

Operating performances indicate that higher vacuums and faster pumping speeds are obtained with the SN-12 than with other commercially available liquid nitrogen cryosorption pumping systems. An improved reactivation process has also been developed for these new pumping systems. Because it has no moving parts, the SN-12 cryosorption pump is virtually maintenance-free and simple to operate. Its outstanding operating efficiency results from a combination of the high gas adsorption characteristics of Union Carbide's molecular sieve adsorbents and proprietary design features. To regenerate the molecular sieve for another pumping cycle, the gas is desorbed by withdrawing the liquid nitrogen and allowing the adsorbent chamber to warm up to room temperature. Because the molecular sieve adsorbs water preferentially, pump capacity may eventually be reduced by the accumulation of water vapor. Full capacity can be readily restored by purging the bed with heated nitrogen gas. Under Carbide's cryosorption equipment is supplied as individual components, or as packaged vacuum pumping systems complete with pumps, a self-contained liquid nitrogen supply vessel, vacuum manifolding and valving, and electrically heated air blower for warm-up and reactivation.

Kneeling Undercarriage

A new undercarriage that allows a freighter aircraft to "kneel," thus varying the height of its cargo bay to facilitate loading and unloading, has been developed by Sowty Group Ltd., Gloucestershire, England. Each leg of the undercarriage can be adjusted independently. This overcomes the difficulties of cargo handling on rough ground, when aircraft and cargo truck may be lying at different angles. Although intended for the Hawker Siddeley Andover military transport, the undercarriage could be modified to suit other freighters. The new mechanism, no larger than conventional main landing gear, has a "double-decked" arrangement of two shock absorbers mounted in series on a levered-suspension type of undercarriage.

Vacuum Silage

World patent rights are pending for a plastic devise which it is claimed will make vacuum silage economical for many farmers. Developed by two New Zealand companies, Blades Chemicals, of Penrose, Auckland, and Plastic Products, of Hamilton, the device—called "Strip Seal"—has two flexible plastic extrusions which are used to join plastic sheets in an airtight seal. To make vacuum silage, the farmer merely stacks green fodder on a sheet of polythene. Another sheet is laid over the stack and joined to the lower sheet by the "Strip Seal" device. Air is then withdrawn from the plastic "cocoon" through a plastic valve attached to a vacuum pump. This compresses the stack to half its original size. Vacuum pressure, maintained for six to eight hours, kills the fodder by suffocation. Respiration ceases, heat generation stops and the crushed grass remains at the level of consolidation. The method can be used to handle stacks containing between 50 and 500 tons of green fodder. Vacuum loss in storage is only about 5 per cent compared with 25.30 per cent in conventional pit or silo methods.

Kryptonates

A process for incorporating radio-active Krypton 85 into many different solids has been developed by Parametrics, Waltham, Massachusetts, U.S.A. It is called, kryptonation and the resulting materials have been dubbed kryptonates. Krypton 85 is a gas with a half-life of ten years and it emits beta radiation. It is put into a material either by bombardment in the ionsed state or by diffusion under high temperature and pressure. The gas atoms are held inside the crystal lattices. So far some 80 different solid kryptonates have been made from elements, alloys, compounds glasses, rubbers, proteins and plastics. Uses are many—investigation of the erosion of turbine blades, wear of bearings, the properties of refractory metals, and so on.

Intensifier Tubes

Newsimage-intensifier tubes capable of tripling the power of a light telescope have been perfected in the United States. The product of ten years' research by the Carnegie Institution, the U.S. Government, and private industry, 20 of the new tubes will be manufactured over the next two years and made available to observatories throughout the world. According to Dr. Merle Tuve, chief Carnegie astronomer, a number of smaller telescopes in other countries, aided by the new tubes, "could rival the unaided capabilities of the world's largest instruments, giving astronomers markedly increased power to explore the universe, from numerous vantage points all over the world." With the new tube, a 60-inch reflector like several in operation at observatories in the southern and northern hemispheres, would be capable of photographing distant stars and faint celestial objects now obtainable only with a few large instruments. The tube would be like the larger picture tube in a home television set to form an image. But it also intensified the image to form a second and much brighter picture.

Door Mat Attracts Dirt

London Carpet Cleaners, of Furmage Street, Garratt Lane, London, S.W.18, offers a dust-attracting door mat service to offices, industrial premises and similar establishments. Known as the clean-tread mat, it is impregnated with a chemical formulated to attract dust and dirt and is placed at the entrance to a building or room so that people are compelled to walk over it. It measures 54 by 30 inches and is latex-backed.

Aluminium Windows

The Twinslide range of anodised aluminium windows now being introduced by Heywood-Helliwell, of Bayhall Works, Huddersfield, Yorks, England, comprises 25 sizes of double-hung vertical sliding sash windows and 12 sizes of horizontal double rolling windows, with picture windows to match. Suitable for use in any type of building, the windows are supplies glazed, double weaing, the windows are supplies glazed, double weaing, ther-stripped and in a natural satin matt finish. Glazing is by bedding on a butyl ribbon externally and a neoprene insert in the bead internally.

Butyl Roofing

The Esso Petroleum Company in London has manufactured butyl rubber sheet for roofing and other building applications. Esso Butyl has been tested for years in such areas as New Mexico, Utah and Texas. It ages very well and is hardly affected by sunlight, ozone and air pollution. It is almost impervious to water—much more so than, for instance, asphalt. A low-cost roof needing no maintenance can be produced in any shape —even hyperbolic-paraboloids. The material can be bonded to wooden panels for prefabricated roofing. The company has worked at edging and guttering techniques to suit the sheeting. Fire tests on a panel of polystyrene foam between cellulose-asbestos boards and covered with butyl rubber sheeting have been given the rating: External F-AB by the Fire Research Organisation.

Centrifugal Pumps

A Dutch engineering firm, Koninklijke Nederlandsche Machine fabrieh, Postbus 33, Helmond, has manufactured centrifugal pumps for aggressive liquids, whose casings, impellers, pedestals and, if desired, baseplates are made of fibreglass-reinforced epoxy resin. Each of these components consists of a single piece, resulting in continuity of reinforcement and maximum strength. The pumps are manufactured in a number of standard types as either vertical or horizontal units. Their capacities vary from 100 to 2,000 litres per minute and their lifts from 6 to 60 metres (197 ft.) They can be supplied both with stuffing boxes and mechanical seals, and furthermore with or without any desired type of motor. The pumps are resistant to many chemically aggressive media at temperatures up to a maximum of 90°C. Since the principal exterior components are also composed of epoxy resin, the pumps are furthermore suitable for mounting in aggressive atmospheres.

Plastic Cables

Ship's cables made of polypropylene are said to be proof against damage which may be caused by frictional heat, due to a polyester jacket which surrounds each polypropylene strand. Cating Rope Works of Maspeth, New York, the producers of the new material, claim that it has all the advantages of those made from ordinary plastic fibres. They float and will neither absorb water nor rot. The outer Jackets of polyester are said to act as insulators from external or internal frictional heat and to make the cable more resistant to abrasion.

Cement Spreader

A machine which spreads cement of a uniform thickness on bricks and building blocks has been developed by Sapat Patent Holdings (Proprietary), 39, Terminus Street, East London, Cape Province, South Africa. The Company says that the machine includes a hopper which carries the cement, a single guide rail which traverses the wall and a jolting mechanism for spreading an even layer. The machine is operated by the man who is building the wall. He draws it along the top of the wall, then places the next layer of bricks on top of the cement and then draws the machine back in readiness for the placing of another layer of cement.

Atomic Prospects in Petrochemistry

The atomic jinn, dramatically "released" from a bomb about 20 years ago and which has not become less threatening during this period, has been applied for peaceful purposes by Soviet scientists. They have turned the cracking from the thermal into the radiative-thermal (R.T.C.), and thus opened up new "atomic" prospects in petrochemistry. The thermal cracking (fission) is a chain reaction to start which a temperature of 700-900 degrees is needed. Research has shown that such high initial temperature can be dispensed with. In the experiments carried out, radiation has proved to be a sufficiently powerful starter for a chain reaction of breaking molecules. Later a special installation was constructed. Its main working part—a loop-shaped pipe—was introduced into the horizontal channel of a nuclear reactor. It became possible to carry out the cracking by using powerful radiation flows at a temperature ranging from 40 to 600 degrees and a pressure ranging from one to 30 atmospheres. In the course of one cycle, 75 per cent of low grade petrol is turned into so-called unsaturated gases which are perfect raw materials for various chemical processes. The reaction may develop at the same speed as in thermal cracking, but at a temperature 150-200 degrees lower, or at the same temperature but with much higher yield. Besides, the resulting gas has a very simple composition which is an important advantage of the R.T.C. process in comparison with thermal cracking. The most conservative estimates show that one ton of ethylene obtained by the R.T.C. method will be 33.4 per cent cheaper than that obtained by pyrolysis. The efficiency of the specially designed reactor whose capacity is already determined will be very high as it will be able to process in a year several million tons of low octane petrol into valuable chemical products. At the same time, the radiative-thermal cracking consumes only a small fraction of the capacity of the reactor and makes it possible to use it for other radioactive and chemical processes as a source of radiation, of electrical and thermal energy.

Synthetic Cycle Saddles

Cycle saddles have caught up with modern materials. Middlemores (Coventry) Torrington Avenue, Coventry, U.K., a company which made horse saddles over two centuries ago, is now producing cycle saddles of entirely synthetic materials. The first order has already been placed for the new miniwheel cycles. The saddles consist, on top, of a flexible synthetic developed by I.C.I. rather like soft leather. Below this comes a foam sponge and then below this a polystyrene sheet which allows eight chromium springs to slide with little friction. The seat is curved to fit the body.

Musti-cylinder Felt Calender

Dhall Enterprises (Textile and Allied Manufacturers, Sir Chinubhai Road, Khadia, Ahmedabad) of Gujarat, has developed a Multi-Cylinder Felt Calender to give the 'feel' on the cloth similar to the one obtained on the sanforizing machine. It has been developed with such equipment as to discourage the use of sanforizing machines, which are a constant drain on the country's precious foreign exchange resources. Dhall Enterprises currently proposes to carry out research for substituting electricity for steam that is now being used in textile and allied industries for drying cloth. The need to find a substitute for the use of steam for heating and drying has long been felt with the change to electricity of the prime movers, and the exhaust steam was used in drying cloth. Now that electric motors provide the motive power, the steam has to be specially generated for use in drying and heating, which is a costly, crude and inefficient method. Lot of steam is wasted during transportation from boilerhouses to the point of utilisation. The use of electricity for heating and drying is known, but the economical use of electricity and demonstration of its commercial potentialities are the crux of this research. The advantages of this research are: easy, even and uninterrupted availability of fuel; economy of production; ease of handling of fuel amounting to reduction in cost of labour required to handle steam; elimination of wastages during the use of fuel; elimination of coal storage and handling and elimination of boilers to the extent that the major portion of engineering department is eliminated which goes a long way in reducing the cost of production.

Photo Enlarge

Photographers will welcome the advent of Multifoc UV, a newly developed enlarger of VEB Pentacon, which operates without darkroom facilities. The new process of photographic documentation is based on the utilisation of the high percentage of ultraviolet light contained in a 50-Watt extra high-pressure mercury vapour lamp, in combination with the special condenser system, the ultraviolet-sensitive special paper ultracop UV and several other technical features. Its application brings with it an increase in output by 80 per cent. The Multifoc UV will repay its purchasing costs within one month at a 75 per cent capacity utilisation. The new investment was exhibited at the autumn fair in Leipzig, East Germany recently.

Coffee Machine

Rio-Luxus is the name given to a new coffee machine by Allhoff and Wöpke, Leipzig, East Germany. The model, which is believed to have no rival in the world market, possesses separate functions for making standard coffee, mocha and coffee with cream. Output is about 250 cups per hour.

Ceporin

A new antibiotic of great power against a wide range of bacteria has been recently announced by Glaxo. The trade name is Ceporin. Treatment with it is by injection only, whether intravenous or intramuscular. The cost is estimated to be as low as that for the cheapest of the newer penecillins. It will be available to the medical profession according to the *Financial Times*, London, very shortly. Ceporin is strongly bactericidal—that is, it kills bacteria, even gram-negative as well as gram-positive organisms. It is less toxic even than penicillin and can be used for patients allergic to penicillin. It is very quick in its action—in one clinical case for urinary-tract infection the urine was steriled within 24 hours, whereas it would have taken up to a week with other antibiotics.

Clinical trials covering 200 patients have been done in London (the post-graduate medical school at Hammersmith). Carshalton, Birmingham, Sheffield, Edinburgh and Glasgow. The Glaxo part of the development of the new drug has taken eight years. The cephalosporin mould from which the drug has been developed was first noticed in Sardinia in 1945, and taken to Oxford University where Sir Howard Florey and his staff started work on it. At the same time the Medical Research Council also started investigations.

INCOMES POLICY FOR BRITAIN

LABOUR GOVERNMENT KEEN ON IT

THE new Government of Britain has asked the trade unions to reach agreement with the employers on the general principles of a policy to keep wages in line with productivity. Mr. George Brown, Minister for Economic Affairs, who met the General Council of the Trades Union Congress (T.U.C.) on the 9th instant, told the unions to do so by Christmas this year and put their policy into practice by early spring next year. He warned them that, if the policy was not put into practice by that time through mutual agreement, the Government would have to take recourse to some "very unpleasant" alternatives. Trade union circles feel that these unpleasant alternatives would take the form of measures for bringing about deflationary conditions in the economy.

The British Government is anxious to evolve and implement an income policy for ensuring a high rate of economic growth unaccompanied by inflation. It wants this growth to be continuous and steady, without the stop-and-go feature that characterised the regime of the Conservative Party. As it is, in marked contrast to the rapid growth witnessed in 1963, there has been a perceptible slackening of business expansion in Britain since the turn of the year. Against a rise of six per cent in 1963, the increase in gross national product has so far been considerably poor this year. The gross national product was higher by only 1.5 per cent during the first half of the current year, as compared with 3.6 per cent in the second half of 1963 and the target of 4 per cent per annum envisaged by the Conservative Party for the next four years. Moreover, nearly all this increase of 1.5 per cent took place in the early part of the year and there was a negligible growth during the second quarter. There are no indications to suggest that the situation has improved in any way since then. Against the rise of 1.5 per cent in gross domestic product, the index of wages during the first half of 1964 was higher by nearly 3 per cent. The result has been the re-emergence of inflationary tendencies in the economy. With 1958 as base, the index of prices of industrial products rose from 108 in the second half of 1963 to 110 in the first quarter and 112 in the second quarter of the current year and cost of living from 111 to 113 and 115 respectively. The rise would have been much more if imports had not increased at a fast rate. As compared with the second half of 1963, imports during the first half of 1964 were higher by over 11 per cent—the corresponding figure for exports being 6 per cent.

Although profits also increased, there is little doubt that the rise is now levelling out. What is more, the rise in undistributed profits appears to be levelling out even faster. Even if profits were to increase at a rapid rate, the Government feels that it could take care of these by fiscal measures and price reviews. It has already made a beginning in this direction by announcing in the "little budget" on 11th instant an increase in income-tax and its decision to introduce capital gains tax in the next annual budget in April next. For wages and salaries, it has suggested that agreements should be reached on an average rate of increase and that a machinery of employees, employers and Government representatives should be created for dealing with any justified exceptions.

Reasons for Stagnation

In an article contributed to the *Financial Times*, London, dated the 3rd instant, Mr. J. Enoch Powell, a member of the Conservative Party, has analysed the reasons for the poor growth of the economy in a very lucid way. His analysis shows that the setback in economic growth experienced in the current year was not due to the absence of a clear cut incomes policy. A brief account of his reading of the position is, therefore, pertinent in this context. When demand increases—as it has done since the relatively low point in 1962—more and more resources," says Mr. Powell, "are drawn into use. Then a point comes—as it came in the earlier part of this year—when all the key resources, or nearly all, have been brought into some kind of use. Thereafter, increase in output is almost certain to be slower, because, from then onwards, it depends on shifting resources from less productive uses to more productive ones. Nevertheless, monetary demand tends to go on rising, with the consequence that prices are driven up." The rise in prices results in a slower growth of exports and faster growth of imports. The excess of imports helps in keeping the availability of goods at a higher level and thereby checks a very fast and sudden rise in prices, but it cannot last for a long time, because neither credit nor reserves are unlimited. Although the Labour Government has taken some measures for improving the exports and bringing down imports, and thereby to improve the balance of payments position, none of these methods touches the underlying situation, for none of them does anything to limit the total monetary demand to a level at which it is satisfied by home production (consumed directly or exchanged for imports). Even after these measures, monetary demand remains as free as before to rise out of line with production. Indeed, it will result in raising prices, and, in so far as rising prices stimulate increase in monetary demand, the measures actually make the situation worse.

Not Tenable

Commenting on the views expressed by many that the faster growth of production is the only solution for the problem, Mr. Powell points out: "The idea that there is some rate of increase in production so fast that the volume of monetary demand cannot increase still faster, is a common belief but one without foundation. In recent years, we have actually seen the opposite happening in Germany and Japan, where steep price increases have occurred while production was increasing at higher rates than the most optimistic of British planners would dare to contemplate. A high rate of increase in production is desirable for its own sake, but it is not a specific against inflation." Discussing the question whether an incomes policy is the right answer to the problem and whether such a policy can be successfully implemented, Mr. Powell says:

"In its general form—that total money incomes ought to move in line with total production—incomes policy is a truism. What nobody has yet even started to suggest is how to proceed from this general and innocent proposition to the determination of individual incomes. If the 'guiding light' of assumed overall increases is 2½ per cent to 5 per cent, who is going to decide (and how?) which incomes shall increase more than that figure and which shall increase less, in order to produce to requisite average?"

Mr. Powell's conclusion is interesting. It is that it is not practicable to have a continuously rising growth year after year without ups and downs. It is worth quoting his views on this point also:

"Measures which do limit monetary demand to match production are exceedingly difficult to time and to gauge correctly. But that is no reason for pretending that they can be replaced by others which evade the problem instead of solving it, or by trying to make them untouchable by smearing them with the evocative bogey-phrase 'stop-go.' As Mr. Maudling told the foreign correspondents of the I.M.F. in Tokyo a few weeks ago, 'there must be ups and downs in economic expansion in the great industrial nations; going steadily ahead is not in the nature of things possible.' Indeed it is not; for the severity of the obstacles to be surmounted is always varying. But to limit the rise of monetary demand to match the rise of production is not 'stopping' anything—except inflation."

Reactions of Trade Union Leaders

There have been divergent reactions to the proposal for an incomes policy from the trade union leaders. The differences pertain not only to the feasibility of an incomes policy but also about the rate of increase in wages and the share of each section of workers. Some of the Union leaders have reasons to feel that the Labour Government's 'guiding light' on increase of wages in 1965 would not be as low as 3 to 3.5 per cent, established by the Conservative Government for 1964. They argue that, if the average annual economic growth target of four per cent, fixed by the National Economic Development Council for 1961 to 1966, is to be achieved, the rate for the next two years will have to be more than four per cent and wages and salaries should rise at a faster pace than that for 1964. On this basis, it is felt that it should be possible to settle the rate of increase in wages at 4 to 4.5 per cent for 1965. However, due to the poor performance of the economy in the current year, the chances for a rate of over four per cent in the coming year are not bright and it may not be feasible for the Government to agree to an increase in wages by 4 to 4.5 per cent. It was, perhaps, this realisation that has made several trade union leaders to soft pedal on the question of expeditious agreement on incomes policy. It is worth recalling in this connection, that the objective of this policy is to restrain wage increases and to see that they do not outstrip the growth in gross national product.

T.U.C.'s Attitude

What is the attitude of the Trades Union Congress to the urgency displayed by the spokesmen of the Labour Government? Mr. George Woodcock, General Secretary of the Trades Union Congress, while supporting the move in principle, feels that the unions could not have an incomes policy imposed on them from the top and that the Government would have to work from the bottom. As the Trades Union Congress is a loose federation, it has neither the power nor the machinery to consult and advise the individual unions on problems of this sort. Mr. George Woodcock also feels that difficulties will occur when it comes to deciding how, in broad terms, the wage and salary earners' share of the cake should be divided among the competing groups of workers. There are already signs of sharp differences of opinion among trade union leaders, with some of them asserting their claims for a higher share. Mr. Les Cannon, President of the Electrical Trades Union, while appealing recently to the trade union movement to prepare for a planned income policy based on the priorities of social justice rather than the power to win new concessions, has warned that, if the unions already well ahead in the wage structure, choose to opt out of a planned income system by making even greater demands, the Electrical Trades Union would opt out as well. He has directed his warning specifically to unions "of power and strength" who had done well by effectively exploiting their power in wage negotiations, while weaker unions in less-favoured industries lagged behind. "We are not going to be the voice in the wilderness," he remarks, "appealing for and practising an income policy when other unions pay lip-service to it but in practice repudiate it." On the whole, however, the Trades Union Congress is for an incomes policy. Mr. Woodcock, for instance, avers that, if an incomes policy could be achieved, it would restore more confidence in sterling than would the operation of the Bank Rate weapon.

Employers' Attitude

The employers are generally in favour of an incomes policy. Only, they have not spelt out the details of this policy; for instance, it is not known as to how they would ensure that the growth of profits, dividends and capital gains does not offend the principles on which the labour is asked to accept a voluntary restraint. Some say that they are pinning their hope on the proposed Prices Review Body which will be given the power to review both wage increases and price increases.

An important reason why employers support national incomes policy is the realisation that, in an economy with full employment and with its currency playing the role of key currency, if wages rise faster than the G.N.P., its balance of payments position would be in jeopardy sooner or later. Speaking before the Annual Conference of the Institute of Directors in London on the 5th inst., Lord Robbins, for instance, pointed out that "it has almost always been the case, in the past that, when the use of capacity, as measured by the index of employment, has exceeded a figure a little less than 98 per cent, there has been a tendency to inflationary pressure at home and an adverse balance on external account." As the situation exists today, the unemployment rate in Britain is, on an average, at a dangerously low level of 1.5 per cent and in the greater part of the country at a still lower level of one per cent. The trade unions are, thus, always in a position to push their demands for higher wages. The result is that wage drift—the amount by which earnings, excluding overtime, exceed negotiated rates—has continued at a high level, particularly in manufacturing industry. In engineering industry, the drift in the first half of the current year was 2.5 per cent. To save the economy from the adverse effects of such demands, the need for a wage policy is self-evident. The unpleasant alternative of deflationary policies will be detrimental both to the economy and the labour itself.

Corrective Steps

The Government, in its "little budget" last week, has already taken some corrective steps. Excluding the capital gains tax, a concrete picture of which will emerge in April next, the Government intends to collect by new levies some £415 million from the private sector of the economy in 1965-66—£122 million by way of increased income-tax, £93 million from higher duty on petrol, hydro-carbon oils and diesel oils and £200 million from higher import duties. In addition, there will be increased national health contributions by the private sector. This burden will bring down considerably further investments in the economy, resulting in its lower rate of advancement. On the other hand, the demand will continue unabated and may even rise still further. Against a collection of £415 million from the economy, £75 million will be paid out to exporters as incentives, £130 million is the net cost to the Exchequer of new social benefits while £300 million of extra demand may shift to the home market because of the import surcharge, making a total generated demand worth £505 million. The extra demand may be even higher than what these figures suggest, to the extent that purchasing power is being transferred to those who are more likely to consume it. The prices may thus rise still further, both because of higher costs as well as the increase in demand. The success of the proposals hinges on a suitable incomes policy. As stressed by Mr. Callaghan, Chancellor of the Exchequer, these measures would work only if there is "a successful and swift conclusion to the discussions on an incomes policy." The alternative, as already pointed out, may be further deflationary measures. It is, therefore, necessary for the trade union leaders to consider the issue in its proper perspective, if they do not want to suffer the consequences of further deflation.

The problems are immense and it would be wrong to assume that the difficulties will be solved quickly. The Labour Government, however, intends to make a determined effort to achieve a workable incomes policy and feels that it has a better chance of doing so—because of its close and cordial relations with the trade unions leaders—than the Conservatives. Luckily, the Conservative Party seems to be inclined to support the Government in any measures to bring about this policy. There are, of course, many Conservatives who feel that a national incomes policy is nothing more than a fashionable prescription practically impossible to be followed. Others consider it as a grandiose attempt and are, therefore, sceptical of its success. Lord Robbins is one of them. He feels that a proper financial and fiscal control would yield more satisfactory results and cause less friction between capital and labour than the complicated incomes policy. While not supporting the "stop and go" policy, he wants the nation to go forward a little slowly when things do get out of hand, as they have done now. There are, however, others among the Conservatives who have fallen in love with a national incomes policy. To give an instance, the Earl of Dundee (Conservative), opening the debate on economics and trade in the House of Lords on the 5th instant, supported this policy of the Labour Government and said, "We must try, by persuasion and agreement, to establish an incomes policy." In short, there is a large measure of support to the national incomes policy in principle. But that does not mean that the chances of giving a practical shape to it and putting it into operation are brighter, as there are yet many hurdles to be overcome.

MORE MILES FOR YOUR MONEY

DC-595A

TUBE INVESTMENTS' PROFIT HIGHER

SHAREHOLDERS GET A LITTLE MORE

THE results of Tube Investments of India Ltd. (Chairman: Dr. A. Ramaswami Mudaliar, Madras) for the year ended 31st July 1964 are in refreshing contrast with those for the year preceding. Thus, whereas an all-round setback was suffered during 1963-64, the Company has made remarkable progress in almost every direction in the year under review, notwithstanding a power cut, difficulties in the way of obtaining materials of the requisite quality and the generally rising trend of prices and cost of labour. Not only has the ground lost in the preceding year been fully recovered, but a firm foundation appears to have been laid for continuing progress.

Thanks to higher output of various products, the turnover has reached the record level of Rs. 748.25 lakhs from Rs. 596 lakhs in the year before. The gross profit, too, has risen, though not in the same proportion as sales; it has advanced from Rs. 128.98 lakhs to Rs. 143.49 lakhs only, the profit-margin being actually lower at 19.2 per cent, as against 22 per cent in 1962-63. This erosion in the profit-margin is mainly accounted for by the phenomenal increase in expenses, particularly in items other than raw materials. The essential provisions are also higher—that for depreciation by Rs. 2.77 lakhs at Rs. 43.20 lakhs and for taxation by Rs. 2.17 lakhs at Rs. 51 lakhs.

Although the net profit at Rs. 49.29 lakhs is some Rs. 10 lakhs better than that for 1962-63, it is appreciably lower than the Rs. 54.73 lakhs earned in 1961-62. Out of this and inclusive of the amount of Rs. 3.13 lakhs written back from past provisions, a handsome sum of Rs. 24.76 lakhs has been credited to reserve. The amount of profit conserved this year is Rs. 2.95 lakhs greater than that last year. For the first time since 1957, the Directors have raised the dividend and that, too, only slightly, the rate of dividend being Rs. 11.25 per share of Rs. 100 each, as compared with Rs. 10 per share hitherto.

A comparative picture of the Company's performance is provided in the following table:

(In lakhs of rupees)

	For the year ended 31st July			
	1964	1963	1962	1961
Sale proceeds	748.25	596.00	619.25	573.13
Other income	16.59	11.13	9.37	10.42
Closing stocks of finished goods	31.00	31.01	18.92	12.28
Materials and stores consumed	348.89	323.89	348.33	315.26
Staff expenses	82.21	68.61	62.85	52.80
Other expenses	100.21	97.77	89.63	77.42
Gross profit	143.49	128.98	136.44	140.44
Provision for—				
Depreciation	43.20	40.43	37.11	27.74
Taxation	51.00	48.83	44.60	48.00
Net profit	49.29	39.72	54.73	64.70
Excess provisions written back	3.13			
To reserves	24.76	18.22	37.76	39.71
Dividend	28.13 (11.25%)	25.00 (10%)	25.00 (10%)	25.00 (10%)
Carry forward	0.04	0.51	4.00	12.03
Market price of ordinary shares (in rupees):	1964	1963	1962	1961
High	214	282	292	294
Low	174	208	205	257

In contrast with the previous year, production of cycles exceeded the targeted figure by a small margin and that of spare parts showed a fair increase over the preceding year's output. These satisfactory results were achieved in the face of difficulties arising out of power cuts and supply of unsatisfactory raw materials, quite often below the required specification. The volume of output by Wright Saddles of India was equally satisfactory and the high quality of the product was maintained. As in the past, however, the saddles had to meet competition from cheaper varieties. Production and sales of tubes by the Tube Products of India showed a considerable increase, despite power cuts and difficulties which still persist in regard to the quality of the indigenous raw material. As a result of frequent consultations with the suppliers the situation is showing signs of improving. The production of cold rolled strips was in keeping with the general trend of output by other divisions, higher than that for the year before and would have been even better but for power cuts. So far as this particular division is concerned, the Board had had under consideration for some time a proposal to expand the present production capacity. The Government's approval has now been obtained for doubling the present capacity and steps are being taken towards implementing the scheme. It will be recalled that the project for the manufacture of cold formed metal sections could not make sufficient progress during the previous year because of the non-receipt of licences for the import of capital equipment. These licences have now been received and orders have been placed with suppliers both abroad and in India.

As regards the subsidiary companies, the performance of T.I. Diamond Chain Ltd., judged in the light of the power cuts and shortage of certain essential materials, must be regarded as satisfactory. Production of industrial chains started during the year and the products were very well received in the market. It is expected that both production and sales would reach the anticipated levels during the current year. A substantial quantity of bicycle chains was exported but the Company has still pending with it some orders and inquiries from certain other countries. T. I. Miller Ltd. started production of some of the components of bicycle dynamo lamps in January 1964. Production of all components and assembly of lamps in quantity, however, got going only somewhat later and actual marketing of lamps was possible from April 1964. Market reports show that the product has been well received. Now that initial difficulties arising out of the novelty of the process of manufacture have been overcome, it is confidently felt by the Directors that planned production will be reached in the current year.

The paid-up share capital of the Company remains unchanged at Rs. 250 lakhs, all in equity shares of Rs. 100 each, but the reserves and surplus are up from Rs. 215.30 lakhs to Rs. 239.60 lakhs. Borrowings too are higher at Rs. 281.07 lakhs as against Rs. 274.51 lakhs and so also current liabilities and provisions at Rs. 115.77 lakhs as against Rs. 109.17 lakhs a year before. With the acquisition of new assets worth Rs. 10.21 lakhs, the gross block has advanced in value to Rs. 575.44 lakhs and yields a net block of Rs. 363.37 lakhs on deduction of Rs. 212.07 lakhs being the amount of depreciation provided so far. Inclusive of the capital work-in-progress valued at Rs. 38.21 lakhs, the total net block as at the date of the balance sheet (that is, 31st July 1964) works out to Rs. 401.58 lakhs. Investments, of which Rs. 47.15 lakhs are in shares of subsidiary companies, are carried in the books at the cost of Rs. 52.99 lakhs. Current assets, loans and advances amount to Rs. 431.86 lakhs, exceeding the total of all borrowings, etc., by a good margin of Rs. 35 lakhs.

At present, the Rs. 100 fully paid ordinary shares of the Company are priced at Rs. 174 *cum-div.* to yield 5.5 per cent per annum net.

(*Concluded from next column*)

ment of dividends. Secured and unsecured loans amount to Rs. 115.51 lakhs. Besides, there are current liabilities and provisions totalling Rs. 150.85 lakhs. The finance supplied by outside interests thus amounts to Rs. 266.36 lakhs, as against own funds of Rs. 258.08 lakhs, but it is more than amply covered on the assets side by current assets, and loans and advances aggregating Rs. 371.00 lakhs. Then, there are investments shown at Rs. 9.97 lakhs. The net block as at the date of balance sheet stands at Rs. 134.25 lakhs, as compared with a gross block of Rs. 309.93 lakhs, the depreciation provided so far being Rs. 168.68 lakhs. Additions to fixed assets during the year aggregated Rs. 33.86 lakhs, while the capital expenditure yet to be allocated is shown at Rs. 1.22 lakh.

The Rs. 100 fully paid ordinary shares of the Company are currently quoted at Rs. 175 and give a net yield of 7.4 per cent per annum.

WEST COAST PAPER MILLS LTD.

The working results of the West Coast Paper Mills Ltd. for the year ended June 1964 are quite encouraging, despite the continuous rise in cost of production due to increase in prices of raw materials, railway freight and wages. The production of paper during the year touched the record level of 30,213 tonnes as against the 27,252 tonnes produced in the previous year. The gross profit has risen by Rs. 39 lakhs to Rs. 1.49 crore. The rise in profit is attributed to the improvement in sales from Rs. 4.00 crores to Rs. 4.44 crores. The allocation to depreciation is Rs. 49.82 lakhs (Rs. 39.38 lakhs). Since however, the tax provision is substantially higher at Rs. 51 lakhs as against Rs. 10 lakhs in 1962-63, thanks to the absence of tax benefit under Section 84 of the Income-tax Act, 1961, which the Company had enjoyed until last year, the net profit has declined from Rs. 60.49 lakhs to Rs. 48.03 lakhs. After transferring Rs. 21.50 lakhs (Rs. 39.75 lakhs) to reserves, including Rs. 50,000 (Rs. 75,000) for development rebate the Directors have stepped up the taxable equity dividend from Rs. 11.00 to Rs. 13.00 per share. Dividends (including preference dividend) will absorb Rs. 26.52 lakhs, as against Rs. 23.52 lakhs in the previous year.

INDIAN HUME PIPE

PROFIT JUMPS UP—DIVIDEND ONLY SHADE BETTER

THE Indian Hume Pipe Company Ltd. (Managing Agents: Messrs. Walchand and Company Private Ltd., Bombay) has given an excellent account of itself during the year ended 30th June 1964. Its turnover, which has been steadily upward in recent years, has increased further during the year under report by Rs. 74.88 lakhs, or about 25 per cent to Rs. 374.75 lakhs. The gross profit, too, has expanded quite substantially from Rs. 50.44 lakhs to Rs. 89.77 lakhs. The ratio of gross profit to sale proceeds, that is, the profit-margin works out to 23.9 per cent or as much as seven points higher than that for the previous year. This betterment is due partly to a higher overall output as evidenced by larger closing stocks of finished goods and partly by bigger receipts by way of pipe-laying contracts.

Consequent upon the improvement in gross profit, the provisions for Managing Agents' commission and taxation have increased, the former by Rs. 2.28 lakhs to Rs. 5.35 lakhs and the latter by as much as Rs. 22.50 lakhs to Rs. 40 lakhs including Rs. 3 lakhs for surtax and Rs. 63,000 for dividend tax. In the preceding year, it may be noted, the Company had to provide Rs. 5 lakhs for super profits tax, though only Rs. 15.50 lakhs for income-tax. The provision for depreciation too has risen from Rs. 12.09 lakhs to Rs. 14.25 lakhs. Even after these larger provisions, the net profit is better at Rs. 30.17 lakhs as against Rs. 17.78 lakhs for the year before, the improvement being as much as 66⅔ per cent. Out of this, as much as Rs. 18.90 lakhs, as against only Rs. 7.97 lakhs last year, have been credited to reserves. Only a small fraction of the handsome improvement in net profit has been utilised to raise the ordinary dividend, just by a point to 15 per cent, subject to deduction of tax. The Directors have thus been extremely conservative in their appropriation policy this year.

The steady progress made by the Company during the past four years is well brought out by the following comparative figures:

(In lakhs of rupees)

	For the year ended 30th June			
	1964	1963	1962	1961
Sale of products	374.75	299.87	293.83	259.71

Carry forward	0.49	..	0.30	0.40
Market price of ordinary shares (in rupees):	1964	1963	1962	1961
High	175	170	182	190
Low	153	153	155	154

During the year under report three new factories, one each at Palghat, Kothavalasa and Bagalkot, were added to the number of 57 factories of the Company as at the end of July 1963. The total number of factories as on date is now 60 and the working of all the factories is stated to be satisfactory. The prestressed concrete pipe division of the Company, too, is making satisfactory progress and the Company has secured a large contract for supplying and laying of prestressed concrete pipeline for Jhansi Bahna water supply scheme in Madhya Pradesh. The penstock division is making good progress. The work of supply of penstock for the second stage of Koyna project is nearing completion and supply of penstocks for the Sharavathy project and Bhira works is in full progress.

As was reported by the Directors a year ago, the Company has secured the outright patents right in India from No-Joint Concrete Pipe Company of U.S.A. for the process of manufacturing continuous concrete pipeline in situ. The Company's proposal for establishing a R.C.C. Hume pipe factory at Benghazi (Libya) has also been approved in principle by the Indian Government and the Libyan Government and steps to register a branch in that country for the purpose of starting business have been taken. The Company is awaiting formal confirmation from the Libyan authorities of the concessions available to it.

The financial position of the Company is fairly strong. The share capital remains unchanged at Rs. 110 lakhs, made-up of Rs. 50 lakhs in preference shares and Rs. 60 lakhs in ordinary shares both of Rs. 100 each. This is backed by reserves aggregating Rs. 148.08 lakhs, excluding Rs. 11.50 lakhs earmarked for pay-

(*Continued in previous column*)

DECCAN SUGAR'S SALES AND PROFIT HIGHER

SAME DIVIDEND BUT FINAL ON HIGHER CAPITAL

INCREASED production and a sellers'—though still controlled—market helped the Deccan Sugar and Abkhari Company Ltd. (Managing Agents: Messrs. Parry and Company Ltd., Madras) to sell more and earn a higher profit during the year ended 31st May 1964. It is evident, from the improvement in sales (excluding excise) from Rs. 344.88 lakhs to Rs. 371.46 lakhs and also from the limited closing stocks of Rs. 82.40 lakhs, that the Company could easily market the higher production obtained during the year. In the previous year, too, sales had gone up from Rs. 283.04 lakhs to Rs. 344.88 lakhs, in spite of a lower production in that year. But this improvement was possible because of large stocks on hand, which in the opening of that year were no less than Rs. 162.42 lakhs as compared with Rs. 83.25 lakhs at the close. The increase in output during the year under review has, no doubt, increase in consumption of raw materials and stores from Rs. 160.08 lakhs to Rs. 241.25 lakhs. Other expenses, including staff expenses, have also been higher. Even so, the gross profit, which in the previous year had recovered from Rs. 28.30 lakhs to Rs. 39.62 lakhs, has gone up further to Rs. 46.15 lakhs during the year under review.

Managing Agents' commission and the essential provisions for depreciation and taxation have naturally claimed more. The tax provision of Rs. 18.55 lakhs (Rs. 16.83 lakhs for the year before) includes the liability on account of dividends declared for the year and also a surtax liability estimated at Rs. 2.55 lakhs. The extent of relief following replacement of the super profits tax by the surtax is indicated by the sum of Rs. 80,000 obtained by way of an adjustment relating to the previous year's tax provision, the amount representing the difference between what was provided in that year (Rs. 2.55 lakhs) for S.P.T. and what is required towards surtax liability in respect of that year. More than a third of the net profit, Rs. 6.65 lakhs to be precise, has been taken to reserves. It represents an increase of Rs. 2.35 lakhs over the previous year's appropriation. The dividend on the Rs. 5 fully paid ordinary shares, including 6.5 per cent interim, has been maintained at 18 per cent per annum, but the final dividend of 11.5 per cent is also payable on the 132,800 bonus shares issued on 30th October 1964. Thus, in terms of amount, the total distribution to the ordinary shareholders has increased from Rs. 7.17 lakhs to Rs. 7.93 lakhs.

The following table compares the Company's progress in the past four years:

(In lakhs of rupees)

	For the year ended 31st May			
	1964	1963	1962	1961
Sale proceeds, less excise duty paid	371.46	344.88	283.04	214.05
Other income	9.56	4.38	4.26	2.44
Closing stock of finished goods and work-in-progress	82.40	83.25	162.42	176.23
Excise duty paid	81.39	83.93	74.63	67.86
Materials and stores consumed	241.25	160.08	167.19	205.16
Staff expenses	38.52	34.25	34.22	32.63
Other expenses	43.04	39.10	37.69	36.78
Gross profit	46.15	39.62	28.30	30.03
Managing Agents' commission	3.19	2.90	2.07	2.20

To reserves	6.65	4.30	1.53	1.45
Dividends—				
Preference	0.64	0.64	0.64	0.64
Ordinary	7.93 (18%)	7.17 (18%)	7.17 (18%)	8.37 (21%)
Carry forward	0.06	0.10	1.03	1.48
Equity shares' market value (in rupees):	1964	1963	1962	1961	1960
High	12.75	12.60	11.75	15.15	17.00
Low	10.75	9.00	9.58	11.10	12.60

The 1963-64 season commenced at the Samalkot factory on 5th November and ended on 7th May. During this period 154,413 tonnes cane were crushed and 8,500 tonnes raw sugar and 6,784 tonnes white sugar were produced. The average recovery in terms of white sugar was 9.70 per cent. This performance compares with 105,993 tonnes cane crushed and 11,757 tonnes raw sugar at a recovery in terms of white sugar of 10.66 per cent during the previous season. The factory worked for 181 days, as against 128 days in the previous year. Both the tonnage crushed and the sugar made constitute a record for the factory. The lower recovery was due to the longer crushing period and adverse climatic conditions during the growth of sugarcane.

At Pugalur, the special season started on 21st August 1963 and finished on 2nd November 1963. In all, 68,851 tonnes cane were crushed and 6,161 tonnes sugar were produced, the recovery being 8.95 per cent, the relative figures for the comparable previous season being 30,508 tonnes of cane, 2,865 tonnes of sugar and 9.39 per cent. During the main season, from 6th November 1963 to 12th June 1964, the factory crushed 207,425 tonnes of cane and produced 19,135 tonnes of sugar at a recovery rate of 9.23 per cent, the relative figures for the previous season being 139,131 tonnes of cane, 14,672 tonnes of sugar and 10.55 per cent recovery.

Taking into account the bonus issue made in October, the paid-up capital, including Rs. 7 lakhs in 7 per cent cumulative preference shares of Rs. 5 each, now stands at Rs. 53.48 lakhs and reserves and surplus (excluding share premium account of Rs. 6.64 lakhs utilised for making the bonus issue) amount to Rs. 50.35 lakhs. A special reserve for taxation is shown separately at Rs. 8.30 lakhs. Borrowings, current liabilities and provisions total Rs. 149.26 lakhs, as against which current assets, book debts and investments aggregate Rs. 178.70 lakhs. The gross block of Rs. 176.40 lakhs (Rs. 164.01 lakhs a year before) has been written to a net value of Rs. 81.61 lakhs; including capital work-in-progress, the total of net block comes to Rs. 82.70 lakhs.

Currently, the Rs. 5 fully paid ordinary shares are quoted at Rs. 11.10 *cum-div.* (final), but *ex-right*. At this rate, they offer a net yield of 7 per cent per annum.

INDIAN AIR GASES LTD.

Indian Air Gases Ltd. of Kanpur has secured an industrial licence for setting up at Varanasi in Uttar Pradesh a factory for the manufacture of oxygen and acetylene gases. The production capacity of the factory will be 36 million cubic feet of oxygen and 6 million cubic feet of acetylene. The total capital outlay is estimated at Rs. 61.07 lakhs which is proposed to be met through a public issue of Rs. 31 lakhs, borrowings of Rs. 25.25 lakhs from the Industrial Finance Corporation of India (I.F.C.) and owned resources amounting to Rs. 4.82 lakhs. The public issue will consist of Rs. 23 lakhs in equity shares (including the subscription of Rs. 10 lakhs by the Directors, their friends and associates) and Rs. 8 lakhs in preference shares. The list is due to open for public subscription some time next month. The I.F.C. has already sanctioned a rupee loan of Rs. 8.09 lakhs and a loan of Rs. 17.16 lakhs ($357,455) in U.S. currency, besides agreeing to underwrite the issue of equity and preference shares to the extent of Rs. 2 lakhs. The Company is also approaching the U.P. Industrial Corporation and other financial institutions like the L.I.C. for loans as well as for underwriting its share issue.

The Company's factory is expected to be equipped with the most modern machinery and equipment. Land admeasuring 12 acres has already been acquired at Varanasi. The Company has entered into a contract with the Diesel Locomotive Works of Varanasi for regular supply of gases etc. The factory is scheduled to go into production before the end of 1965.

AFRICAN DEVELOPMENT BANK

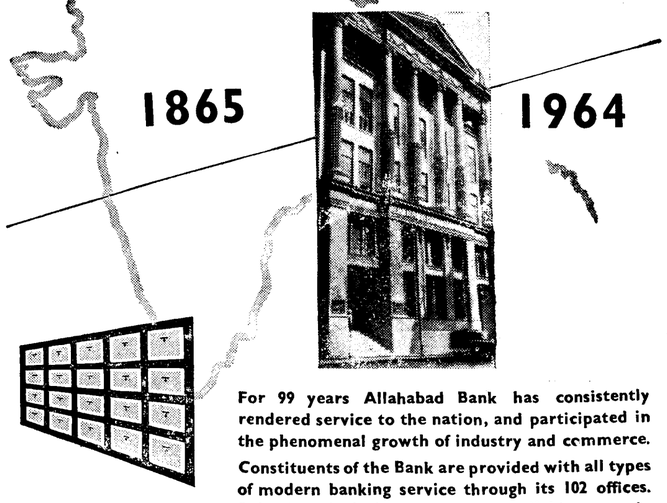
With a view to facilitating the development of member-countries either individually or collectively, 33 African countries have joined together to form the African Development Bank. Sir Abubakar Tafawa Balewa Nigeria's Prime Minister, formally inaugurated the Bank in Lagos (Nigeria), on Wednesday, 4th November 1964. The four-day meeting of the Bank, attended by observers of the U.K., the U.S. and the U.N. monetary agencies and financial institutions, discussed among other matters the choice of the location of the Bank's principal office an appointment of its senior officials. The objectives of the Bank are to make and guarantee loans from its own resources to promote public and private investment from other resources and to provide technical assistance for the development plans of member-countries. The promoters of the Bank, which is a milestone in the history of Africa and of the Organisation of African Unity (O.A.S.), to quote Prime Minister, Sir Balewa, hope that it will act as a catalyst in the field of economic co-operation between African countries.

Set up at a conference of African Finance Ministers in Khartoum in August 1963, the Bank has an authorised capital of 250 million units of account (equivalent to dollars) divided into 25,000 shares of 10,000 units each. The capital is to be subscribed by member-countries in gold or convertible currency in proportion to their population and gross national product (G.N.P.).

The Controller of Capital Issues has sanctioned Voltas Limited's issue of 102,000 rights shares of Rs. 100 each for cash at a premium of Rs. 25 per share. The Directors, on a review of the Company's financial requirements have however, found it possible to defer such issue till the second half of the year 1965 and propose to do so after obtaining the sanction of the Controller of Capital issues.

SERVICE TO THE NATION FOR ALMOST A CENTURY

1865 1964



For 99 years Allahabad Bank has consistently rendered service to the nation, and participated in the phenomenal growth of industry and commerce.

Constituents of the Bank are provided with all types of modern banking service through its 102 offices. Safe deposit lockers are now available even in some of the smaller branches of the Bank.

Low	125.00	116.00

* Dividend payment out of the dividend reserve.

Extracts from the Directors' report: The results achieved by the Company will be considered satisfactory in the light of the high cost of production and increased labour charges. Considering the general trend of the Cotton Textile Industry, the working of the Mill may be considered satisfactory.

The necessary permission has been received to install additional 6,788 spindles. Further, the Government of India issued a general permission to increase the spindleage of all Mills under which this Company shall be entitled to install further 4,000 spindles. Orders have been placed for the supply of the spindles with the National Machinery Manufacturers Ltd. which are expected to be delivered in about two years' time. On completion of installation of these spindles, spindleage of the Mill will be 44,000.

As previously reported, the Company has been continuing its programme of progressive modernisation of its plant and machinery. Against the orders placed previously, supplies of Carding Engines have been received and further supplies are expected during the current year. In pursuance of the modernisation programme, the Company installed *High Speed Warping Frames* and *Hank-to-Cone Winding Machines*. An order has also been placed for *Travelling Cleaners* to work on the *Winding Machines*, some of which have been received, and modernisation of the *Ring Frames* is continuing. Humidification plant in the weaving shed has also been put in commission with good effect. During the year under report additions to the fixed assets come to Rs. 12,25,107 and commitments made for further modernisation at the end of the financial year were Rs. 24 30,461. When all the machinery against modernisation and expansion is received and put in commission the working of the Mill is expected to improve considerably and will be better placed to face competition, increasing cost of production and maintain good results.

Accounts in brief as at 31st March 1964 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	40,00,000	Gross block	1,42,38,531

* For 1964 the dividends will be paid out of general reserve.
† For 1963 dividends were paid out of the dividend reserve.
‡ High and low upto 12th November 1964.

Extracts from the Directors' report: *Output*:—Coal raisings commenced from No. 5 Pit during the year; the total raisings from No. 9/11 Pits and No. 5 Pit amounted to 1,88,920 tonnes compared with 1,74,273 tonnes for the preceding year, showing an increase of 14,647 tonnes.

Sales:—The total Sales for the year amounted to 1,80,476 tonnes compared with 1,65,928 tonnes for the preceding year.

Coal Prices:—The Central Government sanctioned an increase of Re. 0.06 per tonne in the price of this Company's Coal with effect from 5th June 1964 to enable colliery owners to meet the additional cost of implementation of the grades and time scales of pay for the workers, as laid down in the Das Gupta Award. A further increase of Re. 0.50 and Re. 0.49 in the prices of *Slack* and *Steam Coal* respectively has also been granted from 1st October 1964, to cover the rise in variable dearness allowance payable from that date. Thus the controlled prices of the Company's *Steam* and *Slack Coals* (Grade I) are now Rs. 26.20 and Rs. 25.23 per tonne respectively.

Expansion Programme:—A large part of the equipment imported under the World Bank Loan has been installed in No. 5 Pit, and as already recorded, coal output has commenced. Certain initial difficulties were encountered, which are being overcome, and it is expected that raisings from No. 5 Pit will increase steadily during 1964-65.

Accounts in brief as at 30th June 1964 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	20,00,000	Gross block	50,71,209
Reserves and surplus	6,56,254	—Depreciation	29,72,536

		Block in progress	2,51,104
		Current assets	28,73,909
		Investments	24,000
		Cash	44,985
	Rs. 52,92,671		Rs. 52,92,671

* Paid-up capital consists of 24,000 ordinary shares of Rs. 50 each and 16,000—4½ per cent. (tax-free) redeemable cumulative preference shares of Rs. 50 each fully paid (effective rate of dividend is 6.85 per cent. in terms of the Preference Shares (Regulation of Dividends) Act, 1961).

New India Fisheries Ltd.

(*Chairman*: Mr. P. B. Advani, Bombay.)

Ninth Annual General Meeting—Held on 6th November 1964.

Working Results:

	For the year ended 31st March (In thousand rupees)	
	1964	1963
Sales of fish, fins and bladders, ice, etc.	35,02	28,36
Closing stock of fish and ice	1,46	97
Gross profit (+) or loss (—)	—21*	—13*
To Managing Agents' commission	Nil	25
Transfer to provision for contingencies	Nil	6
,, ,, depreciation	3,24	1,59
,, ,, development rebate reserve	Nil	2,50
Net profit (+) or loss (—)	—21	—13
Transfer from reserves	1,68	1,80
Credit balance brought forward	10	18
Total available for disposal	1,78	1,98
Appropriations:		
To adjustment of loss for the year	21	13
To dividends (taxable) preference	15	15
,, ,, ,, deferred preference	15	15
,, ,, ,, ordinary	84	96
,, ,, deferred ordinary	(7.8%) 43	(9%) 50
Carry forward	(7.8%) †	(9%) 10
Market value of ordinary shares (in rupees):	1964	1963
High	124.00	‥
Low	123.00	‥

* Loss after providing for depreciation, development rebate and contingencies.
† Only Rs. 378.36.

Extracts from the Directors' report: Depreciation has been provided at double and triple shift workings for the first time and the total sum for depreciation is much bigger than was provided in the previous year.

Two developments of special importance took place during the year, namely, suspension of trawling in Bombay and putting into commission the Cochin establishment of the Company. The four trawlers operating in Bombay worked at a loss largely owing to substantial increase in the excise duty on diesel oil and 60 per cent rise in the wages of the Japanese personnel. The vessels required overhaul and major repairs, the cost of which in India was exorbitant and the Government of India did not sanction foreign exchange for repairs in Japan. Under the circumstances, there was no option but to lay off two trawlers (Satpatti and Pilotan) and after some repairs to the other two (Arnalla and Paj) transfer them to Cochin for shrimp catching under conditions which are not so exacting as are encountered in fishing off Bombay. This was done in October 1963 and these vessels operated at Cochin at a profit.

Application was made to the Government of India for remission of excise duty on diesel oil, duty on electric power and other concessions to make trawling off Bombay economic. This request was supported by the Government of Maharashtra, but despite reminders orders of Government were not received. Nor did the concerned authorities take action in the matter of provision of a fishing dock, a fish market repair facilities at reasonable cost etc. to which reference has been made in the Company's reports before.

On 22nd July 1964, the Company entered into an Agreement with Taiyo's for charter of "Akashi Marus Nos. 23 and 25" for a period of fifteen months commencing from the date of the departure of the trawlers from Japan to Bombay. These arrived and went into operation in August 1964. The hire for the said charter payable to Taiyo's for the stipulated period is Rs. 2.04 912. The company commenced operation with said trawlers from 5th August 1964. Till today a catch of about 203 tonnes of fish valued at about 1,08,700 has been obtained from the said venture.

Ice Factory and Cold Storage: Bombay continued to work satisfactorily at good profit. The extension work of cold storage made satisfactory progress wh ch when completed should add substantially to the profits of this venture.

Cochin: At this centre Konchu and three Kolmis operated successfully and were joined in November 1963, by Arnalla and Paj from Bombay. The commissioning of the ice factory and cold storage was held up for want of release of power by the Kerala Electricity Board till the 15th of August 1963.

Export operations were started in October 1963 and till March 1964, Rs. 11,40,000 c.i.f. value shrimps were exported. This was done at a reasonable profit and the Company also received import entitlement licences of the value of Rs. 1 97,284 which will save the Company a considerable amount.

Accounts in brief as at 31st March 1964 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	20,00,000	Gross block	37,51,081
Reserves and surplus	3 87,878	—Depreciation	11,12,772
Other liabilities	22,14,329	Net block	26,38,309
		Block in progress	2,65,075
		Current assets	23,84,005
		Cash	4,21,775
	Rs. 46,02,207		Rs. 46,02,207

* Paid-up capital consists of 1,912—6 per cent. tax-free cumulative preference shares of Rs. 100 each; 10,738 ordinary shares of Rs. 100 each; 1,837 deferred preference shares of Rs. 100 each and 5,613 deferred ordinary shares of Rs. 100 each.

Parkside (Neilgherry Hills) Estate Co., Ltd.

(*Secretaries and Treasurers*: Messrs. Matheson, Bosanquet and Company, Ltd., Belmont, Coonoor, Nilgiris)

Thirteenth Annual General Meeting—28th November 1964.

Working Results:

	For the year ended 30th June (In thousand rupees)	
	1964	1963
Tea sales	18,68	21,79
Closing stock	2,08	3,14
Gross profit	6,14	9,03
To Secretaries' and Treasurers' remuneration	41	55
Transfer to depreciation	75	78
,, ,, provision for taxation	2,40	4,11*
Net profit	2,58	3,59
Transfer from general reserve	Nil	62
Provisions written back	48	10
Tax adjustment for previous year	4	4
Surplus brought forward	46	49
Appropriations:		
To super profits tax for the past year	Nil	62
Transfer to development rebate reserve	5	3
To interim dividend (taxable) ordinary	1,12 (7½%)	1,12 (7½%)
Proposed final dividend (taxable) ordinary	2,23 (15%)	2,61 (17½%)
Carry forward	11	46
Market value of ordinary shares (in rupees):	1964†	1963
High	25.75	27.50
Low	25.12	22.00

* Includes Rs. 43,000 for super profits tax.
† High and low upto 10th November 1964.

Extracts from the Directors' report: *Working Results*: Weather conditions from January 1964 until the end of the season were unfavourable to crop and the drought was the worst for many years. As a result the production of tea in South India for the first 6 months of 1964 was substantially lower than in 1963. The crop on Pakside Estate was no exception and was nearly 2 lakhs pounds lower than the previous season. This has inevitably reflected adversely on the profits for the year.

During the year the Company has purchased 9.22 acres of planted tea adjoining the estate. This area requires development and will prove profitable in due course. The Directors are negotiating for the purchase of further land in the same area. The total area under tea is 230.47 hectares.

Crop: The tea manufactured for the year was 7,11,800 lbs. (3.22,867 kgs) which is equivalent to 1,270 lbs. of tea per acre. The crop is the lowest since 1958/59 and is due to insufficient rainfall. The crop for the current season so far is ahead of last year and given reasonable weather conditions, the prospects are promising.

Cost and Selling Prices: The Estate cost of production per kg of Made tea for the year was Rs. 3.37 (Rs. 1.53 per lb) against the budgeted figure of Rs. 3.28 (Rs. 1.49 per lb). The total estate expenditure is substantially lower than the budget but the cost of production per pound of tea is slightly higher as crop was about 38,000 lbs. lower than the estimate. The overall cost of production for the season was Rs. 4.89 per kg. (Rs. 2.22 per lb) including depreciation but excluding provision for taxation.

The average sale price of tea realised for the season has shown a useful improvement at Rs. 6.43 per kg. (Rs. 2.92 per lb) compared with Rs. 6.04 per kg (Rs. 2.74 per lb) realised last year.

	Actually incurred Rs.	*Budgeted* Rs.
Lines	25,297	23,400
Other buildings	3,513	8,000
Furniture	4,095	5,500
Water supply		500
Machinery	32,100	32,000
	Rs. 65,005	74,400

The total capital expenditure incurred during the season was Rs. 65,005 against the estimated figure of Rs. 74,400.

Estimates Season 1964/65: These provide for a crop of 3.40,194 kg (7,50,000 lbs) of Made tea to cost Rs. 3.22 per kg (Rs. 1.46 per lb) including 44 P per kg for manuring. Labour and staff wages however will show an increase due to higher rates recently recommended by the Wage Board which will have an effect on cost of production. Capital expenditure is estimated at Rs. 74,270.

Accounts in brief as at 30th June 1964 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	14,88,960	Gross block	35,69,741
Reserves and surplus	17,38,946	—Depreciation	8,23,035
Other liabilities	6,84,085	Net block	27,46,706
		Block in progress	23,281
		Current assets	4,96,022
		Investments	29,925
		Cash	6,16,057
	Rs. 39,11,991		Rs. 39,11,991

* Paid-up capital consists of 1,48,896 ordinary shares of Rs. 10 each. Of the above 13,528 ordinary shares are allotted as fully paid up by way of bonus shares through capitalisation of reserves.

NEWS IN BRIEF

A CONTRACT for delivery of 150,000 tons of foundry pig iron by Russia to India in 1964-65 was signed on Monday this week, between the representatives of the Governments of India and Soviet Union.

An additional rebate of 10 per cent on retail sale of all varieties of woollen Khadi on which a normal rebate of 10 per cent is permissible has been granted with effect from the 14th inst. It will be valid for a period of 45 days.

The Government of India has decided to license an additional annual sugar production capacity of 800,000 tonnes through expansion of existing units and establishment of new mills. The Madhya Pradesh Government has sought central sanction for nine co-operative sugar mills, and the matter is under consideration.

A survey of the wrap-knitting industry in India and its placement in the textile industry has been undertaken by the Silk and Art Silk Mills' Research Association, Bombay. The objective is to collect the basic date on state of machinery product composition, cost of production of this infant industry.

The Government-owned West Pakistan Industrial Corporation will shortly take over two cement factories in Pakistan owned by India's Associated Cement Companies. The West Pakistan Corporation and the A.C.C. have just finalised the negotiations. They are likely to sign the agreement by the end of this month.

A comprehensive and integrated sugarcane development scheme has been drawn up by the Bihar Government. The scheme envisages the increase in yield per acre from 12 tons to 26 tons in the selected sugarcane-growing areas of the State, namely the reserved areas around Samastipur, Motipur and Bagaha sugar factories in North Bihar and Dalmianagar and Bihta in South Bihar.

A seven-member international team of experts in foreign trade, arranged by the Ford Foundation at the request of the Union Ministry of Commerce arrived in New Delhi on the 14th inst. in order to study India's exports efforts and suggest improvement. The team is being split into two groups, one visiting Calcutta and Madras and the other visiting Bombay and Ernakulam.

The Governments of India and Jordan have agreed to increase the trade exchange between the two countries by 50 per cent in the next two years, according to a joint communique issued at the end of the talks held at Amman recently. An Indian trade office is to be set up in Jordan next year and an industrial team will visit this country to explore possibilities of floating joint industrial projects in Jordan.

The Union Government has constituted a six-member expert committee with Mr. A. C. Mitra, consulting engineer, U.P., as Chairman, to prepare a comprehensive plan for controlling recurrent floods in the rich coastal deltaic areas of the Godavari, Krishna and Guntur districts of Andhra Pradesh. The Committee has been asked to suggest a plan for control of floods in the coastal rivers in this area. It will also consider the methods of improving drainage system in the area.

A study of the possible sites for locating the coke oven plants is reported to have been taken up by the Government of India. It has been decided to invite offers from consultary firms for this purpose. The main objective of the study will be to enable the Government to select locations for these plants and to take steps for the preparation of a detailed project report. It will also indicate the production processes involved, by-product utilisation, and capital and operating costs.

A crash programme for mineral discovery and development entitled "operation hard rock" has been prepared by the Union Ministry of Steel and Mines. The programme envisages intensive investigation of minerals through air-borne surveys so that favourable prospecting areas are pinpointed by aero-magnetic, electro-magnetic and radio metric methods. The total cost of the programme is estimated at Rs. 2 crores and the U.S. Agency for International Development is reported to have indicated its willingness to lend $3.5 million to cover the cost of foreign exchange.

Owing partly to the Land Ceiling Act and partly also to the exemption of agricultural income-tax for the first 12½ standard acres, several big assessees have reduced their holdings to the minimum extent possible and some have disposed of their lands in excess of 12½ standard acres to avoid tax, according to the administration report of the Madras Agricultural Income-tax department. The net collection during 1962-63 after deducting refund of Rs. 16.14 lakhs, amounted to Rs. 116.21 lakhs, as against Rs. 142.96 lakhs in the previous year. The total number of assessees at the end of the year was 42,632, as compared with 23,318.

The regional transport survey unit of the planning commission has reviewed the transport requirements of 15 major commodities till 1975-76 at a meeting held in Calcutta on Monday this week. Mr. Tarlok Singh, member of the Planning Commission, addressed the meeting. Mr. Singh said that half the investment in the fourth Plan would be on transport and industry [illegible] a sizable portion of the expenditure

ment. The meeting discussed the transport development programmes of the State Governments in the eastern region, the progress of the transport survey of the coal and steel belt and problems of common interest.

A decision to start a central agency, known as the Federation of Indian Export Organisations, was taken at the meeting of the Chairmen of export promotion councils, representatives of commodity boards and other important trade organisations held at New Delhi on the 16th inst. The Federation is expected to start functioning early next year. It will sponsor study teams, undertake commodity and market surveys, conduct publicity work, open foreign office and provide common services for the benefit of exporters. It will function as an integral part of the Federation of Indian Chambers of Commerce and Industry. It was also decided to set up a Standing Committee of 30 members, representing major chambers of commerce, export promotion councils and commodity boards under the Chairmanship of Mr. P. A. Narielwala. The office of the Federation will be at New Delhi.

The Study group on the woollen handloom industry (Chairman: Mr. K. Mallappa, President, Mysore State Woollen Handloom Co-operative Society), in its report submitted to the Union Government, has suggested the bringing of the entire handloom industry under the co-operative fold. It has recommended the establishment of centralised scouring blending and carding centres in Andhra Pradesh, Mysore, Uttar Pradesh, Rajasthan, Himachal Pradesh and Jammu and Kashmir; small worsted spinning plants, consisting of 2,000 spindles each in Kulu, Palampur (Punjab), Almora (U.P.) and Srinagar, and shoddy spinning plant of 5,000 spindles at Amritsar and woollen spinning plant of 2,000 spindles each in Andhra Pradesh and Mysore. Another important recommendation is that certain "limited reservation of field of manufacture" between the organised mill sector and the handloom products should be made.

A project report on the proposed integrated aluminium project at Korba in Madhya Pradesh will be prepared by Hungarian experts shortly. An agreement to this effect was signed between the Governments of India and Hungary at New Delhi on Tuesday this week. The report will be in two parts. The first part, which will include the economic assessment of the resources, will be prepared in ten months, and the final report will be presented in 18 months from the date of the agreement on the project report becomes effective. The National Industrial Development Corporation will act as the technical consultary between the Indian Government and the executing agency for the project. The project will have a capacity to manufacture 120,000 tonnes of alumina and 30,000 tonnes of aluminium metal per annum supported by facilities to manufacture aluminium semis. The Hungarian Government has already offered credits to cover the foreign exchange component of the project.

The total exports from India during the month of September this year touched the highest level for any single month, namely, Rs. 75.5 crores representing a rise of Rs. 12 crores as compared with the total exports of Rs. 63.5 crores in September 1963. The rise was accounted for by almost all commodities, especially tea, jute, textiles, mineral ores, tobacco, cashew, cardamom, coffee, chemicals, plastics, handicrafts, jewellery, coir products, fish and fish products, raw cotton, engineering goods and other manufactured articles. Sugar, vegetable oils and black pepper were, however, the only items which did not register as sizable increase in exports. The total exports during the first six months of the current (1964-65) financial year were Rs. 415 crores, that is, Rs. 38 crores higher than the exports (Rs. 377 crores) in the corresponding six months of 1963-64. In spite of the fact of advance in prices in the past few months, the export performance is remarkable and owes a great deal to the cooperation and concerted effort of the various Export Promotion Councils, Commodity Boards and exporters of different commodities.

* * * *

From Abroad

The Prime Minister of Britain intends to seek President Johnson's support for a vast new system of international credit which aims at staving off the peril of world slump.

The United States, West Germany and Britain together accounted for nearly three-fifths of the aggregate World exports of manufactured goods. The exact percentage shares of these countries are 23.1, 19.9 and 14.7 respectively.

Japan's exports during the month of October 1964 touched a new post-war high of $691.6 million. The high level of exports is attributed chiefly to a steady growth in sales to the U.S. and increased purchases by the Soviet Union and Australia.

A shipping service between Pakistan, China and Japan is scheduled to commence from 1st January 1965, according to Commodore Rashid Ahmed, Managing Director of the National Shipping Corporation of Pakistan. The Japanese Conference Lines has agreed to the proposed service in principle. Further negotiations are in progress.

Between 1958 and 1963, Italy, Holland and West Germany in that order led the western world in the growth of industrial production. The average percentage increase in that period was 32.2. Industrial production went up by 20 per cent in Italy, by 39 per cent in Netherlands, by 36 per cent in W. Germany and by 33 per cent in U.S.A.

More young people are in training now than formerly as brain-workers to keep the wheels turning in German industry. According to Government statistics, six per cent more young people (54,118) were studying in the engineering school of West Germany in the autumn of 1963 than in 1962, and 30 per cent more than in 1959. Between 1959 and 1963, the proportion of women engineering students rose by 61 per cent.

Ninety-two high level western business executives began talks at Moscow on the 16th inst. with top Soviet trade officials to explore the possibility of increasing Soviet-U.S. trade. The business men are all American excepting Sir Harry Pilkington, Chairman of the Pilkington Brothers. The talks will range over a wide range of topics including Soviet economic planning, foreign policy, scientific research, agriculture, foreign trade and the financing of trade.

In an attempt to stimulate economic activity further the Austrian Government has lowered customs duties on about ninety groups of agricultural and industrial commodities by an average of 15 to 20 per cent with effect from 1st October 1964. At the same time, a number of commodities have been added to the so-called free list, which enumerates commodities exempt from the turnover equilisation tax. Export bonuses will be granted only on commodities exported after processing or conversion in Austria, but not on goods that leave Austrian territory in the same state as they were first imported.

PERSONAL

MR. Akbar Hydari, Chairman of the Western India Match Company Ltd. and Director of several other companies, has joined the Board of Directors of the Metal Box Company of India Limited.

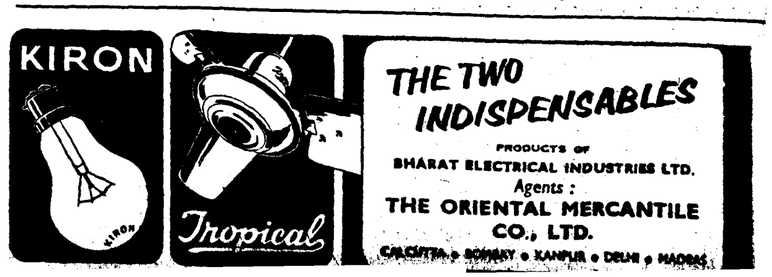
Mr. Prabhu V. Mehta has been re-elected Chairman of the Textile Machinery Manufacturers' Association for the year 1964-65. Mr. J. C. Agrawal and Mr. J. Save have been elected Vice-Chairmen.

Mr. S. C. Sengupta, until recently a member of the P. and T. Board, has taken over charge as the Joint Secretary in the newly created Department of Social Security, in the Ministry of Labour and Employment.

Mr. F. R. Law, Manager, Laboratory, Chemicals Marketing Division of British Drug Houses, is currently in India, studying aspects relating to the increasing demand for laboratory chemicals and drugs in South-East Asia and the Far East. Mr. Law will visit Pakistan before returning home on 29th inst.

Mr. Mark Vahrman, Reader in Industrial Chemistry at Northampton College of Advanced Technology, London arrived in New Delhi on the 15th inst. for a seven-week visit to India under the Colombo Plan. He will have discussions with officials of the Central Road Research Institute and the Central Fuel Research Institute on low temperature carbonisation.

Mr. D. P. Bertlin, of the London firm of consulting engineers, Messrs. Bertlin and Partners, arrived in India on Monday this week to discuss with the senior officials of the Bombay Port Trust a master plan for the development of the harbour. During his 10-day stay in the city, Mr. Bertlin will discuss with the Port Trust authorities questions arising from the £8 million contract to be awarded for the development of the docks and the International Development Association's financing of the foreign exchange costs.



TECHNICAL AID UNDER COLOMBO PLAN

INDIA'S CONTRIBUTION INCREASES

THE backward and underdeveloped countries of the world require enormous amounts of capital and technical assistance for their economic development. Capital aid from the advanced countries no doubt helps them to procure the necessary plant and equipment so very vital for their industrialisation. But mere machines and sophisticated equipments are of no avail without the necessary skilled technicians who alone could use and maintain them properly. Thus, while capital aid is of great importance, in the long run, technical assistance is of even greater importance, being essential to ensure the maximum use of such capital aid. It is in this context that the technical assistance provided under the Colombo Plan to the countries in South and South-East Asia assumes particular significance, aiming, as it does, at the development of the manpower resources of these areas. In view of the dearth of skilled personnel in these countries, the Colombo Plan's activities in this field is invaluable. Technical co-operation, it may be noted here, covers provision for equipment and technical training.

The thirteenth annual report (that is, for 1963-64) by the Colombo Plan Council for Technical Co-operation in South and South-East Asia, released by the Colombo Plan Bureau recently, contains a factual review of progress made in this direction. Started in May 1950 with seven countries, the Council has at present a membership of 22. The Council has among its members the advanced countries such as Australia, Britain, Canada, New Zealand, Japan and the United States and the leading developing countries such as India, Ceylon, Pakistan, Burma, Indonesia, Philippines, Malaysia and Afghanistan. The total expenditure on the various technical assistance programmes during 1963-64 amounted to £36.4 million. Though this figure is slightly less than the peak amount of £42.3 million reached in 1962-63, it represents an increase of about 36 per cent on the average annual expenditure over the last five years and about 98 per cent on the expenditure in 1958-59. As the accompanying table shows, the cumulative total expenditure on technical assistance under the Colombo Plan since 1950 has touched £181.3 million. Of this amount, nearly 39 per cent (£70 million) has been spent on technical equipment, 38 per cent (£69.8 million) on 5,981 experts and advisers who have come to the region, and 23 per cent on 33,046 trainees.

Expenditure on Equipment

The expenditure on equipment during the year under review was £16.1 million. While it falls short of the high figure of £21.1 million in 1962-63, it is well above the annual average for the last five years. Technical equipment supplied has ranged from spare parts for the Departments of Physics and Mathematics, Engineering and Chemistry and Fuel and Metallurgy of the Indian School of Mines, Dhanbad, to heat treatment furnace units, spectrometers and polarographs for the Metallurgy Division of the Department of Mineral Resources, Thailand; from fertilisers, pesticides and seed varieties for the agricultural improvement programme in Vietnam to instruments for the Scientific Instrumentation Centre of the National Institute of Science and Technology, Manila.

Skilled personnel to maintain and man these equipments have been sent to the countries of the Colombo Plan region. As many as 948 experts have come to serve this region during 1963-64, as against 870 in 1962-63. The United States has provided well over half the number (562) of the total experts during the year. It is a matter of some significance that India, a relatively underdeveloped country, has been able to provide the second largest number of experts (106), even compelling Britain to take third place with 86. Among the experts assigned are advisers on town planning and landscaping, radar instruction, project evaluation, wheat and rice breeding, soil surveys, geology, microbiology, etc. These examples illustrate the wide range of international expertise which is being channelled to the developing economies. The largest number of these technical experts has been provided to India (157), Vietnam (137) and Nepal (123), in that order. It is in the field of education that the highest number of experts (255) has been provided. The other important fields where experts have been assigned are food, agriculture and forestry, medical and health, engineering, etc.

Besides sending out experts, the contributing Colombo Plan countries also provide training facilities in their own institutes. The report points out that the number of new training places provided during 1963-64 (4,551) is the highest on record for any single year. The previous highest annual total was 4,529 places in 1961-62. The United States is the leading donor country outside the Colombo Plan region with as many as 2,164 places (48 per cent). Australia and Britain occupy the second and third places in the number of training places provided to trainees with 573 and 454, respectively. India has increased its training places from 242 in 1962-63 to 284 in 1963-64. But it has sent only 693 trainees in 1963-64, as against 742 trainees in 1962-63 and thus dropped to second place after Indonesia (750) in receiving training awards. However, India holds a key position in respect of intra-regional training and has provided no less than 284 places this year (77 per cent of the total of 367).

India's Share

Another interesting set of facts revealed by the technical co-operation report of the Colombo Plan is the country-wise break-up of the total aid given by the various advanced nations to the developing countries of the region. As will be seen from the accompanying Table II, the United States is the largest donor country. Over the years 1950-64, it has provided aid to the tune of £143.4 million or 79 per cent of the aggregate aid of £181.3 million. India has itself contributed to the progress of other developing countries, such as Nepal, Cambodia, Laos, Pakistan and the Philippines. Other advanced nations, such as Britain, Australia, Canada, New Zealand and Japan have also contributed to the technoolgical development of the backward countries. Table III shows, in this connection, the amount of technical aid received by India from other countries during the years 1950-64. Of the total of £25.8 million received by India, £19.9 million or 77.1 per cent is from the United States. Britain and Canada follow with £3.4 and £1.2 million respectively. The share of Australia, New Zealand and Japan in the grant of assistance to India is very negligible. The reasons for this comparatively low amount of technical aid from the latter countries are many, historical ties and geographic location being relatively more important. Australia and New Zealand have made available nearly 50 per cent of their technical aid to their close neighbours, such as Indonesia and Malaysia. Britain has given a large proportion of its assistance (73 per cent) to India, Ceylon, Malaysia and Pakistan, which share common historical associations with that country and have institutions and standards on its pattern. India, in turn, has granted maximum aid to its neighbouring countries, such as Nepal and Ceylon, which have many things in common. This highlights the importance of the bilateral character of technical assistance in maximising its effectiveness. The result is that aid tends to come from the most useful source and also to go to the country most likely to benefit from it.

The Colombo Plan, which was envisaged as a unique pattern of international co-operation at its inception in 1950, has, over the years, acted as a catalytic agent in the planned development of South and South-East Asia, which, incidentally, accounts for one-fourth of the world population and one-sixteenth of the total inhabited land area. With a staff of less than 30 members, the Plan has been a shining example of international co-operation in the fight against the widespread poverty prevalent in the region. The good work done so far needs to be kept up in the coming years as well. Both the quantum and the variety of aid have to be increased against the background of changing needs and the rapid increase in population in this region.

Table I—Expenditure on Technical Co-operation
July 1950 to June 1964
(In million £ sterling)

Period	Trainees	Experts	Equipment	Total
Total upto June 1958	5.9	2.9	2.4	11.2
1958-59	4.4	9.8	4.2	18.4
1959-60	5.3	8.6	3.0	16.9
1960-61	5.8	8.7	5.7	20.2
1961-62	7.0	11.4	17.5	35.9
1962-63	6.9	14.3	21.1	42.3
1963-64	6.2	14.1	16.1	36.4
Total ..	41.5	69.8	70.0	181.3

Table II— Aid Given by Different Countries (1950-64)
(In million £ sterling)

Country	Value
Australia	11.9
Britain	12.3
Canada	6.4
India	1.3
Japan	2.2
New Zealand	3.5
United States	143.4
Other Countries	0.3
Total ..	181.3

SUGAR

(*Concluded from page 902*)

tories owned by joint-stock companies. The validity of this argument has, however, been questioned by the joint-stock sector thus:

> In the case of joint-stock sugar companies, the growers and shareholders are two different entities, whereas, in the case of co-operative mills, the cane cultivators are grower-members and hence they can afford to forgo dividends and get compensated through the higher cane price which is tax-free. It is the character of the financial structure of co-operatives that makes all this difference.

The cane growers' agitation for higher price is perturbing, especially because of the fixation of low ex-factory prices for sugar produced in Maharashtra. If the sugar mills are to pay the price of cane as demanded by growers, the price of their sugar will necessarily have to be raised from the present level of Rs. 116 per quintal. Besides such an increase in cane price, the Government should also concede the plea of sugar industry for partial decontrol of sugar. Surely, such decontrol will, while maintaining the distribution of the bulk of the sugar produced through fair-price shops at stipulated prices, help the mills to sell a part of their production at a higher price in the free market and thereby enable them to meet the competition for cane supply from *gurkhandsari* producers. The scheme of partial decontrol is worth a trial not only in Maharashtra but throughout the country.

The British Government has received applications from India and Southern Rhodesia to become exporting members of the Commonwealth Sugar Agreement, and has proposed that these applications, which the British Government supports, should be discussed with the other parties to the Agreement during the current series of discussions. The British Government has been guided by four considerations; one, India and Southern Rhodesia were not sugar exporters when the Commonwealth Sugar Agreement was signed in 1951, but have since become substantial exporters, two, the British commitments to purchase sugar have been reduced as a result of the termination of the bilateral sugar agreement with South Africa at the end of 1964, three, this provides an opportunity for these major Commonwealth exporters to participate in the benefits of Commonwealth Sugar Agreement, four, the inclusion of these exporters would give further strength to the group as a whole. In respect of Southern Rhodesia, the British Government's attitude is based upon Southern Rhodesia's present position within the Commonwealth. Membership of the Commonwealth Sugar Agreement is confined to the industries of member-countries of the Commonwealth. If Southern Rhodesia should cease to be a member of the Commonwealth for any reason its sugar industry would, of course, forfeit the membership of the Agreement.

The Indian Sugar Mills Association has voiced serious concern at the sudden decision of the Government of India to ban the manufacture of A and B grain size sugars. The ban, according to the Association, is wholly unwarranted, since factories have already commenced crushing operations for the season 1964-65. It is feared that this sudden ban will seriously dislocate the working of the factories specially carbonation factories numbering 36 whose production capacity will be adversely affected. These carbonation factories, have installed costly plant and equipment for producing bold grain size sugars for which there is considerable demand in the country due to the great preference therefor shown by consumers including bulk industrial consumers. Besides, bold grain size sugars have established markets and they also command a premium in normal free trade. As such the Association has pointed out that there is hardly any justification for the sudden prohibition on manufacture of bold grain size sugars due to temporary reported difficulties, if any, experienced under controlled distribution which is a temporary feature. The Association has, therefore, urged the Government to reconsider the matter

TREND OF MARKETS

MONEY EASY

(*From Our Own Correspondent*)

BOMBAY, 18*th November*

The short-term money market ruled distinctly easy during the week under review. Supplies of money were plentiful, following a further large-scale inflow of funds from mofussil centres, while demand for credit tapered off. The inter-bank call rate, as a result, declined. Both renewals and fresh money fetched only one per cent throughout the week with lenders over, whereas, during the greater part of last week, the rate quoted was 3 per cent for the former and 2½ per cent for the latter. Conditions at Calcutta were also distinctly easy. Renewals were done at one per cent, as against 5 per cent, and fresh money at ¾ per cent, as against 4¾ per cent.

Thanks to comfortable money conditions, the 91-day Government of India Treasury Bills, the tenders for which opened on Tuesday the 17th inst, evoked excellent support. The total amount offered (Rs. 4 crores) was twice that (Rs. 2 crores) invited and also accepted. The average rate of accepted tenders moved down from Rs. 2.499 per cent last week to Rs. 2.400 per cent. The intermediate Treasury Bills, too, elicited very good support. The total amount of Bills actually sold from the 11th to 14th inst. was over Rs. 11.23 crores, as against Rs. 48.50 lakhs a week before and Rs. 7.02 crores two weeks before.

India's foreign exchange reserves improved by a further Rs. 29 lakhs during the week ended 13th November. The improvement was entirely in balances held abroad which rose from Rs. 10.14 crores to Rs. 10.43 crores. The foreign securities held in the Issue Department of the Reserve Bank continued unaltered at Rs. 85.46 crores. Loans and advances to scheduled banks declined by Rs. 5.09 crores to Rs. 79 lakhs. The deposits of these banks also receded by Rs. 1.02 crore to Rs. 95.89 crores. Notes in circulation fell by Rs. 6.86 crores to Rs. 2,460.73 crores.

There was a further rise of Rs. 13.10 crores to Rs. 1,720.40 crores in the total credit made available by scheduled banks to their clients during the week ended 6th November. At the same time, deposits declined by Rs. 16.05 crores to Rs. 2,720 crores. Even so, borrowings from the Reserve Bank increased by only Rs. 3.85 crores to Rs. 5.05 crores. Investments fell by Rs. 60.72 crores to Rs. 812.94 crores, while total cash improved by Rs. 20.84 crores to Rs. 173.26 crores.

The Gilt-edged market was dull and quite. 3 per cent non-terminal loan dropped 50 paise to Rs. 62. 3½ per cent 1967 and 1968 shed five paise each to Rs. 99.90 and Rs. 99.85, respectively. The 6½ per cent 1977 Gold Bonds declined by 30 paise to Rs. 117.70 at which level they give a redemption yield of 4.66 per cent. Among State loans, 4¾ per cent 1976 West Bengal encountered selling and fell by Rs. 1.40 to Rs. 98. 4¾ per cent 1976 Uttar Pradesh eased by 20 paise to Rs. 96.90. The Subscription list of the 12-year Rs. 4.75-crore Bombay Municipal Corporation loan was closed on the opening day itself—that is, Monday the 16th inst.—as it was quickly oversubscribed.

In the foreign exchange market, the bank's selling rate for U.S. dollars increased by 25 paise to Rs. 481 per $100 during the week, while their buying rate was unchanged at Rs. 477.50. In New York, the pound sterling eased again *vis-a-vis* the dollar, the spot rate declining by 0.040 cent to 278.300-278.330 cents and the three months' forward by 0.030 cent to 277.670-277.700 cents.

DECLINE IN BULLION

(*From Our Own Correspondent*)

BOMBAY, 18*th November*

The firmness of silver and gold witnessed last week, which gathered momentum in the earlier sessions of the week under review owing to reduced arrivals and brisk demand from local stockists, abated on Tuesday the 17th inst. when both the metals suffered a decline following profit taking at high levels, lack of fresh buying support and reports suggesting tighter enforcement of Gold Control Rules. The decline persisted today also. Since, however, the decline was not appreciable, the closing rate today were higher than a week ago. The net gain was Rs. 2 in silver and Re. 1 in gold.

Silver began the week at Rs. 257, same as last week, and moved gradually to touch a high of Rs. 260.50 on Monday due to heavy demand from local stockists for replenishing their depleted stocks. Subsequently, however, it declined and closed at Rs. 259 today. The weekly average arrivals and offtake of the metal were 16 and 8, respectively, as against 26 and 12, last week.

Fourteen-carat gold improved from Rs. 66.25 to Rs. 67.50 before finishing at Rs. 67.25 today. Pure gold which had earlier increased from Rs. 109.50 to Rs. 113 on reduced arrivals of contraband metal, was done at Rs. 112-113. Sovereign in sympathy, moved upto Rs. 92 before closing at Rs. 91.50.

The international price for gold in the London market was slightly lower at $35.09-¼, as against $35.09-½, last week. The sterling price which initially moved up by 2¼d. to 252*s.* 3¼*d.*, declined later to 252*s.* 2*d.* Spot and forward silver remained unchanged at 112½*d.* and 113¼*d.*, respectively, as also silver in New York at 129.3 cents.

Nearly one million goldsmiths affected by the Gold Control Order throughout the country would observe a one-day nation-wide strike to press their demand for the abolition of the Gold Control Order. Disclosing this at a news conference last week, Mr. Bhawani Shankar Soni, President of the *Akil Bharatiya Swarnakar Sangh*, stated that the strike would be a part of the country-wide agitation to be launched by the *Sangh* next month. He added that a mass demonstration would be staged before the Parliament in the forthcoming session and a memorandum calling for the abolition of the Gold Control Order would be presented to the Government. In order to mobilise public opinion in their favour, the *Sangh*, he said, had asked its units to stage demonstrations and organise picketings in all the important towns. The *Sangh* has strongly resented some of the suggestions contained in the report of the joint select committee of the Gold Control Bill as they are detrimental to the interests of the Goldsmiths.

The following table shows the trend of prices during the week under review:

	18-11-64 (closing)	High	Low	11-11-64 (closing)
	Rs.	Rs.	Rs.	Rs.
SILVER Ready (996 fine) ..	259.00	260.50	257.00	257.00
GOLD				
Ready (14-carat) ..	67.25	67.50	66.25	66.25
Sovereign	91.50*	—	—	91.50*
London—				
Gold	252*s.* 2*d.*	252*s.* 3¼*d.*	252*s.* 1*d.*	252*s.* 1¼*d.*
Silver Ready ..	113¼*d.*	—	—	113¼*d.*
Silver Forward ..	113¼*d.*	—	—	113¼*d.*
New York—				
Silver	129.3 cents	—	—	129.3 cents

N.B.—The quotation for gold is per 10 grams (about 0.85 tola) and that for silver is per kilogram (85.73 tolas). London and New York quotations are per ounce. * Unofficial rate.

YARNS DULL

(*From Our Own Correspondent*)

BOMBAY, 18*th November*

The yarn market continued to put on an dull appearance during the week under review, in the absence of fresh developments. Art silk yarns tended to decline again following selling pressure induced by the reported reduction in price by a leading spinner. The supply position was comfortable, while demand from consuming centres was poor. Staple fibre yarn futures moved narrowly in the earlier session due to lack of fresh incentives, but tended to move up later on rumours of a possible downward revision of excise duty of staple fibre yarns. The rising trend would have persisted till the close of the week but for easy spot advices. Ready yarns ruled easy. Cotton yarns were dull. Business put through was restricted and values moved within narrow limits.

Among art silk yarns Bright Century 105D suffered a steep fall of 68P to Rs. 11.42. 75D fell by 60 p to Rs. 17.05. National Rayon 150D dropped 24 p to Rs. 9.04, 120D receded by 29 p to Rs. 9.61. South India Viscose 120D declined by 13 p to Rs. 12.23.

In the staple fibre yarn section, the 2 × 34 January 1965 contract, after forging ahead from Rs. 849 (per quintal) to Rs. 857 on Friday, declined to close at Rs. 853 today. Spot Kohinoor eased by 9 paise to Rs. 9.68. Sitalaxmi shed 6 paise to Rs. 9.33. Premier lost 15 paise to Rs. 9.46 and Sriram 4 paise to Rs. 9.06.

Cotton yarn Tuticorin slipped by 57 paise to Rs. 39.97. Business was put through at Rs. 27.50 in 17s Bombay Dyeing. 22s Madura were done at Rs. 32.25. 52s Finlay was unchanged at Rs. 80.50.

The following table gives the prices of rayon staple fibre and cotton yarns, today, as compared with those prevailing a week ago:

	18-11-1964	11-11-1964
Art silk yarn (per kg.)—	Rs.	Rs.
National Rayon 120D	9.61	9.90
Century 75D	17.05	17.60
S. I. Viscose 120D	12.23	12.36
Staple fibre yarn (2 × 34 NF) January 1965 (per quintal)	853.00	850.00
Spot (per kg.)		
Sitalaxmi	9.33	9.39
Premier	9.46	9.61
City	9.42	9.42
Cotton yarn - French Count (Rs. per 5 kg.)		
8s Podar	21.50	21.50
17s Modern	27.00	27.00
22s Madura	32.00	32.00
34s T'cott	39.97	40.50
52s Pioneer	68.75	68.75
68s Finlay	100.50	102.00

RECOVERY IN JUTE GOODS

(*From Our Own Correspondent*)

CALCUTTA, 17*th November*

Jute goods market ruled distinctly easy during the major part of the week under review, though it picked up strength on Monday which persisted today also. The easiness was due to pressure of sales by several stockists, while mills did not show much interest in buying. Prices, as a result, registered a fall. The downward trend was, however, arrested on Monday when the market put on a cheerful appearance, thanks to brisk short-covering in the hedge section in view of the approaching closure of accounts relating to November contracts. There was large-scale switching over of operations from the November contracts to February contracts, the high contango rates notwithstanding. The continuance of labour strike in Pakistani jute mills and the unrest among jute mill workers in and around Calcutta on the question of bonus payment also imparted strength. The lower production figure for October (98,000 tonnes of jute goods, as against 104,000 tonnes in September) was another bullish factor. Consequently, prices tended to move up.

In the hedge market, sacking November delivery encountered selling and declined from Rs. 152.10 to Rs. 150.45 on Saturday, but recovered later to close at Rs. 156.25 today. Hessian November, after receding from Rs. 50 to Rs. 49.22, rose to Rs. 49.34 today. Ready hessian (40″ × 10 oz.) and B. twills declined from Rs. 50.10 and Rs. 155.75 to Rs. 49.30 and Rs. 153.20, respectively, on Saturday the 14th inst. Subsequently, however, they recovered, the former to Rs. 49.60 and the latter to Rs. 156.25.

Early in the week, the raw jute market was subdued owing to increased arrivals. Operators in the Calcutta market were eager to lighten their stocks which consisted mainly of lower grade fibre. But the mills were very selective in their purchases because of the small quota of 175,000 bales released for the week ended 14th November. They (mills) preferred better grade fibre even at slightly higher rates. Hence, the prices of all grades of fibre drifted downward. The tone of the market, however, improved later in the week, following the issue of maximum purchase quota 700,000 bales for the week ending 21st November and reports suggesting that raw jute output in Pakistan would be more than 6.6 million bales during the year 1964-65, that is, 700,000 bales short of the second Plan target of 7.3 million bales. Prices, as a consequence, staged a recovery. The recovery was, of course, not marked enough to make up for the earlier losses, so that today's closing rates were below those prevailing a week ago. Thus, over the week, Assam Bottoms fell by Re. 1.50 to Rs. 36 per maund. Northern Bottoms declined by a like amount to Rs. 36.50. Daissee eased by a rupee to Rs. 37.

• • • • •

Very few mutagenic effects of radiations on jute plants are inherited, according to the Jute Agricultural Research Institute of the Indian Central Jute Committee. Only about 2 to 4 per cent of the variations produced have direct use as high-yielding materials or indirect use in hybridisation for incorporating the desirable characters (induced by radiation) into the existing high-yielding strains. The more promising of the variations have been isolated with the help of radiations, which included charges of X-rays upto 140,000r, gamma rays upto 200,000r and chronic gamma rays upto 10,000r. In preliminary yield tests, some of the plant materials selected from X-rayed populations produced 58 to 70 per cent more fibre than the standard white variety D. 154. Stabilisation of the new strains by way of purification is expected to take a few years more. The common belief that jute shows large variations in nature is, according to the Institute, erroneous. The collection of samples from different parts of the world over the past 40 years has yielded only about 100 varieties of the two main species of jute, C. Capsularis (White) and C. Olitorius (Tossa). Since the choice of material is limited, the Institute's programme of breeding and evolving jute varieties which are resistant to insect pests and diseases, drought, waterlogging, lodging and other adverse factors has recorded relatively slow progress. The radiation work is carried out in the Institute's own gamma field, which is equipped with a 20 curie cobalt-60 source and a 100 kvp hard X-ray unit.

OILSEEDS BUOYANT

(*From Our Own Correspondent*)

BOMBAY, 18*th November*

But for a minor setback towards the close, oilseeds maintained a firm and buoyant tone during the week under review. The volume of business was consistently large and the market was sustained by continued bull support and heavy short-covering. Each and every section participated in the buoyancy and it seemed that the reaction at the end was mostly of a technical nature. The lead was provided by groundnuts and at one stage margins came into force, as the market rose by Rs. 2.40—that is the permissible limit for the rise —when the quotation touched Rs. 100.20. On Wednesday, the quotation was Rs. 100.15. Bull operators were encouraged to build up further long positions by the decision of the Gujarat Government to put exports of groundnuts from the State under permits on the basis of last year's performance. Exports during the current month will be allowed to the extent of the actual figure in the same month last year and the feeling was that, as a result of these restrictions, imports into Bombay could not after all be much. The oil needs of the city are around 500 tonnes a day—100 tonnes for domestic consumption and 400 tonnes for use by *vanaspati* manufacturers. But stocks in the city were said to be insufficient to meet the city's requirements. In keeping with futures, spot prices reacted at the close. Turnover was put at an average of 13,000 bags a day, as against the normal figure of 5,000 to 6,000 bags. Oil was also subdued at the close.

The outlook for groundnuts now depends to a large extent on the policy of the Gujarat Government. A section of the market men think that the State Government will have to facilitate larger exports from the State sooner or later, and that this might induce a decline in prices. It is now taken for granted that the Centre will stick to the ban on exports from the country of H.P.S. and groundnut oil. The bearish view is not, however, shared by the other section which asserts that the market is definitely bullish. The fact is that wholesalers in the foodgrains market, now out of business, have, for want of anything better do, entered the oilseeds and cotton markets. It is possible that this element is buying up oilseeds for speculation. This section further anticipates that groundnuts will touch even Rs. 150, if they are allowed to seek their natural levels.

Castor March touched a new high of Rs. 189.25 during the week, although, at the close, it receded to around Rs. 187.50. It sounds rather strange that, with exports of castor oil making a poor show, seeds should be scaling new highs. New elements have entered into the castor market too, and, with the crop still a long way off and stocks very small, it is not difficult to rig up prices. It would, however, be hasty to predict any definite trend for castor. Suffice it to say that currently it is content with following the lead of groundnuts and that its long-term prospects will depend not only on the future of groundnuts but also on its own harvest.

Linseeds were also firm, with the March contract rising to Rs. 44.81 and reacting at the close to Rs. 43.62. There have been no new factors

in linseeds, but, as has been pointed out many a time in this column, its outlook depends on the rapeseed harvest which, however, is still a couple of months off. Cottonseeds were extremely bullish and the highest during the week was Rs. 112.75 which has been the highest so far. There is no need to repeat that exports of cottonseed oil are very difficult, in view of the competition in international markets, while domestic consumption has been hampered by the recent restrictions. But yet the market is bullish and this is obviously due to the high prices which cotton is fetching at present. The outlook for spot cotton remains very firm and, in view of this, the trend in cottonseeds can be anything but bearish.

The outlook for groundnut extractions is excellent and currently the market has been firm with November at Rs. 435, December at Rs. 430 and January at Rs. 420. U.K. advices also indicate a firm tone with November at £39-10, December at £38-5, January at £37-15 and January-February-March at £37. The firm tendency is induced mainly by sustained overseas demand, with communist countries particularly active for the past some days. It is said that, during the last 15 days, business to the tune of 70,000 tonnes has been put through with overseas countries such as Poland, Yugoslavia, East Germany, Czechoslovakia and Russia, while the U.K. is credited with having bought 6,000 to 7,000 tonnes.

The volume of business with the United Kingdom is not much, but market circles interpret the new business as a significant development, for U.K. buyers had been shying off the Indian market since a long time. Informed sources say that the United Kingdom might buy anything between 45,000 tonnes and 50,000 tonnes per month in the current season, while the same sources also think that Russia might take up about 30,000 tonnes a month during 1965.

Trade estimates of exports of groundnut extractions during 1965 are for a total of 1.4 million tonnes earning around Rs. 58 crores by way of foreign exchange and thereby offsetting the shortfall in earnings on account of the ban on exports of oil and H.P.S. goods. Trade circles cite the recent agreement, said to have been concluded between the Government of India and several of the East European countries, which covers a total exports of the value of Rs. 52 crores, as against Rs. 42 crores in 1964, and assert that, out of the rise of Rs. 10 crores, half would be accounted for by extractions which means an additional export of 200,000 tonnes to these countries.

In view of these factors, extractions should continue to maintain a firm tone and knowledgeable sources think that there is scope for a rise of Rs. 60 to Rs. 70 per ton in prices. Crushing is reported to be in full swing and trade estimates are for an output of 140,000 tonnes a month during the current year.

The following table shows the closing prices of oilseeds and oils as on 18th November as compared with the previous two weeks:

	18-11-1964	11-11-1964	28-10-1964
Groundnuts	**Rs.**	**Rs.**	**Rs.**
January 1965 contract	100.15	98.15	94.40
Oil January 1965	N.T.	N.T.	N.T.
Khandesh quality	116.00	120.00	97.00
Oil ex-mill	24.00	24.00	21.00
Oil Rly. Receipt	22.75	23.00	20.50
Castorseed			
March 1965	187.50	184.50	182.00
Ready Madras	85.00	88.50	88.00
Ready Kanpur	83.00	81.50	81.00
Oil B.S.S.	18.00	18.55	18.60
Oil commercial	18.00	17.85	17.70
Linseed			
March 1965	43.62	41.94	39.69
Bold ready	110.00	101.00	95.50
Linseed oil	23.50	21.50	20.15
Cottonseed			
January 1965 contract	110.50	109.50	104.25

N.B.—The quotation for groundnuts January 1965 contract is for 100 kg. The rates for spot groundnut and castor are for 100 kg. Castor and cottonseeds futures are quoted per 250 kg. while linseeds futures are quoted per 50 kg. Groundnut Oil January 1965 and all spot oils are quoted per 10 kg.

TEA IN GOOD DEMAND

[Messrs. Forbes, Ewart and Figgis (Private) Ltd.]

COCHIN, 12*th November*

Offerings in sale No. 44 held on 10th inst. amounted to 674,000 kgs. Quality was generally well maintained. The market opened to good general demand which continued throughout the sale. Low mediums and mediums, meeting useful enquiry, were often irregularly dearer. Good mediums also received strong support and some of them registered advances in price. There was better enquiry than of late for highgrown brokens, following quality, and these were sometimes dearer, but their fannings were irregular and often easier. Clean black leaf descriptions met better demand and were dearer. Teas of unorthodox manufacture were irregular and came to an easier market. Whole leaf grades were sold well at around last rates. There was useful enquiry for a small section of tippy teas on offer.

The quotations (per kg.) were:

	1964	1963
	Rs.	**Rs.**
Low mediums	4.20-4.90	4.15-4.60
Mediums	4.90-5.20	4.65-5.00
Good mediums	5.20-6.00	5.10-5.60
Nilgiri B.O.P.	5.00-6.80	4.80-7.60

The average price realised in sale No. 44 was Rs. 4.87 per kilo, as against Rs. 4.84 a week ago and Rs. 4.66 in the corresponding sale last year.

In dust sale No. 44 held today, 423,000 kgs. were offered. There was fair general demand. Coloury mediums met with useful support and were firm, while low mediums and mediums were irregularly easier. Residuals sold at irregular rates. Highgrowns met with fair demand and prices realised were lower than last. The best unorthodox descriptions again came to a lower market, while others in this category were about firm.

The average price realised in dust sale No. 44 was Rs. 4.37 per kilo, as against Rs. 4.43 a week ago and Rs. 4.46 in the corresponding sale last year.

As we go to press, Messrs. Forbes, Ewart and Figgis (Private) Ltd. wire us as follows:

"*Sale No.* 45: 1,133,000 kgs. offered. Good demand. Low medium and medium brokens barely steady. Similar fannings 10 to 20 paise easier. Good mediums firm. Highgrowns irregular. Unorthodox easier."

FOODGRAINS DECLINE FURTHER

(From Our Own Correspondent)

HAPUR, 16*th November*

Except rice, which continued to rule subdued at Hapur during the week, grains prices indicated a steadier tendency due to the shortage of supplies. The Union Government, it was understood, was thinking of revising its food zone policy and a free movement zone in South is being suggested due to difficult food situation in Kerala. The Union Food Minister has said that from 1st December, the States would make their surplus foodgrains available to the Centre, which would allot it to the deficit States.

After early decline wheat prices improved at Hapur by Rs. 2.50 to Rs. 3.50 per 40 kilogrammes, according to quality, on brisk consumers support and tight supply position. Average quality wheat was quoted between Rs. 36 to Rs. 37 and farm produce between Rs. 37.50 to Rs. 38.50 per 40 kilogrammes. Arrivals in the open market were small and supply of imported wheat, through fair price shops was restricted. Subdued trend continued in the rice market and prices drifted lower by Rs. 2.50 to Rs. 5 per 40 kgs. due to heavy arrivals of new produce and better stocks position. Week-end prices were:—Rice *basmati* superior Rs. 40 to Rs. 41.50, *sela* Rs. 35 to Rs. 37.50, *mainpuri* Rs. 31.25, *ramajwayan* Rs. 32.50 to Rs. 33, *raimunia* Rs. 32.50 to Rs. 33 and *gadda* Rs. 27 to Rs. 28 per 40 kilogrammes.

Following the order of the District Magistrate and R.F.C., asking traders to refrain from selling maize and *bajra* in the open market, maize prices rose upto Rs. 24 per 40 kilogrammes, against Rs. 17.50—the price fixed by the Government. Even at these high rates maize was not easily available in the open market. Gram prices however ruled quiet and prices eased by Rs. 2 per 40 kgs. to be quoted between Rs. 32 to Rs. 33 per 40 kilogrammes. Barley and *bejhar* prices stayed steady at Rs. 27 to Rs. 28 and between Rs. 26.50 to Rs. 27.50 per 40 kilogrammes respectively. *Juwar, guwar* and other coarse grains prices were listless in limited trading. *Rabi* sowings was still being continued and its progress was reported to be very good.

Subdued trend was however witnessed in the pulses market and prices in all section drifted lower on poor buying support at higher price levels. Peas prices declined by Rs. 4 to Rs. 5 per 40 kgs. to be quoted between Rs. 26 to Rs. 27 for *dara* quality and between Rs. 28 to Rs. 29 for farm variety. Peas *dal* prices eased to Rs. 28. *Arhar* and its *dal* prices also tended to ease. The prices of *arhar* ranged between Rs. 35.50 to Rs. 38.50 per 40 kilogrammes. *Urd* and *moong* prices declined as demand was poor. *Urd* was quoted between Rs. 27 to Rs. 29 and *moong* between Rs. 35 to Rs. 37.50 per 40 kilogrammes. *Masoor* and other *dal* prices were stationary. Week-end prices were:—*Arhar dal* Rs. 44 to Rs. 45, *urd dal* Rs. 35.50 to Rs. 36.50, *moong dal* Rs. 42 to Rs. 43, *masoor* Rs. 36.50 to Rs. 39.50, *masoor dal* Rs. 42 to Rs. 43 and gram *dal* Rs. 37.50 per 40 kilogrammes.

COTTON FUTURES MOVE UP

(From Our Own Correspondent)

BOMBAY, 18*th November*

Prices in the futures section of the cotton market reflected a rising trend throughout the week under review; there was a sudden spurt in prices on Monday, the 16th inst., when the Jarilla March contract gained eight points. The bullish fervour was so pronounced that reports envisaging early release of 150,000 bales of American cotton under P.L.480 and announcement of a global quota of 214,000 bales failed to have any sustained effect on the market. Actually, the failure of these reports to materialise provided fresh strength to the bulls and caused cold feet among those who had gone short. As the prices were nearing the official ceiling, the authorities of Cotton Exchange were very much worried. Some even feared that the punitive provisions might be invoked by the Forward Markets Commission.

A meeting of the authorities of the Forward Markets Commission, the Textile Commissioner's Office and the East India Cotton Association took place on the 16th inst. Although it is not known what transpired at the meeting and what action was contemplated by them, enquiries in the market revealed that a leading bull who was long by about 200,000 bales was warned by the Commission and asked to liquidate some of his holdings.

Fears of some strict official action and bull liquidation caused a decline in prices on the following day, that is, Tuesday the 17th, when prices lost 3.5 points. The declining trend continued during today's trading, too, though towards the close a slight recovery set in due to firmness in the spot market and the growing impression that the current crop would be shorter than anticipated earlier.

The Jarilla March contract opened the week Re. 1 higher at Rs. 757 per candy and, after touching Rs. 755 the same day, which later turned to be the lowest of the week, spurted to Rs. 767.50, a new high since its commencement and only Rs. 7.50 below the official ceiling of Rs. 775 for the non-delivery period. It declined to Rs. 759.75 today before closing higher at Rs. 761.50, a gain of Rs. 4.50 over the week.

The turnover in the Sewri spot market was reported to be moderate, with prices of almost all varieties ruling high. Some mills were, however, active buyers and there were reported efforts of cornering of 197/3 cotton for which very high prices were offered. Spinners were reluctant to book bulk quantities at these high prices. Prices of new crop Kalyan-Wagad, Digvijay and L147 showed a rise of 5 to 10 points. Today, however, the prices have receded from the previous levels following increasing tempo of arrivals of new crop varieties in the terminal markets. The following are the latest available quotations in respect of certain popular varieties:

Abohar Old Rs. 801K; Akot L147 Rs. 1,285; Amravati L147 Rs. 1,288; Bawla New Rs. 995; Baramati New Rs. 1,111; Bengal Fine Rs. 795K; Hubli Laxmi Rs. 1,105K; Manavdar Kala New Rs. 912; Nagar Co2 Rs. 1,510 and Viramgaon New Rs. 978.

The prices of Bengal *Deshi* December delivery contract firmed up during the week to Rs. 795 per candy from Rs. 787.88 last week. There are reports that a good part of the rise in the price of this cotton is due to buying by foodgrain dealers in the Punjab and Uttar Pradesh, now that there are serious restrictions on investment in foodgrains, with a view to making quick profit. The latest reports place the export sales registrations in Bengal *Deshi* at 81,000 bales, as ccmpared with 73,000 bales last week. Among the imported varieties, interest was evinced mainly in African cotton.

Cotton crop progress reports indicate that the *Deshi* pickings in the Punjab are almost over, though in other areas 50 per cent remain to be picked. Arrivals, however, are not appreciable in view of the *rabi* sowings. The weather in North Gujarat and Saurashtra regions is reported to be favourable with slight dewfall. Some damage to Jarilla crop has been reported from Madhya Pradesh, though the general weather conditions are satisfactory. In Southern regions, encouraging progress of main crops has been reported from Western and Comptahs. The germination is satisfactory and the plants are reported to be gaining height.

SUGAR STEADY

(From Our Own Correspondent)

HAPUR, 16*th November*

Despite restricted supply position, sugar prices were almost stationary at Rs. 180 to Rs. 185 a quintal in private deal. All factories in west U.P. have commenced their new sugar production season. They are attracting sufficient cane supplies. Buffer stocks of sugar with the Government are reported to have exhausted and new produced sugar is being rushed for distribution in ration. With increased acreage upto 20 per cent and per acre yield also better by 5 per cent, it is expected that sugar production would increase. The Union Government has revised the sugar prices which would now be Rs. 116 to Rs. 129.50 per quintal in different areas.

Prices of *khandsari* continued to be subdued during the week as the demand of the commodity, both from within the State and outside, was poor. Prices of white and creamish quality fell by Rs. 5 a quintal, in non-official deals. The trade has again urged the Union Government to permit export of this quality to States where yellow and brown *khandsari* was being exported against permits. Yellow and brown qualities were being lifted to Gujarat, Rajasthan and M.P. against permits with prices of these varieties quoted upto Rs. 120 a quintal. New production would start sometime in mid-December as crushers were now allowed to function before 6th December.

Pressure of arrivals accounted for a fall of Rs. 2 to Rs. 3 per 40 kgs. in prices of *gur* during the week. Arrivals were about 5,000 maunds a day, and were fairly heavy in mofussil areas. Demand continued brisk from the consuming areas of the South and as entire stocks were being lifted. Week's offtake to Gujarat, M.P., Maharashtra and other States from here was 35 wagon-loads. *Shakker* prices were steadier on good demand in face of poor arrivals and week-end prices (per 40 kgs.) were: *gur pansera* superior Rs. 34 to to Rs. 38. In the Muzaffarnagar market also, while *gur* prices drifted lower under pressure of arrivals, *shakker* ruled firm on renewed demand from the consuming areas.

KIPS FIRM

(From Our Own Correspondent)

MADRAS, 16*th November*

It was a welcome news to the trade that the U.K. Government has classified the E.I. tanned hides and skins as basic industrial raw material and consequently does not attract the 15 per cent import surcharge levied last month. In fact, E.I. tanned hides and skins have been recognised by the Board of Trade in U.K. as industrial raw material and importers were wondering at the omission in the classification made last month. It has been reported that some importers cancelled several contracts which were out of time, due to the recent levy of 15 per cent surcharge, as otherwise they would have normally allowed the shippers extension of time of shipment.

Markets are now slightly firm at this end. Overseas buyers are calling for offers at a penny or two below the levels ruling during the first half of October; and sales have been selective and meagre in the kip section with U.K.

In tanned skins, U.S. and Continental buyers have been keen buyers of goat skins at unchanged prices—same as last week. Inquiries for prime and semi-prime sheep skins were small but for middle class lower selections, the demand was good from the Continent.

Prices in the raw markets were firm. It has been reported that large sales of wet-salted kips skins have been made to the East European countries.

Notices

THE NATIONAL ROLLING AND STEEL ROPES LIMITED

NOTICE

NOTICE IS HEREBY GIVEN THAT THE Twenty-second Annual General Meeting of the Members of The National Rolling and Steel Ropes Limited will be held at the Registered Office of the Company, NICCO HOUSE, Hare Street, Calcutta, on Thursday the 10th December, 1964 at 10 a.m. to transact the following business:

(1) To receive and adopt the Directors' Report and the Audited Balance Sheet and Profit and Loss Account for the year ended 30th June, 1964.

(2) To declare Dividend.

(3) To appoint a Director in place of Dewan Dina Nath, who retires by rotation and is eligible for re-appointment.

(4) To appoint a Director in place of Shri Krishna Prasad Khaitan, who retires by rotation and is eligible for re-appointment.

(5) To appoint Auditors and fix their remuneration.

(6) AS SPECIAL BUSINESS, to consider and, if thought fit, to pass the following Resolution with or without modification, as Ordinary Resolution:

RESOLVED that the revision in the rates of commission payable to Messrs. STATE BANK OF INDIA

NOTICE

NOTICE IS HEREBY GIVEN THAT THE Principal Register and the Branch Registers of the State Bank of India will be closed for transfer of shares from Wednesday, the 16th December 1964 to Thursday, the 31st December 1964, both days inclusive.

N. A. KRISHNAN,
Managing Director.

STATE BANK OF INDIA,
BOMBAY, *the* 4*th November* 1964 / 13*th Krtk.* 1886 (*Saka*)

BANKING

(*Concluded from page* 896)

cial and co-operative banks, on the one hand, and insurance companies on the other, the respective shares were about two-thirds and one-third. These ratios have remained more or less constant during the last few years. However, in the case of residual category "others," whereas the Central Government securities have declined year after year, the State Government securities have been increasing. As a result, whereas in December 1957, State Government securities accounted for 24.3 per cent of the total securities held by this group, the percentage rose to 40.8 in March 1962 and 43.5 in March 1963.

Maturity Pattern

With minor variations from year to year, the short and medium-term securities (due to mature within ten years) continues to have a two-thirds share in the total debt. Whereas the share of securities maturing within five years (short-term) has a rising tendency, increasing from Rs. 616 crores or 31 per cent in December 1957 to Rs. 1,092 crores or 34 per cent in March 1963, the securities maturing from fifth to tenth year have risen at a slower pace, from Rs. 738 crores to Rs. 1,076 crores, the share declining from 37 per cent to 33 per cent. The medium long-term securities (maturing between the tenth and fifteenth year) have also had a slower pace of growth. After increasing from Rs. 242 crores in December 1957 to Rs. 347 crores in March 1962, they have actually retreated to Rs. 300 crores in March 1963; the share on the respective dates being 12 per cent, 12 per cent and 9 per cent. But the long-dated securities (maturing in over 15 years) have risen sharply from Rs. 141 crores in December 1957 to Rs. 359 crores in March 1962 and Rs. 486 crores in March 1963, the share advancing from 7 per cent to 12 per cent and 15 per cent. It may thus be seen that whereas the very short-dated securities (maturing within five years) and long-dated securities (maturing after 15 years) have risen at a fast pace, those maturing between the fifth and fifteenth year have risen at a slower pace. For some years now, the Government has adopted a policy that most of the fresh securities should be of medium-long and long-dated maturities. However, the figures do not show any remarkable change from year to year, partly because of the shifting of loans from one bracket to another with the passage of time and partly because of the natural desire of banks not to go in for loans of longer maturity in a period of rising (however gradually) interest rates.

An ownership-wise analysis shows that commercial banks generally prefer to hold short-dated and short-medium-dated securities maturing within ten years. As on March 1963, nearly 90 per cent of the total securities held by the commercial banks were in this category. The reason is that the slightly higher rate of interest on long-dated securities is not the major consideration with the commercial banks. As they have to sell them many times to augment their resources in the busy season, they are more interested in the saleability and the sale price which is comparatively more favourable in case of short-dated securities. Another consideration is the need to minimise depreciation in the value of their investments. When the rates of interest on Government borrowings go up year after year, as they have done in the past five years, the market values of existing loans go down, the depreciation being greater in the case of longer-dated loans. In contrast to commercial banks, most of the holdings of Life Insurance Corporation and the Provident Funds are of longer-medium-term and long-dated maturities. About half of the securities held by the L.I.C. and over two-thirds of those by Provident Funds were due to mature after ten years. The reason is that for these investors, whose liabilities are of a long-term nature, yields are more important. A fall in the value of these investments does not bother them very much for they can, and invariably do, stick to their holdings until maturity, thereby avoiding any loss of capital.

NEHRU COMMEMORATIVE COINS

The new commemorative coins of the denomination of rupee one and 50 paise issued in honour of the country's late Prime Minister, Mr. Jawaharlal Nehru, on Saturday, 14th November, are of the same weight and value as the ordinary rupee and 50 paise coins. According to Mr. M. V. Rangachari, Deputy Governor, Reserve Bank of India, the Union Government has the intention of minting nearly Rs. 2 crores worth of rupee coins. In the case of 50 paise coins, the Government will mint and issue them till the end of 1966, so that a large quantity of these coins will be in circulation. The new coins are expected to remain in circulation for many long years as part of the country's currency and will serve as a constant reminder to the people of one whose life was a long saga of service to the country.

An Arab Common Market, comprising the United Arab Republic, Iraq, Jordan, Kuwait and Syria, will be formally inaugurated on the 1st January next. This was disclosed at Cairo on Tuesday the 11th inst. by Dr. Mohammed El-Farra, Chairman of the current session of the Arab Economic Unity Board. The Common Market will remain effective for an initial period of ten years, its establishment will not mean an immediate abolition of all customs barriers. The first seven years will be treated as the transitional period when problems connected with the Market will be dealt with.

The Argentine Central Bank has devalued Peso in terms of the U.S. dollar with effect from the 10th inst. The new parity rate *vis-a-vis* dollar is 149.50-150 Pesos, a decline of five points. The devaluable has been prompted by the consideration that it has been impossible under the former exchange rate for wheat exporters to pay farmers more than 750 Pesos a metric quintal for their wheat, which is 4 per cent below the local official minimum price.

The third instalment of advance payment of tax under Section 207 of the Income Tax Act, 1961 for the assessment year 1965-66 is due to be paid by 1st December next. Assessees on whom an order has already been served in this connection by the Income-tax Officer are, therefore, required to make the appropriate payment on or before that date, unless they choose to send their own estimates and make payments accordingly.

The Syndicate bank has opened its fifth branch in Bombay. With the opening of this branch, the number of branches now stands at 195. The bank is also opening shortly two more branches, one at New Delhi and another at Alwal (Andhra State).

TREND OF SHARES

PRICES DECLINE FURTHER

(From Our Own Correspondent)

BOMBAY, 19*th November*

TO say that it was another week of further erosion of share values does not make a new point, but the fact remained that the same mood of despondency pervaded Dalal Street during the week under review—perhaps for the tenth week in succession. Last week, it had been mentioned that the comparable levels would be those of 27th May—so far the lowest during the current year—and the trading pattern during the week under review showed that the market was gradually drifting towards these levels. In fact, some of the scrips like Standard and Premier Auto even reached their year's lowest levels so far. The factors which induced this decline or, to put it in plainer words, which have brought the market to its present pass, continued to be the same old problems of food and inflation which leave little in the hands of the public for investment. It may be asked whether the market is not tired of these old factors, but the point is that they are too powerful to be shaken off easily.

Mention, however, must be made of Premier Construction which provided an exception to the rule. On hectic short-covering and renewed speculative support, this scrip spurted to Rs. 198.50, thereby recording a gain of more than 17 points during the week at the final level of Rs. 198.50; the highest rate touched was Rs. 199. The main factor behind this spurt was the rise in the dividend on the shares announced by the Hindustan Construction Company—from 20 per cent to 50 per cent—and, as Hindustan is the fully owned subsidiary of Premier Construction, the benefit of the increase will naturally accrue to the latter. It is, therefore, interesting to see whether the benefit of this rise would mean a benefit to shareholders of Premier Construction too.

Steel shares were subdued, with Tata Steel reacting from Rs. 146.25 to Rs. 145 and Indian Iron losing 25 p to quote at Rs. 25.10. Interest in steel shares remained purely of a professional nature, for there was nothing by way of developments for the general public to get itself enthused abou it. Mukand lost 40 p to be mentioned at Rs. 16.32 at the end of the week. It appears that steel shares will remain in the background for some time, content with following the fortunes or misfortunes of the present market leaders like Century, Standard and National Rayon.

Losses in textiles were not big, but, in view of the continued decline over a long period of time, declines in future will be small and long drawn out. Standard has lost a further seven points to Rs. 566 at the close, though this was slightly above the level of Rs. 563 touched on Monday which incidentally was the lowest touched so far during the year. Century was down from Rs. 584 to Rs. 576 during the week and it would be difficult for the shares to maintain their levels in the face of the persistently bleak reports that come from the cloth market. The shares are very close to their year's lowest level of Rs. 570 and, in case this support level is broken, it is likely that the shares will come in for a further hammering. National Rayon declined from Rs. 349.50 to Rs. 343.50 and, these shares, too, are dangerously close to their year's low of Rs. 335. Apart from the difficulties which exports of rayon fabrics are experiencing at the present moment, the weakness in this scrip was aggravated by reports of labour trouble. Bombay Dyeing was also weak, while Kohinoor and Svadeshi were well held, the former improving from Rs. 315.50 to Rs. 320 and the latter from Rs. 264 to Rs. 265. Other rayons fared no better. Baroda was down from Rs. 66 to Rs. 63.50 and South India Viscose from Rs. 110 to Rs 104.50.

Among motor shares, Premier Auto touched a new low (for the year) of Rs. 92.20, although, towards the close, it was unchanged at its previous week's level of Rs. 95. Telco was also unchanged at Rs. 258.50, but the undertone in these shares was weak, owing to the decline in the right shares which eased from over Rs. 120 to Rs. 105 before closing at Rs. 108.50. Hindustan Motor was fractionally down to Rs. 16.24. Shippings were steady, with Scindia unchanged at Rs. 15.36.

Interest in other sections was limited. Sugars were easy and tyre shares sought further low levels due to want of support. Electricity shares were dull and miscellaneous engineerings were quiet.

The pattern of trading during the week again indicated that rallies whenever they occurred were feeble and that the market was absolutely without support at higher levels. It appears that speculators have turned their attention to cotton and oilseeds. In fact, there has been a noticeable shift of speculative interest from shares to commodities. The general feeling is that there is little use in hanging on to shares particularly if one happens to be a bull. The two per cent margin is a further deterrent to bullish activity. One consolation, however, is that prices have fallen considerably during the past 10 to 11 weeks and, on this score alone, some correction is due and necessary. The market, however, seems to defy even scientific calculations.

The annual meeting of Tata Chemicals on Thursday was interesting for the manner in which the Chairman, Mr. J. R. D. Tata, defended the Company's price policy. He said that, as the Company was able to reduce the costs, it was in the interests of the Company as well as the country that no advantage was taken of decontrol to raise prices. Mr. Tata hoped that the dividend would be maintained in the coming years. He thought that, in all probability, protection to the industry would continue.

• • • • •

Calcutta has been faithful to the trend in Bombay and the overall sentiment there, too, is one of frustration. Support is no where to be found and the market has been extremely sensitive to bear factors. Jute shares have been dull, while interest in coal shares has been selective. Business in tea shares seems to be possible only at lower levels.

• • • • •

In Madras, forward shares have been easy. Plantings, however, have managed to maintain a steady tone. The turnover in textiles has been only moderate and, in the chemicals section, interest is confined to selected shares.

MARKET GOSSIP

(Concluded from page 887)

extent of Rs. 16.60 lakhs which was to be distributed equally between the foreign collaborators and Indian shareholders. But the issue of that capital was kept in abeyance pending a more detailed examination of the Company's long-term requirements of finance. The new capital issue of Rs. 40 lakhs for which the sanction has been obtained in the place of earlier issue, is intended to meet the long-term and short-term requirements of the Company for financing its fast expanding activities in the various manufacturing sectors.

Philips India has grown rapidly since 1957 when the Company first issued shares to the Indian public. In the last three years, in particular, the Company's turnover has increased markedly from Rs. 6.82 crores in 1961 to Rs. 10.63 crores in 1963. The turnover paid-up capital ratio, which increased from 3.1 in 1961 to 4.8 in 1963, shows that the Company has been pursuing a prudent financial policy by making the maximum utilisation of its existing paid-up capital before expanding the capital base. The Company's net block which stood at Rs. 1.66 crore in 1961 rose to Rs. 2.58 crores in 1963, indicating that progressively larger investment is being made in the Company's manufacturing installations.

Philips India's factory at Loni, near Poona, has been well established and is regarded as the country's most integrated manufacturing centre of radio sets and radio components. In 1960, the Company acquired its own factory in Bombay for manufacturing lighting equipment. Today, it is manufacturing not only a large number of incandescent lamps but also flourescent lamp starters and burners for gaseous discharge lamps. This factory has recently started the production of tungsten and molybdenum wire and tungsten coils—the vital components for electric lamps which were hitherto entirely imported. Of late, work has also started on the construction of a factory on a 50-acre plot acquired in Kalwa, in the industrial belt of Bombay. This factory, which is expected to go into production next year, will manufacture, in a phased programme, different types of lamps and components as well as other products. The Company's other plans for the future envisage considerable increase in its manufacturing activities, requiring the installation of modern capital equipment, greater manpower, larger production and a wider marketing organisation.

A new tractor assembly plant, claimed to be the largest of its kind in the Middle East, was inaugurated by the Shah of Iran in Teheran last week. The factory is part of a scheme for industrial development and mechanisation in farming initiated by Volvo, Bolinder-Munktell (BM) and Overums Bruk of Sweden in collaboration with Iranian interests. To implement the scheme and operate the factory a joint company, Zamyad Company, has been formed. Besides assembling BM tractors, the new factory will also assemble Volvo trucks and Overum ploughs and harrows. Three separate factories produce batteries, radiators and springs both for Zamyad and for other users of the Iranian market.

QUESTIONS ON FOURTH PLAN

THIS week both the Lok Sabha and Rajya Sabha took keen interest in the fourth Plan and elicited some valuable information from Mr. T. T. Krishnamachari on where the Plan stands now and the Government's approach to it. The fourth Plan, it is clear from the Finance Minister's replies, is still nothing more than a memorandum; the targets mentioned therein are only tentative; the place of various sectors is yet to be determined, and so also the share of the Centre and the States; the proposed outlay on the Plan—Rs. 21,500 crores, with a probable addition of Rs. 1,000 crores in case the position of real resources improved to a greater extent than expected—is acceptable to the Government but the figure is not yet final, as ways and means of closing the gap of Rs. 3,000 crores in the financial estimates are yet to be devised; all that the Prime Minister meant when he stressed that there should be an increase in the supply of consumer goods was that the Plan should be a balanced one and it is not right to interpret his observations as being opposed to the emphasis on heavy industry; the foreign exchange requirements are estimated at no more than Rs. 2,500 crores and in doing so the Planning Commission and the Government are aware that repayment of principal of, and interest on, past loans alone would aggregate Rs. 1,200 crores in the fourth Plan period; there are no doubt substantial shortfalls in the achievements of third Plan targets, though the expenditures (outlays) on it have been running ahead of the targets; and the Government is taking care to ensure that the mistakes made in planning hitherto are not repeated in the fourth Plan.

This in brief is a faithful summary of the points made by the Finance Minister. They go to show that the Government's mind on the fourth Plan has not yet been made up and that a lot of consultation at expert level remains to be done. The Government, however, is certain about the goals to be achieved in the fourth Plan period. These are an increase of 6-7 per cent per annum in the growth of national income (hence its belief that an investment of Rs. 21,100—22,100 crores would be necessary) and attainment of self-sufficiency in food by 1970-71. Ambition on a grand scale has always been the hallmark of the Congress Party's plans for economic development and, though achievements have lagged behind at a respectable distance, that character still remains undiminished. T. T. K. is, therefore, not very convincing when he says that the planners (of whom he is one) would learn from past mistakes and avoid the pitfalls of the third Plan in particular. The Planning Commission's memorandum on fourth Plan itself belies this assurance, for its approach is more or less the same as in the case of the current Plan, with only the magnitudes being larger. May be, we are unduly sceptical. Indeed, we shall be happy, if our scepticism is not borne out by the final version of the fourth Plan.

The Finance Minister has reiterated his earlier assurance that there would be no deficit financing in the fourth Plan. This sounds very valuable and important. But, in actual practice, it may mean nothing. Experience hitherto has shown that assurances on deficit financing have been consistently broken, with the limits set for them being exceeded by a large margin. The fact that the Government is talking of a massive Plan, involving a huge outlay of Rs. 22,000 crores, at a time when the economy is groaning under unprecedented rise in prices and cost of living with no convincing signs of any significant relief in the near future, makes one view this assurance also with scepticism. The implementation of Plan projects may take place in such a way that recourse to deficit financing would become unavoidable. The bigger the Plan, the greater are the risks of deficit financing. The assumptions about the resources for the next Plan are so unrealistic that this risk is very real. It may be pertinent to recall here that, despite repeated appeals by the Centre, many a State Government has been living beyond the available resources by taking overdrafts from the Reserve Bank. Has T. T. K. been able to prevent them from doing so? Why, the Centre itself takes overdrafts from the Reserve Bank in the hope of funding them later by raising long-dated loans from the capital market, but, invariably, the hope never materialises in full. It may be possible to present balanced overall budgets by placing the borrowing programme at inflated levels. This, however, does not necessarily mean that, in such cases, there will be no deficit financing, for the central banking institution will have to take up the unsubscribed portion of the loans offered to the public under the borrowing programme. Indeed, there are many ways in which deficit financing can be practised; only they may not strictly come under the definition of deficit financing. If, therefore, one is to believe T.T.K.'s statement that there would be no deficit financing in fourth Plan, the outlay on the Plan should be cut down to a modest size. But this is a condition to which the present Government will not agree.

What the people are now interested in knowing from the Government is the extent to which prices may rise in the fourth Plan period. An assurance on this issue would be more useful than the type repeatedly given by T.T.K. on deficit financing. In other words, let there be a ceiling on the annual rise in price levels as well as on the aggregate increase for the fourth Plan period as a whole. The fiscal policy, the pricing policy, and the investment targets, all these must be subordinated to this ceiling, if the Government really means what it says about the stability and integrity of the rupee. One has seen how excessive taxation in the past three years has played havoc with price levels and undermined people's regard for morals and integrity. Large amounts of taxes have been collected and spent in a manner which has been inflationary in effect. The gestation period in respect of several projects has been longer than expected, while quite a few projects have been infructuous either fully or partly. How is one to believe that all this will not happen again? On the contrary, the Government's policy in regard to community development projects, co-operation, decentralised industrial sectors, irrigation, modernisation and mechanisation, ownership of industries, and control over economic power is still such as to aggravate the inflationary forces rather than curb them. It, therefore, looks as though more democratic socialism in the coming years will mean more inflation.

Both Mr. Asoka Mehta and Mr. T. T. Krishnamachari have already warned the country to be prepared for more taxation. The aggregate burden they have in mind is Rs. 2,000—2,500 crores. The latest reiteration of no deficit financing in the fourth Plan warrants the conclusion that at least this much of burden, if not more, must be borne by the people. This would mean an average annual additional burden of Rs. 500 crores. To the extent production and incomes increase in the fourth Plan period as a result of additional investments, there will certainly be an expansion in taxable capacity

and taxes. But it is too much to think that this normal growth will be sufficient to yield all the revenue that is expected. The balance will, therefore, be collected by increasing both the indirect and direct taxes, as well as by raising the cost of services rendered by the public sector organisations such as railways, posts and telegraphs, electricity departments and motor transport. If any sizable amounts are to be collected, it is the indirect taxes on articles of mass consumption that will require to be stepped up. The cumulative effect of such additional taxation would be a further sharp rise in prices and cost of living in the fourth Plan period. In view of this strong possibility, the common man should not nurse the hope of life becoming easier in the next five-six years, if he is not to feel disappointed later. As for the rich man—the honest one, we mean—he must be prepared to shed a lot more of his wealth. There will probably be fresh evidence of this gloomy prospect for him in the next budget itself.

BETTER LATE THAN NEVER

AT last something like a coherent all-India food policy seems to be taking shape, thanks to the co-operative wisdom, albeit belated, of State Chief Ministers. After months of anxiety and distress in several vulnerable parts of the country, there is thus prospect of a national and more rational approach to the food problem and, consequently, of some stability in the near future, assuming that production of grains will be substantially higher and the Chief Ministers of States will play the game. Whatever be its defects and drawbacks—and there are quite a few of these—the emerging policy constitutes no mean progress, considering that the States, especially those with cereal surpluses, have so far stood in the way of a co-ordinated national approach and that, in the country's federal set-up, the Centre cannot generally flout States' autonomy with impunity. That the Prime Minister, Mr. Lal Bahadur Shastri, has successfully persuaded the State Chief Ministers to accept an all-India policy is all the more remarkable in the present context when the Centre, with its attenuated foodgrain stocks, is in no strong position to call the tune to the States.

The principal elements, including some earlier *ad hoc* measures, of this food policy are easily told. There is, to begin with, the move to procure internally about two million tonnes of rice (1.6 million tonnes by the surplus States and 0.4 million tonnes by the Centre directly) and to import a further one million tonnes in the coming months. The proposed internal procurement is to be done by the five surplus States—Punjab, Madhya Pradesh, Orissa, Andhra Pradesh and Madras—which will then turn over the stocks to the Centre, thereby enabling the latter to fulfil its commitments to the deficit States. This commitment by the surplus States reflects a new sense of responsibility on their part and is in refreshing contrast to the summary way in which two of them—Andhra Pradesh and Madras—recently banned the movement of their rice to Kerala where the Centre had assumed the responsibility for meeting a part of the heavy deficit. It is expected that the agencies being built up in the States for rice procurement purposes will operate only on a temporary basis, for the proposed Food Corporation of India, due to start its operations in January next, will take over the procurement responsibility in due course. In the interim period, the agencies in the surplus States will procure some rice by a sort of levy on mills and license dealers to absorb a part of the marketable surplus. As the *kharif* crop has just been harvested and the principal rice harvest in the States of Madras and Andhra Pradesh will start in January, there is promising scope for prompt procurement in the interim period before the Food Corporation gets ready for the task. Such procurement should also be easy, if, as is now claimed, the rice crop (harvested or standing) this year is a bumper one. As far as wheat is concerned, there is not much of a problem, for the Government is already dominating the market, thanks to P.L. 480 imports which currently run at an annual rate of more than five million tonnes. Such restrictions on movement of indigenous wheat as are now in force may even be relaxed in March next in the event of a bumper *rabi* crop.

Another element of the new food policy is the ban on inter-State movement of rice and coarse grains. This means that each State will now constitute a separate rice zone in accordance with the stand of surplus States but in opposition to the stand of some deficit States like Maharashtra which have vainly pleaded for free movement of rice *within a zone of three or more States*. In the context of the proposed rice procurement by surplus States and of the prospective operations of the Food Corporation, the constitution of each State into a rice zone means, in effect, that supplies from one State can be moved to another State only on Government-to-Government account. In other words, the normal trade channels will be completely out of the picture insofar as inter-State trading in rice is concerned. This development is no doubt unfortunate from the point of view of the trade. Whether it would be a blessing for consumers remains to be seen, though it may appear to be so on paper. But it must not be overlooked that it has been rendered inevitable by the near-chaos in rice trade and the acute scarcity experienced in recent months, as also by the inability of the Centre to meet its commitments with imported rice to the same extent as in the case of wheat which has been imported abundantly under P.L. 480. It was however, not necessary to extend the ban on inter-State movement to coarse grains like *jowar* and *bajra*. This is an unexpected and unwarranted development which has not been adequately explained. Whether or not it has some emergency value, it certainly seems to reflect Central surrender to the States insofar as availability and distribution are concerned. While the elimination of a free all-India market in rice may be condoned as a necessary evil, the same cannot be said of the market in coarse grains which are consumed by the poorer classes. Strangely enough, no provision has been made for the movement of these grains on Government-to-Government account. This, therefore, imposes an obligation on the State Governments to license liberally inter-State movement of coarse grains through normal trade channels.

The proposal to introduce informal rationing in big cities and industrial towns is yet another feature of the new food policy. Such rationing is already in force in some of the scarcity areas like Kerala where, incidentally, it is to be replaced by statutory rationing insofar as urban centres are concerned. The Centre's original proposal to introduce statutory rationing in seven major cities with a population of over one million each, it is noteworthy, has been given up in view of the opposition from some States like Maharashtra and Madras. What has finally emerged as an agreed proposal involves introduction or continuation of informal rationing in big cities and industrial towns and grant of discretion to State Governments in respect of statutory rationing. Thus, while Calcutta and, possibly, Bangalore and Hyderabad are expected to go in for statutory rationing, Bombay and Madras will have only informal rationing. This compromise solution in respect of rationing has the merit of avoiding the extreme remedy of statutory rationing in all cities and towns in a possible set-up of total State trading and monopoly procurement. But it has the twin demerit that adequate supplies may not be always available as a matter of commitment as under statutory rationing and that bogus cardholders may divert their rations, acquired at fair prices, to the free market where prices are generally higher. Incidentally, the number of bogus cardholders under informal rationing should be much larger than under statutory rationing for the simple reason that such informal rationing does not involve strict house-to-house check-up of family members. The attraction of free market will diminish once the rush to hoard supplies by the well-to-do people ceases. Anyway, the merit of this compromise solution outweighs its demerit, and one may heave a sigh of relief that, at least for the present, there will be no total State trading, involving monopoly procurement by the State (and, consequently, total elimination of normal trade channels) and statutory urban rationing—trading of the kind reported to be strongly favoured by the Union Finance Minister, Mr. T. T. Krishnamachari, on the ground that it is absolutely necessary to ensure equitable distribution of foodgrains at stable prices and thereby check the inflationary spiral.

It is in this context that the move to establish the Food Corporation of India will be seen as part of a half-way house which avoids both the extremes of total free trading in foodgrains and total State (that is, monopoly) trading. This is, on the whole, a sound move, for the proposed Corporation, which is to carry on limited State trading (in rice, to begin with) on commercial lines alongside normal trade channels, will assume responsibility (*a*) for large-scale inter-State trade in foodgrains within the framework of national food policy, (*b*) for buffer stock operations and stabilisation of foodgrain prices in the free market and (*c*) for provision of some agricultural credit (*vide* note entitled "Food Corporation Bill" on page 890 of last week's *Commerce*). This Food Corporation idea has emerged from the official realisation that none of the regulatory measures like licensing, requisitioning, and regulation of movement would succeed and no price policy could be effectively administered, unless there is a State agency to secure for itself "a commanding position in the foodgrains trade." As it is fashioned now, the Corporation is meant to face competition from the trade and help maintain such competition on healthy lines. Its purchasing agents at the market centres could be not only co-operatives but even wholesalers and rice mills. And it is not intended to be an agency for monopoly purchase of rice or any other foodgrain, for the current all-India food policy does not contemplate total State trading. If at all monopoly procurement becomes necessary in some desperate situation, it could be provided for only under the Essential Commodities Act or the Defence of India Act but not under the Food Corporation Act. There is, therefore, no warrant for the fear expressed by the Swatantra representative, Mr. N. Dandekar, that the Corporation would turn into "a great monopolistic organisation," resort to compulsory procurement and fleece consumers through higher prices. That the relevant Food Corporation Bill, adopted by the Lok Sabha this week, has been endorsed by all sections of the House except the Swatantra group, is significant.

The Food Minister, while piloting the Bill, has done well to make it clear that the Corporation has not been set up to make any undue profit and that it can seek to make, if at all, only as much profit as the trade itself does within the limits of the declared maximum prices. If anything, it may not be surprising if the Corporation's operations result in losses sometimes. As the Corporation will be purchasing rice at declared minimum (incentive) prices, the likely clamour for increasing such prices (as in the case of sugarcane and cotton) from time to time may force the Government and the Corporation to raise them. And that will mean reduced profits or even losses for the Corporation, if, at the same time, the declared maximum prices cannot be adequately increased, because of the Government's commitment to the policy of ensuring foodgrains to consumers at reasonable prices. The chances are that, instead of profiteering in any way, the Corporation may choose to incur losses in the interest of the consumer and hope to be subsidised by the Government. After all, is it not a fact that the losses—Rs. 12.8 crores in 1962-63, Rs. 12.7 crores in 1963-64 and an estimated Rs. 15.3 crores, possibly more in view of the recent food crisis, in 1964-65—incurred by the Union Food Directorate in distributing imported and Centrally-procured foodgrains at fair prices have to be subsidised by the public exchequer? When the Government is unequivocally wedded to a policy of ensuring remunerative prices to farmers and reasonable prices for consumers, Mr. N. G. Ranga's sweeping statement that "the Corporation's functioning on a commercial basis would mean that it would buy grain at the cheapest price and sell it at the dearest" is nothing short of a shibboleth. It is inconceivable that a democratic Government which has to depend on the votes of the masses can afford to harass or punish either the 60 million households of producers or the 40 million households of non-producing consumers. On the contrary, our apprehensions are that, in its anxiety to please both producers and consumers, the Government might follow uneconomic policies which, in the long run, may do more harm than good to the general economic health of the country. If this danger is to be avoided, the Government must take extraordinary care to see that it does not encourage inefficiency and indifference in agriculture.

MARKET GOSSIP

Unit Trust

THE Unit Trust of India has become one of the major institutional supporters of stock exchanges. Currently, it ranks second, the first rank being held by the Life Insurance Corporation of India. But, in course of time, it may become the biggest institutional investor in equities and other industrial securities. That at any rate is the design of the Government. The fiscal policy has already been adapted, to some extent, to serve that objective and further adjustments in that direction are not unlikely in the next budget.

The initial response to the offer of units by the Trust was excellent. Because of the tax benefit available even to those who are paying high rates of taxation, there was a heavy rush for the units from all the rich people. Most of them have invested up to the maximum amount (about Rs. 16,000) that would give them a tax-free income of Rs. 1,000. The number of applications received during the period (1st July to 14th August 1964) when the units were available at par was over 125,000. They came through recognised stock brokers and about 4,000 commercial bank branches. The amount of these applications is not known so far, but it was substantial enough to enable the Chairman of the Unit Trust of India, Mr. R. S. Bhatt, to claim that "the response has been very good."

The sale price is now Rs. 10.50 per unit of Rs. 10.00 and it is said that applications are being received for purchasing units even at this premium, because the investors are aware that, under the Unit Scheme 1964, unit-holders will receive the same rate of annual dividend irrespective of the date of their purchase. Nevertheless, it is unlikely that the pace of demand for the units now is as brisk as it was in the initial months. For one thing, equities have been steadily going down in value; any slump in stock exchanges is bound to tell on the demand for even the units of U.T.I. Secondly, the Trust has fixed the repurchase price at Rs. 10 per unit, while selling them at Rs. 10.50. The margin is too wide and it is bound to have an adverse psychological effect. The mistake does not lie in fixing the repurchase rate at Rs. 10, but in fixing the first sale price at Rs. 10.35, that is, at a premium of 3.5 per cent. That was rather too big a jump and gave rise to impressions and expectations which the Trustees did not care to correct. Actually, a controversy on this issue has been going on in the share market for some days now. In view of this, the Trust's explanation of the considerations taken into account in fixing the buying and selling prices may be briefly stated here.

The sale and repurchase prices of units, determined in accordance with Clauses 6 and 10 of the Unit Scheme, involve three steps. First, the net assets value of each unit is arrived at by deducting current liabilities from total assets and dividing it by the number of units issued. The shares and securities are valued on the basis of the latest closing stock exchange quotations and other assets at their book value. Income accrued but not realised on shares—securities is also taken into account. Secondly, the net assets value is adjusted for management and investment expenses such as the establishment expenses, etc. (subject to a maximum of 5 per cent of gross income) and brokerage, commission, taxes, if any, and stamp duty. The expenses are added to the sale price but deducted from the repurchase price. The third step is an adjustment, for ease of accounting, to the higher 5 paise in case of sale price and to the lower 5 paise in case of repurchase price.

These methods of calculation are "based on well-established principles of unit trust operations." The pricing policy is determined by the Unit Trust's desire to meet equitably three classes of people: (i) unit-holders who continue with the Trust, (ii) investors who want to come in, and (iii) unit-holders who desire to leave the Trust. The interests of all these three have to be justly reconciled.

Since the unit-holders who continue with the Trust are the real owners of the Trust, they have to bear all the expenses of investing and managing the Trust and in return they get all the benefits accruing to the Trust. Those who wish to join at a later date must agree to share the expenses already incurred; but, in addition, since they will earn the dividend at the same rate as the investor who purchased his units on 1st July 1964, the units ought to cost them a little more. The present rise in the sale price of units from Rs. ten to Rs. 10.50 does not, therefore, reflect capital appreciation alone, but includes expenses as well as interest already earned before the late-comers joined. In fact, a detailed calculation made in a recent issue of *Investment Letter* (published by Messrs. Merwanjee Bomanjee Dalal, Bombay) shows that the sale price of units at Rs. 10.45 prevailing on 31st October 1964 consisted of approximately 39 paise per unit on account of interest and expenses and only 6 paise on account of rounding off and capital appreciation. The Index Numbers of Security Prices also confirm this conclusion; for, since the Unit Trust began its investments in February 1964, there has been no significant amount of capital appreciation at all. In fact, the value of equities, which must be the bulk of the Trust's investments, is substantially down, while preference shares and debentures are only fractionally better in value.

So much for fixing the selling price. As for the repurchase price, three factors are taken into account in determining it. Let us quote the Chairman of the Trust on this point:

"It will be appreciated that, in order to repurchase the units, the Trust would have to sell a part of its underlying securities. In addition to the usual expenses that will be incurred by the Trust in disposing of its securities and realising the sale proceeds, account has also to be taken of the possibility of the investments being disposed of at a loss. Some allowance has, therefore, to be made in the determination of the repurchase price for these factors, since, otherwise, the interests of those unit-holders who elect to continue in the Trust, would be adversely affected. Further, in the case of unit-holders who leave the Trust before the distribution of the dividend, some means has to be found for recovering a proportionate amount of the running expenses of the Trust from them, as otherwise they would be benefiting at the expense of the existing unit-holders."

These various considerations explain the wide margin between the sale and repurchase price of the units. Further, if any profits are made by the Trust as a result of this margin, they will also augment the income of the Trust and will be available for distribution to the exsiting unit-holders. It is, therefore, better to treat the investments in the units of U.T.I. as a long-term investment, rather than as a means of making quick gains out of frequent sales and purchases of the units.

All this is perfectly sound. But the Trustees of U.T.I. could have enforced the application of these principles gradually, especially as the Trust enjoys the most favoured treatment in regard to taxation of its investments. In Britain, the difference between buying and selling prices of similar trusts may be wide, but conditions in India are different. In India, a beginning in Unit Trust has just been made, whereas in the U.K. and other Western countries this system of investment has been in vogue for a long time and fully established. The Trustees seem to have completely ignored the psychological aspect and the necessity for creating confidence among the present holders and prospective buyers of units. Therefore, the sooner the Trustees narrow down the difference between their buying and selling prices the better. They would also do well to consider the advisability of allowing transactions in the units in the open market forthwith, instead of waiting till the end of June, 1965, the stipulated date. May be, there are investors who are prepared to pay a slightly better price for the units. The Trust loses nothing, while the units will gain in liquidity at a higher price.

More On Britain's Incomes Policy

The Labour Government in Britain is pursuing its efforts for evolving and introducing an incomes policy to which we made a detailed reference in our last issue. A draft of a joint policy for incomes and prices—called the Statement of Intentions—has been delivered by it to the Trades Union Congress and the four national employers' organisations, for their consideration and discussion. The draft contains, in the first place, a preliminary statement, stressing the need for keeping incomes and wages in line with production; acknowledging the difficulties faced in framing a policy to this effect, it stresses that a beginning should be made—before going into the details in the next few months—to declare the intentions and objectives towards such a policy. Secondly, it reiterates the Government's commitment to pursue an expansionist policy and not to resort to stop-go measures. Thirdly, it envisages the establishment of a specialised body to keep price increases under review and to examine the demands for a more than average increase in wages in special circumstances. Fourthly, it calls upon the employers to pledge themselves to pursue industrial efficiency, higher productivity and stable prices and to make sure that the profits would be kept in line with the growth of national productivity. And fifthly, it asks the General Council of the T.U.C. to promise that the trade unions would help the employers in raising industrial efficiency and that the wages and salaries would be kept in line with the growth of productivity. The draft will be submitted to the New National Economic Development Council (NEDDY) for discussion and approval early next month.

Incidentally, the Labour Government has made major changes in the constitution of NEDDY. As the role of the Treasury has been restricted mainly to fiscal affairs and taxation reforms, the Chancellor of the Exchequer, who used to be the Chairman, has not even a seat on this important body. Economic planning has been transferred from the Treasury to the new department of Mr. George Brown, Minister for Economic Affairs, who is now the Chairman of the reconstituted body. The strength of Government team has been raised from four to five the other four members being Mr. Frank Cousins, Minister of Technology, Mr. Ray Gunter, Minister of Labour, Mr. Douglas Jay, President of the Board of Trade, and Mr. Fred Catherwood, Industrial Adviser in the Department of Economic Affairs. The rest of NEDDY remains unchanged, with six representatives each of employers and T.U.C., the heads of two nationalised industries and two independent members. Sir Robert Shone continues to be the Director-General.

In the absence of any information regarding the rate of expected growth, both the employers and employees are not likely to take any decision immediately on the Statement of Intentions. The Economic Committee of the Trades Union Congress, which considered the Statement of Intentions on the 20th instant, accorded it "a cautious but on the whole a sympathetic and co-operative response." Although the Committee was of the unanimous view that serious efforts must be made to evolve an incomes policy, there was general agreement that it would be very difficult, if not impossible, to implement it. The labour leaders felt that it was too early to take any final decision in the matter and decided to have a meeting with Mr. George Brown, Minister for Economic Affairs, to seek clarifications on a large number of points. These points range from the constitution and working of the proposed body to review prices to the fiscal measures for taxing profits and capital gains and the ways of "creaming off profits" if they rise faster than wages. The T.U.C. wants information on these points in order to be sure that there are reasonably good chances for the incomes policy to be successfully implemented.

Fortunately, a new consciousness is said to have developed in some of the labour leaders, so that it is now being felt that the old ways of negotiating wages—individually by different unions—were not satisfactory and that T.U.C. should be authorised to negotiate collectively on their behalf for a national wage policy. But then, there are also others like Mr. Bob Willis, General Secretary of the National Graphical Association, who feel that "the T.U.C. has not got the power to tell its affiliated unions what to do." As already pointed out in the last issue of this journal, the major difficulty will arise when the labour leaders have to face the problem of deciding how the wage and salary earners' share of the cake should be divided among the competing groups of workers. Some of the labour leaders are already agitating for a rise in the wages of low-paid workers. Mr. Leslie Cannon, President of the Electrical Trades Union, has informed the T.U.C. that "our major consideration is that an incomes policy, if it is to include an element of restraint on the relatively higher-paid workers, has to have positive measures to improve the pay of low-paid workers." The implication is that the wages of the comparatively higher-paid workers should rise at a slower rate than the national average. It is doubtful whether the higher-paid workers would agree to this condition, especially as the national average itself is not likely to be higher than that contemplated for the current year.

It may be recalled that the National Economic Development Council had earlier planned for a four per cent annual growth during 1961-66. This growth was based on the stipulations of a rapid rise in exports and better performance of productivity. But the growth rate in exports has since worsened. Similarly, the increase in productivity, too, is lagging behind. Thus, both the pillars of NEDDY's planning have been knocked down. In these circumstances, the target of growth for 1965 is not likely to be higher than four per cent and, on this basis, the norm for increase in wages will be the same as in 1964, namely, 3-3½ per cent. Whether the higher-paid workers would agree to an increase in their wages at a rate lower than 3-3½ per cent remains to be seen.

Meanwhile, the leaders of the Federation of British Industries, the British Employers' Confederation and the National Association of British Manufacturers are busy over the plan to merge the three bodies into a single organisation and their comments on the "Statement of Intentions" may, therefore, take some time.

By and large, the need for an incomes policy is conceded in Britain not only by the Government and employers' organisations, but by labour leaders as well. Speaking at the annual meeting of the Midland Regional Advisory Committee of the Trades Union Congress, Mr. George Woodcock, General Secretary of the T.U.C., acknowledged the need for an incomes policy and said that it would not be possible to maintain economic growth without getting something like an incomes policy. "If we cannot get it by an act of will," he said, "it will be imposed on us, in theory by the Government, or by one thing or another." He emphasised that the alternative to such a policy was to modify, or even abandon, the objectives of full employment and fast economic development. But, at the same time, Mr. Woodcock took care to point out that the Statement of Intentions "is a very general statement and I believe, we must move in slow, halting steps. There is considerable conflict in this business between speed and effectiveness. If they (Government) want a quick decision, they are likely to get the wrong decision. Time must be taken in this field."

The difficulty is that time is not on the side of the Government. If no decision is reached by early next year, the pressure on employers for a further rise in wages will be growing again. The Minister for Economic Affairs, Mr. George Brown, is, however, confident that, by Christmas, a decision will be reached on the Statement of Intentions—with some modifications, if necessary—and it would be possible to go into the details early next year. His optimism is, perhaps, based on the assessment that there was a general feeling of mutual confidence between the trade unions and Managements; that the rank and file in both the sectors realised the importance of incomes policy; and that they were more anxious for it than their leaders.

British Bank Rate

The increase in the Britsh Bank Rate from 5 to 7 per cent in one sweep on Monday the 23rd instant was not unexpected in most of the financial centres of the world, such as New York, Zurich, Frankfurt, Geneva and Paris. There were heavy withdrawals from London in the previous week and the pound sterling could be held at the floor level ($2.78 per £) only with the support of the Bank of England. Rumours of devaluation were rife. On Friday last week, Prof. Gunnar Myrdal, a well-known Swedish economist, had suggested in the course of a speech in London, that sterling deserved a moderate devaluation and that this should have been done some time ago. But the more practical-minded international bankers and financiers were aware that devaluation was no solution, as it would lead to one of the worst types of chain reaction, and that the present Government in Britain would not resort to it. They all, therefore, had inferred that a substantial increase in the

TREND OF SHARES

MIXED LIST, BUT DULL TRADING

(From Our Own Correspondent)

BOMBAY, 26th November

ALTHOUGH the final list showed modest gains in a few counters balancing the losses in others, there was no doubt that trading on the stock exchange during the week under review was virtually devoid of interest. As a matter of fact, it was the same 11-week story again—short-selling, failure to digest even modest rallies and the tendency for the volume of business to peter out at bulges. In many a scrip, trading was mostly of a professional nature as the general public preferred to keep away from the market in the absence of fresh developments. It remains to be seen whether any new factors would be forthcoming before the Budget but the indications are that, barring unforeseen developments, nothing important is likely to take place at least in the near future.

Early in the week, reports of assurance from the United Kingdom Government of continued help in the building up of India's defences and the announcement of the extension of the Colombo Plan by another five years beyond 1966 acted as fairly strong stimulants and the market did improve under their influence, but the rally was not sustained and the market definitely looked tired on Thursday. Generally, bullish news falls flat on a market which is inherently weak and is set for a fall. The 2 per cent rise in the Bank of England Rate did cause a flutter in ideas that imports from the United Kingdom would be more expensive but its effect did not last long. Moreover, the market had been beaten down all those days so much that there was very little scope for its influence to be felt. The Life Insurance Corporation and Unit Trust did effect some purchases in selected scrips but it is now common knowledge that these institutions are interested in the market only at very low levels.

At the end of the week, Tata Steel remained unchanged at Rs. 145, while Indian Iron was distinctly better at Rs. 25.45, as against Rs. 25.10 of the previous week though it had touched Rs. 25.50 at one time. Textile shares made a mixed pattern, with Bombay Dyeing up by 20 P to Rs. 57.40 while Century was down from Rs. 576 to Rs. 571.50. Standard was better by three points to Rs. 569 but Kohinoor showed a modest loss—from Rs. 320 to Rs. 318.50. Svadeshi was fractionally down to Rs. 264.50 but more significant was the decline in Central India—from Rs. 95 to Rs. 93. The decline in this scrip followed the skipping of the Preference dividend once again which means that there is no Ordinary dividend either. Preliminary results, however, indicate that the performance during the year to June is not after all bad, for turnover has improved from Rs. 614 lakhs to Rs. 663 lakhs but the dividend has had to be skipped due to the accumulated losses carried forward from the previous years. The news should have normally brought about a much steeper fall in the quotation but the shares are already lying rather low and the scope for a further fall is limited. Anyway, the directors' report should throw more light on the Company's current position and future prospects.

In the rayon group, only National Rayon was fairly well held at Rs. 349 against the previous week's closing level of Rs. 343.50, but, in spite of the improvement, the scrip is not very much above its 27th May level of Rs. 335. Indian Rayon closed fractionally down at Rs. 52.50 while Baroda Rayon eased from Rs. 63.50 to Rs. 62. But by far the worst sufferer was South India Viscose which declined to quote at its par value. It may be recalled that at one stage these shares were quoted over Rs. 190. Century at Rs. 571.50 is just above its crucial level of Rs. 570 and the opportunity may be taken to recall the hectic life of this scrip. During the seven months from August 1963 to February 1964, the shares recorded a steep rise from Rs. 490 to Rs. 709. Their fall was equally steep which started with the increase in the excise duty on rayon. The shares successively fell to Rs. 650 and then to Rs. 570. The lowest on Thursday was Rs. 570.50 but, if the shares were to break the previous low of Rs. 570, there are in for a further sizable fall. It is in this context that the performance of this scrip in the next few days should be watched.

The week's star performer was Premier Construction again. Following the steep rise in the dividend of its subsidiary, Hindustan Construction, the scrip had spurted to Rs. 198.50 last week and again during the week the shares advanced further to their year's highest level of Rs. 211.50. The hope obviously is for a sizable rise in the dividend here too and it remains to be seen whether the dividend is going to fulfil market's expectations. Both Telco and Voltas were better, the former improving from Rs. 258.50 to Rs. 262 and the latter from Rs. 255.50 to Rs. 257. Hindustan Motors were fractionally higher at Rs. 16.28 while Premier Auto was unchanged at Rs. 95. That the latter failed to react to the excellent report which shows a rise of Rs. 4 crores in sales. Further, the Company's Kalyan project has been put on stream and full production is expected to be achieved shortly. Production of trucks is progressing satisfactorily and, after the sheet metal project goes into full production, the indigenous content of trucks is expected to be of the order of 90 per cent. B. B. Petrol is well held at Rs. 2.86; apparently the market is pleased with the Company's annual report.

Chemicals were generally well maintained, with Tata Chemicals at Rs. 18.92 against the previous week's Rs. 18.80. Dhrangadhra was distinctly better at Rs. 114.50, against Rs. 112 and Polychem was fractionally up at Rs. 94.50. Synthetics and Chemicals made a good show, having improved from Rs. 68.50 to Rs. 71. Citric was unchanged at Rs. 79. Among sugars, Belapur improved handsomely from Rs. 213 to Rs. 221.50 while others were steady in sympathy. Shippings were fractionally better. Electricity shares were dull. There was little doing in cash shares and as already pointed out it is extremely difficult for cash scrips to maintain a reasonable measure of activity at a time when forward scrips happen to be dull and sluggish. If individual scrips show off under extraordinary circumstances, it is a different matter.

The one question which is now asked is whether the market would at all look up again. The answer is rather difficult but on the face of it it appears that the market has almost fallen flat. The reasons have been discussed here many a week and there is no need to repeat them. The only hope is the Budget. Powerful incentives are the need of the hour and it is in the hands of the Finance Minister to grant them as much as to reject them.

* * * *

At the time of writing, Lyons Range is steady on scattered short-covering and selective buying. Operators, however, are cautious about commitments in a big way. Paper shares are dull but Titaghur and Orient are steadier, while Birla, among Jutes, is a firm counter. India Carbon has improved owing to a shortage of scrips. Interest in cotton mill shares is limited.

* * * *

In Madras, selected plantings are active and the tone is steady. A few shares like Madurai, Travancore Rayon and Krishnarajendra have changed hands at fractionally higher rates. Banks, electric and sugars are dull. Miscellaneous shares are fairly active, with Mettur Chemical, India Cement, Textool and Madras Aluminum being the more frequently mentioned.

INDIA PAPER'S DEBENTURE STOCK

A seven-per cent debenture-stock 1967-77 worth Rs. 40 lakhs, in units of Rs. 1,000 at par payable in full on application, is being offered to investors by the India Paper Pulp Company, Ltd., Calcutta. The list opens on Monday, 30th November 1964 and is due to be closed on the 9th December 1964 or earlier at the discretion of the Company, but not in any case earlier than 2nd December 1964. The underwriters and their friends have signified their intention to apply for Rs. 20 lakhs of the stock on firm basis which the Company has agreed to allot in full. So only the balance of Rs. 20 lakhs is being offered for public subscription. As will be seen from the announcement published elsewhere in this issue, the whole of the debenture loan will be used by the Company for financing its development plans.

Incorporated in 1918, the Company has been carrying on the business of paper and paper board manufacturers for the past 42 years in its mill at Hazinagar near Naihati, West Bengal. It has three paper-making machines. Its production of paper and paper board during the year ended 31st March 1964 was 16,636 tonnes. Its expansion plan aims at increasing the pulp making capacity to 23,000 tonnes per annum and the paper-making capacity also to 23,000 tonnes, so that it may have a fully balanced unit. It may be recalled that the Company has been successful in its experiment for producing pulp out of jute sticks. This is a valuable achievement, in that an effective substitute for bamboo, now getting scarce, has been found. The new jute sticks pulp plant is already in the course of erection and is expected to be commissioned in the first half of 1965. This, together with the production of bamboo pulp from the existing plant, will give a total pulp production of 23,000 tonnes a year. The Company has also obtained industrial licences for expansion of its paper-making capacity to 23,000 tonnes a year to be achieved through renovation and speeding up of each of its paper-making machines progressively from mid-1965 to 1967.

The Company's financial position is healthy and it has been a regular dividend payer. Its paid-up capital is Rs. 88.20 lakhs (as of 31st March 1964), all in ordinary shares of Rs. 10 each. Reserves and surplus are in excess of the capital by Rs. 9.38 lakhs. Total liabilities at Rs. 53.93 lakhs are covered nearly 2½ times by floating assets amounting to Rs. 126.51 lakhs. The Company's gross block at Rs. 284.23 lakhs has been well depreciated to Rs. 109.34 lakhs. It will thus be noted that the debenture-stock offered by the Company is a sound one and should, therefore, command a ready market.

SYNDICATE BANK LTD.

The Syndicate Bank Ltd. has taken over the assets and liabilities of Sri Ranga Raja Bank Ltd., Mettupalayam, and The Kothamangalam Namboodiri Bank Ltd., Quilandy, with effect from 23rd and 26th November 1964, respectively. Sri Ranga Raja Bank Ltd., and the Kothamangalam Namboodiri Bank Ltd., are the 18th and 19th Banks taken over by the Syndicate.

With the mergers of these two Banks the Syndicate Bank will have 197 Branches in all—one more Branch in Madras State at Mettupalayam and one in Kerala State at Quilandy, raising the total number of Branches in these two States to 22 and 29, respectively.

The South Travancore Bank Ltd., Neyyoor, will also join the Syndicate Bank shortly.

MARKET GOSSIP

(Concluded from previous page)

Bank Rate was inevitable. In fact, the London *Economist*, carried a short note in its last issue published on the 20th inst., indicating that the Bank Rate would have to be increased to at least six per cent. So what was surprising about the increase in the Bank Rate was that it happened on a Monday and that too by as much as 2 per cent points. Usually, it is Bank of England's tradition to announce changes in the Bank Rate only on Thursdays. Once before it had to break this tradition and that was way back in 1931.

Obviously, the British Government must have felt that the sooner the pressure on the pound was checked, the better it would be for all. If the speculators in world financial markets had been given some more time, they might have forced Britain to devalue the pound and the Labour Party would have been exposed undeservingly to the odium for devaluing the currency for the second time since the Second World War. The Labour Party does not deserve that odium, because the financial difficulties confronting Britain are not of its making; they are the result of the bunglings of the Conservatives which Mr. Harold Wilson and his colleagues are now courageously trying to rectify.

The increase in the British Bank Rate has been well received in most parts of the world. Only the U.S. and Canada have so far found it necessary to raise their Bank Rates, but by no more than ½ per cent, the former from 3½ per cent to 4 per cent and the latter from 4 to 4½ per cent. The U.S. has put up its rate to reduce, to some extent, the impact of the high rate in Britain and Canada had to follow suit to counter the effect of U.S. action on its capital market.

This is by no means the first time that the British Bank Rate has been raised to the spectacularly high level of 7 per cent. Twice before, it was pushed up to this level, first in 1957 and again in 1961, when the Conservatives were in power. The present Labour Government has resorted to this weapon only reluctantly and much against its will. Since such a high level may restrain economic growth, it may try to bring the rate down as early as possible. Now that the central banks of the eleven developed countries have joined together to beat off the speculators by giving Britain a credit line of $3,000 million to defend the sterling, the pressure on the pound is bound to ease and the British Bank Rate may be lowered sooner than most people expect.

A New Shipping Company

There are some interesting features about the South India Shipping Corporation Ltd., which is entering the capital market early next week. Registered in January 1964, with its head office in Madras and Mr. A. D. Shroff as Chairman, this is the first shipping company in India with largest foreign participation in capital amounting to 40 per cent. Its foreign partners are the well-known P. & O. Steam Navigation Company of the U.K. and Anglo-Norness Shipping Company, Ltd., of Bermuda. Of the initial issued capital of Rs. two crores, the former will take up 35 per cent and the latter 5 per cent. The rest of the capital will be owned by Indian investors. Secondly, the Company will specialise in tramp trade and participate progressively in coastal trade, too. Thirdly, it will begin its operations on a big scale; the Company has already placed orders for five bulk carriers with West Germany. These vessels are of about 38,100 DWT each suitable to carry light grains to heavy ores. The first ship is expected to be delivered in a year's time from now and others at an interval of three months each thereafter. And, fourthly, both the foreign partners have rich experience in, and up-to-date knowledge of, world shipping. The Anglo-Norness, an associate of P. & O., are the largest owners of bulk carriers in the world and their extensive experience of world-wide tramping would be of immense advantage to the Company. The readiness of P. & O. and its associate to participate in and assist the growth of Indian shipping reflects their confidence and faith in the future of India. The fact that the directors of the Company have decided to raise capital from the market at a time when most shipping shares are standing at a discount also speaks of the courage of their conviction about the bright outlook for the Company.

The Company has already a paid-up capital of Rs. 12.50 lakhs, out of an issued capital of Rs. 50 lakhs. The present issue is for Rs. 150 lakhs in ordinary shares of Rs. 100 each. The foreign participants are subscribing to Rs. 80 lakhs and the balance of Rs. 70 lakhs is offered to the public. The list opens on Wednesday, 2nd December 1964. The entire issue is underwritten, as will be seen from the announcement appearing on pages 952-953 of this issue.

INCOMES POLICY FOR INDIA?

IT seems to have become fashionable for the planners in India to imitate some of the approaches of their confreres in the economically developed Western countries, apparently in the belief that the measures which may be good for those developed countries will be good for India, too. The Union Finance Minister, Mr. T. T. Krishnamachari, replying to questions on the fourth Plan in the Lok Sabha on the 20th instant, said that the question of preserving the value of the rupee was very important, and that, as a measure for ensuring this stability, "the question of evolving a co-ordinated policy in regard to the income, price and consumption pattern for the fourth Plan, is under examination." He informed Parliament that a cell has already been established to evolve a suitable policy in this context which might be implemented, in full or in part, during the fourth Plan. Apparently, India is copying Britain in this respect, but one is a highly developed economy with full employment, while the other is a developing economy with large unemployment and underemployment. It is, of course, true that Britain is also suffering from overinvestment, stagnation of production, rising prices, declining value of the sterling—both in the internal and international markets—and an adverse balance of payments position. But these maladies of British economy are of short-term nature, while they are of a chronic nature in the case of India. No details were provided by Mr. Krishnamachari regarding the national income, wage and price policy, which he wants to implement. Apparently, the Government itself is not clear so far about the scope and pattern of such a policy and the inherent difficulties which will come in the way of its implementation.

In a nutshell, an incomes policy implies a systematic distribution of the national product so that all the factors of production may get an equitable share, with suitable provision for ploughing a reasonable amount back into the production process. Its implementation will reduce the dependence of the economy on deficit finance, and will check the monetary demands from rising faster than production, thereby controlling the inflationary tendencies and assuring a stable growth. The advantages of such a scheme are self-evident and it is not suggested that the need for evolving and implementing an incomes policy does not exist in India. What is suggested is that even the evolution of such a policy is an uphill task, let alone its implementation. Even in an advanced country like Britain, the difficulties have been numerous and years of endeavour by the Conservative party failed to succeed. The Labour Government is now trying hard, picking up the threads where they were left by the Conservatives. It remains to be seen to what extent the present Government will succeed. One of the difficulties is the lack of agreement among the competing groups on how the wage and salary earners' share of the cake should be divided among them. The difficulties in coming to a decision in India, on this issue alone, will be formidable, for, unlike in Britain, where the Trade Union Congress (not affiliated to any political party) represents about 80 per cent of the total trade union membership of approximately 10 million, in India a number of labour federations influence large sectors of industrial workers, numbering about three million, and these trade unions are always at loggerheads with one another. Moreover, the labour federations in this country are directly related to political parties, some of which have a greater interest in creating disruptions in the country than in bringing about stability.

There are many other handicaps to be overcome in this country before an incomes policy can be evolved. A pre-requisite for this exercise is the availability of detailed information regarding the national income and its distribution. Unfortunately, the Central Statistical Organisation, which prepares the estimates of national income for this country, has never taken the trouble of informing the people about the methods adopted by it. But it seems that the estimates are derived mainly on the basis of changes in economic activity in the country, as measured by index numbers of production in agriculture, mining and manufacturing and of the changes in the activities of posts, telegraphs, telephone and other Government departments, railways and banking and insurance. The Government is not likely to have any reliable information regarding the small enterprises in mining, manufacturing, commerce and transport and about professional and liberal arts, domestic service, retail trade and housing (residential).

The data about the income generation in these sectors can at best be guesstimates. Whatever the accuracy of the estimates of national income, there is no doubt that the data on individual incomes are available only for a very small percentage of the population. These are people who are either income-tax payers or are employed in the organised sector and Government departments, and they are not likely to form more than five per cent of the total population.

According to the 1961 census, 82 per cent of the total population of the country lives in rural areas and most of these people are dependent on agriculture, which is largely non-monetised. Foodgrains production accounts for over two-thirds of the total agricultural production and about 30 per cent of the national income. In the absence of any reliable data, it may be safe to assume that at least two-thirds of foodgrains production, equivalent to 20 per cent of the national income, is not traded. The other agricultural products which form one-third of the total agricultural production and 15 per cent of the national income, also have a part in the non-monetised sector. This is particularly true of such commodities as sugarcane, oilseeds and tobacco. If regard is had for the non-monetised element in small enterprises, house property, professions and domestic service, etc. also, it may be found that anything up to 40-50 per cent of the national income is non-monetised. In the face of this situation, it is impossible to assess the income of individuals or even groups of individuals. It is perhaps because of these difficulties that reliable estimates of income even for individual States are not available. In these circumstances, it is well-nigh impossible to evolve a correct and scientifically based incomes policy, much less to implement it.

Among the other difficulties in the way of successfully evolving and implementing an incomes policy mention may be made of (a) the wide fluctuations in the fortunes of agriculture, which accounts for about 45 per cent of the national income, (b) the heavy unemployment and underemployment, both of which are not yet statistically ascertained, and (c) the absence of social security schemes for the vast majority of people. In view of these difficulties, it is better not to think in terms of a national incomes policy, as is being conceived in some of the Western countries. If the Government were to persist in this game of wild-goose chase, it might land itself in great difficulties, as it would give rise to great expectations among the various sections of the masses—expectations which it would not be able to fulfil. The task of producing a substantial national cake itself is still unfinished and it is premature to indulge in the fanciful exercise of dividing the cake among the various sectors. Meanwhile, it would be more fruitful to concentrate on efforts that would ensure for the vast majority of our people some minimum social security, as, for instance, crop and cattle insurance for farmers, better medical and educational facilities, and improvement in employment opportunities. As for workers in industries and commercial establishments, some method may be found for rewarding them a share in the surplus profits of their undertakings over and above a decent wage, taking care to see that their aggregate income has some relation to their productivity. All that is necessary for this purpose is to amend the recommendations of the Bonus Commission suitably.

CAUSTIC SODA SHORTAGE

Caustic soda—an essential heavy chemical used in textile, rayon and several other industries—is one of the sixteen commodities which have been decontrolled since December 1963 insofar as prices and distribution are concerned. This is a basic chemical which has been in short supply in spite of the substantial increase in production from a monthly average of 10,035 tonnes in 1962 to 12,690 tonnes in 1963 and 14,773 tonnes in the January-July period of the current year. As indigenous production has not been adequate to meet internal demand fully, imports on a considerable scale have continued to this day. For instance, imports in the April-August period of fiscal year 1964-65 have aggregated 18,245 tonnes, valued at Rs. 0.90 crore, as against 65,249 tonnes valued at Rs. 2.91 crores in the whole of 1963-64 (when domestic production aggregated 162,962 tonnes). These figures have belied the original expectation that decontrol would lead to a quick expansion in production. In fact, the rate of *increase* in production has slowed down in 1964, as compared with the previous year. No wonder, therefore, regular supplies of this essential chemical are not available, at reasonable prices, to consuming industries.

That the supply and price situation is extremely unfavourable to consuming industries has just been confirmed by Mr. Babubhai M. Chinai, a leading businessman connected with the rayon industry. According to him, the experience of decontrol has been far from satisfactory, for industries depending on an essential raw material like caustic soda are not getting regular supplies of that chemical. Whenever supplies are available, exorbitant prices are demanded by some of the manufacturers. Some of the rayon and aluminium plants, it is said, may even have to close down temporarily for want of adequate supplies of this raw material. It is extremely unfortunate that a protected industry like caustic soda is not uniformly playing fair by the consumer. Of course, some manufacturers have not taken undue advantage of the scarcity situation. For instance, the Tata Chemicals Ltd. has maintained the selling prices of soda ash and caustic soda at pre-decontrol prices, although each producer has been free to set his own prices in the wake of decontrol. But some others have not subjected themselves to any such self-discipline, with the result that a crisis has developed in consuming industries, some of which have been forced to pay Rs. 1,250 per tonne of caustic soda, as compared with Rs. 750 per tonne before decontrol.

In the circumstances, Mr. Chinai's plea for some remedial action is unexceptionable, all the more so because he has wisely refrained from advocating re-imposition of control. His plea is that the Government should facilitate increased production of caustic soda by licensing additional production capacity in existing or new units. In his view, some of the larger consuming industries should also be encouraged to set up plants for the manufacture of caustic soda. Neither the consideration that foreign exchange would be required for setting up new caustic soda plants nor the expected difficulties in the way of gainful use of a by-product like chlorine should be used as an excuse for official inaction. As the net savings of foreign exchange, following expanded production and corresponding elimination of imports, will far outweigh, in due course, the initial foreign exchange expenditure on plant and equipment, the case for taking prompt and energetic steps on the production front is unassailable. It is up to the Government to find out how much, if any, of the licensed capacity is yet to fructify and how much additional capacity needs to be established as a matter of urgency in the light of internal demand for caustic soda. Production levels and product prices in several consuming industries, it needs to be emphasised again, depend on the availability of this crucial raw material at reasonable prices.

SHIPPING FREIGHT RATES

Some of the developments in the sector of world shipping in the last one year have been favourable, and some others unfavourable, to Indian shipping companies. For instance, there has been a sustained improvement in the general level of overseas tramp freight rates, though the actual improvement has not come up to the original expectations engendered by the contemplated movement of foodgrains from the United States, Canada and Australia to Russia and China. In the liner trades, an increase of 10 per cent in the freight rates for services from India to U.K.-Continent and from East Coast of India to the United States has been effected since October 1963. The rates for services from the West Coast of India to the United States have also been increased with effect from March 1964. In the Eastbound trade from U.S. ports to India, an increase of 10 per cent has been in force since July 1963. While the marginal improvement in the international freight market has undoubtedly increased the voyage results (freight and charter hire earnings) of Indian shipping companies in 1963-64, the continued upward trend in operating costs has tended to offset the gains. (But a long-established concern like the Scindia Steam Navigation Company Ltd. has succeeded, to some extent through sustained rationalisation, to retain the advantage consequent upon the aforesaid freight increases.) Apart from the unfavourable factor of increased costs, a certain development that is affecting the availability of cargoes for Indian liner services is the increasing tendency of some European countries to purchase Indian goods on f.o.b. basis and to exercise their discretion in making shipments by other than Indian Lines. This, according to Mr. Dharmasey M. Khatau, Chairman of the Scindia Steam Navigation Company Ltd., whose advance statement to the Forty-fifth Annual General Meeting of the Company has just been issued, is a development about which nothing can be done at the moment.

In view of these unfavourable factors, Mr. Khatau, incidentally, has suggested that the Indian Maritime Freight Commission should be more fully utilised for effecting upward freight adjustments which are otherwise not easily possible or permitted in spite of increased costs. His suggestion is that the machinery of the Maritime Freight Commission, which has been set up precisely for tackling this difficult problem of freight rates but which has not so far faced up to it continuously and expeditiously, should be charged with the responsibility of making a periodic assessment of costs of operation and thereafter permitting the shipping companies appropriate increases from time to time. This is a reasonable plea, considering that several shipping companies have not been working on an economic basis because of uneconomic freight rates—rates which are not as fair to the companies as to the shippers. An adequate increase in coastal freight rates, besides a guaranteed diversion of two to three per cent of the total cargo now carried by the railways, would put coastal shipping, too, on an economic footing.

At the same time, if, as Mr. Khatau has emphasised, the factors that tend to increase costs are eliminated, the required upward freight adjustments may not turn out to be unduly heavy in their incidence. For instance, elimination of frequent strikes in ports, of loading and unloading delays caused by congestion and of go-slow tactics by dock labour can go a long way towards restraining increases in the costs of operation. It is distressing to be told, in this connection, that, out of the total of 823 days lost by the Scindia Steam Navigation Company in the overseas service, as many as 538 were lost in the major ports of Bombay, Calcutta, Madras and Cochin in 1963-64. It is, therefore, imperative that, in fairness to the shipping industry, the Government should require Port Trusts to maintain efficiency at the ports at the highest level possible and to make labour more productive through the introduction of incentive schemes at ports. The labour situation in the U.K. or the U.S. ports, which is none too happy at the moment, is beyond this country's control. But, at least in Indian ports, the labour problem should be tackled with expedition and imagination as much in the interests of Indian shipping companies as in those of export and import trade. It is to be hoped that the Wage Board, just set up for dock labour, will conclude its labours promptly and help improve and stabilise the labour situation in India's ports.

PELLETISATION PLANT

India's vast reserves of iron ore—estimated at 110,000 million tons—can not only sustain the native steel industry for a long time to come but also help the country in earning valuable foreign exchange. As an export commodity, incidentally, it ranks next only to jute goods, tea and cotton textiles. It is well known that Indian ore—20 million tons of which were produced in 1963—is generally of a superior grade. But, as the new sources of the mineral do not contain the same degree of fineness but have waste material in them, there is a long-felt need for pelletisation plants, wherein the waste can be removed and the ore converted into pellets and made readily acceptable to the importing countries. In the pelletising process, it may be noted here, the iron ore is reduced to a fine powder, in which process impurities and tailings are removed. The concentrated iron ore is than mixed with binding agents, formed into marble-size pellets and baked in a furnace. The resultant pellets are harder than the original iron ore and have many advantages in that they can be put straight into the blast furnace of the steel mill.

The Kiriburu mines in Orissa and the Hospet-Bellary mines in Mysore, it is stated, are found to have wastes of 27 and 18 per cent, respectively, in their iron ore, and the need for pelletisation plants to increase the ore content in them is increasingly felt. The wastes include, among others, blue dust, stone and other ingredients. If these wastes are separated from the iron-ore, transportation costs of the mineral from the mines to the ports and later to the importing countries can be greatly reduced. Further, the importing countries, such as West Germany and Japan, who experience shortage of labour, prefer to have refined ore. Moreover, other producing countries like the United States have already set up pelletisation plants to produce refined ore. Thus, with a view to improving our competitive position in the field of iron ore exports also, there is a pressing need for establishing such plants.

Viewed thus, the laying of the foundation stone of the first pelletisation plant in India, nay, the whole of South-East Asia, in Goa by Mr. Manubhai Shah, Union Minister for Commerce last week (21st November) was a gratifying development. This Rs. four-crore project of the Pale Iron Ore Mines of the well-known industrial house of Chowgules is expected to go into production early in 1966. As the hard lumpy ore is setting scarce in the mine, the benefication plant will upgrade the low quality iron ore and make it suitable for export purposes. This plant will pelletise iron ore after removing the hematite and linomite fines from the ore by a special process of aglommeration with the help of an industrial firm, Lurgi in Frankfurt, West Germany. It will produce 550,000 tons of iron ore pellets per annum. Over 2,000 tons of iron ore fines per day will have to be fed into the pelletisation plant for its rated annual production. The Pale mines, manually operated till now, have been yielding 300,000 tons of ore annually. But, with the complete mechanisation of the mines, also commissioned by Mr. Manubhai Shah that day, output is expected to increase to 500,000 tons.

Marketing of these pellets appears to be no problem at all. The Japanese steel interests, consisting of ten leading steel mills, have already signed a contract to purchase all the pelleted ore produced by the Pale mines (550,000 tons) for a period of ten years. This will bring in foreign exchange worth Rs. three crores per annum, for, after pelletisation, iron ore will command a price of Rs. 55 per ton, as against Rs. 15/18 per ton at present. There is also bound to be demand for such pelletised ores from other countries as well. The house of Chowgule's is so very confident of marketing the iron ore pellets that it has already plans to install in due course a large-size pelletisation plant involving a capital outlay of Rs. 12 crores and capable of producing 20 lakh tons of ore pellets per annum. It may be noted, incidentally, that many more pelletisation plants of the kind would be required, if the cost of production is to be reduced and the competitive efficiency of Indian iron ore is to be increased. It is to be hoped that the Union Government will give the necessary encouragement to the mining industry in Goa and elsewhere in India, especially as it has set a big export target of 25-30 million tonnes to be achieved before the end of the fourth Plan, as against the present export level of 9 million tonnes.

A protocol of the 15th meeting of the Comecon Permanent Commission for foreign trade has been signed at Moscow on the 20th inst. The Commission has adopted recommendations which will contribute to the further growth of goods turnover between the Comecon member countries. It has approved proposals for improving the general terms of goods deliveries adopted in 1957.

DOES THE GOVERNMENT REALLY CARE FOR THE CONSUMER?

By A Special Correspondent

THE consumer in India has been receiving greater attention during the last six months than ever before. After Mr. Shastri became the Prime Minister, he has been repeatedly emphasising the need to *provide* the consumer with his elementary requirements so as to enable him to live in reasonable comfort. The Prime Minister has also *admitted* that India's Five-year Plans have not so far made a favourable impact on the living standards of the common man. Indeed, in *some* respects, his economic condition has *become* worse.
