In the matter of food supply, for instance, the *per capita* availability today shows hardly any improvement over what it was some years ago. Nutritional experts say that, for a balanced diet, an adult Indian should consume at least 14 ounces of cereals, 3 ounces of pulses, 2 ounces of ghee, 10 ounces of vegetables, 10 ounces of milk, 3 ounces of fruits and 3 ounces of sugar and *gur*. But the *per capita* consumption of these foods falls much below the minimum requirement. Health-giving items like milk, fruits, vegetables, eggs, fish and meat do not find a place in the diet of the average Indian. The *per capita* consumption of cotton cloth in India is about 16 yards, as compared with 50 yards in the U.S., 35 yards in Japan and 31 yards in Russia. The availability of durable consumer goods is also very low. It is estimated that one out of 300 persons has a radio, one in 20,000 a car, one in 500 has a sewing machine, one in 100 a bicycle and one in 200 an electric fan.

Neglect of the consumer is by no means confined to India. In many other countries of Asia also, the consumer's interests have till now received inadequate attention. Even Russia has failed to promote the welfare of the consumer to any significant extent; and this is supposed to be one of the reasons attributed to the downfall of Mr. Khrushchev. Although the Russian economy under Mr. Khruschev's leadership made *considerable* progress in many directions and Russia became the most powerful nation in the world next only to the U.S.A., the living standards of the common people have not appreciably improved. Agriculture has failed to progress steadily and in the last year Russia had to buy about 10 million metric tons of wheat from the U.S.A. and Canada. The availability of other consumer goods like cloth and shoes has also been meagre. The situation has been succinctly summed up by an American journal thus: "The economic life in Russia is still mainly a matter of waiting—waiting in interminable lines to buy shoddy goods, waiting for the stores to get a shipment of suits in the right size, waiting three years for a refrigerator or washing machine and even longer for a new apartment."

In India, too, the neglect of agriculture and the consumer goods industries has led to acute distress to large sections of the people. But it is essential to understand the nature of this neglect if the past wrongs are to be undone and the right policies are to be adopted for the future.

No Lack of Emphasis

It is often said, for instance, that Indian planners have not realised the importance of agriculture and that the fourth Plan should, therefore, give the highest priority to this subject. But it is necessary to point out that, at least on paper, all the three Five-year Plans did accord the utmost weight to agriculture. The first Five-year Plan said that the importance of agriculture "is both basic and vital."

The second Plan observed: "During the first Five-year Plan, it was of crucial importance that agricultural programme must succeed, for no other consideration had equal significance for the stability of the economy as a whole. The second Five-year Plan implies even more than the first a close inter-dependence between agricultural and industrial development."

The third Plan was even more emphatic in stressing the role of agriculture. It said: "In the scheme of development during the third Plan, the first priority necessarily belongs to agriculture. Experience in the first two Plans, and especially in the second, has shown that the rate of growth in agricultural production is one of the main limiting factors in the progress of the Indian economy. Agricultural production has, therefore, to be increased to the largest extent feasible and adequate resources have to be provided under the third Plan for realising the agricultural targets."

The allotment of funds for agricultural development has also been quite impressive. Investment in agriculture in the first two Plans was about Rs. 2,000 crores. For the third Plan, the investment originally proposed was Rs. 1,460 crores for agricultural development and Rs. 650 crores for major and medium irrigation.

Poor Implementation

If, nevertheless, the country continues to be plagued with scarcity and high prices of food, it is because the agricultural schemes have not been properly implemented and the huge amounts earmarked for this purpose have not been spent effectively. So, if the Government is really serious of providing the consumer with adequate food at low prices, agricultural policies should be evolved realistically and executed efficiently. The accent should be on more production. Schemes of agrarian reforms, based merely on ideological grounds, have to be put in cold storage and the utmost incentives given for improving productivity and increasing the production. Distribution is also equally important. Here the wise policy will be to rely on the normal trade channels rather than on co-operatives and corporations that lack the experience and the know-how to handle this business. If these things are not done, the mere allotment of enormous funds for agriculture will not by itself help the consumer to get his food at prices he can afford.

Manufactured Goods

As regards the manufactured consumer goods like cloth, sugar, paper, matches and so on, the emphasis must be on maximising production. This remedy is, of course, well known but in practice various hindrances are placed in the way of increasing production. The fiscal policy is mainly responsible for inflating the costs of production. The steep increase in direct taxes has reduced the purchasing power of the people and, in the case of companies, has deprived them of the resources required for expansion and modernisation. Indirect taxation has also done great injustice to the consumer. Excise duties, for instance, are levied today on about 67 commodities including cloth, sugar, matches, kerosene, *vanaspati*, soap, paper, cigarettes, footwear, art silk, glassware, wireless sets, fans, bulbs, and so on. The Central excise revenue has increased from Rs. 50 crores in 1948-49 to nearly Rs. 700 crores in 1963-64; and this, no doubt, is one of the important factors responsible for high costs of consumer goods.

Relief to the consumer, therefore, cannot be brought about without suitable adjustments in tax policy. But, with an ambitious fourth Plan involving an outlay of about Rs. 22,000 crores and envisaging additional taxation of nearly Rs. 5,000 crores, it is unlikely that any fiscal concessions will be available in the near future. On the other hand, the indications are that the tax burden will continue to grow, causing further increase in prices.

The proposal to manufacture consumer goods like cloth, sugar and drugs in the public sector is most unlikely to help to increase supplies and bring down prices. India's cloth industry is the second biggest in the world, next to that of the U.S. It has served the country very well indeed, considering the fact that it has not only made India self-sufficient in cloth but has become a major earner of foreign exchange, accounting for about Rs. 50 crores per year. In other words, the industry provides cloth not only to the 400 million people of India but to millions in other parts of the world. And if Indian cloth is not as cheap as it should be, the blame is not entirely that of the industry. If its requirements of cotton and other raw materials are promptly and adequately met and if it is actively encouraged to modernise and expand, it can surely produce and export on a much vaster scale.

Similarly, the record of the sugar industry is also impressive. Till the 'thirties we used to import substantial quantities of sugar; and now we have even become a leading exporter. In 1963-64, we exported sugar valued at Rs. 26.10 crores. The sugar industry too can produce all the requirements for home and export, if its operations are not rigidly controlled and the mills are given reasonable incentives. In fact, whether in the field of consumer or capital goods, the record of the private sector in the matter of production is commendable; and if the supply is short and there is in some industries a good deal of idle capacity, it is due to factors beyond their control, such as non-availability of raw materials. State participation is justified where the industries concerned are of a strategic nature and in which the private sector is unable to take part. But, when capital and experienced personnel are scarce, it is surely wasteful for the Government to enter into the sphere of consumer goods industries.

It is interesting to recall that, in many countries of East Europe today, there is an increasing tendency to denationalise consumer goods industries. In Poland, Czechoslovakia and Hungary, nationalisation had gone too far and even tailoring, laundries, dry cleaning, shoe repairs, house repairs and small restaurants were nationalised. These have been under municipal control. But this has not benefited the consumer. As the East European correspondent of the *Financial Times*, London, pointed out a few days ago, "the municipal services in all three countries have a bad reputation as being slow and expensive. A three-week wait for shoe repairs is normal." In Russia also, it is now recognised that "a modified free enterprise system" is the best way to produce more and better consumer goods. An editorial in *Pravda* recently urged consumer industries to plan their own production on a basis of profitability and said: "It is time to give more independence to the enterprises, so that they will be economically interested in producing high quality goods popular among customers."

If the Government of India is, therefore, really concerned with the consumer's welfare, it should refrain from competing unfairly with the private sector. Fiscal and industrial policy also need revision so as to give incentives to the individual. Above all, the official attitude to consumption as such should change. Under the three Plans so far, the emphasis was on restraining consumption, the idea being that the present generation should be prepared to suffer and sacrifice for the sake of posterity. Such theories have now become discredited. The Indian people have for so long patiently put up with privation and the time has come when they could look forward to the enjoyment not only of the basic necessities but also of certain comforts which alone make life worth living.

INDO-RUSSIAN TRADE

The trade between India and Russia is expected to increase by 50 per cent during the calendar year 1965—from the current level of Rs. 80-85 crores to Rs. 125 crores each way. This was revealed by the Union Minister for Commerce, Mr. Manubhai Shah, at New Delhi on the 18th instant. A significant feature of the 1965 Indo-Soviet trade plan is that Russia has agreed to supply 60,000 tons of ammonium sulphate. India hopes to double the import of Soviet foundry-grade pig iron next year. Other imports from the Soviet Union will comprise machinery and equipment and components for big projects like those at Bhilai, Ranchi, etc. The U.S.S.R. will also supply essential materials like mineral oil products, non-ferrous metals, tinplate and rolled steel products.

Manufactured products will form about 40 per cent of the total exports from India, consisting of engineering products like electric transformers, air-conditioners, water-heaters, accumulators, textile machinery, knitting machines, twist drills, etc. and chemicals like B.H.C. powder, zinc phosphide, mercurial seed dressings, calcium carbide, bleaching powder and detergents. The exports of traditional items, such as tea, jute products, tobacco, coffee, spices, cashew kernels, cotton fabrics and leather footwear are also expected to go up. There is a likelihood of larger exports of Indian tanned skin than of raw goat-skins. Specialists will be sent by Russia to advise Indian industry in the preparation of tanned skins, sheep-casins, bananas and shellac, according to the requirements of the export market.

INDUSTRIAL PRODUCTION IN U.S.

Owing to labour strikes in the automobile industry, industrial production in the United States during October 1964 was lower (131.7 points in the index) than in the previous month (134.0). However, it was higher than that of October last year (126.1). As labour trouble in the auto industry has not yet been resolved—70,000 Ford workers are idle and production has almost completely stopped—the economic indicators are not expected to rise during November, but its effect is unlikely to be as severe as in October. As a direct result of this strike, automobile output has been halved and production of auto parts, materials and trucks reduced. It has also affected retail sales and building activity. The former has declined by three per cent from its record rate reached in August and September: Production of other consumer goods and business equipment, however, has continued to advance. The unemployment rate has remained unchanged at 5.2 per cent of the work force.

However, the Gross National Product has recorded a rise of $10,000 million in the third quarter of 1964 (July-September) over that of the second quarter, taking it to an annual rate of $628,500 million.

WHAT ALTERNATIVE IS ACCEPTABLE?

By Questor

LONDON, 21st November

THE reasons for Britain's decision to impose a temporary surcharge on imports are now more widely understood. The new Government found itself faced with a payments deficit which is likely to be of the order of $2 billion for 1964 as a whole. It was unwilling either to deflate massively (industrial production, after being static for eight months, actually fell in September) or to devalue. Direct action on the balance of payments was, therefore, the only course open to it.

But did it take the best kind of direct action? I do not mean simply that it might have looked at the capital as well as the current side of the account or that it might have muffled the inevitable outcry by giving other Governments a little more advance notice of its intentions.

It chose deliberately to break one rather silly international rule: it chose to impose a tariff surcharge (which is not allowed by the G.A.T.T.) instead of import quotas (which are allowed in an emergency) on the grounds that this would be less discriminatory and do less damage to international trade. But since it was ready to go so far in putting the spirit of international agreements before the letter, I think it might well have gone further. Instead of restricting imports, it might have found some effective way of subsidising exports.

This would certainly have annoyed our trading partners, but perhaps no more than they have in any case been annoyed by the tariff surcharge, providing they were convinced that it was a temporary measure. It would have meant an increase in taxation, but it would have avoided the risks of increased protection and might have got more firms interested permanently in the business of exporting.

In fact, the British Government is taking the opportunity of remitting to exporters certain indirect taxes which they bear at present, as the rules of G.A.T.T. allow it to do. But the rebate is expected to amount to only 1-3 per cent of the value of exports according to type; and, though even this will be of help to firms exporting on very low margins or at a loss, its smallness shows that—unlike the import surcharge—it is meant to be permanent.

Since the Government is determined to avoid devaluation and since exports are not rising, the search for other forms of internationally-acceptable incentives is likely to continue. In particular, an attempt may be made to reopen a question which seemed to be answered finally in the spring of this year—that of introducing a Continental-type turnover tax in Britain. Since the G.A.T.T. allows indirect taxation to be remitted in the case of exports, a system in which indirect taxes are large in relation to direct company taxes obviously carries a built-in incentive to export. In 1962-63, prompted partly by the possibility that Britain would be joining the European Community and would have to harmonise its tax structure with theirs, there was a good deal of public discussion about the desirability of introducing a general sales tax—in particular, a tax on value added of the sort which has gradually been evolved in France. This, it was argued, would not only give an additional incentive to exporters but would encourage firms to cut costs and invest more in new plant and equipment.

The then Government, though sceptical, appointed an expert committee to consider the question. This listened to a great deal of evidence from professional and business organisations and then reported flatly against the change. Firstly, it pointed out (to most people's surprise), indirect taxation was not relatively low in Britain nor was company direct taxation relatively high.

Secondly, an added-value tax ought not to be substituted for our existing purchase tax on consumer goods, which serves the same object more efficiently; the French, indeed, had developed their tax in an attempt to approximate the traditional European sales tax to the British and American pattern. Thirdly, any attempt to replace the direct tax on company profits with an added-value tax—so it was assured by businessmen—would lead to an immediate rise in prices which, in the long run, would do much more harm than good to the country's export trade.

The Committee's rejection of the added-value tax was so strong, and so strongly supported by industry, that it is difficult to see much point in reopening the matter—particularly since the economist who served on it is now the chief adviser to the Ministry of Economic Affairs. But two points emerged from its report which may be worth further study by the Government. First, the present purchase tax on consumer goods leaves a great many goods and services uncovered. It might be extended, particularly to goods and services, which may enter into the production costs of export industries.

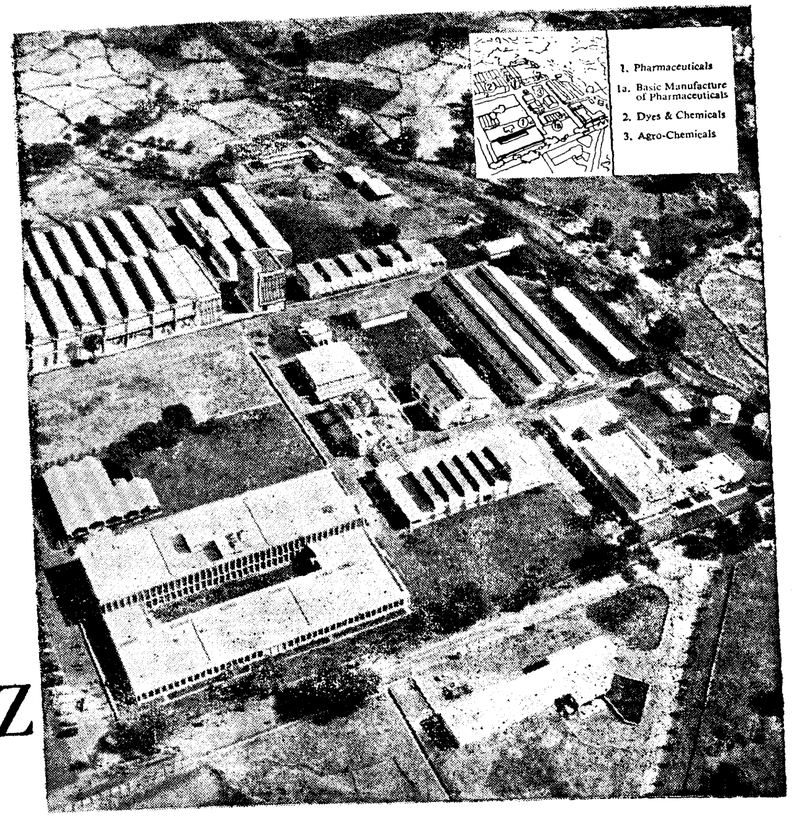
Also, it appeared from the evidence that the majority even of large firms still make investment decisions on the basis of gross anticipated profit on capital employed. There would seem to be room for educating management in the implications of the generous tax concessions which are now provided for investment, particularly in areas of high unemployment; the schools of business education which are now springing up on every side may help to make managers more aware of the advantages of investing in labour-saving equipment.

The P. and O. group, which operates the world's largest and most diverse free enterprise fleet, has just placed contracts worth about £12 million for four bulk oil carriers of 62,000 d.w.t. each, with Japanese and British shipyards. Of these, only one will be built in the U.K. by Fairfield Shipbuilding and Engineering Co., Glasgow. The other three will be built in Japan, two by Hitachi Shipbuilding and Engineering Co., and one by Mitsui Shipbuilding Co. No breakdown of the individual cost of the vessels has been released. The vessels are scheduled to be delivered between the end of 1966 and early 1967.

In a bid to make foreign trade operations more efficient, Czechoslovakia is to establish a new bank for dealing with all foreign trade transactions. The bank will be established in the form of a public limited company with a paid-up capital of 500 million Cz. Crowns (£25 million). This form, which is a departure from the practice of organising all enterprises, including banks, in the form of national corporations, has been resorted to for enabling foreign trade and manufacturing corporations to be represented on the board of the new bank. The bank is expected to start operations from the beginning of next year.

The Government of Britain has imposed an embargo on the export of arms to South Africa. All outstanding licences are now to be revoked "except where these are known to relate to current contracts." Licences for the export of sporting weapons and ammunition will be revoked and shipment will be stopped forthwith. In other cases where licences are revoked, fresh licences will be issued to the extent necessary to permit the execution of current contracts.

In more ways than one...



This is an aerial view of the Sandoz industrial complex. The site covers more than 70 acres. The plant and machinery incorporate the most modern manufacturing techniques, including a high degree of automation. All Sandoz products are manufactured, processed or formulated here, many from the basic stages. Each manufacturing wing has its own Product Development and Quality Control laboratories.

It is here that Sandoz works for national progress in more ways than one...

Pharmaceuticals:
On 4th February, 1961, Dr. S. Radhakrishnan, then Vice-President of India, formally inaugurated the Pharmaceutical and Chemical Plants. The pharmaceuticals manufactured represent established names in therapeutic use and are the result of continual and progressive research in Sandoz Laboratories all over the world.

Dyestuffs and Textile Chemicals:
A complete range of specialised dyes and chemicals is available for the requirements of the textile, leather and paper industry. Most of the dyestuffs licenced for manufacture will be produced for the first time in India. A pilot plant is in operation since last year and capacity production will start early in 1965.

Agro-Chemicals:
The product range in this line has a vast market in India where agriculture on a scientific basis is just beginning to take shape.

MONETARY ASPECTS OF WORLD TRADE AND ECONOMIC DEVELOPMENT

I.M.F. MANAGING DIRECTOR ELUCIDATES

A RECENT address by the Managing Director of the International Monetary Fund, Mr. Pierre-Paul Schweitzer* on the financial and monetary aspects of world trade and economic development underlines his conviction that, while the radical proposals for freer flow of aid undeterred by short-term balance of payments considerations and liberal trading policies with a greater emphasis on trade rather than aid are the obvious solutions of the world economic problems of the later sixties, it is becoming clearer every day that they should be flanked by a monetary approach through the creation of a new world liquidity mechanism. Mr. Schweitzer has devoted special attention to a review of the activities and problems of the Fund in relation to the policies and prospects for trade and development.

Recent discussions on world trade have been characterised by problems of economic development. Though not a new subject, economic development is nowadays viewed from a new angle—co-operation between the richer and poorer nations of the world for the purpose of raising the standards of living of the latter. The developing world has some new things to say in new words to the developed world. Behind this new phraseology and rationale and underlying their attitudes and viewpoints lies a sense of urgency, for the very existence and continuance of political and social institution depends upon the success of this great effort. As Mr. Schweitzer has rightly pointed out, the need for accelerating the pace of economic development has been gathering impetus in recent years and has found its obvious demonstration in the U.N. Conference on Trade and Economic Development held at Geneva last summer.

A Major Problem

A major problem in this task is to find mutually acceptable ways of assisting the developing countries. The developed countries must not only realise the sense of urgency but also appreciate that their own prosperity depends upon mutual assistance. The developing countries, on their part, must appreciate that they must build up enough industrial and economic strength, so that the emphasis shifts from aid to trade. Aid cannot obviously be available in unlimited amounts and there are political and economic limits for the aid-giving countries: promotion of trade, particularly in the manufactures of developing countries, depends upon maintenance of high levels of demand and employment and a satisfactory rate of growth in the developed countries themselves. They are of course conscious of their own interests involved, but obstacles arise in the form of undue pressures on costs and prices as a result of high levels of demand and sharp balance of payments deficits. Hence the need for effective international co-operation in the formulation of economic policies and for adequate levels of international liquidity.

The Fund-Bank organisations have their main justification in these dual task of promoting co-operation and maintaining liquidity. The World Bank family (consisting of I.B.R.D. and its two affiliates, I.D.A. and I.F.C.), together with other formal and informal regional organisations like the three year old Inter-American Development Bank or the recently formed African Development Bank, have the responsibility of assisting countries for promoting economic development. The special function of the Fund and of some voluntary, formal or informal regional groups is "to provide resources to ease countries and to advise them as they seek to work out policies which will achieve the monetary stability so essential to economic growth."

In view, however, of the close connection between the balance of payments difficulties and needs of development financing of the developing countries, the distinction between the Fund-Bank functions is not so sharp as may be imagined. As Mr. Schweitzer puts it:

"It is not surprising, therefore, that our activities with respect to such countries so often require us to consider whether and to what extent we can help to promote the process of development while carrying out the basic duties assigned to the Fund."

Three Main Ways

Mr. Schweitzer has outlined the ways in which the Fund has made significant contribution to the development of underdeveloped nations. First, the Fund has helped strengthen expertise in monetary and financial matters in developing countries through the evolution of progressively improved tools and techniques of monetary analysis. Secondly, through its Department of Fiscal Affairs, I.M.F. Training Institute and a panel of Central Bank experts it has provided technical assistance to many developing countries in improving their taxation, budget and financial structure and controls. In order to appreciate the value of these two forms of assistance one must bear in mind that the weak structure of Government finance is often a major obstacle to correcting the deep-seated imbalances in balance of payments and economic structure. More familiar and more important is the third way—provision of financial assistance. The Fund quotas of developing countries are $4.3 billion as against their gold and reserves amounting to $12 billion. The Fund's resources, however, play a far greater role and are a much more important source of liquidity than these figures suggest, because their reserves are at an absolutely minimum level and cannot always be run down. Fund quotas, therefore, provide the flexible element. Moreover, since the assistance from the Fund is conditional upon the country following appropriate financial and monetary policies, a climate is created in which additional assistance from non-Fund sources also may become available. Above all, while the quotas of developing countries are about one-fourth of the total quotas in the Fund, 80 per cent of the outstanding drawings from the Fund at the end of October 1964 were those of the developing countries. This gives an indication of the extent to which the developing countries are making use of the facility provided by the Fund.

As a measure of further assistance to developing countries, the Fund allows total outstanding drawings to exceed the usual limits by providing *compensating* finance to countries facing payments difficulties created by temporary shortfalls in export receipts. This assistance is normally available on more liberal terms than regular drawings, for up to 25 per cent of a country's borrowing quota.

It is thus clear that the Fund keenly feels its responsibilities for the great mass of its non-industrialised member countries. So much for international co-operation and assistance: but it has become abundantly clear now that transfer of resources from the richer nations to the poorer countries will not start flowing, if the effects on their liquidity and reserves continue to embarrass them. One country after another pleads balance of payments difficulties in giving larger aid and in liberalising trade. The question of ensuring an appropriate level of international liquidity is, therefore, extremely important and equally urgent.

Crux of the Issue

Explaining the basic problem and paradox of international liquidity, Mr. Schweitzer points out:

"On the one hand, it should be adequate to meet the needs of a growing world economy and expanding world trade, while, on the other, it should not be excessive so as to disturb monetary stability and frustrate real economic growth."

Various and often contradictory views were expressed at the Fund-Bank meetings in Tokyo: the great debate on international liquidity has now been going on for over two years with plans and counter-plans piling up. The Fund's own weight has at last been thrust behind a gradual build-up of a truly international credit and liquidity mechanism. Its concept of liquidating is simple, namely, the foreign exchange resources which the monetary authorities of a country own or can readily borrow to finance balance of payments deficits.

Explaining the background behind the differences on the liquidity problem Mr. Schweitzer says:

"As might be expected, the various views expressed were, to some extent, influenced by the economic positions of the respective countries and the pressures confronting them. Those countries that have for several years experienced large surpluses in their balance of payments were inclined to emphasise the need for discipline on the part of the deficit countries and to make less of the need for measures to increase international liquidity. The countries whose balance of payments have tended to be in deficit, on the other hand, were inclined to reverse those priorities."

Despite these differences, however, there was a concensus in principle among the member countries that, while there should be enough international liquidity, it must be ensured that it was neither excessive in quantity nor was it directed to improper uses. If excessive liquidity was readily available, countries could finance external deficits for prolonged periods, without dealing with the structural or long term factors causing the deficits: such abundance of liquidity would not, however, serve the goal of international financial stability and economic growth. Similarly, unless adequate supply of international liquidity is available, countries would be forced to make precipitate changes in their financial and economic policies, for the insufficiency of reserves would not allow them sufficient time to make orderly adjustments. Such insufficiency could damage the world economy, force unwelcome and even unnecessary cut-backs in development plans or modifications of carefully worked out policies. Mr. Schweitzer has illustrated these considerations by taking the recent U.S. experience, not only because the entire world is directly interested in the position of U.S. balance of payments, but also because the U.S. experience of the early 'sixties clearly illustrates "the sort of circumstances in which there is a need for financing (international liquidity) to be available."

The general feeling at the Fund-Bank meetings in Tokyo was that at present there is sufficient international liquidity. In order, however, to meet the anticipated growth in world trade, increased mobility of capital and general convertibility in future, the Fund's Executive Board has been directed to study the question of increasing the quotas, both generally for all members of I.M.F. and specially for those countries whose quotas may be 'out of line.' The Fund's study is still in progress. Mr. Schweitzer feels that the outcome of the study will take care of the increased general need for access to I.M.F. credit facilities for financing balance of payments swings.

Unconditional Liquidity

Credit facilities in the Fund, however, provide what has been generally described as "conditional liquidity." Studies are therefore being made by various regional groups to devise ways of creating international liquidity of an unconditional character in new forms of owned assets with the same usability as gold or foreign exchange reserves or through regional voluntary co-operation and understanding, or by isolating the developed and the developing countries. Mr. Schweitzer, however, refers to the need for truly international co-operation on this problem and points out that needs of equity as well as enlightened self-interest require that all countries should have an opportunity to participate in the benefits of increased liquidity. "It would seem particularly regrettable if the poorer countries were excluded," points out Mr. Schweitzer sharply and adds.

"These considerations, among others, seem to me to weigh heavily in favour of using the Fund for any future arrangements which may be decided upon, for the Fund is the truly world-wide organisation already operating in this field. In this area, as in others I have discussed, the Fund can, through responsible leadership, provide the unifying force among all countries, industrial and agricultural, developed and developing, creditor and debtor, rich and poor."

A Timely Warning

Mr. Schweitzer also refers to the difficul and delicate problems of reconciling the inter ests of debtor and creditor countries and warn against the short-term balance of payments diffi culties that may be created by an excessive us of borrowing facilities provided by the increase extension of short and medium-term expor credits.

No doubt, the export credits serve a usefu and necessary function, but the excessive ir debtedness has led in many cases to the inte vention of I.M.F. for a rephasing of debt sch dules as a result of an impartial examination c technical and resources aspects involved. M Schweitzer, however, does not regard this as a "entirely satisfactory role" for the Fund an points out that frequent encouragement or co donation of default may lead the borrowir countries to relax their vigilance or ignore th financial discipline. While he is all in favou of healthy competition for exports, he fee that the line between healthy competition ar excessive reliance on credit is not easy to determine in advance. This is a particularly timely warning for countries like India the dependence of which on foreign credit has become large in recent years and continues to be so.

*Address to the National Foreign Trade Convention, New York was delivered on 16th November 1964.

I.M.F. GETS READY TO MEET U.K.'S CALL

The International Monetary Fund has approved plans for borrowing from participants, under its General Arrangements to Borrow as a partial means of meeting drawings which the United Kingdom may make under its standby arrangement with the Fund. That arrangement came into effect on 8th August 1964, for a period of one year from that date and for a total amount equivalent to $1,000 million.

The Fund will use three categories of resources to meet drawings by the United Kingdom. These are:

1. A total equivalent to $345 million will be provided from the Fund's present holdings of currencies.

2. The Fund will borrow the equivalent of $405 million in the currencies of eight members, under the provisions of the General Arrangements to Borrow.

3. The Fund will purchase members' currencies against the sale of gold in amounts equivalent to $250 million.

The above amounts will be proportionately reduced if drawings by the United Kingdom total less than $ one billion.

The amounts to be borrowed have been determined on the basis of the Fund's present holdings of members' currencies. No borrowing will take place from the United States, in view of the fact that the Fund's dollar holdings are above the level of the U.S. currency subscription. The Fund plans to borrow from Germany, France and the Netherlands the full amount of their currencies to be used in meeting drawings by the U.K., since the Fund's holdings of their currencies are quite low. Smaller amounts will be borrowed from Belgium, Canada, Italy, Japan and Sweden.

The currencies of 11 countries will be used to make up the equivalent of $750 million, in the following amounts:

(In millions of U.S. dollars or equivalents)

Currencies	*Total*	*From Fund holdings*	*From borrowing*
U.S. dollars	200	200	..
Deutsche mark ..	180	..	180
French francs	100	..	100
Canadian dollars	60	45	15
Belgian francs ..	40	10	30
Japanese yen	40	20	20
Netherlands guilders ..	40	..	40
Spanish pesetas ..	30	30	..
Austrian schillings ..	20	20	..
Italian lire	20	15	5
Swedish kronor ..	20	5	15
Total ..	750	345	405

Gold will be used to purchase ten currencies of which the Fund's holdings are or will be below the subscription level. The amounts of gold to be used will be in proportion to the net use made of each currency in the United Kingdom transaction envisaged, together with its net use in all previous Fund transactions. The figures derived on this basis are as follows:

(Amounts in millions of U.S. dollars)

Germany 93, France 63, Netherland 26, Belgium 17, Japan 14, Spain 10, Canada 9, Austria 8, Sweden 7 and Italy 3. Total 250.

This is the first occasion on which the Fund has made use of its General Arrangements to Borrow, which came into effect on 24th October 1962. The participants are the Governments of Belgium, Canada, France, Italy, Japan, the Netherlands, United Kingdom and United States, the Deutsche Bundesbank and Sveriges Riksbank.

MINOR RELAXATION IN CREDIT CONTROL

On Monday, 23rd November 1964, the Reserve Bank modified the formula to govern the rates of lending to scheduled banks. Hitherto, the net liquid assets position of banks was computed on the basis of their holdings of cash, balances with the Reserve Bank and the balances in current account with the State Bank of India, notified banks and other banks and investments in State and Central Government securities less borrowings from the Reserve Bank and the State Bank of India. Investments in "other approved securities" were, however, not included for purposes of computing the net liquidity ratio. The Reserve Bank had received representations from both banks and the authorities whose issues comprised "approved securities" that banks were reluctant to subscribe to bonds floated by these authorities. In view of this, the Reserve Bank has decided to include, with effect from 4th December 1964, "other approved" securities in computing the net liquidity position. However, to preserve the essence of the credit control formula, it has also been decided to exclude from the total of liquid assets of banks, in addition to their borrowings from the Reserve Bank of India and the State Bank of India, their borrowings from the Industrial Development Bank, too, as the last partakes, in the opinion of the Reserve Bank, of the character of borrowings from the central banking institution.

COTTON TEXTILE INDUSTRY IN U.S.

MILLIONS OF DOLLARS BEING SPENT ON MODERNISATION

FOR the American cotton textile industry, the decade 1954-64 began on a note of depression but ended in rebounding hope for the future of American textiles. The most striking feature of the decade was that, while there was a downward trend in all indicators such as active spindles and looms and annual production, the industry more than doubled its annual rate of modernisation during the decade. In the current year, the industry will be spending $820 million on modernisation, as compared with $331 million in 1954.

A review of the American textile industry published recently by the American Textile Manufacturers' Institute and summarised in the monthly journal (November issue) of the Indian Cotton Mills' Federation shows that, during the period 1954 to 1964, spindles in place decreased from 23.91 million to 19.36 million, thereby recording a fall of 15.5 per cent. The number of active spindles dropped during this period from an average of 19.38 million in 1954 to 15.83 million in 1963 or, in other words, a fall of 18.4 per cent. The reduction in the number of looms was still higher. While looms in place were reduced from 392,000 at the beginning of 1954 to 295,000 at the beginning of 1964, active looms were down to 289,000 at the close of 1963, from 358,000 in 1954.

It will be interesting to see the trend of production of cloth and yarn during this period. The table below sets out the statistics in this regard:

(Yarn in million kgs.; cloth in million yards)

Year	*Yarn production*	*Cloth production*
1954	1,593	9,894
1955	1,695	10,178
1956	1,675	10,321
1957	1,730	9,755
1958	1,655	9,182
1959	1,839	9,600
1960	1,788	9,363
1961	1,754	9,153
1962	1,789	9,274
1963	1,743	8,779

Source: *Cotton World Statistics.*

Many factors have contributed to achieve the production despite a heavy reduction in capacity, both installed and active. Longer operating hours and increased machine efficiency have, of course, led to greater productivity, offsetting in some measure equipment decline.

As many as 6.3 million spindles (approximately one-third of the installed capacity) were rehabilitated during the last five years. This includes rebuilt spindles also. The utilisation statistics show that, as against 5,625 hours operated per active spindle in 1954, the average for 1963 was as high as 6,354. For five consecutive years, hours operated have been constantly above the 6,000-mark equivalent of full three-shift, five-day, 50-week annual operation.

A further indicator of modernisation lies in the annual expenditure of the textile industry for new plant and equipment which has risen from $331 million at the start of the decade to $640 million in 1963. The current indication for 1964, as already stated, is $820 million with clear evidence that regeneration of confidence is playing a substantial role.

Many developments have taken place in the field of international trade for cotton textiles during the decade under review. Negotiations for Japan's accession to the General Agreement on Tariffs and Trade was begun in 1954. It culminated sometime in September 1955 with a slash of 25 to 50 per cent in most of the United States textile duties.

A heavy reduction in import duties resulted in a boom in export followed by international textile agreement in October 1961 to streamline imports. The following figures indicate the magnitude of the boom in exports:

Year	*Imports of cotton piecegoods into U.S.A.* (Million kgs.)
1954	7.5
1955	13.1
1956	18.4
1957	12.5
1958	14.2
1959	25.8
1960	51.7
1961	31.8
1962	57.8
1963	60.1

Source: *Cotton World Statistics.*

Even with the volume of cotton cloth imports exceeding exports, as it has done in three of the last four years, and the consequent supply of goods for consumption in excess of domestic production, it is worthwhile to note that the *per capita* quantity of goods available dropped to a new low of 57.26 square yards for 1963 from 60.44 square yards in 1962 and a ten-year average of 63.00 square yards.

One-price Cotton

Another important event of the decade was the abolition of the two-price raw cotton marketing system in 1964. In 1954, the Federally-held raw cotton stocks were rising dangerously and the first pressures were placed on Government to bridge with an export subsidy the widening gap between its high domestic support price and the lower world market price. For more than eight years, beginning in January 1956 and extending into 1964, domestic mills were to bear the cross of two-price cotton. With the abolition of the two-price system, the United States mills can buy cotton at the same price as their overseas competitors. The new cotton law, fully effective from 1st August 1964, is for two years only. The purpose of this Act is threefold: increasing cotton consumption, maintaining growers' income and preventing discrimination against domestic mills. The American industry is further agitating for making the one-price system permanent. Enactment of the one-price system has witnessed reduction in prices on a great part of the cotton textiles based on supply and demand conditions in the market. It is considered a fair estimate that prices of at least 80 per cent of cotton mill products have gone down.

It is simple economics that, if cotton is substantially lower over a representative time period, goods made from it, other things being equal, will reflect this lower cost, stimulating consumption and sales. In fact, an independent study covering 38 years from 1925 to 1963 has proved a "high, positive correlation" of 90 per cent between prices of raw cotton and wholesale prices of unfinished cotton cloth based on two months lead time, and that "increases or decreases in the one were almost invariably accompanied by increases or decreases of the same degree in the other."

The advent of one-price cotton found cotton textile markets generally in a strong position. Reduction in cotton costs adds substantial attraction for those mills which previously had blended other fibres with cotton more from cost considerations in a difficult period than from product requirements. Meanwhile, there appears likely to be no diminution of progress in the field of those blends which provide special qualities and enjoy public acceptance. The outlook is, therefore, for more attractively priced cotton textiles, increased mill consumption of cotton, improved profits, plough-back of substantial sums into plant and equipment, better promotional activity, and restoration of health and vigour to the industry.

The Bank of Baroda has been handling foreign business for many years. Today, the Bank has branches in London, East Africa, Fiji Islands, Mauritius and East Pakistan.

The Bank of Baroda through any of its foreign branches or its correspondents is fully equipped to offer all the services needed in foreign trade and to handle every type of foreign exchange business—including opening Letters of credit, the negotiation/collection of export bills, clean bills and cheques, foreign remittances, credit information, etc., and is always willing and prepared to assist you in solving your problems concerning imports, exports and foreign travel with prompt and efficient service.

THAT EXPERT TOUCH COMES WITH EXPERIENCE

THE BANK OF BARODA HAS BEEN HANDLING FOREIGN BUSINESS FOR YEARS & YEARS

Branches in London, Nairobi, Mombasa, Kampala, Dar-es-Salaam, Moshi, Mbale, Mwanza, Jinja, Kisumu, Narainganj (East Pakistan), Port Louis (Mauritius), Suva and Lautoka (Fiji Islands) and correspondent banks all over the world.

MANCHESTER LETTER

IMPACT OF BUDGET EXPECTED TO BE INFLATIONARY

MAN-MADE FIBRES LEADING

From Our Special Correspondent

MANCHESTER, *17th November*

WHATEVER the pre-election manifestos may have said, the past week has provided definite evidence that rising prices are near at hand. Putting political considerations aside, the interim Budget contained actual and prospective taxation changes which inevitably mean an increase in overheads and an advance in selling rates.

Under these influences, following so closely on the import surcharge which has intensified demand for locally-produced manufactured goods, the more animated movement among customers can be well understood. From the suppliers' viewpoint, output is limited partly by labour availability and partly by the individual amount of modernised machinery installed. Activity in the mills has reached 90 per cent of capacity but physical difficulties may well hamper any marked expansion beyond this point, as the last 10 per cent is always the hardest to achieve.

Reactions to the financial measures introduced by the new Government in the past three weeks have varied according to the particular circumstances of traders. As an instance, a textile firm, which has extensive overseas links, has described the tariff surcharge as unfortunate, suggesting that a quota, coupled with price restriction for a fixed period, would have curtailed the inflationary tendencies at home. This, however, is an opinion not shared by many local traders who are well satisfied with the turn of events and the demand which has been stimulated by the Government's action.

Phase of Disillusion

For the next few months, however, while the permanent officials at the Treasury are battling with the intricacies of corporation taxes, capital gains taxes and even suggestions of a wealth tax, there will undoubtedly be a phase of disillusion in boardrooms and among executives, foremen and many other types of key personnel in industry.

Government spokesmen have emphasised that measures may be adopted to curtail the activities of firms which take advantage of the new circumstances to raise prices unjustifiably. Textile profits, as illustrated by balance sheets over the past few years, have been far from excessive and the continual expenditure on new machinery has reduced margins to barely economic levels.

More favourable reports from distributing centres have lately been a welcome feature, so that more replenishment buying has followed. A keen demand is likely during the next few months and the market as a whole should benefit from current developments even if the pockets of individuals are liable to be lightened by the Chancellor through heavier taxation and rising prices.

Story of Growth

The importance of the man-made fibre section of the textile trade on the spinning and weaving mills of Lancashire is now so evident that policy statements have a direct bearing on all concerned. Mr. F. C. Bagnall, Chairman of the British Man-made Fibres Federation, took the opportunity in his annual address to cover subjects which are common ground for all users and producers of textiles.

Commenting on a year of record growth for the British Man-made fibre industry and forecasting a continuation of this growth in the future, he predicted that total production this year was likely to exceed 800 million lb. If 1960 is adopted as a base year, the growth index has risen by 35 per cent in the past four year.

Output of the three main synthetic fibres in the United Kingdom, he declared, would reach a much higher level during the next three years, as important plans for new factories and extensions had already been announced. Nylon alone is likely to reach an annual production rate of over 300 million lb., polyester and the acrylics should both exceed the one million lb. mark.

Ambitious plans for extending production of viscose staple capacity have also been outlined and output of some of the less highly developed fibres, including the synthetic elastomers is proceeding on a larger scale. On exports, Mr. Bagnall pointed out that increased production in several former substantial markets had adversely affected shipments of woven and knitted fabrics, but the quantity of staple and continuous filament yarns, sent abroad, had continued to rise over the past five years. Total man-made fibre exports, he said, had made a valuable contribution to the export drive. In 1964 they were likely to reach £81 million, which was double the 1960 figure.

The wider spread of the use of synthetics throughout the production branches of the textile industry had altered the pattern of trading, he continued. Deliveries of staple fibre to Yorkshire had lately exceeded those provided for Lancashire mills. So far in the current year deliveries of staple fibre to all British spinning industries had increased by a third compared with 1960, within which wool spinning consumption had risen by 70 per cent, while the proportion delivered to cotton had shown no change.

The most rapid progress, however, had been in warp knitting as in 1963, man-made fibres had accounted for no less than 90 per cent of fibre consumption in the production of warp knitted fabrics. For carpet piles, man-made fibres had overtaken wool as the most important raw material by weight, their share being 54½ per cent of the total.

The inroads made by the man-made fibres into traditional natural textile fibres have continued in the first half of 1964. The change has mainly affected woollen industry which now holds the proportion of 28 per cent against 31 per cent last year. Cotton's share is the same at 32 per cent, while the usage of man-made fibres has increased from 37 per cent last year to 40 per cent.

On the basis of these figures, Mr. Bagnall described the textile industry as now being more truly national than ever before. The traditional boundaries of fibre usage have become blurred, he added, and so have the old geographical divisions of the textile trade.

Informal talks with leaders of the industry have been going on, he disclosed, on the possibility of establishing some co-ordinating body to bring together the interests and needs of the various textile trade associations, which have represented their individual sections in the past. Co-ordinating bodies, he pointed out, already exist in all the textile industries of Europe apart from Switzerland, and although there are obvious obstacles to be overcome in such a project, they need not be insurmountable.

The Printing Trade

Among the major groups in the British textile industry, whose operations have lately shown considerable diversification, is the Calico Printers' Association where major acquisitions have taken place in retail distribution. The retail division of this combine now operates 25 departmental stores and 260 shops.

The Company's basic business of commission printing and dyeing has lately shown some improvement, according to the annual report, with an increase of 17 per cent in the volume of business offered during the year ended June, 1964. Demand for commission printing was augmented by business transferred on the closure of print works outside the Association.

Mr. Raymond Cullen, the Chairman, points out that this improvement is in relation to a total volume of commission printing business, which has fallen to 80 per cent of what it was only three years ago. The Government reorganisation scheme, he adds, did not go far enough in its attempt to remove surplus productive capacity, a view affirmed by the closure of works after the scheme had ceased.

Imagine a world without colour—a light-and-shadow world instead of our multi-hued universe. Colour implies life, vigour, variety...

Primitive man realised the significance of colour and made it very much a part of his life. He incorporated it in ritual. He used it for adornment or to make himself fearsome in battle.

Modern man uses colour even more—to make life varied and joyful—with bright colour schemes for homes, offices, automobiles—and beautiful illustrated magazines, multi-coloured rubber and plastic articles. All these and many others need pigments, and more so organic pigments such as those manufactured by COLOUR-CHEM.

Textile printers use organic pigment emulsions as well as synthetic binder materials, both of which COLOUR-CHEM were the first to manufacture in India. With the technical knowledge of Germany's leaders in the field—FARBENFABRIKEN BAYER AG. and FARBWERKE HOECHST AG.—and skill born of experience and unceasing research, COLOUR-CHEM continue to manufacture the finest quality products

EXTRA-LONG STAPLE COTTON SITUATION

TOTAL SUPPLY ONLY SLIGHTLY HIGHER, DESPITE MARKED RISE IN OUTPUT

INDIA is the largest single consumer of extra-long staple cotton (that is, cotton of a staple length of 1⅜" and over) in the world. Out of the aggregate world consumption of 1.3 million bales (of 474 lbs. net weight each) of this variety during the season 1963-64, India alone accounted for 190,000 bales, or 15 per cent of the total consumption. The whole of the requirements is being met from imports, as the country does not grow this superior variety of cotton. It is, therefore, natural that mill and trade circles in India always watch with keen interest the trends in the world picture of extra-long staple varieties. Since imports entail the spending of much precious foreign exchange and since prices are reflected in production costs, these circles are somewhat disappointed at the latest assessment of the world extra-long staple situation as made by the International Cotton Advisory Committee (Washington) and published in the October 1964 issue of its monthly publication, *Cotton*. For this assessment reveals that tight supply position in respect of extra-long staple will persist during the current (1964-65) season and that there is no possibility of any relief by way of reduced prices. The currently ruling prices, it may be noted here, are well above those prevailing a year and two years before, except in regard to the prices of U.S. cotton (grade 2 of 1½" staple) which are a shade lower.

Assuming a nominal production estimate of 650,000 bales for the Sudan, the Committee expects the total supply to be very near the 1963-64 level. It feels that demand will probably continue to be strong in Western Europe and Japan. Should, however, demand from Russia and Eastern Europe strengthen to the level of most years since 1958-59, the supply situation, according to the Committee, may remain "very tight."

The total world supply of extra-long staple during the current season is expected to be no more than 2.60 million bales, as against 2.59 million bales in 1963-64, to which level it had receded from 2.97 million bales in 1962-63. The supply is thus practically unchanged (as compared with 1963-64), although the estimated production shows a rise of 265,000 bales, from 1.76 million bales in 1963-64 to over 2.02 million bales in 1964-65. For the rise in production has been more than offset by the appreciable fall in stocks which, as on 1st August 1964, stood at 575,000 bales, as against 832,000 bales and 888,000 bales on the corresponding dates of 1963 and 1962, respectively.

Production

The estimated rise in production during 1964-65 is based entirely on the expectation of

Production and Exports

(In thousand bales)

	1964-65 (prelimi-nary)	1963-64	1962-63	1958-59

Peru	..	186	189	138
U.S.A.	..	2	3	23
Others	..	40	50	41

mproved yields. In the U.A.R., average yield or the 1964-65 crop is estimated at 570 pounds per acre which is slightly higher than the previous record attained in 1962-63 and exceeds, by far, the level attained during any other season. This improvement in yield is attributed largely to the widespread planting of more prolific varieties in place of the Karnak variety. Water supplies have been adequate for irrigation throughout the growing season and aggressive efforts were made to control insect pests. Based on this yield, the first official crop estimate was 987,000 bales, almost 4 per cent greater than the 1963-64 extra-long staple crop.

Production of American-Egyptian type cotton in the United States is estimated at 124,900 bales (500 pounds gross weight), according to the October crop report. This compares with 164,600 bales produced in 1963-64. A 24 per cent decline in acreage for harvest is responsible for the smaller crop here.

On 13th October, the U.S. Department of Agriculture announced a national marketing quota of 84,400 bales (500 lbs.) and a national acreage allotment of 77,758 acres for the 1965 crop of extra-long staple cotton. This would represent a reduction in acreage of almost 50 per cent in two years. Mid-December 1964 has been set as the date for a referendum among the growers on the quotas.

In Peru, a record high yield for extra-long staples, estimated at 551 pounds per acre, resulted in a record crop of 196,000 bales in 1963-64. With harvesting still incomplete, the current crop is estimated at 190,000 bales or near last season's record.

Average yields fell to 243 pounds per acre in Sudan last season, as the crop sustained severe insect damage and the total outturn of extra-long staples fell to no more than 390,000 bales from 650,000 bales a year earlier. Although it is too early to make an actual forecast of the 1964-65 crop in the Sudan, there are indications that the area planted will be slightly larger than last season. Considering that production here has been subject to wide variation from year to year, a nominal estimate of 650,000 bales has been assumed for this study.

Consumption

While the trend of output does exercise considerable influence on the price level, demand continues to be the key factor in the extra-long staple cotton situation. If the total demand were to remain at the last season's relatively high level, carryover stocks in the major producing countries would again be drawn down to minimum levels by the end of the season. Consumption data are not complete in all instances. The International Cotton Advisory Committee has, therefore, sought to give some indication of the trend from such data, as can be derived from the overall consumption and import demand stabilities. It is seen from this review that, in the short run, extra-long staple consumption has been favourably affected by the general upswing in the textile cycle. Consumption, therefore, should continue at near the 1963-64 level during the current season, assuming that a normal crop is harvested in the Sudan in order to assure that total supply is at least at last season's level. The short-term trend of cotton consumption may also be affected by the price trend over the past year. The rise in extra-long staple prices has been much more pronounced than in the longer upland varieties and this has altered the usual relationship that has existed between these types of cotton during the 1962-63 season. To the extent that this resulted in any shift from extra-long to other staples in certain end-uses, this would exert a limiting influence on consumption of extra-long staple cotton.

Competition from Man-made Fibres

In the long run, an important factor in the consideration of the future trend of consumption of extra-long staple cotton is the competition from man-made fibres. Here again, the price trend over the past year has not been favourable to an expansion in consumption of extra-long staple cotton.

Although the sharp increase in exports to Western European countries in 1963-64 may be attributed in part to the replenishment of stocks, it seems to imply at the same time that there was a modest improvement in consumption. Consumption increased somewhat in Austria, Spain, Switzerland, the United Kingdom and Yugoslavia, but probably declined in Italy and West Germany. The total increase in consumption of extra-long staples in Western Europe last season is estimated at about two per cent which is roughly commensurate with the recovery that occurred in upland types.

In India, imports have been well maintained, but consumption has reversed a three-year uptrend with an estimated decline of about 20 per cent from the previous season's record level. Even so, with consumption of 190,000 bales, India maintained its position as the largest single consumer of these cottons. Consumption for Japan is estimated at 120,000 bales—an increase of 50 per cent over the previous season and about double the rate of two years ago. In the United States, extra-long staple cotton consumption continued a two-year decline last season, but a slight upward trend has been evident since June.

The fact that any expansion in consumption of these cottons in many countries to date has been limited, may be attributed in part to intensified competition from the man-made fibres where world production reportedly increased by 16 per cent during the first half of 1964, as compared with same period of 1963. At the same time, there has been some switch to long-staple upland types in certain end-uses where substitution is feasible and where price factors are important.

Exports

Thanks to the decline in total available supply in the two major producing countries, the world exports of extra-long staple have suffered a setback. The actual exports during the 1963-64 season aggregated less than 1.80 million bales, as against the 1.92 million bales shipped in 1963-64. The pattern of trade, too, changed significantly in the sense that, while total trade in extra-long staples declined, larger

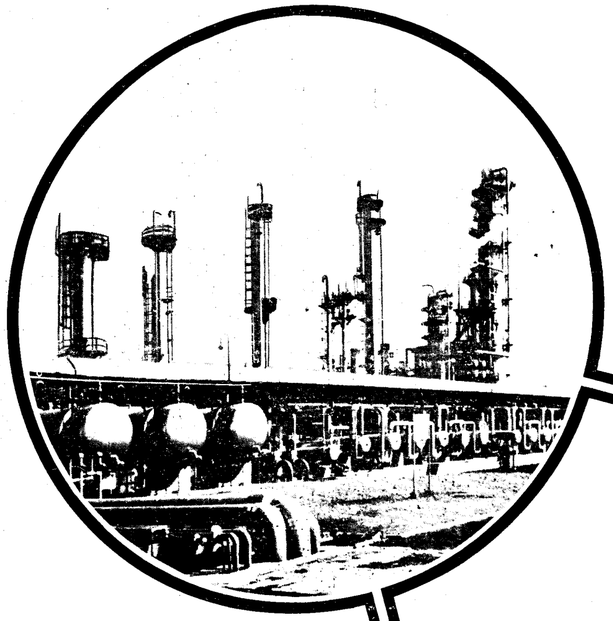
* Excluding U.S.S.R., China and Eastern Europe.

exports were made to most Western European countries. Aggregate shipments to these countries exceeded the 1962-63 level by almost 25 per cent. Exports increased by 40 per cent to Japan and 14 per cent to Mainland China. Conversely, exports to the U.S.S.R. and the Eastern European countries declined by about one-third, as compared with those in 1962-63. As a result of these changes, the share of exports to the Communist countries as a whole (U.S.S.R., Eastern Europe and Mainland China) in 1963-64 declined to about 30 per cent of the total exports, as compared with 40 per cent in the previous season.

Trade prospects for the 1964-65 season are overshadowed by the likelihood that supplies will remain near the 1963-64 level, assuming a more normal outturn in the Sudan. Against this relatively tight supply situation is the probability that demand will continue strong in Western Europe and Japan. Should there be any increase in demand from the U.S.S.R. and Eastern Europe, or should production in the Sudan be below normal, again, the supply situation would become very tight. However, sales commitments recently have been relatively light, which may be attributed in part to the heavy purchases made early this season in the United Arab Republic and to the comfortable stocks position in the importing countries.

The reduction in export availabilities in the principal producing countries and continuous strong demand are reflected in the upward trend of prices of extra-long staple cotton. Extra-long staple prices rose throughout last season with the sharpest rise occurring during April and May when the drastic shortfall in Sudanese production became apparent. This rise in extra-long staple quotations in Liverpool from September 1963 to the same month of 1964 varied from almost 8 cents per pound for Peruvian Pima No. 1 to over 13 cents for Sudanese Sakel G5S. These increases have had the effect of widening the difference between extra-long staple prices and those for other styles. The average premium of Egyp-

(*Continued on page 966*)



Kyushu Oil Company Refinery at Oita, southern part of Kyushu, now under operation.

Mr. Iwamoto, supervising engineer and his group in charge of Oita Refinery construction.

HOW DO YOU BUILD AN OIL REFINERY IN A REMOTE INACCESSIBLE REGION?

Most companies in Japan would turn to Japan Gasoline Company because JGC builds them fast and builds them right. The Kyushu Oil Company refinery at Oita is a typical example. When work began on the 40,000 barrel capacity Oita Refinery, there were no paved roads, no wharves and very few laborers in the area. JGC solved all these problems and after only 10 months the job was completed and Oita Refinery began operation after a test production run. A real achievement record in the annals of refinery construction.

In a briefing with Kyushu Oil, Mr. Iwamoto, supervising engineer in charge of construction explained that construction schedules were rigidly drawn up and timing factors minutely studied. Parts, component and material delivery times were controled right to the exact hour of the day they were to be used. Subcontractors were provided with sufficient lag-time contracts to enable them to meet all deadlines regardless of difficulties and unforseen problems. Material flow-charts controled delivery into pre-arranged staging areas eliminating man-hour waste and inefficiency. Technical, skilled and semi-skilled workers, and laborers were brought into the area as they were required and housing was established on the spot as the work force arrived. Many untrained laborers were recruited, instructed and trained in the finer arts of refinery construction.

There are more than one thousand chemical engineering specialists ready to act as your partner. Use their experience. They have played a vital part in 60% of the refineries constructed in Japan since 1945.

U.P. LETTER

ANTI-HOARDING ORDER PROVES HARMFUL

SUGAR AND COTTON TEXTILES IN DIFFICULTIES

From Our Special Correspondent

LUCKNOW, 23rd *November*

THE anti-hoarding order of the U.P. Government, which came into operation on 4th August 1964, was badly drafted and did not take the practical difficulties of traders into account. The order was amended once in the month of August 1964, when the ceiling on foodgrains held by traders was increased to 100 quintals. But even this limit did not prove economical and in the middle of this month the limit was raised to 250 quintals and the period of disposal of foodgrains over and above the permitted limit was increased from one week to a fortnight. The Chief Minister, Mrs. Sucheta Kripalani, observed that "this will prove more economical to the traders to fetch wagon loads of grains in the market instead of piecemeal transhipment of commodities." In fact the Government should have taken this fact into account at the time of enforcing the anti-hoarding order or even later when the traders pointed out that at least one truck or wagon load should be allowed to be moved into the market by any trader at any one time as it is more economical. It is a sad commentary on the bureaucracy that it ignored this suggestion. It is only now when, in spite of the bumper *kharif* crop, the arrival of foodgrains in the market is exceedingly poor that the Government has realised its mistake and changed the anti-hoarding order. The bad effect of a defective order is seen from the fact that, whereas paddy is selling at three seers a rupee in the villages, the price of rice in the bigger consuming centres even for coarse varieties is as high as one seer a rupee.

The same confused thinking is seen behind the U.P. Oil and Oilseed Control Order under which restrictions were imposed on the export of oils and oilseeds from the State. As against much larger exports in the past, the U.P. Government allowed traders and oil mills to export to other States only 6 per cent of the annual turnover on the basis of last year's record. This naturally created scarcity conditions in markets which were formerly supplied by U.P. The Union Food Ministry protested against this and requested the U.P. Government to remove all restrictions on the export of oil and oilseeds from the State. It is gratifying that the U.P. Government has realised its mistake and has amended the Oil and Oilseed Control Order with effect from 20th November 1964. Now exports of groundnut and groundnut oil, linseed and linseed oil, cottonseed and cottonseed oil are freely allowed. In respect of mustard, for the time being, exports to the extent of 60 per cent of last year's exports are permitted. This has considerably eased the situation and the prices of oils and oilseeds in the U.P. market have not increased much as a result of this relaxation of restriction on exports, although it is as yet early to judge the full effect of the relaxation of exports of oils and oilseeds.

The U.P. Government has also allowed the export of *khandsari* sugar. Since the stock of *khandsari* sugar in U.P. for last year's production, according to Government's estimates, is nearly 25,000 tons, the Government has permitted the export of 10,000 tons of *khandsari* sugar to Maharashtra, 5,000 tons to the Punjab and 5,000 tons to Rajasthan. It is time all restrictions on exports of foodgrains, oils, oilseeds and *khandsari* sugar from U.P. are removed. These restrictions do not seem to serve any worthwhile purpose and make the situation worse both for the U.P. producers and traders and for the consumers in other States. So far as U.P. consumers are concerned, they continue to pay high prices in spite of the restrictions on exports.

As many as 41 writ petitions were moved in the Allahabad High Court against the U.P. Foodgrains (Control, Regulation and Distribution) Order 1963. Mr. Justice B. D. Gupta of the Allahabad High Court has allowed all these writ petitions and has ordered release of stocks of foodgrains which were seized by the U.P. Government in different parts of the State in the last week of September 1964. His Lordship observed that the seizure of foodgrains by the Government in excess of the limits it had imposed was beyond the authority conferred by para 18 of the U.P. Foodgrains (Control, Regulation and Distribution) Order 1963, as the Government had not given any direction either in the order in question or by any other order issued thereafter providing for the mode in which producers or dealers were to act in the event of excess quality of foodgrains remaining undisposed by the prescribed date.

The fact of failure to give any directions by itself constitutes, according to his Lordship, lawful excuse within the meaning of the expression as used in Rule 5 of the Defence of India Rules, 1962, with the result that the mere possession of excessive quantity after the prescribed date does not amount to any contravention of the provisions of the U.P. Foodgrains Order 1963. The decision of the Court is based on the principles laid down in a Full-Bench judgment in the case of *King-Emperor* vs. *Arvind Kumar Deb*, reported in 1949 A.L.J. 383.

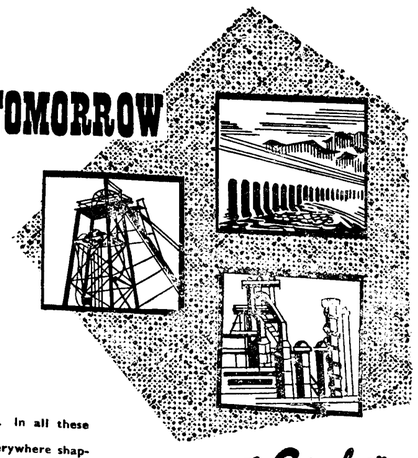
The U.P. Government has filed a special appeal against the order of Mr. Justice B. D. Gupta before Mr. Justice Oak and Mr. Justice Seth of the Allahabad High Court and has also applied for staying the operation of the order of the single judge during the pendency of the appeal. The result of this appeal is awaited with interest not only by traders in U.P. but also elsewhere.

Sugar Production

The current cane crushing season in U.P. commenced quite satisfactorily on 1st inst. and, at the very commencement, 40 out of the 71 sugar factories began crushing operations. This year the sugar acreage in U.P. is nearly 20 per cent higher and the yield is expected to be 5 per cent higher as compared with the last season. The crushing season is expected to be larger by 20 days and would extend to 144 days, if everything goes well. The sugarcane supply is expected to be sufficient to increase the output of factory sugar in U.P. in 1964-65 to 13 lakh tons as against 11 lakh tons in 1963-64. But the revised sugar prices in which the ex-factory prices for some sugar mills in U.P. have actually been reduced and for others not sufficiently increased, is likely to damp the enthusiasm of the millowners.

The U.P. cotton textile industry is also faced with a great hardship on account of the unexpected rise in cotton prices and an increase in the D.A. paid to labour, without a corresponding increasing in cloth prices. The U.P. Cotton Textile Millowners' Association has pointed out that cotton is not readily available unless a mill is prepared to pay premia over the ceiling prices and that, unless suitable adjustments are immediately made in the multiplier for the prices of controlled cloth, taking into account the prevailing market prices of Indian cotton, the cotton mills in U.P. and other upcountry centres will find themselves in great difficulty and will face serious financial losses.

TODAY
A NATION
SHAPES ITS TOMORROW



The people of India are planning in a big way for a prosperous future. Giant Steel Works, great dams and irrigational projects, huge industrial enterprises and thousand other plans for industrial development are rushing the country to its day of prosperity. In all these activities Kirloskar Lathes are everywhere shaping the plans to their successful completion. Pilots of progress, Kirloskar Lathes, have been in the forefront of country's industrial development for nearly a quarter century.

TRANSPORT NEEDS OF STEEL BELT

SOME SUGGESTIONS BY N.C.A.E.R.

IN the region comprising parts of West Bengal, Bihar, Orissa and Madhya Pradesh are situated the country's steel plants, accounting for almost the whole of its present steel production. The region extends east to west from Durgapur to Nagpur and north to south from Gaya to Waltair. The basic raw materials for the manufacture of iron and steel, namely, iron ore, coal, limestone, manganese ore and dolomite are heavily concentrated here. Eighty-seven per cent of reserves of both coking and non-coking coal, 100 per cent of all coking coal reserves and 80 per cent of iron ore reserves of the country are contained in this region. As five tons of raw materials are required for the production of one ton of steel, the region's suitability for the location of steel plants from the point of view of production costs and transportation economy is well known. It has thus come to be known as the "Iron and Steel Belt."

The transportation problems of this Belt have attracted considerable attention, because they have been felt at their maximum severity. This is not surprising, for over 90 per cent of the country's coal and steel production comes from the Belt and these commodities have generally to be carried by the Railways over long distances to reach the consumers. As the coalfields are situated in the interior, rail transport is again required to reach the port for any shipments by sea. Likewise, the bulk of the burden of transporting coal and steel and all the raw materials for the steel plants necessarily falls on the Railways, because the alternative means of transport are of practically no consequence. Road transport, for instance, operates effectively, so far as basic raw materials are concerned, over a range of only about 100 miles. There are also no efficient inland waterways serving the Belt, for the Calcutta-Patna Gangetic service has been closed since 1958 and the few canals in Orissa State are merely carrying the local produce. It would thus appear that the transportation requirements of the Belt are being met almost entirely by the Railways. Some may wonder whether so much dependence on one mode of transport would be prudent. But the National Council of Applied Economic Research (New Delhi), which has exhaustively studied the transport requirements of the Iron and Steel Belt*, has no doubt felt that, "having regard to the volume, intensity and nature of traffic as it now is in the Iron and Steel Belt and will increasingly be in the future, the burden of furnishing adequate transportation services in the region will have to be borne almost entirely by the railways."

Traffic Projections

The N.C.A.E.R.'s railway traffic projections upto 1965-66 (end-year of third Plan) and 1970-71 (end-year of fourth Plan) are, therefore, most relevant here. These are to be found in the accompanying table. It may be worked out from the figures that, while the Iron and Steel Bell's share of the entire originating traffic of the Indian Railways was 49.2 per cent in 1960-61, the relevant proportion will be as much as 62.0 per cent in 1965-66 and 65.0 per cent in 1970-71. The originating traffic in the Belt in the products of mines (including railway coal) situated in the Belt will constitute about 85 per cent and 81 per cent of that of the Indian Railways in 1965-66 and 1970-71, respectively. Also, within the Belt itself, the originating tonnage under products of mines (including railway coal) would be about 76 per cent of the total traffic originating in the Belt, both in 1965-66 and 1970-71. In view of the very large anticipated increase in traffic in the Belt and the great preponderance of the products of mines therein, the National Council considers it imperative that the improved types of rolling stock and improved transportation methods be concentrated in the Belt in the third and subsequent Plan periods to obtain the best results. The task facing the Railways is a challenging one, calling for adequate preparedness. The Council has recommended the following specific steps to improve railway performance:

1. To assist the movement of coal, iron and steel in full train loads, "multiple cars" and "train load" freight rates for these commodities should be introduced. This will be in keeping with the practice in other countries.

2. An early examination and appropriate revision of the railway rates for "smalls" is required to achieve a more rational distribution of traffic as between the railways and the road services, to improve railway finances and to release railway capacity for its more appropriate functions. Incidentally, the present freight difference as between "wagon loads" and "smalls" on the Railways does not adequately reflect the additional costs incurred by them in the haulage of "smalls."

3. As the drop in average speed of the goods trains (from 10.8 miles per hour in 1950-51 to 9.1 m.p.h. in 1962-63 on the broad-gauge and from 9.3 m.p.h. to 8.4 m.p.h. on the metre-gauge) is clearly an adverse operational feature, it should be remedied by sustained and vigorous action on the part of the Railways. Signalling systems should be speedily and substantially improved.

4. The average turn-round time of wagons in India (11.5 days per wagon) is relatively more than in several other countries (6.7 days per wagon in the U.S.S.R., 3.1 days in Japan, 5.5 days in West Germany and 5.8 days in Sweden). This should be examined and, in stations where detention time is excessively long, adequate attention should be paid to improving their capacity and lay-out.

5. The absence of weigh bridges in adequate numbers capable of weighing the new types of wagons is a serious handicap. This should be remedied.

6. The Railways should ensure that (i) wagons are supplied to collieries in adequate numbers and, as far as possible, at fixed times and (ii) sufficient wagons are supplied to all mechanically loading collieries and those loading from static bunkers (where Box wagons are not supplied).

The National Council's study, which has recommended the aforesaid steps to improve railway performance, is not oblivious of such improvements as have already taken place. For instance, the figure of "net ton miles per wagon day," representing the ultimate efficiency of wagon usage, has steadily increased on the broad gauge, recording a 45 per cent increase since 1950-51. Incidentally, this increase has not been due to the use of higher capacity wagons but due to better operation. Similarly, the figure of "net ton miles per engine day," which is an index of engine performance, has registered an increase of 45 per cent between 1950-51 and 1961-62 on the broad-gauge, as against an increase of only 16 per cent in the average tractive effort of engines.

Originating Railway Traffic

Coal Transport

The N.C.A.E.R. study has devoted particular attention to the problem of coal transport, because coal alone (including railway coal) will account for 52.4 per cent of the Steel Belts railway originating traffic in 1965-66 and 50.0 per cent in 1970-71. The Council's recommendations in regard to coal transport are:

(a) An agency linking up the consumers, the producers and the Railways may be set up to submit programmes for coal supplies and to promote movement of coal in trainloads.

(b) Consumers should not be too selective in respect of grades of coal required by them, as it would present difficulties in framing programmes of block rakes. The Coal Controller, too, should see his way to relax his gradewise schedule for industries, if such relaxation would promote movement in block rakes.

(c) Small collieries should examine the feasibility of amalgamation, so as to be able to obtain the best advantage out of the revised pattern of coal distribution.

(d) Excessive dependence on the West Bengal and Bihar coalfields would increase the average lead of coal traffic and cause operational difficulties over heavily-congested routes. To avoid this, the outlying coalfields should be developed with vigour.

(e) The establishment of coal dumps at consuming centres to be operated by stockists should be pursued, so that consumers asking for their entitlement individually could be catered to.

The National Council has also suggested some ways of relieving, as far as possible, the pressure on the Railways in the Steel Belt. It will be recalled, in this connection, that the World Bank Team on Coal Transport has recently outlined a plan involving development of additional railway haulage capacity and improvement of railway performance on the basis that means of transport other than the Railways will not account for more than 10 per cent of coal movement. The National Council, however, seems to be a shade more hopeful about the possibilities for relieving the pressure on the Railways to some extent. According to it, the construction and operation by 1965-66 of a number of thermal power stations (with an aggregate capacity of about two million kW) on the basis of locally available coal in the Belt would relieve the Railways of transporting about five million tons of coal per year. When examined in relation to all other suggestions, the transmission of power, equivalent to five million tons of coal, according to the Council, is the most economical in satisfying the power requirements of this area. Another suggestion pertains to road transport. If the steps being taken to improve the general position of the roads in the Steel Belt are expedited, road transport can account for some four million tons of West Bengal and Bihar coal, as against 72 million tons through railway movement, in 1965-66 and six million tons, as against 113 million tons by railways, in 1970-71.

Some relief can come from the operation of inland transport, provided navigation over the Durgapur Canal is developed by 1965-66 and the Mahanadi Canal System leading to Paradip Port is utilised for the carriage of export ores. The Council, however, does not think much of the potential of the Ganga for the carriage of coal to places in Bihar and Uttar Pradesh. Its view here is that the chances of economical operation are not bright on account of the length and cost of road haulage involved between the collieries and the riverside. As for coastal shipping, the present arrangements involve movement of about two million tons of coal annually from the Bengal and Bihar coalfields to South India and Western India. The level at which movement of this coal will settle down when the economics of coastal shipping operations and the railway freight rates are made more normal, according to the Council, is difficult to predict now. But the Council's conclusion, in this connection, is that, whatever may be the quantity that may move by coastal shipping, it is not likely to be anything but relatively small.

**Transport Requirements of the Iron and Steel Belt.* Published by the National Council of Applied Economic Research, New Delhi. Price: Rs. 18.

ACHIEVEMENTS AT BHILAI

The Soviet-aided Bhilai Steel plant in the public sector has grown from strength to strength since 31st January 1959 when it commenced operations. The first five years of its existence unfold a story of record-breaking achievements. It has thus become a standing example to be emulated by other steel plants not only in achieving projected targets but also in creating records.

The steel melting shop of the steel works has six open-hearth furnace, each of 250-tonne capacity. The open-hearth furnace, incidentally, is the biggest so far in this country, incorporating the latest technological advances, such as oxygen enrichment, evaporation and cooling. The steel melting shop reached its annual rated capacity of one million tonnes of ingot steel in December 1962—that is, within a short period of three years, thanks to Russian technical assistance. Its production has increased ever since and efforts have been made in achieving optimum productivity at minimum costs. The modern innovations in technology and certain modifications in designs have also played a none-too-small role in maintaining production at most of the units above the projected capacity. A glance at the following table will provide a clear picture of the production of major units, as compared with the rated capacity.

Products	Rated capacity (tonnes)	% fulfilment to rated capacity		
		1962-63	1963-64	April to September 1964
B.F. coke (dry)	1,221,000	99.0	100.6	101.4
Hot metal	1,110,000	106.5	116.7	114.8
Ingot steel	1,000,000	106.0	114.3	111.2
Ingots rolled	1,000,000	101.0	112.1	106.5
Billets	427,000	110.8	122.4	116.0
Rails and strip	365,000	93.8	109.9	104.4
Merchant products	255,000	88.3	110.8	119.8

Usually the principal fuel used in making steel is a mixture of coke oven and blast furnace gases. But new techniques, such as improved coke, use of high basicity sinter in blast furnace burden and new bottom-making method for open-hearth furnaces, have been successfully adopted at Bhilai.

NEW PRODUCTS AND PROCESSES

Nickel-base Alloy

UNION Carbide Corporation of New York has announced a new alloy for hot sulphuric and phosphoric acid service. A top corrision-resistant alloy, it is known as "Hastelloy" alloy G. Test results have indicated that it is superior to other commercial materials commonly used in sulphuric acid service. It is resistant to both oxidising and reducing environments, and to stress-corrosion cracking. Available in wrought forms, the alloy is readily fabricated and welded. Weld joint tests have shown that alloy G will suffer no significant loss in strength or ductility. Drawn welded tubing is one of the most promising forms in which the new alloy will be marketed. Outstanding corrosion-resistance, excellent mechanical properties, is of fabrication, and weldability make the alloy a superior choice for chemical process equipment. Other applications that appear to be promising are for phosphate fertiliser equipment, synthetic fibre processing, pulp and paper processes, and dissolution of spent nuclear fuel elements.

Long Life Target for Orthicons

A new target material developed for image orthicons has been given a guaranteed life of at least 750 hours by the English Electric Valve Company of Chelmsford which developed it. The Company reports that pre-production samples tested in the U.S. proved to have lives of between 3,000 and 5,000 hours. The new material has been called Elcon, from ELectronic CONduc.ing, as opposed to the ionic conduction used hitherto to transfer the charge pattern from the image side to the beam side. Other advantages include freedom from image retention, stability of contrast reproduction and effectively constant sensitivity. The Company's full range of 3-inch orthicons has the new target. Sample quantities of the 4½ inch tube will soon be available with full production scheduled for early next year.

New Relay

Standard Telephones and Cables of Britain is introducing a type of relay that has already performed 2,700m operators without deterioration during routine tests conducted over a period of several years by the Company's Belgian associate. The devices have their contacts permanently covered by a film of mercury and, at each operation, contacts are renewed since the liquid metal feeds along the contact blades by capillary action from a small reservoir in the base of the relay. This is a different action from that of the tilting mercury switches used in many types of control devices. The relays are of the reed type having their contacts in thick-walled glass envelopes filled with hydrogen and containing the mercury supply. They can be obtained as basic switch units but are usually supplied complete with coils, the whole unit being potted ready for insertion in printed circuit boards.

Electricity from Sun

A one-kilowatt installation, directly converting solar energy into electricity, has been designed at the U.S.S.R. Research Institute of Power Sources. The inventors believe that the installation would be very useful at pasturelands in pumping water from deep wells. One such installation can supply enough water for 10-12 thousand sheep. The equipment consists of a system of mirrors which focus sun rays on the surface of photo-electric batteries. A special device makes it possible to track the sun automatically. Excess energy is preserved in storage batteries which take over when the day is overcast. It has a service life of at least seven years, periodic cleaning of the mirrors being the only maintenance required.

Wheel Balancer

A compact, mobile wheel balancer introduced by Laycock Engineering Ltd., Sheffield, England, enables complete wheel assemblies, including hubs, to be balanced in a matter of minutes without taking the wheels off the car. The operator sits astride the balancer on a saddle, and propels it forward with his feet to bring the drive roller in contact with the car wheel at its bottom dead centre. He starts the drive by a "deadman" press button, and can take it up to the equivalent of 100 m.p.h. The stroboscope, mounted in front of him on the casing of the balancer, is under his control. He switches it on only when it is wanted and so prolongs the life of the flash tube, which is powerful enough for use in the brightest daylight. The drive roller is inclined to allow tyres of any pattern to be driven, and below it there is a braking plate, operated by a lever, for stopping the wheel. Designed for rapid positioning beneath the suspension, the transducer pick-up unit has an angular adjustment to allow kinetic and dynamic balance to be checked.

Novel Air-conditioner

An air-conditioner in the form of a table lamp, powerful enough to air-condition a room of more than 2,000 cu. ft. is being produced by a British firm. It has a 10½-in. base and stands 9½-in. high. The air is sucked in past the light at the top of the lamp; it is then filtered and released back into the room. A booster control for the rapid filtering of stale air is also fitted.

Automatic Mounted Cultivator

Experts in the Farm Mechanisation and Electrification Institute in Rousse, Bulgaria, have designed an automatic mounted cultivator which can be used simultaneously for inter-row and inter-hill cultivation of crops that have to be hoed. An electric control panel is the most outstanding feature of the machine. The cultivator moves along the rows and special feelers touch the Plants, produce signals which release the electric automatic device pushing the working parts into action. The cultivator hoes round the roots of the plants at a distance of about ten centimetres and with one pass hoes both along and between the rows.

Brushless Generator

With a new brushless D.C. arc-welding generator, voltage and current are infinitely variable by two simple controls. This makes for high-quality welding, since the operator can select the exact striking voltage and welding current for each individual job. The two controls are independent regulators in the voltage and current windings. The generator has neither brushes, brushgear nor commutator. The bearings are sealed and require attention only once in 10,000 running hours. The generator, manufactured by a British firm, Petbow Ltd. of Kent, in 300-amp. and 400-amp. versions, is incorporated in a welding set constructed in a way that gives a perfect and permanent alignment of crankshaft and rotor shaft without the need for shimming. Drive is through a flexible coupling. Engine driven sets are totally enclosed in a sheet-steel canopy for protection against the weather. Normally they are mounted on skids, but can be mounted on two- and four-wheeled trailers.

Refrigerator Casings

Fully-automated production of four-sided casings for refrigerators, washing machines, cookers and similar equipment can be carried out by a new machine manufactured by Redman Tools Ltd., Worchester, England. The first unit, capable of producing casings at the rate of one every ten seconds, is being installed in the London factory of a major refrigerator manufacturer. It costs about £100,000, and is said to be the only machine in the world that can make this type of casing automatically, from the coiled strip to the finished product, under the supervision of only one or two men. Initially, until coil strip is available, steel strip, cut to length, will be fed into the machine automatically by suction pads. The Company says that the machine performs a number of operations, each normally done by a separate machine, saving storage space, reducing inventory requirements and working time. It saves material because less trimming is needed, and also reduces setting-up time.

Measurement of Temperature in Converter

A new device which enables the automatic measurement of temperature in a converter has been developed in the Soviet Union. It permits the prompt replacing of the refractory tips of thermocouples without stopping the furnaces. Tests of the device on a 50-ton converter at Krivoi Rog Steel Works in the Ukraine have confirmed the high accuracy of measurement of the temperature of the molten metal. The refractory tips of the new device withstood as many as five heats.

Lensless Lens

Aluminium-coated glass with fine lines is said to make a "lensless lens" which magnifies without bending light as do ordinary lenses. Developed by Bausch and Lomb, Inc., 635, St. Paul Street, Rochester 2, New York, it consists of a wafer of glass coated with aluminium, with about 500 lines to the inch scribed in circles. The scribed areas permit some light to pass while the remaining aluminium blocks the rest. The Company explains that this lens blocks out "light which is not contributing to the desired image and allows that light to come through which does contribute to the image." The new magnifier, it is said will work with X-ray and infra-red rays as well as ordinary light.

Ironing Board that Won't Burn

For preoccupied housewives, Rhone Poulenc S.A., 22, Avenue Montaigne, Paris 8, has developed a light-weight ironing board that will not burn if a hot iron is left on it—even if the iron is exceedingly hot and left for a very long time. The folding support is of aluminium, but the top, also of aluminium, is covered with a sheet of silicone-rubber, resistant to 250°C. which will absorb steam and is thick enough to give the right amount of compressibility.

NEW IDEAS IN BRIEF

A new range of anti-static chemicals is claimed to prevent plastics and synthetic materials from sticking to machine parts during processing. It is being produced by Ciba, Basle, Switzerland.

Phosphates and starch molecules are combined in a water-soluble chemical which, it is claimed, prevent dirt from being re-deposited on washed clothes as they lie in the tub awaiting rinsing. The chemical is being developed by Chemicals and Phosphates, Haifa Bay, Israel.

A simple way of fixing wall tiles has been introduced without the use of an adhesive by Bertil Waldemar Bourwall, Van Kyrkogatan 1, Umea, Sweden.

Separation of solid particles from viscose liquid has been made easier by a thin separator produced by Bau von Hydrodynamischen Anlagen, 83 Bachstrassem, Freden-Leine, West Germany.

A domestic central heating system has been introduced that employs a single closed circuit system instead of the usual supply and return pipes between the source of heat and the radiators in a process developed by Niermeijer Ringverwarming, Kelders 29-35, Leeuwarden, Holland.

A machine which smoothes and polishes natural and artificial stone has been patented by Luigi Colombi, Via A. Fantoni 22. Bergamo, Italy.

Marketing trials have begun on a carpet incorporating plastic fibres. The resultant product is claimed to be not unlike plain Wilton. It is produced by Carpet Manufacturing Company, Kidderminster, England.

A technique has been patented for spraying insulating plastic foam directly onto metal and other surface, where it adheres as well as paint does in a process develop by Research Centre, East German Aircraft Industry, Konigsbrucher Landstrasse, Dresden N2, East Germany.

Solid lubricants which keep their effectiveness at 1000°F. and resist attack by molten sodium have been developed by the Lewis Research Centre, 21,000 Brook-park Avenue, Cleveland, Ohio. They are fused fluoride coatings; fluorides of calcium mixed with those of barium, lithium or sodium. They are said to be very effective both in vacuum and in air.

AUTHORISED .. .. ..

of Section 3 are mutually exclusive. A sale taxable under clause (*a*) of Section 3 will, therefore, be excluded from the purview of the clause (*b*) of Section 3. The sale contemplated by clause (*b*) of Section 3 is one which is effected by transfer of documents of title to goods during their movement from one State to another. Where the property in the goods has passed before the movement has commenced, the sale will not fall within clause (*b*); nor will the sale in which the property in the goods passes after the movement from one State to another has ceased to be covered by that clause. Accordingly, a sale effected by transfer of documents of title after the commencement of the movement and before its conclusion (and no other sale) will be regarded as an inter-State sale under Section 3(*b*). Under the Sales of Goods Act, 1930, if a document of title to goods is used in the ordinary course of business as proof of possession or control of goods, endorsement or delivery thereof according to mercantile practice will amount to delivery of goods thereby represented. The transfer of documents contemplated by Section 3(b) is, therefore, a transfer which in law amounts to delivery of goods. Transfer of documents either by endorsement or by delivery does contemplate transfer of title, but, in the absence of an indication to that effect in the statute, the place where the documents are transferred is not the place of sale. (*Tata Iron and Steel Company Ltd.* vs. *S. R. Sarkar and others*, 1960, S.T.C. 655).

The movement of goods must be closely linked with the sale of goods to cover movement undertaken for better enjoyment of goods after the title has passed. If the owner moves his own goods outside the State for their better enjoyment of what has been earlier acquired, the journey would not, in the commercial sense, form part of the flow or course of trade.

The exact meaning of the expression "sale occasioning movement of goods" in Section 3(*a*) of the Central Sales Tax Act, 1956 is that the delivery outside the State should be under a covenant or form an incident of a contract of sale. Where the dealer sold certain goods to commission agents who were acting for dealers outside the State and received the full price from the agents and booked the goods to places outside the State in his own name as consignor and consignee under the instructions of the agents and also endorsed the railway receipts in favour of the agents, it was held by the Andhra Pradesh High Court, in *Ramakrishna Rice Working Company* vs. *State of Andhra Pradesh* (1962, S.T.C. p. 755), that the commission agents purchased the goods on behalf of their principals residing in another State and they were not the agents of the sellers. The delivery of goods outside the State was not the direct result of sale. Therefore, the transactions were as inside sales and not exempt under the explanation to Article 286 (1)(*a*) of the Constitution, governing sales or purchases in the course of inter-State trade or commerce.

A paddy and rice merchant in Madras State despatched the goods to a destination in Kerala State, took the railway receipt in his own name, endorsed it in favour of a bank in Kerala State and sent the documents to that bank advising it to deliver the documents to the purchaser against payment. The buyer to whom the goods were intended refused to honour the *hundi*. So the dealer's agent at Kerala arranged to sell the goods to another buyer in Kerala and advised the dealer to send the demand draft in favour of the buyer, who honoured the draft by payment of money to the bank, received the railway receipt and took delivery of the goods. In this case it was held by the Madras High Court (*Thiruvengadaswami Iyengar* vs. *The State of Madras*, 1963 S.T.C., p. 856) that the sales were inter-State sales, coming under Section 3(*b*) of the Act, and that the Kerala State was the "appropriate" State" entitled to levy and collect any tax due from the assessee under the Act.

The principles for determination of the question, namely, whether a sale falls within the provisions of Section 3(*a*) of the Central Sales Tax Act, have been discussed in a number of Supreme Court decisions, one of the latest of such decisions being the case of *Cement Marketing Company* vs. *State of Mysore* (14 S.T.C. 175). It has been laid down in this case, following earlier decisions in 6 S.T.C—687, 11 S.T.C. 655 and 12 S.T.C. 282, that, where a contract of sale itself involves the movement of goods from one State to another, the sale would be an inter-State sale. It has, however, been held in a number of cases that, where the goods were delivered by the seller to the buyer's agent or representative for onward journey, the transaction has no element of inter-State character and is not an inter-State sale but a sale within the State of sale and delivery.

The position which seems to emerge from the aforesaid decisions is that, where, under a contract of sale, the movement of goods from one State to another takes place, such a sale would be an inter-State sale, but, if the delivery of the goods is made by the seller to the buyer or his agent within the State, the sale is an intra-State sale and a subsequent movement of goods at the instance of the buyer would not make it an inter-State sale.

Branch Transfers

The Punjab Government has issued a notification (No. 140/PA.46/48/S.5/63 dated 1st April, 1963 taking effect from the date of issue) that, if the goods manufactured in the State of Punjab were transferred by a dealer to his branch in another State, the transfer of goods would be liable to 2 per cent additional tax on the material purchased in the State of Punjab for use in such goods. As an instance, if a dealer engaged in manufacture of cycles costing Rs. 100 per unit has purchased material worth Rs. 20 per unit in the State of Punjab for consumption in their manufacture, 20 per cent of cost will be subject to 2 per cent additional tax in the event of a branch transfer. Similarly, if any goods purchased for re-sale in the State of Punjab are transferred to a branch in another State they will be subject to 2 per cent additional sales tax on completion of certain formalities. The contention of the Punjab Government is that, according to Section 5(2)(*a*)(ii) of the Punjab Sales Tax Act, the articles purchased in the State of Punjab for re-sale are meant for re-sale in the State of Punjab only and not outside. It is being contended by a section of lawyers that the notification is not valid in law, because the Sales Tax Law Validation Act, 1956 provided for lifting of the ban to tax inter-State sales only to the extent to which Parliament was permitted to do so under the clear terms of the Constitution. It has not permitted the States to levy tax on outside sales falling under Article 286(1)(*a*) even if the taxing statutes are sufficiently clear and valid in their terms and cast the net of taxation. The ban imposed on the States to tax sales or purchases taking place outside the taxing State is absolute and independent of the ban under Article 286, and Article 286(2) is not capable of being interpreted as enabling Parliament to destroy it. Another view is that the notification is perfectly valid, because it does not impose any tax on outside sales but introduces a tax on inside purchases, in pursuance of the second proviso to Section 5(2)(*a*)(ii) which is introduced herein below for ready reference:

"Provided further that when such goods are used by the dealer to whom these are sold for purposes other than those for which these were sold to him, he shall be liable to pay tax on the purchase thereof at such rate, not exceeding the rate of tax leviable on the sale of such goods, as the State Government may by notification direct in respect of a class of dealers specified in such notification, notwithstanding that such purchase is not covered by clause (*ff*) of Section 2."

The latter view appears to be correct, but the new levy in any case is an undue additional burden on the consumer and the trade. It may, therefore, be urged that, before any other State follows the lead of Punjab, the Central Government should take steps to introduce a suitable legislation debarring the State Governments from imposing any sort of tax on branch transfers. A branch transfer is not a sale, because no person can sell to himself.

Sales in the Course of Import

The course of import of goods starts on a point when the goods cross the customs barrier of the foreign country and ends at a point in the importing country after the goods cross its customs barrier. The sale which occasions the import is a sale in the course of import. A purchase by an importer of the goods when they are on the high seas by payment against shipping documents is also a purchase in the course of import. A sale by importer of goods after the property in the goods passed on to him either after receipt of the documents of title against payment or otherwise to a third party by a similar process is also a sale in the course of import.

Where an assessee selling imported milk powder had been taken delivery of the documents of title on payment of the value to the bank and handed them over to the clearing agent and, in the meantime, had entered into contracts of sale with buyers and issued delivery orders to them and the clearing agent had cleared the goods on behalf of the assessee, after receiving the full value from the buyers to whom the assessee had issued delivery orders and delivered the goods to them, it was held by the Madras High Court (*Arun* (1953) *P. Ltd.* vs. *State of Madras*, 1960, S.T.C., 723) that the buyers obtained title to the goods from the assessee only at the point of delivery and the sales were, therefore, sales within the State after completion of the import and were taxable.

In another case where the assessee who imported fuel, kept it in customs bonded warehouse and delivered it to the oceangoing vessels in pursuance of sale contracts and contended that, so long as customs duty had not been paid on the goods imported and they were kept in customs bonded warehouse, they must be deemed to be in the course of import and not taxable by reason of Article 286(1)(b) of the Constitution, it was held by the Madras High Court (*The Deputy Commissioner of Commercial Taxes* vs. *Caltex India Limited, Madras*, 1962, S.T.C. 163) that, when once the goods had been permitted to be imported and import duty had been levied by the customs officer, the course of import ended whether or not the goods were immediately cleared for home consumption or were kept in the bonded warehouse. The mere fact that the assessees, for the purpose of their own convenience warehoused the goods and thereby postponed the payment of duty levied on the goods, could not be taken to indicate that the goods were still beyond the customs frontier. The sales were, therefore, not in the course of import and were not exempt under Article 286(1)(*b*).

Customs Frontier

It was held by the Andhra Pradesh High Court in *Burmah-Shell Oil Storage and Distributing Company Ltd., Vizagapatnam* vs. *State of Andhra Pradesh* (1960, S.T.C. 533) that the customs frontier, as defined by the Government of India by notification dated 1st April 1937 issued under the Government of India Act, 1935, must be regarded as the same as frontier of India and this frontier extends along the sea to a width of six miles, which according to law, has been declared as the territories water belt. As soon as that frontier is crossed by the goods, the import must be regarded as complete. The one important condition required to make a sale an export sale is that the delivery of goods should be effected to the common carrier for the purpose of delivery to the buyer at the other end in the foreign country. Consequently, the sale of furnace oil and other petroleum products by the appellant company to the oceangoing ships directly from the bonded warehouse in the Vizagapatnam port was not a sale in the course of export within the meaning of Article 286(1)(b) of the Constitution and as such not exempt from the levy of sales tax under that Article.

The Madras High Court, however, has disagreed with the above view in a recent judgement in *Deputy Commissioner of Commercial Taxes, Madras Division* vs. *Devar and Company and others* (1963 S.T.C. 904), where it has been held that the customs frontier as elucidated by the Supreme Court in dealing with Article 286(1)(b) of the Constitution in the case of *Wadeyar* vs. *Daulatram Rameshwarlal* (1960, S.T.C. 757) would not mean any geographical feature like land or coast or limits of territorial waters, but would only mean the operation of the machinery of the Customs Department consisting of levy of collection of duty and clearance of the goods. There is no reason to construe the expression "customs frontier" occurring in Section 5 of the Central Sales Tax Act, 1956, in any way different from the sense in which it was understood prior to its enactment. The object and purpose of the President's notification in including six nautical miles of the sea belt as part of the Union or State territory are entirely foreign to the scope and determination of the taxability or otherwise of goods to sales tax enacted by the State legislature. A sale, therefore, by transfer of documents of title relating to goods on board a ship at a point of time after the ship had navigated into the six miles limit is a sale in the course of import within the meaning of expression in Article 286(1)(b) of the Constitution or Section 5 of the Central Sales Tax Act.

Sales or Purchases in the Course of Export

If, in respect of a sale, the property in the goods passes to the buyer after the goods have crossed the customs frontier for the purpose of export to a foreign country, the sale is said to have taken place in the course of 'export' and is, therefore, exempt from tax under Article 286(1)(b) of the Constitution. In the case of a f.o.b. contract, in the absence of a special agreement, the property in the goods does not pass until the goods are actually put on board (1960 S.T.C., p. 758 S.C.). Every sale or purchase preceding the export is not necessarily to be regarded as in the course of export within the meaning of Article 286(1) (*b*). It must be inextricably bound up with the export and a sale or purchase unconnected with the ultimate export as an integral part thereof is not within the exemption. Sales or purchases for the purpose of export are not protected, unless the sales or purchases themselves occasion the export and are integral parts thereof.

While all exports involve the goods being taken out of the country, all goods taken out of the country cannot be said to have been exported. The test is that the goods must have a foreign destination where they can be said to be imported. It matters not that there is no valuable consideration from the receiver at the destination end. If the goods are exported and there is a sale or purchase in the course of that export and the sale or purchase occasions the export to a foreign destination, the exemption is earned. Purchases made by philanthropists of goods in the course of export to foreign countries to alleviate distress there may still be exempted, even though the sending of the goods was not a commercial venture but a charitable one. The crucial fact is the sending of the goods to a foreign destination where they would be received as imports (1960, S.T.C. 764 S.C.).

In order to extract the exemption from sales tax there must be casual relation between the sale and the export, a relation which is intimate and real. Sale must inextricably be bound up with the export and form an integral part thereof. One must be able to say that, without the export, the sale is not effected, in other words, it was the sale which occasioned or caused the export (1962 S.T.C. 310). In certain cases, the assessee had entered into contracts with foreign buyers and delivered the shipping documents to the local banks against payment of price. They contended that the local banks should be deemed to be agents of the foreign buyers, who should, therefore, be assessed as last buyers in the State. It was held by the Madras High Court that the sales by the assessees to the foreign buyers were sales in the course of export and exempt under Article 286, that the banks did not function as the agents of the foreign buyers for taking possession of the goods, that the foreign buyers were not the last purchasers before export and that, therefore, the assessees were rightly assessed to sales tax as last purchasers (1962 S.T.C. 344). In another case, under the terms of contract, the assessee delivered certain goods at the godown of an exporting firm at Madras. At that time, the assessee did not know who the foreign buyer was. On delivery of the goods, the exporting firm paid the assessee 95 per cent of the price of the goods sold after deducting discount, brokerage, freight etc. The balance of the price was paid to the assessee after shipment of the goods was completed. There was nothing in the contract to indicate that the property in the goods passed after shipment. It was held that the sales were purely local sales and were not exempt, under article 286(1) (b) (1962 S.T.C. 824), from the sales tax payable to the State Government.

Notice

THE BENGAL FLOUR MILLS COMPANY LIMITED

NOTICE IS HEREBY GIVEN THAT THE Board of Directors has today declared an Interim Dividend of 10 per cent (subject to deduction of Income-tax) on the shares of the Company in respect of the year 1964. The dividend will be payable on or after 18th December, 1964 to those members whose names are entered in the Register of Members of the Company on that date. Dividend Warrants will be despatched to members and no application to the Company is necessary.

NOTICE is also hereby given that the Register of Members of the Company will be closed from 4th December, 1964 to 18th December 1964, both days inclusive.

By Order of the Board,
BALMER LAWRIE & Co. LTD.,
D. MANSON,
Managing Director.
Managing Agents.

21, NETAJI SUBHAS ROAD,
CALCUTTA, *20th November*, 1964.

Notices

PHILIPS INDIA LIMITED

NOTICE

Notice is hereby given that a General Meeting of the members of the Company will be held at the offices of the Company's Registrars, Jardine Henderson Limited, 4, Clive Row, Calcutta 1, on Thursday, December 17, 1964, at 11 a.m. to consider and if thought fit to pass with or without modifications the following resolutions which will be proposed as special resolutions:—

(*a*) That 4,80,000 new ordinary shares of Rs. 10/- each in the authorised capital of the Company be issued at a premium of Rs. 6/- per share, i.e. Rs. 16/- per share payable in full on application on the footing that such new ordinary shares shall rank in all respects pari passu with the existing ordinary shares in the Company save and except that they shall not participate in any dividend which may be declared in respect of any period ended on or prior to December 31, 1964.

(*b*) That subject to the approval of the Reserve Bank of India, out of the said 4,00,000 new ordinary shares of Rs. 10/- each, 78,125 shares be issued to N. V. Philips' Gloeilampenfabrieken, Eindhoven, Holland for subscription for cash at a premium of Rs. 6/- per share as aforesaid and 21,875 shares (aggregating to a total of 1,00,000 shares) at a premium of Rs. 6/- per share for consideration other than cash in partial conversion of their loan of Rs. 50 lakhs to the Company.

(*c*) That subject to the approval of the Reserve Bank of India wherever necessary the remaining 3,00,000 new ordinary shares of Rs. 10/- each so issued be offered in the first instance for subscription for cash at a premium of Rs. 6/- per share to those members (other than N. V. Philips' Gloeilampenfabrieken, Eindhoven, Holland) whose names are registered on the Register of Members of the Company on December 17, 1964, in the proportion as nearly as circumstances admit of three new ordinary shares for every five ordinary shares held as on that date, fractions if any of a new ordinary share issuable on this basis being disregarded with a right to renounce all or any of the shares so offered to them in favour of any other person and that any question arising in the apportionment of such new shares or any of them amongst members and in the avoidance of fractions shall be determined by the Directors in their absolute discretion.

(*d*) That the Directors be and are hereby authorised to offer the said 3,00,000 new ordinary shares of Rs. 10/- each at a premium of Rs. 6/- per share i.e. Rs. 16/- per share payable in full on application for subscription to the members aforesaid other than to N. V. Philips' Gloeilampenfabrieken, Eindhoven, Holland by a Letter of Rights specifying the number of shares to which they are entitled and providing therein that the offer if not accepted within thirty-one days from the date of offer shall be deemed to have been declined and specifying that the payment for such shares at the rate of Rs. 16/- for each new ordinary share so offered shall be required to be made in full on application.

(*e*) That any new ordinary shares not taken up by any of the said members or their renouncees in response to the aforesaid offer shall be available for subscription by such of the said members who take up their rights in full under the aforesaid offer and who apply for additional shares.

(*f*) That the right to apply for additional shares shall not be renounceable in favour of any other person and in the event of applications for additional shares exceeding the number of shares available, the allotment shall be made in such manner as shall be determined by the Directors in their absolute discretion.

(*g*) That the Company authorises the Directors to dispose of any new ordinary shares not taken up by the said members or their renouncees in accordance with the terms as detailed hereinabove in such manner as shall be determined by the Directors in their absolute discretion.

(*h*) That no allotment of any new ordinary shares shall be made to a person not resident in India unless he or she has obtained prior approval of the Reserve Bank of India.

(*i*) That the Directors are further authorised to settle any question or difficulty that may arise with regard to the issue and allotment of these shares in such manner as they shall determine in their absolute discretion.

The Register of Members of the Company will be closed from December 3, 1964, to December 17, 1964, both days inclusive.

A member entitled to attend and vote at the Meeting is entitled to appoint a proxy to attend and, on a poll, to vote instead of himself; such proxy need not be a member of the Company. Proxies in order to be effective must be received by the Company not later than 48 hours before the Meeting.

An Explanatory Statement as required by Section 173 of the Companies Act, 1956, is being posted to members.

By Order of the Board

THE BRITISH BURMAH PETROLEUM COMPANY LIMITED

(Registered under the English Companies Act)

NOTICE

NOTICE IS HEREBY GIVEN THAT THE fifty-third Annual General Meeting of the Company will be held at Noble Chambers, Parsi Bazar Street, Fort, Bombay, on Thursday, the 24th December 1964, at 4.00 p.m. (S.T.), for the following purposes:—

(*a*) To receive the Balance Sheet and Statement of Accounts for the year ended 31st March 1964 together with the Reports of the Directors and Auditors thereon;

(*b*) To elect a Director in place of Mr. A. P. Faickney who retires by rotation and being eligible offers himself for re-election, and for that purpose to consider, and if thought fit, to pass the following Resolution as an ordinary Resolution, of which special Notice as required by Section 185 of the English Companies Act, 1948, has been received by the Company:—

"RESOLVED THAT Mr. A. P. Faickney, who has attained the age of 70 years and who retires by rotation, be and is hereby re-elected a Director of the Company and it is hereby specifically declared that the age limit for Director prescribed under Section 185 of the English Companies Act, 1948, shall not apply to him."

(*c*) To elect a Director in place of Mr. C. R. Jussawala who retires by rotation and being eligible offers himself for re-election, and for that purpose to consider, and if thought fit, to pass the following Resolution as an Ordinary Resolution, of which special Notice as required by Section 185 of the English Companies Act, 1948, has been received by the Company:—

"RESOLVED THAT Mr. C. R. Jussawala, who has attained the age of 72 years and who retires by rotation, be and is hereby re-elected a Director of the Company and it is hereby specifically declared that the age limit for Director prescribed under Section 185 of the English Companies Act, 1948, shall not apply to him."

(*d*) To appoint Auditors and fix their remuneration.

A Member of the Company entitled to attend and vote at the above Meeting is entitled to appoint a proxy to attend and vote, instead of himself and the proxy need not be a member of the Company.

By Order of the Board,
THE BRITISH BURMAH PETROLEUM COMPANY LTD.,
F. S. PANTHAKI,
Acting Secretary.

NOBLE CHAMBERS,
PARSI BAZAR STREET,
FORT, BOMBAY.
12th November 1964.

The Transfer Books of the Company will be closed from Saturday, the 5th December 1964 to Tuesday, the 22nd December 1964. (Both days inclusive.)

SHAREHOLDERS ARE REQUESTED TO NOTIFY ANY CHANGE IN THEIR ADDRESSES WITHOUT DELAY.

THIS IS AN ANNOUNCEMENT AND NOT A PROSPECTUS. PERSONS INTERESTED IN FULL DETAILS ARE REQUESTED TO APPLY FOR A COPY OF THE PROSPECTUS FROM THE COMPANY'S REGISTERED OFFICE, BANKERS, BROKERS, AND UNDERWRITERS NAMED BELOW

OBJECTS AND PROPOSED ACTIVITIES

The Company proposes to engage in the world-wide tramping and coastal trade. With this end in view, the Company has, in the first instance, ordered five bulk carriers of about 38,100 DWT each from Bremer Vulkan Schiffbau und Maschinenfabrik, Bremen, West Germany, suitable for carriage of bulk cargoes, from light grains to heavy ores. The vessels are to be built to the design and specification approved by Sir Joseph W. Isherwood and Company Ltd., London, one of the world's most renowned firm of Naval Architects and Consultants, specially in ship design and supervision of construction of ships. The first bulk carrier is expected to be delivered about November/December 1965 and others at an interval of three months each thereafter.

APPLICATIONS

Copies of Application Forms and Prospectus can be obtained from the Company's Registered Office, from any of the above mentioned Underwriters, Brokers and Bankers to the issue named in the Prospectus or any of their main branches at the addresses given in the Prospectus.

THE SUBSCRIPTION LIST WILL OPEN AT THE COMMENCEMENT OF BANKING HOURS ON 2ND DECEMBER 1964 AND WILL REMAIN OPEN UNTIL THE CLOSING OF BANKING HOURS ON 9TH DECEMBER 1964 UNLESS CLOSED EARLIER OR LATER AT THE DISCRETION OF THE DIRECTORS BUT NOT BEFORE 7TH DECEMBER 1964.

"Someone should tell him about State Bank Travellers Cheques!"

Armed guards can cost a lot of money. Why not carry all the cash you want in the form of State Bank Travellers Cheques? They're absolutely safe, and much more convenient.

The State Bank of India issues its own Rupee Travellers Cheques in denominations of Rs. 50/- and Rs 100/-. These can be cashed at any of the 1700 Offices of the State Bank of India and its Subsidiaries. They are also encashable at encashing Agents at airports, and hotels and shops; in India and abroad. They're good anywhere, anytime, even after banking hours.

No irksome formalities. No risk. If lost, these cheques can easily be replaced.

Don't take risks.
Take State Bank Travellers Cheques.

STATE BANK OF INDIA

WHAT IS WRONG WITH FOOD PRODUCTION?—II

By S. Ramayya, I.A. & A.S. (Retd.)

THE Indian agricultural system today is one of the worst legacies of British rule in India. The Colonial Empire builders and rulers thought that they were bringing law and order into a strife-torn country and improving its agriculture by introducing irrigation systems, research institutes, tenure laws and credit institutions with a new hotch-potch land revenue system. This base was essential for their other higher policy purposes. The land revenue, which was the main fiscal support of the State in the early days, was then most oppressive and later became anachronistic. The other reforms made little impression, while the by-products of their rule created some awful problems, getting over which is a tremendous task today.

The British peace set the population growing and, after 1920, it was a roaring avalanche, threatening to engulf Indian development. Industrial growth being poor, the people started pressing on the land, with the result that holdings became smaller and smaller; to a bare 3½ acres on an average today. Even in these holdings a huge number subsist on a joint family or joint working conditions. Half the men have practically no work, contribute nothing to production and actually come in one another's way. If 50 per cent of the rural population is removed elsewhere, the other 50 per cent will give the same output and will have better *per capita* income. This is a well-known symptom of an underdeveloped and an overpopulated country, usually referred to as disguised unemployment, with the marginal productivity of labour being zero, if not minus sometimes.

This sector with this background has been the target of developmental attack by Indian planners and administrators since 1950. This is a task which I am going to prove as next to impossible, unless we introduce drastic and violent changes in the approach.

To understand the agricultural problem better, recently I invited a friend of mine, a well-to-do landowner from the Cauvery Delta, Tanjore District, the rice bowl of the South, to come over and discuss with me the farming methods of today of that area, and show me his farm costs and accounts. These discussions and the scrutiny of accounts and costs gave me a good insight into agricultural economics. This combined with the micro-economic picture of today, only served to confirm my ideas on the maladies of this sector. The data in the following paras are all based on actual costs, etc., and are almost accurate.

I shall start with the background of production organisation in agriculture. In the early days of the British rule, the half-baked administrators tried to introduce huge estates in the shape of the *zamindari* system for the sake of easy land revenue collection and in the hope that the *zamindars* would start large-scale farming on the model of the English landlords in the home country. We all know its subsequent history. It is a far cry from those days to the present-time tiny land holding of two to three acres by peasant cultivators propped up by a thousand subsidies. These cultivators are supposed to be the sturdy and independent farmers, owning their land producing not only for themselves but also for the 30 per cent urban sector. There is a ceiling to land holding, the well-known 30-acre limit everywhere.

One of the main problems is how to make the cultivator the real owner of the land. Although he has all the good Indian qualities such as patience, hard work, genial temperament, shrewdness; common sense and a religious background, he is an utterly poor fellow, impecunious, ignorant of modern methods and has not much of the commercial spirit to improve himself and his family. In his surroundings and upbringing, it is impossible to make him the modern economic man, though he is not unaware of his interests. The result is cultivation by peasant landowners with an occasional odd labour is not much in evidence in India. There is a landlord, sometimes for unavoidable reasons residing in the village, letting out his land to crop shares and sitting in his house (which invariably is no better than a hut) and getting his share of the gross produce, now at 40 per cent in the district of Tanjore. Even the successful crop sharer, if he saves and purchases land, lifts himself to the *pial*-sitting class as it gives him greater prestige and status. The useless impecunious type sink into the landless labour class, the 30 per cent underdog of the rural sector.

A large number of absentee landlords of the middle class, owning 5 to 10 acres, live in towns pursuing other avocations. Their economics is simple. The 5-acre plot gets them 80 units of produce; and, at the rate of Rs. 9, it gives them a gross revenue of Rs. 720, or less land revenue, etc., a net of Rs. 660 per annum. Capitalised at 7 per cent or 8 per cent, the value of five acres is about Rs. 8,000. If the price is Rs. 12 per unit, the value of the land is more. In times of difficulty, they sell and clear out, to another man who invests that money in land and expects the same return.

Thus, there is at present a perpetual class of absentee landlords who have no interest in land except the return on capital; they are very much like the small shareholders of a joint-stock company. This is a peculiar trait of the Indian agricultural economy and the key man today is the crop-sharing cultivating tenant. On him rests the production of foodstuffs and we shall soon see how this system in itself retards the progress in output at certain stages. Here there is no way out, unless the State steps in as the monolithic landlord, buying out the absentee owner. Historically this has been tried and found impossible. If the *zamindar* is bought out, the absentee landlord springs in. He is a hydra-headed monster and even if we cut one of his heads another head sprouts. In a full market or semi-market economy, with impecunious subsistence farmers who own the land and who can sell or mortage it, there seems to be no way out. The alternative is only collectivisation of agriculture as in communist societies.

The crop-sharer gives his best, but his limitations are many and well known. Actually, he, with his family and an odd labourer now and then, cannot manage to cultivate even five acres today. The best of them can do only 4 to 4½ acres scattered in 20 places. Sometimes, he can get only 2½ to 3 acres in crowded villages. For convenience of study and calculation, I have taken five acres as his capacity. Agriculture is his main occupation, but, when he has no work in the field (for long spells he does not have any work), he does other odd jobs like road cutting, carrier work with his bullock cart and a little cultivation round his hut. His overall income and domestic economy are different subjects not dealt with here.

The Position in 1950-51

Let me start with an equilibrium position in 1950-51 in a typical five-acre holding cultivated by a crop-sharing peasant. The data are fairly accurate and taken from the then prevailing conditions in the Tanjore District of the Madras State. The price per unit of paddy (this is the well-known *kalam* of 12 Madras measures and I shall use the word *unit* for it) was about Rs. 9 and a five-acre holding yielded about 150 units on an average. The cost of cultivation was about Rs. 625, consisting of the following items:

		Rs.
1.	Seeds	45
2.	Manure: mainly farmyard manure	100
3.	Labour: average of 450 man-days at Re. 1 a day	450
4.	Interest on loans	30
	Total	625

The cultivator got a gross outturn of Rs. 1,350 (150×9), paid Rs. 720 to the landlord (over 50 per cent of the gross product in those days i.e. about 80 units×9) and himself earned out of this activity an income of Rs. 450, mainly for the labour of himself and his family. The land revenue including water charges of about Rs. 40+Rs. 20 for canal repair work was paid by the landlord out of his income of Rs. 720, so that his net income was Rs. 660.

This equilibrium position was, however, reached after a good deal of changes from 42-43 when the paddy price per unit was only Rs. 6. How the change occurs and its consequences are explained in the following paragraphs.

The Period 1950-51 to 1960-61

In the decade ended 1960-61, a number of changes have occurred, showing some interesting features. Production increased throughout India from about 55 million tons to 80 million tons. In the individual farms also naturally, there was an increase in yield. For example, in the five acre holding of the Tanjore District, the yield is now 200 units of paddy on an average as compared to 150 in the previous period. The main reason is stated to be the introduction of chemical fertilisers throughout the area (and also in many parts of India). Other reasons are also there: more regular water supply, newer techniques in cultivation and more marginal lands brought into cultivation. A 35 per cent increase in production has been common. Secondly, prices have increased from Rs. 9 to Rs. 12 per unit, that is, by about 33⅓ per cent. It is an intricate task to analyse the causes for the rise in prices but certain main features can be noted. The wholesale index number of prices in this period has registered a rise of 25 points to 125 (the base being in 1952-53 at 100). The rise for agriculture is 20 per cent and for industry 26 per cent. There has been heavy developmental expenditure. There has been more production but incomes too have risen all round. Consequently, there is more demand for food from urban areas. Greater demand at higher prices and greater production at higher costs meet and once more an equilibrium is attained. In this process, however, the cost of cultivation has gone up to almost double what it was in 1950-51. Noted below are the costs of this period taken from my landowner friend of Tanjore who keeps accurate accounts:

Costs of Cultivation for a 5-acre holding in about 1961 in the Tanjore District

Borne by the cultivator

		Rs.
(1)	Seeds	60
(2)	Manure (chemical fertilisers)	175
(3)	Manure: Farmyard fertiliser	135
(4)	Labour about 450 man-days at Re. 1/75 a man-day	780
(5)	Interest charges	50
	Total	1,200

Borne by the landowner

	Rs.
Land revenue and water charges	60.00
Canal repairs, etc.	22.50
Total	82.50

The gross product of 200 units at Rs. 12 per unit brings in Rs. 2,400 income. Under tenancy laws statutorily obtaining now, the owner gets 40 per cent of the product and the cultivator 60 per cent. From Rs. 2,400, the farmer pays Rs. 960 to the landlord. He is, therefore, left with Rs. 1,440. Deducting Rs. 1,200 his cost (including his and his family's labour), there is a profit element of Rs. 240 to the farmer in this work of cultivation.

Certain interesting deductions can now be made both from the micro-economic and from the aggregate analysis which agree remarkably.

In 1950-51, the population of India was 36 crores. Cereal production was 55 million tons, giving a *per capita* availability of 14 oz. per head per day. In the period 1951

as we saw in the earlier article, an investment of Rs. 1,500 crores in the food sector produced an output, in terms of value of Rs. 1,300 crores. In terms of quantity production went up remarkably by 25 million tons. So about 44 crores of Indian population had 80 million tons to consume in 1961, that is. 16 oz. a day. To a large extent this is a welcome feature indicating a small increase in food consumption which may promote increased economic efficiency of the poverty-stricken people with marginal standards of living.

This is seen in the profit element of Rs. 240 of the farmer which he apparently uses for higher food consumption. Experienced people from the villages confirm this from observation. While in the period before 1950-51, a cultivator's family consumed only 40 units, in the period of 1950-1961 they ate 60 units of paddy. The State, of course, could have squeezed more out of them by taxes (they do probably to a small extent by increase in excise duties and sales taxes), but he is left, rightly, with a larger portion of his production for himself.

The most surprising thing comes from the position of the landlord. In 1950, his net income was (Rs. 720-60) Rs. 660. In 1961, his net income was (Rs. 960-83) Rs. 877, a 33 per cent rise, as against an increase of 25 per cent in the wholesale index of prices. The State should and could have squeezed more out of him for developmental purposes and his position even now compares favourably with one who has invested in industries. This is a serious mistake in our fiscal policy.

Period of Stagnation from 1961 Onwards

From 1961, when the Third Five-year Plan starts, another era begins in agricultural production. As pointed out in the earlier article, in spite of an investment of Rs. 500 crores in the first three years of the third Plan, there is not only no increase in production but actually a loss in output, the food production being below 80 million tons which India reached in 1959 itself. The other symptoms are well known. Prices are shooting up. In the Tanjore district, the price of paddy is Rs. 16 or so per unit. There is great scarcity everywhere and the Government has started controlling prices and is already thinking of rationing. A serious situation is developing and all sorts of methods to increase production are now on the anvil. For the 46 crores today, a production of 80 million tons of foodgrains means only a 15 oz. ration, a fall of 1 oz. from 1961, and it will become worse with the growing population year after year. The crying need of the hour apart from other secondary remedies is to increase production.

What are the ways of increasing production? I put this question to engineers, scientists and practical farmers and I got different answers. Broadly, there are two schools of thought, one, especially those who are in the cultivation business, saying that, hereafter, we cannot increase production by our present methods. Any increase in fertiliser input will not increase output but only ruin the land. Technical and scientific people say that it is possible to increase production by scientific methods especially more manure and fertiliser inputs. We do not know where the truth is. Assuming there is something in what the scientists say, let us see whether, in practice, it is possible to increase output.

Let us take a simple model of a marginal unit with one variable, namely, fertiliser: If the use of another 1,000 lbs. of fertiliser is expected to increase output by 5 per cent in the five-acre holding, the position will be somewhat like this:

	Rs.
Cost of 1,000 lbs. of fertiliser at 15 paise per lb.	150
Extra incidental costs like additional labour, interest, etc.	30
Total	180

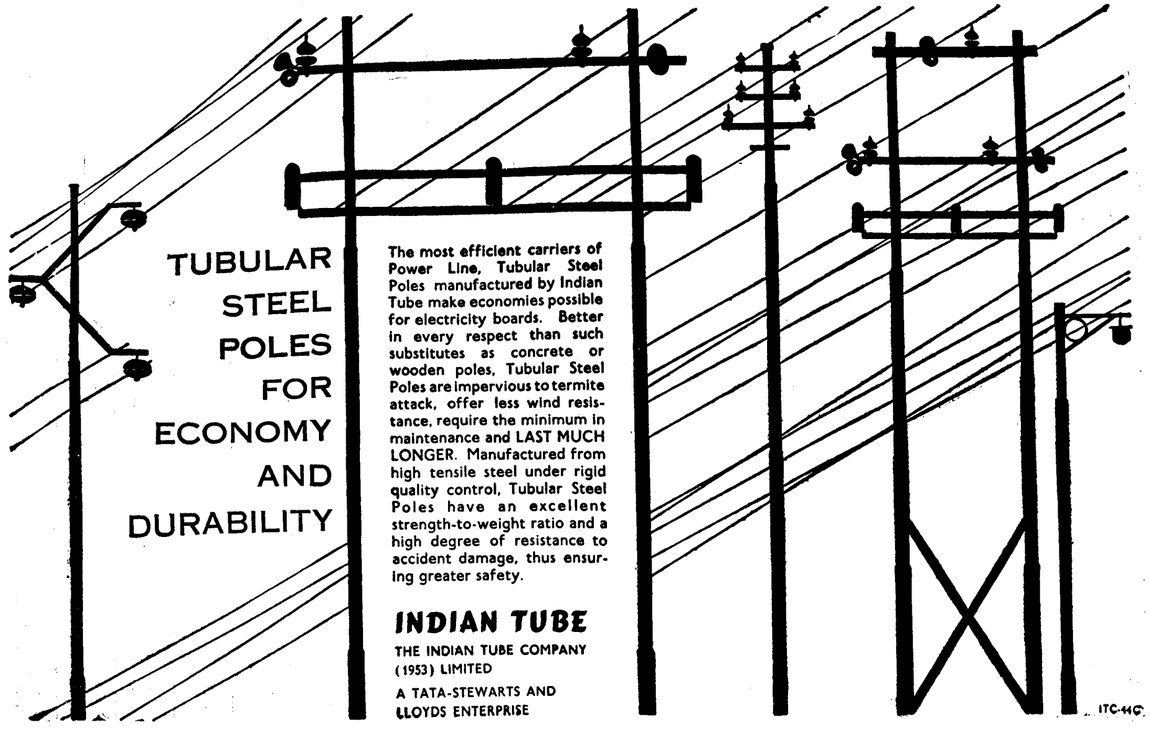
The extra produce is, say, 10 units of paddy and the marginal cost is Rs. 18 per unit which will also be the paddy price throughout the area. *The extra production can be got if we are prepared to pay Rs. 18 per unit as against Rs. 12 in 1961 and Rs. 15-16 today.* Such an increase in the farmer's price of paddy will not, however, work for the following reasons:

First, the urban people cannot simply afford it and the Government cannot go on subsidising rice for ever; somebody has to pay for the subsidies. Secondly, even assuming Rs. 18 per unit will be paid to the cultivator, only the small number of owner-cultivators can be expected to respond to the scheme, as they will not lose; but, psychologically, they are now upset by the food levies and the Government control of prices. Thirdly, the vast majority of crop-sharing cultivators will not obviously touch the scheme, even if we assure them a price of Rs. 18 per unit for the simple reason that their share of the extra output will be only six units and they will realise only 6× Rs. 18, that is, Rs. 108, while the total expenses are Rs. 180, and the balance of Rs. 72 going to the owner for his share of four units. The owner, it may be noted, is not incurring any additional expenditure in the example mentioned. There is one possibility here. If the price of fertilisers is reduced by 50 per cent and the cost for 100 lbs. of fertiliser is only Rs. 75 and if labour and other costs do not exceed Rs. 30, the crop-sharer may feel induced to work the scheme. Then there are other problems. The reduction of input cost in India is possible only by subsidy and subsidies beyond a stage create other repercussions.

This model also illustrates, by the inverse process, how if we cut down the marginal prices by control, production will go down. At Rs. 18, there will be 210 units in a five-acre farm; at Rs. 12, there will be only 200 units of production. It is obvious that the improved techniques of the second Five-year Plan have exhausted themselves and can work no more.

We are in a quandary. This is a vicious circle. How are we to get out of this?

The Kerala Government has constituted a conciliation board and a tripartite committee to go into the problems of the cashew industry workers. The conciliation board is presided over by the Deputy Labour Commissioner and consists of three other members, representing employees and employers. It will consider the demands of workers, including revision of wages. The tripartite committee, with the Chief Inspector of Factories and Boiler, as Chairman, has been asked to recommend minimum standards to be observed by all cashew processing establishments and to chalk out a phased programme for implementing the various provisions of the factories Act fully and strictly.



PROFITABILITY OF SMALL COMPANIES DECLINES SHARPLY

FASTER GROWTH IN BORROWED RESOURCES

FOR the second year in succession, the profitability of small public limited companies declined considerably; this was in 1962-63. As compared with the previous year, the decline in profits after tax was 17.3 per cent in 1962-63, as against 9.3 per cent in 1961-62. Both sales and total income recorded a lower rate of growth in 1962-63. As the expenses had also increased at a slower pace, there was an increase in gross profit and profit before tax. But the taxation provision increased by nearly 40 per cent, as a result of which the profits after tax declined by 17.3 per cent, dividends paid by 4.4 per cent and profits retained by as much as 52 per cent. These conclusions emerge from a study on the finances of 1,015 small public limited non-Governmental and non-financial companies, conducted by the Economic Department of the Reserve Bank of India. The companies studied account for 26 per cent of the paid-up capital of all such companies in the country in 1961-62, with each of them having a paid-up capital of upto Rs. 5 lakhs. The present study is the sixth such survey made by the Bank in the series. Whereas in the previous studies the data was presented for the calendar years, the present study covers the years ending 30th June. The coverage has also been rising from year to year—the number of units covered rising to more than double, from 501 in the first study to 1,015 in the latest study. Because of these variations, the data presented in the various studies are not strictly comparable. Nevertheless, they are sufficient to enable one to have an idea of the progress of these companies.

Working Since 1957

As will be seen from Table A on this page, the highest increase in sales was in 1957. But expenses (especially the cost of raw materials and salaries and wages) rose at a much faster rate, resulting in a sharp decline in gross profit and profit before tax. Although the taxation provision was also lower, profits after tax came to almost one-tenth of that in the previous year. The dividends distributed were lower by five per cent, and even for paying a dividend of about four per cent on paid-up capital, reserves had to be depleted to the tune of Rs. 33 lakhs. In 1958, the situation was almost the other way round. Sales and total income declined—although marginally—but the expenses, instead of rising further, recorded a decline of over two per cent. As a result, the profits and dividends increased considerably and it was possible to raise the reserves by Rs. 7 lakhs. The performance was more or less normal in the next two years, with improvements in all the major items of company finance, 1961 was, however, again a bad year and the deterioration became all the more prominent in 1962-63. The growth of sales and total income was considerably slower. In 1961, the cost of raw materials, salaries, wages and bonus and other manufacturing expenses also rose at a fast rate, resulting in very poor advance in gross profits and profits before tax. Although the situation in these respects improved in 1962-63 and the gross profits and profits before tax increased at a faster pace, but that is little consolation to investors because the greatest beneficiary of this improved performance was the Government. Taxation took away almost the entire increase in profits, with the provision for taxation increasing steeply, by as much as 39.1 per cent in 1962-63 over the previous year, over and above a rise of 14.3 per cent in 1961 over 1960. Consequently, the profit after tax declined by 9.3 per cent in 1961 and 17.3 per cent in 1962-63 and dividends by 4.4 per cent in 1961 and again at the same rate in 1962-63. As percentage to the paid-up capital, dividends paid came down from 6.8 in 1960 to 6.4 in 1961 and 5.7 in 1962-63. After paying these lower dividends very little amount was left for transfer to reserves.

It may be recalled that the Reserve Bank's analysis of the financial trends of the medium and large public limited companies in 1962-63—reviewed in *Commerce* dated 22nd August, 1964, on page 310—disclosed more or less similar features. In the case of medium and large companies also, gross profit and profit before tax had increased at a faster pace. But, due to a very fast rise in taxation provision, profit after tax, dividends paid and profits retained as reserves, all had come down.

Before proceeding further with the Reserve Bank's study under reference, it may be mentioned that the Reserve Bank's conception of gross profit is slightly different from that followed by this journal. According to the Reserve Bank, gross profit is derived after accounting for depreciation provision but before taking care of the payment of interest. According to this journal, it is just the other way round.

Income and Expenditure

An income-wise analysis of the 1,015 small public limited companies reveals that sales increased from Rs. 117.6 crores in 1961-62 to Rs. 127.8 crores in 1962-63, or by 8.7 per cent. Whereas other income remained almost unchanged at Rs. 1.6 crore, closing stocks of finished goods were larger by 20.2 per cent at Rs. 17.7 crores, the total income by 9.8 per cent at Rs. 147.1 crores and the total value of production by 9.8 per cent at Rs. 130.8 crores. On the expenditure side, the cost of raw materials consumed, which accounts for more than half of the total expenditure and appropriations, rose from Rs. 71.5 crores to Rs. 78.3 crores, salaries, wages and bonus from Rs. 15.1 crores to Rs. 16.6 crores and excise duty and cess from Rs. 88 lakhs to Rs. 120 lakhs, or from 0.74 per cent of the total production in 1961-62 to 0.92 per cent in 1962-63. The gross profit increased by 15.2 per cent or from Rs. 5.9 crores to Rs. 6.8 crores. As percentage to sale the gross profit rose from 5.0 to 5.3, as percentage to income from 4.4 to 4.6 and as percentage to paid-up capital from 26.7 to 30.1. Out of the gross profit of Rs. 6.8 crores, Rs. 1.7 crore was paid as interest and Rs. 30 lakhs as managing agents' remuneration, leaving a profit before tax of Rs. 4.8 crores in 1962-63, against Rs. 4.2 crores in the previous year. Over two-thirds of the profit before tax in 1962-63, or Rs. 3.3 crores to be precise, were appropriated for tax provision (the corresponding figures for 1961-62 being 56 per cent or Rs. 2.3 crores), leaving a balance of Rs. 1.53 crore as net profit (Rs. 1.85 crore in the previous year). As percentage to sales, the net profit came down from 1.6 to 1.2, as percentage of income from 1.4 to 1.0 and as percentage of paid-up capital from 8.3 to 6.7. The amount distributed by way of dividend was lower at Rs. 1.29 crore against Rs. 1.35 crore in the previous year—a decline from 6.1 per cent of the paid-up capital to 5.7 per cent. The amount of profit retained in business fell sharply from Rs. 50 lakhs to Rs. 24 lakhs.

Because of the inadequate coverage of some industries and the lack of precise information regarding the coverage of individual industries, it has not been possible for the Reserve Bank to give a complete industrywise information. However, the partial information which is available for a few industries, shows that, whereas the profitability in the plantations and engineering improved during 1962-63, that of rubber plantations, cotton textiles, chemicals, trading, and land and estate deteriorated considerably.

Assets Formation

During 1962-63, gross assets formation of the 1,015 small public limited companies amounted to Rs. 10.10 crores—a rise of 10.4 per cent, against 8.8 per cent in the previous year. Of this amount, paid-up capital accounted for Rs. 49 lakhs, reserves and surplus Rs. 70 lakhs, provisions for depreciation, taxation and other items Rs. 219 lakhs, borrowings Rs. 359 lakhs (bank borrowings Rs. 238 lakhs) and trade dues and other liabilities Rs. 312 lakhs. It will thus be seen that two-thirds of the gross assets formation was financed by external resources—the share in the previous year being nearly half. Borrowings from banks and depreciation provision were the most important items, accounting for 23.6 per cent and 17.1 per cent of the gross assets formation. The contribution of fresh capital through new issues was insignificant at 3.8 per cent or Rs. 39 lakhs—the percentage for the previous year being 4.2. About one-third of the total amount was used for the creation of gross fixed assets, as against nearly half in the previous year. Inventories, on the other hand, stood higher at 38 per cent, against 25 per cent—due to the larger stocks of finished goods. Trade credit, however, increased narrowly from 26 per cent to 28 per cent.

A study of the combined balance sheet shows that the net worth of the companies increased marginally from Rs. 30.86 crores to Rs. 32.05 crores; the percentage share to total liabilities coming down from 37.6 to 35.3. Borrowings, however, rose sharply from Rs. 24.86 crores to Rs. 28.45 crores or from 30.3 per cent to 31.4 per cent (borrowings from banks rising from Rs. 10.26 crores to Rs. 12.64 crores or 12.5 per cent to 13.9 per cent), and trade dues

GREAT EASTERN SHIPPING'S PROFIT DECLINES

UNCERTAIN PROSPECTS FOR CURRENT YEAR

THANKS to continued unfavourable conditions in Indian ports and further increase in operating expenses due to the rise in stevedoring costs, cargo handling charges, etc., the Great Eastern Shipping Company Ltd. [Managing Agents: Messrs. A. H. Bhiwandiwalla and Company (Bombay) Private Ltd., Bombay] has suffered a slight decrease in its profit for the year ended 30th June 1964. The quantity of cargo carried increased from 11.33 lakh tonnes to 11.78 lakh tonnes and so also operating earnings from Rs. 452.92 lakhs to Rs. 527.31 lakhs. But since operating and administrative expenses have together risen by as much as Rs. 79.67 lakhs or about 20 per cent, the gross profit has declined from Rs. 125.10 lakhs to Rs. 120.80 lakhs. Ratio of gross profit to operating earnings therefore shows a drop of no less than 4.7 points to 22.9 per cent. As against the decline in gross profit, the provision for depreciation has gone up from Rs. 64.70 lakhs to Rs. 75.94 lakhs, due, of course, to the expansion in the fleet and though that for the managing agents' remuneration is slightly lower at Rs. 3.90 lakhs as against Rs. 5.07 lakhs last year, the net profit has come down quite sizably by Rs. 14.93 lakhs to Rs. 40.90 lakhs. No provision for taxation has again been found necessary and hence none has been made for 1963-64. A provision of Rs. 13.95 lakhs has, however, had to be made for taxation for the year 1957-58.

Explaining the circumstances which have necessitated this latter provision the Directors observe:

> The Income-tax department has completed assessment of the Company for the accounting year 1957-58 (assessment year 1959-60) and has made a demand of tax of Rs. 24.44 lakhs against which the Company has already made a provision for Rs. 10.50 lakhs in the accounting year 1957-58. The Company has preferred a reference petition to the Central Board of Direct Tax and is hopeful of success. Although it has made a payment of Rs. 16.10 lakhs pending appeal, the Directors have, as measure of abundant precaution thought it fit to provide for this contigent liability out of the profit for 1963-64.

Out of the balance of profit, strengthened by Rs. 16.82 lakhs withdrawn from reserves, Rs. 36.30 lakhs are being transferred to the statutory development rebate reserve and a dividend of 10.8 per cent is being proposed on ordinary shares payable proportionately on the partly paid shares which became fully paid during the year and the bonus shares issued during the year. It will be recalled that, in the preceding year, the Company did not pay any dividend but issued bonus shares, instead, in the proportion of one for two.

The working results of the Company for the past four years are set forth in the following comparative table:

(In lakhs of rupees)

	For the year ended 30th June			
	1964	1963	1962	1961
Operating earnings	527.31	452.90	326.40	285.87
Other income	23.30	22.34	17.73	17.71

Market price of ordinary shares (in rupees):	1964	1963	1962	1961
High	18.28	19.00	14.80	16.23
Low	11.72	11.40	11.24	12.72

With the acquisition of five new ships during the year, the Company's investment on fleet has increased to Rs. 11.85 crores from Rs. 10.27 crores a year earlier. The total of gross block, inclusive of the fleet, has advanced from Rs. 10.34 crores to Rs. 11.94 crores. The depreciation provided so far is Rs. 4.13 crores and the net block is Rs. 7.81 crores. Investments, mostly in seven per cent debenture-stocks of Madura Mills Co. Ltd., are carried in the books at a cost of Rs. 20.87 lakhs while Current assets, loans and advances altogether amount to Rs. 655.93 lakhs. On the liabilities side, the paid-up share capital stands raised to Rs. 149.73 lakhs from Rs. 90 lakhs a year before. This is because, first, the six lakh partly paid shares have become fully paid on the payment of the unpaid amount of Rs. 5 per share and, second, three lakh ordinary shares of Rs. 10 each have been issued during the year as bonus shares in lieu of dividend. The paid-up share capital is supported by reserves and surplus aggregating Rs. 261.53 lakhs. With the increase in the fleet, secured loans have risen from Rs. 682.82 lakhs to Rs. 870.54 lakhs; of these Rs. 558.77 lakhs (as against Rs. 487.15 lakhs last year) are from the Government of India and the balance from banks. Current liabilities and provisions total Rs. 154.24 lakhs and are adequately covered by current assets, loans and advances. Receipts on account of incomplete voyages are Rs. 42.75 lakhs, as against the expenditure of Rs. 21.28 lakhs.

The Company's 1963 expansion programme was successfully completed during the year under review by the acquisition of five additional vessels with a total tonnage of 38,040, raising the number of ships to 19 and the gross registered tonnage to 127,924 as at 30th June 1964. As, however, the additional five ships came into actual operation only during the second half of the year, their working was reflected only partially in the results for the year. The Company has now submitted its 1964 expansion programme to the Government. This contemplates the acquisition of a further five ships at an aggregate cost of Rs. three crores. This is under the active consideration of the Government and if its decision is received in time the result of operations of these new ships will be reflected partly in the working for the current year and fully in that of 1965-66. The Company has placed an order for two bulk carriers of 38,500 dw.t. each, inpolving a total capital outlay of Rs. 4.12 crores. The necessary formalities for giving gurantees to the Japanese Shipyard are being completed and it is expected that the vessels would be delivered early in 1966. These vessels will be utilised for bulk carriage of ores and foodgrains.

As regards the prospects for the current year, the following extract from the Directors' report will be found most illuminating:

> "Last year, the hope was expressed that the Company would be able to derive benefit from the improvement in the international freigth market which was expected to be strengthened by the contemplated movement of foodgrains from the U.S.A., Canada and Australia to Russia and China. However, the actual movement of foodgrain did not materialise to the extent anticipated and consequently the expected benefit from the improvement in freight did not materialise. This goes to show how hazardous the nature of the shipping industry is and how risky it is to forecast the future."
>
> "The coastal freight structure has been reviewed by Mr. T. S. Parasuraman and his report, together with the observations of Mr. Y. N. Sukhtankar, President of the Maritime Freight Commission, are before the Government who are yet to announce their decision as regards increase in the coastal freight rates. The delays in the first three months of the current year to our ships at the various ports in India have been phenomenal. In fact, the Prime Minister, while inaugurating the meeting of the National Shipping Board, had cautioned the concerned authorities about the rapidly deteriorating conditions in the ports and had advocated an early implementation of the modernisation programme and had appealed to the labour to take a balanced view of the mechanisation of loading and unloading operations in the national interest. In these circumstances, it is extremely difficult to say, at this juncture, how the Company would fare during the year 1964-65. We have, however, good tools in hand and, should favourable port conditions be made available to our ships, we have no doubt that the Company would be able to do well."

At present the Rs. 10 fully paid ordinary shares of the Company are quoted at Rs. 12.20 *cum-div.* and a net return of 7.6 per cent per annum can be had at this rate.

(*Concluded from next column*)

ther efforts are being made to develop the export line.

The Company's paid-up capital of Rs. 40 lakhs, all in 10-rupee equity shares, is backed by reserves and surplus amounting to Rs. 46.95 lakhs. Secured loans of Rs. 2.67 lakhs and current liabilities and provisions of Rs. 61.12 lakhs bring the total indebtedness to outsiders to Rs. 63.79 lakhs, as against which current assets, book debts and investments aggregate Rs. 116.90 lakhs. The gross block of Rs. 85.96 lakhs (Rs. 82.03 lakhs a year before) has been written down to Rs. 32.42 lakhs and, including capital work-in-progress, the net block is shown at Rs. 33.85 lakhs.

Currently quoted at Rs. 24.12 *cum-div.*, the Rs 10 fully paid ordinary shares of the Company offer a net yield of 7.1 per cent per annum.

NATIONAL ROLLING HIT BADLY BY TAXATION

PAST PROVISIONS WRITTEN BACK TO RAISE DIVIDEND

THE extent to which the present tax laws penalise an efficient company operating with a limited capital base—limited not in regard to its financial requirements but in respect of its profit-earning capacity—is clearly illustrated by the working of the National Rolling and Steel Ropes Ltd. (Managing Agents: Messrs. Associated Industrial Development Company (P.) Ltd., Calcutta). With its "own" funds (share capital and reserves) aggregating Rs. 86.95 lakhs, this Company has realised a gross profit of Rs. 43.82 lakhs out of sale proceeds of Rs. 155.13 lakhs. Although over the year, the turnover has improved by barely Rs. 2 lakhs, gross profit has expanded by as much as Rs. 8 lakhs. But after the essential provisions, the net profit is a meagre Rs. 7.60 lakhs and is actually lower than the sum of Rs. 8.31 lakhs earned in the previous year. The reason for this is that as much as Rs. 26.55 lakhs of gross profit (as against Rs. 21.70 lakhs a year before) has been claimed by taxation. This includes sur tax provision of Rs. 2.70 lakhs for 1962-63 and of Rs. 4.20 lakhs for 1963-64 and a provision of Rs. 90,000 for dividend tax for these two years.

The replacement of S.P.T. by sur tax has, however, benefited the Company to some extent, since for the former as much as Rs. 4.21 lakhs were provided in the previous year. This provision and an S.P.T. reserve of Rs. 3.25 lakhs created in the previous year, together the two aggregate Rs. 7.46 lakhs, have now been written back. Consequently, the amount available for appropriation is higher, enabling the Directors to carry to reserves a larger sum of Rs. 7.08 lakhs as compared with Rs. 3.26 lakhs in the previous year and also to raise the dividend on the Rs. 10 fully paid ordinary shares from Rs. 1.50 to Rs. 2 per share.

A clearer picture of the year's results is provided in the following table, which also gives an idea of the progress made by the Company in the past four years:

(In lakhs of rupees)

	For the year ended 30th June			
	1964	1963	1962	1961
Sale proceeds	155.13	153.60	124.13	137.89
Other income	11.33	7.27	5.88	4.25
Closing stock	23.08	14.01	8.07	11.99
Excise duty	...	4.22	1.13	...
Materials and stores consumed	103.69	101.27	75.20	88.71
Staff expenses	16.66	15.40	15.61	13.62
Other expenses	11.36	10.30	8.10	8.43
Gross profit	43.82	35.61	26.05	34.35
Managing Agents' commission	3.72	2.53	1.99	2.71
Provision for—				
Depreciation	5.95	3.07	3.43	6.99
Taxation	26.55	21.70	11.65	13.00
Net profit	7.60	8.31	8.98	11.63

To reserves and provisions	7.08	3.26	3.01	6.55
Dividend	8.00	6.00	6.00	6.00
	(20%)	(15%)	(15%)	(15%)
Carry forward	0.09	0.11	0.36	0.36

Equity shares' market value (in rupees):	1964	1963	1962	1961	1960
High	24.37	21.44	23.00	23.37	17.13
Low	18.44	18.50	19.75	18.44	14.50

While comparing sales of the year under review with those of the previous year, it must be noted that the latter also included an excise element of Rs. 4.22 lakhs and to that extent the turnover for 1963-64 shows a definite improvement. Moreover, closing stocks have increased substantially from Rs. 14.01 lakhs to Rs. 23.08 lakhs. The trend of both sales and stocks therefore suggests that the overall production performance during the year under review must have been encouraging. In fact the output increased by 8 per cent in the rolling mill and by 23 per cent in the wire mill. As against this, the production of wire ropes was lower due to reduced demand for haulage ropes for which the existing machines are mainly suitable. The higher output in the rolling mill was obtained thanks to some supplies of billets on special account, since the regular entitlement was further cut in the period January to June 1964. Such special supplies are, however, unlikely to continue.

The balancing plants, put into production towards the end of the year under review, will raise production during the current year. With the erection of these plants, it is proposed to add some new machines to augment the production of flexible ropes to a sizable quantity to cope with the increasing demand for the same. Export of ropes became feasible during the year under review; the Company was able to send its first consignment to Kuwait and subsequently, to some parties in Kenya. For

(*Continued in previous column*)

MODELLA FARES WELL

PRODUCTION AND PROFIT UP

THE results of Modella Woollens Ltd. (Managing Director: Mr. B. M. Grover, Bombay) for the year ended 30th June 1964 are good. The striking features are a higher total realisation, an increased gross profit and a bigger dividend payable on an enlarged capital. Sales including those of by-products and waste have advanced by about 44 per cent from Rs. 64.88 lakhs to Rs. 93.03 lakhs and, since processing charges have also risen by no less than Rs. 9.14 lakhs to Rs. 12.37 lakhs, the total operating revenue at Rs. 105.40 lakhs shows a handsome gain of Rs. 38.29 lakhs over the preceding year. As a result, the gross profit has expanded in consonance from Rs. 13.23 lakhs to Rs. 23.03 lakhs. With the wool top unit at Chandigarh working for the first time for one full year, the provision for depreciation has more than doubled from Rs. 5.25 lakhs to Rs. 11.46 lakhs and though the provision for commission payable to the Managing Director is somewhat low, the profit subject to taxation is actually lower at Rs. 10.97 lakhs as compared with Rs. 12.30 lakhs the year before. Since, in contrast, the provision for taxation has been raised to Rs. 3.55 lakhs from Rs. 1.32 lakhs earlier probably because of a lower development rebate claimed during the year, the resulting net profit is only Rs. 7.42 lakhs as against Rs. 10.98 lakhs a year ago. Although the transfer out of this to other reserves has been maintained at Rs. 2.50 lakhs, that to the statutory development rebate reserve has been slashed from Rs. 5.82 lakhs to mere Rs. 65,000.

A somewhat larger amount, therefore, has become available for distribution and taking advantage of this the Directors have proposed to raise the dividend by a point to seven per cent, subject to deduction of tax. Since the 1,33,300 equity shares allotted to the foreign collaborators also rank for dividend for nine months, the total amount claimed by the dividend is Rs. 4.32 lakhs as against Rs. 3.10 lakhs. A heartening point to note is that the year's dividend will not be subject to a deduction of tax at the prescribed rate of 20 per cent. A part will be exempt from taxation and an application is being made to the Income-tax authorities for determining the amount of the profit which will be exempted from taxation.

The continued progress made by the Company since it went public in 1961 is well reflected in the following comparative figures.

(In lakhs of rupees)

	For the year ended 30th June		
	1964	1963	1962
Sales and processing charges	105.40	67.11	18.90
Other income	2.19	1.83	1.28
Closing stocks of finished goods	6.92	2.73	3.01
Raw materials and stores consumed	60.73	32.63	9.55
Staff expenses	9.01	5.06	1.47
Other expenses	19.01	12.71	5.24
Gross profit	23.03	18.23	6.96
Managing Directors' remuneration	0.60	0.68	0.27
Provision for—			
Depreciation	11.46	5.25	2.02
Taxation	3.55	1.32	1.10
Net profit	7.42	10.98	3.57
Excess provisions written back	0.08		
Development rebate reserve	0.65	5.82	1.89
Other reserves	2.50	2.50	
Dividend	4.32	3.10	1.23
	(7%)	(6%)	(6%)
Carry forward	0.05	0.02	0.46
Market price of ordinary shares (in rupees):	1964	1963	1962
High	14.92	16.76	16.00
Low	11.76	12.48	15.24

During the year the Company issued 1,33,300 equity shares of Rs. 10 each fully paid to its foreign collaborators and this has raised its paid-up share capital, made up exclusively of ordinary shares of Rs. 10 each, to Rs. 64.98 lakhs, with Rs. 2,375 as calls in arrears. This is backed by reserves aggregating Rs. 13.40 lakhs. As against these own funds of Rs. 78.38 lakhs, the outside interest totals Rs. 43.10 lakhs and is made up of Rs. 12.84 lakhs in secured loans and Rs. 30.26 lakhs in current liabilities and provisions. The net block as at 30th June 1963 stands at Rs. 78.21 lakhs, obtained by reducing a gross block of Rs. 96.87 lakhs by Rs. 18.66 lakhs being the amount of depreciation accumulated so far. Additions to the block account during the year amounted to Rs. 8.21 lakhs as against Rs. 38.86 lakhs the year before. Current assets, loans and advances total Rs. 42.27 lakhs while miscellaneous expenditure yet to be written off stands at Rs. one lakh.

The shoddy spinning unit at Thana continued to work satisfactorily. Production and sales were higher than in the previous year as a large quantity of special blanket yarn was spun for defence requirements. Unfortunately, the margin of profit on such yarn was lower than on qualities manufactured for the civilian market since the special yarn had to be sold at prices fixed by the Textile Commissioner. At the beginning of the year under report, production at the wool top unit at Chandigarh was mainly confined to combing of Indian wool. With the stoppage of orders for defence, demand for tops made out of Indian wool subsided and in the absence of an import licence for foreign wool the unit had to undertake commission combing of both wool and polyester fibre on behalf of various spinners in India. In spite of repeated requests, the Government has not acceded to the Company's request for the grant of an import licence for foreign wool. The Company, however, has been granted a custom clearance permit so that foreign top makers can consign wool to the Company for manufacture of tops in India on their behalf.

The dyeing unit at Chandigarh was commissioned in February 1964 and is reported to be working satisfactorily. Both wool and polyester fibre tops have been dyed on customers' account. There is a heavy demand for such services and steps are being taken to increase the installed capacity. A printing plant for tops has also been erected and is likely to be commissioned shortly. The grease extracting plant ordered in the previous year is now at the site and is under erection. The French combing plant for the expansion of the wool top plant is likely to be shipped in February 1965 and necessary adjustments to existing buildings are being made to house it.

It will be recalled that, with the promulgation of Emergency, the Company had obtained an Essentiality Certificate from the Textile Commissioner for the installation by way of expansion of a third carding set and shoddy washing machine at Thana and that steps were being taken to order out these machines. Since the credit negotiations with Japan for the import of these machines did not go through, the Essentiality Certificate now stands cancelled. An application has again been made for the issue of a fresh certificate for import of these machines from Italy.

The Rs. 10 fully paid ordinary shares of the Company are currently quoted at Rs. 12.48 *cum-div.* These fetch a net annual return of over 4.7 per cent on the *ex-div.* price.

BOROSIL GLASS WORKS LTD.

The Borosil Glass Works will operate its second furnace for the manufacture of amber borosilicate glass and additional facilities for the production of blown apparatus are expected to go into production shortly. The first furnace which went into production recently is producing "corning" brand neutral and heat resistant glass tubing from 5 mm. to 150 mm. in diameter. It also manufactures various other types of laboratory glassware such as flasks and breakers as well as apparatus, requiring low co-efficient of expansion glass. As all modern scientific glass and glassware are already available within the country, the commencement of working of the Company's furnace will appreciably cut down glass imports, now of the order of Rs. 10-15 million a year.

The raw materials for the second furnace plant are all from indigenous sources, except for borax and boric acid which, however, form only 5 per cent of the total requirements of raw materials. As part of the training programme for the working of this furnace, nearly 100 graduates have been trained by the Company in the country and about 10 technicians have been trained by the Company's American technical collaborators, namely, the Corning Glass Works. When this plant is commissioned, the Company will have implemented its expansion project in full.

(*Concluded from next column*)

operation, and a new quality drier was installed at the end of the year under review. It is intended to convert this factory to Retrovane/C.T.C. manufacture during the coming year and the quality is expected to improve as a result of this change. The Company's vegetative propagation extension is making good progress and clonal material is expected to be ready for re-planting in a limited area by 1966.

Against the paid-up capital of Rs. 70 lakhs, divided equally into 6 per cent preference and ordinary shares, the Company's reserves and surplus aggregate only Rs. 15.65 lakhs. Loans, current liabilities and provisions bring total indebtedness to outsiders to Rs. 30.04 lakhs, as against which current assets, book debts and investments aggregate Rs. 46.53 lakhs. The gross block, which increased during the year from Rs. 109.68 lakhs to Rs. 111.67 lakhs, has been written down to Rs. 68.94 lakhs and, together with capital work-in-progress, the net block is shown at Rs. 69.16 lakhs.

Currently quoted at a discount at Rs. 9.87 *cum-div.*, the Rs. 10 fully paid ordinary shares of the Company offer a net yield of 4.2 per cent per annum.

BROOKE BOND SUFFERS SETBACK AGAIN

SHAREHOLDERS GET LESS, AS TAX BURDEN GOES UP

IT is the same story repeating once again—after a brief change for two years—in the case of the Brooke Bond Estates India Ltd. (Chairman: Mr. J. P. Hannay, Calcutta). After two satisfactory years—1958-59 and 1959-60—the Company received a serious jolt in the year ended 30th June 1961. The years 1961-62 and 1962-63 were of a recovery, but the year ended 30th June 1964 has witnessed a setback in sales and gross profit, though not as sharply as in the year 1960-61. Thus, whereas three years ago sales had dropped from Rs. 77.97 lakhs to Rs. 63.13 lakhs and gross profit had come down from Rs. 17.44 lakhs to Rs. 12.45 lakhs, during the latest completed year the turnover has shrunk from Rs. 74.31 lakhs to Rs. 72.32 lakhs and gross profit has receded from Rs. 14.40 lakhs to Rs. 11.63 lakhs.

It will, however, be seen that the profit has dropped below the 1960-61 level, in spite of the fact that the production figure, at 14.26 lakh kgs., is higher as compared with 13.51 lakh kgs. a year before and 12.16 lakh kgs. three years ago. This underlines the fluctuating fortunes of the plantation industries depending upon the trend in the world market. It is this factor that explains the Directors' observation that, if the upward trend in world production of tea continues, the increase may well result in a corresponding reduction of the prices to be realised. During the year under review, the average price realised was lower at Rs. 5.12 per kg., as compared with Rs. 5.27 a year before and Rs. 5.31 three years ago. Whereas the selling price obtained was lower, the average garden cost of production increased over the year by 9 paise per kg.

Though gross profit has declined by roughly Rs. 3 lakhs, the tax provision, at Rs. 4.45 lakhs, is lower by only Rs. 1 lakh. It is so because the total tax incidence has been higher, following the increase in Assam (by the Finance Act, 1963) Agricultural Income Tax by a further 7 nP. to 57 nP. in the rupee. This year this tax has been raised still further to 60 paise. Besides, since this Company is not a company in which the public is substantially interested within the meaning of the Income Tax Act, the effective rate of the corporation tax for it is 54 paise, calculated in accordance with the Finance Act, 1964, a rate of tax again higher than that of the previous year. With the consequent drop in net profit from Rs. 5.89 lakhs to Rs. 4.15 lakhs, the axe has fallen on the shareholders' dividend, the rate of which has been reduced from 7.5 per cent to 5 per cent per annum on the Rs. 10 fully paid ordinary shares. The net transfer to reserves is also much less at some Rs. 16,000, as against Rs. 3.42 lakhs a year before.

The following comparative table gives a clear idea of the progress made by the Company in the past four years:

(In lakhs of rupees)

	For the year ended 30th June			
	1964	1963	1962	1961
Sale proceeds of tea	72.32	74.31	74.53	68.13

Low	9.87	10.62	11.65	15.00	17.00

Discussing the development of the estates, the Directors state that a third C.T.C. machine has been installed in the Dibru-Darrang factory with continuous conveyor belts. Prices at the beginning of the new season have been encouraging. On Tinkharia, a further four withering troughs have been brought into

(*Continued in previous column*)

SCINDIA STEAM RAISES DIVIDEND

BUT INCOME AND PROFIT LOWER

THE increase in the dividend of the Scindia Steam Navigation Company Ltd. (Chairman: Mr. Dharamsey M. Khatau, Bombay) from Re. 1 to Re. 1.25 per share of Rs. 20 each for the year ended 30th June 1964, while being true to market expectations, is rather not in keeping with the Company's performance during the year, since income from freight and passage, at Rs. 17.13 crores, is actually lower as compared with Rs. 17.69 crores in the previous year and gross profit, at Rs. 336.26 lakhs, is hardly any better than Rs. 333.92 lakhs a year before. In point of fact, the higher dividend reflects the benefit of increased development rebate, for which as much as Rs. 97.50 lakhs (as against Rs. 9 lakhs a year before) have been carried to a special depreciation reserve, since it has gone to minimise the tax burden to only Rs. 22.50 lakhs (as against Rs. 68 lakhs) and to inflate the net profit to Rs. 111.96 lakhs from Rs. 70.24 lakhs a year before. No doubt, after transferring to reserves Rs. 97.50 lakhs on account of development rebate, the balance of net profit is far too small to cover the increased dividend distribution requiring Rs. 70.40 lakhs (as against Rs. 56.32 lakhs last year), and the Directors have been obliged to withdraw from general reserve a big sum of Rs. 50 lakhs, as against nothing in the previous year. But even after taking into account this withdrawal, the net addition to reserves is higher at Rs. 27.50 lakhs as compared with Rs. 9 lakhs in the previous year. Despite the increase in the dividend, the second in the past five years, the rate of dividend is still very modest, being only 6¼ per cent and well below 6.5 per cent paid for the year 1958-59.

The following table compares the company's progress in the past four years:

(In lakhs of rupees)

	For the year ended 30th June			
	1964	1963	1962	1961
Freight and passage money	17,12.69	17,68.62	16,49.14	17,01.17
Other income	51.91	53.73	52.10	45.22
Expenses	14,28.34	14,88.43	14,55.15	16,34.42
Gross profit	336.26	333.92	246.09	201.97
Directors' remuneration	3.49	3.36	1.95	0.02

	(6.25%)	(5%)	(3%)	(3%)
Carry forward	1.79	7.74	2.83	2.88
Equity shares' market (in rupees):	1964	1963	1962	1961	1960
High	16.60	16.20	13.92	16.16	17.28
Low	12.16	9.76	10.52	12.16	13.44

If the year's performance has failed to support the increase in dividend, the future prospects appear far from fully encouraging. There is, of course, the fond expectation of shipping industry getting greater encouragement from the Government and benefiting from the country's still large food import programme. But here there are two apparent limitations. One is the possibility of services being established parallel to those maintained by the Shipping Conferences. The other is that coastal shipping has still to get an adequate share of internal cargo from the railways. Added to these two are the delays and strikes in ports in India and abroad. Of the 823 days which were lost by the Company in the overseas service, as many as 542 were due to waiting for berths and dry-docks, poor despatch and other handling operations in ports. Of these, as many as 538 days were lost in the major ports of India—Bombay, Calcutta, Madras and Cochin. With the increased import of foodgrains at all important ports, these delays, which raise costs, are likely to be even more serious during the current year.

Above all this, says the Company's Chairman, Mr. Dharamsey M. Khatau, in his annual statement circulated with the accounts, is the basic problem of freight rates. The hope expressed by Mr. Khatau last year that the report of Mr. T. S. Parasuraman as a one-man commission to revive the coastal freight rates would embody recommendations that would put coastal shipping on an economic footing is, he says, unlikely to be realised for sometime yet. The Commission has recommended an increase of only 5 per cent in respect of coal moving from Calcutta to ports up to Cochin. It will be recalled that a recommendation to that effect, which itself was found inadequate, had been made in 1962 by the Abbhi Commission and that it had not been accepted by the Government. Shipping companies, in Mr. Khatau's opinion, cannot work on an economic basis, unless freight rates are designed to cover their total costs of operation.

Discussing the freight rates position during the year ended 30th June 1964, the Directors state that there was a sustained improvement in the general level of overseas tramp freight rates. In the Liner trades there was an increase of 10 per cent in the rates from India to U.K.-Continent and from East Coast of India to the U.S.A. effective from October 1963; that from West Coast of India to the U.S.A. being effective from March 1964. In the East bound trade there was an increase of 10 per cent from U.S.A. ports to India as from July 1963. While the voyage results partly reflect the improvement consequent upon these increases, continued upward trend in operating costs tends to offset the benefit flowing from these increases. It has been possible to retain to some extent the advantage consequent upon these freight increases by sustained rationalisation.

The Company inaugurated its Overseas Liner services from India to Great Lakes in 1964 and while the service is operative during a season of about seven months only, the Company is confident of obtaining good support of shippers both in India and the States and Canada.

The Company has added eight vessels to its fleet, six of them for coastal shipping, one for the West Coast only and one for overseas trade. It has ordered three 15,000-ton vessels from Messrs. Lithgows Ltd., Glasgow, for its overseas trade. This excludes vessels on order with the Hindustan Shipyard, of which the first one is expected to be delivered shortly. There is also one additional 3,800 d.w.t. motor vessel on order abroad for employment on West Coast. It is expected to be delivered in the middle of next year. At the same time, the Company laid up eight steamers for disposal. Four of them were sold during the year under review at a profit of Rs. 25.68 lakhs. Since the close of the year, two more were sold at a loss and the remaining two are expected to be disposed of shortly. In view of the anticipated loss, the Directors have considered it advisable to carry forward the profit of Rs. 25.68 lakhs for adjustment during the current year.

The paid-up capital of the Company, unchanged at Rs. 11.28 crores, is backed by reserves and surplus aggregating Rs. 12.23 crores. During the year, the Company redeemed the outstanding liability of Rs. 310.71 lakhs on account of 4.5 per cent (1963) mortgage debentures. Secured loans now amount to Rs. 11.39 crores (as against Rs. 12.89 crores a year before) of which Rs. 7.71 crores are of a long-term nature and Rs. 3.68 crores of a short-term nature. These short-term borrowings and other current liabilities bring the total short-term indebtedness to Rs. 12.05 crores, as against which current assets, book debts and investments aggregate Rs. 16.54 crores. The gross block, which has expanded during the year from Rs. 38.99 crores to Rs. 42.37 crores, has been written down to Rs. 26.73 crores.

At their current market value of Rs. 15.61 *cum-div.*, the Rs. 20 fully paid ordinary shares of the Company are still at a substantial discount and offer a net yield of nearly 7 per cent per annum.

The Central India Spinning, Weaving and Manufacturing Company Ltd., Bombay, recorded a total turnover of Rs. 663 lakhs in the year ended 30th June 1964, as against Rs. 614 lakhs during the previous year. After providing for depreciation to the extent of Rs. 20.45 lakhs, the profit for the year amounts to Rs. 24.82 lakhs. The Company has decided not to recommend any dividend even on the preference shares of the Company, let alone on the ordinary shares, in view of the accumulated losses carried forward from the previous years.

Exports are vital to India and the export drive is on. To succeed, the goods exported must attract the foreign buyer through their pleasing finish... and what better finish can there be than NICKEL-CHROMIUM plating? You will find it on all the popular brands in world markets... the secret to their popularity.

You will be wise to use Nickel-Chromium Plating for your products, but see that the plating conforms to a standard specification as regards nickel thickness, as it is the NICKEL beneath chromium that guards against corrosion.

Our knowledge of nickel-chromium plating is at your service.

NICKEL INFORMATION BUREAU PRIVATE LIMITED

United Bank of India Building, 25 Pherozshah Mehta Road, Fort, Bombay 1-BR.

PROBLEMS OF NEW ENTERPRISES—II

MANAGEMENT AND FINANCIAL ASPECTS

IN our last issue, we wrote about the problems an entrepreneur had to tackle before establishing an industrial project. These pertain to the various processes and procedures to be gone through on account of Government controls, the issues involved in entering into arrangements with foreign collaborators, the preparation of financial estimates, and the fundamentals to be fulfilled for successfully obtaining the assistance of the Industrial Credit and Investment Corporation of India, popularly known as I.C.I.C.I. It is now proposed to review here the task of successfully establishing and running the enterprise, a task that conveniently falls into two categories, management and finance. These problems are lucidly analysed in the background paper circulated at the I.C.I.C.I.'s recent Conference of its constituents. The paper is a valuable one, as it bears the imprint of the Corporation's experience of a large variety and number of enterprises which have been helped by it.

Planning and Construction Phase

Broadly speaking, the financial and management problems consist of those arising during the planning and construction phase and the ones faced during the initial years of running an enterprise. In the former category, there is, first of all, the problem of an inadequate provision of finance for the execution of the project, which results either from the comparatively limited financial resources of the promoter or from undue optimism on the part of the promoter that the financial problems will resolve themselves with the passage of time. The I.C.I.C.I. has come across certain promoters who are experts in the production field of a particular industry, but who fail to take initiative or decisions on a series of problems required of good management, thereby failing to lead the project. Besides ignoring the fact that each improvement in the technical specification, which they envisage, will cost more money, they have also a tendency to economise even on necessary expenditure. This weakness is particularly true of small entrepreneurs going in for large ventures.

Secondly, there is inadequate planning of details of the project which has been responsible for some projects having large over-runs in costs during execution, thus creating a major financial problem. Sometimes, the promoter does not devote his energies to one project at a time; instead he diffuses his time to too many projects. The tendency to underestimate the period required for erection and trial runs also accounts for adding to such problems. The third problem is one of acquiring, maintaining and developing competent personnel so as to obtain economic and efficient output. The Corporation has found from its experience that promoters do not recognise the value of having a qualified engineer before the receipt of machinery. They also delay the engagement of adequate staff with a view to keeping the pre-operative costs low. Lastly, a lack of clear understanding between the foreign collaborator and the Indian promoter leads to strained relations during the execution of the project, affecting the efficient setting up of the scheduled plant. This problem exists even during the running of the enterprise and causes serious misunderstanding and mistrust between them. But this can easily be avoided by a proper definition of, and adherence to, the functions and responsibilities of the two partners. The differences generally appear in outlook and viewpoint between the two parties, resulting in differences in methods of dealing with technical and financial problems when they arise. The experience of the I.C.I.C.I. has shown that, in some cases, the Indian promoters have had to terminate prematurely the services of technical collaborators or consultants, due to the inadequacy of services rendered.

The second set of financial and management problems arises at the most critical point in the establishment of an industrial undertaking, namely, the stage where the erection of the plant is just complete and production or trial runs commence, that is, when almost all the plant has been erected and facilities have been provided. First, these problems arise due to over-runs in the estimated cost of the fixed assets of the Company. This is quite serious, for it requires long-term finance to get over the difficulties. The shortfall, when it occurs, can be met by raising either additional share capital or long- or medium- term loans from banks. But one can easily imagine how difficult it would be to expect the shareholders of a new company to subscribe to a "rights" issue even before the project goes into production. Financial institutions which are approached for term credit would naturally like to know the causes of over-runs. And, if the reasons given are not satisfactory, they would not get the credit. There have been many instances of entrepreneurs not having been able to get over this hump. All this clearly shows how imperative it is to have a detailed feasibility study, on both the financial and technical aspects before taking up a project for execution.

Working Capital

Another problem arises from running short of working capital. There are two chief reasons why this difficulty arises. One is that the increases in the cost of fixed assets reduce the availability of working capital. The other is the absence of adequate assets for hypothecation with banks. The I.C.I.C.I. has come across many cases, where pledgeable items in the total working capital requirements have been as low as 40 to 50 per cent of the total and, consequently, financing through bank borrowing has fallen short of needs. Moreover, it is necessary to have rational and minimal locking up of funds in liquid assets thereby having some margin of borrowing capacity that would be available for use when unforeseen contingencies arise.

Operational problems faced by new enterprises are of two kinds: transient and lasting. Amongst the transient problems, there is, first of all, the non-availability of adequate supply of raw materials. An industrial unit is set up on the assumption that adequate quantities of suitable raw materials would be available at a satisfactory price and that their uninterrupted supply would be ensured. Similarly, there are expectations regarding the supply of water and power. But experience has shown that these expectations materialise in varying degrees of success. In addition, new or totally unexpected problems arise which are sometimes quite serious, as they cause long interruptions in the supply of indigenous raw materials and restricted imports of some of the components used in the product. Shortage of foundry-grade pig iron is a typical instance. This has affected the progress of new enterprises engaged in the manufacture of forgings, cast iron spun pipes, rolled steel, etc. Shortages of raw materials and the consequent underutilisation of capacity lead to higher costs, aggravate the difficulty of maintaining the quality of products, and cause delays in delivery.

Other Operational Problems

Other operational problems of transient nature are (*a*) the failure to obtain the promised power supply from public undertakings, creating many complications in the working of industrial units, and (*b*) the difficulties in securing enough skilled labour. If power difficulties are detected at early stages of project implementation, these can be got over by installation of generation plants by companies themselves, though it will mean considerable financial drain, initially on capital account and later on in running operations. Some companies, employing special purpose machines, require a large number of skilled labour at various stages of production. Quite a few of the units assisted by I.C.I.C.I. have had considerable difficulties in this regard. Some of the managements have found it better to provide suitable training to labour in the plant itself rather than get skilled labour from outside. This solution, however, has its drawbacks. For instance, valuable equipment may suffer damage at the hands of workers and the quality as well as quantity of production may suffer. Other allied problems which go under the head of "teething troubles" consist of supply lines, utility services and movement of materials, etc. Operations need to be standardised, and labour, after having been adequately trained, needs to register a satisfactory level of productivity. Sometimes, laxity on the part of arrangement causes delay in the beginning of commercial production of the project.

Next, there are the operational problems of a lasting nature, which usually have their roots in the assumptions made while conceiving a project. The plant design might be based on considerations of flexibility in production and requirement of reserve capacity. The experience of I.C.I.C.I. has brought out certain cases, where these assumptions did not prove correct and the units ran into serious difficulties. For instance, a paper mill selected the location for its plant on the assumption that a part of its raw materials would be met by supply of bagasse from a nearby sugar factory. But the refusal by the sugar factory to supply bagasse created the problem of finding alternative raw material in adequate quantities and at a reasonable cost. Similarly, seasonal shortage of power and water is posing problems to units located around Delhi, Madras and Calcutta, resulting in fall in production and rise in costs. Another important problem, which some units experience, is the lack of flexibility in the plant set-up. A unit facing difficulty of this kind cannot plan production to meet the changing requirements of the market. Again, in their anxiety to attain maximum production, some managements fail to ensure proper maintenance of their plants, resulting in costly breakdowns and loss of production.

Marketing

Last, but not the least, is the set of problems relating to marketing. The I.C.I.C.I. itself endeavours to study the market of the products of the companies financed by it in two stages: first, at the stage of appraising the project and, second, at the time when the company actually goes into production. At the appraisal stage, the Corporation seeks to make as accurate an estimate as possible. In the case of consumer goods like soap, vegetable oils, bicycles etc., it bases its estimates on the projections of the past trend of consumption, taking into account factors making for future growth; in the case of intermediate goods industries (as for instance, caustic soda), the estimates are based on the consumption of the industries using the product, and co-relation with the basic variable, related to the product, forms the basis of the likely market for certain undifferentiated products like alloy steel or grinding wheels, demand for which is related to the final production of steel. The other factors that are necessary for consideration are the changing tastes of consumers, likely technological developments making for substitution of one kind of goods for another, as also development programmes which make for uneven growth of certain industries. A related question is the competitive ability of a particular project which has to be determined on the likely supplies of the product from other manufacturers in future. The I.C.I.C.I. undertakes this on the basis of the licences issued and the progress made on them. In a market, the competitive ability of a particular project depends on its cost of production, the flexibility and diversity of its operations and its own financial strength to continue in the market despite losses for a period.

It may, however, be noted that the demand for a product is only one aspect of marketing. An adequate organisation and selling arrangements constitute another aspect. They are an essential element for converting the potential market for a product into the actual market. Selling requires expertise and involves the problem of building consumers' goodwill so as to retain them even in difficult times.

Some Specific Instances

It would be useful to list here the variety of marketing problems faced by some of the industries financed by I.C.I.C.I. so that readers may have an idea of the problems faced by the new units in this country:

Cables: I.C.I.C.I. has financed seven companies for the manufacture of low tension cables and six companies for the manufacture of medium and high tension cables. When the projects were appraised that market forecasts appeared very favourable. The market for medium and high tension cables is still strong, with reported delivery periods ranging upto two years. On the other hand, the market for low tension cables has become extremely competitive, mainly because some units entered the market simultaneously and demand, owing to shortfalls in electricity generation and building targets, has turned out to be less than expected. As a result, many of the units have been working much below capacity in this industry. It has been found here that diversified units or units with established names have less difficulties than single product units or new units without established names.

Electric Meters: I.C.I.C.I. has so far financed four companies for the manufacture of electric meters. When it appraised the demand for electric meters, it appeared that there would be sufficient room for a large number of new units. However, by about 1963, supply caught up with demand and since then not only have stocks of metres been built up but competition has be-

(Continued on page 965)

NEWS IN BRIEF

THE Union Government will shortly set up a study group to make recommendations for a pilot project for unemployment insurance.

The existing capacity of 30,000 tonnes per year of the Nepa Paper Mills will be raised to 75,000 tonnes early in the fourth Plan period.

Thanks to the expected increase in the production of sugar, the Union Government has restored the five per cent cut imposed in March this year in the monthly quotas to the States.

The Anti-Corruption Laws (Amendment) Bill seeking to give effect to some of the recommendations of the Santhanam Committee to ensure speedy trial of cases of bribery and corruption was passed by Parliament on the 20th inst.

A technical team of two experts to be sent on behalf of the Anglo-American consortium, which has agreed to aid India in setting up the fifth public-sector steel plant, is expected to arrive in India shortly.

The textile industry's demands to postpone control on drills and for a special allowance have been turned down by the Union Government. Hence, drills will come under control, as originally stipulated, with effect from 1st December 1964.

A total quantity of 546,200 tonnes of rice was imported during January-15th November 1964. This included rice imports from the U.S. under P.L. 480 (284,000 tonnes), Burma (150,600 tonnes), the U.A.R. (28,000 tonnes), Thailand (9,500 tonnes) and Cambodia (9,600 tonnes).

A five-week training course in Statistical Quality Control techniques will be organised in Bombay by the Silk and Art Silk Mills' Research Association for the personnel engaged in the silk and man-made textile industry. The course commences from 9th December and ends on 15th January next.

The Minerals and Metals Trading Corporation proposes to export as much as 4.5 million tonnes of iron ore during the current calendar year, as against the 3.99 million tonnes of iron ore actually exported in the whole of 1963. Till the end of October 1964, it has exported 3.80 million tonnes.

Orders have already been placed with West Germany and Japan for the construction of six rice mills with modern storage facilities, according to Mr. C. Subramaniam, Union Food and Agriculture Minister. The total capital cost of the mills has been estimated at Rs. 81 lakhs and machineries for the mills are expected to arrive by the end of February next.

In order to secure effective results, the research work of the Central Committees on cotton, oilseeds, coconut, lac, jute, tobacco, arecanut, sugarcane and spices and cashewnut will be transferred to the Indian Council of Agricultural Research. This was disclosed by Mr. C. Subramaniam in Parliament in reply to a question.

The revenue realised from items on which duties are levied and collected by the Union Government during the first six months of the financial year 1964-65 aggregated Rs. 770.45 crores, as against Rs. 661.45 crores collected in the same period in 1963-64. The collection in the month of September 1964 alone amounted Rs. 157.71 crores.

The West Bengal Government is likely to promulgate an ordinance for the acquisition or requisition of fisheries shortly. The ordinance is considered immediately necessary for the improvement of 10,000 acres of *bheri* fisheries in the North and South Salt Lake areas. The compensation payable to owners is being worked out.

The Centre has incurred a trading loss to the extent of Rs. 30.91 crores during 1963-64 as a result of transactions involving procurement and sale of foodgrains, as against a loss of Rs. 27.15 crores in 1962-63. During the year under review it has procured 5.35 million tonnes of foodgrains, as compared with 4.36 million tonnes in the previous year.

The Employees' State Insurance Corporation has proposed to cover all factories employing ten or more persons, if the factories are using power, or 20 or more persons, in case of factories without power, under the E.S.I. Scheme. The Scheme will also be extended to shops and commercial establishments employing 20 or more persons in selected areas.

The Maharashtra Government has decided to take over the Bombay Gas Co. Ltd., according to Mr. S. G. Barve, Minister for Industries. Accordingly, the preliminaries are being investigated. The Government, however, has not decided whether it should run the concern itself or hand it over to the Bombay Municipal Corporation or some new undertaking in the public sector.

The cotton textile mills' production during the month of October 1964 is provisionally placed at 404 million metres of cloth and 83 million kilograms of yarn, as against 358 million metres and 75 million kg. produced in the same month last year. At the end of the month under review, the composite mills of the industry held an estimated stock of 1.34 lakh metric bales as unsold and 1.73 lakh metric bales sold but unlifted.

Union Government, in consultation with the wage board for working journalists, has fixed interim relief equal to eight per cent of the basic pay which a working journalist was drawing on 30th April 1964, subject to a minimum of Rs. 25 per month. The interim relief will be payable with retrospective effect from 1st May 1964. It is applicable only to those working journalists who are drawing a basic salary upto Rs. 750 per month.

The matters pertaining to Company Law, looked after by the Department of Revenue and Company Law, and the items relating to insurance, looked after by the Department of Economic Affairs, have been transferred to a newly created fifth Department of Company Affairs and Insurance in the Union Finance Ministry under a Presidential Order. The former Department of Revenue and Company Law will now be called Department of Revenue.

A Central Wage Board for port and dock workers employed at the major ports in the country has been set up under the chairmanship of Mr. L. P. Dave. The Board will submit its recommendations within three months regarding dock labour's demands for interim relief pending the submission of the final report. All port and dock workers employed in the major ports, namely, Bombay, Calcutta, Madras, Cochin, Visakhapatnam, Kandla and Goa are covered by the scope of the wage board.

With a view to stepping up agricultural production, the Union Government has decided to liberalise the terms of loan assistance being given to State Governments for rural electrification. Under the revised terms, loans will be repayable over a period of 30 years. No interest will be payable in the first five years. The principal and interest will be recovered in 25 equal instalments every year from the sixth year onwards. The State Governments have been asked to pass on the loans to their State Electricity Boards without charging a higher rate of interest.

Geological investigations conducted so far have disclosed that India has proved reserves of 47 million tonnes of copper, lead and zinc ores. The probable reserves are estimated at 144 million tonnes. Region-wise, on the basis of the work so far carried out, reserves of 21 million tonnes of copper ore of 0.8 to 2 per cent grade are estimated to exist in Roam-Sideshwar block, Singhbhum district, Bihar. Exploration in the Zawar area of Rajasthan has indicated total reserves of about 27.4 million tonnes of lead-zinc ore of 1.81 per cent grade for lead and 3.56 per cent for zinc.

The Bombay Port Trust has awarded a contract to a British firm, Kier Ltd., for expansion of the Bombay docks and extension of Ballard Pier. The Company's tender will now be forwarded to the Central Government for its approval. Kier Ltd. will undertake the execution of the work in collaboration with the Svenska Enterprenad (Sentab) and an Indian firm, Engineering Construction Corporation Ltd. The partnership ratio is believed to be 50:30:20. The project, which is expected to be completed in 3½ years' time, includes the construction of six berths, the shifting of ferry wharf to Modi Bunder and the extension of the Ballard Pier.

The Works and Housing Ministry proposes to build a number of hotels, each with 700 to 800 beds and all modern amenities, in Delhi, Calcutta, Bombay and Madras. These hotels may not be departmentally run but may be leased to private hoteliers. The proposal for the Government to go in for hotel construction in a fairly large way is stated to have been discussed lately at a meeting between the Finance and the Works and Housing Ministers. Incidentally, to study the latest trends in architectural designing of luxury hotels, a team of five officials of the Works and Housing Ministry left on a three-week tour of Thailand, Japan and Hong Kong.

From Abroad

West Germany's car output during the first ten months of the current calendar year aggregated 2.4 million representing a rise of 8.8 per cent over the corresponding period last year.

Europe's motor workers will, in due course, demand a 35-hour week to match the demand of the United Automobile Workers of America. This was decided at an international conference of representatives of motor workers held recently at Frankfurt.

The Indonesian Government has taken or will take direct control of British enterprises regardless of a Malaysia dispute settlement, according to Mr. S. Reksodipur, leader of a Parliamentary inspection team in East Indonesia.

Italy's third full-scale nuclear power plant, with a 300 megawatt capacity, (claimed to be largest enriched uranium plant in the world), situated at Trino Vercellese, West of Milan, has just gone into "criticality." It has started to feed power into the country's national grid. It uses enriched uranium as its fuel and is modelled on the Shipping port nuclear power plant in the U.S.

The British Government is to contribute £10,000 towards the costs of the International Co-operation Year, to be observed in 1965. The idea of an International Co-operation Year was originally suggested by the late Indian Prime Minister, Mr. Jawaharlal Nehru, in a speech to the United Nations General Assembly in 1961. At its last sessions, the Assembly agreed that 1965 should be the year.

A robot control starting up and shutting down a large power station boiler has been designed by some British engineers. This robot control, which has been installed on a pilot plant at West Thurrock, Essex, is unique in that the boiler is coal-fired. Hitherto, the U.S. has applied computer control to oil and gas-fied systems, but so far it has not succeeded with the much more complex problem of a coal plant.

Agreements on economic and technical co-operation between the Soviet Union and Kenya have been signed at Nairobi recently. They envisage co-operation in building a number of industrial and agricultural enterprises in Kenya. The Soviet Union has also agreed to grant a long-term credit. Moreover, it will build, as a gift to the Kenyan people, a hospital for 200 beds and a polyclinic and supply the equipment for a technical college for 1,000 students.

The Common Market Commission has agreed to assist the Government of France to sell one million tons of wheat to China by increasing the export restriction payment permitted for the deal. Under the restriction system, the exporter is refunded the difference between the domestic and the World market price with additional allowance for transport charges to certain areas. France has complained that the supplementary allowance of $8 a ton allowed for sales to the China area is inadequate and the Commission is now understood to have raised it to $11 to $12 a ton.

An agreement covering the shipment of more than 2,000 tons of food to Iraq by the World Food Programme was signed on the 14th inst., at Baghdad. The food will be used to help the municipality to Arbil to obliterate a slum area and replace it with a park and to build a by-pass to divert Baghdad-Mosul through traffic from the centre of town. Under the same agreement, Iraq will receive over the next year wheat, flour, canned meat and fruit, butter oil, cheese and tea worth $54,000. The food will be part payment of wages for about 1,900 labourers. Work on clearing the slums and on the road-building project is expected to begin early in 1965.

The International Monetary Fund has just approved a new stand by arrangement with the Government of Paraguay authorising drawings up to the equivalent of $5 million over the next twelve months. The new arrangement follow a series of five stand-by arrangement which Paraguay maintained with the Fund from 1957 onwards, the last of these expiring unused in March 1963. Paraguay's current outstanding drawings on the Fund amount to $500,000. The new stand-by arrangement is intended to provide support for the country's reserve position in the event of temporary balance of payments difficulties and to assist the Government in its efforts to accelerate economic growth in conditions of monetary stability.

PERSONAL

PROF. D. R. Gadgil has been elected President of the National Co-operative Union of India for the next two years.

Mr. H. C. G. Brown has taken over as the General Manager of the Burmah Oil Company (India Trading) Ltd. and Assam Oil Company Ltd.

Prof. M. P. Gandhi has been elected representative of the Federation of Indian Chambers of Commerce and Industry on the All-India Council of Technical Education.

Mr. Jehangir Ghandy, Director, Tata Sons, has been elected President of the International Organisation for Standardisation for a term of three years from January 1965.

Mr. Herbert L. Jacobson of the U.S., who has been Southern European Regional Director of the Cotton Council International for the past five years, has just taken over charge as head of the G.A.T.T. International Trade Centre.

Mr. D. V. Reddy, who recently led the Indian Railways delegation to the E.C.A.F.E. sub-committee session at Bangkok, has become the General Manager of the Chittaranjan Locomotives on the 20th inst.

Mr. Khandubhai K. Desai, M.P., a Government nominated Director on the Board of Oil India Limited and its Chairman since 1961-62, has been re-nominated as Chairman of the Company for the period November 1964 to November 1965.

Mr. S. Ramachar, General Manager, Hindusthan Ideal Insurance Company Ltd., Hyderabad, has been appointed by the Government of Andhra Pradesh as a Director of Andhra Pradesh Industrial Development Corporation Ltd.

Lord Robens, Chairman of British Coal Board, arrived in New Delhi on Wednesday this week to advise the Government of India on ways and means of improving and developing the Indian coal industry. He is accompanied by Mr. M. V. Sheppard, Director-General of Production in the Coal Board.

SYNOPSES OF COMPANY REPORTS

Gangapur Sugar Mills Ltd.

(Secretaries & Treasurers: Messrs. W. H. Brady & Co., Ltd., Bombay.)

Ninth Annual General Meeting—Held on 19th November 1964.

Working Results:

	For the year ended 30th June (In thousand rupees)	
	1964	1963
Sales—Sugar	43,30	1,36,77
,, —*Molasses*	56	29
,, —agricultural products	1,52	1,29
Closing stock of sugar, molasses, etc.	9,80	24,78
Gross profit (+) or loss (—)	—11,39	+10,05
Transfer to depreciation	Nil	8,99
,, ,, development rebate reserve	Nil	5
Net profit (+) or loss (—)	—11,39	+1,01
Appropriations:		
Transfer to development rebate against arrears of previous years	Nil	1,01
Carry forward	—11,39	Nil

Extracts from the Directors' report: This has been a very disappointing year for the Company, principally because it could not secure sufficient cane to run the factory. As the price of *gur* was high, the Company's normal suppliers were reluctant to sell cane to the factory. The Industries Department to the Government of Maharashtra appointed a Committee to try and secure cane for the factory, of which the Company's Manager was one of the members. The efforts of this Committee did not help in securing the cane. The Company could only obtain about 30,000 tons of cane. After running for 28 days and crushing 18,676 tons, the bearings of the rotor got burnt and consequently the turbine failed. It was considered necessary to bring the rotor to Bombay and to have it repaired. As these repairs would normally take more than a month, it was thought advisable to close the factory and send the balance of the cane to Belapur for crushing.

Due to these misfortunes, the working of the Company has resulted in a net loss of Rs. 11,39,155.30 subject to depreciation. For the short time that the Company crushed, the average recovery was 11.07 per cent.

As regards the current season, with the help of advances, the Company hopes to secure more cane but the quantity would hardly be sufficient for an economic crush by the factory. The Directors however are making all efforts to get as much additional cane as possible.

Accounts in brief as at 30th June 1964 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	60,88,900	Gross block	1,69,75,609
Share application money	200	—Depreciation	10,29,465

Carry forward	7,946	1,341

Extracts from the Directors' report: The Company's mill continued to operate throughout the year under review at the maximum capacity permitted by the preparing and spinning machinery available. With effect from 1st February, 1964, the Working Time Agreement of the Indian Jute Mills Association under which the production of the industry has been regulated since 1937, was annulled so that the position is now regulated by the Industries (Development and Regulation) Act, 1951, of the Government of India. Demand for the Company's products continues at a satisfactory level and in addition to capital expenditure during the year amounting to £38,600 the Directors have authorised further expenditure of £87,365 to complete the equipment of the preparing and spinning departments to enable them to produce the full amount of yarn required to operate the installed loomage to its full capacity.

The trend in prices and profitability which was already evident at the date of the previous Report of the Directors has continued for most of the intervening period. Raw jute supplies were adequate, although quality continued to deteriorate, and prices were maintained at the minima imposed by the Government of India; more recently, however, due to estimates and rumours regarding the size of the 1964/65 crop, prices have tended to rise. From a minimum of the equivalent of Rs. 30 per maund they rose in August, 1964, to as much as Rs. 47 per maund but have subsequently fallen in the absence of substantial business to around Rs. 36 per maund.

The Indian jute industry produced a record output of goods in 1963 and while stocks of goods on hand are above the level of a year ago, it can be said that most of the increased production has been disposed of, notwithstanding increased competition in the world's markets, very largely from the Pakistani mills. Nevertheless, while acknowledging the efforts which have been made to develop alternative markets, it must be said that if the Indian jute industry is to continue to demonstrate its resilience and to make the outstanding contribution which it has in recent years to the solution of India's export difficulties, not only will present improvement in quality have to be sustained but, the Directors believe, effective steps will have to be taken to enable Indian mills and shippers to compete with their Pakistani counterparts on more equal terms.

Accounts in brief as at 31st March 1964 are as under:—

Liabilities	£	Assets	£
Capital*	475,000	Gross block	1,454,736
Reserves and surplus	1,036,527	—Depreciation	1,094,881
Other liabilities	479,662	Net block	359,855
		Block in progress	17,626
		Current assets	1,542,691
		Investments	21,348
		Cash	49,169
	£ 1,991,189		£ 1,991,189

* Paid-up capital consists of 55,000 ordinary shares of £5 each, fully paid and 40,000—5 per cent. cumulative preference shares of £5 each fully paid.

Yemmiganur Spinning Mills Ltd.

[*Managing Agents*: M. G. Agencies, Park Road, Yemmiganur P.O. (Karnool Dt.)]

Second Annual General Meeting—14th December 1964.

Extracts from the Directors' report for the year ended 30th June 1964: The past year was one of the continued progress for the Company. The factory buildings and godowns were completed. The blowroom and preparatory machinery from Japan and the indigenous machinery including electrical equipment have arrived in August 1964 and the erection of the machinery is in progress. It is expected that at least half of the machinery, in due proportion as between various departments, could be commissioned into production during October-November 1964.

The Andhra Pradesh State Financial Corporation have sanctioned a loan of Rs. 20 lakhs and the Syndicate Bank Ltd., a loan of Rs. 10 lakhs.

The Government of India has sanctioned additional 12 704 spindles to make the unit as of 25,000 spindles. Necessary arrangements are being made with regard to placing orders for machiney and construction of further factory buildings.

Accounts in brief as at 30th June 1964 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	24,72,200	Block	30,04,740
Other liabilities	14,51,887	Block in progress	1,50,313
		Current assets	5,76,602
		Investments	500
		Cash	1,29,907
		Miscellaneous expenditure	62,025
	Rs. 39,24,087		Rs. 39,24,087

* Paid-up capital consists of 10,000—9.3 per cent. (less Income-tax) redeemable cumulative preference shares of Rs. 100 each and 20,000 equity shares of Rs. 100 each. Allotment money and calls unpaid are as follows: Equity—Rs. 3,15,700 and preference—Rs. 2,12,100.

Bharat Bijlee Ltd.

(Chairman: Mr. Prahlad C. Mehta, Bombay)

Eighteenth Annual General Meeting—22nd December 1964.

Working Results:

	For the year ended 30th June (In thousand rupees)	
	1964	1963
Sales	1,07,63	1,05,95
Closing stock	8,61	8,20
Gross profit	14,38	14,21
Transfer to depreciation	3,25	2,91
,, ,, provision for taxation	6,90	6,92
Net profit	4,21	4,38
Excess provisions written back	1	11

Appropriations:		
Transfer to statutory development rebate reserve	48	45
To expenses written off	Nil	9
To provision for taxation for previous year	Nil	66
Transfer to dividend reserve	4,35	3,45
Proposed dividend (taxable) equity	2,30* (8%)†	1,30* (8%)
Carry forward	2	3
Market value of equity shares (in rupees):	1964‡	1963
High	146.25	176.25
Low	137.50	120.00

* Payment of dividend out of the dividend reserve.
† On the increased ordinary capital.
‡ High and low upto 20th November 1964.

Extracts from the Directors' report: It will be observed that the sales were very slightly lower than those of the previous year. This is attributed entirely to certain serious raw material shortages.

The order position is satisfactory. Sales during the period from 1st July 1964 have shown a rising trend. Material shortages, however, are still a difficulty to be contended with.

A collective bargaining agreement has just been arrived at with the workmen providing for higher emoluments and better service conditions and it is hoped that this will ensure industrial peace for at least the next three years.

Reference was made in the last year's Directors' report to the land taken on lease at Kalwe. Possession was taken during the year and the full occupancy charge has been paid. Development work on the land will commence very soon.

Agreements have been finalised to obtain a foreign exchange loan of a little over Rs. 30 lakhs from Siemens Schuckertwerke, A.G., West Germany, for the import of plant and machinery required for the expansion of the Company's Motor and Transformer Departments. Government's approval has been obtained to this loan. In addition to this, Siemens Schuckertwerke, A.G. had recently agreed to invest Rs. 20 lakhs in the equity capital of this Company. Permission was sought from Government for the issue of these shares to Siemens Schuckertwerke A.G. Government, however, have not thought fit to approve this proposal.

The company proposes to raise additional capital to finance its expansion programme. It is proposed to issue 30,000 cumulative preference shares of Rs. 100 each carrying interest at 9.3 per cent and redeemable after 12 years from the date of issue but not later than 15 years. These shares will be offered to the public through prospectus without being offered to the existing equity shareholders.

Accounts in brief as at 30th June 1964 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	30,00,000	Gross block	51,65,943
Reserves and surplus	14,79,372	—Depreciation	16,35,124
Other liabilities	46,93,717	Net block	35,30,819
		Block in progress	10,893
		Current assets	52,66,323
		Investments	2,38,032
		Cash	17,122
	Rs. 90,64,089		Rs. 90,64,089

* Paid-up capital consists of 30,000 equity shares of Rs. 100 each. 10,000 unclassified shares were classified as equity shares as per shareholders' resolution dated 2nd November 1963.

PROBLEMS OF NEW ENTERPRISES

(*Concluded from page 960*)

come severe. Some of the old established units have been able to stand up even in the face of this competition. Many of the new units are seeking to do job work, in order to keep their capacity fully employed. There have also been suggestions for converting 3 single phase meters into polyphase meters upto 40 Amps.

Glass (Figured and Wired Glass): I.C.I.C.I. has financed two companies, one manufacturing both sheet and figured and wired glass and the other manufacturing only figured and wired glass. Keen competition has arisen in the sale of figured and wired glass. Traders have been slow in coming to the market in anticipation of lower prices. One of the reasons for the present state of demand is that consumers have been turned away from the use of figured and wired glass as a result of its high price, and that hard selling and attempts to attract customers to use figured and wired glass are required in order to stimulate demand for them.

Superphosphate: I.C.I.C.I. has financed five companies for the manufacture of superphosphate. The market for superphosphate is necessarily restricted in area owing to high transportation cost. It is also restricted because of the backwardness of Indian agriculture and peasantry. The actual demand, therefore, would depend upon the absence of a competitor in an adjacent area, sales promotion by educating the Indian peasants, and development of agricultural cooperative credit to enable the peasants to purchase superphosphate. The market for superphosphate has developed, but it has taken time to do so. It is necessary for the manufacturers to work in co-operation with the State Government, particularly the agricultural departments, and co-operative societies in order to induce the use of superphosphate. Demand for superphosphate can also be fostered by mixing it with nitrogenous fertilisers which have been favoured by the Indian farmers.

Automobile Tyres: I.C.I.C.I. has financed one company in the automobile tyre industry. The demand for automobile tyres depends upon the demand from original manufacturers of automobiles and the demand for replacement from users of automobiles. In the last three or four years, the actual production of passenger cars has been low and production has been concentrated on the manufacture of heavy duty vehicles —trucks and buses. The result has been that the total demand for tyres has not come up to expectations, and both the original equipment demand and replacement demand has been much better for heavy duty vehicle tyres than for passenger car tyres; moreover, despite Indian road conditions, replacement demand for passenger car tyres has been as a rate smaller than the expected basis. As a result, a part of the capacity of tyre manufacturers remains unutilised, and, of the utilised capacity, a larger proportion is devoted to the supply of tyres of heavy duty vehicles.

Sanitaryware: I.C.I.C.I. has financed two new projects for the manufacture of sanitaryware and has provided supplementary loans to three other existing manufacturers of sanitaryware for expanding their capacity. The early estimates of demand, even for high quality ware, have not been fulfilled and many units are reported to be operating much below rated capacity.

Polystyrene and P.V.C.: I.C.I.C.I. has financed two polystyrene manufacturers (one already in production) and one P.V.C. manufacturer. Demand for both these products was low Initially, as a result of past stocks held by users, but is now satisfactory. However, the present price is considerably high, and the industry would need to watch future price trends carefully, as newer units, now being planned, go into production.

Ball Bearings: I.C.I.C.I. has financed three companies for the manufacture of ball bearings. The market for ball bearings is weak both as a result of built-up stocks with users and simultaneous entry of new units. Gradually, it is likely that various units might specialise on particular types of bearings or scales of demand.

Hardboard and Particle Board: I.C.I.C.I. has financed the first manufacturer of hardboard in India. The material was new and there was no specific basis on which to estimate the demand. Earlier estimates proved over-optimistic and it was necessary to reduce considerably the price of the product; even then the unit has been working below capacity. Similar problems arise in the case of particle board also.

(*Concluded*)

NOTICE

Re: Dividend

THE MANAGING AGENTS ARE AUTHORISED to announce that the Board of Directors of the above Company have resolved to recommend payment of a Dividend at the rate of Rs. 12 per share (subject to deduction of tax) for the year ended 31st July, 1964.

The said Dividend, when sanctioned at the Annual General Meeting of the Shareholders of the Company to be held on 22nd January, 1965, will be made payable on and from 15th February, 1965, to those Shareholders whose names stood on the Register of Members on 22nd December, 1964, and to whom or to whose Mandatees dividend warrants will be posted at their registered addresses.

INTIMATION OF ANY CHANGE IN ADDRESS SHOULD BE GIVEN TO THE COMPANY IMMEDIATELY.

For CEMENT AGENCIES LTD.,
R. R. HATTIANGADI,
Managing Director.

20th November, 1964.

THE SIRPUR PAPER MILLS LIMITED

Registered Office:

"Ali Villa," 6-3-655, Somajiguda, Hyderabad-4

NOTICE

NOTICE IS HEREBY GIVEN THAT THE TWENTY-FIFTH ANNUAL GENERAL MEETING OF THE SIRPUR PAPER MILLS LIMITED, will be held on Monday the 21st December, 1964 at 4.00 p.m., at the Registered Office of the Company, at "Ali Villa," 6-3-655, Somajiguda, Hyderabad—A.P., to transact the following business:—

1. To consider the Directors' Report and Audited Accounts of the Company for the year ended 30th June, 1964.
2. To declare Dividends on Preference and Ordinary Shares.
3. To appoint Directors in place of (i) Khan Bahadur C. B. Taraporvala and (ii) Rai Bahadur Srikishen Sookdeve Malani, who retire under Article 122 of the Articles of Association of the Company and are eligible for re-appointment.

   (i) Khan Bahadur C. B. Taraporvala has attained the age of more than 65 years (his date of birth being 3rd September, 1896). The Company has received the requisite Special Notice from a shareholder and accordingly the Special Notice is hereby given to the shareholders for passing the following special resolution for reappointment of Khan Bahadur C. B. Taraporvala, as a Director of the Company.

   "RESOLVED that Khan Bahadur C. B. Taraporvala who has attained the age of more than 65 years, be and is hereby reappointed a Director of the Company and it is hereby specifically declared that the age limit prescribed under Section 280 of the Companies Act, 1956, shall not apply to him."

   Khan Bahadur C. B. Taraporvala has rendered valuable advice from time to time since his appointment as a Director of the Company. It is considered advisable, in the interest of the Company, to retain him on the Board to avail of his valuable advice.
4. To appoint Auditors for the current year and fix their remuneration.

The present Auditors of the Company, Messrs. S. B. Billimoria and Company, Chartered Accountants, retire and are eligible for reappointment.

AS SPECIAL BUSINESS

5. To consider and if thought fit to pass with or without modifications the following resolutions:

AS ORDINARY RESOLUTION

(i) "RESOLVED that subject to approval of the Central Government, Messrs. Birla Brothers Private Limited be and are hereby re-appointed Managing Agents of the Company for a period of five years with effect from 15th August, 1965 on the remuneration and upon the terms and subject to the conditions contained in the draft Agreement placed before the meeting and initialled by the Chairman for purposes of identification and that the Directors of the Company be and are hereby authorised to enter into an Agreement with Messrs. Birla Brothers Private Limited in terms of the said draft Agreement subject to any modifications thereof as may be agreed upon between the Directors and Messrs. Birla Brothers Private Limited for the purposes of complying with any modifications required or conditions imposed by the Central Government in granting its consent."

AS SPECIAL RESOLUTION

(ii) "Whereas the East Indian Produce Company Ltd., an Associate of Messrs. Birla Brothers Private Ltd., the Managing Agents of the Company, maintain an Office in London in the United Kingdom and WHEREAS the said Company carry on business *inter alia* of acting as agents in the United Kingdom, the Continent and other countries for purchase and sale of goods including stores, plant and machinery etc. and also have dealings and business connections with parties all over the United Kingdom, the Continent and other countries and their operations are on a very large scale and WHEREAS their expenses of maintaining their Office, amount approximately to £1,25,000 per annum and WHEREAS expenses which can be attributed to the work to be done for and on behalf of the Company, would depend on the value of purchase effected through the said Company, in relation to their total turnover in each year, and WHEREAS the said East Indian Produce Company Ltd. have been acting as buying agents for and on behalf of the Company in the United Kingdom, the Continent and other countries. NOW it is hereby Resolved that the East Indian Produce Company Ltd., continue to act as buying agents of the Company for purchase of stores, plant and machinery in the United Kingdom, the Continent and other countries for a period of 3 years with effect from 30th June, 1965 and that they be paid a commission @ 2½ per cent of the invoice price thereof.

Provided that if anything to be done in pursuance of the above arrangements requires the permission of the Central Government or the Reserve Bank of India, as the case may be, the same will be done in accordance with such permission."

(iii) "WHEREAS Messrs. American East India Corporation, an associate of Messrs. Birla Brothers Private Limited, the Managing Agents of the Company, maintain an Office in New York in the United States of America and WHEREAS the said Company carry on business *inter alia* of acting as agents in the United States of America and other countries for purchase and sale of goods including stores, plant and machinery etc. and also have dealings and business connections with parties all over the United States of America and other countries and their operations are on a very large scale and WHEREAS their expenses of maintaining their office, amount approximately to $2,00,000 per annum and WHEREAS expenses which can be attributed to the work to be done for and on behalf of the Company, would depend on the value of purchases effected through the said Company in relation to their total turnover in each year, and WHEREAS the said Messrs. American East India Corporation have been acting as buying agents for and on behalf of the Company in the United States of America. Now it is hereby Resolved that Messrs. American East India Corporation continue to act as buying agents of the Company for purchase of stores, plant and machinery in the United States of America and other countries for a period of three years with effect from 1st July, 1965 and that they be paid a commission @ 2½ per cent of the invoice price thereof.

Provided that if anything to be done in pursuance of the above arrangements requires the permission of the Central Government or the Reserve Bank of India, as the case may be, the same will be done in accordance with such permission."

The Share Registers of the Company will remain closed from 23rd November, 1964 to 2nd December, 1964, both days inclusive.

By Order of the Board,
For THE SIRPUR PAPER MILLS LIMITED,
P. L. BHANDARI,
Secretary.

Dated 30th October 1964.

Note: 1. A member entitled to attend and vote at the Meeting is entitled to appoint a proxy to attend and vote instead of himself and the proxy need not be a member of the Company.

2. The Dividends, when sanctioned, will be paid on or after 30th January, 1965 to those shareholders whose names appear in the Register of Members of the Company on 2nd December, 1964.

Explanatory Statement as required under Section 173 of the Companies Act, 1956 has been posted to the shareholders of the Company.

PROFITABILITY OF SMALL COMPANIES

(*Concluded from page 956*)

and other current liabilities from Rs. 18.95 crores to Rs. 22.04 crores or from 23.1 per cent to 24.3 per cent. On the assets side, net fixed assets increased from Rs. 27.46 crores to Rs. 29.13 crores, but the percentage to total declined from 33.4 to 32.1. Inventories rose from Rs. 22.20 crores to Rs. 26.08 crores or 27.0 per cent of total assets to 28.8 per cent. Similarly, loans and advances and other debtor balances expanded from Rs. 20.44 crores to Rs. 23.26 crores or from 24.9 per cent to 25.6 per cent.

Comparison with Large Companies

Contrary to popular notions, the profitability of small public limited companies has been considerably poorer than that of medium and large sized companies. The details, according to the various size groups, are shown in Tables B and C, accompanying this article.

The data show that, by and large, profitability moves parallel to the size of the company—the larger the company, the better its performance. There may be exceptions, but this seems to be the general experience. What are the reasons? In the first place, the small companies may not be able to derive the maximum output out of the raw materials, resulting in high cost of production and substantial wastage. Secondly, the quality of their products may not be very good, and the goods may fetch a lower price in the market. When the cost of production is high and the sale price is low, the natural result is a lower margin of profit. Ironically, even the incidence of taxation is considerably larger on small companies than on the medium and large ones, an experience contrary to the declared objective of the Government, namely, to encourage small companies as part of its drive to minimise concentration of economic power in a few hands. Thus, the published data call for a re-thinking on the part of the Government in regard to taxation of small companies. It is, of course, necessary that detailed studies should be made of the working of the various industries in the small, medium and large-scale sectors. The establishment of small industries should be encouraged only in those fields where they can show results, which are better than, or at least equivalent to, those of the medium and large companies. In other words, encouragement to small companies should not be given blindly on the basis of their size, irrespective of the consideration whether their operations are economical and beneficial to the society as a whole. The adoption of such a judicious policy would result in optimum utilisation of raw materials and working funds, both of which are scarce in this country.

TREND OF MARKETS

MONEY STILL EASY

(From Our Own Correspondent)

BOMBAY, 25*th November*

There have been no outstanding developments in the short-term money market during the week under review. Conditions are quite easy with supply of funds plentiful. Throughout the week, the inter-bank rate for day-to-day call money remained unchanged at 1 per cent per annum for both fresh money and renewals. Towards the close of the week, there was some activity, following the increase in the British Bank Rate from 5 per cent to 7 per cent and the consequent interest evinced by the exchange banks. But, as the supply of floating funds was quite large, the demand was easily met without any change in the rate. In Calcutta market, however, inter-bank call rate behaved in an erratic fashion, with the rate moving between 4½ and 3 per cent, before closing at 2½ per cent (pre-clearing). Calcutta bankers, however, contended that their position was comfortable enough.

Indicative of the continued easiness in the money market was the great response to the Intermediate Treasury Bills of 91-day duration, despite the fact that the yield on these bills this week was only 2.336 per cent per annum. Between 18th November and 21st November, the market absorbed as much as Rs. 16.56 crores of these Bills, as against Rs. 11.25 crores in the previous week and a mere Rs. 48.50 lakhs a fortnight before. Surprisingly enough, however, the response to the 91-day Treasury Bills offered under the tender system was not as much as in the previous week. As against the invitation of usual Rs. 2 crores, the amount offered was only Rs. 2.05 crores, representing a fall of Rs. 1.95 crore as compared with the tenders in the previous week. The amount accepted was Rs. 2 crores and the average rate of accepted tenders declined from 2.4 per cent to 2.360 per cent per annum.

In the first half of the week under review, pound-sterling ruled weak in the world markets, but improved later after the Bank Rate was increased as mentioned above. In the New York exchange, for instance, spot sterling went down from 278.300-278.330 to 278.240-278.270 cents before recovering to close at 278.640-278.660 cents per £. Three months' forward, however, continued to be weak, with the rate dropping 0.580 cent over the week to stand at 277.090-277.110 cents. In India, the banks' selling rate for spot U.S. dollars declined from Rs. 481 to Rs. 480.25 but closed a shade better at Rs. 480.50 per 100 dollars. Their buying rate was down by 75 paise at Rs. 476.75.

COTTON FUTURES CLOSE TO CEILING

(From Our Own Correspondent)

BOMBAY, 25*th November*

Buoyancy was imparted to the futures section of cotton market during the week under review by firmness of spot prices, continued reports of lower cotton crop and the absence of official indications about import allocations. Short-covering and bull support halted the declining tendency noticed in prices towards the close of the last week. After ruling distinctly steady during the earlier part of the week, the futures displayed a firm trend, so much so that on Monday, the 23rd inst., the prices touched the official ceiling of Rs. 775 for the Jarilla March 1965 contract. Enquiries in market circles revealed that, in private deals, the prices were quoted higher than the ceiling by two to three points. Subsequently, higher levels met with selling pressure from up-country operators and normalcy was restored later. In the last two sessions of the week, the market fluctuated both ways on alternate bouts of buying and selling.

The Jarilla March contract opened the week 50 paise lower at Rs. 761 and, after touching the ceiling at Rs. 775 on the 23rd inst., declined to Rs. 768.25 on the same day. After narrow fluctuations at the higher range, the contract closed at Rs. 771.75 today, a net gain of over Rs. 10.75.

Mill buying in the Sewri spot market continues to be absent because of high prices of all the old and new varieties of cotton. Limited quantities are reported to have been bought by mills which are in urgent need of cotton. The quantities mostly in demand were L.147 Digvijay, Co2, Kalyan and 197/3. The prices of Wagad, Kalyan and L.147 further hardened by about 10 points. It is no wonder, therefore, that the spinners are resisting the present firmness in spot prices. There is a belief in market circles that, if the position continues as at present, more Government controls such as the introduction of compulsory survey, random requisitioning of stocks and the issue of small quotas to restrict purchases by mills would become inevitable. It is learnt that the Government of India is trying to procure about 100,000 bales of Pakistan cotton to make up for the deficiency in the 197/3 crop. Incidentally, it may be mentioned that the Textile Commissioner, who is reported to be in Paris at present, is likely to proceed to the United States for negotiating the release the 150,000 bales of American cotton under P.L. 480. The global quota is also expected to be announced soon. It is believed that, after these developments take place, the situation will ease in the spot market.

The following are the latest available quotations in respect of certain popular varieties:

Akola L.147 New Rs. 1.291; Amravati L.147 New Rs. 1,315; Bhagalkot Laxmi Rs. 1,042; Dhulia New Rs. 1,170; Hubli Laxmi Rs. 1,041; Nagar Co.2 current Rs. 1,470 and Viramgaon New Rs. 1,005.

Prices of Bengal *Deshi* (December delivery contract) have further hardened during the week to Rs. 814 per candy as against Rs. 795 last week. This is only three points below the ceiling rate of Rs. 817. Arrivals of this variety in the terminal market are said to be poor. Profit-taking at higher levels brought the prices down to Rs. 810 at the close of the week. The next delivery, namely, January 1965 contract, was quoted at a discount of Rs. 5. The total export sales registrations have reached the figure of 83,000 bales. But it is felt that the ruling prices would not enable the trade to export this variety on any big scale.

Amongst imported cottons, mills are reported to have bought East African cotton. Spinner interest was also evinced in the Sudan and Pima cottons. But the prices of these varieties also showed a hardening tendency in keeping with the general trend of prices the world over.

Weather conditions are reported to be generally satisfactory and trade estimates place the current cotton crop in the neighbourhood of six million bales.

BULLION RECOVERS

(From Our Own Correspondent)

BOMBAY, 25*th November*

While silver ruled firm after initial easiness, gold moved erratically during the week under review. The recovery in silver was due to a marked decline in arrivals of the metal and sustained buying support from local and upcountry stockists. Gold fluctuated because of smaller inflow of the metal owing to the extra vigilance of the customs authorities and slack inquiries. Traders, however, felt that the demand for both the metals would pick up on account of the approaching marriage season. Over the week, silver gained Re. 1.50, while gold was lower by 50 paise.

Silver began the week on an easy note at Rs. 259.00, same as last week, and declined to Rs. 258 in the initial sessions only to look up quickly to Rs. 261 before closing at Rs. 260.50, on account of heavy demand from local stockists. The weekly average arrivals and offtake of the metal were 13 and 8 bars respectively, as against 16 and 8 bars last week.

Fourteen-carat gold opened the week 25 paise higher at Rs. 67.50, but, on lack of support, steadily declined to Rs. 66 on Tuesday. Subsequently, however, with fresh buying at lower levels by stockists it improved to close at Rs. 66.75 today. In unofficial dealings, pure gold which was quiet at Rs. 110.50 firmed up on reports of seizure of unauthorised gold worth Rs. 3 lakhs to Rs. 113. Sovereign was done at Rs. 91.50.

The international price for gold in the London market was higher at $35.10⅞, as against $35.09¼ last week. The sterling price fluctuated between 251*s.* 9½*d.* and 252*s.* 3½*d.*, before closing at 251*s.* 11½*d.* as a reaction to the rise in the British Bank Rate to 7 per cent. While spot silver declined by ¼*d.* to 112½*d.*, forward silver gained by the same amount to 113¾*d.* Silver in New York, however, remained unchanged at 129.3 cents.

To obviate the difficulties experienced by goldsmiths in maintaining their accounts in a particular language or in a particular book, the Union Government has decided to allow the goldsmiths to have their accounts in either Hindi or in their regional language. There will be no objection if entries are made in any other language known to the goldsmiths or the customers. It is also not necessary that the form of accounts prescribed for the maintenance by the self-employed goldsmiths should be printed. They can have their accounts maintained in any type of copy book, provided the entries made therein, conform to the form prescribed for the purpose.

The following table shows the trend of prices during the week under review:

	25-11-64 (closing)	High	Low	18-11-64 (closing)
SILVER				
Ready (996 fine)	Rs. 260·50	Rs. 261·00	Rs. 257·50	Rs. 259.00
GOLD				
Ready (14-carat)	66·75	67.50	66.00	67.25
Sovereign	91·50*	—	—	91.50*
London—				
Gold	251*s.* 11½*d.*	252*s.* 3½*d.*	251*s.* 9½*d.*	252*s.* 2*d.*
Silver Ready	112¼*d.*	—	—	112½*d.*
Silver Forward	113¼*d.*	—	—	113¾*d.*
New York—				
Silver	129·3 cents	-	—	129.3 cents

N.B.—The quotation of 24*t* is per 10 grams (about 0.85 tola) and that for silver is per kilogram (35.73 tolas). London and New York quotations are per ounce. * Unofficial rate.

ART SILK YARNS AT NEW LOW LEVELS

(From Our Own Correspondent)

BOMBAY, 25*th November*

The yarn market was generally easy during the week under review. Never in any single week during the past four months art silk yarns have ruled active and firm. On the contrary there has been a continuous erosion in prices. The week under review also has proved no exception to this trend. Actually, prices have declined to new low levels not witnessed in recent years.

The further fall in prices during the week was induced by the reported cut in price by another leading spinner. Stockists who expected early supply turned eager sellers, while buyers were conspicuous by their absence. The strike in the works of National Rayon failed to have any effect on the prices as the position of stocks was comfortable and the company in question maintained its supply from its Mahalaxmi godown.

Staple fibre yarn future moved in a narrow groove in the earlier sessions following slack in demand, but tended to look up in the closing sessions on bear covering. Ready yarns ruled easy owing to lack of adequate offtake. Operators in cotton yarns seemed to have lost all hopes of any improvement in the near future. Dealers interested in finer counts, according to a broker, hesitate to extend goods on credit even to best known establishments. Banks also have restricted the facilities to firms showing only small weekend deposit balances. Market circles, in these circumstances, fear a further fall in prices.

In view of the "comparitively easy supply position," the Union Government has withdrawn the facility given to cotton textile mills to import staple fibre of non-viscose origin and certain other fibres against their retention quotas for cotton. It will be recalled that, under a previous notification, the mills were allowed, as an experimental measure, to import viscose and synthetic yarns up to 20 per cent of the value of their retention quota for import of foreign cotton. The present withdrawal has taken effect from the 12th inst. The mill circles are of the view that this step would soon create a shortage of polyester and similar fibres.

Among art silk yarns, National Rayon 150 shed 6 P to Rs. 8.98. 120D dropped 2 P to Rs. 9.59. Bright Century 100D suffered a steep fall of 20 P to Rs. 11.22. South India Viscose 120D lost 13 P to Rs. 12.10. Bright Century 75D was dull at Rs. 17.05.

In the staple fibre yarn section, the 2 x 34 January 1965 contract, opened the week a rupee higher at Rs. 854 (per quintal) against the last week's close of Rs. 853 and improved thereafter to close at Rs. 863 today. The net gain over the week was Rs. 10. Spot Kohinoor gathered 9 P to Rs. 9.77. Sita Lakshmi dropped 5 P to Rs. 9.28. Premier eased by 4 P to Rs. 9.42.

In the cotton yarns, 8s Podar declined by 25 P to Rs. 21.25. All other counts were quoted unchanged at last week's levels.

The following table gives the prices of rayon staple fibre and cotton yarns, today, as compared with those prevailing a week ago:

	25-11-1964	18-11-1964
Art silk yarn (per kg.)—	Rs.	Rs.
National Rayon 120D	9·59	9.61
Century 75D	17.05	17.05
S. I. Viscose 120D	12.10	12.23
Staple fibre yarn (2 × 34 NF) January 1965 (per quintal)	863.00	853.00
Spot (per kg.)		
Sitalaxmi	9.28	9.33
Premier	9.42	9.46
City	9.42	9.42
Cotton yarn - French Count (Rs. per 5 kg.)		
8s Podar	21.25	21.50
17s Modern	27.00	27.00
22s Madura	32.00	32.00
34s Tcott	39.97	39.97
62s Pioneer	68.75	68.75
68s Finlay	100.50	100.50

OILSEEDS REMAIN FIRM

(From Our Own Correspondent)

BOMBAY, 25*th November*

Trading in oilseeds futures was at a standstill nearly the whole of the week. It was said that the Forward Markets Commission took a serious view of the practice of kerb deals after official trading had come to a close with the attainment of the permissible weekly limit of fluctuations. The Association, it appears, thought it better to suspend trading in castor and linseeds, too, lest it might tempt groundnut interests to come to the market and start dealing in groundnuts futures on the sly. However, there was considerable anxiety about the future of the market. Opinions were divergent particularly about the extent to which price movements could be controlled by artificial measures. One section was maintaining that groundnut futures prices did not warrant any interference, for only in October spot prices had touched Rs. 160 while oil had reached as high a level as Rs. 3,300 per tonne, and that the current price of Rs. 101 or so was not high by any comparison. The argument of this section was that the January contract should be allowed to run its course, allowing full play to the factors of demand and supply. The other and opposite view was for further restrictions. Reports were that the Association had proposed a ceiling of Rs. 104 per 100 kg. for the January contract. The Forward Markets Commission, however, was not in favour of raising the ceiling but preferred to tighten the margin system, with a view to checking further activity of a speculative nature which in the Commission's opinion had been largely responsible for the present bullish tendency.

On Wednesday, the Forward Markets Commission stipulated that, if groundnuts futures crossed the Rs. 103 mark, double margins would be imposed, or, in other words, the margin would be Rs. 10,000 per 25 tonnes and that there would be no free limit over Rs. 103. The present margin is Rs. 5,000 per 25 tonnes if the market crossed Rs. 100, with a free limit of 300 tonnes. The weekly limit of Rs. 2.40 for fluctuation continues to be unaltered.

Meanwhile, the Association decided on Wednesday that no transactions would be allowed until the end of January over and above the level of Rs. 190 per 250 kg. in castor and Rs. 45 per 50 kg. in linseeds. Following the Board's meeting, trading started at 2.30 p.m. The trend was extremely firm and at the start, castor March was quoted at Rs. 190 and linseeds at Rs. 45 while groundnuts were mentioned at Rs. 101.75 and cottonseeds at Rs. 114.50. It therefore seems that trading will be a tame affair hereafter and that the traffic will be one way, that is downwards, for there can hardly be any upward move in face of restrictions. In other words, there is likely to be a stalemate, unless, of course, fresh factors emerge.

Knowledgeable sources, however think that the chances of a decline are absolutely slender, despite factors like the continuation of the ban on exports of oils from the country and a bumper crop in groundnuts. The chances seem more for a rise than a fall. The virtual closure of the grain trade to private interests has flooded the seeds market with a host of new entrants. These

people are wealthy enough to speculate and they are not in a position to go in for manufacture or allied lines. It is possible that these interests are buying up oilseeds and cotton for speculation. Further, co-operatives have given a new feeling of strength to the farmers. Added to these are the old speculators in the seeds market itself. Between themselves, these elements are rigging up the prices and it would be interesting to watch as to how far the measures initiated by the Forward Markets Commission will counteract the speculative tendencies on the part of professional operators.

Reports regarding groundnut deoiled cake (extractions) make happy reading. The market is very firm, thanks to continued demand from overseas countries. At present, ready is quoted at Rs. 445, November at Rs. 442, December at Rs. 438-440 and January-February at Rs. 428-430. The main buyers are the communist countries and the United Kingdom. It was said that Czechoslovakia recently bought about 18,000 tonnes while Russia took about 20,000 tonnes. Market men expect the United Kingdom to buy at the rate of 20,000 tonnes a week. It is thought that extractions alone might lift the groundnuts market by a substantial figure. Advices from the United Kingdom indicate £40-5 for November, £39-5 for December and £38 for January.

As has been mentioned many a time in this column, the firmness in castor is induced by the strength in groundnuts as well as shortage of stocks and the fact that there is time yet for the new crop. Crop reports so far are satisfactory but it remains to be seen whether the crop as such will have any big impact on prices. Linseeds are firm and much of its outlook depends on the rapeseed harvest but this also is still a long way off. Cottonseeds were mentioned on Wednesday afternoon at Rs. 114.50 and there is nothing to suggest that prices have reached their highest. So long as cotton continues to stand at or above the ceilings, nothing can arrest the rise in the prices of cottonseeds.

The following table shows the closing prices of oilseeds and oils as on 25th November as compared with the previous two weeks:

	25-11-1964	18-11-1964	11-11-1964
Groundnuts	Rs.	Rs.	Rs.
January 1965 contract	102.40	100.15	98.15
Oil January 1965	N.T.	N.T.	N.T.
Khandesh quality	111.00	116.00	120.00
Oil ex-mill	23.00	24.00	24.00
Oil Rly. Receipt	22.40	22.75	23.00
Castorseed			
March 1965	190.00	187.50	184.50
Ready Madras	85.50	85.00	83.50
Ready Kanpur	83.50	83.00	81.50
Oil B.S.S.	18.80	18.90	18.55
Oil commercial	18.10	18.00	17.85
Linseed			
March 1965	44.81	43.62	41.94
Bold ready	112·00	110.00	101.00
Linseed oil	23.50	23.50	21.50
Cottonseed			
January 1965 contract	114.50	110.50	109.50

N.B.—The quotation for groundnuts January 1965 contract is for 100 kg. The rates for spot groundnut and castor are for 100 kg. Castor and cottonseeds futures are quoted per 250 kg. while linseeds futures are quoted per 50 kg. Groundnut Oil January 1965 and all spot oils are quoted per 10 kg.

WHOLE LEAF TEA IRREGULAR

[Messrs. Forbes, Ewart and Figgis (Private) Ltd.]

COCHIN, 19*th November*

A large quantity, amounting to 1,133,000 kgs., was offered in tea sale No. 45 held here on Tuesday the 17th inst. Quality was irregular with some of the later invoices showing a decline. There was good demand throughout the sale, while prices tending lower, particularly for fannings grades. The few best highgrowns were firm but the lesser Nilgiris were sometimes dearer following quality, but on average these inclined easier as did their fannings. Good medium descriptions were well supported at around last rates while, in the case of medium and low medium brokens, these sold well but at prices which followed a lower tendency; their fannings eased to a greater extent than their equivalent brokens. Black leaf sorts were sold well and plainest descriptions were about steady. Whole leaf grades came to an irregular market with liquoring sorts meeting with useful competition. Tippy teas sold at around last rates. Unorthodox descriptions again came to a slightly lower market.

The quotations (per kg.) in the sale under review were as follows:

	1964	1963
	Rs.	Rs.
Low mediums	4.20-4.80	4.15-4.60
Mediums	4.65-5.10	4.65-5.00
Good mediums	5.15-5.80	5.10-5.55
Nilgiri B.O.P.	5.00-6.60	4.70-7.30

The average price realised in tea sale No. 45 was Rs. 4.83 per kilo, as compared with Rs. 4.87 a week ago and Rs. 4.64 in the corresponding sale last year.

In dust sale No. 45 held here today, an increased quantity amounting to 519,000 kgs. was offered. There was a good general demand which prevailed throughout the sale with support for clean black exportable types a strong feature, and these were fully firm. Coloury mediums and Wynaad dusts were barely steady and although Travancores came to an irregular market they sold at only slightly below last rates. Milled and residual descriptions were very irregular, often being dearer. Nilgiris came to an irregular market while unorthodox descriptions were again a little easier.

The average price realised in dust sale No. 45 was Rs. 4.39 per kilo, as against Rs. 4.37 a week ago and Rs. 4.50 in the corresponding sale last year.

Colombo: Offerings amounted to 5¼ million lbs. and the market opened to a good demand with best Dimbula brokens steady but the lesser sorts and mediums shed 5-15 cents, while uvas marked greater declines. Lowgrowns ruled firm as did liquoring fannings.

London: *North Indian and other growths*: In Monday's auction there was a fair demand at lower rates.

Ceylon and South Indians: In Tuesday's sale, there was a good demand with the better liquoring teas selling at lower prices. The poorer descriptions came to a weaker market and some withdrawals had to be made.

As we go to press, Messrs. Forbes, Ewart and Figgis (Private) Ltd. wire us as follows:

"*Sale No.* 46: 1,011,000 kgs. offered. Good demand. Low medium and medium brokens irregular and occasionally upto 10 paise easier. Similar fannings upto 30 paise lower. Good mediums about steady. Highgrowns generally lower."

PEPPER IMPROVES

(Messrs. Parekh and Co.)

BOMBAY, 24*th November*

After remaining quiet under pressure of the bear sellings during last week, Malabar pepper this week showed an improving tendency in sympathy with New York, where spot improved from $0.35½ to $0.37½ owing to most of the spot stock being in strong hands and due to absence of sizable offers from origins, Malabar parity being at $0.39 and Indonesia having raised her export check price from $0.39 to $0.40. Since August shipment, there being no fresh shipment of Lampong to New York, the market there has become technically healthy. Short positions by New York dealers in their sales to grinders for January-February-March delivery gave further impetus to the bulls to stage a squeeze in the near future as India is not going to supply pepper to New York in a big way unless it is at its price, even in the midst of the season.

Indonesia having learnt this year a lesson after having sold sizable quantity at one low flat price is now reported to follow a more sane policy in fixing adjustable realistic check price. This is one of the reasons for a more stabilised market in pepper for the future. Sarawak having almost sold out her production, most of the Continental markets shall have either to look to India or Indonesia till the arrival of the new crop. Singapore is reported to be fairly steady at $(M)122¼.

Ready ungarbled at Cochin after having gone down to Rs. 324 is now quoted at Rs. 332 despite sizable arrivals. Garbled rallied from Rs. 334 to Rs. 340. December delivery after going down to Rs. 332 improved to Rs. 342 while January from Rs. 328 to Rs. 338. In Bombay, *posh* delivery after having touched the lowest at Rs. 350 improved to Rs. 365 and *maha* from Rs. 353 to Rs. 368.

The future of the market seems to be promising in view of the fact that the shorts in New York shall have to buy Malabar December shipment for delivery against their sales for January-March delivery as Lampong pepper even if December shipment alone will not be available till March 1965. The political situation in South East Asia appears to be more explosive and that is one of the reasons why the bears will think twice before pressing the market too low.

Ready Malabar is quoted at Rs. 182 per 50 kilos.

JUTE GOODS FIRM

(From Our Own Correspondent)

CALCUTTA, 24*th November*

After an initial easiness owing to selling pressure from stockists, the jute goods market recovered on Thursday the 19th inst., thanks to encouraging news of heavy orders from Burma and Cambodia for sacking goods. The recovery was well maintained till today on reports of good hessian business with the U.S., cornsack shipments to Australia and brisk short-covering in the futures section for November delivery because of the closing day for November contracts. The decline in gunny despatches by 3,300 tons in October as compared with the previous month and the jute mill workers' memorandum to the Union Labour Minister, Mr. D. Sanjivayya, failed to have any effect on the market. A deputation of 2.5 lakh jute workers, who are to observe a day's token strike on Tuesday, 1st December on the refusal of the I.J.M.A. to pay a minimum bonus of 4 per cent of total annual earnings met the Union Labour Minister to seek his intervention in the dispute. The outcome of this meeting is not known at the time of writing.

In the hedge market, Sacking November encountered selling and declined to Rs. 150.40 from the last week's closing of Rs. 156.25 on Wednesday. But, later, it recovered smartly to close with a gain of a rupee at Rs. 157.25. Similarly, Hessian November, after declining to Rs. 48.86 initially, rose to finish at Rs. 50.35.

In the spot market, too, both Hessian (40″×100 oz.) and B. twills maintained a steady trend. Thus, ready hessian moved up from Rs. 49.20 to Rs. 50.25 and B. twills from Rs. 154.50 to Rs. 159.50, though the closing was a shade lower at Rs. 158.75.

Despite the announcement of a higher compulsory mill purchase quota of 2 lakh bales for the week ending 28th November, as against 1.75 lakh bales the previous week, the raw jute market remained subdued till Monday. The easiness was due to increased arrivals and cautious buying by the mills. The rising prices of essential commodities had induced a feeling in the market that weak holders of fibre would resort to distress selling, as their ability to hold on to stocks must have suffered. But slightly steadier conditions were in evidence towards the close with an improvement in the sentiment and firmer advices from the goods section. Dealers were also reluctant to cut their prices for attracting buyers. The recovery, however, was not marked to make up for the earlier losses, so that today's closing rates were slightly below those prevailing a week ago. Assam Bottoms, over the week, were unchanged at Rs. 36, per maund, while Northern Bottoms and Daissee Bottoms declined by Re. 1.50 and Re. 1.00 to Rs. 35.00 and Rs. 36.00, respectively.

FOODGRAINS STEADY

(From Our Own Correspondent)

HAPUR, 23*rd November*

Barring rice which was depressed, thanks to new crops arrivals prices of all cereals recorded a steadier trend during the week under review. Good consumer demand in face of poor supply position was the main influencing factor. Ration shops were faced with deficit supplies and were not in a position to distribute even four kilograms a unit per month. Rice and maize stocks were not yet made available for distribution through ration, and thanks to Government measures maize was not even available in that open market. *Rabi* sowings were still being continued in areas which were badly waterlogged after the last monsoon. As land vacated from cane is also being utilised for such sowings, increased *rabi* acreage is predicted.

Wheat advanced by Re. 1.50 to Rs. 2.50 per 40 kilograms on poor arrivals and brisk consumer demand. Average wheat was quoted at Rs. 36 to Rs. 37 and farm produce between Rs. 37.50 and Rs. 38.50 per 40 kilograms at the week-end. Stocks were meagre. Rice continued to be subdued and declined further by Rs. 2 to Rs. 3 per 40 kilograms according to quality, on increased arrivals of new produce. Week-end prices were:—Rice *basmati* superior Rs. 40 to Rs. 42, *sela* Rs. 36.50 to Rs. 38.50, *mainpuri* Rs. 31.25, *ramajwayan* Rs. 32.75, *raimunia* Rs. 32.75 and *gadda* Rs. 26 to Rs. 27 per 40 kilograms.

After an early decline on lack of support, gram improved by the week-end due to small arrivals. Prices ranged between Rs. 33 and Rs. 33.50 per 40 kilograms. Maize hardened further by Re. 1.50 at Rs. 24.50 to Rs. 25 per 40 kilograms on tight supply position and brisk consumer support. Barley and *bejhar* also improved during the week-end as stocks were meagre. Barley was now quoted between Rs. 28 and Rs. 29 and *bejhar* between Rs. 27 and Rs. 28 per 40 kilograms. *Juwar* and *guwar* were steady because of tight supply position and were quoted between Rs. 24 and Rs. 26 and between Rs. 22 and Rs. 24 per 40 kilograms respectively. *Bajra* and other coarse grains were listless in limited trading.

Steady to quiet trend wars witnessed in the pulses market during the week. Peas declined by Re. 1 to Rs. 2 per 40 kilograms with *dara* variety quoting at Rs. 26 to Rs. 27 and farm at Rs. 27 to Rs. 28 on poor outside enquiry. *Arhar* ruled steady at Rs. 35 to Rs. 38.50 per 40 kilograms on tight supply position. *Urd* and *moong dal* on the other hand were subdued because of increased arrivals. *Urd* was quoted between Rs. 27 and Rs. 29.50 and *moong* between Rs. 34.50 and Rs. 37 per 40 kilograms. *Masoor*, however, hardened on good demand as arrivals and stocks were both meagre. Week-end prices were:—Peas *dal* Rs. 38.50, *arhar dal* Rs. 44 to Rs. 45, *urd dal* Rs. 35.50 to Rs. 36.50, *moong dal* Rs. 42 to Rs. 43, *masoor* Rs. 36.50 to Rs. 40, *masoor dal* Rs. 44 to Rs. 45 and gram *dal* Rs. 38 per 40 kilograms.

SUPPLIES SCARCE

(From Our Own Correspondent)

HAPUR, 23*rd November*

Sugar supplies remained restricted and the prices in unofficial trading ruled steady at Rs. 180 to Rs. 182 per quintal as against the control prices of Rs. 135 a quintal. Most of the factories in this area have gone into production and cane supplies to them is reported as satisfactory, but as the quality of cane offered is poor and still not ripe, sugar percentage is said to be lower around 6 per cent. The Union Government is evolving a long-range policy in regard to the sugar industry and steps are being taken for a further 8 lakh tons sugar capacity soon.

Following the receipt of import permits for bulk quantities from other States, *khandsari* turned steadier and recorded good all-round gains. *Khandsari gulawat* spurted by Rs. 5 to Rs. 10 and was Rs. 100 to Rs. 120 per quintal. *Desi khandsari* white creamish variety prices increased by Rs. 2.50 a quintal to be quoted in the week-end at Rs. 120 to Rs. 152.50 a quintal according to quality. *Khandsari* manufacturing units would start crushing operations in Meerut region from 7th December, but initially these units would undertake manufacture of *gur*.

Pressure of arrivals here as well as in mofussil markets accounted for a fall in *gur* and *shakker* during the week. However, demand continued to be brisk from Gujarat and other consuming areas because of persistent rumours that the Government might impose a ban on the inter-State movement of the commodity as was done last year due to the high prevailing prices. Daily arrivals of *gur* here averaged 6,000 maunds and were also heavy in mufussil markets, but as yet, there has been accumulation of stocks. Week's offtake aggregated 30 wagon loads and week-end prices (in Rs. per 40 kgs.) were: *Pansera* superior 33, average 32.25, *dara* 32, *shakker* 34 to 35, and *balti* 33.50.

In the Muzaffarnagar market, *gur chaku* drifted lower by 50 paise to Rs. 33 to Rs. 34.75 per 40 kgs. under pressure of arrivals. Corresponding prices last year were much lower at Rs. 22 to Rs. 24.50. Prices of other qualities also sagged. *Shakker* lost Re. 1 to Rs. 3 per 40 kgs. Arrivals during the week amounted to 58,000 maunds and as yet there has been no accumulation of stock.

INDIAN OIL CORPORATION LIMITED

ANOTHER YEAR OF PROGRESS AND ACHIEVEMENTS

SPEECH OF CHAIRMAN, SHRI P. A. GOPALKRISHNAN, I.C.S., AT THE ANNUAL GENERAL MEETING ON 24th NOVEMBER, 1964

GENTLEMEN,

THE balance-sheet and profit and loss statement of the Indian Oil Company are in front of you for your ratification. These documents throw a flood of light on the transactions of the Company but I shall confine myself in this statement only to certain salient features.

Sales

1. The sale of oil products has gone up to 1.17 million kilolitres as against 6,29,639 kilolitres in 1962-63. The sale of petroleum coke was 11,498 metric tons in 1962-63 but it is 26,488 in 1963-64.

Operational Cost

2. The operational cost per kilolitre has come down to Rs. 29.21 as against Rs. 30.16 in 1962-63 and Rs. 31.68 in 1961-62.

Profits

3. The profit before taxation is Rs. 104.77 lakhs as against Rs. 62.41 lakhs in the previous year. The return on equity capital is 21.1 per cent as against slightly less than 20 per cent in the previous year.

Unavoidable Expenditure

4. The profit would have been very much higher but for two important items of expenditure which the Company had to bear. One is the under-recovery of railway freight of Rs. 55.77 lakhs on account of the location of the Gauhati Refinery. Government have fixed ceiling selling prices for all oil products on the basis of import parity and companies are allowed to charge only upto these ceiling prices plus freight to the consuming point from the relevant port.

Since many of the consuming points are situated farther away from Gauhati than from the port, the Indian Oil Company had to bear the excess railway freight which it could not recover from the consumers. Burmah Oil Company's share of this unrecovered freight has been taken as Rs. 19 lakhs in our accounts as approximately this amount is due to us from them.

The second item of expenditure is the under-recovery of Central sales tax amounting to Rs. 26.92 lakhs. This is collected at the rate of 2 per cent on sales outside Assam but accrues to the State Government, as it has not exempted inter-company transactions on oil products from sales tax as some other State Governments have done. The State Governments who have exempted such inter-company transactions from sales tax are Maharashtra and Andhra Pradesh. Kerala has also agreed to grant this exemption.

A word of explanation is necessary in respect of both the items. They refer to all the Gauhati products sold by the Indian Oil Company either to consumers or to other oil companies. The latter have refused to pay their share of the under-recovery of freight as well as of Central sales tax, on the ground that these are not recoverable from the consumer and they are allowed to sell products only at the ceiling selling prices fixed by the Government on the basis of import parity. References have been made to Government on these two matters for the last two years but to no effect. The Company had therefore no alternative but show these amounts as reductions from the profit made.

In spite of the two serious handicaps mentioned above, the Indian Oil Company has made a handsome profit in 1963-64 and the net profit (after taxation) gives a return on equity capital of 16.8 per cent.

Increased Tankage

The increase in sales has been made possible because the Company increased its tankages at installations and depots and built many new depots during 1963-64. The facilities of the Company have grown enormously and it can tackle a sale of more than two million kilolitres at the present time.

By an order of the Government, the Indian Refineries merged with the Indian Oil Company on 1st September 1964 and now the combined organisation is known as the Indian Oil Corporation Limited.

The Indian Refineries include the refinery at Gauhati and the one which has now gone on stream in Barauni. The third refinery at Koyali in Gujarat which is under construction by the Oil and Natural Gas Commission will also merge with the Indian Oil Corporation shortly.

The Corporation has at present two divisions, the Refineries Division and the Marketing Division. It will have two more divisions in future, the Pipelines Division and the Petro Chemical Division.

As I have already mentioned more than once in the statements that I have made before, this Corporation is likely to become the biggest oil organisation in the country in six or seven years.

Finally I thank all the Directors of the Board for their co-operation and advice and thank all those officers and staff who have worked hard to make the year successful.

BOMBAY, *24th November* 1964.

(The above does not purport to be a report of the proceedings of the Annual General Meeting.)

COTTON

(Concluded from page 942)

tian Menoufi FG over Memphis territory SM1-1/16 inch cotton was 55 per cent last season, as compared with 33 per cent in 1962-63.

The rise in the prices of extra-long staple would have been more marked but for the release of regular export quotas from the U.S. national stockpile of foreign-grown extra-long staple cottons. Recently, a sale-for-export programme, involving domestic extra-long staples, has also been initiated. Under the sale-for-export programme, stocks of American-Egyptian cotton held by the C.C.C. will be offered on a competitive bid basis. A quantity of cotton equal to purchases under this programme must be exported by 31st July 1965. Sales are limited to 5,000 running bales per month; however, only one bale was sold at the first three openings of bids. Officials have emphasised that under each of the export sales programmes, cotton will be sold at not less than the world price and in such a manner as to avoid disruption of markets.

The U.S. Congress, it may be recalled in passing, passed legislation in September last, requiring the C.C.C. to offer its stocks of extra-long staple cotton for sale at competitive world prices whenever these cottons are in surplus supply. Purchases from these sales, or an equal quantity of extra-long staple cotton, must be exported within a certain period of time. The Secretary of Agriculture is directed to determine the amount, if any, that these cottons are in surplus supply for the 1964-65 marketing year within 30 days from the effective date of the legislation and for each succeeding marketing year at least 30 days prior to the beginning of the season. Extra-long staple cotton will be deemed to be in surplus supply whenever the total supply (not including stockpile) is in excess of estimated domestic consumption and exports (excluding anticipated exports under this authority) *plus* an allowance for carryover equal to 50 per cent of estimated disappearance. Exports under this legislation will be excluded in making any determination with respect to national marketing quotas. The presumption, therefore, is that authority is given to remove any surplus supply but should not contribute to additional production.

AIR-INDIA LIMITED

(In Voluntary Liquidation)

A GENERAL MEETING OF THIS COMPANY will be held in the Board Room, 4th Floor, Bombay House, Bruce Street, Fort, Bombay, on Tuesday, 22nd December 1964, at 4.30 p.m., when in accordance with the provisions of Section 496 of the Companies Act, an account of the acts and dealings of the Liquidators and of the conduct of the winding up for the year ended 30th September 1964 will be laid before the Meeting togther with the prescribed form of statement with respect to the proceedings in and the position of the Liquidation.

A member entitled to attend and vote is entitled to appoint a proxy to attend and vote instead of himself and a proxy need not be a member.

AIR-INDIA LIMITED
(In Voluntary Liquidation)
By Order of the Liquidators,
K. C. BAKHLE,
A Liquidator.

ESPLANADE MANSION,
FULLER ROAD,
BOMBAY-1.

To all Shareholders of Air-India Limited (In Voluntary Liquidation) and particularly to:—

Five-year Premium Prize Bonds, 1964 was issued since 1st January 1964. The outstandings at the end of Aug. 1964 was Rs. 7.89 crores (excluding outstandings of the previous series.

A new series of Premium Prize Bonds, 1964 was issued since 1st January 1964. The outstandings at the end of Aug. 1964 was Rs. 7.89 crores (excluding outstandings of the previous series.

STOCK & SHARE QUOTATIONS

Abbreviations :—D.—Deferred shares. P. O.—Preferred Ordinary shares. Y.—Accounts published yearly. H.—Accounts published half-yearly. P.—Company has Preference shares. T.—Company has Debentures. N.—Nominal quotations. x.d.—Ex. Dividend. c.d.—Cum. Dividend. I—Interim Dividend. C.R.—Cum. Right. XR.—Ex. Right.

Shares :—If a company has different classes of shares—as for example : 'A' shares and 'B' shares—these are indicated by the same letters 'A' and 'B' under the columns 'Paid-up Ordinary Capital' and 'Paid-up' per share.

Accounts :—Figures in the Accounts Closed column represent the months or the year in which the respective companies close their accounts, 6 and 12, for instance, indicate the months of June and December, respectively. Reserves include general and other reserves and all other funds which a company may have, excluding depreciation fund, reserves for tax liability and provident fund. Block represents actual cost of land, buildings, machinery and all other items on which depreciation is allowed less sales, if any, and stands for the gross figures except where otherwise indicated.

Dividends :—Dividends for completed years are shown as amount per share per annum, but where quoted for portion of a year they represent the proportionate dividend for that period. In the case of those companies which close their accounts yearly dividends shown are for their financial year.

COMMERCE

"For Commerce, though the child of Agriculture, fosters his parent Who else must sweat and toil and gain but scanty fare."
William Blake.

VOL. CIX. No. 2798 BOMBAY, 5th DECEMBER 1964 PRICE Rs. 2

INDIAN CAPITAL FOR AFRICA?

SINCE the beginning of 'sixties, the young independent countries of Africa have been receiving the attention of the developed countries of Europe and the U.S. as a market for their goods and an outlet for their investments. As in India, so also in these countries, the first thing the Governments have done is to initiate steps for the development of their economies. This in turn has broadened the opportunities for economic intercourse with the developed countries, a direct benefit of the end of colonialism. The main beneficiaries have, of course, been the former major colonial powers themselves, Britain and France. The entrepreneurs of these two powers had firmly established themselves as traders and exploiters of natural resources in the countries of their domination. So, when independence came and the national Governments started reorganising their economies, they had the benefit of the knowledge of their markets and local entrepreneurs. They knew the products for which manufacturing facilities could be established and on what scale, with whom to collaborate, and how to negotiate with the Governments concerned. The language was not a problem and the people were not strangers to them. But they were soon followed by others from Europe and the U.S. By the time the African countries were politically free, Germany and Italy had become prosperous and able to explore investment opportunities in foreign countries. Germany, more than Italy, was able to conclude many deals for markets and investment with the emergent Africa. U.S. industrialists and financiers, too, could succeed in these respects, for they were in a position to invest on a large scale in iron ore and manganese mining, aluminium smelting, petroleum production and rubber plantations. Some of them were also successful in entering a few fields of simple manufactures.

The result of all this is that today, in most of these African countries, there are some manufacturing units or other. Besides the extractive industries just mentioned, there are textile mills, pharmaceutical, soap, detergent, and plastics factories, and even sewing machines and bicycle manufacturing shops. Hotels is another industry in which foreign, especially U.S., capital has found an outlet. Now Indian industrialists, too, want to participate in the exciting adventure of economic development of Africa. In October last, an industrialists' goodwill mission, sponsored by the Federation of Indian Chambers of Commerce and Industry and blessed by the Government of India, visited nine countries, under the leadership of Mr. A. M. M. Murugappa Chettiar, a prominent industrialist of Madras. The nine countries were Ethiopia, Ghana, Malawi, Nigeria, Northern Rhodesia, Sudan, Kenya, Tanganyika and Uganda, and the tour lasted 25 days. Another goodwill mission is currently touring West Asia, exploring possibilities of trade with, and economic assistance to, the predominantly Arab countries in this region.

The Murugappa Chettiar mission has returned with high hopes and optimism. The Mission's finding is that there are possibilities of setting up joint industrial ventures in fields such as cotton textiles, sugar, cement, jute, light engineering products, and tanneries. It strongly favours joint collaboration ventures in as large a measure as possible on the African Continent and has suggested that the Government should provide sufficient inducements to Indian investors and entrepreneurs to take the risks involved and to compete successfully with their confreres from the rich countries. It has found the investment climate in the countries visited by it favourable and is satisfied with the assurances given by the respective Governments on nationalisation and compensation. The Mission was assured, we are told, that nationalisation of industries was not on the cards, that, in case such was found necessary, adequate compensation would be paid and that, in the event of a dispute on the quantum of compensation, there would be no objection to arbitration by a third party (acceptable to both). It is of the view that there is also scope for participation with African capital in partnership with third parties (as, for instance, British or German or American investors). "If we fail to take advantage of the opportunities that exist now," to quote the Mission, "others would do so. Even as it is, we are already late in the field and many a developed country is already going ahead with projects of economic and industrial collaboration."

This conclusion of the Murugappa Chettiar Mission is convincing in the light of what we have stated at the outset. Many independent observers from this country who have stayed and worked in Africa in recent years are also of the same view. They even go to the extent of saying that some of the countries, especially Nigeria, Ghana and Ethiopia, prefer Indian capital, Indian technicians and Indian teachers to Europeans, apparently for political reasons; the unpleasant memories of the colonial era are still fresh in their minds and so also India's invaluable contribution to the political freedom of Asia and Africa alike. In a small way, some Indian entrepreneurs have, of their own accord, already invested in some of the African countries. Birlas, for instance, have established a textile mill in Ethiopia, equipped mostly with machinery manufactured by Texmaco, one of their heavy engineering companies. The fact that the Government of India gave its permission for this participation and encouraged the Mission to visit the African countries warrants the inference that, in principle, it is also of the same view. Thus, there seems to be no two opinions about the desirability of Indian capital participating in the economic development of the new African countries. Three important advantages will flow from such participation: One, it will help establish export markets for Indian goods, especially plant and machinery. Two, after some years, when the projects are well established and start yielding returns, the dividends on such investments will add to our invisible exports. And, third, it may facilitate strengthening African goodwill for India, assuming that the people of host countries will not treat foreign private investments in the same way as some of the Asian countries (Indonesia, Ceylon, Burma, Egypt, Algeria and Iran in the not distant past) have been doing.

While investments in Africa may be desirable and advantageous, the basic question is whether India is in a position to avail itself of the opportunities that one sees now. In the absence of the full text of the report of the Murugappa Chettiar Mission, one does not know whether it has examined this question. Since, however, it wants the Government to encourage such investments abroad by giving all possible facilities, it *ipso facto* follows that, in its opinion, India is in a position to do what it and others consider desirable. It is here one would like to have more convincing evidence. India's savings are not adequate for its own development; it has had to resort to heavy deficit financing and rely on foreign capital to a substantial extent. Its foreign exchange resources are slender and the balance of payments position pretty difficult. How is this country to find the surplus required for investment in Africa?

India has no doubt achieved proficiency in the manufacture of cement, textiles, jute manufactures, sugar, etc., and can help the Africans in establishing and running these traditional industries. It can squeeze itself to find a sufficient number of technicians and administrators to help them, though, in the present tempo of its development, their supply is not adequate and there is keen competition among the domestic manufacturers themselves for their services. Perhaps, the Africans will find Indian technicians and managers more suitable and less expensive than the Westerners. But there is no large surplus capacity in the industries manufacturing cement, sugar and textile machinery to make any significant contribution to African development. The domestic demand for these very capital goods is running ahead of current supply and prospective growth in the capacity for producing them. The position in regard to supply of raw materials for these capital goods industries is also not happy and the prospects of improvement in the near future are not promising enough to ensure adequate flow of materials for both domestic and export markets of the type envisaged in the report of Murugappa Mission. In saying this, we are not unaware of the fact that India has agreed to export some sugar plants to East African countries. This, however, is due to an unfortunate development in the country. Currently, the sugar industry is in the doldrums and working well below its capacity for want of sufficient raw material. But this, as every one hopes, is only a passing phase and, once the sugar industry starts implementing the capacity target envisaged for it in the next Plan, even the supply of sugar plants would become difficult.

One can argue with a lot of force that India has reached a stage when it has to export more in order to facilitate its own economic growth. Contentment with import substitution alone, so can the argument run, will not do. It must so reorient its economy as to become an exporter of manufactured goods of all varieties—consumption goods, consumer durables and plant and machinery. It must even restrain its domestic consumption for this purpose, need be. Accordingly, it must strive to export those capital goods in the production of which it has had sufficient experience to countries like Africa which do not require highly sophisticated and automatic machinery. All these arguments are fine but rhetoric. When scarce capital goods are exported against capital participation in African ventures, no foreign exchange is earned to give relief to India's balance of

views the issues realistically. India can persuade the Africans to buy their plant and machinery against cash or short-medium-term credit by making them competitive in price, quality and delivery. It can demonstrate the value of their equipment by putting up a few units in joint participation with the capital brought in by partners from the developed countries, provided that element of foreign capital is used for payment towards its export of plant and machinery. It can also have capital participation with Africans alone, but this will necessarily have to be on a relatively small scale. Its primary aim, however, must be to sell its capital goods in such a way as to reduce its balance of payments deficit. This will be possible only if these goods can compete effectively with those made elsewhere in the world.

India may be able to increase the size of its capital participation in the relatively under-developed countries of Asia and Africa, if it follows a realistic policy in regard to import of foreign private capital. It is pertinent to recall here that, in the recent past, Britain, France, Germany and many other Continental countries were in a position to export capital to other countries even when they were short of resources. This they could do, because they had no inhibitions about receiving private capital from other countries. They freely allowed foreign capital to participate in the development of many of their vital basic industries, such as aircraft, automobiles, chemicals, petroleum and petrochemicals, electrical as well as electronics, food and hotels, to mention only some. In fact, no field was reserved exclusively for domestic capital or for public sector and no conditions were laid down about majority or minority participations. Nor were the foreign industrial giants viewed with disfavour and denied opportunities for their participation in economic development as has been done by this country, particularly since 1956, when the Congress Party fell a victim to its imaginary fears of monopoly, oligopoly, concentration of economic power, etc. If post-war Japan, with its acute population problem and limited living space, has now become an industrial power with a shortage of manpower, it is chiefly because of absence of any restrictions on the inflow of foreign private capital. Unfortunately, the Government of India, in its wisdom, has been following a peculiarly restrictive policy on foreign capital which in turn has slowed down the pace of economic growth. If only it had been as liberal as the Western countries and Japan were in admitting foreign capital and know-how, India today would have been in a better position to export capital to countries like Africa on the lines suggested by the Murugappa Chettiar Mission.

Anyway, even if India is in a position to export private capital, it must be careful in selecting the countries. In some of the countries visited by the Mission, political stability is conspicuous by its absence. There is also an anti-Indian feeling, especially in the former East Africa, and the Indian businessmen already settled there for long are being put to various types of discriminatory treatment. Further, in its anxiety not to offend the goodwill of the Governments of neighbouring countries, the Government of India has not cared to protect the investments of Indian nationals in those countries. One has only to recall, in this connection, the heavy losses that have been suffered by Indian investors in Burma, Ceylon and Indonesia, not to mention Pakistan. Every one of these countries has been subjecting our investors to discriminatory treatment, in disregard of the Articles of International Monetary Fund of which they are members. And yet the Government of India has not even protested against their action at the I.M.F. meetings. It would, therefore, be hazardous for investors in this country to invest in Africa, unless they are guaranteed by the Government of India against risks of expropriation, political action, restrictions on transfer of funds and double taxation. And the Government of India can give such a guarantee, only if it has guarantee agreements with the African countries on the lines of its recent agreement with West Germany. As this will not be an easy task, it would be better for India to co-operate with the World Bank in bringing to early fruition an international code containing safeguards for foreign private investments. Such an arrangement would suit India eminently, since a stage is being reached when it will have to play the role of both importer and exporter (however small it may be) of capital. A multilateral agreement on this issue under the auspices of a U.N. agency is any day preferable to bilateral agreements with individual countries, involving prolonged and exasperating negotiations.

G.A.T.T. AND DEVELOPING NATIONS

THE Contracting Parties to the General Agreement on Tariffs and Trade (G.A.T.T.) approved, on 26th November, the text of a new chapter to be added to the Agreement on Trade and Development. The draft is expected to be ratified by member-countries in the current month and may become effective from 1st January 1965. It seeks to establish and codify the trading relationships between the industrially advanced and less developed countries, and thereby help the latter group to expand their exports.

The new chapter sets out the terms of reference of a new Committee on Trade and Development and the various agreements that the Committee will be required to implement. According to the text, the industrialised countries have agreed to "accord high priority to the reduction and elimination of barriers to products, currently or potentially of particular export interest to less developed contracting parties, including customs duties and other restrictions which differentiate unreasonably between such products in their primary and processed forms." Secondly, they have promised to "refrain from introducing or increasing the incidence of customs duties or non-tariff import barriers on products, currently or potentially of particular interest to the less developed contracting parties." And, thirdly, they have "to refrain from imposing new fiscal measures and, in any adjustment of fiscal policy, accord high priority to the reduction and elimination of fiscal measures, which would hamper the growth of consumption of primary products, in raw or processed form." The commitments are, however, subject to an important proviso: "except when compelling reasons, which may include legal reasons, make it impossible." At the same time, it is provided in the text that "the developed contracting parties do not expect reciprocity for commitments made by them in trade negotiations" with the developing countries. On the important issue of the degree of flexibility in import restrictions, which the developing countries may be allowed to further their development plans, the parties could not reach an agreement. There is, therefore, only a mention to the effect that the developing countries may "use special measures to promote their trade and development."

It may be recalled that G.A.T.T. is mainly concerned with the trade in manufactured goods and thus governs largely the trade of industrially advanced countries. It practically excludes from its coverage agricultural commodities—the main exports of the underdeveloped countries. In order to protect the interests of these countries, the Agreement contains a provision to the effect that these countries should be treated on a different footing and be eligible to exceptions to some of the G.A.T.T. rules like non-discrimination in trade and elimination of tariffs and quotas. Their problems are thus treated as secondary items, outside the main scope of G.A.T.T. The dynamic principle of G.A.T.T. is negotiations. The underdeveloped countries feel that, as they have no bargaining power, this principle has little force in their negotiations. It was to solve some of these problems that the U.N. Trade and Development Conference was held in the second quarter of this year at Geneva. The underdeveloped countries made it clear at the Conference that, in order to increase their export earnings, it was necessary to ensure reasonably high prices for the exports of food and raw materials and to extend preferential treatment to their manufactured goods, while leaving complete freedom to them to retain their own tariffs and restrictions on imports, both for balance of payments position and protection to their nascent industries. There is already a provision in the G.A.T.T. which safeguards the latter freedom of the developing countries; but, as there is nothing in it to obtain tariff concessions from the developed countries without offering something in return, this freedom is only of limited value. The underdeveloped countries want these preferences as a matter of right and not by way of negotiations. The Geneva Conference had agreed to establish a Trade and Development Board to take care of the trade problems of underdeveloped countries, thereby threatening the independent existence of the G.A.T.T. The new chapter has been designed to answer some of the criticisms from the underdeveloped countries and to make the G.A.T.T. more competent to serve the interests of these countries.

But the chapter falls short of most of the demands of developing countries and is silent on some key issues. Thus, no time limit has been fixed for putting into practice the commitments made by the industrially advanced countries. While the abolition of reciprocity clause is an important concession, the undertaking to encourage imports of manufactured goods is subject to a proviso, which, though innocent-looking, may serve as an escape clause. Under the pretext of "compelling reasons" or "legal difficulties," many a developed country may dodge the implementation of the undertaking. This is not an unwarranted misgiving, having regard to the unpleasant experience of developing countries in the working of G.A.T.T.'s long-term agreement on cotton textiles. It is common knowledge that the "market disruption" clause has been misused by several of the developed countries, including the U.S., to restrain imports of these simple manufactured goods. Further, it remains to be seen how far this new chapter of G.A.T.T. will eliminate unnecessary and prolonged negotiations between the industrially advanced and backward countries for achieving a balanced, expanding trade.

'WHITLEY COUNCILS' IN INDIA

THE Government of India is yet to honour its four-year old commitment on the establishment of Whitley-type Councils machinery for resolving its disputes with the employees. Such delay is egregious and does not redound to the credit of the Government, supposed to be a model employer. No wonder that its employees are feeling restless and it looks as though peace in Administrative Services may suffer a setback. There are already reports that some of the trade unions of Central Government employees have started "strike ballots" among the employees.

In order to show how slow the Government has been in this respect, it is necessary to recount the whole story. As far back as 1946-47, the First Pay Commission, which had been asked to report, among other things, on the machinery for negotiating and settling disputes arising out of differences between the Government and its employees, had recommended the establishment of Joint Councils, on the lines of the Whitley machinery in Britain. After considering these recommendations, the Government decided that, in view of the then impending changes in the structure of the Central Secretariat Services, it was premature to introduce such Councils. The matter rested there until 1954, when the Government decided to establish Staff Committees (renamed Staff Councils in August 1957) in the Central Ministries. The Second Pay Commission (1957-59), which considered the working of Staff Councils, found that there was a good deal of dissatisfaction among the employees' organisations about their working. The latter's contention against the Staff Councils was that the will was lacking in the Government to accept the principle of joint consultation as an effective instrument for prevention of disputes, that even where the machinery was well-conceived, it was not being worked efficiently; that meetings of Councils were not being held regularly; that decisions were rarely taken and, when taken, were not implemented properly; and that some of the officers, representing the Administration, did not have the right attitude towards the machinery which they were supposed to run.

After considering the various pros and cons of the situation, the Second Pay Commission also came to the same conclusion as the First Pay Commission, and strongly favoured the formation of Whitley-type Councils. The Government accepted its recommendation in principle. It was decided that the proposed machinery would cover all regular civil employees of the Central Government (industrial as well as non-industrial), except (a) Class I Services, (b) Class II Services, other than the Central Secretariat Services, and other comparable services whose duties are mainly ministerial, and (c) the managerial, admnistrative and supervisory staff in industrial establishments. Police and railway protection forces were also to be excluded. It was further decided that the Councils—having the representatives of employers and employees—should be created at three levels, namely, national, departmental and regional and that agreements reached between the two sides would become operative, subject to the final authority of the Cabinet, though such approval was not to be regarded as a normal practice. A board of arbitration was also to be appointed to tackle such disputes as are not settled at the Council level.

The Government initially wanted that, with the establishment of the proposed Councils, a ban should be imposed on the employees' right to strike. There was prolonged discussion on this issue. Ultimately, the Government agreed to give up its insistence on the statutory ban on strikes and the employees, on their part, promised that, so long as any dispute not settled at the Council level automatically became a subject of arbitration, they would not go on strike. After this understanding, the Government should have gone ahead with the implementation of the scheme. But it slept over this matter, once again, for reasons best known to itself, until it was rudely shaken again by serious unrest amongst its staff. In April last, a high level meeting of the Union Ministers and employees' representatives was held in order to expedite the implementation of the proposals. But fresh hurdles arose, thanks to the lack of unanimity among the leaders representing the employees. While the P.S.P. and Communists among them agreed to the Government's suggestion that 'outsiders' in the employees' unions should not be allowed in the Council, the I.N.T.U.C. representatives, strangely enough, strongly opposed it. This disagreement resulted in the postponement of the meeting to June. But, as fate would have it, Mr. Nehru passed away just a few days before the scheduled date. Some delay was, therefore, inevitable, but the threads could surely have been picked up at least a couple of months after the new Government had come into being. What is worse still, there is no sign at all of the postponed meeting being held in the near future.

Central Government employees—unlike the workers in industrial establishments—are, by and large, educated people. Government is, therefore, justified in taking the stand that its employees should and could speak for themselves, without invoking the aid of political parties. While the Government could be blamed for the delay in setting up the Whitley Councils upto April last, it is the union leaders who must be held responsible for the subsequent delay, as they could not agree among themselves on a vital issue. It is time the employees realised that, if further delay is to be avoided, they should give up their dependence on professional trade union leaders and take the matter in their own hands.

MARKET GOSSIP

Wealth Tax Bill

MUCH of the heat and excitement that permeated the debate on Wealth Tax Bill in the Lok Sabha this week could have been avoided if only those who participated in the debate had just cared to read the two sentences in the statement of objects and reasons appended to the Bill. Here are the sentences:

"The income-tax law has been re-codified in the Income-tax Act 1961 and, as the basic pattern of the wealth tax law is the same as that of the income-tax law, it has become necessary to bring the provisions of the Wealth Tax Act 1957, in line with the scheme of the Income-tax Act 1961.

"Opportunity has been taken to implement the recommendations of the Direct Taxes Administration Enquiry Committee relating to the wealth tax law and also to make a few amendments found necessary in the light of the experience gained in the working of the Act."

Conforming to these objects, the amendments proposed in the Bill which was passed by the Lok Sabha on Wednesday the 2nd inst., are simple. Broadly, the amendments fall into three categories: 1. adoption of the I.T.A. provisions pertaining to collection and recovery of taxes, grant of refunds, and checking of tax evasion for the Wealth Tax Act as well; 2. adoption of I.T.A. provisions relating to assessment, appeals and collection of tax based on the recommendations of the Direct Taxes Administration Enquiry Committee; and 3. changes found necessary in the light of the experience gained in the operation of the Wealth Tax Act during the seven years it has been in force. Before proceeding further, some of the important provisions in the Bill may be briefly recapitulated.

A new device is being introduced for the computation of wealth tax designed to defeat transfers of assets to spouses and minor children with a view to defrauding the revenue.

Penalties and prosecutions under the Wealth Tax Act would be along the lines provided under the Income-tax Act. There will be a minimum penalty of 20 per cent of the tax sought to be evaded for concealment of wealth. False certification of returns will be punished with two years' rigorous imprisonment. The Central Government can grant immunity from prosecution to persons supplying information about concealment.

Provision for self-assessment and provisional assessment of wealth tax has been made as in the case of income-tax.

Assessees are being given right of appeal against all orders adverse to them, including the right to appeal direct to the Supreme Court from the Appellate Tribunal, if there is a conflict in the decisions handed down by different High Courts.

Refunds are sought to be granted promptly, assessees being entitled to 4 per cent interest where refunds are delayed beyond six months.

Wealth tax officers will have powers to search and seize in a bid to counter tax evasion, and to fine witnesses who fail to appear before them or produce evidence. They will also be authorised to impound documents produced before them.

The Government will have powers to enter into agreements with foreign countries to avoid double taxation on a reciprocal basis.

In fine, the Bill, as Mr. T. T. Krishnamachari, Union Finance Minister, stated, is intended just to mould the Wealth Tax Act to fit into the general scheme of direct taxes as one of its integral components. The intention is thus clear and the changes introduced are, by and large, unexceptionable. Why, then, were some members, especially Mr. M. R. Masani and Mr. N. Dandekar of the Swatantra Party, so furious and harsh on the Bill? The criticism that the provision giving authorities the power to raid the houses of persons suspected of possessing assets disproportionate to their income smacks of Nazi and communist methods is rather uncharitable. Also uncharitable is the allegation that the kind of jurisprudence contained in the Bill is the kind of justice which people in communist countries talk of and that the provision for compulsory imprisonment is utterly undemocratic, totally contrary to rule of law and fundamental rights. It is true that, in recent months, several businessmen, film stars, and self-employed people were subjected to searches at unearthly hours and for a duration lasting in some cases a whole day or two. But it is also true that quite a number of them were found guilty of possessing undeclared wealth. While the Government must, as was pointed out by us in this column on an earlier occasion, conduct these raids and searches in a more civilised and courteous manner, the innocent victims of such raids must not and need not suffer them in silence. This is still a free country and there are various ways in which they can denounce such actions of the Government in public, so that its officers may not be tempted to indulge in excesses on future occasions or unnecessarily harass others. But it must be emphasised that any act of wilful tax evasion on the part of any one is highly anti-social and it must be put down with a firm hand. Tax evasion, besides depriving the exchequer of financial resources, necessitates greater and greater tax burdens on the honest and law-abiding citizens.

Income-tax and wealth tax laws ought to be strict, if the twin evils of tax evasion and unaccounted money are to be eradicated from society, though "due regard," to quote Dr. M. S. Aney (Independent), "should be had to principles of jurisprudence and justice." From this point of view, some criterion about valuation assets, as Dr. Aney rightly emphasised, should have been laid down in the Wealth Tax Act itself. It was certainly a pertinent question when Mr. Dandekar asked: "How could there be an assessment of market value if it is to be subjected to rules which may be made by authority responsible for assessment and collection of revenue?" Mr. Krishnamachari himself seemed to appreciate the viewpoint of Mr. Dandekar, as witness his remarks: "The only fault which would be found in it (clause 7 of the Bill providing powers for determining the value of assets) by the Swatantra member, Mr. Dandekar, whose knowledge of tax laws is considerable, is in the phraseology used. The rules made under the Bill would be placed on the table of the House. Members can scrutinise them and, if necessary, raise a discussion on them." This explanation may not have convinced Mr. Dandekar fully, but he can have the satisfaction of having extracted an important concession.

While the changes proposed in the Wealth Tax Act, are as already stated, largely unexceptionable and the statement of the Finance Minister that the rules would be framed in a just and fair manner is reassuring, the assurances of Government spokesmen on the question of undue harassment and hardship of assessees are not so. All that Mr. B. R. Bhagat, Minister of State for Planning, who replied to the clause-by-clause debate said on this important point was that the tax authorities would not take recourse to search, unless they had precise information. This does not go far enough, as it is vague.

Although the Finance Minister ably dealt with the vehement criticisms based on political considerations, he could have accepted at least three of the well-reasoned amendments suggested by Mr. Dandekar. One such amendment pertained to exemption of investments in new companies from wealth tax for five years. This concession was there in the past and was withdrawn by Mr. Morarji Desai in his last budget. It is a very valuable and healthy concession that would go a long way towards stimulating establishment of new industries. It is hard to call upon investors in these industries to pay a wealth tax on them even when they do not yield any return. It is to be hoped that the Finance Minister will restore this concession when he presents his next budget. The two other amendments of Mr. Dandekar which the Government should have accepted are: The discretion of the Appellate authorities in regard to penalties should not be fettered; and the period during which an assessee or the Commissioner may require the Appellate Tribunal to refer to the High Court any question arising from an order should be increased from 60 days to 90 days. Mr. Bhagat's contention that the Government found it necessary to fix minimum penalties, as the authorities concerned were not awarding adequate punishment, is a sad commentary on the Finance Ministry's respect for the Appellate authority. Equally unconvincing was his reply to the third point also. He merely said that the time limit of 60 days was on the lines of the Income-tax Act. That may be so, but is there anything wrong in extending the time limit by another 30 days for wealth tax?

Mr. Dandekar, however, was rather too harsh when he described as "utterly monstrous" the provision under which an assessee has to pay wealth tax in accordance with the assessment made, "notwithstanding that a reference has been made to the High Court or the Supreme Court, or an appeal has been preferred to the Supreme Court." No one will dispute the contention that the Government should show due deference to courts. But what one should ask is whether the aforesaid provision violates the force of this contention. The Government has all along maintained that, when a tax order has been made, the tax should be paid. The assessee's right to go to the courts is not taken away. Further, no disrespect is involved to the court in this respect, for, if the court's verdict were in favour of the assessee, the Government would return the money to him and, if refunds were delayed beyond six months, interest would be paid. It must be remembered, in this connection, that, in this country, there has been a tendency on the part of the rich assessees to go in for appeals just to delay the payment of assessed amounts as long as possible, so that they can enjoy the use of funds at the expense of the Exchequer, which means that of the public, in general. There are instances where crores of rupees are being lost to the Government by way of interest alone. It is, therefore, these delaying tactics that deserve to be described as "monstrous." If principles of jurisprudence are not strictly adhered to in such instances, it is because a section of the society has been misusing them for their selfish ends. Equity in law cannot be invoked to protect the inequitous acts of a few that hurt the interests of the society as a whole.

E.E.C. Cereals Issue

All eyes are now anxiously turned towards Brussels where the E.E.C. Ministerial Council is engrossed in discussions over the Common Market's common agricultural policy. For the deadline for reaching a decision on the issue, that is, Tuesday the 15th inst., as agreed to among the Ministers of the European Economic Community at their meeting on 3rd June last, is drawing near. It will be recalled that serious differences had developed between France and West Germany over the price formula as proposed by the E.E.C. Commission. Whereas France saw the possibilities of a new outlet in Germany for its surplus grains under this arrangement, West Germany was not inclined to accept the formula, as its prices were appreciably higher than the ones suggested by the Commission. President de Gaulle has more than once threatened that, if the common agricultural policy were not decided and prices of cereals in the Common Market not harmonised by the proposed deadline, his country would leave the Market. But West Germany, on its part, has throughout been optimistic about settling the differences over cereal prices. In spite of West Germany's optimism, all countries, especially the developing ones, are viewing the Franco-German tussle with great anxiety. The anxiety is understandable, as any showdown between these two major partners of the E.E.C. will not only threaten the existence of the European Common Market itself but will also jeopardise the success of the Kennedy round of tariff negotiations.

Against this background, it is a matter for some satisfaction to find that Dr. Erhard, West German Chancellor, representatives of political parties and the farmers have reached an agreement over a cut in the prices of German cereals to the common E.E.C. level. The exact details of the agreement are not available. It is, however, gathered that West Germany proposes a harmonisation of price level on 1st July 1967. Though no decision regarding the actual prices of cereals has been taken, pending the results of the negotiations, the Germans prefer a price for wheat (soft) anywhere between the present German price of DM 475 per ton and the price of DM 425 proposed by the E.E.C. Commission. Until the end of the period of transition for the Common Market, that is 1970, Germany will expect to draw compensation payments for its farmers from the E.E.C. funds. In addition, it is believed that the German Government will give its farmers tax and other concessions aggregating DM 840 million. Agreement has also been reached to the effect that factors distorting competition, such as the farmers' different costs, financial burdens and social security, must be evened out, as long as they are not harmonised in the Common Market by other means. The Germans, before agreeing to a final common price for cereals, would naturally like to ensure that the agreement would not be nullified subsequently by adjustments in exchange rates, etc.

The West German Government's decision on cereal prices was conveyed to the E.E.C. Council of Ministers on Tuesday this week. While the decision is to be welcomed as an important step forward, it remains to be seen whether a final accord will be reached on the question of agricultural policy before the 15th of this month, what with important differences still existing between the position of West Germany and that of other member-countries.

Processed Food Exports

The experience of practically every industry in every country has shown that the use of outmoded equipment and processes results in poor productivity (quantitatively as well as qualitatively) and inflated costs. It is, of course, difficult to discard their use in a capital-scarcity economy like India, but there is no denying the need for speedy rehabilitation (of outmoded equipment) and rationalisation of these industries. The need is all the pressing in the case of export industries and that too in respect of items like processed food articles where competition in world markets is keen and quality has to be high. How the use of outmoded equipment and processes, an utter lack of initiative, and slavish imitation of the British pattern of labelling have greatly hindered the exports of Indian processed food articles to the West European countries has been vividly brought out by Mr. H. Wroblewiski, the German food expert who was specially invited by the Government of India to suggest ways and means of promoting the exports of these items.

EXPORT PROMOTION COUNCILS AT WORK

A PROBE THAT WAS LONG OVERDUE

By A Special Correspondent

THE Union Commerce Ministry has done well in setting up a committee to review the working of the Export Promotion Councils. The Government's resolution announcing the appointment of the Committee said that this was being done on the recommendation of the Forty-eighth Report of the Estimates Committee issued in March this year. But it is necessary to point out that the Import and Export Policy Committee, which submitted its report in February 1962, was also expected to enquire into the working of the Export Promotion Councils. This Committee had, in its questionnaire, specifically asked: "How far have Export Promotion Councils so far constituted helped in increasing exports of the commodities they are concerned with? How far they have succeeded in establishing new markets for the export of commodities? What suggestions would you offer to make the Export Promotion Councils more effective instruments of export promotion?" But, surprisingly enough, the report of the Import and Export Policy Committee did not deal with the working of the Export Promotion Councils.

It would be much better indeed, whenever committees are appointed, if their terms of reference are made fairly comprehensive, so that it may not be necessary to appoint more committees to deal with aspects of the same problem. For instance, soon after the Import and Export Policy Committee had submitted its report, the Government of India appointed another committee to enquire into fair trading practices. Now yet another committee has been set up to probe into the working of the Export Promotion Councils. Fair trading practices and the working of the Export Promotion Councils were surely appropriate subjects for enquiry by the Export and Import Policy Committee. However, now that a separate committee has been set up to review the work of the Export Promotion Councils, it is hoped that it will do the job thoroughly

Terms of Reference

The Committee consists of six members, with Mr. Prabhu V. Mehta as Chairman. It has been asked to submit its report to the Government within a period of six months. The terms of reference of the Committee are the following:

(1) Progress achieved by the Export Promotion Councils in: (*a*) bringing into the fold of the Council a large percentage of exporters and potential exporters; (*b*) raising of financial resources, and adequacy of present sources of income; (*c*) implementation of measures of assistance, including dissemination of market information and information regarding regulations in other countries; assistance in securing rebates and raw materials for production; publicity; and implementation of export promotion schemes; and (*d*) creation of institutional arrangements such as branch offices in India, servicing of exporters in stations other than the headquarters of the Council, establishment of foreign offices, showrooms, foreign correspondents, etc.;

(2) The extent to which the progress achieved is adequate to meet the needs of exports in the particular field, having regard to the plans for increased exports and directions in which the scope of the working of the Councils should be enlarged to adequately serve exports;

(3) Co-ordination and co-operation among Export Promotion Councils in matters of common interest, and setting up of suitable machinery to the purpose;

(4) The existing distribution of export products amongst the councils, and steps to be taken to ensure adequate specialisation and avoid overlapping; and

(5) General principles on which future action should be taken in regard to the setting up of new E.P. Councils, and the expansion of activities of E.P. Councils.

There are at present sixteen Export Promotion Councils. These are for the following commodities:

1. Cashew.
2. Chemicals and allied products.
3. Cotton textiles.
4. Engineering goods.
5. Processed food.
6. Leather.
7. Marine products.
8. Mica.
9. Plastics and linoleum.
10. Shellac.
11. Silk and rayon textiles.
12. Spices.
13. Sports goods.
14. Basic chemicals, pharmaceuticals and soaps.
15. Tobacco.
16. Finished leather and leather manufactures.

Some of the Export Promotion Councils have been in existence for a fairly long time. For example, the Engineering Export Promotion Council and the Cotton Textile Export Promotion Council have been working for nearly ten years. Others were established only in the last few years. The functions of these Councils, as described officially, are the following:

(1) Guiding newcomers to the export trade by giving advice on different markets, furnishing the names of importers in those markets, advising them about shipping procedure, etc.;

(2) Undertaking market studies and furnishing the results thereof to the trade; also facilitating contact between the Indian exporters and foreign importers by publishing directories and other literature pertaining to industry and trade;

(3) Conducting propaganda through exhibitions, showrooms, bulletins and other media of publicity;

(4) Securing samples from overseas markets of similar goods competing with Indian goods preferred by foreign consumers and exhibiting them to manufacturers in the country so as to enable them to produce goods of similar variety for export;

(5) Deputing overseas officers of the Councils to witness the survey of goods exported from India where such survey has been necessitated as a result of a dispute or difference between the Indian exporters and the foreign importers;

(6) Persuading Indian exporters and the foreign buyers to avail themselves, wherever feasible, of the free facilities in regard to quality control; and

(7) Helping in the settlement of commercial disputes.

Non-traditional Items

India's exports have shown a substantial increase in recent years. But this is due largely to the better performance of traditional items. Among the non-traditional items, only sugar has made a major contribution, its earnings of foreign exchange going up from Rs. 1.71 crore in 1959-60 to Rs. 26.10 crores in 1963-64. The export of engineering goods has increased from about Rs. 5 crores in 1957-58 to Rs. 13 crores in 1963-64 and that of art silk manufactures from Rs. 2.33 crores in 1959-60 to Rs. 10.58 crores in 1963-64. The earnins from the other non-traditional items like chemicals and allied products, sports goods and plastics, are relatively small.

It is, of course, rather premature to judge the utility of these Councils solely in terms of the earnings of foreign exchange. But there can be no two opinions about the fact that these Councils have to display far greater vigour, initiative and enthusiasm in stepping up the exports of the products with which they are connected.

Until recently, one used to hear rather adverse comments about the working of these Councils. It was stated, for example, that some of the Councils were staffed by part-time secretaries who were unable to give their undivided attention to the vital work of export promotion, that the Councils were not always prompt in answering trade enquiries from foreign countries, that the Councils did not take sufficient care to select the right type of men in sponsoring trade delegations to foreign countries, that the reports of delegations were issued too late and that they were also not very informative. The Committee, now examining the working of the Councils, should be able to tell us how far these complaints have become out of date.

The problem of co-ordination, however, remains. This is very important, because, unless the activities of the 16 Councils are properly co-ordinated, we shall not be able to derive full advantage from them. Work may be duplicated and resources dissipated if each Council functions in its own way, unmindful of what is being done by the others. This is in fact one of the aspects that the present Committee has been asked to look into. But it is surprising that, even before the Committee has commenced its work, the Commerce Ministry has already decided to set up a Federation of Export Promotion Councils. At a meeting held in New Delhi on 16th November, a decision to this effect was taken. It was announced that this Federation would work as an integral part of the Federation of Indian Chambers of Commerce and Industry. A committee of 31 members has also been appointed for the new Federation.

Two Comments

In the absence of full particulars about the constitution of the new body, it is difficult to say how far it will work satisfactorily. But two comments may be made: first, the Commerce Ministry should have waited to form the Federation until the report of the Mehta Committee was ready. Second, it is doubtful whether a wholly non-official body will be in a position to effect the right type of co-ordination among the various Export Promotion Councils. The Export Promotion Councils are semi-official bodies. The administrative committees of these Councils consists not only of representatives of trade and industry but also nominees of the State Governments and the concerned Ministries of the Government of India. The Councils get grants-in-aid from the Government; and the Government's approval is essential for their budget estimates. Such being their composition, one wonders if a non-official body will be able to achieve effective co-ordination among these Councils. It is only the Commerce Ministry that can do this job properly. But the Ministry itself, having created so many Councils, is perhaps at a loss to know how exactly co-ordination is to be brought about.

Exporters utilised bank finance to the extent of Rs. 8.7 crores on the strength of policies issued by the Export Credit and Guarantee Corporation during the first ten months of 1964, as against Rs. 5.88 crores in the corresponding period last year and Rs. 8.07 crores during the whole of 1963. The Corporation issued during the period under review 666 policies with a maximum liability of Rs. 12.91 crores, as compared with 429 policies with a maximum liability of Rs. 9.8 crores a year before. The total policies in force as at the end of October 1964 were 967 with a maximum liability of Rs. 22.57 crores. The claims paid during the first ten months of the year aggregate Rs. 1.51 lakh, as against Rs. 6.50 lakhs in the whole of 1963.

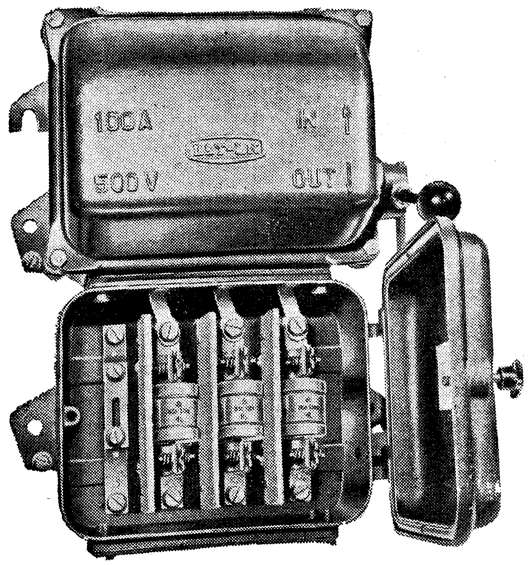
What's the loss from a blown out fuse?

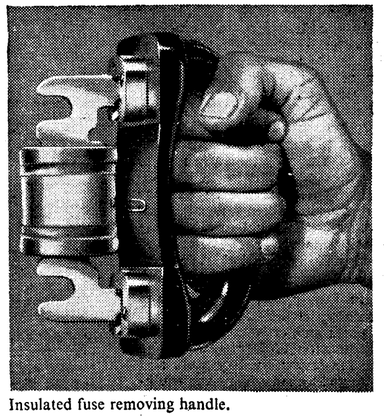


Install high quality LT-LK switch, fuse, and switch fuse units—available in ratings of 100A, 200A, 400A, 600A & 1000A at 500v. A.C.

Much more than you imagine—due to loss of production. The cost of the fuse itself being comparatively insignificant, use only very reliable fuse units which can be replaced in a minute. Then you will keep down fuse replacement time and minimise production loss.

The HRC fuse of an LT-LK unit is simply pushed in against spring pressure. The fuse units have spring loaded contacts, eliminating clumsy bolting. These springs are of stainless steel to ensure long life and resistance to corrosion.

Where the switch fuse unit is not absolutely necessary, a fuse unit alone will serve your purpose. The insertion and removal of the fuse can be done even when the circuit is live, using the insulated fuse handle.



Insulated fuse removing handle.

U.S. AID FOR AGRICULTURE

WITH the country's population growing by eleven million a year now and the larger part of the additional purchasing power generated by development expenditure increasing the pressure of demand for more foodstuffs, food has become a *developmental* issue *par excellence*. The present imbalance between supply and demand has also served to focus official and non-official attention on this issue to an extent greater than ever before. Thanks to this attention, the realisation has dawned on one and all that it is not just enough to grow more food merely to match the growth of population but that additional production should also be sufficient to meet the rising *per capita* demand for food that growing incomes inevitably generate. The growth rate suggested, in this connection, for food production is 5.0 per cent per annum, on an average, in the 'sixties, as compared with 2.5 per cent in the 'fifties. As the first four years of the 'sixties have registered an average annual growth rate of less than two per cent, the remaining years of the decade may have to record a higher rate than 5.0 per cent, if self-sufficiency is to be achieved by 1970-71. Future growth of production on that desirable scale would however, depend on the extent to which intensive cultivation can be practised so as to raise the low level of productivity in agriculture fairly rapidly. This will not be an easy task, of course, for, apart from the organisational question, there is the problem of making the inputs like irrigation water, fertilisers and manures, improved seeds and pesticides in sufficient quantities.

Some of these inputs like fertilisers and pesticides, incidentally, would have to be ensured through imports and/or domestic production. Here it is a question of foreign exchange availability either for importing fertilisers and pesticides or for importing machinery and equipment to manufacture them, or for both purposes. It is in this context that the Government of India has actively sought international co-operation. Where matters stand in this connection may be noted in the following observations made by Mr. C. Subramaniam, Union Minister for Food and Agriculture, at the Seminar on Food and Health, held in Bombay last week under the auspices of the thirty-eighth International Eucharistic Congress:

"In regard to fertilisers, we have recently negotiated with a consortium of American firms to do a feasibility study of the prospects of fertiliser manufacture in India. It is our hope that this venture will take shape quickly and enable the additional production of nearly one million tonnes of nitrogen in the next Plan period. Our current use of fertilisers is very much below that of the advanced countries and expert assessments of our demand for nitrogen in the year 1975-76 vary from five to eight million tonnes. This, I submit, is a fruitful field for international co-operation. Equally of interest to us are the prospects of manufacture of pesticides and other chemicals and the equipments like sprayers and dusters. We have merely scratched the surface in these vital areas."

The kind of co-operation sought by the Government is likely to be extended only or mainly by the United States which, as Mr. John P. Lewis, Minister-Director of the U.S. Agency for International Development Mission to India, told the Eucharistic Congress Seminar on Food, "is deeply committed to, and already has heavily invested in. India's challenging attempt to achieve rapid and sustained economic development by orderly constitutional means." Recognising that the record of food production has been the most distinctly disappointing aspect of the third Plan performance thus far and that the need for agricultural expansion has come to play a pivotal role in the whole development effort in India, the U.S.A.I.D. has lately begun "to assign aid to agricultural expansion the highest of all priorities in its Indian programme." It is gratifying to know from Mr. Lewis that the U.S.A.I.D. is committed to implementing this priority in a variety of ways, namely, (i) provision of non-project dollar loans that both directly and indirectly help to finance fertiliser imports; (ii) provision of loans and technical assistance for the expansion of fertiliser production; (iii) provision of loans and/or technical assistance in the fields of irrigation and water management, of pesticides, and of agricultural extension; (iv) continuing assistance in the establishment of seven State agricultural universities; and (v) provision of technical experts to assist the Indian Government's vital move to establish an effective system of incentive price supports for cultivators. If the United States Government has thus come to accord a high priority to ways of direct and indirect assistance for maximising India's own food production, it is because of its realisation that P.L. 480 food supply cannot be a permanent solution and that, at best, such supply would be useful in building buffer stocks in the next few years for ensuring price stability on the food front. This is what Mr. Lewis, incidentally, said on P.L. 480 and on the need for self-sufficiency in food:

"For many years, U.S. food supplies have prevented severe food shortages (in India), and they have greatly alleviated the current food crisis. They have preserved the opportunity for industrial expansion to press forward without until this year, generating anything approaching violent, development-disrupting food price inflation. *But P.L. 480 obviously is not a permanent solution to India's food supply problem* (italics ours).

"India needs as soon as possible to become self-supporting in food, not because the attainment of national integrity in some abstract sense requires it, but simply for foreign exchange reasons. It is unrealistic to expect Indian exports to rise fast enough to pay for substantial net food imports in addition to all of the needs of industrialisation."

It is good to find that the United States itself is keen on making India self-sufficient in food and that it is confident that this country's food problem *can* be solved. This American confidence is based on some hopeful facts and lessons—namely, (i) that average Indian food-grain yields are still so low that there are enormous opportunities for raising them, (ii) that an increased and balanced supply of inputs, passably well organised, can radically raise farm productivity, (iii) that Indian cultivators are anxious to improve their lot and (iv) that cultivators are prepared to adopt improved farming practices and use fertilisers if they can be shown clearly that particular improvements flow from it. However, if American (and Indian) expectations of higher agricultural productivity are not to be belied, norms for fertiliser use should be carefully evolved in the light of soil characteristics, water availability from natural or artificial sources and traditional cropping patterns in different regions. Considering the delicate organic composition and thin humus content of Indian soils, it is of the utmost importance that chemical fertilisation should be scientifically integrated with timely and adequate water supply and organic manuring (including green manuring) for moisture and fertility conservation. A judicious combination of inorganic fertilisers (depending on local soil requirements) and organic manures can be depended upon to conserve the *natural* soil fertility even while bringing about higher crop yields. It should not be forgotten that soil management in the sense of conservation of soil fertility is, in the main, a function of organic manuring.

PROGRESS OF L.I.C.

An unsatisfactory feature of the Life Insurance Corporation's business has been the continuous rise in the lapse ratio, year after year. From 5.1 per cent of the mean business in 1958, it rose to 6.0 per cent in 1959, 6.6 per cent in 1960, 7.0 per cent in 1961, 8.1 per cent in 1962-63 and 8.2 per cent in 1963-64. It is true that the rise in the lapse ratio in 1963-64 was just 0.1 per cent, that is, next to nothing. Having regard to the difficult conditions of living the people had to face due to a variety of causes, one can justifiably claim that there was no marked deterioration in the position as compared with the experience in the previous years. But it has to be remembered that as the business of L.I.C. has been rising at a fast pace, the number of policies lapsed and sum insured under them must be pretty substantial. Mr. B. K. Kaul, Chairman of the Corporation, gave his reasons for the continuing high level of expense ratio in his statement at the 102nd meeting of the L.I.C., held in Bombay on the 30th November 1964. According to him, "the impact of general economic conditions and of the Compulsory Deposit Scheme on the saving capacity of the insuring public would be expected to have an adverse effect on the lapse ratio." He was of the view that the various steps taken by the Corporation to control lapses were bearing fruit and that the rising trend had been arrested. It is to be hoped that he has correctly assessed the trend and that ratio for the current year would bear out what he says.

While the fact that the pace of deterioration, as represented by the rise in lapse ratio has been arrested, the fact remains that the lapse ratio is still high. Mr. Kaul's explanations are, of course, valid and quite pertinent, but he has to examine and see whether the position cannot be really improved. There are allegations that a large number of L.I.C. agents hold *benami* agencies and that this is one of the causes for the high lapse ratio. The L.I.C. Chairman should look into this question and examine the extent to which this is true. The representatives of the Life Insurance Agents' Associations, who met in Bombay recently, suggested some measures in this regard. It may be worthwhile for him to consider these measures and, if found suitable, give them a fair trial.

But all this should not distract one's attention from the commendable performance of L.I.C. in other respects. During the year ended March 1964, new business booked amounted to Rs. 703 crores under 1.65 million policies, which was only marginally short of the Rs. 708 crores business done in the twelve months ended March 1963. An idea of the success of the L.I.C. in creating insurance consciousness among the people can be had from the fact that 70.5 per cent of the new policies in 1963-64 were taken by persons insured for the first time (69.5 per cent in 1962-63) and that 35.5 per cent of these were issued to people in rural areas (38.3 per cent in 1962-63). The business in foreign countries amounted to Rs. 10.21 crores under 8,532 policies, against Rs. 10.58 crores for 8,885 policies in the twelve months ended March 1963. The slight decline was due to a shortfall in Mauritius and East Africa; the progress being satisfactory at other places. The total business in force as at 31st March 1964 amounted to Rs. 3,571 crores under 10.33 million policies; this was almost three times the business of all insurance companies (as at 31st December 1955) before nationalisation. As compared to the previous year, the amount was higher by nearly thirteen per cent and the number of policies by nine per cent. The premium income in the year under review amounted to Rs. 146 crores and total income Rs. 179 crores—both substantially larger than those in the previous year. The Corporation's Life Fund was bigger by Rs. 89 crores at Rs. 808 crores, and the total assets by Rs. 95 crores at Rs. 881 crores.

Investments in India stood at Rs. 708 crores. Of this total amount, 75.5 per cent was invested in the public sector (mainly in gilt-edged securities), 19.2 per cent in the private sector, 4.3 per cent in co-operative sector and 1.0 per cent in joint sector. The income from interest, dividends and rents (before provision for income-tax) was Rs. 38.25 crores. The gross rate of interest realised was substantially higher at 5.11 per cent, as against 4.76 per cent in the previous accounting period. The net rate was slightly lower at 4.07 per cent as against 4.03 per cent; the reason being that a refund of tax of about Rs. 4 crores in respect of the previous accounting period, had not been received in 1963-64. If this refund had been received, the net rate would have been 4.61 per cent. Both the overall expense ratio and the renewal expense ratio were lower from 29.3 per cent and 14.13 per cent to 27.5 per cent and 12.46 per cent respectively, indicating the increased economy achieved in the working of the Corporation.

The L.I.C. has taken some further steps to enhance its business. The scheme for the collection of premiums through post offices in rural areas—where banking facilities are not available—which was so far in operation only in the Jaipur District of Rajasthan, has been extended to the entire State and will be introduced shortly in many other areas. Arrangements has been made for introducing the Salary Savings Scheme among the State Government employees of Rajasthan, Punjab and Orissa. Moreover, Joint Life Assurances on the lives of husband and wife have been reintroduced, subject to the condition that both of them are earning members. These new schemes should yield handsome dividend in the coming years, other things remaining the same.

COTTON SUPPLY SITUATION

The Indian Cotton Mills' Federation has, perhaps, indulged in some premature forecast when it says categorically (in the course of a press note issued last week-end) that the cotton supply position in the current season, that is, September 1963-August 1964, "should be easy" and that, "with the assurance of adequate supplies and the consequent disappearance of a psychology of scarcity, the mills will be enabled to regulate their purchases of cotton according to their normal pattern." The Federation estimates the cotton crop at 6.05 million bales and expects imports to be around 950,000 bales, as against the corresponding figures of 6.13 million bales and 657,000 bales, respectively, in 1963-64. This journal would, of course, be happier than anyone else, if the assessment of the Federation were, to prove correct. But only it wonders whether it would be wise to count too much before the cold season is out. If, as it sometimes happens, there is a prolonged cold spell, the cotton crop will suffer significant damage, both quantitatively and qualitatively. It is for this reason, perhaps, that the official estimate of the crop places the yield at no more than 5.8 million bales, the lowest estimate being 5.4 million bales.

Assuming, for the nonce, that the Federation's estimates will be borne out by the passage of time, the cotton supply position will be as under:

(In thousand bales)

	1964-65	1963-64
Opening stocks	2,520	1,960
Production	6,050	6,130
Imports	950	660
Total supply ...	9,520	8,750

A supply of 9.52 million bales of cotton will be much more than what is actually needed; not only will the *entire* requirements of mills of both Indian and foreign cotton (estimated at about 6.50 million bales, as against the actual consumption of 6.08 million bales in 1963-64) be met, there will also be a large surplus available for export and sizable carryover stocks. But the 'if' here is a big one.

In view of the comfortable supply position, the Federation, in its press note dated 27th November, observes: "As there need no longer be any scramble to buy cotton, the Federation hopes that there will be a return of stability in cotton prices." This note of confidence runs counter to the concern expressed by the Committee of the Federation at its meeting held in Bombay less than a week earlier, on 21st November. Here is what the Committee said in its press *communique* issued after the meeting:

"The Committee ... considered the question of the present high prices of cotton which had pierced the ceiling in most cases. Reviewing the supply and demand position, the Committee came to the conclusion that, since this year's domestic crop would at the most be of the same size as last year's, while, on the other hand, the consumption of cotton by the textile industry was increasing, there was a widening gap between the supply of cotton and the industry's requirements. The Committee, therefore, felt that the Government should arrange for larger imports of cotton, in order to bridge the gap between the supply and demand and also stabilise the prices of Indian cotton. The Committee also noted that the experience of the past few years had shown that, every time the ceiling was raised, it was promptly pierced. This process of the piercing of the ceiling prices leading to the fixation of higher ceiling prices militated against the basic idea of prescribing a ceiling. The Committee expressed the view that, if this phenomenon of prices chasing the ceiling was to be avoided, it would be necessary to ensure sufficient production in the country by the abolition of ceiling and prescribing only a support price. The Committee further exprssed the view that, pending decision on the above pleas, the Government should take steps to supply cotton to the industry at prices within the existing ceilings..."

The virtually contradictory assessments of the cotton supply situation made by the Federation in its two press notes issued in the same week are surprising to a degree. Be that as it may, the Federation is quite right in urging the Government to take steps to supply cotton to the mills at prices within the existing ceilings. If this plea is not accepted, the Government, as the Federation has suggested, should at least take into account the ruling prices of cotton in fixing the prices for the controlled varieties of cloth. The Federation is also justified in pleading for a readjustment in the percentage of the mills' contribution to the controlled pool. The contribution, it will be recalled, had been calculated at 45 per cent of the production in 1963 by including the yardage of fents and rags. If, however, the 1963 production is properly calculated by excluding fents and rags, the industry's contribution to the controlled pool, it is said, will amount to 48-49 per cent.

Some may feel that the Committee of the Federation never feels tired of stressing the need for speedy modernisation and expansion. But it is only the wearer knows where and to what extent the shoe pinches. Further, there is no getting away from the fact that these are the only ways of ensuring adequate supplies of quality textiles at an economic cost for both domestic consumption and export. In order to facilitate the programme of modernisation and expansion, it is necessary, as the Federation says, to enable the industry to build up its internal resources. Viewed in this context, unexceptionable are the two pleas of the Federation, one for the inclusion of the cotton textile industry in the list of industries of national importance, which, under the current year's Budget, are given a rebate in income-tax and super-tax, and another for the grant of development rebate on a more liberal scale commensurate with the financial requirements for carrying out the programme of rehabilitation and modernisation. And pertinent, indeed, is the note of warning struck by the Federation to the effect that the implementation of the Powerloom Enquiry Committee's (Chairman: Mr. Asoka Mehta) recommendation that the capacity of the cotton mill industry should be frozen at the present level, would be against the interests of the public exchequer, the consumer, foreign exchange earnings and labour.

JUTE RESEARCH

It is, indeed, gratifying to find that, at least in one respect, namely, research in jute industry, Pakistan and India have together joined hands with Britain in an attempt to co-ordinate research work and to make use of the results of such work for extending the uses of jute goods throughout the world. Participating at the first Jute Research Conference now being held at Calcutta are the Research Directors from the jute industries of India, Pakistan and the U.K., as well as Dr. Fox and Mr. Burr from the Fabric Research Laboratories of Boston (U.S.A.), who have, over the last few years, been engaged on product development work for the Indian mills. The deliberations of the Conference are of profound importance particularly because of the need for avoiding cut-throat competition between the Indian and Pakistan jute mills and reducing the impact of competition from alternative packaging materials. In the rising world demand for new materials for packaging and industrial uses, the position of jute goods ought to be strengthened and this is possible only through a concerted and co-ordinate drive to intensify research work.

Viewed thus, the initiative taken by the Indian Jute Mills Association (I.J.M.A.) in bringing together those responsible for pursuing the research activities of the individual jute industries throughout the world is very laudable. How vital is the role played by research in the jute industry was impressively brought out by Mr. R. H. Morrison, Chairman of the I.J.M.A., while inaugurating the aforesaid conference on Monday this week. Threats from new competition (from alternative products), Mr. Morrison declared, could not be shrugged off or ignored and certainly not by seeking refuge in the continuing growth of demand for standard goods stemming from the so-called unsophisticated developing countries as yet unable to take advantage of modern techniques. And he minced no words when he said: "Jute, both in the packaging and in the industrial field, must sell on its own merits and not in default of something better to use. We must try as far as possible to match in our products the special selling points of the alternatives seeking to oust jute from the market." Poising the question as to whether this could be done, he stated: "To achieve this, radical new thinking may be necessary with regard to the work to be done in the Laboratories on the fibre itself. Essentially, this would be long-term research, demanding an application of resources, both financial and in talents, far exceeding that which has to date been utilised in our industries and probably, I vusualise, emobodying assistance at National Laboratory levels."

In the short-term, there is the imperative need for what is described as defensive research, that is, by building into existing jute products all the refinements which the research laboratories have already placed in the hands of mills and others. Mr. Morrison was not exaggerating when he said that "much of what is produced in the laboratories remained unutilised because of apathy and lack of interest on the part of the industry." Such an attitude, as he rightly warned, spells disaster. There must be a lively interest and exchange of ideas between laboratory and production floor, and there must be a calibre of management with the necessary drive and resources to see that the fullest advantage is made of what the laboratories offer. Equally imperative is the need for strong market research and product development efforts. Emphasising this aspect, Mr. Morrison observed:

"We in the East have in the past, and still do, suffer from the disadvantage of supplying re-

LABOUR AND LIQUIDITY

By Questor

LONDON, *28th November*

THERE has been a good deal of comment in Britain about the ineptness of the new Government and its responsibility for the recent run on sterling. Some of it, I suppose, is justified. The emphasis it placed on the size of the payments deficit it had inherited from the Conservatives certainly helped to alert foreign holders of sterling to the scale of its problem. The sudden imposition of a surcharge on imports (which was formally a breach of the rules of the G.A.T.T.) created a good deal of ill-will abroad, especially in the E.F.T.A. countries.

The announcement in an emergency Budget of improvements in social welfare benefits to begin in the spring may have suggested that it was bent on further spending rather than on retrenchment. And the City of London did, indeed, work itself up into a fine fit of uncertainty about the new corporation tax and tax on long-term capital gains which are to be introduced in the next Budget.

But I find it impossible to attribute more than a small part of the blame for the crisis to the Labour Government. The basic fact is that it inherited a payments deficit expected to reach about $2,000 million in 1964 and to remain impossibly large even in 1965. It is odd, perhaps, that this did not cause a run on sterling earlier, but there was no point in attempting to conceal it.

The surcharge—which had been prepared by the previous Government—was regarded as the least harmful method of gaining a breathing-space while longer-term measures to right the balance of payments were under way. Import quotas, though formally permitted by G.A.T.T. rules drawn up many years ago, would have led to undesirable discrimination, while a surcharge does not; advance consultation would probably have led to a rush of imports to anticipate the surcharge.

It may have been unwise to announce an increase in social benefits; but it had been clearly promised during the election campaign, and the Chancellor took the unusual step of legislating in advance for the increase in income-tax which was to finance it. The new taxes, similarly, had been promised in advance—they are no more than a switch to the U.S. system—and the financial institutions might be criticised for not bothering to consider the possible consequences earlier than they did.

The Reckoning

That is by the way, of course. We have had a crisis. Bank Rate had to be raised to 7 per cent, forcing a rise in the U.S. discount rate, but failed to do the trick. Within a couple of days British firms were beginning to buy their foreign exchange needs forward on a large scale, foreigners were selling in advance the sterling they expected to accrue in the future from normal commercial transactions, and prompt action to stem the flood was needed. It is a remarkable fact that central banks were able to arrange, in a matter of hours, a support fund of $ three billion—the largest rescue operation ever mounted. Sterling was not, even then, quite out of danger (confidence takes time to restore, and leads and lags in commercial payments may take some months to unwind), but the pressure eased at once.

Now, however, comes the reckoning. The new British Government had hoped that it would have time in which to introduce long-term measures in which to increase competitiveness, reduce imports and stimulate exports. Now it will be under strong pressure to take immediate steps to cut the payments deficit by reducing the pressure of demand at home—even though industrial production has not apparently risen since the beginning of the year.

Working Under a Disadvantage

It will no doubt meet this, and make whatever cuts are practicable in public expenditure, particularly defence expenditure. But it is working under the disadvantage that cuts in the overdue programmes for schools, hospitals and universities would arouse violent dissension inside the Labour Party which a Government with a tiny majority is in no position to risk. My own guess is that, if the Budget, the 7 per cent Bank Rate, and the atmosphere of crisis are not in themselves sufficient to reduce home demand, we shall have further increases in consumer taxation.

But there are morals to be drawn by the central bankers as well as by Britain's Labour Government. The present international monetary system is obviously unsatisfactory in several ways, and will have to be changed if it is to survive. However, flexible the informal arrangements between central banks have proved to be, they were incapable of dealing as a matter of course with a crisis which had long been anticipated. Confidence in their ability to regulate the markets will now be permanently impaired.

But the 'natural' way of meeting a structural imbalance appears nowadays to be ruled out: the very shakiness of the system has caused it to become much more rigid than was contemplated in 1944. and devaluation of any leading currency is almost ruled out for fear of rocking the boat. Yet a system of fixed exchange rates in modern conditions, without the political union it presupposes, imposes pressures on deficit countries which are barely tolerable while world trade is still expanding rapidly and will become quite intolerable if trade slackens and deflation means heavy unemployment.

The U.S. has used its diplomatic strength to fight its way out of this dilemma in a way that smaller countries cannot. I think that it ought to close its payments gap now, if necessary by imposing further restrictions on capital movements, and use its strength to build up an international monetary system better capable of standing up to the strains which lie ahead.

(Concluded from previous page)

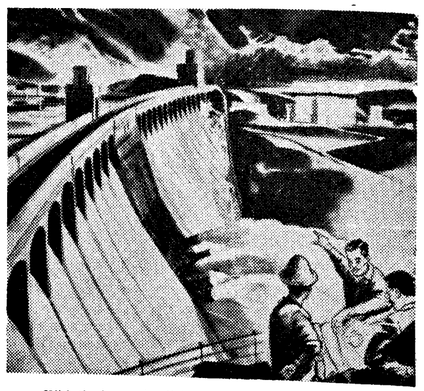
mote markets which make difficult the easy flow back of information from consumers so necessary to keep abreast of changes. The handicap is accentuated by the fact that the remote markets are the most sophisticated where change is most rapid. The Indian industry has, in a modest way, attempted to overcome this difficulty by employing one of America's leading research laboratories in the field of product development, but I feel that a much bigger effort is required covering a much wider area. The question immediately arises: Does this not provide an opportunity for a joint effort on behalf of our jute industries?"

Never before was the need for joint effort on behalf of jute industries so urgent as it is today. The alternative to joint effort is waste of resources on duplication of research efforts which neither India nor Pakistan can afford. If both the countries, which account for bulk of the world trade in jute goods, agree on this issue, it would be easier for them to obtain the help of the developed countries for intensive research in the form of both equipment and know-how.

F.A.P.C.C.I. REVIEW—INAUGURAL NUMBER

The Federation of Andhra Pradesh Chambers of Commerce and Industry has just brought out the inaugural number of a monthly journal called "F.A.P.C.C.I. Review." This journal is devoted to the cause of industry and trade. The present issue includes, among others, interesting articles by businessmen and industrialists a resume of the Federation's activities, business and investment openings, scientific news pertaining to industry and notes on commercial law. It also contains a statistical feature, giving the production trends of selected industries during 1963-64 and other related matters. Dedicating the journal to the cause of spreading commercial and industrial information, the editorial has expressed to hope that it would be able to meet the requirements of the members of the Federation, as well as others interested in trade and industry. The journal is published from the Federation's office in Secunderabad (8573, Rashtrapati Road, Secunderabad). The annual subscription is Rs. 5 and the price of a single copy 50 paise.

DEVELOPMENTS IN THE EAST



With the improving living standards in the East comes the prospect of trade expansion and of increasing opportunities for profitable marketing. The world-wide facilities of three great banking organizations, merged into a single comprehensive service, are at your disposal with up-to-date information and expert advice on all aspects of finance and trade in these areas.

THIS BOTTLENECK MUST BE BROKEN

Today the whole country is astir with economic and industrial development. All our Five Year Plans aim at raising the standard of living of the masses. Very often, however, the development programmes in the country are obstructed by a bottleneck in transportation. *This bottleneck must be broken.*

Not all the rail wagons and all the railway tracks we plan to build can put us on the road to economic growth at the desired pace without the adjunct of an efficient system of motorized transport.

Countries in the West have economically forged ahead largely through the development of road transport. In the USA, for instance, some 2.8 million trucks are used in the agricultural sector alone, and the truck transportation industry provides employment to one out of every nine persons.

We are still far behind in road mileage as compared to the country's territorial area. While England has 230 miles of road for every 100 square miles of area, India has only 12 miles of road per 100 square miles.

The rate of production of motor vehicles must be stepped up. In order to bring about reduction in the price and in the cost of operation, some relief must be provided in the heavy incidence of taxation on motor vehicles. At present, direct and indirect taxes come to over 45% of the "on-the-road" price of trucks and buses produced in India. Again, the licensing policy on motor trucks and buses should be rationalised and the vexatious curbs imposed on inter-state road transport should be removed.

Only in circumstances congenial to its growth can the motor vehicle industry effectively contribute to India's economic development.

Hindustan Motors ... partners in India's industrial transformation

AMERICAN LETTER

U.N. AND DEVELOPING COUNTRIES

IMPORTANT ITEMS ON THE AGENDA OF NINETEENTH SESSION

By N. Pattabhi Raman

NEW YORK, 28th *November*

POLITICAL issues usually dominate news emanating from the U.N. headquarters in New York. Not surprisingly, the keynote has been set this year by the serious conflict over the question of non-payment of special assessments for peace-keeping operations in the Congo, the Middle East and elsewhere by the U.S.S.R., France and a few other countries. Efforts in and outside the lovely U.N. buildings astride the East River are keyed to preventing serious damage to the world organisation as the United States and the Soviet Union collide over this issue.

But the peace-keeping operations of the U.N. in the Congo, Syprus and other parts of the world—and the spirited debates in the Security Council and the General Assembly on international disputes—are only the "preventive" side of the U.N.'s activities. Constructive, peace-building operations represented in programmes to assist economic and social development around the world constitute the positive side, though they rarely attract as much attention in the communications media as the political issues. A major exception to this pattern was the United Nations Conference on Trade and Development (U.N.C.T.A.D.) held in Geneva earlier this year.

Vehicle for Ambition

Nevertheless, it is an indication of the highest importance attached by the developing nations to a U.N. role in world economic and social development that they are increasingly seeking the assistance of the U.N. family in their hopes to build a better world. The U.N. is becoming a vehicle for their ambition to rid themselves of ages-old poverty and achieve progressively improving standards of living for their peoples through the application of modern science and technology. This is illustrated by the fact that many important economic items are on the agenda of the 19th regular session of the U.N. General Assembly.

The Assembly is expected to act swiftly on the report and recommendations of the United Nations Conference on Trade and Development. This Conference, it will be remembered, called, among other things, for the establishment of new international machinery as an integral part of the U.N. to continue the work initiated by it and to implement its recommendations and conclusions. There is doubt in some quarters that the co-operation of one of the key affluent nations will be easily forthcoming, but it is generally expected that the assembly will act to recognise U.N.C.T.A.D. as one of its organs, to establish a Trade and Development Board as the permanent organ of the Conference, and to provide an adequate, permanent secretariat for servicing the Conference and its subsidiary bodies.

Special Fund

The Assembly will also deal with proposals to combine the U.N. Special Fund and the Expanded Programme of Technical Assistance (E.P.T.A.). The Special Fund, under the dedicated leadership of Paul Hoffman, has done a most splendid job in pre-investment activities—in mapping resources, in establishing centres for training manpower in vocational and technical skills, etc. It has assisted a total of 421 projects, located in 130 countries and territories. Operating with voluntary contributions, it has provided $374 million out of the total cost of $919 million of these projects; notably, and in tune with the philosophy underlying the Special Fund's operations, the participating Governments of the developing countries have provided the balance of $545 million. The E.P.T.A., also financed by voluntary contributions, is carried out by the United Nations and its related agencies, and co-ordinated by the Technical Assistance Board. (As distinguished from the Expanded Programme, the U.N.'s regular programme of technical assistance is financed by its regular budget.)

The merger of the Special Fund and the E.P.T.A. has been suggested as a means of better co-ordinating their activities. In a report on the subject, the Secretary-General concluded that all countries contributing to and benefiting from U.N. technical co-operation programmes would be best served, if the Special Fund and the E.P.T.A. were brought together in a new United Nations Development Programme. The merger proposals, however, provide for the continued maintenance of the special characteristics and operations of the two programmes, as well as their two separate funds. Contributions too would continue to be pledged separately. But, instead of two separate governing bodies as existing now, a single inter-governmental would be established as the governing council of the new Development Programme. If the proposals are approved by the Assembly, Paul Hoffman is expected to act as the Administrator of the merged programme until at least the end of 1966.

Opposition from Developed Nations

The Assembly is also expected to consider a plan to transform the U.N. Special Fund into a Capital Development Fund that would embrace both pre-investment and investment activities, but the plan faces opposition. The keen desire of the developing nations to expand the role of the Special Fund in this way is reflected in a number of resolutions adopted by the General Assembly since its fifth session and in the positive recommendation made by U.N.C.T.A.D. The hope is that a Capital Development Fund, supported by generous voluntary contributions, would be able to finance on favourable terms, national and regional plans, programmes and projects, particularly in the field of industrialisation, in the underdeveloped parts of the world. Many experts in the field of international economic development and foreign assistance also believe that it would be best to channel a substantial, if not a major, part of public assistance to the less-developed countries through the U.N. family. Such a procedure, they believe, would help economic and technical considerations to displace political considerations in the administration of air programmes.

The snag in the plan to establish a Capital Development Fund is that the affluent countries that would be expected to bear the major financial load are unwilling to support it, particularly without a weighted voting system that would give them the major voice in its administration. Ten developed countries, considered to be the main potential contributors to such a Fund if created, have openly expressed opposition to its establishment. The issue is deadlocked.

In its desire to assist rapid industrial development in the less-developed areas, the General Assembly established a couple of years ago the U.N. Centre for Industrial Development. During the 19th session, the Assembly will consider steps to strengthen the Centre, so that it might fulfil a number of new functions. It will also consider the establishment of a specialised agency for industrial development. Not long ago, the U.N. Economic and Social Council concluded that there was an urgent need to establish a specialised agency for industrial development.

During its 18th session, the General Assembly considered the advisability of holding sub-regional, regional and international symposia on the problems of industrialisation of developing countries. Now the Secretary-General has prepared a report on the subject, indicating a consensus among Governments and regional economic commissions in favour of holding the symposia. The Assembly will discuss and vote on the budget for the symposia, which will be organised by the Centre for Industrial Development to take place within the next two years.

Perseverance

From these and other items on the agenda, it is clear that the developing nations are fashioning an ambitious role for the U.N. in the field of economic and social development. Not unexpectedly, they have met with open and veiled opposition, but they have given no hint of giving up easily. Like Robert Bruce of yore, they may be expected to keep pushing plans and programmes in the hope of winning the opposition over or wearing it thin. Their drive and perseverance have produced the charge in some quarters that the developing nations, now constituting a majority in the world organisation, are advancing grandiose plans devoid of realism, but, as U.N.C.T.A.D. demonstrated, the processes of conciliation do help to narrow the gap between the attitudes of the rich nations and the aspirations of the poor nations.

In factories, railyards or docks, wherever trolleys are used, Dunlop cushion tyre equipment will smooth the way for your loads. These tyres are specially designed to reduce vibration so as to give greater protection to your products. They reduce tractive effort and so permit speedier work. They are silent and help to eliminate costly repairs in the maintenance of flooring and pathways.

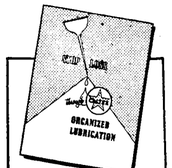
Keep Production rolling with Caltex "STOP LOSS" programme



Company executives can obtain a free copy of this booklet by writing on their official letterhead to their nearest Caltex office.

When a machine bearing fails, it's not the cost of replacement that's expensive, it's the lost production. A Caltex "Stop Loss" Programme can virtually eliminate the most common cause of bearing failure—improper lubrication.

HOW "STOP LOSS" WORKS: Caltex Lubrication Engineers help you set up a fool-proof system of lubrication control. From woodyard to shipping platform, they see to it that every piece of equipment gets the right amount of the right lubricant at the right time. The results: maintenance costs down as much as 15%, number of major lubricants required reduced to as few as six, purchasing simplified.

Production is worth a lot of money—keep it rolling with Caltex "Stop Loss" Programme.

CHANGES IN CREDIT CONTROL FORMULA

INCONSISTENCY IN RESERVE BANK'S POLICY AMAZING

BETWEEN 25th September and 26th November 1964, several changes have been made in the definition and meaning of the new central bank credit formula based upon the *net liquidity position* of scheduled banks, but the Reserve Bank of India has endeavoured all through these changes to preserve the *essence* of the credit control formula. In the paragraphs that follow, an attempt is made to trace these changes, examine their implications (which suggest that the Reserve Bank has only partially succeeded in preserving "the essence of the credit control formula") and show that the final position is not yet clear to and entirely satisfactory for the banks: indeed, the bankers' efforts to secure further modifications mean that they hardly regard the latest position with any degree of finality.

The original purpose, definition and implications of the *net liquidity position*, in terms of the Reserve Bank Circular dated 25th September 1964, were fully explained in *Commerce* dated 17th October 1964 (*vide* page 684). Commenting upon the exclusion of "other approved securities" for the purpose of computing the net liquidity, we had said that it was an unwise, if not an unjust decision from every point of view. Theoretically, with the two signatures they carry, they offer better security than even Government securities themselves. From the practical angle, their exclusion discouraged banks from investing in them and left the local bodies, State Electricity Boards, etc., high and dry. Above all, the position of "other approved securities" became anomalous—banks could include them for their statutory liquidity ratio under Section 24 of the Banking Companies Act, they can borrow against them under Section 17 of the Reserve Bank of India Act, they may even obtain a higher yield over their investments in such securities, but they could not include them in computing the *net liquidity position* for the purpose of determining the cost of borrowing from the central bank. Representations made by banks, pointing out all these defects in the Reserve Bank's decision, produced no result at all. For the Reserve Bank was convinced that the inclusion of "other approved securities" would raise the banks' capacity to borrow from it at the Bank Rate by about Rs. 75 crores and nullify credit control. The need for an effective credit control was thus the *only* justification for an otherwise unjust position.

The harmful effects of the unjust position were soon felt by some of the authorities whose securities were designated "approved securities" and who came to the capital market with their borrowing programmes for the current fiscal year in the last two months. They met with poor response, for the banks would not touch their securities, as they were discriminated against by the Reserve Bank for determining the cost of central bank credit to them. So, these public sector bodies made strong representations to the Reserve Bank that their new issues had failed to evoke banks' support. Thus where the bankers had failed to prevail upon the Reserve Bank of India, pressures of these authorities succeeded. They convinced the Reserve Bank of India that exclusion of "other approved securities" was detrimental to their interests. The Bank, therefore, decided to allow their inclusion with effect from 4th December 1964, in computing the *net liquidity position* for determining the lending rate to be charged by the Reserve Bank of India. However, for preserving the *essence* of the credit control formula, the Bank also decided simultaneously to exclude the banks' borrowing from the Industrial Development Bank of India for computing the *net liquidity position*.

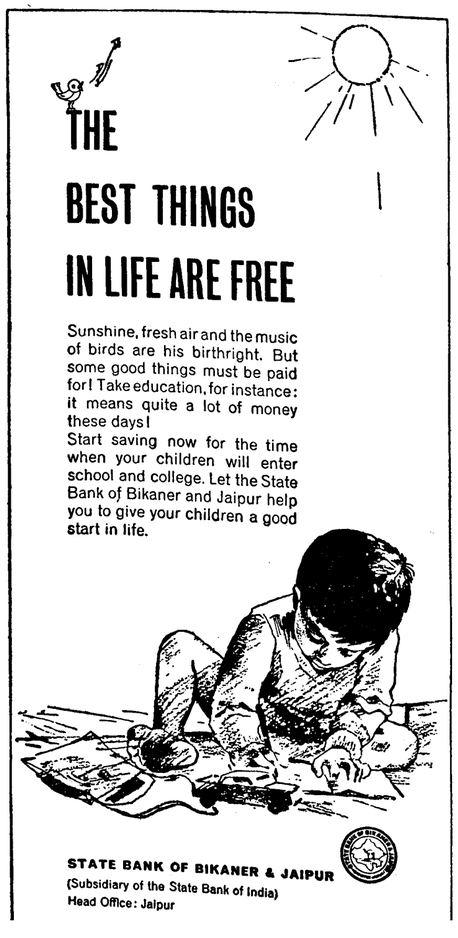
This "relaxation" has merely replaced one irrational action for another and has on top of that failed to achieve the aim of the Reserve Bank. The reason now given for the exclusion of the banks' borrowings from the I.D.B.I. is that they are in the nature of central bank accommodation. It is, however, wrong in principle to equate a commercial bank's borrowings from the I.D.B.I. with those from the Reserve Bank, merely because the former is a wholly-owned subsidiary of the latter. The banks' borrowings from the I.D.B.I. are in the nature of refinance provided to banks against medium-term loans provided by them to industry. A few years ago, banks were in fact pressed by the Reserve Bank to provide term loans and were encouraged to avail themselves of the refinance facilities provided by the then Refinance Corporation for Industry Ltd. (now merged with the I.D.B.I.). Now, how is it fair for the Reserve Bank to take a decision that runs counter to its earlier policy? Surely, a change in credit policy should be consistent with the basic developmental policies, under which the member-banks have taken up long-term or medium-term obligations, as distinct from provision of seasonal credit to trade and industry. If the exclusion of "other approved securities" was unjust to those banks who had large investments in such securities, the exclusion of borrowings from I.D.B.I. will be equally unjust to those who have liberally used the I.D.B.I. facilities for medium-term refinancing. In fact, some of the larger banks who have been most active in this field with the blessings of the Reserve Bank now find that, after the 'relaxation' about "other approved securities" they are worse than they were before, because their borrowings from I.D.B.I. far exceed their holdings of "other approved securities." If the object of the Reserve Bank is to discourage the banks from engaging themselves in providing medium-term finance, that is, if its object is to go back upon a position which it once thought was necessary and desirable, then it should say so frankly and, what is more, should not act in such a way as to give retrospective effect to such a change in policy.

This consideration apart, the exclusion of I.D.B.I. borrowings seems to run contrary to two new developments in the I.D.B.I. financing itself. First, I.D.B.I. will now refinance loans upto Rs. 1 crore in each case and even exceed the amount in exceptional cases as against the old limit of Rs. 50 lakhs. Secondly, the I.D.B.I. will provide refinance only up to 80 per cent of the loans given by banks, who will have to finance the balance of 20 per cent from their own resources. While the former change is designed to enable banks to obtain larger refinance from the I.D.B.I., the latter aims at reducing the I.D.B.I.'s risk by 20 per cent in each case. In effect, the latter requirement reduces the banks' ability to provide short-term credit to its customers. If, in addition, the banks find that their borrowings from I.D.B.I. lower the availability of Reserve Bank's short-term accommodation to them at Bank rate, they will surely be reluctant to use the liberal I.D.B.I. facilities and also to provide medium-term credit to industries. Thus, the Reserve Bank's preoccupation with credit control will affect the flow of institutional resources for term-lending, and that at a time when there is need for increasing them, in view of the continuing depression in the capital market.

Moreover, even the essence of credit control formula is not preserved by the latest changes as claimed by the Reserve Bank. The double change involving the inclusion of "other approved securities" and exclusion of I.D.B.I. borrowings will have the effect of increasing the availability of R.B.I. accommodation to banks at Bank Rate by Rs. 55 to Rs. 60 crores. It is difficult to say whether this liberalisation allowed by the Reserve Bank, despite its professions to the contrary, is the result of its realisation that the screw was tightened rather too much in September, or whether it is the result of its appreciation that demand for genuine legitimate and productive credit during the ensuing busy season will be higher than expected.

By now, the protests of bankers at the exclusion of borrowings from I.D.B.I. must have made the Reserve Bank realise the crudeness of its efforts at inclusion and exclusion of various items in the definition of net liquidity. The most logical and, incidentally, the most just and equitable step for achieving objects and purposes of the Reserve Bank, whatever they be, would have been to alter the *net liquidity ratio* of 28 per cent, rather than arbitrarily manipulate the items in the definition of the *net liquidity ratio* itself.

There is (or can be) no finality in the debate and controversies on the credit control mechanism based upon the *net liquidity*. Noticing the Reserve Bank indecision and its amenability to appropriate pressures, the bankers are still trying to extract a few more changes for toning down the rigours of the credit control formula. How far they succeed in their attempts will be known in time, before the busy season gains momentum at the turn of the year. Meanwhile, it may be added here that there are two directions in which they seek further modifications. First, they are demanding an option to each bank to follow either the approved securities formula or the I.D.B.I. formula; this would mean a further liberalisation of the condition for availability of Reserve Bank credit at the Bank Rate. Secondly, they desire that penal rates based upon the loss of every full point in net liquidity should be charged only upon the *additional* borrowings on a slab rate system and not on the *entire* borrowing at a flat rate. This, if conceded, would reduce the overall cost of central bank credit.



PROGRESS OF DENA BANK

The Devkaran Nanjee Banking Company Limited (Dena Bank for short), which celebrated its Silver Jubilee on 11th November 1964, has made impressive progress since its inception in 1938. Although the Bank completed 25 years of service on 26th May 1963, it could not celebrate the silver jubilee on that date, owing to the prevailing state of emergency at that time. Twenty-six years may not be a long period in the life of a credit institution, but, during this short period the Dena Bank has grown into an adult institution, becoming stronger and sounder with the passing of every birthday in its life.

Starting with a single office in 1938, the Bank had 48 branches in 1948, 75 in 1958 and almost double, that is 147, six years later. The deposits, which stood at only Rs. 5 lakhs in 1938, rose to over Rs. 9 crores in 1948. During the next decade, there was an increase of over 200 per cent to Rs. 30 crores and, since then, there has been a further rise of over 100 per cent, to Rs. 65 crores—the number of accounts being over 300,000. Advances have also improved fast. From only Rs. 1.54 crore in 1948, they increased to Rs. 14 crores in 1958 and Rs. 43 crores in June 1964. In co-operation with the growth of business, the net profits increased from Rs. 6.28 lakhs in 1948 to Rs. 14.22 lakhs in 1958 and over Rs. 26 lakhs in 1963. Although the deposits and advances of Dena Bank are still modest, accounting as they do for less than three per cent of the total for all scheduled banks, their share has been rising at a very fast rate. This progress is certainly a tribute to the Directors and management of the Bank.

"FRINGE BANKING" IN NEW ZEALAND

As originally introduced, a clause in the Reserve Bank of New Zealand Bill provides that, by Order in Council, any person or classes of persons whose principal business is banking may be declared to be trading banks. This would mean that they could have applied to them such restraints as now affect trading banks, in particular the reserve ratio system. The Government has, however, decided to modify this provision, because stock and station agents who act in many ways as bankers to farmers in New Zealand, have strongly represented that they would be in an impossible position if the reserve ratios were applied to them.

A modification is also proposed for an associated clause in the Bill which lays down that specified provisions may be applied to any person or classes of persons who as a substantial part of their business in New Zealand, accept deposits or carry on any banking business (such as finance corporations and insurance companies). The clause as amended, will provide that where a substantial part of a business—but not necessarily a main part—is banking, the Reserve Bank may require information to be supplied and may determine the policy to be followed.

TEXTILE INDUSTRY IN WEST EUROPE

MODERNISATION AND RATIONALISATION MAKE GOOD PROGRESS

RENEWED efforts are being made by the textile industry in Western Europe to raise its productivity with the triple objective of augmenting production, improving quality and reducing costs. Indeed, the continuing modernisation of equipment and rationalisation of manufacturing processes, together with the upturn in the textile cycle, have lately led to results which are markedly better in most cases, as compared with the position obtaining in the nearly months of last year. A casual look at the statistics relating to the spindlage and loomage in all the regions of Western Europe (European Economic Community, European Free Trade Area and the other countries which consist of Finland, Greece and Spain) may, of course, give the impression that the cotton industry has contracted in size. But a closer look will reveal the installation of a large number of automatic looms and replacement of the old type mule spindles by the more efficient ring spindles. Interesting in this connection is the overall assessment of the position made by Mr. J. B. M. Evans of the International Federation of Cotton and Allied Textile Industries, Zurich (Switzerland), in the latest issue of the publication, *European Cotton Industry Statistics*. Here is what Mr. Evans says:

"The year 1963 ended on a rather brighter note, giving rise to the hope that the protracted low point in the textile cycle was at an end and that a period of better trade was commencing. The industry continues in its efforts to benefit from better conditions by steady rationalisation and modernisation."

The aforesaid developments are of great importance to India, because Western Europe, including the United Kingdom, constitutes a vital market for Indian textiles. Almost one-third of the total cotton piecegoods exports from India finds its way to Western Europe, though half of this quantity is absorbed by the U.K. alone. The recent trends in the economy of the Western European cotton textile industry are a pointer to India where the need for speedy modernisation, rehabilitation and rationalisation is much more pressing today than any time before.

Spindlage

The set-up of cotton textile industry in Western Europe, utilisation of capacity, and actual production of yarn and cloth are all vividly brought out in the latest issue of the *European Cotton Industry Statistics*, published by the Federation. The total number of spindles in place in W. Europe which stood at

Cloth Production in Western Europe
(In thousand metric tonnes)

	1963	1962	1961
Total yarn production	1,715.5	1,721.5	1,797.6
Of which:			
E.E.C.	1,006.4	1,104.3	1,143.1
E.F.T.A.	468.1	464.2	501.4
Other countries	151.0	153.0	153.1
Total cotton cloth	1,025.4	1,052.4	1,059.1
Of which:			
E.E.C.	674.2	692.1	706.5
E.F.T.A.	260.5	264.4	276.4
Other countries	90.7	95.9	76.2
Total artificial and synthetic cloth	238.1	223.8	209.9
Of which:			
E.E.C.	145.3	133.5	120.7
E.F.T.A.	85.0	83.2	84.0
Other countries	7.8	7.1	5.2
Total mixture cloth	109.5	111.0	104.1
Of which:			
E.E.C.	73.4	74.0	67.9
E.F.T.A.	26.4	27.8	28.8
Other countries	9.7	9.2	7.4

35.26 million in 1961, declined to 34.32 million in 1962 and still further to 32.23 million. The decline has taken place in both the E.E.C. and the E.F.T.A. regions, whereas "other countries" account for a slight expansion of spindlage. Barring Belgium, where the number of ring spindles has increased from 1.18 million in 1962 to 1.2 in 1963, all the other E.E.C. countries have reported a decline. In the E.F.T.A. countries, it is only the United Kingdom that has reported a major decline from 9.46 million spindles in 1962 to 8.00 million spindles in 1963. A more or less similar trend has been noticed in regard to the spindles which are active. In the case of E.E.C., while the number of spindles installed declined by 4.28 per cent in 1963, as compared with 1962, that of active spindles fell by only 3.26 per cent. Reverse was the position in the E.F.T.A. and other countries. The installed capacity receded by 11.57 per cent in the E.F.T.A. and 5.55 per cent in "other countries," but the active capacity declined as much as 13.28 per cent and 8.57 per cent, respectively. Taking Western Europe as a whole, the total installed spindlage has declined by 6.13 per cent and the total active spindlage by 7.44 per cent.

While the decline in the number of active spindles during 1963 was 7.44 per cent, the fall in the West European average hours spun was only 3.87 per cent. These figures suggest the combination of the trend towards greater machinery utilisation. The number of waste spindles in place in Western Europe continued to fall, as did the number of active and the hours worked during the year. Again, the percentage fall in the hours worked was less than that shown by the number of active waste spindles. In the waste sector, too, a higher degree of activity was secured per spindle used. Despite the large fall in active spindles, consumption of raw materials fell by only 0.77 per cent overall, the rise in man-made fibre consumption partly offsetting the fall in demand for raw cotton and other fibres. It is interesting to note that demand for raw cotton within the E.F.T.A. actually registered a rise of nearly 2 per cent over the 1962 level.

Loomage

The weaving machinery installed and active continued to fall, while the change from ordinary to automatic looms was also still very evident. In 1962, ordinary looms provided 47.5 per cent of the total active looms; in 1963, this share had dropped to 41.6 per cent. The percentage change in looms during 1963, as compared with 1962, is shown below:

	Active %	*Installed* %
E.E.C.	−2.89	−4.90
E.F.T.A.	−13.47	−3.07
Other countries	−23.54	−6.47
W. Europe	−9.18	−4.44

The loom hours worked fell in each group; however, the percentage fall in average W. European hours woven was 5.22 per cent, as compared with the reduction in active looms of 9.18 per cent. As with spindles, active looms were used more intensively, thus fitting into the general pattern of increasing productivity. In the E.E.C. and the E.F.T.A. groups, yarn consumption increased and, although "other countries" used less yarn during the year, the Western European total rose by 1.81 per cent. Again the E.F.T.A. was distinguished by a rise in yarn consumption of some 7.2 per cent which included an increase of 5.1 per cent in the usage of cotton yarn. Cloth production showed a marginal decline only, due in the main to the poor results during the early part of the year.

The total number of looms in place in Western Europe declined from 714,940 in 1961 to 647,163 in 1963, a fall of 10.5 per cent. Though ordinary looms show a decline in all

Spindles and Looms Installed

	1963	1962	1961

Of which:			
E.E.C.	238,606	237,775	239,975
E.F.T.A.	90,474	83,823	84,741
Other countries	26,605	15,995	16,991

the three groups of countries, the change from ordinary to automatic is still evident. In the E.E.C., the number of automatic looms, which had tended to fall from 239,975 in 1961 to 237,775 in 1962, rose to 238,606 in 1963. In the E.F.T.A., too, the number of automatic looms which had declined from 84,741 in 1961 to 83,823 in 1962 rose to 90,474 in 1963. Similarly, in "other countries," the number of automatic looms installed, after receding from 16,991 to 15,995 in 1962, improved perceptibly to 26,605 in 1963. The increase in the number of automatic looms in the E.E.C. has been accounted for mainly by the Netherlands and France. In the E.F.T.A., Sweden has reported a major decline from 7,251 automatic looms in 1962 to 6,519 in 1963. The decline has, however, been more than made good by the perceptible increase registered in Portugal and the United Kingdom. Among the countries outside these two groups, there has been a decline in the number of automatic looms from 5,101 in 1962 to 4,639 in 1963 in Finland, whereas it has increased from 1,950 in 1962 to 2,286 in 1963 in Greece and from 8,944 to 19,680 in Spain.

Raw Materials Consumed

The reduction in utilisation of the installed capacity during the year 1963 is revealed by the statistics pertaining to consumption of raw materials. The total actual consumption of raw cotton, artificial (cellulosic) and synthetic fibres and other fibres including waste, etc. declined slightly from 1.89 million tonnes in 1962 to 1.88 million tonnes in 1963. While the consumption of raw cotton declined from 1.5 million tonnes to 1.48 million tonnes, the consumptoin of artificial and synthetic fibres increased from 273,688 tonnes to 290,813 tonnes. Consumption of other fibres also declined from 125,497 tonnes to 110,533 tonnes. The fall in the total raw material consumption was only in the E.E.C. and "other countries," whereas, in the E.F.T.A., there was an increase in consumption from 472,507 tonnes in 1962 to 475,888 tonnes in 1963.

The fall in yarn production in the whole of Western Europe was, however, very marginal, being only 0.35 per cent, the quantity actually produced declining from 1.72 million tonnes in 1962 to 1.71 million tonnes in 1963. This fall was mainly in the E.E.C., where the total yarn production went down from 1.1 million tonnes in 1962 to 1.09 million tonnes in 1963. While the fall in "other countries" was slight, from 152,971 tonnes in 1962 to 151,055 tonnes in 1963, the E.F.T.A. countries recorded a rise of about 0.84 per cent from 464,184 tonnes in 1962 to 468,088 tonnes in 1963. The major fall in yarn production occurred in Western Germany where the actual production receded from 385,197 tonnes in 1962 to 371,181 tonnes in 1963, as well as in Spain where the production declined from 105,863 tonnes in 1962 to 102,639 tonnes in 1963.

Despite the fall in yarn production, consumption of yarn in weaving mills increased in Western Europe from 1.44 million tonnes in 1962 to 1.46 million tonnes in 1963. The increase was accounted for mainly by the E.E.C. and the E.F.T.A. where the consumption increased from 928,104 tonnes and 390,602 tonnes in 1962 to 930,057 tonnes and 418,715 tonnes, respectively. In "other countries," yarn consumption fell from 116,355 tonnes to 112,229 tonnes.

Cloth Production

Against the background of the rise in the number of automatic looms and higher yarn consumption, it is rather surprising that the total cloth production in Western Europe declined from 1.39 million tonnes in 1962 to 1.37 million tonnes in 1963. The decline was in evidence in cotton cloth and mixture cloth. The production of cotton cloth receded from 1.06 million tonnes in 1961 to 1.05 million tonnes in 1962 and further to 1.03 million tonnes in 1963. The fall occurred in all the regions. In the E.E.C., it was rather marked, from 706,509 tonnes in 1961 to 692,054 tonnes in 1962 and 674,221 tonnes in 1963. The production of artificial and synthetic cloth, however, increased from 209,915 tonnes in 1961 to 223,837 tonnes in 1962 and, again, to 238,155 tonnes in 1963; the E.E.C. countries alone accounted for a rise of about 20 per cent over the period 1961-63 (that is, from 120 666 tonnes in 1961 to 145,280 tonnes in 1963). In the E.F.T.A. region, not only was the setback suffered in 1962 (from 84,040 tonnes in 1961 to 83,229 tonnes) made good, but actually increased further to 85,012 tonnes in 1963. Production in the "other countries" also increased from 5,211 tonnes in 1961 to 7,863 tonnes in 1963. As for mixture cloth, production, which had registered an increase from 104,138 tonnes in 1961 to 111,030 tonnes in 1962, declined to 109,582 tonnes in the year under review.

EXPORTS OF RAYON AND SYNTHETICS

Indian rayon and synthetic textiles put up an impressive performance on the export front during the first nine months of 1964, according to the latest issue of the *Silk-Rayon Newsletter*, published by the Silk and Rayon Textiles Export Promotion Council, Bombay. The actual shipments during this period aggregated about 52 million metres, valued at about Rs. 5.6 crores. This was a new record for the period of the first three quarters. During the corresponding period of 1963, exports were about 47 million metres, valued at Rs. 4.6 crores. Thus the increase registered during the period under review over the corresponding period of 1963 works out to 5 million metres worth about a crores of rupees. In terms of value, the improvement was to the tune of 22 per cent. The average monthly exports during the first three quarters in 1964, came to 5.8 million metres, valued at Rs. 62 lakhs which compared favourably with only 5.2 million metres valued at Rs. 51 lakhs a year before.

The export activity for the current year, however, cannot be considered very encouraging, viewed against the background of the targets (monthly average of Rs. one crore) laid down. Besides, it appears that the high tempo of activity noted during the first quarter was not maintained subsequently. As much as 40 per cent to the total exports during the nine-month period took place in the first quarter itself. The share declined to 32 per cent during the second quarter and further to 28 per cent in the third quarter. In absolute terms, exports which amounted to Rs. 2.23 crores during the first quarter, fell to Rs. 1.77 crore during the first quarter, fell to Rs. 1.77 crore quarters, respectively.

The declining trend of exports is attributed to several adverse factors. They are: (1) a reduction in the incentive under the Export Promotion Scheme from 100 per cent to 70 per cent and withdrawal of allotment of indigenous yarn at concessional prices; (2) grant of art silk yarn as incentive against exports of items for the manufacture of which it is not a raw material (this kind of incentive has now been withdrawn, but the damage has already been done); (3) some of the spinners are under an export obligation which can be fulfilled only by exporting rayon and synthetic fabrics but these exports are not governed by the same regulations as those under the Export Promotion Scheme for art silk fabrics; and (4) introduction of stricter formula for determining fair market value in Canada, import restrictions in Ceylon, political uncertainties in Malaysia, continuing ban on imports into Iran and uncertain situation in Iraq, non-issue of import licences in Morocco and a feeling of insecurity in the trading community in some parts of East Africa.

It is, however, considered to be a matter of gratification that, despite these adverse developments, the average unit value realised from exports has improved. It stood at Re. 1.07 per metre during the January-September 1964 period, as compared with only 98 paise in the same period last year.

COTTON IMPORTS

In October last, it will be recalled, the Government of India released foreign exchange for the purchase of Egyptian-Sudan cotton from the U.S. stockpile for which licences had already been issued upto 30th September 1964. Since many mills had not obtained licences by that date the licences, which were issued until then, covered only a portion of the cotton which the mills had contracted for. The Government has now announced that all such Egyptian-Sudan stockpile cotton for which contracts had been entered into on or before 26th September 1964 can be imported. The mills and/or their authorised importers can obtain the necessary licences by furnishing the following documents:

Where applications for import licences were already made, original cables relating to the offer and acceptance of cotton and actual contract together with the certified copies of these documents should be furnished to the Office of the J.C.C.I. on or before 2nd December 1964.

Where no such application for an import licence had been made, applications should be addressed to the J.C.C.I. and forwarded to him through the Textile Commissioner's Office on or before 7th December 1964. These applications should also be accompanied by original cables and actual contracts with their certified copies.

Where licences have already been issued but no valid letters of credit have been established, such licences should be submitted to the J.C.C.I's office on or before 2nd December 1964 for re-endorsement.

"TEXTILE INDUSTRY ANNUAL 1964"

The Silver Jubilee Number of the Indian Textile Industry Annual 1964 (Editor: M. P. Gandhi, Nanabhoy Mansion, Pherozshah Mehta Road, Bombay-1. Price: Rs. 7.50) is, indeed, very attractive and useful because the publishers have widened the coverage of the publication. The Annual, besides dealing with the organised sector of the textile industry, also surveys the decentralised sector, namely, handlooms and powerlooms, *khadi*, cloth produced from *charkha*, Amber yarn, silk, art silk, man-made fibres, woollen goods, as well as the textile engineering industry. The change in the format and the addition of photographs, charts, etc. have given a bright look to the publication. Appendix I contains statistical tables and Appendix II is a list of the personnel of important textile committees.

Whichever way you look at it...

. . . if it's a question of ball or roller bearings, the answer is SKF

thousands of different types and sizes... with outside diameters of up to 2180 millimetres... for speeds of up to 400000 revolutions a minute... for carrying loads of up to 2000 tons... are manufactured by SKF to meet the needs of every industry and all forms of transport.

MANCHESTER LETTER

OUTLOOK FOR TEXTILE INDUSTRIES

NEW AND DYNAMIC PHASE AHEAD, SAYS COURTAULDS' CHAIRMAN

From Our Special Correspondent

MANCHESTER, 24th November

PREDICTING a "new and dynamic phase" ahead for textiles, Mr. C. F. Kearton, Chairman of Courtaulds, the giant British man-made fibre and cotton group, called for determined moves towards an integrated textile industry that would embrace cotton, man-made fibres and wool. Speaking to the 1964 Convocation of the Textile Institute at Manchester, Mr. Kearton made a plea for people in the industry to think of textiles as one trade, and not sectionally. "We should work towards a national textile trade, capable of speaking in national and international councils for all fibres, fabrics and processes."

Referring to textile mergers into more compact groupings of companies, Mr. Kearton said that he thought it was "optimistic" to say that the industry would eventually rest in the hands of five or six major groups. There would always be room for specialist firms as well. Suggestions that the industry would soon be monopolised by I.C.I. and Courtaulds were "nonsense," he said. The textile industry in its widest form, was probably the biggest single industrial enterprise in the country. Although textiles had lost their overwhelming importance in the country's export trade, they ranked second only to food as the highest consumer of spending money in the country.

On man-made fibres, Mr. Kearton pointed out that the total investment in this part of the textile industry was "gigantic." Production was expanding rapidly, and he forecast that, in about five years, synthetic fibres would move from one-third to one-half of the total United Kingdom fibre use. I.C.I. now had about one-third of their total investment in man-made fibres; the Courtaulds investment was the highest in the Company's history.

"We feel textiles is one of the most worthwhile industries in the country," said Mr. Kearton, and added: "It is going to enter into a new and dynamic phase. We want to do our bit to get this concept of an integrated textile trade accepted."

Profits Up

Reporting a "marked improvement" in profit compared with the previous three first half-yearly figures, Mr. George W. Stott, Chairman of Stott and Smith, the Manchester-based textile group, says in an interim statement that the Company hopes to pay an increased final dividend. But he tells shareholders that the immediate economic future is too unsettled for any promise to be made at this stage. The Directors have declared an interim dividend of three per cent which is one half per cent greater than the previous interim dividend.

Profits before tax for the half-year ended 30th September 1964 total £23,836, as compared with £16,101 last year and £10,920 in the previous six-month period. "This has been achieved by larger sales, smaller costs and better productivity," he adds. "Progress has been made in all sections of the group towards the aims set out in my last statement. We are continuing with these plans which have already yielded these most encouraging improvements."

Mr. Stott reports that, because of economies, the Company had generated "very handsome cash funds" making it possible for the group to plan extensions to its activities. "Every effort is being made to find suitable additions to the group either in the handling of additional textile merchandise or by acquisition of other companies. I shall be happy to hear from anyone who may care to talk to us along these lines. We are now adopting an expansionist policy, the aim of which is greater profits, higher dividends and enhanced share prices."

Some of the Company's selling prices have been increased because of the new import duty, but reductions are being offered for export business arising from the export allowances. "This small help to exporters is most welcome," declares Mr. Stott, "but I believe that as much cost reduction could be achieved again if the Government would reduce the amount of documentation associated with export. Export orders are frequently small consignments and it is hardly an exaggeration to say that the cost of documentation is sometimes greater than the profit earned by the sale."

Taxation on the current year's profit is likely to take a heavier toll than last year when the figure was unusually small because of re-equipment allowances. "The Budget seems designed to enable us to make more profit, the Government will doubtless tax that profit more heavily and in particular that part of the profit which is distributed to shareholders." Mr. Stott says that the fortunes of the group are improving and new ranges are selling well in all areas and from all departments.

Management Comparisons

By a fortunate coincidence, the Cotton Board's Productivity Centre has decided to give more details of its interfirm comparison scheme to companies wishing to join the system at the same time as the *Board of Trade Journal* published a lengthy article on interfirm comparison for management. In the cotton trade's scheme, a comparison of ten financial ratios provides the basis for checking the progress of individual companies against their competitors. These may be extended to as many as 30 ratios when detailed comparisons are required on particular aspects of the business concerned.

According to Mr. H. Ingham of the Centre for Interfirm Comparison, the organisation set up by the British Institute of Management in association with the British Productivity Council in 1959, the results of the surveys give the managing director of a firm taking part an instant picture of the relative profitability of his company. He can see where his business is weaker than his competitors, what weaknesses call for his personal attention and in what directions improvements are indicated.

Policy questions invariably emerge from participation in a comparison project of this kind and the management frequently finds new angles which might not otherwise have been recognised. Mr. Ingham emphasises the appeal of interfirm comparisons to those at top management level because a stimulus to self-criticism at the top will have the strongest impact on the development of the firm. Equally, top management is in the best position to decide on remedial action and to implement it.

Special sets of top management ratios provided by the scheme are designed to indicate to the managing director how the overall success of his business compares with those of other similar firms, why it differs from theirs, what aspects of his firm's policy and performance need attention; and what specific policy questions need to be tackled in order to improve the overall profitability of the firm.

THE INDIAN TEXTILE JOURNAL

With its issue of October 1964, the *Indian Textile Journal* (Editor: Mr. Jal S. Rutnagur, Bombay) entered its 75th year of uninterrupted publication. Founded in 1890 by the late Mr. Sorabji M. Rutnagur, the *Journal* has had a distinguished career. The *Journal* has grown with the country's textile industry, and has undoubtedly made its contribution to the advancement of textile technology in India. It is only in recent years that textile technicians have been able to meet in conferences and symposiums to share their practical experience and 'know-how.' Otherwise, the *Journal* was their only forum and even today, they find it an indispensable source of knowledge. Its rich content of technical articles has earned it the complete confidence and respect of all concerned in the industry—millowners, technicians and machinery manufacturers not to speak of Governmental departments connected with textiles.

WHAT IS WRONG WITH FOOD PRODUCTION?—III

THE WAY OUT OF THE IMPASSE

By S. Ramayya, I.A. & A.S. (Retd.)

THE analysis in the previous article illustrates certain important principles. There is a good deal of confusion regarding agricultural production by adopting advanced techniques and all are frantically urging the peasant to increase output by using more fertilisers and emphasising the importance of steady supply of irrigation water, better implements, pesticides, Japanese cultivation methods supplemented of course by better land tenures, credit, etc. During my talks on these subjects I am frequently asked whether the adoption of these methods will not increase food production. They say that America or Japan produces more wheat or rice in an acre than we do in India.

My answer is that such improved means will certainly increase production. A piece of land with the same soil qualities and more or less with the same amount of input factors will *quantitatively* produce the same amount of wheat or rice whether in India or America. There is, however, one fundamental law about improved technology which no one should forget. It always works under current social and economic laws of production. In a Soviet collective farm or a Chinese Commune, the order to produce a certain amount of physical product will be issued, of course, on the basis of researches. For this, the inputs will be calculated and issued. After allowing a rate of ration for those working in the farms, the surplus will be drained off by the Central Authority and allocated for various other purposes. Thus, a communist economy works under its laws of production without the market mechanism.

Market Mechanism

In India, we still work under the market mechanism to a large extent, though here and there it is being eroded for other objectives. For example, there is subsidy to the farmer in the supply of water and fertilisers. There is control on food prices in the interests of urban residents especially for the weaker sections of the people. There is levy sometimes for buffer stock at somewhat lower than market prices. We think of starting rationing during emergencies. These are all interferences with the working of the market mechanism and have psychological effects on both the producer and the consumer. But we can still say that, to a very large extent, we in India depend on the price and market mechanism in the food sector.

The main features of the price mechanism are well known. It depends on the equilibrium of supply and demand prices. There is a large amount of inelasticity in the demand for food. Food is a basic necessity but nobody consumes it beyond a certain requirement. Overproduction will send the prices crashing down, because of the difficulty of preserving grains for a long time. No consumer stocks enormous quantities of wheat or rice because of low prices. On the other hand, low prices for industrial products will induce greater sales. Similarly, when the demand for food goes up and supply lags behind, prices will sky-rocket. The buffer stock method helps up to a stage in both the cases; but on a large and successful scale it is possible only in advanced countries like America.

The supply price depends normally on the marginal cost of production. In agriculture, marginal costs increase both in the short and long period, due not only to the law of variable proportions or diminishing returns but also due to the major fact that we have to resort to more required on a large scale, because, our holdings one advantage in advanced countries. Greater demand by the agricultural sector for input factors like fertilisers, pesticides or implements in big farms reduced their cost normally, due to well organised mass production of the inputs by the industrial sector.

In India, the position is different. The industrial sector that caters to agriculture is still nascent and not well organised. Any sudden demand for fertilisers will mean higher prices, coupled with inadequate supply. Farm implements of better type like tractors, ploughs, harvesting machines, etc., however, are not yet required on a large scale, because, our holdings being petty, farmers are unable to afford capital-intensive methods.

Then, there are certain peculiar features in regard to production by subsistence farmers. The American farmer in his 500-acre farm consumes barely 0.1 per cent of his own production. He sells practically everything in the market and buys his requirements from the market. On the other hand, the Indian farmer consumes two-thirds of food he produces and lets into the market normally only one-third. This one-third also is subject to violent fluctuations by other factors. If, in an abnormal drought year, the overall production suffers, less than one-third comes into the market, and the prices shoot up.

If the "terms of trade" between the agricultural and industrial sector are favourable to the farmer (that is, if the prices of manufactures used by the peasant increase less than the prices of food—some such position has been obtaining in India in the last three or four years) most of the peasants with traditional ideas of contented living can decrease production and enjoy leisure in festivals and fairs. Where he sold 15 units of paddy for his other requirements, he now sells only 10 units.

We also saw earlier the difficulties of the crop sharer in increasing his marginal output even with higher prices. Subsidies work in the same direction. If Nagarjunasagar water which costs commercially Rs. 55 for an acre is supplied at Rs. 15, the farmer can now reduce his production by three units. Thus we see that economic laws of combination of inputs, in proportions that take into account their prices, their physical input-output ratios and the prices of their products, are overlaid by the peculiar conditions of agricultural production in India by subsistence farmers and act in unpredictable ways.

In the past few years, the general trend has been for production to come down; in any case not to increase. This makes prices go up very high apart from the natural increase in marginal costs. At present prices (a unit of paddy sold at Rs. 4 in 1940 and it is now over Rs. 16 in the Tanjore District), there is naturally alarm all round. If price is controlled, the tendency, as we already saw, is for production to go down still further.

With so many variables working in different directions, State intervention here and there, except in clear-cut and purposive ways, only add to confusion and failure. *Another patent fact is that the few simple advanced techniques that we introduced in the first and second Plans like chemical fertilisers, etc., have exhausted their good effects and cannot deliver the goods in future.*

The Solution

Is there no way out? Yes; there seems to be a way out. Primarily, we want two things. Firstly, more production. Secondly, and this is more important, the higher production should be at a lower cost, which will be fair to the urban people and at the same time will not penalise the cultivator and put him to loss. Greater production seems possible by scientific methods, as we saw in the previous article. But it is by *marginal increase* and at very high cost which the society cannot afford or tolerate. The *marginal approach* which now dominates the Indian scene is, therefore, useless.

In defence of the marginal approach, it is stated that it is the only practical way for the teeming millions who have to subsist somehow on one acre or two acres; it is conducive to better land use, because of the poverty and starvation of the peasant; and any other method will be violent, create enormous social unrest and social suffering and unemployment. The trouble is that the old method has utterly failed and that failure has already started great social unrest. Then why not try a new—there is nothing very new about it except in regard to implementation—and revolutionary change in the structure of agriculture which will add to production at a cheaper cost. As regards unemployment, it is already there and, with higher production at a lower cost, even better doles can be given to the unemployed at cheaper social cost. This is the fundamental way of development in the backward countries, namely, to introduce revolutionary changes and break the stagnation of marginal methods.

In the actual working of a five-acre farm of 1961, we found that the cost of cultivation was as follows:

Labour, manure, etc., cost including profit Rs. 1,440.

The unit cost of cultivating an acre, therefore, is Rs. 1,440 ÷ 5=Rs. 288.

Suppose we take courage in both hands, throw overboard the set of medieval ideas from the cobwebs of our mind and ask foreign Governments to help us start modern capital-intensive farms with trained intelligent farmers, in Nagarjunasagar or Rajasthan Canals with at least 50 acres as minimum, introducing better implements, seeds, pesticides, rotation of crops, fertilisers all on a bigger scale and cheaper unit cost of the inputs the unit cost of cultivating one acre may go down to, say, Rs. 250 from the present cost of Rs. 288 due to economies of large-scale purchase and operation. Such is the position in advanced countries today in big farms. The production is also bound to go up easily by at least 25 per cent due to more scientific methods and techniques (each 5-acre increasing to 250 units from 200 units), i.e., 50 acres will give us 2,500 units. The cost and unit rate will be as follows:

Cost of cultivation Rs. 50×250	=Rs. 12,500
Payment to landlord at Rs. 150 per acre assuming landlords exist and they get 40 per cent of gross produce, i.e., 1,000 units at Rs. 8 per unit	=Rs. 8,000
Total ...	Rs. 20,500

This total cost of Rs. 20,500, spread over 2,500 units, will give a unit rate of Rs. 8. The advantages are a 25 per cent increase in production, an average cost of Rs. 8 per unit and high *per capita* income for farmers and a good deal for owners who, of course, can be taxed suitably.

The figures in the model can be changed here and there; but it embodies a correct principle, namely, bigger farms scientifically managed can not only increase production but also reduce unit cost. This way only lies the salvation of the country. All other methods will lead to chaos.

Conclusions

Indian agriculture is a sick and exhausted sector, with 250 years of decay to its debit. A marginal healthy growth is impossible here. We are still looking at it from the point of view of charity and sentiment. In an utterly decayed area, we must think of robust and drastic remedies. When a patient is sinking, palliatives will not do, but only strong remedies. The broad outline should be clear to everybody. Its implementation is, of course, a difficult task of administration. What is more, there is need for a high degree of political courage to accept a change in the present policy.

Population growth is our worst enemy and a drastic control of the same is a first *Must*, especially in the rural areas. Thirteen years of planning and investment have produced the least impression on the structural side of our economy. Still 70 per cent subsist in the rural sector, while, in the advanced countries, 30 per cent or 20 per cent of the working people produce food not only for themselves but also for the other 70 per cent or so. A drastic and quick change, taking out the people from miserable agriculture to industry and the tertiary sector is the second need. Immediate action is necessary here also. A huge industrial investment, with the help of friendly nations and our own savings, is a corollary. Only then the landman ratio will improve and holdings will go up, by the withdrawal of population to industry. Thirdly, the big industries should produce the inputs necessary for agriculture at a cheaper cost. Fourthly, here and now, we should start with big farms of, say, 50 to 100 acres, in the Nagarjunasagar dam area or in the Narmada Valley Scheme and change the very base of our agriculture.

There is no use saying that these are all idealistic, and will involve enormous suffering. No country, even the well placed Europe in the eighteenth and nineteenth centuries advanced without suffering or agony. Sometime or other—earlier the better—drastic remedies must start: otherwise, there appears no way out. The present tinkering and cheap remedies may give a sop to our soul, but will lead to utter waste as already indicated and the country will never improve. If by old-fashioned methods and huge investments, we are not going to improve even 5 per cent of our production, then why waste that money there! We can put it to better use and in other directions.

ANNOUNCEMENT REGARDING THE PROPOSED ISSUE OF CAPITAL

This is NOT a Prospectus. Persons interested in full details may obtain copies of the Prospectus from the Registered Office of the Company or from a Offices of Bankers to the Issue in towns or cities mentioned against each Bank, Managing Brokers, Brokers and Registrars named hereinafter.

SANDOZ (INDIA) LIMITED

(INCORPORATED UNDER THE COMPANIES ACT, 1913)

Registered Office: **3, Wittet Road, Ballard Estate, Bombay, 1**

EXISTING AND PROPOSED ACTIVITIES OF THE COMPANY

Under licence from SANDOZ Limited, Basle, Switzerland, of which it is an affiliate, the Company carries on manufacturing of a wide range of Pharmaceuticals, Dyestuffs, Textile Chemicals, Pesticides, etc. It also manufactures basic Pharmaceutical Chemicals like Calcium Gluconate, Ferrous Gluconate, etc., Optical Whitening Agents known as "Leucophors" and a wide range of Textile Chemicals. Arrangements exist with SANDOZ Limited, Switzerland, for the use of a number of trade marks registered under their name in India. Switzerland, for the use of a number of trade marks registered under their name in India. provided the products meet quality control standards internationally set for SANDOZ products.

The Company commenced manufacturing in 1959 and has expanded the range of the various lines of production mentioned above in general and pharmaceutical products in particular, by virtue of continuous technical assistance and information received from SANDOZ Limited, Switzerland, regarding new processes and products developed by them in their Research Laboratories.

The Company is exporting pharmaceuticals, dyestuffs and textile chemicals to a number of countries and is considering extension of these activities.

The Company is in the process of establishing a modern Dyestuffs Factory and expanding its Agrochemical and Auxiliary Plants. It also has a scheme to start basic manufacture of certain Agrochemicals in the near future. The Dyestuffs manufacturing programme includes a number of dyes for all fields of application and some well introduced specialities for the processing of wool and synthetic fibres. The Dyestuffs Plant will go into full operation in 1965.

LOCATION OF THE FACTORY

The Company's manufacturing plants are located at a distance of 25 miles from Bombay on a 77 acre site at Kolshet, Dist. Thana, Maharashtra State. The new Dyestuffs Plant has also been constructed on the same site.

BOARD OF DIRECTORS

Name and Address	*Description and Occupation*
1. Sir N. RAGHAVAN PILLAI (Chairman). 5, Mansingh Road. New Delhi.	I.C.S. (Retd.) Industrialist. Chairman of Guest, Keen Williams Limited and Borax Morarji Limited. Managing Director of Martin Burn Limited. Director of other companies.
2. Mr. C. M. A. BATHURST .. .. 16, Raja Santosh Road, Alipore, Calcutta.	Industrialist. Chairman & Managing Director of Shaw Wallace & Co., Ltd. Chairman of: The Indian Yeast Co., Ltd. The Tinplate Co. of India Ltd. The Amalgamated Coalfields Ltd. The Pench Valley Coal Co., Ltd. Rewa Coalfields Ltd. Tezpore Tea Co., Ltd. Director of other companies.
3. Dr. C. M. JACOTTET .. .. .. Therwilerstrasse, 34, Reinach, Basle, Switzerland.	Industrialist. Vice-Chairman of the Board of Directors. Managing Director and Member of the Executive Committee of the Board of Management of SANDOZ Limited. Switzerland. Chairman, Vice-Chairman or Director of 30 Affiliates of SANDOZ Limited, Switzerland, in 29 countries.
Dr. J. N. BANERJEE .. .. .. "Rushilla," 17, Carmichael Road, Bombay 26.	Company Executive—Wholetime Alternate Director for Dr. C. M. Jacottet.
4. Dr. A. LOCHER .. .. Auf der Hueb, 5, Binningen, Basle, Switzerland.	Industrialist. Vice-Chairman of the Board of Directors, Managing Director and Member of the Executive Committee of the Board of Management of SANDOZ Limited, Switzerland. Chairman, Vice-Chairman or Director of 17 Affiliates of SANDOZ Limited, Switzerland, in 12 countries.
Dr. H. J. FRANK .. .. .. Brighton No. 2, Nepean Sea Road, Bombay 6.	Company Executive—Wholetime Alternate Director for Dr. A. Locher.
5. Mr. E. MAIER .. .. Sandreuterweg, 16, Riehen, Basle, Switzerland.	Industrialist. Member of the Executive Committee of the Board of Management of SANDOZ Limited, Switzerland. Director of 16 Affiliates of SANDOZ Limited, Switzerland, in 13 countries.
Mr. C. STUDER .. .. Rockdale, 16, Nepean Road, Bombay 6.	Company Executive. Wholetime Alternate Director for Mr. E. Maier.
6. Dr. E. BRETSCHER .. .. .. Buchenstr 29, Oberwil, Basle, Switzerland.	Industrialist. Member of the Board of Management of SANDOZ Limited, Switzerland. Director of 9 Affiliates of SANDOZ Limited, Switzerland, in 7 countries.
7. Dr. J. RENZ .. .. Kirschbluetenweg, 12, Basle, Switzerland.	Industrialist. Member of the Board of Management of SANDOZ Limited, Switzerland. Director of 10 Affiliates of SANDOZ Limited, Switzerland, in 10 countries.
Dr. G. BUSCHAUER .. .. .. B/6, Sandobagh, Old Agra Road, Kolshet, Thana.	Company Executive—Wholetime Alternate Director for Dr. J. Renz.
8. Mr. D. S. PATEL .. .. .. 134, Queen's Road, Bombay 1.	Industrialist. Managing Director of Indian Electro Chemical Ltd. Director of other companies.
9. Mr. T. MANEKLAL .. .. .. Bhaktawar, N. Dabholkar Road, Bombay 6.	Industrialist. Managing Director of S.L.M.-Maneklal Industries Ltd. Director of other companies.
10. Mr. W. STAUFFACHER .. .. Weinbergstrasse, 27, Binningen, Basle, Switzerland.	Industrialist. Member of the Board of Management of SANDOZ Limited, Switzerland. Vice-Chairman or Director of 17 Affiliates of SANDOZ Ltd., Switzerland, in 14 countries.

SHARE CAPITAL

Authorised:		
15,00,000 Equity Shares of Rs. 10/- each..	Rs.	1,50,00,00
5,00,000 Unclassified Shares of Rs. 10/- each	,,	50,00,00
	Rs.	2,00,00,00
Subscribed & Paid-up :		
7,50,000 Equity Shares of Rs. 10/- each, of which 6,64,000 Shares are beneficially held by SANDOZ Ltd., Switzerland	Rs.	75,00,00
Present Issue :		
7,50,000 Equity Shares of Rs. 10/- each	Rs.	75,00,00
Out of the Present Issue :		
(a) 1,00,000 Equity Shares of Rs. 10/- each have been agreed to be subscribed for at par by SANDOZ Ltd., Switzerland and the Company has agreed to allot such shares credited as fully paid-up in consideration for supply of know-how	Rs.	10,00,00
(b) 1,36,000 Equity Shares of Rs. 10/- each have been agreed to be subscribed for at par by and will be allotted to SANDOZ Limited, Switzerland, for cash ..	Rs.	13,60,00
(c) 75,000 Equity Shares of Rs. 10/- each have been agreed to be subscribed for at par and will be allotted to Shaw Wallace & Co., Ltd., for cash	Rs.	7,50,00
(d) 1,39,000 Equity Shares of Rs. 10/- each have been reserved for allotment at par to other existing shareholders, the Directors, Employees, Customers and Friends of the Company for cash	Rs.	13,90,00
(e) **NOW OFFERED AT PAR FOR PUBLIC SUBSCRIPTION:**		
3,00,000 Equity Shares of Rs. 10/- each in terms of this Prospectus payable as follows : Rs. 5/- per share on application. Rs. 5/- per share on allotment	Rs.	30,00,00
	Rs.	75,00,00

THE MORARJEE GOCULDAS SPG. AND WVG. CO. LTD.

CHAIRMAN, MR. GOPIKISAN PIRAMAL SAYS RISING COSTS DEPRESS PROFITS

WORK ON NEW SPINNING MILL PROGRESSING WELL

ADDRESSING the Ninety-third Annual General Meeting of the Morarjee Goculdas Spinning and Weaving Company Limited held at Bombay on Friday, 27th November, 1964, Mr. Gopikisan Piramal, Chairman of the Company, stated that additional costs, resulting from increased prices of cotton and chemicals and enhanced wage rates, had made it difficult for the textile industry to absorb them without an increase in cloth and yarn prices. The multipliers, the Chairman observed, were not conducive to the efficiency of any textile mill in the country and they would bring the cloth prices to most uneconomic levels. On the Company's prospects for the current year, Mr. Piramal said that the year would be one of the strains and stresses as costs of all materials, particularly cotton, were still rising and also it had not been so far possible for the Company to assess the full impact of the statutory controls on prices. The building for the Company's new spinning mill with 45,000 spindles, he said, was the most up-to-date of its kind in India and was nearing completion. He disclosed that machinery had started arriving and that the bulk of erection work would be completed by June 1965.

The following is the text of Mr. Gopikisan Piramal's speech:

GENTLEMEN,

I extend to you all a warm welcome to the ninety-third annual general meeting of your Company.

Pandit Jawaharlal Nehru is no more with us and India will never be the same without him. We place on record here our deep sorrow at Panditji's passing away and at the same time pledge ourselves to carry forward his work and preserve his ideals under the able leadership of our Prime Minister, Mr. Lal Bahadur Shastri.

Coming to the affairs of your Company, I will make no bones in stating that the profit position of the Company has not been as happy as we would all have wished it to be. The factors steadily depressing our profits are those that have been operating over the past several years, viz. the ever-increasing material and labour costs and uneconomic selling prices. There has been no cessation in the increase in prices of stores, colours, chemicals and cotton as also the dearness allowance payable to the workers. The dearness allowance payable to the workers today in the textile industry is about Rs. 120 per month which perhaps is the highest in the country. Further, the industry was also burdened by the increase in employers' contributions to the employees' provident fund from 6¼ per cent to 8 per cent and in the State Insurance contributions payable by the employers from 1¼ per cent to 2½ per cent. The increase in electricity tariff rates also added to the burden on industry. Paid holidays for the workers have been increased by further seven days' privilege leave and five days' casual leave per annum. Prior to this, the workers were entitled to 15 days' holidays with pay only, so these additional holidays have practically doubled the burden of this benefit to workers which is estimated at Rs. 75 per worker per year. The additional cost resulting from all these increases is considerably high and it appears to be difficult for the textile industry to absorb all these additional costs without an increase in cloth and yarn prices. The minimum bonus of 4 per cent on consolidated wages of the workers as suggested by the Bonus Commission and duly accepted by the Government will in fact mean a straight wage increase.

Cotton Prices

Inspite of a bumper crop last year and good expectations this year, cotton prices on an average have gone up by Rs. 100 per candy. Most of the varieties of cotton have pierced the ceiling prices fixed by the Government. Recently the Government has introduced statutory controls with regard to the production of textiles enforcing 45 per cent production in the category of *dhotis, saris*, shirtings and longcloth. They are also introducing controls on drills with effect from 1st December 1964. The multipliers declared initially and hastily revised are not conducive to any textile mill in India. These multipliers will bring the cloth prices to most uneconomic level. Over and above this, the defence supplies are being made by the Company at unremunerative prices. Our contribution for defence is about 25 per cent of our gross sales. No doubt these factors are entirely beyond our control and till reasonable businesslike conditions are restored, it would not be possible to produce consistently a positive result out of a negative situation. However we are doing our utmost at all levels to rectify the abnormal set of circumstances.

You are well aware that the Company is expanding its capacity by installing 45,000 more spindles and modernising its other plant and machinery. The building to house these additional spindles is nearing completion. I may mention that this is an ultra-modern building designed and supervised by Swiss architects and is perhaps the only one of its kind in India. The ring frames on order have started arriving and we hope the installation of the major portion of additional ring frames will be completed before 30th June 1965. This will however depend upon the delivery position of machinery. This new spinning mill when it goes into production, is expected to add considerably to the profits of the Company.

Bank Finance

The expansion as well as rehabilitation programmes have been mostly financed by the Bank and we propose to continue the same. Unless we are prepared to keep the present plant and machinery in proper condition, I am afraid we may not be able to maintain the position we at present hold in the industry.

The working of the mills was to some extent dislocated as our expansion plans were coming to a head. Such dislocation is a concomitant of any development programme and is only a passing phase. After the completion of the new spinning project, the Company has no other expansion plan and it will be our intention and conscientious efforts to consolidate ourselves during the coming years.

You must have observed from the previous balance sheets that the Company has incurred capital expenditure of about Rs. 3 crores during the last five years by way of expansion and renovation. During the current year also the capital expenditure is likely to be of a sizable amount. All these capital expenditures are sure to bring benefits to the Company in the years to come.

On the recommendation of the Bombay Stock Exchange, the Company has discontinued the practice of charging any transfer fees and splitting and consolidation fees for any shares lodged with the Company.

New Equity Shares

During the year under review, the Company had issued 23,000 new equity shares to the existing equity shareholders in the ratio of four new shares for every nine shares held. 22,976 shares were duly allotted before the close of the year leaving a balance of 24 which are under dispute. The new equity shares shall rank *pari passu* with the existing equity shares in all respects from the beginning of the current year.

You must have observed from the Directors' report and the balance sheet that the Company had to provide an additional depreciation for the year ended 30th June 1963 of Rs. 11,52,425 as admissible by the Finance Act 1964 because of depreciation on the third shift equivalent to 50 per cent of the normal depreciation.

I am conscious of the fact that the shareholders would naturally like to know the prospects for the current year. To my mind it will be a year of strains and stresses as cost of all materials, particularly cotton, are still rising. We have also not been able to assess the full impact of statutory controls of prices. Drill, which is a major item of our production, is also being brought under control from 1st December 1964. Taking into account all these factors, we are tiding over the present difficulties and seeking ways and means to recoup the reduced profits of the past years. Let us always keep in mind that the fortunes of a company are not to be judged by singling out the achievement during an individual year but by the overall soundness of the company and the strenuous efforts within the company to overcome all problems of any nature whatsoever.

Finally, I thank you all, my colleagues on the Board, our staff and workers for their unstinted co-operation.

Note:—*This does not purport to be a record of the proceedings of the Annual General Meeting.*

SOVIET GOLD SALES TAPER OFF

INVESTORS' SEARCH FOR BETTER RETURNS

From Our Special Correspondent

SOVIET foreign gold sales are now expected to return to their usual level of between 200 and 250 million dollars a year, after rising as high as 350 million dollars in the first four months of this year. This move—there have been no sales since April—appears to refute the estimate of the United States Central Intelligence Agency (C.I.A.) that Russia's annual gold output is between 150 and 175 million dollars. The C.I.A. figures, published in January, were thought then to have an element of politics in them. Figures just issued by the United States Bureau of Mines, however, estimate that Soviet gold output in 1963 was probably worth between 437.5 and 427 million dollars, both about 2.5 times the C.I.A. figure.

It is known that Soviet sales between 1957 and 1963 reached around 2,000 million dollars and the International Monetary Fund has estimated that Soviet output in that period was about 77.5 million ounces. The difference between this output and the Russian sales abroad, which came to about 58 million ounces, means that total Russian gold reserves rose by about 665 million dollars, which refutes the C.I.A. suggestion that the reserves in fact fell by 1,000 million dollars between 1956 and 1963.

Unless there is another food crisis, Russia is probably unlikely to send gold to the West on such a large scale again. This conclusion is supported by recent Russian policy. Russia is now buying capital goods in the West on long-term credits and does not appear to be seeking to pay cash for goods as she did with food. The probability is that she wants to build up her reserves again.

Share-buying Across Frontiers

British and West European private investors have lately increased their buying and selling of securities in foreign companies substantially. The relative supply of overseas shares available in London and other European domestic stock markets is still relatively limited, but the growth in demand has caught the attention of brokerage firms in the foreign countries concerned. As a result, there are indications that such firms, American and Japanese ones in particular, may be expanding or initiating direct dealing in Britain and on the Continent, where this is legally permissible. If so, however, they will face strong preference in many areas for traditional dealing through local institutions.

The new interest in foreign securities has pushed up total international portfolio borrowing in London and at Continental centres from an annual rate of £125 million in 1962 to about £357 million a year now, on the basis of latest available information. Behind the movement are such psychological factors as European buyers' desire to hedge against future economic and political developments in the resident country—the discouraging effect on domestic investment in equities or debentures of legal and financial restrictions in some countries; and Europe's new affluence.

But another view of the increase in international investment is that it has in part been spurred by the small-population countries needing outside capital for development needs which exceed their own resources. Another contributory source has been demand from countries, developing or otherwise, which lack funds because their machinery for channelling savings into economic development is inefficient or non-existent.

Many overseas investment opportunities seem to look more promising to the European buyer than those in his own country, in spite of the extra charges such transactions at present involve. Many Continental economies have small, rigidly organised and legally restricted capital markets.

In West Germany, it is considered that only about 20 out of 700 quoted shares can be dealt in at substantial levels without upsetting stock exchange prices. Swiss shares often cost several thousand francs each and average yields are low. In France, low yields are considered to be depressing investment for income. Italy's credit restrictions and controversial withholding tax on investment income, with similar factors, are said to be encouraging foreign securities buying with smuggled funds.

Dutch stock exchanges are believed to be doing a large amount of international business, but local flotations are limited by the small size of the domestic market and the degree to which it comes under strict official surveillance. Belgium's capital market is considered to be virtually pre-empted by public authorities and large institutional trading interests.

Dealing in foreign securities, however, is made costly by the fact that, generally, the European investor must pay two brokerage commissions: that of his local bank or broker acting for him and that of the agent at source supplying the desired security. Even where foreign brokers can deal directly in the buyer's own country, this does not necessarily rule out the possibility of the second commission being included in the net local or acquirement price of the security.

Barring special exceptions under the rules of individual exchanges or permissible private arrangements, double commission charges are more or less general on international security transactions. Local exceptions are often like the informal custom reported by a London broker in which some Belgian banks, at their own discretion may return 25 per cent of the Belgian commission to the British investor in Belgian shares.

On the other hand, there is little prospect that the higher charges involved in international security dealings will soon be lowered. International policies on the matter are lacking. No European Common Market agreement to rule on this aspect of investment business is foreseen at the moment. And direct dealing, a possible basis for changing the double commission system, is banned in Switzerland, West Germany and Belgium.

In addition, direct dealing seems likely to continue to be challenged by local preferences based on both custom and technical advantages. Not only is the investor-broker relationship often a long-standing one of mutual trust; but the native broker in many cases can fulfil orders in either of two markets, wherever the better price is available—his own and that of the country in which the security is issued initially.

Rising Cost of Expense Account Living

New York emerges as the most expensive city for a visiting businessman. Not far behind are Helsinki, Stockholm, Paris and London. The least expensive city is Lisbon, with Oslo and Athens at roughly the same level. Because the index in the adjoining box ignores a number of factors which should properly be included to obtain truly comparable figures, it cannot do more than offer a rough and ready indication of where costs are highest and where they are lowest. The index, compared with the 1963 figures, offers evidence that, over the past year, costs have been rising almost everywhere. Italy seems to have recorded the biggest increase—20 per cent. Dublin records a nine per cent increase in a year (in which there has been increased taxation at retail level); Oslo's increase is seven per cent. Smaller increases are indicated from West Germany and Sweden. Athens records little change.

Expense account living is not quite as common as one might expect to find in any city where business is done. In New York, for example, expense account living is somewhat curtailed by stringent tax rules requiring detailed accounts of the "business" discussed during the meals. Stockholm imposes a Government restriction of 35*s.* each for lunch. Dutch tax inspectors are a good deal less indulgent than their British counterparts but Britain's new Labour Government has promised legislation to restrict expense account spending. Building programmes in various countries are having an impact on rents. In Dublin, the first block of luxury appartments is going up and rents there are expected to be of about £1,500 a year. But in Dusseldorf, following a heavy programme, furnished flats are available for £45 a month. Building appears to be active everywhere.

Visitors' Cost of Living

City	*(a)*	*(b)*	*City*	*(a)*	*(b)*
New York ..	156	100	Vienna ..	91	59
Helsinki ..	134	86	Dusseldorf ..	91	58
Paris ..	131	84	Dublin ..	80	51
Stockholm ..	131	84	Oslo ..	71	46
London ..	119	77	Athens ..	71	45
Rome ..	98	63	The Hague ..	70	45
Cairo ..	97	62	Lisbon ..	63	41
Brussels ..	96	61			

(*a*) Total cost of living expressed as a percentage of average living cost in all 15 cities listed.

(*b*) Cost of living as percentage of cost in New York City.

Any comparison between living costs in a number of major cities is necessarily a rough one. The indices in the table accompanying this article are based, however, on the costs a visiting businessman might incur.

These costs include the price of a night in a de luxe hotel, a night in a medium-priced hotel, a lunch for two, an evening out for four, the monthly rent of a furnished flat, clothes, services, car hire, cigarettes and a "basket of food"—including among other items, steak, a medium-sized chicken, six fresh eggs, potatoes, rice and butter.

The index is, therefore, not intended as a guide to the kind of living costs applicable to a resident, with his own unfurnished house or flat and not having to incur the kind of expenses that a visitor would have to face.

New York is, perhaps, the most expensive for a visitor seeking entertainment. Black market prices for "hit" shows in New York range up to £20 a seat. In Lisbon, by contrast, a businessman can drink local sweet "champagne" for 25*s.* a bottle and, while he is drinking it, watch a floor show in a night club. But "respectable Portuguese" would take their wives only to a limited number of night clubs in the capital. In these, French champagne is served, costing at least £5 a bottle.

Swiss Steps up Inflation Fight

Switzerland, the home of sound money has been having trouble over inflation and looks like having to increase the squeeze still further to overcome it. An action programme, now nine months old, has slowed the rate of increase in prices but not halted the rise. Early this year and last year the cost of living rose at an annual rate of five per cent; this has now been cut back to 2.5 per cent. This progress is insufficient to relax the emergency measures taken in March and the Government is now faced with the problem of introducing supplementary measures at a time when it had hoped to be abandoning restraints altogether.

The next measures will probably be longer-term ones than those already introduced, which include building controls, credit restrictions and a check on the number of foreign workers allowed into the country. It is thought that the new measures will involve some control over consumer purchasing, extention of the powers of the National Bank to move interest rates and the liquidity ratio of the commercial banks, stricter enforcement of anti-trust regulations; and steps to rationalise industry.

The industry most needing rationalisation is the one that has benefited most from the broom-building. Obsolete methods are said to be still bringing in considerable profits, but prices are rising faster than costs despite the building controls. In order to institute the necessary long-term measures, the Government will have to go carefully, it is thought, since Swiss businessmen are considered in many ways to be among the world's most conservative. Yet the Government needs their confidence to implement its plans.

Widening E.F.T.A.'s Boundaries

If the Kennedy Round talks on tariff cutting break down the United States and Canada may join the European Free Trade Association in creating a new, wider free-trade area. Private talks are already thought to have started on how to overcome the possibilities of failure through Common Market obstructions. Both Britain and the United States are seriously concerned at the attitude taken by France and are believed to be considering alternative steps. In the event of failure, a preferential area is envisaged as a first step. Because of the General Agreement on Tariffs and Trade this would have to be expanded into a free-trade area.

Such a move is seen as a logical step. With the Six building an impenetrable barrier round Europe's bigger industrial market closer ties between the north Americans and the Outer Seven might become imperative. Inclusion of other industrial countries, such as Australia, Japan and India might also be considered, it is thought.

Inside the Common Market, the development of a wider Atlantic economic community might appear as a serious and not altogether satisfactory prospect. It would probably be thought that this would reduce the number of countries wishing to have some sort of link with the Six and might even undermine its rate of economic growth.

From the Common Market's point of view, the danger could be that countries outside the Six that do not want to link their political policies with each other might be thrown into economic dependence on each other. The Six would then have to decide whether to go ahead in political and economic unification in spite of the moves being taken in the outside world or whether to temporise on some of the political aspirations in order to maintain links with the wider community.

Too Little Liquidity in Sweden

A sign that Sweden's exports may be levelling off came with the August trade figures, which showed a distinct reaction after a steep rise this year. One month may be too soon to judge future trends accurately but most experts have for some time forecast an end-year falling-off. Swedish export industries are thought to have reached the limit of their capacity and foreign demand seems to be tapering off. Selling will therefore become increasingly difficult.

Among the industries especially hard hit are thought to be timber, pulp, paper, iron ore and steel, where there has been a lot of restocking. Britain's 15 per cent import surcharge will also hit the economy for Sweden sent 13.5 per cent of her exports to Britain last year. In some sectors the share was much higher: of Sweden's exports of butter and eggs 34.3 per cent went to Britain, of pulp 27.5 per cent and of iron ore 22.9 per cent.

The outlook for the engineering industry runs counter to that for the rest of the economy: demand is likely to remain strong from West Germany and other major buyers of Swedish produce. The industry is tied closely to the engineering boom in the rest of Europe and this is thought unlikely to peter out for some time.

The commercial banks of Sweden are being pressed hard on their liquidity ratios since they have no great source of Treasury Bills. Money has been in considerably short supply—at the start of September commercial bank borrowing from the Central Bank was three times higher than a year ago—and it is believed that a rise in Bank rate may be on the way, even though at five per cent it is still among the highest in continental Europe. The gold reserves have been unchanged this year but the holdings of foreign securities have increased by about four per cent and the total gold and currency reserves has risen slightly.

Danes Win in Bacon Talks with U.K.

Danish bacon producers are breathing more freely following what seems to have been a triumph for their views in closed-door talks with the British in Copenhagen. In meetings with representatives of the Danish Government, farm organisations and the bacon industry, British Ministry of Agriculture officials passed on British producers' demand to have a bigger share of their own market. But Danish sources said later that the British representatives were impressed both by Denmark's likely difficulties in other agricultural markets and by the probability that Denmark will have over 17 per cent more bacon to sell abroad next year. As a result, Britain is thought unlikely to move formally to reduce Denmark's dominant share of the British bacon market next year. An added factor is believed to be the anxiety of Britain's Labour Government to minimise the effect on Denmark and her other partners in the European Free Trade Association of its 15 per cent import tariff surcharge imposed last month on most industrial goods.

Under the Bacon Market Sharing Agreement which came into effect on April 1, British producers are permitted a 36.5 per cent share of the domestic market, Poland eigth per cent, Ireland 4.5 per cent and other marginal exporters four per cent. Denmark took the biggest single share, 47 per cent. Danish agricultural exports account for nearly 50 per cent of Denmark's world exports. But in the British market about four-fifths of Danish sales—£132 million out of £165 million last year—are of farm and food products. Of total exports to the British market, bacon has in the past year or so consistently accounted for more than 45 per cent. Denmark has been able, in fact, to ship somewhat more than quota amounts under the Sharing Scheme, and this tendency has lately increased. Nonetheless Danish bacon has been able to maintain its position as the most expensive in the British market, mainly because of the Danes' success in promoting a brand image and imposing stringent quality control.

More for Less (Except Cost) on Austria's Farms

As a result of unprecedented structural changes, Austria has lost nearly 20 per cent of its agricultural labour force but increased farm output by 35 per cent in the last decade. This is shown in a survey by the Creditanstalt—Bankverein, which points out, however, that Australian farm costs are now outpacing farmers' income to a disturbing extent. It estimates gross agricultural proceeds in 1963 to have been 10.9 per cent higher than in 1958, but operating expenditure went up by 19.3 per cent between the same two years.

The loss of some 250,000 farmworkers through a labour drift into industry and other urban occupations, and through earlier retirement, has meant an increase in Austrian agricultural productivity by something like 70 per cent since 1952. The actual net increase in farm output, of some 35 per cent over a little more than a decade, permits Austria to grow about 82 per cent of her food requirements now, compared with 72 per cent just before World War II.

Another result of the expansion is that land-based industries (agriculture and forestry together) have now ousted iron and steel as Austria's second most important export activity after engineering.

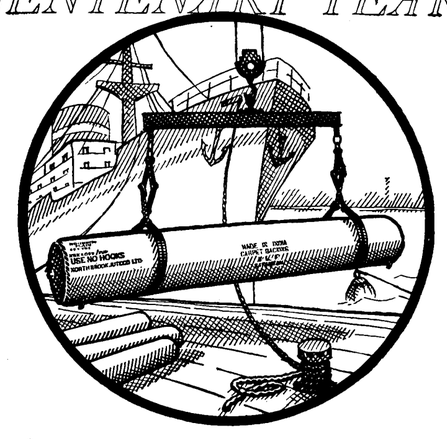
Topical Briefs

The once-flourishing motor industry of *Italy* is still in a state of intense gloom. Although the economic crisis which was responsible for severe measures being imposed on the industry is now easing, the car firms see no quick solution to their problems. Production and sales have been falling for the last six or seven months; imported car registrations have fallen even more catastrophically. The drop started in April and by August the figure was 59 per cent below that of August, 1963. Throughout northern Italy the threat of unemployment or short-time working hangs over the heads of thousands of motor workers—and not only those producing the cars. All the suppliers of components are equally affected. Fiat is to close down between 20th December and 10th January and many of its suppliers wonder how they can continue with a full pay-roll once the major purchaser has stopped buying. Since Fiat dominates the Italian motor industry everyone connected with the trade is waiting apprehensively for the next blow.

With the coming of commercial television to the *Netherlands*, Belgium will soon be the only Common Market country without it. Dutch commercial television is expected to be in operation early in the New Year at the latest, despite continuing controversy over its introduction. Elsewhere, it is becoming increasingly important. In Germany the two commercial channels raise half their revenue from advertisements. Italy introduced advertising on TV in 1957 and extended it with the opening of a second channel three years ago, though advertising material cannot occupy more than five per cent of transmission time. French advertising is limited to economic organisations and sectors whose promotion is considered to be in the national interest—the State savings bank, the national lottery, the coffee industry, for instance. This limitation on advertising is worrying some people in the Community. They argue that its aim is to build a competitive society and that this is incompatible with restrictions on television advertising. It is thought to give some industries or sectors an unfair advantage.

The merchant fleet of *Norway*, third largest in the world, is undergoing radical structural changes. Burdened by high domestic taxes and facing the competition abroad of flags of convenience, Norwegian shipowners are fighting back by offering more modern facilities than their competitors. Norway's fleet is probably already the most modern and up-to-date in the world and the Norwegians are constantly trying to improve it. The country has nearly five million tons of shipping on order, most of it large bulk carriers or tankers. To avoid a glut of shipping the owners are selling off the small tankers and general duty cargo ships. On average, the ships sold over the past 18 months have been under half the size of those delivered. Yet these ship sold have not all been old boats; only one out of every five was built before the war; half the tonnage sold was built between 1948 and 1953. Example of Norwegian enterprise is the way in which a Norwegian group took over the Southampton-Cherbourg and Le Havre car crossing this year after British Railways had closed down a similar link as being uneconomic.

BIRD'S CENTENARY YEAR



OUT-GOING JUTE AND IN-COMING DOLLARS

A boost in exports means increased foreign exchange—today's prime need. Among exports jute is of top priority. The Bird-Heilgers Group's export of jute goods in the last year increased to nearly Rs.10 crores—a significant part of the country's foreign exchange earnings.

Deploying the skills acquired over a hundred years, the Bird-Heilgers Group is making important contributions to the economy.

NEW PUBLICATIONS

Aspects of Economic Development and Policy. By B. K. Madan. Published by Allied Publishers Private Ltd. Pages: 363. Price : Rs. 22.50.

IT is more than a decade since India has been engaged in a war against poverty. The country is trying to get out of the rut of economic stagnation with a view to entering into the cumulative process of growth. The problems of development and growth have, therefore, been at the centre of discussion in India since the commencement of planning within a democratic framework. It is only too well known that, in this crusade, India has been experiencing formidable, if not insurmountable, problems. The book under review, as the title itself explains, is concerned with such problems of development.

It is a collection of author's articles and addresses on varied themes, covering a period of nearly three decades. The problems dealt with by him are indeed varied, and they "range over an extensive field, from problems of the agricultural economy and Indian Five-year Plans to questions of the monetary framework for a developing economy and of international liquidity." Yet one can find the "unifying link" among the various contributions which bear the imprint of the author's scholarship and deep insight into the problems. The problem of development analysed in this volume are divided into three parts; part one deals with the problems of planning and economic policy whereas the other two are concerned with monetary and banking policy and international economic policy.

Amongst ten essays contained in the first art dealing with planning and policy, three says entitled "Problems of Agricultural Economic Policy." Some Aspects of the Problem of rice Policy for Economic Development" and Some observations on the Essentials of a Price olicy for Foodgrains in India" are very interesting and illuminating. Besides, they have a great ignificance to planners in India at the present uncture when they are discussing the size and tructure of the fourth Plan in the alarming situation of rising prices of foodgrains in the closing ears of the third Plan. In these essays, the uthor rightly emphasises the important and trategic role of agriculture in the development rogramme and propagates a sound price policy or agriculture. In his own words, "the main lements of price policy for foodgrains comprise a uarantee of prices for principal foodgrains, with heir main grades, which carries an assurance to he cultivator, particularly in surplus tracts, of easonable return on his investment and, therefore, furnishes an incentive to, and basis for, a rogressive agriculture; a flexible release price or buffer stocks to make supplies available to he consumer at prices which are reasonable and an be sustained with the resources at the disposal of the buffer stock authority; reliance on effective enforcement of the price policies determined, rather than on price fixation as such, or on legislative or executive fiat; consistency of food price policy with general economic policies which alone can make for stability with development; emphasis on growth of production as the answer to the problem of food price policy and harmonisation of growth in food production with increase in agricultural production as a whole" (page 135).

The predominant theme that underlies all essays in part two is "the need for safeguarding the framework of financial and price stability for economic development." In his classic essay on "Monetary Policy and Economic Development," the author aptly puts in the proper perspective the developmental and regulatory functions of the Central Bank in a developing economy. Over and above the traditional regulatory functions, the author stresses the need for promotional and developmental role of the central banking policy. "Monetary policy for a developing economy has to be conceived in terms of preserving a reasonable basis of stability through the adjustment of regulatory devices even while expanding the area of operation of the money and banking sectors and continuing to build up a financial infrastructure for growth." As such, the essays in the second part, such as "Monetary Policy and Economic Development," "the Problem of Inflation," "Banking and Economic Development" and, lastly, "Bank Credit Requirement," "Bank Resources and Money Supply during the third Plan period" are very interesting.

The problem of economic development is viewed in the international context in the third part. The author throws light on the significant role of foreign aid, foreign investment and growth of foreign trade. "Of the specific international aspects of the problem, the export lag and the declining terms of trade of developing countries and the obstacles to access of the products of developing economies to the markets of the advanced countries remain besetting handicaps. The lowering of barriers to exports of less-developed economies has to be accomplished without uniform insistence on reciprocal treatment by them. The problems of foreign aid have to be viewed in the context of the magnitude of the development task in respect of developing economies, and the extent and forms of foreign aid and foreign assistance have to be adapted accordingly. Further, a significant international aspect of self-help by the developing countries relates to the role of concerted and co-operative endeavour by them in accelerating their pace of growth by enlarging their intra-group trade; growth through trade requires to be deliberately initiated" (page 319).

The complex problem of economic growth has thus been viewed in its various facets. Though the book does not propound a theory of economic growth which, obviously, is not the objective of the author, it certainly unfolds the author's coherent and cogent ideas on economic development. As such, it does contribute to the development of economic thought.

Labour Law and Practice. By G. L. Kothari. Published by N. M. Tripathi Private Ltd., Princess Street, Bombay-2. Pages: 11,106. Price: Rs. 40.

Mr. Kothari has brought to bear on this book his rich experience at the Bar, as well as on the Bench. It is one of the comprehensive and exhaustive books on the subject. The book is full of quotations from the resolutions in the International Labour Organisation, from eminent authors like Willyard Wirz, William C. Robinson and Hon'ble Mr. Arthur T. Vanderbilt, and from the important decisions of the Supreme Court and High Courts.

Part I of the book consists of principles of practice on the labour side, social justice and adjudication in India, common law of master and servant, basic concepts of employment and industrial disputes, collective bargaining, principles of industrial adjudication, drafting and preparation of collective bargaining agreements, contract provisions and plans, industrial welfare and plans and schemes, pleadings and forms under various labour laws, principles of practice and forms regarding disciplinary matters in public and private employment, and writs and forms relating to writs. The modern ideas that the author has introduced in the book in the form of precedents, plans, schemes and guidance in drafting agreements are quite useful to a raw labour practitioner, labour adviser and persons entering the industrial field as employers.

Part II deals with statutory laws, rules and regulations regarding labour practice in India. This part consists of the Industrial Disputes Act, Rules framed by the Central Government, procedural Rules of the Tribunals, the Bombay Industrial Relations Act and Rules, the Bombay Wage Board Rules, Industrial Court regulations and Labour Court practice and procedure rules. The enactments in Gujarat and Madhya Pradesh which are based on the Bombay Act are also included. The U.P. Industrial Disputes Act is also included in the book.

The commentary in Part I consists of case law on the subject. The Industrial Disputes Act contains, immediately after each section, the amendments introduced by the various States, so that the book may be useful from the all-India point of view. However, the author could have made the book much more useful by giving reference to relevant cases under various sections. For instance, there is enough case law on Sections 10, 18, 25 A to G, Sections 33 and 36 of the Industrial Disputes Act.

The chapter on drafting industrial agreements gives, in addition to principles on which the draft should be prepared, specific agreements that prevail or prevailed between the various employers and unions. A model gratuity scheme is supported by gratuity schemes from Calico Mills, Larsen and Toubro and Awards in respect of gratuity from Shaparia Dock and Steel Company Ltd. and Spencer and Company. A model rationalisation agreement for employers, showing how lay-off is to be effected, is also given in detail as guidance to employers and welfare officers.

The Government should consider how many of these labour enactments could be consolidated for the benefit of citizens. The number of enactments and rules, notifications and orders under the various enactments, by themselves, could form a code. Added to the Central enactments are the State laws framed under the Concurrent powers in the Constitution of India. The Industrial Disputes Act has been duplicated by the Bombay Industrial Relations Act, the U.P. Industrial Disputes Act and the Central Provinces Act. These duplications could well have been avoided.

The Estate Duty Act. Nanavati (Second Edition.) Published by N. M. Tripathi Private Ltd., Princess Street, Bombay-2. Pages : 640. Price : Rs. 30.

The need for a careful study of the Estate Duty branch of the tax laws in our country has increased due to the lowering of the exemption limit from Rs. one lakh to Rs. 50,000. With the advent of the Wealth Tax Act, the Government must be in a position to estimate the number of citizens likely to be affected by this enactment. Of course, the difficulty will be in finding the number of citizens falling in the category between Rs. 50,000 and Rs. one lakh. This number, covering the upper middle class, must be quite a sizable one. Though there has been a hue and cry about the increased tax measures and the frequent changes in the Finance Acts, the middle class which would be largely affected by the Estate Duty Act, has not cared to do anything about it. To some extent, it is for the Press to bring such an important piece of legislation to the attention of the middle class. It is, therefore, necessary to encourage its study and give prominence to the case law on the subject and to the Government notifications and orders issued from time to time.

Mr. Nanavati's book is today one of the best treatises and the only one brought up-to-date. The ordinary middle class citizen stands to gain by it inasmuch as the commentary is written on topic basis, instead of in the traditional legal commentary style meant essentially for professionals. This edition is necessitated by the number of amendments introduced by the Finance Act 1964 and by the important decisions on the various provisions both in India and in the U.K. from which India has borrowed the basis and most of the provisions of its enactment.

The author has pointed out how the decision of the Privy Council in the case of *Chick* vs. *Commissioner of Stamp Duties* for New South Wales is important to us. However, it is gratifying to note that our Courts do not just follow the cases decided in England, as will be evident from the decision of the Assam High Court in the case of *Controller of Estate Duty, Assam* vs. *Birendra Kumar Sen*, which distinguished the said Chick's case and followed the decision of the Privy Council in another case. However, it is worth watching how far the Courts and the Government will consider the said decision in Chick's case applicable. In Chick's case, incidentally, the deceased had gifted the property which belonged to him and then remained in possession of the said property in his capacity as a rent-paying tenant. The Privy Council held that the donor had not parted with the control of the property and hence the estate of the donor was liable to pay death duty in respect of the said property also.

The Law of Industrial Disputes in India. By R. F. Rustamji. 2nd Revised Edition. Published by Asia Publishing House, Ballard Estate, Bombay-1. Pages : 878. Price : Rs. 45.

The Industrial Disputes Act 1947 has been in force in the country for the past 17 years. Some of the States have their own laws applicable to all the industries or some of the industries. The Act has definitely strengthened the trade union movement. There is now definitely a sort of pressure sought to be exercised by the trade unions, with the active support of the State Governments concerned, on the employers to yield to their demands, especially the ones relating to bonus. It is true that the employers must grant a bonus to their workmen voluntarily as the wages have not attained the character of living wages and there has been a big rise in the cost of living. But the Government's attempt to bypass the industrial machinery for arriving at a settlement on bonus matters every year is not conducive to the maintenance of the Rule of Law. To some extent, of course, the industrial adjudication machinery must also be blamed for the delay in disposal of disputes referred to them. The Supreme Court, incidentally, has rendered a signal service in the development of this branch of law. It has really applied the principles of equity, instead of merely following the strict rules of law.

The law has grown so much that a busy lawyer, or an employer, or a trade unionist requires a good commentary on the Industrial Disputes Act. Rustamji's revised second edition, published very recently, is a good reference book on the subject. The commentary is written on the basis of the sections in the Act. The first 134 pages of the book have been devoted to a discussion of important issues like social justice, collective bargaining, dangers of individual discretion, principles of natural justice in India, etc. The commentary begins thereafter. The author has done well in quoting relevant passages from the various decisions. Important sections like Sections 10, 25 A to G, Sections 33, 33 A to C and 36 have been properly commented on, with the latest case law on the subject.

The book could have devoted separate chapters to bonus, wages, disciplinary action, gratuity schemes, as these are some of the important subjects which employers, lawyers, practitioners and trade unionists have to deal with. Nevertheless, it is, on the whole a good commentary on the Act.

Direct Tax Laws—1964-65. By Dastur, Damania and Dastur. Published by N. M. Tripathi Private Ltd., Princess Street, Bombay-2. Pages : 680. Price : Rs. 20.

This book has been edited on the lines of the Finance Act. The need for a book of this nature has been a long-felt one. The book gives all the direct taxes in one volume. The amendments to the various tax laws have been incorporated in the original enactments and shown in italics. To a busy practitioner this is a boon. The authors have provided a brief commentary, wherever essential, with the case law on the subject. Commentary is also to be found on the recent amendments. A special and valuable feature of this book is that, in addition to the commentary on the provisions of the Finance Act, the authors have explained the rates on the various taxes with simple illustrations. This book, of course, is not a treatise. But it is a handy one, providing in a nutshell the essentials of a good commentary useful for lawyers, accountants, corporations, businessmen and even tax-gatherers.

Indian Income-tax Law and Practice. By Sukumar Bhattacharya. Published by Nababharat Publishers, 72, Mahatma Gandhi Road, Calcutta-9. Pages : 480. Price not mentioned.

This book is a commentary on the Income-tax Act 1961, as amended by the Finance Act prior to the one in 1964. The author has also included a commentary on the Wealth Tax Act, Gift Tax Act, Super Profits Tax and the Compulsory Deposit Scheme.

The book has been written on the basis of the various topics in the tax laws. The author has also provided illustrations to explain the various provisions, wherever necessary. The book is mainly written for the benefit of beginners, students studying for commerce and departmental examinations. All that the author has to do is to bring it up-to-date for including the recent amendments and the pending Bills before Parliament.

No textbook on any law in the country and, especially, on the tax enactments could remain up-to-date due to the spate of amendments introduced day in and day out. It is highly necessary that the principle that ignorance of law is no excuse should be changed or altered in the circumstances stated above. The jurists and the Courts in the country must consider the issue when it arises before them.

ANNOUNCEMENT REGARDING THE PROPOSED ISSUE OF CAPITAL

THIS IS ONLY AN ANNOUNCEMENT AND NOT A PROSPECTUS AND PERSONS INTERESTED ARE REQUESTED TO APPLY FOR A COPY OF THE PROSPECTUS FOR FULL DETAILS.

INTERNATIONAL TRACTOR COMPANY OF INDIA LIMITED

Registered Office: Gateway Building, Apollo Bunder, Bombay 1

EXISTING AND PROPOSED ACTIVITIES

The Company has been promoted jointly by Mahindra & Mahindra Limited, Voltas Limited and International Harvester Company, Chicago, U.S.A. with the immediate object of manufacturing and marketing agricultural tractors, implements and allied attachments and spare parts, thereof. The Company holds Industrial Licences Nos. (i) L/10-1/N-6/59 dated 2-9-1959 and (ii) L/10(1)/4/60-A.E.I. dated 15-6-1960, for manufacture of 3,500 tractors and matching implements per annum on single shift basis.

The Company holds Import Licence for Rs. 92,70,000/- C.I.F., for import of machinery. Orders for machinery have been placed with suppliers abroad.

The Company has received import licences for Tractor components valued at Rs. 30,00,000/-. Production will commence early in 1965.

LOCATION

Factory buildings are nearing completion on approximately 38 acre site at Akurli Village, Kandivli, near Bombay.

BOARD OF DIRECTORS

1. Mr. Keshub Mahindra (*Chairman*), Indian, 45, Nepean Sea Road, Bombay 6. — Industrialist. *Chairman:* Mahindra & Mahindra Ltd., Mahindra Owen Limited, Dr. Beck & Co. (India) Ltd., Turner Hoare & Co., Ltd., and others. *Director:* Kaiser Jeep International Corporation, U.S.A., Union Carbide India Ltd., Coat Tyres of India Ltd., Reserve Bank of India, Western Area Local Board, Machinery Manufacturers Corpn. Ltd., Mysore Cements Limited, Otis Elevator Co. (India) Ltd. and others.
2. Mr. Brooks McCormick, American, 1530 North State Street, Chicago, Illinois, U.S.A. — *Executive Vice President:* International Harvester Co., Chicago, U.S.A. *Director:* International Harvester Co. of Canada Ltd., International Harvester Export Company, Chicago, U.S.A., First National Bank of Chicago, U.S.A. and others.
3. Mr. Rustom Furdoonji Sorabji Talyarkhan, Indian, Lyndewode House, Cumballa Hill, Bombay 26. — *Managing Director:* Voltas Limited. *Director:* Roche Products Ltd., Scottish Indian Machine Tools Ltd. and others.
4. Mr. Harish Chandra Mahindra, Indian, 65, Nepean Sea Road, Bombay 6. — Industrialist. *Chairman:* Mahindra Ugine Steel Co., Ltd., Press Syndicate Ltd., Indian & Eastern Engineer Co., Ltd., Mapa Tools Pvt. Ltd. and others. *Executive Director:* Mahindra & Mahindra Ltd. *Director:* Electro Equipment Corporation Ltd., Turner Hoare & Co., Ltd. and others.
5. Mr. Jack L. Camp, American, 2440 N. Lakeview, Chicago, Illinois, U.S.A. — *Vice President:* International Harvester Co., Chicago, U.S.A. *Director:* International Harvester Export Co., International Harvester Co. of Great Britain Ltd., International Harvester Co. of Australia Pvt. Ltd. and others.
6. Mr. Adal Bomanji Parakh, Indian, Kashmir House, 94, Nepean Sea Road, Bombay 6. — *Jt. Managing Director (Mfg. & Dev.)* Voltas Limited. *Director:* Scottish Indian Machine Tools Ltd., Tata-Merlin & Gerin Ltd., Indian Roads & Transport Development Association and others.
7. Mr. Paruthiparambil Cheryan Cheryan, Indian, Kum-Kum, 50-A, Peddar Road, Bombay 26. — *Technical Director & General Manager (Engg.)* Voltas Limited. *Director:* Scottish Indian Machine Tools Ltd., Tata-Merlin & Gerin Ltd., Lakshmi Machine Works Ltd. and others.
8. Mr. Ivan James Syer, Australian, Hotel Ambassador, Bombay. — *Technical Representative in India of:* International Harvester Co., Chicago.
9. Mr. Bhalchandra Ramchandra Sule, Indian, Daisylea, Off Mount Pleasant Road, Bombay 6. — *Chairman:* Indian Liggett Co., Ltd. *Director:* Mahindra Van Wijk & Visser Pvt. Ltd. and others. *Chief Engineer:* Mahindra & Mahindra Ltd.

ALTERNATE DIRECTORS :

10. Mr. Shantaram Yeshwant Rege, Indian, (Alternate Director to Mr. Brooks McCormick), Godawari Niwas, Gamdevi, Near Kennedy Bridge, Bombay 7. — *Director:* Sandvik Asia Limited, British Drug Houses (India) Limited, The British Steel Piling Co. (India) Pvt. Ltd., Adrema of India Ltd. and others.
11. Mr. Michael Henry Desmond Collin, English, (Alternate Director to Mr. Jack L. Camp) 3rd floor, "Belmont", Nepean Sea Road, Bombay 6. — *Technical Representative in India of:* International Harvester Export Company, Chicago, U.S.A.

SECRETARIES & TREASURERS

Mahindra & Mahindra Ltd., with the approval of the Central Government have been appointed Secretaries and Treasurers of the Company for a period of 10 years with effect from 21-6-1963.

SHARE CAPITAL

		Rs.
A.	**Authorised Capital :**	
	40,00,000 equity shares of Rs. 10/- each	4,00,00,000
B.	**Issued Capital :**	
	15,00,000 equity shares of Rs. 10/- each	1,50,00,000

ROLE OF FORESTRY IN PAPER INDUSTRY

NEED FOR RAISING PRODUCTIVITY URGENT

By P. M. Taggarse

Superintendent of Plantations, West Coast Paper Mills Ltd., Dandeli

WITH the rapid industrialisation and the standard of living going up, India is now facing an acute shortage of raw materials in all spheres. Particularly so is the paper and pulp industry. The problem that now confronts the planners as well as the executioners is how best and soon could this shortage be mitigated. Unlike other industries or agriculture, wood-based industries have to depend upon long-term programmes for the raw materials, the main resources of which are from forests, and the majority of the forest areas in India are owned by the State Governments. Therefore, the consumers and the producers are to plan out on a mutual understanding and solve the problem of supplies in a co-ordinated manner and so manage the forests as to aim at a regular and perpetual productivity of suitable raw material.

India has 24 per cent of the land under forest, as against the world average of 33 per cent. Our national forest policy has also laid down that at least one-third of the land should be under forests. With even 28 per cent of the land under forests, the annual increment, that is the yearly output, is 0.5 cubic metre per hectare, as against the world average of 2.0 cubic metres per hectare. This means that, with the existing conditions of the forests, we may require four times the land area under forest. This is asking for the impossible. Therefore, in the existing forest areas, we have to strive and achieve a higher productivity by improving the existing condition of the forests. Unfortunately for us, the Indian forests, mostly classified as the tropical forests, consist of ever so many species most of which are considered unsuitable or uneconomic for any important industrial use. At present, the *per capita* consumption of industrial wood in India is 2.0 cubic metres per 100 persons. This forms 9 per cent of industrial wood to the total wood production. The world average is about 40 cubic metres.

Progress in Technology

In recent years, India has made good progress in technology in respect of wood-pulp, and other wood-based industries. This has made industrially acceptable woods of species which were so far considered unsuitable. More technological progress is expected in this field and it may be possible to consume more of such species which are now considered useless for the purpose. Whatever it is, the requirements of raw materials for the wood based industries are expected to touch a high line by 1975, and doubtless the industry would face shortages. Particularly the plight of the paper and pulp industry, which has to depend upon long-fibred raw materials, is very difficult. The tropical broad-leaved species are mostly short-fibred which are not quite suitable for the purpose. The only long-fibred material so far available is from bamboo and grass of some species only. This is evidently in short supply. The tropical climate in the majority of the Indian States does not permit the cultivation of pines, etc., which are of the temperate climates or higher elevations. Besides, the tropical forests do not produce any of the short-fibred species in a single crop, which makes the use of mixed short-fibre woods still more difficult in the pulp industry.

Viewed from all these shortcomings, the problem that poses before us is how best we could surmount this ticklish issue and that too in as short a period as possible. Unless this is critically analysed, studied and ways and means found out, the future poses a problem so bleak and unsteady. Unfortunately for us, the forests, unlike in many other countries, is a State subject where the Central Government cannot pursue a policy of its own to iron out the shortcomings and take suitable measures. It is always in an advisory capacity that the Centre formulates a policy for the States to follow. This is obvious from the remarks made by the Planning Commission that, in the first two Five-year Plan periods, no special works were undertaken to augment production of pulp-wood and, in the third Five-year Plan, as against a provision of 56,000 hectares for planting pulpwood, it is anticipated that only 47,000 hectares would be planted.

To achieve self-sufficiency in pulpwoods, as also other wood-based raw materials, it is high time the States considered reorientation of the forest policy. It will perhaps be necessary, as Mr. K. P. Sagreiya, I.F.S., as President of the F.R.I. and Colleges, in his talk to the members of Parliament in September 1963, had rightly pointed out, to reclassify the forests and allocate areas for different purposes. Each State should have national forests meant for the well-being of the nation as a whole, the preservation of which is necessary for climatic and geographic considerations. The conversion of certain forests as commercial forests for the supply of raw materials to the industries would be necessary. There are, of course, certain forest areas relegated to the production of timber and firewood. This perhaps would be the more balanced approach to the problems.

A Needless Misgiving

The Food and Agriculture Ministry, in the fourth Five-year Plan, has proposed raising of 20,000 hectares of bamboo, 40,000 hectares of fast growing species and 2,000 hectares of conifers plantations for which a provision of Rs. 7.5 crores is made. Will this be possible for all the States to fulfil? The Planning Commission's Resources and Scientific Research Division has suggested that paper mills interested in undertaking plantations of bamboo and other pulp-wood species should be encouraged by leasing out suitable areas of Government forests at reasonable rates. It is a known fact that many of the State Governments are quite averse to this suggestion. All the paper and pulp industries are aware of the fact that the raw materials are in short supply and many would be eager to raise their own plantations. The availability of land for raising plantations is posing a serious problem and challenge to

Forest Area, Growing Stock and its Increment

Country	Forest as % of geographical area	Forest area per 1,000 persons (hectares)	Growing stock (cubic metres per hectare)	Growing stock *per capita* (cubic metres)	Increment (cubic metres per hectare)
India ..	24	220	28	5	0.53
Asia ..	19	300	90	15	2.60
Japan ..	63	300	63	8	2.50
Europe ..	30	300	80	26	2.50
U.K. ..	7	30	89	2	3.50
U.S.S.R. ..	51	5,600	152	326	1.90
North America ..	39	3,800	100	1.88	2.80
U.S.A. ..	34	1,800	91	100	3.00
World ..	33	1,600	110	57	2.00

private concerns. With practically all the forest lands under the management of the States, where could the private concerns raise their own plantations? It is, therefore, in the interest of the national "build up" of the raw materials that the States should have a practical approach to this problem and implement the suggestion of the Planning Commission, by leasing out suitable forest lands to concerns which are earnest about it on reasonable lease conditions. The fear that such leasing out of forest areas would be misused appears to be unfounded. Industries are more anxious and eager to keep their concerns assured of sufficient raw materials and no doubts of misuse should be entertained on this account.

In other countries undergoing economic expansion, industrial plantations are raised on an extensive scale. In many countries, forests are private owned also. Finland, for instance, has 46 per cent of forests under private control and it is the main industry there. Therefore, to overcome the apparent shortage, a few suggestions made here may be considered by the States. Forestry, so far as it relates to raising industrial plantations, has to be put on a "war footing." All the State Governments should strive their best to achieve the targets for the fourth Plan period. Suitable forest lands should be made over to private concerns on reasonable lease conditions for raising their own plantations. Industrial Plantation Corporations should be established to make use of the private owned forests now in a deplorable and depleted condition to raise plantations, if necessary by suitable legislation. Vast areas lying as waste lands could be also channelised for this purpose. With this three-pronged attack, if it could be rightly called so, it will not be difficult to attain self-sufficiency in a decade or so. These are some suggestions to which the States could give a serious thought and implement them as quickly as possible.

The astounding progress made in other countries in raising plantations for wood-pulp and other uses should at least make us conscious of the fact. Eucalypts, which are the quickest growing trees so far known and the amazing way in which they grow in all regions, though with certain limiting factors have taken the stride, and many countries undergoing economic expansion have resorted to large-scale planting of eucalypts. Barring Australia, the home of eucalypts, which has 4 million hectares of eucalpytus, Latin America has 800,000 hectares, Mediterranean countries like Italy, Spain, Portugal, Morocco, etc., have 400,000 hectares, Africa 410,000 hectares, North America 10,000 hectares, Hawaii 14,000 hectares and New Zealand 10,000 hectares. In other regions, the use of eucalypts in plantations has become more widespread. India is perhaps nowhere in this race for self-sufficiency. Though short-fibred, eucalypts can be used for wood pulp in certain mixture and technique is fast developing whereby eucalypts could be used in much greater proportions.

Bamboo

The species of bamboo, which are long fibred, will always be in demand for good quality paper. This species could also be grown in suitable localities in India. Harvesting bamboo crop is usually from eight to ten years after formation of plantation and certain species would give an annual increment of anywhere between four and ten tons per acre.

With the apparent short supply of raw materials for paper manufacture, the management of the West Coast Paper Mills has lost no time in raising self-plantations of bamboo and eucalyptus, to supplement their requirement and attain sufficiency. The West Coast Paper Mills went into production in 195[illegible]. Though in the early teething troubles, as a[illegible] industries do have, the management, conscious of the fact that self-plantations are a must for all paper mills, built up the Forest Organisation both for the supply of raw material as well as for raising nurseries, and plantation and experiments. In 1960 the start was made and, in 1962, regular large-scale plantations of bamboo and eucalyptus were raised. To date the Company has 1,690 acres (836 hectares) of eucalyptus in a private owned depleted forest area, taken on long lease, about 50 miles away from Dandeli. In the concession area in Dandeli region the Company has 10,400 acres (4,160 hectares) of bamboo plantations. The average expenditure on raising and maintenance of eucalypius is about Rs. 300 per acre (Rs. 750 per hectare) and, for bamboo plantations, it is Rs. 150 per acre (Rs. 375 per hectare).

Concluding, I would draw the attention to the grave situation and urge the need for bringing about in all the States an atmosphere of the motto "Self-sufficiency by Self-plantations."

Notice

THE BURRAKUR COAL COMPANY LIMITED

AT A MEETING OF THE BOARD OF DIRECTORS held on Thursday the 26th November 1964, the following Dividends were recommended for declaration at the Annual General Meeting to be held on the 29th December 1964, subject to deduction of Tax.

On 22,998, 7 per cent Cumulative Preference Shares at the rate of 9.10 per cent per annum in accordance with the provisions of the Preference Shares (Regulation of Dividends) Act, 1960.

On 45,000, 6 per cent Second Cumulative Preference Shares at the rate of 4.9 per cent per annum in accordance with the provisions of the Preference Shares (Regulation of Dividends) Act, 1960.

On Ordinary Shares at 13 per cent per annum.

By Order of the Board.
BIRD AND COMPANY (PRIVATE) LTD.,
Managing Agents

CALCUTTA, *26th November*, 1964.

WAGE SYSTEM IN THE U.S.S.R.

INCENTIVES PLAY AN IMPORTANT ROLE

THE prevalent feeling in many of the backward countries is that wage differences in Communist countries are very minor and the earnings of people—most of them being wage-earners—are almost equal. This impression is not correct. All the available information indicates that wage differences in Russia—the biggest communist country—are much greater than those in India and in many of the so-called capitalist countries. In a particular industry, the wages of the highest paid workers are larger by 80-100 per cent than those of the lowest paid workers. There are also differences from industry to industry—the average earnings in coal industry being 130 per cent higher as compared with those in food industry. In many cases, regional allowances are paid, raising the income by upto 100 per cent. The aggregate effect of all these factors can be made clear by an illustration. Suppose the lowest paid worker in food industry gets a wage of 100 roubles per month. The wage of the highest paid worker would then be 200 roubles. On this basis, the highest paid worker in coal industry may get 460 roubles. And if the coal industry is located in a comparatively difficult area, his income may rise to no less than 920 roubles—more than nine times the wage of the lowest paid worker in food industry in a normal area, where there are no special difficulties.

These conclusions are derived from an article on the Industrial Wage System in the U.S.S.R., contributed by Mr. A. S. Shkurko, Deputy Director of Labour Research Institute of the State Labour and Wages Committee, Moscow to the *International Labour Review* (October 1964 issue) published by the International Labour Office, Geneva. The author has not provided any data regarding the wages paid to different categories of workers in the U.S.S.R., but he points out that nearly 75 per cent of the total income is paid directly to the worker as wages and that only the remaining 25 per cent is supplied by the State in the form of social benefits such as free education, care of children (free of charge or at favourable rates), free medical treatment, pensions, temporary incapacity allowances, regular holiday pay, free cultural amenities and subsidies for housing and communal services. These social benefits are increasing rapidly as percentage to the total income. As compared with 1953-59, whereas wages and salaries rose by 70 per cent, the benefits provided by the social funds have doubled.

The existing wage system was introduced in the U.S.S.R. between 1956-61. With the implementation of this system, wages and salaries were substantially increased, the change being introduced in such a way that the rise in lower categories was more than that in the higher categories, thereby narrowing the gap between the two. Uniform wages and salary scales were also introduced in individual industries and new payment and bonus systems were applied. Thus, those who are engaged in occupations or trades, not peculiar to any particular industry, are now paid uniform remuneration. Most of the industrial wage scales consist of six grades, the ratio between the lowest and the highest grade being 1:2.0 or 1:1.8. The scales rise gradually, so that workers have greater incentives to obtain promotions by improving their skills.

Wage Differentials

Wages are generally fixed in proportion to the quantity and quality of work; the rates being higher for more complex operations and for unhealthy and exhausting operations. There are three groups of gradings for different conditions of work, the wages rising up to 30 per cent of the normal rates. In most industries, piece-workers—who account for about 60 per cent of the manual workers—are better paid than time rated workers, because they are generally required to put more intensive effort on their jobs.

In some cases, the scales differ from industry to industry. It may be that some occupations, not being covered by standard occupational classification and being peculiar to a specific branch of the industry, need to be treated differently. Or it may be that a particular industry is very important. Whereas the wage rates are lowest in food and other light industries, higher wages are paid in coal mining, metallurgy, chemical and other heavy industries. As compared with the food industry, the average earnings are higher by 7 per cent in textile industry, 35 per cent in engineering, 66 per cent in iron and steel and 130 per cent in coal mining. This differentiation was introduced in order to ensure a regular supply of skilled personnel to these industries.

In areas where the natural conditions are difficult and there is shortage of man-power, regional allowances are paid to the workers, both to give them an incentive to move to such areas and also to compensate them for extra expenditure on daily needs. These allowances range from 10 to 100 per cent of the wage, depending upon the living and working conditions.

It must be noted here that the above mentioned wage structure relates only to unskilled and skilled manual workers, and excludes foreman, engineers, technicians and non-manual employees. Foremen, who represent the intermediate link between wage earners and salaried employees, get 10-15 per cent more than the highest paid manual worker in the industry. The salary of engineers, technicians and non-manual employees are fixed in accordance with the importance of the industry in which they work and their level of skill. But even in the same industry, it differs from unit to unit, due to the volume and complexity of work, which, in turn, depends on the number of subordinates, level of output, complexity of product and production process. Although the salaries are fixed at a higher level than the wages, the differentials between average salaries and wages have been brought down from 75 per cent in 1950 to 44 per cent now, by raising the wages of workers.

The payment of bonus to industrial workers is not a peculiar characteristic feature of the free world; it is prevalent in the Communist countries, too. But, whereas in countries like India, workers are entitled to bonus irrespective of their productivity and their contribution to raising the profits of the industry, in Russia bonus is paid only when specified quality and quantity requirements of the product are met or exceeded. Nearly two-thirds of the total industrial wage earners are covered by this benefit.

Forty per cent of the total industrial workers are time-rated. About 15 per cent of these hold the posts like caretakers, storekeepers and cleaners and are thus not in a position to effect the output materially. Bonus is allowed to them on straight time rates and is based on the grade and hours of work. In the case of remaining 85 per cent, it is related to the quality and quantity of production. The rates are generally 15-20 per cent of the basic wage, though they rise some times even to 30 per cent.

Bonus for Workers

By their very nature, payments on piece-rate basis do not provide any scope for bonus. However, more than half of the total piece-rated workers are given an added bonus for attaining or exceeding the quality and quantity of production, and better use of materials. This amounts to 10-20 per cent of the normal piece-rate earnings for achieving the target in some industries, an additional 1-2 per cent for every percentage point in excess of the targets of production and 1-3 per cent for each percentage point over and above the normal standard of quality. Special payments are also made in appreciation of the economy achieved in the use of raw materials and improved utilisation of plant and machinery.

Bonuses are paid to salaried employees, as well as to engineers and technicians, who are

LONG-TERM ROAD DEVELOPMENT

BETTER CONSTRUCTION TECHNIQUES BEING EVOLVED

THE third Plan's road development programme represents the first phase of the 20-year road plan drawn up by the Chief Engineers of the Central and State Governments for the period 1961-81. The broad objective of this long-term plan, it is well known, is that no village in a developed agricultural area should remain more than four miles from a metalled (surfaced) road and more than 1½ miles from any type of road. Its specific objective is to reach a total road length of 657,000 miles—252,000 miles of surfaced roads and 405,000 miles of unsurfaced roads—by 1980-81. The plan is also noteworthy for its broad order of priorities, according to which (i) on all arterial routes missing bridges should be provided and the road surfaces improved at least to one-lane black-topped specification, (ii) the main roads in the vicinity of large towns should be widened to two lanes or more, and (iii) the major arterial routes should have at least two-lane carriage way. The plan has further laid down that the first task in regard to rural roads should be their improvement to fair weather standard. All this, no doubt, represents a vast and difficult job. And yet, as Mr. Asoka Mehta, Deputy Chairman of the Planning Commission, recently said, one must underline the vital role that can and must be played by roads and road transport in locating and developing those hundred or two hundred growth-centres in the hinterland.

To what extent these objectives of the Plan will be achieved in its five-year phase (1961-66) is not clear. The only thing that the Union Ministry of Transport has indicated precisely in its report for 1963-64 is that, over the third Plan period, the total length of surfaced roads in the country is expected to increase from about 147,000 miles as on 1st April 1961 to 172,000 miles at the end of 1965-66 and that, during the first two years of the Plan, about 11,000 miles of surfaced roads were added to the road network. It may, however, be broadly inferred from the revised financial allocations for road development under the Plan that the ultimate physical achievements may exceed or, at least, not fall short of the original targets. The third Plan, it will be recalled in this connection, originally provided for an outlay of Rs. 272 crores on roads —Rs. 222 crores by the States and Rs. 50 crores by the Centre. The estimate of the cost of the States' programme has since been revised to Rs. 241 crores and that of Centre's programme to Rs. 175 crores. The large increase of Rs. 125 crores in the States' programme is partly accounted for by schemes connected with the Emergency which are expected to cost Rs. 76 crores. Actual expenditure on roads during the first three years of the Plan aggregated Rs. 220 crores—Rs. 142 crores by the States and Rs. 78 crores by the Centre, leaving a balance of Rs. 196 crores to be spent in the last two years—1964-65 and 1965-66. It remains to be seen whether the revised expenditure target will be fully reached and what would be the physical achievement in terms of roads. As far as the fourth Plan is concerned the proposals are expected to be drawn up in the light of the projection that the number of commercial vehicles on road will be almost doubled by 1970-71. They are also expected to reflect the present trend of thinking in the Planning Commission presumably in the light of its Transport Policy Committee's working. The ideas that are taking shape in this connection are:

1. In the planning of road development, it is of the utmost importance to take an overall view and develop a connected network of national highways, State highways, district roads and village roads. It is equally important to connect State road systems by developing inter-State road links.

2. As the limitations arising from scarcities of materials and of construction equipment are as important as the limitation of financial resources in the road construction programmes, greater attention should be given to the indigenous manufacture of materials and equipment.

3. There is need for application of scientific and technological methods in road construction with a view to achieving better techniques and economics and to reducing costs of road building and maintenance.

4. Traffic studies and surveys with a view to evolving suitable methods of improving the road system should be undertaken in different regions.

Roads Congress Discussions

The last two ideas mentioned above have also just come in for discussion at the twentieth annual session of the Indian Roads Congress, held at Jaipur this week. Referring to scientific road designs, Mr. Z. S. Shah, a road engineer, has emphasised, for instance, that, in flexible road pavements, it is the sub-grade soil which has to carry the traffic load and that building up the pavement with stronger material is necessary to enable the latter to withstand the stresses set up by imposed traffic. Consequently, the highway engineer's main problem is one of deciding the thickness to which these should be laid over the sub-grade. Gone are the days when an engineer used to press his heel into the soil, equated the sensation this produced with the estimate of traffic loads and mentally assessed what thickness of available strengthening material would be required. Fortunately for the road user, the taxpayer and, above all, the engineer, the science of road design has come a long way since, for, as Mr. Shah has put it, the intuitive approach has been replaced by an analytical approach. The new procedures, according to his claim, provide better roads and ensure for the taxpayer better value for his money.

The scientific development of the new road pavement design has involved, incidentally, years of research and experiment. In such research, it has been assumed that a flexible pavement would behave as a three-layered elastic structure—the top layer representing all the bitumen-bound courses, the middle layer the unbound granular layers and the sub-grade the bottom layer. Stresses and strains in such a structure due to imposed traffic have been calculated by the use of general elastic equations. Through a process of identifying the critical stresses and strains in a pavement, it has been possible to express the life of the pavement in terms of the number of standard axle loads rather than traffic. The values for the moduli and permissible strains in the three principal layers have been used in calculations to find the thicknesses of the various layers required for any particular wheel load and soil. The results obtained have been expressed in the form of design curves in which the thickness of the asphalt layer is plotted against that of the unbound granular layer. For any particular design curve a suitable construction is also indicated. It would appear from this brief review of research presumably in the Central Road Research Institute that the surfaced roads of the future are likely to be of better and improved design.

Traffic Studies

As for traffic surveys in the light of which future development of roads and road transport is intended to take place, another highway engineer has highlighted several lines of specific enquiry. In view of the fast growth of automobile traffic, industries and population in cities, detailed surveys of vehicle volume and composition of traffic and of origin and destination of traffic and people, studies of vehicle speeds and delays, vehicle registration trends, vehicle and axle loads, pedestrian traffic, etc. have, according to him, become necessary for evolving standards for road design and construction. The surveys relating to vehicle, volume and composition of traffic, it is said, would be most useful, for volume data are needed not only in planning and design but also in economic analysis for establishing priorities and the schedules of traffic improvements. Maximum hourly volumes and average daily volumes, it is said, are commonly used in the planning, design and operation of traffic facilities. Traffic demands in vehicles per hour per traffic lane are also essential for dealing with problems of high class facilities.

Speed studies are considered essential to determine the magnitude, range and distribution of speeds under the prevailing condition of the roadway and operation regulations, to correlate speed and accident as a guide to the use of traffic control devices, to measure the effect of speed control measures and to determine the need for such measures. Delay studies are intended to determine the amount, causes, location, duration and frequency of traffic delays, as well as the running speed between specified points on a route. Origin and destination studies are equally important, for they are calculated to determine the selection of route, the length of trip and the direction of travel of all classes of motor vehicles and of people. The desired lines of travel, it has been found, have a great bearing on the actual location of routes and the satisfactory provision of facilities at pre-determined intersections. It may be noted finally that the vehicle and axle load studies, referred to earlier, are necessary for the evolution of ever-more durable road design techniques. All these studies, some of which are stated to be under way in selected places, seem to be worthwhile. But how all of them will be carried out and what machinery are being established for the purpose are not known.

LOCKHEED'S SUPERSONIC AIRLINER DESIGN

The supersonic transport design programme, submitted recently by the Lockheed-California Company to the U.S. Federal Aviation Agency, is calculated to ensure safe and cosy supersonic jet airliner travel in the near future. The Company has so designed its programme as to achieve major advances in operating economy, range-payload characteristics and airline profitability. It has also offered three different fuselage sizes by which optimum use can be achieved. But for the different fuselage lengths and passenger capacities (these range from 170 to 250 passengers) all the three designs have the same maximum take-off weight and the same wing, landing gear systems and engines. Each version of the airliner is set to cruise with full payload at three times the speed of sound, at 2,000 m.p.h. to be precise, and high above the weather at altitudes between 70,000 and 80,000 feet.

One important feature of the supersonic airliner is that uninterrupted vision for the pilot on take-off and landing is provided by the plane's "weather vision nose." The nose section, forward of the flight deck, can be adjusted downwards by as much as 15 degrees to facilitate landings under extremely poor visibility conditions. It is also compatible with basic airport facilities, including runway length and strength, and it is designed to make less noise than the present-day subsonic jet liners. It has significantly improved sonic boom characteristics and aerodynamic efficiency.

As its programme is based on global market surveys and the traffic growth pattern predictable for the period 1970-90, the Company is confident that its airliner would eclipse the highly successful subsonic jets as a money-spinner for domestic and international operators. It goes without saying that years of engineering research, involving millions of dollars and man-hours, have gone into the Company's resultant supersonic transport design. If the programme comes into practice, trips between Paris and New York will take just three hours and New York and Los Angeles will be brought within two-hour commuting time.

DON ATOMIC POWER STATION IN U.S.S.R.

The Novovoronezh Atomic Power Station on the banks of the Don has just been switched into the integrated power grid of the European U.S.S.R. The generating capacity of the first unit is 210,000 kilowatts. The capacity of the second unit, which is already under construction, will be 365,000 kilowatts.

A conventional thermal power station of 210,000 kilowatts, incidentally burns over 2,000 tons of coal a day, as compared with about 800 grams of uranium—235 burned by the atomic power station. The atomic reactor contains over 30,000 thin zirconium tubes filled with small tablets of sintered uranium dioxide. The reactor, together with the fuel elements, weighs over 400 tons.

The reactor is installed in a thick-walled concrete shaft. Its maximum height, together with the control and protection system's drives, is 18 metres. There is another shaft a short distance away, where used fuel elements will be immersed in water to reduce radio-activity. The transfer of used elements from the reactor to the cooling pond is done under water.

The dosimetrical control service is claimed to be of the highest standard at the station. Automation and telemechanics are widely used there. The human element has been replaced by instruments wherever special accuracy is required.

NON-FERROUS METALS

India's present annual requirements of non-ferrous metals are estimated at Rs. 60 crores. They are expected to touch a high of Rs. 230 crores by 1970-71, thanks to their increasing use in industries. Domestic production of non-ferrous metals at present is too meagre to meet the demand which, in turn, necessitates heavy imports, involving a drain on the valuable foreign exchange reserves. Mr. A. L. Sabharwal, Chairman of the Development Council, for Non-ferrous Metals, has, therefore, done well to stress the need for a higher priority for the production of non-ferrous metals in the country at the meeting of the Council held at New Delhi on 25th November 1964.

The Council has also examined, *inter alia*, the problems in respect of the production and use of non-ferrous metals. The progress so far achieved in the cable industry has also been reviewed at some length. It has been recommended, in this connection, that aluminised wire should be used in the place of galvanised wire and that future expansion of the cable industry should be on the basis of aluminised wire. Further steps to expand the capacity of the industry to meet the fourth Plan targets have also been broadly discussed.

NEW PRODUCTS AND PROCESSES

Revivor-narcosis Apparatus

A SIMPLE but effective revivor-narcosis apparatus that does not require oxygen to function properly has been developed by the Swedish Aga Company. It was shown for the first time in Sweden during the "Medical Care and Health" exhibition in Gothenburg. The device is designed for emergency use at smaller medical units such as Red Cross stations and military hospitals in the field. If oxygen is not available, the apparatus, which is manually operated, functions on ordinary air. The "Aga Revivor" consists primarily of a non-respiratory vent, a gas tank and a gas bladder which refills automatically. The non-respiratory vent is an entirely new design comprising one inhaling and one exhaling unit. They are separated in such a fashion that the two breathing operations do not mix, which prevents the patient from inhaling air which is saturated with carbon dioxide. When artificial respiration is applied with a traditional anæsthetic gas bladder, compressed air is required for refilling and the amount of gas has to be exact. The automatically refilling gas bladder combined with the new two-way gas tank eliminates filling irregularities. The gas tank consists of coil tubing with one end attached to the non-respiratory vent and the other end open. When the gas bladder is filled, the surplus oxygen is channelled back to the gas tank and can be used the next time the bladder is filled. By attaching a draw-over gasifier between the open gas tank and the non-respiratory vent, the apparatus can be used for anæsthesia with air-over-ether or air-over-fluothane without adding oxygen or laughing gas. Should the supply of narcosis gases become short it would not matter, since the gases are automatically replaced by ordinary air.

Transformer Laminations

A machine developed by Radman Tools Ltd., Worcester, England for the automatic production of high voltage transformer laminations from coiled silicone steel strip uses a diffraction grating to control the length of cut. This is claimed to eliminate the delay caused in conventional machines by the feed-back of the gripper head between cuts. Length of cut, selected by pressing a series of buttons, is numerically controlled through a diffraction grating which governs electronic control equipment. This in turn governs hydraulically-driven feed rolls, so that the material travels the pre-selected distance before the cut is made. The number of components to be cut is dialled on disc controls. Increase in production claimed over conventional machines vary with the length of cut and are greater for longer lengths.

Walking on Water

Walking on the water has long been a dream of man. An invention to enable one to accomplish this feat has been developed by a Japanese manufacturer, Sun Co. Ltd., Tokyo. This new innovation is a vinyl pneumatic toy shaped like a pair of huge shoes. By putting one's feet in the holes of this toy called "*Pelica*," one can "walk" freely on the water, using "ski poles" with floats attached. With proper means and applications, Pelica enables users to enjoy various unique water sports and can increase the variety of water amusements, according to the manufacturer. The body of Pelica is made of special quality vinyl which is said to have high tensile strength and elasticity. The vinyl material resists heat and low temperatures, and its colour is fast and does not fade. The body is composed of two vinyl sheets, which are plastered together.

Photo Calculator

An aid for commercial photographers and printers giving immediate answers to problems of enlargement or reduction of prints is available in the form of a pocket calculator. Accountants, engineers and others who have to work out ratios and percentages will also find a ready use for the gadget which consists of two dials, one of which is moveable to set length and breadth, or any other data. By moving a cursor, the new dimensions, or proportions are shown immediately. It is made by Grevilles Photographic Services, 311 Bath Road, Slough, England and will be of great service to professional photographers, blockmakers and litho printers.

Stronger Lead

Lead in a new physical state, with mechanical properties not found in ordinary lead, is being produced by Associated Lead Manufacturers Ltd., London. Dispersion-strengthened, it has a strength, temperature stability, and resistance to creep and fatigue much greater than those of ordinary lead. Its chemical properties remain unchanged, retaining excellent corrosion resistance. The process involves the controlled introduction of small amounts of lead oxide into lead powder, starting with a thin surface coating of lead oxide on each powder particle. Special fabricating processes are then employed to produce shear forces that rupture the oxide film, resulting in an intimate and homogeneous dispersion of small oxide fragments throughout the matrix of metallic lead. The mechanical properties of dispersion-strengthened lead are superior to those of any commercial lead alloy, and its inherent thermal stability cannot be obtained with ordinary lead or, to any useful degree, with conventional lead alloys. Dispersion-strengthened lead with a five per cent oxide content, at 80° C., has an ultimate tensile strength of 5,500 p.s.i. and an elongation of only eight per cent. By comparison, Type A chemical lead (a very pure form) at the same temperature has an ultimate tensile strength of 1,600 p.s.i. and an elongation of 50 per cent.

Processing of Ramie

The Jute Agricultural Research Institute in Calcutta has developed a process of degumming ramie, the strongest vegetable fibre known. Ramie, according to technologists, is four times stronger than silk, and is hardly damaged by water and atmospheric humidity. The fibre is, therefore, used for making hose pipes and rot-proof textiles. Blended with other fibres like nylon, rayon, cotton and wool, ramie can produce attractive fabrics. It is lustrous, dyes beautifully and retains the colour better than other fabrics. The soil, rainfall and topography of certain parts of India are ideally suited to the development of ramie plantation, but any large-scale cultivation of the plant for a new source of textile fibre in this country has been impeded by the lack of knowledge of processing the fibre from the stem. The ramie fibre, unlike jute, is mostly cellulose, with a gummy coat that has to be removed by microbial or chemical action. The Jute Agricultural Research Institute has shown that a strain of *Bacillus subtilis* largely removes the gummy coat without affecting the ramie fibre. The remaining traces of gum are cleared by alkali extraction. The economics of the process is to be assessed soon in a pilot project.

Shearing Machine

The largest steel billet shearing machine to be made in Japan has just been put on the market by Nippon Kokan K.K. Weighing about 60 tons, it has a capacity of 1,200 tons and can be adapted to carry out various metalworking operations. It is claimed to be highly accurate and to cut at much greater speed than a bandsaw. Maximum diameter of round steel bars that the machine will cut is 200 mm., while maximum shear width when dealing with square-sectioned bars is 180 mm.

Quick-setting Ceramic Glaze

A quick-setting ceramic glaze developed by two German companies enables them to omit a time-consuming step in the production of decorated porcelain. Lack-Albrecht G.m.b.H., of 33, Wallaustr., Mainz, and F. X. Leopold, of 20, Osterreicherstr., Zirndorf via Nurnberg-2, coat dry ceramic articles with the glaze in the usual way. But instead of having to bake them to set the glaze—before decorating them with coloured ceramic pastes and re-baking them—they just let the glaze set, decorate and then bake. The decoration is stated to have high gloss and to resist wear because it diffuses into the glaze.

One-way Milk Distribution System

What is claimed to be the first fully one-way system of packaging and distributing milk is at present being tried out in Malmö, Sweden's third largest city. Developed by Tetra Pak—the Swedish company that introduced tetrahedral throw-away containers over a decade ago—the system is based on a new type of brick-shaped container, Tetra Pak Brik, and the use of ordinary water-resistant wrapping paper instead of distribution crates. Milk is considered a "difficult" product in the trade. It took some time for the throw-away pack to become established, and even today the containers are usually transported in heavy returnable crates of wood or metal. Even though Tetra Pak designed a stackable lightweight crate, the company believed that the system could be further developed to meet the requirements of the ultramodern self-service store where manual handling is kept to an absolute minimum and every type of returnable material is in principle unacceptable. Tetra Pak Brik was developed with this in mind. It is so designed that the packs can be distributed wrapped in ordinary wrapping paper and nothing else. A parcel containing 12 one-litre packs has been found a suitable unit of distribution, which also fits on European standard loading pallets. An entire consignment can thus for a large shop be transported directly into the cold store. Since the individual pack has no air space when filled, it keeps its shape and does not burst when a load presses on it from above. The liquid inside absorbs the pressure and distributes it evenly all round. The four flaps that stick out when the pack is formed are folded in and serve as a pouring lip and as reinforcement. Eliminating bulky crates, Tetra Pak Brik containers make better use of expensive cold storage space. In display counters in the stores, 144 litres of milk will fit into a 40×120×34 cm. area.

Window Fan

A ventilation fan which can easily be installed on the window pane instead of the wall has just been developed. Made of plastic, this ventilation fan called "Win Pet" is free from rust, according to its manufacturer, Matsushita Electric Co., Tokyo. As the conventional ventilation fans had been designed to be installed on the wall, their installation was troublesome. With the Win Pet, however, it is not necessary to break the wall. By cutting a round piece out of the window pane, the Win Pet can easily be installed, according to the manufacturer. Another advantage of this six-wing ventilation fan is its bearing made of oilless metal which makes its motor noiseless.

Everlasting Flash Lamp

The German Academy of Science has patented a design for a high-intensity gas-discharge lamp that, theoretically, should never burn out. The secret of its long life is claimed to lie in preventing the inner surface of the glass from becoming coated with condensed metal vapour so that short-circuiting between anode and cathode cannot occur. The tubular glass envelope of the lamp contains the usual tungsten anode and mercury cathode but between the two is an inert gas at such high pressure that mercury vapour forms at concentrations too low for deposition. Repeated light flashes are produced when an electrical discharge bridges the gap, its intensity depending on voltage. The lamp can thus be used for photographic work or for winking navigation lights.

Paper Filler

In order to improve the already good properties of the magnesia silicates as filler in the paper industry, an Austrian firm, Messrs. Talkumwerke Naintsch, Kiwisch & Co., Freiheitsplatz, Graz, has developed a filler produced accor ing to a special dressing process. Its a vantages are that it improves the quality of t paper, simplifies the production process and ther by reduces its cost of production. The filler other qualities are its better sheet formatio larger tension length, improvement of the prir and writeability, less dusty nature and a diminis ed tendency to turn yellow. Contrary to simila products, this filler effects a better imperviousne of the paper. The new product's essential pr perties are among others: simpler glazing and detaching of the web of paper from the press, no peeling and no inclination to form folds on the calendars. It has the best filler yield (70 per cent or more) and a favourable influence on the drainin of the material on account of the good retaining properties and promotes the dry content of the web of paper.

Ore Analyser

A new automatic on-stream analysis system for mineral ore processing plants, developed by a British firm, enables low-grade ores to be processed profitably. The system is built around a multi-fixed-channel X-ray fluorescent spectrometer, and incorporates digital computing elements for the direct presentation of results. It will analyse the copper content of six continuous sample flotation streams and the copper/iron content of six continuous tailing sample streams (containing trace elements). It also incorporates provision for the analysis of the titanium content of three further flotation streams at a later stage of the project. The accurate and continuous sampling of the mineral content of the ore entering the flotation plant will enable the process to be controlled in the optimum manner to produce the maximum output of copper, iron and titanium.

Inexpensive Double Glazing

Inexpensive double glazing for hard American winters is provided by rigid aluminium frames which the householder assembles and covers with transparent plastic film. They are then fitted into the window frames outside the glass panes. Virginia Iron and Metal Company, Box 8664, Richmond, Virginia, U.S., sells the assemblies of aluminium rod and plastic. Assembly of the frames is said to be easy.

Waveform Generator

A new low-frequency waveform generator, developed in Britain by Servomex Controls Ltd., Sussex, can produce 90 distinct waveforms in the audio and servo frequency ranges and yet is small and light enough to be carried in one hand. Unlike the conventional generator, which produces waveforms continuously, it can produce a single waveform, or even half of one. The generator, in which transistors and printed circuits are used extensively, has a frequency range of 0.002 to 2,000 cycles per second and produces all the 90 waveforms without any ancillary equipment whatever. The output voltage is zero to 10 volts peak in three ranges, with maximum peak voltages of 10 volts, 1 volt and 0.1 volt. The instrument has a direct frequency dial and the output voltage can either be balanced about the zero line or polarised. This produces additional waveforms and some delayed waveforms. A special feature is that it can be keyed; the application of an external "paralysing" voltage will stop the main generator, allowing one or more cycles to appear.

NEW IDEAS IN BRIEF

Porous plastic tubes can be used for drainage conduits, and for bubbling air through sewage sludges and chemical liquids in a process developed by Shell Internationale, Research Maatschappij, 30 Carel van Bylandtlaan, The Hague, Netherlands.

Aluminium components such as building facing panels, doors, window frames and fittings can be given a range of colours from yellow to dark brown or black by modifying the usual solutions used for anodising in a system produced by Vereinigte Aluminium-Werke, Am Nordbahnhof, Bonn, West Germany.

A new process adapts the standard phosphoric acid production system so as to produce pure phosphoric acid from fertiliser-grade phosphoric acid at a cost equivalent to a fraction of the near 40 per cent price difference now existing between the two grades. It is being developed by Israel Mining Industries, Haifa, Israel.

A floor-cleaning fluid has been developed that thoroughly cleans any surface and is also anti-bacterial by Floor Treatments, High Street, High Wycombe, England.

A dishwasher which scrubs dishes by blasting small foam-rubber-coated particles against them in the jet of detergent water has been designed by Dr. I. W. Lepper, Berghaus Heckenfels, Honnef am Rhein, Germany.

A new method of capturing aerosols, fumes and fog in a low-frequency acoustic field has been developed. Information about this is available from: Leningrad Institute of Aviation Instrument Making, Leningrad, Russia.

Russia has produced an artificial hand that can "feel" by sending signals on the strength of the grasping effort of the fingers back to the nervous system, according to the Soviet Information Service, 3 Rosary Gardens, London, S.W.7.

Development of a technique for tunnelling through hard rock or cutting coal has been claimed by J. Wohlmeyer, 13 Blaasstrasse, Vienna 19, Austria.

A type of heavy optical glass which is not susceptible to spotting has been patented by Ernst Leitz, Wetzler, Germany.

The first standard for solar water heaters to be prepared by any country has just been published in draft form, according to the Standards Institution of Israel, Bney Israel Street, Ramat Aviv, Tel Aviv, Israel.

LIFE INSURANCE CORPORATION OF INDIA

CHAIRMAN, MR. B. K. KAUL, REVIEWS PROGRESS

TOTAL BUSINESS IN FORCE RECORDS PHENOMENAL RISE

THE total business of the Life Insurance Corporation of India has recorded a phenomenal rise of 12.8 per cent during the year ended 31st March 1964, from Rs. 3,165 crores under 95 lakh policies as on 31st March 1963 to Rs. 3,571 crores under 103.28 lakh policies, which is almost three times the business in force of all the insurers taken together as on 31st December 1955. This was revealed by Mr. B. K. Kaul, I.C.S., Chairman of the Corporation, in his statement at the Hundred and second Meeting of the Corporation held at Bombay on Monday, 30th November 1964. Mr. Kaul disclosed that the percentage of the first insurances, that is, policies taken for the first time, during the year under review had increased from 69.5 in the last accounting period of 15 months to 70.5 in the year under review. The new business itself, however, had suffered a marginal decline from Rs. 708 crores in 1962-63 to Rs. 703 crores. This decline was attributed by the Chairman to the rising cost of living as also the Compulsory Deposit Scheme. There was also a slight setback in the foreign business transacted by the L.I.C. from Rs. 10.58 crores in 1962-63 to Rs. 10.21 crores in 1963-64, which, Mr. Kaul stated, was due to a shortfall in business in Mauritius and East Africa.

The following is the full text of Mr. Kaul's statement:

The draft of the annual report and the statement of accounts for the period 1st April 1963 to 31st March 1964 have been circulated and are now before us for consideration.

The country suffered an irreparable loss in the sad and sudden demise of Jawaharlal Nehru. At its meeting held on 29th June 1964, the Corporation passed a resolution placing on record its deep sense of sorrow at the passing away of our beloved Prime Minister. The Corporation was proud to recall the privilege of having him on 26th December 1963 in Bombay to declare open its new headquarters, 'Yogakshema,' and his inspiring words on that occasion which would guide the Corporation in carrying on such activities from 'Yogakshema' as would contribute its humble share in the various tasks of national reconstruction so dear to him.

New Business

During the year under review, our new business amounted to Rs. 703 crores under 16.46 lakh policies as against Rs. 746 crores under 17.68 lakh policies in the previous accounting period. As that period comprised 15 months while the period under review covered 12 months only, a direct comparison of the figures is not possible. However, the new business performance during the year under review may be evaluated by comparison of business completed in the period 1st April 1962 to 31st March 1963. During this period the Corporation completed a business of Rs. 708 crores. There has thus been a slight reduction in new business.

The rise in the cost of living during the year under review as also the introduction of the Compulsory Deposit Scheme, which affected the taxpayers, had their inevitable repercussions on our business. In addition to this, natural calamities like famine conditions in some parts of the country and excess rainfall in others also had their adverse effect on our business. The shortfall in business is only marginal and, in the context of the prevailing conditions, the achievements should be considered as fairly satisfactory.

First Insurances

As many as 11.54 lakh policies, forming 70.5 per cent of the total policies issued during the year, were taken by persons who were insuring for the first time. The corresponding figure for the previous accounting period of 15 months was 12.22 lakh policies, being 69.5 per cent of the total policies issued. This confirms the trend of growing insurance-consciousness and gives satisfaction that the message of insurance is being taken to more people who have hitherto not availed of life insurance protection for their families

Rural Business

5.85 lakh policies assuring Rs. 209.40 crores were issued to people in rural areas. The corresponding figures for the accounting period of 15 months ending 31st March 1963 being 6.77 lakh policies assuring Rs. 233.45 crores. The classification of urban and rural areas is the same as adopted in the 1961 Census.

The scheme for collection of premiums through selected post offices in rural areas, where banking facilities do not exist, which was operating in Jaipur district of Rajasthan, has since been extended to the whole State of Rajasthan. The postal authorities have also agreed to extend the scheme to the States of Andhra Pradesh, Kerala, Madras and Mysore, and the details are being settled.

Offices

As on 31st March 1964, we had offices in 251 out of the 316 districts and in five out of ten Union Territories in India. We also had Development Centres in 32 of the remaining districts and in one of the Union Territories. The programme for 1964-65 is to open two branch offices, three sub-offices and 17 development centres.

Non-Medical Business

During the year 7.21 lakh policies assuring Rs. 164.87 crores were issued under the Non-Medical Schemes: 2.38 lakh policies assuring Rs. 36.36 crores being under the Non-Medical General Scheme and 4.83 lakh policies assuring Rs. 128.51 crores under the Non-Medical Special Scheme. It may be mentioned that under the Non-Medical Special Scheme, proposals are entertained for amounts upto Rs. 10,000 from special categories of persons in civil employment and also category A-1 of commissioned officers in the armed forces.

Salary Savings Scheme

Under the Salary Savings Scheme, we issued during the year under review 2.71 lakh policies assuring Rs. 81.47 crores as against 1.93 lakh policies assuring Rs. 61.03 crores during the previous accounting period of 15 months. I am glad that the scheme is proving popular with the employees and employers in general. More and more employees are coming forward to make the premium deduction a first charge on their salaries, thus ensuring insurance protection for their families with least inconvenience to themselves.

I am happy that in addition to the existing scheme for employees of Kerala State Government, satisfactory arrangements were made with the Governments of Rajasthan and Punjab for introducing the salary savings scheme amongst their employees. In July 1964, similar arrangements have been made with the Government of Orissa.

Group Insurance and Group Superannuation Schemes

New business amounting to Rs. 12.30 crores was written during the year under the group insurance schemes and under the group superannuation schemes. Life annuities of Rs. 2.86 lakhs per annum were granted. The comparative figures for the previous 15-month period were Rs. 10.49 crores and Rs. 5.05 lakhs respectively.

Business in Goa

The policies issued by the erstwhile Portuguese companies to Indian citizens resident in Goa, Daman and Diu vested in the Corporation as from 8th June 1962, which has been fixed as the appointed day while applying the Life Insurance Corporation Act to these territories, *vide* notification issued on 29th February 1964 by the Government of Goa, Daman and Diu. How to meet the deficit in respect of this business is being discussed with the Central Government.

Foreign Business

During the year the Corporation issued 8,532 policies assuring Rs. 10.21 crores in the foreign countries where it is operating, as against 9,498 policies assuring Rs. 11.24 crores during the previous accounting period of 15 months. For the sake of comparison, it may be mentioned that during the period 1st April 1962 to 31st March 1963, the Corporation issued 8,885 policies assuring Rs. 10.58 crores. The slight setback in the business is due to a shortfall in business in Mauritius and East Africa. At other places there was satisfactory progress.

Business in Force

The total business in force as at 31st March 1964 was Rs. 3,571 crores under 103.28 lakh policies as against Rs. 3,165 crores under 95 lakh policies as at 31st March 1963, thus recording 12.8 per cent increase during the year under review. I may mention that the business in force as at 31st March 1964 is almost three times the business in force of all the insurers taken together as at 31st December 1955.

Lapse Ratio

The ratio of lapses to mean business in force was 8.2 per cent during the year as against 8.1 per cent during the period 1st January 1962 to 31st March 1963. The impact of the general economic conditions and of the compulsory deposit scheme on the saving capacity of the insuring public would be expected to have an adverse effect on the lapse ratio. From the very slight increase in the lapse ratio, it appears that the various steps which the Corporation took to control lapses are bearing fruit and the rising trend has been arrested.

Valuation

During the year the Fourth Valuation of the Corporation's business as at 31st March 1963 was completed. Usually the Corporation's business is valued biennially but consequent upon the change in the accounting year of the Corporation, it was decided that the Fourth Valuation should cover the 15-month period ending 31st March 1963. As a result of this valuation, Rs. 25.03 crores were allocated to the participating policies. The rates of reversionary bonus allowed to the policies issued by the Corporation were increased from Rs. 16 per thousand sum assured per annum to Rs. 17.50 per thousand sum assured per annum in the case of whole life policies and from Rs. 12.80 per thousand sum assured per annum to Rs. 14 per thousand sum assumed per annum in the case of endowment policies. In the case of policies issued by the erstwhile insurers corresponding increased bonuses were allowed in accordance with the scheme of differential bonuses.

Underwriting of Female Lives

As a result of the review of the conditions for grant of assurances to female lives, a new categorisation for grant of such assurances has been adopted and joint life assurances on the lives of husband and wife have been reintroduced, subject to the condition that both should be earning and the amount of insurance should be commensurate with their separate incomes.

Premium and Other Income

The premium income for the year under review amounted to Rs. 146.32 crores against Rs. 150.38 crores in the previous accounting period of 15 months. The total income for the year under review was Rs. 179 crores as against Rs. 185 crores during the previous accounting period of 15 months.

Life Fund, Investments and Total Assets

The Corporation's Life Fund as at 31st March 1964 was Rs. 808.36 crores, registering a handsome rise of Rs. 88.80 crores over the adjusted Life Fund at the beginning of the year. Of the total investments in India of Rs. 707.60 crores, the public sector accounted for 75.5 per cent, co-operative sector 4.3 per cent, the joint sector 1.0 per cent and the private sector 19.2 per cent. During the year, 70 new issues were agreed to be underwritten to the extent of an aggregate sum of Rs. 13 crores.

The total assets of the Corporation as at 31st March 1964 amounted to Rs. 880.57 crores as against Rs. 785.94 crores as at 31st March 1963. The net increase in the assets of the Corporation, since its inception, amounted to Rs. 466 crores.

Rate of Interest

The income from interest, dividends and rents before deduction of income-tax was Rs. 38.25 crores as against Rs. 39.38 crores during the 15 months ended 31st March 1963. The gross rate of interest realised on the mean Life Fund was 5.11 per cent per annum as against 4.76 per cent per annum during the previous accounting period.

The net rate realised was 4.07 per cent per annum against 4.08 per cent per annum during the previous accounting period. The net rate of interest has not increased commensurately with the increase in the gross rate due to the fact that a refund of tax of about Rs. 4.04 crores in respect of the previous accounting period had not been received in the year as the income-tax assessment of the Corporation had not yet been finalised. If this refund of tax of Rs. 4.04 crores had been received in the year, then the net rate of interest would have been 4.61 per cent.

Expense Ratio

The overall expense ratio for the year has come down to 27.5 per cent from 29.3 per cent in the previous accounting period of 15 months. The renewal expense ratio has also come down from 14.13 per cent to 12.46 per cent. This is gratifying because the reduction has been achieved in spite of the increase in salaries and allowances of employees in classes II, III and IV.

Claims

During the year the claims inclusive of bonus additions amounted to Rs. 33.86 crores under matured policies and Rs. 10.80 crores under policies becoming claims by death. The total claims for the year amounted to Rs. 44.66 crores as compared with Rs. 43.96 crores in the previous accounting period of 15 months. The outstanding claims as at 31st March 1964 amounted to Rs. 14.91 crores as against Rs. 13.55 crores as at 31st March 1963.

The percentage of outstanding claims as at the end of the accounting period to claims arising during the period has been gradually coming down. It was 49.9 per cent for the year 1959, 40.8 per cent for the year 1961 and 33.4 per cent for the year under review. We are constantly endeavouring to reduce delays in settlement of claims. During the year a "Service to Claimants Campaign" was initiated and our branch managers and assistant branch managers called on a large number of claimants personally to render them assistance for early settlement of claims. This form of service to the claimants will be rendered as a part of the normal settlement procedure hereafter. I hope that our efforts will bear fruit and with the co-operation of the public we shall be able to speed up claims settlement.

Building Activities

During the year, apart from the Divisional Office at Varanasi and buildings at other places, our Central Office building "Yogakshema" was completed and was opened at the hands of the late Prime Minister, Jawaharlal Nehru.

Mortgages

As I mentioned in the last report, the "Own Your Home" Scheme came into operation from the 1st of January 1964 at 26 centres. It has since been extended to further 49 centres and it is proposed to extend it to two more centres from 1st January 1965. The earlier scheme for grant of loans on immovable properties which was in operation in 26 centres was extended to ten more centres.

In addition to the schemes mentioned above, we are advancing loans to State Governments for financing the Middle Income Group Housing Schemes, the Rental Housing Schemes, the Village Housing Project Scheme, the Low Income Group Housing Scheme, the Plantation Labour Housing Scheme and Land Acquisition and Development Scheme. Loans are also granted to co-operative societies formed by employees of the Corporation and a scheme has been introduced for grant of loan to individual employees of the Corporation for purchase or construction of houses. The total assistance given by the Corporation to housing development under these various schemes upto 31st March 1964 amounted to Rs. 62.78 crores.

Publicity

The Corporation continues to do vigorous publicity work both in the urban and rural areas, using a wide variety of media. Emphasis is being placed on outdoor publicity and use of audio-visual media in the shape of films, slides, and slide-ones exhibited in 2,500 theatres throughout the country and through the Corporation's publicity vans and projection units in the outlying rural areas. I am proud to mention that the total publicity effort has won for the Corporation the I.S.A.-Khatau Gold Medal awarded by the Indian Society of Advertisers. The presentation is being made today at the hands of Mrs. Indira Gandhi, Union Minister for Information and Broadcasting. I am also happy to mention that the Corporation's house magazine, *Yogakshema*, was awarded the first prize in the category of English periodicals (other than annuals) at the Ninth State Awards instituted by the Ministry of Information and Broadcasting.

General Insurance

Implementing the decision taken during the year under review, with the approval of the Central Government, the Corporation has started transacting all kinds of General Insurance business from 1st April 1964. We can now look forward to giving complete and comprehensive insurance service to the public to suit their varying needs. I may mention that although the Corporation is not a member of the Tariff Committee of the Insurance Association of India, we have adopted the tariff rates for the present. It is, however, open to us to revise the rates in due course in the light of our own experience.

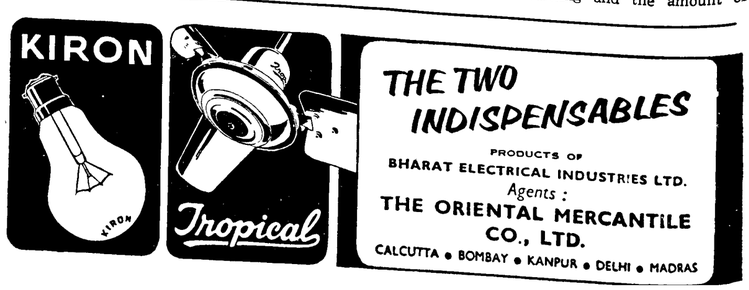
Electronic Data Processing

The Corporation has decided to install two Computer Systems, one at Bombay and the other at Calcutta. These machines will ultimately replace the existing Adrema and Punch Card machines and are expected to do the job more efficiently yielding more information to the management to bring about an improvement in the servicing to policyholders and agents. I may reiterate that this decision will not lead to any retrenchment in the existing staff.

Organisational Set-up

A re-organisation scheme was prepared during the year and it was to be implemented in stages. Since representations were received from members of the public, from institutions and other bodies, further steps in the implementation of the scheme have been deferred. In the meantime, a review of the scheme, in the light of the points raised in the representations is being made.

I have always received sincere co-operation and valuable advice from my colleagues on the Board and on the Investment Committee. I offer my grateful thanks to them. I take this opportunity to record my appreciation of the services rendered by the officers and staff at all levels. It is their services which have solely contributed to the fine results achieved by the Corporation. Finally, I thank all the agents who have done such excellent work in spreading the message of insurance to the people.



Over 100 Years of Banking in India

NATIONAL AND GRINDLAYS BANK LIMITED

(Amalgamating National Bank of India Limited, Grindlays Bank Limited, and the Eastern Branches of Lloyds Bank Limited)

Registered in London under the Companies Act of 1862 on the 23rd March, 1866. The Liability of Members is Limited.

Bankers to the Government in Aden, Kenya, Uganda and Zanzibar.

ISSUED CAPITAL AND RESERVES OVER £ 11 MILLIONS

HEAD OFFICE: 26, BISHOPSGATE, LONDON, E.C.2.

London Branch:

13, ST. JAMES'S SQUARE, S.W.1.

Branches throughout Aden, Ceylon, India, Kenya, Pakistan, Rhodesia, Somalia, Tanganyika, Uganda, Zambia and Zanzibar.

The Bank conducts all classes of Banking and Exchange Business throughout the world.

Bombay Branches:

90, Mahatma Gandhi Road; 270/272, Dr. Dadabhoy Naoroji Road, (Lloyds Branch); Mint Road, (Corner of Mint Road and Sir P. M. Road); 21/29, Princess Street, (Lloyds Branch); 117-119, Kazi Syed Street, Mandvi; 65F, Linking Road, Santa Cruz; 2/571, Gowalia Tank Road, Cumballa Hill; Shivaji Mandir, N. C. Kelkar Road, Dadar; 24B, Club Road, Byculla; THANA: Agra Road, Kolbad Road, (Near Castle Mills).

NGB/46A

DELHI CLOTH AND GENERAL MILLS COMPANY, LIMITED

CHAIRMAN, DR. BHARAT RAM'S SPEECH AT ANNUAL GENERAL MEETING

A CRITICAL appraisal of the fiscal policies of the Government of India was made by Dr. Bharat Ram, Chairman of the Delhi Cloth and General Mills Company Limited, in the course of his speech at the Seventy-sixth Annual General Meeting of the Company, held at Delhi on Tuesday, 24th November 1964. He observed that a large part of the resources mopped up by additional taxation was dissipated by Government over uses which did not increase the productive capacity of the country. Dr. Bharat Ram opined that this factor should be kept in mind while framing the fourth Plan wherein the outlays should be such as would yield substantial increases in production.

The following is the text of Dr. Bharat Ram's speech:

FRIENDS,

It is a great pleasure for me to welcome you all to this 76th annual general meeting of your Company. Since we met last year a great tragedy overtook the country. We lost our respected Prime Minister, Pandit Jawaharlal Nehru. Indeed, few people, in any country at any time, have contributed so much to enrich the lives of their countrymen. He was not a man of the moment, but an architect who shaped the destiny of India. He conceived things in a big way, and it is his farsightedness that made India embark upon a massive programme of social and economic development. Let us pay our humble homage to this great son of India and observe silence for a minute.

We are gratified that the void created by the loss of such an eminent personality has been repaired by exemplary democratic means. We now have as our Prime Minister, Mr. Lal Bahadur Shastri. With his great attachment to social values, devotion to the cause of the common man and personal integrity, I have every hope that he will lead the country to greater and greater prosperity.

Rising Prices

At the moment, however, the problems appear to me to be getting out of hand. In a single year, prices rose by more than 15 per cent, though this rise is mainly confined to agricultural commodities. There is no doubt that the spurt in the price level was occasioned, on the one hand, by shortfalls in agricultural production, and on the other, by excessive spending on the part of the Government on non-productive uses. The food shortage evinces rather clearly that our agricultural policy has not been working in the right manner. There have been failures in the administration of policy at village and block levels and incomplete co-ordination between different departments in Government. The impact of these shortages has been exaggerated by restrictions on free movement of foodgrains imposed by State Governments. An artificial scarcity has been created in so-called deficit areas.

Thus, to a large extent the present rise in prices has been self-imposed and can be very much improved by removal of restrictions. We have been helped by timely assistance from foreign countries, particularly the U.S.A. While such assistance is of great importance to overcome temporary difficulties, we cannot depend on such assistance for all time. It is absolutely necessary for the country to become self-sufficient in food production and the administrative structure and policy to be reoriented towards this goal. It is no use diverting the public attention by placing blame at the door of one section of the community or the other. No system of distribution will be effective if production itself remains at a low level. There should be adequate incentives for the farmer to produce more and he should be provided with adequate facilities at the right time. Uptill now industrialists have not taken direct interest in agriculture. I feel that such interest is absolutely necessary; at least by those who run industries primarily based on agriculture. If I may say, it should be possible to impart to agriculture the techniques that make the successful running of industries. Our experience will be useful in this behalf.

The food shortage has created many problems not only in the economic sphere, but in others on which the very social order depends. Mischievous elements in society have taken advantage of the explosive sentiments and aggravated what would appear to be minor handicaps. There are disturbances every day in some part of the country or other. Scenes of lawlessness in which even students are participating have become common. Strikes are organised at vital points like docks which have to clear food imports.

All this is happening when we are programming the fourth Plan with a comparatively faster growth. It is reported that the fourth Plan will be designed in a manner which will help rapid growth of agricultural and industrial output. The problem, however, is not one which merely calls for greater expenditures. Unless effort is concentrated on specific factors which promote productivity directly, it is difficult to see how it would be possible to increase production and control the price level. So in the fourth Plan outlays must be such that they will augment productivity. A balance has of course to be secured between short-term and long-term yields. It will be dangerous to dissipate resources in non-productive fields.

Capital Market

There is a contradiction in the present economic situation. While on the one hand there is a rapid increase in prices of commodities, there is, on the other, almost a continuous decline in the level of share prices. It is more natural to expect that prices of shares provide hedge against inflation. But not only have they failed in this respect, but have even declined by a substantial margin. This shows that there is certainly something wrong in the financial policy which has tended to divert larger parts of investible funds from the people to Government. This aspect is again revealed in smaller contributions to new issues. Even good companies are finding it difficult to raise rupee resources. A great many of the new issues are underwritten and a large part of the issue is held by the underwriters themselves. This situation is not conducive to rapid industrial development. Unless there is a free flow of finance from people to industry it is not possible for industry to secure the necessary balance between different types of finance consistent with considerations of risk and profitability.

The major factor which led to freezing of the flow of finance from the public was additional taxation, particularly in the budget for 1963-64. Considering the measures adopted in the last four years the yield from additional taxation will be about Rs. 2,500 crores over the third Plan period—Rs. 800 crores more than the Plan provision. This unprecedented draft on private income has naturally depleted the investible funds in the hands of the private sector. What is worse is that a large part of the resources mopped up by additional taxation was dissipated by Government over uses which did not increase the productive capacity of the country. In the first three years of the third Plan alone over Rs. 600 crores have been absorbed by purposes unrelated to the Plan. To this extent, the growth in national income was suppressed and the generation of investible finance was lessened. It would have been more proper for the Government to secure finance for investment by borrowing on the capital market. This would have not only promoted better use of resources but indicated the urgency of the investment in different sectors of the economy. But to replace taxation by borrowings would again require the revival of the market for Government securities. Thus, on the whole it would appear that fiscal and monetary policies have tended to mitigate the growth of private industry by creating scarcity of finance. Establishment of newer financial institutions will, if anything, deter the growth of normal channels which alone can sustain development. Industry cannot be made to depend only on financial institutions in which case these institutions will virtually assume an unhealthy dominant position. Looked at from any angle, it is imperative that savings in the hands of the individual must be encouraged.

In this connection, I would like to refer to the much talked about 'unaccounted money.' This has been made to appear the principal villain in the present crisis. Let me be clear that I would not justify any wrong business practices, but at the same time, I would not like the business community to be wrongly blamed. Government have organised raids to unearth this unaccounted money, but often the raids have not resulted in any tangible results. They have only created an atmosphere of suspicion which does no one any good. On the contrary, the tensions which follow and the distrust, which is shown, lead to inaction and only hamper the growth of industrial activity. I, therefore, hope that Government will show greater understanding and ensure greater security and individual freedom. The punishment of the guilty, I feel, cannot be justified by harassment of the honest.

I must here refer to the tacit assumption of Governmental thinking that in proportion as the State interferes more and more with established institutions, it will approach nearer and nearer to perfection. Only this can explain the plethora of laws, rules, regulations and directives. I submit that this idea that the problems of the country can be solved by the exercise of political power should be abandoned. It is time that Government adopted a purposive policy which will evoke from the community at large wholehearted, instinctive, spontaneous response to programmes of development. Unless we are able to solve the problems quickly by releasing productive forces, I venture to express the fear that the democratic way of life itself will be in jeopardy.

I feel that the greatest handicap from which we are suffering is the way in which policies are implemented—or rather not implemented. When it comes to the stage of implemention, there is so much of vacillation and delay. It appears as if our administrative machinery is loth to move. Everyone is only too painfully aware of the gap between programmes and performance. I am of the view that this stage of affairs could be remedied if only the Government would see that, in all areas of activity, those who do not produce results will not be tolerated, whether at the ministerial or administrative level.

I have briefly referred to some of the economic problems facing the country and if immediate steps are not taken, the danger is that these problems may become even more difficult of solution.

Company's Affairs

Coming to the Company's affairs, as you are aware, the Company has completed 75 years of its successful and progressive working. To mark this happy occasion, your Directors have recommended a special dividend of 2 per cent on ordinary shares. It is not necessary for me to review in detail the progress of the Company; but suffice it to say that starting from a very small beginning today we are ranked among the seven biggest companies in the country. This fine record of progress and good name of the Company has been made possible by the co-operation and dedicated efforts of generations of our team of workers and managers who have been, and will continue to be, the Company's most valuable asset. It is also not necessary for me to recall again the part played by the late Lala Shri Ram who in fact has been the chief architect of D.C.M.

As you will observe from the balance-sheet, while the gross profits of the Company have increased from Rs. 3,39,22,290 to Rs. 3,94,00,334, the net profits have gone down. This phenomenon is not unusual or unhealthy and may continue as long as the Company continues to invest large amounts of money in new industries because of the heavy initial depreciation and development rebate on new investments.

All the units of the Company have done well in the last year except the sugar units which, like all other sugar mills in our area, have suffered due to shortage and low quality of cane. Even in the current year, the prospects do not appear to be very bright for the sugar industry. You will be pleased to know that the P.V.C. plant of the Company is now in full production and the rayon tyre cord plant is expected to start very shortly. Unfortunately, there is a danger of the P.V.C. plant having to reduce its production due to a cut in electricity by the Rajasthan Government. However, the Company is making efforts to find an alternative solution.

In the end, I would like to place on record our sincere appreciation of the wonderful work of all our workers and staff whose efforts have enabled us to achieve such good results during the year.

Note: *This does not purport to be a record of the proceedings of the Annual General Meeting.*

PROBLEMS OF PAPER PRODUCERS

MR. G. D. SOMANI PLEADS FOR TAX RELIEF

THE paper industry in India can feel justly proud of its achievements during the last few years. The industry, despite several difficulties, has expanded its capacity and production to a significant extent, diversified its manufacture, and improved the quality of products. Thus, between 1950-51 (base year for the first Plan) and today, the aggregate annual installed capacity of the industry has risen by as much as 360,000 metric tons to about 500,000 tons. The industry has not only expanded its capacity but also endeavoured its best to utilise the capacity to the maximum extent possible. The total production of paper and paper boards is currently maintained at an annual rate of about 490,000 tons, whereas the actual output in 1951 was no more than 134,000 tons. Thanks to diversification programmes of individual mills, several new kinds of paper and paper products are now being manufactured within the country. And efforts continue to be made to produce superior quality paper, including speciality paper. What is more, the prices of paper and paper products are not unduly high, having regard to the general level of prices and rising cost of living. In fact, since the present controlled prices were fixed a couple of years ago, there has been a marked increase in production costs for which no allowance has been made in prices and many units, especially the new ones with high capital costs, are suffering from unremunerative prices.

Remarkable though the progress of paper industry is, there is no room whatsoever for any sense of complacency. Indeed, the need for augmenting production of paper and paper products is pressing to a degree, in view of the persistently rising demand for the same. A clear idea of the demand potential was given by Mr. G. D. Somani, a Director of the West Coast Paper Mills Ltd., in his welcome address at the second international seminar on recovery of chemicals and forestry operation and plantation problems organised by the Indian Pulp and Paper Technical Association at Dandeli last week. Mr. Somani observed:

"The advent of planning in India has ushered in an era of dynamic industrial expansion in the country. The paper industry has a special role to play under planning, because, with vigorous literacy campaigns under the auspices of the Five-year Plans, the industry has assumed added responsibility for meeting the growing demand for paper at reasonable rates. During the first Plan, the demand for paper and paper boards increased at the rate of 8 per cent per annum; it rose to about 9.5 per cent during the second Plan, and is estimated to grow at the cumulative rate of 12½ per cent during the third Plan. In absolute figures, the total demand for paper and paper boards would increase from 366,000 tons at the end of second Plan to about 700,000 tons at the end of the third. A recent projection puts the demand for paper at 1.4 million tons by 1970-71, that is, the end of the fourth Plan. However, even with this impressive growth of the industry, India is far behind in *per capita* consumption of paper as compared with some other developed countries. The *per capita* consumption of paper (including newsprint) amounts to only 2 lbs. in India, as against 405 lbs. in the U.S.A., 198 lbs. in the U.K., 77 lbs. in Italy and 70 lbs. in Japan. This shows that potentialities of growth of this industry in India are stupendous and the industry has to make much leeway even to achieve a moderate standard of *per capita* consumption."

Deterioration in Profitability

The paper industry, as Mr. Somani said, may have the capacity and the willingness to accept the challenge to meet the rapidly growing requirements of paper. But what about some of the disquieting problems confronting the industry? The biggest problem pertains to the deterioration in profitability in recent years, as the paper industry has been caught between high production costs and heavy incidence of taxation, on the one side, and uneconomic (controlled) prices, on the other. It is calculated that the average rate of return on investment (that is, net profit after tax as per cent of net worth), which was 10.7 per cent during the first Plan, fell to 9.2 per cent in the second Plan and further to 7.5 per cent during the first two years of the third Plan. The revenue collected by the Central Government by way of excise duty on paper and paper products is estimated at Rs. 20 crores on an annual turnover of Rs. 80-85 crores. This is certainly a stiff burden on both the industry and the consumer. If the paper industry is to meet successfully the challenge posed before it, the return to it must be more attractive. While Mr. Somani refrained from openly pleading for an upward revision in the controlled prices of paper and paper products, he did urge for some indirect relief. It was possible, he said, to work out a scheme by which a small part of the excise duty might be allowed to remain with manufacturers earmarked for the industry's development and research programme, as well as for the regeneration of forest areas.

The Industry's Responsibility

The need for higher prices and tax relief apart, a heavy responsibility is cast on the industry itself. What this responsibility is was impressively highlighted by Mr. Somani. To quote him again:

"Placed in a difficult situation as we are, it is all the more necessary that the technicians and executives concerned with planning, research and execution of this industry continually apply themselves to reduce production costs and increase productivity, thereby helping the country not only to manufacture these products at low cost but also to facilitate exports. A lot will have to be done to diversify our products, standardise our specifications for quality control, increase the technical talent in the country and forge it together. We, at the West Coast, find that, given the opportunity, there is nothing that an inspired team of persons cannot do to rise to the occasion. I have no doubt that the other units feel the same way as we do."

The example of West Coast Paper Mills cited by Mr. Somani is appropriate. This writer who had the privilege of visiting the factory is deeply impressed by the splendid work of the management in making the factory one of the most efficient units in India, worthy of emulation by others in the field. Special attention continues to be devoted to training of personnel. It is proposed to commence next month a twelve-month training course in the different branches of paper technology. The course will be open to those who have obtained degrees with distinction in chemical engineering. The candidates selected will be offered handsome stipends and, after completion of the course, they will be absorbed, according to the Company's management, in the permanent cadre with attractive starting salaries and running grades. It is also proposed to send some persons for training in paper making in foreign countries such as the U.K., West Germany and Sweden.

Research

Closely allied to the problem of training personnel is that of pooling scientific and technical data and know-how. Since no basic research is being done on any worthwhile scale in the country except at Dehra Dun, which, by itself, can hardly be regarded as adequate, it was just as well that Mr. Somani should have urged the Indian Pulp and Paper Technical Association (I.P.P.T.A.) to take concrete steps to see that the experience of any particular mill was instantly available to others. He also suggested the establishment by the paper industry of a central research laboratory, similar to the laboratories set up by some other industries. A fund, according to him, can be created based on contributions of, say, Rs. 10 per ton of annual production. When enough resources are obtained, the industry can approach the F.A.O. and certain pulp and paper organisations abroad for help in procuring equipment and instruments. If the Government allows a part of the excise duty for development purposes, a portion of this earmarked amount can also be used for setting up and running the proposed laboratory. It may be noted here that the Government of India has met half the non-recurring and recurring expenditure on the research laboratories set up by some industries such as cotton textiles and art silk. Inaugurating the seminar, Mr. S. Nijalingappa, Chief Minister of Mysore, held out the welcome assurance that, if the industry were to come out with a concrete scheme, he would see that the Government of his State and at the Centre provided half of the total outlay.

Raw Materials

The problem of raw materials is a crucial one and it was not surprising that both Mr. Somani and Mr. V. Podder (President of the I.P.P.T.A.) dealt with it at some length. Inasmuch as the paper industry depends mainly on the forest-based raw materials, it would be necessary, as Mr. Podder rightly remarked, to have a perspective plan for a sufficiently long period. The production targets for paper and paper products, newsprint and chemical pulp tentatively fixed in the fourth, fifth and sixth Five-year Plans and the raw materials required for realising the targets are indicated in Table B. The paper industry, it may be noted here, uses mainly bamboos and sabai grass, in view of the high quantity of pulp they yield, easy cooking facilities they provide and their availability in good quantity at a reasonable cost. The other raw materials are imported wood-pulp, waste paper, hemp, etc., bagasse, conifers and salai wood. The West Coast Paper Mills is also producing paper from eucalyptus.

It is somewhat disquieting to hear that an accurate estimate of the country's entire forest resources is not available, nor have forestry problems been intensively studied and the widespread flowering of bamboos in some regions sometimes have been causing much concern. Mr. Somani was quite right when he said that the paper mills should themselves consider this bread-and-butter matter, rather than leave the same entirely to the Government. The West Coast Paper Mills must be congratulated on its initiative in promoting private afforestation. The Company has succeeded in implementing a programme of intensive plantation of bamboo and eucalyptus which is expected to raise the yield from less than a ton per hectare to about four to five tons in due course. It was, indeed, commendable on the part of Mr. Somani to have held out the assurance that his Company was always glad to pass on such data as it would have on forestry operations to other paper mills in the country.

Plantation timber ..	..	..	2,000	3,500

N.A.—Not available.

Recovery of Chemicals

Another crucial problem of the paper industry concerns the recovery of chemicals. The nature of this problem was vividly described by Mr. Podder. Here is the relevant extract from his speech:

"A number of chemical methods of converting cellulosic raw material to paper pulp are dependent for financial success upon recovery of chemicals from the spent digestion liquor which contains approximately one-half of the original weight of raw material plus almost all the pulping chemicals. In our country, the price of chemicals is very high. Caustic soda is delivered to the mills at an extremely high price and it is almost double the price prevalent in other countries. The price of salt cake has also soared high in recent years. Except one mill in India, all are working on alkaline process and, therefore, it is very important that alkaline process mills in our country should pay much attention to the efficient operation of the chemical recovery units. Most of our mills have inefficient chemical recovery plants not with sufficient capacity and their chemical recovery efficiency is as low as 60-65 per cent, whereas, in advanced countries like the U.S.A. and Canada, chemical recovery efficiency of over 90 per cent is not unusual.

"The production of chemical pulp in India by the end of third Plan period will about 2,000 tons a day and the caustic soda consumption above 1,000 tons a day. Most of this caustic soda should be regenerated and, therefore, a soda recovery unit should not be considered an auxiliary plant but a unit by itself on which the economy of the paper mill entirely depends. The capital requirement and production cost per ton of caustic soda in soda recovery is much less than the cost involved in a caustic soda plant and it will be a tragedy if steps are not taken to modernise these plants to the maximum efficiency.

"The paper mills in India have been facing considerable difficulties owing to sizable losses of chemicals due to operational handicaps and due to obsolete poor recovery plants. Besides these, there are many factors responsible for poor recovery, namely, nature of the cellulosic raw material, washing efficiency of the brown stock, qua-

PREMIER AUTO TURNS THE CORNER

KALYAN PROJECT PROGRESSING WELL

A SAFE conclusion that one can draw from the report of the Premier Automobiles Ltd. (Managing Agents; Messrs. Aero-Auto Ltd., Bombay) for the year ended 30th June 1964 is that the Company has seen the worst and that its working should improve in the coming years. The production and sale of trucks which had improved in the preceding year by 388 to 5,712 trucks advanced by a further 1,000 to 6,711 trucks during the year under report, though that of passenger cars has dropped further by 267 to 4,083 cars. The value of spare parts sold, on the other hand, was also greater at Rs. 2.55 crores as against Rs. 1.92 crore a year ago. Further, as the Chairman, Mr. Lalchand Hirachand says in his statement circulated along with the annual report, with the commissioning of the press plant at Kalyan and the installation of balancing equipment at Kurla, the Company has very nearly completed its manufacturing programme and has reached about 90 per cent indigenous content in regard to trucks and about 74 per cent in regard to Fiat cars. What is more, it is now ready to launch on its expansion programme for the manufacture of 15,000 commercial vehicles and components, subject, of course, to the necessary finance being available.

With the aforesaid increase in production, sales during the year under report rose by Rs. 3.98 crores or approximately 25 per cent to Rs. 24.10 crores. The gross profit has expanded to Rs. 162.43 lakhs from Rs. 118.81 lakhs earlier. If the improvement in gross profit has not been sufficiently encouraging, it is mainly because of a higher wage bill—staff expenses are up from Rs. 276.74 lakhs to Rs. 322.89 lakhs—rise in cost of raw materials and higher rate of interest on borrowings. Moreover, the heavy capital expenditure of Rs. five crores incurred on the Kalyan project has not yet started yielding any return. Consequent upon the inflation in the gross block, the provision for depreciation too has gone up by Rs. 13.48 lakhs to Rs. 76.95 lakhs and so also that for taxation to Rs. 33.50 lakhs from Rs. 19.15 lakhs. The rise in net profit is, therefore, a mere Rs. 9.88 lakhs to Rs. 46.67 lakhs, after providing Rs. 5.91 lakhs as against *nil* for the Managing Agents' commission. After a net addition of Rs. 17.01 lakhs as against Rs. 28.75 lakhs to reserves, the Directors have proposed a "modest" dividend of four per cent which claims Rs. 29 lakhs. It will be recalled that, in the preceding year, the dividend had had to be passed over owing to paucity of profits.

The working results of the Company for the year under review are set forth in the comparative table below with those of the preceding three years thrown in for the sake of comparison:

(In lakhs of rupees)

	For the year ended 30th June			
	1964	1963	1962	1961
Sale proceeds	24,09.83	20,11.64	21,47.62	22,73.87
Other income	18.88	16.88	12.74	14.60
Closing stock of finished goods	292.50	199.66	217.01	191.63
Raw materials and stores consumed	18,80.01	14,81.83	16,09.10	17,80.58
Staff expenses	322.89	276.74	266.40	222.64
Other expenses	147.22	133.74	146.47	119.12
Gross profit	162.43	118.81	163.68	193.86
Managing Agents' commission	5.91	..	6.76	8.83
Provision for—				
Depreciation	76.95	63.47	60.37	56.14

Expenses relating to past years	16.04	10.90	5.07	4.32
To reserves	17.01	28.75	8.00	23.00
Ordinary dividend	29.00	..	39.32	49.82
	(4%)	..	(7%)	(9%)
Carry forward	0.67	0.40	1.84	4.76
Market price of ordinary shares (in rupees):	1964	1963	1962	1961
High	112	117	160 c.r.	187
Low	92	95	92 x.r.	151

As stated earlier, the number of passenger cars manufactured and sold dropped further from 4,350 to 4,083 but the Company maintained the progress in increasing the indigenous content of the Fiat car. With the commencement of the body sheet metal parts production at the Kalyan plant, the indigenous content is expected to go up to 74 per cent. As for trucks, the Company executed satisfactorily the orders for the supply of vehicles to the Defence Department, the number of trucks sold rising by approximately 1,000 to 6,711. The production programme is now proceeding according to schedule and, when the sheet metal project goes into full production, the indigenous content of trucks will go up to approximately 90 per cent.

As regards the Kalyan project, the Directors say that land admeasuring 388 acres was purchased during the year and the construction of the press plant building and the erection of presses were completed. Dies for major panels such as doors, roofs, side panels, bonnets, etc., were also received. Contrary to expectations the first phase of production of body panels could not commence in the first quarter of 1964 mainly due to the non-availability of cement, difficulties experienced in transporting the heavy presses to the plant site and the subsequent assembly thereof. The plant, however, started production in July last and is expected to go into full production shortly.

During the year, the 1,87,237 new shares became fully paid consequent upon the final call being made payable on or before 1st February. This has raised the paid-up share capital to Rs. 742.94 lakhs; reserves and surplus amount to Rs. 220.34 lakhs. Two foreign exchange loans were also received and these have raised total borrowings to Rs. 1,203.82 lakhs from Rs. 890.78 lakhs earlier. These are besides current liabilities and provisions which on the date of the balance sheet, that is, 30th June 1964, aggregate Rs. 509.39 lakhs. On the assets side, with the addition of new assets worth Rs. 138.38 lakhs, the gross block account now stands raised at Rs. 1,025.62 lakhs and yields on deducting from it the depreciation provided so far (Rs. 517.43 lakhs) a net block of Rs. 508.19 lakhs. The total expenditure up-to-date on the new project under erection is placed at Rs. 508.71 lakhs. Investments, a major portion of which is in shares of wholly owned subsidiaries, are shown at cost at Rs. 15.82 lakhs while current assets, loans and advances altogether amount to Rs. 1,636.74 lakhs. Miscellaneous expenditure yet to be recouped is Rs. 6.02 lakhs.

The present market quotation for the Rs. 100 paid ordinary shares of the Company is Rs. 94 *cum*-div. At this price, the net yield works out to a little over 3.5 per cent per annum.

J.K. STEEL LTD.

The working results of J.K. Steel Ltd. (Managing Agents: J.K. Industries Private Ltd.) for the year ended 30th June 1964 are not as encouraging as those for the previous year. For, thanks to unsatisfactory supply position in respect of raw materials, especially billets, and continued restriction on electric power, sales have dropped from Rs. 176 lakhs to Rs. 162 lakhs and the gross profit from Rs. 32.27 lakhs to Rs. 31.36 lakhs. The provision for depreciation has been raised from Rs. 3.18 lakhs to Rs. 3.50 lakhs while that for taxation is reduced from Rs. 14.63 lakhs to Rs. 13.44 lakhs. The net profit is a shade lower at Rs. 14.42 lakhs, as against Rs. 14.47 lakhs. The directors have allocated Rs. 5 lakhs (Rs. 15.24 lakhs) to general reserves and Rs. 2.54 lakhs (Rs. 0.06 lakh) to development rebate reserve. Equity dividend has been maintained at 15 per cent and will absorb Rs. 6 lakhs.

Manufacture of electric hoists and chain pulley blocks has commenced in the new mill of the Company during the year and the products have been very well received in the market. The expansion projects of the Company with regard to its wire rope plant has progressed considerably and most of the imported machinery have been shipped. The Company is further pursuing other expansion schemes of its cold rolling mills and electric overhead travelling cranes.

(*Concluded from next column*)

of necessary foreign exchange. It is learnt that the Company's applications has been forwarded by the Government to the Agency for International Development and it is expected to be finalised shortly.

There is no change in the paid-up capital of the Company which, as at 30th June 1964, stands at Rs. 344.64 lakhs, made up of Rs. 70.93 lakhs in preference shares of Rs. 100 each and Rs. 273.71 lakhs in ordinary shares of Rs. 10 each. Reserves, on the other hand, have moved up from Rs. 76.19 lakhs to Rs. 101.87 lakhs, so that the total of own funds amounts to Rs. 446.51 lakhs. As against this, the outside interest aggregates Rs. 210.18 lakhs, comprising Rs. 133.10 lakhs as borrowings and Rs. 77.08 lakhs as current liabilities and provisions. This is more than fully covered on the assets side by the total of current assets, investments and loans and advances at Rs. 264.99 lakhs. The gross block, inclusive of the additions of Rs. 6.43 lakhs and the capital work-in-progress of Rs. 11.70 lakhs, stands raised at Rs. 744.06 lakhs and on deducting the accumulated amount of depreciation of Rs. 352.36 lakhs, the net block comes to Rs. 391.70 lakhs.

The Rs. 10 fully paid ordinary shares of the Company are currently priced on a *cum*-final dividend basis at Rs. 12.20. On an *ex*-final dividend price, fresh investments fetch a net annual return of about 8.4 per cent.

SMART IMPROVEMENT IN SIRPUR PAPER

PROFITS AND DIVIDEND HIGHER

THANKS to the improvement in labour relations, the Sirpur Paper Mills Ltd. (Managing Agents: Messrs. Birla Brothers Private Ltd., Calcutta) has been able to effect a smart recovery in its working in the year ended 30th June 1964. With the production of paper rising to the peak level of 36,000 tonnes from 24,000 tonnes for the preceding year, the net realisation (that is after deducting the excise duty paid) from sales has advanced by no less than Rs. 197.77 lakhs to the record figure of Rs. 550.84 lakhs. And even though there was a further rise in cost of raw materials, chemicals, power, fuel, etc., the gross profit has almost trebled to Rs. 107.91 lakhs from Rs. 38.51 lakhs for the year before. As a result of this rise in the gross profit, the provision for the Managing Agents' commission has gone up from Rs. 0.12 lakh to Rs. 3.29 lakhs while that for depreciation at Rs. 40.89 lakhs is higher by Rs. 8.44 lakhs than that for the previous year. Surprisingly enough, no provision for taxation is still found necessary partly because of the heavy amount of development rebate claimed for the year and partly because depreciation computed according to scheduled income-tax rates works out to Rs. 56.52 lakhs or Rs. 15.63 lakhs higher than that actually provided.

Consequently, the resulting net profit shows a handsome rise of Rs. 56.78 lakhs to Rs. 63.73 lakhs. Although the Directors have stepped up the credit to reserves by Rs. 64 lakhs to Rs. 67 lakhs (of this, 80 per cent, or Rs. 53 lakhs, is to the credit of statutory development rebate reserve), as much as Rs. 41 lakhs of these merely represent the amount transferred from the development rebate reserve created a year earlier. The net transfer to reserves out of the year's profit thus amounts to only Rs. 26 lakhs and, therefore, leaves a substantial amount for the distribution of dividend. Out of the balance so available, the Directors have first set aside Rs. 5.53 lakhs for the payment of preference dividend and to compensate the ordinary shareholders for the loss in dividend suffered by them in the preceding year they have proposed a final dividend of 8.5 per cent in addition to the interim of 3.5 per cent paid earlier. The total ordinary dividend for the year thus amounts to 12 per cent as against five per cent for 1962-63 and 8.5 per cent per annum for 1961-62 and 1960-61.

The following table presents synoptically the working results of the Company for each of the past four years.

(In lakhs of rupees)

	For the year ended 30th June			
	1964	1963	1962	1961
Sales less excise duty	550.84	357.07	484.25	453.96

Market price of ordinary shares (in rupees):	1964	1963	1962	1961
High	13.76	15.40	17.80	19.12
Low	11.00	10.76	10.80 x.r.	13.40

Although the working of the factory during the year under review was satisfactory, it was not wholly free from trouble. There was a fire in June in the paper machine section in the motor generation unit of the main drive of machine No. 3 which remained closed for about a fortnight. The loss due to the damage and subsequent loss of production which is covered by insurance is under the scrutiny of the insurers.

Under its plans for modernisation and expansion of its mills, the Company has now finalised orders for certain indigenous equipment for effecting improvement in the existing plant and the foreign exchange requirement amounting to Rs. 20 lakhs has also been approved in principle by the lending authority. As regards the substantial expansion of the mills to be effected in collaboration with the Kimberly Clark Corporation of the U.S.A. the Company has applied to the Government for grant

(*Continued in previous column*)

WEST COAST PAPER PAYS MORE AGAIN

FINANCES HEALTHY—PROSPECTS BETTER

WISE men say that a bird in hand is better than two in the bush. But one would be called especially lucky if one were to find that one has already got one bird in hand and is equally sure of getting the two more in bush. Such enviable luck is given to the shareholders of the West Coast Paper Mills Ltd. (Chairman: Mr. Gobindlall Bangur, Bombay). For the fourth year in succession—the one ended 30th June 1964—they have received a higher dividend, this time of Rs. 13 against Rs. 11 the year before. Four years ago, the rate of dividend was just Rs. 6. The prospects of their getting a still better deal from the Directors appear almost certain. At Dandeli, where the Company played host to a seminar, its spokesman announced a Rs. 1.20-crore expansion programme designed to step up production to 40,000 tonnes by 1965-66. The current year's target is 32,000 tonnes against 30,213 tonnes actual production last year. Since the expansion programme, which will also increase the production range to include art and glaze paper, will be financed through retained earnings, the shareholders will reap the full benefit of it without investing anything more on their own.

Yet another significant development is the investment by the Company of Rs. 66 lakhs in the Andhra Pradesh Paper Mills, bringing with it full managerial control over the latter Company, with equal ownership by the Andhra Government and the public. This additional investment of roughly Rs. 2 crores by the Company the State Government and the public (who is to be offered shares worth Rs. 66 lakhs in March next) is required to raise the capacity from 6-7 tonnes per day at present to 60 tonnes in order to run this formerly State owned and styled as Rajahmundry Paper Mills on an economic basis. Lack of finance was a serious handicap for the State Government in installing new machinery lying in crate for the last two years. Under the 8-year agreement with the State Government, the Company will manage the undertaking and provide the technical know-how for a remuneration of Rs. 4 lakhs per annum. The investment of Rs. 66 lakhs has been made by the Company after obtaining the approval of its shareholders and also of the Industrial Finance Corporation of India Ltd. to which it still owes a sum of Rs. 1.20 crore out of an original loan of Rs. 1.50 crore. The Company Law Board also has given its consent to the deal. This is, indeed, a bold venture.

It is interesting to hear that the Company will start a 12-month intensive training course in different branches of paper technology from January next. The course will be open to graduates in engineering who have passed with distinction. The Company has also plans to depute every year five to six persons from the existing personnel to undergo training in paper making in the U.K. and Germany.

Now to turn to the financial results for the year under review. The two-point increase to Rs. 13 in the dividend reflects the benefit of an increase of Rs. 44 lakhs to Rs. 444.47 lakhs in net sales (that is, after excluding excise duty paid) and a sharp rise in gross profit from Rs. 109.87 lakhs to Rs. 148.85 lakhs. Net profit, however, shows a setback from Rs. 60.49 lakhs to Rs. 48.03 lakhs, since both depreciation and taxation have claimed a larger amount. The third shift allowance permitted under the Finance Act 1964 has raised the depreciation provision from Rs. 39.38 lakhs to Rs. 49.82 lakhs. The tax provision has increased from Rs. 10 lakhs to Rs. 51 lakhs. As the equity dividend has been raised in spite of a lower net profit, the amount transferred to reserves has had to be reduced considerably from Rs. 39.75 lakhs to Rs. 21.50 lakhs.

During the year, the price of essential chemicals and other materials recorded a further rise and the cost of production went up, while the controlled prices of paper remained unchanged. The Company's working would have been adversely affected, but for the fact that the increase in production costs was offset by attaining greater efficiency and higher production, which was an all-time record of 30,213 tonnes, 2,961 tonnes more as compared with the previous year's output. Laboratory experiments have contributed to improvement in quality of paper.

The Company has already embarked upon an intensive programme to plant not only bamboo species but also certain fast growing varieties of tropical woods like eucalyptus, hybrids, paper mulberry, etc., in addition to species of bamboo not usually grown in the Dandeli forests. Actual bamboo plantation done during the year is approximately 10,000 acres which is really a good start towards attaining self-sufficiency in raw material.

The following comparative table gives a clear idea of the Company's progress in the past four years:

(In lakhs of rupees)

	For the year ended 30th June			
	1964	1963	1962	1961
Sale proceeds, less excise	444.47	400.09	360.87	383.93
Other income	6.79	1.75	1.60	2.17
Closing stock of paper	17.24	18.29	16.70	14.60
Excise duty	91.02	82.60	75.03	66.82
Materials, chemicals, stores and spares consumed	135.03	126.50	121.05	126.43
Staff expenses	53.97	43.93	41.50	39.23
Other expenses	112.35	123.15	109.74	110.78
Gross profit	148.85	109.87	92.27	105.77
Depreciation	49.82	39.38	39.12	47.33
Taxation	51.00	10.00	..	..
Net profit	48.03	60.49	53.15	58.44
Transfer to reserves	21.50	39.75	32.00	40.00
Dividends—				
Preference	7.02	7.02	7.02	7.02
Ordinary	19.50 (13%)	16.50 (11%)	12.00 (8%)	11.25 (7.5%)
Carry forward	0.07	0.06	2.54	0.71
Equity shares' market value (in rupees):	1964	1963	1962	1961	1960
High	177.00	175.00	194.00	229.00	240.00
Low	149.50	125.00	135.00	168.50	149.50

Financially, the Company is in a sound shape. Its paid-up capital, including Rs. 89.99 lakhs in 6 per cent cumulative preference shares, is unchanged at Rs. 239.99 lakhs and commands a backing of Rs. 178.32 lakhs in reserves and surplus. Secured loans of Rs. 126.76 lakhs are of a long-term nature. Short-term indebtedness by way of current liabilities and provisions is of Rs. 112.84 lakhs and is well covered by liquid assets aggregating Rs. 210.52 lakhs. The gross block of Rs. 648.80 lakhs (Rs. 638.59 lakhs a year before) stands reduced by a third at Rs. 436.54 lakhs, the depreciation provided so far being Rs. 212.27 lakhs.

At the current market value of Rs. 165.50 *cum-div.*, the Rs. 100 fully paid ordinary shares of the Company offer a net yield of 6.7 per cent per annum.

LABOUR

(*Concluded from page* 1003)

all paid on time rates. They are given bonuses for fulfilling and exceeding the cost-reduction plans and in some industries for exceeding output and quality improvement targets. Explaining the details of the scheme Mr. Shkurko says:

"The system in operation before 1959, under which bonuses for salaried staffs depended on fulfilment or over-fulfilment of production targets, combined with reduction of costs, tended to force up the volume of output only. With the increasing importance of economic indices it was necessary to find a system under which due emphasis would be placed by engineers, technicians and other salaried staff on quality as well as quantity.

"Cost of production reflects all aspects of the activities of an undertaking and its various sections. Bonuses for salaried staffs therefore encourage them both to increase output and to cut costs. But as production cost plans can be fulfilled, even though other important requirements are neglected, no economy bonuses are paid unless all requirements are satisfied with regard to productivity and delivery. This provides the material incentive for all-round efficiency.

"Subject to these general rules, salaried employees in production sub-sections receive bonuses on the basis of the performance of the department or shop to which they are attached; whereas for those in the management of the undertaking, it is the performance of the undertaking as a whole that counts. Members of auxiliary sections are awarded bonuses according to the output of the whole undertaking or of the principal sections they serve, provided that their own sections meet quality and output standards.

"Bonuses are calculated on monthly results. Managerial staff, however, receive only 50 per cent of the bonuses at the end of each month, the remainder being paid to them only upon fulfilment of the plans for each quarter, as an incentive to achieve satisfactory results not only in a favourable month but also over a longer period.

"In addition to the forms of bonus payment described above, undertakings also award bonuses to employees who devise or introduce technical innovations or methods, leading to complex mechanisation and automation of production. This form of bonus is payable on one occasion only, and only to the workers directly involved. The sums awarded depend on the benefits obtained during the year from introduction of new machinery, materials or process. Staff are informed of the amount of these awards at the same time as the plans for the innovations are made known.

"Engineers and technicians are entitled to these innovation bonuses (over and above cost-reduction bonuses) up to an annual ceiling equivalent to six months' salary in the engineering industry and three months' salary elsewhere. Wage earners may also be awarded such bonuses (over and above their bonuses for fulfilling or exceeding monthly targets) up to an annual ceiling equivalent to three months' wages."

Technical Progress and Wage Rates

Technical progress in the U.S.S.R. is advancing at a fast pace and is gradually levelling out the intensity of effort demanded of the workers. With the introduction of complex mechanisation and automation, unskilled worker is also gradually disappearing. In highly mechanised operations, the worker's job is circumscribed by the supervision, adjustment and maintenance of machines and he loses the power to push up production beyond the technically established limits. It thus becomes impossible to assess the productivity of an individual worker and piece-rate become ineffective. At best, an assessment can be made of the productivity of a group of workers and the individual piece-rate system is therefore being gradually replaced by group systems for whole production teams or sections. Growing mechanisation will gradually result in bringing down the difference between the wages of piece-rate and time-rate workers. It will also make the conditions of work in various industries more uniform and thereby narrow the industry-wise differentials.

It is said that, in the U.S.S.R., there is a growing emphasis on the need for improving the profits of industrial and other undertakings. This is sought to be done by bringing down production costs. It has been estimated that an economy of one per cent will mean a saving of 2,100 million roubles in costs. With the advance in technical progress, labour cost per unit of production will naturally be lower. But, whereas technical progress makes the equipment more productive, it also adds to the cost of capital equipment, so that its unsatisfactory utilisation will result in a greater loss. In order to ensure the effective use of plant and machinery, the bonus system, as already described, has been introduced.

Discussing possible future trends, the author of the article says:

"Quality control is a further essential factor in economic expansion. Systematic improvement of quality does not merely mean better goods: since what is produced will last longer, it also means that more goods will be available. Moreover, as machinery becomes increasingly complex, high standards of quality and precision are vital to smooth and efficient operation of production plant, transfer mechanisms and other equipment. To existing quality grading methods, incentive systems will sooner or later have to add such factors as reliability and durability.

"The need for greater incentives to improve quality does not imply that output incentives should be abandoned; on the contrary, it is planned to step up industrial production sixfold in the next 20 years. Ensuring that the workers have a material interest in higher output therefore remains the most important function of incentive systems, despite the increased weight that will be attached to economic indices and improvement of quality. One of the essential principles which must guide such systems in the near future is the need to reward quantity and quality in the right proportions.

"One last requirement should be mentioned in conclusion. According to the current economic plans, a vast amount of new automated plant, remote-control installations, flow-lines and strictly regulated continuous processes will be brought into operation in the next few years. Only by means of such technical progress can a high rate of increased production be obtained, conditions of work steadily improved and wage differentials reduced. Accordingly, all personnel must have a material as well as a moral interest in technical advance. It is, therefore, necessary to perfect methods of incentive payment for the preparation and introduction of new machinery and techniques, for inventions and organisational proposals."

It will thus be seen that payment of incentives to workers has become an integral part of Soviet wage system and an important instrument of industrial progress of the U.S.S.R.

MORE PAID HOLIDAYS FOR AMERICAN WORKERS

American workers who are covered by labour union contracts are receiving more paid holidays than ever before. A survey made by the U.S. Department of Labour of nearly 1,700 major union contracts recently negotiated, covering 7.40 million workers, shows that: (1) in place of the six holidays with pay, typical ten years ago, most union contracts at larger plants now provide at least seven holidays. In addition, clauses calling for eight or more days are now contained in about 40 per cent of these contracts; (2) new holiday concepts are emerging—a holiday on the worker's birthday; an unspecified "floating" holiday which can be used to make a long week-end; or an extra day during the traditional holidays; and (3) premium pay for work on holidays is being raised to triple-time (holiday pay *plus* double time for hours worked). Improvements in holiday practice will continue to be feature of collective bargaining in coming years, the A.F.L.-C.I.O. *American Federationist* predicts. As automation makes it increasingly possible to produce more and more goods and services with fewer workers, the work-week will be reduced and there will be longer vacation, earlier retirement and more holidays.

SYNOPSES OF COMPANY REPORTS

Smith, Stanistreet and Co., Ltd.

(*Chairman*: Mr. D. M. Jaffray, Calcutta.)

Annual General Meeting—22nd December 1964.

† Upto 20th November 1964.

Extracts from the Directors' report: A number of pharmaceutical specialities and a few quality cosmetics were introduced during the year. The pharmaceutical specialities were favourably received by the profession and trade and the cosmetics were well appreciated by consumers.

In South India five branches were opened at Madras, Bangalore, Ernakulam, Kakinada (now shifted to Vijayawada) and Hyderabad for better distribution of Company's own products and the progress of sales in these places was more marked during the year compared to the previous years when the territory was operated by Distributors.

The Research Division is engaged in the development of a number of pharmaceutical specialities and it is expected that they will attract good sales when released to the market.

Accounts in brief as at 30th June 1964 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	25,00,000	Gross block	33,60,093
Reserves and surplus	19,28,732	—Depreciation	20,06,653
Other liabilities	87,94,966	Net block	13,53,440
		Current assets	1,10,43,410
		Investments	3,18,835
		Cash	5,08,007
	Rs.1,32,23,698		Rs.1,32,23,698

* Paid-up capital consists of 10,000—10 per cent preference shares of Rs. 50 each and 4,00,000 ordinary shares of Rs. 5 each. Of the above, 2,33,768 ordinary shares are held by the Holding Company—The Shalimar Works Ltd.

Mandya National Paper Mills Ltd.

(*Managing Agents*: Bedi & Co. Management Ltd., Bangalore.)

Sixth Annual General Meeting—9th December 1964.

Extracts from the Directors' report for the year ended 30th June 1964:

This was the second year of operation of the Mill, and the profit and loss account shows a working loss of Rs. 12,34,154 as compared with a working loss of Rs. 28,42,856 in the previous year, before providing for depreciation. Sales of paper have increased from Rs. 1,13,00,000 in the financial year 1962-63 to Rs. 1,76,00,000 during 1963-64. The per tonne sales realisation has also increased slightly from Rs. 1,825 in 1962-63 to Rs. 1,887 in 1963-64. There was a notable reduction in the per tonne cost of raw materials consumed which, together with the normal working of the Mill, has resulted in an improvement in the overall working results noted above. The cost of insurance has also diminished somewhat due to the discontinuation of the Emergency Risk Insurance from December, 1963. There has been an increase in the value of finished stocks due to seasonal fluctuations in the market. The Company received an Import Licence under the Development Loan Fund in the course of the year, and has been able to slightly build up its stocks of essential imported spare parts, which reflects in the increase in the value of stores and spares.

During the year the cost of production was affected by an acute shortage of bagasse. It is likely that if bagasse had been available in adequate quantities, the working loss would have been eliminated entirely. Due to the non-availability of sugarcane, the Mysore Sugar Company Ltd., Mandya, had to curtail its crushing season by approximately 4 months, ending crushing in December 1963 instead of April 1964. The position with regard to the supply of sugarcane has now improved, and it is hoped that supplies from the sugar mill at Mandya will be adequate for the ensuing year, and enable the Mill to eliminate working losses and perhaps cover part of the depreciation. The Mill's equipment is working satisfactorily and since August 1964, when bagasse supplies were available, the Mill was able to produce paper with more than 70 per cent bagasse on average. Paper has also been produced satisfactorily with 100 per cent bagasse, which represents a technological achievement of the first order. The paper manufactured by the Mill was very well received in the market.

The finished production during the year ended 30th June 1964, was 10,114 tonnes against a rated capacity of 10,800 tonnes. The Mill worked for 300 days out of 366 days. 6 days production was lost due to non-availability of power; 4 days due to non-availability of water and 56 days production due to holidays, wire changes, mechanical, operational and other reasons.

Government have granted a 15 per cent rebate in excise duty on production of mills coming into operation after 1961. They have also granted a rebate of 5 paise per Kg. for paper units based on bagasse, producing paper with more than 40 per cent bagasse content. These concessions, it is expected, will assist, along with the stable supply of raw materials, in eliminating operational losses for the next working season. Upto the end of September 1964, the Company has drawn a sum of Rs. 1,17,00,000 from the loan made available by the United States Agency for International Development, Washington, D. C., leaving a balance of Rs. 33,00,000 set apart for meeting part of the cost of the proposed expansion of the Company. The mortgage in favour of the AID is still to be executed. The expansion proposals are likely to be implemented during the course of the ensuing year and, on completion, will alter the profitability picture of the Company to its advantage. The Industrial Finance Corporation of India is expected to grant a loan of Rs. 1,00,57,000 to the Company for expansion to cover the cost of machinery as well as a refinancing loan of Rs. 96,66,000. During the course of the year, three instalments of deferred payments, amounting to Rs. 61,08,000 have been repaid from the loan taken from the AID.

Accounts in brief as at 30th June 1964 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	2,02,72,580	Block	4,72,14,584
Other liabilities	3,67,04,256	Current assets	49,99,649
		Investments	1,000
		Cash	3,08,574
		Miscellaneous expenditure	3,76,019
		P.L. a/c deficit	40,77,010
	Rs.5,69,76,836		Rs.5,69,76,836

* Paid-up capital consists of 14,300 equity shares of Rs. 10 each and 60,000—7 per cent tax-free redeemable cumulative preference shares of Rs. 100 each. Calls in arrears—ordinary=Rs. 22,795 and preference=Rs. 4,625.

Rajagiri Rubber and Produce Co., Ltd.

(*Managing Agents*: A. V. Thomas & Co., Ltd., Alleppey, Kerala.)

Twenty-seventh Annual General Meeting—16th December 1964.

Working Results:

	For the year ended 30th June (In thousand rupees)	
	1964	1963
Sales of rubber	30,16	26,91
Income from sundry produce	18	28
Closing stock of rubber	3,38	3,42
Gross profit	12,02	9,28
To Managing Agents' remuneration	1,12	88
Transfer to depreciation	52	35
,, ,, provision for taxation	5,20	2,80
Net profit	5,18	5,25
Appropriations:		
Transfer to-dividend equalisation reserve	50	85
To dividends (taxable) preference	1,37	1,37
,, ,, ,, equity	3,36	2,87
	(25%)*	(21½%)*
Carry forward	14	21
Market value of equity shares (in rupees):	1964†	1963

* Dividend paid out of the dividend reserve.
† High and low upto 27th November 1964.

Extracts from the Directors' report: Encouraged by the results of the research so far done by the technical staff and the new types of batteries that they have developed within limited facilities available, the Directors have sanctioned the establishment of a fully equipped Research Laboratory including facilities for Pilot Plant Operation. Orders for the necessary Laboratory Equipment and Testing Instruments are being placed. It is hoped this Laboratory would be in operation by the end of the current year.

The demand for special types of batteries both for defence and civilian requirements have considerably increased—thanks to the admirable performance of the Company's patented Pg Batteries in the various fields of application. In addition the exports requirements too, during the year have been of considerable volume. These two demands are being met with on a priority basis and hence there has been naturally, a shortfall in the supply of automobile batteries to the trade. To overcome this shortfall and also reduce the gap between the demand and supply on the Company's Factory, the Directors have taken necessary steps for substantial increase in production. It is hoped during the current year, the Factory would increase its production by another 50 per cent.

Sizable increase in the working space has been taken up and the Factory is building in its own Workshops most of the equipment to take care of this increased production and in addition orders have been placed for some of the special equipment which could not be manufactured by the Company. This machine building activity in the Company's own Shops and the development of the Technical Personnel, has enabled the Directors to consider with confidence proposals of technical collaboration that are being received from the developing countries in Africa and Asia.

Accounts in brief as at 30th June 1964 are as under:—

Extracts from the Directors' third annual report: In spite of the fact that the factory remained practically closed during April and May 1964 for certain major repairs, the turnover during the year has been higher than during the previous year. The increased turnover has been due to the Plant No. 1 being operated in a more scientific manner. The Company had the benefit of advice and guidance of a foreign technician specially deputed by the manufacturers of the Extrusion Press.

Development: Most of the machinery for Plant No. 2 has been received at site and the construction of the building, and machinery erection is proceeding satisfactorily. In the absence of any unforeseen circumstances the Directors expect to commission this new plant by the middle of next year.

Finance: The Directors allotted 41,040 equity and 10,000 9.5 per cent cumulative redeemable preference shares of Rs. 100 each pursuant to the Prospectus issued by the Company in October 1963. As on 30th June 1964 an amount of Rs. 75 per share was called up on these shares. The Directors also issued 5,350 equity and 5,350 cumulative redeemable preference shares of Rs. 100 each to Messrs. Delta Metal Co. Ltd., London, against their supply of plant and machinery upto 30th June 1964. Thus the total issued capital of the Company as on 1st September 1964 was Rs. 1,05,70,000.

Accounts in brief as at 30th June 1964 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	82,02,793	Gross block	80,83,760
Reserves and surplus	4,84,897	—Depreciation	10,44,276
Other liabilities	98,29,887	Net block	70,39,484
		Current assets	1,10,13,835
		Cash	30,980
		Miscellaneous expenditure	4,33,278
	Rs.1,85,17,577		Rs.1,85,17,577

* Paid-up capital consists of 49,310 equity shares of Rs. 100 each; 41,040 equity shares of Rs. 100 each—Rs. 75 per share called up; 5,350—9.5 per cent. cumulative redeemable preference shares of Rs. 100 each and 10,000—9.5 per cent. cumulative redeemable preference shares of Rs. 100 each—Rs. 75 per share called up.

NEWS IN BRIEF

THE Monopolies Commission is expected to submit its report to the Government by the end of October 1965.

The production of cars during 1964-65 is estimated at 21,000, as against the 18,077 cars actually produced in 1963-64.

The annual general meeting of the Associated Chambers of Commerce and Industry of India will be held at Calcutta on Monday, the 21st inst. The Prime Minister, Mr. Lal Bahadur Shastri, will be the chief guest.

Exports of steel during the financial year 1964-65 are expected to be of the order of about Rs. 4 crores. The export quota of bars, rods, structurals and rails fixed for the year is 100,000 tons, same as the quota fixed last year.

The Uttar Pradesh Government is actively considering a proposal for setting up a Sugar Mills Corporation in the State to undertake the establishment of sugar and bagasse-based industries, as well as to take over the defaulting sugar factories.

The State-owned Shipping Corporation of India has acquired three second-hand Italian ships at a total cost of Rs. 141 lakhs in order to meet the urgent commitments in respect of its existing liner services.

The rate of commission given by the Indian Airlines Corporation to its travel agents is five per cent for domestic bookings and 7 per cent for international bookings. Bookings to Nepal are treated as domestic bookings.

A court of inquiry has been set up by the Union Government to probe into the causes of industrial unrest at Marmagoa Port and to suggest remedial measures for improving the industrial relations between workers and management.

A labour force of 35 million will have to be found employment during the fourth Plan period, according to Mr. D. Sanjivayya, Union Labour Minister. The employment potential during the current Plan period is estimated at 20 to 25 million, and unemployment at 12 million.

The State's Chief Inspectors of Factories and officials of the Union Government will meet at a six-day conference scheduled to commence at Calcutta on the 7th inst. They will discuss the difficulties experienced by them while implementing or enforcing the Factories Act.

The Central Government has decided in principle to establish a unit in the public sector for manufacturing tractors and power tillers. A feasibility study in this direction is being undertaken. The preliminary report received from the Government of Czechoslovakia is under the scrutiny of the Government.

The Union Government has, on the advice of the Forward Markets Commission, granted permission to the Alleppey Oil Mills and Merchants' Association to conduct forward trading in pepper for one year with effect from the 10th inst. Forward trading in pepper is at present conducted in Cochin and Bombay.

The Bureau of Mines is reported to have discovered in the West Bokaro Coalfield in Bihar new seams capable of yielding nearly 800 million tonnes of coking coal suitable for metallurgical purposes. A substantial portion of the coal has been described as of first and second grades. Earlier, 22 coal seams were located in the Ramgarh field in Bihar.

Fresh alternatives for increasing production of cars, including the one regarding revival of small car project, are being explored by the Central Government, according to Mr. B. Misra, Deputy Minister for Industry and Supply. Talks are now being held with certain Indian parties as well as some foreign parties in respect of the likely projects.

The Open Hearth No. 7 of the Bhilai Steel Works, Asia's biggest open hearth furnace, went into production on 26th November 1964. The furnace has a capacity to produce 1,000 tonnes of steel per day. The plant will have five such large capacity furnaces under the present expansion programme to raise the capacity from one million tonnes to 2.5 million tonnes of ingot steel per annum by March 1966.

Following an agreement with the West German Bank for Development to provide a loan of Rs. 45 lakhs, the National Small Industries Corporation has decided to make available imported machines and equipment worth Rs. 60 lakhs to small industrialists on hire-purchase basis. Under the hire-purchase scheme, the Corporation has so far distributed Rs. 20 crores worth of imported and indigenous machines and equipment.

The Minerals and Metals Trading Corporation has, for the second time in succession, incurred a loss of Rs. 82 lakhs on iron ore exports. The loss is attributed to the low price of 74s. at which iron ore was sold to Japan. The Corporation is reported to be evolving a strategy, in a bid to avoid further loss, for the massive production of iron ore to ensure substantial reduction in its c.i.f. value.

The Union Ministry of Works and Housing has allocated Rs. 10 crores from the L.I.C. funds to four States, namely, Madhya Pradesh (Rs. 3.5 crores), Orissa (Rs. 3.0 crores), Bihar (Rs. 2.5 crores) and the Punjab (Rs. 1.0 crore) for advancing loans under different housing schemes during the current year. With this allocation, the total amount advanced by the L.I.C. during the current Plan comes to Rs. 44.50 crores.

The findings of a study of the rates charged for power in the different parts of the country by a Committee of the Representatives of State Governments and the Planning Commission reveal the need for an increase in electricity charges in almost all the States. The Committee has suggested that the rates should be so adjusted as to enable an earning of 10 per cent on investment, after meeting working expenses and depreciation charges.

The Prevention of Food Adulteration (Amendment) Bill, which seeks to tighten the law against food adulteration, was passed by Parliament on 26th November 1964. The penal clause of the Bill, however, was greatly softened by a last-minute official amendment. As reported by the Joint Select Committee to which it had been referred, the Bill made it obligatory on the courts to award prison sentence of less than six months for adulteration offences. In addition, there was the provision of fine of less than Rs. 1,000. The official amendment accepted gave the courts the discretion to award a prison sentence of less than six months or a fine of less than Rs. 1,000 or both.

The Governments of India and the U.S. signed at New Delhi on Monday this week three U.S. loan agreements amounting to $60.3 million (Rs. 28.7 crores) for the development of industry, power generation and transport in this country. The first loan of $50 million (Rs. 23.8 crores) will be utilised for financing imports of fertilisers, steel, lubricants, machinery, sulphur, rubber, tyre cord, carbon black, caustic soda, insecticides, chemicals and a wide range of components. The second loan of $7.2 million (Rs. 3.4 crores) will meet the cost of acquiring 25 broad gauge diesel locomotives by the Indian Railways. The third loan of $3.1 million (Rs. 1.5 crore) is to be used for procuring a 89,100-kw. generator for the Sharavathi hydro-electric project in Mysore State.

From Abroad

Following the increase in British Bank Rate, the Malaysian treasury has raised its discount rate from 4 to 5 per cent with effect from 25th November 1964. The Bank of Jamaica has also increased its Bank Rate from 4 to 5 per cent.

The aggregate output (in terms of value) of the British motor industry during the first nine months of this year amounted to £556 million, as against £516 million in the corresponding period last year. Exports of parts and accessories aggregated £159 million, representing an increase of 11 per cent over the same period last year.

For the third consecutive year, Australia is expecting a record wheat crop in the 1964-65 season which began on the 1st of this month. The total output is officially estimated at 9.2 million tons, as against the 8.9 million tons actually harvested in 1963-64, 8.2 million tons in 1962-63 and 6.6 million tons in 1961-62.

The 210-MW pressurised water reactor Atomic station at Novo-Voronezh on the banks of the Don River has been switched into the unified power grid of the Western Soviet Union. The station is using uranium oxide fuel contained in zoreonium tubing and has served as the prototype for the second half of the station, now under construction, which will ultimately generate 365 MW of power.

The Scandinavian Airlines System has placed an order for four "second generation" DC-8-62 long-range jet aircraft at a cost of £11 million (excluding spares) with the Douglas Aircraft Company. It has also an option to buy four more jets. The first of the D.C. liner will be pressed into service on the Company's polar route in May 1967, while the delivery of the remaining three will take place a few months after the first delivery.

The fifth European Agricultural and Industrial Fair will be held at Jon-koping, in Sweden, from 3rd to 13th June 1965. The main sections are agriculture, forest and wood and section for excavators, other contractors' machines and transportation equipment. The Fair is receiving international recognition as a means of exchanging ideas in agriculture, forestry, woodworking industry, mature conservancy and recreational facilities.

In the first half of 1964, new life assurance business amounting to f. 4,455 million was written by Holland's life assurance companies, an increase of no less than f. 1,053 million over the same period of 1963. In this period, receipts from premiums and purchase sums aggregated f. 695.2 million (first half of 1963: f. 617.1 million) and benefits paid to f. 200.4 million (f. 185.1 million). The invested capital of the combined companies rose from f. 10,927 million at 31st December 1963 to f. 11,499 million at the end of June 1964. The principal sectors of investment were debenture loans (f. 5,533 million) and mortgages (f. 3,105 million).

The Government of Argentina has introduced a new series of import regulations designed to limit payments for capital goods during the next two years, when the country's foreign debt obligations are expected to be particularly heavy. The regulations set minimum repayment periods for capital goods purchases ranging from two years upwards according to value. The minimum period of two years applies to goods valued at $5,000 to $20,000, with a six-month moratorium on payments from the date of purchase. For goods worth between $500,000 and $1 million there is to be a two-year moratorium on payments, followed by half-yearly quotas spread over seven years. Shorter repayment periods are allowed for industries affected by the Government's industrial promotion legislation. Imports from the Latin American free trade area are exempt. The recently published national development plan estimates Argentina's requirements of imported capital goods at $1,860 million over the next five years.

The Swedish Aircraft Company, Saab, may reach a new sales record in excess of Kr. 1,000 million this year. The actual sales in the first six months aggregated Kr. 535 million, representing a rise of 19 per cent, as compared with January-June 1963 period. Military deliveries have developed according to plan. The Company has obtained a Swedish Air Force order for 130 twin-jet trainers of the Saab 105 type and work is proceeding on the all-purpose combat aircraft Saab 37 Viggen. The Austrian Air Force has ordered 24 Safir trainers, while the Swiss and Danish ministries of defence have signed contracts for bomb sights. A guided missile developed by the Company, designated 305, has gone into production. The non-military sector of the Company's activities has also developed favourably. The automobile division's deliveries of cars was up by 15 per cent to 23,400 units, including a 40 per cent rise in exports. Total deliveries this year are likely to be about 45,000, as against 40,000 last year. Next year, capacity is to be raised to about 50,000 cars.

West Germany's pharmaceutical industry is well on its way to recovering the leading position it occupied in the world prior to World War II. Medicine valued at nearly DM three billion was manufactured last year, of which medicine alone was valued at roughly DM 800 million. In 1960, only DM 600 million worth of medicine were exported. West Germany's pharmaceutical imports amounted to roughly DM 190 million in 1960 and increased to nearly DM 250 million in 1963. Overseas countries remained the country's best pharmaceutical buyers. Nearly 20 per cent of the country's medical exports went to Asia. Japan alone imported roughly DM 66 million worth of West German pharmaceutical products. But Africa and the Near East have also recently increased their pharmaceutical imports. West Germany's pharmaceutical industry is increasingly able to sell its products to other European countries. For a long while, it appeared as if the market lost with the World War II could not be regained. Last year, however, its pharmaceutical exports to European countries amounted to DM 380 million and reached nearly half of the country's entire pharmaceutical exports.

PERSONAL

MR. E. E. Naegeli, until recently Deputy Manager for India of Nestle's Products (India) Limited, has been appointed as the Manager for India.

Mr. Rohit C. Mehta, Vice-President of the Gujarat Chamber of Commerce, will be the President of the Local Board constituted for the new Ahmedabad Circle of the State Bank of India.

Mr. D. T. Ghatpande, Regional Provident Fund Commissioner, Maharashtra, has been concurrently appointed Regional Provident Fund Commissioner for Goa, Daman and Diu.

Mr. Manubhai Shah, Union Minister for Commerce, has left for Geneva to attend a ministerial session of the G.A.T.T. After attending this session, he will leave for New York to join the Indian delegation to the U.N. General Assembly.

Mr. Ramkrishna Bajaj, Chairman of Bajaj Tempo Ltd., has been elected President of the Maharashtra Chamber of Commerce. Mr. M. L. Apte, Mr. Y. A. Fazalbhoy and Mr. D. C. Shah have been elected Vice-Presidents.

Mr. V. C. Trivedi, Ambassador-designate to Switzerland, has concurrently been appointed India's Minister to Vatican with residence at Berne. He is expected to assume charge of his new assignment in January next.

Mr. Ramnath A. Podar, Mr. Zafar Futehally, Mr. Shantaram M. Dahanukar, Dr. Rustom Cawasjee Cooper, Mr. Krishna Chandra Maitra and Prof. Mohanlal Lallubhai Dantwala have been nominated members of the Bombay, Calcutta, Madras, New Delhi, Kanpur and Ahmedabad Local Boards, respectively, of the State Bank of India.

Notices

THE BRADY ENGINEERING COMPANY, LIMITED

NOTICE

NOTICE IS HEREBY GIVEN THAT AN Extraordinary General Meeting of the shareholders of the Company will be held at the Registered Office of the Company at Brady House, 12-14 Veer Nariman Road, Fort, Bombay, on Thursday the 24th day of December, 1964, at 12 noon (S.T.) or so soon after the statutory Meeting of the shareholders of the Company to be convened on that day under an Order of the High Court, Bombay, under section 391 of the Companies Act, 1956, is concluded, to consider and if thought fit, is pass with or without modifications the following resolutions:—

As An Ordinary Resolution:

RESOLVED that the Authorised Capital of the Company be increased from Rs. 25,00,000 divided into 25,000 shares of Rs. 100 each to Rs. 1,00,00,000 divided into 1,00,000 shares of Rs. 100 each by the creation of 75,000 new shares of Rs. 100 each.

I. **As An Ordinary Resolution:**

RESOLVED that the remuneration of the Directors of the Company for attending meetings of the Board or of the Committees of the Board be increased as from 1st May 1964 from Rs. 60 to Rs. 150 for each Director for each Meeting of the Board or a Committee of Board attended by him.

II. **As A Special Resolution:**

RESOLVED that subject to the consent of the Controller of Capital Issues being obtained and the amalgamation of Morris and Brady Limited with the Company being sanctioned by the High Court, Bombay, the Company do issue out of 75,000 new shares of Rs. 100 each 20,200 shares of Rs. 100 each as Equity shares ranking *pari passu* in all respects with the existing 25,000 Equity shares of the Company of Rs. 100 each save and except that they shall not be entitled to participate in the profits of the Company for the year ending 31st December 1964 and that such 20,200 new Equity shares be offered by the Board of Directors of the Company to any persons whether they are or not those persons who are the holders of the existing 25,000 Equity shares in the Company and in such manner as the Board of Directors of the Company may deem proper and that out of the said 20,200 Equity shares to be issued 10,754 Equity shares of Rs. 100 each be allotted to Herbert Morris Limited of the U.K. credited as fully paid up in payment of a sum of Rs. 10,75,400 being the price of such of the plant and machinery as may be required for the expansion scheme to be supplied by them to the Company and that a further 2,000 Equity shares of Rs. 100 each be also allotted to the said Herbert Morris Limited of the U.K. credited as fully paid up in payment of a sum of Rs. 2,00,000 being the price of the "know-how" for the manufacture of Lifting and Carrying Machinery, Electric Hoist Blocks and Electric Overhead Travelling Cranes and Hand and Loan Chains, to be supplied by the said Herbert Morris Limited of the U.K. to the Company with power to the Board of Directors of the Company to assent to such modifications as the Controller of Capital Issues may make or impose on the allotment of the said 10,754 and 2,000 shares respectively.

IV. **As A Special Resolution:**

RESOLVED that pursuant to the provisions of Section 360 of the Companies Act, 1956 and other applicable provisions of the said Act the Company doth hereby accord its approval to a contract or contracts for the erection of a building or buildings from time to time required by the Company, being entered into with Shapoorji Pallonji & Company Private Limited an associate of W. H. Brady & Company Limited the Managing Agents of the Company, the rates to be charged by Shapoorji Pallonji & Company Private Limited to the Company for such work or works not being less favourable to the Company than the usual market rates for such work or works or which are otherwise reasonable.

V. **As A Special Resolution:**

RESOLVED that pursuant to the provisions of Section 360 of the Companies Act, 1956 and other applicable provisions of the said Act the Company doth hereby accord its approval to a contract or contracts for oil painting and distempering any building or buildings of the Company from time to time required by the Company, being entered into with M. Pallonji & Company Private Limited an associate of W. H. Brady & Company Limited, the Managing Agents of the Company, the rates to be charged by M. Pallonji & Company Private Limited to the Company for such work or works not being less favourable to the Company than the usual market rates for such work or works or which are otherwise reasonable.

VI. **As A Special Resolution:**

RESOLVED that subject to the amalgamation of Morris & Brady Limited with the Company being sanctioned by the High Court, Bombay, Article 140 of the Articles of Association of the Company providing for qualification of Directors be and is hereby deleted and that the following Article 140 be substituted for the same:—

"140. The Directors of the Company need not hold any qualification shares."

VII. **As A Special Resolution:**

RESOLVED that subject to the amalgamation of Morris & Brady Limited with the Company being sanctioned by the High Court, Bombay, and subject to the approval of the Central Government the name of the Company be changed into "Brady and Morris Engineering Company Limited" and accordingly the name "The Brady Engineering Company Limited" wherever it occurs in the Memorandum and Articles of Association of the Company be and is hereby substituted by the name "Brady and Morris Engineering Company Limited."

the 2nd December, 1964.

COMMERCE AND INDUSTRY

(Concluded from page 1009)

lity of lime and poor process control due to insufficient instrumentation, etc.

"Black liquor obtained from bamboo, which is high in silica content, results in frequent deposits of scales at different stages in evaporators and furnaces. This results in frequent stoppage of the recovery plant for the purpose of cleaning, thereby affecting the normal running of the plant."

The problem of recovery of chemicals ought to be solved satisfactorily in right earnest. The following three solutions which Mr. Podder offered in this connection are pertinent:

1. Sufficient space to store the black liquor (obtained from bamboo) is a necessity. Filtration of black liquor to remove fine pulp should be resorted to for improving the quality of liquor for operating the recovery plants continuously.

2. There should be strict control of sodium and sulphur losses in the recovery operation, that is, in multiple-effect evaporators, recovery furnace (including waste heat boiler, direct contact evaporator and electrostatic precipitator), and causticising section.

3. A complete co-ordination of efforts for proper maintenance will provide to a great extent trouble-free service in the recovery operations, resulting in better economy.

Considering that the two factors relating to recovery of chemicals and forestry operations influence the cost of paper production and determine the development of the industry itself in the coming years, it was but natural that the deliberations of the I.P.P.T.A. seminar centred mainly on these issues. About 300 technicians and senior executives employed in several paper mills participated in the seminar; the actual number of mills in existence is 38. The seminar would surely have served the purpose for which it was convened if its deliberations were to result in concrete solutions to the problems confronting the paper industry which has a total productive investment of approximately Rs. 90 crores, employs more than 50,000 persons, and produces about Rs. 90 crores worth of paper and paper products that are widely used not only for reading and writing purposes but also for wrapping and packaging.

We can help EXPORTERS to expand their business by providing pre-shipment finance. We can advise EXPORTERS of trade enquiries, put them in touch with foreign buyers, and obtain credit information and status reports on foreign buyers.
We can give to EXPORTERS effective Letters of Introduction on our Foreign Branch Managers and Correspondents, provide them with Travellers' Cheques, Foreign Currency Notes, and Letters of Credit—when they travel.
We can collect and negotiate for EXPORTERS all types of foreign bills; give Excise guarantees where necessary and guarantees under Export Promotion Schemes; and buy various foreign currencies, at the finest rates, both "spot" and "forward".
We can advise EXPORTERS on matters concerning import restrictions, duties, etc. in foreign countries.
With our 14 branches overseas and correspondents in almost all parts of the world, we are well equipped to handle FOREIGN EXCHANGE BUSINESS of any description.

TREND OF MARKETS

MONEY TIGHT

(From Our Own Correspondent)

BOMBAY, *2nd December*

Conditions in the short-term money market during the week under review were tight. The pressure of demand for credit was persistent, while the supply of funds available was very much limited. Borrowers, therefore, had to look around for accommodation and interest rates were marked up. In the inter-bank call section, fresh day-to-day money fetched as high at 5 per cent and renewals were reported at 4½ per cent, whereas both commanded no more than one per cent last week. Calcutta also reported stringency, the call rate there spurting from 2½ per cent to 5-5½ per cent.

The tight money conditions are reflected in the very poor response elicited by the Government of India 91-day Intermediate Treasury Bills. The Bills actually sold from 25th to 28th November aggregated no more than Rs. 52 lakhs, as against Rs. 16.57 crores a week before and Rs. 11.25 crores two weeks before. In the case of the 91-day Treasury Bills sold on tender basis and the tenders for which opened on Tuesday the 1st inst., the total amount offered (Rs. 2 crores) was just equal to that invited; the whole of it was accepted. The average rate of accepted tenders was higher at Rs. 2.400 per cent, as against Rs. 2.360 per cent a week before.

The total credit made available by scheduled banks to their clients declined by Rs. 4.90 crores to Rs. 1,714.18 crores during the week ended 20th November. At the same time, there was a rise of Rs. 19.42 crores to Rs. 2,733.05 crores in their deposits. And so the borrowings from the Reserve Bank were negligible, being just Rs. 1.46 crore, a fall of Rs. 81 lakhs over the week. Investments improved by Rs. 9.24 crores to Rs. 828.82 crores, while total cash declined by Rs. 2.92 crores to Rs. 164.03 crores.

The Gilt-edged market was quiet, though the volume of business was a shade better than in the previous week. Price movements were narrow in both Central and State loan sections.

In the foreign exchange market, the banks selling rate for U.S. dollars dropped a rupee to Rs. 479.50 per $100. Their buying rate also fell by 75 paise to Rs. 476. In New York, the pound sterling ruled firm *vis-a-vis* the dollar, the spot rate rising by 0.570 cent to 279.200-279.230 cents and the three months' forward by 0.120 cent to 277.200-277.230 cents.

• • • •

The total cash collections to the National Defence Fund up to the end of November 1964 amounted to Rs. 59.13 crores, including Rs. 28 lakhs received from Britain and Rs. 63 lakhs from other countries. During the same period, contributions in the form of gold and gold ornaments amounted to 2,400.526 grammes (206,649 lakhs).

BULLION EASY

(From Our Own Correspondent)

BOMBAY, *2nd December*

Both silver and gold moved rather erratically during the week under review. Over the week, silver was unchanged at last levels, while gold was a shade lower. The undertone of the market at the time of writing was easy. Traders were inclined to feel that the trend of the market would be uncertain till the Gold Control Bill now in Parliament was finally passed.

Silver began the week 50 paise lower at Rs. 260 and moved upto Rs. 261.50 on demand from local dealers. It, however, declined to Rs. 261 following better arrivals but rose again to Rs. 261.50 on upcountry support before finishing lower at Rs. 260.50. The weekly average arrivals and offtake of the metal were 19 bars and 8 bars, as against 13 bars and 8 bars last week.

Fourteen-carat gold receded from Rs. 66.75 to Rs. 66.50 due to lack of interest. Subsequently, it improved to Rs. 67 thanks to demand from refiners and dealers. But the goldsmiths' token strike on 1st December induced fresh selling and it closed lower at Rs. 66.90. Pure gold, in unofficial dealings, was very quiet at Rs. 111. Sovereign declined to Rs. 91.

The international price for gold in the London market was slightly lower at $35.10, as against $35.10¼ last week. The sterling price fluctuated between 251*s.* 4½*d.* and 251*s.* 11¼*d.* before closing at 251*s.* 5*d.* Both spot and forward silver was unchanged at 112½*d.* and 113½*d.*, respectively, as also silver in New York at 129.3 cents.

More than 3,000 goldsmiths from the different parts of the country demonstrated outside Parliament as a part of a country-wide agitation organised by the *Akil Bharatiya Swarnakar Sangh* on 1st December. The demonstrators marched in procession and submitted to the Speaker of the Lok Sabha a memorandum seeking redress of their grievances. The memorandum, claimed to have been signed by more than one lakh goldsmiths, demanded, among other things, the removal of restrictions on the manufacture of primary gold ornaments of more than 14-carat purity and consideration of *swarnakala* as a cottage industry with all the benefits and preferential treatment given to it by the Government.

In response to the call for a token strike by the All-India Goldsmiths Association, the goldsmiths all over the country observed a *hartal*. They demonstrated before the respective State and district headquarters for the repeal of the Gold Control Order without delay.

The Government of India, according to Mr. Manubhai Shah, Minister for Commerce, is considering the release of gold from the Reserve Bank's gold reserves to jewellery manufacturers for the manufacture of jewellery for export purposes. This is expected to relieve the shortage of gold for this purpose. Foreign exchange earnings from the export of jewellery has increased substantially. During 1963-64, export earnings of this item (including precious stones and pearls) amounted to Rs. 11.53 crores. The estimate for the current year is Rs. 14 crores.

The following table shows the trend of prices during the week under review:

	2-12-64 (closing)	High	Low	25-11-64 (closing)
	Rs.	Rs.	Rs.	Rs.
SILVER				
Ready (996 fine) ..	260.50	261.50	260.00	260.50
GOLD				
Ready (14-carat) ..	66.50	67.00	66.50	66.75
Sovereign ..	91.00*	—	—	91.50*
London—				
Gold ..	251*s.* 5*d.*	251*s.* 11¼*d.*	251*s.* 4½*d.*	251*s.* 11¼*d.*
Silver Ready ..	112½*d.*	—	—	113½*d.*
Silver Forward ..	113½*d.*	—	—	113¾*d.*
New York—				
Silver	129.3 cents	—	—	129.3 cents

N.B.—The quotation for gold is per 10 grams (about 0.85 tola) and that for silver is per kilogram (85.73 tolas). London and New York quotations are per ounce. * Unofficial rate.

COTTON FUTURES FIRM

(From Our Own Correspondent)

BOMBAY, *2nd December*

Trading in the futures section of the cotton market was characterised by firmness almost throughout the week under review mainly on account of the steadiness of the spot section. The buoyancy prevailing last week was suddenly brought to a halt on the first day of the week, that is, Thursday, the 26th November 1964, when prices declined by five points, following the decision of the Forward Markets Commission to withdraw the free concession limit of 1,000 bales for payment of margins for hedge trading in cotton. But a recovery ensued on the following day itself, in view of the strength of the spot market as also of the feeling in the market circles that no appreciable drop in futures could be anticipated in view of the healthy statiscal position of the commodity. It may be noted here that, while the Jarilla March 1965 contract is being quoted 27-30 points below the ultimate ceiling of Rs. 798 per three quintals, the price of some basic staple in the spot market is at a substantial premium over the ceiling rates. Reports of increasing arrivals of cotton at the terminal markets and optimistic expectations that imports of foreign cotton in the current season would be to the order of 9.5 lakh bales, the futures displayed a somewhat quiet trend in the latter half of the week. But short-covering and firm rates, once again, enabled the contract to close the week on a firm note, with only a nominal loss over the week.

The Jarilla March 1965 contract opened the week under review at Rs. 768 50, that is Rs. 3.25 lower than the closing rate of the previous week, touched the highest of the week at Rs. 772.50 on Monday, 30th November 1964 and declined again to Rs. 765.75 on the penultimate day of the week, before closing at Rs. 770.50 today, a loss of Re. 1.25 over the week.

In the spot market at Sewri, there were no appreciable changes in prices. The following are the latest available quotations (per candy) for some of the popular varieties:

Akola L.147 New Rs. 1,281; Anjangaon L.147 New Rs. 1,321; Bhavnagar C. J. Rs. 1,090; Dhulia New Rs. 1,173; Ganganagar New Rs. 881; Karanjia L.147 New Rs. 1,280; Monbi New Rs. 940; Shirpur New Rs. 1,150 and Viramgaon New Rs. 1,033.

After opening slightly easy, Bengal *deshi* December delivery contract ruled firm, moving within a range of Rs. 811 to Rs. 816 per three quintals. The export registrations stood around 85,000 bales. Bengal *deshi* January, February and March 1965 contracts were being quoted at Rs. 811, Rs. 807 and Rs. 803 respectively.

No fresh business was reported in the imported varieties, though mills evinced interest in the African, Sudan Pima and American varieties. According to a press release by the Joint Chief Controller of Imports and Exports, the Government of India has decided to issue licences for import in respect of Egyptian-Sudan cotton lying in the U.S. stockpile for which contracts have been entered into on or before 26th September 1964.

Consumption of Indian and foreign cotton during the first month of the current season, that is, September 1964 was 5.50 lakh bales, as against 5.01 bales in the same month last season. Projected on this basis, the total consumption of cotton during 1964-65 season would be around 65 lakh bales, as compared with the actual consumption of 60.81 bales during the 1963-64 season.

Mention may be made here about the special meeting on cotton promotion held at Paris on the 29th November 1964 where India expressed its willingness to accept the International Cotton Advisory Committee's proposal for a central organisation to strengthen the competitive power of fabrics made out of cotton *vis-a-vis* those manufactured from man-made fibres. India, it is reported, has also agreed to the establishment of a central fund in the management of which the contributing countries would have a controlling voice.

First official estimates of cotton in Pakistan place the total area under cotton cultivation in the season 1964-65 at 3.4 million acres, showing a decline of 8 per cent from the final estimates of area at 3.7 million acres in the last season. Trade estimates of this season's crop place it at 25.08 lakh bales, an increase of 12 per cent as compared with the 1963-64 crop of 22.40 lakh bales.

YARNS RECEDE

(From Our Own Correspondent)

BOMBAY, *2nd December*

The yarn market ruled easier during the week under review. Art silk yarns suffered a further setback in values, thanks to comfortable supply position and poor demand. Even at lower prices, operators were hesitant to enter into fresh commitments. Staple fibre yarns, which were somewhat lively in the early sessions of the week following steady support from bulls and small offerings, drifted down later, on stray bull liquidation and limited demand from Surat weavers. Cotton yarns were dull, as demand was slack.

It is understood that the Textile Commissioner has informed the textile mills that the withdrawal of the facility to import non-cellulosic staple fibre against the retention quotas for cotton will be effective only from the beginning of next year and not from 12th November 1964 as has been announced earlier. The details were given in our last week's report.

Among art silk yarns, National Rayon 150D shed 5 P to Rs. 8.93. 120D declined by 13 P to Rs. 9.59. South India Viscose 120D slumped by 97 P to Rs. 11.13. Bright Century 105D dropped 2 P to Rs. 11.20. 75D was dull at Rs. 17.05.

In the staple fibre yarn section, the 2×34 January 1965 contract opened the week at the last week's closing of Rs. 863 and touched a new high of Rs. 867 on the same day. Subsequently, however, it declined and closed at Rs. 861 today. Spot City shed 7 P to Rs. 9.35. Premier 11 P to Rs. 9.33, Madhave 7 P to Rs. 9.17 and Sitalaxmi two paise to Rs. 9.26. Sriram and Kohinoor were both neglected, the former at Rs. 9.06 and the latter at Rs. 9.77.

In the cotton yarns, 34s Vasantas eased by 50 P to Rs. 42.50, 52s Finlay dropped 38 P to Rs. 9.50. Other counts were quoted at last week's levels.

The following table gives the prices of rayon staple fibre and cotton yarns, today, as compared with those prevailing a week ago:

	2-12-1964	25-11-1964
	Rs.	Rs.
Art silk yarn (per kg.)—		
National Rayon 120D	9.46	9.59
Century 75D	17.05	17.05
S. I. Viscose 120D	11.13	12.10
Staple fibre yarn (2×34 NF)		
January 1965 (per quintal)	861.00	863.00
Spot (per kg.)		
Sitalaxmi	9.26	9.28
Premier	9.33	9.42
City	9.35	9.42
Cotton yarn - French Count (Rs. per 5 kg.)		
8s Podar	21.25	21.25
17s Modern	27.00	27.00
22s Madura	32.25	32.00
34s T'cott	39.96	39.97
52s Kasturi	55.00	56.00
68s Finlay	100.50	100.50

DOUBLE MARGINS IN G'NUTS

(From Our Own Correspondent)

BOMBAY, *2nd December*

Trading in the oilseeds market during the week under review showed the futility of attempts to divert price movements by means of artificial measures from their natural course. The desirability of holding the price line has never been questioned, particularly in the present state of the country's economy, but, unfortunately, the demand and supply position has rendered official measures infructuous. Only a week ago, the Bombay Oilseeds Exchange, under orders from the Forward Markets Commission, instituted a second line of margins for the groundnuts January contract by which double margins were made payable if the price touched the Rs. 103-level. The margin then would be Rs. 10,000 per 25 tonnes. Moreover, the free limit of 300 tonnes would not be allowed above this level. It had been mentioned in this column that, in spite of this, the undertone of the market was firm and that it should cause no surprise if bull operators were to dare even the double margin. This was what exactly happened during the week under review.

After a brief spell of early hesitancy, the January contract advanced to Rs. 103.25 on Wednesday the closing price was above the limit, double margins automatically came into force. Sentiment in groundnuts was induced by lack of sufficient arrivals at the terminal centres and satisfactory demand. It was heard in the market that farmers had been holding on in anticipation of yet higher prices. This is not unfounded for, unlike olden days, they are now in a position to dictate their own terms. It is said that they are aided by co-operatives. Perhaps so. The fact remains that the market is firm and indications are that it might seek higher levels. Further, the market here was expecting the Gujarat Government to release groundnuts from movement restrictions, but so far, this has not been done. Consumers are starved of goods and, since they cannot afford to be idle, they have to pay through the nose, and that is what they are doing at present.

Early in the week, is was reported that the market had been facing payments difficulties following the failure of a bear operator to meet his obligations. The crisis was reported to have been got over later. However, crises like these are not difficult to understand. At one time, it may be the bulls that find themselves in a soup, while, at another, it may be the bears. It appears that shippers of H.P.S. are committed to the tune of 18,000 tonnes for export for December-January shipments. Apparently, they are covering their positions.

Groundnuts de-oiled cake (extractions) ruled steady with the quotation at Rs. 440 for December, Rs. 430 for January and Rs. 425 for February. Expeller cakes were also well held. Rates were: Rs. 470 for ready, Rs. 465 for December, Rs. 460 for January. Market men consider the outlook to be bullish. Although currently inquiries from overseas markets are smaller, the overall position is said to be extremely satisfactory. It is said that communist countries have, between themselves, committed to buying about 300,000 tonnes upto March. The U.K. buyers have also been showing keener interest in the Indian market. London advices indicate £41 for November afloat, £39 for December, £38-5 for January and £38 for January-February.

Castor and linseeds were both extremely firm during the week under review. Along with the imposition of the double margin system for groundnuts, the Oilseeds Exchange, again under the F.M.C.'s instructions, had fixed a ceiling of Rs. 190 for castor March and Rs. 45 for linseeds. The market was to work within these limits and this was to hold good until the end of January. Thereafter, the position was to be reviewed in the light of the prevailing circumstances. Unfortunately the position is that the time to review the position has come even before the ink is dry on the F.M.C.'s orders. The trend in cottonseeds is also firm with the January contract closing at Rs. 115.75 on Wednesday. As discussed earlier the trend in cottonseeds is guided more by the position of cotton which is quoting at or above ceilings. Further, cottonseeds can hardly have a trend independent of groundnuts and other seeds. It looks as though one has to get oneself reconciled to high prices for yet some time to come.

The following table shows the closing prices of oilseeds and oils as on 2nd December as compared with the previous two weeks:

	2-12-1964	25-11-1964	18-11-1964
	Rs.	Rs.	Rs.
Groundnuts			
January 1965 contract ..	113.05	102.40	100.15
Oil January 1965 ..	19.85 (Nom.)	N.T.	N.T.
Khandesh quality ..	113.00	111.00	116.00
Oil ex-mill	22.50	23.00	24.00
Oil Rly. Receipt ..	21.75	22.40	22.75
Castorseed			
March 1965	190.00	190.00	187.50
Ready Madras	85.50	85.50	85.00
Ready Kanpur	84.00	83.50	83.00
Oil B.S.S.	19.00	18.80	18.90
Oil commercial	18.25	18.10	18.00
Linseed			
March 1965	45.00	44.81	43.62
Bold ready	111.00	112.00	110.00
Linseed oil	23.25	23.50	23.50
Cottonseed			
January 1965 contract ..	115.75	114.50	110.50

N.B.—The quotation for groundnuts January 1965 contract is for 100 kg. The rates for spot groundnut and castor are for 100 kg. Castor and cottonseeds futures are quoted per 250 kg. while linseeds futures are quoted per 50 kg. Groundnut Oil January 1965 and all spot oils are quoted per 10 kg.

BUFFHIDES NEGLECTED

(From Our Own Correspondent)

MADRAS, *30th November*

The kip prices ruled steady. Shipment trading with U.K. was at a low ebb. Inquiries were selective with emphasis on top marks light weight cowhides and fifths selection. Demand for cowcalf was small and buffhides were neglected. Only in the buffcalf section, there was some life and importers in the U.S. and U.K. were putting through a few orders for shipment in new season calf.

Enquiries for tanned goat skins were mostly in 5½-6 lbs. and 8-9 lbs. average in superior tannages and 15-16 lbs. up in all marks. Middle class sheep skins in lower gades were in demand but, as the quality of the arrivals was not good, good shippers were hesitating to enter into contracts for shipment. Prime and semi-prime sheep skins were comparatively neglected, on account of price.

Prices in the raw centres for goat skins were very firm, and for sheep, quiet.

The Tanned skins public sales will take place on the 7th December in U.K. when 55,000 goat skins and 55,000 sheep skins will be offered for sale. The public auctions in Germany will also be held on the 7th December and 215,000 goat and 18,000 sheep skins will be available for sale. The results are awaited with interest by the trade.

LESS DEMAND FOR TEAS

[*Messrs. Forbes, Ewart and Figgis (Private) Ltd.*]

COCHIN, *26th November*

A total of 1,011,000 kgs. was offered in tea sale No. 46 held here on Tuesday, the 24th inst. Quality of the offerings was generally maintained. There was a good but rather less general demand at lower rates, particularly for the poorer fannings. The limited selection of best quality highgrowns was barely steady, but, in the case of the lesser sorts, these ruled easier following less competition. Good medium brokens were about steady but their fannings inclined easier. Medium and low mediums brokens were sold well at slightly reduced rates and while clean fannings in these categories were only slightly lower, the poorer more fibrous types shed 20-30 paise per kg. Black leaf brokens came to a firm market and their fannings were only fractionally easier, while in the case of the plainest brokens, these were about steady but their fannings ruled much easier. Whole leaf grades were irregular and although flowery pekoes were well, orange pekoes came to a lower market. Tippy teas were sold at reduced rates. Unorthodox descriptions again eased in price.

Quotations (per kg.) were:

	1964	1963
	Rs.	Rs.
Low mediums	4.20-4.65	4.10-4.30
Mediums	4.50-5.10	4.50-4.85
Good mediums	5.15-5.60	4.90-5.50
Nilgiri B.O.P.	5.00-6.45	4.70-7.20

The average price realised in sale No. 46 was Rs. 4.79 per kilo, as against Rs. 4.83 a week ago and Rs. 4.62 in the corresponding sale last year.

In dust sale No. 46 held today 462.000 kg. were offered. There was less general demand at generally lower rates for most of the descriptions. All medium Travancore teas came to an easier market, following less enquiry. Wynaad types, however, met with better support and were only a little lower. Black leaf dusts were also easier. Milled and residual grade encountered less enquiry and were sold below valuations. Unorthodox and Nilgiri types were again a little lower.

The average price realised indust sale No. 46 was Rs. 4.33 per kilo, as compared with Rs. 4.39 a week ago and Rs. 4.46 in the corresponding sale last year.

Colombo: Just over 5 million lbs. were offered and the market opened to a strong general demand with highgrown brokens occasionally dearer, while mediums advanced by 5-10 cents and low-growns remained firm; Uvas inclined easier following quality and liquoring fannings shaded in price.

London: North Indian and other growths: In Monday's sale there was rather better demand but at slightly easier prices with Assam C.T.Cs selling at 1d. to 3d. lower.

Ceylon and South Indians: In Tuesday's auction there was fair general demand and all descriptions were 1d. to 2d. easier.

As we go to press, Messrs. Forbes, Ewart and Figgis (Private) Ltd., wire as follows:

"*Sale No.* 47: 745,000 kgs. offered. Good demand. Low medium brokens barely steady. Similar fannings 10 to 20 paise lower. Medium brokens fully firm to dearer. Fannings easier. Good mediums irregularly lower. Highgrowns easied. C.F.T.'s much lower."

JUTE GOODS STEADIER

(From Our Own Correspondent)

CALCUTTA, *1st December*

The jute goods market, which ruled depressed in the earlier sessions of the week (Wednesday and Thursday), owing to tired bull liquidation and emergence of jute mills as sellers in every position, staged a recovery on Friday 27th November which persisted till today. The recovery was aided by reports of scattered hessian business with the U.S., brisk shipper-covering in ready goods, and the continuance of strike in the jute mills of Pakistan. It is reported that the strike in Pakistan mills since 12th October has completely paralysed the industry in East Pakistan resulting in a total production loss of 18,000 tons. The strike, which is over the payment of minimum wages to workers, is believed to have created a feeling of uncertainty in the minds of overseas buyers. This, it is said, has resulted in India receiving substantial orders from Australia and South African countries. Thanks to these orders, prices, especially of sacking goods, have gone up to some extent.

The near-term outlook for hessian goods, however, is not considered to be very bright. This is because Russia has made large purchases of hessian goods which would last upto March 1965 and there is no possibility of export to Argentina, a regular buyer of our goods as no steamer is proceeding to that country this month. Further, the U.S.A. is making only hand-to-mouth purchases of this variety and it has also the prospect of an abundant supply of jute goods in the near future. Meanwhile, nearly 250,000 jute workers in the 82 jute mills in West Bengal struck work today in response to the token strike call of the National Union of Jute Workers on the question of bonus. The strike meant a production loss of 4,000 tons worth Rs. 1.2 crore. The workers also lost Rs. 12 lakhs by way of wages.

In the hedge market, sacking February was subjected persistently to heavy bull liquidation and it moved down from Rs. 157.25 to Rs. 146.90 on the 26th inst. It, however, recovered thereafter and closed at Rs. 149.10 today. Hessian November, after declining to Rs. 50.90 in the earlier sessions, rose to finish at Rs. 51.22.

Ready hessian (40″ x 10 oz.) began the week 10 paise higher at Rs. 50.35 and, after hovering around this rate for some time, closed at Rs. 50.25. B. twills receded from Rs. 158.75 to Rs. 156 before finishing at Rs. 158.

Raw jute was steady in the earlier sessions of the week owing to mill purchases of selected grade fibre. But with increased arrivals and the non-receipt of this week's quota of mill purchases, the fibre declined. The decline was, of course, slight. Over the week, both Assam bottoms and northern bottoms were at their previous levels of Rs. 36 and Rs. 35 per maund, respectively. Daissee bottoms was actually a rupee higher at Rs. 37.

FOODGRAIN ARRIVALS POOR

(From Our Own Correspondent)

HAPUR, *30th November*

Ration shops were faced with dearth of stocks, and ration at the rate of four kilogrammes each unit per month was not available. The U.P. Government is purchasing rice and maize to build up a buffer stocks, but as arrivals in open market were still poor, a substantial quantity has not yet been received by Government. *Rabi* sowings in scattered areas, which were badly waterlogged after last heavy rains, is still been done and first reports indicate that germination has been good.

Steadier trend continued in wheat market during the week and prices hardened further by Re. 1.50 per 40 kilogrammes on brisk consumers' support. Arrivals were negligible and prices in open market were now quoted between Rs. 36.50 to Rs. 37.50 for *dara* quality and between Rs. 38 to Rs. 39 for farm produce. After an early decline, because of increased arrivals, rice prices ruled firm in the week-end on good buying support. Prices rose by Re. 1.50 to Rs. 2.50 per 40 kilogrammes, according to quality, to be quoted for *basmati* superior at Rs. 40 to Rs. 42, *sela basmati* Rs. 37 to Rs. 39, *mainpuri* Rs. 32, *ramajwayan* and *raimunia* Rs. 33.50, and *gadda* Rs. 27 to Rs. 29 per 40 kilogrammes.

ANTI-CORROSIVE METAL

READY STOCKS AVAILABLE

Contact:

SOUTHWOOD ROLLING MILLS

George Oakes Building, N.R. Square,

BANGALORE, 2.

Gram prices again firmed up by Re. 1 per 40 kilogrammes during the week, after ruling easy earlier, on good demand and prices were now quoted between Rs. 32 to Rs. 32.50. Maize prices, in unofficial deals, recorded further gains as it was not easily available in the open market. Consumers' demand was brisk and prices ranged between Rs. 25 to Rs. 25.50 per 40 kilogrammes as against Rs. 17.50 fixed by the U.P. Government. Barley and *bejhar* prices also tended to rise, as stocks were reported meagre. Barley was quoted at Rs. 28 to Rs. 29 and *bejhar* between Rs. 28 to Rs. 28.50. *Juwar* and *guwar* also improved as supply position was tight. *Bajra* and other coarse grains ruled firm in sympathy. Week-end prices were: *Juwar* Rs. 27 to Rs. 28, *guwar* Rs. 26 to Rs. 27, *methi* Rs. 28 to Rs. 30, *bajra* Rs. 25.50 to Rs. 26.50 and oats Rs. 29 to Rs. 30 per 40 kilogrammes.

Firm trend was witnessed in pulses market during the week and prices registered good gains in all sections. Peas improved by Rs. 2.50 to Rs. 5 per 40 kilogrammes, according to quality, on brisk outside buying enquiry, in face of tight supply position due to nominal stocks. Peas *dara* was quoted at Rs. 30 to Rs. 31 and farm quality at Rs. 31 to Rs. 32. Peas *dal* prices also moved up to Rs. 32. *Arhar* and its *dal* prices were steadier on good buying support and prices of *arhar* ranged between Rs. 36.50 to Rs. 39.50. *Urd* and *moong* prices ruled firm as arrivals were small. *Urd* was quoted at Rs. 28 to Rs. 31 and *moong* between Rs. 36 to Rs. 38.50. *Masoor* also touched new high levels due to poor stocks. Week-end prices were: *Arhar dal* Rs. 45 to Rs. 46 *urd dal* Rs. 37.50, *moong dal* Rs. 43 to Rs. 45, *masoor* Rs. 37 to Rs. 41, *masoor dal* Rs. 46 and gram *dal* Rs. 37.50 per 40 kilogrammes.

"KHANDSARI" RECEDES

(From Our Own Correspondent)

HAPUR, *30th November*

Sugar prices continued steady on increased demand with the commencement of marriage season and restricted supplies. Most of the factories in west U.P. commenced new sugar production season, but as cane supplied to factories was of inferior quality and not fully ripe, sugar recovery was reported to be low by about 6.5 per cent. Sugar in the open market was quoted at Rs. 180 to Rs. 185 per quintal, as against the controlled prices around Rs. 135. Thanks to good cane crop, which was reported to be ten per cent better than last year. With the early beginning of new sugar production season, it was expected that sugar production in the current season would be better around 30 lakh tons as against 25 lakh tons in last season.

Superior *khandsari* prices ran down sharply during the week by Rs. 10 a quintal as demand further slackened. Inferior and medium quality, however, evoked brisk demand from Rajasthan, Gujarat and M.P. against export permits and prices of these qualities were maintained around previous week's levels. Superior quality was quoted at Rs. 132.50 to Rs. 140 a quintal while inferior and medium quality prices ranged between Rs. 120 and Rs. 130 a quintal. Boora was quoted at Rs. 141 to Rs. 150 a quintal. New production season would start by the end of December, as power crushers would be allowed to function from 7th December.

Gur prices recorded a sagging trend during the week under pressure of arrivals. Demand was, however, fair and entire arrivals were being lifted and consequently there was no stock building as yet. *Balti* quality *gur*, being much in request from the consuming States of South, was at a premium of about Rs. 3 per 40 kgs. over the pansera variety. Week's arrivals were around 45,000 maunds and offtake 65 wagon loads and week-end prices (per 40 kgs.) were: *Pansera* superior Rs. 31, average Rs. 30, *balti* Rs. 33 and *shakker* Rs. 35 to Rs. 36.

Ready *gur* and *shakker* prices declined sharply during the week in the Muzaffarnagar market following an increase in daily arrivals. *Gur chaku* lost Rs. 5.50 per 40 kgs. and *pansera* variety Rs. 3.75. *Khurpapar* and *laddoo* prices also eased and week-end prices (per 40 kgs.) were:—*Chaku* Rs. 27.50 to Rs. 31, *pansera* and *khurpapar* Rs. 28 to Rs. 29.50, *laddoo* Rs. 27.

The total sugar production in the month of October 1964 amounted to about 38,000 tonnes, as against 33,000 tonnes produced in the same month last season. The total production up to the end of 31st October, 1964 aggregated to 2.57 million tonnes, as against 2.16 million tonnes in the corresponding period last year. The offtake from factories during the month (including 3,000 tonnes despatched for exports) was 201,000 tonnes, as compared with 235,000 tonnes (including 11,000 tonnes despatched for export) during the corresponding period last season. Total despatches in 1963-64 season ending 31st October, 1964, were 2.55 million tonnes (including 262,000 tonnes despatched for exports) as against 3.0 million tonnes (including 406,000 tonnes for exports) in the same period last season. The total closing stock with the factories on the 31st October 1964 was 166,000 tonnes, as against 150,000 tonnes.

EXCISE ON SUGAR

In the article on sugar exports appearing in *Commerce* dated 7th November 1964 (*vide* page 810), the excise duty on sugar is put at Rs. 291 per metric ton, whereas it is per long ton (of 2,240 lbs). The actual rate of duty per metric ton is only Rs. 286.50.

TREND OF SHARES

WIDESPREAD LOSSES AGAIN

(From Our Own Correspondent)

BOMBAY, 3rd *December*

LOSSES were again widespread and deep on the Bombay Stock Exchange during the week under review. Support could hardly be expected after the Finance Minister's pessimistic assessment of the country's foreign exchange situation and his proposal to cut foreign exchange allocation during the October 1964-March 1965 period by 10 per cent. Furthermore, the finance Minister's plain speaking about the overall situation in the country and the crisis it was facing, although much appreciated, had an unsettling effect on the stock market. The amendments to the Wealth Tax Bill also had their effect and added to this came again the Finance Minister with his bid to "get very near mastering" the problem of black money in a year or two. No one could ever blame him to get hold of black money in the country, but in the context of the present situation, his carping criticism of the well-to-do people and emphasis on the need for reducing further the economic disparities in the country were bearishly interpreted on the stock exchange.

Support therefore was simply absent. Bull operators have burnt their fingers very badly in the present 12-week fall and some of the disillusioned among them have even turned bears. The market is hammered at every rally and the result has been a succession of losses in values. During the week under review, Tata Ordinary declined further from Rs. 145 to Rs. 143 and Indian Iron from Rs. 25.45 to Rs. 25.05. Public interest in steels was not much in evidence and the market is now an affair of professional operators.

Among textiles, Century and Standard were the worst sufferers and in fact the present decline is led by these two scrips along with National Rayon. Century declined during the week from Rs. 571.50 to Rs. 556 and Standard from Rs. 569 to Rs. 561. There was no particular adverse factor as such to induce a further decline in mill shares but what has already happened is enough to keep them down for a long time. High prices of cotton which are ruling at or above the ceilings and the feeling that the mill industry has to pay through the nose for its raw materials has scared operators away from mill shares. It would be very difficult to revive confidence in them. Moreover, the industry has lost its hold on nearly 50 per cent of the production and it is rather difficult to expect investors to put their money in a field which is subject to so many handicaps. The case of National Rayon and Century are almost identical and their difficulties arise from the sluggishness in the rayon market. In fact, Century built up its prosperity more on rayon than cotton textiles but with the art silk market being what it is the shares have naturally fallen back. The recent labour trouble added to the unwillingness on the part of investors to add to their portfolio of National Rayon. The shares have declined from their 2nd September, high of Rs. 383 to Rs. 331.50 during the week under review.

Opportunity may be taken here to compare current levels with those of 2nd September, for the market has been declining continuously since that date. On that day, Century was quoted at Rs. 640 (day's high) against the present quotation of Rs. 556. Standard has come down from Rs. 682 to Rs. 561, while National Rayon has eased from Rs. 383 to Rs. 331.50, after touching today a low of Rs. 328.50. The decline in steel shares has also been rather steep even after allowing for the dividends. Tata Steel is just around Rs. 143 against its 2nd September high of Rs. 162.25 (c.d.) and Indian Iron around Rs. 25.05 against Rs. 27.95 (c.d.), Indian Dyestuff which had touched a level of over Rs. 311 is now at Rs. 258.50. Current market levels are generally just a little above the year's lows touched sometime towards the close of 2nd May and, with one or two hammerings, they might break into the lowest of the year. The decline has been long and steep but yet one cannot say with any measure of definiteness that the worst has been seen.

Premier Construction hit the headlines again during the week and were bid up to a new high level of Rs. 221 on hectic short-covering and renewed influential support. Expectations were that, following the prosperous position of some of its subsidiaries, there was likely to be a rise in the dividend. It may be pointed out that Premier Construction is entirely a holding company and accounts for about 99.5 per cent of the share capital of Hindustan Construction which raised its dividend recently from 20 per cent to 50 per cent. Premier holds 71,063 shares of the latter and the benefit should therefore be substantial. Cooper is another wholly-owned subsidiary of Premier's and its working results have been satisfactory. Scindia, in which Premier has considerable interest, has already declared a higher dividend. Walchandnagar is yet to declare its dividend but the presumption is that the dividend would be attractive. At the end of the week, however, the shares declined to close at Rs. 216.50 but still the quotation is more than five points higher than in the previous week. The accounting year of Premier Construction ends with December and it would be interesting to see whether the directors would fulfil market's expectations about dividend.

The firmness in Belapur particularly in a weak market was due to expectations of a higher dividend and these have materialised with the directors having raised the dividend to Rs. 20 per share, subject to tax, or Rs. 16 net, against Rs. 18 per share subject to tax last year which worked out to Rs. 12.60 net. The directors' report is not out yet but it is believed that the Company has fared well during the year and that there is a sizably higher gross profit.

The other sections followed the general trend. Shippings were quiet but Chemicals were generally easy. Voltas was distinctly better but Dyestuffs were weak. By and large the market seemed to be completely devoid of strength.

* * * *

The Calcutta share market also was easy. Business was restricted to a few counters. Among papers, Orient was well held. Jutes were devoid of interest, while tea shares continued to be dull. In Madras, the trend was irregular, but the undertone was quiet. Plantings, however, tried to maintain a steady tone but textiles were dull. In the miscellaneous section, India Cements and Mettur Chemicals were a little active.

CHEMICALS AND PLASTICS INDIA LTD.

The demand for polyvinyl chloride (P.V.C.) and various other plastic compounds in India is rapidly rising being ahead of domestic production, currently running at 25,000 tons per annum out of a capacity of about 30,000 tons. The targeted output of plastic compounds in third Plan is 74,000 tons. It is tentatively estimated that the demand for plastics in the fourth Plan period would be over 300,000 tons, nearly a fourfold increase of the third Plan target. With a view to tapping this almost insatiable demand, a new company, Chemicals and Plastics India Ltd., with an initial capacity of 6,000 tons of P.V.C. resins and compounds per year, has been formed in Madras. The new Company's factory to manufacture P.V.C. resins will be located at Mettur Dam in the Salem District of Madras State and its fabrication plant to process 1,500 tons of resins to P.V.C. products will be situated near Bombay. The main indigenous raw materials for the production of these products, namely, industrial alcohol derived from molasses, and chlorine will, it is said, be easily available from the adjoining places. Chlorine will be delivered by pipeline from the adjacent plant of Mettur Chemicals and industrial alcohol from a central distillery scheduled to be constructed in Tiruchirapalli. The fabrication plant for producing the extruded products is located in Western India because of the availability of a ready market for the finished goods.

The Company is fortunate enough to have secured the technical collaboration of the world's largest producers of polyvinyl chloride, Messrs. B.F. Goodrich and Company, Akron, U.S.A. All design work relating to the project estimated to cost Rs. 3.39 crores will be planned and supervised by Goodrich engineers. The collaborators will provide the Company with all technical information, know-how and data for the manufacture of P.V.C. and other related materials. The terms of agreement with the U.S. firm for obtaining the technical know-how are said to be extremely profitable from the point of view of the Indian Company. The lumpsum payment of $350,000 towards technical assistance will be satisfied with the allotment of 17,213 shares in the equity capital of the new firm. The foreign collaborators have also agreed to be financially interested in the efficient working of the concern by taking up additional shares worth Rs. 17.21 lakhs. Further, the Company has secured a loan of $3.15 million (Rs. 150 lakhs) from the U.S. Export-Import Bank in Washington to finance the cost of imported plant and machinery. Apart from this, another loan of Rs. 32.21 lakhs from the Cooley funds has been sanctioned to meet the rupee cost of customs duties and part of the expenditure on construction of building, etc. These loans are, however, repayable in convenient instalments from early 1968, by which time, the two factories would have been in operation for over a year.

Chemicals and Plastics India Ltd. which has an authorised capital of Rs. 2 crores (divided into 1.5 lakh equity shares of Rs. 100 each and 50,000 cumulative redeemable preference shares of Rs. 100 each), will shortly enter the capital market to raise a capital of Rs. 150 lakhs (Rs. 135 lakhs in ordinary shares of Rs. 100 each and Rs. 15 lakhs in 9.5 per cent cumulative redeemable preference shares of Rs. 100 each). Of this amount, the signatories to the memorandum and articles of association, Directors, their friends and associated companies have agreed to take 51,075 equity shares and 2,500 preference shares. Of this India Cements Ltd. and Mettur Chemicals Ltd., the two leading promoters, alone are taking up 13,500 and 5,000 equity shares respectively. The collaborators, as stated earlier, will be allotted 17,212 equity shares for their technical assistance and 17,213 equity shares as part of their financial interest in the working of the Company. The balance of 49,500 equity shares and 12,500 preference shares which is fully underwritten will be available for public subscription.

With an assured market, the Company hopes to earn a profit right from the time the plant goes into operation in 1966. The business will be managed by Indplast Private Ltd. under an agreement entered into with Chemicals and Plastics India Ltd.

SANDOZ (INDIA) LTD.

Some more details pertaining to the public issue of Sandoz (India) Ltd. (a reference to which was made in *Commerce* dated 14th November 1964, *vide* page 836) are now available. The list will open for public subscription on the 14th inst. and will close on the 24th or earlier but not before the 16th. The public issue has not been underwritten either wholly or partly in India. For Sandoz Ltd. of Switzerland, the parent Company, has agreed to take up the unsubscribed part of the capital issued, besides taking up shares worth Rs. 23.6 lakhs allotted to it (out of the total new equity issue of Rs. 75 lakhs) partly for cash and partly in consideration for the planning and development of the Company's medical herbs scheme and extraction plant. A sum of Rs. 7.5 lakhs has been agreed to be subscribed for by and will be allotted to Shaw Wallace & Co., Ltd. which has been associated with Sandoz for many years; Rs. 13.90 lakhs have been reserved for allotment to other existing shareholders, Directors, employees and friends. The balance of Rs. 30 lakhs will be offered at par for public subscription.

The Company's licensed capacity of the dyestuffs plant is 524 tons per annum; the important items of manufacture include pigments in emulsion form, direct dyestuffs, acid dyestuffs, chrome dyestuffs, lanasyn dyestuffs and direct turquoise blues. The plant is expected to go into production by the end of first quarter of 1965 and the total output in 1965 is estimated at 200 tons. The Company's licensed capacity for the manufacture of Leucophor (optical whitening agent) is 33 tons per annum. The expansion programme for 1965 also envisages a rise in the capacities of agrochemical and auxiliary plants. The textile chemicals now being manufactured by the Company include carriers for dyeing polyester fibres, levelling agents, detergents, wetting out agents, mercerising agents, dye fixing agents and softening agents. The combined production capacity covering these items is 434 tons per annum. During the first nine months of 1964, the Company produced 258 tons. The estimated production for 1965 is 400 tons.

The working results of the Company for the year ending 31st December 1964 are expected to be quite encouraging. The Company's sales up to the end of October amounted to Rs. 2.82 crores, as against Rs. 2.14 crores in the corresponding period of 1963, representing an increase of 30 per cent. The turnover for the whole of 1964 is expected to be of the order of Rs. 3.50 crores (Rs. 2.76 crores in 1963). The gross profit is likely to be Rs. 30 lakhs, as against about Rs. 18 lakhs in 1963. The Directors hope to maintain the ordinary dividend on enhanced capital at the previous year's level of 6 per cent. The Company's expansion programme is expected to be completed in the year 1968 and the turnover then is estimated to go up to Rs. 6 crores.

In view of (a) the encouraging peformance so far, (b) ready demand for the Company's products, and (c) the benefit of research and technical assistance secured from the parent Company, the public issue of Sandoz (India) Ltd. will, there is no doubt, receive good support.

MYSORE ACETATE AND CHEMICALS CO., LTD.

The Mysore Acetate and Chemicals Co., Ltd., incorporated in December 1963, with the object of setting up a plant for the manufacture of 1,200 tons of cellulose tri-acetate flakes and about 3,000-3,500 tons of cellulose acetate moulding powders, has entered the capital market with a public issue of Rs. 70 lakhs, divided into 70,000 equity shares of Rs. 100 each; the subscription list will open on Thursday, the 10th inst. The issue represents nearly one-third of the total issued capital of Rs. 225 lakhs, the balance of Rs. 155 lakhs representing the combined contribution of the Directors and friends (Rs. 7 lakhs), the Government of Mysore (Rs. 50 lakhs), the Mysore Sugar Company (Rs. 30 lakhs) and the foreign collaborators (Rs. 68 lakhs). The entire public issue of Rs. 70 lakhs has been underwritten by the Industrial Finance Corporation, the Life Insurance Corporation and some leading banks. The Company is seeking two foreign exchange loans, one for Rs. 100 lakhs from the Export-Import Bank of Washington and another for Rs. 75 lakhs from the Industrial Credit and Investment Corporation of India for financing imports of plant and machinery as well as engineering and know-how charges.

The Company has entered into collaboration agreements with Von Kohorn-Universal Corporation Stanton in California (U.S.A.) and Aktiebolaget Chematur, Stockholm (Sweden), for the supply of machinery and equipment for the manufacture of cellulose tri-acetate, acetate moulding compounds, together with all the required auxiliary facilities. The technical know-how of the well-known firm Gevaert Photo Production of Belgium has been secured for the manufacture of cellulose tri-acetate of the quality suitable for use in photographic films. The American and the Swedish companies are also responsible for the engineering and commissioning of the plants.

The Company's factory is being established in a 64-acre site at Mandya, 60 miles from Bangalore. Construction work is to start early in 1965 and the factory is expected to attain full production by the end of 1966.

The cellulose tri-acetate flakes produced by the factory will be the raw material for the production of photographic film in the Government-owned Hindustan Photo-film Factory near Ootacamund. The cellulose moulding powders are useful for the manufacture of cellulose plastics. Cellulose acetate plastics, in turn, are particularly useful for the manufacture of spectacle frames, fountain pen barrels, tooth brush handles and numerous other moulded and extruded articles.

INTERNATIONAL TRACTOR'S NEW ISSUE

The public issue of the International Tractor Company of India Limited will open for subscription on Monday the 7th inst. and will close on Thursday the 17th inst. or earlier at the discretion of the Directors but not before Wednesday the 9th inst. The issue consists of Rs. 61,00,500 divided into 610,050 equity shares of Rs. 10 each. This is in addition to the shares worth Rs. 12,49,400 which have been agreed to be subscribed for cash at par by Mahindra and Mahindra Limited, their associates, directors and friends. The company has been jointly promoted by Mahindra and Mahindra Limited, Voltas Limited and the International Harvester Company, Chicago, (U.S.A.) with the object of manufacturing and marketing of agricultural tractors, implements and allied attachments as also the spare parts thereof. The factory, which is now being established at Kandivili, near Bombay, is scheduled to commence production early in 1965.

The Company holds an industrial licence for the manufacture of 3,500 tractors and matching implements per annum on single-shift basis. It also possesses an import licence for importing machinery worth Rs. 92.70 lakhs and tractor components worth Rs. 30.00 lakhs. The Company has an authorised capital of Rs. 4 crores divided into four million equity shares of Rs. 10 each. The subscribed and paid-up capital is Rs. 76,50,100. The Board of Directors of the Company is presided over by Mr. Harish Mahindra, Chairman of Mahindra and Mahindra Limited.

THIS IS AN ANNOUNCEMENT ONLY AND NOT A PROSPECTUS

Persons interested are requested to obtain application forms along with copies of Prospectus from the Registered Office of the Company or from the Bankers/Brokers/Underwriters.

THE MYSORE ACETATE AND CHEMICALS COMPANY LIMITED

(INCORPORATED AS A PUBLIC COMPANY ON DECEMBER 24, 1963—AND OBTAINED CERTIFICATE OF COMMENCEMENT OF BUSINESS ON MAY 25, 1964)

Registered Office: MYSUGAR BUILDINGS, SRI JAYACHAMARAJA WADIYAR ROAD, BANGALORE-2 (Mysore State)

FIRST TRIACETATE FACTORY IN INDIA

SHARE CAPITAL

	Rs.
AUTHORISED :	
5,00,000 Shares of Rs. 100 each	5,00,00,000
PRESENT ISSUE :	
2,25,000 Equity Shares of Rs. 100 each at par	2,25,00,000
Out of the Present Issue	
A. The following have paid for the shares noted against them in full and have been allotted shares accordingly	
1. The Government of Mysore at par for cash 50,000 Equity Shares of Rs. 100 each	50,00,000
2. The Mysore Sugar Company Limited at par for cash, 30,000 Equity Shares of Rs. 100 each	30,00,000
B. The Directors and their friends have agreed to take at par for cash, 7,000 Equity Shares of Rs. 100 each ..	7,00,000
The Directors have paid Rs. 35,000 for 350 Equity Shares already taken up by them.	
C. Foreign Collaborators, Viz.	
(a) Messrs. Von Kohorn-Universal Corporation, Stanton, California, U.S.A. and/or their designees have been allotted 58,500 Equity Shares of Rs. 100 each, for consideration other than cash, in part payment of the cost of plant and machinery know-how, blue prints, manuals, fees &c.	58,50,000
(b) Messrs. Aktiebolaget Chematur, Ankdamnsgatan, Solna, Sweden have been allotted 9,500 Equity Shares of Rs. 100 each, for consideration other than cash, in payment of the cost of know-how relevant blue prints, manuals, fees &c.	9,50,000
	1,55,00,000
D. Now offered for public subscription at par and for cash ; 70,000 Equity Shares of Rs. 100 each, and fully underwritten	70,00,000
	2,25,00,000

TERMS OF PAYMENT OF THE ABOVE SHARES

The amount payable in respect of the present issue of Equity Shares is as follows :

On Application	Rs. 25 per share
On Allotment	Rs. 25 per share

The balance of Rs. 50 is payable in two calls of Rs. 25 each at intervals of not less than two months, provided that the last call shall be made not later than 18 months after allotment.

PROPOSED ACTIVITIES OF THE COMPANY

The Company was incorporated with the objects stated in its Memorandum of Association and with the immediate object of manufacturing about 1,200 tonnes of Cellulose triacetate of film quality and 2,400 tonnes of Cellulose acetate with expert foreign collaboration. Cellulose acetate will be converted into moulding compounds by the addition of plasticizers and fillers. Production is expected to start by the end of 1966.

LOCATION OF FACTORY

The Factory will be located at Mandya, in Mysore State, about 60 miles, from Bangalore, on the Bangalore-Mysore Road in the neighbourhood of the Sugar Factory and Distillery belonging to the Mysore Sugar Company Ltd. As the Acetic Acid required by this Company is to be produced and supplied by the Mysore Sugar Company out of alcohol produced in its Distillery, the location of the Factory at Mandya ensures the maximum savings in transport costs of Acetic Acid which is a basic raw material in the manufacture of Cellulose acetate.

Mandya is also ideally suited for the location of the Factory on account of adequate supplies of water, power and labour and proximity to Ooty where the Hindustan Photo Film Manufacturing Company Ltd., consumers of Cellulose Triacetate is situated.

BOARD OF DIRECTORS

1. Sri A. M. M. MURUGAPPA CHETTIAR, 9, Santhome High Road, Mylapore, Madras-4 (CHAIRMAN OF THE BOARD OF DIRECTORS) Industrialist, Chairman & Director of Madras Industrial Investment Corporation Ltd., Sri Sarvaraya Sugars Ltd., Mysore Cements Ltd., Lakshmi Machine Works Ltd., Managing Director of—Tube Investments of India Ltd., Carborandum Universal Ltd., Director of—Thiru Arooran Sugars Ltd., E.I.D. Parry Ltd., Kanoria Chemicals and Industries Ltd., Ashok Leyland Ltd. and others.
2. Mr. HENRY JOHN CAIL, Stanton, California, U.S.A., President, Von Kohorn Universal Corporation, Stanton, California, U.S.A.
3. General K. S. THIMAYYA, D.S.O. (Retd.), 6, Sampegay Tank Road, Bangalore, Commander, UNFICYP, Nicosia-CYPRUS.
4. Sri JAYANNA M. CHIGATERI, Sri Krishnarajendra Road, Davangere, Industrialist, Managing Agents, Sree Shankara Textiles Ltd., Director, The Mysore Industrial & Testing Laboratory Ltd., Mahaboob Shahi Kulbarga Mills Co. Ltd.
5. Sri K. V. SHANKARA GOWDA, B.A., L.L.B., Advocate, Mandya, Director—The Mysore Sugar Co. Ltd.
6. Sri BAHUBALI GULABCHAND, Construction House, Ballard Estate, Fort, Bombay-1, Chairman, Bharatiya Engineering Co. (P) Ltd., Director of—The Hindustan Construction Co. Ltd., The Indian Hume Pipe Co. Ltd., The Hindustan Spun Pipes Ltd., The Neptune Insurance Co. Ltd. and others.
7. Sri V. VENUGOPAL NAIDU, 4 Brunton Road, Bangalore—1, MANAGING DIRECTOR. Chairman & Managing Director—The Mysore Sugar Co. Ltd., Director of—The Mysore Chemicals and Fertilisers Ltd., The Mysore Lac and Paints Ltd., The Mysore Fruit Products Ltd., The Mandya National Paper Mills Ltd., etc.

MANAGING DIRECTOR

Sri V. VENUGOPAL NAIDU, 4, Brunton Road, Bangalore-1.

UNDERWRITERS

The public issue of Rs. 70 lakhs is fully underwritten by the following Institutions and Banks.

1. Industrial Finance Corporation of India.
2. Life Insurance Corporation of India.
3. Bank of Baroda Ltd.
4. Andhra Bank Ltd.
5. Devkaran Nanjee Banking Co. Ltd.
6. Canara Bank Ltd.
7. Syndicate Bank Ltd.
8. Indian Overseas Bank Ltd.

BANKERS

1. The Bank of Baroda Ltd.
2. The State Bank of Mysore.
3. The Andhra Bank Ltd.
4. Devkaran Nanjee Banking Co. Ltd.
5. Canara Bank Ltd.
6. Syndicate Bank Ltd.
7. Indian Overseas Bank Ltd.

BROKERS

Bangalore

1. Messrs. Lokkur & Co., Kempegowda Road, Bangalore-9.
2. Messrs. P. R. Subramanyam & Sons, " Shree Siva," 24, 4th Street, Benson Cross Road, Bangalore-6.
3. Messrs. M. Nanjappiah Jahgirdhar, 181, Cavalry Road, P.B. 7, Bangalore-1.
4. Messrs. Satyaprakash & Co., 8, Kempegowda Road, Bangalore-9.
5. Messrs. Jahgirdar & Co., 126, Subedar Chatrem Road, Seshadripuram, Bangalore-20.
6. Messrs. Sivan & Co., 25/10, Kempegowda Road, Extension, Bangalore-9.

Madras

1. Messrs. Paterson & Co., P.B. 48, 11/12, Second Line Beach, Madras-1.
2. Messrs. Chitra & Co., P.B. 1557, 322-323, Linghi Chetti Street, Madras-1.
3. Messrs. Dalal & Co., National Insurance Buildings, P.B. 149, Madras-1.
4. Messrs. Kothari & Sons, P.B.267, Oriental Buildings, Armenian Street, Madras.
5. Messrs. Maconochie & Co., P.B. 291, Mercantile Bank Buildings, Madras-1.
6. Messrs. Subramanian & Co., 1st Floor, 14, 2nd Line Beach, Madras-1.

Bombay

1. Messrs. P. R. Subramanyam & Sons, 70-A, Stock Exchange Buildings, Apollo Street, Fort, Bombay-1.
2. Messrs. Lewis & Jones, Bank of Baroda Buildings, Apollo Street, Fort, Bombay-1.

7. Messrs. Desh Bandhu Gupta & Co., 45, Stock Exchange Buildings, Asaf Ali Road, New Delhi-1.

Calcutta

1. Messrs. G. M. Pyne, Allahabad Bank Buildings, 14, India Exchange Place, Calcutta-1.
2. Messrs. L. N. Roy & Co., 7, Lyons Range, Calcutta-1.

Hyderabad

1. Messrs. P. B. Afzulpurkar, B.Sc., Sultan Bazar, Hyderabad (A.P.).
2. Messrs. M. R. & Company, Singhvee Bhavan, Tilak Road, Hyderabad (A.P.).
3. Messrs. Kapurchand Shrimal, Sultan Bazar, Hyderabad (A.P.).

Ahmedabad

1. Messrs. Chunilal Chimanlal Dalal, Fatehbai Haveli, Ratanpole, Ahmedabad.

DATES OF THE OPENING AND CLOSING OF THE SUBSCRIPTION LIST

The subscription list will be open at the commencement of Banking hours on Thurdsay, 10-12-1964 and will close at the close of Banking hours on Tuesday, 22-12-1964 or earlier at the discretion of the Directors of the Company but not earlier than the close of Banking hours on Saturday, 12-12-1964.

MARKET GOSSIP

(*Concluded from page 979*)

Revealing, indeed, are the following observations of Mr. Wroblewiski:

"Most of the factories visited by me are so small and in their outlook so shortsighted that their participation in export trade ought to be rejected, because it would diminish the available help to be given to the few really effective factories which could gain in the world market. . . . There are only a few pieces of modern equipment for the technical processes. Even when one finds occasionally modern equipment in Indian factories, they are not used to their full extent, because, at the very outset, the production process is outdated and is handicapped by too much manual work and, for that reason, proceeds too slowly. . . . Most of the Indian processed food articles are out-of-date in the matter of presentation. In taste, they are not on a par with the average offer from other countries, except canned prawns and shrimps."

The West German expert has not merely drawn attention to these defects but also offered some concrete suggestions. The solutions put forward by him are: formation of a consortium or combined food export houses in Bombay, with an auxiliary (an Indian food house for Europe) located in Frankfurt-on-Maine for organising exhibitions; award of suggestive trade seals to quality producers; use of superior quality labels; establishment of personal liaison with EUFODA (European Food Distribution Association) with a technical director provided by them; establishment of a factory in Goa with machinery to be imported for the purpose; setting up of a good labelled can producing factory; establishment of a liaison office in West Germany at Frankfurt-on-Maine; collaboration of Tea and Coffee and Cashew Boards, Processed Foods and Marine Products Export Promotion Council; opening of Indian tea and coffee bars and restaurants in Europe; training of Indians in foreign technical market export promotion; grant of cheap and regular freight facilities; regular participation in food fairs; and setting up of an advertisement and designs wing in India.

The suggestions put forward by Mr. Wroblewiski are quite practical and must be implemented in right earnest, if India is really serious about earning as much foreign exchange as possible through exports of processed food articles. The Press version of Mr. Wroblewiski's recommendations does not, however, mention anything about the packaging of food products which is very important. Whether it is for raising production or for improving packaging, the food processing and preservation industry will need quite a bit of foreign exchange. An official estimate places the total foreign exchange requirements of the industry during the next two years at about Rs. 200 lakhs—Rs. 140 lakhs for tin plate, Rs. 50 lakhs for machinery and equipment, and Rs. 10 lakhs for raw materials like citric acid. Considering that the industry earns for the country a sizable amount of foreign exchange, these requirements must be met. At the same time, however, there is much force in the Government's plea to the industry to substitute, as far as possible, the use of tin plate by other means of packing materials, such as aluminium foil and polythene.

What 7% Means To London Money Market

The seven per cent Bank rate forced upon the British monetary authorities by a sudden and fierce crisis of confidence in sterling is a clear indication that domestic policies are being attuned to the needs of long-term balance of payments position of the U.K. But the rise in Bank rate failed to stop the run on sterling and needed the support of a speedily and informally negotiated joint credit of $3,000 million from the central banks of the U.S., eleven European countries, the Bank of International Settlements and the U.S. Import-Export Bank. The long-term causes and the chain of events preceding the worst of the sterling crisis leading up to the 7 per cent Bank rate are by now well known. They raise some fundamental issues pertaining to international liquidity which are discussed by Questor in his despatch published on page 984. It is proposed to outline here the effect of the rise in the Bank rate on the London money market.

The immediate result of the 2 per cent rise in the Bank rate was an increase in the clearing banks' deposit and lending rates. Since the 7-days' deposit rates are tied to a level of 2 per cent below the Bank rate, they came up to 5 per cent automatically. In addition, the banks also raised the interest rates on savings accounts by one per cent to 3½ per cent for the first £250, the current rate being paid on the higher balance. This is a significant development in that this is the first change in the savings bank rate offered by the British banks since the last war. After all the fuss made over the method, manner and technique of raising deposit rates during the past two years, the banks in Britain have ultimately seized this opportunity to test the reaction of the authorities and the public. At the current levels, the British deposit rates can no longer be deemed to be uncompetitive or low, the way Radcliffe Committee put it.

The banks lending rates, too, now in the range of 7½-9 per cent, cannot be regarded as low. In fact, during the last few months, the banks were actually trying to raise their lending rates in subtle ways, despite the 11-year old indication of the Treasury that it would not relish any increase in advances rates. To the banks, therefore, the higher Bank rate has provided a welcome opportunity to realign their lending rates, to increase the spread to accommodate the varying shades of risk, and to subject borrowers to stricter and tougher scrutiny. Following the Bank rate rise, at least two banks, the Midland and the Westminster, have revised the nominal rate of interest on personal loans from 6 per cent to 7 per cent. The effective rate, however, is much higher on account of the special technique of charging for personal loans on the basis of opening balances of a year irrespective of the repayments during the year. Barclays Bank, however, has said that its rate for personal loans would remain unchanged at 6 per cent.

The higher Bank rate this time was not accompanied by any other measures of credit squeeze, because the Bank of England must have realised that the bankers had taken the cue and were themselves applying the squeeze and that the need for a compulsory squeeze was not, therefore, imperative in purely domestic terms. Bank advances have been steadily building up, but banks have taken a more selective attitude during the past three-four months. Credit-deposit ratio at 53 per cent is itself an automatic check on further lendings by banks. Liquidity ratio at 30.1 per cent, barely 2 per cent above the official floor, is not at all excessive for this time of the year, when banks should be building up their liquidity for the annual window-dressing. Moreover, the balance of payments deficit and sales of reserves are cutting both ways in the bank's ability to extend further credit, partly by increasing the current advances to finance imports but largely by cutting into the banks' liquid assets. In the circumstances, the Bank rate has been accompanied neither by *special requests* from the Bank of England "which would have been superfluous" nor by *special deposits* "which would have been excessively deflationary," to quote a British commentator.

In the absence of credit squeeze and higher rates, banks stand to gain by the higher Bank rate, but discount houses are the worst sufferers, for they have to take the heavy losses on their bills and bonds portfolios. Their losses are particularly sharp, for, during the past two or three weeks, they were actually building up their portfolios on the basis of earlier official assurances that the Bank rate would not be raised. The discount market's rate for three months' time trade bills has gone up from 5¼ to 7¼ per cent.

In order to insulate the domestic economy, generally, and the long-term interest rates and housing loans, particularly, from the higher short-term rates of interest, the Labour Government may soon have to follow a 'two-tier' interest rates policy. The yield on Treasury Bills has increased sharply from 4.11/16 to 6¼ per cent. Local authority mortgage rates have jumped up to 7 per cent. Although the prospects for long-term rates are not yet clear, the slides in the short-dated gilt-edged prices has produced sizable increases in the net redemption yields of dated Government securities. The net redemption yield (that is, return after allowing for freedom from liability for income-tax on capital appreciation element) in some cases is close to or even beyond 9 per cent. But by refusing to raise the Public Works Loan Board lending rates from around the 6 per cent level, the Government has already introduced in effect a second tier of interest rates. It is also expected that, in view of this, the Government will treat it as its moral obligation not to allow an increase in the rate of interest on national savings certificates from the present 3½ per cent tax-free to beyond five per cent. All over the world it has now become a common practice to introduce refinements in the Bank rate weapon, in order to safeguard the interests of special sectors. So even the grandma of the central banks, which had hitherto stuck to the old tradition, has to move with the times.

Like the discount houses, however, the hire-purchase finance companies will suffer losses, because their lending rates are stickier than their borrowing rates, due to keen competition. Although the Finance Houses Association is likely to raise the ceiling rate on instalment loans for cars from 9 to 10 per cent, their profit-margin may be substantially affected, for the rates that they pay on almost one-fourth of their resources which are obtained from banks will go up by 2 points to 8 per cent; besides they will also be forced to pay more for deposits in competition with the commercial banks. The rate for three months' fixed deposits accepted by the Finance Houses has gone up from 5½ to 7¼ per cent.

Notice

THE INDO-BURMA PETROLEUM COMPANY LIMITED

Registered Office:

Gillander House, Netaji Subhas Road Calcutta-1

NOTICE IS HEREBY GIVEN THAT THE Preference Register of Members of the Company will be closed from the 18th December 1964 to 30th December 1964, both days inclusive, for payment of the dividend for the half-year ending 31st December 1964, on the 2nd January 1965, at the rate of Rs. 2.914 per share (being the stipulated dividend of Rs. 3.50 per share increased by 11 per cent to Rs. 3.885 less Rs. 0.971 being Income Tax at the Company's rate of 25 per cent) subject to tax being deducted therefrom in accordance with the provisions of Section 194 of the Income Tax Act, 1961.

AUTOMOBILES—A MUCH MALIGNED INDUSTRY

THE automobile industry is again in the dock for no fault of its own. It was dragged to the floor of the Lok Sabha this week by some over-zealous members, claiming to champion the cause of consumers. They were, of course, discharging their legitimate function. Only, most of those who spoke on the subject paid scant regard for facts and the couple of members who sought to present them were nearly ridiculed. The facts about the Indian automobile industry are well known, thanks to the enquiry into it by the Tariff Commission, the Jha Committee, the country-wide publicity given by the automobile manufacturers themselves, the publication of the directors' annual reports and statements of accounts of the automobile companies, and the observations made by the Ministers concerned on the floors of both the Houses in the past. It is unfortunate that, despite all this mine of information, there should be so much misunderstanding about this vital industry. One wonders whether this is not a case of one not wanting to be convinced of the truth, because it does not suit one to do so.

To some extent, the Government itself is to be blamed, for it does not seem to know its mind and makes statements that conflict with its earlier decisions. To anyone who had carefully studied the economics of automobile industry in this country, it was obvious that it would be uneconomical to permit one more unit for manufacturing small cars alone. Yet the Government toyed with the idea for a long time, invited offers from several manufacturers, and appointed committees to consider whether or not a separate project should be established for making small cars or whether any one of the existing ones could be allowed to take it up. To the discredit of existing manufacturers it must be said that, instead of opposing the whole move, which would have been the right thing to do, they all vied with one another for getting the licence; their opposition was only to the establishment of an entirely new company.

This illogical stand on the part of the private sector apart, the Government itself came to the conclusion last year, when the subject was under the portfolio of Mr. C. Subramaniam, that it was not worthwhile proceeding with the project. The impression that one got was that the small-car project had been postponed *sine die*. But now it looks as though one was wrong in drawing that conclusion, for, on 27th November last, the Deputy Minister for Industry and Supply, Mr. B. Misra, informed the Lok Sabha that "fresh alternatives for increasing the production of cars, *including the one regarding the revival of the small-car project, are being explored*" (italics ours). Why should the Government again entertain the idea of small cars, when all that can be said in its favour and against has been stated and judged and there has been no change for the better in the factors that went against the small-car project? Such statements serve no useful purpose; on the contrary, they only cause confusion, engender false hopes and make the Government itself an easy target for the Opposition. It may be recalled, in this connection, that several members of Parliament have alleged that the Government shelved the small-car project under pressure from the monopolists and vested interests, an unfair charge undoubtedly, but one that may be believed by the gullible among the public.

It is true that the on-the-road prices of cars made in India are prohibitively high, that the cars suffer from far too many defects than inevitable in an underdeveloped country and that production is lagging far behind demand. The manufacturers do not deny these charges, but their contention is that they cannot be held responsible for them, because the causes are beyond their control. The complaints may be examined one by one. To take the question of high prices first. About one-third of the present prices (paid by the buyer) represents taxes (excise duty, customs duty and sales tax). In the case of commercial vehicles, the element of tax is higher still, at over 45 per cent. If all these taxes are abolishd, the price of car to the buyer will not compare very unfavourably with the prices paid by buyers in Europe for comparable makes. Again, since 1958, the cost of everything (raw materials, components, wages and salaries, freight, insurance, packaging, etc.) has gone up substantially and yet the ex-factory price, regulated by the Government, has risen only by a fraction. It is worth remembering, in this connection, that the profits of automobile companies have been poor all along, their shares are friendless and have suffered heavier capital depreciation than other industrials and the ratio of borrowings to own resources is pretty high. The experience of individual automobile companies in this respect varies, depending upon the extent of non-automobile engineering work executed by them, but, if one were to take the profits of passenger cars division alone, one would find that there is not much difference in their performance. Under the Government's policy of dispersal of economic power, the car manufacturers are allowed to manufacture only specified items of components, leaving the others to be produced by other entrepreneurs. This policy has led to higher production costs, lack of control over the prices of such components as are made outside and, in some cases, unsatisfactory quality, too. Again, prices of raw materials and components are higher than those in Europe. Steel, for instance, costs Rs. 1,260 per ton in India, as against Rs. 650 in the U.K., a set of wheels Rs. 142, as against Rs. 48, and a set of tyres Rs. 567, as against Rs. 225. There is, therefore, no point in blindly criticising the manufacturers for the high cost of cars.

As for the cars not being as good in quality as those manufactured by the foreign collaborators in their own country, the Indian car manufacturers are, perhaps, blameworthy to some extent, but not fully. The common complaints are: the wear and tear of parts are unduly high (some of the parts taken from the old and well used imported cars, it is said, last longer than the new parts manufactured in India), the cars are not leakproof against monsoon, the quality of stainless steel fittings is very poor, and the paintwork fades away much sooner than in the case of imported car. To the extent the quality of raw materials, components and workmanship in this country is not comparable with that obtaining in Europe, the cars made in India are bound to be poorer in quality and the manufacturers cannot be held responsible for this state of affairs. Again, as the size of the units in India are small, they cannot employ automation to the same extent as their confreres in Europe do. And this in turn contributes to a fall in quality, for automation goes a long way towards eliminating the faults inherent in human labour, besides bringing down costs. There is, however, no reason why some of the defects that exasperate the users of car cannot be eliminated, given adequate inspection, testing, and supervision. Surely, cannot leak-proof (against rain) cars be produced in India even after fifteen years of experience? Similarly, it should be possible to improve the rust-proof quality of the stainless steel used in the bumpers. Again, more durable material can be used in the channelling of window glasses. Improvements are also possible in the fitting of various parts to prevent rattling noise. The same thing can be said of electrical fittings too. It is these avoidable qualitative defects that have deprived the sympathy of even knowledgeable users for our car manufacturers and turned them into their cynical critics. The manufacturers should strive hard to eliminate these defects and endeavour to disabuse the impression that they are the result of their anxiety to increase the rate of production and minimise their costs.

The remedy for the long waiting list of intending buyers of cars lies in stepping up production, but this is beyond the control of manufacturers. The waiting list for Fiat cars is so long that, even a four-year-old car which has done 40,000 miles, fetches a premium of about Rs. 2,000 over the on-the-road price of a brand new car. The realisation that one can replace a Fiat, after using it for four years, at a substantial profit is an added attraction to that car as compared with the Ambassador or the Standard. The real bottleneck to increasing production is insufficient foreign exchange allotment for buying materials and components. The establishment of a new factory for the production of small cars, requiring an investment of Rs. 50-60 crores, would only make matters worse in this respect. If the foreign exchange required for this project is made available to the existing manufacturers, the bottleneck could be broken earlier and perhaps at a lower cost. If production were increased, the waiting list would be shorter and the prevailing black market practices could be considerably minimised. A less expensive (from the point of view of foreign exchange) way out might be to permit imports of second-hand cars from Europe and the U.S. where they are very cheap, but that would be no permanent solution to the problem confronting the country. The Government must, therefore, allot more foreign exchange to the existing manufacturers for stepping up the production of cars.

In the inconclusive non-official debate on the automobile industry that took place in the Lok Sabha this week, the members who were excessively critical of the manufacturers of cars failed to acknowledge the fact that passenger cars have been given a low priority by the Government in the allocation of foreign exchange, while securing large foreign assistance for the manufacture of trucks and other commercial vehicles. An exclusively truck manufacturer like T.E.L. Co. is [illegible]

ree from the political attacks to which the ndustry has been subjected in Parliament rom time to time. This is only by the way. What is more important is the need to re-ognise that passenger cars are also as neces-ary as commercial vehicles. While some riority for trucks may be justified, the low ating given to cars has been overdone. An utomobile is not a luxury, it is a necessity or certain tyes of workers, including mem-ers of Parliament. Both in taxing this ehicle and in allocating foreign exchange for ts manufacture, the Government has carried he concept of luxury to absurd lengths.

A point that is conveniently ignored by he carping critics of automobile manufac-turers is that the higher the indigenous ontent of the car the greater has become the ost, because the indigenously manufactured omponents cost more. They have also failed o realise that the non-implementation of some of the third Plan projects, as, for instance, the one for manufacturing special steels, for which he blame rests with the Government, has seriously upset the plans of many industries, including the automobile industry. If special steels were available within the country, a considerable amount of foreign exchange could be saved and used for expanding the produc-ion of cars.

In any plan the Government has in mind for ending the shortage of cars, first priority must be accorded to expansion in the produc-tion of existing car-manufacturing units. That would be the most economical way of tackling the problem. But this by itself may not result in any substantial reduction in the cost of cars. The Premier Automobiles, for instance, says that, even if its production of Fiat cars were raised from the current level of 4,500-5,000 cars per annum (in 1960-61 and 1961-62, it had pro-duced about 7,000 cars per annum, the sub-sequent fall being due largely to the cut in the foreign exchange allocation) to 35,000 cars a year, there might not be "any appreciable saving in cost, because of the higher cost of raw materials from imported and local sources, taxes on imported raw materials, higher duty on capital machinery, etc." Mr. Misra himself disclosed in Parliament the other day that two manufacturers had told the Government that, "even if their capacity were stepped up to 50,000 cars per annum, the reduction in price from the current level would not be more than about Rs. 750 per car." The prospect of such a small reduction in the selling price should not, however, be used as an excuse for not allowing an increase in their production and productive capacity. For, apart from sub-stantially reducing the long waiting list for cars and the evils flowing from it, a rise in the production of cars from 23,000-24,000 units to 50,000 per annum would enable the com-panies to attain the economic strength necessary for further expansion.

A suggestion that has been repeatedly put forward in the past one or two years pertains to amalgamation of the three existing manu-facturers of cars, so that the country may have the benefit of the economies of large-scale manufacture. This idea was supported by some members of Parliament in the course of the debate under reference. Actually, the Government put it to the three manufacturers that their existing facilities might be "in-tegrated into a common unit to produce one or at the most two makes of cars, making a rational use of exsting facilities and under-taking expansion in the most economic manner." Or, alternatively, "one of the exist-ing manufacturers may be selected for sub-stantial expansion, the selection being made on a competitive basis with reference mainly to requirements and arrangements for foreign exchange and assurance in regard to price reduction." The response from the manufactur-ers to these alternatives was not encouraging and, apparently, it is in this context that they have tried to establish that, even if production were raised to 50,000 cars per year, there could be a reduction of no more than Rs. 750 per car. This, however, does not mean that the idea of amalgamation is unsound. It needs to be explored further and the Government will do well to appoint a committee of independent technical experts for this purpose. For a number of years to come, the Indian market for automobiles will remain too narrow to permit the swift growth of three manufacturers along sound lines, without imposing excessive burden on the users, burdens which will restrict the pace of expansion and the excellent gainful employment opportunities it offers. An amalgamated company may also offer scope for inviting participation by foreign private capital which, in turn, will help break the vicious circle caused by foreign exchange shortage. All over the Western world, auto-mobile industry has been strengthened in recent years by large-scale mergers of indepen-dent units. In India, too, the cement industry was strengthened in the pre-war years by the merger brought about by the late Mr. F. E. Dinshaw, a genius of those days. But a con-sideration which is basic to this idea is that the Government should not later on turn round and say that a monopoly has been brought into existence and that it should, therefore, be nationalised. An assurance from it that the automobile industry would not be nationalised for at least a period of 25 years, if the existing manufacturers of cars agreed to merge them-selves, would be quite pertinent. The expan-sion problems of this vital industry calls for a dynamic approach.

PLAN FOR ELECTRONICS

AMONG the modern industries that have grown by leaps and bounds, especially in advanced countries, electronics, with its appli-cations in several spheres of human activity like the public address system, radio and tele-vision broadcasting, space communication, in-dustrial instrumentation, medical examination and mechanical computation, holds the pride of place. Considering that this is a complicated industry, requiring the manufacture of a wide range of raw materials, accessories, components and devices and of an equally wide range of delicate instruments, equipment and gadgets for civilian and military purposes, its growth, especially since the last World War, has been truly phenomenal. In the United States, for in-stance, the general electronics industry itself expects to have sales to the tune of $20 billion in 1965. Generally speaking, in the Western countries, the share of industrial applications in modern electronics has increased to such an extent that it is now 50 per cent more than the consumer market for radio receivers.

The industry's progress in India has, how-ever, been quite slow so far; confined as it is largely to the assembly of radio receivers in the private sector and to the manufacture of some military communication equipment in the public-sector Bharat Electronics Ltd., it is of a relatively small size in terms of annual pro-duction capacity. That the annual output of radio receivers ranges only round 400,000 sets (valued at about Rs. seven crores) at present may be noted in this connection. Equally telling is the fact that, while there are nearly 100 million households in the country, the aggre-gate number of radio receivers in operation is no more than 2.7 million. This, incidentally, provides a measure of the task that lies ahead in just one sub-sector of the electronics indus-try. When the other sub-sectors of the indus-try are also taken into account, it is seen that the present annual output of all electronic goods (including radio receivers) is no more than Rs. 30 crores. It should be clear, therefore, that the country will have to go a long way before it can become reasonably self-sufficient in elec-tronic components and equipment. In fact, the Central Government's Electronics Committee (Chairman: Dr. H. J. Bhabha) has just assessed the country's aggregate requirements of elec-tronic goods at about Rs. 1,600 crores during the entire period from 1963 to 1973, or Rs. 330 crores per annum by 1973. Incidentally, though the Committee has taken the period 1963-73 as the basis for its recommendations, the period of ten years is to be reckoned from the first year of implementation. A break-up of the 10-year aggregate output figure is as follows:

1. Rs. 180 crores, being the cost of 11 mil-lion domestic radio receivers, 350,000 commu-nity sets and 25,000 television sets to be pro-duced during the 10-year period.

2. Rs. 50 crores, being the cost of replace-ments for three million radio sets over the same period.

3. Rs. 730 crores (including Rs. 70 crores for replacement parts) on account of electro-nic equipment required by the Defence Services.

4. Rs. 90 crores to meet the requirements of All-India Radio, civil aviation, lighthouses and lightships, railways, meteorology, over-seas communication services and internal security force.

5. Rs. 70 crores worth of electronic equip-ment required by the Post and Telegraphs Department.

6. Rs. 100 crores on account of miscellane-ous items of entertainment equipment like phonograph amplifiers, tape-recorders and public address systems.

7. Rs. 200 crores of industrial electronic equipment for machine control and instrumen-tation in industries.

8. Rs. 100 crores worth of electronic com-puters.

9. Rs. 100 crores worth of radio receivers to be produced for export.

In all, therefore, aggregate production of electronic equipment during the 10-year period upto 1973, according to the Committee, would have to be not less than Rs. 1,600 crores. This would call for the creation of new production capacity at the rate of Rs. 33 crores per year, so that the country may have an annual pro-duction of the value of Rs. 330 crores (including Rs. 24 crores on account of raw materials like metals, glass, insulating materials, chemicals, paints and varnishes and Rs. 84 crores on ac-count of components like resistors, capacitors, connectors, relays, switches, semi-conductor de-vices, electron tubes, panel instruments and hardware) by 1973. It may be noted by way of comparison here that Japan, with a fifth of the population and a tenth of the area of India, has *already* an annual production of Rs. 700 crores of electronic goods predominantly for civilian and export purposes. The Committee is thus right in claiming that a possible annual pro-duction target of Rs. 330 crores *by 1973* for a rapidly industrialising country like India is a very modest one.

But the more relevant question here is how much capital investment would be required to establish production capacity of that order. The Committee's estimate, in this connection, is that a total investment of Rs. 180 crores will have to be made over the 10-year period in the electro-nics industry. In other words, the required capital investment works out to an an-nual average of Rs. 18 crores during the 10-year period for a production capacity of Rs. 33 crores per annum during that period. This represents a very favourable capital-output ratio of nearly 1 : 2. Consider-ing the all-pervasive importance of electronics in a modern society with its sophisticated civi-lian and defence requirements, the suggested investment of Rs. 180 crores over a 10-year period is by no means large. Although the Com-mittee, in its interim report just released, has refrained from giving a break-up of investment and production targets for the public sector and the private sector on the ground that it would be necessary to plan the development of the in-dustry on an integrated basis in three tiers, namely, raw materials, components and equip-ment, in both the sectors, it is possible to figure out that the private sector will have a big role to play. It is not the amount of capital re-quired—this is not relatively much in the elec-tronics industry, as compared with several other capital-intensive industries—that may deter new entrants into this field. The difficulties in the way are quite different, for these pertain to re-search, design and technical training.

Given (i) adequate research and design faci-lities to suit the equipment trends in this field of continuously evolving technology and (ii) facilities for training as many as 400,000 skilled workers, engineers and scientists over the 10-year period (besides an unknown num-ber of technical personnel required by users for the maintenance of electronic equipment), an electronics industry of the magnitude envisaged by the Committee would be quite a feasible proposition. The first condition can be largely met by every produc-tion plant, if an adequate design, development and research potential is built into it at the very outset. But the second condition would have to be met largely by the Government through technical institutes and colleges. As the Government will be the biggest single user of electronic equipment (accounting for nearly 60 per cent of the entire output), it has the biggest stake in the development of the electronics industry and may, therefore, be expected to establish adequate technical train-ing facilities. In such a situation, entre-preneurs are bound to take in a big way to an industry like electronics which has such remarkable growth potential and is generally capable of yielding a return of 15 to 20 per cent on net assets and a margin of five per cent on sales. It may be that the Bhabha Committee's interim report "will stimulate interest in the private entrepreneur and give him a purpose and direction." That, at any rate, is the expectation of the Committee. There is, however, an important omission in this report and that is about the need and scope for foreign collaboration. Does the Committee think that India can advance in this field of high technology without foreign collaboration and participation? It is to be hoped that the Committee's final report will soon be forthcoming and that, in it, it will examine this question in detail.

MARKET GOSSIP

Toning Up The Capital Market

DESPITE sizable purchases of stocks and shares by the L.I.C. and the Unit Trust in recent months, Stock Exchanges continue to rule depressed, with very little turnover. Over the past one year alone, there has been a drop of more than 5.5 per cent in equity prices; the all-India average index (base: 1952-53=100) of variable industrial securities for the week ended 28th November stands at 162.8, as against 172.3 a year before and 174.3 on the eve of the last Budget. One may, of course, contend that a de-cline of about 5 to 6 per cent in equity prices over a period of twelve months need not cause any undue alarm. But one should not overlook the severe impact that such a decline has had on the capital market, especially at a time when the capital market ought to be cheerful, so that a large part of the community's savings could be channelled into investments in stocks and shares. The most important point to be borne in mind is that the drop in equity values is in contrast to the sharp rise in price levels and cost of living. Ordinarily, when inflationary forces are strong, as they have been in the last one year, equities should be booming. The fact that it has been the other way about is striking evidence of the ex-tent to which the Government's fiscal policy has hit equities. There is, therefore, no exaggera-tion in the description of the Presidents of the recognised Stock Exchanges that the capital mar-ket has "become completely emaciated and anæmic."

In a few months, the Central Budget for 1965-66 will be presented. In the coming weeks, the Finance Minister will be busy with its preparation and doing a lot of exercises in his mind. The Stock Exchange Presidents have, therefore, done well in reminding him of the state of the capital market in a joint memorandum submitted to him this week. The private sector, as the Stock Exchange Presidents have pointed out, is finding it difficult to raise rupee resources from the open market and entrepreneurs are depending solely on institutional support for the supply of capital. The total capital raised by companies through shares and debentures has been small. The public response to new issues has been so poor that quite a large part of the capi-tal issued has had to be taken up by the under-writers themselves. The consents granted by the Controller of Capital Issues continue to be limited, in spite of the institutional support from the I.F.C. of India, I.C.I.C.I., Unit Trust and the Industrial Development Bank. Indeed, but for the help of these institutions and the support of the L.I.C. and State Financial Corporations, it might have been impossible to float a company of some magnitude.

What is this state of affairs in the capital market due to? The answer to the poser is not far to seek. There is, first of all, the high rates of direct taxation which have made evasion a reward and adversely affected incentives to work, save and invest. Big investors are chary of com-ing forward to take reasonable risks with the present high level of taxation. The salaried and middle classes, which, it is well known, con-stitute the backbone of the investment market in India, are finding it very difficult to expand their investment portfolios, as their capacity to save and invest "has been," to quote the memorandum, "paralysed with the onslaught of inflation which has sent up prices of consumer goods soar-ing." What little is left in their hands is taken away by the annuity deposit scheme. In fact, a large section of the salaried class has been com-pelled to liquidate even its existing investments in stocks and shares to meet unforeseen capital expenditure and to pay the annuity deposits.

When such is the position, how can one ex-pect the private sector to finance the expansion and development programmes it already has in its hands, let alone to fulfil the much heavier commitments assigned to it by planners in the fourth Five-year Plan? It may be noted here that the outlay proposed for the fourth Plan in the private sector is as big as Rs. 7,000 crores which is nearly sixty per cent more than the third Plan provision of Rs. 4,100 crores. It would simply be foolish to think optimistically about the private sector's capacity to muster resources of this magnitude, unless the Government of India accepts the Stock Exchange Presidents' well-reasoned plea for immediate steps by way of both fiscal and administrative measures designed to revive the capital market and create conditions conducive to attract investments in stocks and shares. The specific reliefs in taxation sought by the Presidents are:

The *dividend tax*, if it cannot be altogether given up, should be made applicable only to dividends in excess of a specified minimum, say, 10 per cent.

The *tax on bonus shares* should be withdrawn; this is an inequitous measure, especially when the companies are also subjected to an extra 12.5 per cent tax on the issue of bonus shares. It is a case of multiple taxation with a vengeance.

Section 104 *companies* must be treated on the same footing as any other public companies and they should not be subject to any increased rate of tax (super-tax for these companies was raised in the last budget from 25 to 35 per cent).

Wealth tax should not be applicable to in-vestments in new issues of shares and debentures. (We would be happy if the exemption is given only to equities and preference shares. It is un-necessary to include debentures in this category.)

Capital gains on shares of new companies should not be subject to any tax, or at any rate should not attract capital gains tax for a period of at least five years from the date of issue of the security.

The *surtax on companies' profits* is a levy on efficiency and prudence of companies and should be done away with as early as possible.

The rates of *estate duty* and *gift tax* must be reduced drastically.

The *Annuity Deposit* must be made applicable to those who are in the income bracket of over Rs. 25,000, the rate of deposit should be lowered and the slabs be liberalised.

The incidence of *individual taxation* (income-tax, super-tax, surcharge and wealth tax) must be reduced.

Comments on these suggestions are super-fluous. For this journal itself has been pleading for such tax relief measures. In fact, it would go a step further and say that the whole system of annuity deposits should be abolished. Fiscal measures, it is needless to say, must be so framed as to generate savings in the hands of both in-dividuals and corporate bodies. What Japan and the U.S. have done in this field is there for all to see. A reduction in taxation at both individ-ual and corporate levels, besides promoting sav-ings and investments, will also help production to an extent where revenues to the Exchequer will actually increase. Simultaneously with the revi-sion of the fiscal policy, the Government must take certain administrative steps to help the capi-tal market. The three specific proposals put for-ward by the Stock Exchange Presidents are: (1) Banks should be more liberal in advancing against stocks and shares; (2) income from divi-dends must be treated as earned income; and (3) the 2 per cent carryover margin that is compul-sorily payable on the aggregate of the net balances of purchases as well as sales of cleared securities must be removed. The first two proposals may be accepted. The third proposal can be con-veniently ignored by the Government. Those who wish to speculate on the Stock Exchanges for mak-ing quick profits must be subjected to some re-straint. In fact, the margin requirements should be increased, for two per cent is too low.

Essential Commodities (Amendment) Bill

The Essential Commodities (Amendment) Bill 1964, which provides for stringent punish-ment and summary trial of food offenders, was passed by the Lok Sabha on the 9th instant. The Bill replaces the Essential Commodities (Amend-ment) Ordinance, promulgated by the Government of India on 5th November. The Ordinance, it may be recalled, provided for summary trial, by First Class Magistrates specially empowered in this respect by the State Governments or by the Presidency Magistrates, of the offenders contra-vening the Essential Commodities Act, be they traders or officials conniving at the offence.

The Criminal Procedure Code has already a provision for summary trials. Section 262 of the Code empowers a Magistrate to try food offen-ders summarily and pass a sentence of imprison-ment not exceeding three months. The Ordinance increased this maximum to one year. Under Sec-tion 414 of the Code, a person convicted in a summary trial, with a fine exceeding Rs. 200, has the right to appeal to superior courts. According to the Ordinance, there is no provision for appeal for a sentence of imprisonment not exceeding one month or a fine not exceeding Rs. 2,000, or both. The Ordinance also provides that public servants, charged with the abetment of crimes under food laws, will also be treated in the same way as the perpetrators of food offences.

All these provisions of the Ordinance have been incorporated in the Bill. One of the new clauses relates to the right of appeal in case of the forfeiture of property. Section 7 of the Essen-tial Commodities Act provides for forfeiture of property under the orders of the Court in cer-tain circumstances. A specific provision has been made in the Bill in this regard, so that, whether or not any order of forfeiture of property is made in addition to a sentence passed by the concerned Magistrate, an appeal shall lie to a higher court only where a Magistrate passes a sentence of im-prisonment in excess of one month or fine ex-ceeding Rs. 2,000, or both. Another technical clause makes it necessary that a notification would have to be issued by the Government, specifying the particular order as the special order for the purpose of adopting the summary proce-dure for trial of offences under the Order.

The Essential Commodities (Amendment) Ordinance was discussed in the columns of *Com-merce* dated 15th November 1964, wherein it was pointed out that, the machinery of Government being what it is, the Ordinance would be a source of harrassment, both to the genuine and law-abiding traders and the consumers. The only noticeable change, which the passing of the Bill makes is that, from temporary arrangement, the provisions have been converted into a more or less permanent feature.

In the Lok Sabha, the Bill received the sup-port of the Congress, Communist and other leftist parties. It was, however, vehemently criticised by the Jan Sangh and the Swatantra Party on the ground that it militated against the principles of legal jurisprudence and fundamental rights. Mr. N. Dandekar (Swatantra Party) described the Bill as "unnecessary, uncivilised, savage and cruel ... another milestone down the slippery slope of unprincipled legislation ... and designed to enforce slavish obligations by a par-ticular group (traders) towards a particular party," and pointed out that the cause for the present food difficulties was the poor attention given to agriculture and laying more em-phasis on heavy engineering, gigantic projects, deficit financing, special borrowing of P.L. 480 counterpart funds, impracticable land reforms and restrictions on food movements. Mr. R. V. Bade (Jan Sangh) blamed the Government for "wrong planning" and accused it of vindictiveness in dealing with traders. Mr. N. G. Ranga (Swatantra Party) was afraid that not only the traders would suffer, but also millions of cultivators, as the lat-ter could also be "brought under the mischief of this Act" by extending the definition of traders to them. Mr. Subramaniam, Union Food Minister, refuted these criticisms. He argued that the principle that no one should be presumed to be guilty and no one should be convicted without evidence was not being abrogated. Even in cases where there would be no appeal, the remedy of revision by the High Court was there. He gave an assurance that it was not the intention of the Government to bring producers within the scope of the Bill, but only those who were mainly dealers and only incidentally producers. In other words, he meant that dealers should not try to take shelter by calling themselves producers.

Whatever be the merits of criticism in Parlia-ment, the fact is that the Congress Party, with its vast majority, could get any Bill placed on the Statute Book. Although clause 1(3) of the Bill lays down that the provisions should cease to operate after 31st December 1966, they may stay with us for many more years, if the history of the Preventive Detention Act in this country is any indication.

Cable Industry In Difficulty

Persistent paucity of basic raw materials like copper, lead, tin and to some extent aluminium has brought the cable industry in this country to the brink of crisis, according to a re-presentation made by the Indian Non-ferrous Metal Manufacturers' Association. The demand for the industry's products, namely, copper con-ductors, plastic wires, rubber sheathed cables, etc., is rising, but it is unable to grow as fast as was expected because of the scarcity of raw materials. The basic allocations of foreign exchange during the period from April 1963 to March 1964 were drastically cut and they have been cut further for the current year from April 1964 to March 1965. In terms of quantity, the cut is more serious than it appears, because of the rise in the prices of non-ferrous metals in the world mar-kets. The quantities allocated in the licence, it may be noted here, are not related to the prices prevailing at the time of placing the orders.

Another unsatisfactory feature of the licens-ing policy is that the proportionate requirements of various raw materials are not taken into account and licences so issued as to facilitate continuous production of all items of manufacture. There are reported to be cases where a little additional allocation for one or more items of raw materials would have considerably eased the production programme of the industry. For example, the Government was compelled to im-port finished power cables, thus spending 9 to 10 times more foreign exchange than needed for the immediate import of lead—an item in short supply for the industry. Again, the Government permitted the import of insulated cables of the value of Rs. 13 crores during 1963-64, but a sub-stantial portion of this could have been saved, according to the aforesaid Association, by allow-ing the manufacturing units to import the basic raw materials needed by them. The cable manufacturers are no doubt trying to substitute aluminium for copper but there are certain fields where this offers only a limited solution. Further, even aluminium ingots are in short supply. It is, for instance, stated that the manufacturers of underground paper insulated power cables are faced with closures by mid-January next and that this contingency could be avoided only if immediate steps are taken to rectify the scarcity of lead, aluminium and other base metals.

Trends In Chillies

Chillies, because of their pungency, are an essential ingredient in the dietary of many peo-ple, not only in India but in many parts of the world. They are grown over large areas in tro-pical countries, including India. While the bulk of the production of this important cash crop in India is consumed within the country, about 30 per cent of the output is exported to countries such as Ceylon, Kuwait, Bahrein Islands and the United Kingdom. During 1963-64, exports of chillies amounted to 12.1 million kgs. and contri-buted nearly Rs. 280 lakhs of foreign exchange. In the first quarter of the fiscal year 1964-65 (April-June), exports of this commodity were higher at 2.8 million kgs. (or Rs. 57 lakhs in terms of value), as compared with 900,000 kgs. (or Rs. 19 lakhs) in the corresponding period of last year. In addition to serving as a recipe in the prepara-tion of special dishes, chillies have also found several uses in the field of medicine.

While thus the uses of this cash crop and con-sequently the demand for it are increasing, its output in India is not keeping pace. Actually, it has tended to fall in recent years. The final crop estimates of chillies in India for 1963-64 are not yet available, but it is placed slightly lower than that of 383,000 metric tonnes for 1962-63. Owing to its wide range of adaptability, chillies are grown over an extensive area in India—nearly 630,000 hec-tares or 1.6 million acres—the chief producing States being Maharashtra, Andhra Pradesh, Mysore, Madras, Madhya Pradesh and Bihar. Maharashtra, incidentally, is the largest producer and has 24 per cent of the total area under culti-

TREND OF SHARES

DECEPTIVE STEADINESS?

(From Our Own Correspondent)

BOMBAY, 10th December

EQUITIES on the Bombay Stock Exchange during the week under review maintained a steady tone but the steadiness seemed rather deceptive, for the market failed to respond to some excellent bull factors like the Prime Minister's statement in London that the Government would do something to arrest the present sluggishness in the capital market and the Finance Minister's observation that private foreign capital should be preferred to loans. Further, there was the news of higher output by Tata Steel during November. These factors, however, did influence sentiment a bit but the influence was short-lived. The rise in prices was more of a sporadic nature than due to any sustained support with a long-term objective.

The highlight of the week's trading was the spurt in the Standard to Rs. 594 on Friday, a net gain of 25 points over the previous day's closing. The rise was due to hectic short-covering and fresh support on vague talk of a bonus issue from out of the premium account. It is true that the Company has a substantial sum collected by way of premiums but then there was no confirmation from reliable sources. It appeared that some operators were carrying their hopes too far and the way the shares slipped back again suggested that such an issue was unlikely at least in the foreseeable future. At the close, the scrip was quoted at Rs. 581, still 20 points above the previous week's closing level.

As a whole, the list of forward scrips at the close was not such as to add further to the despondency of the recent several weeks. Tata Ordinary gained one point over the week to be placed at Rs. 144 while Indian Iron improved from Rs. 25.05 to Rs. 25.25. Century, however, was quiet at Rs. 553.50 but Central India was fractionally better at Rs. 93. Svadeshi was quietly steady at Rs. 263 but Bombay Dyeing was well maintained at Rs. 57.30 against Rs. 57.20 of the previous week. In fact, Tata Steel had touched a high of Rs. 145.25 and Century Rs. 561 but as already mentioned the rise in prices was not founded on enduring factors. Maybe they were due to short-covering which was only to be expected in view of the decline over the past several weeks. Maybe it is due to some favourable aspects of individual shares. But the way the market tended to slip back suggested that it was basically devoid of strength.

Rayon shares were quiet and their leader, National Rayon, had been taken down to Rs. 326, before rallying to Rs. 335 at the close against Rs. 331.50 of the previous week. Gwalior Rayon was steady around Rs. 36.75. South India Viscose which had been hammered down to below par level improved a little during the week to Rs. 101.50. By far the most conspicuous in the group was Baroda Rayon which gained 12 points at Rs. 73. The Company has done very well during the year ended September last, the first year of full operation. Sales are satisfactory and the Company would perhaps have done even better but for the burden of the excise duty on rayon yarn. The Directors seem hopeful, despite current accumulation of stocks and this should augur well for the Company's future.

Motors were steady with Hindustan unchanged at Rs. 16.24 and Premier at Rs. 95. Tyre shares were easy, with Ceat at Rs. 82 and Premier at Rs. 75. Reports that the demand for automobile tyres was broadening and that this must help the industry not only to get its accumulated stocks out of the way but also to produce more fell flat on the market. The feeling in market circles is that something should be done to tone up the industry. Some price increase was given a few months ago and other small concessions were granted, but, from the behaviour of these shares on the stock exchange, it appears that these have been inadequate and some drastic remedies are necessary. After all, the Government cannot allow the market in tyre shares to languish like this. If the industry needs some incentives, they had better be given both in the interests of the industry and the investor.

Among Engineerings, Telco was steady but Larsen improved from Rs. 21.56 to Rs. 22.20, though they had been bid up to Rs. 22.48 during the week. The spurt was due to the directors' decision to issue bonus shares in the ratio of one equity share for every seven held. The hope is that the dividend would be maintained even on the increased capital. For long, the shares of Larsen and Toubro have been amongst the hot favourites of the investor and the proposed bonus issue, the first one in the Company's history, may help revive their popularity.

There was nothing special in the other sections to merit a detailed examination. Suffice it to sum up that the market is basically weak, rallies are mostly due to short-covering and bull operators are hard to find at present. How long is this going to last? Well, as long as the Government does not take active steps to revitalise the market. In a memorandum to the Union Finance Minister, stock exchanges have pleaded for immediate fiscal and administrative measures for revitalising the market. Meanwhile, operators are drifting from stocks to commodities, adding to the mess over there. It speaks to the credit of entrepreneurs that, despite unfavourable conditions, some really good issues have been forthcoming. One of them is Hindustan Ferodo which is offering 5,46,800 equity shares of Rs. 10 each at a premium of Rs. 17 a share. Another is Sandoz (India) Ltd. Mysore Acetate is also considered a good proposition. A feature of Mysore Acetate is that its American and Swedish collaborators are participating in the equity capital on a substantial scale.

* * * *

In Calcutta, trading was a tame affair. Support from investors was virtually absent. Cash scrips, however, attracted some inquiry on a selective basis. The undertone was hesitant. Price movements in Madras were narrow but textiles managed to maintain a steady tone. Plantings were easier but the other sections were dull and almost featureless.

"INDIA AND PAKISTAN WOOL, HOSIERY AND FABRICS"

The sixteenth (1965) edition of the India and Pakistan—Wool, Hosiery and Fabrics (Editor: N. E. Vakil), published by Commerce (1935) Limited, Brady House, Veer Nariman Road, Bombay, in association with Messrs. John Worrall Limited, Oldham (England), is, indeed, a very useful publication. Providing as it does wide and varied data relating to raw wool production, classification, marketing, imports and exports, yarn production, knitting manufactures, processing and distribution, it plays the role of a ready guide not only for those directly concerned with the woollen industry in India and Pakistan but also for those outside seeking knowledge about this industry in the sub-continent. Besides several interesting review articles on raw wool, woollen goods, hosiery and jute textiles, the publication gives classified lists of woollen and worsted mills in India and Pakistan, felt manufacturers, hosiery units, jute mills, carpet factories and linen mills. Also included are the names of the firms engaged in distribution and manufacturing, as well as trade associations and organisations. The utility of the publication is enhanced by the inclusion of a classified buyers' guide, illustrated lists of advertisers' trade names and designs, and alphabetical lists of trade and brand names.

The State-owned Shipping Corporation of India has a full-fledged expansion programme under which 20 ships are in various stages of construction in different shipbuilding yards. This was disclosed by Mr. Govind Seth, Managing Director, while taking delivery of a cargo ship built at the Hindustan Shipyard at Visakhapatnam on the 6th inst. With the addition of these 20 vessels during the next three to four years, the Corporation's shipping tonnage will reach 500,000 gross registered tons.

MARKET GOSSIP

(Concluded from previous page)

vation. The crop is found to grow under all conditions—from sea level to an elevation of 1,500 metres—and in a variety of soils like medium black and red loams, light alluvial loams and laterite. Further, it can be cultivated either by rainfall of 75 to 125 cms or by irrigation. It is stated that, while the yield from a rainfed crop ranges widely from 225 to 900 kgs. per hectare, under irrigated conditions, it is as high as 1,350 to 2,900 kgs. It would thus be advantageous to bring more area devoted to chillies under irrigation and thereby increase the output per hectare.

Another handicap from which cultivation of chillies in India suffers is the susceptibility of plants to attacks of pests and diseases. Some of them like "thrips," "fruit-rot" and "die-back" cause untold havoc to the chilli plant especially when it is at the stage of flowering. It has been found from experience that increased use of green manures and fertilisers and timely spraying of bourdeaux mixture solution help in controlling the pests. Where these measures have been adopted, it has been found that a farmer could obtain a handsome profit of Rs. 300 to Rs. 1,500 per acre, depending upon the yield. Extensive research and propaganda are, however, required for spreading the use of fertilisers and plant protection methods among the farmers in the country and thereby increase the output of chillies. Already research has helped to discover several varieties of chillies of commercial value that could be grown in the country. As there is great scope for producing chillies in the hilly regions, efforts should be directed to bring more of them under this crop.

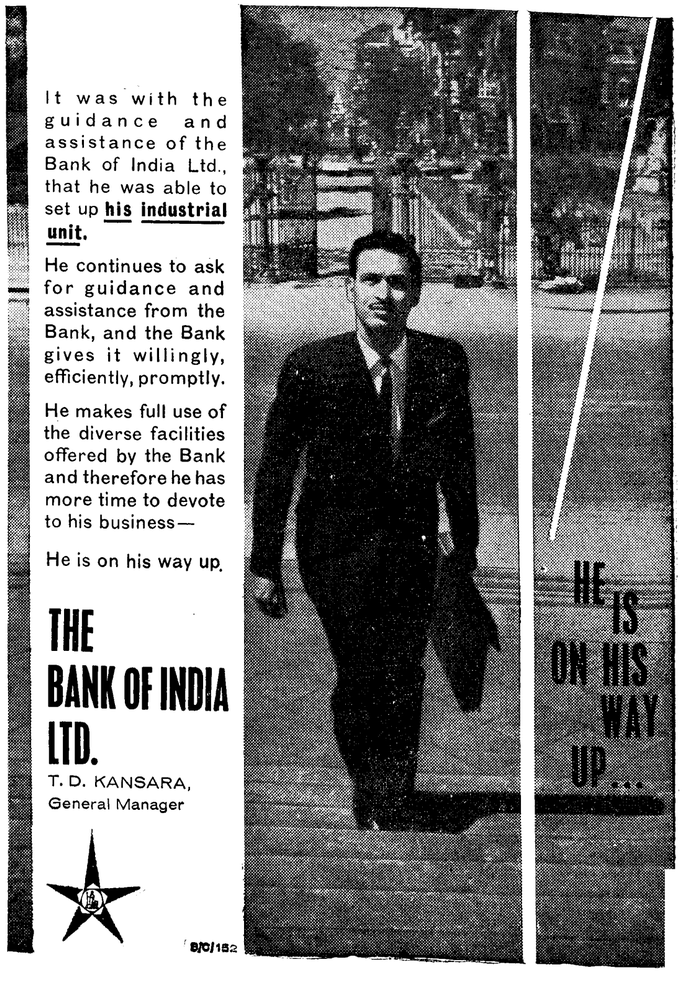
The prices of this condiment have been fluctuating rather fairly widely. But, on the whole, they are higher today than they were a year ago as the following figures will show:

(Rupees per quintal)

Variety	Latest	About 3 months ago	Six months ago	A year ago
Bombay M Pandi ..	220-225	165-180	170-200	210-215
Delhi Red Samana ..	228-255	190-203	230-254	168-188
Davangere	165-250 50	140-188 75	185-230	115-236
Sangli Red	150-277	100-210	200-250	N A

N A —Not available

Price increase has not been as sharp as in the case of other food articles. In other words, in terms of chillies, the purchasing power of the rupee has fallen only slightly!



"BUSINESS SCHOOLS" FOR BRITAIN

GOVERNMENT AND INDUSTRY AGREED ON THE MOVE

By Dr. M. S. Venkataramani

BRITAIN'S Labour Government has officially expressed its "enthusiastic support" for the establishment of two high-level institutions for management training—"Business Schools"—in this country. The institutions are to be located in London and Manchester, respectively.

Labour's attitude was expounded in the House of Lords a few days ago by Lord Snow, Parliamentary Secretary in the newly-established Ministry of Technology. His Lordship is no other than C. P. Snow, well-known scientist, professor, publicist, and best-selling novelist. His latest political novel, *The Corridors of Power*, has been selling briskly in Britain, the United States, and other countries where English is spoken. Snow had written about the political jungle as an observer on the outside; but now, thanks to Mr. Harold Wilson, he has obtained an opportunity to stalk the corridors of power himself. It was with considerable interest that I looked forward to his maiden speech in Parliament. That he chose the theme of management education is an indication not merely of his personal interest in the subject but of the importance that Britain's Socialist Government attaches to it.

The initial moves for the establishment of the two Business Schools emanated from institutions regarded virtually as citadels of conservatism. It was in July last year that a high-powered group, consisting of Lord Rootes, the noted industrialist, Sir Norman Kipping, Director-General of the Federation of British Industries, Mr. Cecil Meade, Chairman of the British Institute of Management, Mr. J. W. Platt, Chairman of the Foundation for Management, and Sir Robert Shone, Director-General of the National Economic Development Office, came to the conclusion that the time had come when Britain should have high-level institutions for management training of a standard equivalent to that of the Graduate School of Business of Harvard University. They invited Lord Franks to hold consultations with representatives of universities and industrial establishments and to submit his recommendations. It was on the basis of his report that the decision was reached to start two centres instead of one and to locate them in London and Manchester, respectively.

Need for Competent Managers

Lord Franks found that forward-looking managing directors were of the view that there was an urgent need in Britain for more competent managers. On the basis of his discussions, Lord Franks postulated the case for establishing the two Schools in these terms: "The accelerating pace of technical and technological innovation with its destructive impact on habitual methods and ideas; the rapidly increasing extent to which prices of manufactured goods are fixed by international competition of growing intensity; the ways in which the general management of the economy by Government directly affects the shorter range prospects and profitability of individual companies or, indeed, of whole sections of industry and commerce; these have all emphasised the value of an education and training which will provide industry and commerce with managers better fitted to foresee and decide well in swiftly changing conditions." Britain, he emphasised, could learn a great deal from the experience of the leading American Business Schools and the methods and curricula that the latter had experimented with in recent years. He cautioned, however, that the Schools to be set up in Britain should evolve their own programmes and not attempt merely to "transplant" American practices.

Lord Franks delineated in his report the two broad areas that might be profitably studied in the proposed British Schools. He described the first as the "framework"—applied economics, sociology, and psychology. The objective in studying them was "to increase understanding of what a man is doing in his job and ... to develop capacity clearly and vigorously to analyse new situations as they arise." The second area related to significant techniques developed in recent years that have had a profound impact on managerial decision-making—operational research, linear programming, resource allocation, decision theory, computer techniques, and the like. The objective was not to make the students specialists in computer mathematics, for instance, but to "enable young men in business to understand the relevance of these techniques in solving urgent problems" and to make them aware of where the application of these techniques may be fruitful and where not.

Mutual Uneasiness

The success of a Business School will depend on the extent of harmonious co-operation between the academic community and the business community. In the course of his discussions, Lord Franks found that a great deal of "mutual uneasiness" existed between the two communities in Britain. If such a state of affairs was not checked, he wrote, it could "spread through a Business School like a dry rot through timber." Businessmen were worried whether the academic community might treat the School as a centre for the advancement and communication of knowledge rather than a place that would equip men to become better managers. On the other hand, the scholarly community viewed with concern what it regarded as the propensity of businessmen to look for "results" and to insist on speed. To remove mutual suspicion, the sole remedy, Lord Franks suggested, was to draw up a constitution for the administration of the Schools that would ensure genuinely shared responsibility between the universities and business in regard to policy and finance. He advocated a "partnership ... so positive and close that shared responsibility dissipates doubt."

Lord Franks recommended that each of the two Schools should be part of a university and, at the same time, enjoy a large measure of autonomy. He urged their location in London and Manchester, instead of in certain places in the countryside, because the two metropolitan areas represented great industrial-commercial complexes. "This is necessary," he stated, "if the close, easy and frequent two-way traffic between School and business, so vital to health and prosperity of the School, is to be secured. It is also a condition of the staff being able to move easily in and out of industrial plants." Such visits by the faculty as well as by the students would be valuable for case studies in the School. Location of the Schools in London and Manchester would also ensure that leaders in the fields of commerce and industry might more conveniently visit them than if they had been set up in some area away from the great cities.

F.B.I.'s Role

The Federation of British Industries, which undertook the responsibility for implemeting the Franks report, appointed a Working Party under Lord Normanbrook to carry the task forward. The group has estimated that the capital cost of the two Schools will be £2.4 million, while the net recurrent expenditure during the formative period of seven years will be £1.7 million. Thereafter the net recurrent annual expenditure for the two Schools will be £330,000. These figures give an idea of the ambitious scale in which the Schools are conceived. The group recommended that each School should admit 200 recent graduates for a one-year course and 100 young executives of the age-group 28-35 for a twenty-week "post-experience" course.

To ensure the kind of shared responsibility between the university and business that Lord Franks had emphasised, the Working Party has suggested the following formula for the composition of the Governing Council of each School: the Vice-Chancellor (Chairman); nine members nominated by the University; nine members from manufacturing industry, the nationalised industries, commerce, and retail trade; and four individuals of standing and experience from the trade union movement, civil service, press, broadcasting and the like. In addition, the Working Party suggests, the Governing Council may co-opt two members if certain types of experience useful for the administration of the School are not adequately represented on the Council.

The Working Party also chose to offer its view on the training programme in the Schools. "We consider," it states, "that emphasis should be given, in the curriculum, to the importance of acquiring a thorough knowledge of financial controls in a business organisation. We also hope that the courses will be designed to inculcate a strong sense of cost-consciousness—which, in our view, is needed, not only in organisations operating for profit, but equally in non-profit-making organisations of all kinds."

Labour Government's Approval

With the wholehearted endorsement of the Federation of British Industries behind it, the appeal for contributions for the setting up of the Schools has evoked a ready response from this country's private sector. The move had the support of Sir Alec Douglas Home's Conservative administration. Lord Snow's recent speech in the House of Lords, mentioned at the outset in this paper, gave the Labour administration's stamp of approval for the project.

Lord Snow pointed out that efficiency and productivity were bound up with sound managerial techniques. The United States, he said, produced two to four times per man as Britain did. Failure to recognise the weakness induced in Britain's economic health by such a state of affairs would represent a "creeping danger" more sinister than a sudden and clear crisis. "We should use every scrap of wit we possess and really make technology work for us as we have not done since the early days of the Industrial Revolution. . . . If Britain failed in this, it is hard to see how she could have a future which any would envisage with pleasure," he warned.

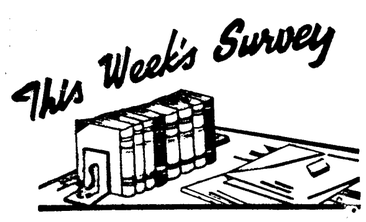
Snow dealt with the question whether men could really be trained to become good managers. His answer was in the affirmative. About three per cent of any reasonably intelligent group might have an innate gift for management and might not require any special training. They were the real "stars" of the show. But others could greatly improve their equipment by the right kind of training.

Managerial Talent

Managerial talent, Snow pointed out, was not necessarily confined to certain sections of society. It was socially important to ensure that managerial talent in all segments of society should be located and developed. Snow drove home his point with a telling analogy from the realm of athletics. "We must remember the analogy of the Olympic Games, in which the people who win gold medals now come from every social origin and every country. We must dig right into the country. We cannot afford to waste talent. We have not got enough. We must choose it wherever it may come from and not worry in what accent it speaks," he declared.

The Parliamentary Secretary did not fight shy of dealing with the crucial issue of whether appropriate employment opportunities would be available for persons who completed the prescribed courses at the new Schools. However well-organised the courses and however competent the teachers, the future of the Schools and the kind of students that they would attract would depend on the prospects for material advancement open to their *alumni*. In discussing the problem, Lord Snow took note of certain institutional and psychological difficulties. In many industries older men, who had come up the hard way and who might have been brought up in a "less intellectual environment," might be in key positions. Such persons might not be very enthusiastic over the benefits that might result from a year's stay at the Business School and might not be receptive to the idea of recruiting its graduates for responsible managerial positions. It was most important, Snow emphasised, that industry should itself work out arrangements to accommodate the men who would be trained at the Schools. Unless this was worked out in advance, "there would be disappointment and bitterness, and they might produce an unemployed managerial intelligentsia," he warned.

The move for the establishment of the two high-level Business Schools has proceeded with traditional British thoroughness and painstaking attention to detail. The support of the British business community has been enthusiastic; it has been expressed not merely in words but concrete pledges of financial support. Lord Snow's address makes it clear that the Labour Government will not in any way fall behind its Conservative predecessor in supporting the project. The omens are auspicious for significant strides in management education in Great Britain in the years that lie ahead.



EXPORT TRADE

INDIA'S export trade continues to show some heartening trends. The total value of exports during the current financial year is expected to touch an all-time record of Rs. 850 crores which is well above the third Plan target of Rs. 800 crores fixed to be achieved in 1965-66. As compared with the actual exports of Rs. 767 crores in 1963-64, the estimated exports of Rs. 850 crores in 1964-65 represent a rise of as much as Rs. 83 crores, the rate of growth in exports being 10 per cent. Apart from the fact that this growth rate is thrice the world exports growth rate and 2½ times the rate of advanced countries like Japan, the export performance is noteworthy for three important reasons. In the first place, exports have risen markedly despite a general fall in the prices of several internationally-traded commodities. Secondly, a wide range of products, among which jute goods, coffee, textiles, leather, cashew, engineering goods, plastics, fish and fish products, and mineral ores are prominent, has contributed to the improvement. And, thirdly, the rise in exports is spread over almost all the regions of the world with which India has trade relations.

Gratifying though these trends are, there is, as Mr. Manubhai Shah, Union Minister for Commerce, cautioned once again when he addressed the sixteenth meeting of the Board of Trade at Madras on Monday this week, no room for complacency. For exports are still nowhere near the heavy import requirements which are currently running at an annual rate of over Rs. 1,100 crores. Considering the prospects of continued heavy import bill and the problem of external debt servicing, Mr. Shah did well to reiterate the supreme urgency of intensifying export promotion efforts. But there is no use merely emphasising time and again the need for stepping up exports. What is wanted is energetic action on the part of both Central and State Governments to improve the competitive capacity of the export industries from the point of view of quantity, quality, price and delivery schedule. The following four general recommendations made by the Board are pertinent and deserve to be implemented:

1. Over and above pre-shipment and quality control measures, survey certificates from well-known recognised international surveyors should be made compulsory, particularly in the case of machine tools and heavy engineering goods.

2. An air freight unit (as recommended by the Air Freight Unit Committee headed by Mr. S. K. Kooka) must be set up with a view to promoting exports of goods requiring air transport, like perishable consumer products.

3. The views of export promotion councils and trade bodies on the report of the Selectivity Committee (Chairman: Dr. A. Ramaswami Mudaliar) must be ascertained, so that final decision could be taken at the next meeting of the Board to be held at New Delhi on 15th February 1965.

4. An Indian Council of Arbitration (as suggested by the Merchant Committee) should be set up to propagate and popularise the idea of commercial arbitration and mainly co-ordinate the activities of existing agencies and also cover the residuary field, if necessary.

The problems pertaining to exports of tobacco and leather manufactures were discussed at some length by the Board. On tobacco, the Board urged the State Trading Corporation either to assist the holders of Agmarked stocks of tobacco (about 11,000 metric tons), which remain uncommitted but saleable at the end of this month, by making reasonable monetary advances or to take over the stocks at negotiated prices. Out of the 1964 exportable varieties aggregating 91,000 tons, about 80,000 tons valued at Rs. 22 crores have already been exported. The total exports of tobacco in the whole of 1964 are expected to be of the order of Rs. 26-27 crores. The Board urged the need for (a) reorienting production and marketing practices, (b) prohibiting growing of tobacco on saline areas and (c) granting adequate credit facilities to tobacco growers. Further, it decided to appoint a committee, with Mr. Ranganathan, Secretary to the Union Ministry of Industry and Supply, as Chairman, to undertake a more intensive study of the possibilities of exporting tobacco manufactures (cigars, *bidis*, cigarettes and cigarolls). On hides and skins, the Board felt that the early implementation of the Saraiya Committee's recommendations on sales tax and the Chablani Committee's recommendations on export credit would assist in bringing down the cost of exports to some extent and thus maintain and improve the competitive strength of Indian exporters. At the same time, it stressed the importance of modernisation of leather industry and establishment of some first class shoe factories using modern methods to turn out goods for export.

There are vast possibilities of expanding the exports of several items to the countries of South-East Asia and the Far East. The Board of Trade noted with satisfaction the reversal of India's unfavourable trade balance with these countries, but called for accelerated efforts to step up exports further and to strengthen the ties of economic co-operation. The Board's plea for encouraging the establishment of joint industrial ventures in the developing countries with a view to stimulating exports of capital equipment and components is no doubt a pertinent one, but there are some limitations. Until such time as India can fully avail itself of the opportunity of closer participation in the economic development of these countries, attention must be concentrated on those products which have the greatest potential for export. A special study of such products, as the Board suggested, may be undertaken. Further, two or three trading houses may be set up at suitable locations in Asian countries with the assistance of consortia of Indian exporters and the various export promotion councils.

PRIZE BONDS AND SMALL SAVINGS

The Government of India has announced its decision to discontinue the Prize Bond Scheme with effect from 1st January 1965. Addressing the two-day session of the National Savings Central Advisory Board at New Delhi on the 5th instant, Mr. B. R. Bhagat, Minister for Planning, said that the experience of the Scheme had not been happy. The Prize Bond Scheme, it will be recalled, was launched in April 1960 with the Five-year Interest Free Prize Bonds, 1965. During the first year of its working, the collections amounted to Rs. 15.77 crores, as against the budget estimate of Rs. 25 crores. In the next year, however, the receipts were substantially lower at Rs. 3.35 crores. Because of this poor performance, the Scheme was discontinued from 1st July 1962 when the total collections amounted to Rs. 20.22 crores. It was, however, reintroduced after the declaration of emergency and was launched—in a modified form—from 1st January 1963. Named as the Premium Prize Bonds Scheme, it provided for an interest of ten per cent on maturity, in addition to the attraction of prizes. During 1963, the collections under the new Scheme amounted to a bare Rs. 5.76 crores. And, though some modifications were introduced from 1st January 1964, the collections during the first eight months of 1964 stood at only Rs. 2.13 crores. In view of this poor response to the Scheme, the Government has wisely decided to discontinue it and stop the waste of efforts and the cost of collection. As Rs. 20 crores, collected under the Five-year Interest Free Prize Bonds, 1965, will be due for repayment in April 1965, the Government is devising some means to mop up such repayments through the various instruments of small savings. It is, however, to be hoped that no compulsion would be exercised on the Prize Bond holders to get their Bonds converted into other instruments of small savings.

As for small savings, the commendable collections under the relevant schemes constitute a different story. As against the annual average target for the third Plan period of Rs. 120 crores, the actual net collections in 1963-64 amounted to Rs. 126.30 crores. During the current year, the collection till the end of October amounted to Rs. 62 crores—about Rs. 10 crores more than during the corresponding period of last year—and, if this rate of increase is maintained during the rest of the year, the net amount for 1964-65 may aggregate Rs. 150 crores. But it must not be overlooked that the first two years of the Plan period were lean; the collections amounted to Rs. 87 crores in 1961-62 and Rs. 75 crores in 1962-63 and, as compared with the average annual Plan target, they were short by Rs. 33 crores and Rs. 45 crores respectively.

To achieve the five-year target, the shortfall of Rs. 78 crores (Rs. 33 crores plus Rs. 45 crores) in the first two years was to be made good during the following three years. As compared with the previous year, the collections in 1963-64 were higher by Rs. 51 crores or 69 per cent. Still, they were able to narrow the gap by only Rs. 6 crores and so a gap of Rs. 72 crores remains still to be bridged during 1964-65 and 1965-66. If the net collections during the current year reach near about Rs. 150 crores, there will be fairly good chances of reaching the overall target of Rs. 600 crores. Incidentally, the State Bank's decision to sell Savings Certificates at its branches from next year may go some way towards enhancing the popularity of these certificates, thereby ensuring the attainment of the third Plan target in full.

A disquieting feature of the performance of small savings schemes should not, however, be ignored. Out of the total net collections of Rs. 126 crores in 1963-64, as much as Rs. 51 crores, or nearly 40 per cent, came from provident fund investments and Rs. 16 crores, or 13 per cent, from interest on Post Office Savings Bank deposits. As pointed out by Mr. Bhagat in his address, a recent survey had shown that the small savings schemes were, to a considerable extent, being patronised by persons with large incomes, in view of the tax concessions which the schemes provided. While there can hardly be any objection to accepting savings from large-income groups, it must also be recognised that there is a great need for popularising these schemes amongst the low-income group.

As pointed out in an earlier issue of *Commerce*, whereas a large number of people—even in urban areas—have not even heard about these schemes, many more are only marginally acquainted with them. The Post Office Savings Bank has an important role to play in promoting the savings habit of the common man, particularly in rural areas. With its widespread organisation throughout the country, it is very well suited to perform this function. Unfortunately, however, the Bank has restricted its activities to the collection of funds; it hardly makes efforts to popularise the small savings schemes as such. This perhaps explains why deposits in the Bank have not increased even fractionally in recent years, as compared with the deposits in scheduled banks. While, generally speaking, an unhealthy competition between Post Office Savings Bank and scheduled banks may not be in the best interests of the economy, it must not be forgotten that the former can play an important role in the rural areas, which the scheduled banks are generally not in a position to serve. The magnitude of mobilisable resources in the rural areas can be assessed in a way from the fact that the minimum foodgrains prices, recently announced, will alone make available to the agriculturists an additional amount of Rs. 200 crores. The situation calls for a comprehensive enquiry into the working of the Post Office Savings Bank so as to devise ways and means of making this agency more efficient in the mobilisation of rural resources.

S. & L. AND SUGAR PLANTS

For many years S. & L. have been supplying complete pipework installations for the Sugar Industry, and also supply their annual requirements of pipework. S. & L's reputation in this vital industry is second to none, as mill owners all over India will testify.

Recognised as the leading manufacturers in India of fabricated pipework, S. & L. offer a complete service from design to commissioning, with all materials and workmanship of the traditional high standards associated with S. & L.

DURGAPUR STEEL PLANT

In about two weeks from now the public-sector steel plant at Durgapur in West Bengal will be completing its first five years of operation. Being the youngest of the Hindustan Steel's three units, the British-aided Durgapur plant, it is not surprising, has been able to achieve near-capacity production only since last year. With an output of about 966,000 tonnes in 1963 and an estimated output of 995,000 tonnes in 1964 in terms of steel ingots, the plant has now come to utilise its rated capacity (1,025,000 tonnes) almost fully. As Mr. D. J. Bell, General Manager, has rightly claimed, the period between the completion of the one-million-tonne Durgapur plant and the attainment of its rated capacity "is one which is not often equalled abroad." The phasing of operations to the point of reaching the rated capacity, incidentally, has involved several formidable problems which, however, have been overcome by the sheer human determination of a large number of young Indian engineers, metallurgists and technicians. It is significant that the number of foreign technicians on the operations/maintenance side had come down to less than 60 by the end of 1963.

The availability of such enthusiastic young men, according to Mr. Bell, has done a lot to ease the training problem, and the industry is now in a position to groom men for senior posts in the future. In particular, the Durgapur plant, it is noteworthy, is now actively engaged in developing its own management cadres in view of the plant's continuous expansion for several years to come. Already the third Plan project for expanding the plant from its initial capacity of one million tonnes to 1.6 million tonnes is well under way, thanks to the availability of a sizable sterling credit provided by the British Government. When this is completed by the middle of 1966, work will commence, if everything goes well, on the fourth Plan expansion project for *doubling* the plant's already-expanded capacity of 1.6 million tonnes in terms of ingot steel. Continuous expansion of the kind, incidentally, requires that the plant itself must produce its own senior staff so as to maintain continuity in the future. The fact that the Durgapur training scheme places greater emphasis on training inside the plant may be noted in this connection. As the Training Department provides, at each session, in-plant training to about 60 engineers, 140 senior operatives, 150 junior operatives and 160 artisan trainees and the plant's own Technical Institute, with its attached workshop, is already under construction, the technical and managerial manpower requirements of the continuously expanding Durgapur Steel works will be adequately met.

Although the Durgapur plant, as it expands further, can thus confidently look forward to the indigenous availability of technical and managerial manpower, it is by no means so very clear that indigenous manufacture of spares and stores would keep pace with the demands of an expanding steel industry. There are already grave shortages in the supply of indigenously manufactured stores and spares of a quality comparable to that of imported ones. The General Manager of the Durgapur Steel Plant has particularly drawn attention to the need for ensuring the availability of such stores and spares in reasonable quantities and with good delivery periods. But "quality" is an all-important consideration here. This is what Mr. Bell has said about Durgapur's experience:

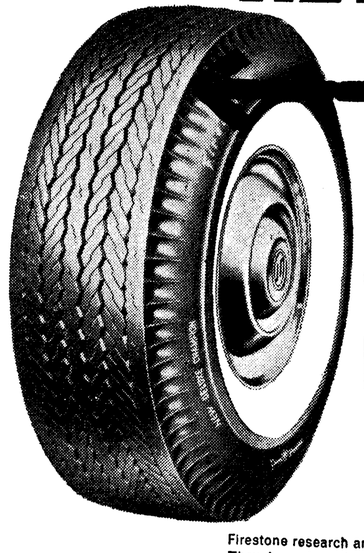
"In Durgapur every effort is made to encourage indigenous manufacturers (of stores and spares). An Indigenous Procurement Cell, with all relevant data on indigenous availability, scrutinises all plant requirements before orders are placed and only essential items which cannot be supplied or replaced from indigenous sources are imported. Nevertheless, it is worth sounding a note of warning here that, on occasion, production has been gravely hampered by poor quality supplies from some indigenous sources. In such cases, it is practice to invite manufacturers to visit Dur pur to hear our story and to study the differen in performance of items of their manufacti against imported items. It is felt that only these methods will many indigenous manufactur be encouraged to raise the quality of th products."

There can be no gainsaying that indigeno manufacture of spares is an aspect of the hig est importance to the country for one simp reason. The reason is that the country can longer afford the foreign exchange to impo items which could be manufactured here. Th is, therefore, a field in which both public-sect and private-sector steel plants should intere themselves more actively than they have do so far. The methods followed by the Durgapu Steel Plant for encouraging indigenous man facture of spares and stores of good quality see to be well conceived in this connection.

SUPERSONIC AIR TRANSPORT

In a technological sense, supersonic ai transport is no doubt quite feasible. But, fro the standpoint of commercial aviation with it prime considerations of economy, comfort an safety, there does not really seem to be an great need for further reductions in flight time This, in short, is the view expressed by Mr. B. R Patel, Vice-Chairman and General Manage Air India, while speaking the other day at meeting of the Rotary Club of Bombay North Mr. Patel's argument is that the cost of super sonic air travel would be prohibitively high and that only a businessman in a hurry or an occasional tourist might choose to pay more t go by a supersonic aircraft instead of by the present-day fast subsonic aircraft. Besides this question of cost, there are also the comfort and safety factors. It is estimated that, during a total flight of about two hours, a supersonic aircraft would be steeply climbing for about half an hour before it levels for the flight and that it will take a similar half an hour at the end of the journey. As this would leave little time for a luxury meal, a passenger might prefer a little longer but more comfortable subsonic flight. As for the factor of safety, while all

"DRAMATIC NEW TYRE"



with the record mileage
SUP-R-TUF
Miracle Rubber
the most advanced tyre ever built to give you EXTRA mileage

Firestone research and development engineers have done it again! They have formulated a new miracle rubber — 'SUP-R-TUF' — which gives extra mileage...at no extra cost! And at the same time, comes the NEW DeLuxe Champion tyre, with its perfected tread design for safer motoring.
Now, every Firestone passenger tyre is built with SUP-R-TUF rubber to give you extra mileage on any road at any speed. And you get greater safety, because SUP-R-TUF is tougher and has more resistance to punctures, bruises and breaks.

Firestone NEW DELUXE CHAMPION TYRE

possible snags may be anticipated and corrected, there is always the unknown when one ventures into a new technological field. At a height of about 70,000 to 80,000 feet, where the supersonic jet will normally fly, there are the problems of radiation, skin temperature, etc. Though the actual effects of exposure can be known only after long experience, there are already fears that many people may go sterile. Further, as some parts of the supersonic aircraft would visibly glow at high altitudes, there would be a terrifying psychological effect on the travellers who might then be obsessed with the thought of being fried alive.

Perhaps the doubts raised by Mr. Patel are not unwarranted. But they will be dispelled or confirmed only by actual experience in the development and operation of supersonic jets. As of now, there is no certainty that an economical supersonic aircraft would be successfully developed. The Anglo-French Concord project, for instance, almost stands abandoned in view of its colossal cost and the threatened withdrawal of Britain from it. Attempts are, of course, being made at present in the U.S. to develop a supersonic transport plane on a commercial basis. If this attempt meets with success and the supersonic jet can be depended upon to compete with the subsonic jet on equal terms, there would naturally be a good market for the former. But, if the cost of travel by the supersonic aircraft happens to be more than what is expected at present, the differential between the cost of supersonic travel and that of subsonic travel would be so great as to price it (the supersonic transport) out of the market. In fact, the Americans are about to embark on the manufacture of a very large subsonic plane with a capacity for carrying about 450 passengers. As this is expected to materialise earlier, the cost of subsonic travel itself could be reduced by as much as 30 per cent. In view of this development, the possibility of any large-scale switchover by international airlines to supersonic aircraft after 1972 cannot be rated highly, even assuming that a foolproof and commercial supersonic plane might be successfully developed by that time. In any case, no airline, which is a member of the International Air Transport Association, may be expected to introduce supersonic transport into service unless it meets the ten minimum technical and economic requirements deemed essential by the I.A.T.A.

STABILISING RAW JUTE PRICES

Raw jute, it is well known, accounts for well over half of the jute industry's production costs. But frequent fluctuations in its prices, such as those witnessed in both India and Pakistan a couple of months back, seriously hamper all plans pertaining to production and export. There is thus an insistent need to stabilise prices at a reasonable level, for such stability will be as much in the interest of the industry as in that of the jute grower himself. It is, therefore, a welcome development that the need for abundant supplies of raw jute at a reasonable level of prices has just been recognised at the international level too. The development is that the working party on stabilisation of the market for jute, set up by the Study Group of the Food and Agriculture Organisation (F.A.O.) is to analyse shortly the instability existing in the world jute economy and study possible solutions, national or international. The working party, which is to meet in Dacca towards the end of January 1965, consists, incidentally, of representatives from Belgium, France, W. Germany, India, Italy, Pakistan, Poland, Spain, Thailand and the United Kingdom. It will also invite the Association of European Jute Industries, the Commission of E.E.C. and other interested U.N. agencies to its deliberations.

In this connection, it is gratifying to find that Pakistan, the world's largest raw jute growing country, has also pleaded strongly for a global bid to stabilise the jute industry. Addressing the fifth annual general meeting of the Pakistan Jute Association (P.J.A.) on the 5th instant, Pakistan's Commerce Minister, Mr. Wahiduzzaman, suggested that "steps should be taken on an international level to check sharp fluctuations in jute prices and supply to safeguard the future of jute." The Pakistan Government's policy on jute, he said, was to ensure the interest of the millions of growers and to market it to the mutual advantage of both sellers and buyers. Despite a lower crop of 6.0 million bales in 1963-64, as against 6.3 million bales in 1962-63, a liberal export policy was being continued with the abolition of the export minimum price and enhancement of the local minimum price. With the world demand for, and consumption of, jute steadily increasing, especially in Asia and Africa, and new uses for the commodity being found, the Minister expressed his confidence that "jute would be able to hold its own, due to its versatile qualities and competitive prices."

While the outcome of the forthcoming Dacca meeting of the F.A.O. Working Party may be difficult to predict, there can at least be no two opinions on the need for avoiding sharp fluctuations in raw jute prices. As far as this country is concerned, both the Government of India and the jute industry are seized of this problem, having taken some steps to stabilise prices. The jute industry has, in fact, been operating a buffer stock scheme on a voluntary basis. It will be recalled here that these steps taken in India came in for praise at the F.A.O. Study Group meeting held in Rome in September last. Incidentally, this country would also welcome some arrangement with Pakistan in regard to prices of raw jute. Prices, it has been found, fluctuate mainly because both India and Pakistan harvest their crops from June to September. But mill consumption is evenly spread throughout the year and, in the short period, the demand for jute fibres does not increase or decrease because of any change in the price level. If both the countries, which between them, account for the bulk of world trade in jute goods, can come to some form of agreement either of their own accord or under the auspices of an international body like the F.A.O., it would be very good indeed from the export point of view. Such an agreement would also put an end to the present unhealthy competition in foreign markets.

Notice

THE PEERMADE TEA COMPANY LIMITED

(Incorporated in India)

NOTICE IS HEREBY GIVEN THAT THIS Company will pay on the 31st December 1964 to the Registered holders as at that date dividend due on the Preference Shares at the rate of 6.765 per cent [calculated in accordance with the Preference Shares (Regulation of Dividends) Act, 1960], subject to deduction of tax.

Preference Share Transfer Books will be closed from 29th December 1964 to 31st December 1964, both days inclusive.

TWO-TIER OR NOT TWO-TIER

By Questor

LONDON, *4th December*

THE fact that interest rates have an effect abroad as well as at home puts most governments in a quandary from time to time. In the past few years, therefore, since large international movements of private capital began to interfere with normal monetary management, a number of attempts have been made in different countries to draw a distinction between the rates available on the domestic market and those available to foreigners: the German refusal to pay interest on short-term foreign deposits is one example of this tendency, the U.S. interest equalisation tax is another, this time aimed primarily at long-term capital.

The only experiment Britain has so far made in this field is to revive a former practice of lending at last resort to the money market, when the occasion requires it, not at bank rate but at up to one per cent above it. The idea of this is to open up a small differential between money market rates, in which foreigners are most interested, and those domestic rates which are conventionally tied to Bank rate. But it is of no great importance: and although the machinery for creating a differential has been installed, it has yet to be used.

The British Labour Party, however, has long had more ambitious ideas. Although it has the same traditional prejudice against high interest rates as the present U.S. Administration, it accepts the fact that high short-term rates may be inevitable in an emergency to prevent a mass exodus of short-term capital: the recent increase in Bank rate to seven per cent, which had so little effect, was foreshadowed by Mr. Wilson in a speech made last January. But in the same speech he repeated a theme which has been appearing in Labour speeches on and off for years past: that certain borrowers should be insulated from the effect of a rise in short-term rates by the establishment of a two-tier interest structure.

I should stress that this is not a new theme. Labour was, on the whole, solidly behind the conclusion of the Radcliffe Committee on the working of the monetary system, that monetary policy is only one of many instruments of control available to governments and that it implies taking a view about interest rates and rejecting the neutral approach. But Mr. Wilson, when the report was debated, regretted the fact that Labour's two-tier theory had not been considered.

It is not, in fact, a complete or co-ordinated theory, so far as I know. It rests on a suggestion by Mr. Jay (now President of the Board of Trade) that local authorities should be able to borrow from the Government for public works at a fixed rate year in, year out—he once mentioned three per cent as an example. It was developed by Mr. Wilson to mean that, when interest rates had to be raised for external reasons, certain borrowers of special importance —public housing, agricultural credits, colonial development were given as examples—should be allowed to go on borrowing on the old terms.

In the months before the election, however, the only field mentioned as eligible for special treatment was local authority finance for house-building: the still-serious housing shortage in Britain is a delicate political issue. But local authorities, apart from building houses themselves for rent to tenants on their waiting-lists, make loans available on mortgage to people who wish to buy their own houses. The possibility that they would be subsidised, therefore, caused great alarm among the building societies, which are non-profit-making as well as being responsible for the greater part of private house purchase in Britain.

They sought some reassurance from Mr. Wilson before the election, and they obtained what did seem—though the wording was vague —to be a reassurance that local authorities would not be given an unfair competitive advantage in the mortgage business.

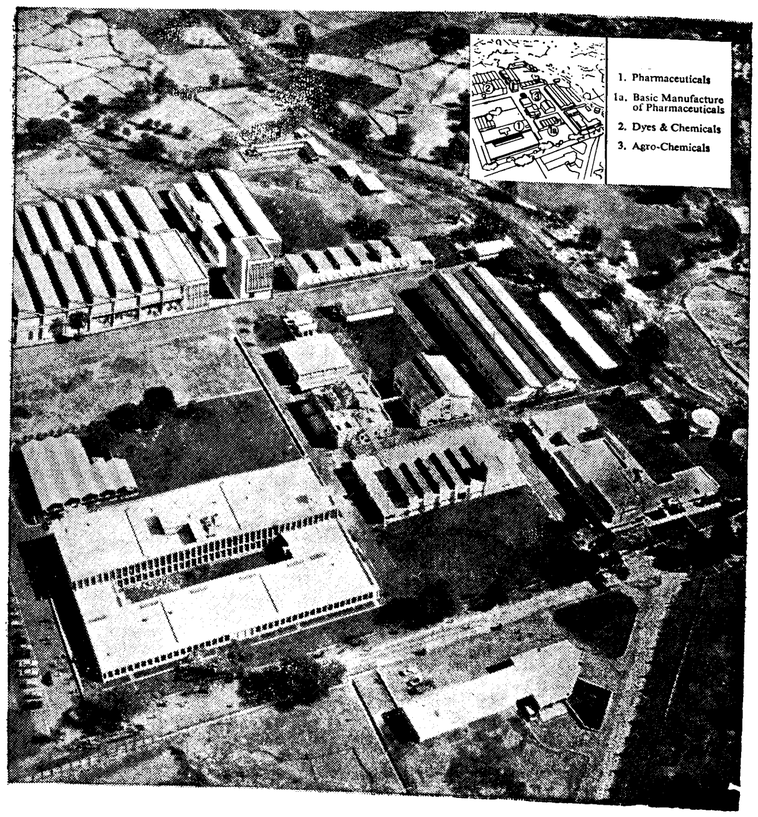
And now? Bank rate has been raised to seven per cent, and the circumstances are precisely those in which Labour's two-tier interest rate structure ought to come into operation. But the whole thing has happened so suddenly that there seems to be no question of off-setting measures in the immediate future. The building societies are holding down their deposit rates, at the risk of losing funds to competitive institutions, but the Government has said that there is no chance of special measures to help them in this session: they hope to gain something, however, from the proposed change in the basis of company taxation.

And local authorities? These are entitled to draw a certain proportion of their capital requirements from the Public Works Loans Board at the rate of interest at which the Government itself borrows. If they were to be insulated from the effect of rising interest rates for some purposes, it would be easy enough to peg P.W.L.B. rates: and, in fact, P.W.L.B. rates have not risen since the increase in Bank rate.

Some commentators have claimed to read significance into this. But yields on long-term Government bonds discounted a rise in rates some time ago, and the average yield on 20-year stock has risen since the change of Government —and all it has entailed—only from 5.95 to 6.17 per cent. If the Bank rate has to be kept high for any length of time, or if long-term yields rise markedly, the two-tier idea may be put into practice. For the moment, however, the new Government is probably too shaken to risk unnecessary financial experiments.

WORLD FOOD PROGRAMME

The 24-nation Inter-Governmental Committee, the governing body of the joint U.N.-F.A.O. World Food Programme, met at Rome this week and reviewed the progress of projects using food aid to speed economic and social development. The Committee laso heard the Executive Director of the Programme, Mr. A. H. Boerma, report on developments since the last session in June. Since then, four more countries—Brazil, Congo (Brazzaville), Tanganyika and Uganda—have been given emergency help. In all, the Programme has given help in 17 emergencies—arising out of floods, earthquakes, storms or movements of refugees—in the past two years, sending 82,000 tons of food at a cost of some $10 million. The World Food Programme, it may be recalled, started operations in January 1963 as a three-year experiment in using food for economic development. So far, 95 projects have been approved, involving food worth nearly $38 million and a total expenditure of nearly $54 million. Agreements have been signed for 70 projects costing some $42 million.



In more ways than one...

This is an aerial view of the Sandoz industrial complex. The site covers more than 70 acres. The plant and machinery incorporate the most modern manufacturing techniques, including a high degree of automation. All Sandoz products are manufactured, processed or formulated here, many from the basic stages. Each manufacturing wing has its own Product Development and Quality Control laboratories.

It is here that Sandoz works for national progress in more ways than one...

Pharmaceuticals:
On 4th February, 1961, Dr. S. Radhakrishnan, then Vice-President of India, formally inaugurated the Pharmaceutical and Chemical Plants. The pharmaceuticals manufactured represent established names in therapeutic use and are the result of continual and progressive research in Sandoz Laboratories all over the world.

Dyestuffs and Textile Chemicals:
A complete range of specialised dyes and chemicals is available for the requirements of the textile, leather and paper industry. Most of the dyestuffs licenced for manufacture will be produced for the first time in India. A pilot plant is in operation since last year and capacity production will start early in 1965.

Agro-Chemicals:
The product range in this line has a vast market in India where agriculture on a scientific basis is just beginning to take shape.

BANKING PROBLEMS AT HOME AND ABROAD

INCREASING COMPETITION AND CONTROLS

A RECENT survey of the trends in international banking by *The Economist**, London, deals with the new problems faced by banks at home and abroad as a result of the breaking down of geographical barriers and disappearance of functional barriers. The problems are, on the one hand, those of competition between domestic and foreign banks in the world's major financial centres and, on the other, of the fast disappearing distinctions between banks and other financial institutions.

At all times, the essence of the business of banking consists in striking "a neat balance between the conflicting virtues of prudence and enterprise." The present times are particularly difficult, for the old traditions have crumbled down in many cases and new opportunities for growth, expansion and progress have arisen, but they are accompanied by new risks too. The recent flowering of the international financial institutions and the revival of the world wide money markets, reminiscent of the golden days of gold standard, are, however, evidence of the fact that reluctant bankers are increasingly yielding to growing temptations of world banking.

Although the growth and expansion of banking across the national frontiers is not a preplanned or a deliberate affair and is the result of a variety of methods and considerations, a distinct pattern of a three-way expansion is discernible. Firstly, there are the American and the Japanese banks, which are attracted by the increasing opportunities in international money markets and their method of expansion is through opening foreign branches. Secondly, the European investment and British merchant banks are seeking new footholds in international capital markets by creating foreign subsidiaries. And, lastly, there is the British way of seeking the local partners, not only for sharing the banking and commercial risks, but also for protecting them from political risks.

Branch Expansion

Opening foreign branches is not a new development in international banking, for the vast network of exchange banking was built up by the British and European banks throughout the colonies in Asia and Africa and in the Pacific during the nineteenth century. But the present phase of expansion is different, for the new arrivals in Hongkong, Far East and even in major European centres are competing vigorously for the local customers with local big established banks—a competition which the latter do not like. Even here at home the bankers are reported to have made strong but unsuccessful representations to the Reserve Bank of India against the permission recently given to existing foreign banks to open more branches in India and to new banks to enter.

Abroad, in Belgium, for example, the French banks are accused of soliciting deposits from local companies by breaking the rates of interest voluntarily agreed to amongst the local banks. The effect is not merely a transfer of deposits, but also an increasingly flagrant and subtle violations of the inter-bank rate agreements by local banks also—violations which even the inspections by Belgium Bankers' Association are unable to prevent.

In Germany, the complaint is that some of the foreign banks borrow funds from the money market at the inter-bank rate of 5 per cent and use them for under-cutting the German banks below their agreed lending rate of 7 per cent. The funds are mainly provided by the smaller German banks who are somewhat happy that the foreign banks take away business from local giants.

Such competition is felt in varying degrees in other European centres also, though it is not always so dramatic. In France, it hits the private commercial banks rather than the nationalised commercial banks. In the Netherlands, the recent double merger of four banks into two was the result of growing international competition. In London, the foreign banks have obtained their deposits from non-British customers by seizing opportunities which the clearing banks have denied to themselves as a result of their agreement on interest rates and have obtained their business by competing with the merchant banks who lack the branch network of a world-wide banking system.

In Britain, the whole tone and temper of banking business are, however, different. The British banks abroad have secured a universal commendation for their restrained behaviour with their competitors: in return, the 160 international banking offices in London—the largest number anywhere—do not *solicit* deposits from British nationals: indeed there are instances of foreign bank branch managers having gently turned away such deposits back to British Banks!

The mood in Switzerland is diametrically opposite. One foreign bank was boycotted for five years, inspite of its truthful assurances of gentlemanly behaviour. Another foreign bank could avoid such an embarrassing situation by nominating three representatives of local banks on its seven-member Board! Yet it must be added, by way of a post-script, that where it suits their purpose, Swiss bankers are willing to co-operate with the foreign banks. In the absence of a developed domestic money market, the Swiss bankers are willing to deposit their surplus funds with foreign banks.

Most Reluctant

The Germans and the Swiss are the most reluctant among the European bankers—they are unwilling to go abroad, for the war-time perils are still green in their memory. The Germans recall the bitter memories of war-time expropriations of foreign branches and subsidiaries of German banks, and the Swiss still remember that, by 1945, they had the liabilities at home and all assets abroad, and that, if the war had lasted another couple of years, they would all have gone bankrupt.

If the Swiss reception to foreign bank branches is ice-cold, and if the British tolerate them on a live-and-let-live type of co-existence, the Americans go to the other extreme to welcome foreign banks, and to make them comfortable in all possible ways. New York, for example, gives them full facilities for conducting sustained radio and television advertising to attract personal savings. The motive behind this freedom is neither charity nor reciprocity: it is the desire to create the freest possible atmosphere for setting the pace of international expansion in banking.

American Banks' New Fervour

Nevertheless, the desire of American banks to go abroad is only of a recent origin and is the result of special circumstances. They do not have the freedom of branch expansion at home and rates of interest they can pay on domestic deposits are prescribed by the statutory authorities. The American banks' new fervour to go abroad, either through branches or through wholly-owned subsidiaries in Asia, Africa and Latin America is comparable in principle with the spread of European (largely British) exchange banking abroad in the nineteenth century, although, in practice, the size of its expansion effort may not be comparable at all: as witness the fact that, as against the 100 overseas offices of the First National City Bank of New York, Barclays D.C.O., with its 4,350 offices in 40 African, Mediterranean and West Indian States, is the world's biggest purely international bank.

The continuing growth in Euro-currencies and relatively larger and swifter transaction in the Euro-markets, accompanied by closer integration of international capital markets and brighter outlook for freer capital movements, provide the greatest attractions for branching out abroad. Even the reluctant Germany is opening a banking office in New York in January. Yet, as a whole, the European bankers do not appear very keen on opening foreign branches at places other than the largest financial centres. Indeed, the Dutch have already sold away a few of their branches or a part of their share in foreign branches.

The British bankers have found a *via media* between neglecting foreign opportunities and risking foreign friendships. Their expansion is largely through wholly-owned subsidiaries as in the past, or through majority-owned subsidiaries with local or international participation as in recent months. The domestic and foreign businesses are kept separate, but the subsidiaries are deliberately kept out of the domestic interest rate agreement of the clearing banks, in order to be able to pay competitive rates for domestic deposits too.

Such participation arrangements have their advantages as well as drawbacks too. "When little is ventured, little is gained," as *The Economist* puts it. But the British are traditionally the most conservative and compromise-minded. Participations may be ineffective at times, slow at others. But they provide excellent risk cover and shield against financial as well as political risks of branching out in the unknown investment fields of developing countries.

These are the problems and treatment that bankers face when they go abroad; but the problems they face at home are not very dissimilar. Credit is provided at home not only by banks but also by a large number and variety of financial institutions who have come into prominence recently, and who do not yet fit into the framework of traditional monetary control.

The higher Bank rate in Britain was not accompanied this time by other measures of credit restraint, because there was in fact no excess liquidity in the banking system, with credit-deposit ratio at 53 per cent and deficit in the balance of payments. But credit restraints will again be necessary, sooner or later, once the balance of payments position begins to improve. The problem facing British monetary authorities is *how widely* should the tightening be applied when it becomes necessary.

Special Deposits

So far as the banks are concerned, the Bank of England Governor's preference for special deposits is already well known. But how are the non-banks and near-banks to be treated? Should they be brought under a broadened range of formal monetary controls, or should the monetary authorities be satisfied by addressing them informally by making what has come to be known as special requests?

On the ground both of equity and effectiveness, the British banks would prefer to bring all financial institutions, whether banking or non-banking, within the net of monetary controls. South Africa has, indeed, recently passed a special legislation to that effect. But the variety, complexity and range of London's institutions and links cannot be matched by the South African money market, and it would hardly be possible to devise a suitable method of applying credit controls to all the various institutions.

Flexibility

If such controls are to be imposed, it is essential that they must be comprehensive, because all such controls restrict the supply of credit without restricting the demand for it. It has been the effect of the credit squeeze in the past that they have succeeded more in raising the cost of credit rather than in cutting down its supply. Moreover, as has been rightly pointed out by the Canadian Royal Commission on Banking and Finance, such comprehensive controls formalise a particular pattern of specialisation and rigidities in the financial system, as well as in the interest rates current in the system, while the need is to break down the institutional and other rigidities in rates. In fact, it has been argued that "the prime reason why the rival financial institutions have fared so much better than the banks in periods of tight money may not after all lie in their freedom from official controls as such but in the fact that their interest rates are usually more flexible than those of the banks." If all interest rates were equally flexible, it is obvious that their manipulation by the monetary authorities would affect the liquidity over the entire spectrum of financial institutions.

In Canada, the Royal Commission on Banking and Finance, which submitted its report earlier this year, has recommended that all "near-banks" must be brought within the scope of the present banking regulations. This has been done by providing a uniform and comprehensive definition of banking and by stipulating that similar institutions should be treated in a similar manner. But that is not the essence of the Commission's recommendations. The essence is that it has proposed "one of the most openly competitive and rationally regulated banking structures in the world." This competitive banking system is based not on applying specific controls to other financial institutions but on removing impediments to banks' own flexibility. It, however, appears now that, even in Canada, these radical recommendations of the Commission stand little chance of being fully implemented.

The basic weakness of British banks, as admirably summed up by *The Economist* remains. It is this: "the heaviest shackles on the banks' growth have been the self-imposed ones of their interest rates cartel. And, if the next credit squeeze is to be made more effective than the last, it is imperative that these shackles be struck off, not that new shackles be put on elsewhere."

Consumer Credit

In the field of consumer credit, the results and lessons of British banks' six-year-experience of personal loans are not available in statistical terms, but one thing is clear: in spite of a growth in their share of total consumer credit from *nil* to 18 per cent, the British banks have lacked the commercial drive usually evident among the German commercial banks in this respect. Notwithstanding the absence of a branch net work comparable to that of the British banks, the German banks have been able to achieve spectacular success in consumer loans, because they have an effective, efficient and comprehensive credit reporting system, with credit particulars of over 20 million Germans. Even so, the finance houses and instalment credit institutions in Germany have held out remarkably against banks and that, too, despite the high *effective* interest rates charged by them, rates which vary between 14 and 19 per cent per annum. The success of German consumer credit system is explained by the fact that, even without any official controls, it has been able to avoid the gigantic bad debts of British finance houses during and after 1958. It must, however, be added that, although official controls on German consumer-lending are absent, full precautions are taken. Assignment of borrowers' wages is always insisted upon, and the employer co-operates with the lenders by deducting a percentage of the wage packet in case of default, though the Government strictly controls this percentage. Change of jobs and places creates no problems, for movements between different towns require civil registration and it is always possible to trace a person's movement.

These two aspects of German consumer credit—assignment of wages and civil registration—may not always be preferred by other countries, but the freedom of the German lending institutions to provide consumer loans either in cash or through the dealers and the highly developed system of credit investigation, reporting and control deserve admiration and are worth of emulation.

*The *Economist*, 21st November, 1964 "Bankers Step Out." The article is based upon the findings of the survey.

CANARA BANK RELIEF AND WELFARE SOCIETY

With a view to improving the falling standards in secondary education in Mysore State as is evident from the deteriorating S.S.L.C. results in some of the districts, the Canara Bank Ltd., one of the leading banks of India, has instituted an incentive scheme. Known as the Canara Bank Relief and Welfare Society's Scheme, it envisages the award of shields to schools in all the 20 districts of the Mysore State—the Bank's home State. In addition, it proposes to give cash awards to teachers and prizes to students in these selected districts. A rolling shield in each of the 20 districts will be awarded to the school securing the highest percentage of passes in the S.S.L.C. Examination every year from March 1965. The conditions for awarding the shields include, among others, the stipulation that the school should get the highest percentage of passes in the district. This percentage should be 25 per cent higher than the State average. In addition, as an incentive to teachers in three districts of the State (Bangalore rural, Gulbarga and Chitradurga), which have shown poor results in the last two years, cash awards of Rs. 1,200 (first prize), Rs. 1,000 (second prize) and Rs. 800 (third prize) will be made. These awards will be given to S.S.L.C. teachers and headmasters of the shield winning schools. The cash prizes awarded to the schools will be distributed equally among the teachers eligible for the prize, except the headmaster, who will be awarded double the cash prize given to others. Further, three prizes of Rs. 60, Rs. 50 and Rs. 40 would be given to the best three students in each of the abovementioned districts. The scheme, administered by a committee of five members, will, in the first instance, be for a period of three years, beginning from March 1965.

Unit Trust of India

Over 1,25,000 Applications for 'Units' have been received during the initial sale period, July 1 to August 14, 1964 alone, when the units were sold at par.

Applications continue to flow in for 'Units' at Premium

The premium on 'units' includes an element of income accrued to the Trust, which will be returned to unitholders as part of the Trust's income distribution as dividend.

Units are a safe investment, bring in steady income and are liquid enough to realise when you need money. Further, income on unit up to Rs. 1,000/- is exempted from income-tax.

Repurchase operations by the Unit Trust have commenced from November 16, 1964.

Units certificates are being despatched every day. Those who have not yet received their certificates will receive them shortly.

UNITS ARE ON SALE AT ALL BRANCHES OF LEADING SCHEDULED BANKS THROUGHOUT THE COUNTRY

EXPANSION AND MODERNISATION OF COTTON MILLS

FISCAL RELIEF URGENTLY WANTED

THE rising domestic demand for cloth, the exigency of earning foreign exchange through exports and the growing competition in world markets for textiles invest the need for expanding the capacity of cotton mill industry and raising its productivity with urgency. Indeed, never before was the need so pressing as it is today and it will be more pressing in the years to come. It is true that, along with the expansion in the installed capacity of the industry in the past fourteen years, there has also been an improvement in productivity, following the rehabilitation of a part of the spindles of several mills and installation of a few thousand automatic looms partly as new additions and partly as replacement of ordinary looms. Thus, between 1950 and 1964, the average annual production of yarn per worker has gone up from 789 kg. to 1,134 kg. and that of cloth from 4,965 metres to 5,551 metres. Similarly, the average yarn production per spindle per shift and the average cloth production per loom per shift have risen, the former from 27 kg. to 34 kg. and the latter from 10,242 metres to 10,747 metres; the figures for 1964 are projected on the basis of the actual trend during the first six months of the year. But the improvement in productivity has not been very appreciable. At any rate, the present productivity rate of the industry is well below what is obtaining in countries like Japan and the U.S.

Maximum production of quality textiles at economic costs cannot be ensured so long as a considerable part of the industry's machinery and equipment continues to remain old and out-moded. This aspect has been impressively highlighted by the Indian Cotton Mills' Federation in the course of a communication (urging fiscal relief for the mill industry for modernisation and expansion) addressed to the Secretary to the Union Ministry of Finance. The Federation observes:

"Our machinery is obsolete and old, some 50 per cent of the machinery being as old as 40 years and over. It is, therefore, obvious that, if the industry is not only to hold its own in the export markets but also improve its export performance, and if it is to improve the supply position of cloth in the domestic market, both quantitatively and qualitatively, and also reduce the unit cost of production, modernisation and expansion of the industry is urgent and imperative."

It will be recalled that both the Working Party (Chairman: Dr. A. Ramaswami Mudaliar) in 1950 and the N.I.D.C.'s Working Group in 1960 had stressed the supreme urgency of speedy rehabilitation and modernisation. In its report, the N.I.D.C. Working Group had estimated that, out of the total spindles (about 13.55 million) as of 1960, 15 per cent (2.03 million) were over 40 years, 50 per cent (6.78 million) more than 20 years but less than 40 years and only 35 per cent (4.74 million) were the latest. Since the publication of this report, no official estimates of the extent to which rehabilitation has actually taken place are available. The Cotton Mills' Federation, however, has made its own study and prepared some estimates of the extent to which rehabilitation has taken place. The findings of the study, which were published recently, are summarised below:

Estimated Rehabilitation

	1963	1962	1961
Ring frames (total availability) ..	2,047	1,576	1,356
Of which:			
Manufactured	1,990	1,571	1,340
Imported	57	5	16
No. of spindles to be rehabilitated ..	1,080,078	1,996,958	2,030 500
No. of spindles rehabilitated ..	266,327	346,818	372,280
No. of spindles to be rehabilitated but not done so at the end of the year	1,722,751	1,650,340	1,658,220
Rate of rehabilitation* .. (%)	13.39	17.36	18.33

* Ratio of spindles rehabilitated to spindles requiring rehabilitation.

The above figures bring out the magnitude of the problem of rehabilitating the existing spindles alone. There is then the need for (*a*) installing additional spindles for the purpose of expansion, (*b*) establishing more and more automatic looms, and (*c*) rehabilitating the various other items of equipment employed in cotton mills. All this entails pretty huge capital outlay. The Planning Sub-group on Cotton Textiles has estimated the outlay required for the expansion of spinning and weaving capacities at Rs. 92 crores during the last two years of third Plan and at Rs. 225 crores during the fourth Plan period, or a total of Rs. 317 crores. To this has to be added the requirement for rehabilitation. The industry, according to the Federation, has been actually spending at an annual rate of Rs. 40 crores on rehabilitation. This requires to be stepped up considerably having regard to the rising prices of machinery and the need to accelerate the pace of rehabilitation. But even on the assumption that investment in rehabilitation remains unchanged at the level of Rs. 40 crores per annum, the finance required for rehabilitation for the remaining two years of the current Plan and the five years of the next Plan will be:

For expansion in the remaining two years of the current Plan Rs. 92 crores; for expansion in the five years of the next Plan Rs. 225 crores; and for rehabilitation at Rs. 40 crores per year for two years of the current Plan and five years of next Plan Rs. 280 crores, or a total of Rs. 597 crores, or, say, Rs. 600 crores. It is emphasised that this estimate is based on the current values of machinery and, with rising prices, is likely to be exceeded.

In the present state of the capital market, it would be very difficult, in the opinion of the Federation, for new textile mills to come into being. Even if it is assumed that a part of the expansion is entrusted to new units for being financed by them through resort to the capital market, the requirement of existing units for the expansion already allowed and that may be allowed, as well as for rehabilitation, so says the Federation, would be substantially in excess of Rs. 400 crores. In view of the low profitability of the textile industry, it may be possible to raise only a small portion of the outlay by fresh capital issues. Most of the money required, as the Federation has pointed out, has, therefore, to be obtained from internal resources and borrowings. But the internal resources of the industry are being fast eroded. That there is no exaggeration whatever in this statement will be evident from the analysis of the financial position of 294 mill companies (representing about 82 per cent of the total installed capacity) for the years 1955 to 1959 and a subsequent analysis in respect of 269 mill companies (representing 72 per cent of installed capacity) for the years 1961 and 1962 as made by the Federation. The relevant figures are as follows:

Financial Position

(In crores of rupees)

	269 mill companies		294 mill companies	
	End of		End of	
	1962	1961	1959	1955
Paid-up capital	111.07	107.50	111.96	99.78
Reserves and surplus	111.89	107.27	73.81	79.88
Total ..	222.96	214.77	185.77	179.66
Less net block	195.49	175.81	165.91	103.55
Internal resources for working capital	27.47	38.96	19.86	76.11
Borrowings	183.74	152.00	146.79	81.72
Trade dues	85.75	78.02	72.75	52.34
Gross block	415.18	380.19	351.07	243.78
Depreciation provision ..	219.77	204.38	185.16	140.23

A look at the above figures will reveal two disquieting features, namely, the strain that has been put on the cotton mill industry's resources for working capital and the staggering increase in borrowings. Internal resources declined by Rs. 56.25 crores in respect of 294 mill companies during the five years from 1955 to 1959 and by Rs. 11.49 crores in respect of 269 companies during 1962 (as compared with 1961), while borrowings and trade dues went up by Rs. 85.48 crores and Rs. 39.47 crores, respectively. When such is the position, how can one expect the mill industry to fulfil its obligations successfully as a supplier of one of the basic needs of people and as a major foreign exchange earner? If the internal resources are not adequate enough, the industry will simply not be able to meet its growing requirements of working capital and to reduce

MANCHESTER LETTER

CLOTH IMPORTS RISE AGAIN

PEAK OF 1961 LIKELY TO BE EXCEEDED THIS YEAR

From Our Special Correspondent

MANCHESTER, 1st *December*

AS the Government's surcharge on imports was only imposed in the last week of October, its impact can only be expected in the final two months of the year. Even so, it seems reasonable to suppose that the 1961 peak purchases of foreign cotton cloth will be exceeded, as arrivals during the first ten months of this year have been well above any previous levels.

The October overseas trade returns show that total imports from all sources had already reached 670,688,000 square yards. This was 34 million yards more than aggregate arrivals during the whole of 1963 and barely 60 million yards short of the all-time record. The quantity of cotton grey goods reaching British ports in the ten months was nearly 536 million yards, as against 408 million yards in the same period last year. Imports of finished cotton fabrics were nearly 135 million yards, as against 125 million yards. In the case of man-made fibre cloth, arrivals exceeded 79 million yards, as against 52 million yards.

Still the Same Suppliers

Compared with the same month in 1963, however, India's shipments of cotton grey cloth were drastically cut, being less than 10 million yards, as against nearly 20 million yards, but, over the ten months, Indian arrivals were 206,886,000 yards, as against 150,115,000 yards. In the same period, Hong Kong sent nearly 67 million yards, as against 77 million yards and Pakistan 42 million yards, as against 50 million yards. The other major supplier was China, with 52,500,000 yards, as against 31 million yards.

In the yarn sector, arrivals of cotton goods amounted to over 35,500,000 lbs., as against 30 million lbs., while man-made fibre yarn and thread obtained from abroad was twice the 1963 level at 26 million lbs. The cost of cotton yarn and manufactured goods alone in the ten months was £68,500,000, as against £51,334,000, while purchases of man-made fibre goods were valued at over £31 million, as against £19 million.

Better Yarn Exports

Exports of cotton and man-made fibre cloth combined showed very little change from the previous year. By the end of October, the quantity of cotton cloth shipped abroad was 172,570,000 yards, as against 185,663,000 yards, but, in man-made fibre fabrics, the total increased by nearly 10 million yards to 74,655,000 yards.

A sharp increase in exports of cotton yarn and thread in October to the highest total for the past two years, apart from May, made the 10-month aggregate 17,989,000 lbs., as against 17,227,000 lbs. in 1963. Man-made fibre yarn exports continued their upward progress and by the end of October had reached almost 79 million lbs., as against 67,300,000 lbs. last year.

Memorable measures adopted by the Government to prop up the sagging pound sterling have been the focal point of financial interest during the past week; for the time being at any rate, they appear to have been successful. Lack of confidence abroad and a general feeling of uncertainty threatened the possibility of a devaluation, but this fortunately has been averted.

The action so far taken, coupled with the promise of heavier taxation and the imposition of increased charges for fuel, haulage, insurance contributions, and probably postage, make rising overheads a certainty. Within the industry, margins have lately been lifted and employers know their hours and wages costs for more than two years ahead, but there comes a time when users may call a halt to the increases they are asked to pay.

The recent upsurge in demand, partly accentuated by the import surcharge, gave producers a strong fillip and substantial orders have since been booked. There are grounds for supporting the opinion held by an increasing number of distributors, however, that economic pressure may sharply reduce retail activity before the end of 1965.

Many of the contracts now under consideration involve deliveries in the second half of next year, by which time the Government may have introduced plans for holding down domestic demand in order to encourage exports. Traders may strongly object to such policies, but the probability cannot be denied.

Trans-Pennine Links

How far Yorkshire interests in textiles will emulate the big changes which have taken place on the Western side of the Pennines has been the subject of speculation among traders for some months past and has certainly given the City Editors of the newspapers food for gossip. The action of Woolcombers a few weeks ago in banding together a group of mainly private companies in the top-making section brought initial signs of activity; in the past week the movement has quickened.

At first sight, the bid made by Lister and Co. for Mutual Mills, the Heywood spinning firm which specialises in blended man-made fibre yarns, seemed a little "off-beat," but a more discernible pattern quickly emerged when 48 hours later it was announced that the I.C.I. had arranged to take a 20 per cent interest in Lister's capital. In addition, financial backing up to £3 million is to be provided for the further expansion of the Lister group. From this basis it is being widely assumed that Lister is to play a similar role to Viyella in any broadening of the Yorkshire trade in the future.

The deal also fits in snugly with the knitting subsidiary of Mutual Mills, which is jointly owned by Klinger Manufacturing, a company in which the I.C.I. has already forged a financial link. As all connected with textiles will agree, the problem of "Who owns Who" gets more and more complicated every day!

At the same time, integration among firms in the West Riding and on the Eastern side of the Pennines is just as much to be commended as the reconstruction which is steadily taking place in Lancashire. The continual moves towards more effective collaboration in all phases of textiles has much in its favour, with man-made fibres as the common factor between the mills which were at one time widely separated by their independent processing of either wool or cotton.

Into Ireland Too

Within the past month, there had been earlier signs of more developments in this direction. Whitworth & Mitchell Textorial, whose expansion projects, in contrast to other firms in the area, have concentrated on the acquisition of textile companies, relinquished their main woollen interests by disposing of two subsidiaries to the Woolcombers group.

With part of the money from this sale a half-share has been purchased in an Irish firm of double jersey manufacturers, Ernetex of Clones, Co., Monaghan. The thriving knitwear and allied traders are certainly a magnet at present to traditional textile companies with cash in hand.

One of the minor mysteries tied up with the mammoth mid-summer transactions involving the man-made fibre producers and Lancashire spinning interests was what would happen to the small non-textile subsidiaries picked up by the spinning groups over the years. Courtaulds has now indicated one line of action by announcing that negotiations are in progress for the disposal of J. Walton (Electrical), a subsidiary of the Lancashire Cotton Corporation, to Thomas Tilling, the industrial holding group. In return, Thomas Tilling is involved in selling one of its textile subsidiaries to Courtaulds—Spray and Burgess, dyers and finishers, of Nottingham.

Goodlass NEROLAC Paints

ONE STEP AHEAD OF PROGRESS

Paints and surface coatings must keep pace with the changing and unceasing demands of industry □ We at Goodlass Nerolac welcome the challenge of remaining ahead in technology, quality and production . of meeting these ever widening demands □ We accept the challenge in a characteristic way by adopting new methods of manufacture . by conducting constant research into new qualities .. by giving you today the paints for tomorrow's needs.

WORLD PLANTATION CROPS

A REVIEW OF RECENT TRENDS

MARKED fluctuations in the world prices of plantation products adversely affect the economies of developing countries like India, Ceylon and Malaysia which are dependent to a great extent on the export trade in these products. Such fluctuations, besides causing an immediate instability in the economic structure, also seriously hamper the implementation of developmental programmes. Even when the economy of a country is so diversified that a fall in the price of a particular commodity it exports may not affect its economy, it does have a disquieting effect on the living of people engaged in the production of that commodity through a fall in their real incomes. Despite efforts to diversify the economies of developing countries, as the latest annual *Review* of plantation crops (1964) published recently by the Commonwealth Economic Committee, London, shows, continue to lean heavily on the export earnings of a number of producers, as will be evident from the following data:

The export trade of Mauritius consists almost entirely of sugar, tea and rubber together make up the greater part of Ceylon's exports, cocoa accounts for some two-thirds of Ghana's exports, cloves account for the bulk of the foreign trade of Zanzibar, approximately one-half of Malaya's exports consists of rubber, coffee shipments account for 45 per cent of Uganda's exports and, out of the export trade of Kenya, the share of coffee and tea alone comes to nearly one-third. The dependence of Latin American countries on exports of some of these commodities remains marked. Sugar accounts for over four-fifths of exports from Cuba and coffee accounts for 70 per cent of exports from Columbia. In Africa, coffee is the staple earner of foreign exchange for Ethiopia, accounting as it does for over half of the total earnings. In Asia, the share of rubber is predominant in the case of Indonesia, being over two-fifths of the aggregate exports. With the falling off in rice shipments from South-East Asia since 1962, rubber has increased in relative importance in South Viet Nam and Cambodia, accounting for over 70 per cent of all exports from the former and nearly 40 per cent from the latter. Sugar takes second place next to copra as an export item in the Philippines, accounting for anywhere between one-quarter and one-fifth of total shipments. In India, too, with the expansion of the total export trade, though the relative position of tea has slightly declined, sugar has appeared in recent years as a significant item of exports.

International Efforts

This brief narrative highlights the vital importance of avoiding frequent and marked fluctuations in the prices of plantation crops. Since the avoidance of such fluctuations is in the interest as much of importing countries as in that of the producing countries, efforts at international level have been made from time to time to ensure stability of prices. The extent to which these efforts have met with success has been indicated in the *Review*. The findings of the Study show that, while the downward drift in the prices of plantation products has in some cases been checked and actually reversed in the case of sugar, renewed attempts have been made to find solutions to the international supply problems through commodity agreements. The International Sugar Agreement, though its economic provisions ceased to have effect after the end of 1961, continued in existence until the end of 1963 and was extended by a further two years through a protocol agreed at a United Nations Conference in July 1963, pending a study of the basis and framework of a new Agreement. Meanwhile, the Commonwealth Sugar Agreement continues in force; in 1963, it was renewed upto 1971. In July 1963, the new International Coffee Agreement came into force, with provisions for fixing quotas for exports to traditional markets as well as for negotiating production goals. Talks on an additional agreement on cocoa, however, broke down last year, as the producing and consuming countries could not agree on the price range. The International Rubber Study Group and the International Tea Committee continue as statistical bodies. The F.A.O. Committee on Commodity Problems felt (in May 1963) that a study group on tea was not called for, but suggested that the need for further action be examined after a study of the recent trends.

U.N. Studies

Fluctuations in export products have been the subject of study by the United Nations. Proposals for compensatory financing by means of a Development Insurance Fund and a proposal of the organisation of American States for an international fund for the stabilisation of export receipts were considered early in 1963 by the Commission of International Commodity Trade. This Commission referred to the recent creation of new compensatory financing facilities by the International Monetary Fund and postponed consideration pending further studies of long-term international commodity problems. Moreover, a programme of Action submitted by eighteen member-countries of the General Agreement on Tariffs and Trade at the end of 1962 proposed the early elimination of quantitative restrictions affecting the exports of less developed countries; action by industrialised countries to permit duty-free entry; the elimination of tariffs on primary products and the reduction in those on semi-processed and processed products important in the trade of less developed countries; and the progressive reduction of internal charges and revenue duties on products wholly or mainly produced in less developed countries. This programme of Action was accepted at the meeting of Ministers in May 1963 by the industrialised countries except the Six, which, with the Associated countries, urged more positive measures to increase the export earnings of less developed countries. An Action Committee was set up by the Council of the G.A.T.T. in June 1963 to study the implementation of the Programme by individual Governments and co-ordinate further measures.

It may be appropriate to summarise here the Commonwealth Economic Committee's review of the recent trends in the consumption, production, exports and prices of six plantation crops, namely, sugar, tea, coffee, cocoa, tobacco and rubber.

Consumption

The increase in world sugar consumption reflects in great measure the rising standard of living in Latin America and in parts of Asia and America, but *per capita* levels of consumption are still rising in some European countries; consumption of tea has risen not so much in the older markets as in countries of the Middle East and North Africa as well as in the producing countries themselves. Increased supplies of cocoa, too, have been followed by increased grindings not only in the traditional importing countries and Japan but also in producing countries (though ultimately for the export market also). The increase in coffee consumption in the U.K. is attributable to the spread of 'instant' coffees, but these appear to have played little part in the expansion of consumption in the United States and Continental Europe. Despite temporary checks due to medical reports on lung cancer, individual consumption of cigarettes shows no sign of falling off, though the spread of filter tips has reduced the rate of increase of actual tobacco smoked. Despite the increased use of rubber over the last decade, the amount of natural rubber consumed in the U.S. and the industrialised countries of the Commonwealth had declined, while demand in Continental Western Europe is levelling off. The demand for rubber in Japan has been met to an increasing extent by synthetic rubber, but the Soviet Union has supplemented its synthetic output by large imports of natural rubber.

Sugar

According to the *Review*, the output of cane sugar showed a slight recovery in 1962-63; a high level of production in the Commonwealth, particularly in Australia, offset the fall in Cuban output. The aggregate world output (outside China and U.S.S.R.) which had declined from 29.07 million tons in 1960-61 to 26.15 million tons in 1961-62, increased to 26.53 million tons in 1962-63. The beet sugar output continued to decline, from 16.62 million tons in 1960-61 to 15.37 million tons in 1961-62 and further to 13.75 million tons in 1962-63. Accordingly, taking both beet and cane sugar together, the world production receded from 45.69 million tons in 1960-61 to 41.52 million tons in 1961-62 and 40.28 million tons in 1962-63. Sugar production in India, after rising from 3.0 million tons in 1959-60 to 3.6 million tons in 1960-61, fell to 2.8 million tons in 1961-62 and again to 2.7 million tons in 1962-63. There was a contraction of the international trade in sugar during the years 1962 and 1963 reflecting reduced shipments from Cuba and other Latin American countries; the net value equivalent of sugar entering world trade in 1963 was lower at 13.9 million tons, as against 15.0 million tons in 1962 and 16.8 million tons in 1961. A large part of the world trade in sugar has been within the framework of special marketing arrangements. India has joined the list of sugar exporters in recent years, its main customers being Canada, the U.S., Hong Kong, Pakistan and Netherlands, besides Malaya and Aden. The world prices of sugar staged a recovery in 1962 and the recovery gathered momentum in 1963 and the early months of 1964 since when they have drifted downward. The fluctuations in world sugar prices have been in the "free" market, as a substantial part of the trade in sugar is conducted under special arrangement.

Tea

World production of tea (outside China and the Soviet Union) showed a minor change in 1962 from the high level touched in the previous year, a fall in tea harvest in India and Japan was offset by a further expansion in Ceylon, East Africa, Indonesia and Taiwan. The actual production in 1962 was 1,807 million lbs. a record level, as against the 1,801 million lbs. produced in 1961. Out of this output, India alone accounted for 757 million lbs., as against 781 million lbs. in 1961. Ceylon's output increased from 455 million lbs. to 467 million lbs. In 1963, production was about the same level as in 1962. The harvest in India was again large and that in Ceylon touched a peak. There was some recovery in Pakistan and production in East Africa continued to expand. The aggregate world tea exports recorded an expansion from 1,121 million lbs. in 1961 to 1,175 million lbs. in 1962 and further to 1,182 million lbs. in 1963. Shipments from India increased from 452 million lbs. to 493 million lbs., as also those from Ceylon and Kenya, the former from 426 million lbs. to 456 million lbs. and the latter from 25 million lbs. to 33 million lbs. The downward trend of tea prices, which was checked immediately after the Chinese attack on India in October 1962, was resumed in 1963. There was a slight hardening of prices as a result of the Common Market's decision to suspend the import duty on unpackaged tea, but, towards the close of 1963, prices were again below the 1962 level.

Coffee

The world production of coffee registered a rise in 1961-62, the quantity actually plucked being 82.22 million cwt. In the following year, however, the production fell and touched 77.17 million cwts. While production suffered a setback in 1962-63, the world exports of coffee were higher at 53.55 million cwt., as against the exports of 50.83 million cwt. in 1961-62. The decline in the prices of *arabica* coffee was checked in 1962, while the recovery in *robusta* prices noted in that year continued in the following year (1963). The interim International Coffee Agreement was replaced in 1963 by a new agreement which included the importing countries too and which provided for the regulation of both production and exports.

Cocoa

The world production of cocoa touched the record level of 1.15 million tons in 1961-62 but it declined to 1.13 million tons in 1962-63. Trade in 1963 was at much the same level as in the previous year, the total world exports amounting to 1.0 million tons. The expansion in Commonwealth Shipment was offset by a decline elsewhere. The volume of trade in cocoa during the year 1963 was somewhat lower than in the previous year. Grinding statistics showed a steady increase in consumption but stocks at the end of 1961-62 were above those a year before. Prices, which were low throughout 1962 rose early in 1963 and touched the peak in April-May.

Tobacco

Tobacco maintained a rising trend of production in 1963. The tobacco output reached a record 6.8 million lbs. (excluding China) in 1963, the Commonwealth share alone reaching a new high of 1.5 million lbs., as a result of larger crop in India and Pakistan. Production tended to rise particularly in Turkey and Greece. Trade in manufactured tobacco, however, showed some decline in 1962, but in 1963, it recorded an improvement, heavier exports from the U.S., India, Greece and Yugoslavia offsetting a fall in exports from Turkey and Italy.

The price of flue-cured in the United States declined by 4.2 cents per lb. in 1962, the first break in the steady upward movement since 1957, when output was sharply reduced. In Southern and North-Western Rhodesia, on the other hand, where the expansion of production was checked in 1962, the average price showed an appreciable rise to 33.0*d.* per lb., reversing the previous steady decline since 1957. South-Western Rhodesian flue-cured reached a near-record level of 41.6*d.* per lb. in 1963, but United States averaged 58.0 cents, the lowest for six years.

Rubber

The upward trend of raw rubber production continued in 1962, reflecting not only an increasing acreage but also the use of high-yielding varieties. The actual output in that year was 2.1 million tons, as against 2.08 million tons in 1961. In 1963, however, the output has receded to 2.0 million tons. The greater part of the rubber entering world trade is still natural rubber, the consumption of which exceeded that of synthetic rubber in 1962; the increase in stocks of synthetic rubber was relatively greater. The prices of rubber remained low but stable during 1962 but declined appreciably during the year 1963, though the downward trend has been checked in recent months.

MYSORE PLANTERS' ASSOCIATION

This souvenir published by the Mysore State Planters' Association on the occasion of its centenary celebrations held last month end, gives an interesting account of the progress made by the plantation industry in Mysore State during the last hundred years. The story of the Association began perhaps 250 years after the coffee was introduced in India. It was not until 1830, according to the souvenir, that any systematic cultivation of coffee was undertaken in India. After the emergence of coffee as a systematically cultivated crop, the most active and historically noteworthy are the three decades beginning with 1850. In the story of planting progress, the connecting thread is the strong, vigorous and enterprising planter himself. His robust individualism, steadfastness of purpose and organising ability have lifted planting to the status of a modern and progressive industry in the standards of management and efficiency of production. The history of the Mysore Planters' Association testifies to the long and devoted service the planting associations render to the industry.

TEXTILES

(*Concluded from page 1032*)

its heavy commitments of borrowings for financing the bulk of its investment programme. Let alone the rising cost of borrowing, even to obtain loans at higher rates of interest, the success of the industry depends on the financial picture it presents. For no prospective lender, after all, will consider a mill's application for loan, if the internal resources position of the mill concerned is heavily strained.

Judged against this background, the need for helping the mill industry to improve its internal resources is quite obvious. Such an improvement would be ensured to some extent at least if the Government of India were to concede the two just pleas of the Federation. One, the mill industry should be included in the list of industries of national importance which, under this year's budget, have been given rebate in income-tax and super-tax. Two, the industry should be granted development rebate on a more liberal scale, as has been done in the case of coal and shipping industries. The relief asked for will, of course, cost the exchequer, but the loss suffered is estimated at no more than Rs. 4 crores annually. The Government should certainly not grudge the grant of such a modest relief. Moreover, whatever loss the Government incurs will be more than made good by the larger revenue accruing to the exchequer as a result of the growth in the turnover of the cotton industry that would follow the expansion, rehabilitation and modernisation of the industry.

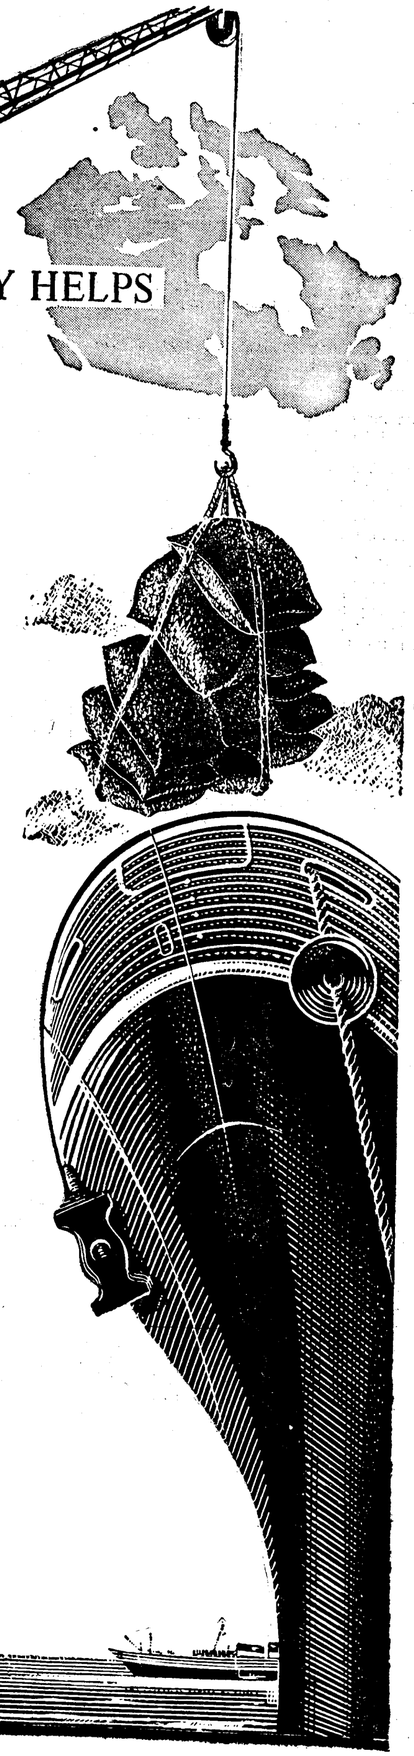
THE E.I.D.-PARRY GROUP
1964

SUGAR FOR EXPORT—
E.I.D.-PARRY HELPS



India is now a regular exporter of sugar. The country exported in 1962/63 4.18 lakh tonnes valued at over Rs. 16 crores. The Middle East, Malaysia, Japan, Canada & the U.S.A are her best customers. The production capacity is to be expanded by 5 lakh tonnes. This means more sugar for domestic consumption and export.

The E.I.D.-Parry Group with its five sugar factories at Nellikuppam, Pugalur, Samalkot, Pettaivaythalai and Tiruvalla is contributing to export expansion from its own output which is expected to improve in 1964 significantly to a lakh of tonnes. Export obligations have been met regularly and planned extensions are in progress. Sugar exports are now supplemented by confectionery in which E.I.D.-Parry has been firmly established as manufacturer for fifty years and exporter for twenty-five years.

The E.I.D.-Parry Group helps the South Indian cane-grower with fertilisers, (especially super-phosphate) to raise the yield per acre and get the benefit of higher prices. In 1963 the Group supplied 25,000 tonnes of fertilisers to the sugarcane industry alone.

Other manufactures of the Group include sanitary-ware, acids, chemicals, carbonic acid gas and industrial and potable alcohol.

Started as a small trading concern in 1788, the Group today comprises nine companies of substance, offering employment to more than 10,000 people, and continues expanding its activities in pace with the nation's march to economic independence.

THE E.I.D.—PARRY GROUP, MADRAS

AY YOUR PART IN THE NATIONAL DEFENCE EFFORT

TUBE INVESTMENTS OF INDIA LIMITED

CHAIRMAN, DR. A. RAMASWAMI MUDALIAR'S SPEECH

CAPACITY OF COLD ROLLING MILL TO BE DOUBLED

SPEAKING at the Fifteenth Annual General Meeting of the Tube Investments of India Limited, held at Madras on Monday the 7th inst., Dr. A. Ramaswami Mudaliar, Chairman of the Company, said that the output of cycles during the year ended 30th September 1964 was particularly satisfactory and that the new products brought out by the subsidiary companies were well received in the market. Dr. Mudaliar revealed that approval of the Government for doubling the existing capacity of the cold rolling mill had been received and that steps were being taken to implement the sanction.

The following is the full text of Dr. Mudaliar's speech:

GENTLEMEN,

Let me extend to you a cordial welcome to the fifteenth annual general meeting of the shareholders of Tube Investments of India Limited. The Directors' report, the audited balance-sheet and the profit and loss account for the year ended 31st July 1964, have been in your hands for some time and with your permission, I shall take them as read.

During the year, the Company had to face a serious power cut which considerably affected all sections. Nevertheless, I am happy to state that owing to special efforts made by the management in the factories, the results have been better than were anticipated.

Cycles

I am glad to report that from the point of view of final output of cycles, this has been a particularly satisfactory year. The target figure was exceeded by a slight margin and, it is hoped, during the current year we shall be able to exceed even this. This forecast is subject, of course, to conditions being satisfactory regarding power supply and adequate raw materials, sufficient in quantity, and the quality upto requisite standard. Several improvements have taken place in the cycle factory to overcome the defects in indigenous raw materials.

The debrassing plant was completed early in the year and its operation has been successful. In addition to increased production of cycles, the components section has produced a fair amount of spares which is in excess of what was produced in the previous year. Both freewheels and hubs are available to the market which has received supplies to fulfil a reasonable portion of the requirements. It is hoped, subject to availability of raw materials, this supply could be increased.

Tube Products

The Directors' report refers to the increase in the production of tubes of various kinds in the factory. There are still difficulties due to the power cut and more especially to the nature of a skelp that is supplied. I referred to various handicaps which the Tube Mill suffered from, in my speech last year, particularly the cut in the import licence for essential consumable stores. There has been no great improvement in this respect during the year under review.

The question of the quality of raw materials supplied has been taken up again with the suppliers and I am glad to say that, after prolonged consultations, there is now a better understanding about our requirements by the indigenous suppliers and efforts are being made to meet our requirements. The deficiency in quality has not been completely made up and this naturally affects the quantity available for processing. Further improvements in outturn of tubes are mainly dependent on the quality of steel supplied to us and on the quantity. As we are one of the main suppliers in the country of high quality cold drawn tubes, it is extremely important that suitable raw materials should be available.

Cold Rolling Mill

The production from this mill showed some increase over the previous year's output. The demand, however, far outsteps the supply. It is proposed to expand the production and the approval of the Government having been received for doubling the existing capacity, your Board have taken steps to implement this sanction.

Metal Sections

In my speech last year, I referred to the fact that while all preliminary steps had been taken by us including selection of personnel for the special training required for this section and the erection of buildings to install the plant and machinery of the unit, Government orders for the capital goods licence had not been received. I am glad to inform you that this licence for the metal section has since been received and orders have been placed for plant and machinery both abroad and in India. The building is ready and the imported plant and machinery from abroad is expected to be received early in 1965 and will be installed in the buildings already erected.

T.I. Diamond Chain Limited

Further progress has been made in the manufacture of cycle chains. The number of bicycle chains produced in the factory has shown a satisfactory increase and we hope we will be able to export a fair quantity of chains—indicating that the quality of the product has been such that it has been possible to export the chains to Great Britain.

This factory was also constructed to produce industrial chains and I am glad to state that the chains produced have been well received in the market. Single, duplex and triplex industrial chains have been produced and our collaborators in the United States have approved these chains as being of good quality and the reception in the market has been enthusiastic.

T.I. Miller Limited

I stated last year that the production of dynamo lamps was expected to commence early in the new year. During the year under review, a reasonable quantity of lamps was produced and I consider this a satisfactory performance, when it is borne in mind that this is a completely new unit with raw labour and a limited senior staff. Certain components are in short supply, particularly magnets. The product has been put on the market and very favourably commented upon.

Collaborators

I should like to record our sincere thanks for the ready help and advice that your Company has continued to receive from our associates, Messrs. Tube Investments of the United Kingdom and other companies in their group. We have had the benefit of the advice given by the technicians and planners coming to India and examining the working of the factory. Our collaborators for the subsidiary companies have also helped us with their best advice and have placed at our disposal the latest know-how.

Board of Directors

In my speech at the thirteenth annual general meeting, I referred to certain changes that had been made in the Board of Directors and in particular to the appointment as Director of your Company, of the Rt. Hon'ble Lord Plowden, K.C.B., K.B.E., Chairman of Tube Investments of Birmingham. As was anticipated, he has been taking a keen interest in the Indian company and his experience as an administrator and industrialist has been of great value.

I also stated then that Sir Ivan Arthur Rice Stedeford, G.B.E., had expressed a desire to retire from your Board, as he would cease to be Chairman of Tube Investments of Birmingham, although he would hold the Presidentship of the parent Company. On the request of the Indian Directors, however, he acceded to their desire to continue as Directors of your Company. I have now had his approval personally to his being re-elected Director as his term of office as Director ceased during the year and I have genuine pleasure in requesting you as shareholders to elect him at this meeting as a Director.

Mr. R. D. Young who has been associated with the T. I. Cycles project in India for a long time will cease to be a Director of your Company in the course of the current year, as he has ceased to be connected with the Tube Investments of Birmingham. I cannot overestimate the interest that he took and the help that he gave to this Company during all these years. I would like, with your approval, that our deep appreciation and thanks for his contribution to the progress and success of Tube Investments of India, should be recorded. I wish Mr. Young all success in the new field in which he will be working hereafter.

Mr. B. A. Forsyth, Works Director, will be returning shortly to the United Kingdom to take up a position with the Tube Investments of Birmingham. Mr. Forsyth came to Madras in 1955 and joined the Tube Investments of India, at that time the T. I. Cycles of India, at an interesting stage of development. He has been associated with development of the cycle factory and components unit, and has latterly been supervising the chain and lamp factories. First as Works Manager and then as Works Director, he has been closely associated with the progress of the Company and has played his part in helping the standardisation of cycle parts manufactured in the country by the Indian Standards Institution. I wish to express the appreciation of the Board for the service he has rendered to the cycle industry.

Acknowledgments

We are grateful to the Government of India and to the State Government of Madras for the interest that they have shown in all the activities of the Company, for the facilities that they have extended to us and the advice they have given to us in the expansion programme.

Our relations with our employees, both officers and workers in the administrative offices and in the factory, have been cordial and I have pleasure in acknowledging with thanks, the co-operation that has been extended to us in the difficult circumstances that prevailed during the year.

Note: *This does not purport to be a record of the proceedings of the Annual General Meeting.*

W. GERMAN DELEGATION TO VISIT INDIA

A delegation of 35 leading German industrialists and bankers will be arriving in New Delhi on 16th January 1965 on a three-week visit to this country. Sponsored by the Indian Investment Centre, New Delhi, the visit has been arranged in co-operation with the Federation of German Industries (Bundesverband der Deutschen Industrie, Cologne). During their three-week stay in this country, the delegation will acquaint itself with current economic conditions in India and explore possibilities of German private investments. It will be led by Dr. Hans Kuntze of Klein Schanzlin & Becker AG, and its members have been drawn from leading German industries and banks. Dr. Hans Henckel, Ministerial Director of the Federal German Ministry of Economics, is expected to accompany the delegation. In the delegation are members whose business institutions have collaboration arrangements with about twenty Indian enterprises. The leader of the delegation himself represents a firm which has set up a joint venture in India.

The members represent a wide range of industries such as electrical engineering goods, insulation pipes and tubes, ball and roller bearings, plants and equipment for chemical, pharmaceutical and food industries, machine tools, radio and telecommunication engineering, automobiles, shipbuilding, mining and metallurgy, oil refineries, coal products, photographic equipment, textile machinery, steam boilers, submersible pumps, industrial furnaces, agricultural machinery including tractors and harvestors, banking, handicrafts and several domestic goods industries.

The delegation will begin its tour with discussions with the Government of India and then visit Bombay, Ahmedabad, Baroda, Poona, Bangalore, Madras, Coimbatore, Calcutta and Jamshedpur. At these places, they will see a cross-section of India's development projects as well as projects and industries which have come up with German collaboration. They will return to New Delhi on 2nd February to resume their discussions. A part of the delegation will leave for Germany on 6th February 1965. The others will stay on for attending the 20th Congress of the International Chambers of Commerce.

JINDAL quality steel pipes

Carriage of water, gas, and chemicals, irrigation and structural work demand quality steel pipes. Equipped with the latest imported machinery and the right technical skill at every phase of production, **Jindal** manufactures steel pipes upto 4" (100 mm.) dia. according to IS. 1239—1958 to cope with the country's growing demand for quality steel pipes.

NEW PRODUCTS AND PROCESSES

Gas from Naphtha

A DEVELOPMENT that could mean cheaper gas—it enables town gas to be produced directly from naphtha in one process instead of the usual two—is announced by the Gas Council in Britain. Called the Catalytic Rich Gas process and invented by a team of scientists at the Gas Council's research station in Warwickshire, England, it can also be used for making a methane-rich gas that can be mixed with town gas, or natural gas or for enriching to town gas standard the lean gas produced by the steam-reforming of naphtha. The process is said to have an outstandingly high degree of thermal efficiency, flexibility and simplicity of operation, and the gas it produces, is non-toxic and of high purity. Like other oil-reforming processes, it is based on the catalytic reaction between steam and hydrocarbons, but differs in that it uses a specially-developed nickel-alumina catalyst that gives the high activity needed to carry out the reaction at the relatively low temperature required for the production of methane.

Super High-tension Electron Microscope

The construction of a super-high tension electron microscope, the most powerful in Japan or probably in the world, is expected to start shortly. It is a microscope with 1 million accelerated voltage, developed by the Japan Electron Optics Laboratory Company, Ltd. at a cost of some 100 million yen and is expected to be completed by the summer of 1966. This electron microscope consist of the power source, high-tension generating device, accelerator tubes, mirror and control system. It is 6m. high and weighs about 5 tons, but has accessories weighing 10 tons. As for its performance, it will develop accelerated voltage of 1 million volts, will have one million magnifications and an analyzing capacity of 10 angstrom. As the action of the microscope is accelerated at a super-high voltage of 1 million volts, the transmittance of electron ray is 9 micron in terms of stainless steel. So far, the penetrating power limit of the electron microscope has been 0.5 microns. The penetrability of the microscope is so great that it will be possible to examine a living specimen wrapped in film. In the past samples had to be observed in a near vacuum, and so all the specimens were dead ones. Thus the completion of this microscope is expected to revolutionise electronics studies, metallurgy, biology and medicine, which have put up a barrier to the use of the electron microscope.

Cold Cleaner for Metals

A cold cleaner, designed to make hot cleaning of metal unnecessary in many operations, is being produced by Electro-Chemical Engineering Company Ltd., Sheerwater, Woking, Surrey, England. It is a medium-to-heavy-duty alkaline cleaner, especially formulated for operation at room temperature. It is intended for application by spray or immersion-type machines and has proved to be suitable for all types of metals. It has been estimated that savings of up to 75 per cent of the cost of running a cleaning machine can be achieved through the elimination of the need for heating. In addition, up to 25 per cent of the cost of installing a machine is spent on the heating and fume extraction equipment, both of which can now be significantly reduced. The cleaner is particularly, effective for the removal of cutting fluids, mineral oils and greases, swarf and general shop soil, and is being used extensively for the treatment of engine and machined components during manufacturing stages.

Coupling for Welding Cables

A Dutch hardware factory J. H. Hanekamp & Zn., Zuiderdiep, 146, Groningen (Holland), has introduced a patented coupling for welding cables, by which a connection can be made with the turn of a hand. The coupling consists of two heavy copper parts which fit into each other conically. The part with the cone has at the top a T-shaped bolt; the part with the conical recess, has at the bottom an oblong slot through which this T-bolt can pass. To effect the connection, the two parts are pressed together in such a way that the cross-piece of the T-bolt slides through the slot. Next, one part is given a quarter turn in relation to the other. The T-bolt of one part then engages the bottom of the other and, after closure, the cables to be connected lie end to end. The T-bolt passes through a square hole in the top of the cone and is secured at the back by means of a spring washer and a lock nut. This spring washer has the effect of pressing the two elements of the coupling together with a constant force. Owing to the conical shape of the two parts of the coupling, the contact surfaces are large, thus ensuring good current flow. As the parts turn in a flat lane no torsion can be created in the welding cables. Both parts are enclosed in thick rubber insulating sleeves so that, from the outside, no contact is possible with the live parts of the coupling. The insulating sleeves also house the connections for the cables, each half containing a cylinder, a tapered pin and a connecting bolt for 35, 50 or 70 mm. cable. As all components are replaceable, the coupling has a long service life.

Electric Blankets

Electric blankets heated by tubes of warm water instead of resistance wires are being made by Fieldcrest Mills, of Spray, North Carolina. They are said to be safer and longer lasting than purely electric ones. The water is electrically heated in a box-shaped container to a lukewarm temperature. The warm water then circulates through tiny plastic tubes woven into the b anket. The blanket is completely safe for children, because, even if they chew it, there are no wires carrying electricity. It can be washed in a washing machine and the tubes are said to be more resistant to breakage than fine wire. A thermostat controls the temperature of the water, which has to be replenished a few times each winter.

Leak Detector

A liquid for detecting leaks, large or small, in any kind of gas pipe or container has been developed by Industrial (Anti-Corrosion) Services, 138 High Street, Waltham Cross, Hertfordshire, England. It is slow-drying, slightly viscous, water-soluble and non-corrosive, and can be applied with a brush. It is harmless to the skin and can be used on hot surfaces. A very small leak of low pressure shows as a bubble and a large leak, or where the pressure is high, as a foam of bubbles.

World Timer

K. Hattori & Co., Ltd. in Japan has manufactured the "Seiko Crown Chronograph," a new wrist watch with a stop watch, and the "Seiko Worldtime," a wrist watch which indicates the time at 26 major cities of the world. The "Seiko Crown Chronograph" is so designed that the second hand will be switched into the stop watch hand the moment a button is pushed. It is set with 21 jewels and is water-proof. The "Worldtime" is so designed that the time in the world's major cities will be indicated by a special hand which is set in accordance with a city marked outside the face. It is automatic and water-proof.

Car-door Opener

A device which opens and closes the doors of cars and commercial vehicles has been patented by Ikegami Kogyo K.K. 176 Ikegami-Shinden, Kawasaki-City, Japan. It uses the suction in the inlet manifold of the vehicle as the source of power and consists simply of a cylinder and piston connected to the manifold and the door. It is operated by a switch on the dashboard and is suitable for the medium and lower-priced car ranges. It can also be used for opening and closing the back doors of commercial vehicles.

Silicone Transistor

Hitachi Ltd. of Tokyo, Japan, has announced a new, minute PM-type *Silicone transistor* having a wide range of applications. The new transistor has been developed by Hitachi's own technology; it is made by covering completely the surface of the elementary particle of ordinary transistor with oxidized silicone film (0.6 micron thick). It has a greater electric current amplifying rate in the low tension current area than the ordinary X-type transistor, and it has a higher anti-pressure rate. Moreover, it has a considerably high reliability, which is the life of the transistor. It can be used in electronic computers, regulators, communications equipment and industrial instruments. It can also be used side by side with electron tubes, and can be used in the transceiver and Hi-Fi device as well. Hitachi is scheduled to produce this silicone transistors soon at a rate of some 50,000 a month.

New Cardboard

The Ligna Foreign Trade Corporation of Czechoslovakia is introducing a new kind of cardboard which is suitable for technical application. It is a specially adapted cardboard capable of withstanding temperatures and therefore suitable for electrical machines. The new cardboard is resistant to normal solvents, gasoline, xylene, etc. The cardboard is delivered in rolls of 15 to 17 cm in diameter, 100 m long (50 sq.m.)

Synchroniser for Power Plants

A small transistorised synchronising unit that considerably reduces the element of human error in the control of power plant, has been introduced by British Electrical Eng. Co. Ltd., England. The synchroniser, an 11-in. cube-shaped device, can be easily and quickly connected. It is intended for installations where manual synchronising is the normal practice, and its purpose is to prevent bad synchronisation between an alternator and the generating system into which it is being introduced. The synchroniser senses differences in frequency and voltage between the busbars and the incoming alternator and, if they are within preset limits, permits breaker closure within 10 degrees of phase coincidence. It can also be used semi-automatically to close the breaker at the correct instant after speed and voltage matching has been carried out manually. A plug and socket adjustment enables the acceptable voltage mismatch to be set in steps of 2 per cent. The maximum difference in frequency can also be adjusted in settings of one cycle in eight seconds, one in 12 and one in 16.

Continuous Roasting of Coffee Beans

A continuous method of roasting coffee beans, which is claimed to increase yield, flavour and aroma, has been patented by Hans Osswald, 16 Kreuzplatz, Zurich, Switzerland. The beans are subjected to indirect cooling through the walls of a drum after they have been roasted in an adjacent drum—the transfer from roasting drum to cooling drum being continuous. The beans are kept under hermetic seal throughout the cooling stage.

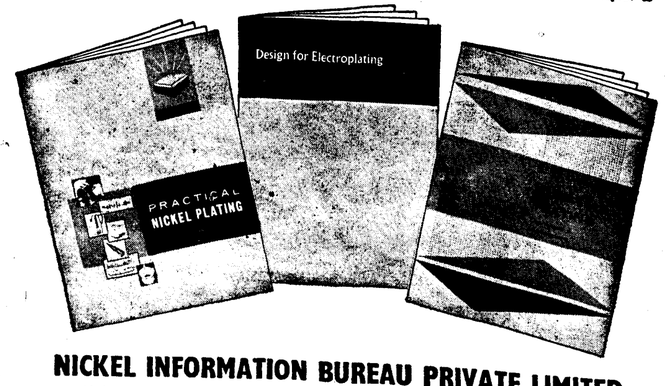
MANUFACTURERS DO YOU KNOW THE MEANING OF

IS 1068-1958?

IS 1068:1958 is the Indian Standards Specification covering nickel-chromium plating, and is the first step towards quality control. A strict observance of recognised standards of nickel plating will guarantee satisfied customers and repeat sales, both at home and abroad. Do your own products conform to these standards?

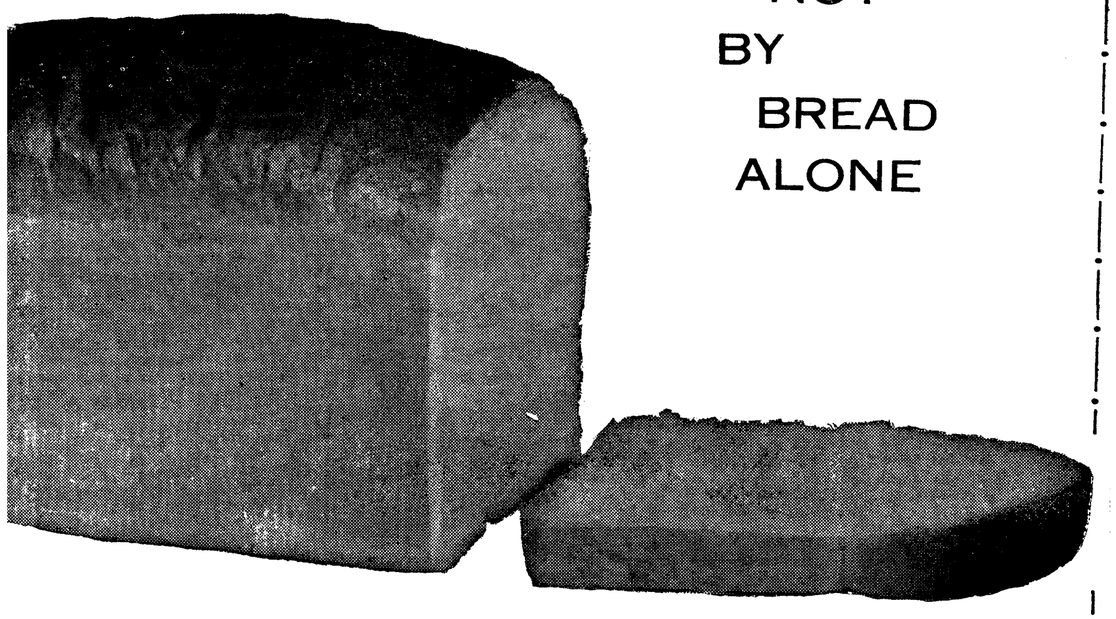
Ask yourself these questions. Is the product properly designed to make the most of nickel chromium plating? Is the thickness of the plating suitable for the type of job the product is expected to do? How can the thickness of plating be checked without damaging the plated surface?

The answers to these questions and many others can be found in the pages of these booklets. Write today for your free copies to



NICKEL INFORMATION BUREAU PRIVATE LIMITED

United Bank of India Building, 25 Pherozshah Mehta Road, Fort, Bombay 1-BR.



We need food in increasing quantities—food to feed India's teeming millions. Yes, food is today perhaps the most vital of our needs, but we cannot live by bread alone. Other things too are needed just as pressingly—things like shelter, clothing, education and medical care.

The extent to which these basic needs of our people can be met depends, to no small extent, on the means of transport at our disposal.

To move land produce from the fields to the markets, to distribute food supplies to the points of consumption, to rush grain to deficit areas, motor trucks provide the quickest and most economical mode of transport.

Stacks of bricks, ascending scaffoldings, trucks carrying building materials are familiar sights everywhere. All these testify to the country's growing building activities. And as the drive to provide shelter to everyone gathers momentum, motor trucks are called upon to carry more loads of materials.

Likewise, in order to provide adequate clothing to our masses, textile mills depend on motor transport as an adjunct to our over-taxed railways to carry their raw materials, their work force and their finished products.

In the field of education, we will require school buses in ever-increasing numbers to transport the students of tomorrow to schools and colleges.

To provide improved medical care on a national basis, adequate road transport facilities are indispensable. The establishment of thousands of new hospitals and dispensaries, the training of thousands of additional doctors, the expansion of pharmaceutical production depend largely on the development of an efficient system of motorized transportation.

ASP/HM-94

POWERLOOM ENQUIRY COMMITTEE'S RECOMMENDATIONS

REACTIONS OF MILLOWNERS

QUOTING facts and figures, the Indian Cotton Mills' Federation has shown, in a communication addressed to the Commerce Ministry of Government of India last week, that, if the recommendations of the Asoka Mehta Committee on powerlooms were implemented, the worst sufferers would be the consumers, the Exchequer and the export trade of India. The Federation's contention is that only the handlooms, because of their large employment potential, should be given special treatment *vis-a-vis* the cotton mills and that powerlooms should not in any way be sheltered from the competition of mills. The following is the full text of the Federation's representation to the Government:

The Committee of the Federation have gone carefully through the Report of the Powerloom Enquiry Committee with particular reference to that Committee's main recommendation, namely, that, during the fourth Plan period, there should be no further expansion of the capacity of the cotton mill industry beyond the marginal expansion permitted towards the end of last year and that the additional production of 1,500 million yards of cloth for the fourth Plan should be assigned entirely to the powerloom sector. It is the considered view of the Committee of the Federation that this recommendation is not calculated to serve the interests of the consumer, the public exchequer, labour and export earnings.

Brief Exceeded

At the outset, the Committee wish to point out that the Powerloom Committee was appointed by Government to ascertain the reasons for the phenomenal growth in recent years of the powerloom sector, to consider the relative role of powerlooms in the production of cloth and to examine the desirability and scope for converting handlooms into powerloom co-operatives. Subsequently, in response to a query from the Powerloom Enquiry Committee, the Government, we are told, informed the Committee that, as may be considered necessary, it might touch the question of capacities of handlooms, powerlooms and the mill sector. The Enquiry Committee appear to have interpreted this too liberally and in doing so, have perhaps assumed for themselves, a role which properly belongs to the Planning Commission. If it was the Government's intention to entrust to the Enquiry Committee the task of apportioning targets of production between the three sectors of the industry, the mill industry ought to have been and would have been given—official representation on that Committee. Apart, therefore, from our belief that the Enquiry Committee have travelled far beyond the scope of work allotted to them, we submit that, in the absence of a proper and balanced perspective which the Committee would have been able to take with the inclusion of the mill industry's representatives, the recommendation of the Committee suggesting a freeze on the mill sector has lost all value and must, in fairness to the mill sector, be complete'y ignored. However, just to complete the record, we proceed to show how even on merits the recommendation cannot stand any scrutiny.

In making its recommendation, the Powerloom Enquiry Committee have been actuated by the belief that powerlooms represent the dispersal of entrepreneurship and mobilisation of capital in the dispersed areas. The Committee themselves have pointed out how the powerloom sector cannot function in the rural areas and why the powerlooms must be located in and around towns. Today, the bulk of the powerlooms are concentrated in urban areas and since this also is to be the future pattern for the powerloom sector, it is difficult to understand how this brings about mobilisation of capital in dispersed areas.

Turning to dispersal of entrepreneurship, according to the Enquiry Committee, 70,000 additional powerlooms should be installed, 10,000 in the current plan and 60,000 in the fourth Plan. The Enquiry Committee have expressed their inclination to agree with the technical opinion placed before them that the economic size in the medium range of powerloom establishments should be between 24 and 36 looms Ignoring, therefore the existing widespread binami ownership and assuming that the additional powerlooms will be in units of 24 to 36, the number of new entrepreneurs that will be added over the next 5 to 7 years, will be just around 2,500. Even if the ownership is split up to as low a figure as 5 powerlooms on an average, the maximum number of new entrepreneurs that can be added over the next 5 to 7 years will be 14,000, that is to say, an average of 2 to 2½ thousand per annum. One must consider the price that the country will have to pay for achieving the social and economic gain arising from the addition of so many new entrepreneurs.

Loss to Consumer

The Enquiry Committee's Report itself concedes that the quality of the powerloom cloth is low. It cannot be otherwise, because the powerloom sector uses inferior technology and cannot afford the services of qualified technicians. Thus, the entire population will be made to pay a higher price for the inferior cloth produced by the powerloom sector.

Further, the wide fluctuations witnessed from year to year in the price and supply position of textiles which create great difficulties for the consumer, the industry and the authorities, are, in no small measure, due to the activities of the powerloom sector. The powerloom cloth being indistinguishable from mill cloth, one can easily pass for the other. The powerloom cloth not being amenable to control, in times of scarcity, the task of the authorities to enforce price controls on mill cloth is thus made extremely difficult. When, however, the supply is plentiful, with lack of holding capacity, powerloom cloth is thrown on the market at any price, creating distress conditions for all sectors. As both the production and the prices of the mill sector are amenable to regulation, if the consumers' supplies came principally from the mill sector, it would be possible to regulate production according to the exigencies of the consumer demand and to minimise the privations suffered due to alternating situations of scarcity and glut of supplies experienced at present.

Loss to the Exchequer

As a result of the existing differential rate of excise duty, the public exchequer to-day loses nearly Rs. 52 crores in respect of 2,000 million yards of cloth now produced by powerlooms (details of this calculation are given in the annexure to this memorandum). If, as recommended by the Enquiry Committee, the powerlooms begin to produce another 1,500 million yards, the loss on a proportionate basis will be another Rs. 39 crores per annum (*vide* the note at the end) taking the total loss to the exchequer to Rs. 91 crores per annum. It is true that the Enquiry Committee have suggested the shifting of the incidence of excise duty to the two key points, namely, yarn and processing. But at the same time they have recommended that the powerloom sector should enjoy a privileged position insofar as the excise duty on fabrics is concerned. The Enquiry Committee have not mentioned any figures, but, since they want the powerloom sector to pay a smaller amount of duty than the mill sector, the exchequer will stand to lose crores of rupees of revenue, which otherwise, it could have obtained from so much additional production of mill cloth, without placing any extra burden on the consumer. Indirectly, it will mean a subsidy from the Central revenues to cover the technological and marketing disability of the powerloom sector. There will, however, be no compensating benefit, as in the case of handlooms, of providing employment on a large scale.

Loss in Exports

Because of its inferior quality and high prices, there can be little hope of exporting powerloom cloth. The establishment of new mills or expansion of existing mills with modern machinery to generate the additional production would not only mean a rise in the export potential but also a rise in the level of efficiency of the mill sector and improvement in its competitive capacity in the international markets.

Loss to Workers

As the Enquiry Committee have themselves admitted, a powerloom weaver earns on an average Rs. 86 per month, against a mill weaver's average earning of Rs. 175 per month. The monthly production per loom-shift in the mill sector is around 1,100 yards per loom. The monthly production of a two-loom weaver will thus be 2,200 yards which fetches him a wage of Rs. 175 and this is equivalent to 8 P. per yard. A powerloom weaver whose average monthly wage is said to be Rs. 86 hardly earns 4 P. per yard and thus every yard produced in the powerloom sector means a loss of over 4 P. to labour. If, therefore, the powerloom sector gives an additional production of 1,500 million yards as proposed, the annual loss to labour will be Rs. 6 crores.

Apart from this monetary loss, the powerloom weaver also does not enjoy the benefits of the factory and social security legislation which is applied to the mill sector. Furthermore, he is required to work for long hours in unhealthy surroundings.

Conclusion

Summarising the above discussion, the conclusion that emerges is that to achieve the supposed social and economic gain arising from an addition of, at the most, 2 to 2½ thousand entrepreneurs per annum, the price that the country will have to pay will be: (*a*) payment by the entire population of a higher price for inferior cloth; (*b*) loss to the Central Exchequer which, at the current rates of excise duty, amounts to Rs. 39 crores per annum (in addition to Rs. 52 crores per annum already being lost on the current rate of powerloom production); (*c*) loss of export potential and of the opportunity to raise the general level of efficiency of the exporting sector; and (*d*) loss to the working population of Rs. 6 crores apart from workers being required to work in unhygenic and disagreeable working conditions.

No Inhibition Should Be Placed

The Committee of the Federation submit that the objective of the country's textile policies should be: (*i*) to make available to the consumer progressively better quality of cloth at increasingly lower prices and (*ii*) to strengthen the export potential of the country. In the absence of such a well-defined policy, the country's cotton textile problems are being handled as they arise, on an *ad hoc* basis and this practice has resulted in avoidable privation to the consumer and loss in the export potential. A policy, which accords due supremacy to the interests of the consumer and export earnings can be promoted effectively only if the different cotton cloth producing sectors are allowed to expand without any inhibition and on their own merits. It will be conceded that, because of its high employment potential, the handloom sector is entitled to fiscal concessions. But so far as the mill sector and the powerloom sector are concerned, there should be no differentiation between the two, which means that neither of these sectors should have the privilege of an excise duty differential or any other fiscal concession.

In such a climate of uninhibited and at the same time unprivilege expansion, it is obvious that that sector alone will grow which serves the consumer interest best. The Committee of the Federation wish to point out, in this connection, that, even before the policy of favouring the powerloom sector in respect of the excise duty was introduced, that sector had come into being and by 1942 had assumed such proportions that the Fact Finding Committee which reported in that year was constrained to warn the Government that "a more serious rival to the handloom industry than the mills had arisen in the small-scale powerloom factory."

Incidentally, we would like to invite Government's attention to the experience of the last two or three decades. If the weaving capacity of the mill sector had not been frozen at the level of two lakh looms for as long as 25 years, today's picture of the textile situation would probably have been very much different. Addition of modern equipment on the weaving side, which normal growth would have brought about in the period of the last 25 years, would have made mills more competitive. The mill sector would probably have been exporting much more and also supplying the domestic requirements on a much larger scale thus avoiding so many of the present complications.

Handlooms Not Benefited

The mill industry was made to suffer from stagnation on the weaving side in the name of encouragement for the handloom sector. Actually, however, the Government's policy has resulted not in any benefit to the handloom sector, but in the mushrooming of the powerloom sector. Now in the name of encouraging and promoting the powerloom sector, it has been recommended that the capacity of

OBJECTS, PROPOSED ACTIVITIES AND LOCATION OF INDUSTRY

The main objects of the Company are as set out in the Memorandum of Association and include, *inter alia*, the following: to carry on business as manufacturers of and dealers in polyvinyl chloride, polyvinyl dichloride and other chemicals and products of a like nature or otherwise; and also to carry on business as manufacturers and dealers in all other chemicals, plastics/petro-chemicals, oils, paints, pigments and varnishes and in any similar or allied business and either in connection with the said business or as a distinct or separate business; to carry on business as distillers, gas makers, smelters, metallurgists and chemical engineers, manufacturers and dealers in rubber and rubber products, textiles, nylon, rayon and materials of all descriptions connected with the foregoing; to manufacture, deal in and manipulate P.V.C bases into electrical wires, leather cloths, lining material and as films, sheets and pipes for general use and for construction material; to construct, maintain and alter any chemical and industrial plants, buildings or works.

The Company has been formed with the object of setting up a factory at Mettur, Madras State, for the manufacture of polyvinyl chloride (P.V.C.) and other chemicals and products which may be usefully or conveniently combined with or derived from the same and another factory near Bombay in Maharashtra State for fabricating P.V.C. pipes, fittings, other extrusions and mouldings (both rigid and flexible). The Company has entered into a Technical Service Agreement for a period of ten years in the first instance with the B. F. Goodrich Company of Akron, Ohio, United States of America (Goodrich), the largest producer of polyvinyl chloride in the world. Goodrich will provide the Company all technical information, know-how, and data and the Company will be licensed to use in India the relevant patents of Goodrich. Goodrich will assist the Company in planning the layout of the factories and provide drawings, designs, blueprints and specifications for the plant, machinery and equipment for the setting up of the factories, besides procuring for the Company trained and competent engineers and technicians and providing in its plants in the U.S.A. training facilities for the Company's technical personnel. It is expected that the factory will go into production before the end of 1966.

APPLICATIONS

Copies of Application Forms and Prospectus can be obtained from the Company's Registered Office, from any of the abovementioned Underwriters, Brokers and Bankers to the issue named in the Prospectus or any of their main branches at the addresses given in the Prospectus.

THE SUBSCRIPTION LIST WILL OPEN AT THE COMMENCEMENT OF BANKING HOURS ON 16th DECEMBER 1964 AND WILL REMAIN OPEN UNTIL THE CLOSING OF BANKING HOURS ON 24th DECEMBER 1964 UNLESS CLOSED EARLIER OR LATER AT THE DISCRETION OF THE DIRECTORS BUT NOT BEFORE 18th DECEMBER 1964.

PARRYS CONFECTIONERY LIMITED

SHORTAGE AND HIGH COST OF RAW MATERIALS MAIN PROBLEMS, SAYS CHAIRMAN, MR. H. V. R. IENGAR

HIGHER PRODUCTION COSTS HINDERING EXPORTS

THE Annual General Meeting of Parrys Confectionery Limited will be held at Madras on Thursday, 31st December 1964. In his statement to the shareholders circulated in advance, Mr. H. V. R. Iengar, Chairman of the Company, states that, though trading conditions in the eighteen months ended 30th September 1964 were favourable, the supply position of the main raw materials presented considerable difficulties and that these still persist. Apart from the shortage of raw materials, their prices are continually rising, with no prospect of a fall in the near future, according to Mr. Iengar. The consequent higher production costs are hindering the building up of a large volume of exports. The following is the full text of Mr. Iengar's statement:

Since we last met, the country has suffered an irreparable loss in the death of Jawaharlal Nehru. Millions of words have been written about him—his courage and sacrifice, his intense patriotism, his humanism, and his contribution to world peace. I am sure shareholders would wish to have recorded, in this statement, their grief at his passing away and their determination, in so far as they are concerned, to see that they make such contribution as they can to the carrying on of the great work which he launched as the first Prime Minister of India.

Accounts

Shareholders are aware that the year-end of the Company has been changed from 31st March to 30th September and the report and accounts which have been in your hands for the statutory period, relate to the eighteen-month period 1st April 1963 to 30th September 1964, whereas the comparative figures of the previous year reflect the results of the twelve months to 31st March 1963. As indicated in the Directors' report, the sales for the period under review were higher by Rs. 50 lakhs over the corresponding eighteen months ended 31st March 1963.

Profit

The net profit before taxation for the period under review is Rs. 21,82,374. Provision for taxation including the surtax of Rs. 2,81,000 amounts to Rs. 14,71,180 leaving available for appropriations, together with a small balance of Rs. 2,705 brought forward from the previous year, a sum of Rs. 7,13,899. Out of this sum, the statutory transfer to development rebate reserve, and the two interim dividends totalling 18 per cent have absorbed Rs. 3,70,000 leaving available Rs. 3,43,899 for the final dividend. The Directors have recommended payment of a final dividend at the rate of 9 per cent amounting to Rs. 1,80,000 and transfer of a sum of Rs. 1,60,000 to general reserve, leaving a small surplus of Rs. 3,899 to be carried forward. The total of dividends paid and proposed for the eighteen-month period under review amount to 27 per cent or 18 per cent per annum, that is, an increase of 2 per cent over the previous year. In the context of the need to conserve resources for rehabilitation of plant and machinery and strengthen the reserves in order to reduce the high incidence of surtax, the total dividend for the period should be considered satisfactory.

Sales Turnover

Shareholders will have noted from the report of the Directors that the sales turnover of Rs. 2·77 crores was the highest achieved so far, the increase over the eighteen months ended 31st March 1963 being 22 per cent in value and 25 per cent by volume. The upward trend of sales was maintained everywhere which is proof of the growing popularity of your products throughout the country.

Raw Materials and Rising Costs

Although, during the period under review, trading conditions were on the whole favourable, the supply position of the main raw materials presented considerable difficulties and I am sorry to say that these continue to persist. Consequent on the imposition of control in April 1963, releases of sugar for confectionery manufacture have been strictly controlled by Government. Other essential raw materials like milk powder and condensed milk are not available in the quantities we require, owing to the diversion of the bulk of the indigenous production for Defence needs. Apart from the short supply of these raw materials, their prices are continually rising, with no prospect of a fall in the near future. The recent increase in the price of sugar is another factor that has enhanced the cost. Our selling prices have had to be increased from time to time in an endeavour to absorb some of these increases, but, for a commodity like sweets, it is clearly undesirable to go beyond the limit at which consumer resistance is likely to affect the offtake.

Rehabilitation

In my statement circulated with the last year's accounts, I referred to the difficulty your Company was facing in obtaining machinery for replacement and rehabilitation. I am glad to inform you that during the period under review your Company successfully negotiated the purchase of the Manjula Confectionery Limited's machinery for replacement of some of of our old units which have reached the end of their useful life. This machinery had been very little used, had been well maintained and was in very good condition at the time of purchase. It was available for purchase as the Manjula Confectionery Limited discontinued the manufacture of sweets. Whilst these and other additions to machinery will help replacement and modernisation of our plant, there is still a considerable imbalance between the sweet making and wrapping capacity. If your Company is to maintain its present rate of growth in the home market and play an effective role in developing exports, further additions, particularly of wrapping machines, are essential. The long-term prospect, therefore, depends largely on your Company's ability to overcome the twin problems of raw material shortage and procurement of machinery to sustain a satisfactory rate of sales growth.

Exports

Your Company exported during the period under review sweets valued at Rs. 1.31 lakhs. Surveys made by the Company's Executives in the Far East, Middle East and East African markets, reveal that a considerable export potential exits, but it is difficult to achieve a satisfactory volume of exports in competition with other exporting countries, because of our higher production costs. The reasons for the wide disparity in prices between the foreign and Indian manufacturer have been brought to the attention of Government from time to time, but, until substantial assistance such as supply of sugar and glucose at international prices and liberalisation of imports of other essential raw materials is forthcoming, it is impossible to build up a large volume of exports. I would, therefore, urge Government to view these problems of the industry more sympathetically and extend the necessary help for the development of exports.

During the year under review our relations with the staff and labour have been most cordial and I take this opportunity to record our sincere appreciation of the good work done by them.

Note: The above statement is not a report of the proceedings of the Annual General Meeting, which will be held on the 31st December, 1964.

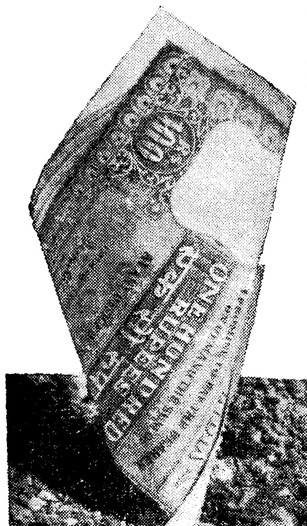
ASP/LIC/PR-2

LIC PLANTS THE MONEY

L.I.C. sows saplings into the economic soil of the country. Saplings which will grow into a rich harvest of prosperity tomorrow.

L.I.C. invests nearly 3 million rupees a day in industry, agriculture, railways, transport, electricity and many other projects. The growth effect of these investments creates more jobs, more incomes, more food—in fact, a higher standard of living for everybody.

Remember, when you insure or are already a policyholder, your premiums are helping in two ways. Firstly in protecting yourself and your family, and secondly in helping to improve economic conditions for the country at large.



Some LIC Investments at a glance

Plantations	Rs. 240 lakhs
Rubber Products	Rs. 253 lakhs
Coal	Rs. 316 lakhs
Dyes, Chemicals & Pharmaceuticals	Rs. 323 lakhs
Banks	Rs. 462 lakhs
Cotton Textiles	Rs. 1,216 lakhs

LIC—YOUR COMPANION IN PROGRESS

INDIA AND COMMONWEALTH TRADE

EXPORTS RISE, WHILE IMPORTS DECLINE

WHAT are the prospects for Commonwealth trade? And can India hope to share fully in the expansion of international trade as a member of the Commonwealth? These are questions on which a lively debate has been going on for some time in India as well as outside. While the answer to the second question lies largely in the competitive capacity of India's export products in world markets, there are three different views on the first question. Some are very optimistic about a substantial expansion of Commonwealth trade in the coming years, while some others are very pessimistic about such prospects and, actually, they feel that trade will go on shrinking as each year passes. In between these two extreme views, there is a section of opinion according to which the possibilities of markedly increasing Commonwealth trade may not be high, but it would be wrong to say categorically that there is no scope at all for any further growth. By and large, however, one may expect that the Commonwealth as a whole will share fully in the expansion of international trade. That this expectation is a reasonable one will be evident from the interesting review of the Commonwealth trade in the past few years, published recently by the Commonwealth Economic Committee (Marlborough House, Pall Mall, London S.W.1. Price: 7*s.* 6*d.*)

Between 1959 and 1963, total Commonwealth trade in each direction increased by about a fifth in value; in actual figures, exports rose by £1,940 million and imports by £1,975 million. Taking the year 1963 alone, the Commonwealth countries accounted for about 23 per cent of the aggregate world exports of merchandise (*vide* Table A). A considerable portion of Commonwealth exports consisted, as usual, of primary commodities, and exports from most individual countries were higher in 1963 than in 1962. The growth rate (year on year) was around 15 per cent for India, Australia, New Zealand, Hong Kong and Nigeria, and much higher for Uganda and Tanganyika. The U.K. was slightly below the 8 per cent world average growth rate for exports, while Canada was slightly above.

Two Striking Features

The past five years have witnessed two striking features in Commonwealth trade. One is that, just as the economies of Commonwealth countries have expanded and grown more sophisticated, so also their export markets and sources of supply have become more diverse. Consequently, the growth of trade among Commonwealth countries has been outpaced by that of trade with other countries, though, in 1963, Commonwealth countries sold about 31 per cent of their exports and bought about 30 per cent of their imports within the Commonwealth (*vide* Table B). The second striking feature is that the trade of a number of Commonwealth countries has become more regionalised. For example, the trade of Australia and New Zealand with each other and with Far Eastern countries and the U.S. has become of greater importance now than before. On the other hand, most of the rise in U.K. exports was concentrated in Western Europe, especially the Common Market and the E.F.T.A. Although trade between the U.K. and other Commonwealth countries, accounting as it does for about three-quarters of all intra-Commonwealth trade, grew less rapidly than both the trade of Commonwealth with the outside world and the mutual trade of Commonwealth countries other than the U.K., the U.K. remained the major market for, and the supplier to, the Commonwealth. Table C depicts in summary form the trade of Commonwealth countries with each other and with their main non-Commonwealth trading partners, the figures in brackets giving the share of India.

Primary Products Exports

Primary products, as already stated, account for a considerable part of Commonwealth exports. There was an appreciable rise in exports of foodstuffs, the rise in the case of wheat and wheat flour alone being of the order of £60 million, thanks to large-scale buying by China, Russia and East European countries from Australia and Canada. Higher prices and an increase in shipments from most countries, particularly to the U.S., resulted in a very large rise in the value of Commonwealth sugar exports. A marked expansion in Australian and New Zealand sales to the U.S. led to a continuation in the upward trend of meat exports, and the value of dairy produce exports recovered further and were back to about the 1960 level. While small increases were recorded in Commonwealth earnings from coffee and tea, there was little change in those from cocoa, since the value of sales by Ghana were unchanged as compared with 1962 and the decline in those of Nigeria was offset by gains by other suppliers.

Other Items

Commonwealth exports of non-metallic crude materials rose substantially in value during 1963. Higher prices for wool led to a marked increase in Commonwealth earnings from this commodity. Cotton also contributed a greater amount. Largely because of higher shipments from Canada, Commonwealth receipts from wood and wood pulp exceeded the 1962 figures. On the other hand, for the third year in succession, returns from rubber fell, chiefly because of lower earnings by Malaysia. The value of oilseeds exports showed little change in 1963. The value of exports of metal ores and base metals was appreciably higher than in 1962, much of the increase being due to a rise in sales of iron ore by Canada and India. Exports of iron and steel also rose in value, the increases for Canada and the U.K. more than offsetting the decline in Australian and Indian sales. Notwithstanding a reduction in cotton and jute fabrics, the value of total textile manufactures from Commonwealth countries increased as compared with 1962 and, mainly because of greater shipments from Hong Kong, so did those of clothing. Commonwealth exports of machinery and transport equipment as a group showed a large rise in value during 1963. Electrical machinery, appliances and apparatus accounted for much of the expansion following greater sales by the U.K. and Canada, and these two countries provided most of the large growth for transport equipment during 1963.

Although exports from most Commonwealth countries increased during 1963, many of them continued to show substantial deficits on merchandise trade, as a result of the persistently heavy imports. About half of the increase in the total Commonwealth imports in 1963 was due to higher payments for imports into the U.K. and rise in imports into Australia, Canada and Pakistan. New Zealand imports more than recovered from the decline of 1962 and the upward trend of Hong Kong imports continued. Imports into Malaysia, however, fell considerably, while those into India showed a slight decline. There was an appreciable drop in purchases by Ceylon which were at the lowest level for many years, as were those of Rhodesia and Nyasaland.

Imports

An analysis of Commonwealth imports by major commodity classes shows that the bulk of Commonwealth imports was in manufactured goods, with all categories sharing in the growth. The increase was particularly marked in respect of Commonwealth imports was in manufactures, upward trend in the value of machinery imports persisted in 1963, and there was a recovery in the prices of a number of crude materials such as wool and wood pulp.

Since imports exceeded exports, several countries showed substantial deficits in 1963. The U.K. deficit, which had declined during the years 1931 and 1932, rose appreciably in 1963, though it was still about 70 per cent of the 1960 level. With reduced imports and increased exports, the Indian deficit was reduced sizably, while, in the case of Pakistan, the increase in exports, which far outweighed that in imports, led to a marked rise in the overall deficit. The surplus of Australia and Canada were substantially greater in 1963 than in 1962, but that of New Zealand dropped.

Region-wise Trade

The downward trend in world prices of primary products was checked in 1963 by an upward movement caused partly by economic expansion in the U.S. and the U.K. and partly by exceptional conditions in certain commodity markets, notably those for sugar, wool and meat. However, except for those countries relying heavily on exports of sugar, the terms of trade for most of the developing Commonwealth countries continued to decline.

The total value of imports for consumption in the U.S. was almost 5 per cent above the corresponding 1962 figure and, with supplies from Commonwealth countries increasing by around 6 per cent, the Commonwealth continued to provide 33 per cent of the total. From the Commonwealth viewpoint, the U.S. accounted for over a fifth of total Commonwealth exports. In 1962, the rise in U.S. imports was largely confined to industrial materials and foodstuffs. In 1963, however, the increase was principally in manufactured goods. Consequently, the experience of individual Commonwealth countries in the U.S. market varied, but most of them, with the notable exceptions of Ghana and Malaysia, increased the value of their exports to the U.S.

The European Economic Community continued to receive 15 per cent of Commonwealth exports in 1963, and this represented about 12 per cent of the total imports into the six countries and 19 per cent of those from countries outside the E.E.C. The Commonwealth contributed fully to the further rise in imports into

(*Continued on page 1049*)

INSURANCE BUSINESS IN BRITAIN

IMPRESSIVE GROWTH IN THE PAST TEN YEARS

INSURANCE business by British companies has grown at a fast rate during the last few years. The net premiums advanced from £981 million a decade back to more than double at £2,075 million in 1963—a record figure. The rise has been particularly remarkable in motor and accident business and life insurance. The net premium for motor and accident policies increased during the decade by 136 per cent to £680 million and for life insurance by 134 per cent to £984 million. As compared with the previous year, the total net premium was higher by 9.1 per cent or £173 million. There was an improvement in all the various branches of insurance, but, in the case of motor insurance, the rise was 13.1 per cent and for life insurance 12.3 per cent.

The impressive rise in the business of British insurance in the past decade is a remarkable achievement, especially as it took place in spite of the fact that the climate of international insurance (in which Britain has a substantial share) was more unsettled than at any other time, and the competition was growing, both in the long-existing and new markets. Moreover, as the developing countries are short of foreign exchange, they regard the premiums paid to foreign insurers as an unnecessary loss of foreign exchange, and many of these countries have passed restrictive legislation, retarding the growth of overseas business of British insurers.

Fire and Motor Insurance

Although the business has expanded at a fast pace, the profitability has not behaved favourably, mainly due to heavy underwriting losses. These losses were, amounting to £43 million, exceptionally high last year in the case of fire and accident insurance—due mainly to bad weather conditions. Fire damages alone resulted in a loss of £66.5 million last year. The estimate for the first ten months of the current year is £57.6 million—about two per cent higher than the loss during the corresponding period of last year—and is estimated to reach £68 million by this year-end. This is almost three times the loss six years back. These figures include both insured and uninsured damage, the insured part of it being considerably large. It was, therefore, inevitable for the insurance companies to combat these losses by raising the rates of premium. As an interim measure, a 15 per cent surcharge for all commercial and industrial fire risks was introduced from 1st December 1963. In the meantime, the Fire Offices Committee undertook a comprehensive survey of the incidence of fire losses, to decide where further and/or permanent increases in rates were required. This survey was completed at the end of July and the new rates—based on the recommendations of the Committee—will come into effect from 1st March 1965.

Adjustments in rates were also introduced in home motor business, with effect from 1st October 1963. The new rates are aimed at penalising the motorists with bad records, and those with a heavier risk element. A detailed research into the transactions of motor insurance business is now in process to find out whether there are any other solutions to the problem.

Marine Insurance

Heavy losses have again been one of the features of marine insurance. Apart from the losses of ships and the rising cost of repairs, there have been substantial rating concessions given to shipowners. To a great extent, the fortunes of marine insurers are bound up with those of the shipowners, whom they insure; and the shipowners are generally not running their business in profits now. Freight rates have come down substantially, the reason being that the capacities of transport are still much larger than the business available, and an increasing amount of cargo is being sent by air. Nevertheless, some improvement has resulted from the decision of insurers to charge higher premiums on shipments carried in tramp vessels, more than 20 years old. For many years, the limit had been 25 years and its lowering was brought about by the large number of casualties sustained by war-built vessels.

Life Insurance

Life insurance forms the most important part of total business of British insurance companies. As already stated, there was a rise of 134 per cent in the net life insurance premium during the last ten years. As a result, it accounted for 47.4 per cent of total net insurance premium in 1963—the corresponding figure being 42.9 in 1953 and 46.0 in 1962. New life policies, issued in 1963 covered a sum of £4,040 million—a new record—and the total sums assured (including bonuses) stood at £22,400 million, against £20,200 million in 1962 and £14,800 million in 1959.

A special feature of life insurance in Britain is that most of the insured people pay their premiums the "Home Service Insurance" way—that is, they are collected by an agent of the insurance company. Out of a total net premium of £984 million on life insurance, £220 million was covered by such policies in 1963, and, what is more, this form of insurance is getting more and more popular every day. The "Home Service" covers not only the collection of premiums, but also servicing of the contract, including prompt payment of benefits, usually in cash.

Impact of New Taxes

Life insurance is a long-term business. The contracts for the payment of benefits may mature in twenty years or even more. Thus, it calls for precise calculations to organise certainties out of uncertainties. The recent announcement by the Chancellor of the Exchequer, to introduce corporate and capital gains tax from the next fiscal year, has created anxieties among the insurers. The main questions now being discussed in the insurance circles are: (1) Will these measures tend to reduce investment income to the funds, and, if so, to what extent? And (2) Will they increase the amount of taxation payable by the funds; and, if so, by how much? Mr. E. H. Haynes, Chairman of the Life Offices' Association, has explained, in a very lucid way, the effect of these uncertainties on life insurance business. Writing in the *Financial Times*, London, a few days ago, Mr. Haynes points out that "the premiums of all these policies were based on past assumptions relating to the scale of earnings, likely to accrue to the fund from investment, and to the conditions under which taxation would be levied on those earnings. The calculation of premium rates for all new business depends upon contemporary assumptions and estimates. At present, the grounds for firm assumptions and estimates scarcely exist. The uncertainty, created by the lack of any definition, concerning the new tax proposals, inevitably prompts the question, whether current rates of premium require adjustment. Until hard facts are made available, worthwhile calculation is impracticable. It is, consequently, most important for the health of the business that uncertainties are, as far as possible, cleared up without delay."

On the role of life insurance for attracting savings, Mr. Haynes says: "The power to attract savings derives mainly from two factors in combination: low cost protection of dependents and high return on savings, invested in endowment assurances and with-profits contracts of all kinds. Both these factors result, in a large measures, from the skill and judgment exercised by the life offices, investing freely in keen competition with each other, to ensure the highest long-term income, they safely can, for their policyholders' funds. The need for massive regular saving, to underpin the economy and finance its expansion and modernisation, is not a matter of controversy. These savings must either be attracted or extracted. If they are to be attracted, no better mechanism to do the job can be devised than the free life assurance system, which has evolved in this country over the past 200 years." He has, therefore, pleaded that the new taxes should not deprive life assurance of the lasting conditions, it must have, if it is to go on exerting its unique power, to attract regular savings and to invest them skilfully for the benefit, alike, of its policyholders and the economy.

Investment Policy

Insurance not only serves the policyholders, but it is also one of the important sources of finance to both the public and private sectors. There has been a substantial change in the investment pattern of British insurers during the last decade. As compared with 1953, whereas the share of British Government securities and Commonwealth and other Government securities in total insurance investments has come down substantially, there has been a considerable rise in the shares of ordinary shares and mortgages and real property—the percentage share remaining almost unchanged in the case of debenture and preference stocks. The investments in British Government securities have come down from 32.6 per cent in 1953 to as low as 18.7 per cent in 1963. During the war days, it may be noted here, the insurance companies had invested most of their funds in the low-yielding British gilt-edged securities. Since then, the companies have not made any large sales of the securities, but have been investing the bulk of new funds in the other types of assets. The percentage share of gilt-edged has, therefore, come down sharply in the last decade. Commonwealth and other foreign Governments' securities are being held, mainly by the companies, having business transactions in foreign countries, either as compulsory deposits or voluntarily. The decline from 10.5 to 7.0 per cent in these securities is mainly accounted for by the fall in the foreign business of British insurers.

The British insurers investments in ordinary shares, during the decade 1953-63, increased from 12.5 per cent to 22.2 per cent, involving an increase of about £1,500 million in the value of holdings. The rise has been mainly due to the attractions of equity investments, from the point of view of both yield and capital gains. The share of mortgages and real property also increased by £1,500 million or from 18.9 per cent to 25.1 per cent. The money was used both to help a large number of people to own their own homes and also to finance the construction of commercial offices and shops.

Debentures and Preference Stocks

The share of debentures and preference stocks, however, remained constant at about 20 per cent. As a matter of fact, this share has remained more or less constant during the last 40 years. In terms of amount, however, the holdings increased during the decade by about £1,000 million. Most of this amount was used in subscribing for new issues.

By their very nature, life funds are long-term liabil ties and can safely be invested in long-dated securities. On the other hand, there is a tendency to invest non-life funds in short-term holdings. It was mainly due to this reason that a larger percentage of life funds, as compared with the non-life funds, were invested in British Government securities, debentures and preference stocks and mortgages and real property. As against this, non-life funds contributed a larger percentage for the holdings of ordinary shares (which are readily saleable). A very large share of the non-life funds was also invested in foreign Governments' securities—the share of life funds in these holdings being very low—the reason being that, whereas a substantial part of the non-life business of British insurers is in foreign countries, very few British offices do life insurance business overseas now. Although non-life funds are also invested in British Government securities, debentures and preference stocks and mortgages and real property most of these are of short-term maturity.

BOOM IN JAPANESE MOTOR BUSINESS

The number of motor cars on Japanese road has been increasing at the rate of 20 to 30 per cent a year in recent years, and at the end of June reached 4.39 million units, according to a survey by the Japan Automobile Industry Association. Of the total 2,712 000 were trucks, 1,420.000 passenger cars, 88.000 buses and 171,000 were special vehicles. Vehicle production increased 8.3 per cent between 1954 and 1963 and is matched by a corresponding increase in insurance. Total value of compulsory automobile liability insurance in fiscal 1963 showed an increase of 59.2 per cent over the previous year. The voluntary insurance increase was 34.4 per cent. These increases compare favourably with the 17.5 per cent in fire insurance and 10.5 per cent in marine insurance.

As a result, automobile insurance moved up to second place in total non-life insurance with a percentage of 28.8 in fiscal 1963 compared to 24.7 the year before. It surpassed marine insurance (22.4 per cent) which has always accounted for a large percentage of non-life insurance and moved closer to fire insurance (44.4 per cent). All vehicle owners are compelled by Japanese law to take out the compulsory automobile liability insurance. This means in effect, that as long as the current increase of 20 to 30 per cent a year in the number of vehicles in Japan continues, there will always be a corresponding increase in the amount of compulsory insurance. However, the percentage of vehicle owners taking out voluntary automobile insurance to cover damage to the car, damage to the other car and buildings, human life liability and other liabilities is only a little over 30 per cent.

KIRLOSKAR ELECTRIC COMPANY

RESULTS BETTER THAN EXPECTED

"THE Company has been following a policy of gradually expanding the production every year. However, during the current year 1963-64, the Board does not feel sure of achieving increased production due to severe curtailment in the supply position of pig iron and also of other raw materials like copper wire, etc., and as such, it will be difficult to maintain production let alone increasing it." This was what the Directors of Kirloskar Electric Company Ltd. (Managing Agents: Messrs. Kirloskar Associates, Harihar, Mysore State) had stated a year ago. Viewed from this context, the actual results of the Company for the year ended 30th June 1964, come as a pleasant surprise and give a complete lie to the earlier forebodings. Thus, the gross realisation from the sale of a well diversified range of electrical equipment which was on a continuously upward trend for the past many a year has expanded further by as much as 24 per cent from Rs. 465.54 lakhs to Rs. 560.61 lakhs. The gross profit which has been rising in consonance with the turnover has not only advanced as it should have, from Rs. 83.25 lakhs to Rs. 108.76 lakhs, but what is more, has been earned at an accelerated rate of 19.4 per cent, as against 17.9 per cent of the sale proceeds in the previous year. Unfortunately, a very substantial portion of the improved gross profit has been neutralised by the essential provisions which, in aggregate, have risen by Rs. 9.70 lakhs to Rs. 76.23 lakhs. Of these, the provision for the Managing Agents' commission takes up Rs. 10.48 lakhs as against Rs. 6.18 lakhs, that for depreciation Rs. 14 lakhs as against Rs. 13.85 lakhs, and for taxation Rs. 51.75 lakhs as against Rs. 47.50 lakhs. Even so, the net profit at Rs. 32.53 lakhs is more than twice as high as that of Rs. 15.72 lakhs the year before. Although out of this as much as Rs. 24.86 lakhs has been ploughed back, the Directors have still found it possible to raise the dividend by 2½ points to 12.5 per cent subject to deduction of tax. This claims Rs. 7.67 lakhs, as against Rs. 6.14 lakhs a year before. As though to compensate the shareholders for the loss suffered by them a year ago when the dividend was lowered by two points to ten per cent, the Directors further propose to issue bonus shares in the proportion of one for three by capitalising a sum of Rs. 20.45 lakhs out of the amount standing to the credit of the general reserve. This is, however, subject to the consent of the Industrial Finance Corporation and sanction of the Controller of Capital Issues.

The rapid strides made by the Company during the past four years are well brought out by the following comparative table:

(In lakhs of rupees)

	For the year ended 30th June			
	1964	1963	1962	1961
Sale of products (gross) ..	560.66	465.54	357.65	285.69
Other income	0.58	0.18	0.13	0.07

Carry forward	..	..	0.02	0.02
Market price of ordinary shares (in rupees):	1964	1963	1962	1961
High	22.25	23.62	23.75	15.80
Low	18.40	16.91	17.00	12.50

Notwithstanding the difficulties experienced in the procurement of essential raw materials, the Company continued to maintain good progress in regard to production of electric motors, transformers and alternators. The production of welding generators which was taken up recently also progressed well and it is now expected that the rated capacity in this regard would be attained within a year's time. Meanwhile, the Company has been granted letters of intent for its expansion schemes in regard to the manufacture of flameproof motors as also for alternators up to 1,500 kva and steps are being taken to process these schemes further. As for the manufacture of larger-size transformers and the modernisation of its foundry, the Company has negotiated a foreign exchange loan of Rs. 38.34 lakhs with the Industrial Finance Corporation of India for the import of necessary plant and equipment. The loan was finally sanctioned recently and steps to purchase the capital equipment for these projects are being taken.

As at the date of the balance sheet, namely, 30th June 1964, the Company's own funds aggregate Rs. 146.80 lakhs, made up of Rs. 61.97 lakhs in ordinary shares of Rs. 10 each fully paid up and Rs. 84.83 lakhs in reserves and surplus. As against these, the outside interest totals Rs. 203.25 lakhs, comprising Rs. 53.68 lakhs in borrowings and Rs. 149.57 lakhs in current liabilities and provisions. This is, however, fully covered on the assets side by the total of current assets, loans and advances aggregating Rs. 224.06 lakhs. Investments, most of which are in the ordinary shares of Kirloskar Asea Ltd., are shown in the balance-sheet at cost as Rs. 4.36 lakhs. During the year under review, net additions to fixed assets aggregated Rs. 23.81 lakhs and this has inflated the gross block account to Rs. 181.01 lakhs. On deduction therefrom Rs. 67.25 lakhs being the depreciation provided so far, the net block works out to Rs. 113.76 lakhs. Besides this, there is the item capital work-in-progress valued at Rs. 7.87 lakhs.

The Rs. 10 fully paid ordinary shares of the Company are currently priced at Rs. 22.25 *cum-div.* and fetch a net return of 4.7 per cent per annum.

J. K. STEEL SCRAPES THROUGH

There is nothing significant to stress about the working of J. K. Steel Ltd. [Managing Agents: Messrs. J. K. Industries (P) Ltd., Calcutta] during the year ended 30th June 1964. The results show that the Company has just scraped through. Sales have actually receded from Rs. 173.31 lakhs to Rs. 159.32 lakhs, and the Directors' explanation is that the previous year's turnover included sale of accumulated stock of jute baling hoops. Indeed, the stock of finished goods at the start of the previous year was higher at Rs. 23.50 lakhs as compared with Rs. 8.79 lakhs at the start of the year under review.

This also explains the increase in the purchase of raw materials from Rs. 68.19 lakhs to Rs. 97.27 lakhs during the year under review, since to maintain production the Company had to buy more raw materials. But, while staff expenses have also gone up from Rs. 17.40 lakhs to Rs. 19.82 lakhs, other expenses have come down from Rs. 19.02 lakhs to Rs. 16.64 lakhs. Consequently, gross profit, at Rs. 33.99 lakhs, is just only a shade below the previous year's figure of Rs. 34.78 lakhs.

The essential provisions have been more or less maintained, and the net profit is a little higher at Rs. 14.52 lakhs as compared with Rs. 14.46 lakhs for the year before. But with the amount brought in being only Rs. 2,000, as against Rs. 87,000 a year before, the transfer to reserves is a little lower at Rs. 7.54 lakhs as against Rs. 8.39 lakhs in the previous year, while, after paying the preference shareholders, the dividend on the 10-rupee ordinary shares has been maintained at 15 per cent per annum.

The following table compares the Company's progress in the past four years:

(In lakhs of rupees)

	For the year ended 30th June			
	1964	1963	1962	1961
Sale proceeds, less commission paid	159.32	173.31	111.94	152.00
Stock of finished goods ..	11.93	8.79	23.50	15.74
Other income	0.77	0.83	0.54	0.55
Materials and stores consumed..	92.79	88.23	71.00	100.35
Staff expenses	19.82	17.40	12.15	14.86
Other expenses	16.64	19.02	11.11	8.79
Gross profit	33.99	34.78	25.08	36.37
Depreciation	3.50	3.18	2.77	7.49
Taxation	13.44	14.63	9.10	9.85
Managing Agents' commission..	2.53	2.51	1.85	2.76
Net profit	14.52	14.46	11.36	16.27
Transfer to reserves	7.54	8.39	6.55	11.31
Dividends—				
7% (tax-free) C.R. preference	0.01	0.01	0.01	0.01
Ordinary	6.00 (15%)	6.00 (15%)	4.00 (10%)	4.00 (20%)
Carry forward	0.09	0.02	0.87	0.96
Equity shares' market value (in rupees):	1964	1963	1962	1961	1960
High	18.12	18.12	20.62	35.06 C.R.	18.60
Low	14.87	13.44	15.62	15.44 X.R.	12.62

The increase in the retention price of jute baling hoops for 1962-63 has amounted to Rs. 1.70 lakh and has been credited to the last year's accounts. The Company has again represented to the Government for a review of these retention prices because they are inadequate. Billet supply remains unsatisfactory and the restrictions on electric power supply continue. Notwithstanding all this, sales during the first four months of the current year have been higher and are expected to maintain this upward trend in the rest of the year.

It is interesting to find that the Company has started manufacturing electric hoist and chain pulley blocks and that its products have been well received in the market. But the wire rope project to double the existing capacity, which, in 1963, was expected to come into commission in about one year's time, is still to materialise. Machinery for the project, for which the I.C.I.C.I. has loaned Rs. 36 lakhs in foreign exchange, is due to arrive soon. Since the commissioning of the plant will take some months, it is doubtful whether the current year will show any benefit from the expansion. The schemes for expanding the cold rolling mill to obtain an additional production of 4,800 tonnes of cold rolled strips per year and for manufacturing electric overhead travelling cranes are being pursued.

With its "own" funds, including reserves of Rs. 51.88 lakhs, aggregating Rs. 101.88 lakhs, the Company has raised loans of Rs. 23.19 lakhs, of which only Rs. 4.71 lakhs are of a short-term nature. These short-term loans and current liabilities and provisions make a total of Rs. 107.98 lakhs, which is exceeded by current assets and loans and advances by Rs. 34.37 lakhs. Investments have declined during the year from Rs. 14.91 lakhs to Rs. 11.92 lakhs, out of which Rs. 8.79 lakhs are quoted lower at Rs. 8.67 lakhs. The gross block now works out to Rs. 108.44 lakhs, as against Rs. 97.99 lakhs at the end of the previous year and has been written down to Rs. 74.16 lakhs.

At Rs. 17.94 *cum-div.*, which is their current market value, the Rs. 10 fully paid ordinary shares of the Company offer a net yield of 7.1 per cent per annum.

COMMERCE AND INDUSTRY

(*Concluded from page* 1047)

the Continental member-countries of the E.F.T.A., its exports to this group in 1963 being 10 per cent higher than in 1962.

The Commonwealth also shared fully in the expansion of imports into Japan, its total exports to this country during 1963 being 27 per cent as compared with 1962. With the exception of Ceylon, all the leading Commonwealth countries sent more to Japan

Exports from Commonwealth countries to Eastern Europe were higher by 25 per cent, due to a rise in the value of exports from Canada, especially of wheat. The upward trend of exports to China, which had been decreased in 1962, was resumed during 1963, when the total exports rose by as much as 36 per cent.

India's trade with other developing countries and with Eastern Europe is expanding within the usual administrative framework of trade agreements. Trade under most agreements is in inconvertible rupees, but, in the case of Pakistan, where it has been found to be difficult to maintain a bilateral balance, the trade is now in sterling. The target for trade with the U.S.S.R. was achieved in 1963, and both imports and exports with Eastern Europe have risen very rapidly since 1959. Barter agreements are also important, and agreements with Ceylon, Jordan the U.A.R., Iraq, Chile and and Indonesia, among others, were signed during the year.

How India fared in Commonwealth trade is indicated in both Table A and Table C. The terms of trade moved slightly in India's favour during the year 1963 following a small rise in the export price index. This improvement, coupled with a reduction in imports, brought the deficit on merchandise trade to the lowest level for several years. The actual deficit in 1963 was lower at Rs. 312 crores, as against the deficit of Rs. 462 crores in 1962.

INDIA'S CATTLE ECONOMY

India's livestock population, covering cows, buffaloes, sheep and goats, is as much as 336 million. This immense animal wealth sustains the country's agricultural economy. The role played by cattle is, therefore, an interesting subject for study. Such a study, incidentally, is to be found in the publication: "Building From Below—Essays on India's Cattle Economy" (published by *Sarva Seva Sangh-Krishi Goseva Samiti*, 37 Shanker Market, Connaught Circus, New Delhi-1). The publication has a collection of articles on the country's cattle economy, with special reference to cows, written by eminent authorities on the subject. The statistical supplement to the publication gives important details regarding the general utility of cattle, their breeds and habitat, quantity and value of livestock products, contribution of cattle to national income, area under fodder crop, animal waste in relation to soil fertility, cattle farms in the country and training facilities in dairy farming.

SPENCER & CO. MAINTAINS DIVIDEND

PROFITS, HOWEVER, LOWER

A MODEST setback has been suffered by Spencer and Company (Chairman: Mr. Z. R. Irani, Madras), one of the largest trading houses in the South, in its profit for the year ended 30th June 1964. Thus, whereas the turnover has increased by about 10 per cent from Rs. 537.80 lakhs to Rs. 589.61 lakhs, accompanied by a small rise in other income and closing stock of finished goods, the gross profit has declined by Rs. 4.02 lakhs to Rs. 24.45 lakhs, the lowest level to be touched during the past four years, despite steadily rising sales. The ratio of gross profits to gross sales works out to 4.1 per cent or 1.2 points below that for the previous year. Commenting on this somewhat discouraging state of affairs, the Directors observe: "The considerable increase in the cost of living index figure has resulted in a very steep increase in the payment of dearness allowance at all branches of the Company. It has not generally been possible to pass such increases on to the consumer and these have had to be absorbed in working expenses with a consequent lowering in profits. Since the close of the financial year, there have been further appreciable rises in the cost of living and these have naturally resulted in increased dearness allowance payment." Staff expenses have thus increased from Rs. 61.92 lakhs to Rs. 67.90 lakhs but, as will be seen from the following comparative table, other expenses too have risen. The cost of materials, finished goods and stocks consumed has advanced somewhat disproportionately from Rs. 416.59 lakhs to Rs. 474.30 lakhs, while other expenses are up from Rs. 43 lakhs to Rs. 47.75 lakhs. Although depreciation at Rs. 4.35 lakhs is only a little higher than previously, the provision for taxation has fortunately declined by Rs. 3.75 lakhs to Rs. eight lakhs. The resulting net profit at Rs. 12.10 lakhs is, therefore, only a shade less as compared with Rs. 12.59 lakhs earned in the year before. After transferring Rs. 1.34 lakh from this to reserve and provisions and setting aside a further Rs. 3.93 lakhs for payment of preference dividend, the Directors have proposed to maintain the ordinary dividend at 18 per cent, subject to tax, inclusive of the interim of six per cent paid earlier. This claims Rs. 7.20 lakhs as before, leaving Rs. four lakhs as carry forward as against Rs. 4.37 lakhs brought in.

The working results of the Company for the past four years are presented synoptically in the following comparative table:

(In lakhs of rupees)

	For the year ended 30th June			
	1964	1963	1962	1961
Sales and receipts less excise	589.61	537.80	505.36	451.71

Low	20.75	20.12	21.62	21.86

Severe draught from September 1963 to January 1964 caused a considerable drop in production at the Company's Rob Roy tea estates from 206,000 kg. to 175,000 kg. The average price quoted in auction was, however, only slightly better at Rs. 4.42 per kg., as against Rs. 4.34 per kg. and so the profit for the year was adversely affected. The profits of hotel business on the other hand, continued to be satisfactory and resulted from a large increase in the average daily occupancy. At the Madras aerated water factory, a new automatic syruping, filling, crowning, labelling and washing machine was installed and is now reported to be in full use in place of the old plant which had very much lower production capacity. The Board feels that the improvement both in output and quality should give better results during the current year.

It will be recalled that, in their previous report, the Directors had made a reference to a three-storeyed building that was being constructed on land belonging to the Company facing Mount Road at Madras; this was to be used partly for the Company's own business and the rest was to be let out. We are now told that the building was completed in October 1964 and portions of it have already been let out. The ground floor, the Directors state, has made admirable showrooms and is being used by the Company's steel equipment division. Similarly, the 20-bedroom block at the West End Hotel, Bangalore, the plans for which were approved the previous year, is also nearing construction and when brought into use early in 1965 will satisfactorily add to the revenue of the hotel.

The Company's financial position as revealed by its balance-sheet as at 30th June 1964 is quite comfortable. The paid-up share capital continues to stand at Rs. 100 lakhs, of which as much as Rs. 60 lakhs are in two classes of preference shares of Rs. 10 each and the balance in ordinary shares also of Rs. 10 each. This is supported by reserves and surplus aggregating Rs. 114.89 lakhs to give a total of own funds of Rs. 214.89 lakhs. As against these, the borrowings total Rs. 70.07 lakhs and current liabilities and provisions another Rs. 77.20 lakhs. Both these together are, however, more than adequately covered by current assets, loans and advances all amounting to Rs. 231.38 lakhs. Investments are carried in the books at a cost of Rs. 38.15 lakhs, a substantial portion of which is in the shares of subsidiary or associated companies. During the year under review, the Company acquired new assets worth Rs. 7.52 lakhs and this has resulted in raising the gross block to Rs. 172.88 lakhs. On deducting therefrom Rs. 93.61 lakhs being the depreciation to date, a net block of Rs. 79.27 lakhs is obtained. This excludes the capital work-in-progress valued at Rs. 13.36 lakhs.

The Rs. 10 fully paid ordinary shares of the Company are currently quoted at Rs. 21.50 *cum-final div.* On reducing the price to the *ex*-dividend level, the net return on fresh investment works out to about seven per cent per annum.

SANDOZ PLANS FOR NEW PRODUCTS

Sandoz (India) Ltd., which is entering the capital market on the 14th inst. with a public issue of Rs. 30 lakhs, has launched a number of expansion plans. Dr. G. Buschauer, Works Director of the Company, told pressmen on the 8th instant that the Company proposed to start the production of an intermediate for the manufacture of cancer drug. The intermediate would be derived from a herb, called 'bankakri,' grown in a 200-acre nursery in the hilly areas of Northern India. Mr. H. Frank, another Director of the Company in charge of the dyes division, stated that the installation of the plant for the production of dyes was likely to be completed shortly. The total licensed capacity for the three dyestuffs, namely, azo dyes, metal complex dyes and phthalocyamine dyes, will be 540 tonnes per annum, but production during the first year is expected to be 200 tonnes. The production of agro-chemicals is also likely to be increased to meet the increased demand in the country. The Company has already made a start in exporting the drugs manufactured by it, and has ambitious plans to increase these exports when the new plants go into production.

NEWS IN BRIEF

THE Government of Uttar Pardesh has decided to set up an export promotion corporation with a capital of Rs. 60 lakhs to increase the export trade.

The Supreme Court has held valid Section 3 of the Wealth Tax Act, 1957, which provides for the levy of wealth tax on the net wealth of a Hindu undivided family.

The Indian Council of Agricultural Research has decided to give 100 per cent financial assistance to agricultural universities for research schemes under taken on behalf of the Council.

The employees Provident Fund Scheme is being extended to cover about 4,400 workers, employed in 29 milk and milk product factories with effect from the beginning of next year.

The Indian Trade Unions (Amendment) Bill, which seeks to prevent persons convicted of an offence involving "moral turpitude" from occupying any office in a trade Union, was passed by Parliament on the 7th inst.

The State-owned Bharat Electronics produced Rs. 6 crores worth of goods during the year 1963-64, as against the output amounting to Rs. 3 crores in 1962-63. The production is expected to rise to Rs. 7 crores in 1964-65 and further to Rs. 8.5 crores in 1965-66.

There is no proposal to impose control on the price of *vanaspati*, according to Mr. C. Subramaniam, Union Food and Agriculture Minister. The minister hopes that the price will come down in view of the "fairly adequate" production of groundnuts.

The Director of the Labour Bureau, Government of India, is at present engaged in compiling a new series of consumer indices with 1960 as base for 50 centres. On the basis of this series, the Director will formulate the all-India new series.

The Government of India and Pakistan have tentatively agreed on the disposal of the erstwhile Hyderabad Government funds lying with the Westminster Bank at London in the ratio of 60:40. The money thus obtained will be utilised for providing scholarships to Indian students.

The shipping period for exports of cotton yarn under the Indo-U.K. quota agreement for 1964 has been extended upto 31st March next. This facility is allowed only to those exporters who have effected the shipment of 75 per cent of their entire 1964 quotas by the end of this month.

The Union Government's decision to increase the allotment of newsprint to 10 per cent every year has not yet been implemented, owing to foreign exchange difficulties and in view of the fact that none of the three private units licensed to produce newsprint has made any headway.

The removal of the ban on issuing new licences for manufacturing scooters is under the active consideration of the Government. The estimated demand for scooters and three wheelers during 1964-65 is estimated at 60,000 units, which is double the production of 30,000 units.

The Hindustan Steel Ltd. incurred a net loss of Rs. 4.79 crores during 1963-64, after providing Rs. 32.19 crores for depreciation and Rs. 17.71 crores on account of interest on Government loans. The loss is attributed to the fact that the production of saleable steel did not reach the full-rated capacity.

The Central Government has granted a licence to a Gujarat industrialist to set up a factory to produce instant food from bananas, limes, mangoes, tomatoes and milk. The proposed factory is to be set up at Bulsar in collaboration with a U.S. firm. The capacity of the plant will be 1,000 tonnes a year, and 25 per cent of the finished produces will be exported.

The fourth blast furnace of the Bhilai Steel plant, claimed to be the biggest in Asia, was commissioned on Tuesday this week by Mr. P. C. Sethi, Union Deputy Minister for Steel and Mines. The furnace has a capacity of 6,739 tonnes of pig iron per day and is 1,719 cu. metres in volume. It cost Rs. 10.3 crores and required 1,372,000 mandays to build.

The question of setting up a sugar marketing board has been referred to the Sen Commission and a final decision on it will be taken soon, after the commission's report is submitted to the Government. The centre is also considering whether the Food Corporation can be entrusted with the distribution of sugar also, so that there is no need for a separate sugar marketing board.

A DM-60 million (Rs. 70,60,000) plant to produce high quality special steels is proposed to be built by the Duisburg engineering firm of Demag (West Germany) at Bhadravati in Mysore State. The cost of the project will be met from a credit being extended by the West German Government. The production capacity of the plant is expected to be about 80,000 to 100,000 tons of various kinds of high quality steel per annum.

An agreement providing for agricultural commodity assistance was signed at New Delhi on the 4th inst. between the Governments of India and West Germany. The agreement covers 1,700 tons of fertilisers, six tons of plant protection material and agricultural implements together worth Rs. 11 lakhs. The programme is designed to assist in the implementation of the Indo-German agricultural development project at Mandi in Himachal Pradesh.

A raw materials depot for small industries, financed by the National Small Industries Corporation, is proposed to be set up in Delhi during the fourth Plan period. The depot will procure raw materials (imported and indigenous) through its own resources and also those of the State Trading Corporation, the Minerals and Metals Trading Corporation, and other organisations. It will distribute raw materials on the recommendations of the Directorate of Industries. It will have a revolving fund of Rs. 40 lakhs to buy and stock raw materials.

A 14-member third Electric Power Survey Committee headed by Mr. K. P. S. Nair, Chairman of the Central Electricity Authority, has been constituted to guide the load survey of the country during the next year. It includes the representatives of the Planning Commission, State electricity boards, electricity undertakings in the private sector, as also Mr. K. B. Mathur, Chairman, Heavy Electricals and Dr. P. S. Lokanathan, Director General, National Council of Applied Economic Research. The first survey committee was set up in 1962 and the second in January 1964.

In spite of the liberal licensing of capacity for manufacture of pig iron in the private sector and the setting up of additional blast furnaces at Bhilai and Durgapur, India will continue to experience shortage of pig iron for some more time, according to Mr. Sanjiva Reddy, Union Minister for Steel. The Government is also considering the possibility of setting up a low shaft furnace at Bhilai with a capacity of 150 to 200 tons of pig iron per day. Feasibility studies have also been undertaken at eigth locations in the country with a view to erecting a few blast furnace complexes for the production of pig iron. A technical committee has been appointed to suggest measures for increasing the blast furnace efficiency at the existing steel plants by effecting technological improvements.

From Abroad

The Bank rate in South Africa has been raised from 4 to 4.50 per cent with effect from the 8th inst.

World production of natural rubber in 1963 is estimated at 2.21 million long tons and that of synthetic rubber at 2.76 million tons.

China is reported to have offered a loan of £30 million carrying an interest of 2.5 per cent to the United Arab Republic. The U.A.R. Minister for Industries is visiting Peking shortly to discuss the details of the loan offer.

The world population will rise from 3,300 million at present to 4,300 million by 1980. This is the estimate made by the American Bureau of Population Studies. The World population is growing at a rate of 65 million annually, that is, more than the population of Great Britain.

The New Zealand Institute of Economic Research has revised upward its estimate of New Zealand's gross national product for the year ending 31st March 1965, and now expects an increase of 7 per cent, as compared with 10 per cent in 1963-64. The gross national product for 1964-65 is currently estimated at £1,711 million.

Canada's gross national product in the second quarter of 1964 is estimated at an annual rate of $46,000 million, slightly more than one per cent higher than in the first quarter. Nearly all of this, however, represents higher prices, leaving the volume of the nation's output much the same. The Gross National Product value, excluding net farm income, rose by about one half of one per cent.

Britain exported £66.6 million worth of staple fibre, yarn, woven and knitted fabrics during the first ten months of the current calendar year, as against the exports of £54.7 million in the corresponding period last year. Britain also exported £16.3 million worth of staple fibre (including waste) and £30.3 million worth of filament yarn, the corresponding figures for the same period last year being £13.4 million and £25.1 million, respectively.

The aggregate oil refining capacity of the Common Market countries is likely to show an annual growth rate of 11 per cent between 1963 and 1968, reaching a total of 328 million tons by the latter year, according to the E.E.C. Commission. Refined product output is expected to reach 251.4 million tons by the same date. Imports of refined products increased from 21.6 million tons in 1962 to 25.9 million tons in 1963, while exports rose from 27 million tons to 29.8 million tons.

A West German shipping line has placed an order for a British Hovercraft for use on passenger services on the River Elbe and for trips to German North Sea beaches and islands. The Hovercraft, a Westland SR.N5, which can carry 20 passengers at a speed of 70 knots, will be delivered in June 1965. The Mitsubishi Company of Tokyo and Bell Aerosystems, of the U.S. have already taken delivery of the SR.N5s they had ordered from Westland, and a third will be supplied to Scandinavian Hovercraft Promotion of Oslo, Norway, early next year. Two SR.N5s are being operated by the British Inter-Service Hovercraft Trials Unit.

The U.S. Treasury has announced important amendments to the anti-dumping regulations which will come into force in a month's time. The important amendments are: the evidence submitted to the treasury by parties in anti-dumping cases will no longer be treated as confidential; interested parties will be allowed to argue their cases in each other's presence rather than separately; an allowance will be made for a quantity discount only if it is actually enjoyed with respect to 20 per cent of merchandise sold in the home market or unless it is justified by cost; the present retroactive application of dumping duties will largely be eliminated.

The Common Market Commission has submitted to the Council its proposals for a unitary community market organisation for food, oils and fats. It has suggested a community financed system of deficiency payments to producers, in addition to the usual market intervention procedure. For olive oil, colza, rape and sunflower seed, a new "norm" price will be fixed corresponding to the fair return for the producer. Deficiency payments will be made when the target price, which will take account of competing products, falls below this norm level. Processing industries buying oilseeds of community origin will receive a rebate equal to the difference between the norm price and the world market price.

All the three major New Zealand—based non-life insurance companies, namely, New Zealand, National and South British, have reported reduced overall net profits for the year 1963-64. Smaller underwriting profits are a prime factor in these results. In particular, underwriting emanating from Britain was a contributing cause, with higher loss ratios in the fire accounts. Accident business and premium income generally improved, although vehicle insurance continued to require careful watching. Underwriting result for Australia and New Zealand were satisfactory and have so far retained a greater degree of stability than elsewhere. Non-marine business in the U.S. has now completely "run-off," but marine accounts are still being operated there. Investment income from various sources has helped to offset declines experienced in underwriting profits.

The Canada Labour (Standards) Code, recently introduced in Parliament, is intended to establish, for the first time in Canada's history, a "package" of minimum standards covering basic working conditions for those engaged in the part of the Canadian economy that falls within federal jurisdiction. The proposed code, which will apply to employment on or in connection with the operation of any work, undertaking or business within the legislative authority of the Parliament of Canada, provides for a wage-rate of not less than $1.25 an hour; a standard eight-hour day and 40-hour week, with time-and-a-half for overtime (which is limited under ordinary conditions to eight hours a week); seven general holidays with pay and an annual vacation of two weeks with pay after every completed year of employment. Industries covered under this code include shipping, air transport, inter-provincial rail and highway transport and communication, as well as banking, uranium mining, grain elevators, feed mills and certain Crown Corporation.

PERSONAL

MR. Lal Bahadur Shastri, Prime Minister of India, returned on Monday this week after a six-day visit to the U.K.

Mr. R. C. Dutt, Special Secretary, Department of Revenue and Company Law, Ministry of Finance, has been appointed Secretary, Company Affairs and Insurance.

Dr. S. B. Dutt, a senior Director of the United Bank of India, has been elected Chairman of the Board of Directors of the Bank, *vice* Dr. N. N. Law who has retired on grounds of health.

Mr. P. R. Subramanian, till recently Chairman of the Cochin Port Trust, assumed charge as the General Manager of the Bombay Port Trust on Monday this week *vice* Mr. E. H. Simoes, who has been appointed Chairman of the Mormagao Port Trust.

Mr. Jagdish Prasad, Engineer-in-chief, Public Works Department, Uttar Pradesh, has been elected President of the Indian Roads Congress for the year 1964-65. Mr. B. D. Mathur (Chief Engineer, P.W.D., Rajasthan), Mr. S. N. Gupta (Chief Engineer, W. Bengal), and Mr. Z. S. Shah (of Burmah-Shell) have been elected Vice-Presidents.

A CORRECTION

Mr. Ramnath A. Podar, Mr. Zafar Futehally, Mr. S. M. Dahanukar, Dr. R. C. Cooper, Mr. K. C. Maitra and Prof. M. L. Dantwala have been nominated (by the Central Government) members of the reconstituted Bombay Local Board of the State Bank of India and not Members of the Bombay, Calcutta, Madras, New Delhi, Kanpur and Ahmedabad Local Boards, respectively, as was mentioned in our last issue.

Notices

THE KINNISON JUTE MILLS COMPANY, LIMITED

NOTICE IS HEREBY GIVEN THAT A GENERAL Meeting of the holders of Rs. 25,00,000 five per cent Registered debentures of Rs. 1,000 each of the abovenamed Company constituted and secured by a Trust Deed dated the 30th day of December 1949 will be held at the Registered Office of the Company at Chartered Bank Buildings, Calcutta on Tuesday the 22nd day of December 1964 at 11.00 a.m. to consider, and if thought fit, to pass with or without modification, the following Resolutions which will be proposed as Resolutions as required by Clause 58 of the said Trust Deed.

"That this General Meeting of the holders of 2,500 five per cent Registered Debentures (hereinafter called "the said Debentures") of The Kinnison Jute Mills Company Limited (hereinafter called "the Company") constituted and secured by a Trust Deed (hereinafter called "the said Trust Deed") dated the 30th day of December 1949 and made between the Company of the one part and George Reid Crooks and Hugh Clough Waters as Trustees of the other part hereby assents to and sanctions:

1. *a*) the date of redemption of the said debentures being postponed from the 31st day of December 1964 to the 31st day of December 1979 with liberty to the Company to purchase at any time in the market at or under par (exclusive of accrued interest but inclusive of costs of purchase) all or any of the said Debentures for the time being outstanding and with further liberty to the Company to redeem at par the said Debentures or any part thereof (in the latter case by drawings) on the 30th day of June 1975 or any subsequent half-yearly date of payment of interest on giving not less than six calendar months' notice in writing of such intention to the Registered holders of the said Debentures or their legal personal representatives Provided that any debentureholder present at the meeting or if he has not attended the meeting, has in writing before the due date of the redemption expressed his wish to have his holding of debentures repaid before the 31st December 1964 he shall be paid in cash on or before that date;

(*b*) subject to the approval of the Controller of Capital Issues the rate of interest payable on the said Debentures being increased from five per cent per annum to seven and half per cent per annum as from the 1st day of January 1965.

2. That the said Trust Deed be further amended so as to provide that—

a) a fixed charge be created by the company—

i) on all its lands (in addition to the fixed charge created on the lands referred to in the First Schedule to the said Trust Deed) and other immovable properties as may be or may have been acquired at any time during the continuance of the said Trust Deed; and,

ii) on its plant and machinery both existing as well as future in lieu of the floating charge created by the said Trust Deed; and

b) the Company do establish a Cumulative Sinking Fund on the following terms and conditions:

i) during the year ending the 31st day of March 1967 and during every succeeding year ending the 31st day of March whilst any of the said Debentures remains outstanding the Company shall set aside out of the distributable profits (as hereinafter defined) of the Company's financial year ending on the 31st day of March of each such year, as and by way of a Sinking Fund, a sum not less than Rs. 1,00,000 PROVIDED THAT the Company may in any year credit to the Sinking Fund a sum in excess of the foregoing annual instalment and the amount of such excess may be applied by the Company in reduction *pro tanto* of its obligations under this condition in any subsequent year or years;

ii) the Company may at any time and from time to time apply the whole or any part of the amount for the time being standing to the credit of the Sinking Fund in the purchase of the said Debentures in the market at any price not exceeding par exclusive of accrued interest but inclusive of costs of purchase;

iii) the amount for the time being standing to the credit of the Sinking Fund may be applied by the Company in redemption of the said Debentures but any accrued interest on the Debentures so redeemed shall be payable by the Company otherwise than out of the Sinking Fund;

iv) such part of the amount to the credit of the Sinking Fund as shall not be applied in or towards the purchase or redemption of the said Debentures shall be deposited in the name of the Company with a Bank to be approved by the Trustees or may at the option of the Company be invested in Trustee Securities with full power for the Company to vary and transpose such investments. The expenses of the purchase of such investments shall be borne by the Sinking Fund and the net proceeds of sale thereof and all income accruing therefrom shall belong to the Sinking Fund;

v) all Debentures purchased or redeemed out of the Sinking Fund shall be cancelled and the Company shall not be entitled to keep the same alive for the purpose of re-issue nor to re-issue the same;

vi) for the purposes of this condition the expression "distributable profits" shall, unless otherwise agreed by the Company and the Trustees for the time being of the said Trust Deed, mean the profits of the Company in respect of the Company's financial year ending on the 31st day of March excluding any profit carried forward from a previous year and after providing for Income-tax, Super-Tax, Sur-Tax and any other tax as may be payable by the Company but before setting aside any sum to reserve. The amount of such profit shall be certified annually by the Company's auditors.

3. That for the purpose of effecting the foregoing modifications of the said Trust Deed the present Trustees thereof be and are hereby authorised to concur with the Company in the execution of a Supplemental Trust Deed in the form of the draft submitted to this meeting and for the purpose of identification initialled by the Chairman hereof subject to such amendments, if any, as the said Trustees may require or agree.

By Order of the Board,

F. W. HEILGERS & Co. (PRIVATE) LTD.
Managing Agent.

Registered Office:
CHARTERED BANK BUILDINGS,

Dated the 28th November, 1964.

Notes:

1. A debentureholder entitled to attend and vote at the meeting may appoint a proxy to attend and vote in his stead. A proxy need not be a debentureholder.

2. The relative Explanatory Statement is annexed to this Notice.

3. The draft Supplemental Trust Deed referred to in this Notice may be inspected at the Registered Office of the Company and will also be available at the meeting.

THE AUCKLAND JUTE COMPANY LIMITED

NOTICE IS HEREBY GIVEN THAT A General Meeting of the holders of Rs. 15,00,000 four per cent Bearer Debentures of Rs. 1,000 each of the abovenamed Company constituted and secured by a Trust Deed dated the 2nd day of October, 1945 will be held at the Registered Office of the Company at Chartered Bank Buildings Calcutta on Tuesday the 22nd day of December 1964 at 11.10 a.m. to consider, and if thought fit, to pass with or without modification, the following Resolutions which will be proposed as Resolutions as required by Clause 59 of the said Trust Deed.

"That this General Meeting of the holders of 1,500 four per cent Bearer Debentures (hereafter called "the said Debentures") of The Auckland Jute Company Limited (hereinafter called "the Company") constituted and secured by a Trust Deed (hereinafter called "the said Trust Deed") dated the 2nd day of October, 1945 and made between the Company of the one part and Arthur Paul Benthall and Hugh Clough Waters as Trustees of the other part hereby assents to and sanctions:

1. *a*) the date of redemption of the said Debentures being postponed from the 31st day of December 1964 to the 31st day of December 1979 with liberty to the Company to purchase at any time in the market at or under par (exclusive of accrued interest but inclusive of costs of purchase) all or any of the said Debentures for the time being outstanding and with further liberty to the Company to redeem at par the said Debentures or any part thereof (in the latter case by drawings) on the 30th day of June 1975 or any subsequent half-yearly date of payment of interest on giving not less than one calendar month's notice of such intention by advertisement once at least in two newspapers circulating in the district of the Registered Office of the Company. Provided that any debentureholder present at the meeting or if he has not attended the meeting, has in writing before the due date of the redemption expressed his wish to have his holding of debentures repaid before the 31st December, 1964, he shall be paid in cash on or before that date;

b) subject to the approval of the Controller of Capital Issues the rate of interest payable on the said Debentures being increased from four per cent per annum to seven and half per cent per annum as from the 1st day of January 1965.

2. That the said Trust Deed be further amended so as to provide that—

a) a fixed charge be created by the company—

i) on all its land (in addition to the fixed charge created on the lands referred to in the First Schedule to the said Trust Deed) and other immovable properties as may be or may have been acquired at any time during the continuance of the said Trust Deed; and,

ii) on its plant and machinery both existing as well as future in lieu of the floating charge created by the said Trust Deed; and

b) the Company do establish a Cumulative Sinking Fund on the following terms and conditions:

i) during the year ending the 31st day of March 1967 and during every succeeding year ending the 31st day of March whilst any of the said Debentures remains outstanding the Company shall set aside out of the distributable profits (as hereinafter defined) of the Company's financial year ending on the 31st day of March of each such year, as and by way of a Sinking Fund, a sum not less than Rs. 1,00,000 PROVIDED THAT the Company may in any year credit to the Sinking Fund a sum in excess of the foregoing annual instalment and the amount of such excess may be applied by the Company in reduction *pro tanto* of its obligations under this condition in any subsequent year or years;

ii) the Company may at any time and from time to time apply the whole or any part of the amount for the time being standing to the credit of the Sinking Fund in the purchase of the said Debentures in the market at any price not exceeding par exclusive of accrued interest but inclusive of costs of purchase;

iii) the amount for the time being standing to the credit of the Sinking Fund may be applied by the Company in redemption of the said Debentures but any accrued interest on the Debentures so redeemed shall be payable by the Company otherwise than out of the Sinking Fund;

iv) such part of the amount to the credit of the Sinking Fund as shall not be applied in or towards the purchase or redemption of the said Debentures shall be deposited in the name of the Company with a Bank to be approved by the Trustees or may at the option of the Company be invested in Trustee Securities with full power for the Company to vary and transpose such investments. The expenses of the purchase of such investments shall be borne by the Sinking Fund and the net profits of sale thereof and all income accruing therefrom shall belong to the Sinking Fund;

v) all Debentures purchased or redeemed out of the Sinking Fund shall be cancelled and the Company shall not be entitled to keep the same alive for the purpose of re-issue nor to re-issue the same;

vi) for the purposes of this condition the expression "distributable profits" shall unless otherwise agreed by the Company and the Trustees for the time being of the said Trust Deed mean the profits of the Company in respect of the Company's financial year ending on the 31st day of March excluding any profit carried forward from a previous year and after providing for Income-Tax, Super Tax, Sur Tax and any other tax as may be payable by the Company but before setting aside any sum to reserve. The amount of such profit shall be certified annually by the Company's auditors.

3. That for the purpose of effecting the foregoing modifications of the said Trust Deed the present Trustees thereof namely Cockwood Trustee Company (Private) Limited and Dalhousie Holdings Limited be and are hereby authorised to concur with the Company in execution of a Supplemental Trust Deed in the form of the draft submitted to this meeting and for the purpose of identification initialled by the Chairman hereof subject to such amendments, if any, as the said Trustees may require or agree."

By Order of the Board,

BIRD & CO. (PRIVATE) LIMITED,
Managing Agents.

Registered Office:

Dated the 28th November, 1964.

Notes:

1. Holders of the Bearer Debentures wishing to attend or vote at this meeting are required to produce the original Debentures or a Certificate in original issued by any of the Trustees namely Dalhousie Holdings Limited and Cockwood Trustee Co. (Private) Limited or by any Scheduled Bank stating that the bearer of such Certificate is the holder of one or more Bearer Debentures and specifying the same in number. Such Certificate must be lodged at the Registered Office of the Company not less than seven days before the date of the meeting.

2. An Explanatory Statement has been prepared with reference to the subject matter of the Resolutions to be proposed at the meeting and a copy of this statement will be supplied on application to the Registered Office of the Company.

3. The draft Supplemental Trust Deed referred to in the Notice may be inspected at the Registered Office of the Company and will also be available at the meeting.

THE NORTHBROOK JUTE COMPANY LIMITED

NOTICE IS HEREBY GIVEN THAT A General Meeting of the holders of Rs. 20,00,000 four per cent Bearer Debentures of Rs. 1,000 each of the abovenamed Company constituted and secured by a Trust Deed dated the 30th day of June, 1945, will be held at the Registered Office of the Company at Chartered Bank Buildings, Calcutta, on Tuesday the 22nd day of December 1964, at 11.20 a.m., to consider, and if thought fit, to pass with or without modification, the following Resolutions which will be proposed as Resolutions as required by Clause 59 of the said Trust Deed.

" That this General Meeting of the holders of 2,000 four per cent Bearer Debentures (hereinafter called "the said Debentures") of The Northbrook Jute Company Limited (hereinafter called "the Company") constituted and secured by a Trust Deed (hereinafter called "the said Trust Deed") dated the 30th day of June, 1945 and made between the Company of the one part and Sir George Bond Morton and Hugh Clough Waters as Trustees of the other part hereby assents to and sanctions:

1. (*a*) the date of redemption of the said Debentures being postponed from the 31st day of December 1964 to the 31st day of December 1979 with liberty to the Company to purchase at any time in the market at or under par (exclusive of accrued interest but inclusive of costs of purchase) all or any of the said Debentures for the time being outstanding and with further liberty to the Company to redeem at par the said Debentures or any part thereof (in the latter case by drawings) on the 30th day of June 1975 or any subsequent half-yearly date of payment of interest on giving not less than one calendar month's notice of such intention by advertisement once at least in two newspapers circulating in the district of the Registered Office of the Company. Provided that any debenture-holder present at the meeting or if he has not attended the meeting, has in writing before the due date of the redemption expressed his wish to have his holding of debentures repaid before the 31st December, 1964, he shall be paid in cash on or before that date;

(*b*) subject to the approval of the Controller of Capital Issues the rate of interest payable on the said Debentures being increased from four per cent per annum to seven and half per cent per annum as from the 1st day of January 1965.

2. That the said Trust Deed be further amended so as to provide that—

(*a*) a fixed charge be created by the Company—

(i) on all its land (in addition to the fixed charge created on the lands referred to in the First Schedule to the said Trust Deed) and other immovable properties as may be or may have been acquired at any time during the continuance of the said Trust Deed; and,

(ii) on its plant and machinery both existing as well as future in lieu of the floating charge created by the said Trust Deed; and

(*b*) the Company do establish a Cumulative Sinking Fund on the following terms and conditions:

(i) during the year ending the 31st day of March 1967 and during every succeeding year ending the 31st day of March whilst any of the said Debentures remains outstanding the Company shall set aside out of the distributable profits (as hereinafter defined) of the Company's financial year ending on the 31st day of March of each such year, as and by way of a Sinking Fund, a sum not less than Rs. 1,00,000 PROVIDED THAT the Company may in any year credit to the Sinking Fund a sum in excess of the foregoing annual instalment and the amount of such excess may be applied by the Company in reduction *pro tanto* of its obligations under this condition in any subsequent year or years;

(ii) the Company may at any time and from time to time apply the whole or any part of the amount for the time being standing to the credit of the Sinking Fund in the purchase of the said Debentures in the market at any price not exceeding par exclusive of accrued interest but inclusive of costs of purchase;

(iii) the amount for the time being standing to the credit of the Sinking Fund may be applied by the Company in redemption of the said Debentures but any accrued interest on the Debentures so redeemed shall be payable by the Company otherwise than out of the Sinking Fund;

(iv) such part of the amount to the credit of the Sinking Fund as shall not be applied in or towards the purchase or redemption of the said Debentures shall be deposited in the name of the Company with a bank to be approved by the Trustees or may at the option of the Company be invested in Trustee Securities with full power for the Company to vary and transpose such investments. The expenses of the purchase of such investments shall be borne by the Sinking Fund and the net profits of sale thereof and all income accruing therefrom shall belong to the Sinking Fund;

(v) all Debentures purchased or redeemed out of the Sinking Fund shall be cancelled and the Company shall not be entitled to keep the same alive for the purpose of re-issue nor to re-issue the same;

(vi) for the purposes of this condition the expression "distributable profits" shall unless otherwise agreed by the Company and the Trustees for the time being of the said Trust Deed mean the profits of the Company in respect of the Company's financial year ending on the 31st day of March excluding any profit carried forward from a previous year and after providing for Income-tax, Super Tax, Sur-Tax and any other tax as may be payable by the Company but before setting aside any sum to reserve. The amount of such profit shall be certified annually by the Company's auditors.

3. That for the purpose of effecting the foregoing modifications of the said Trust Deed the present Trustees thereof namely Cockwood Trustee Company (Private) Limited and Dalhousie Holdings Limited be and are hereby authorised to concur with the Company in execution of a Supplemental Trust Deed in the form of the draft submitted to this meeting and for the purpose of identification initialled by the Chairman hereof subject to such amendments, if any, as the said Trustees may require or agree."

By Order of the Board,

BIRD & CO. (PRIVATE) LIMITED,
Managing Agents.

Registered Office:
CHARTERED BANK BUILDINGS,
CALCUTTA 1.
Dated the 28th November, 1964.

Notes:

1. Holders of the Bearer Debentures wishing to attend or vote at this meeting are required to produce the original Debentures or a Certificate in original issued by any of the Trustees namely Dalhousie Holdings Limited and Cockwood Trustee Co. (Private) Limited or by any Scheduled Bank stating that the bearer of such Certificate is the holder of one or more Bearer Debentures and specifying the same in number. Such Certificate must be lodged at the Registered Office of the Company not less than seven days before the date of the meeting.

2. An Explanatory Statement has been prepared with reference to the subject matter of the Resolutions to be proposed at the meeting and a copy of this statement will be supplied on application to the Registered Office of the Company.

3. The draft Supplemental Trust Deed referred to in the Notice may be inspected at the Registered Office of the Company and will also be available at the meeting.

HARIHAR,
Date: 28*th November*, 1964.

POWERLOOM ENQUIRY COMMITTEE'S RECOMMENDATIONS

(*Concluded from page* 1042)

the mill industry should continue to remain frozen. The Committee of the Federation submit that to accept such a recommendation would mean to ignore the lessons of the past and to persist in policies which have been responsible for the present situation. The past policies of the Government have been responsible for the stagnation of the mill industry not only by being cut off from fresh springs of improvement through competition among equals, but by being positively discouraged from modernisation. The Committee of the Federation submit that these stagnant conditions should be ended and that the mill industry be allowed to expand vigorously in the best interests of the consumer and the country's exports.

* * * *

Note: The amount of excise duty collected from the powerloom sector in 1961-62 was Rs. 95 lakhs. If this is spread over the powerloom production of 2,000 million yards, the duty per yard paid by the powerloom sector as a whole comes to hardly 0.475 P.

Turning to the mill sector, the following table gives the rate of excise duty on mill-made grey cloth, excluding yarn compounded duty. Column 6 of the table gives the average width of mill cloth in each category based on Central Excise statistics. This information is used in columns 7 and 8 to arrive at the average excise duty per linear yard paid by the mill sector.

Existing rates of excise duty on mill-made grey cloth excluding yarn compounded duty

(Effective from 1st March, 1964)

(In paise per sq. metre)

Category	Basic excise duty	Handloom cess	Additional excise duty	Total duty per sq. metre	Average width in metres of mill cloth	Average excise duty per linear metre (5) divided by (6)	Average excise duty per linear yard
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)
Coarse ..	1.0	1.9	3.6	6.5	0.90	7.2	6.6
Lower Medium ..	3.0	1.9	4.8	9.7	0.93	10.4	9.5
Higher Medium ..	5.0	1.9	4.8	11.7	0.86	13.6	12.4
Fine ..	16.0	1.9	9.6	27.5	0.80	34.4	31.5
Superfine ..	22.0	1.9	15.5	39.4	1.03	38.3	35.0

Avg. 26.3

The production of the powerloom sector is concentrated in fine and superfine categories where incidence of the excise duty is the maximum. But we may assume that the production of the powerloom sector is equally distributed between the three categories, higher medium, fine and superfine. If the excise duty were levied on powerloom cloth in the same manner as has been done in the case of mill cloth, the powerloom sector would have paid in the current year an excise duty of Rs. 52.6 crores (2,000 m. yds x 26.3 P per yard). Since, for the purposes of excise duty, the structure of the powerloom sector has not changed for the better, it may be assumed that the actual collection of excise duty from this sector in 1964-65 would be of the same order as in 1961-62. This means that the Exchequer would suffer a loss of Rs. 52 crores, because of the excise duty structure in respect of powerloom grey cloth. It may be added that the actual loss to the Exchequer would be higher than the above amount of Rs. 52 crores if one takes into consideration the differential excise duty on processed powerloom cloth.

TUFTED CARPETS

What is claimed to be an improved way of manufacturing tufted-pile carpets with delicate designs of great definition, high resistance to flattening and better wearing properties, has been developed by Societe Rhovyl, 21 Rue Jean-Goujon, Paris 8e, France. The usual tufting technique is used followed by subjecting the unwoven carpet backing to a hot air blast so that the backing shrinks and the tufts become more firmly anchored. In the process a tuft density of six tufts per square centimetre is converted to a density of ten tufts per square centimetre with consequent "tightening" of the carpet and improvement in its qualities. The method is said to be applicable to tufted materials for use in clothing. Harder wearing and warmer clothes are the result.

TREND OF MARKETS

CALL RATE RISES AGAIN

(From Our Own Correspondent)

BOMBAY, *9th December*

The short-term money market continued to rule tight during the week under review. Demand for credit was quite high. Funds were, of course, available, but only borrowers had to pay more, as lenders were not prepared to part with money except at higher rates of interest. In the inter-bank call section, the rate for fresh day-to-day money moved up further from 5 to 5½ per cent and, renewals were bid at 5½ per cent, as against 4½ per cent last week. Conditions at Calcutta were a little better, the call rate for both renewals and fresh money declining from 5-5½ per cent to 4¾-5¼ per cent.

Thanks to tight money conditions, the 91-day Government of India Treasury Bills, tenders for which opened on Tuesday the 8th inst., elicited poor response. The total amount offered, namely, Rs. 2 crores, was just equivalent to that invited and also accepted. The average rate of accepted tenders was higher at Rs. 2.500 per cent, as against Rs. 2.400 per cent. The response to the Intermediate Treasury Bills was also poor, though the total amount of Bills actually sold from the 2nd to 5th inst. was slightly higher at Rs. 129.50 lakhs, as against Rs. 52 lakhs.

India's foreign exchange reserves rose by Rs. 3.38 crores to Rs. 96.86 crores during the week ended 4th December. The whole of this rise was in balances held abroad which increased from Rs. 8.01 crores to Rs. 11.39 crores. The foreign securities held in the Issue Department of the Reserve Bank continued unchanged at Rs. 85.46 crores. Deposits of scheduled banks declined by Rs. 4.72 crores to Rs. 89.23 crores, while loans and advances obtained by them from the Reserve Bank spurted by Rs. 17.43 crores to Rs. 18.26 crores. Notes in circulation went up by Rs. 50.51 crores to Rs. 2,472.97 crores.

There was a small decline of Rs. 90 lakhs to Rs. 1,713.90 crores in the total credit made available by scheduled banks to their clients during the week ended 27th November. But deposits fell by nearly Rs. 11 crores to Rs. 2,722.39 crores. Even so, borrowings from the Reserve Bank receded by Rs. 14.99 lakhs to Rs. 1.31 crore. Investments went up by Rs. 10.44 crores to Rs. 839.26 crores, while total cash declined by Rs. 4.61 crores to Rs. 159.42 crores.

Listless conditions prevailed in the Gilt-edged market. The values of most Central loans were unchanged at last week's levels. In the State section, the 4½ per cent 1976 loans attracted some support and tended to move up. West Bengal spurted by a rupee to Rs. 99. Kerala, Rajasthan and Assam hardened by 10 paise to Rs. 96.90. Maharashtra gathered five paise to Rs. 99.60. The Industrial Development Bonds 1976 (for Rs. 2.50 crores) was closed on the very first day (Monday, the 7th inst.), as the issue was fully subscribed.

In the foreign exchange market, the banks' buying rate for U.S. dollars improved by 50 paise to Rs. 476.50 per $100. Their buying rate also rose by 25 paise to Rs. 479.75. In New York, the pound sterling eased a little *vis-a-vis* the dollar, the spot rate receding by 0.170 cent to 279.040-279.060 cents and the three months' forward by 0.010 cent to 277.200-277.220 cents.

TRADING IN COTTON FUTURES SUSPENDED

(From Our Own Correspondent)

BOMBAY, *9th December*

Except for some easiness on Saturday the 5th inst. following the release of a global import quota of 2.15 lakh bales, cotton futures ruled buoyant throughout the week under review and actually today, Jarilla March 1965 contract was knocking at the official ceiling of Rs. 775 fixed for the non-delivery period. The East India Cotton Association had, therefore, no alternative but to suspend trading in the futures market. The buoyancy was due to firmness of spot cotton and bullish advices from the commodity markets. The sentiment in the futures section was not influenced in the least by the Union Commerce Minister's statement that the total supply of cotton during the season 1964-65 at 95 lakh bales (imports of 9.5 lakh bales plus carry over stocks at 25 lakh bales plus the expected current crop at 60.5 lakh bales) would be well above the anticipated mill consumption of 65 lakh bales. Purchases by upcountry operators and short-covering provided further strength to the market. Fears were expressed by some in the market to the effect that the Government might step in to check the current high level of prices, but there were others who discounted such a possibility.

The Jarilla March 1965 contract opened the week a rupee higher at Rs. 771.50 and, after declining to Rs. 772 on the 5th inst., reached the ceiling rate of Rs. 775 today, a gain of Rs. 4.50 over the week.

At the Sewri spot market, prices continued to be firm and, in most of the varieties, even pierced through the ceilings. Mills' buying remained restricted, on account of high prices, to only staple varieties like L. 147, 197/3, Co2, Kalyan and Digvijay, in order to cover their immediate needs. On the penultimate day of the week, namely, Tuesday the 8th inst., the prices of certain popular varieties were reported to have gone up by 20 points. The following are the latest available quotations in respect of certain popular varieties:

Amravati L. 147 Rs. 1,325; Akluj Co2 Rs. 1,500; Baramati Co2 Rs. 1,550; Bawla Kalyan Rs. 1,055; Digvijay New Rs. 1,251; Dhulia Rs. 1,215; Malegaon Co2 Rs. 1,525 and Viramgaon New Rs. 1,030.

Bengal *Deshi* December delivery contract firmed up further to touch the ceiling of Rs. 818 per candy, as against Rs. 816 last week. The total export registrations upto the 5th inst., aggregate about 88,000 bales, as compared with the last week's total of 85,000 bales. The January, February and March 1965 contracts were quoted at Rs. 816, Rs. 814 and Rs. 812, respectively. Among imported varieties, interest continues to be envinced in East African cotton.

The Government of India, it is reported, is not inclined to accept the mills' plea for removing the present compulsion on mills to purchase a prescribed quantity of Cambodia cotton. It may be recalled, in this connection, that the textile units are under an obligation to buy this variety to the extent of 7½ per cent of their consumption of indigenous cotton during the previous season.

Cotton interests, though they have welcomed the import of 50,000 bales of cotton from Pakistan, wonder whether the payment for this cotton, instead of being made in sterling, could not have been in rupees, as is the case in respect of the commodities covered under the Indo-Pakistan Trade Agreement. If it is the payment in sterling, the market circles feel, better staples from Sudan, etc., could be imported.

The first all-India official estimate of cotton in the current season places the total area at 16.5 million acres representing an increase of 2.1 per cent or 339,000 acres over the previous season.

RECOVERY IN BULLION

(From Our Own Correspondent)

BOMBAY, *9th December*

Gold ruled steady throughout the week under review, while silver, after declining in the earlier sessions, recovered later. The steadiness of gold was due to scattered support from jewellers and stockists owing to the marriage season. Silver encountered selling early in the week following reports of large arrivals from upcountry centres. Consequently, prices drifted downward. The declining trend was, however, arrested on Monday, the 7th inst. when the white metal staged a recovery following good support from upcountry dealers. The recovery gathered momentum yesterday and today on hopes of enlarged demand in the coming weeks. The entire previous loss was made up and today's closing rate was the same as that a week ago.

Silver began the week at Rs. 260.50, same as last week, and moved down swiftly to Rs. 257.50 per kg. on Saturday, the 5th inst. It, however, rallied and closed at Rs. 260.50. The weekly average arrivals and offtake of the metal were 22 and 8 bars, as against 19 and 8 bars, respectively, last week.

Fourteen-carat gold moved up from Rs. 66.50 to Rs. 67.25 per 10 gms. on sustained support from traders before finishing a shade lower at Rs. 67. Pure gold, in unofficial dealings, was a rupee higher at Rs. 112 on reports of seizure of contraband metal. Sovereign was firm at Rs. 91.

The international price for gold in the London market was higher at $35.11½, as against $35.10 last week. The sterling price rose by 3½d. to 251s. 8½d. Both spot and forward silver was unchanged at 112½ and 113½d., respectively, as also silver in New York at 129.3 cents.

Resenting the Andhra Government's decision to discontinue individual loans to displaced goldsmiths and bring them into the co-operative sector, a Congress legislator and eight others have resigned from the State-sponsored Goldsmiths' Rehabilitation Committee. Past experience, according to the legislator, has proved that co-operatives or partnership concerns for goldsmiths is not useful. Over 80 per cent of the co-operatives formed last year with Government assistance have failed to commence work.

The following table shows the trend of prices during the week under review:

	9-12-64 (closing)	High	Low	2-12-64 (closing)
SILVER	Rs.	Rs.	Rs.	Rs.
Ready (996 fine) ..	260.50	260.50	257.50	260.50
GOLD				
Ready (14-carat) ..	67.00	67.25	66.25	66.50
Sovereign	91.00*	—	—	91.00*
London—				
Gold	251s. 8½d.	251s. 8½d.	251s. 5½d.	251s. 5d.
Silver Ready ..	112½d.	—	—	112¾d.
Silver Forward ..	113½d.	—	—	113¾d.
New York—				
Silver	129.3 cents	—	—	129.3 cents

N.B.—The quotation for gold is per 10 grams (about 0.85 tola) and that for silver is per kilogram (85.73 tolas). London and New York quotations are per ounce. * Unofficial rate.

YARNS EASY

(From Our Own Correspondent)

BOMBAY, 9*th December*

The yarn market ruled easy during the week under review. Staple fibre yarns suffered a set back in vales, following stray bull liquidation induced by weak spot advices. Art silk yarns were subdued following comfortable supply position in the wave of slack demand from upcountry centres. Cotton yarns were dull with the exception of higher counts which attracted scattered support.

The Committee of the Indian Cotton Mills' Federation has sent a representation to the Union Ministry of Commerce urging restoration of the facility under which exporting mills are allowed to import non-cellulosic staple fibre, viscose, rayon yarn polynosic viscose staple fibre synthetic yarn to the extent of 20 per cent of their cotton retention quotas. (This facility, it may be recalled, has been withdrawn by the Government with effect from shipments made on and after 1st January 1965.) The Federation's plea is based on the following grounds.

(1) Mixed fabrics are greatly prized by the consumer and this fact has proved to be a great incentive to exporting mills. With the widening gap, caused mainly by the high prices of Indian cotton, between the international prices and Indian prices of cotton textiles, the stoppage of the incentive in question will increase the export difficulties; (2) During the last four years, the textile mills have developed the technique of manufacturing mixed fabrics. The mills must be encouraged to perfect the technique in order to be able in due course, to ship mixed fabrics abroad to meet the growing demand for them in the foreign markets; (3) As imports of non-cellulosic staple fibre, etc., are allowed only against cotton retention quotas, no extra foreign exchange is being used for the purpose. Since mixed fabrics are more durable, the extra price that has to be paid for man-made fibres does not mean waste of foreign exchange; (4) In order to meet the growing demands for cloth of the increasing population of the country, production of cotton cloth must increase appreciably. Meanwhile, mixed fabrics will help bridge to some extent, the widening gap between the supply of and demand for cotton textiles. Moreover, continued imports of non-viscose staple fibre will not mean reduced offtake of indigenously manufactured viscose fibre or rayon as fabrics made from the two types of fibre are not mutually competitive.

Among art silk yarns, National Rayon 150D declined by 13 P to Rs. 8.80 and 120D by 11 P to Rs. 9.35. South India Viscose 120D was neglected at Rs. 11.13. Bright Century 105D, however, put on 6 P to Rs. 11.26 on special support.

In the Staple fibre yarn section, the 2×35 January 1965 contract, opened at Rs. 861, same as last week, but fell to Rs. 857 on the same day. The closing was also Rs. 857. Spot City lost 13 P to Rs. 9.22. Sitalaxmi shed 4 P to Rs. 9.22. Premier, however, gathered 2 P to Rs. 9.35.

In the cotton yarns, 34s Tuticorin gained 4 P to Rs. 40. 68s Finlay put on Rs. 7 to Rs. 98. 52s Finlay shed Re. 1.12 to Rs. 79. All other counts were unchanged at last week's level.

The following table gives the prices of rayon staple fibre and cotton yarns, today, as compared with those prevailing a week ago:

	9-12-1964	2-12-1964
	Rs.	Rs.
Art silk yarn (per kg.)—		
National Rayon 120D	9.35	9.46
Century 75D	17.05	17.05
S. I. Viscose' 120D	11.13	11.13
Staple fibre yarn (2×34 NF) January 1965 (per quintal)	857.00	861.00
Spot (per kg.)		
Sitalaxmi	9.22	9.26
Premier	9.35	9.33
City	9.22	9.35
Cotton yarn - French Count (Rs. per 5 kg.)		
8s Podar	21.25	21.25
17s Modern	27.00	27.00
22s Madura	32.25	32.25
34s T'cott	40.00	39.96
52s Kasturi	55.00	55.00
68s Finlay	100.50	100.50

OILSEEDS SHOOT UP

(From Our Own Correspondent)

BOMBAY, *9th December*

For oilseeds the sky seems to be the limit. Groundnuts continued to be in the forefront during the week under review, making a mockery of the efforts of authorities to control price movements by means of margins. It may be recalled that the Association, under instructions from the Forward Markets Commission, has introduced a system of double margins at the rate of Rs. 10,000 for 25 tonnes if the quotation for the January contract crosses the Rs. 103-level. Further, the exemption limits are disallowed after this level. The market, however, has ignored these restrictions and, during the week, official trading came to a standstill, as the contract touched the permissible weekly limit of Rs. 106.30 on Friday. It had moved up by Rs. 2.40 from the previous week's close of Rs. 103.90. Since then there has been no rate on the Board.

Sentiment in groundnuts was aided further by the recent decision of the Government of India to allow exports of H.P.S. variety. The market had a hunch that exports of these would be allowed soon and shippers were already buying in anticipation of the announcement. It was said that commitments to the tune of 13,000 tonnes had been made. There is no quantitative limit to exports just at present, but there is the fear that permission may be withdrawn whenever the Government feels so. The commitments, however, are there. A further inducement was the vague talk that the Government might allow exports of groundnut oil from the country and it was said that a leading export house had been buying oil and that its purchases to-date aggregated about 3,500 tonnes. The question, however, is asked whether it would be in the interests of the country to export a basic consumer commodity like groundnut oil, but a section of the market is confidently asserting that the announcement would be made in the near future.

It is reliably understood that the first consignment of 8,000 tonnes of soyabean oil would be arriving from the United States sometime early next year. This is part of the 75,000 tonnes contracted for purchase under P.L. 480. Arrivals would be spread over a couple of months, but the whole of it would have come by the middle of next year. It may be recalled that the object of the Government of India in arranging for imports of soyabean oil from the United States was to enable the *vanaspati* industry to obtain its requirements of raw material at reasonable prices and incidentally to check the rise in oil prices. It is true that groundnut oil is now quoted much below the record level of Rs. 3,300 per tonne it had once touched, but, then, the seeds market has now been scaling remarkably high levels. It remains to be seen whether there is anything on earth that can stop prices from advancing further.

Groundnuts de-oiled cake (extractions) was well maintained, the spot quotation standing at Rs. 455. Export commitments upto February are reported to be around 2½ to 3 lakh tonnes. And

export business is still going on. Export houses are, therefore, keen buyers and this had also done a lot in pushing up the market as a whole. Castor March also touched the permissible ceiling of Rs. 190 but the unofficial rate was around Rs. 192.50. Linseeds were mentioned in the kerb at Rs. 46.25, as against the permissible ceiling of Rs. 45. Sentiment here is induced mainly by the firmness of groundnuts. Stocks of castor at present are negligible and it is yet too early to talk of new crop prospects. Cottonseeds were also firm and, at Rs. 117, there are only a little under the ceiling of Rs. 118. With the cotton market being what it is, there seems to be little doubt that cottonseeds will touch the ceiling before long.

The spurt in prices has given rise to talk of a payments crisis and some of the bears who got themselves squeezed are reported to be finding it difficult to meet their commitments. At the time of writing, members are reported to be working on a scheme by which the settlement can pass off smoothly. The outstanding positions are said to be 100.000 candies in groundnuts and 150.000 candies in castor.

The following table shows the closing prices of oilseeds and oils as on 9th December as compared with the previous two weeks:

	9-12-1964	2-12-1964	25-11-1964
Groundnuts	Rs.	Rs.	Rs.
January 1965 contract	110.00	103 05	102.40
Oil January 1965	(Nom.) 19.05 N.T.	(Nom.) 19.05 (Nom.)	N.T.
Khandesh quality	123 00	113 00	111.00
Oil ex-mill	24 00	22.50	23.00
Oil Rly. Receipt	23.20	21.75	22.40
Castorseed			
March 1965	192 50 (Nom.)	190.00	190.00
Ready Madras	86 00	85 50	85 50
Ready Kanpur	84 00	84 00	83 50
Oil B.S.S.	19.10	19.00	18.80
Oil commercial	18.25	18.25	18.10
Linseed			
March 1965..	46.25 (Nom.)	45.00	44.81
Bold ready	115.00	111 00	112 00
Linseed oil	24.00	23.25	23.50
Cottonseed			
January 1965 contract	116 75	115.75	114.50

N.B.—The quotation for groundnuts January 1965 contract is for 100 kg. The rates for spot groundnut and castor are for 100 kg. Castor and cottonseeds futures are quoted per 250 kg. while linseeds futures are quoted per 50 kg. Groundnut Oil January 1965 and all spot oils are quoted per 10 kg.

KIPS EASY

(From Our Own Correspondent)

MADRAS, *7th December*

Arrivals of stocks from the tanneries were moderate and clearance was fair-sized. There were more enquiries from U.K. for light weight cowhides and fifths selection in medium weights and also for buffcalf run selection. Importers resisted the higher prices demanded by the shippers and trading was easy.

In the goat skins section, as raw markets were firmly held, tanners were not able to meet the buyers' ideas and place large business. Demand for 8-9 lbs. top marks was brisk and a few orders were booked at 3d. to 6d. over last week's levels. Demand for heavier averages from U.S. was good. In the sheep skins section, buyers were not willing to raise their level of prices. There was good call for lower grades in middle class sheep. But prime and semi primes were not in demand.

In the Priamet market, workers did not turn up for sorting and packing at the shippers godown and gave strike notice. This week, there is labour strike in the docks. All this will cause great hardship to stock holders.

The following were the nominal prices per lb. for all round lots in the local market:—

Tanned cow hides 8/8½ lbs. average Rs 2.00 to Rs. 2.06, buff hides 12/13 lbs average Re. 1.70 to Re. 1.75 and buff calf 1½/2 Rs. 2.56 to Rs. 2.65.

HIGHGROWN TEA IRREGULAR

[*Messrs. Forbes, Ewart and Figgis (Private) Ltd.*]

COCHIN, *3rd December*

A total of 705,000 kgs. was offered in tea sale No. 47 held here on Tuesday, the 1st inst. Quality was irregular, but generally well maintained. The market met with a good demand. Highgrowns were irregular but generally easier. Good mediums showed an easier tendency, particularly fannings. Medium brokens were sold well at prices fully firm and sometimes dearer on last. Similar fannings however, were again lower. Low medium brokens were about steady but their fannings again showed a falling away in price. Black leaf brokens were about steady while similar fannings followed the easier trend for this grade. Whole leaf grades were irregular. The small selection of tippy teas on offer evoked a better demand. Unorthodox types were the weakest feature of the market, were sometimes neglected and came to a considerable lower market.

Quotations (per kg.) were:

	1964	1963
	Rs.	Rs.
Low mediums	4.20-4.65	4.10-4.50
Mediums	4 60-5.15	4.45-4.85
Good mediums	4.15-5.40	4.90-5.50
Nilgiri B.O.P.	5.00-6.30	4.50-7.00

The average price realised in sale No. 47 was Rs. 4.73 per kilo, as against Rs. 4.79 a week ago and Rs. 4.58 in the corresponding sale last year.

In dust sale No. 47 held here today a total 317.000 kgs. was offered. The market encountered a good general demand. Plain and low mediums were sold well but at prices 5 to 10 paise below last. Coloury mediums and Wynaad types opened about steady but eased slightly as the sale progressed. Black leaf dusts came to a lower market. Highgrowns were irregular but generally were sold around last week's rates. Milled and residual grades followed the trend of the market. Unorthodox dusts met less enquiry and were again easier.

The average price realised in dust sale No. 47 was Rs. 4.24 per kilo, as compared with Rs. 4.33 a week ago and Rs. 4.48 in the corresponding sale last year.

Colombo: The market elicited good demand. Best western brokens eased by 10 to 20 cents but other highgrowns were firm to dearer. Mediums were sold at around last prices. Uva B.O.Ps and small leaf low grown were firm to dearer. Fannings, however, were generally easier.

London: North Indian and other growths: In Monday's auction there was fair and improved demand. Assam C.T.Cs came to a lower market by 1d. to 2d. Doors C.T.Cs showed an easier tendency but orthodox descriptions were steady.

Ceylon and South Indians: As many as 23.807 packages were up for sale on Tuesday of which South India contributed 3,150 packages. There was better general demand for Ceylons with best quality and coloury medium teas selling at firm rates while others were 1d. to 2d. lower. South Indians were generally slightly easier.

As we go to press, Messrs. Forbes, Ewart and Figgis (Private) Ltd. wire:

"*Sale No.* 48: 689,000 kgs. offered. Fair general demand. Highgrowns irregular with quality. Good mediums about steady. Mediums and low mediums less enquiry. Lower unorthodox fannings firmer."

DEMAND FOR TEA SLACKENS

(From Our Own Correspondent)

CALCUTTA, *8th December*

With increased stocks of tea in the U.K.—105 million lbs. in the week ended 27th November as against 103.87 million lbs. in the previous week—demand in London auctions has naturally become subdued. This also leads to similar conditions in Calcutta export auctions. Last week's internal sales, however, met with increased demand albeit at easier rates. The increasing level of output makes buyers less keen to cover their requirements fully. Up to the 15th November, the North Indian crop aggregated 591 million lbs.. an increase of 61 million lbs. as compared to the same period of last year. The increase as compared to the same period of 1961, when there was a bumper crop, was 21 million lbs. Despite increased production, exports from North India have been lagging behind last year's level. At the same time, internal consumption has not increased; on the other hand, in view of the sharp rise in the cost of living, there is the belief that tea consumption appears to have been affected. However, South Indian production has declined in view of the earlier drought this year, the output in the first ten months of this year at only 65.9 million lbs. as against 74.3 million lbs. in the same period last year. Ceylon is also having a lower crop.

Production in Pakistan in this year is estimated at 60 million lbs. of which exports will claim only 4 million lbs. In the six months till October, Pakistani output was 50.58 million lbs. as against 44.10 million lbs. in the same period of 1963.

Despite increased production, tea gardens have not improved their profitability. Increased costs have not been followed by increased prices in auctions. If the tea industry should be enabled to play its role in the fourth Plan, no time should be lost in improving the finances of gardens so that they have adequate funds for expansion and introduction of technical innovations. New machines that have come in the market are productivity-oriented. Speaking recently at the annual meeting of the Assam Branch of the Indian Tea Association at Jorhat, Mr. S. G. B. Brown, the Chairman, contended that finances must be left with companies if they were expected to expand and increase production. The second interim wage increase, the Bonus Commission's recommendations, a further upward revision in the Assam Agricultural Income-tax, increase in sales-tax, and other impositions under the Panchayat Act, have all been recent additions to burdens on the industry.

Evidently, investment on tea gardens has become less attractive, and this is exhibited by the lack of enthusiasm for tea shares on the Calcutta stock exchange. It is to be hoped that Government accepts the recommendations of the Tea Finance Committee. The Committee has already recommended that revenue expenditure should include expenditure on re-planting and new planting. This means that such expenditure from profits would be tax-free and would meet with a definite incentive. The industry is suffering from lack of adequate medium and long-term finance for development, and if, as recommended, a Tea Finance Corporation is set up, a long-felt need would have been met.

During the internal sale held in the last week, dusts on offer were 34 340 packages, which met with a better general demand at irregularly lower prices. Clean plain and medium C.T.C. teas were nearer to last levels, but the gap in prices of fibrous sorts was higher. Good C.T.C. teas were in good demand at lower prices. Plain orthodox teas were weak, and medium Assam teas eased up to 30 p. "Teas for price" recorded a sharp decline, with legg-cut teas also showing a decline. The quotations per kg. inclusive of excise duty were: good Assam C.T.C. dust Rs. 5.60 to Rs. 6.20, medium C.T.C. dust Rs. 4.70 to Rs. 5.05, plain C.T.C. dust Rs. 4:55 to Rs. 4.70, legg-cut dust Rs. 4.50 to Rs. 4.70, medium Assam dust Rs. 4.30 to Rs. 4.70, and plain orthodox dust Rs. 3.70 to Rs. 4.30.

Leaf on offer during last week's export sale held here aggregated 78,058 chests. On lower demand, prices generally eased. Plain C.T.C. teas were taken at rates 30 to 40 paise below last rates. Medium teas also recorded a like decline. Good liquoring C.T.C. teas lost as much as 50 paise leading to some withdrawals. Plain orthodox teas eased by 20 to 30 p. Fannings received much less support. Medium Dooars B.O.P. teas were down by 10 to 20 paise with little support for fannings. Good Assam teas of orthodox manufacture were in good demand, although at slightly eased rates. Whole leaf grades shared the general trend, but Darjeeling teas were about firm. The quotations per kg. inclusive of excise duty were: good Assam C.T.C. fannings Rs. 4.80 to Rs. 5.10, good Assam C.T.C. B.P. Rs. 5.00 to Rs. 5.30, clean plain pekoe Rs. 5.10 to Rs. 5.40, medium C.T.C. B.P. Rs. 4.70 to Rs. 4.90, medium C.T.C. fanning Rs. 4.40 to Rs. 4.70, plain C.T.C. B.P. Rs. 4.40 to Rs. 4.70, plain C.T.C. fanings Rs. 4.10 to Rs. 4.30, plain orthodox fannings Rs. 3.80 to Rs. 4.00, and plain orthodox B.P. Rs. 3.80 to Rs. 4.00.

JUTE GOODS EASY

(From Our Own Correspondent)

CALCUTTA, *8th December*

Although good business was transacted in jute goods during the week under review, the report that the strike in Pakistani jute mills was being called off affected sentiment, and prices eased as the week progressed. In respect of raw jute, although mofussil prices remained above Calcutta's parity, arrivals tended to increase to erase the mid-week's gain of 50 paise per maund.

During the week under review, a good number of inquiries for gunnies were received, and substantial business was done with several destinations. The large orders which Indian mills have received for sacking from several countries including Cuba, Burma, Australia, Syria and the Philippines indicated that overseas consumers had delayed replenishment of stocks in the hope of a price fall. However, the loss of production in Philippines indicated that overseas consumers had strike led to deterioration in the stock position of overseas consumers. That explained for the receipt of orders for substantial quantities by Indian mills. Even if production were resumed in Pakistan, there would be no immediate relief. But the possibility of an easing in the present tight stock position in heavy goods explained the caution displayed by speculative buyers during the week and the consequent recession in prices, albeit in an insignificant manner. It has been a disappointment to the trade that British purchases have lagged behind, but this tendency is attributed to the 15 per cent import surcharge. Also, with the raising of the British bank rate, carrying of inventories has been made much costlier. However, the trade has noted the plea made by Mr. Shastri to the British Government, which has stated that the import surcharge is a purely temporary measure to strengthen the sterling and would be removed as soon as the economic conditions in the U.K. showed an improvement. Needless to say, the surcharge is restricting U.K. offtake of Indian goods, including jute manufactures.

Disappointment has also been caused inasmuch as, although orders from the United States has increased, the increase has been much below earlier expectations. The report that U.S. burlap consumption amounted to only 73 million yards in October 1964, as against 81 million yards in the previous month and 79 million yards in October 1963 was also received discouragingly. In the ten-month period October 1964, total consumption at 735 million yards showed a decline of 25 million yards as compared to the same period in the last year, thus reducing the monthly average so far to 73.5 million yards from 76 million yards. It is hardly likely that the fall in consumption would be made good this year. Despite increased economic activity in the United States, the lower consumption has caused some surprise, but the reason should be found in the growing popularity of the bulk handling methods and in the inroad by substitutes and synthetic fibres. The importance of the U.S. market to the jute industry in India is rated very high, and it should be said to the credit of the industry in India that in recent years it is paying much attention to research. In these days of finer and lighter packing, it is necessary that some improvement in texture is brought about to jute goods with a view to better surface. Against this background, the suggestion made by Dr. W. G. Macmillan, the Research Director of the Indian Jute Mills Association, at the recent conference of research directors of jute manufacturing industries of India, the United Kingdom and Pakistan, to form a combination of jute fabrics with such commodities as plastics through coating and laminating techniques is timely.

Dr. Macmillan spoke about the need for scientific liaison to eliminate unnecessary duplication of research, since there was no time to be wasted if the jute industry should be enabled to face competition as a result of the latest advances in fibre utilisation. The industry was engaged in research in several countries, but to enable it to keep abreast of development in the packaging techniques it was necessary that the resources of the industry should form a composite world body so that co-ordination in scientific research would eliminate waste and accelerate further progress. In this respect, the convening of the conference by the I.J.M.A. has been a step in the right direction, as this has given an opportunity for an exchange of ideas on scientific matters among research workers in the three most important countries, where most of the world's manufacturing capacity has been installed. Inaugurating the conference, the I.J.M.A. Chairman, Mr. R. H. Morrison, said that the same would help evolve a well-knit programme of long-range research through an interchange of ideas and experience. He said that the most searching investigations were necessary to find means not only of retaining price levels for the fibre which would at one and the same time encourage its production by the cultivator and its consumption in the form of finished products, but also of deciding just what qualities in the various strains produced were most desirable from the industry's point of view. He also spoke of the importance of developing by-products from jute sticks, and of the need to develop machinery with greater productive efficiency to enable the industry to cut down costs as well as improve quality. This was a surer way to meet the threat from substitutes and synthetics.

As planned, workers in jute mills struck work on 1st December in furtherance of their demand for payment of bonus in accordance with the recommendations of the Bonus Commission as accepted by the Government of India. Workers are already in receipt of annual bonus in terms of the award given by the Wage Board for the jute industry, and mills have pointed out that the award should be observed for the period it relates to. The dispute is to be discussed in New Delhi on 19th December by the tripartite industrial committee on jute. This proposed discussion as well as the Union Labour Minister's appeal to workers not to precipitate the issue by going on strike were ignored by workers' organisations. Output loss as a result of the day's strike was estimated at Rs. 1.2 crore, and workers' loss of wages at Rs. 12 lakhs.

The prevailing higher prices for paddy have made such of the jute cultivators as grow paddy also, indifferent to sell fibre. This has led to mofussil prices to remain at above Calcutta's parity. Reports of a rise in prices in Pakistan also encouraged such a trend. However, as the week progressed, arrivals increased and the mid-week rise of 50 paise per maund was negatived, the latest quotations being Assam bottoms Rs. 36.00, northern bottoms Rs. 35.00, and daissee bottoms Rs. 37.00. Mills showed preference to buy selected grades, the offerings of which were limited.

Substantial quantities changed hands in the goods market, a good portion of them going into the hands of genuine buyers. Overseas demand for sacking goods continued unabated, despite the possibility of Pakistani mills resuming production. Shipping space was in good demand for several destinations. On Tuesday last, ready B. twills hardened to Rs. 157.35 from Rs. 156.55 on the previous day and hessian 40" 10 oz. to Rs. 50.35 from Rs. 50.25. This followed good covering business in both the constructions. The feature on Wednesday was business with Australia in woolpacks and cornsacks for both immediate and forward shipments. Although hessian 40" 10 oz. hardened to Rs. 50.85, B. twills eased to Rs. 155.60 on the news of the possibility of resumption of production by Pakistani mills. Australia turned again buyer of woolpacks for all deliveries on Thursday, but B. twills fell to Rs. 154.75. In sympathy, hessian 40" 10 oz. eased slightly to Rs. 50.70. Covering demand on Friday pushed up B. twills to Rs. 156.25 and sentiment was also aided by report of business on Government account. However, hessian 40" 10 oz. shed further to Rs. 50.55. Covering business was again a feature over the week-end, despite which B. twills eased to Rs. 155.25 and hessian 40" 10 oz. to Rs. 50.15. The recession followed selling pressure in the futures market. There was definite news during yesterday that Pakistani mills resumed work. As a result, ready B. twills eased to Rs. 154 and hessian 40" 10 oz. to Rs. 49.95. Loss of foreign exchange to Pakistan as a result of the strike is estimated at Rs. 7½ crores, and that of production loss at 48,000 tons.

COPPER SCRAP HARDENS

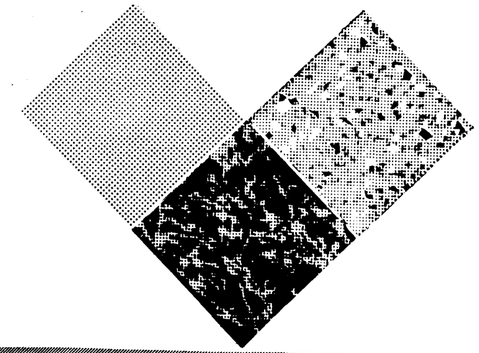
(From Our Own Correspondent)

CALCUTTA, *8th December*

Prices in the Calcutta metal market during the week under review maintained recent gains. Conditions on the London Metal Exchange also continued to be buoyant, but it would appear that the uptrend in respect of copper and tin had been fully spent as in recent weeks both the quotations tended to look back. On the other hand, both lead and zinc forged ahead, with the new high of £142½ having been touched on 28th November.

On the London Metal Exchange, spot tin opened at £1,405-£1,415 and eased to £1,380-£1,385. The decline was attributed to a fall in demand by Japan and the U.S.S.R. and to the belief of a visible increase in production in some areas. However, uncertainty continued to prevail over the U.S. General Services Administration's future disposal policy. It was reported that the G.S.A.'s recent discussions with the U.S. tin trade were not useful. The U.S. Steel Companies would welcome futures buying of Government tin. It was, also suggested that the release price should be based on Penang (Malaya) quotations rather than on the New York quotations. The raising by the International Tin Council of the floor and ceiling prices of tin to £1,000 a ton and £1,200 from £850 and £1,000 respectively has met with sharp criticism in producing countries.

While Bolivia thought the new ranges were more realistic but that it should continue to press the I.T.C. for measures leading to increased production and price stability, Malaysian opinion



GREATER STYLE with new

VYNATILE

WONDERFUL PLASTIC TILES FOR FLOORS!

There's nothing like VYNATILE—the unique new floor covering! Strong, flexible and beautiful, VYNATILE does wonders for rooms—looks distinctive on any floor. Ideally suited to offices, shops, restaurants, showrooms, banks, theatres, homes and hospitals!

Choose VYNATILE in 180 cms x 90 cms sheets, in thicknesses of 1.5 mm. or 2 mm. Or ask for it in any economical size. Better still, take it as tiles to fit into your scheme of things!

VYNATILE...better in so many ways!

- So durable. Won't rot, crack, break or scratch!
- Can be used on any surface!
- Superbly finished. In 28 attractive colours and patterns!
- Can be wiped clean in seconds!
- Professionally laid to last for years!

B1-BI-4

would not consider the price as affording incentive for new investment. However, the mining industry in Malaya has pointed out its apprehension of a possible world surplus in the near future and emphasised the desirability for the renewal of the International Tin Agreement to control sales and prices. The present agreement will expire on 30th June 1966, and the I.T.C. Chairman, Mr. H. W. Allen, while announcing the new price ranges (the lower sector £1,000-1,050, the middle sector £1,050-1,150, and the upper section £1,150-1,200) ruled out any possibility of a further revision for the rest of the agreement period. Since the new prices are much lower than the ruling quotations and the I.T.C. cannot do anything to bring them down in line with its prices, the I.T.C.'s new range is of only academic interest. The possibility of greater releases from the U.S.A. has been hinted at in overseas reports. In Calcutta, the price was maintained at Rs. 3.350 per 100 kgs.

Spot copper wire-bars on the L.M.E. rose from £493-498 to £500-507½ and eased to £485-490. Cathodes after hardening from £480-490 to £492½-500 closed at £490-500. Fire-refined copper was unchanged at £425. In Calcutta, utensil copper scrap hardened from Rs. 690 to Rs. 710 per 100 kgs. The trade noted with satisfaction the increase in export of non-ferrous metal manufactures in the first eight months of this year to Rs. 1.65 crores from Rs. 1.52 crores in the same period of last year. It would, therefore, plead for increased import of inputs. Electrical wires and cables are being exported in increasing quantities, but output is being affected in view of the paucity of basic metals. Mr. H. F. Oppenheimir, Chairman of the Anglo-American Corporation, declared that inasmuch as consumers were being forced to obtain their requirements at much higher prices than the producers' price of £260 a ton and the Chilean price of £280, this meant that fabricated copper was uncompetitive.

Spot lead on the L.M.E. after reaching a high of £141-142 was quoted this week at £138½-139. Spot zinc was also firm at £130½-132. In Calcutta, zinc rose from Rs. 460 to Rs. 464 per 100 kgs. and lead was unchanged but firm at Rs. 345.

FOODGRAINS FIRM

(From Our Own Correspondent)

HAPUR, *7th December*

Foodgrain prices continued firm as supplies in the open market were very poor. Ration shops too were faced with paucity of stocks, and despite U.P. Government's declaration that ration has been increased to 8 kilogrammes a unit per month, even half the quantity is not made available. U.P. Government's procurement policy for building a buffer stock of four lakh tons out of *kharif* grains, is yet under very early stages as only 15 per cent of the target has been purchased so far. Arrivals of *kharif* grains in markets were very poor and growers were withholding their produce.

Wheat attracted brisk consumers' support in the face of poor arrivals. Prices advanced by Re. 1 to Re. 1.50 per 40 kilogrammes, to be quoted at the week-end at Rs. 37.50 to Rs. 38.50 for average quality and Rs. 39 to Rs. 40 for farm produce, against Rs. 17.50 per 40 kgs. at fair price shops. Stocks were reported to be nominal and fair price shops had inadequate supplies. Steadier conditions continued in rice, which registered good gains on small arrivals. Prices hardened Rs. 2.50 to Rs. 5 per 40 kilogrammes, according to quality. Week-end prices were:—Rice *basmati* superior Rs. 42 to Rs. 43.50, *sela* Rs. 39 to Rs. 40, *mainpuri* Rs. 29 to Rs. 31 and *ramajwayan* and *raimunia* Rs. 27 to Rs. 29 per 40 kilogrammes.

Meagre stocks against good demand accounted for further steadiness in gram prices, which hardened upto Rs. 2 per 40 kilogrammes, to be quoted between Rs. 32 to Rs. 33. Maize was not easily available in open market and its price firmed up to Rs. 25.75 to Rs. 26.75. Barley and *bejhar* however stayed steady at Rs. 29 to Rs. 29.50 and Rs. 28 to Rs. 29 respectively, as stocks were negligible. *Juwar* ruled quiet while *guwar* improved fractionally on good demand. *Bajra* and other coarse grains also tended to rise in sympathy. Week-end prices were:—*Juwar* Rs. 24, *guwar* Rs. 26, *methi* Rs. 28 to Rs. 29, *bajra* Rs. 26.50 to Rs. 27, and oats Rs. 29 to Rs. 30 per 40 kilogrammes.

Pulses were also steadier during the week on brisk outside buying enquiry. Peas improved further by Re. 1.50 and prices ruled between Rs. 31 to Rs. 32 for *dara* quality and between Rs. 32.50 to Rs. 33 for farm quality. *Arhar* and its *dal* ruled firm due to poor supply position. *Urd* and *moong* recorded further gains on smaller arrivals. *Masoor* prices shot up by Rs. 5 on good demand. Other dal prices ruled firm in sympathy. Week-end prices were:—Peas *dal* Rs. 32, *arhar* Rs. 37 to Rs. 39, *arhar dal* Rs. 47, *urd* Rs. 28 to Rs. 31, *urd dal* Rs. 37.50 to Rs. 38.50, *moong* Rs. 37 to Rs. 40, *moong dal* Rs. 45 to Rs. 46, *masoor* Rs. 38 to Rs. 43.50, *masoor dal* Rs. 48 and gram *dal* Rs. 40.50 per 40 kilogrammes.

SUGAR STEADY

(From Our Own Correspondent)

HAPUR, *7th December*

Sugar prices in the open market continued steady at Rs. 180 to Rs. 185 a quintal. Sugar factories here in west U.P. are facing shortage of cane as growers have demanded an increase in prices of cane to Rs. 3 a maund as against Rs. 2 sanctioned by the Government. Two factories in this region have already stopped working due to strike by growers and other, too, were working at a low speed as cane supplies were far short of their requirements. In the Muzaffarnagar and part of the Meerut district, the two main cane growing areas, cane crop has suffered very heavily and is drying up and losses on this account in some areas is about 50 per cent. The Union Government, in consultation with the U.P. Government, is likely to impose some regulatory measures to see that cane in adequate quantities reaches the factories. Sugar production as a whole may be hit due to this demand of the cane growers.

Deshi khandsari prices again turned steady in the wake of brisk demand against import permits. Heavy despatches to Gujarat, the Punjab, Maharashtra, M.P. and Rajasthan were reported. Crushers, manufacturing *khandsari*, began operations here as well as in Muzaffarnagar and were purchasing cane at Rs. 5.50 per quintal as against Rs. 5.04 paid by factories at outstations. Prices of white-creamish *khandsari* spurted by Rs. 5 to Rs. 120-145 a quintal. New *khandsari* reaching from other areas fetched from Rs. 147.50 to Rs. 150 per quintal in the Muzaffarnagar centre. Stocks of old stuff were fast running down and *galawat* quality was being quoted at Rs. 100 to Rs. 120 a quintal.

Ready *gur* and *shakker* prices stayed steady despite marked increase in daily arrivals here as well as in all mofussil centres. Persistent rumours that Government is imposing price control on *gur* also added to the demand as consuming centres wanted to build stocks before the price or movement control is enforced. Daily arrivals here were about 8,000 maunds and week's offtake aggregated sixty wagon-loads mostly to Gujarat, M.P., Rajasthan and Bengal. Week-end prices (per 40 kgs.) were, *pansera* superior Rs. 30, average Rs. 29, *balti* Rs. 33 to Rs. 34, *shakker* Rs. 35 to Rs. 36.

Gur chaku prices firmed up in the Muzaffarnagar market during the week on hectic alround buying. Prices in other sections also improved despite marked increase in daily arrivals. Week's arrivals around 90,000 maunds were readily lifted.

NEW CEMENT FACTORIES TO BE SET UP

The Government of India has licensed additional capacity for setting up new cement factories and expanding the existing units to the extent of 4.47 million tonnes. Advance approval has also been given for a capacity of 8.9 million tonnes of cement. On the basis of progress made so far under these schemes, it is expected that, by the end of 1964-65, additional capacity of 750,000 tonnes will be commissioned for production, bringing the industry's total capacity to 11.25 million tonnes. During the next year, that is, 1965-66, further augmentation capacity by about 1.75 million tonnes is expected to be achieved. These figures were furnished by the Union Minister for Industry and Heavy Engineering, Mr. T. N. Singh, in the course of a statement laid on the table of the Lok Sabha on 4th inst. in reply to a question by Mr. Y. S. Chaudhary and seven others.

The Minister, who was detailing the steps taken by Government to meet shortage of cement in the country, said that, in order to stimulate the maximum utilisation of the existing capacity, an incentive by way of extra price had been offered to producers. This extra price was payable on the excess production achieved in the year 1965 over the best annual production for the three years ending 1962. This incentive scheme had been in force in the year 1963 as well and had been responsible for increase in production of about 500,000 tonnes. Proposals for the import of balancing equipment by the factories for maximising the utilisation of capacity were under examination. Augmentation of production was also being achieved by utilisation of blast furnace slag and pozzalanie materials. The Minister stated that a new slag cement factory with an annual capacity of 290,000 tonnes had just gone into production.

In order to promote the steady growth of the cement industry, the Government, according to Mr. Singh, hoped to set up shortly the Cement Corporation of India, a private limited company fully owned by the Government. The three principal functions of the Corporation would be: survey, prospecting and proving of limestone deposits in the country, establishment of capacity for manufacture of cement and ancillary and supporting activity for building up the cement industry in the country, including the development of expertise. The present production in the industry the Minister said, was of the order of 9.5 million tonnes per annum, as against the annual demand estimated at about 12.5 million tonnes.

Indian research projects aimed at making wheat more rust-resistant and at finding chemical compounds to control plant virus diseases are the recipients of two grants aggregating more than Rs. 9 lakhs from the U.S. Government. The grants are from U.S. owned rupees received from the sale of agricultural products supplied to India under the U.S. P.L. 480 (Food for Peace) Programme. One of grant of Rs. 743,398 is to the Indian Agricultural Research Institute, New Delhi. The Institute is undertaking a five-year study on the characteristics of wheat which make it resistant to the damaging fungi commonly known as wheat rust—a major cause of foodgrain losses. The second grant (Rs. 188,300) is to the University of Lucknow for a five-year study of the use of antiviral compounds—chemicals found effective in checking the action of certain viruses—to control plant diseases. The general information obtained from these studies is expected to be useful in working out a principle for finding new antiviral compounds.

* The production statistics relate to six 'A class' units only. Hence the index based on their production has been inflated by the ratio of production of all units in 1961 to production of six 'A class' units in that year.
† Due to non-availability of production data, July 1964 figures has been repeated.

Note : The figures relate to Government Railways. Figures include Broad and Metre Gauges. The monthly figures are progressive from April and incorporate revision in respect of earlier months. *Source :*—Ministry of Railways.

STOCK & SHARE QUOTATIONS

Abbreviations :—D.—Deferred shares. P. O.—Preferred Ordinary shares. Y.—Accounts published yearly. H.—Accounts published half-yearly. F.—Company has Preference shares. T.—Company has Debentures. N.—Nominal quotations. x.d.—Ex. Dividend. c.d.—Cum. Dividend. I—Interim Dividend. C.R.—Cum. R'ght. XR.—Ex. Right.

Shares :—If a company has different classes of shares—as for example : ' A ' shares and ' B ' shares—these are indicated by the same letters ' A ' and ' B ' under the columns ' Paid-up Ordinary Capital ' and ' Paid-up ' per share.

Accounts :— Figures in the Accounts Closed column represent the months or the year in which the respective companies close their accounts, 6 and 12, for instance, indicate the months of June and December, respectively. Reserves include general and other reserves and all other funds which a company may have excluding depreciation fund, reserves for tax liability and provident fund. Block represents actual cost of land, buildings, machinery and all other items on which depreciation is allowed less sales, if any, and stands for the gross figures except where otherwise indicated.

Dividends :—Dividends for completed years are shown as amount per share per annum, but where quoted for portion of a year they represent the proportionate dividend for that period. In the case of those companies which close their accounts yearly dividends shown are for their financial year.

VOL. CIX. No. 2800 BOMBAY, 19th DECEMBER 1964 PRICE Rs. 2

CAUSTIC SODA AND SODA ASH DEPROTECTED

CAUSTIC soda and soda ash—two basic chemical raw materials used in a variety of industries—are among the sixteen commodities which have been freed from price controls since December 1963. Of the two, the former has been in the news in recent weeks because its supply has fallen very much short of demand, leading to a steep rise in prices. A somewhat similar, albeit not quite so alarming, trend seems to have been in operation in the field of soda ash supply too. In either case the price trend has been such as to cause disquiet to consuming industries and invite the Tariff Commission's condemnation. The Commission's reports on the question of protection to the caustic soda and soda ash industries, released this week, have examined the price changes since decontrol and passed strictures on the manufacturers, most of whom have put up the prices. This is what the report on caustic soda industry has to say on the aftermath of decontrol: "The decontrol of prices of caustic soda should not have been taken as an occasion for raising its price without adequate justification. Caustic soda is a basic chemical and any rise in its price will have a cumulative effect on the prices of all other products depending upon it. ... Decontrol was meant to serve as an incentive to increase production rather than as an opportunity for profiteering." In regard to soda ash, too, the Commission has observed that decontrol should not have been construed by the manufacturers as an occasion for making substantial changes in its prices, adding that a certain amount of self-restraint is called for on the part of producers in a *protected* industry in the interests of national development.

Although the two protected industries have thus not played fair by the consumer in the last one year, the Tariff Commission has generously recommended continuance of protection to them on the principal ground that tariff protection for a further three years up to the end of 1967 is necessary to increase their production and thereby reduce their costs. The Commission's arguments, in this connection, have run counter to the opinion of some consumers in the case of caustic soda and to the deprotection plea advanced by the producers themselves in the case of soda ash. The demand for protection voiced by caustic soda manufacturers and supported by the Directorate General of Technical Development has obviously appealed to the Commission. The industry's argument, it will be recalled, was to the effect that, since imports of caustic soda were necessary to make up the shortfall in indigenous production and as import prices were lower than internal costs, they would impair the growth of the Indian industry in the absence of tariff protection; the Technical Development Directorate's argument was that continued protection was necessary to increase production and reduce costs. The Commission has found no difficulty in rejecting the deprotection plea advanced by some consumers, for several other consumers had no objection to possible continuance of protection, if, at the same time, increased imports of caustic soda, self-sufficiency within a reasonable time and restraint on prices during the transitional period could be ensured. In regard to soda ash, however, the Commission has had to argue the case for continuance of protection to it more elaborately and with greater difficulty in view of the manufacturers' own stand that continuance of tariff protection to the industry would be unnecessary in the context of import restrictions which might continue indefinitely because of balance-of-payments difficulties. This is how the Commission has presented the case for continuance of protection to the soda ash industry:

"... But the manufacturers averred at the public enquiry that, in the event of any easing of import restrictions, the industry, which stood in need of help in various ways, could *not* withstand foreign competition. ... While indigenous output of soda ash is not still adequate to meet essential domestic demand, its cost disparities *vis-a-vis* imports have grown wider. Further, import restrictions dictated by economic expediency are in no sense part of a scheme of tariff protection and constitutes no suitable alternative to duty protection and the watch over an industry's progress going with it. In the circumstances, we do not consider the industry is yet in a stage to be deprotected.

"... In the existing circumstances, protection to the industry is more to bring it within the sphere of developmental measures that are being offered to protected industries than to offer a mere equalisation of price differential between indigenous production and imports. ... The effect of deprotection and removing the scope for independent scrutiny of the performance of producers may make them less cost-conscious. ... At present, while the producers are not able to reduce their costs of production, the consumers have not only to suffer uncertainties of availability but also bear the burden of high prices. This is a problem that could be alleviated only by the State sponsoring the cause of both the producers and the consumers by offering suitable measures to bring about reduction in the cost structure and also to meet the scarcity of supply by encouraging enhanced production of the existing units and also by setting up new units for the purpose. ..."

The Government, however, has just rejected the Commission's recommendation that protection to caustic soda and soda ash industries be continued beyond 31st December 1964. The stand taken by the Government, in this connection, is that, "having regard to (i) the progress the two industries have made so far and (ii) the fact that in the present circumstances there is no likelihood of any unhealthy competition from imports" following deprotection, there is no case for continuance of protection. The Government's explanation is all too brief, being confined to the words within inverted commas in the foregoing sentence. It has, at the same time, decided to continue the statutory rates of duty on caustic soda and soda ash as revenue duties. In effect, therefore, the equalisation of price differentials between indigenous production and imports will continue and the Government will realise a sizable revenue from imports of caustic soda and soda ash. The two grounds on which the Government's decision has been based would, however, need to be examined in the light of facts and figures found in the Commission's two reports.

To take production and demand trends in respect of caustic soda first. Domestic production in 1963, it is seen, amounted to 152,000 tonnes, while imports in that year came to 68,000 tonnes. The apparent consumption thus aggregated 220,000 tonnes. Agreed estimates of demand by consuming industries (of which the major ones are soap, textiles, paper and paperboard, rayon and aluminium) add up to 272,000 tonnes for 1964, 307,000 tonnes for 1965, 362,000 tonnes for 1966 and 412,000 tonnes for 1967. But estimates of production for these four years reveal shortfalls in domestic supplies of 90,000 tonnes, 70,000 tonnes, 58,000 tonnes and 82,000 tonnes, respectively. These shortfalls, according to the Tariff Commission, will have to be met from imports. Since the maximum limits to import licensing will be set by these estimated shortfalls in domestic supplies, there is, in our opinion, no reason to believe that domestic manufacturers may have to face undue foreign competition. Moreover, import prices (including duties) will be more or less on par with domestic ex-factory prices. In any case, caustic soda imports will continue to be channelled through the State Trading Corporation which has taken the responsibility to cover the gap between indigenous production and estimated demand and which is certainly not going to—in fact, as a consequence of the equalisation of price differentials between domestic and imported caustic soda through the existing statutory rates of import duty, will not be in a position to—indulge in any unhealthy competition with the manufacturers by any drastic undercutting of the latter's prices. If at all, the S.T.C. may sell at fair prices comparable more or less to pre-decontrol prices and that will have a healthy restraining impact on the domestic prices of caustic soda which have been put up since decontrol, besides providing a spur to manufacturers to reduce costs in all possible ways. The chances of cost reduction and expansion of production would be greater, at least in theory, in the context of decontrol-cum-deprotection than they have been in the last one year of decontrol-cum-protection. It would thus appear that the Government's decision to deprotect the caustic soda industry is a wise and shrewd move. Only, at the same time, energetic steps must be taken by the Central and State Governments to implement the Tariff Commission's other recommendations which have a bearing on production, cost reduction and utilisation of by-products.

As for soda ash, its production and demand trends also reveal shortfalls in domestic supplies. It has been estimated that, as against an apparent consumption of 302,000 tonnes (including 15,000 tonnes of imports) of soda ash in 1963, the probable demand for the four years from 1964 to 1967 would be 402,000 tonn

importance to the argument. Perhaps, it feels confident that it can keep the deprotected industries under watch and control in other ways. It now only needs to be added here that the Government should actively encourage further expansion in the capacity of the industry and also conserve the resources of limestone (a vital raw material) on the lines recommended by the Tariff Commission. For its part, the industry would do well to heed the Commission's advice that sizable economies in production should be achieved through some form of structural reorganisation.

DYESTUFF INDUSTRY

UNTIL the end of the First World War, India was the principal supplier of natural dyes such as indigo and lac. But the importance of these dyes receded greatly during the period from 1919 to 1939, following the remarkable development of synthetic dyestuffs in several Western countries, especially in the United States, Britain, Soviet Russia and Japan, and the indigo plantations ultimately died. The pace of development of synthetic dyes got accelerated during the war (second) and post-war years. The progress would not have been so spectacular but for all the active support and assistance received by the industry from the Governments of the countries concerned. In Britain, for instance, the Dyestuffs Importation Act of 1920 protected the domestic industry by allowing imports of only such dyes as could not be manufactured in the country at a reasonable price; the Act was extended in 1940. In the U.S., imports of dyes are regulated on top of a high levy and, in Japan, such measures as subsidies and licensing have been adopted to foster the growth of this industry. Thanks to the phenomenal progress of the synthetic dyestuff industry in other countries, on the one side, and the marked rise in the demand for synthetic dyestuffs from several consuming industries (textiles, paper, leather, etc.), on the other, the position of India changed from being an earner of foreign exchange through exports of natural dyes in the first two decades of this century to that of a spender of foreign exchange on large-scale imports in the 'forties and 'fifties. The actual annual value of imports before Independence was of the order of Rs. 15 crores. It was the Dyestuff Exploratory Committee (appointed in 1945 by the Council of Scientific and Industrial Research) that opened the eyes of the authorities to the imperative need for a rapid development of the dyestuff industry. And it was the 15-year plan formulated by this Committee that marked the beginning of a full-fledged dyestuff industry in India, though the first indigenous enterprise (on a small scale) had been launched by the Associated Research Laboratories of Bhatgar in 1940. The industry, however, received a real impetus only in 1955 when the Government of India, on the recommendation made by the Tariff Commission, granted tariff protection for full ten years, that is, up to the end of 1964.

It must certainly be said to the credit of the dyestuff industry that it has endeavoured its best to fulfil the obligations of a protected industry. Not only has the installed capacity of the industry expanded significantly (from a bare 2,022 tonnes in 1954 to as much as 22,892 tonnes in 1964), but actual production also has registered an appreciable rise (from no more than 674 tonnes in 1953 to over 9,260 tonnes in 1963). What is more, the range of production has been diversified, the principal items of manufacture being azo dyes, sulphur dyes. azoic dye components (naphthols and fast colour salts), pigment printing emulsions and miscellaneous dyes. It may be noted here that the textile industries alone account for 90 per cent of the aggregate consumption of dyestuffs. Further, there has been a considerable improvement in quality, especially in respect of stability and consistency in strength and shade. It is gratifying to learn that most of the producers in the organised sector—this sector consists of 21 units, besides the 120 units in the small-scale sector—have set up well-equipped laboratories to carry out research and other developmental work connected with the industry, besides having up-to-date analytical laboratories for testing raw materials for purity and finished dyes for strength and shade at various intermediate stages. Indeed, the Tariff Commission, in its latest report (1964), says that the quality of the dyestuffs manufactured in India by most producers is, by and large, found satisfactory. This testimonial should not, however, engender any sense of complacency among dyestuff producers. For the quality of dyestuffs, as that of any other material, does not remain static; it is ever-changing, thanks to technological inventions and the varying needs of users. The Tariff Commission itself has emphasised that there is still room for further improvement in the quality of dyestuffs made in this country. At any rate, the industry will have to make renewed efforts to maintain the highest quality standards if it is to overcome the generally deep-rooted prejudice against indigenous dyestuffs among consumers who prefer imported materials, if given the choice.

The quantitative and qualitative performance of the dyestuff industry is on the whole impressive. And it is a matter for much satisfaction that the industry has not put up the prices of its products, despite heavier wage bill, higher prices of raw materials and increases in the other elements of manufacturing cost. Actually, since 1962, the prices of azoic and solubilised vat dyes have either come down or remained constant and, in the case of naphthols, prices in one case have been uniformly reduced; the same is true of fast colour bases. Of course, as compared with the prices of imported items, the prices of indigenous dyestuffs are higher. But it is still too early to blame the industry for this state of affairs. It is still an infant and cannot stand comparison with the giants in the developed countries. Its units are relatively small and do not, therefore, enjoy the economies of scale. Further, while there may be scope for a further reduction in prices, one should not ignore the general impact of inflation on the dyestuff industry. This consideration apart, it would be wrong to expect a reduction in the prices of dyestuffs until the industry is in a position to obtain the requisite supplies of intermediates at reasonable prices within the country. Out of the 300 intermediates (primary and complex) needed by the dyestuff industry, only ten are produced in the country and the rest are imported. Even in respect of intermediates produced in the country, there is said to be a large deficit in production as compared with the actual demand, except in the use of nitro benzene and sulphanilic acid.

OUR NEXT ISSUE

With this issue of "Commerce" we conclude our regular issues for 1964, as, in the next two weeks, we will be preoccupied with our customary Annual Number. Our next regular issue will be the one dated 9th January 1965.

The Annual Number will be of 252 pages of our usual size and will contain, besides the review of all the aspects of Indian economy in 1964, over 50 feature articles on a variety of subjects contributed by eminent economists, administrators and businessmen.

While the Annual Number will be free to regular subscribers, a limited number of copies will be available for sale at Rs. 10 per copy.

We take this opportunity of wishing all our readers Merry Christmas and a Happy and Prosperous New Year.

EDITOR

Judged against this background, it is clearly apparent that the dyestuff industry in India, as the Tariff Commission rightly points out, cannot become self-sufficient and independent as long as the intermediates needed in substantial quantities are imported from abroad. It is, therefore, heartening to learn that some units have already been licensed for establishment in the private sector to produce the majority of intermediates and that these units will be able to produce in course of time all the intermediates (excepting a few) needed in large quantities. Appropriately enough, the Tariff Commission has recommended the release of adequate foreign exchange for import of equipment and raw materials required for producing intermediates. In view of the acute scarcity of foreign exchange and the continuously deteriorating balance of payments position, apparently, the Government of India has not been able to accept this recommendation wholly. All that it has said is that it has taken note of the Commission's recommendation and that steps will be taken to implement it "as far as possible."

Till such time as sufficient capacity for the production of intermediates is built up within the country, there can be no escape from imports. Owing to inadequate supplies of intermediates, a considerable part of the dyestuff industry's capacity continues to remain idle, the actual extent of idle capacity being 45 per cent in the organised sector and 73 per cent in the small-scale sector. It is a pity that so much of capacity installed at a heavy outlay is remaining unutilised. The country cannot afford such waste of capital resources. Besides, it adds to the cost of production. The least that can be done is to bring down the cost of imported intermediates. The Tariff Commission has, therefore, struck a note of realism when it urges imports at a concessional rate of duty of intermediates which are not produced in the country. The four specific suggestions made by the Commission which the Government of India has done well to accept are: 1. Thirty specific intermediates should be granted the concessional rates of duty of 10 per cent *ad valorem* (standard) and nil (preferential); 2. the existing concessional rates of duty on H-acid, Chicago-acid, Gamma-acid and J-acid urea should be extended to their corresponding salts; 3. beta naphthol should continue to be exempted from the payment of countervailing excise duty till the domestic production of this commodity is established; and 4. the existing duty concession in respect of dimethylaniline must be continued, provided this intermediate is used in the manufacture of dyestuffs only.

The aggregate annual production capacity of the dyestuff industry (as of early 1964) is, as already stated, about 22,900 tonnes which is well above what is actually needed to meet the current and prospective demand, estimated at 11,800 tonnes in 1964, 12,500 tonnes in 1965, 13,200 tonnes in 1966 and 14,000 tonnes in 1967. When there is already in existence surplus capacity and considering the heavy under-utilisation of capacity, one fails to understand the reason why the Government of India has licensed an additional capacity of 1,266 tonnes in the small-scale sector (746 tonnes through expansion of 4 existing units and 520 tonnes through establishment of 10 new units). Evidentally, this is a case of favouritism for the small producer in the name of socialism, ignoring economic realities. The crux of the issue here is whether there is need for so many small producers of dyes. It is a pity the Tariff Commission did not go into this question.

As for tariff protection proper, the Government of India has accepted the Tariff Commission's recommendation for extending protection for dyestuffs covered by Indian Customs Tariff item Nos. 30 (15 and 16) naphthols and 2-amino-anthraquinone by a further period of three years—that is, up to the end of 1967—at the existing *ad valorem* rate of 20 per cent (exclusive of surcharge and the countervailing excise duty), 50 per cent and 55 per cent (45 per cent preferential) respectively. The Government has also accepted the Commission's recommendation for similar extension of protection for fast colour bases, benzanthrone and beta-oxy-naphthoic acid, though it has reduced, contrary to the Commission's recommendation, the *ad valorem* rates of duty from 100 per cent to 75 per cent for the first item, from 100 per cent (90 per cent preferential) to 75 per cent (65 per cent for the second item, and from 80 per cent (70 per cent) to 75 per cent (65 per cent) for the third item. The Commission, it may be noted, had recommended the continuation of the *status quo*.

In deciding to continue protection to the dyestuff industry as above, the Government of India has been swayed by the following remarks of the Tariff Commission:

"The dyestuff industry occupies a very important place in the industrial development of a country, as its proper growth not only contributes to strengthening the national economy but also encourages the technical progress in the entire field of organic chemical industry. Although during the last ten years, the dyestuff industry has recorded a remarkable expansion of capacity and production and has developed new lines of manufacture, it is not yet established on sound footing. For it continues to depend upon imports for a large number of intermediates required by it. This unsatisfactory situation was largely due to non-implementation of H.O.C's (Hindustan Organic Chemicals) plans as originally envisaged by Government. Further, owing to our balance of payments difficulties, the industry is unable to obtain its full requirements of raw materials as a result of which it is saddled with large idle capacity which adds to its cost of manufacture. Government have already sanctioned capacities for the manufacture of some intermediates... The industry has already on hand various schemes of expansion and diversification of the range of its products, including certain intermediates. To encourage the balanced growth of the different sections of the industry, we consider it necessary to protect the industry as a whole."

The objectives for which the Tariff Commission wanted extension of protection to the dyestuff industry are no doubt clear, but one may argue whether these objectives cannot be achieved by deprotection, as the industry has already attained sufficient maturity and is in any case protected by stringent import controls. This, however, is rather a superficial view. The reasons given by the Tariff Commission are sound and the Government's concurrence with the Commission is quite justified. The industry, for its part, must take all possible steps to improve its efficiency and bring down production costs.

MARKET GOSSIP

An Unimpressive Performance

THIS year's Madon Memorial Lecture at the Indian Merchants' Chamber, Bombay, under the auspices of its Economic Research and Training Foundation, delivered by Dr. V. K. R. V. Rao, a Member of the Planning Commission, on the "Banking Structure and Policies in a Developing Economy: India" must have come both as a disappointment and a pleasant surprise to many who may have expected him to reveal his mind on the issue of nationalisation of commercial banks, particularly because, in the stormy controversy over the issue last year, he was widely credited to be the author of a detailed blueprint for nationalisation of banks. It must have been a disappointment because much of his lecture was merely factual and a pleasant surprise because he chose to be silent on the issue of nationalisation. Whatever be the reasons that induced Dr. Rao to ignore this controversial issue, the fact that he ignored it completely is significant. May be, Dr. Rao realised that it would serve no useful purpose to raise an issue that is dead for all practical purposes. It is also possible that he did not want to hurt the sentiments of his audience which consisted mostly of businessmen and free enterprisers, by propounding extremist views. It is also possible that Dr. Rao himself never really held the extremist views attributed to him on nationalisation of banks, though he had not cared to contradict them and silence could be construed as consent. In any case, even if he held those views, he chose not to give public expression to them on this occasion and has missed an excellent opportunity of joining issue with the protagonists of banking in the private sector.

The main theme of Dr. Rao's lecture was confined to a recital of the major fundamental changes that have taken place in the banking structure and policy and facilitated economic development and progress of the economy in the fields of both agriculture and industry. These changes have taken two forms. First, initiative has been taken by the State for setting up new institutions in the banking sector and for supplying them funds with the primary object of meeting the capital requirements of industry for rehabilitation, expansion and diversification. Secondly, banking policies of the private commercial banks as well as the State Bank of India have been given a change of direction, in order to give greater attention to the short and medium-term financial requirements of industry in the private sector and have been reoriented to satisfy the needs of the weaker sectors of the economy such as the small-scale industries, co-operatives and export markets.

Almost half of Dr. Rao's lecture was devoted to a simple description of the objects, capital structure, organisation, functions and operations of the various specialised institutions set up in the public sector with the financial and administrative assistance provided by the Government and the Reserve Bank, without making any effort to analyse the problems of development financing faced and solved by the institutions concerned. The other half also was mostly descriptive, supplemented with a lot of statistical details; it was only a chronicle of the changes in banking techniques and policies initiated by the State Bank in the public sector and the other commercial banks in the private sector, in order to meet the needs of the developing economy; it was also devoid of any effort to evaluate and compare their relative performance. Dr. Rao himself admitted this deficiency when he said that his review was "brief and somewhat cursory, partly in view of the time factor and partly because of the special interests" of his audience. It was not clear what he meant by "special interests" here. He, however, promised to "rectify this (deficiency) in the printed copies of the address" that would be published shortly.

In short, the entire lecture failed to come up to the standards of searching and critical analysis for which Dr. Rao is reputed and which are usually expected in a memorial lecture. In fact, it left an unmistakable impression in the mind of this writer that he was not able to do full justice to the difficult and complicated subject chosen by him. May be, he was unable to find sufficient time from his otherwise busy schedule to prepare the lecture. A more correct explanation may be the self-imposed limitations within which he desired to talk on a delicate subject. Anyway, Dr. Rao did not succeed completely in concealing which way his inclination was. His predilections for the public sector and his faith in its omniscience were clearly evident from his assertion that all structural changes in development banking were initiated by the public sector and funds were provided for by the State and that the principal beneficiaries were the private sector. He did recognise the changes made by the other commercial banks in banking techniques and policies, but made no secret of his belief that it was the State Bank of India that gave the lead in this respect.

While Dr. Rao is welcome to champion the role of the public sector, it is necessary to add that he is not right in suggesting that all the credit for the advances made in the sphere of development banking must go to the Government. It must not be forgotten, in this connection, that, right from the beginning, the banks in the private sector have extended their full co-operation to the establishment of specialised financial institutions such as the I.F.C., the State Financial Corporations and the I.C.I.C.I., by liberally subscribing to their share capital and loans, as well as by providing the know-how. There are also two more points to be made in this connection. One, the World Bank and some of the private sector banks in countries like the U.S., the U.K. and West Germany have also played a significant role in the development of industrial banking in this country. The World Bank and, particularly, its present President, Mr. George Woods, have made a substantial contribution to the progress of development banking. Secondly, the great bulk of the finance provided by the Government to the private sector through the special lending institutions has come from the P.L. 480 counterpart funds which are the result of the munificence of a private enterprise economy. In making these points, we do not in any way underrate the initiative taken, and the lead given, by the State and State-owned institutions. But that surely is the function of the State; in a modern economy, the State is a catalytic agent and it is its duty to play that role effectively, without depriving the people of their initiative and enterprise. Whether it has done so in India is, however, a different question.

E.C.M. Survives The Mid-December

The European Common Market Council of Ministers came to an agreement on the elusive Community cereals price issue on the 15th instant, after a marathon all-night session. It will be recalled that 15th December was the official deadline for reaching such an agreement and the accord came only a few hours before the deadline, thereby removing the threat of President de Gaulle to take out France from the E.C.M. in case of a failure to reach an understanding on an issue he considered vital.

The question of harmonising the prices of grains has been under discussion for long. France is an important producer of foodgrains in the Community, with a surplus for export, and the French prices are comparatively low. As against this, the other countries, especially West Germany and Italy, import foodgrains in substantial quantities, but, in order to safeguard the interests of agriculturists, the prices in these countries have been kept at a substantially high level by way of levies on imports. The task of harmonising the prices in these circumstances was, therefore, a ticklish problem. France was not willing to raise the prices, because of the fear that it might result in overproduction. At the same time, it was very keen on a harmonised price structure for the whole Community, as it would broaden the market for its cereals, albeit mainly at the expense of the U.S. and Canada, which are exporting substantial quantities of wheat and other cereals to the Continent.

The details of the agreement are not available at the time of writing. It is, however, reported that the basic prices will be £38 6s. per ton for soft wheat, £45 for hard wheat, £32 18s. for barley, £32 14s. for maize and £33 16s. for rye. West Germany, which had experienced great difficulty in accommodating itself to the Commission's unitary cereals price plan in the last two years, has made considerable sacrifice for preventing the collapse of E.C.M. on this score. It has accepted much lower price levels for cereals than had been proposed by it earlier. It has also agreed to a curtailment of the interval for bringing into effect the plan for uniform levels of cereal prices. Thus, the unitary prices are to be enforced on 1st July 1967, instead of in 1969 as originally demanded by the Germans. The Commission, for its part, has accepted the Germans' suggestion that prices should be revised from time to time in the light of economic changes and that the first re-examination should be on 1st July 1966.

It would be wrong to assume that Germany was the only stumbling block to the unification of agriculture in the E.C.M. In the last stages, Italy, too, raised quite a few hurdles. It was adamant on the incorporation of some of its suggestions in the agreement. These suggestions related to greater protection to fruits and vegetables (which Italy produces and exports in considerable quantities), a lower price for coarse grains (which it produces and imports in large quantity to build its livestock) and a lower ceiling on its contribution to the E.C.M. Agricultural Fund. However, it ultimately agreed to the suggestions of the Commission, when it found itself isolated in the Community.

The main implications of the agreement to Europe and the world may now be briefly stated, pending the arrival of the details thereof: (1) One of the major stumbling blocks to the economic unification of E.C.M. countries has been got over and the future of Common Market secured. (2) General de Gaulle has got what he wanted and thus added one more feather to his cap. (3) The Germans and Italians have finally thrown their lot with France and have wholeheartedly realised that, for them, the balance of advantage lies in strengthening the E.C.M. and paving the way for the realisation of the grand ideal of a United States of Europe. (4) The Seven (E.F.T.A.) may have to think afresh, sooner or later, on the rapprochement with the Six, as the chances of a split in the latter have been greatly minimised, if not eliminated. (5) The prospects for "Kennedy Round" have brightened, for the Six, particularly France, may be in a more accommodating mood, especially as the agreement on grains will have unfavourable effects on the exports of U.S. and Canadian wheat and feed-grains to the E.C.M. countries. (6) India must now concentrate on the "Kennedy Round" of talks and make sure that the benefits of the substantial across-the-board tariffs cuts are not watered down by providing too many escape clauses and exceptions. (7) India must not allow itself to be carried away by the sweet words of the present Labour Government in Britain on Commonwealth trade and Commonwealth preference. It must be realistic enough to recognise that the Common Market has come to stay and do all it can to foster its economic, as well as political, relations with it. Besides continuing to strengthen its ties with Britain and the E.F.T.A. in Europe, it must cultivate the Common Market more intensively than is being done now. And (8) The business community in India, in particular, must take keener interest in the Six, learn the languages of, and the marketing practices in, these countries, as, in the coming years, they will constitute one of the wealthiest markets in the world.

Commonwealth Sugar Agreement

India has special reason to welcome the announcement of the British Ministry of Agriculture on Wednesday the 9th inst. on the Commonwealth Sugar Agreement, for this is the first time this country has been included in the Agreement as one of quota countries for exports of sugar to the United Kingdom. For a long time, India has been seeking entry into the Commonwealth Sugar Agreement. Efforts were made in this direction by Mr. S. K. Patil, when he was in charge of Food and Agriculture; he had asked for a modest quota of at least 150,000 tons. What it has obtained now is so small—a mere 25,000 tons for 1965—that it is nothing more than a gesture. But it can have no cause for disappointment over this, as it does not have much of a surplus in sugar for export. The Government of India estimates that sugar production this season will be about 3,000,000 tons, some 450,000 tons better than in the 1963-64 season. Even so, Mr. C. Subramaniam is of the view that exports in the current season can be no more than 200,000-300,000 tons, depending on the size of production. It is rather too early to say what the output will be, but the official expectation of three million tons seem to err on the side of optimism. In any case, India can press for a higher quota under the Commonwealth Agreement, when it comes up for revision to cover the requirements of Britain for 1966.

The special value of the Commonwealth Agreement lies in the fact that it ensures higher prices to the exporting countries, in the face of lower prices in the free world market—the London market spot price on the 9th inst. was £27 a ton, as against £35 a ton a year before. It is laid down in the agreement that the basic price, payable by the U.K. next year for Commonwealth sugar, which covers over 90 per cent of the U.K. sugar imports, will be £42 a ton f.o.b., as compared with around £46 10s. in 1964. But this price is applicable only to Australia, which is relatively a low-cost producer and a highly developed country, shipping just one-seventh of its sugar production to the U.K. The other members, including India, will receive a special extra payment of £3 5s. a ton in the form of aid as they are all developing countries. In addition, they will obtain a further £1 6s. 6d., representing the benefit under the Colonial Certified Preference. These extra payments will bring their return to around £46 11s. 6d., roughly the same as in 1964. It is not clear whether India will be entitled to this latter benefit of £1 6s. 6d., as it ceased to be a Colonial territory long ago.

Under the Agreement now revised, some alterations are envisaged in the special payments for the next year (1966) and the Commonwealth producers are scheduled to assemble at London in April 1965 to discuss the British Government's proposals for a link between the additional payment and the world price. It is expected that the size of the benefit will be linked with the prospective world sugar price on a sliding scale, moving upwards if the world price falls, and conversely if it rises. There will, however, be no change in the operation of the basic price.

The British Government has raised the quotas for 1965 by 50,000 tons in response to higher consumption in the U.K. But it is said that, for the next few years, no further increase is expected. Since South Africa has ceased to be a Commonwealth country, its quota of 150,000 tons has been distributed thus: 85,000 tons to Swaziland, 25,000 tons each to India and Rhodesia and 15 000 tons to the domestic producers. The actual market shares for the other countries are: Australia 335,000 tons; British Honduras 20,500 tons; East Africa 7,000 tons; Fiji 140,000 tons; Mauritius 380,000 tons; West Indies and British Guiana 725,000 tons.

The Commonwealth Sugar Agreement has been to the benefit of both the U.K. and the exporting countries. It assures the U.K.—a country with one of the highest *per capita* consumption of refined sugar in the world—a steady supply of sugar year after year. When world prices are high, as they were in 1963 (when prices were well over £100) and early this year, Britain gets sugar under this Agreement at substantially lower prices. Thus, during most part of last year and this year, Britain got 90 per cent of its sugar requirements at nearly half the world price. Similarly, as they exporting countries are assured of a regular steady market for their production of sugar under this Agreement at substantially lower becomes obvious in times such as the present when the free world market price is some £20 below the price fixed under the Agreement. It may be noted here that many of them send over 50 per cent of their sugar production to the U.K.

LEGAL ABORTION FOR THE CORPORATION TAX?

By Questor

LONDON, 12*th December*

CHANGING a country's established system of company taxation is bound to cause upheaval at any time, and the new British Government's proposal to introduce a corporation tax next spring has certainly added to business uncertainty. It is not, in fact, a distinctively Labour proposal: it was put forward by the Conservative Government several years ago, and the Inland Revenue has been studying it ever since. But the change is certain to create transitional anomalies, besides raising administrative difficulties, and the Chancellor's long-expected statement of clarification has not completely reassured business or the Stock Exchange.

It is not altogether clear to me what the great advantages are about a corporation tax to justify the upheaval. The two arguments commonly advanced are that the complete separation of company and personal tax makes it possible to limit the growth of dividends and that the provision of a financial incentive to plough back profits rather than distribute them will encourage productive investment.

But the growth of dividends could be controlled, if necessary, by imposing a special tax on them; and there is no automatic connection between retaining profits and investing them—many large British companies already seem to have a surplus of cash and a low-geared capital structure. I suspect that one strong reason for the proposed change is the irrational assumption that the tax system common in other countries must necessarily be superior to our own.

It is encouraging, at any rate, to note that some people are now beginning to argue that, if we *must* introduce sweeping changes into the structure of company taxation, we might as well see that they are such as to help solve our main economic problems—the chief of which is the sluggishness of exports.

After the outcry provoked by its temporary surcharge on tariffs, the Government is likely to go carefully about the business of creating export incentives; but it has made no secret of the fact that it would like to find some tax incentive which is compatible with the rules of the E.F.T.A. and the G.A.T.T. The obvious field for inquiry, therefore, is the remission of indirect tax to exporters which these rules permit. We should either raise the general level of indirect tax or introduce new forms of it.

There was a good deal of interest here a couple of years ago, at the time when early entry into the European Common Market seemed possible, in the possibility of introducing a French-style added-value tax. The last Government went so far as to appoint a committee to look into the desirability of substituting an added-value tax for either the company profits tax or the purchase tax on consumer goods; but the Committee came down against the idea, partly because of the great increase in administrative costs involved, and partly because business witnesses declared that a turnover tax would immediately be passed on in higher prices.

But its supporters have never quite given up their faith. Professor Merrett, of the Department of Business Studies at Sheffield University, has now put forward the same idea in a much more dramatic form. If we are to change the whole basis of company taxation, he argues, why not do away with taxation on profits altogether and raise the same revenue by a tax on value added? This change, he claims, would cause no greater administrative difficulties or transitional anomalies than the switch to a corporation tax; it would be compatible with other aims of policy—such as separating personal from company taxation and giving tax incentives to capital investment; and it would have certain considerable advantages.

First, firms would—in strict agreement to international trading rules—have their tax liability cancelled in respect of goods exported; the incentive to export, even to those companies which have so far taken little interest in overseas markets, would be very considerable and a faster rate of national economic growth could be firmly based on export demand.

Secondly, it would be a considerable spur to efficiency; companies taxed on value added rather than on profitability would be less tempted into wasteful expenditure on the grounds that half its cost, as at present, is paid for by the Inland Revenue.

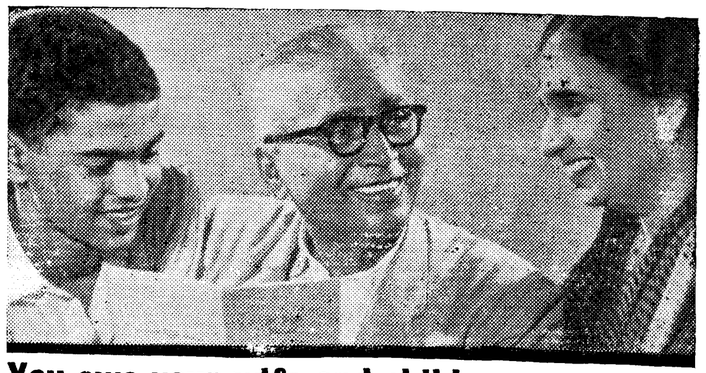
Then, in addition, the high (if unmeasured) cost of tax administration which is at present met by companies themselves in preparing accounts in a suitable form would be saved. And, permission to deduct from turnover tax liability a proportion of the cost of new capital investment would have a much greater impact than the present system of capital allowances, the generosity of which is offset by the fact that many businessmen seem not to understand it.

It is extremely unlikely, I fear, that the Government, for all its anxiety to stimulate exports, will now abandon its proposals about a corporation tax—still less likely, after its recent experience, that it will be willing to risk the consequences of such a bold jump as Professor Merrett suggests. But it is not altogether impossible.

But isn't it a little absurd that a country which cannot alter its exchange rate for fear of the effects on the international monetary system should contemplate revising its whole tax structure to take advantage of a loophole in the international rules? The rules were drawn up some time ago when conditions were different; politicians, if not their officials, should surely be ready to consider changing them.

YUGOSLAVIA TO GET WORLD BANK LOAN

A loan equivalent to $70 million for the modernisation and improvement of railways in Yugoslavia has just been announced by the World Bank. Three commercial banks are participating in the loan, without the World Bank's guarantee, for a total equivalent to $575,000, representing part of the first maturity which falls due in March 1970. The Bank's loan is for a term of 25 years and bears interest at the rate of 5¼ per cent per annum. Amortisation will begin on 1st March 1970. The loan is guaranteed by the Socialist Federal Republic of Yugoslavia.



You owe your wife and children

a visit to State Bank of India

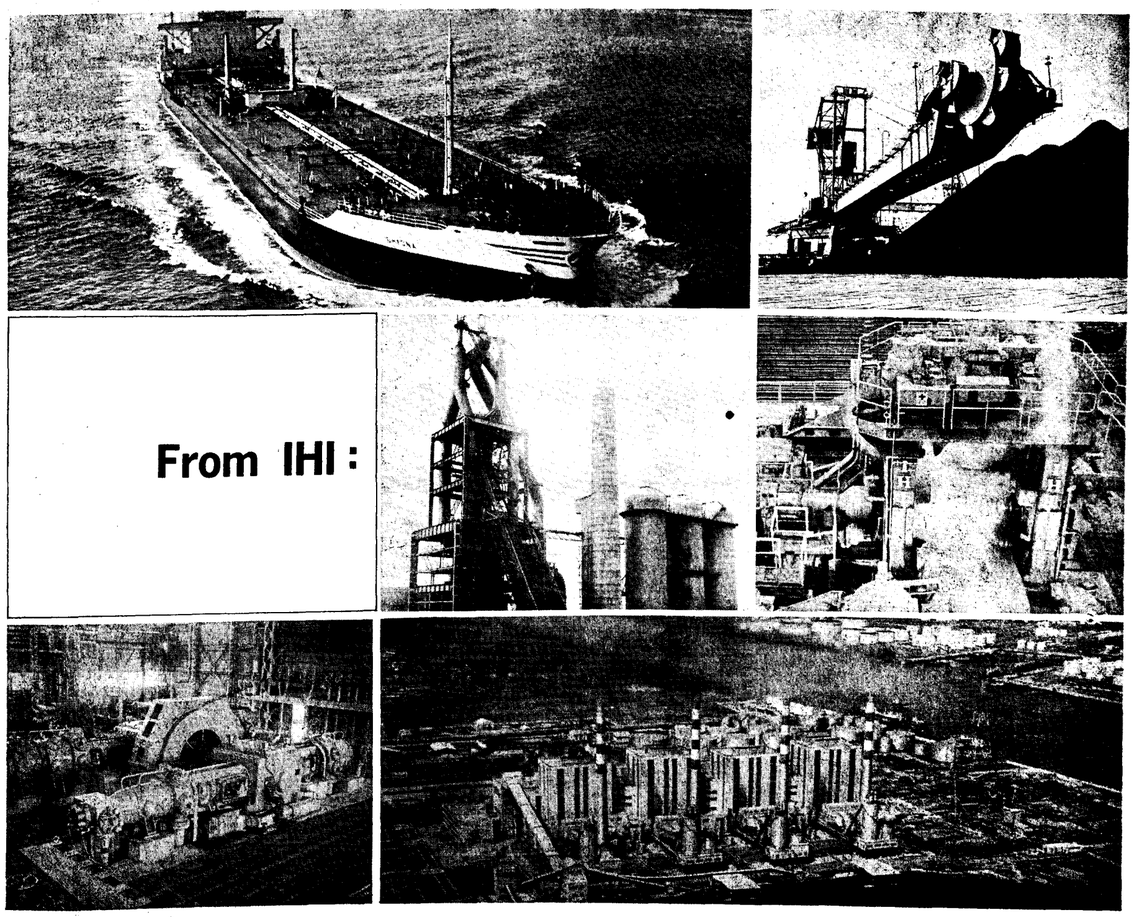
As a family man you owe it to your dependants to make a proper will, sort out your affairs legally and correctly.

The State Bank of India acts as executor and trustee for its clients and offers its services for appointment as (1) executor of a will (2) trustee of public, religious, charitable and private trusts (3) custodian trustee of provident and pension funds (4) special trustee of life insurance policies under Married Women's Property Act 1874.

We have expert staff to handle such business and access to the best legal guidance. Leave these affairs in our hands. We will take care of them.

Our Agents at branches will be happy to be of assistance to you.

STATE BANK OF INDIA
INDIA'S BIGGEST BANK



service, speed and economy in heavy industrial equipment

It is a matter of record that industrialists and government planners in almost every area of the globe are turning oftener to IHI for the equipment they need.

What is behind this increasing recognition by men who demand quality combined with value? Part of the answer is dependability. For IHI has more than a century of experience in meeting the requirements of industry. Not only do we furnish the right equipment for the job, we also provide full after-service by trained technicians.

Another answer is speed. IHI has the reputation for completing jobs before or by the target date . . . and at prices that are always competitive. For cranes and dredgers, land and marine engines, equipment for the steel, cement, chemical and paper industries and much, much more, it pays to turn to IHI.

We are also one of the world's largest shipbuilders in gross tons launched. To men who know technological progress, it makes sense to work as a partner with IHI.

PILOT SURVEY OF A C.D. BLOCK

MUCH has been said and written in recent years about the gap between theory and practice—promise and performance—in three related fields of rural development activity, namely, Community Development, Co-operation and *Panchayati Raj*. The Union Minister for Community Development, Mr. S. K. Dey, himself, it will be recalled, candidly admitted, at the Annual Conference on Community Development and *Panchayati Raj* in July last, that there "is need for an integrated approach to the problem of mobilising the rural people and getting them properly oriented for the task of maximum production" and that, "although agriculture is the main occupation of rural people and rural industrialisation could flow only from the growth of agriculture, much remains to be done in bringing it into focus so far as the Community Development is concerned." That was a significant admission after 12 years of community development—a period during which the whole country was covered, albeit by stages, by extension services, and a major part of it by popular institutions like *panchayats* and co-operatives. Incidentally, the fact that rural development, in general, and agricultural development, in particular, is yet to develop a dynamism of its own finds confirmation in the report of a pilot survey, recently carried out by the Indian Co-operative Union (New Delhi) in the Alipore Community Development Block of the Union Territory of Delhi.

The I.C.U. survey, which was undertaken at the suggestion of the late Mr. V. T. Krishnamachari (former Deputy Chairman, Planning Commission), has examined the working and achievement of the Alipore block with reference to (i) the basic objectives of community development, *panchayat* and co-operation, (ii) the targets fixed and fulfilled in respect of rural and agricultural development works and (iii) the causes of success and failure of these programmes. It is noteworthy that the working of the block administration, *panchayats* and co-operatives has been studied in detail precisely in those villages (numbering 10 out of a total of 57 in the block with its population of 69,000 and cultivated area of 45,000 acres) that are considered best in the fields of co-operation and *panchayati raj*. The survey findings in respect of these interrelated agencies for rural development make disquieting reading and cannot thus be deemed flattering to the administration of a block which, started as a Community Project early in October 1952, reached its post-intensive phase in 1956 and became a permanent unit of planning and development in 1960 and which absorbed aggregate development outlays of Rs. 17.8 lakhs in the period 1952-58 and Rs. 5.4 lakhs in the period 1958-63. The more significant of these findings bearing on community development proper are highlighted below:

(1) No attempt has been made by the block to implement or even formulate village development plans. There has not been any (*a*) planning of land use, (*b*) determination of targets, long-term or short-term, and (*c*) linking of development programmes and Government assistance to production targets and land use, including allocation of improved seeds, fertilisers, etc., according to plan.

(2) The level of agricultural development activity achieved in 1958-63 was in general less than that achieved during 1952-58. Improved seeds distributed per year decreased from about 8 kilograms per cultivable acre in 1952-58 to two kilograms in 1958-63. In the case of fertilisers, distribution was much below the standard rate prescribed for obtaining satisfactory results in agricultural yields. The annual increase in irrigated area, potential or actual, was only one acre per 288 cultivable acres in 1952-58 and still less in 1958-63, being only one acre per 386 cultivable acres.

(3) The block development plans have been formulated without any regard to the conditions prevailing in the block, including its resources, needs and requirements. The Block Development Office plays no role in determining either the nature and type of activities required for local development or the extent of funds which it would require for undertaking the activities suggested for execution. It is simply *directed* to spend a specific amount of funds for specific purposes, without any consideration of local conditions and needs.

(4) There is no evidence to show that, as a result of community development activities, there has been any improvement in "employment and production;" "self-help and self-reliance" and "utilisation of local energy for the benefit of the community." None of the households owning less than 15 acres considered the programme to be of any use to them.

Have *panchayats* and co-operatives, which are meant to serve as two pillars of development in C.D. Blocks, done any better? Here, again, the survey findings show that the performance of these popular institutions leaves much to be desired. To take *panchayats* first. The aggregate annual income of an average *panchayat* in 1962-63 was Rs. 2,845, of which Rs. 2,331 was spent on local works. These resources or expenses, according to the survey report, hardly offered any opportunity for the *panchayats* to undertake any development work worth naming or encouraging people's enthusiasm, for the *per capita* income or expenditure of these *panchayats* averaged only about two rupees in 1962-63. To make matters worse, the *panchayats* were ridden with factional quarrels and bickerings. As for co-operatives, the situation had improved during the first three years of the third Plan, for the small cultivators had been considerably assisted insofar as credit was concerned. For instance, in nine selected societies in which about 54 per cent of the total membership belonged to households owning less than five acres and 28 per cent to households owning between five and 10 acres, the average borrowing per household was Rs. 1,600 in the first category of households and Rs. 1,300 in the second category. However, according to the survey report, the gains could have been better consolidated had credit been linked with production or marketing and the use of loans been subjected to technical supervision. In sum, therefore, neither rural development, in general, nor agricultural development, in particular, has been significantly fostered by the C.D., *panchayat* and co-operative agencies. That is the state of affairs in a block at the very doorstep of the Union Ministry of Community Development which has been guiding or directing the C.D. movement as a whole. And thereby hangs a tale.

GOVERNMENT PRINTING PRESSES

Not many may perhaps be aware that the Central and State Governments together constitute the single largest consumer of paper in India. The quantity of paper actually purchased by the Central Stationery Office for the 7,000 Central Government indentors alone during the year 1963-64 was 44,000 tonnes, representing about 12 per cent of the total estimated consumption of 370,500 tonnes. Of this quantity, the 12 Government presses consumed 15,077 tonnes, as against 10,365 tonnes in 1960-61 and a bare 3,160 tonnes in 1947-48 when the number of presses in existence was just six. Such large-scale consumption of paper by Government presses and the few thousand tonnes consumed directly by several departments, besides indicating the marked increase in governmental work, also reflect, to some extent, the dominant (direct) role played by the public sector in the different sectors of the economy, not to speak of the enormous paper work resulting from more and more controls; special mention may be made, in this connection, of the filing of weekly, fortnightly, monthly, quarterly, half-yearly and yearly returns on a wide and varied subjects by industrial and commercial firms.

The tempo of work in Government departments is bound to gather further momentum in the coming years, what with all the new development plans, greater activity in social and cultural fields, growth of publicity work both at home and abroad, expansion of tourism, and the requirements of the country's role in international affairs. It is such work that has prompted the Government of India to pay special attention to the development of its printing presses. An idea of the development programme was given by Mr. Mehr Chand Khanna, Union Minister for Works and Housing, while speaking at the foundation-stone laying ceremony of a new Rs. 1.77-crore printing press at New Delhi on Sunday the 13th inst.; this press will constitute the primary unit for Hindi printing, in addition to handling the publication of Parliamentary proceedings. The programme envisages (*a*) establishment of several more printing presses at a cost of over Rs. 9 crores, (*b*) expansion and modernisation of existing presses, and (*c*) introduction of new processes of printing.

The third Five-year Plan envisaged the setting up of four new Government presses. The first one at Coimbatore, established primarily as a book printing press, started working early this year. The second press (for printing forms) is coming up at Koratti in Kerala; it is likely to commence operation next year. The third press is under erection at Santragachi near Calcutta. The fourth press is the one for which foundation-stone was laid on Sunday this week. Of the seven new presses proposed to be set up during the fourth Plan period, five will be for printing forms and manufactured stationery and two for printing publicity material and book work (by using the photo-litho process), together involving an outlay of over Rs. 9 crores. In addition to these, the Ministry of Works and Housing is establishing, in association with the Education Ministry, three presses (one each at Mysore, Chandigarh and Bhubaneshwar) for printing textbooks to meet the needs of compulsory primary education. Considering the noble cause for which these presses are to be set up, the gesture of the West German Government to supply the requisite machinery as a gift is to be widely appreciated.

Alongside the establishment of new presses, efforts are being made to maximise the productivity of the existing presses through modernisation and working of second shift in some units. Efforts are also being made to introduce new processes of printing so as to ensure higher standards of work.

While the presses do the printing of forms, documents, etc., the Publications Branch undertakes the storage and distribution of Government publications, including those of Defence Services but excluding the material intended primarily for publicity. There is then the Stationery Office (Calcutta). With the rapid expansion of governmental activities consequent on the implementation of Five-year Plans, this Office, as Mr. Khanna pointed out, has had to shoulder an increasing responsibility. The staff strength of the Office has more than doubled since 1947-48 from 700 to 1,444, expenditure on stores from Rs. 1.34 crore to Rs. 8.43 crores (1963-64), and paper purchased by the Office from 18,000 tonnes to 44,000 tonnes (for Central Government indentors alone, including Defence, Railways and P. & T.). With a view to giving better and more efficient service to indentors, the supply of stationery stores has been decentralised by opening regional depots at Bombay, Madras and New Delhi and an incentive bonus scheme is in operation.

The Printing, Publication and Stationery Branches of the Union Ministry of Works and Housing together employ as many as 14,400 persons, whereas, in 1947-48, the number was no more than 5,800. It is certainly gratifying to hear from Mr. Khanna that the Government is devoting special attention to the welfare and well-being of workers, as well as to the rationalisation of the skills of various trade groups and creation of opportunity for advancement and development of the worker.

TECHNICAL DEVELOPMENT DIRECTORATE

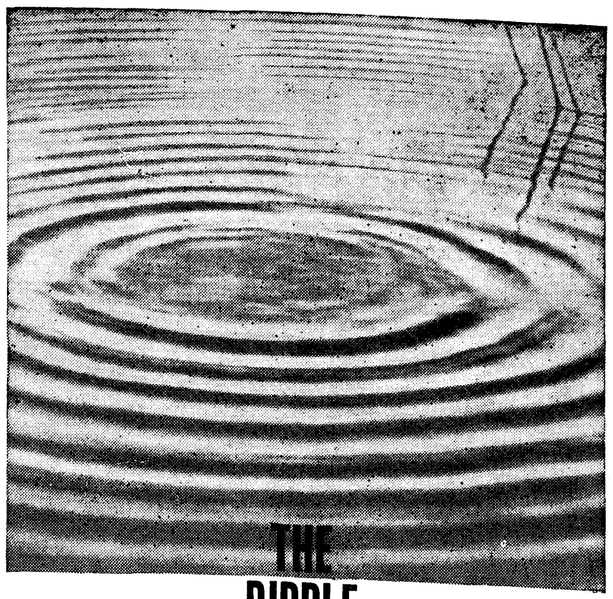
It is a crucial role that the Directorate General of Technical Development (Government of India) plays in the planning and execution of industrial development programmes. The responsibilities of this executive agency are many and varied. For instance, it specifically assists in the integrated planning of industries by collecting and analysing statistics regarding industrial capacity, actual production, employment position, stocks and prices and by formulating, and keeping under constant review, the detailed industrial production targets under the Plans. It also scrutinises, from the technical angle, all applications under the Industries (Development and Regulation) Act either for establishing new industrial units or for expanding existing ones. Another principal responsibility of the agency is to clear imports from the point of view of indigenous non-availability, to investigate and advise on the possibilities of developing indigenous production of imported stores either wholly or partly and to advise generally on the substitution of imported materials with indige-

responsibilities have been discharged by the Directorate General fairly satisfactorily so far is the considered opinion of the All-India Manufacturers' Organisation which has just conveyed its views to the study team that is currently examining the working of that Government agency. This appreciation, however, carries the qualification that there is scope for improving and streamlining the Directorate's working. There is, for instance, scope for improving the procedures under which the D.G.T.D. makes recommendations in regard to licences under the Industries Act. The improvement suggested by the A.I.M.O., in this connection, is that the D.G.T.D. should evolve and implement a properly phased programme for the licensing of industrial units by taking into account the expected yearly availability of foreign exchange during the five-year planning period. The present procedures, incidentally, involve the issue of licences almost to the targeted capacity even before the commencement of a Plan or in its very first year, leading to bottlenecks in foreign exchange and consequent restrictions on imports by the middle of the Plan period. Hence the need for a phased programme of licensing.

Another direction in which the working of the D.G.T.D. can be improved is the one pertaining to the allocation of raw materials, steel, cement, fuel, electric power, etc. and the issue of steel quota certificates and of licences for the import of machine tools. It is said that, in spite of the D.G.T.D.'s assistance in this regard, there is considerable underutilisation of capacity in several industries. To the extent that scarce materials can be procured indigenously there is certainly some point in the A.I.M.O.'s plea that the D.G.T.D. should review the raw material and supply problems of each industry every year and recommend prompt remedial measures. Where, however, imports of raw materials and stores are called for, there are limits to what the D.G.T.D. can do, for it is a question of foreign exchange availability. But, even within the limits set by foreign exchange availability, it should be possible for the agency to clear applications for import licences more expeditiously, if only it can minimise its time-consuming enquiries as to whether the materials applied for are indigenously produced or not. Two concrete suggestions have been made by the A.I.M.O. in this connection. One is that the Government should publish once a year, in consultation with the D.G.T.D., three schedules of products—(i) those which can be freely licensed or imported within the limits of foreign exchange availability, (ii) those which cannot be normally imported, and (iii) those which can be allowed only after proper scrutiny by the D.G.T.D. The other suggestion is that the Directorate should prepare a separate exhaustive directory, with product-wise and manufacturer-wise cross references, of all products made in the country, keep it up-to-date every six months and make it available to actual users and the employees of the D.G.T.D. The idea here is that a brief reference to the directory should be adequate to examine the application for import licence from the angle of indigenous availability. Both these suggestions are realistic; if adopted, they will go a long way towards reducing procedural delays in import licensing. By pricing the directory adequately, the Department can cover the cost of compiling, printing and publishing it. There is no reason why the actual users should not pay for this service, since the time and labour saved by them in this way will more than compensate for the loss of a few rupees.

PROGRESS OF CIVIL AVIATION

India's civil aviation registered further progress in the first half of 1964. The two public-sector corporations—Indian Airlines and Air-India—together carried during the period 13.5 per cent more passengers and cargo than during the corresponding period of 1963. But the I.A.C.'s overall revenue load factor (that is, revenue ton-kilometres operated as a percentage of capacity ton-kilometres) has come down to 65.9 per cent in the first half of 1964 from 67.5 per cent in the second half and 71.3 per cent in the first half of 1963. This continuous decline in I.A.C.'s overall revenue load factor reflects the increase in its idle capacity. On the other hand, Air-India's performance has been more encouraging, for its overall revenue load factor has increased from 44.4 per cent in the first half of 1963 to 49.2 per cent in the first half of the current year. This improvement reflects better utilisation of capacity in spite of acute world competition, although there is no denying the fact that, relatively speaking, Air-India, as of now, has more idle capacity than Indian Airlines.



THE RIPPLE

The LIC is at the centre of a ripple whose widening impact is felt throughout the land.

On the one hand, LIC's operations are far reaching. They cover about 729 centres, a number which is steadily increasing. So is the number of new individuals in India being covered with Life Insurance.

On the other hand, the LIC invests nearly 3 million rupees a day in industry, agriculture, railways, transport, electricity and many other projects. The radiating effect of these investments creates more jobs, more incomes, more food—in fact, a higher standard of living—for everybody.

PRESIDENT'S PROMPT ACTION SUCCESSFUL

By N. Pattabhi Raman

NEW YORK, 12*th December*

IN a large economy, money management is never an easy task. In the U.S., this task has been greatly complicated ever since, some four or five years ago, the nation's balance of payments deficit became a major problem and a source of worry about the stability of the dollar. The difficulty has been, essentially, how to reconcile the need for easy money for domestic economic expansion with the objective of preventing large-scale flows of U.S. dollars to other countries as a result of differences in interest rates in the U.S. and foreign markets.

Operation Twist

The record of the last four years shows that the Kennedy-Johnson Administration has handled this difficult task with reasonably good results. In what has been described as Operation Twist, long-term interest rates have been held low to sustain an expansion in domestic credit, while, simultaneously, short-term money market rates have been maintained close to or above the rates prevailing in European markets. In addition, some selective controls have been exercised, through such measures as the equalisation tax on purchases of foreign securities, to prevent the exodus of dollars to the Old World. As a result of these actions, credit has been available in ample measure to support a handsome rise in the level of domestic business activity, while the size of the payments deficit has been trimmed.

This balancing act is not over yet; in fact, it remains as delicate a task as ever. This was highlighted by recent developments following the dramatic measures to stop the run on the British pound. When the United Kingdom raised its Bank Rate from 5 per cent to a whopping 7 per cent, the danger arose that dollars would again migrate in large flocks across the Atlantic, attracted by the heftier feed in London, thereby enlarging the U.S. payments deficit and precipitating a dollar crisis. The Federal Reserve acted promptly to prevent such catastrophic consequences: it increased the U.S. bank rate from 3.5 per cent to 4 per cent. The Federal Reserve's chairman, William McChesney Martin, Jr., explained that the object of the step was to push up short-term interest rates in the money market. Conscious that the measure might trigger deflationary developments in the domestic economy, he coupled this explanation with a statement that, in view of "a sufficiency of funds," a general increase in the lending rates of banks was "not necessary." The Federal Reserve, he said, would continue to pursue an "essentially easy" credit policy.

President's Frown Tells

In the U.S., the prime rate or the interest rate charged by banks to their best customers, has been remarkably steady at 4.5 per cent since August 1960. When the bank rate was raised by half a point on 23rd November, the major banks were reluctant to jump on the bandwagon, itching though they were to raise their lending rates. In this, they were influenced by two market factors. Loan demand was good, but not exceptional; moreover, big corporations were selling their bonds without difficulty at 4.5 per cent. Coming on top of these, Chairman Martin's implied warning against a general escalation of long-term rates was generally effective.

Four banks, including the First National Bank of Boston—broke away from the majority and raised their prime rates to 4.75 per cent. This promptly drew a public comment from no less an official than the President of the United States. In a speech before a high-level business group on 2nd December, Mr. Johnson suggested that "any general increase in the rates which banks charge to their customers" was not justified, and declared that the Federal Reserve will maintain an ample supply of credit for banks and businesses. The purpose of his statement was to apply gentle pressure on First National of Boston and the other three banks to rescind the increase in their prime lending rates, and to counter any adverse psychological impact of the rise in the Bank Rate on the nation's businessmen who could possibly see the Federal Reserve's action as hastening the approach of the economy's cyclical turning point.

For the moment at least, the Administration has achieved what it wanted. Short-term money market rates have risen. The banks that raised their prime rates have reverted to the national norm of 4.5 per cent. Also, the Federal Reserve, through pouring more than a billion dollars into the banking system in the week following the discount rate hike in order to meet a swollen demand, has demonstrated that it will maintain easy credit conditions.

Controversy Persists

The Administration's actions and admonitions have, however, attracted criticisms from those who resent Government interference in the market mechanism. They have, moreover, intensified a public controversy over monetary policy.

For those who deplore Government intervention in business decisions, the pressure exercised by the Administration through the President's statement of 2nd December and other behind-the-scenes activities revived memories of the dramatic actions that President Kennedy and his Administration took in April 1962 to squelch a general price increase in the steel industry. The degree of intervention was much smaller this time and its temper mild, but the principle was about the same, they seemed to think. A senior officer of a large bank reacted to the President's statement by saying: "That was horrendous, a real interference in private business." The newly elected president of the Investment Bankers Association, Mr. Wendell W. Witter, observed: "Increases in interest rates are a matter of supply and demand rather than a question of whether they are justified." Perhaps, the banks would have been unable to sustain an increase in the prime lending rate in any case, whether the Administration had applied pressure or not.

The controversy over monetary policy antedates the recent developments. It has its roots in the fear of some that, unless the monetary authorities initiated measures to tighten credit moderately now, inflation might set in and then it might be too late to arrest its growth and to prevent a renewal of pressure on the dollar. On the other side, the Administration has taken the stand that, so long as inflation is not an immediate threat, it will maintain an expansionary credit policy in order to offset a possible decline in the economy's momentum. The Administration believes that a general rise in commercial lending rates could act as a brake on the expansion of business. Moreover, it believes that it is necessary to give assurances regarding the continued availability of ample credit, such as those given my President Johnson and Chairman Martin of the Federal Reserve System in recent weeks, in order to deter a major rush to borrow when the going is good as a hedge against increases in interest rates. Consistent with these beliefs are the appeals of President Johnson and Treasury Secretary Douglas Dillon for moderation in wage and price increases.

Significance

The President has assured the critics of the expansionary credit policy that the monetary system will remain flexible, in order to face developments as they arise. Mr. Martin, for his part, has said that the Federal Reserve is prepared to tighten credit, if and when inflation becomes evident or the balance of payments situation deteriorates. A slight tightening of credit in terms of the reserves made available to banks was all that he would concede to the Administration's critics, but even here, in the aftermath of the discount rate rise, the Federal Reserve has loosened its reins.

Within the Federal Reserve itself, there is controversy regarding the types of credit controls that might be used in the coming months towards the twin objects of sustaining domestic expansion without inflation and reducing dollar outflows. Some members of the Board of Governors of the Federal Reserve System believe that general and indirect controls over credit are (*a*) less than fully effective as anti-inflationary measures and (*b*) totally unsuitable for countering any deterioration in the balance of payments situation. They advocate selective controls—specific restraints on mortgage loans, consumer credit, etc., in the domestic sphere, and techniques similar to the equalisation tax on foreign securities in the international front. These controversies underline the intricate task that faces the monetary authorities. The Federal Reserve is not a circus, but it is necessary these days that the nation's money managers be experts in tightrope walking.

WORLD BANK'S OFFICE IN WEST AFRICA

The World Bank has decided to establish a West African Office at Abidjan in Ivory Coast. Mr. Alfred E. Matter, Assistant Director of the Department of Operations for the Western Hemisphere, will head the new Office. Initially, Mr. Matter will be assisted by two economists, an engineer and an agricultural specialist. The Office is expected to open early in 1965, and Mr. Matter is currently at Abidjan discussing arrangements with Ivory Coast authorities. Plans are under way for a similar office in East Africa. These offices are being established to assist in the preparation of development projects in some of the member countries in Africa. They will help to identify promising projects and to plan, organise and supervise the studies necessary to establish their feasibility and bring them to the point where they can be presented to the Bank or I.D.A. for financing. For the time being, the work will be confined to agricultural and transportation projects.

I.O.B. is big enough to serve you...

I.O.B. is an international bank with offices throughout India and South-east Asia and correspondents the world over. It offers a wide range of services to suit the needs of varied customers. Indeed, I.O.B. is big enough to serve you.

We asked our customers, thousands of them at random, what they thought of our service. They replied: "We are pleased". They also made several helpful suggestions which we are implementing. Indeed, I.O.B. is small enough to know you.

Range of I.O.B. services: Savings and Current Accounts—Recurring and Fixed Deposits—Personal and Business Loans—Bills Payment Service—Gift Cheques—Travellers Cheques—Safe Deposit Lockers—Trade and Export Information and Advice—and whatever other specialised help you may need.

...and small enough to know you

AUTOMATION IN AVIATION

FASCINATING SUBJECT FOR SPECULATION

By Our Aviation Correspondent

FROM time immemorial, man has had to labour to produce the necessities of existence. His more ambitious projects, of course, have been achieved only at the expense of monstrous toil. Take the Pyramids, for instance; we do not know exactly how these were constructed but there can be no shadow of doubt that the numbers employed were immense, the labour involved enormous, and the toll of human life on a commensurate scale. Coming to more recent times, we see, all around us, the products not only of man's ingenuity but of his handicraft. Canal, road, and rail systems, bridges, immense buildings, ocean liners and so on down the scale to watches and precision instruments, all are the fruits of labour.

In many fields, of course, and to an ever greater extent, mechanisation is lightening the load. In agriculture, in building, in factories, in the waging of war, and even in the home, it plays an increasingly important part. But mechanisation has been an exceedingly gradual process—and one, however mistakenly, often resisted by labour; it has led, generally speaking, not to the loss of jobs but to the creation of new fields of employment. Shall we be able, in the course of time, to say the same of a new form of mechanisation created by electronics—automation?

Born into a world where one of the most cherished tenets of society has always been—whether fulfilled or unfulfilled—the individual's right to earn a living, the prospects of a form of mechanisation which so clearly threatens our whole concept of life and its aims, cannot but cause us apprehension. Man, however, is an adaptable creature. The younger generation, no doubt, will take the whole thing in their stride. That, at any rate, is what we must hope, because, unlike the rather leisurely progress of mechanisation, the advance of automation is likely to be that of the forest fire.

In almost all forms of industry today, the cost of the end-product—be this a box of matches or a form of transport—reflects the rising cost of labour. Take shipbuilding, for example—or, for that matter, any form of construction which takes a year or so in the doing. In some countries, in order to cover a rise in wages which, almost inevitably, will be sought before the work is completed, it has become the practice to insert an escalator clause in the contract. This kind of thing, of course, does not help to sell the goods—and this is certainly reflected in the loss of many traditional markets. The compelling urge today, consequently, is to reduce and to stabilise the costs of labour.

The imminence of the impact of automation on our lives is hard to estimate. In a few countries—and notably in the United States—automation is well established and has already, or so one is led to believe, cost a good many thousands of men their jobs. In other countries, it is still little more than a cause for apprehension amongst trade union officials. It is strange how seldom the world Press dilates on a subject which, after all, is likely to affect far more lives than is space exploration or supersonic travel. After considerable search through current journals, one finds two brief but relevant allusions. One is from a shipping journal and reads:

"The first of a class of new, fast, and highly automated cargo liners, the s.s. *American Racer,* is a vessel of 13,000 tons deadweight and a service speed of 21 knots.... With the liner's high degree of automation on the bridge, in the engine-room, and on deck, the owners have been able to reduce the crew needed for this size of vessel by 25 per cent.... She has push-button control of hatch covers, high speed electric winches, and reinforced decks to support fork lift trucks of up to 12 tons...."

The second item is taken from an article by the Scientific Editor of the *Financial Times* and concerns a manufacturing process. "Russia," it runs, "is not merely hoping for a second industrial revolution; it is systematically planning one. Already, they are assembling watches in two-thirds of the time normal in Switzerland. This early application of automation could well affect the whole watch-making industry of Europe."

Involved, then, in automation, we see three vitally important and highly competitive factors—speed, accuracy, and the reduction of labour costs. A factory, a form of transport, or an army, confronted by a fully automated rival, can do one of two things—follow suit or go out of business. One is concerned, of course, principally with the case of air transport. Rather belatedly, perhaps, one now turns to this subject. In this, the most modern of all forms of transport, and one, moreover, keenly competitive and, consequently, highly dependent on cost and quality controls, automation is going to play an almost revolutionary role.

There are, of course, varying degrees of automation in the actual conduct of flight. Automated navigational and landing systems, now in a comparatively early stage of development, are only the forerunners of comprehensive systems which will take care of every phase of flight and will require human control for monitoring or emergency purposes only. The future of Air Traffic Control also lies in electronics. Even today, radio communications and the speed of human speech are barely adequate for subsonic jets. Means of communication and control, considerably more rapid and more accurate than at present, will certainly have to be found for the supersonic age.

In both respects—automated flight and automated traffic control—material advantages will be found. All-weather operation will be achieved, airport and airway traffic capacities will be increased, and far fewer weather delays and cancellations—now a costly item in the operational bill—will be experienced. So far as overall costs are concerned, the greatest advantages of automation, presumably, are to be found in those departments of the industry which are most demanding of time and labour. The traffic and maintenance sections seem to be cases in point.

The modern airliner is an immensely costly vehicle. The supersonic liner of the future is likely to cost five to ten times as much. If it is to bring its owners an adequate return, it will have to be kept fully employed. Turn-round times, in this context, are of vital importance—as are those periods of immobility when the airliner is undergoing routine checks and servicing. Various electronic test rigs have been devised and are already proving great savers of time and labour. There is enormous scope for the extension of apparatus of this kind. Finally, in the general field of passenger and freight handling, and more particularly, perhaps, of bookings and reservations, automation should be easy to apply and very rewarding in results.

The ultimate effects of automation on the air transport industry is a fascinating subject for speculation. There can be no doubt, for instance, that world communication systems will be enormously extended and improved. It will certainly not be long before telephonic-*cum*-television facilities are widely available. Will this be a disincentive to travel? If the businessman can conduct meetings and personal discussions from his office chair, will he be so eager to rush, in his thousands, on to trans-Atlantic airliners?

And what of the tourist? Already, we are told, it is possible to simulate a game of golf at St. Andrews—or any other course of your choice—in your own garden. It needs little imagination to visualise how this might be extended to skiing in the Alps, sunbathing on the Costa Brava, or a conducted tour of the Taj Mahal. However, we should, perhaps, exercise some restraint on the imagination. Some of the prospects it conjurs up are positively frightening!

Exports are vital to India and the export drive is on. To succeed, the goods exported must attract the foreign buyer through their pleasing finish... and what better finish can there be than NICKEL-CHROMIUM plating? You will find it on all the popular brands in world markets... the secret to their popularity.

You will be wise to use Nickel-Chromium Plating for your products, but see that the plating conforms to a standard specification as regards nickel thickness, as it is the NICKEL beneath chromium that guards against corrosion.

Our knowledge of nickel-chromium plating is at your service.

HIRE-PURCHASE TRANSACTIONS

MOVE TO ENACT A SEPARATE LAW

THE Law Commission had recommended in its twentieth Report that there was a need to enact a separate legislation for regulating the hire-purchase transactions. Although the report was presented as far back as in May 1961—3½ years now—no law on the lines, suggested by the Commission, has so far been enacted by the Government. It is, therefore, gratifying to find that a Bill for Hire-Purchase Act has been introduced in the Lok Sabha. The provisions of the Bill have been published in the *Gazette of India Extraordinary* dated 20th November 1964. It is, of course, true that the hire-purchase system is not so popular in India as in the Western countries. But it is already in vogue, especially in regard to purchase of lorries, trucks, buses and machinery and more and more people are taking recourse to it for purchasing such household equipment as radio sets, sewing machines, and refrigerators. Unlike in the Western countries, there are not many separate finance houses of any significant size in India, specialising in hire-purchase finance, or consumer credit, as it is called. Nor have the banks in India taken to this type of finance on a large scale. Nevertheless, some banks have made a modest beginning in the field of consumer credit and are having a little more than modest turnover in financing commercial vehicles and machinery. The State Bank of India and its subsidiaries, as well as the National Small Industries Corporation, in particular, have been specialising in this business under active encouragement from the Government of India. Thus, the hire-purchase finance system is steadily growing in the industrial field and may assume significant proportions in the marketing of consumer goods once the supply of consumer durables increases. It is not, therefore, too early to enact a specific law for this purpose, a law that will safeguard the interests of the contracting parties, including the guarantor, if any, who stands as the surety for the hirer.

Hire-purchase Agreement

The Bill provides that every hire-purchase agreement should be in writing and signed by all the parties to it. The agreement should state both the hire-purchase price and the cash price or the market value of the goods, the date on which the agreement commences, the number and amount of instalments, the date (or the mode of determining the date) on which instalments are payable and the person to whom and place where they are payable. Incidentally, a hire-purchase price means the total sum payable by the hirer to complete the purchase of goods to which the agreement relates; it includes any sum payable by the hirer under the hire-purchase agreement by way of deposit or other initial payment, but excludes the sum payable as penalty, or compensation, or damages for a breach of the agreement.

The hire-purchase agreement should also state the goods to which it relates, in a manner sufficient to identify them; and where a part of the payment is to be provided otherwise than in cash, the agreement should contain a description of that part of the consideration. The Bill also seeks to provide that the goods shall be free from any charge or encumbrance in favour of any third party, and be of marketable quality. No such condition regarding quality shall, however, be implied (*a*) as regards defects of which the owner (the person who has let the goods to the hirer) could not reasonably have been aware at the time of agreement, (*b*) where the hirer (that is, the person who has obtained the goods under the hire-purchase agreement) had examined the goods, or a sample thereof, and (*c*) if the goods are second-hand and the agreement contains a statement to that effect.

If the hirer makes known to the owner the particular purpose for which the goods are required, there shall be an implied condition in the agreement that the goods should be reasonably fit for such purpose; as an alternative, the owner will have to bring down the contradictions to the notice of the hirer and make the effects of these contradictions known to him. The disputes about quality have given rise—directly or indirectly—to much litigation between the contracting parties. The importance of the provision to this effect, in the Bill, is therefore self-evident. It remains, however, to be seen as to how far the situation will improve under this provision, especially in the case of machinery where the quality—particularly of second-hand goods—cannot be early ascertained.

In order to own the goods, the hirer need not wait till the last instalment matures. He can accelerate the purchase at any time during the subsistency of the agreement, after giving the owner not less than 14 days' notice. The payment will be equivalent to the balance of hire-purchase price less two-thirds of the proportional hire-purchase charges (that is, the difference between hire-purchase price and cash price). Although no mention of the reasons is made in the Bill, it is obvious that the owner is allowed to have one-third of the hire-purchase charges in order to cover his establishment expenses and the trouble he took to supply the hirer with the goods at the initial stages. The Bill also provides that, where the terms of the agreement entitle the hirer to a rebate higher than that calculated on the above lines, he shall be entitled to it. No recognition will, however, be taken of the provision of a lower rebate in the agreement. The Government is taking powers to stop acquisition of ownership rights by the hirer, in case it feels that the goods concerned are in short supply or are subject to restrictions in respect of imports.

Similarly, by giving 14 days' notice, the hirer can terminate the agreement by paying the amounts due to him, including the sum provided for payment in the agreement on account of such termination. The liability to pay the last mentioned sum is, however, subject to two conditions: (*a*) Where the total of the sums paid and due before the termination exceeds 50 per cent of the hire-purchase price, the hirer shall not be liable to pay the sum so named, (b) where the amount does not exceed 50 per cent, he shall pay the balance or such less sum as may be named in the agreement.

A hirer, who is liable to make payments in respect of two or more agreements to the same owner, is provided with a safeguard for enabling him to save some of the goods at least, if he cannot save all of them. Thus, notwithstanding any agreement to the contrary, he is entitled to appropriate the sum paid by him, towards the satisfaction of the sum due under any one or more of the agreements. If no such appropriation is made by him, the Bill provides that the amount should be appropriated in the order in which the agreements have been entered into.

In the absence of a contract otherwise, the hirer is bound to take as much care of the goods as a man would take of his own goods. If he faithfully fulfils this condition, he will not be responsible for any loss, destruction or deterioration; otherwise, he is liable to compensate the owner for any damage. This is an important provision, as, in the absence of ownership rights, the hirers generally do not take full precautions to maintain the quality of the assets hired by them. The Bill also provides that, if the hirer makes any use of the goods which is not according to the conditions of the agreement, he shall be liable to pay compensation to the owner for any damage accruing from such use.

Rights and Obligations of Owner

The rights of owners are subject to certain important limitations. Where the hirer does not observe the conditions of the agreement, the owner is entitled to terminate the agreement by giving to the hirer a notice of termination. The owner shall be entitled (*a*) to retain the hire which has accrued due and which has already been paid, (*b*) to recover the arrears of hire due, (*c*) to forfeit the initial deposit (if so provided for in the agreement), and (*d*) to seize the goods, recover their possession and realise any damages in case of non-delivery of goods. However, when the statutory proportion (50 per cent in cases where the hire-purchase price is Rs. 15,000 or less and 75 per cent in other cases) of the hire-purchase price has been paid, the owner shall not enforce any right to recover possession of the goods, otherwise than by a petition or suit. The object of this provision in the Bill is obviously to safeguard what, in many cases, may be the only source of livelihood of the hirer. But, in actual practice, it may result in more litigation and prove a source of great difficulty to the owner of the goods hired. Take, for instance, a lorry or a commercial vehicle, sold under the hire-purchase agreement. These vehicles cost more than Rs. 15,000. If this provision goes on the Statute Book as it is, the owner may find it pretty difficult to collect the instalments, once the hirer has paid them upto the value of 75 per cent. Knowing full well that the owner has no right to dispossess him of the vehicle, the hirer may not care to pay the remaining instalments regularly and in full. The position will be still worse in respect of goods, the value of which is less than Rs. 15,000. It is, therefore, a moot point whether the introduction of this provision will actually encourage the system of hire-purchase or prove a hindrance to those who are really in need of this facility. In fine, this is a highly controversial provision and needs to be carefully examined.

Safeguarding Hirer's Interest

There is a further provision to safeguard the interest of hirer. If the owner terminates the agreement on the basis of default in payment of the instalment, and institutes any suit or petition against the hirer, the latter can pay the owner the arrears, along with interest and the cost of the suit, at the time of hearing in the Court, and the Court may pass an order, relieving the hirer against the termination of agreement. Where an agreement is terminated on the ground that the hirer has indulged in acts inconsistent with the terms of the agreement, or violatd an express condition, no suit or petition by the owner shall lie unless and until he serves on the hirer a notice, specifying the particular breach or act complained of, and if the breach or act is capable of remedy, the hirer must correct it within a period of 14 days from the date of serving the notice.

Another important provision of the Bill relates to insolvency of the hirer. If during the continuance of the agreement, the hirer is adjudged insolvent, the Official Receiver will have the same rights and obligations in respect of the concerned goods as the hirer in question had. The Official Receiver can also assign the rights and obligations of the hirer to any other person. This is an important provision, as it will help a hirer to make the best of the bargain, when he goes bankrupt and is unable to continue payments of the instalments.

It is also important to note that the provisions of the Hire-Purchase Bill will not apply to any agreement made before the commencement of this legislation. In other words, the legislation, now on the anvil, will not have any retrospective effect.

JAPANESE AID TO DEVELOPING NATIONS

The total amount of economic co-operation extended by Japan to developing countries, which was U.S. $250 million in 1960, $371 million in 1961, and $282 million in 1962, aggregated $265 million during 1963 and ranked sixth among the group of free industrial nations. The ratio of the amount of this economic aid during 1963 to Japan's national income for the year stood, according to the *Weekly Review* published by the Bank of Tokyo, at 0.54 per cent, a percentage lower than the target figure (1.0 per cent of national income) which was urged and adopted at the United Nations Conference on Trade and Development.

It is widely recognised that to carry forward a scheme of economic aid in developing countries, the promotion of foreign trade in the developing countries is important, and means to achieve this promotion should be reflected in the economic co-operation from the advanced countries. Aid problems of developing countries have been deliberated upon on an international scale at the Board of the Development Assistance Committee and the World Bank, and the trade problems have been investigated at the meeting of the United Nations Conference on Trade and Development and the G.A.T.T.

Meanwhile, of Japan's export markets, developing countries account for almost half of them, and worthy of note here is the fact that, in the exports of machinery and plant equipment, which are anticipated to expand vigorously in the period ahead, deliveries to the developing countries stand fairly high on priority lists. The Japanese Ministry of International Trade and Industry observes that further positive efforts should be taken to promote economic aid to and co-operation with the developing countries.

RAMTIRTH BRAHMI OIL

Special No. 1. Registered.

An invaluable hair tonic for the prevention of dandruff and falling hair. It is manufactured scientifically with many precious ingredients, which cools brain, improves system and brings sound sleep. Most ideal for body massage. Useful to every one in all seasons.

Available Everywhere.

MANCHESTER LETTER

BIG TAKEOVER DEALS IN TEXTILES

FRESH MOVE AFOOT TO RATIONALISE PRODUCTION AND CUT COSTS

From Our Special Correspondent

MANCHESTER, 8th December

GRADUALLY the thinking behind the big midsummer takeover deals in textiles begins to take shape. Courtaulds some weeks ago announced the formation of its Northern Board to co-ordinate the many important new units it had lately brought under its wing. Last week it was the turn of I.C.I. to show how it intended to administer its additional textile strength.

The merging of its fibres division, including British Nylon Spinners, into a single wholly-owned subsidiary called I.C.I. Fibres, makes this group the third largest fibre producer in the world. Only Dupont and Chemstrand can claim to have a larger business in fibres; I.C.I.'s new giant is no stripling, as it aims at a working target of 250 million lbs. of fibre annually, its capital at home and abroad is estimated at £200 million and its employees number 16,000.

Quite apart from the big British interests of the group, facilities for production are already available in Canada, Australia, India and Portugal. Early next year, full-scale operations will also be proceeding in New Zealand, South Africa and Germany.

Further Planning

Perhaps one of the most significant aspects of the integration of the new subsidiary is that its guiding spirits will be delegated wide powers for further planning in the field of textile processing and distribution. Already I.C.I. has a direct financial interest in Viyella International, Carrington and Dewhurst, English Sewing Cotton, Klinger Manufacturing and Lister and Co.

These firms, in turn, are utilising the resources put at their disposal to build up an interlocking group with many ramifications. The present I.C.I. policy of providing support for and investment in companies in the textile industry is likely to continue and to be intensified.

Courtaulds' Northern Mills

Not to be outdone in making known its rationalisation plans, Courtaulds soon followed the I.C.I. announcement by elaborating on the structure of its Northern textiles division. In all, 75 mills employing some 20,000 operatives are affected by the scheme, of which more than 50 are cotton-type spinning units.

Three management groups, as already reported, will comprise the division. The spinning section, made up basically of the mills of the Lancashire Cotton Corporation, Fine Spinners and Doublers, the former operating companies of Hayeshaw, and the mills previously owned by Courtaulds itself, will be split into five sub-divisions. The fine and combed yarns group contains 12 mills; medium counts 13 mills; man-made fibres 8 mills; coarse counts 12 mills; and carpet yarns 6 mills.

Officially given as the reason for the reorganisation, as could well have been forecast, is the need to rationalise production and reduce costs. Many of the mills concerned were turning out similar products in competition with each other; the intention of the new owners is that each mill is to concentrate on a limited range of the goods for which they are best suited.

Mr. W. T. Winterbottom, Chairman of Fine Spinners and Doublers, has already been nominated as Chairman of the spinning management group; he will also be Deputy Chairman of the Northern textiles division, under the chairmanship of Mr. G. A. Samuel of Courtaulds. Col. J. B. Whitehead, Chairman of Lancashire Cotton Corporation, will be responsible for the woollen and worsted interests of the group, as well as its non-textile activities.

Such extensive reconstruction plans can hardly be effected overnight, and there will undoubtedly be a period of reorientation while both buyers and sellers establish new alignments. So many policies are in need of readjustment these days that traders generally have to be alert to keep pace with events. Integration projects carried out by both the giant groups, however, should encourage greater stability in the trade.

Geneva Pact's Purpose

The long-term arrangement on world trade in cotton textiles which was drawn up more than two years ago has now run nearly half its course, but, as was to be expected, there are already those among the many nations represented who feel that its purpose has not been fulfilled. Trying to compromise between the ambitious programmes of the developing countries and the understandable reactions of the traditional textile manufacturing areas is no easy task.

Throughout last week further talks went on at Geneva when a review of the second year's operations of the arrangement was carried out. Many of the same arguments arose illustrating the conflicting attitudes of the two different types of countries engaged in textile manufacture, those with long historical records of traditional fabric production and those who have only lately come on the scene.

Britain was originally given leave to opt out from the disruption clause in the agreement as it was generally felt that this country had done more than enough to provide an open door to foreign textiles, especially from the Commonwealth, but apparently some of the developing nations regarded Lancashire's position in much the same light as the United States and European countries.

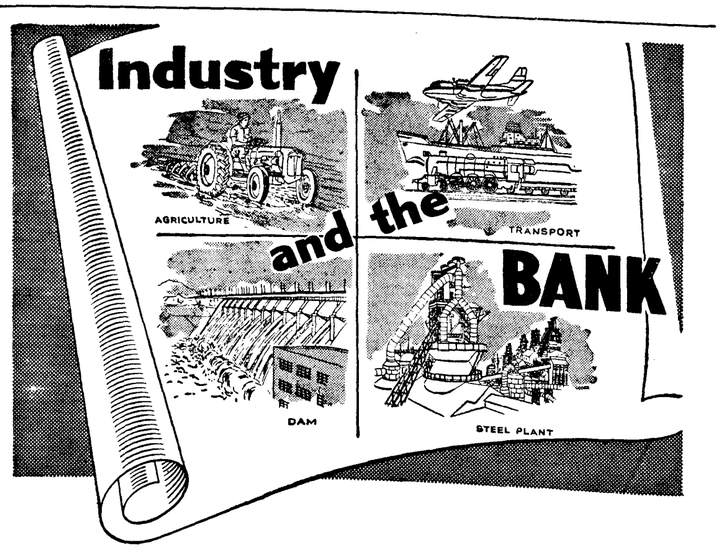
It was pointed out that Britain had already asked nine countries this year to restrain their exports. In most cases, however, no final arrangement had yet been reached, although revised licensing procedures had been adopted to avoid a build-up of supplies from particular areas which had no traditional trade in textiles with the United Kingdom. Most of the complaints listed by the developing countries, however, were aimed against the American and European attitude, whose traders were accused of keeping to the letter rather than the spirit of the arrangement.

No Renewal?

From some of the views expressed by delegates at the recent annual meeting of the International Federation of Cotton and Allied Textile Industries, the opposition to a continuation of the pact after 1967 may be strong. Indeed, the Chairman of the Indian Cotton Mills Federation stated categorically that his country would not support the renewal of the agreement in its existing form. The main argument against the current scheme was that some of the more industrialised countries had been too eager to invoke the market disruption clause in order to curtail imports from the developing areas.

It is, of course, too early yet to consider the likely fate of this attempt to secure some form of international collaboration on such a controversial matter. Britain's position, as well as that of several other important textile manufacturing countries, is complicated by the inter-industry arrangements controlling imports into the United Kingdom which are due to be reconsidered next year.

Mr. T. D. F. Powell, Director-General of the Cotton Board, is quoted as describing the Geneva agreement as "a fine concept," but admitted that its practical implementation caused conflicts of opinion. He felt that, in the face of opposition from countries such as Japan, India, Pakistan and the United Arab Republic, the long-term arrangement could scarcely be renewed in its present form. The American cotton textile Industry, however, is anxious to maintain the current scheme; its spokesmen have repeatedly denied that they had failed to offer facilities to the developing countries to extend trade with the United States.



Blueprints of expansion of a nation's industrial activity require adequate financial resources for implementation.

ROAD TRANSPORT DESERVES A BETTER DEAL

Addressing recently a meeting of the Indian Road & Transport Development Association, the Deputy Chairman of the Planning Commission emphasized that our transport facilities should be developed in step with, in fact a step ahead of, other economic developments which depend on them. It is time that all concerted efforts are made to achieve this goal.

The country's road network must be developed rapidly. Equally important is a rapid expansion in the production of commercial vehicles.

The automobile industry is stepping up its production capacity. However, the extent of the increase in the future demand for commercial vehicles will depend mainly on two factors whether the cost to the transport operator can be decreased through a reduction in the taxation ; and whether the licensing policies on inter-state road transport are rationalized.

For instance, the "on-the-road" price in Calcutta of a Bedford 167" diesel truck chassis in the 5-ton range comes to Rs. 35,280. Out of this amount, direct and indirect taxes absorb Rs. 15,940 or over 45% of the total cost. This calculation applies to the bare chassis, excluding the cost of cab and body and items like maintenance costs and hire-purchase charges. Curbs on inter-state road transport further hamper the growth of the industry.

The automobile industry urgently needs speedy relief from excessive taxation and vexatious restrictions to help the expansion of road transport and thereby accelerate the tempo of our economic growth.

ADVTHS-25

FOOD CORPORATION ACT OUTLINED

RICE PROCUREMENT TO START FROM JANUARY NEXT

IT was being felt by the Government of India for some months now that, in order to implement effectively any policy of ensuring minimum price to the primary producer and to protect the consumer from the variations in prices, there was a need to set up a State agency for the purpose of undertaking trade in foodgrains. A Bill was, therefore, introduced in Parliament last month, for the setting up of the Food Corporation of India. The Bill was passed by the Lok Sabha on 25th November 1964 and by the Rajya Sabha on 7th instant. The primary duty of the Corporation will be to undertake the purchase, storage, movement, transport, distribution and sale of foodgrains and other foodstuffs. It may also, with the approval of the Central Government, promote—by such means as it thinks fit—the production of foodgrains and other foodstuffs; set up or assist in setting up, rice mills, flour mills and other undertakings for the processing of foodgrains and other foodstuffs; and discharge any other supplemental, incidental or consequential functions. The Corporation will work as a statutory organisation, wholly owned by the Government. But it will be encouraged to function generally as an autonomous body, working on business principles, having regard to the interests of producers and consumers. With its head office at Madras, the Corporation can establish, with the approval of the Central Government, offices or agencies at other places in or outside India.

The initial capital of the Corporation will be Rs. 100 crores, provided solely by the Central Government. But the Government has the power to increase it from time to time. In order to augment its resources, the Corporation is authorised to take advances, against the stocks held by it, from scheduled banks or any other bank or financial institution, approved by the Central Government. The Government of India may guarantee such loans as to the repayment of principal, the payment of interest thereon and other incidental charges.

A Board of Directors will be constituted for the general superintendence, direction and management. The Board to be appointed by the Government, will consist of (*a*) Chairman, (*b*) three Directors to represent the Union Ministries of Food, Finance and Co-operation, (*c*) the Managing Director of the Central Warehousing Corporation as Director, (*d*) a Managing Director and (*e*) six other Directors. The majority of the Directors will be non-officials, having expert knowledge, useful for the efficient working of the Corporation. All questions which come up before any meeting of the Board, shall be decided by the majority of votes, and, in the event of an equality of votes, the Chairman shall have and exercise the second or casting vote. The Board may constitute an Executive Committee, consisting of the Managing Director and three other Directors as members of the Committee, with the Chairman of the Board being the Chairman of the Committee as well. This Executive Committee will deal with any matter within the competence of the Corporation. The Central Government, in consultation with the Corporation, may also constitute one or more Advisory Committees to advise the Government or the Corporation, in regard to any matter connected with the purposes of this Act.

Agencies in States

The Central Government may establish a Board of Management for a single State or two or more contiguous States, if no State Food Corporation is functioning in such a State or States. The members of the Board of Management—to be appointed by the Food Corporation of India—will consist of a Chairman, the senior-most executive of the Corporation attached to the Board of Management, and upto ten other members. The Board will advise the Corporation on such matters as may be referred to it and shall perform such functions as the Corporation may delegate. It will be dissolved on the establishment of State Food Corporation in the concerned State.

In consultation with the Government of a State, the Union Government may establish a Food Corporation in that State. The State Food Corporation will perform such of the functions as the Central Corporation may delegate to it. The capital, to start with, will not exceed Rs. 10 crores, but it may be increased by the Central Government from time to time, and will be provided by the Central Corporation and the Central Government, in the proportion decided by the latter. It can also raise loans from the financial institutions, in the same way as prescribed for the F.C.I. The Board of Directors of the S.F.C. will consist of the Chairman, the General Manager and not more than ten other members, all of whom shall be appointed by the F.C.I. in consultation with the Central and State Governments. The Board of Directors of a S.F.C. may constitute an Executive Committee, consisting of the Chairman of the S.F.C. as the Chairman of the Executive Committee, the General Manager and three Directors. The Board may also constitute such other committees as it thinks fit, for such purposes as it may decide.

It will be noted from the foregoing account that both the Board of Management and S.F.C.'s are subsidiary and subordinate bodies to the Central Corporation, working in different areas, and not autonomous or semi-autonomous bodies.

Credit to Agriculturists

The Food Corporations may lend or advance money to any person engaged in the production of foodgrains, upon the security of foodgrains or such other security as may be prescribed, for any purpose connected with such production. It may also enter into agreement with any grower of food crops for the purchase of foodgrains after the harvest of such crop, and such agreement may also provide that any sum payable by the Food Corporation to the grower under such agreement, shall be payable to any scheduled bank or other financing agency nominated by the grower in this behalf, to such extent as may be specified in the agreement. The scheduled bank or other financing agency may, on the basis of any such agreement, lend money to a grower. The Food Corporation will guarantee such loans, repayable within a period of upto five years, on such terms and conditions as it may think fit.

Regulatory Measures

The Food Corporations shall, before the commencement of each year, prepare a statement of programme of their activities during the forthcoming year, as well as a financial estimate in respect thereof. The Statement shall be submitted for approval (*a*) in the case of F.C.I. to the Government of India, and (*b*) in the case of a S.F.C. to the F.C.I. It will establish a reserve fund, to which shall be credited, every year, such portion of its annual net profits as it thinks fit. After making provision for such reserve fund and for bad and doubtful debts, depreciation in assets and all other matters which are usually provided for by companies registered and incorporated under the Companies Act, the balance of the annual net profit shall be paid (1) in the case of F.C.I. to the Central Government and (2) in the case of S.F.C. to the Central Government and F.C.I., in proportion to the capital provided by them. For the purpose of income-tax, super-tax etc. a Food Corporation shall be deemed to be a company within the meaning of the Income Tax Act, and shall be liable to pay tax accordingly. As soon as possible after the end of each year, a Food Corporation shall submit to the Union Government an annual report about its working, which, along with the audited report, will be laid before both Houses of Parliament.

Speaking on the Bill and replying to the debate thereon, Mr. C. Subramaniam informed the House that the Food Corporation of India would start its purchase operations in the Southern zone from January 1965 and the Corporation was expected to build for itself a commanding position in the rice trade in that region. To start with, the Corporation would not procure rice on a monopoly basis, but, if the behaviour of traders necessitated monopoly

VEEGAL ENGINES & ENGINEERING LIMITED

(INCORPORATED IN INDIA AS A PUBLIC COMPANY ON 10TH DECEMBER, 1948 UNDER THE INDIAN COMPANIES ACT, 1913)

Registered Office:

31, Chittaranjan Avenue, CALCUTTA-12

EXISTING AND PROPOSED ACTIVITIES

The Company's main business consists of the manufacture of Petrol engines of varying sizes for which the Company have a licensed manufacturing capacity of 12,000 H.P. on a single-shift basis. The proceeds of the issue will be entirely devoted to financing the Company's present engine manufacturing project.

LOCATION OF THE FACTORY

8·52 bighas (2·56 acres) of land at 8, Jessore Road, Dum Dum. This site is large enough to allow room for all development contemplated during the next few years.

SHARE CAPITAL:

AUTHORISED:—

	Rs.
5,00,000 Equity Shares of Rs. 10/- each	50,00,000
50,000 6% Cumulative Redeemable Preference Shares of Rs. 100/- each	50,00,000
	1,00,00,000

20,000 Equity Shares of Rs. 10/- each subscribed by Directors, their friends and associates and allotted on 25th September 1963 and upon which Rs. 5/- per share has now been paid	2,00,000	1,00,000
	12,00,000	11,00,000

PRESENT ISSUE—

The present issue is of 1,20,000 Equity Shares of Rs. 10/- each at par, now offered to the Public for subscription in Cash.

APPLICATIONS—

Copies of the Application Form and Prospectus can be obtained from the Registered Office of the Company or from the Bankers, Brokers and Underwriters listed below.

BOARD OF DIRECTORS:

1. SIR P. C. B. DEO, 3, Rainey Park, Calcutta-19.
   Industrialist and Chairman of the Company. Also a
   Director of—
   Indian Iron & Steel Co., Ltd.,
   Hooghly Docking & Engineering Co., Ltd.,
   Union Carbide (India) Ltd.,
   Associated Battery Makers (Eastern) Ltd., and other companies.

2. MR. G. V. K. MITCHELL, 33, Chowringhee Road, Calcutta.
   Solicitor, Orr, Dignam & Co.
   Director of—
   The Angus Co., Ltd.,
   Budge Budge Jute Mills Co., Ltd.,
   Calcutta Discount Co., Ltd.,
   Eastern Investments Ltd.,
   Gladstone Lyall & Co., Ltd.,
   Tractors (India) Ltd.,
   Williamson Magor & Co., Ltd.,
   The East Indian Coal Co., Ltd. (Incorporated in U.K.) and other companies.

3. SRI SUKUMAR ROY, 57, Lansdowne Road, Calcutta-25. Company Director.
   Director of—
   The Shillong Hydro-Electric Ltd.,
   Oriental Gas Company Ltd.,
   National Tobacco Co. of India Ltd.,
   Dr. Paul Lohmann (India) Ltd., and other companies.

4. SRI N. D. AGARWALLA, 230, Lower Circular Road, Calcutta. Industrialist.
   Director of—
   National Iron & Steel Co., Ltd.,
   Tatanagar Foundry Co., Ltd.,
   Britannia Building Co., Ltd., and other companies.

5. SRI K. K. ROY, P9, Gariahat Road, Calcutta-29.
   (Managing Director) Aeronautical Engineer and Industrialist.
   Director of—
   Airways (India) Ltd.,
   Aluminium Mfg. Co., Pr. Ltd.,
   Motor & Machinery Mfrs. Ltd.,
   Rehabilitation Industries Corporation Ltd. and other companies.
   Member of—
   Calcutta State Transport Corporation.
   West Bengal Development Corporation.

UNDERWRITING:

The entire issue offered for public subscription has been underwritten as follows—

Name of Underwriter	No. of shares underwritten	Rs.
1. Industrial Credit and Investment Corporation of India Ltd., 163, Backbay Reclamation, Bombay-1	70,000	7,00,000
2. West Bengal Financial Corporation, 23, Rajendra Nath Mukherjee Road, Calcutta-1 ..	50,000	5,00,000
		12,00,000

DATES OF OPENING AND CLOSING OF SUBSCRIPTION LIST

The Subscription List will open at the commencement of Banking hours on the 22nd December 1964 and will remain open until the close of Banking hours on the 4th January 1965 or earlier at the discretion of the Directors, but not before the close of Banking hours on the 24th December, 1964.

EXPORTS OF ENGINEERING PRODUCTS

PRODUCTION PROBLEMS CALL FOR PROMPT SOLUTION

THE group of industries manufacturing a wide range of engineering goods (other than steel) in India accounts for an estimated Rs. 600 crores worth of gross annual output. These industries, broadly covering the manufacture of machinery and transport equipment, engineering and electrical accessories and non-ferrous metals, have more than doubled their production since the beginning of the second Plan, for the index of production (base 1956=100) pertaining to them is currently running at the rate of 230. The index, however, does not cover the output of the unorganised sector which, with its large number of small-scale engineering units, makes a substantial contribution to the production of engineering goods. Presumably, the value of output in the small-scale sector is included in the aforesaid estimate of Rs. 600 crores representing the aggregate value of annual production.

It will be seen from the accompanying Table No. I (which gives capacity and production figures for 1963 and capacity and production targets under the third Plan) that several of the principal engineering industries in the organised sector are well on the way to achieving their targets for 1965-66. Particular mention may be made, in this connection, of the industries manufacturing diesel engines, power-driven pumps, textile machinery, power transformers, electric lamps, dry batteries, storage batteries and aluminium. But many other engineering industries, it will be seen from the table, seem to be lagging behind and so are not likely to achieve their targets fully. In fact, the Planning Commission's memorandum on the fourth Plan, which has just given the latest estimates of likely production in 1965-66 in some of the important engineering industries, brings out the likely shortfalls in achievement. For instance, the present estimate of production of commercial vehicles in 1965-66 is 54,000 against the target of 60,000; of tractors 8,000 against 10,000; of bicycles 1.6 million against 2.0 million; of locomotives 340 against 360; of sugar mill machinery Rs. 12 crores against Rs. 14 crores; and of machine tools Rs. 25 crores against Rs. 30 crores.

Seminar Report

By and large, even the lagging engineering industries may yet make better progress towards the attainment of their third Plan targets, if their problems of production are more expeditiously solved. When the internal market for engineering goods is expanding all the time, it would be too much to expect an increasingly larger surplus for export, unless the aggregate volume of engineering output itself increases. That the country has progressively stepped up its exports of engineering goods from Rs. 3.4 crores in 1956 to Rs. 13.7 crores in 1963 and an estimated Rs. 14.9 crores in 1964 is no doubt a creditable achievement. This progress is truly remarkable, considering that Indian exports have had to compete abroad with established brand names, vastly superior foreign sales and servicing organisation and established export traditions and that these exports have had to be organised in the climate of acute and critical shortage of raw materials like pig-iron, non-ferrous metals, spares and components. But there is a long way to go before the export target of Rs. 50 crores (*vide* the accompanying Table No. II) laid down by the Engineering Export Promotion Council for 1970-71, can be achieved. It would, therefore, be as much in the interest of export promotion as in that of the internal market to solve the production problems of engineering industries as early as possible. Viewed thus, the recommendations of the Seminar on Exports of Engineering Products, held recently by the Indian Institute of Foreign Trade (New Delhi) in collaboration with the Engineering Export Promotion Council at Calcutta, seem to be both timely and realistic. The Institute has just published the report on the Seminar which makes interesting reading.

In view of the acute competition between domestic requirements and export surpluses on the projected limited supplies of basic raw materials like pig iron, steel and aluminium in the fourth Plan period and in view of the likely increases in the prices of such raw materials, the Seminar has considered it necessary to recommend the establishment of an "Export Industries Materials Corporation." This Corporation, to whose initial capital of Rs. one crore the Government should contribute 90 per cent and the private engineering industries the balance of 10 per cent, should stockpile, from indigenous and imported sources, the basic raw materials required by exporting engineering industries and make releases of these materials to exporting factories on demand against production for export. In regard to individual raw materials the Seminar's recommendations are that (i) the requirements of foundry grade pig iron and rolled steel in different categories and sizes for production of different export goods by 1965-66 and 1970-71 be assessed by a technical expert group immediately, (ii) steps be taken to enlarge the range of rolled steel sections in the re-rolling sector in view of the present limited range of such sections rolled in the integrated steel plants, and (iii) steps be taken to ensure the quality of pig iron and steel at a consistent level. Unless some such organised effort is made to ensure supplies of raw materials to the required specifications, quantities and deliveries, it would be extremely difficult for engineering industries to implement their production programmes for export.

Fiscal and Other Concessions

More directly, an export drive with a target of Rs. 50 crores for 1970-71, would also require expansion of export finance facilities—both in respect of their easy availability and low cost. The export credit, according to the Seminar, should be available to exporters at a concessional rate—a maximum of five per cent for discounting bills—and the Export Credit and Guarantee Corporation should adopt a bolder policy of covering risk involved in export. Although the working of the present export promotion scheme for engineering goods has been found to be generally satisfactory, the Seminar has rightly urged that it should remain unaltered for 10 years, unless changes, if any, are favourable to exporters. As income-tax relief is one of the most powerful incentives for export promotion, the Seminar has done well to recommend that such relief should be given on the lines of the scheme obtaining in Japan. Under the Japanese scheme, incidentally, the trading companies are allowed to deduct from their taxable income one per cent of the proceeds from the export contracts and the manufacturing companies three per cent of the proceeds from their sales contracts for exported goods. These and other recommendations (such as the ones relating to foreign exchange releases for opening offices, for deputing sales representatives and for doing market surveys in foreign countries) have been addressed to the Union Ministries concerned. These Ministries, one hopes, will put their heads together and evolve an integrated policy for engineering exports on the lines recommended by the Seminar in which representatives of both Government and Engineering Industry had participated.

Components and Spares

As for components, the industry's expectation is that the availability of such of those engineering components as are not indigenously manufactured would be ensured within the scheme of import entitlement under the special export promotion scheme for engineering goods. The Seminar's recommendation in regard to spares is that the Engineering Export Promotion Council should be empowered to recommend the grant of import licences for emergency spares of a reasonable value in cases of breakdown of plant and quipment in engineering industries. As power cuts are a recurring feature, the Seminar has recommended that their impact on the factories engaged in export promotion should be mitigated to the maximum extent possible. Hard coke supplies to foundries engaged in direct exports of iron castings or in the supply of castings to exporters of finished engineering equipment, according to the Seminar, should be of uniform quality. The other recommendations bearing on production are briefly summarised below:

1. Any engineernig factory which already exports 15 per cent or more of its production should be automatically allowed to double its capacity, if, under the expanded capacity, it undertakes to export the same additional percentage of production.

2. The exporting engineering industries, in particular, should establish their own facilities for design, research and development.

3. No restrictions should be imposed on reasonable imports by exporting engineering industries of prototypes and samples of technically advanced foreign products.

4. In view of the steadily rising costs, further concessions in the prices of pig iron and rolled steel, fuller plant utilisation and linking of wages and bonus with productivity are necessary.

WIRE ROPE FACTORY IN S. INDIA

The steel wire rope industry is of recent origin in India. During the second Plan period, two firms in West Bengal commenced manufacture of steel wire ropes and their combined capacity was only 6,120 tons per year (on double-shift basis). But the country's requirements are much greater and these are mostly met by imports from Britain, Belgium, West Germany, the Netherlands, Japan and the Soviet Union. A target of 40,000 tons has, therefore, been fixed for the third Plan. With a view to achieving this target, the Union Government has issued licences not only for the expansion of the existing units in W. Bengal but also for the setting up of four new units in Maharashtra, two each in W. Bengal and Bihar and one in Kerala. When these units are established, an additional capacity of 32,718 tons per annum on double-shift basis is expected to be attained.

Steel wire ropes have attained the status of a "must" item in almost all industrial activity. They are used extensively in the mining industry for haulage and winding and for aerial ropeways, in ships as hawser ropes and mooring ropes and in the general engineering industry for cranes and winches. It is, in this context, heartening to note that the Seshasayee Wire Ropes Ltd. is going into production this week.

The Seshasayee Wire Ropes Ltd., claimed to be the first of its kind in South India, is situated at Edathala, near Alwaye, in Kerala—the home of the coir rope. The plant, built in collaboration with the Kokoku Iron and Steel Wire Manufacturing Co. Ltd. of Japan, has an annual production capacity of 3,000 tons of steel wire ropes, valued at Rs. one crore. The authorised capital of the Company is Rs. one crore, of which Rs. 50 lakhs is subscribed (including the share of the Japanese collaborators). The foreign exchange component of the project was provided under the yen credit assistance scheme. Besides helping in the erection of the plant, the collaborators have trained the Indian engineers.

CANADIAN UNDERGROUND POWER HOUSE

The world's largest underground power house, a 2.3 million kilowatt plant, will be constructed by the British Columbia Hydro at the site of the Portage Mountain Dam on the Peache River in Canada. The powerhouse is to be located deep in bedrock under the left flank of Portage Mountain Dam. The powerhouse cavern will be 1,000 feet long, 80 feet wide and 120 feet high.

The project require excavation of 50,000 cubic yards of rock to form 3,000 feet of access tunnels leading deep into the Peache River Canyon. One tunnel, 1,400 feet long, 25 feet high and 32 feet wide, will be the permanent powerhouse access tunnel. Another tunnel, 1,600 feet long and roughly with same dimensions, will lead from the main access tunnel around approximately two-thirds of the powerhouse perimeter.

The project is scheduled to begin generating first power in the year 1968.

ANNOUNCEMENT REGARDING THE PROPOSED ISSUE OF CAPITAL

This is not a Prospectus. Persons interested in full details may obtain copies of Prospectus from the Company's Registered Office or from the Underwriters, Bankers and Brokers to the issue mentioned hereinafter.

SHAMA FORGE COMPANY LIMITED

(INCORPORATED AS A PUBLIC COMPANY ON 5TH OCTOBER, 1963, UNDER THE COMPANIES ACT, 1956)

Registered Office: **14-F, Connaught Place, Centre Circle, New Delhi**

SHARE CAPITAL

Authorised:

	Rs.
7,00,000 Equity shares of Rs. 10 each	70,00,000
30,000 Cumulative Redeemable Preference shares of Rs. 100 each	30,00,000
	Rs. 1,00,00,000

Issued and Subscribed:

	Equity Rs.	Preference Rs.
7 Equity shares of Rs. 10 each fully paid up by subscribers	70	
1,43,543 Equity shares of Rs. 10 each and 5,225 9.5% Cumulative Redeemable Preference shares of Rs. 100 each by Promoters, Directors, their friends, associates and others including Indo-Burma Petroleum Co., Ltd. (both 50% paid up)	14,35,430	5,22,500
	14,35,500	5,22,500
Total paid-up Capital..	9,79,035	

Present Issue:

	Rs.
3,56,450 Equity shares of Rs. 10 each	35,64,500
19,775 9.5% Cumulative Redeemable Preference shares of Rs. 100 each	19,77,500
	55,42,000

Out of the present issue 2,16,450 Equity shares are reserved for allotment at par to Kropp Forge Company of U.S.A., foreign collaborators, against price of equipment to be supplied by them to the Company 21,64,500

Now Offered at par for Public Subscription:

1,40,000 Equity shares of Rs. 10 each	14,00,000
19,775 9.5% Cumulative Redeemable Preference shares of Rs. 100 each	19,77,500
	33,77,500

NOTE:—Cumulative Redeemable Preference shares are carrying dividend at 9·5 per cent free of Company's tax, but subject to deduction of tax at source at prescribed rates and these shares are redeemable at such premium if any as may be determined at that time by the Company and at any time after the expiry of twelve years from the date of allotment but before fifteen years from the said date at the option of the Company by a notice of at least 15 days.

OBJECTS AND PROPOSED ACTIVITIES

The main object for which the Company has been established is, *inter alia*, to carry on the business as manufacturers of and dealers in "Forgings" of various types. The Industrial Licence from the Central Government authorises the manufacture of 5,000 tons annually of mild and alloy steel forgings. The indigenous production of forgings is inadequate to meet the present, as also the growing demands from the expanding industries and for the Defence requirements in all its phases from Ordnance to aircraft and missiles. The tariff policy of the Government of India gives encouragement to the forging industry and the Company hopes to establish itself in a short period as one of the premier manufacturers of quality forgings on mass scale.

FOREIGN COLLABORATION

The Promoters, viz. Messrs. B. K. Khanna & Co. Private Ltd., entered into an agreement dated 1st August, 1963 with Messrs. Kropp Forge Company of Chicago, U.S.A., who, having 66 years' experience in forging industry are among the largest manufacturers in U.S.A. of forging from various ferrous and non-ferrous metals. The said collaborators have agreed to make available their extensive experience in the manufacture of mild and alloy steel and other metal forgings, to assist in the layout of the plant and erection of factory, to train Indian personnel at their Works and to provide men with technical experience. This agreement has been assigned in favour of the Company by the promoters. The duration of the Agreement is ten years.

LOCATION

The Plant will be located at Bhopal in Madhya Pradesh where land has been acquired.

FINANCIAL ARRANGEMENTS

The Company has arranged loans from Industrial Finance Corporation of India for Rs. 26,40,000 (foreign exchange loan of Rs. 23,34,000 and rupee loan of Rs. 3,06,000) and United States Agency for International Development ("A.I.D.") for Rs. 47,50,000.

APPLICATION FOR SHARES

Application for shares must be for a minimum of 25 Equity shares or multiples thereof and/or for a minimum of 5 Preference shares or multiples thereof, and must be on the prescribed forms accompanying the Prospectus, which can be had from the Company's Registered Office, Underwriters, the Bankers and Brokers to the Issue.

All application forms duly completed must be lodged together with the amount payable on application with the UNION BANK OF INDIA LIMITED, Connaught Place, New Delhi or THE NATIONAL AND GRINDLAYS BANK LIMITED, H-Block, Connaught Circus, New Delhi or THE CENTRAL BANK OF INDIA LIMITED, National Insurance Building, Parliament Street, New Delhi, or at principal branches of any of the said Banks at Agra, Ahmedabad, Ajmer, Allahabad, Ambala, Amritsar, Bangalore, Baroda, Bhopal, Bombay, Calcutta, Chandigarh, Coimbatore, Cuttack, Debra Dun, Delhi, Ernakulam, Gauhati, Hyderabad, Indore, Jaipur, Jammu, Jamshedpur, Jullundur, Kanpur, Kotah, Lucknow, Ludhiana, Madras, Madurai, Meerut, Mysore, Nagpur, New Delhi, Patiala, Patna, Poona, Ranchi, Shillong and Surat.

DATE OF OPENING AND CLOSING OF SUBSCRIPTION LIST

The Subscription List will open both in respect of Equity and Preference shares, at the commencement of banking hours on 28th December, 1964, and will remain open until the close of 12th January, 1965, unless closed earlier or later at the discretion of the Directors but not before the close of the banking hours on 2nd January, 1965.

BUSINESS NEWS FROM EUROPE

ITALY NOT KEEN ON ADMITTING MORE ASSOCIATES TO E.C.M.

GROWTH OF MANAGEMENT CONSULTANCY

From Our Special Correspondent

THE Common Market is going through a period of reappraisal of its attitude towards associates. The debate largely centres around the Italians who want a more rigid policy on admitting outside countries to E.E.C. associate membership.

This question is being put to the test by an application for association from Spain. Most of the Six want little to do with Spain economically; and the prospect of a political link with her alarms them. They mostly take the view that only the retirement of General Franco would make Spain's claim easier for them.

Behind the Italian demand is a fear that the countries now applying for associate membership—among them Israel, the Lebanon, Nigeria and Tunisia—will be able to undercut her citrus fruit trade and other Mediterranean industries, which make up a considerable part of her economy.

The rest of the Six are opposed to the Italian proposal. They feel that, with so many different countries applying, each having its own peculiarities and difficulties, the need for a flexible approach to admissions is essential. This is especially true when countries seeking associate membership do so with different ideas themselves on the extent to which they will participate in the Market.

Talks held in the summer over the admission of Austria showed that the Community's Commission was winning this battle with Italy. As a neutral, Austria could not have full membership. But, as in the case of Sweden and Switzerland two years ago, which were also debarred by their neutrality from accepting full membership, the Commission was prepared to explore ways by which Austria could associate with the fullest benefit to both sides. If there had been hard-and-fast rules on the Italian model, such talks might have been still-born almost before they had started.

Management Consultancy

One of the most important beneficial influences that has occurred in European industry in the past 10 to 15 years, it is claimed has been the rise of the management consultant. The news that a British giant, the £290 million iron and steel group, Guest, Keen and Nettlefold, is working closely with a firm of consultants is merely the latest development among a long list of companies seeking such services that includes Shell, I.C.I. and K.L.M.

Management consultancy, an American innovation, first came to Europe in 1918, when a firm was established in Germany. The idea never caught on there, and today West Germany has the lowest proportion of consultants per head of population, one for every 680,000 people, of the major countries of Europe.

The pioneering company's next base, France, somewhere between 1918 and 1920, was much more successful and here the opposite has happened. France has taken willingly to management consultancy. Although no figures are yet available—a survey was undertaken this year—she is thought to have just a few less than Britain's 1,476 consultancy firms. This would give France a ratio of one such company for every 3,300 of population, as compared with Britain's one for every 3,500.

These figures have to be taken more as a guide than as a definitive statement, because they refer only to consultants with firms belonging to Management Consultancy Associations (M.C.A.). These cover most of the field, but there are some independent firms outside the associations. Also, most associations demand that a firm should be in existence for five years before it can join. This not only debars new, growing companies but also offshoots of the American giants which have recently entered foreign markets. In Britain's M.C.A., for example, the three American firms of McKinsey, Emerson, and Booz, Allen are still too new to be included, though they probably employ some 150 to 200 consultants.

By 1930 management consultancy was established in almost every country with the exception of Finland, where it later grew in the war years 1940 to 1944. In six countries—Austria, Denmark, France, Germany, Britain and Switzerland—the trend grew on its own initiative, but in Norway, the Netherlands and Sweden, there was help from industrial organisations to get the new kind of service to companies off the ground. In Finland, it has been the brain-child of an industrial body. After France and Britain consultancy is most important, as a proportion of total population, in Sweden, Norway and Switzerland. But by total figures Britain, followed by France, leads by a considerable distance from Sweden's estimated 600, Switzerland's 250, Norway's 239 and Austria's 200. Since 1960, the greatest proportionate increase has been in Austria where there has been a 150 per cent rise. Other countries to show large rises in numbers of management consultancies have been Denmark and Switzerland, where the rise has been about 90 per cent, and Norway, where it has been just over 50 per cent.

Most of these increases have been due to increased business for national firms. There is very little cross-border competition, and only two European countries, Switzerland and Britain, have substantial foreign businesses. Switzerland last year earned 40 per cent of its management consultant income from foreign business. The British proportion was about a third, just under £2 million being earned abroad from a total revenue of some £6 million. Breaking in to a foreign market is difficult because a lot of the work that has to be done concerns local matters in factories and offices. For this reason, those firms that do open offices abroad try to do so as far as possible with native-born consultants as staff.

Foreign competition appears to be growing only in Holland, Switzerland, and, to a lesser extent, Finland. There is some in Germany, mostly from American firms, but, as the number of consultants in the country is small, any increase would show up relative to the whole. France is trying to branch out of Europe and has been developing consultancies in the Mediterranean countries and Latin America. But she appears to be the only country that has such broad vision. For the rest, it is still very much a matter of business beginning, and staying, at home.

Tinned Meat Imports Keep Rising

Continental Europe is buying more tinned meat. Figures show that consumption last year, the last period for which full figures are available, rose by 4.1 per cent from 33,300 tons in 1962 to 47,000 tons. But European consumption as a whole fell because of a considerable drop in British demand, where consumption has fluctuated considerably over the past four years.

British demand for tinned meats dominates the European market, accounting for over 78 per cent of total imports last year. This proportion has been tending to fall, from 86 per cent in 1960, but not sufficient to make any serious inroads into the British position. Last year British imports of tinned meat were 169,800 tons, as compared with 187,500 tons in 1962 and 198,000 tons in 1961. Part of the fall was probably due to a typhoid epidemic in Aberdeen, Scotland, at the end of the year which was attributed to a virus in corned beef from the Argentine. Since, however, this took place so late in the year, it could not be the full explanation and a fall in supplies from Australia and Denmark also contributed. In some lines, such as pigmeat products, Holland has replaced Denmark as the leading supplier.

The downward trend appears to have been reversed this year because imports in the first six months were about 6 per cent higher than last year. This would indicate an annual import figure of about 180,000 tons.

The biggest European importer of tinned meat outside Britain is West Germany, where imports have risen by almost 40 per cent since 1960 in spite of a minor setback in 1962. Since then, there has been a considerable improvement in German imports and, from figures available for the first five months of this year, it appears that her intake will be about 33,000 tons this year as compared with 24,500 tons last year.

After Germany the Italians are the next most important importers, having doubled their consumption between 1960 and 1963 and it appears that this year they will for the first time take more than 10,000 tons. In the other countries, there have been some quite large proportionate increases over the four years, especially in the Netherlands and Belgium, but total imports are still very small.

Exports of tinned meat from European countries have been expanding for some time, the leading exporters last year being Denmark, Poland, Holland and Yugoslavia. These four countries exported 220,600 tons of tinned meat, most of it pigmeat products. Since 1960 these four have increased their exports by 15.7 per cent. Total European exports have increased in the same period from 230,300 tons to 268,800 tons, a slightly higher increase of 16.5 per cent. This faster rate of growth for the whole of Europe, however, masks the fact that almost the whole of the increase has been due to more exports from Denmark. In the period Danish exports increased by almost a half from 68,800 tons to 93,400 tons and has helped to offset decreases from Ireland, Belgium, France, Holland, and Germany.

Soviet Aid Down the Drain?

The extent to which Russia has been helping her East European allies build up their chemical industries in recent years has now been made plain from official Soviet sources. No figures are available for the monetary amount this support has cost Russia, but it appears certain that a considerable amount of it may have to be written off, because of the refusal of Rumania to join in Comecon plans requiring her to concentrate on agriculture. Rumania had been helped to build 29 plants altogether to produce agriculture fertilisers.

The Rumanian refusal means that Russia will now almost certainly have to provide more capital for chemical industries in other East European countries if the Comecon plan is still to work.

Another lot of capital investment that will have to be written off is that made to China. In spite of the political break over the last three years, Russia has provided China with plants to produce nitrogen fertiliser, ammonium nitrate and ammonium sulphate with a total capacity of over 170,000 tons a year.

The rest of the East European bloc has benefited to the tune of at least 31 plants as well as assistance on a large number of other projects. For instance, although only one plant has been built in Czechoslovakia, invaluable Russian aid had been given on the Comecon pipeline which has its Czech terminal at the Slovnapht refinery.

The biggest share of the Russian assistance has gone to Bulgaria and Hungary; while the former has had the largest number of plants built with Russian aid, it is thought that greater output will come from those put up in Hungary. On top of this, Russia is still delivering phosphatic fertilisers to all the East European couuntries in return for equipment and machinery bought on credit.

Cyprus Eyes Economics of Enosis

Many Cypriots are now beginning to be apprehensive about the economic consequences of Enosis—union with Greece. As the political negotiations of Enosis continue, it is felt that too little attention is being paid to the economic side. They point out that a marriage between two partners with such different living standards is not going to help Cyprus raise her own standard of living. Per capita income on the island is 40 per cent higher than in Greece, despite the wealth of Athens, and the islanders also enjoy other advantages such as more advanced social services. After union, the Cypriots feel they would probably have in effect to pay for development in Greece through higher taxes.

A more serious problem would be the loss of Commonwealth preference in Britain, which takes 41.5 per cent of Cyprus's exports and provides one-third of her imports. Trade with Greece is negligible by comparison; last year 1.4 per cent of Cypriot exports went there and she imported 3 per cent of Greek goods in return. To make matters worse, Enosis would be a serious blow to those industries which are building up their trade and rely heavily on free entry into Britain. Agriculture is a particular example and nearly [illegible]

of its output goes to Britain. Fruit and wines would also be badly hit.

It is unlikely that Greece could replace this income through tourism, though this is what she is pinning her faith on at the moment. This is bound to be one of Cyprus's main foreign income earners in future but it is thought almost certain that Greece has no greater tourist potential flow for the island than Britain in spite of the nearness between the two.

High Hopes About Austria Materialise

Hopes expressed earlier this year that the Austrian economy would continue to improve have been adequately borne out over the summer. Despite a slowing down in the rate of growth of consumer goods, there has been almost uninterrupted growth in all other sectors. The core of the rise has been in raw materials and capital goods, where the stagnation experienced in 1963 has turned into considerable progress.

The real growth of the gross national product was 6 per cent higher in the second quarter than in 1963, while prices went up by only 3.8 per cent. And, although there has been a larger deficit on the balance of visible trade, this has been more than offset by increased invisible earnings, especially from tourism, and influx of other capital. There has been no overall increase in tourism, but the stay of each visitor has lengthened.

On the industrial front, productivity grew in the first 10 months of the year by 8 per cent as compared with last year and industrial production per working day rose by 7.4 cent.

Retail trade has been one sector in which there has been disturbing slackness. After brisk business in July, August was a comparatively bad month. Total turnover for the month only just reached the 1963 August level. Durables were down by 8 per cent as compared with last year and tobacco by 2 per cent. There were, however, considerable increases in clothing, photographic goods and stationery.

There was a considerable increase in liquidity in August as bank deposits grew. Overall savings increased by 1.4 per cent, while time deposits grew at their fastest rate this year—5 per cent. Tourist receipts will have helped this, as did the fine summer which meant that farmers received income from sales much sooner.

More Australian Beef for Italy?

Australian beef exporters are shaping up for a big drive to oust Argentina as the chief supplier of the lucrative Italian market. Italy is now the world's third largest beef importer after the United States and Britain, and last year bought some 258,000 tons, compared with an average of less than 100,000 tons in earlier years.

The rapid increase in consumption has come at a time of falling supplies from Latin America. It has forced Italy to go elsewhere for fatstock and carcase meat, notably to Britain, Ireland, Rhodesia—and now Australia. On grounds of price, Italy is actively encouraging the Australian campaign. In 1963, Australia sent no beef at all to Italy. In the first ten months of this year, she shipped nearly 9,000 tons of beef and beef products, valued at more than £1.6 million. Italy herself expects to have to import some £88 million of beef this year, as compared with £64 million in 1963.

Senator Vecellio said South American sources had become difficult for Italy, because short supply had increased Argentine and Uruguayan export prices sharply. Last year, average landing prices for imported beef in Italy were estimated at about £12 10s. a cwt. This year, Australian beef is reported to have landed at Italian ports at about £10 a cwt.

Higher Egg Prices Forecast

European egg traders predict substantial rises in prices in the New Year following heavy reductions in hen flocks during a period of low prices earlier in 1964. Retail prices in Europe are currently high enough to have a noticeable effect on total consumption figures. If prices rise much higher, traders say, there may be a marked decrease in retail sales.

Topical Briefs

Consumption of potassium fertilisers has been falling steadily in *Holland* for the past five years. Holland depends for a large proportion of her potassium fertilisers on imports and the unusual position has arisen that she imported in 1962-63 about 32 per cent more than she needed. Between 1959-60 and 1962-63, the last year for which figures are available, Dutch consumption fell by a quarter. Consumption in the first year was 152,700 tons; by the latter year it had dropped to 124,500 tons, compared with imports of 164,000 tons. The whole of the imports in the last year came from six countries—Germany and France in the Common Market, East Germany and the Soviet Union from behind the Curtain and small amounts from Israel and Spain. West Germany and France were by far the most important suppliers, the former accounting for 52,000 tons and the latter 51,000 tons, East Germany was next with 28,000 tons. The rest came from Russia, 16,000 tons, Israel, 9,000 tons and Spain, 8,000.

A considerable improvement in the *Turkish* oil industry has considerably benefited the economy by helping to save on imports. Although oil prospecting began at the turn of the century it is only in the last 10 years that serious efforts have been made to develop the industry in Turkey. The Turkish Petroleum Corporation (T.P.A.O.) is the most active producer, with 613,000 metric tons of crude oil last year and an estimated 650,000 tons this year. Of the foreign oil concessionaires Shell and Mobil are the most important, producing 119,000 metric tons between them last year. This year's output should come to almost a million tons, which is about a quarter of the country's needs. It has been estimated that next year's output will be about 35 per cent of requirements. In refining, Turkey is now well equipped, having three refineries with a joint output of nearly 5 million tons a year, of which T.P.A.O.'s share is about 14 per cent.

Prices are still tending to rise in the *European Economic Community*. The E.E.C. Commission's third quarterly economic report for the year says that Governments must continue with their anti-inflationary policies with especial emphasis on price and cost stabilisation as well as restrictions on investment. The Commission believes that if its advice is followed equilibrium could be achieved in about a year's time. It bases this belief on the patterns which are already emerging in intra-Community trade. Italy's balance of payments has improved and there has been a reduction in the German trade surplus. Only in Holland has the growth of imports from other members continued unabated. It was 23 per cent up on the third quarter of last year. Price increases have been particularly acute in Italy; the signs are that they have gone up faster than before. Belgium also still has a strong upward movement. France and Holland have been the most successful in keeping rises in check, especially the former.

Exports by *Poland* in the first half of the year exceeded the targets set for them by 10 per cent. Foreign trade is not handled by one body in Poland and the authorities concerned have had varying degrees of success. Most successful has been the Elektrim foreign trade enterprise which raised its planned exports by 29 per cent and for the first time exported equipment for railway traffic control to India, television studio equipment to Bulgaria, the United Arab Republic and Cuba and isotopes and apparatus for nuclear research to Iceland. Metalexport, another foreign trade concern, had a lower rate of growth, seven per cent. But the volume of heavy industry and metal products sold was 55 per cent above the same period of last year. The emergence of goods not normally associated with Poland's economy, such as the TV equipment, has been a feature of the year. Other less usual lines have been tractors to Venezuela, combine harvesters to Algeria, sports goods to Australia and Holland, gas stoves to Norway and chandeliers to Britain and the United States.

E.E.C. FARM PROBE

The E.E.C. Commission plans a large-scale probe of Common Market farming to help implement the common agricultural policy. Initially, the Commission expects to make a survey covering 1.75 million farms, a quarter of the Community totals. The aim of the first survey, which will cost £4.7 million, is to obtain information on what Community farms produce, on farming conditions, and on the location of agricultural undertakings. Statistics available at present to the Community for the elaboration of its Common agricultural policy do not meet the requirements, because, in many instances, they are not comparable from country to country.

DEFENCE AND DEVELOPMENT WITH STABILITY

CHANGE IN TECHNIQUES AND POLICIES OVERDUE

By A. D. Shroff

PRESIDENT, FORUM OF FREE ENTERPRISE

"ANY improvement in the economic conditions of the country postulates an increase in national wealth: a mere redistribution of existing wealth would make no essential difference to the people and would merely mean the distribution of poverty. A dynamic national policy must, therefore, be directed to a continuous increase in production by all possible means, side by side with measures to secure its equitable distribution." Thus the First Industrial Policy Resolution of 1948 set before the country the goal of *rapid and large-scale economic development*. With communist Chinese aggression of India in 1962, a new dimension of Defence was added to this. With the upswing in prices during the last year, a further dimension of stability has been added. So, the problem before the country now is: Defence and Development with Stability.

In fact Chinese aggression has thrust upon our national consciousness the paramountcy of defence which was not sufficiently appreciated hitherto. Edward Mead Earle, a commentator on military strategy, has pointed out the close inter-relationship between defence and economy as follows:

"Only in the most primitive societies, if at all, is it possible to separate economic power and political power. In modern times—with the rise of the national State, the expansion of European civilisation throughout the world, the industrial revolution, and the steady advance of military technology—we have constantly been confronted with the interrelation of commercial, financial and industrial strength, on the one hand, and political and military strength on the other. This interrelationship is one of the most critical and absorbing problems of statesmanship. It involves the security of the nation and, in large measure, determines the extent to which the individual may enjoy life, liberty, property, and happiness."

Even economists as far apart as Adam Smith, who advocated maximum individual enterprise, and Friedrich List, who stood for Statist economic policies, have seen eye to eye on the paramountcy of defence in national affairs. "The first duty of the sovereign, that of protecting the society from the violence and invasion of other independent societies, can be performed only by means of a military force," declared Adam Smith. Hence, "defence is of much more importance than opulence." List, a forerunner of present-day Statist economic policies, was equally categorical. "Power," he observed, "is of more importance than wealth . . . because the reverse of power—namely feebleness—leads to the relinquishment of all that we possess, not of acquired wealth alone, but of our powers of production, of our civilisation, of our freedom, nay, even of our national independence, into the hands of those who surpass us in might."

Drawing a parallel from the early days of the American Republic, we find once again that Alexander Hamilton and Thomas Jefferson, who held divergent views, agreed on the importance of defence. To Hamilton, "a nation despicable by its weakness, forfeits even the privilege of being neutral." Only strength will enable a country to "choose peace or war as our interest guided by justice shall dictate." Jefferson, who called for universal military training —"we cannot be safe till this is done"—shared the belief with Hamilton that military power can be neglected only at the cost of national integrity.

We in India should appreciate this close interrelationship in view of the enemy we face. For communists have adopted Clausewitz's dictum that "war is politics continued by other means." Lenin made it clear that "the Marxists have always considered this axiom as the theoretical foundation for the meaning of every war." Thus, the political, psychological and economic foundations of our defence—security, to use a more appropriate term—deserve the closest study and attention. I shall deal here with the economic aspect—development with stability.

II

The outstanding feature of the economic scene in 1964 is the persistent rise in prices. A recent Reserve Bank of India survey pointed out that, in the period ended 4th September 1964, prices rose by 14 per cent the increase being the highest for any 12-month period since the Second World War. Prices of food articles alone rose by 23.6 per cent, of industrial raw materials by 21.9 per cent, of manufactures by 4.7 per cent. But to realise the impact of the price rise on the common man, one has to look at the increase in prices of food articles—wheat, 51.7 per cent; rice, 11 per cent; gram 108 per cent; groundnut, 37.8 per cent—and consider this against the background of the fact that middle classes spend over 40 per cent of their income on food, and those lower down the income scale spend considerably more.

Note: This article is an adaptation of the author's presidential address at the eighth annual general meeting of the Forum of Free Enterprise held at Bombay on 9th December 1964.

Economic Malaise Deeper

This price rise cannot be dismissed as due to hoarding and profiteering by traders and/or producers. While no doubt there is some hoarding and profiteering by anti-social elements, of which the business community naturally has its share as other sections of society, even such hoarding and profiteering is the consequence of a deeper economic malaise. The very fact that the price of highly perishable goods like vegetables has gone up indicates that the price rise is general, and stems from some basic malaise afflicting the economy. In fact, the present price rise is the cumulative result of economic policies pursued over the last few years. To understand the reasons for the price rise, one has to analyse these policies and test them on the touchstone of inexorable economic laws.

The economy of the country has been dominated by Five-year Plans since 1951. The first Plan was a mere collection of projects, some of which had been launched well before 1951. But it gave a sense of growth and direction to the economy. The second and third Plans were based on ideological considerations. Soviet planning techniques were used in drawing up these plans.

One characteristic of Soviet model of planning is what is called "physical planning." Planning targets are set out first, without consideration of availability of resources. Since needs of an underdeveloped country are unlimited, naturally the targets prove to be much beyond the capacity of the country to save, and thus there remains a large gap between targets and resources. Economic development without strains and stresses can be accomplished if investment is financed out of the *genuine savings* of the community. The genuine savings are available to the Government in the form of taxes, public loans, revenues from commercial undertakings of the State, and, finally, foreign aid which is in reality savings of other people.

Deficit Financing

When these sources of *genuine savings* are exhausted, under physical planning the Government resorts to deficit financing. In simple terms, this means the printing of currency notes to pay off Government bills. Since planning was initiated in India, deficit financing in 13 years has been of the order of Rs. 1,960 crores. Although a ceiling of Rs. 550 crores was set for the third Plan, the compulsions of physical planning have led to deficit financing to the tune of Rs. 674 crores in the first three years of the Plan. As a result, money supply, which was Rs. 2,216 crores in 1955-56 increased to Rs. 2,868 crores in 1960-61, and had crossed the Rs. 3,700-crore mark in November 1964.

This increase in money supply is the basic factor in the price rise. It should be remembered that money is valuable only in so far as it represents the stream of goods and services produced in the country. What a great Roman Emperor, Hadrian, said centuries ago is still true: "Our currency has been dangerously depressed for a century; it is nevertheless by the exchange rate of our gold pieces that Rome's eternity is appraised; it behoves us to *give them solid weight and true value in terms of commodities.*"

Today, the central bank of our country puts this economic fact in the technical jargon of economists: "The sharp rise in prices . . . reflected the imbalance between the rate of growth in the liquidity in the economy and the increase in real output and the rise in money supply. . ."

Another feature of Soviet model of planning which has aggravated the price situation is the heavy industry bias and consequent neglect of agriculture and consumer goods industries. The present food crisis is the result of years of neglect of India's fundamental asset, agriculture, and the unsettling effect of ideological land reforms. The neglect of the agricultural sector, while the authorities were busy with prestigeous heavy industries, is best illustrated by the statement of the Plan Protection Adviser to the Government of India that crops worth Rs. 1,000 crores were lost in the country annually owing to incidence of pest diseases and inroads of rodents, etc. Even Communist China, after bitter experience, has shifted its emphasis back from heavy industry to agriculture, having had to import 11 million tons of wheat between 1960-63.

The food crisis on the production front has spread over to the distribution front because of dislocation of the normal market mechanism. State trading in foodgrains is often prescribed as a remedy. But experience of state trading does not indicate its efficacy. According to Audit Report for 1964, cumulative losses of state trading in foodgrains between 1943-44 and 1962-63 were over Rs. 131 crores. In the eastern region alone, according to a Press report, foodgrains worth over Rs. 1,56,000 were lost from Union Government depots in three years owing to inefficiency malpractices, etc.

Another feature of Soviet model of planning is the expanding Public Sector. An objective review of this sector shows that it has been an important factor in pushing up the price level. The scarce resources, which would have fructified in the pockets of the people have been diverted to the Public Sector where the returns have been disappointing, thus aggravating the imbalance between money supply, on the one hand, and goods and services on the other.

Instances of Mismanagement

A report submitted to Parliament by the Comptroller and Auditor-General of India disclosed that, for the second year in succession, there was a net loss in their working. On an employed capital of Rs. 1,294.11 crores in 46 Central Government companies in 1962-63, there was a loss of Rs. 12.38 crores. In the previous year, the loss was Rs. 10.60 crores on an employed capital of Rs. 1,090.75 crores. Thus, in two years, instead of earning Rs. 240 crores, according to the 10-per-cent-profit formula propounded by the Deputy Chairman of the Planning Commission, there was an invisible tax of Rs. 263 crores on the public. It is, therefore, not surprising that the Union Finance Ministry was reported to have ordered an inquiry into the working of public sector undertakings, as it found that the Hindustan Machine Tools was the only "efficiently run and profit-making institution" in that sector. The Mysore Government recently got permission of the Union Government to withdraw Rs. 67 lakhs from Hindustan Aircraft on the ground that it was not getting any return on its investment. A brief review of some public sector enterprises, of the Central and State Governments, gives a clearer picture.

The Audit (Commercial) Report for 1964 reported that the non-acceptance of the lowest tender for Ashoka Hotel construction "resulted in an extra expenditure of Rs. 3,26,000 approximately on the final cost." In the Praga Tools Corporation, "preparation of inaccurate estimates, poor performance in the shops and surplus labour" led to "substantial losses on account of the production costs being higher than the selling prices." Moreover, "out of the total plant and machinery of Rs. 88.69 lakhs (original vaule), plant and machinery worth Rs. 47.15 lakhs or 54 per cent is surplus to the requirements on 31st March 1963." The Auditor-General comments: "Apart from the blocking of funds and consequent loss of interest, such machinery is likely to deteriorate due to efflux of time and obsolescence."

In Heavy Electricals, an excess payment of £6,000 made to consultant had been commented upon by Audit Report 1961, and the Lok Sabha Public Accounts Committee Report. In January 1964, "the missing file of the Ministry is still not available." Moreover, another case of overpayment of £20,000 had come to notice. As regards production, "the target prescribed in the project report and also those laid down under phased programme based on single shift could not be achieved by the Company even in double shift." The shortfall was 24 per cent in 1962-63. This was, in spite of the fact that there was 80 per cent excess staff than recommended in the project report. Between 1960 and 1963, accumulated losses were Rs. 611.60 lakhs.

The Hindustan Steel was found to have committed several errors costing lakhs of rupees. For instance, there was a loss of Rs. 2,83,500 in iron ore mine contract; about Rs. 25 lakhs in the power plant due to non-installation of dust catchers; Rs. 70,000 on an infructuous dairy scheme; Rs. 30.10 lakhs by negligence to store iron scrap properly. In the Hindustan Shipyard, a loss of Rs. nine lakhs was incurred on reconditioning imported machinery worth Rs. 10 lakhs because it was allowed to lie in the open without cover. In the Garden Reach Workshops, there was a loss of Rs. 19 lakhs on a fabrication work because of defective estimates. An item costing about Rs. 26 lakhs to manufacture had been quoted at only about Rs. 7 lakhs!

Periodic press and parliamentary reports reinforce this story of waste and mismanagement. For instance, a delay in clearing goods by the Heavy Engineering Corporation led to payment of Rs. 36.26 lakhs as rent and penalty to the Calcutta Port. "Mismanagement and inefficiency" were said to be the reasons for losses of Rs. 5 lakhs at Nahan Foundry in 1962-63, and anticipated further losses of Rs. 15 lakhs. The annual audit of the Oil and Natural Gas Commission disclosed "serious irregularities and lapses, financial as well as administrative, resulting in heavy losses." For instance, as on 31st December 1963, goods worth Rs. 10 crores could not be linked and accounted for.

Fertiliser, which the country needs urgently to increase food production, was not produced in sufficient quantities by the plant at Rourkela because of a dispute between the Hindustan Steel and the Fertiliser Corporation of India, both Public Sector concerns, about terms of transfer! In February 1964, the production had fallen to one-fourth of rated capacity. The Indian Railways lost Rs. 40 lakhs on unused loose steel jaws because of a decision to stop import of steel sleepers as it was found that wooden sleepers could be imported at a cheaper price.

Public Sector in States

The situation with regard to Public enterprises run by State Governments is more distressing. To cite only a few instances: The Estimates Committee of Madras Legislative Assembly was alarmed at the increasing losses incurred since 1959-60 by the Madras Dairy and Milk Project. The Maharashtra Public Accounts Committee (report for 1961-62) commented on the Nagpur Milk Supply Scheme as follows: "It is evident that the framing of the scheme and its execution were not well thought out and planned before it was accepted by the Government." The target of supply to the city of 1,080 maunds of milk was to be reached in four or five years, but was expected to be reached in 10 to 15 years. The Madhya Pradesh Government had decided in 1964 to discontinue five dairy farms on which nearly Rs. 35 lakhs had been spent because only one of them had shown a profit of Rs. 584, whereas the rest had incurred a loss of Rs. 1,00,132. In Uttar Pradesh, 12 State mechanised farms had incurred a loss of Rs. 81.59 lakhs during last 15 years. In its 15th Report, the Estimates Committee of Rajasthan Assembly castigated the Government for its "unfortunate" neglect of the Public Sector. There "has been sheer wastage, heavy losses and mismanagement" in all industries or undertakings run by the Government, the Committee observed.

The West Bengal Audit Report, 1963, noted instances such as a loss of about Rs. 6 lakhs by the State Forest Department in its charcoal manufacture project. A special committee of the Orissa Assembly set up to investigate State enterprises found that, excepting a few pilot project units, where private entrepreneurs were managing directors, and the State transport, the rest were in a financially sick condition. In fact, 5 out of 40 companies under pilot project scheme were under liquidation. The State Audit Report (1964) noted that even by the end of September 1963, the accounts of six State enterprises for 1960-61, 4 for 1961-62 and 23 for 1962-63 were not available, and they had not held annual meetings under the Companies Act. In spite of this experience, the zeal for Public Sector expansion continued, and in September 1964 it was reported that, after spending Rs. 27,09,000 on "preliminary arrangements" and "procurement of material" for a factory the Orissa Government had wound it up!

The Maharashtra Exchequer incurred a loss of Rs. 7,31,000 on two grossly defective textbooks which it had to withdraw in the face of vehement public protest. Although the Education Minister admitted that the text-books contained "certain major errors, such as incomplete and wrong information, wrong maps, and few confusing statements, and did not come up to the standard laid down for State-produced textbooks," the Government was determined to persist in its policy of state monopoly of textbooks.

A bicycle factory run by the Mysore Government had attracted countrywide attention a few years ago as it had produced the costliest bicycles in the country. The Audit Report for 1964 disclosed that, between 1959-60 and 1962-63, only 322 bicycles, being 1.8 per cent of installed capacity, had been produced while the cost incurred was Rs. 7.07 lakhs, thus enabling the factory to maintain its cost record.

S.T.C.

The State Trading Corporation, which came in for severe criticism from the public and Parliamentary Estimates Committee for its profiteering in cement, continued to attract unfavourable attention. It was flayed once again by the Parliamentary Estimates Committee in March 1964 for incurring a heavy loss of Rs. 2.13 crores in 1962-63 in earning Rs. 3.44 crores of foreign exchange in the export of groundnut oil and oilcake. The Committee called for an inquiry into this deal. In December 1963, a bungling by S.T.C. in lemongrass oil export, with unsold stocks of over one crore of rupees, came to public notice. It was also found that S.T.C. made an unjustified profit of Rs. 5,28,000 on imported betelnut costing Rs. 3 lakhs! It was disturbing to learn that S.T.C., in its anxiety to earn foreign exchange, was exporting groundnut oil to Burma in large quantities even though it was known that the commodity was being re-exported to Communist China. Disclosing this, Mr. Devji Rattansey, Vice-President of Bombay Grain, Rice and Oilseeds Merchants' Association, said, in July 1964: "We are thus feeding the very people who are hostile to us."

It is seldom realised that waste and mismanagement of Public Sector enterprises are not their only deficiencies. When such enterprises are monopolies, indirect losses to the economy could be very heavy and consumer exploitation a reality. For instance, the frequent cancellation of flights and chronic delays in departure and arrival of planes run by the Indian Airlines Corporation constitutes an impediment to smooth functioning of India's economic life. The loss of tourist revenue on this score is well known. Delivering a judgment in an appeal filed by a widow, the Madras High Court deplored that the Life Insurance Corporation was putting "up a fight on the pattern of ordinary litigants" to resist claims, "on frivolous pleas and reckless allegations."

When the Public Sector expands by nationalising private enterprises, there is the additional danger of political considerations submerging all economic considerations. The Supreme Court, in a judgment in January 1964, in a case of nationalised bus transport in Kurnool, Andhra Pradesh, observed: "We are constrained to hold that the allegations that the Chief Minister was motivated by bias and personal ill-will against the appellants (private owners) stand unrebutted."

III

A discussion of the public sector cannot be complete without a reference to their personnel policy which has been a matter of serious concern as it has a bearing both on human welfare and production. A recent strike in the Sindhri Fertiliser Factory, for instance, resulted in production loss of Rs. 54 lakhs. What the Union Minister for Petroleum and Chemicals described as the "chapter of misunderstanding that had lasted some years" between employees and management of Hindustan Antibiotics had led to frequent disputes. A seven-day strike in 1964 resulted in a loss of Rs. 8 lakhs.

Labour in Public Sector

The views of labour leaders, who cannot be accused of hostility to the public sector on ideological grounds, are interesting. Mr. Satish Loomba, Secretary of A.I.T.U.C., in an article in "New Age," Communist Party's official organ, wrote:

"Some problems are peculiar to the public sector.

"Police verification of all employees, which leads to easy victimisation, is an obnoxious practice in public sector. It must go. Most enterprises are in new places which poses the problem of housing and transport. Standing order, leave rules, promotion policy, etc., are in a chaotic condition. And then there is the question of status: many workers in public sector are not treated as industrial workers but as Government servants, depriving them of many rights of industrial workers.

"The question of settlement of disputes is another sore point. In the public sector, arbitration is accepted very rarely, if at all. Reference to adjudication is also difficult to secure. With bureaucratic managements, involvement of many Ministries in a dispute and non-recognition of representative unions, disputes have very little chance of settlement.

"So either the workers have to go on suffering patiently or when patience is exhausted, take to some form of action. The managements, which are too lethargic to consider any grievance ordinarily, pounce upon any attempt to organise action by workers in defence of their rights, as has recently happened in the Heavy Electricals, Bhopal.

"Unless a realistic labour policy is adopted, industrial relations in public sector enterprises are not likely to be very happy."

Mr. George Fernandes, Socialist trade union leader, said in Bombay in January 1964, that the Central Government "is not only the biggest employer, but also a damned rotten employer."

A Parliamentary Estimates Committee Report and a Government investigating officer's report on the Heavy Engineering Corporation seem to confirm these reviews with documented evidence. The Estimate Committee noted that the Public Sector undertakings were openly defying Parliament's wishes that departmental secretaries should not be chairmen of such enterprises. An oft-repeated complaint that Parliament was being kept in the dark was underlined again. The Committee "regret to place on record that, despite repeated reminders, the information called for in their written questionnaire dated 7th September 1963, has not yet been received from Garden Reach Workshops Ltd., nor have they intimated any reason for their inability to furnish the requisite information."

Overstaffing

The "public undertakings are invariably overstaffed," the Committee observed. In the three steel plants alone, as against project estimates of 18,666, the strength on 30th December 1963, was 50,814, there being an excess of 32,148. Some disturbing aspects brought out by the Committee were: 18 undertakings, some started as far back as 1952 and 1954, had not laid down terms and conditions of service; some had not classified their posts; 28 undertakings had not framed recruitment rules ("It is not surprising that, in the absence of these rules, there have been allegations of favouritism and nepotism," the Committee observed); 31 undertakings had no promotion rules ("It is noticed that there have been quite a few cases of quick promotions in many undertakings" the Committee noted: in one instance, a junior engineer appointed on Rs. 380 in February 1960 was drawing Rs. 900 in April 1963); 17 undertakings in contravention of the Industrial Employment (Standing Orders) Act, 1964, had not either framed standing orders or not had them certified; 28 undertakings had no grievance redressal procedure; 19 undertakings had not framed disciplinary rules. The Committee concluded that "labour-management relations are not very cordial in a number of public undertakings," and recommended that outsiders should not be allowed to act as office-bearers of unions.

Mr. Mukerji's report on the sorry state of affairs in the Heavy Engineering Corporation said: "there was, I am constrained to say, almost a criminal lack of supervision and control." Some lapses listed are:

The Chairman was unable to work his team to the best advantage of the undertaking; this fact very adversely affected every sphere of the undertakings' activity.

There was a complete lack of co-ordination where such co-ordination was essential: there was almost a chaos in certain departments of the administration due to many reasons, which led to a state of affairs where anything could have happened.

The security arrangements were pathetically inadequate: there was no adequate security consciousness.

Co-operative Sector

State patronage of co-operatives has virtually converted them into public sector. Their performance, therefore, makes an impact on the price structure. It is a matter of regret that the genuine co-operative movement, built up by dedicated men like the late Mr. Vaikuntlal Mehta, is today in danger of being wrecked by State-dominated co-operatives whose record of wastage of public funds is alarming. The Union Minister for Co-operation and Community Development, Mr. S. K. Dey, himself was constrained to admit in June 1964, that bogus co-operatives and vested interests were crippling the growth of the movement. "Non-genuine co-operatives in India today are the most powerful ones, because of the political strings attached," he added. "I am forced to bend my head in

shame" in the area of marketing of foodgrains by co-operatives, Mr. Dey admitted. Reports from different States bore witness to his admissions. A New Delhi co-operative affairs frequently figured in Parliament, because reportedly it had profiteered to the extent of 36 per cent, whereas its legitimate profit should have been 2 per cent in the sale of *gur*. In the Punjab, 5,000 or almost one-sixth of registered societies had to be wound up recently as they were moribund. In Kashmir, the Audit Report stated that, out of 1,401 societies, on 31st March 1962, 139 were running at a loss and 554 were dormant. The time has come for a review of State policy with regard to use of public funds to bolster up such co-operatives.

Two more important features of the Soviet model of comprehensive centralised planning as applied to a democratic set-up such as ours are rigid controls and heavy taxation on productive private enterprise of citizens. The multifarious controls and the jungle of administrative regulations frustrate the objective of greater production. The Estimates Committee, after hearing evidence, came out with a strong plea to eliminate multiplicity of forms and applications to be filled in by a joint-stock company. It mentioned an instance of a non-official organisation which had to submit applications and enclosures weighing 90 pounds to get the Company Law Division's approval of the appointment of a secretary and treasurer! Mr. S. G. Barve, Maharashtra's Industries Minister and a veteran administrator, has observed that the sum total of our laws, procedures and practices was such that the rewards of productive investment were nothing like the gains reaped by speculation or trading activities. He admitted that the country's economic system "does not encourage productive industrial enterprise sufficiently."

It is pertinent to repeat in this context what I have pointed out a number of times—the social costs of controls. The Santhanam Committee Report on Corruption confirms these fears. It observed: "It was the unanimous opinion of all witnesses who appeared before us that administrative delays are one of the major causes of corruption. We agree with this view. We have no doubt that quite often delay is deliberately contrived so as to obtain some kind of illicit gratification."

Taxation Overdone

The heavy hand of fiscal authorities is pushing down the tempo of economic development and production, thus aggravating the imbalance between money supply, and goods and services. The Directors of the Reserve Bank, in their Annual Report, 1964, have pointed out that "additional taxation during 1964-65 is expected to raise the ratio of Central and State's tax revenue to national income from 9.6 per cent at the end of second Plan to 14 per cent." This increased taxation is mainly borne by the already heavily taxed assessees numbering less than ½ per cent of the entire population. Two recent surveys of the Reserve Bank of India clearly prove how the additional tax burden has retarded production and growth: According to a Reserve Bank survey of some representative companies, while their pre-tax profits increased by Rs. 22.8 crores over the previous year, tax provision rose by Rs. 28.5 crores. As a result, dividends declined by Rs. 3.8 crores. According to another R.B.I. survey of 1,015 small public limited companies, while profits before tax in 1962-63 increased to Rs. 4.8 crores from Rs. 4.2 crores in the previous year, profits after tax declined to Rs. 1.53 crore from Rs. 1.85 crore. Retained profits likewise declined to Rs. 24 lakhs from Rs. 50 lakhs. "The rate of dividend, as indicated by the ratio of dividends to paid-up capital, showed a fall from 6.1 per cent to 5.7 per cent."

Considering the fact that "additional taxation at the Centre in the first three years of the third Plan is estimated to yield about Rs. 1,900 crores over the entire Plan period, thus exceeding the five-year target of the Plan (Rs. 1,100 crores)," it is time that the Union Finance Minister heeded the wise counsel offered to Alexander the Great when he was not desisting in his march in India despite reluctance of the troops to follow him: "Sir, if there is one thing above all others a successful man should know, it is *when to stop*."

Administrative Deficiency

While I have been an enthusiast of planned economic development long before the authorities thought of the subject, I have repeatedly stated that the Soviet centralised, comprehensive planning is not suited to India. Eight years of such planning have brought distress to millions in the fixed income groups. One important deficiency in Indian planning against which I have warned is the inadequacy and inefficiency of the administration.

So far as Public Sector enterprises are concerned, Government servants, by temperament and training, are not suited to run them efficiently. Lack of personal stakes, political interference, and weak Parliamentary control worsen the situation. In Indian economic development, the scarcest factor is time. Administrative delays have made this factor still scarce. The Chief Minister of Mysore, Mr. Nijalingappa, has pointed out that out of every 100 files which came to him 50 attracted his attention because they were delayed. He cited the case of a Government servant whose pension had not been received by his family for 18 years.

A few instances of chronic administrative delay indicate the inability of the administration to deliver the goods in a comprehensively planned economy: a scholarship sanctioned by the Punjab Education Department to a primary class pupil in 1957 had not been paid till early 1964. Over 100 reminders by the boy's father had no effect excepting to elicit finally a reply from the District Education Officer saying, "No use writing cards daily as the matter has been taken up and early action is likely." The Union Education Minister, Mr. Chagla, has disclosed that an International Students' Hostel, proposed to be built in 1955 with 300 rooms at a cost of Rs. 8 lakhs was delayed and, finally, had been built with only 100 rooms at a cost of Rs. 9 lakhs. In Kerala, a Government guest house built at a cost of over a lakh of rupees had remained unused for four years for lack of electrical and sanitary fittings. The Chief Municipal Auditor of Bombay Municipal Corporation recently complained that one department had not submitted *quarterly returns* for 11 years, and 10 for over five years! The Orissa Public Accounts Committee was "surprised" that audit objections for the year 1947-48 had not been disposed of even after 14 years. The Committee observed: "Departments of Government are not sincere and keen in their efforts to dispose of their outstandings quickly." The following report perhaps gives a clue to this situation. The correspondent of a Calcutta daily reported from Jabalpur:

"Quite a sensation prevailed in the office of the Chanwarpatha Development Block when the Collector of Narsinghpur paid a surprise visit and found almost the entire staff away from their desks.

"It is stated that, as Mr. Rajput, Collector, was wearing a turban and *dhoti*, nobody could recognise him and he was considered as an ordinary common villager. Clerks, peons and other staff were either busy gossiping here and there without caring to work or were in adjoining teastalls. Certain members of the staff were found playing cards under a tree while others were slumbering."

IV

A corrective to the economy is required at this stage if national aspirations of prosperity and social justice are not to be scuttled by running away inflation. In the light of experience gained, the suggestions made by Prime Minister Lal Bahadur Shastri are sound economic commonsense. He has rightly recognised that "the farm sector is, and will remain for many years, decisive in Indian development." Therefore, he has suggested a shift away from heavy industries. Besides agriculture, the need to develop consumer goods industries to supply the basic needs of the people has been proposed. Such meaningful production of goods and services required by the people will not only reduce inflationary pressures, but also make Indian planning democratic, instead of being bureaucratic as at present. The West German experiment holds a lesson for us. The Economic Miracle took place as "the consumer regained control over the economy, because, with a stable currency, planning passes from civil servants to the people."

An Unwarranted Confusion

The Prime Minister also suggested consolidation of existing projects before launching new ones. Since the idea of *consolidation* is confused with *stagnation* by some, it needs some elaboration. Consolidation is a logical step in the operation of any enterprise, since it means extraction of best value from scarce resources invested. As applied to our current economic scene, it will halt inflationary pressures, and give a fillip to economic growth on healthy lines. To take the case of river valley projects: The Bhakra-Nangal project, estimated at Rs. 132.91 crores in 1950, had actually cost Rs. 202.91 crores by March 1963. But receipts in 1961-62 were only Rs. 44.88 lakhs, as against estimates of Rs. 184.50 lakhs. The annual loss on irrigation wing was two crores of rupees and on electricity side, Rs. 2.76 crores; Rajasthan Canal Project work being incomplete, water cannot be released from the Punjab portion of the feeder canal; Mysore's major irrigation projects, with an investment of Rs. 86 crores, had not yielded any revenue to the Government till 1962-63; the Damodar Valley Corporation has reported that the irrigation potential created by it has not been utilised for want of water courses and field channels; a press report in October 1964 says that a D.V.C. 80-mile navigation canal, linking Durgapur with Hooghly, built at a cost of over Rs. 3.7 crores, had remained unused for months; the Hirakud Project, built at a cost of Rs. 85 crores, was causing an annual loss of Rs. 65 lakhs to the Orissa Government.

Consolidation would mean proper utilisation of these assets already created and making them economically viable. The economic base would be strengthened by consolidation of existing projects rather than embarking on more ill-digested ones.

Apart from this shift in Plan strategy, the economic situation demands that the Government devote its exclusive attention to its basic functions: defence, law and order, regulation of economic activities, and provision of basic amenities and infrastructure, that is, education, roads, ports, postal communications, etc. It is not uncommon to read news items like that of acute shortage of drinking water in Yeotmal, a town of Maharashtra, resulting in sale of water at 50 paise per tin. The Union Education Minister's disclosure that India is the most backward country in the world so far as expenditure on education is concerned underlines the deficiency of this important item of the infrastructure. A major obstacle to economic growth is the dearth of adequate and efficient postal, telephonic and telegraphic facilities. There are periodic reports of shortages of postal stationery. A Union Minister who recently inaugurated a Rs. 50-lakh factory in Bombay confessed that he was "ashamed" to learn that the factory had no telephone! In 1962-63, 2.3 million telegrams—6 per cent of the total booked—were disposed of by post! Inadequate port facilities accentuated India's food crisis. In July 1964, 12 ships with a load of 2.5 lakh tons of wheat were berthed midstream in Bombay port, while there was an acute shortage of wheat in the city. Meanwhile, the Government was paying a demurrage of Rs. 50,000 daily in precious foreign exchange!

Even Communists Are Changing

Happenings in communist countries reinforce this plea for a change in our economic policy. After decades of experimenting with centralised comprehensive planning, recently, Soviet Union has adopted a modified free enterprise system as the best way to produce more and better consumer foods. *Pravda* has called for less central planning in light industries. "It is time to give more independence to the enterprises, so that they will be economically interested in producing high quality goods popular among the customers," it declared. A Vienna report on Communist Czechoslovakia, considered to be a Stalinist country, said that that country had embarked on a radical course of economic reform. "In essence," the report said, "the proposed economic measures call for the disappearance of complete centralised planning at all levels of industry, allowing individual factory managers to make their own production decisions and forcing them to become financially self-sufficient." Mr. Walter Ulbricht, of Communist East Germany, indicated the same new economic policy for his country to replace communist economic practices. He said: "Petty, narrow-minded bureaucrats, divorced from the realities of life and of the workers, who have lost the taste for novelty and human contacts, are as little wanted as leaders as are the men who hang on to outworn routines and will not recognise that it is impossible to lead men with old-fashioned dogma of the past." His new economic policy was designed to create "an economic lever operating on the principle of material interest which will encourage the manufacturers, collectives and individual workers towards the goal of scientific-technical progress." The new prices under this policy "will differentiate between goods of varying quality and will allow manufacturers to sell at profit after covering their costs of production, thereby encouraging increased production."

The need for *material incentives* and the indispensability of the profit motive as a measure of efficiency, a rational allocator of resources, a source of internal capital formation and above all an incentive for greater production have now been recognised by communist countries. For instance, *Pravda* has argued that "it is not the machines and technology but human beings" who are the principal productive force and who "are not disembodied angles deprived of individual needs and personal interest." An economist and authority on automation, Mr. Tiapeznikov, writing in *Pravda* in August 1964, upheld the profit motive as follows:

"To work up an efficient economic influence on economic activity, it is necessary to select an indicator, which characterises the work of the enterprise to the highest possible degree, but also is in line with the interests of the national economy and of the employees of the enterprise. We think that such an indicator, besides other quantitative and qualitative indicators, is represented by profits."

Mr. Lev Leontyev, a member of the Soviet Academy of Sciences, has pleaded for "economic methods of planned management" (i.e., market mechanism of profits, etc.) in place of "administrative methods" which he rediculed as being concerned with "production, distribution and the use of every nail."

On the farm front, too, a radical shift has taken place. The former Soviet Premier, Mr. Khrushchev, disclosed in March, 1964, that the Soviet leadership had "borrowed a little from the practices of running farms in the U.S." in reorganising Soviet agriculture after Stalin's death. He praised U.S. farming for its "concreteness" and "businesslike efficiency." The Government of Ukraine announced in November 1964, that it had decided to abolish ceiling on private lands and ownership of cattle. Even doctrinaire communist China disbanded the communes and about 9 per cent of land in China was distributed among peasants as private plots according to the policy of "economic revisionism."

With such convincing evidence from communist countries, a change in our planning techniques and economic policy are overdue to stop inflation and give a stimulus to development. But such a change cannot be contemplated without a change in the Planning Commission's composition, power and functions. A recent study by Mr. H. K. Paranjape of the Indian Institute of Public Administration has brought out some interesting facts. In 14 years of its existence, the Commission's membership had undergone many changes, there being 24 appointments. The staff has increased from 244 in 1951-52 to 1,025 in 1963-64. Expenditure on the Commission has gone up from Rs. 8,56,536 in 1950-51 to Rs. 67,02,000 in 1964 Budget Estimates.

Dominated by politicians and Government officers, the Planning Commission's functioning has naturally revealed a lack of appreciation of the actual working of the economy. But, constitutionally, none of the members can be held accountable for the lapses and consequent repercussions on the economy. In fact, the country has witnessed the amusing spectacle of ex-members of the Commission attacking it when the tide of public criticism has waxed strong! Thus, the Planning Commission, as at present, happens to be an unsound instrument for economic development and democratically an anachronism, because it enjoys power without accountability. The Commission should be remodelled on the lines of its French counterpart and made a purely advisory body. If this change is made and a shift effected from "imperative planning" of Soviet type to "indicative planning" of French type, the vast, untapped human and natural resources of our country can be easily mobilised to meet the challenge of defence and development while ensuring stability. Realistic planning based on the inexorable economic laws of the market and respect for individual freedom in economic as well as political spheres leads to economic prosperity and social justice.

NEW PRODUCTS AND PROCESSES

Packing Small Articles

A NEW machine for packing small articles individually in sealed bags at rates up to 40 per minute, known as the Seal-o-pac, is being manufactured and marketed by S.O.A.G. Machine Tools Ltd., Juxon Street, Lambeth, London. It can handle all kinds of goods, including food, wool skeins, toys, stationery and electrical and toilet accessories. These can be up to 7 inches wide or 4 inches high and any length from ½ inch to 11 inches. The most usual wrapping material is transparent cellulose film, which is heat-sealed, but the machine can be adapted to use coated films, laminated foils, heat-sealable papers or cold-sealing materials. The machine is also being developed to handle polyethylene type films. The Seal-o-pac can be used on its own or incorporated in a production line with automatic weighing, counting and casing machinery. In either case, articles are usually fed from a hopper, but irregularly-shaped articles can be inserted by hand. If one machine is used for articles of several different sizes, changeover of parts takes about 15 minutes. Inexperienced operators can be trained to use the Seal-o-pac in a few hours. Wrapping material, drawn from a reel at the back of the machine, is progressively channelled into the form of a tube with overlapping edges. The longitudinal seam is sealed at the top of the tube by a heating head, and is not in direct contact with the products; jaws above and below the tube then make transverse seams which form the back of one pack and the front of the next. Articles are fed singly on to the material just before the tube is complete, each being positioned accurately by a ram which thrusts it forward against the previous transverse seam. The heating jaws then grasp the tube behind the article, making the next seam, and draw the pack forward by its own length. Finally a guillotine within the jaws cuts off the completed pack, which is carried away for casing by a conveyor.

Long-lasting Anæsthetic

A new anæsthetic, Zecain, which is said to remain effective longer than other similar agents, has been developed by Bofors of Sweden. According to Dr. Bo af Ekenstam, head of the Company's medical research laboratory, the new local analgesic is a further development of its Carbocain, which was introduced in 1957. Zecain has been extensively tested on close on 3,000 patients over the past four years and no undesirable side effects on nerves have been recorded. The new analgesic has proved of particular value after major surgery, such as thoracic and abdominal operations, when long duration of the analgesic effect is desirable. The pain is reduced and the patient thus more rapidly recovers his full breathing capacity, which cuts the time for post-operative hospitalisation.

Mixing Asbestos and Cement

The Revisione Construzione Machine Company, 85 Corso Pietro Colletta, Turin, Italy, has developed an apparatus for mixing asbestos and cement with water to produce, automatically, a mix of the correct consistency for use in the building industry—principally for use as asbestos boards. Water enters a tank, suspended on the arm of a weighing machine, and when sufficient has been added, photo-cells close the valve and open another that lets in asbestos. When sufficient of this has been added and thoroughly mixed by a pump cement is also added and mixing continues for a set time. The contents are then pumped away and the cycle is repeated.

Balance for Blood Analysis

The Industrial Automation Works in Prague, Czechoslovakia produce a balance for blood analysis. The balance bears the Meopta trade mark. It serves for measuring the content of hæmoglobin, red blood cells, hæmatocrit and the total content of proteins in the blood. The qualities of these blood components may be read on a scale of the balance with an accuracy to one-tenth of a milligram, the indication being based on the specific gravity of the blood and blood serum. Blood analysis carried out with the balance lasts only five to ten seconds.

Safety with Freedom

A safety device that allows a man working at heights to move freely up and down, but acts as a firm anchor if he should fall, has been developed by Barrow Hepburn & Bale Ltd., London. It consists of a cylinder that fits over a steel or nylon cable running from the top of the building to the bottom. In the cylinder, to which the safety line from the man's belt or harness is attached, is a second cylinder and an arrangement of steel balls in a conical housing. Any weight suddenly applied causes the balls to bind on the cable and anchor the cylinder. The greater the weight, the firmer is the grip.

Welding "Difficult" Steels

A way of joining difficult-to-weld steels without setting up stresses between them that have to be removed by annealing has been jointly claimed by Brown Boverie and Co., of Baden, Switzerland, and the Bureau d'Etudes Industrielles Fernand Courtoy, 43, Rue des Colonies, Brussels 1. The edges of the components to be joined are first thinly "buttered" to a maximum thickness of 2 mm. with a steel that lacks the "difficult" constituents and then a weld seam is formed between them to complete the sandwich.

Electronic Data Processing System

The Nippon Electric Co., Ltd., in Japan has completed a small high-performance electronic data processing system—NEAC-2200. Its production will be started in June at a monthly rate of 5 to 10 units, the new products being placed on the market within the year. The system has been developed jointly with the Honeywell Co. of the U.S., with which the Nippon Electric has a technical tie. This is twice as quick in operational speed as the smallest model 30 of the IBM-360 series recently announced and 30 per cent smaller in size. The feature of the NEAC is its operation speed of the central processing device. The speed is 1 microsecond for the main memory device and 250 nanoseconds (1 nanosecond is a billionth of second) for the restricted memory device, and so, it is possible to operate the input and output devices simultaneously with computation without any accessory device.

Improved Magnet

A magnetic material of high coercivity is made by the International General Electric Company of New York, 296, High Holborn, London, W.C.1. It is sintered Alnico 8. This material is fabricated by powder-metallurgy techniques and has a fine grain structure, giving a more uniform flux distribution than that of the cast form of Alnico 8. It has also higher temperature stability. Coercive force achieved is 1,550 oersteds. Magnets of the new material are being used in a prototype low-noise travelling wave tube for more uniform focusing of the beam. Other applications include rotors and fields for small motors and generators, hearing aids and so on.

Dust Collector

A device for the removal of dust and fluff floating in the air and deposited on textile machines, which is stated to be compact, lightweight, easy to maintain and require only small amounts of power to operate, is reported by Veb Maschinen-U, Apparatebau Schkeuditz, 10-12, Kurt-Beyerstr., Schkeuditz, Germany. The device is mounted next to the machine and has an electrostatically charged endless belt for collection of the undesirable flotsam. A scraper continually removes this as the belt rotates. The maker claims that it is suit for use with every type of textile machine.

Ultrasonics to Foil Burglars

A detection device based on ultrasonics will sense the slightest untoward movement in any room that it protects. Applicable also to doorways and corridors, it is called the Intruder Alarm and is developed by Decca Radar's Hersham Division, Lyon Road, Walton-on-Thames, Surrey, England, applying radar principles. Detection of movement relies on the Doppler effect in air at ultrasonic frequencies. The area to be protected is flooded with inaudible sound at high frequencies. Any movement within the area not only alters the pattern of reflections but also the frequency of the reflected sound. Electronic filters and a correlation technique eliminate false responses to such things as draughts. The equipment does not need to be reset if the contents of the protected area are changed or rearranged and the alarm itself can be local and audible or remote and visual.

Common Cold Vaccine

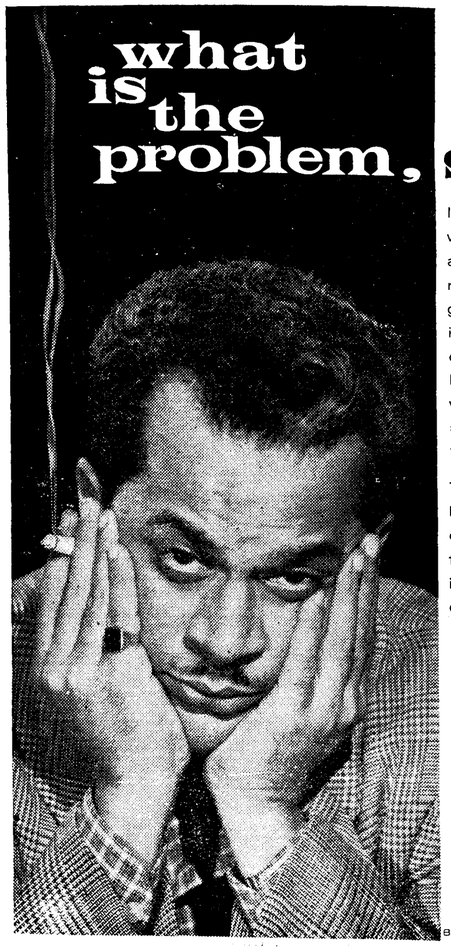
The first vaccine against the common cold has been produced at the Medical Research Council's Common Cold Research Unit at Salisbury, England. There are, however, 50 or so types of virus responsible for the common cold, and the vaccine acts only against one. The ideal aimed at is a vaccine against all types of common cold. The one already developed appears to be effective for some years.

Rubber Springs

Of particular interest to motorists is a British company's hollow rubber spring kits, which can be fitted to most cars. Used as original equipment by a number of racing teams, the springs help to eliminate "snaking" and generally improve the ride of the complete unit. On popular cars, the two springs are mounted on their fixing brackets at each end of the rear axle and compress against the frame member during large axle movements or when the car is laden. They are said to give an improved ride, to help eliminate roll and sway and to increase stability.

Speedy Delivery of Goods

Wheeled stillages designed to speed the delivery of goods to retail shops from lorries and vans are marketed by Bambergers Pallets and Cases, Angel Factory Colony, Edmonton, London, N. 18. Each stillage consists of a pallet fitted with detachable metal sides and it is mounted on castors to make handling easier. It forms the essential part of what is called the Combitainer Roll Pallet System which, it is claimed, enables the driver of a lorry to load his vehicle with 7 tons of goods in about 40 minutes and also to unload them and put them in the retailer's storeroom in the same length of time. When the stillage is loaded, the two sides are pulled together at the top and held by nylon straps so that the packages, which can be of varying shapes and sizes, are held firmly and prevented from slipping. Each unit will carry 6 to 7 cwt. of goods. Stillages of this type are designed for use with the hydraulic tail lifts of lorries.



what is the problem, sir?

If it has anything to do with banking services — and particularly if it relates to help and guidance for developing INDUSTRIES or developing IMPORT-EXPORT BUSINESS - we would cordially suggest a reference to us.

THE BANK OF INDIA LTD., has had 57 years' experience of trade, finance and industry — it is at the disposal of our customers.

Industry booms, employment grows, economy thrives — this is what J. K. aims for. Much has materialised in the last 75 years of Progressive Development. The J. K. Organisation today employing well over 40,000 persons, consists of a countrywide network of industries, banking, insurance and other institutions, in the service of the nation. The drive still continues and each of India's Five Year Plans has been an inspiration, a help and a guide to strengthen our service to the nation.

A DRIVE TO FULL EMPLOYMENT AND ECONOMY THROUGH INDUSTRIALISATION!

Though only 31·7% of India's 438 Millions constitute the Labour force, J. K. has proudly contributed to a very commendable percentage for this employment.

J. K. ORGANISATION

OVER 150 YEARS IN THE SERVICE OF THE NATION

THE SCINDIA STEAM NAVIGATION COMPANY LIMITED

CHAIRMAN, MR. DHARAMSEY M. KHATAU'S SPEECH

RECENT FREIGHT RATE INCREASES OFFSET BY RISING COSTS

THE Forty-fifth Annual General Meeting of the Scindia Steam Navigation Company Limited was held at Bombay on Wednesday the 16th December 1964. In his speech at the meeting, Mr. Dharamsey M. Khatau, the Chairman of the Company, reviewed the progress of the Company and referred to recent freight rate increases, rising costs, war risk insurance and official policy on shipping.

Mr. Dharamsey M. Khatau referred feelingly to the sad death of our beloved Prime Minister, Mr. Jawaharlal Nehru who gave national shipping its place of pride in the transport economy. In welcoming the new Prime Minister, Mr. Lal Bahadur Shastri, he referred to the consolidation and expansion of the shipping industry achieved due to bold and energetic policy pursued by him during his tenure as Transport Minister. While referring to the recent freight increases, which were effective only for a period of the year, he stated that these increases were offset by continued increase in costs. He was critical of the entry of other Indian Lines into the shipping services which were satisfactorily maintained by Indian Lines, Members of the Shipping Conferences, inasmuch as such entry would render a working of the Lines uneconomic. He made special reference to strikes in ports in India and abroad, the berthing and dry-dock delays and the poor despatch, all of which went to add to the cargo handling costs. He urged the Government to take active interest in requiring Port Trusts to maintain efficiency at ports at the highest level possible and to make labour more productive through the introduction of incentive schemes and the adoption of other similar methods.

Freight Rates

Regarding the rates of freight on the coast, he pressed for adequate increase in the background of a detailed reference to the 1962 recommendation of Mr. R. G. Abbhi's Commission, which was not fully accepted by the Government and which itself was not considered adequate by the industry. He referred to the costs that have since risen and maintained that the view that the return on capital would be adequate if "some uneconomic ships" were eliminated was not practical. His reason was that, apart from the fact that all units of any industry are not economic in operation at all points of time, the coastal industry suffered from a particular handicap in that though it was keen on eliminating uneconomic units, foreign exchange was not available for purchase of replacement vessels. He insisted that the coastal vessels should be given adequate quantities of coal, salt and other cargoes which must be continuously assured to enable coastal shipping to work economically and to develop in a planned manner and at the same time to provide for efficient services.

Maritime Freight Commission

He made particular reference to the urgent need for making continuous and expeditious use of the machinery of the Maritime Freight Commission and observed that this Commission should be charged with the responsibility of making periodical assessment of costs of operation and thereafter permitting the shipping companies appropriate increases from time to time. He requested the Government to take required decision early.

Mr. Khatau made reference to the addition of eight vessels to the fleet since the last annual meeting. Of these, six are for employment on the coast of India, one for the west coast and one for overseas trade. A further order for three 15,000-ton vessels was placed with Messrs. Lithgows Ltd., Glasgow. There were also on order with the Hindustan Shipyard for three vessels and one 3,800 d.w.t. motor vessel was on order abroad.

War Risk Insurance

Regarding war risk insurance, Mr. Khatau referred to his observations back in 1962. The Indian National Steamship Owners' Association, he said, had been requesting the Government of India since September 1959 to evolve a suitable scheme and it was urged that immediate measures be taken to formulate the scheme so as to ensure adequate insurance protection to Indian vessels against war risks. Although the Association was advised that the Government was actively considering the matter, nothing had so far happened. He, therefore, reiterated his appeal to the Government to give this question priority consideration.'

As regards Scindia Workshop Ltd., he referred to the conclusion of the contract with Messrs. Siemens Engineering and Manufacturing Company, of India Ltd., Bombay, for manufacture of cargo winches and to negotiations with Messrs. Mac-Gregor-Comarin, Paris, for manufacture of Ship's hatch covers.

Konkan Services

About Konkan services, Mr. Khatau observed that the new Committee, which was expected to be formed by the Government and to submit its report to the Government, had not yet been formed. As a result, no progress had been made in determining the amount payable to the Company for the year 1962-63 and onwards. This was, he said, in the background of the original claim of the Bombay Steam Navigation Company (1953) Ltd. against the Maharashtra and the Central Governments for the two years 1961-62 and 1962-63 amounting to Rs. 25,68,253. He requested the Government to hold early a tripartite conference between the Government of India, the Government of Maharashtra and the Company. In his concluding remarks he said unless freight rates were designed to cover costs of operation, shipping companies cannot work on an economic basis.

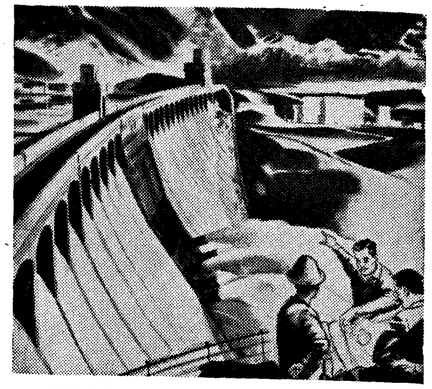
Future Prospects

Regarding future prospects, his observation was that the Company's year under review was good and, as far as he could see, the Company expected to maintain the improvement.

Mr. Khatau welcomed Mr. Raghunath Singh, the newly appointed Chairman of the National Shipping Board, and referred to his close knowledge of shipping problems. He said he would look forward to further satisfactory progress of the industry. He also expressed his appreciation of the active assistance of Mr. Raj Bahadur, Transport Minister, and Dr. Nagendra Singh, Special Secretary, for their efforts in stabilising and expanding Indian shipping.

He thanked the shippers, patrons and consignees, here and abroad, and appreciated the services of the management, officers and staff and the Company's agents.

DEVELOPMENTS IN THE EAST



With the improving living standards in the East comes the prospect of trade expansion and of increasing opportunities for profitable marketing. The world-wide facilities of three great banking organizations, merged into a single comprehensive service, are at your disposal with up-to-date information and expert advice on all aspects of finance and trade in these areas.

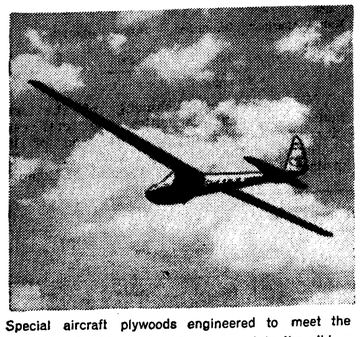
LIGHT, STRONG, FLEXIBLE

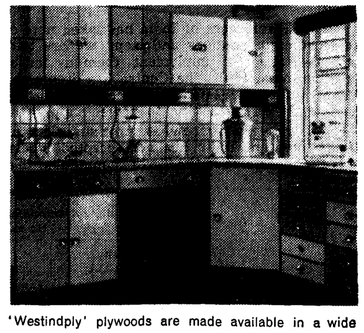
WESTERN INDIA PLYWOODS LIMITED
are the largest suppliers of aircraft plywoods in India

Aircraft is one of those highly specialised industries that demand highly specialised plywoods engineered to meet the requirements of lightness, strength and flexibility to withstand high flying pressures. The 3-ply, 0.8" thick 'WESTINDPLY' plywoods that go into India's gliders and other aircraft are meeting these requirements exceptionally well. Western India Plywoods, the largest manufacturers of processed woods in India, make numerous varieties of specialised 'WESTINDPLY' plywoods to meet the industrial, architectural and defence needs of our country. They also manufacture 'WESTON' Hardboards, 'WIPEX' Paper laminates, Flushdoors and Block Boards.

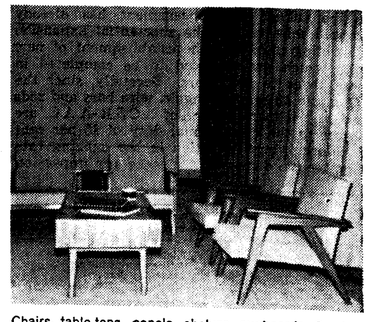
* * *



Special aircraft plywoods engineered to meet the demands of lightness and strength, go into the gliders and other aircrafts built in India.



'Westindply' plywoods are made available in a wide variety of veneers to add colour and prestige to the reception lounge.



Chairs, table tops, panels, shelves, cupboards, flooring —infinite is the scope of 'Westindply', 'Weston' and 'Wipex'

ALUMINIUM INDUSTRY FORGES AHEAD

EXTENSION OF TARIFF PROTECTION FOR FOUR MORE YEARS JUSTIFIED

THERE are two important criteria for determining the case of any industry for continuance of tariff protection. One is whether the industry has fulfilled the obligation of a protected industry over a period of time, namely, maximum production of quality products at an economic cost. The other is whether the industry will be able to stand on its own feet without protection with a reasonable period of time. Judged by these criteria, it must be said that the performance of the aluminium industry in India has been quite remarkable, and the Government of India has done well, indeed, in accepting the Tariff Commission's recommendation to extend protection to the industry for four more years, that is, up to the end of 1968; protection to this industry was first granted in 1946. So remarkable have been the achievements of the industry that every word of the praise showered on it by the Tariff Commission is well deserved. Here is the relevant extract from the Commission's report:

"The industry has made considerable progress since our last report. Production of ingots, which was 18,120 tonnes in 1960, has trebled itself to 54,966 tonnes in 1963. The quality has improved greatly and all the three producing units have installed adequate equipment and laboratory facilities to check on quality at each stage of production, and the indigenous product is in every way as good as the imported one. The production of E.C. grade metal has also increased greatly and there has been a great deal of diversification of fabricated products which now include extruded products and alloys of a very high quality. The marked rise in the production of ingots was accompanied by a greater increase in the output of alumina from 27,885 tonnes in 1960 to 103,724 tonnes in 1963. Consequently, imports of alumina declined sharply from 10,272 tonnes in 1960 to 4,639 tonnes in 1963. The industry is now fully on the way to further expansion and the production of ingots is expected to double itself when the installed capacity increases to 113,800 tonnes by the end of 1967."

Although both installed capacity and actual production of aluminium have expanded markedly in recent years, the industry's products, with the exception of aluminium circles which enjoy a price advantage, still suffer from price disadvantage as compared with the imported ones. A comparison of the fair ex-works prices of indigenous products with the landed cost (without duty) of imported products as made by the Commission shows a price disadvantage of 22.4 per cent for ingots, 6.2 per cent for common alloy and 10.9 per cent for magnesium alloy sheets. Even so, the Commission did not propose any downward revision in the existing rate of protective duty, namely, 35 per cent *ad valorem* (exclusive of surcharge and countervailing excise duty) for three reasons. In the first place, several expansion schemes are in the offing; the Government has already licensed schemes for the substantial expansion of existing units and the establishment of new units which are expected to be completed in about three to five years. Secondly, since the E.C. grade aluminium ingots, wire bars and rods used in the manufacture of A.C.S.R.-A.A.C. are subject to the concessional duty of 15 per cent *ad valorem*, any reduction in the existing rate of protective duty will not make any impact on imports. And, thirdly, so long as indigenous production of ingots falls short of the country's requirements, it is doubtful whether the benefits of reduction in duty will be passed on to consumers.

While the continuance of tariff protection to aluminium products will help foster the development of the industry, there is the need for maintaining production costs at a reasonable level in the interest of consumers who it is that make a sacrifice in the name of protection. It is, therefore, just as well that the Government has agreed with the finding of the Tariff Commission that, in order to assist the industry to keep cost of production at a reasonable level, the existing concessional duty (20 per cent *ad valorem* standard and 10 per cent *ad valorem* preferential) on alumina imports should continue for a further period of four years, that is, up to the end of 1968 by which time, it is stated, the alumina plants for the new or expanded capacities will have been erected and commissioned. Of interest to consumers of aluminium are the following recommendations of the Commission:

While the Government's policy of granting fabricating capacities to primary producers of aluminium would contribute to economies of production and be in the long-term interests of the consumer the small and medium fabricators should be provided with their requirements of ingots.

Since it will be in the national interest to encourage the growth of the large units in this industry, while sanctioning new and increased capacities, the Government should keep in view the size of the unit and the desirability of falling in line with the world trend towards the expansion of smelter capacities.

As bauxite is a basic raw material for the aluminium industry, it is important that there should be a uniform all-India policy in respect of grant of bauxite mining concessions. It is also necessary that these concessions should be granted to primary users of the ore in preference to others. As the present known deposits of bauxite are likely to be exhausted by about 1990, urgent steps are required to carry out extensive prospecting work on both known and potential deposits.

It is desirable that power rates applicable to this industry whose progress depends upon cheap, abundant and assured supply of electric power should, as far as possible, be uniform all over the country, so that new units could be set up wherever power is available, without fear of unfair competition from other producers of the metal. The whole question should be examined in consultation with the State Governments and representatives of the State Electricity Boards and aluminium producers, so that means may be devised to assure the industry of reasonably low tariff rates and uniformity and constancy of duties over long periods. Considering the high load factor, it should be in the interests of the States themselves to encourage this industry and to keep the rates chargeable to it constant and at a low margin of profit.

The Government of India has taken note of these recommendations and steps, we are told, will be taken to implement them as far as possible. Meanwhile, the Centre has drawn the attention of the State Governments to the recommendation pertaining to power supply.

It is, however, somewhat surprising that the Government of India has not accepted wholesale the viewpoint of the Tariff Commission that the objective of national policy should be to develop the aluminium industry as fast as possible and to render it all possible assistance during its expansion. Demand for aluminium has gone up considerably in the past few years and is bound to increase faster in future than in the past. The force of this contention is fully borne out by the Tariff Commission's assessment of the demand position. The uses of aluminium, according to the Commission, are so varied and the metal has so many advantages (lightness, rigidly, conductivity, tensile strength, etc.) over other metals that its consumption has increased very rapidly. The total demand, which was no more than 15,000 tonnes in 1951, rose to 45,000 tonnes in 1960 and further to about 75,000 tonnes in 1963. The estimated demand for the years 1964 and 1967 is as high as 115,000 tonnes and 170,000 tonnes, respectively, against which actual production is estimated at 55,000 tonnes in 1964 and 114,000 tonnes in 1967, or a shortfall of 60,000 tonnes and 56,000 tonnes in the said two years, respectively. Significant, in this connection, are the following remarks of the Commission:

"These figures show the need for further increase in capacity of this industry. The tendency all over the world is to use aluminium in preference to other non-ferrous metals and the use of this metal in electrical, transportation, and building and construction industries is increasing rapidly. Aluminium has already made a big headway in the cable industry in replacing copper and, in view of the shortage of zinc, which is now almost wholly imported in India, the use of aluminium has interesting possibilities. The use of aluminium per head of the population per year is 12 kg. in the U.S.A., 7 kg. in the U.K. and only one-fourth of a kilogram in our country. We are convinced that the demand in future will increase even faster than in the past. The objective of national policy should, therefore, be to develop this industry as fast as possible and to render it all assistance during its expansion."

Considering the persistently rising demand for aluminium, it is creditable that the industry is endeavouring its best to utilise its capacity to the maximum extent possible. In regard to aluminium ingots, the entire capacity is being fully utilised. Actually, production is now maintained at an annual rate of 55,000 tonnes which is above the installed capacity of 53,800 tonnes to which level it has risen from 17,800 tonnes in 1960. Of the present capacity of 53,800 tonnes, the Indian Aluminium Company's Hirakud and Alupuram plants account for 20,300 tonnes and 6,000 tonnes, respectively, the balance being shared by Hindustan Aluminium Corporation (20,000 tonnes) and Aluminium Corporation of India (7,500 tonnes). In addition to the existing capacity, licences have been issued for an aggregate capacity of 60,000 tonnes as shown below:

	Licence granted for expansion or new units (Tonnes)	*Expected date of installation of capacity*
Indian Aluminium Company (Alupuram plant)	10,000	First 5,000 tonnes† by June 1965 and next 5,000 tonnes by January 1966
Hindustan Aluminium Corporation	40,000*	Early 1967
Madras Aluminium Co. (Salem plant)	10,000†	Early 1965
Total ..	60,000	

* Expansion. † New Unit.

With the establishment of the sanctioned additional capacities, the total capacity of the industry by the end of 1967 would be of the order of 113,800 tonnes. The projected plant of Indian Aluminium Company in Mysore State with a capacity of 30,000 tonnes may go into production by the middle of 1967 on the basis of imported alumina. A letter of intent has also been issued to Madras Aluminium Company for an additional capacity of 10,000 tonnes. Two proposals to set up plants in public sector are also under consideration, one with a capacity of 30,000 tonnes at Korba in Madhya Pradesh and the other with a capacity of 25,000 tonnes at Koyna in Maharashtra. It is not known when these proposals will materialise, but, when they do, the aggregate capacity would be 209,000 tonnes around 1970.

Between 1960 and now, the aggregate capacity of the rolling sector has gone up from 19,000 tonnes to 27,100 tonnes; the latter figure is the combined capacity of eleven units. The Aluminium Corporation has been granted a licence to expand its fabrication capacity by 5,100 tonnes, including rolling capacity by 2,500 tonnes, and it is expected to be implemented by the end of 1964. The Hindustan Aluminium Corporation has also obtained licences for an aggregate fabrication capacity of 37,000 tonnes of aluminium. Its rolling mill with an annual capacity of 7,000 tonnes is expected to be commissioned by the end of 1964 and its capacity will be increased to 20,000 tonnes by the end of 1966. The Jeewanlal (1929) Ltd., Madras, which is licensed to set up a new rolling mill with an annual capacity of 3 860 tonnes is expected to commence production in 1967. Madras Aluminium is likely to implement its licence for a rolling capacity of 3,500 tonnes in the middle of 1965. Thus, when all these licences amounting to an aggregate capacity of 29,860 tonnes are implemented, the rolling capacity would increase from the present level of 27,100 tonnes to 56,960 tonnes. In addition to the units included in D.G.T.D.'s list, there are also a number of small scale units engaged in this activity. The capacity of these small units has been estimated by the Indian Non-ferrous Metals Manufacturers' Association, Calcutta, at about 6,000 tonnes and by the Development Commissioner, Small-scale Industries, at about 8,000 tonnes per year.

As for aluminium foils, the total capacity has risen from 2,000 tonnes in 1960 to 3,000 tonnes at present, while that of container sheets continues unchanged at 1,200 tonnes. The capacity of both these branches of the industry is, however, not being fully utilised; actually output is currently running at an annual rate of 2,470 tonnes and 835 tonnes, respectively. The under-utilisation of capacity is attributed to shortage of foil-stock, the main raw material. Three more units have been granted licences for the manufacture of aluminium foils: Indian Aluminium Company (Calcutta) 2,500 tonnes, General Industrial Society (New Delhi) 1,200 tonnes, and Aluminium Corporation of India (Calcutta) 500 tonnes. The first two are likely to go into production by July 1965 and the second by the end of this year. When these capacities are established, the total capacity for aluminium foils (including container sheets) will increase to 8,400 tonnes which is considered to be adequate to meet the anticipated demand by 1967.

Simultaneously with expansion of capacity, efforts must be made to augment production of bauxite, an important raw material. About 2.75 tonnes of bauxite are required to produce one tonne of alumina and about two tonnes of alumina are required to produce one tonne of aluminium ingot. In other words, 5.5 tonnes of bauxite are needed to produce one tonne of aluminium. The known deposits of usable bauxite are estimated at 59 million tonnes. Assuming a production rate of 240,000 tonnes of aluminium metal in 1970 and the output doubling itself every ten years, the present known reserves will be exhausted by about 1990. Describing this state of affairs as unsatisfactory, the Tariff Commission has rightly urged immediate steps to carry out extensive prospecting work in both known and potential deposits.

The industry has made good progress in the manufacture of alumina and imports in relation to aggregate production of aluminium has decreased from 0.56 tonne (per tonne of ingot produced) in 1960 to 0.15 tonne in January-March 1964. In spite of the development of indigenous capacity, the shortage of alumina is expected to continue and large quantities will have to be imported when the additional capacities granted to Indian Aluminium Company, Hindustan Aluminium Corporation and some of the other newly licensed companies go into operation during the next few years, as it is not always possible to synchronise the manufacture of alumina with that of aluminium. It takes a longer time to set up an alumina plant because of the time required to prospect, prove and develop mineral resources and to establish communication and transport facilities between mines and the nearest railhead. The erection of an alumina plant, with its network of storage tanks, pipe connections, pumps, elevators, etc., is more complicated than the installation of a smelter or rolling mill. The Indian Aluminium Company has estimated that it will have to import 110,000 tonnes of alumina during 1967 and 1968, made up of 20,000 tonnes for the start-up inventory and transit *plus* 90,000 tonnes to cover 18 months' operation of the new smelter in Mysore State. Alumina import will be necessary, as the commissioning of the alumina plant in Mysore State simultaneously with the smelter has not been found feasible. The Aluminium Corporation of India has estimated its additional requirement of alumina during 1964 at 5,300 tonnes which may also partly have to be imported. The Hindustan Aluminium Corporation has been granted licence for expansion of its ingot capacity by 40,000 tonnes. The smelter is to be completed by early 1967. For this expansion programme, the Hindustan Aluminium Corporation expects to meet the entire requirements of aluminium estimated at about 100,000 tonnes from imports for about two years after commissioning the smelter.

The other important raw materials are caustic soda, calcined petroleum coke, cryolite, fluorspar, aluminium fluoride and soft pitch. The actual position in respect of these is as follows:

Although the production of caustic soda is increasing rapidly in the country, the bulk of the requirements of the three aluminium producers is obtained through imports from the State Trading Corporation. Green petroleum coke is being produced by the Oil Refinery at Nunmati and is also proposed to be produced by the Oil Refinery at Barauni. It is being calcined by India Carbon Ltd., Gauhati, for supply in the form of calcined petroleum coke, and its capacity is 50,000 tonnes of calcined petroleum coke per year. The Oil Refinery at Nunmati has a capacity of 39,000 tonnes of green petroleum coke per annum and the Barauni refinery is expected to have a capacity of 73,000 tonnes, making a total of 112,000 tonnes. Cryolite is not available in India and has to be imported. Although some deposits of fluorspar have been found in the country the quality has not yet been proved suitable for the aluminium industry. Until this is done, imports are necessary. Aluminium fluoride is not produced in India and has to be imported. Soft pitch is being obtained indigenously.

Barring some of aluminium goods consumers who consider the domestic prices to be reasonable, the majority of consumers have represented that the prices of indigenous products are high *vis-a-vis* those of the corresponding products. The Tariff Commission has accordingly drawn the attention of producers to this representation. Since it is the consumer that makes, as already stated, a sacrifice in the name of production, it well behoves the aluminium producers to pay heed to the Tariff Commission's call for reviewing their pricing policies so as to fix their prices in fair relation to their production costs. But far more important, in this connection, is the need for bringing down their production costs. This should be possible, if the State Governments supplying power bring down their rates for electric power to more reasonable levels. Consumption of power in the manufacture of aluminium is pretty heavy; some 20,000 kwh. of power is required for producing every tonne of metal. Accordingly, even a variation of one paisa per kwh in the cost of power will alter the cost of production by 200 per tonne.

"THE PIONEER" CENTENARY SOUVENIR

The Pioneer, a well-known English daily published from Lucknow (Editor: Mr. S. N. Ghosh, 20 Vidhan Sabha Marg, Lucknow), has published special souvenir to commemorate its centenary celebrated a few weeks ago. Attractively produced, the 130-page souvenir, besides narrating the paper's long and eventful history of growth, carries a good number of informative articles about the press in the United Kingdom and in India. Some of the eminent contributors are Charles Sandell, G. A. Johnson, Louis Kirby, Donald Tyerman, Lawrence P. Scott, H. C. Thompson, A. N. Jha and Chanchal Sarkar. The souvenir also contains a feature entitled "Pages from the Past," which includes despatches and writings from illustrious men who were connected with the paper, such as Sir Winston Churchill and the late Rudyard Kipling. The souvenir is a fine memento of the first centenary of a paper which richly deserves the good wishes of its innumerable readers for its continued service.

K.C.P. MAINTAINS DIVIDEND

RS. 20 LAKHS FOR VENTURES IN UGANDA

AN impressive recovery in net sales (excluding excise) from Rs. 522.74 lakhs to Rs. 682.41 lakhs and an increase in gross profit from Rs. 107.90 lakhs to Rs. 128.37 lakhs of the K.C.P. Ltd. [Managing Agents: Messrs. V. Ramakrishna Sons (Private) Ltd., Madras] seem less striking when one finds that the net profit is down again from Rs. 28.72 lakhs to Rs. 27.89 lakhs. But, as in the previous year, the decline in net profit is due, again, to a higher depreciation provision of Rs. 64.57 lakhs (as against Rs. 49.10 lakhs a year before and Rs. 26.40 lakhs two years ago) following a further large addition to the block account. Taxation, too, has claimed roughly Rs. 5 lakhs more at Rs. 31 lakhs. The dividend on the 10-rupee ordinary shares has been maintained at 15 per cent per annum, after withdrawing Rs. 6.01 lakhs from reserves and provisions. After allowing for this withdrawal, the net amount carried to reserves is Rs. 13.71 lakhs, as against Rs. 14.60 lakhs a year before.

Tabulated below is the Company's progress in the past four years:

(In lakhs of rupees)

	For the year ended 30th June			
	1964	1963	1962	1961
Sale proceeds and internal transfers, less excise	682.41	522.74	529.09	370.71
Other income	6.42	7.24	9.00	4.96
Closing stocks and work-in-progress	133.41	124.20	150.92	162.08
Excise duty	125.56	125.77	73.39	74.63
Cess on sugar	10.10	10.13	13.65	16.38
Materials, stores and spares consumed	355.00	222.87	298.36	244.93
Staff expenses	52.99	49.28	38.89	29.05
Other expenses	151.49	121.68	82.39	71.29
Gross profit	128.37	107.90	99.38	70.59
Managing Agents' remuneration	4.91	4.00	4.90	3.50

Taxation	31.00	26.08	18.00	10.50
Net profit	27.89	28.72	50.08	35.17
Transfer from reserves and provisions	6.01	18.58	8.14	10.17
Transfer to reserves and provisions	19.72	33.18	44.10	31.28
Dividends				
Preference	3.85	3.85	3.85	3.85
Ordinary	10.29 (15%)	10.29 (15%)	10.29 (15%)	10.28 (15%)
Carry forward	0.16	0.13	0.15	0.17
Equity shares' market value (in rupees):	**1964**	**1963**	**1962**	**1961**	**1960**
High	24.00	26.12	22.95	27.00	26.00
Low	22.85	22.00	22.00	23.48	16.63

The improved financial results reflect a better working during the year. For instance, production of sugar has increased from 25,901 tonnes to 36,612 tonnes, though the costs have been higher because of a decline in the average recovery of sugar from cane from 10.45 per cent to 10.08 per cent. The confectionery department has made a satisfactory show. From 31st May, the distillery has been working at an expanded capacity of a million gallons of industrial alcohol. Cement production has improved from 1.51 lakh tonnes to 2.07 lakh tonnes. Four out of the five sugar factories to which the Company has sold plants of 1,250 tonnes daily capacity have already gone into production and the fifth one is expected to commence production this month. The progress on manufacture and supply of cement machinery to the Industrial Development Corporation of Orissa and of sugar machinery to the sugar co-operatives of Madurai and Kallakurichi in Madras State is proceeding satisfactorily. The workshops have also supplied three superphosphate plants and one sulphuric acid plant. Production in the workshops had to be slowed down because of the drastic power cut in Madras. Machinery production during the current year is, however, expected to reach the level of Rs. 3 crores.

The Company is already exporting sugar. During the year under review, Rs. 121.40 lakhs out of gross sales of Rs. 808 lakhs were on account of export. Of interest in this field, however, is the Government's allotment to the Company of two sugar plants for supply to the Uganda Sugar Development Corporation in the equity capital of which the Government and the people of Uganda, the Government of India and a few of the sugar and sugar machinery manufacturers in this country have agreed to participate. The Company itself is subscribing Rs. 20 lakhs to the capital of the Corporation.

During the year, applications were made for establishing an asbestos cement products factory and for expanding the sugar factory. Further proposals are under consideration for the utilisation of alcohol, bagasse and other by-products of the sugar industry. The workshops' expansion is progressing satisfactorily. The project for the establishment of the heavy forge and foundry of the K.C.P. Fives Lille-Call (Private) Ltd. has been finalised and work will be commenced early in 1965. The Government has approved of the collaboration agreement with Messrs. Wilhelmsburger Maschinenfabrik, West Germany, for the manufacture of plate working machinery and has granted the necessary import licences for components. Production of this machinery is expected to start early in 1965.

The Company's paid-up capital, including Rs. 43.28 lakhs in two classes of preference shares, amounts to Rs. 111.93 lakhs and is backed by Rs. 167.41 lakhs in reserves and surplus. Long-term loans have been reduced from Rs. 86.36 lakhs to Rs. 70.51 lakhs, but short-term borrowings have gone up from Rs. 197.87 lakhs to Rs. 208.67 lakhs. These bank borrowings of Rs. 208.67 lakhs, unsecured loans of Rs. 17.66 lakhs and current liabilities and provisions of Rs. 265.53 lakhs bring the total of short-term indebtedness to outsiders to Rs. 491.86 lakhs, as against which current assets, book debts and investments aggregate Rs. 438.09 lakhs. The gross block of Rs. 656.38 lakhs (Rs. 636.68 lakhs a year before) has been written down to Rs. 419.81 lakhs.

Currently quoted at Rs. 23.50 *cum-div.*, the Rs. 10 fully paid ordinary shares of the Company offer a net yield of 5.3 per cent per annum.

NEW CAPITAL ISSUES

The following are some of the important companies to which the Controller of Capital Issues gave permission to raise capital in the week ended 13th December, 1964. The consent is valid for a period of 12 months.

Steelcrete Foundation Ltd. will issue Rs. one crore equity capital in shares of Rs. 10 each for cash at par. Of this, shares to the tune of Rs. 40 lakhs will be subscribed by Foundation Overseas Ltd., Canada, or their nominees against supply of construction machinery, etc. Further, shares worth Rs. 29 lakhs will be subscribed privately and the remaining shares of the value of Rs. 30 lakhs will be offered to the public.

Indian Explosives Ltd., Calcutta, is to issue an additional capital of Rs. 43 lakhs, divided into 4,30,000 equity shares of Rs. 10 each for cash at a premium of Rs. 12 per share. Of this, shares of the value of Rs. 57,000 will be taken up by directors and employees of the Company and of associate companies. The balance of shares worth Rs. 37.30 lakhs will be offered for public subscription. The increased capital is to be utilised for the manufacture of detonations.

Larsen and Toubro Ltd., Bombay, will be issuing Rs. 175 lakhs debenture-stock carrying 7 per cent rate of interest redeemable in 1976 and in units of Rs. 1,000 each. The debentures are to be offered to the public for cash at par. The money is to be used for the Company's expansion programme.

Star Paper Mills Ltd., Calcutta, will issue further capital of Rs. 30 lakhs divided into 3 lakh equity shares of Rs. 10 each for cash at par. The issue will be made to the existing shareholders and to the public simultaneously on the condition that only shares not taken up by the existing shareholders will be allotted to the public. The money will be used for financing the Company's expansion scheme.

The Aluminium Industries Ltd., Kundara, Kerala State, is to issue capital of Rs. 67.50 lakhs divided into 6,75,000 equity shares of Rs. 10 each for cash at a premium of Rs. 2.50 per share. The shares will be offered to the existing shareholders in the ratio of one new share for every two shares now held. The capital is required for manufacture of wire-drawing and stranding machines at Ramachandrapuram, near Hyderabad, in collaboration with a Japanese firm.

CANE SHORTAGE, MYSORE SUGAR'S MAIN HANDICAP

1:4 BONUS ISSUE PROPOSED

WELCOME though it is, the improvemen in gross profit from Rs. 8.90 lakhs t Rs. 18.88 lakhs of the Mysore Sugar Compan Limited (Chairman and Managing Director Mr. V. Venugopal Naidu, Bangalore) during th year ended 30th June 1964 is rather intriguin when one finds that production of sugar declin ed from 27,390 tonnes to 22,091 tonnes and tota sale proceeds, which in the previous year ha increased from Rs. 342.81 lakhs to Rs. 393.7 lakhs, dropped to Rs. 330.30 lakhs. This is, how ever, not much of a riddle, and the answe lies in the decline in closing stocks fron Rs. 84.81 lakhs to Rs. 40.44 lakhs to the exten of which the 1963-64 sales have been pushe up without the goods having been actually pro duced during that year. In turn, therefore, an along with the decline in the cost of sugarcan purchased and milled from Rs. 114.45 lakhs t Rs. 93.48 lakhs, expenses on other heads als have come down from Rs. 134.27 lakhs t Rs. 115.80 lakhs, and the gross profit has gon up.

The net surplus, after the essential provi sions, though a credit balance of Rs. 2.12 lakh as against a debit balance of some Rs. 17,000 year before, is nowhere near the double figur mark which it used to be three-four years ag The reason for this is cane shortage which cor tinues to be the Company's main handicap. I the light of this, the Directors' decision to hav the rate of dividend on the 10-rupee ordinar shares to 15 per cent per annum, after maintair ing it even in the previous year at 30 per cen is quite justified, especially when the entir distribution is once again being met from re serves. An immediate provocation to impos the 50 per cent cut in dividend, however, seem to be that the dividend for 1963-64 is also pay able on the 213,677 new shares allotted to th shareholders as a rights issue at a premium c Rs. 2 per share in the proportion of one for one for-four bonus issue for which sanction has bee received from the Controller of Capital Issues

The following table compares the Com pany's progress in the past four years:

(In lakhs of rupees)

	For the year ended 30th June			
	1964	1963	1962	1961
Sales—				
Sugar and distillery products	316.70	376.86	328.95	323.68

Withdrawal from reserves	4.75	5.80	..	..
Transfer to reserves and provisions	3.46	0.81	5.97	3.05
Dividend	6.47 (15%)	6.54 (30%)	6.54 (30%)	6.54 (30%)
Carry forward	0.18	0.05	0.26	0.64
Equity shares' market value (in rupees)	**1964**	**1963**	**1962**	**1961**	**1960**
High	46.75	53.40	56.50	60.50	59.25
Low	27.25 x.r.	43.75	53.40	56.50	49.50

Insufficient supplies of cane have not stop ped the Company from proceeding with the programme of expanding its crushing capacity and, in anticipation of the formal licence, i has installed additional equipments worth Rs. 23 lakhs during the long shut-down perioc of the factory from January to June this year The licence for doubling the distillery's capa city to 2.4 million gallons is expected to be received shortly. Manufacture of acetic acid has already been licensed and orders for plant and machinery against a foreign credit of Rs. 2 lakhs have been placed.

The rights issue has doubled the Company's paid-up capital from Rs. 21.79 lakhs t Rs. 43.16 lakhs, which is backed by reserves and surplus amounting to Rs. 114.91 lakhs. Bank loans have been reduced from Rs. 104.63 lakhs to Rs. 77.99 lakhs, apparently following the increase in the paid-up capital. These loans and current liabilities and provisions bring the total short-term indebtedness to Rs. 142.9 lakhs, which is well covered by current assets book debts and investments aggregating Rs. 213.24 lakhs. The gross block, carried in books at Rs. 198.75 lakhs (Rs. 181.60 lakhs a year before), has been written down to a net value of Rs. 61.62 lakhs and, with capital works in-progress, the total of net block is shown at Rs. 89.37 lakhs.

BALLARPUR PAPER'S PROFIT-MARGIN DOWN, DESPITE LARGER TURNOVER

DIVIDEND CUT SUBSTANTIALLY

SOME unavoidable teething troubles experienced in the working of its expanded paper mills and uncontrolled cost inflation have made a big dent in the profit-margin of the Ballarpur Paper and Straw Board Mills Ltd. (Managing Agents: Messrs. Karamchand Thapar & Bros. Private Ltd., Calcutta) for the year ended 30th June 1964. Thanks to an almost 50 per cent rise in the production and despatch of paper, the net realisation (that is, after deducting the excise duty paid) from the sale of paper and stationery has spurted quite smartly from Rs. 238.30 lakhs to Rs. 340.69 lakhs while closing stocks are also three times as high as those a year before. As against these improvements, the gross profit, on the other hand, has remained virtually stagnant at Rs. 60.25 lakhs. Commenting on this somewhat disquieting feature of the year's working, the Directors observe: "It is most unfortunate that the spiral of steady increases in prices of raw materials, chemicals and other stores still continues. These increases in the price of essential materials required for the manufacture of paper are obviously reflected in the manufacturing costs. The use of purchased pulp which is much more expensive than our own manufactured pulp has also contributed to the increased costs. The two new machines (commissioned during the year) had to be run only on purchased pulp, as our pulp mill was not ready. Since the prices of paper are fixed, it has been our constant endeavour to offset the increased production costs by better efficiency and operational control."

A very substantial portion of the almost unchanged gross profit has been absorbed by the provision for depreciation which has risen by as much as Rs. 35.45 lakhs to Rs. 43.37 lakhs consequent upon the commissioning of the two new paper machines installed during the year. As a result, the net profit has declined quite sharply from Rs. 24.83 lakhs to Rs. 15.25 lakhs, despite the fact that the provision for Managing Agents' commission has been reduced from Rs. 4.10 lakhs to Rs. 1.63 lakh and no provision has been found necessary for taxation as against Rs. 23.15 lakhs provided the year before. After supplementing this with the amount brought forward from the previous year and Rs. 39.64 lakhs withdrawn from reserves the Directors have first credited Rs. 43.50 lakhs (Rs. 90,000) to the statutory development rebate reserve and a further Rs. 1.17 lakh for the payment of preference dividend. In view of heavy disbursements in connection with the implementation of the expansion scheme and the imperative need to conserve available resources to the maximum they have considered a temporary reduction in equity dividend as advisable. Accordingly, the dividend has been cut from 14.5 per cent to 7.5 per cent. The cut is rather sharp, but, as the Directors have described it as only temporary, one may expect it to be restored in the near future.

The Company's past four years' working results are set forth in the following comparative table:

(In lakhs of rupees)

	For the year ended 30th June			
	1964	1963	1962	1961
Sale of paper and stationery less excise duty paid	340.69	238.30	213.79	208.29

Low	15.56	14.50	17.06	36.00*

* For the Rs. 25 paid shares.

During the year under review, both production and sales of paper registered a considerable increase. Production was 19,611 tonnes, as against 13,225 tonnes in 1963-64, while sales were 18,685 tonnes as against 13,185 tonnes. These increases were possible because of the commissioning of the M.G. machine in October 1963 and the new M.F. machine in March 1964. As the pulp mill was not ready for operations both these machines had to be run on purchased pulp. Since the close of the year, however, the pulp mill, coal boilers and the recovery section have been completed and the plant has been pressed into service. Working conditions in the recovery section, we are told, have not yet been stabilised and this is the main reason why the new machines are not being run to their full capacity. It is, however, hoped that the recovery section would settle down within the next few weeks when production would rise to 115 tonnes per day. With the commissioning of the pulp mill, the paper making machines would be run on pulp produced in the mill itself and this should result in a substantial reduction in production costs, other things remaining the same. The erection of the Empacel pulp and paper mill is also in progress. The stationery wing continued to show satisfactory results for the year under review.

The financial position of the Company continues to be fairly good. The paid-up share capital stands unchanged at Rs. 161.32 lakhs of which only Rs. 18.09 lakhs are in preference shares of Rs. 100 each while the balance, that is, Rs. 143.23 lakhs, is in ordinary shares of Rs. 10 each. The share capital is supported by reserves which, as at 30th June 1964, aggregate Rs. 117.25 lakhs. Since the recently completed expansion programme was financed mainly by long-term loans, borrowings both on secured and unsecured terms aggregate as high as Rs. 424.05 lakhs, as against total "own" funds of Rs. 278.57 lakhs. Besides these there are current liabilities and provisions totalling Rs. 397.66 lakhs. Additions to fixed assets during the year amounted to Rs. 285.61 lakhs and as such the block account has now risen to Rs. 589.69 lakhs. On deducting therefrom Rs. 275.99 lakhs being the depreciation provided so far, a net block of Rs. 313.70 lakhs is obtained. The cost of capital work-in-progress including the advance paid against machinery and steel structure is placed at Rs. 382.08 lakhs and this is in addition to the net block. Investments, all of which are in shares of companies belonging to the same group, are carried in the books at a cost of Rs. 36.38 lakhs of which Rs. 20.74 lakhs are in quoted shares with a market value of Rs. 20.43 lakhs as at the date of the balance sheet. Current assets, loans and advances total Rs. 364.43 lakhs while miscellaneous expenditure yet to be recouped stands at Rs. 3.65 lakhs. It will thus be noted that the resources position of the Company is rather strained. For a long time to come, the Company will, therefore, have to conserve a good part of its profits.

As regards the outlook, the Directors state in their report that the increase in output and sales achieved during the year augurs well for the future. At the same time, they have warned the shareholders against undue optimism. With th expansion of some of the old mills, they say, paper is now available in plenty and the demand is not as brisk as it was in the past. With consumers becoming increasingly quality-conscious, the paper market is becoming more and more competitive. The Company, however, has little to worry on this score as the paper manufactured by it is still considered, quality-wise, among the best available in the country.

The Rs. 10 fully paid ordinary shares of the Company are currently quoted at Rs. 15.56 *cum-div.* On the basis of *ex-div.* price, they fetch a net annual return of four per cent for the fresh investor.

AIR-INDIA CURTAILS SERVICES

The management of Air-India has decided to curtail with immediate effect, one service to London and one service to Tokyo to meet operational requirements. This decision was taken in Bombay on 14th December 1964, following discussions between the Management and the Indian Pilots' Guild. The airline industry the world over is experiencing an acute shortage of pilots and Air-India is no exception.

The Indian Airlines Corporation, at the request of Air-India, has agreed to release to Air-India 17 pilots immediately, and additional pilots in gradual stages, to enable Air-India to meet its operational commitments. The pilots are expected to join Air-India in the very near future and commence training on the Boeing aircraft.

SYNOPSES OF COMPANY REPORTS

Central India Spg., Wvg. and Mfg. Co., Ltd.

(*Secretaries & Treasurers*: Tata Industries Private Ltd., Bombay.)

Ninetieth Annual General Meeting—24th December 1964.

Working Results:

	For the year ended 30th June (In thousand rupees)	
	1964	1963
Sales of cloth, yarn and waste (gross)	7,63,65	7,92,05
Closing stock	1,22,86	1,14,50
Gross profit	45,27	17,88
Transfer to depreciation	29,45	14,29
Net profit	84,82	3,59
Appropriations:		
To adjustment against loss brought forward ..	24,82	3,59
Carry forward (debit)*	—15,38	—49,20
Market value of ordinary shares (in rupees):	1964†	1963
High	107.00	125.50
Low	85.50	84.50

* After adjustment with general reserve.
† Upto 30th November 1964.

Extracts from the Directors' report: The gross profit for the year shows an appreciable increase as compared to the corresponding figure for the previous financial year. The increase in the profits was mainly due to the improved tone of the cloth market accompanied by changes in the pattern of production and the continuous process of renovation and rehabilitation of the mills.

In view of the arrears of losses still to be written off and the need to conserve the financial resources of the Company, the Directors regret their inability to recommended payment of any accumulated arrears of preference dividend.

Production during the year under review was well maintained with the utilisation of the manufacturing capacity to the maximum extent possible, under the present operating conditions.

New Plant and Machinery: During the year under report, new and used plant and equipment of the approximate value of Rs. 27 lakhs was installed. These included combing equipment, drawing frames, drying ranges, automatic looms, conversion material for ring frames, drafting system and other miscellaneous humidification, electrical and mechanical equipment. Orders have also been placed, after the close of the financial year, for plant and equipment of the approximate value of Rs. 3 lakhs.

Loan from the Industrial Finance Corporation: Reference was made in the Chairman's statement of the previous accounting year to the negotiations started by the Company with the Industrial Finance Corporation of India for a long term loan of Rs. 50 lakhs to finance further expenditure on new plant and equipment. The negotiations are still continuing and it is hoped that before the end of 1964, the loan will be sanctioned.

Proposed Increase in Capital: The consent order of the Controller of Capital Issues, for the issue of new equity capital amounting to Rs. 46,87,500, which was last extended upto 30th June 1964 has been further extended upto 30th June 1965. The Board has not yet considered it opportune to make an offer to the shareholders for new capital in terms of this consent order.

Accounts in brief as at 30th June 1964 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital* ..	96,87,500	Gross block ..	3,71,52,453
Reserves ..	10,75,722	—Depreciation	67,49,946

* Represents profit exempt from tax under Sections 84 and 101 of the Income-tax Act, 1961.
† Upto 30th November 1964.

Extracts from the Directors' report: Out of the Special Reserve of Rs. 12,00,000 the Directors recommend dividend on 6 per cent income-tax free cumulative redeemable preference shares from the date of allotment of said shares upto the year ended 30th June, 1960 which amount works out at Rs. 11,77,500 approximately, calculated at the rate of 7.8 per cent, as required by provisions of Preference Shares (Regulation of Dividend) Act, 1960.

During the year ended on 30th June, 1964, the working of the Company has been quite regular and normal. As against the production of clinker of 210,500 tonnes last year, it has been 205,000 tonnes this year and the production of cement has been 219,400 tonnes this year as aganist 214,000 tonnes last year.

The Company has incurred a total capital expenditure of Rs. 21,75,399 of which Rs. 6,99,414 have been expanded by the Company at its Singach Salt Works at Singach near Jamnagar.

The Company is progressing steadily in connection with its erection work of the expansion project which is going on in full swing. The Directors hope that if everything goes well, the Company will be able to go in for production of expansion project by first quarter of 1965 when the Company will have a total rated capacity of production of over five lakh tonnes of cement per annum, in place of the existing capacity of two lakh tonnes of cement per annum.

As to the progress of Singach Salt Works of the Company situated at Singach near Jamanagar, it is to be noted that the Salt Works could not achieve its production target during the year under review on account of natural calamities like torrential winds and heavy rainfall which washed away considerable quantity of accumulated brine water in Sagarpalas and production of salt respectively. In view of this, the Salt Works of the Company could produce only 12,425.310 tonnes of salt during the year under consideration.

The Company also undertook the activity of excavation of *Gypsum* at Adesar Mines in Kutch and the total production of *Gypsum* amounted to 622.750 tonnes during the year of which 376.126 tonnes of *Gypsum* were sold during the year.

The *Lime Kiln* of the Company at Ranavav had been worked only for some period during which there was a total production of 647.404 tonnes and of which 477.384 tonnes were sold during the year.

Accounts in brief as at 30th June 1964 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital* ..	1,50,00,000	Gross block ..	3,00,26,382
Reserves and surplus..	61,14,068	—Depreciation	1,16,34,093
Other liabilities ..	96,61,944	Net block ..	1,83,92,289
		Block in progress ..	21,24,619
		Current assets ..	95,41,015
		Cash	5,59,723
		Miscellaneous expenditure ..	1,58,366
	Rs. 3,07,76,012		Rs. 3,07,76,012

* Paid-up capital consists of 1,00,000 equity shares of Rs. 100 each and 50,000—6 per cent. income-tax free cumulative redeemable preference shares of Rs. 100 each.

Inchek Tyres Ltd.

(*Managing Agents*: National Rubber Manufacturers Ltd., Calcutta.)

Fourth Annual General Meeting—22nd December 1964.

Extracts from the Directors' report for the year ended 30th June 1964:

Change of Name: As per special resolution passed at the extraordinary general meeting of the shareholders of the Company held on 20th May, 1964 the name of the Company was changed to Inchek Tyres Limited and the new name became effective from 20th June, 1964.

Buildings, Plant and Machinery: During the year under review construction of buildings and installation of plant and machinery required for the first stage production of 600 tyres per day was virtually completed including suitable provision in respect of buildings and structures for the second stage expansion as per industrial licence received from the Government of India in February, 1963.

Production: After satisfactory completion of tests in respect of initial production of tyres and tubes at the Company's plant at Kankinara, Dt. 24-Parganas, commercial production commenced from December, 1963 and have since been steadily increasing. Production programme for the manufacture of 350 tyres per day has been presently taken in hand.

Marketing: Almost simultaneously with the commencement of bulk production the Company's products are being marketed initially through the all-India net work of sales offices of the Managing Agents and the quality of the tyres and tubes produced at the Company's factory has already been satisfactorily established in the market and highly appreciated by customers.

Export: In accordance with the agreement with the collaborators the first export consignment of the Company's tyres was shipped to Czechoslovakia in August 1964. Since then the Company has taken up a programme of progressively increasing its exports to East European, African and other countries from where substantial orders have been received.

Expansion Programme: As already mentioned adequate provision has been made for undertaking a further expansion programme in the existing buildings. Details of plant, machinery and equipments required for the expansion have been finalised after negotiations with the technical collaborators and application has been submitted for an import licence for such plant and machinery.

The Industrial Finance Corporation of India has sanctioned an additional loan of Rs. 40 lakhs to meet a part of the finance required by the Company for balancing its present production re-lating to certain types and sizes of tyres and tubes. Consent has already been obtained from the Controller of Capital Issues for making a *rights issue* of equity shares of Rs. 80 lakhs at par at the rate of one new share for every existing equity share held in the Company. The Directors propose to make the issue at an appropriate time having regard to the requirement of funds for the phased implementation of the expansion programme and to the prevailing climate of the investment market.

Accounts: During the year under review the sales of the Company's products amounted to Rs. 28,28,060. After taking into account all expenses and depreciation there was a loss of Rs. 8,94,695 for the year which, together with the balance brought forward from the previous year, amounts to Rs. 12,75,335 and the Directors recommend that the same be carried forward.

Accounts in brief as at 30th June 1964 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital* ..	99,22,722	Gross block ..	1,01,02,281
Other liabilities ..	1,06,79,505	—Depreciation ..	3,87,247

Market value of equity shares (in rupees):	1964†	1963
High	99.00	126.00
Low	61.50	87.00

† High and low upto 10th December 1964.

Extracts from the Directors' report: This marks the first year of full operation of the Rayon Plant, which has now progressively achieved the optimum efficiency. The quality of rayon yarn produced can compete with the rayon yarn produced by any other competitive manufacturer and the same has been well received by the weavers all around.

Production and Sales: The output of rayon yarn was 2,764 M. tons on 100 Denier basis against the licensed capacity of 2,300 M. tons per annum. The Tariff Commission was directed by the Government of India during the early part of the year to go into the cost-structure of the Rayon Industry, but it had to discontinue its enquiry as the distribution and price control on rayon yarn was removed in December, 1963. The industry was likely to get better realisation for its yarn but heavy imposts of excise duty to the extent of 50 per cent on the existing rates in the last Budget belied the earlier expectations and instead, the prices started sagging with the result that the industry was faced with the accumulation of stocks. The Company could not sell its goods in the distressed conditions and, therefore, had to face the problem of accumulation of stocks. The market conditions remained sluggish and unfavourable during a considerable part of the year. It was only in the middle of October, 1964, that the long-awaited relief, though inadequate, has been given to the industry. The Directors hope that the stocks of the Company would be cleared off in the course of next two months. The demand is likely to rally and the turnover and the working of the Company may show an improvement in the course of the next year.

Expansion: The import Licence for the import of plant and machinery for increasing the capacity of the plant by 1½ tons per day has not yet been received. This matter continues to receive the best attention of the Directors and it is felt that in the course of the next 3-4 months, the long-awaited licence may be received. The Company received during the year, a licence for the import of equipments to convert its boilers from coal-firing to oil-firing. The shipment is expected to be at the site in the beginning of December, 1964.

Under the Government's Incentive Scheme for Export of Rayon Fabrics, the Company is likely to receive a weaving capacity of 100 looms for the manufacture of rayon fabrics. The details of the scheme are awaited.

Accounts in brief as at 30th September 1964 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital* ..	4,75,79,800	Gross block ..	8,81,05,720

Market value of equity shares (in rupees):	1964*	1963
High	2.53	2.72
Low	2.17	2.20

* Upto 4th December 1964.

Extracts from the Directors' report: The reasons for the low profits are the smaller tea crop and lower prices and a lower crop of coffee of 628,836 kgs. compared with 799,579 kgs. of previous year. This was due to climatic conditions.

Cost and Crop—Tea: Due to severe adverse weather conditions, the crop harvested was only 686,265 kgs. against the estimate of 905,000 kgs.

Coffee: The crop harvested this year was 628,836 kgs. as against an estimate of 520,000 kgs.

Tea		1961-62	1962-63	1963-64
Crop in kgs.	..	716,244	853,764	686,265
All-in-cost per kg.	Rs.	4.12	3.65	4.50

Net price realised per kg. ex-estate	Rs.	4.84	4.81	4.63
(1 kg. : 2.2 lbs.		1 hectare : 2.5 acres)		

(Net price is calculated after deducting brokerage, excise duty, cess, sales-tax and shipping expenses.)

Coffee		1961-62	1962-63	1963-64
Crop in kgs.	..	612,417	799,579	628,836
All-in-cost per kg.	Rs.	2.66	2.83	2.80

Estimate for 1964-65: Tea: The crop has been estimated at 870,000 kgs. to be manufactured at an all-in-cost of Rs. 4.00 per kg.

Coffee: A crop of 813,000 kgs. at an all-in-cost of Rs. 2.53 per kg. has been estimated.

New Factory: Construction of a new factory at the Company's Colacumbie Estate in Coonoor was taken up and it will go into production early 1965. This new factory will save transport charges on green leaf, also relieve the congestion in the Brooklands factory. Further, the quality of tea is expected to improve. From the year 1965 onwards this tea will be marketed as Colacumbie teas.

Development Programme: About 6 hectares of tea were planted in Nilgiri Estates and about 13 hectares of Coffee in Santawerry Estate. The programme of new extensions is being maintained as per schedule.

Citrus and Pepper: *Citrus* seedlings and pepper cuttings interplanted in coffee 3 years back in Santawerry and Santaghery Estates in Mysore State are coming up very well. During this year, the Company has planted *Citrus* plants in 24 hectares of land in Santaghery Estate. During the next 3 years the entire *Arabica* Block will have been interplanted with *Citrus* plants, i.e., in a total of 120 hectares.

Fertiliser Factory: The production and marketing of superphosphate this year have been satisfactory. The turnover in respect of mixtures has also improved considerably and the Company marketed 5,800 tonnes of various N.P.K. mixtures. If more of straight nitrogenous fertilisers had been available the production of mixtures would have been much larger. The Company opened mixing centres at Bangalore, Tiruchirapalli, Tinnevelli, Pollachi and Villupuram during the year. A mixing centre at Kurnool has also been opened to cover practically the whole of Rayalaseema District.

Accounts in brief as at 30th June 1964 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital* ..	84,00,000	Gross block ..	1,56,46,906

,, ,, general reserve	3,20	1,00
,, ,, dividend reserve	4,65	3,38
Proposed dividends (taxable) ordinary ..	4,64* (15%)†	3,38* (15%)‡
Carry forward	4	11
Market value of ordinary shares (in rupees):	1964§	1963
High	191.00	255.00
Low	168.00	127.00

* Dividends—payment out of the dividend reserve.
† On the increased or tinary capital of Rs. 30,89,750.
‡ On a paid-up capital of Rs. 22,50,000.
§ High and low upto 4th December 1964.

Extracts from the Directors' report: The year under review has been significant as the production of *Superphosphate* has touched a new peak at 50,930 tonnes which is much above the licensed capacity of 36,000 tonnes. Lately there has been difficulty in obtaining *Rock Phosphate* in sufficient quantity due to much lower allotment by the Government necessitating subsequent shut down of the Plant. Since then the licensed capacity for the manufacture of *Superphosphate* has been increased to 61 800 tonnes per annum and it is expected that there should be no difficulty in obtaining sufficient quantity of raw materials.

Accounts in brief as at 30th June 1964 are as under:—

Liabilities	Rs.	Assets	Rs.
Capital*	31,19,700	Gross block ..	69,33,219

		Cash	11,687
	Rs. 1,13,99,084		Rs. 1,13,99,084

* Paid-up capital consists of 30,091 ordinary shares of Rs. 100 each. Calls in arrears amount to Rs. 350. The amount received on application for 599 shares is Rs. 29,950.

Notices

BALMER LAWRIE AND COMPANY LIMITED

NOTICE IS HEREBY GIVEN THAT THE Board of Directors has today declared an Interim Dividend of 7 per cent (subject to deduction of Income Tax) on the Ordinary Shares of the Company, in respect of the year 1964. The dividend will be payable on or after 29th December, 1964 to those members whose names are entered in the Register of Members of the Company on that date. Dividend Warrants will be despatched to members and no application to the Company is necessary.

NOTICE is also hereby given that the Register of Members of the Company will be closed from 18th December, 1964 to 29th December, 1964, both days inclusive.

By Order of the Board,
D. MANSON,
Managing Director.

21, NETAJI SUBHAS ROAD,
CALCUTTA, *8th December*, 1964.

THE BRITANNIA BISCUIT COMPANY LIMITED

THE DIRECTORS HAVE TODAY DECLARED an Interim Dividend in respect of the year ending 31st March 1965, at 6 per cent on the Ordinary Shares and 5.20 per cent on Preference Shares, both subject to deduction of tax.

The Register of Members of the Company will be closed from Saturday the 26th December 1964 to Monday the 4th January 1965, both days inclusive, and the dividends will be paid on or after the 15th January 1965 to the Shareholders whose names appear in the Register of the Company on the 4th January 1965.

By Order of the Board,
A. P. CHANDA,
Director and Secretary.

15, TARATOLA ROAD,
CALCUTTA-53.
11th December 1964.

FOOD CORPORATION ACT OUTLINED

(*Concluded from page* 1082)

procurement, the Government would not hesitate to take recourse to it and requisition the stocks under the Essential Commodities Act and the Defence of India Act. It would have freedom to choose its purchase agents at the market centres from the co-operative marketing societies, commission agents, wholesale traders and rice mills. The Corporation, in due course, would extend its sphere of operations to other areas and might also be entrusted with powers to negotiate and procure supplies from abroad. But, the Minister hinted that it was not likely to take up procurement of wheat for quite some time. Even in the next year, the Minister said wheat imports were likely to amount to 4½ to 5 million tonnes and it might not be necessary for the Corporation to buy wheat in the internal market.

It is envisaged that the Corporation would ultimately turn its attention to the long-term objective of assisting the farmer in the overall increase of agricultural production. Credit will be the principal means by which the farmer would be brought closely with the Corporation's activities. Mr. Subramaniam assured the House that the rate of interest would be as low as possible. The Corporation would also undertake the supply of productive inputs to those farmers who entered into agreement with it. The development of subsidiary foods and food processing industries might also receive the attention of the Corporation at a later date.

JAPAN MACHINE TOOLS EXHIBITION

The exhibition of machine tools and textile machinery organised by the Japan Machinery Centre at U.S. showroom at Mistry Bhavan, Dinshaw Vachha Road, Backbay Reclamation, Bombay, was declared open by Dr. B. P. Divgi, Mayor of Bombay, on Monday this week. The exhibition will be open to the public till the 26th inst. In all, there are seventeen machineries and other products representing 21 leading Japanese manufacturers. These exhibits will enable the Indian industrialists to have a glimpse at the latest technical developments in the Japanese machinery and precision instruments industries.

THIS ANNOUNCEMENT IS NOT A PROSPECTUS

Persons interested in full details are requested to obtain copies of the Prospectus, which are available from the Registered Office of the Company or from the Offices of the Company's Brokers, Bankers to the Issue and the Underwriters.

KALYANPUR LIME & CEMENT WORKS LIMITED

(The Company was incorporated in India as a Public Company on the 11th August, 1937, under the Indian Companies Act, 1913)

REGISTERED OFFICE: **2 & 3, CLIVE ROW, CALCUTTA-1**

EXISTING AND PROPOSED ACTIVITIES

The Company's business is the manufacture of Portland Cement and Lime. The existing manufacturing capacity of cement is 420 tons per day. The Company has an Industrial Licence to instal an additional plant with a capacity of 600 tons per day, which is now proposed to be installed.

LOCATION OF WORKS

The Company works limestone quarries at Banjari in the district of Shahabad, Bihar, and has its cement factory adjacent to the quarries.

Thermocole

keeps your room so cool, so gay!

THERMOCOLE is foamed polystyrene: the lightest rigid insulation material, it is available in white slabs, as well as in gaily patterned tiles that make attractively gay false ceilings.

THERMOCOLE is efficient. Its closed cells provide an effective barrier against heat, noise and moisture. In fact, one inch of THERMOCOLE insulates better than four feet of concrete.

THERMOCOLE is versatile. It is ideal for insulating roofs, walls and floors in all kinds of buildings. It is also excellent for fabricating light-weight insulating partitions and doors.

THERMOCOLE is feather-light yet strong, durable and easy to work with. It cuts structure and labour costs. Efficiency with economy—that's the insulation THERMOCOLE provides.

TUBULAR STEEL POLES FOR ECONOMY AND DURABILITY

The most efficient carriers of Power Line, Tubular Steel Poles manufactured by Indian Tube make economies possible for electricity boards. Better in every respect than such substitutes as concrete or wooden poles, Tubular Steel Poles are impervious to termite attack, offer less wind resistance, require the minimum in maintenance and LAST MUCH LONGER. Manufactured from high tensile steel under rigid quality control, Tubular Steel Poles have an excellent strength-to-weight ratio and a high degree of resistance to accident damage, thus ensuring greater safety.

TREND OF MARKETS

MONEY SLIGHTLY BETTER

(From Our Own Correspondent)

BOMBAY, *16th December*

Excepting for some strigency on the opening day (that is, Thursday the 10th inst.), conditions in the short-term money market were slightly better during the week under review. Demand for funds no doubt continued to be high, but borrowers did not find it difficult to obtain their requirements, since the supply position improved following the return flow of funds from mofussil centres. The inter-bank call rate for both renewals and fresh money, which had gone up from 5½ to 6 per cent early in the week, declined to 5-5½ per cent later, bulk of the business having been put through at 5 per cent. Calcutta also reported a slightly better trend, the call rate there receding from 4¾-5½ per cent to 3¾-4½ per cent.

Despite the improvement in the supply of funds available, the response to the 91-day Government of India Treasury Bills, tenders for which opened on Tuesday the 15th instant, continued to be limited. The total amount offered was a bare Rs. 2 crores which was just the amount invited: the whole of it was accepted, the average rate of accepted tenders being the same as last week, namely, Rs. 2.500 per cent per annum. The Intermediate Treasury Bills, too, elicited poor support, the Bills actually sold from the 9th to 12th inst. aggregating Rs. 1.50 crore, as against Rs. 1.30 crore a week before.

India's foreign exchange reserves declined by Rs. 55 lakhs to Rs. 96.30 crores during the week ended 11th December. The whole of this decline was in balances held abroad which stood at Rs. 10.84 crores. The foreign securities held in the Issue Department of the Reserve Bank continued unchanged at Rs. 85.46 crores. Loans and advances to scheduled banks rose by Rs. 5.04 crores to Rs. 23.30 crores. Their deposits with the Reserve Bank also rose by Rs. 4.32 crores to Rs. 93.55 crores. Notes in circulation jumped up by a further Rs. 37.56 crores to Rs. 2,510.53 crores.

There was a sharp rise of Rs. 44.61 crores to Rs. 1,758.51 crores in the total credit made available by scheduled banks to their clients during the week ended 4th December. Since, at the same time, deposits fell by Rs. 26.90 crores to Rs. 2,695.49 crores, borrowings from the Reserve Bank went up by Rs. 14.06 crores to Rs. 15.37 crores, of which those against usance bills accounted for Rs. 6.10 crores, a rise of Rs. 5.96 crores. Investments fell by Rs. 36.72 crores to Rs. 802.54 crores and total cash by Rs. 1.64 crore to Rs. 157.78 crores.

The Gilt-edged market put on a dull appearance during the week in the absence of any fresh development. Business put through was very thin, with values of both Central and State loans remaining practically unchanged at last week's levels.

In the foreign exchange market, the banks' buying and selling rates for U.S. dollars were unchanged at Rs. 479.75 and Rs. 476.50 per $100, respectively. In New York, the pound sterling eased again, albeit slightly, *vis-a-vis* the dollar, the spot rate declining by 0.010 cent to 279.030-279.060 cents and the three months' forward by 0.060 cent to 277.170-277.200 cents.

BULLION FIRM

(From Our Own Correspondent)

BOMBAY, *16th December*

Both gold and silver ruled firm during the week under review. The firmness of gold was due to good support by some dealers and restricted arrivals. Silver was easy on Thursday the 10th inst. due to poor demand, but the easiness was arrested on the next day (Friday the 11th inst.) when, following support from upcountry dealers and limited arrivals, the metal staged a recovery. The recovery was well sustained in the subsequent sessions also. Stockists were hesitant to sell in anticipation of higher prices. Over the week, silver was higher by a rupee and gold by 75 paise.

Silver began the week at Rs. 260.50, same as last week, and declined swiftly to Rs. 259.50. Thanks to poor arrivals, it rallied and closed higher at Rs. 261.50 today. The weekly average arrivals were lower at 13 bars, as against 22 bars last week, while offtake was unchanged at 8 bars.

Fourteen-carat gold moved up from Rs. 67 to Rs. 67.75. Pure gold, in unofficial dealings, spurted from Rs. 112 to Rs. 113.50. Soverign was fully maintained at Rs. 91.

The international price for gold in the London market declined to $35.11¼ from $35.11½ last week. The sterling price fluctuated between 251*s.* 8*d.* and 251*s.* 9*d.* before finishing at the last week's closing of 251*s.* 8¼*d.* Both spot and forward silver was firm at 112½*d.* and 113¼*d.*, respectively, as also silver in New York at 129.3 cents.

Replying to a question in the *Rajya Sabha* last week, Mr. T. T. Krishnamachari, Union Minister for Finance, declared that Gold Control would be enforced more strictly and widely in order to check smuggling. Any rise in smuggling, he said, would not justify the abrogation of the Gold Contral Act but would only call for a stricter enforcement. Incidentally, he revealed that the value of gold seized by customs during the financial year 1963-64 which was not sold but deposited with the mint was Rs. 75.96 lakhs. The value of gold seized during the period from 1st January to 30th October 1964 was Rs. 86.69 lakhs.

The Maharashtra Government has plans to train the goldsmiths affected by the Gold Control Order in the textile mills in Bombay, Nagpur and Sholapur, according to the State's Labour Minister. It is proposed to grant a stipend of Rs. 30 per trainee, to continue the goldsmiths affected by the Order in service till they pass the Public Service Commission Examination, and to relax condition of age-limit and qualification in their case.

All those dealers and refiners licensed under the Gold Control Rules who wish to continue their trade during 1965 have been asked to renew their licences. The renewal applications are to be made to the nearest licensing authority before 31st January 1965 along with the fee of Rs. 25.

The following table shows the trend of prices during the week under review:

	16-12-64 (closing)	High	Low	9-12-64 (closing)
SILVER	Rs.	Rs.	Rs.	Rs.
Ready (996 fine)	261 50	261.50	259 00	260.50
GOLD				
Ready (14-carat)	67 75	67.75	67 00	67.00
Sovereign	91 00*	—	—	91.00*
London—				
Gold	251*s.* 8¼*d*	251*s.* 9*d.*	251*s.* 8*d.*	251*s.* 8¼*d.*
Silver Ready ..	112½*d.*	—	—	112½*d.*
Silver Forward ..	113¼*d.*	—	—	113¼*d.*
New York—				
Silver	129.3 cents	—	—	129.3 cents

N.B.—The quotation for gold is per 10 grams (about 0 85 tola) and that for silver is per kilogram (85.73 tolas). London and New York quotations are per ounce. * Unofficial rate.

TRADING IN COTTON FUTURES REMAINS SUSPENDED

(From Our Own Correspondent)

BOMBAY, *16th December*

Trading in the futures section of the cotton market remained suspended throughout the week under review as the prices had touched the ceiling of Rs. 775 beyond which no official trading in the Jarilla March 1965 contract is permissible in the non-delivery period. Unofficially, the contract was quoted around Rs. 780 per candy in the earlier sessions of the week. The operators who were anxious to settle their commitments paid the differences in cash as no deal over the ceiling is officially cognisable. The kerb rates showed some easiness towards the end of the week, in view of the anticipated official action to curb the spiralling cotton prices. At the close today, the contract was unofficially quoted at Rs. 778.

The cotton situation was reported to be difficult for mills and the prices in the spot market at Sewri were about Rs. 100 above their ceilings. The following are the latest available quotations in respect of certain popular varieties:

Aurangabad Buri Rs. 1,201; Abhor New Rs. 880; Dhulia Co2 Old Rs. 1,525; Digvijay 5 st. Rs. 1,325; Gadag Laxmi Old Rs. 1,115; Malegaon Co2 Rs. 1,581 and Yeotmal L. 147 Rs. 1,326.

Prices of Bengal *deshi* December delivery contract continued to rule at the ceiling of Rs. 818 per candy. The export sales registration were reported to be around 90,000 bales as against 88,000 bales last week. The January, February and March 1965 Bengal *deshi* contracts were quoted at Rs. 814, Rs. 812 and Rs. 810 respectively. Among the imported varieties, active interest was evinced in the market in Pakistan, American and African varieties.

The following official communique was issued by the Ministry of Commerce, New Delhi on the 14th inst.

"Already the cotton crop this year, though less than the original estimate, is quite satisfactory at about 60.5 lakh bales. The Government have arranged for the import of about 9.5 lakh bales and most of the import quotas have already been issued. In spite of such a satisfactory position of cotton supplies, due to speculative tendencies in commodity markets, rush purchases by the textile mills and the tendency on the part of some of the growers to withhold stocks, the prices have crossed the ceilings in the spot market for many varieties. This has rendered the position of cotton supply difficult.

"The Textile Commissioner has, therefore, called a meeting of the representative of growers, growers' co-operative societies, cotton trade, East India Cotton Association, and the Indian Cotton Mills Federation for Thursday, 17th December 1964, at Bombay to discuss and devise satisfactory methods and procedures for the sale and purchase of cotton.

"As all the sections and interests concerned, that is, growers, co-operatives and traders, have offered to co-operate in coming to a satisfactory solution, Government hope that normal market conditions will be restored immediately. The present situation cannot be allowed to continue."

The traders have attributed the current high cotton prices to the inadequacy of arrivals in the terminal markets and have urged the Government to find the real causes of the situation, instead of blaming the trade. Whereas the mills have pressed the Government for the removal of ceilings which, they hold, have been rendered ineffective, the cotton growers of Gujarat are understood to have approached the Government not to put any unilateral restrictions on prices.

It may be recalled in this connection that the mills are permitted to buy freely in the cotton market. It is believed that this freedom may be restricted, by reintroducing the quota system based on consumption in the last season. It is also possible that the Textile Commissioner will impose compulsory survey and requisitioning of cotton for the benefit of mills, besides expediting imports.

YARNS EASIER

(From Our Own Correspondent)

BOMBAY, *16th December*

The yarn market continued to rule easy during the week under review. Art silk yarns encountered selling despite reports of good offtake at consuming centres, for the supply position was very comfortable. It was reported that large stocks were lying unsold with spinners. Staple fibre yarns were sluggish due to easy spot advices and rumours that some Coimbatore mills and dealers might be offering shortly sizable quantities at lower rates. In sympathy with both art silk yarns and staple fibre yarns and in the absence of any new development cotton yarns were listless.

Among artsilk yarns, Bright Century 105D eased by 6 P to Rs. 11.20. National Rayon 150D and South India Viscose 120D were neglected, the former at Rs. 8.80 and the latter at Rs. 11.13. National Rayon 120D, however, gathered 13 P to Rs. 9.48 on special support.

In the staple fibre yarn section, the 2 × 34 January 1965 contract began the week at the last week's closing of Rs. 837, but declined thereafter and touched a low of Rs. 852 today. Spot City lost 11 P to Rs. 9.11. Sitalaxmi shed 5 P to Rs. 9.17. Premier was dull at Rs. 9.35, as also Kohinoor at Rs. 977.

Cotton yarns 50 Counts Minerva declined by Rs. 2 to Rs. 56. 68s Elphinstone dropped a rupee to Rs. 86 and Minerva 50 P to Rs. 91.50. All other counts were unchanged at last week's levels.

The following table gives the prices of rayon staple fibre and cotton yarns, today, as compared with those prevailing a week ago:

	16-12-1964	9-12-1964
Art silk yarn (per kg.)—	Rs.	Rs.
National Rayon 120D	9 48	9 35
Century 75D	17 05	17 05
S. I. Viscose 120D	11 13	11 13
Staple fibre yarn (2 × 34 NF) January 1965 (per quintal)	852.00	857.00
Spot (per kg.)		
Sitalaxmi	9.17	9 22
Premier	9 35	9 35
City	9 11	9.22
Cotton yarn - French Count (Rs. per 5 kg.)		
8s Polar	21.25	21 25
17s Modern	27 70	27 70
22s Madura	32 25	32 25
34s Tcott	40 00	40 00
52s Kasturi	55 00	55 00
68s Finny	100 00	100.00

MAXIMUM LIMIT FOR G'NUTS

(From Our Own Correspondent)

BOMBAY, *16th December*

Some weeks ago we had occasion to comment in this column that oilseeds prices were losing their sense and perspective. This statement holds good with greater force today than then. The market has defied every single effort of the authorities to keep the rise in prices under control. Margins and double margins have been brushed aside. The groundnuts January contract is being quoted in the kerb at around Rs. 110. The Forward Markets Commission has issued a notification fixing a maximum price of Rs. 110 per quintal for the January contract and Rs. 22 per 10 kg. for groundnut oil. In its note the Commission says that this step has been in view of the continued pressure on the ready and forward prices of groundnut and groundnut oil, despite the steps taken recently to arrest the rising trend.

One wishes the Forward Markets Commission every success, but it remains to be seen whether even the fixation of maximum prices will work. With the stock market being what it is and the country's grain trade out of business commodities like oilseeds, cotton and spices have attracted to themselves new elements which, with their vast resources are building up long positions in futures and buying for stock the available spot supplies. The question of oilseeds has become extremely difficult and one does not know where all this is going to end.

Influential sections of the trade, say that the basis of the contract should be widened and facilities should be provided for delivery at all producing centres. Furthermore, all varieties should be allowed to be tendered with suitable premiums. Also the prices in the spot market should be taken into consideration at the time of delivery. In the meantime, talks are going on for opening the April contract in groundnuts. On the face of it the idea of opening a new contract at this juncture looks rather strange, but it is said that the terms and conditions of the new contract would be fixed in such a way that there would be no need to repeat the recent experience. It is said that at its meeting on Tuesday, the Bombay Oilseeds Exchange discussed the new contract. The Exchange was said to have favoured the tightening of the present restrictions. There is to be no exemption limits, but the weekly limit of fluctuations will remain unchanged at Rs 2.40. A new proposal will be for the introduction of deposits at each and every transaction sale or purchase, at a rate varying from Rs. 2 to Rs. 5 per candy. Automatic clearings are also suggested at a difference of Rs. 5 in fluctuations. These proposals, however, are still in the preliminary stage. The Exchange will discuss it fully at another meeting on Thursday and present a concrete scheme at a meeting of all the recognised associations said to have been called by the Forward Markets Commission on Monday.

The groundnuts January, castor March, and linseeds March contracts were not officially quoted, as outstanding positions in them were squared up by mutual agreement between members at Rs. 110.50, Rs. 192.50 and Rs. 46.25 respectively.

Reliable sources indicate that the Government of India is also contemplating some measures to bring about a change in the market's trend. The Government is the most worried of all, as the inflationary trends engendered by the rise in commodities are capable of throwing the economy of our country out of gear. The measures contemplated include among others, ban on exports of H.P.S. groundnuts and fixation of a ceiling for oiled cake. The Government may also ban the exports of sesamum, mustard, linseeds and copra cakes. Further, it is likely that regionwise export quotas may be introduced and steps taken to discourage the system of incentives for some of the items. These measures are expected to be announced in the new year.

Trading in castor and linseeds March during the week under review followed the pattern of groundnuts, for the latter is now the market's asknowledged leader. Supplies in the spot market continued to be short.

The following table shows the closing prices of oilseeds and oils as on 16th December as compared with the previous two weeks:

	16-12-1964	9-12-1964	2-12-1964
Groundnuts	Rs.	Rs.	Rs.
January 1965 contract	110.50	110.00	103.05
Oil January 1965	23.80	(Nom.) N.T.	19.65 (Nom.)
Khandesh quality	128 25	123 00	113.00
Oil ex-mill	24 00	24.00	22.50
Oil Rly. Receipt	23.75	23.20	21.75
Castorseed			
March 1965	192.50	192.50	190.00
Ready Madras	85 50	86.00	85.50
Ready Kanpur	83 50	84.00	84.00
Oil B.S.S.	19 00	19.10	19.00
Oil commercial	18 50	18.25	18.25
Linseed			
March 1965	46.25	46.25 (Nom.)	45.00
Bold ready	124 00	115.00	111.00
Linseed oil	25.75	24.00	23.25
Cottonseed			
January 1965 contract	116.75	116.75	115.75

N.B.—The quotation for groundnuts January 1965 contract is for 100 kg. The rates for spot groundnut and castor are for 100 kg. Castor and cottonseeds futures are quoted per 250 kg. while linseeds futures are quoted per 50 kg. Groundnut Oil January 1965 and all spot oils are quoted per 10 kg.

The rates given for Groundnuts January, Castor March and Linseeds March are those at which all outstanding positions in the respective contracts were squared up by mutual agreement among the members.

KIPS STEADY

(From Our Own Correspondent)

MADRAS, *14th December*

Kip market ruled steady. Overseas demand was mostly for lower selections in cowhides and run grades in buffcalf from U.K. Importers in U.S. showed good interest in buffcalf heavier averages and prices were held firm in this section.

In tanned goat skins, there was no change in the pattern of demand from the Continent and the U.S.; the market was firm, because sellers were in a well sold forward position. As regards sheep skins, inquiries were mostly for lower grades in middle class tannages 6-7 and 7-8 lbs. averages; other lines were neglected.

In the tanned skins public sales held last week in London, clearance of stocks was very meagre. In the German actions, 25 per cent of the goat skins and 20 per cent sheep available for sale were cleared at unchanged to 6*d.* above last sale levels. The results of the sales on consignment account during this month have been disheartening to the shippers.

Shipments during November were as follows: 1,766 bales tanned cowhides, 157 cowcalf, 233 buffcalf, 226 goat skins and 123 sheep skins to U.K. ports; 5 buffcalf, 799 goat and 256 sheep skins to the Continent; 5 cowcalf, 30 buffhides, 5 buffcalf, 325 goat and 30 sheep skins to U.S.; 16 goat and 224 sheep skins to Japan.

UNORTHODOX TEAS EASIER

[*Messrs. Forbes, Ewart and Figgis (Private) Ltd.*]

COCHIN, *10th December*

A total of 689,000 kgs. was offered in sale No. 48 held on Tuesday the 8th inst. Quality was generally about maintained but there were a few improved Nilgiris on offer. There was a good demand but at generally lower levels, except for a few improved highgrowns which sold well. The limited selection of best Nilgiris sold readily at around last rates but the lesser brokens came to a lower market, except where quality was improved; fannings in this category were irregular and often lower. Good medium descriptions ruled firm while in the case of medium and low medium brokens these were irregular, meeting with less enquiry at lower rates; similar fannings were well supported and although irregular were often of clean appearance. Black leaf descriptions sold well but plainest sorts were again weaker. Orange pekoes met with limited support and while liquoring flowery pekoes were firm, others eased in price. Tippy teas met with less enquiry at reduced levels. Teas of unorthodox manufacture were again easier, except for the cleaner sorts and some fannings which were well supported at around last rates.

The quotations (per kg.) were as follows:

	1964	1963
	Rs.	Rs.
Low mediums	4.20-4.60	4.10-4.50
Mediums	4.50-5.10	4.40-4.80
Good mediums	5.15-5.50	4.90-5.50
Nilgiris B.O.P.	5.00-6.40	4.50-7.50

The average price realised in sale No. 48 was Rs. 4.66 per kilo as compared with Rs. 4.73 a week ago and Rs. 4.52 in the corresponding sale last year.

In dust sale No. 48 held here today 311,000 kgs. were offered. There was fair general demand. The limited selection of highgrowns came to an irregular market following quality. Good mediums sold well at slightly easier rates. Medium and low medium descriptions were readily taken up at prices 10 to 15 paise below last rates. Milled and residual types were about firm on last rates. Unorthodox descriptions sold readily at rates generally 20 paise easier.

The average price realised in dust sale No. 48 was at Rs. 4.19 per kilo as against Rs. 4.24 a week ago and Rs. 4.45 in the corresponding sale last year.

As we go to press, Messrs. Forbes, Ewart and Figgis (Private) Ltd. wire us as follows:

"*Sale No.* 49: 917,000 kgs. offered. General demand. Low medium and medium brokens easier. Fannings much lower. Good mediums steady. Highgrowns irregular with quality generally lower. Unorthodox fannings firm. Others easier."

PEPPER FIRM

(Messrs. Parekh and Co.)

BOMBAY, *15th December*

Malabar black pepper ruled firm during the week in sympathy with New York where spot pepper was raised from $0.35½ to $0.44, owing to scarcity and strong holding. Absence of offers from Indonesia and higher offers from India were responsible for the present state of affairs. Exporters and bears who sold short a sizable quantity to East European countries and the U.S.A. in anticipation of lower price following larger arrivals of new crop were badly caught, as growers became reserved sellers when they saw prices in America rising. Ungarbled rose to Rs. 402 and garbled to Rs. 412.

In Cochin, December delivery rallied to Rs. 416 with few sellers and January to Rs. 420. In Bombay, *Posh* surged to Rs. 454 and *Maha* to Rs. 461. In Singapore, black pepper rose to $M137½.

Some interested parties both in Bombay and Alleppey raised a hue and cry against the present unexpected rise, as earlier business booked by them on views showed heavy loss. They approached the Forward Market Commission with so many proposals for checking the rise, but so far the Forward Market Commission did not like to step in the matter, as it was more or less an affair between bulls and bears and the rise in India was more due to rise in New York, which is always considered a criterion of the world's pepper prices. The present rise was long overdue, as the pepper was selling below production cost owing to undercutting between major producing countries.

The future depends upon the selling policy of Indonesia and on the impending Dock strike in America, which, if it materialises, may still push up the prices in spot in New York. Nearby future of pepper in general, if America continues to take interest in Malabar, appears to be rosy and not bad as anticipated by bears in India at the start of new season.

TEA IMPROVES

(From Our Own Correspondent)

CALCUTTA, *15th December*

While last week's export sale met with only fair demand at lower rates, the internal sales evidenced better conditions leading to an improvement in prices. The 1964 tea crop of North East India is a record one. Naturally, therefore, buyers wait in anticipation of a fall in prices. No wonder, conditions during last week's sale in Mincing Lane were also easier, with Assam teas declining by 2*d.* to 4*d.* per lb.

No authoritative report has so far been issued with regard to the recommendations made to Government by the Tea Finance Committee, but what summaries have already seen the light of the day at intervals emphasise the dire need of the industry for relief. The reported recommendation for excise duty rebate by 18 paise per kg. on exports is indeed welcome, but having regard to the need to step up exports, the industry had thought that it had presented an unbending case for relief to the extent of this entire levy.

The long-felt need for doing away with the entry tax of West Bengal and the carriage tax of Assam on tea has received the attention of the Committee, which has recommended their abolition. The tea industry hopes that the Government would accept these recommendations as also the ones relating to the setting up of a Tea Finance Corporation and to allowing the cost of replanting and new planting as revenue expenditure for taxation. It is possible that Government's decision on the Committee's report along with the necessary measures for fiscal relief would be announced in the next Budget.

In the export sales held last week, leaf on offer at 79,723 packages met with fair demand at lower rates. C.T.C. teas met with selective demand, and prices eased by 20 to 40 paise with buyers showing a preference for B.P. teas. This trend led to some withdrawals, most of which were the fanning grades. Plain orthodox brokens gave way by 20 to 40 paise, their fannings meeting with improved enquiries; however, "teas for price" met with ready demand at lower rates. Medium B.O.P. teas met with good attention, and some kinds of same were bid at higher prices. Medium

and good Assam teas eased in line with the general trend, but a few lines were about firm. Whole leaf grades also eased and Darjeelings were unchanged. The quotations per kg. inclusive of excise duty were: good Assam C.T.C. fannings Rs. 4.50 to Rs. 4.90, good Assam C.T.C. B.P. Rs. 4.80 to Rs. 5.10, clean plain pekoe Rs. 4.90 to Rs. 5.20, medium C.T.C. B.P. Rs. 4.50 to Rs. 4.70, medium C.T.C. fannings Rs. 4.20 to Rs. 4.40, plain orthodox B.P. Rs. 3.70 to Rs. 4.00, plain C.T.C. B.P. Rs. 4.20 to Rs. 4.40, plain orthodox fannings Rs. 3.70 to Rs. 4.00, and plain C.T.C. fannings Rs. 3.90 to Rs. 4.10.

Dusts on offer during last week's internal sales at 33,895 packages met with increased demand as compared to recent weeks. Keen competition was accorded to good C.T.C. teas. Poor C.T.C. eased, other C.T.C. teas being about firm. Orthodox teas eased slightly. Legg-cut teas were readily absorbed, albeit at slightly lower rates. The quotations per kg. inclusive of excise duty were: good Assam C.T.C. dust Rs. 5.70 to Rs. 6.20, medium Assam C.T.C. dust Rs. 4.70 to Rs. 5.05, plain C.T.C. dust Rs. 4.50 to Rs. 4.70, legg-cut dust Rs. 4.40 to Rs. 4.65, medium Assam dust Rs. 4.20 to Rs. 4.70, and plain orthodox dust Rs. 3.70 to Rs. 4.20.

RAW JUTE RECEDES

(From Our Own Correspondent)

CALCUTTA, 15*th December*

In sympathy with the easiness of jute goods, despite good demand, fibre also gave way during the week under review. The news regarding resumption of work in Pakistani mills continued to have their impact on goods, especially sacking, although the volume of business transacted was good. The announcement of a decline in goods in stock with mills as at the end of November for a time arrested the downtrend and enabled a recovery. The recovery, however, was short-lived, as it soon transpired that the rise in November output had not been as large as earlier anticipated. In regard to fibre, sellers were keen for business, but mills showed more interest in selected grades.

At 114,200 tonnes, goods in stock with mills declined by 3,600 tonnes as compared with October 1964. The largest fall, that is, 2,700 tonnes, was shown in sacking at 38,600 tonnes. The decline in hessian at 45,200 tonnes was 500 tonnes, in carpet backing cloth at 19,700 tonnes 300 tonnes, and in miscellaneous constructions at 10,700 tonnes 100 tonnes. These figures were released on Wednesday and, since the market had anticipated a still larger decline in view of good business in November, it was thought that November output had risen substantially. Towards the week-end, the output details were available and, at 104,500 tonnes, the total output had risen by 6,500 tonnes. Sacking rose by 4,500 tonnes to 46,800 tonnes, hessian by 800 tonnes to 43,500 tonnes, carpet backing cloth by 600 tonnes to 8,200 tonnes, and miscellaneous goods by 600 tonnes to 6,000 tonnes. Stocks at the end of October 1964 being 117,800 tonnes, total availability in the month was 222,300 tonnes. In other words, demand in November aggregated 108,100 tonnes, that is, higher than production by 3,600 tonnes. Such a healthy statistical position was derived as a result of increased shipments to overseas countries. The strike in Pakistani mills meant diversion of some demand from that country to Calcutta. Despite this good statistical position, if prices closed at lower levels during the week under review, the same should be attributed to the termination of labour strike in Pakistani mills.

In this connection, the findings of the Indian trade delegation that visited Guinea, Tunisia, Nigeria, Egypt, Ghana, Senegal and the Ivory Coast, are significant. The team, sent by the Calcutta Jute Fabrics Shippers Association and sponsored by the Union International Trade Ministry, has emphasised in no uncertain terms the need to make Indian sacking more competitive in the developing African markets in relation to the Pakistani product. In these markets, the Pakistani sacking is preferred in view of its superior quality and lower prices. The team observes that the quality of Indian sacking must be improved by improving the quality of fibre grown. The trade delegation pointed out to the financial difficulties being faced in some of these countries, where importers would prefer a deferred payment system, if possible. African countries would like to associate Indian industrialists in the setting up of jute mills. If Indian capital can do so, India would not find it as difficult as at present to find an export outlet for the surplus fibre. Even with the starting of jute mills in Africa, African imports of jute goods are likely to increase in view of the economic and agricultural progress planned.

Raw jute prices eased by about Re. 1 a maund. This was in sympathy with the declining trend in the goods market. Also the earlier belief that the crop had not in fact been as good as estimates is gradually being removed. This has led to the keenness of sellers to reduce their inventories. The latest quotations are: Assam bottoms Rs. 35.00; northern bottoms Rs. 34.50; and daisee bottoms Rs. 36.00.

During the week, the U.S. only continued to show moderate interest in hessian. Prices on Tuesday last eased as a result of selling pressure in the futures market. Ready B. twills were quoted at Rs. 153.30, as against Rs. 154.00 on the previous day, and hessian 40" 10 oz. at Rs. 49.60, as against Rs. 49.65. A recovery was the feature on Wednesday as a result of covering business for ready and near delivery heavy goods. Also, the announcement of a decline in stocks of goods with mills was a bullish factor. B. twills improved to Rs. 155.25 and hessian 40" 10 oz. to Rs. 50.15. At this stage, Australia showed interest in woolpacks for delivery up to June next. Scattered business in hessian was also done with both the U.K. and the U.S. The result was the rise in B. twills to Rs. 155.40, but hessian 40" 10 oz. eased to Rs. 49.90 as business done was only small. On Friday, easier conditions prevailed with B. twills quoting Rs. 153.65 and hessian 40" 10 oz. Rs. 49.50. Over the week-end, the quotations eased further to Rs. 152.25 and Rs. 49.20 following the news of a rise in output in November. The feature yesterday was some activity in the futures market, but, because there was only limited business in ready goods, the steadiness in futures only checked the pace of the declining trend, with ready B. twills being priced at Rs. 153.50 and hessian 40" 10 oz. at Rs. 49.70. Government showed interest in ready B. twills.

FOODGRAINS RISE AGAIN

(From Our Own Correspondent)

HAPUR, 14*th December*

Hardening trend in foodgrain prices continued unabated during the week and prices touched new heights. The reason was that almost all the grains were in short supplies in the open market while consumers, both from urban and rural areas, were active buyers. Despite U.P. Government's claims that ration is being supplied at the rate of eight kgs. per unit a month, supplies always fall short even at the rate of four kgs. per unit. *Rabi* sowings have finished, and thanks to fairly good rains during the week, they were progressing very satisfactorily. However, cold wave all over Northern India during the week is likely to retard the growth of the crop. The U.P. Government, under advice from the Centre, is likely to remove restrictions on trade in coarsegrains.

Wheat prices improved by Rs. 2 to Rs. 4 per 40 kgs. during the week, to be quoted on Monday at Rs. 40 for average quality and upto Rs. 43 for better farm produce. Daily arrivals as well as stocks were meagre and supplies through fair-price shops were also restricted. Steadier tendency also continued in the rice market and price recorded all-round gains upto Rs. 2 to Rs. 4 per 40 kilogrammes. The U.P. Government is reported to be arranging to supply rice through ration shops. Week-end prices in the open market were:—Rice *basmati* superior Rs. 42 to Rs. 44, *sela* Rs. 40, *mainpuri* Rs. 31, *ramajwayan* and *raimunia* Rs. 35 to Rs. 37 and *gadda* Rs. 30 per 40 kilogrammes.

In coarsegrains, gram improved by Re. 1 and was quoted at Rs. 35 per 40 kgs. Maize was not easily available in the open market as the State Government had fixed its price at Rs. 17.50 per 40 kgs. while in the black market it was available at anything between Rs. 27 to Rs. 28. Despite inter-State movement ban on the commodity, maize was reaching at an average of eight to ten truckloads in unofficial trading, to be lifted at very high prices. Barley, *bejhar*, *bajra* and other coarsegrain were also firm while *juwar* and *guwar* were stationary.

SPURT IN SUGAR

(From Our Own Correspondent)

HAPUR, 14*th December*

Sugar supplies during the week remained restricted and demand was fairly brisk due to marriage season. While sugar factories in central and eastern districts of U.P. are reported to be getting adequate supplies of cane, factories in west U.P. were faced with deficit supplies. The cane growers were demanding prices at Rs. 3 a maund, as against Rs. 2 sanctioned by the Government. The Union Government, in consultation with U.P. Government, are reported to be taking measures to ensure adequate supplies of cane to factories. Sugar in the open market was quoted at Rs. 180 to Rs. 182 per bag, as against the controlled price of Rs. 136 per bag.

Khandsari attracted good buying support. Power crushers manufacturing *khandsari* bought cane upto Rs. 5.50 per quintal, as against Rs. 5.04 paid by factories at outstation centres, but supplies even at this rate were reported to be inadequate. While old *khandsari* is being lifted to other States against permits, new *khandsari* is much in request for local and east U.P. requirements. Week-end prices (per quintal) were:—*galawat* Rs. 100 to Rs. 120, *desi* superior Rs. 120 to Rs. 145 and new Rs. 150 to Rs. 153.75.

Ready *gur* prices continued firm on brisk buying support influenced by rumours that the Central Government was going to put a ban on the inter-State movement of the commodity. Daily arrivals earlier at an average of 8,000 to 10,000 maunds dwindled to 2,000 to 3,000 maunds in last three days due to rains and cloudy weather. The week's offtake aggregated fifty wagons mostly to Gujarat, M.P., Maharashtra and Rajasthan. Loading facilities were reported easy and as yet there was no building up of stocks. Daily arrivals in the mofussil markets were also reported heavy as on the prevailing high prices, the cane growers were finding it very profitable to manufacture *gur* and *shakker* rather than supplying cane to mills or crushers. Week-end prices (per 40 kgs.) were *pansera* superior Rs. 35.50, average Rs. 34, *balti* Rs. 35.50 to Rs. 36 and *shakker* Rs. 36 to Rs. 38.

LEAD ADVANCES

(From Our Own Correspondent)

CALCUTTA, 15*th December*

The steady rise in the price of lead on the London Metal Exchange was the outstanding feature during the week under review. While tin and zinc shed insignificantly, copper on the L.M.E. registered an advance. In Calcutta, the high levels already touched were maintained steadfast, as scarcity was only increasing every day.

Depleted stocks in London followed by the large increase in European demand—the European Lead Development Committee recently estimated 1964 European consumption of refined lead as being 1,175,000 tonnes, representing an increase of 5½ per cent over 1963—explained the steady advance in the price of lead on the L.M.E. since the last two to three weeks. Spot lead opened in the current week under review at £144-145 a ton and closed substantially higher on balance at £150-152. It has also been estimated that European consumption of lead in the next year is likely to be maintained at this year's level, according to the Committee referred to above. The price in Calcutta was distinctly steady around Rs. 353 per 100 kgs. India at present produces only about 4,000 to 5,000 tons of lead a year, but this is likely to increase to about 10,000 tons in the next couple of years or so, when the annual demand would have gone up to about 60,000 tons.

Spot copper wire-bars on the L.M.E. opened at £502-503 and after gradually rising to £522-525, closed at £515-517½. Cathodes, however, closed lower on balance at £455-470, after opening at £484-495 and being higher at £495-500. Fire-refined copper opened at £420-422½, and rose to £432½-437½ to close at £425-435. In Calcutta, utensil copper scrap rose from Rs. 705 to Rs. 710 per 100 kgs. The high price level has led to the fear of substitution in Chile and a subsequent fall in demand. Chile is attempting to increase its production to one million tonnes by 1970 by proposing massive investments with the help of the U.S. firms. The deal with the Cerro Corporation has already been completed, and Chilean negotiations with Kennecott and Anaconda are progressing.

Tin in Calcutta was maintained at Rs. 3,350 per 100 kgs. On the L.M.E. tin followed an erratic course. The spot rate opened at £1,350-1,352½, and eased to £1,315-1,317½, but soon recovered to £1,332½-1,337½ to make a somersault to £1,257½-1,262½. The easing trend was attributed to demand failing to keep the steady rise of earlier months. Naturally, the belief that tin consumption the world over has not risen by the same degree as demand is getting finer. Spot zinc on the L.M.E. eased to £126-127 from £132-133. The Calcutta rate was maintained firm at Rs. 466 per 100 kgs. in the early sessions but subsequently, fell to Rs. 460.

SHAMA FORGE COMPANY LIMITED

The Shama Forge Company Limited, a new company, is entering the capital market on the 28th instant with a public issue of Rs. 33.78 lakhs, comprising Rs. 14 lakhs in equity shares of Rs. 10 each and Rs. 19,77,500 in cumulative redeemable preference shares of Rs. 100 each. The entire issue has been underwritten. The subscription list will remain open till Tuesday 12th January 1965 unless closed earlier or later at the discretion of the directors, but not before 2nd January 1965. For the term of preference shares and the details of underwriting arrangements, readers' attention is invited to the announcement appearing on page 1085.

Incorporated in October 1963, the Company's main business will consist, *inter alia*, of manufacturing and dealing in forgings of various types; the Company possesses a licence for the manufacture of 5,000 tons annually of mild and alloy steel forgings. The factory will be established in Bhopal where it has already acquired the necessary land. The promoters have entered into an agreement with Messrs. Kropp Forge Company of Chicago, U.S.A., who, with their 66 years experience in the line, are considered among the largest U.S. manufacturers of forgings from various ferrous and non-ferrous metals. The collaborators have agreed to make available their executive experience in the manufacture of mild and alloy steel and other metal forgings, to assist in the layout of the plant and erection of factory, to train Indian personnel at their Works and to provide men with technical experience. The duration of the agreement is ten years.

The foreign collaborators have also agreed to invest in the Company Rs. 21,64,500 by subscribing to its equity capital. This represents the cost of plant and machinery that will be supplied by them. The equipment consists of used machines dies, tools, jigs and fixtures, but they will be reconditioned and carry the guarantee of the suppliers in regard to their performance.

The directors and their friends have subscribed to the equity capital to the tune of Rs. 14,35,500 and to preference capital to the tune of Rs. 5,22,500. The Industrial Finance Corporation of India has agreed to give a loan of Rs. 26.40 lakhs, of which Rs. 23.34 lakhs will be in U.S. dollars. Another loan of Rs. 47.50 lakhs has been arranged by the Company with the U.S. Agency for International Development (I.D.A.)

The entire capital cost of the Company's project is expected to cost Rs. 148.90 lakhs and working capital requirements are placed at Rs. 37.50 lakhs.

VEEGAL ENGINES AND ENGINEERING LTD.

A public issue of Rs. 12 lakhs in equity shares of Rs. 10 each will be offered for subscription by Veegal Engines and Engineering Limited next week. The subscription list will open on Tuesday, the 22nd inst. and close on Monday 4th January 1965 or earlier but not before Thursday the 24th inst. The Industrial Credit and Investment Corporation and the West Bengal Financial Corporation have underwritten the issue in the proportion of 7:5.

The Company was incorporated in 1948 under the name of Aeronautical Services Limited and, since 1956, it has been a subsidiary of Airways (India) Limited when it began to manufacture gliders. It changed into the present name in 1959, and worked in collaboration with Aktiebalaget Aldell Motor of Karlskoga, Sweden, until 1962. Its main business now consists of manufacturing petrol engines of varying sizes for which it has a licensed capacity of 12,000 h.p. on a single-shift basis. The present issue is for financing the engine manufacturing project. In its factory at Dum Dum near Calcutta, the Company designs its own engines in three sizes. It has applied for a licence to increase the capacity to meet the growing demand for industrial engines. It has also obtained a licence for manufacturing 3-wheel commercial vehicles with a gross weight of 1 ton [illegible] each.

TREND OF SHARES

A MODEST RALLY

(From Our Own Correspondent)

BOMBAY, 17*th December*

TRADING on the stock exchange during the week under review was almost featureless, although a smart rally after the middle of the week caused some enthusiasm. This feeling of enthusiasm was natural, in view of the fact that the market had been declining over the past 14 weeks without a distinct break. The rally was attributed to the fact that the current is a four-week settlement as well as to short-covering and replacement buying. Gains were fairly good and widespread, though by no means spectacular. Tata Steel moved up from Rs. 144 to Rs. 147.25, Indian Iron from Rs. 25.25 to Rs. 25.80, Century from Rs. 553 to Rs. 564, Standard from Rs. 580 to Rs. 593, National Rayon from Rs. 335 to Rs. 354.50, Tata Chemicals to Rs. 18.16, Indian Dyestuff from Rs. 258 to Rs. 275, Telco from Rs. 262.50 to Rs. 268 and Hindustan Motors from Rs. 16.24 to Rs. 16.92.

Almost everyone in the market is now talking in bullish terms but it must be remembered that trends are not made overnight. A rally was overdue on technical considerations alone. The market has still some hopes that the Prime Minister would do something to revitalise the market. These hopes are currently centred on his forthcoming speech at the meeting of the Associated Chambers of Commerce in Calcutta. During the British days it was the custom for the Finance Member of the Viceroy's Executive Council to address the Chambers' annual meeting but since the advent of freedom, the Prime Minister has invariably been the guest of honour at these meetings. It has been usual to throw hints of the Government's policy at these meetings but more often it is an occasion on which very nice things are said of each other and nothing more. Anyway, the market believes that Mr. Lal Bahadur Shastri might make some positive announcements regarding the long-awaited incentives. But it remains to be seen to what extent the Prime Minister will to oblige the market.

The rally during the week has been refreshing but it would be unwise to read too much into it. One satisfaction is that the market did not break the support levels of 27th May, when the lowest points for the year were recorded. If these levels had been broken, then one could have safely said that there was something radically wrong with the market. At this stage one can only hope that the market will not react again to the neighbourhood of these levels.

The market is influenced by several factors—the food factor, the political factor, the industrial factor and last but not least the incentive factor. A long-term improvement is difficult to visualise at this stage, unless, of course, there is a radical change for the better in the Government's approach to these factors and its handling of them.

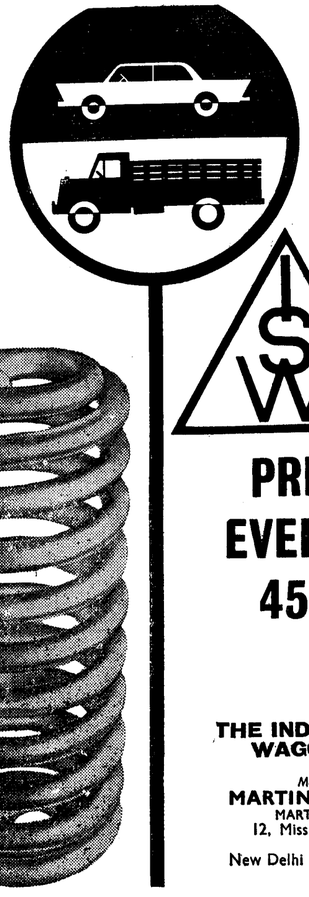
Steel shares were well supported and both Tata Ordinary and Indian Iron closed the week with fairly good gains. Activity was confined to professional interests, though as prices began to look up the public was not slow to follow the market. However, trading was amost monopolised by Century, National Rayon and Standard. By now these are the acknowledged leaders of the market, whether in its rise or fall. At one stage, National Rayon had been taken up to Rs. 356.50 and Standard had crossed the Rs. 600 mark to quote at Rs. 602. Likewise, Century spurted to Rs. 564. Nothing much has happened between the time the shares were lying low and now to induce a spurt in them. It is in the nature of the market to draw inducements from itself when it is set for a rise.

It is difficult to understand why Scindia failed to respond to the optimistic note struck by the Chairman of the Company, Mr. Dharamsey M. Khatau, on Wednesday evening this week. In fact, on Thursday, the shares were a shade easier after having gained fractionally earlier in the week. May be, some operators who had anticipated Mr. Khatau's speech and remarks and bought in advance, were taking out their profit. Mr. Khatau told the annual meeting that the directors would not have increased the dividend if they had any doubts of maintaining it in the current year, though he qualified this remark by adding that shipping was a difficult business and that the current year's prospects depended upon the cargo position and port conditions. So far during the year, the Company has earned Rs. 5.9 crores, Rs. 37 lakhs more of freight than last year. Mr. Khatau also said that it was better they tried to fly the Scindia flag in new waters than go in for lines other than shipping. It was important, he said, to keep good ships and develop new routes.

Miscellaneous issues followed the general trend. Indian Dyestuff fared well and support to these shares was reported from knowledgeable sources. Telco was well held, while Hindustan Motors and Premier Auto maintained a steady tone. Banks, insurances and electrics were neglected.

• • • •

The Calcutta market was active at the time of writing and an improvement in sentiment was noticeable. There too it was a case of hopes of fiscal incentives. The turnover in cash scrips was, however, limited but the undertone was good. The Madras market was listless, but the trend was steady. South India Viscose and Periakaramalai were somewhat prominent this week. Business in electrics and plantings was selective. Textiles were dull, while, among the miscellaneous counters, India Cement, Aluminium Industry and Deccan Sugar evoked some investment buying.



Automotive Springs are made by The Indian Standard Wagon Company who have 45 years' experience in the manufacture of all types of springs.
Made from the highest quality raw material using the most up to date methods and plant, ISW Automotive Springs are tested quality products.
After considerable research a "Fatigue Resistant" quality of Springs has been developed which will give an extended dependable life under the most trying conditions of service.

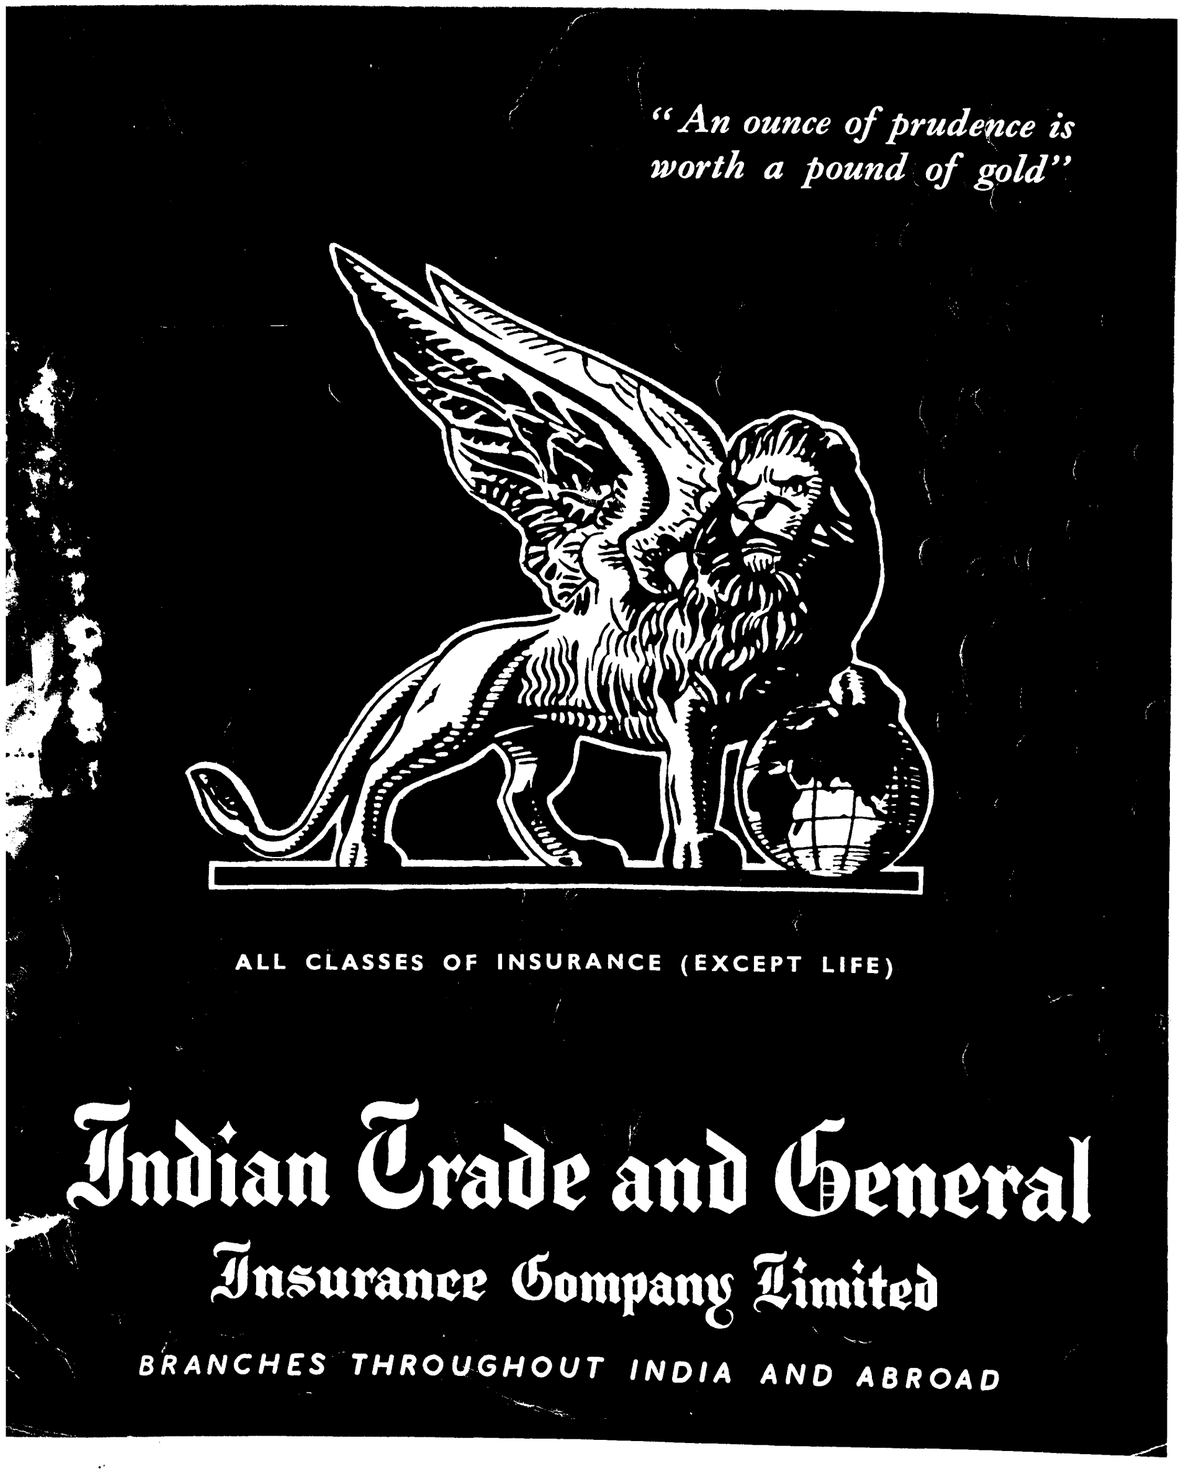
VOL. CIX. NO. 2801 BOMBAY, DECEMBER 1964 PRICE: Rs. 10/-



An aerial view of L&T's Powai Works

OUT OF THE ACHIEVEMENTS OF THE PAST, A PROMISE FOR THE FUTURE...

Consider almost any field of national development. Food and agriculture? Oil and mining? Power and irrigation? Steel and Cement?...Larsen & Toubro is in it.

Blast furnaces at Rourkela. Mining lignite at Neyveli. The first oil refinery in the Public Sector. A power station for Madhya Pradesh. A complex dairy, meeting the daily needs of a large city. A mammoth irrigation scheme changing near-desert tracts into arable land. These are but a few of the major projects where L&T's manufacturing skill, technical know-how and engineering experience have been effectively utilised in the service of the nation.

L&T's Fabrication Shop and Switchgear Factory at Powai is a humming industrial unit where many ideas originate and take shape. It fabricates and manufactures specialised plant and equipment for a variety of major industries; chemical and pharmaceutical, food processing, oil distribution, dairies, switchgear, fertilizers, petro-chemicals and paper. At Sion, Bombay, the Drilling and Mining Division manufactures drills and diamond bits used in mining enterprises all over the country.

Tractors, trailers, cranes and dredgers, supplied by L&T's Earth-moving and Agricultural Equipment Division are busy at many of India's major projects. Other important L&T Divisions are: Heavy Plant, Instruments, Industrial Appliances, Cooling Towers and Engineering Projects.

Behind many L&T undertakings is the weight of collaboration from world-renowned manufacturers: GHH, Voith, Caterpillar, Laur.Knudsen, Silkeborg, Christensen, Longyear, Audco...

With such varied activities, experience and world-wide contacts, L&T has steadily grown over the years. These significant achievements of the past hold a promise for a still brighter future.

LARSEN & TOUBRO LIMITED

has been licensed by the Government of India to manufacture machinery for the Cement Industry in collaboration with F. L. Smidth & Co. of Copenhagen.

LARSEN & TOUBRO LIMITED
Cement Machinery Division
Bombay 1.

THE BRADY GROUP

THE BRADY ENGINEERING CO., LTD. Factory at Tulsi Pipe Road, Lower Parel, Bombay. Manufacturers of Morris Mechanical Handling and Lifting Equipment by arrangement with Morris and Brady Ltd. Chain Drive Components to standards of Renold Chains Ltd. Bread Making Plant by arrangement with Baker Perkins Ltd.

G. CLARIDGE & CO., LTD. With a Printing Press known as Caxton Works at Frere Road, Fort, Bombay. Leading printers with up-to-date Photo-offset and Letterpress machinery. Security printing a speciality.

THE BELAPUR COMPANY LTD. One of the leading Sugar Mills in India with modern machinery, having its own sugarcane farm. Factory at Harigaon, District Ahmednagar.

GANGAPUR SUGAR MILLS LTD. A Sugar Mill in Marathwada (Maharashtra State) with modern machinery. Factory at Raghunathnagar, District Aurangabad.

SPECIAL STEELS LTD. The Company manufactures Umbrella Ribs, Wires, Cycle Spoke Wires, Prestressed Concrete Wires and Mild Steel and Electrodes.

MORRIS & BRADY LTD. A joint enterprise of W. H. Brady & Co., Ltd. and Herbert Morris Ltd., Loughborough, England.

COMMERCE (1935) LTD. Publishers of "Commerce," a leading Economic and Financial Weekly of 50 years' standing.

THE DALTON PROPERTY CO., LTD., Manchester (incorporated in the United Kingdom).

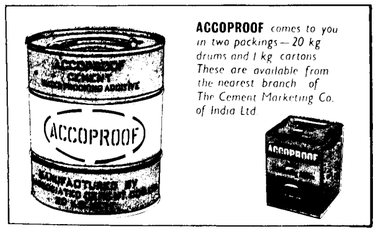
DRIP!
DRIP!
DRIP!

Leaking roof... dampness seeping through walls... mildew everywhere...

You solve all these problems by using

ACCOPROOF



ACCOPROOF *comes to you in two packings—20 kg drums and 1 kg cartons. These are available from the nearest branch of The Cement Marketing Co. of India Ltd*

ACC's cement-waterproofing additive

Just 2%. Accoproof mixed with cement for mortar or concrete can make your walls, roof, basement, in fact the whole building completely resistant to water seepage. Accoproof guards against deterioration...and raises the value of your property.

Accoproof is essential for all buildings in areas of heavy rainfall and for all water-retaining structures, such as tanks, reservoirs, conduits, swimming pools etc.

What every engineer should insist on— in Switchboard DESIGN

In evaluating a switchboard, some features are of greater importance than others, depending on the environment in which it has to function. What are these features? Can you recognise them?

Totally enclosed design: In almost any industry, dust, like corrosion, is a very serious problem. To keep dust out, every unit has to be made to seal like an oyster-shell. Research has revealed that only a carefully machined, rigid, cast-iron clad enclosure, lined with rubber gasket, effectively resists dust, vermin and moisture.

Interchangeability: All components should have standard flange openings and machined surfaces; only then can they be inter-changed.

Flexibility: It should be easy to extend the switchboard at site, when you want to. This is possible only if the busbar chamber has standard end openings.

Maintenance: Must be judged largely by your ready access to busbars and easy examination of contacts.

Safety: A dented cover of a unit not only fails to keep dust, vermin and moisture out but could become a source of great danger without your knowing it. So value every safety feature in the design, the rigid sturdy shell, inter-locking system, and insulated handles.

Carefully examine all these features listed here against your own specific needs.

LT-LK switchboards, like LT-LK motor starters, have secured in so short a time, the highest sales in the country. Take another look at the features and you will know just why!

Switchgear Division **LARSEN & TOUBRO LIMITED**

Bombay P.O. Box 278 • Calcutta P.O. Box 619 • Madras P. Bag 5247 • New Delhi P.O. Box 323

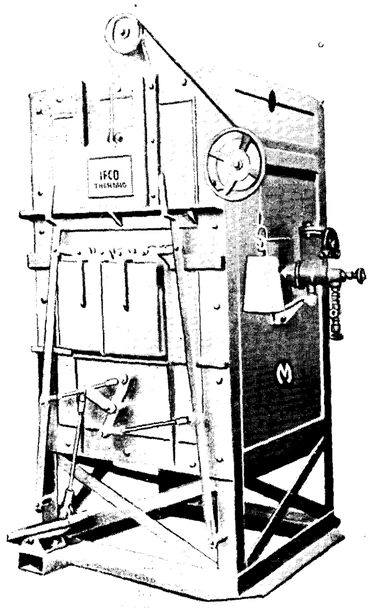
FOR THE FINEST FURNACES

OIL FIRED TOOL ROOM HARDENING FURNACE



OT Furnace

IDEALLY SUITED FOR

HARDENING OF

HIGH SPEED STEEL AND ALLOY STEELS

Double Chamber Type for Preheating and Hardening. Provided with Recuperative system for preheated air supply to the Burner.

Maximum Temperature Range: 1400 Deg. C. in Hardening Chamber and 900 Deg. C. in Preheating Chamber.

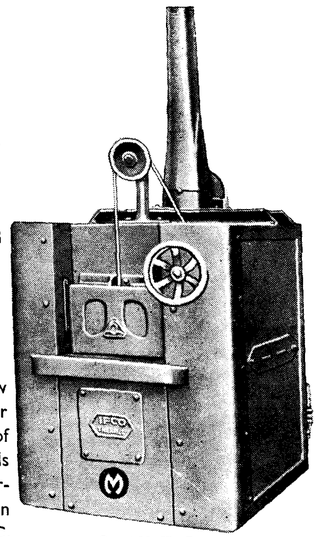
OIL FIRED SEMI-MUFFLE FURNACES

TYPES F5, F10 and F15

These standard types of Furnaces are suitable for General Heat Treatment work such as:

PACK CARBURISING
HARDENING
NORMALISING
ANNEALING

of Carbon and low alloy steels and other Heat Treatment of Non-Ferrous metals and alloys. Temperature range between 600 to 1100 deg. C.



Semi-Muffle Furnace

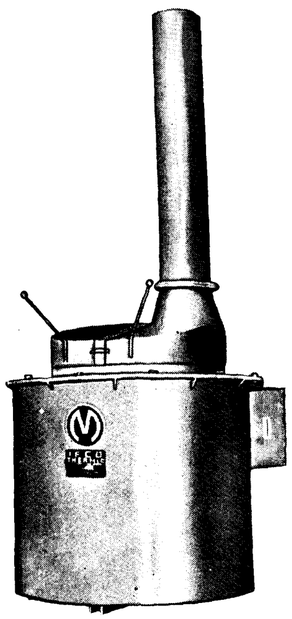
OIL FIRED SALT BATH FURNACES

These Furnaces are General Purpose Heat Treatment Equipments.

Temperature range between 600 to 950 deg. C.

Normal temperature 920 deg. C.

Standard Models	*Pot Sizes:*
Model OCP 4A:	12″ dia. x 18″ deep (304.8 mms. x 457.2 mms.)
Model OCP 5A:	15″ dia. x 18″ deep (381.0 mms. x 457.2 mms.)
Model OCP 8A:	18″ dia. x 24″ deep (457.2 mms. x 609.6 mms.)



SALT BATH FURNACE

Ideally suited for:

- **Cyaniding**
- **Liquid Carburising**
- **Hardening in neutral salts**

A Year of Inflation and Controls

FOR India A.D. 1964 has been a year of rich harvest, not of food and raw materials but of bitter fruits of primitive socialism of the nineteenth century. The seeds of this socialism were sown in the initial years of independence and the plants were nurtured with great care year after year. They had reached the fruit-bearing stage some years ago and the country has been "enjoying" the fruits of this great socialist endeavour in the form of more controls, high inflation, crushing tax burdens, scarcity of necessities of life, corruption in all walks of life and indiscipline. The year that will soon be rung out has had the distinction of witnessing these fruits grow in profusion, besides taking away with it (towards the close of its fifth month) the chief architect of India's Socialist Pattern of Society, Mr. Jawaharlal Nehru. In a way, it was kind to him, for, had he lived through the rest of the year, he would have writhed in pain at the sight of all-round deterioration in the economy of the country which he had loved and served with all his heart. This is not a criticism of those who have shouldered the responsibility of steering the ship of State after Mr. Nehru, for much of what has happened this year is the cumulative outcome of the wrong policies and methods followed for well over a decade and a half. But, as most of them have been associated with these policies and methods, they cannot disown their responsibility for the serious economic mess in which the country finds itself today.

An unprecedented rise in prices and cost of living has been the most striking but unpleasant development of the year under review. In the past twelve months, the purchasing power of the rupee within the country has gone down by about one-fifth and that on top of an eight per cent fall in the preceding year. The cost of living has risen by nearly 14 per cent, as against 7 per cent in 1963. Barring South Korea and Indonesia, no other country in Asia has suffered such a steep rise in cost of living as India has done. With such a poor record in economic stability for the second year in succession, it is a moot point whether this country can claim to hold a model of economic development for other underdeveloped countries in the free world. The deterioration in price situation is much more glaring when compared with the experience of the developed countries in 1964, where the rise in prices has ranged between one per cent and five per cent. Italy, however, is an exception, in that the average increase in cost of living has been six per cent, that is, substantially above the average rate for the Common Market as a whole. It is only in some of the Latin American countries such as Argentine, Brazil, Chile and Colombia that cost of living has risen much faster than in this country, but that is not much of a consolation.

In their bid to hold the price line, check tax evasion, unearth unaccounted money, plug loopholes in the foreign exchange regulation, and prevent smuggling of goods, precious metals, diamonds, etc., the authorities have enacted so many new controls that the country has virtually become a jungle of controls. This is another outstanding feature of 1964. The rapid growth in controls has aggravated the evil of corruption, just at the time when Mr. Gulzarilal Nanda has been valiantly trying to eradicate it. Indeed, his well-intentioned and determined drive against corruption has had some unpleasant repercussions on political life, the most serious one being lack of stability in some States. Similarly, the Finance Minister's attack on black money, tax evasion, etc., is having a demoralising effect on the business community and Administration. The introduction of controls on movement of foodgrains and edible oils from one State to another has provided a veritable gold mine to smugglers and the officials in charge of inter-State movements. By smuggling one tonne of groundnut oil from Gujarat into Maharashtra, for instance, one can easily make a gross profit of Rs. 500 or a net of Rs. 400 after expenses, because the price of oil in Bombay is Rs. 2,500, whereas it is only Rs. 2,000 per tonne in Ahmedabad. Again, these controls have gravely undermined the sense of unity in the country and encouraged parochial tendencies even among those in charge of State Governments. All this in turn has had an adverse effect on the pace of economic development and caused disillusionment among the public.

The evils of persistent inflation of a high degree began to assert themselves rather forcefully in 1964. Deterioration in moral standards was only one of them. Another was the growing unrest among the workers, industrial and non-industrial alike. The most distressing feature of this phenomenon was the resort to strikes even by doctors, air pilots, teachers and students. The cost of living has become so unbearably high and the taxes take away so much of one's income that the will to bear them silently has considerably weakened. The seriousness of this aspect of our economy and their implications to the future are discussed at some length by a few of the contributors to this Annual Number. Unless the powers-that-be pause and reflect and introduce appropriate correctives, the country will be exposed to the danger of being swamped by anti-democratic forces sooner or later.

Failures on the economic front in 1964 led to an increase in industrial unrest. The respect for law suffered a further setback and the people's doubt about the efficacy of the type of planning undertaken by the Congress Party increased. The Communists and other leftists seized this opportunity to organise strikes and hartals (*bandhs*, as they are now called) in defiance of the Defence of India Rules. "Go-slow" and "work-to-the rule" tactics were increasingly adopted in violation of tripartite agreements on Codes of Discipline and Conduct. The report of the Bonus Commission submitted in the first half of the year was a great disappointment to those who had expected that it would help remove one of the basic causes of friction between workers and employers. The Commission fought shy of facing the issues involved scientifically and the opportunity to link the payment of bonus to levels of production was thus missed. On the contrary, its report has only served to add to the confusion and controversy over the principles governing the payment of bonus. Generally speaking, the Government's decision on the Commission's recommendations has been more in favour of workers. As a result, large sums of money—one estimate puts the figure at Rs. 44 crores per annum—will be distributed to workers without securing any additional production in return and with both the industrious and lazy workers being treated alike. Thus, 1964 saw no improvement in employer-employee relations and the hope that the labour policy would be oriented towards increasing production and productivity still remains to be fulfilled. This was not all. A considerable amount of industrial strife was due to political motivations of the politically-oriented trade unions and to inter-union rivalries. The industrial units in the public sector suffered more than those in the private sector as a result of such non-industrial provocations.

Thus, loss of industrial production in 1964 caused by labour unrest must have gone up substantially as compared with 1963 and 1962 which were relatively peaceful years. While this was an important factor for the drop, albeit slight, in the pace of growth of industrial production, there were also other factors. Such data as are available at the time of writing show that the *rate* of industrial growth, which had gradually increased from 7.3 per cent in 1961 and 7.7 per cent in 1962 to 9.2 per cent in 1963, suffered a slight setback in 1964 to 8.5 per cent and that the average annual growth rate in the first four years of the third Plan would work out to 8 per cent, as compared with the Plan target of 11 per cent, the shortfall being a little less than 30 per cent. High in the list of causes for the slower pace of industrial growth in 1964 stands the stagnation in agriculture. Next comes scarcity of foreign exchange and the consequent shortage of raw materials and stores. The lag in the creation of additional capacity in certain basic industries such as pig iron, steel, cement, and heavy chemicals may be mentioned as the third factor. And, finally, there are the high levels and punitive types of taxation acting as a restraint on the initiative and enthusiasm of entrepreneurs as well as investors and creating a sense of frustration among them. The position would have been worse but for the perceptible improvement in the generation and supply of power, as well as in the availability of railway transport. The growth in road transport, however, has been running behind expectations. This is true also of port facilities.

An interesting feature of industrial situation in 1964 was that, although the pace of industrial growth had slowed down and inflation was rife, certain industries were faced with surpluses and a buyers' market. Notable among them were coal, art silk yarn and fabrics, tyres, electric cables, certain types of paper, and consumer durables like refrigerators, radio sets, and electrical appliances. The accumulation of coal stocks was directly the result of non-materialisation of the pace of industrial growth envisaged in the third Plan and the growing use of furnace oil as fuel by industries (including cement) situated far away from the coal belt. The demand for tyres failed to keep pace with the increase in production, as the automobile industry could not grow to the extent needed. Shortage of cement and the consequent slow down in construction activity, as well as heavy taxation, had an adverse effect on the market for some types of electric cables. The fall in the purchasing power of people due to high cost of food and other necessaries of life, coupled with excessive indirect taxation, had a depressing influence on the markets for rayon and staple fibre goods. Again, excessive taxation and the continuation of compulsory savings in the form of Annuity Deposits on incomes of Rs. 15,000 and over per annum restrained the demand for consumer durables. The rise in interest rates and restrictions on bank credit also served to keep down the demand for these goods.

It was, however, the relatively poor performance of agriculture, especially in the food sector, for the third year in succession that was the primary cause of the critical economic situation in the country. Not that there was no improvement at all in agricultural production; only the improvement was not adequate. The impact of inadequate agricultural growth has been all-pervading. Introduction of controls over distribution and consumption in order to ensure equitable distribution and to check the upward trend of prices has aggravated the shortage, as it has led to stockpiling by producers, traders and consumers. As a partial solution to this shortage, larger imports have had to be arranged which in turn have neutralised a part of the impressive improvement in exports, the most encouraging aspect of Indian economy in 1964. The necessity to conserve supplies for domestic consumption has made inroads into the exportable surplus of some commodities (for example, sugar and groundnut oil) which had made substantial contribution to the increase in exports in 1963-64. The net result has been a cut in the allocation of foreign exchange for sustaining and expanding industrial production in the coming six to twelve months.

Crop estimates pertaining to the 1964-65 season point to some improvement in a number of commodities, including foodgrains. But, as prices continue to rule high, it looks as though the increase in production is, once again, not enough. Moreover, the minimum prices fixed for foodgrains and sugarcane are so high that there is very little prospect of any significant fall in price levels in the new year. In fact, in their understandable anxiety to provide incentives to agricultural producers and to ensure peace among the working class, the authorities have virtually perpetuated the inflation that has taken place in the past 12 months and there is no likelihood of the rupee regaining any sizable part of the loss in its purchasing power. If anything, there may be a further fall in it, what with a heavy Budget ahead and an ambitious fourth Plan which, one is told, will be twice as big as the third Plan. Even if the Government were to give some relief in taxation in order to stimulate savings and encourage investments in equities, it would take quite some time for the country to realise the benefits of such a policy in the form of increased production. The task of sustaining the rate of increase in exports in the coming year will, therefore, be extremely difficult. Fortunately for this country, world trade is still in an expansionary phase, thanks to the continuing growth in the economies of the developed countries. The lessening tension between the major power blocs, the proposed curtailment of defence expenditure by the U.S. and Soviet Russia, and the certainty of the Common Market's survival are all highly encouraging developments. But there are quite a few potential trouble spots, political and economic alike, in the world. The balance of payments position of both the U.S. and the U.K., for instance, is delicate, though manageable because of the continuing spirit of co-operation among the Western countries. If the buoyancy of world trade were to suffer as a result of any unforeseen developments, India's exports would be seriously hurt and the country might be confronted with an acute foreign exchange crisis, capable of causing serious damage to its plans for progress.

THE INVESTOR'S CHANGED PSYCHOLOGY

By S. NARAYANASWAMY

TO discuss or canvass the prospects for investment in stocks and shares at this particular moment in the winter of 1964 and in so bleak an economic background, may raise a smile on the lips of the sophisticated reader and build up an unflattering image of the author of so unseasonal an effort. But it, is among the occupational risks of the commentator on economic affairs that people occasionally brand him as belonging to a pitifully naive species of *homo sapiens*. Well, if the fourth Plan which is on its way to the launching pad, can assume an investment of Rs. 6,980 crores by the private sector, out of the grandiose total of Rs. 22,500 crores, after the way in which inflation and taxation have between them made mincemeat of people's savings, is not the economic commentator in the rather distinguished and blue-stockinged company of the Planning Commissioners—in the matter of making certain facile assumptions? There seems little need to hum and haw over the theme. The greater danger is that one might get lost in cynical overtones—when talking of the investor and his mood.

Stock markets started the year with all the diffidence that goes with prolonged debilitation. Morbid conjuctures about the budget cooled the ardour of the operators. All the effort to spin out bull points based on some good balance sheets and dividends was more than neutralised by sledge-hammer blows that rained on the market in various forms. It was widely anticipated that the abrupt exit of Mr. Morarji Desai from Union Finance Ministership and the entry of Mr. T. T. Krishnamachari would result in discriminating tax reliefs, in more retained profits with the corporate sector, and would generally result in stimulating investment in stocks and shares. Indeed, his broadcast on taking up office encouraged that impression. It, however, proved a dismaying anti-climax. It revealed an anxiety to disarm political critics who might say that the apple-cart so painstakingly built up by the Morarji Budget was upset by a successor, who was known to have bright ideas of his own. Thus, it proved to be a proverbial Tweedledum in place of Tweedledee.

Finance Ministry's Whipping Boy

The much denounced super profits tax was replaced by a surtax and a dividend tax of 7½ per cent was introduced; the expenditure tax was reintroduced; the gift tax was rendered more rigorous with aggregation provisions thrown in; the expected restoration of the wealth tax *concession on new share* issues did not materialise; halting and immaterial modifications of the gold control regulations that made Mr. Morarji Desai so unpopular—underwrote continued unemployment of goldsmiths. The bonus issue tax continued to disfigure the statute book. The compulsory deposit was replaced by the annuity deposit. The subsistence income groups got relief, on the one hand, while the new deposit obligation, on top of tax payments, began depleting the liquid resources of the middle income group and those of the midly affluent, the very class that had in the past proved to be the backbone of the investment market, because they had both the resources and the enlightenment to invest in stocks and shares of established as well as new companies. In the total picture, the Krishnamachari Budget had a larger number of anti-market elements built into it, than even the Morarji Budget, which contained but the solitary Frankenstien of a super profit tax.

The investor argued: What does a division tax without the saving grace of a minimum exemption limit signify? It meant only one thing: that, while the moneylender was entitled to interest on his money and the houseowner was entitled to rental income on his property, it was, in the opinion of the Union Finance Minister, improper and unethical for the equity shareholder to receive dividend on his invested capital in the case of new companies even at the end of four or five years of *nil* return on his investment. The Company which committed the impropriety of distributing dividend should pay a penalty out of distributable profits. What does a bonus issue tax mean? That companies which exercise prudence, plough back profits into the industry, do not make extravagant dividend distributions must, when they pass on the benefits of past prudence to shareholders, expose their shareholders to the penalty of a bonus issue tax. But when on top of this inelegant pyramid, was placed a capital gains levy on bonus shares issued (other than out of share premia collected), the investor's exasperation was complete. The illogicality of a penalty on basic dividend distributions on equity shares, accompanied by a penalty on past prudence practised by companies, in the shape of resources ploughed back, had already baffled and irritated him. On top of this for Government to declare that bonus issues made out of revenue reserves are capital gains, was certainly what made him decide that the corporate sector had become the Finance Ministry's "whipping boy."

A bonus issue is basically a book entry. No doubt the shareholder receives supplementary share certificates and the area of dividend payment enlarges. But, in the meantime, share prices and dividends have necessarily to go down in proportion to the share splitting that has taken place. That the Government should maintain that a new asset has come out of the blue and that this is a total capital accretion—is what stunned the investor. The fact that bonus is born of reserves built out of taxed profits, that such bonus issues suffer an issue tax, payable by the company, and that, on top of that, the shareholder is told he has rubbed the Alladin's lamp and the genie has handed him a packet of precious stones which he has done nothing to deserve and must therefore pay a tax thereon—these have driven the investor, who has suffered this amazing trinity of tax deprivations, to the conclusion that stock exchange securities are rather vulnerable areas of property-holding in India.

In the matter of comparing the rigours of a budget fabric, it is but realistic to go upon the financial leftovers of a completed assessment period on the companies and the individuals. Plough back finance in companies, on the one hand, and spendable money that is left in the individuals' hands on the other, will finally determine motivations of the entrepreneur, the managing agent and the investor. The result of these severe tax inroads on the economy, particularly in the last two years in the holy name of Plan finance, has had quite unwholesome effects on the community of taxpayers.

Selective Slump

Accompanying this article is a table of companies from representative units of the corporate sector selected from the textile, sugar, cement, chemical and engineering companies. The ratio of tax provisions made to taxable profits over the two years 1962-63 and 1963-64 is set forth in each case. This indicates that the 1963-64 tax formula did not invariably benefit companies—indeed in some cases the companies had to pay a greater percentage of tax than in the previous year. Throughout this period, what disconcerted the investor were not cuts in dividends. There were undoubtedly several cases of surgery performed on even standardised equity dividends, but these were few and the cut was not serious. What worried the investor far more was the steady depreciation in the value of his holdings based on a long-term interpretation of the tax levies. India has been riding the winged horse of inflation and prices in the primary sectors were going up. Indeed, the prices of the articles manufactured by industrial companies were going up—what time their share values continued to shrink. In the realm of real property, prices shot up—indeed they sky-rocketed. Asset values of every description rose. The shares of public joint stock companies were the only ones to plummet down—it was, in short, a selective slump.

In the case of new issues, the investor in the past years had the satisfaction of witnessing a rise in values as a result of partial allotment and was thus accustomed to being compensated for absence of income for the first four or five years, by accretion to capital values. Today, there is no rise in values. Indeed, there is a fall in values, as a result of poor public response to prospectuses. Subsequent tired selling by needy holders aggravated price drops. This brought about a change in the psychology of the investor whose reserves of forbearance were fast getting exhausted.

A number of other considerations have influenced his attitude. The steadily increasing cost of living has rendered it necessary to obtain the maximum *current* income from his savings to supplement earned income. Personal taxation at even middling levels has gone high—and a higher retained income has become a paramount need. A marked disinclination to wait for four or five years for a return on money, coupled with the suspicion that new issues may land him in depreciated capital values, has developed in him a strong resistance to new issues. It is not the reluctance of the stockbroker to leave the air-conditioned room—very few indeed of this tribe ever lived in air-condition rooms even in their halcyon days—and go after the urban or rural investor to canvass new issues that has resulted in chronic undersubscription of new issues and left institutions with blocks of underwritten shares, but the twin factors of inflation in living costs and steep corporate and personal taxation, coupled with uncertainties caused by mercurial changes in economic policy, which have cumulatively tilted the balance of public confidence against new share issues.

L.I.C. and Unit Trust

The investor has been watching what has been happening in the stock exchanges in the last two or three years. The shares that an individual investor may sell for any reason does not go to another individual as often it used to. Far too frequently the L.I.C. has been the buyer. With prices so low, yields so attractive and records of performance reassuring in the case of quite a number of established companies, there is no reason why L.I.C. should not buy. The L.I.C. is equipped with an efficient statistical and research wing and does quite a competent job of selecting what will help to build up a portfolio of sound growth stock, that has a satisfactory current yield. In the last three months, another institution has come on the scene—the Unit Trust of India, for whom sound investment selection is a whole-time assignment and not one incidental to fund accumulation. The Unit Trust has commenced its purchases on the basis of preferences exercised through its department of expert investigators.

Zest for Equities Declines

The alert investor has been watching the mounting magnitude of institutional purchases on the market; and the correspondingly aggravating imbalance between individual selling and absence of individual investor buying—the latter having shrunk to proportions, that have begun to disconcert all those that think in terms of expanding stock exchange activity, through an enlarging fraternity of individual investors. The problem of floating supplies of stocks on the trading rings shrinking through the aforesaid one-way traffic of institutional buying is assuming disturbing proportions. But a shrinkage in popular interest in equity shares can create long-range problems of free marketability for these very institutions that select scrips on the basis of marketability also. The investor is disturbed by the striking shift in investment holdings, by the shrinkage in the number of individuals that hold sizable equity investment and the migration of these investment groups to other sectors of investment, where that Old Man of the Sea, the tax-gatherer, does not sit heavily on slender Sinbad's shoulder. The investor wonders: What is the likely pattern of shareholding in India in five to ten years from now—particularly in the light of overwhelming institutional underwriting of new issues, which everybody knows do not go well on the market?

IMPACT OF TAXATION

Towards A Better Balance In India's Economic Plans

BY LIBRA

INDIA'S Economic Planning has quite a few achievements to its credit; yet it would be difficult to assert that it has brought the country any nearer the so-called 'take-off' stage or that people generally feel that it has made their lot any better than it was some fifteen years ago. It remains, on the whole, a fairly unbalanced plan. India's achievements in the field of large industry and in important sections of the infrastructure development, especially in power and irrigation, remain without a balance in the growth of consumer goods industries. In particular, the solution of the food problem and its main cause, the problem of numbers, remain exactly where they were some fifteen years ago or, perhaps, a trifle worse.

In the view of the present writer, this imbalance is imparted to the Indian Plans by six sets of causes:

1. Erroneous concepts concerning the public and the private sectors, leading to a failure of harmonious co-operation between them:

2. An exaggerated faith in controls, restrictions, directives and prohibitations—all negative influences—as instruments of growth;

3. An obsession with deadwood ideas which have hampered the growth of sound production (the idea of concentration of economic power, exploitation of the masses and a misplaced humanism in labour policies, to give a few instances);

4. A failure to harmonise fiscal and financial policies and practices adequately with Plan objectives and needs;

5. A lack of clarity and courage in tackling the monstrous problems of food and population; and

6. Failure to tackle problems in the field of social planning and security.

Pathetic Faith

We started our economic planning with a sanctimonious faith that the private sector is full of sin and sinners and the public sector is full of angels. Fifteen years of experimentation with practical affairs has shown that the proportion between devils and angels is approximately the same in both of them; that human nature is broadly subject to the same pulls and temptations; that cupidity and corruption are not lacking in the one as in the other. Some of these ideas about State intervention were picked up by our leaders, who, incidentally, all belong to the ideological framework of the Nineteenth Century Fabianism—whether Congressman or Communists—and who during the years of struggle for independence went on preparing a list of virtuous practices they would initiate once the colonial administration was packed out. Also, it is a reflection on the state of the peoples' lack of self-reliance generally that in this country, more than in many others, one reads such catch phrases as—"But why does not the Government do something" or "Government should step in and take charge of things" or this, that or other enterprise should be "nationalised" as if all virtue automatically gets established once a bunch of civil servants runs a concern instead of profit-seeking men who stand to lose if they make mistakes unlike the civil servants who never lose. This colossal but pathetic faith in "the State," in its wisdom, omniscience, selfishness and competence is one of the sad aspects of India's history since its independence. It also offers a sad confirmation that this country, the world's largest democracy, is a weak, unorganised, unself-reliant, indisciplined mass of humanity in which every one is content to wail and complain that the deities they have installed in New Delhi and their high priests —the civil servants—are not "doing something" about this, that or the other problem, as if they and not the community that put them there are the source and inspiration of all ideas.

Yet, what goes by the name of the public sector comprises mainly a few people who hold the reins of power in Delhi, with an average age past the sixties; with an intellectural apparatus acquired in the nineteenth century; with their energies flagging after years of struggle in the pursuit of personal ambition. These people, helped and assisted by a civil service which is ready to do any job—from the management of banks or steel mills or fertiliser or petroleum industries to the direction of research or the promotion of State trading—comprises the rickety combine which goes by the name of the public sector in this country. It has undoubtedly some achievements to its credit but, generally speaking, it has failed to do first things first or to take full advantage of the numerous other talents and resources available to the country outside of itself or to work with them co-operatively and harmoniously. And it has failed, above all, to create and generate enthusiasm, initiative and enterprise —a many-sided flowering of the genius of the country—in an effort to solve poverty and establish a less pathetic state of the economy than what we have at present.

The Private Sector

This somewhat angry description of the public sector does not derive inspiration in the mind of this writer from an excess of love for the private sector. The private sector—our private sector—let it be admitted, has the same proportion of doubtful characters as the public version; some of our businessmen behave as gracelessly as some of our politicians or civil servants; some of them are as guilty of evading taxes as their counterparts in the public sector are guilty of accepting "rewards"; some of them are as greedy of money as some of their counterparts in the public sector are greedy of power; some of them show as much vulgar taste in displaying wealth as their counterparts in the public sector do in the display of their transient access to authority.

But, will all that list of colossal shortcomings in human nature in both sectors, this writer believes in freedom as a factor for growth—economic growth as well as any other growth—freedom to organise, freedom to acquire legitimate wealth, freedom to earn profit out of risk and enterprise, freedom to try out new ideas and processes and to earn a reward for these ideas, if successful. In such a concept of economic freedom, the role of the public sector will be that of a check and a balance on the vagaries of the private sector, as a watchdog of the interest of the community, as a custodian of its financial and monetary stability, and as an industrial manager only of the last resort, but not as an all-pervading colossus wanting to do things it can never do, things that call for qualities it does not possess and motivations which it could never acquire.

This (the foregoing) is a concept based on the idea that "capitalism" as a living, growing reality is something different from the version that Karl Marx knew and despised; that it has limitations and shortcomings but so has communism; that acquisition of power under communism offers as insidious a temptation as the acquisition of wealth under capitalism; and given all the limitations of the systems and the men who work the systems, neither will work efficiently, unless the *people* are disciplined, vigilant and alert; and, where the people remain the real source of power and progress, freedom is a better instrument of progress than restraints, controls and dictation.

Growing Jungle of Controls

It is from this angle that one has to protest against the growing jungle of restraints and controls and laws in this country. Controls are not an evil in themselves and controls are essential as a temporary expedient in wars, emergencies or crises or as a transitional affair between one period of self-propelled activity and another. But controls that continue on for dozens of years are quite another matter. They are like the sling, and the bandages on a broken leg. While they may help to heal a broken bone, they will render the leg ineffective, if kept too long, for its own normal function. They distort the economy, stimulate corruption, encourage a habit of disrespect for law and a deviousness of attitudes which is unhealthy in the long run. They detach the economy from the normal interplay of contacts with the outside world. To a world-traveller of today, India looks like the dead past of two centuries ago—even countries which make no pretensions to planning like Thailand, Malaysia and the Philippines wear a much more prosperous and a more modern look about them than India with all its "vigorous planning."

A great deal of this "distortion" in our economy arises from our cutting ourselves adrift from the interplay of the influences of world commerce. We are growing into an introvert economy, less strong internationally than even Communist China which was so much more weak and introvert when it started than we were at the time. With all the foreign aid we received, we should have put up a better showing than we do. But the worst thing about our controls is that no one seems to bother about the lack of effectiveness of the controls. No one seems to bother about the fact that controls are only 10 per cent effective. The fact of the matter is that our planning, which started with the objective of restraining the free operations of the price mechanism and the market mechanism, has time and again found itself in the helpless grip of those very mechanisms. Repeated failures have not led our planners either to enquire into the causes of their failure; or to estimate realistically the strength of their adversary or their own lack of strength in dealing with it. They have done some such exercise in the case of steel prices, but then wisdom lingers; it has been lingering hopelessly in respect of many other controls.

For example, after years of frustration and failure, we still seem to believe that controls and rationing will produce more food! One good monsoon, we are all optimists; one crop failure, we are down into despondency. What we need as a long-term solution to our food problem is a balanced policy of food reserves and price *supports* not price *controls*.

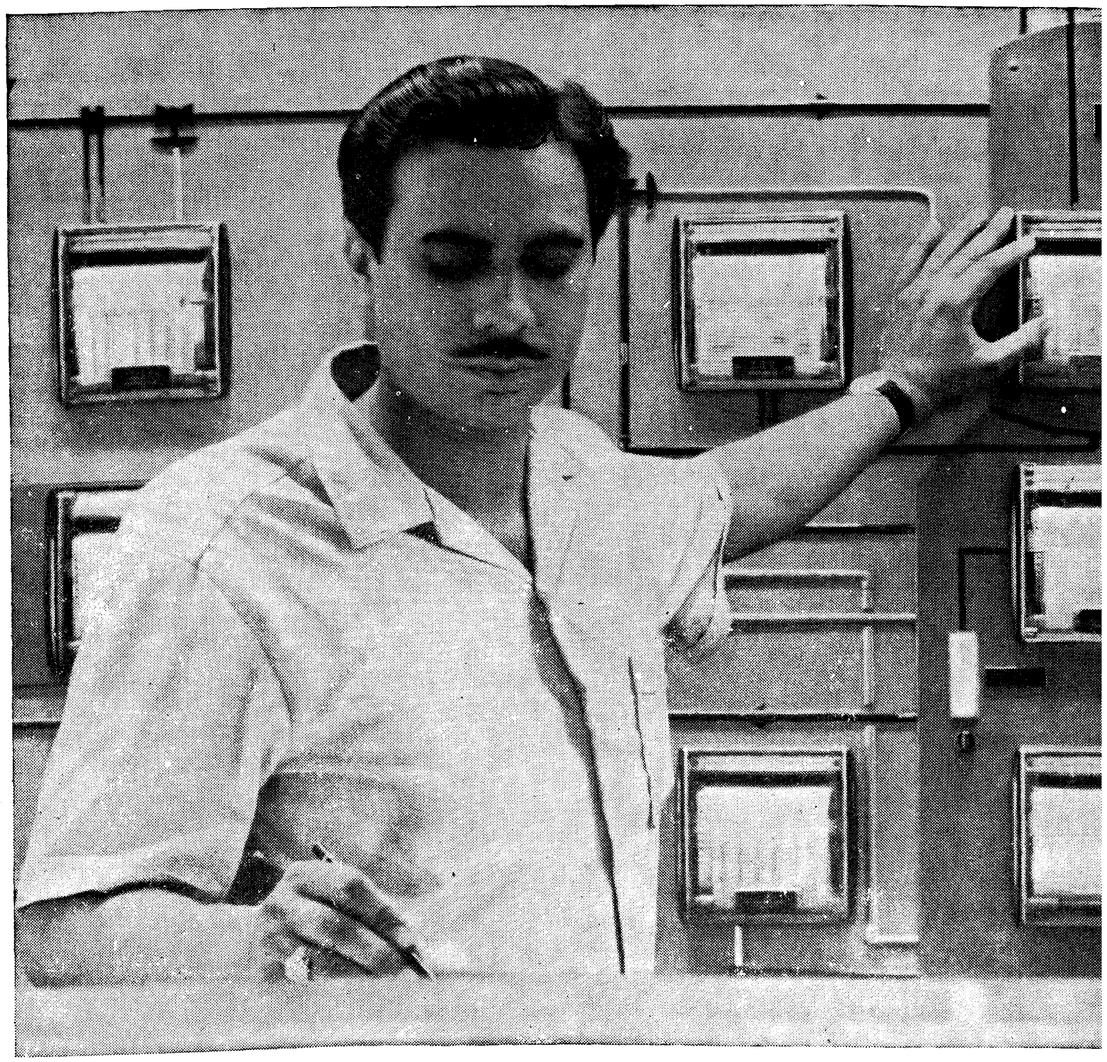
Chronic Malady—Timid Approach

Ironically enough, believers in all kinds of controls, we have done little to bring about the most desirable of controls—that of the reckless increase in our numbers. A drastic situation like ours requires drastic solutions. In the solution of this immense problem, our approach had been timid, if not cowardly, sometimes even hypocritical. Population, let it be affirmed, is the root cause of our poverty and a major explanation for the lack of economic progress in this country. It is no use finding scapegoats in merchants and traders for a problem created by the people themselves. We need leaders with courage who can stand up and say that the people can get only what they have and produce; the merchant and the trader cannot distribute what is not produced or imported; that, after the hoard is eaten up, there is so much less available in the coming month or year and unhoarding of stocks is no solution to the basic problem of scarcity—scarcity that grows more scarce, when numbers become more numerous.

Our failure against the acceleration of numbers is not the only big black mark on our planning. Our labour and income and taxation policies too, have been defective. They encourage, indirectly at any rate, recklessness as against prudence and caution; laziness as against industry; they fail to thank the hard-working people and reward them and they fail to sack the man who drags his feet and does not produce.

Labour Policy

Our labour policy broadly stems from the assumption—again a nineteenth century carryover—that the businessman is full of evil and the labourer is a poor sacrificial goat full of innocence and industry. It fails to recognise that there are industrious labourers and lazy ones, that there are honest labourers and dishonest ones. It is a policy too full of sentimentality for labour, devoid of practical experience. It was inspired by either humanists like Mr. Nehru to whom labour was a mass in the abstract—weak, exploited and always right—or by politicians for whom labour is a vote-catching mechanism and therefore always "right" also—whether it is right or wrong. So our labour policy stems from either excessive



chain reaction

ESSO BOMBAY REFINERY
TENTH ANNIVERSARY 1954-196

Ten years ago, India's first modern oil refinery began operations near Bombay. Once mainly a swamp known as Trombay, the area around the refinery is now a bustling industrial township. For the switches that started the Esso Refinery also sparked off a powerful chain reaction of industrial development—many ancillary industries, a thermal power station and a number of chemical plants have sprung up in the area and a fertilizer plant is now under construction.

Trombay will remain a significant land-mark in the economic take-off of the country and Esso's investment an example of how private 'seed capital' can provide the stimulus for continuous industrial growth.

Esso

humanism unrelated to reality, or from political motivations injurious to the country's economic interests. Labour has every right to organise itself for collective bargaining and for the realisation in full measure of its economic rewards justly earned; but it has no business to use its political strength for its economic betterment, because, in that way, the very basis of economic betterment—namely, industry and efficient production, will become, as indeed they have become, the primary casuality in both the public and private sectors. A community like ours that does not lay emphasis on efficiency in production will never catch up with the developed nations —and it is difficult to assert that our labour is advised to emphasise efficiency as much as they are advised to be conscious of their rights and privileges.

A Contrast

In regard to labour attitudes, it would be well to dwell on the reflection that labour in communist countries has more work to do, generally, and less pay; that living standards of labour in the industrialised countries of the West are immensely better than those in the communist world; and that, with the establishment and expansion of social security, labour in the European democracies has all that communism promises to offer but fails to produce; and that even in agriculture the industrial nations of the West are better able to subsidise agricultural living standards than the communists are able to do. A great deal of this country's well-deserved reputation of being "neutral" on the side of communism—whether in foreign policy or labour and social attitudes—stems from this fact: When it comes to questions of labour, the bulk of our leaders think, at best, with their hearts minus their heads; or at worst, they think of labour merely as a pawn in a political game of vote-catching and the acquisition of power.

This emphasis on the politics of our labour problems to the detriment of their economic implications has a parallel in the obsessions of our planners about the alleged concentration of economic power. Let it be admitted that concentration of economic power is an evil; yet, it is no greater an evil than the concentration of political power in the hands of a single monolithic party run by an oligarchy that lives in the intellectual ferment of the nineteenth century, and in an introvert environment devoid of contacts of friendship either with the world around us of the aspirations of the intellectual and the educated sections of its own community.

Lively Contradictions

Yet, given this concentration of political power, the problems arising from concentration of economic power should be dealt with easily enough through the fiscal arm of the State and a few sound indirect controls. This obsession about the concentration of economic power has led to some lively contradictions—such as the long arm of law stretching itself out to prevent the full use of capital equipment in a capital-scarce economy; to add to overheads by the multiplication of units; and to bring about an uneconomic increase in costs in an economy already eliminated from the markets of the world by its own high production costs. The tactics chosen by our planners to deal with this problem are having the curious effect of throwing out of the window the virtue of economy in production—the very thing for the safeguard of which economic planning is considered essential.

Monetary and Fiscal Policies

In matters of monetary and fiscal policy, too, there are elements of imbalance. In our environment of inflation and deficit-spending, we have pursued over the years a virtual cheap money policy. It is true that, in 1951, the Reserve Bank of India tended to move in the right direction by increasing its Bank Rate from 3½ to 4 per cent. But, later, apparently the Reserve Bank has been vanquished as a maker of financial policy and the reign of cheap money and low interest rates continued unabated till a few weeks ago. Recently, again, presumably under pressure from international institutions such as the World Bank and the I.M.F., there has been some indication of awakening towards a new policy on interest rates. With a Labour Government in England putting up the Bank Rate to 7 per cent, we in India have no business to dally round a 5 per cent rate structure and we need more courageous steps along the direction of higher interest rates more appropriate to a capital-scarce environment.

Like the interest rates, the exchange rate has been very widely out of tune with domestic costs and the purchasing power of the rupee over many years. Yet, unlike in the case of the interest rate, a clear cut policy on the exchange rate is not so easy to enunciate. But, all the pros and cons considered, it would seem advisable to bring the exchange rate into line with its real purchasing power. It will make exchange controls less difficult to operate; it will make import controls more manageable; but it will, above all, give a much needed fillip to India's exports, especially in areas where our high-cost goods are in competition with goods from more efficiently organised industrial countries. It will, of course, put up our foreign debt bill and aggravate the budgetary problem, but it is the price we have to pay for a more viable relationship with the international economy.

There is also need for a great deal more of appraisal of our investments and credits in terms of their actual contribution to the output of goods and services. It would be interesting, for example, to learn what additional contribution in terms of agricultural production results from the expansion of credit to agriculture by the Reserve Bank of India; what, for example, is the additional production and in what kind of time sequence does it result from an investment in a dam or an irrigation project; what, in concrete, is the rate of return, financial and economic, to a given unit of investment in steel in the private sector as against that in the public sector; or between steel and fertilisers in the public sector. Such information as the Planning Commission may have on this—if it has it—should be more widely shared with the public.

All Roads to Leadership End . . .

Last but not least, balanced planning calls for the adaptation of social and economic institutions and practices to policies conducive to economic growth. Community Development, Co-operatives and Social Welfare, in particular, have received a good deal of attention but here is an area where great popular movements are what are needed. What can be achieved by a group of officials in Planning Commission and Ministries is very limited. Curiously enough, in our post-independence years, all enthusiasm for widespread reform movements of one kind or another seems to have come to an end. Even the universities which provided a good deal of leadership in the field of social change under the colonial administration have become completely wooden and stagnant. All roads to leadership nowadays seem to end only in political leadership, and the politician has assumed all leadership —whether in community development or co-operatives or universities or youth movements. None of these is any better for this invasion, though politics may have gained somewhat from this insidious "politicalisation" of the non-political segments of life. Centralisation, one concedes, is the essence of planning; but it has to be a centralisation brought about by the pooling of a variety of talents and resources not by just one talent and that not a very noble one, claiming all the monopoly of power and privilege, because, in such an event, the dead hand of stagnation would descend on that community. Where are all those patriotic young men and women who swarmed Gandhiji's unpaid armies of action? Why do many of our young men who are sound in heart and head go about smashing up so much public property in moods of deep frustration? Why are many other intelligent, highly skilled professional men keen to leave the country and go and live amidst inhospitable social surroundings abroad?

Prerequisites

In sum: If India's economic planning is to become truly balanced operation:

(a) The Planning Commission should cease to be a commission of politicians—whether its members originate from Parliament or the services or the universities. It has to be, above all others, a pool of talents and a body imbued with the highest level of social enthusiasm and idealism. It has of necessity to function in a political environment, but it will do less than justice to itself and the country, if it does not feel free to function in an atmosphere of detachment and freedom from the stresses and strains of day-to-day politics.

(b) We must give up this fruitless and noisy argument about the public and the private sectors and stop denigrating all businessmen simply because some businesmen are discovered to be crooks.

(c) We must give up the assumption that the public sector is full of angels and also the assumption that the public sector can do no wrong.

(d) There are a lot of businessmen whose knowledge and experience are invaluable in economic policy-making and there must be ways of asspciating them with the work of the country without being inhibited by a sense of sentimental untouchability into which they are consigned today, even though their money is found to be a good lubricant for party needs.

(e) There must come back again a climate of ideas, in which wealth and property honestly acquired should be freely enjoyed without a sense of shame or guilt, so that the present hypocrisy in which politicians who are after the good things of life like anyone else do not have to put on the hypocritical garments of poverty.

(f) The public sector should have a better appreciation of its limitations and inadequacies as a manager of industry and should confine itself to areas of fiscal and financial management and enlarge the areas of free private activity with an accent on the positive rather than the negative instruments of economic growth.

(g) Population and food should remain the major concerns of policy and a certain amount of courageous ruthlessness should inform the policy towards the former.

(h) The noisy argument between labour and capital should be dealt with firmly yet justly, recognising that neither all employers are bad nor all the labourers are good. Labour leaders, as well as employers, who show indifference to the needs of efficient production should both be severely handled. Labour legislation should not exceed what is capable of efficient implementation.

(i) Our Bank Rate should go up and exchange rate should be devalued to make the economy more self-reliant and less in need of controls which are ineffective for the most part anyway.

(j) Our planners should give less attention to sophisticated theoretical techniques of economic analysis derived from the experience of industrialised countries and develop their own understanding of the problems of our economy through a pragmatic attack on them and informed by common sense and business acumen which play little part nowadays in discussions and analyses of plans.

(k) A little more *real* humility on the part of the politicians and a little more respect from the powers-that-be for other talents such as those of the scientist, the economist, the industrial magnate and the educator will make for an improvement in the quality of our collective decision and thought. The political caste today thinks severely alone. The politicians will only be benefiting themselves if they realise that there may be a few useful ideas to be found amongst leaders and men in the other castes as well.

(l) While our dumb millions are suitably represented by the honourable members in Parliament, cannot the Planning Commission or even Parliament itself, set up a house of intellect to which will be invited each year a variety of people of intellect and experienee selected from different walks of life and asked to reflect on a selected list of the country's problems, to give ideas and comment on policies from which perchance the Government and Parliament may derive some benefit?

THE INVESTOR'S CHANGED PSYCHOLOGY

(*Concluded from page 16*)

Would it be nine-tenths institutional and one-tenth personal? Even in countries where hundreds of investment trusts or mutual funds function, institutional holdings account for less than 10 per cent as in the U.S. and the individual is the mainstay of markets.

A declining individual zest for investment and bloated holding by quasi-Government institutions are by no means a sign of economic health of the country—but this is the inescapable outcome of ideology-propelled tax effort, inflation in living costs not wholly ascribable to developmental activities and annual shifts in economic policies. The investor feels he is too small a person to debate the matter with Government. He has moved over silently where he thinks his savings can function in comparative security. Those are sectors that afford him protection and advantage—but are unproductive of goods or services; do not enlarge the area of import substitution: nor increase employment—in general, do not initiate new economic activity.

The elements of economic statesmanship demand that this lethal climate should be changed; that the choked conduits of incentive for investment should be opened up; that a commonsense approach to the motivations of savings groups should be made. In short, there has to be a new dimension in the thinking of all planners—if the imposing blueprints of a fourth Plan are to be translated into three-dimensional actualities.

Weight lifters
Our Boeings!

We had a 25% increase in our cargo uplift last year! Because we offer reliable transportation for selling your goods in the markets of the world.

Not only do your goods reach in time, but your buyers are benefited as they can cut their inventory by half, without being out of stock. And your business will grow when buyers get faster replacements.

Our Boeings have spacious pressurised cargo holds with 5-ton capacity per flight. Bulky, heavy, or light cargo—from baby elephants and machinery to sea-food and commercial samples, all reach their destination swiftly and safely. Your goods get expert handling; we also have trained attendants for livestock.

Contact your Cargo Agent or our local office for assistance.

THE STRATEGY FOR THE FOURTH PLAN

By Dr. P. S. LOKANATHAN

In a recent broadcast, Prime Minister Lal Bahadur Shastri said: "It has become essential to ensure by all possible means that every man gets the necessary quantum of food and at reasonable prices." The Planning Commission also has repeatedly laid emphasis on this and other ultimate objectives in the earlier Plans, namely, (a) to ensure a minimum level of living to every family, (b) to provide employment to all those who seek it, and (c) to narrow economic and social disparities. The same goals have again been enunciated in the Fourth Plan Memorandum. But it is not enough just to repeat these objectives; the required measures necessary to ensure their attainment should be spelt out. As long as economic and social goals continue to be defined in too general and all-too-comprehensive terms, no real advance in reaching the goals would be possible. The time has come to give a more concrete content to these objectives both in terms of the tangible results sought to be achieved and the time span within which these are to be achieved. This should form the basic strategy of the fourth Plan.

Minimum Consumption

A minimum consumption of essential commodities for all is a highly desirable objective, but, if this be found to be too difficult to achieve in the fourth Plan, let the Government undertake the responsibility for providing a minimum consumption of foodgrains to all within the Plan period. This is a modest objective, but, if it can be realised, it would create a welcome psychological atmosphere among the masses of the population. They would come to feel that the Plan means something definite for them and so the prospect of their sense of participation in the Plan will improve. But even this limited objective cannot be achieved, if we concentrate only on production and ignore the distribution approach. Despite a 5 per cent rate of growth in agriculture and a 6·5 per cent general rate of growth in the national income as planned for, there can be no assurance of the minimum for all, unless measures are introduced deliberately to change the distributive system, in order to attain the end in view. These measures broadly are rationing in urban areas and public works in the rural areas.

Rationing

Rationing has to be accepted, not merely as a temporary measure for any year of stress but as a more or less permanent mechanism to assure a more equitable distribution of scarce consumer goods. In the face of a rapidly rising population and the intense desire to accelerate the growth of the economy, there is bound to be continuance of scarcity of essential consumer goods for several years. With such scarcities, it would be almost impossible to provide resources for such developments as may be desired and needed, unless we safeguard the minimum requirements of the masses. This is an essential condition for allocating resources for heavy, basic and other industries. The establishment of a rationing system on a more firm basis would in time make the rationing machinery more efficient, and hence less costly. This in turn would enable other essential commodities to be brought within the scope of rationing if this is found necessary. I know there will be difference of opinion on rationing, but all talk of achieving a rate of growth of 6 to 7 per cent per annum would be wholly unrealistic if we do not take care of the minimum food requirements of the hundred and fifty millions who are now undernourished and who are below the subsistence level. Given an assured minimum for all, we can go forward imposing sacrifices on the more prosperous sections of the community. The basic minimum of essential articles of consumption should be provided both by raising the output of consumer goods and by ensuring a proper distributive mechanism.

Rural Areas

In the rural areas, a different approach will need to be adopted. Here there is a large surplus of manpower, a good part of which is also poor and ill-fed. This manpower is a potential capital asset, inasmuch as it can be utilised for increasing capital formation in the rural areas. This has not been done—at least not adequately.

The utilisation of this surplus manpower in the rural areas is a most urgent task—a task which will also be rewarding. The urgency arises out of the need to provide employment to those millions who cannot even afford a minimum consumption of food. It will be rewarding, because, if organised properly, it can, within a span of five years, provide the workers sufficient income to make it possible for them to have a minimum level of consumption.

The surplus manpower in rural areas is sought to be utilised through a nation-wide rural public works programme. These rural public works will engage village folk in works which are capital forming in nature. The workers will be paid in foodgrains (about 75 per cent) as well as in cash. A good part of the foodgrains required for payment would come from the better off families in the villages who will gain substantially from the capital assets created through the rural works.

Real Issue Missed

Current thinking in the Government has been mainly in terms of reducing inequalities between the rich and the moderately rich. This has missed the real issue, which is that there are millions in this country who lack incomes even for a minimum level of food consumption. This is the basic cause of poverty and also of disparity.

An advantage of the rural public works, which will be organised in close co-ordination with other agricultural and related programmes, will be that through adding to the pace of capital formation, it would further increase both agricultural and industrial output.

While the rural works would be conducted essentially at the village and district levels, the programme itself should be conceived as a national programme and the organisation to handle it must be built on national lines.

The Planning Commission has been unable to get over the traditional thinking in regard to unemployment. While in each successive Plan they have talked of backlogs and new employment, we are no nearer the solution. The concept of backlog of unemployment in the rural sector is of doubtful value and help. The so-called unemployment in rural areas is really serious under-employment. To cull a category of backlog out of this has no statistical basis and it only takes the attention away from the basic nature of the problem as it is found in rural areas.

Our objective should be to provide employment opportunities to all those who seek employment from the rural areas at least to the extent that would ensure a minimum consumption of foodgrains. It may be added that a minimum 5 per cent annual rate of growth of agriculture would also help in bringing about a slight reduction in the present inequalities of income between the rural and urban areas.

Industrialisation

Even on the assumption that the rate of growth of 5 per cent in agriculture would be maintained during the fourth Plan, the level of productivity in this sector would still be far below the productivity in other sectors. If this gap is to be covered within a reasonable period of time, it is essential to make rapid strides in industrialisation to enable larger transfers from the agricultural working force into industry. Hence the emphasis on rural public works programme should not be regarded in any way as reducing the urgency and importance of rapid industrialisation which is necessary from every point of view. Much of the agricultural development itself has to rest on a rapid programme of industrialisation to meet agricultural needs in terms of fertilisers, insecticides, pesticides, etc. Rapid industrialisation is also necessary to bring about a self-generating economy in the near future.

Notwithstanding the criticisms directed against the fourth Plan's allocation of resources for services and social overheads, this writer feels that this weightage is fully justified. If there is one lesson which we have all learnt during the last ten years, it is that investment in human resources is highly rewarding. It is felt that there should be no attempt to slow down the pace of expansion in mass education. The National Council which had made a study recently of the use of fertilisers has shown that the literate and educated farmers have got a greater propensity to use fertilisers than the uneducated. To educate the farmers, schooling alone is not sufficient. It is also necessary to build up a corps of technicians whose help and guidance should be easily available to the farmers in developing their technology.

Foreign Exchange

The foreign exchange need for maintenance imports must be met by exports, but the present export target of Rs. 5,100 crores falls short of the requirements of Rs. 5,500 crores of maintenance imports. It is suggested, therefore, that the export policy should be more clearly defined and that towards this end the Industrial Policy Resolution should be amended with a view to give due importance to industries with export potential. This is stressed specially, because it appears that not only the State Governments but even the Ministries at the Centre have not properly appreciated the importance of exports.

In line with the above, it seems necessary that there should be a much deeper economic analysis of the relative value of investment in terms of foreign exchange gains in import saving industries *vis-a-vis* export promotion industries.

The investment and outlay targets of the fourth Plan as envisaged by the Planning Commission seem to be reasonable and feasible. If adequate steps are taken to control the price level and if the targets for agricultural production (5 per cent per year compound) are realised, the raising of the necessary financial resources will not be difficult.

Strategy Outlined

To sum up, the strategy of the fourth Plan should be as follows:

(1) To increase agricultural production by 5 per cent a year in order to provide the minimum consumption requirements of foodgrains for all sections of the people.

(2) To provide for all the basic inputs for achieving such a rate of growth in agriculture.

(3) To organise a public works programme in the rural areas and to introduce rationing in the urban areas in order to ensure a proper distribution of the agricultural output.

(4) To provide for the basic industries essential for accelerated development and for the defence of the country.

(5) To provide for all types of economic overheads to meet the requirements of industry and agriculture.

(6) To provide for the basic social services for the rising population, especially primary education, technical education and public health facilities. Expenditure on family planning should be increased manifold.

Finally, the administration both at the Centre and at the States should be capable of implementing in time and without increase in the costs, all the possible projects in the Plan. Unless India possesses an honest and efficient administration at all levels, no amount of planning can lead to the desired results.

PLANNING COMMISSION ON FOURTH PLAN

"The basic objectives which have been enunciated for the fifteen-year period commencing with the third Plan are to lay sound foundations for self-sustaining economic growth, to provide avenues and opportunities of employment to all those who seek it, and, while narrowing economic and social disparities, to ensure a minimum level of living to every family in the country. The third Plan was visualised as the first phase of a period of intensive effort to achieve these aims and its shape and strategy were designed accordingly. Since its inception, the economy has moved in changing directions, some favourable, some unfavourable, to the pace of the long-term objectives. The basic needs of the nation, however, remain as compulsive as they were at the outset and, if anything, more pressing on account of the slow progress of the economy in recent years. The fourth Plan must ensure that, in spite of unanticipated difficulties in the immediate past, the move towards a better life for the common people maintains its momentum. The central problem for the fourth Plan continues to be one of generating a rapid increase in the national product, without impairing social stability. More explicity, basic goods and services required for consumption by the mass of the people have to be produced; and at the same time, investments in human and material resources should generate a much larger supply of those goods and services essential for future growth and for which we are now critically dependent on external assistance. It is these sophisticated goods and varied skills that help to diversify the productive as well as the occupational structure of the economy. It is only in this manner that hunger, poverty and unemployment can be removed. The goals and the strategy for the fourth Plan derive from the need to evoke maximum national effort for these vital tasks."—*Memorandum on the Fourth Five-year Plan.*

EXPANDING INDIA'S SHIPPING HORIZON...

PORTS-IMPORTS AND EXPORTS

A bulk carrier arrives. The port is busy. Cargo is being loaded for some faraway destination. After a few weeks it will reach there and the port of arrival in turn will hum with activity.

Shipping involves men – men at the shore and men at sea. Together they work in the endeavour and common pursuit of carrying goods on the oceans—goods which earn valuable foreign exchange for the country.

Jayanti operates a fleet of 21 vessels—inland with her seven Liberty vessels, to the various world ports with her seven bulk carriers, five Courtline vessels and two oil tankers.

AGRICULTURE IN THE FOURTH PLAN

By ASOKA MEHTA
DEPUTY CHAIRMAN, PLANNING COMMISSION

A STAGNANT agriculture is the hallmark of a traditional society. Stereotyped agricultural practices, inadequate use of water and fertilisers, land fatigue and soil erosion, poor quality of seeds and antiquated tools characterise Indian farming. Modernisation and economic growth can come only if this stagnation is broken for good. India's economic planning is based on this premise.

It must, however, be admitted that, so far, our efforts have not attained that degree of momentum which can decisively dynamise our agriculture. This is borne out by the fact that, although we have accorded the highest priority to agriculture in the third Plan, we do not expect the physical targets to be fulfilled. According to present anticipations, the level of foodgrains production may be of the order of 90 to 92 million tonnes at the end of the third Plan, as against 100 million tonnes originally envisaged, production of oilseeds 7 to 8 million tonnes as against the target of 9.8 million tonnes, that of cotton 6 million bales as against 7 million bales as originally targeted. The programme is likely to be fulfilled in the case of jute production and more than fulfilled in the case of sugarcane.

The Main Problem

The possibility of Plan fulfilment in the case of sugarcane, jute and to some extent cotton also shows that there are some forces at work in the production of important commercial crops which are somehow non-existent or feeble in their impact in the case of production of foodgrains and other crops. These are the economic incentives provided by an organised countrywide market. In one sense, to open the door to such incentives in the rest of the agricultural sector, particularly in the production of foodgrains, constitutes the main problem of agricultural development.

Three reasons are generally attributed to the likely limited achievement of the current Plan in respect of foodgrains production. In the first place, progress in physical terms in irrigation, soil conservation and other programmes has been somewhat smaller than envisaged. In the case of major and medium irrigation, the third Plan target was to create a cumulative potential for 29.5 million gross acres. We now anticipate the creation of potential for only 20 million gross acres at the end of the Plan, of which 16 million gross acres or 80 per cent may be actually utilised. Much of the benefit will accrue only in the fourth Plan period. Secondly, the supply of material inputs of agriculture, particularly fertilisers, has been significantly below the levels originally contemplated. In the case of chemical fertilisers, against a target production of one million tonnes in terms of N, we are likely to produce about 600 thousand tonnes at the end of the current Plan. In respect of diesel engines for use in agriculture, we are likely to produce only 78 thousand units at the end of the Plan against a target of 166 thousand, although in power pumps we shall better the target of 150 thousand units by producing 180 thousand units. Finally, we have the perpetual excuse of unfavourable weather conditions and natural calamities. All this, however, goes to show that there is something basically wrong with our agriculture. Unless we make an effort and find out what it is, agriculture is likely to prove the Achilles' heel of Indian planning.

The fourth Plan for agriculture which is under preparation can really be drawn up only after the States have built up their respective agricultural plans from below, i.e., from the block and the district levels up. On the basis of overall requirements, however, an outline of the Plan has already emerged. We require about 120 million tonnes of foodgrains, about 12 million tonnes of oilseeds, 13 million tonnes of sugar, 9 million bales of cotton and roughly 8 million bales of jute at the end of the fourth Plan on the basis of certain projections of population, consumption trends, etc. On the assumption of a more balanced diet than the bulk of the people are now enjoying, the requirements of foodgrains may be two or three million tonnes less, but this will call for a much bigger rise in the production of legumes and milk and consequently of fodder than is envisaged at present.

The overall aim is to achieve an increase of agricultural production of not less than 5 per cent per annum which is supposed to look after this scale of requirements. According to a recent analysis of the growth of agricultural production during the period 1951-54 to 1958-61, 33 out of the 184 districts for which results were studied achieved on average annual increase of 7.5 per cent or more per annum and 69 districts out of the total number studied did better than 5 per cent a year. Since we have about 300 districts in the country, the rate of growth in agricultural production aimed at in the fourth Plan would indicate the magnitude of the task. Unless perhaps we aim at a somewhat higher rate of growth and provide adequate resources for that, the physical requirements may not be fully met at the end of the fourth Plan. For on the basis of the outlay tentatively proposed at present, we expect to produce the full requirement of foodgrains, sugarcane and jute but may end up by producing only 10 million tonnes of oilseeds as against our requirement of 12 million tonnes and 8.5 million bales of cotton, as against our requirement of 9 million bales.

Outlay

In the proposed tentative Plan outlay of Rs. 22,600 crores as a whole, outlay on agriculture in the fourth Plan will be of the order of Rs. 3,100 crores or nearly 14 per cent. If we include another Rs. 1,000 crores proposed for investment on irrigation the share of the combined agriculture and irrigation sector in the total investment would be of the order of 18 per cent. Out of the proposed investment of Rs. 3,100 crores in agriculture, the share of public sector is likely to be Rs. 2,400 crores and that of the private sector Rs. 700 crores. For the public sector alone, the scale of investment now proposed for the fourth Plan is nearly two and a half times that anticipated for the third Plan as a whole. It would be interesting to see how this massive programme of investment would be built up in the various areas of development.

Actual targets of development of irrigation, soil conservation, improved seeds, double cropping and other agricultural programmes can be finalised only after the State plans have been drawn up. As a preliminary and tentative framework, we envisage that, in the fourth Plan, 13 and 17 million acres respectively will be irrigated under major and minor schemes, leaving about 15 million acres to be irrigated in the subsequent Plans, 20 million and 2.5 million acres will be respectively covered under soil conservation and land reclamation schemes, while the area under double cropping would be extended by 22.50 million acres. At the same time the scale of consumption of chemical fertilisers is expected to reach a level of two million tonnes of nitrogen, one million tonnes of phosphates and 0.35 million tonnes of potassic fertilisers from an anticipated level of consumption of 0.65, 0.25 and 0.15 million tonnes, respectively, at the end of the third Plan. The total area under improved seeds so far as foodgrains are concerned will be 274 million acres, going up from an anticipated level of 164 million acres at the end of the third Plan. The use of organic and green manures will go up to 5.4 and 64 million tonnes, respectively, of urban compost and green manures from a level of 4.22 and 27.9 million tonnes at the end of the third Plan. Finally, 160 million acres are expected to be brought under plant protection schemes, the level expected at the end of the third Plan being 40 million acres.

Organisation

These are programmes of a massive nature and they call for the greatest utilisation of the existing agencies for agricultural development and in many cases their expansion. In the years to come, we shall have to depend more and more heavily on the extension services attached to the community development blocks for the purpose of organising this mammoth development work and on rural co-operatives for providing the finance which will become necessary in the wake of such development. It has already been recognised that the central task of the community development organisation in the blocks is to mobilise the entire rural community and the extension services for sustained and concentrated efforts for increasing agricultural production. It is true that the community development organisation in the blocks includes Extension Officers at the block level for agriculture, co-operation, *panchayats*, animal husbandry, industries, health and medical services, women's welfare and rural engineering, but, unless agricultural improvement becomes the focal point of all these various activities, the real task of releasing the energies of the community will not be served. We have already brought 5,100 development blocks out of a total of 5,200 within the scheme of community development, these accounting for a population of nearly 40 crores. By the time the fourth Plan is launched, the entire country is expected to be brought under a network of community development blocks and village democracy, effec-

tively committed to the task of economic development in the countryside.

At the same time, rural co-operatives will have to play their part increasingly in supplying the much needed finance. The membership of the primary agricultural credit and service societies exceeded two crores at the end of 1962-63, as against the total of six crores agricultural families living in this country. The gap between these two figures represents the leeway we have to make up in bringing the sources of cheap credit close to a farmer of small means. Already a diversification of the co-operative movement in the countryside is in evidence. There are more than 40 co-operative sugar factories, 850 other processing units and more than 3,000 agricultural marketing societies. However, there is much room for improvement in respect of management of business, administration and supervision of units. Large overdues (26 per cent in 1962-63) and diversion of loans to non-productive uses have also to be brought under control. Besides, one of the notorious facts of the current pattern of development is that the poor farmers who are preponderant in number are not able to avail themselves of the facilities of the co-operative movement to any significant degree. This is tending to make the poor farmer poorer and the rich farmer richer. Unless these defects are removed, the creative role of the movement in a democratic pattern of economic development will never materialise.

Another factor which will have considerable effect on agricultural development in the fourth Plan is the pace at which land reform measures are completed within the third Plan period. The progress in this field has not been very rapid. Administrative arrangements for supervising action on land reform enactments have not been adequate and even complete and up-to-date records of rights of tenants do not seem to exist in several States. The consequence of all this has been that the poorer farmers and the landless rural workers are becoming increasingly identified as a weak spot in Indian agriculture, a source of serious discontent. Efforts are already being made to implement the reforms in full in all the States before the fourth Plan is launched.

Basic Approach

The dimension of the agricultural problem and the need for solving it quickly in the interest of rapid economic growth have compelled a re-examination in recent months of the basic approach to agricultural development. While substantial investments have been made in agriculture, irrigation and allied programmes over the past decade or so, neither the volume of these investments nor the results achieved through it can be said to have been commensurate with the requirements of a growing economy like ours. Apart from the quantitative inadequacy of inputs in agriculture so far, the quality of these inputs also leaves much to be desired. The most glaring inadequacy in this respect has been that science and technology have not been applied to agriculture as an input. It is well known that the agricultural revolution in the other advanced countries is ultimately traceable to the application of the results of scientific research and technological improvements in the field of agriculture. It is true that the application of this input is about the most difficult to achieve in the agricultural sector of a traditional society. Yet certain beginnings have already been made as will be found from the figures of consumption of chemical fertilisers over the last few years. The real thrust of the fourth Plan in agriculture will come from a purposive and systematic application of science and technology.

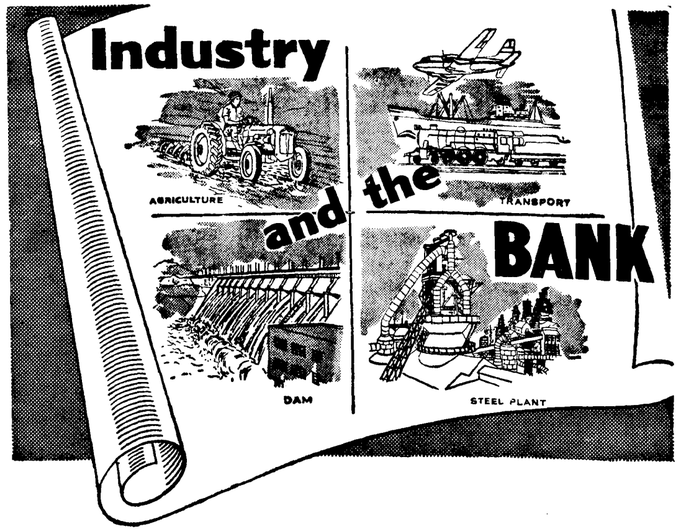
One corollary of this is the newly adopted intensive area approach, i.e. an approach which makes use of large quantities of fertilisers in areas with irrigation and assured rainfall specialising in certain crops. Another is the extension of the Intensive Agricultural Development Programme in more and more districts. A third is the crash programme in agriculture now under way, and intensification of the production of subsidiary foods, vegetable growing, poultry farming, etc.

Institutional Framework

Another way in which the application of the scientific method will be sought to be encouraged is to build up a structure of rational prices for agricultural commodities, particularly foodgrains, which make such application economically worthwhile. A beginning has already been made in this direction so far as foodgrains are concerned. A Food Trading Corporation ushering an era of State trading in food, which is already in existence in many advanced countries in respect of selected commodities, has been set up. This new departure in the institutional framework of distribution, along with the Agricultural Prices Commission which is in the offing, State warehousing and credit facilities, is ultimately bound to have a salutary effect on production itself, through a rational price structure for food, lowering of transportation costs and better storage facilities.

The plan for technical training is also being geared to the increasing needs of agriculture in the fourth Plan. The opening of more and more agricultural universities is a step in this direction.

In the days of foreign rule, we were often told that Indian agriculture was a gamble in rain. This fatalistic excuse has to go and we have to recognise that agriculture in this country is a fight against nature. It is also a fight against man. It is a fight against all that is conservative and custom-ridden in man in this country. Unless we can rid him of these drugs on his advance through a process of education and enlightenment, we shall not be able to solve our agricultural problem. This cannot be achieved overnight, nor easily. It is only through a continuous process of dissemination of the results of scientific research, through repeated practical demonstration of the superiority of modern methods over the antiquated, organised throughout the length and breadth of the country, and through constant persuasion to modify his old practices can we finally win him over to the side of change. And, until we can involve the great majority of the people engaged in agriculture in this vortex of change, the agricultural revolution in this country will always elude us.



Blueprints of expansion of a nation's industrial activity require adequate financial resources for implementation.

Allahabad Bank plays its part in providing funds for projects. The investor's money thus plays a vital role in the country's rapid development, the Bank guaranteeing its security and interest to the investor.

THE HUMAN FACTOR IN ECONOMIC GROWTH

WANTED—A FIVE-YEAR PLAN OF CONSOLIDATION

By C. N. VAKIL

ECONOMIC development is for the benefit of human beings and it has to be brought about by human agency. The skill, the resourcefulness and disciplined hard work of the people are more important than material resources. Large investment may not yield results, if the human agency is not effective; better results can be produced with a smaller investment, if the human agency is efficient, devoted and *honest*.

The third Plan has a provision of 9 per cent of the total proposed expenditure for "Education, Training and Research." It is proposed to increase this in the fourth Plan. Though this is not adequate, it shows some awareness among the authorities for the need to develop the human factor for economic growth. Without going into details, we may say that we have achieved quantitative progress, but it is not possible to say that we have achieved qualitative progress to the desired extent. We have some brilliant people in some activities; what is wanted, however, is that we should have a high average efficiency with integrity and willingness to do disciplined hard work. Unless we achieve this, the contribution of the human factor will be limited. With large and increasing numbers of people, we continue to allow the human factor to be a liability, instead of an asset. The suggestion made in some quarters that the somewhat higher provision for Social Services proposed for the fourth Plan should be reduced to accommodate other items is misconceived. The case is for a still higher provision for the development of the human factor.

I

THE MALADIES

Let us consider a few illustrations in support of these remarks:

(1) In spite of various efforts and large investment during the three Plans, for the development of agriculture, we do not seem to have achieved satisfactory results. The questions are how far has the farmer adjusted to the requirements of planning; how far has he benefited from the new arrangements; and how far has his productivity increased? Has the large expenditure on Community Development Projects helped to improve the efficiency of the farmer? Has the effort to develop co-operation resulted in appropriate change for the better? Unfortunately, we must admit that the human factor on the land has remained static and, barring a few exceptions, progress is not visible. The greatest problem before the country is to find ways and means of making the farmer more productive in his work on the land.

(2) There is a state of unrest among industrial workers who seem to demand larger and larger benefits without putting forth proportionate productive effort. This leads to strikes or go-slow tactics. Even when such immediate problems are solved, such a state of affairs introduces a state of indiscipline which comes in the way of production. The political parties who dominate the trade unions use them for their own purposes, without regard to the interests of the country. The workers are induced to adopt undesirable methods for personal gains, but very little is done by the political parties or the trade unions to increase the efficiency of the workers or to instil in them a sense of discipline.

(3) A similar state of unrest seems to have spread among the so-called white-collar workers in offices, private and public. This has also resulted in go-slow tactics, loss of efficiency and work as well as a state of indiscipline. Here also, though the immediate problem is temporarily solved, the indiscipline remains with undesirable consequences. The application of legislation intended for the benefit of industrial workers to this class of workers has resulted in a situation in which the management becomes ineffective in discharging its responsibility. Legislation or other methods intended to help them should not result in indiscipline and loss of work, which, unfortunately, is common in both public and private establishments.

(4) It is unfortunate that a state of indiscipline pervades also in many educational institutions. We hear of strikes in universities and colleges some of which are violent. The recent developments in Orissa, where the students dictate terms to the Chief Minister and take the law into their own hands, shows the extent to which indiscipline has spread in the student world. We also hear of strikes of teachers. Stories of tensions between management of educational institutions and the staff, between the teachers and the pupils are also common. The various elected bodies which are supposed to manage the affairs of the growing number of universities in the country seem to be full of intrigues and tensions, intended to divide the spoils of power and patronage, subordinating in consequence academic principles and academic work.

Mr. Asoka Mehta, in his Convocation address to the Jammu and Kashmir University on 20th October 1964, observed that there should be an intellectual take-off before the economic take-off. What he meant was the need for intellectual development in the country to provide a sense of direction and purpose to the continuing development process. The question is whether the universities in the country are organised for this challenging essential task. One hears of falling standards in the rapidly growing number of universities in the country. In some, it may not be inappropriate to say that there is a systematic effort to lower standards, which may be described as organised inefficiency. If the universities which should provide leadership for the country in different walks of life, are in such a state, we may not have the intellectual take-off that Mr. Asoka Mehta expects; in other words, the central machinery for the development of the human material at the highest level is weak and ineffective.

(5) The legislative bodies in the country who are charged with the high functions of legislating for the changing needs of the country consisting of the elected representatives of the people also reflect a similar tendency. Cases of indiscipline in the legislative bodies have become frequent. Defiance of the authority of the Speaker is not uncommon. Cases in which the Speaker had to arrange for bodily removal of some members of the legislature are on the increase. This spectacle obviously puts a seal on the state of indiscipline in other walks of life to which reference has been made above.

(6) So far as the Executive Government is concerned, i.e. Ministers and officials, we find that the state of tensions has spread in their ranks. There are very few ministries in the country in different States where there is complete harmony and team work. Cases of mutual wranglings, of internal politics and mutual charges have become common. The existence of corruption in the official world, including the rank of Ministers has been the subject of official investigation by the Santhanam Committee, apart from special investigations of cases like those of the former Chief Minister of Punjab. The respect for the politician and the administrator should be such that it may act as a deterrent to indiscipline and dishonesty; if the prestige of these persons in high positions is low and therefore the esteem in which they are held by the people falls, the consequence is obvious. The Government is anxious to remove this evil and is trying to take suitable steps for the same. It is not clear, however, whether the steps taken so far are likely to bring about the desired results. It is no longer a question of dealing with isolated cases of wrong behaviour; it has become a general and widespread malady which requires radical remedies.

(7) Such a state of unrest in the country is aggravated by the phenomenon of rising prices in recent times, as it is being exploited by political parties who wish to make capital out of it. In consequence, we have the organisation of general strikes which coerce peace-loving people from doing their ordinary daily work, as the Government may or may not be able to give protection to such peaceful workers. Besides maintaining unrest, such methods involve considerable loss of work and consequent loss of production. Instead of reducing prices which we all want, these methods will help to raise prices. This only shows that, in their effort to get political power, some parties do not mind working against the larger interests of the country.

(8) The way in which some persons interested in advancing their own self-interest do not mind inflicting considerable inconvenience and loss of time on innocent third parties is illustrated by the way in which the go-slow tactics of the pilots of the I.A.C. worked havoc for some time on air-travellers within the country. This shows that we have got into the habit of making a public exhibition of our grievances, right or wrong, and of creating nuisance of ourselves in order to seek remedies. Whatever the justification of the attitude of different groups in such cases, the fact remains that the state of unrest is widespread in the country amounting to absence of internal peace or

Kyushu Oil Company Refinery at Oita, southern part of Kyushu, now under operation.

Mr. Iwamoto, supervising engineer and his group in charge of Oita Refinery construction.

HOW DO YOU BUILD AN OIL REFINERY IN A REMOTE INACCESSIBLE REGION?

Most companies in Japan would turn to Japan Gasoline Company because JGC builds them fast and builds them right. The Kyushu Oil Company refinery at Oita is a typical example. When work began on the 40,000 barrel capacity Oita Refinery, there were no paved roads, no wharves and very few laborers in the area. JGC solved all these problems and after only 10 months the job was completed and Oita Refinery began operation after a test production run. A real achievement record in the annals of refinery construction.

In a briefing with Kyushu Oil, Mr. Iwamoto, supervising engineer in charge of construction explained that construction schedules were rigidly drawn up and timing factors minutely studied. Parts, component and material delivery times were controled right to the exact hour of the day they were to be used. Subcontractors were provided with sufficient lag-time contracts to enable them to meet all deadlines regardless of difficulties and unforseen problems. Material flow-charts controled delivery into pre-arranged staging areas eliminating man-hour waste and inefficiency. Technical, skilled and semi-skilled workers, and laborers were brought into the area as they were required and housing was established on the spot as the work force arrived. Many untrained laborers were recruited, instructed and trained in the finer arts of refinery construction.

There are more than one thousand chemical engineering specialists ready to act as your partner. Use their experience. They have played a vital part in 60% of the refineries constructed in Japan since 1945.

Main Plants: Oil Refineries ● Petrochemical Plants ● Coal Tar Plants ● Gas Chemical Plants ● Fats & Oils Plants ● Fertilizers Plants ● Synthetic Resins Plants ● Other Chemical Plants

stability which is a condition precedent for economic progress.

(9) Another important source of unrest affecting the human factor which is growing in the country is reflected in the phenomenon of what is called "unaccounted money," which I prefer to call "unrecorded gains." It is acknowledged that the large variety of methods by which some persons obtain such gains, accumulate them and turn them into forms other than money have become widespread, that the evil has gone deep in society, that it has become a normal way of life with some and that it leads to large-scale evasion of taxes. The consequence is that honesty is at a discount; the honest person feels that he has to pay more to the Government because he is honest, and that his dishonest neighbour would have not only larger monetary resources at his disposal, but would be in a position to wield power and influence because of his money, and enjoy a higher status in society.

The result of such a situation is that the honest person becomes dissatisfied with his lot, and begins to wonder whether he should not adopt those means which give more money and better status. The tension from which such honest persons suffer may well be imagined. Those who succeed in obtaining such gains are not free from tensions; they are continuously having a dual personality, one intended to be correct with the law, the other calculated to be in defiance of the law, not open but secret, requiring efforts to conceal the gains or cover up their behaviour by false pretences. The mental state of such persons is bound to be a state of tensions due to the continuous conflict between the demands of the law and their actions which are at variance with the same. This is thus a moral problem, though in economic form. The various steps recently taken by Government may mave some effect in checking the evil. But, if it is realised that it is a moral problem, it will be agreed that such steps need to be supplemented by systematic efforts to change the outlook of the people and make them feel that there should be identity of interests between the people and the Government, and that, in case of conflict, the interests of the State should be above those of the individual.

(10) In connection with the process of rapid economic development, in general, and industrial development, in particular, we have the emergence of the managerial class. Under the type of conditions that prevail in the country amounting to unrest and indiscipline, the managerial class would not be able to perform supervisory and executive tasks efficiently, because of the diversion of time and energy to undesirable and abnormal procedures. It may be that talented persons will avoid or withdraw from positions of responsibility, as it would not be possible for them to discharge their functions conscientiously.

Among the motive forces which have helped progress in the advanced countries, may be mentioned Enterprise and Innovation. In modern industrial work, enterprise plays an important part and, if the environment is such that enterprise is chilled instead of being encouraged, progress will suffer. At the same time, persons in charge of industrial work should be free to think of and introduce new processes and methods; a continuous process of innovation is characteristic of progress. If the prevailing atmosphere in a developing society is not conducive to innovation, progress will suffer.

I may also refer to the position of the managerial class, whose importance has been recognised. It would be of interest to ascertain as to how far the managerial class is in a position to have initiative, responsibility and recognition in the growing economic activities of the country. The various methods which are organised to train the managerial cadre will not have the desired results, if the hold of the traditional system of management continues to dominate industrial organisation in one form or another. We observe the growing interest of some people in institutions devoted to Management Training. A deeper examination of the actual practice may, however, show that a good deal of this interest is lip sympathy and that the new manager has yet to come into his own, except in a few cases. In the private sector, the control of the family boss may continue, even as the control of the politician may continue in the public sector.

II

THE REMEDIES

We have not yet achieved national integration nor have we developed national consciousness. A good deal of the prevailing tensions could be removed, if the necessary national consciousness exists in the country at large. For this purpose, the following suggestions are made:

(a) Both in the national sphere and in other walks of life, we have not only to teach but also to practice mutual tolerance and at the same time develop an identity of interests between the country, on the one hand, and individuals and groups, on the other. In other words, the people should realise in practice that the interests of the country are above the interests of the individual and groups, and that nothing should be done to further the interests of the individual or groups which may come in the way of the interests of the country.

(b) At the same time, we should improve our skills at all levels in all activities and train ourselves to systematic hard work with the confidence that such work will not only advance our individual interests, but also that that is the only way in which the progress of the country can be assured.

(c) In this connection, we may refer to one of the factors which affects development of the human factor, namely, the relative neglect of that group of people in the country who may be described as the intelligentsia. This group of people are capable of helping the country in its efforts at economic growth but do not seem to have adequate opportunities to do so. We may include in this group the members of the teaching profession, the managerial and technical personnel in the growing industrial activities in the country and such other persons. Research workers in different subjects or experts would also be included in this group.

Although the Constitution provides equality of opportunity to all and the removal of special privileges which existed in the traditional social system of the country, we have the emergence of a new social structure in the country in which a new type of class-consciousness is coming into existence. In the new hierarchy of the country, we have the Politician at the top. The absence of an effective two-party system or of an effective opposition has crystallised the members of the ruling party in a class by themselves. This class seems to have acquired certain privileges; they have certain assumptions of knowledge and wisdom leading to certain consciousness of superiority over others.

The Administrator, whose importance must grow with the Welfare State and the growing public sector, comes next in the social hierarchy. So much importance is given to the Politician and the Administrator that there is not a function, however trivial, where a Minister does not participate and there is no occasion, however small, where the Administrator is not flattered. There is no suggestion to deny respect to one whose inherent qualities are such that he deserves it. It is, however, not untrue to say that, barring a few persons of eminence at the top, the average politician and administrator in the country must be classed as mediocre.

The Capitalist seems to have suffered to some extent in public esteem because of the current efforts to evolve a socialistic pattern of society and to reduce concentration of economic power. Several legal and administrative measures have been taken to reduce the privileges of the capitalist. In spite of loud complaints, he has, however, shown remarkable capacity of resilience to the changing political and economic climate in the country. The detached observer may find plenty of food for thought in the game between the Politician and the Capitalist for power and profit, which is a feature of the political and economic arena in the country.

Although we see many efforts in different directions to help the agriculturist and to pamper the industrial worker, we find increasing frustration among the members of the lower middle-class and increasing neglect of the intelligentsia. A society in which the Teacher has the lowest social status, in which the Research Worker is patronised by those who offer him assistance, in which the Expert has to flatter those in power before he can use his expert knowledge and in which the trained and experienced Executive of a concern must be ready to take orders from an inexperienced young boss or from an inexperience politician—such a society is wasting valuable human resources and is definitely not working towards a self generating economy.

Among other things, the principal defect in the situation is the absence of suitable arrangements for recognition of men without influence or personal contacts. In spite of the various procedures laid down for the selection of persons for various posts, small and big, either in the public or in the private sector, it is well known that there are methods by which these procedures often become a formal farce and the selection is often made on considerations other than those of merit. We complain of a large number of persons trained abroad who either go to foreign countries for employment or do not return. But we do not seem to have yet found the real reason and the cure for this unfortunate situation. It is not so much monetary considerations that attract qualified young men to seek careers abroad; it is the opportunity to do work on one's own initiative and to bring out the best in one's capacity as well as the treatment afforded by those in authority to such young persons for such development—these are the factors which weigh more in the decision of such persons to stay abroad than money.

It may be of interest to enquire as to how many brilliant young per-

AID TO INDIA SERIES—I

From UNITED STATES OF AMERICA

STANDARDS FOR AID HIGH, BUT BENEFICIAL

BY JOHN P. LEWIS, Minister-Director, U.S. Agency for International Development Mission to India

AMERICAN aid as a whole is a vast topic and the substantial portion flowing to India provides material for several volumes. In my book, *The Quiet Crisis in India*, I covered some of this ground. This brief article necessarily is limited to a few highlights. I will first review the overall magnitudes and broad categories of assistance, then discuss the evolution of the Indo-American aid relationship and some important current developments.

Magnitude

American aid actually delivered to India last year amounted to more than Rs. 400 crores. This was divided in roughly equal parts between foods and fibres supplied through Food for Peace (P.L. 480) and other forms of capital and technical assistance—men, machines and materials which constitute the sinews of investment for planned development. Leaving aside P.L. 480, last year's American aid was almost half of all assistance delivered. Counting the essential shipments of wheat, rice, cotton, milk and other P.L. 480 products. American aid delivered in 1963-64 accounted for over two-thirds of the total. American aid provided more than a third of total Indian imports.

Commitments of U.S. aid other than Food for Peace during the third Plan aggregate about Rs. 900 crores and P.L. 480 commitments commencing with the multi-year agreement of May 1960 have likewise cumulated to over Rs. 900 crores. Combined, these contributions will provide the equivalent of one and a half year's total imports of all kinds at the current rate.

India's Plans have required an increasing quantum of net imports. Consequently, after the severe drain of resources in 1956-58, the Plans have been predicated on a growing volume of assistance. Aid requirements for the third Plan period apart from P.L. 480 were reckoned at Rs. 2,600 crores, over two and a half times the aid actually used through the end of the second Plan. Although actual aid used, exclusive of Food for Peace, may fall somewhat short of this, P.L. 480 deliveries will undoubtedly exceed the amounts anticipated when the Plan was formulated.

Aid-India Consortium

India has been receiving aid consistent with the third Plan requirements. Capital assistance pledged by the Consortium already exceeds Rs. 2,100 crores, and another full year's pledges will be made prior to the end of the Plan. American capital assistance—dollar loans for developmental projects and general commodity imports—compose about 40 per cent of Consortium aid. Led by the World Bank, the Consortium now has ten member-countries. Through the device of periodic meetings, India's progress and needs are considered in concert, and, as the statistics confirm, Indian requirements have been substantially met. Of course, India has been able to draw upon assistance from others as well, notably the Eastern European countries, which have supplied about 11.5 per cent of the economic aid delivered (excluding P.L. 480) during the first three years of the present Plan.

Flexibility

Perhaps, obscured by the total aid figures is the fact that American aid in recent years has been flexible. To the diversification and differentiation of industrial import requirements, America has responded with large-scale finance of imports not related to projects. Commodity assistance loans available for importing iron and steel, non-ferrous metals, miscellaneous capital equipment, components, spares, a variety of chemicals and other production requisites account for over half of U.S. capital-financing. No other nation has been so liberal in this matter, but increasingly the American example is being emulated by other Consortium members, and, approximately one half of all Consortium assistance this year will not be tied to particular projects. America's response to the unforeseen needs for additional food provides another example of flexibility. P.L. 480 imports this year will be the largest ever. And, of course, the U.S. response to Indian requirements for defence assistance was also rapid.

Not Without Frictions

Because of its magnitude, quality and adaptability, American aid has contributed vitally to Indian development. But the evolution of the aid relationship has not been entirely without frictions. Despite denials, the fact is that all foreign aid carries conditions and every foreign aid relationship involves bargaining, however genteel, between the aiding and receiving parties. The question is, how acceptable are the conditions and how constructive the bargaining.

Any national donor wants some prior satisfaction on the uses to which his contribution will be put, as well as typically some information after the fact about whether the recipient's intentions were made good. Moreover, in the case of democratic Governments, this natural impulse is fortified and formalised by the phenomenon of political accountability. The aiding parties of the first instance, the Governments, are not legal principals but agents. Their discretion is, constitutionally and politically, limited, and they are held responsible to their superiors (legislatures and electorates) through elaborate, meticulously prescribed financial and other accounting procedures.

The specification of uses and the setting of conditions for aid is a touchy business. But it must be accomplished and, in principle, it is feasible where the aiding and receiving parties have common or compatible objectives. In practice, it works best where the rendering and receiving of aid is recognised as a straightforward bargaining relationship between legal and moral equals, in which each party has something to gain from the transaction and is prepared to negotiate, but not beyond certain points.

Web of Cross-purposes

The Indo-American aid relationship has been evolving towards this sort of constructive healthy enterprise, but the evolution has not always been smooth. I have elsewhere christened the early phase of our aid relations the Era of Cross-Purposes (1951-59). During this period, world-wide American aid policy came to be preoccupied with military security, which left the technical-assistance-oriented India programme detached from the mainstream. India's non-aligned foreign policy and her particularly voluble advocacy of public enterprise both conflicted fundamentally with the American aid posture, which was based primarily on the need to reinforce positions of allied military strength around the periphery of the Communist world and was morally committed to the promotion of private enterprise overseas.

Despite this web of cross-purposes, the Indo-American aid programme survived and haltingly broadened through the 1960's. Whatever the vagaries of high policy, the India programme drew more than its share of competent American professionals. A series of highly competent American ambassadors and enough officials and members of Congress in Washington remained alive to the importance of Indian economic development to give these field workers effective support. And, certainly, much credit for the survival and growth of the aid programme during this difficult phase belongs to the pragmatic common sense that the Indian Government, despite rhetorical differences, continued to display in its working relationship with the United States.

FOREIGN ASSISTANCE—RECEIPT AND DISBURSEMENT

(In crores of rupees)

Name of lending country/institution	Amount for which agreements have been signed upto 30-9-64	Value of equipment/ stores ordered upto 30-9-64	Loan amount disbursed upto 30-9-64

Note: This statement excludes U.S. commodities assistance, drawings from I.M.F., grants and Kuwaiti Loan of Rs. 34.19 crores on account of repatriation of special Indian notes which were in circulation as legal tender in Kuwait.

* Figures are up to the end of August 1964.

In my book on this subject, I said the period 1959-61 was characterised by "a mending relationship not yet mended." Fundamentally, this mending began on the U.S. side with the establishment of the Development Loan Fund, giving expression to an increasing concern by the U.S. for the successful non-coercive development of friendly less-developed countries regardless of their status or potential as military allies. From the beginning, India was the favourite "case in point" of this new phase of American foreign aid policy. The *rapprochement* also was assisted by the Government of India's growing pragmatism towards private enterprise. And, of course, India's second Plan foreign exchange difficulties provided the immediate rationale for an expanded aid programme.

My last direct observations of American aid in India prior to completion of *The Quiet Crisis* took place in 1960. Consequently, I was reluctant to comment on subsequent developments. Since returning to India, I have been here only a short time; I think it would be premature, and indeed immodest, to pass judgments on the events that have transpired in the intervening period, but I can honestly say that the Indo-American aid programme appears to be more solidly based and purposely oriented. Many of the organisational problems that were being tackled have been worked through. The Agency for International Development in Washington has evolved a workable structure that integrates many, though by no means all, aspects of American aid. The reorganisation of 1961 has resulted in a distinct increase in the country focus of aid administration. More responsibility lies with the regional offices and increasingly authority has been delegated to the field missions. To my mind this is a welcome and constructive development.

The Delhi Mission

The complexion of the Delhi Mission has been changing to assure that it will be able to discharge its new duties. The financial, economic, and engineering staff has been considerably augmented, so that the Mission is now in a position to evaluate, negotiate and monitor most development loans. The final approval still lies with Washington, but an increasing portion of the administration, analysis, and recommendations emanate from Delhi.

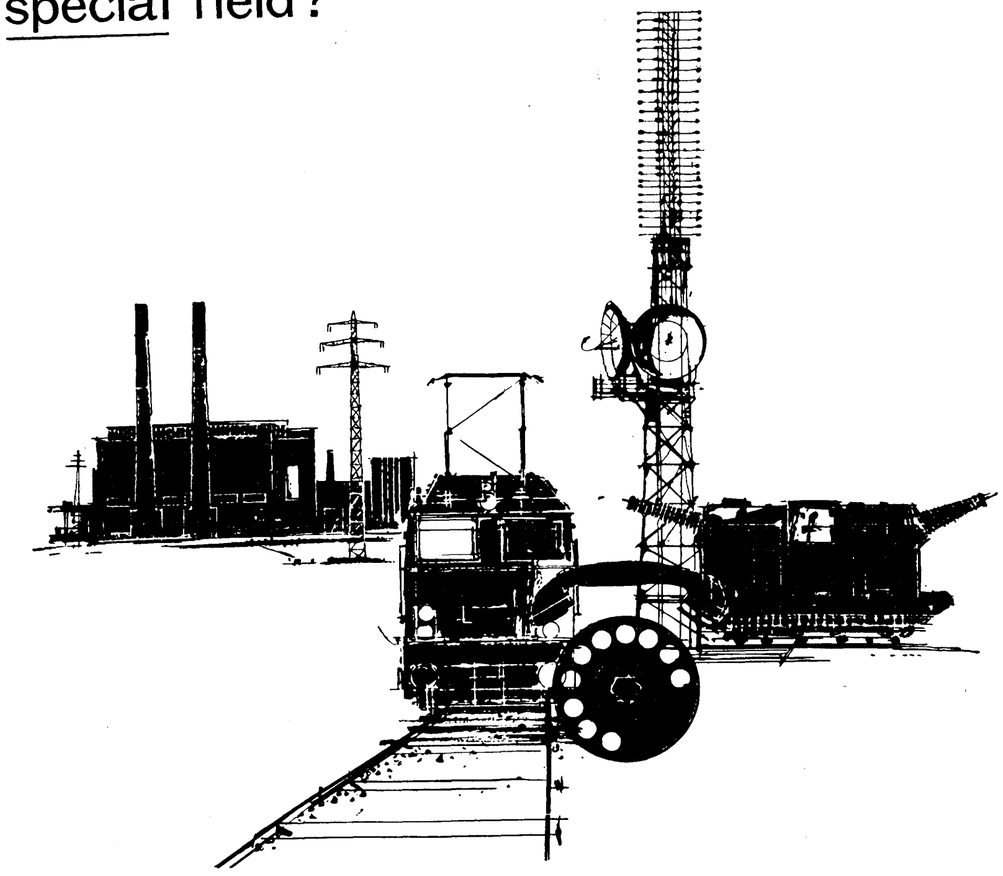
Another product of the growing field orientation is the increasingly active interest that A.I.D. personnel have been taking in the analysis, assessment, and general policy discussion attendant to India's formulation of development plans and policies. Americans have become less diffident about expressing their views on a variety of subjects related to aid. This is as it should be. It signals a growing maturity in our countries' relations. Americans make no claim to having panaceas for India's ills. Americans do have an opportunity to view the problems from a rather different perspective and frequently can raise useful questions or offer ideas based on experience elsewhere that may be relevant to India's problems.

Model for Others

It is also true that we have come to expect a great deal from India as a leader among developing nations. As a "case in point," India is a

SIEMENS

What is Siemens special field?



Our special field is the whole spectrum of electrical engineering. For whoever builds a modern power station must also be familiar with instrumentation. Whoever builds electronic computers must have an intimate knowledge of solid-state technology. There are no section barriers in engineering, least of all in electrical engineering. For the Siemens Group it has always been a matter of course to make use of the latest results of research and practical experience acquired on one sector in development work on other sectors as well. The practical implication for customers is that, whether the project on hand is the planning of an electronic computer center, the designing of a special-purpose drive, the construction of a power station, the automation of a steel mill, or the establishment of a communications network: it can always be said to be our special field.

The Siemens Group — your experienced partner in all electrical engineering projects

BI-SE-10

model for much of the world. It has come to be expected, for example, that India will meet increasingly rigorous standards in the presentation of projects. To be sure, our lending agencies have sometimes been tardy in their consideration of projects. Many delays, however, are caused by faulty or incomplete preparation of project reports. There is need for mobilising high calibre economic, financial and technical expertise to assure uniformly high quality project formulation from the outset. Likewise, there is much scope for eliminating delays from execution of the projects. With adequate preparation, the gestation periods of major projects can be reduced and costs can be controlled.

By associating itself with projects from an early stage, the U.S.A.I.D. Mission in Delhi is contributing to improvement in project analysis. Many questions that formerly came from Washington months after the submission of a report are now raised during the preparation stage. This certainly conserves time and talent. The U.S. Technical Assistance Programme itself is also contributing to improved project analysis and execution by providing experts in operations research who are assisting in the introduction of scientific project scheduling techniques. These methods, which can yield significant reductions in project costs and implementation time, eventually will be applied to all major U.S. assistance projects for which they are suitable. I have no doubt that they will be widely adopted elsewhere in India.

Non-Project Assistance

I have already indicated that a high proportion of American capital assistance is not tied to projects. While there is a need for aid to finance general commodity imports, the standards required to qualify for this sort of assistance are also being raised. Non-project assistance has never been particularly popular with the U.S. Congress. Understandably, there is a desire to show results in concrete and steel to justify expenditure of the taxpayer's money. There is also a feeling that the possibility of waste is increased when expenditures are divorced from a particular project that stands on its own merits. Consequently, it is much more difficult to justify aid of this sort to legislators.

Difficulties on the Congressional front are certainly not the only basis for raising standards, however. For years now, there have been complaints about inadequate use of industrial capacity due to the foreign exchange shortage. This has served time and again as a primary justification for non-project aid. Yet there is too little reliable information about the degree of slack capacity or the precise imports required to overcome the problem.

Not Simple Matter

Certainly this last is not a simple matter. A great deal of study will be necessary to provide satisfactory answers. The basic problem, however, lies in the inadequacies of data collection and processing. Better industrial statistics are needed to guide decisions about imports. This would be true in the absence of import controls. With controls, it is even more important that the decisions taken by Government affecting the operations of entire industries be supported with adequate information. Obviously, this problem is not confined to the needs of aid donors for better justifications, but improved justifications would be a useful by-product of its solution.

Fortunately, the G.O.I. is alive to this matter and the U.S.A.I.D., as well as others, are providing assistance to strengthen industrial statistics. Meanwhile, there is no plan to reduce non-project aid, but additional amounts will be increasingly difficult to authorise except in relation to specific policy objectives, for example, the need to augment fertiliser consumption in support of the agricultural production programme.

Food for Peace

In reviewing the quantum of U.S. aid, it was noted that Food for Peace, or P.L. 480, has accounted for about half the total in recent years. Although the value of this resource at times has been underestimated, the present food shortage has made its essentiality abundantly clear.

It is sometimes alleged that P.L. 480 imports, though useful for the consumer, have adversely affected Indian agriculture. This, I think, would be difficult to prove, but I do feel the time has come to assure that P.L. 480 supplies are a positive benefit to Indian agricultural development. This can be accomplished through the proper integration of food and agricultural policies. On the food side, P.L 480 can contribute to meeting the urgent needs of deficit areas at reasonable prices. It can also help in the built-up of buffer stocks, the operation of which eventually should permit the maintenance of a stable food situation. At the same time, the adoption of support prices for food crops will provide a necessary incentive for producers and gradually permit cultivators to adopt more modern agricultural practices needed to augment yield.

P.L. 480 supplies can contribute to a sound agricultural policy, because, in the final analysis, they greatly increase the chance of creating a stable food situation. With acute shortages, the needs of the moment often override the requirements for long-term production increases. Absent P.L. 480 supplies, agriculturists would be more likely to be faced with requisitions and controls that would dampen incentives. There would inevitably be calls for extremist experiments that could doom the agricultural programme for years. Properly conceived, therefore, the P.L. 480 programme can be the handmaiden of enlightened agricultural policies and agricultural progress. But it will take continuing hard thinking and hard work to maintain the required balance between food policy and agricultural policy.

Quality Aspect

To summarise, America has been by far the largest contributor of aid to India. Last year, U.S. aid financed over a third of all Indian imports. Qualitatively, American aid has been flexible and adaptable. A high proportion is in the form of non-project loans, additional food, and defence aid that has been given quickly when conditions changed. The Indo-American aid relationship has evolved and is in a much healthier state than in earlier days. But a great deal is expected from India as a leader among the developing nations. Thus the standards for aid to India are high. But this is not really a disadvantage to India, because measuring up to these standards is one good way of improving development performance.

cali—plast

pioneers progress thro' pvc

CALI-PLAST PVC—Polyvinyl Chloride—the modern plastic material for today's industrial age. CALI-PLAST PVC for rigid pipes and flexible tubes. For insulated and sheathed cables. For handrails. Coated fabrics. Films. For a variety of uses in a variety of industries. And the home, too.

CALI-PLAST, the Chemicals and Plastics Division of Calico Mills, are the pioneer manufacturers of PVC in India. Manufacture of raw materials and finished products started in August 1961 —in collaboration with Dynamit Nobel AG, West Germany.

To meet the needs of tomorrow, CALI-PLAST are planning today. Production of PVC has already been stepped up. A new plant to produce Polyvinyl Acetate (PVA) and copolymers is now under construction. In this and other ways, CALI-PLAST are helping the Nation's progress.

CALI-PLAST PVC is made to international quality standards. Resistant to chemicals. Corrosion-resistant. Fire-retardant. Light in weight. And in attractive colours. It can profitably be used to replace metals as well as soft flexible materials.

AID TO INDIA SERIES—II

From THE WORLD BANK GROUP

PROUD TO HAVE HAD SOME PART

By J. BURKE KNAPP, Vice-President, World Bank

WITHIN the next three years, India's population will exceed 500 million, an increase of 160 million in two decades since independence. The fact that there has been some improvement in average living standards, despite this enormous population increase and without the sacrifice of essential political freedoms, speaks more eloquently than any words of praise for the immense effort of the Indian Government and people in their drive for economic development.

In the World Bank, we are proud to have had some part in this achievement and we expect to find further opportunities to lend support to India's leaders as they face the many deeprooted problems that must be overcome, if this great country is to climb to the high ground of self-sustained economic growth.

India—in total figures, though not on a *per capita* basis—is the largest borrower from the Bank group of institutions. By 31st October 1964, a total of nearly $1,350 million in Bank loans ($847 million), I.D.A. credits ($485 million) and I.E.C. investments ($11 million) had been approved for development purposes in India.

The Beginning

World Bank assistance to India began only two years after independence, well before the Government drafted its first Five-year Plan in 1950, when loans were made for improvement of the national railways, reclamation of large tracts of land in Central India, and for a thermal power project which constituted the first step in a larger scheme to develop the Damodar Valley in Eastern India. As successive Plans have been formulated and carried out, the World Bank group has helped to finance a wide range of high priority projects—chiefly basic investments in transportation, power, industry, agriculture and communications which form the essential foundation for economic growth.

The Bank group, of course, is only one of a number of sources to which India has been able to turn for the large volume of foreign exchange her Five-year Plans have required, but the Bank's support for India's development has extended well beyond the limits of its financial contribution. In 1958, when a foreign exchange crisis threatened to disrupt development plans, the Bank took the leadership in bringing together a group of capital-exporting countries for regular consultations on the requirements of India's Five-year Plans. Representatives of these countries, together with others that have since joined, have met regularly under the chairmanship of the Bank as the Indian Consortium, the so-called "Aid-India Club." The Consortium now consists of ten capital-exporting countries *plus* the Bank and I.D.A. Together, they have pledged $4,445 million for the first four years of the third Five-year Plan. They will meet again early next year to consider pledges for the final year of the current Plan. Of total Consortium pledges for the first four years, the share of the Bank and I.D.A. has been $940 million.

Disturbing Trend

We must now face the fact that progress during the last few years has not been as rapid as all of us had hoped, and national output has barely been keeping pace with the rise in population. This is disturbing to all friends of India. Growth in agricultural production especially has been disappointing, due in part to bad weather, and in part to a combination of other causes with which the Government is grappling, and food prices have risen sharply. This critical situation again emphasises the key importance of agriculture in the Indian economy and surely gives agriculture a demanding claim to priority consideration. Industrial production, too, has expanded at a rate considerably lower than envisaged in the third Five-year Plan, partly because shortage of foreign exchange precluded the import of required materials.

Taxes have been raised, but much of the increase in revenue has gone for defence expenditures since the Chinese attack in 1962. Thus, despite higher taxes, development investment from domestic savings has not grown. Imports have increased steadily, as they must if economic growth is to be sustained, but the export drive has lagged and the balance-of-payments position has been growing worse. At the same time, India's obligations for debt service on foreign loans have mounted continuously and may amount to as much as $1,300 million during the third Plan period, or about as much as the World Bank group has made available to India since its first loan in 1949.

A Real Test

In the light of this situation, it is evident that the drawing-up of the fourth Plan is of crucial importance and that its presentation will represent a real test. Prospects were viewed fairly optimistically when previous plans were inaugurated, both by India and by the countries assisting and investing in India's development. This optimism has not been fully reflected in the record of accomplishments. The earlier underrating of the problems and difficulties will no doubt be reflected both in the Plan itself and in the attitude of those who have shown their interest in supporting India's development efforts.

Railways

Although, as seems inevitable in any development plan, performance has often fallen short of set targets, there are several projects, assisted by the Bank, that have come up to expectations and made significant impact on the economic life of the country.

Take the Indian railways, for example. At the end of the Second World War, rehabilitation of the Indian railways was one of the most urgent tasks and their continued expansion and improvement have required vast outlays since independence to keep pace with the growth of industry and commerce. As in all development, the great preponderance of investment in the railways has come from domestic sources, but large amounts have also been required in foreign exchange to purchase goods and services from overseas. To help meet these needs, the Bank and I.D.A. have made available more than for any other single purpose in any country—a total of $507 million, including an I.D.A. credit of $62 million approved in October 1964.

As India's capacity to manufacture railway equipment has increased, foreign exchange requirements for this purpose have diminished during the third Five-year Plan, but substantial needs remain. The situation of the Indian railways today is a far cry from what it was when the Bank's association with India began: the railways now are able to move all of the freight they are offered and even some surplus capacity is reported. In 1962-63, the amount of freight (in ton-kilometres) moved on the railways was almost 80 per cent larger than in 1955-56 and passenger kilometres increased by 35 per cent in the same period.

Steel

One of India's greatest assets in economic development is the availability of rich deposits of iron ore and coal, and the Bank has made loans totalling $186 million to the principal steel companies in the private sector. India's five main steel plants are now working at capacity and all of them are in the process of expansion. Except for flat products, special steels and pig iron for sale to foundries, the industry is now capable of meeting most of the current demand. With present expansion plans, steel-making capacity is expected to keep pace with the rising tide of requirements resulting from the nation's economic development.

Development Bank

A third example of success is the activity of the Industrial Credit and Investment Corporation (I.C.I.C.I.), a privately owned development financing institution that was established in 1955 with the Bank's advice and assistance. The Bank has made five loans to I.C.I.C.I. totalling $90 million. In its first nine years of existence, the Corporation has assisted more than 280 companies in India with more than $155 million equivalent in loans and purchases of equity. It has channelled foreign exchange and rupees into a wide range of industries, nearly half of them newly established, and has helped to develop the capital market by its own underwriting activities. It is estimated that the operations of I.C.I.C.I. have resulted in mobilising five times the amount of its own investments in capital from other sources, domestic and foreign. The ownership of this Corporation is vested primarily in Indian hands, with participation by investors in Japan, the Federal Republic of Germany, the United Kingdom and the United States.

Other Fields

The Bank has also assisted in a number of other projects in agriculture, transportation (highways and ports), power generation, telecommunications and industry. Satisfactory progress has been made in several of these projects, too, in addition to the three examples specially mentioned—railways, steel and the I.C.I.C.I. Loans for the coal-mining industry, and for enterprises producing transportation, telecommunications, construction and other equipment have provided imported components and materials, normally unobtainable because of lack of foreign exchange, thereby stimulating increased efficiency and capacity in existing plants.

Projects Under Study

Several projects which might be financed by the Bank and I.D.A. in the next few years are now under preliminary consideration, including loans to the Tata Iron and Steel Company and the Indian Iron and Steel Company, both of which have received substantial assistance from the Bank in the past. Other joint projects under serious discussion include further assistance to selected Indian capital goods industries, a new loan to the Industrial Credit and Investment Corporation of India, funds for a fertiliser project in Andhra Pradesh, the development of the new port of Haldia and expansion of water supply in Bangalore.

The activities of the World Bank group in India are far from limited to extending individual loans and credits. There is a continuous and frank exchange of views and information between the Bank and the Government of India; Bank experts regularly visit India to enable the Bank to keep in close touch with the economic situation, follow the country's development efforts, keep currently informed of progress on Bank-supported undertakings, and study, in a preliminary way, the feasibility of new projects. An example of this close collaboration and interchange of information and views is the team of experts, organised by the World Bank, which is now in India to study some key sectors of the development programme. The Bank also finances the foreign exchange costs of specific technical studies being carried out by consultants, such as the recent study of interim and long-term measures to improve the transport of coal.

Optimum Return

I am confident that many more co-operative ventures between India and the Bank group will be undertaken in the future. In launching them, we will both, of course, desire to build on the experience we have gained which, as already stated, has had both disappointing and promising aspects. No doubt, the Indian authorities, as well as the Bank, will have many suggestions to offer for improvements and innovations. The Indian Prime Minister himself has indicated, in a broader context, that changes in management and housekeeping methods might result in an annual increase of as much as one per cent in the national product. I feel that this is, if anything, an understatement. In any case, as India is so desperately short of capital, it is of the utmost importance that each investment project be carefully designed both in the construction stage and in the subsequent operating stage to achieve the maximum possible return.

Perhaps there are other ways, too, of promoting higher returns from the Indian economy in the efforts to fill the constant and pressing need for foreign exchange. For instance, too much emphasis has probably been put on import substitution and too little on investment in growing export industries, —both the traditional ones like tea and jute and the more recent ones of sugar, oilcake, iron ore, and tourism. Perhaps also there has been an undue reliance on dirigiste policies and procedures and too little trust in the well-proven incentives of markets and prices. Again, because India is such a vast and complex social organism, it would

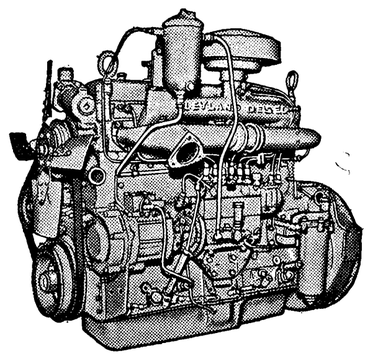
A heavy-duty engine for a heavy-duty chassis



Mark III Diesel Engine

The Ashok Leyland Mark III diesel engine with its developed power of 100. B. H. P. at 2,200 R. P. M. has set up standards of longevity and operating economy. It has been developed with a background of experience in diesel engine power requirements for transport of men and materials. Its nitrided crankshaft is the toughest known and rarely needs the first regrind under 200,000 miles. Contributing to ease of maintenance are the push-fit cylinder liners which are replaceable with the engine *in situ*.

Heavy-duty chassis

The Ashok Leyland Comet is a heavy-duty chassis built for rugged performance. Every part is specifically designed for heavy duty. No other chassis offers 100 b.h.p. 255 lbs. ft. Torque engine, Nitrided Crankshaft, Slip Fit Liners, 13" Diameter Clutch, 5-speed Constant Mesh Gearbox, 9"-deep Frame, 8-ton Rear Axle and 24-volt Electrical System.

Fleet owners prefer Ashok Leyland Comets

Remarkably low fuel consumption and economy in maintenance and overhead costs are among the many superb qualities that make the Leyland Comet the choice vehicle in India. Just as it is in eighty other countries in the world.

AID TO INDIA SERIES—III

From UNITED KINGDOM

NO IMPOSITION OF ANY SPECIAL PATTERN

By E. A. MIDGLEY, British Minister (Economic and Commercial), New Delh

TRADING relations between India and Britain go back a good three centuries. It was not, however, until the nineteenth century that Britain began seriously to invest in India—first in irrigation canals and railways, then in coal and the plantation industries, mainly tea, jute and coffee. The managing agency system through which these industries were organised proved a useful invention. It made managerial and technical know-how available, in the most economical way, to new enterprises, provided a channel through which capital could flow to them and made development prospects attractive to British and Indian investors through the assurance given by well-known and established names. This form of enterprise, branching out later into cotton textile mills, sugar factories and engineering works laid the foundations for the modern industrial equipment which we see in India today. The plantation industries continue to play their indispensable role of making up the hard core of Indian exports.

Perhaps, because India was already an established country with an ancient culture and a considerable population already settled on the land, British investment did not fertilise industrial growth on the same scale as it managed to do at the same period in the empty lands of North America. Moreover, the concept of setting out deliberately to plan the industrialisation of a whole sub-continent was foreign to the nineteenth century and the early parts of the twentieth. Nor was it, perhaps, clearly understood that the duplication of manufacturing capacity overseas would in the long run increase rather than diminish trade, and the wealth of the investing country.

Faith in India

India, in common with the rest of the world, suffered from the depression of the inter-war years and it was not until the Second World War that ideas of planning industrial development began to take firm shape. At the end of the war, India found herself with an accumulation of capital in the form of debts owed by Britain for the war-time services and supplies which India had provided. With these to prime the pump, India was able confidently to set about the preparation of plans for economic progress. At that stage, the cost, in terms of foreign exchange, of industrial development on any significant scale though envisaged was not fully computable. It soon became clear, however, that India's sterling reserves would need to be carefully husbanded, and a stringent control on imports was imposed. This called forth a co-operative response from British private enterprise. With enlightened self-interest, British exporters perceived that, if they could not trade with India as heretofore, they could accelerate the trend already begun of transferring their operations to Indian soil. They demonstrated their faith in India by expanding local manufacture in association with Indian partners.

To illustrate the success of this operation for both partners, it is only necessary to set out a selected list of the products (pre- and post-war) now made in India in some or other town of association with British firms: biscuits, chocolate, starch, tobacco, food colours, dyestuffs, a wide range of chemicals, fertilisers, pesticides, pharmaceuticals, toilet preparations, explosives, paints, plastics, steel tubes, castings, machine tools, small tools, diesel engines, textile machinery, contractors' plant, mechanical handling equipment, air-conditioning equipment, weighing scales and machinery, sugar machinery, boilers, ball bearings, photographic equipment, switchgear, wire and cables, telephone apparatus, electronic equipment, trucks and motor cars and all their ancillary industries, tractors, aircraft, railway equipment, mining machinery, sewing cotton, textiles, glass, special cement, abrasives, special papers and boards, and so on. The list is not exhaustive and in some of the categories the names of twenty or more British firms can be counted (twenty-three for instance under chemicals, more than fifty in the electrical, electronic and cables division). They range from the biggest—I.C.I., Vickers, Babcock and Wilcox, A.E.I., English Electric, Levers, Leyland, Shell, Turner Newall—to a whole range of smaller firms expert in their fields. We know of over 500 collaboration agreements between British and Indian partners approved since 1959 and 65 per cent of all foreign private investment in India is British (new British investment is flowing in at the rate of about Rs. 20 crores per annum). All this, bearing in mind our long historical connection, is very much as it should be.

Public Sector

British private enterprise does not confine itself to partnership with private enterprise in India—it is associated with a number of projects in the public sector. I.C.I. acted as consultants to the Government of India for the Sindri Fertiliser Plant; Marconi, Pye and other firms provide technical assistance to Bharat Electronics; Automatic Telephone and Electric Company, assisted in the establishment of Indian Telephone Industries at Bangalore; Folland, Bristol and Rolls Royce are in technical partnership with Hindustan Aircraft; an entirely new aircraft, the A.V.R.O. 748, designed as an alternative to the Dakota, is now being produced by the Indian Air Force Maintenance Group at Kanpur; the enormous Heavy Electrical Plant at Bhopal was designed and developed in consultation with Associated Electrical Industries.

A special virtue of partnership of this sort in the private sector is that it automatically entails the transfer of know-how, both technical and managerial. A new generation of future technical directors, works managers, managing directors and chairmen is growing up in Indian plants bearing joint Indian and British names.

Colombo Plan

The complex of arrangements conveniently classified under the name "Colombo Plan," a primarily Commonwealth invention in which India plays a leading part, supplements these private arrangements with general machinery for the grafting of technical skills. When participating countries find that some service available in one would be of benefit to the other, an "expert" is provided or a student goes for training. It may be to develop new strains of potatoes, or to advise on the cultivation of cotton, or the equipment of lighthouses. Sometimes, it is possible to establish a permanent institution such as the Indian Institute of Technology at Delhi in which British and Indian professors teach together. Another kind of technical assistance is exemplified by the project report on a new coal mine prepared by the British National Coal Board for the Indian National Coal Development Corporation. Under the Colombo Plan, India has experts and training of her own to offer (India has sent out some 700 experts with supporting equipment to neighbouring countries and taken 2,500 students from overseas).

New Methods of Co-operation

Private investment, largely from Britain, provided the founding capital on which the industrial wealth of the United States was later built. Private enterprise has a big part to play in the development of India but, in many ways, times have now changed and circumstances are different. In the first place, India is not an empty but almost an overfull country. The size of the basic sectors of industry now considered economic and efficient, and of the individual plants, has grown to a point where private resources cannot, unaided, assemble the necessary capital to initiate and maintain them. The speed of modern communications continually reminds us of the unacceptable differences in standards of living between developed and developing countries, and of the need for haste in removing them. Fortunately the West learnt, through the compelling need to repair quickly the devastation of the last war, new methods of economic co-operation at the national level. Britain as a member of an international consortium is now applying these methods to supplement and to sustain co-operation between the two countries in the private sector.

British Government credits, now extended for a term of 25 years, at an interest rate of about 5 per cent but with an initial grace period for both principal and interest of seven years, have been extended to help finance India's second and third Plans. The contribution to the second Plan was Rs. 107 crores and so far to the third Rs. 207 crores. These credits which are additional to British subscriptions to the International Bank and the International Development Association, from which India also benefits, pay for the export of British goods and services to India. The projects to be assisted and the ways in which the money is to be spent are agreed in discussion with the Government of India. The object is to provide the greatest possible measure of support to the Indian economy keeping in mind what Britain is best placed to supply.

Where surpluses in one country coincide with the needs in the other, it is sensible to direct these credits into the appropriate channels. Both British industry and India benefit in this way from the financing by the British Government of a British steel plant at Durgapur, the total cost of which may well add up to Rs. 200 crores in foreign exchange alone by the time it is finished. Credits furnished by the British Government also help to sustain the vast Heavy Electrical Plant at Bhopal in which Britain has an interest through the private sector consultancy connection.

The flexibility of this type of co-operation is underlined by the success of the so-called Kipping loans which enable the Indian Government to break critical import bottlenecks by licensing the import of British capital and producer goods and spare and maintenance parts needed by the private sector.

No Imposition

Britain does not, however, seek to impose any special pattern in the way credits are offered. At this advanced stage of industrial development in India, it is recognised that India must be as free as possible to choose between the conflicting priorities. For this reason, half of the credits furnished by Britain this year were for general purposes. Of the remainder, the majority were already determined by inescapable needs to maintain or expand projects already started.

I have spoken of "economic co-operation" and of "credits" rather than of "aid," because it is by now generally recognised that the wealth of the world is indivisible. Even were the wide disparities of wealth among the countries of the world humanly and politically tolerable, which they no longer are, it would still not be good economic sense to allow them to continue. It is now clear that it is between the most highly industrialised countries that trade grows fastest. In "aiding" India, therefore, and other developing countries both at the private and the national level within the limits set by our own balance of payments, we shall ultimately, if all goes well, be helping ourselves. Britain, which depends for its livelihood on foreign trade, has a stake in India's prosperity.

From WORLD BANK GROUP

(*Concluded from page 36*)

seem wise to lay stress on monetary and fiscal policies and procedures as the regulators of economic life rather than to try to impose direct controls which would overtax the already highly strained administrative mechanisms.

This is not the place to translate these generalities into specific remedies for India's challenging economic problems. The Bank stands ready, however, to give its candid and unbiased advice and assistance in these matters, whenever it is desired. The sharpened attention paid by the Bank to the agricultural and educational sectors of its member-countries is of particular interest to India. The development and growth of I.D.A. should also be encouraging to countries like India which are faced with a dangerously high and growing debt burden. It is our firm hope that the India-Bank group partnership, now in its fifteenth year, will be able, despite the weight of population growth, to throw into the other side of the scale solid achievements in expanding the output and productivity of the Indian economy.

AID TO INDIA SERIES—IV

From WEST GERMANY

AN APPRAISAL OF POLICY AND METHODS

By G. F. DUCKWITZ, Ambassador of the Federal Republic of Germany, New Delhi

THE theory of development aid and of speedy industrialisation of backward economies is the latest addition to the economic sciences. There are neither classic nor neo-classic authorities in this branch of study, thus depriving each author of the chance to quote without the pain of proving. Economic theorems based on experience do not exist or, when they do, they are not yet convincing on account of the fact that practical verification is lacking due to close proximity as far as time is concerned. Nevertheless, a substantial pragmatic beginning has been made and we learn whilst we are striding along.

Almost all the leading industrialised countries in the world have, on account of economic and humanitarian reasons as well as those governed by foreign policy, made assistance to developing countries an inseparable part of their general policy. This policy is also being followed rigorously by the Federal Republic of Germany ever since she regained her economic strength. The vast complex of governmental offices, public bodies, institutions, firms and private individuals dealing with problems connected with assistance to developing countries covers each and every branch of public life from which we can expect a significant contribution in this direction. The Federal Republic has set up a Ministry of Economic Co-operation to co-ordinate the activities of all other ministries dealing with questions related to development aid. In the field of financing, the *Kreditanstalt für Wiederaufbau* (Bank for Reconstruction) is functioning as the German governmental development Bank.

Hence the institutional machinery, as well as the economic and political instruments, are now available. An endeavour is made to outline below some of the methods with which these institutions are implementing the various types of programmes aimed at providing development aid, in general, and to India, in particular.

Magnitude of Aid

During the last decade, the Federal Republic has granted nearly DM. 1,500 crores (one DM.=1.20 rupee) worth of capital aid worldwide to developing countries. In addition to this, there have been assistance measures like State guarantees in respect of export credits granted by German firms to customers in developing countries, depreciation allowances for investments made in the way of capital goods and an increasing amount of grants rendered within the scope of technical aid. These types of assistance amount to another DM. 1,000 crores. With this contribution, the Federal Republic of Germany holds a prominent place amongst the industrialised donor countries of the West.

As a rule, capital assistance consists of credits which are either granted on terms determined by investment banks at real market conditions or as so-called "soft credits." India has upto now received nearly DM. 400 crores as capital aid from the Federal Republic. This amount represents nearly 26 per cent of the total aid of that type granted by Germany to developing countries world-wide.

The most important projects in India built with the help of German capital assistance are, amongst others, the Steel Works in Rourkela, the Rourkela Fertiliser Project, and the expansion schemes of the Mysore Iron and Steel Works and its conversion into an alloy and special steel plant.

Manifold Problems

The problems connected with the granting of capital aid are manifold. If, for instance, these credits are given at real market rates of interest, it is likely that the repayment obligations of interest and principal might put an undue strain on the repayment capacity of the debtor country. This will lead to conversions and prolongation of the currency of the loan when maturing for repayment. Remembering, however, that the very meaning of capital aid is to strengthen the recipient economy, I consider such emergency measures, which may have to be taken quite frequently, to be a tragedy for the donor as well as the receiver—a tragedy which reaches beyond the mere financial implications of the given case.

I am, therefore, of the opinion that capital assistance—may be at an artificially reduced rate of interest—should be granted mainly for projects which are productive from an overall economic point of view, but cannot be expected from a business point of view to yield profits within a short span of time. Here I am thinking of projects like the construction of roads or bridges, soil enrichment, construction of irrigation systems for gradually converting chalky soil into agriculturally arable soil, etc. In such cases of developing the infrastructure of the economy, credits with low interest rates, long periods for amortisation and commencing with a period of grace, are economically justified. Thus, the scanty hard currency reserves are preserved and available to help financing the purchase of urgently required capital goods from abroad.

In the industrial field, however, soft credits are not in each and every instant preferable to credits advanced at regular market rates. Interest rates charged at market conditions exercise a selective function. Many an investment made at artificially reduced rates of interest, which later proved to be a failure, would have never been carried out, had the investor been charged with the full cost at free market rates for his loan. In the absence of this barrier, submarginal suppliers are teased to step into markets which they could never serve under competitive terms. The loss in such a case is not borne by the unsuccessful investor alone, but by the economy as a whole which has thus been deprived of a capital urgently needed in other fields.

"Interest-splitting"

In this connection, it is not out of place to mention that the idea of "interest-splitting," with its merits or demerits presenty under study by Indian and German officials, would be a new element amongst the credit terms administered so far. Under this scheme, the rate of interest prevalent under free market conditions is to be split in such a manner that one part of it is payable in hard currency and another in the national currency of the debtor country. The funds accruing on account of the rupee payments can then be lent to Indian enterprises.

A weak point when providing capital aid for industrial projects constitutes, in my opinion, the fact that important investment decisions are made between two Governments, instead of being the sole prerogative of dynamic entrepreneurs. Here the unconvinced reader should remember that Germany adheres to a social and economic order which is known as a social market economy. At the outset of the development aid programmes, we did not have the institutional facilities to grant capital aid on a Government-to-Government level; we had to create them *ad hoc*. While having done so, we keep aware of the fact that private development assistance is generally of higher quality than strict governmental assistance.

The private investor adds to the capital investment his technical know-how as well as his intricate knowledge of the market he is aiming at—skills which are a must, a prerequisite for every successful investment. This aside, a personal stake in the project usually enables the private investor to overcome temporary difficulties by using modified economical, technical or distribution methods. Faced with a similar situation, the publicly controlled and managed enterprise often reacts with underutilisation of capacity and it takes some time before the respective governmental official grasps that somewhere, something was not planned correctly.

Value of Private Capital

When starting new industries in an underdeveloped and undercapitalised economy, it is quite common that the investment demand cannot be met by the strength of the domestic capital market or by attracting at once sufficient amounts of foreign capital for private participation. Here I see two alternatives to the procedure so far followed when starting projects in the public sector. Firstly, public and private resources could be combined to achieve a common purpose. Depending upon the circumstances, the majority or minority role could be held by either partner. In each case, both partners can supplement each other to their mutual benefit, the State by its authority and its superior possibility for raising money providing, so to speak, the infrastructure of an industry and the private partner by contributing his capital, his managerial experience and his better knowledge of the market. The other alternative would call for a postponement of starting a new venture, if natural financial resources are not available.

A growth in equilibrium can be achieved more rapidly by postponing investments in capital-intensive projects and accelerating investments in labour-intensive productions or production programmes. The latter will sooner yield practical results as can be achieved by huge Government-directed investments in favour of a few privileged basic industries. Creation of new industries without sound financing leads, under the given circumstances, to structural distortions and continued disequilibrium. The pace of investment in basic industries may, for instance, not be geared with the rate of expansion in the processing industries. The economist and the practical businessman are aware of the damage which unsynchronised sectors can inflict upon each other. The "investment prosperity" achieved in one sector will soon come to a standstill when the market for processing its products does not exist or is too limited to absorb them. The prosperity in the one sector will thus soon be reduced to underemployment characterised by idle capacities and growing unmarketable stocks. With this in mind, I think the postponing of investments which are not induced by the market is the much smaller evil; actually it would be an attitude fully in line with the real market conditions.

I, therefore, look with great hopes and expectations towards a step-up of private German investments in India. Along with the advent of as many as possible profitable small and medium-sized industries spread all over the country, the decisive break through for a sound industrialisation of India will be achieved. On this foundation, one day a sound domestic capital market may accumulate the funds to start or to expand heavy industries. At the present stage, however, one should hope that a sufficient number of entrepreneurs is ready and willing to set up light industries in the vast rural districts of India. The almost unlimited needs of the rural population would, after initial encouragement, create unforeseen avenues of employment. It is only when more and more people are engaged in productive work, and the hidden unemployment of the rural population is reduced—in fact, reduced to zero one day—that the Indian economy can be said to be embarking on the road to a sustained rate of growth. Only when new personal incomes are created, will the *per capita* income increase, resulting in demand backed up with purchasing power. Growing personal incomes will enhance the saving activities. The rate of savings in turn determines the rate of investments. To contribute German assistance to such an economic development I would welcome much more than adding funds earmarked to be invested in heavy industries at the few industrially congested areas with undue haste.

Adjustments

No doubt the industrialisation of India—in fact of all the developing countries—will have repercussions for the economies of the industrialised countries. It will also confront the German economy with problems. Readjustments, changes and a high degree of flexibility will be called for to adopt to a changing world. In spite of these anticipated difficulties, however, it should not be overlooked that the developing countries will have more purchasing power when they produce and export more goods and that this purchasing power will be used for buying more goods—especially high grade capital goods. In this context, India with its large manpower resources and its vast natural raw material deposits will play an important part. Once this development is completed, economic relations between our two countries will be based on trade, instead of aid.

When granting capital aid for industrial projects, as mentioned earlier, we are constantly faced with a situation which calls for additional foreign exchange to maintain the project by supplying it with raw material, spare parts and components. If these essentials are not available, a drop in production or even standstill are the consequences. It is for this reason that commodity aid comes into the picture. Through this type of aid, untied import of goods from abroad can be financed. While the capital aid is usually tied

to a particular project, commodity aid is not. It thereby has the advantage of being utilised momentarily, thus relieving the foreign exchange position of the recipient country at once. If such commodity aid, however, is spent to supply projects sponsored by third parties with raw material, subsidiary materials, etc., it is rather discouraging for the original creditor, who nourished, naturally, the hope that his own capital aid projects would benefit from the supplementary credit.

Financial assistance extended by my country to Indian development institutions like the Industrial Finance Corporation, the Industrial Credit and Investment Corporation of India (I.C.I.C.I.) and the National Small Industries Corporation (N.S.I.C.) is another effective contribution to the industrial development of the country. These institutions possess thorough experiences, the knowledge of the prevailing market conditions and are fit to grant well-aimed development loans to selected, qualified enterprises.

The success of an investment is, however, not guaranteed by credits in whatever form alone. Even an optimal capitalisation of an enterprise cannot make up for poor management, lack of skilled labour and faulty planning. With this in mind, we try to play our part for the betterment of the conditions on hand in extending technical aid. Technical aid is administered in many forms. It can be applied, for instance, in the economic or technical field, the training of Indian specialists in India or abroad, the establishment of training institutions and model plants, the despatch of German specialists and teachers to India, etc.—in short, technical aid consists of the transfer of knowledge and experience—in which an economically advanced country is ahead of the less-developed country.

I will not enumerate the various projects which are run in India within the frame of German technical assistance. One of these projects, nevertheless, I wish to mention as an example. In Mandi (Himachal Pradesh), a handful of German agricultural experts are co-operating since a few years with Indian specialists in a so-called package deal programme to intensify agricultural production. By applying scientific methods of cultivation in farming, fruit growing and horticulture, an increase of 40 per cent in output has been achieved so far. A deficit region has thus changed within the span of two years into an agricultural surplus area. One could easily visualise the economic impact if such an example were to be copied and spread nationwide!

In an article dealing with developing aid, the Indo-German foreign trade deserves a reference, inasmuch as both types of economic activities are interdependent. As far as the German economy is concerned, India is one of the most important overseas markets. India's exports to Germany are smaller in volume and value—nevertheless they are a significant factor too. There are still some import restrictions on Indian export goods into the E.E.C. countries, though rudimentary in nature. A large portion of the trade, however, has been liberalised. Moreover, the conquest of new markets or the capability of defending a market position is essentially a matter of dynamic, ingenious *entrepreneurship*. The goods should be produced and styled in line with the market demand.

Too persistent demands for an immediate removal of all customs duties or quota restrictions I am inclined to counter with the request to compare the existing import barriers surrounding my country or the E.E.C. countries with the import restrictions or import bans protecting the host country. On the whole, India has its pains of economic growth. We realise her balance of payment problems and take them into account. On the other hand, there is the stringent necessity for my country too to remain constantly aware of its own balance of payment position and the budgetary accounts. The budget position may quite often splash cold water on the readiness to give free rein to imports from developing countries, for the loss of income derived from customs duties and consumption taxes cannot automatically be substituted by tapping other sources.

In one of the issues of this magazine, I had recently read an article written by an Indian economist who had visited Germany. He was appreciative that Germany had abolished import duties on unpacked tea but he was dismayed about the fact that a rather stiff consumption tax was imposed on that commodity. Commenting on this, I would like to point out that the Federal Republic maintains trade relations with countries all over the world. Some of them are developing countries whose main exports products consist of raw coffee. For them, Germany is an important market. Let us assume that Germany abolishes consumption tax on tea and further that the elasticity of demand leads to an increase in consumption proportionately to the price decrease. Coffee and tea are substitutes; thus the price decrease for tea will lead to a dwindling demand for coffee. The coffee growers will register their complaints demanding equal treatment and so forth. Trying to judge not from a parochial point of view but rather from a world-wide angle little will be gained by such isolated interventions. Moreover, since Germany is pursuing a trade policy committed to the most-favoured-nation principle, she is compelled to weigh single interventions favouring a particular trade partner with the secondary effects such measures may have on third countries.

The demand for rigorous abolition of customs duties, quotas, consumption taxes, etc., in the industrialised countries in favour of unrestricted imports from developing countries is logically inconsistent, if one does not, at the same time, remember what a decrease of income at the exchequers of the importing country will imply. Development aid has to be financed out of tax proceeds. Therefore, allowances granted for one account will, hence, lead to cuts in other accounts.

The efforts being made between the industrialised countries to strengthen the economy of developing countries against all sorts of crises are far more important than one or the other singular measures which may lead to secondary effects, toning down or even subverting the results originally desired.

Whatever the occasional shortcomings of our mutual attempts to help each other might be, the common willingness to do so contains such strong and constructive elements that I have no doubt that the ultimate goal, namely, a decent standard of living for all in a free society, will be reached eventually.

AID TO INDIA SERIES—V

From CANADA

UNDERLYING PHILOSOPHY, BASIS, METHOD AND QUANTUM

BY ROLAND MICHENER, High Commissioner for Canada, New Delhi

I WELCOME the opportunity provided by *Commerce* to write a few words about Canadian assistance in the economic development of India since the commencement of the first Five-year Plan. Although our efforts in this field are known to many, it is natural that the extent of economic ties between India and Canada is not always appreciated, because of the more dramatic developments in India's economic relations with the greater powers. Nevertheless, our record is such that we are proud to be able to present it.

No account, however brief, of Canada's connections with India's economic development over the past 13 years should fail to mention some of the factors which operate in Canada to influence and mould our external economic relations. The first and most obvious is that Canada is still a small nation with less than one-twentieth of India's population. Nineteen million people are scattered unevenly over 3.8 million square miles of territory, large tracts of which are barren or undeveloped. Canada is young as a nation and even younger as an industrial power. In fact, the bulk of Canada's wealth comes from its natural resources.

While our industrial development has leaped ahead in the past 25 years, the Canadian economy is largely geared to the ever-increasing needs of the industrial giant to our south and this has a tendency to emphasise the development in Canada of extractive industries rather than manufacturing industries. Capital flows into Canada, principally from the United States but also from Britain and other European countries, to assist in the development of our resources. In this respect, therefore, Canada is similar to India—we are a developing country, struggling to build up our basic and secondary manufacturing industries and anxious to control the development of the economy so that control remains in our own hands. It should also be pointed out that Canada, like India, usually has a balance of payments problem and our trade deficits, mainly with the United States, have run as high as $1 billion in recent memory, and have only been offset by the inflow of developmental capital.

Limiting Factors

The above considerations have clear implications for Canada's economic relations with countries such as India. For one thing, Canada must watch carefully the outflow of money. For another, private Canadian capital naturally looks to investment opportunities within Canada. (It may be encouraged, but cannot be forced, to invest in India.) Furthermore, the rapidly growing demand for technologists in our own industries and in our mushrooming universities makes it difficult to find enough of the right kind of qualified people who are willing to come out and assist in Indian development. Canada has not yet been able to build a corps of advisers and experts who make a career of service abroad in industry and education. These factors are mentioned not to provide excuses, because I think we owe none to anyone, but to make our position more fully understood.

It may be noted that, so far, I have mentioned only the economic and practical problems which Canada faces in trying to play a significant role in international economic development. The reason is that there have been really no political problems for Canadians in this area. Our memories of two world wars, a shattering depression, and our dependence on foreign trade (to a greater extent than all but three or four nations of the world) produced an "internationalist" outlook which led us after 1945 into active participation in the United Nations (in its specialised agencies concerned with economic affairs and multilateral aid) and in bilateral foreign assistance. There has never been much opposition in Canada, one of the more fortunate and prosperous nations, to assisting the less-developed countries. When the Foreign Ministers of the Commonwealth countries met in Colombo in 1950 to evolve what has become known as the Colombo Plan, Canada was represented and became a "charter" member. Ever since the Colombo Plan got underway in 1951, Canada has made it her largest single aid programme and India has absorbed more than half of all the aid extended by Canada under the Colombo Plan over the past 13 years. As evidence of Canadian support for foreign aid one can say that all political parties have generally approved our programmes and have even vied from time to time in encouraging the Government to raise its sights. Recent Canadian administrations of the two leading parties have successively increased expenditure in this field.

Fundamental Philosophy

The philosophy underlying Canadian participation in the Plan was summed up by the former Prime Minister of Canada, Mr. John G. Diefenbaker, in an address on 29th June 1958, when he said that:

> "The good citizen and the good nation must recognise his obligations to the broad community of man."

Mr. Diefenbaker went on to explain the concept of the interdependence of nations in the following words:

> "While we have our duty to ourselves and our special relationship to our families and our neighbours, more and more, we, as Canadians and citizens of the world, must seek to share the problems of every continent. We have much to give to other peoples, particularly those in less fortunate lands, but we have also much to learn from them."

The present Secretary of State for External Affairs in July last explained Canadian motivation to the Standing Committee on External Affairs in these terms.

> "I can say that this Government, its predecessor and the preceding Government, regard assistance not on the basis of political interest but on the basis of our appreciation of the need of the particular areas that were receiving assistance from Canada. In our country, the humanitarian desire to share our resources has certainly, over the years, been the main motivating force behind Canadian contributions. Furthermore, a statistical table may have some relationship to the quantitative effort, but it cannot reveal the qualitative aspects of the programme. In the matter of quality the Canadian programme —I think I may say—is held in high regard by recipients and by other donors.
>
> "...From the statement I made last November, you will see that there is a considerable increase in the aid resources which we will make available in this fiscal year, subject, of course, to parliamentary approval.
>
> "It will be the intention of the Government to play its full part, in concert with other advanced countries, in what is now regarded as a collective aid effort. We know that our partners, who are in a position to extend assistance, share our objectives. We are also confident that the less-developed countries, which will continue to supply the bulk of resources for their own development, recognise their responsibility both to themselves and to others to use the resources available in the most effective manner.
>
> "The policy of Canadian Governments—all of them since 1950—has been to make progressive increases in aid funds whenever economic circumstances permit."

In line with this policy, the Canadian Government had announced in November 1963 that external aid in all forms for the fiscal year 1964-65 would be increased by $70-80 million.

Self-help

Another basic principle of Canadian aid to which we attach great importance is that of self-help. Most aid projects are undertaken on the understanding that the recipient country will also contribute. In other words, aid projects are considered to be joint projects in which Canada and the recipient countries participate according to their respective capacities. The local Government is normally expected to meet all local currency costs of capital projects, including those for labour and materials, and, at the same time, is required to make personnel available who can be trained on the job. Of all projects now under way, the total financial contribution agreed to by recipients is slightly higher than the total Canadian contribution. The proportion varies, of course, depending on the nature of the project and local capabilities. The Indian share of the Kundah project, for example, will be the equivalent of $80 million, or nearly double the Canadian share, since a great deal of local labour and local materials are being used in it.

Canadian Governmental assistance falls into three categories and is handled in three different ways. The first category is capital assistance for specific projects. Within this category, some provision has recently been made for a limited amount of equipment and spares for existing plants. The second category of aid is for the purchase of commodities, the supply of which results in the establishment of counterpart funds by the Government of India. Incidentally, all counterpart funds remain with the Government of India and, although Canada is consulted and approves uses of these funds, we reserve none of the counterpart funds for our own purposes. The third category is technical assistance which involves the transfer of trainees to Canada, usually at the graduate and undergraduate level, and of experts and advisers from Canada to India.

Three Methods

The three methods of extending aid referred to above are grants, long-term loans, and medium-term credits on a semi-commercial basis. I should like particularly to draw attention to the factor of quality as well as quantity in the Canadian aid programme. The bulk of Canadian aid, which has been under the Colombo Plan, has been in the form of outright grants which provide a maximum benefit to the recipient country because there is no repayment problem. This is an important consideration: several developing countries, including India, are reaching the stage where loans and credits received during the early years of development are now maturing and must be repaid, to the detriment of the current and new programmes. Under the Colombo Plan, Canada's contribution has not raised any problem of this kind for India.

The second method of extending aid is through a new Special Development Loan programme which was announced in Ottawa in November, 1963. The new loans will be repayable in 40-50 years *plus* a ten-year period of grace and will be interest-free except for a small service charge of 3/4 of 1 per cent. I should add that Canada's entry into this field of long-term loans came at a time when many other countries were reducing their aid or hardening the terms. Canada's action represents a net increase in our aid effort and, in terms is as favourable as that of any other country or international institution in the field of foreign aid.

The third method is through medium-term loans (10-20 years) at near commercial rates of interest, i.e. about 6 per cent. These loans are made by the Export Credits Insurance Corporation and were devised to assist Canadian exporters by guaranteeing payment to them. These credits are used mainly for projects which will produce early and measurable economic returns, as contrasted with grant-aid projects which often involve infrastructure projects.

It may be noted that, with Colombo Plan grant-aid, long-term soft loans, and medium-term loans, Canada is providing one of the most flexible forms of aid offered by any country. Indeed, no other country, except the United States, is providing such a varied range of assistance.

Extent of Aid

In concrete terms, Canadian Colombo Plan assistance to India from the start of the Plan to the end of the fiscal year 1963-64 was $238,956,000, which includes $18 86 million voted in 1963-64. Another $22 million has been allocated for 1964-65. All of these funds have been or will be used since Canada has made special legislative provision to ensure that Colombo Plan funds, once voted, do not lapse. At this date, actual expenditure by Canada for India's benefit is about $245 million. This figure includes capital assistance projects, commodity shipments, and technical assistance. There are numerous small projects in the capital programme, but a

few large ones have taken the bulk of the funds. Some of these larger projects are Kundah (stages I, II and III), Mayurakshi (the Canada dam), the Umtru Hydro-electric Project, the Canada-India reactor at Trombay, transportation equipment (chiefly locomotives), an aerial survey, and cobalt beam therapy units. The commodity shipments include wheat, copper, aluminium, zinc, lead, newsprint, asbestos and fertilisers and represent an expenditure of approximately $149 million, resulting in counterpart funds of Rs. 65.5 crores. These counterpart funds have been used in part for local costs of the Mayurakshi, Umtru and Kundah projects referred to above and for seven engineering institutes. Currently, some of these funds are committed to the Idikki Hydro-electric scheme ($20 million) in Kerala and to industrial housing ($11 million).

In terms of money spent, the technical assistance programme may appear modest, but, in terms of numbers of people, the Canadian programme has been quite large. From 1950 to 30th June 1964, the total number of Indians who have received or are receiving training in Canada under the Colombo Plan is 716. Another 193 have come under other auspices, e.g., the Commonwealth Scholarship Plan (66), U.N.T.A.A. (40), and U.S. A.I.D. (51). In the same period, 35 Canadian advisers have come to India under the Colombo Plan; others have come under different auspices. The flow of trainees and advisers continues and is expanding.

Joint Ventures

For reasons outlined earlier in this article, Canadian participation in joint ventures and business collaboration has been on a more modest scale. The most outstanding relationship which Canada has with Indian industry in this category is the Indian Aluminium Company Limited, associated with the Aluminium Company of Canada Limited. It is one of the finest industrial developments in India from every point of view. With a highly efficient Indian management, outstanding labour relations and leadership in the field of non-ferrous metals, greatly needed in India, the Indian Aluminium Company sets a standard and exemplifies a type of Canadian-Indian relationships of which both countries can be proud. It carries into the industrial field the same kind of Canadian-Indian understanding which has been acclaimed so often as a model in the field of aid, especially under the Colombo Plan.

It is interesting to note that there is now, in the course of construction, a further projection of Canadian-Indian collaboration in non-ferrous metals production by another outstanding Canadian firm, The Consolidated Mining and Smelting Company of Canada Limited, Montreal. Its collaboration with Metal Distributors Limited under the name of Comico Binani Zinc Limited for the smelting of zinc in Kerala, brings together a leading metal producer of Canada and one of India's major non-ferrous metal distributors. This zinc smelter will do much to relieve India of the drain on its foreign exchange which is now occasioned by heavy imports of non-ferrous metals. This particular project was financed with Canadian Government assistance under a long-term loan.

There is some prospect that Canada may also participate in the erection of a newsprint mill through the collaboration of a well-known Canadian newsprint manufacturer leading Indian firm. In this ›ada is the outstanding the world today, and any such collaboration would be bringing to India the know-how and support of a highly experienced Canadian firm, and again would contribute to a great saving in foreign exchange.

Agriculture

Agriculture in Canada, as in India, is one of the primary economic activities of the country. Indeed, Canada's first approach to world trade on a large scale was through its export of the famous Canadian Hard Wheat. With its immense areas of cultivation, Canadian agriculturists have been among the world leaders in farm mechanisation. This has given rise to a well-established industry in the manufacture of up-to-date farm implements etc. Some association between Canada and India in this phase of industry is found in the collaboration of Massey-Ferguson Limited, the well-known Canadian agricultural implements firm, with Amalgamations Private Limited of Madras, in setting up Tractors and Farm Equipment, Limited.

In short, although the number of Canadian firms collaborating with Indian firms is small, the areas in which they are participating and the contributions which they are making to stabilisation of the Indian economy are significant.

Before concluding I should like to mention two private ventures in the aid field. The first is the Canadian Universities Service Overseas which has been organised and financed by private persons with the object of selecting public-spirited young Canadian university graduates who are willing to devote one or two post-graduate years to working in developing countries with no material reward. In a country the size of India, a few young Canadians will have an almost imperceptible influence, but each in his or her own *ashram* or school will be part of the give and take referred to earlier and will add something tangible to Canadian-Indian co-operation and understanding.

The other privately-sponsored venture is the Canada-Mysore Project for training people in India, as well as people from South-East Asian countries, in modern techniques of food processing and preservation. Working in co-operation with and at the request of the United Nations Food and Agricultural Organisation, the Canadian Freedom from Hunger Committee, which is a non-governmental organisation, has offered to raise the money from contributions of private citizens and corporations in Canada to provide staff and teaching equipment for a training centre and to transport students and maintain them during their training. The centre is to be located in Mysore in buildings donated for the purpose by the Governor of Mysore State. As the Indian Government itself is running the Food Technology Centre at Mysore, the Canada-Mysore Project Training Centre will be able to profit from the existence of established working facilities in the field of food research, not to mention the advantage of having several hundred Indian technologists already working nearby.

The Prospects

Finally, from Canada's point of view, what has been achieved by Indo-Canadian economic co-operation to date and what are the prospects for the future? Such things as hydro-electric projects and atomic reactors which have been built and are being built and the imparting of knowledge through the technical assistance programme represent a permanent and continuing contribution to India's development. Canadians are happy and proud to be able to help a country which, in some ways, is less fortunate than their own. Of equal importance is that, through this association, Canadians have learned to understand and respect India's achievements. We have not failed to note the outstanding efforts and accomplishments of Indian planners, engineers and workers in the projects with which we have been associated. This is encouraging for all of us. In working with Indian officials on future plans, we have become acquainted not only with the problems, but also with the dedicated, concerted planning and effort that has gone and continues to go into the modernisation and industrialisation of the economy. We have also become acutely aware of the distance still to go and of the fact that the gap between the developed and the less-developed countries, including India, is widening, despite the efforts made by both sides. This trend must be reversed, here, by speeding up India's rate of advance. We know from experience that India can be relied on in this endeavour, and we in Canada are anxious to assist by all means within our capacity.

AID TO INDIA SERIES—VI

From SOVIET RUSSIA

WARM AND GAINFUL CO-OPERATION

BY K. KRISHNA MOORTHY

AT the Bhilai Steel plant built with Soviet economic and technical assistance, there is a plaque on which are inscribed the words of the late Jawaharlal Nehru describing the Bhilai project as "the symbol and portent of the future of India" and alongside are the words of Mr. Nikita Khrushchev: "Let our friendship be as strong as the steel smelted at this plant." The significance of the Bhilai project covers more than the facts of Indo-Soviet friendship; it extends to the initiation of a new experiment in international relations on the part of the Soviet Union.

The year 1955 marked the turning point in Khrushchev-directed Soviet policies governing India and other non-communist non-aligned underdeveloped countries in the region. In the pursuit of peaceful co-existence and competition with the capitalist world, on 26th January 1955—India's Republic Day—Soviet newspapers elaborated on the theme of support to non-communist non-aligned countries to promote economic and political stability. This was followed immediately afterwards by the signing on 2nd February 1955, of the agreement on Soviet assistance to build the Bhilai steel plant. The British and West German Governments and firms were also participating in the construction of Government steel mills but the Russians started with initial advantages, including the fact that the Soviet Government was the turnkey contractor which could efficiently co-ordinate the massive task of putting up the steel mill—a venture in which the Indian Government had no experience. The Russians also had considerable experience in tackling projects in backward regions within the Soviet Union.

Statesmanship

There is no doubt that, in attempting this new form of relationship, Mr. Nehru and Mr. Khrushchev demonstrated immense statesmanship and the greatness of one rubbed on the other's shoulders. Mr. Khrushchev's longing for co-existence and competition needed an arena for demonstration and Mr. Nehru provided the opportunity. The Russians emphasised that their aid to India—and to other non-communist countries later—would be without strings. The important question which was publicly debated when Mr. Nehru launched on a policy of accepting communist assistance was whether such aid flow would lead to communist interference in India's domestic and foreign policies. The Soviet assistance would be available naturally for the Government sector and the Industrial Policy Resolution of the Indian Government and later socialistic policy declarations of the ruling Congress Party meant that there need not be a conflict of interest between the Soviet Union and India. Indeed, the Soviet Government all along maintained proper stance and developed few if any intimate associations with Indian communists as a result of provision of economic aid.

While the United States was reluctant to help India in industrial sectors where the Government wanted to establish a commanding position, the Russians provided the technological and other strength for the Indian State sector to develop industries. On the face of it, the Soviet policy appeared self-contradictory. India and the United Arab Republic had Governments which were anti-communist on the domestic fronts. Helping these Governments would be against the interests of the national communist parties in these countries. But the Soviet Government under Khrushchev did not subscribe to this thesis which was among the causes for the worsening of the Sino-Soviet ideological dispute. Instead of exporting revolution, as the Chinese wanted all Communist Governments to do, Khrushchev supported anti-revolutionary forces like Nehru and Nasser, who were anti-colonial but whose socialist garb was, no doubt, thin.

Forum for Peaceful Competition

Nehru provided Khruschev with a respectable forum for peaceful competition even as the Soviet leader declared his intention ultimately to bury the capitalists. The first major exposure of Khrushchev to Indian crowds on a big scale was during his and Bulganin's jaunt across India during which Khrushchev also revelled in his adventures. Mr. Nehru's visit to the Soviet Union also impressed the Soviet leaders during the days when Mr. Dullas was the master of American foreign policy.
